b) Group ID to User Position, denoted by UserPositionInGroupID[g] for $1 \le g \le 62$

When a STA receives a VHT MU PPDU where the Group ID field in VHT-SIG-A has the value k and where MembershipStatusInGroupID[k] is equal to 1, then the number of space-time streams for that STA is indicated in the MU[UserPositionInGroupID[k]] NSTS field in VHT-SIG-A. The space-time streams of different users are ordered in accordance to user position values, i.e., the space-time streams for the user in user position 0 come first, followed by the space-time streams for the user in position 1, followed by the space-time streams for the user in position 2, and followed by the space-time streams for the user in position 3.

A STA is also able to identify the space-time streams intended for other STAs that act as interference. VHT-LTF symbols in the VHT MU PPDU are used to measure the channel for the space-time streams intended for the STA and can also be used to measure the channel for the interfering space-time streams. To successfully demodulate the space-time streams intended for the STA, the STA may use the channel state information for all space-time streams to reduce the effect of interfering space-time streams.

If a STA finds that it is not a member of the group, or the STA is a member of the group but the corresponding MU NSTS field in VHT-SIG-A indicates that there are zero space-time streams for the STA in the PPDU, then the STA may elect to not process the remainder of the PPDU.

21.3.12 VHT preamble format for sounding PPDUs

NDP is the only VHT sounding format.

The format of a VHT NDP is shown in Figure 21-28.

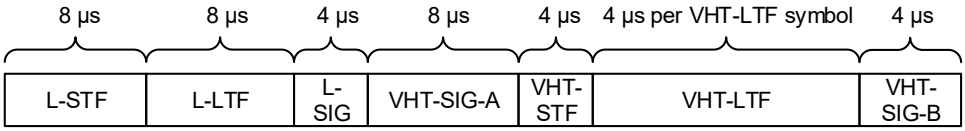

Figure 21-28—VHT NDP format

NOTE—The number of VHT-LTF symbols in the NDP is determined by the SU NSTS field in VHT-SIG-A.

The VHT NDP has the following properties:

— Uses the VHT PPDU format but without the Data field.
— Is a VHT SU PPDU as indicated by the VHT-SIG-A field.
— Has the data bits of the VHT-SIG-B field set to a fixed bit pattern (see 21.3.8.3.6).

21.3.13 Regulatory requirements

Wireless LANs (WLANs) implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision or may be superseded. Requirements that are subject to local geographic regulations are annotated within the PHY specification. Regulatory requirements that do not affect interoperability are not addressed in this standard. Implementers are referred to the regulatory sources in Annex D for further information. Operation in countries within defined regulatory domains might be subject to additional or alternative national regulations.

21.3.14 Channelization

A VHT channel is specified by the four PLME MIB fields specified in Table 21-22.

Table 21-22—Fields to specify VHT channels

Field	Meaning
dot11CurrentChannelWidth	Channel width. Possible values represent 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz channels.
dot11CurrentChannelCenterFrequencyIndex0	For a 20 MHz, 40 MHz, 80 MHz, or 160 MHz channel, denotes the channel center frequency. For an 80+80 MHz channel, denotes the center frequency of the frequency segment 0, which is the frequency segment containing the primary channel. Valid range is 1 to 200. See Equation (21-102).
dot11CurrentChannelCenterFrequencyIndex1	For an 80+80 MHz channel, denotes the center frequency of the frequency segment 1, which is the frequency segment that does not contain the primary channel. Valid range is 1 to 200. See Equation (21-102). For a 20 MHz, 40 MHz, 80 MHz, or 160 MHz channel, set to 0.
dot11CurrentPrimaryChannel	Denotes the location of the primary 20 MHz channel. Valid range is 1 to 200. See Equation (21-103).

Given dot11CurrentChannelCenterFrequencyIndex0 and dot11CurrentChannelCenterFrequencyIndex1, the respective channel center frequency is given by Equation (21-102).

$$\text{Channel center frequency [MHz]} = \text{Channel starting frequency} + 5 \times \text{dot11CurrentChannelCenterFrequencyIndex} \quad (21\text{-}102)$$

where

Channel starting frequency is given by the operating class (Annex E)

dot11CurrentChannelCenterFrequencyIndex is either dot11CurrentChannelCenterFrequencyIndex0 or dot11CurrentChannelCenterFrequencyIndex1

The center frequency of the primary 20 MHz channel is given by Equation (21-103).

$$\text{Primary 20 MHz channel center frequency [MHz]} = \text{Channel starting frequency} + 5 \times \text{dot11CurrentPrimaryChannel} \quad (21\text{-}103)$$

where

Channel starting frequency is defined as dot11ChannelStartingFactor × 500 kHz.

A channel center frequency of 5 GHz shall be indicated by dot11ChannelStartingFactor = 8000 and dot11CurrentPrimaryChannel = 200.

For an 80+80 MHz channel, any two channels that would each be allowed as 80 MHz channels and whose center frequencies are separated by greater than 80 MHz (difference between dot11CurrentChannelCenterFrequencyIndex0 and dot11CurrentChannelCenterFrequencyIndex1 corresponds to a frequency difference greater than 80 MHz) may be used.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For example, a channel specified by

Channel starting frequency = 5000 MHz
dot11CurrentChannelWidth = 80 MHz
dot11CurrentChannelCenterFrequencyIndex0 = 42
dot11CurrentPrimaryChannel = 36

is an 80 MHz channel with a center frequency of 5210 MHz and the primary 20 MHz channel centered at 5180 MHz.

A channel specified by

Channel starting frequency = 5000 MHz
dot11CurrentChannelWidth = 160 MHz
dot11CurrentChannelCenterFrequencyIndex0 = 50
dot11CurrentPrimaryChannel = 56

is a 160 MHz channel with a center frequency of 5250 MHz and the primary 20 MHz channel centered at 5280 MHz.

A channel specified by

Channel starting frequency = 5000 MHz
dot11CurrentChannelWidth = 80+80 MHz
dot11CurrentChannelCenterFrequencyIndex0 =155
dot11CurrentChannelCenterFrequencyIndex1 = 106
dot11CurrentPrimaryChannel = 161

is an 80+80 MHz channel in which frequency segment 0 has 80 MHz bandwidth and center frequency of 5775 MHz. Frequency segment 1 also has 80 MHz bandwidth and center frequency of 5530 MHz. The primary 20 MHz channel is centered at 5805 MHz.

21.3.15 Slot time

The slot time for the VHT PHY shall be 9 μs for 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz channel spacing.

21.3.16 Transmit and receive port impedance

The impedance of exposed transmit and receive antenna connectors are defined in 17.3.8.7.

21.3.17 VHT transmit specification

21.3.17.1 Transmit spectrum mask

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements and the mask defined in this subclause.

NOTE 2—Transmit spectral mask figures in this subclause are not drawn to scale.

NOTE 3—For rules regarding TX center frequency leakage levels, see 21.3.17.4.2. The spectral mask requirements in this subclause do not apply to the RF LO.

The overall transmit spectral mask is constructed using two components. First, an interim spectral mask is constructed whose mask level is determined relative to the maximum spectral density of the signal. Second, an absolute transmit spectral limit is computed based on the mask bandwidth. The overall transmit spectral mask is then constructed by taking the higher of the interim transmit spectral mask and the absolute transmit spectral limit at each frequency offset.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For a 20 MHz mask PPDU of non-HT, HT or VHT format, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 18 MHz, –20 dBr at 11 MHz frequency offset, –28 dBr at 20 MHz frequency offset, and –40 dBr at 30 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 9 and 11 MHz, 11 and 20 MHz, and 20 and 30 MHz shall be linearly interpolated in dB domain from the requirements for 9 MHz, 11 MHz, 20 MHz, and 30 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –39 dBm/MHz at any frequency offset. Figure 21-29 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –39 dBm/MHz.

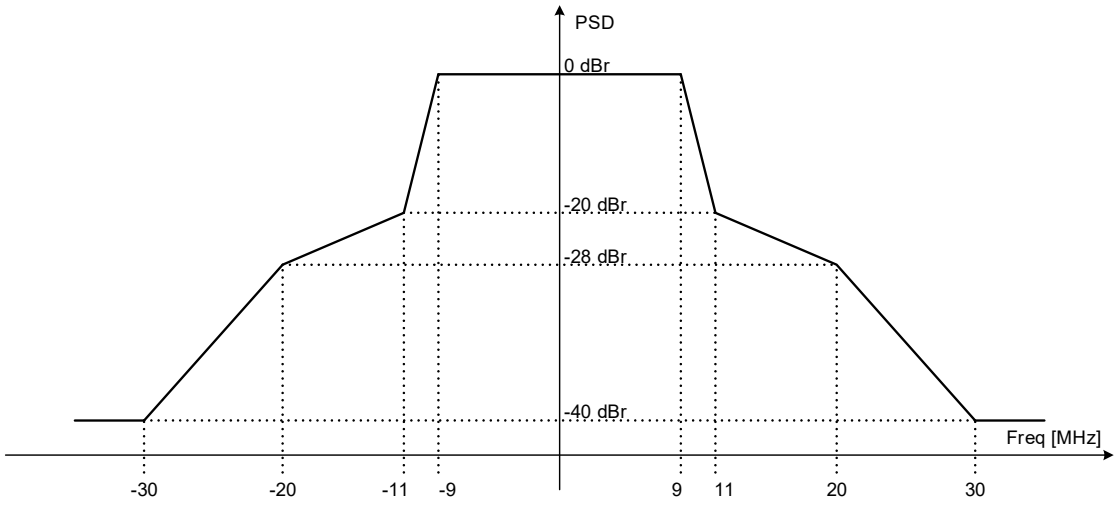

Figure 21-29—Example transmit spectral mask for 20 MHz mask PPDU

For a 40 MHz mask PPDU of non-HT, non-HT duplicate, HT or VHT format, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 38 MHz, –20 dBr at 21 MHz frequency offset, –28 dBr at 40 MHz frequency offset, and –40 dBr at 60 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 19 and 21 MHz, 21 and 40 MHz, and 40 and 60 MHz shall be linearly interpolated in dB domain from the requirements for 19 MHz, 21 MHz, 40 MHz, and 60 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –39 dBm/MHz at any frequency offset greater than 19 MHz. Figure 21-30 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –39 dBm/MHz.

For an 80 MHz mask PPDU of non-HT, non-HT duplicate, HT or VHT format, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 78 MHz, –20 dBr at 41 MHz frequency offset, –28 dBr at 80 MHz frequency offset, and –40 dBr at 120 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 39 and 41 MHz, 41 and 80 MHz, and 80 and 120 MHz shall be linearly interpolated in dB domain from the requirements for 39 MHz, 41 MHz, 80 MHz, and 120 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectrum mask and –39 dBm/MHz at any frequency offset. Figure 21-31 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –39 dBm/MHz.

For a 160 MHz mask PPDU of non-HT, non-HT duplicate, HT or VHT format, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 158 MHz, –20 dBr at 81 MHz frequency offset, –28 dBr at 160 MHz frequency offset, and –40 dBr at 240 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 79

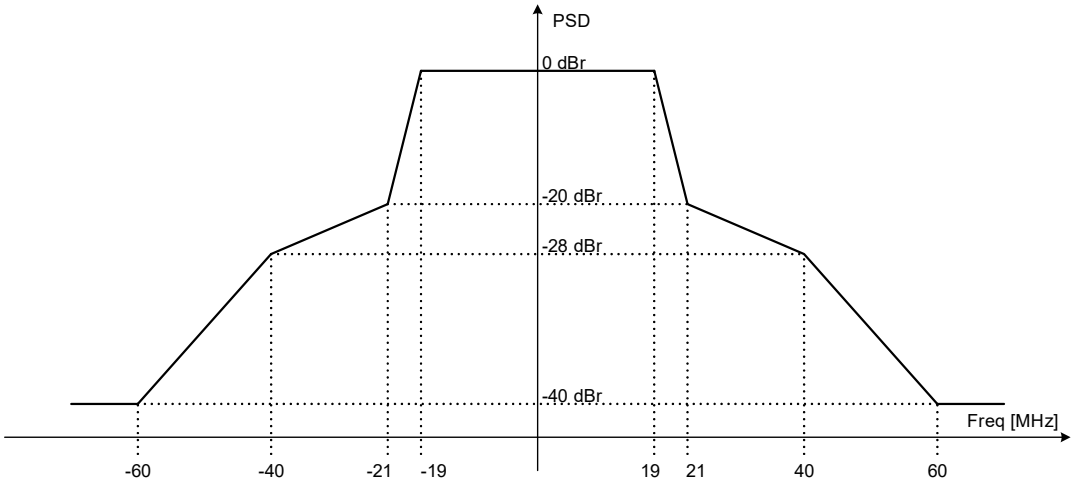

Figure 21-30—Example transmit spectral mask for 40 MHz mask PPDU

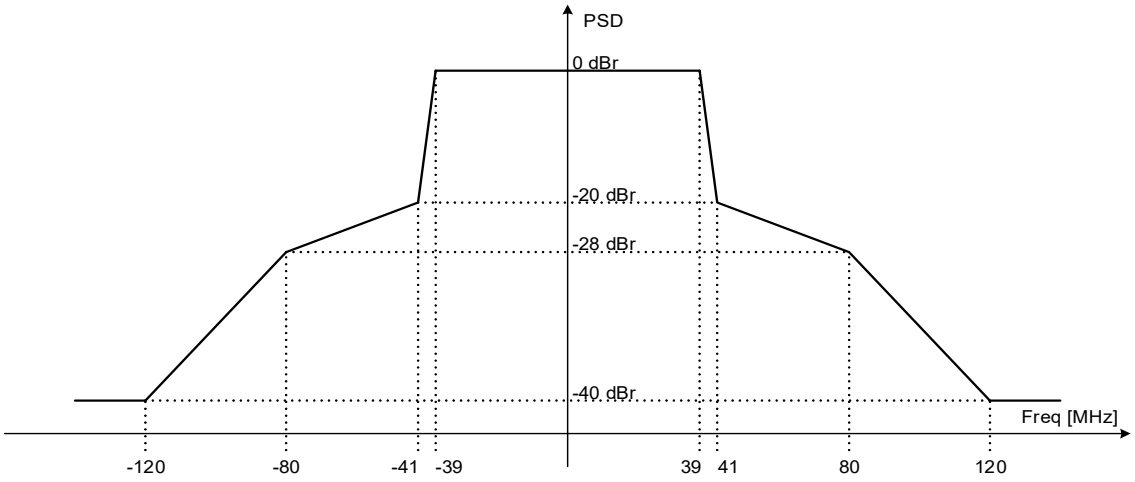

Figure 21-31—Example transmit spectral mask for 80 MHz mask PPDU

and 81 MHz, 81 and 160 MHz, and 160 and 240 MHz shall be linearly interpolated in dB domain from the requirements for 79 MHz, 81 MHz, 160 MHz, and 240 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectrum mask and –39 dBm/MHz at any frequency offset. Figure 21-32 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –39 dBm/MHz.

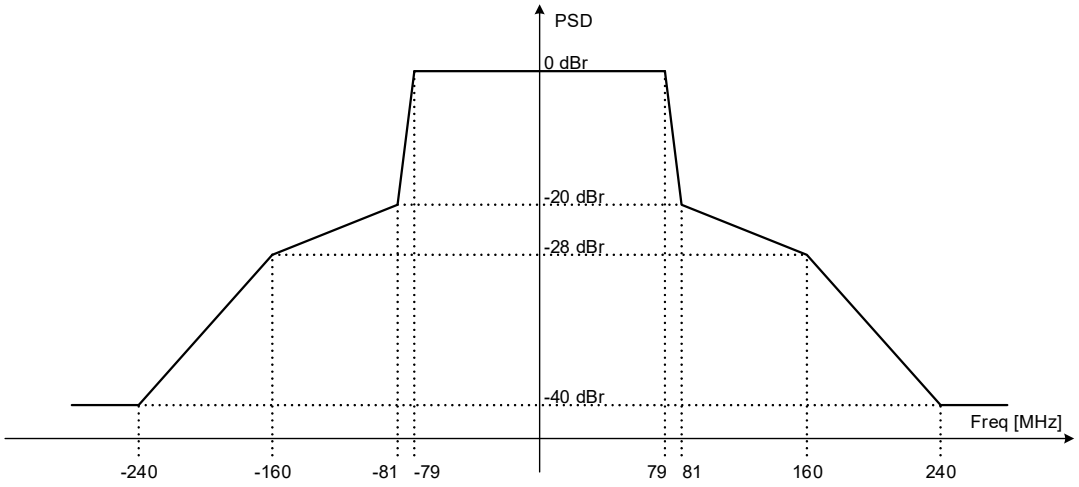

Figure 21-32—Example transmit spectral mask for 160 MHz mask PPDU

For an 80+80 MHz mask PPDU of non-HT duplicate or VHT format, the overall transmit spectral mask is constructed in the following manner. First, the 80 MHz interim spectral mask is placed on each of the two 80 MHz frequency segments. Then, for each frequency at which both of the 80 MHz interim spectral masks have values greater than –40 dBr and less than –20 dBr, the sum of the two interim mask values (summed in linear domain) shall be taken as the overall spectral mask value. Next, for each frequency at which neither of the two 80 MHz interim masks have values greater than or equal to –20 dBr and less than or equal to 0 dBr, the higher value of the two interim masks shall be taken as the overall interim spectral value. Finally, for any frequency region where the mask value has not been defined yet, linear interpolation (in dB domain) between the nearest two frequency points with the interim spectral mask value defined shall be used to define the interim spectral mask value. The transmit spectrum shall not exceed the maximum of the interim transmit spectrum mask and –39 dBm/MHz at any frequency offset. Figure 21-33 shows an example of a transmit spectral mask for a noncontiguous transmission using two 80 MHz channels where the center frequency of the two 80 MHz channels are separated by 160 MHz and the –40 dBr spectrum level is above –39 dBm/MHz.

Different center frequency separation between the two 80 MHz frequency segments of the spectral mask as well as different peak levels of each 80 MHz frequency segment of the spectral mask are possible, in which case a similar procedure in determining the spectral mask as in Figure 21-33 is followed.

The transmit spectral mask for noncontiguous transmissions using two nonadjacent 80 MHz channels is applicable only in regulatory domains that allow for such transmissions.

Measurements shall be made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

21.3.17.2 Spectral flatness

Spectral flatness measurements shall be conducted using BPSK modulated PPDUs. Demodulate the PPDUs according to the following (or equivalent) procedure:

a) Start of PPDU shall be detected.
b) Transition from L-STF to L-LTF shall be detected and fine timing shall be established.
c) Coarse and fine frequency offsets shall be estimated.
d) Symbols in a PPDU shall be derotated according to estimated frequency offset.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

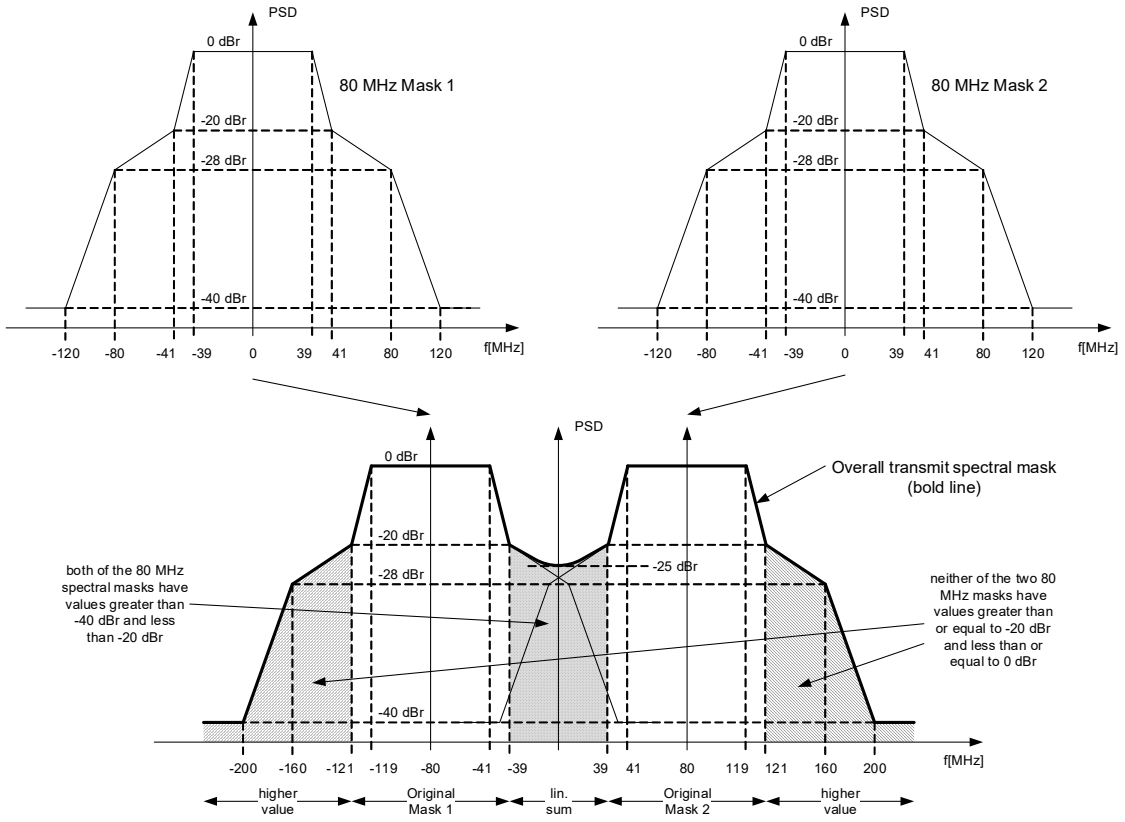

Figure 21-33—Example transmit spectral mask for 80+80 MHz mask PPDU

e) For each VHT-LTF symbol, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, and derotate the subcarrier values according to the estimated phase.

f) For each of the data OFDM symbols: transform the symbol into subcarrier received values.

The spectral flatness test shall be performed over at least 20 PPDUs. The PPDUs under test shall be at least 16 data OFDM symbols long.

Evaluate spectral flatness using the subcarrier received values or the magnitude of the channel estimation.

Let $E_{i,\,avg}$ denote the magnitude of the channel estimation on subcarrier *i* or the average constellation energy of a BPSK modulated subcarrier *i* in a VHT data symbol.

In a contiguous non-HT duplicate or VHT transmission having a bandwidth listed in Table 21-23, $E_{i,\,avg}$ of each of the subcarriers with indices listed as tested subcarrier indices shall not deviate by more than the specified maximum deviation in Table 21-23 from the average of $E_{i,\,avg}$ over subcarrier indices listed as averaging subcarrier indices. Averaging of $E_{i,\,avg}$ is done in the linear domain.

In an 80+80 MHz transmission, each segment shall meet the spectral flatness requirement for an 80 MHz transmission.

For the spectral flatness test, the transmitting STA shall be configured to use a spatial mapping matrix Q_k (see 21.3.10.11) with flat frequency response. Each output port under test of the transmitting STA shall be

Table 21-23—Maximum transmit spectral flatness deviations

Format	Bandwidth of transmission (MHz)	Averaging subcarrier indices	Tested subcarrier indices	Maximum deviation (dB)
VHT	20	–16 to –1 and +1 to +16	–16 to –1 and +1 to +16	± 4
			–28 to –17 and +17 to +28	+4/–6
	40	–42 to –2 and +2 to +42	–42 to –2 and +2 to +42	± 4
			–58 to –43 and +43 to +58	+4/–6
	80	–84 to –2 and +2 to +84	–84 to –2 and +2 to +84	± 4
			–122 to –85 and +85 to +122	+4/–6
	160	–172 to –130, –126 to –44, +44 to +126, and +130 to +172	–172 to –130, –126 to –44, +44 to +126, and +130 to +172	± 4
			–250 to –173, –43 to –6, +6 to +43, and +173 to +250	+4/–6
non-HT duplicate	40	–42 to –33, –31 to –6, +6 to +31, and +33 to +42	–42 to –33, –31 to –6, +6 to +31, and +33 to +42	± 4
			–43 to –58 and +43 to +58	+4/–6
	80	–84 to –70, –58 to –33, –31 to –6, +6 to +31, +33 to +58, +70 to +84	–84 to –70,–58 to –33, –31 to –6, +6 to +31, +33 to +58, +70 to +84	± 4
			–122 to –97, –95 to –85 and +85 to +95, +97 to +122	+4/–6
	160	–172 to –161, –159 to –134, –122 to –97, –95 to –70, –58 to –44, +44 to +58, +70 to +95, +97 to +122, +134 to +159, +161 to +172	–172 to –161, –159 to –134, –122 to –97, –95 to –70, –58 to –44, +44 to +58, +70 to +95, +97 to +122, +134 to +159, +161 to +172	± 4
			–250 to –225, –223 to –198, –186 to –173, –43 to –33, –31 to –6, +6 to +31, +33 to +43, +173 to +186, +198 to +223, +225 to +250	+4/–6

connected through a cable to one input port of the testing instrumentation. The requirements apply to 20 MHz, 40 MHz, 80 MHz, and 160 MHz contiguous transmissions as well as 80+80 MHz transmissions.

21.3.17.3 Transmit center frequency and symbol clock frequency tolerance

The symbol clock frequency and transmit center frequency tolerance shall be ± 20 ppm. The transmit center frequency and the symbol clock frequency for all transmit antennas and frequency segments shall be derived from the same reference oscillator. Transmit signals with the TXVECTOR parameter CH_BANDWIDTH set to CBW160 or CBW80+80 may be generated using two separate RF LOs, one for each of the lower and upper 80 MHz frequency portions.

NOTE—The signal phase of the two 80 MHz frequency portions might not be correlated.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

21.3.17.4 Modulation accuracy

21.3.17.4.1 Introduction to modulation accuracy tests

Transmit modulation accuracy specifications are described in 21.3.17.4.2 and 21.3.17.4.3. The test method is described in 21.3.17.4.4.

21.3.17.4.2 Transmit center frequency leakage

TX LO leakage shall meet the following requirements for all formats and bandwidths except 80+80 MHz where the RF LO falls outside both frequency segments:

— When the RF LO is in the center of the transmitted PPDU BW, the power measured at the center of transmission BW using resolution BW 312.5 kHz shall not exceed the maximum of the average power per-subcarrier of the transmitted PPDU and –20 dBm, or equivalently, $max(P - 10\log 10(N_{ST}), -20)$, where P is the transmit power per antenna in dBm, and N_{ST} is defined in Table 21-5.

— When the RF LO is not at the center of the transmitted PPDU BW, the power measured at the location of the RF LO using resolution BW 312.5 kHz shall not exceed the maximum of –32 dB relative to the total transmit power and –20 dBm, or equivalently $max(P - 32, -20)$, where P is the transmit power per antenna in dBm.

For an 80+80 MHz transmission where the RF LO falls outside both frequency segments, the RF LO shall follow the spectral mask requirements as defined in 21.3.17.1.

The transmit center frequency leakage is specified per antenna.

21.3.17.4.3 Transmitter constellation error

The relative constellation RMS error, calculated by first averaging over subcarriers, frequency segments, VHT PPDUs, and spatial streams (see Equation (19-89)) shall not exceed a data-rate dependent value according to Table 21-24. The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized testing instrumentation input ports. In the test, $N_{SS} = N_{STS}$ (no STBC) shall be used and no beamforming steering matrix shall be used. Each output port of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The requirements apply to 20 MHz, 40 MHz, 80 MHz, and 160 MHz contiguous transmissions as well as 80+80 MHz noncontiguous transmissions.

Table 21-24—Allowed relative constellation error versus constellation size and coding rate

Modulation	Coding rate	Relative constellation error (dB)
BPSK	1/2	–5
QPSK	1/2	–10
QPSK	3/4	–13
16-QAM	1/2	–16
16-QAM	3/4	–19

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 21-24—Allowed relative constellation error versus constellation size and coding rate

64-QAM	2/3	–22
64-QAM	3/4	–25
64-QAM	5/6	–27
256-QAM	3/4	–30
256-QAM	5/6	–32

For non-HT duplicate transmissions, requirements defined in 17.3.9.7.4 apply to each 20 MHz subchannel.

21.3.17.4.4 Transmitter modulation accuracy (EVM) test

The transmit modulation accuracy test shall be performed by instrumentation capable of converting the transmitted signals into a stream of complex samples at sampling rate greater than or equal to the bandwidth of the signal being transmitted; except that

— For non-HT duplicate transmissions, each 20 MHz subchannel may be tested independently while all subchannels are being transmitted and

— For noncontiguous transmissions, each frequency segment may be tested independently while both segments are being transmitted.

In this case, transmit modulation accuracy of each segment shall meet the required value in Table 21-24 using only the subcarriers within the corresponding segment.

The instrument shall have sufficient accuracy in terms of I/Q arm amplitude and phase balance, DC offsets, phase noise, and analog to digital quantization noise. A possible embodiment of such a setup is converting the signals to a low IF frequency with a microwave synthesizer, sampling the signal with a digital oscilloscope and decomposing it digitally into quadrature components. The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or equivalent procedure:

a) Start of PPDU shall be detected.
b) Transition from L-STF to L-LTF shall be detected and fine timing shall be established.
c) Coarse and fine frequency offsets shall be estimated.
d) Symbols in a PPDU shall be derotated according to estimated frequency offset.
e) For each VHT-LTF symbol, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, and derotate the subcarrier values according to the estimated phase.
f) Estimate the complex channel response coefficient for each of the subcarriers and each of the transmit streams.
g) For each of the data OFDM symbols: transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, derotate the subcarrier values according to the estimated phase, group the results from all of the receiver chains in each subcarrier to a vector, and multiply the vector by a zero-forcing equalization matrix generated from the estimated channel.
h) For each data-carrying subcarrier in each spatial stream, find the closest constellation point and compute the Euclidean distance from it.
i) Compute the average across PPDUs of the RMS of all Data field errors per PPDU as given by Equation (19-89).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—In the case the transmit modulation accuracy test is performed simultaneously for the two frequency segments of the 80+80 MHz transmissions, N_{ST} in Equation (19-89) represents the total number of subcarriers of both 80 MHz frequency segments.

The test shall be performed over at least 20 PPDUs [N_f as defined in Equation (19-89)]. The PPDUs under test shall be at least 16 data OFDM symbols long. Random data shall be used for the symbols.

21.3.17.5 Time of Departure accuracy

The RMS accuracy of the time of departure provided in TIME_OF_DEPARTURE shall be less than or equal to 80 ns.

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is

$20 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{20\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW20

$40 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{40\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW40

$80 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{80\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW80

$160 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{160\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW160 or CBW80+80

where

f_H is the nominal center frequency in Hz of the highest channel in the channel set

f_L is the nominal center frequency in Hz of the lowest channel in the channel set, the channel set is the set of channels upon which PPDUs providing measurements are transmitted, the channel set comprises channels uniformly spaced across $f_H - f_L \leq 50$ MHz

— FIRST_TRANSITION_FIELD is L-STF.

— SECOND_TRANSITION_FIELD is L-LTF.

— TRAINING_FIELD is L-LTF windowed in a manner which should approximate the windowing described in 17.3.2.5 with TTR = 100 ns.

— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns.

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

21.3.18 VHT receiver specification

For tests in this subclause, the input levels are measured at the antenna connector and are referenced as the average power per receive antenna. For tests in 21.3.18.1, 21.3.18.2, and 21.3.18.3, the number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized receiving STA antenna (input) ports. Except where otherwise noted, each output port of the transmitting STA shall be connected through a cable to one input port of the receiving STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

21.3.18.1 Receiver minimum input level sensitivity

The PER shall be less than 10% for a PSDU length of 4096 octets with the rate-dependent input levels listed in Table 21-25. The test in this subclause and the minimum sensitivity levels specified in Table 21-25 apply only to non-STBC modes, 800 ns GI, BCC, and VHT PPDUs.

Table 21-25—Receiver minimum input level sensitivity

Modulation	Rate (R)	Minimum sensitivity (20 MHz PPDU) (dBm)	Minimum sensitivity (40 MHz PPDU) (dBm)	Minimum sensitivity (80 MHz PPDU) (dBm)	Minimum sensitivity (160 MHz or 80+80 MHz PPDU) (dBm)
BPSK	1/2	–82	–79	–76	–73
QPSK	1/2	–79	–76	–73	–70
QPSK	3/4	–77	–74	–71	–68
16-QAM	1/2	–74	–71	–68	–65
16-QAM	3/4	–70	–67	–64	–61
64-QAM	2/3	–66	–63	–60	–57
64-QAM	3/4	–65	–62	–59	–56
64-QAM	5/6	–64	–61	–58	–55
256-QAM	3/4	–59	–56	–53	–50
256-QAM	5/6	–57	–54	–51	–48

21.3.18.2 Adjacent channel rejection

Adjacent channel rejection for W MHz channels (where W is 20, 40, 80 or 160) shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25 and raising the power of the interfering signal of W MHz bandwidth until 10% PER is caused for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding adjacent channel rejection. The center frequency of the adjacent channel shall be placed W MHz away from the center frequency of the desired signal.

Adjacent channel rejection for 80+80 MHz channels shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25. Then, an interfering signal of 80 MHz bandwidth is introduced, where the center frequency of the interfering signal is placed 80 MHz away from the center frequency of the frequency segment lower in frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let ΔP_1 be the power difference between the interfering and desired signal. Next, the interfering signal of 80 MHz bandwidth is moved to a frequency where the center frequency of the interfering signal is 80 MHz away from the center frequency of the frequency segment higher in frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let ΔP_2 be the power difference between the interfering and desired signal. The smaller value between ΔP_1 and ΔP_2 is the corresponding adjacent channel rejection.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The interfering signal in the adjacent channel shall be a signal compliant with the VHT PHY, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. The corresponding rejection shall be no less than specified in Table 21-26.

The test in this subclause and the adjacent sensitivity levels specified in Table 21-26 apply only to non-STBC modes, 800 ns GI, BCC, and VHT PPDUs.

Table 21-26—Minimum required adjacent and nonadjacent channel rejection levels

Modulation	Rate (R)	Adjacent channel rejection (dB)		Nonadjacent channel rejection (dB)	
		20/40/80/ 160 MHz Channel	80+80 MHz Channel	20/40/80/ 160 MHz Channel	80+80 MHz Channel
BPSK	1/2	16	13	32	29
QPSK	1/2	13	10	29	26
QPSK	3/4	11	8	27	24
16-QAM	1/2	8	5	24	21
16-QAM	3/4	4	1	20	17
64-QAM	2/3	0	–3	16	13
64-QAM	3/4	–1	–4	15	12
64-QAM	5/6	–2	–5	14	11
256-QAM	3/4	–7	–10	9	6
256-QAM	5/6	–9	–12	7	4

The measurement of adjacent channel rejection for 160 MHz operation in a regulatory domain is required only if such a frequency band plan is permitted in that regulatory domain.

21.3.18.3 Nonadjacent channel rejection

Nonadjacent channel rejection for W MHz channels (where W is 20, 40, 80, or 160) shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25, and raising the power of the interfering signal of W MHz bandwidth until a 10% PER occurs for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding nonadjacent channel rejection. The nonadjacent channel rejection shall be met with any nonadjacent channels located at least $2\times W$ MHz away from the center frequency of the desired signal.

Nonadjacent channel rejection for 80+80 MHz channels shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25. Then, an interfering signal of 80 MHz bandwidth is introduced, where the center frequency of the interfering signal is placed at least 160 MHz away from the center frequency of the frequency segment lower in frequency of the desired signal. The center frequency of the interfering signal shall also be at least 160 MHz away from the center frequency of the frequency segment higher in frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let ΔP_1 be the power difference between the interfering and desired signal. Next, the interfering signal of 80 MHz bandwidth is moved to a

frequency where the center frequency of the interfering signal is at least 160 MHz away from the center frequency of the frequency segment higher in frequency of the desired signal. The center frequency of the interfering signal shall also be at least 160 MHz away from the center frequency of the frequency segment lower in frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let ΔP_2 be the difference in power between the signals in the interfering channel and the desired channel. The smaller value between ΔP_1 and ΔP_2 is the corresponding nonadjacent channel rejection.

The interfering signal in the nonadjacent channel shall be a signal compliant with the VHT PHY, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. The corresponding rejection shall be no less than specified in Table 21-26.

The test in this subclause and the nonadjacent sensitivity levels specified in Table 21-26 apply only to non-STBC modes, 800 ns GI, BCC, and VHT PPDUs.

The measurement of nonadjacent channel rejection for 160 MHz operation in a regulatory domain is required only if such a frequency band plan is permitted in that regulatory domain.

21.3.18.4 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 4096 octets, for a maximum input level of –30 dBm, measured at each antenna for any baseband VHT modulation.

21.3.18.5 CCA sensitivity

21.3.18.5.1 General

The thresholds in this subclause are compared with the signal level at each receiving antenna.

21.3.18.5.2 CCA sensitivity for operating classes requiring CCA-OCSED

For the operating classes requiring CCA-Operating Class Specific Energy Detect (CCA-OCSED), the PHY shall also indicate a medium busy condition when CCA-OCSED detects a channel busy condition.

For improved spectrum sharing, CCA-OCSED is required in some bands. The behavior class indicating CCA-OCSED is given in Table D-2. The operating classes requiring the corresponding CCA-OCSED behavior class are given in E.1. The PHY of a STA that is operating within an operating class that requires CCA-OCSED shall operate with CCA-OCSED.

CCA-OCSED shall detect a channel busy condition when the received signal strength exceeds the CCA-OCSED threshold as given by dot11OFDMEDThreshold for the primary 20 MHz channel, dot11OFDMEDThreshold for the secondary 20 MHz channel (if present), dot11OFDMEDThreshold + 3 dB for the secondary 40 MHz channel (if present), and dot11OFDMEDThreshold + 6 dB for the secondary 80 MHz channel (if present). The CCA-OCSED thresholds for the operating classes requiring CCA-OCSED are subject to the criteria in D.2.5.

NOTE—The requirement to detect a channel busy condition as stated in 21.3.18.5.3 and 21.3.18.5.4 is a mandatory energy detect requirement on all Clause 21 receivers. Support for CCA-OCSED is an additional requirement that relates specifically to the sensitivities described in D.2.5.

21.3.18.5.3 CCA sensitivity for signals occupying the primary 20 MHz channel

A VHT STA with a *W* MHz operating channel width shall detect, with >90% probability, the start of a PPDU that occupies at least the primary 20 MHz channel in an otherwise idle *W* MHz operating channel

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

width, and issue a PHY-CCA.indication(BUSY, {primary}) primitive within a period of aCCATime (see 21.4.4) if one of the following conditions is met:

— The start of a non-HT PPDU as defined in 17.3.10.6.

— The start of an HT PPDU as defined in 19.3.19.6.

— The start of a non-HT duplicate or VHT PPDU for which the power measured within the primary 20 MHz channel is or above –82 dBm.

The CCA signal shall be held busy (PHY-CCA.indication(BUSY, {primary}) primitive) for the duration of the PPDU.

The receiver shall issue a PHY-CCA.indication(BUSY, {primary}) primitive for any signal that exceeds a threshold equal to 20 dB above the minimum modulation and coding rate sensitivity (–82 + 20 = –62 dBm) in the primary 20 MHz channel within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the receiver shall not issue a PHY-CCA.indication(BUSY,{secondary}), PHY-CCA.indication(BUSY,{secondary40}), PHY-CCA.indication(BUSY,{secondary80}), or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

21.3.18.5.4 CCA sensitivity for signals not occupying the primary 20 MHz channel

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary}) primitive if the conditions for issuing PHY-CCA.indication(BUSY, {primary}) primitive are not present and one of the following conditions are present in an otherwise idle 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz operating channel width:

— Any signal within the secondary 20 MHz channel at or above a threshold of –62 dBm within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY,{secondary40}), PHY-CCA.indication(BUSY,{secondary80}), or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

— A 20 MHz non-HT, HT-mixed format, HT-greenfield format or VHT PPDU detected in the secondary 20 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime (see 21.4.4).

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary40}) primitive if the conditions for issuing a PHY-CCA.indication(BUSY, {primary}) and PHY-CCA.indication(BUSY, {secondary}) primitive are not present and one of the following conditions are present in an otherwise idle 80 MHz, 160 MHz, or 80+80 MHz operating channel width:

— Any signal within the secondary 40 MHz channel at or above a threshold of –59 dBm within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY, {secondary80}) primitive or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

— A 40 MHz non-HT duplicate, HT-mixed format, HT-greenfield format or VHT PPDU detected in the secondary 40 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime (see 21.4.4).

— A 20 MHz non-HT, HT-mixed format, HT-greenfield format or VHT PPDU detected in any 20 MHz subchannel of the secondary 40 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime.

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary80}) primitive if the conditions for PHYCCA.indication(BUSY, {primary}), PHY-CCA.indication(BUSY, {secondary}), and PHY-CCA.indication(BUSY, {secondary40}) primitive are not present and one of the following conditions are present in an otherwise idle 160 MHz or 80+80 MHz operating channel width:

— Any signal within the secondary 80 MHz channel at or above –56 dBm.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— An 80 MHz non-HT duplicate or VHT PPDU detected in the secondary 80 MHz channel at or above –69 dBm with >90% probability within a period aCCAMidTime (see 21.4.4).
— A 40 MHz non-HT duplicate, HT-mixed format, HT-greenfield format or VHT PPDU detected in any 40 MHz subchannel of the secondary 80 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime.
— A 20 MHz non-HT, HT-mixed format, HT-greenfield format or VHT PPDU detected in any 20 MHz subchannel of the secondary 80 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime.

21.3.18.6 RSSI

The RSSI parameter returned in the RXVECTOR shall be calculated during the reception of the VHT-LTFs and shall be a monotonically increasing function of the received power.

21.3.18.7 Received channel power indicator (RCPI) measurement

The RCPI is a measure of the received RF power in the selected channel for a received PPDU. This parameter shall be a measurement by the PHY of the received RF power in the channel measured over the VHT-STF or VHT-LTF field of the received PPDU. The received power shall be the average of the power in all active receive chains.

RCPI shall equal the received RF power in dBm within an accuracy of ± 5 dB (95% confidence interval) within the specified dynamic range of the receiver.

21.3.19 PHY transmit procedure

There are two paths for the transmit PHY procedure:

— The first path, for which typical transmit procedures are shown in Figure 21-34, is selected if the FORMAT parameter of the PHY-TXSTART.request(TXVECTOR) primitive is VHT. These transmit procedures do not describe the operation of optional features, such as LDPC, STBC or MU.
— The second path is to follow the transmit procedure in Clause 17 if the FORMAT parameter of the PHY-TXSTART.request(TXVECTOR) primitive is NON_HT and the NON_HT_MODULATION parameter is set to NON_HT_DUP_OFDM except that the signal referred to in Clause 17 is instead generated simultaneously on each of the 20 MHz channels that are indicated by the CH_BANDWIDTH parameter as defined in 21.3.8 and 21.3.10.12.

NOTE 1—For a VHT MU PPDU the A-MPDU is per user in the MAC sublayer and the VHT-STF, VHT-LTFs, VHT-SIG-B, and Data are per user in the PHY in Figure 21-34, with the number of VHT-LTF symbols depending on the total number of space-time streams across all users.

NOTE 2—The transmit procedure for NON_HT format where NON_HT_MODULATION is OFDM is specified in 21.2.5.2. The transmit procedure for HT-mixed and HT-greenfield formats is specified in 21.2.5.3.

In both paths, in order to transmit data, the MAC generates a PHY-TXSTART.request primitive, which causes the PHY entity to enter the transmit state. Further, the PHY is set to operate at the appropriate frequency through station management via the PLME, as specified in 21.4. Other transmit parameters, such as VHT-MCS Coding types and transmit power, are set via the PHY SAP using the PHY-TXSTART.request(TXVECTOR) primitive, as described in 21.2.2. The remainder of the clause applies to the first path.

The PHY indicates the state of the primary channel and other channels (if any) via the PHY-CCA.indication primitive (see 21.3.18.5 and 8.3.5.12). Transmission of the PPDU shall be initiated by the PHY after receiving the PHY-TXSTART.request(TXVECTOR) primitive. The TXVECTOR elements for the PHY-TXSTART.request primitive are specified in Table 21-1.

NOTE—This procedure does not describe the operation of optional features, such as MU-MIMO, LDPC or STBC.

Figure 21-34—PHY transmit procedure for SU transmission

Transmission of the PHY preamble may start if TIME_OF_DEPARTURE_REQUESTED is false, and shall start immediately if TIME_OF_DEPARTURE_REQUESTED is true, based on the parameters passed in the PHY-TXSTART.request primitive.

If all of the following conditions are met:

— If dot11TODImplemented and dot11TODActivated are true or if dot11TimingMsmtActivated is true,

— The TXVECTOR parameter TIME_OF_DEPARTURE_REQUESTED is true,

then the PHY shall issue a PHY-TXSTART.confirm primitive to the MAC, forwarding the TIME_OF_DEPARTURE corresponding to the time when the first PPDU energy is sent by the transmitting port and TIME_OF_DEPARTURE_ClockRate parameter within the TXSTATUS. If dot11TimingMsmtActivated is true, then the PHY shall forward the value of TX_START_OF_FRAME_OFFSET in the TXSTATUS.

After the PHY preamble transmission is started, the PHY entity immediately initiates data scrambling and data encoding. The encoding method for the Data field is based on the FEC_CODING, CH_BANDWIDTH, NUM_STS, STBC, MCS, and NUM_USERS parameter of the TXVECTOR, as described in 21.3.2.

The SERVICE field and PSDU are encoded as described in 21.3.3. The data shall be exchanged between the MAC and the PHY through a series of PHY-DATA.request(DATA) primitives issued by the MAC, and PHY-DATA.confirm primitives issued by the PHY. Zero to seven PHY padding bits are appended to the PSDU to make the number of bits in the coded PSDU an integer multiple of the number of coded bits per OFDM symbol.

Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PSDU transmission is terminated by receiving a PHY-TXEND.request primitive. Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY. In an SU transmission, normal termination occurs after the transmission of the final bit of the last PSDU octet, according to the number of OFDM symbols indicated by N_{SYM} (see 21.4.3).

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In the PHY, the GI or short GI is inserted in every data OFDM symbol as a countermeasure against delay spread.

When the PPDU transmission is completed the PHY entity enters the receive state.

A typical state machine implementation of the transmit PHY for an SU transmission is provided in Figure 21-35. Request (.request) and confirmation (.confirm) primitives are issued once per state as shown. This state machine does not describe the operation of optional features, such as multi-user, LDPC or STBC. If the TXVECTOR parameter FORMAT is equal to NON_HT, refer to the transmit procedure and state machine in 17.3.11. If the TXVECTOR parameter FORMAT is equal to HT_MF or HT_GF, refer to the transmit procedure and state machine in 19.3.20.

21.3.20 PHY receive procedure

A typical PHY receive procedure is shown in Figure 21-36 for VHT format. A typical state machine implementation of the receive PHY is given in Figure 21-37. This receive procedure and state machine do not describe the operation of optional features, such as LDPC or STBC. If the detected format indicates a non-HT PPDU (denoted “Not VHT-SIG-A” in Figure 21-37), refer to the receive procedure and state machine in 17.3.12. If the detected format indicates an HT PPDU format (denoted “HT_SIG (HT GF preamble)” and “HT_SIG (HT MF preamble)” in Figure 21-37), refer to the receive procedure and state machine in 19.3.21. Further, through station management (via the PLME) the PHY is set to the appropriate frequency, as specified in 21.4. The PHY has also been configured with group information (i.e., group membership and position in group) so that it can receive data intended for the STA. Other receive parameters, such as RSSI and indicated DATARATE, may be accessed via the PHY SAP.

Upon receiving the transmitted PHY preamble overlapping the primary 20 MHz channel, the PHY measures a receive signal strength. The PHY indicates this activity to the MAC by issuing a PHY-CCA.indication primitive. A PHY-CCA.indication(BUSY, channel-list) primitive is also issued as an initial indication of reception of a signal as specified in 21.3.18.5. The channel-list parameter of the PHY-CCA.indication primitive is absent when the operating channel width is 20 MHz. The channel-list parameter is present and includes the entry primary when the operating channel width is 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz.

The PHY shall not issue a PHY-RXSTART.indication primitive in response to a PPDU that does not overlap the primary 20 MHz channel.

The PHY includes the most recently measured RSSI value in the PHY-RXSTART.indication(RXVECTOR) primitive issued to the MAC.

After the PHY-CCA.indication(BUSY, channel-list) primitive is issued, the PHY entity shall begin receiving the training symbols and searching for L-SIG in order to set the duration of the PPDU.

For an HE STA that determines it is receiving a VHT PPDU, the STA’s receive procedure shall resume here. Existing state, including knowledge of the L-SIG Parity and RATE checks, is retained.

If a valid L-SIG parity bit is indicated, the RATE field indicates 6 Mbps, the L-SIG field indicates at least six OFDM symbols after the L-SIG field, and the first OFDM symbol after the L-LTF field is using BPSK modulation, then the PHY entity shall issue a PHY-RXEARLYSIG.indication primitive.

If the check of the L-SIG parity bit is not valid or the RATE field is an undefined value, neither a PHY-RXEARLYSIG.indication nor a PHY-RXSTART.indication primitive is issued, and instead the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive. If a valid L-SIG parity bit is indicated, the RATE field indicates 6 Mb/s, the L-SIG field indicates at least six OFDM symbols after the L-SIG field (i.e., the L-SIG LENGTH is at least 13 octets at 6 Mb/s), the first two OFDM symbols after the L-

NOTE—This state machine does not describe the operation of optional features, such as MU-MIMO, LDPC or STBC.

Figure 21-35—PHY transmit state machine for SU transmission

LTF field are using BPSK modulation, and the third OFDM symbol after the L-LTF field is using QBPSK modulation, then the VHT PHY shall maintain PHY-CCA.indication(BUSY, channel-list) primitive for the predicted duration of the transmitted PPDU, as defined by RXTIME in Equation (21-105), for all supported modes, unsupported modes, Reserved VHT-SIG-A Indication, invalid VHT-SIG-A CRC and invalid L-SIG Length field value. The L-SIG Length field value of a VHT PPDU is invalid if it is not divisible by 3. Reserved VHT-SIG-A Indication is defined as a VHT-SIG-A with Reserved bits equal to 0 or MU[u] NSTS

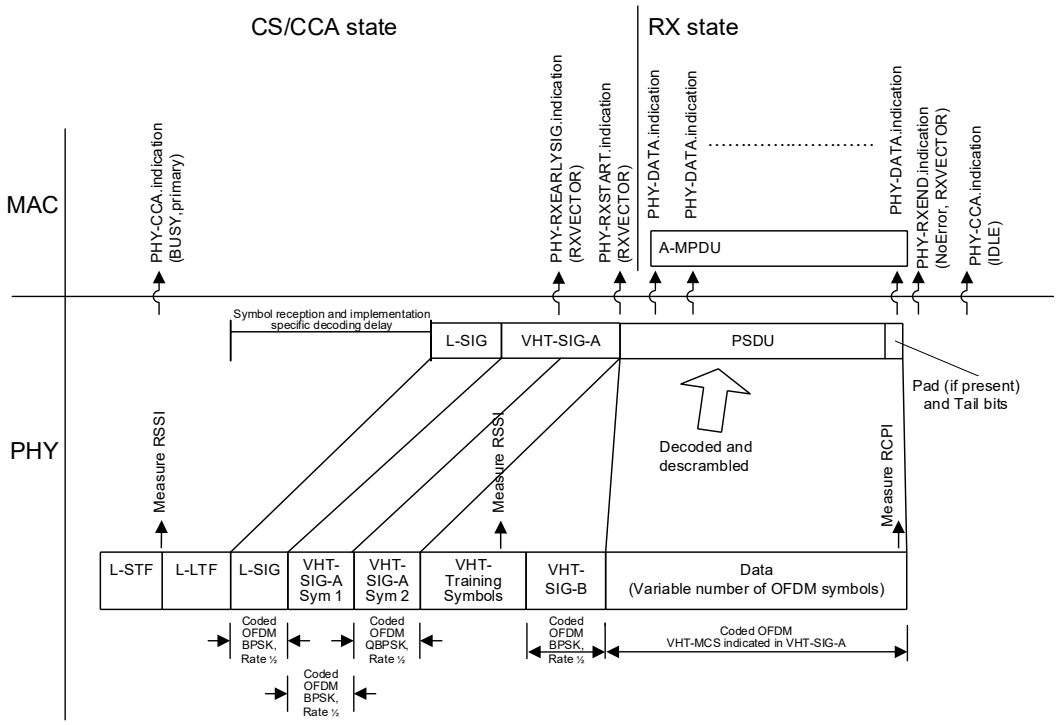
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.



NOTE—This procedure does not describe the operation of optional features, such as LDPC or STBC. This procedure describes the case where VHT-SIG-A indicates a mode not requiring decoding of VHT-SIG-B.

Figure 21-36—PHY receive procedure for SU transmission

fields (u = 0, 1, 2, 3) set to 5-7 or Short GI field set to 0 and Short GI NSYM Disambiguation field set to 1, or a combination of VHT-MCS and N_{STS} not included in 21.5 or any other VHT-SIG-A field bit combinations that do not correspond to modes of PHY operation defined in Clause 21. If the VHT-SIG-A indicates an unsupported mode, the PHY shall issue a PHY-RXEND.indication(UnsupportedRate) primitive. If the VHT-SIG-A indicates an invalid CRC or Reserved VHT-SIG-A Indication or if the L-SIG Length field is invalid, the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive.

After receiving a valid L-SIG and VHT-SIG-A indicating a supported mode, the PHY entity shall begin receiving the VHT-STF, VHT-LTFs and VHT-SIG-B. If the received group ID in VHT-SIG-A has a value indicating a VHT SU PPDU (see 10.19), the PHY entity may choose not to decode VHT-SIG-B. If VHT-SIG-B is not decoded, subsequent to an indication of a valid VHT-SIG-A CRC, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued.

Subsequently, if dot11TimingMsmtActivated is true, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued and RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 20.2.2).

NOTE—The RX_START_OF_FRAME_OFFSET value is used to estimate when the start of the preamble for the incoming PPDU was detected on the medium at the receive antenna connector.

The RXVECTOR associated with this primitive includes the parameters specified in Table 21-1.

If the Group ID field in VHT-SIG-A has a value indicating a VHT MU PPDU (see 10.19), the PHY, in a STA that is MU beamformee capable, shall decode VHT-SIG-B. If the VHT-SIG-B indicates an

unsupported mode, the PHY shall issue the error condition PHY-RXEND.indication(UnsupportedRate) primitive.

If VHT-SIG-B was decoded the PHY may check the VHT-SIG-B CRC in the SERVICE field. If the VHT-SIG-B CRC in the SERVICE field is not checked a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. The RXVECTOR associated with this primitive includes the parameters specified in Table 21-1.

The PHY optionally filters out the PPDU based on the GroupID, MU[0-3] NSTS and Partial AID fields of VHT-SIG-A and the contents of the PHYCONFIG_VECTOR as follows:

- The PHY shall not filter out the PPDU if one of the following is true:
  - ($g = 0$) and (l_{00} is true) and (*partialaid* is included in PARTIAL_AID_LIST_GID00)
  - ($g = 63$) and (l_{63} is true) and (*partialaid* is included in PARTIAL_AID_LIST_GID63)
  - ($1 \le g \le 62$) and (MembershipStatusInGroupID[g] = 1) and (n_{STS}[UserPositionInGroupID[g]] > 0)
- where
  - l_{NN} is the one of the LISTEN_TO_GID*NN* parameters of the PHYCONFIG_VECTOR
  - MembershipStatusInGroupID[g] is the Membership Status Array field of the GROUP_ID_MANAGEMENT parameter of the PHYCONFIG_VECTOR for group g
  - g is the value of the GroupID field of VHT-SIG-A
  - $n_{STS}[u]$ is the value of the MU[u] NSTS field of VHT-SIG-A
  - UserPositionInGroupID[g] is the User Position Array field of the GROUP_ID_MANAGEMENT parameter of the PHYCONFIG_VECTOR for group g
  - *partialaid* is the value of the Partial AID field of VHT-SIG-A
- Otherwise, the PHY may filter out the PPDU.

If the PPDU is filtered out, the PHY shall issue a PHY-RXEND.indication(Filtered) primitive.

Following training and signal fields, the Data field shall be received. The number of symbols in the Data field is determined by Equation (21-104).

$$N_{SYM} = \begin{cases} N'_{SYM} - 1, \text{ if Short GI = 1 and Short GI NSYM Disambiguation = 1} \\ N'_{SYM}, \text{ otherwise} \end{cases} \tag{21-104}$$

where

$$N'_{SYM} = \left\lfloor \frac{\text{RXTIME} - \left(\begin{array}{c} T_{\text{L-STF}} + T_{\text{L-LTF}} + T_{\text{L-SIG}} + T_{\text{VHT-SIG-A}} + \\ T_{\text{VHT-STF}} + N_{VHT\text{-}LTF} T_{\text{VHT-LTF}} + T_{\text{VHT-SIG-B}} \end{array} \right)}{T_{SYM}} \right\rfloor$$

$$\text{RXTIME}(\mu s) = \left\lceil \frac{\text{LENGTH} + 3}{3} \right\rceil \cdot 4 + 20 \tag{21-105}$$

where LENGTH is the LENGTH field in L-SIG.

The value of the PSDU_LENGTH parameter returned in the RXVECTOR using BCC encoding is calculated using Equation (21-106).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$\text{PSDU\_LENGTH} = \left\lfloor \frac{N_{SYM} N_{DBPS} - N_{service} - N_{tail} \cdot N_{ES}}{8} \right\rfloor \quad (21\text{-}106)$$

For a VHT SU PPDU, the SU/MU[0] Coding field of VHT-SIG-A2 indicates the type of coding. The PHY entity shall use an LDPC decoder to decode the C-PSDU if this bit is 1; otherwise, BCC decoding shall be used. For an MU transmission, the SU/MU[0] Coding, MU[1] Coding, MU[2] Coding and MU[3] Coding fields of VHT-SIG-A2 indicate the type of coding for user u with USER_POSITION[u] = 0, 1, 2, and 3, respectively. The PHY entity shall use an LDPC decoder to decode the C-PSDU for the respective user if its bit for its C-PSDU is 1. BCC decoding shall be used otherwise. When an LDPC decoder is to be used, $N_{SYM,init}$ is obtained from Equation (21-107).

$$N_{SYM,init} = \begin{cases} N_{SYM,init}, \text{ if LDPC Extra OFDM Symbol} = 0 \\ N_{SYM,init} - 1, \text{ if LDPC Extra OFDM Symbol} = 1 \text{ and STBC} = 0 \\ N_{SYM,init} - 2, \text{ if LDPC Extra OFDM Symbol} = 1 \text{ and STBC} = 1 \end{cases} \quad (21\text{-}107)$$

where

LDPC Extra OFDM Symbol and STBC are fields in VHT-SIG-A (see Table 21-12)

The value of the PSDU_LENGTH parameter returned in the RXVECTOR using LDPC encoding is calculated using Equation (21-108).

$$\text{PSDU\_LENGTH} = \left\lfloor \frac{N_{SYM,init} N_{DBPS} - N_{service}}{8} \right\rfloor \quad (21\text{-}108)$$

The value of the PSDU_LENGTH parameter returned in the RXVECTOR for an NDP is 0.

If VHT-SIG-B is decoded and the VHT-SIG-B CRC in the SERVICE field is checked and not valid, the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive. If the VHT-SIG-B field is decoded and the VHT-SIG-B CRC field is checked and valid, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. The RXVECTOR associated with this primitive includes the parameters specified in Table 21-1.

If signal loss occurs during reception prior to completion of the PSDU reception, the error condition shall be reported to the MAC using a PHY-RXEND.indication(CarrierLost) primitive. After waiting for the intended end of the PSDU as determined by Equation (21-105), the PHY shall generate a PHY-CCA.indication(IDLE) primitive and return to RX IDLE state.

The received PSDU bits are assembled into octets, decoded, and presented to the MAC using a series of PHY-DATA.indication(DATA) primitive exchanges. Any final bits that cannot be assembled into a complete octet are considered pad bits and discarded. After the reception of the final bit of the last PSDU octet, and possible padding and tail bits, the receiver shall be returned to the RX IDLE state, as shown in Figure 21-37 (PHY receive state machine). A PHY-RXEND.indication(NoError) primitive shall be issued on entry to the RX IDLE state.

21.4 VHT PLME

21.4.1 PLME SAP layer management primitives

Table 21-27 lists the MIB attributes that may be accessed by the PHY entities and the intralayer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.7.

21.4.2 PHY MIB

VHT PHY MIB attributes are defined in Annex C with specific values defined in Table 21-27. The Operational semantics column in Table 21-27 contains two types: static and dynamic.

— Static MIB attributes are fixed and cannot be modified for a given PHY implementation.

— Dynamic MIB attributes are interpreted according to the MAX-ACCESS field of the MIB attribute.

When MAX-ACCESS is read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is read-write, the MIB attribute may be read and written by management entities but shall not be updated by the PLME.

21.4.3 TXTIME and PSDU_LENGTH calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated for a VHT PPDU using Equation (21-109) for short GI and Equation (21-110) for long GI.

$$\text{TXTIME} = T_{\text{LEG\_PREAMBLE}} + T_{\text{L-SIG}} + T_{\text{VHT-SIG-A}} + T_{\text{VHT\_PREAMBLE}} + T_{\text{VHT-SIG-B}} + T_{SYML} \times \left\lceil \frac{T_{SYMS} \times N_{SYM}}{T_{SYML}} \right\rceil \quad (21\text{-}109)$$

$$\text{TXTIME} = T_{\text{LEG\_PREAMBLE}} + T_{\text{L-SIG}} + T_{\text{VHT-SIG-A}} + T_{\text{VHT\_PREAMBLE}} + T_{\text{VHT-SIG-B}} + T_{SYML} \times N_{SYM} \quad (21\text{-}110)$$

where

$T_{\text{LEG\_PREAMBLE}} = T_{\text{L-STF}} + T_{\text{L-LTF}}$

$T_{\text{VHT\_PREAMBLE}} = T_{\text{VHT-STF}} + N_{VHT\text{-}LTF} T_{\text{VHT-LTF}}$

T_{SYML}, T_{SYMS}, $T_{\text{L-SIG}}$, $T_{\text{VHT-SIG-A}}$, $T_{\text{VHT-SIG-B}}$, $T_{\text{L-STF}}$, $T_{\text{VHT-STF}}$, $T_{\text{L-LTF}}$, and $T_{\text{VHT-LTF}}$ are defined in Table 21-5

$N_{VHT\text{-}LTF}$ is defined in Table 21-13

For an NDP, there is no Data field and $N_{SYM} = 0$.

For a VHT SU PPDU using BCC encoding, the total number of data symbols in the Data field is given by Equation (21-111).

$$N_{SYM} = m_{\text{STBC}} \times \left\lceil \frac{8 \cdot \text{APEP\_LENGTH} + N_{service} + N_{tail} \cdot N_{ES}}{m_{\text{STBC}} \cdot N_{DBPS}} \right\rceil \quad (21\text{-}111)$$

where

m_{STBC} is equal to 2 when STBC is used, and 1 otherwise

For a VHT SU PPDU using LDPC encoding, the total number of data symbols in the Data field, N_{SYM}, is given in 21.3.10.5.4 (computed using Equation (19-41) in step d) of 19.3.11.7.5).

For a VHT MU PPDU, the total number of data symbols in the Data field, N_{SYM}, is given by Equation (21-67).

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for a VHT SU PPDU using BCC encoding is calculated using Equation (21-112).

$$\text{PSDU\_LENGTH} = \left\lfloor \frac{N_{SYM} N_{DBPS} - N_{service} - N_{tail} \cdot N_{ES}}{8} \right\rfloor \quad (21\text{-}112)$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for a VHT SU PPDU using LDPC encoding is calculated using Equation (21-113).

$$\text{PSDU\_LENGTH} = \left\lfloor \frac{N_{SYM,\,init} N_{DBPS} - N_{service}}{8} \right\rfloor \tag{21-113}$$

where

$N_{SYM,\,init}$ is given by Equation (21-62)

The value of the PSDU_LENGTH parameter for user u returned in the PLME-TXTIME.confirm primitive and in the RXVECTOR for a VHT MU PPDU is calculated using Equation (21-114).

$$\text{PSDU\_LENGTH}_u = \begin{cases} \left\lfloor \dfrac{N_{SYM} N_{DBPS,\,u} - N_{service} - N_{tail} \cdot N_{ES,\,u}}{8} \right\rfloor & \text{when BCC is used for user } u \\ \left\lfloor \dfrac{N_{\text{SYM\_max\_init}} N_{DBPS,\,u} - N_{service}}{8} \right\rfloor & \text{when LDPC is used for user } u \end{cases} \tag{21-114}$$

where

N_{SYM} is given by Equation (21-67)

$N_{\text{SYM\_max\_init}}$ is given by Equation (21-65)

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for an NDP is 0.

21.4.4 VHT PHY

The VHT PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, are shown in Table 19-25 unless otherwise listed in Table 21-28. The definitions for these characteristics are given in 6.7.4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 21-28—VHT PHY characteristics

Characteristics	Value
aCCAMidTime	25 μs
aPPDUMaxTime	5.484 ms
aPSDUMaxLength	4 692 478 octets (see NOTE 1)
aRxPHYStartDelay	24 μs (see NOTE 2)
aAPEPMaxLengthVHTMU20	262 140 octets (see NOTE 3)
aAPEPMaxLengthVHTMU40	524 284 octets (see NOTE 3)
aAPEPMaxLengthVHTMU80orMore	2 097 148 octets (see NOTE 3 and NOTE 4)

NOTE 1—This is the maximum length in octets for a VHT SU PPDU with a bandwidth of 160 MHz or 80+80 MHz, VHT-MCS 9, and 8 spatial streams, and limited by 1504 possible Short GI data symbols in aPPDUMaxTime. This is the maximum PSDU length a VHT PHY could support assuming no restrictions in MAC. See 10.12.2 and 9.2.4.8.1 for additional restrictions on the maximum number of octets the MAC could support.

NOTE 2—This value arises from the time to the end of when the HT_MF PPDU format is excluded, which is at the end of the first OFDM symbol after the L-SIG field (see Figure 21-4).

NOTE 3—This value is derived inversely from Equation (21-46) using corresponding VHT-SIG-B Length in Table 21-14.

NOTE 4—This value is larger than the constraint by the Maximum A-MPDU Length Exponent of 7 and the maximum A-MPDU length is limited by the Maximum A-MPDU Length Exponent (see 10.12.2 and 10.13).

21.5 Parameters for VHT-MCSs

The rate-dependent parameters for 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz $N_{SS} = 1, \ldots, 8$ are given in Table 21-29 to Table 21-60. Support for 400 ns GI is optional in all cases. Support for VHT-MCS 8 and 9 (when valid) is optional in all cases. A VHT STA shall support single spatial stream VHT-MCSs within the range VHT-MCS 0 to VHT-MCS 7 for all channel widths for which it has indicated support regardless of the Tx or Rx Highest Supported Long GI Data Rate subfield values in the Supported VHT-MCS and NSS Set field. When more than one spatial stream is supported, the Tx or Rx Highest Supported Long GI Data Rate subfield values in the Supported VHT-MCS and NSS Set field may result in a reduced VHT-MCS range (cut-off) for $N_{SS} = 2, \ldots, 8$. Support for 20 MHz, 40 MHz, and 80 MHz with $N_{SS} = 1$ is mandatory. Support for 20 MHz, 40 MHz, and 80 MHz with $N_{SS} = 2, \ldots, 8$ is optional. Support for 160 MHz and 80+80 MHz with $N_{SS} = 1, \ldots, 8$ is optional. N_{ES} values were chosen to yield an integer number of punctured blocks for each BCC encoder per OFDM symbol.

Table 21-29 to Table 21-32, Table 21-37 to Table 21-40, Table 21-45 to Table 21-48, and Table 21-53 to Table 21-56 define VHT-MCSs not only for SU transmission but also for user u of MU transmission. In the case of VHT-MCSs for MU transmission, the parameters, N_{SS}, R, N_{BPSCS}, N_{CBPS}, N_{DBPS}, and N_{ES} are replaced with $N_{SS,u}$, R_u, $N_{BPSCS,u}$, $N_{CBPS,u}$, $N_{DBPS,u}$, and $N_{ES,u}$, respectively. Note that the 400 ns GI rate values are rounded to 1 decimal place.

22. Television very high throughput (TVHT) PHY specification

22.1 Introduction

22.1.1 Introduction to the TVHT PHY

Clause 22 specifies the PHY entity for a television very high throughput (TVHT) orthogonal frequency division multiplexing (OFDM) system.

Three basic channel units (BCUs) are defined as 6 MHz, 7 MHz, or 8 MHz, depending on the regulatory domain, and denoted in the rest of this clause as a BCU or TVHT_W. Many of the terms used in this clause refer to different bands, depending on the regulatory domain. These terms include

— TVHT_2W, which represents two contiguous BCUs (12 MHz, 14 MHz, or 16 MHz)
— TVHT_W+W, which represents two noncontiguous BCU (6+6 MHz, 7+7 MHz, or 8+8 MHz)
— TVHT_4W, which represents four contiguous BCUs (24 MHz, 28 MHz, or 32 MHz)
— TVHT_2W+2W, which represents two noncontiguous frequency segments, each of which is composed of two BCUs (12+12 MHz, 14+14 MHz, or 16+16 MHz)

The TVHT PHY is based on the VHT PHY, as defined in 21.3, 21.4, and 21.5, and on Clause 17.

All TVHT transmissions in one BCU shall use the VHT PHY parameters for 40 MHz channel defined in 21.3, 21.4, and 21.5 with a sampling clock change to fit into each of the BCU bandwidths and with the number of encoders (N_{ES}) always being 1 (for SU-MIMO and per user in MU-MIMO).

Table 22-8 describes the sampling clock for each of the BCUs and the basic PHY parameters for transmission over one BCU.

For all VHT PPDUs and non-HT PPDUs in TVWS band, timing-related parameters shall be used as defined in Table 22-5 and Table 22-8; frequently used parameters shall be used as defined in Table 22-6 and Table 22-9; phase rotation parameter $\Upsilon_{k,\mathrm{BW}}$ shall be replaced by $\Upsilon_{k,\mathrm{M}}$, which is defined in Table 22-12; and cyclic shift parameters shall be used as defined in 22.3.8.3.2.

As shown in Table 22-8, the design is based on defining 144 OFDM tones in the 6 MHz and 8 MHz channel units and using up to tone 58 on each side of the DC tone for data and pilots, exactly matching the VHT 40 MHz PHY parameters. The 7 MHz channel unit is split into 168 tones to maintain the same tone spacing and PHY design as used for 6 MHz channels (note the ratio of 168 to 144 is identical to the ratio of 7 to 6). The choice of 144 and not 128 was made to reduce the PHY channel BW from 6 MHz to 5 1/3 MHz in order to allow sharper filtering to achieve 55 dB ACLR.

The TVHT PHY defines the following transmission modes that incorporate transmission on one, two, or four BCUs:

a) Mandatory transmission mode - one BCU (TVHT_MODE_1)
b) Optional transmission modes - multi-BCUs
    1) Two contiguous BCUs (TVHT_MODE_2C)
    2) Two noncontiguous BCUs (TVHT_MODE_2N)
    3) Four contiguous BCUs (TVHT_MODE_4C)
    4) Two noncontiguous frequency segments, each of which comprises two contiguous BCUs (TVHT_MODE_4N)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The tone spacing, DFT duration, and other timing parameters remain unchanged for all optional modes compared with the definition in Table 22-8.

The number of occupied tones in each BCU of any optional mode is the same as the number defined in Table 22-8.

The location of the occupied tones in each BCU of any optional mode is shown in Table 22-9.

The DATA encoding process for multi-BCUs transmission is similar to one BCU transmission and is defined in 22.3.10.

A TVHT STA shall support the following features:

— TVHT_MODE_1 (one BCU)
— Single spatial stream MCSs 0 to 7 (transmit and receive)
— BCC coding
— Normal and short guard interval (transmit and receive)

A TVHT STA may support the following features:

— TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, or TVHT_MODE_4N (two or four BCUs)
— Two or more spatial streams (transmit and receive)
— Beamforming sounding (by sending a VHT NDP)
— Respond to transmit beamforming sounding (provide compressed beamforming feedback)
— STBC (transmit and receive)
— LDPC (transmit and receive)
— VHT MU PPDUs (transmit and receive)
— MCSs 8 and 9 (transmit and receive)

22.1.2 Scope of TVHT PHY services

The services provided to the MAC by the TVHT PHY consist of a protocol function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. These STAs support a TVHT PHY.

22.1.3 TVHT PHY functions

22.1.3.1 General

See 21.1.3.1 with “TVHT” replacing “VHT”.

22.1.3.2 PHY management entity (PLME)

See 21.1.3.2.

22.1.3.3 Service specification method

See 21.1.3.3 with “TVHT” replacing “VHT”.

22.1.4 PPDU formats

The structure of the PPDU transmitted by a TVHT STA is determined by the TXVECTOR parameters as defined in 22.2.2.

The FORMAT parameter determines the overall structure of the PPDU and includes the following:

— Non-HT format (NON_HT), based on Clause 17. Support for non-HT format is mandatory.
— VHT format (VHT). Support for TVHT_W VHT format is mandatory.

22.2 TVHT PHY service interface

22.2.1 Introduction

See 21.2.1.

22.2.2 TXVECTOR and RXVECTOR parameters

The TXVECTOR and RXVECTOR parameters are defined in Table 22-1.

The TXVECTOR parameter FORMAT shall be set to NON_HT or VHT. When the TXVECTOR parameter FORMAT equals NON_HT, then NON_HT_MODULATION shall be set to NON_HT_DUP_OFDM.

When the TXVECTOR parameter FORMAT equals NON_HT, the TXVECTOR parameter L_DATARATE indicates the data rate used to transmit the PSDU in Mb/s. The allowed values are 6 Mb/s, 9 Mb/s, 12 Mb/s, 18 Mb/s, 24 Mb/s, 36 Mb/s, 48 Mb/s, and 54 Mb/s divided by 7.5 for 6 MHz and 7 MHz unit channels and by 5.625 for 8 MHz channels.

When the TXVECTOR parameter FORMAT equals VHT, the TXVECTOR parameter CH_BANDWIDTH indicates the channel width of the transmitted PPDU:

Enumerated type:

— TVHT_W for one BCU
— TVHT_2W for two contiguous BCUs
— TVHT_W+W for two noncontiguous BCUs
— TVHT_4W for four contiguous BCUs
— TVHT_2W+2W for two noncontiguous frequency segments, each of which comprises two contiguous BCUs

Note that TVHT_W represents the broadcast channel bandwidth for the regulatory domain, e.g., TVHT_W is 6 MHz, 7 MHz, or 8 MHz. TVHT_2W represents two contiguous BCUs with the same regulatory domain, e.g., TVHT_2W is 12 MHz, 14 MHz, or 16 MHz.

When the TXVECTOR parameter FORMAT equals NON_HT, the TXVECTOR parameter CH_BANDWIDTH indicates the channel width of the transmitted PPDU on transmission and the estimated channel width of the received PPDU on reception:

Enumerated type:

— TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When the TXVECTOR parameter FORMAT equals VHT, the TXVECTOR parameter NUM_STS indicates the number of space-time streams: range 1 to 4 for SU, 1 to 3 per user for MU. NUM_STS summed over all users shall be less than or equal to 4. The TXVECTOR parameter NUM_STS is not present when the TXVECTOR parameter FORMAT equals to NON_HT.

Table 22-1—TXVECTOR and RXVECTOR parameters

Parameter	Condition	Value	TXVECTOR	RXVECTOR
FORMAT		Determines the format of the PPDU. Enumerated type: NON_HT indicates non-HT duplicated PPDU format. In this case, the modulation is determined by the NON_HT_MODULATION parameter. VHT indicates VHT format.	Y	Y
NON_HT_MODULATION	FORMAT is NON_HT	In TXVECTOR, indicates the format type of the transmitted non-HT PPDU. In RXVECTOR, indicates the estimated format type of the received non-HT PPDU. Enumerated type: NON_HT_DUP_OFDM indicates non-HT duplicate format.	Y	Y
	Otherwise	Not present	N	N
L_LENGTH	FORMAT is NON_HT	Indicates the length of the PSDU in octets in the range 1 to 4095. This value is used by the PHY to determine the number of octet transfers that occur between the MAC and the PHY.	Y	Y
	FORMAT is VHT	Not present NOTE—The Length field of the L-SIG field in VHT PPDUs is defined in Equation (22-9) using the scaling factor defined in 22.3.8.2.1.	N	N
L_DATARATE	FORMAT is NON_HT	Indicates the data rate used to transmit the PSDU in Mb/s. The allowed values are 6, 9, 12, 18, 24, 36, 48, and 54 divided by 7.5 for 6 MHz and 7 MHz unit channels and by 5.625 for 8 MHz channels.	Y	Y
	FORMAT is VHT	Not present NOTE—The RATE field in the L-SIG field in a VHT PPDU is set to the value representing 6/*X* Mb/s in TVWS band “Modulation BPSK and Coding rate 1/2” row of Table 22-4.	N	N
N_TX	FORMAT is VHT	Indicates the number of transmit chains.	Y	N
	Otherwise	Not present	N	N

Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
EXPANSION_MAT_TYPE	FORMAT is VHT and EXPANSION_MAT is present.	Set to COMPRESSED_SV	Y	N
	Otherwise	See corresponding entry in Table 19-1		
EXPANSION_MAT	FORMAT is VHT	Contains a vector in the number of selected subcarriers containing feedback matrices as defined in 22.3.11.2 based on the channel measured during the training symbols of a previous VHT NDP.	M U	N
	Otherwise	See corresponding entry in Table 19-1		
CHAN_MAT_TYPE	FORMAT is VHT and PSDU_LENGTH equals zero	Set to COMPRESSED_SV NOTE—This parameter is present only for TVHT NDPs.	N	Y
	FORMAT is VHT and PSDU_LENGTH is greater than zero	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1		
CHAN_MAT	FORMAT is VHT and PSDU_LENGTH equals zero	Contains a set of compressed beamforming feedback matrices as defined in 21.3.11.2 based on the channel measured during the training symbols of the received VHT NDP.	N	Y
	FORMAT is VHT and PSDU_LENGTH is greater than zero	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1		
DELTA_SNR	FORMAT is VHT	Contains an array of delta SNR values as defined in 9.4.1.50 based on the channel measured during the training symbols of the received VHT NDP. NOTE—In the RXVECTOR this parameter is present only for VHT NDPs for MU sounding.	M U	Y
	Otherwise	Not present	N	N

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
SNR	FORMAT is VHT	Contains an array of measures of the received SNR for each spatial stream. SNR indications of 8 bits are supported. SNR shall be the sum of the decibel values of SNR per tone divided by the number of tones represented in each stream as described in 9.4.1.48.	N	Y
	Otherwise	See corresponding entry in Table 19-1		
NO_SIG_EXTN	FORMAT is VHT	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1		
FEC_CODING	FORMAT is HT	Indicates which FEC encoding is used. Enumerated type: BCC_CODING indicates binary convolutional code. LDPC_CODING indicates low-density parity check code.	M U	Y
	Otherwise	See corresponding entry in Table 19-1		
STBC	FORMAT is VHT	Indicates whether STBC is used. 0 indicates no STBC ($N_{STS}=N_{SS}$ in the Data field). 1 indicates STBC is used ($N_{STS}=2N_{SS}$ in the Data field).	Y	Y
	Otherwise	See corresponding entry in Table 19-1		
GI_TYPE	FORMAT is VHT	Indicates whether a short guard interval is used in the transmission of the Data field of the PPDU. Enumerated type: LONG_GI indicates short GI is not used in the Data field of the PPDU. SHORT_GI indicates short GI is used in the Data field of the PPDU.	Y	Y
	Otherwise	Not present	N	N
TXPWR_LEVEL_INDEX	FORMAT is VHT	The allowed values for the TXPWR_LEVEL_INDEX parameter are in the range 1 to $N/2$, where N is the number of octets in dot11TxPowerLevelExtended. This parameter is used to indicate which of the available transmit output power levels defined in dot11TxPowerLevelExtended shall be used for the current transmission.	Y	N
	Otherwise	See corresponding entry in Table 19-1

Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
RSSI	FORMAT is VHT	The allowed values for the RSSI parameter are in the range 0 to 255. This parameter is a measurement by the PHY of the power observed at the antenna connector used to receive the current PPDU measured during the reception of the TVHT-LTF field. RSSI is intended to be used in a relative manner, and it is a monotonically increasing function of the received power.	N	Y
	Otherwise	See corresponding entry in Table 19-1		
MCS	FORMAT is VHT	Indicates the modulation and coding scheme used in the transmission of the PPDU. Integer: range 0 to 9	M U	Y
	Otherwise	See corresponding entry in Table 19-1		
REC_MCS	FORMAT is VHT	Indicates the MCS that the STA's receiver recommends.	N	O
	Otherwise	Not present	N	N
CH_BANDWIDTH	FORMAT is VHT	Indicates the channel width of the transmitted PPDU: Enumerated type: TVHT_W for one BCU TVHT_2W for two contiguous BCUs TVHT_W+W for two noncontiguous BCUs TVHT_4W for four contiguous BCUs TVHT_2W+2W for two noncontiguous frequency segments, each of which comprises two contiguous BCUs	Y	Y
	FORMAT is NON_HT	In TXVECTOR, indicates the channel width of the transmitted PPDU. In RXVECTOR, indicates the estimated channel width of the received PPDU. Enumerated type: TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W if NON_HT_MODULATION equals NON_HT_DUP_OFDM	Y	Y
DYN_BANDWIDTH_IN_NON_HT	FORMAT is NON_HT	In TXVECTOR, if present, indicates whether the transmitter is capable of dynamic bandwidth operation as an RTS originator. In RXVECTOR, if valid, indicates whether the transmitter is capable of dynamic bandwidth operation as an RTS originator (see 10.3.2.9). Enumerated type: — Static if the transmitter is only capable of static bandwidth operation. — Dynamic if the transmitter is capable of dynamic bandwidth operation. NOTE—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the received MPDU.	O	Y
	Otherwise	Not present	N	N

Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
CH_BANDWIDTH_IN_NON_HT	FORMAT is NON_HT	In TXVECTOR, if present, indicates the channel width of the transmitted PPDU, which is signaled via the scrambling sequence. In RXVECTOR, if valid, indicates the channel width of the received PPDU, which is signaled via the scrambling sequence. Enumerated type: TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W. NOTE—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the received MPDU.	O	Y
	Otherwise	Not present	N	N
APEP_LENGTH	FORMAT is VHT	If equal to 0, indicates a TVHT NDP for both RXVECTOR and TXVECTOR. If greater than zero, in the TXVECTOR, indicates the number of octets in the range 1 to 1 048 575 in the A-MPDU pre-EOF padding (see 10.12.2) carried in the PSDU. If greater than zero, in the RXVECTOR, is the value obtained from the VHT-SIG-B Length field multiplied by 4.	M U	O
	Otherwise	Not present	N	N
PSDU_LENGTH	FORMAT is VHT	Indicates the number of octets in the VHT PSDU in the range 0 to 1 065 600 octets. A value of 0 indicates a VHT NDP.	N	Y
	Otherwise	Not present	N	N
USER_POSITION	FORMAT is VHT and $1 \leq$ GROUP_ID ≤ 62	Index for user in MU transmission. Integer: range 0 to 3. NOTE—The entries in the USER_POSITION array are in ascending order.	M U	O
	Otherwise	Not present	N	N
NUM_STS	FORMAT is VHT	Indicates the number of space-time streams. Integer: range 1 to 4 for SU, 1 to 3 per user in the TXVECTOR, and 0 to 4 in the RXVECTOR for MU. NUM_STS summed over all users is between 1 and 4.	M U	Y
	Otherwise	Not present	N	N
GROUP_ID	FORMAT is VHT	Indicates the group ID. Integer: range 0 to 63 (see Table 22-12) A value of 0 or 63 indicates a VHT SU PPDU. A value in the range 1 to 62 indicates a VHT MU PPDU.	Y	Y
	Otherwise	Not present	N	N

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
PARTIAL_AID	FORMAT is VHT and GROUP_ID is 0 or 63	Provides an abbreviated indication of the intended recipient(s) of the PSDU (see 10.19). Integer: range 0 to 511.	Y	Y
	Otherwise	Not present	N	N
NUM_USERS	FORMAT is VHT	Indicates the number of users with nonzero space-time streams. Integer: range 1 to 4.	Y	N
	Otherwise	Not present	N	N
BEAMFORMED	FORMAT is VHT and GROUP_ID is 0 or 63	Set to 1 if a beamforming steering matrix is applied to the waveform in an SU transmission. Set to 0 otherwise. NOTE—When BEAMFORMED is 1, smoothing is not recommended.	Y	O
	Otherwise	Not present	N	N
TXOP_PS_NOT_ALLOWED	FORMAT is VHT	Indicates whether a TVHT AP allows non-AP TVHT STAs in TXOP power save mode to enter doze state during the TXOP. 0 indicates that the TVHT AP allows non-AP TVHT STAs to enter doze state during a TXOP. 1 indicates that the TVHT AP does not allow non-AP TVHT STAs to enter doze state during a TXOP.	Y	Y
	Otherwise	Not present	N	N
TIME_OF_DEPARTURE_REQUESTED		Boolean value: true indicates that the MAC entity requests that the PHY entity measures and reports time of departure parameters corresponding to the time when the first PPDU energy is sent by the transmitting port. false indicates that the MAC entity requests that the PHY entity neither measures nor reports time of departure parameters.	O	N

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
RX_START_OF_FRAME_OFFSET	dot11TimingMsmtActivated is true	0 to 2^{32}– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble of the PPDU arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC.	N	Y
	Otherwise	Not present	N	N

NOTE 1—In the TXVECTOR and RXVECTOR columns, the following apply:
Y = Present;
N = Not present;
O = Optional;
MU indicates that the parameter is present once for a VHT SU PPDU and present per user for a VHT MU PPDU. Parameters specified to be present per user are conceptually supplied as an array of values indexed by *u*, where *u* takes values 0 to NUM_USERS – 1.

NOTE 2—On reception, where valid, the CH_BANDWIDTH_IN_NON_HT parameter is likely to be a more reliable indication of subformat and channel width than the NON_HT_MODULATION and CH_BANDWIDTH parameters, since for non-HT or non-HT duplicate PPDUs, CH_BANDWIDTH is a receiver estimate of the bandwidth, whereas CH_BANDWIDTH_IN_NON_HT is the signaled bandwidth.

22.2.3 Effects of CH_BANDWIDTH parameter on PPDU format

Table 22-2 shows the PPDU format as a function of the CH_BANDWIDTH and FORMAT parameters.

Table 22-2—PPDU format as a function of CH_BANDWIDTH parameter

FORMAT	CH_BANDWIDTH	PPDU format
VHT	TVHT_W	The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_1.
VHT	TVHT_2W	The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_2C.
VHT	TVHT_4W	The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_4C.
VHT	TVHT_W+W	The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_2N.
VHT	TVHT_2W+2W	The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_4N.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 22-2—PPDU format as a function of CH_BANDWIDTH parameter *(continued)*

FORMAT	CH_BANDWIDTH	PPDU format
NON_HT	TVHT_W	The STA transmits a non-HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using one TVHT_W channel as defined in 22.3.10.12. If the BSS bandwidth is wider than TVHT_W, then the transmission shall use the primary TVHT_W channel.
NON_HT	TVHT_2W	The STA transmits a non-HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two adjacent TVHT_W channels as defined in 22.3.10.12. If the BSS bandwidth is wider than TVHT_2W, then the transmission shall use the primary TVHT_2W channel.
NON_HT	TVHT_4W	The STA transmits a non-HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using four adjacent TVHT_W channels as defined in 22.3.10.12.
NON_HT	TVHT_W+W	The STA transmits a non-HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two nonadjacent frequency segments, with each frequency segment consisting of single TVHT_W channels as defined in 22.3.10.12.
NON_HT	TVHT_2W+2W	The STA transmits a non-HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two nonadjacent frequency segments, with each frequency segment consisting of two adjacent TVHT_W channels as defined in 22.3.10.12.

22.2.4 Support for NON_HT and HT formats

Transmission of HT PPDUs is not supported in Clause 22. Except for Non-HT duplicate transmission defined in 22.3.10.12, transmission of NON_HT is not supported in Clause 22.

Non-HT duplicate transmission is based on Clause 17, unless otherwise stated in Clause 22.

Non-HT PPDU format is shown in Figure 17-1. The PPDU encoding process is defined in 17.3.2.2 except for following modifications:

Modulation-dependent parameters for Non-HT duplicate mode in TVWS band is defined in Table 22-3. Timing related parameters are defined in Table 22-5. t_{SIGNAL} in Equation (17-2) is equal to 16 multiplied by X μs, and t_{DATA} in Equation (17-2) is equal to 20 multiplied by X μs where X is 7.5 for 6 MHz and 7 MHz unit channels and X is 5.625 for 8 MHz channels.

The timings for preamble are multiplied by X where X is 7.5 for 6 MHz and 7 MHz unit channels and X is 5.625 for 8 MHz channels.

Constructions of L-STF, L-LTF, and L-SIG are same as in 22.3.4.2, 22.3.4.3, and 22.3.4.4 except for the value field parameters in L-SIG.

Table 22-3—Modulation-dependent parameters for Non-HT duplicate mode in TVWS band

Modulation	Coding rate (R)	Coded bits per subcarrier (N_{BPSC})	Coded bits per OFDM symbol (N_{CBPS})	Data bits per OFDM symbol (N_{DBPS})	Data rate (Mb/s) (TVWS band)
BPSK	1/2	1	48	24	6/X (see NOTE)
BPSK	3/4	1	48	36	9/X (see NOTE)
QPSK	1/2	2	96	48	12/X (see NOTE)
QPSK	3/4	2	96	72	18/X (see NOTE)
16-QAM	1/2	4	192	96	24/X (see NOTE)
16-QAM	3/4	4	192	144	36/X (see NOTE)
64-QAM	2/3	6	288	192	48/X (see NOTE)
64-QAM	3/4	6	288	216	54/X (see NOTE)
NOTE—In TVWS band, X depends on regulatory domain, i.e., 7.5 for 6 MHz and 7 MHz unit channels and 5.625 for 8 MHz channels.					

Interpretation of the bits R1-R4 in the SIGNAL field is modified as in Table 22-4.

Table 22-4—RATE field in L-SIG

R1-R4	Modulation	Coding rate
1101	BPSK	1/2
1111	BPSK	3/4
0101	QPSK	1/2
0111	QPSK	3/4
1001	16-QAM	1/2
1011	16-QAM	3/4
0001	64-QAM	2/3
0011	64-QAM	3/4

Table 22-5 and Table 22-6 define the timing-related parameters for Non-HT format and location of occupied tones.

Other timing parameters are derived as in Table 17-5 using the definition of T_{FFT} in Table 22-5. Table 22-6 defines the number of occupied tones and their location in all transmission modes. Zero denotes the DC tone of any contiguous segment.

Refer to Table 21-6 for parameters definition. The definitions in the table are applicable to Clause 22 with the exception that in each transmission mode in Clause 22 $N_{CBPSSI} = N_{CBPSS}$ for SU and MU PPDUs.

Table 22-5—Timing-related constants in Non-HT PPDU

Parameter	6 MHz	7 MHz	8 MHz	Description
N_{SD}	96	96	96	Number of complex data numbers per BCU
N_{SP}	8	8	8	Number of pilot values per BCU
N_{ST}	104	104	104	Total number of subcarriers per BCU
N_{SR}	58	58	58	Highest data subcarrier index per BCU
Δ_F	$\frac{6\text{ MHz}}{144} = 41\frac{2}{3}$ kHz	$\frac{7\text{ MHz}}{168} = 41\frac{2}{3}$ kHz	$\frac{8\text{ MHz}}{144} = 55\frac{5}{9}$ kHz	Subcarrier frequency spacing
T_{DFT}	24 μs	24 μs	18 μs	IDFT/DFT period
T_{GI}	6 μs = T_{DFT} /4	6 μs = T_{DFT} /4	4.5 μs = T_{DFT} /4	Guard interval duration
T_{GIS}	3 μs = T_{DFT} /8	3 μs = T_{DFT} /8	2.25 μs = T_{DFT} /8	Short guard interval duration

Table 22-6—Tone location in Non-HT PPDU

Parameter	TVHT_MODE_1	TVHT_MODE_2C	TVHT_MODE_2N	TVHT_MODE_4C	TVHT_MODE_4N	Description
N_{ST}	104	104	104	104	104	Total number of occupied subcarriers per BCU
N_{TT}	104	208	208	416	416	Total number of occupied subcarriers across all BCUs
Subcarrier index	–58 to –33, –31 to –6, +6 to +31, and +33 to +58	–130 to –105, –103 to –78, –66 to –41, –39 to –14, +14 to +39, +41 to +66, +78 to +103, and +105 to +130	–58 to –33, –31 to –6, +6 to +31, and +33 to +58 for each BCU	–274 to –249, –247 to –222, –210 to –185, –183 to –158, –130 to –105, –103 to –78, –66 to –41, –39 to –14, +14 to +39, +41 to +66, +78 to +103, +105 to +130, +158 to +183, +185 to +210, +222 to +247, and +249 to +274	–130 to –105, –103 to –78, –66 to –41, –39 to –14, +14 to +39, +41 to +66, +78 to +103, and +105 to +130 for each BCU	Location of occupied subcarriers for 6 MHz and 8 MHz channel units

Table 22-6—Tone location in Non-HT PPDU *(continued)*

Parameter	TVHT_ MODE_1	TVHT_ MODE_2C	TVHT_ MODE_2N	TVHT_ MODE_4C	TVHT_ MODE_4N	Description
Subcarrier index	–58 to –33, –31 to –6, +6 to +31, and +33 to +58	–142 to –117, –115 to –90, –78 to –53, –51 to –26, +26 to +51, +53 to +78, +90 to +115, and +117 to +142	–58 to –33, –31 to –6, +6 to +31, and +33 to +58 for each BCU	–310 to –285, –283 to –258, –246 to –221, –219 to –194, –142 to –117, –115 to –90, –78 to –53, –51 to –26, +26 to +51, +53 to +78, +90 to +115, +117 to +142, +194 to +219, +221 to +246, +258 to +283, and +285 to +310	–142 to –117, –115 to –90, –78 to –53, –51 to –26, +26 to +51, +53 to +78, +90 to +115, and +117 to +142 for each BCU	Location of occupied subcarriers for 7 MHz

22.2.5 PHYCONFIG_VECTOR parameters

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains a BASIC_CHANNEL_UNIT parameter, which identifies the basic channel unit with possible values being 6 MHz, 7 MHz, and 8 MHz.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains an OPERATING_CHANNEL parameter, which identifies the operating or primary channel. The PHY shall set dot11CurrentPrimaryChannel to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains a CHANNEL_WIDTH parameter, which identifies the operating channel and takes one of the values TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, and TVHT_2W+2W. The PHY shall set dot11CurrentTVHTChannelWidth to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains a CENTER_FREQUENCY_SEGMENT0 parameter. The PHY shall set dot11CurrentTVHTChannelCenterFrequencyIndex0 to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains a CENTER_FREQUENCY_SEGMENT1 parameter. The PHY shall set dot11CurrentTVHTChannelCenterFrequencyIndex1 to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains a GROUP_ID_MANAGEMENT parameter, which specifies membership status and STA position for each of the group IDs as described in 9.6.22.3.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains a PARTIAL_AID_LIST_GID00 parameter, which includes the list of partial AIDs, of which the STA is an intended recipient, associated with group ID 0. The settings of the PARTIAL_AID are specified in 10.19.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains a PARTIAL_AID_LIST_GID63 parameter, which includes the list of partial AIDs, of which the STA is an intended recipient, associated with group ID 63. The settings of the PARTIAL_AID are specified in 10.19.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains a LISTEN_TO_GID00 parameter, which, when true, indicates to the PHY not to filter out PPDUs with GROUP_ID field equal to 0.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a TVHT PHY contains a LISTEN_TO_GID63 parameter, which, when true, indicates to the PHY not to filter out PPDUs with GROUP_ID field equal to 63.

Additional PHYCONFIG_VECTOR parameters are defined in Table 8-4.

22.3 TVHT PHY layer

22.3.1 Introduction

See 21.3.1.

22.3.2 VHT PPDU format in TVWS bands

A single PPDU format is defined for this PHY: the VHT PPDU format in TVWS bands. Figure 22-1 shows the VHT PPDU format in TVWS bands, with the timing parameters (8 μs and 4 μs) in Figure 21-4 replaced by numbers from Table 22-8.

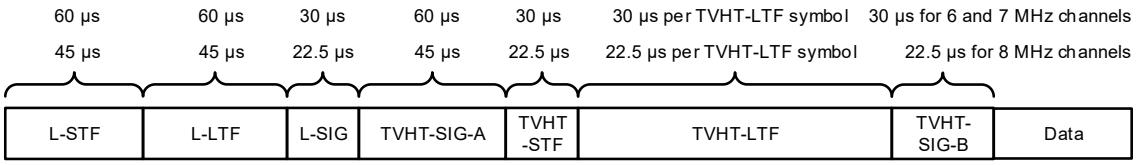

Figure 22-1—VHT PPDU format in TVWS bands

The fields of the VHT PPDU format in TVWS bands are summarized in Table 22-7.

The TVHT-SIG-A, TVHT-STF, TVHT-LTF, and TVHT-SIG-B fields exist only in VHT PPDU in TVWS bands. In a TVHT NDP, the Data field is not present. The number of symbols in the TVHT-LTF field, $N_{TVHT\text{-}LTF}$, can be 1, 2, or 4 and is determined by the total number of space-time streams across all users being transmitted in the VHT PPDU in TVWS bands (see Table 21-13).

22.3.3 Transmitter block diagram

The transmit process for the L-SIG and TVHT-SIG-A fields of a VHT PPDU using one BCU is shown in Figure 21-5, with “TVHT” replacing “VHT” and with bandwidth corrected according to TVHT bandwidth.

The transmit process for generating the TVHT-SIG-B field of a VHT SU PPDU and VHT MU PPDU using one frequency segment is shown in Figure 21-5 and Figure 21-7, respectively, with “TVHT” replacing “VHT” and with bandwidth corrected according to TVHT bandwidth.

Table 22-7—Fields of the VHT PPDU in TVWS bands

Field	Description
L-STF	Non-HT Short Training field
L-LTF	Non-HT Long Training field
L-SIG	Non-HT SIGNAL field
TVHT-SIG-A	TVHT Signal A field
TVHT-STF	TVHT Short Training field
TVHT-LTF	TVHT Long Training field
TVHT-SIG-B	TVHT Signal B field
Data	The Data field includes the PSDU

The transmit process for generating the Data field of an SU PPDU in TVHT_MODE_1, TVHT_MODE_2C, or TVHT_MODE_4C with BCC and LDPC encodings, using one BCU, is shown Figure 21-10 and Figure 21-11, respectively, with "TVHT" replacing "VHT" and with bandwidth corrected according to TVHT bandwidth. Single BCC encoder shall be assumed in Figure 21-10.

The transmit process for generating the Data field of an MU PPDU in TVHT_MODE_1, TVHT_MODE_2C, or TVHT_MODE_4C with BCC and LDPC encoding is shown in Figure 21-12, with "TVHT" replacing "VHT" and with bandwidth corrected according to TVHT bandwidth. In the case of BCC encoding, single BCC encoder shall be assumed in Figure 21-12.

Figure 22-2 and Figure 22-3 show the transmit process for generating the Data field of a TVHT_MODE_2N or TVHT_MODE_4N SU PPDU with BCC and LDPC encoding, respectively, where the subcarrier allocation block allocates the subcarriers for the two IDFTs in each transmit path by the subcarrier mapper as described in 22.3.10.11.

22.3.4 Overview of the PPDU encoding process

22.3.4.1 General

This subclause provides an overview of the VHT PPDU in TVWS bands encoding process.

22.3.4.2 Construction of L-STF

Construct the L-STF field as defined in 22.3.8.2.2 following the procedure in 21.3.4.2 reading "Clause 22" for references to "Clause 21" except the following:

c) Duplication and phase rotation: Duplicate the L-STF over the BCUs of the CH_BANDWIDTH. Apply appropriate phase rotation as defined in 22.3.7.

22.3.4.3 Construction of the L-LTF

Construct the L-LTF field as defined in L-LTF definition following the procedure in 21.3.4.3 reading "Clause 22" for references to "Clause 21" except the following:

c) Duplication and phase rotation: Duplicate the L-LTF over the BCUs of the CH_BANDWIDTH. Apply appropriate phase rotation as defined in 22.3.7.

Copyright © 2025 IEEE. All rights reserved.

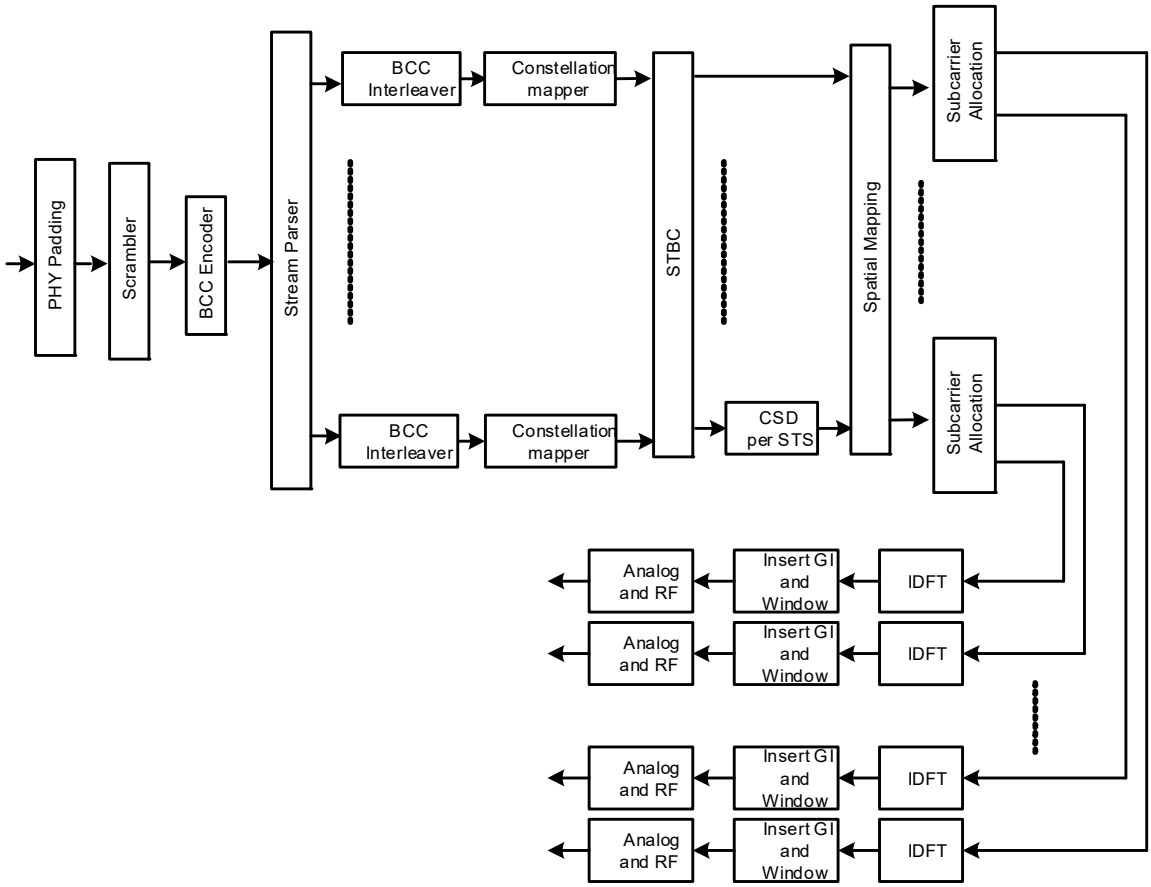

Figure 22-2—Transmitter block diagram for the Data field of a TVHT_MODE_2N or TVHT_MODE_4N SU PPDU with BCC encoding

22.3.4.4 Construction of L-SIG

Construct the L-SIG field as the SIGNAL field defined by 22.3.8.2.4 following the procedure in 21.3.4.4 reading "Clause 22" for references to "Clause 21" except the following:

a) For a VHT PPDU in TVWS bands, set the RATE subfield in the SIGNAL field R1-R4 to 1101. Set the Length, Parity, and Tail bits in the SIGNAL field as defined in 22.3.8.2.4. Add calculated one bit parity and N_{tail} bits into the L-SIG symbol.

f) Duplication and phase rotation: Duplicate the L-SIG field over the BCUs of the CH_BANDWIDTH. Apply appropriate phase rotation as defined in 22.3.7.

22.3.4.5 Construction of TVHT-SIG-A

The TVHT-SIG-A field consists of two symbols, TVHT-SIG-A1 and TVHT-SIG-A2, constructed as defined in 22.3.8.3.3 following the procedure in 21.3.4.5 reading "Clause 22" for references to "Clause 21" except the following:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

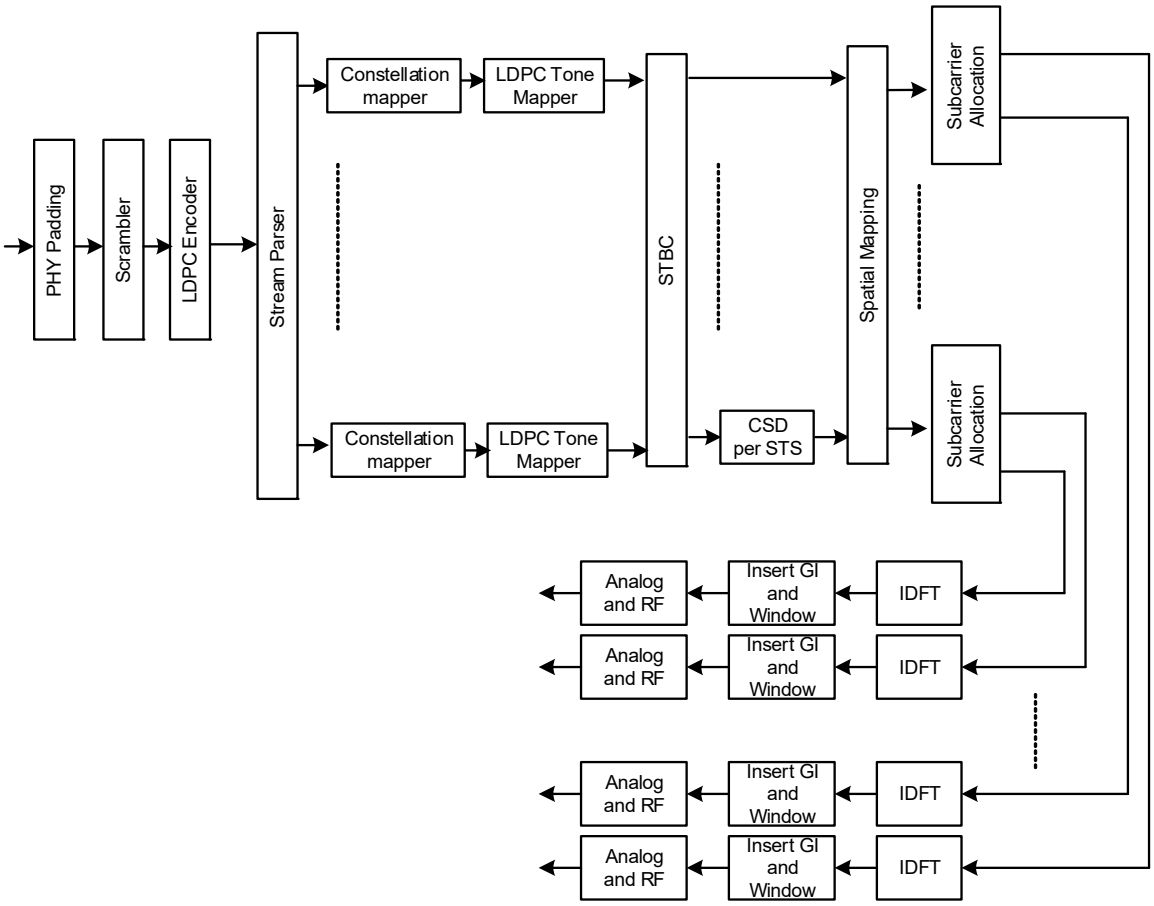

Figure 22-3—Transmitter block diagram for the Data field of a TVHT_MODE_2N or TVHT_MODE_4N SU PPDU with LDPC encoding

e) Pilot insertion: Insert pilots following the steps defined in 22.3.10.10.

f) Duplication and phase rotation: Duplicate TVHT-SIG-A1 and TVHT-SIG-A2 over of the BCUs of the CH_BANDWIDTH. Apply the appropriate phase rotation as defined in 22.3.7.

i) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7.

22.3.4.6 Construction of TVHT-STF

Construct the TVHT-STF field for each BCU as defined in 22.3.8.3.4 with channel bandwidth being 40 MHz, following the procedure in 21.3.4.6 reading “Clause 22” for references to “Clause 21” except the following:

b) Phase rotation: Apply appropriate phase rotation as defined in 22.3.7.

f) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7.

In multiple BCU transmissions TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N, the TVHT-STF subcarriers of one BCU are repeated in each BCU with an appropriate phase rotation factor being applied as described in 22.3.8.3.4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

22.3.4.7 Construction of TVHT-LTF

Construct the TVHT-LTF field for each BCU as defined in 22.3.8.3.5 with channel bandwidth being 40 MHz, following the procedure in 21.3.4.7 reading “Clause 22” for references to “Clause 21” except the following:

b) Phase rotation: Apply appropriate phase rotation as defined in 22.3.7.

g) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7.

In multiple BCU transmissions TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N, the TVHT-LTF subcarriers of one BCU are repeated in each BCU with an appropriate phase rotation factor being applied as described in 22.3.8.3.5.

22.3.4.8 Construction of TVHT-SIG-B

The TVHT-SIG-B field is constructed per-user for each BCU as defined in 21.3.4.8 with channel bandwidth being 40 MHz, reading “Clause 22” for references to “Clause 21” except the following:

i) Pilot insertion: Insert pilots following the steps defined in 22.3.10.10.

m) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7.

o) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7.

In multiple BCU transmissions TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N, the TVHT-SIG-B subcarriers of one BCU are repeated in each BCU with an appropriate phase rotation factor being applied as described in 22.3.8.3.6.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

22.3.4.9 Construction of the Data field in an SU PPDU

22.3.4.9.1 Using BCC

The construction of the Data field in a VHT SU PPDU with BCC encoding proceeds as defined in 21.3.4.9.1 reading “Clause 22” for references to “Clause 21” except the following:

d) BCC encoder: Only one encoder is used.

f) Segment parser is omitted.

i) Segment deparser is omitted.

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 22.3.8.3.2.

n) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7.

o) IDFT: When in TVHT_MODE_2N or VHT_MODE_4N, allocate the subcarriers for the two IDFTs in each transmit path as described in 22.3.10.11.

p) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as defined in 22.3.7.

22.3.4.9.2 Using LDPC

The construction of the Data field in a VHT SU PPDU with LDPC encoding proceeds as defined in 21.3.4.9.2 reading “Clause 22” for references to “Clause 21” except the following:

f) Segment parser is omitted.

i) Segment deparser is omitted.

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 22.3.8.3.2.

n) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7. When in TVHT_MODE_2N or VHT_MODE_4N, allocate the subcarriers for the two IDFTs in each transmit path as described in 21.3.10.11.1.

o) IDFT: When in TVHT_MODE_2N or VHT_MODE_4N, allocate the subcarriers for the two IDFTs in each transmit path as described in 22.3.10.11.

p) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as defined in 22.3.7.

22.3.4.10 Construction of the Data field in an MU PPDU

22.3.4.10.1 General

See 21.3.4.10.1.

22.3.4.10.2 Using BCC

A Data field with BCC encoding is constructed using the process defined in 22.3.4.9.1 before the spatial mapping block and repeated for each user that uses BCC encoding.

22.3.4.10.3 Using LDPC

A Data field with LDPC encoding is constructed using the process defined in 22.3.4.9.2 before the spatial mapping block and repeated for each user that uses LDPC encoding.

22.3.4.10.4 Combining to form an MU PPDU

The per-user data is combined as defined in 21.3.4.10.4 except the following:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

a) Spatial mapping: The Q matrix is applied as defined in 22.3.10.11. The combining of all user data is done in this block.

b) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7.

d) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as defined in 22.3.7.

e) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 22.3.7 and 22.3.8 for details.

22.3.5 Modulation and coding scheme (MCS)

The MCS is a value that determines the modulation and coding used in the Data field of the PPDU. It is a compact representation that is carried in the TVHT-SIG-A field for SU PPDUs and in the TVHT-SIG-B field for MU PPDUs. Rate-dependent parameters for the full set of MCSs are shown in Table 22-26 to Table 22-37 (in 22.5). These tables give rate-dependent parameters for MCSs with indices 0 to 9, with number of spatial streams from 1 to 4 and bandwidth options of one, two, or four BCUs. Equal modulation (EQM) is applied to all streams for a particular user.

Table 22-26 to Table 22-29 show rate-dependent parameters for MCSs for one to four streams for one BCU operation. Table 22-30 to Table 22-33 show rate-dependent parameters for MCSs for one to four streams for dual BCU operation. Table 22-34 to Table 22-37 show rate-dependent parameters for MCSs for one to four streams for quad BCU operation.

22.3.6 Timing-related parameters

Table 22-8 and Table 22-9 define the timing-related parameters for VHT format and location of occupied tones in TVWS bands.

Table 22-8—Timing-related parameters

Parameter	6 MHz	7 MHz	8 MHz	Description
N_{SD}	108	108	108	Number of complex data numbers per BCU
N_{SP}	6	6	6	Number of pilot values per BCU
N_{ST}	114	114	114	Total number of subcarriers per BCU
N_{SR}	58	58	58	Highest data subcarrier index per BCU
Δ_F	$\frac{6\text{ MHz}}{144} = 41\frac{2}{3}$ kHz	$\frac{7\text{ MHz}}{168} = 41\frac{2}{3}$ kHz	$\frac{8\text{ MHz}}{144} = 55\frac{5}{9}$ kHz	Subcarrier frequency spacing
T_{DFT}	24 μs	24 μs	18 μs	IDFT/DFT period
T_{GI}	6 μs = T_{DFT}/4	6 μs = T_{DFT}/4	4.5 μs = T_{DFT}/4	Guard interval duration

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 22-9—Tone location

Parameter	TVHT_ MODE_1	TVHT_ MODE_2C	TVHT_ MODE_2N	TVHT_ MODE_4C	TVHT_ MODE_4N	Description
N_{ST}	114	114	114	114	114	Total number of occupied subcarriers per BCU
N_{TT}	114	228	228	456	456	Total number of occupied subcarriers across all BCUs
Subcarrier index	–58 to –2 and +2 to +58	–130 to –74, –70 to –14, +14 to +70, and +74 to +130	–58 to –2 and +2 to +58 for each BCU	–274 to –218, –214 to –158, –130 to –74, –70 to –14, +14 to +70, +74 to +130, +158 to +214, and +218 to +274	–130 to –74, –70 to –14, +14 to +70, and +74 to +130 for each BCU	Location of occupied subcarriers for 6 MHz and 8 MHz channel units
Subcarrier index	–58 to –2 and +2 to +58	–142 to –86, –82 to –26, +26 to +82, and +86 to +142	–58 to –2 and +2 to +58 for each BCU	–310 to –254, –250 to –194, –142 to –86, –82 to –26, +26 to +82, +86 to +142, +194 to +250, and +254 to +310	–142 to –86, –82 to –26, +26 to +82, and +86 to +142 for each BCU	Location of occupied subcarriers for 7 MHz

The rest of the timing parameters are derived as in Table 21-5 using the definition of T_{DFT} in Table 22-8. Table 22-9 defines the number of occupied tones and their location in all transmission modes. Zero denotes the DC tone of any contiguous segment.

Refer to Table 21-6 for the frequency parameters. The definitions in the table are applicable to Clause 22 with the exception that in each transmission mode in Clause 22 $N_{CBPSSI} = N_{CBPSS}$ for SU and MU PPDUs.

22.3.7 Mathematical description of signals

For a description of the conventions used for the mathematical description of the signals, see 17.3.2.5.

For all VHT PPDU in TVWS bands transmission modes the signal is transmitted on subcarriers as defined in Table 22-9.

Let

$f_{c,\text{idx0}}$ = dot11CurrentTVHTChannelCenterFrequencyIndex0 (see Table 22-17)

$f_{c,\text{idx1}}$ = dot11CurrentTVHTChannelCenterFrequencyIndex1 (see Table 22-17)

$f_{\text{PW, idx}}$ = dot11CurrentPrimaryChannel (see Table 22-17), where TVHT_W refers to a BCU of 6 MHz, 7 MHz, or 8 MHz

$f_{\text{CH, start}}$ = Channel starting frequency given in the operation class (E.1)

When dot11CurrentTVHTChannelWidth is TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, or TVHT_2W+2W, $f_{PW,idx}$ and $f_{c,idx1}$ shall have the relationship specified in Equation (22-1).

$$f_{\text{PW, idx}} = f_{c,\text{idx0}} + n_{\text{PW}} \tag{22-1}$$

where

$$N_{PW} = \begin{cases} 1 \text{ in TVHT\_W and TVHT\_W+W} \\ 2 \text{ in TVHT\_2W and TVHT\_2W+2W} \\ 4 \text{ in TVHT\_4W} \end{cases}$$

n_{PW} is an integer with possible range $0 \le n_{\text{PW}} \le N_{PW} - 1$

When dot11CurrentTVHTChannelWidth is TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, or TVHT_2W+2W,

— The primary TVHT_W channel is the channel with TVHT_W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT\_W} \times f_{\text{PW, idx}}$, where $f_{\text{PW, idx}}$ is given in Equation (22-1).

When dot11CurrentTVHTChannelWidth is TVHT_2W, TVHT_4W, or TVHT_2W+2W,

— The secondary TVHT_W channel is the channel with TVHT_W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT\_W} \times f_{\text{SW, idx}}$, where $f_{\text{SW, idx}}$ is given in Equation (22-2).

$$f_{\text{SW, idx}} = \begin{cases} f_{\text{PW, idx}} + 1, & \text{if } n_{\text{PW}} \text{ is even} \\ f_{\text{PW, idx}} - 1, & \text{if } n_{\text{PW}} \text{ is odd} \end{cases} \tag{22-2}$$

When dot11CurrentTVHTChannelWidth is TVHT_W+W,

— The secondary TVHT_W channel is the channel with TVHT_W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT\_W} \times f_{\text{SW, idx}}$, where $f_{\text{SW, idx}}$ is given in Equation (22-3).

$$f_{\text{SW, idx}} = f_{c,\text{idx1}} \tag{22-3}$$

When dot11CurrentTVHTChannelWidth is TVHT_2W, TVHT_4W, or TVHT_2W+2W,

— The primary TVHT_2W channel is the channel with TVHT_2W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT\_W} \times f_{\text{P2W, idx}} + 0.5 \times \text{TVHT\_W}$ MHz, where $f_{\text{P2W, idx}}$ is given in Equation (22-4).

— The secondary TVHT_2W channel is the channel with TVHT_2W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT\_W} \times f_{S2W,\text{idx}} + 0.5 \times \text{TVHT\_W}$ MHz, where $f_{S2W,\text{idx}}$ is given in Equation (22-5).

$$f_{\text{P2W, idx}} = f_{c,\text{idx0}} + 2 \times n_{\text{P2W}} \quad 0 \le n_{\text{P2W}} \le N_{P2W} - 1 \quad N_{P2W} = \begin{cases} 1 \text{ in TVHT\_2W and TVHT\_2W+2W} \\ 2 \text{ in TVHT\_4W} \end{cases} \tag{22-4}$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When dot11CurrentTVHTChannelWidth is TVHT_4W,

— The secondary TVHT_2W channel is the channel with TVHT_2W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT\_W} \times f_{S2W, \text{idx}} + 0.5 \times \text{TVHT\_W}$ MHz, where $f_{S2W, \text{idx}}$ is given in Equation (22-5).

$$f_{\text{S2W, idx}} = \begin{cases} f_{\text{P2W, idx}} + 2, & \text{if } n_{\text{P2W}} \text{ is even} \\ f_{\text{P2W, idx}} - 2, & \text{if } n_{\text{P2W}} \text{ is odd} \end{cases} \quad (22\text{-}5)$$

When dot11CurrentTVHTChannelWidth is TVHT_2W+2W,

— The secondary TVHT_2W channel is the channel with TVHT_2W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT\_W} \times f_{S2W, \text{idx}} + 0.5 \times \text{TVHT\_W}$ MHz, where $f_{S2W, \text{idx}}$ is given in Equation (22-3).

The transmitted signal is defined in complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal by the relation shown in Equation (21-11) in Clause 21.

$f_c^{(i_{Seg})}$ represents the center frequency of the PPDU transmitted in frequency segment i_{Seg} in each transmission mode in Clause 22.

Note that in TVHT_MODE_2C and TVHT_MODE_4C, the gap between the center frequencies of the adjacent segments is as shown in Table 22-9.

Table 22-10 shows $f_c^{(i_{Seg})}$ as a function of dot11CurrentTVHTChannelWidth.

Table 22-10—Center frequency of a PPDU transmitted in frequency segment i_{Seg}

dot11CurrentTVHTChannelWidth	CH_BANDWIDTH	$f_c^{(i_{Seg})} = f_{\text{CH, start}} + \text{TVHT\_W} \times f_{(i_{Seg})} + Correction$	
		$(f_{(0)}, Correction)$	$(f_{(1)}, Correction)$
TVHT_W	TVHT_W	$(f_{c, \text{idx0}}, 0)$	—
TVHT_2W	TVHT_W	$(f_{\text{PW, idx}}, 0)$	—
	TVHT_2W	$(f_{c, \text{idx0}}, 0.5 \times \text{TVHT\_W})$	—
TVHT_W+W	TVHT_W	$(f_{\text{PW, idx}}, 0)$	
	TVHT_W+W	$(f_{c, \text{idx0}}, 0)$	$(f_{c, \text{idx1}}, 0)$
TVHT_4W	TVHT_W	$(f_{\text{PW, idx}}, 0)$	—
	TVHT_2W	$(f_{\text{P2W, idx}}, 0.5 \times \text{TVHT\_W})$	—
	TVHT_4W	$(f_{c, \text{idx0}}, 1.5 \times \text{TVHT\_W})$	—
TVHT_2W+2W	TVHT_W	$(f_{c, \text{idx0}}, 0)$	
	TVHT_2W	$(f_{c, \text{idx0}}, 0.5 \times \text{TVHT\_W})$	
	TVHT_2W+2W	$(f_{c, \text{idx0}}, 0.5 \times \text{TVHT\_W})$	$(f_{c, \text{idx1}}, 0.5 \times \text{TVHT\_W})$

NOTE—Transmitted signals in TVHT_MODE_2N and TVHT_MODE_4N might have different impairments such as phase offset or phase noise between the two frequency segments in TVHT_MODE_2N or TVHT_MODE_4N, which is not shown in Equation (21-11) for simplicity. See 22.3.17.3.

The transmitted RF signal is derived by upconverting the complex baseband signal, which consists of several fields. The signal transmitted on frequency segment i_{Seg} of transmit chain i_{TX} is described by Equation (21-12) in 21.3.7. The timing boundaries for the various fields are shown in Figure 21-17.

Each field is defined as the summation of one or more subfields, where each subfield is defined to be an inverse discrete Fourier transform as specified in Equation (21-13) and where references to Table 21-5, Table 21-6, Table 21-8, Table 21-9, Table 21-10, and Table 21-11 are replaced by the corresponding descriptions in Clause 22 including Table 22-8, Table 22-9, Table 22-11, and Table 22-12.

Table 22-11 summarizes the various values of $N_{\text{Field}}^{\text{Tone}}$ as a function of number of BCUs (TVHT_MODE_1 has one BCU, TVHT_MODE_2C and TVHT_MODE_2N have two BCUs, and TVHT_MODE_4C and TVHT_MODE_4N have four BCUs).

Table 22-11—Tone scaling factor and guard interval duration values for PHY fields

Field	$N_{\text{Field}}^{\text{Tone}}$ as a function of the number of BCUs			Guard interval duration
	One	Two	Four	
L-STF	24	48	96	—
L-LTF	104	208	416	T_{GI2}
L-SIG	104	208	416	T_{GI}
TVHT-SIG-A	104	208	416	T_{GI}
TVHT-STF	24	48	96	-
TVHT-LTF	114	228	456	T_{GI}
TVHT-SIG-	114	228	456	T_{GI}
VHT-Data	114	228	484	T_{GI} or T_{GIS} (see NOTE 2)
NON_HT_DUP_OFDM-Data (see NOTE 1)	104	208	416	T_{GI}

NOTE 1—For notational convenience, NON_HT_DUP_OFDM-Data is used as a label for the Data field of a non-HT PPDU with format type NON_HT_DUP_OFDM.

NOTE 2—T_{GI} denotes guard interval duration when TXVECTOR parameter GI_TYPE equals LONG_GI, T_{GIS} denotes short guard interval duration when TXVECTOR parameter GI_TYPE equals SHORT_GI.

In addition, the parameter $\Upsilon_{k,\text{BW}}$ in Equation (21-13) is replaced by $\Upsilon_{k,\text{M}}$ as defined in Table 22-12.

Table 22-12—Transmission mode and Gamma sub$_{k,M}$

Transmission mode	$\Upsilon_{k,\text{M}}$
TVHT_MODE_1, TVHT_MODE_2N	$\Upsilon_{k,1}$ per segment
TVHT_MODE_2C, TVHT_MODE_4N	$\Upsilon_{k,2}$ per two contiguous segments
TVHT_MODE_4C	$\Upsilon_{k,4}$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For TVHT_MODE_1 and TVHT_MODE_2N PPDU transmission,

$$\Upsilon_{k,1} = \begin{cases} 1, & k < 0 \\ j, & k \geq 0 \end{cases} \quad (22\text{-}6)$$

For TVHT_MODE_2C and TVHT_MODE_4N PPDU transmission,

$$\Upsilon_{k,2} = \begin{cases} 1, & k < -72 \text{ for 6 MHz and 8 MHz channels, } k < -84 \text{ for 7 MHz channels} \\ -1, & k \geq -72 \text{ for 6 MHz and 8 MHz channels, } k \geq -84 \text{ for 7 MHz channels} \end{cases} \quad (22\text{-}7)$$

For TVHT_MODE_4C PPDU transmission,

$$\Upsilon_{k,4} = \begin{cases} 1, & k < -216 \text{ for 6 MHz and 8 MHz channels, } k < -252 \text{ for 7 MHz channels} \\ -1, & -216 \leq k < 0 \text{ for 6 MHz and 8 MHz channels, } -252 \leq k < 0 \text{ for 7 MHz channels} \\ 1, & 0 \leq k < 72 \text{ for 6 MHz and 8 MHz channels, } 0 \leq k < 84 \text{ for 7 MHz channels} \\ -1, & k \geq 72 \text{ for 6 MHz and 8 MHz channels, } k \geq 84 \text{ for 7 MHz channels} \end{cases} \quad (22\text{-}8)$$

22.3.8 TVHT preamble

22.3.8.1 Introduction

A TVHT preamble is defined to carry the required information to operate in either single user or multi-user mode.

22.3.8.2 Non-TVHT portion of TVHT format preamble

22.3.8.2.1 Cyclic shift definition for pre-TVHT modulated fields

The cyclic shift value $T_{CS}^{i_{TX}}$ for the L-STF, L-LTF, L-SIG, and TVHT-SIG-A fields of the PPDU for transmit chain i_{TX} out of a total of N_{TX} is defined in Table 21-10 with a scaling factor to account for the change in sampling clock frequency. The CSD delay values shall be multiplied by the corresponding correction values for the 6 MHz, 7 MHz, and 8 MHz channels, respectively.

The scaling factor for transmissions over 6 MHz and 7 MHz channels is 7.5.

The scaling factor for transmissions over 8 MHz channels is 5.625.

As an example, the CSD value for antenna-2 with 2-transmit antennas is –200 ns, and the corresponding CSD value for 6 MHz channels is –1.5 μs.

22.3.8.2.2 L-STF definition

The L-STF field for each BCU in any transmission mode is defined by Equation (19-9) in 19.3.9.3.3.

The time domain representation of the signal on BCU i_{Seg} in transmit chain i_{TX} is specified in Equation (21-20), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 and where N_{SR} and Δ_F are defined in Table 22-8.

22.3.8.2.3 L-LTF definition

The L-LTF field for each BCU in any transmission mode is defined by Equation (19-12) in 19.3.9.3.4.

Note that these equations do not include the phase rotations as defined in Table 22-12.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The time domain representation of the signal in transmit chain i_{TX} is specified in Equation (21-23), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 and where N_{SR} is defined in Table 22-8.

22.3.8.2.4 L-SIG definition

The L-SIG field is used to communicate data rate and length information. The structure of the L-SIG field is defined in Figure 17-5.

In a VHT PPDU, the RATE field shall be set to the value corresponding to 6 Mb/s in the 20 MHz channel spacing column of Table 17-6.

In a non-HT duplicate PPDU, the RATE field is defined in 17.3.4.2 using the L_DATARATE parameter in the TXVECTOR.

The LENGTH field shall be set to the value given by Equation (22-9).

$$\text{LENGTH} = [(\text{TXTIME} - (20 \times \text{scaling factor}))/(4 \times \text{scaling factor})] \times 3 - 3 \quad (22\text{-}9)$$

where the scaling factor is defined in 22.3.8.2.1 and TXTIME is defined in 22.4.3. In a non-HT duplicate PPDU, the LENGTH field is defined in 17.3.4.3 using the L_LENGTH parameter in the TXVECTOR.

The time domain waveform of the L-SIG field in each BCU is specified in Equation (21-25) using $N_{20\mathrm{MHz}} = 2$, where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 and where the rest of the parameters are specified in 22.3.7.

22.3.8.3 TVHT portion of TVHT format preamble

22.3.8.3.1 Introduction

The TVHT portion of the VHT format preamble consists of the TVHT-SIG-A, TVHT-STF, TVHT-LTF, and TVHT-SIG-B fields.

Notational conventions are specified in 21.3.8.3.1.

22.3.8.3.2 Cyclic shift for TVHT modulated fields

The definition, application, and CSD values are defined in 21.3.8.3.2 with scaling factors as defined in 22.3.8.2.1.

22.3.8.3.3 TVHT-SIG-A definition

The TVHT-SIG-A field carries information required to interpret VHT PPDU in TVWS bands and is defined in 21.3.8.3.3.

The time domain waveform of the TVHT-SIG-A field in each BCU is specified in Equation (21-28), where $N_{20\mathrm{MHz}} = 2$ and where the rest of the parameters are specified in 22.3.7.

Fields in the TVHT-SIG-A fields are the same as in Table 21-12 except for the description B0-B1 (BW) and B10-B21 in TVHT-SIG-A1. Description of B0-B1 is specified in Table 22-13.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 22-13—B0-B1 (BW) in TVHT-SIG-A1

B0-B1	TVHT_MODE
00	Not used
10	TVHT_MODE_1
01	TVHT_MODE_2C and TVHT_MODE_2N
11	TVHT_MODE_4C and TVHT_MODE_4N

Description of B10-B21 (N_{STS}/Partial AID) is specified as follows:

For an MU PPDU:

N_{STS} is divided into 4 user positions of 3 bits each. User position p, where $0 \le p \le 3$, uses bits B(10+3p)-B(12+3p). The number of space-time streams for user u is indicated at user position p = USER_POSITION[u] where u = 0, 1, ..., NUM_USER – 1 and where the notation A[b] denotes the value of array A at index b. Zero space-time streams are indicated at positions not listed in the USER_POSITION array.

Set to 0 for 0 space-time streams
Set to 1 for 1 space-time stream
Set to 2 for 2 space-time streams
Set to 3 for 3 space-time streams
Values 4 to 7 are reserved

For an SU PPDU:

B10-B12

Set to 0 for 1 space-time stream
Set to 1 for 2 space-time streams
Set to 2 for 3 space-time streams
Set to 3 for 4 space-time streams
Values 4 to 7 are reserved

B13-B21

Partial AID: Set to the value of the TXVECTOR parameter PARTIAL_AID. Partial AID provides an abbreviated indication of the intended recipient(s) of the PSDU (see 10.19).

22.3.8.3.4 TVHT-STF definition

The TVHT-STF field for each BCU in any transmission mode is defined by Equation (21-30) in 21.3.8.3.4.

The time domain waveform of the TVHT-STF field in each BCU is specified in Equation (21-33), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 and where N_{SR} is defined in Table 22-8.

22.3.8.3.5 TVHT-LTF definition

The TVHT-LTF field is defined in 21.3.8.3.5.

The TVHT-LTF sequence transmitted for each BCU in any transmission mode is defined by Equation (21-37).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The time domain waveform of the TVHT-LTF field in each BCU is specified in Equation (21-42), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 and where N_{SR} is defined in Table 22-8.

22.3.8.3.6 TVHT-SIG-B definition

The TVHT-SIG-B field for each BCU in any transmission mode is defined in 21.3.8.3.6 for 40 MHz bandwidth.

The 27 TVHT-SIG-B bits are first repeated twice, then BCC encoded, interleaved, and made into constellations as described by Figure 21-22 and the corresponding text in 21.3.8.3.6. If the channel bandwidth of the current PPDU is TVHT_W, then the IDFT is conducted as defined in 21.3.8.3.6.

The time domain waveform for the TVHT-SIG-B field in each BCU in a VHT PPDU is the same as Equation (21-47) with channel bandwidth being 40 MHz. If the channel bandwidth of the current PPDU is larger than TVHT_W, then the TVHT-SIG-B subcarriers as described above are repeated in each BCU, with appropriate phase rotation factors $\Upsilon_{k,\mathrm{M}}$ being applied as shown in Table 22-12, before conducting IDFT.

22.3.9 Transmission of NON_HT and HT PPDUs with multiple antennas

A TVHT STA that transmits a non-HT PPDU shall apply the cyclic shifts defined in 22.3.8.2.1 for L-STF, L-LTF, and L-SIG fields of the PPDU.

22.3.10 Data field

22.3.10.1 General

See 21.3.10.1, with “TVHT” replacing “VHT”.

22.3.10.2 SERVICE field

See 21.3.10.2, with “TVHT” replacing “VHT”.

22.3.10.3 CRC calculation for TVHT-SIG-B

The CRC calculation and insertion is illustrated in Figure 21-23.

The value of the CRC field shall be the 1s complement of Equation (21-59) with the values of N set to 21 for all Modes.

22.3.10.4 Scrambler

See 21.3.10.4 with “TVHT” replacing “VHT”.

22.3.10.5 Coding

See 21.3.10.5 with “TVHT” replacing “VHT”.

22.3.10.6 Stream parser

After coding and puncturing, the data bit streams at the output of the FEC encoders are processed in groups of N_{CBPS} bits. Each of these groups is rearranged into N_{SS} blocks of N_{CBPSS} bits ($N_{SS,u}$ blocks of $N_{CBPSS,u}$ bits in the case of an MU transmission). This operation is referred to as *stream parsing* and is described in 21.3.10.6.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

22.3.10.7 Segment parser

The segment parser as described in 21.3.10.7 is not used in Clause 22. All modes of operation use a common interleaver in the case of BCC or use a common tone mapper in the case of LDPC.

22.3.10.8 BCC interleaver

The BCC interleaver and deinterleaver for one BCU (TVHT_MODE_1) is defined in 21.3.10.8 for 40 MHz.

The BCC interleaver and deinterleaver for TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N reuse the same formulas as described in 21.3.10.8 for 40 MHz with new values for N_{COL} , N_{ROW}, and N_{ROT} as defined in Table 22-14.

Table 22-14—Number of rows and columns in the interleaver

Parameter	TVHT_MODE_1	TVHT_MODE_2C, TVHT_MODE_2N	TVHT_MODE_4C, TVTH_MODE_4N
N_{COL}	18	27	48
N_{ROW}	$6 \times N_{BPSCS}$	$8 \times N_{BPSCS}$	$9 \times N_{BPSCS}$
N_{ROT} ($N_{SS} \leq 4$)	29	46	78

22.3.10.9 Constellation mapping

22.3.10.9.1 General

The mapping between bits at the output of the interleaver and complex constellation points is as described in 21.3.10.9.1.

The streams of complex numbers in frequency subblock *l* for user *u* are denoted

$d'_{k,i,n,l,u}$; $k = 0, 1, \ldots, N_{SD} - 1$; $i = 1, \ldots, N_{SS,u}$; $n = 0, 1, \ldots, N_{SYM} - 1$;
$l = 0$ for all transmission modes.

22.3.10.9.2 LDPC tone mapping

The LDPC tone mapping for one BCU (TVHT_MODE_1) is defined in 21.3.10.9.2 for 40 MHz.

The LDPC tone mapping for TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N reuses the same formulas as described in 21.3.10.9.2 for 40 MHz with values for D_{TM} as defined in Table 22-15.

Table 22-15—LDPC Tone Mapping Distance for each transmission mode

Parameter	TVHT_MODE_1	TVHT_MODE_2C, TVHT_MODE_2N	TVHT_MODE_4C, TVHT_MODE_4N
D_{TM}	6	8	9

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For all Clause 22 transmission Modes, the LDPC tone mapping for LDPC-coded streams corresponding to user u is done by permuting the stream of complex numbers

$$d''_{k,i,n,l,u};\quad k = 0, 1, \ldots, N_{SD}-1;\quad i = 1, \ldots, N_{SS,u};\quad n = 0, 1, \ldots, N_{SYM}-1;$$
$$l = 0 \text{ for all transmission modes.}$$

generated by the constellation mappers, to obtain

$$d''_{t(k),i,n,l,u};\quad k = 0, 1, \ldots, N_{SD}-1;\quad i = 1, \ldots, N_{SS,u};\quad n = 0, 1, \ldots, N_{SYM}-1;$$
$$l = 0 \text{ for all transmission modes.}$$

where

$$t(k) = D_{TM}\left(k \bmod \frac{N_{SD}}{D_{TM}}\right) + \left\lfloor \frac{k \times D_{TM}}{N_{SD}} \right\rfloor \quad \text{for all transmission modes}$$

22.3.10.9.3 Segment deparser

The segment deparser is not used in Clause 22 as no segment parser is used in Clause 22.

22.3.10.9.4 Space-time block coding

See 21.3.10.9.4 with “TVHT” replacing “VHT”.

22.3.10.10 Pilot subcarriers

For TVHT_MODE_1 transmission, six pilot tones shall be inserted in subcarriers –53, –25, –11, 11, 25, and 53. The pilots are generated as described in 21.3.10.10 for 40 MHz transmission.

When multiple BCUs are used (TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N), each BCU shall use the same pilot tones, which are generated as described in 21.3.10.10 for 40 MHz transmission.

22.3.10.11 OFDM modulation transmission in VHT format

For TVHT transmissions, the signal from transmit chain i_{TX}, $1 \le i_{TX} \le N_{TX}$ shall be as specified in Equation (21-95), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 and where N_{SR} and Δ_F are defined in Table 22-8.

For TVHT_MODE_1 transmission, parameters shall be selected to be the same with 40 MHz VHT transmission as defined in 21.3.10.11.1.

For multi-segment transmissions TVHT_MODE_2C and TVHT_MODE_4C, each frequency segment shall follow the waveform as described in Equation (21-95), and the data and pilot subcarriers are allocated to the IDFT block according to the subcarrier mapping as specified in Table 22-9 in consecutive order from the lowest subcarrier to the highest subcarrier.

For multi-segment transmissions TVHT_MODE_2N and TVHT_MODE_4N, each frequency segment shall follow the waveform as described in Equation (21-95), and the data and pilot subcarriers are allocated by the subcarrier allocation block, as shown in Figure 22-2, to the two IDFT blocks according to the subcarrier mapping as specified in Equation (21-95) and Table 22-9 in consecutive order from the lowest subcarrier to the highest subcarrier in each of the two frequency segments, the lower half of the subcarriers are mapped to the IDFT corresponding to the lower frequency segment, and the upper half of the subcarriers are mapped to the IDFT corresponding to the upper frequency segment.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

22.3.10.12 Non-HT duplicate transmission

When the TXVECTOR parameter FORMAT is NON_HT and the TXVECTOR parameter NON_HT_MODULATION is NON_HT_DUP_OFDM, the transmitted PPDU shall be a non-HT duplicate. Multiple BCUs non-HT duplicate transmission is used to transmit to TVHT STAs that may be present in a part of a channel.

For non-HT duplicate transmission, the Data field shall be as defined in 21.3.10.12, with "TVHT" replacing "VHT" and with references to "Clause 22" replacing references to "Clause 21", using the parameter values defined in Table 22-16. The Data field shall be as defined by Equation (21-100) with following modifications. $N_{20\text{MHz}}$ is defined in Table 22-16. $K_{\text{Shift}}(i)$ in Equation (21-100) is replaced by $K_{\text{Shift}}(i) = (N_{20\text{MHz}} - 1 - 2i) \times 32 + 8 \cdot \lfloor N_{20\text{MHz}}/4 \rfloor + 8 \times \lfloor N_{20\text{MHz}}/8 \rfloor - (16 \times \lfloor i/2 \rfloor)$.

$T_{\text{CS}}^{i_{TX}}$ represents the cyclic shift of the transmit chain i_{TX} and is defined in 22.3.8.2.1. $N_{\text{NON\_HT\_DUP\_OFDM-Data}}^{\text{Tone}}$ is defined in Table 22-16.

Table 22-16—Parameters for Non-HT duplicate transmissions

Parameter	TVHT_MODE_1	TVHT_MODE_2C	TVHT_MODE_2N	TVHT_MODE_4C	TVHT_MODE_4N
$N_{20\text{MHz}}$	2	4	2	8	4
$N_{\text{NON\_HT\_DUP\_OFDM-Data}}^{\text{Tone}}$	104	208	104	416	208

In addition, the parameter $\Upsilon_{k,BW}$ is replaced by $\Upsilon_{k,M}$ as defined in Table 22-12. For a noncontiguous TVHT_W+W or TVHT_2W+2W non-HT duplicate transmission, data transmission in each frequency segment shall be as defined for a TVHT_W or TVHT_2W non-HT duplicate transmission, respectively.

22.3.11 SU-MIMO and MU-MIMO Beamforming

22.3.11.1 General

SU-MIMO and DL MU-MIMO beamforming in TVWS band is used as defined in 21.3.11.1 reading "Clause 22" for references to "Clause 21" except for feedback report format described in 9.4.1.48.

22.3.11.2 Beamforming Feedback Matrix V

Beamforming Feedback Matrix V is constructed as defined in 21.3.11.2 reading "Clause 22" for reference to "Clause 21" except for CSD values defined in 22.3.8.3.2.

22.3.11.3 Group ID

See 21.3.11.4 with "TVHT" replacing "VHT".

22.3.12 TVHT preamble format for sounding PPDUs

The format of a VHT NDP in TVWS bands is constructed as defined Figure 22-1.

NOTE—The number of TVHT-LTF symbols in the NDP is determined by the SU N_{STS} field in TVHT-SIG-A.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The TVHT NDP has the following properties:

— Uses the TVHT PPDU format but without the Data field.
— Is a TVHT SU PPDU as indicated by the TVHT-SIG-A field.
— Has the data bits of the TVHT-SIG-B field set to a fixed bit pattern (see 22.3.8.3.6).

22.3.13 Regulatory requirements

See 21.3.13.

22.3.14 Channelization

A TVHT channel is specified by the four PLME MIB fields specified in Table 22-17.

Table 22-17—Fields to specify TVHT channels

Field	Meaning
dot11CurrentTVHTChannelWidth	Channel width. Possible values represent TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W.
dot11CurrentTVHTChannelCenterFrequencyIndex0	In TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C operation denotes the center frequency of the lowest TV channel. In TVHT_MODE_2N and TVHT_MODE_4N operation, denotes the center frequency of the lowest TV channel in the frequency segment that contains the primary channel. Valid range is 1 to 200. See Equation (22-10).
dot11CurrentTVHTChannelCenterFrequencyIndex1	In TVHT_MODE_2N and TVHT_MODE_4N operation, denotes the center frequency of the lowest TV channel in the frequency segment that does not contain the primary channel. Valid range is 1 to 200. See Equation (22-10). Undefined for TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C operation.
dot11CurrentPrimaryChannel	Denotes the location of the primary TVHT_W channel. Valid range is 1 to 200. See Equation (22-11).

Given dot11CurrentTVHTChannelCenterFrequencyIndex0 and dot11CurrentTVHTChannelCenterFrequencyIndex1, the respective channel center frequency is given by Equation (22-10).

$$\text{Channel center frequency [MHz]} = \text{Channel starting frequency} + \text{TVHT\_W} \times \text{dot11CurrentChannelCenterFrequencyIndex} + \text{ChannelCenterFrequencyCorrection} \quad (22\text{-}10)$$

where
Channel starting frequency is given by the Operating Class (E.1)
dot11CurrentTVHTChannelCenterFrequencyIndex is either
dot11CurrentTVHTChannelCenterFrequencyIndex0 or
dot11CurrentTVHTChannelCenterFrequencyIndex1 and
ChannelCenterFrequencyCorrection is
0 for TVHT_MODE_1 and TVHT_MODE_2N
0.5 × TVHT_W for TVHT_MODE_2C and TVHT+MODE_4N
1.5 × TVHT_W for TVHT_MODE_4C.

NOTE—Channel starting frequency is the frequency that results in the regulatory domain's channel number being the RLAN channel number, i.e., the center frequency of the channel for index 0. For example, the center frequency of United States and its territories TV channel 2 is 57 MHz. The center frequency of United States and its territories TV channel 2 is obtained by Equation (22-10) as follows:

Channel center frequency [MHz] = Channel starting frequency + TVHT_W × dot11CurrentTVHTChannelCenterFrequencyIndex + ChannelCenterFrequencyCorrection = (0.045 × 1000) + 6 × 2 + 0 = 57 MHz.

The center frequency of the primary TVHT_W channel is given by Equation (22-11).

$$\text{Primary channel center frequency [MHz]} = \text{Channel starting frequency} + \text{TVHT\_W} \times \text{dot11CurrentPrimaryChannel} \quad (22\text{-}11)$$

where

Channel starting frequency is given by the Operating Class (see E.1)

For TVHT_MODE_2N operation, any two nonidentical channels may be used.

For TVHT_MODE_4N operation, any two channels that would each be allowed as TVHT_2W channels and whose center frequencies are separated by greater than TVHT_2W (difference between dot11CurrentTVHTChannelCenterFrequencyIndex0 and dot11CurrentTVHTChannelCenterFrequencyIndex1 corresponds to a frequency difference greater than 2) may be used.

For example, in the United States and its territories, a channel specified by

dot11CurrentTVHTChannelWidth = TVHT_2W (12 MHz)
dot11CurrentTVHTChannelCenterFrequencyIndex0 = 15
dot11CurrentPrimaryChannel = 16

is a 12 MHz channel with a center frequency of 482 MHz and the primary 6 MHz channel centered at 485 MHz.

A channel specified by

dot11CurrentTVHTChannelWidth = TVHT_4W (24 MHz)
dot11CurrentTVHTChannelCenterFrequencyIndex0 = 14
dot11CurrentPrimaryChannel = 17

is a 24 MHz channel with a center frequency of 482 MHz and the primary 6 MHz channel centered at 491 MHz.

A channel specified by

dot11CurrentTVHTChannelWidth = TVHT_2W+2W (12+12 MHz)
dot11CurrentTVHTChannelCenterFrequencyIndex0 =15
dot11CurrentTVHTChannelCenterFrequencyIndex1 = 40
dot11CurrentPrimaryChannel = 16

is an 12+12 MHz channel in which frequency segment 0 has 12 MHz bandwidth and center frequency of 482 MHz. Frequency segment 1 also has 12 MHz bandwidth and center frequency of 632 MHz. The primary 6 MHz channel is centered at 485 MHz.

22.3.15 Slot time

The slot time for the TVHT PHY shall be 24 μs for 6 MHz and 7 MHz channel units and 20 μs for 8 MHz channel units.

22.3.16 Transmit and receive port impedance

The impedance of exposed transmit and receive antenna connectors are defined in 17.3.8.7.

22.3.17 TVHT transmit specification

22.3.17.1 Transmit spectrum mask

The overall transmit spectral mask is constructed using two components. First, an interim spectral mask is constructed whose mask level is determined relative to the maximum spectral density of the signal. Second, an absolute transmit spectral limit is computed based on the mask bandwidth. The overall transmit spectral mask is then constructed by taking the higher of the interim transmit spectral mask and the absolute transmit spectral limit at each frequency offset.

For transmission in TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C, the transmit spectral mask shall be as described for 40 MHz mask PPDU in 21.3.17.1 with the frequency axis multiplied by the frequency scaling factor as defined in Table 22-18.

Table 22-18—Spectral mask frequency scaling factor for contiguous transmission

Mode	Scaling for 6 MHz channels	Scaling for 7 MHz channels	Scaling for 8 MHz channels
TVHT_MODE_1	6 / 40	7 / 40	8 / 40
TVHT_MODE_2C	12 / 40	14 / 40	16 / 40
TVHT_MODE_4C	24 / 40	28 / 40	32 / 40

For transmission in mode TVHT_MODE_4N, the transmit spectral mask shall be as described for 80+80 MHz mask PPDU in 21.3.17.1 with the frequency axis multiplied by the frequency scaling factor as defined in Table 22-19.

Table 22-19—Spectral mask frequency scaling factor for TVHT_MODE_4N

Mode	Scaling for 6 MHz channels	Scaling for 7 MHz channels	Scaling for 8 MHz channels
TVHT_MODE_4N	12 / 80	14 / 80	16 / 80

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements (measured as defined in the relevant regulation) and the mask defined in this subclause.

NOTE 2—For rules regarding TX center frequency leakage levels, see 22.3.17.4.2.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For a TVHT_W+W mask PPDU of VHT or non-HT duplicate format, the overall transmit spectral mask is constructed in the following manner. First, the 40 MHz interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 38 MHz, –20 dBr at 21 MHz frequency offset, –28 dBr at 40 MHz frequency offset, and –40 dBr at 60 MHz frequency offset and above. The 40 MHz interim transmit spectral mask for frequency offsets in between 19 MHz and 21 MHz, 21 MHz and 40 MHz, and 40 MHz and 60 MHz shall be linearly interpolated in dB domain from the requirements for 19 MHz, 21 MHz, 40 MHz, and 60 MHz frequency offsets. Then the 40 MHz interim spectral mask frequency points are scaled as defined in Table 22-20 to produce a TVHT_W interim spectral mask. Then, the TVHT_W interim spectral mask is placed on each of the two segments to produce the TVHT_W+W interim spectral mask. Then, for each frequency at which both of the TVHT_W interim spectral masks have values greater than –40 dBr and less than –20 dBr, the sum of the two TVHT_W interim mask values (summed in linear domain) shall be taken as the overall TVHT_W+W interim spectral mask value. Next, for each frequency at which neither of the two TVHT_W interim masks has values greater than or equal to –20 dBr and less than or equal to 0 dBr, the higher value of the two interim masks shall be taken as the overall TVHT_W+W interim mask spectral value. Finally, for any frequency region where the TVHT_W+W interim mask value has not been defined yet, linear interpolation (in dB domain) between the nearest two frequency points with the TVHT_W+W interim spectral mask value defined shall be used to define the TVHT_W+W interim spectral mask value. The transmit spectrum shall not exceed the maximum of the TVHT_W+W interim transmit spectrum mask and –59 dBm/MHz at any frequency offset.

Table 22-20—Spectral mask frequency scaling factor for TVHT_MODE_2N

Mode	Scaling for 6 MHz channels	Scaling for 7 MHz channels	Scaling for 8 MHz channels
TVHT_MODE_2N	6 / 40	7 / 40	8 / 40

Example transmit spectral mask for a TVHT_W+W mask PPDU for BCU of 6 MHz and spacing of 12 MHz is shown in Figure 22-4.

22.3.17.2 Spectral flatness

Spectral flatness measurements shall be conducted using BPSK modulated PPDUs. See 22.3.17.4.4 for the demodulation procedure of the PPDUs as well as the number of PPDUs and OFDM symbols to be used for testing.

Let $E_{i,avg}$ denote the average constellation energy of a BPSK modulated subcarrier i in a TVHT data symbol.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

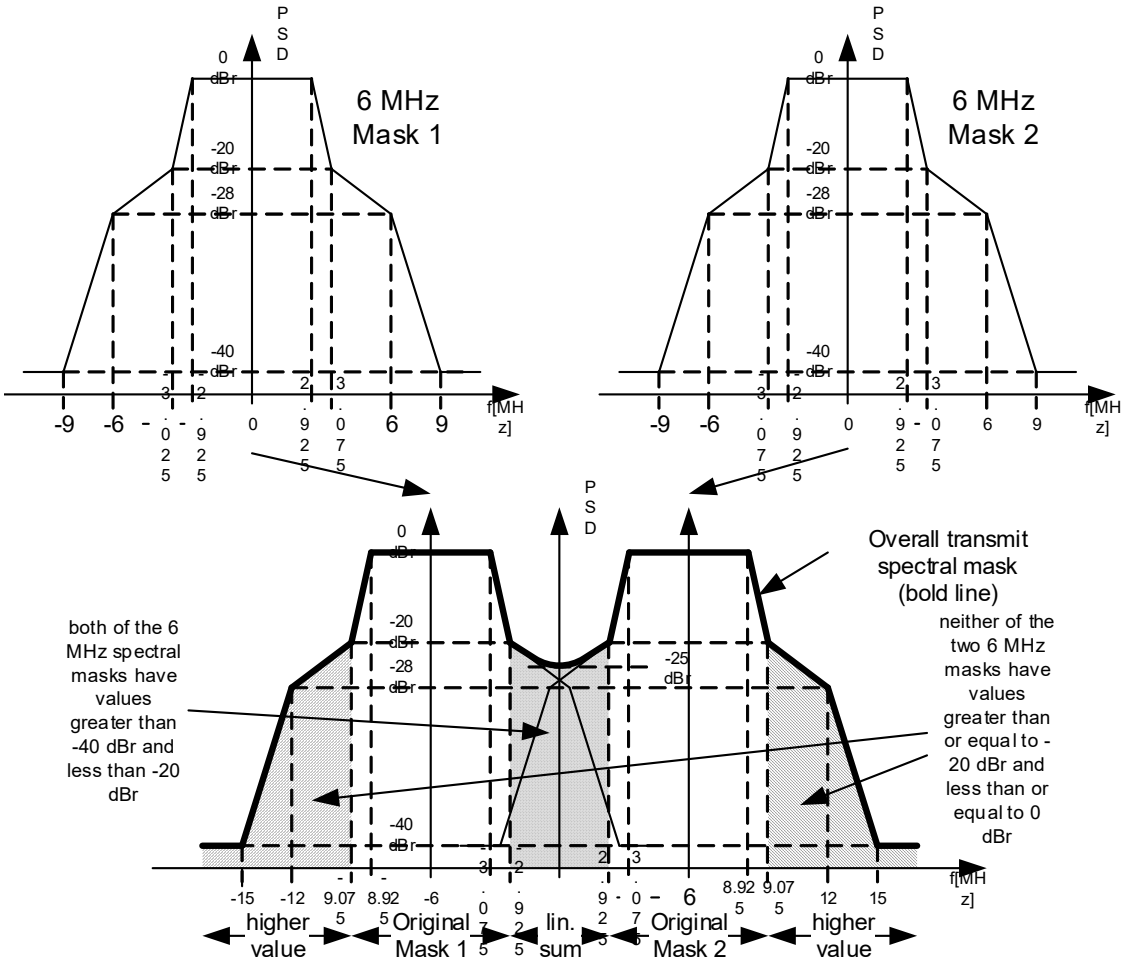

Figure 22-4—Example transmit spectral mask for an 6+6 MHz mask PPDU

For TVHT_MODE_1 contiguous non-HT duplicate or TVHT transmission having a bandwidth listed in Table 22-21, $E_{i,avg}$ of each of the subcarriers with indices listed as tested subcarrier indices shall not deviate by more than the specified maximum deviation in Table 22-21 from the average of $E_{i,avg}$ over subcarrier indices listed as averaging subcarrier indices. Averaging of $E_{i,avg}$ is done in the linear domain.

Table 22-21—Maximum transmit spectral flatness deviations

Format	Bandwidth of transmission (MHz)	Averaging subcarrier indices	Tested subcarrier indices	Maximum deviation (dB)
VHT	TVHT_W	–42 to –2 and +2 to +42	–42 to –2 and +2 to +42	± 4
			–58 to –43 and +43 to +58	+4/–6
non-HT duplicate	TVHT_W	–42 to –33, –31 to –6, +6 to +31, and +33 to +42	–42 to –33, –31 to –6, +6 to +31, and +33 to +42	± 4
			–43 to –58 and +43 to +58	+4/–6

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For transmissions consisting of multiple contiguous or noncontiguous BCUs, each BCU shall meet the spectral flatness requirement for TVHT_MODE_1 transmission.

For the spectral flatness test, the transmitting STA shall be configured to use a spatial mapping matrix Q_k (see 22.3.10.11) with flat frequency response. Each output port under test of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation.

22.3.17.3 Transmit center frequency and symbol clock frequency tolerance

The transmitter center frequency tolerance shall be ± 25 ppm. Carrier (LO) and symbol clock frequencies for the all transmit chains and BCUs shall be derived from the same reference oscillator.

NOTE—For multichannel operation, the signal phase of each BCU might be uncorrelated.

The symbol clock frequency tolerance shall be ± 25 ppm. The transmit center frequency and the symbol clock frequency for all transmit antennas and contiguous BCUs shall be derived from the same reference oscillator.

22.3.17.4 Modulation accuracy

22.3.17.4.1 Introduction to modulation accuracy tests

Transmit modulation accuracy specifications are defined in 22.3.17.4.2 and 22.3.17.4.3. The test method is described in 21.3.17.4.4.

22.3.17.4.2 Transmit center frequency leakage

For transmissions using all formats except noncontiguous where the RF LO falls outside both BCUs, TX LO leakage shall meet the following requirements:

— When the RF LO is in the center of the transmitted PPDU BW, the power measured at the center of transmission BW using resolution BW (6/144 or 8/144) MHz shall not exceed the average power per subcarrier of the transmitted PPDU, or equivalently $(P - 10\log 10(N_{ST}))$, where P is the transmit power per antenna in dBm and N_{ST} is defined in Table 22-8.

— When the RF LO is not at the center of the transmitted PPDU BW, the power measured at the location of the RF LO using resolution BW (6/144 or 8/144) MHz shall not exceed the maximum of –32 dB relative to the total transmit power and –20 dBm, or equivalently $max(P - 32, -20)$, where P is the transmit power per antenna in dBm.

For transmissions using TVHT_MODE_2N and TVHT_MODE_4N, where the RF LO falls outside both BCUs, the RF LO shall follow the spectral mask requirements as defined in 22.3.17.1.

22.3.17.4.3 Transmitter constellation error

For all modes defined in TVHT PHY, the requirements for transmit constellation RMS error are same as defined in 21.3.17.4.3.

For non-HT duplicate transmissions, requirements defined in 17.3.9.7.4 apply to all parts of the channel bandwidth. The channel bandwidth is determined by the TXVECTOR parameter CH_BANDWIDTH.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

22.3.17.4.4 Transmitter modulation accuracy (EVM) test

For the transmit modulation accuracy test, the same methodology as that defined in 21.3.17.4.4 shall be applied per BCU (termed frequency segment in Clause 21). The channel bandwidth is determined by the TXVECTOR parameter CH_BANDWIDTH.

22.3.17.5 Time of Departure accuracy

For Time of Departure accuracy test, the test parameters defined in 21.3.17.5 shall be used for evaluation of TOD except the channel bandwidth, TTR and TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH. The channel bandwidth is determined by TXVECTOR parameter CH_BANDWIDTH in 22.2.2. TTR and TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH shall be multiplied by the corresponding scaling factor for the 6 MHz, 7 MHz, and 8 MHz channels, where the scaling factor is defined in 22.3.8.2.1.

22.3.18 TVHT receiver specification

22.3.18.1 General

See 21.3.18.

22.3.18.2 Receiver minimum input level sensitivity

The PER shall be less than 10% for a PSDU length of 4096 octets with the rate-dependent input levels listed in Table 22-22. The test in this subclause and the minimum sensitivity levels specified in Table 22-22 apply only to non-STBC modes, long GI, BCC, and VHT PPDU in TVWS bands.

Table 22-22—Receiver minimum input level sensitivity

Modulation	Rate (R)	Minimum sensitivity (dBm)					
		6 or 7 MHz (TVHT_MODE_1)	12/14 MHz (TVHT_MODE_2C) or 6+6/7+7 MHz (TVHT_MODE_2N)	24/28 MHz (TVHT_MODE_4C or 12+12/14+14 MHz (TVHT_MODE_4N)	8 MHz (TVHT_MODE_1)	16 MHz (TVHT_MODE_2C) or 8+8 MHz (TVHT_MODE_2N)	32 MHz (TVHT_MODE_4C) or 16+16/16+16 MHz (TVHT_MODE_4N)
BPSK	1/2	–88	–85	–82	–87	–84	–81
QPSK	1/2	–85	–82	–79	–84	–81	–78
QPSK	3/4	–83	–80	–77	–82	–79	–76
16-QAM	1/2	–80	–77	–74	–79	–76	–73
16-QAM	3/4	–76	–73	–70	–75	–72	–69
64-QAM	2/3	–72	–69	–66	–71	–68	–65
64-QAM	3/4	–71	–68	–65	–70	–67	–64
64-QAM	5/6	–70	–67	–64	–69	–66	–63
256-QAM	3/4	–65	–62	–59	–64	–61	–58

22.3.18.3 Adjacent channel rejection

Adjacent channel rejection for TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C follow the definition in the first paragraph of 21.3.18.2 and use the values in Table 22-23.

Adjacent channel rejection for TVHT_MODE_2N (TVHT_W+W) and TVHT_MODE_4N (TVWT_2W+2W) follows the definition in the second paragraph of 21.3.18.2, where “80 MHz” is replaced by “TVHT_W” for TVHT_MODE_2N and “TVHT_2W” for TVHT_MODE_4N, and uses the values in Table 22-23.

The definitions in the rest of 21.3.18.2 apply to Clause 22 using the values in Table 22-23.

Table 22-23—Minimum required adjacent and nonadjacent channel rejection levels

Modulation	Rate (R)	Adjacent channel rejection (dB)		Nonadjacent channel rejection (dB)	
		6 MHz, 7 MHz, 8 MHz, 12 MHz (TVHT_MODE_2C), 14 MHz (TVHT_MODE_2C), 16 MHz (TVHT_MODE_2C), 24 MHz (TVHT_MODE_4C), 28 MHz (TVHT_MODE_4C), 32 MHz (TVHT_MODE_4C)	6+6 MHz (TVHT_MODE_2N), 7+7 MHz (TVHT_MODE_2N), 8+8 MHz (TVHT_MODE_2N), 12+12 MHz (TVHT_MODE_4N), 14+14 MHz (TVHT_MODE_4N), 16+16 MHz (TVHT_MODE_4N)	6 MHz, 7 MHz, 8 MHz, 12 MHz (TVHT_MODE_2C), 14 MHz (TVHT_MODE_2C), 16 MHz (MTVHT_MODE_2C), 24 MHz (TVHT_MODE_4C), 28 MHz (TVHT_MODE_4C), 32 MHz (TVHT_MODE_4C)	6+6 MHz (TVHT_MODE_2N), 7+7 MHz (TVHT_MODE_2N), 8+8 MHz (TVHT_MODE_2N), 12+12 MHz (TVHT_MODE_4N), 14+14 MHz (TVHT_MODE_4N), 16+16 MHz (TVHT_MODE_4N)
BPSK	1/2	16	13	32	29
QPSK	1/2	13	10	29	26
QPSK	3/4	11	8	27	24
16-QAM	1/2	8	5	24	21
16-QAM	3/4	4	1	20	17
64-QAM	2/3	0	–3	16	13
64-QAM	3/4	–1	–4	15	12
64-QAM	5/6	–2	–5	14	11
256-QAM	3/4	–7	–10	9	6
256-QAM	5/6	–9	–12	7	4

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

22.3.18.4 Nonadjacent channel rejection

Nonadjacent channel rejection for TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C channels follows the definition in the first paragraph of 21.3.18.3 and use the values in Table 22-23.

Nonadjacent channel rejection for TVHT_MODE_2N (TVHT_W+W) and TVHT_MODE_4N (TVWT_2W+2W) follows the definition in the second paragraph of 21.3.18.3, where “80 MHz” is replaced by “TVHT_W” for TVHT_MODE_2N and “TVHT_2W” for TVHT_MODE_4N, and uses the values in Table 22-23.

The definitions in the rest of 21.3.18.3 apply to Clause 22 using the values in Table 22-23.

22.3.18.5 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 4096 octets, for a maximum input level of –20 dBm, measured at each antenna for any baseband TVHT modulation.

22.3.18.6 CCA sensitivity

22.3.18.6.1 General

The thresholds in this subclause are compared with the signal level at each receiving antenna.

22.3.18.6.2 CCA sensitivity for signals occupying the primary channel

The PHY shall issue a PHY-CCA.indication(BUSY, {primary}) primitive if one of the conditions listed in Table 22-24 is met in an otherwise idle TVHT_W (TVHT_MODE_1), TVHT_2W (TVHT_MODE_2C), TVHT_4W (TVHT_MODE_4C), TVHT_W+W (TVHT_MODE_2N), and TVHT_2W+2W (TVHT_MODE_4N) operating channel width. With >90% probability, the PHY shall detect the start of a PPDU that occupies at least the primary TVHT_W channel under the conditions listed in Table 22-24 within a period of aCCATime (see 22.4.4) and hold the CCA signal busy [PHY-CCA.indication(BUSY, channel-list)] for the duration of the PPDU.

Table 22-24—Conditions for CCA BUSY on the primary channel

Frequency segment width	Conditions
6 MHz	The start of a 6 MHz non-HT duplicate or VHT PPDU in TVWS bands in the primary 6 MHz channel at or above –88 dBm.
7 MHz	The start of a 7 MHz non-HT duplicate or VHT PPDU in TVWS bands in the primary 7 MHz channel at or above –88 dBm.
8 MHz	The start of a 8 MHz non-HT duplicate or VHT PPDU in TVWS bands in the primary 8 MHz channel at or above –87 dBm.

The receiver shall issue a PHY-CCA.indication(BUSY, {primary}) primitive for any signal that exceeds a threshold equal to 20 dB above the minimum modulation and coding rate sensitivity (–88 + 20 = –68 dBm in the case of 6 MHz channel) in the primary TVHT_W channel within a period of aCCATime after the signal arrives at the receiver’s antenna(s); then the receiver shall not issue a PHY-CCA.indication(BUSY,{secondary}), PHY-CCA.indication(BUSY,{secondaryTVHT_2W}), or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

22.3.18.6.3 CCA sensitivity for signals not occupying the primary channel

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary}) primitive if the conditions for issuing a PHY-CCA.indication(BUSY, {primary}) primitive are not present and one of the following conditions is present in an otherwise idle TVHT_2W (TVHT_MODE_2C), TVHT_4W (TVHT_MODE_4C), TVHT_W+W (TVHT_MODE_2N), and TVHT_2W+2W (TVHT_MODE_4N) operating channel width:

— Any signal within the secondary channel at or above a threshold (–68 dBm for 6 MHz, –68 dBm for 7 MHz, and –67 dBm for 8 MHz) within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY,{secondaryTVHT_2W}) or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

— A TVHT_W non-HT duplicate or VHT PPDU in TVWS bands detected in the secondary channel at or above a threshold (–81 dBm for 6 MHz, –81 dBm for 7 MHz, and –80 dBm for 8 MHz) with >90% probability within a period aCCAMidTime (see 22.4.4).

The PHY shall issue a PHY-CCA.indication(BUSY, {secondaryTVHT_2W}) primitive if the conditions for issuing a PHY-CCA.indication(BUSY, {primary}) primitive and a PHY-CCA.indication(BUSY, {secondary}) primitive are not present and one of the following conditions is present in an otherwise idle TVHT_4W (TVHT_MODE_4C) and TVHT_2W+2W (TVHT_MODE_4N) operating channel width:

— Any signal within the secondary TVHT_2W channel at or above a threshold (–65 dBm for 12 MHz, –65 dBm for 14 MHz, and –64 dBm for 16 MHz) within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

— A TVHT_2W non-HT duplicate or VHT PPDU in TVWS bands detected in the secondary TVHT_2W channel at or above a threshold (–78 dBm for 6+6 MHz, –78 dBm for 7+7 MHz, and –77 dBm for 8+8 MHz or 16 MHz) with >90% probability within a period aCCAMidTime (see 22.4.4).

— A TVHT_W non-HT duplicate or VHT PPDU in TVWS bands detected in any TVHT_W subchannel of the secondary TVHT_2W channel at or above a threshold (–81 dBm for 6 MHz, –81 dBm for 7 MHz, and –80 dBm for 8 MHz) with >90% probability within a period aCCAMidTime.

22.4.4 TVHT PHY

The TVHT PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, are shown in Table 19-25, unless otherwise listed in Table 22-25. The definitions for these characteristics are given in 6.7.4.

Table 22-25—TVHT PHY characteristics

Characteristics	Value
aSlotTime	24 μs (BCUs: 6 MHz or 7 MHz) plus any coverage-class-dependent aAirPropagationTime (see Table 9-133) 20 μs (BCUs: 8 MHz) plus any coverage-class-dependent aAirPropagationTime (see Table 9-133)
aSIFSTime	120 μs (BCUs: 6 MHz or 7 MHz) 90 μs (BCUs: 8 MHz)
aSignalExtension	0 μs
aCCATime	< 15 μs (6 MHz or 7 MHz) < 11.25 μs (8 MHz)
aCCAMidTime	< 94 μs (6 MHz or 7 MHz) < 70 μs (8 MHz)
aAirPropagationTime	As indicated by the coverage class (see 10.22.5)
aPPDUMaxTime	20 ms
aPSDUMaxLength	1 401 120 octets (see NOTE 1)
aRxPHYStartDelay	20 μs× 7.5 (6 and 7 MHz channels) or 5.625 (8 MHz channels) (see NOTE 2)
NOTE 1—This is the maximum length in octets for SU PPDUs with a bandwidth of 32 MHz or 16+16 MHz, MCS 9 and 4 spatial streams, limited by 973 possible Short GI data symbols in aPPDUMaxTime. NOTE 2—This value arises from the time to the end of the L-SIG field (see Figure 22-1).

22.5 Parameters for TVHT-MCSs

The rate-dependent parameters for one BCU mode (6 MHz, 7 MHz, and/or 8 MHz) and corresponding two and four BCU modes with $N_{SS} = 1, \ldots, 4$ are given in Table 22-26 to Table 22-37. Support for MCS 8 and 9 (when valid) is optional in all cases. A TVHT STA shall support single spatial stream MCSs within the range MCS 0 to MCS 7 for all channel widths for which it has indicated support regardless of the Tx or Rx Highest Supported Data Rate subfield values in the TVHT Supported MCS Set field. When more than one spatial stream is supported, the Tx or Rx Highest Supported Data Rate subfield values in the TVHT Supported MCS Set field may result in a reduced MCS range (cut-off) for $N_{SS} = 2, \ldots, 4$. Support for 6 MHz, 7 MHz, or 8 MHz with $N_{SS} = 1$ is mandatory. Support for 6 MHz, 7 MHz, and 8 MHz with $N_{SS} = 2, \ldots, 4$ is optional. Support for two BCU modes with 12 MHz, 14 MHz, and 16 MHz or with 6+6 MHz, 7+7 MHz, and 8+8 MHz with $N_{SS} = 1, \ldots, 4$ is optional. Support for four BCU modes with 24 MHz, 28 MHz, and 32 MHz or with 12+12 MHz, 14+14 MHz, and 16+16 MHz with $N_{SS} = 1, \ldots, 4$ is optional. N_{ES} values were chosen to yield an integer number of punctured blocks per OFDM symbol. Note that N_{ES} values are 1 for all Clause 22 modulations.

Table 22-26 to Table 22-37 define TVHT-MCSs not only for SU transmission but also for user u of MU transmission. In the case of TVHT-MCSs for MU transmission, the parameters, N_{SS}, R, N_{BPSCS}, N_{CBPS}, and N_{DBPS} are replaced with $N_{SS,u}$, R_u, $N_{BPSCS,u}$, $N_{CBPS,u}$, and $N_{DBPS,u}$, respectively.

In the MCS parameter tables that follow, data rates for a 400 ns GI are rounded to 1 decimal place.

Table 22-26—TVHT-MCSs for TVHT_MODE_1, $N_{SS} = 1$

MCS Index	Modulation	R	N_{BPSCS}	N_{SD}	N_{SP}	N_{CBPS}	N_{DBPS}	Data rate (Mb/s) for 6 MHz or 7 MHz		Data rate (Mb/s) for 8 MHz

23. Sub 1 GHz (S1G) PHY specification

23.1 Introduction

23.1.1 Introduction to the S1G PHY

Clause 23 specifies the PHY entity for an S1G orthogonal frequency division multiplexing (OFDM) system.

The S1G PHY is based on the VHT PHY defined in Clause 21, which in turn is based on HT PHY defined in Clause 19 and the OFDM PHY defined in Clause 17. The S1G PHY defines an OFDM PHY in the sub-1 GHz bands using narrower bandwidths than those in 2.4 GHz and 5 GHz bands, with maximum number of space-time streams supported being four, and with support for downlink multi-user (MU) transmissions. A downlink MU transmission supports up to four users with up to three space-time streams per user with the total number of space-time streams not exceeding four.

The S1G PHY provides support for 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz contiguous channel widths. A tone spacing of 31.25 kHz is used in all the bandwidths.

Transmissions of PPDUs with channel bandwidth 2 MHz, 4 MHz, 8 MHz, and 16 MHz are in general modulated the same way as 20 MHz, 40 MHz, 80 MHz and 160 MHz contiguous mode as specified in Clause 21, respectively, except with a 1/10 clock rate. For details refer to Table 23-5 (in 23.3.6). Transmissions of PPDUs with 1 MHz channel bandwidth are modulated as described in 23.3.4.4.

The S1G PHY data subcarriers are modulated using binary phase shift keying (BPSK), quadrature phase shift keying (QPSK), 16-quadrature amplitude modulation (16-QAM), 64-QAM, 256-QAM and 1024 QAM. Forward error correction (FEC) coding (convolutional or LDPC coding) is used with coding rates of 1/2, 2/3, 3/4, and 5/6.

A non-AP S1G STA shall support the following Clause 23 features:

— 1 MHz and 2 MHz channel width
— S1G_1M, S1G_SHORT PPDU
— S1G_LONG PPDU, if ≥ 4 MHz channel width is supported
— Detect and decode SIG-A field of the S1G_LONG preamble.
— Single spatial stream MCSs 0 to 2, and MCS 10 (for 1 MHz PPDU only)
— BCC coding
— Normal Guard Interval T_{GI} as defined in Table 23-5 (in 23.3.6)
— Fixed Pilots

An S1G AP shall support the following Clause 23 features:

— 1 MHz and 2 MHz channel width
— S1G_1M, S1G_SHORT PPDU
— S1G_LONG PPDU, if ≥4 MHz channel width is supported
— Detect and decode SIG-A field of the S1G_LONG preamble.
— Single spatial stream MCSs 0 to 7, and MCS 10 (for 1 MHz PPDU only)
— BCC coding
— Normal Guard Interval T_{GI} as defined in Table 23-5 (in 23.3.6)
— Fixed Pilots

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An S1G STA may support the following Clause 23 features:

- 2 or more spatial streams (transmit and receive)
- S1G_LONG preamble when maximum channel width supported is less than 4 MHz
- Beamforming sounding (through S1G NDP) for an AP
- Beamforming sounding response (i.e., providing compressed beamforming feedback) for a non-AP STA
- STBC (transmit and receive)
- LDPC (transmit and receive)
- S1G MU PPDUs (transmit and receive)
- 4 MHz channel widths
- 8 MHz channel widths
- 16 MHz channel widths
- S1G-MCSs 8 and 9 (transmit and receive) for an AP, and S1G-MCSs 3-9 (transmit and receive) for a non-AP STA
- Short Guard Interval
- Traveling Pilots

23.1.2 Scope of S1G PHY services

The services provided to the MAC by the S1G PHY consist of the following protocol functions:

a) A function that defines a method of mapping the PSDUs into a PPDU format suitable for sending and receiving PSDUs between two or more STAs.

b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs.

23.1.3 S1G PHY features

23.1.3.1 General

The S1G PHY contains two functional entities: the PHY function, and the physical layer management function (i.e., the PLME). Both of these functions are described in detail in 23.3 and 23.4.

The S1G PHY service is provided to the MAC through the PHY service primitives defined in Clause 8. The S1G PHY service interface is described in 23.2.

23.1.3.2 PHY management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

23.1.3.3 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation; the actual method of implementation is left to the discretion of the developer.

The service of a layer is the set of capabilities that it offers to a user in the next higher layer. Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

23.1.4 PPDU formats

The structure of the PPDU transmitted by an S1G STA is determined by the TXVECTOR parameters as defined in Table 23-1 (in 23.2.2).

The FORMAT parameter determines the overall structure of the PPDU, and the allowed values are:

— S1G, for S1G non-duplicate PPDUs
— S1G_DUP_2M, for S1G 2 MHz duplicate PPDUs
— S1G_DUP_1M, for S1G 1 MHz duplicate PPDUs

The PPDU bandwidth is determined by the CH_BANDWIDTH parameter, and the preamble type (i.e., S1G_1M preamble, S1G_SHORT preamble, and S1G_LONG preamble) is determined by the PREAMBLE_TYPE parameter.

— The 1 MHz format PPDU (S1G_1M) is used for non-duplicate S1G transmissions at 1 MHz bandwidth (i.e., CH_BANDWIDTH = CBW1), and for S1G_DUP_1M transmissions of any bandwidth (i.e., CH_BANDWIDTH = CBW1, CBW2, CBW4, CBW8, or CBW16). The S1G_1M preamble (see 23.3.8.3) is used. Support for the S1G_1M is mandatory.
— The greater than or equal to 2 MHz short format (S1G_SHORT) is used for non-duplicate S1G transmissions and for S1G_DUP_2M transmissions, at bandwidths of 2 MHz and higher (i.e., CH_BANDWIDTH = CBW2, CBW4, CBW8, or CBW16). The S1G_SHORT preamble (see 23.3.8.2.1) is used. This PPDU format is similar to the HT-greenfield format in Clause 19, which does not contain a legacy portion in the preamble. Support for S1G_SHORT is mandatory.
— The greater than or equal to 2 MHz long format (S1G_LONG) is used for non-duplicate S1G transmissions at bandwidths of 2 MHz and higher (i.e., CH_BANDWIDTH = CBW2, CBW4, CBW8, or CBW16). The S1G_LONG format is not used for S1G_DUP_2M transmissions. The S1G_LONG preamble (see 23.3.8.2.2) is used. This PPDU format is similar to the HT-mixed format in Clause 19. Support for S1G_LONG is optional if a STA supports only 1 MHz and 2 MHz PPDUs, and is mandatory if a STA supports wider than 2 MHz PPDUs. All S1G STAs shall support detecting and decoding up to the SIG-A field of S1G_LONG PPDUs.

An S1G_LONG PPDU can be further categorized as an S1G SU PPDU or an S1G MU PPDU. An S1G_LONG PPDU with MU_SU = MU is an S1G MU PPDU, otherwise it is an S1G SU PPDU. An S1G MU PPDU carries one or more PSDUs to one or more STAs and shall be an S1G_LONG PPDU.

23.2 S1G PHY service interface

23.2.1 Introduction

The PHY provides an interface to the MAC through an extension of the generic PHY service interface defined in 8.3.4. The interface includes TXVECTOR, RXVECTOR, and PHYCONFIG_VECTOR.

The TXVECTOR supplies the PHY with per-PPDU transmit parameters. Using the RXVECTOR, the PHY informs the MAC of the received PPDU's parameters. Using the PHYCONFIG_VECTOR, the MAC configures the PHY for operation, independent of PPDU transmission or reception.

23.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 23-1 are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive.

Table 23-1—TXVECTOR and RXVECTOR parameters

Parameter	Condition	Value	TXVECTOR	RXVECTOR
FORMAT		Determines the format of the PPDU. Enumerated type: S1G indicates S1G PPDU format. S1G_DUP_1M indicates S1G 1 MHz Duplicate format PPDU S1G_DUP_2M indicates S1G 2 MHz Duplicate format PPDU	Y	Y
PREAMBLE_TYPE	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16)	Determine the type of preamble of the S1G PPDU. Enumerated type: S1G_SHORT_PREAMBLE indicates the short preamble defined in 23.3.8.2.2. S1G_LONG_PREAMBLE indicates the long preamble defined in 23.3.8.2.3.	Y	Y
	(FORMAT is S1G and CH_BANDWIDTH is CBW1) or FORMAT is S1G_DUP_1M	Set to S1G_1M_PREAMBLE defined in 23.3.8.3	Y	Y
	FORMAT is S1G_DUP_2M	Set to S1G_SHORT_PREAMBLE.	Y	Y
	Otherwise	Not present	N	N
MU_SU	FORMAT is S1G and PREAMBLE_TYPE is S1G_LONG_PREAMBLE and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16)	Determine whether MU or SU of the S1G PPDU Enumerated type: Set to MU if NUM_USERS is 2 to 4. Set to SU if NUM_USERS is 1.	Y	Y
	Otherwise	Not present	N	N
NDP_INDICATION		Determine the type of S1G PPDU. Set to 1 if this PPDU is one of NDP CMAC PPDUs as defined in 23.3.12. Set to 0 otherwise.	Y	Y

Table 23-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
NDP_CMAC_PPDU_BODY	NDP_INDICATION is 1	Set to concatenated fields, which describe the NDP CMAC PPDU body content in one of NDP CMAC PPDU types defined in Table 23-30. (See 23.3.12).	Y	Y
	Otherwise	Not present	N	N
SMOOTHING	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) and PREAMBLE_TYPE is S1G_LONG_PREAMBLE and NUM_STS is larger than 1	Indicates whether frequency domain smoothing is recommended as part of channel estimation. Set to 1 if frequency domain smoothing is recommended. Set to 0 otherwise.	Y	Y
	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) and PREAMBLE_TYPE is S1G_LONG_PREAMBLE and NUM_STS is 1	Not present	N	N
	Otherwise	Indicates whether frequency domain smoothing is recommended as part of channel estimation. Set to 1 if frequency domain smoothing is recommended. Set to 0 otherwise.	Y	Y
AGGREGATION		Indicates whether the PSDU contains an A-MPDU. Enumerated type: AGGREGATED indicates this PSDU contains an A-MPDU. NOT_AGGREGATED indicates this PSDU does not contain an A-MPDU.	Y	Y
SECTOR_ID	FORMAT is S1G and PREAMBLE_TYPE is S1G_LONG_PREAMBLE	Indicates which sectorized beam of the available sectorized beams are used in the transmission. The length of the parameter is 8 bits. A 1 in bit position n, relative to the LSB, indicates that Sector n is used. This parameter is present only if sectorization is applied.	O	N
	Otherwise	Not present	N	N

Table 23-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
N_TX		Indicates the number of transmit chains.	Y	N
EXPANSION_MAT	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) and MU_SU is MU	Contains a vector in the number of selected subcarriers containing feedback matrices as defined in 23.3.10.2 based on the channel measured during the training symbols of a previous S1G NDP.	M U	N
	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) and MU_SU is SU	Contains a vector in the number of selected subcarriers containing feedback matrices as defined in 23.3.10.2 based on the channel measured during the training symbols of a previous S1G NDP.	O	N
	Otherwise	Not present	N	N
CHAN_MAT	PSDU_LENGTH equals 0 and NDP_INDICATION is 0	Contains a set of compressed beamforming feedback matrices as defined in 23.3.10.2 based on the channel measured during the training symbols of the received S1G NDP.	N	Y
	Otherwise	Not present	N	N
DELTA_SNR	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16)	Contains an array of delta SNR values as defined in 9.4.1.49 based on the channel measured during the training symbols of the received S1G NDP. NOTE—In the RXVECTOR this parameter is present only for S1G NDPs for MU sounding.	M U	Y
	Otherwise	Not present	N	N
RCPI		Is a measure of the received RF power averaged over all the receive chains in the STF or LTF fields of the current PPDU. Refer to 23.3.18.7 for the definition of RCPI.	N	Y
SNR		Contains an array of measures of the received SNR for each spatial stream. SNR indications of 8 bits are supported. SNR shall be the sum of the decibel values of SNR per tone divided by the number of tones represented in each stream as described in 9.4.1.47.	N	Y
FEC_CODING	FORMAT is S1G	Indicates which FEC encoding is used. Enumerated type: BCC_CODING indicates binary convolutional code. LDPC_CODING indicates low-density parity check code.	M U	Y
	FORMAT is S1G_DUP_2M or S1G_DUP_1M	Indicates which FEC encoding is used. Enumerated type: BCC_CODING indicates binary convolutional code. LDPC_CODING indicates low-density parity check code.	Y	Y

Table 23-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
STBC		Indicates whether or not STBC is used. 0 indicates no STBC ($N_{STS}=N_{SS}$ in the Data field). 1 indicates STBC is used ($N_{STS}=2N_{SS}$ in the Data field).	Y	Y
GI_TYPE		Indicates whether a short guard interval is used in the transmission of the Data field of the PPDU. Enumerated type: LONG_GI indicates short GI is not used in the Data field of the PPDU. SHORT_GI indicates short GI is used in the Data field of the PPDU.	Y	Y
TXPWR_LEVEL		The allowed values for the TXPWR_LEVEL parameter are in the range from 1 to $N/2$, where N is the number of octets in dot11TxPowerLevelExtended. This parameter is used to indicate which of the available transmit output power levels defined in dot11TxPowerLevelExtended shall be used for the current transmission.	Y	N
RSSI		The allowed values for the RSSI parameter are in the range 0 to 255. This parameter is a measurement by the PHY of the power observed at the antenna connector used to receive the current PPDU measured during the reception of the LTF field. RSSI is intended to be used in a relative manner, and it is a monotonically increasing function of the received power.	N	Y
MCS	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16)	Indicates the modulation and coding scheme used in the transmission of the PPDU. Integer: range 0 to 9, 11 and 12	M U	Y
	FORMAT is S1G_DUP_2M	Indicates the modulation and coding scheme used in the transmission of the PPDU. Integer: range 0 to 9, 11 and 12	Y	Y
	Otherwise	Indicates the modulation and coding scheme used in the transmission of the PPDU. Integer: range 0 to 2	Y	Y
REC_MCS	FORMAT is [S1G with (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16)] or S1G_DUP_2M	Indicates the MCS that the STA's receiver recommends. Integer: range 0 to 9, 11 and 12	N	O
	Otherwise	Indicates the MCS that the STA's receiver recommends. Integer: range 0 to 2	N	O

Table 23-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
CH_BANDWIDTH	FORMAT is S1G	Indicates the channel width of the transmitted PPDU: Enumerated type: CBW1 for 1 MHz CBW2 for 2 MHz CBW4 for 4 MHz CBW8 for 8 MHz CBW16 for 16 MHz	Y	Y
	FORMAT is S1G_DUP_2M	In TXVECTOR, indicates the channel width of the transmitted S1G 2 MHz Duplicate PPDU. In RXVECTOR, indicates the estimated channel width of the received S1G 2 MHz Duplicate PPDU. Enumerated type: CBW4 for 4 MHz CBW8 for 8 MHz CBW16 for 16 MHz	Y	Y
	FORMAT is S1G_DUP_1M	In TXVECTOR, indicates the channel width of the transmitted S1G 1 MHz Duplicate PPDU. In RXVECTOR, indicates the estimated channel width of the received S1G 1 MHz Duplicate PPDU. Enumerated type: CBW2 for 2 MHz CBW4 for 4 MHz CBW8 for 8 MHz CBW16 for 16 MHz	Y	Y
LENGTH	AGGREGATION is AGGREGATED	Indicates the PPDU duration in number of symbols in the PSDU	Y	Y
	AGGREGATION is NOT_AGGREGATED	Indicates the PPDU duration in number of octets in the PSDU	Y	Y
APEP_LENGTH	FORMAT is S1G and AGGREGATION is AGGREGATED	If equal to 0, indicates an S1G NDP for both RXVECTOR and TXVECTOR. If greater than 0 in the TXVECTOR, indicates the number of octets in the A-MPDU pre-EOF padding (see 10.12.2) carried in the PSDU. This parameter is used to determine the number of OFDM symbols in the Data field that do not appear after an A-MPDU subframe with 1 in the EOF/Tag subfield.	M U	O
	(FORMAT is S1G_DUP_2M or SIG_DUP_1M) and AGGREGATION is AGGREGATED	If equal to 0, indicates an S1G NDP for both RXVECTOR and TXVECTOR. If greater than 0 in the TXVECTOR, indicates the number of octets in the A-MPDU pre-EOF padding (see 10.12.2) carried in the PSDU. This parameter is used to determine the number of OFDM symbols in the Data field that do not appear after an A-MPDU subframe with 1 in the EOF/Tag	Y	O
	Otherwise	Not present	N	N

Table 23-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
PSDU_LENGTH	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) and MU_SU is MU	Indicates the value in the RXVECTOR obtained from 23.4.3.	N	Y
	Otherwise	If greater than 0 in the TXVECTOR and AGGREGATION is NOT_AGGREGATED, indicates the number of octets in the PSDU. If greater than 0 in the RXVECTOR, this parameter is the value obtained from 23.4.3. A value of 0 indicates an S1G NDP for both RXVECTOR and TXVECTOR.	Y	Y
USER_POSITION	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) and MU_SU is MU	Index for user in MU transmission. Integer: range 0–3. NOTE—The entries in the USER_POSITION array are in ascending order.	Y	Y
	Otherwise	Not present	N	N
NUM_STS	FORMAT is S1G	Indicates the number of space-time streams. Integer: range 1–4 per user in the TXVECTOR and 0–4 in the RXVECTOR. NUM_STS summed over all users is in the range 1 to 4 for MU-MIMO.	MU	Y
	FORMAT is S1G_DUP_2M or S1G_DUP_1M	Indicates the number of space-time streams. Integer: range 1–4 per user in the TXVECTOR and 0–4 in the RXVECTOR.	Y	Y
GROUP_ID	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) and MU_SU is MU	Indicates the group ID. Integer: range 1–62 (see Table 23-15 in 23.3.8.2.3.2.5).	Y	Y
	Otherwise	Not present	N	N
PARTIAL_AID	(FORMAT is S1G, CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16, and MU_SU is SU) or FORMAT is S1G_DUP_2M	Provides an abbreviated indication of the intended recipient(s) of the PSDU (see 10.21). Integer: range 0–511 if UPLINK_INDICATION is 1, and range 0–63 if UPLINK_INDICATION is 0.	Y	Y
	Otherwise	Not present	N	N

Table 23-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
NUM_USERS	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) and MU_SU is MU	Indicates the number of users with nonzero space-time streams. Integer: range 1 to 4.	Y	N
	Otherwise	Set to 1	Y	N
BEAM_CHANGE	FORMAT is S1G and MU_SU is SU and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) and PREAMBLE_TYPE is S1G_LONG_PREAMBLE and NUM_STS is 1	Set to 1 if the Q matrix is changed from the omnidirectional portion to the beam changeable portion of the long preamble, in at least one of the nonzero subcarrier of the omnidirectional portion as described in 23.3.8.2.3.2.5. Set to 0 if the Q matrix is unchanged in all the nonzero subcarriers of the omnidirectional portion. NOTE—If BEAM_CHANGE is 0 and PREAMBLE_TYPE is S1G_LONG_PREAMBLE, the receiver may perform channel smoothing. Otherwise, smoothing is not recommended.	Y	Y
	Otherwise	Not present	N	N
RESPONSE_INDICATION		Set to 0 if No Response. Set to 1 if NDP Response. Set to 2 if Normal Response. Set to 3 if Long Response.	Y	Y
TRAVELING_PILOTS		Set to 1 if traveling pilots are used in the PPDU. Set to 0 otherwise.	Y	O
TIME_OF_DEPARTURE_REQUESTED		Boolean value: true indicates that the MAC entity requests that the PHY entity measures and reports time of departure parameters corresponding to the time when the first PPDU energy is sent by the transmitting port. false indicates that the MAC entity requests that the PHY entity neither measures nor reports time of departure parameters.	O	N
RX_START_OF_FRAME_OFFSET	dot11TimingMsmtActivated is true	0 to 2^{32}– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble of the PPDU arrived at the receive antenna port to the point in time at which this primitive is issued to the MAC.	N	Y
	Otherwise	Not present	N	N

Table 23-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
UPLINK_INDICATION	NDP_INDICATION is 0 and FORMAT is S1G and CH_BANDWIDTH is not CBW1	Set to 1 if the S1G PPDU is addressed to AP Set to 0 otherwise (See 10.21).	Y	Y
	Otherwise	Not present	N	N
COLOR	UPLINK_INDICATION is 0 and NDP_INDICATION is 0 and (FORMAT is S1G or S1G_DUP_2M) and CH_BANDWIDTH is not CBW1 and MU_SU is SU	Set to a value of its choosing within the range 0 to 7 (See 10.21)	Y	Y
	Otherwise	Not present	N	N
SCRAMBLER_OR_CRC	NDP_INDICATION is 0	Indicates the scrambler initialization value in the SERVICE field (as defined in 23.3.9.2) prior to descrambling. Bit sequence of 7 bits in length: [B0:B6] of the SERVICE field value prior to descrambling.	N	Y
	FORMAT is S1G and NDP_INDICATION is 1	Indicates the value of the calculated CRC in the SIG field. Bit sequence of 4 bits in length: Either [B26:B29] of the 1 MHz SIG field or [B38:B41] of the ≥ 2 MHz SIG field.	N	Y
	FORMAT is S1G_DUP_2M and NDP_INDICATION is 1	Indicates the value of the calculated CRC in the SIG field. Bit sequence of 4 bits in length: [B38:B41] of the ≥ 2 MHz SIG field.	N	Y
	FORMAT is S1G_DUP_1M and NDP_INDICATION is 1	Indicates the value of the calculated CRC in the SIG field. Bit sequence of 4 bits in length: [B26:B29] of the 1 MHz SIG field.	N	Y
	Otherwise	Not present	N	N

NOTE—In the TXVECTOR and RXVECTOR columns, the following apply:
Y = Present.
N = Not present.
O = Optionally present.
MU indicates that the parameter is present once for an S1G SU PPDU and present per user for an S1G MU PPDU. Parameters specified to be present per user are conceptually supplied as an array of values indexed by *u*, where *u* takes values 0 to NUM_USERS-1.

23.2.3 Effect of CH_BANDWIDTH parameter on PPDU format

Table 23-2 shows the PPDU format as a function of the CH_BANDWIDTH parameter.

Table 23-2—PPDU format as a function of CH_BANDWIDTH parameter

FORMAT	CH_BANDWIDTH	PPDU format
S1G	CBW1	The STA transmits an S1G PPDU of 1 MHz bandwidth. If the operating channel width is wider than 1 MHz, then the transmission shall use the primary 1 MHz channel.
S1G	CBW2	The STA transmits an S1G PPDU of 2 MHz bandwidth. If the operating channel width is wider than 2 MHz, then the transmission shall use the primary 2 MHz channel.
S1G	CBW4	The STA transmits an S1G PPDU of 4 MHz bandwidth. If the operating channel width is wider than 4 MHz, then the transmission shall use the primary 4 MHz channel.
S1G	CBW8	The STA transmits an S1G PPDU of 8 MHz bandwidth. If the operating channel width is wider than 8 MHz, then the transmission shall use the primary 8 MHz channel.
S1G	CBW16	The STA transmits an S1G PPDU of 16 MHz bandwidth.
S1G_DUP_2M	CBW4	The STA transmits an S1G 2 MHz Duplicate PPDU using two adjacent 2 MHz channels as defined in 23.3.9.12.2. If the operating channel width is wider than 4 MHz, then the transmission shall use the primary 4 MHz channel. Phase rotation pattern for each 2 MHz channel is [1 j] from the lowest frequency as defined in Equation (23-7).
S1G_DUP_2M	CBW8	The STA transmits an S1G 2 MHz Duplicate PPDU using four adjacent 2 MHz channels as defined in 23.3.9.12.2. If the BSS operating channel width is 16 MHz, then the transmission shall use the primary 8 MHz channel. Phase rotation pattern for each 2 MHz channel is [1 -1 -1 -1] from the lowest frequency as defined in Equation (23-8).
S1G_DUP_2M	CBW16	The STA transmits an S1G 2 MHz Duplicate PPDU using eight adjacent 2 MHz channels as defined in 23.3.9.12.2. Phase rotation pattern for each 2 MHz channel is [1 -1 -1 -1 1 -1 -1 -1] from the lowest frequency as defined in Equation (23-9).
S1G_DUP_1M	CBW2	The STA transmits an S1G 1 MHz Duplicate PPDU using two adjacent 1 MHz channels as defined in 23.3.9.12.1. If the operating channel width is wider than 2 MHz, then the transmission shall use the primary 2 MHz channel. Phase rotation pattern for each Equation (23-10).
S1G_DUP_1M	CBW4	The STA transmits an S1G 1 MHz Duplicate PPDU using four adjacent 1 MHz channels as defined in 23.3.9.12.1. If the operating channel width is wider than 4 MHz, then the transmission shall use the primary 4 MHz channel. Phase rotation pattern for each 1 MHz channel is [1 j -j -1] from the lowest frequency as defined in Equation (23-11).

Table 23-2—PPDU format as a function of CH_BANDWIDTH parameter *(continued)*

FORMAT	CH_BANDWIDTH	PPDU format
S1G_DUP_1M	CBW8	The STA transmits an S1G 1 MHz Duplicate PPDU using eight adjacent 1 MHz channels as defined in 23.3.9.12.1. If the BSS operating channel width is 16 MHz, then the transmission shall use the primary 8 MHz channel. Phase rotation pattern for each 1 MHz channel is [1 -1 1 1 1 1 -1 -1] from the lowest frequency as defined in Equation (23-12).
S1G_DUP_1M	CBW16	The STA transmits an S1G 1 MHz Duplicate PPDU using sixteen adjacent 1 MHz channels as defined in 23.3.9.12.1. Phase rotation pattern for each 1 MHz channel is [1 1 1 -1 1 1 1 -1 -1 -1 1 -1 1 1 -1 1] from the lowest frequency as defined in Equation (23-13).

23.2.4 TXSTATUS parameters

The parameters listed in Table 23-3 are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm service primitive.

Table 23-3—TXSTATUS parameters

Parameter	Value
TIME_OF_DEPARTURE	0 to $2^{32} - 1$. The locally measured time when the first PPDU energy is sent by the transmitting port, in units equal to 1/TIME_OF_DEPARTURE_ClockRate. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.

23.2.5 PHYCONFIG_VECTOR parameters

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a S1G PHY contains a GROUP_ID_MANAGEMENT parameter, which specifies membership status and STA position for each of the group IDs as described in 9.6.22.3.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a S1G PHY contains a PARTIAL_AID_LIST_GID00 parameter, which includes the list of partial AIDs, of which the S1G STA is an intended recipient, in which a frame is addressed to an AP. The settings of the PARTIAL_AID are specified in 10.21.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a S1G PHY contains a PARTIAL_AID_LIST_GID63 parameter, which includes the list of partial AIDs, of which the S1G STA is an intended recipient, in which a frame is addressed to a non-AP STA. The settings of the PARTIAL_AID are specified in 10.21.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a S1G PHY contains a LISTEN_TO_GID00 parameter, which, when true, indicates to the PHY not to filter out PPDUs with GROUP_ID field equal to 0.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a S1G PHY contains a LISTEN_TO_GID63 parameter, which, when true, indicates to the PHY not to filter out PPDUs with GROUP_ID field equal to 63.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a S1G PHY contains a CCA_SENSITIVITY_TYPE parameter, which is an enumerated type that can take the following values:

— CCA_SENSITIVITY_TYPE_1 indicates that the PHY issues a PHYCCA. indication primitive based on the CCA conditions listed in Table 23-37 and 23.3.18.5.4.
— CCA_SENSITIVITY_TYPE_2 indicates that the PHY issues a PHYCCA. indication primitive based on the CCA conditions listed in Table 23-38 and 23.3.18.5.4.
— CCA_SENSITIVITY_TYPE_2_WIDEBAND indicates that the PHY issues a PHY-CCA.indication primitive based on the CCA conditions listed in Table 23-39 and 23.3.18.5.4.

23.3 S1G PHY layer

23.3.1 Introduction

This subclause provides the procedure by which PSDUs are converted to and from transmissions on the wireless medium.

During transmission, a PSDU (in the SU case) or one or more PSDUs (in the MU case) are processed (e.g., scrambled and coded) and appended to the PHY preamble to create the PPDU. At the receiver, the PHY preamble is processed to aid in the detection, demodulation and delivery of the PSDU.

23.3.2 S1G PPDU format

Three formats are defined for the S1G PHY: S1G_SHORT, S1G_LONG, and S1G_1M.

The general structure for S1G_SHORT is defined as in Figure 23-1. This format is used for SU transmission using 2 MHz, 4 MHz, 8 MHz, and 16 MHz PPDUs.

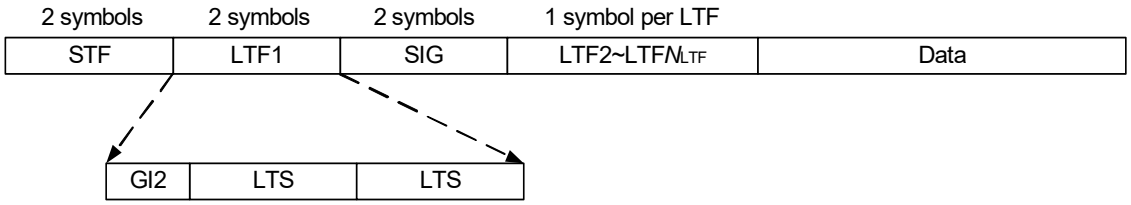

Figure 23-1—S1G_SHORT format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The general structure for S1G_LONG is defined as in Figure 23-2. This PPDU format can be used for MU and SU beamformed transmissions using 2 MHz, 4 MHz, 8 MHz, and 16 MHz PPDUs.

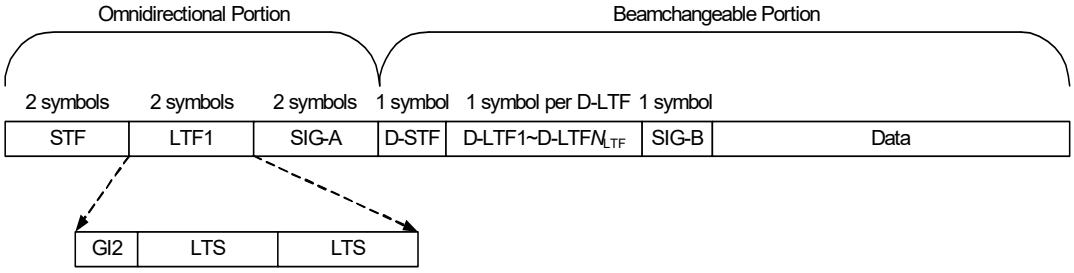

Figure 23-2—S1G_LONG format

The general structure for S1G_1M is defined as in Figure 23-3. This PPDU format is used for S1G_1M PPDU SU transmission.

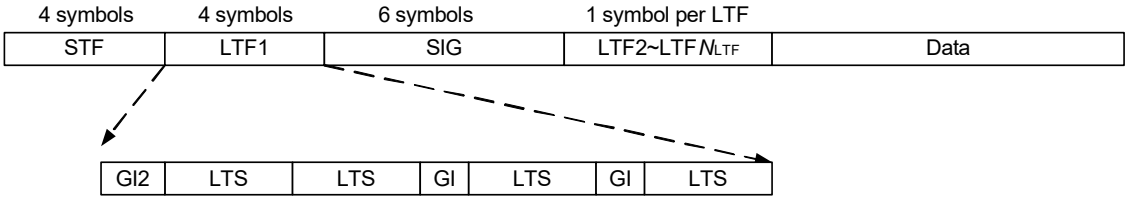

Figure 23-3—S1G_1M format

The fields of the S1G PPDU formats are summarized in Table 23-4.

Table 23-4—Fields of the S1G PPDU

Field	Description
STF	Short Training field
LTF	Long Training field
SIG	SIGNAL field
SIG-A	Signal A field
D-STF	Short Training field for the beam changeable portion
D-LTF	Long Training field for the beam changeable portion
SIG-B	Signal B field
Data	The Data field carries the PSDU(s)
GI	Guard interval
GI2	Double guard interval
LTS	Long training symbol

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The SIG-A, D-STF, D-LTF, and SIG-B fields exist only in S1G_LONG format. In an S1G NDP, the Data field is not present (see 23.3.11. The number of symbols in the LTF field of S1G_1M and S1G_SHORT, or in the D-LTF field of S1G_LONG, N_{VHTLTF}, can be either 1, 2, or 4 and is determined by the total number of space-time streams across all users being transmitted in the S1G PPDU (see Table 23-11 in 23.3.8.2.2).

23.3.3 Transmitter block diagram

Each field in an S1G PPDU can be generated using a subset of the following blocks (only select blocks are listed below):

a) PHY padding
b) Scrambler
c) BCC encoder parser
d) FEC (BCC or LDPC) encoders
e) Stream parser
f) Segment parser (for 16 MHz)
g) BCC Interleaver
h) Replicate the encoded bits (for 1 MHz MCS 10)
i) Constellation mapper
j) Pilot insertion
k) Replicate over multiple 1 MHz or 2 MHz widths
l) Multiply by first column of P_{HTLTF}
m) LDPC tone mapper
n) Segment deparser (for 16 MHz)
o) Space-time block code (STBC) encoder
p) Cyclic shift diversity (CSD) per STS insertion
q) Spatial mapper
r) Inverse discrete Fourier transform (IDFT)
s) Cyclic shift diversity (CSD) per chain insertion
t) Guard interval (GI) insertion
u) Windowing

The general transmission flow for S1G_1M MCS 0–9, and all the MCSs for S1G_SHORT and S1G_LONG formats are the same as the corresponding portions in 21.3.

Specifically, Figure 21-5, with “20 MHz” replaced by “2 MHz”, shows the transmit process for the SIG-A field of an S1G PPDU in S1G_LONG. These transmit blocks are also used to generate the omnidirectional portion of the S1G_LONG PPDU, except that the BCC encoder and interleaver are not used when generating the STF and LTF1 fields.

Figure 21-6 and Figure 21-7, with “20 MHz” replaced by “2 MHz”, show the transmit process for generating the SIG-B field of a 2 MHz, 4 MHz, and 8 MHz long format S1G PPDU for SU PPDU and MU PPDU, respectively. Figure 21-8, with “160 MHz” replaced by “16 MHz”, shows the transmit process for generating the SIG-B field of a 16 MHz long format S1G SU PPDU.

Figure 21-10 shows the transmitter blocks used to generate the BCC encoded Data field of a 2 MHz, 4 MHz, and 8 MHz SU PPDU in short or long format, and of an S1G_1M PPDU except MCS 10. It should be noted that the number of encoders is fixed to one for BCC (i.e., N_{ES}=1), in S1G operation. A subset of these transmitter blocks consisting of the constellation mapper and CSD blocks, as well as the blocks to the right

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

of, and including, the spatial mapping block, are also used to generate the STF and LTF fields in S1G_1M and S1G_SHORT, or the D-STF and D-LTF fields in S1G_LONG. This is illustrated in Figure 23-6 in 23.3.8.2.2.4 for the mentioned LTF fields. A similar set of transmit blocks is used to generate the mentioned STF fields.

Figure 21-11 shows the transmitter blocks used to generate the LDPC encoded Data field of a 2 MHz, 4 MHz, and 8 MHz SU PPDU in short or long format, and of an S1G_1M PPDU except MCS 10.

Figure 21-12 shows the transmit process for generating the Data field of a 2 MHz, 4 MHz, and 8 MHz MU PPDU in long format with BCC and/or LDPC encoding. The number of encoders is fixed to one (i.e., N_{ES}=1) for BCC in S1G operation.

Figure 21-13 and Figure 21-14 show the transmit process for generating the Data field of a 16 MHz SU PPDU in short or long format, with BCC and LDPC encoding, respectively. The number of encoders is fixed to one (i.e., N_{ES}=1) for BCC in S1G operation.

Figure 23-4 below shows the transmit process for generating the Data field of an S1G_1M PPDU with MCS 10, either BCC or LDPC encoded.

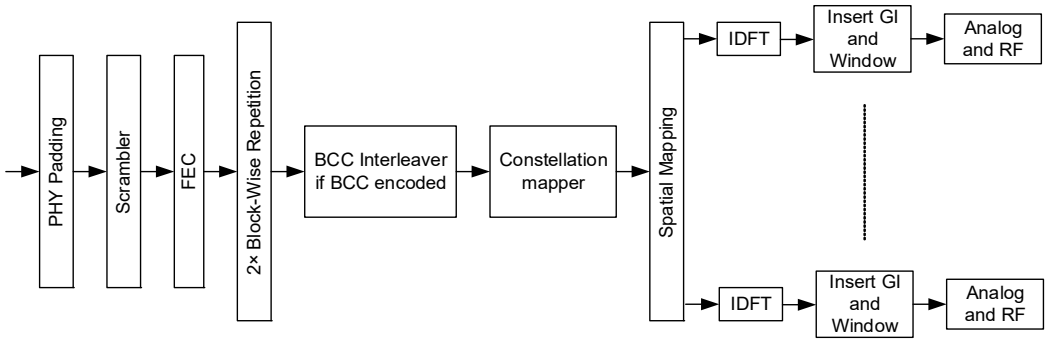

Figure 23-4—Transmitter block diagram for the Data field of an S1G_1M PPDU with BCC or LDPC encoding and MCS 10

23.3.4 Overview of the PPDU encoding process

23.3.4.1 General

This subclause provides an overview of the S1G PPDU encoding process.

23.3.4.2 Construction of the Preamble part in an S1G_LONG PPDU

23.3.4.2.1 Construction of STF

Construct the STF field as defined in 23.3.8.2.2.3 with the following highlights:

a) Determine the CH_BANDWIDTH from the TXVECTOR.
b) Sequence generation: Generate the STF field sequence over the CH_BANDWIDTH as described in 23.3.8.2.3.2.3.
c) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.
d) IDFT: Compute the inverse discrete Fourier transform.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

e) CSD: Apply CSD for each transmit chain and frequency segment as described in 23.3.8.2.3.2.2.

f) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 23.3.7.

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.2.2 Construction of LTF1

Construct the LTF1 field as defined in 23.3.8.2.2.4 with the following highlights:

a) Determine the CH_BANDWIDTH from the TXVECTOR.

b) Sequence generation: Generate the LTF1 field sequence over the CH_BANDWIDTH as described in 23.3.8.2.2.4.

c) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

d) IDFT: Compute the inverse discrete Fourier transform.

e) CSD: Apply CSD for each transmit chain and frequency segment as described in 23.3.8.2.3.2.2.

f) Insert GI and apply windowing: Prepend a GI of 16 μs in duration and apply windowing as described in 23.3.7.

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.2.3 Construction of SIG-A

The SIG-A field consists of two symbols, SIG-A1 and SIG-A2, as defined in 23.3.8.2.3.2.5 and is constructed as follows:

a) Obtain the CH_BANDWIDTH, STBC, MU_SU, GROUP_ID (MU only), PARTIAL_AID (SU only), NUM_STS, GI_TYPE, FEC_CODING, MCS (SU only), NUM_USERS, LENGTH, AGGREGATION (SU only), RESPONSE_INDICATION, BEAM_CHANGE (SU only for single space-time stream), SMOOTHING and TRAVELING_PILOTS from the TXVECTOR. Add the reserved bits, append the calculated 4-bit CRC, then append the N_{tail} tail bits as shown in 23.3.8.2.3.2.5. This operation gives as a result 48 uncoded bits.

b) BCC encoder: Encode the data by a convolutional encoder at the rate of R=1/2 as described in 17.3.5.6.

c) BCC interleaver: Interleave as described in 17.3.5.7.

d) Constellation mapper: QBPSK modulate the first 48 interleaved bits by rotating by 90° counter-clockwise relative to the original BPSK as described in 23.3.8.2.3.2.5 to form the first symbol of SIG-A field. BPSK modulate the second 48 interleaved bits to form the second symbol of SIG-A field.

e) Pilot insertion: Insert pilots as described in 17.3.5.10.

f) Duplication and phase rotation: Duplicate SIG-A1 and SIG-A2 over each 2 MHz of the CH_BANDWIDTH. Apply the appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

g) IDFT: Compute the inverse discrete Fourier transform.

h) CSD: Apply CSD for each transmit chain as described in 23.3.8.2.3.2.2.

i) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

j) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.2.4 Construction of D-STF

The D-STF field is defined in 23.3.8.2.3.3.3 and constructed as follows:

a) Sequence generation: Generate the D-STF field in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.2.3.3.3.

b) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

c) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.3.2.2.

d) Spatial mapping: Apply the Q matrix as described in 23.3.10 and 23.3.9.11.

e) IDFT: Compute the inverse discrete Fourier transform.

f) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.2.5 Construction of D-LTF

The D-LTF field is defined in 23.3.8.2.3.3.4 and constructed as follows:

a) Sequence generation: Generate the D-LTF field sequence in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.2.3.3.4.

b) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

c) A_{LTF} matrix mapping: Apply the P_{HTLTF} matrix to the D-LTF field sequence (the pilot tones are processed differently) as described in 23.3.8.2.3.3.4.

d) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.3.2.2.

e) Spatial mapping: Apply the Q matrix as described in 23.3.10 and 23.3.9.11.

f) IDFT: Compute the inverse discrete Fourier transform.

g) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.

h) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.2.6 Construction of SIG-B

The SIG-B field is constructed per user as follows:

a) Obtain the MCS (for MU only) from the TXVECTOR.

b) SIG-B bits: Set the MCS (for MU only) as described in 23.3.8.2.3.3.5. Add the reserved bits and N_{tail} bits of tail.

c) SIG-B field Bit Repetition: Repeat the SIG-B field bits as a function of CH_BANDWIDTH as defined in 23.3.8.2.3.3.5.

d) BCC encoder: Encode the SIG-B field using BCC at rate R=1/2 as described in 17.3.5.6.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

e) Segment parser (if needed): For a 16 MHz transmission, divide the output bits of the BCC encoder into two frequency subblocks as described in 23.3.9.7. This block is bypassed for 2 MHz, 4 MHz, and 8 MHz S1G PPDU transmissions.

f) BCC interleaver: Interleave as described in 23.3.9.8.

g) Constellation mapper: Map to a BPSK constellation as defined in 17.3.5.8.

h) Segment deparser (if needed): For a 16 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 23.3.9.9.3. This block is bypassed for 2 MHz, 4 MHz, and 8 MHz S1G PPDU transmissions.

i) Pilot insertion: Insert pilots following the steps described in 21.3.10.10.

j) P_{HTLTF} matrix mapping: Apply the mapping of the first column of the P_{HTLTF} matrix to the data subcarriers as described in 23.3.8.2.3.3.5. The total number of data and pilot subcarriers is the same as in the Data field.

k) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.3.2.2.

l) Spatial mapping: Apply the Q matrix as described in 23.3.10 and 23.3.9.11.

m) Phase rotation: Apply the appropriate phase rotations for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

n) IDFT: Compute the inverse discrete Fourier transform.

o) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.

p) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.3 Construction of the Preamble part in an S1G_SHORT PPDU

23.3.4.3.1 Construction of STF

The STF field is defined in 23.3.8.2.2.3 and constructed as follows:

a) Determine the CH_BANDWIDTH from the TXVECTOR.

b) Sequence generation: Generate the STF field in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.2.2.3.

c) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

d) P_{HTLTF} matrix mapping: Apply the mapping of the first column of the P_{HTLTF} matrix to the STF field sequence as described in 23.3.8.2.2.4.

e) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.2.2.

f) Spatial mapping: Apply the Q matrix as described in 23.3.10 and 23.3.9.11.

g) IDFT: Compute the inverse discrete Fourier transform.

h) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.

i) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

23.3.4.3.2 Construction of LTF1

The LTF1 field is defined in 23.3.8.2.2.4 and constructed as follows:

a) Determine FORMAT from TXVECTOR.

b) Sequence generation: If FORMAT is S1G, generate the LTF1 field sequence in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.2.2.4. If format is S1G_DUP_2M, generate the LTF1 field sequence in the frequency domain over a 2 MHz bandwidth.

c) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

d) A_{LTF} matrix mapping: Apply the mapping of the first column of the P_{HTLTF} matrix to the LTF1 field sequence (the pilot tones are processed differently) as described in 23.3.8.2.2.4.

e) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.2.2.

f) Spatial mapping: Apply the Q matrix as described in 23.3.10 and 23.3.9.11.

g) IDFT: Compute the inverse discrete Fourier transform.

h) Insert GI and apply windowing: Prepend a GI of 16 μs in duration and apply windowing as described in 17.3.2.5.

i) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.3.3 Construction of SIG

The SIG field is constructed per-user as follows:

a) Obtain the CH_BANDWIDTH, STBC, PARTIAL_AID, NUM_STS, GI_TYPE, FEC_CODING, MCS, SMOOTHING, NUM_USERS, LENGTH, AGGREGATION, RESPONSE_INDICATION, NDP_INDICATION, TRAVELING_PILOTS, UPLINK_INDICATION, and COLOR, from the TXVECTOR. Add the reserved bits, append the calculated 4-bit CRC, then append the N_{tail} tail bits as shown in 23.3.8.2.2.5. This operation gives as a result 48 uncoded bits.

b) BCC encoder: Encode the data by a convolutional encoder at the rate of R=1/2 as described in 17.3.5.6.

c) BCC interleaver: Interleave as described in 17.3.5.7.

d) Constellation mapper: QBPSK modulate the first 48 interleaved bits as described in 17.3.5.8 to form the first symbol of SIG field. QBPSK modulate the second 48 interleaved bits to form the second symbol of SIG field.

e) Pilot insertion: Insert pilots as described in 17.3.5.10.

f) P_{HTLTF} matrix mapping: Apply the mapping of the first column of the P_{HTLTF} matrix to the data subcarriers as described in 23.3.8.2.2.5.

g) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.2.2.

h) Spatial mapping: Apply the Q matrix as described in 23.3.10 and 23.3.9.11.

i) Duplication and phase rotation: Duplicate two symbols of SIG field over each 2 MHz of the CH_BANDWIDTH. Apply the appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

j) IDFT: Compute the inverse discrete Fourier transform.

k) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

l) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.3.4 Construction of LTF2-LTFN_{LTF}

The LTF2-LTFN_{LTF} field is defined in 23.3.8.2.2.4 and constructed as follows:

a) Sequence generation: Generate the LTF2-LTFN_{LTF} field sequence in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.2.2.4.

b) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

c) A_{LTF} matrix mapping: Apply the mapping of the P_{HTLTF} matrix (from the second column to the last column) to the LTF2-LTFN_{LTF} field sequence (the pilot tones are processed differently) as described in 23.3.8.2.2.4.

d) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.2.2.

e) Spatial mapping: Apply the Q matrix as described in 23.3.10 and 23.3.9.11.

f) IDFT: Compute the inverse discrete Fourier transform.

g) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.

h) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.4 Construction of the Preamble part in an S1G_1M PPDU

23.3.4.4.1 Construction of 1 MHz STF

The 1 MHz STF field is defined in 23.3.8.3.3 and constructed as follows:

a) Determine the CH_BANDWIDTH from the TXVECTOR if S1G 1 MHz Duplicate PPDU.

b) Sequence generation: Generate the 1 MHz STF field in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.3.3. Apply the 3 dB power boosting if the MCS from the TXVECTOR equals MCS 10 as described in 23.3.8.3.3.

c) Phase rotation: Apply appropriate phase rotation for each 1 MHz subchannel if S1G 1 MHz Duplicate PPDU as described in 23.3.9.12 and 23.3.7.

d) P_{HTLTF} matrix mapping: Apply the mapping of the first column of the P_{HTLTF} matrix to the 1 MHz STF field sequence as described in 23.3.8.3.4.

e) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.3.2.

f) Spatial mapping: Apply the Q matrix as described in 23.3.9.11.

g) IDFT: Compute the inverse discrete Fourier transform.

h) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.

i) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.4.2 Construction of 1 MHz LTF1

The 1 MHz LTF1 field is defined in 23.3.8.3.4 and constructed as follows:

a) Determine FORMAT from TXVECTOR.

b) Sequence generation: If FORMAT is S1G, generate the 1 MHz LTF1 field sequence in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.3.4. If FORMAT is S1G_DUP_1M, generate the LTF1 field sequence in the frequency domain over a 1 MHz bandwidth.

c) Phase rotation: Apply appropriate phase rotation for each 1 MHz subchannel if S1G 1 MHz Duplicate PPDU as described in 23.3.9.12 and 23.3.7.

d) A_{LTF} matrix mapping: Apply the mapping of the first column of the P_{HTLTF} matrix to the 1 MHz LTF1 field sequence (the pilot tones are processed differently) as described in 23.3.8.3.4.

e) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.3.2.

f) Spatial mapping: Apply the Q matrix as described in 23.3.9.11.

g) IDFT: Compute the inverse discrete Fourier transform.

h) Insert GI and apply windowing: Prepend a GI of 16 μs in duration for the first two symbols and insert a GI of 8 μs in duration per each subsequent symbol. Apply windowing as described in 17.3.2.5.

i) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.4.3 Construction of 1 MHz SIG

The SIG field is constructed per-user as follows:

a) Obtain the STBC, NUM_STS, GI_TYPE, FEC_CODING, MCS, SMOOTHING, LENGTH, AGGREGATION, RESPONSE_INDICATION, NDP_INDICATION and TRAVELING_PILOTS from the TXVECTOR. Add the reserved bits, append the calculated 4-bit CRC, then append the N_{tail} tail bits as shown in 23.3.8.3.5. This operation gives as a result 36 uncoded bits.

b) BCC encoder: Encode the data by a convolutional encoder at the rate of R=1/2 as described in 17.3.5.6 and apply the block-wise 2 times repetition on a per-OFDM symbol basis.

c) BCC interleaver: Interleave as described in 23.3.9.8.

d) Constellation mapper: BPSK modulate the interleaved bits as described in 17.3.5.8 to form the 6 symbols of SIG field.

e) Pilot insertion: Insert pilots as described in 17.3.5.10.

f) P_{HTLTF} matrix mapping: Apply the mapping of the first column of the P_{HTLTF} matrix to the data subcarriers as described in 23.3.8.3.5.

g) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.3.2.

h) Spatial mapping: Apply the Q matrix as described in 23.3.9.11.

i) Duplication and phase rotation: Duplicate 6 symbols of SIG field over each 1 MHz of the CH_BANDWIDTH if S1G 1 MHz Duplicate PPDU. Apply the appropriate phase rotation for each 1 MHz subchannel as described in 23.3.9.12 and 23.3.7.

j) IDFT: Compute the inverse discrete Fourier transform.

k) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.

l) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.4.4 Construction of 1 MHz LTF2-LTFN_{LTF}

The 1 MHz LTF2-LTFN_{LTF} field is defined in 23.3.8.3.4 and constructed as follows:

a) Sequence generation: Generate the 1 MHz LTF2-LTFN_{LTF} field sequence in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.3.4.

b) Phase rotation: Apply appropriate phase rotation for each 1 MHz subchannel as described in 23.3.9.12 and 23.3.7 if S1G 1 MHz Duplicate PPDU.

c) A_{LTF} matrix mapping: Apply the mapping of the P_{HTLTF} matrix (from the second column to the last column) to the 1 MHz LTF2-LTFN_{LTF} field sequence (the pilot tones are processed differently) as described in 23.3.8.3.4.

d) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.3.2.

e) Spatial mapping: Apply the Q matrix as described in 23.3.9.11.

f) IDFT: Compute the inverse discrete Fourier transform.

g) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.

h) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.5 Construction of Preambles for S1G_DUP_2M and S1G_DUP_1M

For S1G_DUP_2M and S1G_DUP_1M, the preambles are initially constructed according to 23.3.4.3 and 23.3.4.4, respectively.

In the case of S1G_DUP_2M, the initial 2 MHz preamble is duplicated in frequency with phase rotation as defined in 23.3.4.3 to fill the final transmission bandwidth (i.e., 4 MHz, 8 MHz, or 16 MHz) indicated by the TXVECTOR parameter CH_BANDWIDTH.

In the case of S1G_DUP_1M, the initial 1 MHz preamble is duplicated in frequency with phase rotation as defined in 23.3.4.4 to fill the final transmission bandwidth (i.e., 2 MHz, 4 MHz, 8 MHz, or 16 MHz) indicated by the TXVECTOR parameter CH_BANDWIDTH.

23.3.4.6 Construction of Data field in S1G SU PPDUs for all cases except 1 MHz MCS 10

23.3.4.6.1 Using BCC

The construction of the Data field in an S1G SU PPDU with BCC encoding proceeds as follows:

a) SERVICE field: Generate the SERVICE field as described in 23.3.9.2 and append the PSDU to the SERVICE field.

b) PHY padding: Append the PHY pad bits to the PSDU as described in 23.3.9.4.3.2.

c) Scrambler: Scramble the PHY padded data as described in 23.3.9.3.

d) BCC encoder: Divide the scrambled bits between the encoders by sending bits to different encoders in a round robin manner. The number of encoders is determined by rate-dependent parameters described in 23.5. BCC encode as described in 23.3.9.4.2 and 23.3.9.4.3.

e) Stream parser: Rearrange the output of the BCC encoders into blocks as described in 23.3.9.6.

f) Segment parser (if needed): For a contiguous 16 MHz transmission, divide the output bits of each stream parser into two frequency subblocks as described in 23.3.9.7. This block is bypassed for 1 MHz, 2 MHz, 4 MHz, and 8 MHz S1G PPDU transmissions.

g) BCC interleaver: Interleave as described in 23.3.9.8.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

h) Constellation mapper: Map to BPSK, QPSK, 16-QAM, 64-QAM, 256-QAM, or 1024-QAM constellation points as described in 23.3.9.9.

i) Segment deparser (if needed): For a contiguous 16 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 23.3.9.9.3. This block is bypassed for 1 MHz, 2 MHz, 4 MHz, and 8 MHz S1G PPDU transmissions.

j) STBC: Apply STBC as described in 23.3.9.9.4.

k) Pilot insertion: Insert pilots following the steps described in 23.3.9.10.

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.2.2 if S1G_SHORT preamble is used, 23.3.8.2.3.3.2 if S1G_LONG preamble is used and 23.3.8.3.2 if S1G_1M preamble is used.

m) Spatial mapping: Apply the Q matrix as described in 23.3.10 and in 23.3.9.11.

n) Phase rotation: Apply the appropriate phase rotations for each 2 MHz subchannel if 2 MHz preamble is used or for each 1 MHz subchannel if S1G 1 MHz Duplicate PPDU as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

o) IDFT: Compute the inverse discrete Fourier transform.

p) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 17.3.2.5. If the TXVECTOR parameter GI_TYPE equals LONG_GI, the GI duration shall be 8 μs. If the GI_TYPE parameter is SHORT_GI, the GI duration shall be 8 μs for the first OFDM symbol of the Data field, and 4 μs for all subsequent OFDM symbols.

q) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.6.2 Using LDPC

The construction of the Data field in an S1G SU PPDU with LDPC encoding proceeds as follows:

a) SERVICE field: Generate the SERVICE field as described in 23.3.9.2 and append the PSDU to the SERVICE field.

b) PHY padding: Append the PHY pad bits to the PSDU as described in 23.3.9.4.4.2.

c) Scrambler: Scramble the PHY padded data as described in 23.3.9.3.

d) LDPC encoder: The scrambled bits are encoded using the LDPC code with the LENGTH from the TXVECTOR as described in 23.3.9.4.4.

e) Stream parser: The output of the LDPC encoder is rearranged into blocks as described in 23.3.9.6.

f) Segment parser (if needed): For a contiguous 16 MHz transmission, divide the output bits of each stream parser into two frequency subblocks as described in 23.3.9.7. This block is bypassed for 1 MHz, 2 MHz, 4 MHz, and 8 MHz S1G PPDU transmissions.

g) Constellation mapper: Map to BPSK, QPSK, 16-QAM, 64-QAM, 256-QAM, or 1024-QAM constellation points as described in 23.3.9.9.

h) LDPC tone mapper: The LDPC tone mapping shall be performed on all LDPC encoded streams as described in 23.3.9.9.2. LDPC tone mapper is bypassed for 1 MHz transmission.

i) Segment deparser (if needed): For a contiguous 16 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 23.3.9.9.3. This block is bypassed for 1 MHz, 2 MHz, 4 MHz, and 8 MHz S1G PPDU transmissions.

j) STBC: Apply STBC as described in 23.3.9.9.4.

k) Pilot insertion: Insert pilots following the steps described in 23.3.9.10.

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.2.2 if S1G_SHORT preamble is used, 23.3.8.2.3.3.2 if S1G_LONG preamble is used and 23.3.8.3.2 if S1G_1M preamble is used.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

m) Spatial mapping: Apply the *Q* matrix as described in 23.3.10 and in 23.3.9.11.

n) Phase rotation: Apply the appropriate phase rotations for each 2 MHz subchannel if 2 MHz preamble is used or for each 1 MHz subchannel if S1G 1 MHz Duplicate PPDU as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

o) IDFT: Compute the inverse discrete Fourier transform.

p) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 17.3.2.5. If the TXVECTOR parameter GI_TYPE equals LONG_GI, the GI duration shall be 8 μs. If the GI_TYPE parameter is SHORT_GI, the GI duration shall be 8 μs for the first OFDM symbol of the Data field, and 4 μs for all subsequent OFDM symbols.

q) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.7 Construction of the Data field in an S1G SU PPDU (1 MHz MCS 10 mode)

23.3.4.7.1 Using BCC

The construction of the Data field in an S1G SU PPDU (1 MHz MCS 10 mode) with BCC encoding proceeds as follows:

a) SERVICE field: Generate the SERVICE field as described in 23.3.9.2 and append the PSDU to the SERVICE field.

b) PHY padding: Append the PHY pad bits to the PSDU as described in 23.3.9.4.3.2.

c) Scrambler: Scramble the PHY padded data as described in 23.3.9.3.

d) BCC encoder: BCC encode as described in 23.3.9.4.2 and 23.3.9.4.3.

e) Block repetition: Apply the block-wise 2 times repetition on a per-OFDM symbol basis as described in 23.3.9.5.

f) BCC interleaver: Interleave as described in 23.3.9.8.

g) Constellation mapper: Map to BPSK constellation points as described in 23.3.9.9.

h) Pilot insertion: Insert pilots following the steps described in 23.3.9.10.

i) Spatial mapping: Apply the *Q* matrix as described in 23.3.9.11.

j) Phase rotation: Apply appropriate phase rotation for each 1 MHz subchannel if S1G 1 MHz Duplicate PPDU as described in 23.3.9.12 and 23.3.7.

k) IDFT: Compute the inverse discrete Fourier transform.

l) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 17.3.2.5. If the TXVECTOR parameter GI_TYPE equals LONG_GI, the GI duration shall be 8 μs. If the GI_TYPE parameter is SHORT_GI, the GI duration shall be 8 μs for the first OFDM symbol of the Data field, and 4 μs for all subsequent OFDM symbols.

m) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.7.2 Using LDPC

The construction of the Data field in an S1G SU PPDU (1 MHz MCS 10 mode) with LDPC encoding proceeds as follows:

a) SERVICE field: Generate the SERVICE field as described in 23.3.9.2 and append the PSDU to the SERVICE field.

b) PHY padding: Append the PHY pad bits to the PSDU as described in 23.3.9.4.4.2.

c) Scrambler: Scramble the PHY padded data as described in 23.3.9.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

d) LDPC encoder: The scrambled bits are encoded using the LDPC code with the LENGTH from the TXVECTOR as described in 23.3.9.4.4.

e) Block repetition: Apply the block-wise 2 times repetition on a per-OFDM symbol basis as described in 23.3.9.5.

f) Constellation mapper: Map to BPSK constellation points as described in 23.3.9.9.

g) Pilot insertion: Insert pilots following the steps described in 23.3.9.10.

h) Spatial mapping: Apply the Q matrix as described in 23.3.9.11.

i) Phase rotation: Apply appropriate phase rotations for each 1 MHz subchannel if S1G 1 MHz Duplicate PPDU as described in 23.3.9.12 and 23.3.7.

j) IDFT: Compute the inverse discrete Fourier transform.

k) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 17.3.2.5. If the TXVECTOR parameter GI_TYPE equals LONG_GI, the GI duration shall be 8 μs. If the GI_TYPE parameter is SHORT_GI, the GI duration shall be 8 μs for the first OFDM symbol of the Data field, and 4 μs for all subsequent OFDM symbols.

l) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.8 Construction of the Data field in an S1G MU PPDU

23.3.4.8.1 General

For an MU transmission, the PPDU encoding process is performed on a per-user basis up to the input of the spatial mapping block except that the CSD is applied across users as described in 23.3.8.2.3.3.2 if an S1G_LONG preamble is used. All user data is combined and mapped to the transmit chains in the spatial mapping block. An S1G_1M PPDU, or an S1G_SHORT PPDU, or an 2 MHz S1G duplicate PPDU in S1G_LONG format shall not be used for an MU transmission.

23.3.4.8.2 Using BCC

A Data field with BCC encoding is constructed using the process described in 23.3.4.6.1 and 23.3.4.7.1 before the spatial mapping block and repeated for each user that uses BCC encoding.

23.3.4.8.3 Using LDPC

A Data field with LDPC encoding is constructed using the process described in 23.3.4.6.2 and 23.3.4.7.2 before the spatial mapping block and repeated for each user that uses LDPC encoding.

23.3.4.8.4 Combining to form an S1G MU PPDU

The per-user data is combined as follows:

a) Spatial Mapping: Apply the Q matrix as described in 23.3.10. The combining of all user data is done in this block.

b) Phase rotation: Apply the appropriate phase rotations for each 2 MHz subchannel as described in 23.3.9.11 and 23.3.7.

c) IDFT: Compute the inverse discrete Fourier transform.

d) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 17.3.2.5. If the TXVECTOR parameter GI_TYPE equals LONG_GI, the GI duration shall be 8 μs. If the GI_TYPE parameter is SHORT_GI, the GI duration shall be 8 μs for the first OFDM symbol of the Data field, and 4 μs for all subsequent OFDM symbols.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

e) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.5 Modulation and coding scheme

The S1G-MCS is a value that determines the modulation and coding used in the Data field of the PPDU. It is a compact representation that is carried in the SIG field or SIG-A field for S1G SU PPDUs and in the SIG-B field for S1G MU PPDUs using S1G_LONG. Rate-dependent parameters for the full set of S1G-MCSs are shown in Table 23-42 to Table 23-61 (in 23.5).

Table 23-42 to Table 23-61 give rate-dependent parameters for S1G-MCSs with indices 0 to 9 (and index 10 solely for 1 MHz, $N_{SS} = 1$), with number of spatial streams from 1 to 4 and bandwidth options of 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz. Equal modulation is applied to all streams for a particular user.

23.3.6 Timing-related parameters

Table 23-5 defines the timing-related parameters for all S1G PPDU formats, except the SIG field in S1G_SHORT, and the SIG-A field in S1G_LONG. Note that the timing-related parameters for the SIG field in S1G_1M PPDU and the SIG-B field in S1G_LONG are the same as those defined for the Data field as shown in Table 23-5.

Table 23-5—Timing-related constants

Parameter	CBW1	CBW2	CBW4	CBW8	CBW16	Description
N_{SD}	24	52	108	234	468	Number of data subcarriers per OFDM symbol
N_{SP}	2	4	6	8	16	Number of pilot subcarrier per OFDM symbol
N_{ST}	26	56	114	242	484	Total number of useful subcarriers per OFDM symbol
N_{SR}	13	28	58	122	250	Highest data subcarrier index per OFDM symbol
Δ_F	31.25 kHz					Subcarrier frequency spacing
T_{DFT}	32 μs = $1/\Delta_F$					IDFT/DFT period
T_{GI}	8 μs = $T_{DFT}/4$					Guard interval duration
T_{GI2}	16 μs					Double guard interval
T_{GIS}	4 μs = $T_{DFT}/8$					Short guard interval duration
T_{SYML}	40 μs = $T_{DFT} + T_{GI} = 1.25 \times T_{DFT}$					Duration of OFDM symbol with normal guard interval

Table 23-5—Timing-related constants *(continued)*

Parameter	CBW1	CBW2	CBW4	CBW8	CBW16	Description
T_{SYMS}	36 μs = T_{DFT} + T_{GIS} = 1.125 × T_{DFT}					Duration of OFDM symbol with short guard interval
T_{SYM}	T_{SYML} or T_{SYMS} depending on the GI used					OFDM symbol duration
T_{STF}	160 μs = 4 × T_{SYML}	80 μs = 2 × T_{SYML}				STF field duration
T_{DSTF}	N/A	40 μs = T_{SYML}				S1G_LONG preamble D-STF field duration
T_{LTF1}	160 μs = 4 × T_{DFT} + 2 × T_{GI} + T_{GI2}	80 μs = 2 × T_{DFT} + T_{GI2}				First LTF field duration
T_{LTF}	40 μs = T_{SYML}					Second and subsequent LTF field duration
T_{DLTF}	N/A	40 μs = T_{SYML}				S1G_LONG preamble D-LTF field duration
T_{SIG}	240 μs = 6 × T_{SYML}	80 μs = 2 × T_{SYML}				SIG field duration
T_{SIG-A}	N/A	80 μs = 2 × T_{SYML}				S1G_LONG preamble SIG-A field duration
T_{SIG-B}	N/A	40 μs = T_{SYML}				S1G_LONG preamble SIG-B field duration
Nservice	8					Number of bits in the SERVICE field
N_{tail}	6					Number of tail bits per BCC encoder

NOTE— $N_{ST} = N_{SD} + N_{SP}$.

Table 23-6 defines the timing-related parameters for the SIG field in S1G_SHORT, or the SIG-A field in S1G_LONG. Note that short/double guard interval is not used for SIG/SIG-A field in ≥ 2 MHz PPDUs.

Table 23-6—Timing-related constants for SIG/SIG-A field in ≥ 2 MHz PPDUs

Parameter	CBW1	CBW2	CBW4	CBW8	CBW16	Description
N_{SD}	N/A	48	48	48	48	Number of data subcarriers per OFDM symbol per 2 MHz subchannel
N_{SP}	N/A	4	4	4	4	Number of pilot subcarrier per OFDM symbol per 2 MHz subchannel
N_{ST}	N/A	52	52	52	52	Total number of useful subcarriers per OFDM symbol per 2 MHz subchannel
N_{SR}	N/A	26	56	120	248	Highest data subcarrier index per OFDM symbol
Δ_F	N/A	31.25 kHz				Subcarrier frequency spacing
T_{DFT}	N/A	32 μs = $1/\Delta_F$				IDFT/DFT period
T_{GI}	N/A	8 μs = $T_{DFT}/4$				Guard interval duration
T_{SYM}	N/A	40 μs = $T_{DFT} + T_{GI} = 1.25 \times T_{DFT}$				OFDM symbol duration
T_{SIG}	N/A	80 μs = $2 \times T_{SYM}$				SIG field duration
$T_{SIG\text{-}A}$	N/A	80 μs = $2 \times T_{SYM}$				S1G_LONG preamble SIG-A field duration

Table 23-7 defines parameters used frequently in Clause 23.

Table 23-7—Frequently used parameters

Symbol	Explanation
N_{CBPS}, $N_{CBPS,u}$	Number of coded bits per symbol for user u, u = 0, ..., N_u–1. For an S1G SU PPDU, $N_{CBPS} = N_{CBPS,0}$. For an S1G MU PPDU, N_{CBPS} is undefined.
N_{CBPSS}, $N_{CBPSS,u}$	Number of coded bits per symbol per spatial stream. For the SIG-B field in S1G_LONG, $N_{CBPSS} = N_{SD}$ for all users. For the Data field, $N_{CBPSS,u}$ equals the number of coded bits per symbol per spatial stream for user u, u = 0, ..., N_u–1. For the Data field of an S1G SU PPDU, $N_{CBPSS} = N_{CBPSS,0}$. For the Data field of an S1G MU PPDU, N_{CBPSS} is undefined.
N_{CBPSSI}, $N_{CBPSSI,u}$	Number of coded bits per symbol per spatial stream per BCC interleaver block. For an S1G SU PPDU, $N_{CBPSSI} = \begin{cases} N_{CBPSS}, \text{ for 1 MHz, 2 MHz, 4 MHz, or 8 MHz} \\ \frac{N_{CBPSS}}{2}, \text{ for a 16 MHz PPDU} \end{cases}$ For an S1G MU PPDU for user u, u = 0, ..., N_u–1 $N_{CBPSSI,u} = \begin{cases} N_{CBPSS,u}, \text{ for 1 MHz, 2 MHz, 4 MHz, or 8 MHz} \\ \frac{N_{CBPSS,u}}{2}, \text{ for a 16 MHz PPDU} \end{cases}$
N_{DBPS}, $N_{DBPS,u}$	Number of data bits per symbol for user u, u = 0, ..., N_u–1. For an S1G SU PPDU, $N_{DBPS} = N_{DBPS,0}$. For an S1G MU PPDU, N_{DBPS} is undefined.
N_{BPSCS}, $N_{BPSCS,u}$	Number of coded bits per subcarrier per spatial stream for user u, u = 0, ..., N_u–1. For an S1G SU PPDU, $N_{BPSCS} = N_{BPSCS,0}$. For an S1G MU PPDU, N_{BPSCS} is undefined.
N_{RX}	Number of receive chains.
N_u	For S1G_LONG, the omnidirectional portion always has N_u=1, and in the beam changeable portion, N_u represents the number of users in the transmission (equal to the TXVECTOR parameter NUM_USERS). For S1G_1M and S1G_SHORT, N_u=1.
N_{STS}, $N_{STS,u}$	Number of space-time streams. For S1G_LONG, the omnidirectional portion always has $N_{STS,u}$=1 (see NOTE); and for the beam changeable portion $N_{STS,u}$ is the number of space-time streams for user u, u = 0,…, N_u–1. For S1G_1M and S1G_SHORT,$N_{STS} = N_{STS,0}$. For an S1G SU PPDU, $N_{STS} = N_{STS,0}$; for an S1G MU PPDU, N_{STS} is undefined.

Table 23-7—Frequently used parameters *(continued)*

Symbol	Explanation
$N_{STS,total}$	For S1G_1M, S1G_SHORT, and the beam changeable portion of S1G_LONG, $N_{STS,total}$ is the total number of space-time streams in a PPDU. $N_{STS,total} = \sum_{u=0}^{N_u-1} N_{STS,u}$ For the omnidirectional portion of S1G_LONG, $N_{STS,total}$ is undefined. Note that $N_{STS,total} = N_{STS}$ for an S1G SU PPDU.
N_{SS}, $N_{SS,u}$	Number of spatial streams. For S1G_LONG, the omnidirectional portion always has $N_{SS,u}=1$ (see NOTE); and for the beam changeable portion $N_{SS,u}$ is the number of spatial streams for user u, $u = 0,\ldots, N_u-1$. For S1G_1M and S1G_SHORT, $N_{SS} = N_{SS,0}$. For an S1G SU PPDU, $N_{SS} = N_{SS,0}$; for an S1G MU PPDU, N_{SS} is undefined.
N_{TX}	Number of transmit chains.
N_{ES}, $N_{ES,u}$	The number of BCC encoders. For the SIG-B field of S1G_LONG, $N_{ES}=1$ for each user. For the beam changeable portion of S1G_LONG, $N_{ES,u}$ is the number of BCC encoders for the Data field for user u, $u = 0,\ldots, N_u-1$. For the Data field of an S1G SU PPDU, $N_{ES} = N_{ES,0}$. For the Data field of an S1G MU PPDU, N_{ES} is undefined. For the Data field encoded using LDPC, $N_{ES}=1$ for an S1G SU PPDU and $N_{ES,u}=1$ for an S1G MU PPDU for user u, $u = 0,\ldots, N_u-1$.
N_{LTF}	Number of long training fields in S1G_1M or S1G_SHORT; or the number of data long training fields in S1G_LONG (see 23.3.8.2.2.4, 23.3.8.2.3.3.3, and 23.3.8.3.4)
R, R_u	R_u is the coding rate for user u, $u = 0, \ldots, N_u-1$. For an S1G SU PPDU, $R = R_0$ For an S1G MU PPDU, R is undefined
M_u	For the omnidirectional portion of S1G_LONG, $M_u = 0$. Otherwise, $M_u = \sum_{u'=0}^{u-1} N_{STS,u'}$ with $M_0 = 0$.
NOTE—For the omnidirectional portion of S1G_LONG, u is 0 only since $N_u=1$.	

23.3.7 Mathematical description of signals

For a description of the conventions used for the mathematical description of the signals, see 17.3.2.5.

For a 1 MHz S1G PPDU transmission, the 1 MHz is divided into 32 subcarriers. The signal is transmitted on subcarriers –13 to –1 and 1 to 13, with 0 being the center (DC) subcarrier.

For a 2 MHz S1G PPDU transmission, the 2 MHz is divided into 64 subcarriers. The signal is transmitted on subcarriers –28 to –1 and 1 to 28, with 0 being the center (DC) subcarrier.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For a 4 MHz S1G PPDU transmission, the 4 MHz is divided into 128 subcarriers. The signal is transmitted on subcarriers –58 to –2 and 2 to 58.

For an 8 MHz S1G PPDU transmission, the 8 MHz is divided into 256 subcarriers. The signal is transmitted on subcarriers –122 to –2 and 2 to 122.

For a 16 MHz S1G PPDU transmission, the 16 MHz is divided into 512 subcarriers. The signal is transmitted on subcarriers –250 to –130, –126 to –6, 6 to 126, and 130 to 250.

The transmitted signal is described in complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal by the relation shown in Equation (23-1).

$$r_{RF}(t) = \mathrm{Re}\{r(t)\exp(j2\pi f_c t)\} \tag{23-1}$$

where

f_c represents the center frequency of the carrier

The transmitted RF signal is derived by upconverting the complex baseband signal, which consists of several fields. The timing boundaries for the various fields of the different PPDU formats are shown in Figure 23-5, where N_{LTF} is the number of LTF or D-LTF field symbols and is defined in Table 23-11 (in 23.3.8.2.2.4), for up to $N_{STS,Total} = 4$.

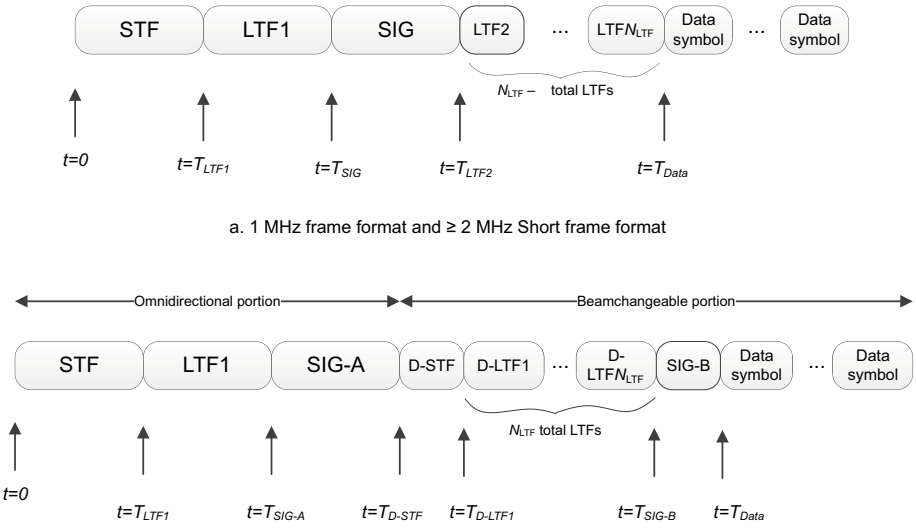

Figure 23-5—Timing boundaries for S1G PPDU fields

The time offset, t_{Field}, determines the starting time of the corresponding field.

For the S1G_1M PPDU PPDU format and the S1G_SHORT PPDU PPDU format, the signal transmitted on transmitted on transmit chain i_{TX} shall be as shown in Equation (23-2).

$$\begin{aligned} r_{PPDU}^{i_{TX}}(t) &= r_{STF}^{i_{TX}}(t) + r_{LTF1}^{i_{TX}}(t - t_{LTF1}) + r_{SIG}^{i_{TX}}(t - t_{SIG}) \\ &+ \sum_{}^{N_{LTF}} r_{LTF}^{(i_{TX}, i_{LTF})}(t - t_{LTF2} - (i_{LTF} - 2)T_{LTF}) + r_{Data}^{i_{TX}}(t - t_{Data}) \end{aligned} \tag{23-2}$$

where

$$\begin{aligned} t_{LTF} &= T_{STF} \\ t_{SIG} &= t_{LTF1} + T_{LTF1} \\ t_{LTF2} &= t_{SIG} + T_{SIG} \\ t_{Data} &= t_{LTF2} + (N_{LTF} - 1)T_{LTF} \end{aligned}$$

For the S1G_LONG PPDU format, the signal transmitted on transmit chain *iTX* shall be as shown in Equation (23-3).

$$\begin{aligned} r_{\text{PPDU}}^{(i_{\text{TX}})}(t) &= r_{\text{STF}}^{(i_{\text{TX}})}(t) + r_{\text{LTF1}}^{(i_{\text{TX}})}(t - t_{\text{LTF1}}) + r_{\text{SIG-A}}^{(i_{\text{TX}})}(t - t_{\text{SIG}}) + r_{\text{D-STF}}^{(i_{\text{TX}})}(t - t_{D-STF}) \\ &+ \sum_{i_{\text{LTF}}=1}^{N_{\text{LTF}}} r_{\text{D-LTF}}^{(i_{\text{TX}}, i_{\text{LTF}})}(t - t_{\text{D-LTF1}} - (i_{\text{LTF}} - 1)T_{\text{LTF}}) + r_{\text{SIG-B}}^{(i_{\text{TX}})}(t - t_{\text{SIG-B}}) + r_{\text{Data}}^{(i_{\text{TX}})}(t - t_{\text{Data}}) \end{aligned} \tag{23-3}$$

where

$$\begin{aligned} t_{\text{LTF1}} &= T_{\text{STF}} \\ t_{\text{SIG-A}} &= t_{\text{LTF1}} + T_{\text{LTF1}} \\ t_{\text{D-STF}} &= t_{\text{SIG-A}} + T_{\text{SIG-A}} \\ t_{\text{D-LTF1}} &= t_{\text{D-STF}} + T_{\text{D-STF}} \\ t_{\text{SIG-B}} &= t_{\text{D-LTF1}} + N_{\text{LTF1}} \cdot T_{\text{LTF}} \\ t_{\text{Data}} &= t_{\text{SIG-B}} + T_{\text{SIG-B}} \end{aligned}$$

Each field, $r_{Field}^{(i_{\text{TX}})}(t)$, is defined as the summation of one or more subfields, where each subfield is defined to be an inverse discrete Fourier transform as specified in Equation (23-4).

$$\begin{aligned} r_{\text{Field}}^{(i_{\text{TX}})}(t) = \frac{1}{\sqrt{N_{\text{Field}}^{\text{Tone}} N_{\text{Norm}}}} w_{T_{\text{Field}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_u-1} \sum_{m=1}^{N_{STS,u}} \left[Q_k\right]_{i_{TX},(M_u+m)} \Upsilon_{k,\text{BW}} X_{k,u}^{(m)} \\ \exp\left(j2\pi k \Delta_F (t - T_{GI,Field} - T_{CS}(M_u + m))\right) \end{aligned} \tag{23-4}$$

This general representation holds for all subfields. When the bandwidth is greater than or equal to 2 MHz and the S1G_LONG format is used, the total power of the time domain beam changeable portion field signals summed over all transmit chains should not exceed the total power of the time domain omnidirectional portion signals summed over all transmit chains. For notational simplicity, the parameter BW is omitted from some bandwidth dependent terms.

Table 23-8 summarizes the various values of $N_{\text{Field}}^{\text{Tone}}$ as a function of bandwidth per frequency segment.

Table 23-8—Tone scaling factor and guard interval duration values for PHY fields

Field	$N_{\text{Field}}^{\text{Tone}}$ as a function of bandwidth per frequency segment					Guard interval duration
	1 MHz	2 MHz	4 MHz	8 MHz	16 MHz	
STF	6	12	24	48	96	N/A (See NOTE 2)
LTF1	26	56	114	242	484	For bandwidths ≥ 2 MHz, duration is T_{GI2}. For 1 MHz bandwidth, duration is T_{GI2} for first and second symbols, and T_{GI} for third and fourth symbols.
S1G_DUP_1M-LTF1 (see NOTE 4)	N/A	52	104	208	416	Duration is T_{GI2} for first and second symbols, and T_{GI} for third and fourth symbols.
S1G_DUP_2M-LTF1 (see NOTE 4)	N/A	N/A	112	224	448	T_{GI2}
SIG	26	52	104	208	416	T_{GI}
SIG-A for long format	N/A	52	104	208	416	T_{GI}
D-STF for long format	N/A	12	24	48	96	N/A
LTF2~LTFN_{LTF}	26	56	114	242	484	T_{GI}
S1G_DUP_1M-LTF2~LTFN_{LTF} (see NOTE 4)	N/A	52	104	208	416	T_{GI}
S1G_DUP_2M-LTF2~LTFN_{LTF} (see NOTE 4)	N/A	N/A	112	224	448	T_{GI}
D-LTF for long format	N/A	56	114	242	484	T_{GI}
SIG-B for long format	N/A	56	114	242	484	T_{GI}
First Data Symbol	26	56	114	242	484	T_{GI} (see NOTE 3)

Table 23-8—Tone scaling factor and guard interval duration values for PHY fields *(continued)*

Field	$N_{\text{Field}}^{\text{Tone}}$ as a function of bandwidth per frequency segment					Guard interval duration
	1 MHz	2 MHz	4 MHz	8 MHz	16 MHz	
From second to the last Data Symbols	26	56	114	242	484	T_{GI} or T_{GIS} (see NOTE 3)
S1G_DUP_1M-Data (see NOTE 1)	N/A	52	104	208	416	T_{GI} or T_{GIS} (see NOTE 3)
S1G_DUP_2M-Data (see NOTE 1)	N/A	N/A	112	224	448	T_{GI} or T_{GIS} (see NOTE 3)

NOTE 1—For notational convenience, S1G_DUP_1M-Data and S1G_DUP_2M-Data is used as a label for the Data field of a duplicate PPDU with format type S1G_DUP_1M or S1G_DUP-2M, respectively.

NOTE 2—The OFDM symbols of the STF field do not have a guard interval, therefore its duration is not applicable.

NOTE 3—T_{GI} denotes guard interval duration when TXVECTOR parameter GI_TYPE equals LONG_GI, T_{GIS} denotes short guard interval duration when TXVECTOR parameter GI_TYPE equals SHORT_GI. Regardless of the GI_TYPE value in TXVECTOR, the first Data OFDM symbol always uses T_{GI} as its guard interval duration.

NOTE 4—For notational convenience, S1G_DUP_1M-LTF1 and S1G_DUP_2M-LTF1 are used as a label for the LTF1 of a duplicate PPDU with format type S1G_DUP_1M or S1G_DUP_2M, respectively, and S1G_DUP_1M-LTF2~LTFN_{LTF} and S1G_DUP_2M-LTF2~LTFN_{LTF} are used as a label for the LTF2~LTFN_{LTF} of a duplicate PPDU with format type S1G_DUP_1M or S1G_DUP_2M, respectively.

N_{Norm} for the omnidirectional portion of the S1G_LONG, $N_{\text{Norm}} = N_{\text{TX}}$, for all other cases, $N_{\text{Norm}} = N_{STS,total}$, where $N_{STS,total}$ is given in Table 23-7.

$w_{\text{T}_{\text{Field}}}(t)$ is a windowing function. An example function, $w_{\text{T}_{\text{Field}}}(t)$, is given in 17.3.2.5.

T_{Subfield} is the duration of the subfield being referenced, and its usage is as follows:

- T_{STF} for the STF field, $T_{D\text{-}STF}$ for the D-STF field
- T_{LTF1} for the LTF1 field
- T_{SIG} for the SIG field, $T_{SIG\text{-}A}$ for the SIG-A field
- T_{LTF} for the LTF2~LTFN_{LTF} fields for the S1G_1M, the S1G_SHORT format, and for the D-LTFs fields in the S1G_LONG format
- $T_{SIG\text{-}B}$ field for the SIG-B

N_u is defined in Table 23-7.

N_{SR} is the highest data subcarrier index per frequency segment and has values listed in Table 23-5 and in Table 23-6.

$N_{STS,u}$ is defined in Table 23-7.

M_u is defined in Table 23-7.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$[X]_{a,\,b}$ indicates the element in row a and column b of the matrix X, where $1 \le a \le N_{\text{row}}$, and $1 \le b \le N_{\text{col}}$. N_{row} and N_{col} are the number of rows and columns, respectively, of the matrix X.

Q_k is the spatial mapping matrix for the subcarrier k. For the omnidirectional portion of S1G_LONG, Q_k is a column vector, denoted as $Q_k^{(omni)}$, with N_{TX} elements with element i_{TX} being $\exp(-j2\pi k\Delta_F T_{CS}^{i_{TX}})$, where $T_{CS}^{i_{TX}}$ represents the cyclic shift for transmitter chain i_{TX} whose values are given in Table 23-13 (in 23.3.8.2.3.2.2). For other cases, Q_k is a matrix with N_{TX} rows and $N_{STS,total}$ columns.

Δ_F is the subcarrier frequency spacing given in Table 23-5.

$X_{k,\,u}^{(m)}$ is the frequency domain symbol in subcarrier k of user u for of space-time stream m. Some of the $X_{k,\,u}^{(m)}$ within $-N_{\text{SR}} \le k \le N_{\text{SR}}$ have a value of zero. Examples of such cases include the DC tones, guard tones on each side of the transmit spectrum, as well as the unmodulated tones of STF and D-STF fields.

$T_{GI,Field}$ is the guard interval duration used for each OFDM symbol in the field. The value for each field is defined in Table 23-8. T_{GI}, T_{GI2} and T_{GIS} are defined in Table 23-5.

$T_{CS}(l)$ for the omnidirectional portion of S1G_LONG, $T_{CS}(l) = 0$. For the other cases, $T_{CS}(l)$ represents the cyclic shift per space-time stream, whose value is defined in Table 23-10 (in 23.3.8.2.2.2) for ≥ 2 MHz, and Table 23-18 (in 23.3.8.3.2).

The function $\Upsilon_{k,\,\text{BW}}$ is used to represent a rotation of the tones. BW in $\Upsilon_{k,\,\text{BW}}$ is determined by the TXVECTOR parameter CH_BANDWIDTH as defined in Table 23-9.

Table 23-9—CH_BANDWIDTH and Gamma sub$_{\text{k, BW}}$

CH_BANDWIDTH	$\Upsilon_{k,\text{BW}}$
CBW1	$\Upsilon_{k,1}$
CBW2	$\Upsilon_{k,2}$
CBW4	$\Upsilon_{k,4}$
CBW8	$\Upsilon_{k,8}$
CBW16	$\Upsilon_{k,16}$

If CH_BANDWIDTH is CBW1,

$$\Upsilon_{k,1} = 1 \tag{23-5}$$

If FORMAT is S1G_DUP_1M and CH_BANDWIDTH is CBW16,

$$\Upsilon_{k,16} = \begin{cases} 1, & k < -160 \\ -1, & -160 \le k < -128 \\ 1, & -128 \le k < -32 \\ -1, & -32 \le k < 64 \\ 1, & 64 \le k < 96 \\ -1, & 96 \le k < 128 \\ 1, & 128 \le k < 192 \\ -1, & 192 \le k < 224 \\ 1, & 224 \le k \end{cases} \quad (23\text{-}13)$$

23.3.8 S1G preamble

23.3.8.1 Introduction

Three preamble formats are defined that correspond to the three non-duplicate S1G PPDU formats: the S1G_1M preamble, the S1G_SHORT preamble, and the S1G_LONG preamble. The first two preamble formats are defined solely for single user, and the third preamble format may be used in either single user or multi-user PPDUs. The duplicate mode PPDU formats S1G_DUP_2M and S1G_DUP_1M use the S1G_SHORT and S1G_1M preambles, respectively.

All numeric fields are transmitted in unsigned format, LSB first.

23.3.8.2 Formats for greater than or equal to 2 MHz

23.3.8.2.1 Introduction

This subclause describes the preamble formats used for non-duplicate S1G PPDUs of 2 MHz and greater and duplicate S1G_DUP_2M PPDUs.

23.3.8.2.2 S1G_SHORT preamble

23.3.8.2.2.1 General

The S1G_SHORT preamble is used for the S1G_SHORT and S1G_DUP_2M PPDU formats and is only used for SU transmissions. The S1G_SHORT preamble is structured similarly to the Greenfield format as defined in Clause 19.

23.3.8.2.2.2 Cyclic shift for S1G modulated fields

The cyclic shift values defined in this subclause apply to the STF, LTF, SIG and Data fields of the S1G_SHORT preamble PPDU, for ≥ 2 MHz transmit bandwidths. Throughout the S1G_SHORT preamble, cyclic shifts are applied to prevent beamforming when similar signals are transmitted in different space-time streams. The STF, LTF, and SIG fields start as single stream during generation but are replicated up to $N_{STS,total}$ streams. For the LTF, these replicated streams undergo P-matrix mapping prior to CSD application as shown in Figure 23-6 (in 23.3.8.2.2.4). For the STF and SIG the CSDs are applied per stream immediately after replication. The same cyclic shift is applied to the $N_{STS,total}$ streams during the transmission of the Data field of the S1G_SHORT preamble PPDU. The cyclic shift value $T_{CS}(n)$ for space-time stream n out of $N_{STS,total}$ total space-time streams is shown in Table 23-10.

3	0	−4	−2	—
4	0	−4	−2	−6

23.3.8.2.2.3 STF definition

The STF field for a 2 MHz or 4 MHz transmission is defined by Equation (19-8) and Equation (19-9), respectively, in 19.3.9.3.3. For a 8 MHz or 16 MHz transmission, the STF field is defined by Equation (21-18) and Equation (21-19), respectively, in 21.3.8.2.2. Note that these equations do not include the phase rotation per 2 MHz subchannel.

The time domain representation of the STF field signal at transmit chain i_{TX} shall be as specified in Equation (23-14).

$$r_{\mathrm{STF}}^{(i_{\mathrm{TX}})}(t) = \frac{1}{\sqrt{N_{\mathrm{STF}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} w_{T_{\mathrm{STF}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left[Q_k \right]_{i_{TX},m} \left[P_{HTLTF} \right]_{m,1} \Upsilon_{k,\mathrm{BW}} S_k \exp\left(j2\pi k \Delta_F (t - T_{CS}(m)) \right) \quad (23\text{-}14)$$

where

N_{SR} is 26 for a 2 MHz transmission or defined in Table 23-5 for a 4 MHz, 8 MHz, or 16 MHz transmission

S_k is defined in Equation (19-8), Equation (19-9), Equation (21-8), or Equation (21-9) for a 2 MHz, 4 MHz, 8 MHz, or 16 MHz transmission, respectively.

$T_{CS}(m)$ represents the cyclic shift for space-time stream m with a value given in Table 23-10

$\Upsilon_{k,BW}$ is defined by Equation (23-6) to Equation (23-9)

Δ_F is defined in Table 23-5

N_{STS} is defined in Table 23-7

P_{HTLTF} is defined in 19.3.9.4.6

N_{STF}^{Tone} has the value given in Table 23-8

Q_k is defined in 23.3.7

23.3.8.2.2.4 LTF definition

The LTF field provides means for the receiver to estimate the MIMO channel between the set of constellation mapper outputs (or, if STBC is applied, the STBC encoder outputs) and the receive chains. The transmitter provides training for N_{STS} space-time streams (spatial mapper inputs) used for the transmission of the PSDU. For each tone, the MIMO channel that can be estimated is an $N_{RX} \times N_{STS}$ matrix. All S1G transmissions have a preamble that contains LTF symbols, where the data tones of each LTF symbol are multiplied by entries belonging to a matrix P_{HTLTF}, to enable channel estimation at the receiver.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The pilot tones of each LTF symbol are multiplied by the first column of the P_{HTLTF} matrix. The multiplication of the pilot tones in the LTF symbols by the first column of the P_{HTLTF} matrix instead of the whole P_{HTLTF} matrix is to allow receivers to track phase and frequency offset during MIMO channel estimation using the LTF. The number of LTF symbols, N_{LTF}, is a function of the total number of space-time streams N_{STS} as shown in Table 23-11. As a result, the LTF field consists of one, two, or four symbols that are necessary for the demodulation of the Data field in the PPDU or for channel estimation in an NDP.

Table 23-11—Number of LTFs required for different numbers of space-time streams

N_{STS}	N_{LTF}
1	1
2	2
3	4
4	4

The LTF field for a 2 MHz, 4 MHz, 8 MHz, or 16 MHz transmission is defined by Equation (21-36) Equation (21-37), Equation (21-38), and Equation (21-39), respectively, in 21.3.8.3.5. Note that these equations do not include the phase rotation per 2 MHz subchannel.

The generation of the time domain LTF symbols is shown in Figure 23-6 where A^k_{LTF} is given in Equation (23-15).

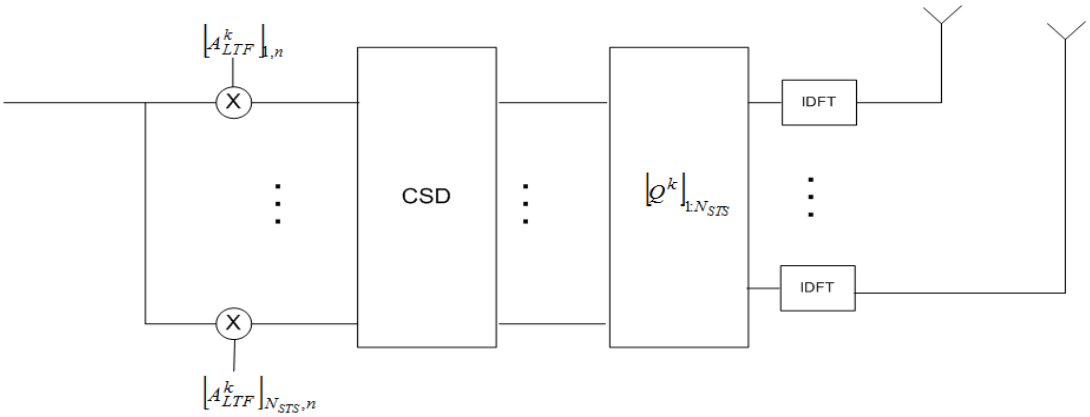

Figure 23-6—Generation of LTF symbols

$$A^k_{LTF} = \begin{cases} [P_{HTLTF}]_{*,1} \times [1\ 1\ 1\ 1], if\ k \in K_{Pilot\_Fix} \\ P_{HTLTF}, \text{ otherwise} \end{cases} \quad (23\text{-}15)$$

where

K_{Pilot_Fix} is the subcarrier indices for the fixed pilot tones:

For a 2 MHz transmission, $K_{Pilot\_Fix} = \{\pm 7, \pm 21\}$

For a 4 MHz transmission, $K_{Pilot\_Fix} = \{\pm 11, \pm 25, \pm 53\}$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For an 8 MHz transmission, $K_{Pilot\_Fix} = \{\pm 11, \pm 39, \pm 75, \pm 103\}$

For a 16 MHz transmission,

$K_{Pilot\_Fix} = \{\pm 25, \pm 53, \pm 89, \pm 117, \pm 139, \pm 167, \pm 203, \pm 231\}$

$[P_{HTLTF}]_{*,1}$ is the first column of the P_{HTLTF} matrix

The time domain representation of the LTF1 field, and LTF2~LTFN_{LTF} fields signals at transmit chain i_{TX} shall be as specified in Equation (23-16) and Equation (23-17), respectively.

$$r_{\mathrm{LTF1}}^{(i_{\mathrm{TX}})}(t) = \frac{1}{\sqrt{N_{\mathrm{LTF}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} w_{T_{\mathrm{LTF1}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left(\begin{array}{l} \left[Q_k \right]_{i_{TX},m} \Upsilon_{k,\mathrm{BW}} \left[A_{LTF}^{k} \right]_{m,1} LTF_k \\ \quad \cdot \exp\left(j 2\pi k \Delta_F (t - T_{GI2} - T_{CS}(m)) \right) \end{array} \right) \tag{23-16}$$

$$\begin{aligned} r_{\mathrm{LTF2\sim LTF}_{N_{\mathrm{LTF}}}}^{(i_{\mathrm{TX}})}(t) = & \frac{1}{\sqrt{N_{\mathrm{LTF}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} \sum_{n=1}^{N_{LTF}-1} w_{T_{\mathrm{LTF}}}(t - (n-1)T_{LTF}) \\ & \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left(\begin{array}{l} \left[Q_k \right]_{i_{TX},m} \Upsilon_{k,\mathrm{BW}} \left[A_{LTF}^{k} \right]_{m,(n+1)} LTF_k \\ \quad \cdot \exp\left(j 2\pi k \Delta_F (t - (n-1)T_{LTF} - T_{GI} - T_{CS}(m)) \right) \end{array} \right) \end{aligned} \tag{23-17}$$

where

LTF_k is defined in Equation (21-36), Equation (21-37), Equation (21-38), or Equation (21-39) for a 2 MHz, 4 MHz, 8 MHz, or 16 MHz transmission, respectively

N_{SR} and T_{LTF} are defined in Table 23-5

$T_{CS}(m)$ represents the cyclic shift for space-time stream m with a value given in Table 23-10

$\Upsilon_{k,BW}$ is defined by Equation (23-6) to Equation (23-9)

Δ_F is defined in Table 23-5

N_{STS} is defined in Table 23-7

A_{LTF}^{k} is defined in Equation (23-15)

N_{LTF}^{Tone} has the value given in Table 23-8

Q_k is defined in 23.3.7

The first LTF (LTF1) field consists of two periods of the long training symbol, preceded by a double length (16 μs) cyclic prefix. The placement of the first and subsequent LTF fields in an S1G_SHORT PPDU is shown in Figure 23-1.

23.3.8.2.2.5 SIG definition

The SIG field carries information required to interpret S1G PPDUs sent with a short preamble. The structure of the SIG field for the first symbol (SIG-1) is shown in Figure 23-7 and for the second symbol (SIG-2) is shown in Figure 23-8. The SIG field format of NDP CMAC PPDUs is described in Figure 23-21 (in 23.3.11).

Figure 23-7—SIG-1 structure

Figure 23-7—SIG-1 structure

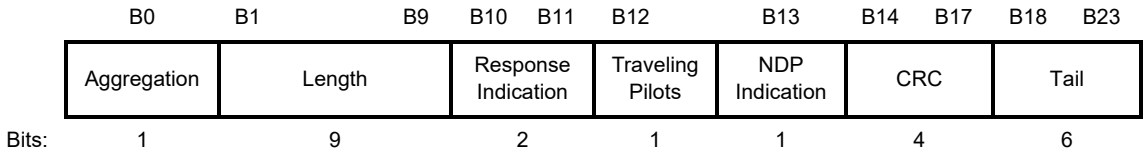

Figure 23-8—SIG-2 structure

The SIG field of S1G PPDUs sent with a short preamble contains the fields listed in Table 23-12.

The SIG field is composed of two OFDM symbols, SIG-1 and SIG-2, each providing 24 data bits, as shown in Table 23-12. SIG-1 is transmitted before SIG-2. The SIG field symbols shall be BCC encoded at rate, R = 1/2, interleaved, mapped to a BPSK constellation, and have pilots inserted following the steps described in 17.3.5.6, 17.3.5.7, 17.3.5.8, and 17.3.5.9, respectively.

The first and second half of the stream of 96 complex numbers generated by these steps (before pilot insertion) is divided into two groups of 48 complex numbers $d_{k,n}$, $k = 0, \ldots, 47$, where $n = 0, 1$, respectively. All the 96 complex numbers are rotated by 90° counter-clockwise relative to their original BPSK constellation points in order to accommodate differentiation of the S1G_SHORT PPDU from an S1G_1M PPDU, or from an S1G_LONG PPDU. The first rotated 48 complex numbers form the first symbol of SIG field; and the second rotated 48 complex numbers form the second symbol of SIG field, which follow the constellation diagram shown in Figure 23-9.

Figure 23-9—Data constellation in SIG field of S1G_SHORT

Table 23-12—Fields in the SIG field of short preamble

Symbol	Bit	Field	Description
SIG-1	B0	Reserved	Reserved. Set to 1 on transmit. See 23.3.20 for behavior on receive.
	B1	STBC	Set to 1 if all spatial streams have space-time block coding and set to 0 if no spatial streams has space-time block coding.
	B2	Uplink Indication	Set to 1 if the PPDU is addressed to an AP. Set to 0 otherwise. (See TXVECTOR parameter UPLINK_INDICATION.)
	B3–B4	BW	If FORMAT is S1G in TXVECTOR, set to 0 when CH_BANDWIDTH is CBW2 1 when CH_BANDWIDTH is CBW4 2 when CH_BANDWIDTH is CBW8 3 when CH_BANDWIDTH is CBW16 If FORMAT is S1G_DUP_2M in TXVECTOR, set to 0.
	B5–B6	Nsts	Set to 0 for 1 space-time stream Set to 1 for 2 space-time streams Set to 2 for 3 space-time streams Set to 3 for 4 space-time streams
	B7–B15	ID	If Uplink Indication field is not present or 1, B7–B15 are the partial AID to provide an abbreviated indication of the intended recipient(s) of the PSDU (see 10.21). If Uplink Indication field is 0, B7–B9 are an identifier of the BSS and B10–B15 are the partial AID. (See TXVECTOR parameter COLOR and TXVECTOR parameter PARTIAL_AID.)
	B16	Short GI	Set to 0 if short guard interval is not used in the Data field. Set to 1 if short guard interval is used in the Data field.
	B17	Coding	Set to 0 for BCC and 1 for LDPC
	B18	LDPC Extra	If Coding field is 1, set to 1 if the LDPC PPDU encoding process (of an SU PPDU), results in an extra OFDM symbol (or symbols) as described in 21.3.10.5.4, otherwise set to 0. If Coding field is 0, this field is set to 1.
	B19–B22	MCS	MCS Index
	B23	Smoothing	A value of 1 indicates that channel smoothing is recommended. A value of 0 indicates that channel smoothing is not recommended.

Table 23-12—Fields in the SIG field of short preamble *(continued)*

Symbol	Bit	Field	Description
SIG-2	B0	Aggregation	Set to 1 when aggregation is ON (as indicated by AGGREGATION parameter of TXVECTOR), and 0 otherwise. NOTE— S1G PPDUs are transmitted with aggregation ON when PSDU to be carried is greater than 511 octets, as defined in 10.12.5.
	B1–B9	Length	When the Aggregation subfield is equal to 0, set to the number of octets in the PSDU. When the Aggregation subfield is equal to 1, set to N_{SYM_i} given in 23.4.3. (See TXVECTOR parameter PSDU_LENGTH.)
	B10–B11	Response Indication	Set to the value obtained from the TXVECTOR parameter RESPONSE_INDICATION. The Response Indication field indicates the presence and type of the PPDU that is expected to follow SIFS after the current transmission (see 10.3.2.5).
	B12	Traveling Pilots	Set to 1 to indicate traveling pilots usage in PPDU. Otherwise 0 to indicate regular pilot tone locations.
	B13	NDP Indication	Differentiate the PPDU from an NDP CMAC PPDU: Set to 0 to indicate that the PPDU is not an NDP CMAC PPDU.
	B14–B17	CRC	CRC calculated as in 23.3.8.2.2.6.
	B18–B23	Tail	Used to terminate the trellis of the convolutional decoder. Set to 0.

The time domain waveform for the SIG field in an S1G_SHORT PPDU at transmit chain i_{TX} shall be as specified in Equation (23-18).

$$r_{\mathrm{SIG}}^{(i_{\mathrm{TX}})}(t) = \frac{1}{\sqrt{N_{\mathrm{SIG}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} \sum_{n=0}^{1} w_{T_{\mathrm{SYML}}}\left(t - nT_{SYML}\right) \sum_{i_{BW}=0}^{N_{2MHz}-1} \left(\sum_{k=-26}^{26} \sum_{m=1}^{N_{STS}} \Upsilon_{(k-K_{shift}(i_{BW})),\mathrm{BW}} \left[Q_k\right]_{i_{TX},m} \left[P_{HTLTF}\right]_{m,1} \left(j.D_{k,n,2} + p_n P_k\right) \cdot \exp\left(j2\pi(k - K_{Shift}(i_{BW}))\Delta_F(t - nT_{SYML} - T_{GI} - T_{CS}(m))\right) \right) \tag{23-18}$$

where

N_{2MHz} is the number of 2 MHz subchannels that are contained within the whole bandwidth of the current PPDU (e.g., $N_{2MHz} = 2$ for a 4 MHz PPDU)

$$K_{Shift}(i) = (N_{2MHz} - 1 - 2i).32 \tag{23-19}$$

$$D_{k,n,2} = \begin{cases} 0, & k = 0, \pm 7, \pm 21 \\ d_{M'_2(k),n}, & \text{otherwise} \end{cases} \tag{23-20}$$

where $M'_2(k)$ is defined in Equation (23-21)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$M_2'(k) = \begin{cases} k+26, & -26 \le k \le -22 \\ k+25, & -20 \le k \le -8 \\ k+24, & -6 \le k \le -1 \\ k+23, & 1 \le k \le 6 \\ k+22, & 8 \le k \le 20 \\ k+21, & 22 \le k \le 26 \end{cases} \quad (23\text{-}21)$$

p_n and P_k are defined in 17.3.5.10
$T_{CS}(m)$ represents the cyclic shift for space-time stream m with a value given in Table 23-10
T_{SYML} is defined in Table 23-5
$\Upsilon_{k,BW}$ is defined by Equation (23-6) to Equation (23-9)
Δ_F is defined in Table 23-5
N_{STS} is defined in Table 23-7
P_{HTLTF} is defined in 19.3.9.4.6
N_{SIG}^{Tone} has the value given in Table 23-8
Q_k is defined in 23.3.7

NOTE—This definition results in a QBPSK modulation on the two symbols of SIG field, where the constellation of the data tones is rotated by 90º counter-clockwise relative to the third and fourth repetitions of LTF1 field in S1G_1M preamble, and relative to the second symbol of SIG-A field of the S1G_LONG preamble, respectively, as shown in Figure 23-1 to Figure 23-3, to facilitate the differentiation among the three preamble formats at the receiver.

23.3.8.2.2.6 CRC calculation for S1G SIG-A fields

The CRC protects bits 0–25 of the 1 MHz SIG field and bits 0–37 of the ≥ 2 MHz SIG-A field. The value of the CRC field shall be the 1s complement of

$$crc(D) = (M(D) \oplus I(D))D^4 \bmod G(D) \quad (23\text{-}22)$$

where

$M(D) = m_0D^N + m_1D^{N-1} + \ldots + m_ND^0$ is the SIG field or SIG-A represented as a polynomial

where
N is 25 for the 1 MHz SIG field and 37 for the ≥ 2 MHz SIG-A field
m_i is the ith bit of the corresponding SIG/SIG-A field
$I(D) = \sum_{i=N-3}^{N} D^i$ are initialization values that are added modulo 2 to the first 4 bits of SIG/SIG-A field
$G(D) = D^4 + D^1 + 1$ is the CRC generating polynomial
$crc(D) = c_3D^3 + c_2D^2 + c_1D^1 + c_0D^0$

The CRC field is transmitted with c_3 first.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Figure 23-10 shows the operation of the CRC. First, the shift register is reset to all 1s. The bits are then passed through the XOR operation at the input. When the last bit has entered, the output is generated by shifting the bits out of the shift register, C3 first, through an inverter.

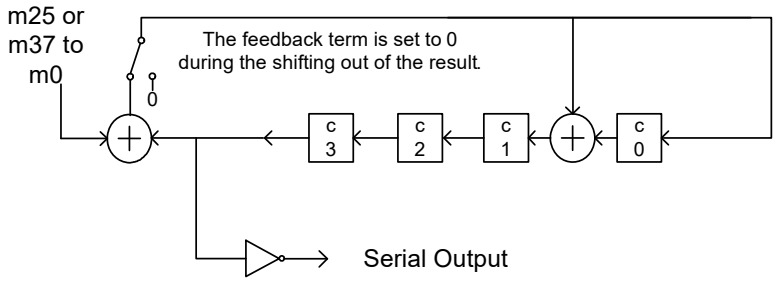

Figure 23-10—4-bit CRC calculation

As an example, if bits $\{m_0 \ldots m_{25}\}$ are given by {11 0110 0111 0110 1001 1110 1111}, the output bits $\{b_3 \ldots b_0\}$, where b_3 is output first, are {0101}.

23.3.8.2.3 S1G_LONG preamble

23.3.8.2.3.1 General

The S1G_LONG preamble is used for the S1G_LONG PPDU format. In contrast to the S1G_1M and S1G_SHORT preambles, the S1G_LONG preamble can be used for MU transmissions, in addition to SU transmissions. The S1G_LONG preamble is structured similarly to the Mixed mode format as defined in Clause 19 and Clause 21.

23.3.8.2.3.2 Omnidirectional portion

23.3.8.2.3.2.1 General

The omnidirectional portion of the S1G_LONG preamble is single user and single-space-time stream modulated. By definition, to be omnidirectional, no spatial mapping (Q-matrix multiplication) is applied.

23.3.8.2.3.2.2 Cyclic shift for S1G modulated fields

This subclause describes the set of cyclic shift values (defined per-antenna) to be applied to the omnidirectional portion of the S1G_LONG preamble, namely the STF, LTF, and SIG-A fields. The STF, LTF, and SIG-A fields start as single-stream during generation but are replicated up to N_{TX} streams. These fields are mapped to the transmit antennas, at which point the cyclic shifts are applied. The cyclic shift values are defined in Table 23-13, which specifies the per-antenna cyclic shift value $T_{CS}^{i_{TX}}$ for antenna i_{TX} of the N_{TX} total transmit antennas.

Table 23-13—Per antenna cyclic shift values of S1G_LONG preamble PPDU

$T_{CS}^{i_{TX}}$ for ≥ 2 MHz, omnidirectional portion of S1G_LONG Preamble PPDU

23.3.8.2.3.2.3 STF definition

The STF field for 2 MHz, 4 MHz, 8 MHz, and 16 MHz are the same as the STF field in short preamble as specified in 23.3.8.2.2.3.

The time domain representation of the STF field signal at transmit chain i_{TX} shall be as specified in Equation (23-23).

$$r_{STF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{STF}^{Tone} N_{TX}}} w_{\mathrm{T}_{STF}}(t) \sum_{k=-N_{SR}}^{N_{SR}} [Q_k^{(\mathrm{omni})}]_{i_{TX},1} \Upsilon_{k,\mathrm{BW}} S_k \exp(j2\pi k \Delta_F t) \quad (23\text{-}23)$$

where

N_{SR} is 26 for a 2 MHz transmission or defined in Table 23-5 for a 4 MHz, 8 MHz or 16 MHz transmission.

S_k is defined in Equation (19-8), Equation (19-9), Equation (21-8), or Equation (21-9) for a 2 MHz, 4 MHz, 8 MHz, or 16 MHz transmission, respectively.

$\Upsilon_{k,BW}$ is defined by Equation (23-6) to Equation (23-9)

Δ_F is defined in Table 23-5

N_{STF}^{Tone} has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8

$Q_k^{(omni)}$ is defined in 23.3.7

23.3.8.2.3.2.4 LTF1 definition

The LTF1 field values for 2 MHz, 4 MHz, 8 MHz, and 16 MHz are the same as the LTF field in short preamble as specified in 23.3.8.2.2.4.

The time domain representation of the LTF1 field signal at transmit chain i_{TX} shall be as specified in Equation (23-24).

$$r_{\mathrm{LTF1}}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{LTF}^{Tone} N_{TX}}} w_{\mathrm{T}_{LTF1}}(t) \sum_{k=-N_{SR}}^{N_{SR}} [Q_k^{(\mathrm{omni})}]_{i_{TX},1} \Upsilon_{k,\mathrm{BW}} LTF_k \exp(j2\pi k \Delta_F (t - T_{GI2})) \quad (23\text{-}24)$$

where

LTF_k is defined in Equation (21-36), Equation (21-37), Equation (21-38), or Equation (21-39) for a 2 MHz, 4 MHz, 8 MHz, or 16 MHz transmission, respectively

N_{SR} is defined in Table 23-5

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$\Upsilon_{k,BW}$ is defined by Equation (23-6) to Equation (23-9)

Δ_F is defined in Table 23-5

N_{STF}^{Tone} has the value given in Table 23-8

$Q_k^{(omni)}$ is defined in 23.3.7.

The LTF1 field consists of two periods of the long training symbol, preceded by a double length (16 μs) cyclic prefix. The placement of the first and subsequent LTF fields in an S1G_SHORT PPDU is shown in Figure 23-1.

23.3.8.2.3.2.5 SIG-A definition

The SIG-A field of the long preamble carries information required to interpret S1G PPDUs sent using the long preamble. The structure of the SIG-A field is different for SU PPDUs and MU PPDUs. The structure of the SIG-A field for SU PPDUs for the first symbol (SIG-A1) is shown in Figure 23-11 and for the second symbol (SIG-A2) is shown in Figure 23-12. The structure of the SIG-A field for MU PPDUs for the first symbol (SIG-A1) is shown in Figure 23-13 and for the second symbol (SIG-A2) is shown in Figure 23-14.

The SIG-A field of S1G PPDUs sent with an S1G_LONG preamble for SU contains the fields listed in Table 23-14 and for MU, the fields listed in Table 23-15.

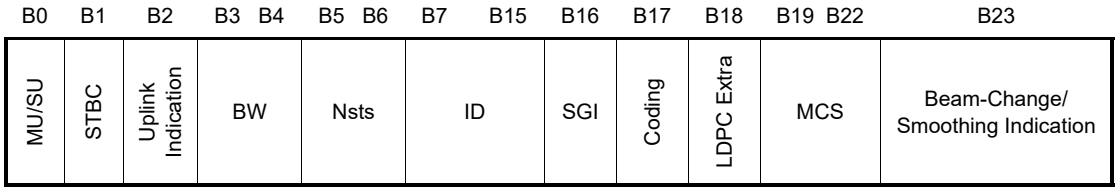

Figure 23-11—SIG-A1 structure for SU PPDU

Figure 23-14—SIG-A2 structure for MU PPDU

The SIG-A field is composed of two OFDM symbols, SIG-A1 and SIG-A2, each containing 24 data bits, as shown in Table 23-14. SIG-A1 is transmitted before SIG-A2. The SIG-A field symbols shall be BCC encoded at rate, R = 1/2, interleaved, mapped to a BPSK constellation, and have pilots inserted following the steps described in 17.3.5.6, 17.3.5.7, 17.3.5.8, and 17.3.5.9, respectively. The first and second half of the stream of 96 complex numbers generated by these steps (before pilot insertion) is divided into two groups of 48 complex numbers $d_{k,n}$, $k = 0, \ldots, 47$, where $n = 0, 1$, respectively. The first group of the 48 complex numbers are rotated by 90° counter-clockwise relative to their original BPSK constellation points in order to accommodate differentiation of the S1G_LONG PPDU from an S1G_1M PPDU. The second group of the 48 complex numbers without rotations may be used to accommodate differentiation of the S1G_LONG PPDU from an S1G_SHORT PPDU. The first rotated 48 complex numbers form the first symbol of SIG-A; and the second unrotated 48 complex numbers form the second symbol of SIG-A, which follow the constellation diagram shown in Figure 23-15.

Table 23-14—Fields in the SIG-A field of S1G_LONG preamble SU PPDU

Symbol	Bit	Field	Description
SIG-A1	B0	MU/SU	Set to 0 for SU PPDUs.
	B1	STBC	Set to 1 if all spatial streams have space-time block coding and set to 0 if no spatial streams has space-time block coding.
	B2	Uplink Indication	Set to 1 if the PPDU is addressed to an AP. Set to 0 otherwise. (See TXVECTOR parameter UPLINK_INDICATION.)
	B3–B4	BW	Set to 0 for 2 MHz, 1 for 4 MHz, 2 for 8 MHz, 3 for 16 MHz
	B5–B6	Nsts	Set to 0 for 1 space-time stream Set to 1 for 2 space-time streams Set to 2 for 3 space-time streams Set to 3 for 4 space-time streams
	B7–B15	ID	If Uplink Indication field is not present or 1, B7–B15 are the partial AID to provide an abbreviated indication of the intended recipient(s) of the PSDU (see 10.21). If Uplink Indication field is 0, B7-B9 are an identifier of the BSS and B10–B15 are the partial AID. (See TXVECTOR parameter COLOR and TXVECTOR parameter PARTIAL_AID.)
	B16	Short GI	Set to 0 if short guard interval is not used in the Data field. Set to 1 if short guard interval is used in the Data field.
	B17	Coding	Set to 0 for BCC and 1 for LDPC
	B18	LDPC Extra	If Coding field is 1, set to 1 if the LDPC PPDU encoding process (of an SU PPDU), results in an extra OFDM symbol (or symbols) as described in 21.3.10.5.4, otherwise set to 0. If Coding field is 0, this field is set to 1.
	B19–B22	MCS	MCS Index
	B23	Beam Change/ Smoothing Indication	If Nsts subfield indicates 1 space-time stream, this field is a Beam Change Indication field: — A value of 1 indicates that the Q matrix is changed from the omnidirectional portion to the beam changeable portion of the preamble, in at least one of the nonzero subcarriers of the omnidirectional portion. — A value of 0 indicates that the Q matrix is unchanged in all the nonzero subcarriers of the omnidirectional portion. If Nsts subfield indicates more than 1 space-time stream, this field is a Smoothing Indication field: — A value of 1 indicates that channel smoothing is recommended, — A value of 0 indicates that channel smoothing is not recommended. See NOTE 1. See NOTE 2.

Table 23-14—Fields in the SIG-A field of S1G_LONG preamble SU PPDU *(continued)*

Symbol	Bit	Field	Description
SIG-A2	B0	Aggregation	Set to 1 when aggregation is ON (as indicated by AGGREGATION parameter of TXVECTOR), and 0 otherwise. NOTE—S1G PPDUs are transmitted with aggregation ON when PSDU to be carried is greater than 511 octets, as defined in 10.12.5.
	B1–B9	Length	When the Aggregation subfield is equal to 0, set to the number of octets in the PSDU. When the Aggregation subfield is equal to 1, set to N_{SYM_i}, given in 23.4.3. (See TXVECTOR parameter PSDU_LENGTH.)
	B10–B11	Response Indication	Set to the value obtained from the TXVECTOR parameter RESPONSE_INDICATION. The Response Indication field indicates the presence and type of the PPDU that is expected to follow SIFS after the current transmission (see 10.3.2.5).
	B12	Reserved	Reserved. Set to 1 on transmit. See 23.3.20 for behavior on receive.
	B13	Traveling Pilots	Set to 1 to indicate traveling pilots usage in PPDU. Otherwise 0 to indicate regular pilot tone locations.
	B14–B17	CRC	CRC calculated as in 23.3.8.2.2.6.
	B18–B23	Tail	Used to terminate the trellis of the convolutional decoder. Set to 0.
NOTE 1—When the Nsts subfield indicates 1 space-time stream, if Beam Change/Smoothing Indication field is set to 0, the receiver may perform channel smoothing. Otherwise, smoothing is not recommended. NOTE 2—The Q matrix for omnidirectional portion is $Q_k^{(\mathrm{omni})}$ as defined in 23.3.7.			

The time domain waveform for the SIG-A field in an S1G_LONG PPDU at transmit chain i_{TX} shall be as specified in Equation (23-25).

$$r_{SIG-A}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{SIG-A}^{Tone} N_{TX}}} \sum_{n=0}^{1} w_{\mathrm{T}_{SYML}}(t - nT_{SYML}) \sum_{i_{BW}=0}^{N_{2MHz}-1} \left(\sum_{k=-26}^{26} [Q_k^{(\mathrm{omni})}]_{i_{TX},1} \Upsilon_{(k-K_{Shift}(i_{BW})),BW}((-1)^n j^{n+1} D_{k,n,2} + p_n P_k) \exp(j2\pi(k - K_{Shift}(i_{BW}))\Delta_F(t - nT_{SYML} - T_{GI})) \right) \quad (23\text{-}25)$$

where

N_{2MHz}, $K_{Shift}(i)$, and $D_{k,n,2}$ are the same as those defined in 23.3.8.2.2.5

p_n and P_k are defined in 17.3.5.10

T_{SYML} is defined in Table 23-5

$\Upsilon_{k,BW}$ is defined by Equation (23-6) to Equation (23-9)

Δ_F is defined in Table 23-5

$N_{SIG\text{-}A}^{Tone}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8

Table 23-15—Fields in the SIG-A field of S1G_LONG preamble MU PPDU

Symbol	Bit	Field	Description
SIG-A1	B0	MU/SU	Set to 1 for MU PPDUs
	B1	STBC	Set to 0 in MU PPDUs.
	B2	Reserved	Reserved. Set to 1 on transmit. See 23.3.20 for behavior on receive.
	B3–B10	NSTS	NSTS is divided into 4 user positions of 2 bits each, denoted by 4 subfields MU[0] Nsts …MU[3] Nsts. User position *p*, where $0 \le p \le 3$, uses bits $B(3+2p) - B(4+2p)$. The space-time streams of user u are indicated at user position $p = \text{USER\_POSITION}[u]$ where $u = 0, 1, \ldots \text{NUM\_USERS} - 1$ and the notation A[*b*] denotes the value of array A at index *b*. Zero space-time streams are indicated at positions not listed in the USER_POSITION array. Set to 0 for 0 space-time streams Set to 1 for 1 space-time stream Set to 2 for 2 space-time streams Set to 3 for 3 space-time streams
	B11–B12	BW	Set to 0 for 2 MHz, 1 for 4 MHz, 2 for 8 MHz, 3 for 16 MHz
	B13–B18	GID	In an MU PPDU the Group ID is set as defined in 23.3.10.4
	B19	Short GI	Set to 0 if short guard interval is not used in the Data field. Set to 1 if short guard interval is used in the Data field.
	B20–B23	Coding-I	If the MU[0] NSTS field is nonzero, then B20 indicates coding for user 0: set to 0 for BCC, 1 for LDPC. If the MU[0] NSTS field is 0, then B20 is reserved and set to 1. If the MU[1] NSTS field is nonzero, then B21 indicates coding for user 1: set to 0 for BCC, 1 for LDPC. If the MU[1] NSTS field is 0, then B21 is reserved and set to 1. If the MU[2] NSTS field is nonzero, then B22 indicates coding for user 2: set to 0 for BCC, 1 for LDPC. If the MU[2] NSTS field is 0, then B22 is reserved and set to 1. If the MU[3] NSTS field is nonzero, then B23 indicates coding for user 3: set to 0 for BCC, 1 for LDPC. If the MU[3] NSTS field is 0, then B23 is reserved and set to 1.
SIG-A2	B0	Coding-II	Set to 1 if at least one LDPC user's PPDU encoding process results in an extra OFDM symbol (or symbols) as described in 21.3.10.5.4 and 21.3.10.5.5. Set to 0 otherwise.
	B1	Reserved	Reserved. Set to 1 on transmit. See 23.3.20 for behavior on receive.
	B2–B10	Length	Set to the N_{sym}, given in 23.4.3. NOTE— A-MPDU is always used for MU PPDUs.
	B11–B12	Response Indication	Set to the value obtained from the TXVECTOR parameter RESPONSE_INDICATION. The Response Indication field indicates the presence and type of the PPDU that is expected to follow SIFS after the current transmission (see 10.3.2.5).
	B13	Traveling Pilots	Set to 1 to indicate traveling pilots usage in PPDU. Otherwise 0 to indicate regular pilot tone locations.
	B14–B17	CRC	CRC calculated as in 23.3.8.2.2.6.
	B18–B23	Tail	Used to terminate the trellis of the convolutional decoder. Set to 0.

$Q_k^{(omni)}$ is defined in 23.3.7

NOTE—As shown in Figure 23-1 to Figure 23-3, this definition results in a QBPSK modulation on the first symbol of SIG-A field, where the constellation of the data tones is rotated by 90º counter-clockwise relative to the third repetition of LTF1 field in S1G_1M preamble, facilitating its differentiation from S1G_1M; and the second symbol of SIG-A field is BPSK modulated, facilitating its differentiation from S1G_SHORT.

23.3.8.2.3.3 Beamchangeable portion

23.3.8.2.3.3.1 General

The beamchangeable portion of the S1G_LONG preamble can be either single-user or multi-user modulated with single or multiple space-time streams. Beamforming can be applied through spatial mapping (Q-matrix multiplication) starting with the beamchangeable portion of the preamble and continuing into the Data field.

Beamchangeable portion of the long preamble could be either single user or multi-user modulated.

23.3.8.2.3.3.2 Cyclic shift for S1G modulated fields

This subclause describes the set of cyclic shift values (defined per space-time stream) to be applied to the beamchangeable portion of the S1G_LONG preamble, namely the D-STF, D-LTF, and SIG-B fields. In a transmission, these fields start as single stream and are replicated up to $N_{STS,total}$ streams at which point the cyclic shifts are applied. The cyclic shift values are defined in Table 23-16, which specifies the per-stream cyclic shift value $T_{CS}(n)$ for space-time stream *n* out of $N_{STS,total}$ total space-time streams.

When the S1G_LONG preamble PPDU is used for an MU transmission, the cyclic shifts of the beamchangeable portion are applied sequentially, first per user and then per space-time stream up to the total number of users and space-time streams $N_{STS,total}$ as follows: the cyclic shift of the space-time stream number m for user *u* is given by $T_{CS}(M_u + m)$, of the row corresponding to $N_{STS,total}$ in Table 23-16. In this case, the index *n* takes into account the cyclic shifts already applied to space-time streams of prior users (M_u), and the space-time stream index (m) of the current user *u* in the sequence.

M_u is given by Table 23-7.

Table 23-16—Per space-time stream cyclic shift values of S1G_LONG preamble PPDU

$T_{CS,S1G}^{long}(n)$ for ≥2 MHz, beam changeable portion of S1G_LONG preamble PPDU				
Total number of space-time streams ($N_{STS,total}$)	**Cyclic for space-time stream n (μs)**			
	1	**2**	**3**	**4**
1	0	N/A	N/A	N/A
2	0	–4	N/A	N/A
3	0	–4	–2	N/A
4	0	–4	–2	–6
NOTE—N/A = not applicable.

23.3.8.2.3.3.3 D-STF definition

The main purpose of the D-STF field is to improve automatic gain control estimation in an SU or MU MIMO transmission. The duration of the D-STF field is 40 μs. The frequency domain sequence $\{S_k\}$ used to construct the D-STF field is the same as the STF field in short or long preamble as indicated in 23.3.8.2.2.3.

The time domain representation of the D-STF field signals at transmit chain i_{TX} shall be as specified in Equation (23-26).

$$r_{\text{D-STF}}^{(i_{\text{TX}})}(t) = \frac{1}{\sqrt{N_{\text{D-STF}}^{\text{Tone}} N_{\text{STS,total}}}} w_{T_{\text{D-STF}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_u-1} \sum_{m=1}^{N_{STS,u}} \left(\begin{array}{l} \left[Q_k\right]_{i_{TX},(M_u+m)} \Upsilon_{k,\text{BW}} \cdot S_k \\ \cdot \exp\left(j2\pi k\Delta_F (t - T_{CS}(M_u+m))\right) \end{array} \right) \quad \text{(23-26)}$$

where

N_{SR} is defined in Table 23-5

$T_{CS(m)}$ represents the cyclic shift for space-time stream *m* with a value given in Table 23-16

$\Upsilon_{k,\text{BW}}$ is defined by Equation (23-6) to Equation (23-9)

Δ_F is defined in Table 23-5

$N_{STS,total}$, $N_{STS,u}$, N_u, and M_u are defined in Table 23-7.

$N_{\text{D-STF}}^{\text{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8

Q_k is defined in 23.3.7

The duration of the D-STF field is $T_{\text{D-STF}}$ regardless of the Short GI field setting in SIG-A.

23.3.8.2.3.3.4 D-LTF definition

The D-LTF field values for 2 MHz, 4 MHz, 8 MHz, and 16 MHz are the same as the LTF field in short preamble as specified in 23.3.8.2.2.4.

The generation of the time domain D-LTF field symbols per frequency segment is shown in Figure 23-6.

The time domain representation of the D-LTF field signals at transmit chain i_{TX} shall be as specified in Equation (23-27).

$$\begin{aligned} r_{\text{D-LTF}}^{(i_{\text{TX}})}(t) = & \frac{1}{\sqrt{N_{\text{D-LTF}}^{\text{Tone}} N_{\text{STS,total}}}} \sum_{n=0}^{N_{LTF}-1} w_{T_{\text{D-LTF}}}(t - nT_{D-LTF}) \\ & \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_u-1} \sum_{m=1}^{N_{STS,u}} \left(\begin{array}{l} \left[Q_k\right]_{i_{TX},(M_u+m)} \Upsilon_{k,\text{BW}} \cdot \left[A_{LTF}^k\right]_{(M_u+m),(n+1)} LTF_k \\ \cdot \exp\left(j2\pi k\Delta_F (t - nT_{D-LTF} - T_{GI} - T_{CS}(M_u+m))\right) \end{array} \right) \end{aligned} \quad \text{(23-27)}$$

where

N_{SR} is defined in Table 23-5

$T_{CS(m)}$ represents the cyclic shift for space-time stream *m* with a value given in Table 23-16

$\Upsilon_{k,\text{BW}}$ is defined by Equation (23-6) to Equation (23-9)

Δ_F is defined in Table 23-5

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$N_{STS,total}$, $N_{STS,u}$, N_u, and M_u are defined in Table 23-7

A_{LTF}^{k} is defined in Equation (23-15)

$N_{\text{D-STF}}^{\text{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8

Q_k is defined in 23.3.7

As indicated by Equation (23-27), the duration of each symbol of the D-LTF field is $T_{\text{D-LTF}}$ regardless of the Short GI field setting in SIG-A.

The generation of the time domain D-LTF field symbols is the same as Figure 23-6, with N_{STS} replaced by $N_{STS,total}$.

23.3.8.2.3.3.5 SIG-B definition

If the SU/MU Indication subfield in SIG-A field is 0 (SU), then SIG-B field is one symbol that is identical to the first D-LTF field (D-LTF1). In this case, the time domain representation of the SIG-B field at transmit chain i_{TX} shall be as specified in Equation (23-27) with n=0.

If the SU/MU Indication subfield in SIG-A field is 1 (MU), then SIG-B field is one symbol and contains 26 bits in a 2 MHz PPDU, 27 bits in a 4 MHz PPDU and 29 bits in 8 MHz and 16 MHz PPDUs for each user. The fields in the SIG-B field are listed in Table 23-17.

Table 23-17—Fields in the SIG-B field for MU PPDU

Field	Bit Allocation				Description
	2 MHz	4 MHz	8 MHz	16 MHz	
MCS	B0–B3	B0–B3	B0–B3	B0–B3	Per-user MCS in MU-MIMO
Reserved	B4–B11	B4–B12	B4–B14	B4–B14	Set to all 1s on transmit. See 23.3.20 for behavior on receive.
CRC	B12–B19	B13–B20	B15–B22	B15–B22	
Tail	B20–B25	B21–B26	B23–B28	B23–B28	All 0s

The 8-bit CRC is calculated according to the procedure described in 23.3.8.2.3.3.6.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In this case, the repetition, encoding, interleaving and modulation flow for the data subcarriers of SIG-B field in 2 MHz, 4 MHz, 8 MHz, and 16 MHz are identical to those specified for 20 MHz, 40 MHz, 80 MHz, and 160 MHz, respectively, as shown in 21.3.8.3.6. Different from the VHT-SIG-B field defined in Clause 21, the pilot subcarriers of SIG-B field are mapped by the first column of P_{HTLTF} matrix to N_{STS}, total space-time streams, and the pilot polarity of the SIG-B symbol is p_2 instead of p_3. The time domain representation for SIG-B field signal at transmit chain i_{TX} shall be as specified in Equation (23-28).

$$r_{\mathrm{SIG\text{-}B}}^{(i_{\mathrm{TX}})}(t) = \frac{1}{\sqrt{N_{\mathrm{SIG\text{-}B}}^{\mathrm{Tone}} N_{\mathrm{STS,total}}}} w_{T_{\mathrm{SIG\text{-}B}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_u-1} \sum_{m=1}^{N_{STS,u}} \left(\begin{array}{l} \left[Q_k\right]_{i_{TX},(M_u+m)} \Upsilon_{k,\mathrm{BW}} \cdot \left[P_{HTLTF}\right]_{(M_u+m),1} \left(D_{k,BW}^{(u)} + p_2 P_0^k\right) \\ \cdot \exp\left(j2\pi k \Delta_F (t - T_{GI} - T_{CS}(M_u+m))\right) \end{array} \right) \tag{23-28}$$

where

N_{SR} is defined in Table 23-5

$T_{CS(m)}$ represents the cyclic shift for space-time stream *m* with a value given in Table 23-16

$\Upsilon_{k,\mathrm{BW}}$ is defined by Equation (23-6) to Equation (23-9)

Δ_F is defined in Table 23-5

$N_{STS,total}$, $N_{STS,u}$, N_u , and M_u are defined in Table 23-7

P_{HTLTF} is defined in Equation (19-27) in 19.3.9.4.6

p_n is defined in 17.3.5.10

P_n^k is defined in 21.3.10.10

$N_{\mathrm{SIG\text{-}B}}^{\mathrm{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8

Q_k is defined in 23.3.7

For a 2 MHz transmission,

$$D_{k,2}^{(u)} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M_2'(k)}^{(u)}, \text{otherwise} \end{cases} \tag{23-29}$$

$$M_2'(k) = \begin{cases} k+28, & -28 \le k \le -22 \\ k+27, & -20 \le k \le -8 \\ k+26, & -6 \le k \le -1 \\ k+25, & 1 \le k \le 6 \\ k+24, & 8 \le k \le 20 \\ k+23, & 22 \le k \le 28 \end{cases} \tag{23-30}$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For a 4 MHz transmission,

$$D_{k,4}^{(u)} = \begin{cases} 0, k = 0, \pm 1, \pm 11, \pm 25, \pm 53 \\ d_{M_4'(k)}^{(u)}, \text{otherwise} \end{cases} \tag{23-31}$$

$$M_4'(k) = \begin{cases} k+58, & -58 \le k \le -54 \\ k+57, & -52 \le k \le -26 \\ k+56, & -24 \le k \le -12 \\ k+55, & -10 \le k \le -2 \\ k+52, & 2 \le k \le 10 \\ k+51, & 12 \le k \le 24 \\ k+50, & 26 \le k \le 52 \\ k+49, & 54 \le k \le 58 \end{cases} \tag{23-32}$$

For an 8 MHz transmission,

$$D_{k,8}^{(u)} = \begin{cases} 0, k = 0, \pm 1, \pm 11, \pm 39, \pm 75, \pm 103 \\ d_{M_8'(k)}^{(u)}, \text{otherwise} \end{cases} \tag{23-33}$$

$$M_8'(k) = \begin{cases} k+122, & -122 \le k \le -104 \\ k+121, & -102 \le k \le -76 \\ k+120, & -74 \le k \le -40 \\ k+119, & -38 \le k \le -12 \\ k+118, & -10 \le k \le -2 \\ k+115, & 2 \le k \le 10 \\ k+114, & 12 \le k \le 38 \\ k+113, & 40 \le k \le 74 \\ k+112, & 76 \le k \le 102 \\ k+111, & 104 \le k \le 122 \end{cases} \tag{23-34}$$

For a 16 MHz transmission

$$D_{k,16}^{(u)} = \begin{cases} 0, k = 0, \pm 1, \pm 2, \pm 3, \pm 4, \pm 5, \pm 25, \pm 53, \pm 89, \pm 117, \pm 127, \pm 128, \pm 129, \pm 139, \pm 167, \pm 203, \pm 231 \\ d_{M_{16}'(k)}^{(u)}, \text{otherwise} \end{cases}$$

$$M'_{16}(k) = \begin{cases} k+250, & -250 \le k \le -232 \\ k+249, & -230 \le k \le -204 \\ k+248, & -202 \le k \le -168 \\ k+247, & -166 \le k \le -140 \\ k+246, & -138 \le k \le -130 \\ k+243, & -126 \le k \le -118 \\ k+242, & -116 \le k \le -90 \\ k+241, & -88 \le k \le -54 \\ k+240, & -52 \le k \le -26 \\ k+239, & -24 \le k \le -6 \\ k+228, & 6 \le k \le 24 \\ k+227, & 26 \le k \le 52 \\ k+226, & 54 \le k \le 88 \\ k+225, & 90 \le k \le 116 \\ k+224, & 118 \le k \le 126 \\ k+221, & 130 \le k \le 138 \\ k+220, & 140 \le k \le 166 \\ k+219, & 168 \le k \le 202 \\ k+218, & 204 \le k \le 230 \\ k+217, & 232 \le k \le 250 \end{cases} \quad (23\text{-}35)$$

23.3.8.2.3.3.6 CRC calculation for SIG SIG-B field

The CRC protects the MCS and Reserved field bits of the SIG-B field. The value of the CRC field shall be the 1s complement of

$$crc(D) = (M(D) \oplus I(D))D^8 \bmod G(D) \quad (23\text{-}36)$$

where

$M(D) = m_0D^N + m_1D^{N-1} + \ldots + m_ND^0$ is the MCS and Reserved field appended (bits 0–N of SIG B) and represented as a polynomial

where

N is 11, 12, 14, and 14 for 2 MHz, 4 MHz, 8 MHz, and 16 MHz SIG-B fields, respectively

m_i is the ith bit of the corresponding SIG-B field

$I(D) = \sum_{i=N-7}^{N} D^i$ are the initialization values that are added to the first 8 bits of the SIG-B field

$G(D) = D^8 + D^2 + D^1 + 1$ is the CRC generating polynomial

$crc(D) = c_0D^7 + c_1D^6 + \ldots + c_6D^1 + c_7$

The CRC field is transmitted with c_7 first.

Figure 19-8 in 19.3.9.4.4 shows the operation of the CRC using the same generator polynomial. For SIG-B CRC operation specifically, the bits are input serially from m_N to m_0.

23.3.8.3 Format for 1 MHz

23.3.8.3.1 Introduction

This subclause describes the preamble format used for non-duplicate S1G PPDUs of 1 MHz and duplicate S1G_DUP_1M PPDUs.

23.3.8.3.2 Cyclic shift for S1G modulated fields

The cyclic shift values defined in this subclause apply to the STF, LTF, SIG and Data fields of the S1G_1M PPDU. Throughout the S1G_1M preamble, cyclic shifts are applied to prevent beamforming when similar signals are transmitted in different space-time streams. The STF, LTF, and SIG fields start as single stream during generation but are replicated up to $N_{STS,total}$ streams. For the LTF, these replicated streams undergo P-matrix mapping prior to CSD application as shown in Figure 23-6. For the STF and SIG the CSDs are applied per stream immediately after replication. The same cyclic shift is applied to the $N_{STS,total}$ streams during the transmission of the Data field of the S1G_1M PPDU. The cyclic shift value $T_{CS}(n)$ for space-time stream n out of $N_{STS,total}$ total space-time streams is shown in Table 23-18.

Table 23-18—Cyclic shift values of S1G_1M PPDU

$T_{CS}(n)$ values for S1G_1M PPDU				
Total number of space-time streams ($N_{STS,total}$)	**Cyclic shift for space-time stream n (μs)**			
	1	**2**	**3**	**4**
1	0	—	—	—
2	0	–4	—	—
3	0	–4	–1	—
4	0	–4	–1	–5

23.3.8.3.3 STF definition

The STF field in S1G_1M preamble is repeated with 4 OFDM symbols, i.e., twice the duration of the STF fields in S1G_SHORT preamble and S1G_LONG preamble.

The time domain representation of the STF field signal at transmit chain i_{TX} shall be as specified in Equation (23-37).

$$r_{\mathrm{STF}}^{(i_{TX})}(t) = \frac{\alpha(\mathrm{MCS})}{\sqrt{N_{\mathrm{STF}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} w_{T_{\mathrm{STF}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left[Q_k\right]_{i_{TX},m} \left[P_{HTLTF}\right]_{m,1} \cdot S_k \exp\left(j2\pi k \Delta_F (t - T_{CS}(m))\right) \quad (23\text{-}37)$$

where

N_{SR} is defined in Table 23-5

$T_{CS}(m)$ represents the cyclic shift for space-time stream m with a value given in Table 23-18

Δ_F is defined in Table 23-5

N_{STS} is defined in Table 23-7

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

P_{HTLTF} is defined in Equation (19-27) in 19.3.9.4.6

$N_{\mathrm{STF}}^{\mathrm{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8

S_k has nonzero values $[0.5, -1, 1, -1, -1, -0.5] \times (1+j) \times \sqrt{2/3}$ on tones k = [-12,-8,-4,4,8,12], respectively

$\alpha(MCS)$ is an MCS dependent scaling factor, with the following value $\alpha(MCS) = \begin{cases} \sqrt{2}, & \text{MCS=10} \\ 1, & \text{otherwise} \end{cases}$

Q_k is defined in 23.3.7

23.3.8.3.4 LTF definition

The duration of the first LTF (LTF1) field in S1G_1M preamble is of 4 OFDM symbols with repetitions, i.e., twice the duration of the LTF1 fields in S1G_LONG preamble and S1G_SHORT preamble. The first two repetitions have the same structure as the LTF1 field in S1G_LONG preamble and S1G_SHORT preamble, i.e., they consist of two periods of the long training symbol, preceded by a double length (16 μs) cyclic prefix. Each of the last two repetitions of LTF1 field consists one period of the long training symbol preceded by a normal length (8 μs) cyclic prefix. The duration of the each of the remaining LTFs in S1G_1M preamble is of one OFDM symbol.

The placement of the first and subsequent LTFs in an S1G_1M PPDU is shown in Figure 23-3.

The generation of the time domain LTF symbols is the same as Table 23-7.

The time domain representation of the first two repetitions of the LTF1 field, and the last two repetitions of the LTF1 field shall be as specified in Equation (23-38) and Equation (23-39), respectively

$$r_{\mathrm{LTF1\_1,2}}^{(i_{\mathrm{TX}})}(t) = \frac{1}{\sqrt{N_{\mathrm{LTF}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} w_{T_{\mathrm{LTF1}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left(\begin{array}{l} \left[Q_k \right]_{i_{TX},m} \Upsilon_{k,\mathrm{BW}} \left[A_{LTF}^{k} \right]_{m,1} LTF_k \\ \quad \cdot \exp\left(j2\pi k \Delta_F (t - T_{GI2} - T_{CS}(m)) \right) \end{array} \right) \tag{23-38}$$

$$r_{\mathrm{LTF1\_3,4}}^{(i_{\mathrm{TX}})}(t) = \frac{1}{\sqrt{N_{\mathrm{LTF}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} w_{T_{\mathrm{LTF}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left(\begin{array}{l} \left[Q_k \right]_{i_{TX},m} \Upsilon_{k,\mathrm{BW}} \left[A_{LTF}^{k} \right]_{m,1} LTF_k \\ \quad \cdot \exp\left(j2\pi k \Delta_F (t - T_{GI} - T_{CS}(m)) \right) \end{array} \right) \tag{23-39}$$

where

N_{SR}, T_{LTF1}, and T_{LTF} are defined in Table 23-5

$T_{CS(m)}$ represents the cyclic shift for space-time stream *m* with a value given in Table 23-18

$\Upsilon_{k,\mathrm{BW}}$ is defined by Equation (23-6) to Equation (23-9)

Δ_F is defined in Table 23-5

N_{STS} is defined in Table 23-7

$N_{\mathrm{LTF}}^{\mathrm{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8

A_{LTF}^{k} is defined in Equation (23-40)

Q_k is defined in 23.3.7

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$A_{LTF}^{k} = \begin{cases} [P_{HTLTF}]_{*,1} \times [1 \quad 1 \quad 1 \quad 1], \text{ if } k \in K_{\text{Pilot\_Fix}} \\ P_{HTLTF}, \text{ otherwise} \end{cases} \tag{23-40}$$

where

$K_{\text{Pilot\_Fix}}$ is the subcarrier indices for the fixed pilot tones. For a 1 MHz transmission, $K_{\text{Pilot\_Fix}} = \{\pm 7\}$.

$[P_{HTLTF}]_{*,1}$ is the first column of the P_{HTLTF} matrix.

$LTF_{-16:15} = \{0, 0, 0, 1, -1, 1, -1, -1, 1, -1, 1, 1, -1, 1, 1, 1, 0, -1, -1, -1, 1, -1, -1, -1, 1, -1, 1, 1, 1, -1, 0, 0\}$

NOTE 1—This LTF sequence is chosen to be orthogonal to both halves of the 2 MHz LTF sequence in order to facilitate the differentiation of S1G_1M preambles from S1G_SHORT and S1G_LONG preambles. The orthogonality metric used to select the sequences satisfied the criteria

$$\sum_{k} A(k)B(k)A(k+1)^{*}B(k+1)^{*} = 0$$

where {A} and {B} are the 1 MHz sequence and either of the halves of the 2 MHz sequence, and where k=1,2,3,...,16,18,19,...,31 skipping the 1 MHz DC location on k=17.

NOTE 2—This definition results in a BPSK modulation on the last two symbols of LTF1 field, to facilitate the differentiation of S1G_1M preambles from S1G_SHORT and S1G_LONG preamble.

The time domain representation of the LTF2~LTFN_{LTF} field signals at transmit chain i_{TX} shall be as specified in Equation (23-41).

$$r_{\text{LTF2~LTF}_{N_{\text{LTF}}}}^{(i_{\text{TX}})}(t) = \frac{1}{\sqrt{N_{\text{LTF}}^{\text{Tone}} N_{\text{STS}}}} \sum_{n=1}^{N_{LTF}-1} w_{T_{\text{LTF}}}(t-(n-1)T_{LTF}) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left(\begin{array}{l} [Q_k]_{i_{TX},m} \cdot [A_{LTF}^{k}]_{m,(n+1)} \, LTF_k \\ \quad \cdot \exp\left(j2\pi k \Delta_F (t-(n-1)T_{LTF} - T_{GI} - T_{CS}(m)) \right) \end{array} \right) \tag{23-41}$$

where

N_{SR} and T_{LTF} are defined in Table 23-5

$T_{CS(m)}$ represents the cyclic shift for space-time stream *m* with a value given in Table 23-16

Δ_F is defined in Table 23-5

N_{STS} is defined in Table 23-7

A_{LTF}^{k} is defined in Equation (23-40)

$N_{\text{LTF}}^{\text{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8

Q_k is defined in 23.3.7

23.3.8.3.5 SIG definition

The SIG field carries information required to interpret S1G_1M PPDUs. The structure of the 6 symbol SIG field (which carries 6 information bits per symbol) is shown in Figure 23-16. Note that unlike other SIG field structures the indexing of the bits incorporates all the SIG field symbols, i.e., B0–B5 denote the first symbol, B6–B11 the second, and so on. The SIG field format of NDP CMAC PPDUs is described in Figure 23-20 and Figure 23-21 (in 23.3.11).

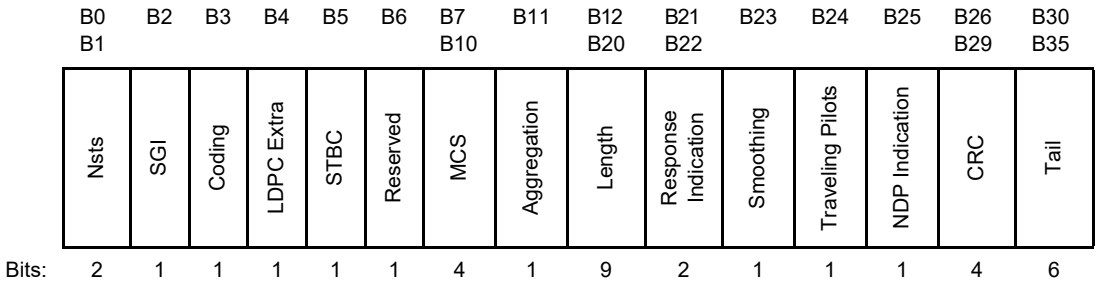

Figure 23-16—Structure of the 6 symbol SIG field of S1G_1M PPDU

The SIG field of S1G_1M PPDU contains the fields listed in Table 23-19.

Table 23-19—Fields in the SIG field of S1G_1M PPDU

Symbol	Bit	Field	Description
SIG-1	B0–B1	NSTS	Set to 0 for 1 space-time stream Set to 1 for 2 space-time streams Set to 2 for 3 space-time streams Set to 3 for 4 space-time streams
	B2	Short GI	Set to 0 if short guard interval is not used in the Data field. Set to 1 if short guard interval is used in the Data field.
	B3	Coding	Set to 0 for BCC and 1 for LDPC
	B4	LDPC Extra	If Coding field is 1, set to 1 if the LDPC PPDU encoding process (of an SU PPDU), results in an extra OFDM symbol (or symbols) as described in 21.3.10.5.4, otherwise set to 0. If Coding field is 0, this field is set to 1.
	B5	STBC	Set to 1 if all spatial streams have space-time block coding and set to 0 if no spatial streams has space-time block coding.
SIG-2	B6	Reserved	Reserved. Set to 1 on transmit. See 23.3.20 for behavior on receive.
	B7–B10	MCS	MCS Index
	B11	Aggregation	Set to 1 when aggregation is ON (as indicated by AGGREGATION parameter of TXVECTOR), and 0 otherwise. NOTE— S1G PPDUs are transmitted with aggregation ON when PSDU to be carried is greater than 511 octets, as defined in 10.12.5.

Table 23-19—Fields in the SIG field of S1G_1M PPDU *(continued)*

Symbol	Bit	Field	Description
SIG-3 and SIG-4	B12–B20	Length	When the Aggregation subfield is equal to 0, set to the number of octets in the PSDU. When the Aggregation subfield is equal to 1, set to N_{SYM_i}, given in 23.4.3. (See TXVECTOR parameter PSDU_LENGTH.)
	B21–B22	Response Indication	Set to the value obtained from the TXVECTOR parameter RESPONSE_INDICATION. The Response Indication field indicates the presence and type of the PPDU that is expected to follow SIFS after the current transmission (see 10.3.2.5).
	B23	Smoothing	A value of 1 indicates that channel smoothing is recommended. A value of 0 indicates that channel smoothing is not recommended.
SIG-5	B24	Traveling Pilots	Set to 1 to indicate traveling pilots usage in PPDU. Otherwise 0 to indicate regular pilot tone locations.
	B25	NDP Indication	Differentiate the PPDU from an NDP CMAC PPDU: Set to 0 to indicate that the PPDU is not an NDP CMAC PPDU.
	B26–B29	CRC	CRC calculated as in 23.3.8.2.2.6.
SIG-6	B30–B35	Tail	Used to terminate the trellis of the convolutional decoder. Set to 0.

The SIG field of S1G_1M is composed of six OFDM symbols, SIG-1 ~ SIG-6, each containing 6 data bits, as shown in Table 23-19. SIG-1 is transmitted first and SIG-6 is the last. The SIG field symbols shall be BCC encoded at rate, R = 1/2, and repeated two times for the encoded bits within each OFDM symbol, interleaved, mapped to a BPSK constellation, and have pilots inserted, following the steps for MCS 10 transmission flow described in 23.3.9. The stream of 144 complex numbers generated by these steps (before pilot insertion) is divided into six groups of 24 complex numbers $d_{k,n}$, $k = 0, \ldots, 23$, where $n = 0, 1, \ldots, 5$, respectively. All the 144 complex numbers are BPSK modulated. The first 24 complex numbers form the first symbol of SIG field; and the second 24 complex numbers form the second symbol of SIG field, and so forth.

The time domain waveform for the SIG field in an S1G_1M PPDU at transmit chain i_{TX} shall be as specified in Equation (23-42).

$$r_{\mathrm{SIG}}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{\mathrm{SIG}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} \sum_{n=0}^{5} w_{T_{\mathrm{SYML}}}(t - nT_{SYML}) \cdot \sum_{k=-13}^{13} \sum_{m=1}^{N_{STS}} \left[Q_k \right]_{i_{TX},m} \left[P_{HTLTF} \right]_{m,1} \left(D_{k,n,1} + p_n P_n^k \right) \cdot \exp\left(j2\pi k \Delta_F (t - nT_{SYML} - T_{GI} - T_{CS}(m)) \right) \quad (23\text{-}42)$$

where

p_n is defined in 17.3.5.10, and P_n^k for S1G_1M is defined in 23.3.9.10

$T_{CS(m)}$ represents the cyclic shift for space-time stream *m* with a value given in Table 23-18

T_{SYML} is defined in Table 23-5

Δ_F is defined in Table 23-5

N_{STS} is defined in Table 23-7

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

P_{HTLTF} is defined in Equation (19-27) in 19.3.9.4.6

$N_{\mathrm{SIG}}^{\mathrm{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8

Q_k is defined in 23.3.7

$$D_{k,n,1} = \begin{cases} 0, & k = 0, \pm 7 \\ d_{M_1'(k),n}, & \text{otherwise} \end{cases} \tag{23-43}$$

where

$M'_1(k)$ is defined in Equation (23-44)

$$M_1'(k) = \begin{cases} k+13, & -13 \le k \le -8 \\ k+12, & -6 \le k \le -1 \\ k+11, & 1 \le k \le 6 \\ k+10, & 8 \le k \le 13 \end{cases} \tag{23-44}$$

23.3.9 Data field

23.3.9.1 General

The number of OFDM symbols in the Data field is determined by the Length field in SIG field or SIG-A field of the three S1G PPDU formats, the preamble duration and the setting of the Short GI field in SIG field or SIG-A field, (see 23.3.8.2.2.5, 23.3.8.2.3.2.5, and 23.3.8.3.5). When BCC encoding is used, the Data field shall consist of the SERVICE field, the PSDU, the PHY pad bits and the tail bits (bits for SU and bits for each user *u* in MU). When LDPC encoding is used, the Data field shall consist of the SERVICE field, the PSDU and the PHY pad bits. No tail bits are present when LDPC encoding is used.

23.3.9.2 SERVICE field

In S1G PPDUs, the SERVICE field has 8 bits, which shall be denoted as bits 0–7. The bit 0 shall be transmitted first in time.

The SERVICE field is as shown in Table 23-20.

Table 23-20—SERVICE field

Bits	Field	Description
B0–B6	Scrambler Initialization	Set to 0
B7	Reserved	Set to 0 on transmit and ignored on receive

23.3.9.3 Scrambler

The SERVICE, PSDU and PHY pad parts of the Data field shall be scrambled by the scrambler defined in 17.3.5.5.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

23.3.9.4 Coding

23.3.9.4.1 General

The Data field shall be encoded using either the binary convolutional code (BCC) defined in 23.3.9.4.2 and 23.3.9.4.3, or the low-density parity check (LDPC) code defined in 23.3.9.4.4. The encoder is selected by the coding bit(s) in SIG field or SIG-A field of the three S1G PPDU formats, as defined in 23.3.8.2.2.5, 23.3.8.2.3.2.5, and 23.3.8.3.5. When BCC FEC encoding is used, the number of encoders is determined by rate-dependent parameters as defined in 23.5. The operation of the BCC FEC is described in 23.3.9.4.2 and 23.3.9.4.3. The operation of the LDPC coder is described in 23.3.9.4.4. Support for the reception of a BCC encoded Data field is mandatory.

23.3.9.4.2 BCC encoder parsing operation

The BCC encoder parsing operation for S1G PPDUs is the same as those specified in 21.3.10.5.2.

23.3.9.4.3 BCC coding and puncturing

23.3.9.4.3.1 General

The BCC coding and puncturing operation for S1G PPDUs is the same as those specified in 21.3.10.5.3.

23.3.9.4.3.2 Padding for BCC

For a BCC encoder, the number of PHY padding bits, $N_{PAD,u}$, is calculated as

$$N_{PAD,u} = N_{SYM} \times N_{DBPS,u} - 8 \times PSDU\_LENGTH_u - N_{service} - N_{tail} \times N_{ES,u}$$

where

$PSDU\_LENGTH_u$ is the value of the TXVECTOR parameter PSDU_LENGTH for user u

N_{SYM} is the number of symbols in the Data field and is given in 23.4.3 by Equation (23-79) for S1G SU PPDUs and Equation (23-82) for S1G MU PPDUs

For SU, $N_{PAD} = N_{PAD,0}$.

The padding flow for BCC encoded PPDUs is as follows:

For an S1G MU PPDU, or an S1G SU PPDU with the Aggregation subfield equal to 1 in its SIG field or SIG-A field, the MAC delivers a PSDU that fills the available octets in the Data field of the PPDU for each user u (i.e., append the maximum number of octets that is less than or equal to $N_{PAD,u}$). The PHY determines the number of PHY pad bits, which is $N_{PAD,u}$ modulo 8, and appends them to the PSDU, each of the PHY padding bits could be either 0 or 1. In this case, the Length subfield in SIG field or SIG-A field shall set the appropriate value indicating N_{SYM} data symbols.

For an S1G SU PPDU with the Aggregation subfield equal to 0 in its SIG field or SIG-A field, MAC padding is not conducted and the PHY directly appends N_{PAD} padding bits to the PSDU, each of the PHY padding bits could be either 0 or 1. In this case, the Length field shall set the appropriate value indicating PSDU_LENGTH in number of octets.

Both the PSDU and the PHY padding bits are scrambled and finally the $6.N_{ES}$ zero tail bits are appended after the scrambled PSDU and PHY padding bits.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

23.3.9.4.4 LDPC coding

23.3.9.4.4.1 General

For an S1G SU PPDU using LDPC coding to encode the Data field, the LDPC code and encoding process described in 19.3.11.7 shall be used with the following modifications. First, all bits in the Data field including the scrambled SERVICE, PSDU, and pad bits are encoded. Thus, N_{pld} for S1G SU PPDUs shall be computed using Equation (23-45) instead of Equation (19-35).

$$N_{pld} = N_{SYM,init} \times N_{DBPS} \tag{23-45}$$

where

$N_{SYM,init}$ is given by Equation (23-46) if the Aggregation subfield in its SIG field or SIG-A field is set to 1 or Equation (23-47) otherwise.

$$N_{SYM,init} = m_{STBC} \times \left\lceil \frac{8 \cdot APEP\_LENGTH + N_{service}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \tag{23-46}$$

$$N_{SYM,init} = m_{STBC} \times \left\lceil \frac{8 \cdot PSDU\_LENGTH + N_{service}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \tag{23-47}$$

where

m_{STBC}	is equal to 2 when STBC is used, and 1 otherwise
$APEP\_LENGTH$	is the value of TXVECTOR parameter APEP_LENGTH
$PSDU\_LENGTH$	is the value of TXVECTOR parameter PSDU_LENGTH

Following the calculation of N_{pld}, N_{avbits} shall be computed using Equation (23-48) instead of Equation (19-36).

$$N_{avbits} = N_{SYM,init} \times N_{CBPS} \tag{23-48}$$

In addition, if N_{SYM} computed in Equation (19-41) in step d) of 19.3.11.7.5 is greater than $N_{SYM,init}$, then the LDPC Extra field of its SIG field or SIG-A field shall be set to 1. Otherwise, the LDPC Extra field of its SIG field or SIG-A field shall be set to 0.

LDPC codes used in S1G MU PPDUs shall follow the definitions in 19.3.11.7. Refer to 23.3.9.4.5 for a description of the LDPC encoding process for S1G MU PPDUs.

23.3.9.4.4.2 Padding for LDPC

For LDPC encoding, the number of PHY padding bits for user u, $N_{PAD,u}$ is calculated as

$$N_{PAD,u} = N_{SYM,init} \times N_{DBPS,u} - 8 \times PSDU\_LENGTH_u - N_{service}$$

where

$PSDU\_LENGTH_u$ is the value of the TXVECTOR parameter PSDU_LENGTH for user u

$N_{SYM,init}$ is the initial number of symbols for the Data field when using LDPC given in 23.4.3 by Equation (23-82) for S1G SU PPDUs and Equation (23-83) for S1G MU PPDUs.

For SU, there is only one user, hence $N_{PAD} = N_{PAD,0}$.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The padding flow for LDPC encoded PPDUs is as follows:

The initial parameter computation $N_{SYM,init}$, N_{pld} and N_{avbits} are identical to those defined in 21.3.10.5.4.

For an S1G MU PPDU, or an S1G SU PPDU with the Aggregation subfield equal to 1 in its SIG field or SIG-A field, the MAC delivers a PSDU that fills the available octets in the Data field of the PPDU for each user *u* (i.e., append the maximum number of octets that is less than or equal to N_{PAD} or $N_{PAD,u}$). The PHY determines the number of pad bits, which is N_{PAD} mod 8 or $N_{PAD,u}$ mod 8, and appends them to the PSDU, each of the PHY padding bits could be either 0 or 1. In this case, the Length subfield in SIG field or SIG-A field shall set the appropriate value indicating N_{SYM} data symbols.

For an S1G SU PPDU with the Aggregation subfield equal to 0 in its SIG field or SIG-A field, MAC padding is not conducted and the PHY directly appends N_{PAD} padding bits to the PSDU, each of the PHY padding bits could be either 0 or 1. In this case, the Length field shall set the appropriate value indicating PSDU_LENGTH in number of octets

Both the PSDU and the PHY padding bits are scrambled, and then finally the scrambled PSDU and PHY padding bits are LDPC encoded according to 21.3.10.5.4.

In both cases, if $N_{SYM} > N_{SYM,\ init}$, the LDPC Extra subfield of SIG field or SIG-A field shall be set to 1 (see 23.3.8.2.2.5, 23.3.8.2.3.2.5, and 23.3.8.3.5).

23.3.9.4.5 Encoding process for S1G MU PPDUs

The encoding process for S1G MU PPDUs using S1G_LONG is the same as those specified in 21.3.10.5.5.

23.3.9.5 Repetition for 1 MHz MCS 10

In an 1 MHz PPDU that is modulated by MCS 10, the 6 information bits of each OFDM symbol are encoded with R=1/2, then the 12 encoded bits in each OFDM symbol is block-wise repeated by the following steps.

Assume that the sequence $[C_1 \ldots C_{12}]$ represents the 12 encoded bits in each OFDM symbol, the output bit stream after the repetition is:

$$C_{out}=[[C_1 \ldots C_{12}], [C_1 \ldots C_{12}] \text{ XOR } s], \quad (23\text{-}49)$$

where
s = [1 0 0 0 0 1 0 1 0 1 1 1]

The 24 output bits of the repetition are then sent to BCC interleaver (if BCC encoded) or the constellation mapper (if LDPC encoded).

23.3.9.6 Stream parser

The stream parser for S1G PPDUs is the same as those specified in 21.3.10.6 with up to 4 spatial streams.

For S1G_1M PPDU modulated using MCS 10, more than one spatial stream shall not be applied.

23.3.9.7 Segment parser

The segment parser for S1G 16 MHz PPDUs is the same as those specified for 160 MHz PPDUs in 21.3.10.7.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

23.3.9.8 BCC interleaver

The BCC interleavers for S1G 2 MHz, 4 MHz, 8 MHz, and 16 MHz PPDUs are the same as those defined for 20 MHz, 40 MHz, 80 MHz, and 160 MHz PPDUs, respectively, as specified in 21.3.10.8.

For S1G_1M PPDU, the interleaver parameters are defined by Table 23-21.

Table 23-21—Number of rows and columns in the interleaver for 1 MHz

Parameter	1 MHz
N_{COL}	8
N_{ROW}	$3 \times N_{BPSCS}$
$N_{ROT}\,(N_{SS} \leq 4)$	2

The interleaver parameters for 1 MHz MCS 10 is identical to the parameters used for 1 MHz MCS 0.

23.3.9.9 Constellation mapping

23.3.9.9.1 General

The constellation mappings for S1G PPDUs modulated using MCS 0 to MCS 9 are the same as those specified in 21.3.10.9.1 with the same MCS indices. The constellation mappings for S1G PPDUs modulated using MCS 11 and MCS 12 are the same as those specified in 27.3.12.9 for 1024-QAM.

The constellation mapping for 1 MHz MCS 10 is identical to the BPSK constellation mapping that is applied in MCS 0.

23.3.9.9.2 LDPC tone mapping

The LDPC tone mappings for S1G 2 MHz, 4 MHz, 8 MHz, and 16 MHz PPDUs are the same as those defined for 20 MHz, 40 MHz, 80 MHz, and 160 MHz PPDUs, respectively, as specified in 21.3.10.9.2.

For LDPC encoded S1G_1M PPDU, LDPC tone mapping is not applied.

23.3.9.9.3 Segment deparser

The segment deparser for S1G 16 MHz PPDUs is the same as those specified for 160 MHz PPDUs in 21.3.10.9.3.

23.3.9.9.4 Space-time block coding

The STBC for S1G PPDUs is the same as those specified in 21.3.10.9.4.

For S1G_1M PPDU modulated using MCS 10, STBC shall not be applied.

23.3.9.10 Pilot subcarriers

For an S1G_1M SIG field and Data field, two pilot tones shall be inserted in subcarriers. For fixed pilots, the pilot mapping for subcarrier k for symbol n shall be as specified in Equation (23-50).

$$P_n^{\{-7,7\}} = \{\Psi_{(n \bmod 2)+2}, \Psi_{((n+1) \bmod 2)+2}\} \quad (23\text{-}50)$$

$$P_n^{k \notin \{-7,7\}} = 0$$

where

Ψ_m is given in Table 21-21 in 21.3.10.10

For S1G_SHORT PPDU and S1G_LONG PPDU, with fixed pilots, P_n^k with same FFT sizes is identical to what is defined in 21.3.10.10.

For traveling pilots, at symbol n, P_n^k is defined as follows:

$$P_n^k = \begin{cases} 1.5 \times P_{n,\text{fix}}^{k_{\text{Pilot\_Fix}}^{(l)}}, k \in K_{\text{Pilot\_Travel}}(n) \text{ and } k = K_{\text{Pilot\_Travel}}^{(l)}(n) \\ 0, \text{otherwise} \end{cases} \quad (23\text{-}51)$$

where

$K_{\text{Pilot\_Travel}}(n)$ is the set of traveling pilot subcarrier positions corresponding to data symbol n ($n = 0, 1, 2, \ldots, N_{SYM}-1$)

$K_{\text{Pilot\_Travel}}^{(l)}(n)$ is the pilot tone position in the pilot subcarrier set $K_{\text{Pilot\_Travel}}(n)$ corresponding to pilot index l, as shown in Table 23-22 to Table 23-29

$P_{n,\text{fix}}^k$ is identical to P_n^k for fixed pilots

$k_{\text{Pilot\_Fix}}^{(l)}$ is the pilot tone position corresponding to pilot index l in the case of fixed pilots, specifically:

For 1 MHz, $\{k_{\text{Pilot\_Fix}}^{(0)}, k_{\text{Pilot\_Fix}}^{(1)}\} = \{-7, 7\}$

For 2 MHz, $\{k_{\text{Pilot\_Fix}}^{(0)}, \ldots, k_{\text{Pilot\_Fix}}^{(3)}\} = \{-21, -7, 7, 21\}$

For 4 MHz, $\{k_{\text{Pilot\_Fix}}^{(0)}, \ldots, k_{\text{Pilot\_Fix}}^{(5)}\} = \{-53, -25, -11, 11, 25, 53\}$

For 8 MHz, $\{k_{\text{Pilot\_Fix}}^{(0)}, \ldots, k_{\text{Pilot\_Fix}}^{(7)}\} = \{-103, -75, -39, -11, 11, 39, 75, 103\}$

For 16 MHz,

$\{k_{\text{Pilot\_Fix}}^{(0)}, \ldots, k_{\text{Pilot\_Fix}}^{(15)}\} = \{-231, -203, -167, -139, -117, -89, -53, -25, 25, 53, 89, 117, 139, 167, 203, 231\}$

The traveling pilot positions for symbol n, $K_{\text{Pilot\_Travel}}(n)$, are derived by the following paragraphs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For an S1G SU PPDU where in its SIG field or SIG-A field the NSTS subfield indicates one space-time stream and the Traveling Pilots subfield is set to 1, the traveling pilots positions $K_{\text{Pilot\_Travel}}(n)$ varies from symbol to symbol according to Table 23-22 to Table 23-25 for bandwidth 1 MHz, 2 MHz, 4 MHz, and 8 MHz. In this case, for data symbol n (n = 0, 1, 2, …, N_{SYM}–1), the pilot positions $K_{\text{Pilot\_Travel}}(n)$ equal to those in the column corresponding to the pattern index.:

$$m(n) = n \bmod N_{TP,BW} \tag{23-52}$$

where

$N_{TP,BW}$ is the traveling pilot pattern period with the following values:

$N_{TP,1\text{MHz}} = 13$

$N_{TP,2\text{MHz}} = 14$

$N_{TP,4\text{MHz}} = 19$

$N_{TP,8\text{MHz}} = 32$

$N_{TP,16\text{MHz}} = 32$

For an S1G SU PPDU where in its SIG field or SIG-A field the NSTS subfield indicates two space-time streams, STBC subfield is set to 1 and the Traveling Pilots subfield is set to 1, the traveling pilots positions $K_{\text{Pilot\_Travel}}(n)$ varies every other symbol according to Table 23-26 to Table 23-29 for bandwidth 1 MHz, 2 MHz, 4 MHz, and 8 MHz. In this case, for data symbol n (n = 0, 1, 2, …, N_{SYM}–1), the pilot positions $K_{\text{Pilot\_Travel}}(n)$ equal to those in the column corresponding to the pattern index.

$$m(n) = \left\lfloor \frac{n}{2} \right\rfloor \bmod N_{TP,BW} \tag{23-53}$$

where

$N_{TP,BW}$ is the traveling pilot pattern period with the following values:

$N_{TP,1\text{MHz}} = 7$

$N_{TP,2\text{MHz}} = 7$

$N_{TP,4\text{MHz}} = 10$

$N_{TP,8\text{MHz}} = 16$

$N_{TP,16\text{MHz}} = 16$

For a 16 MHz S1G PPDU with traveling pilots, in the data symbol n (n = 0, 1, 2, …, N_{SYM}–1), there are a total of 16 pilot subcarriers, whose positions $K_{\text{Pilot\_Travel}}(n)$ are expressed as

$$K_{\text{Pilot\_Travel}}(n) = \begin{cases} K_{\text{Pilot\_Travel,8MHz}}(n) - 128, \text{ for pilot indices } 0 \le l \le 7 \\ K_{\text{Pilot\_Travel,8MHz}}(n) + 128, \text{ for pilot indices } 8 \le l \le 15 \end{cases} \quad (23\text{-}54)$$

where $K_{\text{Pilot\_Travel,8MHz}}(n)$ is the traveling pilot positions of the 8 pilot subcarriers for symbol index n and 8 MHz, calculated based on Table 23-25 for a single space-time stream, or based on Table 23-29 for STBC with two space-time streams.

For S1G MU PPDUs, or S1G SU PPDUs with more than two space-time streams, or S1G SU PPDUs with two space-time streams without STBC, traveling pilots are not defined.

23.3.9.11 OFDM modulation

For S1G transmissions using S1G_SHORT, the Data field signal from transmit chain i_{TX}, $1 \le i_{TX} \le N_{TX}$, shall be as specified in Equation (23-55).

$$r_{Data}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{Data}}^{\text{Tone}} N_{\text{STS}}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - T_{Accum}(n)) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} ([Q_k]_{i_{TX}, m} \gamma_{k, BW} (\tilde{D}_{k, m, n, BW} + [P_{HTLTF}]_{m, g(n)} \cdot p_{n+2} P_n^k) \exp(j2\pi k \Delta_F (t - T_{Accum}(n) - T_{GI, Data}(n) - T_{CS}(m)))) \quad (23\text{-}55)$$

where

$$g(n) = \begin{cases} (n \bmod 2) + 1, & \text{if the STBC bit and Traveling Pilots bit in SIG field are both set to 1} \\ 1, & \text{otherwise} \end{cases}$$

For S1G transmissions using S1G_LONG, the Data field signal from transmit chain i_{TX}, $1 \le i_{TX} \le N_{TX}$, shall be as specified in Equation (23-56).

$$r_{Data}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{Data}}^{\text{Tone}} N_{\text{STS,total}}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - T_{Accum}(n)) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_u - 1} \sum_{m=1}^{N_{STS,u}} ([Q_k]_{i_{TX}, (M_u + m)} \gamma_{k, BW} (\tilde{D}_{k, m, n, BW} + [P_{HTLTF}]_{m, g(n)} \cdot p_{z(n)} P_{(z(n)-2)}^k) \exp(j2\pi k \Delta_F (t - T_{Accum}(n) - T_{GI, Data}(n) - T_{CS}(m)))) \quad (23\text{-}56)$$

where

$$g(n) = \begin{cases} (n \bmod 2) + 1, & \text{if the STBC bit and Traveling Pilots bit in SIG-A field are both set to 1} \\ 1, & \text{otherwise} \end{cases}$$

For S1G transmissions using S1G_1M, the Data field signal from transmit chain i_{TX}, $1 \le i_{TX} \le N_{TX}$, shall be as specified in Equation (23-57).

$$r_{Data}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{Data}}^{\text{Tone}} N_{\text{STS}}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - T_{Accum}(n)) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} ([Q_k]_{i_{TX}, m} \gamma_{k, BW} (\tilde{D}_{k, m, n, BW} + [P_{HTLTF}]_{m, g(n)} \cdot p_{n+6} P_n^k) \exp(j2\pi k \Delta_F (t - T_{Accum}(n) - T_{GI, Data}(n) - T_{CS}(m)))) \quad (23\text{-}57)$$

where

N_{SR}	is defined in Table 23-5
p_n	is defined in 17.3.5.10
P_n^k	is defined in 23.3.9.10
$T_{CS(m)}$	represents the cyclic shift for space-time stream *m* with a value given in Table 23-10 in the case of ≥ 2 MHz formats, and in Table 23-18 in the case of S1G_1M
$\Upsilon_{k,\mathrm{BW}}$	is defined by Equation (23-6) to Equation (23-9)
Δ_F	is defined in Table 23-5
N_{STS}, $N_{STS,total}$, and $N_{STS,u}$	are defined in Table 23-7
P_{HTLTF}	is defined in Equation (19-27) in 19.3.9.4.6
$N_{\mathrm{Data}}^{\mathrm{Tone}}$	has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8
N_u, and M_u	are defined in Table 23-7

$z(n)$ in Equation (23-56) is defined as follows:

$$z(n) = \begin{cases} n+2, \text{ if the MU/SU bit in SIG-A field is 0} \\ n+3, \text{ if the MU/SU bit in SIG-A field is 1} \end{cases}$$

$T_{GI,Data}(n)$ is the guard interval duration with the value as follows:

$$T_{GI,Data}(n) = \begin{cases} T_{GI}, \text{ if } n = 0 \\ T_{GI}, \text{ if } n > 0 \text{ and Short GI subfield of SIG or SIG-A field is 0} \\ T_{SGI}, \text{ if } n > 0 \text{ and Short GI subfield of SIG or SIG-A field is 1} \end{cases} \quad (23\text{-}58)$$

$\tilde{D}_{k,m,n,BW}$ is defined by Equation (23-59).

$$\tilde{D}_{k,m,n,BW} = \begin{cases} 0, & \text{if } k \in K_{\mathrm{Pilot}}(n) \\ d_{M'_{BW}(k),\,m,\,n,} & \text{otherwise} \end{cases} \quad (23\text{-}59)$$

where

$$K_{Pilot}(n) = \begin{cases} K_{Pilot\_\mathrm{Fix}}, & \text{if the Traveling Pilot bit in SIG or SIG-A field is 0} \\ K_{Pilot\_\mathrm{Travel}}(n), & \text{if the Traveling Pilot bit in SIG or SIG-A field is 1} \end{cases} \quad (23\text{-}60)$$

in which $K_{\mathrm{Pilot\_Fix}}$ is defined in 23.3.8.2.2.4 for ≥ 2 MHz and 23.3.8.3.4 for 1 MHz, and $K_{\mathrm{Pilot\_Travel}}(n)$ is defined in 23.3.9.10; and $M'_{BW}(k)$ is defined in Equation (23-30) to Equation (23-35) in 23.3.8.2.3.3.5 for 2 MHz, 4 MHz, 8 MHz, and 16 MHz, as well as Equation (23-44) in 23.3.8.3.5 for 1 MHz.

$T_{Accum}(n)$ is the accumulated duration from data symbol 0 to data symbol (*n-1*).

$$T_{Accum}(n) = \begin{cases} 0, & \text{if } n = 0 \\ T_{SYML} + (n-1)T_{SYM}, & \text{if } n > 0 \end{cases} \quad (23\text{-}61)$$

where

T_{SYML} and T_{SYM} are defined in Table 23-5

Q_k is a spatial mapping/steering matrix with N_{TX} rows and N_{STS} or $N_{STS,total}$ columns for subcarrier k. Q_k may be frequency dependent. Refer to the examples of listed in 19.3.11.11.2 for examples of that could be used for S1G SU PPDUs. Note that implementations are not restricted to the spatial mapping matrix examples listed in 19.3.11.11.2 and the number of transmit chains N_{TX} could be up to 4. For SU PPDUs to which beamforming is applied, Q_k is a beamforming steering matrix and is derived from the TXVECTOR parameter EXPANSION_MAT. For S1G MU PPDUs, Q_k is the DL MU-MIMO steering matrix and is derived from the TXVECTOR parameter EXPANSION_MAT. The beamforming steering matrices and DL MU-MIMO steering matrices are implementation specific.

The autodetection between 1 MHz and 2 MHz preambles assumes channel smoothness. It is recommended that the spatial mapping matrix Q_k applied to LTF1 field is chosen such that it preserves the smoothness of the physical channel. This can, for example, be achieved by minimizing the amplitude and phase variation of each element of Q_k in successive tones.

Examples:

a) The following may be used Q_k: Q_k as defined for cyclic shift diversity using the values specified in the corresponding tables.

b) The following Q_k should not be used:
   — Antenna hopping as described in 19.3.11.11.2 c) 2)
   — The values of Q_k on successive tones flip between 1 and 0

23.3.9.12 S1G 1 MHz and 2 MHz duplicate transmission

23.3.9.12.1 S1G 1 MHz duplicate transmission

An S1G 1 MHz duplicate transmission is used to transmit to S1G STAs that may be present in a part of a 2 MHz, 4 MHz, 8 MHz, or 16 MHz channel.

In an S1G 1 MHz duplicate PPDU, both the S1G_1M preamble and Data field are duplicated in each 1 MHz subchannel of the 2 MHz, 4 MHz, 8 MHz, or 16 MHz channel. Both an 1 MHz data PPDU and an 1 MHz NDP may be duplicated.

For S1G 1 MHz duplicate transmission, the Data field signal from transmit chain i_{TX}, $1 \le i_{TX} \le N_{TX}$, shall be as specified in Equation (23-62).

$$r_{Data}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{1MHz\_DUP\_Data}}^{\text{Tone}} N_{STS}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - T_{Accum}(n)) \sum_{i_{BW}=0}^{N_{1MHz}-1} \Bigg(\sum_{k=-13}^{13} \sum_{m=1}^{N_{STS}} ([Q_k]_{i_{TX},m} \gamma_{1MHz,\, k-(K_{Shift,\,1MHz}(i_{BW})),\, BW} (\tilde{D}_{k,m,n,1MHz} + [P_{HTLTF}]_{m,\, g(n)} \cdot p_{n+6} P_n^k) \exp(j2\pi(k - K_{Shift,\,1MHz}(i_{BW}))\Delta_F \cdot (t - T_{Accum}(n) - T_{GI,\,Data}(n) - T_{CS}(m)))) \Bigg) \quad (23\text{-}62)$$

where

p_n is defined in 17.3.5.10

P_n^k is defined in 23.3.9.10

$T_{CS(m)}$ represents the cyclic shift for space-time stream *m* with a value given in Table 23-18

$\Upsilon_{1MHz,k,\,\mathrm{BW}}$ is defined by Equation (23-10) to Equation (23-13)

Δ_F is defined in Table 23-5

N_{STS} is defined in Table 23-7

P_{HTLTF} is defined in Equation (19-27) in 19.3.9.4.6

$N^{\mathrm{Tone}}_{\mathrm{1MHz\_DUP\_Data}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-8

$T_{GI,Data}(n)$ is defined in Equation (23-58)

$\tilde{D}_{k,\,n,\,n,\,BW}$ is defined in Equation (23-59)

$T_{Accum}(n)$ is defined in Equation (23-61)

N_{1MHz} is the number of 1 MHz subchannels that are contained within the whole bandwidth of the current PPDU (e.g., $N_{1MHz} = 4$ for a 4 MHz PPDU)

$$g(n)=\begin{cases}(n \bmod 2)+1, & \text{if the STBC bit and Traveling Pilots bit in SIG-A field are both set to 1}\\ 1, & \text{otherwise}\end{cases}$$

$$K_{Shift,1MHz}(i)=(N_{1MHz}-1-2i).16 \tag{23-63}$$

23.3.9.12.2 S1G 2 MHz duplicate transmission

An S1G 2 MHz duplicate transmission is used to transmit to S1G STAs that may be present in a part of a 4 MHz, 8 MHz, or 16 MHz channel.

In an S1G 2 MHz duplicate PPDU, the S1G_SHORT preamble and Data field are duplicated in each 2 MHz subchannel of the 4 MHz, 8 MHz, or 16 MHz channel.

A 2 MHz NDP sounding shall not be duplicated. Instead, a 4 MHz, 8 MHz, or 16 MHz NDP shall be transmitted whenever needed. NDP CMAC PPDUs transmitted over a 4 MHz, 8 MHz, or 16 MHz channel shall be carried in an S1G 2 MHz duplicate PPDU.

For an S1G 2 MHz duplicate PPDU, the Data field signal from transmit chain i_{TX}, $1 \le i_{TX} \le N_{TX}$, shall be as specified in Equation (23-64).

$$r^{(i_{TX})}_{Data}(t) = \frac{1}{\sqrt{N^{\mathrm{Tone}}_{\mathrm{2MHz\_DUP\_Data}} N_{STS}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - T_{Accum}(n)) \sum_{i_{BW}=0}^{N_{2MHz}-1} \Bigg(\sum_{k=-28}^{28} \sum_{m=1}^{N_{STS}} ([Q_k]_{i_{TX},\,m} \Upsilon_{(k-K_{Shift}(i_{BW})),\,BW} (\tilde{D}_{k,\,m,\,n,\,2MHz} + [P_{HTLTF}]_{m,\,g(n)} \cdot p_{n+2} P^k_n) \exp(j2\pi(k-K_{Shift}(i_{BW}))\Delta_F \cdot (t - T_{Accum}(n) - T_{GI,\,Data}(n) - T_{CS}(m)))) \Bigg) \tag{23-64}$$

where

p_n is defined in 17.3.5.10

P^k_n is defined in 23.3.9.10

$K_{Shift}(i)$ is defined in Equation (23-19)

23.3.10 SU-MIMO and DL MU-MIMO Beamforming

23.3.10.1 General

S1G SU-MIMO and DL MU-MIMO beamforming are techniques used by a STA with multiple antennas (the beamformer) to steer signals using knowledge of the channel to improve throughput. The general description of SU-MIMO and DL MU-MIMO beamforming is identical to its VHT counterparts as described in 21.3.11.1 with VHT replaced by S1G.

In S1G operation, the SU-MIMO allows beamforming up to 4 space-time streams, and DL MU-MIMO beamforming allows up to 4 total number of space-time streams for all users each with up to 3 space-time streams.

S1G beamforming exchange is defined only for 2 MHz, 4 MHz, 8 MHz, and 16 MHz.

23.3.10.2 Beamforming Feedback Matrix V

The description of beamforming feedback matrix V in an S1G band is identical to its VHT counterpart as described in 21.3.11.2 with VHT replaced by S1G.

Compressed beamforming feedback using 19.3.12.3.6 is the only beamforming feedback format defined for S1G operation. In certain cases when the ψ angle is not included in the feedback frame (e.g., for SU feedback with $N_c = 1$), the ψ angles not included in the feedback report are given the values below, which corresponds to a single column V matrix having elements with equal magnitude:

If $N_r \times N_c = 4 \times 1$, $\Psi_{21} = 0.25\pi$, $\Psi_{31} = 0.196\pi$, $\Psi_{41} = 0.167\pi$
If $N_r \times N_c = 3 \times 1$, $\Psi_{21} = 0.25\pi$, $\Psi_{31} = 0.196\pi$
If $N_r \times N_c = 2 \times 1$, $\Psi_{21} = 0.25\pi$

23.3.10.3 Maximum Number of Total Spatial Streams in S1G MU PPDUs

An MU capable STA shall support reception of S1G MU PPDUs with the total number of space-time streams across the NUM_USERS users being less than or equal to its Compressed Steering Number of Beamformer Antennas Supported in the S1G Capabilities Information field. The upper limit is 4 spatial streams.

23.3.10.4 Group ID

The description of Group ID in an S1G band is identical to its VHT counterpart as described in 21.3.11.4 with VHT replaced by S1G.

23.3.11 S1G preamble format for NDPs

An NDP may be used for sounding or for NDP CMAC PPDUs. In the case of NDP sounding, the SIG field in an NDP shall indicate multiple space-time streams and more than one LTF fields; NDP CMAC PPDUs only contain single space-time stream with one LTF field.

NDP is the only S1G sounding format.

NDP for sounding is defined only using the S1G_SHORT, and NDP for sounding is not allowed for 1 MHz transmissions. NDP CMAC PPDUs may either use an S1G_SHORT, or an S1G_1M.

The format of an S1G NDP for sounding is shown in Figure 23-17.

2 symbols	2 symbols	2 symbols	1 symbol per LTF
STF	LTF1	SIG	LTF2 ~ LTFN_{LTF}

Figure 23-17—S1G NDP for sounding format

NOTE—The number of LTF symbols in the NDP is determined by the NSTS subfield in SIG field.

Transmission of an S1G NDP for sounding shall comply with the following rules:

- Shall use the S1G PPDU format but without the Data field.
- Shall use the S1G_SHORT.
- Shall use the following settings in SIG field:
  - MCS field is set to 0.
  - Length field is set to 0.
  - Bandwidth field is set to the same value as the TXVECTOR parameter CH_BANDWIDTH in the preceding VHT NDP Announcement frame carried in an S1G PPDU.
  - NSTS field indicates two or more space-time streams.
  - Partial AID field is set as described in 10.21.
  - The NDP indication bit is set to 0.
  - Response Indication field is set to Long Response (see TXVECTOR parameter RESPONSE_INDICATION).

The format of an NDP CMAC PPDU in 2 MHz, 4 MHz, 8 MHz, or 16 MHz is shown in Figure 23-18. The > 2 MHz NDP CMAC PPDUs are 2 MHz NDP CMAC PPDUs duplicated up to the transmission bandwidth according to CH_BANDWIDTH in TXVECTOR.

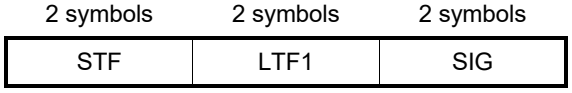

Figure 23-18—NDP CMAC PPDU for ≥ 2 MHz

The format of an S1G NDP CMAC PPDU in 1 MHz is shown in Figure 23-19. S1G NDP CMAC PPDUs for 1 MHz are duplicated up to their transmission bandwidth according to CH_BANDWIDTH in TXVECTOR.

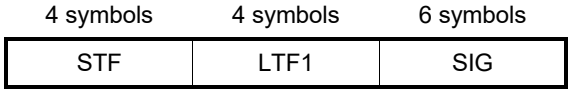

Figure 23-19—NDP CMAC PPDU for 1 MHz

Transmission of an NDP CMAC PPDU shall comply with the following rules:

- Shall use the S1G PPDU format but without the Data field.
- Shall use either the S1G_SHORT or the S1G_1M.
- Shall use the following settings in SIG field:
  - The NDP indication bit is set to 1.
- Shall contain only one LTF field.

The SIG field formats of NDP CMAC PPDUs are shown in Figure 23-20 and Figure 23-21.

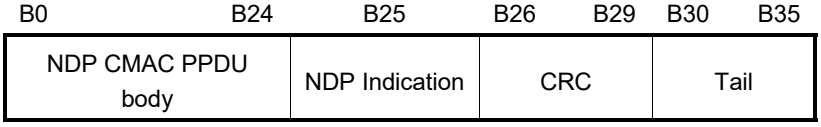

Figure 23-20—SIG field format for 1 MHz NDP CMAC PPDU

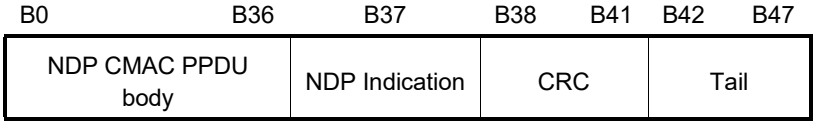

Figure 23-21—SIG field format for ≥ 2 MHz NDP CMAC PPDU

The NDP CMAC PPDU body field is described in 23.3.12.

The NDP Indication field is set to 1.

The CRC field is described in 23.3.8.2.2.6. Tail field is set to 0.

23.3.12 NDP CMAC PPDUs

23.3.12.1 General

The format of NDP CMAC PPDUs that use the S1G_1M format is shown in Figure 23-19. Figure 23-20 shows the SIG field format that contains the NDP CMAC PPDU body field. B25 of the SIG field (the second bit of the fifth symbol) is set to 1 to indicate an NDP CMAC PPDU. The NDP CMAC PPDU body field is 25 bits for NDP CMAC PPDUs that are transmitted using the S1G_1M format (NDP_1M).

The format of NDP CMAC PPDUs that use the S1G_SHORT format is shown in Figure 23-18. Figure 23-21 shows the SIG field format that contains the NDP CMAC PPDU body field. B37 of the SIG field (the fourteenth bit of the second symbol) is set to 1 to indicate an NDP CMAC PPDU. The NDP CMAC PPDU body field is 37 bits for NDP CMAC PPDUs that are transmitted using the S1G_SHORT format (NDP_2M).

An NDP CMAC PPDU is indicated by setting the TXVECTOR parameter NDP_INDICATION to 1. The TXVECTOR parameter NDP_CMAC_PPDU_BODY is set to the concatenated bits of the NDP CMAC PPDU body field.

An RXVECTOR parameter NDP_INDICATION equal to 1 indicates reception of an NDP CMAC PPDU, and the NDP CMAC PPDU body field of the frame is obtained from the RXVECTOR parameter NDP_CMAC_PPDU_BODY.

The PHY preamble format for transmission of NDP CMAC PPDUs is defined in 23.3.11.

This subclause describes the NDP CMAC PPDU body field content for each of the NDP CMAC PPDU types. The type of the NDP CMAC PPDU is indicated in the NDP CMAC PPDU Type field and its values are defined in Table 23-30.

NDP CMAC PPDUs are not MPDUs but NDPs, but they obey the rules for equivalent MPDUs, as shown in Table 23-30.

Table 23-30—NDP CMAC PPDU Type field values

Value	Meaning	Equivalent MPDU	See subclause
0	NDP CTS or NDP CF-End	CTS or CF-End	23.3.12.2.1, 23.3.12.2.2
1	NDP PS-Poll	PS-Poll	23.3.12.2.3
2	NDP Ack	Ack	23.3.12.2.4
3	NDP PS-Poll-Ack	Ack to PS-Poll	23.3.12.2.5
4	NDP BlockAck	BlockAck	23.3.12.2.6
5	NDP Beamforming Report Poll	Beamforming Report Poll	23.3.12.2.7
6	NDP Paging	Action	23.3.12.2.8

23.3.12.2 NDP CMAC PPDU details

23.3.12.2.1 NDP CTS

23.3.12.2.1.1 NDP_1M CTS

The format of the NDP CMAC PPDU body field of the NDP_1M CTS frame is shown in Figure 23-22.

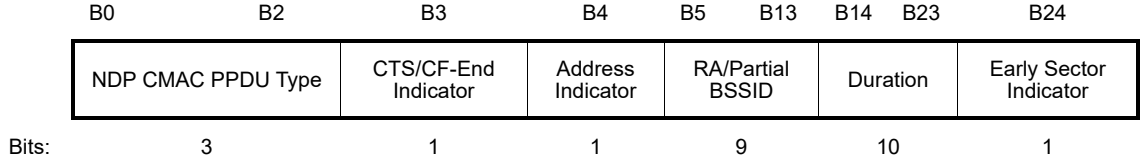

Figure 23-22—NDP CMAC PPDU body field of the NDP_1M CTS frame

The NDP CMAC PPDU Type field is set to 0.

The CTS/CF-End Indicator field is set to 0.

The Address Indicator field is set to 0 to indicate that the RA/Partial BSSID field contains the partial identifier of the receiving STA. It is set to 1 to indicate that the RA/Partial BSSID field contains the partial BSSID of the BSS of the AP transmitting the frame and is interpreted as a broadcast address (see 10.3.2.9 for the receiving STA's behavior). When the NDP CTS frame is used in the sector training it is set to 1.

The RA/Partial BSSID (PBSSID) field indicates:

— RA: the partial AID of the receiving non-AP STA or the partial BSSID of the receiving AP's BSS as described in 10.21

— Partial BSSID: the partial BSSID of the BSS of the transmitting AP as described in 10.21

The Duration field is expressed in units of OFDM symbol duration (40 μs) (Table 23-5) and follows the definitions in 9.3.1.3.

The Early Sector Indicator field is set to 1 to indicate that the NDP CTS frame is followed by the sectorized beam frame exchange sequence. It is set to 0 to indicate that the NDP CTS frame is not followed by the sectorized beam frame exchange sequence.

23.3.12.2.1.2 NDP_2M CTS

The format of the NDP CMAC PPDU body field of the NDP_2M CTS frame is shown in Figure 23-23.

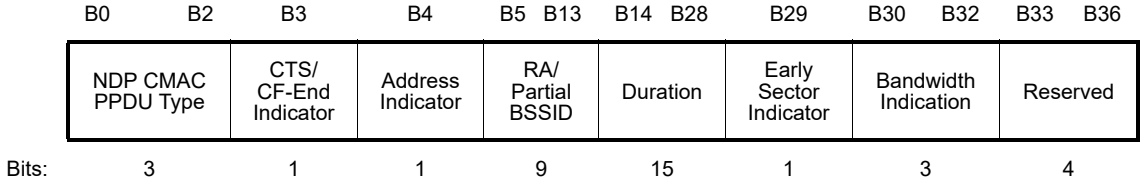

Figure 23-23—NDP CMAC PPDU body field of the NDP_2M CTS frame

The NDP CMAC PPDU Type field is set to 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The CTS/CF-End Indicator field is set to 0.

The Address Indicator field is set to 0 to indicate that the RA/Partial BSSID field contains the partial identifier of the receiving STA. It is set to 1 to indicate that the RA/Partial BSSID field contains the partial BSSID of the BSS of the AP transmitting the frame and is interpreted as a broadcast address (see 10.3.2.9 for the receiving STA's behavior). When the NDP CTS frame is used in the sector training it is set to 1.

The RA/Partial BSSID (PBSSID) field indicates

— RA: the partial AID of the receiving non-AP STA or the partial BSSID of the receiving AP's BSS as described in 10.21

— Partial BSSID: the partial BSSID of the BSS of the transmitting AP as described in 10.21

The Duration field is expressed in units of microseconds and follows the definitions in 9.3.1.3.

The Early Sector Indicator field is set to 1 to indicate that the NDP CTS frame is followed by the sectorized beam frame exchange sequence. It is set to 0 to indicate that the NDP CTS frame is not followed by the sectorized beam frame exchange sequence.

The Bandwidth Indication field is described in 9.2.4.1.11.

The Reserved field shall be set to all 0s on transmit and ignored on receive.

23.3.12.2.2 NDP CF-End

23.3.12.2.2.1 NDP_1M CF-End

The format of the NDP CMAC PPDU body field of the NDP_1M CF-End frame is shown in Figure 23-24.

	B0 B2	B3	B4 B12	B13 B22	B23 B24
	NDP CMAC PPDU Type	CTS/CF-End Indicator	Partial BSSID (TA)	Duration	Reserved
Bits:	3	1	9	10	2

Figure 23-24—NDP CMAC PPDU body field of the NDP_1M CF-End frame

The NDP CMAC PPDU Type field is set to 0.

The CTS/CF-End Indicator field is set to 1.

The Partial BSSID field indicates the PARTIAL_AID of the address of the STA contained in the AP.

The Duration field is expressed in units of OFDM symbol time (40 μs) and follows the definitions in 9.3.1.6.

The Reserved field shall be set to all 0s on transmit and ignored on receive.

23.3.12.2.2.2 NDP_2M CF-End

The format of the NDP CMAC PPDU body field of the NDP_2M CF-End frame is shown in Figure 23-25.

The NDP CMAC PPDU Type field is set to 0.

The CTS/CF-End Indicator field is set to 1.

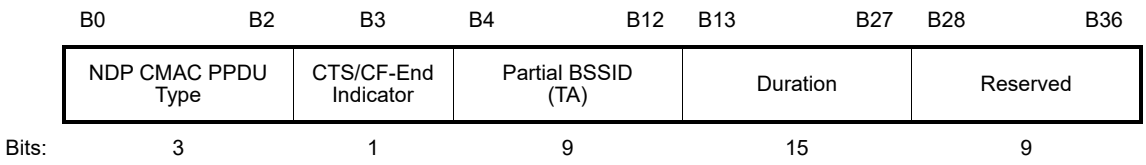

Figure 23-25—NDP CMAC PPDU body field of the NDP_2M CF-End frame

The Partial BSSID field indicates the PARTIAL_AID of the address of the STA contained in the AP.

The Duration field is expressed in units of microseconds and follows the definitions in 9.3.1.6.

The Reserved field shall be set to all 0s on transmit and ignored on receive.

23.3.12.2.3 NDP PS-Poll

23.3.12.2.3.1 NDP_1M PS-Poll

The format of the NDP CMAC PPDU body field of the NDP_1M PS-Poll frame is shown in Figure 23-26.

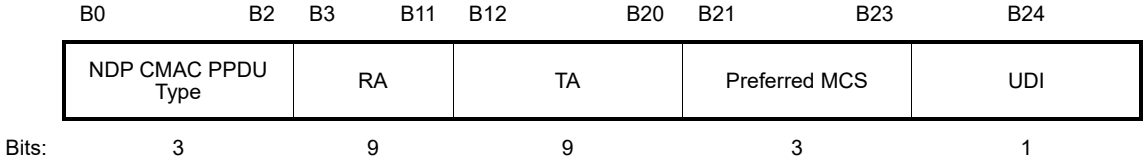

Figure 23-26—NDP CMAC PPDU body field of the NDP_1M PS-Poll frame

The NDP CMAC PPDU Type field is set to 1.

The RA field indicates the partial AID of the STA contained in the AP as described in 10.21.

The TA field indicates the partial AID of the STA transmitting the frame as described in 10.21.

The Preferred MCS field indicates the preferred MCS level for an 1 MHz channel width of the STA for downlink transmission. Mapping between Preferred MCS value and corresponding MCS index is shown in Table 23-31.

Table 23-31—Preferred MCS subfield values for NDP_1M PS-Poll frame

Preferred MCS value	MCS Index	Description
0	0	BPSK 1/2
1	1 or 2	QPSK 1/2 or QPSK 3/4
2	3 or 4	16-QAM 1/2 or 16-QAM 3/4
3	5 or 6	64-QAM 2/3 or 64-QAM 3/4
4	7 or 8	64-QAM 5/6 or 256-QAM 3/4
5	9	64-QAM 5/6

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 23-31—Preferred MCS subfield values for NDP_1M PS-Poll frame

6	10	BPSK 1/4
7	No Preference	

The Uplink Data Indicator (UDI) subfield indicates if the STA has uplink data to transmit:

— Set to 0 to indicate that there is no uplink data present
— Set to 1 to indicate that there is uplink data present

23.3.12.2.3.2 NDP_2M PS-Poll

The format of the NDP CMAC PPDU body field of the NDP_2M PS-Poll frame is shown in Figure 23-27.

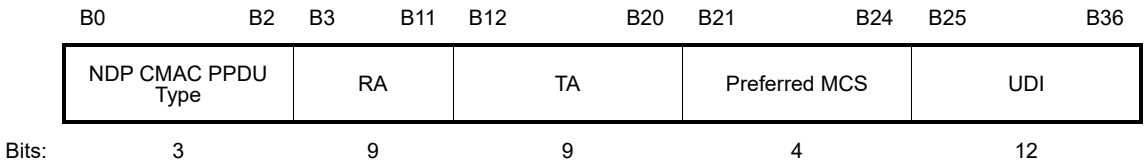

Figure 23-27—NDP CMAC PPDU body field of the NDP_2M PS-Poll frame

The NDP CMAC PPDU Type field is set to 1.

The RA field indicates the partial AID of the address of the STA contained in the AP as described in 10.21.

The TA field indicates the partial AID of the address of the STA transmitting the frame as described in 10.21.

The Preferred MCS field indicates the preferred MCS level for a 2 MHz channel width of the STA for downlink transmission. Mapping between Preferred MCS value and corresponding MCS index is shown in Table 23-32.

Table 23-32—Preferred MCS subfield values for NDP_2M PS-Poll frame

Preferred MCS value	MCS Index	Description
0–9	0–9	The value represents the MCS index for the STA's preferred MCS level.
10	No Preference	
11–12	11–12	The value represents the MCS index for the STA's preferred MCS level.
13–15	Reserved	

The Uplink Data Indicator (UDI) subfield indicates if the STA has uplink data to transmit and is used by an SST STA to indicate its selected SST channel:

— Set to 0 to indicate that there is no uplink data present
— Set to 1 to indicate that there is uplink data present but the estimated time for the transmission of the uplink Data frames that are present at the STA is not determined.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Set to a value between 2 and 9 to indicate the relative position of the selected SST channel with respect to the lowest numbered channel in the SST Enabled Channel Bitmap field of a received SST Operation element. For example, setting the UDI to 2 indicates that the selected SST channel is the first channel in the SST Enabled Channel Bitmap field, while setting the UDI to 3 indicates that the selected SST channel is the second channel in the SST Enabled Channel Bitmap field, etc.
— Set to a value greater than 9 to indicate the estimated time, in units of 40 μs, required for the transmission of the uplink Data frames that are present at the STA, excluding the duration of their response and applicable IFS durations.

23.3.12.2.4 NDP Ack

23.3.12.2.4.1 General

The NDP Ack frame, used to respond to an S1G frame, other than an NDP PS-Poll frame, is described in this subclause.

23.3.12.2.4.2 NDP_1M Ack

The format of the NDP CMAC PPDU body field of the NDP_1M Ack frame is shown in Figure 23-28 (NDP CMAC PPDU body field of the NDP_1M Ack frame).

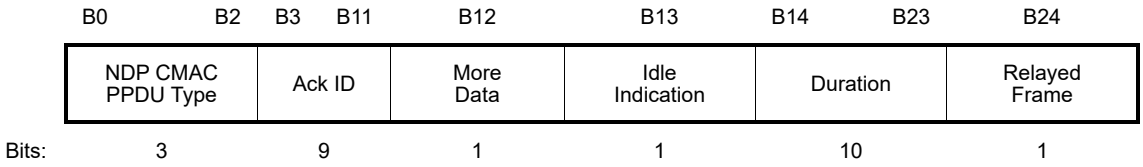

Figure 23-28—NDP CMAC PPDU body field of the NDP_1M Ack frame

The NDP CMAC PPDU Type field is set to 2.

The Ack ID field is set to the bit sequence Scrambler Initialization [0:6] || FCS[30:31] obtained from the scrambler initialization value in the SERVICE field (as defined in 23.3.9.2) prior to descrambling, and the FCS field of the PSDU that carries the soliciting frame. The scrambler initialization value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

The More Data field is described in 9.2.4.1.8.

The Idle Indication field is set to 0 if the value of the Duration field sets the NAV as described in 9.2.5.6. Otherwise, it is set to 1 if the value of the Duration field indicates an idle period.

If the Idle Indication field is 0, the Duration field is set as described in 9.2.5.6 where the value is expressed in units of 40 μs. If the Idle Indication field is 1, the Duration field is set to the duration of time, in milliseconds, during which an idle period (during which there is no frame transmission) is expected from the STA that elicited the response, starting from the end of the NDP Ack frame response.

The Relayed Frame field is set as described in 10.53.5 and 10.60.

23.3.12.2.4.3 NDP_2M Ack

The format of the NDP CMAC PPDU body field of the NDP_2M Ack frame is shown in Figure 23-29.

The NDP CMAC PPDU Type field is set to 2.

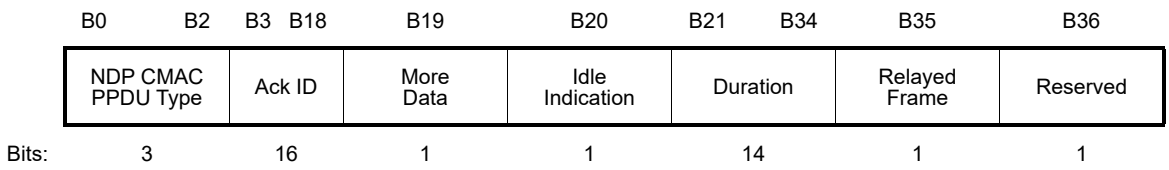

Figure 23-29—NDP CMAC PPDU body field of the NDP_2M Ack frame

The Ack ID field is set to the bit sequence Scrambler Initialization [0:6] || FCS[23:31] obtained from the scrambler initialization value in the SERVICE field (as defined in 23.3.9.2) prior to descrambling, and the FCS field of the PSDU that carries the soliciting frame. The scrambler initialization value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

The More Data field is described in 9.2.4.1.8.

The Idle Indication field is set to 0 if the value of the Duration field sets the NAV as described in 9.2.5.6. Otherwise, it is set to 1 if the value of the Duration field indicates an idle period.

If the Idle Indication field is 0, the Duration field is set as described in 9.2.5.6 where the value is expressed in units of 1 μs. If the Idle Indication field is 1, the Duration field is set to the duration of time, in milliseconds, during which an idle period (during which there is no frame transmission) is expected from the STA that elicited the response, starting from the end of the NDP Ack frame response.

The Relayed Frame field is set as described in 10.53.5 and 10.60.

The Reserved field shall be set to all 0s on transmit and ignored on receive.

23.3.12.2.5 NDP PS-Poll-Ack

23.3.12.2.5.1 General

The NDP PS-Poll-Ack frame, used to respond to an NDP PS-Poll frame, is described in this subclause.

23.3.12.2.5.2 NDP_1M PS-Poll-Ack

The format of the NDP CMAC PPDU body field of the NDP_1M PS-Poll-Ack frame is shown in Figure 23-30.

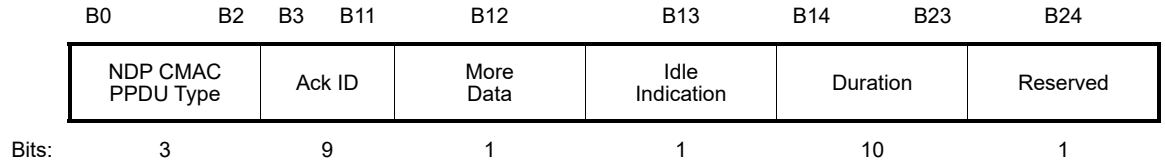

Figure 23-30—NDP CMAC PPDU body field of the NDP_1M PS-Poll-Ack frame

The NDP CMAC PPDU Type field is set to 3.

The Ack ID field is set to the bit sequence CRC[0:3] || TA[4:8] obtained from the CRC and TA field of the NDP PS-Poll frame that elicited the response. The CRC value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

The More Data field is described in 9.2.4.1.8.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Idle Indication field is set to 0 if the value of the Duration field is an extension of the Ack ID. Otherwise, it is set to 1 if the value of the Duration field indicates an idle period.

If the Idle Indication field is 0, the Duration field is set to the bit sequence TA[3] || RA[0:8] obtained from the RA and TA fields of the NDP PS-Poll frame that elicited the response. If the Idle Indication is 1, the Duration field is set to the duration of time, in milliseconds, during which an idle period (during which there is no frame transmission) is expected from the STA that elicited the response, starting from the end of the NDP PS-Poll-Ack frame response.

The Reserved field shall be set to all 0s on transmit and ignored on receive.

23.3.12.2.5.3 NDP_2M PS-Poll-Ack

The format of the NDP CMAC PPDU body field of the NDP_2M PS-Poll-Ack frame is shown in Figure 23-31 (NDP CMAC PPDU body field of the NDP_2M PS-Poll-Ack frame).

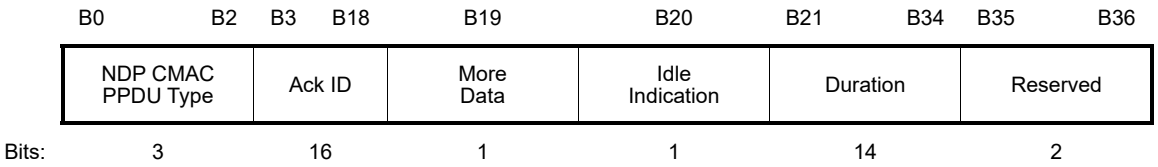

Figure 23-31—NDP CMAC PPDU body field of the NDP_2M PS-Poll-Ack frame

The NDP CMAC PPDU Type field is set to 3.

The Ack ID field is set to the bit sequence CRC[0:3] || TA[0:8] || RA[6:8]] obtained from the CRC, TA, and RA field of the NDP PS-Poll frame that elicited the response. The CRC value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

The More Data field is described in 9.2.4.1.8.

The Idle Indication field is set to 0 if the value of the Duration field sets the NAV as described in 10.3.2.15. Otherwise, it is set to 1 if the value of the Duration field indicates an idle period.

If the Idle Indication field is 0, the Duration field is set as described in 10.3.2.15, where the value is expressed in units of 1 μs.

If the Idle Indication field is 1, the Duration field is set to the duration of time, in milliseconds, during which an idle period (during which there is no frame transmission) is expected from the STA that elicited the response, starting from the end of the NDP PS-Poll-Ack frame response.

The Reserved field shall be set to all 0s on transmit and ignored on receive.

23.3.12.2.6 NDP BlockAck

23.3.12.2.6.1 NDP_1M BlockAck

The format of the NDP CMAC PPDU body field of the NDP_1M BlockAck frame is shown in Figure 23-32.

The NDP CMAC PPDU Type field is set to 4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

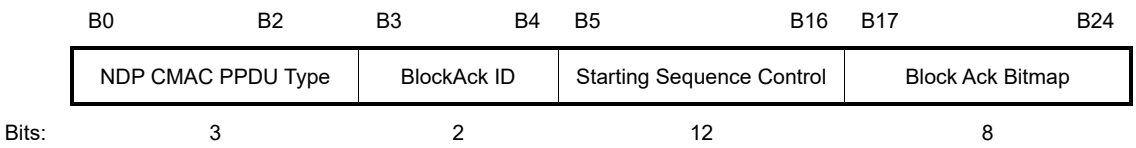

Figure 23-32—NDP CMAC PPDU body field of the NDP_1M BlockAck frame

The BlockAck ID field contains the identifier of the NDP BlockAck frame. It is set to the 2 LSBs of the bit sequence of the scrambler initialization value in the SERVICE field (as defined in 23.3.9.2), prior to descrambling, of the PSDU that carries the soliciting frame. The scrambler initialization value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

The Starting Sequence Control field contains the sequence number of the first MSDU or A-MSDU for which the NDP BlockAck frame is sent. This field is defined in 10.25.6.5 when the NDP BlockAck is used during a block ack agreement and is defined in 10.3.2.12 when it is used in a fragment BA procedure.

The Block Ack Bitmap field of the NDP BlockAck frame is used to indicate the received status of:

— Up to 8 MSDUs and A-MSDUs when the NDP BlockAck is used during a block ack agreement. Each bit that is equal to 1 in the NDP BlockAck bitmap acknowledges the reception of a single MSDU or A-MSDU in the order of sequence number, with the first bit of the NDP BlockAck bitmap corresponding to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Control field.

— Up to 8 fragments of an MSDU when the NDP BlockAck is used in a fragment BA procedure (see 10.3.2.12). Each bit that is equal to 1 in the BlockAck Bitmap acknowledges the reception of a single fragment of an MSDU, in the order of the fragment number, with the first bit of the BlockAck Bitmap corresponding to the MPDU with fragment number equal to 0 or 8.

The transmitting (receiving) STA encodes (decodes) the BlockAck ID field and the Starting Sequence Control field of the NDP BlockAck frames applying the protection mechanism described in 10.56.

23.3.12.2.6.2 NDP_2M BlockAck

The format of the NDP CMAC PPDU body field of the NDP_2M BlockAck frame is shown in Figure 23-33.

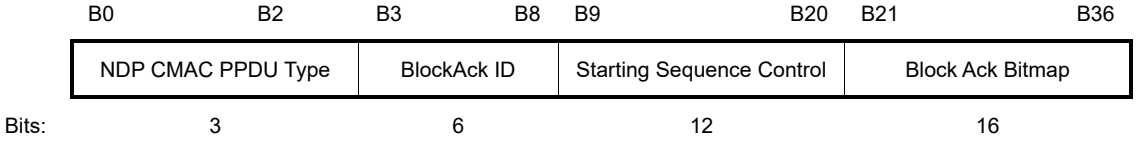

Figure 23-33—NDP CMAC PPDU body field of the NDP_2M BlockAck frame

The NDP CMAC PPDU Type field is set to 4.

The BlockAck ID field contains the identifier of the NDP BlockAck frame. It is set to the 6 LSBs of the bit sequence of the scrambler initialization value in the SERVICE field (as defined in 23.3.9.2), prior to descrambling, of the PSDU that carries the soliciting frame. The scrambler initialization value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

The Starting Sequence Control field contains the sequence number of the first MSDU or A-MSDU for which the NDP BlockAck frame is sent. This field is defined in when the NDP BlockAck is used during a block ack agreement and is defined in 10.3.2.12 when it is used in a fragment BA procedure.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Block Ack Bitmap field of the NDP BlockAck frame is used to indicate the received status of:

— Up to 16 MSDUs and A-MSDUs when the NDP BlockAck is used during a block ack agreement. Each bit that is equal to 1 in the NDP BlockAck bitmap acknowledges the reception of a single MSDU or A-MSDU in the order of sequence number, with the first bit of the NDP BlockAck bitmap corresponding to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Control field.

— Up to 16 fragments of an MSDU when the NDP BlockAck is used in a fragment BA procedure (see 10.3.2.12). Each bit that is equal to 1 in the BlockAck Bitmap acknowledges the reception of a single fragment of an MSDU, in the order of the fragment number, with the first bit of the BlockAck Bitmap corresponding to the MPDU with fragment number equal to 0.

The transmitting (receiving) STA encodes (decodes) the BlockAck ID field and the Starting Sequence Control field of the NDP BlockAck frames applying the protection mechanism described in 10.56.

23.3.12.2.7 NDP Beamforming Report Poll

23.3.12.2.7.1 NDP_2M Beamforming Report Poll

The format of the NDP CMAC PPDU body field of the NDP_2M Beamforming Report Poll frame is shown in Figure 23-34.

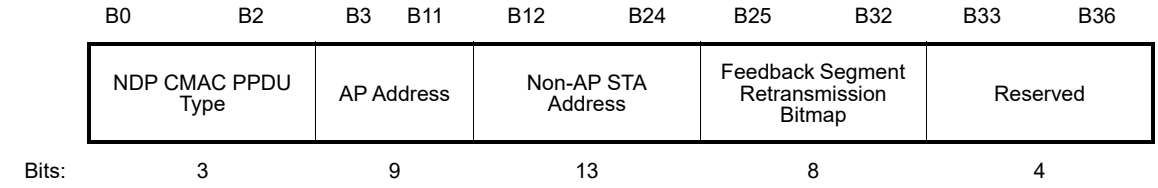

Figure 23-34—NDP CMAC PPDU body field of the NDP_2M Beamforming Report Poll frame

The NDP CMAC PPDU Type field is set to 5.

The AP Address field indicates the partial BSSID of the AP's BSS as described in 10.21.

The Non-AP STA Address field indicates the AID of the non-AP STA.

The Feedback Segment Retransmission Bitmap field indicates the feedback segments to be polled in VHT compressed beamforming feedback, which is contained in one or more VHT Compressed Beamforming frames.

The Reserved field shall be set to all 0s on transmit and ignored on receive.

23.3.12.2.8 NDP Paging

23.3.12.2.8.1 General

An NDP Paging frame is an NDP_1M Paging frame or an NDP_2M Paging frame, as defined in this subclause.

23.3.12.2.8.2 NDP_1M Paging

The format of the NDP CMAC PPDU body field of the NDP_1M Paging frame is shown in Figure 23-35.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

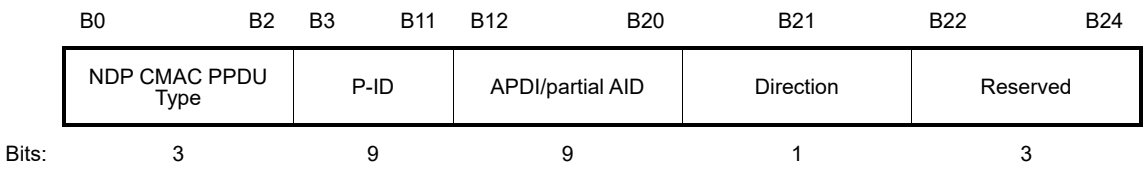

Figure 23-35—NDP CMAC PPDU body field of the NDP_1M Paging frame

The NDP CMAC PPDU Type field is set to 6.

The P-ID field is the identifier of the NDP paging requester, as described in 10.46.6.

If the Direction field is 1 the APDI/partial AID field indicates the AP direction information (APDI), where

- The 8 MSBs of the APDI, depending on the value of the Action subfield of the NDP paging response, contain
  - The PTSF subfield if the Action subfield is not equal to 4. The PTSF subfield is set to the value of the partial TSF of the transmitting STA as defined in 10.46.6.
  - The ASD subfield if the Action subfield is equal to 4. The ASD subfield is the additional sleep duration and is set to the time, in units of SIFS, after which the receiver STA is in awake state as described in 10.46.6.
- The LSB of the APDI is the Check Beacon Flag subfield and is an indicator of critical changes in the Beacon frame as described in 10.46.6.

If the Direction field is 0, the APDI/partial AID field indicates the partial AID of the NDP paging responder STA.

The Direction field is set to 1, if the NDP paging responder is an AP, otherwise it is set to 0.

The Reserved field shall be set to all 0s on transmit and ignored on receive.

23.3.12.2.8.3 NDP_2M Paging

The format of the NDP CMAC PPDU body field of the NDP_2M Paging frame is shown in Figure 23-36.

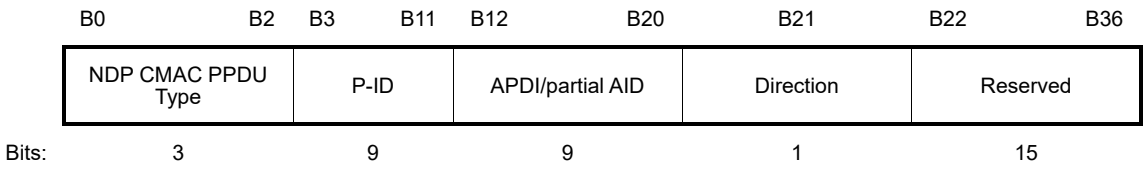

Figure 23-36—NDP CMAC PPDU body field of the NDP_2M Paging frame

The NDP CMAC PPDU Type field is set to 6.

The P-ID field is the identifier of the NDP paging requester, as described in 10.46.6.

If the Direction field is 1, the APDI/partial AID field indicates the APDI (AP Direction Information) where:

- The 8 MSBs of the APDI, depending on the value of the Action subfield of the NDP paging response, contain
  - The PTSF subfield if the Action subfield is not equal to 4. The PTSF subfield is set to the value of the partial TSF of the transmitting STA as defined in 10.46.6.

— The ASD subfield if the Action subfield is equal to 4. The ASD subfield is the additional sleep duration and is set to the time, in units of SIFS, after which the receiver STA is in awake state as described in 10.46.6.

— The LSB of the APDI is the Check Beacon Flag subfield and is an indicator of critical changes in the Beacon frame as described in 10.46.6.

If the Direction field is 0, the APDI/partial AID field indicates the partial AID of the NDP paging responder STA.

The Direction field is set to 1, if the NDP paging responder is an AP, otherwise it is set to 0.

The Reserved field shall be set to all 0s on transmit and ignored on receive.

23.3.12.2.9 NDP Probe Request

23.3.12.2.9.1 General

NDP Probe Request frames are used in the procedures described in 11.1.4.3.6.

23.3.12.2.9.2 NDP_1M Probe Request

The format of the NDP CMAC PPDU body field of the NDP_1M Probe Request frame is shown in Figure 23-37.

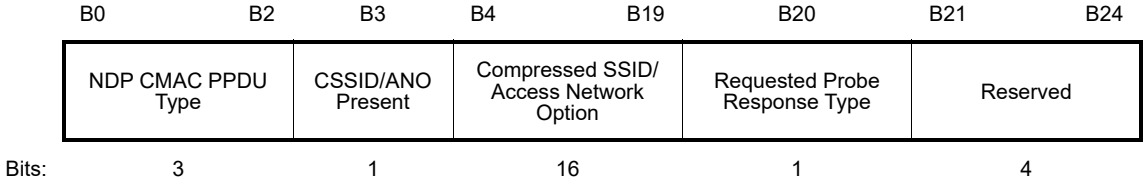

Figure 23-37—NDP CMAC PPDU body field of the NDP_1M Probe Request frame

The NDP CMAC PPDU Type field is set to 7.

The CSSID/ANO Present field indicates if the NDP Probe Request frame contains a Compressed SSID field or an Access Network Option field:

— Set to 0 if the NDP Probe Request frame contains the Compressed SSID field.

— Set to 1 if the NDP Probe Request frame contains the Access Network Option field.

When the CSSID/ANO Present field is 0, the Compressed SSID/Access Network Option field is set to the compressed SSID, which is the 2 least significant octets of a 32-bit CRC calculated as defined 9.2.4.9, wherein the calculated fields is the SSID.

NOTE—This is encoded per 9.2.2. For example, if the short SSID has the coefficient of the highest order term set, and the coefficient of the next-to-lowest order term set, and all other coefficients clear, then the Compressed SSID/Access Network Option field contains 0x02 followed by 0x00.

When the CSSID/ANO Present field is 1, the Compressed SSID/Access Network Option field bits [0:7] are set to Access Network Option, which is defined in 9.4.2.90 (see Figure 9-564). The Compressed SSID/Access Network Option field bits [8:15] are reserved and shall be set to all 0s on transmit and ignored on receive.

The Requested Probe Response Type field indicates the Probe Response type:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Set to 0 if the STA requests a PV1 Probe Response frame.
— Set to 1 if the STA requests a Probe Response frame.

The Reserved field shall be set to all 0s on transmit and ignored on receive.

23.3.12.2.9.3 NDP_2M Probe Request

The format of the NDP CMAC PPDU body field of the NDP_2M Probe Request frame is shown in Figure 23-38.

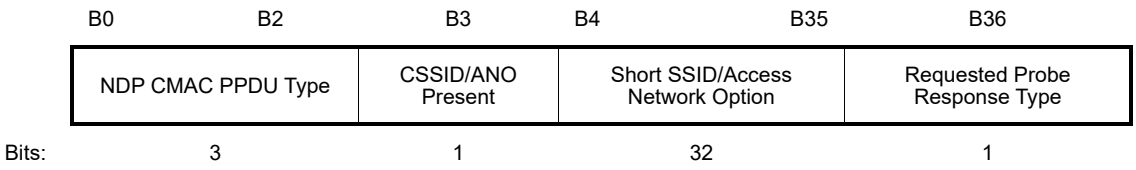

Figure 23-38—NDP CMAC PPDU body field of the NDP_2M Probe Request frame

The NDP CMAC PPDU Type field is set to 7.

The CSSID/ANO Present field indicates if the NDP Probe Request frame contains a Short SSID field or an Access Network Option field:

— Set to 0 if the NDP Probe Request contains the Short SSID field.
— Set to 1 if the NDP Probe Request contains the Access Network Option field.

When the CSSID/ANO Present field is 0, the Short SSID/Access Network Option field is set to the short SSID, which is a 32-bit CRC calculated as defined in 9.2.4.9, wherein the calculated fields is the SSID.

When the CSSID/ANO Present field is 1, the Short SSID/Access Network Option field bits [0:7] are set to Access Network Option, which is defined in 9.4.2.90 (see Figure 9-564). The Short SSID/Access Network Option field bits [8:31] are reserved and shall be set to all 0s on transmit and ignored on receive.

The Requested Probe Response Type field indicates the Probe Response type:

— Set to 0 if the STA requests a PV1 Probe Response frame.
— Set to 1 if the STA requests a Probe Response frame.

23.3.13 Regulatory requirements

WLANs implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision, or may be superseded. Requirements that are subject to local geographic regulations are annotated within the PHY specification. Regulatory requirements that do not affect interoperability are not addressed in this standard. Implementers are referred to the regulatory sources in Annex D for further information. Operation in countries within defined regulatory domains may be subject to additional or alternative national regulations.

23.3.14 Channelization

STAs compliant with the physical layer defined in Clause 23 operate in the channels (700 MHz – 1 GHz) defined in Annex E.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The channel center frequency, f_c, is defined as

$$f_c \text{ [MHz]} = ChannelStartingFrequency + f_{separation} \times ChannelCenterChannelNumber$$

where

$f_{separation}$ is the frequency separation between channels, and has the value of 0.5 MHz

ChannelStartingFrequency and *ChannelCenterChannelNumber* are region and operating class specific and given in Annex E. The Channel spacing column in Annex E denotes the corresponding bandwidth for S1G operation.

The center frequency of the primary 1 MHz or primary 2 MHz channel, $f_{c,\ primary}$, is defined as:

$$f_{c,\ primary} \text{ [MHz]} = ChannelStartingFrequency + f_{separation} \times PrimaryChannelNumber$$

where

$f_{separation}$ is the frequency separation between channels, and has the value of 0.5 MHz

PrimaryChannelNumber is the subchannel index of the primary 1 or 2 MHz channel within the overall bandwidth for S1G operation

23.3.15 Slot time

The slot time for the S1G PHY shall be 52 μs.

23.3.16 Transmit and receive port impedance

The impedance of exposed transmit and receive antenna ports are defined in 17.3.8.7.

23.3.17 S1G transmit specification

23.3.17.1 Transmit spectrum mask

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements and the mask defined in this subclause.

NOTE 2—Transmit spectral mask figures in this subclause are not drawn to scale.

NOTE 3—For rules regarding TX center frequency leakage levels see 23.3.17.4.2. Transmit modulation accuracy specifications are described in 23.3.17.4.2 and 23.3.17.4.3. The test method is described in 23.3.17.4.4. The spectral mask requirements in this subclause do not apply to the RF LO leakage.

The overall transmit spectral mask is constructed using two components. First, an interim spectral mask is constructed whose mask level is determined relative to the maximum spectral density of the signal. Second, an absolute transmit spectral limit is computed based on the mask bandwidth. The overall transmit spectral mask is then constructed by taking the higher of the interim transmit spectral mask and the absolute transmit spectral limit at each frequency offset.

For a 1 MHz mask PPDU, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 0.9 MHz, –20 dBr at 0.6 MHz frequency offset, –28 dBr at 1 MHz frequency offset and –40 dBr at 1.5 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 0.45 and 0.6 MHz, 0.6 and 1 MHz, and 1 and 1.5 MHz shall be linearly interpolated in dB domain from the requirements for 0.45, 0.6, 1 and 1.5 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –40 dBm/MHz at any frequency offset. Figure 23-39 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –40 dBm/MHz.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Measurements shall be made using a 10 kHz resolution bandwidth and a 100 Hz video bandwidth.

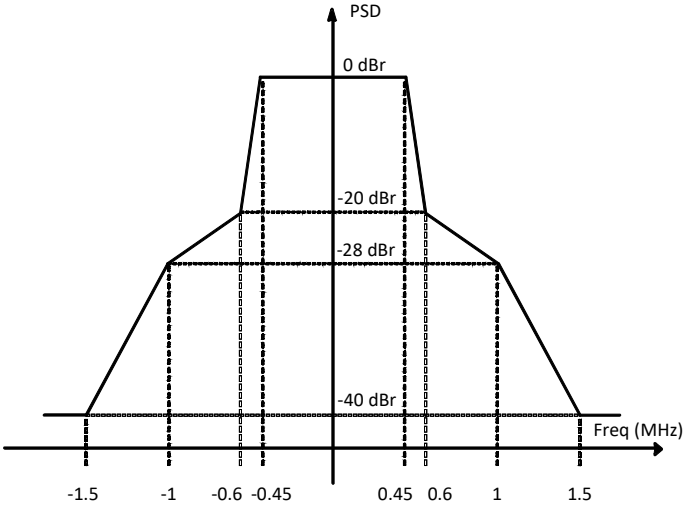

Figure 23-39—Transmit spectral mask for 1 MHz channel

For a 2 MHz mask PPDU, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 1.8 MHz, –20 dBr at 1.1 MHz frequency offset, –28 dBr at 2 MHz frequency offset and –40 dBr at 3 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 0.9 and 1.1 MHz, 1.1 and 2 MHz, and 2 and 3 MHz shall be linearly interpolated in dB domain from the requirements for 0.9, 1.1, 2 and 3 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –43 dBm/MHz at any frequency offset. Figure 23-40 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –43 dBm/MHz.

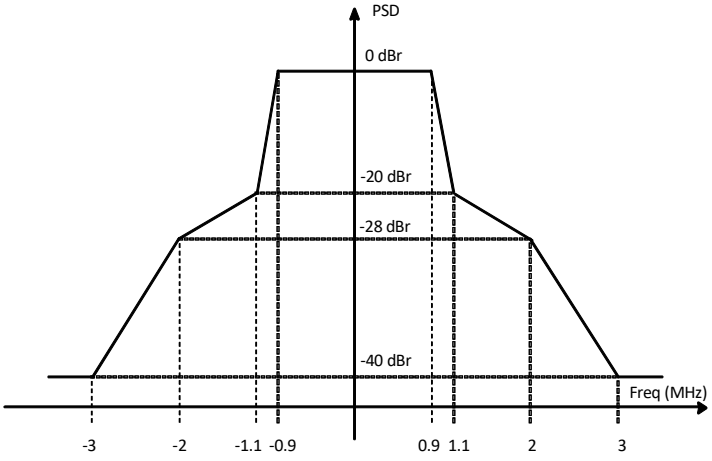

Figure 23-40—Transmit spectral mask for 2 MHz channel

For a 4 MHz mask PPDU, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 3.8 MHz, –20 dBr at 2.1 MHz frequency offset, –28 dBr at 4 MHz frequency offset and –40 dBr at 6 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 1.9 and 2.1 MHz, 2.1 and 4 MHz, and 4 and 6 MHz shall be linearly interpolated in dB domain from the requirements for 1.9, 2.1, 4 and 6 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –46 dBm/MHz at any

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

frequency offset. Figure 23-41 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –46 dBm/MHz.

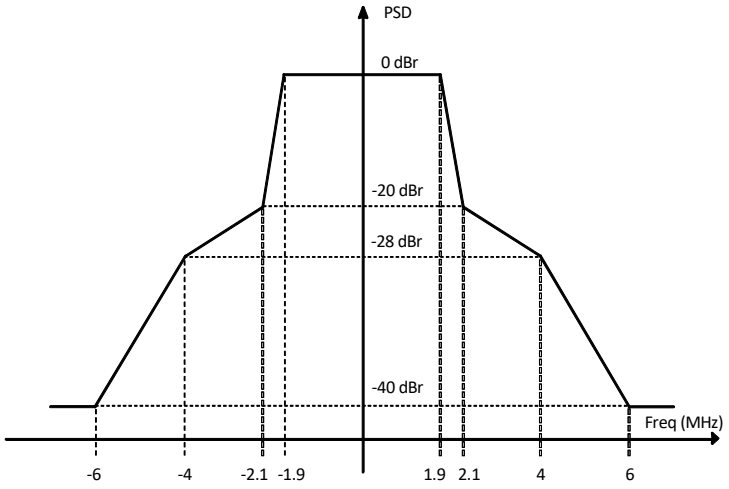

Figure 23-41—Transmit spectral mask for 4 MHz channel

For a 8 MHz mask PPDU, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 7.8 MHz, –20 dBr at 4.1 MHz frequency offset, –28 dBr at 8 MHz frequency offset and –40 dBr at 12 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 3.9 and 4.1 MHz, 4.1 and 8 MHz, and 8 and 12 MHz shall be linearly interpolated in dB domain from the requirements for 3.9, 4.1, 8 and 12 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –49 dBm/MHz at any frequency offset. Figure 23-42 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –49 dBm/MHz.

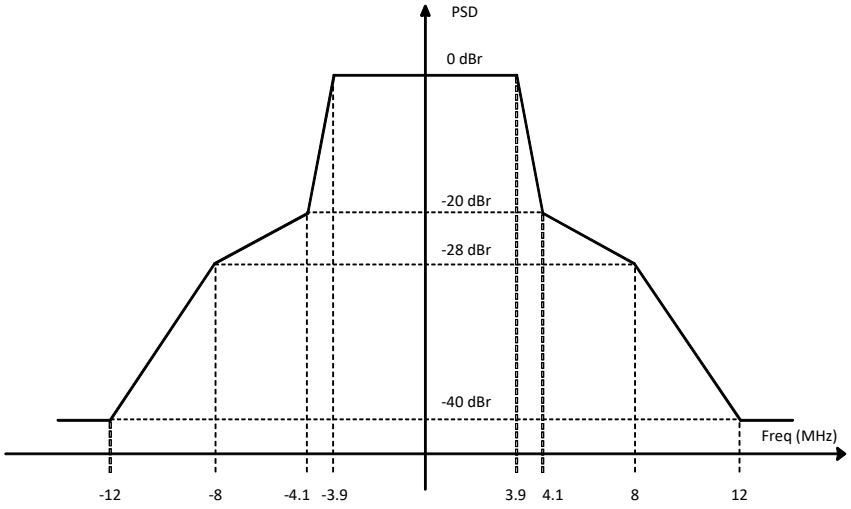

Figure 23-42—Transmit spectral mask for 8 MHz channel

For a 16 MHz mask PPDU, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 15.8 MHz, –20 dBr at 8.1 MHz frequency offset, –28 dBr at 16 MHz frequency offset and –40 dBr at 24 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 7.9 and 8.1 MHz, 8.1 and 16 MHz, and 16 and 24 MHz shall be linearly interpolated in dB domain from the requirements for 7.9, 8.1, 16

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

and 24 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –49 dBm/MHz at any frequency offset. Figure 23-43 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –49 dBm/MHz.

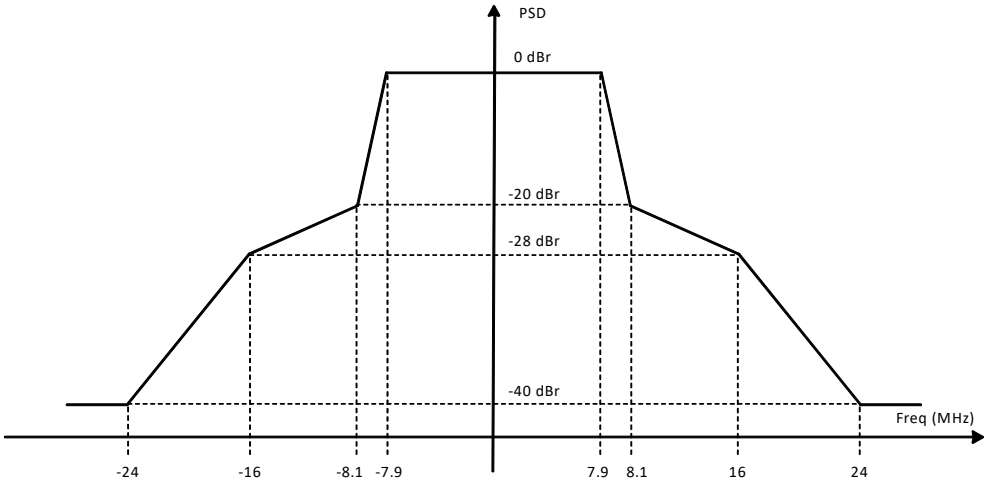

Figure 23-43—Transmit spectral mask for 16 MHz channel

23.3.17.2 Spectral flatness

Spectral flatness measurements shall be conducted using BPSK modulated PPDUs.

Let $E_{i,\,avg}$ denote the average constellation energy of a BPSK modulated subcarrier *i* in an S1G data symbol.

In a normal mode S1G transmission or contiguous S1G 1 MHz or 2 MHz Duplicate mode transmission having a bandwidth listed in Table 23-33, $E_{i,\,avg}$ of each of the subcarriers with indices listed as tested subcarrier indices shall not deviate by more than the specified maximum deviation in Table 23-33 from the average of $E_{i,\,avg}$ over subcarrier indices listed as averaging subcarrier indices. Averaging of $E_{i,\,avg}$ is done in the linear domain.

For the spectral flatness test, the transmitting STA shall be configured to use a spatial mapping matrix Q_k with flat frequency response. Each output port under test of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The requirements apply to 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz normal mode transmissions and transmissions based on 1 and 2 MHz duplicated segments.

23.3.17.3 Transmit center frequency and symbol clock frequency tolerance

The symbol clock frequency and transmit center frequency tolerance shall be ± 20 ppm. The transmit center frequency and the symbol clock frequency for all transmit antennas and frequency segments shall be derived from the same reference oscillator.

23.3.17.4 Modulation accuracy

23.3.17.4.1 Introduction to modulation accuracy tests

Transmit modulation accuracy specifications are described in 23.3.17.4.2 and 23.3.17.4.3. The test method is described in 23.3.17.4.4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 23-33—Maximum spectral flatness deviations

Format	BW of transmission (MHz)	Averaging subcarrier indices	Tested subcarrier indices	Maximum deviation (dB)
Normal Mode S1G	1	–8 to –1 and +1 to +8	–8 to –1 and +1 to +8	± 4
			–13 to –9 and +9 to +13	+4/–6
	2	–16 to –1 and +1 to +16	–16 to –1 and +1 to +16	± 4
			–28 to –17 and +17 to +28	+4/–6
	4	–42 to –2 and +2 to +42	–42 to –2 and +2 to +42	± 4
			–58 to –43 and +43 to +58	+4/–6
	8	–84 to –2 and +2 to +84	–84 to –2 and +2 to +84	± 4
			–122 to –85 and +85 to +122	+4/–6

23.3.17.4.2 Transmitter center frequency leakage

TX LO leakage is a consequence of the RF local oscillator (LO) and is the DC power emitted at its tuned center frequency. This TX LO leakage shall meet the following requirements for all formats and bandwidths:

— When the RF LO is in the center of the transmitted PPDU BW, the power measured at the center of transmission BW using resolution BW 31.25 kHz shall not exceed the average power per-subcarrier of the transmitted PPDU, or equivalently,($P - 10\log 10(N_{ST})$), where P is the transmit power per antenna in dBm, and N_{ST} is defined in Table 23-5.

— When the RF LO is not at the center of the transmitted PPDU BW, the power measured at the location of the RF LO using resolution BW 31.25 kHz shall fall within that resolution BW of a 2 MHz channelization boundary and shall not exceed the maximum of –27 dB relative to the total transmit power and –15 dBm, or equivalently max(P–27,–15), where P is the transmit power per antenna in dBm. If 2 MHz channelization is not allowed in the regulatory region of operation, the TX LO leakage shall fall within the resolution BW of a 1 MHz channelization boundary and shall not exceed the maximum of –27 dB relative to the total transmit power and –15 dBm, or equivalently max(P–27,–15), where P is the transmit power per antenna in dBm.

The transmit center frequency leakage is specified per antenna.

23.3.17.4.3 Transmitter constellation error

The relative constellation RMS error, calculated by first averaging over subcarriers, OFDM PPDUs and spatial streams (see Equation (19-89)) shall not exceed a data-rate dependent value according to Table 23-34. The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized testing instrumentation input ports. In the test, N_{SS}=N_{STS} (no STBC) shall be used. Each output port of the transmitting STA shall be connected

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

through a cable to one input port of the testing instrumentation. The requirements apply to 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz transmissions.

Table 23-34—Allowed relative constellation error versus constellation size and coding rate

Modulation	Coding rate	Relative constellation error (dB)
BPSK	1/2 with 2× repetition	–4
BPSK	1/2	–5
QPSK	1/2	–10
QPSK	3/4	–13
16-QAM	1/2	–16
16-QAM	3/4	–19
64-QAM	2/3	–22
64-QAM	3/4	–25
64-QAM	5/6	–27
256-QAM	3/4	–30
256-QAM	5/6	–32
1024-QAM	3/4	–35/–32
1024-QAM	5/6	–35/–32

For 1024-QAM, the relative constellation error shall meet the following requirements:

— The relative constellation error shall be less than or equal to –35 dB with amplitude drift compensation enabled in the test equipment, and the relative constellation error shall be less than or equal to –32 dB with amplitude drift compensation disabled in the test equipment.

For all other constellations, the relative constellation error shall be less than or equal to the values in Table 23-34 regardless of whether amplitude drift compensation is enabled in the test equipment.

23.3.17.4.4 Transmitter modulation accuracy (EVM) test

The transmit modulation accuracy test shall be performed by instrumentation capable of converting the transmitted signals into a stream of complex samples at sampling rate greater than or equal to the bandwidth of the signal being transmitted; except that for duplicate transmissions, each 1 MHz or 2 MHz subchannel may be tested independently while all subchannels are being transmitted.

The instrument shall have sufficient accuracy in terms of I/Q arm amplitude and phase balance, DC offsets, phase noise, and analog to digital quantization noise. A possible embodiment of such a setup is converting the signals to a low IF frequency with a microwave synthesizer, sampling the signal with a digital oscilloscope and decomposing it digitally into quadrature components. The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or equivalent procedure:

a) Start of PPDU shall be detected.

b) Transition from STF field to LTF1 field shall be detected and fine timing shall be established.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

c) Coarse and fine frequency offsets shall be estimated.

d) Symbols in a PPDU shall be derotated according to estimated frequency offset.

e) For each LTF symbol, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, and derotate the subcarrier values according to the estimated phase.

f) Estimate the complex channel response coefficient for each of the subcarriers and each of the transmit streams.

g) For each of the data OFDM symbols: transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, derotate the subcarrier values according to the estimated phase, group the results from all the receiver chains in each subcarrier to a vector, and multiply the vector by a zero-forcing equalization matrix generated from the estimated channel.

h) For each data-carrying subcarrier in each spatial stream, find the closest constellation point and compute the Euclidean distance from it.

i) Compute the average across PPDUs of the RMS of all errors per PPDU as given by Equation (19-89).

The test shall be performed over at least 20 PPDUs [as defined in Equation (19-89)]. The PPDUs under test shall be at least 16 data OFDM symbols long. Random data shall be used for the symbols.

23.3.17.5 Time of Departure accuracy

The RMS accuracy of the time of departure provided in TIME_OF_DEPARTURE shall be less than or equal to 80 ns.

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex T with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is

$1 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{1\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW1

$2 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{2\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW2

$4 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{4\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW4

$8 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{8\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW8

$16 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{16\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW16

where

f_H is the nominal center frequency in Hz of the highest channel in the channel set

f_L is the nominal center frequency in Hz of the lowest channel in the channel set, the channel set is the set of channels upon which PPDUs providing measurements are transmitted.

— FIRST_TRANSITION_FIELD is the STF field.

— SECOND_TRANSITION_FIELD is the LTF1 field.

— TRAINING_FIELD is the LTF1 field windowed in a manner that should approximate the windowing described in 17.3.2.5 with TTR = 1000 ns.

— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns for a CH_BANDWIDTH parameter equal to CBW16, and unspecified otherwise.

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

23.3.18 S1G receiver specification

23.3.18.1 Receiver minimum input level sensitivity

The PER shall be less than 10% for a PSDU length of 256 octets with the rate-dependent input levels listed in Table 23-35. The test in this subclause and the minimum sensitivity levels specified in Table 23-35 apply only to non-STBC modes, 8 μs GI, BCC, and S1G PPDU.

Table 23-35—Receiver minimum input level sensitivity

Modulation	Rate (R)	Minimum sensitivity (1 MHz PPDU) (dBm)	Minimum sensitivity (2 MHz PPDU) (dBm)	Minimum sensitivity (4 MHz PPDU) (dBm)	Minimum sensitivity (8 MHz PPDU) (dBm)	Minimum sensitivity (16 MHz PPDU) (dBm)
BPSK	1/2 with 2× repetition	–98	N/A	N/A	N/A	N/A
BPSK	1/2	–95	–92	–89	–86	–83
QPSK	1/2	–92	–89	–86	–83	–80
QPSK	3/4	–90	–87	–84	–81	–78
16-QAM	1/2	–87	–84	–81	–78	–75
16-QAM	3/4	–83	–80	–77	–74	–71
64-QAM	2/3	–79	–76	–73	–70	–67
64-QAM	3/4	–78	–75	–72	–69	–66
64-QAM	5/6	–77	–74	–71	–68	–65
256-QAM	3/4	–72	–69	–66	–63	–60
256-QAM	5/6	–70	–67	–64	–61	–58
1024-QAM	3/4	–67	–64	–61	–58	–55
1024-QAM	3/4	–65	–62	–59	–56	–53

23.3.18.2 Adjacent channel rejection

Adjacent channel rejection for *W* MHz channels (where *W* is 1, 2, 4, 8, or 16) shall be measured by setting the requested signal's strength 3 dB above the rate dependent sensitivity specified in 23.3.18.1 and raising the power of the interfering signal of *W* MHz bandwidth until 10% PER is caused for a PSDU length of 256 octets. The power difference between the interfering and requested channel is the corresponding adjacent channel rejection. The center frequency of the adjacent channel shall be placed *W* MHz away from the center frequency of the requested signal.

The interfering signal in the adjacent channel shall be a conformant S1G signal, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. For a conforming S1G PHY, the corresponding rejection shall be no less than specified in Table 23-36.

The test in this subclause and the adjacent sensitivity levels specified in Table 23-36 only apply to non-STBC modes with 8 μs GI and BCC.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The measurement of adjacent channel rejection for 2/4/8/16 MHz operation in a regulatory domain is only required if such a frequency band plan is permitted in that regulatory domain.

Table 23-36—Minimum required adjacent and nonadjacent channel rejection levels

Modulation	Rate, R	Adjacent Channel Rejection (dB)		Nonadjacent Channel Rejection (dB)	
		1 MHz Channel	2/4/8/16 MHz Channel	1 MHz Channel	2/4/8/16 MHz Channel
BPSK	1/2 with 2× repetition	19	N/A	35	N/A
BPSK	1/2	16	16	32	32
QPSK	1/2	13	13	29	29
QPSK	3/4	11	11	27	27
16-QAM	1/2	8	8	24	24
16-QAM	3/4	4	4	20	20
64-QAM	2/3	0	0	16	16
64-QAM	3/4	–1	–1	15	15
64-QAM	5/6	–2	–2	14	14
256-QAM	3/4	–7	–7	9	9
256-QAM	5/6	–9	–9	7	7
1024-QAM	3/4	–12	–12	4	4
1024-QAM	5/6	–14	–14	2	2

23.3.18.3 Nonadjacent channel rejection

Nonadjacent channel rejection for *W* MHz channels (where *W* is 1, 2, 4, 8, or 16) shall be measured by setting the requested signal's strength 3 dB above the rate-dependent sensitivity specified in Table 23-36, and raising the power of the interfering signal of W MHz bandwidth until a 10% PER occurs for a PSDU length of 256 octets. The power difference between the interfering and requested channel is the corresponding nonadjacent channel rejection. The center frequency of the nonadjacent channel shall be placed 2×*W* MHz or more away from the center frequency of the requested signal.

The interfering signal in the nonadjacent channel shall be a conformant S1G signal, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. For a conforming OFDM PHY, the corresponding rejection shall be no less than specified in Table 23-36.

The test in this subclause and the nonadjacent sensitivity levels specified in Table 23-36 only apply to non-STBC modes with 8 μs GI and BCC.

The measurement of nonadjacent channel rejection for 2/4/8/16 MHz operation in a regulatory domain is only required if such a frequency band plan is permitted in that regulatory domain.

23.3.18.4 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 256 octets, for a maximum input level of –30 dBm, measured at each antenna for any baseband S1G modulation.

23.3.18.5 CCA sensitivity

23.3.18.5.1 General

The thresholds in this subclause are compared with the signal level at each receiving antenna.

23.3.18.5.2 Type 1 and type 2 channelization for CCA levels

In S1G operation, the CCA sensitivity levels are defined such that they are dependent and specific to country channelization and channel location within the frequency band. For S1G channelizations in all regions of the world, there are to be two available classifications for channels and CCA levels, defined as type 1 and type 2.

For BSSs set up on channels classified as using type 1, STAs are to use what are referred to in this subclause as type 1 CCA levels when performing their CCA procedures. Likewise, if the BSS is set up on channels classified as type 2, STAs are required to use type 2 specific CCA levels. For SST BSS setups (see 10.51) where the SST BSS can include both type 1 and type 2 channels, the device in the SST BSS shall use the CCA level (type 1 or type 2) that corresponds to the current channel that is being accessed when performing their CCA procedures. The type 1 and type 2 channel classification for different operating classes in different regions of the world are denoted by “CCA Level Classification” in Table E-4 to Table E-5 in Annex E.

In general, type 1 channels have CCA levels set to favor protection of ongoing transmissions and range of devices, relative to type 2 channels. Type 2 channels have CCA levels set to favor higher bandwidth and data rate transmissions, and to allow for higher reuse within the total network across different BSSs (relative to type 1 channels). To achieve this, type 2 channel CCA levels (i.e., thresholds) are defined to be higher than type 1 channel CCA levels.

CCA levels impact system behavior and performance increasingly with loading, therefore it is generally advantageous for BSSs primarily serving devices requiring more channel and transmission protection to set up on type 1 channels, and for BSSs expected to service devices with higher bandwidth and data rate transmissions to set up on type 2 channels if the region/country has both type 1 and type 2 channels available.

An S1G STA configures its active CCA conditions by generating a PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive with the CCA_SENSITIVITY_TYPE parameter. For operating in type 1 channels, the MAC sublayer generates a PHY-CONFIG.request primitive with a PHYCONFIG_VECTOR parameter CCA_SENSITIVITY_TYPE set to CCA_SENSITIVITY_TYPE_1. For operating in type 2 channels, the MAC sublayer generates a PHY-CONFIG.request primitive with a PHYCONFIG_VECTOR parameter CCA_SENSITIVITY_TYPE set to CCA_SENSITIVITY_TYPE_2. For operating the 8/16 MHz intended channel width in type 2 channels, the MAC sublayer generates a PHY-CONFIG.request primitive with a PHYCONFIG_VECTOR parameter CCA_SENSITIVITY_TYPE set to CCA_SENSITIVITY_TYPE_2_WIDEBAND.

23.3.18.5.3 CCA sensitivity for signals occupying the primary 2 MHz and/or primary 1 MHz channel

23.3.18.5.3.1 General

In S1G operation, the CCA sensitivity levels a device shall use when detecting the start of S1G PPDUs are based on whether the occupied primary channel in question is classified as type 1 or type 2.

For devices operating in type 1 channels, the PHY shall issue a PHY-CCA.indication(BUSY, {primary1}) if one of the following conditions is present in an otherwise idle primary 1 MHz channel:

— The start of an S1G_1M PPDU or duplicate S1G_1M PPDU detected in the primary 1 MHz channel at or above –98 dBm within the primary 1 MHz channel with > 90% probability within a period aCCATime (see 23.4.4).

— Any S1G PPDU detected at or above –89 dBm within the primary 1 MHz channel with > 90% probability within a period of aCCAMidTime (see 23.4.4).

For devices operating in type 2 channels, the PHY shall issue a PHY-CCA.indication(BUSY, {primary1}) if one of the following conditions is present in an otherwise idle primary 1 MHz channel:

— The start of an S1G_1M PPDU or duplicate S1G_1M PPDU detected in the primary 1 MHz channel at or above –89 dBm within the primary 1 MHz channel with > 90% probability within a period aCCATime (see 23.4.4).

— Any S1G PPDU detected at or above –86 dBm within the primary 1 MHz channel with > 90% probability within a period of aCCAMidTime (see 23.4.4).

The device shall not issue a PHY-CCA.indication(BUSY, {primary2}), PHY-CCA.indication(BUSY, {secondary2}), PHY-CCA.indication(BUSY, {secondary4}), or PHY-CCA.indication(BUSY, {secondary8}) until the end of the duration indicated by the PPDU or until all conditions above are no longer satisfied. Additionally, for both type 1 and type 2 channels, the device shall issue a PHY-CCA.indication(BUSY, {primary1}) if any received signal in the primary 1 MHz channel exceeds –75 dBm within a period aCCATime.

For devices operating in type 1 channels, the PHY shall issue a PHY-CCA.indication(BUSY, {primary2}) if the conditions for issuing PHY-CCA.indication(BUSY, {primary1}) are not present and one of the following conditions is met in an otherwise idle 2 MHz, 4 MHz, 8 MHz, or 16 MHz operating channel width:

— An S1G_1M PPDU detected in the nonprimary 1 MHz portion of the primary 2 MHz channel at or above –89 dBm within the nonprimary 1 MHz with > 90% probability within a period of aCCAMidTime (see 23.4.4).

— A ≥ 2 MHz S1G PPDU at or above –89 dBm within the primary 2 MHz channel with > 90% probability within a period of aCCAMidTime (see 23.4.4).

— Any of the applicable conditions listed in Table 23-37. An applicable condition shall be met (i.e., triggered) if the PHY detects the start of the described PPDU(s) in Table 23-37 with > 90% probability within a period of aCCATime (see 23.4.4).

For devices operating in type 2 channels, the PHY shall issue a PHY-CCA.indication(BUSY, {primary2}) if the conditions for issuing PHY-CCA.indication(BUSY, {primary1}) are not present and one of the following conditions is met in an otherwise idle 2 MHz, 4 MHz, 8 MHz, or 16 MHz operating channel width:

— An S1G_1M PPDU is detected in the nonprimary 1 MHz portion of the primary 2 MHz channel at or above –86 dBm within the nonprimary 1 MHz with > 90% probability within a period of aCCAMidTime (see 23.4.4).

Table 23-37—Additional conditions for CCA BUSY on the primary 2 MHz in type 1 channelization

Operating Channel Width	Conditions
2 MHz, 4 MHz, 8 MHz, 16 MHz	The start of a 2 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –92 dBm in the primary 2 MHz channel.
4 MHz, 8 MHz, 16 MHz	The start of a 4 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –89 dBm in the primary 4 MHz channel.
8 MHz, 16 MHz	The start of an 8 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –86 dBm in the primary 8 MHz channel.
16 MHz	The start of a 16 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –83 dBm.

— A ≥ 2 MHz S1G PPDU at or above –86 dBm within the primary 2 MHz channel with > 90% probability within a period of aCCAMidTime (see 23.4.4).

— Any of the applicable conditions listed in Table 23-38. An applicable condition shall be met (i.e., triggered) if the PHY detects the start of the described PPDU(s) in Table 23-38 with > 90% probability within a period of aCCATime (see 23.4.4).

Table 23-38—Additional conditions for CCA BUSY on the primary 2 MHz in type 2 channelization

Operating Channel Width	Conditions
2 MHz, 4 MHz, 8 MHz, 16 MHz	The start of a 2 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –89 dBm in the primary 2 MHz channel.
4 MHz, 8 MHz, 16 MHz	The start of a 4 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –86 dBm in the primary 4 MHz channel.
8 MHz, 16 MHz	The start of an 8 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –83 dBm in the primary 8 MHz channel.
16 MHz	The start of a 16 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –80 dBm.

The device shall not issue a PHY-CCA.indication(BUSY, {secondary2}), PHY-CCA.indication(BUSY, {secondary4}), or PHY-CCA.indication(BUSY, {secondary8}) until the end of the duration indicated by the PPDU or until all conditions above are no longer satisfied. Additionally, for both type 1 and type 2 channels, the device shall issue a PHY-CCA.indication(BUSY, {primary2}) if any received signal in the primary 2 MHz channel exceeds –72 dBm within a period aCCATime.

Additionally, when a STA detects an S1G_SHORT or S1G_LONG PPDU with a Partial AID field of its SIG field indicating a partial AID or COLOR value that matches its partial AID or BSSID, the PHY shall issue a

PHY-CCA.indication(BUSY, {primary2}) for the remaining duration of the PPDU as indicated in its preamble.

23.3.18.5.3.2 CCA sensitivity for devices in type 2 channels implementing intended 8 or 16 MHz transmit channel width channel access procedure

For devices operating in type 2 channels, if the device intends to transmit an 8 or 16 MHz channel width PPDU and the device implements the procedure and rules for high intended BW transmission channel access described in 10.23.2.6, the PHY shall issue a PHY-CCA.indication(BUSY, {primary1}) if one of the following conditions is present in an otherwise idle primary 1 MHz channel:

— The start of an S1G_1M PPDU or duplicate S1G_1M PPDU detected in the primary 1 MHz channel at or above –86 dBm within the primary 1 MHz channel with > 90% probability within a period aCCATime (see 23.4.4).

— Any S1G PPDU detected at or above –86 dBm with > 90% probability within a period of aCCAMidTime (see 23.4.4).

The device shall not issue a PHY-CCA.indication(BUSY, {primary2}), PHY-CCA.indication(BUSY, {secondary2}), PHY-CCA.indication(BUSY, {secondary4}), or PHY-CCA.indication(BUSY, {secondary8}) until the end of the duration indicated by the PPDU or until all conditions above are no longer satisfied. Additionally, the device shall issue a PHY-CCA.indication(BUSY, {primary1}) if any received signal in the primary 1 MHz channel exceeds –75 dBm within a period aCCATime.

The PHY shall issue a PHY-CCA.indication(BUSY, {primary2}) if the conditions for issuing PHY-CCA.indication(BUSY, {primary1}) are not present and one of the following conditions is met in an otherwise idle 8 MHz or 16 MHz operating channel width:

— An S1G_1M PPDU is detected in the nonprimary 1 MHz portion of the primary 2 MHz channel at or above –86 dBm within the nonprimary 1 MHz with > 90% probability within a period of aCCAMidTime (see 23.4.4).

— A ≥ 2 MHz S1G PPDU at or above –86 dBm within the primary 2 MHz channel with > 90% probability within a period of aCCAMidTime (see 23.4.4).

— Any of the applicable conditions listed in Table 23-39. An applicable condition shall be met (i.e., triggered) if the PHY detects the start of the described PPDU(s) in Table 23-39 with > 90% probability within a period of aCCATime (see 23.4.4).

Table 23-39—Additional conditions for CCA BUSY on the primary 2 MHz in type 2 channelization for 8/16 MHz intended channel width

Operating Channel Width	Conditions
8 MHz, 16 MHz	The start of a 2 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –86 dBm in the primary 2 MHz channel.
8 MHz, 16 MHz	The start of a 4 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –83 dBm in the primary 4 MHz channel.
8 MHz, 16 MHz	The start of an 8 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –80 dBm in the primary 8 MHz channel.
16 MHz	The start of a 16 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –77 dBm.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The device shall not issue a PHY-CCA.indication(BUSY, {secondary2}), PHY-CCA.indication(BUSY, {secondary4}), or PHY-CCA.indication(BUSY, {secondary8}) until the end of the duration indicated by the packet or until all conditions above are no longer satisfied. Additionally, for both type 1 and type 2 channels, the device shall issue a PHY-CCA.indication(BUSY, {primary2}) if any received signal in the primary 2 MHz channel exceeds –72 dBm within a period of aCCATime.

Additionally, when a STA detects an S1G_SHORT or S1G_LONG PPDU with a Partial AID field of its SIG field indicating a partial AID or COLOR value that matches its partial AID or BSSID, the PHY shall issue a PHY-CCA.indication(BUSY, {primary2}) for the remaining duration of the PPDU as indicated in its preamble.

23.3.18.5.4 CCA sensitivity for signals not occupying the primary 2 MHz channel

In S1G operation, the CCA sensitivity levels for detecting signals in the secondary channels may be classified separately for type 1 or type 2 channels.

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary2}) if the conditions for issuing PHY-CCA.indication(BUSY, {primary2}) are not present and one of the following conditions are present in an otherwise idle 4 MHz, 8 MHz, 16 MHz operating channel width:

- For both type 1 and type 2 channels, any signal within the secondary 2 MHz channel at or above a threshold of –72 dBm within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY,{secondary4}), PHY-CCA.indication(BUSY,{secondary8}) or PHY-CCA.indication(IDLE) while the threshold continues to be exceeded.
- For type 1 channels, a 2 MHz S1G PPDU detected in the secondary 2 MHz channel at or above –86 dBm with > 90% probability within a period of aCCAMidTime (see 23.4.4).
- For type 2 channels, a 2 MHz S1G PPDU detected in the secondary 2 MHz channel at or above –82 dBm with > 90% probability within a period of aCCAMidTime (see 23.4.4).

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary4}) if the conditions for issuing PHY-CCA.indication(BUSY, {primary2}) and PHY-CCA.indication(BUSY, {secondary2}) are not present and one of the following conditions are present in an otherwise idle 8 MHz, 16 MHz operating channel width:

- For both type 1 and type 2 channels, any signal within the secondary 4 MHz channel at or above a threshold of –69 dBm within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY, {secondary8}) or PHY-CCA.indication(IDLE) while the threshold continues to be exceeded.
- For type 1 channels:
  - A 4 MHz S1G PPDU detected in the secondary 4 MHz channel at or above –86 dBm with > 90% probability within a period of aCCAMidTime (see 23.4.4).
  - A 2 MHz S1G PPDU detected in any 2 MHz subchannel of the secondary 4 MHz channel at or above –86 dBm with > 90% probability within a period of aCCAMidTime.
- For type 2 channels:
  - A 4 MHz S1G PPDU detected in the secondary 4 MHz channel at or above –82 dBm with > 90% probability within a period of aCCAMidTime (see 23.4.4).
  - A 2 MHz S1G PPDU detected in any 2 MHz subchannel of the secondary 4 MHz channel at or above –82 dBm with > 90% probability within a period of aCCAMidTime.

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary8}) if the conditions for PHY-CCA.indication(BUSY, {primary2}), PHY-CCA.indication(BUSY, {secondary2}) and

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

PHY-CCA.indication(BUSY,{secondary4}) are not present and one of the following conditions are present in an otherwise idle 16 MHz operating channel width:

- For both type 1 and type 2 channels, any signal within the secondary 8 MHz channel at or above –66 dBm.
- For type 1 channels:
  - An 8 MHz S1G PPDU detected in the secondary 8 MHz channel at or above –83 dBm with > 90% probability within a period of aCCAMidTime (see 23.4.4).
  - A 4 MHz S1G PPDU detected in any 4 MHz subchannel of the secondary 8 MHz channel at or above –86 dBm with > 90% probability within a period of aCCAMidTime.
  - A 2 MHz S1G PPDU detected in any 2 MHz subchannel of the secondary 8 MHz channel at or above –86 dBm with > 90% probability within a period of aCCAMidTime.
- For type 2 channels:
  - An 8 MHz S1G PPDU detected in the secondary 8 MHz channel at or above –79 dBm with > 90% probability within a period aCCAMidTime (see 23.4.4).
  - A 4 MHz S1G PPDU detected in any 4 MHz subchannel of the secondary 8 MHz channel at or above –82 dBm with > 90% probability within a period of aCCAMidTime.
  - A 2 MHz S1G PPDU detected in any 2 MHz subchannel of the secondary 8 MHz channel at or above –82 dBm with > 90% probability within a period of aCCAMidTime.

23.3.18.6 RSSI

The RSSI parameter returned in the RXVECTOR shall be calculated during the reception of the (D-)LTFs and shall be a monotonically increasing function of the received power.

23.3.18.7 Received channel power indicator (RCPI) measurement

The RCPI is a measure of the received RF power in the selected channel for a received PPDU. This parameter shall be a measurement by the PHY of the received RF power in the channel measured over the STF or LTF fields of the received PPDU. If the RCPI is measured over the STF field for an S1G 1 MHz PPDU using MCS 10, then the reported RCPI value is 3 dB less than the measured power over the STF field. The received power shall be the average of the power in all active receive chains.

NOTE—The STF field in an S1G 1 MHz PPDU using MCS 10 has 3 dB higher power than the Data field, hence the reported RCPI value is subtracting from 3 dB from the measured power.

RCPI shall equal the received RF power in dBm within an accuracy of ± 5 dB (95% confidence interval) within the specified dynamic range of the receiver.

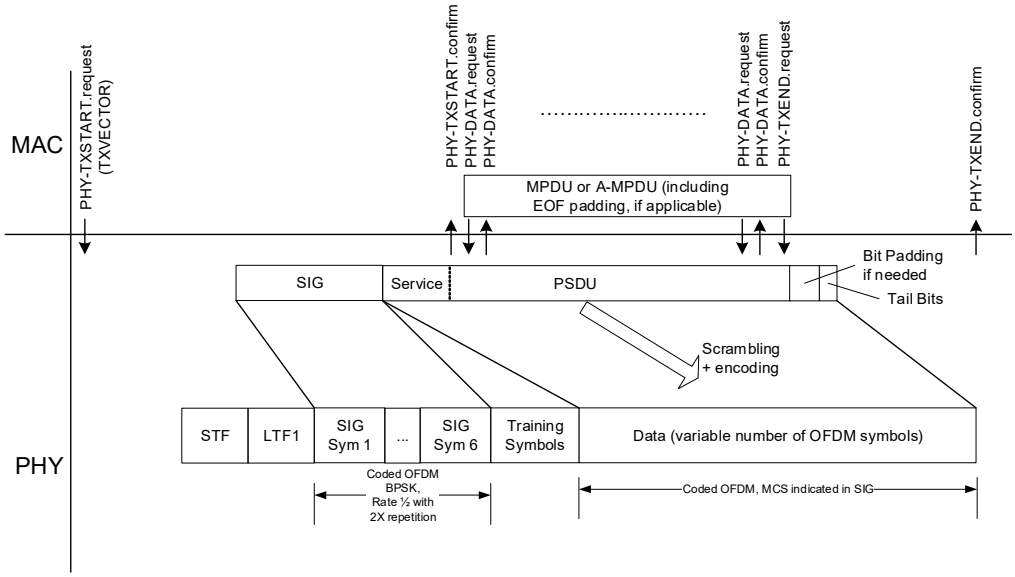
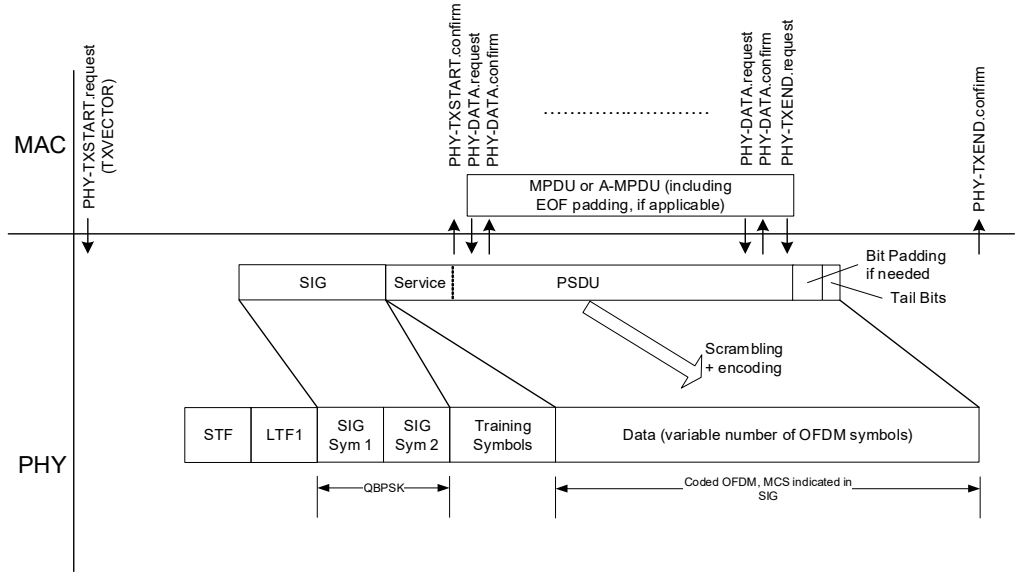
23.3.19 PHY transmit procedure

The typical transmit procedure is shown in Figure 23-44, Figure 23-45, and Figure 23-46. For this transmit procedure, the FORMAT parameter of the PHY-TXSTART.request(TXVECTOR) primitive is S1G. These transmit procedures do not describe the operation of optional features, such as LDPC, STBC, or MU.



NOTE—This procedure does not describe the operation of optional features, such as MU-MIMO, LDPC or STBC.

Figure 23-44—PHY transmit procedure for an SU transmission using S1G_1M procedure



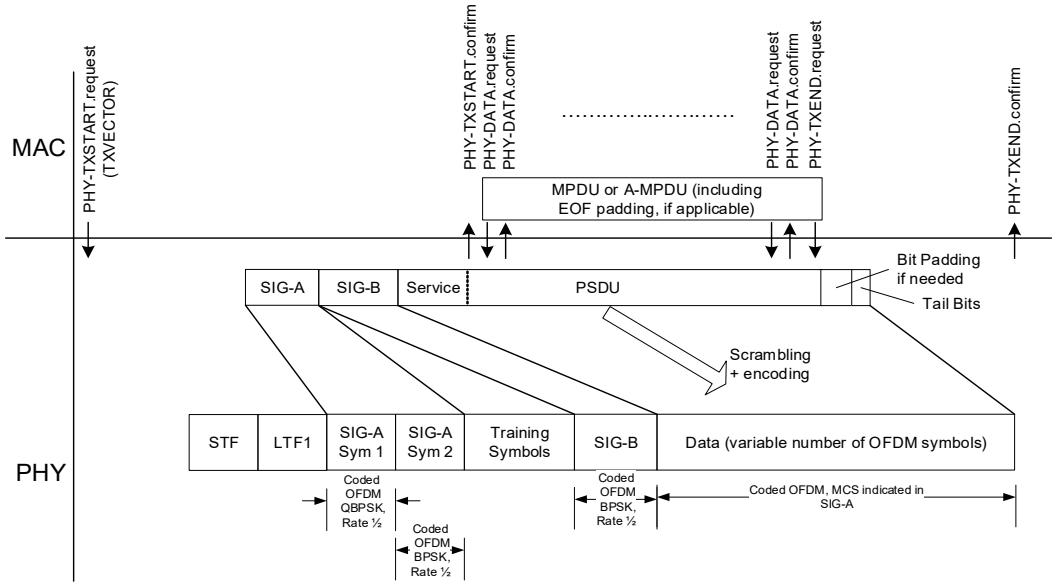
NOTE—This procedure does not describe the operation of optional features, such as MU-MIMO, LDPC or STBC.

Figure 23-45—PHY transmit procedure for an SU transmission using S1G_SHORT procedure

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—For an MU PPDU the A-MPDU is per user in the MAC sublayer and the S1G training symbols, SIG-B, and Data are per user in the PHY layer in Figure 23-46, with the number S1G training symbols depending on the total number of space-time streams across all users.

In order to transmit data, the MAC generates a PHY-TXSTART.request primitive, which causes the PHY entity to enter the transmit state. Further, the PHY is set to operate at the appropriate frequency through station management via the PLME, as specified in 23.4.



NOTE—This procedure does not describe the operation of optional features, such as MU-MIMO, LDPC or STBC.

Figure 23-46—PHY transmit procedure for an SU transmission using S1G_LONG procedure

Other transmit parameters, such as S1G-MCS coding types and transmit power, are set via the PHY SAP using the PHY-TXSTART.request(TXVECTOR) primitive, as described in 23.2.2.

The PHY indicates the state of the primary channel and other channels (if any) via the PHY-CCA.indication primitive (see 23.3.18.5 and 8.3.5.12). Note that under some circumstances, the MAC uses the value of the PHY-CCA.indication primitive before (and if) issuing the PHY-TXSTART.request primitive. Transmission of the PPDU shall be initiated by the PHY after receiving the PHY-TXSTART.request(TXVECTOR) primitive. The TXVECTOR elements for the PHY-TXSTART.request primitive are specified in Table 23-1.

Transmission of the PHY preamble shall start immediately, using the parameters passed in the PHY-TXSTART.request primitive and the PHY shall issue a PHY-TXSTART.confirm primitive to the MAC.

After the PHY preamble transmission is started, the PHY entity immediately initiates data scrambling and data encoding. The encoding method for the Data field is based on the FEC_CODING, CH_BANDWIDTH, NUM_STS, STBC, MCS, and NUM_USERS parameter of the TXVECTOR, as described in 23.3.2.

The SERVICE field and PSDU are encoded as described in 23.3.3. The data shall be exchanged between the MAC and the PHY through a series of PHY-DATA.request(DATA) primitives issued by the MAC, and PHY-DATA.confirm primitives issued by the PHY. Zero to seven PHY padding bits are appended to the PSDU to make the number of bits in the coded PSDU an integer multiple of the number of coded bits per OFDM symbol.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Transmission can be prematurely terminated by the MAC through the primitive PHY-TXEND.request primitive. PSDU transmission is terminated by receiving a PHY-TXEND.request primitive. Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY. In an SU transmission, normal termination occurs after the transmission of the final bit of the last PSDU octet, according to the number of OFDM symbols indicated by NSYM (see 23.4.3).

In the PHY, the GI or short GI is inserted in every data OFDM symbol as a countermeasure against delay spread.

An NDP CMAC PPDU transmit procedure is shown in Figure 23-47 and Figure 23-48.

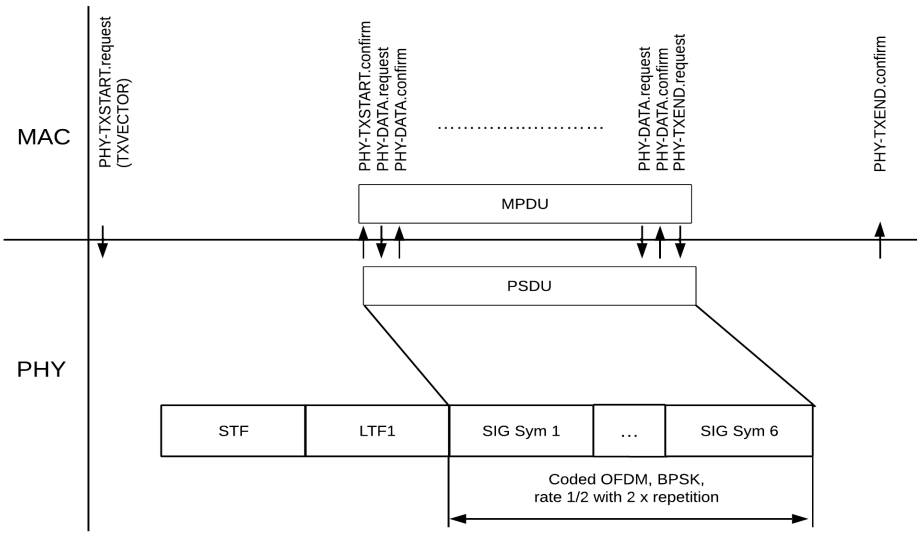


Figure 23-47—PHY transmit procedure for an NDP CMAC PPDU transmission using S1G_1M format

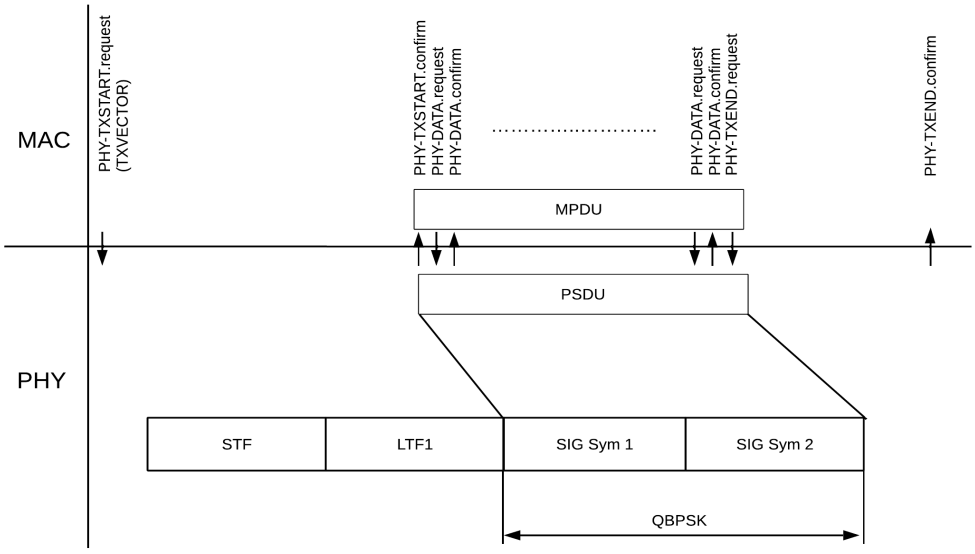

Figure 23-48—PHY transmit procedure for an NDP CMAC PPDU transmission using S1G_SHORT format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In case of transmission of the NDP CMAC PPDU, the PHY performs the same procedure like the typical transmit procedure as described in this subclause except as follows

— No service field appended
— No PHY padding bits appended to the PSDU
— No scrambling applied to PSDU
— PSDU is mapping to the SIG field

When the PPDU transmission is completed the PHY entity enters the receive state.

A typical state machine implementation of the transmit PHY for an S1G PPDU transmission is provided in Figure 23-49. Request (.request) and confirmation (.confirm) primitives are issued once per state as shown. This state machine does not describe the operation of optional features, such as multi-user, LDPC, or STBC.

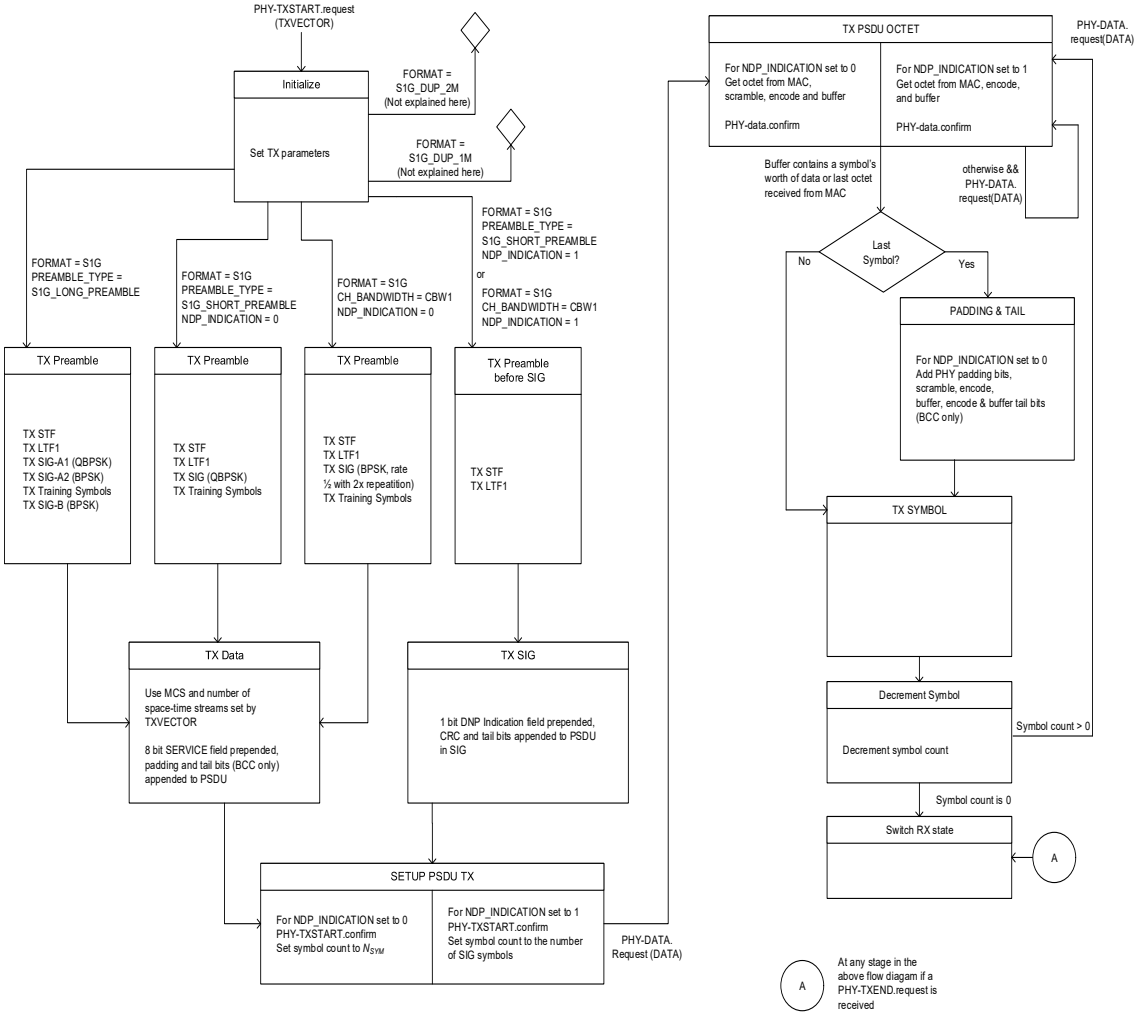

Figure 23-49—PHY transmit state machine for an S1G PPDU transmission

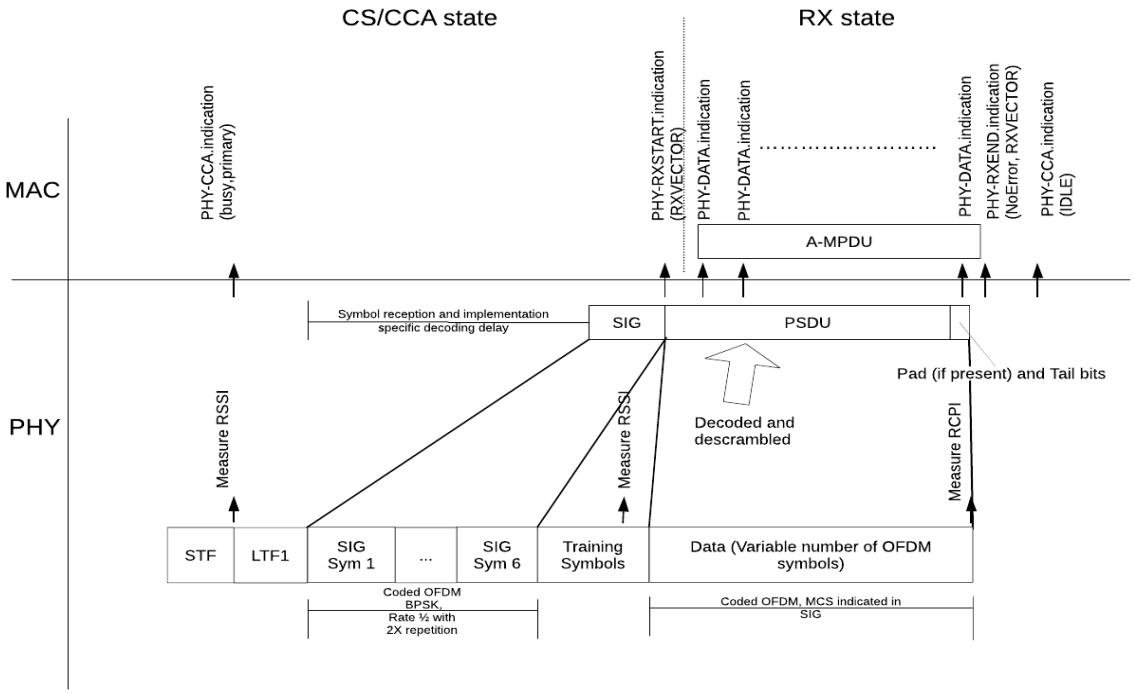
23.3.20 PHY receive procedure

Typical PHY receive procedures are shown in Figure 23-50, Figure 23-51, and Figure 23-52, corresponding to S1G_1M preamble format, S1G_SHORT preamble format, and S1G_LONG preamble format,

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

respectively. A typical state machine implementation of the receive PHY is given in Figure 23-53. This receive procedure and state machine do not describe the operation of optional features, such as LDPC or STBC. Through station management (via the PLME) the PHY is set to the appropriate frequency, as specified in 23.4. The PHY has also been configured with group information (i.e., group membership and position in group) so that it can receive data intended for the STA. Other receive parameters, such as RSSI and indicated DATARATE, may be accessed via the PHY SAP.



NOTE—This procedure does not describe the operation of optional features, such as LDPC or STBC.

Figure 23-50—PHY receive procedure for an SU transmission, S1G_1M procedure

Upon receiving the transmitted PHY preamble overlapping the primary 2 MHz channel in a greater than or equal to 2 MHz BSS, or primary 1 MHz channel in a 1 MHz BSS, the PHY measures a receive signal strength. This activity is indicated by the PHY to the MAC via a PHY-CCA.indication primitive. A PHY-CCA.indication(BUSY, channel-list) primitive is also issued as an initial indication of reception of a signal as specified in 23.3.18.5. The CH_BANDWIDTH parameter indicates one of the 1 MHz, 2 MHz, 4 MHz, 8 MHz and 16 MHz channel widths.

The PHY shall not issue a PHY-RXSTART.indication primitive in response to a PPDU that does not overlap the primary channel.

The PHY includes the most recently measured RSSI value in the PHY-RXSTART.indication(RXVECTOR) primitive issued to the MAC.

After the PHY-CCA.indication(BUSY, channel-list) is issued, the PHY entity shall begin receiving the training symbols and searching for SIG or SIG-A in order to set the duration of the PPDU and get other PHY parameters such as the demodulation type, code type, and the decoding rate. If the check of the SIG or SIG-A CRC is not valid, no PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive is issued, and instead the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive,

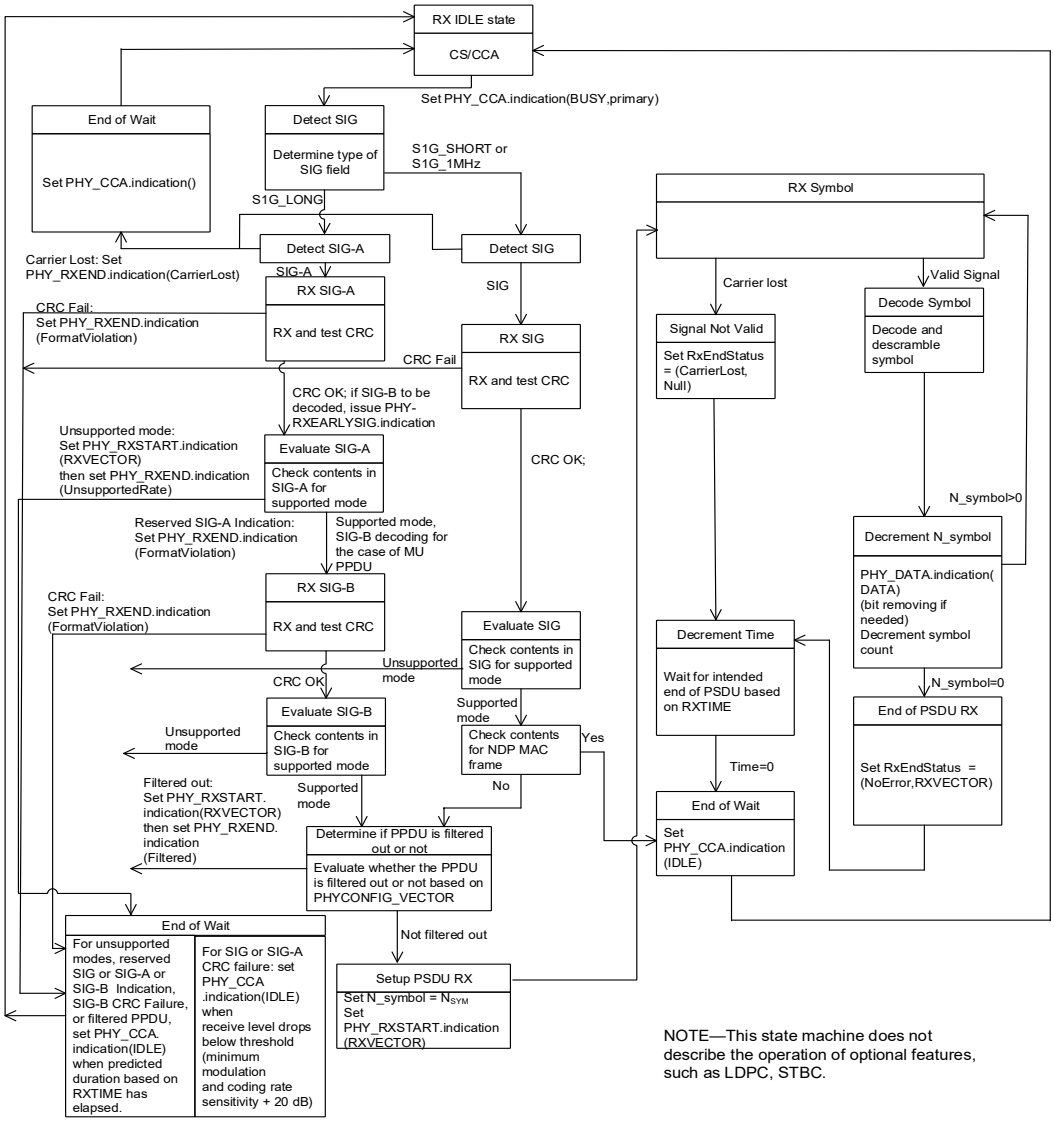

Figure 23-53—PHY receive state machine

and set PHY_CCA.indication(IDLE) when receive level drops below threshold (minimum modulation and coding rate sensitivity + 20 dB). If a valid SIG or SIG-A CRC is indicated, and the Uplink Indication bit is 1 and the ID field value matches the PBSSID of the BSS of which the STA is a member or the Uplink Indication bit is 0 and the COLOR field value matches the COLOR indicated by the AP to which the STA is associated, then the S1G PHY shall maintain PHY-CCA.indication(BUSY, channel-list) for the predicted duration of the transmitted PPDU, as defined by RXTIME in Equation (23-69) or Equation (23-70), for all supported modes, unsupported modes, and Reserved SIG or SIG-A Indication. If a valid SIG or SIG-A CRC is indicated, and the Uplink Indication bit is 1 and the ID field value does not match the PBSSID of the BSS of which the STA is a member or the Uplink Indication bit is 0 and the COLOR field value does not match the COLOR indicated by the AP to which the STA is associated, then the S1G PHY shall maintain PHY-CCA.indication(BUSY, channel-list) for the predicted duration of the transmitted PPDU, as defined by RXTIME in Equation (23-69) or Equation (23-70), for all supported modes, unsupported modes, and Reserved SIG-A Indication if the reception meets the minimum CCA sensitivity level specified

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

in 23.3.18.5.3. Reserved SIG or SIG-A Indication is defined as an SIG or SIG-A with Reserved bits equal to 0 or a combination not valid as defined in 23.3.8.2.2.5, 23.3.8.2.3.2.5, or 23.3.8.3.5, or a combination of S1G-MCS and NSTS not included in 23.5 or any other SIG or SIG-A field bit combinations that do not correspond to modes of PHY operation defined in Clause 23.

NOTE 1—From Figure 23-53, Reserved SIG or SIG-A Indication does not apply to the Reserved fields in NDP CMAC PPDUs since NDP CMAC PPDUs do not use S1G_LONG format.

Subsequently, if dot11TimingMsmtActivated is true, a PHY-RXSTART.indication (RXVECTOR) shall be issued and RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 23.2.2).

NOTE 2—The RX_START_OF_FRAME_OFFSET value is used to estimate when the start of the preamble for the incoming PPDU was detected on the medium at the receive antenna connector.

If the SIG or SIG-A indicates an unsupported mode, the PHY shall issue PHY-RXEND.indication(UnsupportedRate). If the SIG or SIG-A indicates an invalid CRC or Reserved SIG or SIG-A Indication, the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation).

If the PHY preamble reception is successful and a valid SIG or SIG-A CRC is indicated:

— Upon reception of an S1G_LONG format preamble, after receiving a valid SIG-A indicating a supported mode, the PHY entity shall begin receiving the rest of S1G training symbols and SIG-B. If the received MU/SU subfield in SIG-A has a value indicating SU PPDU (see 23.3.8.2.3.2.5), the PHY entity does not need to decode SIG-B since in this case SIG-B does not carry any information bit (see 23.3.8.2.3.3.5). If SIG-A is valid and indicates that SIG-B is not to be decoded, then a PHY-RXSTART.indication (RXVECTOR) primitive shall be issued, and otherwise a PHY-RXEARLYSIG.indication primitive shall be issued.

  If the received MU/SU subfield in SIG-A has a value indicating MU PPDU (see 23.3.8.2.3.2.5), SIG-B shall be decoded. If the check of the SIG-B CRC is not valid, a PHY-RXSTART.indication primitive is not issued, and instead the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive, and the S1G PHY shall maintain PHYCCA.indication(BUSY, channel-list) for the predicted duration of the transmitted PPDU, as defined by RXTIME in Equation (23-69) or Equation (23-70), for all supported modes, unsupported modes, and Reserved SIG-B Indication. Reserved SIG-B Indication is defined as a SIG-B with the bits of the Reserved field not all 1s or MCS not included in 23.5. If the SIG-B indicates an unsupported mode, the PHY shall issue the error condition PHY-RXEND.indication(UnsupportedRate) primitive, and a PHY-RXSTART.indication primitive shall not be issued. If the check of the SIG-B CRC is valid and it indicates a supported mode, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. The RXVECTOR associated with this primitive includes the parameters specified in Table 23-1.

— Upon reception of an S1G_SHORT or S1G_1M format preamble, after receiving a valid SIG indicating a supported mode, the PHY entity shall begin receiving the rest of S1G training symbols, and then a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. The RXVECTOR associated with this primitive includes the parameters specified in Table 23-1.

  In this case, if the NDP Indication subfield in SIG field has a value indicating an NDP CMAC PPDU, the PHY shall generate a PHYCCA.indication(IDLE) primitive and return to RX IDLE state, and it shall not issue the PHY-RXSTART.indication(RXVECTOR) primitive.

The PHY optionally filters out the PPDU based on the GID, MU[0-3] NSTS, UPLINK_INDICATION and ID fields of SIG or SIG-A and the contents of the PHYCONFIG_VECTOR as follows:

— The PHY shall not filter out the PPDU if one of the following is true:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

- — (g = 0) and (l_{00} is true) and (*partialaid* is included in PARTIAL_AID_LIST_GID00)
- — (g = 63) and (l_{63} is true) and (*partialaid* is included in PARTIAL_AID_LIST_GID63)
- — (1 ≤ g ≤ 62) and (MembershipStatusInGroupID[g] = 1) and (n_{STS}[UserPositionInGroupID[g]] > 0)

— where
- — l_{NN} is the one of the LISTEN_TO_GID*NN* parameters of the PHYCONFIG_VECTOR
- — MembershipStatusInGroupID[g] is the Membership Status Array field of the GROUP_ID_MANAGEMENT parameter of the PHYCONFIG_VECTOR for group g
- — g is defined to be
  - — The value of the GroupID field of the SIG-A for an S1G MU PPDU
  - — 0 for an S1G SU PPDU when UPLINK_INDICATION is equal to 1
  - — 63, in all other cases
- — $n_{STS}[u]$ is the value of the MU[u] NSTS field of SIG or SIG-A
- — UserPositionInGroupID[g] is the User Position Array field of the GROUP_ID_MANAGEMENT parameter of the PHYCONFIG_VECTOR for group g
- — *partialaid* is the value of the ID field of SIG or SIG-A

— Otherwise, the PHY may filter out the PPDU.

If the PPDU is filtered out, the PHY shall issue a PHY-RXEND.indication(Filtered) primitive.

The Data field follows the training and signal fields. When the Coding subfield in SIG or SIG-A field indicates BCC, the number of symbols in the Data field is determined by Equation (23-65).

$$N_{SYM} = \begin{cases} \text{LENGTH}, & \text{if Aggregation = 1} \\ m_{STBC} \times \left\lceil \dfrac{8 \times LENGTH + N_{service} + N_{tail} \times N_{ES}}{m_{STBC} \times N_{DBPS}} \right\rceil, & \text{if Aggregation = 0} \end{cases} \quad (23\text{-}65)$$

where

N_{ES} and N_{DBPS}	are defined in Table 23-7
$N_{service}$ and N_{tail}	are defined in Table 23-5
m_{STBC}	is equal to 2 when STBC is used, and 1 otherwise
LENGTH and Aggregation	are the values indicated by the LENGTH and Aggregation subfields of SIG or SIG-A field, respectively

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When the Coding subfield in SIG or SIG-A indicates LDPC and Aggregation subfield in SIG or SIG-A field is 1, the number of symbols in the Data field is determined by Equation (23-66).

$$N_{SYM} = LENGTH \tag{23-66}$$

where

LENGTH is the value indicated by the LENGTH subfield of SIG or SIG-A field

When the Coding subfield in SIG or SIG-A indicates LDPC and Aggregation subfield in SIG or SIG-A field is 0, the parameter $N_{SYM, init}$ is determined by Equation (23-67).

$$N_{SYM, init} = m_{STBC} \times \left\lceil \frac{8 \times LENGTH + N_{service}}{m_{STBC} \times N_{DBPS}} \right\rceil \tag{23-67}$$

where

N_{DBPS} is defined in Table 23-7

$N_{service}$ is defined in Table 23-5

m_{STBC} is equal to 2 when STBC is used, and 1 otherwise

LENGTH is the value indicated by the LENGTH subfield of SIG or SIG-A field

In this case, the number of symbols in the Data field N_{SYM} is determined by Equation (23-68).

$$N_{SYM} = \begin{cases} N_{SYM, init}, & \text{if LDPC Extra OFDM Symbol = 0} \\ N_{SYM, init} + 1, & \text{if LDPC Extra OFDM Symbol = 1 and STBC = 0} \\ N_{SYM, init} + 2, & \text{if LDPC Extra OFDM Symbol = 1 and STBC = 1} \end{cases} \tag{23-68}$$

where

LENGTH is the value indicated by the LENGTH subfield of SIG or SIG-A field

LDPC Extra OFDM Symbol is the value indicated by LDPC Extra subfield in SIG or SIG-A field

STBC is the value indicated by the STBC subfield in SIG or SIG-A field

The PHY parameter RXTIME for the case of S1G_SHORT or S1G_1M format is determined by Equation (23-69).

$$RXTIME(\mu s) = \begin{cases} T_{DSTF} + T_{LTF}(N_{LTF} - 1) + N_{SYM} T_{SYML}, & \text{if Short GI = 0} \\ T_{DSTF} + T_{LTF}(N_{LTF} - 1) + T_{SYML} + (N_{SYM} - 1).T_{SYMS}, & \text{if Short GI = 1} \end{cases} \tag{23-69}$$

where

T_{LTF} , T_{SYML} and T_{SYMS} are defined in Table 23-5

N_{LTF} is defined in Table 23-11

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The PHY parameter RXTIME for the case of S1G_LONG format is determined by Equation (23-70).

$$RXTIME(\mu s) = \begin{cases} T_{DSTF} + N_{LTF}T_{DLTF} + T_{SIG-B} + N_{SYM}T_{SYML}, & \text{if Short GI = 0} \\ T_{DSTF} + N_{LTF}T_{DLTF} + T_{SIG-B} + T_{SYML} + (N_{SYM} - 1).T_{SYMS}, & \text{if Short GI = 1} \end{cases} \quad (23\text{-}70)$$

where

T_{DLTF} , T_{SIG-B} , T_{SYML} and T_{SYMS} are defined in Table 23-5

N_{LTF} is defined in Table 23-11

When the Aggregation subfield in the SIG or SIG-A field is equal to 0, the value of the PSDU_LENGTH parameter returned in the RXVECTOR using is set to the LENGTH field of the SIG/SIG-A.

When the Aggregation subfield in the SIG or SIG-A field is equal to 1, the value of the PSDU_LENGTH parameter returned in the RXVECTOR using BCC encoding is calculated using Equation (23-71).

$$\text{PSDU\_LENGTH} = \left\lfloor \frac{N_{SYM}N_{DBPS} - N_{service} - N_{tail} \cdot N_{ES}}{8} \right\rfloor \quad (23\text{-}71)$$

where

N_{ES} is defined in Table 23-7

N_{DBPS} is defined in Table 23-7

$N_{service}$ and N_{tail} are defined in Table 23-5

The value of the PSDU_LENGTH parameter returned in the RXVECTOR using LDPC encoding is calculated using Equation (23-72).

$$PSDU\_LENGTH = \left\lfloor \frac{N_{SYM}.N_{DBPS} - N_{service}}{8} \right\rfloor \quad (23\text{-}72)$$

where

N_{DBPS} is defined in Table 23-7

$N_{service}$ is defined in Table 23-5

When the Aggregation subfield in the SIG or SIG-A field is equal to 1, the value of the PSDU_LENGTH parameter returned in the RXVECTOR for an NDP sounding or an NDP CMAC PPDU is 0.

If signal loss occurs during reception prior to completion of the PSDU reception, the error condition PHY-RXEND.indication(CarrierLost) shall be reported to the MAC. After waiting for the end of the PSDU as determined by Equation (23-69) or Equation (23-70), the PHY shall set the PHY-CCA.indication(IDLE) primitive and return to the RX IDLE state.

The received PSDU bits are assembled into octets, decoded, and presented to the MAC using a series of PHY-DATA.indication(DATA) primitive exchanges. Any final bits that cannot be assembled into a complete octet are considered pad bits and discarded. After the reception of the final bit of the last PSDU octet, and possible padding and tail bits, the receiver shall be returned to the RX IDLE state, as shown in Figure 23-53 (PHY receive state machine).

23.4.2 PHY MIB

S1G PHY MIB attributes are defined in Annex C with specific values defined in Table 23-40. The Operational semantics column in Table 23-40 contains two types: static and dynamic.

— Static MIB attributes are fixed and cannot be modified for a given PHY implementation.

— Dynamic MIB attributes are interpreted according to the MAX-ACCESS field of the MIB attribute.

When MAX-ACCESS is read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is read-write, the MIB attribute may be read and written by management entities but shall not be updated by the PLME.

23.4.3 TXTIME and PSDU_LENGTH calculation

For S1G_SHORT preamble, the value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated for an S1G PPDU using Equation (23-73) for short GI and Equation (23-74) for long GI.

$$\text{TXTIME} = \begin{cases} T_{PREAMBLE} + T_{SIG} + T_{LTF} \cdot (N_{LTF} - 1), \text{ if } N_{SYM} = 0 \\ T_{PREAMBLE} + T_{SIG} + T_{LTF} \cdot (N_{LTF} - 1) + T_{SYML} + T_{SYMS} \cdot (N_{SYM} - 1), \text{ if} N_{SYM} > 0 \end{cases} \quad (23\text{-}73)$$

$$\text{TXTIME} = T_{PREAMBLE} + T_{SIG} + T_{LTF} \cdot (N_{LTF} - 1) + T_{SYML} \cdot N_{SYM} \quad (23\text{-}74)$$

where

$T_{PREAMBLE} = T_{STF} + T_{LTF1}$

T_{STF}, T_{LTF1}, T_{LTF}, T_{SYML} and T_{SYMS} are defined in Table 23-5

T_{SIG} is defined in Table 23-6

N_{LTF} is defined in Table 23-11

For S1G_LONG preamble, the value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated for an S1G PPDU using Equation (23-75) for short GI and Equation (23-76) for long GI.

$$\text{TXTIME} = \begin{cases} T_{PREAMBLE} + T_{SIG-A} + T_{D\_PREAMBLE} + T_{SIG-B}, \text{ if } N_{SYM} = 0 \\ T_{PREAMBLE} + T_{SIG-A} + T_{D\_PREAMBLE} + T_{SIG-B} + T_{SYML} + T_{SYMS} \cdot (N_{SYM} - 1), \text{ if } N_{SYM} > 0 \end{cases} \quad (23\text{-}75)$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$\text{TXTIME} = T_{PREAMBLE} + T_{SIG-A} + T_{D\_PREAMBLE} + T_{SIG-B} + T_{SYML} N_{SYM} \quad (23\text{-}76)$$

where

$T_{PREAMBLE} = T_{STF} + T_{LTF1}$

$T_{D\_PREAMBLE} = T_{DSTF} + T_{DLTF} \cdot N_{LTF}$

T_{STF}, T_{LTF1}, T_{DSTF}, T_{DLTF}, T_{SIG-B}, T_{SYML} and T_{SYMS} are defined in Table 23-5

T_{SIG-A} is defined in Table 23-6.

N_{LTF} is defined in Table 23-11.

For S1G_1M preamble, the value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated for an S1G PPDU using Equation (23-77) for short GI and Equation (23-78) for long GI.

$$\text{TXTIME} = \begin{cases} T_{PREAMBLE} + T_{SIG} + T_{LTF} \cdot (N_{LTF} - 1), \text{ if } N_{SYM} = 0 \\ T_{PREAMBLE} + T_{SIG} + T_{LTF} \cdot (N_{LTF} - 1) + T_{SYML} + T_{SYMS}(N_{SYM} - 1), \text{ if } N_{SYM} > 0 \end{cases} \quad (23\text{-}77)$$

$$\text{TXTIME} = T_{PREAMBLE} + T_{SIG} + T_{LTF} \cdot (N_{LTF} - 1) + T_{SYML} N_{SYM} \quad (23\text{-}78)$$

where

$T_{PREAMBLE} = T_{STF} + T_{LTF1}$

T_{STF}, T_{LTF1}, T_{LTF}, T_{SIG}, T_{SYML} and T_{SYMS} are defined in Table 23-5

N_{LTF} is defined in Table 23-11

For an NDP, there is no Data field and $N_{SYM} = 0$.

For an S1G SU PPDU using BCC encoding, the total number of data symbols in the Data field, $N_{SYM,}$ is given by Equation (23-79) if the Aggregation subfield in its SIG field or SIG-A field is 1 or Equation (23-80) otherwise.

$$N_{SYM} = m_{STBC} \times \left\lceil \frac{8 \cdot APEP\_LENGTH + N_{service} + N_{tail} \cdot N_{ES}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \quad (23\text{-}79)$$

$$N_{SYM} = m_{STBC} \times \left\lceil \frac{8 \cdot PSDU\_LENGTH + N_{service} + N_{tail} \cdot N_{ES}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \quad (23\text{-}80)$$

where

m_{STBC}	is equal to 2 when STBC is used, and 1 otherwise
N_{ES} and N_{DBPS}	are defined in Table 23-7
$N_{service}$ and N_{tail}	are defined in Table 23-5
PSDU_LENGTH	is the value of TXVECTOR parameter PSDU_LENGTH

For an S1G SU PPDU using LDPC encoding, the total number of data symbols in the Data field, N_{SYM}, is given in 23.3.9.4.4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For an S1G MU PPDU, the total number of data symbols in the Data field, N_{SYM}, is given by

$$N_{SYM} = \max\{N_{SYM,u}\}_{u=0}^{N_{user}-1}$$

where

$N_{SYM,u}$ is defined in Equation (23-79) replacing N_{SYM}, $APEP\_LENGTH$, N_{ES}, and N_{DBPS} with $N_{SYM,u}$, $APEP\_LENGTH_u$, $N_{ES,u}$, and $N_{DBPS,u}$ for BCC and in 23.3.9.4.4 for LDPC

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for an S1G SU PPDU using BCC encoding is calculated using Equation (23-81)

$$PSDU\_LENGTH = \left\lfloor \frac{N_{SYM} \cdot N_{DBPS} - N_{service} - N_{tail} N_{ES}}{8} \right\rfloor \quad (23\text{-}81)$$

where

N_{SYM} is given by Equation (23-79) or Equation (23-80)

N_{ES} and N_{DBPS} are defined in Table 23-7

$N_{service}$ and N_{tail} are defined in Table 23-5

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for an S1G SU PPDU using LDPC encoding is calculated using Equation (23-82)

$$PSDU\_LENGTH = \left\lfloor \frac{N_{SYM,init} \cdot N_{DBPS} - N_{service}}{8} \right\rfloor \quad (23\text{-}82)$$

where

$N_{SYM,init}$ is given by Equation (23-46) or Equation (23-47)

N_{DBPS} is defined in Table 23-7

$N_{service}$ is defined in Table 23-5

The value of the PSDU_LENGTH parameter for user u returned in the PLME-TXTIME.confirm primitive and in the RXVECTOR for an S1G MU PPDU is calculated using Equation (23-83)

$$PSDU\_LENGTH_u = \begin{cases} \left\lfloor \frac{N_{SYM} \cdot N_{DBPS,u} - N_{service} - N_{tail} N_{ES,u}}{8} \right\rfloor & \text{when BCC is used for user } u \\ \left\lfloor \frac{N_{SYM\_max\_init} \cdot N_{DBPS,u} - N_{service}}{8} \right\rfloor & \text{when LDPC is used for user } u \end{cases} \quad (23\text{-}83)$$

where

$N_{SYM\_max\_init}$ is given by Equation (21-65)

$N_{ES,u}$ is N_{ES} for user u, where N_{ES} is defined in Table 23-7

$N_{DBPS,u}$ is N_{DBPS} for user u, where N_{DBPS} is defined in Table 23-7

$N_{service}$ and N_{tail} are defined in Table 23-5

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for an NDP is 0.

23.4.4 PHY characteristics

The S1G PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, are shown in Table 23-41. The definitions for these characteristics are given in 6.7.4.

Table 23-41—S1G PHY characteristics

Characteristics	Value
aSlotTime	52 μs
aSIFSTime	160 μs
aCCATime	< 40 μs
aRxPHYStartDelay	600 μs for S1G_1M preamble; 280 μs for S1G_SHORT preamble and S1G_LONG preamble.
aRxTxTurnaroundTime	Implementation dependent, see 10.3.7.
aTxPHYDelay	Implementation dependent, see 10.3.7.
aRxPHYDelay	Implementation dependent, see 10.3.7.
aRxTxSwitchTime	Implementation dependent, see 10.3.7.
aTxRampOnTime	Implementation dependent, see 10.3.7.
aAirPropagationTime	6 μs
aMACProcessingDelay	Implementation dependent, see 10.3.7.
aCCAMidTime	212 μs
aPPDUMaxTime	27 920 μs (see NOTE 1)
aPSDUMaxLengthWithNoAggregation	511 octets (see NOTE 2)
aPSDUMaxLength	797 159 octets (see NOTE 3)

NOTE 1—This is the maximum PPDU duration in μs for an S1G_1M PPDU with a bandwidth of 1 MHz, S1G-MCS 10 and 1 spatial stream, limited by PSDU length of 511 octets.

NOTE 2—This is the maximum PSDU length in octets for an S1G PPDU supported by the Length field in the S1G SIG field when the Aggregation field is 0.

NOTE 3—This is the maximum length in octets for an S1G SU PPDU with a bandwidth of 16 MHz, S1G-MCS 9 and 4 spatial streams, limited by 511 data symbols supported by the Length field in the S1G SIG field, excluding the SERVICE field and tail bits.

23.5 Parameters for S1G-MCSs

The rate-dependent parameters for 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz, N_{ss} = 1,...,4 are given in Table 23-42 to Table 23-61. Support for 4 μs GI is optional in all cases. Support for MCS 8 and 9 (when valid) is optional in all cases. Support for MCS 11 and 12 (when valid) is optional in all cases. An S1G AP-STA shall support single spatial stream MCSs within the range MCS 0 to MCS 7 for all channel widths for which it has indicated support regardless of the Tx or Rx Highest Supported Data Rate subfield values in the Supported S1G-MCS and NSS Set and Extended Supported S1G-MCS and NSS Set fields. A non-AP S1G STA shall support single spatial stream MCSs within the range MCS 0 to MCS 2 for 1 and 2 MHz channel widths. When more than one spatial stream is supported, the Tx or Rx Highest Supported Data Rate subfield

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

values in the Supported S1G-MCS and NSS Set and Extended Supported S1G-MCS and NSS Set fields may result in a reduced MCS range (cut-off) for greater than one spatial stream. Support for 1 MHz and 2 MHz with N_{SS} = 1 is mandatory. Support for 1 and 2 MHz with N_{SS} = 2,3,4 is optional. Support for 4 MHz, 8 MHz, and 16 MHz with N_{SS} = 1,...,4 is optional.

NOTE—When LDPC is used with MCS 10, the resulting N_{CBPS} is 12 because the 2× repetition is applied after the LDPC encoding procedure.

24. China directional multi-gigabit (CDMG) PHY specification

24.1 CDMG PHY introduction

24.1.1 Scope

The CDMG PHY supports a 1.08 GHz channel width in comparison with the DMG PHY in Clause 20, which supports a 2.16 GHz channel width. As many aspects of CDMG PHY are the same as DMG PHY, this clause mainly lists the new features corresponding to Clause 20.

The CDMG PHY supports two modulation methods:

— A control modulation using MCS 0 of the CDMG Control mode defined in 24.4

— A single carrier (SC) modulation using MCS 1 to MCS 16 of the CDMG SC mode defined in 24.5 and MCS 17 to MCS 23 of the CDMG low-power SC mode defined in 24.6

All CDMG modulation methods share a similar preamble (see 24.3.6).

The services provided to the MAC by the CDMG PHY consist of the following protocol functions, defined as follows:

a) A function that defines a method of mapping the PHY service data units (PSDU) into a framing format (PPDU) suitable for sending and receiving PSDUs between two or more STAs.

b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the MCSs, these STAs support a mixture of CDMG SC mode, CDMG low-power SC mode, and CDMG control mode.

24.1.2 CDMG PHY functions

24.1.2.1 General

The CDMG PHY contains two functional entities: the PHY and the layer management function (PLME). Each of these functions is described in detail in 24.3 to 24.9. The CDMG PHY service is provided to the MAC through the PHY service primitives defined in Clause 8.

24.1.2.2 PHY management entity

The PLME performs management of the local PHY functions in conjunction with the MLME.

24.1.2.3 Service specification method

The description for service specification method is the same as that contained in 20.1.2.2.

24.2 CDMG PHY service interface

24.2.1 Introduction

The introduction for CDMG PHY service interface is the same as that contained in 20.2.1.

24.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 24-1 are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive.

Table 24-1—TXVECTOR and RXVECTOR parameters

Parameter	Value	TXVECTOR	RXVECTOR
MCS	The MCS parameter is an enumerated type that indicates the modulation and coding scheme used in the transmission of the PPDU. Values are integers in the range 0–23. — A MCS value of 0 indicates the use of CDMG control mode or CDMG robust PHY mode. — MCS values of 1 to 16 indicate use of Single Carrier modulations. The value is an index to Table 24-9. — MCS values of 17–23 indicate use of CDMG low-power SC mode. The value is an index toTable 24-11. The CDMG low-power SC mode is obsolete. Support for this mechanism might be removed in a later revision of the standard.	Y	Y
LENGTH	Indicates the number of octets in the PSDU in the range 1–262 143.	Y	Y
ADD_PPDU	Enumerated type: — ADD-PPDU indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU. — NO-ADD-PPDU indicates no additional PPDU follows this PPDU.	Y	Y
PPDU_TYPE	Enumerated type: — TRN-R indicates either a PPDU whose Data field is followed by one or more TRN subfields, or a PPDU that is requesting TRN subfields to be appended to a future response PPDU. — TRN-T indicates a PPDU whose Data field is followed by one or more TRN subfields. The transmitter may change AWV configuration at the beginning of each TRN subfield. This parameter is reserved if TRN_LEN is 0.	Y	Y
TRN_LEN	TRN_LEN indicates the length of the training field. Values are in the range 0–16 (see 24.9.2.2.3).	Y	Y
AGGREGATION	Indicates whether the PSDU contains an A-MPDU. Enumerated type: — AGGREGATED indicates this is a PSDU with A-MPDU aggregation. — NOT_AGGREGATED indicates this is a PSDU without A-MPDU aggregation.	Y	Y
RSSI	The allowed values for the RSSI parameter are in the range from 0 to 255. This parameter is a measurement by the PHY of the power observed at the input of the antennas plus the antenna gain, or equivalent antenna gain for a phase-array antenna, used to receive the current PPDU. RSSI shall be measured during the reception of the PHY preamble. RSSI is intended to be used in a relative manner, and it shall be a monotonically increasing function of the received power.	N	Y
SNR	This parameter indicates the SNR measured during the reception of a CDMG control mode PPDU. Values are –10 dB to 53.75 dB in 0.25 dB steps.	N	Y

Table 24-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Value	TXVECTOR	RXVECTOR
ANT_CONFIG	Indicates which antenna configuration(s) is to be used throughout the transmission of the PPDU and when to switch between configurations. Values are implementation dependent.	Y	N
CHAN_MEASUREMENT	Channel as measured during the reception of the TRN subfields. Each measurement includes 63 complex numbers.	N	Y
TIME_OF_DEPARTURE_REQUESTED	Enumerated type: — true indicates that the MAC entity requests that the PHY entity measure and report time of departure parameters corresponding to the time when the first PPDU energy is sent by the transmitting port. — false indicates that the MAC entity requests that the PHY entity neither measure nor report time of departure parameters.	O	N
RX_START_OF_FRAME_OFFSET	0 to 2^{32}–1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble of the PPDU arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC.	N	See NOTE
BEAM_TRACKING_REQUEST	This parameter indicates whether beam tracking is requested. Enumerated type: — BEAM-TRACKING-REQUESTED or BEAM-TRACKING-NOT-REQUESTED.	Y	Y
LAST_RSSI	In the TXVECTOR, LAST_RSSI indicates the received power level of the last PPDU with a valid PHY header that was received a SIFS before transmission of the current PPDU; otherwise, it is set to 0 (10.3.2.3.3). In the RXVECTOR, LAST_RSSI indicates the value of the LAST_RSSI field from the header of the received PPDU. Valid values are integers in the range 0 to 15: — Values of 2 to 14 represent power levels (–74+value×2) dBm. — A value of 15 represents power greater than or equal to –45 dBm. — A value of 1 represents power less than or equal to –71 dBm. — A value of 0 indicates that the previous PPDU was not received a SIFS before the current transmission.	Y	Y
Turnaround	Set to 1 or 0 as specified in 10.3.2.3.3.	Y	Y
ENHANCED_BEAM_TRACKING_REQUEST	This parameter indicates whether enhanced beam tracking is requested. Enumerated type: — ENHANCED-BEAM-TRACKING-REQUESTED or ENHANCED-BEAM-TRACKING-NOT-REQUESTED.	Y	Y
ROBUST_MODE	This parameter incorporating with the MCS parameter is an enumerated type that indicates CDMG control mode or CDMG robust PHY mode used in the transmission of the PPDU. It is present if MCS index is 0. Values are integers in the range 0–2. — A CDMG ROBUST_MODE value of 0 indicates the use of CDMG control mode. — A CDMG ROBUST_MODE value of 1 indicates the use of CDMG robust PHY mode 0. — A CDMG ROBUST_MODE value of 2 indicates the use of CDMG robust PHY mode 1. This parameter is not present if MCS index is not 0.	Y	Y
NOTE—“Y” if dot11TimingMsmtActivated is true; otherwise, “N”.

24.2.3 TXSTATUS parameters

The parameters listed in Table 24-2 are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm primitive.

Table 24-2—TXSTATUS parameters

Parameter	Value
TIME_OF_DEPARTURE	When the first PPDU energy is sent by the transmitting port, in units equal to 1/TIME_OF_DEPARTURE_ClockRate. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TIME_OF_DEPARTURE_ClockRate	0 to 2^{16}–1. The clock rate, in units of MHz, is used to generate the TIME_OF_DEPARTURE value. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TX_START_OF_FRAME_OFFSET	0 to 2^{32}–1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble of the PPDU was transmitted at the transmit antenna connector to the point in time at which this primitive is issued to the MAC.

24.3 Common parameters

24.3.1 Channelization

The CDMG PHY operates in the channels defined in Annex E and shall support at least channel numbers 2, 35, and 36.

The channel center frequency is defined as:

Channel center frequency = Channel starting frequency + Channel spacing × (Channel number mod 32)

where the channel starting frequency is equal to 56.16 GHz, and the channel spacing is defined in Table E-6 in Annex E.

24.3.2 Transmit mask

The transmitted spectrum shall adhere to the transmit spectrum mask shown in Figure 24-1. The transmit spectrum shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 0.94 GHz, –17 dBr at a 0.6 GHz offset, –22 dBr at a 1.35 GHz offset, and –30 dBr at a 1.53 GHz offset and above, inside the channels allowed for the regulatory domain in which the STA is transmitting. The measurement shall be made using a 1 MHz resolution bandwidth and a 300 kHz video bandwidth.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The transmitted spectrum shall be measured on data PPDUs longer than 10 μs without the training fields.

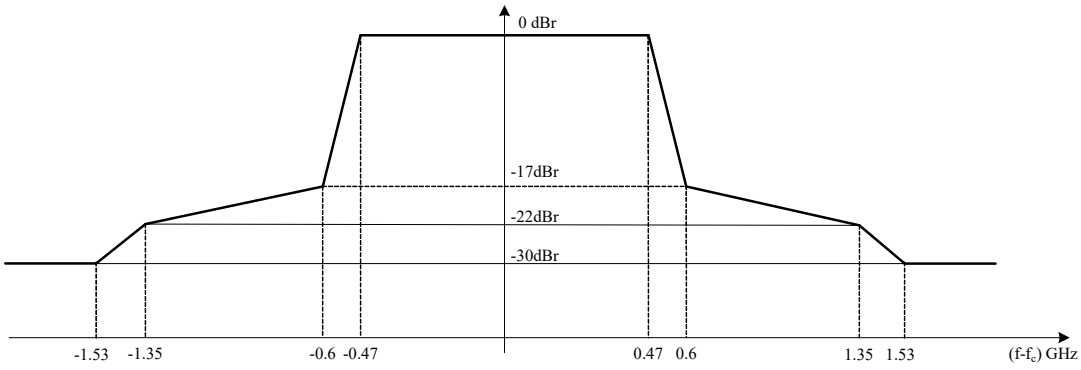

Figure 24-1—Transmit mask

24.3.3 Common requirements

24.3.3.1 Introduction

This subclause describes the common requirement from all three CDMG modes: control, SC, and low-power SC.

In all of the modes, all defined fields are transmitted bit 0 first in time.

24.3.3.2 Center frequency tolerance

24.3.3.2.1 General

The transmitter center frequency tolerance shall be ± 20 ppm.

24.3.3.2.2 Center frequency convergence

The transmitter center frequency shall converge to within 1 ppm of its final value within 0.9 μs from the start of the PPDU.

24.3.3.3 Symbol clock tolerance

The symbol clock frequency tolerance shall be ± 20 ppm.

The transmit center frequency and the symbol clock frequency shall be derived from the same reference oscillator.

24.3.3.4 Transmit center frequency leakage

The transmitter center frequency leakage shall not exceed –23 dB relative to the overall transmitted power.

24.3.3.5 Transmit rampup and rampdown

The description for transmit rampup and rampdown for CDMG PHY is the same as that contained in 20.3.3.5.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

24.3.3.6 Antenna setting

Antenna setting shall remain constant for the transmission of the entire PPDU except for the case of transmission of BRP-TX PPDU (see 24.9.2.2). During the transmission of BRP-TX PPDUs it shall remain constant for the transmission of the STF, CE field, and Data field.

24.3.3.7 Maximum input requirement

The receiver maximum input level is the maximum power level at the receive antenna(s) of the incoming signal, in dBm, present at the input of the receiver for which the error rate criterion (defined in 24.3.3.8) is met. A receiver shall have a receiver maximum input level at the receive antenna(s) of at least 10 $\mu W/cm^2$ for each of the modulation formats that the receiver supports.

24.3.3.8 Receiver minimum input level sensitivity

For MCS 0, the PER shall be less than 5% for a PSDU length of 256 octets with the MCS dependent input levels listed in Table 24-3 defined at the antenna connector. For the other MCSs, the PER shall be less than 1% for a PSDU length of 4096 octets with the MCS dependent input levels listed in Table 24-3 defined at the antenna connector.

NOTE—For RF power measurements performed over the air, the input level is corrected to compensate for the antenna gain in the implementation. The gain of the antenna is the maximum estimated gain by the manufacturer. In the case of the phased-array antenna, the gain of the phased-array antenna is the maximum sum of estimated element gain minus 3 dB implementation loss.

24.3.4 Timing-related parameters

Table 24-4 defines timing-related parameters.

Table 24-4—Timing-related parameters

Parameter	Value
N_{GI}	64
N_{SPB}	448
F_c: chip rate	880 MHz
T_c: chip time	$1 / F_c$ (~1.14 ns)
T_{seq}	$128 \times T_c$ (~146 ns)
T_{STF}: Detection sequence duration	$18 \times T_{seq}$ (~2618.2 ns)
T_{CE}: Channel estimation sequence duration	$9 \times T_{seq}$ (~1309.1 ns)
T_{HEADER}: header duration	$3 \times 512 \times T_c$ (~1.75 μs)
$T_{STF\text{-}CP}$: Control mode short training field duration	$50 \times T_{seq}$ (~7.2727 μs)
$T_{CE\text{-}CP}$: Control mode channel estimation field duration	T_{CE} (~1309.1 ns)
T_{Data}	(N_{BLKS} × aSCBlockSize + aSCGILength) × T_c NOTE—N_{BLKS} is defined in 20.5.3.2.3.3 and aSCBlockSize and aSCGILength are defined in Table 20-30.

24.3.5 Mathematical conventions in the signal description

The description for CDMG PPDU structure and related equations is the same as that contained in 20.3.5.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

24.3.6 Common preamble

24.3.6.1 General

The preamble is the part of the PPDU that is used for PPDU detection, AGC, frequency offset estimation, synchronization, I/Q imbalance estimation, indication of modulation (SC), and channel estimation. The SFS field in the preamble enables the receiver to perform estimation and compensation for the PPDU in a time domain and frequency domain according to the STF. The format of the preamble consists of a Short Training field followed by a Channel Estimation field. Figure 24-2 illustrates the SC PPDU preamble.

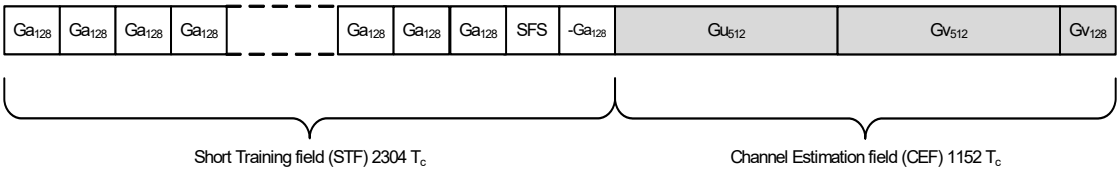

Figure 24-2—CDMG SC mode preamble

All numeric fields are transmitted in unsigned format, LSB first.

24.3.6.2 Short training field

The Short Training field is composed of 16 repetitions of sequences $Ga_{128}(n)$ of length 128 defined in 20.10, a single frequency sequence (SFS) of length 128 that used for I/Q imbalance estimation, followed by a single sequence $-Ga_{128}(n)$. The SFS is defined as

$$SFS(n) = \exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots$$

The waveform for the Short Training field is

$$r_{STF}(nT_c) = \begin{cases} (Ga_{128}(n \bmod 128))\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 16\times 128 - 1 \\ \exp\left(j\pi\frac{n}{2}\right), n = 16\times 128, \ldots, 17\times 128 - 1 \\ (-Ga_{128}(n \bmod 128))\exp\left(j\pi\frac{n}{2}\right), n = 17\times 128, \ldots, 18\times 128 - 1 \end{cases}$$

24.3.6.3 Channel estimation field

The Channel Estimation field is used for channel estimation, as well as indication of which modulation is going to be used for the PPDU, and enables the receiver to suppress nonlinear impact generated in a power amplification process according to the CE field. The Channel Estimation field is composed of a concatenation of two sequences $Gu_{512}(n)$ and $Gv_{512}(n)$ where the last 128 samples of $Gu_{512}(n)$ are equal to the last 128 samples used in the Short Training field. They are followed by a 128 samples sequence $Gv_{128}(n)$ equal to the first 128 samples of both $Gu_{512}(n)$ and $Gv_{512}(n)$.

The Gu_{512} and Gv_{512} sequences are defined as

$$Gu_{512} = \left[-Gb_{128}\ -Ga_{128}\ Gb_{128}\ -Ga_{128}\right]$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$Gv_{512} = \left[-Gb_{128}\ Ga_{128}\ -Gb_{128}\ -Ga_{128}\right]$$

When the Data field of the PPDU is modulated using single carrier, the Gu_{512} and Gv_{512} fields are concatenated in the order illustrated in Figure 24-3.

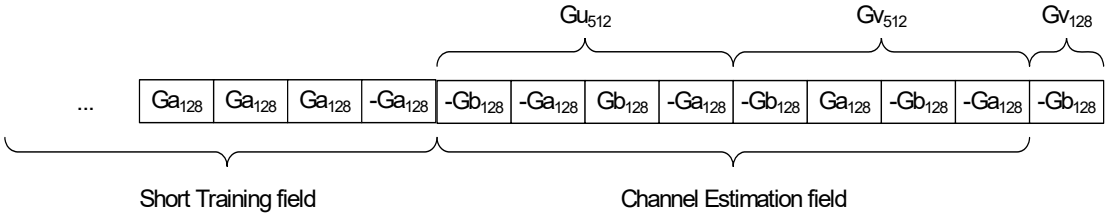

Figure 24-3—Channel Estimation field for SC PPDUs

The waveform for the channel estimation sequence is

$$r_{CE_{SC}}(nT_c) = (Gu_{512}(n) + Gv_{512}(n-512) + Gv_{128}(n-1024))\exp\left(j\pi\frac{n}{2}\right),\ n = 0, 1, \ldots, 1151$$

Note that sequences $Gu_{512}(n)$ and $Gv_{512}(n)$ are defined for $0 \le n \le 511$. For other values of n, $Gu_{512}(n)$ and $Gv_{512}(n)$ are set to 0.

24.3.7 HCS calculation for headers of CDMG control mode and CDMG SC mode

The description for HCS calculation for headers of CDMG control mode and CDMG SC mode is the same as that contained in 20.3.7.

24.3.8 Common LDPC parity matrices

The description for common LDPC parity matrices for CDMG PHY is the same as that contained in 20.3.8.

24.3.9 Scrambler

The description for CDMG PHY scrambler is the same as that contained in 20.3.9.

24.3.10 Received channel power indicator (RCPI) measurement

The description for received channel power indicator (RCPI) measurement for CDMG PHY is the same as that contained in 20.3.10.

24.4 CDMG control mode

24.4.1 Introduction

Transmission and reception of control mode PPDUs are mandatory. CDMG control mode uses the same chip rate as the CDMG SC mode. CDMG control mode is transmitted when the TXVECTOR indicates MCS 0.

The modulation and coding scheme for the CDMG control mode is shown in Table 24-5.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 24-5—CDMG control mode modulation and coding scheme

MCS index	Modulation	Code rate	Data rate
0	DBPSK	1/2[a]	13.75 Mb/s[a]

[a] Code rate and data rate might be lower due to codeword shortening.

24.4.2 PPDU format

The CDMG control mode PPDU is shown in Figure 24-4.

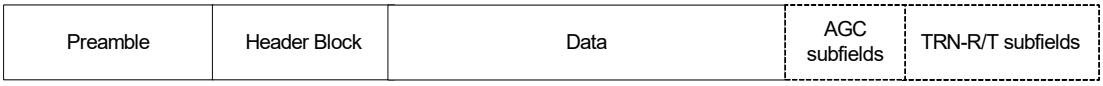

Figure 24-4—CDMG control mode PPDU format

24.4.3 Transmission

24.4.3.1 Preamble

24.4.3.1.1 General

The preamble is the part of the CDMG control mode PPDU that is used for PPDU detection, AGC, frequency offset estimation, synchronization, indication of PPDU type, and channel estimation.

The preamble is composed of two parts as shown in Figure 24-5: the Short Training field and the Channel Estimation field.

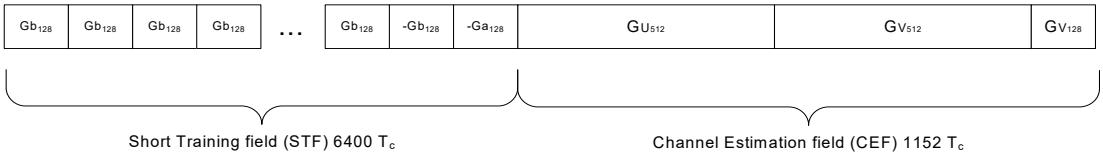

Figure 24-5—CDMG control mode preamble

24.4.3.1.2 Short Training field

The Short Training field is composed of 48 repetitions of sequences $Gb_{128}(n)$ of length 128, followed by a single $-Gb_{128}(n)$ sequence (for synchronization) and then a single $-Ga_{128}(n)$ sequence. The sequences $Ga_{128}(n)$ and $Gb_{128}(n)$ are defined in 20.10.

The waveform for the Short Training field is

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$r_{STF}(nT_c) = \begin{cases} Gb_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right), & n = 0, 1, \ldots, 48 \times 128 - 1 \\ -Gb_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right), & n = 48 \times 128, \ldots, 49 \times 128 - 1 \\ -Ga_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right), & n = 49 \times 128, \ldots, 50 \times 128 - 1 \end{cases}$$

Note that sequences $Ga_{128}(n)$ and $Gb_{128}(n)$ are defined for $0 \le n \le 127$. For other values of n, they are set to 0.

24.4.3.1.3 Channel Estimation field

The Channel Estimation field is the same as the Channel Estimation field of the CDMG SC mode, as defined in Figure 24-3 of 24.3.6.3.

24.4.3.2 Header

24.4.3.2.1 General

In the CDMG control mode, the preamble is followed by the header block. The header consists of several fields that define the details of the PPDU to be transmitted.

The header fields are described in Table 24-6.

Table 24-6—CDMG control mode header fields

Field name	Bit	Description
Differential Encoder Initialization	B0	Used to initialize the differential encoding *c(0)* in 20.4.3.3.4. May be set to any value.
Scrambler Initialization	B1–B4	Bits X1–X4 of the initial scrambler state (see 20.4.3.3.2).
Length	B5–B14	Number of data octets in the PSDU. Range 14–1023.
PPDU Type	B15	As defined in Table 24-8.
Training Length	B16–B20	Length of the training field. The use of this field is defined in 24.9.2.2.3.
Turnaround	B21	Contains a copy of the parameter TURNAROUND from the TXVECTOR.
Robust PHY Mode Indication	B22–B23	— Set to 0: control mode. — Set to 1: robust PHY mode 1. — Set to 2: robust PHY mode 0. The value 3 is reserved.
HCS	B24–B39	Header check sequence. Calculation of the header check sequence is defined in 24.3.7.

Reserved bits shall be set to 0 by the transmitter and shall be ignored by the receiver.

All numeric fields are transmitted in unsigned format, LSB first.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

24.4.3.2.2 Generation of HCS bits

The header check sequence (HCS) is calculated over bits 0–23 and uses CRC 16-CCITT as described in 24.3.7.

24.4.3.2.3 Header encoding and modulation

The header bits followed by the HCS bits are prepended to the Data field bits and passed into the Data field encoder per 24.4.3.3. The minimal payload length is 14 octets

24.4.3.3 Data field

The description for Data field for CDMG control mode is the same as that contained in 20.4.3.3.

24.4.4 Performance requirements

24.4.4.1 Transmit requirements

24.4.4.1.1 Introduction

Transmitter performance requirements of the CDMG control mode are defined in 24.4.4.1.2.

24.4.4.1.2 Transmit EVM

The description for transmit EVM for CDMG control mode is the same as that contained in 20.4.4.1.2.

24.4.4.2 Receive requirements

24.4.4.2.1 Introduction

This subclause describes the performance requirement from the CDMG control mode receiver.

24.4.4.2.2 CCA

The start of a CDMG control mode transmission at a receive level greater than –71 dBm shall cause CCA to indicate busy with a probability > 90% within 3 μs.

24.5 CDMG SC mode

24.5.1 Introduction

Transmission and reception of CDMG SC mode PPDUs are mandatory for selected MCSs.

24.5.2 PPDU format

An SC PPDU is shown in Figure 24-6.

Figure 24-6—SC PPDU format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The robust PHY modes use the CDMG control mode with short spreading sequences for the data. (See Table 24-7.) The following Golay complementary sequences Ga(8) and Ga(4) are used as spreading sequences for robust PHY mode 0 and 1, respectively.

Ga(8)=(+1, +1, +1, −1, +1, +1, −1, +1)

Ga(4)=(+1, +1, +1, −1)

Table 24-7—CDMG robust PHY modes

CDMG-Robust mode	Modulation	Code rate	Spreading sequence	Data rate (Mb/s)
0	DBPSK	1/2	Ga(8)	55
1	DBPSK	1/2	Ga(4)	110

24.5.3 Transmission

24.5.3.1 Header

24.5.3.1.1 General

In the CDMG SC mode, the preamble is followed by the header. The header consists of several fields that define the details of the PPDU to be transmitted. The encoding and modulation of the header are described in 24.5.3.1.4.

The header fields are described in Table 24-8.

Table 24-8—CDMG SC mode header fields

Field name	Number of bits	Start bit	Description
Scrambler Initialization	7	0	Bits X1–X7 of the initial scrambler state (see 20.3.9).
MCS	6	7	Modulation and coding scheme (see Table 24-9).
Length	18	13	Number of data octets in the PSDU. Range 1–262 143.
Additional PPDU	1	31	Contains a copy of the parameter ADD_PPDU from the TXVECTOR. A value of 1 indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU. A value of 0 indicates that no additional PPDU follows this PPDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 24-8—CDMG SC mode header fields *(continued)*

Field name	Number of bits	Start bit	Description
PPDU Type	1	32	Corresponds to the TXVECTOR parameter PPDU_TYPE. — PPDU Type = 0 (BRP-RX PPDU, see 20.9.2.2.3), indicates either a PPDU whose Data field is followed by one or more TRN subfields (when the Beam Tracking Request field is 0 or in CDMG control mode), or a PPDU that contains TRN subfields to be appended to a future response PPDU (when the Beam Tracking Request field is 1). — PPDU Type = 1 (BRP-RX PPDU, see 20.9.2.2.3), indicates a PPDU whose Data field is followed by one or more TRN subfields. The transmitter may change AWV at the beginning of each TRN subfield. The field is reserved when the Training Length field is 0.
Training Length	5	33	Corresponds to the TXVECTOR parameter TRN_LEN. If the Beam Tracking Request field is 0, the Training Length field indicates the length of the training field. The use of this field is defined in 24.9.2.2.3. A value of 0 indicates that no training field is present in this PPDU. If the Beam Tracking Request field is 1 and the PPDU Type field is 1, the Training Length field indicates the length of the training field appended to this PPDU. If the PPDU Type field is 0, the Training Length field indicates the length of the training field requested for receive training.
Aggregation	1	38	Set to 1 to indicate that the PPDU in the data portion of the packet contains an A-MPDU; otherwise, set to 0.
Beam Tracking Request	1	39	Corresponds to the TXVECTOR parameter BEAM_TRACKING_REQUEST. Set to 1 to indicate the need for beam tracking (10.41.7); otherwise, set to 0. The Beam Tracking Request field is reserved when the Training Length field is 0.
Last RSSI	4	40	Contains a copy of the parameter LAST_RSSI from the TXVECTOR. The value is an unsigned integer: Values of 2 to 14 represent power levels (–74+value×2) dBm. A value of 15 represents a power greater than or equal to –45 dBm. A value of 1 represents a power less than or equal to –71 dBm. A value of 0 indicates that the previous PPDU was not received a SIFS before the current transmission.
Turnaround	1	44	As defined in Table 24-1.
Enhanced Beam Tracking Request	1	45	Corresponds to the TXVECTOR parameter ENHANCED_BEAM_TRACKING_REQUEST. Set to 1 to indicate that one STF and CE field are appended to the Data and TRN fields. Otherwise, set to 0.
Reserved	2	46	
HCS	16	48	Header check sequence. Definition of this field calculation is in 24.5.3.1.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Reserved bits are set to 0 by the transmitter and shall be ignored by the receiver.

If the Additional PPDU field is equal to 1, the Training Length field shall be set to 0.

All numeric fields are transmitted in unsigned format, LSB first.

24.5.3.1.2 Modulation and coding scheme

The modulation and coding scheme (MCS) field specifies the modulation and code rate that is used in the PPDU. The modulation and coding schemes for the SC mode are defined in Table 24-9.

Table 24-9—CDMG SC mode modulation and coding schemes

MCS index	Modulation	N_{CBPS}	Repetition	Code rate	Data rate (Mb/s)
1	π/2-BPSK	1	2	1/2	192.5
2	π/2-BPSK	1	1	1/2	385
3	π/2-BPSK	1	1	5/8	481.25
4	π/2-BPSK	1	1	3/4	577.5
5	π/2-BPSK	1	1	13/16	625.625
6	π/2-QPSK	2	1	1/2	770
7	π/2-QPSK	2	1	5/8	962.5
8	π/2-QPSK	2	1	3/4	1155
9	π/2-QPSK	2	1	13/16	1251.25
10	π/2-16-QAM	4	1	1/2	1540
11	π/2-16-QAM	4	1	5/8	1925
12	π/2-16-QAM	4	1	3/4	2310
13	π/2-16-QAM	4	1	13/16	2502.5
14	π/2-64-QAM	6	1	5/8	2887.5
15	π/2-64-QAM	6	1	3/4	3465
16	π/2-64-QAM	6	1	13/16	3453.75

Transmit and receive support for MCS 9 and below is mandatory. Other MCSs are optional.

24.5.3.1.3 Generation of the HCS bits

Calculation of the HCS for bits 0–47 of the header is defined in 24.3.7.

24.5.3.1.4 Header encoding and modulation

The description for header encoding and modulation for CDMG SC mode is the same as that contained in 20.5.3.1.4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

24.5.3.2 The Data field

24.5.3.2.1 General

The Data field consists of the payload data of the PSDU and possible padding. The data are padded with 0s, scrambled, encoded, and modulated as described in the following subclauses. The amount of padding is defined in 24.5.3.2.3.

24.5.3.2.2 Scrambler

The description for CDMG SC mode scrambler is the same as that contained in 20.5.3.2.2.

24.5.3.2.3 Encoding

The description for CDMG SC mode encoding is the same as that contained in 20.5.3.2.3.

24.5.3.2.4 Modulation mapping

24.5.3.2.4.1 General

The coded and padded bit stream is converted into a stream of complex constellation points according to the modulation specified in the MCS table.

24.5.3.2.4.2 π/2-BPSK modulation

The description for CDMG SC mode π/2-BPSK modulation is the same as that contained in 20.5.3.2.4.2.

24.5.3.2.4.3 π/2-QPSK modulation

The description for CDMG SC mode π/2-QPSK modulation is the same as that contained in 20.5.3.2.4.3.

24.5.3.2.4.4 π/2-16-QAM modulation

The description for CDMG SC mode π/2-16-QAM modulation is the same as that contained in 20.5.3.2.4.5.

24.5.3.2.4.5 π/2-64-QAM modulation

In π/2-64-QAM modulation, the input bit stream is grouped into sets of 6 bits and mapped according to the following equation:

$$\tilde{s}(k) = \frac{1}{\sqrt{42}}((8c_{6k}-4)-(2c_{6k}-1)(4c_{6k+1}-2)+(2c_{6k}-1)(2c_{6k+1}-1)(2c_{6k+2}-1)) + j\frac{1}{\sqrt{42}}((8c_{6k+3}-4)-(2c_{6k+3}-1)(4c_{6k+4}-2)+(2c_{6k+3}-1)(2c_{6+4}-1)(2c_{6k+5}-1))$$

where k is the output symbol index, k = 0, 1, …. Each output symbol is then rotated according to the following equation:

$$s_k = s_k \cdot e^{j \cdot \pi \cdot k/2}$$

Copyright © 2025 IEEE. All rights reserved.

The constellation bit encoding for 64-QAM is shown in Figure 24-7.

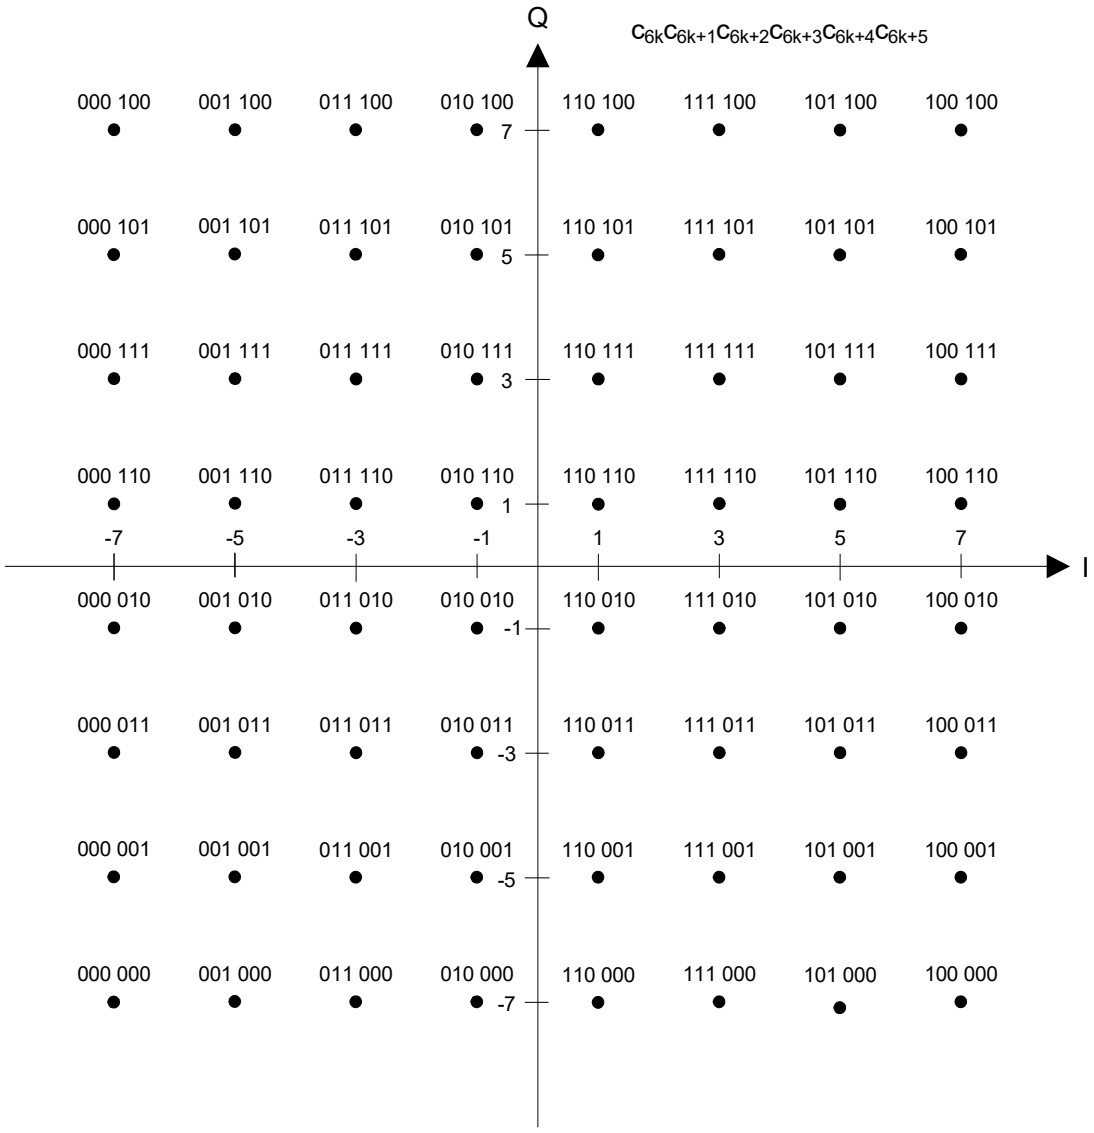

Figure 24-7—64-QAM constellation bit encoding

24.5.3.2.5 Symbol blocking and guard insertion

The description for CDMG SC mode symbol blocking and guard insertion is the same as that contained in 20.5.3.2.5.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

24.5.4 Performance requirements

24.5.4.1 Transmit requirements

24.5.4.1.1 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, etc.

The instrumentation shall perform carrier lock, symbol timing recovery, and amplitude adjustment while making the measurements. The equalizer shall be trained using information in the SC preamble (STF and/or CE field). For the CDMG SC mode EVM, measuring N_s samples at the sample rate, the measured symbols should not contain the first and the last hundred symbols of a given PPDU (ramp up/down). The EVM is calculated according to the formula below:

$$EVM = 20\log 10\left(\sqrt{\left(\frac{1}{N_s P_{avg}}\sum_{i=1}^{N_S}[(I_i - I_i^* - I_0)^2 + (Q_i - Q_i^* - Q_0)^2]\right)}\right)$$

where

N_s is the number of samples to be measured and N_s should be 1000

P_{avg} is the average power of the constellation

(I_i, Q_i) is the complex coordinates of the measured symbol i

(I_i^*, Q_i^*) is the complex coordinates of the ideal constellation point for the measured symbol i

(I_0, Q_0) is the complex DC term chosen to reduce EVM

The test equipment should use a root-raised cosine filter with roll-off factor of 0.25 for the pulse shaping filter when conducting EVM measurement.

The transmit pulse shaping used is left to the implementer.

The relative constellation error (EVM) shall not exceed a MCS dependent value according to Table 24-10.

Table 24-10—CDMG SC mode EVM requirements

MCS index	Modulation	Coding rate	EVM value (dB)
1	π/2-BPSK	1/2 with repetition	–6
2	π/2-BPSK	1/2	–7
3	π/2-BPSK	5/8	–9
4	π/2-BPSK	3/4	–10
5	π/2-BPSK	13/16	–12
6	π/2-QPSK	1/2	–11
7	π/2-QPSK	5/8	–12
8	π/2-QPSK	3/4	–13

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 24-10—CDMG SC mode EVM requirements *(continued)*

MCS index	Modulation	Coding rate	EVM value (dB)
9	π/2-QPSK	13/16	–15
10	π/2-16-QAM	1/2	–19
11	π/2-16-QAM	5/8	–20
12	π/2-16-QAM	3/4	–21
13	π/2-16-QAM	13/16	–23
14	π/2-64-QAM	5/8	–25
15	π/2-64-QAM	3/4	–26
16	π/2-64-QAM	13/16	–28

24.5.4.1.2 Time of departure accuracy

The RMS accuracy of the time of departure provided in TIME_OF_DEPARTURE shall be less than or equal to 80 ns.

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is 880×10^6 sample/s.
— FIRST_TRANSITION_FIELD is Short Training field.
— SECOND_TRANSITION_FIELD is Channel Estimation field.
— TRAINING_FIELD is Channel Estimation field.
— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns.

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

24.5.4.2 Receive requirements

24.5.4.2.1 Introduction

This subclause describes the receiver requirements of the CDMG SC mode.

24.5.4.2.2 CCA sensitivity

The start of a CDMG SC mode transmission at a receive level greater than the minimum sensitivity for MCS 1 (–71 dBm) shall cause CCA to indicate busy with a probability > 90% within 1 μs. The receiver shall hold the carrier sense signal busy for any signal 20 dB above the minimum sensitivity for MCS 1.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

24.6 CDMG low-power SC mode

24.6.1 Introduction

The CDMG low-power SC mode is obsolete. Support for this mechanism might be removed in a later revision of the standard.

The CDMG low-power SC mode is an optional SC mode. This mode can provide lower processing power requirements for CDMG transceivers.

24.6.2 Transmission

24.6.2.1 Preamble

The CDMG low-power SC mode uses the same preamble as the CDMG SC mode.

24.6.2.2 Header

24.6.2.2.1 General

The CDMG low-power SC mode header fields are the same fields as in the CDMG SC mode (see Table 24-8 in 24.5.3.1).

The CDMG low-power SC mode modulation and coding schemes are listed in Table 24-11.

Table 24-11—CDMG low-power SC mode modulation and coding schemes

MCS	Modulation	Effective code rate	Coding scheme	N_{CPB}	Rate (Mb/s)
17	π/2-BPSK	13/28	RS(224,208)+Block-Code(16,8)	392	313
18	π/2-BPSK	13/21	RS(224,208)+Block-Code(12,8)	392	417
19	π/2-BPSK	52/63	RS(224,208)+SPC(9,8)	392	556
20	π/2-QPSK	13/28	RS(224,208)+Block-Code(16,8)	392	625.5
21	π/2-QPSK	13/21	RS(224,208)+Block-Code(12,8)	392	834
22	π/2-QPSK	52/63	RS(224,208)+SPC(9,8)	392	1112
23	π/2-QPSK	13/14	RS(224,208)+Block-Code(8,8)	392	1251.5

24.6.2.2.2 Header encoding and modulation

The description for header encoding and modulation for CDMG low-power SC mode is the same as that contained in 20.6.2.2.2.

24.6.2.3 Data field

The description for CDMG SC mode Data field is the same as that contained in 20.6.2.3.

24.7 PHY transmit procedure

The PHY transmit procedure is shown in Figure 24-8. In order to transmit data, a PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through station management via the PLME, as specified in 24.10. Other transmit parameters, such as MCS and transmit power, are set via the PHY SAP with the PHY-TXSTART.request(TXVECTOR) primitive, as described in 24.2.2.

Transmission of the PHY preamble may start if TIME_OF_DEPARTURE_REQUESTED is false and shall start immediately if TIME_OFDEPARTURE_REQUESTED is true, based on the parameters passed in the PHY-TXSTART.request primitive.

The preamble format (control or SC mode) depends on the MCS in the PHY-TXSTART.request primitive. The PHY shall calculate the length of the PPDU according the MCS and the length specified in the PHY-TXSTART.request primitive, adding padding bits if necessary.

The PHY continues with the encoding and transmission of the header according to the parameters of the PHY-TXSTART.request(TXVECTOR) primitive. The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The data are encoded as described in 20.4.3.3.3, 20.5.3.2.3, and 20.6.2.3.3. The encoded data are then modulated as described in 24.4, 24.5, and 24.6, depending on the MCS requested in the PHY-TXSTART.request primitive. Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PHY-TXSTART shall be disabled by receiving a PHY-TXEND.request primitive.

Transmission of the PSDU is completed with the transmission of the last bits of the (encoded) PSDU. If no TRN units are specified in the PHY-TXSTART.request primitive, the PHY shall issue a PHY-TXEND primitive after the transmission of the last bits. If TRN units are requested in the PHY-TXSTART.request primitive, the transmission continues with the transmission of the AGC subfields and TRN units. The PHY issues the PHY-TXEND.confirm primitive to the MAC after the transmission of the last TRN unit. The PPDU transmission shall be completed, and the PHY entity shall enter the receive state (i.e., PHY-TXSTART shall be disabled). Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY.

24.8 PHY receive procedure

A CDMG STA shall follow the DMG receive procedure defined in 20.8 when a DMG PPDU is detected on a 2.16 GHz channel.

The CDMG PHY receive procedure follows similar rules as descrived in 20.8.

24.9 Beamforming

24.9.1 Beamforming concept

The beamforming concept is the same as that contained in 20.9.1.

24.9.2 Beamforming frame format

24.9.2.1 Sector-level sweep

PPDUs transmitted during transmit sector sweep are CDMG control mode PPDUs. PPDUs transmitted during receive sector sweep are CDMG control mode or CDMG SC mode PPDUs.

24.9.2.2 Beam refinement

24.9.2.2.1 General

See 20.9.2.2.1 for the general description of beam refinement.

In addition to DMG beam refinement features, enhanced beam tracking is a process that the CDMG STAs can use to improve their antenna configurations (or antenna weight vectors) both for transmission and reception and measure the backup channel performance of an alternative link via beam tracking. Once the current link has poor quality due to blockage or antenna rotation, the CDMG STAs can switch to an alternative link. Only if the alternative link has been set and enhanced beam tracking is enabled, can CDMG STAs perform enhanced beam tracking. The procedure of enhanced beam tracking is described in 10.41.9.

In addition to TRN training sequences appended, CDMG enhanced beam tracking uses BRP-RX or BRP-TX PPDUs that have an STF and a CE field appended to them.

— BRP-RX PPDUs are PPDUs that have e-TRN-R/TRN-R training sequences following the Data field. These PPDUs with TRN-R sequences enable receiver antenna weight vector training, and these PPDUs with e-TRN-R sequences enable receiver antenna weight vector training and measuring one alternative link.

— BRP-TX PPDUs are PPDUs that have e-TRN-T/TRN-T training sequences following the Data field. The transmitting STA may change antenna configuration at the beginning of each sequence. The receiving STA performs measurements on these sequences and sends feedback to the STA that transmits the BRP-TX PPDU, including the measurement results of alternative link.

24.9.2.2.2 BRP PPDU structure

If the Enhanced Beam Tracking Request field in the PHY header is equal to:

— 0, each BRP PPDU structure is shown in Figure 20-20.

— 1, each BRP PPDU structure is shown in Figure 24-9.

The STF and CE fields at the end of the BRP PPDU have the same structure as those at the beginning of the PPDU as defined in 24.3.6. The collection of the AGC field, TRN field, STF, and CE field at the end of BRP

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

PPDU is termed an *e-TRN field*. The AGC fields and TRN fields are used to train the current link and the adjacent links of the current link during beam tracking process. The alternative link is a beam link with different propagation characteristic that cannot be measured accurately by the AGC field and the training field (TRN-R/T) that are used for measuring the adjacent beam links. The STF and the CE field at the end of BRP PPDU are used for measuring and training the alternative link of CDMG STAs during enhanced beam tracking (see 10.41.9). The BRP PPDU structure for CDMG STAs that perform enhanced beam tracking is shown in Figure 24-9.

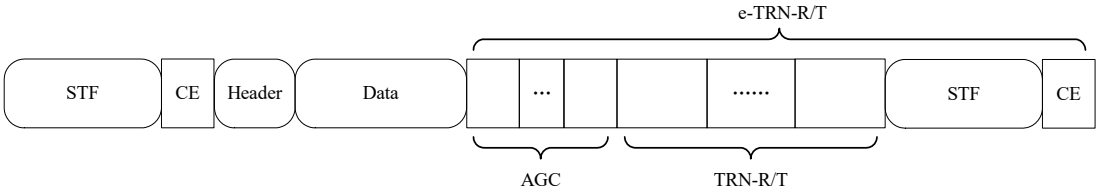

Figure 24-9—BRP PPDU structure (CDMA STAs)

24.9.2.2.3 BRP PPDU Header field

The description for BRP PPDU Header field is the same as that contained in 20.9.2.2.3.

24.9.2.2.4 BRP PPDU duration

The minimum duration of the Data field of a BRP PPDU when sent in an SC mode is aBRPminSCblocks SC blocks (see 24.5.3.2.5), and, if needed, the Data field of the PPDU shall be extended by extra 0 padding to generate the required number of SC blocks. Table 24-12 contains the values of N_{CWmin} for MCSs 1 to 9 necessary to compute the padding described in 20.5.3.2.3.3.

Table 24-12—Zero filling for SC BRP PPDUs with MCSs 1 to 9

MCS index	Modulation	N_{CBPS}	Repetition	Code rate	Data rate (Mb/s)	N_{CWmin}
1	π/2-BPSK	1	2	1/2	192.5	12
2	π/2-BPSK	1	1	1/2	385	12
3	π/2-BPSK	1	1	5/8	481.25	12
4	π/2-BPSK	1	1	3/4	577.5	12
5	π/2-BPSK	1	1	13/16	625.625	12
6	π/2-QPSK	2	1	1/2	770	23
7	π/2-QPSK	2	1	5/8	962.5	23
8	π/2-QPSK	2	1	3/4	1155	23
9	π/2-QPSK	2	1	13/16	1251.25	23

The minimum duration of the Data field of a BRP PPDU when sent with the low-power SC mode is N_{BLK_MIN} low-power SC blocks (see 20.6.2.3.3).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

24.9.2.2.5 AGC field

The AGC fields in the BRP PPDU are composed of 4*N* repetitions of the sequence [Ga_{64} Ga_{64} Ga_{64} Ga_{64} Ga_{64}] when the PPDU is transmitted using the SC mode and [Gb_{64} Gb_{64} Gb_{64} Gb_{64} Gb_{64}] when the PPDU is transmitted using the control mode. The sequences Ga64 and Gb64 are defined in 20.10. The sequences are transmitted using rotated π/2-BPSK modulation.

In a BRP-TX PPDU, the transmitter may change the TX AWV configuration at the beginning of each AGC field. Any transmit signal transients that occur due to this TX AWV configuration change shall completely settle by the end of the first Ga64 or Gb64 subsequence. The set of AWVs used for the AGC subfields should be the same as that used for the TRN-T fields. In a BRP-RX PPDU, the transmitter shall use the same TX AWV as in the preamble and Data fields of the PPDU.

24.9.2.2.6 TRN field

The description for TRN field is the same as that contained in 20.9.2.2.6.

24.9.2.2.7 Channel measurement

The description for channel measurement is the same as that contained in 20.9.2.2.7.

24.10 CDMG PLME

24.10.1 PLME SAP layer management primitives

Table 24-13 lists the MIB attributes that may be accessed by the PHY entities and the intra-layer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.7.

24.10.2 CDMG PHY MIB

All CDMG PHY MIB attributes are defined in Annex C, with specific values defined in Table 24-13. The column titled “Operational semantics” in Table 24-13 contains two types: static and dynamic. Static MIB attributes are fixed and cannot be modified for a given PHY implementation. Dynamic MIB attributes can be modified by some management entity.

Table 24-13—CDMG PHY MIB attribute default values

Managed object	Default value/range	Operational semantics
dot11PHYOperationTable		
dot11PHYType	cdmg(12)	Static
dot11PHYCDMGTable		
dot11LowPowerSCPHYImplemented	Boolean	Static
dot11LowPowerSCPHYActivated	Boolean	Dynamic

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When MAX-ACCESS is read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is read-write, the MIB attribute may be read and written by management entities but shall not be updated by the PLME.

24.10.3 TXTIME calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated according to the following equations.

For the CDMG SC PHY (N_{TRN} is Training Length field defined in the header; see, for example, Table 24-8):

$$TXTIME = \begin{cases} T_{STF} + T_{CE} + T_{header} + T_{Data} & N_{TRN} = 0 \\ T_{STF} + T_{CE} + T_{header} + \max\{T_{Data}, (\alpha \times \beta + \gamma) \times T_C\} + N_{TRN} \times T_{TRN-Unit} & N_{TRN} > 0 \text{ and SC} \end{cases}$$

where

α = aBRPminSCblocks
β = aSCBlockSize
γ = aSCGILength
$T_{TRN-Unit}$ = aBRPTRNBlock $\times$ T_C

For the CDMG control PHY:

$$TXTIME = T_{STF-CP} + T_{CE-CP} + (11 \times 8 + (Length - 6) \times 8 + N_{CW} \times 168) \times T_C \times 32 + N_{TRN} \times T_{TRN-Unit}$$

where N_{CW} calculation is defined in 20.4.3.3.3.

24.10.4 PHY characteristics

The CDMG PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, are shown in Table 24-14. The definitions for these characteristics are given in 6.7.4.

Table 24-14—CDMG PHY characteristics

PHY parameter	Value
aPPDUMaxTime	4 ms
aPSDUMaxLength	262 143 octets

25. China millimeter-wave multi-gigabit (CMMG) PHY specification

25.1 Introduction

25.1.1 Introduction to CMMG PHY

Clause 25 specifies the PHY entities for China millimeter-wave multi-gigabit (CMMG) single carrier (SC) and orthogonal frequency division multiplexing (OFDM) systems.

The maximum number of space-time streams supported in CMMG SC and OFDM system is four.

The CMMG PHY provides support for 540 MHz and 1080 MHz channel widths.

The CMMG PHY data are modulated using binary phase shift keying (BPSK), quadrature phase shift keying (QPSK), 16-quadrature amplitude modulation (16-QAM), and 64-QAM. Forward error correction (FEC) coding (LDPC coding) is used with coding rates of 1/2, 3/4, 5/8, and 13/16.

A CMMG STA shall support the following features:

— 540 MHz channel width
— CMMG control mode and CMMG SC mode (directional transmit and receive)
— Single spatial stream MCS 0 (CMMG control mode transmit and receive) in all supported channel widths
— Single spatial stream MCSs 1 to 3 (CMMG SC mode transmit and receive) in all supported channel widths
— LDPC coding with length 672
— Normal guard interval as defined in Table 25-3

A CMMG STA may support the following features:

— Support for 1080 MHz channel width
— CMMG-MCSs 4 to 8 (CMMG SC mode transmit and receive)
— CMMG-MCSs 9 to 16 (CMMG OFDM mode transmit and receive)
— Two or more spatial streams (transmit and receive)
— Short guard interval (transmit and receive)
— LDPC coding with length 2016
— Support MIMO transmission (CMMG SC mode and CMMG OFDM mode with omnidirectional antenna pattern or quasi-omni antenna pattern transceiver)
— STBC (transmit and receive)
— Transmit beamforming sounding (by sending a CMMG NDP)
— Responding to transmit beamforming sounding

NOTE—MIMO transmission only applies in the case where the antenna pattern is the omnidirectional antenna pattern or quasi-omni antenna pattern.

25.1.2 Scope of CMMG PHY services

The CMMG PHY supports three modulation methods:

— A control modulation using MCS 0 (the CMMG control mode; see 25.4)
— A single carrier (SC) modulation using MCS 1 to MCS 8 (the CMMG SC mode; see 25.5)
— An OFDM modulation using MCS 9 to MCS 16 (the CMMG OFDM mode; see 25.6)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

All these modulation methods share a common preamble (see 25.3.5).

The services provided to the MAC by the CMMG PHY consist of the following protocol functions:

a) A function that defines a method of mapping the PSDUs into a PPDU format suitable for sending and receiving PSDUs between two or more STAs.
b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the PPDU format, these STAs support a mixture of CMMG control mode, CMMG SC mode, and CMMG OFDM mode.

25.1.3 CMMG PHY functions

25.1.3.1 General

The CMMG PHY contains two functional entities: the PHY function and the physical layer management function (PLME). Each of these functions is described in detail in 25.4 (for CMMG control mode), 25.5 (for CMMG SC mode), 25.6 (for CMMG OFDM mode), and 25.14 (for CMMG PLME). The CMMG PHY service is provided to the MAC through the PHY service primitives defined in Clause 6.

25.1.3.2 PHY management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

25.1.3.3 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation; the actual method of implementation is left to the discretion of the CMMG PHY compliant developer. The service of a layer or sublayer is the set of capabilities that it offers to a user in the next higher layer (or sublayer). Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

25.1.3.4 PPDU formats

The structure of the PPDU transmitted by a CMMG STA is determined by the TXVECTOR parameters as defined in Table 25-1.

A CMMG PPDU can be further categorized as a CMMG control mode PPDU, a CMMG SC mode PPDU, or a CMMG OFDM mode PPDU.

25.2 CMMG PHY service interface

25.2.1 Introduction

The PHY provides an interface to the MAC through an extension of the generic PHY service interface defined in 8.3.4. The interface includes TXVECTOR, RXVECTOR, and PHYCONFIG_VECTOR.

The TXVECTOR supplies the PHY with per-PPDU transmit parameters. Using the RXVECTOR, the PHY informs the MAC of the received PPDU's parameters. Using the PHYCONFIG_VECTOR, the MAC configures the PHY for operation, independent of PPDU transmission or reception.

25.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 25-1 are defined as part of the TXVECTOR parameter list in the PHYTX-START.request primitive and/or as part of the RXVECTOR parameter list in the PHYRXSTART.indication primitive.

Table 25-1—TXVECTOR and RXVECTOR parameters

Parameter	Value	TXVECTOR	RXVECTOR
MCS	The MCS parameter indicates the modulation and coding scheme used in the transmission of the packet. Values are integers in the range from 0 to 31. — An MCS value of 0 indicates the use of CMMG control mode. — MCS values of 1 to 8 indicate use of single carrier modulations. The value is an index to Table 25-38 to Table 25-45. — MCS values of 9 to 16 indicates use of OFDM modulations. The value is an index to Table 25-46 to Table 25-53.	Y	Y
LENGTH	Indicates the number of octets in the PSDU in the range from 0 to 262 143. A value of zero indicates a PPDU in which no Data field follows the SIG.	Y	Y
N_TX	Indicates the number of transmit chains.	Y	N
NSS	Indicates the number of spatial streams.	Y	N
EXPANSION_MAT	If PPDU transmission mode is CMMG OFDM mode, contains a set of compressed beamforming feedback matrices as defined in 25.6.8.13.2. The number of elements depends on the number of spatial streams and the number of transmit chains. Otherwise, not present.	Y	N
CHAN_MAT	If PSDU LENGTH equals 0, contains a set of compressed beamforming feedback matrices as defined in 25.6.8.13.2 based on the channel measured during the training symbols of the received PPDU. The number of elements depends on the number of spatial streams and the number of transmit chains. Otherwise, not present.	N	Y
ADD_PPDU	Enumerated type: — ADD-PPDU indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU. — NO-ADD-PPDU indicates no additional PPDU follows this PPDU.	Y	Y
AGGREGATION	Indicates whether the PSDU contains an A-MPDU. Enumerated type: — AGGREGATED indicates this is a packet with A-MPDU aggregation. — NOT_AGGREGATED indicates this is a packet without A-MPDU aggregation.	Y	Y
RSSI	The allowed values for the RSSI parameter are in the range from 0 to 255. This parameter is a measurement by the PHY of the power observed at the antennas used to receive the current PPDU. RSSI shall be measured during the reception of the PHY preamble. RSSI is intended to be used in a relative manner, and it shall be a monotonically increasing function of the received power.	N	Y
REC_MCS	Indicates the MCS that the STA's receiver recommends.	N	O

Table 25-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Value	TXVECTOR	RXVECTOR
SNR	Contains an array of received SNR measurements for each spatial stream. SNR indications of 8 bits are supported. SNR shall be the sum of the decibel values of SNR per tone divided by the number of tones represented in each stream as described in 9.4.1.47.	N	Y
STBC	Indicates whether STBC is used. 0 indicates no STBC (NSTS=NSS in the Data field). 1 indicates STBC is used (NSTS=2NSS in the Data field). This parameter is 0 for a CMMG OFDM MU PPDU.	Y	Y
RCPI	Is a measure of the received RF power measured over the preamble of a received frame. Refer to 20.3.10 for the definition of RCPI.	N	Y
TXOP_PS_NOT_ALLOWED	Indicates whether a CMMG AP allows non-AP CMMG STAs in TXOP power save mode to enter doze state during the TXOP. 0 indicates that the CMMG AP allows non-AP CMMG STAs to enter doze state during a TXOP. 1 indicates that the CMMG AP does not allow non-AP CMMG STAs to enter doze state during a TXOP.	Y	Y
PARTIAL_AID	Provides an abbreviated indication of the intended recipient(s) of the PSDU (see 10.19). Integer: range from 0 to 511 if UPLINK_INDICATION is 1, and range from 0 to 63 if UPLINK_INDICATION is 0.	Y	Y
UPLINK_INDICATION	Set to 1 if the CMMG PPDU is addressed to AP. Set to 0 otherwise (see 10.19).	Y	Y
COLOR	If UPLINK_INDICATION is 0, set to a value of its choosing within the range from 0 to 7 and shall maintain that value for the duration of the existence of the BSS. Otherwise, not present (see 10.19).	Y	Y
CH_BANDWIDTH	Indicates the channel width of the transmitted PPDU: Enumerated type: — CBW540 for 540 MHz — CBW1080 for 1080 MHz	Y	Y
DUPLICATE_MODULATION	In TXVECTOR, indicates the PPDU transmitted with CMMG duplicate format. In RXVECTOR, indicates the estimated PPDU transmitted with CMMG duplicate format; — Present if CH_BANDWIDTH equals CBW1080 and the PPDU is transmitted with duplicate format. — Otherwise not present.	O	O

Table 25-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Value	TXVECTOR	RXVECTOR
DYN_BANDWIDTH	In TXVECTOR, if present, indicates whether the transmitter is capable of dynamic bandwidth operation as an RTS originator. In RXVECTOR, if valid, indicates whether the transmitter is capable of dynamic bandwidth operation as an RTS originator (see 10.3.2.9). Enumerated type: — Static if the transmitter is only capable of static bandwidth operation. — Dynamic if the transmitter is capable of dynamic bandwidth operation. NOTE—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the received MPDU.	O	Y
BEAMFORMED	Set to 1 if a beamforming steering matrix is applied to the waveform in a CMMG OFDM mode transmission as described in 19.3.11.11.2. Set to 0 otherwise. NOTE—When BEAMFORMED is equal to 1, smoothing is not recommended.	Y	O
TIME_OF_DEPARTURE_REQUESTED	Enumerated type: — true indicates that the MAC entity requests that the PHY entity measure and report time of departure parameters corresponding to the time when the first frame energy is sent by the transmitting port. — false indicates that the MAC entity requests that the PHY entity neither measure nor report time of departure parameters.	O	N
RX_START_OF_FRAME_OFFSET	0 to 2^{32}–1. An estimate of the offset (in 100 ps units) from the point in time at which the start of the preamble of the PPDU arrived at the receive antenna port to the point in time at which this primitive is issued to the MAC.	N	Y
PPDU_TYPE	Enumerated type: — TRN-R indicates either a PPDU whose Data field is followed by one or more TRN-R subfields, or a PPDU that is requesting TRN-R subfields to be appended to a future response PPDU. — TRN-T indicates a PPDU whose Data field is followed by one or more TRN-T subfields. This parameter is reserved if TRN_LEN is 0.	Y	Y
BEAM_TRACKING_REQUEST	This parameter indicates whether beam tracking is requested. Enumerated type: — BEAM-TRACKING-REQUESTED or BEAM-TRACKING-NOT-REQUESTED.	Y	Y

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 25-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Value	TXVECTOR	RXVECTOR
LAST_RSSI	In the TXVECTOR, LAST_RSSI indicates the received power level of the last PPDU with a valid PHY SIG that was received a SIFS before transmission of the current packet; otherwise, it is set to 0 (see 10.3.2.3.3). In the RXVECTOR, LAST_RSSI indicates the value of the LAST_RSSI field from the header of the received PPDU. Valid values are integers in the range from 0 to 15: — Values of 2 to 14 represent power levels (–71+value×2) dBm. — A value of 15 represents power greater than or equal to –42 dBm. — A value of 1 represents power less than or equal to –68 dBm. — A value of 0 indicates that the previous packet was not received a SIFS before the current transmission.	Y	Y
SPREADING_FACTOR	Indicates the spreading factor used in the CMMG control mode: — 0 indicates that the spread factor is 13. — 1 indicates that the spread factor is 7. — 2 indicates that the spread factor is 4. — 3 indicates no spreading.		
Turnaround	Set to 1 or 0 as specified in 10.3.2.3.3.	Y	Y

NOTE—In the TXVECTOR and RXVECTOR columns, the following apply:
Y = Present
N = Not present
O = Optional

25.3 Common parameters

25.3.1 Introduction

This subclause introduces some common parameters.

25.3.2 Common requirements

25.3.2.1 Introduction

This subclause describes the common requirements from all 3 modes: control, SC, and OFDM.

25.3.2.2 Transmit RF delay

The transmit RF delay is defined in 17.3.8.6, and its value is implementation dependent.

25.3.2.3 Center frequency tolerance

25.3.2.3.1 General

The transmitter center frequency tolerance shall be ± 20 ppm.

25.3.2.3.2 Center frequency convergence

The transmitter center frequency shall converge to within 1 ppm of its final value within 2.5 μs from the start of the PPDU.

25.3.2.3.3 Symbol clock tolerance

The symbol clock frequency tolerance shall be ± 20 ppm.

The transmit center frequency and the symbol clock frequency shall be derived from the same reference oscillator.

25.3.2.3.4 Transmit rampup and rampdown

The transmit power-on ramp is defined as the time it takes for a transmitter to rise from less than 10% to greater than 90% of the average power to be transmitted in the frame.

The transmit power-on ramp shall be less than 30 ns.

The transmit power-down ramp is defined as the time it takes the transmitter to fall from greater than 90% to less than 10% of the maximum power to be transmitted in the frame.

The transmit power-down ramp shall be less than 30 ns.

25.3.2.3.5 Maximum input requirement

The receiver maximum input level is the maximum power level at the receive antenna(s) of the incoming signal, in dBm, present at the input of the receiver antenna for which the error rate criterion (defined in 25.3.2.3.6) is met. A compliant receiver shall have a receiver maximum input level at the receive antenna(s) of at least 10 $\mu W/cm^2$ for each of the modulation formats that the receiver supports.

25.3.2.3.6 Receive sensitivity

The PER shall be less than 10% for a PSDU length of 4096 octets with the rate-dependent input levels listed in Table 25-2.

Table 25-2—Receiver sensitivity in dBm

MCS Index	540 MHz	1080 MHz
0	–81	–78 (see NOTE)
1	–74	–71
2	–69	–66
3	–67	–64
4	–61	–58
5	–59	–56
6	–55	–52
7	–53	–50
8	–51	–48

11	–66	–63
12	–64	–61
13	–60	–57
14	–57	–54
15	–55	–52
16	–53	–50
NOTE—The sensitivity is for the largest spreading factor for MCS 0.		

25.3.3 Timing-related parameters

Table 25-3 defines the timing-related parameters for CMMG format.

Table 25-3—Timing-related parameters

Parameter	CBW540	CBW1080	Description
N_{SD}	168	336	Number of complex data numbers per OFDM symbol
N_{SP}	8	16	Number of pilot subcarriers per OFDM symbol
N_{DC}	3	3	Number of DC subcarriers per OFDM symbol
N_{ST}	179	355	Total number of subcarriers per OFDM symbol
N_{SR}	89	177	Highest data subcarrier index per OFDM symbol
F_S	660 MHz	1320 MHz	OFDM sample rate
T_S	$1/F_S$ (~1.515 ns)	$1/F_S$ (~0.758 ns)	OFDM sample time
F_C	440 MHz = 2/3 F_S	880 MHz = 2/3 F_S	SC chip rate
T_C	$1/F_C$ (~2.273 ns)	$1/F_C$ (~1.136 ns)	SC chip time
N_{DFT}	256	512	DFT length
Δ_F	F_S / N_{DFT} = 2.578125 MHz		Subcarrier frequency spacing
T_{DFT}	$N_{DFT} \times T_S$ (~387.879 ns)		IDFT/DFT period
T_{GI}	$T_{DFT}/4$ (~96.97 ns)		Guard interval duration
T_{GIS}	$T_{DFT}/8$ (~48.485 ns)		Short guard interval duration
T_{SYML}	$T_{DFT} + T_{GI} = 1.25T_{DFT}$ (~484.8 ns)		Long GI symbol interval

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 25-3—Timing-related parameters *(continued)*

Parameter	CBW540	CBW1080	Description
T_{SYMS}	$T_{DFT} + T_{GIS} = 1.125T_{DFT}$ (~436.4 ns)		Short GI symbol interval
T_{SYM}	T_{SYML} or T_{SYMS} depending on the GI used		Symbol interval
T_{seq}	256 T_C (~581.8 ns)		ZCZ block duration (see NOTE)
T_{CSTF}	50 × 32 × T_C (~3636.8 ns)		Short training field duration for CMMG control mode (see NOTE)
T_{STF}	17 × 32 × T_C (~1236.5 ns)		Short training field duration for CMMG SC/OFDM mode (see NOTE)
T_{CEF}	4 T_{seq} (~2327.3 ns)		Channel estimation field duration for CMMG control/SC/ OFDM mode (see NOTE)
T_{SIG}	1024 × 13 × T_C (~30258.2 ns)		SIG field duration for CMMG control mode (see NOTE)
	4 × (254 + 64) × T_C (~2909.4 ns)		SIG field duration for CMMG SC mode (see NOTE)
	4 T_{SYML} (~1939.2 ns)		SIG field duration for CMMG OFDM mode (see NOTE)
T_{OSTF}	T_{SYML} (~484.8 ns)		Duration of each OSTF
T_{OCEF}	T_{SYML} (~484.8 ns)		Duration of each OCEF

NOTE—Since the construction of the STF, CEF, and SIG field for transmissions over 1080 MHz are based on duplication transmission of the STF, CEF, and SIG field for transmissions over 540 MHz (see 25.3.10), the durations of the STF, CEF, and SIG field for CBW1080 are equivalent to those for CBW540. The durations of the STF and CEF for CMMG control mode, CMMG SC mode, and the durations of the SIG field for CMMG control mode and CMMG SC mode are calculated based on the SC chip time for 540 MHz transmission. The durations of the CMMG OFDM mode SIG field, the CMMG OFDM mode STF (OSTF), and the CMMG OFDM mode CEF (OCEF) are calculated based on the OFDM symbol time for 540 MHz transmission.

Table 25-4 defines parameters used frequently in Clause 25.

Table 25-4—Frequently used parameters

Symbol	Explanation
N_{BL}	Number of the data blocks for SC transmission.
N_{CBPB}	Number of coded bits per block.
N_{CBPS}	For OFDM transmission: Number of coded bits per OFDM symbol. For SC transmission: Number of coded bits per constellation symbol.
N_{CBPSS}	Number of coded bits per symbol per spatial stream.
N_{DBPS}	Number of data bits per symbol.
N_{DSPB}	Number of data constellation symbols per block for SC transmission.
N_{UWPB}	Length of the UW in each block for SC transmission.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 25-4—Frequently used parameters *(continued)*

Symbol	Explanation
$N_{BLS} = N_{DSPB} + N_{UWPB}$	Number of the symbols in each block for SC transmission.
N_{BPSCS}	Number of coded bits per subcarrier per spatial stream.
N_{RX}	Number of receive chains.
N_{STS}	For pre-CMMG modulated fields, $N_{STS} = 1$(see NOTE). For CMMG modulated fields, N_{STS} is the number of space-time streams.
N_{OCEF}	Number of OCEF symbols 25.6.7.
N_{SS}	Number of spatial streams.
N_{TX}	Number of transmit chains.
R	R is the coding rate.
NOTE—Pre-CMMG modulated fields refer to the STF, CEF, and CMMG SIG field, while CMMG modulated fields refer to the OCEF and Data field (see Figure 25-1, Figure 25-2, and Figure 25-3).	

25.3.4 Mathematical conventions in the signal description

25.3.4.1 Notation

$[\mathbf{Q}]_{m,n}$ indicates the element in row m and column n of matrix $\mathbf{Q}$.

25.3.4.2 Subcarrier indices in use

For a 540 MHz CMMG OFDM mode PPDU transmission, the 540 MHz is divided into 256 subcarriers. The signal is transmitted on subcarrier –89 to –2 and 2 to 89, with –1, 0, and 1 being the center (DC) subcarriers.

For a 1080 MHz CMMG OFDM mode PPDU transmission, the 1080 MHz is divided into 512 subcarriers. The signal is transmitted on subcarrier –177 to –2 and 2 to 177, with –1, 0, and 1 being the center (DC) subcarriers.

25.3.4.3 Transmitted signal

The transmitted signal is described in complex baseband signal notation. The actual transmitted signal is defined by the complex baseband signal in Equation (25-1).

$$r_{RF}^{i_{TX}} = \mathrm{Re}\left\{ r_{PPDU}^{i_{TX}}(t) \exp(j2\pi f_c t) \right\} \tag{25-1}$$

where

r_{PPDU} represents the complex baseband signal in transmit chain i_{TX}
f_c represents the center frequency of the portion of the transmitted PPDU

The transmitted RF signal is derived by upconverting the complex baseband signal, which consists of several fields. The fields and timing boundaries for various fields are shown in Figure 25-1 to Figure 25-3.

The time offset, t_{Field}, determines the starting time of the corresponding field.

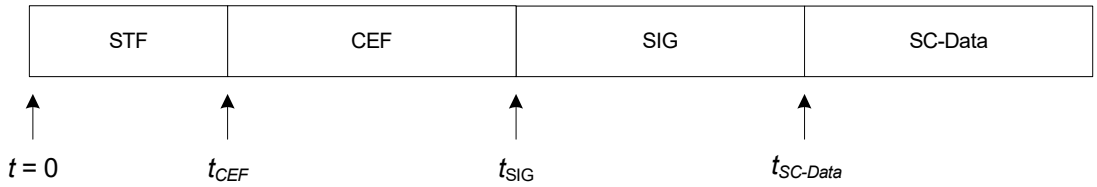

Figure 25-1—PPDU structure for the CMMG SC mode PPDU with CBW540

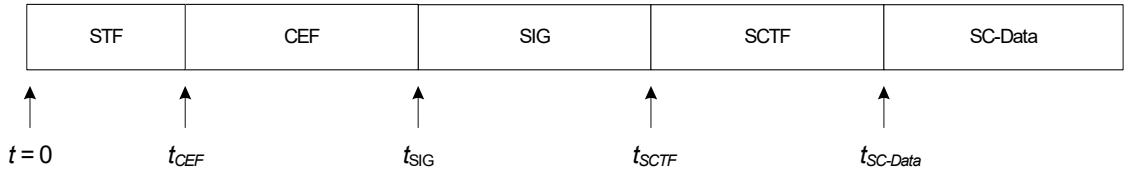

Figure 25-2—PPDU structure for the CMMG SC mode PPDU with CBW1080

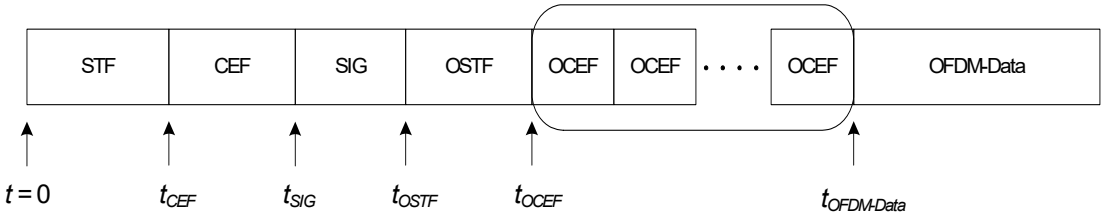

Figure 25-3—PPDU structure for the CMMG OFDM mode PPDU

For the CMMG SC mode transmission with 540 MHz,

$$r^{i_{TX}}_{PPDU}(t) = r^{i_{TX}}_{STF}(t) + r^{i_{TX}}_{CEF}(t - t_{CEF}) + r^{i_{TX}}_{SIG}(t - t_{SIG}) + r^{i_{TX}}_{SC-Data}(t - t_{SC-Data}) \quad (25\text{-}2)$$

For the CMMG SC mode transmission with 1080 MHz,

$$r^{i_{TX}}_{PPDU}(t) = r^{i_{TX}}_{STF}(t) + r^{i_{TX}}_{CEF}(t - t_{CEF}) + r^{i_{TX}}_{SIG}(t - t_{SIG}) + r^{i_{TX}}_{SCTF}(t - t_{SCTF}) + r^{i_{TX}}_{SC-Data}(t - t_{SC-Data}) \quad (25\text{-}3)$$

For the CMMG OFDM mode transmission,

$$r^{i_{TX}}_{PPDU}(t) = r^{i_{TX}}_{STF}(t) + r^{i_{TX}}_{CEF}(t - t_{CEF}) + r^{i_{TX}}_{SIG}(t - t_{SIG}) + r^{i_{TX}}_{MCTF}(t - t_{MCTF}) + r^{i_{TX}}_{OFDM-Data}(t - t_{OFDM-Data}) \quad (25\text{-}4)$$

where

$t_{CEF} = T_{STF}$

$t_{SIG} = t_{CEF} + T_{CEF}$

$t_{SCEF} = t_{SIG} + T_{SIG}$

$T_{OSTF} = t_{SIG} + T_{SIG}$

$t_{OCEF} = t_{OSTF} + T_{OSTF}$

$t_{SC-Data} = t_{SCTF} + T_{SCTF}$

$$t_{OFDM-Data} = t_{OCTF} + N_{OCEF} T_{OCEF}$$

Each CMMG OFDM mode baseband waveform $r_{subfield}(nT_s)$, for the fields above, is defined via the inverse discrete Fourier transform (IDFT) as,

$$r^{i_{TX}}_{subfield}(t) = \frac{1}{\sqrt{N_{Tone} N_{STS}}} w_{Tsubfield}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=0}^{N_{STS}-1} [Q_k]_{i_{TX}, m} \gamma_{k, CBW} X_{k, m} \exp((j2\pi k \Delta_F (t - T_{GI} - T_{CS}(m)))) \quad (25\text{-}5)$$

In Equation (25-5) the following notions are used:

n_{Tone}	is, for 540 MHz transmission, 176 and, for 1080 MHz transmission, 352
N_{STS}	is the number of the space-time streams
T_{GI}	is the guard interval duration used for each OFDM symbol
Q_k	is the spatial mapping matrix with N_{TX} rows and N_{STS} for the subcarrier k
$w_{Tsubfield}$	is a windowing function. An example function, $w_{Tsubfield}$, is given in 25.3.4.5
$\gamma_{k, CBW}$	is defined in 25.3.4.4
Δ_F	is the subcarrier frequency spacing given in Table 25-3
$T_{CS}(m)$	represents the cyclic shift per space-time stream, whose value is defined in Table 25-27
$X_{k,m}$	is the frequency-domain symbol in subcarrier k of space-time stream m. Some of the $X_{k,m}$ within $-N_{SR} \le k \le N_{SR}$ have a value of 0, such as the DC tones

The base band waveform for fields defined by time domain sequence or for single carrier transmission is

$$r_{Field}(nT_C) = x(n) \quad (25\text{-}6)$$

where $x(n)$ is the constellation point n.

Conversion from the sampled digital domain to the continuous time domain is beyond the scope of this document. Filtering for pulse shaping such as in GMSK is beyond the scope of this standard.

25.3.4.4 Definition of tone rotation for CMMG OFDM mode transmission

The function $\gamma_{k, CBW}$ is used to represent a rotation of the tones. $\gamma_{k, CBW}$ is determined by the TXVECTOR parameter CH_BANDWIDTH as defined in Table 25-5.

Table 25-5—CH_BANDWIDTH and $\gamma_{k,CBW}$

CH_BANDWIDTH	$\gamma_{k, CBW}$
CBW540	$\gamma_{k, 540}$
CBW1080	$\gamma_{k, 1080}$

For a 540 MHz CMMG OFDM mode PPDU transmission,

$$\gamma_{k, 540} = 1 \quad (25\text{-}7)$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For a 1080 MHz CMMG OFDM mode PPDU transmission,

$$\Upsilon_{k,\,1080} = \begin{cases} 1, k < 0 \\ j, k \geq 0 \end{cases} \tag{25-8}$$

25.3.4.5 The windowing function

The windowing function $w_{TField}(nT_S)$ is used to smooth the transition between adjacent fields in the PPDU where CMMG OFDM mode modulation is employed. No windowing is applied to preamble fields or to SC modulated fields. The windowing function is different from being equivalent to "1" only in the transition region.

An example of a windowing function is given by

$$w_T(t) = \begin{cases} \sin^2\left(\frac{\pi}{2}\left(\frac{1}{2} + \frac{t}{T_R}\right)\right), \frac{-T_R}{2} < t \leq \frac{T_R}{2} \\ 1, \frac{T_R}{2} < t \leq T - \frac{T_R}{2} \\ \sin^2\left(\frac{\pi}{2}\left(\frac{1}{2} - \frac{t}{T_R}\right)\right), T - \frac{T_R}{2} < t \leq T + \frac{T_R}{2} \end{cases} \tag{25-9}$$

The transition region creates an overlap (with length T_R) between adjacent fields. The field wave form is extended cyclically to fill the part of the transition region in which it is undefined. If the transition region vanishes (i.e., T_R=0), the windowing function degenerates to a rectangular window. The choice of windowing function is implementation dependent, as long as transmit EVM and transmit mask requirements are met.

25.3.5 CMMG PHY preamble

25.3.5.1 General

The CMMG PHY preamble is the part of the PHY PPDU that is used for PPDU detection, AGC, frequency offset estimation, synchronization, indication of transmission mode (CMMG Control mode, CMMG SC mode, or CMMG OFDM mode), indication of transmission bandwidth (540 MHz or 1080 MHz), and channel estimation. The format of the preamble is common to both SC PPDUs and OFDM PPDUs and consists of a Short Training field followed by a Channel Estimation field. The content of the Short Training field is the same between SC and OFDM PPDUs (see 25.3.5.2), but the content of the Channel Estimation field is not the same between such PPDUs (see 25.3.5.3).

NOTE 1—For SC and OFDM MIMO transmission, different transmit antenna transmit a different preamble that is composed of one of the four ZCZ sequences with the order of $Z^1_{256}, Z^2_{256}, Z^3_{256}, Z^4_{256}$, such as for the case of one transmit antenna, the preamble sequence is composed of Z^1_{256}, for the case of two transmit antennas, the preamble sequences are composed of Z^1_{256}, Z^2_{256}, respectively.

NOTE 2—For CMMG Control mode and CMMG SC mode preambles, all fields are transmitted with CMMG SC mode transmission. For CMMG OFDM mode preamble, the STFs, the CEFs, and the SIG fields are transmitted with CMMG SC mode transmission. For 1080 MHz SC transmission, the STFs, the CEFs, and the SIG fields are transmitted in duplicate format as defined in 25.3.10.

25.3.5.2 CMMG Short Training field

25.3.5.2.1 STF of CMMG control mode

The Short Training field is composed of 50 repetitions of the sequence $Z(n)$ of length 32. The sequences $Z(n)$ is defined in 25.8.

The waveform for the STF is

$$r_{STF}(nT_C) = Z(n \bmod 32)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 50\times 32 - 1 \quad (25\text{-}10)$$

where T_C is SC chip time of CBW540.

25.3.5.2.2 STF of CMMG SC and OFDM modes

The Short Training fields of CMMG SC and OFDM modes share the same definition. The common Short Training field is composed of 17 repetitions of the sequence $Z(n)$ of length 32. The sequences $Z(n)$ is defined in 25.8.

The waveform for the Short Training field is

$$r_{STF}(nT_C) = Z(n \bmod 32)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 17\times 32 - 1 \quad (25\text{-}11)$$

where T_C is SC chip time of CBW540.

25.3.5.3 CMMG Channel Estimation field

25.3.5.3.1 CEF of CMMG control mode

The CEF of CMMG control mode is composed of four concatenated $Z(n)$ sequences where each sequence is multiplied by an individual sign assignment. As shown in Figure 25-4, the CEF of CMMG control mode is defined as $-Z(n)$, $Z(n)$, $-Z(n)$, $-Z(n)$, where the sequence is defined in 25.8.

The waveform for the CEF is

$$r_{CEF}(nT_C) = \begin{cases} -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 256 - 1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256, \ldots, 256\times 2 - 1 \\ -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 2, \ldots, 256\times 3 - 1 \\ -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 3, \ldots, 256\times 4 - 1 \end{cases} \quad (25\text{-}12)$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

where T_C is SC chip time of CBW540. The CMMG control mode preamble is defined in Figure 25-4.

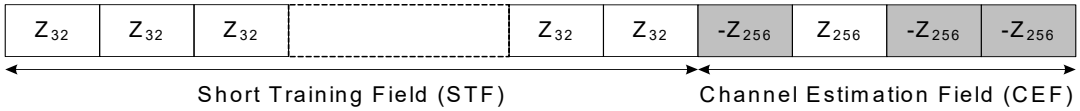

Figure 25-4—CMMG Control mode preamble

25.3.5.3.2 CEF of CMMG SC mode

The CEF of CMMG SC mode is also composed of four concatenated *Z(n)* sequences but is with different sign assignment patterns. As shown in Figure 25-5 and Figure 25-6, the CEF of SC 540 MHz PHY is defined as [–*Z*(*n*), *Z*(*n*), *Z*(*n*), –*Z*(*n*)], and the CEF of SC 1080 MHz PHY is defined as [–*Z*(*n*), –*Z*(*n*), *Z*(*n*), *Z*(*n*)], where the sequence *Z(n)* is defined in 25.8.

The waveform for the CEF of SC 540 MHz mode is

$$r_{CEF}(nT_C) = \begin{cases} -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 256-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256, \ldots, 256\times 2-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 2, \ldots, 256\times 3-1 \\ -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 3, \ldots, 256\times 4-1 \end{cases} \quad (25\text{-}13)$$

and the waveform for the CEF of SC 1080 MHz mode is

$$r_{CEF}(nT_C) = \begin{cases} -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 256-1 \\ -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256, \ldots, 256\times 2-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 2, \ldots, 256\times 3-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 3, \ldots, 256\times 4-1 \end{cases} \quad (25\text{-}14)$$

where T_C is SC chip time of CBW540.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The CMMG SC mode preambles are defined in Figure 25-5 and Figure 25-6.

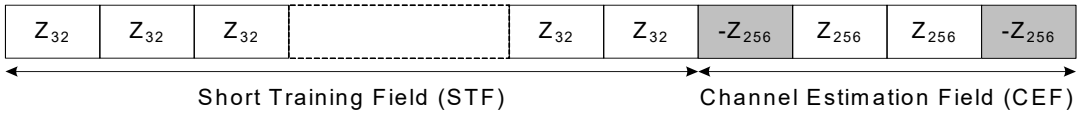

Figure 25-5—CMMG SC mode preamble for CBW540

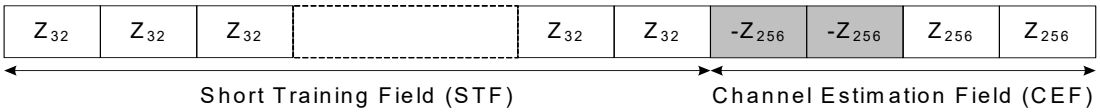

Figure 25-6—CMMG SC mode preamble for CBW1080

25.3.5.5.3.3 CEF of CMMG OFDM mode

The CEF of CMMG OFDM mode is also composed of four concatenated $Z(n)$ sequences but is with different sign assignment patterns. As shown in Figure 25-7 and Figure 25-8, the CEF of OFDM 540 MHz PHY is defined as [$-Z(n)$, $Z(n)$, $Z(n)$, $Z(n)$], and the CEF of OFDM 1080 MHz PHY is defined as [$-Z(n)$, $-Z(n)$, $-Z(n)$, $Z(n)$], where the sequence $Z(n)$ is defined in 25.8.

The waveform for the CEF of OFDM 540 MHz mode is

$$r_{CEF}(nT_C) = \begin{cases} -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 256-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256, \ldots, 256\times 2-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 2, \ldots, 256\times 3-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 3, \ldots, 256\times 4-1 \end{cases} \quad (25\text{-}15)$$

and the waveform for the CEF of OFDM 1080 MHz mode is

$$r_{CEF}(nT_C) = \begin{cases} -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 256-1 \\ -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256, \ldots, 256\times 2-1 \\ -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 2, \ldots, 256\times 3-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 3, \ldots, 256\times 4-1 \end{cases} \quad (25\text{-}16)$$

where T_C is SC chip time of CBW540.

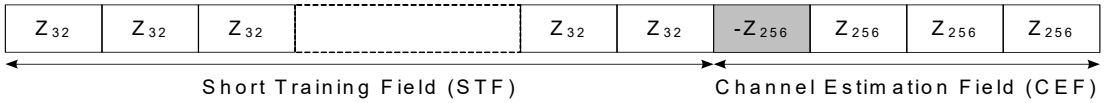

Figure 25-7—CMMG OFDM mode preamble for CBW540

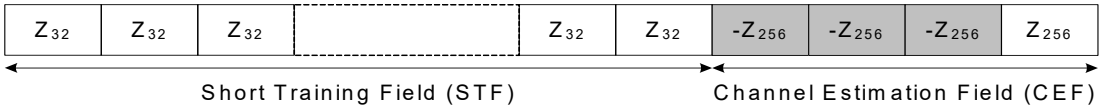

Figure 25-8—CMMG OFDM mode preamble for CBW1080

25.3.6 CRC calculation

The value of cyclic redundancy check (CRC) field is the 1s complement of Equation (25-17).

$$CRC(D) = (M(D) \oplus I(D))D^K \bmod G(D) \tag{25-17}$$

where

$m(D) = m_0 D^{N-1} + m_1 D^{N-2} + \ldots + m_{N-1}$

N is the number of bits over which the CRC is generated

m_i is bit i of the input bit sequence

$I(D) = \sum_{i=N-K}^{N-1} D^i$ are initialized values that are added modulo 2 to the first K bits of the input bit sequence

K is the length of CRC sequence: $K = 16$ for CRC of the CMMG SIG, and $K = 8$ for the Data field

$G(D) = D^{16} + D^{12} + D^5 + 1$ is the CRC generating polynomial of 8 bits

$crc(D) = x_0 D^{15} + x_1 D^{14} + \ldots + x_{14} D + x_{15}$

Figure 25-9 shows the operation of the CRC of 16 bits. First, the shift register is reset to all 1s. The bits are then passed through the XOR operation at the input. When the last bit has entered, the output is generated by shifting the bits out of the shift register, x_{15} first, through an inverter.

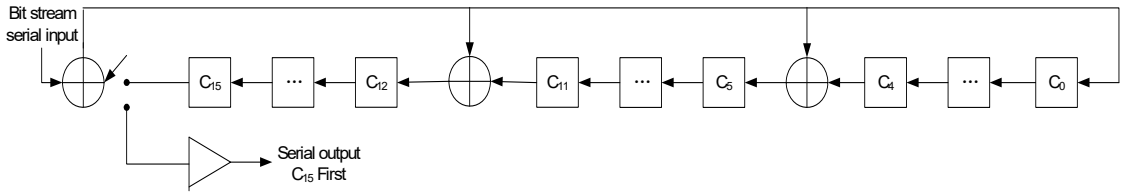

Figure 25-9—16-bit CRC calculation

$G(D) = D^8 + D^7 + D^4 + D^3 + D + 1$ is the CRC generating polynomial of 8 bits.

$crc(D) = x_0 D^7 + x_1 D^6 + \ldots + x_6 D + x_7$

Figure 25-10 shows the operation of the CRC of 8 bits.

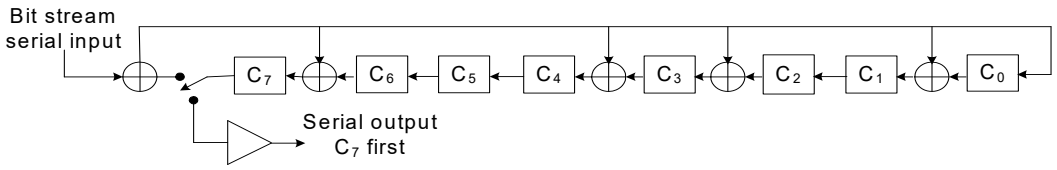

Figure 25-10—8-bit CRC calculation

25.3.7 Scrambler

The CMMG control mode SIG, CMMG SC/OFDM mode SIG, and the Data fields following the scrambler initialization field (including data padding bits) shall be scrambled by XORing each bit in turn with a length 127 periodic sequence generated by the polynomial $S(x) = x^7 + x^4 + 1$. The octets of the PSDU and the pad bits shall be placed into a bit stream with bit 0 (LSB) of each octet first and bit 7 of each octet (MSB) last. The generation of the sequence and the XOR operation are defined in Figure 25-11.

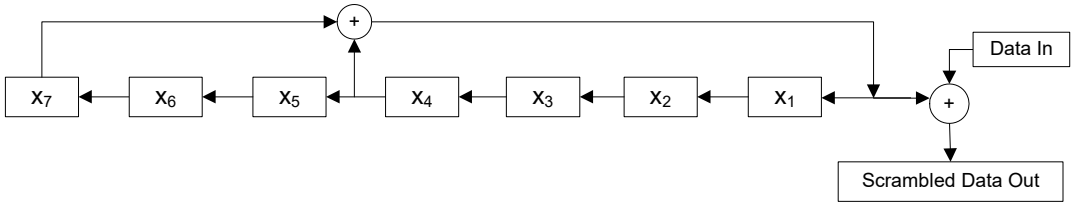

Figure 25-11—Scrambler

For each PPDU, the transmitter shall select a nonzero seed value for the scrambler (bits x_1 to x_7). The seed value should be selected in a pseudo random fashion. The seed value is sent in the Scrambler Initialization field of the PHY header. Each data bit in the Data field of the PPDU is then XORed with the scrambler output (x_4 XOR x_7), and the scrambler content shifts once.

25.3.8 Common LDPC parity matrices

25.3.8.1 Introduction

Transmission/reception of LDPC with codeword length of 672 bits (expansion factor $z = 42$) is mandatory, and transmission/reception of LDPC with codeword length 2016 bits (expansion factor $z = 126$) is optional.

25.3.8.2 General

The structured LDPC code is defined by a parity check matrix $\mathbf{H}$ of size $(m \times z) \times (n \times z)$, which is determined by a base matrix $\overline{\mathbf{H}}$ of size $m \times n$, an expansion factor z, and a base permutation matrix $\mathbf{P}$ of size $z \times z$. The number of information bits is $k = (n - m) \times z$, the number of codeword bits is nz, then the coding rate is $r = k/(nz)$. If each element $\overline{h}_{ij}$ in the base matrix $\overline{\mathbf{H}}$ is replaced by zero subblock matrix of size $z \times z$ or the subblock matrix $\mathbf{P}^{\overline{h}_{ij}}$, the parity check matrix $\mathbf{H}$ can be obtained.

The base matrix $\overline{\mathbf{H}}$ is defined as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$\overline{\mathbf{H}} = \begin{bmatrix} \overline{h}_{00} & \overline{h}_{01} & \dots & \overline{h}_{0(n-1)} \\ \overline{h}_{10} & \overline{h}_{11} & \dots & \overline{h}_{1(n-1)} \\ \dots & \dots & \dots & \dots \\ \overline{h}_{(m-1)0} & \overline{h}_{(m-1)1} & \dots & \overline{h}_{(m-1)(n-1)} \end{bmatrix} \quad (25\text{-}18)$$

The parity check matrix **H** is defined as follows:

$$\mathbf{H} = \begin{bmatrix} \mathbf{P}^{\overline{h}_{00}} & \mathbf{P}^{\overline{h}_{01}} & \dots & \mathbf{P}^{\overline{h}_{0(n-1)}} \\ \mathbf{P}^{\overline{h}_{10}} & \mathbf{P}^{\overline{h}_{11}} & \dots & \mathbf{P}^{\overline{h}_{1(n-1)}} \\ \dots & \dots & \dots & \dots \\ \mathbf{P}^{\overline{h}_{(m-1)0}} & \mathbf{P}^{\overline{h}_{(m-1)1}} & \dots & \mathbf{P}^{\overline{h}_{(m-1)(n-1)}} \end{bmatrix} \quad (25\text{-}19)$$

where, if $\overline{h}_{ij} = -1$, $\mathbf{P}^{\overline{h}_{ij}}$ equals a zero matrix of size $z \times z$; otherwise, $\mathbf{P}^{\overline{h}_{ij}}$ equals the base permutation matrix **P** to h_{ij} power. The base permutation matrix **P** of size $z \times z$ is defined as follows:

$$\mathbf{P} = \begin{bmatrix} 0 & 1 & 0 & \dots & 0 \\ 0 & 0 & 1 & \dots & 0 \\ \dots & \dots & \dots & \dots & \dots \\ 0 & 0 & 0 & \dots & 1 \\ 1 & 0 & 0 & \dots & 0 \end{bmatrix} \quad (25\text{-}20)$$

Table 25-6 defines the base matrix prototypes of the parity-check matrices for a codeword block length *nz* bits, with a subblock size *z* bits.

25.3.9 CMMG SIG

25.3.9.1 General

The CMMG SIG field carries information required to interpret PPDUs. The preamble and the CMMG SIG fields are all transmitted using modulation. The structure of the CMMG SIG field is shown in Figure 25-12.

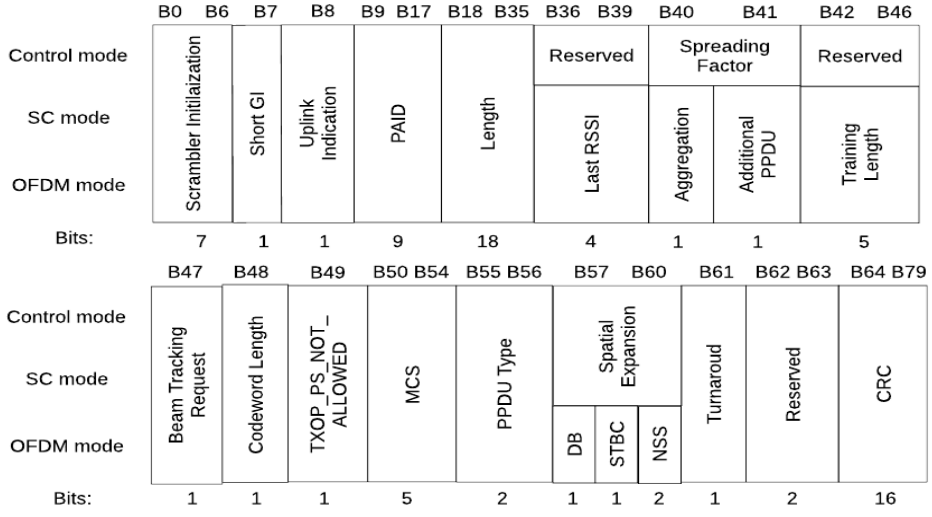

Figure 25-12—CMMG SIG structure

The CMMG SIG field contains the fields listed in Table 25-7. The mapping of the fields is also described in Table 25-7.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 25-7—Fields in the CMMG SIG field

Bit	Fields	Number of bits	Description
B0–B6	Scrambler Initialization	7	Bits X1-X7 of the initial scrambler state (see 25.3.7).
B7	Short GI	1	Set to 0 if short guard interval is not used in the Data field. Set to 1 if short guard interval is used in the Data field.
B8	Uplink Indication	1	Set to 1 if the PPDU is addressed to an AP. Set to 0 otherwise. (See TXVECTOR parameter UPLINK_INDICATION.)
B9–B17	PAID	9	If Uplink Indication is not present or set to 1, B9–B17 are the partial AID to provide an abbreviated indication of the intended recipient(s) of the PSDU (see 10.19). If Uplink Indication is equal to 0, B9–B11 are an identifier of the BSS and B12–B17 are the partial AID. (See TXVECTOR parameter COLOR and TXVECTOR parameter PARTIAL_AID.)
B18–B35	Length	18	Number of data octets in the PSDU, Range from 0 to 262 143
B36–B39	Last RSSI	4	For CMMG SC/OFDM mode: Contains a copy of the parameter LAST_RSSI from the TXVECTOR. When set to 0, this field is reserved and ignored by the receiver. The value is an unsigned integer: — Values of 2 to 14 represent power levels (–71+value×2) dBm. — A value of 15 represents a power greater than or equal to –42 dBm. — A value of 1 represents a power less than or equal to –68 dBm. Value of 0 indicates that the previous PPDU was not received a SIFS before the current transmission. For CMMG control mode: Reserved.
B40–B41	Spreading Factor/ Aggregation/Additional PPDU	2	For CMMG control mode: — Set to 0: spreading by 13 — Set to 1: spreading by 7 — Set to 2: spreading by 4 — Set to 3: no spreading For CMMG SC/OFDM mode: Aggregation: — Set to 1 indicate that the PSDU contains an A-MPDU; otherwise, set to 0. Additional PPDU: — Contains a copy of the parameter ADD_PPDU from the TXVECTOR. A value of 1 indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU. — A value of 0 indicates that no additional PPDU follows this PPDU.

Table 25-7—Fields in the CMMG SIG field *(continued)*

Bit	Fields	Number of bits	Description
B42–B46	Training Length	5	For CMMG SC/OFDM mode: Corresponds to the TXVECTOR parameter TRNLEN. If the Beam Tracking Request field is 0, the Training Length field indicates the length of the training field. The use of this field is defined in 25.7.2.3. A value of 0 indicates that no training field is present in this PPDU. If the Beam Tracking Request field is 1 and the PPDU Type field is 10, the Training Length field indicates the length of the training field. If the PPDU Type field is 11, the Training Length field indicates the length of the training field requested for receive training. For CMMG control mode: Reserved.
B47	Beam Tracking Request	1	Corresponds to the TXVECTOR parameter BEAM_TRACKING_REQUEST. Set to 1 to indicate the need for beam tracking (10.41.7); otherwise, set to 0. The Beam Tracking Request field is reserved when the Training Length field is 0.
B48	Codeword Length	1	Set to 0 indicate that the codeword length is 672. Set to 1 indicate that the codeword length is 2016.
B49	TXOP_PS_NOT_ALLOWED	1	Set to 0 by CMMG AP if it allows non-AP CMMG STAs in TXOP power save mode to enter doze state during a TXOP. Set to 1 otherwise. The bit is reserved and set to 1 in CMMG PPDUs transmitted by a non-AP CMMG STA.
B50–B54	MCS	5	MCS index (see 25.15).
B55–B56	PPDU Type	2	When the Training Length field is nonzero, corresponds to the TXVECTOR parameter PPDU_TYPE. — PPDU Type = 11 indicates either a PPDU whose Data field is followed by one or more TRN-R subfields, or a PPDU that is requesting TRN-R subfields to be appended to a future response PPDU. — PPDU Type = 10 indicates a PPDU whose Data field is followed by one or more TRN-T subfields. When the Training Length field is zero and PPDU Type = 01, indicates that PPDU is a sounding PPDU. This field is reserved when the Training Length field is zero and PPDU Type = 00.

Table 25-7—Fields in the CMMG SIG field *(continued)*

Bit	Fields	Number of bits	Description
B57–B60	Spatial Expansion	4	For CMMG control/SC mode: Index into the corresponding spatial expansion method defined in Table 25-15.
	DB	1	For CMMG OFDM mode: If the PPDU is transmitted on 1080 MHz channel: Set DB to 1 for allowing dynamic bandwidth. Set to 0 for not allowing dynamic bandwidth. Otherwise set to 0 (Reserved). For CMMG control and SC modes: Reserved.
	STBC	1	For CMMG OFDM mode: Set to 1 if space-time block coding is used; otherwise, set to 0.
	NSS	2	For OFDM mode: Set to 0 for 1 spatial stream. Set to 1 for 2 spatial streams. Set to 2 for 3 spatial streams. Set to 3 for 4 spatial streams.
B61	Turnaround	1	As defined in Table 25-1.
B62–B63	Reserved	2	Reserved.
B64–B79	CRC	16	CMMG SIG check sequence. Definition of this field calculation is in 25.3.6.
NOTE—A value of 0 in the CMMG Length field indicates a PPDU that does not include a Data field, i.e., NDP. NDP transmissions are used for sounding purposes only (see 10.35.2). The NDP ends after the last CMMG OCEF or the CMMG SIG.			

Reserved bits are set to 0 by the transmitter and shall be ignored by the receiver.

All numeric fields are transmitted in unsigned format, LSB first.

25.3.9.2 Encoding of SIG

The scrambled SIG sequence consists of 80 bits, shown as $x = (x_0, x_1, x_2, \ldots, x_{79})$ and encoded with LDPC of rate-1/2 and length 672, as follows:

a) The scrambled SIG sequence is padded with 4 0s bits to create 84 bits. The 84-bit sequence include two contiguous subsequences with length of 42 bits, shown as $[[0, 0, 0, x_0, \ldots, x_{37}], [x_{38}, \ldots, x_{79}]]$, and the two subsequences are repeated once, respectively, to obtain 168 bits, such as $\mathbf{a}' = [[0]_{1\times 4}, x_0, \ldots, x_{37}, [0]_{1\times 4}, x_0, \ldots, x_{37}, x_{38}, \ldots, x_{79}, x_{38}, \ldots, x_{79}]$. Then, the repeated data sequence is padded with 168 zero bits to create 336 bits.

b) Then, using rate-1/2 LDPC base matrix and setting $\overline{h}_{26} = -1$, the 336-bit sequence is added with parity bits $[p_0, \ldots, p_{335}]$ to create LDPC codeword, shown as $\mathbf{c} = [[0]_{1\times 168}, \mathbf{a}', [p_0, \ldots, p_{335}]]$, such that $\mathbf{H} \times \mathbf{c}^{\mathrm{T}} = \mathbf{0}$, where $\mathbf{H}$ is revised LDPC parity check matrix.

The basic code is $\mathbf{c}' = [x_0, x_1, \ldots, x_{79}, p_0, p_1, \ldots, p_{335}]$. Using rate-matching to obtain transmitting sequence of 1024 bits: $S = [\mathbf{c}', \mathbf{c}', \mathbf{c}'(0, \ldots, 191)]$.

25.3.10 CMMG duplication transmission on a 1080 MHz channel

The STFs, the CEFs, and the SIG fields that are transmitted using SC modulation are specified at the SC chip rate F_C equal to 440 MHz. For transmission on the 1080 MHz channel, the signal is resampled with a 2 rate change, applied appreciate phase rotation for each 540 MHz subband, and then summed to form the transmitted signal.

Let $r(nT_C) = r_{STF}(nT_C) + r_{CEF}(nT_C - t_{CEF}) + r_{SIG}(nT_C - t_{SIG})$, where T_C is the SC chip duration for 540 MHz channel bandwidth and r_{CEF} is described in 25.3.5.

Then

$$r^{(1)}\left(n\frac{T_C}{2}\right) = \begin{cases} r\left(n\frac{T_C}{2}\right), n = 0, 2, 4, \ldots \\ 0, otherwise \end{cases} \quad (25\text{-}21)$$

$$r^{(2)}\left(n\frac{T_C}{2}\right) = \sum_{k=0}^{K-1} r^{(1)}\left((n-k)\frac{T_C}{2}\right) h_{Filt}(k), n = 0, 1, 2, \ldots \quad (25\text{-}22)$$

$$\bar{r}\left(n\frac{T_C}{2}\right) = r^{(2)}\left(\left(n + \frac{K-1}{2}\right)\frac{T_C}{2}\right), n = 0, 1, 2, \ldots \quad (25\text{-}23)$$

where K is the length of the filter defined in at chip rate 880 MHz whose definition is out of scope of this standard. The transmitted signal is given as

(25-24)

where B = 540 MHz.

25.3.11 h_{Filt} definition

The filter h_{Filt} is defined by the following coefficients (from h_0 to h_{70}):

[1,–6,–5,3,8,0,–8,–4,6,8,–4,–13, –2,16,14,–9,–23,–4,23,15, –20,–27,20,57,4,–99, –102,70,247,144,–264, –558,–175,991,2327,2917,2327,991,–175,–558,–264,144,247,70,–102, –99,4,57,20,–27,–20, 15,23,–4, –23,–9,14,16,–2,–13,–4,8,6,–4,–8,0,8,3,–5,–6,1].

Normalized to have a norm of $\sqrt{3}$ so that $h_{Filt}(k) = \frac{\sqrt{3}h_k}{\sqrt{\sum_{l=0}^{70}|h_l|^2}}$.

25.3.12 Encoding of Data field

The scrambled Data field is encoded with LDPC codeword length of n bits, information length of k bits, and expansion factor of z as follows:

a) $L_{DPCW} = k - 8$ is the maximal number of data bits in each LDPC codeword. The number of LDPC codeword is calculated as

$$N_{CW} = \lceil Length \times 8 / L_{DPCW} \rceil .$$

b) The number of data bits in the i^{th} LDPC codeword is

$$L_i = \begin{cases} L_{DPCW1}, i = 0, 1, \ldots, N_{CW1} - 1 \\ L_{DPCW1} - 1, i = N_{CW1}, N_{CW1} + 1, \ldots, N_{CW} - 1 \end{cases}$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

where

$L_{DPCW1} = \lceil Length \times 8 / N_{CW} \rceil$

$N_{CW1} = \mathrm{mod}((Length \times 8), (L_{DPCW1} - 1))$

c) The Data field is broken into N_{CW} blocks of data word $\mathbf{b}_i$, i = 0, 1, …, N_{CW}–1. Each data word is added with 8-bit CRC sequence, see 25.3.6, then padded with $f_i = k - L_i - 8$ zero bits to create k bits, such as $\mathbf{b'}_i = (0, \ldots, 0, \mathbf{b}_i, crc_0^i, \ldots, crc_7^i)$.

d) For each data word, n–k parity bits are added to create the LDPC codeword $\mathbf{d}_i = (\mathbf{b'}_i, p_0^i, p_1^i, \ldots, p_{(n-k-1)}^i)$, such that $\mathbf{H} \times \mathbf{d}_i^T = \mathbf{0}$.

e) Data field encoding: The j^{th} bit set that is composed of all the j^{th} bits of N_{CW} LDPC codeword is encoded with 1-bit parity check to create a parity bit T_j, j = 0, 1, …, n–1. All the parity bits T_j (j = 0, 1, …, n–1) are combined into a parity data word $\mathbf{d}_{N_{CW}}$ with length of n bits. That is, $\mathbf{d}_{N_{CW}} = \mathbf{d}_0 \oplus \mathbf{d}_1 \ldots \oplus \mathbf{d}_{(N_{CW}-1)}$.

f) Bits selection parameter: the punctured-bit index set of i^{th} codeword that are not belong to padding bits are $\mathbf{S}_i$ (i = 0, 1, …, N_{CW}–1), and the punctured-bit index set of parity data word $\mathbf{d}_{N_{CW}}$ is $\bar{\mathbf{S}}_{N_{CW}}$. The intersection of any two different sets of $\bar{\mathbf{S}}_i$ (i = 0, 1, …, N_{CW}) is empty set. The length of $\bar{\mathbf{S}}_i$ is e_i (i = 0,…, N_{CW}), such as: (where $n' = n - f_0$).

1) if N_{CW} = 1: $e_0 = 0$, $e_1 = n'$;

2) if $1 < N_{CW} \le 15$: $e_i = z$, i = 0, 1, …N_{CW}–1, $e_{N_{CW}} = n' - \sum_{i=0}^{N_{CW}-1} e_i$;

3) if $N_{CW} > 15$:

$$e_i = \begin{cases} a+1, i = 0, 1, \ldots, g-1 \\ a, i = g, g+1, \ldots, N_{CW} \end{cases},$$

where $a = \lfloor n'/(N_{CW}+1) \rfloor$, $g = n' - a \times (N_{CW}+1)$.

g) Bits selection: the first element of $\bar{\mathbf{S}}_i$ is equal to the last element of $\bar{\mathbf{S}}_{(i-1)}$ plus 1, such as,

$$\bar{\mathbf{S}}_i = \left[f_0 + \sum_{j=0}^{i-1} e_j, f_0 + \sum_{j=0}^{i-1} e_j + 1, \ldots, f_0 + \sum_{j=0}^{i} e_j - 1 \right],$$

where f_0 is the length of padding bits for the 0$^{\text{th}}$ codeword. Remove the zero padding bits and the punctured bits from $\mathbf{d}_i$ to obtain codeword $\mathbf{c}_i$, where i = 0, 1, …, N_{CW}–1. The punctured-bit index set of parity data word $\mathbf{d}_{N_c}$ is

$$\bar{\mathbf{S}}_{N_{CW}} = \left[f_0 + \sum_{j=0}^{N_{CW}-1} e_j, f_0 + \sum_{j=0}^{N_{CW}-1} e_j + 1, \ldots, f_0 + \sum_{j=0}^{N_{CW}} e_j - 1 \right].$$

Remove the padding-bit-generated bits and the punctured bits from $\mathbf{d}_{N_{CW}}$ to obtain $\mathbf{c}_{N_{CW}}$, where the padding-bit-generated bits are totally generated from the zero padding bits.

Example of Data field encoding:

The Data field contains *Length* = 512 octets. The parameter of LDPC: n = 672, k = 336, R = 1/2, z = 42.

a) $L_{DPCW} = k - 8 = 328$, the number of LDPC codeword: $N_{CW} = \lceil Length \times 8 / L_{DPCW} \rceil = 13$;

b) $L_{DPCW1} = \lceil Length \times 8 / N_{CW} \rceil = 316$, $N_{CW1} = \mathrm{mod}((Length \times 8), (L_{DPCW1} - 1)) = 1$,

$$L_i = \begin{cases} 316, i = 0 \\ 315, i = 1, 2, \ldots, 12 \end{cases};$$

that is, the number of data bits in the *0*th LDPC codeword is 316, and the 1st–12th LDPC codeword is 315.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

c) The Data field is broken into N_{CW} = 13 blocks of data word. Each data word is added with 8 bits *CRC* sequence, see 25.3.6. Then padded with zero bits: the *0*th data word is padded with 12 bits and the 1st-12th data word are padded with 13 bits.

d) All the data words are encoded to obtain LDPC codeword $\mathbf{d}_i = (\mathbf{b}'_i, p_0^i, p_1^i, ..., p_{(n-k-1)}^i)$, i = 0, 1, …,12.

e) Data field encoding: Encoded with 1-bit parity check to create $\mathbf{d}_{13}$, length of 672 bits.

f) Bits selection parameter: because of $(N_{CW} = 13) \le 15$, e_i = 42, i = 0, 1, …, 12, and $n' = n - f_0 = 672 - 12 = 660$, $e_{13} = 660 - \sum_{i=0}^{12} e_i = 114$.

Bits selection: Remove the zero padding bits [0, 1, …, 11] and the punctured bits $\bar{\mathbf{S}}_0 = [12, 13, ..., 53]$ from $\mathbf{d}_0$ to obtain codeword $\mathbf{c}_0$ with length of 618 bits; Remove the zero padding bits [0, 1, …, 12] and the punctured bits $\bar{\mathbf{S}}_1 = [54, 55, ..., 95]$ from $\mathbf{d}_1$ to obtain codeword $\mathbf{c}_1$ with length of 617 bits; the same operating to obtain $\mathbf{c}_2$, …, $\mathbf{c}_{12}$. Remove the padding-bit-generated bits [0, 1, …, 11] and the punctured bits $\bar{\mathbf{S}}_{13} = [558, 559, ..., 671]$ from $\mathbf{d}_{13}$ to obtain codeword $\mathbf{c}_{13}$ with length of 546 bits.

25.3.13 Received channel power indicator (RCPI) measurement

The RCPI is a measure of the received RF power in the selected channel for a received frame. This parameter shall be a measurement by the PHY of the received RF power in the channel measured over the STF or the CEF field of the received PPDU.

RCPI shall equal the received RF power in dBm with an accuracy of ± 5 dB (95% confidence interval) within the specified dynamic range of the receiver. The relative error between RF power measurements made within a one second interval should be less than ± 1 dB.

25.4 CMMG control mode

25.4.1 Introduction

Transmission and reception of the CMMG control mode PPDUs are mandatory. The CMMG control mode uses the same chip rate as the CMMG SC mode. The CMMG control mode is transmitted when the TXVECTOR indicates MCS 0. The modulation and coding scheme for the CMMG control mode is shown in Table 25-8.

Table 25-8—Modulation and coding scheme for the CMMG control mode

MCS index	Modulation	Code rate	Data rate
0	π/2-BPSK	1/2	25.38 Mb/s for SF 13, 47.14 Mb/s for SF 11, 82.5 Mb/s for SF 4, and 330 Mb/s for no spreading

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

25.4.2 PPDU format

The CMMG control mode PPDU is shown in Figure 25-13.

Figure 25-13—CMMG control mode PPDU format

25.4.3 CMMG preamble transmission

In CMMG control mode preamble is transmitted using SC transmission (see 25.3.5).

25.4.4 CMMG control mode SIG transmission

25.4.4.1 General

The CMMG control mode SIG and data are modulated by π/2-BPSK and are spread by Barker sequences.

25.4.4.2 Generation of CRC bits

The CRC sequence is calculated over bits 0–63 and uses CRC 16-CCITT as described in 25.3.6.

25.4.4.3 Scrambler

The operation of the scrambler is defined in 25.3.7. Bits $x_1, x_2, x_3, x_4, x_5, x_6, x_7$ of the scrambler shift register are initialized using the bits in the scrambler initialization bits from the SIG. The SIG is scrambled starting from bit 7.

25.4.4.4 Encoding

See 25.3.9.2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

25.4.4.5 Modulation

The CMMG control mode SIG is modulated with π/2-BPSK modulation, the input bit stream is mapped according to the following equation $\tilde{s}_k = 2 \cdot c_k - 1$. Each output symbol is then rotated according to the following equation: $s_k = \tilde{s}_k e^{(j\pi k)/2}$.

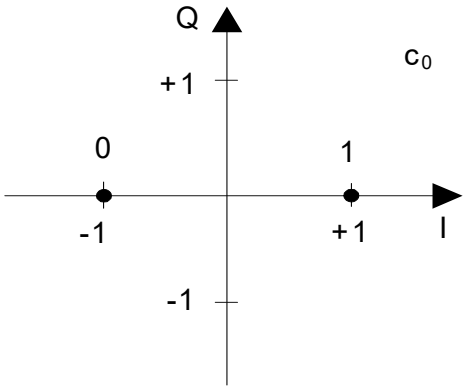

Figure 25-14—Constellation bit encoding for BPSK

25.4.4.6 Spreading

The constellation points are spread using the Barker sequence Barker(*L*) defined as follows in Table 25-9, where *L* is the spreading length.

Table 25-9—The Barker(*L*) sequences

Length *L*	Barker(*L*) sequences
4	+1,+1, –1,+1
7	+1, +1, +1, −1, −1,+1, −1
13	+1, +1, +1, +1, +1, −1, −1, +1, +1, −1, +1, −1, +1

The waveform for the modulated and spread Data field is

$$r_{DATA}(nT_C) = \left(\text{Barker}(n \bmod L) d\left(\left\lfloor \frac{n}{L} \right\rfloor\right)\right) \times \exp\left(j\pi\frac{n}{2}\right), n = 0, 1, 2, \ldots \quad (25\text{-}25)$$

where $d(k)$ is the modulated constellation point k and T_C is the SC chip time.

For CMMG control mode SIG, the spreading factor is always Barker(13).

25.4.5 CMMG control mode Data field

25.4.5.1 General

The Data field consists of the payload data of the PSDU. The PSDU is scrambled, encoded, modulated, and spread as described in the following subclauses.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

25.4.5.2 Scrambler

The operation of the scrambler is defined in 25.3.7. The scrambling of the Data field continues the scrambling of the CMMG control mode SIG with no reset.

25.4.5.3 Encoding

Use the LDPC of rate-1/2 and length 672. See 25.3.12.

25.4.5.4 Modulation

See 25.4.4.5.

25.4.5.5 Spreading

Spreading factor of CMMG control mode Data field is indicated in CMMG control mode SIG. See 25.4.4.6.

25.4.6 CMMG control mode performance requirements

25.4.6.1 Transmit requirements

25.4.6.1.1 Introduction

Transmitter performance requirements of the CMMG control mode are defined in 25.4.6.1.2.

25.4.6.1.2 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, etc. The instrumentation shall perform carrier lock, symbol timing recovery, and amplitude adjustment while making the measurements. The instrumentation shall incorporate a rake receiver or equalizer to reduce error resulting from multipath. If used, the equalizer shall be trained using information in the preamble (STF/CEF). For CMMG control mode EVM, the signal is first despread using the spreading Barker sequence, the EVM is then calculated on the resulting symbols according to Equation (25-26).

$$EVM = 20\log 10\left(\sqrt{\frac{1}{N_S P_{avg}}\sum_{i=1}^{N_S}[(I_i - I_i^*)^2 + (Q_i - Q_i^*)^2]}\right) \quad (25\text{-}26)$$

where N_S is the number of samples to be measured and N_S shall be 1000, P_{ave} is the average power of the constellation, (I_i, Q_i) is the complex coordinates of the measured symbol i, (I_i^*, Q_i^*) is the complex coordinates of the ideal constellation point for the measured symbol i.

The test equipment should use a root-raised cosine filter with roll-off factor of 0.25 for the pulse shaping filter when conducting EVM measurement.

The transmit pulse shaping used is left to the implementer.

The relative constellation error (EVM) shall not exceed an MCS dependent value according to Table 25-10.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 25-10—EVM requirement for CMMG control mode

MCS index	Description	EVM value (dB)
0	CMMG Control mode modulation	–6

25.4.6.2 Receive requirements

25.4.6.2.1 Introduction

Subclause 25.4.6.2.2 describes the performance requirement from the CMMG control mode receiver.

25.4.6.2.2 CCA

The start of a CMMG control mode transmission at a receive level greater than the minimum sensitivity for CMMG control mode (–78 dBm) shall cause CCA to indicate busy with a probability > 90% within 3 μs.

25.5 CMMG SC mode

25.5.1 Introduction

Transmission and reception of CMMG SC mode PPDUs in MCSs 1 to 3 is mandatory. Transmission and reception of CMMG SC mode PPDUs with MIMO may be supported.

25.5.2 Transmitter block diagram

Figure 25-15 shows the transmit process for the CMMG SC mode SIG transmission. The actual structure of the transmitter is implementation dependent.

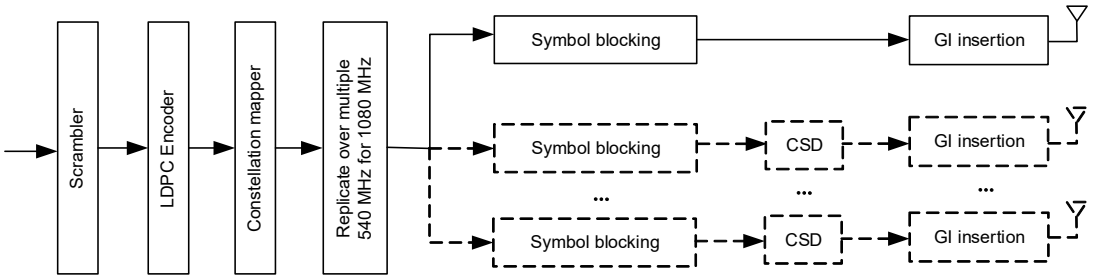

Figure 25-15—Transmitter block diagram for CMMG SC mode SIG field

Figure 25-16 shows the transmit block used to generate the Data fields of 540 MHz and 1080 MHz using CMMG SC mode transmission.

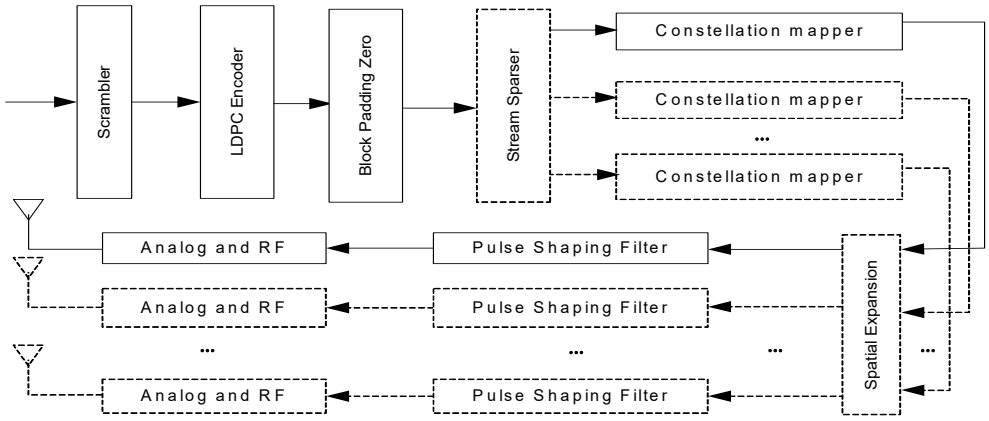

Figure 25-16—Transmitter block diagram for Data fields of a CMMG SC mode PPDU

NOTE—The operations denoted by the dotted line arrows and dotted line boxes in the above two figures are optional and are applied for SC MIMO transmission.

25.5.3 Overview of the PPDU encoding process

25.5.3.1 General

This subclause provides an overview of the CMMG SC mode PPDU encoding process.

25.5.3.2 Construction of CMMG SC mode SIG

The construction of the CMMG SC mode SIG field proceeds as follows:

a) Obtain the parameters from TXVECTOR. Add the reserved bits, append the calculated CRC. The calculation of the CRC of the CMMG SC mode SIG is described in 25.3.6.

b) Scrambler: Scramble the CMMG SC mode SIG bits. The scrambler is described in 25.3.7.

c) LDPC encoder: The scrambled bits are encoded using the LDPC code as described in 25.5.5.4.2.

d) Constellation mapper: BPSK modulate the coded bits as described in 25.5.5.4.3 to form the transmitted symbol blocks of CMMG SC mode SIG.

e) Duplication and phase rotation: Apply the appropriate phase rotations for each 540 MHz subchannel as 25.5.5.4.4.

f) Symbol blocking: Divide the encoded SIG field into symbol block of length 256.

g) CSD: Apply CSD for each transmit chain as described in 25.5.5.4.5. This only applies to the CMMG SC mode MIMO mechanism.

h) GI insertion: Prepend a GI for each symbol block of length 256.

i) Pulse filter, Analog, and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit.

NOTE—Conversion from the sampled digital domain to the continuous time domain is beyond the scope of this document. Filtering for pulse shaping such as in GMSK is beyond the scope of this standard.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

25.5.3.3 Construction of CMMG SC mode PPDUs

The construction of the Data field in a CMMG SC mode PPDU LDPC encoding proceeds as follows:

a) Scrambler: Scramble the PHY padded data.
b) LDPC encoder: The scrambled bits are encoded using the LDPC code as described in 25.3.12.
c) Blocking Padding Zero: Append the PHY pad bits to the PSDU as described in 25.5.6.4.
d) Stream parser: The output of the LDPC encoder is rearranged into blocks as described in 25.5.6.5.
e) Constellation mapper: Map to π/2-BPSK, π/2-QPSK, π/2-16-QAM, or π/2-64-QAM constellation points as described in 25.5.6.6.
f) Spatial Expansion: Apply the spatial expansion mechanism according to the combination of the number of the spatial streams and the number of the transmit antennas as described in 25.5.6.7.
g) Pulse filter, Analog, and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit.

25.5.4 CMMG SC mode PPDU format

The format of a CMMG SC mode PPDU is shown in Figure 25-17 where the SCTF field is transmitted for 1080 MHz channel bandwidth.

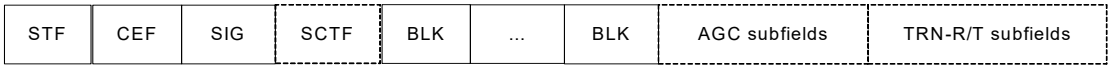

Figure 25-17—Format of CMMG SC mode PPDU

NOTE—The SCTF is only transmitted for 1080 MHz channel bandwidth and is composed of a ZCZ sequence of length 512. For MIMO transmission, different transmit antenna transmit a different preamble that is composed of one the four ZCZ sequences with the order of $Z_{512}^{1}, Z_{512}^{2}, Z_{512}^{3}, Z_{512}^{4}$, such as for the case of one transmit antenna, the preamble sequence is composed of Z_{512}^{1} , for the case of two transmit antennas, the preamble sequences are composed of Z_{512}^{1}, Z_{512}^{2} , respectively.

25.5.5 CMMG SC mode SIG transmission

25.5.5.1 SIG field

The CMMG SC mode SIG field carries information required to interpret PPDUs. The preamble and the CMMG SC mode SIG fields all are transmitted with SC mode modulation.

25.5.5.2 Generation of the CRC bits of SIG

The calculation of the CRC of the CMMG SC mode SIG is described in 25.3.6.

25.5.5.3 Scrambler

The operation of the scrambler is defined in 25.3.7. Bits $x_1, x_2, x_3, x_4, x_5, x_6, x_7$ of the scrambler shift register are initialized using the bits in the scrambler initialization bits from the SIG. The CMMG SC mode SIG is scrambled starting from bit 7.

25.5.5.4 Encoding and modulations

25.5.5.4.1 General

The modulation and coding scheme defines the modulation and code rate that is used in the PPDU. The modulation and coding schemes are defined in 25.5.6.6.

25.5.5.4.2 Encoding

See 25.3.9.2.

25.5.5.4.3 Modulation

See 25.4.4.5.

25.5.5.4.4 Duplication

If the channel bandwidth is 1080 MHz, the modulated SIG symbols are transmitted in duplicate format as defined in 25.3.10.

25.5.5.4.5 Symbol blocking, CSD, and GI insertion

The modulated CMMG SC mode SIG symbols are divided into four symbols blocks of length 256. For each block, the cyclic shift values for the CMMG SC mode SIG field of the PPDU for transmit chain i_{TX} out of a total of N_{TX} are defined in Table 25-11.

Table 25-11—Cyclic shift values for the CMMG SIG field

$T_{CS}^{i_{TX}}$ values for the CMMG-SIG field				
Total number of transmit chains (N_{TX})	Cyclic shift for transmit chain i_{TX} (in units of ns)			
	1	2	3	4
1	0	—	—	—
2	0	$-128T_C$	—	—
3	0	$-85T_C$	$-170T_C$	—
4	0	$-64T_C$	$-128T_C$	$-192T_C$

After the CSD operations, each group of 256 symbols is prepended by the last 64 symbols that form the cyclic prefix.

25.5.6 Data field transmission

25.5.6.1 General

The subclause describes the transmission of the SC Data field.

25.5.6.2 Scrambler

The operation of the scrambler is defined in 25.3.7. The scrambling of the Data field continues the scrambling of the CMMG SC mode SIG with no reset for CMMG SC mode transmission.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

25.5.6.3 Encoding

See 25.3.12.

25.5.6.4 Symbol block padding zeros

The number of symbol blocks, N_{BL}, is calculated as follows:

$$N_{BL} = m_{SE}\left\lceil \frac{Length \times 8 + (8 + L_{CHECK}) \times N_{CW}}{m_{SE} N_{CBPB}} \right\rceil \quad (25\text{-}27)$$

where L_{CHECK} is the number of LDPC parity bits, m_{SE} values are listed in Table 25-12, and N_{CBPB} values are shown in Table 25-13.

Table 25-12—Values of m_{SE}

N_{SS}	N_{TX}	m_{SE}
1	1	1
	2	2
	3	3
	4	4
2	2	2
	3	4
	4	4
3	3	3
	4	6
4	4	4

Table 25-13—Values of N_{CBPB}

Symbol mapping	N_{CBPB} (540 MHz)		N_{CBPB} (1080 MHz)	
	Long GI	Short GI	Long GI	Short GI
π/2-BPSK	192	224	384	448
π/2-QPSK	384	448	768	896
π/2-16-QAM	768	896	1536	1792
π/2-64-QAM	1152	1344	2304	2688

The number of padding 0s is given by

$$N_{BPAD} = N_{BL} N_{CBPB} - (Length \times 8 + (8 + L_{CHECK}) \times N_{CW}) \quad (25\text{-}28)$$

The PSDU is concatenated with N_{BPAD} 0s. They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

25.5.6.5 Stream parser

After coding and puncturing, the data bit streams at the output of the FEC encoder are processed in groups of N_{CBPB}. Each of these groups is rearranged into N_{SS} blocks of N_{CBPSS} bits.

The number of bits assigned to a single axis (real or imaginary) of a constellation point in a spatial stream is denoted by Equation (25-29).

$$s = \max\left\{1, \frac{N_{CBPS}}{2}\right\} \tag{25-29}$$

Consecutive blocks of s bits are assigned to different spatial streams in a round robin fashion.

Bit i at the output of encoder is assigned to input bit k of spatial stream where

$$i = (i_{SS} - 1) \cdot s + N_{SS} \cdot s \cdot \left\lfloor \frac{k}{s} \right\rfloor + k \bmod s \tag{25-30}$$

where $i_{SS} = 1, 2, \ldots, N_{SS}$, $i = 0, 1, \ldots, N_{CBPB}-1$, $k = 0, 1, \ldots, N_{CBPSS}-1$.

25.5.6.6 Constellation mapping

The modulation and coding scheme (MCS) field specifies the modulation and code rate used in the PPDU.

A CMMG STA shall support all equal modulation (EQM) rates for one spatial stream (MCSs 1 to 3). MCSs 4 to 8 are optional.

The coded and padded bit stream is converted into a stream of complex constellation points according to the modulation specified in the MCS table.

In π/2-BPSK modulation, the input bit stream is mapped according to the following equation:

$$\tilde{s}_k = 2 \cdot c_k - 1$$

where c_k is the k^{th} input coded (or scrambled pad) bit. Each output symbol is then rotated according to the following equation:

$$s_k = \tilde{s}_k e^{(j\pi k)/2}$$

NOTE—With appropriate choice of transmit filtering, π/2-BPSK is equivalent to a precoded pulse-shaped MSK (e.g., GMSK). The precoder is simply $b_{out,k} = b_{in,k} \oplus b_{in,k-1}$, where $b_{in,k}$ is the scrambled input stream, $b_{in,-1}$ is 0, and $b_{out,k}$ is the input to the (G)MSK modulator.

In π/2-QPSK modulation (see Figure 25-18), the input bit stream is mapped according to the following equation:

$$\tilde{s}(k) = \frac{1}{\sqrt{2}}((2c_{2k} - 1) + j(2c_{2k+1} - 1)) \exp\left(-j\frac{\pi}{4}\right)$$

where k is the output symbol index, $k = 0, 1, \ldots$. Each output symbol is then rotated according to the following equation:

$$s_k = \tilde{s}_k e^{(j\pi k)/2}$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

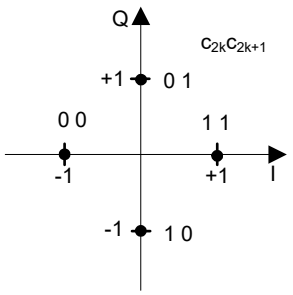

Figure 25-18—QPSK constellation bit encoding

In π/2-16-QAM modulation (see Figure 25-19), the input bit stream is mapped according to the following equation:

$$\tilde{s}_k = \frac{1}{\sqrt{10}}\{(4c_{4k}-2)-(2c_{4k}-1)(2c_{4k+1}-1)+j(4c_{4k+2}-2)-j(2c_{4k+2}-1)(2c_{4k+3}-1)\} \quad (25\text{-}31)$$

where k is the output symbol index, k = 0, 1, …. Each output symbol is then rotated according to the following equation:

$$s_k = \tilde{s}_k e^{(j\pi k)/2}$$

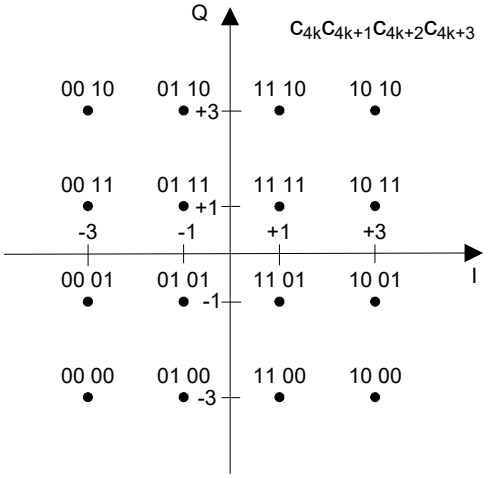

Figure 25-19—16-QAM constellation bit encoding

In π/2-64-QAM modulation (see Figure 25-20), the input bit stream is mapped according to the following equation:

$$\begin{aligned}\tilde{s}_k = {} & \frac{1}{\sqrt{42}}((8c_{6k}-4)-(2c_{6k}-1)(4c_{6k+1}-2)+(2c_{6k}-1)(2c_{6k+1}-1)(2c_{6k+2}-1)) \\ & +j\frac{1}{\sqrt{42}}((8c_{6k+3}-4)-(2c_{6k+3}-1)(4c_{6k+4}-2)+(2c_{6k+3}-1)(2c_{6+4}-1)(2c_{6k+5}-1))\end{aligned} \quad (25\text{-}32)$$

where k is the output symbol index, k = 0, 1, …. Each output symbol is then rotated according to the following equation:

$$s_k = \tilde{s}_k e^{(j\pi k)/2}$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

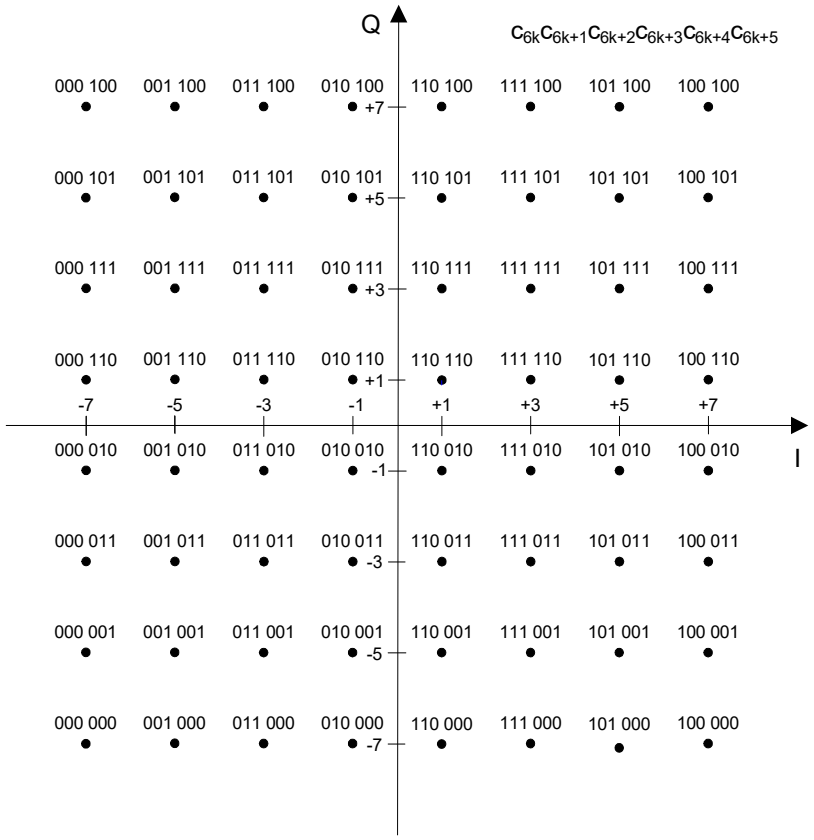

Figure 25-20—64-QAM constellation bit encoding

25.5.6.7 Spatial expansion

Each spatial stream is divided into many subblocks that each subblock includes N_{DSPB} constellation symbols. Values of N_{DSPB} and N_{UWPB} are shown in Table 25-14.

Table 25-14—Values of N_{DSPB} and N_{UWPB}

	N_{CBPB} (CBW540)		N_{CBPB} (CBW1080)	
	Long GI	**Short GI**	**Long GI**	**Short GI**
N_{DSPB}	192	224	384	448
N_{UWPB}	64	32	128	64

The spatial stream of complex numbers, $\mathbf{d}_{i,n}$, $i = 1, \ldots, N_{SS}$, $n = 0, 1, \ldots, N_{BL}–1$, is the input to the spatial expansion module, which produces as output the stream of complex numbers $\mathbf{x}_{i_{TXT},n}$, $i_{TXT} = 1, \ldots, N_{TXT}$. The relation between the spatial streams and the output streams is given in Table 25-15 where $\mathbf{x}_{i_{TXT},n} = (\tilde{\mathbf{x}}_{i_{TXT},n})^T$, $\tilde{\mathbf{d}}_{i,n} = [\mathbf{d}_{i,n}, \mathbf{0}_{1\times N_{UWPB}}]^T$, $\tilde{\mathbf{u}}_{i_{TXT}} = \left[\mathbf{0}_{1\times N_{DSPB}}, Z^{i_{TXT}}_{N_{UWPB}}\right]^T$, and $\mathbf{Q}_{N_{BLS}}$ is defined as

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$\mathbf{Q}_{N_{BLS}} = \begin{bmatrix} \mathbf{Q}_1 & \mathbf{Q}_2 \\ \mathbf{Q}_3 & \mathbf{Q}_4 \end{bmatrix} \tag{25-33}$$

where $\mathbf{Q}_2 = \mathbf{0}_{N_{DSPB} \times N_{UWPB}}$, $\mathbf{Q}_3 = \mathbf{0}_{N_{UWPB} \times N_{DSPB}}$, and

$$\mathbf{Q}_1 = \begin{bmatrix} 0 & 0 & 0 & \dots & 0 & 0 & 1 \\ 0 & 0 & 0 & \dots & 0 & 1 & 0 \\ \dots & \dots & \dots & \dots & \dots & \dots & \dots \\ 0 & 1 & 0 & \dots & 0 & 0 & 0 \\ 1 & 0 & 0 & \dots & 0 & 0 & 0 \end{bmatrix}_{N_{DSPB} \times N_{DSPB}}, \mathbf{Q}_4 = \begin{bmatrix} 0 & 0 & 0 & \dots & 0 & 0 & 1 \\ 0 & 0 & 0 & \dots & 0 & 1 & 0 \\ \dots & \dots & \dots & \dots & \dots & \dots & \dots \\ 0 & 1 & 0 & \dots & 0 & 0 & 0 \\ 1 & 0 & 0 & \dots & 0 & 0 & 0 \end{bmatrix}_{N_{UWPB} \times N_{UWPB}} \tag{25-34}$$

The starting index for the first symbol for π/2 rotation is 0. If the Additional PPDU field within the SIG field is equal to 0, the same ZCZ sequence guard interval is prepended to the first block transmitted. If the Additional PPDU field within the SIG field is equal to 1, the same ZCZ sequence guard interval is prepended to the first block transmitted. See Figure 25-21.

NOTE 1—$a = 2$, for $N_{SS} = 1$ and $N_{TXT} = 4$; otherwise, $a = 1$.
NOTE 2—* indicates conjugate operation.

25.5.6.8 Duplication transmission

When the TXVECTOR parameter DUPLICATE_MODULATION is present, the transmitted PPDU is a duplicate. The modulated data symbols are duplicated as described in 25.3.10.

25.5.7 Performance requirements

25.5.7.1 Transmit requirements

25.5.7.1.1 Introduction

Transmitter performance requirements of the CMMG SC mode are defined in 25.5.7.1.2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

25.5.7.1.2 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, DC offsets, phase noise, etc.

The instrumentation shall perform carrier lock, symbol timing recovery, amplitude adjustment, and equalization while making the measurements. The equalizer shall be trained using information in the CMMG SC mode preamble (STF/CEF). For the CMMG SC mode EVM, measuring samples at the sample rate, the measured symbols should not contain the first and the last hundred symbols of a given PPDU (ramp up/down). The EVM is calculated according to the formula below:

(25-35)

where

N_S is the number of samples to be measured and N_S should be 1000

P_{avg} is the average power of the constellation

(I_i, Q_i) is the complex coordinates of the measured symbol i

(I_i^*, Q_i^*) is the complex coordinates of the ideal constellation point for the measured symbol i

(I_0, Q_0) is the complex DC term chosen to reduce EVM

The test equipment should use a root-raised cosine filter with roll-off factor of 0.25 for the pulse shaping filter when conducting EVM measurement.

The transmit pulse shaping used is left to the implementer.

The relative constellation error (EVM) shall not exceed an MCS dependent value according to Table 25-16.

Table 25-16—EVM requirements for CMMG SC mode

CMMG-MCS indices	Modulation	Coding rate	EVM value (dB)
1	π/2-BPSK	1/2	–7
2	π/2-QPSK	1/2	–11
3	π/2-QPSK	3/4	–13
4	π/2-16-QAM	1/2	–19
5	π/2-16-QAM	3/4	–21
6	π/2-64-QAM	5/8	–25
7	π/2-64-QAM	3/4	–26
8	π/2-64-QAM	13/16	–28

25.5.7.1.3 Time of Departure accuracy

The RMS accuracy of the time of departure provided in TIME_OF_DEPARTURE shall be less than or equal to 80 ns.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is 440×10^6 sample/s for a 540 MHz channel and 880×10^6 sample/s for a 1080 MHz channel.
— FIRST_TRANSITION_FIELD is Short Training field.
— SECOND_TRANSITION_FIELD is Channel Estimation field.
— TRAINING_FIELD is Channel Estimation field.
— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

25.5.7.2 Receive requirements

25.5.7.2.1 Introduction

This subclause describes the receiver requirements of the CMMG SC mode.

25.5.7.2.2 CCA

The start of a CMMG SC mode transmission at a receive level greater than the minimum sensitivity for MCS 0 (–81 dBm for 540 MHz, –78 dBm for 1080 MHz) shall cause CCA to indicate busy with a probability > 90% within 1 μs. The receiver shall hold the carrier sense signal busy for any signal 20 dB above the minimum sensitivity for MCS 0.

25.6 CMMG OFDM mode

25.6.1 Introduction

Transmission and reception of CMMG OFDM mode PPDUs are optional.

25.6.2 CMMG OFDM mode PPDU format

The format of a CMMG OFDM mode PPDU is shown in Figure 25-22.

25.6.4 Overview of CMMG OFDM mode PPDU encoding process

25.6.4.1 General

This subclause provides an overview of the CMMG OFDM mode PPDU encoding process.

25.6.4.2 Construction of CMMG OFDM mode SIG

The construction of the CMMG OFDM mode SIG field proceeds as follows:

a) Obtain the parameters from TXVECTOR. Add the reserved bits, append the calculated CRC. The calculation of the CRC of the CMMG OFDM mode SIG is described in 25.3.6.
b) Scrambler: Scramble the CMMG OFDM mode SIG bits. The Scrambler is described in 25.3.7.
c) LDPC encoder: The scrambled bits are encoded using the LDPC code as described in 25.5.5.4.2.
d) Constellation mapper: BPSK modulate the coded bits as described in 25.5.5.4.3 to form the transmitted symbol blocks of CMMG PHY SIG.
e) Duplication and phase rotation: Apply the appropriate phase rotations for each 540 MHz subchannel as 25.5.5.4.4.
f) CSD: Apply CSD for each transmit chain as described in 25.5.5.4.5. This is need only for the CMMG OFDM MIMO mechanism.
g) Symbol blocking and GI insertion: Prepend a GI and generate the transmission symbol block.
h) Upsampling, filtering, and downsampling: Sample rate change in CMMG OFDM mode transmission as described in 25.6.5.4. This only applies to the CMMG OFDM mode MIMO mechanism.
i) Pulse filter, Analog, and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit.

NOTE—Conversion from the sampled digital domain to the continuous time domain is beyond the scope of this document. Filtering for pulse shaping such as in GMSK is beyond the scope of this standard.

25.6.4.3 Construction of CMMG OFDM mode PPDU

The construction of the Data field in a CMMG OFDM mode PPDU with LDPC encoding proceeds as follows:

a) Scrambler: Scramble the PHY padded data. The scrambler is described in 25.3.7.
b) LDPC encoder: The scrambled bits are encoded using the LDPC code with the APEP_LENGTH in the TXVECTOR as described in 25.6.8.3.
c) Stream parser: The output of the LDPC encoder is rearranged into blocks as described in 25.6.8.5.
d) Constellation mapper: Map to BPSK, QPSK, 16-QAM, or 64-QAM constellation points as described in 25.6.8.6.
e) LDPC tone mapper: The LDPC tone mapping shall be performed on all LDPC encoded streams as described in 25.6.8.7.
f) OFDM symbol padding 0s: Append the CMMG OFDM mode pad bits to the PSDU as described in 25.6.8.4.
g) STBC: Apply STBC as described in 25.6.8.8.
h) Pilot insertion: Insert pilots following the steps described in 25.6.8.9.
i) CSD: Apply CSD for each space-time stream as described in 25.6.8.10.
j) Spatial mapping: Apply the **Q** matrix as described in 25.6.8.11.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

k) Phase rotation: Apply the appropriate phase rotations for each 540 MHz subchannel as described in 25.3.4.4.

l) IDFT: Compute the inverse discrete Fourier transform.

m) Insert GI and apply windowing: Prepend a GI and apply windowing.

n) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit.

25.6.4.4 Construction of OSTF

The OSTF is defined in 25.6.6 and is constructed as follows:

a) Sequence generation: Generate the OSTF in the frequency-domain over the bandwidth indicated by CH_BANDWIDTH as described in 25.6.6.

b) Phase rotation: Apply appropriate phase rotation for each 540 MHz subchannel as described in 25.3.4.3 and 25.3.4.4.

c) CSD: Apply CSD for each space-time stream and frequency segment as described in 25.6.8.10.

d) Spatial mapping: Apply the **Q** matrix as described in 25.6.8.11.

e) IDFT: Compute the inverse discrete Fourier transform.

f) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 25.3.4.3.

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 25.3.4.3 and 25.6.6 for details.

25.6.4.5 Construction of OCEF

The OCEF is defined in 25.6.7 and constructed as follows:

a) Sequence generation: Generate the OCEF sequence in the frequency-domain over the bandwidth indicated by CH_BANDWIDTH as described in 25.6.7.

b) Phase rotation: Apply appropriate phase rotation for each 540 MHz subchannel as described in 25.3.4.3 and 25.3.4.4.

c) Matrix mapping: Apply the matrix to the OCEF sequence and apply the matrix to the pilot tones as described in 25.6.7.

d) CSD: Apply CSD for each space-time stream and frequency segment as described in 25.6.8.10.

e) Spatial mapping: Apply the **Q** matrix as described in 25.6.8.11.

f) IDFT: Compute the inverse discrete Fourier transform.

g) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 25.3.4.3.

h) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 25.3.4.3 and 25.6.7 for details.

25.6.5 CMMG OFDM mode SIG fields

25.6.5.1 SIG fields

See 25.5.5.1 to 25.5.5.4.2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

25.6.5.2 Modulation

See 25.4.4.5.

25.6.5.3 Duplication

If the channel bandwidth is 1080 MHz, the modulated SIG symbols are duplicated as described in 25.3.10.

25.6.5.4 Symbol blocking, CSD, and GI insertion

See 25.5.5.4.5.

25.6.5.5 Symbol rate change

If the channel bandwidth is 540 MHz, the preamble sequence and the CMMG OFDM mode SIG fields defined in the above subclauses are specified at the SC chip rate (T_C). For transmission in the OFDM (nominal) sample rate, the signal is resampled with a 3/2 rate change. The resampling is done by upsampling by a factor of 3, filtering by the filter h_{Filt} defined in 25.3.11, and downsampling by a factor of 2 (see equation below). To define the transmission of the preamble when the PPDU is an OFDM mode PPDU, the preamble waveform is defined below.

Let $r(nT_C) = r_{STF}(nT_C) + r_{CEF}(nT_C - t_{ce}) + r_{SIG}(nT_C - t_{SIG})$, then

$$r\left(n\frac{T_s}{2}\right) = \begin{cases} r\left(n\frac{T_c}{3}\right), n = 0, 3, 6, \ldots \\ 0, otherwise \end{cases} \quad (25\text{-}36)$$

$$\tilde{r}\left(n\frac{T_s}{2}\right) = \sum_{k=0}^{K-1} r\left((n-k)\cdot\frac{T_s}{2}\right) h_{Filt}(k), n = 0, 1, \ldots \quad (25\text{-}37)$$

$$r(nT_s) = \tilde{r}\left(2n\frac{T_s}{2} - \frac{K-1}{2}\frac{T_s}{2}\right), n = 0, 1, \ldots \quad (25\text{-}38)$$

where K is the length of the filter defined in 25.3.11, $\tilde{r}(n=0)$ for $n<0$.

25.6.6 OSTF definition

The main purpose of the OFDM Short Training Field (OSTF) is to improve automatic gain control estimation in a MIMO transmission. The duration of the OSTF is T_{OSTF} regardless of the Short GI field setting in CMMG OFDM SIG.

For a 540 MHz transmission, the frequency domain sequence is given by Equation (25-39).

$$OSTF_{-89,\,89} = \{0, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{b}, \mathbf{a}, \mathbf{b}, \mathbf{b}, \mathbf{b}, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{b}, \mathbf{b}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{a}, 0, 0, 0, 0, \mathbf{b}, \mathbf{b}, \mathbf{b}, \mathbf{b}, \mathbf{a}, \mathbf{b}, \mathbf{b}, \mathbf{b}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{a}, 0, 0\} \quad (25\text{-}39)$$

where **a** = [1, 0, 0, 0] and **b** = [–1, 0, 0, 0].

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For a 1080 MHz transmission, the frequency domain sequence is given by Equation (25-40).

$$OSTF_{-177,\,177} = \frac{1+j}{\sqrt{2}}\{0, \mathbf{b}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{b}, \mathbf{b}, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{b}, \mathbf{b}, \mathbf{b}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{b}, \mathbf{b}, \mathbf{b}, \mathbf{a},$$
$$\mathbf{b}, \mathbf{b}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{b}, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{b}, \mathbf{0}, \mathbf{0}, \mathbf{0}, \mathbf{0}, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{b}, \mathbf{b}, \mathbf{b}, \mathbf{b}, \mathbf{b}, \mathbf{b}, \mathbf{a}, \mathbf{a}, \quad (25\text{-}40)$$
$$\mathbf{b}, \mathbf{b}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{b}, -1, 0\}$$

where **a** = [1, 0, 0, 0] and **b** = [–1, 0, 0, 0].

The time domain representation of the signal of transmit chain i_{TXT} shall be as specified in Equation (25-41).

$$r^{i_{TX}}_{OSTF}(t) = \frac{w_{T_{OCEF}}(t)}{\sqrt{N_{Tone} N_{STS}}} \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} [Q_k]_{i_{TX},\,m}\, \Upsilon_{k,\,CBW} OSTF_k \exp(j2\pi\Delta_F(t - T_{CS}(m))) \quad (25\text{-}41)$$

where

N_{Tone} is, for 540 MHz transmission, 176, and, for 1080 MHz transmission, 352
T_{CS} is given in Table 25-27
Q_k is defined in 25.6.8.13
$\Upsilon_{k,\,CBW}$ is defined in 25.3.4.4

25.6.7 OCEF definition

The OCEF provides a means for the receiver to estimate the MIMO channel between the set of constellation mapper outputs (or, if STBC is applied, the STBC encoder outputs) and the receive chains. The transmitter provides training for N_{STS} space-time streams (spatial mapper inputs) used for the transmission of the PSDU(s). For each tone, the MIMO channel that can be estimated is a $N_{RX} \times N_{STS}$ matrix. A PPDU transmission has a preamble that contains OCEF symbols, where the data tones of each OCEF symbol are multiplied by entries belonging to a matrix $\mathbf{P}_{OCEF}$, to enable channel estimation at the receiver. The pilot tones of each OCEF symbol are multiplied by the entries of a matrix $\mathbf{R}_{OCEF}$ defined in the following text. The multiplication of the pilot tones in the OCEF symbol by the $\mathbf{R}_{OCEF}$ matrix instead of the $\mathbf{P}_{OCEF}$ matrix allows receivers to track phase and frequency offset during MIMO channel estimation using the OCEF. The number of OCEF symbols, N_{OCEF}, is a function of the number of space-time streams N_{STS} as shown in Table 25-17. As a result the OCEF consists of one, two, or four symbols.

Table 25-17—Number of OCEFs required for different numbers of space-time streams

N_{STS}	N_{OCEF}

In a 540 MHz transmission, let $OCEF_{left}$ and $OCEF_{right}$ be the sequences defined in Equation (25-42) and Equation (25-43), respectively.

$$\begin{aligned} OCEF_{left} = \{ & 1, -1, -1, 1, 1, -1, -1, 1, 1, -1, 1, 1, 1, 1, 1, 1, 1, 1, -1, -1, 1, -1, 1, 1, 1, \\ & -1, 1, 1, -1, 1, -1, -1, 1, 1, -1, -1, 1, -1, 1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, 1, \\ & -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, 1, -1, -1, -1, -1, 1, 1, -1, -1, -1, -1, -1, \\ & -1, 1, -1, -1, -1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, 1 \} \end{aligned} \tag{25-42}$$

$$\begin{aligned} OCEF_{right} = \{ & -1, 1, -1, 1, 1, -1, 1, -1, -1, -1, 1, 1, 1, 1, 1, -1, -1, -1, 1, 1, 1, 1, -1, -1, \\ & -1, -1, -1, -1, -1, 1, -1, 1, -1, 1, 1, 1, -1, -1, -1, -1, 1, 1, -1, -1, -1, 1, \\ & 1, -1, 1, 1, -1, 1, 1, 1, 1, -1, 1, -1, -1, -1, 1, -1, 1, -1, 1, -1, 1, -1, 1, 1, \\ & 1, 1, -1, 1, -1, 1, -1, -1, 1, 1, 1, -1, 1, 1, -1, -1, -1, 1 \} \end{aligned} \tag{25-43}$$

In a 540 MHz transmission, the OCEF sequence transmitted is given by Equation (25-44).

$$OCEF_{-89, 89} = \{ OCEF_{left}, 0, 0, 0, OCEF_{right} \} \tag{25-44}$$

In a 1080 MHz transmission, let $OCEF_{left}$ and $OCEF_{right}$ be the sequences defined in Equation (25-45) and Equation (25-46), respectively.

$$\begin{aligned} OCEF_{left} = \{ & 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, 1, 1, 1, 1, -1, -1, -1, -1, 1, \\ & -1, 1, -1, 1, 1, 1, 1, -1, 1, 1, -1, -1, 1, 1, 1, -1, 1, 1, -1, -1, 1, -1, -1, -1, \\ & 1, -1, 1, 1, -1, 1, 1, 1, -1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, -1, -1, \\ & -1, 1, -1, 1, 1, 1, -1, -1, -1, -1, 1, 1, 1, -1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, 1, \\ & 1, 1, 1, -1, -1, -1, 1, -1, 1, 1, -1, 1, 1, -1, 1, 1, -1, 1, 1, -1, 1, 1, 1, 1, 1, -1, 1, \\ & 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, -1, -1, -1, 1, -1, 1, 1, -1, 1, 1, 1, -1, \\ & -1, 1, -1, 1, 1, 1, 1, -1, 1, 1, 1, -1, 1, 1, 1, 1, -1, 1, -1, -1, -1, 1, -1, 1, 1, 1, \\ & -1, -1, -1, -1, -1, -1, 1 \} \end{aligned} \tag{25-45}$$

$$\begin{aligned} OCEF_{right} = \{ & -1, 1, -1, -1, 1, 1, 1, -1, 1, -1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, 1, -1, -1, -1, \\ & 1, 1, 1, -1, -1, 1, -1, -1, -1, 1, -1, 1, -1, 1, -1, 1, 1, 1, -1, 1, -1, -1, -1, \\ & -1, 1, 1, -1, 1, -1, 1, 1, 1, -1, 1, 1, 1, 1, -1, -1, -1, -1, 1, 1, 1, 1, 1, -1, 1, \\ & -1, 1, 1, -1, 1, -1, -1, 1, -1, -1, -1, -1, 1, 1, 1, 1, -1, 1, 1, 1, 1, 1, -1, 1, \\ & 1, -1, -1, -1, 1, -1, -1, -1, 1, -1, 1, 1, 1, 1, -1, -1, -1, 1, 1, -1, 1, -1, 1, \\ & -1, 1, -1, -1, -1, -1, -1, -1, 1, -1, -1, -1, 1, -1, 1, 1, 1, 1, 1, -1, -1, -1, \\ & 1, 1, 1, -1, -1, -1, 1, -1, -1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, 1, -1, \\ & 1, -1, 1, 1, 1, -1, 1, -1, 1, -1, 1, 1 \} \end{aligned} \tag{25-46}$$

In a 1080 MHz transmission, the OCEF sequence transmitted is given by Equation (25-47).

$$OCEF_{-177, 177} = \{ OCEF_{left}, 0, 0, 0, OCEF_{right} \} \tag{25-47}$$

The generation of the time domain OCEF symbols per frequency segment is shown in Figure 25-25 where A_{OCEF} is given in Equation (25-48).

$$A^{k}_{OCEF} = \begin{cases} R_{OCEF}, k \in K_{Pilot} \\ P_{OCEF}, otherwise \end{cases} \tag{25-48}$$

where K_{Pilot} is the set of subcarrier indices for the pilot tones.

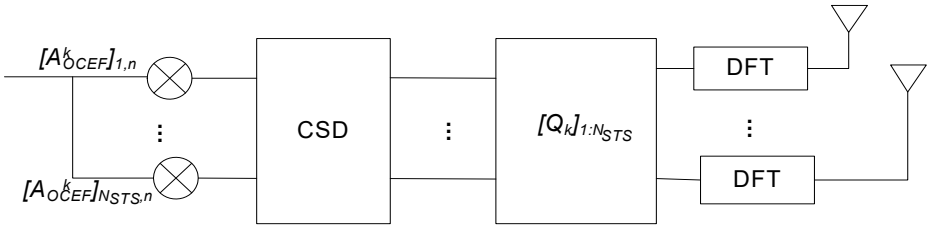

Figure 25-25—Generation of OCEF symbols per frequency segment

For a 540 MHz transmission, $K_{Pilot} = \{\pm 11, \pm 33, \pm 55, \pm 77\}$.

For a 1080 MHz transmission, $K_{Pilot} = \{\pm 11, \pm 33, \pm 55, \pm 77, \pm 99, \pm 121, \pm 143, \pm 165\}$.

$\mathbf{R}_{OCEF}$ is a $N_{OCEF} \times N_{OCEF}$ matrix whose elements are defined in Equation (25-49).

$$[R_{OCEF}]_{m,n} = [P_{OCEF}]_{1,n},\ 1 \le m, n \le N_{OCEF} \tag{25-49}$$

$$P_{OCEF} = \begin{bmatrix} 1 & -1 & 1 & 1 \\ 1 & 1 & -1 & 1 \\ 1 & 1 & 1 & -1 \\ -1 & 1 & 1 & 1 \end{bmatrix} \tag{25-50}$$

The time domain representation of the waveform transmitted on transmit chain i_{TX} shall be as described by Equation (25-51).

$$r^{i_{TX}}_{OCEF}(t) = \sum_{n=0}^{N_{OCEF}-1} \frac{w_{T_{OCEF}}(t - nT_{OCEF})}{\sqrt{N_{Tone}N_{STS}}} \left(\sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} [Q_k]_{i_{TX},m} [A^k_{OCEF}] \Upsilon_{k,CBW} OCEF_k \exp(j2\pi\Delta_F(t - nT_{OCEF} - T_{GI} - T_{CM}(m))) \right) \tag{25-51}$$

where

N_{Tone} is, for 540 MHz transmission, 176, and, for 1080 MHz transmission, 352
T_{CS} is given in Table 25-27
Q_k is defined in 25.6.8.13
$\Upsilon_{k,CBW}$ is defined in 25.3.4.4
T_{OCEF} is the duration of each OCEF symbol
A_{OCEF} is defined in Equation (25-49)

25.6.8 Data fields

25.6.8.1 General

The LDPC encoding process is composed of several steps including determining the number of padding bits, padding with 0s, and the coding of every word.

25.6.8.2 Scrambler

The operation of the scrambler is defined in 25.3.7. The scrambling of the Data field continues the scrambling of the CMMG OFDM mode SIG with no reset for OFDM transmission.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

25.6.8.3 Encoding

See 25.3.12.

25.6.8.4 OFDM symbol padding 0s

The number of symbol blocks, N_{SYM}, is calculated as

$$N_{SYM} = \left\lceil \frac{Length \times 8 + (8 + L_{CHECK}) \times N_{CW}}{R \cdot lcm\{m_{STBC} N_{CBPS}, L_{CW}\}} \right\rceil \cdot \frac{lcm\{m_{STBC} N_{CBPS}, L_{CW}\}}{N_{CBPS}} \quad (25\text{-}52)$$

where

L_{CHECK} is the number of LDPC parity bits
$lcm\{a,b\}$ denotes the least common multiple of a and b
L_{CW} denotes the LDPC code word length
$Length$ is the length of the PSDU defined in the CMMG SIG field
R is the code rate
N_{CBPS} is the number of code bits per symbol as defined in the MCS table
$m_{STBC} = 2$ if STBC is used; else $m_{STBC} = 1$

$$N_{SPAD} = R \times N_{SYM} \times N_{CBPS} - (Length \times 8 + (8 + L_{CHECK}) \times N_{CW}) \quad (25\text{-}53)$$

The PSDU is concatenated with N_{SPAD} 0s. They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU.

25.6.8.5 Stream parser

After coding and puncturing, the data bit streams at the output of the FEC encoder are processed in groups of N_{CBPS}. Each of these groups is rearranged into N_{ss} blocks of N_{CBPSS} bits.

The number of bits assigned to a single axis (real or imaginary) of a constellation point in a spatial stream is denoted by Equation (25-54).

$$s = \max\left\{1, \frac{N_{BPSCS}}{2}\right\} \quad (25\text{-}54)$$

Consecutive blocks of s bits are assigned to different spatial streams in a round robin fashion.

Bit i at the output of encoder is assigned to input bit k of spatial stream where

$$i = (i_{SS} - 1) \cdot s + N_{ss} \cdot s \cdot \left\lfloor \frac{k}{s} \right\rfloor + k \mod s \quad (25\text{-}55)$$

where $i_{SS} = 1, 2, \ldots, N_{SS}$, $i = 0, 1, \ldots, N_{CBPS} - 1$, $k = 0, 1, \ldots, N_{CBPSS} - 1$.

25.6.8.6 Subcarrier modulation mapping

The OFDM subcarriers shall be modulated by using BPSK, QPSK, 16-QAM, or 64-QAM, depending on the RATE requested. The encoded and interleaved binary serial input data shall be divided into groups of (1, 2, 4, or 6) bits and converted into complex numbers representing BPSK, QPSK, 16-QAM, or 64-QAM constellation points. The conversion shall be performed according to Gray-coded constellation mappings, illustrated in Figure 25-26, with the input bit, B_0 being the earliest in the stream. The output values, d, are formed by multiplying the resulting (I+jQ) value by a normalization factor K_{MOD}, as described in Equation (25-56).

$$d = (I + jQ) \times K_{MOD} \tag{25-56}$$

The normalization factor, K_{MOD}, depends on the base modulation mode, as prescribed in Table 25-18. Note that the modulation type can be different from the start to the end of the transmission, as the signal changes from SIGNAL to DATA, as shown in Figure 25-20 and Figure 25-26. The purpose of the normalization factor is to achieve the same average power for all mappings. In practical implementations, an approximate value of the normalization factor may be used, as long as the device conforms with the modulation accuracy requirements described in 25.6.9.1.2.

Table 25-18—Modulation-dependent normalization factor

Modulation	K_{MOD}
BPSK	1
QPSK	$1/\sqrt{2}$
16-QAM	$1/\sqrt{10}$
64-QAM	$1/\sqrt{42}$

For BPSK, B_0 determines the I value, as illustrated in Table 25-19. For QPSK, B_0 determines the I value, and B_1 determines the Q value, as illustrated in Table 25-20. For 16-QAM, B_0 and B_1 determine the I value, and B_2 and B_3 determine the Q value, as illustrated in Table 25-21. For 64-QAM, B_0, B_1, and B_2 determine the I value, and B_3, B_4, and B_5 determine the Q value, as illustrated in Table 25-22.

25.6.8.7 Tone mapping

The LDPC tone mapping shall be performed on all LDPC encoded streams using an LDPC tone-mapping distance parameter, D_{TM}. D_{TM} is constant for each bandwidth, and its value for different bandwidths is given in Table 25-23.

Table 25-23—Value of tone mapping parameter

Parameter	CBW540	CBW1080
D_{TM}	6	12

LDPC tone mapping for LDPC-coded streams is done by permuting the stream of complex numbers generated by the constellation mappers to obtain

$$d''_{t(k),i,n} = d''_{k,i,n} \tag{25-57}$$

where

$i = 1, 2, \ldots, N_{SS}$

$$t(k) = D_{TM}\left(k \bmod \frac{N_{SD}}{D_{TM}}\right) + \left\lfloor \frac{kD_{TM}}{N_{SD}} \right\rfloor \tag{25-58}$$

The two consecutively generated complex constellation numbers are transmitted on two data tones that are separated by at least $D_{TM} - 1$ from other data tones.

25.6.8.8 Space-time block coding

This subclause defines a set of optional robust transmission techniques that are applicable only when using STBC coding for CMMG OFDM mode PPDUs. In this case, N_{SS} spatial streams are mapped to N_{STS} space-time streams. These techniques are based on STBC. When the STBC field in the CMMG SIG is 1, a symbol operation shall occur between the constellation mapper and the spatial mapper as defined in this subclause.

If STBC is applied, the stream of complex numbers $d_{k,i,n}$, $k = 0, 1, \ldots, N_{SD}-1$, $i = 1, 2, \ldots, N_{SS}$, $n = 0, 1, \ldots, N_{SYM}-1$, is the input to the STBC encoder, which produces as output the stream of complex numbers $\tilde{d}_{k,i_{STS},n}$, $k = 0, 1, \ldots, N_{SD}-1$, $i_{STS} = 1, 2, \ldots, N_{STS}$, $n = 0, 1, \ldots, N_{SYM}-1$. For given values of k and i, STBC processing operates on the complex modulation symbols in sequential pairs of OFDM symbols so that the values of $\tilde{d}_{k,2i-1,2m}$ and $\tilde{d}_{k,2i,2m}$ depend on $\tilde{d}_{k,2i,2m}$ and $d_{k,i,2m+1}$. Also, $\tilde{d}_{k,2i-1,2m+1}$ and $\tilde{d}_{k,2i,2m+1}$ depend on $d_{k,i,2m}$ and $d_{k,i,2m+1}$. This is defined in Table 25-24.

If STBC is not applied, $d_{k,i,n} = \tilde{d}_{k,i,n}$ and $N_{STS} = N_{SS}$.

NOTE—When STBC is applied, an odd number of space-time streams is not allowed, and $N_{STS} = 2N_{SS}$.

		2	$-d^*_{k,1,2m+1}$	$d^*_{k,1,2m}$
		3	$d_{k,2,2m}$	$d_{k,2,2m+1}$
		4	$-d^*_{k,2,2m+1}$	$d^*_{k,2,2m}$

25.6.8.9 Pilot subcarriers

For a 540 MHz transmission, eight pilot tones shall be inserted in subcarriers {± 77, ± 55, ± 33, ± 11}. The pilot mapping P_n^k for subcarrier k for symbol n shall be as specified in Equation (25-59).

$$\begin{aligned} P_n^k \in \{-77,-55,-33,-11,11,33,55,77\} &= \{\Psi_{n \bmod 8}, \Psi_{(n+1) \bmod 8}, \ldots, \Psi_{(n+7) \bmod 8}\} \\ P_n^k \notin \{-77,-55,-33,-11,11,33,55,77\} &= 0 \end{aligned} \quad (25\text{-}59)$$

where Ψ_m is defined in Table 25-25.

Table 25-25—Pilot values for 540 MHz transmission

Ψ_0	Ψ_1	Ψ_2	Ψ_3	Ψ_4	Ψ_5	Ψ_6	Ψ_7
1	1	1	–1	–1	1	1	1

For a 1080 MHz transmission, 16 pilot tones shall be inserted in subcarriers –165, –143, –121, –99, –77, –55, –33, –11, 11, 33, 55, 77, 99, 121, 143, 165. The pilot mapping P_n^k for subcarrier k for symbol n shall be as specified in Equation (25-60).

$$\begin{aligned} P_n^k \in \{-165,-143,-121,-99,-77,-55,-33,-11,11,33,55,77,99,121,143,165\} &= \{\Psi_{n \bmod 16}, \Psi_{(n+1) \bmod 16}, \ldots, \Psi_{(n+15) \bmod 16}\} \\ P_n^k \notin \{-165,-143,-121,-99,-77,-55,-33,-11,11,33,55,77,99,121,143,165\} &= 0 \end{aligned} \quad (25\text{-}60)$$

where Ψ_m is defined in Table 25-26.

25.6.8.10 Cyclic shift diversity (CSD) for CMMG OFDM mode Data fields transmission

The cyclic shift values defined in this subclause apply to the Data fields of the PPDU. Cyclic shifts are applied eliminate unintended beamforming when correlated signals are transmitted in multiple space-time streams $T_{CS}(n)$. The cyclic shift value for the Data fields for space-time stream n out of N_{STS} total space-time streams is shown in Table 25-27.

Table 25-27—Cyclic shift values for the Data fields of a CMMG OFDM mode PPDU

$T_{CS}(n)$ values for the Data field of a PPDU				
N_{STS}	Cyclic shift for space-time stream n (ns)			
	1	2	3	4
1	0	—	—	—
2	0	$-128T_S$	—	—
3	0	$-170T_S$	$-85T_S$	—
4	0	$-128T_S$	$-64T_S$	$-192T_S$

25.6.8.11 OFDM modulation

The time domain waveform of the Data field of a CMMG OFDM mode PPDU from transmit chain, shall be as defined in Equation (25-61).

$$r_{Data}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{Tone}N_{STS,total}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - nT_{SYM}) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STT}} [Q_K]_{i_{TX},m} \Upsilon_{k,CBW} (\tilde{D}_{k,m,n,CBW} + p_n P_n^k) \exp(j2\pi k\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}m)) \quad (25\text{-}61)$$

where

p_n is defined in 17.3.5.10

N_{Tone} is, for 540 MHz transmission, 176 and, for 1080 MHz transmission, 352

$\tilde{D}_{k,m,n,CBW}$ is the transmitted constellation on subcarrier k, space-time stream m, and Data field OFDM symbol n and is defined in Equation (25-62) to Equation (25-64)

T_{GI} is the (short) guard interval duration and is given in Table 25-3

$T_{CS}(n)$ is given in 25.6.8.10

P_n^k is defined in 25.6.8.9

$\Upsilon_{k,CBW}$ is defined in 25.3.4.4

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For a 540 MHz transmission,

$$\tilde{D}_{k,m,n,540} = \begin{cases} 0, k = 0, \pm1, \pm11, \pm33, \pm55, \pm77 \\ \tilde{d}_{M^r_{540}(k),m,n}, otherwise \end{cases} \quad (25\text{-}62)$$

and $M^r_{540}(k)$ is defined as

$$M^r_{540}(k) = \begin{cases} k+89, -89 \le k \le -78 \\ k+88, -76 \le k \le -56 \\ k+87, -54 \le k \le -34 \\ k+86, -32 \le k \le -12 \\ k+85, -10 \le k \le -2 \\ k+82, 2 \le k \le 10 \\ k+81, 12 \le k \le 32 \\ k+80, 34 \le k \le 54 \\ k+79, 56 \le k \le 76 \\ k+78, 78 \le k \le 89 \end{cases} \quad (25\text{-}63)$$

For a 1080 MHz transmission,

$$\tilde{D}_{k,m,n,1080} = \begin{cases} 0, k = 0, \pm1, \pm11, \pm33, \pm55, \pm77, \pm99, \pm121, \pm143, \pm165 \\ \tilde{d}_{M^r_{1080}(k),m,n}, otherwise \end{cases} \quad (25\text{-}64)$$

and $M^r_{1080}(k)$ is defined as

$$M^r_{1080}(k) = \begin{cases} k+177, -177 \le k \le -166 \\ k+176, -164 \le k \le -144 \\ k+174, -142 \le k \le -122 \\ k+173, -120 \le k \le -100 \\ k+172, -98 \le k \le -78 \\ k+171, -76 \le k \le -56 \\ k+170, -54 \le k \le -34 \\ k+169, -32 \le k \le -12 \\ k+168, -10 \le k \le -2 \\ k+165, 2 \le k \le 10 \\ k+164, 12 \le k \le 32 \\ k+163, 34 \le k \le 54 \\ k+162, 56 \le k \le 76 \\ k+161, 78 \le k \le 98 \\ k+160, 100 \le k \le 120 \\ k+159, 122 \le k \le 142 \\ k+158, 144 \le k \le 164 \\ k+157, 166 \le k \le 177 \end{cases} \quad (25\text{-}65)$$

$\mathbf{Q}_k$ is a spatial mapping/steering matrix with N_{TX} rows and columns N_{STS} for subcarrier k. $\mathbf{Q}_k$ may be frequency dependent. Refer to the examples of listed in 19.3.11.11.2 for examples of that could be used for CMMG OFDM mode PPDU. Note that implementations are not restricted to the spatial mapping matrix examples listed in 19.3.11.11.2.

25.6.8.12 Duplication transmission

When the TXVECTOR parameter DUPLICATE_MODULATION is present, the transmitted PPDU is a duplicate. For 1080 MHz, the Data field shall be as defined by Equation (25-66).

$$r_{Data}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{Tone}N_{STS,total}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - nT_{SYM}) \sum_{k=-89}^{89} \sum_{m=1}^{N_{STS}} (\tilde{D}_{k,m,n} + p_n P_n^k)([Q_{k-88}]_{i_{TX,m}} \Upsilon_{k,CBW} \exp(j2\pi(k-88)\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}(m))) + j[Q_{k-88}]_{i_{TX,m}} \Upsilon_{k,CBW} \exp(j2\pi(k+88)\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}(m))))) \quad (25\text{-}66)$$

where

p_n is defined in 17.3.5.10

N_{Tone} is 352

$\tilde{D}_{k,m,n}$ is the transmitted constellation on subcarrier k, space-time stream m, and Data field OFDM symbol n and is defined in Equation (25-62) to Equation (25-64)

T_{GI} is the (short) guard interval duration and is given in Table 25-3

$T_{CS}(n)$ is given in 25.6.8.10

P_n^k is defined in 25.6.8.9

$\Upsilon_{k,CBW}$ is defined in 25.3.4.4

25.6.8.13 Beamforming

25.6.8.13.1 General

CMMG OFDM MIMO beamforming is used by a STA with multiple antennas (the beamformer) to steer signals using knowledge of the channel to improve throughput. With CMMG OFDM MIMO beamforming, all space-time streams in the transmitted signal are intended for reception at a single STA.

For CMMG OFDM MIMO beamforming, the steering matrix $\mathbf{Q}_k$ can be determined from the effective channel $\mathbf{H}_{eff,k}$, or the beamforming feedback matrix, $\mathbf{V}_k$, that is sent back to the beamformer by the beamformee using compressed beamforming feedback matrix format as defined in 25.6.8.13.2. The feedback report format is described in 9.6.29.2.

25.6.8.13.2 Compressed Beamforming feedback matrix

Upon receipt of an NDP sounding PPDU, the beamformee shall remove the space-time stream CSD in Table 25-27 from the measured channel before computing a set of matrices for feedback to the beamformer. The beamforming feedback matrix $\mathbf{V}_k$, found by the beamformee for subcarrier k shall be compressed in the form of angles using the method described in 19.3.12.3.6. The angles, $\phi(k)$ and $\psi(k)$, are quantized according to Table 9-117.

The beamformee shall generate the beamforming feedback matrices with the number of rows (N_r) equal to the N_{STS} of the NDP.

After receiving the angle information, $\phi(k)$ and $\psi(k)$, the beamformer reconstructs $\mathbf{V}_k$ using Equation (19-79). For CMMG OFDM MIMO beamforming, the beamformer can use this $\mathbf{V}_k$ matrix to determine the steering matrix $\mathbf{Q}_k$. The method used by the beamformer to calculate the steering matrix $\mathbf{Q}_k$ is implementation specific.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The beamformee decides the tone grouping value to be used in the beamforming feedback matrix **V**. A beamformer shall support all tone grouping values and codebook information values.

25.6.8.14 CMMG preamble format for sounding PPDU

25.6.8.14.1 General

The MIMO channel measurement takes place in every PPDU as a result of transmitting the OCEFs as part of the PHY preamble. The number of OCEFs transmitted shall be determined by the number of space-time streams transmitted. The use of the same spatial transformation enables the computation of the spatial equalization at the receiver.

When the number of space-time streams, N_{STS}, is less than the number of transmit antennas, or less than min(N_{TX}, N_{RX}), sending only N_{STS} OCEFs does not allow the receiver to recover a full characterization of the MIMO channel, even though the resulting MIMO channel measurement is sufficient for receiving the Data field of the CMMG PPDU.

However, there are several cases where it is desirable to obtain as full a characterization of the channel as possible, thus requiring the transmission of a sufficient number of OCEFs to sound the full dimensionality of the channel, which is in some cases N_{STS} and in other cases min(N_{TX}, N_{RX}). These cases of MIMO channel measurement are referred to as MIMO channel sounding. A sounding PPDU may be used to sound available channel dimensions. A sounding PPDU is identified by setting the Not Sounding field in the CMMG SIG to 0. A sounding PPDU may have any allowed number of OCEFs satisfying $N_{OCEFs} \geq N_{STS}$ as shown in Table 25-17.

25.6.8.14.2 Sounding with an NDP

A STA may sound the channel using an NDP (indicated by zero in the Length field in the CMMGSIG field) with the Not Sounding field set to 0. The number of OCEFs is the number implied by the $2^{STBC}\,N_{ss}$, which shall indicate spatial time streams. The last OCEF of an NDP shall not be followed by a Data field as shown in Figure 25-27.

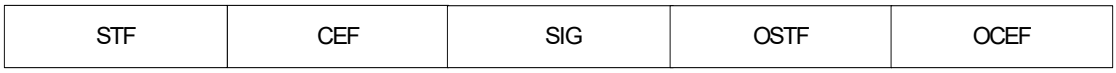

Figure 25-27—CMMG NDP format

It is optional for a STA to process an NDP.

25.6.8.14.3 Sounding PPDU for channel quality assessment

In response to an MRQ, sent by STA A to STA B, the responding STA B returns to the requesting STA A an MCS selection that STA B determines to be a suitable MCS for STA A to use in subsequent transmissions to STA B. In determining the MCS, STA B performs a channel quality assessment, which entails using whatever information STA B has about the channel, such as an estimate of the MIMO channel derived from the sounding PPDU that carries the MRQ. To enable this calculation, the MRQ is sent in conjunction with a sounding PPDU.

The STA sending the MRQ (STA A) determines how many OCEFs to send and whether to use an NDP or not, based on the Transmit Beamforming Capabilities field, number of space-time streams used in the PPDU carrying the MRQ, the number of transmit chains it is using (N_{TX}), whether the transmit and receive STAs support STBC, and in some cases, the number of receive chains at the responding STA (N_{RX}).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The maximum number of available space-time streams is set by the number of transmit and receive chains and the STBC capabilities of the transmitter and receiver, as is shown in Table 25-28. While the number of receive chains at a STA is not communicated in a capabilities indicator, the maximum number of space-time streams supported may be inferred from the STBC capabilities of the receiving STA. When the number of receive chains is known at the transmitter, the number of OCEFs sent to obtain a full channel quality assessment is determined according to the maximum number of space-time streams indicated in Table 25-28. The number of OCEFs to use in conjunction with the indicated number of space-time streams is determined according to Table 25-17.

Table 25-28—Maximum available space-time streams

N_{TX}	N_{RX}	$N_{STS,max}$ **without STBC**	$N_{STS,max}$ **with STBC**
1	1	1	N/A
2	1	1	2
4	1	1	2
4	2	2	4

The sounding PPDU may have nonidentity spatial mapping matrix $\mathbf{Q}_k$. For different receiving STAs, $\mathbf{Q}_k$ may vary.

25.6.9 Performance requirements

25.6.9.1 Transmit requirements

25.6.9.1.1 Introduction

This subclause describes the performance requirement from the CMMG OFDM mode transmitter.

25.6.9.1.2 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, DC offsets, phase noise, etc.

The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or an equivalent procedure:

a) Start of PPDU shall be detected.
b) Transition from short sequences to channel estimation sequences shall be detected, and fine timing (with one sample resolution) shall be established.
c) Frequency offsets shall be estimated and corrected.
d) The PPDU shall be derotated according to estimated frequency offset.
e) The complex channel response coefficients shall be estimated for each of the subcarriers using information contained in the preamble (STF/CEF and/or OCEF).
f) For each of the OFDM symbols: transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, derotate the subcarrier values according to estimated phase, and divide each subcarrier value with a complex estimated channel response coefficient.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

g) For each data-carrying subcarrier, compute the Euclidean distance to the ideal location for the symbol, or pilot.

h) Compute the RMS average of all errors in the Data field of a PPDU. It is given by

$$EVM = 20\log 10\left(\frac{1}{N_f}\sum_{i=1}^{N_f}\sqrt{\frac{\sum_{j=1}^{N_{SYM}}\left\{\sum_{k\in K}\left[(I(i,j,k)-I^*(i,j,k))^2+(Q(i,j,k)-Q^*(i,j,k))^2\right]\right\}}{(N_{ST}-N_{DC})N_{SYM}P_0}}\right) \quad (25\text{-}67)$$

where

N_f is the number of PPDUs

i is the PPDU index

k is the carrier index

K is the set of pilot and data subcarriers $\{1,2, \ldots, (N_{SR}-1), (N_{SR}+N_{DC}), (N_{SR}+N_{DC}+1),\ldots, N_{ST}\}$

j is the symbol index

N_{SYM} is the number of symbols

N_{ST} is the total number of subcarriers

I^*,Q^* is the ideal constellation point for I and Q, respectively

P_0 is the average power of the constellation (I^*,Q^*) computed over the i^{th} PPDU

The measurements shall occur on the OFDM symbols and shall not occur on the other kinds of symbols. The measurement shall be performed on at least 10 PPDUs with 16 symbols at least in each of them. Random data shall be used.

The EVM RMS error shall not exceed an MCS dependent value as found in Table 25-29.

Table 25-29—EVM requirements for OFDM

MCS index	Modulation	Coding rate	EVM value (dB)
9	BPSK	1/2	–7
10	QPSK	1/2	–11
11	QPSK	3/4	–13
12	16-QAM	1/2	–15
13	16-QAM	3/4	–19
14	64-QAM	5/8	–22
15	64-QAM	3/4	–24
16	64-QAM	13/16	–26

25.6.9.2 TX flatness

25.6.9.2.1 TX flatness for 540 MHz channel

Let E_i denote the constellation energy averaged over OFDM symbols for the subcarrier with index i, E_{avg} denote E_i averaged over i equal to –70 to –2 and +2 to +70. When using the CMMG OFDM mode and only while transmitting OFDM symbols, E_i with i equal to –70 to –2 and +2 to +70 shall not deviate by more than ± 2 dB from E_{avg}. And E_i with i equal to –71 to –89 and +71 to +89 shall not deviate by more than +2/–4 dB from E_{avg}.

25.6.9.2.2 TX flatness for 1080 MHz channel

Let E_i denote the constellation energy averaged over OFDM symbols for the subcarrier with index i, E_{avg} denote E_i averaged over i equal to –146 to –2 and +2 to +146. When using the CMMG OFDM mode and only while transmitting OFDM symbols, E_i with i equal to –146 to –2 and +2 to +146 shall not deviate by more than ± 2 dB from E_{avg}. And E_i with i equal to –147 to –177 and +147 to +177 shall not deviate by more than +2/–4 dB from E_{avg}.

25.6.9.2.3 Time of Departure accuracy

The RMS accuracy of the time of departure provided in TIME_OF_DEPARTURE shall be less than or equal to 80 ns.

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is 660×10^6 sample/s for a 540 MHz channel and 1320×10^6 sample/s for a 1080 MHz channel.
— FIRST_TRANSITION_FIELD is Short Training field.
— SECOND_TRANSITION_FIELD is Channel Estimation field.
— TRAINING_FIELD is Channel Estimation field.
— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns.

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

25.6.9.3 Receive requirements

25.6.9.3.1 Introduction

Subclause 25.6.9.3.2 describes the performance requirement for a CMMG OFDM mode receiver.

25.6.9.3.2 CCA

The start of a CMMG OFDM mode or CMMG SC mode transmission at a receive level greater than the minimum sensitivity for MCS 0 (–81 dBm for 540 MHz, –78 dBm for 1080 MHz) shall cause CCA to indicate busy with a probability > 90% within 1 μs.

25.7 Analog beamforming PPDU format

25.7.1 TX sector sweep

The PPDUs sent during TX sector sweep are CMMG control mode packets as defined in 25.4.

25.7.2 Beam refinement

25.7.2.1 General

Beam refinement is a process where a STA can improve its antenna configuration (or antenna weight vectors) both for transmission and reception. If the SLS beamforming training did not include an RSS, as in the case where both devices have more than one transmit sector per antenna, beam refinement can serve as the first receive antenna configuration training. The procedure of beam refinement is described in 10.41.6.4. In the beam refinement procedure, BRP PPDUs are used to train the receiver and transmitter antenna. There are two types of BRP PPDUs: BRP-RX PPDUs and BRP-TX PPDUs.

— BRP-RX PPDUs are PPDUs that have TRN-R training sequences following the Data field. These PPDUs enable receiver antenna weight vector training.

— BRP-TX PPDUs are PPDUs that have TRN-T training sequences following the Data field. The transmitting STA may change antenna configuration at the beginning of each sequence. The receiving STA performs measurements on these sequences and sends feedback to the STA that transmits the BRP-TX PPDU.

25.7.2.2 BRP PPDU structure

Each BRP PPDU is shown in Figure 25-28.

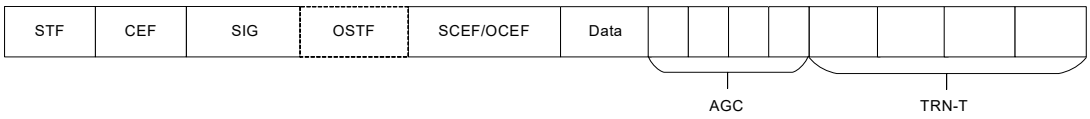

Figure 25-28—BRP PPDU structure

25.7.2.3 BRP PPDU SIG fields

The PPDU Type field in a BRP PPDU is defined in Table 25-7.

A value of *N* in the Training Length field indicates that the AGC has 4*N* subfields and that the TRN- R/T field has *N* subfields.

The value *N* in the Training Length field of a BRP-RX PPDU is equal to the value of the L-RX field requested by the intended receiver of the BRP-RX PPDU at a previously received BRP Request field (see 9.5.4).

25.7.2.4 Beam refinement AGC field

The beam refinement AGC fields are composed of 4*N* repetitions of the sequence $[Z_{64}^{1}\ Z_{64}^{1}\ Z_{64}^{1}\ Z_{64}^{1}\ Z_{64}^{1}]$ when the PPDU is transmitted using the CMMG control mode in bandwidth 540 MHz, $[Z_{64}^{2}\ Z_{64}^{2}\ Z_{64}^{2}\ Z_{64}^{2}\ Z_{64}^{2}]$ when the PPDU is transmitted using the CMMG SC mode in bandwidth 540 MHz, $[Z_{64}^{3}\ Z_{64}^{3}\ Z_{64}^{3}\ Z_{64}^{3}\ Z_{64}^{3}]$ when the PPDU is transmitted using the CMMG OFDM mode in bandwidth 540 MHz, $[Z_{128}^{1}\ Z_{128}^{1}\ Z_{128}^{1}\ Z_{128}^{1}\ Z_{128}^{1}]$ when the PPDU is transmitted using the CMMG control mode in bandwidth 1080 MHz, $[Z_{128}^{2}\ Z_{128}^{2}\ Z_{128}^{2}\ Z_{128}^{2}\ Z_{128}^{2}]$ when the PPDU is transmitted using the CMMG SC mode in

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

bandwidth 1080 MHz, and $[Z_{128}^{3}\ Z_{128}^{3}\ Z_{128}^{3}\ Z_{128}^{3}\ Z_{128}^{3}\ Z_{128}^{3}]$ when the PPDU is transmitted using the CMMG OFDM mode in bandwidth 1080 MHz. The sequences Z_{64}^{1}, Z_{64}^{2}, Z_{64}^{3}, Z_{128}^{1}, Z_{128}^{2}, and Z_{128}^{3} are defined in 25.8. The sequences are transmitted using rotated π/2-QPSK modulation.

In a BRP-TX PPDU, the transmitter may change the TX AWV configuration at the beginning of each AGC subfield. Any transmit signal transients that occur due to this TX AWV configuration change shall completely settle by the end of the first Z_{64}^{1}, Z_{64}^{2}, or Z_{64}^{3} subsequence in bandwidth 540 MHz and Z_{128}^{1}, Z_{128}^{2}, or Z_{128}^{3} subsequence in bandwidth 1080 MHz. The set of AWVs used for the AGC subfields should be the same as that used for the TRN-T subfields. In a BRP-RX PPDU, the transmitter shall use the same TX AWV as in the preamble and Data fields of the PPDU.

25.7.2.5 Beam refinement TRN-R subfield

The TRN-R subfields enable receiver AWV training. The TRN-R subfields have the form shown in Figure 25-29.

Figure 25-29—TRN-R subfield definition

Each subfield CEF matches the Channel Estimation field defined in 25.3.5. The $4N$ subfields R_1 to R_{4N} each consist of the sequence $[Z_{256}^{1}\ Z_{256}^{3}\ Z_{256}^{1}\ Z_{256}^{2}\ Z_{256}^{4}\ Z_{256}^{2}]$ in bandwidth 540 MHz and $[Z_{512}^{1}\ Z_{512}^{3}\ Z_{512}^{1}\ Z_{512}^{2}\ Z_{512}^{4}\ Z_{512}^{2}]$ in bandwidth 1080 MHz. The sequences Z_{256}^{1}, Z_{256}^{2}, Z_{256}^{3}, and Z_{256}^{4} are defined in Table 25-33, and Z_{512}^{1}, Z_{512}^{2}, Z_{512}^{3}, and Z_{512}^{4} are defined in Table 25-34 in 25.8. The sequences are transmitted using rotated π/2-QPSK modulation.

25.7.2.6 Beam refinement TRN-T subfield

The TRN-T subfield enables transmitter AWV training. The TRN-T subfields have the form shown in Figure 25-30.

Figure 25-30—TRN-T subfield definition

Each subfield CEF matches the Channel Estimation field defined in 25.3.5. The $4N$ subfields T_1 to T_{4N} each consist of the sequence $[Z_{256}^{1}\ Z_{256}^{3}\ Z_{256}^{1}\ Z_{256}^{2}\ Z_{256}^{4}\ Z_{256}^{2}]$ in bandwidth 540 MHz and $[Z_{512}^{1}\ Z_{512}^{3}\ Z_{512}^{1}\ Z_{512}^{2}\ Z_{512}^{4}\ Z_{512}^{2}]$ in bandwidth 1080 MHz. The sequences Z_{256}^{1}, Z_{256}^{2}, Z_{256}^{3}, and Z_{256}^{4} are defined in Table 25-33, and Z_{512}^{1}, Z_{512}^{2}, Z_{512}^{3}, and Z_{512}^{4} are defined in Table 25-34 in 25.8. The sequences are transmitted using rotated π/2-QPSK modulation. When transmitting the CEF subfield, the transmitter shall use the same AWV as in the preamble and Data fields of the PPDU. Any transmit signal transients that occur due to TX AWV configuration changes between subfields shall settle by the end of the first 64 samples of the subfield.

25.7.2.7 Channel measurement

The good autocorrelation properties of the ZCZ sequences enable reconstructing part of the impulse response of the channel between the transmitter and the receiver. The receiver should find the tap with largest amplitude in the channel during the CEF of the BRP-RX. It selects thereafter the set of taps that is measured around the tap with the largest amplitude, according to the value of dot11ChanMeasFBCKNtaps. It can select a contiguous set of taps or select a noncontiguous set of taps and include the tap delays subfield

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

as part of the subfield measurement. It then measures the phase and amplitude of the corresponding channel taps in each of the TRN-T subfield repetition (except for those using the CEF AWV configuration). The beam refinement feedback subfield *k*–1 is the relative amplitude and phase of this tap in the *k*'th repetition compared to this tap in the first TRN-T subfield.

25.7.2.8 BRP resampling in a CMMG OFDM mode PPDU

The BRP AGC field, the CEF, and Tn/Rn field are specified at the SC chip rate (T_c). When appended to an OFDM mode PPDU, the signal is resampled as defined in 25.3.10.

25.8 ZCZ sequence

The following ZCZ sequences set is used in the STF, the CEF, the SCTF, and the Unique Word (UW). These are 5 ZCZ sequences sets, namely, z_{32}^{i}, z_{64}^{i}, z_{128}^{i}, z_{256}^{i}, and z_{512}^{i}, with i = 1, 2, 3, 4where the subscript denotes the length of the sequences and the superscript denotes the index of the ZCZ sequence. The sets are generated using the following recursive procedure, illustrated as in Figure 25-31.

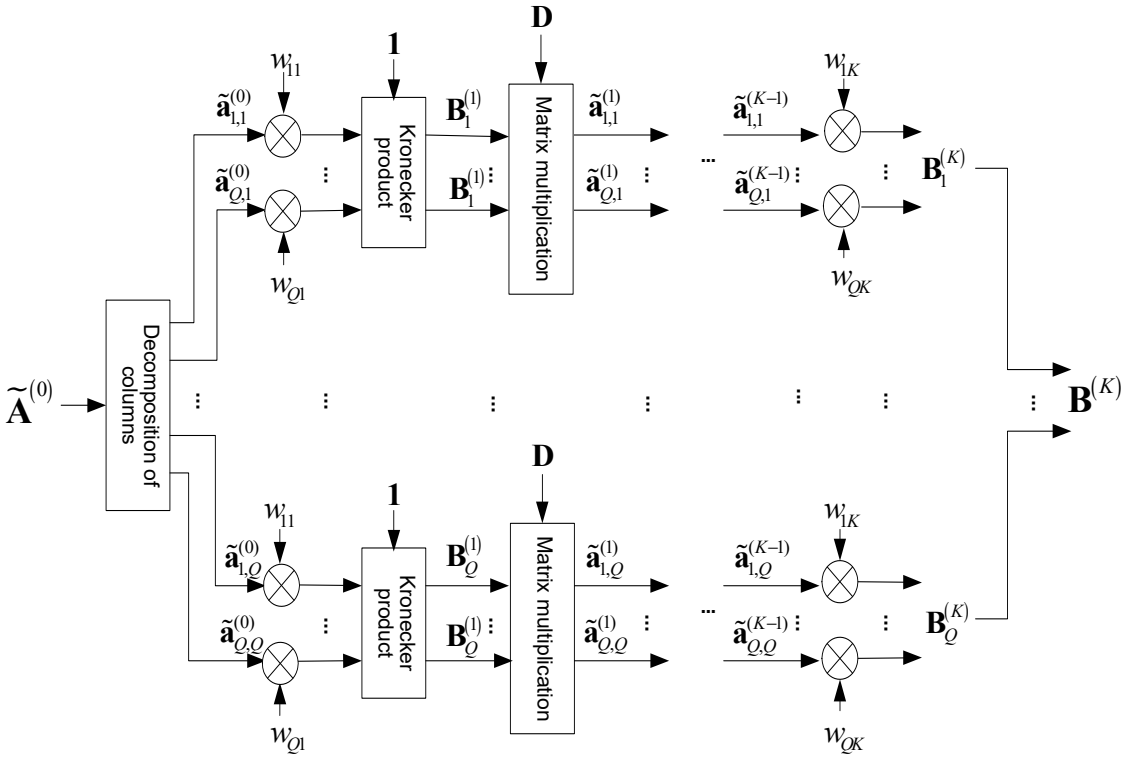

Figure 25-31—Generation of ZCZ sequences set

$\tilde{\mathbf{A}}^{(0)}$, $\mathbf{B}^{(k)}$, and $\tilde{\mathbf{A}}^{(k)}$ used in Figure 25-31 are defined as follows, respectively.

$$\tilde{\mathbf{A}}^{(0)} = \begin{bmatrix} \tilde{\mathbf{a}}_{1,1}^{(0)} & \cdots & \tilde{\mathbf{a}}_{1,Q}^{(0)} \\ \cdots & \cdots & \cdots \\ \tilde{\mathbf{a}}_{Q,1}^{(0)} & \cdots & \tilde{\mathbf{a}}_{Q,Q}^{(0)} \end{bmatrix} \tag{25-68}$$

$$\mathbf{B}^{(k)} = \begin{bmatrix} w_{1,k}\mathbf{I}_{Q^{k-1}L} & \mathbf{0}_{Q^{k-1}L} & \cdots & \mathbf{0}_{Q^{k-1}L} \\ \mathbf{0}_{Q^{k-1}L} & w_{2,k}\mathbf{I}_{Q^{k-1}L} & \cdots & \mathbf{0}_{Q^{k-1}L} \\ \cdots & \cdots & \cdots & \cdots \\ \mathbf{0}_{Q^{k-1}L} & \mathbf{0}_{Q^{k-1}L} & \cdots & w_{Q,k}\mathbf{I}_{Q^{k-1}L} \end{bmatrix} \tilde{\mathbf{A}}^{(k-1)}, \tilde{\mathbf{A}}^{(k)} = \mathbf{D}(\mathbf{1} \otimes \mathbf{B}^{(k)}) \tag{25-69}$$

where

$\tilde{\mathbf{a}}_{i,j}^{(0)}, i = 1, ..., Q, j = 1, ..., Q$	denotes the initial sequence
Q	is the number of ZCZ sequences
$\mathbf{I}_{Q^{k-1}L}$	denotes the identity matrix of size $Q^{k-1}L \times Q^{k-1}L$
L	denotes the length of the initial sequence
$\mathbf{0}_{Q^{k-1}L}$	denotes all zero matrix of size $Q^{k-1}L \times Q^{k-1}L$
$w_{i,j}, i = 1, \ldots, Q, j = 1, \ldots, K$	are elements of the coefficient matrix $\mathbf{W}$ of size $Q \times K$
K	is the number of the iterations
$\mathbf{D} = Diag(f_{1,1}\mathbf{I}_{Q^{k-1}L}, ..., f_{1,Q}\mathbf{I}_{Q^{k-1}L}, ..., f_{Q,1}\mathbf{I}_{Q^{k-1}L}, ..., f_{Q,Q}\mathbf{I}_{Q^{k-1}L})$	with $Diag(\upsilon)$ denoting the diagonal matrix with diagonal element υ
$f_{i,j}, i = 1, \ldots, Q, j = 1, \ldots, Q$	are elements of the Discrete Fourier Transform (DFT) matrix $\mathbf{F}_Q$ of size $Q \times Q$
$\mathbf{1}$	denotes all 1 column vector
$\otimes$	denotes Kronecker product

Note that $M = \{e^{(j2\pi\theta)/Q}\}_{\theta=0}^{Q-1}$, the elements of $\tilde{\mathbf{A}}^{(0)}$ belongs to M, and $w_{i,k} \in M, i = 1, ..., Q$.

When $\tilde{\mathbf{A}}^{(0)}$, $\mathbf{F}_4$, and $\mathbf{W}$ are given by Equation (25-70), the generated ZCZ sequence set Z_{32}^{i} is listed in Table 25-30 where 0, 1, 2, and 3 denote +1,+j,–1,–j.

$$\tilde{\mathbf{A}}^{(0)} = \begin{bmatrix} (-1,-1)^T & (-1,1)^T & (-1,-1)^T & (-1,1)^T \\ (-1,-1)^T & (-1,1)^T & (1,1)^T & (1,-1)^T \\ (-1,1)^T & (-1,-1)^T & (-1,1)^T & (-1,-1)^T \\ (-1,1)^T & (-1,-1)^T & (1,-1)^T & (1,1)^T \end{bmatrix}, \mathbf{F}_4 = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & j & -1 & -j \\ 1 & -1 & 1 & -1 \\ 1 & -j & -1 & j \end{bmatrix}, \mathbf{W} = \begin{bmatrix} 1 \\ -j \\ -1 \\ 1 \end{bmatrix} \tag{25-70}$$

When $\tilde{\mathbf{A}}^{(0)}$, $\mathbf{F}_4$, and $\mathbf{W}$ are given by Equation (25-71), the generated ZCZ sequence set Z_{64}^{i} is listed in Table 25-31 where 0, 1, 2, and 3 denote +1,+j,–1,–j.

$$\tilde{\mathbf{A}}^{(0)} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & j & -1 & -j \\ 1 & -1 & 1 & -1 \\ 1 & -j & -1 & j \end{bmatrix}, \mathbf{F}_4 = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & j & -1 & -j \\ 1 & -1 & 1 & -1 \\ 1 & -j & -1 & j \end{bmatrix}, \mathbf{W} = \begin{bmatrix} -j & -1 \\ -1 & j \\ j & -j \\ -1 & -j \end{bmatrix} \tag{25-71}$$

25.9 Regulatory requirements

Wireless LANs (WLANs) implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision or may be superseded.

25.10 Channelization

A CMMG channel is specified by the two PLME MIB fields specified in Table 25-35.

Table 25-35—Fields to specify CMMG channels

Field	Meaning
dot11CMMGCurrentChannelWidth	Channel width. Possible values represent 540 MHz and 1080 MHz channels.
dot11CMMGCurrentChannelCenterFrequencyIndex	For a 540 MHz or 1080 MHz channel, denotes the channel center frequency.

If dot11CMMGCurrentChannelWidth indicates a 540 MHz channel, the channel center frequency is given by Equation (25-75) (see Figure 25-32).

$$f(n)\ [GHz] = \quad (25\text{-}75)$$

$$\begin{cases} 42.66 + 0.54 \times (\text{dot11CMMGCurrentChannelCenterFrequencyIndex} - 1),\ 1 \le \text{dot11CMMGCurrentChannelCenterFrequencyIndex} \le 8 \\ 47.52 + 0.54 \times (\text{dot11CMMGCurrentChannelCenterFrequencyIndex} - 9),\ \text{dot11CMMGCurrentChannelCenterFrequencyIndex} = 9, 10 \end{cases}$$

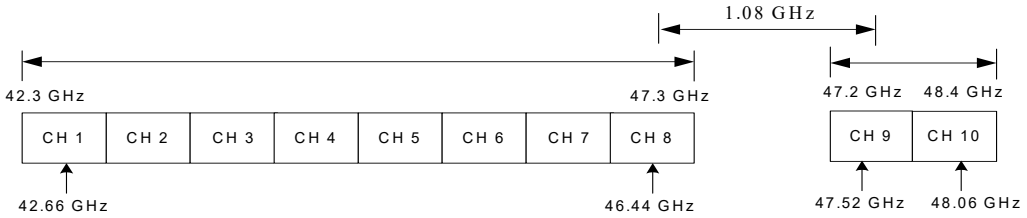

Figure 25-32—Channelization for CBW540

If dot11CMMGCurrentChannelWidth indicates a 1080 MHz channel, the channel center frequency is given by Equation (25-76) (see Figure 25-33).

$$f(n)\ [GHz] = \quad (25\text{-}76)$$

$$\begin{cases} 42.93 + 1.08 \times (\text{dot11CMMGCurrentChannelCenterFrequencyIndex} - 1),\ 1 \le \text{dot11CMMGCurrentChannelCenterFrequencyIndex} \le 4 \\ 47.79,\ \text{dot11CMMGCurrentChannelCenterFrequencyIndex} = 5 \end{cases}$$

25.11 Transmit spectrum mask

For a 540 MHz or 1080 MHz mask PPDU, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 470 MHz or 940 MHz, –17 dBr at 330 MHz or 660 MHz frequency offset, –22 dBr at 1350 MHz or 2670 MHz frequency offset, and –30 dBr at 1530 MHz or 3060 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 235 MHz or 470 MHz and 330 MHz or 660 MHz, in between 330 MHz or 660 MHz and 1350 MHz or 2700 MHz, and in between 1350 MHz or 2700 MHz and 1530 MHz or 3060 MHz shall be linearly interpolated in dB domain from the requirements for 235 MHz, 330 MHz, 1350 MHz, and 1530 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask.

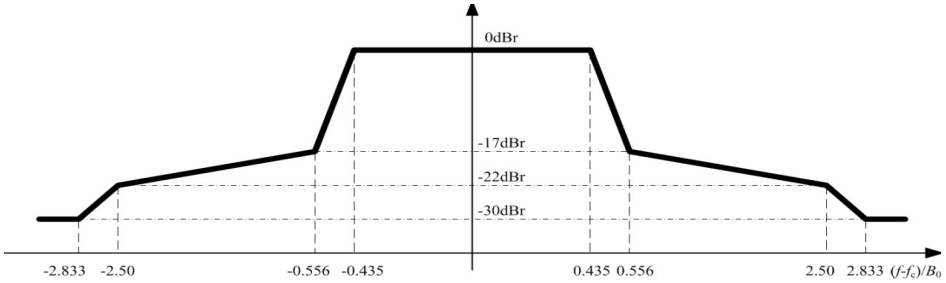

Figure 25-34—Example transmit spectral mask for a PPDU

25.12 PHY transmit procedure

25.12.1 PHY transmit procedure for a CMMG SC mode transmission

The PHY transmit procedure for a CMMG SC mode transmission is shown in Figure 25-35. In order to transmit data, a PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through station management via the PLME, as specified in 25.14. Other transmit parameters, such as MCS and transmit power, are set via the PHY SAP with the PHYTXSTART.request (TXVECTOR) primitive, as described in Table 25-1.

The PHY shall then issue a PHY-TXSTART.request primitive, and transmission of the PHY preamble shall start, based on the parameters passed in the PHY-TXSTART.request primitive. The PHY shall calculate the length of the PPDU according the MCS and the length specified in the PHY-TXSTART.request primitive, adding padding bits if necessary.

The PHY continues with the scrambling, encoding, and transmission of the CMMG-SIG-A according to the PHY-TXSTART.request(TXVECTOR) primitive parameters. The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The data are encoded as described in 25.5.6.3. The encoded data are then modulated as described in 25.5.6.6, depending on the MCS requested in the PHY_TXSTART.request primitive. Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PHY-TXSTART shall be disabled by receiving a PHY-TXEND.request primitive.

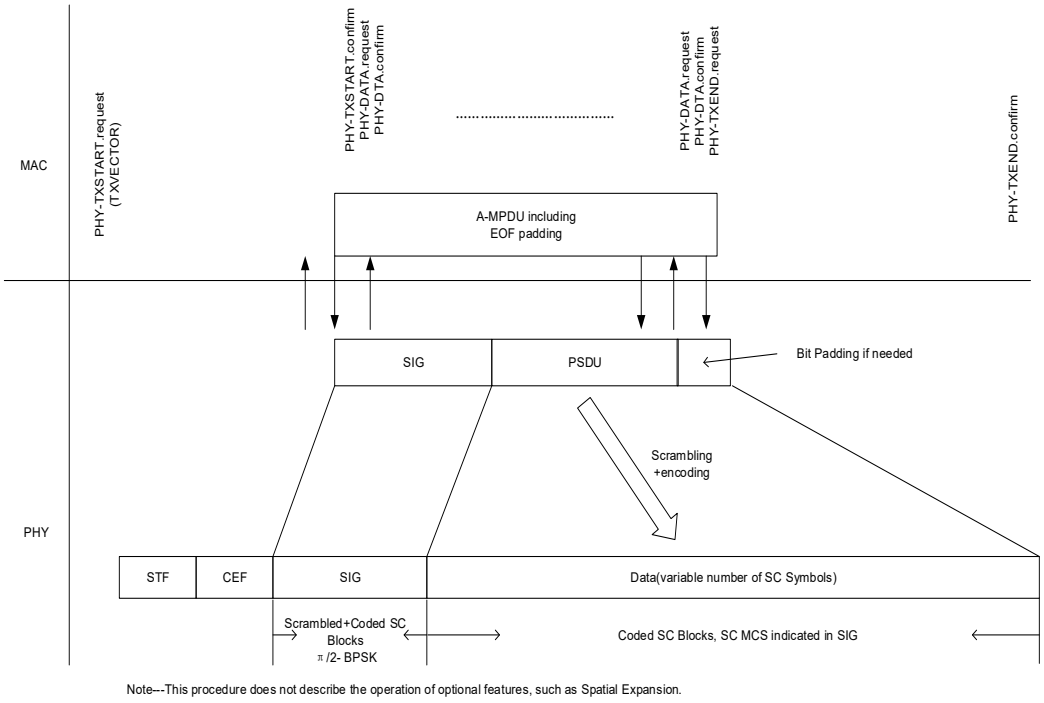
Transmission of the PSDU is completed with the transmission of the last bits of the (encoded) PSDU. If no TRN-T/R fields are specified in the PHY-TXSTART.request primitive, the PHY shall issue a PHY-TXEND.confirm primitive after the transmission of the last bits. If TRN-T and TRN-R fields are requested in the PHY-TXSTART.request primitive, the transmission continues with the transmission of AGC subfields and TRN-T/R subfields. The PHY issues the PHY-TXEND.confirm primitive to the MAC after the transmission of the last TRN-T/R subfield. The PPDU transmission shall be completed, and the PHY entity shall enter the receive state (i.e., PHYTXSTART shall be disabled). Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY.



Note---This procedure does not describe the operation of optional features, such as Spatial Expansion.

Figure 25-35—PHY transmit procedure for a CMMG SC mode transmission

25.12.2 PHY transmit procedure for a CMMG OFDM mode transmission

The PHY transmit procedure for a CMMG OFDM transmission is shown in Figure 25-36. In order to transmit data, a PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through station management via the PLME, as specified in 25.14. Other transmit parameters, such as MCS and transmit power, are set via the PHY SAP with the PHYTXSTART.request(TXVECTOR) primitive, as described in Table 25-1.

The PHY shall then issue a PHY-TXSTART.request primitive, and transmission of the PHY preamble shall start, based on the parameters passed in the PHY-TXSTART.request primitive. The PHY shall calculate the length of the packet according the MCS and the length specified in the PHY-TXSTART.request primitive, adding padding bits if necessary.

The PHY continues with the scrambling, encoding, and transmission of the CMMG SIG according to the PHY-TXSTART.request(TXVECTOR) primitive parameters. The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The data are scrambled and encoded as described in 25.6.8.2 and 25.6.8.3, respectively. The encoded data are then modulated as described in 25.6.8.6,

A typical state machine implementation of the transmit PHY for a CMMG OFDM mode transmission is provided in Figure 25-37. This state machine does not describe the operation of optional features, such as STBC.

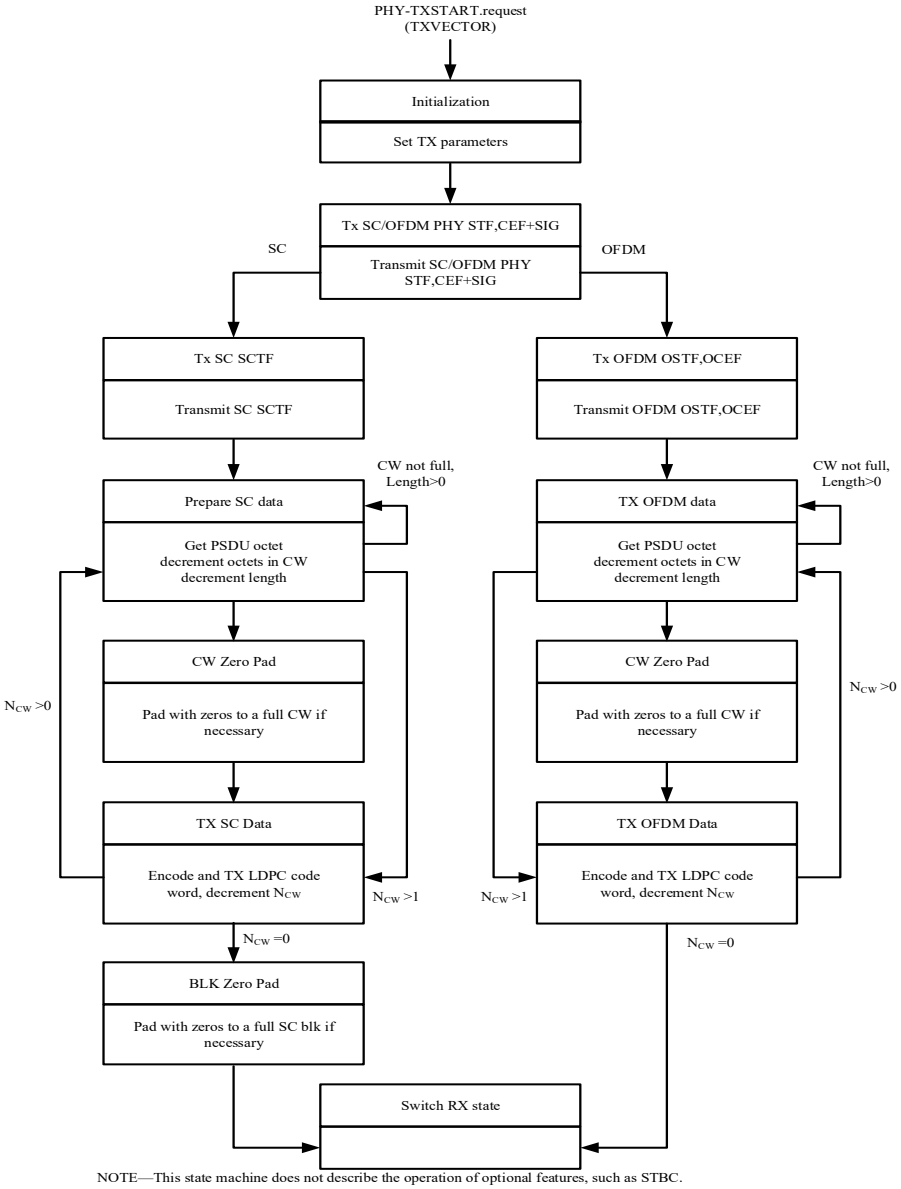

Figure 25-37—Typical Tx state machine

25.13 Receive procedure

A typical PHY receive procedure is shown in Figure 25-39 for a CMMG SC mode transmission.

Upon receiving the transmitted PHY preamble overlapping the primary 540 MHz channel, the PHY measures a receive signal strength. This activity is indicated by the PHY to the MAC via a PHY-CCA.indication primitive. A PHY-CCA.indication (BUSY, channel-list) primitive is also issued as an initial indication of reception of a signal as specified in 25.6.9.3.2. The channel-list parameter of the PHY-CCA.indication primitive is absent when the operating channel width is 540 MHz. The channel-list parameter is present and includes the entry primary when the operating channel width is 1080 MHz.

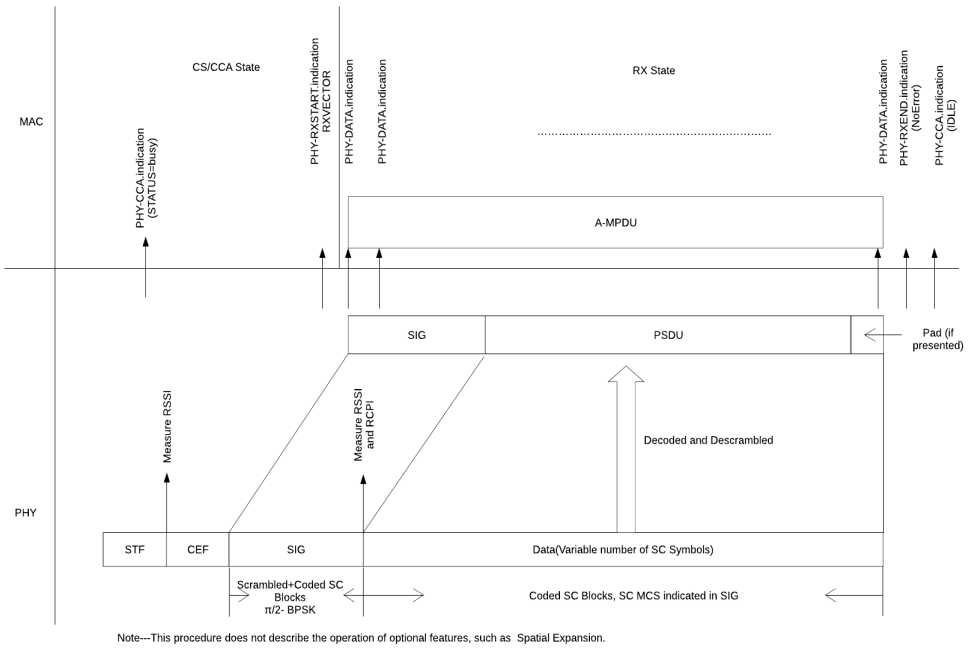

Figure 25-38—PHY receive procedure for a CMMG SC mode transmission

After the PHY-CCA.indication(BUSY) primitive is issued, the PHY entity shall use the following ZCZ sequences of length 256 for synchronization and channel estimation. If the CE field indicated a CMMG SC mode, the receiver is capable of receiving CMMG SC mode. The PHY shall decode the CMMG SIG and determine the MCS, length, and other parameters needed for the demodulation of the remainder of the PPDU.

Subsequently, if dot11TimingMsmtActivated is true, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued, and the RX-START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 25.2.2).

NOTE—The RX_START_OF_FRAME_OFFSET value is used to estimate when the start of the preamble for the incoming PPDU was detected on the medium at the receive antenna connector.

At the end of the Data field, the PHY shall indicate PHY-RXEND.indication(No_Error) primitive to the MAC. If the CMMG SIG indicated the presence of the training field, the PHY shall continue to receive these training fields after the Data field and measure the channel. After the end of the training fields, the PHY shall generate a PHY-CCA.indication(IDLE) primitive.

In the case of signal loss before the decoding of the CMMG SIG or in the case of an invalid header, the PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the received level drops below a value that is 20 dB higher than the receiver sensitivity of MCS 1. In the case of signal loss after decoding of a valid CMMG SIG, the PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the expected end of the packet, including the AGC and TRN fields.

A typical state machine implementation of the receive PHY is given in Figure 25-39. This receive procedure and state machine do not describe the operation of optional features, such as STBC.

25.14 CMMG PLME

25.14.1 PLME SAP layer management primitive

Table 25-36 lists the MIB attributes that may be accessed by the PHY entities and the intralayer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.7.

25.14.2 PHY MIB

CMMG PHY MIB attributes are defined in Annex C with specific values defined in Table 25-36. The Operational semantics column in Table 25-36 contains two types: static and dynamic.

— Static MIB attributes are fixed and cannot be modified for a given PHY implementation.
— Dynamic MIB attributes are interpreted according to the MAX-ACCESS field of the MIB attribute.

When MAX-ACCESS is read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is read-write, the MIB attribute may be read and written by management entities but shall not be updated by the PLME.

25.14.3 TXTIME calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated for a CMMG SC mode PPDU using Equation (25-77) and for a CMMG OFDM mode PPDU using Equation (25-78).

$$TXTIME = T_{STF} + T_{CEF} + T_{SIG} + T_{SCTF} + N_{BL} \times T_{BLK} \quad (25\text{-}77)$$

$$TXTIME = T_{STF} + T_{CEF} + T_{SIG} + T_{OSTF} + N_{OCEF} T_{OCEF} + N_{SYM} \times T_{SYM} \quad (25\text{-}78)$$

where T_{STF}, T_{CEF}, T_{SIG}, T_{SCTF}, T_{OSTF}, and T_{OCEF} are defined in Table 25-3.

For an NDP, there is no Data field, and $N_{SYM} = 0$.

For a CMMG SC mode PPDU, the total number of data blocks in the Data field, N_{BL}, is given by Equation (25-27).

25.14.4 PHY characteristics

The CMMG PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, are shown in Table 25-37. The definitions for these characteristics are given in 6.7.4.

25.15 Parameters for CMMG-MCSs

25.15.1 General

The rate-dependent parameters for 540 MHz and 1080 MHz are given in 25.15.2 and 25.15.3. Support for short GI is optional in all cases. Support for CMMG-MCSs 4 to 16 is optional in all cases. A CMMG STA shall support single spatial stream CMMG-MCSs within the range CMMG-MCS 0 to 3 for 540 MHz channel widths for which it has indicated support regardless of the Tx or Rx Highest Supported Long GI Data Rate subfield values in the Supported CMMG-MCS and NSS Set field. When more than one spatial stream is supported, the Tx or Rx Highest Supported Long GI Data Rate subfield values in the Supported CMMG-MCS and NSS Set field may result in a reduced CMMG-MCS range (cut-off) for N_{SS} = 2, 3, 4. Support for 540 MHz with N_{SS} = 1 and SC transmission is mandatory. Support for 540 MHz and 1080 MHz with N_{SS} = 2, 3, 4 and SC transmission is optional. Support for 540 MHz and 1080 MHz with OFDM transmission is optional.

25.15.2 Parameters for CMMG-MCSs with CMMG SC mode transmission

The related parameters for different modulation are summarized in Table 25-38 to Table 25-41 for 540 MHz channel bandwidth with CMMG SC mode transmission.

Table 25-38—CMMG SC MCSs for mandatory 540 MHz, N_{SS}=1

MCS index	Modulation	*R*	N_{CBPS}	Data rate (Mb/s)	
				Long GI	Short GI
1	π/2-BPSK	1/2	1	165.00	192.50
2	π/2-QPSK	1/2	2	330.00	385.00
3	π/2-QPSK	3/4	2	495.00	577.50
4	π/2-16-QAM	1/2	4	660.00	770.00
5	π/2-16-QAM	3/4	4	990.00	1155.00
6	π/2-64-QAM	5/8	6	1237.50	1443.75
7	π/2-64-QAM	3/4	6	1485.00	1732.50
8	π/2-64-QAM	13/16	6	1608.75	1876.88

Table 25-39—CMMG SC MCSs for optional 540 MHz, N_{SS}=2 (Optional)

MCS index	Modulation	*R*	N_{CBPS}	Data rate (Mb/s)	
				Long GI	Short GI
1	π/2-BPSK	1/2	1	330.00	385.00
2	π/2-QPSK	1/2	2	660.00	770.00
3	π/2-QPSK	3/4	2	990.00	1155.00
4	π/2-16-QAM	1/2	4	1320.00	1540.00
5	π/2-16-QAM	3/4	4	1980.00	2310.00
6	π/2-64-QAM	5/8	6	2475.00	2887.50
7	π/2-64-QAM	3/4	6	2970.00	3465.00
8	π/2-64-QAM	13/16	6	3217.50	3753.75

The related parameters for different modulation are summarized in Table 25-42 to Table 25-45 for 1080 MHz channel bandwidth with CMMG SC mode transmission.

25.15.3 Parameters for CMMG-MCSs with CMMG OFDM mode transmission

The related parameters for different modulation are summarized in Table 25-46 to Table 25-49 for 540 MHz channel bandwidth with CMMG OFDM mode transmission.

26. High-efficiency (HE) MAC specification

26.1 Introduction

An HE STA has a MAC and MLME that comprises the functions defined in Clause 26 as well as the functions defined in Clause 10, the MLME functions defined in Clause 11, and the security functions defined in Clause 12, except when the functions in Clause 26 supersede the functions in Clause 10 or Clause 11.

A frame successfully transmitted by a non-AP STA in response to a Basic Trigger frame is a successful frame exchange sequence initiated by the STA as referred to in Clause 11 and Clause 12.

26.2 HE channel access

26.2.1 TXOP duration-based RTS/CTS

In an HE BSS, the use of RTS/CTS can be TXOP duration based or PSDU length based. An HE AP may configure a non-AP HE STA to use the TXOP duration-based RTS/CTS exchanges to help mitigate interference in dense environments.

An HE AP may set the TXOP Duration RTS Threshold subfield in the HE Operation Parameters field in the HE Operation element it transmits to a value between 1 and 1022 to enable TXOP duration-based RTS/CTS exchanges of its associated STAs. The AP may set the TXOP Duration RTS Threshold field to 1023 to disable TXOP duration-based RTS/CTS exchanges of its associated STAs. In Beacon and Probe Response frames, the AP may set the TXOP Duration RTS Threshold field to 0 to make no changes to TXOP duration-based RTS/CTS exchanges of its associated STAs.

If the TXOP Duration RTS Threshold subfield in the HE Operation Parameters field in the most recently received HE Operation element sent by the AP with which a non-AP HE STA is associated is equal to a nonzero value, then the non-AP HE STA shall set dot11TXOPDurationRTSThreshold to the value of the TXOP Duration RTS Threshold subfield. Otherwise, the non-AP HE STA shall not update dot11TXOPDurationRTSThreshold.

The TXOP duration-based RTS/CTS exchange is disabled at a non-AP HE STA if dot11TXOPDurationRTSThreshold is 1023. The TXOP duration-based RTS/CTS exchange is enabled at a non-AP HE STA when dot11TXOPDurationRTSThreshold is less than 1023.

A non-AP HE STA shall use an RTS/CTS exchange to initiate a TXOP if TXOP duration-based RTS/CTS exchange is enabled at a non-AP HE STA and the following conditions are met:

— The STA intends to transmit individually addressed frames to the HE AP or to a TDLS peer STA
— The TXOP duration is greater than or equal to 32 μs × dot11TXOPDurationRTSThreshold

Otherwise, the non-AP HE STA follows the rules defined in 10.3.1.

26.2.2 Intra-BSS and inter-BSS PPDU classification

A STA shall classify a received PPDU as an inter-BSS PPDU if at least one of the following conditions is true:

— The BSS color is not disabled (see 26.17.3.3) and the RXVECTOR parameter BSS_COLOR is not 0 and is not the BSS color of the BSS of which the STA is a member.

— The PPDU is a VHT PPDU with RXVECTOR parameter PARTIAL_AID not equal to the BSSID[39:47] of the BSS in which the STA is associated or any of the other BSSs in the same multiple BSSID set or co-hosted BSSID set to which its BSS belongs and the RXVECTOR parameter GROUP_ID is 0.

— The PPDU is a VHT PPDU with RXVECTOR parameter PARTIAL_AID[5:8] not equal to the 4 LSBs of the BSS color announced by the BSS of which the STA whose dot11PartialBSSColorImplemented is equal to true is a member and RXVECTOR parameter GROUP_ID equal to 63 when the Partial BSS Color field in the most recent HE Operation element is 1.

— The PPDU is either a VHT MU PPDU or an HE MU PPDU with the RXVECTOR parameter UPLINK_FLAG equal to 0, and the STA is an AP.

— The PPDU carries a frame that has a BSSID field, the value of which is not the BSSID of the BSS in which the STA is associated or any of the other BSSs in the same multiple BSSID set or co-hosted BSSID set to which its BSS belongs or the wildcard BSSID.

— The PPDU carries a frame that does not have a BSSID field but has both an RA field and TA field, neither value of which is equal to the BSSID of the BSS in which the STA is associated or any of the other BSSs in the same multiple BSSID set or co-hosted BSSID set to which its BSS belongs. The Individual/Group bit in the TA field is forced to 0 prior to comparison.

A STA shall classify the received PPDU as an intra-BSS PPDU if at least one of the following conditions is true:

— The BSS color is not disabled (see 26.17.3.3) and the RXVECTOR parameter BSS_COLOR is the BSS color of the BSS of which the STA is a member or the BSS color of any TDLS direct links to which the STA belongs if the STA is an HE STA associated with a non-HE AP.

— The PPDU is a VHT PPDU with RXVECTOR parameter PARTIAL_AID equal to the BSSID[39:47] of the BSS in which the STA is associated or any of the other BSSs in the same multiple BSSID set or co-hosted BSSID set to which its BSS belongs and the RXVECTOR parameter GROUP_ID equal to 0.

— The PPDU is a VHT PPDU with RXVECTOR parameter PARTIAL_AID[5:8] equal to the 4 LSBs of the BSS color announced by of the BSS of which the STA whose dot11PartialBSSColorImplemented is equal to true is a member, the RXVECTOR parameter GROUP_ID is equal to 63, and the Partial BSS Color field in the most recent HE Operation element is 1.

— The PPDU carries a frame that has an RA, TA, or BSSID field value that is equal to the BSSID of the BSS or the BSSID of any BSS in which the STA is associated or any of the other BSSs in the same multiple BSSID set or co-hosted BSSID set to which its BSS belongs. The Individual/Group bit in the TA field is forced to 0 prior to the comparison.

— The PPDU carries a Control frame that does not have a TA field and that has an RA field value that matches the saved TXOP holder address of the BSS or any BSS in which the STA is associated or any of the other BSSs in the same multiple BSSID set or co-hosted BSSID set to which its BSS belongs.

NOTE—See 10.19 for the definition of PARTIAL_AID[5:8] and BSSID[39:47].

Otherwise, the PPDU cannot be determined as an intra-BSS or inter-BSS PPDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If, based on the MAC address information of a frame carried in a received PPDU, the received PPDU satisfies both intra-BSS and inter-BSS conditions, then the received PPDU is classified as an intra-BSS PPDU.

If the received PPDU satisfies the intra-BSS conditions using the RXVECTOR parameter BSS_COLOR and also satisfies the inter-BSS conditions using MAC address information of a frame carried in the PPDU, then the classification made using the MAC address information takes precedence.

26.2.3 SRG PPDU identification

Identification of SRG and non-SRG PPDUs is used during SRG OBSS PD spatial reuse operation as described in 26.10.

A non-AP HE STA that has received a Spatial Reuse Parameter Set element from its associated AP with a value of 1 in the SRG Information Present subfield shall use information provided in the Spatial Reuse Parameter Set element to identify BSSs that are members of the STA's SRG to determine if a received inter-BSS PPDU is an SRG PPDU. An HE AP may use an SRG that is different from the SRG that it transmits to other STAs in Spatial Reuse Parameter Set elements to determine whether a received inter-BSS PPDU is an SRG PPDU.

A received HE PPDU that is an inter-BSS PPDU is an SRG PPDU if the bit in the SRG BSS Color Bitmap field indexed by the value of the RXVECTOR parameter BSS_COLOR is 1. A received VHT PPDU that is an inter-BSS PPDU is an SRG PPDU if the GROUP_ID parameter of the RXVECTOR has a value of 0 and the bit in the SRG Partial BSSID Bitmap field that corresponds to the numeric value of PARTIAL_AID[0:5] of the RXVECTOR is 1.

A received PPDU that is an inter-BSS PPDU is an SRG PPDU if BSSID information from a frame carried in the PPDU is correctly received and the bit in the SRG Partial BSSID Bitmap field that corresponds to the numeric value of BSSID[39:44] is 1.

A VHT PPDU that is an inter-BSS PPDU and that is received with RXVECTOR parameter GROUP_ID equal to 0 is an SRG PPDU if the bit in the SRG Partial BSSID Bitmap field that corresponds to the numeric value of bits [39:44] of the RA field of any correctly received frame from the PPDU is 1.

A VHT PPDU that is an inter-BSS PPDU and that is received with RXVECTOR parameter GROUP_ID equal to 63 is an SRG PPDU if the bit in the SRG Partial BSSID Bitmap field that corresponds to the numeric value of bits [39:44] of the TA field of any correctly received frame from the PPDU is 1.

An HE SU PPDU, HE ER SU PPDU, or HE MU PPDU that is an inter-BSS PPDU and that is received with the RXVECTOR parameter UPLINK_FLAG equal to 1 is an SRG PPDU if the bit in the SRG Partial BSSID Bitmap field that corresponds to the numeric value of bits [39:44] of the RA field of any correctly received frame from the PPDU is 1.

Otherwise, the PPDU is not determined to be an SRG PPDU. A non-AP HE STA that has not received a Spatial Reuse Parameter Set element from its associated AP with a value of 1 in the SRG Information Present subfield shall not classify any received PPDUs as an SRG PPDU. An HE AP that has not transmitted a Spatial Reuse Parameter Set element with a value of 1 in the SRG Information Present subfield may classify received PPDUs as SRG PPDUs using information that it has not transmitted.

26.2.4 Updating two NAVs

A non-AP HE STA shall maintain two NAVs, and an HE AP may maintain two NAVs: an intra-BSS NAV and a basic NAV. The intra-BSS NAV is updated by an intra-BSS PPDU. The basic NAV is updated by an

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

inter-BSS PPDU or a PPDU that cannot be classified as intra-BSS or inter-BSS. The mechanism by which a PPDU is classified intra-BSS or inter-BSS is defined in 26.2.2.

Maintaining two NAVs is beneficial in dense deployment scenarios in which a STA requires protection from frames transmitted by STAs within its BSS, i.e., intra-BSS, and wants to avoid interference from frames transmitted by STAs in a neighboring BSS, i.e., inter-BSS. For example, in a TXOP initiated by the AP with which a STA is associated for an HE TB PPDU transmission, the intra-BSS NAV of the STA is set by the AP to prevent the STA from contending for the channel. The basic NAV of the STA is not updated by transmissions from the AP during the TXOP so that if the basic NAV of the STA is nonzero and the STA receives, from the AP, a Trigger frame with the CS Required subfield equal to 1, the STA does not respond (see 26.5.2.5).

The requirements in 10.3.2.1 apply to an HE STA maintaining two NAVs, with the exception of the virtual CS indication of medium. For an HE STA maintaining two NAVs, if both the NAV timers are 0, the virtual CS indication is that the medium is idle; if at least one of the two NAV timers is nonzero, the virtual CS indication is that the medium is busy.

The procedure in 10.3.2.9 applies to an HE STA maintaining two NAVs, and the NAV referred by the description in 10.3.2.4 is the basic NAV.

A STA shall update the intra-BSS NAV with the duration information indicated by the received frame in a PSDU if all the following conditions are met:

— The frame is identified as intra-BSS according to the rule described in 26.2.2.
— The indicated duration is greater than the current intra-BSS NAV value.
— The RA of the received frame is not the STA’s MAC address; or the STA is not a TXOP holder, and the PPDU carrying the frame does not contain a frame that solicits an immediate response from the STA; or the STA is not a TXOP holder, and the received frame is a Trigger frame.

Otherwise it shall not so update the intra-BSS NAV.

A STA shall update the basic NAV with the duration information indicated by the received frame in a PSDU if all the following conditions are met:

— The frame is identified as inter-BSS or cannot be identified as intra-BSS or inter-BSS according to the rule described in 26.2.2.
— The indicated duration is greater than the current basic NAV value.
— The RA of the received frame is not the STA’s MAC address.

Otherwise it shall not so update the basic NAV.

A STA that is a TXOP holder shall not update the intra-BSS NAV with the duration information indicated by the RXVECTOR parameter TXOP_DURATION.

A STA that is not a TXOP holder shall update the intra-BSS NAV with the duration information indicated by the RXVECTOR parameter TXOP_DURATION for an HE PPDU if all the following conditions are met:

— The RXVECTOR parameter TXOP_DURATION is not UNSPECIFIED.
— The PPDU that carried information of the RXVECTOR parameter is identified as intra-BSS according to the rule described in 26.2.2.
— The STA does not receive a frame with a Duration field in the PPDU.
— The duration information indicated by the RXVECTOR parameter TXOP_DURATION is greater than the current intra-BSS NAV of the STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Otherwise it shall not so update the intra-BSS NAV.

A STA shall update the basic NAV with the duration information indicated by the RXVECTOR parameter TXOP_DURATION for an HE PPDU if all the following conditions are met:

— The RXVECTOR parameter TXOP_DURATION is not UNSPECIFIED.
— The PPDU that carried information for the RXVECTOR parameter is identified as inter-BSS or cannot be identified as intra-BSS or inter-BSS according to the rule described in 26.2.2.
— The STA does not receive a frame with a Duration field in the PPDU.
— The duration information indicated by the RXVECTOR parameter TXOP_DURATION is greater than the current basic NAV of the STA.

Otherwise it shall not so update the basic NAV.

NOTE 1—If a PS-Poll frame is received in an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU, then the RXVECTOR parameter TXOP_DURATION does not indicate duration information (see 26.11.5).

NOTE 2—If a STA receives an HE PPDU with the duration information indicated by both a frame with a Duration field and the RXVECTOR parameter TXOP_DURATION, then the duration information indicated by the RXVECTOR parameter TXOP_DURATION is ignored.

NOTE 3—The additional rules of NAV consideration for a STA that is solicited for an immediate response are described in 10.3.2.9, 10.3.2.11, and 26.5.2.5.

A PHY-CCARESET.request primitive shall be issued if one of the following condition is met:

— One NAV is reset, and the other NAV timer is 0.
— Both NAVs are reset simultaneously.

The NAVs (if any) are updated at the expected end of the PPDU as defined in 10.3.2.4.

An HE STA that used information from an RTS or MU-RTS Trigger frame as the most recent basis to update its NAV may reset the NAV that is updated by the RTS or MU-RTS Trigger frame if no PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive is received from the PHY during a period with a duration of 2 × aSIFSTime + CTS_Time + aRxPHYStartDelay + 2 × aSlotTime starting when the MAC receives a PHY-RXEND.indication primitive corresponding to the detection of the RTS or MU-RTS Trigger frame (see 10.3.2.4 for the definition of CTS_Time).

26.2.5 Truncation of TXOP

A non-AP HE STA that is not associated with an HE AP shall interpret the reception of a CF-End frame as a NAV reset, i.e., it resets its maintained NAV to 0 at the end of the PPDU containing this frame.

An HE AP that maintains one NAV (see 10.3.2.1) and receives a CF-End frame should reset the NAV, unless either of following conditions is met:

— The received CF-End frame is carried in an inter-BSS PPDU, and the most recently updated NAV was due to a frame carried in an intra-BSS PPDU (see 26.2.2).
— The received CF-End frame is carried in an intra-BSS PPDU, and the most recently updated NAV was due to a frame carried in an inter-BSS PPDU (see 26.2.2).

An HE STA that maintains two NAVs (see 26.2.4) and receives a CF-End frame should reset the basic NAV if the received CF-End frame is carried in an inter-BSS PPDU and reset the intra-BSS NAV if the received CF-End frame is carried in an intra-BSS PPDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An HE STA that maintains two NAVs may reset both NAVs if the received CF-End frame is carried in an intra-BSS PPDU and the basic NAV was updated due to a frame carried in a PPDU that cannot be identified as either an inter-BSS PPDU or intra-BSS PPDU.

An HE STA that receives a CF-End frame and resets all its maintained NAV(s) can start contending for the medium without further delay.

26.2.6 MU-RTS Trigger/CTS frame exchange sequence procedure

26.2.6.1 General

The MU-RTS Trigger/CTS frame exchange sequence procedure allows an AP to initiate a TXOP and protect the TXOP frame exchange sequences. An AP may transmit an MU-RTS Trigger frame to solicit simultaneous CTS frame transmissions from one or more non-AP STAs.

Figure 26-1 shows an example of the exchange of MU-RTS and simultaneous CTS responses to protect the DL MU PPDU and the acknowledgment responses.

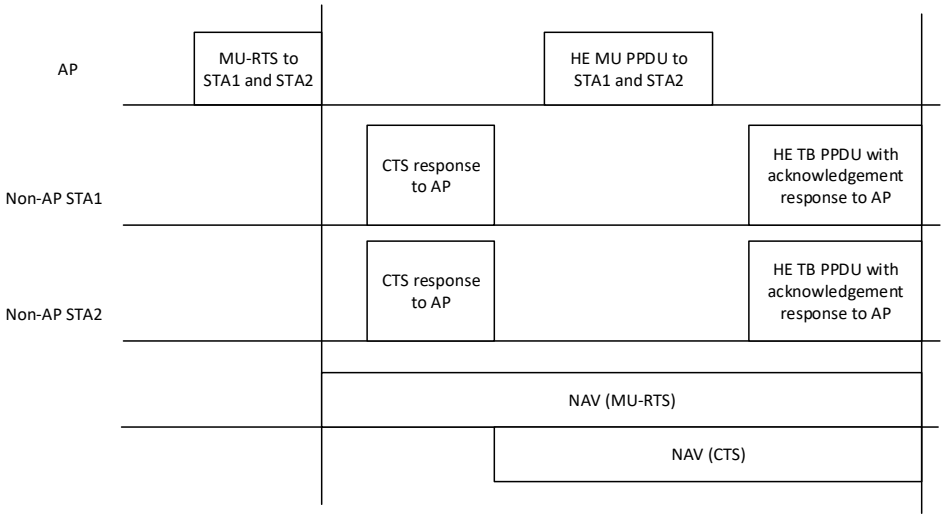

Figure 26-1—Example of MU-RTS/CTS/DL MU PPDU/Acknowledgment Response and NAV setting

Figure 26-2 shows an example of the exchange of MU-RTS and simultaneous CTS responses to protect the HE TB PPDU and Multi-STA BlockAck frame.

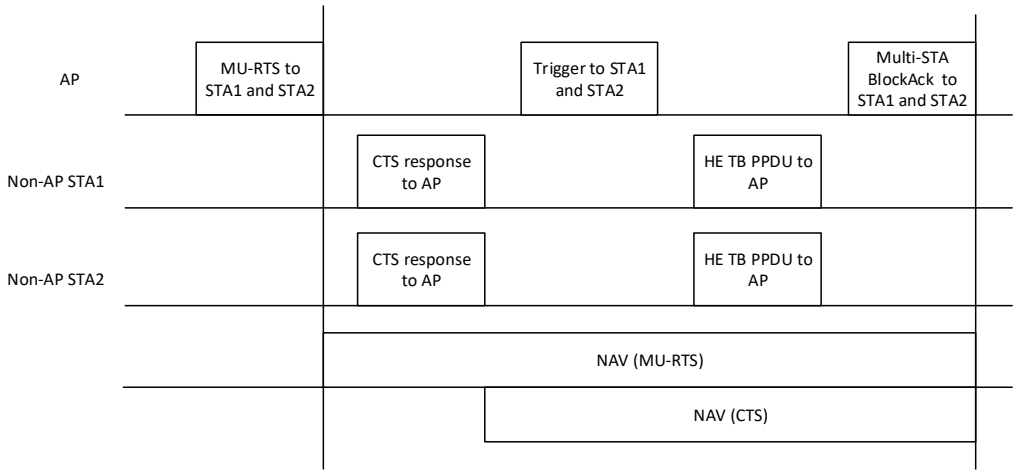

Figure 26-2—Example of MU-RTS/CTS/Trigger/HE TB PPDU/Multi-STA BlockAck and NAV setting

26.2.6.2 MU-RTS Trigger frame transmission

In each 20 MHz channel occupied by the PPDU that contains an MU-RTS Trigger frame, the transmitter of the MU-RTS Trigger frame shall request at least one non-AP STA to send a CTS frame that occupies the 20 MHz channel. The transmitter of an MU-RTS Trigger frame shall not request a non-AP STA to send a CTS frame in a 20 MHz channel that is not occupied by the PPDU that contains the MU-RTS Trigger frame.

After transmitting an MU-RTS Trigger frame, the AP shall wait for a CTSTimeout interval of aSIFSTime + aSlotTime + aRxPHYStartDelay that begins when the MAC receives the PHY-TXEND.confirm primitive for the transmitted MU-RTS Trigger frame. If the MAC does not receive a PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive during the CTSTimeout interval, the AP shall conclude that the transmission of the MU-RTS Trigger frame has failed, and, if the MU-RTS Trigger frame initiated a TXOP, the AP shall invoke its backoff procedure. If the MAC receives a PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive during the CTSTimeout interval, then the MAC shall wait for the corresponding PHY-RXEND.indication primitive to determine whether the MU-RTS Trigger frame transmission was successful. The receipt of a CTS frame from any non-AP STA addressed by the MU-RTS Trigger frame before the PHY-RXEND.indication primitive shall be interpreted as the successful transmission of the MU-RTS Trigger frame, permitting the frame exchange sequence to continue. The receipt of any other type of frame shall be interpreted as a failure of the MU-RTS Trigger frame transmission. In this instance, the AP may process the received frame and, if the MU-RTS Trigger frame initiated a TXOP, shall invoke its backoff procedure at the PHY-RXEND.indication primitive.

NOTE—If an AP transmits an MU-RTS Trigger frame in an already initiated TXOP and the MU-RTS Trigger frame transmission fails, then the AP might perform a PIFS recovery as described in 10.23.2.8 or invoke the backoff procedure described in 10.23.2.2.

An MU-RTS Trigger frame shall not be carried in a VHT MU PPDU or an HE MU PPDU.

26.2.6.3 CTS frame sent in response to an MU-RTS Trigger frame

If a non-AP STA receives an MU-RTS Trigger frame, the non-AP STA shall commence the transmission of a CTS frame at the SIFS time boundary after the end of a received PPDU when all the following conditions are met:

— The MU-RTS Trigger frame has one of the User Info fields addressed to the non-AP STA. The User Info field is addressed to a non-AP STA if the AID12 subfield is equal to the 12 LSBs of the AID of the STA and the MU-RTS Trigger frame is sent by the AP with which the non-AP STA is associated or by the AP corresponding to the transmitted BSSID if the non-AP STA is associated with an AP corresponding to a nontransmitted BSSID and has indicated support for receiving Control frames with TA field set to the transmitted BSSID by setting the Rx Control Frame To MultiBSS subfield to 1 in the HE Capabilities element that the non-AP STA transmits.

— The UL MU CS condition indicates that the medium is idle (see 26.5.2.5).

Otherwise, the non-AP STA shall not send a CTS frame.

NOTE 1—The RU Allocation subfield in the User Info field addressed to the non-AP STA indicates whether the CTS frame is to be sent on the primary 20 MHz channel, primary 40 MHz channel, primary 80 MHz channel, 160 MHz channel, or 80+80 MHz channel as described in 9.3.1.22.5.

NOTE 2—A combination of virtual CS and ED-based CCA during the SIFS after the PPDU containing the MU-RTS Trigger frame is used to determine the state of the medium (see 26.5.2.5).

The CTS frame sent in response to an MU-RTS Trigger frame shall be carried in a non-HT or non-HT duplicate PPDU (see Clause 17) with a 6 Mb/s rate and with the TXVECTOR parameter SCRAMBLER_INITIAL_VALUE set to the same value as the RXVECTOR parameter SCRAMBLER_INITIAL_VALUE of the PPDU carrying the MU-RTS Trigger frame. The PPDU carrying the CTS frame shall be transmitted on the 20 MHz channels indicated in the RU Allocation subfield of the User Info field of the MU-RTS Trigger frame.

NOTE 3—A bandwidth signaling TA is not used in an MU-RTS Trigger frame or a CTS frame sent in response to an MU-RTS Trigger frame (see 9.3.1.22 and 9.3.1.3). As a result, the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT is not present when transmitting an MU-RTS Trigger frame or CTS frame sent in response to an MU-RTS Trigger frame.

The Power Management and More Data subfields in a CTS frame sent in response to an MU-RTS Trigger frame shall be set to 0.

NOTE 4—Other subfields of the Frame Control field of the CTS frames sent in response to an MU-RTS Trigger frame are set as described in Figure 9-37.

Figure 26-3 shows an example of the exchange of an MU-RTS Trigger frame and simultaneous CTS frame transmissions on the primary 40 MHz channel. In this example, MU-RTS Trigger frame is transmitted in a 40 MHz non-HT duplicate PPDU on the primary 40 MHz channel. Further, the MU-RTS Trigger frame requests non-AP STA1 to transmit a CTS frame in a non-HT PPDU on the primary 20 MHz channel and non-AP STA2 to transmit a CTS frame in a 40 MHz non-HT duplicate PPDU on the primary 40 MHz channel.

A non-AP STA that transmits a CTS frame in response to an MU-RTS Trigger frame shall follow the precorrection requirements defined in 27.3.15.3.

NOTE 5—The AP Tx Power and UL Target Receive Power fields in an MU-RTS Trigger frame are reserved, and there is no power precorrection requirement for the CTS frame sent in response to an MU-RTS Trigger frame (i.e., the AP that sends the MU-RTS frame does not specify the transmission power of the solicited CTS frame).

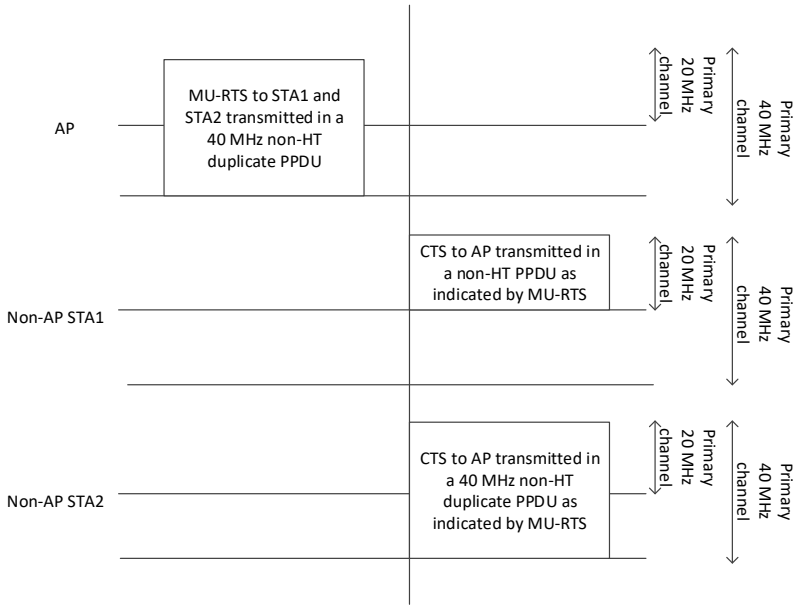

Figure 26-3—Example of MU-RTS Trigger frame soliciting CTS frame transmissions on primary 40 MHz channel

26.2.7 EDCA operation using MU EDCA parameters

An HE AP shall set the QoS Info field of an MU EDCA Parameter Set element (if present) to the same value as the QoS Info field of an EDCA Parameter Set element (if present). An HE AP may change the MU EDCA parameters by including the MU EDCA Parameter Set element with updated MU EDCA parameters in the Beacon frames and Probe Response frames it transmits. The EDCA Parameter Set Update Count subfield in the QoS Info field of the EDCA Parameter Set element and MU EDCA Parameter Set element is incremented every time any EDCA parameters or MU EDCA parameters change.

A non-AP HE STA shall update the dot11EDCATable and dot11MUEDCATable that correspond to fields in an EDCA Parameter Set element or an MU EDCA Parameter Set element within an interval of time equal to one beacon interval after receiving an updated EDCA or MU EDCA parameter set from its associated AP. When updating its MIB attributes, an HE STA stores the value of the EDCA Parameter Set Update Count subfield in the QoS Info field of the received EDCA Parameter Set element or MU EDCA Parameter Set element.

A non-AP HE STA shall use the EDCA Parameter Set Update Count subfield in the QoS Capability element of Beacon frames, where present, to determine whether the STA is using the current EDCA (and optionally MU EDCA) parameters. If the EDCA Parameter Set Update Count subfield value is different from the value that has been stored, the STA shall query the updated EDCA (and any MU EDCA) parameters by sending a Probe Request frame to the AP.

NOTE 1—If the QoS Capability element is present in a Beacon frame, the EDCA Parameter Set element and the MU EDCA Parameter Set element are not present. In this case, the only way for an HE STA to obtain the updated parameters is to send a Probe Request frame to the AP.

A non-AP HE STA that receives a Basic Trigger frame that contains a User Info field addressed to the STA shall update its CWmin[AC], CWmax[AC], AIFSN[AC], and MUEDCATimer[AC] state variables to the values contained in the dot11MUEDCATable, for all the ACs from which at least one QoS Data frame was transmitted successfully in an HE TB PPDU in response to the Trigger frame. A QoS Data frame is

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

transmitted successfully by the STA in an HE TB PPDU for an AC if it requires immediate acknowledgment and the STA receives an immediate acknowledgment for that frame, or if the QoS Data frame does not require immediate acknowledgment.

The MUEDCATimer[AC] state variable is updated with the value contained in the MU EDCA Timer subfield of the MU EDCA Parameter Set element. The backoff counter maintenance corresponding to the updated state variables shall follow the rules in 10.23.2.2, except that if AIFSN[AC] is 0, then the EDCAF corresponding to that AC shall be suspended until the MUEDCATimer[AC] reaches 0 or is reset to 0. The updated MUEDCATimer[AC] shall start at the end of the immediate response if the transmitted HE TB PPDU contains at least one QoS Data frame for that AC that requires immediate acknowledgment, and shall start at the end of the HE TB PPDU if the transmitted HE TB PPDU does not contain any QoS Data frames for that AC that require immediate acknowledgment.

In a non-AP HE STA, each MUEDCATimer[AC] shall uniformly count down without suspension to 0 when its value is nonzero.

NOTE 2—A non-AP STA that sends a frame to the AP with an OM Control subfield containing a value of 1 in the UL MU Disable subfield or a value of 0 in the UL MU Disable subfield and a value of 1 in the UL MU Data Disable subfield does not participate in UL MU operation. As such it is exempt from updating its EDCA access parameters to the values contained in the MU EDCA Parameter Set element as defined in this subclause.

NOTE 3—A non-AP STA does not update its state variables to the values contained in the MU EDCA Parameter Set element if any of the following applies:

a) The Trigger frame addressed to the STA is not a Basic Trigger frame.
b) The STA does not include QoS Data frames in the HE TB PPDU response sent in response to the Basic Trigger frame.
c) The STA transmits the HE TB PPDU in response to a Basic Trigger frame following the rules defined in 26.5.4.

NOTE 4—The TXOP limits are not updated by the procedure defined in this subclause, but by the procedure in 10.23.2.9.

A non-AP STA that sends frames that are not addressed to its associated AP may use the EDCA parameters that are contained in the most recently received EDCA Parameter Set element sent by the AP with which the STA is associated or the default EDCA parameters (see Table 9-194), following the rules in 10.2.3.2.

If the MUEDCATimer[AC] of a non-AP HE STA reaches 0, either by counting down or due to a reset following the reception of an MU EDCA Reset frame, the STA shall update CWmin[AC], CWmax[AC], and AIFSN[AC] to the values that are contained in the most recently received EDCA Parameter Set element sent by the AP with which the STA is associated.

A non-AP HE STA that sends a frame with an OM Control subfield with the UL MU Disable subfield set to 1 or with the UL MU Disable subfield set to 0 and the UL MU Data Disable subfield set to 1 as defined in 26.9.3 may set the MUEDCATimer[AC] for all ACs to 0 on receiving an immediate acknowledgment from the OMI responder. The STA continues the current EDCA backoff procedure without modifying the QSRC[AC] or the backoff counter for the associated EDCAF, regardless of whether the MUEDCATimer[AC] has reached zero, until the STA invokes a new EDCA backoff procedure. The STA follows the rules defined in 10.23.2.2 for updating CWmin, CWmax, and AIFSN for that AC.

A non-AP HE STA that receives an individually addressed MU EDCA Reset frame from its associated AP may reset the MUEDCATimer[AC] to 0 for an AC if the bit corresponding to that AC in the Affected ACs subfield is equal to 1 when the MUEDCATimer[AC] of the STA is not equal to 0. The STA may invoke a new EDCA backoff procedure after the MUEDCATimer[AC] is reset for that AC and after CWmin[AC], CWmax[AC], and AIFSN[AC] are updated for that AC, as per this subclause, in response to the MUEDCATimer[AC] reset.

26.2.8 Multiple frame exchange sequences in an EDCA TXOP in the 6 GHz band

A STA that operates in the 6 GHz band and transmits multiple frames shall follow the rules defined in 10.23.2.7 with the exceptions described in this subclause.

NOTE 1—In the 6 GHz band, the TXOP field in the HE-SIG-A field can be understood by all STAs. The TXOP field provides TXOP protection equivalent to non-HT duplicate RTS/CTS.

In a TXOP without non-HT duplicate PPDUs, if the TXOP is protected by the TXOP field in the HE-SIG-A field of the first HE PPDU in the TXOP, i.e., the TXOP field is not set to UNSPECIFIED, the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of the subsequent PPDUs in the TXOP to indicate a bandwidth that is the same or narrower than the bandwidth indicated by the CH_BANDWIDTH parameter of the first HE PPDU in the TXOP.

NOTE 2—Frame exchange sequences in a TXOP that is protected by RTS/CTS follow the rules in 10.23.2.8.

Additionally, if the first HE PPDU whose TXOP field in the HE-SIG-A field is not set to UNSPECIFIED is a DL HE MU PPDU with preamble puncture, then the TXOP holder shall use the 20 MHz channels for the non-initial PPDU that are within the set of 20 MHz channels where pre-HE modulated fields of the first HE PPDU whose TXOP field in the HE-SIG-A field is not set to UNSPECIFIED are located.

Within an obtained TXOP that does not include HE PPDUs whose TXOP field in the HE-SIG-A field is not UNSPECIFIED nor non-HT duplicate PPDUs, the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of a non-initial PPDU to be equal to or less than the TXVECTOR parameter CH_BANDWIDTH of the preceding PPDU that was transmitted in the same TXOP, subject to the following constraints:

— If the preceding PPDU is a DL HE MU PPDU with preamble puncture, the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of the non-initial PPDU to a value whose corresponding 20 MHz channels are within a set of 20 MHz channels where pre-HE modulated fields of the preceding PPDU are located.
— If the non-initial PPDU is a DL HE MU PPDU with preamble puncture, the TXOP holder shall set the TXVECTOR parameter RU_ALLOCATION of the non-initial PPDU to a value whose corresponding RU is within a set of 20 MHz channels where pre-HE modulated fields of the preceding PPDU are located.

26.3 Fragmentation and defragmentation

26.3.1 General

An HE STA shall follow the fragmentation procedures defined in 10.2.7, 10.4, and 10.5, except that some of the rules are relaxed as defined in the subclauses of 26.3. Dynamic fragmentation provides further flexibility in aggregating data to fit in a constrained PPDU duration (see 26.5).

Subclauses 10.2.7 and 10.4 define the procedure to generate uniformly fragmented MSDUs or MMPDUs, where the length of each fragment is the same, except for the last fragment. These fragments are not included in an A-MPDU under HT-immediate block ack agreements.

An HE STA can negotiate the use of different levels of dynamic fragmentation:

— Level 1: support for one dynamic fragment that is a non-A-MPDU; no support for dynamic fragments in an A-MPDU that does not contain an S-MPDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

- Level 2: support for dynamic fragments in an A-MPDU that does not contain an S-MPDU, subject to the following conditions:
  - No more than one dynamic fragment of any given MSDU or A-MSDU in the A-MPDU; this dynamic fragment is sent under a block ack agreement.
  - No more than one MPDU that is a dynamic fragment of an MMPDU in the A-MPDU (see 26.6.2 and 26.6.3).
- Level 3: support for dynamic fragments in an A-MPDU that does not contain an S-MPDU, subject to the following conditions:
  - No more than four dynamic fragments of any given MSDU or A-MSDU in the A-MPDU; these dynamic fragments are sent under a block ack agreement.
  - No more than one MPDU that is a dynamic fragment of an MMPDU in the A-MPDU (see 26.6.2 and 26.6.3).

NOTE 1—An HE STA that is operating in level 2 or level 3 also supports transmitting and receiving level 1 dynamic fragments.

NOTE 2—Under level 2, there might be multiple Data frames that are dynamic fragments, but these have different sequence numbers and/or UPs.

This subclause defines the procedure for generating nonuniformly fragmented MSDUs, A-MSDUs, or MMPDUs, where the length of each fragment is not necessarily the same. The length of the first fragment shall be greater than or equal to the minimum fragment size indicated in the Minimum Fragment Size subfield in the HE Capabilities Information field in the HE Capabilities element sent by the recipient STA. If the length of the MSDU, A-MSDU, or MMPDU is less than the minimum fragment size, then the MSDU, A-MSDU, or MMPDU shall not be fragmented. The fragments generated with dynamic fragmentation are referred to as dynamic fragments.

These procedures allow the inclusion of one dynamic fragment that is a non-A-MPDU in level 1, level 2, and level 3 and allow the inclusion of one or more dynamic fragments within an A-MPDU that contains one or more MPDUs in level 2 and level 3.

An HE STA follows the rules defined in 26.3.2 for generating these fragments and the rules defined in 26.3.3 for defragmenting of the received dynamic fragments. In 26.3.2 and 26.3.3, the HE STA follows the fragmentation level that is indicated in the Dynamic Fragmentation Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element it transmits, unless an ADDBA Extension element is included in the ADDBA Request and ADDBA Response frames exchanged during the block ack setup procedure. In this case, the HE STA follows the fragmentation level that is indicated in an ADDBA Extension element in the ADDBA Response frame it receives (see 26.3.3.1) during the block ack setup procedure.

An HE STA shall set the HE Fragmentation Operation subfield in the ADDBA Extension element, if present, in the ADDBA Request or ADDBA Response frame to a value that is less than or equal to the value of the Dynamic Fragmentation Support subfield in the HE Capabilities element it transmits.

An HE STA shall set the HE Fragmentation Operation subfield in the ADDBA Extension element, if present, in the ADDBA Response frame to a value that is less than or equal to the value of HE Fragmentation Operation subfield in the ADDBA Extension element, if present, in the received ADDBA Request frame.

26.3.2 Dynamic fragmentation

26.3.2.1 General

With level 1 and level 2 dynamic fragmentation, the following apply:

— An originator STA transmitting one or more dynamic fragments shall solicit an immediate response from the recipient STA for each of the fragments.

— The originator STA shall transmit the fragments in order as defined in 10.4.

With level 3 dynamic fragmentation, not all dynamic fragments require an immediate response, and dynamic fragments are not required to be sent in order.

An HE STA may transmit dynamic fragments of an A-MSDU, provided the A-MSDU Fragmentation Support subfield in the HE Capabilities element transmitted by the recipient is 1.

The originator STA shall not transmit concurrently the dynamic fragments of a number of outstanding MSDUs and A-MSDUs (if supported) to the same recipient STA that is greater than N_{max}, where N_{max} for MSDUs and A-MSDUs (if supported) is calculated based on the Maximum Number of Fragmented MSDUs/A-MSDUs subfield in the HE Capabilities element transmitted by the recipient STA. The term *outstanding* refers to an MPDU containing all or part of an MSDU, A-MSDU, or MMPDU for which transmission has been started and for which delivery of the MSDU, A-MSDU, or MMPDU has not yet been completed (i.e., an acknowledgment of the final fragment has not been received and the MSDU, A-MSDU, or MMPDU has not been discarded due to retries, lifetime, or some other reason).

NOTE—Dynamic fragments of outstanding MMPDUs are not counted in the check against the N_{max} limit.

An originator STA may retransmit the full MSDU, A-MSDU, or MMPDU if all the previously transmitted dynamic fragments of that MSDU, A-MSDU, or MMPDU have explicitly failed at the receiving STA. An originator STA may retransmit a failed fragment if one or more of the previously transmitted fragments of that MSDU, A-MSDU, or MMPDU have explicitly failed at the receiving STA (see the next paragraph for a definition of the term *explicitly failed*). The frame body length and contents of the retransmitted fragment shall be the same as the initially transmitted fragment and shall remain fixed for the lifetime of the MSDU, A-MSDU, or MMPDU at that STA, except when the frame is not encrypted, all the fragments preceding the initial transmitted fragment were received, and all the fragments following the initial transmitted fragment either have explicitly failed or have not been transmitted. In such cases, the frame body length and contents of the retransmitted fragment may be different from the initially transmitted fragment.

A fragment has explicitly failed at the receiving STA if the originator STA receives an immediate response that contains the following:

— A valid first MPDU that is not an Ack frame, Compressed BlockAck frame, or Multi-STA BlockAck frame, of which all the preceding pre-EOF MPDU delimiters are received.

— A Multi-STA BlockAck frame that does not contain a BA Information field with TID equal to that of the fragment.

— A Compressed BlockAck frame or Multi-STA BlockAck frame that contains a BA Information field with TID equal to that of the fragment, but does not acknowledge receipt of the fragment.

An originator STA shall not transmit to a recipient STA an MPDU that is not carried in an A-MPDU or an A-MPDU that carries dynamic fragments that do not satisfy the conditions in 26.3.2.2, 26.3.2.3, and 26.3.2.4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

26.3.2.2 Level 1 dynamic fragmentation

An originator STA may transmit one dynamic fragment of an MSDU, A-MSDU (if supported by the recipient), or MMPDU that is a non-A-MPDU and that is not sent under a block ack agreement to a recipient STA using level 1 dynamic fragmentation if the Dynamic Fragmentation Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element received from the recipient STA is 1, 2, or 3.

An originator STA may transmit a fragmented MSDU or A-MSDU (if supported by the recipient) under a block ack agreement to a recipient STA using level 1 dynamic fragmentation, provided the following condition is met: the Dynamic Fragmentation Support subfield in the HE Capabilities element received from the recipient STA is 1, 2, or 3; and for the block ack agreement associated with the TID of the MSDU or A-MSDU, the HE Fragmentation Operation subfield is 1 if the ADDBA Extension element is present in the ADDBA Response frame received from the recipient STA.

26.3.2.3 Level 2 dynamic fragmentation

An originator STA may transmit fragmented MSDUs or A-MSDU (if supported by the recipient) under a block ack agreement to a recipient STA using level 2 dynamic fragmentation, provided one of the following conditions is met:

— The Dynamic Fragmentation Support subfield in the HE Capabilities element received from the recipient STA is 2; and for the block ack agreement associated with the TID of the MSDU or A-MSDU, the HE Fragmentation Operation subfield is 2 if the ADDBA Extension element is present in the ADDBA Response frame received from the recipient STA.

— The Dynamic Fragmentation Support subfield in the HE Capabilities element received from the recipient STA is 3; and for the block ack agreement associated with the TID of the MSDU or A-MSDU, the ADDBA Extension element is present, and the HE Fragmentation Operation subfield is 2 in the ADDBA Response frame received from the recipient STA.

An originator STA may transmit to a recipient STA the following:

— One dynamic fragment of an MSDU, A-MSDU (if supported by the recipient), or MMPDU that is a non-A-MPDU using level 1 dynamic fragmentation.

— Up to one dynamic fragment of an MSDU or A-MSDU (if supported by the recipient) for each MSDU or A-MSDU and up to one dynamic fragment of an MMPDU in an A-MPDU where the A-MPDU contains at least one dynamic fragment using level 2 dynamic fragmentation; the dynamic fragment of an MSDU or A-MSDU shall be sent under a block ack agreement.

NOTE—The originator STA follows the rules in 10.12.8 for generating the S-MPDU, the rules in 10.25.6.7 for generating the A-MPDU, and the rules in 26.6.3 for generating a multi-TID A-MPDU that can contain the fragment of the MMPDU.

26.3.2.4 Level 3 dynamic fragmentation

An originator STA may transmit fragmented MSDUs or A-MSDU (if supported by the recipient) under a block ack agreement or fragmented MMPDU to a recipient STA using level 3 dynamic fragmentation, provided the following conditions are met:

— The Dynamic Fragmentation Support subfield in the HE Capabilities element received from the recipient STA is 3.

— For the block ack agreement associated with the TID of the MSDU or A-MSDU, the HE Fragmentation Operation subfield is 3 if the ADDBA Extension element is present in the ADDBA Response frame received from the recipient STA.

Level 3 fragmentation allows multiple fragments of an MSDU or A-MSDU included in the same A-MPDU, reducing the fragments' transmission delay.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An originator STA may transmit to a recipient STA the following:

- One dynamic fragment of an MSDU, A-MSDU (if supported by the recipient), or MMPDU that is a non-A-MPDU using level 1 dynamic fragmentation.
  - The originator STA shall follow the rules defined in 10.12.8 for generating the S-MPDU.
- Up to four dynamic fragments of an MSDU or A-MSDU (if supported by the recipient) for each MSDU or A-MSDU and up to one dynamic fragment of an MMPDU in an A-MPDU, where the A-MPDU contains at least one dynamic fragment using level 3 dynamic fragmentation; the dynamic fragment of an MSDU or A-MSDU shall be sent under block ack agreement.
  - The originator STA shall set the Fragment Number subfield of each MPDU to a value less than 4.
  - The originator STA shall follow the rules defined in 10.25.6.7 for generating the A-MPDU with the exception that the A-MPDU shall contain MPDUs whose range of the Sequence Number subfields does not exceed $B_L / 4$, where B_L is the length of the Block Ack Bitmap field of the Compressed BlockAck or Multi-STA BlockAck frame that corresponds to a TID of a transmitted fragment (see 10.25.6 and 26.4).
  - The originator STA shall ensure that $WinSize_O$ does not exceed $B_L / 4$, where B_L is the length of the Block Ack Bitmap field of the Compressed BlockAck or Multi-STA BlockAck frame that corresponds to a TID of a transmitted fragment (see 10.25.6 and 26.4).

26.3.3 Dynamic defragmentation

26.3.3.1 General

An HE STA shall set the Dynamic Fragmentation Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element it transmits to 0 if it does not support dynamic fragments. Otherwise, the HE STA shall set the Dynamic Fragmentation Support subfield as follows:

- Set to 1, 2, or 3 if the STA supports reception of dynamic fragments following the procedure defined in 26.3.2.2.
- Set to 2 or 3 if the STA supports reception of dynamic fragments following the procedure defined in 26.3.2.3.
- Set to 3 if the STA supports reception of dynamic fragments following the procedure defined in 26.3.2.4.

An HE STA shall set dot11HEDynamicFragmentationLevel to the value of Dynamic Fragmentation Support subfield in the HE Capabilities element it transmits if it supports reception of dynamic fragments.

If a fragment is sent under level 1, level 2, or level 3 fragmentation, it belongs to dynamic fragment.

Defragmentation of dynamic fragments shall follow the rules defined in 10.5 with the following exceptions:

- The recipient STA shall support the concurrent reception of dynamic fragments of a number of *outstanding* MSDUs and A-MSDUs when supported from the same transmitting STA that is equal to N_{max}, where N_{max} for MSDUs and A-MSDUs (if supported) is obtained from the Maximum Number Of Fragmented MSDUs/A-MSDUs Exponent subfield in the HE Capabilities element transmitted by the STA. The term *outstanding* refers to an MPDU containing all or part of an MSDU or A-MSDU for which transmission has been started and for which delivery of the MSDU or A-MSDU has not yet been completed (i.e., an acknowledgment of the final fragment has not been received and the MSDU, A-MSDU, or MMPDU has not been discarded due to retries, lifetime, or some other reason). The recipient STA shall support the concurrent reception of dynamic fragments of one outstanding MMPDU from a transmitting STA.
- The recipient STA may be subject to the receive timer rules for each of the MSDUs, A-MSDUs, and MMPDUs defined in 10.5.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The A-MSDU Present subfield of all QoS Data frames containing fragments of a given MSDU (not in an A-MSDU) or of a given A-MSDU shall be the same.

A STA that has dot11AMSDUFragmentationOptionImplemented true shall set the A-MSDU Fragmentation Support subfield in the HE Capabilities element to 1. Otherwise, the STA shall set the A-MSDU Fragmentation Support subfield in the HE Capabilities element to 0.

26.3.3.2 Level 1 dynamic defragmentation

Upon reception of a non-A-MPDU or A-MPDU that carries a dynamic fragment, the recipient STA responds with an Ack frame or a Multi-STA BlockAck frame if the received fragment is contained in an MPDU that solicits an immediate response. The receiver STA shall follow the rules defined in 10.3.2.11 for generating the Ack frame for the soliciting dynamic fragment that is an MPDU or carried in an S-MPDU or ack-enabled single-TID A-MPDU and the rules defined in 26.4 for generating the Multi-STA BlockAck frame that contains the acknowledgment for the soliciting S-MPDU that carries one dynamic fragment and carried in an HE TB PPDU, ack-enabled single-TID A-MPDU or ack-enabled multi-TID A-MPDU.

26.3.3.3 Level 2 dynamic defragmentation

Upon reception of a non-A-MPDU that is a dynamic fragment or A-MPDU that carries one or more dynamic fragments, the recipient STA responds with one of the following frames:

— An Ack frame or Multi-STA BlockAck frame if the received fragment is a non-A-MPDU or contained in an A-MPDU and solicits the immediate response. The recipient STA shall follow the rules defined in 10.3.2.11 for generating the Ack frame for the soliciting dynamic fragment that is an MPDU or carried in an S-MPDU or ack-enabled single-TID A-MPDU and the rules defined in 26.4 for generating the Multi-STA BlockAck frame that contains the acknowledgment for the soliciting S-MPDU carried in an HE TB PPDU, ack-enabled single-TID A-MPDU, or ack-enabled multi-TID A-MPDU.

— A Compressed BlockAck frame or Multi-STA BlockAck frame if the received fragments of an MSDU or A-MSDU (if any) (up to one fragment for each MSDU or A-MSDU) are contained in an A-MPDU that contains an MPDU that solicits an immediate response. The recipient STA shall follow the rules defined in 10.25.6.5 for generating the BlockAck frame and the rules in 26.4 for generating the Multi-STA BlockAck frame, except that the STA shall:
  — Set to 0 the LSB of the Fragment Number subfield in the Block Ack Starting Sequence Control subfield of the Compressed BlockAck frame or Multi-STA BlockAck frame that corresponds to a TID of a received fragment that is sent under a block ack agreement.
  — Set to 1 each bit of the Block Ack Bitmap field that corresponds to a Sequence Number subfield and TID subfield of a received fragment that is sent under a block ack agreement contained in the soliciting A-MPDU that is not an S-MPDU.

— The STA shall update the corresponding block acknowledgment record for an MSDU or A-MSDU for which fragments are received only if that MSDU or A-MSDU is successfully reconstructed (see 10.5). Otherwise, the STA shall not update the block ack record for that MSDU or A-MSDU.

NOTE—The recipient STA sets the bits of the Block Ack Bitmap field that correspond to a Sequence Number and TID subfield of an MPDU that is not a fragment as defined in 10.25.6.5.

A recipient STA shall discard any fragments of incomplete MSDUs or A-MSDUs that have been received during an HT-immediate block ack session for a TID if it receives a BlockAckReq frame from the originator STA for that TID if the fragments have a Sequence Number field value that is less than the value of the Starting Sequence Number field of the BlockAckReq frame or have a sequence number that is less than $WinStart_B$ (see 10.25.6.6). The comparison of the two values is performed circular modulo 4096 as described in 10.25.1.

26.3.3.4 Level 3 dynamic defragmentation

Upon reception of a non-A-MPDU that is a dynamic fragment or A-MPDU that carries one or more dynamic fragments, the recipient STA responds with one of the following frames:

— An Ack frame or a Multi-STA BlockAck frame if the received fragment is a non-A-MPDU or contained in an A-MPDU that solicits the immediate response. The recipient STA shall follow the rules defined in 10.3.2.11 for generating the Ack frame for the soliciting dynamic fragment that is a MPDU or carried in an S-MPDU or ack-enabled single-TID A-MPDU and the rules defined in 26.4 for generating the Multi-STA BlockAck frame that contains the acknowledgment for the soliciting S-MPDU carried in an HE TB PPDU, ack-enabled single-TID A-MPDU, or ack-enabled multi-TID A-MPDU.

— A Compressed BlockAck frame or Multi-STA BlockAck frame if the received fragments of an MSDU or A-MSDU (if any) corresponding to a TID (one or more fragments for each MSDU or A-MSDU) are contained in an A-MPDU where at least one received MPDU's Fragment Number field corresponding to the same TID as the received fragments is of nonzero value that solicits the immediate response. The recipient STA shall follow the rules in 10.25.6.5 for generating the BlockAck frame and the rules in 26.4 for generating the Multi-STA BlockAck frame, except that the STA shall

  — Set to 1 the LSB of the Fragment Number subfield in the Block Ack Starting Sequence Control subfield of the Compressed BlockAck frame or Multi-STA BlockAck frame that corresponds to a TID of a received fragment that is sent under a block ack agreement.

  — Set to 1 each bit in position B of the Block Ack Bitmap field that corresponds to a received fragment that is sent under a block ack agreement and shall set it to 0 otherwise, with B calculated as $B = 4 \times (SN - SSN) + FN$, where the operations on the sequence numbers are performed modulo 4096.

    SN is the value of the Sequence Number subfield of an MPDU containing the fragment for which the receive status is indicated.

    SSN is the value of the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield of the BlockAck frame.

    FN is the value in the Fragment Number subfield.

— A Compressed BlockAck frame or Multi-STA BlockAck frame if the received fragments of an MSDU or A-MSDU (if any) corresponding to a TID (one or more fragments for each MSDU or A-MSDU) are contained in an A-MPDU where all the received MPDUs' Fragment Number fields corresponding to the same TID as the received fragments are of zero value that solicits the immediate response. The recipient STA shall follow the rules in 10.25.6.5 for generating the BlockAck frame and the rules in 26.4 for generating the Multi-STA BlockAck frame, except that the STA shall

  — Set to 0 the LSB of the Fragment Number subfield in the Block Ack Starting Sequence Control subfield of the Compressed BlockAck frame or Multi-STA BlockAck frame that corresponds to a TID of a received fragment that is sent under a block ack agreement.

  — Set to 1 each bit of the Block Ack Bitmap field that corresponds to a Sequence Number subfield and TID subfield of a received fragment that is sent under a block ack agreement contained in the soliciting A-MPDU that is not an S-MPDU.

— The STA shall update the corresponding block acknowledgment record for an MSDU or A-MSDU for which fragments are received only if that MSDU or A-MSDU is successfully reconstructed (see 10.5). Otherwise, the STA shall not update the block ack record for that MSDU or A-MSDU.

NOTE—The recipient STA sets the bits of the Block Ack Bitmap field that correspond to a Sequence Number and TID subfield of an MPDU that is not a fragment as defined in 10.25.6.5.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The recipient STA shall discard any fragments of incomplete MSDUs or A-MSDUs that have been received during an HT-immediate block ack session for a TID if it receives a BlockAckReq frame from the originator STA for that TID and the fragments have a Sequence Number field value that is less than the value of the Starting Sequence Number field of the BlockAckReq frame or have a sequence number that is less than $WinStart_B$ (see 10.25.6.6). The comparison of the two values is performed circular modulo 4096 as described in 10.25.1.

26.4 HE acknowledgment procedure

26.4.1 Overview

The HE acknowledgment procedure builds on the features defined for HT-immediate block ack (see 10.25.6), with the following extensions:

- Support for a Multi-STA BlockAck frame
- Support for a MU-BAR Trigger frame
- Support for a Multi-TID BlockAckReq frame
- Support for BlockAck Bitmap field lengths of 32, 64, 128, and 256
- Acknowledging QoS Data frames with two or more TIDs using a Multi-STA BlockAck frame
- Acknowledging QoS Data frames with one or more TIDs and a Management frame using a Multi-STA BlockAck frame
- Acknowledging all MPDUs in a PPDU using a variant of the Multi-STA BlockAck frame
- Acknowledging MPDUs from multiple associated STAs using a single Multi-STA BlockAck frame
- Acknowledging MPDUs from multiple unassociated STAs with a single Multi-STA BlockAck frame

An HE STA shall be able to respond with Compressed BlockAck frames if HT-immediate block ack is supported in the role of recipient (see 10.25.6.1). An HE STA shall be able to respond with a Multi-STA BlockAck frame if multi-TID A-MPDU operation (26.6.3) is supported in the role of recipient.

A non-AP HE STA that is associated with an AP and that sends a Multi-STA BlockAck frame shall set the AID11 subfield in the Per AID TID Info field of the Multi-STA BlockAck frame to 0 and the RA field to the MAC address of the intended recipient. A non-AP HE STA that is not associated with an AP shall not send a Multi-STA BlockAck frame.

An HE AP that sends a Multi-STA BlockAck frame where the Per AID TID Info fields are addressed to more than one STA shall set the RA field to the broadcast address. An HE AP that sends a Multi-STA BlockAck frame where the Per AID TID Info fields are all addressed to a single recipient STA and that is sent in response to an HE TB PPDU may set the RA field of the Multi-STA BlockAck frame either to the address of the recipient STA or to the broadcast address. An HE AP that sends a Multi-STA BlockAck frame where the Per AID TID Info fields are all addressed to a single recipient STA and that is not sent in response to an HE TB PPDU shall set the RA field of the Multi-STA BlockAck frame to the address of the recipient STA.

An HE AP that sends a Multi-STA BlockAck frame to an associated STA shall set the AID11 subfield in the Per AID TID Info field of the Multi-STA BlockAck frame to the 11 LSBs of the AID of the intended STA. An HE AP that sends a Multi-STA BlockAck frame to an unassociated STA shall set the AID11 subfield in the Per AID TID Info field of the Multi-STA BlockAck frame to 2045.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An HE STA that transmits a Multi-STA BlockAck frame shall use a rate, HT-MCS, <VHT-MCS, NSS> tuple, or <HE-MCS, NSS> tuple that is supported by all recipient STAs.

An HE STA that receives a Multi-STA BlockAck frame that is a response to frames requiring acknowledgment shall examine the Per AID TID Info field received in the Multi-STA BlockAck frame and shall process each Per AID TID Info field using the procedure defined in 26.4.2.

A non-AP HE STA that receives a Multi-STA BlockAck frame that is a response to frames requiring acknowledgment but that do not belong to an established block ack agreement shall examine each Per AID TID Info field received in the Multi-STA BlockAck frame as follows:

— If the Ack Type field is 1 and the TID field is less than 8, then the Per AID TID Info field indicates the acknowledgment of a tagged MPDU that is a QoS Data frame with the indicated TID. The BA Information field is addressed to the STA if the AID of the BA Information field contains the STA's AID.
— If the Ack Type field is 1 and the TID field is 15, then the Per AID TID Info field indicates the acknowledgment of a tagged MPDU that is a Management frame that solicits acknowledgment or a PS-Poll frame. The BA Information field is addressed to the STA if the AID of the BA Information field contains the STA's AID.
— If the Ack Type field is 0, the AID field is 2045, and the TID field is 15, then the Per AID TID Info field indicates the acknowledgment of a tagged MPDU that is a Management frame soliciting immediate acknowledgment. The RA field in the Per AID TID Info field is the MAC address of an unassociated STA for which the Per AID TID Info subfield is intended. The BA Information field is addressed to the STA if the RA field of the BA Information field contains the STA's MAC address.

If the BA Information field is addressed to the STA, it is processed according to the procedure defined in 26.4.2.

An HE AP with dot11MultiBSSIDImplemented equal to true shall not send to a non-AP STA that is associated with an AP corresponding to a nontransmitted BSSID in the multiple BSSID set a Multi-STA BlockAck frame with the TA field set to the transmitted BSSID, unless the HE AP has received from the non-AP STA an HE Capabilities element with the Rx Control Frame To MultiBSS subfield in HE MAC Capabilities Information field equal to 1.

An AP that transmits a Multi-STA BlockAck frame addressed to HE STAs shall set the TA field of the frame to the MAC address of the AP, unless dot11MultiBSSIDImplemented is true and the Multi-STA BlockAck frame is directed to STAs from at least two different BSSs of the multiple BSSID set. In this case, the AP shall set the TA field of the frame to the transmitted BSSID.

NOTE—An AP sets the TA field of the Multi-STA BlockAck frame that is not carried in HE MU PPDU to the transmitted BSSID when the TXOP is obtained from the transmitted BSSID (see 10.23.2.4).

An HE STA that transmits a Multi-TID BlockAckReq frame in a PPDU that is not an HE TB PPDU shall set the TID Value subfields in the Per TID Info subfields of the BAR Information field of the Multi-TID BlockAckReq frame to TIDs that correspond to ACs that have the same or higher priority as the primary AC. An HE STA that transmits a Multi-TID BlockAckReq frame in an HE TB PPDU may set each of the TID Value subfields in the Per TID Info subfields of the BAR Information field of the Multi-TID BlockAckReq frame to a TID that corresponds to any AC.

An HE STA that transmits a BlockAckReq frame in an HE TB PPDU may set the TID subfield in the AID TID Info field in the BAR Information field of the BlockAckReq frame to a TID that corresponds to any AC.

26.4.2 Acknowledgment context in a Multi-STA BlockAck frame

A recipient of an A-MPDU shall set the Ack Type subfield and TID subfield in the Per AID TID Info field of the Multi-STA BlockAck frame sent as a response depending on the acknowledgment context as follows:

- An HE AP that receives, prior to association, an A-MPDU that includes one tagged MPDU that is a Management frame soliciting an acknowledgment but does not include any other MPDUs may generate a Multi-STA BlockAck frame using the procedure defined in the *preassociation ack context* [described in item b) below in this subclause].
- An HE STA that receives an A-MPDU that does not include a tagged MPDU but does include one or more untagged MPDUs that are QoS Data frames with Normal Ack or Implicit BAR ack policy belonging to the same block ack agreement may generate a Multi-STA BlockAck frame as follows:
  - If all MPDUs in the A-MPDU are received successfully, then the recipient may follow the procedure defined in the *all ack context* [described in item a) below in this subclause].
  - Otherwise, the recipient shall follow the procedure defined in the *block ack context* [described in item d) below in this subclause].
- If an HE STA supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1 and if the A-MPDU includes a tagged MPDU that is a Management frame that solicits acknowledgment and includes one or more MPDUs (either tagged MPDUs or untagged MPDUs) that are QoS Data frames with Normal Ack or Implicit BAR ack policy, then the recipient shall generate Multi-STA BlockAck frame as follows:
  - If all the MPDUs in the A-MPDU are received successfully, then the recipient may follow the procedure defined in the all ack context.
  - Otherwise:
    - For the MPDU that is a Management frame, the recipient shall create a Per AID TID info field using the procedure defined in the *ack context* [described in item c) below in this subclause] with the TID value set to 15.
    - For the tagged MPDUs that are QoS Data frames, the recipient shall create a Per AID TID info field using the procedure defined in the ack context with the TID set to the TID of the QoS Data frame.
    - For the untagged MPDUs that are QoS Data frames, the recipient shall create a Per AID TID info field using the procedure defined in block ack context with the TID set to the TID of the QoS Data frame.
- If an HE STA supports multi-TID aggregation and the A-MPDU does not include a tagged MPDU but does include untagged MPDUs that are QoS Data frames with Implicit BAR ack policy and belonging to more than one block ack agreement, then the recipient shall generate a Multi-STA BlockAck frame as follows:
  - If all MPDUs in the A-MPDU are received successfully, then the recipient may follow the procedure defined in the all ack context.
  - Otherwise, for each TID included the received A-MPDU, the recipient shall create a per AID TID info field using the procedure defined in the block ack context with the TID set to the TID of the QoS Data frame.

NOTE—A STA indicates the maximum number of Per AID TID Info fields with the same AID excluding the one for a Management frame that it can include in the Multi-STA BlockAck frame in the Multi-TID Aggregation Rx Support field in the HE Capabilities element it transmits.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The procedures for the different acknowledgment contexts for generating a Multi-STA BlockAck frame are defined as follows:

a) *All ack context:* If the originator had set the All Ack Support subfield in the HE Capabilities element to 1, then the recipient may set the Ack Type field to 1 and the TID subfield to 14 to indicate the reception of all the MPDUs carried in the eliciting A-MPDU or multi-TID A-MPDU. Otherwise, the recipient shall not set the Ack Type field to 1 and the TID subfield to 14. The Multi-STA BlockAck frame shall contain only one Per AID TID Info field addressed to an originator in the Multi-STA BlockAck frame. The recipient determines that all the MPDUs carried in the eliciting A-MPDU were received if there were no MPDU delimiter CRC errors and no MPDU FCS errors in that A-MPDU.

b) *Preassociation ack context:* A recipient receiving a Management frame from an unassociated STA that requires an acknowledgment shall set the Ack Type field to 0, AID subfield to 2045, and TID field to 15 in the Per AID TID Info field and set the RA field of the Per AID TID Info field to the intended recipient's MAC address to indicate the reception of that Management frame.

c) *Ack context:* A recipient that sets the Ack-Enabled Aggregation Support subfield in the HE Capabilities element to 1 and that receives a tagged MPDU soliciting acknowledgment shall set the Ack Type field to 1 and, if the tagged MPDU is a QoS Data frame, set the TID field to the TID of the QoS Data frame or, if the tagged MPDU is a Management frame or PS-Poll frame, set the TID field to 15.

   If a received A-MPDU contains more than one tagged MPDU that solicits an immediate acknowledgment, then the Multi-STA BlockAck frame shall contain multiple Per AID TID Info fields, with Ack Type field equal to 1, one for each such received tagged MPDU requesting an acknowledgment.

   The TID field is set to the TID of the QoS Data or QoS Null frame that is being acknowledged and set to 15 for a PS-Poll frame or Management frame that is being acknowledged.

d) *Block ack context:* The recipient shall set the Ack Type field to 0 and the TID field of a Per AID TID Info field to the TID value of MPDUs requesting block acknowledgment that are carried in the eliciting A-MPDU or multi-TID A-MPDU.

   The Multi-STA BlockAck frame may contain multiple occurrences of these Per AID TID Info fields addressed to an originator, one for each MPDU that is requesting block acknowledgment. In such cases, the Block Ack Starting Sequence Control and Block Ack Bitmap fields shall be set according to 10.25.6 for each block ack session and according to 26.3 for each block ack session with dynamic fragmentation.

   The allowed values for the TID field in this context are 0 to 7 (for indicating block acknowledgment of QoS Data frames).

   Variable bitmap lengths may be included in the Per AID TID Info field when the originator and recipient negotiate their use as defined in 26.4.3.

The Ack Type subfield(s) in a Multi-STA BlockAck frame shall be set to 0 if the Multi-STA BlockAck frame is sent in response to an MU-BAR Trigger frame.

Upon receipt of a Multi-STA BlockAck frame, the originator shall examine each Per AID TID Info field and shall perform the following operations:

— If the AID subfield is 0 for an AP originator or the non-AP STA's AID for a non-AP STA originator, the Ack Type field is 0, and the TID field is less than 8, then the Block Ack Starting Sequence Control, TID, and Block Ack Bitmap fields of the Per AID TID Info field are processed according to 10.25.6, 26.3, and 26.4.4.

— If the AID subfield is 2045, the Ack Type field is 0, and the TID field is 15, then the Per AID TID Info field indicates the acknowledgment of a single Management frame sent by the unassociated STA as defined by the acknowledgment context.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— If the AID subfield is 0 for an AP originator or the non-AP STA's AID for a non-AP STA originator, the Ack Type field is 1, and the TID is less than or equal to 7 or is equal to 15, then the Per AID TID Info field indicates the acknowledgment of an tagged MPDU that is a QoS Data frame identified by the value of the TID, a Management frame, or a PS-Poll frame.
— If the AID subfield is 0 for an AP originator or the non-AP STA's AID for a non-AP STA originator, the Ack Type field is 1, and the TID subfield of AID TID Info field is 14, then the Per AID TID Info field indicates the acknowledgment of all MPDUs carried in the eliciting A-MPDU as defined by the acknowledgment context.

If an associated non-AP STA that does not support the UORA procedure receives a Multi-STA BlockAck frame in response to an eliciting frame, and if the Multi-STA BlockAck frame contains a Per AID TID Info subfield with the AID11 subfield set to 2045, then the STA shall ignore this Per AID TID Info subfield, and shall continue to parse the following Per AID TID Info subfields (if any).

26.4.3 Negotiation of block ack bitmap lengths

Both the Compressed BlockAck frame and Multi-STA BlockAck frame allow different Block Ack Bitmap subfield lengths. The length of the Block Ack Bitmap subfield is indicated in the Fragment Number subfield of the Block Ack Starting Sequence Control field as defined in 9.3.1.8. The allowed Block Ack Bitmap lengths for each of the negotiated buffer sizes are defined in Table 26-1.

Table 26-1—Negotiated buffer size and Block Ack Bitmap subfield length

Negotiated buffer size	Block Ack Bitmap subfield length in a Compressed BlockAck frame (bits)	Block Ack Bitmap subfield length in a Multi-STA BlockAck frame (bits)
1–64	64	32 or 64
65–128	64 or 256	32, 64, or 128
129–256	64 or 256	32, 64, 128, or 256
NOTE—A 32-bit Block Ack Bitmap subfield length is not allowed, unless the originator has set the 32-bit BA Bitmap Support field in the HE MAC Capabilities Information field in the HE Capabilities element to 1.		

An HE STA that transmits a Compressed BlockAck frame or a Multi-STA BlockAck frame shall use a Block Ack Bitmap subfield length identified in Table 26-1 for the negotiated buffer size of the block ack agreement to which the BA Information field corresponds.

The recipient is allowed to respond with a Block Ack Bitmap subfield in the BA Information field that is less than the maximum allowed Block Ack Bitmap for the negotiated buffer size. The length of the Block Ack Bitmap subfield in a Compressed BlockAck frame or a Multi-STA BlockAck frame may be less than the maximum allowed Block Ack Bitmap but shall be sufficient to include the recipient's scoreboard state for MPDUs beginning with the MPDU for which the Sequence Number subfield value is $WinStart_R$ and ending with a successfully received MPDU for which the Sequence Number subfield is less than or equal to $WinEnd_R$.

The recipient shall not include in the Buffer Size field of an ADDBA Response frame a value that would cause the BlockAck Bitmap length of its block ack responses to exceed the BlockAck Bitmap length that is derived by the Buffer Size field of the ADDBA Request frame sent by the originator. When the Buffer Size field in the ADDBA Request frame is 0, the Buffer Size field of an ADDBA Response frame is in the range 1 to 64.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—Refer to Block Ack Bitmap subfield length identified in Table 26-1 for the negotiated buffer size of the block ack agreement.

A recipient shall not include in a Multi-STA BlockAck frame a Per AID TID Info field with a 32-bit BlockAck Bitmap field addressed to an originator if the 32-bit BA Bitmap Support field in the HE MAC Capabilities Information field in the HE Capabilities element received from that originator is 0.

NOTE 2—A Multi-STA BlockAck frame might include Per AID TID Info fields with a 32-bit BlockAck Bitmap field addressed to other originators, and the nonsupporting originator needs to able to parse these fields to locate a possible Per AID TID Info field addressed to it.

The originator of a BlockAckReq frame, MU-BAR Trigger frame, GCR MU-BAR Trigger frame, or a A-MPDU that includes QoS Data frames that solicits an immediate BlockAck frame response or Management frame that solicits acknowledgment shall set the Duration field accounting for the largest BlockAck Bitmap length based on negotiated buffer size.

A recipient shall not transmit a Compressed BlockAck frame or a Multi-STA BlockAck frame with the LSB of the Fragment Number subfield set to 1, unless the recipient has received from the originator an HE Capabilities element with the Dynamic Fragmentation Support subfield equal to 3. If the LSB of the Fragment Number subfield of the BlockAck frame is 1, then the Block Ack Bitmap fields are set as defined in 26.3.2.4.

26.4.4 Per-PPDU acknowledgment selection rules

26.4.4.1 General

A STA that transmits a PPDU can solicit different immediate responses for frames contained in the PPDU by using the Ack Policy Indicator subfield of QoS Data or QoS Null frames, the type of the frame, PPDU format, number of TIDs in the A-MPDU, and the EOF/Tag field setting of the A-MPDU delimiter.

26.4.4.2 Responding to an HE SU PPDU or HE ER SU PPDU with an SU PPDU

An HE STA that receives an HE SU PPDU or HE ER SU PPDU carrying an A-MPDU that includes MPDUs, solicits acknowledgment, and does not include a triggering frame shall respond using an SU PPDU as follows:

a) If the A-MPDU includes only one MPDU and the MPDU is a tagged MPDU that either is a QoS Data frame or QoS Null frame with Normal Ack ack policy or is a Management frame that solicits acknowledgment, then the STA shall respond with an Ack frame.

b) If the A-MPDU includes only one MPDU and the MPDU is an EOF MPD that is a PS-Poll frame, the STA shall respond with an Ack frame or a QoS Data frame.

c) If the HE STA supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1, and if the A-MPDU includes more than one MPDU, only one of which solicits acknowledgment and the MPDU that solicits acknowledgment is a tagged MPDU that either is a QoS Data frame or a QoS Null frame with Normal Ack ack policy or is a Management frame that solicits acknowledgment, then the HE STA shall respond with an Ack frame.

d) If the A-MPDU does not include a tagged MPDU but does include one or more untagged MPDUs that are QoS Data frames belonging to the same block ack agreement and with the Ack Policy Indicator subfield equal to Implicit BAR for at least one MPDU, then the STA shall respond with a Compressed BlockAck frame as defined in 10.25.6.5. Alternatively, if all the MPDUs carried in the eliciting A-MPDU were received, the STA may respond with a Multi-STA BlockAck frame with Ack Type field set to 1 and the TID field set to 14 as defined in 26.4.2 if the originator of the A-MPDU has indicated support for the all ack context by setting the All Ack Support subfield in the HE MAC Capabilities Information field to 1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

e) If the HE STA supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1, and if the A-MPDU includes a Management frame that solicits an acknowledgment and includes one or more QoS Data frames with Normal Ack or Implicit BAR ack policy, then the STA shall respond with a Multi-STA BlockAck frame as defined in 26.4.2.

f) If the HE STA supports multi-TID aggregation and if the A-MPDU includes two or more QoS Data frames with Implicit BAR ack policy and belonging to more than one block ack agreement, then the STA shall respond with a Multi-STA BlockAck frame as defined in 26.4.2.

26.4.4.3 Responding to an HE MU PPDU with an SU PPDU

If an AP intends to solicit an immediate response in an SU PPDU, the following apply:

— An AP shall set the Ack Policy Indicator subfield in the QoS Data and QoS Null frames to Normal Ack or Implicit BAR in at most one A-MPDU in the HE MU PPDU (see 10.3.2.10.1 for an example of this sequence).

— The A-MPDUs in the HE MU PPDU shall not contain a Management frame that solicits acknowledgment.

An HE STA that receives an HE MU PPDU with an A-MPDU that contains MPDUs that solicit acknowledgment and that does not include a triggering frame shall respond using an SU PPDU as follows:

a) If the A-MPDU carries only one MPDU and the MPDU is a tagged MPDU that is either a QoS Data frame or QoS Null frame with Normal Ack ack policy, then the STA shall respond with an Ack frame.

b) If the HE STA supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1, and if the A-MPDU includes more than one MPDU, only one of which solicits acknowledgment and the MPDU that solicits acknowledgment is a tagged MPDU that is a QoS Data frame or a QoS Null frame with Normal Ack ack policy, then the HE STA shall respond with an Ack frame.

c) If the A-MPDU does not include a tagged MPDU but does include one or more untagged MPDUs that are QoS Data frames belonging to the same block ack agreement and with the Ack Policy Indicator subfield equal to Implicit BAR for at least one MPDU, then the STA shall respond with a Compressed BlockAck frame as defined in 10.25.6.5. Alternatively, if all the MPDUs carried in the eliciting A-MPDU were received, the STA may respond with a Multi-STA BlockAck frame with the Ack Type set to 1 and the TID field set to 14 as defined in 26.4.2 if the originator of the A-MPDU has indicated support for the all ack context by setting the All Ack Support subfield in the HE MAC Capabilities Information field to 1.

d) If the HE STA supports multi-TID aggregation and if the A-MPDU includes two or more QoS Data frames with Implicit BAR ack policy addressed to it and belonging to more than one block ack agreement, then the STA shall respond with a Multi-STA BlockAck frame as defined in 26.4.2.

NOTE—A control response frame carried in an SU PPDU that is an immediate response to an HE MU PPDU follows the rules defined in 10.6.6.5

An AP that sends an HE MU PPDU shall not set the Ack Policy Indicator subfield to Normal Ack or Implicit BAR for any of the MPDUs carried in the HE MU PPDU if the PPDU containing a control response would occupy one or more 20 MHz channels where pre-HE modulated fields of the HE MU PPDU are not located.

26.4.4.4 Responding to an HE MU PPDU, HE SU PPDU, or HE ER SU PPDU with an HE TB PPDU

An AP that sends an HE MU PPDU, HE SU PPDU, or HE ER SU PPDU that contains an MPDU that solicits an immediate response carried in an HE TB PPDU shall set the Ack Policy Indicator subfield to

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

HETP Ack for each of the QoS Data frames for which it intends to solicit an immediate response (see 10.3.2.13.2). If a Management frame that solicits acknowledgment is carried in an HE MU PPDU, then the response is carried in an HE TB PPDU. A non-AP STA that receives an HE MU PPDU, HE SU PPDU, or HE ER SU PPDU with an A-MPDU that contains a QoS Data frame with HETP Ack ack policy addressed to it or contains a Management frame that solicits an immediate acknowledgment shall not respond, unless it has also received a triggering frame in the A-MPDU.

A non-AP STA that receives an HE MU PPDU, HE SU PPDU, or HE ER SU PPDU with an A-MPDU that contains one or more MPDUs soliciting acknowledgment and includes a triggering frame shall respond with an HE TB PPDU as follows:

a) If the A-MPDU includes only one MPDU and the MPDU is a tagged MPDU that either is a QoS Data or QoS Null frame with HETP Ack ack policy or is a Management frame that solicits acknowledgment, then the STA shall respond with an Ack frame.

b) If the HE STA supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1, and if the A-MPDU includes more than one MPDU, only one of which solicits acknowledgment and the MPDU that solicits acknowledgment is a tagged MPDU that either is a QoS Data or QoS Null frame with HETP Ack ack policy or is a Management frame that solicits acknowledgment, then the HE STA shall respond with an Ack frame.

c) If the A-MPDU does not include a tagged MPDU but does include one or more untagged MPDUs that are QoS Data frames belonging to the same block ack agreement and with the Ack Policy Indicator subfield equal to HETP Ack for at least one MPDU, then the STA shall respond with a Compressed BlockAck frame as defined in 10.25.6.5. Alternatively, if all the MPDUs carried in the eliciting A-MPDU were received, the STA may respond with a Multi-STA BlockAck frame with the Ack Type set to 1 and the TID field set to 14 as defined in 26.4.2 if the originator of the A-MPDU has indicated support for the all ack context by setting the All Ack Support subfield in the HE MAC Capabilities Information field to 1.

d) If the HE STA supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1, and if the A-MPDU includes a Management frame that solicits an acknowledgment and contains one or more QoS Data frames with HETP Ack or Implicit BAR ack policy, then the STA shall respond with a Multi-STA BlockAck frame as defined in 26.4.2.

e) If the HE STA supports multi-TID aggregation and if the A-MPDU includes two or more QoS Data frames with HETP Ack ack policy and belonging to more than one block ack agreement, then the STA shall respond with a Multi-STA BlockAck frame.

26.4.4.5 Responding to an HE TB PPDU with an SU PPDU

A non-AP STA that sends an HE TB PPDU as a response to a Basic Trigger frame shall set the Ack Policy Indicator subfield of the QoS Data frames or QoS Null frames to Normal Ack or Implicit BAR (see 10.3.2.13.3 for an example of this sequence).

If the HE TB PPDU carries MPDUs only from one STA and if the HE AP intends to send the response in an SU PPDU, then the HE AP shall respond using an SU PPDU as follows:

a) If the A-MPDU includes only one MPDU, and the MPDU is a tagged MPDU that either is a QoS Data frame or QoS Null frame with Normal Ack ack policy or is a Management frame that solicits acknowledgment, then the HE AP shall respond with either an Ack frame or a Multi-STA BlockAck frame with the Ack Type field set to 1.

b) If the HE AP supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1, and if the A-MPDU includes more than one MPDU, only one of which solicits acknowledgment and the MPDU that solicits acknowledgment is a tagged MPDU that either is a QoS Data or QoS Null frame with Normal Ack

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

ack policy or is a Management frame that solicits acknowledgment, then the HE AP shall respond with an Ack frame or a Multi-STA BlockAck frame with the Ack Type field set to 1.

c) If the A-MPDU does not include a tagged MPDU but does include one or more untagged MPDUs that are QoS Data frames belonging to the same block ack agreement and with Ack Policy Indicator subfield equal to Implicit BAR for at least one MPDU, then the HE AP shall respond with a Compressed BlockAck frame as defined in 10.25.6.5 or a Multi-STA BlockAck frame with the Ack Type field set to 0. Alternatively, if all the MPDUs carried in the eliciting A-MPDU were received, the HE AP may respond with a Multi-STA BlockAck frame with the Ack Type field set to 1 and the TID field set to 14 if the originator of the A-MPDU has indicated support for the all ack context by setting the All Ack Support subfield in the HE MAC Capabilities Information field to 1, as defined in 26.4.2.

d) If the HE AP supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1, and if the A-MPDU carries a Management frame that solicits acknowledgment and carries one or more QoS Data frames with Implicit BAR ack policy, then the HE AP shall respond with a Multi-STA BlockAck frame as defined in 26.4.2.

e) If the HE AP supports multi-TID aggregation and if the A-MPDU includes two or more QoS Data frames with Normal Ack or Implicit BAR ack policy and belonging to more than one block ack agreement, then the HE AP shall respond with a Multi-STA BlockAck frame as defined in 26.4.2.

If the AP receives HE TB PPDUs from more than one STA, and if the AP intends to send the response in an SU PPDU, then the AP shall respond with a Multi-STA BlockAck frame carried in an SU PPDU that contains the appropriate settings in each Per AID TID Info field addressed to each STA as defined in 26.4.2.

26.4.4.6 Responding to an HE TB PPDU with an HE MU PPDU

A non-AP STA that sends an HE TB PPDU as a response to a Basic Trigger frame that solicits an immediate response shall set the Ack Policy Indicator subfield to Normal Ack or Implicit BAR for each of the QoS Data frames carried in the A-MPDU (see 10.3.2.13.3 for an example of this sequence).

If an HE AP sends a response to an HE TB PPDU that it received using an HE MU PPDU, then the AP shall respond to each A-MPDU that it received using the following procedure:

a) If the A-MPDU received from a STA includes only one MPDU and the MPDU is a tagged MPDU that either is a QoS Data frame or QoS Null frame with Normal Ack ack policy or is a Management frame that solicits acknowledgment, then the STA shall respond with an Ack frame or a Multi-STA BlockAck frame with the Ack Type field set to 1 carried in the HE MU PPDU.

b) If the HE AP supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1, and if the A-MPDU includes more than one MPDU, only one of which solicits acknowledgment and the MPDU that solicits acknowledgment is a tagged MPDU that either is a QoS Data frame with Normal Ack ack policy or is a Management frame that solicits acknowledgment, then the HE AP shall respond with an Ack frame or a Multi-STA BlockAck frame with the Ack Type field set to 1 carried in the HE MU PPDU.

c) If the A-MPDU does not include a tagged MPDU but does include one or more untagged MPDUs that are QoS Data frames belonging to the same block ack agreement and with the Ack Policy Indicator subfield equal to Implicit BAR for at least one MPDU, then the HE AP shall respond with a Compressed BlockAck frame as defined in 10.25.6.5 or a Multi-STA BlockAck frame with the Ack Type field set to 0. Alternatively, if all the MPDUs carried in the eliciting A-MPDU were received, the HE AP may respond with a Multi-STA BlockAck frame with the Ack Type field set to 1 and the TID field set to 14 if the originator of the A-MPDU has indicated support for the all ack context by setting the All Ack Support subfield in the HE MAC Capabilities Information field to 1 as defined in 26.4.2 carried in the HE MU PPDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

d) If the HE AP supports ack-enabled aggregation by setting the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field to 1, and if the A-MPDU carries a Management frame that solicits acknowledgment and carries one or more QoS Data frames with Implicit BAR ack policy, then the HE AP shall respond with a Multi-STA BlockAck frame as defined in 26.4.2 carried in the HE MU PPDU.

e) If the HE AP supports multi-TID aggregation and if the A-MPDU includes two or more QoS Data frames with Implicit BAR ack policy and belonging to more than one block ack agreement, then the HE AP shall respond with a Multi-STA BlockAck frame as defined in 26.4.2.

In addition, an AP with dot11MultiBSSIDImplemented equal to true may do one of the following:

— For each BSS belonging to the multiple BSSID set for which the AP has received an HE TB PPDU, the AP responds with a Multi-STA BlockAck frame with RA field set to the broadcast address and carried in a DL HE MU PPDU (see 9.3.1.8.6). The AP shall set the TXVECTOR parameter STA_ID for the RU carrying the Multi-STA BlockAck frame to the value of the BSSID Index field as defined in 26.11.1.

— The AP may respond with a Multi-STA BlockAck frame with the TA field set to the transmitted BSSID and carried in a DL HE MU PPDU to acknowledge the STA's transmission, if the recipient non-AP STA is associated with an AP corresponding to a nontransmitted BSSID of the multiple BSSID set and the AP has received an HE Capabilities element from the STA with the Rx Control Frame To MultiBSS subfield equal to 1 (see 9.3.1.8.6). The AP shall set the TXVECTOR parameter STA_ID for the RU carrying the Multi-STA BlockAck frame to 2047.

NOTE—An AP includes at most one Ack or BlockAck frame (group addressed Multi-STA BlockAck frame included) in an A-MPDU as specified in 9.7.3.

26.4.5 HE block acknowledgment request and response rules

An HE AP may solicit BlockAck frame responses from multiple HE STAs using an MU-BAR Trigger frame or GCR MU-BAR Trigger frame. An HE AP shall not send a Multi-TID BlockAckReq (as part of a User Info field addressed to the STA in an MU-BAR Trigger frame or as a BlockAckReq frame) to a STA that has not indicated support for multi-TID A-MPDU. The Block Ack Bitmap length of the block ack sent in response to an eliciting Multi-TID BlockAckReq frame, BlockAckReq frame, GCR MU-BAR Trigger frame, or MU-BAR Trigger frame is determined as defined in 26.4.3.

An HE STA that receives a BlockAckReq frame or an MU-BAR Trigger frame that contains a Compressed BlockAckReq variant in the User Info field addressed to the STA or receives a GCR MU-BAR Trigger frame that contains a Compressed BlockAckReq variant in the Common Info field shall respond with a Compressed BlockAck frame as defined in 10.25.6 or a Multi-STA BlockAck frame as defined in 26.4 with the Starting Sequence Number subfield set to the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield and the length of the Block Ack Bitmap subfield calculated as defined in 26.4.3.

An HE STA that receives a Multi-TID BlockAckReq frame or an MU-BAR Trigger frame that contains a Multi-TID BlockAckReq variant in the User Info field addressed to the STA or receives a GCR MU-BAR Trigger frame that contains a Multi-TID BlockAckReq variant in the Common Info field shall respond with a Multi-STA BlockAck frame that contains a Per AID TID Info field with a Block Ack Bitmap subfield for each of the TIDs (with values less than 8) contained in the BlockAckReq frame, with the Starting Sequence Number subfield set to the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield, and with the length of the Block Ack Bitmap subfield calculated as defined in 26.4.3.

A non-AP HE STA that responds to a Compressed BlockAckReq frame, Multi-TID BlockAckReq frame, MU-BAR Trigger frame, or GCR MU-BAR Trigger frame with a Multi-STA BlockAck frame shall set the Ack Type subfield of the Multi-STA BlockAck frame to 0.

26.5 MU operation

26.5.1 HE DL MU operation

26.5.1.1 General

HE DL MU operation allows an AP to transmit simultaneously to one or more non-AP STAs in DL OFDMA, DL MU-MIMO, or both.

The PSDU on each RU in an HE MU PPDU shall be padded to end at the same time, indicated by the L-SIG field as described in 27.3.11.5.

The padding procedure for each A-MPDU in an HE MU PPDU is defined in 26.6.2.2.

An AP shall not transmit an HE MU PPDU with an RU that is narrower than the PPDU bandwidth and that is allocated to more than one STA (DL MU-MIMO), unless the AP has received from each STA an HE Capabilities element with the Partial Bandwidth DL MU-MIMO subfield in the HE PHY Capabilities Information field equal to 1.

An AP shall not send to a STA an A-MPDU contained in an HE MU PPDU that contains one of the following combinations of frames, unless the AP has received from the STA an HE Capabilities element with the Ack-Enabled Aggregation Support subfield in the HE MAC Capabilities Information field equal to 1:

— A QoS Data frame with HETP Ack ack policy carried in an A-MPDU subframe with the EOF/Tag field set to 1 and a Trigger frame.
— A Management frame carried in an A-MPDU subframe with the EOF/Tag field set to 1, where the Management frame is a Disassociation frame, (Re)Association Response frame, Authentication frame, or Action frame, and a Trigger frame.

The AP follows the EDCA procedure in 10.23 with the following modifications:

— The definition of transmission success (see 10.23.2.2) is extended such that if a DL MU PPDU includes a triggering frame and the AP receives an MPDU in response from at least one of the STAs addressed by the triggering frame, then transmission is a success; otherwise the transmission is a failure.
— The aggregation rules in 26.6 supersede the rules in 10.23.2.7.

An AP shall not transmit an HE MU PPDU where the number of OFDM symbols in the HE-SIG-B field is greater than 16 to a non-AP STA with a 20 MHz operating channel width.

26.5.1.2 RU addressing in an HE MU PPDU

The Type and Subtype subfields in the Frame Control field and address type (individually addressed or group addressed) of MPDUs may be different across A-MPDUs in different PSDUs within the same HE MU PPDU.

An AP includes in the TXVECTOR for an HE MU PPDU at least one parameter STA_ID for each RU in the HE MU PPDU as defined in 26.11.1. The AP shall not include in the TXVECTOR more than one parameter STA_ID with the same value, unless the value is 2046 (indicating an unallocated RU).

An HE AP with dot11MultiBSSIDImplemented equal to false shall not include in an HE MU PPDU anything other than one or more of the following:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— One or more individually addressed RUs, corresponding to the parameter STA_ID equal to the AID(s) of STA(s) associated with the AP, to carry information intended for the STA(s).
— A broadcast RU corresponding to parameter STA_ID equal to 0 to carry information intended for the STAs associated with the AP that are not the recipient of a individually addressed RU.
— A broadcast RU corresponding to parameter STA_ID equal to 2045 to carry information intended for STAs not associated with the AP.
— One or more RUs corresponding to parameter STA_ID equal to 2046 for unallocated RUs.

An HE AP with dot11MultiBSSIDImplemented equal to true shall not include in an HE MU PPDU anything other than one or more of the following:

— One or more individually addressed RUs, corresponding to the parameter STA_ID equal to the AID(s) of STA(s) associated with any AP in the multiple BSSID set, to carry information intended for that associated STA.
— A broadcast RU corresponding to parameter STA_ID equal to 0 to carry information intended for STAs associated with the AP corresponding to the transmitted BSSID and not the recipient of an individually addressed RU.
— A broadcast RU corresponding to parameter STA_ID equal to the BSSID Index of a BSSID in a multiple BSSID set to carry information intended for STAs associated with the AP corresponding to that BSSID and not the recipient of an individually addressed RU.
— A broadcast RU corresponding to parameter STA_ID equal to 2047 to carry information intended for STAs associated with the APs in the multiple BSSID set and not the recipient of an individually addressed RU or another broadcast RU corresponding to parameter STA_ID equal 0 or equal to the BSSID Index of a BSSID in a multiple BSSID set.
— A broadcast RU corresponding to parameter STA_ID equal to 2045 to carry information intended for STAs not associated with any AP in the multiple BSSID set.
— One or more RUs corresponding to parameter STA_ID equal to 2046 for unallocated RUs.

A non-AP STA that receives an HE MU PPDU where the RXVECTOR includes a parameter STA_ID that matches the 11 LSBs of the non-AP STA's AID shall disregard any broadcast RU in the HE MU PPDU. A non-AP STA that receives an HE MU PPDU where the RXVECTOR includes a parameter STA_ID that is equal to the BSSID Index of the BSSID of the AP with which the STA is associated (see 9.4.2.72) shall disregard a broadcast RU corresponding to parameter STA_ID equal to 2047.

For an AP with dot11MultiBSSIDImplemented equal to false, the AP shall set the TA and BSSID fields (when present) to the BSSID of the AP's BSS for all the frames carried in a broadcast RU that corresponds to parameter STA_ID equal to 0 or 2045.

For an AP with dot11MultiBSSIDImplemented equal to true, the AP shall set the TA and BSSID fields (when present) to the transmitted BSSID for all the frames carried in a broadcast RU corresponding to parameter STA_ID equal to 0 or 2045 or 2047.

For an AP with dot11MultiBSSIDImplemented equal to true, the AP shall set the TA and BSSID fields (when present) to the BSSID of the corresponding nontransmitted BSSID for the all frames carried in a broadcast RU corresponding to parameter STA_ID equal to the BSSID Index of a nontransmitted BSSID in a multiple BSSID set.

26.5.1.3 RU allocation in an HE MU PPDU

An AP shall not transmit a 40 MHz HE MU PPDU in the 2.4 GHz band with an RU allocated to a 20 MHz operating non-AP HE STA, unless the AP has received from the 20 MHz operating non-AP HE STA an HE

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Capabilities element with the 20 MHz In 40 MHz HE PPDU In 2.4 GHz Band subfield in the HE PHY Capabilities Information field equal to 1.

An AP shall not transmit a 160 MHz or 80+80 MHz HE MU PPDU with an RU allocated to a 20 MHz operating non-AP HE STA, unless the AP has received from the 20 MHz operating non-AP HE STA an HE Capabilities element with the 20 MHz In 160/80+80 MHz HE PPDU subfield in the HE PHY Capabilities Information field equal to 1.

An AP shall not transmit a 160 MHz or 80+80 MHz HE MU PPDU with an RU allocated to an 80 MHz operating non-AP HE STA, unless the AP has received from the 80 MHz operating non-AP HE STA an HE Capabilities element with the 80 MHz In 160/80+80 MHz HE PPDU subfield in the HE PHY Capabilities Information field equal to 1.

An AP shall follow the RU restriction rules defined in 27.3.2.8 when assigning an RU to a 20 MHz operating non-AP STA in a 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz HE MU PPDU. An AP shall follow the rules in 27.3.2.7 and 27.3.2.9 or the SST subchannel (if applicable) in which the STA is operating (see 26.8.7) if allocating RUs to a non-AP STA.

An AP shall not transmit a 40 MHz HE MU PPDU in the 2.4 GHz band with a 242-tone RU allocated to a 20 MHz operating non-AP HE STA, unless the AP has received from the 20 MHz operating non-AP HE STA an HE Capabilities element with B4 of the Supported Channel Width Set subfield of the HE PHY Capabilities Information field equal to 1.

An AP shall not transmit a 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz HE MU PPDU in the 5 GHz band with a 242-tone RU allocated to a 20 MHz operating non-AP HE STA, unless the AP has received from the 20 MHz operating non-AP HE STA an HE Capabilities element with B5 of the Supported Channel Width Set subfield of the HE PHY Capabilities Information field equal to 1.

An HE MU PPDU shall have a sufficient number of RUs allocated to users such that all of the following conditions are satisfied:

a) At least $N \times 4 \times 26$ subcarriers are modulated by the allocated RUs within the entire PPDU, where N is the number of 20 MHz subchannels that are not preamble punctured in the PPDU.
b) For each 20 MHz subchannel S within the bandwidth of the HE MU PPDU, at least 2×26 subcarriers are modulated by the allocated RUs in the 20 MHz subchannel S if all of the following are true:
    1) At least one RU is allocated in the 20 MHz subchannel S.
    2) Transmitter is an AP.
    3) The AP is operating in an operating class for which the behavior limits set listed in Annex E includes the DFS_50_100_Behavior.
    4) The AP has received at least one Beacon frame from OBSS B within the past dot11ObssNbRuToleranceTime in the current operating channel in which any of the following are true:
        i) The Extended Capabilities element is not present.
        ii) The OBSS Narrow Bandwidth RU In OFDMA Tolerance Support field in the Extended Capabilities element is not present.
        iii) The OBSS Narrow Bandwidth RU In OFDMA Tolerance Support field in the Extended Capabilities element is 0.
    5) The 20 MHz subchannel S overlaps with the operating bandwidth of the OBSS B.
c) At least one RU is allocated in the primary 20 MHz.

26.5.2 UL MU operation

26.5.2.1 General

UL MU operation allows an AP to solicit simultaneous immediate response frames from one or more non-AP HE STAs. A non-AP HE STA shall follow the rules in this subclause for the transmission of response frames in an HE TB PPDU, unless the Trigger frame is an MU-RTS Trigger frame, in which case the response is a CTS frame sent in a non-HT PPDU (see 26.2.6).

A non-AP STA shall not send a triggering frame.

An HE STA that is a mesh STA shall not transmit and shall not receive HE TB PPDUs.

A non-AP HE STA shall set the TRS Support subfield in the HE Capabilities element it transmits to 1 if its dot11TRSOptionImplemented is true; otherwise, the STA shall set it to 0.

A non-AP HE STA shall set the UL 2×996-tone RU Support subfield in HE Capabilities element to 1 if it supports receiving a frame that carries a TRS Control subfield that allocates a 2×996-tone RU or a Trigger frame with User Info field addressed to the STA with RU Allocation subfield indicating a 2×996-tone RU.

If a non-AP HE STA supports transmitting an HE TB PPDU that uses UL MU-MIMO within an RU that spans the entire PPDU bandwidth, then the STA shall set dot11HEFullBWULMUMIMOImplemented to true and the Full Bandwidth UL MU-MIMO subfield of the HE PHY Capabilities Information field in the HE Capabilities element it transmits to 1. Otherwise, the HE STA shall set dot11HEFullBWULMUMIMOImplemented to false and the Full Bandwidth UL MU-MIMO subfield to 0.

If a non-AP HE STA with dot11HEFullBWULMUMIMOImplemented equal to true also supports transmitting an HE TB PPDU that uses UL MU-MIMO within an RU that does not span the entire PPDU bandwidth, then the STA shall set dot11HEPartialBWULMUMIMOImplemented to true and the Partial Bandwidth UL MU-MIMO subfield in the HE PHY Capabilities Information field in the HE Capabilities element it transmits to 1. Otherwise, the non-AP HE STA shall set dot11HEPartialBWULMUMIMOImplemented to false and the Partial Bandwidth UL MU-MIMO subfield to 0.

If a non-AP STA has dot11HEDeviceClass equal to ClassA (1), then it indicates Class A in the Device Class subfield in the HE PHY Capabilities Information field in the HE Capabilities element, and the HE TB PPDUs it transmits shall meet the Class A requirements in 27.3.15. Otherwise, it indicates Class B in the Device Class subfield in the HE PHY Capabilities Information field in the HE Capabilities element, and the HE TB PPDUs it transmits shall meet the Class B requirements in 27.3.15.

A non-AP HE STA with dot11HTVHTTriggerOptionImplemented equal to true shall set the HT And VHT Trigger Frame Rx Support field to 1 in the HE MAC Capabilities Information field in HE Capabilities elements that it transmits. A non-AP HE STA with dot11HTVHTTriggerOptionImplemented equal to false shall set the HT And VHT Trigger Frame Rx Support field to 0.

26.5.2.2 Rules for soliciting UL MU frames

26.5.2.2.1 General

An HE AP shall not allocate an RU for a 40 MHz HE TB PPDU to a 20 MHz operating non-AP HE STA in the 2.4 GHz band, unless the AP has received from the 20 MHz operating non-AP HE STA an HE Capabilities element with the 20 MHz In 40 MHz HE PPDU In 2.4 GHz Band subfield in the HE PHY Capabilities Information field in its HE Capabilities element equal to 1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An HE AP shall not allocate an RU for an 160 MHz or 80+80 MHz HE TB PPDU to a 20 MHz operating non-AP HE STA, unless the AP has received from the 20 MHz operating non-AP HE STA an HE Capabilities element with the 20 MHz In 160/80+80 MHz HE PPDU in the HE PHY Capabilities Information field equal to 1.

An AP shall not allocate to a 20 MHz operating non-AP HE STA a 242-tone RU for a 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz HE TB PPDU transmission.

An AP shall not transmit a Trigger frame soliciting an HE TB PPDU that uses UL MU-MIMO within an RU that does not span the entire PPDU bandwidth to a non-AP STA from which it has not received an HE Capabilities element with the Partial Bandwidth UL MU-MIMO subfield of the HE PHY Capabilities Information field equal to 1.

An AP shall not transmit a Trigger frame soliciting an HE TB PPDU that uses UL MU-MIMO within an RU that spans the full bandwidth to a non-AP STA from which it has not received an HE Capabilities element with the Full Bandwidth UL MU-MIMO subfield of the HE PHY Capabilities Information field equal to 1.

An AP shall not send a frame that carries a TRS Control subfield to a non-AP STA that has not set the TRS Support subfield to 1 in the HE MAC Capabilities Information field in the HE Capabilities element it transmits.

An AP shall not send a frame that carries a TRS Control subfield that allocates a 2×996-tone RU to a non-AP STA or a Trigger frame with a User Info field that allocates a 2×996-tone RU to a non-AP STA, unless the AP has received from the non-AP STA an HE MAC Capabilities element with the UL 2×996-tone RU Support subfield in the MAC Capabilities Information field equal to 1.

NOTE 1—An AP does not send a Trigger frame containing a User Info field with AID12 subfield carrying the 12 LSBs of the AID of a non-AP STA or a frame addressed to a non-AP STA that carries a TRS Control subfield if the AP has received from the non-AP STA an OM Control subfield with UL MU Disabled subfield set to 1 and UL MU Data Disable subfield set to 0 (see 26.9.3).

An AP that transmits a PPDU may solicit an HE TB PPDU from one or more non-AP STAs through one of the following mechanisms:

- Including in the PPDU one or more Trigger frames that include one or more User Info fields with one of the following AID12 subfield settings:
  - The AID12 subfield is set to the 12 LSBs of the AID of the non-AP STA if the User Info field is addressed to a STA that is associated with the AP.
  - The AID12 subfield is set to the 12 LSBs of the AID of the non-AP STA if the User Info field is addressed to a STA that is associated with an AP corresponding to a nontransmitted BSSID in a multiple BSSID set to which the AP belongs, the TA field of the Trigger frame is set to the transmitted BSSID, and the non-AP STA has set the Rx Control Frame To MultiBSS subfield in the HE Capabilities element it transmits to 1.
  - The AID12 subfield indicates that one or more contiguous RA-RUs are allocated (see 26.5.4).
- Including in the PPDU one or more individually addressed frames that include a TRS Control subfield and that are carried in one of the following:
  - An S-MPDU that solicits an immediate Ack frame (see 10.12.8).
  - An A-MPDU that solicits an immediate BlockAck frame (see 10.25.6.7).
  - A multi-TID A-MPDU that solicits an immediate Multi-STA BlockAck frame (see 26.6.3).

The AP shall follow the rules in 26.3.2 if any MPDUs are fragments.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

More than one Trigger frame may be aggregated in an A-MPDU. If more than one Trigger frame is aggregated in an A-MPDU, all of them shall have the same content. An AP may include a frame carrying a TRS Control subfield in an HE MU PPDU, HE SU PPDU, or HE ER SU PPDU.

NOTE 2—The TRS Control subfields within MPDUs carried in an A-MPDU have the same value (see 10.8).

An A-MPDU shall not include both a Trigger frame and a frame carrying a TRS Control subfield.

An AP shall not transmit a triggering frame if all of the following conditions are satisfied:

- The AP is operating in an operating class for which the behavior limits set listed in Annex E includes the DFS_50_100_Behavior (see Table E-1).
- The AP has received at least one Beacon frame from OBSS *B* within the past dot11ObssNbRuToleranceTime in the current operating channel in which any of the following is true:
  - The Extended Capabilities element is not present.
  - The OBSS Narrow Bandwidth RU In OFDMA Tolerance Support field in the Extended Capabilities element is not present.
  - The OBSS Narrow Bandwidth RU In OFDMA Tolerance Support field in the Extended Capabilities element is 0.
- The triggering frame allocates at least one 26-tone RU whose location in frequency overlaps with the operating bandwidth of the OBSS *B*.

If a non-AP HE STA operating in an operating class for which the behavior limits set listed in Annex E includes the DFS_50_100_Behavior does not respond to a triggering frame in which the non-AP HE STA is allocated a 26-tone RU, then the AP should not allocate a 26-tone RU to the non-AP HE STA in the next triggering frame.

An AP shall not transmit a Trigger frame with a User Info field addressed to a non-AP STA in an HT or VHT PPDU, unless the AP has received from the non-AP STA an HE Capabilities element with the HT And VHT Trigger Frame Rx Support subfield in HE MAC Capabilities Information field equal to 1.

An AP shall not use the short guard interval for an HT or VHT PPDU that carries a Trigger frame. A Trigger frame shall not be carried in a DSSS or HR/DSSS PPDU. An AP shall not use STBC encoding for a PPDU that carries a triggering frame.

An AP shall not set the UL STBC subfield in the Common Info field in a Trigger frame it transmits if any of the RUs allocated in that Trigger frame is assigned to more than 1 user.

26.5.2.2.2 Requirements for allocating resources

An AP that sends a Basic Trigger frame, a BQRP Trigger frame, or a BSRP Trigger frame that is not aggregated with a QoS Data frame with HETP Ack ack policy or with a Management frame that solicits acknowledgment shall allocate sufficient resources for the responding STA indicated by each User Info field for the solicited associated non-AP STA or the UORA response from an associated non-AP STA to send at least one QoS Null frame that carries an HT Control field.

NOTE—An AP that sends a Basic Trigger frame uses an implementation specific method to decide the amount of resources indicated for UORA allocations.

An AP that solicits an Ack or BlockAck frame carried in an HE TB PPDU from a non-AP STA shall allocate sufficient resources for the non-AP STA to send the expected acknowledgment. If the AP solicits a BlockAck frame, the allocated resource shall be sufficient for the non-AP STA to send the BlockAck frame with Block Ack Bitmap subfields that are the negotiated block ack bitmap length (see 26.4.3).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An AP that sends a BFRP Trigger frame shall allocate sufficient resources for the HE TB PPDU response from each HE beamformee to include all the solicited feedback, including feedback that is segmented and including an HT Control field in each frame.

26.5.2.2.3 Padding for a triggering frame

An AP transmitting a PPDU that contains a BCC-encoded triggering frame soliciting a response from a non-AP STA shall ensure that the number of bits in the PSDU following the last bit of *SCH* is at least $L_{PAD,MAC}$ as defined in Equation (26-1), which is based on the *MinTrigProcTime* indicated by the non-AP STA (see Table 9-375), where *SCH* is either

— The User Info field addressed to the STA of the last or only Trigger frame, or

— The last TRS Control subfield in the PSDU.

$$L_{PAD,MAC} = N_{DBPS} m_{PAD} \tag{26-1}$$

where

N_{DBPS} is defined in Table 17-4 for a non-HT PPDU, Table 19-7for an HT PPDU, Table 21-6 for a VHT PPDU, and Table 27-16 for an HE PPDU. If the triggering frame is carried in an HE MU PPDU, N_{DBPS} is replaced by $N_{DBPS,u}$ of the target user in Equation (26-1).

m_{PAD} is as follows:

— For a non-HT PPDU, HT PPDU, and VHT PPDU:

$$m_{PAD} = \begin{cases} 0, \text{ if } MinTrigProcTime \text{ is } 0 \\ 2, \text{ if } MinTrigProcTime \text{ is } 8\ \mu s \\ 4, \text{ if } MinTrigProcTime \text{ is } 16\ \mu s \end{cases}$$

— For an HE PPDU:

$$m_{PAD} = \begin{cases} 0, \text{ if } MinTrigProcTime \text{ is } 0 \\ 1, \text{ if } MinTrigProcTime \text{ is } 8 \text{ or } 16\ \mu s \end{cases}$$

An AP transmitting a Trigger frame that contains at least one User Info field with AID12 subfield indicating allocation of one or more contiguous RA-RUs for associated STAs shall ensure that the number of bits following the last bit of *SCH* is at least $L_{PAD,MAC}$ as defined in Equation (26-1), which is based on the largest *MinTrigProcTime* of all associated non-AP STAs, where *SCH* is the last User Info field with AID12 subfield equal to either 0 or 2046.

An AP transmitting a Trigger frame that contains at least one User Info field with AID12 subfield indicating allocation of one or more contiguous RA-RUs for unassociated non-AP STAs should ensure that the number of bits following the last bit of *SCH* is at least $4 \times N_{DBPS}$ for a non-HT PPDU, HT PPDU, or VHT PPDU or N_{DBPS} for an HE PPDU, where S*CH* is the last User Info field with AID12 subfield equal to either 2045 or 2046.

An AP transmitting an NFRP Trigger frame shall ensure that the number of bits following the last User Info field with an AID12 subfield not equal to 4095 is at least $4 \times N_{DBPS}$ for a non-HT PPDU, HT PPDU, or VHT PPDU or N_{DBPS} for an HE PPDU.

An AP may use any type of padding to satisfy the *MinTrigProcTime* requirement of a non-AP STA, such as using the Padding field in a Trigger frame, using post-EOF A-MPDU padding, or aggregating other MPDUs in the A-MPDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If a triggering frame is LDPC encoded, then the transmitting AP ensures that $T_{TrigProc}$ meets the following requirements:

— $T_{TrigProc}$ shall be greater than or equal to the *MinTrigProcTime* specified by the non-AP STAs that are the recipients of the Trigger frame.

— For a Trigger frame that contains at least one User Info field with AID12 subfield indicating allocation of one or more contiguous RA-RUs for associated STAs, $T_{TrigProc}$ shall be greater than or equal to the largest *MinTrigProcTime* of all associated non-AP STAs.

— For a Trigger frame that contains at least one User Info field with AID12 subfield indicating allocation of one or more contiguous RA-RUs for unassociated STAs, $T_{TrigProc}$ should be at least 16 μs.

— For an NFRP Trigger frame, $T_{TrigProc}$ shall be at least 16 μs.

$T_{TrigProc}$ is defined as the duration of PPDU that is after the OFDM symbol containing the last coded bit of the LDPC codeword that encodes the last bit of *SCH* minus $T_{PE,nominal}$ defined in 27.3.13.

26.5.2.2.4 Allowed settings of the Trigger frame fields and TRS Control subfield

An AP with dot11MultiBSSIDImplemented equal to true shall not send a Trigger frame (other than an NFRP Trigger frame or Ranging Trigger frame) with the TA field set to the transmitted BSSID to a non-AP STA that is associated with a nontransmitted BSSID in the multiple BSSID set unless the AP has received an HE Capabilities element from non-AP STA with the Rx Control Frame To MultiBSS subfield in the HE MAC Capabilities Information field equal to 1. An AP with dot11MultiBSSIDImplemented equal to true may send an NFRP Trigger frame with the TA field set to the transmitted BSSID to a non-AP STA that is associated with a nontransmitted BSSID in a multiple BSSID set. An AP with dot11MultiBSSIDImplemented equal to true may send a Ranging Trigger frame, with the TA field set to a transmitted BSSID, to an ISTA during a TB ranging measurement exchange (11.21.6.4.3) when the FTM session was established using a nontransmitted BSSID in the multiple BSSID set {of, associated with} the transmitted BSSID.

An AP that transmits a Trigger frame shall set the TA field of the frame to the MAC address of the AP, except if dot11MultiBSSIDImplemented is true and the Trigger frame is directed to non-AP STAs from at least two different BSSs of a multiple BSSID set. In this case, the AP shall set the TA field of the frame to the transmitted BSSID.

The AP shall set the UL Length subfield of a Trigger frame to the value given by Equation (27-11) with $m = 2$.

If an AP transmits a Trigger frame that allocates an RU that spans the entire HE TB PPDU bandwidth and assigns the RU to more than one non-AP STA (i.e., for UL MU-MIMO) and with the GI And HE-LTF Type subfield of the Common Info field set to indicate either 2x HE-LTF + 1.6 μs GI or 4x HE-LTF + 3.2 μs GI, the AP may set the MU-MIMO HE-LTF Mode subfield in the Common Info field of the Trigger frame to indicate either HE single stream pilot HE-LTF mode or HE masked HE-LTF sequence mode. Otherwise, the AP shall set the MU-MIMO HE-LTF Mode subfield in the Common Info field to indicate HE single stream pilot HE-LTF mode.

An AP that transmits Trigger frames in more than one A-MPDU in an HE MU PPDU shall set each subfield, except the Trigger Type, More TF, CS Required, and Trigger Dependent Common Info subfields, in the Common Info field of the Trigger frame in one A-MPDU to the same value as the corresponding subfield in the Common Info field of the Trigger frames in the other A-MPDUs.

An AP that transmits frames carrying a TRS Control subfield in more than one A-MPDU in an HE MU PPDU shall set the UL Data Symbols and AP Tx Power subfields of the TRS Control subfield in the frames

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

of one A-MPDU to the same value as the corresponding subfields of the TRS Control subfield in the frames of the other A-MPDUs.

An AP that transmits one or more Trigger frames in one or more A-MPDUs and frames carrying a TRS Control subfield in one or more other A-MPDUs in an HE MU PPDU shall set the Common Info field of the Trigger frames and the TRS Control subfields in each A-MPDU as follows:

- The UL Length subfield in the Common Info field of the Trigger frames and the UL Data Symbols subfield in the TRS Control subfields indicate the same HE TB PPDU duration.
- The AP Tx Power subfield in the Common Info field of the Trigger frames and the AP Tx Power subfield in the TRS Control subfields indicate the same transmit power.
- In the Common Info field of the Trigger frames:
  - The MU-MIMO HE-LTF Mode and UL STBC subfields are set to 0.
  - The Number Of HE-LTF Symbols And Midamble Periodicity subfield is set to 0.
  - The Doppler subfield is set to 0.
  - The Pre-FEC Padding Factor subfield is set to 0 (i.e., to indicate a pre-FEC padding factor of 4).
  - The UL Length subfield and the PE Disambiguity subfield are set to indicate the PE duration calculated with Equation (27-114) is the default PE duration value, which is indicated by the AP in the Default PE Duration subfield of the HE Operation element it transmits.
  - The UL Spatial Reuse subfield is set to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED.
  - If the TXVECTOR parameters HE_LTF_TYPE and GI_TYPE of the HE PPDU carrying the Trigger frame are either 4xHE-LTF and 3u2s_GI, respectively, or 2xHE-LTF and 1u6s_GI, respectively, then the GI And HE-LTF Type subfield is set to 2. Otherwise, the GI And HE-LTF Type subfield is set to 1.

NOTE 1—A non-AP STA obtains the information required to prepare an HE TB PPDU explicitly and implicitly. Explicit information is obtained in the triggering frame contained in the triggering PPDU. Implicit information is obtained in previously exchanged frames with the AP, e.g., in the BSS Color and the Default PE Duration subfields of the HE Operation element, or from default values specified in 26.5.2.3.

An AP shall not set any subfields of the Common Info field of a Trigger frame to a value that is not supported by all the recipient non-AP STAs of the Trigger frame and the AP. An AP shall not set any subfields of the User Info field of a Trigger frame to a value that is not supported by the recipient non-AP STA of the User Info field and the AP. An AP shall set the values of the subfields of the Common Info field and User Info field of a Trigger frame such that the combination together would cause the solicited non-AP STA to construct a valid HE TB PPDU. An AP shall not set any subfields of a TRS Control subfield to a value that is not supported by the recipient non-AP STA of the TRS Control subfield and the AP. An AP shall set the values of the subfields of a TRS Control subfield such that the combination together would cause the solicited non-AP STA to construct a valid HE TB PPDU. If an RU is allocated to only one non-AP STA, the Starting Spatial Stream subfield for that non-AP STA shall be set to 0.

NOTE 2—Subclauses 27.3.4 and 27.3.6.10 specify the requirements on each of the other remaining subfields, such that the solicited non-AP STAs each construct a valid HE TB PPDU in response to the Trigger frame.

An AP shall follow the RU restriction rules defined in 27.3.2.8 when assigning an RU to a 20 MHz operating non-AP STA for a 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz HE TB PPDU. An AP shall not set the RU Allocation subfield of the User Info field of a triggering frame that is addressed to a non-AP STA to a value such that the RU allocated to the STA lies outside the channel in which the STA is operating (see 27.3.2.6 and 27.3.2.9) or outside the SST subchannel (if applicable) in which the STA is operating (see 26.8.7).

If a Trigger frame is transmitted in the broadcast RU of an HE MU PPDU, then the Trigger frame shall not include any User Info fields addressed to a non-AP STA that is identified as a recipient of another RU or spatial stream of the same HE MU PPDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A TRS Control subfield shall not be included in a group addressed frame.

If an AP transmits one or more Trigger frames or frames carrying a TRS Control subfield, then the frames shall collectively elicit HE TB PPDU responses such that at least one scheduled RU is allocated for each 20 MHz channel occupied by the eliciting PPDU. An AP shall not allocate an RU in any 20 MHz channel that is not occupied by the immediately preceding DL PPDU.

An AP may indicate an unallocated RU in a Trigger frame by including a User Info field with the AID12 subfield set to 2046. The AP shall place any User Info fields with the AID12 subfield set to 2046 after User Info fields with the AID12 subfield set to a value less than 2046.

An AP shall not transmit a Trigger frame that contains more than one User Info field with the same value in the AID12 subfield, unless the value in the AID12 subfield is 0 or greater than 2007. The AP shall place User Info fields with the same value in the AID12 subfield together as a contiguous block in the Trigger frame. The AP shall place User Info fields with the AID12 subfield set to 0 or a value greater than 2007 after User Info fields with the AID12 subfield set to a value in the range 1 to 2007 (if any present).

An AP that transmits an individually addressed Trigger frame shall include only one User Info field in the Trigger frame with the AID12 subfield set to the 12 LSBs of the AID of the non-AP STA addressed by the RA field.

An example of User Info field ordering in a Trigger frame and the relationship to RU locations is shown in Figure 26-4.

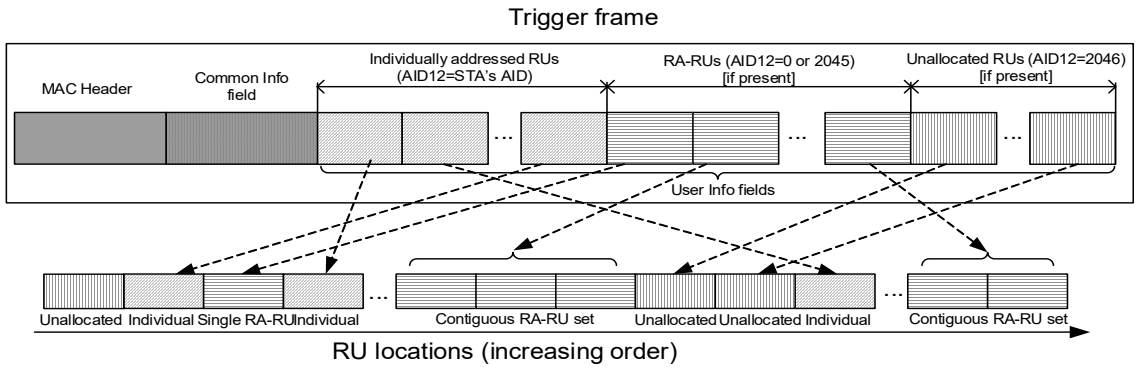

Figure 26-4—Example of User Info field ordering and RU location mapping

An AP that sends a Basic Trigger frame shall set the TID Aggregation Limit subfield of a User Info field that is addressed to a non-AP STA to a value between 0 and 1 plus the value of the Multi-TID Aggregation Tx Support subfield in the HE Capabilities element most recently received from the non-AP STA. A value 0 in the TID Aggregation Limit subfield indicates to the non-AP STA that it shall not solicit any immediate response for the MPDUs that the non-AP STA aggregates in the HE TB PPDU. A value of 7 in the TID Aggregation Limit subfield indicates to the non-AP STA that it may aggregate QoS Data frames from any number of different TID values in the multi-TID A-MPDU. Table 26-2 provides a summary of the possible combinations.

Table 26-2—Relation between TID Aggregation Limit field, Multi-TID Aggregation Tx Support field, and solicited immediate response

AP: TID Aggregation Limit field	Non-AP STA: Multi-TID Aggregation Tx Support field	Non-AP STA: Solicited immediate response?
0	Any value	No
1	Any value	Yes for at most one TID and/or one Management frame
tal (0 to *mta* + 1)	*mta*	Yes at most *tal* TIDs and/or at most one Management frame
Legend: *tal* is the value in the TID Aggregation Limit field. *mta* is the value in the Multi-TID Aggregation Tx Support field.		

The AP may assign any ACI value defined in Table 9-193 in the Preferred AC subfield in the Trigger Dependent User Info field for an HE STA and identified by the AID12 subfield of the User Info field of a Basic Trigger frame. If the AP does not have a recommendation, then it shall set the Preferred AC subfield to the value 0 (AC_BE).

When transmitting a PPDU carrying a triggering frame, an AP should not apply transmit beamforming to the following:

— Non-HT PPDUs
— Fields prior to the HT-STF field of an HT mixed format PPDU
— Pre-VHT modulated fields of an VHT PPDU
— Pre-HE modulated fields of an HE PPDU

An AP shall transmit an HE PPDU that carries a triggering frame with the TXVECTOR parameter BEAM_CHANGE set to 1.

An AP should set the TID Aggregation Limit subfield in the User Info fields of a Basic Trigger frame to 0 if the CS Required subfield in the Common Info field of the Basic Trigger frame is 0.

An AP shall set the TID Aggregation Limit subfield in the User info fields of a Basic Trigger frame to 0 if the solicited HE TB PPDU is the last PPDU of the TXOP.

NOTE 3—An HE TB PPDU is the last PPDU if the Duration/ID field is equal to 0 in the MPDU(s) contained in the HE TB PPDU.

26.5.2.2.5 AP access procedures for UL MU operation

The AP shall follow the EDCA procedure defined in 10.23 and the additional rules in this subclause.

If an AP receives an immediate response with at least one frame from at least one non-AP STA solicited by a triggering frame, the frame exchange sequence is successful.

If an AP does not receive an immediate response with at least one frame from at least one non-AP STA solicited by a PPDU that contains at least one Trigger frame, then the frame exchange sequence is not successful, and the AP shall follow the backoff procedure in 10.23.2.2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An AP may use any AC for sending a PPDU that contains only Trigger frames.

If the PPDU contains frames that are not Trigger frames in addition to a Trigger frame, then the AP follows the MPDU aggregation rules in 26.6, which supersede the rules in 10.23.2.7.

26.5.2.3 Non-AP STA behavior for UL MU operation

26.5.2.3.1 General

A non-AP STA shall not send an HE TB PPDU, unless it is explicitly triggered by an AP in one of the operation modes described in this subclause.

The interframe space between a PPDU that contains a triggering frame and the HE TB PPDU is a SIFS.

A non-AP STA shall not transmit an HE TB PPDU if all of the conditions in 26.5.2.3.2 are satisfied. Otherwise, a non-AP STA shall transmit an HE TB PPDU a SIFS after a received PPDU if all of the following conditions are met:

- The received PPDU contains either a Trigger frame (that is not an MU-RTS variant) with a User Info field addressed to the non-AP STA or a frame addressed to the non-AP STA that contains an TRS Control subfield. A User Info field in the Trigger frame is addressed to a non-AP STA if one of the following conditions are met:
  - The AID12 subfield is equal to the 12 LSBs of the AID of the non-AP STA, and the Trigger frame is sent by the AP with which the non-AP STA is associated or by the AP corresponding to the transmitted BSSID if the non-AP STA is associated with an AP corresponding to a nontransmitted BSSID and has indicated support for receiving Control frames with TA field set to the transmitted BSSID by setting the Rx Control Frame To MultiBSS subfield to 1 in the HE Capabilities element that the STA transmits.
  - The AID12 subfield indicates allocation of one or more contiguous RA-RUs for associated STAs, the non-AP STA is associated with the AP that sent the Trigger frame, the non-AP STA supports the UORA procedure, and the conditions in 26.5.4 are satisfied.
  - The AID12 subfield indicates allocation of one or more contiguous RA-RUs for unassociated STAs, the non-AP STA is not associated with the AP that sent the Trigger frame, the non-AP STA supports the UORA procedure, the conditions in 26.5.4 are satisfied, and the resource to which the non-AP STA gains access is sufficient for the non-AP STA to include the pending frame.
- The CS Required subfield in the Trigger frame is 1, and the UL MU CS condition described in 26.5.2.5 indicates the medium is idle; or the CS Required subfield in a Trigger frame is 0; or the response was solicited by a frame containing a TRS Control subfield.
- The UL MU Disable subfield is 0, and the UL MU Data Disable subfield is 0 in the most recent OM Control subfield (if any) sent by the non-AP STA to the AP; or the UL MU Disable subfield is 0, the UL MU Data Disable subfield is 1 in the most recent OM Control subfield (if any) sent by the non-AP STA to the AP, and the frame that is being triggered is an acknowledgment (see 26.9.3).

A non-AP STA addressed by a User Info field in a Trigger frame (i.e., the AID12 subfield is equal to the 12 LSBs of the AID of the non-AP STA) may ignore the remainder of User Info fields in the Trigger frame.

A non-AP STA generates the A-MPDU carried in the HE TB PPDU as defined in 26.5.2.4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

26.5.2.3.2 Conditions for not responding with an HE TB PPDU

A non-AP STA shall not transmit an HE TB PPDU that is not an HE TB feedback NDP if all the following conditions are satisfied:

- The non-AP STA is operating in an operating class for which the behavior limits set listed in Annex E includes the DFS_50_100_Behavior (see Table E-1).
- The HE TB PPDU would be in response to one of the following:
  - A Trigger frame containing a User Info field with AID12 subfield carrying the 12 LSBs of the AID of the STA.
  - A frame addressed to the non-AP STA that includes a TRS Control subfield.
  - A Trigger frame that allocates at least one RA-RU.
- The RU is a 26-tone RU.
- The non-AP STA has received at least one Beacon frame within the past dot11ObssNbRuToleranceTime from an AP with which the non-AP STA is not associated, and the Beacon frame meets any of the following conditions:
  - The Extended Capabilities element is not present.
  - The OBSS Narrow Bandwidth RU In OFDMA Tolerance Support field in the Extended Capabilities element is not present.
  - The OBSS Narrow Bandwidth RU In OFDMA Tolerance Support field in the Extended Capabilities element is 0.

A non-AP STA may choose to not respond to a Trigger frame that contains one or more subfields in the Common Info field or in the User Info field addressed to or selected by the non-AP STA with values that are not recognized, are not supported, or cannot be satisfied by the non-AP STA.

NOTE—The User Info field in this context corresponds to the one directed to the non-AP STA (i.e., value in the AID12 subfield matches the STA's AID) or the one allocating an RA-RU (single or within a contiguous set) that is selected by the non-AP STA.

A non-AP STA may choose to not respond a TRS Control subfield in a frame addressed to the non-AP STA if the TRS Control subfield contains one or more subfields with values that are not recognized, are not supported, or cannot be satisfied by the non-AP STA.

A non-AP STA shall update the intra-BSS NAV (see 26.2.4) based on the duration information of the triggering frame even if it decides to not respond to the frame.

26.5.2.3.3 TXVECTOR parameters for HE TB PPDU response to Trigger frame

A non-AP STA transmitting an HE TB PPDU in response to a Trigger frame that is not an MU-RTS Trigger frame shall set the TXVECTOR parameters as follows (subject to, in the case of an NFRP Trigger frame, the exceptions given in 26.5.7.2):

- The FORMAT parameter is set to HE_TB.
- The TRIGGER_METHOD parameter is set to TRIGGER_FRAME.
- The TXOP_DURATION parameter is set as defined in 26.11.5.
- The BSS_COLOR parameter is set as follows:
  - If the Trigger frame was received in an HE PPDU, then set to the value of the RXVECTOR parameter BSS_COLOR of the HE PPDU.
  - If the Trigger frame was received in a non-HE PPDU, then set to the value of the active BSS color as defined in 26.11.4.
- The L_LENGTH parameter is set to the value indicated by the UL Length subfield in the Common Info field of the Trigger frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The GI_TYPE and HE_LTF_TYPE parameters are set to the value indicated by the GI and HE-LTF Type subfield of the Common Info field of the Trigger frame.
— The NUM_STS parameter is set to the number of space-time streams indicated by the Number Of Spatial Streams subfield of the SS Allocation field of the User Info field and UL STBC subfield in the Common Info field of the Trigger frame. The NUM_STS parameter is set to 1 if the HE TB PPDU is sent on an RA-RU following the UORA procedure.
— The CH_BANDWIDTH parameter is set to the value of the UL BW subfield in the Common Info field of the Trigger frame.
— The HE_LTF_MODE parameter is set to the value indicated by the MU-MIMO HE-LTF Mode subfield of the Common Info field of the Trigger frame if the HE_LTF_TYPE parameter does not indicate 1x HE-LTF and the Trigger frame indicated full-bandwidth MU-MIMO. Otherwise, the parameter is not present.
— The NUM_HE_LTF parameter is set to the value indicated by the Number Of HE-LTF Symbols And Midamble Periodicity subfield of the Common Info field of the Trigger frame.
— The STBC parameter is set to the value indicated by the UL STBC subfield of the Common Info field of the Trigger frame.
— The LDPC_EXTRA_SYMBOL parameter is set to the value indicated by the LDPC Extra Symbol Segment subfield of the Common Info field of the Trigger frame.
— The SPATIAL_REUSE parameter is set to the value of the UL Spatial Reuse subfield in the Common Info field of the eliciting Trigger frame.
— The DOPPLER parameter is set to the value of the Doppler subfield in the Common Info field of the Trigger frame.
— The MIDAMBLE_PERIODICITY parameter is present if the Doppler subfield in the Common Info field of the Trigger frame is 1. If present, it is set to the value indicated by the Number Of HE-LTF Symbols And Midamble Periodicity subfield in the Common Info field of the Trigger frame.
— The HE_SIG_A2_RESERVED parameter is set to the value of the UL HE-SIG-A2 Reserved subfield in the Common Info field of the Trigger frame.
— The MCS parameter is set to the value of the UL HE-MCS subfield in the User Info field of the Trigger frame.
— The DCM parameter is set to the value indicated by the UL DCM subfield of the User Info field of the Trigger frame.
— The STARTING_STS_NUM parameter is set to the value of the Starting Spatial Stream subfield in the SS Allocation field in the User Info field of the Trigger frame. The STARTING_STS_NUM parameter is set to 0 if the HE TB PPDU is sent on an RA-RU following the UORA procedure.
— The FEC_CODING parameter is set to the value indicated by the UL FEC Coding Type subfield of the User Info field of the Trigger frame.
— The RU_ALLOCATION parameter is set as follows:
  — If the RU is not an RA-RU or an RA-RU with the Number Of RA-RU subfield of the User Info subfield of the Trigger frame set to 0, it is set to the value indicated by the RU Allocation subfield of the User Info subfield of the Trigger frame.
  — If the RU is the k^{th} RU of a set of contiguous RA-RUs starting with an RA-RU with Number Of RA-RU subfield of the User Info subfield of the Trigger frame set to a nonzero value, it is set to the value indicated by the RU Allocation subfield of the corresponding User Info subfield of the Trigger frame plus k minus 1.
— The TXPWR_LEVEL_INDEX parameter is set to a value based on the computed transmission power (see 27.3.15.2) for an HE TB PPDU and the value of the AP Tx Power subfield in the Common Info field and the UL Target Receive Power subfield in the User Info field of the Trigger frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The HE_TB_PE_DISAMBIGUITY parameter is set to the value indicated by the PE Disambiguity subfield in the Common Info field in the Trigger frame.
— The PRE_FEC_PADDING_FACTOR parameter is set to the value indicated by the Pre-FEC Padding Factor subfield in the Common Info field in the Trigger frame.

26.5.2.3.4 TXVECTOR parameters for HE TB PPDU response to TRS Control subfield

A non-AP STA transmitting an HE TB PPDU in response to a frame containing a TRS Control subfield shall set the TXVECTOR parameters as follows:

— The FORMAT parameter is set to HE_TB.
— The TRIGGER_METHOD parameter is set to TRS.
— The L_LENGTH parameter is computed as described in Equation (27-11) using the TXTIME value. The TXTIME is defined by Equation (27-149) where N_{SYM} is set to F_{VAL} + 1, where F_{VAL} is the value of the UL Data Symbols subfield of the TRS Control subfield.
— The RU_ALLOCATION and MCS parameters are set to the values of the RU Allocation and UL HE-MCS subfields of the TRS Control subfield, respectively.
— The CH_BANDWITDTH parameter is set to the value of the RXVECTOR parameter CH_BANDWIDTH of the soliciting DL HE PPDU (see Table 27-1).
— The BSS_COLOR and DCM parameters are set to the values of the RXVECTOR parameters BSS_COLOR and DCM of the soliciting DL HE PPDU, respectively.
— The DOPPLER parameter is set to 0, and the MIDAMBLE_PERIODICITY parameter is absent.
— The NUM_HE_LTF parameter is set to 1.
— The STARTING_STS_NUM parameter is set to 0.
— The STBC parameter is set to 0, and the NUM_STS parameter is set to 1 (the HE_LTF_MODE parameter is not present).
— The FEC_CODING parameter is set to BCC_CODING if the RU Allocation subfield indicates an RU that is smaller than a 484-tone RU; otherwise, it is set to LDPC_CODING.
— The LDPC_EXTRA_SYMBOL parameter is set to 0 if the RU Allocation subfield indicates less than a 484-tone RU; otherwise, it is set to 1.
— The SPATIAL_REUSE parameter is set to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED.
— The DEFAULT_PE_DURATION parameter is set to the default PE duration value for UL MU response scheduling, which is indicated by the AP in the Default PE Duration subfield of the HE Operation element it transmits.
— The TXOP_DURATION parameter is set as defined in 26.11.5.
— The HE_SIG_A2_RESERVED parameter is set to 511 (all 1s).
— If the RXVECTOR parameters HE_LTF_TYPE and GI_TYPE of HE MU PPDU carrying the frame with the TRS Control subfield are either 4xHE-LTF and 3u2s_GI, respectively, or 2xHE-LTF and 1u6s_GI, respectively, then the HE_LTF_TYPE and GI_TYPE parameters are set to 4xHE-LTF and 3u2s_GI, respectively. Otherwise, the HE_LTF_TYPE and GI_TYPE parameters are set to 2xHE-LTF and 1u6s_GI, respectively.
— The TXPWR_LEVEL_INDEX parameter is set to a value based on the computed transmission power (see 27.3.15.2) for an HE TB PPDU and the value of the AP Tx Power subfield of the TRS Control subfield and the UL Target Receive Power subfield of the TRS Control subfield.

NOTE 1—A non-AP STA transmitting an HE TB PPDU in response to a frame carrying a TRS Control subfield considers both physical CS and virtual CS to be 0 (see 26.5.2.5).

NOTE 2—The only permissible values for CH_BANDWIDTH are CBW20, CBW40, CBW80, CBW80+80, and CBW160 if the triggering PPDU is an HE SU PPDU or HE MU PPDU. The only permissible value for CH_BANDWIDTH is CBW20 if the triggering PPDU is an HE ER SU PPDU.

26.5.2.3.5 RA field for frames carried in an HE TB PPDU

The RA field of the frames sent in response to a MU-RTS Trigger frame is set as defined in 9.3.1.3. The RA field of the frames sent in response of a GCR MU-BAR Trigger frame or MU-BAR Trigger frame is set as defined in 9.3.1.8. The RA field of the QoS Null frames, QoS Data frames, and Management frames sent in response to a Trigger frame shall be set to the MAC address of the destination AP (see 9.3.2.1 and 9.3.3.1). The RA field of a QoS Null frame or Action No Ack frame sent in response to a frame carrying TRS Control subfield shall be the MAC address of the destination AP (see 9.3.2.1 and 9.3.3.1).

NOTE 1—If dot11MultiBSSIDImplemented is true and the TA field of the soliciting Trigger frame contains the transmitted BSSID, the destination AP is the BSSID to which the non-AP STA intends to send the frame.

NOTE 2—All MPDUs within an A-MPDU carried in an HE TB PPDU have the same RA (see 9.7.3). The settings of the address fields of MPDUs within the A-MPDU depend on the type and subtype of the MPDU as defined in 9.3.

26.5.2.4 A-MPDU contents in an HE TB PPDU

A non-AP STA that receives a triggering frame other than an MU-RTS Trigger frame or an NFRP Trigger frame and that transmits an HE TB PPDU response shall follow the A-MPDU padding procedure described in 26.6.2.3 and construct the A-MPDU carried in the HE TB PPDU as described below in this subclause, provided the AP allocates sufficient resources for the non-AP STA to include MPDU(s) in the A-MPDU. Otherwise, the non-AP STA is not required to include MPDUs in the A-MPDU and includes only padding in the A-MPDU.

NOTE 1—The responses to a MU-RTS Trigger frame and a NFRP Trigger frame are exempt from these construction rules since the MU-RTS Trigger frame does not solicit an HE TB PPDU and the NFRP Trigger frame solicits an HE TB PPDU that does not carry an A-MPDU.

A non-AP STA shall follow the rules in 26.5.4.5 to construct an HE TB PPDU in response to a Trigger frame that is not an MU-RTS Trigger frame from an AP with which it is not associated and that allocates RA-RUs for unassociated STAs.

A non-AP STA that responds to a DL MU PPDU containing one or more frames addressed to it that include a TRS Control subfield follows the rules defined in 10.3.2.11 for generating the Ack frame, the rules defined in 10.25.6.5 for generating the BlockAck frame, and the rules defined in 26.4 for generating the Multi-STA BlockAck frame if at least one of the received MPDUs solicits an immediate acknowledgment. The contents of the A-MPDU carried in the HE TB PPDU shall be as defined in the following:

— Table 9-663 if at least one of the received MPDUs solicits an immediate acknowledgment.
— Table 9-662 with the exception that the A-MPDU does not contain QoS Data frames, if none of the received MPDUs solicit an immediate acknowledgment.

NOTE 2—The non-AP STA additionally follows the rules in 26.3.2 if fragments are present in the soliciting A-MPDU.

NOTE 3—An AP might transmit an HE MU PPDU with an RU allocated to STA-ID 2045 with an A-MPDU that includes a Management frame that is addressed to an unassociated non-AP STA, solicits an acknowledgment, and carries a TRS Control subfield. The TRS Control subfield allocates resources for the unassociated non-AP STA to respond with an HE TB PPDU that carries the acknowledgment.

An associated non-AP STA that responds to a Basic Trigger frame addressed to it shall construct the A-MPDU carried in the HE TB PPDU as defined in the following:

— Table 9-663 if the Trigger frame is contained in an A-MPDU and the non-AP STA received in the same A-MPDU at least one MPDU that solicits an immediate acknowledgment. The TID Aggregation Limit field of the User Info field addressed to the non-AP STA may have any value.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Table 9-662 with the exception that the A-MPDU does not contain QoS Data frames, if the Trigger frame either is not carried in an A-MPDU or is carried in an A-MPDU but the non-AP STA receives no other MPDUs that solicit an immediate acknowledgment. The TID Aggregation Limit field of the User Info field addressed to the non-AP STA may have any value.
— Table 9-664with the following restrictions:
  — The S-MPDU shall be a control response frame if the non-AP STA received in the same A-MPDU at least one MPDU that solicits an immediate acknowledgment. The TID Aggregation Limit field of the User Info field addressed to the non-AP STA may have any value.
  — The S-MPDU may be a Multi-TID BlockAckReq frame, provided that the number of TIDs present in the Multi-TID BlockAckReq frame does not exceed the TID aggregation limit indicated by the TID Aggregation Limit field of the User Info field addressed to the non-AP STA.
  — The S-MPDU may be a QoS Data, QoS Null, Management, BlockAckReq, or PS-Poll frame if the TID Aggregation Limit field of the User Info field addressed to the non-AP STA is greater than 0.
  — Otherwise, the S-MPDU shall be a QoS Data, QoS Null, or Management frame that does not solicit an immediate acknowledgment.
— Table 9-665 or Table 9-667 if the TID Aggregation Limit field of the User Info field addressed to the non-AP STA in the Trigger frame is greater than 0 and the non-AP STA intends to carry one or more untagged MPDUs (see 10.12 and 26.6.3.3). The A-MPDU is subject to the following restrictions:
  — It shall contain a control response frame if the non-AP STA received in the same A-MPDU at least one MPDU that solicits an immediate acknowledgment.
  — The number of TIDs present in the A-MPDU shall count towards reaching the TID aggregation limit indicated by the TID Aggregation Limit field of the User Info field addressed to the non-AP STA in the Trigger frame.
— Table 9-666 or Table 9-668 if the TID Aggregation Limit field of the User Info field addressed to the non-AP STA in the Trigger frame is greater than 0 and the non-AP STA intends to carry an ack-enabled single-TID A-MPDU or ack-enabled multi-TID A-MPDU (see 26.6.3.1 and 26.6.3.4). The A-MPDU is subject to the following restrictions:
  — It shall contain a control response frame if the non-AP STA receives at least another MPDU that solicits an immediate acknowledgment.
  — The number of TIDs present in the A-MPDU, in either QoS Data or BlockAckReq frames, shall count towards reaching the TID aggregation limit that is obtained from the TID Aggregation Limit field of the User Info field addressed to the non-AP STA in the Trigger frame.

If the associated non-AP STA has no frames pending or is unable to include pending frames in response to a Basic Trigger frame because the allocated resource is insufficient, then the associated non-AP STA shall include in the A-MPDU at least one QoS Null frame if the allocated resource is sufficient for containing a QoS Null frame.

NOTE 4—The non-AP STA can transmit one QoS Null frame as defined in 9-664 or one or more QoS Null frames as defined in Table 9-662.

A non-AP STA that responds to a BFRP Trigger frame addressed to it shall construct an A-MPDU carried in the HE TB PPDU with one or more HE Compressed Beamforming/CQI frames (see 26.7); other frames shall not be allowed in the A-MPDU.

NOTE 5—It is not always possible to segment the HE Compressed Beamforming/CQI Report field (see 26.7.4). If the length of the HE TB PPDU is insufficient to contain the HE compressed beamforming/CQI report requested by a BFRP Trigger frame, no feedback is sent.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A non-AP STA that responds to an MU-BAR Trigger frame addressed to it shall construct the A-MPDU carried in the HE TB PPDU as defined in Table 9-663. The non-AP STA includes either a BlockAck frame or a Multi-STA BlockAck frame in the A-MPDU as defined in 26.4.

A non-AP STA that responds to a GCR MU-BAR Trigger frame addressed to it shall construct the A-MPDU carried in the HE TB PPDU as defined in Table 9-663. The non-AP STA includes a GCR BlockAck frame in the A-MPDU as defined in 10.25.8.

A non-AP STA that responds to a BSRP or BQRP Trigger frame addressed to it and that is not aggregated with any MPDUs that solicit an immediate acknowledgment shall construct the A-MPDU carried in the HE TB PPDU as defined in Table 9-662 with the exception that the A-MPDU does not contain QoS Data frames. The non-AP STA shall include in the A-MPDU at least one QoS Null frame. A non-AP STA that responds to a BSRP or BQRP Trigger frame addressed to it and that is aggregated with at least one MPDU that solicits an immediate acknowledgment, shall construct the A-MPDU carried in the HE TB PPDU as defined in Table 9-663.

NOTE 6—The frame type of MPDUs might be different across A-MPDUs within the same HE TB PPDU subject to A-MPDU context.

NOTE 7—A non-AP STA follows the rules in 26.6.3 for aggregating the QoS Data frames with multiple TIDs in HE TB PPDUs.

A non-AP STA may set dot11HEUPHControlActivated to false if the most recent OM Control field sent (if any) to the AP had the UL MU Disable field equal to 1; otherwise, the non-AP STA shall set dot11HEUPHControlActivated to true.

A STA that transmits an HE TB PPDU transmits the decibel value of its UL power headroom, HR_{STA}, in the UPH Control subfield of frames (that can carry an HE-variant HT Control field) carried in the HE TB PPDU, to assist in the AP's HE-MCS selection. The UL power headroom for the assigned HE-MCS is defined in Equation (26-2).

$$HR_{STA} = Tx_{pwr}^{Max} - Tx_{pwr}^{STA} \tag{26-2}$$

where

Tx_{pwr}^{Max} represents the maximum UL transmit power of an HE TB PPDU with the assigned HE-MCS after considering hardware capability, regulatory requirements, and local maximum transmit power levels (see 11.7.5) as well as non-IEEE-802.11 in-device coexistence requirements

Tx_{pwr}^{STA} represents the current UL transmit power of the HE TB PPDU for the assigned HE-MCS, which is determined by power control and subject to the non-AP STA's capabilities and other requirements as defined in 27.3.15.2

HR_{STA} is the UL power headroom, in dB, of the HE TB PPDU, the encoding of which is specified in 9.2.4.7.5

NOTE 8—If the Minimum Transmit Power Flag subfield in the UPH Control subfield is 1, then the non-AP STA is transmitting the HE TB PPDU at its minimum Tx_{pwr}^{STA} for the assigned HE-MCS. The UL power headroom is calculated for the assigned HE-MCS and is independent of TOM parameters provided in any OM Control field contained in the same A-Control field (see 26.9.3).

NOTE 9—The uplink power headroom is not normalized to 20 MHz bandwidth, unlike the value in the AP Tx Power subfield.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A non-AP STA shall include an HE variant HT Control field containing the UPH Control subfield in the frames carried in the A-MPDU of the HE TB PPDU with the following exceptions:

— A UPH Control subfield is not included in any frame if the remaining space in the A-MPDU, after inclusion of solicited frames that are required to be included in the A-MPDU but cannot contain an HE variant HT Control field, is not sufficient to contain a frame that can be included in the A-MPDU and can contain an HE variant HT Control field.

— A UPH Control subfield is not included in a frame if the frame contains Control subfields other than UPH Control and ONES Control subfields and the remaining space in the HE variant HT Control field of the frame is not sufficient to contain a UPH Control subfield as well.

— A UPH Control subfield is not included in a frame that is a Control frame.

A non-AP STA shall not include a ONES Control subfield in the HE variant HT Control field of the frames carried in an HE TB PPDU.

26.5.2.5 UL MU CS mechanism

The ED-based CCA and virtual CS functions are used to determine the state of the medium if CS is required before responding to a received Trigger frame. ED-based CCA for the UL MU CS mechanism is defined in 27.3.22.6.4, and virtual CS is defined in 10.3.2.1.

If the CS Required subfield in a received Trigger frame is 0 or a frame that includes a TRS Control subfield and solicits a response is received, then the non-AP STA may respond without regard to the busy/idle state of the medium.

NOTE 1—Responding without regard to the busy/idle state of the medium means that a non-AP STA can respond without the need to check the medium indication from physical CS and virtual CS (i.e., basic NAV and intra-BSS NAV).

A non-AP STA does not consider the intra-BSS NAV in determining whether to respond to a Trigger frame sent by the AP with which the non-AP STA is associated.

A non-AP STA considers the basic NAV in determining whether to respond to a Trigger frame sent by the AP with which the non-AP STA is associated.

A non-AP STA considers the NAV in determining whether to respond to a Trigger frame sent by an AP with which the non-AP STA is not associated, through the UORA procedure (see 26.5.4), unless the NAV was set by a frame originating from the AP sending the Trigger frame.

NOTE 2—A non-AP STA considers the intra-BSS NAV associated with an AP in determining whether to respond to a Trigger frame with RU allocations for unassociated STAs sent by another AP.

NOTE 3—The details of how a non-AP STA is solicited by the Trigger frame for transmission are described in 26.5.2.2.4.

NOTE 4—If a non-AP STA responds to a Trigger frame from an AP with which it is not associated through the UORA procedure, the method to identify that a NAV was set by a frame originating from the AP sending the Trigger frame is implementation specific. For example, the non-AP STA can save the TXOP holder address and match the saved TXOP holder address with the TA field of the Trigger frame.

For a non-AP STA that is solicited by a Trigger frame for transmission, the indication of the virtual CS is described as follows. If the non-AP STA does not consider any NAV, then the virtual CS indicates idle. If all NAVs that the non-AP STA considers have their NAV counter equal to 0, then the virtual CS indicates idle. Otherwise, the virtual CS indicates busy.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the CS Required subfield in a Trigger frame is 1, then the non-AP STA shall consider the status of the CCA [using energy detect defined in 27.3.22.6 and the virtual carrier sense (NAV)] during the SIFS between the Trigger frame and the PPDU sent in response to the Trigger frame. In this case, the non-AP STA shall sense the medium using energy detect after receiving the PPDU that contains the Trigger frame (i.e., during the SIFS), and it shall perform the energy detect at least in the subchannel that contains the non-AP STA's UL allocation, where the sensed subchannel consists of one or more 20 MHz channels. The non-AP STA may transmit the solicited PPDU if the 20 MHz channels containing the RUs allocated in the Trigger frame are considered idle. If the non-AP STA detects that the 20 MHz channels containing the allocated RUs are not all idle, then the non-AP STA shall not transmit.

NOTE 5—The solicited PPDU is a non-HT or non-HT duplicate PPDU if the Trigger frame is an MU-RTS Trigger frame (see 26.2.6); otherwise, the solicited PPDU is an HE TB PPDU (see 26.5.2.3).

The CS Required subfield in the MU-RTS Trigger frame shall be set to 1.

An AP that transmits a BFRP Trigger frame with the UL Length subfield in the Common Info field set to a value greater than 76 shall set the CS Required subfield in the Common Info field to 1.

An AP that transmits a Basic, BSRP, MU-BAR, BQRP, or GCR MU-BAR Trigger frame shall set the CS Required subfield to 1, unless one of the following conditions is met:

— The RA of the Trigger frame is an individually addressed non-AP STA's MAC address, a QoS Data frame with HETP Ack ack policy and/or a Management frame that solicits an acknowledgment is aggregated with the Trigger frame in an A-MPDU, and the UL Length subfield in the Common Info field of the Trigger frame is less than or equal to 418.
— The Trigger frame is either an MU-BAR or a GCR MU-BAR Trigger frame, and the UL Length subfield in the Common Info field of the Trigger frame is less than or equal to 418.
— The UL Length subfield in the Common Info field of the Trigger frame is less than or equal to 76.

NOTE 6—The threshold value 418 of the UL Length subfield in the Common Info field of the Trigger frame is obtained from the maximum HE TB PPDU duration, 584 μs, that can be solicited by the TRS Control subfield based on Equation (27-16). This duration is the sum of 20 μs for the L-STF, L-LTF, and L-SIG fields; 20 μs for the RL-SIG, HE-SIG-A, and HE-STF fields; 16 μs for the 4x HE-LTF field with 3.2 μs GI; 512 μs for 32 OFDM symbols in the Data field with 3.2 μs GI; and 16 μs for the PE field (see 9.2.4.7.1, 26.5.2.3, and 27.3.4).

NOTE 7—The UL Length subfield value 76 is derived from the duration 128 μs, which is the duration of an HE TB PPDU with 4 HE-LTF symbols and a PE field.

An AP may transmit an NFRP Trigger frame with the CS Required subfield set to 0 or 1.

An RSTA that transmits a Ranging Trigger frame shall set the CS Required subfield to 1 unless one of the following conditions is met:

— The Ranging Trigger frame is of subvariant Poll, Sounding, Secure Sounding, or Passive Sounding.
— The Ranging Trigger frame is of subvariant Report and the UL Length subfield in the Common Info field of the Trigger frame is less than or equal to 418.

26.5.3 MU cascading sequence

An MU cascading sequence is a frame exchange sequence between an AP and one or more non-AP STAs in which the AP, within a single PPDU, acknowledges one or more frames from a STA and triggers the STA for a further UL transmission. An example of an MU cascading sequence is shown in Figure 26-5 (Example of MU cascading sequence). In this figure the second HE MU PPDU contains an Ack or BlockAck frame and a triggering frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

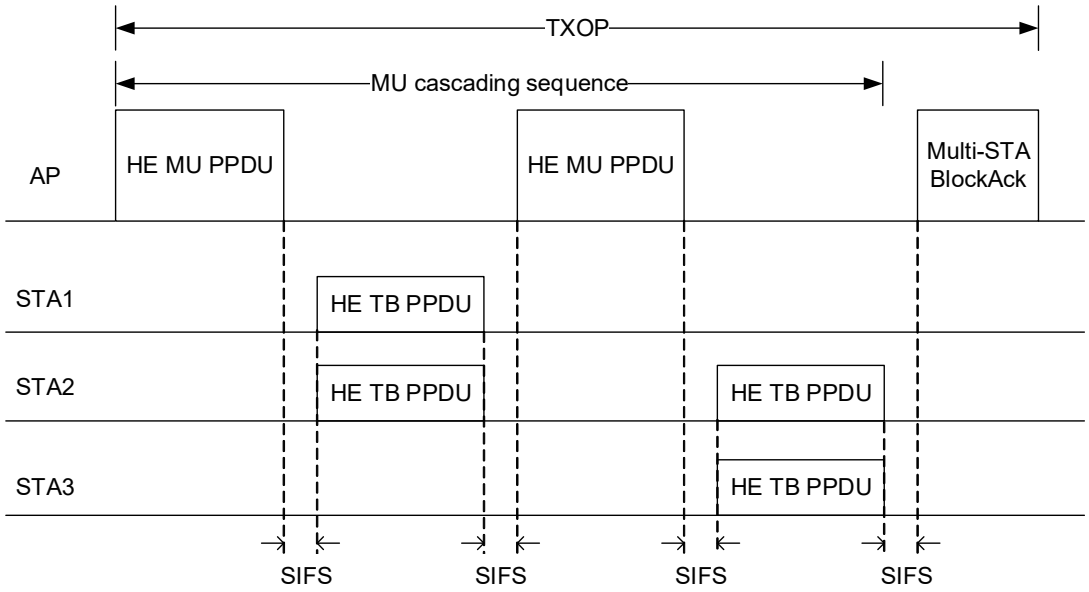

Figure 26-5—Example of MU cascading sequence

An AP shall not transmit an A-MPDU to a non-AP STA that includes an Ack or BlockAck frame together with a triggering frame, unless both the AP and the non-AP STA have indicated support by setting the MU Cascading Support subfield to 1 in the MAC Capabilities Information field in the HE Capabilities element they transmit.

NOTE—An A-MPDU sent by an AP in an MU cascading sequence typically includes, in addition to the acknowledgement and triggering frames, one or more QoS Data frames with HETP Ack ack policy and/or a Management frame soliciting acknowledgement, subject to the rules in 26.6.

In an MU cascading sequence, the receivers of an HE MU PPDU may differ from the transmitters of preceding HE TB PPDUs. An MU cascading sequence is sent within a single TXOP.

An AP follows the procedure in 26.5.2.2.5.

26.5.4 UL OFDMA-based random access (UORA)

26.5.4.1 General

An HE STA with dot11OFDMARandomAccessOptionImplemented equal to true shall set the OFDMA RA Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element to 1. Otherwise, it shall set the OFDMA RA Support subfield to 0.

NOTE 1—A non-AP STA that does not support UORA can contend for the WM using EDCA for sending UL frames to the AP with which it intends to communicate.

A non-AP STA with dot11OFDMARandomAccessOptionImplemented set to true shall follow the procedure defined in 26.5.4.3 and 26.5.4.5 to contend for an eligible RA-RU.

An HE AP may transmit a Basic Trigger frame, BQRP Trigger frame, or BSRP Trigger frame that contains one or more RUs for random access. An AP that transmits a Trigger frame that is not a Basic Trigger frame shall not set the AID12 subfield of any User Info field of the frame to indicate allocation of one or more RA-

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

RUs for unassociated STAs. An AP that transmits a Trigger frame that is not a Basic Trigger frame, BQRP Trigger frame, or BSRP Trigger frame shall not set the AID12 subfield of any User Info field of the frame to indicated allocation of one or more RA-RUs for associated STAs.

NOTE 2—A non-AP HE STA that changes the maximum number of receiving spatial streams to 1 and sets the OFDMA RA Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element to 1 cannot receive a Trigger frame sent with more than one spatial stream. As a result, if the Trigger frame indicates eligible RA-RUs for associated non-AP STAs, the non-AP HE STA cannot perform UORA defined in 26.5.4). An AP might take this behavior into consideration when sending a Trigger frame indicating eligible RA-RUs for associated non-AP STAs.

An HE AP that transmits a Basic Trigger frame should set the TID Aggregation Limit subfield in the User Info field indicating an RA-RU to 0 or 1.

An AP shall set the More RA-RU subfield in the User Info field to 1 if it intends to transmit additional Trigger frames in the current broadcast TWT SP that allocate RA-RUs matching the AID12 subfield value in the User Info field (see Table 9-52).

A non-AP HE STA shall ignore the More RA-RU subfield if the More TF field in the Trigger frame is equal to 0.

The HE AP may include the UORA Parameter Set element (see 9.4.2.249) in Management frames that it transmits. The AP shall indicate the range of OFDMA contention window (OCW) in the UORA Parameter Set element for non-AP STAs to initiate random access following the Trigger frame transmission. An AP corresponding to a nontransmitted BSSID in a multiple BSSID set shall follow the rules in 11.1.3.8.4.

NOTE 3—An AP with dot11MultiBSSIDImplemented equal to true can allocate RA-RUs for non-AP STAs associated with different BSSIDs in a multiple BSSID set by transmitting a DL MU PPDU carrying broadcast RUs, one per BSS in the set (see 26.5.1.2), with an A-MPDU in each broadcast RU carrying a Trigger frame with at least one User Info field with the AID12 subfield set to 0.

A non-AP HE STA shall maintain an internal OCW and an internal OBO counter. OCW is an integer in the range *OCWmin* to *OCWmax*. The *OCWmin* and *OCWmax* parameters are defined by dot11OCWmin and dot11OCWmax. A non-AP HE STA shall update dot11OCWmin and dot11OCWmax from an UORA Parameter Set element within an interval of time equal to one beacon interval after receiving an updated UORA Parameter Set element carried in a Beacon, Probe Response, or (Re)Association Response frame transmitted by its associated AP, unless the non-AP HE STA is associated with an AP corresponding to a nontransmitted BSSID of a multiple BSSID set. In this case, it shall update dot11OCWmin and dot11OCWmax by following the rules in 11.1.3.8.4.

Each time a non-AP HE STA associates with a different AP and prior to the initial attempt of RA-RU transmission towards it, the non-AP STA shall set the value of OCW to the *OCWmin* value and shall initialize its OBO counter in the range 0 to OCW as defined in 26.5.4.3.

NOTE 4—For a non-AP STA with dot11MultiBSSIDImplemented equal to true, associating with a different AP includes associating with an AP corresponding to a different BSSID in the same multiple BSSID set.

26.5.4.2 Eligible RA-RUs

A non-AP STA that is the intended receiver of a User Info field in a Trigger frame (i.e., the AID12 subfield equal to the 12 LSBs of the AID of the non-AP STA) shall not contend for an RA-RU that is indicated by a Trigger frame contained in the same PPDU and shall not decrement its OBO counter.

A non-AP STA shall consider an RU as an eligible RA-RU if it is capable of transmitting an HE TB PPDU in that RU according to the parameters indicated in the Common Info field and in the User Info field that allocates the RU (as described in 26.5.2.3), the non-AP STA is associated with the BSS whose BSSID is the value in the TA field of the Trigger frame, and the RA-RU is allocated for associated STAs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—If the STA is a 20 MHz operating non-AP HE STA, RUs that are excluded as specified in 27.3.2.8 are not present in the list of eligible RA-RUs.

A non-AP STA may consider an RU as an eligible RA-RU if it supports all the transmit parameters indicated in the Common Info field and in the User Info field that allocates that RU (as described in 26.5.2.3), the non-AP STA is not associated with the BSS, and the RA-RU is allocated for unassociated STAs.

An HE AP may allocate a contiguous set of RUs for random access by setting the Number Of RA-RU subfield in the User Info field of the Trigger frame to a value greater than 1. The RA-RU indicated by the RU Allocation subfield in the User Info field shall represent the starting RU of the set. The size of all RA-RUs in the set shall be the same and equal to the size of the RA-RU indicated by the RU Allocation subfield in the User Info field. The remaining subfields of the User Info field apply to each RA-RU in the set. An AP allocating a contiguous set of RA-RUs in a Trigger frame with a UL BW subfield that indicates 80+80 MHz or 160 MHz shall set the Number Of RA-RU subfield so that all the RA-RUs in the set lie in one 80 MHz frequency segment.

NOTE 2—An AP can transmit a Trigger frame carrying more than one User Info field, each allocating a single or a contiguous set of RA-RUs, to ensure that an RA-RU set does not overlap with other RUs allocated by the frame.

A non-AP HE STA shall determine the total number of eligible RA-RUs in a contiguous set from the Number Of RA-RU subfields (see Table 9-95) in the User Info field corresponding to an eligible RA-RU, excluding RA-RUs that are not within its operating bandwidth.

A non-AP HE STA may consider as eligible RA-RUs all or a subset of the RA-RUs indicated by the User Info fields in a Trigger frame that carries more than one User Info field that allocates RA-RUs. The number of eligible RA-RUs that the non-AP STA considers for OBO countdown and transmission (see 26.5.4.3) shall be the total number of eligible RA-RUs indicated by the selected subset of User Info fields.

NOTE 3—A STA that considers only a subset of User Info fields can randomly select User Info fields from the available set of User Info fields that allocate RA-RUs so that the UORA contention is not concentrated at the RA-RU set indicated by the first User Info field.

26.5.4.3 Transmission procedure for UORA

In this subclause, the transmit procedure using RA-RUs is described with respect to UORA parameters. The procedure is also illustrated in Figure 26-6.

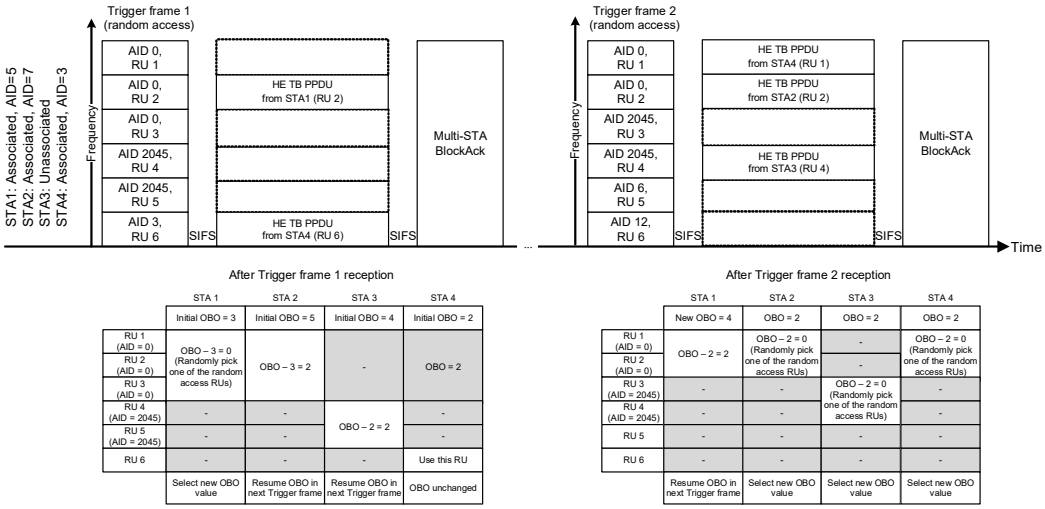

Figure 26-6—Illustration of UORA procedure

A non-AP STA shall not contend for an eligible RA-RU or decrement its OBO counter if it does not have pending frames for the AP.

If an HE STA has a pending frame for the AP upon the reception of a Trigger frame containing at least one eligible RA-RU and if the OBO counter of an HE STA is not greater than the number of eligible RA-RUs in a Trigger frame from that AP, then the HE STA shall set its OBO counter to zero and randomly select one of the eligible RA-RUs to be considered for transmission. Otherwise, the HE STA decrements its OBO counter by the number of eligible RA-RUs in the Trigger frame.

In the example in Figure 26-6:

- Before Trigger frame 1 was sent by the AP, HE STA 1, STA 2, STA 3, and STA 4 had initial OBO values of 3, 5, 4, and 2, respectively.
- Upon receiving Trigger frame 1:
  - STA 4, which is associated with the AP and has pending frames for the AP, is allocated a dedicated RU (RU6). The STA does not contend for RA-RUs and instead transmits its pending frames on RU6.
  - STA 1 and STA 2, both associated with the AP and having pending frames for the AP, decrement their respective OBO counters by the number of eligible RA-RUs indicated in the Trigger frame (i.e., three RA-RUs for associated STAs). Since STA 1's OBO counter decrements to 0, it transmits its pending frames on RU2 that it randomly selects from the eligible set of RUs (i.e., RU1, RU2, and RU3). Since STA 2's OBO counter decrements to a nonzero value, it maintains the new OBO value (2) until it receives a later Trigger frame carrying RA-RUs for associated STAs.
  - STA 3, which is not associated with the AP but has a pending frame for the AP, decrements its OBO counter by the number of eligible RA-RUs indicated in the Trigger frame (i.e., two

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

RA-RUs for unassociated STAs). Since STA 3's OBO counter decrements to a nonzero value, it maintains the new OBO value (2) until it receives a later Trigger frame carrying RA-RUs for unassociated STAs.

- After transmission of HE TB PPDU in response to Trigger frame 1:
  - STA 4 has additional frames pending for the AP. Therefore, it maintains its initial OBO value (2) until it receives a later Trigger frame carrying RA-RUs for associated STAs.
  - STA 1 has additional frames pending for the AP and randomly selects a new OBO value (4).
- Upon receiving Trigger frame 2:
  - STA 1, STA 2, and STA 4 decrement their respective OBO counters by the number of eligible RA-RUs (two in this case). Since STA 2 and STA 4's OBO counters decrements to 0, they both transmit their pending frames on a randomly selected RU (RU2 in the case of STA 2 and RU1 in the case of STA 4). If either STAs have additional frames pending for the AP, each would randomly select a new OBO value. Since STA 1's OBO decrements to a nonzero value, it maintains the new OBO value (2) until it receives a later Trigger frame carrying RA-RUs for associated STAs.
  - STA 3 decrements its OBO counter by the number of eligible RA-RUs (two in this case). Since the STA's OBO counter decrements to 0, it transmits its pending frame on a randomly selected RU (RU4 in this case).

A non-AP STA shall follow the rules in 26.5.2.3 to construct an HE TB PPDU and shall follow the rules as defined in 26.5.2.5 to determine the state of the medium before transmitting the HE TB PPDU. If CS is required and the selected RU is considered busy, then the non-AP STA shall not transmit the HE TB PPDU and the non-AP STA shall set its OBO counter to a random value drawn from a uniform distribution in the range 0 to OCW.

The MU acknowledgment procedure for UORA follows the procedure as defined in 10.3.2.13.3.

If a non-AP STA transmits an HE TB PPDU that contains a frame that solicits an immediate response in an RA-RU and the expected response is not received, the transmission is considered unsuccessful. Otherwise, the transmission is considered successful. After each successful HE TB PPDU transmission in an RA-RU, a non-AP HE STA shall set the value of OCW to the *OCWmin* obtained from the most recent *OCWmin* indicated in the UORA Parameter Set element from the HE AP or the default (if UORA Parameter Set element was not received) and shall initialize its OBO counter to an integer value randomly selected from a uniform distribution in the range 0 to OCW. The non-AP STA shall follow the retransmission procedure defined in 26.5.4.4 if the transmission is not successful.

NOTE—A non-AP STA that transmits an HE TB PPDU in response to a Trigger frame that is not an MU-RTS Trigger frame that allocates RA-RU(s) by following the UORA procedure does not update its state variables to the values contained in the MU EDCA Parameter Set element (see 26.2.7).

26.5.4.4 Retransmission procedure for UORA

A non-AP STA whose HE TB PPDU transmission sent in an RA-RU of a Trigger frame is unsuccessful, may attempt to retransmit the failed PPDU using EDCA or as a response to a Trigger frame.

If the HE TB PPDU is not successfully transmitted in the selected RA-RU, then the non-AP STA shall update its OCW to $2 \times \text{OCW} + 1$ when the OCW is less than the value of *OCWmax*, and shall randomly select its OBO counter in the range 0 and OCW. Once the OCW reaches *OCWmax* for successive retransmission attempts, the OCW shall remain at the value of *OCWmax* until the OCW is reset as described in 26.5.4.3.

A non-AP STA shall update its OCW value under the condition that the updated OCW remains in the range *OCWmin* to *OCWmax* obtained from the most recently received UORA Parameter Set element (see

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.249). If the updated OCW becomes greater than *OCWmax* as a consequence of receiving a modified UORA Parameter Set element, then the non-AP STA shall set the value of OCW to the new *OCWmax* value.

26.5.4.5 Additional considerations for unassociated STAs

An AP transmitting a Trigger frame that allocates one or more RA-RUs for unassociated STAs shall transmit the Trigger frame in an HE PPDU.

NOTE 1—This allows an unassociated non-AP STA to determine the BSS color. The non-AP STA needs this information to indicate it in the HE TB PPDU.

An HE AP that supports the UORA procedure and broadcast TWT operation and that intends to transmit Trigger frames that allocate one or more RA-RUs for unassociated STAs shall schedule the transmission of at least one such Trigger frame within each TWT SP corresponding to a Broadcast TWT Parameter Set field in a TWT element with a Broadcast TWT ID subfield equal to 0, Flow Type subfield equal to 0, Trigger subfield equal to 1, and Broadcast TWT Recommendation subfield equal to 2.

An AP that receives an Authentication frame within an RA-RU should schedule for transmission, at a time no less than 3 TUs and no greater than 5 TUs subsequent to the transmission of the Authentication frame that is a response to that reception, a Trigger frame that allocates one or more RA-RUs for unassociated STAs.

NOTE 2—This Trigger frame provides a potential opportunity for an unassociated STA that transmitted the Authentication frame to transmit another Authentication frame or an Association Request frame.

An AP that supports the UORA procedure, broadcasts TWT operation, operates a BSS with a width of 80 MHz or greater, and transmits a Trigger frame that allocates one or more RA-RUs for unassociated STAs shall include at least 2 RA-RUs for unassociated STAs for at least one transmission of such a Trigger frame within a Broadcast TWT SP that meets the conditions described above.

An AP that intends to transmit Trigger frames that allocates one or more RA-RUs for unassociated STAs should transmit FILS Discovery frames as described in 11.45.2.1 at regular intervals within a beacon period to assist unassociated STA discovery of the BSS and its operating parameters.

The TWT scheduling AP (see 26.8.3.1) that supports the UORA procedure may include a broadcast TWT element in FILS Discovery frames and in broadcast Probe Response frames to indicate the TWT SPs during which the AP intends to schedule for transmission at least one Trigger frame allocating one or more RA-RUs for STAs not associated with the AP. The broadcast TWT element shall carry only a broadcast TWT parameter set with the Broadcast TWT Recommendation subfield set to 2, the Trigger subfield set to 1, the Flow Type subfield set to 0, and the Broadcast TWT ID subfield set to 0. The AP transmits broadcast Probe Response frames if it has dot11FILSOmitReplicateProbeResponses equal to true.

A non-AP STA that receives a FILS Discovery frame from an AP with which it is not associated may use the values carried in the frame to determine the operating parameters for that AP and may use the information when responding to a Trigger frame from the AP containing RA-RUs for unassociated non-AP STAs.

An unassociated non-AP STA that has not received an UORA Parameter Set element from the AP with which it intends to communicate shall use the default OCW values as defined in 26.5.4.1. Each time an unassociated non-AP STA communicates with a different AP using random access, it shall initialize its OCW using the default values or the parameters from the UORA Parameter Set element received from that AP and shall initialize its OBO counter as defined in 26.5.4.3.

An unassociated non-AP STA that supports the UORA and TWT procedure may begin listening for Trigger frames at the start of a particular broadcast TWT SP after receiving a Beacon frame, a broadcast Probe Response frame, or a FILS Discovery frame containing a TWT element with a Broadcast TWT Parameter

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Set field that has the Broadcast TWT ID subfield equal to 0, the Flow Type subfield equal to 0, the Trigger subfield equal to 1, and the Broadcast TWT Recommendation subfield equal to 2.

A non-AP STA shall include at most one Management frame that is an S-MPDU when it transmits an HE TB PPDU in response to a Trigger frame that is not an MU-RTS Trigger frame sent by an AP with which the non-AP STA is not associated.

An AP that receives Management frames from one or more unassociated non-AP STAs carried in HE TB PPDUs transmitted on RA-RUs shall respond with a Multi-STA BlockAck frame carried either in an SU PPDU or in a DL HE MU PPDU on a broadcast RU corresponding to parameter STA-ID equal to 2045.

An AP with dot11FILSOmitReplicateProbeResponses equal to true shall follow the procedure defined in 11.1.4.3.4 to respond with a broadcast Probe Response frame or the next Beacon frame if it receives one or more Probe Request frames via the UORA procedure.

26.5.5 Buffer status report operation

A non-AP STA delivers buffer status reports (BSRs) to assist its AP in allocating UL MU resources. The non-AP STA can either implicitly deliver BSRs in the QoS Control field or BSR Control subfield of any frame transmitted to the AP (unsolicited BSR) or explicitly deliver BSRs in any frame sent to the AP in response to a BSRP Trigger frame (solicited BSR). The buffer status reported in the QoS Control field consists of a queue size value for a given TID (see 9.2.4.5.6). The buffer status reported in the BSR Control field consists of an ACI bitmap, delta TID, a high priority AC, and two queue sizes (see 9.2.4.7.4).

An HE STA shall set the BSR Support subfield in the HE Capabilities element it transmits to 1 if dot11HEBSRControlImplemented is true; otherwise, the HE STA shall set the BSR Support subfield to 0.

A non-AP STA reports its buffer status (unsolicited BSR) to the AP with which it is associated in the QoS Control field in QoS Null and QoS Data frames and in the BSR Control subfield (if present) in QoS Null, QoS Data, and Management frames as defined below:

- The HE STA shall report the queue size for a given TID in the Queue Size subfield of the QoS Control field in QoS Data or QoS Null frames it transmits; the STA may set the Queue Size subfield to 255 to indicate an unknown/unspecified queue size for that TID.
  - The HE STA may aggregate multiple QoS Data frames or QoS Null frames in an A-MPDU to report the queue size for different TIDs. The HE STA shall follow the A-MPDU aggregation rules defined in 26.6.3 for aggregating QoS Data frames with multiple TIDs. The HE STA does not follow the rules defined in 26.6.3 for QoS Null frames with No Ack ack policy.
- The HE STA may report the buffer status in the BSR Control subfield of frames it transmits if the AP has indicated its support in the BSR Support subfield of its HE Capabilities element; otherwise, the STA shall not report the buffer status in the BSR Control subfield.
  - The HE STA shall report the queue size for its preferred AC, indicated by the ACI High subfield, in the Queue Size High subfield of the BSR Control subfield; the STA may set the Queue Size High subfield to 255 to indicate an unknown/unspecified queue size for that AC.
  - The HE STA shall report the queue size for the ACs, indicated by the ACI Bitmap subfield, in the Queue Size All subfield of the BSR Control subfield; the STA may set the Queue Size All subfield to 255 to indicate an unknown/unspecified BSR for those ACs.
  - The HE STA shall set the Delta TID subfield according to Table 9-32 and the Scaling Factor subfield as defined in 9.2.4.7.4.

NOTE 1—The STA can send an unsolicited BSR in response to certain Trigger frames except MU-RTS and BSRP (with or without RA-RUs, as defined in 26.5.2.3 and 26.5.4), or it can send the unsolicited BSR after accessing the WM using EDCA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 2—The STA might include a BSR Control subfield in a QoS Data or QoS Null frame. In this case the Queue Size subfield in the QoS Control field and the Queue Size High and Queue Size All subfields in the BSR Control subfield might differ, and any of the three subfields might be set to 255 to indicate unspecified/unknown queue size. The STA might include only the BSR Control subfield in a Management frame.

An AP can also solicit one or more associated non-AP STAs for their BSR(s) by sending a BSRP Trigger frame (see 9.3.1.22.6). The non-AP STA responds (solicited BSR) as defined below:

- The non-AP STA that receives a BSRP Trigger frame shall follow the rules defined in 26.5.2.3 to generate the HE TB PPDU if the Trigger frame contains the 12 LSBs of the non-AP STA's AID in any of the User Info fields; otherwise, if the non-AP STA's buffers are not empty and the non-AP STA supports the UORA procedure, it may follow the rules defined in 26.5.4 to gain access to an RA-RU and generate the HE TB PPDU when the Trigger frame contains one or more RA-RUs.
- The non-AP STA shall include in the HE TB PPDU one or more QoS Null frames containing one or more of the following:
  - The QoS Control field(s) with Queue Size subfields for each of the TIDs for which the non-AP STA has queue size to report to the AP.
  - The BSR Control subfield with the Queue Size All subfield indicating the queue size for the ACs, indicated by the ACI Bitmap subfield, for which the non-AP STA has queue size to report to the AP if the AP has indicated its support in the BSR Support subfield of its HE Capabilities element. The non-AP STA shall set Delta TID, Scaling Factor, ACI High, and Queue Size High subfields of the BSR Control subfield as defined in 9.2.4.7.4.
- The non-AP STA shall not solicit an immediate response for the frames carried in the HE TB PPDU (e.g., the Ack Policy Indicator subfield of a QoS Null frame shall not be set to Normal Ack or Implicit BAR).

NOTE 3—As with unsolicited BSR, the STA might include a BSR Control subfield in a QoS Null frame that is sent in response to the BSRP Trigger frame. In this case, the Queue Size subfield in the QoS Control field and the Queue Size High and Queue Size All subfields in the BSR Control subfield might differ, and any of the three subfields might be set to 255 to indicate an unspecified/unknown queue size.

NOTE 4—An AP does not send a BSRP Trigger frame containing the 12 LSBs of the AID of the non-AP STA that sets the UL MU Disable field to 1.

An AP may include a BSRP Trigger frame together with other Control, Data, and Management frames in one A-MPDU to a non-AP STA if the HE Capabilities element received from the non-AP STA has the BSRP BQRP A-MPDU Aggregation field equal to 1. A non-AP STA constructs the A-MPDU contained in the HE TB PPDU sent in response to a BSRP Trigger frame as described in 26.5.2.4.

The NDP feedback report procedure described in 26.5.7 can be used for buffer status feedback operation. An AP that sent an NFRP Trigger frame to one or more non-AP STAs may send a BSRP Trigger frame to those non-AP STAs to get more precise buffer status information.

26.5.6 Bandwidth query report operation

A non-AP STA may send bandwidth query reports (BQRs) to assist its AP in allocating DL MU and UL MU resources. The non-AP STA may either implicitly deliver BQRs in the BQR Control subfield of a frame transmitted to the AP (unsolicited BQR) or explicitly deliver BQRs in a frame sent to the AP in response to a BQRP Trigger frame (solicited BQR).

An HE STA shall set the BQR Support subfield in the HE Capabilities element it transmits to 1 if dot11HEBQRControlImplemented is true; otherwise, the HE STA shall set the BQR Support subfield to 0.

The HE STA may report the channel availability information as specified in 27.3.22.6.5 in the BQR Control subfield of frames it transmits if the AP has indicated its support in the BQR Support subfield of its HE

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Capabilities element; otherwise, the STA shall not report the channel availability information in the BQR Control subfield.

The availability of each 20 MHz subchannel reported in the BQR Control field shall be reported for the 20 MHz subchannels located in the operating channel of the reporting STA (see 9.2.4.7.6).

NOTE 1—The STA can send an unsolicited BQR in response to certain Trigger frames except NFRP, MU-RTS, and BQRP (with or without RA-RUs, as defined in 26.5.2.3 and 26.5.4), or it can send the unsolicited BQR after accessing the WM using EDCA.

An AP may solicit BQRs from a non-AP STA only if the non-AP STA has indicated support by setting the BQR Support field in the HE Capabilities element it transmits to 1; otherwise, the AP shall not solicit BQRs from the non-AP STA. An AP may solicit BQRs from one or more non-AP HE STAs that support generating BQRs, by sending a BQRP Trigger frame (see 9.3.1.22.8).

An AP shall not transmit a BQR Trigger frame with the User Info field addressed to a non-AP STA, unless it has received from the non-AP STA an HE Capabilities element with the BQR Support subfield equal to 1.

If a non-AP STA supports BQR operation and receives a BQRP Trigger frame with a User Info field addressed to the non-AP STA, then the non-AP STA shall respond by following the procedure in 26.5.2.3.1.

If a non-AP STA supports both BQR operation and the UORA procedure and receives a BQRP Trigger frame from the AP with which it is associated and that allocates RA-RUs for associated STAs but that does contain a User Info field addressed to the non-AP STA, then the non-AP STA shall respond by following the procedure in 26.5.4.

If the non-AP STA responds with an HE TB PPDU using one of the above procedures, then the A-MPDU carried in the HE TB PPDU shall include one or more QoS Null frames containing a BQR Control subfield with the channel availability information of the STA. The non-AP STA shall not solicit an immediate response for the frames carried in the HE TB PPDU. The Ack Policy Indication subfield of the frame shall be set to No Ack.

NOTE 2—An AP does not send a BQRP Trigger frame addressed to a STA that has set the UL MU Disable field to 1.

NOTE 3—The channel availability information of the STA is limited to the STA's operating channel width. See 9.2.4.7.6.

An AP may include a BQRP Trigger frame together with other Control, Data, and Management frames in one A-MPDU to a STA if the HE Capabilities element received from the STA has the BSRP BQRP A-MPDU Aggregation field equal to 1. A non-AP STA constructs the A-MPDU contained in the HE TB PPDU sent in response to a BQRP Trigger frame as described in 26.5.2.4.

26.5.7 NDP feedback report procedure

26.5.7.1 General

The NDP feedback report procedure allows an HE AP to collect feedback that is not channel sounding from multiple non-AP HE STAs.

An HE AP sends an NFRP Trigger frame to solicit NDP feedback report response from many non-AP STAs that are identified by a range of scheduled AIDs in the Trigger frame. The NDP feedback report response from a non-AP STA is an HE TB feedback NDP (see 27.3.18). A non-AP STA uses the information carried in the NFRP Trigger frame to know if it is scheduled and, in this case, to derive the parameters for the transmission of the response.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The NDP feedback report procedure is described in 26.5.7.2 through 26.5.7.5.

26.5.7.2 STA behavior

A non-AP STA shall set the NDP Feedback Report Support subfield in the HE Capabilities element to 1 if it supports NDP feedback report and set it 0, otherwise.

A non-AP STA shall not transmit an NDP feedback report response, unless it is explicitly enabled by an AP in one of the operation modes described in this subclause. The interframe space between a PPDU that contains an NFRP Trigger frame and the NDP feedback report response is SIFS. A non-AP STA shall commence the transmission of an NDP feedback report response at the SIFS time boundary after the end of a received PPDU if all the following conditions are met:

— The received PPDU contains an NFRP Trigger frame.
— The non-AP STA is scheduled by the NFRP Trigger frame.
— The NDP feedback report support subfield in HE MAC Capabilities Information field is set to 1.
— The non-AP STA intends to provide a response to the type of the NDP feedback contained in the NFRP Trigger frame, as described in 26.5.7.4.

A non-AP STA that does not satisfy all of the above conditions shall not respond to the NFRP Trigger frame.

A non-AP STA is scheduled to respond to the NFRP Trigger frame if all the following conditions are met:

— The non-AP STA is associated with an AP corresponding to the BSSID indicated in the TA field of the NFRP Trigger frame; or the non-AP STA is associated with an AP corresponding to a nontransmitted BSSID of a multiple BSSID set, and the TA field of the NFRP Trigger frame is set to the transmitted BSSID of that multiple BSSID set.
— The non-AP STA's AID is greater than or equal to the starting AID and less than the starting AID + N_{STA}, using the Starting AID subfield in the eliciting Trigger frame and N_{STA} as the total number of non-AP STAs that are scheduled to respond to the NFRP Trigger frame. N_{STA} is calculated by the following equation, using UL BW subfield and Number Of Spatially Multiplexed Users subfield from the eliciting Trigger frame:

$$N_{STA} = 18 \times 2^{BW} \times (\text{value of the Number Of Spatially Multiplexed Users subfield} + 1)$$

A non-AP STA shall obtain NDP feedback report parameter values from the most recently received NDP Feedback Report Parameter Set element carried in a Beacon, Probe Response, or (Re)Association Response frame from its associated AP, unless the non-AP STA is associated with an AP corresponding to a nontransmitted BSSID of a multiple BSSID set. In this case, it shall follow the rules in 11.1.3.8.4 to determine the NDP feedback parameter values. If the NDP Feedback Report Parameter Set element is not received in a Management frame with a TA equal to the BSSID of the associated AP or to the transmitted BSSID of the multiple BSSID set, the non-AP STA shall use default values for the NDP Feedback Report parameters.

An NDP feedback report response is an HE TB feedback NDP as defined in 27.3.4.

A non-AP STA transmitting an NDP feedback report response shall set the TXVECTOR parameters as for transmitting an HE TB PPDU in response to a Trigger frame that is not an MU-RTS Trigger frame as described in 26.5.2.3, except for the following parameters:

— The FORMAT parameter shall be set to HE_TB.
— The APEP_LENGTH parameter shall be set to 0.
— The RU_ALLOCATION parameter shall be set to be maximum RU size for the BW.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The RU_TONE_SET_INDEX parameter shall be set using the following equation, with the value of the Starting AID subfield in the User Info field of the eliciting Trigger frame:

$$\text{RU\_TONE\_SET\_INDEX} = 1 + ((\text{AID} - \text{Starting AID}) \bmod (18 \times 2^{BW}))$$

— The NUM_STS parameter shall be set to 1.

— The SPATIAL_REUSE parameter shall be set to PSR_DISALLOW.

— The STARTING_STS_NUM parameter shall be set with the following equation, using the values of the Starting AID subfield in the User Info field of the eliciting Trigger frame:

$$\text{STARTING\_STS\_NUM} = \lfloor (\text{AID} - \text{Starting AID}) / 18 / 2^{BW} \rfloor$$

— The MCS parameter shall be set to 0.

— The DCM parameter shall be set to 0.

— The FEC_CODING parameter shall be set to BCC_CODING.

— The TXPWR_LEVEL_INDEX parameter shall be set to the value based on the Transmit Power Control for an HE TB PPDU and based on the value of the AP Tx Power subfield and the UL Target Receive Power subfield in the User Info field of the eliciting Trigger frame (see 27.3.15.2).

NOTE—The subcarriers for each RU_TONE_SET index are contained in a 20 MHz channel and can be transmitted by a 20 MHz operating STA.

26.5.7.3 AP behavior

An AP shall set the NDP Feedback Report Support subfield in the HE Capabilities element to 1 if it supports NDP feedback report and set it 0 otherwise.

An AP may include the NDP Feedback Report Parameter Set element in Beacon frames, Probe Response frames, and (Re)Association Response frames in order to modify parameters for NDP Feedback Report operation. The procedure of NDP Feedback report described in this subclause allows operation even if the NDP Feedback Report Parameter Set element is not sent by the AP.

The NFRP Trigger frame shall be transmitted in a non-HT PPDU or HT PPDU, or as a tagged MPDU in a VHT, HE ER SU PPDU, or HE SU PPDU.

An AP that transmits an NFRP Trigger frame shall set the TA field of the frame to the MAC address of the AP, unless dot11MultiBSSIDImplemented is true and the Trigger frame is directed to STAs from at least two different BSSs of a multiple BSSID set. In this case, the AP shall set the TA field of the frame to the transmitted BSSID.

Following the transmission from an AP of an NFRP Trigger frame, multiple STAs may simultaneously send NDP feedback report responses to the AP. Based on the RXVECTOR parameter NDP_REPORT, which provides the detected status array for the resources of each spatial stream and tone set assigned by the Trigger frame, the AP can derive the list of AIDs from the resources to which an NDP feedback report response was sent and their responses.

The AP shall not send any acknowledgment in response to the reception of NDP feedback report responses.

26.5.7.4 NDP feedback report for a resource request

If the Feedback Type subfield in the User Info field of the NFRP Trigger frame is 0, a STA that is scheduled may send an NDP feedback report response in order to signal to the AP that it is in the awake state and that it might have frames in its queues for UL MU. If the STA does not satisfy either of the conditions in Table 26-3, then the STA shall not respond to the NFRP Trigger frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Each STA that is scheduled is assigned a STARTING_STS_NUM and an RU_TONE_SET_INDEX to transmit a FEEDBACK_STATUS bit.

The meaning of the FEEDBACK_STATUS bit is defined in Table 26-3:

Table 26-3—FEEDBACK_STATUS description

FEEDBACK_STATUS	Condition
0	The STA is in the awake state and reports buffered octets for transmission not exceeding the resource request buffer threshold. NOTE—The STA can use this value to indicate that it is in the awake state even if it does not have any buffered octets for transmission, e.g., to solicit delivery of BUs known to be buffered at the AP.
1	The STA is in the awake state and reports buffered octets for transmission exceeding the resource request buffer threshold.

The resource request buffer threshold is equal to $2^{(\text{Resource request buffer threshold exponent})}$ octets, using the Resource Request Buffer Threshold Exponent subfield in the most recently received NDP Feedback Report Parameter Set element sent by the AP with which the STA is associated. The resource request buffer threshold is equal to 256 octets if the STA did not receive an NDP Feedback Report Parameter Set element from the AP with which the STA is associated.

26.5.7.5 Power save operation with NDP feedback report procedure

An HE AP that sends an NFRP Trigger frame to a non-AP STA in PS mode and receives an NDP feedback report response from the STA shall assume the STA to be in, or to have transitioned to, the awake state and shall follow the rules defined in

- 11.2.3.5 to deliver BUs to the STA as if the STA had sent a U-APSD trigger frame if the STA is using U-APSD.
- 11.2.3.1 to deliver BUs to the STA as if the STA had sent a PS-Poll frame, if the STA is not using U-APSD.
- 26.8 for delivery of BUs during the TWT SP if the STA operates with TWT.

NOTE—As the AP does not send an acknowledgment in response to the NDP Feedback Report response, a STA that sends an NDP Feedback Report response and indicates that it is in the awake state might still schedule for transmission a PS-Poll or U-APSD trigger frame in order to indicate that it is in the awake state.

26.5.8 Use of TSPEC by HE STAs

In addition to the TS Setup operations as described in 11.4.4, a non-AP HE STA may use a TSPEC contained in a Basic ADDTS Request frame to provide its traffic characteristics and QoS requirements to an HE AP that supports the reception of Basic ADDTS Request frame in order to facilitate efficient scheduling for HE AP's UL and DL MU operations. A TSPEC provided by a non-AP HE STA is used by a receiving HE AP to facilitate the creation of a schedule for contention based channel access (EDCA) or MU operation. How the HE AP uses the information provided by the non-AP HE STA is beyond the scope of this standard.

An HE AP transmits an ADDTS Response frame as a response to ADDTS Request frame as described in 11.4.4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A non-AP HE STA should send a DELTS frame with the corresponding TSID if the traffic associated with the TSID has been terminated. When receiving a DELTS from a non-AP HE STA, the HE AP shall consider the information provided in the TSPEC as no longer valid.

26.5.9 UL MU transmit power capabilities

A non-AP HE STA may use the UL MU Power Capabilities element in a (Re)Association Request frame in order to inform an HE AP of the relative maximum transmit power at which the non-AP HE STA is capable of transmitting an HE TB PPDU for each HE-MCS when using an RU size greater than or equal to 242 subcarriers.

An HE AP might use this information as an input into the algorithm used to schedule the non-AP HE STA for UL MU transmission. The specification of the algorithm is beyond the scope of this standard.

26.6 A-MPDU operation in an HE PPDU

26.6.1 General

A-MPDU operation for an HE PPDU follows the procedures defined in 10.12 and the additional rules in this subclause.

An HE STA that sends a Class 1 frame or a Class 2 frame in an HE PPDU shall send the frame as an S-MPDU (see Table 9-664).

An HE STA that sends a VHT Capabilities element, an HT Capabilities element, or an HE 6 GHz Band Capabilities element and an HE Capabilities element with Maximum A-MPDU Length Exponent Extension field of 0 shall support in reception an A-MPDU pre-EOF padding with maximum length defined in Table 10.12.2.

An HE STA that sends a VHT Capabilities element and an HE Capabilities element with Maximum A-MPDU Length Exponent Extension subfield greater than 0 shall support reception of an HE PPDU with an A-MPDU pre-EOF padding as defined in Table 10.12.2, except that the maximum length for the A-MPDU pre-EOF padding shall be equal to $min(2^{(20 + \text{Maximum A-MPDU Length Exponent Extension})} - 1, 6\,500\,631)$. An HE STA that sets the Maximum A-MPDU Length Exponent Extension subfield in the HE Capabilities element to a value greater than 0 shall set the Maximum A-MPDU Length Exponent subfield of the VHT Capabilities element to 7.

NOTE 1—The value 6 500 631 is defined in Table 9-34 as the upper bound of A-MPDU size.

An HE STA that does not send a VHT Capabilities element but sends an HT Capabilities element and an HE Capabilities element with Maximum A-MPDU Length Exponent Extension subfield greater than 0 shall support in reception an A-MPDU pre-EOF padding in an HE PPDU as defined in Table 10.12.2, except that the maximum length for the A-MPDU pre-EOF padding shall be equal to $2^{(16 + \text{Maximum A-MPDU Length Exponent Extension})} - 1$. An HE STA that sets the Maximum A-MPDU Length Exponent Extension subfield in the HE Capabilities element to a value greater than 0 shall set the Maximum A-MPDU Length Exponent subfield of the HT Capabilities element to 3.

NOTE 2—An HE STA that is a VHT STA sends a VHT Capabilities element. An HE STA that is not a VHT STA does not send a VHT Capabilities element.

An HE STA that sends an HE 6 GHz Band Capabilities element and an HE Capabilities element with Maximum A-MPDU Length Exponent Extension subfield greater than 0 shall support in reception an A-MPDU pre-EOF padding in an HE PPDU as defined in Table 10.12.2, except that the maximum length for the A-

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

MPDU pre-EOF padding shall be equal to $min(2^{(20 + \text{Maximum A-MPDU Length Exponent Extension})} - 1, 6\,500\,631)$. An HE STA that sets the Maximum A-MPDU Length Exponent Extension subfield in the HE Capabilities element to a value greater than 0 shall set the Maximum A-MPDU Length Exponent subfield of the HE 6 GHz Band Capabilities element to 7.

An HE STA shall not transmit an A-MPDU in an HE PPDU to a STA that exceeds the maximum A-MPDU length capability indicated in the HE Capabilities, VHT Capabilities, and HT Capabilities elements received from the recipient STA. If a VHT Capabilities element is received from the recipient STA, then the maximum A-MPDU length capability is derived from the Maximum A-MPDU Length Exponent Extension subfield in the HE Capabilities and the Maximum A-MPDU Length Exponent subfield in the VHT Capabilities element. Otherwise, the maximum A-MPDU length capability is derived from the Maximum A-MPDU Length Exponent subfields in the HE Capabilities element and the Maximum A-MPDU Length Exponent subfield in the HT Capabilities element or in the HE 6 GHz Band Capabilities element.

An HE STA may transmit an HE SU PPDU or HE MU PPDU that carries an A-MPDU with contents defined in Table 9-662 or Table 9-665.

An A-MPDU with any number of QoS Null frames with any TID and with No Ack ack policy and aggregated with or without other frames may be transmitted to a recipient STA in an HE PPDU that is not an HE TB PPDU regardless of the value of the Multi-TID Aggregation Rx/Tx Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element received from the recipient STA.

An A-MPDU with any number of QoS Null frames with any TID and with No Ack ack policy and aggregated with or without other frames in an A-MPDU may be transmitted in the HE TB PPDU regardless of the value of the TID Aggregation Limit subfield and the value of the Preferred AC subfield in the Basic Trigger frame and the value of the Multi-TID Aggregation Rx Support of the AP that solicits the A-MPDU.

NOTE 3—A QoS Null frame with Normal Ack or Implicit BAR ack policy is not allowed to be sent in an A-MPDU, except for a QoS Null frame with Normal Ack ack policy in an S-MPDU (as defined in Table 9-662, Table 9-663, Table 9-665, Table 9-666, Table 9-667, and Table 9-668).

26.6.2 A-MPDU padding in an HE PPDU

26.6.2.1 General

In an HE PPDU, a STA shall not add an A-MPDU subframe with the EOF/Tag field set to 1 and with the MPDU Length field set to 0 before an A-MPDU subframe with a nonzero MPDU Length field. In an HE PPDU, a STA should add an A-MPDU subframe with the EOF/Tag field set to 1 and with the MPDU Length field set to 0 (i.e., EOF padding) immediately after the last A-MPDU subframe with a nonzero MPDU Length field.

26.6.2.2 A-MPDU padding in an HE SU PPDU, HE ER SU PPDU, and HE MU PPDU

An HE STA that transmits a DL HE MU PPDU that contains one or more PSDUs, each of which carries an A-MPDU, shall construct the A-MPDUs as described in 10.12.6, except that one or more A-MPDU subframes with a nonzero MPDU Length field and with an EOF/Tag field equal to 1 may be added if the A-MPDU is an ack-enabled single-TID A-MPDU (see 26.6.3).

An HE STA that transmits an HE SU PPDU, HE ER SU PPDU, or UL HE MU PPDU that contains one A-MPDU shall construct the A-MPDU as described in 10.12.6, except that one or more A-MPDU subframes with a nonzero MPDU Length field and with an EOF/Tag field equal to 1 may be added if the A-MPDU is an ack-enabled single-TID A-MPDU (see 26.6.3).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

26.6.2.3 A-MPDU padding in an HE TB PPDU

A non-AP STA that transmits an HE TB PPDU shall construct the PSDU carried in the HE TB PPDU as described in this subclause.

The STA calculates the PSDU_LENGTH as defined in 6.7 and initializes A-MPDU_Length to 0.

The STA may add A-MPDU subframes to the A-MPDU contained in the PSDU, provided that the following constraints are fulfilled:

— The A-MPDU content constraints (see 10.12.1 and 26.6.3) for the intended recipient
— The Length limit constraints (see 9.7.1 and 10.12.2) for the intended recipient
— The MPDU start spacing constraints (see 10.12.3) for the intended recipient

and provided that the following conditions are met:

— The A-MPDU subframes have a value greater than 0 in the MPDU Length field, or have a value 0 in the MPDU Length field and a value 0 in the EOF/Tag field.
— After incrementing the A-MPDU_Length with the length of each such added A-MPDU subframe, the relationship A-MPDU_Length ≤ PSDU_LENGTH is true.

Padding is then added so that the resulting A-MPDU contains exactly PSDU_LENGTH octets as follows:

— First, while A-MPDU_Length < PSDU_LENGTH and A-MPDU_Length mod 4 ≠ 0, add an octet to the final A-MPDU subframe's Padding subfield, and increment A-MPDU_Length by 1.
— Then, while A-MPDU_Length + 4 ≤ PSDU_LENGTH, add an EOF padding subframe to the EOF Padding Subframes field, and increment A-MPDU_Length by 4.
— Finally, while A-MPDU_Length < PSDU_LENGTH, add an octet to the EOF Padding Octets subfield, and increment A-MPDU_Length by 1.

An A-MPDU pre-EOF padding is constructed from each user from any of the following:

— A-MPDU subframes constructed from the MPDUs available for transmission from any AC that is selected by the STA.
— A-MPDU subframes with 0 in the MPDU Length field and 0 in the EOF/Tag field.

26.6.3 Multi-TID A-MPDU and ack-enabled single-TID A-MPDU

26.6.3.1 General

A non-ack-enabled multi-TID A-MPDU is an A-MPDU that does not contain a tagged MPDU but does contain untagged MPDUs from at least two TIDs (see Table 9-667).

An ack-enabled multi-TID A-MPDU is an A-MPDU that contains at least one tagged MPDU that solicits acknowledgment and one or more MPDUs from at least one TID (see Table 9-668).

An ack-enabled single-TID A-MPDU is an A-MPDU that contains one tagged MPDU that solicits acknowledgment and one or more untagged MPDUs that do not solicit an immediate response (see Table 9-666).

An HE STA with dot11HEAMPDUwithMultipleTIDOptionImplemented equal to true shall set the Multi-TID Aggregation Rx Support subfield to a nonzero value in the HE MAC Capabilities Information field in the HE Capabilities element it transmits. An HE STA with dot11HEAMPDUwithMultipleTIDOptionImplemented equal to false shall set the Multi-TID Aggregation Rx Support subfield to 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An HE STA with dot11AckEnabledAMPDUOptionImplemented equal to true shall set the Ack-Enabled Aggregation Support subfield to 1 in the HE MAC Capabilities Information field in the HE Capabilities element it transmits. An HE STA with dot11AckEnabledAMPDUOptionImplemented equal to false shall set the Ack-Enabled Aggregation Support subfield to 0.

A multi-TID A-MPDU is either a non-ack-enabled multi-TID A-MPDU or an ack-enabled multi-TID A-MPDU. A first HE STA may transmit a non-ack-enabled multi-TID A-MPDU to a second HE STA if the first HE STA has received from the second STA an HE Capabilities element where the Multi-TID Aggregation Rx Support subfield is nonzero. A first HE STA may transmit an ack-enabled multi-TID A-MPDU or a non-ack-enabled multi-TID A-MPDU to a second HE STA if the first HE STA has received from the second HE STA an HE Capabilities element where the Multi-TID Aggregation Rx Support subfield is nonzero and the Ack-Enabled Aggregation Support subfield is 1. Otherwise, the first HE STA shall not transmit a multi-TID A-MPDU to the second HE STA.

An HE STA shall not transmit a multi-TID A-MPDU or ack-enabled single-TID A-MPDU in a VHT PPDU or a HT PPDU.

A non-AP STA shall not send a non-ack-enabled multi-TID A-MPDU in an HE TB PPDU, unless it is in response to a Basic Trigger frame where the TID Aggregation Limit field of the User Info field addressed to the STA is greater than 1. A non-AP STA shall not send an ack-enabled multi-TID A-MPDU in an HE TB PPDU, unless it is in response to a Basic Trigger frame where the TID Aggregation Limit field of the User Info field addressed to the STA is greater than 0.

NOTE 1—An ack-enabled multi-TID A-MPDU solicited by a Basic Trigger frame with TID Aggregation Limit field equal to 1 can contain one Management frame that solicits acknowledgment and one or more QoS Data frames from the same TID if the AP supports reception of ack-enabled multi-TID A-MPDUs.

A multi-TID A-MPDU shall not be transmitted in an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU, unless the TXOP limit is greater than 0 for the AC that is used to gain access to the medium. The AC used to gain access to the medium is the primary AC (see 10.23.2.9). If the TXOP limit of the primary AC is greater than 0, then the STA may aggregate QoS Data frames from one or more TIDs in the A-MPDU under the following conditions:

— The A-MPDU shall be carried in either an HE SU PPDU or an HE ER SU PPDU transmitted by the STA within the obtained TXOP or in an HE MU PPDU transmitted by a non-AP STA within the obtained TXOP.
— The A-MPDU shall contain one or more MPDUs with any of the TIDs that correspond to the primary AC.
— If no more MPDUs can be aggregated in the A-MPDU from any of the TIDs that correspond to the primary AC, then the A-MPDU may additionally contain one or more MPDUs with TIDs that do not correspond to the primary AC if the TIDs correspond to any AC that has a higher priority with respect to the primary AC and the addition of these MPDUs does not cause the STA to exceed the TXOP limit of the primary AC.

An HE AP may aggregate MPDUs from any TIDs in a multi-TID A-MPDU for DL HE MU PPDU transmission, and the number of TIDs in the multi-TID A-MPDU shall not be more than the Multi-TID Aggregation Rx Support announced by the recipient.

The Multi-STA BlockAck frame is used to acknowledge the MPDUs in a multi-TID A-MPDU as defined in 26.4.

In a multi-TID A-MPDU, MPDUs with the same TID are not necessarily contiguous.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A non-AP HE STA that transmits a multi-TID A-MPDU in an HE TB PPDU should aggregate QoS Data frames in the following order:

— First, any and all MPDUs that correspond to the Preferred AC subfield of the Trigger Dependent User Info field addressed to the STA in the Trigger frame.
— Then, any and all MPDUs that correspond to any AC that has a higher priority.
— Then, any MPDUs that correspond to any AC that has a lower priority.

The aggregation of the QoS Data frames is subject to the following:

— The limit indicated in the TID Aggregation Limit subfield in the Trigger Dependent User Info field addressed to the STA in the Trigger frame.
— The restrictions in Table 26-2.
— The duration indicated in the UL Length subfield in the Common Info field of the Trigger frame.

NOTE 2—These rules permit a STA to not aggregate any MPDUs from the preferred AC or a higher priority AC, and permit a STA to aggregate MPDUs in any order.

NOTE 3—A multi-TID A-MPDU allows the aggregation of a Management frame regardless of the value indicated in the Multi-TID Aggregation Rx Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element as long as the indicated value of the TID Aggregation Limit subfield in the Trigger Dependent User Info field of a the Basic Trigger frame is nonzero.

A non-AP HE STA that transmits a single-TID A-MPDU in an HE TB PPDU should select the TID in the following order:

— A TID that corresponds to the Preferred AC subfield of the Trigger Dependent User Info field addressed to the STA in the Trigger frame if there is a corresponding MPDU for that TID.
— Otherwise, a TID that corresponds to any AC that has a higher priority, if there is a corresponding MPDU for that TID.
— Otherwise, a TID that corresponds to any AC that has a lower priority.

The TID selection is subject to the following:

— The limit indicated in the TID Aggregation Limit subfield in the Trigger Dependent User Info field addressed to the STA in the Trigger frame.
— The duration indicated in the UL Length subfield in the Common Info field of the Trigger frame.

NOTE 4—These rules permit a STA to not select MPDUs from the preferred AC or a higher priority AC.

26.6.3.2 Ack-enabled single-TID A-MPDU operation

An ack-enabled single-TID A-MPDU is an A-MPDU with contents defined in Table 9-666.

NOTE—An ack-enabled single-TID A-MPDU does not contain more than one of the following frames: (a) a QoS Data frame or (b) a Management frame that solicits acknowledgment. In this case, the Management frame that solicits acknowledgment is treated as if it were a QoS Data frame with TID equal to 15.

An HE STA shall not transmit an ack-enabled single-TID A-MPDU to a recipient STA, unless it has received from the recipient STA an HE Capabilities element with the Ack-Enabled Aggregation Support subfield equal to 1.

26.6.3.3 Non-ack-enabled multi-TID A-MPDU operation

A non-ack-enabled multi-TID A-MPDU is an A-MPDU with contents defined in Table 9-667.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—A non-ack-enabled multi-TID A-MPDU might include other frames such as a Trigger frame, BlockAck frame, or QoS Null frame (see Table 9-661).

An HE STA shall not transmit a non-ack-enabled multi-TID A-MPDU to a recipient STA, unless it has received from the recipient STA an HE Capabilities element where the Multi-TID Aggregation Rx Support subfield is nonzero.

A STA that receives a non-ack-enabled multi-TID A-MPDU responds as defined in 26.4.4.

26.6.3.4 Ack-enabled multi-TID A-MPDU operation

An ack-enabled multi-TID A-MPDU is an A-MPDU with contents defined in Table 9-668.

QoS Data frames with the same TID shall have the same ack policy.

QoS Data frames with the same TID shall be carried in A-MPDU subframes with the same value in the EOF/Tag field setting.

In an ack-enabled multi-TID A-MPDU, the EOF/Tag field in the MPDU delimiter of each A-MPDU subframe carrying a frame that solicits an Ack frame as defined in Table 9-668 shall be set to 1. The EOF/Tag field in all other A-MPDU subframes in the A-MPDU that carry frames shall be set to 0.

An HE STA shall not transmit an ack-enabled multi-TID A-MPDU to a recipient STA, unless it has received from the recipient STA an HE Capabilities element where the Multi-TID Aggregation Rx Support subfield is nonzero and the Ack-Enabled Aggregation Support subfield is 1.

A STA that receives an ack-enabled multi-TID A-MPDU responds as defined in 26.4.4.

A STA that transmits an ack-enabled multi-TID A-MPDU that contains at least two tagged MPDUs shall discard the immediate response if it is an Ack frame.

26.7 HE sounding operation

26.7.1 General

Transmit beamforming and DL MU-MIMO require knowledge of the channel state to compute a steering matrix that is applied to the transmit signal to optimize reception at one or more receivers. HE STAs use the HE sounding protocol to determine the channel state information. The HE sounding protocol provides explicit feedback mechanisms, defined as HE non-trigger-based (non-TB) sounding and HE trigger-based (TB) sounding, where the HE beamformee measures the channel using a training signal (i.e., an HE sounding NDP) transmitted by the HE beamformer and sends back a transformed estimate of the channel state. The HE beamformer uses this estimate to derive the steering matrix.

The HE beamformee returns an estimate of the channel state in an HE compressed beamforming/CQI report carried in the HE Compressed Beamforming/CQI Report field. There are three types of HE compressed beamforming/CQI report:

— SU feedback: The HE Compressed Beamforming/CQI Report field consists of an HE Compressed Beamforming Report field.
— MU feedback: The HE Compressed Beamforming/CQI Report field consists of an HE Compressed Beamforming Report field and HE MU Exclusive Beamforming Report field.
— CQI feedback: The HE Compressed Beamforming/CQI Report field consists of an HE CQI Report field.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—Use of HE TB sounding does not necessarily imply MU feedback. HE TB sounding is also used to obtain SU feedback and CQI feedback.

The HE Compressed Beamforming/CQI Report field is carried in a single HE Sounding Feedback Segment field if the resulting HE Compressed Beamforming/CQI frame is less than or equal to 11 454 octets in length (see 26.7.3). Otherwise, the HE Compressed Beamforming/CQI Report field is segmented, with each segment carried in an HE Sounding Feedback Segment field, and each HE Sounding Feedback Segment field carried in separate HE Compressed Beamforming/CQI frames.

An HE beamformer shall support a maximum MPDU length for an HE Compressed Beamforming/CQI frame that is the minimum of 11 454 octets and the maximum length of the HE Compressed Beamforming/CQI frame that the HE beamformer intends to solicit from its HE beamformees.

26.7.2 HE sounding protocol

An SU beamformer is an HE STA that sets the SU Beamformer subfield in the HE PHY Capabilities Information field in the HE Capabilities element it transmits to 1.

An SU beamformee is an HE STA that sets the SU Beamformee subfield in the HE PHY Capabilities Information field in the HE Capabilities element it transmits to 1. A non-AP HE STA shall set the SU Beamformee subfield to 1. An HE AP may set the SU Beamformee subfield to 1.

An MU beamformer is an HE AP that sets the MU Beamformer subfield in the HE PHY Capabilities Information field in the HE Capabilities element it transmits to 1. An HE AP that indicates support for 4 or more space-time streams in the Tx HE-MCS Map ≤ 80 MHz subfield in the Supported HE-MCS And NSS field in the HE Capabilities element shall set the MU Beamformer subfield to 1. A non-AP HE STA shall set the MU Beamformer subfield to 0. An MU beamformer is also an SU beamformer and shall set the SU Beamformer subfield to 1.

NOTE—A non-AP STA might use the setting of the MU Beamformer subfield to determine the AP with which it will associate.

A non-AP HE STA shall support operation as an MU beamformee. An HE AP does not support operation as an MU beamformee.

The term *HE beamformer* refers to both the SU beamformer and MU beamformer. The term *HE beamformee* refers to both the SU beamformee and MU beamformee.

The type of feedback (SU, MU, or CQI) solicited by an HE beamformer from an HE beamformee is indicated in the Feedback Type And Ng and Codebook subfields in the STA Info field identifying the HE beamformee in the HE NDP Announcement frame as defined in Table 9-45 and Table 9-46.

The bandwidth (partial or full) of the feedback solicited by an HE beamformer from an HE beamformee depends on the Partial BW Info subfield in the STA Info field identifying the HE beamformee in the HE NDP Announcement frame, the bandwidth of the PPDU carrying the HE NDP Announcement frame, and the value of the Disallowed Subchannel Bitmap subfield, if present. Full bandwidth feedback is solicited if the RU Start Index subfield in the Partial BW Info subfield is 0, the Disallowed Subchannel Bitmap subfield is absent or contains all zeroes, and the RU End Index subfield in the Partial BW subfield is the value shown in Table 26-4 where partial bandwidth is not supported by the HE beamformer, for the bandwidth of the PPDU carrying the HE NDP Announcement frame.

Other settings of the Partial BW Info subfield solicit partial-bandwidth feedback. Punctured sounding is indicated by the inclusion of a nonzero Disallowed Subchannel Bitmap subfield in the HE NDP Announcement frame. In such a case, the disallowed subchannels are applied to the tone information to be

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

included in the feedback after selecting tones for feedback based on the RU Start Index and RU End Index subfield values and HE NDP Announcement frame bandwidth as described above. See Table 26-4.

The RU Start Index and RU End Index subfields shall cover at least one allowed subchannel.

An SU beamformer may solicit full-bandwidth SU feedback from an SU beamformee in an HE non-TB sounding sequence. An SU beamformer shall not solicit partial-bandwidth SU feedback in an HE non-TB sounding sequence. An SU beamformer may solicit partial-bandwidth or full-bandwidth SU feedback from an SU beamformee in an HE TB sounding sequence if the SU beamformee indicates support by setting the Triggered SU Beamforming Feedback subfield in the HE PHY Capabilities Information field in the HE Capabilities element it transmits to 1.

An MU beamformer may solicit full-bandwidth MU feedback from an MU beamformee in an HE TB sounding sequence. An MU beamformer may solicit partial-bandwidth MU feedback from an MU beamformee in an HE TB sounding sequence if the MU beamformee indicates support by setting the Triggered MU Beamforming Partial BW Feedback subfield to 1. An MU beamformer shall not solicit MU feedback in an HE non-TB sounding sequence.

An MU beamformer may solicit full-bandwidth or partial-bandwidth CQI feedback from an MU beamformee in an HE TB sounding sequence if the MU beamformee indicates support by setting the Triggered CQI Beamforming Feedback subfield to 1.

An MU beamformer may solicit full-bandwidth CQI feedback from an MU beamformee in an HE non-TB sounding sequence if the MU beamformee indicates support by setting the Non-Triggered CQI Beamforming Feedback subfield to 1.

An HE beamformer may solicit punctured SU feedback from an HE beamformee in an HE TB sounding sequence if the HE beamformee indicates support for punctured sounding by setting the Punctured Sounding Support subfield in the HE Capabilities elements it transmits to 1. An HE beamformer shall indicate punctured subchannels in the HE sounding NDP of an HE TB sounding sequence by setting the appropriate bits of the Disallowed Subchannel Bitmap subfield of the STA Info field with the AID11 subfield set to 2047 in the preceding HE NDP Announcement frame. An SU beamformer that indicates punctured subchannels in an HE NDP Announcement frame in an HE TB sounding sequence shall set the TXVECTOR parameter INACTIVE_SUBCHANNELS of the non-HT duplicate PPDU carrying the HE NDP Announcement frame and the HE sounding NDP as described in 26.11.7.

An SU beamformee that supports punctured sounding shall generate feedback corresponding to the subchannels indicated in the STA Info field addressed to it in an HE NDP Announcement frame, but excluding subcarriers that are disallowed according to the value of the Disallowed Subchannel Bitmap subfield in that frame.

An HE beamformer shall not send an HE NDP Announcement frame that initiates an HE TB sounding sequence with a STA Info field identifying an HE beamformee if the STA Info field and the PHY Capabilities Information field in the HE Capabilities element most recently received from the HE beamformee meet any of the following conditions (see Table 9-45):

— The Feedback Type And Ng subfield in the STA Info field indicates SU and $Ng = 16$, and the $Ng = 16$ SU Feedback subfield in the HE PHY Capabilities Information field is 0.
— The Feedback Type And Ng subfield in the STA Info field indicates MU and $Ng = 16$, and the $Ng = 16$ MU Feedback subfield in the HE PHY Capabilities Information field is 0.
— The Feedback Type And Ng subfield in the STA Info field indicates SU, the Codebook Size subfield indicates codebook resolution $(\phi, \psi) = \{4, 2\}$, and the Codebook Size $(\phi, \psi) = \{4, 2\}$ SU Feedback subfield in the HE PHY Capabilities Information field is 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The Feedback Type And Ng subfield in the STA Info field indicates MU, the Codebook Size subfield in the STA Info field indicates codebook resolution (ϕ, ψ) = {7, 5}, and the Codebook Size (ϕ, ψ) ={7, 5} MU Feedback subfield in the HE PHY Capabilities Information field is 0.
— The Feedback Type And Ng and Codebook Size subfields in the STA Info field indicate CQI, and the Triggered CQI Beamforming Feedback subfield in the HE PHY Capabilities Information field is 0.
— The Feedback Type And Ng subfield in the STA Info field indicates MU, the Partial BW Info subfield in the STA Info field indicates partial bandwidth, and the Triggered MU Beamforming Partial BW Feedback subfield in the HE PHY Capabilities Information field is 0.
— The Feedback Type And Ng subfield indicates SU, and the Triggered SU Beamforming Feedback subfield in the HE PHY Capabilities Information field is 0.

An HE beamformee indicates the maximum number of HE-LTF symbols it can receive in a 20 MHz, 40 MHz, or 80 MHz HE sounding NDP in the Beamformee STS ≤ 80 MHz subfield in the PHY Capabilities Information field in the HE Capabilities element it transmits.

An HE beamformee shall set the Beamformee STS ≤ 80 MHz subfield to indicate a maximum number of HE-LTF symbols of 4 or greater.

An HE beamformee that supports 160 MHz or 80+80 MHz channel widths indicates the maximum number of HE-LTF symbols it can receive in a 160 MHz or 80+80 MHz HE sounding NDP in the Beamformee STS > 80 MHz subfield in the PHY Capabilities Information field in the HE Capabilities element it transmits.

An HE beamformer shall not transmit a 20 MHz, 40 MHz, or 80 MHz HE sounding NDP with a TXVECTOR parameter NUM_STS that is greater than the maximum number of HE-LTF symbols indicated in the Beamformee STS ≤ 80 MHz subfield of any STA identified by a STA Info field in the preceding HE NDP Announcement frame.

An HE beamformer shall not transmit a 160 MHz or 80+80 MHz HE sounding NDP with a TXVECTOR parameter NUM_STS that is greater than the maximum number of HE-LTF symbols indicated in the Beamformee STS > 80 MHz subfield of any STA identified by a STA Info field in the preceding HE NDP Announcement frame.

An HE beamformer indicates the maximum number of HE-LTF symbols it might transmit in a 20 MHz, 40 MHz, or 80 MHz HE sounding NDP in the Number Of Sounding Dimensions ≤ 80 MHz subfield.

An HE beamformer indicates the maximum number of HE-LTF symbols it might transmit in an 80+80 MHz or 160 MHz HE sounding NDP in the Number Of Sounding Dimensions > 80 MHz subfield.

An HE beamformer shall not transmit a 20 MHz, 40 MHz, or 80 MHz HE sounding NDP where the number of HE-LTF symbols exceeds the value indicated in the Number Of Sounding Dimensions ≤ 80 MHz subfield.

An HE beamformer shall not transmit an 80+80 MHz or 160 MHz HE sounding NDP where the number of HE-LTF symbols exceeds the value indicated in the Number Of Sounding Dimensions > 80 MHz subfield.

26.7.3 Rules for HE sounding protocol sequences

An HE non-TB sounding sequence is initiated by an HE beamformer with an individually addressed HE NDP Announcement frame comprising exactly one STA Info field, followed after a SIFS by an HE sounding NDP. The triggered HE beamformee responds after a SIFS with an HE Compressed Beamforming/CQI frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The AID11 subfield of the STA Info field shall be set to the AID of the STA identified by the RA field of the HE NDP Announcement frame, or to 0 if the STA identified by the RA field is a mesh STA, AP, or IBSS STA.

An example of an HE non-TB sounding sequence with a single HE beamformee is shown in Figure 26-7.

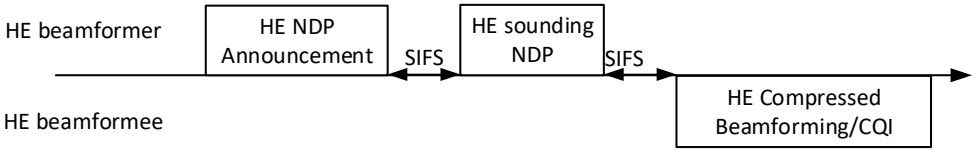

Figure 26-7—Example of HE non-TB sounding

An HE beamformer that initiates the HE non-TB sounding sequence shall transmit the HE NDP Announcement frame with a single STA Info field, and the value in the AID11 field of that STA Info field shall be other than 2047 and set to the AID of the STA identified by the RA field or to 0 if the STA identified by the RA field is a mesh STA, AP, or IBSS member STA.

An HE beamformer may initiate an HE non-TB sounding sequence with an HE beamformee to solicit SU feedback over full bandwidth.

An HE beamformer shall not initiate an HE non-TB sounding sequence with an HE NDP Announcement frame that has a Partial BW Info subfield that indicates less than full bandwidth (see Table 26-4).

An HE TB sounding sequence is initiated by an HE beamformer with a broadcast HE NDP Announcement frame with two or more STA Info fields, followed after a SIFS by an HE sounding NDP, followed after a SIFS by a BFRP Trigger frame. Each triggered HE beamformee responds after a SIFS with an HE TB PPDU containing one or more HE Compressed Beamforming/CQI frame.

An example of an HE TB sounding sequence with more than one HE beamformee is shown in Figure 26-8.

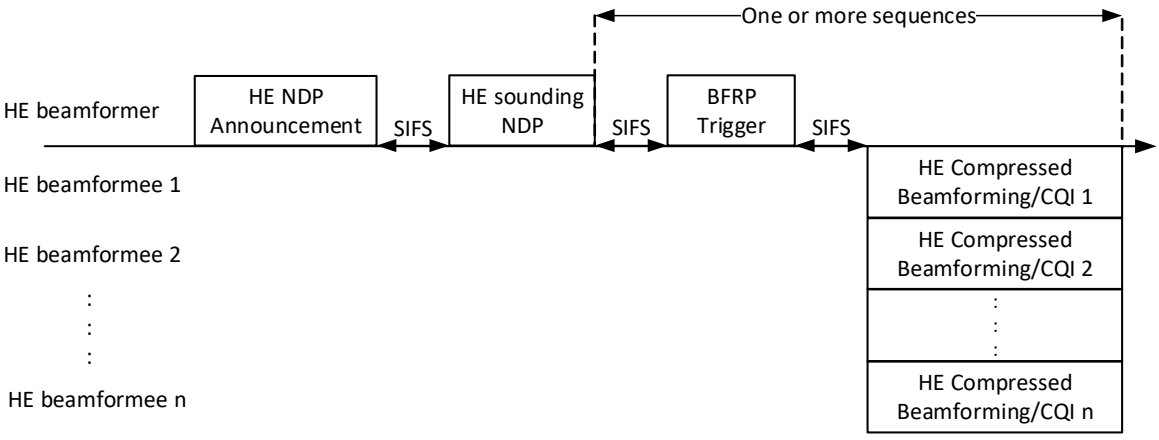

Figure 26-8—Example of HE TB sounding

An HE beamformer that initiates an HE TB sounding sequence shall transmit the HE NDP Announcement frame with two or more STA Info fields and the RA field set to the broadcast address.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An HE beamformer may initiate an HE TB sounding sequence to solicit MU feedback over full bandwidth.

An HE beamformer may initiate an HE TB sounding sequence to solicit a feedback variant only if the feedback variant is computed based on parameters supported by the HE beamformee; otherwise, the HE beamformer shall not solicit a feedback variant computed based on parameters not supported by the HE beamformee (see 26.7.2).

An HE AP with dot11MultiBSSIDImplemented equal to true shall not send an HE NDP Announcement frame with the TA field set to the transmitted BSSID to a non-AP STA that is associated with an AP corresponding to a nontransmitted BSSID in the multiple BSSID set, unless the AP has received from the non-AP STA an HE Capabilities element with the Rx Control Frame To MultiBSS subfield in the HE MAC Capabilities Information field equal to 1. An AP with dot11MultiBSSIDImplemented equal to true shall not send an individually addressed HE NDP Announcement frame with the TA field set to the transmitted BSSID to a non-AP STA associated with an AP corresponding to a nontransmitted BSSID.

An AP that transmits an HE NDP Announcement frame identifying HE STAs shall set the TA field of the frame to the MAC address of the AP, unless dot11MultiBSSIDImplemented is true and the HE NDP Announcement frame identifies STAs from at least two different BSSs of the multiple BSSID set. In this case, the AP shall set the TA field of the frame to the transmitted BSSID. If the HE NDP Announcement frame is transmitted in a non-HT duplicate PPDU, then the TA field of the HE NDP Announcement frame is a bandwidth signaling TA (see 10.6.6.6).

An HE beamformer that transmits an HE NDP Announcement frame to an HE beamformee that is an AP, TDLS peer STA, mesh STA, or IBSS STA shall include one STA Info field in the HE NDP Announcement frame and shall set the AID11 field in the STA Info field of the frame to 0.

An HE beamformer that is an AP and that transmits an HE NDP Announcement frame to one or more HE beamformees shall set the AID11 field in the STA Info field identifying a non-AP STA to the 11 LSBs of the AID of the non-AP STA.

An HE NDP Announcement frame shall not include multiple STA Info fields that have the same value in the AID11 subfield.

An HE beamformer that transmits an HE NDP Announcement frame initiating an HE TB sounding sequence may include a STA Info field with an AID11 subfield value of 2047 to indicate disallowed subchannels during punctured channel operation. When present, the STA Info field with AID11 value of 2047 shall be the first STA Info field in the frame. An HE beamformer that transmits an HE NDP Announcement frame shall not include more than one STA Info field with an AID11 subfield value of 2047. An HE beamformer that transmits an HE NDP Announcement frame initiating a HE non-TB sounding sequence shall not include a STA Info field with an AID11 subfield value of 2047.

In an HE TB sounding sequence, a STA Info field in the HE NDP Announcement frame that solicits SU or MU feedback indicates the subcarrier grouping (*Ng*), codebook size, and number of columns (*Nc*) to be used by the HE beamformee identified by the STA Info field for the generation of the SU or MU feedback.

In an HE non-TB sounding sequence where the STA Info field in the HE NDP Announcement frame solicits SU feedback, the *Ng*, codebook size, and the *Nc* used for the generation of the SU feedback are determined by the HE beamformee.

In an HE TB sounding sequence, a STA Info field in the HE NDP Announcement frame that solicits CQI feedback indicates the *Nc* to be used by the HE beamformee identified by the STA Info field for the generation of the CQI feedback.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In an HE non-TB sounding sequence where the STA Info field in the HE NDP Announcement frame solicits CQI feedback, the *Nc* used for the generation of the CQI feedback is determined by the HE beamformee.

An HE beamformer that has initiated an HE TB sounding sequence shall transmit a BFRP Trigger frame to solicit feedback and may send one or more additional BFRP Trigger frames in the same TXOP as shown in Figure 26-8 (Example of HE TB sounding). The HE beamformer uses the additional BFRP Trigger frames to solicit HE compressed beamforming/CQI reports from HE beamformees not addressed in a previous BFRP Trigger frame or to solicit retransmission of an HE compressed beamforming/CQI report. An HE beamformer shall not transmit a BFRP Trigger frame that identifies a STA identified in the HE NDP Announcement frame of an HE TB sounding sequence, unless it is in the same TXOP as the HE TB sounding sequence.

An HE beamformer that transmits an HE NDP Announcement frame as part of an HE TB sounding sequence shall set the Nc subfield of the STA Info field to indicate a value less than or equal to the minimum of the following:

— The maximum number of supported spatial streams according to the corresponding HE beamformee's Rx HE-MCS Map ≤ 80 MHz, Rx HE-MCS Map 160 MHz, and Rx HE-MCS Map 80+80 MHz subfields in the Supported HE-MCS And NSS Set field in the HE Capabilities element sent by the HE beamformee.
— The maximum number of supported spatial streams according to the Rx NSS subfield value in the most recently received Operating Mode Notification frame, Operating Mode Notification element with the Rx NSS Type subfield equal to 0, or OM Control subfield sent by the corresponding HE beamformee (see 26.9).
— The maximum *Nc* indicated by the Max Nc subfield in the HE PHY Capabilities Information field in the HE Capabilities element sent by the HE beamformee.

An HE beamformer that transmits an HE NDP Announcement frame shall set the RU Start Index and RU End Index subfields in a STA Info field to indicate the starting 26-tone RU and the ending 26-tone RU, respectively, of the solicited HE compressed beamforming/CQI report (see 9.3.1.19). For preamble punctured sounding, the RU Start Index and RU End Index correspond to the bandwidth before puncturing, and the Disallowed Subchannel Bitmap subfield is used to indicate the subcarriers that are punctured in the HE sounding NDP and in the solicited feedback.

NOTE 1—In order to maximize the channel estimate quality after interpolation/extrapolation resulting from grouping, the subcarriers for which feedback is requested using the RU Start Index and RU End Index subfields do not necessarily lie within the actual RU as defined in Table 27-8, Table 27-9, and Table 27-10. Rather, they are defined in Table 9-124 and Table 9-125.

The bandwidth of the PPDU carrying the HE NDP Announcement frame is obtained from the RXVECTOR parameter CH_BANDWIDTH of the HE NDP Announcement frame if received in an HE, VHT, or HT PPDU; is obtained from the RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT if the HE NDP Announcement frame is received in a non-HT duplicate PPDU; and is 20 MHz if the HE NDP Announcement frame is received in a non-HT PPDU.

In an HE non-TB sounding sequence, an HE beamformer shall solicit full-bandwidth feedback. In an HE TB sounding sequence, an HE beamformer shall solicit full-bandwidth feedback in a STA Info field identifying an HE beamformee that has not indicated support for partial-bandwidth feedback. In an HE TB sounding sequence, an HE beamformer may solicit full-bandwidth or partial-bandwidth feedback in a STA Info field identifying an HE beamformee that has indicated support for partial-bandwidth feedback (see 26.7.2).

For 80+80 MHz, feedback is not requested for the gap between the 80 MHz segments.

The HE beamformer shall set the TXVECTOR parameter CH_BANDWIDTH or CH_BANDWIDTH_IN_NON_HT, the RU Start Index field, and the RU End Index field of the HE NDP

Announcement frame, depending on the operating channel width and partial BW support of the HE beamformee, as defined in Table 26-4. The bandwidth of the PPDU carrying the HE NDP Announcement frame is determined before applying puncturing based on disallowed subchannels.

Table 26-4—Settings for BW, RU Start Index, and RU End Index fields in HE NDP Announcement frame

Partial bandwidth supported by HE beamformer	Operating channel width of the HE beamformee (MHz)	Bandwidth of HE NDP Announcement frame	RU Start Index field	RU End Index field
No	20, 40, 80, 160/80+80	20 MHz	0	8
Yes	20, 40, 80, 160/80+80		0–8	0–8
No	40, 80, 160/80+80	40 MHz	0	17
Yes	40, 80, 160/80+80		0–17	0–17
No	80, 160/80+80	80 MHz	0	36
Yes	80, 160/80+80		0–36	0–36
No	160/80+80	160 MHz or 80+80 MHz	0	73
Yes	160/80+80		0–73	0–73

NOTE 1—The value of the RU Start Index field is always less than or equal to the value of the RU End Index field.

NOTE 2—Partial BW feedback can be solicited only with an HE TB sounding sequence and cannot be solicited with an HE non-TB sounding sequence.

The HE beamformer shall use the lowest 26-tone RU, which is the lower bound of the starting 26-tone in the RU Start Index subfield of a STA Info field that is equal to the maximum of the following:

— The minimum 26-tone RU located within the channel width indicated in the VHT Operation Information field of either the HE Operation element or the VHT Operation element, whichever is present, and within the channel width indicated in the HT Operation element.

— The minimum 26-tone RU located within the channel width indicated in the most recently received Operating Mode Notification frame, Operating Mode Notification element with the Rx NSS Type subfield equal to 0, or OM Control subfield sent by the corresponding HE beamformee (see 26.9).

The HE beamformer shall use the highest 26-tone RU, which is the upper bound of the ending 26-tone RU in the RU End Index subfield of a STA Info field that is equal to the minimum of the following:

— The maximum 26-tone RU located within the channel width indicated in the VHT Operation Information field of either the HE Operation element or the VHT Operation element, whichever is present, and within the channel width indicated in the HT Operation element.

— The maximum 26-tone RU located within the channel width indicated in the most recently received Operating Mode Notification frame, Operating Mode Notification element with the Rx NSS Type subfield equal to 0, or OM Control field sent by the corresponding HE beamformee (see 26.9).

In an HE non-TB sounding sequence soliciting SU feedback, B26 (in the Feedback Type And Ng subfield), the Codebook Size subfield, and the Nc subfield in the STA Info field of the HE NDP Announcement frame are reserved.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In an HE non-TB sounding sequence soliciting CQI feedback, the Nc subfield in an HE NDP Announcement frame is reserved.

An HE beamformee that receives an HE NDP Announcement frame soliciting SU feedback as part of an HE non-TB sounding sequence shall generate an HE compressed beamforming/CQI report for SU feedback with *Nc* in the range 1 to 8, *Ng* = 4 or *Ng* = 16, and codebook size (ϕ, ψ) = {4, 2} or (ϕ, ψ) = {6, 4}. The HE beamformee shall transmit the HE compressed beamforming/CQI report a SIFS after the HE sounding NDP.

An HE beamformee that receives an HE NDP Announcement frame soliciting CQI feedback as part of an HE non-TB sounding sequence shall generate an HE compressed beamforming/CQI report for CQI feedback with *Nc* determined by the HE beamformee.

An HE beamformee that receives an HE NDP Announcement frame soliciting CQI feedback as part of an HE TB sounding sequence shall generate an HE compressed beamforming/CQI report for CQI feedback with *Nc* determined by the HE beamformer.

An HE beamformee that receives an HE NDP Announcement frame from an HE beamformer with which it is associated and that contains the HE beamformee's MAC address in the RA field (indicating a non-TB sounding sequence) and also receives an HE sounding NDP a SIFS after the HE NDP Announcement frame shall transmit its HE compressed beamforming/CQI report a SIFS after the HE sounding NDP. The TXVECTOR parameter CH_BANDWIDTH for the PPDU containing the HE compressed beamforming/CQI report shall be set to indicate a bandwidth not wider than that indicated by the RXVECTOR parameter CH_BANDWIDTH of the HE sounding NDP.

An HE beamformee that receives an HE NDP Announcement frame as part of an HE TB sounding sequence with a STA Info field identifying it soliciting SU or MU feedback shall generate an HE compressed beamforming/CQI report using the feedback type, *Ng*, codebook size, and *Nc* indicated in the STA Info field. If the HE beamformee then receives a BFRP Trigger frame with a matching STA Info field, the HE beamformee transmits an HE TB PPDU containing the HE compressed beamforming/CQI report following the rules defined in 26.5.2.3. If the HE NDP Announcement frame has the TA field set to the transmitted BSSID and the HE beamformee is a non-AP STA associated with an AP corresponding to a nontransmitted BSSID that supports receiving Control frames with TA field set to the transmitted BSSID, then the HE Compressed Beamforming/CQI frame(s) sent in response shall have the RA field set to as defined in 26.5.2.3.5.

NOTE 2—A non-AP HE beamformee that transmits an OM Control subfield with the UL MU Disable field set to 1 does not respond to BFRP Trigger frames (see 26.9).

An HE beamformee that is a non-AP STA that transmits an HE Compressed Beamforming/CQI frame shall set the RU Start Index and RU End Index subfields of the HE MIMO Control field to indicate the range of tones for which compressed beamforming/CQI information is provided. If the HE NDP Announcement frame that solicited the feedback includes a Disallowed Subchannel Bitmap field with a nonzero value, then a beamformee that indicates support for punctured sounding by setting the Punctured Sounding Support subfield in the HE Capabilities elements that it transmits to 1 shall include a Disallowed Subchannel Bitmap subfield in the solicited feedback with the same value as the Disallowed Subchannel Bitmap subfield of the HE NDP Announcement frame that solicited the feedback to indicate subcarriers for which feedback information is not provided from within the range of subcarriers indicated by the RU Start Index and RU End Index subfields.

An HE beamformee that transmits HE compressed beamforming/CQI report shall include neither the HE Compressed Beamforming Report field nor the HE MU Exclusive Beamforming Report field in the HE Compressed Beamforming/CQI Report field if the transmission duration of the PPDU carrying the HE Compressed Beamforming/CQI Report field would exceed the maximum PPDU duration. In this case, the HE Compressed Beamforming/CQI frame does not include the HE Sounding Feedback Segment field.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Sounding Dialog Token Number field in the HE MIMO Control field shall be set to the same value as the Sounding Dialog Token Number field in the corresponding HE NDP Announcement frame.

An HE beamformer that sends a BFRP Trigger frame shall set the Feedback Segment Retransmission Bitmap fields of the BFRP Trigger frame to all 1s, except when the HE beamformer intends to solicit the retransmission of segmented feedback as defined in 26.7.4.

NOTE 3—The BFRP Trigger frame contains one or more User Info fields, each of which identifies an HE beamformee.

The SNR per subcarrier computation should be done on at least 4 subcarriers in a 26-tone RU.

26.7.4 Rules for generating segmented feedback

The HE Sounding Feedback Segment field consists of bits in octet number $N1$ to octet number $N2$ of the HE Compressed Beamforming/CQI Report field (see 9.4.1.66). Let L_{HCBCR} denote the length of the HE Compressed Beamforming/CQI Report field in octets.

If the HE Compressed Beamforming/CQI Report field would result in an HE Compressed Beamforming/CQI frame that does not exceed 11 454 octets in length, then the HE Compressed Beamforming/CQI Report field shall be included in a single HE Sounding Feedback Segment field. In this case, $N1 = 1$ and $N2 = L_{HCBCR}$ for the HE Sounding Feedback Segment field.

If the HE Compressed Beamforming/CQI Report field would result in an HE Compressed Beamforming/CQI frame that exceeds 11 454 octets in length, then the HE Compressed Beamforming/CQI Report field shall be split into K HE Sounding Feedback Segment fields. Let L be the length of the HE Sounding Feedback Segment field in octets that results in the length of the HE Compressed Beamforming/CQI frame being 11 454 octets (see NOTE 1). Then, the number of HE Sounding Feedback Segment fields is $K = \text{Ceil}(L_{HCBCR} / L)$. For the k-th HE Sounding Feedback Segment field that is not the last HE Sounding Segment field ($k = 1, \ldots, K\text{-}1$), $N1 = (k\text{-}1) \times L + 1$ and $N2 = k \times L$. For the last HE Sounding Segment field, $N1 = (K\text{-}1) \times L + 1$ and $N2 = L_{HCBCR}$ (see NOTE 3). Each HE Sounding Feedback Segment field shall be included in a separate HE Compressed Beamforming/CQI frame. Each HE Sounding Feedback Segment field is identified by the value of the Remaining Feedback Segments subfield and the First Feedback Segment subfield in the HE MIMO Control field in the HE Compressed Beamforming/CQI frame containing the HE Sounding Feedback Segment field as defined in 9.4.1.62; the other nonreserved subfields of the HE MIMO Control field shall be the same for all HE Compressed Beamforming/CQI frames carrying different HE Sounding Feedback Segment fields of the same HE Compressed Beamforming/CQI Report field. All HE Compressed Beamforming/CQI frames carrying different portions of the same HE Compressed Beamforming/CQI Report field shall be sent in a single A-MPDU contained in a PPDU and shall be included in the A-MPDU in the descending order of the Remaining Feedback Segments subfield values.

NOTE 1—An HE Sounding Feedback Segment field together with the other fields in the Frame Body field of the HE Compressed Beamforming/CQI frame (see Figure 9-128 and Table 9-643, constitutes a single unfragmented MMPDU.

NOTE 2—The maximum length of the HE Compressed Beamforming/CQI Report field is 30 008 octets (160 MHz MU type feedback with 8 columns, 8 rows, $Ng = 4$ and $(\phi, \psi) = \{9, 7\}$ bits, see Table 9-122). Therefore, the maximum number of the HE Compressed Beamforming/CQI frames needed to carry an HE Compressed Beamforming/CQI Report field is 3.

NOTE 3—This results in all HE Sounding Feedback Segment fields that are not the last HE Sounding Segment field to have equal length. All HE Compressed Beamforming/CQI frames that do not contain the last HE Sounding Feedback Segment field have equal length of 11 454 octets. The last HE Sounding Feedback Segment field might have length smaller than the other HE Sounding Feedback Segment fields. The HE Compressed Beamforming/CQI frame containing the last HE Sounding Feedback Segment field has a length less than or equal to 11 454 octets.

An HE beamformer that sends a BFRP Trigger frame, in its first attempt to retrieve an HE compressed beamforming/CQI report from an HE beamformee, shall solicit all possible feedback segments by setting all

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

of the bits in the Feedback Segment Retransmission Bitmap subfield to 1 in the User Info field identifying the HE beamformee.

An HE beamformer that fails to receive some or all of the feedback segments of the HE compressed beamforming/CQI report from the HE beamformee may solicit the selective retransmission of missing feedback segments by sending a BFRP Trigger frame that indicates in the Feedback Segment Retransmission Bitmap subfield of the User Info field identifying the HE beamformee the list of feedback segments solicited for retransmission (see 9.3.1.22.3).

NOTE 4—In an HE non-TB sounding sequence, if the HE beamformer does not receive all feedback segments from the HE beamformee, the HE beamformer cannot use a BFRP Trigger frame to request retransmission of the feedback segments. In this case the HE beamformee can only repeat the entire non-TB sounding sequence.

An HE beamformer that fails to receive the first feedback segment (identified by the First Feedback Segment field set to 1), may solicit the selective retransmission of the missing feedback segments assuming the HE Compressed Beamforming/CQI Report field is split into 8 feedback segments. The HE beamformer may also solicit the retransmission of all feedback segments by setting all of the bits in the Feedback Segment Retransmission Bitmap subfield to 1 in the User Info field identifying the HE beamformee.

An HE beamformee that transmits an HE compressed beamforming/CQI report including the HE Compressed Beamforming Report information and any HE MU Exclusive Beamforming Report information in response to a BFRP Trigger frame shall either transmit only the feedback segments indicated in the Feedback Segment Retransmission Bitmap field in the User Info field of the BFRP Trigger frame identifying the HE beamformee or transmit all the feedback segments available at the HE beamformee, excluding the feedback segments that do not exist at the HE beamformee.

NOTE 5—If an HE beamformer solicits the missing feedback segments from a beamformee and does not receive a response from the beamformee, the HE beamformer might either initiate an HE TB sounding sequence or transmit an additional BFRP Trigger frame to the HE beamformee.

26.7.5 HE sounding NDP transmission

The TXVECTOR parameters for an HE sounding NDP shall be set as follows:

- FORMAT is set to HE_SU.
- APEP_LENGTH is set to 0.
- HE_LTF_TYPE is set to either 2xHE-LTF or 4xHE-LTF.
- If HE_LTF_TYPE is 2xHE-LTF, then GI_TYPE is set to either 0u8s_GI or 1u6s_GI.
- If HE_LTF_TYPE is 4xHE-LTF, then GI_TYPE is set to 3u2s_GI.
- NUM_STS indicates two or more space-time streams if the Feedback Type field in the HE MIMO Control field of the preceding HE NDP Announcement frame indicates either SU or MU, or one or more space-time streams if the Feedback Type field in the HE MIMO Control field of the preceding HE NDP Announcement frame indicates CQI.
- CH_BANDWIDTH is set to the same value as the TXVECTOR parameter CH_BANDWIDTH in the preceding HE NDP Announcement frame.
- INACTIVE_SUBCHANNELS is set to the value of the Disallowed Subchannel Bitmap subfield of the STA Info field with the AID11 subfield set to 2047 in the preceding HE NDP Announcement frame.
- SPATIAL_REUSE is set to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED (see 26.11.6).
- BSS_COLOR is set to the value indicated in the BSS Color subfield of the HE Operation element received or transmitted by the HE AP.
- TXOP_DURATION set to either 127 or a value defined in Equation (26-3).

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$\max(\min(8\left\lfloor\frac{\lceil D_{\text{HE\_NDPA}} - \text{SIFS} - \text{TXTIME}\rceil}{8}\right\rfloor, 504), \min(128\left\lfloor\frac{\lceil D_{\text{HE\_NDPA}} - \text{SIFS} - \text{TXTIME}\rceil}{128}\right\rfloor, 8448)) \quad (26\text{-}3)$$

where

$D_{\text{HE\_NDPA}}$ is the value of the Duration/ID field in the MAC header of the preceding HE NDP Announcement frame

TXTIME is the transmission time of an HE sounding NDP defined in Equation (27-149)

The Supported HE-MCS and NSS Set field in the HE Capabilities element transmitted by the transmitter and the receiver of the HE sounding NDP do not affect the values used for the NUM_STS parameter for the TXVECTOR of an HE sounding NDP.

The destination of an HE sounding NDP is equal to the RA of the immediately preceding HE NDP Announcement frame.

The source of an HE sounding NDP is equal to the TA of the immediately preceding HE NDP Announcement frame.

26.8 TWT operation

26.8.1 General

Target wake time (TWT) allows an AP to manage activity in the BSS in order to minimize contention between STAs and to reduce the required amount of time that a STA utilizing a power management mode needs to be awake. This is achieved by allocating STAs to operate at nonoverlapping times and/or frequencies, and concentrate the frame exchange sequences in predefined service periods.

An HE STA negotiates individual TWT agreements, as defined in 10.46, subject to the additional rules and restrictions that are defined in 26.8.2 and 26.8.7. A non-AP HE STA establishes membership in broadcast TWT schedules, as defined in 26.8.3, which are used as defined in 26.8.3.3, 26.14.2, and 26.14.3. An HE AP delivers broadcast TWT parameter sets to non-AP HE STAs as described in 26.8.3.2, 26.14.2, and 26.14.3.

A STA does not need to be aware of the values of TWT parameters of the TWT agreements of other STAs in the BSS of the STA or of TWT agreements of STAs in other BSSs. A STA does not need to be aware that a TWT service period (SP) is used to exchange frames with other STAs. Frames transmitted during a TWT SP are carried in any PPDU format supported by the pair of STAs that have established the TWT agreement corresponding to that TWT SP, including HE MU PPDU, HE TB PPDU, etc.

An HE STA with dot11TWTOptionImplemented equal to true shall set the following:

- The TWT Requester Support subfield to 1 in the HE Capabilities element that it transmits if it supports operating in the role of a TWT requesting STA; otherwise, to 0.
- The TWT Responder Support subfield to 1 in the HE Capabilities elements that it transmits if it supports operating in the role of a TWT responding STA; otherwise, to 0.
- The Broadcast TWT Support subfield to 1 in the HE Capabilities element that it transmits if it supports operating in the role of a TWT scheduled STA or in the role of a TWT scheduling AP; otherwise, to 0.

An HE AP shall set the TWT Responder Support subfield of the Extended Capabilities element and HE Capabilities element to 1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An HE AP may request TWT participation by all associated STAs that have declared support for TWT. A non-AP STA declares support for the role of TWT requesting STA by setting the TWT Requester Support subfield in the Extended Capabilities element or in the HE Capabilities element to 1 and declares support for the role of TWT scheduled STA by setting the Broadcast TWT Support subfield in the HE Capabilities element to 1. The HE AP makes the request for TWT participation by setting the TWT Required subfield to 1 in HE Operation elements it transmits. A STA that supports TWT and that has received an HE Operation element with the TWT Required subfield equal to 1 from the HE AP with which it is associated shall either negotiate individual TWT agreements, as defined in 26.8.2, or participate in broadcast TWT operation, as defined in 26.8.3.

NOTE—The AP sets the TWT Required subfield to 1 if it is not available outside TWT SPs (see 26.8.2 and 26.8.3). The AP might not be available outside TWT SPs if it sets the Responder PM Mode subfield to 1 (see 10.46.7).

26.8.2 Individual TWT agreements

An HE STA may negotiate individual TWT agreements with another HE STA as defined in 10.46.1, except that the STA

- May set the Responder PM Mode subfield to 1 if it is a TWT responding STA that intends to go to doze state outside of TWT SPs.
  - If the TWT responding STA is an AP then it may set the Responder PM Mode subfield to 1 only if all non-AP STAs that are associated to it indicate support of TWT and the AP has set the TWT Required subfield to 1 in the HE Operation element it transmits; otherwise, it shall set the Responder PM Mode subfield to 0.
  - An AP that sets the Responder PM Mode subfield to 1 follows the rules defined in 10.46.7.
- Shall set the Implicit subfield to 1 and the NDP Paging Indicator/Unavailability Mode subfield to 0 in all TWT elements that it transmits during the TWT setup.
- May set the Trigger subfield to 1 in the TWT element it transmits during the TWT setup to negotiate a trigger-enabled TWT.
  - A successful TWT agreement whose Trigger subfield in the TWT response sent by the AP is 1 is a trigger-enabled TWT; otherwise, it is not a trigger-enabled TWT.
- Shall set the TWT Channel subfield in the TWT element it transmits to 0, unless the HE STA sets up a subchannel selective transmission operation as defined in 26.8.7.
- May set the TWT Protection field to 1 to indicate that TXOPs within the TWT SPs shall be initiated with a NAV protection mechanism, such as (MU) RTS/CTS or CTS-to-self frame; otherwise, it shall set it to 0.
- Shall not use the RAW mechanism for protection of TWT SPs.

NOTE 1—Whether the Responder PM Mode subfield is set to 0 or 1, the AP unavailability both inside and outside of the TWT SP is affected by any advertised broadcast TWT element with Broadcast TWT ID subfield equal to 0 and with Responder PM Mode subfield equal to 1 (see 26.8.3.2).

An HE STA that successfully sets up a TWT agreement with another HE STA shall follow the rules defined in 10.46.1 and 10.46.4 except that all the additional rules defined in 26.8 supersede all the respective rules defined in 10.46.1 and 10.46.4. A TWT or TWT SP that is set up under an implicit TWT agreement is an implicit TWT or implicit TWT SP, respectively (see 10.46.1). A TWT or TWT SP that is set up under a trigger-enabled TWT agreement is a trigger-enabled TWT or trigger-enabled TWT SP, respectively. The TWT responding STA of a trigger-enabled TWT agreement is an HE AP.

An example of individual TWT operation is shown in Figure 26-9, where the AP is the TWT responding STA and STA 1 and STA 2 are the TWT requesting STAs.

In this example, STA 1 sends a TWT request to the TWT responding STA to setup a trigger-enabled TWT agreement. The TWT responding STA accepts the TWT agreement with STA 1 and confirms the acceptance

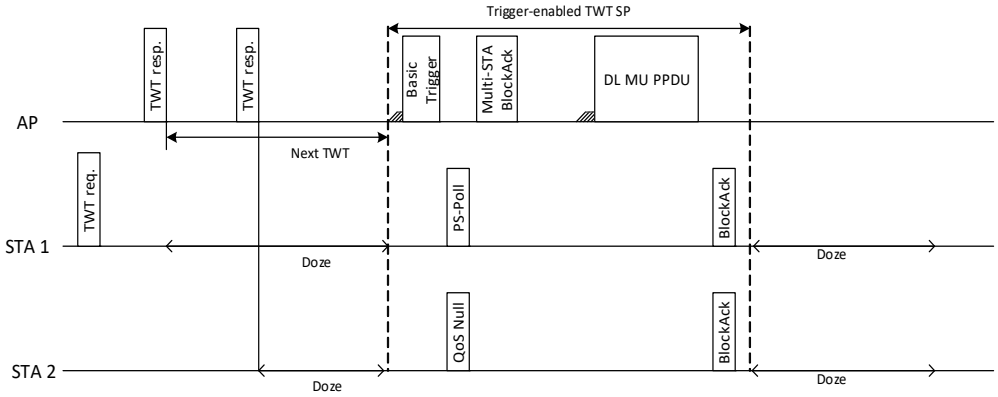

Figure 26-9—Example of individual TWT operation

in the TWT response sent to STA 1. Subsequently, the TWT responding STA sends an unsolicited TWT response to STA 2 to set up a trigger-enabled TWT agreement with STA 2. Both these TWT agreements are set up as announced TWTs. During the trigger-enabled TWT SP, the TWT responding STA sends a Basic Trigger frame to which the TWT requesting STAs indicate that they are awake during the TWT SP. STA 1 indicates that it is awake by sending a PS-Poll frame, and STA 2 indicates that it is awake by sending a QoS Null frame in response to the Basic Trigger frame. STA 1 and STA 2 receive their DL BUs in a subsequent exchange with the TWT responding STA and go to doze state outside of this TWT SP.

An HE STA may execute the individual TWT setup exchanges defined in Table 26-5 in addition to the exchanges defined in 10.46. An HE STA that intends to set up an individual TWT shall set the Negotiation Type subfield to 0 as defined in 10.46 or as defined in Table 26-5. The HE STA may respond to the TWT request with a TWT response that has the Negotiation Type subfield equal to 3 as indicated in Table 26-5 to provide recommended broadcast TWT schedules for the requesting STA.

An HE STA that successfully sets up an individual TWT agreement and operates in PS mode may listen to Beacon frames, but is exempt from the requirements for receiving Beacon frames as defined in 11.2.3.1. The HE STA follows the rules in 11.2.3 to receive group addressed frames.

NOTE 2—An HE AP sets the bit in the TIM element of the Beacon frame that corresponds to the AID of the TWT requesting STA to 1 to indicate the presence of available buffered BUs for the STA (see 11.2.3.7).

NOTE 3—The TWT responding STA might inform the TWT requesting STA, if it supports TIM Broadcast, of any critical update (as defined in 11.2.3.14) by sending a Management frame to the TWT requesting STA when the STA is in the awake state.

An HE STA may tear down an individual TWT agreement by sending a TWT Teardown frame with the Negotiation Type subfield set to 0. An HE STA may tear down all individual TWT agreements by sending a TWT Teardown frame with the Teardown All TWT field set to 1.

An HE AP may send an unsolicited TWT response with the Trigger subfield equal to 1 to a non-AP HE STA that has set the TWT Requester Support subfield to 1 in the HE Capabilities elements that it transmits to the AP. The TWT response shall have one of these values in the TWT Setup Command field: Accept TWT, Alternate TWT, or Dictate TWT. An unsolicited TWT response with TWT Setup Command field of Alternate TWT or Dictate TWT contains an advisory notification to the recipient of TWT parameters that are likely to be accepted by the AP if the recipient transmits a subsequent TWT request to the AP that

Table 26-5—TWT setup exchange for unsolicited TWT and recommended broadcast TWT switch

TWT Setup Command field in an initiating frame	TWT Setup Command field in a response frame	TWT condition after the completion of the exchange
Request TWT, Suggest TWT, or Demand TWT with Broadcast subfield = 0	Accept TWT with Broadcast subfield = 1	This response is not allowed.
Request TWT, Suggest TWT, or Demand TWT with Broadcast subfield = 0	Dictate TWT with Broadcast subfield = 1	No individual TWT agreement exists with the associated TWT Flow identifier. One or more broadcast TWT schedules exist that use the TWT parameters identified in the response frame including a Broadcast TWT ID. The broadcast TWT schedules are not necessarily newly created. The responding STA does not create any new individual TWT agreement with the requester at this time. The STA transmitting the initiating frame is not a member of the broadcast TWT; however, the STA may join any of the broadcast TWT schedules.
Accept TWT with Broadcast subfield set to 0	No frame transmitted	The STA receiving this frame now has an individual TWT agreement with the transmitter of the frame where the parameters of the individual TWT agreement are identified by the initiating frame.
Alternate TWT or Dictate TWT with Broadcast subfield = 0	No frame transmitted	The STA receiving this frame is not, through the receipt of this frame, a member of the TWT identified by the initiating frame but can use the information provided to create a request to set up a TWT in a subsequent initiating frame that it transmits.

NOTE 1—The Negotiation Type subfield in the TWT element contained in these frames is 0 if the Broadcast subfield is 0 and is 3 if the Broadcast subfield is 1.

NOTE 2—The initiating frame and response frame settings not listed in the tables in 10.46 or 26.8 are not allowed. The initiating frame is a TWT request if the TWT element carried in the frame has the TWT Request field set to 1; otherwise, it is a TWT response (see Table 9-347). The response frame is a TWT response if the TWT element contained in the frame has the TWT Request field equal to 0.

includes those TWT parameters. An unsolicited TWT response with the TWT Setup Command field of Accept TWT creates a TWT agreement between the two STAs. A STA that receives an unsolicited TWT response with the TWT Setup Command field of Accept TWT may transmit a TWT Teardown frame to delete the unsolicited individual TWT agreement.

NOTE 4—The HE AP might send an unsolicited TWT response to a non-AP HE STA with a TWT Flow Identifier that corresponds to an existing TWT agreement. The unsolicited TWT response with TWT Setup Command field of Accept TWT indicates new TWT parameters that are different from the previously negotiated TWT parameters for that TWT agreement.

An HE STA shall not transmit BAT, TACK, or STACK frames, which are allowed in 10.46.2.

A TWT requesting STA should not transmit frames to the TWT responding STA outside of negotiated TWT SPs and should not transmit frames that are not contained within HE TB PPDUs to the TWT responding STA within trigger-enabled TWT SPs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 5—The TWT requesting STA decides which frames to transmit within or outside a TWT SP; and while it is recommended that the TWT requesting STA not transmit using EDCA within or outside TWT SPs, the TWT requesting STA might still do so. If the STA decides to transmit, then the STA might contend for access to the medium as defined in 10.23.2 and in 26.2.7.

The TWT responding STA of a trigger-enabled TWT agreement shall schedule for transmission a Trigger frame for the TWT requesting STA, as described in 26.5.2, within each TWT SP for that TWT agreement, except that the Trigger frame may be replaced by a frame carrying a TRS Control subfield, provided that the frame is carried in a DL MU PPDU and the AP allocates enough resources in the HE TB PPDU for the STA to at least deliver its BSRs in response to the soliciting DL MU PPDU. The TWT responding STA should solicit buffer status reports from the TWT requesting STA at the start of the TWT SP following the procedure described in 26.5.5 or as described in 26.5.7. The TWT responding STA that intends to schedule for transmission additional Trigger frames during a trigger-enabled TWT SP shall set the More TF subfield in the Common Info field of the Trigger frame to 1 to indicate that it will schedule for transmission another Trigger frame within the same TWT SP. The TWT responding STA shall set the More TF subfield to 0 when the Trigger frame is the last scheduled Trigger frame of the TWT SP or when the Trigger frame is scheduled for transmission outside of a TWT SP.

NOTE 6—The TWT responding STA can cancel the transmission of a scheduled Trigger frame if the STA gains access to the wireless medium outside of the TWT SP. The TWT responding STA does not schedule for transmission a Trigger frame for the TWT requesting STA when the TWT agreement is not a trigger-enabled TWT agreement or when the TWT requesting STA has sent an OM Control subfield that has the UL MU Disable subfield equal to 1 (see 26.9).

NOTE 7—If the AP replaces the Trigger frame with a frame carrying a TRS Control field, then it is recommended that the AP allocate enough resources in subsequent Trigger frames sent during the TWT SP so that the STA can send as much as possible of the data reported in the BSR.

A TWT requesting STA transmits an HE TB PPDU as a response to a Trigger frame that identifies it and is sent during a trigger-enabled TWT SP (see 26.5.2). A TWT requesting STA that is in PS mode and is awake shall include a PS-Poll frame or a U-APSD trigger frame in the HE TB PPDU if the TWT is an announced TWT, unless the STA has already transmitted a PS-Poll or U-APSD trigger frame or transmitted any other indication that the STA is in the awake state within that TWT SP or has, previous to the start of the TWT SP but after the end of the most recent TWT SP, indicated to the AP that it is currently in the awake state. The STA may include other frames in the HE TB PPDU when other rules do not prohibit their inclusion (see 26.5.2 and 9.7.3).

NOTE 8–A Trigger frame identifies a TWT requesting STA if it is sent by the AP with which the STA is associated and the frame contains the 12 LSBs of the STA's AID in any of its User Info fields. The Trigger frame can have multiple recipients, each of which is identified by the presence of the 12 LSBs of the recipient's AID in any of its User Info fields (see 26.5.2), and can have in the TA field the MAC address of the AP or the transmitted BSSID under the conditions defined in 26.5.2.2.4.

NOTE 9—Other indications that the STA is in the awake state are the transmission of an HE TB feedback NDP in response to an NFRP Trigger frame (see 26.5.7) or the transmission of a frame that indicates that the STA is in active mode (see 11.2.3.2).

A TWT responding STA that receives a PS-Poll frame or a U-APSD trigger frame or any other indication from a TWT requesting STA in PS mode, during or before an announced TWT SP but after the end of the most recent TWT SP, that the TWT requesting STA is in the awake state during the TWT SP shall follow the rules defined in 11.2.3.6, except that the TWT responding STA should deliver to the TWT requesting STA as many buffered BUs as are available at the TWT responding STA, provided that the BU delivery does not exceed the duration of the TWT SP, the TWT requesting STA has indicated that it is in the awake state for that TWT SP, and the TWT requesting STA has not entered the doze state (see 26.8.4.2 and 26.8.5).

NOTE 10—The indication that the TWT requesting STA is in the awake state for that TWT SP might be a PS-Poll, U-APSD trigger frame, or any frame for which an immediate response is solicited and that follows the rules in 11.2.3.2 but the corresponding immediate response frame is not received by the TWT requesting STA. Other indications that the

STA is in the awake state are the transmission of an HE TB feedback NDP in response to an NFRP Trigger frame (see 26.5.7) or the transmission of a frame that indicates that the STA is in active mode (see 11.2.3.2).

A TWT responding STA that sends frames to a TWT requesting STA that is in PS mode during an unannounced TWT SP shall follow the rules defined in 11.2.3.6, except that the TWT responding STA should deliver to the TWT requesting STA as many buffered BUs as are available at the TWT responding STA, provided that the BU delivery does not exceed the duration of the TWT SP and the TWT requesting STA has not entered the doze state (see 26.8.4.2 and 26.8.5).

NOTE 11—The TWT responding STA can deliver the buffered BUs in A-MPDUs sent under a block ack agreement if the TWT is an announced TWT and the TWT requesting STA is awake for that TWT SP, or if the TWT is an unannounced TWT (at the start of which the TWT requesting STA is assumed to already be awake). The buffered BUs can be delivered in multiple PPDUs transmitted within the TWT SP. The TWT responding STA can transmit frames to TWT requesting STA after the end of the TWT SP if the STA is in active mode.

A TWT responding STA may transmit to a TWT requesting STA that is in active mode at any time (see 11.2.3.2). A TWT responding STA may transmit to a TWT requesting STA that is in PS mode and awake outside of a TWT SP following the rules in 11.2.3.6.

26.8.3 Broadcast TWT operation

26.8.3.1 General

A TWT scheduling AP is an HE AP with dot11TWTOptionActivated equal to true that sets the Broadcast TWT Support field in the HE Capabilities element it transmits to 1 and that follows the rules for TWT scheduling APs in 26.8.3.2, for power save with UORA and TWT in 26.14.2, and for periodic opportunistic power save (OPS) defined in 26.14.3.

A TWT scheduling AP includes a broadcast TWT element in the Beacon frame as described in 26.8.3.2. An AP corresponding to a nontransmitted BSSID in a multiple BSSID set shall follow the rules in 11.1.3.8.4.

A TWT scheduling AP may include a TWT element with the Negotiation Type subfield equal to 3 in a (Re)Association Response frame or in a TWT setup frame to assign the recipient STA to a broadcast TWT schedule without having received a request from the STA to become a member of the broadcast TWT schedule if that STA has set the Broadcast TWT Support field of HE Capabilities element it transmits to 1.

A non-AP HE STA shall obtain TWT parameter values from the most recently received TWT element carried in a Beacon, Probe Response, or (Re)Association Response frame from its associated AP, unless the non-AP HE STA is associated with an AP corresponding to a nontransmitted BSSID of a multiple BSSID set. In this case, it shall follow the rules in 11.1.3.8.4 to determine the TWT parameter values.

The non-AP HE STA determines the start time of subsequent TWTs of a TWT parameter set from the Target Wake Time field of the TWT parameter set contained in the received TWT element, TSF timer, and the TWT wake interval (see 26.8.3.2).

NOTE—The Target Wake Time field carries only B10:B25 of the relevant target TSF time, and changes in B26:B63 of the corresponding TSF timer are not explicitly communicated to the receiving STA. Hence, the STA must consider when setting up a broadcast TWT schedule the rollover of B26:B63 of the target TSF time that might happen at the receiving STA during the lifetime of the broadcast TWT schedule (i.e., resulting from the Target Wake Time field and the Broadcast TWT Persistence field).

A TWT scheduled STA is a non-AP HE STA that sets the Broadcast TWT Support field in the HE Capabilities element it transmits to 1 and receives a broadcast TWT element transmitted by an HE AP that is a TWT scheduling AP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A TWT scheduled STA follows the schedule provided by the TWT scheduling AP as described in 26.8.3.3 and, in addition, the rules in 26.14.2 if the STA supports the UORA procedure and the rules in 26.14.3 if the STA supports OPS operation. A TWT scheduled STA can negotiate the wake TBTT and wake interval for Beacon frames it intends to receive as described in 26.8.6 or can join a particular broadcast TWT as described below in this subclause.

An example of broadcast TWT operation is shown in Figure 26-10, where the AP is the TWT scheduling AP and STA 1 and STA 2 are the TWT scheduled STAs.

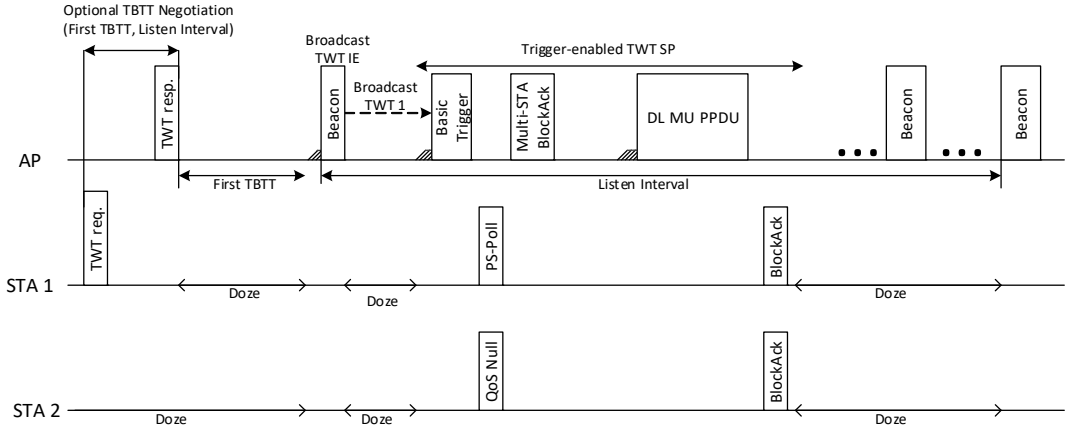

Figure 26-10—Example of broadcast TWT operation with optional TBTT negotiation

The TWT scheduling AP includes a broadcast TWT element in the Beacon frame that indicates a broadcast TWT SP during which the AP intends to send Trigger frames, or DL BUs to the TWT scheduled STAs. STA 1 and STA 2 wake to receive the Beacon frame to determine the broadcast TWT. During the trigger-enabled TWT SP, the AP sends a Basic Trigger frame to which STA 1 and STA 2 indicate that they are awake during the TWT SP. STA 1 indicates that it is awake by sending a PS-Poll, and STA 2 indicates that it is awake by sending a QoS Null frame in response to the Basic Trigger frame. STA 1 and STA 2 receive their DL BUs in a subsequent exchange with the AP and go to doze state outside of this TWT SP.

Each broadcast TWT is uniquely identified by the <broadcast TWT ID, MAC address> tuple, where the broadcast TWT ID is the value of the Broadcast TWT ID subfield and is greater than 0 and the MAC address is the address of the TWT scheduling AP.

Broadcast TWT schedules are advertised by the TWT scheduling AP in frames that carry TWT elements with the Negotiation Type subfield set to 2 as described in 26.8.3.2. Broadcast TWT schedules that are intended for member TWT scheduled STAs are identified by a Broadcast TWT ID subfield that is greater than 0, and broadcast TWT schedules that are intended for all TWT scheduled STAs are identified by a Broadcast TWT ID subfield equal to 0.

Negotiations to become a member of or terminate membership in a broadcast TWT, identified by a Broadcast TWT ID subfield greater than 0, are performed with an exchange of frames that carry TWT elements with the Negotiation Type subfield set to 3 as described in 26.8.3.3.

The TWT scheduling AP may send an unsolicited TWT response with the Trigger subfield set to 1 to a non-AP HE STA that has set the Broadcast TWT Support subfield to 1 in the HE Capabilities elements that it transmits to the AP. The TWT response shall indicate one of the following values in the TWT Setup Command field: Accept TWT, Alternate TWT, or Dictate TWT. An unsolicited TWT response with TWT

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Setup Command field indicating Alternate TWT or Dictate TWT contains an advisory notification to the recipient of TWT parameters that are likely to be accepted by the AP if the recipient transmits a subsequent TWT request to the AP that includes those TWT parameters. An unsolicited TWT response with a TWT Setup Command field that indicates Accept TWT allocates a broadcast TWT schedule to the receiving STA. A STA that receives an unsolicited TWT response with a TWT Setup Command field that indicates Accept TWT may transmit a TWT Teardown frame or a TWT response with TWT Setup Command field indicating Reject TWT to withdraw from the unsolicited broadcast TWT schedule.

26.8.3.2 Rules for TWT scheduling AP

A TWT scheduling AP may include a broadcast TWT element in a Beacon frame that is scheduled at a TBTT (see 11.1.3.2). The TWT scheduling AP shall include one or more TWT parameter sets in the TWT element, and each TWT parameter set may indicate a periodic occurrence of TWTs. The TWT scheduling AP shall set the Last Broadcast Parameter Set subfield to 0 in each TWT parameter set, except for the last (or only) TWT parameter set of the TWT element that shall have the Last Broadcast Parameter Set subfield set to 1. The TWT scheduling AP shall set the Negotiation Type subfield to 2 and may set the Responder PM Mode subfield to 0 in the TWT element (see 10.46.7). The TWT scheduling AP may set the NDP Paging Indicator/Unavailability Mode subfield to 0 or 1 subject to the additional rules defined in this subclause if the Broadcast TWT ID subfield is equal to 0 and the Responder PM Mode subfield is equal to 1, otherwise, the NDP Paging Indicator/Unavailability Mode subfield is reserved for a TWT scheduling AP. Each TWT parameter set specifies the TWT parameters of a specific broadcast TWT that are valid within a broadcast TWT SP. Each specific broadcast TWT is identified as indicated in 26.8.3.1. Individual STAs may have membership in broadcast TWTs as a result of negotiation with a TWT scheduling AP as described in 26.8.3.1.

The TWT scheduling AP sets the TWT parameters of each TWT parameter set as described below in this subclause.

The TWT scheduling AP shall set the TWT Request subfield to 0 and the TWT Setup Command subfield as defined in Table 26-6 and shall include the broadcast TWT element in the Beacon frames for as long as there is at least one active broadcast TWT schedule. Broadcast TWT announcements are broadcast TWT schedules advertised in broadcast TWT elements contained in broadcast Management frames.

The TWT scheduling AP shall set the Broadcast TWT Persistence subfield for each broadcast TWT to the number of TBTTs for which the Broadcast TWT schedule will be in existence, counting forward from the current TBTT. The AP may change the value of the Broadcast TWT Persistence subfield for any Broadcast TWT within any transmitted TWT element. If the AP reduces the value of the subfield, it shall not reduce the value by more than one as compared to the value transmitted during the immediately preceding beacon interval. If the AP increases the value of the Broadcast TWT Persistence subfield, it may increase the value by any amount as compared to the value transmitted during the immediately preceding TBTT.

A TWT scheduling AP that sets the TWT Setup Command subfield to Reject TWT shall indicate the TBTT at which the periodic broadcast TWT will be terminated by setting the value of the Broadcast TWT Persistence subfield to indicate the number of TBTTs that remain until the broadcast TWT schedule is terminated. The broadcast TWT schedule terminates at the next TBTT that follows the TBTT at which the TWT scheduling AP transmits the broadcast TWT element with Broadcast TWT Persistence subfield for that broadcast TWT schedule equal to 0.A TWT scheduling AP may terminate the membership of a TWT scheduled STA in all broadcast TWTs by transmitting a TWT Teardown frame with the Teardown All TWT field set to 1.

A TWT scheduling AP that sets the TWT Setup Command subfield to Alternate TWT shall indicate the TBTT at which the periodic broadcast TWT parameter set will be modified by setting the Broadcast TWT Persistence subfield to indicate the number of TBTTs that remain until the broadcast TWT schedule is modified. The broadcast TWT schedule will be modified at the next TBTT that follows the TBTT at which

Table 26-6—Broadcast TWT announcements

TWT Setup Command field in an initiating frame	TWT Setup Command field in a response frame	Condition after the completion of the exchange
Accept TWT	No frame transmitted	Only an HE AP is permitted to transmit this sequence. TWT scheduled STAs that receive this frame use the provided TWT parameters to determine the broadcast TWT schedule. The broadcast TWT schedule is identified by the broadcast TWT ID and the TA of the initiating frame.
Alternate TWT	No frame transmitted	When transmitted by a TWT scheduling AP, some of the parameters of the broadcast TWT schedule identified by the broadcast TWT ID and the TA of the initiating frame will change at the TBTT that occurs after the Broadcast TWT Persistence field of that broadcast TWT parameter set reaches 0. The new parameters will be present in the first Beacon frame transmitted by the TWT scheduling AP at the TBTT that has a broadcast TWT parameter set with the same broadcast TWT ID and same TA, but with the TWT command value set to Accept TWT.
Reject TWT	No frame transmitted	When transmitted by a TWT scheduling AP, the broadcast TWT schedule identified by the broadcast TWT ID and the TA of the initiating frame will be terminated at the TBTT that occurs after the Broadcast TWT Persistence field of that broadcast TWT parameter reaches 0. The termination occurs at the TBTT at which a Beacon frame is transmitted by the TWT scheduling AP that does not include a broadcast TWT parameter set with the same broadcast TWT ID and same TA as the initiating frame.

NOTE 1—The Negotiation Type subfield of the TWT element contained in these frames is 2.

NOTE 2—The initiating frame and response frame settings not listed in the tables in 10.46 or 26.8 are not allowed. The initiating frame is a TWT response.

NOTE 3—MMPDUs that contain a broadcast TWT element generated by a TWT scheduling AP can be broadcast Probe Response, FILS Discovery, and Beacon frames. The TWT element has the TWT Request field equal to 0 and the Negotiation Type subfield equal to 2. The TWT scheduling AP can include a TWT parameter set with Broadcast TWT ID value 0 to indicate a TWT allocated for all STAs, and Broadcast TWT ID greater than 0 to indicate a TWT intended to TWT scheduled STAs that are members of that broadcast TWT.

the TWT scheduling AP transmits the broadcast TWT element with Broadcast TWT Persistence subfield for that broadcast TWT schedule equal to 0. The AP shall include in the broadcast TWT element the future broadcast TWT parameter set that will take effect at that TBTT. The future broadcast TWT parameter set shall have the same values in the TWT Setup Command and Broadcast TWT ID subfields as the current broadcast TWT parameter set that is being modified and switch the TWT Setup Command subfield from Alternate TWT to Accept TWT at that TBTT. The future broadcast TWT parameter set shall be in a Broadcast TWT Parameter Set field that is located after the Broadcast TWT Parameter Set field that contains the current broadcast TWT parameter set.

NOTE 1—TWT scheduled STAs follow the broadcast TWT parameters that are included in the current broadcast TWT parameter set and switch to following the broadcast TWT parameters in the future broadcast TWT parameter set only if the TWT Setup Command field is equal to Accept TWT in the Broadcast TWT Parameter Set field that contains the future broadcast TWT parameter set.

A TWT scheduling AP should indicate Alternate TWT or Reject TWT in the TWT Setup Command field of the broadcast TWT element for as many TBTTs as needed to exceed the longest interval any STA is expected to not receive Beacon frames either when the TWT parameters of a periodic TWT will change, or when the periodic TWT specified by that TWT parameter set will be terminated.

The TWT scheduling AP shall set the Trigger field to 1 to indicate a trigger-enabled TWT. Otherwise, it shall set the Trigger field to 0 (i.e., the TWT is not a trigger-enabled TWT). The AP is not expected to schedule for transmission Trigger frames during a non-trigger-enabled TWT SP and is expected to schedule Trigger frames during a trigger-enabled TWT SP as described below in this subclause.

The TWT scheduling AP shall schedule for transmission of a Trigger frame addressed to one or more TWT scheduled STAs during a trigger-enabled TWT SP, except that the Trigger frame may be replaced by a frame carrying a TRS Control subfield, provided that the frame is carried in a DL MU PPDU and the AP allocates enough resources in the HE TB PPDU for the STA to at least deliver its BSRs in response to the soliciting DL MU PPDU. A TWT scheduling AP should not include the 12 LSBs of the STA's AID in a User Info field of a Trigger frame transmitted within a broadcast TWT SP, unless the STA is in the awake state, has established membership in the broadcast TWT with that Broadcast TWT ID, or has indicated to receive the Beacon frame preceding the beacon interval that contains this TWT SP (see 26.8.6). A TWT scheduling AP may cancel the transmission of a Trigger frame during a trigger-enabled TWT SP if the AP does not expect any member TWT scheduled STAs to be in the awake state at the time of transmitting the Trigger frame.(

The TWT scheduling AP that schedules for transmission additional Trigger frames during a trigger-enabled TWT SP shall set the More TF subfield in the Common Info field of the Trigger frame to 1 to indicate that it will schedule for transmission another Trigger frame within the same TWT SP. The TWT scheduling AP shall set the More TF subfield to 0 if the Trigger frame is the last scheduled Trigger frame of the TWT SP or if the Trigger frame is scheduled for transmission outside of a trigger-enabled TWT SP. The TWT scheduling AP should poll as many STAs as possible among TWT scheduled STAs that are members of that nonzero Broadcast TWT ID so that the STAs can perform a frame exchange with the TWT scheduling AP during that TWT SP.

NOTE 2—The TWT scheduling AP does not intend to schedule for transmission of a Trigger frame for the TWT scheduled STA when the broadcast TWT is not a trigger-enabled TWT or when the TWT scheduled STA has sent an OM Control subfield that has the UL MU disable bit equal to 1 (see 26.9).

NOTE 3—The TWT scheduling AP can cancel the transmission of a scheduled Trigger frame if the AP gains access to the wireless medium outside of the TWT SP.

NOTE 4—If the AP replaces the Trigger frame with a frame carrying a TRS Control field, then it is recommended that the AP allocate enough resources in subsequent Trigger frames sent during the TWT SP so that the STA can send as much as possible of the data reported in the BSR.

The TWT scheduling AP shall set the Flow Type field to 1 to indicate an unannounced TWT. Otherwise, it shall set the Flow Type field to 0 to indicate an announced TWT.

The TWT scheduling AP should schedule delivery of individually addressed DL BUs during unannounced TWT SPs with nonzero Broadcast TWT ID subfield.

The TWT scheduling AP shall set the Broadcast TWT Recommendation subfield according to Table 9-348. The TWT scheduling AP shall set the Trigger field to 1 if the Broadcast TWT Recommendation subfield is 1 or 2 and may set the Trigger field to any value if the Broadcast TWT Recommendation subfield is 0 or 3.

A TWT scheduling AP that has advertised a broadcast TWT with a Broadcast TWT ID equal to 0 shall schedule the following:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The delivery of group addressed DL BUs during the broadcast TWT SPs located within the beacon interval that follows the DTIM beacon if the TWT parameter set indicated non-trigger enabled unannounced TWT SP and had the Broadcast TWT Recommendation subfield equal to 0.
— The transmission of a Trigger frame that does not contain an RA-RU during the broadcast TWT SPs if the TWT parameter set indicated trigger-enabled announced TWT SP and had the Broadcast TWT Recommendation subfield equal to 1. The Trigger frame shall contain at least one User Info field addressed to a TWT scheduled STA whose TIM bit in the Beacon frame is 1 and that is not a member of any nonzero broadcast TWT during this beacon interval.
— The transmission of a Trigger frame that contains at least one RA-RU (see 26.5.4) during the broadcast TWT SPs if the TWT parameter set indicated a trigger enabled announced TWT SP and had the Broadcast TWT Recommendation subfield set to 2 (see 26.14.2).
— The transmission of a TIM frame or FILS Discovery frame at the start of a broadcast TWT SP if the TWT parameter set indicated a non-trigger enabled unannounced TWT SP and had the Broadcast TWT Recommendation subfield set to 3 (see 26.14.3.2).

If a TWT scheduling AP has advertised a TWT element that carries one or more Broadcast TWT Parameter Set fields with a Broadcast TWT ID subfield equal to 0 and a Responder PM Mode subfield equal to 1, then:

— If the NDP Paging Indicator/Unavailability Mode subfield is set to 0, the AP may be unavailable outside of these broadcast TWT SPs, except within any other TWT SP that is setup with the AP or advertised by the AP.
— If the NDP Paging Indicator/Unavailability Mode subfield is set to 1, the AP may be unavailable outside of these broadcast TWT SPs, even if that time falls within any other TWT SP that is setup with the AP or advertised by the AP.

NOTE 5—An AP that is unavailable is not capable of receiving PPDUs, following the definition in 11.2.1.

A Trigger frame transmitted during a broadcast TWT SP whose TWT parameter set has the Broadcast TWT Recommendation subfield equal to 0 or 3 may contain zero or more RA-RUs (see 26.5.4). A Trigger frame transmitted during a broadcast TWT SP whose TWT parameter set has the Broadcast TWT Recommendation subfield equal to 1 shall contain no RA-RU.

The TWT scheduling AP shall set the Target Wake Time field to TSF_{Ref}[10:25], where TSF_{Ref} corresponds a TWT scheduled for this TWT parameter set that will occur after the AP has queued for transmission the frame that contains the TWT element. The TSF timer at which that TWT is scheduled has bits 0 to 9 equal to 0 and bits 26 to 63 equal to the same value as the respective bits in the current value of the TSF timer.

The TWT scheduling AP shall include a nonzero value for the TWT wake interval in the TWT Wake Interval Exponent and TWT Wake Interval Mantissa fields for a periodic TWT and a zero value for an aperiodic TWT. The TWT wake interval shall be a multiple of 1 TU.

The TWT parameters are valid for each successive TWT of a periodic TWT and for the only TWT of an aperiodic TWT.

The TWT scheduling AP shall include a unique value in the Broadcast TWT ID subfield for each Broadcast TWT to allow identification of each Broadcast TWT, unless the TWT Setup Command field is Alternate TWT or the Broadcast TWT ID subfield is zero.

NOTE 6—The broadcast TWT element contains two Broadcast TWT Parameter Set fields with the same Broadcast TWT ID subfield value if the TWT Setup Command field indicates Alternate TWT in one of the Broadcast TWT Parameter Set fields. The broadcast TWT element might contain multiple Broadcast TWT Parameter Set fields with the Broadcast TWT ID subfield equal to 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A TWT scheduling AP that receives a PS-Poll or a U-APSD trigger frame or any other indication from a TWT scheduled STA in PS mode, during or before a specific announced TWT SP but after the end of the most recent TWT SP preceding the specific TWT SP (if any), that the TWT scheduled STA is in the awake state during the TWT SP shall follow the rules defined in 11.2.3.6, except that the AP should deliver to the TWT scheduled STA as many buffered BUs as are available at the AP, provided that the BU delivery does not exceed the duration of the TWT SP, the TWT scheduled STA has indicated that it is in the awake state for that TWT SP, and the TWT scheduled STA has not entered the doze state (see 26.8.4.3 and 26.8.5).

NOTE 7—The indication that the TWT scheduled STA is in the awake state for that TWT SP might be a PS-Poll, U-APSD trigger frame, or any frame for which an immediate response is solicited and that follows the rules in 11.2.3.2 but the corresponding immediate response frame is not received by the TWT scheduled STA. Other indications that the STA is in the awake state are the transmission of an HE TB feedback NDP in response to an NFRP Trigger frame (see 26.5.7) or the transmission of a frame that indicates that the STA is in active mode (see 11.2.3.2).

A TWT scheduling AP that sends frames to a TWT scheduled STA that is in PS mode during an unannounced TWT SP shall follow the rules defined in 11.2.3.6, except that the AP should deliver to the TWT scheduled STA as many buffered BUs as available at the AP, provided that the BU delivery does not exceed the duration of the TWT SP and the TWT scheduled STA has not entered the doze state (see 26.8.4.3 and 26.8.5).

NOTE 8—The TWT scheduling AP can deliver the buffered BUs in A-MPDUs sent under a block ack agreement if the TWT is an announced TWT and the TWT scheduled STA is awake for that TWT SP or if the TWT is an unannounced TWT (at the start of which the TWT scheduled STA is assumed to already be awake). The buffered BUs can be delivered in multiple PPDUs transmitted within the TWT SP. The TWT scheduling AP can exceed the duration of the TWT SP if the TWT scheduled STA is in active mode.

A TWT scheduling AP may transmit to a TWT scheduled STA that is in active mode at any time (see 11.2.3.2). A TWT scheduling AP may transmit to a TWT scheduled STA that is in PS mode and awake outside of a TWT SP following the rules in 11.2.3.6.

A TWT scheduling AP that receives a TWT element with the TWT Request field equal to 1, the Negotiation Type subfield equal to 3, and the TWT Setup Command field set to Suggest or Demand may respond with a frame containing a TWT element as shown in Table 26-7 (in 26.8.3.3).

A TWT scheduling AP that receives a TWT element with the TWT Request field equal to 1, the Negotiation Type subfield equal to 3, and the TWT Setup Command field set to Reject shall delete the membership of the STA corresponding to the TA of the MMPDU that contained the TWT element from the broadcast TWT schedule that has the Broadcast TWT ID value that is equal to the value of the Broadcast TWT ID field of the TWT element.

A TWT scheduling AP may transmit a broadcast TWT announcement at any time. Valid broadcast TWT announcements are described in Table 26-6.

26.8.3.3 Rules for TWT scheduled STA

A TWT scheduled STA that receives a broadcast TWT element in a Beacon frame shall follow the rules defined in this subclause to interact with the TWT scheduling AP.

A TWT scheduled STA should not transmit frames to the TWT scheduling AP outside of broadcast TWT SPs and should not transmit frames that are not contained within HE TB PPDUs to the TWT scheduling AP within trigger-enabled broadcast TWT SPs, except that the STA can transmit frames within negotiated individual TWT SPs as defined in 26.8.2.

NOTE 1—The TWT scheduled STA decides which frames to transmit within or outside a TWT SP; and while it is recommended that the TWT scheduled STA not transmit using EDCA within or outside TWT SPs, the TWT scheduled

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

STA might still do so. If the STA decides to transmit, then the STA might contend for accessing the medium as defined in 10.23.2 and in 26.2.7.

A TWT scheduled STA may request to become a member of a broadcast TWT by transmitting a frame to its associated AP that contains a TWT element with the Negotiation Type subfield set to 3 and the TWT Setup Command field set to Request TWT, Suggest TWT, or Demand TWT. The TWT Parameter set indicates the Broadcast TWT ID of the broadcast TWT that the STA is requesting to join. See Table 26-7.

A TWT scheduled STA may terminate membership in a broadcast TWT by transmitting a frame to its associated AP that contains a TWT element with the Negotiation Type subfield set to 3 and the TWT Setup Command field set to Reject TWT or by transmitting a TWT Teardown frame that has the Negotiation Type subfield set to 3. A TWT scheduled STA may terminate membership in all broadcast TWTs by transmitting a TWT Teardown frame with the Teardown All TWT field set to 1.

A TWT scheduled STA that receives a TWT element with the TWT Request field equal to 0, the Negotiation Type subfield equal to 3, and the TWT Setup Command field indicating Accept TWT is a member of the broadcast TWT identified by the <broadcast TWT ID, MAC address> tuple, where the broadcast TWT ID is the value of the Broadcast TWT ID subfield in the TWT element and the MAC address that is the TA of the MMPDU that contained the TWT element is equal to the MAC address of the AP with which the STA is associated, regardless of whether the TWT scheduled STA had previously transmitted a corresponding TWT element to the AP with the TWT Setup Command field indicating Request TWT, Suggest TWT, or Demand TWT.

Valid broadcast TWT membership exchanges are described in Table 26-7.

Table 26-7—Broadcast TWT membership exchanges

TWT Setup Command field in an initiating frame	TWT Setup Command field in a response frame	Condition after the completion of the exchange
Demand TWT	Accept TWT	A broadcast TWT schedule exists or has been created with the TWT parameters indicated in the initiating frame and repeated in the response frame. The TWT scheduled STA transmitting the initiating frame is a member of the Broadcast TWT schedule identified by the Broadcast TWT ID and the TA of the response frame.
Request TWT or Suggest TWT	Accept TWT	A broadcast TWT schedule exists or has been created with the TWT parameters indicated in the response frame. The TWT scheduled STA transmitting the initiating frame is a member of the broadcast TWT schedule identified by the broadcast TWT ID and the TA of the response frame.
Suggest TWT or Demand TWT	Alternate TWT	No new broadcast TWT schedule has been created with the TWT parameters indicated in the initiating frame. The TWT scheduling AP is offering an alternative set of parameters to those indicated in the initiating frame as a means of negotiating TWT parameters with the TWT scheduled STA. The TWT scheduled STA can send a new request with any set of TWT parameters, and the TWT scheduling AP might create a new broadcast TWT schedule using the parameters indicated in the response frame.

Table 26-7—Broadcast TWT membership exchanges *(continued)*

TWT Setup Command field in an initiating frame	TWT Setup Command field in a response frame	Condition after the completion of the exchange
Suggest TWT or Demand TWT	Dictate TWT	A broadcast TWT schedule either is created or already exists and is using the TWT parameters identified in the response frame, including a broadcast TWT ID. The TWT scheduling AP will not create any new broadcast TWT schedule with the TWT scheduled STA at this time. The TWT scheduled STA transmitting the initiating frame is not a member of the broadcast TWT schedule identified by the broadcast TWT ID and the TA of the response frame. The TWT scheduled STA can send a new request, but will receive an Accept TWT only if it uses the dictated TWT parameters.
Request TWT, Suggest TWT, or Demand TWT	Reject TWT	The TWT scheduled STA transmitting the initiating frame is a not a member of a broadcast TWT identified by the broadcast TWT ID and the TA of the response frame, if such a broadcast TWT exists. The TWT scheduling AP will not accept any new request from the TWT scheduled STA to join or create a broadcast TWT at this time.
Accept TWT	No frame transmitted	Not permitted to be transmitted by a TWT scheduled STA. When transmitted by a TWT scheduling AP, the recipient STA's membership in the broadcast TWT schedule identified by the broadcast TWT ID and the TA of the initiating frame is established.
Alternate TWT or Dictate TWT	No frame transmitted	Not permitted to be transmitted by a TWT scheduled STA. When transmitted by a TWT scheduling AP, the TWT scheduled STA receiving this frame is not, through the receipt of this frame, a member of the broadcast TWT identified by the initiating frame. The TWT scheduled STA can use the information provided to create a request to join a TWT in a subsequent initiating frame that it transmits.

Table 26-7—Broadcast TWT membership exchanges *(continued)*

TWT Setup Command field in an initiating frame	TWT Setup Command field in a response frame	Condition after the completion of the exchange
Reject TWT	No frame transmitted	When transmitted by a TWT scheduled STA, the transmitting STA's membership in the broadcast TWT schedule identified by the broadcast TWT ID and the RA of the initiating frame is terminated. When transmitted by a TWT scheduling AP, the receiving STA's membership in the broadcast TWT schedule identified by the broadcast TWT ID and the TA of the initiating frame is terminated.

NOTE 1—The Negotiation Type subfield of the TWT element contained in these frames is 3.

NOTE 2—The initiating frame and response frame settings not listed in the tables in 10.46 or 26.8 are not allowed. The initiating frame is a TWT request if the TWT element contained in the frame has the TWT Request field equal to 1 (see Table 9-347); otherwise, it is a TWT response. The response frame is a TWT response.

NOTE 3—In addition to these exchanges, the TWT scheduling AP might respond to an initiating frame that solicits membership in a broadcast TWT schedule with an indication or solicitation of the establishment of an individual TWT agreement.

NOTE 4—MMPDUs that contain a broadcast TWT element generated by a TWT scheduled STA can be (Re)Association Request frames and can be TWT Setup frames with TWT Request field equal to 1. The TWT element has the Negotiation Type subfield equal to 3 and the Broadcast TWT ID(s) that the STA intends to join or withdraw. MMPDUs that contain a broadcast TWT element generated by a TWT scheduled AP can be (Re)Association Response frames and can be TWT Setup frames with TWT Request field equal to 0. The TWT element has the Negotiation Type subfield equal to 3 and the Broadcast TWT ID(s) to which the STA is assigned or from which the STA is withdrawn.

A TWT scheduled STA that is in PS mode may enter the doze state after receiving a Beacon frame with a TWT element indicating the existence of a broadcast TWT and shall be in the awake state at specific broadcast TWT start times for which the STA has indicated it will be awake by any of the following means:

— Establishing a membership for the unannounced broadcast TWT with the applicable broadcast TWT IDs, in which case the specific broadcast TWTs are the unannounced broadcast TWTs.
— Negotiating a wake TBTT and wake interval between Beacon frames that the STA receives, as defined in 26.8.6, in which case the specific broadcast TWTs are those that occur during the beacon interval, and the Beacon frame that is sent at the start of that beacon interval and that had the TIM bit corresponding to that STA equal to 1.
— Having sent a PS-Poll or U-APSD trigger frame during the beacon interval, in which case the specific broadcast TWT is the first broadcast TWT that occurs during that beacon interval and either during or after sending that frame.
— Having sent another indication that it is in the awake state during that beacon interval, in which case the specific broadcast TWT is the first broadcast TWT that occurs during that beacon interval and either during or after sending that indication.

NOTE 2—Other indications that the STA is in the awake state are the transmission of an HE TB feedback NDP in response to an NFRP Trigger frame (see 26.5.7) or the transmission of a frame that indicates that the STA is in active mode (see 11.2.3.2).

NOTE 3—The STA might indicate that it will not be awake at certain broadcast TWT start times by sending a TWT Information frame. The AP might indicate to a STA that it need not be awake at certain broadcast TWT start times by sending a TWT information frame (see 26.8.4).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A TWT scheduled STA is not required to be in the awake state at broadcast TWT SP start times corresponding to the broadcast TWT that has the broadcast TWT ID value of 0.

A TWT scheduled STA that did not receive a Beacon frame at a TBTT shall act as if it had received the expected Beacon frame containing a TWT element for a broadcast TWT if the missed beacon corresponds to a TBTT that is within the next *n* TBTTs beyond the most recently received Beacon frame that included a TWT element for that broadcast TWT, where *n* is equal to 1 plus the value obtained from the Broadcast TWT Persistence subfield of the corresponding Broadcast TWT, except that *n* is infinite if the Broadcast TWT Persistence subfield is 255.

A TWT scheduled STA transmits an HE TB PPDU as a response to a Trigger frame that is addressed to it and is sent during a trigger-enabled TWT SP (see 26.5.2). A TWT scheduled STA that is in PS mode and is awake during an announced TWT SP shall include a PS-Poll frame or a U-APSD trigger frame in the HE TB PPDU if it intends to solicit buffered BUs from the TWT scheduling AP (see 11.2.3.7), unless the STA has already transmitted within that TWT SP a PS-Poll or U-APSD trigger frame, or has transmitted any other indication that the STA is in the awake state within that TWT SP, or has, previous to the start of the TWT SP but after the end of the most recent TWT SP, indicated to the AP that it is currently in the awake state. A TWT scheduled STA that is in PS mode shall transition to the awake state at the start of an unannounced TWT SP of which it is a member. The STA may include other frames in the HE TB PPDU when other rules do not prohibit their inclusion (see 26.5.2 and 9.7.3).

NOTE 4—A TWT scheduling AP sets the bit in the TIM element of the Beacon frame that corresponds to the AID of the TWT scheduled STA to 1 to indicate that it expects the TWT scheduled STA to solicit available buffered BUs (see 11.2.3.7).

NOTE 5—Other indications that the STA is in the awake state are the transmission of an HE TB feedback NDP in response to an NFRP Trigger frame (see 26.5.7) or the transmission of a frame that indicates that the STA is in active mode (see 11.2.3.2).

A TWT scheduled STA should not send frames that do not satisfy the Broadcast TWT Recommendation subfield recommendations in Table 9-348 during the corresponding TWT SP(s). Frames sent as a response to a Trigger frame are subject to further restrictions as defined in 26.5.2 and 9.7.3.

26.8.4 Use of TWT Information frames

26.8.4.1 General

An HE STA may transmit a TWT Information frame to its peer STA during an individual TWT agreement, during broadcast TWT schedule, or at any time as defined in 26.8.4.2, 26.8.4.3, and 26.8.4.4, respectively.

NOTE 1—An HE AP might include multiple TWT Information frames, each addressed to a different peer STA, in an HE MU PPDU (see 26.5.1).

The TWT Information frame shall have the Response Requested subfield equal to 0, the Next TWT Request subfield equal to 0, and one of the following:

- The Next TWT subfield that is equal to a nonzero value if the frame is transmitted by a TWT responding STA, by a TWT scheduling AP, or by any HE STA to a peer STA that has set the Flexible TWT Schedule Support field to 1 in the HE Capabilities element it transmits.
  - The value of the Next TWT subfield shall be selected from the future target wake times of an individual TWT agreement if the Flexible TWT Schedule Support field in the HE Capabilities element received from the peer STA is 0 and shall be selected from the future target wake times of a broadcast TWT schedule regardless of the value of the Flexible TWT Schedule Support field received from the peer STA.
  - The Next TWT subfield may contain any nonzero value if the Flexible TWT Schedule Support field in the HE Capabilities element received from the peer STA is 1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

  - The All TWT subfield is 1 if the resumption applies to all broadcast TWT schedules followed by the TWT scheduled STA and/or to all individual TWT agreements followed by the TWT responding STA.
- A Next TWT subfield that is present if the frame is transmitted by a TWT requesting STA, by a TWT scheduled STA, or by any HE STA to a peer STA that has set the Flexible TWT Schedule Support field to 1 in the HE Capabilities element it transmits.
  - The Next TWT subfield indicates the earliest TWT at which the individual TWT agreement or broadcast TWT schedule is resumed and shall be selected from the future target wake times of that TWT agreement or broadcast TWT schedule if the Flexible TWT Schedule Support field in the HE Capabilities element received from the peer STA is 0.
  - The All TWT subfield is 1 if the resumption applies to all broadcast TWT schedules followed by the TWT scheduled STA and/or to all individual TWT agreements followed by the TWT requesting STA.
  - The Next TWT subfield may contain any nonzero value if Flexible TWT Schedule Support field in the HE Capabilities element received from the peer STA is 1.
- A Next TWT subfield that is not present if the frame is transmitted by a TWT requesting STA or a TWT scheduled STA to indicate suspension of the individual TWT agreement or broadcast TWT schedule.
  - The All TWT subfield is 1 if the suspension applies to all broadcast TWT schedules followed by the TWT scheduled STA and/or to all individual TWT agreements followed by the TWT requesting STA.

NOTE 2—Information exchanged with TWT Information frames does not modify the TWT parameters of any existing TWT session, except if the TWT Information frame is sent under flexible TWT (see 26.8.4.4).

The use of TWT Information frames for suspending and/or resuming existing individual TWT agreements is described in 26.8.4.2. The use of TWT Information frames for suspending and/or resuming existing broadcast TWT schedules is described in 26.8.4.3. The use of TWT Information frames for providing a flexible TWT that is independent of any existing TWT agreements or TWT schedules is described in 26.8.4.4.

26.8.4.2 TWT Information frame exchange for individual TWT

An HE STA that has an individual TWT agreement may transmit a TWT Information frame to a peer STA with which it has the agreement if the peer STA has set the TWT Information Frame Disabled field to 0 in the TWT element sent during TWT setup; otherwise, the HE STA shall not transmit a TWT Information frame to the peer STA. The HE STA sets the fields of the TWT Information frame as defined in 26.8.4.1.

A TWT requesting STA that receives a TWT Information frame containing a Next TWT subfield follows the rules in 10.46.4 and the rules below in this subclause.

A TWT requesting STA that receives an acknowledgment in response to a TWT Information frame transmitted by the STA that does not contain a Next TWT subfield shall consider the corresponding TWT agreement suspended until the TWT session is resumed. A TWT requesting STA that receives an acknowledgment in response to a TWT Information frame transmitted by the STA that does contain a Next TWT subfield shall consider the corresponding TWT agreement suspended and shall resume the TWT agreement starting from the value indicated in the Next TWT subfield of the transmitted TWT Information frame. A TWT requesting STA that receives an acknowledgment in response to a TWT Information frame transmitted by the STA assumes that any other individual TWT agreements and broadcast TWT schedules (see 26.8.3) are not affected by the transmission of this TWT Information frame, except when the All TWT subfield of the TWT Information frame is equal to 1. Other default PS procedures are not affected by the transmission of this TWT Information frame (see 11.2).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—The TWT Flow Identifier, together with the MAC addresses of the TWT requesting STA and TWT responding STA, identifies the TWT agreement for which the TWT Information frame is sent (see 10.46.1).

If the TWT Information frame contains an All TWT subfield equal to 1, then the above rules apply to all individual TWT agreements, except that the resumptions of the respective TWTs shall occur at the first TWT of the respective TWT agreement that occurs not earlier than the Next TWT value contained in the TWT Information frame, regardless of the value of the Flexible TWT Schedule Support field in the HE Capabilities element exchanged between the two STAs.

A TWT requesting STA that is in PS mode and that transmits a TWT Information frame to a TWT responding STA shall suspend the corresponding TWT agreement and may transition to doze state after receiving the acknowledgment even if it has previously transmitted a PS-Poll or U-APSD trigger frame and has not yet received the expected frames from the AP in response. The STA shall resume TWT operation for the corresponding TWT agreement at the specified TWT indicated (if any) in the TWT Information frame. A TWT requesting STA that is in PS mode and that receives a TWT Information frame from a TWT responding STA shall suspend the TWT agreement and may go to doze state after transmitting the acknowledgment even if it has previously transmitted a PS-Poll or U-APSD trigger frame and has not yet received the expected frames from the TWT responding STA in response. The STA shall resume TWT operation for the corresponding TWT agreement at the specified TWT indicated (if any) in the TWT Information frame.

26.8.4.3 TWT Information frame exchange for broadcast TWT

An HE STA that is a TWT scheduling AP may transmit a TWT Information frame to any of the members of a broadcast TWT schedule if the member has set the TWT Information Frame Disabled field to 0 in the TWT element sent when joining the broadcast TWT schedule. An HE STA that is a TWT scheduled STA may transmit a TWT Information frame to the TWT scheduling AP corresponding to a broadcast TWT schedule established by that STA if the AP has set the TWT Information Frame Disabled field to 0 in the broadcast TWT element it transmits. The HE STA sets the fields of the TWT Information frame as defined in 26.8.4.1.

A TWT scheduled STA that receives a TWT Information frame that contains an All TWT subfield equal to 1 follows the rules defined in 26.8.3.3, except that the TWT scheduled STA shall consider all the broadcast TWT schedules as suspended and shall resume each broadcast TWT schedule at the first TWT that occurs not earlier than the Next TWT subfield value contained in the received TWT Information frame.

A TWT scheduled STA that receives an acknowledgment in response to a TWT Information frame transmitted by the STA that contains an All TWT subfield equal to 1 and that does not contain a Next TWT subfield shall consider all broadcast TWT schedules suspended and can follow the default PS procedure defined in 11.2 until the broadcast TWT schedules are resumed.

A TWT scheduled STA that receives an acknowledgment in response to a TWT Information frame transmitted by the STA that contains an All TWT subfield equal to 1 and contains a Next TWT subfield shall suspend all broadcast TWT schedules and shall resume the broadcast TWT schedules at the first scheduled TWT for each respective broadcast TWT schedule that occurs not earlier than the value indicated in the Next TWT subfield contained in the transmitted TWT Information frame, regardless of the values of the Flexible TWT Schedule Support field in the HE Capabilities element exchanged between the two STAs.

NOTE—TWT suspension and resumption as indicated by a TWT Information frame with the All TWT subfield equal to 1 applies to all broadcast TWT schedules of the TWT scheduling AP.

A TWT scheduled STA that is in PS mode and that transmits a TWT Information frame to a TWT scheduling AP shall suspend the corresponding broadcast TWT schedule and may transition to doze state after receiving the acknowledgment, even if it has previously transmitted a PS-Poll or U-APSD trigger

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

frame and has not yet received the expected frames from the TWT scheduling AP in response. The STA shall resume TWT operation for the corresponding broadcast TWT schedule at the specified TWT indicated (if any) in the TWT Information frame. A TWT scheduled STA that is in PS mode and that receives a TWT Information frame from a TWT scheduling AP shall suspend the corresponding broadcast TWT schedule and may transition to doze state after transmitting the acknowledgment, even if it has previously transmitted a PS-Poll or U-APSD trigger frame and has not yet received the expected frames from the TWT scheduling AP in response. The STA shall resume TWT operation for the corresponding broadcast TWT schedule at the specified TWT indicated (if any) in the TWT Information frame.

26.8.4.4 TWT Information frame exchange for flexible wake time

An HE STA may transmit a TWT Information frame that contains a flexible TWT to a peer STA if the peer STA has set the Flexible TWT Schedule Support field in the HE Capabilities it transmits to 1; otherwise, the HE STA shall not transmit a TWT Information frame that contains a flexible TWT to the peer STA.

A flexible TWT is a nonzero value indicated in the Next TWT subfield of a TWT Information frame with All TWT subfield equal to 0, and the value is independent from any existing TWT values of TWT agreements that the HE STA might be following (if any). The HE STA sets the fields of the transmitted TWT Information frame as defined in 26.8.4.1.

NOTE 1—Flexible TWT support does not depend on the STA's TWT capabilities, i.e., the STA can use flexible TWT without being required to set up an individual TWT agreement or broadcast TWT schedule.

An HE STA that receives an acknowledgment for a TWT Information frame with flexible TWT that contains a TWT Flow Identifier field that identifies an existing individual TWT agreement shall replace the next TWT SP start time for that TWT agreement with the value contained in the Next TWT subfield of the TWT Information frame.

An HE STA that receives a TWT Information frame with flexible TWT that contains a TWT Flow Identifier field that identifies an existing individual TWT agreement shall replace the next TWT SP start time for that TWT agreement with the value contained in the Next TWT subfield of the TWT Information frame.

A non-AP HE STA that receives an acknowledgment for a TWT Information frame with flexible TWT that contains a TWT Flow Identifier field that does not identify any existing individual TWT agreement will use the same PM mode that the STA has at time *t1*, which is the time the acknowledgment for the TWT Information frame was received, at time *t2*, which is the time indicated in the Next TWT subfield of the TWT Information frame as described below in this subclause.

A non-AP HE STA that receives a TWT Information frame with flexible TWT that contains a TWT Flow Identifier field that does not identify any existing individual TWT agreement preserves the PM mode from the time the acknowledgment of the TWT Information frame was transmitted to the time indicated in the Next TWT subfield of the TWT Information frame as described below in this subclause.

NOTE 2—If the TWT Information frame has the All TWT field equal to 1, then the TWTs are suspended and resumed as described in 26.8.4.2 and 26.8.4.3.

A non-AP HE STA that transmits a TWT Information frame with flexible TWT to a peer STA

- May go to doze state after receiving the acknowledgment sent in response to the TWT Information frame if it is in PS mode (i.e., the PM subfield of the Frame Control field of the TWT Information frame is 1).
- May be unavailable if it is in active mode (i.e., the PM subfield of the Frame Control field of the TWT Information frame is 0).
- Shall be in the awake state at the time indicated in the Next TWT subfield of the TWT Information frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Shall be in the PS mode if the PM subfield of the TWT Information frame was 1 and in active mode if the PM subfield of the TWT Information frame was 0.

The STA, once in the awake state, shall follow the rules that correspond to the power management mode of the STA, which are defined in 11.2.3 for the active and PS modes and in 26.8 when the STA operates within TWT SPs.

NOTE 3—An HE AP delivers DL BUs to the STA at or after the flexible TWT indicated in the flexible TWT by following the rules in 11.2.3.6 if the STA does not follow TWT and by following the rules in 26.8 if the STA follows TWT and the delivery falls within a TWT SP. The STA is not required to send a frame at or after the flexible TWT to indicate its awake state to the AP. If the STA is following U-APSD, then the operation is resumed at a time that occurs at the flexible TWT; and if the STA is following an APSD schedule, then the operation is resumed at a time that occurs at or after the flexible TWT.

A non-AP HE STA that receives a TWT Information frame with flexible TWT from a peer STA

— May go to doze state after transmitting the acknowledgment if it is in PS mode.
— May be unavailable if it is in active mode.
— Shall be in the awake state at the time it indicated in the Next TWT subfield of the TWT Information frame.
— Shall be in the PS mode if the STA was in PS mode when it received the TWT Information frame and in active mode if the STA was in active mode when it received the TWT Information frame.

The STA, once in the awake state, shall follow the rules that correspond to the power management mode of the STA, which are defined in 11.2.3 for the active and PS modes and in 26.8 when the STA operates within TWT SPs.

26.8.5 Power save operation during TWT SPs

The following rules apply to TWT SPs for both broadcast TWT schedules and individual TWT agreements where the TWT SP of a broadcast TWT is uniquely identified by the <broadcast TWT ID, MAC address of TWT scheduling AP> tuple and the TWT SP of an individual TWT is uniquely identified by the <TWT flow identifier, MAC address of TWT requesting STA, MAC address of TWT responding STA> triple.

A TWT requesting STA or a TWT scheduled STA that is not in PS mode and that transmits a frame with the Power Management subfield set to 1 during a TWT SP shall remain in the awake state until the AdjustedMinimumTWTWakeDuration time has elapsed from the TWT SP start time or until a TWT SP termination event is detected, whichever occurs first for that particular TWT SP.

A TWT requesting STA or a TWT scheduled STA in PS mode that is in the awake state for a TWT SP may transition to the doze state after AdjustedMinimumTWTWakeDuration time has elapsed from the TWT SP start time even if it has previously transmitted a PS-Poll frame or U-APSD trigger frame and has not yet received the expected frames from the AP in response. For a trigger-enabled TWT SP, if the AdjustedMinimumTWTWakeDuration time has elapsed from the scheduled TWT SP start time and no Trigger frames are received by the STA, the HE STA may enter doze state if no other condition requires the STA to remain awake.

When a TWT SP termination event is detected within a TWT SP by a STA in PS mode that is participating in the TWT SP, the STA may transition to the doze state without waiting for the expiration of the AdjustedMinimumTWTWakeDuration time as described in 10.46.1, even if it has previously transmitted a PS-Poll frame or U-APSD trigger frame and has not yet received the expected frames from the AP in response.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A TWT requesting STA or a TWT scheduled STA shall classify any of the following events as a TWT SP termination event:

a) The transmission by the TWT requesting STA of an acknowledgment in response to an individually addressed QoS Data or QoS Null frame sent by the TWT responding STA that had the EOSP subfield equal to 1.

b) The transmission by the TWT scheduled STA of an acknowledgment in response to an individually addressed QoS Data or QoS Null frame sent by the TWT scheduling AP that had the EOSP subfield equal to 1.

c) The transmission by the TWT requesting STA of an acknowledgment in response to an individually addressed frame that is neither a QoS Data frame nor a QoS Null frame, but that was sent by the TWT responding STA with the More Data field equal to 0.

d) The transmission by the TWT scheduled STA of an acknowledgment in response to an individually addressed frame that is neither a QoS Data frame nor a QoS Null frame, but that was sent by the TWT scheduling AP with the More Data field equal to 0.

e) The reception of an individually addressed or broadcast QoS Data or QoS Null frame sent by the TWT responding STA or TWT scheduling AP that does not solicit an immediate response and had the EOSP subfield equal to 1.

f) The reception of an individually addressed frame that is neither a QoS Data frame nor a QoS Null frame, but that was sent by the TWT responding STA or TWT scheduling AP, does not solicit an immediate response, and had the More Data field equal to 0.

g) The reception of a Trigger frame sent by the TWT responding STA or TWT scheduling AP that has the More TF field equal to 0 and is not addressed to the TWT requesting STA or TWT scheduled STA, provided that the TWT requesting STA or TWT scheduled STA either is awake for an announced trigger-enabled TWT SP but did not transmit an indication that it is in the awake state to the TWT responding STA or TWT scheduling AP or is awake for an unannounced trigger-enabled TWT SP.

h) The transmission or reception by the TWT requesting STA of the acknowledgment for a TWT Information frame that satisfies specific conditions in 26.8.4.2 and 26.8.4.4.

i) The transmission or reception by the TWT scheduled STA of the acknowledgment for a TWT Information frame that satisfies specific conditions in 26.8.4.3 and 26.8.4.4.

The classification of a More Data field equal to 0 in an Ack, BlockAck, or individually addressed Multi-STA BlockAck frame as an event that terminates a TWT SP is possible only when both STAs have indicated support of transmitting or receiving the frame with a nonzero More Data subfield, which is indicated in the More Data Ack subfield of the QoS Info field of frames they transmit (see 11.2.3).

NOTE 1—A STA participating in multiple TWT SPs that overlap in time stays in the awake state until the latest AdjustedMinimumTWTWakeDuration time of all of the TWT SPs expires, except that a TWT SP termination event causes all of the overlapping TWT SPs to terminate.

NOTE 2—A Trigger frame is addressed to the STA if the Trigger frame contains the AID of the STA in one of its User Info fields (see 26.5.2) and has in its TA field either the MAC address of its associated AP or the transmitted BSSID (see 26.5.2.2.4). Otherwise, the Trigger frame is not addressed to the STA. If the Trigger frame contains one or more RA-RUs for which the STA can gain access according to 26.5.4, then the STA can follow the rules defined in 26.14.2 to determine an early TWT SP termination event.

26.8.6 Negotiation of wake TBTT and wake interval

A TBTT scheduled STA that intends to operate in power save mode (see 11.2.3.2) may transmit a TWT request to the TBTT scheduling AP that identifies the wake TBTT of the first Beacon frame and the wake interval between subsequent Beacon frames it intends to receive. The TWT request shall contain the following:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The Negotiation Type subfield equal to 1 and the TWT Setup Command field equal to Suggest TWT or Demand TWT.
— The requested first wake TBTT in the Target Wake Time field.
— The requested wake interval between consecutive TBTTs in the TWT Wake Interval Mantissa and TWT Wake Interval Exponent fields.
— The requested TBTT wake duration in the Nominal Minimum TWT Wake Duration field.
— All other fields in the TWT element reserved.

A TBTT scheduling AP that receives a TWT request from a STA whose value of the Negotiation Type subfield is 1 shall respond with a TWT response that contains Accept TWT, Alternate TWT, or Reject TWT in the TWT Setup Command field. For an Accept TWT, it shall also contain the following:

— The Negotiation Type subfield equal to 1.
— The allocated first wake TBTT in the Target Wake Time field.
— The allocated wake interval between consecutive TBTTs in the TWT Wake Interval Mantissa and TWT Wake Interval Exponent fields.
— The allocated TBTT wake duration in the Nominal Minimum TWT Wake Duration field.
— All other fields in the TWT element reserved.

After successfully completing the negotiation, the TBTT scheduled STA may go to doze state until its TSF matches the next negotiated wake TBTT, provided that the STA is in power save mode and no other condition requires the STA to remain awake. The TBTT scheduled STA shall be in the awake state to listen to Beacon frames transmitted at negotiated wake TBTTs and shall operate as described in 26.8.3.3.

If the TBTT scheduled STA receives a Beacon frame from the TBTT scheduling AP at or after TBTT, the TBTT scheduled STA may go to doze state until the next wake TBTT if no other condition requires the STA to remain awake. The TBTT scheduled STA may go to doze state after a nominal minimum TBTT wake duration time has elapsed from the TBTT start time if no other condition requires the STA to remain awake.

Either STA that is a party to an established wake TBTT agreement can tear down the wake TBTT agreement by following the teardown procedure described in 10.47.8 and by setting the Negotiation Type subfield to 1 in the TWT Teardown frame.

Table 26-8 summarizes the interactions between devices that negotiate a Wake TBTT agreement.

26.8.7 HE subchannel selective transmission

26.8.7.1 General

An HE STA that supports HE subchannel selective transmission (SST) operation shall set dot11HESubchannelSelectiveTransmissionImplemented to true and shall set the HE Subchannel Selective Transmission Support field in the HE Capabilities element it transmits to 1. An HE STA that does not support HE SST operation shall set the HE Subchannel Selective Transmission Support field in the HE Capabilities element it transmits to 0.

A non-AP HE STA with dot11HESubchannelSelectiveTransmissionImplemented equal to true is a HE SST non-AP STA.

An HE AP with dot11HESubchannelSelectiveTransmissionImplemented equal to true is an HE SST AP.

An HE SST non-AP STA and an HE SST AP may set up SST operation by negotiating a trigger-enabled TWT as defined in 26.8.2 with the following exceptions:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 26-8—Wake TBTT negotiation exchanges

TWT Setup Command field in an initiating frame	TWT Setup Command field in a response frame	Condition after the completion of the exchange
Request TWT	Accept TWT, Alternate TWT, Dictate TWT, Reject TWT, or no response	This exchange is not allowed.
Demand TWT or Suggest TWT	Accept TWT	A Wake TBTT agreement has been created with the Wake TBTT parameters indicated in the initiating frame.
Demand TWT or Suggest TWT	Reject TWT	No Wake TBTT agreement has been created.
Demand TWT or Suggest TWT	Alternate TWT	No Wake TBTT agreement has been created. The TBTT scheduling AP is offering an alternative set of parameters to those indicated in the initiating frame. The TBTT scheduled STA can send a new request with any set of Wake TBTT parameters, and the responder might create a Wake TBTT agreement using those parameters. The TBTT scheduled STA is unlikely to send a new request if the TWT Setup Command is Demand TWT and is very likely to send a new request if the TWT Setup Command is Suggest TWT.
NOTE 1—The Negotiation Type subfield of the TWT element contained in these frames is equal to 1. NOTE 2—The initiating frame and response frame settings not listed in the tables in 10.46 or 26.8 are not allowed. The initiating frame is a TWT request, and the response frame is a TWT response.		

— The TWT request may have a TWT Channel field with up to one bit set to 1 to indicate the secondary channel requested to contain the RU allocations addressed to the HE SST non-AP STA that is a 20 MHz operating STA.
— The TWT request may have a TWT Channel field with all 4 LSBs or all 4 MSBs set to 1 to indicate whether the primary 80 MHz channel or the secondary 80 MHz channel is requested to contain the RU allocations addressed to the HE SST non-AP STA that is an 80 MHz operating STA.
— The TWT response shall have a TWT Channel field with up to one bit set to 1 to indicate the secondary channel that will contain the RU allocations addressed to the HE SST non-AP STA that is a 20 MHz operating STA.
— The TWT response shall have a TWT Channel field with all 4 LSBs or all 4 MSBs set to 1 to indicate whether the primary 80 MHz channel or the secondary 80 MHz channel will contain the RU allocations addressed to the HE SST non-AP STA that is a 80 MHz operating STA.

26.8.7.2 SST operation

An HE SST non-AP STA and HE SST AP that successfully set up SST operation shall follow the rules defined in this subclause.

If an HE SST AP causes its operating channel or channel width to change and if any secondary channel of a trigger-enabled TWT is not within the new operating channel or channel width, then the HE SST AP and the HE SST non-AP STA implicitly terminate the trigger-enabled TWT.

The HE SST AP follows the rules in 26.8.2 to exchange frames with the HE SST non-AP STA during trigger-enabled TWT SPs, except that the AP shall ensure the following:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The individually addressed RUs allocated in DL MU PPDUs and in Trigger frames addressed to the HE SST non-AP STA are within the subchannel indicated in the TWT Channel field of the TWT response and follow the RU restriction rules defined in 27.3.2.8 if the HE SST non-AP STA is a 20 MHz operating STA and in 27.3.2.9 if the HE SST non-AP STA is an 80 MHz operating STA.
— The TXVECTOR parameter CH_BANDWIDTH of a DL MU PPDU is not set to HE-CBW-PUNC160-PRI20, HE-CBW-PUNC80+80-PRI20, HE-CBW-PUNC160-SEC40, or HE-CBW-PUNC80+80-SEC40 if the DL MU PPDU is addressed to at least one HE SST non-AP STA that is an 80 MHz operating STA operating in a secondary channel.
— The trigger-enabled TWT SPs do not overlap with TBTTs at which DTIM beacons are sent.
— The same subchannel is used for all trigger-enabled TWT SPs with the same HE SST non-AP STA that overlap in time.

An HE SST non-AP STA operating on the secondary channel shall not conduct OMI operation as defined in 26.9 or operating mode notification operation as defined in 11.40 to change the operating bandwidth.

The HE SST non-AP STA follows the rules in 26.8.2 to exchange frames with the HE SST AP during trigger-enabled TWT SPs, except that the STA

— Shall be available in the subchannel indicated in the TWT Channel field of the TWT response at TWT start times.
— Shall not access the medium in the subchannel using DCF or EDCAF.
— Shall not respond to Trigger frames addressed to it (see 26.5 and 26.8.2), unless it has performed CCA until a frame is detected by which it can set its NAV, or until a period equal to NAVSyncDelay has transpired, whichever is earlier.
— Shall update its NAV according to 26.2.4 if it receives a PPDU in the subchannel.

An HE SST non-AP STA may include a Channel Switch Timing element in (Re)Association Request frames it transmits to an HE SST AP to indicate the time required by the STA to switch between different subchannels. The received channel switch time informs the HE SST AP of the duration of time that the HE SST non-AP STA might not be available to receive frames before the TWT start time and after the end of the trigger-enabled TWT SP.

NOTE—An HE SST STA in PS mode is not required to move to the primary channel after the end of the trigger-enabled TWT SP.

26.9 Operating mode indication

26.9.1 General

OMI is a procedure used between an OMI initiator and an OMI responder. An HE STA that transmits a frame including an OM Control subfield is defined as an OMI initiator. An HE STA with dot11OMIOptionImplemented equal to true that receives a frame including an OM Control subfield is defined as an OMI responder.

An HE STA with dot11OMIOptionImplemented equal to true shall set the OM Control Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element it transmits to 1; otherwise, the HE STA shall set the OM Control Support subfield to 0. An HE AP shall set dot11OMIOptionImplemented to true, and the HE AP shall implement the reception of the OM Control subfield.

An OMI initiator may send to an OMI responder an individually addressed QoS Data, QoS Null, or Class 3 Management frame after association that contains the OM Control subfield and that solicits an immediate acknowledgment to indicate a change in its receive operating mode (ROM) as defined in 26.9.2 and/or transmit operating parameters (TOM) as defined in 26.9.3. An OMI responder implements the reception of

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

an individually addressed QoS Data, QoS Null, or Class 3 Management frame that contains the OM Control subfield that indicates a change in ROM and/or TOM parameters.

The OMI initiator shall indicate a change in its ROM parameters by including the OM Control subfield in a QoS Data, QoS Null, or Class 3 Management frame that solicits acknowledgment and is addressed to the OMI responder as defined in 26.9.2.

NOTE 1—Frames that solicit an immediate acknowledgment are, for example, QoS Null frames and QoS Data frames with Normal Ack or Implicit BAR ack policy and Action frames.

An HE STA can change its operating mode setting using either the operating mode notification as described in 11.40 or the operating mode indication (OMI) procedure described in this subclause. An HE STA should not transmit an OM Control subfield and an Operating Mode field in the same PPDU. If a STA transmits both an OM Control subfield and Operating Mode field in the same PPDU, then the OMI responder shall use the channel width and the maximum number of spatial streams indicated by the most recently received OM Control subfield or Operating Mode field from the OMI initiator.

NOTE 2—An OM Control field is transmitted before an Operating Mode field in the same frame.

The OMI initiator supports receiving PPDUs with a bandwidth up to the value indicated by the Channel Width subfield and with a number of spatial streams, *Nss*, as indicated in the Rx NSS subfield of the OM Control subfield and calculated in Equation (26-4).

If the operating channel width of the STA is greater than 80 MHz, then the maximum number of spatial streams that the STA supports in reception for a given HE-MCS as a function of the received HE PPDU bandwidth *BW* at an HE STA transmitting an OM Control subfield is defined in Equation (26-4).

$$\text{Floor}\,(Rx\text{-}NSS\text{-}from\text{-}OMI \times (Max\text{-}HE\text{-}NSS\text{-}at\text{-}BW \,/\, Max\text{-}HE\text{-}NSS\text{-}at\text{-}80)) \quad (26\text{-}4)$$

where

Rx-NSS-from-OMI	is Rx NSS from the OM Control subfield transmitted by the STA
Max-HE-NSS-at-BW	is the maximum NSS among all HE-MCS at *BW* MHz from the Supported HE-MCS And NSS Set field transmitted by the STA as described in 26.15.4
Max-HE-NSS-at-80	is the maximum NSS among all HE-MCS at 80 MHz from the Supported HE-MCS And NSS Set field transmitted by the STA

NOTE 3—If the operating channel width of the STA is greater than 80 MHz, then the Rx NSS subfield indicates the maximum number of spatial streams for PPDU bandwidths that are equal to or less than 80 MHz. If the operating channel width of the STA is less than or equal to 80 MHz, then the Rx NSS subfield indicates the maximum number of spatial streams, N_{SS}, that the STA supports in reception.

The VHT channel width and the VHT NSS allowed at an HE STA transmitting an OM Control subfield are defined in Table 26-9 to determine the allowed NSS when operating as HE STA using channel bandwidth of 160 MHz or 80+80 MHz.

The OMI initiator shall indicate a change in its TOM parameters by including the OM Control subfield in a QoS Data, QoS Null, or Class 3 Management frame that solicits an immediate acknowledgment frame and is addressed to the OMI responder as defined in 26.9.3.

A non-AP STA OMI initiator that sends an OM Control subfield with UL MU Disable subfield equal to 0, supports transmitting an HE TB PPDU with an RU allocation that is within the operating channel width indicated in the Channel Width subfield and with a number of space-time streams, N_{STS}, that is up to the value indicated by the Tx NSTS subfield of the OM Control subfield as defined in 26.9.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 26-9—Setting of VHT Channel Width and VHT NSS at an HE STA transmitting the OM Control subfield

OM Control subfield	VHT capabilities of STA transmitting OM Control subfield		VHT NSS support of STA transmitting the OM Control subfield as a function of the PPDU bandwidth (× Max VHT NSS) (see requirements R1 and R2 at end of this table)					Location of 160 MHz center frequency if BSS bandwidth is 160 MHz	Location of secondary 80 MHz center frequency if BSS bandwidth is 80+80 MHz
Channel Width	Supported Channel Width	Extended NSS BW Support	20 MHz	40 MHz	80 MHz	160 MHz	80+80 MHz		
0	0–2	0–3	1						
1	0–2	0–3	1	1					
2	0–2	0–3	1	1	1				
3	0	1	1	1	1	1/2		CCFS2	
3	0	2	1	1	1	1/2	1/2	CCFS2	CCFS2
3	0	3	1	1	1	3/4	3/4	CCFS2	CCFS2
3	1	0	1	1	1	1		CCFS1	
3	1	1	1	1	1	1	1/2	CCFS1	CCFS2
3	1	2	1	1	1	1	3/4	CCFS1	CCFS2
3	1	3	2	2	2	2	1	CCFS1	CCFS1
3	2	0	1	1	1	1	1	CCFS1	CCFS1
3	2	3	2	2	2	1	1	CCFS1	CCFS1

R1: NSS support shall be rounded down to the nearest integer.
R2: The maximum NSS support shall be 8.

NOTE 1—Max VHT NSS as indicated by the value of the Rx NSS field. The Rx NSS field indicates the same Max HE NSS and Max VHT NSS. Max VHT NSS is at the bandwidth indicated in the VHT Capabilities element. For all allowed MCS values, the Max VHT NSS values are same, but the supported NSS can be different.

NOTE 2—1/2 × or 3/4 × Max VHT NSS support might end up being 0, indicating no support.

NOTE 3—Any other combination than the ones listed in this table is reserved.

NOTE 4—CCFS1 refers to the value of the Channel Center Frequency Segment 1 field of the most recently transmitted VHT Operation element (if any) or HE Operation element.

NOTE 5—CCFS2 refers to the value of the Channel Center Frequency Segment 2 field of the most recently transmitted HT Operation element.

NOTE 6—CCFS1 is nonzero when the current BSS bandwidth is 160 MHz or 80+80 MHz and the NSS support is at least Max VHT NSS. CCFS2 is zero in this case.

NOTE 7—CCFS2 is nonzero when the current BSS bandwidth is 160 MHz or 80+80 MHz and the NSS support is less than Max VHT NSS. CCFS1 is zero in this case.

NOTE 8—At most one of CCFS1 and CCFS2 is nonzero.

NOTE 9—A supported multiple of Max VHT NSS applies to both transmit and receive. A supported multiple of Max HE NSS applies to receive.

NOTE 10—Some combinations of Supported Channel Width Set and Extended NSS BW support might not occur in practice.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 4—To avoid possible frame loss, an OMI initiator can continue with its current operating channel width, active receive chains, and active transmit chains in HE TB PPDUs and not suspend HE TB PPDUs or Data frames in HE TB PPDUs until it infers that the OMI responder has processed an OM Control subfield from the OMI initiator indicating any of the following changes:

— Reduced operating channel width
— Reduction in the number of active receive chains
— Reduction in the number of active transmit chains in HE TB PPDUs
— Suspension of UL MU operation

The OMI initiator might make this inference from any combination of the following:

— By receiving a frame addressed to itself from the second HE STA in a PPDU with a bandwidth and NSS that are less than or equal to the channel width and NSS, respectively, indicated in the OM Control subfield.
— Based on the passage of time in some implementation-dependent way, which is beyond the scope of this standard.

NOTE 5—It might take a long time for a STA to change its operating mode following the transmission of the OM Control subfield. During that time the STA might not be able to receive frames, and this situation may result in frame loss. If a non-AP STA cannot tolerate frame loss during that period, it can set the Power Management subfield of the Frame Control field of the frame that carries the OM Control subfield to 1 to indicate that the STA has entered power save. When the non-AP STA has completed its operating mode change, it can send another frame (such as a QoS Null) with the Frame Control field Power Management subfield set to 0 to indicate that the STA has exited power save.

26.9.2 Receive operating mode (ROM) indication

ROM indication allows the OMI initiator to adapt the maximum operating channel width and/or the maximum number of spatial streams, *Nss*, it can receive from the OMI responder.

An OMI initiator that sends a frame that includes an OM Control subfield should change its OMI parameters, Rx NSS and Channel Width as follows:

— When the OMI initiator changes a ROM parameter from higher to lower, it should make the change for that parameter only after the TXOP in which it received the immediate acknowledgment from the OMI responder.
— When the OMI initiator changes a ROM parameter from lower to higher, it should make the change for that parameter only after the TXOP in which it expects to receive acknowledgment from the OMI responder.

An OMI initiator that is an HE AP should be capable of receiving within an operating channel width and with N_{SS} that are up to the values of the most recently transmitted Channel Width subfield and Rx NSS subfield that the OMI initiator has successfully indicated in the OM Control subfield or in the Operating Mode field sent to any associated STA.

NOTE 1—In the event of transmission failure of the frame containing the OM Control subfield, the OMI initiator attempts the recovery procedure defined in 10.23.2.8.

The OMI responder shall update the operating channel width and the maximum N_{SS} values as obtained from the Channel Width and Rx NSS subfields, respectively, of the most recently received OM Control subfield sent by the OMI initiator to send SU PPDUs and to assign an RU allocation in sent MU PPDUs, subject to restrictions defined in 27.3.1.2, addressed to the OMI initiator in subsequent TXOPs. The OMI responder shall update the maximum N_{SS} value to a value determined from the Rx NSS subfield and Table 26-9 if the Channel Width subfield of the OM Control field indicates 160 MHz or 80+80 MHz.

After transmitting the acknowledgment for the frame containing the OM Control subfield, the OMI responder may transmit subsequent SU PPDUs or MU PPDUs that are addressed to the OMI initiator.

NOTE 2—The acknowledgment is transmitted a SIFS after the frame. A subsequent PPDU is a PPDU that is intended for the OMI initiator and need not be the PPDU immediately following the acknowledgment.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An OMI initiator that is a non-AP STA may set the DL MU-MIMO Resound Recommendation subfield to 1 in the OM Control field in frames addressed to an OMI responder that is an AP to indicate that the non-AP STA suggests that the AP resound the channel with the non-AP STA. An OMI initiator that is a non-AP STA and that has no recommendation on the AP's DL MU-MIMO operation shall set DL MU-MIMO Resound Recommendation subfield to 0.

An OMI responder that receives a frame that carries an OM Control field with the DL MU-MIMO Resound Recommendation field equal to 1 from an OMI initiator may resound the channel or increase the frequency of the channel sounding with the OMI initiator if the OMI responder sends a DL MU-MIMO PPDU addressed to the OMI initiator.

26.9.3 Transmit operating mode (TOM) indication

TOM indication allows the OMI initiator to suspend and resume responding to variants of the Trigger frame and TRS Control subfields per the UL MU Disable and UL MU Data Disable subfields settings as indicated in Table 9-29 or to adapt the maximum operating channel width and/or the maximum number of space-time streams, N_{STS}, that it can transmit in response to a triggering frame sent by the OMI responder

NOTE 1—TOM indication does not relate to transmissions in PPDUs other than HE TB PPDUs. An AP does not perform TOM indication as an OMI initiator.

An OMI initiator that is a non-AP STA may indicate changes in its transmit parameters by sending a frame that contains the OM Control subfield to the OMI responder. The OMI initiator shall set

- The UL MU Disable subfield to 1 to indicate that responding to a triggering frame is suspended (see 26.5.2).
  - An AP that is an OMI initiator shall set the UL MU Disable subfield to 0.
- The Tx NSTS subfield to the maximum N_{STS} that the STA will use for an HE TB PPDU sent in response to a triggering frame.
- The Channel Width subfield to the maximum operating channel width that the STA will use for an HE TB PPDU sent in response to a triggering frame.

NOTE 2—Responding to all Trigger frame variants, including MU-RTS Trigger frames and NFRP Trigger frames, is suspended.

If a non-AP HE STA has received the OM Control UL MU Data Disable RX Support field in the HE Capabilities element set to 1, then the non-AP HE STA, acting as an OMI initiator, may set the UL MU Disable subfield to 0 and the UL MU Data Disable subfield to 1 to indicate that only UL MU Data frame transmission is suspended. In other words, UL MU control response frame transmissions in response to a Basic Trigger frame are not suspended (see 26.5.2), responses to other Trigger frame variants are not suspended, and management frame transmissions are not suspended.

An OMI initiator shall set the UL MU Disable subfield to 0 and the UL MU Data Disable subfield to 0 to indicate resumption or continuation of participation in all triggered UL MU operations.

If an HE AP has set the OM Control UL MU Data Disable RX Support field in the HE Capabilities element it transmits to 0, an associated STA shall not set the UL MU Data Disable subfield in the OM Control field to 1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An OMI initiator that sent a frame including the OM Control subfield should change its TOM parameters, Tx NSTS, UL MU Disable, UL MU Data Disable, and Channel Width as follows:

— If the OMI initiator changes a TOM parameter from higher to lower, it should make the change for that parameter only after the TXOP in which it received the immediate acknowledgment from the OMI responder.

— If the OMI initiator changes a TOM parameter from lower to higher, it should make the change for that parameter only after the TXOP in which it expects to receive acknowledgment from the OMI responder.

The TOM parameters UL MU Disable and UL MU Data Disable change from higher to lower if their values change from 0 to 1. The change of UL MU Disable from 1 to 0 and UL MU Data Disable from 0 to 1 is a change from lower to higher.

An OMI responder that receives a frame containing an OM Control subfield from an OMI initiator performs the operations described below in this subclause.

An AP OMI responder shall not send any triggering frames to a non-AP STA OMI initiator for subsequent TXOPs (see 26.5.2) if the UL MU Disable subfield is 1 in the most recently received OM Control subfield sent by the STA.

NOTE 3—A device might have multiple radios that can create difficult in-device coexistence challenges. The device might set UL MU Disable subfield to 1 and the UL MU Data Disable subfield to 0 if it has trouble responding to a triggering frame because the timing or high transmit power would cause interference with another radio in the device.

An OMI responder shall consider the OMI initiator as participating in UL MU operation for subsequent TXOPs if the UL MU Disable subfield is 0 in the most recently received OM Control subfield with the following restrictions:

— The maximum N_{STS} that the OMI initiator can transmit in an HE TB PPDU is indicated in the Tx NSTS subfield of the OM Control subfield.

— The maximum operating channel width over which the OMI initiator can transmit in an HE TB PPDU is indicated in the Channel Width subfield of the OM Control subfield.

An OMI responder that has transmitted the OM Control UL MU Data Disable RX Support subfield set to 1 shall regard an OMI initiator as capable of participating in UL MU operation only for transmitting acknowledgments if the UL MU Disable subfield is equal to 0 and the UL MU Data Disable subfield is equal to 1 in the most recently received OM Control subfield from that OMI initiator.

The OMI responder shall indicate a number of spatial streams, N_{SS}, in the User Info field of a Trigger frame, which contains the AID of the OMI initiator, that is less than or equal to the N_{STS} that is calculated from the Tx NSTS subfield of the OM Control subfield received from the OMI initiator.

The OMI responder shall indicate, in the RU Allocation subfield of the User Info field of a triggering frame addressed to the OMI initiator, an RU allocation that is within the operating channel width specified in the Channel Width subfield of the OM Control subfield received from the OMI initiator and subject to the restrictions defined in 27.3.1.2.

26.10 HE spatial reuse operation

26.10.1 General

The objective of HE spatial reuse operation is to allow the medium to be reused more often between OBSSs in dense deployment scenarios by the early identification of signals from overlapping basic service sets (OBSSs) and interference management.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

There are two independent spatial reuse modes: OBSS PD-based spatial reuse and PSR-based spatial reuse.

An HE AP participating in spatial reuse may request an associated non-AP HE STA to gather information regarding the neighborhood by sending a Beacon request (see 9.4.2.20.7) following the procedure described in 11.11. An HE AP shall not set a measurement mode in a Beacon request to an associated STA to a mode for which the STA has not explicitly indicated support via the RM Enabled Capabilities element (see 9.4.2.43). An HE AP that sends a Beacon request for this purpose

— May request that the non-AP HE STA gather information of BSSs matching a particular BSSID and/or SSID.
— May request that the non-AP HE STA generate a report that is only for the channel on which the requesting AP is operating or to which the requesting AP is considering switching.
— Shall request that the non-AP HE STA include the HE Operation element of neighboring HE APs in order to help determine the BSS color information of the neighboring APs.

A non-AP HE STA that performs spatial reuse operation shall have dot11RadioMeasurementActivated set to true and shall respond to a Beacon request from its associated AP with a Beacon report as described in 11.11.

A Class B device as defined in 27.3.15.3 shall not operate with the procedures defined in this subclause.

26.10.2 OBSS PD-based spatial reuse operation

26.10.2.1 General

OBSS PD-based spatial reuse operation comprises two types of operation. The first type is defined in 26.10.2.2 and allows a STA, under specific conditions, to ignore an inter-BSS PPDU using a non-SRG OBSS PD level. The second type is defined in 26.10.2.3 and allows a STA, under specific conditions, to ignore inter-BSS PPDUs that are identified as being SRG PPDUs, using an SRG OBSS PD level. In addition to these differences between the two types, Non-SRG OBSS PD Min offset is fixed and defined in the specification while the SRG OBSS PD Min offset can be defined by the AP. A STA may operate using one of the two types, neither type, or both types simultaneously.

26.10.2.2 General operation with non-SRG OBSS PD level

If the PHY of a STA issues a PHY-CCA.indication(BUSY) followed by a PHY-RXEARLYSIG.indication or PHY-RXSTART.indication due to a PPDU reception, then the STA's MAC sublayer may:

a) issue a PHY-CCARESET.request primitive before the end of the PPDU and not update its basic NAV timer based on the PPDU, or
b) treat the PPDU as not having been received for purposes of its basic NAV timer (i.e., not update its basic NAV timer),

if (for either (a) or (b)) all the following conditions are met:

1) The STA has not set the TXVECTOR parameter SPATIAL_REUSE to the value PSR_AND_NON_SRG_OBSS_PD_PROHIBITED in any HE PPDU it has transmitted in the current beacon period and in the previous beacon period.
2) The most recently received Spatial Reuse Parameter Set element from its associated AP had the Non-SRG OBSS PD SR Disallowed subfield equal to 0, or the non-AP STA has not received a Spatial Reuse Parameter Set element from its associated AP, or the STA is an AP and its most recently transmitted Spatial Reuse Parameter Set element had the Non-SRG OBSS PD SR Disallowed subfield equal to 0, or the STA is an AP and has not transmitted a Spatial Reuse Parameter Set element.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

3) The received PPDU is an inter-BSS PPDU (see 26.2.2), and the received PPDU is not a non-HT PPDU carrying a response frame (Ack, BlockAck, or CTS frame); or the received PPDU contains a CTS, a PHY-CCA.indication transition from BUSY to IDLE occurred within the PIFS time immediately preceding the received CTS, and that transition corresponded to the end of an inter-BSS PPDU that contained an RTS that was discarded following this procedure.
4) The STA is operating with an SRG OBSS PD level as described in 26.10.2.3, and the received PPDU is not an SRG PPDU; or the STA is not operating with an SRG OBSS PD level.
5) The SPATIAL_REUSE subfield in the HE-SIG-A field (if present) of the received PPDU is not set to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED.
6) The received signal strength level, which is measured from the L-STF or L-LTF fields of the PPDU or the PHY SYNC field, shortSYNC field, or Long PHY SYNC field, whichever exists and is used to determine PHY-CCA.indication, is below the non-SRG OBSS PD level. The non-SRG OBSS PD level is defined in 26.10.2.4. If the STA has dot11HEPSROptionImplemented set to true, it also follows the rules defined in 26.10.4 to determine non-SRG OBSS PD level.
7) The PPDU is not one of the following:
    i) A non-HE PPDU that carries a frame where the RA field is equal to the STA MAC address
    ii) A non-HE PPDU that carries a Public Action frame
    iii) A non-HE PPDU that carries a VHT/HE NDP Announcement frame or FTM frame
    iv) A non-HE NDP

NOTE 1—A STA cannot perform SR over an HE sounding NDP or HE TB feedback NDP (see 26.11.6).

If the frame is carried in an HE ER SU PPDU that is identified as an inter-BSS PPDU (where power of the L-STF/L-LTF symbols is boosted 3 dB), 3 dB shall be subtracted from the received signal strength measured from the L-STF or L-LTF fields of the PPDU, prior to using it to determine PHY-CCA.indication and to comparing it to the non-SRG OBSS PD level as described in this subclause, to compensate for the power difference.

NOTE 2—If a received CF-End frame satisfies the conditions above, neither the issuance of a PHY-CCARESET.request nor the choice to not update the basic NAV timer results in the cancellation of the NAV, which would normally occur following the reception of a CF-End frame.

The PHY-CCARESET.request primitive shall be issued at the end of the PPDU if the PPDU is an HE SU PPDU or an HE ER SU PPDU and the RXVECTOR parameter SPATIAL_REUSE indicates SR_DELAYED.

NOTE 3—A STA sets the TXVECTOR parameter SPATIAL_REUSE to SR_DELAYED in a PPDU if it allows OBSS PD-based spatial reuse operation, but only after the end of the PPDU.

NOTE 4—An AP can get protection equivalent to SR_DELAYED by transmitting the Trigger frame in a non-HT PPDU or HT PPDU with the TXVECTOR parameter AGGREGATION set to 0 instead of in a VHT PPDU.

If the PHY-CCARESET.request primitive is issued before the end of the received PPDU, and a TXOP is initiated within the duration of the received PPDU, then the TXOP and the duration of the transmitted PPDU within that TXOP shall be limited to the duration of the received PPDU if the received PPDU is an HE MU PPDU and the RXVECTOR parameter SPATIAL_REUSE indicates SR_RESTRICTED.

NOTE 5—A STA sets the TXVECTOR parameter SPATIAL_REUSE to SR_RESTRICTED in a PPDU if it allows OBSS PD-based spatial reuse operation, but only before the end of the PPDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A STA that ignores a PPDU following the procedure described in this subclause is deemed to perform non-SRG OBSS PD-based spatial reuse.

26.10.2.3 General operation with SRG OBSS PD level

If the PHY of a STA issues a PHY-CCA.indication(BUSY) followed by a PHY-RXEARLYSIG.indication or PHY-RXSTART.indication due to a PPDU reception, then the STA's MAC sublayer may:

a) issue a PHY-CCARESET.request primitive before the end of the PPDU and not update its basic NAV timer based on the PPDU, or

b) treat the PPDU as not having been received for purposes of its basic NAV timer (i.e., not update its basic NAV timer),

if (for either (a) or (b)) all the following conditions are met:

1) The received PPDU is an SRG PPDU (see 26.2.3)

2) The received signal strength level, which is measured from the L-STF or L-LTF fields of the PPDU or the PHY SYNC field, shortSYNC field, or Long PHY SYNC field, whichever exists and is used to determine PHY-CCA.indication, is below the SRG OBSS PD level. The SRG OBSS PD level is defined in 26.10.2.4. If the STA has dot11HEPSROptionImplemented set to true, it also follows the rules defined in 26.10.4 to determine SRG OBSS PD level.

3) The PPDU is not one of the following:

   i) A non-HE PPDU that carries a frame where the RA field is equal to the STA MAC address

   ii) A non-HE PPDU that carries a Public Action frame

   iii) A non-HE PPDU that carries a VHT/HE NDP Announcement frame or FTM frame

   iv) A non-HE NDP

NOTE 1—A STA cannot perform SR over an HE sounding NDP or HE TB feedback NDP (see 26.11.6).

If the frame is carried in an HE ER SU PPDU that is identified as an inter-BSS PPDU (where power of the L-STF/L-LTF symbols is boosted 3 dB), 3 dB shall be subtracted from the received signal strength measured from the L-STF or L-LTF fields of the PPDU, prior to using it to determine PHY-CCA.indication and to comparing it to the SRG OBSS PD level as described in this subclause, to compensate for the power difference.

NOTE 2—If a received CF-End frame satisfies the conditions above, neither the issuance of a PHY-CCARESET.request nor the choice to not update the basic NAV timer results in the cancellation of the NAV, which would normally occur following the reception of a CF-End frame.

The PHY-CCARESET.request primitive shall be issued at the end of the PPDU if the PPDU is an HE SU PPDU or an HE ER SU PPDU and the RXVECTOR parameter SPATIAL_REUSE indicates SR_DELAYED.

NOTE 3—An AP can get protection equivalent to SR_DELAYED by transmitting the Trigger frame in a non-HT PPDU or HT PPDU with the TXVECTOR parameter AGGREGATION set to 0 instead of in a VHT PPDU.

If the PHY-CCARESET.request primitive is issued before the end of the received PPDU, and a TXOP is initiated within the duration of the received PPDU, then the TXOP and the duration of the transmitted PPDU within that TXOP shall be limited to the duration of the received PPDU if the received PPDU is an HE MU PPDU and the RXVECTOR parameter SPATIAL_REUSE indicates SR_RESTRICTED.

NOTE 4—The restriction, in addition to the TXOP limit, of the PPDU duration within the TXOP is included in the above paragraph related to SR_RESTRICTED as there are conditions where the TXOP limit can be exceeded (see 10.23.2.9).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An AP that sends a Spatial Reuse Parameter Set element with the SRG Information Present subfield in the SR Control field set to 1 shall set the SRG BSS Color Bitmap and SRG Partial BSSID Bitmap fields as follows:

— If the transmitting AP is in the same ESS as another AP (i.e., with the same SSID and connected by a DS) or is controlled by the same external management entity as another AP (irrespective of SSID), then the transmitting AP may set the SRG BSS Color Bitmap and/or SRG Partial BSSID Bitmap fields that correspond to that other AP to 1.

— Otherwise, the AP shall set the bits in the SRG BSS Color Bitmap and/or SRG Partial BSSID Bitmap to 0.

If an HE AP determines values for dot11SRGAPBSSColorBitmap and dot11SRGAPBSSIDBitmap (i.e., the SRG for the AP's own transmissions), then the values shall be determined according to the rules above in this subclause.

26.10.2.4 Adjustment of OBSS PD and transmit power

If using OBSS PD-based spatial reuse, an HE STA shall maintain an OBSS PD level and may adjust this OBSS PD level in conjunction with its transmit power and a value, *PPDU_BW*, derived from the received PPDU. The adjustment shall be made in accordance with Equation (26-5).

$$OBSS\_PD_{level} \leq max(OBSS\_PD_{min}, min(OBSS\_PD_{max}, OBSS\_PD_{min} + (TX\_PWR_{ref} - TX\_PWR))) + 10\log 10(PPDU\_BW/20\ \text{MHz}) \quad (26\text{-}5)$$

where *PPDU_BW* is determined by Table 26-10 using the following RXVECTOR parameter of the received PPDU:

— CH_BANDWIDTH if present

— CH_BANDWIDTH_IN_NON_HT if present and if CH_BANDWIDTH is not present

— DATARATE if neither CH_BANDWIDTH nor CH_BANDWIDTH_IN_NON_HT is present

Table 26-10—*PPDU_BW* determination

DATARATE	CH_BANDWIDTH or CH_BANDIWDTH_IN_NON_HT	*PPDU_BW*
N/A	CBW20, HT_CBW20, NON_HT_CBW20	20 MHz
N/A	CBW40, HT_CBW40, NON_HT_CBW40	40 MHz
N/A	CBW80, HE-CBW-PUNC80-PRI, HE-CBW-PUNC80-SEC	80 MHz
N/A	CBW160, CBW80+80, HE-CBW-PUNC160-PRI20, HE-CBW-PUNC80+80-PRI20, HE-CBW-PUNC160-SEC40, HE-CBW-PUNC80+80-SEC40	160 MHz
1, 2, 5.5, or 11	N/A	20 MHz

The value of the $OBSS\_PD_{level}$ is applicable to the start of a 20 MHz PPDU received on the primary 20 MHz channel. If the bandwidth of the received PPDU differs from 20 MHz, then the value of the $OBSS\_PD_{level}$ is increased by 10 log10 (bandwidth/20 MHz), using the bandwidth in MHz indicated by the value of RXVECTOR parameter CH_BANDWIDTH or CH_BANDWIDTH_IN_NON_HT if present.

TX_PWR_{ref} = 21 dBm for non-AP STAs.

TX_PWR_{ref} = 21 dBm for an AP with the Max HE-MCS For 3 SS subfield in the Tx HE-MCS Map ≤ 80 MHz subfield in the Supported HE-MCS and NSS Set field of its HE Capabilities element field set to 3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

TX_PWR_{ref} = 25 dBm for an AP with the Max HE-MCS For 3 SS subfield in the Tx HE-MCS Map ≤ 80 MHz subfield in the Supported HE-MCS and NSS Set field of its HE Capabilities element field set to a value other than 3.

TX_PWR is the combined transmit power at the transmit antenna connector of all antennas in dBm and is set following the rules in 11.7.6 and, for transmission of HE TB PPDU, also following the rules in 27.3.15.2.

NOTE 1—The TX_PWR_{ref} is 4 dB higher for APs with more than 2 spatial streams because those APs typically have higher transmit power than other devices and the OBSS PD procedure is based on a relative reduction of power.

NOTE 2—A STA might adjust its OBSS PD level, provided that Equation (26-5) is satisfied. As an example, a non-AP HE STA might monitor the beacons transmitted by the AP to which it is associated, measure their RSSI, subtract a value of 25 dB (as an approximation to the required RSNI) to provide a candidate OBSS PD level, and if Equation (26-5) is satisfied, adjust its OBSS PD level to the candidate level.

The adjustment rule is illustrated in Figure 26-11.

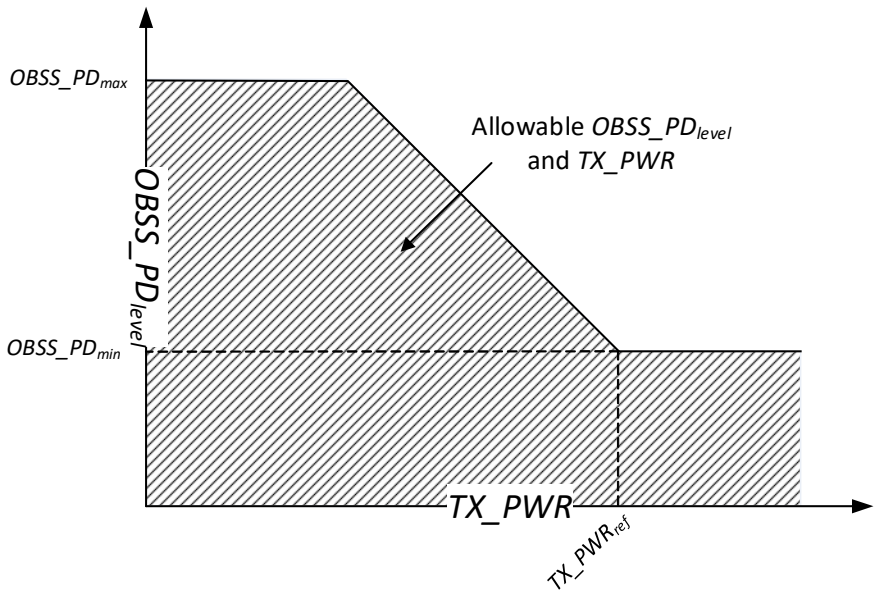

Figure 26-11—Illustration of the adjustment rule for OBSS PD and TX_PWR

An AP may define SRG OBSS PD Min Offset and SRG OBSS PD Max Offset values that are used by its associated STAs to derive an SRG OBSS PD level for determining reception behavior for inter-BSS PPDUs that are determined to be SRG PPDUs. An AP may define a non-SRG OBSS PD Max Offset value that is used by its associated STAs to derive a non-SRG OBSS PD level for determining reception behavior for inter-BSS PPDUs that are not determined to be SRG PPDUs. The values of SRG OBSS PD Min Offset, SRG OBSS PD Max Offset, and Non-SRG OBSS PD Max Offset are transmitted to associated STAs within the Spatial Reuse Parameter Set element.

An AP transmitting a Spatial Reuse Parameter Set element shall respect the following constraints:

— –82 ≤ –82 + SRG OBSS PD Min Offset ≤ –62
— SRG OBSS PD Min Offset ≤ SRG OBSS PD Max Offset
— –82 + SRG OBSS PD Max Offset ≤ –62
— –82 + Non-SRG OBSS PD Max Offset ≤ –62

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An HE STA shall maintain a non-SRG OBSS PD level, with its value selected by respecting the OBSS PD level condition in Equation (26-5) but with Non-SRG OBSS PD Min and Non-SRG OBSS PD Max in place of $OBSS\_PD_{min}$ and $OBSS\_PD_{max}$, respectively. A non-AP STA shall determine Non-SRG OBSS PD Min and Non-SRG OBSS PD Max according to Table 26-11. An HE AP shall set Non-SRG OBSS PD Min to –82 dBm and Non-SRG OBSS PD Max to –82 dBm + dot11NonSRGAPOBSSPDMaxOffset.

Table 26-11—Non-SRG OBSS PD Min and Non-SRG OBSS PD Max values for non-AP STAs

Non-SRG OBSS PD SR Disallowed field in Spatial Reuse Parameter Set element	Non-SRG Offset Present field in Spatial Reuse Parameter Set element	Value of Non-SRG OBSS PD Min (dBm)	Value of Non-SRG OBSS PD Max (dBm)
Not applicable if the Spatial Reuse Parameter Set element is not received	Not applicable if the Spatial Reuse Parameter Set element is not received	–82	–62
0	0	–82	–62
0	1	–82	–82 + Non-SRG OBSS PD Max Offset
1	N/A	–82	–82

An HE STA shall maintain an SRG OBSS PD level, with its value selected by respecting the OBSS PD level condition in Equation (26-5) but with SRG OBSS PD Min and SRG OBSS PD Max in place of $OBSS\_PD_{min}$ and $OBSS\_PD_{max}$, respectively. A non-AP STA shall determine SRG OBSS PD Min and SRG OBSS PD Max using Table 26-12. An HE AP shall set SRG OBSS PD Min to –82 + dot11SRGAPOBSSPDMinOffset dBm and SRG OBSS PD Max to –82 + dot11SRGAPOBSSPDMaxOffset dBm. An HE AP may transmit SRG OBSS PD Min and SRG OBSS PD Max offset values that are different from the ones that it uses.

Table 26-12—SRG OBSS PD Min and SRG OBSS PD Max values for non-AP STAs

SRG Information Present field in Spatial Reuse Parameter Set element	Value of SRG OBSS PD Min (dBm)	Value of SRG OBSS PD Max (dBm)
Not applicable if the Spatial Reuse Parameter Set element is not received	N/A see NOTE	N/A see NOTE
0	N/A see NOTE	N/A see NOTE
1	–82 + SRG OBSS PD Min Offset	–82 + SRG OBSS PD Max Offset
NOTE—If SRG Information is not present, a STA cannot determine a PPDU to be SRG and therefore will not use SRG OBSS PD Min or SRG OBSS PD Max values.		

The Spatial Reuse Parameter Set element is optionally present in Beacon frames, Probe Response frames, and (Re)Association Response frames.

26.10.2.5 OBSS PD SR transmit power restriction period

If a STA ignores an inter-BSS PPDU following the procedure in 26.10.2.3 using a chosen SRG OBSS PD level, or following the procedure in 26.10.2.2 using a chosen non-SRG OBSS PD level, then the STA shall start an OBSS PD SR transmit power restriction period. This OBSS PD SR transmit power restriction period shall be terminated at the end of the TXOP that the STA gains once its backoff reaches zero.

If a STA starts an OBSS PD SR transmit power restriction period with a chosen non-SRG OBSS PD level, the STA's transmit power as measured at the transmit antenna connector shall be equal to or lower than the TX_PWR_{max}, calculated with the chosen non-SRG OBSS PD level using Equation (26-6) and the appropriate non-SRG parameters according to Table 26-11, for the transmissions of any PPDU that is not carrying a frame that is allowed to be sent without regard to the busy/idle state of the medium until the end of the OBSS PD SR transmit power restriction period.

If a STA starts an OBSS PD SR transmit power restriction period with a chosen SRG OBSS PD level, the STA's transmit power as measured at the transmit antenna connector shall be equal to or lower than the TX_PWR_{max}, calculated with the chosen SRG OBSS PD level using Equation (26-6) and the appropriate SRG parameters according to Table 26-12, for the transmissions of any PPDU that is not carrying a response frame that is allowed to be sent without regard to the busy/idle state of the medium until the end of the OBSS PD SR transmit power restriction period.

NOTE 1—Examples of frames that are transmitted without regard to the busy/idle state of the medium include but are not limited to a frame contained in an HE TB PPDU that is a response to a Trigger frame with the CS Required subfield set to 0 and an Ack or BlockAck frame sent as an immediate response.

A STA may have multiple ongoing OBSS PD SR transmit power restriction periods that overlap in time.

NOTE 2—The STA's transmit power is always equal to or lower than the minimum TX_PWR_{max} among all TX_PWR_{max} from ongoing OBSS PD SR transmit power restriction periods.

NOTE 3—Equation (26-6) is equivalent to the condition defined in Equation (26-5). The STA can derive $OBSS\_PD_{level}$ from its transmit power or can derive TX_PWR_{max} from $OBSS\_PD_{level}$.

$$TX\_PWR_{max} = \begin{cases} \text{unconstrained, if } OBSS\_PD_{level} \le OBSS\_PD_{min} \\ TX\_PWR_{ref} - (OBSS\_PD_{level} - OBSS\_PD_{min}), \text{ if } OBSS\_PD_{max} \ge OBSS\_PD_{level} > OBSS\_PD_{min} \end{cases} \quad (26\text{-}6)$$

NOTE 4—Anytime, even if TX_PWR_{max} is unconstrained, the STA has to respect the transmit power restrictions defined in 11.7.6.

An example of OBSS PD SR operation is shown in Figure 26-12. In this example, STA SR S2

— Receives the PPDU from S1 and, if it classifies the PPDU as inter-BSS PPDU, ignores the PPDU using OBSS PD-based spatial reuse with non-SRG OBSS PD, starts the OBSS PD SR transmit power restriction period 1 with TX_PWRmax 1, and decrements its backoff counter until the reception of the PPDU from D1.

— Receives the PPDU from D1 and, if it classifies the PPDU as inter-BSS PPDU, ignores the PPDU (if it chooses to do so) using OBSS PD-based spatial reuse with non-SRG OBSS PD, starts the OBSS PD SR transmit power restriction period 2 with TX_PWRmax 2, and decrements its backoff counter until the reception of the PPDU from S1".

— Defers during the TXOP S1" set by the intra-BSS PPDU from S1" that belongs to its own BSS and, at the end of the TXOP S1", resumes the decrement of its backoff until the reception of the PPDU from S1'.

— Receives the PPDU from S1' and, if it classifies the PPDU as SRG PPDU, ignores the PPDU (if it chooses to do so) using OBSS PD-based spatial reuse with SRG OBSS PD, starts the OBSS PD SR

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

transmit power restriction period 3 with TX_PWRmax 3, and decrements its backoff counter until the counter reaches zero because it does not receive the PPDU from D1'.

— Starts transmitting a PPDU with a TX_PWRmax equal to min(TX_PWRmax 1, TX_PWRmax 2, TX_PWRmax 3) and respects this transmit power restriction until the end of the SR TXOP.

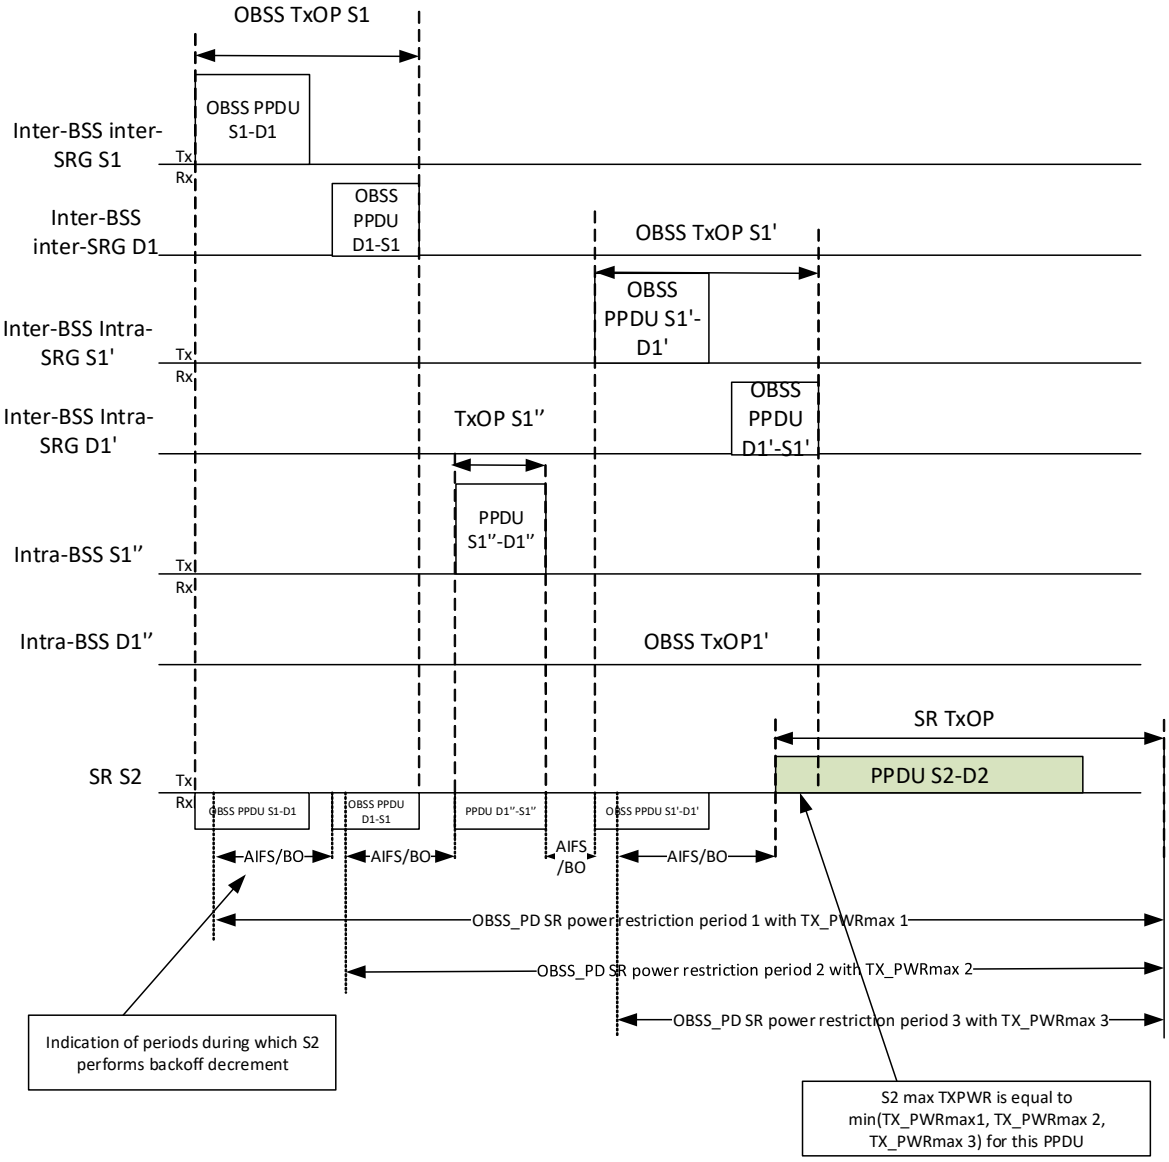

Figure 26-12—Example of OBSS PD SR operation

26.10.2.6 OBSS PD-based spatial reuse backoff procedure

If an HE STA ignores an inter-BSS PPDU following the procedure in 26.10.2.2, the HE STA may resume EDCAF procedures after the PHY-CCARESET.request primitive is sent, provided that the medium condition is not otherwise indicated as BUSY.

26.10.3 PSR-based spatial reuse operation

26.10.3.1 General

An HE STA supporting PSR-based PSRT PPDU transmission indicates this support by setting the PSR-based SR Support subfield to 1 in the HE PHY Capabilities Information field in the HE Capabilities element (see Table 9-376). An HE-STA supporting PSR-based PSRT PPDU reception indicates this support by setting the PSR Responder subfield to 1 in the HE MAC Capabilities Information field in the HE Capabilities element (see Table 9-375).

An HE STA shall set the PSR-based SR Support field to 1 in the HE Capabilities element it transmits if it supports transmitting an PSRT PPDU under the conditions specified in this subclause; otherwise, the STA shall set the PSR-based SR Support field to 0.

STAs that receive a Spatial Reuse Parameter Set element from their associated AP that has a value of 1 in the PSR Disallowed subfield shall not perform PSR-based SR transmissions.

An PSR opportunity is identified from the value of the RXVECTOR parameter SPATIAL_REUSE of an HE TB PPDU and/or the contents of a Trigger frame. An HE STA may initiate an SR transmission during an PSR opportunity for the duration of an ongoing PPDU when certain conditions, designed to avoid interfering with the reception of the ongoing PPDU at the recipient, are met. If the RXVECTOR parameter SPATIAL_REUSE of the ongoing PPDU has the value PSR_DISALLOW or PSR_AND_NON_SRG_OBSS_PD_PROHIBITED, no PSR-based SR transmission is allowed for the duration of that PPDU.

An AP sending a Trigger frame may set the Spatial Reuse *n* field(s) in the UL Spatial Reuse subfield in the Common Info field of the Trigger frame to PSR_DISALLOW or, if permitted by the rules in 26.11.6, to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED to disallow OBSS STAs from performing PSR-based SR transmission during the ensuing uplink PPDU duration. An AP sending a Trigger frame shall not set the SR field in the Common Info field of the Trigger frame to SR_DELAYED or SR_RESTRICTED.

An HE STA shall set the PSR Responder subfield in the HE Capabilities element it transmits to 1 if dot11SRResponderOptionImplemented is true; otherwise, the HE STA shall set the PSR Responder subfield to 0.

26.10.3.2 PSR-based spatial reuse initiation

An HE STA identifies an PSR opportunity if the following two conditions are met:

a) The STA receives a PHY-RXEARLYSIG.indication or PHY-RXSTART.indication corresponding to the reception of a PSRR PPDU that is identified as an inter-BSS PPDU (see 26.2.2).

b) An PSRT PPDU is queued for transmission, and the intended transmit power of the PSRT PPDU in dBm meets the following condition:

$$TxPower_{PSRT} - 10 \times log10(N_{PSRT,nonpunc}) \leq PSR_{min} - RPL_{PSRR,20MHz}$$

where,

$TxPower_{PSRT}$ is the intended transmit power over the entire bandwidth of the PSRT PPDU in dBm
$N_{PSRT,nonpunc}$ is the number of nonpunctured 20 MHz subchannels of the PSRT PPDU
$RPL_{PSRR,20MHz}$ is the normalized received signal power in units of dBm/20 MHz, measured at the antenna connector in at least one 20 MHz subchannel. The measured 20 MHz subchannel(s) shall be the subchannel(s) in which the preamble of both the PSRR PPDU and the PSRT PPDU are present. The measurement method is implementation dependent.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

PSR_{min} is equal to the PSR value if there exists one PSR value within the bandwidth of the PSRT PPDU or the smallest of the PSR values if there exist multiple PSR values within the bandwidth of the PSRT PPDU. Each PSR value is specified per 20 MHz. They are obtained from the Meaning column of Table 27-24 based on at least one of the following:

i) The value of the UL Spatial Reuse subfield in the Common Info field of the Trigger frame of the PSRR PPDU.

ii) The value of the RXVECTOR parameter Spatial Reuse of the HE TB PPDU that follows the PSRR PPDU.

The PSR value is determined for each 20 MHz subchannel for a 20 MHz, 40 MHz, or 80 MHz PPDU. In the case of a 160 MHz or 80+80 MHz PSRR PPDU or HE TB PPDU that follows the PSRR PPDU, the UL Spatial Reuse subfield or the RXVECTOR parameter SPATIAL_REUSE represent the PSR value per 20 MHz and the two 20 MHz subchannels within each 40 MHz subband have the same PSR value, see Table 27-22.

An HE STA that identifies an PSR opportunity may choose to not perform NAV update operations normally executed based on the receipt of the RXVECTOR parameter TXOP_DURATION and the Trigger frame Duration field. An OBSS STA, shown as $STA_{OBSS\text{-}A}$ in Figure 26-13, that identifies an PSR opportunity to transmit a PSRT PPDU to another OBSS STA, shown as $STA_{OBSS\text{-}B}$ in the same figure, may issue a PHY-CCARESET.request to discard the associated HE TB PPDU(s) that are triggered by the Trigger frame of the PSRR PPDU and that occur within aSIFSTime + aRxPHYStartDelay + 2 × aSlotTime of the end of the last symbol on the air of the triggering PPDU (which is also the PSRR PPDU), provided that the value of the RXVECTOR parameter BSS_COLOR of the HE TB PPDU matches the BSS color of the PSRR PPDU. An OBSS STA that identifies an PSR opportunity shall not transmit an PSRT PPDU that terminates beyond the PPDU duration of the HE TB PPDU that is triggered by the Trigger frame of the PSRR PPDU.

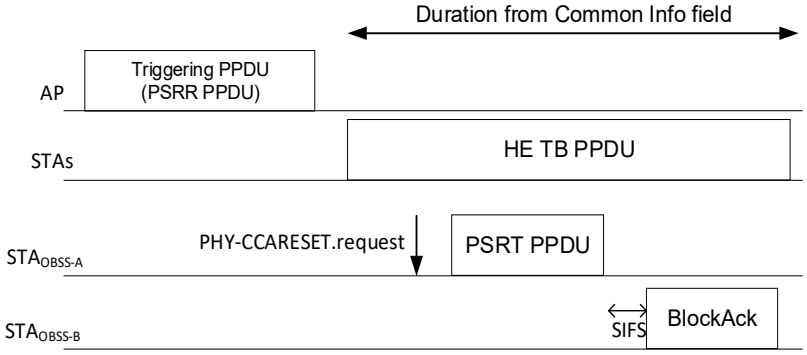

Figure 26-13—PSRR PPDU spatial reuse

26.10.3.3 PSR-based spatial reuse backoff procedure

If an HE STA identifies an PSR opportunity as allowed in 26.10.3.2, the HE STA may continue the countdown of an existing backoff procedure, provided that the medium condition is not otherwise indicated as BUSY. If the HE STA receives another PPDU during the backoff procedure, it shall suspend its backoff; subsequently, if an PSR opportunity is identified based on the identification of the new PPDU as an PSRR PPDU, then the STA may resume its backoff procedure. The TXOP that the HE STA gains once its backoff reaches zero shall not extend beyond the PSR opportunity endpoint that is the earliest ending of all durations of all PSRR PPDUs that were used to confirm the PSR opportunity and all durations indicated in the Common Info fields of Trigger frames within all PSRR PPDUs that were used to confirm the PSR opportunity.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the HE STA is employing $OBSS\_PD_{level}$ as a threshold for determination of an IDLE medium condition prior to the reception of an PSRR PPDU per the rules specified in 26.10.2, the intended transmit power of the next PSRT PPDU in the transmission queue as measured at the transmit antenna connector shall be equal to or lower than the TX_PWR_{max}, calculated with this specific $OBSS\_PD_{level}$ using Equation (26-6).

After a STA has identified the start of an PSR opportunity, and until the PSR opportunity endpoint is reached, the transmission of any PPDU by the STA shall be limited by the transmit power restrictions identified in 26.10.3.

26.10.3.4 UL Spatial Reuse subfield of Trigger frame

An AP with dot11HEPSROptionImplemented set to true that transmits a Trigger frame may determine the value of the UL Spatial Reuse subfield of the Common Info field of the Trigger frame for each 20 MHz subchannel for a 20 MHz, 40 MHz, or 80 MHz PPDU or for each 40 MHz subchannel for an 80+80 MHz or 160 MHz PPDU by selecting the row in Table 27-24 that has a value in the Meaning column that is the highest value that is less than or equal to the numeric value of the computed MAC parameter PSR_INPUT as follows:

$$\text{PSR\_INPUT} = TX\_PWR_{AP} + \text{Acceptable Receiver Interference Level}_{\text{AP}} \quad (26\text{-}7)$$

where

TX_PWR_{AP} is the total power at the antenna connector, in dBm, for that 20 MHz subchannel for a 20 MHz, 40 MHz, or 80 MHz PPDU or for that 40 MHz subchannel for an 80+80 MHz or 160 MHz PPDU, over all antennas used to transmit the PSRR PPDU containing the Trigger frame

Acceptable Receiver Interference Level_{AP}
is a value in dBm for that 20 MHz subchannel for a 20 MHz, 40 MHz, or 80 MHz PPDU or for that 40 MHz subchannel for an 80+80 MHz or 160 MHz PPDU and should be set to the expected receive signal power indicated by the UL Target Receive Power subfield in the Trigger frame for the highest HE-MCS of the ensuing HE TB PPDUs minus the minimum SNR value that yields ≤ 10% PER for that MCS minus a safety margin value not to exceed 5 dB as determined by the AP

An AP with dot11HEPSROptionImplemented set to true that transmits a Trigger frame may set the value of the UL Spatial Reuse subfield of the Common Info field of the Trigger frame in each 20 MHz bandwidth for a 20 MHz, 40 MHz, or 80 MHz PPDU or in each 40 MHz bandwidth for an 80+80 or 160 MHz PPDU to PSR_DISALLOW.

An AP with dot11HEPSROptionImplemented set to false that transmits a Trigger frame shall set the value of the UL Spatial Reuse subfield of the Common Info field of the Trigger frame in each 20 MHz bandwidth for a 20 MHz, 40 MHz, or 80 MHz PPDU or in each 40 MHz bandwidth for an 80+80 or 160 MHz PPDU to PSR_DISALLOW.

26.10.3.5 PSRT PPDU transmission requirements

An HE STA that identifies an PSR opportunity shall not transmit a frame during the PSR opportunity that elicits a response transmission from a STA from which it has not received an HE Capabilities element with the PSR Responder subfield equal to 1. An HE STA that identifies an PSR opportunity shall not transmit a frame that does not include a CAS Control subfield with the PSRT PPDU subfield set to 1 and that solicits a response transmission during that PSR opportunity.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

26.10.3.6 PSRT PPDU reception and response transmission requirements

An HE STA that receives a PPDU that contains at least one frame with a CAS Control subfield with an PSRT PPDU subfield equal to 1 shall not transmit a response PPDU elicited by the received PPDU if all outstanding PSR and OBSS PD transmit power requirements are not met by the response transmission.

26.10.4 Interaction of OBSS PD and PSR-based spatial reuse

An HE STA with dot11HEPSROptionImplemented set to true that receives a PPDU that is identified as an inter-BSS PPDU with a value other than PSR_DISALLOW or PSR_AND_NON_SRG_OBSS_PD_PROHIBITED for the RXVECTOR parameter SPATIAL_REUSE and fails to identify an PSR opportunity based on the receipt of the PPDU shall disable OBSS PD SR operation on this PPDU.

An HE STA with dot11HEPSROptionImplemented set to true that receives a PPDU that is identified as an inter-BSS PPDU with a value other than PSR_DISALLOW, SR_DELAYED, or PSR_AND_NON_SRG_OBSS_PD_PROHIBITED for the RXVECTOR parameter SPATIAL_REUSE and identifies an PSR opportunity based on the receipt of the PPDU may disable OBSS PD SR operation on this PPDU.

An HE STA with dot11HEPSROptionImplemented set to true that receives a PPDU that is identified as an inter-BSS PPDU with a value other than PSR_DISALLOW or PSR_AND_NON_SRG_OBSS_PD_PROHIBITED in the UL Spatial Reuse subfield of the Common Info field of a Trigger frame and fails to identify an PSR opportunity based on the receipt of the PPDU shall disable OBSS PD SR operation on the HE TB PPDU that is elicited by the Trigger frame.

An HE STA with dot11HEPSROptionImplemented set to true that receives a PPDU that is identified as an inter-BSS PPDU with a value other than PSR_DISALLOW in the UL Spatial Reuse subfield of the Common Info field of a Trigger frame and identifies an PSR opportunity based on the receipt of the PPDU may disable OBSS PD SR operation on the Data field of the HE TB PPDU that is elicited by the Trigger frame.

26.11 Rules for setting some TXVECTOR parameters for PPDUs transmitted by an HE STA

26.11.1 STA_ID

Each parameter STA_ID in the TXVECTOR identifies the STA or group of STAs that is the recipient of an RU in the HE MU PPDU transmitted with the TXVECTOR parameter UPLINK_FLAG set to 0. For an individually addressed RU the parameter STA_ID is set to the 11 LSBs of the AID of the STA receiving the PSDU contained in that RU. If an RU is intended for one or more unassociated non-AP STAs, then the parameter STA_ID for that RU is set to 2045. If an RU is intended for no user, then the parameter STA_ID for that RU is set to 2046.

If an RU is intended for an AP (i.e., the TXVECTOR parameter UPLINK_FLAG is 1), then the parameter STA_ID contains one element that is set to the 11 LSBs of the AID of the non-AP STA transmitting the PPDU. If the parameter STA_ID has more than one element, then all other elements are set to 2046.

NOTE 1—When the UL HE MU PPDU is a 20 MHz HE MU PPDU with just a 106-tone RU, the parameter STA_ID contains two or more elements, one for the RU allocated to the AP and the others for unallocated RUs (see Table 27-27).

NOTE 2—A non-AP STA can transmit a UL HE MU PPDU to help the AP identify the transmitter of a failed PPDU so that the AP can allocate resources for that non-AP STA in a later TXOP. All unassociated STAs share the same

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

parameter STA_ID value (i.e., 2045), which does not uniquely identify the transmitter. Therefore an unassociated STA is not allowed to transmit a UL HE MU PPDU.

If an RU is intended for multiple STAs for MU-MIMO, then multiple STAs identified by STA-IDs in the parameter STA_ID use the same resource unit (see 26.5.2). If an RU is intended for multiple associated STAs and carries a single A-MPDU, then the parameter STA_ID is set as follows:

— For an AP with dot11MultiBSSIDImplemented equal to false, if the RU is intended for more than one associated STA in the BSS that is not a recipient of an individually addressed RU, the parameter STA_ID is set to 0.
— For an AP with dot11MultiBSSIDImplemented equal to true, if the RU is intended for more than one associated STA in any of its BSSs that is not a recipient of an individually addressed RU, the parameter STA_ID is set to 0 for a transmitted BSSID or to the value of the BSSID Index field corresponding to that BSS (see 9.4.2.72) for a nontransmitted BSSID. The number of such elements shall not exceed the maximum number of BSSs of the multiple BSSID set.
— For an AP with dot11MultiBSSIDImplemented equal to true, if the RU is intended for more than one associated STA on any of its BSSs that is not a recipient of an individually addressed RU or another broadcast RU corresponding to parameter STA_ID equal 0 or equal to the BSSID Index of a BSSID in a multiple BSSID set, the parameter STA_ID is set to 2047.

The parameter STA_ID values between 2008 and 2044 are reserved.

A non-AP STA shall not transmit an HE MU PPDU where the TXVECTOR parameter STA_ID includes more than one entry in the range 1 to 2007.

26.11.2 UPLINK_FLAG

An HE STA transmitting an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU sets the TXVECTOR parameter UPLINK_FLAG as follows:

— A STA transmitting an HE PPDU containing frames that are addressed to an AP shall set the TXVECTOR parameter UPLINK_FLAG to 1, unless the HE PPDU is an HE ER SU PPDU with the TXVECTOR parameter TXOP_DURATION set to UNSPECIFIED and contains an RTS or CTS frame. In this case, the STA may set the TXVECTOR parameter UPLINK_FLAG to 0.
— Otherwise, the HE STA shall set the TXVECTOR parameter UPLINK_FLAG to 0.

26.11.3 BEAM_CHANGE

An HE STA uses the TXVECTOR parameter BEAM_CHANGE to indicate a change in the spatial mapping of the pre-HE-STF portion of the PPDU and the first symbol of HE-LTF (see Table 27-1).

An HE STA that transmits an HE SU PPDU or an HE ER SU PPDU shall set the TXVECTOR parameter BEAM_CHANGE to 1 if one or more of the following conditions are met:

— The number of spatial streams is greater than 2.
— The PPDU is the first PPDU in a TXOP.
— The PPDU carries a Trigger frame.

26.11.4 BSS_COLOR

An HE STA that transmits an HE Operation element shall select and advertise a BSS color as described in 26.17.3.

An HE STA that transmitted an HE Operation element shall set the TXVECTOR parameter BSS_COLOR as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— For an HE SU PPDU, HE ER SU PPDU, or DL HE MU PPDU, the parameter BSS_COLOR is set to the value indicated in the BSS Color subfield of the HE Operation element if all the recipient STAs are members of the HE STA's BSS or the PPDU carries at least one triggering frame.
— For an HE SU PPDU, HE ER SU PPDU, or DL HE MU PPDU, the parameter BSS_COLOR is set to 0 if the HE STA expects that at least one intended recipient STA is not a member of the HE STA's BSS and the PPDU does not carry a triggering frame.

A non-AP HE STA that transmits an HE SU PPDU or HE ER SU PPDU to a STA that is not a member of the transmitting STA's HE BSS shall set the TXVECTOR parameter BSS_COLOR to 0.

NOTE 1—An HE AP that is starting an infrastructure BSS or an HE STA that is starting an IBSS or MBSS selects a nonzero BSS color as described in 26.17.3.2.

The active BSS color is one of the following:

— The value of the BSS Color field in the most recently received HE Operation element if an HE STA receives an HE Operation element from a peer HE STA.
— The value of the New BSS Color field in the most recently received BSS Color Change Announcement element if an HE STA receives a BSS Color Change Announcement element from a peer HE STA and the BSS color change TBTT has passed (see 26.17.3.4).

An HE STA shall set the TXVECTOR parameter BSS_COLOR for an HE SU PPDU, HE ER SU PPDU, or UL HE MU PPDU that is addressed to a peer STA to the active BSS color value, if the HE STA has established any of the following:

— An association with the peer STA
— A TDLS direct link with the peer STA
— An IBSS membership with the peer STA

NOTE 2—A non-AP HE STA sets the TXVECTOR parameter BSS_COLOR for an HE TB PPDU to the active color (see 26.5.2.3).

NOTE 3—An HE mesh STA sets the TXVECTOR parameter BSS_COLOR for an HE PPDU that it transmits to a peer HE mesh STA to the value in the BSS Color subfield of its transmitted HE Operation element.

An HE STA that receives an HE PPDU with RXVECTOR parameter BSS_COLOR with a value between 1 and 63 follows the spatial reuse rule described in 26.10.

NOTE 4—An HE STA that receives an HE PPDU with the RXVECTOR parameter BSS_COLOR equal to 0 might not follow the spatial reuse rules described in 26.10.

An HE STA that receives an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU with the RXVECTOR parameter BSS_COLOR equal to 0 shall not discard the HE PPDU on that basis.

While the BSS Color Disabled subfield is 1, an HE STA shall continue to advertise a nonzero value (same as before the color was disabled) in the BSS Color subfield of HE Operation element and in the TXVECTOR parameter BSS_COLOR of an HE PPDU that it transmits.

NOTE 5—A non-AP HE STA sets the TXVECTOR parameter BSS_COLOR of an HE PPDU that it transmits to the value advertised by the AP with which it intends to communicate even if the AP has disabled BSS color.

If the value of TXVECTOR parameter PARTIAL_AID[5:8] for VHT PPDUs with the TXVECTOR parameter GROUP_ID equal to 63 transmitted by an HE AP to any associated STA would not be consistent with the partial BSS color (i.e., *BCB*(0:3) described in 26.17.4) announced by the HE AP, then the HE AP shall set the Partial BSS Color field in the HE Operation element to 0. Otherwise, the HE AP may set the Partial BSS Color subfield in the HE Operation element to 1 (see 26.17.4).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

26.11.5 TXOP_DURATION

The TXVECTOR parameter TXOP_DURATION of an HE PPDU indicates duration information for NAV setting and protection of the TXOP, except that the TXVECTOR parameter TXOP_DURATION is set to UNSPECIFIED to indicate no duration information.

NOTE 1—The value of TXVECTOR parameter TXOP_DURATION is converted to an indication in the TXOP field of the HE-SIG-A field as described in Table 27-19, Table 27-21, and Table 27-22. The indication in the TXOP field of the HE-SIG-A field is converted to the RXVECTOR parameter TXOP_DURATION as described in Table 27-1.

A STA that is not a TXOP responder and that transmits an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU may set the TXVECTOR parameter TXOP_DURATION to UNSPECIFIED.

A STA that transmits an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU that carries a PS-Poll frame shall set the TXVECTOR parameter TXOP_DURATION to UNSPECIFIED.

A STA that is a TXOP responder that transmits an HE SU PPDU, HE ER SU PPDU, or HE TB PPDU shall set the TXVECTOR parameter TXOP_DURATION to UNSPECIFIED if the RXVECTOR parameter TXOP_DURATION of the HE PPDU that solicits a response from the STA is UNSPECIFIED.

An HE AP that has set the BSS Color Disabled field in the HE Operation element to 1 shall set the TXVECTOR parameter TXOP_DURATION to UNSPECIFIED for an HE PPDU that it transmits to non-AP STAs associated to it.

If the BSS Color Disabled field is 1 in the HE Operation element most recently received from an AP by a non-AP STA, then the non-AP STA should set the TXVECTOR parameter TXOP_DURATION to UNSPECIFIED for an HE PPDU that is not an HE TB PPDU sent to that AP.

A STA that transmits an HE TB PPDU shall not set the TXVECTOR parameter TXOP_DURATION to UNSPECIFIED if any one of the following conditions is met:

— The RXVECTOR parameter TXOP_DURATION is present for the PPDU that solicits a response from the STA and is not UNSPECIFIED.
— The PPDU that solicits a response from the STA is not an HE PPDU.

A STA that transmits a frame with a Duration field in an HE PPDU with the TXVECTOR parameter TXOP_DURATION not set to UNSPECIFIED shall set the TXVECTOR parameter TXOP_DURATION to the smaller of the duration information indicated by the Duration field and 8448.

NOTE 2—For a TXOP responder, the Duration field in a frame carried in a response PPDU is set based on the Duration field in a frame carried in the PPDU that solicits a response from the TXOP responder as described in 9.2.5.6 or 9.2.5.7

If a STA transmits either an HE TB feedback NDP or an HE TB PPDU carrying a PS-Poll frame with the TXVECTOR parameter TXOP_DURATION not set to UNSPECIFIED, it shall calculate the duration information and set the TXVECTOR parameter TXOP_DURATION for the HE TB feedback NDP or HE TB PPDU to the value of the computed duration information. The TXOP responder shall calculate duration information equal to the duration information indicated by the Duration field of the frame that solicits the response minus the time, in microseconds, between the end of the PPDU carrying the frame that is soliciting the HE TB PPDU and the end of the HE TB PPDU. If the calculated duration information includes a fractional microsecond, the duration information is rounded up to the next higher integer. If the calculated duration information is smaller than 8448 μs, the TXVECTOR parameter TXOP_DURATION shall be set to the calculated duration information. Otherwise, the TXVECTOR parameter TXOP_DURATION shall be set to 8448.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 3—The time is equal to SIFS plus the duration of the HE TB PPDU, where the duration of the HE TB PPDU is defined in Equation (27-147).

In the 6 GHz band, a TXOP holder shall not set the TXVECTOR parameter TXOP_DURATION for a transmitted HE PPDU to UNSPECIFIED, unless at least one of the following conditions is true:

— The BSS Color Disabled field is 1 in the HE Operation element transmitted within the BSS of which the TXOP holder is a member.
— The HE PPDU carries a PS-Poll frame.

26.11.6 SPATIAL_REUSE

The contents of the Spatial Reuse fields are carried in the TXVECTOR parameter SPATIAL_REUSE for an HE PPDU indicating spatial reuse information. The behavior of STAs upon reception of an HE PPDU with different SPATIAL_REUSE values is described in 26.10.2 and 26.10.3. The different values that may be indicated in the SPATIAL_REUSE parameter of the TXVECTOR are listed in Table 27-23 and Table 27-24. The value PSR_DISALLOW is used to prohibit PSR-based spatial reuse during the transmission of the corresponding PPDU. The value PSR_AND_NON_SRG_ OBSS_PD_PROHIBITED is used to prohibit both PSR-based spatial reuse and non-SRG OBSS PD-based spatial reuse during the transmission of the corresponding PPDU. The interpretations of other values are described in this subclause and in 26.10. The conditions for a STA to set the SPATIAL_REUSE parameter to its different values are described in this subclause.

For a PPDU with a value of HE_TB for the TXVECTOR parameter FORMAT, the SPATIAL_REUSE parameter contains an array of one to four values, depending on the TXVECTOR parameter CH_BANDWIDTH. If the TXVECTOR parameter CH_BANDWIDTH is CBW20, CBW40, or CBW80, the first value in the array is the SPATIAL_REUSE parameter that applies to the lowest frequency 20 MHz subband, the second value, if present, applies to the second lowest frequency 20 MHz subband, the third value, if present, applies to the third lowest frequency 20 MHz subband, and the fourth value, if present, applies to the highest frequency 20 MHz subband. If the TXVECTOR parameter CH_BANDWIDTH is CBW160 or CBW80+80, the first value in the array is the SPATIAL_REUSE parameter that applies to the lowest frequency 40 MHz subband, the second value applies to the second lowest frequency 40 MHz subband, the third value applies to the third lowest frequency 40 MHz subband, and the fourth value applies to the highest frequency 40 MHz subband. Each value in the SPATIAL_REUSE parameter array shall individually conform to the rules in this subclause.

An HE STA that transmits an HE TB PPDU sets the TXVECTOR parameter SPATIAL_REUSE as defined in 26.5.2.3.

An AP with dot11HEPSROptionImplemented set to true that transmits an HE ER SU PPDU that does not contain a Trigger frame should set the TXVECTOR parameter SPATIAL_REUSE to PSR_DISALLOW.

A non-AP STA with dot11HEPSROptionImplemented set to true that transmits an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU may set the TXVECTOR parameter SPATIAL_REUSE, when permitted by other conditions, to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED if the HESIGA Spatial Reuse Value15 Allowed subfield of the SR Control field of the most recently received Spatial Reuse Parameter Set element from its associated AP is equal to 1. Otherwise, the non-AP STA shall set it to PSR_DISALLOW.

An HE STA that transmits an HE TB PPDU determines the value of the TXVECTOR parameter SPATIAL_REUSE according to 26.5.2.3.

An HE AP with dot11HEPSROptionImplemented set to true that transmits an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU may set the TXVECTOR parameter SPATIAL_REUSE to PSR_DISALLOW to disallow OBSS STAs from performing PSR-based SR transmission during the duration of the corresponding PPDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An HE STA with dot11HEPSROptionImplemented set to false may set the TXVECTOR parameter SPATIAL_REUSE to PSR_DISALLOW for any PPDU that is not an HE TB PPDU, an HE NDP PPDU, a PPDU containing an HE NDP Announcement frame, or a PPDU containing a response to an HE NDP Announcement frame.

A STA shall set the TXVECTOR parameter SPATIAL_REUSE of an HE PPDU to PSR_DISALLOW or, if permitted by the other rules in this subclause, to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED, if the STA is a non-AP HE STA and the PSR Disallowed subfield of the SR Control field of the most recently received Spatial Reuse Parameter Set element from its associated AP is equal to 1.

An HE STA shall set the TXVECTOR parameter SPATIAL_REUSE to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED for an HE NDP PPDU.

An HE STA shall set the TXVECTOR parameter SPATIAL_REUSE to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED for a PPDU containing an NDP Announcement frame and in any frame that is transmitted as a response to an NDP Announcement frame.

A non-AP HE STA may set the TXVECTOR parameter SPATIAL_REUSE of an HE PPDU to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED if the HESIGA Spatial Reuse Value15 Allowed subfield of the SR Control field of the most recently received Spatial Reuse Parameter Set element from its associated AP is equal to 1. If the HESIGA Spatial Reuse Value15 Allowed subfield of the SR Control field of the most recently received Spatial Reuse Parameter Set element from its associated AP is equal to 0 or if STA has not received a Spatial Reuse Parameter Set element from its associated AP, the STA shall not set the TXVECTOR parameter SPATIAL_REUSE of any HE PPDU to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED, unless the HE PPDU contains an NDP, contains an NDP Announcement frame, or is a frame that is transmitted as a response to an NDP Announcement frame.

An AP HE STA may set the TXVECTOR parameter SPATIAL_REUSE of an HE PPDU to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED if the HESIGA Spatial Reuse Value15 Allowed subfield of the SR Control field of the most recently transmitted Spatial Reuse Parameter Set element is equal to 1. If the HESIGA Spatial Reuse Value15 Allowed subfield of the SR Control field of the most recently transmitted Spatial Reuse Parameter Set element is equal to 0, or if the AP has not transmitted a Spatial Reuse Parameter Set element, the AP shall not set the TXVECTOR parameter SPATIAL_REUSE of any HE PPDU to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED.

An HE AP that transmits an HE SU PPDU or an HE ER SU PPDU that contains a Trigger frame should set the TXVECTOR parameter SPATIAL_REUSE to SR_DELAYED. An HE STA that transmits an HE MU PPDU shall not set the TXVECTOR parameter SPATIAL_REUSE to SR_DELAYED.

An HE STA that transmits an HE SU PPDU or HE ER SU PPDU shall not set the TXVECTOR parameter SPATIAL_REUSE to SR_RESTRICTED.

An HE AP that transmits an HE MU PPDU that contains a Trigger frame should set the TXVECTOR parameter SPATIAL_REUSE to SR_RESTRICTED.

An HE STA that transmits a PPDU that does not contain a Trigger frame shall not set the TXVECTOR parameter SPATIAL_REUSE to SR_DELAYED or SR_RESTRICTED.

26.11.7 INACTIVE_SUBCHANNELS and RU_ALLOCATION

The indication of which subchannels are punctured in an HE sounding NDP or in an HE NDP Announcement frame that is carried in a non-HT duplicate PPDU is conveyed from the MAC to the PHY through the TXVECTOR parameters INACTIVE_SUBCHANNELS and RU_ALLOCATION. The parameter INACTIVE_SUBCHANNELS may be present in the TXVECTOR of a non-HT duplicate PPDU

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

that carries an HE NDP Announcement frame or of an HE sounding PPDU. The parameter INACTIVE_SUBCHANNELS shall not be present otherwise. The setting of the RU_ALLOCATION parameter for other PPDUs is specified in 26.5.2.3.3, 26.5.2.3.4, and 26.5.7.2.

INACTIVE_SUBCHANNELS is an 8-bit bitmap with an encoding that is the same as the encoding for the Disallowed Subchannel Bitmap subfield defined in 9.3.1.19. A bit in the INACTIVE_SUBCHANNELS bitmap is set to 1 to indicate that no energy is transmitted on the corresponding subchannel for the corresponding PPDU. The RU_ALLOCATION parameter is set to a value that corresponds to the puncturing signaled by the INACTIVE_SUBCHANNELS bitmap. If a bit in the INACTIVE_SUBCHANNELS bitmap corresponds to a 20 MHz subchannel outside the PPDU bandwidth, then the bit is set to 1.

A STA transmitting an HE sounding NDP may set the TXVECTOR parameter INACTIVE_SUBCHANNELS to any value, provided that the bit representing the primary 20 MHz channel is set to 0.

If an HE AP transmits an HE NDP Announcement frame in a PPDU with punctured channels, then the TXVECTOR parameters FORMAT, NON_HT_MODULATION, INACTIVE_SUBCHANNELS, and CH_BANDWIDTH shall be set as follows:

- The TXVECTOR parameter FORMAT shall be set to NON_HT.
- The TXVECTOR parameter NON_HT_MODULATION shall be set to NON_HT_DUP_OFDM.
- The INACTIVE_SUBCHANNELS parameter may have any value, except that the bit in the bitmap representing the primary 20 MHz subchannel shall be set to 0.
- The CH_BANDWIDTH parameter value shall be set to CBW80 if there are no bits set to 0 in the INACTIVE_SUBCHANNELS bitmap that correspond to any 20 MHz subchannel of the secondary 80 MHz and at least one bit set to 0 that corresponds to any 20 MHz subchannel of the secondary 40 MHz.
- The CH_BANDWIDTH parameter value shall be set to CBW160 if there is at least one bit set to 0 in the INACTIVE_SUBCHANNELS bitmap that corresponds to any 20 MHz subchannel of the secondary 80 MHz.

Each 8 bits of the RU_ALLOCATION are set to 113 (01110001 in binary representation) for the 242-tone RU that is most closely aligned in frequency with the 20 MHz subchannel that is indicated as disallowed by the value 1 in the INACTIVE_SUBCHANNELS parameter. Each 8 bits of the RU_ALLOCATION are set to 192 (11000000 in binary representation) for the 242-tone RU that is most closely aligned in frequency with the 20 MHz subchannel that is indicated as not disallowed by the value 0 in the INACTIVE_SUBCHANNELS parameter.

26.11.8 TRIGGER_RESPONDING

A non-AP HE STA that transmits a non-HT or non-HT duplicate PPDU shall set the TXVECTOR parameter TRIGGER_RESPONDING to true if the PPDU is sent in response to an MU-RTS Trigger frame. Otherwise, the non-AP HE STA shall set the TXVECTOR parameter TRIGGER_RESPONDING to false.

26.11.9 STBC and DCM

An HE STA shall not transmit an HE SU PPDU or HE ER SU PPDU with the TXVECTOR parameter STBC set to 1 if any of the following conditions is met:

- TXVECTOR parameter DCM is set to 1.
- TXVECTOR parameter NUM_STS is not equal to 2.
- TXVECTOR parameters HE_LTF_TYPE and GI_TYPE are set to 4x HE-LTF and 0u8s_GI, respectively.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An HE STA shall not transmit an HE TB PPDU with the TXVECTOR parameter STBC set to 1 if any of the following conditions is met:

— TXVECTOR parameter DCM is set to 1.
— TXVECTOR parameter NUM_STS is not equal to 2.

An HE STA shall not transmit an HE MU PPDU with the TXVECTOR parameter STBC set to 1 if any of the following conditions is met:

— At least one element in the TXVECTOR parameter DCM is set to 1.
— At least one element in the TXVECTOR parameter NUM_STS is not equal to 2.
— Two or more STA_ID parameters in the TXVECTOR use the same RU.

NOTE—Two or more STA_ID parameters in the TXVECTOR using the same RU means that DL MU-MIMO is used.

An HE STA shall not transmit an HE SU PPDU or HE ER SU PPDU with the TXVECTOR parameter STBC or DCM set to 1 if the TXVECTOR parameters HE_LTF_TYPE and GI_TYPE are set to 4x HE-LTF and 0u8s_GI, respectively.

26.11.10 POWER_BOOST_FACTOR

For an OFDMA HE MU PPDU, the POWER_BOOST_FACTOR parameter for an occupied RU in the TXVECTOR shall be in the range $[1/\sqrt{2}, \sqrt{2}]$ if the Power Boost Factor Support subfield of the HE PHY Capabilities Information field in the HE Capabilities element from any recipient STA of the PPDU equals 0; otherwise the POWER_BOOST_FACTOR parameter shall be in the range [1/2, 2].

For an HE SU PPDU, non-OFDMA HE MU PPDU and HE ER SU PPDU, the POWER_BOOST_FACTOR parameter in the TXVECTOR shall be set to 1.

NOTE—For an HE TB PPDU, the POWER_BOOST_FACTOR parameter is not present in the TXVECTOR.

26.12 HE PPDU post-FEC padding and packet extension

An HE STA with dot11PPEThresholdsRequired set to false may set the PPE Thresholds Present subfield in HE Capabilities elements that it transmits to 0.

An HE STA with dot11PPEThresholdsRequired set to true shall set the PPE Thresholds Present subfield in HE Capabilities elements that it transmits to 1.

A STA that sets the PPE Thresholds Present subfield to 0 and the Nominal Packet Padding subfield to 0 in HE Capabilities elements that it transmits has as a nominal packet padding of 0 μs for all constellations, NSS, and RU allocations that it supports.

A STA that sets the PPE Thresholds Present subfield to 0 and the Nominal Packet Padding subfield to 1 in the HE Capabilities elements that it transmits has a nominal packet padding of 8 μs for all constellations, NSS, and RU allocations that it supports.

A STA that sets the PPE Thresholds Present subfield to 0 and the Nominal Packet Padding subfield to 2 in the HE Capabilities elements that it transmits has nominal packet padding of 16 μs for all constellations, NSS, and RU allocations that it supports.

A STA that sets the PPE Thresholds Present subfield to 1 in the HE Capabilities elements that it transmits shall indicate its nominal packet padding per constellation, NSS and RU allocation by setting the subfields

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

of the PPE Thresholds field according to 9.4.2.247 and using the corresponding values from dot11PPEThresholdsMappingTable.

After receiving the PPE Thresholds field from a second STA, the first STA uses the combination of the PPET8 NSTS*n* RU*b* subfield and PPET16 NSTS*n* RU*b* subfield values to determine the nominal packet padding for HE PPDUs that are transmitted to the second STA, using NSTS = *n* and an RU allocation corresponding to RU Allocation Index b, for each value of NSTS and RU specified by the field. The nominal packet padding is used in computing the PE field duration (see 27.3.13).

NOTE 1—If the pre-FEC padding factor is 4, then the value of nominal T_{PE} is equal to the nominal packet padding (see Table 27-47).

For all values of *n* and *b* for which PPET8 and PPET16 are not present, the nominal packet padding is 0 for HE PPDUs that are transmitted to the STA using NSTS = *n* and an RU allocation corresponding to RU allocation index *b*. The nominal packet padding as a function of the PPE thresholds, the number of spatial streams, and the RU allocation index is described in Table 26-13.

Table 26-13—PPE thresholds per PPET8 and PPET16

Result of comparison of constellation index *x* of an HE PPDU with NSTS value *n* and RU allocation size that corresponds to RU Allocation index = (*b* + DCM) to the value in . . .		**Nominal packet padding for an HE PPDU transmitted to this STA using constellation index = *x*, NSTS = *n*, and RU allocation size that corresponds to RU Allocation index = (*b* + DCM)**
PPET8 NSTS*n* RU (*b* + DCM) subfield	**PPET16 NSTS*n* RU (*b* + DCM) subfield**	
x greater than or equal to PPET8	*x* less than PPET16 or PPET16 equal to None	8 µs
x greater than PPET8 or PPET8 equal to None	*x* greater than or equal to PPET16	16 µs
All other combinations not otherwise listed in this table		0
NOTE—DCM = 1 if the HE PPDU uses DCM; DCM = 0 otherwise.		

In Table 26-13, "RU Allocation index = (*b* + DCM)" means the following. With the exception of a 2×996-tone RU, if DCM is applied in a given RU, the nominal packet padding value is based on the next larger RU size (RU index + 1). For example, if DCM is applied to a 242-tone RU, then the nominal packet padding value for a 484-tone RU is used. If DCM is applied to 106-tone RU, then the nominal packet padding value for a 242-tone RU is used. If DCM is applied to a 2×996-tone RU, then the nominal packet padding value for a 2×996-tone RU is used.

The nominal packet padding value shall be 0 for all RU less than 242, unless the RU size is 106 and DCM is enabled.

A STA transmitting an HE PPDU provides the nominal packet padding in the TXVECTOR parameter NOMINAL_PACKET_PADDING for the minimal PE calculation (see 27.3.13).

A STA transmitting an HE PPDU that carries a broadcast frame shall set the value of the TXVECTOR parameter NOMINAL_PACKET_PADDING to 16 µs. A STA transmitting an HE PPDU that carries a group addressed, but not broadcast, frame shall not set the value of the TXVECTOR parameter NOMINAL_PACKET_PADDING to a value that is less than that required for any of the recipients in the group.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A STA transmitting an HE PPDU to a receiving STA shall include post-FEC padding determined by the pre-FEC padding factor (see 27.3.12); and after including the post-FEC padding, the transmitting STA shall include a packet extension with a duration indicated by the TXVECTOR parameter NOMINAL_PACKET_PADDING (see 27.3.13).

A STA A shall set the value of the TXVECTOR parameter NOMINAL_PACKET_PADDING to 16 µs when transmitting to a STA B if the STA A has not received a frame including the HE Capabilities element from the STA B.

NOTE 2—One such situation is an AP transmitting to an unassociated STA. Another such situation is an unassociated STA transmitting to an AP without having received a management frame including an HE Capabilities element from the AP, such as a Beacon or Probe Response frame.

26.13 Link adaptation using the HLA Control subfield

This subclause applies to frame exchange sequences that include PPDUs containing an HE variant HT Control field.

An HE STA shall set the HE Link Adaptation Support subfield in the HE Capabilities Information field in the HE Capabilities element it transmits to the value of dot11HEMCSFeedbackOptionImplemented.

A STA that supports HE link adaptation using the HLA Control subfield shall set the HE Link Adaptation Support subfield in the HE Capabilities Information field in the HE Capabilities element to 2 or 3, depending on its own link adaptation feedback capability. A STA shall not send an MRQ to a STA that has not set the HE Link Adaptation Support subfield to 3 in the HE Capabilities Information field in the HE Capabilities element. A STA shall not send an unsolicited MFB in any frame that contains an HLA Control subfield to a STA that has not set the HE Link Adaptation Support subfield to either 2 or 3 in the HE Capabilities Information field in the HE Capabilities element.

The MFB requester may set the MRQ subfield to 1 and Unsolicited MFB subfield to 0 in the HLA Control subfield of a frame to request a STA to provide link adaptation feedback. In each request, the MFB requester shall set the MSI field to a value ranging from 0 to 6. For the MFB requester, how to choose the MSI value is implementation dependent.

The appearance of more than one instance of an HLA Control subfield with the MRQ field equal to 1 within a single PPDU shall be interpreted by the receiver as a single request for link adaptation feedback.

The MFB requester shall specify the RU index and BW requesting the link adaptation feedback.

On receipt of an HLA Control subfield with the MRQ subfield equal to 1, an MFB responder computes the HE-MCS, NSS, and DCM of the RU and BW specified in the MRQ, and these estimates are based on the same RU of the PPDU carrying the MRQ. The PPDU carrying MRQ shall include the RU requested for MFB. The MFB responder labels the result of this computation with the MSI value from the HLA Control subfield in the received frame carrying the MRQ. The MFB responder may include the received MSI value in the MSI field of the corresponding response frame. In the case of a delayed response, this allows the MFB requester to associate the MFB with the soliciting MRQ.

An MFB responder that sends a solicited MFB shall set the Unsolicited MFB subfield to 0 and MRQ subfield to 0 in the HLA Control subfield.

The STA receiving MFB may use the received MFB to compute the appropriate HE-MCS, DCM, and NSS.

The MFB responder may send a solicited response frame with any of the following combinations of HE-MCS, NSS, and MSI:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

- HE-MCS = 15, NSS = 7, MSI = 0–6: the responder does not provide feedback for the request that had the MSI value.
- HE-MCS = valid value, NSS = valid value, MSI = 0–6: the responder is providing feedback for the request that had the MSI value. The MSI value in the response frame matches the MSI value of the MRQ request.

A STA sending unsolicited MFB using the HLA Control subfield shall set the Unsolicited MFB subfield to 1.

Unsolicited HE-MCS, NSS, DCM, BW, and RU estimates reported in an HLA Control subfield sent by a STA are computed based on the most recent PPDU received by the STA that matches the description indicated by the PPDU format, Tx Beamforming, and Coding Type subfields in the same HLA Control subfield.

In an unsolicited MFB response the PPDU Formats, Coding Type, and Tx Beamforming subfields are set according to the RXVECTOR parameters of the received PPDU from which the HE-MCS, RU, BW, and NSS are estimated, as follows:

- The PPDU format subfield is set and encoded as follows:
  - 0 if the parameter FORMAT is equal to HE_SU
  - 1 if the parameter FORMAT is equal to HE_MU
  - 2 if the parameter FORMAT is equal to HE_ER_SU
  - 3 if the parameter FORMAT is equal to HE_TB
- The Coding Type subfield is set to 0 if the parameter FEC_CODING is equal to BCC_CODING and set to 1 if that parameter is equal to LDPC_CODING.
- The Tx Beamforming subfield is set to 1 if the parameter BEAMFORMED is equal to 1 and set to 0 if that parameter is equal to 0.
- The BW subfield shall indicate a bandwidth less than or equal to the bandwidth indicated by the parameter CH_BANDWIDTH.
- The RU subfield indicates the RU at which the recommended HE-MCS is applied. The recommended RU shall be within an RU or a bandwidth in which the received HE PPDU is located.

For either a solicited or an unsolicited response, the recommended HE-MCS and NSS subfields of HLA Control subfield shall be selected from the HE-MCS and NSS set supported by the recipient STA.

The HE-MCS subfield of HLA Control subfield is the recommended data rate, for given transmission properties carried in the RXVECTOR of the PPDU used for MFB estimation, which results in an estimated frame error rate of 10% or lower for an MPDU length of 3895 octets.

NOTE—Some HE PPDU might not be able to carry 3895 octets due to PPDU duration limitations.

If the MFB requester sets the MRQ subfield to 1 and sets the MSI subfield to a value that matches the MSI subfield value of a previous request for which the responder has not yet provided feedback, the responder shall discard or abandon the computation for the MRQ that corresponds to the previous use of that MSI subfield value and start a new computation based on the new request.

A STA may respond immediately to a current request for MFB with a frame containing an MSI field value and NSS, HE-MCS, and DCM subfields that correspond to a request that precedes the current request.

A non-AP HE STA may set the UL HE TB PPDU MFB to 1 in the HLA Control field it transmits to the AP to indicate that the NSS, HE-MCS, DCM, BW, and RU Allocation in the HLA Control field represent the recommended MFB for the HE TB PPDU sent from the non-AP HE STA. The AP should not exceed the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

recommended RU size indicated in the most recently received RU Allocation field of the HLA Control field when it sends a triggering frame addressed to the STA.

26.14 Power management

26.14.1 Intra-PPDU power save for non-AP HE STAs

Intra-PPDU power save is the power save mechanism for an HE STA to enter the doze state or become unavailable until the end of a received PPDU that is identified as an intra-BSS PPDU. The STA can enter the doze state if it is in PS mode and can become unavailable if it is in active mode (see 11.2.3.2).

A non-AP HE STA that has dot11IntraPPDUPowerSaveOptionActivated equal to true operates in intra-PPDU power save mode.

A non-AP HE STA that is in intra-PPDU power save mode may enter the doze state or become unavailable until the end of a PPDU currently being received if one of the following conditions is met:

- The PPDU is an HE MU PPDU where the RXVECTOR parameter BSS_COLOR is the BSS color of the BSS in which the STA is associated, the RXVECTOR parameter UPLINK_FLAG is 0, the RXVECTOR parameters STA_ID do not include the identifier of the STA or the broadcast identifier(s) intended for the STA, and the BSS Color Disabled subfield is 0 in the most recently received HE Operation element from the AP with which it is associated.
- The PPDU is an HE MU PPDU, HE SU PPDU, or HE ER SU PPDU and one of the following conditions is true:
  - The RXVECTOR parameter BSS_COLOR is the BSS color of the BSS in which the STA is associated, the RXVECTOR parameter UPLINK_FLAG is 1, and the BSS Color Disabled subfield is 0 in the most recently received HE Operation element from the AP with which it is associated.
  - The RXVECTOR parameter BSS_COLOR is the BSS color of the BSS in which the STA is associated, the RXVECTOR parameter UPLINK_FLAG is 0, a PHY-RXEND.indication(UnsupportedRate) primitive was received, and the BSS Color Disabled subfield is 0 in the most recently received HE Operation element from the AP with which it is associated.
- The PPDU is an HE TB PPDU where the RXVECTOR parameter BSS_COLOR is the BSS color of the BSS in which the STA is associated and the BSS Color Disabled subfield is 0 in the most recently received HE Operation element from the AP with which it is associated.
- The PPDU is a VHT PPDU where the RXVECTOR parameter PARTIAL_AID is the BSSID[39:47] of the BSS in which the STA is associated or any of the other BSSs in the same multiple BSSID set or co-hosted BSSID set to which its BSS belongs and the RXVECTOR parameter GROUP_ID is 0.
- The PPDU contains:
  - An A-MPDU including an MPDU with a TA or an RA equal to either the BSSID of the BSS to which the STA is associated, or any of the other BSSs in the same multiple BSSID set, or co-hosted BSSID set to which the STA belongs, and
  - The RA is not the individual address of the STA or the group address(es) of the STA.
- The PPDU is either an HE MU PPDU with the RXVECTOR parameter UPLINK_FLAG set to 0 or a VHT MU PPDU containing an A-MPDU and
  - The RAs of the MPDUs in the A-MPDU are equal to the STA's individual address and
  - The STA has received in the A-MPDU at least one MPDU delimiter with the value of EOF equal to 1 and with an MPDU length field equal to 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A non-AP HE STA that is in intra-PPDU power save mode and has entered doze state or has become unavailable shall continue to operate its NAV timers and to consider the medium busy and shall transition to the awake state at the end of the PPDU.

A non-AP HE STA that is in intra-PPDU power save mode may discard a PPDU identified as an inter-BSS PPDU as defined in 26.2.2 until the end of the PPDU.

NOTE—The STA can contend for access to the medium immediately on the expiry of the NAV timers.

26.14.2 Power save with UORA and TWT

This subclause defines the power save mechanisms for a non-AP HE STA that is operating in PS mode and is UORA and TWT capable.

An HE AP may indicate start times for one or more broadcast TWT SPs containing Trigger frames with random access allocations in the broadcast TWT element that is included in a Management frame as described in 26.8.3.2. An example of power save operation is shown in Figure 26-14.

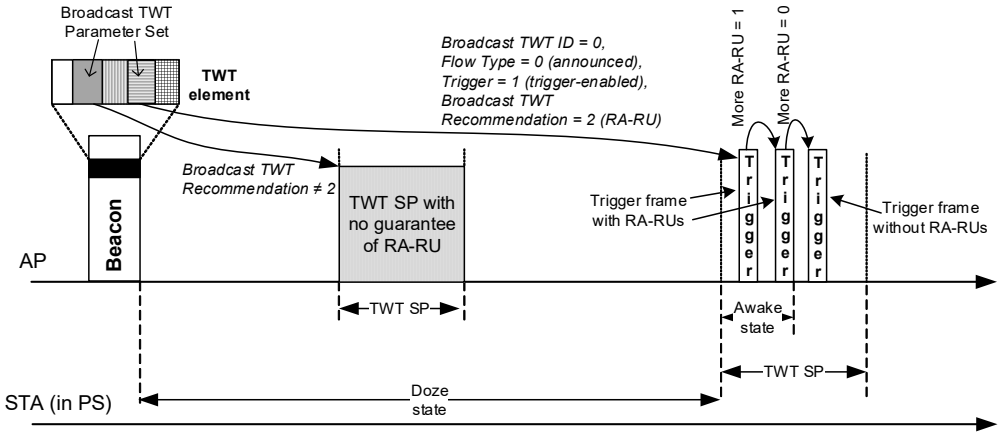

Figure 26-14—Example of power save operation with UORA and TWT

A TWT SP with RA-RU is a TWT SP corresponding to a Broadcast TWT Parameter Set field in a TWT element that has a Broadcast TWT ID subfield equal to 0, Flow Type subfield equal to 0, Trigger subfield equal to 1, and a Broadcast TWT Recommendation subfield equal to 2. An associated HE STA that supports the TWT and UORA procedure when operating in PS mode, upon receiving a Beacon frame from its associated AP carrying a TWT element indicating a schedule for TWT SP(s) with RA-RU, may enter the doze state if no other condition requires it to be awake. The STA may transition to awake state at the start of a TWT SP with RA-RU and follow the procedure in 26.5.4) to send an HE TB PPDU to its associated AP.

An HE STA shall follow the procedure described in 26.8.5 to determine if a TWT SP termination event has occurred and may enter doze state if no other condition requires the STA to remain awake.

A non-AP HE STA shall decrement its OBO counter by following the procedure in 26.5.4.3. If the OBO counter decrements to a nonzero value, then the STA may enter the doze state until the end of the current TWT SP if the STA has not declared to the AP that it is in awake state (as described in 26.8.3.3), no other condition requires it to remain awake, and one of the following conditions is met:

— The More TF subfield in the Common Info field of the Trigger frame is equal to 0.
— The More TF subfield in the Common Info field of the Trigger frame is equal to 1, and the More RA-RU subfield in the User Info field is equal to 0 indicating that subsequent Trigger frames in the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

current broadcast TWT SP will not include RA-RUs matching the value in AID12 subfield (see Table 9-52).

26.14.3 Opportunistic power save

26.14.3.1 General

An OPS non-AP STA is a non-AP HE STA that sets the OPS Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element to 1.

An OPS AP is an AP HE STA that sets the OPS Support subfield in the HE MAC Capabilities Information field in HE Capabilities element to 1.

The objective of the opportunistic power save mechanism is to allow OPS non-AP STAs to be unavailable or to be in doze state so that they can save power for a defined period.

The opportunistic power save mechanism has two modes: aperiodic and periodic.

In the aperiodic mode, an OPS AP sends an OPS frame or a FILS Discovery frame at any time to provide the scheduling information for all OPS non-AP STAs for the OPS period that follows the transmission of the OPS frame or FILS Discovery frame. Based on this information, the OPS non-AP STAs that are in active mode may be unavailable during the OPS period, and the OPS non-AP STAs that are in PS mode may be in doze state during the OPS period.

In the periodic mode, an OPS AP splits a beacon interval into several periodic broadcast TWT SPs and provides, at the beginning of each SP, the scheduling information for all OPS non-AP STAs. Based on this information, the OPS non-AP STAs that are in active mode may be unavailable until the next TWT SP, and the OPS non-AP STAs that are in PS mode may be in doze state until the next TWT SP.

26.14.3.2 AP operation for opportunistic power save

To enable aperiodic opportunistic power save, an OPS AP shall schedule for transmission an OPS frame or a FILS Discovery frame with the RA field set to the broadcast address that includes a TIM element (see 9.4.2.5) and an OPS element (see 9.4.2.256). The AP should transmit a FILS Discovery frame instead of an OPS frame if the target transmission time closely aligns with the transmission time of a FILS Discovery frame. The OPS Duration field in the OPS element shall be set to the duration of the OPS period that immediately follows the transmission of the OPS frame or FILS Discovery frame. The TIM element is encoded specifically as defined in 9.4.2.5 in order to identify which STAs are not scheduled during the OPS period. If the OPS AP sets the bit corresponding to an OPS non-AP STA in the traffic indication virtual bitmap field carried by the Partial Virtual Bitmap field of the TIM element of the OPS frame or FILS Discovery frame to 0, the AP should send neither individually addressed frames to the STA nor Trigger frames with a User Info field that addresses the STA during the OPS period.

For the APs in a multiple BSSID set, only the AP corresponding to the transmitted BSSID may transmit an OPS frame; other APs corresponding to nontransmitted BSSIDs shall not transmit an OPS frame.

To enable periodic opportunistic power save, an OPS AP shall include a TWT element in beacons to set a periodic Broadcast TWT SP with the following information:

— The Broadcast TWT Recommendation field set to 3
— The Broadcast TWT ID subfield set to 0

At the beginning of these periodic TWT SPs with the Broadcast TWT Recommendation field set to 3, the AP shall schedule for transmission a TIM frame or a FILS Discovery frame with the RA field set to the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

broadcast address that includes a TIM element (see 9.4.2.5). The FILS Discovery frame may include an OPS element. The AP should transmit a FILS Discovery frame instead of a TIM frame if the TWT SP start time closely aligns with the transmission time of a FILS Discovery frame. If the OPS AP also operates with TIM Broadcast and uses TIM frames for opportunistic power save, the OPS AP should align the transmission time of a TIM frame for TIM Broadcast with the start time of the broadcast TWT SP with the Broadcast TWT Recommendation field set to 3. If the OPS AP sets the bit corresponding to an OPS non-AP STA in the traffic indication virtual bitmap carried in the Partial Virtual Bitmap field of the TIM element of the TIM frame or FILS Discovery frame to 0, the AP should send neither individually addressed frames to the STA nor Trigger frames with a User Info field that addresses the STA during the TWT SP, until the next TWT SP with the Broadcast TWT Recommendation field set to 3.

26.14.3.3 STA operation for opportunistic power save

With aperiodic opportunistic power save, if an OPS non-AP STA with AID *N* that is in the awake state receives a TIM element and an OPS element in an OPS frame or a FILS Discovery frame from the associated OPS AP, then the STA may be unavailable if the STA is in active mode or may be in doze state if the STA is in PS mode until the end of the OPS period indicated in the OPS element, if the bit *N* in the traffic indication virtual bitmap carried in the Partial Virtual Bitmap field of the current TIM element is 0, unless other conditions not related to operation with the OPS AP require the STA to be in the awake state. At the end of the OPS period, the STA shall be in the awake state, unless determined otherwise by other power save protocols.

With periodic opportunistic power save, if an OPS non-AP STA with AID *N* that is in the awake state receives from the associated OPS AP a TIM element with bit *N* of the traffic indication virtual bitmap field equal to 0 in a TIM frame or FILS Discovery frame within a broadcast TWT SP with the Broadcast TWT Recommendation field set to 3, then the STA may be unavailable if the STA is in active mode or may be in doze state if the STA is in PS mode during the TWT SP and until the next TWT SP with the Broadcast TWT Recommendation field set to 3, unless other conditions not related to operation with the OPS AP require the STA to be in the awake state.

An OPS non-AP STA shall not operate with TIM broadcast procedure if its associated AP is an OPS AP.

26.14.4 HE dynamic SM power save

A STA that supports HE dynamic SM power save has dot11HEDynamicSMPowerSaveOptionImplemented set to true and shall set the HE Dynamic SM Power Save subfield in the HE MAC Capabilities Information field in the HE Capabilities element it transmits to 1.

A non-AP HE STA in dynamic SM power save mode (see 11.2.6) that sets the HE Dynamic SM Power Save subfield in the HE MAC Capabilities Information field in the HE Capabilities element it transmits to 1 shall follow the dynamic SM power save procedures defined in 11.2.6 and shall also enable its multiple receive chains if it responds to a Trigger frame that starts a frame exchange sequence that satisfies the following conditions:

— The Trigger frame is transmitted with a single spatial stream.
— The Trigger frame is from the associated AP or from the AP corresponding to the transmitted BSSID if the non-AP HE STA is associated with an AP corresponding to a nontransmitted BSSID and has indicated support for receiving Control frames with TA set to the transmitted BSSID by setting the Rx Control Frame To MultiBSS subfield to 1 in the HE Capabilities element that the non-AP HE STA transmits.
— The Trigger frame is an MU-RTS Trigger frame, BSRP Trigger frame, or BQRP Trigger frame that includes a User Info field with the AID12 subfield equal to the 12 LSBs of the AID of the non-AP HE STA (see 26.5.2.2.1).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The non-AP HE STA shall, subject to its spatial stream capabilities (see 9.4.2.54.4, 9.4.2.156.3, and 9.4.2.247) and operating mode (see 11.40 and 26.9), be capable of receiving a PPDU that is sent using more than one spatial stream a SIFS after the end of the PPDU that it sends in response. The STA may switch back to single receive chain mode immediately after the end of the frame exchange sequence.

NOTE 1—A Trigger frame always solicits an immediate response.

NOTE 2—A non-AP HE STA that is in dynamic SM power save mode and that sets the HE Dynamic SM Power Save subfield in the HE MAC Capabilities Information field in the HE Capabilities element it transmits to 1 cannot distinguish between a Trigger frame that precedes a MIMO transmission and a Trigger frame that does not precede a MIMO transmission and, therefore, always enables its multiple receive chains if it responds to an MU-RTS Trigger frame, BSRP Trigger frame, or BQRP Trigger frame that has a User Info field addressed to it.

NOTE 3—The STA determines the end of the frame exchange sequence as described in 11.2.6.

26.15 PPDU format, BW, MCS, NSS, and DCM selection rules

26.15.1 General

An HE STA can transmit different PPDU formats, and use different transmit parameters such as channel width, MCS, NSS, DCM. Subclause 26.15 defines the rules followed by an HE STA for selecting these parameters depending on the capabilities of the intended receiver(s) and other considerations.

26.15.2 PPDU format selection

An HE STA that transmits non-HT, HT, or VHT PPDUs shall follow the rules in 10.6. An HE STA may transmit an HE SU PPDU to a peer HE STA subject to the restrictions defined in this subclause.

An HE AP may transmit an HE MU PPDU as defined in 26.5.1. A non-AP HE STA transmits HE TB PPDUs as defined in 26.5.2.

A STA shall not transmit a 242-tone HE ER SU PPDU to a peer non-AP STA if the most recently received OM Control field from that peer non-AP STA, if any, has the ER SU Disable subfield equal to 1.

A STA shall not transmit a 242-tone HE ER SU PPDU to an AP if the most recently received HE Operation element from that AP has the ER SU Disable subfield equal to 1.

A STA shall not transmit a 106-tone HE ER SU PPDU to a peer STA if the HE Capabilities element received from that peer STA has the Partial Bandwidth Extended Range field equal to 0.

A non-AP STA, TDLS STA, or IBSS STA shall not transmit a 20 MHz HE MU PPDU with only a 106-tone RU to a peer STA, unless it has received from the peer STA an HE Capabilities element with the Rx Partial BW SU In 20 MHz HE MU PPDU subfield in the HE PHY Capabilities Information field equal to 1.

NOTE 1—A non-AP STA transmitting an HE MU PPDU sets the TXVECTOR parameter UPLINK_FLAG to 1 if the PPDU is sent to the AP and to 0 if the PPDU is sent to a TDLS STA (see 26.11.2). The HE MU PPDU format enables the non-AP STA to include its AID (i.e., transmitter's AID if the UPLINK_FLAG is 1 and the receiver's AID if the UPLINK_FLAG is 0) in the PHY header of the PPDU, and its use is beyond the scope of this standard.

NOTE 2—Only a 106-tone RU is allowed for a 20 MHz HE MU PPDU that does not span the entire 20 MHz bandwidth and is intended for a single user according to the rules for RU allocation (see 26.5.1.3).

NOTE 3—Since there is no entry for an RU Allocation subfield in a n HE-SIG-B field (see Table 27-27) defined for just a single 106-tone RU, at least two RUs are indicated in the RU Allocation subfield and two or more corresponding User fields are required in the HE-SIG-B field.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An HE STA shall not transmit an HE MU PPDU with a single user being allocated an RU occupying the entire PPDU bandwidth and a compressed HE-SIG-B field to a peer STA, unless the HE STA has received from the peer STA an HE Capabilities element with the Rx Full BW SU Using HE MU PPDU With Compressed HE-SIG-B subfield in the HE PHY Capabilities Information field equal to 1.

An HE STA shall not transmit an HE MU PPDU with a single user being allocated an RU occupying the entire PPDU bandwidth and a noncompressed HE-SIG-B field to a peer STA, unless the PPDU bandwidth is less than or equal to 80 MHz and the HE STA has received from the peer STA an HE Capabilities element with the Rx Full BW SU Using HE MU PPDU With Non-Compressed HE-SIG-B subfield in the HE PHY Capabilities Information field equal to 1.

NOTE 4—An HE AP does not transmit an HE MU PPDU for full-bandwidth MU-MIMO transmission with noncompressed HE-SIG-B field format (see 27.3.2.5).

An HE STA shall send Control frames following the rules defined in 10.6.6 with the following exceptions:

- A Control frame shall be carried in an HT PPDU, VHT PPDU, HE ER SU PPDU, or HE SU PPDU when the Control frame is sent using an STBC frame.
- A Control frame sent by the AP as a response to an HE TB PPDU may be carried in any PPDU format that is supported by the intended receivers.
- A Trigger frame that is not an MU-RTS Trigger frame may be carried in any PPDU format that is supported by the intended receivers subject to the restrictions in 26.5.2.
- A Control frame is carried in an HE TB PPDU if it is sent as a response to a PPDU that contains a Trigger frame that is not an MU-RTS Trigger frame or if it is sent as a response to a PPDU that contains a frame containing a TRS Control subfield (see 26.5.2).
- A Control frame sent by an HE STA as a response to an HE ER SU PPDU that does not contain a triggering frame should be carried in an HE ER SU PPDU, unless the most recent PPDU sent by the HE STA to the recipient of the Control frame, after association, was not an HE ER SU PPDU. In this case, the Control frame should be carried in a non-HT PPDU.
- A Control frame sent by an HE STA as a response to an HE SU PPDU or a non-HT PPDU that does not contain a triggering frame should be carried in a non-HT PPDU, unless the most recent PPDU sent by the HE STA to the recipient of the Control frame, after association, was an HE ER SU PPDU. In this case, the Control frame should be carried in an HE ER SU PPDU.
- A control response frame shall not be sent in an HE ER SU PPDU if the channel bandwidth of the PPDU containing the frame that elicited the response is greater than 20 MHz.
- A Control frame that is not solicited by another frame and is not a Trigger frame may be carried in an HE ER SU PPDU.
- A Control frame that is sent in the 6 GHz band as a response to an HE SU PPDU or HE MU PPDU but that is not carried in an HE TB PPDU may be carried in an HE SU PPDU if the transmit time of HE SU PPDU is less than or equal to the PPDU duration of a non-HT PPDU containing the Control frame sent at the primary rate (see 10.6.6.5.2).

NOTE 5—A change in the format of the PPDU containing the control response frame (between non-HT and HE ER SU PPDU) occurs in subsequent TXOPs. A STA that solicits a control response frame from a responding STA accounts for the PPDU format of the control response frame to calculate the expected duration of the TXOP. The responding STA determines that the most recent PPDU sent to the soliciting STA is received if it receives an immediate acknowledgment by the soliciting STA in response to the PPDU.

NOTE 6—A STA does not transmit a Control frame in an HE ER SU PPDU to a receiving STA, unless the receiving STA indicates that HE ER SU PPDU reception is enabled.

During an EDCA FTM session, an HE STA should send an Ack frame that is the response to an FTM frame carried in a VHT PPDU or HT PPDU in the same PPDU format as the PPDU carrying the FTM frame. It

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

shall also send an Ack frame in an HE SU PPDU in response to an FTM frame carried in an HE SU PPDU format; see 26.17.2.

26.15.3 MCS, NSS, BW, and DCM selection

An HE STA shall follow the rules defined in 10.6 and 26.15.4 for selecting the rate, MCS, and NSS and the rules defined in 10.3.2.7, 10.3.2.9, 10.6.6, and 10.6.12 for selecting the channel width (BW) of transmitted PPDUs with the following exceptions:

— HE-MCS, NSS, and BW selection for an HE TB PPDU is defined in 26.5.2.3.

— Rate and BW selection for a CTS sent in response to an MU-RTS Trigger frame is defined in 26.2.6.

— A STA that transmits a Control frame carried in a non-HT PPDU that is a response to a frame received in an HE ER SU PPDU shall set the rate of the non-HT PPDU to 6 Mb/s.

— A STA that transmits a Control frame that is an S-MPDU carried in an HE ER SU PPDU and that is a response to a frame received in an HE ER SU PPDU shall use the <HE-MCS, NSS> tuple <HE-MCS 0, 1>.

— NSS and BW selection is further constrained as defined in 11.40, 26.9, 26.15.2, 26.15.4 through 26.15.8, and 26.17.

An HE STA that transmits an HE PPDU to a receiving STA shall use an <HE-MCS, NSS> tuple that is supported by the receiving STA as indicated by the Supported HE-MCS And NSS Set field in the HE Capabilities element that the receiving STA transmits. If the Supported HE-MCS and NSS set of a receiving STA is not known, the transmitting STA shall transmit using a <HE-MCS, NSS> tuple in the basic HE-MCS and NSS set if the basic HE-MCS and NSS set is not empty. Otherwise, the transmitting STA shall transmit using a <HE-MCS, NSS> tuple in the mandatory HE-MCS and NSS set. An HE STA is subject to all of the rules for HT STAs and VHT STAs that apply to its operating band (see 10.27).

An HE STA may transmit an HE PPDU with 1024-QAM on a 26-, 52-, and 106-tone RU to a recipient STA if it has received from the recipient STA an HE Capabilities element with the Rx 1024-QAM < 242-tone RU Support subfield in the HE PHY Capabilities Information field equal to 1; otherwise, the HE STA shall not transmit an HE PPDU with 1024-QAM on a 26-, 52-, and 106-tone RU.

An HE AP shall not set the UL HE-MCS subfield of a User Info field in a Trigger frame to 10 or 11 for a 26-, 52-, or 106-tone RU allocation, unless the User Info field is addressed to a non-AP HE STA from which the HE AP has received an HE Capabilities element with the Tx 1024-QAM < 242-tone RU Support subfield in the HE PHY Capabilities Information field equal to 1.

An HE STA that sends a Control frame in response to a frame carried in an HE SU PPDU, or HE ER SU PPDU, or HE MU PPDU that carries a frame with the Normal Ack or Implicit BAR ack policy shall set the TXVECTOR parameter CH_BANDWIDTH to indicate a channel width that is the same as the channel width indicated by the RXVECTOR parameter CH_BANDWIDTH of the frame eliciting the response. If the most recently received PPDU sent by the responding STA to the soliciting STA after association was an HE ER SU PPDU, the soliciting STA shall set the TXVECTOR parameter CH_BANDWIDTH to CBW20 for an HE SU PPDU and to ER-RU-242 or ER-RU-H-106 for an HE ER SU PPDU.

NOTE 1—A preamble punctured HE MU PPDU cannot carry a frame with Normal Ack or Implicit BAR ack policy whose acknowledgment would be transmitted in one or more punctured 20 MHz channels of the preamble punctured HE MU PPDU (see 26.4.4.3).

If a control response frame is transmitted in an HE SU PPDU or HE MU PPDU, the channel width (CH_BANDWIDTH parameter of the TXVECTOR) shall be selected first according to 10.6.6.6, and then the <HE-MCS, NSS> tuple shall be selected from a set of <HE-MCS, NSS> tuples called the *CandidateMCSSet*. The CandidateMCSSet is defined in 10.6.6.5.3, except that the set additionally contains the <HE-MCS, NSS> tuples for an HE STA.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An HE STA may transmit an HE SU PPDU or HE ER SU PPDU with DCM applied to the Data field to a recipient STA if it has received from the recipient STA an HE Capabilities element with the DCM Max Constellation Rx subfield in the HE PHY Capabilities Information field greater than 0; otherwise, the HE STA shall not transmit an HE SU PPDU or HE ER SU PPDU with DCM applied to the Data field to the recipient STA.

An HE STA may transmit to a recipient STA an HE MU PPDU with DCM applied to the HE-SIG-B field and/or an RU in the Data field addressed to the STA if it has received from the recipient STA an HE Capabilities element with the DCM Max Constellation Rx subfield in the HE PHY Capabilities Information field greater than 0; otherwise, the HE STA shall not transmit to the recipient STA an HE MU PPDU with DCM applied to the HE-SIG-B field and/or an RU in the Data field addressed to the STA.

An HE STA transmits an HE TB PPDU with DCM as defined in 26.5.2.3. An HE AP shall not set the DCM subfield of a User Info field in a Trigger frame to 1 if it has not received from the recipient STA an HE Capabilities element with the DCM Max Constellation Tx subfield in the HE PHY Capabilities Information field greater than 0.

An HE STA that transmits an HE PPDU with DCM applied to the Data field to a recipient STA shall use an RU size that is less than or equal to the maximum RU size indicated in the DCM Max RU subfield in the HE PHY Capabilities Information field in the HE Capabilities element received from the recipient STA.

An HE AP that transmits a Trigger frame addressed to a recipient STA that solicits an HE TB PPDU with DCM shall set the RU Allocation subfield in the Trigger frame to indicate an RU size that is less than or equal to the maximum RU size indicated in the DCM Max RU subfield in HE PHY Capabilities Information field in the HE Capabilities element received from the recipient STA.

An HE STA that transmits an HE PPDU with DCM applied to the Data field to a recipient STA shall use an NSS that is less than or equal to the value indicated in the DCM Max NSS Rx subfield in the HE PHY Capabilities Information field in the HE Capabilities element received from the recipient STA.

An HE AP that transmits a Trigger frame with a User Info field addressed to a recipient STA and with the UL DCM subfield in the User Info field set to 1 shall set the Number Of Spatial Streams subfield in the SS Allocation subfield in the User Info field to less than or equal to the DCM Max NSS Tx subfield in HE PHY Capabilities Information field in the HE Capabilities element received from the recipient STA.

An HE AP shall not transmit a Trigger frame with the UL STBC subfield set to 1 and the UL BW subfield set to indicate a bandwidth less than or equal to 80 MHz if at least one User Info field is addressed to a non-AP HE STA from which the HE AP has received an HE Capabilities element with the STBC Tx ≤ 80 MHz subfield in HE PHY Capabilities Information field equal to 0.

An HE AP shall not transmit a Trigger frame with the UL STBC subfield set to 1 and the UL BW subfield set to indicate 80+80 MHz or 160 MHz if at least one User Info field is addressed to a non-AP HE STA from which the HE AP has received an HE Capabilities element with the STBC Tx > 80 MHz subfield in HE PHY Capabilities Information field equal to 0.

An HE STA that sends a Control frame in an HE ER SU PPDU format should use

— DCM encoding if the most recently received PPDU sent by the HE STA, after association, to the STA soliciting the Control frame used DCM; otherwise, the STA should not use DCM for the Control frame.
— 106-tone HE ER SU PPDU if the most recently received PPDU sent by the HE STA, after association, to the STA soliciting the Control frame was a 106-tone HE ER SU PPDU; otherwise, the STA should not use a 106-tone HE ER SU PPDU for the Control frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 2—Transmit parameter switching occurs in subsequent TXOPs. A STA that solicits a Control frame from a peer STA accounts for the transmit parameter of the Control frame to calculate the expected duration of the TXOP. The responding STA determines that the most recent PPDU sent to the soliciting STA is received if it receives an immediate acknowledgment by the soliciting STA in response to the PPDU.

26.15.4 Rate selection constraints for HE STAs

26.15.4.1 Receive HE-MCS and NSS Set

The receive HE-MCS and NSS set is the set of <HE-MCS, NSS> tuples for PPDU bandwidths less than or equal to 80 MHz, 160 MHz, or 80+80 MHz PPDUs that an HE STA is capable of receiving. The receive HE-MCS and NSS set for a first HE STA is determined by a second HE STA for each <HE-MCS, NSS> tuple, NSS = 1, …, 8, and PPDU bandwidth (less than or equal to 80 MHz, 160 MHz, or 80+80 MHz) from the Supported HE-MCS And NSS Set field in the HE Capabilities element received from the first HE STA as follows:

— If support for the <HE-MCS, NSS> tuple at that PPDU bandwidth is mandatory (see 27.1.1), then the <HE-MCS, NSS> tuple at that bandwidth is supported by the first HE STA on receive.

— Otherwise, if the Max HE-MCS For *n* SS subfield (*n* = NSS) in each Rx HE-MCS Map *b* subfield for $b \in \{\leq 80$ MHz, 160 MHz, 80+80 MHz$\}$ indicates support and neither the Operating Mode field nor the OM Control subfield is received from the first HE STA, then the <HE-MCS, NSS> tuple at PPDU bandwidth *b* for a given operating channel width is supported by the first HE STA on receive as defined in 9.4.2.247.4.

— Otherwise,
  — If the Operating Mode field is received from the first HE STA, the <HE-MCS, NSS> tuple at that PPDU bandwidth for a given operating channel width is supported by the first HE STA on receive as defined in 9.4.2.247.4 and by Equation (9-5).
  — If the OM Control subfield is received from the first HE STA, the <HE-MCS, NSS> tuple at that PPDU bandwidth for a given operating channel width is supported by the first HE STA on receive as defined in 9.4.2.247.4 and by Equation (26-4).

— Otherwise, the <HE-MCS, NSS> tuple at that PPDU bandwidth is not supported by the first HE STA on receive.

The <HE-MCS, NSS> tuples excluded by 26.15.4.3 can also be eliminated from the receive HE-MCS and NSS set.

An HE STA shall not, unless explicitly stated otherwise, transmit an HE PPDU, unless the <HE-MCS, NSS> tuple and bandwidth used are in the receive HE-MCS and NSS set of the receiving HE STA(s).

26.15.4.2 Transmit HE-MCS and NSS Set

The transmit HE-MCS and NSS set is the set of <HE-MCS, NSS> tuples for PPDU bandwidth less than or equal to 80 MHz, 106 MHz, or 80+80 MHz PPDUs that a HE STA is capable of transmitting. The transmit HE-MCS and NSS set of a first HE STA is determined by a second HE STA for each <HE-MCS, NSS> tuple, NSS = 1, …, 8, and PPDU bandwidth (less than or equal to 80 MHz, 160 MHz, or 80+80 MHz) from the Supported HE-MCS And NSS Set field received from the first HE STA as follows:

— If support for the <HE-MCS, NSS> tuple at that PPDU bandwidth is mandatory (see 27.1.1), then the <HE-MCS, NSS> tuple at that bandwidth is supported by the first HE STA on transmit.

— Otherwise, if the Max HE-MCS For *n* SS subfield (*n* = NSS) in each Tx HE-MCS Map *b* subfield for $b \in \{\leq 80$ MHz, 160 MHz, 80+80 MHz$\}$ indicates support, then the <HE-MCS, NSS> tuple at PPDU bandwidth *b* for a given operating channel width is supported by the first HE STA on transmit as defined in 9.4.2.247.4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Otherwise, the <HE-MCS, NSS> tuple at that PPDU bandwidth is not supported by the first HE STA on transmit.

A non-AP STA may exclude certain numbers of space-time streams, N_{STS}, as defined in 26.9.3 from its transmit HE-MCS and NSS set.

26.15.4.3 Additional rate selection constraints for HE PPDUs

A HE STA shall not transmit a 20 MHz or 40 MHz HE PPDU with an <HE-MCS, NSS> tuple that has HE-MCS 0, 1, 2, or 3 and NSS less than or equal to 4 to a receiver HE STA that has marked as unsupported the HT-MCS with value HE-MCS + 8 × (NSS – 1) in the Rx MCS Bitmask subfield in the Supported MCS Set field in the HT Capabilities element it transmits. The transmission of a 20 MHz or 40 MHz HE PPDU with HE-MCS greater than 3 is not subject to this constraint.

A HE STA shall not transmit an 80 MHz, 160 MHz, or 80+80 MHz HE PPDU with an <HE-MCS, NSS> tuple that has HE-MCS 0 or 1 and NSS less than or equal to 4 to a receiver HE STA that has marked as unsupported the HT-MCS values of both 2 × HE-MCS + 8 × (NSS – 1) and 2 × HE-MCS + 1 + 8 × (NSS – 1) in the Rx MCS Bitmask subfield in the Supported MCS Set field in the HT Capabilities element it transmits. The transmission of an 80 MHz, 160 MHz, or 80+80 MHz HE PPDU with HE-MCS greater than 1 is not subject to this constraint.

An example tabulation of this behavior is given in Table 26-14.

Table 26-14—Example of rate selection for HE PPDUs

HT-MCSs that are marked as unsupported	<HE-MCS, NSS> tuples that are not used for CBW20 and CBW40	<HE-MCS, NSS> tuples that are not used for CBW80, CBW160, and CBW80+80
0, 8, 16	<0, 1>, <0, 2>, <0, 3>	—
1, 9	<1, 1>, <1, 2>	—
10	<2, 2>	—
3	<3, 1>	—
0, 1	<0, 1>, <1, 1>	<0, 1>
2, 3	<2, 1>, <3, 1>	<1, 1>
0, 1, 8, 9	<0, 1>, <1, 1>, <0, 2>, <1, 2>	<0, 1>, <0, 2>

26.15.4.4 Rx Supported VHT-MCS and NSS Set

For each <VHT-MCS, NSS> tuple, NSS = 1, …, 8, and bandwidth (20 MHz, 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz) from the Supported VHT-MCS and NSS Set field received from a first HE STA, a second HE STA shall follow the rules in 10.6.13.1 to determine the Rx Supported VHT-MCS and NSS Set of the first HE STA with the following exception:

— If the second HE STA receives OM Control subfield from the first HE STA, the receive VHT-MCS and NSS Set of a first HE STA is determined by a second HE STA according to 9.4.2.156.3 and Table 26-9.

NOTE—If the second HE STA receives both an Operating Mode field and an OM Control subfield from the first HE STA, the rules in 26.9.1 apply.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

26.15.5 Additional rules for ER beacons and group addressed frames

An AP that transmits group addressed frames in an HE ER SU PPDU shall transmit the HE ER SU PPDU with an <HE-MCS, NSS> tuple where the HE-MCS is a mandatory HE-MCS and NSS = 1.

A group addressed frame (including a Beacon frame) transmitted in an HE ER SU PPDU shall be sent as an S-MPDU (see Table 9-534), except for group addressed Data frames, which are not required to be sent as an S-MPDU but are required to follow the rules in 10.12.4.

The HE AP transmitting the HE ER SU PPDU shall set the TXVECTOR parameters as follows:

— CH_BANDWIDTH to ER-RU-242
— HE_LTF_TYPE to 2xHE-LTF and GI_TYPE to 0u8s_GI or 1u6s_GI, or HE_LTF_TYPE to 4xHE-LTF and GI_TYPE to 3u2s_GI
— FEC_CODING to BCC_CODING
— STBC to 0
— DCM to 0
— DOPPLER to 0
— BEAMFORMED to 0
— NUM_STS to 1
— NOMINAL_PACKET_PADDING to 16 μs
— NO_SIG_EXTN to false in the 2.4 GHz band and true otherwise
— BEAM_CHANGE as defined in 26.11.3

26.15.6 Additional rules for HE beacons and group addressed frames

An AP that transmits group addressed frames in an HE SU PPDU shall transmit the HE SU PPDU with an <HE-MCS, NSS> tuple where the HE-MCS is a mandatory HE-MCS and NSS = 1.

NOTE—An AP does not send a Beacon frame in an HE SU PPDU (an HE beacon), unless it is operating in the 6 GHz band (see 26.17.2.2).

A HE beacon or other group addressed frame transmitted in an HE SU PPDU shall be sent as an S-MPDU (see Table 9-534), except for group addressed Data frames, which are not required to be sent as an S-MPDU but are required to follow the rules in 10.12.4.

If the HE SU PPDU contains a group addressed frame intended for at least one STA that is not associated to the AP, then the HE AP shall set the TXVECTOR parameters for the HE PPDU as follows:

— CH_BANDWIDTH to CBW20
— HE_LTF_TYPE to 2xHE-LTF and GI_TYPE to 0u8s_GI or 1u6s_GI, or HE_LTF_TYPE to 4xHE-LTF and GI_TYPE to 3u2s_GI
— FEC_CODING to BCC_CODING
— STBC to 0
— DCM to 0
— DOPPLER to 0
— BEAMFORMED to 0
— NUM_STS to 1
— NOMINAL_PACKET_PADDING to 16 μs
— NO_SIG_EXTN to false in the 2.4 GHz band and true otherwise
— BEAM_CHANGE as defined in 26.11.3

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Otherwise, if the HE SU PPDU contains group addressed frames intended only for associated STAs then the AP shall set the TXVECTOR parameters listed above to values that are indicated as supported by all the intended STAs, except that the CH_BANDWIDTH shall be set to CBW20 if at least one of the intended STAs is currently not in the awake state.

26.15.7 Additional rules for group addressed frames in an HE MU PPDU

An HE AP may include group addressed frames in an HE MU PPDU subject to the rules defined in this subclause.

An HE AP shall not include a Beacon frame in an HE MU PPDU.

An HE AP that includes a group addressed frame in an HE MU PPDU shall ensure that the frame is included in a broadcast RU in the HE MU PPDU. The HE AP shall additionally ensure that the following conditions are satisfied for the broadcast RU:

- The RU allocation shall comply with the rules in 26.5.1.3 and 27.3.2.8.
- The <HE-MCS, NSS> tuple shall have a mandatory HE-MCS and NSS = 1.
- The broadcast RU shall be located within
  - The primary 20 MHz channel if the group addressed frame is a FILS Discovery or a Probe Response frame, except when the primary 20 MHz channel does not coincide with a PSC and the AP is a 6 GHz-only AP. For this exception, the broadcast RU may be in a PSC that is within the BSS operating channel width (see 26.17.2.3). The broadcast RU size shall not exceed 106 subcarriers if the MU PPDU has a bandwidth that is greater than 20 MHz.
  - The primary 20 MHz channel if the group addressed frame is addressed to at least one associated non-AP STA that has not declared to be in the awake state. The broadcast RU size shall not exceed 106 subcarriers if the MU PPDU has a bandwidth that is greater than 20 MHz.
  - A bandwidth that is indicated as supported in reception by one or more associated non-AP STAs, if the group addressed frame is addressed only to those non-AP STAs and the STAs have declared to be in the awake state. The broadcast RU size shall not exceed the minimum common bandwidth that is supported in reception by all STAs in the HE Capabilities element they transmit or in the most recently sent OM Control or Operating Mode Notification frames.
  - The SST subchannel if the group addressed frame is addressed to one or more HE SST STAs, the primary 20 MHz channel does not coincide with the subchannel assigned to the HE SST STAs and the frame is not addressed to any STAs other than the HE SST STAs in that subchannel (see 26.8.7.2). The broadcast RU size shall not exceed 106 subcarriers if the SST subchannel is 20 MHz.
- The TXVECTOR parameters listed below shall be set as follows:
  - HE_LTF_TYPE to 2xHE-LTF and GI_TYPE to 0u8s_GI or 1u6s_GI, or HE_LTF_TYPE to 4xHE-LTF and GI_TYPE to 3u2s_GI
  - FEC_CODING to BCC_CODING
  - STBC to 0
  - DCM to 0
  - DOPPLER to 0
  - BEAMFORMED to 0
  - NOMINAL_PACKET_PADDING to 16 μs
  - NO_SIG_EXTN to false in the 2.4 GHz band and true otherwise
  - BEAM_CHANGE as defined in 26.11.3
  - STA_ID as defined in 26.11.1

Group addressed frames transmitted in an HE MU PPDU shall be sent as an S-MPDU (see Table 9-535), except for group addressed Data frames, which are not required to be sent as an S-MPDU but are required to follow the rules in 10.12.4.

26.15.8 Additional rules for PPDUs sent in the 6 GHz band

An HE STA that transmits a PPDU that is not sent in response to a Trigger frame in the 6 GHz band and that contains a frame that is not a control response frame with the Address 1 field set to the MAC address of an HE AP with which it is not associated and from which it has received a FILS Discovery frame or an HE Operation element shall ensure that the PPDU meets the following conditions:

— The bandwidth of the PPDU is less than or equal to the operating bandwidth of the HE BSS as indicated in the BSS Operating Channel Width subfield of the FILS Discovery frame or in the Channel Width subfield of the HE Operation element sent by the AP.

— The PPDU is transmitted with a number of spatial streams that is less than or equal to the maximum number of spatial streams of the HE BSS as indicated in the Maximum Number of Spatial Stream subfield of the FILS Discovery frame or in the Basic HE-MCS And NSS Set field of the HE Operation element sent by the AP.

— If the PPDU is an HE PPDU, then the PPDU is transmitted with an <HE-MCS, NSS> tuple providing a data rate that is greater than or equal to the minimum rate indicated in the FILS Minimum Rate field (if present) of the FILS Discovery frame or in the Minimum Rate field of the HE Operation element sent by the AP.

— If the PPDU is a non-HT PPDU, then the PPDU is transmitted with a data rate that is greater than or equal to the minimum of <R, 54 Mb/s>, where R is the minimum rate indicated in the FILS Minimum Rate field (if present) of the FILS Discovery frame or in the Minimum Rate field of the HE Operation element sent by the AP.

An HE STA that transmits a PPDU that is not sent in response to a Trigger frame in the 6 GHz band and that contains a frame that is not a control response frame with Address 1 field set to the MAC address of the AP with which it is associated shall ensure that the PPDU meets the following conditions:

— If the PPDU is a non-HT (duplicate) PPDU, then the PPDU is transmitted with a data rate that is greater than or equal to the minimum of <R, 54 Mb/s>, where R is the minimum rate indicated in the Minimum Rate field of the HE Operation element sent by the AP.

— If the PPDU is an HE PPDU, then the PPDU is transmitted with an <HE-MCS, NSS> tuple providing a data rate that is not less than the data rate indicated in the Minimum Rate field of the HE Operation element sent by the AP.

An HE STA that transmits a PPDU that is not an HE TB PPDU in the 6 GHz band and that contains a frame that is not a control response frame with Address 1 field set to the MAC address of an AP with which it is not associated shall determine a local maximum transmit power for that transmission following the rules in 11.7.5 if the local maximum transmit power is received in Transmit Power Envelope elements and combinations of Country elements and Power Constraint elements in the most recent Beacon or Probe Response frame, on the channel from that AP.

26.16 Midamble parameter setting rules

A STA shall not set the TXVECTOR parameter DOPPLER to 1 for an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU, unless the STA has received from each of the intended recipient STAs an HE Capabilities element with the Doppler Rx subfield in the HE PHY Capabilities Information field equal to 1.

A STA shall not send a Trigger frame with the Doppler subfield in the Common Info field set to 1, unless the STA has received from each of the intended recipient STAs of the Trigger frame an HE Capabilities element with the Doppler Tx subfield in the HE PHY Capabilities Information field equal to 1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A STA shall not set the TXVECTOR parameter HE_LTF_TYPE to 1xHE-LTF and the parameter DOPPLER to 1 for an HE SU PPDU, unless the STA has received an HE Capabilities element from each of the intended recipient STAs where the HE PHY Capabilities Information field meets the following conditions:

— The Midamble Tx/Rx 2x And 1x HE-LTF subfield is 1.
— The HE SU PPDU With 1x HE-LTF And 0.8 μs GI subfield is 1.

A STA shall not set the TXVECTOR parameter HE_LTF_TYPE to 1xHE-LTF and the parameter DOPPLER to 1 for an HE ER SU PPDU, unless the HE STA has received from each of the intended recipient STAs an HE Capabilities element in which the HE PHY Capabilities Information field meets the following conditions:

— The Midamble Tx/Rx 2x And 1x HE-LTF subfield is 1.
— The HE ER SU PPDU With 1x HE-LTF And 0.8 μs GI subfield is 1.

A STA shall not set the TXVECTOR parameter HE_LTF_TYPE to 2xHE-LTF and the parameter DOPPLER to 1 for an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU, unless the HE STA has received an HE Capabilities element with the Midamble Tx/Rx 2x And 1x HE-LTF subfield in the HE PHY Capabilities Information field equal to 1.

A non-AP STA shall not transmit an HE Capabilities element with the Doppler Tx subfield in the HE PHY Capabilities Information field set to 1, unless the non-AP STA meets all of the following conditions:

— The non-AP STA is capable of transmitting an HE TB PPDU with midambles and a 4x HE-LTF.
— If the non-AP STA has set the Midamble Tx/Rx 2x And 1x HE-LTF subfield in the HE PHY Capabilities Information field to 1, the non-AP STA is capable of transmitting an HE TB PPDU with midambles and a 2x HE-LTF.
— If the non-AP STA has set both the Midamble Tx/Rx 2x And 1x HE-LTF and the Full Bandwidth UL MU-MIMO subfields in the HE PHY Capabilities Information field to 1, the non-AP STA is capable of transmitting an HE TB PPDU with midambles, using full-bandwidth UL MU-MIMO, and a 1x HE-LTF.

A STA that transmits an HE SU PPDU or HE ER SU PPDU with the TXVECTOR parameter DOPPLER set to 1 shall not set the TXVECTOR parameter NUM_STS to indicate a number of space-time streams that is greater than indicated in the Midamble Tx/Rx Max NSTS subfield in the HE PHY Capabilities Information subfield in the HE Capabilities element received from any of the intended recipient STAs.

A STA transmitting an HE MU PPDU with the TXVECTOR parameter DOPPLER set to 1 shall not set the TXVECTOR parameter NUM_STS[u] to indicate a number of space-time streams that is greater than indicated in the Midamble Tx/Rx Max NSTS subfield in the HE PHY Capabilities Information subfield in the HE Capabilities element received from the intended recipient STA u.

An AP transmitting a Trigger frame with the Doppler subfield in the Common Info field set to 1 shall not set the Number Of Spatial Streams subfield in a User Info field in the Trigger frame to indicate a number of space-time streams that is greater than indicated in the Midamble Tx/Rx Max NSTS subfield in the HE PHY Capabilities Information subfield in the HE Capabilities element received from the STA addressed by the User Info field.

26.17 HE BSS operation

26.17.1 Basic HE BSS operation

The Beacon frames generated within an HE BSS contain an HE Operation element.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An HE STA has dot11HEOptionImplemented equal to true.

A STA that is operating in an HE BSS shall be able to receive and transmit at each of the <HE-MCS, NSS> tuple values indicated by the Basic HE-MCS And NSS Set field of the HE Operation parameter of the MLME-START.request primitive and shall be able to receive at each of the <HE-MCS, NSS> tuple values indicated by the Supported HE-MCS and NSS Set field in the HE Capabilities parameter of the MLME-START.request primitive.

The basic HE-MCS and NSS set is the set of <HE-MCS, NSS> tuples that are supported by all HE STAs that are members of an HE BSS. It is established by the STA that starts the HE BSS and indicated by the Basic HE-MCS And NSS Set field of the HE Operation parameter in the MLME-START.request primitive. Other HE STAs determine the basic HE-MCS and NSS set from the Basic HE-MCS And NSS Set field of the HE Operation element in the BSSDescription derived through the scan mechanism (see 11.1.4.1).

An HE STA shall not attempt to join (MLME-JOIN.request primitive) a BSS, unless it supports (i.e., is able to both transmit and receive using) all of the <HE-MCS, NSS> tuples in the basic HE-MCS and NSS set.

NOTE 1—An HE STA does not attempt to (re)associate with an HE AP, unless the STA supports (i.e., is able to both transmit and receive using) all of the <HE-MCS, NSS> tuples in the Basic HE-MCS And NSS Set field in the HE Operation element transmitted by the AP because the MLME-JOIN.request primitive is a necessary precursor to (re)association.

A STA operating in the 2.4 GHz band that sets dot11HEOptionImplemented to true shall set dot11HighThroughputOptionImplemented to true. A STA operating in the 5 GHz or 6 GHz band that sets dot11HEOptionImplemented to true shall set both dot11VHTOptionImplemented and dot11HighThroughputOptionImplemented to true. A non-AP STA that sets dot11HEOptionImplemented to true shall set dot11MultiBSSIDImplemented to true.

An HE STA operating in the 6 GHz band is a VHT STA, except that it is exempt from following VHT and HT functionalities and/or requirements that are not applicable or that are superseded by equivalent HE functionalities and/or requirements (see Clause 26 and Clause 27) and except that it shall use the HE format instead of the VHT, HT-greenfield or HT-mixed format for PPDUs transmitted in the 6 GHz band. Additional HE functionalities and/or requirements for the 6 GHz band are defined in 26.17.2.

A STA that is an HE AP or an HE mesh STA declares the channel widths at which it is capable of operating in the PHY Capabilities Information field in the HE Capabilities element that it transmits (see Table 9-376).

An HE AP operating in the 5 GHz or 6 GHz bands shall set B1 in the Supported Channel Width Set field in the PHY Capabilities Information field in the HE Capabilities element to indicate support for 40 MHz and 80 MHz channel width.

A STA transmitting an HT Capabilities element and HE Capabilities element shall set the Supported Channel Width Set subfield of the HT Capabilities element to 1 if either B0 or B1 of the Supported Channel Width Set subfield in the HE Capabilities element is 1, unless the STA is a 20 MHz-only non-AP HE STA. In this case, the Supported Channel Width Set subfield of the HT Capabilities element shall be set to 0.

A STA transmitting a VHT Capabilities element and HE Capabilities element shall set the Supported Channel Width Set subfield of the VHT Capabilities element to indicate the same channel width as indicated in the HE Capabilities element, unless the STA is a 20 MHz-only non-AP HE STA. In this case, the Supported Channel Width Set subfield of the VHT Capabilities element is reserved.

At a minimum, an HE STA sets the Rx MCS Bitmask subfield of the Supported MCS Set field of its HT Capabilities element according to the setting of each Rx HE-MCS Map b subfield for $b \in \{\leq 80$ MHz,

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

160 MHz, 80+80 MHz} of the Supported HE-MCS And NSS Set field of its HE Capabilities element as follows: For each Max HE-MCS For *n* SS subfield (where $1 \le n \le 4$) of each Rx HE-MCS Map *b* subfield for $b \in$ {≤ 80 MHz, 160 MHz, 80+80 MHz} with a value other than 3 (i.e., no support for that number of spatial streams), the STA shall indicate support for HT MCSs $8 \times (n - 1)$ to $8 \times (n - 1) + 7$ in the Rx MCS Bitmask subfield, where *n* is the number of spatial streams, except for HT-MCSs marked as unsupported as described in 26.15.4.3.

An HE AP or an HE mesh STA shall set the VHT Operation Information Present field in the HE Operation element to 0 if a VHT Operation element is present in the frame that carries the HE Operation element or if the frame that carries the HE Operation element is sent in the 2.4 GHz band. An HE AP or HE mesh STA shall set the VHT Operation Information Present field in the HE Operation element to 1 if a VHT Operation element is not present in the frame that carries the HE Operation element and the frame is sent in the 5 GHz band.

An HE AP or an HE mesh STA that transmits an HE Operation element that has the VHT Operation Information Present field set to 1 shall do one of the following to set the BSS operating channel:

— Set the STA Channel Width subfield and Channel Center Frequency Segment 2 subfield in the HT Operation Information field in the HT Operation element, the Channel Width subfield in the VHT Operation Information field in the HE Operation element, and the Channel Center Frequency Segment 0 and Channel Center Frequency Segment 1 subfields in the VHT Operation Information field in the HE Operation element to indicate the BSS bandwidth as defined in Table 11-29 and Table 11-31 based on the Extended NSS BW Support and Supported Channel Width Set fields.

— Set the STA Channel Width subfield and Channel Center Frequency Segment 2 subfield in the HT Operation Information field in the HT Operation element, the Channel Width subfield in the VHT Operation Information field in the HE Operation element, and the Channel Center Frequency Segment 0 and Channel Center Frequency Segment 1 subfields in the VHT Operation Information field in the HE Operation element to indicate the BSS bandwidth as defined in Table 11-29 and Table 11-31 based on the Rx HE-MCS Map ≤ 80 MHz, Rx HE-MCS Map 160 MHz, and Rx HE-MCS Map 80+80 MHz fields.

NOTE 2—The Channel Center Frequency Segment 2 is 0 if Table 11-30 is applied.

NOTE 3—These two methods give the same result.

The setting of the Channel Center Frequency Segment 0, Channel Center Frequency Segment 1, and Channel Center Frequency Segment 2 subfields is defined in Table 11-30, except that the Max NSS support is provided by the HE STA in frames that contain an HE Capabilities element (see 9.4.2.247) and an Operating Mode field (see 9.4.1.51), where in the table the maximum NSS support refers to the HE maximum NSS support instead of the VHT maximum NSS support for an HE STA.

An HE STA shall determine the channelization using the information in the Primary Channel field of the HT Operation element when operating in 2.4 GHz and using the combination of the information in the Primary Channel field in the HT Operation element and the Channel Center Frequency Segment 0 and Channel Center Frequency Segment 1 subfields in the VHT Operation Information field in the VHT Operation element if operating in the 5 GHz band (see 21.3.14). An HE STA determines the channelization as defined in 26.17.2 if operating in the 6 GHz band.

An HE AP or an HE mesh STA shall set the Secondary Channel Offset subfield in the HT Operation Information field in the HT Operation element to indicate the secondary 20 MHz channel as defined in Table 9-230, if the BSS bandwidth is more than 20 MHz.

An HE STA that is a member of an HE BSS shall follow the rules in 11.38.1 when transmitting a 20 MHz, 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz HE PPDU with the following exceptions:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— An HE TB PPDU sent in response to a triggering frame follows the rules defined in 26.5.2.3.
— An 80 MHz, 160 MHz, or 80+80 MHz DL HE MU PPDU with preamble puncturing may be transmitted if the primary 20 MHz or the primary 40 MHz channel is occupied by the transmission and certain 20 MHz subchannels of the secondary channel are idle (see Table 27-21 and 10.23.2.5).

An HE STA shall not transmit to a recipient HE STA using a channel width that is not indicated as supported in the Supported Channel Width Set subfield in the HE Capabilities element received from that HE STA.

An HE STA shall not transmit to a recipient HE STA using a channel width that exceeds the BSS channel width in the Channel Width field that is contained in the following:

— The HE Operation element most recently exchanged with the recipient STA, if any, and if the Channel Width field is present.
— Otherwise, the VHT Operation element most recently exchanged with the recipient STA, if any.
— Otherwise, the HT Operation element most recently exchanged with the recipient STA, if any.

A STA shall not transmit an HE PPDU to a recipient STA that carries a frame that is not an HE Compressed Beamforming/CQI frame (see 26.7.3) and that exceeds the maximum MPDU length capability indicated in the VHT Capabilities element received from the recipient STA in the 2.4 GHz or 5 GHz band or, if a VHT Capabilities element has not been received from the recipient STA, a frame that carries an A-MSDU that exceeds the maximum A-MSDU length indicated in the HT Capabilities element received from the recipient STA in the 2.4 GHz or 5 GHz band.

An HE AP shall set the RIFS Mode field in the HT Operation element to 0.

An HE STA follows the rules in 11.38 for channel selection, scanning requirements, channel switching, NAV assertion, and antenna indication when operating in the 5 GHz or 6 GHz band unless explicitly stated otherwise in Clause 26. An HE STA shall additionally follow the rules in 26.17.2 for scanning and operation in the 6 GHz band.

An HE STA shall follow the rules in 11.15 for channel selection, scanning requirements, channel switching, and NAV assertion when operating in 2.4 GHz unless explicitly stated otherwise in Clause 26.

The AP of an ER BSS shall not transmit a Probe Response or (Re)Association Response frame in response to a Probe Request or (Re)Association Request frame, respectively, sent by a non-HE STA. An HE AP that is not operating an ER BSS may set the ER SU Disable subfield in the HE Operation element it transmits to 1.

A STA shall have the same value of maximum HE NSS defined by its Rx HE-MCS Map ≤ 80 MHz subfield in the HE Capabilities element as the maximum NSS value indicated by its Rx VHT-MCS Map field in the VHT Capabilities element. If a STA supports 160 MHz, the Maximum NSS defined by its Rx VHT-MCS Map field and Extended NSS BW Support field in the VHT Capabilities element at 160 MHz shall not be more than the maximum NSS defined by its Rx HE-MCS Map 160 MHz subfield in the HE Capabilities element at 160 MHz. If a STA supports 80+80 MHz, the maximum NSS defined by its Rx VHT-MCS Map field and Extended NSS BW Support field in the VHT Capabilities element at 80+80 MHz shall not be more than the maximum NSS defined by its Rx HE-MCS Map 80+80 MHz subfield in the HE Capabilities element at 80+80 MHz. For every NSS in VHT Capabilities elements and HE Capabilities elements transmitted by a STA, if the maximum HE-MCS is 9 or more, the maximal VHT-MCS shall be 9. Otherwise, the maximal VHT-MCS shall be the same as the HE-MCS. An HE STA shall not transmit a VHT Capabilities element with the Supported Channel Width Set field equal to 1 and the Extended NSS BW Support field equal to 3 or with the Supported Channel Width Set field equal to 2 and the Extended NSS BW Support field equal to 3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If an HE STA supports 160 MHz, the maximum NSS defined by its Rx HE-MCS Map 160 MHz subfield for an HE-MCS in the HE Capabilities element at 160 MHz shall not be more than the maximum NSS defined by its Rx HE-MCS Map ≤ 80 MHz subfield for the HE-MCS in the HE Capabilities element at 80 MHz.

If an HE STA supports 80+80 MHz, the maximum NSS defined by its Rx HE-MCS Map 80+80 MHz subfield for an HE-MCS in the HE Capabilities element at 80+80 MHz shall not be more than the maximum NSS defined by its Rx HE-MCS Map ≤ 80 MHz subfield for the HE-MCS in the HE Capabilities element at 80 MHz.

26.17.2 HE BSS operation in the 6 GHz band

26.17.2.1 General

A STA that supports operation in the 6 GHz band sets dot11HE6GOptionImplemented to true.

A STA with dot11HE6GOptionImplemented equal to true and operating in the 6 GHz band is a STA 6G.

An AP with dot11HE6GOptionImplemented equal to true and operating in the 6 GHz band is a 6 GHz AP.

A mesh STA with dot11HE6GOptionImplemented equal to true and operating in the 6 GHz band is a 6 GHz mesh STA.

A non-AP STA with dot11HE6GOptionImplemented equal to true and operating in the 6 GHz band is a 6 GHz non-AP STA.

NOTE—A STA 6G sets dot11HighThroughputOptionImplemented and dot11VHTOptionImplemented to true, but certain VHT and HT functionalities do not apply when operating in the 6 GHz band. See 26.17.1.

A STA 6G shall have dot11ExtendedChannelSwitchActivated, dot11MultiDomainCapabilityActivated, and dot11OperatingClassesRequired equal to true and shall set the Extended Channel Switching field to 1 in the Extended Capabilities elements it transmits.

A STA 6G shall meet the Class A requirements in 27.3.15.

A 6 GHz AP shall indicate support for at least 80 MHz channel width.

A 6 GHz AP shall set the Co-Hosted BSS subfield in HE Operation element to 0.

A STA 6G shall not transmit an HT Capabilities element, VHT Capabilities element, HT Operation element, VHT Operation element, or an HE Operation element that contains a VHT Operation Information field.

A STA 6G shall not transmit in an HE PPDU a frame that is not an HE Compressed Beamforming/CQI frame (see 26.7.3) and that exceeds the maximum MPDU length capability indicated in the HE 6 GHz Band Capabilities element received from the recipient STA.

A 6 GHz AP or 6 GHz mesh STA shall include the 6 GHz Operation Information field in the HE Operation elements it transmits. The AP or mesh STA shall set the Channel Width subfield, the Channel Center Frequency Segment 0, and the Channel Center Frequency Segment 1 subfields of the 6 GHz Operation Information field as defined in Table 26-15, based on the Rx HE-MCS Map ≤ 80 MHz, Rx HE-MCS Map 160 MHz, and Rx HE-MCS Map 80+80 MHz subfields of the Supported HE-MCS And NSS Set field in the HE Capabilities element transmitted by the AP.

A STA 6G shall determine the BSS channelization using the Primary Channel, Channel Center Frequency Segment 0, and Channel Center Frequency Segment 1 subfields in the 6 GHz Operation Information field in

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 26-15—6 GHz BSS channel width

Channel Width field	Center Frequency Segment 1 field	BSS channel width (MHz)
0	0	20
1	0	40
2	0	80
3	CCFS1 > 0 and |CCFS1 – CCFS0| = 8	160
3	CCFS1 > 0 and |CCFS1 – CCFS0| > 16	80+80

NOTE—CCFS0 represents the value of the Channel Center Frequency Segment 0 field, and CCFS1 represents the value of the Channel Center Frequency Segment 1 field.

the HE Operation element when operating in 6 GHz band (see 21.3.14 for the channelization and 27.3.25.2 for the equation defining the channel center frequencies in the 6 GHz band).

A STA 6G shall not transmit an HT PPDU.

A STA 6G shall not transmit a VHT PPDU.

A STA 6G shall not transmit a DSSS PPDU.

A STA 6G shall not transmit an HR/DSSS PPDU.

A STA 6G shall not transmit an ERP-OFDM PPDU.

A STA 6G shall set dot11SpectrumManagementRequired to true and operate as defined in 11.7.

A 6 GHz AP shall set dot11FILSOmitReplicateProbeResponses to true.

A 6 GHz AP may respond with a (Re)Association Response frame with the Status Code field indicating DENIED_POOR_CHANNEL_CONDITIONS if it receives a (Re)Association Request frame from a non-AP STA below a minimum RSSI threshold value. A 6 GHz AP may send a Disassociation frame with the Reason Code field indicating POOR_RSSI_CONDITIONS to an associated non-AP STA if it receives frames from the STA below a minimum RSSI threshold value for a sufficiently long period of time. How an AP selects a minimum RSSI threshold value or sufficient interval of time is beyond the scope of this standard.

A 6 GHz non-AP STA that receives a (Re)Association Response frame with the Status Code field indicating DENIED_POOR_CHANNEL_CONDITIONS or a Disassociation frame with the Reason Code field indicating POOR_RSSI_CONDITIONS from a 6 GHz AP should not transmit a (Re)Association Request frame or a Probe Request frame to the AP until one of the following conditions is met:

— Sufficient time has passed since it received the (Re)Association Response frame or Disassociation frame from the AP.
— The STA has determined that a (Re)Association Request frame or Probe Request frame that it transmits will be received by the AP at a sufficiently high RSSI level and in sufficiently good conditions compared with its previous transmission to the AP.

How a 6 GHz non-AP STA determines sufficient time has passed or a suitable RSSI threshold is beyond the scope of this standard.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A 6 GHz STA that negotiates an EDCA based FTM session, as defined in 11.21.6, shall set the Format And Bandwidth subfield, in the FTM Parameters field, to a value that corresponds to an EDCA based HE format, see Table 9-325, in the IFTMR frame for the ISTA, and in the IFTM frame for the RSTA.

A 6 GHz STA that negotiates an EDCA FTM session shall transmit FTM frames in an HE SU PPDU and FTM Request frames in either a non-HT PPDU, or an HE SU PPDU. The HE SU PPDU shall use 2x HE-LTF and 1.6 μs GI for both the FTM frame and corresponding the acknowledgement frame.

26.17.2.2 Beacons in the 6 GHz band

A 6 GHz AP transmits Beacon frames as defined in 11.1, and they may be contained in a non-HT PPDU, non-HT duplicate PPDU, or HE SU PPDU.

A 6 GHz AP that transmits a Beacon frame in a non-HT PPDU follows the rules in 10.6.5.1.

A 6 GHz AP that transmits a Beacon frame in a non-HT duplicate PPDU shall follow the rules in 10.6.5.1 and shall set the TXVECTOR parameter CH_BANDWIDTH of the PPDU to a value that is up to the operating channel width of the BSS.

If a 6 GHz AP schedules a Beacon frame for transmission in a non-HT duplicate PPDU, then it shall set the Duplicate Beacon subfield to 1 in the 6 GHz Operation Information field of the HE Operation element it transmits; otherwise, the AP shall set the Duplicate Beacon subfield to 0.

A 6 GHz AP that transmits a Beacon frame in an HE SU PPDU shall follow the rules defined in 26.15.6.

NOTE—An AP does not transmit a Beacon frame in an HE SU PPDU or non-HT duplicate PPDU in the 2.4 GHz or 5 GHz bands.

26.17.2.3 Scanning in the 6 GHz band

26.17.2.3.1 General

A STA 6G shall perform the subset of the operations defined for a FILS STA that is described in 26.17.2.3 and may perform all the other operations defined for a FILS STA.

A 6 GHz AP may set dot11ColocatedRNRImplemented to true and shall set dot11ShortSSIDListImplemented to true. An AP that is in the same colocated AP set as a 6 GHz AP shall set dot11ColocatedRNRImplemented to true and dot11ShortSSIDListImplemented to true.

A STA 6G shall not transmit a Probe Request frame to the broadcast address that includes a Short SSID List element with more than one Short SSID field.

NOTE—In bands other than the 6 GHz band, there might be more than one Short SSID field in a Short SSID List element in a Probe Request frame to the broadcast address. A Probe Request frame does not contain more than one Short SSID List element (see Table 9-68). A Probe Request frame transmitted to the broadcast address that contains a Short SSID List element has the SSID field of the SSID element set to the SSID of a known AP or set to the one-octet value 128 if the STA does not know any SSID (see 11.1.4.3.2).

26.17.2.3.2 AP behavior for fast passive scanning

A 6 GHz AP that does not share the same colocated AP set as an AP operating in the 2.4 GHz band or 5 GHz band is referred to as a 6 GHz-only AP.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A 6 GHz-only AP that intends to be efficiently discovered by STAs using scanning in the 6 GHz band shall have dot11FILSFDFrameBeaconMaximumInterval set to a nonzero value that is less than or equal to 20 TUs.

NOTE 1—A 6 GHz-only AP intends to be efficiently discovered by STAs using scanning in the 6 GHz band if it schedules for transmission FILS Discovery, Beacon, or unsolicited Probe Response frames every 20 TUs or less.

If a 6 GHz AP has dot11UnsolicitedProbeResponseOptionActivated equal to true, then the AP shall have dot11FILSFDFrameBeaconMaximumInterval set to a nonzero value that is less than or equal to 20 TUs; otherwise, the AP may have dot11FILSFDFrameBeaconMaximumInterval set to any value.

A 6 GHz AP that has dot11FILSFDFrameBeaconMaximumInterval equal to a nonzero value shall schedule for transmission FILS Discovery frames as described in 11.45.2.1, except that the following apply:

— If the FILS Discovery frame is contained in a DL HE MU PPDU, then it shall be included in a broadcast RU of the DL HE MU PPDU as defined in 26.15.7.
— If dot11UnsolicitedProbeResponseOptionActivated is true, all FILS Discovery frames shall be omitted, and an unsolicited broadcast Probe Response frame, instead of each omitted FILS Discovery frame, shall be scheduled for transmission at the target transmit time.
— If dot11UnsolicitedProbeResponseOptionActivated is false, then a FILS Discovery frame may be omitted, and an unsolicited broadcast Probe Response frame, instead of the omitted FILS Discovery frame, shall be scheduled for transmission at the target transmit time.

A 6 GHz AP may send an unsolicited broadcast Probe Response frame. The Probe Response frame may be included in a broadcast RU of a DL HE MU PPDU as defined in 26.15.7. The Probe Response may be carried in a non-HT duplicate PPDU in which case the PPDU shall have the TXVECTOR parameter CH_BANDWIDTH set to a value that is up to the operating channel width of the BSS.

A 6 GHz AP that transmits a FILS Discovery frame carrying an FD Capability field shall set the PHY Index subfield to 4.

An AP that corresponds to a nontransmitted BSSID does not schedule for transmission FILS Discovery frames (see 11.45.2.1) or unsolicited broadcast Probe Response frames (see 11.1.4.3.4).

See 11.1.3.8 for procedures on advertisement of nontransmitted BSSIDs in a multiple BSSID set.

A 6 GHz-only AP should set up the BSS with a primary 20 MHz channel that coincides with a preferred scanning channel (PSC) (see 26.17.2.3.3).

NOTE 2—An AP might initiate a BSS with a primary channel that coincides with a PSC in order to assist STAs that are scanning the 6 GHz band to discover the BSS. The AP might subsequently switch its operating channel to a non-PSC (e.g., using a CSA mechanism) if it does not expect that additional (not yet associated) STAs need to discover the BSS.

A 6 GHz AP shall not respond to a Probe Request frame if the frame carries a FILS Request Parameters element and the AP is unable to satisfy the response time constraint specified in the Max Channel Time field in the element (see 11.1.4.3.4). If a 6 GHz AP receives a Probe Request frame and responds with a Probe Response frame (per 11.1.4.3.4), the Address 1 field of the Probe Response frame shall be set to the broadcast address.

26.17.2.3.3 Non-AP STA scanning behavior

The 20 MHz channels in the 6 GHz band, with channel center frequency (ch_a = Channel starting frequency – 55 + 80 × n, in megahertz) are referred to as *preferred scanning channels* (PSCs). Channel starting frequency is defined in 27.3.25.2, and n = 1, …, 15.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—PSCs might not all be available in a specific location due to regulatory restrictions. A STA scanning the 6 GHz band knows where these PSCs are located since their position is fixed.

A non-AP STA that is actively scanning a channel in the 6 GHz band shall operate as defined in 11.1.4.3.2, unless a given rule is superseded by the rules defined in 26.17.2.3.

The non-AP STA shall not transmit a Probe Request frame to the broadcast address with the Address 3 field set to the wildcard BSSID and the SSID set to the wildcard SSID.

The non-AP STA shall not send a Probe Request frame to the broadcast address with the Address 3 field (BSSID) set to the BSSID of an AP from which it has already received a Probe Response or a Beacon frame since the start of its scanning on that channel.

The non-AP STA shall not send a Probe Request frame to the broadcast address with the Address 3 field (BSSID) set to the BSSID of a nontransmitted BSSID if it has already received the nontransmitted BSSID profile for that BSSID via a Beacon frame or Probe Response frame sent by the transmitted BSSID since the start of its scanning on that channel.

Until the FILSProbeTimer reaches dot11FILSProbeDelay, the non-AP STA shall not send a Probe Request frame to the broadcast address with the SSID field set to the SSID of an AP for which it has received a Reduced Neighbor Report or Neighbor Report element with the Unsolicited Probe Responses Active subfield corresponding to that AP set to 1 and that indicates that the AP is operating in that channel. Until the FILSProbeTimer reaches dot11FILSProbeDelay, the non-AP STA shall not send a Probe Request frame to the broadcast address with the Address 3 field set to the BSSID of an AP for which it has received a Reduced Neighbor Report or Neighbor Report element with the Unsolicited Probe Responses Active subfield corresponding to that AP set to 1 and that indicates that the AP is operating in that channel. Until the FILSProbeTimer reaches dot11FILSProbeDelay, the non-AP STA shall not send a Probe Request frame to the broadcast address with the Short SSID field set to the short SSID that corresponds to the SSID of an AP for which it has received a Reduced Neighbor Report or Neighbor Report element with the Unsolicited Probe Responses Active subfield corresponding to that AP set to 1 and that indicates that the AP is operating in that channel.

The non-AP STA shall not transmit more than one Probe Request frame to the broadcast address with the Address 3 field set to the wildcard BSSID and the SSID field not set to the wildcard SSID during each 20 TU period scanning the channel. The non-AP STA shall not transmit more than three Probe Request frames to the broadcast address with Address 3 field set to a non-wildcard BSSID during each 20 TU period scanning the channel.

The non-AP STA shall set dot11FILSProbeDelay to a value equal to or greater than 20 TU.

NOTE 2—A non-AP STA waits for at least 20 TU so that it maximizes the probability of receiving FILS Discovery or broadcast Probe Response frames, if any, sent by an AP in that channel (see 26.17.2.3.2).

If the non-AP STA is scanning a channel, then the following apply:

— If the STA has received a FILS Discovery frame indicating that an AP is operating in that channel, or if the STA has received a Reduced Neighbor Report or Neighbor Report element indicating that an AP is operating in that channel, then the STA may, subject to the other rules in this clause, send a Probe Request frame to the broadcast address in that channel, with the SSID field set to the SSID that corresponds to that AP or with the Short SSID field of the Short SSID List element set to the short SSID that corresponds to that AP and/or with the Address 3 field set to the BSSID of that AP, starting from step c) of 11.1.4.3.2.
— Otherwise, if the channel is a PSC and the STA has determined the medium to be idle for a continuous period of at least dot11MinPSCProbeDelay from the start of the scan on the channel, then the STA may, subject to other rules in this subclause, send a Probe Request frame to the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

broadcast address in that channel, with the SSID field set to the SSID that corresponds to an AP or with the Short SSID field of the Short SSID List element set to the short SSID that corresponds to an AP, and/or with the Address 3 field set to the BSSID of an AP, after invoking the backoff procedure, described in 10.23.2.2, starting from step c) of 11.1.4.3.2.

— Otherwise, if the STA has discovered the presence of an AP in that channel through means that are beyond the scope of this standard and the AP is on the same channel and is range of the STA, then the STA may send a Probe Request frame to the broadcast address in that channel, with the Address 3 field set to the BSSID of that AP, starting from step c) of 11.1.4.3.2.

— Otherwise, if the FILSProbeTimer reaches dot11FILSProbeDelay and the channel is a PSC, then the STA may, subject to the other rules in this subclause, send a Probe Request to the broadcast address in that channel, starting from step c) of 11.1.4.3.2.

— Otherwise, the STA shall not send a Probe Request frame to the broadcast address in that channel.

NOTE 3—The STA might send an individually addressed Probe Request frame to an AP for reasons other than active scan (e.g., to obtain an updated EDCA parameter set) even if it has already received a FILS Discovery, Probe Response, or Beacon frame from that AP.

If a non-AP STA sends a Probe Request frame in the 6 GHz band that includes a FILS Request Parameters element, then the non-AP STA shall set the value of PHY Support Criterion subfield in the element to either 0 or 3.

See 11.1.3.8 for procedures on discovery of nontransmitted BSSIDs in a multiple BSSID set.

26.17.2.4 HE STA antenna indication

A 6 GHz HE STA that does not change its receive antenna pattern after association shall set the Rx Antenna Pattern Consistency subfield in the HE 6 GHz Band Capabilities element to 1; otherwise, the STA shall set the Rx Antenna Pattern Consistency subfield in the HE 6 GHz Band Capabilities element to 0.

A 6 GHz HE STA that does not change its transmit antenna pattern after association shall set the Tx Antenna Pattern Consistency subfield in the HE 6 GHz Band Capabilities element to 1; otherwise, the STA shall set the Tx Antenna Pattern Consistency subfield in the HE 6 GHz Band Capabilities element to 0.

26.17.3 BSS color

26.17.3.1 General

BSS color identifies a BSS and assists a STA receiving a PPDU that carries BSS color in identifying the BSS from which the PPDU originates so that the STA can use the channel access rules in 26.10, reduce power consumption as described in 26.14.1, or update its NAV as described in 26.2.4.

All APs that are members of a multiple BSSID set or co-hosted BSSID set shall use the same BSS color.

An HE STA that transmits an HE Operation element shall select an initial BSS color by following the procedure in 26.17.3.2.

An HE STA that transmits an HE Operation element may disable BSS color by following the procedure in 26.17.3.3.

An HE AP may follow the procedure in 26.17.3.4 to select and advertise a new BSS color.

An HE STA may follow the procedure in 26.17.3.5 to determine and report a BSS color collision.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

26.17.3.2 Initial BSS color

An HE AP starting an infrastructure BSS or an HE STA starting an IBSS or MBSS shall set the BSS Color subfield of the first HE Operation element it transmits to a value in the range 1 to 63 and shall maintain that value in subsequent HE Operation elements it transmits for the lifetime of the BSS or until the BSS color is changed as described in 26.17.3.4. When selecting a BSS color, the HE STA should consider the BSS colors in use by neighboring OBSSs.

A non-AP HE STA that is associated with an HE AP and that is the initiating STA of a TDLS direct link shall set the BSS Color subfield of the HE Operation element it transmits to the TDLS peer HE STA to the value indicated in the BSS Color subfield of the HE Operation element received from its associated HE AP. A non-AP HE STA that is associated with a non-HE AP and that is the initiating STA of the TDLS direct link shall use the same BSS color for all its TDLS direct links by setting the BSS Color subfield of the HE Operation element it transmits to the TDLS peer HE STA to the value of dec(BSSID[39:44]) of the non-HE AP or the dec(transmitted BSSID[39:44]) of the non-HE AP if the AP indicates the support of multiple BSSID in its Extended Capabilities element.

26.17.3.3 Disabling BSS color

An HE STA that transmits an HE Operation element and that decides to disable the use of BSS color in the BSS to which it belongs, for example, after detecting a BSS color collision with an OBSS (see 26.17.3.5), shall set the value of BSS Color Disabled subfield in the HE Operation element to 1 to inform other STAs in the BSS that the BSS color is disabled; otherwise, the HE STA shall set the BSS Color Disabled subfield to 0.

NOTE—It is recommended that an HE STA that transmits an HE Operation element does not disable the BSS color for an extended period of time, so that other HE STAs can benefit from features relying on BSS color.

If the most recently received HE Operation element from the AP with which it is associated contained a value of 1 in the BSS Color Disabled subfield, then the following apply:

— A non-AP HE STA should use the Address 1, Address 2, and Duration/ID fields of the frames contained in the received HE PPDUs, instead of the RXVECTOR parameters BSS_COLOR and TXOP_DURATION, to determine whether the STA should update the intra-BSS NAV.
— A non-AP HE STA should use the Address 1 and Address 2 fields of the frames contained in the received HE PPDUs, instead of the RXVECTOR parameters BSS_COLOR and STA_ID, to determine whether the STA may go to doze state for the duration of that PPDU (see 26.14.1).

A non-AP HE STA may use the RXVECTOR parameter BSS_COLOR of an HE PPDU to determine whether it should update the intra-BSS NAV (see 26.2.4), and/or the STA may go to doze state for the duration of the PPDU (see 26.14.1) if the most recently received HE Operation element from the AP with which it is associated contained a value of 0 in the BSS Color Disabled subfield.

26.17.3.4 Selecting and advertising a new BSS color

An HE STA that transmits an HE Operation element shall select a BSS color as defined in 26.17.3.2 for its BSS. An HE AP may change the BSS color under certain conditions, for example, if it detects that an OBSS is using the same color. An HE AP shall announce an upcoming BSS color change using the BSS Color Change Announcement element. A non-AP HE STA shall not transmit a BSS Color Change Announcement element.

NOTE—A non-AP HE STA includes a STA participating in an IBSS or MBSS. The color change mechanism described in this subclause does not apply to an IBSS or a mesh BSS since these BSSs do not have a single coordinator.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When changing the BSS color, the HE AP should consider the BSS colors of OBSSs that the HE AP has identified by itself or via the autonomous collision reports received from associated non-AP HE STAs (see 26.17.3.5).

The BSS Color Change Announcement element may be carried in the Beacon, Probe Response, (Re)Association Response, and HE BSS Color Change Announcement frames transmitted by the AP. An HE AP should announce an upcoming BSS color change for a period of time that is sufficiently long for all STAs in the BSS, including STAs in PS mode, to have an opportunity to receive at least one frame carrying a BSS Color Change Announcement element before the BSS color change.

If the Color Switch Countdown field in the BSS Color Change Announcement element has a value greater than 1, then at the next TBTT the AP shall decrement the Color Switch Countdown field value by 1. The BSS color change TBTT is the TBTT following a frame containing a BSS Color Change Announcement element with the Color Switch Countdown field containing the value 1. An HE AP shall not alter the BSS color change TBTT after it has announced a pending BSS color change. An AP belonging to a co-hosted BSSID set (see 26.17.7) should select the value of Color Switch Countdown field such that the BSS color change TBTT interval between the BSSs in the set shall not be greater than one beacon interval of the BSS with largest beacon interval in the set.

During the time leading up to the BSS color change TBTT,

- An HE AP shall set the BSS Color Disabled subfield to 1 and shall continue to advertise the existing BSS color via the BSS Color subfield in the HE Operation element.
- An HE AP shall not change the value it advertises in the New BSS Color subfield of the BSS Color Change Announcement element.
- An HE AP shall set the TXVECTOR parameter BSS_COLOR of an HE PPDU to the existing BSS color.

At the BSS color change TBTT, an HE AP shall

- Set the BSS Color Disabled subfield in the HE Operation element that it transmits to 0, unless the HE AP belongs to a co-hosted BSSID set. In this case, it shall continue to set the BSS Color Disabled subfield to 1 until all the BSSs in the co-hosted BSSID set have passed their respective BSS color change TBTT.
- Start advertising the new BSS color in the BSS Color subfield in the HE Operation element.
- Start using the new BSS color for all frames that it transmits after the TBTT.

A co-hosted AP should not transmit an HE PPDU during the transition period until all the BSSs in the co-hosted set have completed their switch to the new color.

A non-AP HE STA that receives a BSS Color Change Announcement element from an AP shall use the value specified in the New BSS Color field of the element as the BSS color when communicating with that AP following the BSS color change TBTT.

26.17.3.5 Detecting and reporting BSS color collision

26.17.3.5.1 General

An HE AP may determine that a BSS color collision has occurred if it receives HE PPDUs on its primary channel from an OBSS STA containing the same BSS color as the one it has selected for its BSS or if it receives autonomous BSS color collision event reports from its associated STAs. The HE AP shall set the BSS Color Disabled subfield to 1 in the HE Operation element that it transmits if the BSS color collision persists for a duration of at least dot11BSSColorCollisionAPPeriod and if

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

dot11BSSColorCollisionAPPeriod is not –1. The value –1 means that the BSS color is not disabled in the case of a collision.

26.17.3.5.2 Autonomous reporting of BSS color collision

A STA that supports autonomous reporting of BSS color collision shall set dot11AutonomousBSSColorCollisionReportingImplemented to true.

A non-AP HE STA that supports autonomous reporting of BSS color collision may send a color collision report to its associated AP when it detects that color collision has occurred. The STA shall declare that a color collision has occurred if it receives, on its associated AP's primary channel, an HE PPDU with at least three Address fields in the MAC header and with the same color as its associated BSS in which none of the Address fields match the BSSID of the BSS with which the STA is associated or any of the other BSSs in the same multiple BSSID set or co-hosted BSSID set to which its BSS belongs.

The HE STA's autonomous report shall include BSS color information of all OBSSs from which the STA is able to detect frames in order to help its associated AP select a new nonoverlapping BSS color when the AP decides to switch to a different BSS color.

A non-AP HE STA that is autonomously reporting a BSS color collision shall transmit an Event Report frame (see 9.6.13.3) containing a single Event Report element (see 9.4.2.66). The Event Report element shall carry Event Token field value set to 0 (autonomous report) and Event Type field value set to 4 (BSS Color Collision). The Event Report Status field shall be set to 0 (Successful), and the Event Report field shall carry information about the BSS color used by OBSSs that the reporting STA is able to detect.

A non-AP HE STA that has dot11AutonomousBSSColorCollisionReportingImplemented equal to true shall transmit a BSS Color Collision Event Report frame to its associated HE AP when it determines that a color collision has occurred. Subsequently, the STA shall schedule for transmission a BSS color collision event report every dot11BSSColorCollisionSTAPeriod, unless the BSS color collision no longer exists, the AP has set the BSS Color Disabled field to 1 in the HE Operation element that it transmits, or the STA has successfully transmitted a certain number of collision reports to the AP.

26.17.4 AID assignment

An HE AP that transmits an HE Operation element with the Partial BSS Color subfield in the BSS Color Information field set to 1 shall allocate AIDs that meet the constraint in Equation (26-8).

$$\text{AID}(5{:}8) = bin[(BCB(0{:}3) - (BSSID[44{:}47] \oplus BSSID[40{:}43])) \bmod 2^4, 4] \quad (26\text{-}8)$$

where *BCB*(0:3) represents bits 0 to 3 inclusive of the BSS color in the transmitted HE Operation element with bit 0 being the first transmitted and AID(5:8) represents bits 5 to 8 inclusive of the allocated AID with bit 5 being the first transmitted.

NOTE—See 1.5 for the behavior of the mod operator with a negative first operand.

26.17.5 Quiet HE STAs in an HE BSS

26.17.5.1 General

Quiet time period (QTP) is an optional feature that defines a period of time that is intended to be used primarily for the exchange of specific frames between a STA requesting a QTP and its peers using peer-to-peer links. The particular frames to be exchanged using peer-to-peer links during the QTP are identified by a service-specific identifier. The determination of which frames are associated with the service-specific

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

identifier is beyond the scope of this standard. The method for selection of the service-specific identifier by the peer-to-peer operation is beyond the scope of this standard.

An AP with dot11QTPOptionImplemented equal to true is a QTP AP and shall set the QTP Support field to 1 in HE Capabilities elements that it transmits; otherwise, an AP shall set the QTP Support field to 0. A non-AP HE STA with dot11QTPOptionImplemented equal to true is a QTP non-AP STA and shall set the QTP Support field to 1 in HE Capabilities elements that it transmits; otherwise, a non-AP HE AP shall set the QTP Support field to 0.

A QTP non-AP STA may request its QTP AP to set up a QTP, and if successful, the QTP AP informs other associated QTP non-AP STAs of the QTP and of the service-specific identifier associated with that QTP.

The QTP mechanism informs other HE STAs of the period and the intended peer-to-peer operation and requests that, during the QTP, the QTP non-AP STAs should not exchange frames that are not associated with the service-specific identifier.

A QTP non-AP STA may ignore the QTP. A QTP non-AP STA that decides to stay quiet during a QTP suspends the decrementing of its backoff counters at the start time of the QTP and resumes them when the QTP ends.

NOTE—Otherwise, a STA that does not stay quiet does not suspend the decrementing of its backoff counters.

26.17.5.2 QTP Requesting STA procedure

A QTP requesting STA is a QTP non-AP STA that requests a quiet time period (QTP). Figure 26-15 illustrates a QTP operation.

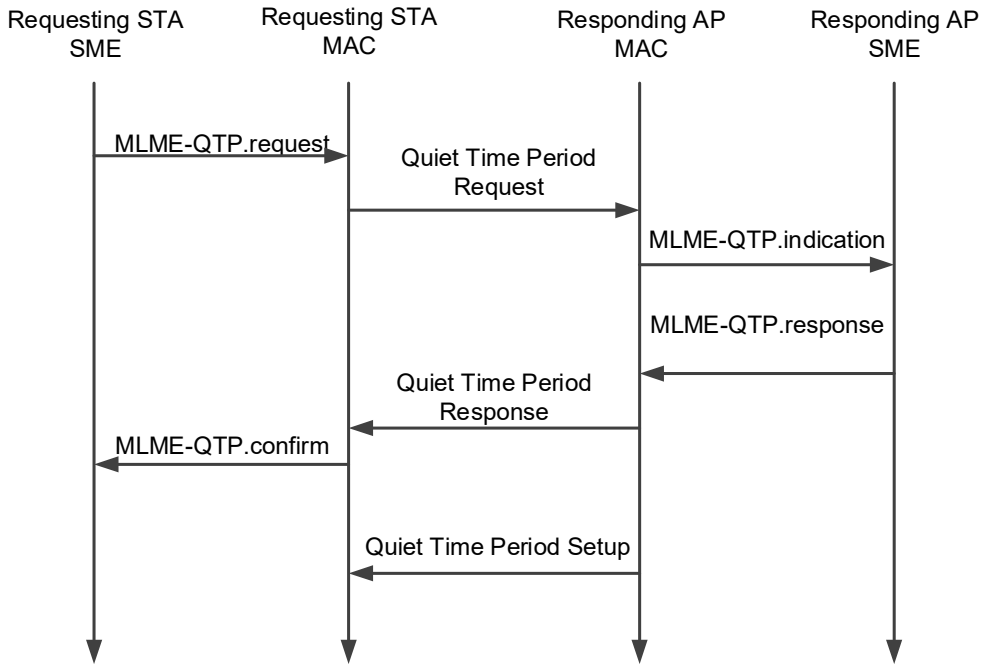

Figure 26-15—Quiet time period operation

Upon the reception of an MLME-QTP.request primitive, a QTP requesting STA shall perform the following procedure:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

a) If a QTP requesting STA is associated with a QTP AP, the QTP requesting STA sends a QTP Request frame that is a Quiet Time Period Action frame (9.6.31.3) with the Control field of the Quiet Time Period element indicating the Quiet Time Period Request subtype. The QTP Request frame indicates the duration, interval, and type of operation (indicated by the Service Specific Identifier parameter). The QTP requesting STA may include multiple Quiet Time Period elements with Request subtype in one QTP Request frame for multiple types of frames associated with different service-specific identifiers.

b) A QTP Response frame is a Quiet Time Period Action frame (9.6.31.3) with the Control field of the Quiet Time Period element indicating Quiet Time Period Response subtype. If a QTP Response frame is received with the dialog token matching the request token with a status code set to a value of SUCCESS, the QTP AP has confirmed the reception of the QTP Request frame, and the MLME shall issue an MLME-QTP.confirm primitive indicating the success of the procedure.

c) A QTP Setup frame is a Quiet Time Period Action frame (9.6.31.3) with the Control field of the Quiet Time Period element indicating Quiet Time Period Setup subtype. If a QTP Setup frame is received, at the start time for a QTP, the QTP requesting STA may schedule frames for transmission that are associated with the service-specific identifier indicated in the QTP Setup frame and should not transmit frames that are not associated with the service-specific identifier.

26.17.5.3 Responding AP procedure

Upon receipt of a QTP request, a QTP AP shall operate as follows (Figure 26-15):

a) The MLME of the AP shall issue an MLME-QTP.response primitive.

b) Upon receipt of the MLME-QTP.response primitive, the AP may respond by sending a broadcast QTP Response frame.

   1) If the status code in the broadcast QTP Response frame is SUCCESS, the AP accepts the request. The AP shall schedule the quiet period(s) according to the accepted request. Contained in the transmitted QTP Response frame is a copy of the dialog token from the QTP requesting STA. The QTP procedure shall be terminated if the number of quiet periods exceeds the value of the Repetition Count field specified.

   2) If the status code in the broadcast QTP Response frame is REJECTED, the AP indicates that the request cannot be fulfilled.

   3) If the status code in the broadcast QTP Response frame is COUNTERED, the AP counters the request with recommended values, and the current request is rejected. Upon receiving the counter-proposal, a QTP STA can send a QTP Request frame to set up another QTP.

c) At the start time for a quiet time period, the AP may schedule for transmission a QTP Setup frame. The AP shall set the Quiet Period Duration field of the QTP Setup frame to a value no larger than indicated in the Quiet Period Duration field of the QTP Request frame sent by the QTP requesting STA.

NOTE—The AP is not required to transmit a QTP Setup frame at a scheduled QTP. The interference mitigation protocol is to provide an AP a tool to manage and avoid interference. How or whether the AP will transmit QTP Setup frame at a scheduled QTP is beyond the scope of this standard.

26.17.6 ER beacon generation in an ER BSS

An ER beacon is a Beacon frame carried in an HE ER SU PPDU using a 242-tone RU and transmitted in the primary 20 MHz channel. An ER beacon provides additional link budget for downlink transmissions to compensate for the link budget imbalance between downlink and uplink due to the introduction of UL OFDMA transmission. An HE AP shall operate an ER BSS in addition to a non-ER BSS operated by another AP that is in the same colocated AP set. An ER BSS, if present, shall operate independently of the colocated non-ER BSS that is in the same colocated AP set, and the AP operating the ER BSS shall have a BSSID different from the AP operating the non-ER BSS.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—An AP that uses ER beacons can balance the link budget by allocating narrow RUs to STAs. An ER BSS is expected to have a larger coverage area than a non-ER BSS.

The HE AP of an ER BSS shall not set the ER SU Disable subfield to 1 in HE Operation elements it transmits.

The HE AP of an ER BSS shall transmit Beacon frames and group addressed frames in HE ER SU PPDUs following the rules in 26.15.5.

26.17.7 Co-hosted BSSID set

HE BSSs that are not part of a multiple BSSID set (i.e., dot11MultiBSSIDImplemented is false) but share the same operating class, channel, receive antenna connector, and transmit antenna connector belong to a co-hosted BSSID set.

A STA that supports co-hosted BSSID capability shall have dot11CoHostedBSSIDImplemented equal to true.

An AP that belongs to a co-hosted BSSID set shall perform the following operations:

— Set the Co-Hosted BSS subfield in the HE Operation element that it transmits to 1.
— Set the Max Co-Hosted BSSID Indicator field in the HE Operation element that it transmits to a nonzero value n, where $1 \leq n \leq 8$, such that 2^n indicates the maximum number of BSSIDs in the co-hosted set.

Members of the co-hosted BSSID set have the same $48 - n$ bits (BSSID[0:(47 – n)]) in their BSSIDs.

If its associated AP has set the Co-Hosted BSS subfield in the HE Operation Parameters field to 1, a non-AP STA shall identify a BSS as a co-hosted BSS, if the $48 - n$ bits (BSSID[0:(47 – n)]) of the BSSID of the BSS are the same as the $48 - n$ bits (BSSID[0:(47 – n)]) of the BSSID of its associated AP, where n is the value carried in the Max Co-Hosted BSSID Indicator field of the HE Operation element transmitted by the associated AP.

27. High-efficiency (HE) PHY specification

27.1 Introduction

27.1.1 Introduction to the HE PHY

Clause 27 specifies the PHY entity for a high-efficiency (HE) orthogonal frequency division multiplexing (OFDM) system. In addition to the requirements in Clause 27, an HE STA shall support transmitting and receiving PPDUs that are compliant with the mandatory requirements of the following PHY specifications:

— Clause 19 and Clause 21 if the HE STA supports an operating channel width greater than or equal to 80 MHz and is operating in the 5 GHz band.

— Clause 19 and Clause 21 transmission and reception on 20 MHz channel width (see 26.17.1) if the HE STA is a 20 MHz-only non-AP HE STA and is operating in the 5 GHz band.

— Clause 19 if the HE STA is operating in the 2.4 GHz band.

— Clause 17 if the HE STA is operating in the 6 GHz band.

For 2.4 GHz band operation, the HE PHY is based on HT PHY defined in Clause 19, which in turn is based on the OFDM PHY defined in Clause 17.

For 5 GHz band operation, the HE PHY is based on the VHT PHY defined in Clause 21, which in turn is based on the HT PHY defined in Clause 19, which in turn is further based on the OFDM PHY defined in Clause 17.

For 6 GHz band operation, the HE PHY is based on the OFDM PHY defined in Clause 17.

The HE PHY extends the maximum number of users supported for DL MU-MIMO transmissions to 8 users per resource unit (RU) and provides support for DL and UL orthogonal frequency division multiple access (OFDMA) as well as for UL MU-MIMO. Both DL and UL MU-MIMO transmissions are supported on portions of the PPDU bandwidth (on resource units greater than or equal to 106 tones). In an MU-MIMO resource unit, there is support for up to 8 users with up to 4 space-time streams per user with the total across all users not exceeding 8 space-time streams.

The HE PHY provides support for 20 MHz, 40 MHz, 80 MHz, and 160 MHz contiguous channel widths and support for 80+80 MHz noncontiguous channel width, depending on the frequency band and capability. For PPDU bandwidths greater than or equal to 80 MHz, the HE PHY supports preamble punctured HE MU PPDU transmissions where pre-HE modulated fields (see Figure 27-23 in 27.3.10) are not transmitted in one or more of the nonprimary 20 MHz channels, and RUs associated with those punctured 20 MHz channels as defined in 27.3.11.8.3 are not allocated.

The HE PHY provides support for 0.8 μs, 1.6 μs, and 3.2 μs guard interval durations.

The HE PHY provides support for 3.2 μs (1x), 6.4 μs (2x), and 12.8 μs (4x) HE-LTF symbol durations, excluding the GI duration. The HE PHY supports a DFT period of 3.2 μs and 12.8 μs for the pre-HE modulated fields and the HE modulated fields in an HE PPDU, respectively. The HE PHY data subcarrier frequency spacing is a quarter of VHT PHY and HT PHY subcarrier frequency spacing defined in Clause 21 and Clause 19, respectively.

The HE PHY data subcarriers are modulated using BPSK, BPSK DCM, QPSK, QPSK DCM, 16-QAM, 16-QAM DCM, 64-QAM, 256-QAM, and 1024-QAM. Forward error correction (FEC) coding (convolutional or LDPC coding) is used with coding rates of 1/2, 2/3, 3/4, and 5/6.

The HE PHY provides support for midambles. Midambles facilitate updating of the channel estimate during HE PPDU reception and might be of use in high mobility scenarios that often result in significant variations of the wireless channel over the duration of a PPDU.

An HE STA shall support the following features:

- Transmission and reception of an HE SU PPDU that consists of a single RU spanning the entire PPDU bandwidth.
- Transmission and reception of an HE ER SU PPDU that consists of a 242-tone RU spanning the entire primary 20 MHz PPDU bandwidth.
- BCC coding (transmit and receive). BCC coding is not used in the following cases:
  - An HE SU PPDU with a bandwidth greater than 20 MHz
  - An RU of size greater than 242 subcarriers in an HE MU PPDU or an HE TB PPDU
  - An HE SU PPDU with number of spatial streams greater than 4
  - An RU allocated to a single user in an HE MU PPDU or for an HE TB PPDU with a number of spatial streams greater than 4
  - An HE SU PPDU using HE-MCSs 10 or 11
  - An RU in an HE MU PPDU or an HE TB PPDU using HE-MCSs 10 or 11
- LDPC coding (transmit and receive) in all supported HE PPDU types, RU sizes, and number of spatial streams if the STA supports transmitting and receiving in channel bandwidths greater than 20 MHz.
- LDPC coding (transmit and receive) in all supported HE PPDU types, RU sizes, and number of spatial streams if the STA declares support for transmitting or receiving more than 4 spatial streams.
- LDPC coding (transmit and receive) in all supported HE PPDU types, RU sizes, and number of spatial streams if the STA declares support for HE-MCSs 10 and 11 (transmit and receive).
- Single spatial stream HE-MCSs 0 to 7 (transmit and receive) in all supported channel widths for HE SU PPDUs.
- HE SU PPDUs and HE ER SU PPDUs with a 2x HE-LTF and 0.8 μs GI duration on the HE-LTF and Data field OFDM symbols (transmit and receive).
- HE SU PPDUs and HE ER SU PPDUs with a 2x HE-LTF and 1.6 μs GI duration on the HE-LTF and Data field OFDM symbols (transmit and receive).
- HE SU PPDUs and HE ER SU PPDUs with a 4x HE-LTF and 3.2 μs GI duration on the HE-LTF and Data field OFDM symbols (transmit and receive).
- Full bandwidth UL MU-MIMO with a 1x HE-LTF and 1.6 μs GI duration on the HE-LTF and Data field OFDM symbols if the STA supports UL MU-MIMO.
- HE SU PPDUs with a 4x HE-LTF and 0.8 μs GI duration on the HE-LTF and Data field OFDM symbols if the STA supports HE ER SU PPDUs with a 4x HE-LTF and 0.8 μs GI duration on the HE-LTF and Data field OFDM symbols (transmit and receive).
- Single spatial stream HE-MCSs 0 to 2 in primary 20 MHz channel for HE ER SU PPDUs.
- HE ER SU PPDU is not used in the following cases:
  - Number of spatial streams greater than 1
  - HE-MCS greater than 2 when 242 subcarriers are used in the Data field OFDM symbols
  - HE-MCS greater than 0 when 106 subcarriers are used in the Data field OFDM symbols
  - Bandwidth greater than 20 MHz
- 20 MHz channel width and all RU sizes and locations applicable to the 20 MHz channel width in 2.4 GHz, 5 GHz, and 6 GHz bands (transmit and receive).

An HE STA may support the following features:

- HE-MCSs 8 to 11 (transmit and receive).
- Two or more spatial streams (transmit and receive).

— DCM (transmit and receive).
— HE SU PPDUs and HE ER SU PPDUs with a 1x HE-LTF and 0.8 μs GI duration on the HE-LTF and Data field OFDM symbols (transmit and receive).
— HE SU PPDUs with a 4x HE-LTF and 0.8 μs GI duration on the HE-LTF and Data field OFDM symbols if the STA does not support HE ER SU PPDUs with a 4x HE-LTF and 0.8 μs GI duration on both the HE-LTF and Data field OFDM symbols (transmit and receive).
— HE ER SU PPDUs with a 4x HE-LTF and 0.8 μs GI duration on both the HE-LTF and Data field OFDM symbols (transmit and receive).
— LDPC coding (transmit and receive) if the maximum number of spatial streams the STA is capable of transmitting or receiving in an HE SU PPDU is less than or equal to 4.
— Single spatial stream HE-MCS 0 in the higher frequency 106-tone RU of the primary 20 MHz channel for an HE ER SU PPDU.
— STBC (transmit and receive).
— HE Ranging NDP (transmit and receive).
— HE TB Ranging NDP (transmit and receive).

NOTE—Support for HE Ranging NDP and HE TB Ranging NDP are indicated in the Extended Capabilities element.

An HE AP shall support the following features:

— Transmission of an HE MU PPDU where none of the RUs utilize MU-MIMO (DL OFDMA).
— Reception of an HE TB PPDU where none of the RUs utilize MU-MIMO (UL OFDMA).
— Transmission of an HE MU PPDU consisting of a single RU spanning the entire PPDU bandwidth and utilizing MU-MIMO (DL MU-MIMO), provided the AP is capable of transmitting 4 or more spatial streams.
— Transmission of the HE-SIG-B field in an HE MU PPDU at HE-MCSs 0 to 5.
— Single spatial stream HE-MCSs 0 to 7 in all supported channel widths and RU sizes for HE MU PPDUs (transmit) or HE TB PPDUs (receive).
— 40 MHz and 80 MHz channel widths and all RU sizes and locations applicable to the 40 MHz and 80 MHz channel width in 5 GHz and 6 GHz bands (transmit and receive).
— HE MU PPDUs with a 2x HE-LTF and 0.8 μs GI duration on the HE-LTF and Data field OFDM symbols (transmit).
— HE MU PPDUs with a 2x HE-LTF and 1.6 μs GI duration on the HE-LTF and Data field OFDM symbols (transmit).
— Reception of an HE TB PPDU with a 2x HE-LTF and 1.6 μs GI duration on the HE-LTF and Data field OFDM symbols.
— Reception of an HE TB PPDU with a 4x HE-LTF and 3.2 μs GI duration on the HE-LTF and Data field OFDM symbols.
— Transmission of an HE MU PPDU with a 4x HE-LTF and 3.2 μs GI duration on the HE-LTF and Data field OFDM symbols.
— Transmission of an HE MU PPDU with a 4x HE-LTF and 0.8 μs GI duration on the HE-LTF and Data field OFDM symbols if the HE AP supports HE ER SU PPDUs with the same HE-LTF and GI combinations.
— All RU sizes and locations applicable to 40 MHz channel width in the 2.4 GHz band if 40 MHz channel width is supported in the 2.4 GHz band (transmit and receive).

An HE AP may support the following features:

— MU-MIMO transmission on an RU in an HE MU PPDU where the RU does not span the entire PPDU bandwidth (DL MU-MIMO within OFDMA).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— MU-MIMO reception on an RU in an HE TB PPDU where the RU spans the entire PPDU bandwidth (UL MU-MIMO).
— MU-MIMO reception on an RU in an HE TB PPDU where the RU does not span the entire PPDU bandwidth (UL MU-MIMO within OFDMA).
— Reception of the payload on an RU in an HE MU PPDU where RU spans the entire PPDU bandwidth or a 106-tone RU within 20 MHz PPDU bandwidth.
— 40 MHz channel width in the 2.4 GHz band (transmit and receive).
— 160 MHz and 80+80 MHz channel widths and 2×996-tone RU size applicable to the 160/80+80 MHz channel width in the 5 GHz and 6 GHz bands (transmit and receive).
— Transmission of an HE MU PPDU with preamble puncturing.
— HE MU PPDUs with a 4x HE-LTF and 0.8 μs GI duration on the HE-LTF and Data field OFDM symbols if the STA does not support HE ER SU PPDUs with a 4x HE-LTF and 0.8 μs GI duration on the HE-LTF and Data field OFDM symbols (transmit).
— Punctured sounding operation.

A non-AP HE STA shall support the following features:

— Reception of an HE MU PPDU from an AP where the RU allocated to the non-AP STA is not utilizing MU-MIMO (DL OFDMA).
— Transmission of an HE TB PPDU where the RU allocated to the non-AP STA is not utilizing MU-MIMO (UL OFDMA).
— Reception of an HE MU PPDU consisting of a single RU spanning the entire PPDU bandwidth and utilizing MU-MIMO (DL MU-MIMO). The maximum number of spatial streams per user the non-AP STA can receive in the DL MU-MIMO transmission shall be equal to the minimum of 4 and the maximum number of spatial streams supported for reception of HE SU PPDUs. The non-AP STA shall be able to receive its intended spatial streams in a DL MU-MIMO transmission with a total number of spatial streams across all users of at least 4.
— Reception of an HE MU PPDU with up to 4 HE-LTF OFDM symbols, where the RU allocated to the non-AP STA does not span the entire PPDU bandwidth.
— Responding with the requested beamforming feedback in an HE sounding procedure with the maximum number of space-time streams in the HE sounding NDP that the non-AP STA can respond to being at least 4.
— Reception of the HE-SIG-B field in an HE MU PPDU at HE-MCSs 0 to 5.
— Single spatial stream HE-MCSs 0 to 7 in all supported channel widths and RU sizes for HE MU PPDUs (receive) or HE TB PPDUs (transmit).
— 40 MHz and 80 MHz channel widths and all RU sizes and locations applicable to the 40 MHz and 80 MHz channel widths in the 5 GHz band (transmit and receive), except for a 20 MHz-only non-AP HE STA in which case the 40 MHz and 80 MHz channel widths, 996-tone RU, and 484-tone RU sizes in the 5 GHz and 6 GHz bands are not applicable.
— Reception of an HE MU PPDU with a 2x HE-LTF and 0.8 μs GI duration on the HE-LTF and Data field OFDM symbols.
— Reception of an HE MU PPDU with a 2x HE-LTF and 1.6 μs GI duration on the HE-LTF and Data field OFDM symbols.
— Transmission of an HE TB PPDU with a 2x HE-LTF and 1.6 μs GI duration on the HE-LTF and Data field OFDM symbols.
— Reception of an HE MU PPDU with a 4x HE-LTF and 3.2 μs GI duration on the HE-LTF and Data field OFDM symbols.
— Transmission of an HE TB PPDU with a 4x HE-LTF and 3.2 μs GI duration on the HE-LTF and Data field OFDM symbols.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Reception of an HE MU PPDU with a 4x HE-LTF and 0.8 μs GI duration on the HE-LTF and the Data field OFDM symbols if the non-AP HE STA supports HE ER SU PPDUs with the same HE-LTF and GI combinations.

— 26-, 52-, and 106-tone RU sizes on locations allowed in 27.3.2.8 in the primary 20 MHz channel within 40 MHz channel width if the non-AP HE STA is a 20 MHz operating non-AP HE STA and that is capable of supporting 40 MHz channel width (B0 of the Supported Channel Width Set subfield in the HE PHY Capabilities Information field in the HE Capabilities element is 1) (transmit and receive).

— 26-, 52-, and 106-tone RU sizes on locations allowed in 27.3.2.8 in the primary 20 MHz channel within 80 MHz channel width if the non-AP HE STA is a 20 MHz operating non-AP HE STA and is operating in the 5 GHz or 6 GHz bands (transmit and receive).

A non-AP HE STA may support the following:

— Transmission of an HE MU PPDU with a single RU spanning the entire PPDU bandwidth or a 20 MHz HE MU PPDU with a single 106-tone RU in the primary 20 MHz channel.

— 40 MHz channel width in the 2.4 GHz band (transmit and receive). If 40 MHz channel width in the 2.4 GHz band is supported, then all RU sizes and locations applicable to 40 MHz channel width are supported, except for a 20 MHz-only non-AP HE STA in which case the 40 MHz channel width and all RU sizes and locations of 40 MHz channel width in 2.4 GHz band are not applicable.

— 160 MHz and 80+80 MHz channel width and 2×996-tone RU size applicable to the 160 MHz and 80+80 MHz channel width in the 5 GHz and 6 GHz bands (transmit and receive), except for a 20 MHz-only non-AP HE STA in which case the 160 MHz and 80+80 MHz channel width and 2×996-tone RU size in the 5 GHz and 6 GHz bands are not applicable.

— MU-MIMO reception on an RU in an HE MU PPDU where the RU does not span the entire PPDU bandwidth (DL MU-MIMO within OFDMA). The maximum number of spatial streams per user in the DL MU-MIMO within OFDMA transmission that the non-AP STA can receive shall be a minimum of 4 and the maximum number of spatial streams supported for reception of HE SU PPDUs. The total number of spatial streams (across all users) in the DL MU-MIMO within OFDMA transmission that the non-AP STA can receive shall be at least 4.

— Reception of an HE MU PPDU with up to 8 HE-LTF OFDM symbols, where the RU allocated to the non-AP STA does not span the entire PPDU bandwidth.

— MU-MIMO transmission on an RU in an HE TB PPDU where the RU spans the entire PPDU bandwidth (UL MU-MIMO). If supported, then the non-AP HE STA shall support transmitting UL MU-MIMO where the total space-time streams summed across all users is less than or equal to 8.

— MU-MIMO transmission on an RU in an HE TB PPDU where the RU does not span the entire PPDU bandwidth (UL MU-MIMO within OFDMA). If supported, then the non-AP HE STA shall support transmitting UL MU-MIMO where the total space-time streams summed across all users is less than or equal to 8.

— The reception of a 160 MHz or 80+80 MHz HE MU PPDU, or the transmission of a 160 MHz or 80+80 MHz HE TB PPDU where the assigned RU is in the primary 80 MHz channel if the non-AP HE STA is capable of up to 80 MHz channel width and operating with 80 MHz channel width.

— HE MU PPDUs with a 4x HE-LTF and 0.8 μs GI duration on the HE-LTF and Data field OFDM symbols if the non-AP HE STA does not support HE ER SU PPDUs with a 4x HE-LTF and 0.8 μs GI duration on the HE-LTF and Data field OFDM symbols (receive).

— Punctured sounding operation.

A 20 MHz-only non-AP HE STA may support the following:

— 26-, 52-, 106-, and 242-tone RU sizes on locations allowed in 27.3.2.8 in the primary 20 MHz channel within 40 MHz channel width in the 2.4 GHz band if the 20 MHz-only non-AP HE STA does not support the HE subchannel selective transmission operation described in 26.8.7.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— 26-, 52-, 106-, and 242-tone RU sizes on locations allowed in 27.3.2.8 in any 20 MHz channel within 40 MHz channel width in the 2.4 GHz band if the 20 MHz-only non-AP HE STA supports the HE subchannel selective transmission operation as described in 26.8.7.

— 26-, 52-, 106-, and 242-tone RU sizes on locations allowed in 27.3.2.8 in any 20 MHz channel within 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz channel widths in the 5 GHz and 6 GHz bands if the 20 MHz-only non-AP HE STA supports the HE subchannel selective transmission operation as described in 26.8.7.

A 20 MHz operating non-AP HE STA may support 26-, 52-, 106-, and 242-tone RU sizes on locations allowed in 27.3.2.8 in the primary 20 MHz channel within 160 MHz and 80+80 MHz channel widths in the 5 GHz and 6 GHz bands.

27.1.2 Scope

The services provided to the MAC by the HE PHY consist of the following protocol functions:

a) A function that maps the PSDU received from the MAC into a PPDU for transmission to one or more receiving STAs.

b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the PPDU format, these STAs support a mixture of Clause 27, Clause 21, Clause 19, Clause 18, Clause 17, Clause 16, and Clause 15 PHYs. A 20 MHz-only non-AP HE STA supports a mixture of Clause 27, Clause 21, Clause 19 and Clause 17 PHYs, and also supports transmission and reception of VHT PPDUs of 20 MHz PPDU bandwidth.

27.1.3 HE PHY functions

27.1.3.1 General

The HE PHY contains two functional entities: the PHY function and the physical layer management function (i.e., the PLME). These functions are described in detail in 27.3 and 27.4, respectively. The HE PHY service is provided to the MAC through the PHY service primitives defined in Clause 8. The HE PHY service interface is described in 27.2.

27.1.3.2 PHY management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

27.1.3.3 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation.

The service of a layer is the set of capabilities that it offers to a user in the next higher layer. Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

27.1.4 PPDU formats

The structure of the PPDU transmitted by an HE STA is determined by the TXVECTOR parameters as defined in Table 27-1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The FORMAT parameter determines the overall structure of the PPDU and can take on one of the following values:

- Non-HT format (NON_HT), based on Clause 17 or Clause 18 and including non-HT duplicate format.
- HT-mixed format (HT_MF) as specified in Clause 19.
- HT-greenfield format (HT_GF) as specified in Clause 19.
- VHT format (VHT) as defined in Clause 21.
- HE SU PPDU format (HE_SU) that carries a single PSDU. With this format the HE-SIG-A field is not repeated.
- HE ER SU PPDU format (HE_ER_SU) that carries a single PSDU. It is similar to the HE SU PPDU format, except that the HE-SIG-A field is repeated.
- HE MU PPDU format (HE_MU) that carries one or more PSDUs to one or more users.
- HE TB PPDU format (HE_TB) that carries a single PSDU and is sent in response to a PPDU that carries a triggering frame. The preamble format prior to the HE-STF field is identical to the HE SU PPDU.

27.2 HE PHY service interface

27.2.1 Introduction

The PHY provides an interface to the MAC through an extension of the generic PHY service interface defined in 8.3.4. The interface includes TXVECTOR, RXVECTOR, PHYCONFIG_VECTOR, and TRIGVECTOR.

The MAC uses the TXVECTOR to supply the PHY with per-PPDU transmit parameters. The PHY uses the RXVECTOR to inform the MAC of the received PPDU parameters. The MAC uses the PHYCONFIG_VECTOR to configure the PHY for operation that is independent of PPDU transmission or reception. The MAC uses the TRIGVECTOR to configure the PHY to receive HE TB PPDUs over each assigned RU.

27.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 27-1 are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication and PHY-RXEND.indication primitives. TXVECTOR and RXVECTOR parameters for transmitting or receiving a DSSS, HR/DSSS, OFDM, ERP, HT or VHT PPDU are defined in:

- DSSS PPDU: Table 15-1 and Table 15-2
- HR/DSSS PPDU: Table 16-5
- OFDM PPDU: Table 17-1 and Table 17-2
- ERP PPDU: Table 18-1 and Table 18-3
- HT PPDU: Table 19-1
- VHT PPDU: Table 21-1.

27.2.3 TRIGVECTOR parameters

The TRIGVECTOR is carried in a PHY-TRIGGER.request primitive and provides the PHY of the AP with the parameters needed to receive an HE TB PPDU over each assigned RU. The parameters in Table 27-2 are defined as part of the TRIGVECTOR parameter list in the PHY-TRIGGER.request primitive.

Table 27-1—TXVECTOR and RXVECTOR parameters

Parameter	Condition	Value	TXVECTOR	RXVECTOR
FORMAT		Determines the format of the PPDU. Enumerated type: NON_HT indicates Clause 15, Clause 16, Clause 17, Clause 18, or non-HT duplicate PPDU format. In this case, the modulation is determined by the NON_HT_MODULATION parameter. HT_MF indicates HT-mixed format. HT_GF indicates HT-greenfield format. VHT indicates VHT format. HE_SU indicates HE SU PPDU format. HE_MU indicates HE MU PPDU format. HE_ER_SU indicates HE ER SU PPDU format. HE_TB indicates HE TB PPDU format.	Y	Y
NON_HT_MODULATION	See corresponding entry in Table 19-1.			
L_DATARATE	FORMAT is NON_HT	Indicates the rate used to transmit the PSDU in Mb/s. Allowed values depend on the value of the NON_HT_MODULATION parameter as follows: ERP-DSSS: 1 and 2 ERP-CCK: 5.5 and 11 ERP-OFDM, NON_HT_DUP_OFDM: 6, 9, 12, 18, 24, 36, 48, and 54 OFDM: 6, 9, 12, 18, 24, 26, 48, and 54	Y	Y
	Otherwise	Not present.		
L_LENGTH	FORMAT is HE_SU, HE_MU, or HE_ER_SU	Not present NOTE—The LENGTH field of the L-SIG field for HE PPDU is defined in Equation (27-11) using the TXTIME value defined in 27.4.3, which in turn depends on other parameters including the TXVECTOR parameter APEP_LENGTH.	N	N
	FORMAT is HE_TB	Indicates the value in the LENGTH field of the L-SIG field in the range 1 to 4095. The value is obtained from the triggering frame to which the HE TB PPDU is a response.	Y	N
	Otherwise	See corresponding entry in Table 19-1 or Table 21-1.		
N_TX	FORMAT is HE_SU, HE_MU, HE_ER_SU, or HE_TB	Indicates the number of transmit chains.	Y	N
	Otherwise	See corresponding entry in Table 21-1.

Table 27-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
EXPANSION_MAT	FORMAT is HE_SU, HE_ER_SU, or HE_TB	Contains a vector in the number of selected subcarriers containing feedback matrices as defined in 27.3.16.2 based on the channel measured during the training symbols of previous HE sounding NDPs or VHT NDPs.	Y	N
	FORMAT is HE_MU	For each user, contains a vector in the number of all the subcarriers in the RU that is assigned to this user. The vector for each subcarrier contains feedback matrices as defined in 27.3.16.2 based on the channel measured during the training symbols of previous HE sounding NDPs or VHT NDPs.	M U	N
	Otherwise	See corresponding entry in Table 21-1.		
CHAN_MAT	FORMAT is HE_SU and PSDU_LENGTH is 0	Contains a vector in the number of selected subcarriers containing feedback matrices as defined in 27.3.16.2 based on the channel measured during the training symbols of previous HE sounding NDP.	N	Y
	FORMAT is HE_MU, HE_ER_SU, or HE_TB. FORMAT is HE_SU and PSDU_LENGTH is greater than 0.	Not present	N	N
	Otherwise	See corresponding entry in Table 21-1.		
DELTA_SNR	FORMAT is HE_MU	Contains an array of delta SNR values as defined in 9.4.1.64 based on the channel measured during the training symbols of the received HE sounding NDP.	M U	N
	FORMAT is HE_SU and PSDU_LENGTH greater than 0, or FORMAT is HE_ER_SU or HE_TB		O	N
	FORMAT is HE_SU and PSDU_LENGTH is 0		N	Y
	Otherwise	See corresponding entry in Table 19-1 or Table 21-1.		
RCPI	See corresponding entry in Table 19-1 or Table 21-1.			
SNR	FORMAT is HE_SU and PSDU_LENGTH is 0	Contains an array of average values of received SNR measurements for each spatial stream. SNR indications of 8 bits are supported. Average value of SNR shall be the sum of the decibel values of SNR per subcarrier divided by the number of subcarriers represented in each stream as described in 9.4.1.63.	N	Y
	FORMAT is HE_MU, HE_ER_SU, or HE_TB, or FORMAT is HE_SU and PSDU_LENGTH is greater than 0	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1 or Table 21-1.

Table 27-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
CQI	FORMAT is HE_SU and PSDU_LENGTH is 0	Contains an array of received per-RU average SNRs for each space-time stream, where each per-RU average SNR is the arithmetic mean of the SNR in decibels over a 26-tone RU as described in 9.4.1.65.	N	Y
	Otherwise	Not present	N	N
NO_SIG_EXTN	FORMAT is HE_SU, HE_MU, HE_ER_SU, or HE_TB	Indicates whether signal extension needs to be applied at the end of transmission. Boolean: true indicates that no signal extension is present. false indicates that a signal extension is present.	Y	N
	Otherwise	See corresponding entry in Table 19-1 or Table 21-1.		
FEC_CODING	FORMAT is HE_SU, HE_MU, HE_ER_SU, or HE_TB	Indicates the FEC encoding used. Enumerated type: BCC_CODING indicates BCC coding. LDPC_CODING indicates LDPC coding.	M U	M U
	Otherwise	See corresponding entry in Table 21-1.		
LDPC_EXTRA_SYMBOL	FORMAT is HE_TB	Indicates the presence of the LDPC extra symbol segment in an HE TB PPDU. Integer: 1 indicates that an LDPC extra symbol segment is present. 0 indicates that an LDPC extra symbol segment is not present.	Y	N
	Otherwise	Not present	N	N
STBC	FORMAT is HE_SU, HE_MU, HE_ER_SU, or HE_TB	Indicates if STBC is used. For an HE MU PPDU and HE TB PPDU where each RU includes no more than 1 user: Set to 1 to indicate that for all RUs the Data field is STBC encoded. Set to 0 to indicate that in no RU is the Data field STBC encoded. For an HE SU PPDU or HE ER SU PPDU: Set to 1 to indicate that the Data field is STBC encoded. Set to 0 to indicate that the Data field is not STBC encoded.	Y	Y
	Otherwise	See corresponding entry in Table 19-1 or Table 21-1.

Table 27-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
GI_TYPE	FORMAT is HE_SU, HE_MU, HE_ER_SU, or HE_TB	Indicates the length of the GI for the HE-LTF and Data fields. Enumerated type: 0u8s_GI indicates 0.8 μs. 1u6s_GI indicates 1.6 μs. 3u2s_GI indicates 3.2 μs. NOTE—the length of GI for pre-HE modulated fields is 0.8 μs.	Y	Y
	Otherwise	See corresponding entry in Table 21-1.		
TXPWR_LEVEL_INDEX	FORMAT is HE_SU, HE_MU, HE_ER_SU, or HE_TB	The allowed values for the TXPWR_LEVEL_INDEX parameter are in the range from 1 to numberOfOctets (dot11TxPowerLevelExtended)/2. This parameter is used to indicate which of the available transmit output power levels defined in dot11TxPowerLevelExtended shall be used for the current transmission.	Y	N
	Otherwise	See corresponding entry in Table 21-1.		
RSSI	FORMAT is HE_SU, HE_ER_SU, HE_MU, or HE_TB	The allowed values for the RSSI parameter are in the range 0 to 255 inclusive. This parameter is a measurement by the PHY of the power observed at the antennas used to receive the current PPDU measured during the reception of the HE-LTF field. RSSI is intended to be used in a relative manner, and it is a monotonically increasing function of the received power.	N	Y
	Otherwise	See corresponding entry in Table 21-1.		
RSSI_LEGACY	FORMAT is HE_SU, HE_MU, HE_ER_SU, or HE_TB	The allowed values for the RSSI_LEGACY parameter are in the range 0 to 255 inclusive. This parameter is a measurement by the PHY of the power observed at the antennas used to receive the current PPDU measured during the reception of non-HE portion of the HE PPDU preamble. RSSI_LEGACY is intended to be used in a relative manner, and it is a monotonically increasing function of the received power.	N	Y
	Otherwise	Not present	N	N
MCS	FORMAT is HE_SU, HE_MU or HE_TB	Indicates the modulation and coding schemes used in the transmission of the PPDU. Integer: range 0 to 11.	M U	M U
	FORMAT is HE_ER_SU	Indicates the modulation and coding schemes used in the transmission of the PPDU. Integer: range 0 to 2.	Y	Y
	Otherwise	See corresponding entry in Table 21-1.

Table 27-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
DCM	FORMAT is HE_SU, HE_MU, HE_ER_SU, or HE_TB	Set to 1 to indicate that DCM is used for the Data field. Set to 0 to indicate that DCM is not used for the Data field. NOTE—DCM is applicable to only HE-MCSs 0, 1, 3, and 4. DCM is applicable to only 1 and 2 spatial streams.	M U	M U
	Otherwise	Not present		
MCS_SIG_B	FORMAT is HE_MU	Indicates the modulation and coding scheme used for the HE-SIG-B field. Integer: 0 indicates HE-MCS 0. 1 indicates HE-MCS 1. 2 indicates HE-MCS 2. 3 indicates HE-MCS 3. 4 indicates HE-MCS 4. 5 indicates HE-MCS 5.	Y	Y
	Otherwise	Not present	N	N
DCM_SIG_B	FORMAT is HE_ MU	Set to 1 to indicate that DCM is used for the HE-SIG-B field. Set to 0 to indicate that DCM is not used for the HE-SIG-B field.	Y	Y
	Otherwise	Not present	N	N
SIG_B_COMPRESSION_MODE	FORMAT is HE_MU	Indicates whether the Common field is present in the HE-SIG-B field. Integer: 0 indicates that the Common field is present. 1 indicates that the Common field is not present.	Y	N
	Otherwise	Not present	N	N
REC_MCS	FORMAT is HE_SU, HE_MU, or HE_ER_SU	Indicates the HE-MCS that the receiver recommends.	N	O
	FORMAT is HE_TB	Not present	N	N
	Otherwise	See corresponding entry in Table 21-1.

Table 27-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
CH_BANDWIDTH	FORMAT is HE_SU	Indicates the channel width of the PPDU. Enumerated type: CBW20 for 20 MHz. CBW40 for 40 MHz. CBW80 for 80 MHz. CBW160 for 160 MHz.	Y	Y
	FORMAT is HE_ER_SU	Indicates the channel width of the PPDU. Enumerated type: ER-RU-242 for the 242-tone RU in the primary 20 MHz channel. ER-RU-H-106 for the higher frequency 106-tone RU in the primary 20 MHz channel.	Y	Y

Table 27-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
CH_BANDWIDTH *(continued)*	FORMAT is HE_MU	Indicates the channel width of the PPDU. Enumerated type: CBW20 for full 20 MHz. CBW40 for full 40 MHz. CBW80 for full 80 MHz. CBW160 for full 160 MHz. CBW80+80 for 80+80 MHz. HE-CBW-PUNC80-PRI for preamble puncturing in 80 MHz, where in the preamble the only punctured subchannel is the secondary 20 MHz channel. HE-CBW-PUNC80-SEC for preamble puncturing in 80 MHz, where in the preamble the only punctured subchannel is one of the two 20 MHz subchannels in the secondary 40 MHz channel. HE-CBW-PUNC160-PRI20 for preamble puncturing in 160 MHz, where in the preamble the only punctured subchannels are the secondary 20 MHz channel and zero to two of the 20 MHz subchannels in the secondary 80 MHz channel. See Table 27-21 for allowed 20 MHz punctured subchannel combinations. HE-CBW-PUNC80+80-PRI20 for preamble puncturing in 80+80 MHz, where in the preamble the only punctured subchannels are the secondary 20 MHz channel and zero to two of the 20 MHz subchannels in the secondary 80 MHz channel. See Table 27-21 for allowed 20 MHz punctured subchannel combinations. HE-CBW-PUNC160-SEC40 for preamble puncturing in 160 MHz, where in the preamble the only punctured subchannels are zero, one or both of the 20 MHz subchannels in the secondary 40 MHz channel and zero to two of the 20 MHz subchannels in the secondary 80 MHz channel. At least one 20 MHz subchannel is punctured. See Table 27-21 for allowed 20 MHz punctured subchannel combinations. HE-CBW-PUNC80+80-SEC40 for preamble puncturing in 80+80 MHz, where in the preamble the only punctured subchannels are zero, one or both of the 20 MHz subchannels in the secondary 40 MHz channel and zero to two of the 20 MHz subchannels in the secondary 80 MHz channel. At least one 20 MHz subchannel is punctured. See Table 27-21 for allowed 20 MHz punctured subchannel combinations.	Y	Y
	FORMAT is HE_TB	Indicates the Bandwidth field of the HE-SIG-A field in the transmitted or received PPDU. Enumerated type: CBW20 for 20 MHz. CBW40 for 40 MHz. CBW80 for 80 MHz. CBW160 for 160 MHz. CBW80+80 for 80+80 MHz.	Y	Y
	Otherwise	See corresponding entry in Table 19-1 or Table 21-1.

Table 27-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
INACTIVE_SUBCHANNELS	FORMAT is HE_MU and CH_BANDWIDTH is any value for preamble puncturing, or FORMAT is NON_HT and NON_HT_MODULATION is NON_HT_DUP_OFDM, or FORMAT is HE_SU and PSDU_LENGTH is 0	Indicates the 20 MHz subchannels that are punctured. A bitmap indexed by the 20 MHz subchannels in ascending order with the LSB indicating the lowest frequency 20 MHz subchannel. A bit is set to 1 to indicate that the corresponding 20 MHz subchannel is punctured and set to 0 to indicate the corresponding 20 MHz subchannel is not punctured.	Y	N
	Otherwise	Not present	N	N
APEP_LENGTH	FORMAT is HE_SU or HE_ER_SU	Integer. If 0 and FORMAT is HE_SU, indicates an HE sounding NDP or HE Ranging NDP. If 0 and FORMAT is HE_TB, indicates an HE TB Ranging NDP. Otherwise, indicates the number of octets in the range 1 to *aPSDUMaxLength* in the A-MPDU pre-EOF padding (see Table 27-61) that is carried in the PSDU.	Y	O
	FORMAT is HE_MU or HE_TB		MU	O
	Otherwise	See corresponding entry in Table 19-1 or Table 21-1.		
PSDU_LENGTH	FORMAT is HE_SU, HE_MU, HE_ER_SU, or HE_TB	Indicates the number of octets in the PSDU in the range 0 to *aPSDUMaxLength* octets (see Table 27-61). A value of 0 indicates an HE sounding NDP, HE Ranging NDP, or HE TB Ranging NDP.	N	Y
	Otherwise	See corresponding entry in Table 21-1.

Table 27-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
NUM_STS	FORMAT is HE_SU	Indicates the number of space-time streams. Integer: range 1 to 8.	Y	Y
	FORMAT is HE_ER_SU	Indicates the number of space-time streams. Integer: range 1 to 2. NOTE—NUM_STS set to 1 is valid only if STBC is not used. NUM_STS set to 2 is valid only if STBC is used.	Y	Y
	FORMAT is HE_MU	Indicates the number of space-time streams. Integer in the range: 1–4 per user per MU-MIMO RU in the TXVECTOR. 1–4 per MU-MIMO RU in the RXVECTOR. 1–8 per RU assigned to no more than 1 user in the TXVECTOR and RXVECTOR. NUM_STS summed over all users per RU is not greater than 8.	MU	Y
	FORMAT is HE_TB	Indicates the number of space-time streams. Integer in the range: 1–4 for a MU-MIMO RU in the TXVECTOR 1–4 per user per MU-MIMO RU in the RXVECTOR 1–8 for an RU assigned to no more than 1 user in the TXVECTOR and RXVECTOR NUM_STS summed over all users per RU is not greater than 8.	Y	N
	Otherwise	See corresponding entry in Table 21-1.

Table 27-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
TXOP_DURATION	FORMAT is HE_SU, HE_MU, HE_ER_SU, or HE_TB	Indicates the TXOP duration. Enumerated type or integer: UNSPECIFIED indicates no NAV value specified. 0–8448 indicates a value in units of 1 μs that is used to update the NAV for this TXOP (see 26.2.4). TXVECTOR parameter TXOP_DURATION is converted to a value in the TXOP subfield of the HE-SIG-A field (see Table 27-19, Table 27-21, and Table 27-22) as follows: TXOP_DURATION = UNSPECIFIED: B0–B6 = 127. TXOP_DURATION < 512: B0 = 0, B1–B6 = ⌊TXOP_DURATION / 8⌋. Otherwise: B0 = 1, B1–B6 = ⌊(TXOP_DURATION – 512) / 128⌋. RXVECTOR parameter TXOP_DURATION is determined from the value in the TXOP subfield of the HE-SIG-A field (see Table 27-19, Table 27-21, and Table 27-22) as follows: B0–B6 = 127: TXOP_DURATION = UNSPECIFIED. B0 = 0: TXOP_DURATION = 8 × B1-B6. Otherwise: TXOP_DURATION = 512 + 128 × B1–B6. See 26.11.5 for more details.	Y	Y
	Otherwise	Not present	N	N
SPATIAL_REUSE	FORMAT is HE_SU, HE_MU, HE_ER_SU, or HE_TB	Indicates the spatial reuse parameter value. There is one value of the parameter for each of an HE SU PPDU, HE ER SU PPDU, and HE MU PPDU. There are one to four values of the parameter present for an HE TB PPDU, with the number of values present dependent on the bandwidth of the PPDU. See the Spatial Reuse field definition in 27.3.11.7.2. See 26.5.2.3 and 26.11.6.	Y	Y
	Otherwise	Not present	N	N
DOPPLER	FORMAT is HE_SU, HE_MU, HE_ER_SU, or HE_TB	Set to 1 to indicate that either the midamble is present for the PPDU or that the channel is with high Doppler. Set to 0 otherwise.	Y	Y
	Otherwise	Not present	N	N

Table 27-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
RU_ALLOCATION	FORMAT is HE_MU and SIG_B_COMPRESSION_MODE is 0	For the TXVECTOR, indicates the RU Allocation subfield of Common field in the HE-SIG-B field of the transmitted PPDU. 8 bits for a 20 MHz PPDU. 16 bits for a 40 MHz PPDU. 32 bits for an 80 MHz PPDU. 64 bits for a 160 MHz or 80+80 MHz PPDU. See 27.3.11.8.3 for details. For the RXVECTOR, 8 bits are used to indicate the RU allocated in the whole bandwidth. See 9.3.1.22 for details.	Y	Y
	FORMAT is HE_TB	8 bits are used to indicate the RU allocated in the whole bandwidth per user. See 9.3.1.22 for details.	Y	N
	FORMAT is HE_SU, APEP_LENGTH is 0, and CH_BANDWIDTH is not CBW20 or CBW40	For the TXVECTOR, indicates the active RUs. 32 bits for 80 MHz PPDU. 64 bits for 160 MHz and 80+80 MHz PPDU. For each 8 bits, only the following values are allowed: 113 (01110001 in binary representation). 192 (11000000 in binary representation). See 27.3.11.8.3 for details.	Y	N
	FORMAT is NON_HT, NON_HT_MODULATION is NON_HT_DUP_OFDM, and CH_BANDWIDTH is not CBW20 or CBW40			
	Otherwise	Not present	N	N
BEAMFORMED	FORMAT is HE_SU or HE_ER_SU	Set to 1 if a beamforming steering matrix is applied to the HE modulated fields. Set to 0 otherwise.	Y	Y
	FORMAT is HE_MU or HE_TB	For an RU with no more than 1 user allocated, set to 1 if a beamforming steering matrix is applied to this non-MU-MIMO allocation, and set to 0 otherwise. For each user in an RU assigned to more than 1 user, always set to 0.	MU	O
	Otherwise	See corresponding entry in Table 21-1.

Table 27-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
CENTER_26_TONE_RU	FORMAT is HE_MU and CH_BANDWIDTH is CBW80, CBW160, CBW80+80, HE-CBW-PUNC80-PRI, HE-CBW-PUNC80-SEC, HE-CBW-PUNC160-PRI20, HE-CBW-PUNC80+80-PRI20, HE-CBW-PUNC160-SEC40, or HE-CBW-PUNC80+80-SEC40.	Indicate the presence of the center 26-tone RU with regard to bandwidth. If the CH_BANDWIDTH parameter is CBW80, HE-CBW-PUNC80-PRI or HE-CBW-PUNC80-SEC: Set to 1 to indicate that a user is allocated to the center 26-tone RU (see Figure 27-7). Set to 0 to indicate that no user is allocated to the center 26-tone RU. If the CH_BANDWIDTH parameter is CBW160, CBW80+80, HE-CBW-PUNC160-PRI20, HE-CBW-PUNC80+80-PRI20, HE-CBW-PUNC160-SEC40, or HE-CBW-PUNC80+80-SEC40: Set to 0 to indicate that no user is allocated to either the center 26-tone RU of the lower frequency 80 MHz or that of the higher frequency 80 MHz. Set to 1 to indicate that a user is allocated to the center 26-tone RU of the lower frequency 80 MHz. Set to 2 to indicate that a user is allocated to the center 26-tone RU of the higher frequency 80 MHz. Set to 3 to indicate that a user is allocated to each of the center 26-tone RU of the lower frequency 80 MHz and that of the higher frequency 80 MHz individually. See 27.3.11.8.3.	Y	N
	Otherwise	Not present	N	N
HE_LTF_TYPE	FORMAT is HE_SU, HE_MU, HE_ER_SU, or HE_TB	Indicates the type of HE-LTF. Enumerated type: 1xHE-LTF indicates a 1x HE-LTF. 2xHE-LTF indicates a 2x HE-LTF. 4xHE-LTF indicates a 4x HE-LTF. See 27.3.11.10.	Y	Y
	Otherwise	Not present	N	N
HE_LTF_MODE	FORMAT is HE_TB	Integer: Set to 0 to indicate that the transmitted PPDU uses HE single stream pilot HE-LTF mode. Set to 1 to indicate the transmitted PPDU uses HE masked HE-LTF sequence mode. Present for full-bandwidth MU-MIMO not using 1x HE-LTF and not present otherwise. See 27.3.11.10.	O	N
	Otherwise	Not present	N	N

Table 27-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
NUM_HE_LTF	FORMAT is HE_MU or HE_TB	Indicates the number of OFDM symbols in the HE-LTF field. See 26.5.2.3 and 27.3.11.7.2.	Y	N
	Otherwise	Not present	N	N
HE_SIG_A2_RESERVED	FORMAT is HE_TB	Indicates the Reserved field setting for the HE-SIG-A2 subfield of HE TB PPDU. See 26.5.2.3 and Table 27-22 for details.	Y	N
	Otherwise	Not present	N	N
STARTING_STS_NUM	FORMAT is HE_TB	The sum of the number of space-time streams assigned to other users with lower space-time stream indices than this user.	Y	N
	Otherwise	Not present	N	N
RX_START_OF_FRAME_OFFSET	See corresponding entry in Table 21-1.			
PREAMBLE_TYPE	FORMAT is NON_HT and NON_HT_MODULATION is one of ERP-DSSS ERP-CCK	Enumerated type: SHORTPREAMBLE. LONGPREAMBLE.	Y	Y
	Otherwise	Not present	N	N

Copyright © 2025 IEEE. All rights reserved.

Table 27-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
NOMINAL_PACKET_PADDING	FORMAT is HE_SU, HE_MU, or HE_ER_SU	The nominal packet padding as defined in 9.4.2.247.5. Possible values are 0 μs, 8 μs, and 16 μs.	M U	N
	Otherwise	Not present	N	N
TRIGGER_METHOD	FORMAT is HE_TB	Indicates the method used to trigger this HE TB PPDU transmission. Enumerated type: TRIGGER_FRAME for Trigger frame. TRS for TRS Control subfield.	Y	N
	Otherwise	Not present	N	N
PRE_FEC_PADDING_FACTOR	FORMAT is HE_TB and TRIGGER_METHOD is TRIGGER_FRAME	Indicates the pre-FEC padding factor used by the HE TB PPDU transmission.	Y	N
	Otherwise	Not present	N	N
DEFAULT_PE_DURATION	FORMAT is HE_TB and TRIGGER_METHOD is TRS	Duration of the PE field to be transmitted (see 26.5.2.3). A value 0, 4, 8, 12, or 16 indicating the PE field duration in μs.	Y	N
	Otherwise	Not present	N	N

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 27-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
BEAM_CHANGE	FORMAT is HE_SU or HE_ER_SU	Integer: Set to 0 to indicate that the spatial mapping of the pre-HE modulated fields are the same as the first symbol of HE-LTF field. Set to 1 to indicate that the spatial mapping of the pre-HE modulated fields are different from the first symbol of HE-LTF field.	Y	Y
	Otherwise	Not present	N	N
BSS_COLOR	FORMAT is HE_SU, HE_MU, HE_ER_SU, or HE_TB	Set to a value in the range 0 to 63 (see 26.11).	Y	Y
	Otherwise	Not present	N	N
UPLINK_FLAG	FORMAT is HE_SU or HE_MU	Set to 1 if the PPDU is addressed to an AP. Set to 0 otherwise.	Y	Y
	FORMAT is HE_ER_SU	Set to 0 if the PPDU is not addressed to an AP, or if the PPDU is addressed to an AP and meets the exception in 26.11.2. Set to 1 otherwise.	Y	Y
	Otherwise	Not present	N	N
STA_ID	FORMAT is HE_MU	Indicates the list of STA-IDs for an HE MU PPDU (see 26.11).	MU	MU
	Otherwise	Not present	N	N
SCRAMBLER_INITIAL_VALUE	FORMAT is HE_SU or HE_ER_SU	The first 7 bits of the scrambling sequence (the value of the Scrambler Initialization field prior to descrambling), with the first bit of the scrambling sequence being the LSB of SCRAMBLER_INITIAL_VALUE.	N	Y
	FORMAT is HE_MU or HE_TB	Not present	N	N
	Otherwise	See corresponding entry in Table 21-1		
TRIGGER_RESPONDING	FORMAT is NON_HT	Boolean value: true indicates that the MAC entity requests that the PHY entity follow the precorrection requirements defined in 27.3.15.3. false indicates that the MAC entity does not request that the PHY entity follow the precorrection requirements defined in 27.3.15.3.	Y	N
	Otherwise	Not present	N	N

Table 27-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
NDP_REPORT	FORMAT is HE_TB and PSDU_LENGTH = 0	Provides the detected status array on the resources assigned by the Trigger frame. The array has N_{STA} entries (N_{STA} is defined in 26.5.7.2) where each entry takes on the value: 1 if transmission is detected on the first group of the tone set. 0 if transmission is detected on the second group of the tone set. NONE if transmission is not detected on either group of the tone set.	N	Y
	Otherwise	Not present	N	N
FEEDBACK_STATUS	FORMAT is HE_TB and APEP_LENGTH = 0	Indicates the value of the one bit used to modulate the tones in each tone set. See 27.3.4 and 26.5.7.	Y	N
	Otherwise	Not present	N	N
RU_TONE_SET_INDEX	FORMAT is HE_TB and APEP_LENGTH = 0	Indicates the RU tone set used for an HE TB feedback NDP. See 27.3.18.	Y	N
	Otherwise	Not present	N	N
MIDAMBLE_PERIODICITY	FORMAT is HE_SU, HE_MU, HE_ER_SU, or HE_TB, and DOPPLER is 1	Indicates the midamble periodicity in number of OFDM symbols in the Data field. Set to 10 or 20.	Y	N
	Otherwise	Not present	N	N
HE_TB_PE_DISAMBIGUITY	FORMAT is HE_TB and TRIGGER_METHOD is TRIGGER_FRAME	Indicates PE disambiguity for the HE TB PPDU transmission. Set to 0 to indicate no PE disambiguity. Set to 1 to indicate PE disambiguity.	Y	N
	Otherwise	Not present	N	N

Copyright © 2025 IEEE. All rights reserved.

Table 27-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
POWER_BOOST_FACTOR	FORMAT is HE_SU, HE_MU or HE_ER_SU	For an occupied RU, set to the power boost factor of the RU in the range 0.5 to 2 (see 26.11.10)	M R	N
	Otherwise	Not present	N	N
TIME_OF_DEPARTURE_REQUESTED	FORMAT is HE_SU or (HE_TB and RANGING_FLAG is present)	Enumerated type: True indicates that the MAC entity requests that the PHY entity measures and reports time of departure parameters corresponding to the time when the first frame energy is sent by the transmitting port. False indicates that the MAC entity requests that the PHY entity neither measures nor reports time of departure parameters.	O	N
	FORMAT is HE_ER_SU or HE_MU	Not present.	N	N
	Otherwise	See corresponding entry in Table 21-1.		
LTF_KEY	FORMAT is either HE_SU or HE_TB and RANGING_FLAG is present and SECURE_LTF_FLAG is 1	Contains the *rsta-ltf-key* or *ista-ltf-key* (see 11.21.6.4.5.4) when the secure HE-LTFs are used (see 11.21.6.4.5).	Y	N
	Otherwise	Not present.		
LTF_IV	FORMAT is either HE_SU or HE_TB and RANGING_FLAG is present and SECURE_LTF_FLAG is 1	Contains the *ltf-iv* (see 11.21.6.4.5.4) used to generate the secure HE-LTFs.	Y	N
	Otherwise	Not present.		
LTF_REP	FORMAT is either HE_SU or HE_TB and RANGING_FLAG is present	Indicates the number of HE-LTF repetitions.	Y	N
	Otherwise	Not present.		
RANGING_FLAG	FORMAT is HE_SU	If present, indicates that the PPDU is an HE Ranging NDP. Not present otherwise.	O	N
	FORMAT is HE_TB	If present, indicates that the PPDU is an HE TB Ranging NDP. Not present otherwise.	O	N
	Otherwise	Not present.	N	N

Table 27-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
SECURE_LTF_FLAG	FORMAT is either HE_SU or HE_TB and the RANGING_FLAG is present.	Set to 1 to indicate that the HE Ranging NDP or HE TB Ranging NDP will use secure HE-LTF. Set to 0 otherwise.	Y	N
	Otherwise	Not present.		
TX_WINDOW_FLAG	FORMAT is either HE_SU or HE_TB and RANGING_FLAG is present and SECURE_LTF_FLAG is 1	Set to 1 to indicate that the secure HE-LTF of an HE Ranging NDP or HE TB Ranging NDP will use the optional frequency domain Tx window. Set to 0 otherwise.	Y	N
	Otherwise	Not present.		

NOTE 1—In the TXVECTOR and RXVECTOR columns, the following apply:
Y = Present.
N = Not present.
O = Optional.
MU indicates that the parameter is present once for an HE SU PPDU and HE ER SU PPDU and present per user for an HE MU PPDU. For an HE TB PPDU, MU in the TXVECTOR column indicates that the parameter is present once and MU in the RXVECTOR column indicates the parameter is not present (the receiver knows the values since they were specified in the triggering PPDU). Parameters specified to be present per user are conceptually supplied as an array of values indexed by *u*, where *u* takes values 0 to NUM_USERS – 1.
MR indicates that the parameter is present once for an HE SU PPDU and HE ER SU PPDU and is present per RU for an HE MU PPDU. Parameters specified to be present per RU are conceptually supplied as an array of values indexed by *r*, where *r* takes values 0 to the number of RUs minus 1.
NOTE 2—Refer to Clause 15, Clause 16, Clause 17, Clause 18, Clause 19, and Clause 21 for the TXVECTOR and RXVECTOR parameters that are not present in this table when FORMAT is not HE_SU, HE_MU, HE_ER_SU, or HE_TB.

Table 27-2—TRIGVECTOR parameters

Parameter	Value
CH_BANDWIDTH	Indicates the bandwidth in the HE-SIG-A field of the expected HE TB PPDU(s). Enumerated type: CBW20 for 20 MHz. CBW40 for 40 MHz. CBW80 for 80 MHz. CBW160 for 160 MHz. CBW80+80 for 80+80 MHz.
UL_LENGTH	Indicates the value of the LENGTH field in the L-SIG field of the expected HE TB PPDU(s).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 27-2—TRIGVECTOR parameters *(continued)*

Parameter	Value
GI_AND_HE_LTF_TYPE	Indicates the GI and HE-LTF type of the expected HE TB PPDU(s). Enumerated type: 1x HE-LTF + 1.6 μs GI. 2x HE-LTF + 1.6 μs GI. 4x HE-LTF + 3.2 μs GI.
MU_MIMO_HE_LTF_MODE	Indicates the HE-LTF mode of the expected UL MU-MIMO HE TB PPDU(s), if it uses full-bandwidth MU-MIMO and does not use 1x HE-LTF. Set to 0 to indicate that HE single stream pilot HE-LTF mode is used. Set to 1 to indicate that HE masked HE-LTF sequence mode is used.
NUMBER_OF_HE_LTF_SYMBOLS	Indicates the number of HE-LTF symbols present in the expected HE TB PPDU(s). If the parameter DOPPLER is 0: Set to 0 for 1 HE-LTF symbol. Set to 1 for 2 HE-LTF symbols. Set to 2 for 4 HE-LTF symbols. Set to 3 for 6 HE-LTF symbols. Set to 4 for 8 HE-LTF symbols. If the parameter DOPPLER is 1: Set to 0 for 1 HE-LTF symbol. Set to 1 for 2 HE-LTF symbols. Set to 2 for 4 HE-LTF symbols.
MIDAMBLE_PREIODICITY	Indicates the midamble periodicity. Present only if the parameter DOPPLER is 1. Integer value: Set to 10 to indicate a 10 symbol midamble periodicity. Set to 20 to indicate a 20 symbol midamble periodicity.
STBC	Indicates the status of STBC encoding in the expected HE TB PPDU(s). Set to 1 if STBC encoding is used. Set to 0 otherwise.
LDPC_EXTRA_SYMBOL	Indicates the status of the LDPC extra symbol segment in the expected HE TB PPDU(s). Set to 1 if LDPC extra symbol segment is present. Set to 0 otherwise.
PRE_FEC_FACTOR	Indicates the pre-FEC padding factor for the expected HE TB PPDU(s). Set to 0 to indicate a pre-FEC padding factor of 4. Set to 1 to indicate a pre-FEC padding factor of 1. Set to 2 to indicate a pre-FEC padding factor of 2. Set to 3 to indicate a pre-FEC padding factor of 3.
PE_DISAMBIGUITY	Indicates the PE disambiguity for the expected HE TB PPDU(s). Set to 0 to indicate no PE disambiguity. Set to 1 to indicate PE disambiguity.
DOPPLER	Indicates a high Doppler mode for the expected HE TB PPDU(s). Set to 1 to indicate that midambles are present. Set to 0 otherwise.
AID12_LIST	Each entry of AID12_LIST is (12-bit) AID of the corresponding HE TB PPDU. See the AID12 subfield in 9.3.1.22. NOTE—The MSB of the 12-bit AID is always 0.

Table 27-2—TRIGVECTOR parameters *(continued)*

Parameter	Value
RU_ALLOCATION_LIST	8 bits are used per STA to indicate the RU allocated in the whole bandwidth. See 9.3.1.22.
FEC_CODING_LIST	Each entry indicates the coding type of the corresponding HE TB PPDU. See the UL FEC Coding Type subfield description in 9.3.1.22.
HE_MCS_LIST	Each entry of HE_MCS_LIST indicates the HE-MCS of the corresponding HE TB PPDU. See the UL HE-MCS subfield in 9.3.1.22 for more information of each entry.
UL_DCM_LIST	Each entry indicates whether DCM is applied to the corresponding HE TB PPDU. See the UL DCM subfield description in 9.3.1.22 for details.
SS_ALLOCATION_LIST	Each entry indicates the spatial streams of the corresponding HE TB PPDU. See the SS Allocation subfield description in 9.3.1.22.

27.2.4 LTFVECTOR parameters

The LTFVECTOR is carried in a PHY-RXLTFSEQUENCE.request for the PHY of a STA to receive an HE Ranging NDP or an HE TB Ranging NDP. The parameters in Table 27-3 are defined as part of the LTFVECTOR parameter list in the PHY-RXLTFSEQUENCE.request primitive.

Table 27-3—LTFVECTOR parameters

Parameter	Value
LTF_NSTS	Indicates the number of space-time streams in the following HE Ranging NDP or the following HE TB Ranging NDP.
LTF_REP	Indicates the number of HE-LTF repetitions in the following HE Ranging NDP or the following HE TB Ranging NDP.
SECURE_LTF_FLAG	Set to 1 to indicate that the HE Ranging NDP or HE TB Ranging NDP uses secure HE-LTF.
LTF_KEY	Present when SECURE_LTF_FLAG is set to 1. Contains the *rsta-ltf-key* or *ista-ltf-key* (see 11.21.6.4.5.4) when receiving the secure HE-LTFs.
LTF_IV	Present when SECURE_LTF_FLAG is set to 1. Contains the ltf-iv (see 11.21.6.4.5.4) for secure HE-LTFs or null otherwise.
LTF_OFFSET	Present when SECURE_LTF_FLAG is set to 1. Indicates the number of HE-LTF to skip before beginning to process the HE-LTF symbols.
TX_WINDOW_FLAG	Present when SECURE_LTF_FLAG is set to 1. Set to 1 to indicate that the secure HE-LTF of an HE Ranging NDP or HE TB Ranging NDP will use the optional frequency domain Tx Window.

27.2.5 PHYCONFIG_VECTOR parameters

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for an HE PHY contains an OPERATING_CHANNEL parameter, which identifies the operating or primary channel. The PHY shall set dot11CurrentPrimaryChannel to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for an HE PHY contains a CHANNEL_WIDTH parameter, which identifies the operating channel width and takes one of the values 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz. The PHY shall set dot11CurrentChannelWidth to the value of this parameter. The PHY shall set dot11HECurrentChannelWidthSet to a value that is obtained from the Supported Channel Width Set subfield in the HE Capabilities element transmitted by the STA.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for an HE PHY contains a CENTER_FREQUENCY_SEGMENT_0 parameter, which identifies the center frequency of the channel (or of segment 0 if the CHANNEL_WIDTH parameter indicates 80+80 MHz) and takes a value between 1 and 255. The PHY shall set dot11CurrentChannelCenterFrequencyIndex0 to the value of this parameter. The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for an HE PHY contains a CENTER_FREQUENCY_SEGMENT_1 parameter, which takes the value 0 if the CHANNEL_WIDTH parameter does not indicate 80+80 MHz, and otherwise identifies the center frequency of segment 1 and takes a value between 1 and 200. The PHY shall set dot11CurrentChannelCenterFrequencyIndex1 to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for an HE PHY contains a BSS_COLOR_LIST parameter, which indicates a list of color values for which PPDUs have to be processed. Processing of PPDUs with color values not in BSS_COLOR_LIST can be terminated as soon as their color is determined.

Additional PHYCONFIG_VECTOR parameters are defined in Table 8-4.

27.2.6 Effects of CH_BANDWIDTH parameter on PPDU format

Table 27-4 shows the valid combinations of the FORMAT, NON_HT_MODULATION, and CH_BANDWIDTH parameters and the corresponding PPDU format and value of CH_OFFSET (if applicable). Other combinations are reserved.

Table 27-4—Interpretation of FORMAT, NON_HT_MODULATION, CH_BANDWIDTH, and CH_OFFSET parameters

FORMAT	NON_HT_ MODULATION	CH_BANDWIDTH	CH_OFFSET	PPDU format
HE	N/A	CBW20	N/A	The STA transmits an HE PPDU of 20 MHz bandwidth. If the BSS bandwidth is wider than 20 MHz, then the transmission shall use the primary 20 MHz channel.
HE	N/A	CBW40	N/A	The STA transmits an HE PPDU of 40 MHz bandwidth. If the BSS bandwidth is wider than 40 MHz, then the transmission shall use the primary 40 MHz channel.

Table 27-4—Interpretation of FORMAT, NON_HT_MODULATION, CH_BANDWIDTH, and CH_OFFSET parameters *(continued)*

FORMAT	NON_HT_ MODULATION	CH_BANDWIDTH	CH_OFFSET	PPDU format
HE	N/A	CBW80	N/A	The STA transmits an HE PPDU of 80 MHz bandwidth. If the BSS bandwidth is wider than 80 MHz, then the transmission shall use the primary 80 MHz channel.
HE	N/A	CBW160	N/A	The STA transmits an HE PPDU of 160 MHz bandwidth.
HE	N/A	CBW80+80	N/A	The STA transmits an HE PPDU of 80+80 MHz bandwidth.
HE	N/A	HE-CBW-PUNC80-PRI	N/A	The STA transmits an 80 MHz HE PPDU where the only punctured subchannel is the secondary 20 MHz channel.
HE	N/A	HE-CBW-PUNC80-SEC	N/A	The STA transmits an 80 MHz HE PPDU where the only punctured subchannel is one of the two 20 MHz subchannels in the secondary 40 MHz channel.
HE	N/A	HE-CBW-PUNC160-PRI20	N/A	The STA transmits a 160 MHz HE PPDU where the only punctured subchannels are the secondary 20 MHz channel and zero to two of the 20 MHz subchannels in the secondary 80 MHz channel. See Table 27-21 for allowed 20 MHz punctured subchannel combinations.
HE	N/A	HE-CBW-PUNC80+80-PRI20	N/A	The STA transmits an 80+80 MHz HE PPDU where the only punctured subchannels are the secondary 20 MHz channel and zero to two of the 20 MHz subchannels in the secondary 80 MHz channel. See Table 27-21 for allowed 20 MHz punctured subchannel combinations.
HE	N/A	HE-CBW-PUNC160-SEC40	N/A	The STA transmits a 160 MHz HE PPDU where the only punctured subchannels are zero, one or both of the 20 MHz subchannels in the secondary 40 MHz channel and zero to two of the 20 MHz subchannels in the secondary 80 MHz channel. At least one 20 MHz subchannel is punctured. See Table 27-21 for allowed 20 MHz punctured subchannel combinations.

Table 27-4—Interpretation of FORMAT, NON_HT_MODULATION, CH_BANDWIDTH, and CH_OFFSET parameters *(continued)*

FORMAT	NON_HT_ MODULATION	CH_BANDWIDTH	CH_OFFSET	PPDU format
HE	N/A	HE-CBW-PUNC80+80-SEC40	N/A	The STA transmits an 80+80 MHz HE PPDU where the only punctured subchannels are zero, one or both of the 20 MHz subchannels in the secondary 40 MHz channel and zero to two of the 20 MHz subchannels in the secondary 80 MHz channel; at least one 20 MHz subchannel is punctured. See Table 27-21 for allowed 20 MHz punctured subchannel combinations.
HT_MF, HT_GF, VHT	See Table 21-2 and Table 19-2.			
NON_HT	If INACTIVE_SUBCHANNELS is not present, see Table 21-2 and Table 19-2.			
NON_HT	If INACTIVE_SUBCHANNELS is present, see Table 27-5.			

Valid combinations of the CH_BANDWIDTH and INACTIVE_SUBCHANNELS parameters when FORMAT is NON_HT and the corresponding PPDU and CH_OFFSET (if applicable) are shown in Table 27-5. Other combinations are reserved.

27.2.7 Support for non-HT, HT, and VHT formats

27.2.7.1 General

An HE STA logically contains Clause 15, Clause 16, Clause 17, Clause 18, Clause 19, Clause 21, and Clause 27 PHYs. The MAC interacts with the PHYs via the Clause 27 PHY service interface, which in turn interacts with the Clause 15, Clause 16, Clause 17, Clause 18, and Clause 19, and Clause 21 PHY service interfaces as shown in Figure 27-1, Figure 27-2, and Figure 27-3.

27.2.7.2 Support for non-HT format

The behavior of the HE PHY on receipt of a PHY-TXSTART.request(TXVECTOR) primitive with the FORMAT parameter equal to NON_HT and the NON_HT_MODULATION parameter not equal to NON_HT_DUP_OFDM is defined in Clause 15, Clause 16, Clause 17, and Clause 18 and depends on the parameter NON_HT_MODULATION. If the parameter NON_HT_MODULATION is OFDM or NON_HT_DUP_OFDM, then the following additional requirements apply:

— The requirements in 21.3.9.1
— The requirements in 21.3.17.1 instead of the requirements in 17.3.9.3
— The requirements in 27.3.21.3 instead of the requirements in 17.3.9.7.2

The modulation equation for non-HT duplicate transmission is defined in 27.3.14.

Table 27-5— Interpretation of CH_BANDWIDTH and INACTIVE_SUBCHANNELS parameters when FORMAT is equal to NON_HT and NON_HT_MODULATION is equal to NON_HT_DUP_OFDM

CH_BANDWIDTH	INACTIVE_SUBCHANNELS	CH_OFFSET	PPDU format
CBW80	All bits set to 1, except for the four bits corresponding to the primary 80 MHz channel, which are set to 0	N/A	The STA transmits a non-HT PPDU of 80 MHz bandwidth. If the BSS bandwidth is wider than 80 MHz, then the transmission shall use the primary 80 MHz channel.
CBW80	The bit corresponding to the primary 20 MHz channel set to 0 and two other bits set to 0 that correspond to any other subchannels in the primary 80 MHz, all other bits set to 1	N/A	The STA transmits a punctured non-HT PPDU of 80 MHz bandwidth. If the BSS bandwidth is wider than 80 MHz, then the transmission shall use the primary 80 MHz channel.
CBW160	All bits set to 0	N/A	The STA transmits a non-HT PPDU of 160 MHz bandwidth.
CBW160	Either the bit corresponding to the secondary 20 MHz channel or zero, one or both bits corresponding to the secondary 40 MHz channel set to 1. Zero to two bits corresponding to 20 MHz subchannels in the secondary 80 MHz channel set to 1. All other bits set to 0. Not all bits set to 0. If two bits corresponding to 20 MHz subchannels in the secondary 80 MHz channel are set to 1 these correspond to the lower two or higher two 20 MHz subchannels. No more than two bits corresponding to adjacent 20 MHz subchannels set to 1.	N/A	The STA transmits a punctured non-HT PPDU of 160 MHz bandwidth.
CBW80+80	All bits set to 0	N/A	The STA transmits a non-HT PPDU of 80+80 MHz bandwidth.
CBW80+80	Either the bit corresponding to the secondary 20 MHz channel or zero, one or both bits corresponding to the secondary 40 MHz channel set to 1. Zero to two bits corresponding to 20 MHz subchannels in the secondary 80 MHz channel set to 1. All other bits set to 0. Not all bits set to 0. If two bits corresponding to 20 MHz subchannels in the secondary 80 MHz channel are set to 1 these correspond to the lower two or higher two 20 MHz subchannels.	N/A	The STA transmits a punctured non-HT PPDU of 80+80 MHz bandwidth.

The HE PHY TXVECTOR parameters in Table 27-1 are mapped to Clause 15, Clause 16, Clause 17, and Clause 18 TXVECTOR parameters according to Table 27-6. The HE PHY parameters not listed in the table are not present.

Table 27-6—Mapping of the HE PHY parameters for non-HT operation

HE PHY parameter	2.4 GHz operation defined by Clause 15	2.4 GHz operation defined by Clause 16	2.4 GHz operation defined by Clause 18	5 GHz and 6 GHz operation defined by Clause 17	Parameter list
L_LENGTH	LENGTH	LENGTH	LENGTH	LENGTH	TXVECTOR/ RXVECTOR
L_DATARATE	DATARATE	DATARATE	DATARATE	DATARATE	TXVECTOR/ RXVECTOR
TXPWR_LEVEL_INDEX	TXPWR_LEVEL_INDEX	TXPWR_LEVEL_INDEX	TXPWR_LEVEL_INDEX	TXPWR_LEVEL_INDEX	TXVECTOR
RSSI	RSSI	RSSI	RSSI	RSSI	RXVECTOR
SERVICE	SERVICE	SERVICE	SERVICE	SERVICE	TXVECTOR/ RXVECTOR
RCPI	RCPI	RCPI	RCPI	RCPI	RXVECTOR
CH_BANDWIDTH_IN_NON_HT	discarded	discarded	CH_BANDWIDTH_IN_NON_HT	CH_BANDWIDTH_IN_NON_HT	TXVECTOR/ RXVECTOR
DYN_BANDWIDTH_IN_NON_HT	discarded	discarded	DYN_BANDWIDTH_IN_NON_HT	DYN_BANDWIDTH_IN_NON_HT	TXVECTOR/ RXVECTOR
OPERATING_CHANNEL	discarded	discarded	discarded	OPERATING_CHANNEL	PHYCONFIG_VECTOR

The behavior of the HE PHY on receipt of a PHY-TXSTART.request(TXVECTOR) primitive with the FORMAT parameter equal to NON_HT and the NON_HT_MODULATION parameter equal to NON_HT_DUP_OFDM is defined in 27.3.14.

To support the non-HT format, the HE PHY, on receipt of a PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive, behaves as if it were a Clause 15, Clause 16, Clause 17, or Clause 18 PHY that had received a PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive but without the PHYCONFIG_VECTOR parameters CHANNEL_WIDTH, CENTER_FREQUENCY_SEGMENT_0, and CENTER_FREQUENCY_SEGMENT_1.

As defined in 27.3.24, once a PPDU is received and detected as a non-HT PPDU, the behavior of the HE PHY is defined in Clause 15, Clause 16, Clause 17, or Clause 18 depending on the PPDU format. The RXVECTOR parameters from Clause 15, Clause 16, Clause 17, and Clause 18 are mapped to the HE PHY RXVECTOR parameters as defined in Table 27-6. The HE PHY parameters not listed in the table are not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

27.2.7.3 Support for HT format

The behavior of an HE PHY on receipt of a PHY-TXSTART.request(TXVECTOR) primitive with the TXVECTOR parameter FORMAT equal to HT_MF or HT_GF is defined in Clause 19 with the following additional requirements:

— The requirements in 21.3.9.2

— The requirements in 27.3.21.3 instead of the requirements in 19.3.18.4

The HE PHY TXVECTOR parameters in Table 27-1 are mapped directly to Clause 19 TXVECTOR parameters in Table 19-1. The HE PHY parameters not listed in Table 19-1 are not present. The PHY shall use a value of CH_OFFSET in the Clause 19 TXVECTOR that is consistent with Table 27-4. A 20 MHz-only non-AP HE STA supports HT transmission only on 20 MHz channel width.

On receipt of a PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive, the HE PHY behaves, for the purposes of HT PPDU transmission and reception, as if it were a Clause 19 PHY that had received PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive but without the PHYCONFIG_VECTOR parameters CHANNEL_WIDTH, CENTER_FREQUENCY_SEGMENT_0, and CENTER_FREQUENCY_SEGMENT_1 and with the PHYCONFIG_VECTOR parameter SECONDARY_CHANNEL_OFFSET set to SECONDARY_CHANNEL_NONE if dot11CurrentChannelWidth indicates 20 MHz, to SECONDARY_CHANNEL_ABOVE if $f_{P20,idx} < f_{S20,idx}$, or to SECONDARY_CHANNEL_BELOW otherwise.

As defined in 27.3.24, once a PPDU is received and detected as an HT PPDU, the behavior of the HE PHY is defined in Table 19. The RXVECTOR parameters in Table 19-1 are mapped directly to the RXVECTOR parameters in Table 27-1. The HE PHY parameters not listed in Table 19-1 are not present. A 20 MHz-only non-AP HE STA supports HT reception only on 20 MHz channel width.

27.2.7.4 Support for VHT format

The behavior of an HE PHY on receipt of a PHY-TXSTART.request(TXVECTOR) primitive with the TXVECTOR parameter FORMAT equal to VHT is defined in Clause 21, except that the requirements in 27.3.21.3 apply instead of the requirements in 21.3.17.4.2.

The HE PHY TXVECTOR parameters in Table 27-1 are mapped directly to the Clause 21 TXVECTOR parameters in Table 21-1. The HE PHY parameters not listed in Table 21-1 are not present. The 20 MHz-only non-AP HE STA supports VHT transmission only on 20 MHz channel width.

On receipt of a PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive, the HE PHY behaves, for the purposes of VHT PPDU transmission and reception, as if it were a Clause 21 PHY that received the PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive.

As defined in 27.3.24, once a PPDU is received and detected as an VHT PPDU, the behavior of the HE PHY is defined in Clause 21. The RXVECTOR parameters in Table 21-1 are mapped directly to the RXVECTOR parameters in Table 27-1. The HE PHY parameters not listed in Table 21-1 are not present. A 20 MHz-only non-AP HE STA supports VHT reception only on 20 MHz channel width.

27.3 HE PHY

27.3.1 Introduction

Subclause 27.3 provides the procedure by which PSDUs are converted to and from transmissions on the wireless medium.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

During transmission, a PSDU (in the SU case) or one or more PSDUs (in the MU case) are processed (i.e., scrambled and coded) and appended to the PHY preamble to create the PPDU. At the receiver, the PHY preamble is processed to aid in the detection, demodulation, and delivery of the PSDU.

27.3.1.1 MU transmission

The MU transmissions include DL MU transmissions and UL MU transmissions.

DL MU transmission allows an AP to simultaneously transmit information to more than one non-AP STA. For a DL MU transmission, the AP uses the HE MU PPDU format and employs either DL OFDMA or DL MU-MIMO, or a mixture of both. UL MU transmission allows an AP to simultaneously receive information from more than one non-AP STA. UL MU transmissions are preceded by a triggering frame from the AP. The non-AP STAs transmit using the HE TB PPDU format and employ either UL OFDMA or UL MU-MIMO, or a mixture of both.

The HE PHY supports OFDMA transmissions, in both the DL and the UL where different users can occupy different RUs in a PPDU (see 27.3.10). The transmission within an RU in a PPDU may be a single stream to one user, multiple streams spatially multiplexed to one user (SU-MIMO), or multiple streams spatially multiplexed to multiple users (MU-MIMO).

NOTE—The VHT PHY supports only full-bandwidth DL MU-MIMO as described in 21.3.11.

The HE PHY supports DL MU-MIMO and UL MU-MIMO, for both the full-bandwidth case and the partial-bandwidth case where MU-MIMO is used only on certain RUs in the PPDU. The combination of non-MU-MIMO allocations for some RUs and MU-MIMO allocations on different RUs in one PPDU is also supported.

27.3.1.2 OFDMA

OFDMA is an OFDM-based multiple access scheme where different subsets of subcarriers are allocated to different users, and this scheme allows simultaneous data transmission to or from one or more users. In OFDMA, users are allocated different subsets of subcarriers that can change from one PPDU to the next. The difference between OFDM and OFDMA is illustrated in Figure 27-4. Similar to OFDM, OFDMA

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

employs multiple subcarriers, but the subcarriers are divided into several groups where each group is referred to as an RU. With OFDMA, different transmit powers may be applied to different RUs.

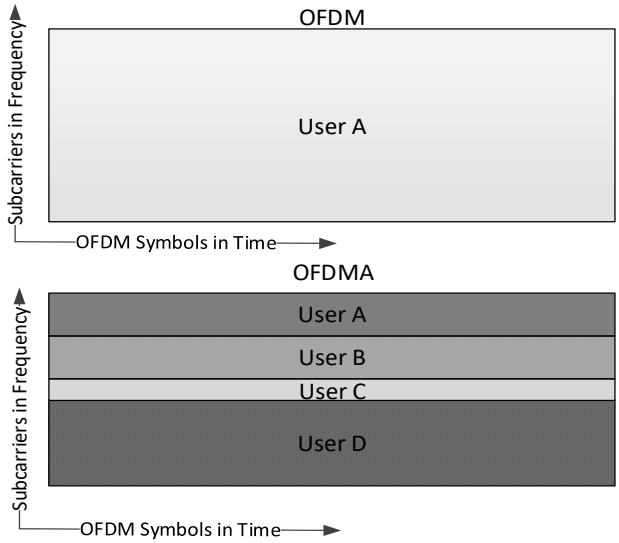

Figure 27-4—Illustration of OFDM and OFDMA concepts

27.3.2 Subcarrier and resource allocation

27.3.2.1 General

An OFDM symbol is constructed of subcarriers, the number of which is a function of the PPDU bandwidth. There are several subcarrier types:

a) Data subcarriers, which are used for data transmission (see 27.3.2.2).
b) Pilot subcarriers, which are used for phase information and parameter tracking (see 27.3.2.4).
c) Unused subcarriers, which are not used for either data or pilot transmission. The unused subcarriers are the DC subcarriers (see 27.3.2.2), the Guard band subcarriers at the band edges (see 27.3.2.2), and the Null subcarriers (see 27.3.2.3).

The following notations are used to describe the indices for a set of subcarriers:

— $[x1{:}y1]$ represents the set of subcarriers with index k that satisfies $x1 \le k \le y1$.
— $[x1{:}y1, x2{:}y2]$ represents the set of subcarriers with index k that satisfies either $x1 \le k \le y1$ or $x2 \le k \le y2$.

27.3.2.2 Resource unit, guard, and DC subcarriers

The RUs defined for DL and UL transmission are as follows: 26-tone RU, 52-tone RU, 106-tone RU, 242-tone RU, 484-tone RU, 996-tone RU, and 2×996-tone RU.

The 26-tone RU, 52-tone RU, 106-tone RU, and 242-tone RU are used in the 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz HE MU PPDU format. The 52-tone RU, 106-tone RU and 242-tone RU are used in the 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz HE TB PPDU format. The 26-tone RU is used in the 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz HE TB PPDU format unless a STA is operating in an operating class for which the behavior limits set listed in Annex E includes the DFS_50_100_Behavior (see 26.5.2.2.1 and 26.5.2.2.3). The 106-tone RU is used in the HE ER SU PPDU format.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The 484-tone RU is used in the 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz HE MU PPDU and HE TB PPDU formats. The 996-tone RU is used in the 80 MHz, 160 MHz, and 80+80 MHz HE MU PPDU and HE TB PPDU formats. The 2×996-tone RU is used in the 160 MHz and 80+80 MHz HE MU PPDU format and 160 MHz and 80+80 MHz HE TB PPDU format.

The 242-tone and larger RUs are used in the HE SU PPDU format. The 242-tone RU is used in the 20 MHz HE SU PPDU and HE ER SU PPDU formats. The 484-tone RU is used in the 40 MHz HE SU PPDU format. The 996-tone RU is used in the 80 MHz HE SU PPDU format. The 2×996-tone RU is used in the 160 MHz and 80+80 MHz HE SU PPDU formats.

The maximum number of RUs in the 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz HE PPDU formats is defined in Table 27-7.

Table 27-7—Maximum number of RUs for each channel width

RU type	CBW20	CBW40	CBW80	CBW80+80 and CBW160
26-tone RU	9	18	37	74
52-tone RU	4	8	16	32
106-tone RU	2	4	8	16
242-tone RU	1	2	4	8
484-tone RU	N/A	1	2	4
996-tone RU	N/A	N/A	1	2
2×996 tone RU	N/A	N/A	N/A	1

An HE MU PPDU using OFDMA transmission can carry a mixture of 26-, 52-, 106-, 242-, 484-, and 996-tone RUs.

A 26-tone RU consists of 24 data subcarriers and 2 pilot subcarriers. The positions of the pilots for the 26-tone RU are defined in 27.3.2.4. The locations of the 26-tone RUs are fixed as defined in Table 27-8, Table 27-9, and Table 27-10.

The data and pilot subcarrier indices for a non-OFDMA 80 MHz HE PPDU are the same as those for a 996-tone RU.

The locations of the 26-tone RUs are shown in Figure 27-5, Figure 27-6, and Figure 27-7 for the 20 MHz, 40 MHz, and 80 MHz HE MU PPDU formats or HE TB PPDU formats using OFDMA transmission, respectively. The same structure as used for the 80 MHz HE MU PPDU formats or HE TB PPDU formats using OFDMA transmission is used for both the primary 80 MHz and secondary 80 MHz channels in the 160 MHz and 80+80 MHz HE MU PPDU or HE TB PPDU formats using OFDMA transmission.

A 52-tone RU consists of 48 data subcarriers and 4 pilot subcarriers. The positions of the pilots for the 52-tone RU are defined in 27.3.2.4. The locations of the 52-tone RUs are fixed as defined in Table 27-8, Table 27-9, and Table 27-10 and illustrated in Figure 27-5, Figure 27-6, and Figure 27-7 for the 20 MHz, 40 MHz, and 80 MHz HE MU PPDU formats or HE TB PPDU formats using OFDMA transmission, respectively. The same structure as used in the 80 MHz HE MU PPDU format or HE TB PPDU formats using OFDMA transmission is used for both the Primary 80 MHz and Secondary 80 MHz channels in the 160 MHz and 80+80 MHz HE MU PPDU formats or HE TB PPDU formats using OFDMA transmission.

Table 27-8—Data and pilot subcarrier indices for RUs in a 20 MHz HE PPDU and in a non-OFDMA 20 MHz HE PPDU

RU type	RU index and subcarrier range				
26-tone RU	RU 1 [–121: –96]	RU 2 [–95: –70]	RU 3 [–68: –43]	RU 4 [–42: –17]	RU 5 [–16: –4, 4: 16]
	RU 6 [17: 42]	RU 7 [43: 68]	RU 8 [70: 95]	RU 9 [96: 121]	
52-tone RU	RU 1 [–121: –70]	RU 2 [–68: –17]	RU 3 [17: 68]	RU 4 [70: 121]	
106-tone RU	RU 1 [–122: –17]		RU 2 [17: 122]		
242-tone RU	RU 1 [–122: –2, 2:122]				

NOTE 1—The subcarrier index of 0 corresponds to the DC tone. Negative subcarrier indices correspond to subcarriers with a frequency lower than the DC tone, and positive subcarrier indices correspond to subcarriers with a frequency higher than the DC tone.

NOTE 2—RU 5 is the middle 26-tone RU.

Table 27-9—Data and pilot subcarrier indices for RUs in a 40 MHz HE PPDU and in a non-OFDMA 40 MHz HE PPDU

RU type	RU index and subcarrier range				
26-tone RU	RU 1 [–243: –218]	RU 2 [–217: –192]	RU 3 [–189: –164]	RU 4 [–163: –138]	RU 5 [–136: –111]
	RU 6 [–109: –84]	RU 7 [–83: –58]	RU 8 [–55: –30]	RU 9 [–29: –4]	
	RU 10 [4: 29]	RU 11 [30: 55]	RU 12 [58: 83]	RU 13 [84: 109]	RU 14 [111: 136]
	RU 15 [138: 163]	RU 16 [164: 189]	RU 17 [192: 217]	RU 18 [218: 243]	
52-tone RU	RU 1 [–243: –192]	RU 2 [–189: –138]	RU 3 [–109: –58]	RU 4 [–55: –4]	
	RU 5 [4: 55]	RU 6 [58: 109]	RU 7 [138: 189]	RU 8 [192: 243]	
106-tone RU	RU 1 [–243: –138]	RU 2 [–109: –4]	RU 3 [4: 109]	RU 4 [138: 243]	
242-tone RU	RU 1 [–244: –3]		RU 2 [3: 244]		
484-tone RU	RU 1 [–244: –3, 3: 244]				

NOTE—The subcarrier index of 0 corresponds to the DC tone. Negative subcarrier indices correspond to subcarriers with a frequency lower than the DC tone, and positive subcarrier indices correspond to subcarriers with a frequency higher than the DC tone.

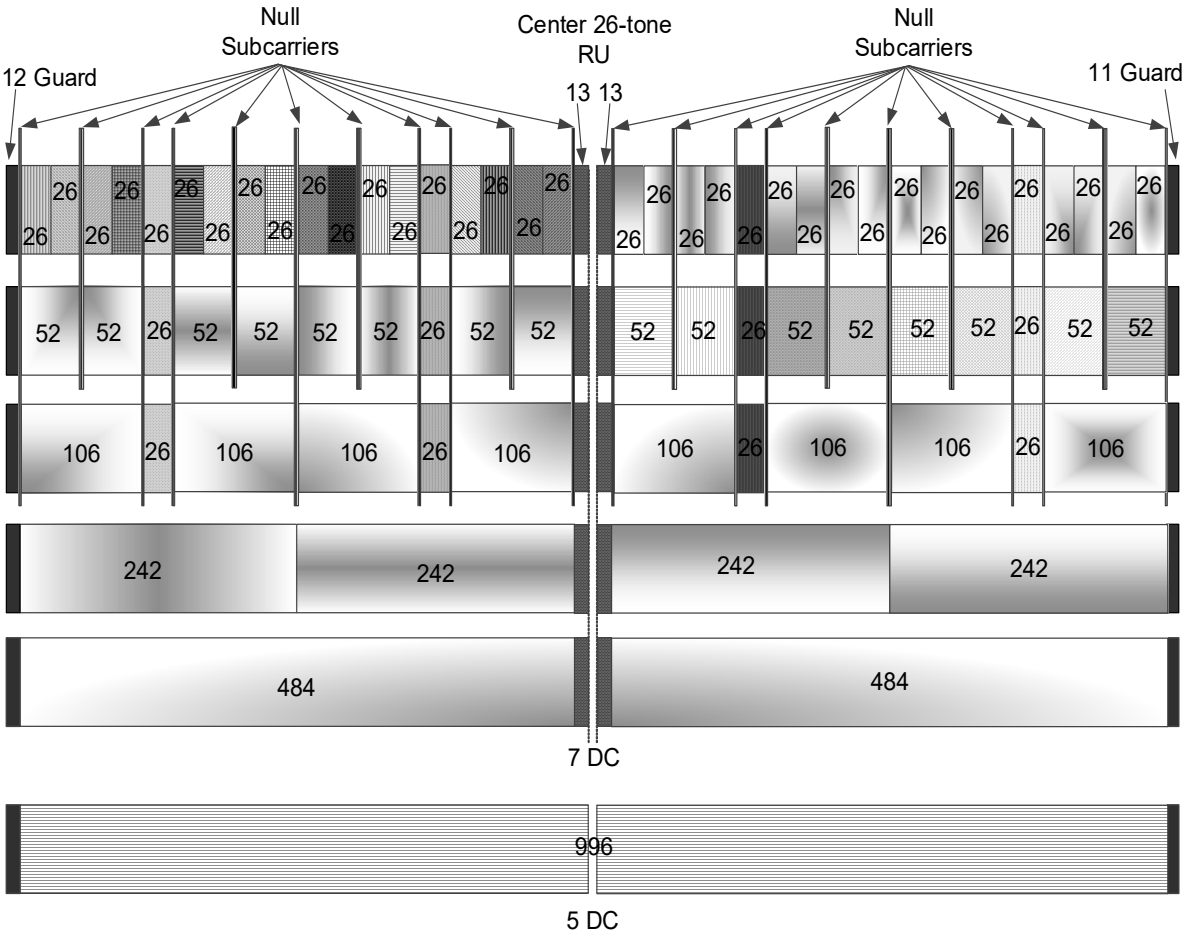

Figure 27-7—RU locations in an 80 MHz HE PPDU

A 106-tone RU consists of 102 data subcarriers and 4 pilot subcarriers. The positions of the pilots for the 106-tone RU are defined in 27.3.2.4. The locations of the 106-tone RUs are fixed as defined in Table 27-8, Table 27-9, and Table 27-10 and illustrated in Figure 27-5, Figure 27-6, and Figure 27-7 for the 20 MHz, 40 MHz, and 80 MHz HE MU PPDU formats or HE TB PPDU formats using OFDMA transmission, respectively. The same structure as used in the 80 MHz HE MU PPDU formats or HE TB PPDU formats using OFDMA transmission is used for both the Primary 80 MHz and Secondary 80 MHz channels in the 160 MHz and 80+80 MHz HE MU PPDU formats or HE TB PPDU formats using OFDMA transmission.

A 242-tone RU consists of 234 data subcarriers and 8 pilot subcarriers. The positions of pilots for the 242-tone RU are defined in 27.3.2.4. The locations of the 242-tone RUs are fixed as defined in Table 27-8, Table 27-9, and Table 27-10 and illustrated in Figure 27-5, Figure 27-6, and Figure 27-7 for the 20 MHz, 40 MHz, and 80 MHz HE PPDU formats, respectively. The same structure as used in the 80 MHz HE PPDU formats is used for both the Primary 80 MHz and Secondary 80 MHz channels in both the Primary 80 MHz and Secondary 80 MHz channels in the 160 MHz and 80+80 MHz HE PPDU formats.

A 484-tone RU consists of 468 data subcarriers and 16 pilot subcarriers. The positions of the pilots for the 484-tone RU are defined in 27.3.2.4. The locations of the 484-tone RUs are fixed as defined in Table 27-9 and Table 27-10 and illustrated in Figure 27-6 and Figure 27-7 for the 40 MHz and 80 MHz HE PPDU formats. The same structure as used for the 80 MHz HE PPDU formats is used for both the Primary 80 MHz and Secondary 80 MHz channels in the 160 MHz and 80+80 MHz HE PPDU formats.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A 996-tone RU consists of 980 data subcarriers and 16 pilot subcarriers. The positions of the pilots for the 996-tone RU are defined in 27.3.2.4. The locations of the 996-tone RUs are fixed and located on subcarriers [–1012: –515, –509: –12] and [12: 509, 515: 1012] for each half of the bandwidth, respectively, for the 160 MHz and 80+80 MHz HE PPDU formats.

A 2×996-tone RU consists of two 996-tone RUs, one RU in each of the 80 MHz channels for the 160 MHz and 80+80 MHz HE PPDU formats.

The 20 MHz HE MU PPDU and HE TB PPDU with one or more RUs with less than 242 tones have 7 DC subcarriers located at [–3: 3]. The 20 MHz HE SU PPDU, HE MU PPDU, and HE TB PPDU with a 242-tone RU have 3 DC subcarriers located at [–1: 1]. The 40 MHz HE PPDU has 5 DC subcarriers located at [–2: 2]. The 80 MHz HE MU PPDU and HE TB PPDU with one or more RUs with less than 996 tones have 7 DC subcarriers located at [–3: 3]. The 80 MHz HE SU PPDU, HE MU PPDU, and HE TB PPDU with a 996-tone RU have 5 DC subcarriers located at [–2: 2]. The structure used in the 80 MHz HE PPDU is used for both the Primary 80 MHz and Secondary 80 MHz channels in the 160 MHz and 80+80 MHz HE PPDU. The DC subcarriers are located on subcarriers [–11: 11].

The 20 MHz HE PPDU has 11 guard subcarriers: the 6 lowest frequency subcarriers [–128: –123] and the 5 highest frequency subcarriers [123: 127] as shown in Figure 27-5. The 40 MHz HE PPDU has 23 guard subcarriers: the 12 lowest frequency subcarriers [–256: –245] and the 11 highest frequency subcarriers [245: 255] as shown in Figure 27-6. The 80 MHz HE PPDU has 23 guard subcarriers: the 12 lowest frequency subcarriers [–512: –501] and the 11 highest frequency subcarriers [501: 511] as shown in Figure 27-7. For the 160 MHz and 80+80 MHz HE PPDU, the same number of lowest frequency and highest frequency guard subcarriers as 80 MHz are defined at each edge of the 160 MHz and 80+80 MHz.

27.3.2.3 Null subcarriers

There are null subcarriers between the 26-, 52-, and 106-tone RU locations as illustrated in Figure 27-5, Figure 27-6, and Figure 27-7. The null subcarriers are located near the DC or edge tones to provide protection from transmit center frequency leakage, receiver DC offset, and interference from neighboring RUs. The null subcarriers have zero energy. The indices of the null subcarrier are enumerated in Table 27-11.

Table 27-11— Null subcarrier indices

Channel width	RU size	Null subcarrier indices
20 MHz	26, 52	± 69, ± 122
	106	none
	242	none
40 MHz	26, 52	± 3, ± 56, ± 57, ± 110, ± 137, ± 190, ± 191, ± 244
	106	± 3, ± 110, ± 137, ± 244
	242, 484	none

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 27-11— Null subcarrier indices *(continued)*

Channel width	RU size	Null subcarrier indices
80 MHz	26, 52	± 17, ± 70, ± 71, ± 124, ± 151, ± 204, ± 205, ± 258, ± 259, ± 312, ± 313, ± 366, ± 393, ± 446, ± 447, ± 500
	106	± 17, ± 124, ± 151, ± 258, ± 259, ± 366, ± 393, ± 500
	242, 484	none
	996	none
160 MHz	26, 52, 106	{null subcarrier indices in 80 MHz – 512, null subcarrier indices in 80 MHz + 512}
	242, 484, 996, 2×996	none

The null subcarriers locations for each 80 MHz frequency segment of an 80+80 MHz HE PPDU shall follow the locations of an 80 MHz HE PPDU.

27.3.2.4 Pilot subcarriers

Within the HE modulated fields (see 27.3.10) of an HE PPDU, pilot subcarriers are present in the Data field and may be present in the HE-LTF field (see 27.3.11.10). The pilot subcarrier indices for the Data field OFDM symbols are defined in 27.3.12.13.

One of three HE-LTF types is used in the HE-LTF field of an HE PPDU: 1x HE-LTF, 2x HE-LTF, or 4x HE-LTF (see 27.3.11.10). If pilot subcarriers are present in the HE-LTF field of an HE PPDU, then, for a 4x HE-LTF and 2x HE-LTF, the pilot subcarrier locations in the HE-LTF field are the same as the pilot subcarrier locations in the Data field. For a 1x HE-LTF, the pilot subcarrier locations in the HE-LTF field are the pilot subcarriers locations in the Data field that are multiples of 4.

27.3.2.5 Resource indication and User identification in an HE MU PPDU

An AP that transmits an HE MU PPDU shall set the UL/DL field in the HE-SIG-A field to 0.

The HE-SIG-B field consists of one or two HE-SIG-B content channels, with each HE-SIG-B content channel conveying user allocation for one or more 20 MHz subchannels. A 20 MHz HE MU PPDU has one HE-SIG-B content channel, while an HE MU PPDU with greater than 20 MHz PPDU bandwidth has two HE-SIG-B content channels.

A full-bandwidth MU-MIMO transmission using the HE MU PPDU format shall have a value of 1 for the HE-SIG-B Compression field in the HE-SIG-A field, where the Common field in the HE-SIG-B field is not present, the HE modulated fields of the PPDU consist of one RU that spans the entire PPDU bandwidth, and the preamble is not punctured. The number of users in the MU-MIMO group is indicated in the Number Of HE-SIG-B Symbols Or MU-MIMO Users field in the HE-SIG-A field. The allocated spatial streams for each user and the total number of spatial streams are indicated in the Spatial Configuration field of the User field in the HE-SIG-B field containing the STA-ID of the designated MU-MIMO STA as defined in Table 27-31.

If the value of the HE-SIG-B Compression field in the HE-SIG-A field is 0, then the RU Allocation subfield in the Common field in each HE-SIG-B content channel indicates the combination of RUs in the current PPDU and the number of User fields included in the corresponding HE-SIG-B content channel for each RU. See 27.3.11.8.2 for a description of the HE-SIG-B content channels.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If there is only one User field (see Table 27-29) for an RU in the HE-SIG-B content channel, then the number of spatial streams for the user in the RU is indicated by the NSTS field in the User field.

If there is more than one User field (see Table 27-30) for an RU in the HE-SIG-B content channel, then the number of allocated spatial streams for each user in the RU is indicated by the Spatial Configuration field of the User field in the HE-SIG-B field. Note that, if the value of the HE-SIG-B Compression field in the HE-SIG-A field is 0, for an RU with 484 or more subcarriers and having two or more intended users, the User fields corresponding to the RU may be split between two HE-SIG-B content channels. In this case, the total number of users and the total number of spatial streams in the RU are the sum of the number of users and number of spatial streams per user, respectively, indicated in both HE-SIG-B content channels. For PPDU bandwidths greater than 20 MHz, the split is an equitable split for full-bandwidth DL MU-MIMO (see 27.3.11.8.4) or a dynamic split when the HE-SIG-B Compression field in the HE-SIG-A field is equal to 0 (see 27.3.11.8.3).

In each HE-SIG-B content channel, the User fields are ordered so that, together with the HE-SIG-B Compression field in the HE-SIG-A field and the Common field in the HE-SIG-B field (if present), the RU location and spatial streams allocated to each user can be identified (see 27.3.11.8.4). If the UL/DL field in the HE-SIG-A field is 0, the STA-ID field in each User field indicates the intended recipient user of the corresponding spatial streams and the RU. Otherwise, the STA-ID field indicates the STA that transmits the PPDU in the corresponding spatial streams and the RU.

HE-LTF symbols in the DL HE MU PPDU are used to measure the channel for the space-time streams intended for the STA and can also be used to measure the channel for the interfering space-time streams. To successfully demodulate the space-time streams intended for the STA, it is recommended that the STA use the channel knowledge for all space-time streams to reduce the effect of space-time streams allocated to other users.

If a STA is included as a member of the MU-MIMO group in RU r, its corresponding $N_{STS,r,u}$ contained in the User field in the HE-SIG-B field for user u shall not be zero. If a STA determines that it is not a member of the MU-MIMO group in RU r, then the STA may elect not to process RU r in the remainder of the PPDU.

27.3.2.6 Resource allocation for an HE TB PPDU

UL MU transmissions are preceded by a triggering frame from the AP. The triggering frame indicates the parameters, such as the duration of the HE TB PPDU, RU allocation, target RSSI, and HE-MCS (see 9.3.1.22, 9.2.4.7.1, and 26.5.2.3), required to transmit an HE TB PPDU.

The Trigger frame indicates whether the UL MU transmission following it uses HE single stream pilot HE-LTF mode or HE masked HE-LTF sequence mode if the HE-LTF type of the HE TB PPDU is 2x HE-LTF or 4x HE-LTF. HE no pilot HE-LTF mode is used if the HE-LTF type of the HE TB PPDU is 1x HE-LTF. If HE single stream pilot HE-LTF mode is used, no masking is applied to the HE-LTF. HE single stream pilot HE-LTF mode is used for any UL OFDMA transmission, including UL OFDMA with MU-MIMO transmissions.

27.3.2.7 20 MHz operating non-AP HE STAs

A 20 MHz-only non-AP HE STA is a non-AP HE STA that indicates support for only 20 MHz channel width for the frequency band in which it is operating using the Supported Channel Width Set subfield in the HE PHY Capabilities Information field in the HE Capabilities element that it transmits (see 9.4.2.247.3). A 20 MHz operating non-AP HE STA is a non-AP HE STA that is operating in 20 MHz channel width mode, such as a 20 MHz-only non-AP HE STA or an HE STA that reduced its operating channel width to 20 MHz using operating mode indication (OMI).

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A 20 MHz operating non-AP HE STA shall operate in the primary 20 MHz channel, except when the 20 MHz operating non-AP HE STA sets dot11HESubchannelSelectiveTransmissionImplemented equal to true. In this case, the 20 MHz operating non-AP HE STA may operate in any 20 MHz channel within the BSS bandwidth by following the procedure in 26.8.7.

An HE AP operating in the 5 GHz or 6 GHz band shall be able to interoperate with non-AP HE STAs, regardless of the indicated value of B1 in the Supported Channel Width Set subfield in the HE PHY Capabilities Information field in the HE Capabilities element (see 9.4.2.247.3).

A 20 MHz operating non-AP HE STA shall support tone mapping of 26-tone RU, 52-tone RU, 106-tone RU, and 242-tone RU for a 20 MHz HE PPDU (see Table 27-8) in the 2.4 GHz, 5 GHz, and 6 GHz frequency bands.

A 20 MHz operating non-AP HE STA indicates support for tone mapping of 26-tone RU, 52-tone RU, and 106-tone RU for a 40 MHz HE PPDU (see Table 27-9) in the 2.4 GHz band using the 20 MHz In 40 MHz HE PPDU In 2.4 GHz Band subfield in the HE PHY Capabilities Information field in the HE Capabilities element (see 9.4.2.247.3), with the exception of RUs that are restricted from operation as specified in 27.3.2.8.

A 20 MHz operating non-AP HE STA indicates support for tone mapping of 26-tone RU, 52-tone RU, and 106-tone RU for 80+80 MHz PPDU and 160 MHz HE PPDUs using the 20 MHz In 160/80+80 MHz HE PPDU subfield in the HE PHY Capabilities Information field in the HE Capabilities element (see 9.4.2.247.3), with the exception of RUs that are restricted from operation as specified in 27.3.2.8.

A 20 MHz operating non-AP HE STA may support tone mapping of 242-tone RU for the reception of a 40 MHz HE MU PPDU (see Table 27-9) in the 2.4 GHz, 5 GHz, and 6 GHz bands and 80 MHz, 80+80 MHz, and 160 MHz HE MU PPDUs (see Table 27-10) in the 5 GHz and 6 GHz bands. This support is indicated in the Supported Channel Width Set subfield in the HE PHY Capabilities Information field in the HE Capabilities element (see 9.4.2.247.3).

27.3.2.8 RU restrictions for 20 MHz operation

If a 20 MHz operating non-AP HE STA is the receiver of a 40 MHz, 80 MHz, 80+80 MHz, or 160 MHz HE MU PPDU or the transmitter of a 40 MHz, 80 MHz, 80+80 MHz, or 160 MHz HE TB PPDU, then the RU tone mapping in 20 MHz is not aligned with the 40 MHz, 80 MHz, 80+80 MHz, or 160 MHz RU tone mapping (see 27.3.2.2).

An AP shall not assign the following RUs to a 20 MHz operating non-AP HE STA where the RU index is defined in Table 27-9:

— 26-tone RU 5 and 14 of a 40 MHz HE MU PPDU and HE TB PPDU

An AP shall not assign the following RUs to a 20 MHz operating non-AP HE STA where the RU index is defined in Table 27-10:

— 26-tone RU 5, 10, 14, 19, 24, 28, and 33 of an 80 MHz HE MU PPDU and HE TB PPDU
— 26-tone RU 5, 10, 14, 19, 24, 28, and 33 of the lower 80 MHz of an 80+80 MHz and 160 MHz HE MU PPDU and HE TB PPDU
— 26-tone RU 5, 10, 14, 19, 24, 28, and 33 of the upper 80 MHz of an 80+80 MHz HE MU PPDU and HE TB PPDU
— 52-tone RU 5 and 12 of an 80 MHz HE MU PPDU and HE TB PPDU
— 52-tone RU 5 and 12 of the lower 80 MHz of an 80+80 MHz and 160 MHz HE MU PPDU and HE TB PPDU
— 52-tone RU 5 and 12 of the upper 80 MHz of an 80+80 MHz HE MU PPDU and HE TB PPDU

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— 106-tone RU 3 and 6 of an 80 MHz HE MU PPDU and HE TB PPDU
— 106-tone RU 3 and 6 of the lower 80 MHz of an 80+80 MHz and 160 MHz HE MU PPDU and HE TB PPDU
— 106-tone RU 3 and 6 of the upper 80 MHz of an 80+80 MHz HE MU PPDU and HE TB PPDU

27.3.2.9 80 MHz operating non-AP HE STAs

An HE AP shall not allocate an RU in a 160 MHz or 80+80 MHz HE MU or HE TB PPDU to an 80 MHz operating non-AP HE STA if the non-AP STA has set the 80 MHz In 160/80+80 MHz HE PPDU subfield in the HE PHY Capabilities Information field in the HE Capabilities element to 0.

An HE AP shall not allocate an RU outside of the primary 80 MHz in a 160 MHz or 80+80 MHz HE MU or HE TB PPDU to an 80 MHz operating non-AP HE STA if the non-AP STA has set the HE Subchannel Selective Transmission Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element to 0.

An HE AP shall not allocate an RU outside of the primary 80 MHz in a 160 MHz or 80+80 MHz HE MU or HE TB PPDU to an 80 MHz operating non-AP HE STA if the non-AP STA has set the HE Subchannel Selective Transmission Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element to 1 but has not set up SST operation on the secondary 80 MHz channel with the HE AP.

27.3.3 MU-MIMO

27.3.3.1 DL MU-MIMO

27.3.3.1.1 Supported RU sizes in DL MU-MIMO

A STA that sets the Partial Bandwidth DL MU-MIMO subfield of the HE PHY Capabilities Information field in the HE Capabilities element that it transmits to 1 shall support receiving an RU in an HE MU PPDU where MU-MIMO is employed in the RU, the RU size is greater than or equal to 106 tones, and the RU does not span the entire PPDU bandwidth.

27.3.3.1.2 Maximum number of spatial streams in an HE MU PPDU

An HE STA shall support the reception of DL MU-MIMO transmissions on full bandwidth with a maximum number of space-time streams (per user) that is the minimum of 4 and the maximum number of space-time streams supported for reception of HE SU PPDUs. The maximum number of space-time streams supported for reception of HE SU PPDUs is indicated for various bandwidths in the Supported HE-MCS and NSS Set field in the HE Capabilities element.

For transmissions using bandwidth less than or equal to 80 MHz, an HE STA shall support reception of DL MU-MIMO transmissions on full bandwidth with the total number of space-time streams (across all users) up to the value indicated by the Beamformee STS $\leq$ 80 MHz subfield in the HE PHY Capabilities Information field in the HE Capabilities element. For transmissions using bandwidth greater than 80 MHz, an HE STA shall support reception of DL MU-MIMO transmissions on full bandwidth with the total number of space-time streams (across all users) up to the value indicated by the Beamformee STS > 80 MHz subfield in the HE PHY Capabilities Information field in the HE Capabilities element.

An HE AP that is capable of transmitting 4 or more space-time streams shall support DL MU-MIMO transmissions on full bandwidth.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

All of the aforementioned requirements in this subclause on the per user and total number of space-time-streams are also applicable to an MU-MIMO transmission on an RU in an HE MU PPDU where the RU does not span the entire PPDU bandwidth.

27.3.3.2 UL MU-MIMO

27.3.3.2.1 Introduction

UL MU-MIMO is a technique to allow multiple STAs to transmit simultaneously over the same frequency resource to the receiver. The concept is very similar to SU-MIMO where multiple space-time streams are transmitted simultaneously over the same frequency resource utilizing spatial multiplexing through multiple antennas at the transmitter and receiver. The key difference from SU-MIMO is that in UL MU-MIMO, the transmitted streams originate from multiple STAs.

27.3.3.2.2 Supported RU sizes in UL MU-MIMO

An AP that sets the Partial Bandwidth UL MU-MIMO subfield of the HE PHY Capabilities Information field in the HE Capabilities element that it transmits to 1 shall support receiving an RU in an HE TB PPDU where MU-MIMO is employed in the RU, the RU size is greater than or equal to 106 tones, and the RU does not span the entire PPDU bandwidth.

A non-AP STA that sets the Partial Bandwidth UL MU-MIMO subfield of the HE PHY Capabilities Information field in the HE Capabilities element that it transmits to 1 shall support transmitting an RU in an HE TB PPDU where UL MU-MIMO is employed in the RU, the RU size is greater than or equal to 106 tones, and the RU does not span the entire PPDU bandwidth.

A STA that sets the Partial Bandwidth UL MU-MIMO subfield to 1 shall set the Full Bandwidth UL MU-MIMO subfield in the HE PHY Capabilities Information field to 1.

27.3.3.2.3 MU-MIMO HE-LTF modeSupported RU sizes in UL MU-MIMO

A non-AP STA that sets the Full Bandwidth UL MU-MIMO subfield of the HE PHY Capabilities Information field in the HE Capabilities element it transmits to 1 shall support both the HE single stream pilot HE-LTF mode and the HE masked HE-LTF sequence mode as defined in Equation (27-59) for the transmission of an HE TB PPDU with one RU spanning the entire PPDU bandwidth and the RU using MU-MIMO.

An AP that sets the Partial Bandwidth UL MU-MIMO subfield of the HE PHY Capabilities Information field in the HE Capabilities element it transmits to 1 shall support receiving HE TB PPDUs using the HE single stream pilot HE-LTF mode if the HE TB PPDUs use MU-MIMO in an RU that does not span the entire PPDU bandwidth.

A non-AP STA that sets the Partial Bandwidth UL MU-MIMO subfield of the HE PHY Capabilities Information field in the HE Capabilities element it transmits to 1 shall support transmitting an HE TB PPDU using the HE single stream pilot HE-LTF mode if the HE TB PPDU uses MU-MIMO in an RU that does not span the entire PPDU bandwidth.

27.3.3.2.4 Maximum number of spatial streams in UL MU-MIMO

A non-AP STA that supports UL MU-MIMO shall support transmitting an HE TB PPDU using MU-MIMO where

— The number of spatial streams allocated to the non-AP STA ranges from 1 to *N*, where *N* is the smaller of 4 and the maximum number of spatial streams supported by the non-AP STA for transmitting HE SU PPDUs.

— The number of total spatial streams (summed over all users) is less than or equal to 8.

The maximum number of spatial streams supported by a STA for the transmission of an HE SU PPDU is indicated in the Supported HE-MCS And NSS Set field in the HE Capabilities element.

All the requirements in this subclause on the per user and total number of spatial streams are applicable to both full-bandwidth and partial-bandwidth MU-MIMO.

27.3.4 HE PPDU formats

Four HE PPDU formats are defined: HE SU PPDU, HE MU PPDU, HE ER SU PPDU, and HE TB PPDU. The HE sounding NDP and HE Ranging NDP are variants of the HE SU PPDU and are defined in 27.3.17 and 27.3.19.1, respectively. The HE NDP TB PPDU feedback and the HE TB Ranging NDP are variants of the HE TB PPDU and defined in 27.3.18 and 27.3.19.2, respectively.

NOTE—The HE ER SU PPDU is not a variant of the HE SU PPDU. Requirements related to HE SU PPDUs and HE ER SU PPDUs are specified separately.

The format of the HE SU PPDU is defined as in Figure 27-8. This PPDU format is used for SU transmission, and in this format, the HE-SIG-A field is not repeated.

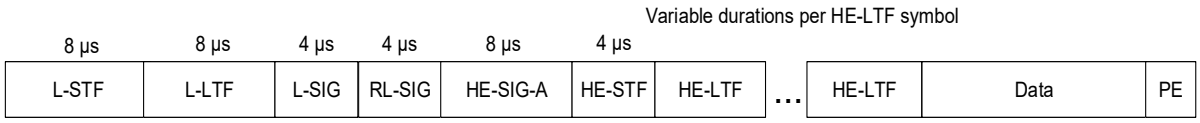

Figure 27-8—HE SU PPDU format

The format of the HE MU PPDU is defined as in Figure 27-9. This format is used for transmission to one or more users if the PPDU is not a response of a Trigger frame. In the HE MU PPDU, the HE-SIG-A field is not repeated. The HE-SIG-B field is present in this format.

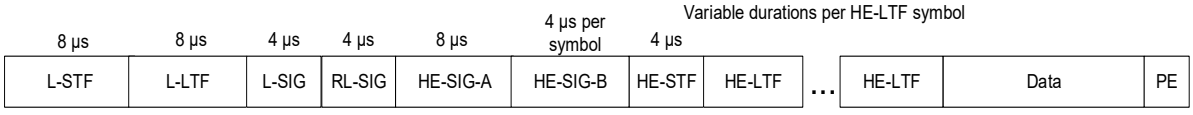

Figure 27-9—HE MU PPDU format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The format of the HE ER SU PPDU is defined as in Figure 27-10. This format is used for SU transmission, and in this format, the HE-SIG-A field is twice as long as the HE-SIG-A field in other HE PPDU formats.

Figure 27-10—HE ER SU PPDU format

The format of the HE TB PPDU is defined as in Figure 27-11. This format is used for a transmission that is a response to a triggering frame from an AP.

The format of the HE TB PPDU is the same as the HE SU PPDU, except that the duration of the HE-STF field in the HE TB PPDU is twice the duration of the HE-STF field in the HE SU PPDU.

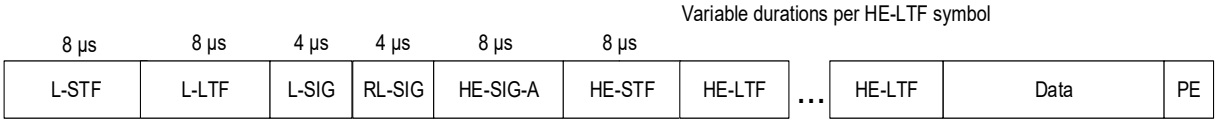

Figure 27-11—HE TB PPDU format

The fields of the HE PPDU formats are summarized in Table 27-12.

Table 27-12—HE PPDU fields

Field	Description
L-STF	Non-HT Short Training field
L-LTF	Non-HT Long Training field
L-SIG	Non-HT SIGNAL field
RL-SIG	Repeated Non-HT SIGNAL field
HE-SIG-A	HE SIGNAL A field
HE-SIG-B	HE SIGNAL B field
HE-STF	HE Short Training field
HE-LTF	HE Long Training field
Data	The Data field carrying the PSDU(s)
PE	Packet extension field

The RL-SIG, HE-SIG-A, HE-STF, HE-LTF, and PE fields are present in all HE PPDU formats. The HE-SIG-B field is present only in the HE MU PPDU. The PE field is defined in 27.3.13.

The L-STF, L-LTF, L-SIG, RL-SIG, HE-SIG-A, and HE-SIG-B fields are referred to as *pre-HE modulated fields*, while the HE-STF, HE-LTF, Data, and PE fields are referred to as *HE modulated fields*.

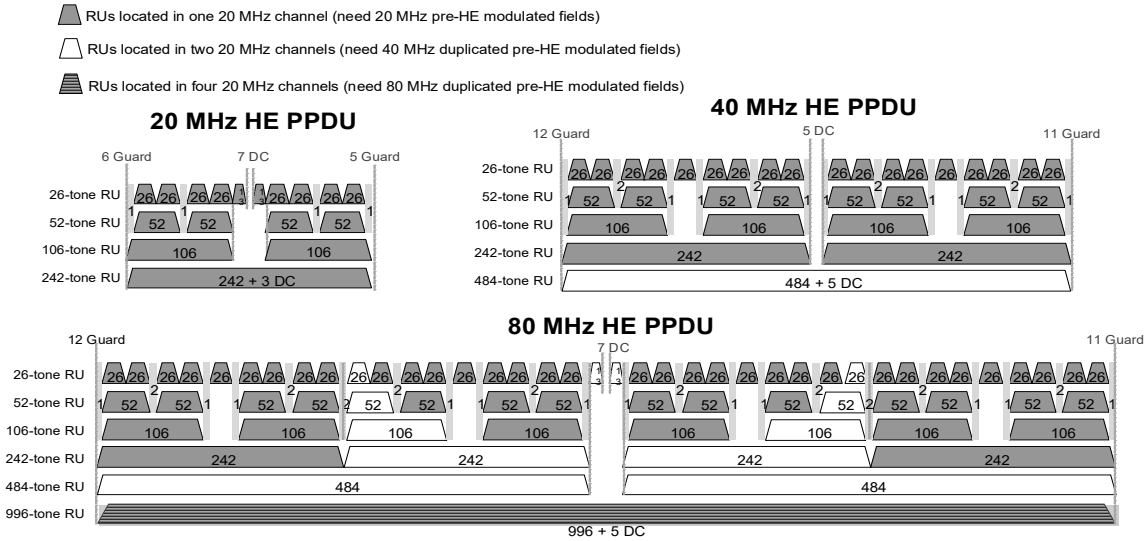
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In the HE TB PPDU, the pre-HE modulated fields are sent only on the 20 MHz channels where the STA's HE modulated fields are located. If the HE modulated fields are located in more than one 20 MHz channel, the pre-HE modulated fields are duplicated over the multiple 20 MHz channels. Figure 27-12 shows how many 20 MHz channels need to be modulated for the pre-HE modulated fields for each RU size and location in an HE TB PPDU.



The 160 MHz and 80+80 MHz HE PPDU uses the 80 MHz HE PPDU RU locations in Primary 80 MHz and Secondary 80 MHz channels

Figure 27-12—Number of 20 MHz channels that need to be modulated for the pre-HE modulated fields for each RU size and location in an HE TB PPDU

A PPDU transmitted with the TXVECTOR parameter NO_SIG_EXTN set to false is followed by a period of duration aSignalExtension without transmission. See 10.3.8.

A signal extension shall be present in a transmitted PPDU if the TXVECTOR parameter NO_SIG_EXTN is false and one of the following conditions apply:

— The TXVECVTOR parameter FORMAT is HE, HT_MF or HT_GF

— The TXVECTOR parameter FORMAT is NON_HT and the TXVECTOR parameter NON_HT_MODULATION is ERP-OFDM or NON_HT_DUP_OFDM

A signal extension shall be assumed to be present (for the purpose of timing PHY-RXEND.indication and PHY-CCA.indication primitives, as described below in this subclause and in 27.3.24) in a received PPDU if one of the following conditions apply:

— The RXVECTOR parameter FORMAT is HE, HT_MF or HT_GF

— The RXVECTOR parameter FORMAT is NON_HT and the RXVECTOR parameter NON_HT_MODULATION is ERP-OFDM or NON_HT_DUP_OFDM

A PPDU containing a signal extension is called a signal extended PPDU. When transmitting a signal extended PPDU, the PHY-TXEND.indication primitive shall be emitted a period of aSignalExtension after the end of the actual ending time of the PPDU. When receiving a signal extended PPDU, the PHY-RXEND.indication primitive shall be emitted a period of aSignalExtension after the end of the actual ending time of the PPDU.

27.3.5 Transmitter block diagram

The generation of each field in an HE PPDU uses many of the following blocks:

a) pre-FEC PHY padding
b) Scrambler
c) FEC (BCC or LDPC) encoders
d) post-FEC PHY padding
e) Stream parser
f) Segment parser (for contiguous 160 MHz and noncontiguous 80+80 MHz transmissions)
g) BCC interleaver
h) Constellation mapper
i) DCM tone mapper
j) Pilot insertion
k) Replication over multiple 20 MHz (for BW > 20 MHz)
l) Multiplication by 1st column of $P_{HE\text{-}LTF}$
m) LDPC tone mapper
n) Segment deparser
o) Space time block code (STBC) encoder for one spatial stream
p) Cyclic shift diversity (CSD) per STS insertion
q) Spatial mapper
r) Frequency mapping
s) Inverse discrete Fourier transform (IDFT)
t) Cyclic shift diversity (CSD) per chain insertion
u) Guard interval (GI) insertion
v) Windowing

Example transmitter block diagrams are shown in Figure 27-13 to Figure 27-22. The actual structure of the transmitter is implementation dependent.

In particular, Figure 27-13 shows the transmit process for the L-SIG, RL-SIG, and HE-SIG-A fields of an HE PPDU using one frequency segment when the Beam Change subfield in the HE-SIG-A field is 1. These transmit blocks are also used to generate the L-STF and L-LTF fields of the HE PPDU when the Beam Change subfield in the HE-SIG-A field is 1, with the following exceptions:

— The BCC encoder and interleaver and the constellation mapper are not used when generating the L-STF and L-LTF fields.
— The BCC interleaver is not applied in the 2nd and the 4th OFDM symbols of the HE-SIG-A field in the HE ER SU PPDU.

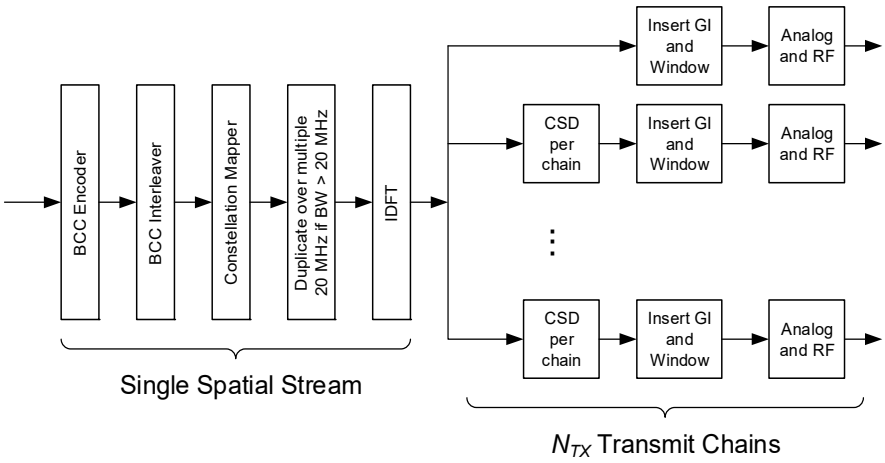

Figure 27-13—Transmitter block diagram for L-SIG, RL-SIG, and HE-SIG-A fields for an HE SU PPDU and HE ER SU PPDU if Beam Change subfield is 1

Figure 27-14 shows the transmit process for the L-SIG, RL-SIG, and HE-SIG-A fields of an HE PPDU using one frequency segment when the Beam Change subfield in the HE-SIG-A field is 0. These transmit blocks are also used to generate the L-STF and L-LTF fields of the HE PPDU if the Beam Change subfield in the HE-SIG-A field is 0, with the following exceptions:

— The BCC encoder and interleaver and the constellation mapper are not used when generating the L-STF and L-LTF fields.

— The BCC interleaver is not applied in the 2nd and the 4th OFDM symbols of the HE-SIG-A field in the HE ER SU PPDU.

NOTE—For an HE MU PPDU, the duplication on 20 MHz channels is subject to the availability of 20 MHz channels in the case of preamble puncturing.

Figure 27-15 shows the transmit process for the L-SIG, RL-SIG, and HE-SIG-A fields of an HE TB PPDU using one frequency segment. In the HE TB PPDU, the transmission of the pre-HE modulated fields refers to the description in 27.3.4 and is also shown in Figure 27-15. The BCC encoder and interleaver are not used when generating the L-STF and L-LTF fields.

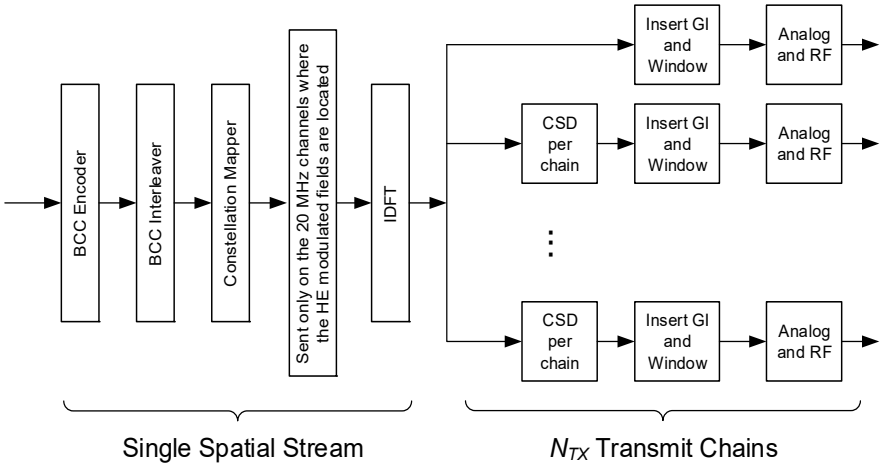

Figure 27-15—Transmitter block diagram for L-SIG, RL-SIG, and HE-SIG-A fields of an HE TB PPDU

Figure 27-16 shows the transmit process for the HE-SIG-B field of an HE MU PPDU using one frequency segment. This block diagram is for transmitting an HE-SIG-B field in one 20 MHz subchannel. Refer to 27.3.11.8.2 for the methods of transmitting an HE-SIG-B field in 40 MHz, 80 MHz, and 160 MHz. The DCM tone mapper, which is defined in 27.3.12.9, is applied only if the HE-SIG-B DCM field in the HE-SIG-A field is 1.

Figure 27-17 shows the transmitter blocks for the UL transmission or DL non-MU-MIMO transmission of a Data field with BCC encoding on a 26-, 52-, 106-, or 242-tone RU for a single frequency segment if the number of spatial streams is less than or equal to 4. Figure 27-17 applies to the Data field of an HE MU PPDU that is transmitted on an RU allocated to a single user, the Data field of an HE SU PPDU, and the Data field of an HE TB PPDU (regardless of whether it is spatially multiplexed with other users).

The DCM tone mapper, which is part of the constellation mapper, is applied only if DCM is indicated for the RU. A subset of these transmitter blocks consisting of the constellation mapper and CSD blocks and the blocks to the right of, and including, the spatial mapping block is also used to generate the HE-LTF fields. This is illustrated in Figure 27-32 (in 27.3.11.10). A subset of these transmitter blocks consisting of the constellation mapper and CSD blocks and the blocks to the right of, and including, the spatial and frequency mapping block of Figure 27-17 is also used to generate the HE-STF field. This figure also applies to the Data field with BCC encoding in an HE TB PPDU.

27.3.6 Overview of the PPDU encoding process

27.3.6.1 General

Subclause 27.3.6 provides an overview of the HE PPDU encoding process.

27.3.6.2 Construction of L-STF field

Construct the L-STF field as defined in 27.3.11.3 with the following highlights:

a) Determine the channel bandwidth from the TXVECTOR parameter CH_BANDWIDTH.

b) Sequence generation: Generate the L-STF sequence over the channel bandwidth as described in 27.3.11.3. Apply a 3 dB power boost if transmitting an HE ER SU PPDU as described in 27.3.11.3.

c) Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 27.3.10 and 21.3.7.5.

d) CSD per STS: If the TXVECTOR parameter BEAM_CHANGE is 0, apply CSD per STS for each space-time stream and frequency segment as described in 27.3.11.2.2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

e) Spatial mapping: If the TXVECTOR parameter BEAM_CHANGE is 0, apply the A matrix and the Q matrix as described in 27.3.11.3.

f) IDFT: Compute the inverse discrete Fourier transform.

g) CSD per chain: If the TXVECTOR parameter BEAM_CHANGE is 1 or not present, apply CSD per chain for each transmit chain and frequency segment as described in 27.3.11.2.1.

h) GI and windowing: Prepend a GI ($T_{GI,\text{Pre-HE}}$), and apply windowing as described in 27.3.10.

i) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 27.3.10 and 27.3.11 for details.

27.3.6.3 Construction of L-LTF field

Construct the L-LTF field as defined in 27.3.11.4 with the following highlights:

a) Determine the channel bandwidth from the TXVECTOR parameter CH_BANDWIDTH.

b) Sequence generation: Generate the L-LTF sequence over the channel bandwidth as described in 27.3.11.4. Apply a 3 dB power boost if transmitting an HE ER SU PPDU as described in 27.3.11.4.

c) Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 27.3.10 and 21.3.7.5.

d) CSD per STS: If the TXVECTOR parameter BEAM_CHANGE is 0, apply CSD per STS for each space-time stream and frequency segment as described in 27.3.11.2.2 before spatial mapping.

e) Spatial mapping: If the TXVECTOR parameter BEAM_CHANGE is 0, apply the A matrix and the Q matrix as described in 27.3.11.4.

f) IDFT: Compute the inverse discrete Fourier transform.

g) CSD per chain: If the TXVECTOR parameter BEAM_CHANGE is 1 or not present, apply CSD per chain for each transmit chain and frequency segment as described in 27.3.11.2.1.

h) GI and windowing: Prepend a GI ($T_{GI,\text{L-LTF}}$), and apply windowing as described in 27.3.10.

i) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the carrier frequency of the desired channel and transmit. Refer to 27.3.10 and 27.3.11 for details.

27.3.6.4 Construction of L-SIG field

Construct the L-SIG field as the SIGNAL field defined in 27.3.11.5 with the following highlights:

a) Set the RATE subfield in the SIGNAL field to 6 Mb/s. Set the LENGTH, Parity, and Tail fields in the SIGNAL field as described in 27.3.11.5.

b) BCC encoder: Encode the SIGNAL field by a convolutional encoder at the rate $R = 1/2$ as described in 27.3.12.5.1.

c) BCC interleaver: Interleave as described in 17.3.5.7.

d) Constellation mapper: BPSK modulate as described in 27.3.12.9.

e) Pilot insertion: Insert pilots as described in 27.3.11.5.

f) Extra subcarrier insertion: Four extra subcarriers are inserted at $k \in \{-28, -27, 27, 28\}$ for channel estimation purpose, and the values on these four extra subcarriers are $\{-1, -1, -1, 1\}$, respectively. Apply a 3 dB power boost to the four extra subcarriers if transmitting an HE ER SU PPDU as described in 27.3.11.5.

g) Duplication and phase rotation: Duplicate the L-SIG field over each occupied 20 MHz subchannel of the channel bandwidth. Apply appropriate phase rotation for each occupied 20 MHz subchannel as described in 27.3.10 and 21.3.7.5.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

h) CSD per STS: If the TXVECTOR parameter BEAM_CHANGE is 0, apply CSD per STS for each space-time stream and frequency segment as described in 27.3.11.2.2 before spatial mapping.

i) Spatial mapping: If the TXVECTOR parameter BEAM_CHANGE is 0, apply the A matrix and Q matrix as described in 27.3.11.5.

j) IDFT: Compute the inverse discrete Fourier transform.

k) CSD per chain: If the TXVECTOR parameter BEAM_CHANGE is 1 or not present, apply CSD per chain for each transmit chain and frequency segment as described in 27.3.11.2.1.

l) GI and windowing: Prepend a GI ($T_{GI,\text{Pre-HE}}$), and apply windowing as described in 27.3.10.

m) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain. Refer to 27.3.10 and 27.3.11 for details.

27.3.6.5 Construction of RL-SIG field

Construct the RL-SIG field as the repeat SIGNAL field defined in 27.3.11.6 with the following highlights:

a) Set the RATE subfield in the repeat SIGNAL field to 6 Mb/s. Set the LENGTH, Parity, and Tail fields in the repeat SIGNAL field as described in 27.3.11.6.

b) BCC encoder: Encode the repeat SIGNAL field by a convolutional encoder at the rate $R = 1/2$ as described in 27.3.12.5.1.

c) BCC interleaver: Interleave as described in 17.3.5.7.

d) Constellation mapper: BPSK modulate as described in 27.3.12.9.

e) Pilot insertion: Insert pilots as described in 27.3.11.6.

f) Extra subcarrier insertion: Four extra subcarriers are inserted at $k \in \{-28, -27, 27, 28\}$ for channel estimation purpose, and the values on these four extra subcarriers are $\{-1, -1, -1, 1\}$, respectively. Apply a 3 dB power boost to the four extra subcarriers if transmitting an HE ER SU PPDU as described in 27.3.11.6.

g) Duplication and phase rotation: Duplicate the RL-SIG field over each occupied 20 MHz subchannel of the channel bandwidth. Apply appropriate phase rotation for each occupied 20 MHz subchannel as described in 27.3.10 and 21.3.7.5.

h) CSD per STS: If the TXVECTOR parameter BEAM_CHANGE is 0, apply CSD per STS for each space-time stream and frequency segment as described in 27.3.11.2.2 before spatial mapping.

i) Spatial mapping: If the TXVECTOR parameter BEAM_CHANGE is 0, apply the A matrix and the Q matrix as described in 27.3.11.6.

j) IDFT: Compute the inverse discrete Fourier transform.

k) CSD per chain: If the TXVECTOR parameter BEAM_CHANGE is 1 or not present, apply CSD per chain for each transmit chain and frequency segment as described in 27.3.11.2.1.

l) GI and windowing: Prepend a GI ($T_{GI,\text{Pre-HE}}$), and apply windowing as described in 27.3.10.

m) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain. Refer to 27.3.10 and 27.3.11 for details.

27.3.6.6 Construction of HE-SIG-A field

a) For an HE SU PPDU, HE MU PPDU, and HE TB PPDU, the HE-SIG-A field consists of two subfields, HE-SIG-A1 and HE-SIG-A2 and two OFDM symbols, HE-SIG-A-sym-1 and HE-SIG-A-sym2 as defined in 27.3.11.7, and is constructed as follows:

   1) Obtain the HE-SIG-A field values from the TXVECTOR. Add the reserved bits, append the calculated CRC, and then append the N_{tail} tail bits as shown in 27.3.11.7. This results in 52 uncoded bits.

   2) BCC encoder: Encode the data by a convolutional encoder at the rate $R = 1/2$ as described in 17.3.5.6.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

3) BCC interleaver: Interleave as described in 27.3.12.8.
4) Constellation mapper: BPSK modulate the first 52 interleaved bits as described in 17.3.5.8 to form the first OFDM symbol of the HE-SIG-A field. BPSK modulate the second 52 interleaved bits to form the second OFDM symbol of the HE-SIG-A field.
5) Pilot insertion: Insert pilots as described in 17.3.5.9.
6) Duplicate and phase rotation: Duplicate the HE-SIG-A OFDM symbols over each occupied 20 MHz subchannel of the channel width. Apply the appropriate phase rotation for each occupied 20 MHz subchannel as described in 27.3.10 and 21.3.7.5.
7) CSD per STS: If the TXVECTOR parameter BEAM_CHANGE is 0, apply CSD per STS for each space-time stream and frequency segment as described in 27.3.11.2.2 before spatial mapping.
8) Spatial mapping: If the TXVECTOR parameter BEAM_CHANGE is 0, apply the A matrix and the Q matrix as described in 27.3.11.7.4.
9) IDFT: Compute the inverse discrete Fourier transform.
10) CSD per chain: If the TXVECTOR parameter BEAM_CHANGE is 1 or not present, apply CSD per chain for each transmit chain and frequency segment as described in 27.3.11.2.1.
11) GI and windowing: Prepend a GI ($T_{GI,\text{Pre-HE}}$), and apply windowing as described in 27.3.10.
12) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 27.3.10 and 27.3.11for details.

b) For an HE ER SU PPDU, the HE-SIG-A field consists of two subfields, HE-SIG-A1 and HE-SIG-A2, and four OFDM symbols: HE-SIG-A-sym-1, HE-SIG-A-sym-1-R, HE-SIG-A-sym-2, and HE-SIG-A-sym-2-R. The HE-SIG-A-sym-1 and HE-SIG-A-sym-1-R OFDM symbols are calculated from one set of coded bits common to both OFDM symbols while the HE-SIG-A-sym-2 and HE-SIG-A-sym-2-R OFDM symbols are calculated from a second set of coded bits common to both OFDM symbols as defined in 27.3.11.7. The HE-SIG-A field is constructed as follows:
   1) Obtain the HE-SIG-A fields from the TXVECTOR. Add the reserved bits, append the calculated CRC, and then append the N_{tail} tail bits as shown in 27.3.11.7. This results in 52 uncoded bits.
   2) BCC encoder: Encode the data by a convolutional encoder at the rate $R = 1/2$ as described in 17.3.5.6.
   3) BCC interleaver: Interleave the first and second half of coded bits of the HE-SIG-A field as described in 27.3.12.8. The coded bits of the HE-SIG-A-sym-1-R and HE-SIG-A-sym-2-R subfields are not interleaved.
   4) Constellation mapper: BPSK modulate the BCC interleaver output of the HE-SIG-A-sym-1, HE-SIG-A-sym-2, and HE-SIG-A-sym-2-R OFDM symbols as described in 17.3.5.8 to form the first, third, and fourth OFDM symbols of the HE-SIG-A field, respectively. QBPSK modulate the BCC interleaver output of the HE-SIG-A-sym-1-R OFDM symbol to form the second OFDM symbol of the HE-SIG-A field.
   5) Pilot insertion: Insert pilots as described in 17.3.5.9.
   6) Duplication and phase rotation: Duplicate the HE-SIG-A field over each occupied 20 MHz subchannel of the channel bandwidth. Apply appropriate phase rotation for each occupied 20 MHz subchannel as described in 27.3.10 and 21.3.7.5.
   7) CSD per STS: If the TXVECTOR parameter BEAM_CHANGE is 0, apply CSD per STS for each space-time stream and frequency segment as described in 27.3.11.2.2 before spatial mapping.
   8) Spatial mapping: If the TXVECTOR parameter BEAM_CHANGE is 0, apply the A matrix and the Q matrix as described in 27.3.11.7.4.
   9) IDFT: Compute the inverse Fourier transform.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

10) CSD per chain: If the TXVECTOR parameter BEAM_CHANGE is 1 or not present, apply CSD per chain for each transmit chain and frequency segment as described in 27.3.11.2.1.
11) GI and windowing: Prepend a GI ($T_{GI,\text{Pre-HE}}$), and apply windowing as described in 27.3.10.
12) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 27.3.10 and 27.3.11 for details.

27.3.6.7 Construction of HE-SIG-B field

For an HE MU PPDU, the HE-SIG-B field consists of a Common field followed by a User Specific field as defined in 27.3.11.8 and is constructed as follows:

a) Obtain the HE-SIG-B field values from the TXVECTOR. Add the reserved bits, append the calculated CRC, and then append the N_{tail} tail bits as shown in 27.3.11.8.
b) BCC encoder: Encode the Common field data and each User Block field data individually by a convolutional encoder as described in 27.3.12.5.1.
c) BCC interleaver: Interleave as described in 27.3.12.8.
d) Constellation mapper: Obtain MCS_SIG_B from the TXVECTOR and use it to modulate the interleaved bits as described in 27.3.12.9 to form the HE-SIG-B OFDM symbols.
e) Pilot insertion: Insert pilots as described in 17.3.5.9.
f) Duplicate and phase rotation: Duplicate HE-SIG-B OFDM symbols as described in 27.3.11.8.5. Apply the appropriate phase rotation for each 20 MHz subchannel as described in 27.3.10 and 21.3.7.5.
g) IDFT: Compute the inverse Fourier transform.
h) CSD per chain: Apply CSD per chain for each transmit chain and frequency segment as described in 27.3.11.2.1.
i) GI and windowing: Prepend a GI ($T_{GI,\text{Pre-HE}}$), and apply windowing as described in 27.3.10.
j) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 27.3.10 and 27.3.11 for details.

27.3.6.8 Construction of HE-STF field

The HE-STF field is defined in 27.3.11.9 and is constructed as follows:

a) Sequence generation: Generate the HE-STF in the frequency domain over the bandwidth indicated by the TXVECTOR parameter CH_BANDWIDTH as described in 27.3.11.9. Apply a 3 dB power boost if transmitting an HE ER SU PPDU as described in 27.3.11.9.
b) CSD: Apply CSD for each space-time stream and frequency segment as described in 27.3.11.2.2.
c) Spatial mapping: Apply the Q matrix as described in 27.3.11.9.
d) IDFT: Compute the inverse discrete Fourier transform.
e) GI and windowing: Prepend a GI, i.e., 0.8 μs GI for an HE SU PPDU, HE ER SU PPDU, and HE MU PPDU and 1.6 μs GI for an HE TB PPDU. Apply windowing as described in 27.3.10.
f) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 27.3.10 and 27.3.11 for details.

27.3.6.9 Construction of HE-LTF field

The HE-LTF field is defined in 27.3.11.10 and is constructed as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

a) Sequence generation: Generate the HE-LTF sequence in frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 27.3.11.10. Apply a 3 dB power boost if transmitting an HE ER SU PPDU as described in 27.3.11.10.

b) $A_{\text{HE-LTF}}$ matrix mapping: Apply the $P_{\text{HE-LTF}}$ matrix to the data tones of the HE-LTF sequence, and apply the $R_{\text{HE-LTF}}$ matrix to pilot subcarriers of the HE-LTF sequence, except the UL MU-MIMO transmission not using HE single stream pilot HE-LTF mode as described in 27.3.11.10. There is no pilot mapping for an HE TB feedback NDP.

c) CSD: Apply CSD for each space-time stream and frequency segment as described in 27.3.11.2.2.

d) Spatial mapping: Apply the Q matrix as described in 27.3.11.10.

e) IDFT: Compute the inverse discrete Fourier transform.

f) GI and windowing: Prepend a GI indicated by the TXVECTOR parameter GI_TYPE, and apply windowing as described in 27.3.10.

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 27.3.10 and 27.3.11 for details.

27.3.6.10 Construction of the Data field in an HE SU PPDU, HE ER SU PPDU, and HE TB PPDU

27.3.6.10.1 Using BCC

The construction of the Data field in an HE SU PPDU, HE ER SU PPDU, and HE TB PPDU with BCC encoding proceeds as follows:

a) Construct the SERVICE field as described in 27.3.12.3, and append the PSDU to the SERVICE field.

b) Pre-FEC padding: Append the pre-FEC pad bits and tail bits as described in 27.3.12.

c) Scrambler: Scramble the pre-FEC padded data.

d) BCC encoder: BCC encode as described in 27.3.12.5.1.

e) Post-FEC padding: Append the post-FEC pad bits and PE field as described in 27.3.12.

f) Stream parser: Rearrange the output of BCC encoder into blocks as described in 27.3.12.6.

g) BCC interleaver: Interleave as described in 27.3.12.8.

h) Constellation mapper: Map to BPSK, BPSK DCM, QPSK, QPSK DCM, 16-QAM, 16-QAM DCM, 64-QAM, or 256-QAM constellation points as described in 27.3.12.9.

i) STBC: Apply STBC as described in 27.3.12.12.

j) Pilot insertion: Insert pilots following the steps described in 27.3.12.13.

k) CSD: Apply CSD for each space-time stream and frequency segment as described in 27.3.11.2.2.

l) Spatial mapping: Apply the Q matrix as described in 27.3.12.14.

m) IDFT: In an 80+80 MHz transmission, map each frequency subblock to a separate IDFT. Compute the inverse discrete Fourier transform.

n) GI and windowing: Prepend a GI determined by the TXVECTOR parameter GI_TYPE, and apply windowing as described in 27.3.10.

o) Analog and RF: Upconvert the resulting complex baseband waveform with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 27.3.10 and 27.3.11 for details.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

27.3.6.10.2 Using LDPC

The construction of the Data field in an HE SU PPDU, HE ER SU PPDU, and HE TB PPDU with LDPC encoding proceeds as follows:

a) Construct the SERVICE field as described in 27.3.12.3, and append the PSDU to the SERVICE field.
b) Pre-FEC padding: Append the pre-FEC padding bits as described in 27.3.12. There are no tail bits.
c) Scrambler: Scramble the pre-FEC padded data.
d) LDPC encoder: LDPC encode as described in 27.3.12.5.2.
e) Post-FEC padding: Append the post-FEC pad bits and PE field as described in 27.3.12.
f) Stream parser: Rearrange the output of LDPC encoder into blocks as described in 27.3.12.6.
g) Segment parser (if needed): In a 160 MHz or 80+80 MHz transmission with a 2×996-tone RU, divide the output of each stream parser into two frequency subblocks as described in 27.3.12.6. This block is bypassed for 20 MHz, 40 MHz, and 80 MHz transmissions.
h) Constellation mapper: Map to BPSK, BPSK DCM, QPSK, QPSK DCM, 16-QAM, 16-QAM DCM, 64-QAM, 256-QAM, or 1024-QAM constellation points as described in 27.3.12.9.
i) LDPC tone mapper: the LDPC tone mapping shall be performed on all LDPC encoded streams as described in 27.3.12.10.
j) Segment deparser (if needed): In 160 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 27.3.12.11. This block is bypassed for 20 MHz, 40 MHz, 80 MHz, and 80+80 MHz transmissions.
k) STBC: Apply STBC as described in 27.3.12.12.
l) Pilot insertion: Insert pilots following the steps described in 27.3.12.13.
m) CSD: Apply CSD for each space-time stream and frequency segment as described in 27.3.11.2.2.
n) Spatial mapping: Apply the Q matrix as described in 27.3.12.14.
o) IDFT: In an 80+80 MHz transmission, map each frequency subblock to a separate IDFT. Compute the inverse discrete Fourier transform.
p) GI and windowing: Prepend a GI determined by the TXVECTOR parameter GI_TYPE, and apply windowing as described in 27.3.10.
q) Analog and RF: Upconvert the resulting complex baseband waveform with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 27.3.10 and 27.3.11 for details.

27.3.6.11 Construction of the Data field in an HE MU PPDU

27.3.6.11.1 General

In an HE MU transmission, the PPDU encoding process is performed independently in an RU on a per user basis up to the input of the spatial mapping block, except that CSD is performed with knowledge of the space-time streams starting index for that user. All user data in an RU is combined and mapped to the transmit chains in the spatial mapping block.

27.3.6.11.2 Using BCC

A Data field with BCC encoding is constructed using steps a) to l) in 27.3.6.10.1 and then applying CSD for an HE MU PPDU as described in 27.3.11.2.2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

27.3.6.11.3 Using LDPC

A Data field with LDPC encoding is constructed using steps a) to l) in 27.3.6.10.2 and then applying CSD for an HE MU PPDU as described in 27.3.11.2.2.

27.3.6.11.4 Combining to form an HE MU PPDU

The per user data is combined as follows:

a) Spatial mapping: The *Q* matrix is applied as described in 27.3.12.14. The combining of all user data of an RU is done in this block.
b) IDFT: Compute the inverse discrete Fourier transform.
c) GI and windowing: Prepend a GI determined by the TXVECTOR parameter GI_TYPE, and apply windowing as described in 27.3.10.
d) Analog and RF: Upconvert the resulting complex baseband waveform with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 27.3.10 and 27.3.11 for details.

27.3.7 HE modulation and coding schemes (HE-MCSs)

The HE-MCS is a compact representation of the modulation and coding used in the Data field of the PPDU. For an HE SU PPDU and an HE ER SU PPDU, it is carried in the HE-SIG-A field. For an HE MU PPDU, it is carried per user in the User Specific field of the HE-SIG-B field. For an HE TB PPDU, it is carried in the User Info field of the Trigger frame soliciting the HE TB PPDU.

Rate-dependent parameters for the full set of HE-MCSs are shown in Table 27-62 to Table 27-117(in 27.5). These tables give rate-dependent parameters for HE-MCSs with indices 0 to 11; number of spatial streams from 1 to 8; RU options of 26-tone RU, 52-tone RU, 106-tone RU, 242-tone RU, 484-tone RU, and 996-tone RU; and bandwidth options of 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz.

The HE ER SU PPDU supports only a single 242-tone or 106-tone RU. An HE ER SU PPDU with a 242-tone RU shall be transmitted with only the <HE-MCS, NSS> tuples <HE-MCS 0, 1>, <HE-MCS 1, 1>, and <HE-MCS 2, 1>. An HE ER SU PPDU with a 106-tone RU shall be transmitted with only the <HE-MCS, NSS> tuple <HE-MCS 0, 1>. The 106-tone RU location within the 20 MHz tone plan is fixed as the one that is higher in frequency.

DCM is an optional modulation scheme used for the HE-SIG-B field and the Data field in an HE PPDU. The use of DCM for the HE-SIG-B field in an HE MU PPDU is indicated in the HE-SIG-A field. For the HE-SIG-B field, DCM is applicable to only the HE-SIG-B-MCSs 0, 1, 3, and 4. The use of DCM on the Data field of an HE SU PPDU and HE ER SU PPDU is indicated in the HE-SIG-A field. The use of DCM in the Data field of an HE MU PPDU is indicated in the HE-SIG-B field. For the Data field, DCM is applicable to only the HE-MCSs 0, 1, 3, and 4.

The pre-HE modulated fields (see Figure 27-23) are not transmitted in 20 MHz subchannels in which the preamble is punctured as described in 27.3.11.3.

27.3.8 HE-SIG-B modulation and coding schemes (HE-SIG-B-MCSs)

The HE-SIG-B-MCS is a compact representation of the modulation and coding used in the HE-SIG-B field of the HE MU PPDU. The HE-SIG-B modulation and coding scheme is carried in the HE-SIG-B-MCS subfield of the HE-SIG-A field in the HE MU PPDU and indicates an HE-SIG-B-MCS in the range 0 to 5.

27.3.9 Timing-related parameters

Refer to Table 19-6 and Table 21-5 for timing-related parameters for non-HE PPDU formats.

Table 27-13 defines the timing-related parameters for HE PPDU formats.

Table 27-13—Timing-related constants

Parameter	Values	Description
$\Delta_{F,\text{Pre-HE}}$	312.5 kHz	Subcarrier frequency spacing for the pre-HE modulated fields.
$\Delta_{F,\text{HE}}$	78.125 kHz	Subcarrier frequency spacing for the HE modulated fields.
$T_{DFT,\text{Pre-HE}}$	3.2 μs	IDFT/DFT period for the pre-HE modulated fields.
$T_{DFT,\text{HE}}$	12.8 μs	IDFT/DFT period for the Data field.
$T_{GI,\text{Pre-HE}}$	0.8 μs	Guard interval duration for the pre-HE modulated fields.
$T_{GI,\text{L-LTF}}$	1.6 μs	Guard interval duration for the L-LTF field.
$T_{GI1,Data}$	0.8 μs	Base guard interval duration for the Data field.
$T_{GI2,Data}$	1.6 μs	Double guard interval duration for the Data field.
$T_{GI4,Data}$	3.2 μs	Quadruple guard interval duration for the Data field.
$T_{GI,\text{HE-LTF}}$	$T_{GI1,Data}$, $T_{GI2,Data}$ or $T_{GI4,Data}$ depending on the GI used for data	Guard interval duration for the HE-LTF field, same as $T_{GI,Data}$.
$T_{GI,Data}$	$T_{GI1,Data}$, $T_{GI2,Data}$ or $T_{GI4,Data}$ depending on the GI used for data	Guard interval duration for the Data field.
T_{SYM1}	13.6 μs = $T_{DFT,\text{HE}} + T_{GI1,Data} = 1.0625 \times T_{DFT,HE}$	OFDM symbol duration with base GI.
T_{SYM2}	14.4 μs = $T_{DFT,\text{HE}} + T_{GI2,Data} = 1.125 \times T_{DFT,HE}$	OFDM symbol duration with double GI.
T_{SYM4}	16 μs = $T_{DFT,\text{HE}} + T_{GI4,Data} = 1.25 \times T_{DFT,\text{HE}}$	OFDM symbol duration with quadruple GI.
T_{SYM}	T_{SYM1}, T_{SYM2}, or T_{SYM4} depending on the GI used for data	OFDM symbol interval for HE PPDU fields. See Table 27-17.
$T_{\text{L-STF}}$	8 μs = $10 \times T_{DFT,\text{Pre-HE}}/4$	Non-HT Short Training field duration.
$T_{\text{L-LTF}}$	8 μs = $2 \times T_{DFT,\text{Pre-HE}} + T_{GI,\text{L-LTF}}$	Non-HT Long Training field duration.
$T_{\text{L-SIG}}$	4 μs	Non-HT SIGNAL field duration.
$T_{\text{RL-SIG}}$	4 μs	Repeated non-HT SIGNAL field duration.
$T_{\text{HE-SIG-A}}$	8 μs = 2 × 4 μs	HE-SIG-A field duration in an HE SU PPDU, HE MU PPDU, and HE TB PPDU.
$T_{\text{HE-SIG-A-R}}$	16 μs = 4 × 4 μs	HE-SIG-A field duration in an HE ER SU PPDU.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 27-13—Timing-related constants *(continued)*

Parameter	Values	Description
$T_{\text{HE-SIG-B}}$	4 μs = $T_{DFT,\text{Pre-HE}} + T_{GI,\text{Pre-HE}}$	Duration of each OFDM symbol in the HE-SIG-B field.
$T_{\text{HE-STF-T}}$	8 μs = 5 × 1.6 μs	HE-STF field duration for an HE TB PPDU.
$T_{\text{HE-STF-NT}}$	4 μs = 5 × 0.8 μs	HE-STF field duration for an HE SU PPDU, HE ER SU PPDU, and HE MU PPDU.
$T_{\text{HE-LTF-1X}}$	3.2 μs	Duration of each 1x HE-LTF OFDM symbol without GI.
$T_{\text{HE-LTF-2X}}$	6.4 μs	Duration of each 2x HE-LTF OFDM symbol without GI.
$T_{\text{HE-LTF-4X}}$	12.8 μs	Duration of each 4x HE-LTF OFDM symbol without GI.
$T_{\text{HE-LTF}}$	$T_{\text{HE-LTF-1X}}$, $T_{\text{HE-LTF-2X}}$ or $T_{\text{HE-LTF-4X}}$ depending upon the HE-LTF duration used	Duration of each OFDM symbol without GI in the HE-LTF field.
$T_{\text{HE-LTF-SYM}}$	$T_{\text{HE-LTF}} + T_{GI,\text{HE-LTF}}$	Duration of each OFDM symbol including GI in the HE-LTF field.
$N_{service}$	16	Number of bits in the SERVICE field.
N_{tail}, $N_{tail,u}$	6 for BCC encoder, 0 for LDPC encoder	Number of tail bits per encoder (for user u).
T_{SYML}	4 μs	OFDM symbol duration including GI prior to the HE-STF field.
T_{PE}	0, 4 μs, 8 μs, 12 μs or 16 μs depending on the actual extension duration used	Duration of the PE field.

Table 27-14 defines tone allocation related parameters for a non-OFDMA HE PPDU.

Table 27-15 defines tone allocation related parameters for an OFDMA HE PPDU.

Table 27-16 defines parameters used frequently in Clause 27.

27.3.10 Mathematical description of signals

For a description of the conventions used for the mathematical description of the signals, see 17.3.2.5. In addition, the following notational conventions are used in Clause 27:

— $[Q]_{m,n}$ indicates the element in row m and column n of matrix Q, where $1 \le m \le N_{row}$ and $1 \le n \le N_{col}$, with N_{row} and N_{col} being the number of rows and columns of matrix Q, respectively.

— $[Q]_{m:n}$ indicates a matrix consisting of columns m to n of matrix Q.

For a description on subcarrier indices over which the signal is transmitted for non-HT, HT, and VHT PPDUs, see 27.3.7.

For the HE modulated fields of a 20 MHz non-OFDMA HE PPDU transmission, the 20 MHz is divided into 256 subcarriers. The signal is transmitted on all or a subset of subcarriers –122 to –2 and 2 to 122, with 0 being the center subcarrier.

Table 27-14—Subcarrier allocation related constants for the HE-modulated fields in a non-OFDMA HE PPDU

Parameter	CBW20	CBW40	CBW80	CBW80+80	CBW160	Description
N_{SD}	See 27.5					Number of data subcarriers per frequency segment
N_{SP}	8	16	16	16	32	Number of pilot subcarriers per frequency segment
N_{ST}	242	484	996	996	1992	Total number of subcarriers per frequency segment
N_{SR}	122	244	500	500	1012	Highest data subcarrier index per frequency segment
N_{Seg}	1	1	1	2	1	Number of frequency segments
N_{DC}	3	5	5	5	23	Number of null subcarriers at DC per segment

Table 27-15—Subcarrier allocation related constants for RUs in an OFDMA HE PPDU

Parameter	RU Size (subcarriers)							Description
	26	52	106	242	484	996	2×996	
N_{SD}	See 27.5							Number of data subcarriers per RU
N_{SP}	2	4	4	8	16	16	32	Number of pilot subcarriers per RU
N_{ST}	26	52	106	242	484	996	1992	Total number of subcarriers per RU

Table 27-16—Frequently used parameters

Symbol	Explanation
N_{RU}	For pre-HE modulated fields, $N_{RU} = 1$. For HE modulated fields, N_{RU} represents the number of occupied RUs in the transmission.
$N_{user,r}$	For pre-HE modulated fields, $N_{user,r} = 1$. For HE modulated fields, $N_{user,r}$ represents the total number of users in the r^{th} occupied RU of the transmission.
$N_{user,total}$	Total number of users in all occupied RUs of an HE transmission, i.e., $N_{user,\,total} = \sum_{r=0}^{N_{RU}-1} N_{user,r}$

Table 27-16—Frequently used parameters *(continued)*

Symbol	Explanation
N_{CBPS}, $N_{CBPS,u}$	Number of coded bits per OFDM symbol for user u, $u = 0, \ldots, N_{user,total} - 1$. For an HE SU PPDU and HE ER SU PPDU, $N_{CBPS} = N_{CBPS,0}$. For an HE MU PPDU, N_{CBPS} is undefined.
N_{CBPSS}, $N_{CBPSS,u}$	Number of coded bits per OFDM symbol per spatial stream for user u, $u = 0, \ldots, N_{user,total} - 1$. For the Data field of an HE SU PPDU and HE ER SU PPDU, $N_{CBPSS} = N_{CBPSS,0}$. For the Data field of an HE MU PPDU, N_{CBPSS} is undefined.
N_{DBPS}, $N_{DBPS,u}$	Number of data bits per OFDM symbol for user u, $u = 0, \ldots, N_{user,total} - 1$. For an HE SU PPDU and HE ER SU PPDU, $N_{DBPS} = N_{DBPS,0}$. For an HE MU PPDU, N_{DBPS} is undefined.
N_{BPSCS}, $N_{BPSCS,u}$	Number of coded bits per subcarrier per spatial stream for user u, $u = 0, \ldots, N_{user,total} - 1$. For an HE SU PPDU and HE ER SU PPDU, $N_{BPSCS} = N_{BPSCS,0}$. For an HE MU PPDU, N_{BPSCS} is undefined.
N_{RX}	Number of receive chains.
N_{STS}, $N_{STS,r,u}$	For HE modulated fields, $N_{STS,r,u}$ represents the number of space-time streams in the r^{th} occupied RU for user u, $u = 0, \ldots, N_{user,r} - 1$. For STBC, $N_{STS,r,u} = 2$. For an HE SU PPDU and HE ER SU PPDU, $N_{STS} = N_{STS,0,0}$. For an HE MU PPDU, N_{STS} is undefined if any one of the RUs is assigned to more than one user, and $N_{STS} = 2$ if all RUs are assigned to no more than one user and the STBC field is set to 1.
$N_{STS,r,total}$	For HE modulated fields, $N_{STS,r,total}$ is the total number of space-time streams over all the users in the r^{th} occupied RU. $N_{STS,r,total} = \sum_{u=0}^{N_{user,r}-1} N_{STS,r,u}$ For pre-HE modulated fields, $N_{STS,r,total}$ is undefined if the TXVECTOR parameter BEAM_CHANGE is 1 or not present and $N_{STS,r,total} = N_{STS}$ if BEAM_CHANGE is 0. NOTE—$N_{STS,r,total} = N_{STS}$ for an HE SU PPDU and HE ER SU PPDU.
N_{SS}, $N_{SS,r,u}$, $N_{SS,u}$	Number of spatial streams. For the Data field, $N_{SS,r,u}$ is the number of spatial streams at r^{th} RU for user u, $u = 0, \ldots, N_{user,r} - 1$ and $N_{SS,u}$ is the number of spatial streams for user u, $u = 0, \ldots, N_{user,total} - 1$. For the Data field of an HE SU PPDU and HE ER SU PPDU, $N_{SS} = N_{SS,0,0}$. For the Data field of an HE MU PPDU, $N_{SS} = max_{r=0}^{N_{RU}-1} N_{SS,r,total}$.

Table 27-16—Frequently used parameters *(continued)*

Symbol	Explanation
$N_{SS,r,total}$	For HE modulated fields, $N_{SS,r,total}$ is the total number of spatial streams at r^{th} RU in a PPDU. $N_{SS,r,total} = \sum_{u=0}^{N_{user,r}-1} N_{SS,r,u}$ For pre-HE modulated fields, $N_{SS,r,total}$ is undefined. NOTE—$N_{SS,r,total} = N_{SS}$ for an HE SU PPDU and HE ER SU PPDU.
N_{TX}	Number of transmit chains.
$N_{HE\text{-}LTF}$	The number of OFDM symbols in the HE-LTF field (see 27.3.11.10.
$N_{HE\text{-}SIG\text{-}B}$	The number of OFDM symbols in the HE-SIG-B field (see 27.3.11.8).
K_r	Set of used subcarrier indices in the r^{th} occupied RU.
R, R_u	R_u is the coding rate for user u, $u = 0, \ldots, N_{user,total} - 1$. For an HE SU PPDU, $R = R_0$. For an HE MU PPDU, R is undefined.
$M_{r,u}$	The sum of the number of space-time streams of users prior to user u in RU r. For pre-HE modulated fields, $M_{r,u} = 0$. For HE modulated fields, $M_{r,0} = 0$ for $u = 0$ and $M_{r,u} = \sum_{u'=0}^{u-1} N_{STS,r,u'}$ for $u = 1, \ldots, N_{user,r} - 1$.

For the HE modulated fields of a 20 MHz OFDMA HE PPDU transmission, the 20 MHz is divided into 256 subcarriers. The signal is transmitted on all or a subset of the subcarriers –122 to –4 and 4 to 122, with 0 being the center subcarrier.

For the HE modulated fields of a 40 MHz non-OFDMA HE PPDU transmission, the 40 MHz is divided into 512 subcarriers. The signal is transmitted on subcarriers –244 to –3 and 3 to 244, with 0 being the center subcarrier.

For the HE modulated fields of a 40 MHz OFDMA HE PPDU transmission, the 40 MHz is divided into 512 subcarriers. The signal is transmitted on all or a subset of subcarriers –244 to –3 and 3 to 244, with 0 being the center subcarrier.

For the HE modulated fields of an 80 MHz non-OFDMA HE PPDU transmission, the 80 MHz is divided into 1024 subcarriers. The signal is transmitted on subcarriers –500 to –3 and 3 to 500, with 0 being the center subcarrier.

For the HE modulated fields of an 80 MHz OFDMA HE PPDU transmission, the 80 MHz is divided into 1024 subcarriers. The signal is transmitted on all or a subset of the subcarriers –500 to –4 and 4 to 500, with 0 being the center subcarrier.

For the HE modulated fields of a 160 MHz HE PPDU transmission, each half 80 MHz bandwidth is divided into 1024 subcarriers, and the subcarriers on which the signal is transmitted in each 80 MHz bandwidth are identical to an 80 MHz HE PPDU transmission with a corresponding subcarrier index shift, depending on non-OFDMA or OFDMA transmission within the corresponding 80 MHz.

For the HE modulated fields of a noncontiguous 80+80 MHz transmission, each half 80 MHz bandwidth is divided into 1024 subcarriers, and the subcarriers on which the signal is transmitted in each 80 MHz

bandwidth are identical to an 80 MHz HE PPDU transmission, depending on non-OFDMA or OFDMA transmission within the corresponding 80 MHz.

The transmitted signal is described in complex baseband signal notation. The actual transmitted signal on transmit chain i_{TX} and frequency segment i_{Seg} is related to the complex baseband signal by the relation shown in Equation (27-1).

$$r_{RF}^{(i_{Seg}, i_{TX})}(t) = \mathrm{Re}\left\{ \frac{1}{\sqrt{N_{Seg}}} r_{PPDU}^{(i_{Seg}, i_{TX})}(t) \exp\left(j2\pi f_c^{(i_{Seg})} t \right) \right\}, \quad i_{Seg} = 0, \ldots, N_{Seg} - 1; \; i_{TX} = 1, \ldots, N_{TX} \quad (27\text{-}1)$$

where

N_{Seg} represents the number of frequency segments in the transmit signal as defined in Table 27-14

$r_{PPDU}^{(i_{Seg}, i_{TX})}$ represents the complex baseband signal of frequency segment i_{Seg} and transmit chain i_{TX}

$f_c^{(i_{Seg})}$ represents the center frequency of the portion of the PPDU transmitted in frequency segment i_{Seg}. Table 21-7 shows $f_c^{(i_{Seg})}$ as a function of the channel starting frequency, dot11CurrentChannelWidth (see Table 21-22) and CH_BANDWIDTH where $f_{CH,start}$, $f_{P20,idx}$, $f_{P40,idx}$, and $f_{P80,idx}$ are given in Equation (21-4), Equation (21-5), Equation (21-7), and Equation (21-9), respectively.
For an HE STA operating in the 6 GHz band, see 27.3.25.2 for the value of channel starting frequency and the valid range of dot11CurrentChannelCenterFrequencyIndex0 and dot11CurrentChannelCenterFrequencyIndex1.

The transmitted RF signal is derived by upconverting the complex baseband signal, which consists of several fields. The timing boundaries for the various fields when the midamble is not present are shown in Figure 27-23, where $N_{\text{HE-LTF}}$ is the number of HE-LTF symbols and is defined in Table 27-16, $N_{\text{HE-SIG-B}}$ is the number of OFDM symbols in the HE-SIG-B field present in an HE MU PPDU, and N_{SYM} is the number of data OFDM symbols.

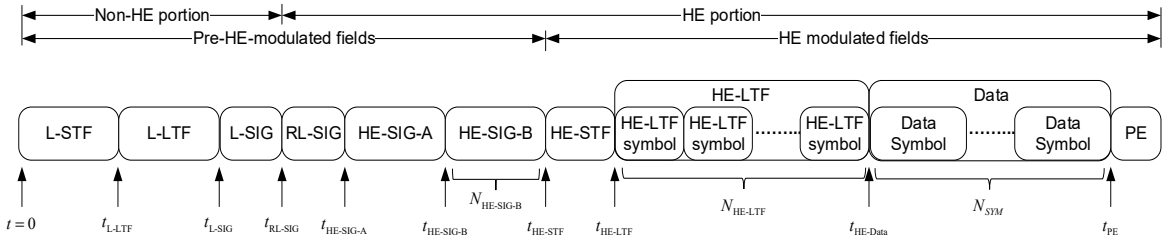

Figure 27-23—Timing boundaries for HE PPDU fields if midamble is not present

NOTE 1—Data OFDM symbols are OFDM symbols in the Data field of an HE PPDU that are not midamble symbols.

The time offset, t_{Field}, determines the starting time of the corresponding field relative to the start of L-STF ($t = 0$).

The signal transmitted on frequency segment i_{Seg} and transmit chain i_{TX} shall be as shown in Equation (27-2) if midamble is not present.

\end{aligned}
\tag{27-2}
$$

where

$r_{\text{HE-SIG-B}}^{(i_{Seg}, i_{TX})}(t - t_{\text{HE-SIG-B}})$ is only applicable to an HE MU PPDU

$0 \le i_{Seg} \le N_{Seg} - 1$

$1 \le i_{TX} \le N_{TX}$

$t_{\text{L-LTF}} = T_{\text{L-STF}}$

$t_{\text{L-SIG}} = t_{\text{L-LTF}} + T_{\text{L-LTF}}$

$t_{\text{RL-SIG}} = t_{\text{L-SIG}} + T_{\text{L-SIG}}$

$t_{\text{HE-SIG-A}} = t_{\text{RL-SIG}} + T_{\text{RL-SIG}}$

$$
t_{\text{HE-SIG-B}} = \begin{cases} t_{\text{HE-SIG-A}} + T_{\text{HE-SIG-A}}, & \text{for an HE MU PPDU} \\ undefined, & \text{otherwise} \end{cases}
$$

$$
t_{\text{HE-STF}} = \begin{cases} t_{\text{HE-SIG-A}} + T_{\text{HE-SIG-A}}, & \text{for an HE SU PPDU and HE TB PPDU} \\ t_{\text{HE-SIG-A}} + T_{\text{HE-SIG-A-R}}, & \text{for an HE ER SU PPDU} \\ t_{\text{HE-SIG-B}} + N_{\text{HE-SIG-B}} T_{\text{HE-SIG-B}}, & \text{for an HE MU PPDU} \end{cases}
$$

$$
t_{\text{HE-LTF}} = \begin{cases} t_{\text{HE-STF}} + T_{\text{HE-STF-T}}, & \text{for an HE TB PPDU} \\ t_{\text{HE-STF}} + T_{\text{HE-STF-NT}}, & \text{otherwise} \end{cases}
$$

$t_{\text{HE-Data}} = t_{\text{HE-LTF}} + N_{\text{HE-LTF}} T_{\text{HE-LTF-SYM}}$

$t_{\text{HE-PE}} = t_{\text{HE-Data}} + N_{SYM} T_{SYM}$

In an HE SU PPDU, HE MU PPDU, and HE ER SU PPDU, for each field excluding the PE field, $r_{Field}^{(i_{Seg}, i_{TX})}(t)$ is defined as the summation of one or more subfields. Each subfield, $r_{Subfield}^{(i_{Seg}, i_{TX})}(t)$, is defined to be an inverse discrete Fourier transform in Equation (27-3).

$$
\begin{aligned}
r_{Subfield}^{(i_{Seg}, i_{TX})}(t) = {} & w_{T_{Subfield}}(t) \sum_{r=0}^{N_{RU}-1} \frac{\alpha_r \beta_r^{Field}}{\sqrt{N_{Norm,\, r}}} \sum_{k \in K_r} \eta_{Field,\, k} \sum_{u=0}^{N_{user,\, r}-1} \sum_{m=1}^{N_{STS,\, r,\, u}} \left[Q_k^{(i_{Seg})} \right]_{i_{TX},\, (M_{r,\, u}+m)} \Upsilon_{k,\, BW} \\
& X_{k,\, r,\, u}^{i_{Seg},\, m} \exp\left(j 2\pi k \Delta_{F,\, Field} (t - T_{GI,\, Field} - T_{CS,\, \text{HE}} (M_{r,\, u} + m)) \right)
\end{aligned}
\tag{27-3}
$$

In an HE TB PPDU, transmitted by user u in the r^{th} occupied RU, each subfield, $r_{Subfield,\, r,\, u}^{(i_{Seg}, i_{TX})}(t)$, is defined in Equation (27-4).

$$
\begin{aligned}
r_{Subfield,\, r,\, u}^{(i_{Seg}, i_{TX})}(t) = {} & \frac{\beta_r^{Field}}{\sqrt{N_{Norm,\, r}}} w_{T_{Subfield}}(t) \sum_{k \in K_r} \eta_{Field,\, k} \sum_{m=1}^{N_{STS,\, r,\, u}} \left[Q_{k,\, u}^{(i_{Seg})} \right]_{i_{TX},\, m} \Upsilon_{k,\, BW} \\
& X_{k,\, r,\, u}^{(i_{Seg},\, m)} \exp\left(j 2\pi k \Delta_{F,\, Field} (t - T_{GI,\, Field} - T_{CS,\, \text{HE}} (M_{r,\, u} + m)) \right)
\end{aligned}
\tag{27-4}
$$

For an HE SU PPDU, HE MU PPDU, and HE ER SU PPDU, the total power of the time domain HE modulated field signals summed over all transmit chains should not exceed the total power of the time domain pre-HE modulated field signals summed over all transmit chains if the TXVECTOR parameter BEAM_CHANGE is 1 or not present and power boost in HE modulated fields is not present.

For an HE TB PPDU, the total power of the time domain HE modulated field signals summed over all transmit chains may exceed the total power of the time domain pre-HE modulated field signals summed over all transmit chains by up to 3 dB.

For notational simplicity, the parameter BW is omitted from some bandwidth-dependent terms.

In Equation (27-3) and Equation (27-4), the following notations are used:

$N_{Norm,r}$ If the TXVECTOR parameter BEAM_CHANGE is 1 or not present, then for pre-HE modulated fields, $N_{Norm,r} = N_{TX}$. If the TXVECTOR parameter BEAM_CHANGE is 0, then for pre-HE modulated fields $N_{Norm,r} = N_{STS,r,total}$, where $N_{STS,r,total}$ is given in Table 27-16. For HE modulated fields $N_{Norm,r} = N_{STS,r,total}$.

$w_{Subfield}(t)$ is a windowing function. An example function, $w_{Subfield}(t)$, is given in 17.3.2.5.

K_r For pre-HE modulated fields, K_r is the set of subcarriers indices in the allocated 20 MHz channels. For HE modulated fields in a non-OFDMA HE PPDU, K_r is the set of subcarriers indices from $-N_{SR}$ to N_{SR} as defined in Table 27-14 excluding DC subcarriers. For HE modulated fields in an OFDMA HE PPDU, K_r is the set of subcarrier indices for the tones in the r^{th} RU as defined in Table 27-8, Table 27-9, and Table 27-10.

$\eta_{Field,k}$ is the power scale factor of the k^{th} subcarrier of a given field within an OFDM symbol, which is $\sqrt{2}$ for all the subcarriers of the L-STF, L-LTF, HE-STF, and HE-LTF fields in the HE ER SU PPDU. For the L-SIG and RL-SIG fields of an HE ER SU PPDU,

$$\eta_{Field,k} = \begin{cases} \sqrt{2}, k = -28, -27, 27, 28 \\ 1, \text{ otherwise} \end{cases}$$

For the HE-SIG-A and Data fields in an HE ER SU PPDU, $\eta_{Field,k} = 1$. For the pre-HE portion of the HE TB PPDU, $\eta_{Field,k} = \left[\frac{1}{\sqrt{2}}, 1\right]$, meaning in the range $\frac{1}{\sqrt{2}}$ to 1. For all other fields in other HE PPDUs $\eta_{Field,k} = 1$.

α_r is the power boost factor of the r^{th} occupied RU in an HE PPDU, and equals the associated POWER_BOOST_FACTOR parameter in the TXVECTOR.

NOTE 2—α_r is constrained as defined in 26.11.10, i.e., for an HE MU PPDU, α_r is in the range $[1/\sqrt{2}, \sqrt{2}]$ if the Power Boost Factor Support subfield of the HE PHY Capabilities Information field in the HE Capabilities element from any recipient STA of the PPDU equals 0; and otherwise α_r is in the range $[1/2, 2]$; further, for an HE SU PPDU, non-OFDMA HE MU PPDU, and HE ER SU PPDU, α_r is set to 1.

β_r^{Field} is the power normalization factor and is defined in Equation (27-5).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$\beta_r^{Field} = \begin{cases} \dfrac{\varepsilon_{Field}}{\sqrt{N_{Field}^{\text{Tone}} \cdot \dfrac{|\Omega_{20\text{MHz}}|}{N_{20\text{MHz}}}}}, \text{ for pre-HE modulated fields} \\ \dfrac{1}{\sqrt{|\Gamma_r^{Field}|}}, \text{ for HE modulated fields in an HE TB PPDU} \\ \sqrt{\dfrac{|K_r|}{|\Gamma_r^{Field}|}} \Big/ \sqrt{\sum_{r=0}^{N_{RU}-1} \alpha_r^2 |K_r|}, \text{ otherwise} \end{cases} \quad (27\text{-}5)$$

$|K_r|$ is the cardinality of the set of subcarriers K_r

Γ_r^{Field} equals the number of modulated subcarriers within the HE-STF and Data fields. For the HE-LTF field, Γ_r^{Field} is defined as below to ensure per tone power is the same for both HE-STF and Data fields, regardless of 1×, 2×, or 4× HE-LTF:

$$\Gamma_r^{HE\text{-}LTF} = \begin{cases} |K_r|, \text{ for a 4x HE-LTF} \\ |K_r|/2, \text{ for a 2x HE-LTF} \\ |K_r|/4, \text{ for a 1x HE-LTF} \end{cases}$$

N_{RU} is defined in Table 27-16.

$$\varepsilon_{Field} = \begin{cases} \sqrt{\dfrac{N_{\text{L-LTF}}^{\text{Tone}}}{N_{\text{L-SIG}}^{\text{Tone}}}}, \text{ for the L-STF and L-LTF fields} \\ 1, \text{ otherwise} \end{cases}$$

N_{Field}^{Tone} is given in Table 27-17, which summarizes the various values of N_{Field}^{Tone} as a function of bandwidth per frequency segment.

Table 27-17—Number of modulated subcarriers and guard interval duration values for HE PPDU fields

Field	N_{Field}^{Tone} as a function of PPDU bandwidth				Guard interval duration
	20 MHz	40 MHz	80 MHz	160 MHz	
L-STF	12	24	48	96	—
L-LTF	52	104	208	416	$T_{GI,\text{L-LTF}}$
L-SIG in an HE PPDU	56	112	224	448	$T_{GI,\text{Pre-HE}}$
L-SIG in a non-HT duplicate PPDU	—	104	208	416	
RL-SIG	56	112	224	448	$T_{GI,\text{Pre-HE}}$
HE-SIG-A	56	112	224	448	$T_{GI,\text{Pre-HE}}$
HE-SIG-B	56	112	224	448	$T_{GI,\text{Pre-HE}}$
NON_HT_DUP_OFDM-Data (see NOTE)	—	104	208	416	$T_{GI,\text{Pre-HE}}$

NOTE—For notational convenience, NON_HT_DUP_OFDM-Data is used as a label for the Data field of a non-HT PPDU with format type NON_HT_DUP_OFDM.

$Q_k^{(i_{Seg})}$ is the spatial mapping matrix for the subcarrier k in frequency segment i_{Seg}. For HE modulated fields, $Q_k^{(i_{Seg})}$ is a matrix with N_{TX} rows and $N_{STS,r,total}$ columns. When beamforming or DL MU-MIMO is applied, $Q_k^{(i_{Seg})}$ is a beamforming or DL MU-MIMO steering matrix that is derived from the TXVECTOR parameter EXPANSION_MAT. The beamforming steering matrices and DL MU-MIMO steering matrices are implementation specific. If the TXVECTOR parameter BEAM_CHANGE is 1 or not present, then for pre-HE modulated fields $Q_k^{(i_{Seg})}$ is a column vector with N_{TX} elements with element i_{TX} being $\exp(-j2\pi k\Delta_{F,\text{Pre-HE}}T_{CS}^{i_{TX}})$, where $T_{CS}^{i_{TX}}$ represents the cyclic shift for the transmitter chain whose values are defined in 27.3.11.2.1; otherwise it is identical to the spatial mapping $Q_k^{(i_{Seg})}$ for HE modulated fields.

$Q_{k,u}^{(i_{Seg})}$ is the spatial mapping matrix for user u on subcarrier k in frequency segment i_{Seg}. For HE modulated fields, $Q_{k,u}^{(i_{Seg})}$ is a matrix with N_{TX} rows and $N_{STS,r,u}$ columns. For pre-HE modulated fields, $Q_{k,u}^{(i_{Seg})}$ is a column vector with N_{TX} elements with element i_{TX} being $\exp(-j2\pi k\Delta_{F,\text{Pre-HE}}T_{CS}^{i_{TX}})$, where $T_{CS}^{i_{TX}}$ represents the cyclic shift for the transmitter chain whose values are defined in 27.3.11.2.1.

$\Delta_{F,Field}$ is the subcarrier frequency spacing. For pre-HE modulated fields, $\Delta_{F,Field} = \Delta_{F,\text{Pre-HE}}$ given in Table 27-13. For HE modulated fields, $\Delta_{F,Field} = \Delta_{F,\text{HE}}$ given in Table 27-13.

$M_{r,u}$ is given in Table 27-16.

$X_{k,r,u}^{(i_{Seg},m)}$ is the frequency-domain symbol in subcarrier k of user u in the r^{th} RU for frequency segment i_{Seg} of space-time stream m. Some of the $X_{k,r,u}^{(i_{Seg},m)}$ within $-N_{SR} \le k \le N_{SR}$ have a value of zero. Examples of such cases include the DC tones, guard tones on each side of the transmit spectrum, the null subcarriers in an HE OFDMA PPDU, and the unmodulated tones of L-STF, HE-STF, and HE-LTF fields.

$T_{GI,Field}$ is the guard interval duration used for each OFDM symbol in the field. The value for each field is defined in Table 27-13.

$T_{CS,\text{HE}}(l)$ For pre-HE modulated fields, if the TXVECTOR parameter BEAM_CHANGE is 1 or not present, $T_{CS,\text{HE}}(l) = 0$. For HE modulated fields and pre-HE modulated fields if the TXVECTOR parameter BEAM_CHANGE is 0, $T_{CS,\text{HE}}(l)$ represents the cyclic shift per space-time stream, whose value is defined in 27.3.11.2.2.

$\Upsilon_{k,BW}$ is used to represent tone rotation. BW in $\Upsilon_{k,BW}$ is determined by the TXVECTOR parameter CH_BANDWIDTH as defined in Table 27-18. In HE modulated fields, $\Upsilon_{k,BW} = 1$ for all the subcarriers. In pre-HE modulated fields, $\Upsilon_{k,BW}$ is defined as in 21.3.7.5 if TXVECTOR parameter BEAM_CHANGE is 1 and $\Upsilon_{k,BW} = 1$ for all the subcarriers if TXVECTOR parameter BEAM_CHANGE is 0. If the TXVECTOR parameter BEAM_CHANGE is not present (such as in an HE MU PPDU and HE TB PPDU), BEAM_CHANGE is assumed to be 1.

Table 27-18—CH_BANDWIDTH and $\Upsilon_{k,BW}$ for pre-HE modulated fields

CH_BANDWIDTH	$\Upsilon_{k,\text{BW}}$
CBW20	$\Upsilon_{k,20}$
CBW40	$\Upsilon_{k,40}$
CBW80	$\Upsilon_{k,80}$
CBW160	$\Upsilon_{k,160}$
CBW80+80	$\Upsilon_{k,80}$ per frequency segment
HE-CBW-PUNC80-PRI	$\Upsilon_{k,80}$
HE-CBW-PUNC80-SEC	$\Upsilon_{k,80}$
HE-CBW-PUNC160-PRI20	$\Upsilon_{k,160}$
HE-CBW-PUNC80+80-PRI20	$\Upsilon_{k,80}$ per frequency segment
HE-CBW-PUNC160-SEC40	$\Upsilon_{k,160}$
HE-CBW-PUNC80+80-SEC40	$\Upsilon_{k,80}$ per frequency segment

$\Omega_{20\text{MHz}}$ is a set of 20 MHz channels where pre-HE modulated fields are located. The set of 20 MHz channels contains one or more values in the range 0 to $N_{20\text{MHz}} - 1$ for an HE TB PPDU, HE sounding NDP, or HE MU PPDU with preamble puncturing, and it contains all values in the range 0 to $N_{20\text{MHz}} - 1$ for other HE PPDU formats.

$|\Omega_{20\text{MHz}}|$ is the cardinality of the set of 20 MHz channels where pre-HE modulated fields are located.

$$N_{20\text{MHz}} = \begin{cases} 1, \text{ if CH\_BANDWIDTH is CBW20} \\ 2, \text{ if CH\_BANDWIDTH is CBW40} \\ 4, \text{ if CH\_BANDWIDTH is CBW80, HE-CBW-PUNC80-PRI,} \\ \quad \text{HE-CBW-PUNC80-SEC, CBW80+80, HE-CBW-PUNC80+80-PRI20,} \\ \quad \text{or HE-CBW-PUNC80+80-SEC40} \\ 8, \text{ if CH\_BANDWIDTH is CBW160, HE-CBW-PUNC160-PRI20,} \\ \quad \text{or HE-CBW-PUNC160-SEC40} \end{cases}$$

27.3.11 HE preamble

27.3.11.1 Introduction

The HE preamble consists of pre-HE modulated fields and HE modulated fields. The pre-HE modulated fields for the various HE PPDU formats are the following:

— L-STF, L-LTF, L-SIG, RL-SIG, and HE-SIG-A fields of an HE SU PPDU, HE ER SU PPDU, and HE TB PPDU

— L-STF, L-LTF, L-SIG, RL-SIG, HE-SIG-A, and HE-SIG-B fields of an HE MU PPDU

The HE modulated fields in the preamble for all HE PPDU formats are the HE-STF and HE-LTF fields.

See 27.3.20 for the description of the HE-LTF field using secure HE-LTF in the preamble of HE Ranging NDP and HE TB Ranging NDP.

27.3.11.2 Cyclic shift

27.3.11.2.1 Cyclic shift for pre-HE modulated fields

If the TXVECTOR parameter BEAM_CHANGE is 1 or not present, then the cyclic shift value $T_{CS}^{i_{TX}}$ for the L-STF, L-LTF, L-SIG, RL-SIG, HE-SIG-A, and HE-SIG-B fields of the PPDU for transmit chain i_{TX} out of a total of N_{TX} are defined in Table 21-10. In UL MU transmission, the cyclic shift value $T_{CS}^{i_{TX}}$ is based on the local transmit chain indices at each STA.

If the TXVECTOR parameter BEAM_CHANGE is 0, then the cyclic shift value $T_{CS,\,\text{HE}}(n)$ for the L-STF, L-LTF, L-SIG, RL-SIG, and HE-SIG-A fields is specified in 27.3.11.2.2.

27.3.11.2.2 Cyclic shift for HE modulated fields

The cyclic shift values defined in this subclause apply to the HE-STF, HE-LTF, and Data fields of the HE PPDU if the TXVECTOR parameter BEAM_CHANGE is 1 or not present and apply to the entire PPDU if the TXVECTOR parameter BEAM_CHANGE is 0.

Throughout the HE modulated fields of the preamble, cyclic shifts are applied to prevent unintended beamforming when correlated signals are transmitted in multiple space-time streams. The same cyclic shifts are also applied to these streams during the transmission of the Data field of the HE PPDU. For the r^{th} RU, the cyclic shift value $T_{CS,\,\text{HE}}(n)$ for the HE modulated fields for space-time stream n out of $N_{STS,r,total}$ total space-time streams is shown in Table 21-11.

27.3.11.3 L-STF field

If the TXVECTOR parameter BEAM_CHANGE is 1 or not present, the time domain representation of the L-STF field, transmitted on frequency segment i_{Seg} and transmit chain i_{TX}, shall be as specified in Equation (27-6). The equation applies to signals up to a contiguous 160 MHz PPDU bandwidth and noncontiguous 80+80 MHz PPDU bandwidth.

$$r_{\text{L-STF}}^{(i_{Seg}, i_{TX})}(t) = \frac{\varepsilon}{\sqrt{N_{TX} \cdot N_{\text{L-STF}}^{\text{Tone}} \cdot \frac{|\Omega_{20\text{MHz}}|}{N_{20\text{MHz}}}}} w_{T_{\text{L-STF}}}(t) \sum_{i_{BW} \in \Omega_{20\text{MHz}}} \sum_{k=-26}^{26} \eta_{\text{L-STF}, k} \left(\Upsilon_{(k - K_{\text{Shift}}(i_{BW})), \text{BW}} S_{k, 20} \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{\text{BW}}))\Delta_{F, \text{Pre-HE}}(t - T_{CS}^{i_{TX}})) \right) \quad (27\text{-}6)$$

where

ε is a power scaling factor with the value $\varepsilon = \sqrt{\frac{N_{\text{L-LTF}}^{\text{Tone}}}{N_{\text{L-SIG}}^{\text{Tone}}}}$

$\eta_{\text{L-STF}, k}$ is a PPDU format-dependent scaling factor for the L-STF field on subcarrier index k with the following value:

$$\eta_{\text{L-STF}, k} = \begin{cases} \sqrt{2}, & \text{for an HE ER SU PPDU} \\ \left[\frac{1}{\sqrt{2}}, 1\right], & \text{for an HE TB PPDU} \\ 1, & \text{otherwise} \end{cases} \quad (27\text{-}7)$$

$K_{Shift}(i) = (N_{20\text{MHz}} - 1 - 2i) \times 32$

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} with a value given in 27.3.11.2.1

$N_{\text{L-STF}}^{\text{Tone}}$ has the value given in Table 27-17

$S_{k,20}$ is defined as $S_{-26,26}$ in Equation (19-8)

i_{BW} is the index of 20 MHz channels, $0 \le i_{BW} \le N_{20\text{MHz}} - 1$

If the TXVECTOR parameter BEAM_CHANGE is 0, the time domain representation of the L-STF field shall be as specified in Equation (27-8). The equation applies to signals up to a contiguous 160 MHz PPDU bandwidth and noncontiguous 80+80 MHz PPDU bandwidth.

$$r_{\text{L-STF}}^{(i_{Seg}, i_{TX})}(t) = \frac{\varepsilon}{\sqrt{N_{STS} \cdot N_{\text{L-STF}}^{\text{Tone}} \cdot \frac{|\Omega_{20\text{MHz}}|}{N_{20\text{MHz}}}}} w_{T_{\text{L-STF}}}(t) \sum_{i_{BW}=0}^{N_{20\text{MHz}}-1} \sum_{k=-26}^{26} \sum_{m=1}^{N_{STS}} \eta_{\text{L-STF}, k} \left(\left[Q_{4(k - K_{\text{Shift}}(i_{BW}))}^{(i_{Seg})} \right]_{i_{TX}, m} \left[A_{\text{HE-LTF}}^{4(k - K_{\text{Shift}}(i_{BW}))} \right]_{m, 1} S_{k, 20} \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{\text{BW}}))\Delta_{F, \text{Pre-HE}}(t - T_{CS, \text{HE}}(m))) \right) \quad (27\text{-}8)$$

where

$T_{CS,\,\mathrm{HE}}(m)$ represents the cyclic shift for space-time stream m as defined in 27.3.11.2.2

$Q_k^{(i_{Seg})}$ is the spatial mapping/steering matrix for subcarrier k, in frequency segment i_{Seg} on the data OFDM symbols over subcarrier spacing $\Delta_{F,\,\mathrm{HE}}$ as defined in Table 27-13. Refer to the descriptions in 21.3.10.11.1 for examples of $Q_k^{(i_{Seg})}$.

$A^k_{\text{HE-LTF}}$ is defined in Equation (27-55)

N_{STS} is the number of space-time streams of the HE-modulated fields in an HE SU PPDU or HE ER SU PPDU as defined in Table 27-16

27.3.11.4 L-LTF field

If the TXVECTOR parameter BEAM_CHANGE is 1 or not present, the time domain representation of the L-LTF field, transmitted on frequency segment i_{Seg} and transmit chain i_{TX}, shall be as specified in Equation (27-9). The equation applies to signals up to a contiguous 160 MHz PPDU bandwidth and noncontiguous 80+80 MHz PPDU bandwidth.

$$r_{\text{L-LTF}}^{(i_{Seg},\,i_{TX})}(t) = \frac{\varepsilon}{\sqrt{N_{TX}\cdot N_{\text{L-LTF}}^{\text{Tone}}\cdot\dfrac{|\Omega_{20\text{MHz}}|}{N_{20\text{MHz}}}}} w_{T_{\text{L-LTF}}}(t) \sum_{i_{BW}\in\Omega_{20\text{MHz}}}\sum_{k=-26}^{26}\eta_{\text{L-LTF},\,k}\left(\begin{array}{l}\Upsilon_{(k-K_{\text{Shift}}(i_{BW})),\,\text{BW}}L_{k,\,20}\\ \cdot\exp(j2\pi(k-K_{\text{Shift}}(i_{\text{BW}}))\Delta_{F,\,\text{Pre-HE}}(t-T_{GI,\,\text{L-LTF}}-T_{CS}^{i_{TX}}))\end{array}\right) \tag{27-9}$$

where

$\eta_{\text{L-LTF},\,k}$ is a PPDU format-dependent scaling factor for the L-LTF field on subcarrier index k with the same value as $\eta_{\text{L-STF},\,k}$

ε is a power scaling factor with the value $\varepsilon = \sqrt{\dfrac{N_{\text{L-LTF}}^{\text{Tone}}}{N_{\text{L-SIG}}^{\text{Tone}}}}$

$T_{GI,\text{L-LTF}}$ is given in Table 27-13

$K_{Shift}(i) = (N_{20\text{MHz}} - 1 - 2i)\times 32$

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} with a value given in 27.3.11.2.1

$N_{\text{L-LTF}}^{\text{Tone}}$ has the value given in Table 27-17

$L_{k,20}$ is defined as $L_{-26,26}$ in Equation (17-8)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the TXVECTOR parameter BEAM_CHANGE is 0, the time domain representation of the L-LTF field shall be as specified in Equation (27-10). The equation applies to signals up to a contiguous 160 MHz PPDU bandwidth and noncontiguous 80+80 MHz PPDU bandwidth.

$$r_{\text{L-LTF}}^{(i_{Seg}, i_{TX})}(t) = \frac{\varepsilon}{\sqrt{N_{STS} \cdot N_{\text{L-LTF}}^{\text{Tone}} \cdot \frac{|\Omega_{20\text{MHz}}|}{N_{20\text{MHz}}}}} w_{T_{\text{L-LTF}}}(t) \quad (27\text{-}10)$$

$$\sum_{i_{BW}=0}^{N_{20\text{MHz}}-1} \sum_{k=-26}^{26} \sum_{m=1}^{N_{STS}} \eta_{\text{L-LTF}, k} \left(\left[Q_{4(k-K_{\text{Shift}}(i_{BW}))}^{(i_{Seg})} \right]_{i_{TX}, m} \left[A_{\text{HE-LTF}}^{4(k-K_{\text{Shift}}(i_{BW}))} \right]_{m, 1} L_{k, 20} \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{\text{BW}}))\Delta_{F, \text{Pre-HE}}(t - T_{GI, \text{L-LTF}} - T_{CS, \text{HE}}(m))) \right)$$

where

$T_{CS, \text{HE}}(m)$ represents the cyclic shift for space-time stream m as defined in 27.3.11.2.2

$Q_k^{(i_{Seg})}$ is defined in 27.3.10

$A_{\text{HE-LTF}}^k$ is defined in Equation (27-55)

27.3.11.5 L-SIG field

The L-SIG field is used to communicate rate and length information. The structure of the L-SIG field is defined in Figure 17-5.

In an HE PPDU, the RATE field shall be set to the value representing 6 Mb/s in the Rate (20 MHz channel spacing) column of Table 17-6. In a non-HT duplicate PPDU, the RATE field is defined in 17.3.4.2using the L_DATARATE parameter in the TXVECTOR.

For an HE TB PPDU, the LENGTH field is set to the TXVECTOR parameter L_LENGTH. For an HE SU PPDU, HE ER SU PPDU, and HE MU PPDU, the LENGTH field is set to the value given by the Equation (27-11).

$$\text{Length} = \left\lceil \frac{\text{TXTIME} - \textit{SignalExtension} - 20}{4} \right\rceil \times 3 - 3 - m \quad (27\text{-}11)$$

where

TXTIME is defined in 27.4.3 (in μs)

m is 1 for an HE MU PPDU and HE ER SU PPDU and 2 otherwise

SignalExtension is 0 μs if the TXVECTOR parameter NO_SIG_EXTN is true and is aSignalExtension as defined in Table 27-61 if the TXVECTOR parameter NO_SIG_EXTN is false

In a non-HT duplicate PPDU, the LENGTH field is defined in 17.3.4.3 using the L_LENGTH parameter in the TXVECTOR.

The Reserved (R) field shall be set to 0.

The Parity (P) field has the even parity of bits 0-16.

The SIGNAL TAIL field shall be set to 0.

The L-SIG field shall be encoded, interleaved, and mapped following the steps described in 17.3.5.6, 17.3.5.7, and 17.3.5.8. The stream of 48 complex numbers generated by these steps is denoted by

Copyright © 2025 IEEE. All rights reserved.

d_k, $k = 0, \ldots, 47$ and is mapped to subcarriers [–26, 26]. In addition, values [–1, –1, –1, 1] are mapped to the extra subcarriers [–28, –27, 27, 28] of the L-SIG field of a 20 MHz HE PPDU. Subcarriers [–28, –27, 27, 28] are also BPSK modulated. Pilots shall be inserted as described in 17.3.5.9.

If the TXVECTOR parameter BEAM_CHANGE is 1 or not present, the time domain waveform of the L-SIG field, transmitted on frequency segment i_{Seg} and transmit chain i_{TX}, shall be as given by Equation (27-12).

$$r_{\text{L-SIG}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{\text{L-SIG}}^{\text{Tone}} \cdot \frac{|\Omega_{20\text{MHz}}|}{N_{20\text{MHz}}}}} w_{T_{\text{L-SIG}}}(t) \sum_{i_{BW} \in \Omega_{20\text{MHz}}} \sum_{k=-28}^{28} \left(\begin{array}{l} \Upsilon_{(k - K_{\text{Shift}}(i_{BW})), \text{BW}} \eta_{\text{L-SIG}, k} (D_{k,20} + p_0 P_k) \\ \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{\text{BW}})) \Delta_{F, \text{Pre-HE}} (t - T_{GI, \text{Pre-HE}} - T_{CS}^{i_{TX}})) \end{array} \right) \quad (27\text{-}12)$$

where

$\eta_{\text{L-SIG}, k}$ is a PPDU-dependent scaling factor for the L-SIG field on the subcarrier k defined as follows:

$$\eta_{\text{L-SIG}, k} = \begin{cases} \sqrt{2}, & k = \pm 28, \pm 27 \text{ for an HE ER SU PPDU} \\ \left[\frac{1}{\sqrt{2}}, 1\right], & \text{for an HE TB PPDU} \\ 1, & \text{otherwise} \end{cases}$$

$T_{GI,\text{Pre-HE}}$ is given in Table 27-13

$K_{Shift}(i) = (N_{20\text{MHz}} - 1 - 2i) \times 32$

$$D_{k,20} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ -1, k = -28, -27, 27 \\ 1, k = 28 \\ d_{M_{20}^r(k)}, \text{otherwise} \end{cases}$$

$$M_{20}^r(k) = \begin{cases} k + 26, -26 \le k \le -22 \\ k + 25, -20 \le k \le -8 \\ k + 24, -6 \le k \le -1 \\ k + 23, 1 \le k \le 6 \\ k + 22, 8 \le k \le 20 \\ k + 21, 22 \le k \le 26 \end{cases}$$

P_k is defined in 17.3.5.10

p_0 is the first pilot value in the sequence defined in 17.3.5.10

$N_{\text{L-SIG}}^{\text{Tone}}$ is defined in Table 27-17

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} with a value given in 27.3.11.2.1

NOTE—$M_{20}^r(k)$ is a "reverse" function of the function $M(k)$ defined in 17.3.5.10.

If the TXVECTOR parameter BEAM_CHANGE is 0, the time domain waveform of the L-SIG field, transmitted on frequency segment i_{Seg} and transmit chain i_{TX}, shall be as given by Equation (27-13).

$$r_{\text{L-SIG}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{\text{L-SIG}}^{\text{Tone}} \cdot \frac{|\Omega_{20\text{MHz}}|}{N_{20\text{MHz}}}}} w_{T_{\text{L-SIG}}}(t) \sum_{i_{BW}=0}^{N_{20\text{MHz}}-1} \sum_{k=-28}^{28} \sum_{m=1}^{N_{STS}} \left(\begin{array}{l} \left[Q_{4(k-K_{\text{Shift}}(i_{BW}))}^{(i_{Seg})} \right]_{i_{TX}, m} \left[A_{\text{HE-LTF}}^{4(k-K_{\text{Shift}}(i_{BW}))} \right]_{m, 1} \eta_{\text{L-SIG}, k}(D_{k, 20} + p_0 P_k) \\ \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{\text{BW}}))\Delta_{F, \text{Pre-HE}}(t - T_{GI, \text{Pre-HE}} - T_{CS, \text{HE}}(m))) \end{array} \right) \quad (27\text{-}13)$$

where

$T_{CS, \text{HE}}(m)$ represents the cyclic shift for space-time stream m as defined in 27.3.11.2.2

$Q_k^{(i_{Seg})}$ is defined in 27.3.10

$A_{\text{HE-LTF}}^k$ is defined in Equation (27-55)

27.3.11.6 RL-SIG field

The RL-SIG field is a repeat of the L-SIG field and is used to differentiate an HE PPDU from a non-HT PPDU, HT PPDU, and VHT PPDU.

If the TXVECTOR parameter BEAM_CHANGE is 1 or not present, the time domain waveform of the RL-SIG field, transmitted on frequency segment i_{Seg} and transmit chain i_{TX}, shall be as given by Equation (27-14).

$$r_{\text{RL-SIG}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{\text{RL-SIG}}^{\text{Tone}} \cdot \frac{|\Omega_{20\text{MHz}}|}{N_{20\text{MHz}}}}} w_{T_{\text{RL-SIG}}}(t) \sum_{i_{BW} \in \Omega_{20\text{MHz}}} \sum_{k=-28}^{28} \left(\begin{array}{l} \Upsilon_{(k-K_{\text{Shift}}(i_{BW})), \text{BW}} \eta_{\text{L-SIG}, k}(D_{k, 20} + p_1 P_k) \\ \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{\text{BW}}))\Delta_{F, \text{Pre-HE}}(t - T_{GI, \text{Pre-HE}} - T_{CS}^{i_{TX}})) \end{array} \right) \quad (27\text{-}14)$$

If the TXVECTOR parameter BEAM_CHANGE is 0, the time domain waveform of the RL-SIG field, transmitted on frequency segment i_{Seg} and transmit chain i_{TX}, shall be as given by Equation (27-15).

$$r_{\text{RL-SIG}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{\text{RL-SIG}}^{\text{Tone}} \cdot \frac{|\Omega_{20\text{MHz}}|}{N_{20\text{MHz}}}}} w_{T_{\text{RL-SIG}}}(t) \sum_{i_{BW}=0}^{N_{20\text{MHz}}-1} \sum_{k=-28}^{28} \sum_{m=1}^{N_{STS}} \left(\begin{array}{l} \left[Q_{4(k-K_{\text{Shift}}(i_{BW}))}^{(i_{Seg})} \right]_{i_{TX}, m} \left[A_{\text{HE-LTF}}^{4(k-K_{\text{Shift}}(i_{BW}))} \right]_{m, 1} \eta_{\text{L-SIG}, k}(D_{k, 20} + p_1 P_k) \\ \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{\text{BW}}))\Delta_{F, \text{Pre-HE}}(t - T_{GI, \text{Pre-HE}} - T_{CS, \text{HE}}(m))) \end{array} \right) \quad (27\text{-}15)$$

where

p_1 is the second pilot value in the sequence defined in 17.3.5.10

other variables are defined after Equation (27-1), Equation (27-3), Equation (27-4), Equation (27-6), Equation (27-8), and Equation (27-12)

27.3.11.7 HE-SIG-A field

27.3.11.7.1 General

The HE-SIG-A field carries information necessary to interpret HE PPDUs. The integer fields of the HE-SIG-A field are transmitted in unsigned binary format, LSB first, where the LSB is in the lowest numbered bit position.

27.3.11.7.2 Content

The HE-SIG-A field for an HE SU PPDU or an HE ER SU PPDU contains the fields listed in Table 27-19.

For an HE SU PPDU and HE ER SU PPDU, the DCM, STBC, and GI+HE-LTF Size subfields in the HE-SIG-A field are interpreted as defined in Table 27-20.

The HE-SIG-A field of an HE MU PPDU contains the fields listed in Table 27-21.

It is optional for an HE STA to receive a preamble punctured HE MU PPDU with the Bandwidth field in the HE-SIG-A field in the range 4 to 7. An HE STA indicates that it is capable of receiving a preamble punctured HE MU PPDU with the Bandwidth field of the HE-SIG-A field in the range 4 to 7 using the Punctured Preamble Rx subfield in the HE PHY Capabilities Information field in the HE Capabilities element (see 9.4.2.247).

The HE-SIG-A field for an HE TB PPDU contains the fields listed in Table 27-22.

The four Spatial Reuse fields, 1, 2, 3, and 4, are arranged in increasing order of frequency and correspond to the following:

- For 20 MHz, one Spatial Reuse field corresponding to the entire 20 MHz (the other 3 Spatial Reuse fields indicate the same value). The Spatial Reuse fields apply to only the 20 MHz used for the transmission.
- For 40 MHz, two Spatial Reuse fields with the Spatial Reuse 3 field identical in value to the Spatial Reuse 1 field and the Spatial Reuse 4 field identical in value to the Spatial Reuse 2 field. Each pair of Spatial Reuse fields applies to only the corresponding 20 MHz used for the transmission.
- For 80 MHz, four Spatial Reuse fields, one for each 20 MHz subchannel.
  - For an OFDMA transmission of a given BW, each of the Spatial Reuse fields that corresponds to a 20 MHz subband is also applicable to the 242-tone RU that is most closely aligned in frequency (in the tone plan for that BW) with the aforementioned 20 MHz subband. The correspondence from an Spatial Reuse field to a 242-tone RU also holds for any RU within the 242-tone RU. The above also implies that a 20 MHz OBSS STA uses the Spatial Reuse field corresponding to its 20 MHz channel; a 40 MHz OBSS STA located on the lower frequency half of the 80 MHz BSS uses Spatial Reuse 1 field and Spatial Reuse 2 field values; and a 40 MHz OBSS STA located on the upper frequency half of the 80 MHz BSS uses Spatial Reuse 3 field and Spatial Reuse 4 field values.
- For 160 MHz and 80+80 MHz, four Spatial Reuse fields, one for each 40 MHz subchannel.
  - For an OFDMA transmission of a given BW, each of the Spatial Reuse fields that corresponds to a 40 MHz subband is also applicable to the 484-tone RU that is most closely aligned in frequency (in the tone-plan of that BW) with the aforementioned 40 MHz subband. The correspondence from an Spatial Reuse field to a 484-tone RU also holds for any RU within the 484-tone RU.

Table 27-23 defines the encoding for the Spatial Reuse field for an HE SU PPDU, HE ER SU PPDU, and HE MU PPDU.

Table 27-24 defines the encoding for the Spatial Reuse 1, Spatial Reuse 2, Spatial Reuse 3, and Spatial Reuse 4 fields for an HE TB PPDU.

NOTE—The unit for PSR in the Meaning column of Table 27-24 is $10\log10(\mathrm{mW}^2)$

27.3.11.7.3 (CRC computation

The CRC computation defined in this subclause applies to the HE-SIG-A field, the Common field of the HE-SIG-B field, and the User Block field of the HE-SIG-B field.

The CRC is calculated over bits 0 to 41 of the HE-SIG-A field and over bits 0 to L of the HE-SIG-B field ($L = x$ for each Common field where $x = N \times 8$ if the Center 26-tone RU field is present and $x = N \times 8 - 1$ otherwise; $L = 20$ for an User Block field that contains one User field; and $L = 41$ for an User Block field that contains two User fields). Bits 0 to 41 of the HE-SIG-A field correspond to bits 0–25 of the HE-SIG-A1 subfield followed by bits 0–15 of the HE-SIG-A2 subfield. Refer to Table 27-25 for N and the conditions under which the Center 26-tone RU field is present.

The value of the CRC field shall be the 1s complement of

$$crc(D) = (M(D) + I(D))D^8 mod\ G(D)$$

where

$$M(D) = \sum_{i=0}^{L} m_{L-i} D^i$$

$$I(D) = \sum_{i=L-7}^{L} D^i$$

$G(D)$ is defined in 19.3.9.4.4

$$crc(D) = c_0 D^7 + c_1 D^6 + \ldots + c_6 D + c_7$$

m_L is the serial input shown in Figure 27-24

The CRC field is transmitted from c_4 to c_7 with c_7 first.

Table 27-19—HE-SIG-A field of an HE SU PPDU and HE ER SU PPDU

Bit	Field	Number of bits	Description
HE-SIG-A1 subfield of HE-SIG-A field			
B0	Format	1	Differentiate an HE SU PPDU and HE ER SU PPDU from an HE TB PPDU: Set to 1 for an HE SU PPDU and HE ER SU PPDU.
B1	Beam Change	1	Set to 1 to indicate that the pre-HE modulated fields of the PPDU may be spatially mapped differently from the first symbol of the HE-LTF. Equation (27-6), Equation (27-9), Equation (27-12), Equation (27-14), Equation (27-16), and Equation (27-18) apply if the Beam Change field is 1. Set to 0 to indicate that the pre-HE modulated fields of the PPDU are spatially mapped the same way as the first symbol of the HE-LTF on each subcarrier. Equation (27-8), Equation (27-10), Equation (27-13), Equation (27-15), Equation (27-17), and Equation (27-19)apply if the Beam Change field is 0.
B2	UL/DL	1	Indicates whether the PPDU is sent in the UL or DL. Set to 1 if the PPDU is addressed to an AP. Set to 0 otherwise. See TXVECTOR parameter UPLINK_FLAG.
B3–B6	HE-MCS	4	For an HE SU PPDU: Set to *n* for HE-MCS *n*, where *n* = 0, 1, 2, …, 11. Values 12–15 are reserved. For an HE ER SU PPDU with Bandwidth field set to 0 (242-tone RU): Set to *n* for HE-MCS *n*, where *n* = 0, 1, 2. Values 3–15 are reserved. For an HE ER SU PPDU with Bandwidth field set to 1 (upper frequency 106-tone RU): Set to 0 for HE-MCS 0. Values 1–15 are reserved.
B7	DCM	1	Indicates whether DCM is applied to the Data field for the HE-MCS indicated. See Table 27-20 for the interpretation of this field. NOTE—DCM is applicable to only HE-MCSs 0, 1, 3, and 4. DCM is applicable to only 1 and 2 spatial streams.
B8–B13	BSS Color	6	An identifier of the BSS. See TXVECTOR parameter BSS_COLOR.
B14	Reserved	1	Reserved and set to 1.
B15–B18	Spatial Reuse	4	Indicates whether spatial reuse modes are allowed during the transmission of this PPDU: Set to a value from Table 27-23 (see 26.11.6 and 26.10).

Table 27-19—HE-SIG-A field of an HE SU PPDU and HE ER SU PPDU *(continued)*

Bit	Field	Number of bits	Description
B19–B20	Bandwidth	2	For an HE SU PPDU: Set to 0 for 20 MHz. Set to 1 for 40 MHz. Set to 2 for 80 MHz. Set to 3 for 160 MHz and 80+80 MHz. For an HE ER SU PPDU: Set to 0 for 242-tone RU. Set to 1 for upper frequency 106-tone RU within the primary 20 MHz. Values 2 and 3 are reserved.
B21–B22	GI+HE-LTF Size	2	Indicates the GI duration and HE-LTF size. See Table 27-20 for the interpretation of this field.
B23–B25	NSTS And Midamble Periodicity	3	If the Doppler field is 0, indicates the number of space-time streams. Set to the number of space-time streams minus 1. For an HE ER SU PPDU, values 2–7 are reserved. If the Doppler field is 1, then B23-B24 indicates the number of space time streams, up to 4, and B25 indicates the midamble periodicity. B23-B24 is set to the number of space time streams minus 1. For an HE ER SU PPDU, values 2 and 3 are reserved. B25 is set to 0 for 10 symbol midamble periodicity, to 1 for 20 symbol midamble periodicity. See TXVECTOR parameter MIDAMBLE_PERIODICITY.
HE-SIG-A2 subfield of HE-SIG-A field			
B0–B6	TXOP	7	Set to 127 to indicate no duration information. Set to a value less than 127 to indicate the closest minimum bound on the duration information for NAV setting and protection of the TXOP as follows: If B0 is 0, the TXOP duration indicated is B1-B6, in units of 8 μs. If B0 is 1, the TXOP duration indicated is B1-B6, in units of 128 μs, plus 512 μs. See TXVECTOR parameter TXOP_DURATION.

Table 27-19—HE-SIG-A field of an HE SU PPDU and HE ER SU PPDU *(continued)*

Bit	Field	Number of bits	Description
B7	Coding	1	Indicates whether BCC or LDPC is used: Set to 0 to indicate BCC Set to 1 to indicate LDPC
B8	LDPC Extra Symbol Segment	1	Indicates the presence of the LDPC extra symbol segment: Set to 1 if an LDPC extra symbol segment is present. Set to 0 if an LDPC extra symbol segment is not present. Reserved and set to 1 if the Coding field is 0.
B9	STBC	1	Indicates whether STBC is applied to the Data field. See Table 27-20 for the interpretation of this field.
B10	Beamformed	1	Set to 1 if a beamforming steering matrix is applied to the HE modulated fields. Set to 0 otherwise.
B11–B12	Pre-FEC Padding Factor	2	Indicates the pre-FEC padding factor: Set to 0 to indicate a pre-FEC padding factor of 4. Set to 1 to indicate a pre-FEC padding factor of 1. Set to 2 to indicate a pre-FEC padding factor of 2. Set to 3 to indicate a pre-FEC padding factor of 3.
B13	PE Disambiguity	1	Indicates PE disambiguity as defined in 27.3.13.
B14	Reserved	1	Reserved and set to 1.
B15	Doppler	1	Set to 1 if one of the following applies: — The number of OFDM symbols in the Data field is larger than the signaled midamble periodicity plus 1 and the midamble is present. — The number of OFDM symbols in the Data field is less than or equal to the signaled midamble periodicity plus 1 (see 27.3.12.16, the midamble is not present, but the channel is fast varying. It recommends that midamble may be used for the PPDUs of the reverse link. Set to 0 otherwise.
B16–B19	CRC	4	CRC for bits 0–41 of the HE-SIG-A field (see 27.3.11.7.3). Bits 0–41 of the HE-SIG-A field correspond to bits 0–25 of the HE-SIG-A1 subfield followed by bits 0–15 of the HE-SIG-A2 subfield.
B20–B25	Tail	6	Used to terminate the trellis of the convolutional decoder. Set to 0.

Table 27-20—Interpretation of DCM, STBC, and GI+HE-LTF Size subfields

Subfields in the HE-SIG-A field of an HE SU PPDU or HE ER SU PPDU (see Table 27-19)			Interpretation		
DCM	STBC	GI+HE-LTF Size	DCM Applied	STBC Applied	GI+HE-LTF size
0	0	0	No	No	1x HE-LTF and 0.8 μs GI
		1			2x HE-LTF and 0.8 μs GI
		2			2x HE-LTF and 1.6 μs GI
		3			4x HE-LTF and 3.2 μs GI
1	0	0	Yes	No	1x HE-LTF and 0.8 μs GI
		1			2x HE-LTF and 0.8 μs GI
		2			2x HE-LTF and 1.6 μs GI
		3			4x HE-LTF and 3.2 μs GI
0	1	0	No	Yes	1x HE-LTF and 0.8 μs GI
		1			2x HE-LTF and 0.8 μs GI
		2			2x HE-LTF and 1.6 μs GI
		3			4x HE-LTF and 3.2 μs GI
1	1	0–2	Reserved		
		3	No	No	4x HE-LTF and 0.8 μs GI

Table 27-21—HE-SIG-A field of an HE MU PPDU

Bit	Field	Number of bits	Description
HE-SIG-A1 subfield of HE-SIG-A field			
B0	UL/DL	1	Indicates whether the PPDU is sent UL or DL: Set to 1 if the PPDU is addressed to an AP. Set to 0 otherwise. See TXVECTOR parameter UPLINK_FLAG. NOTE—The TDLS peer can identify the TDLS frame by To DS and From DS subfields in the MAC header of the frame.
B1–B3	HE-SIG-B-MCS	3	Indicates the HE-MCS of the HE-SIG-B field: Set to 0 for HE-SIG-B-MCS 0. Set to 1 for HE-SIG-B-MCS 1. Set to 2 for HE-SIG-B-MCS 2. Set to 3 for HE-SIG-B-MCS 3. Set to 4 for HE-SIG-B-MCS 4. Set to 5 for HE-SIG-B-MCS 5. Values 6 and 7 are reserved.

Table 27-21—HE-SIG-A field of an HE MU PPDU *(continued)*

Bit	Field	Number of bits	Description
B4	HE-SIG-B DCM	1	Set to 1 indicates that the HE-SIG-B field is modulated with DCM for the HE-MCS. Set to 0 indicates that the HE-SIG-B field is not modulated with DCM for the HE-MCS. NOTE—DCM is applicable to only HE-SIG-B-MCS 0, 1, 3, and 4.
B5–B10	BSS Color	6	An identifier of the BSS. See TXVECTOR parameter BSS_COLOR.
B11–B14	Spatial Reuse	4	Indicates whether spatial reuse modes are allowed during the transmission of this PPDU: Set to a value from Table 27-23 (see 26.11.6 and 26.10). See TXVECTOR parameter SPATIAL_REUSE.
B15–B17	Bandwidth	3	Set to 0 for 20 MHz. Set to 1 for 40 MHz. Set to 2 for 80 MHz non-preamble puncturing mode. Set to 3 for 160 MHz and 80+80 MHz non-preamble puncturing mode. If the HE-SIG-B Compression field is 0: Set to 4 for preamble puncturing in 80 MHz, where in the preamble the only punctured subchannel is the secondary 20 MHz channel. Set to 5 for preamble puncturing in 80 MHz, where in the preamble the only punctured subchannel is one of the two 20 MHz subchannels in secondary 40 MHz channel. Set to 6 for preamble puncturing in 160 MHz or 80+80 MHz, where in the preamble the only punctured subchannels are the secondary 20 MHz channel and zero to two of the 20 MHz subchannels in the secondary 80 MHz channel. If two of the 20 MHz subchannels in the secondary 80 MHz channel are punctured, these are either the lower two or the higher two. No more than two adjacent 20 MHz subchannels are punctured across 160 MHz. Set to 7 for preamble puncturing in 160 MHz or 80+80 MHz, where in the preamble the only punctured subchannels are zero, one or both of the 20 MHz subchannels in the secondary 40 MHz channel and zero to two of the 20 MHz subchannels in the secondary 80 MHz channel; at least one 20 MHz subchannel is punctured. If two of the 20 MHz subchannels in the secondary 80 MHz channel are punctured, these are either the lower two or the higher two. No more than two adjacent 20 MHz subchannels are punctured across 160 MHz. If the HE-SIG-B Compression field is 1, then values 4–7 are reserved.

Table 27-21—HE-SIG-A field of an HE MU PPDU *(continued)*

Bit	Field	Number of bits	Description
B18–B21	Number Of HE-SIG-B Symbols Or MU-MIMO Users	4	If the HE-SIG-B Compression field is 0, indicates the number of OFDM symbols in the HE-SIG-B field: Set to the number of OFDM symbols in the HE-SIG-B field minus 1 if the number of OFDM symbols in the HE-SIG-B field is less than 16. Set to 15 to indicate that the number of OFDM symbols in the HE-SIG-B field is equal to 16 if Longer Than 16 HE-SIG-B OFDM Symbols Support subfield in the HE Capabilities element transmitted by at least one recipient STA is 0. Set to 15 to indicate that the number of OFDM symbols in the HE-SIG-B field is greater than or equal to 16 if the Longer Than 16 HE-SIG-B OFDM Symbols Support subfield in the HE Capabilities element transmitted by all the recipient STAs are 1 and if the HE-SIG-B-MCS field is set to 0, 1, 2, or 3 regardless of the value of the HE-SIG-B DCM field, or the HE-SIG-B-MCS field is set to 4 and the HE-SIG-B DCM field is set to 1. The exact number of OFDM symbols in the HE-SIG-B field is calculated based on the number of User fields in the HE-SIG-B content channel, which is indicated by the Common field of the HE-SIG-B field in this case. If the HE-SIG-B Compression field is 1, indicates the number of users and is set to the number of users minus 1. If the number of users is greater than 1, then MU-MIMO is used in the HE modulated fields.
B22	HE-SIG-B Compression	1	Set to 0 if the Common field in the HE-SIG-B field is present. Set to 1 if the Common field in the HE-SIG-B field is not present.
B23–B24	GI+HE-LTF Size	2	Indicates the GI duration and HE-LTF size: Set to 0 to indicate a 4x HE-LTF and 0.8 μs GI. Set to 1 to indicate a 2x HE-LTF and 0.8 μs GI. Set to 2 to indicate a 2x HE-LTF and 1.6 μs GI. Set to 3 to indicate a 4x HE-LTF and 3.2 μs GI.
B25	Doppler	1	Set to 1 if one of the following applies: — The number of OFDM symbols in the Data field is larger than the signaled midamble periodicity plus 1 and the midamble is present. — The number of OFDM symbols in the Data field is less than or equal to the signaled midamble periodicity plus 1 (see 27.3.12.16, the midamble is not present, but the channel is fast varying. It recommends that midamble may be used for the PPDUs of the reverse link. Set to 0 otherwise.
HE-SIG-A2 subfield of HE-SIG-A field			
B0–B6	TXOP	7	Set to 127 to indicate no duration information. Set to a value less than 127 to indicate the closest minimum bound on the duration information for NAV setting and protection of the TXOP as follows: If B0 is 0, the TXOP duration indicated is B1-B6, in units of 8 μs. If B0 is 1, the TXOP duration indicated is B1-B6, in units of 128 μs, plus 512 μs. See TXVECTOR parameter TXOP_DURATION.

Table 27-21—HE-SIG-A field of an HE MU PPDU *(continued)*

Bit	Field	Number of bits	Description
B7	Reserved	1	Reserved and set to 1.
B8–B10	Number of HE-LTF Symbols And Midamble Periodicity	3	If the Doppler field is 0, indicates the number of HE-LTF symbols: Set to 0 for 1 HE-LTF symbol. Set to 1 for 2 HE-LTF symbols. Set to 2 for 4 HE-LTF symbols. Set to 3 for 6 HE-LTF symbols. Set to 4 for 8 HE-LTF symbols. Other values are reserved. If the Doppler field is 1, B8–B9 indicates the number of HE-LTF symbols and B10 indicates midamble periodicity. B8–B9 is encoded as follows: 0 indicates 1 HE-LTF symbol. 1 indicates 2 HE-LTF symbols. 2 indicates 4 HE-LTF symbols. 3 is reserved. B10 is set to 0 to indicate 10 symbols midamble periodicity and set to 1 to indicate 20 symbols midamble periodicity.
B11	LDPC Extra Symbol Segment	1	Indication of the presence of an LDPC extra symbol segment: Set to 1 if an LDPC extra symbol segment is present. Set to 0 otherwise.
B12	STBC	1	In an HE MU PPDU where each RU includes no more than 1 user: Set to 1 to indicate all RUs are STBC encoded in the payload. Set to 0 to indicate all RUs are not STBC encoded in the payload. STBC does not apply to the HE-SIG-B field.
B13–B14	Pre-FEC Padding Factor	2	Indicates the pre-FEC padding factor: Set to 0 to indicate a pre-FEC padding factor of 4. Set to 1 to indicate a pre-FEC padding factor of 1. Set to 2 to indicate a pre-FEC padding factor of 2. Set to 3 to indicate a pre-FEC padding factor of 3.
B15	PE Disambiguity	1	Indicates PE disambiguity as defined in 27.3.13.
B16–B19	CRC	4	CRC for bits 0-41 of the HE-SIG-A field (see 27.3.11.7.3). Bits 0-41 of the HE-SIG-A field correspond to bits 0-25 of the HE-SIG-A1 subfield followed by bits 0–15 of the HE-SIG-A2 subfield.
B20–B25	Tail	6	Used to terminate the trellis of the convolutional decoder. Set to 0.

Table 27-22—HE-SIG-A field of an HE TB PPDU

Bit	Field	Number of bits	Description
HE-SIG-A1 of the HE-SIG-A field			
B0	Format	1	Differentiate an HE SU PPDU and HE ER SU PPDU from an HE TB PPDU: Set to 0 for an HE TB PPDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 27-22—HE-SIG-A field of an HE TB PPDU *(continued)*

Bit	Field	Number of bits	Description
B1–B6	BSS Color	6	An identifier of the BSS. Set TXVECTOR parameter BSS_COLOR.
B7–B10	Spatial Reuse 1	4	Indicates whether specific spatial reuse modes are allowed in a subband of the PPDU during the transmission of this PPDU, and if PSR spatial reuse is allowed, indicates a value that is used to determine a limit on the transmit power of the PSRT PPDU. If the Bandwidth field indicates 20 MHz, 40 MHz, or 80 MHz, then this Spatial Reuse field applies to the first 20 MHz subband. If the Bandwidth field indicates 160/80+80 MHz, then this Spatial Reuse field applies to the first 40 MHz subband of the 160 MHz operating band. Set to a value from Table 27-24 for an HE TB PPDU (see 26.11.6 and 26.10). See the first value in the TXVECTOR parameter SPATIAL_REUSE.
B11–B14	Spatial Reuse 2	4	Indicates whether specific spatial reuse modes are allowed in a subband of the PPDU during the transmission of this PPDU, and if PSR spatial reuse is allowed, indicates a value that is used to determine a limit on the transmit power of the PSRT PPDU. If the Bandwidth field indicates 40 MHz or 80 MHz: This Spatial Reuse field applies to the second 20 MHz subband. If the STA operating channel width is 20 MHz, then this field is set to the same value as the Spatial Reuse 1 field. If the STA operating channel width is 40 MHz in the 2.4 GHz band, this field is set to the same value as the Spatial Reuse 1 field. If the Bandwidth field indicates 160/80+80 MHz, then this Spatial Reuse field applies to the second 40 MHz subband of the 160 MHz operating band. Set to a value from Table 27-24 for an HE TB PPDU (see 26.11.6 and 26.10). See the second value in the TXVECTOR parameter SPATIAL_REUSE, if present.

Table 27-22—HE-SIG-A field of an HE TB PPDU *(continued)*

Bit	Field	Number of bits	Description
B15–B18	Spatial Reuse 3	4	Indicates whether specific spatial reuse modes are allowed in a subband of the PPDU during the transmission of this PPDU, and if PSR spatial reuse is allowed, indicates a value that is used to determine a limit on the transmit power of the PSRT PPDU. If the Bandwidth field indicates 80 MHz: This Spatial Reuse field applies to the third 20 MHz subband. If the STA operating channel width is 20 MHz or 40 MHz, this field is set to the same value as the Spatial Reuse 1 field. If the Bandwidth field indicates 160/80+80 MHz: This Spatial Reuse field applies to the third 40 MHz subband of the 160 MHz operating band. If the STA operating channel width is 80+80 MHz, this field is set to the same value as the Spatial Reuse 1 field. Set to a value from Table 27-24 for an HE TB PPDU (see 26.11.6 and 26.10). See the third value in the TXVECTOR parameter SPATIAL_REUSE, if present.
B19–B22	Spatial Reuse 4	4	Indicates whether specific spatial reuse modes are allowed in a subband of the PPDU during the transmission of this PPDU, and if PSR spatial reuse is allowed, indicates a value that is used to determine a limit on the transmit power of the PSRT PPDU. If the Bandwidth field indicates 80 MHz: This Spatial Reuse field applies to the fourth 20 MHz subband. If the STA operating channel width is 20 MHz, then this field is set to the same value as the Spatial Reuse 1 field. If the STA operating channel width is 40 MHz, then this field is set to the same value as the Spatial Reuse 2 field. If the Bandwidth field indicates 160/80+80 MHz: This Spatial Reuse field applies to the fourth 40 MHz subband of the 160 MHz operating band. If the STA operating channel width is 80+80 MHz, then this field is set to same value as the Spatial Reuse 2 field. Set to a value from Table 27-24 for an HE TB PPDU (see 26.11.6 and 26.10). See the fourth value in the TXVECTOR parameter SPATIAL_REUSE, if present.
B23	Reserved	1	Reserved and set to 1. NOTE—Unlike other Reserved fields in the HE-SIG-A field of the HE TB PPDU, B23 does not have a corresponding bit in the Trigger frame.
B24–B25	Bandwidth	2	Set to 0 for 20 MHz. Set to 1 for 40 MHz. Set to 2 for 80 MHz. Set to 3 for 160 MHz and 80+80 MHz.

Copyright © 2025 IEEE. All rights reserved.

Table 27-22—HE-SIG-A field of an HE TB PPDU *(continued)*

Bit	Field	Number of bits	Description
HE-SIG-A2 of the HE-SIG-A field			
B0–B6	TXOP	7	Set to 127 to indicate no duration information. Set to a value less than 127 to indicate the closest minimum bound on the duration information for NAV setting and protection of the TXOP as follows: If B0 is 0, the TXOP duration indicated is B1-B6, in units of 8 μs. If B0 is 1, the TXOP duration indicated is B1-B6, in units of 128 μs, plus 512 μs. See TXVECTOR parameter TXOP_DURATION.
B7–B15	Reserved	9	Reserved and set to value indicated in the UL HE-SIG-A2 Reserved subfield in the Trigger frame.
B16–B19	CRC	4	CRC of bits 0–41 of the HE-SIG-A field. See 27.3.11.7.3. Bits 0–41 of the HE-SIG-A field correspond to bits 0–25 of the HE-SIG-A1 subfield followed by bits 0–15 of the HE-SIG-A2 subfield.
B20–B25	Tail	6	Used to terminate the trellis of the convolutional decoder. Set to 0.

Table 27-23—Spatial Reuse field encoding for an HE SU PPDU, HE ER SU PPDU, and HE MU PPDU

Value	Meaning

Figure 27-24 shows the operation of the CRC. First, the shift register is reset to all 1s. The bits are then passed through the XOR operation at the input. When the last bit has entered, the output is generated by shifting the bits out of the shift register, c_7 first, through an inverter.

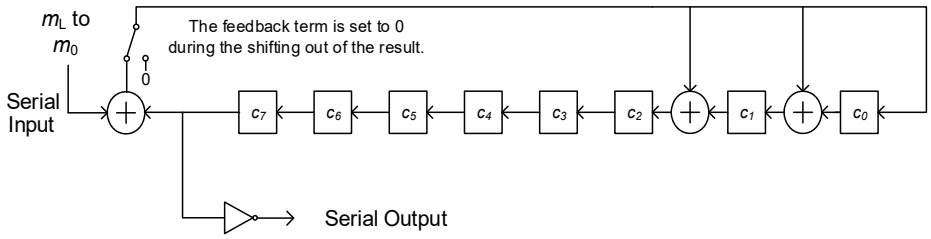

Figure 27-24—CRC calculation

As an example, if bits $\{m_0 \ldots m_{41}\}$ are given by {1 1 0 1 1 1 0 0 0 0 0 0 0 1 0 0 0 0 0 0 1 1 0 0 0 0 0 0 0 0 0 0 0 1 0 0 1 1 0 1 0}, the output bits $\{B_7 \ldots B_4\}$, where B_7 is output first, are {0 1 1 1}.

27.3.11.7.4 Encoding and modulation

For an HE SU PPDU, HE MU PPDU, and HE TB PPDU, the HE-SIG-A field is composed of two subfields, HE-SIG-A1 and HE-SIG-A2, each containing 26 data bits. These two subfields are sent as two OFDM symbols: HE-SIG-A-sym-1 and HE-SIG-A-sym-2. The HE-SIG-A-sym-1 OFDM symbol is transmitted before the HE-SIG-A-sym-2 OFDM symbol. The data bits of the HE-SIG-A OFTDM symbols shall be BCC

encoded at rate $R = 1/2$, be interleaved, be mapped to a BPSK constellation, and have pilots inserted following the steps described in 17.3.5.6, 27.3.12.8, 17.3.5.8, and 17.3.5.9, respectively. The constellation mappings of the HE-SIG-A field in an HE SU PPDU, HE MU PPDU, and HE TB PPDU are shown in Figure 27-25. The first half and second half of the stream of 104 complex numbers generated by these steps (before pilot insertion) are divided into two groups of 52 complex numbers, where the first 52 complex numbers form the first OFDM symbol of the HE-SIG-A field, HE-SIG-A-sym-1, and the second 52 complex numbers form the second OFDM symbol of the HE-SIG-A field, HE-SIG-A-sym-2, respectively.

If the TXVECTOR parameter BEAM_CHANGE is 1 or not present, the time domain waveform for the HE-SIG-A field of an HE SU PPDU, HE MU PPDU, and HE TB PPDU, transmitted on frequency segment i_{Seg} and transmit chain i_{TX}, shall be as specified in Equation (27-16).

$$r_{\text{HE-SIG-A}}^{(i_{Seg} i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{\text{HE-SIG-A}}^{\text{Tone}} \cdot \frac{|\Omega_{20\text{MHz}}|}{N_{20\text{MHz}}}}} \sum_{n=0}^{1} w_{T_{SYML}}(t - nT_{SYML}) \sum_{i_{BW} \in \Omega_{20\text{MHz}}} \sum_{k=-28}^{28} \eta_{\text{HE-SIG-A},k} \left(\begin{array}{l} \Upsilon_{(k - K_{\text{Shift}}(i_{BW})),\,\text{BW}}(D_{k,n,20} + p_{n+2} P_k) \\ \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{\text{BW}}))\Delta_{F,\,\text{Pre-HE}}(t - nT_{SYML} - T_{GI,\,\text{Pre-HE}} - T_{CS}^{i_{TX}})) \end{array} \right) \quad (27\text{-}16)$$

where

T_{SYML} is given in Table 27-13

$K_{\text{Shift}}(i) = (N_{20\text{MHz}} - 1 - 2i) \times 32$

$$D_{k,n,20} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M_{20}^r(k),n}, \text{otherwise} \end{cases}$$

$$M_{20}^r(k) = \begin{cases} k + 28, -28 \le k \le -22 \\ k + 27, -20 \le k \le -8 \\ k + 26, -6 \le k \le -1 \\ k + 25, 1 \le k \le 6 \\ k + 24, 8 \le k \le 20 \\ k + 23, 22 \le k \le 28 \end{cases}$$

$$\eta_{\text{HE-SIG-A},k} = \begin{cases} \left[\frac{1}{\sqrt{2}}, 1\right], \text{ for an HE TB PPDU} \\ 1, \text{ otherwise} \end{cases}$$

P_k and p_n are defined in 17.3.5.10

$N_{\text{HE-SIG-A}}^{\text{Tone}}$ is defined in Table 27-17

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} with a value given in 27.3.11.2.1

If the TXVECTOR parameter BEAM_CHANGE is 0, the time domain waveform of the HE-SIG-A field shall be as given by Equation (27-17).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$r_{\text{HE-SIG-A}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{\text{HE-SIG-A}}^{\text{Tone}} \cdot \frac{|\Omega_{20\text{MHz}}|}{N_{20\text{MHz}}}}} \sum_{n=0}^{1} w_{T_{SYML}}(t - nT_{SYML}) \quad (27\text{-}17)$$

$$\sum_{i_{BW}=0}^{N_{20\text{MHz}}-1} \sum_{k=-28}^{28} \sum_{m=1}^{N_{STS}} \left(\left[Q_{4(k-K_{\text{Shift}}(i_{BW}))}^{(i_{Seg})} \right]_{i_{TX}, m} \left[A_{\text{HE-LTF}}^{4(k-K_{\text{Shift}}(i_{BW}))} \right]_{m, 1} (D_{k, n, 20} + p_{n+2} P_k) \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{\text{BW}}))\Delta_{F, \text{Pre-HE}}(t - nT_{SYML} - T_{\text{GI, Pre-HE}} - T_{CS, HE}(m))) \right)$$

where

$T_{CS, \text{HE}}(m)$ represents the cyclic shift for space-time stream m as defined in 27.3.11.2.2

$Q_k^{(i_{Seg})}$ is defined in 27.3.10

$A_{\text{HE-LTF}}^k$ is defined in Equation (27-55)

For an HE ER SU PPDU, the HE-SIG-A field is composed of two subfields, HE-SIG-A1 and HE-SIG-A2, each containing 26 data bits. These two subfields are sent as four OFDM symbols: HE-SIG-A-sym-1, HE-SIG-A-sym-1-R, HE-SIG-A-sym-2, and HE-SIG-A-sym-2-R. These four OFDM symbols are transmitted sequentially from HE-SIG-A-sym-1 to HE-SIG-A-sym-2-R. The data bits of the HE-SIG-A1 and HE-SIG-A2 subfields shall be BCC encoded at rate R = 1/2, be interleaved, be mapped to a BPSK constellation, and have pilots inserted. The HE-SIG-A-sym-1-R OFDM symbol is calculated from the same encoded bits as the HE-SIG-A-sym-1 subfield, and the encoded bits shall be mapped to a QBPSK constellation without interleaving and have pilots inserted. The constellation mappings of the HE-SIG-A field in an HE ER SU PPDU are shown in Figure 27-25. The QBPSK constellation on the HE-SIG-A-sym-1-R OFDM symbol is used to differentiate between an HE ER SU PPDU and an HE MU PPDU when m = 1 in Equation (27-11). The HE-SIG-A-sym-2-R OFDM symbol is calculated using the same encoded bits as the HE-SIG-A-sym-2 OFDM symbol, and the encoded bits shall be mapped to a BPSK constellation without interleaving and have pilots inserted. BCC encoding, data interleaving, constellation mapping, and pilot insertion follow the steps described in 17.3.5.6, 27.3.12.8, 17.3.5.8, and 17.3.5.9, respectively.

If the TXVECTOR parameter BEAM_CHANGE is 1 or not present, the time domain waveform for the HE-SIG-A field in an HE ER SU PPDU shall be as specified in Equation (27-18).

$$r_{\text{HE-SIG-A}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{\text{HE-SIG-A}}^{\text{Tone}} \cdot \frac{|\Omega_{20\text{MHz}}|}{N_{20\text{MHz}}}}} \sum_{n=0}^{3} w_{T_{\text{SYML}}}(t - nT_{SYML}) \sum_{k=-28}^{28} (R_n D_{k,n,20} + p_{n+2} P_k) \cdot \exp(j2\pi k \cdot \Delta_{F,\text{Pre-HE}}(t - nT_{SYML} - T_{GI,\text{Pre-HE}} - T_{CS}^{i_{TX}})) \quad (27\text{-}18)$$

where

R_n is a phase rotation vector defined as [1, j, 1, 1]

If the TXVECTOR parameter BEAM_CHANGE is 0, the time domain waveform for the HE-SIG-A field in an HE ER SU PPDU shall be as specified in Equation (27-19).

$$r_{\text{HE-SIG-A}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{\text{HE-SIG-A}}^{\text{Tone}} \cdot \frac{|\Omega_{20\text{MHz}}|}{N_{20\text{MHz}}}}} \sum_{n=0}^{3} w_{T_{SYML}}(t - nT_{SYML}) \sum_{k=-28}^{28} \sum_{m=1}^{N_{STS}} \left(\left[Q_{4k}^{(i_{Seg})} \right]_{i_{TX}, m} \left[A_{\text{HE-LTF}}^{4k} \right]_{m,1} (R_n D_{k,n,20} + p_{n+2} P_k) \cdot \exp(j2\pi k \cdot \Delta_{F,\text{Pre-HE}}(t - nT_{SYML} - T_{\text{GI,Pre-HE}} - T_{CS,HE}(m))) \right) \quad (27\text{-}19)$$

27.3.11.8 HE-SIG-B field

27.3.11.8.1 General

The HE-SIG-B field provides the necessary signaling, including the OFDMA and DL MU-MIMO resource allocation information, to allow the STAs to look up the corresponding resources to be used in the HE modulated fields of the PPDU. The integer fields of the HE-SIG-B field are transmitted in unsigned binary format, LSB first, where the LSB is in the lowest numbered bit position.

Dynamic split is defined as the split of User fields across HE-SIG-B content channels according to the Common field in each HE-SIG-B content channel and used when the HE-SIG-B Compression field in the HE-SIG-A field is set to 0.

Equitable split is defined as the split of User fields across HE-SIG-B content channels used when the HE-SIG-B Compression field in the HE-SIG-A field is set to 1.

27.3.11.8.2 HE-SIG-B content channels

The HE-SIG-B field of a 20 MHz HE MU PPDU contains one HE-SIG-B content channel. The HE-SIG-B field of an HE MU PPDU that is 40 MHz or wider contains two HE-SIG-B content channels.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The HE-SIG-B content channel format is shown in Figure 27-26. The HE-SIG-B content channel consists of a Common field, if present, followed by a User Specific field.

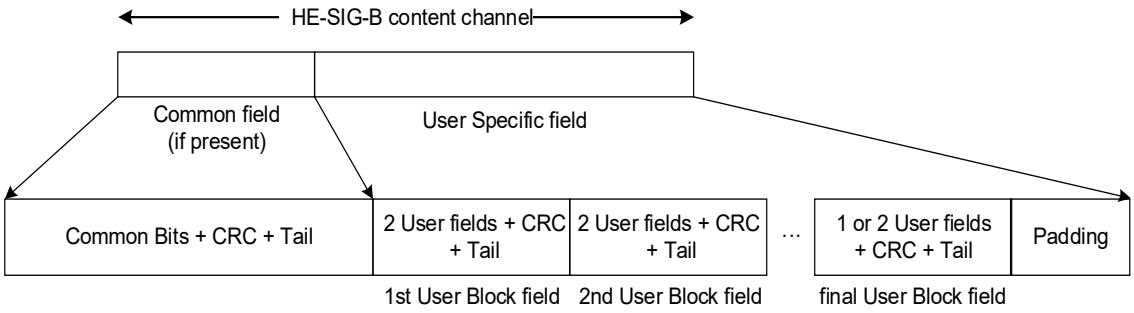

Figure 27-26—HE-SIG-B content channel format

If the HE-SIG-B Compression field in the HE-SIG-A field of an HE MU PPDU is 1 (indicating full-bandwidth MU-MIMO transmission), then the Common field is not present, and the HE-SIG-B content channel consists of only the User Specific field. If the HE-SIG-B Compression field in the HE-SIG-A field of an HE MU PPDU is 0, the Common field is present in the HE-SIG-B content channel.

The Common field of an HE-SIG-B content channel contains information regarding the resource unit allocation such as the RU assignment to be used in the HE modulated fields of the PPDU, the RUs allocated for MU-MIMO, and the number of users in MU-MIMO allocations. The Common field is defined in 27.3.11.8.3.

The union of the User Specific fields in the HE-SIG-B content channels contains information for all users in the PPDU on how to decode their payload. As shown in Figure 27-26, the User Specific field is organized into User Block fields that in turn contain User fields. See 27.3.11.8.4 for a description of the contents of the User Specific field.

See Annex Z for HE-SIG-B content examples.

27.3.11.8.3 Common field

This subclause is not applicable if the HE-SIG-B Compression field in the HE-SIG-A field of an HE MU PPDU is 1.

The Common field format is defined in Table 27-25.

A 996-tone RU is referred to by two consecutive RU Allocation subfields per HE-SIG-B content channel, for both HE-SIG-B content channels. The two consecutive RU Allocation subfields per HE-SIG-B content channel are labeled the first RU Allocation subfield and the second RU Allocation subfield. A 484-tone RU is referred to by a single RU Allocation subfield per HE-SIG-B content channel, for both HE-SIG-B content channels. Smaller RUs are referred to by a single RU Allocation subfield in a single HE-SIG-B content channel. If a Common field is present in a 160 MHz or 80+80 MHz PPDU, a 2×996 tone RU is not permitted and cannot be indicated by the RU allocation subfield.

Table 27-25—Common field

Subfield	Number of subfields	Number of bits per subfield	Description
RU Allocation	N	8	*N* RU Allocation subfields are present in an HE-SIG-B content channel, where *N* = 1 if the Bandwidth field in the HE-SIG-A field is 0 or 1 (indicating a 20 MHz or 40 MHz HE MU PPDU) *N* = 2 if the Bandwidth field in the HE-SIG-A field is 2, 4, or 5 (indicating an 80 MHz HE MU PPDU) *N* = 4 if the Bandwidth field in the HE-SIG-A field is 3, 6, or 7 (indicates a 160 MHz or 80+80 MHz HE MU PPDU) Each RU Allocation subfield in an HE-SIG-B content channel corresponding to a 20 MHz frequency subchannel indicates the RU assignment, including the size of the RU(s) and their placement in the frequency domain, to be used in the HE modulated fields of the HE MU PPDU in the frequency domain and indicates information needed to compute the number of users allocated to each RU, where the subcarrier indices of the RU(s) meet the conditions in Table 27-26.
Center 26-tone RU	0 or 1	1	The Center 26-tone RU field is present if the Bandwidth field in the HE-SIG-A field indicates a bandwidth greater than 40 MHz and not present otherwise. If the Bandwidth field in the HE-SIG-A field is 2, 4, or 5 (indicating 80 MHz): Set to 1 to indicate that a user is allocated to the center 26-tone RU (see Figure 27-7) and that its User field is present in HE-SIG-B content channel 1; otherwise, set to 0. The same value is applied to both HE-SIG-B content channels. If the Bandwidth field in the HE-SIG-A field is 3, 6, or 7 (indicating 160 MHz or 80+80 MHz): For HE-SIG-B content channel 1, set to 1 to indicate that a user is allocated to the center 26-tone RU of the lower frequency 80 MHz; otherwise, set to 0. For HE-SIG-B content channel 2, set to 1 to indicate that a user is allocated to the center 26-tone RU of the higher frequency 80 MHz; otherwise, set to 0.
CRC	1	4	The CRC is calculated over bits 0 to $N \times 8$ if the Bandwidth field in the HE-SIG-A field indicates a bandwidth greater than 40 MHz, and bits 0 to $N \times 8 - 1$ otherwise. See 27.3.11.7.3.
Tail	1	6	Used to terminate the trellis of the convolutional decoder. Set to 0.

For an RU that is referred to by a first or only RU Allocation subfield in an HE-SIG-B content channel, the RU Allocation subfield encodes the number of User fields per RU contributed to the User Specific field in the same HE-SIG-B content channel as the RU Allocation subfield. This number is labeled $N_{user}(r, c)$ for RU r and HE-SIG-B content channel c as described in Table 27-27.

For an RU that is referred to by two RU Allocation subfields in an HE-SIG-B content channel (i.e., a 996-tone RU in a 160 MHz or 80+80 MHz PPDU), the second RU Allocation subfield in the HE-SIG-B content channel encodes zero additional User fields per RU contributed to the User Specific field in the same HE-SIG-B content channel as the RU Allocation subfield.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In an HE MU PPDU, an RU that is not allocated to a user can be indicated as follows:

— The Center 26-tone RU subfield in the Common field of the HE-SIG-B field is set to 0 (see Table 27-25).
— The RU Allocation subfield in the Common field of the HE-SIG-B field is set to a value between 16 and 31 or between 96 and 113 (see Table 27-27).
— Both RU Allocation subfields at the same position in each Common field of the two HE-SIG-B content channels are set to 114 (see Table 27-27).
— The STA-ID subfield in the User field of the HE-SIG-B field is set to 2046 (see 26.11.1 and 27.3.11.8.4).

The subcarriers in the HE modulated fields of a PPDU that correspond to an unallocated RU shall not be modulated.

If an RU is an unallocated RU, zero users are allocated to it. Otherwise, the number of users allocated to RU r is determined from the RU size and $N_{user}(r, c)$ as follows:

— If RU r is a 26-tone or 52-tone RU, then one user is allocated to the RU.
— If RU r is a 106-tone or 242-tone RU, then the number of users allocated to the RU is $N_{user}(r, c)$.
— If RU r is a 484-tone or larger RU, then the number of users allocated to the RU equals the number of User fields for the RU summed across both HE-SIG-B content channels, i.e., $N_{user}(r, 1) + N_{user}(r, 2)$.

NOTE 1—The exact dynamic split of User fields between the two content channels, $N_{user}(r, 1)$ and $N_{user}(r, 2)$, is not specified and might be used to reduce any disparity in the number of User fields between content channels.

NOTE 2—If the number of users per RU is greater than one, then the users in the RU are multiplexed using MU-MIMO.

For a 996-tone RU, for each HE-SIG-B content channel, the first 8-bit RU Allocation subfield referring to the RU may use values in the range 208–215 ($11010y_2y_1y_0$ in binary representation) as in Table 27-27 with $y_2y_1y_0$ indicating the number of User fields signaled in the corresponding content channel, while the second 8-bit RU Allocation subfield referring to the RU shall be set to 115 (01110011 in binary representation).

NOTE 3—Although there are two RU Allocation subfields per HE-SIG-B content channel for the users of a 996-tone RU, each user is described by only one User field, which is located in one HE-SIG-B content channel.

As defined in Table 27-25 and Table 27-26, the Center 26-tone RU field carries the same value in both HE-SIG-B content channels. The User field that corresponds to the center 26-tone RU is carried in HE-SIG-B content channel 1.

Table 27-26—RUs associated with each RU Allocation subfield for each HE-SIG-B content channel and PPDU bandwidth

PPDU bandwidth	RU Allocation subfield and Center 26-tone RU subfield (if present)	RUs in the subcarrier range, or overlapping with the subcarrier range if the RU is larger than a 242-tone RU
20 MHz	The RU Allocation subfield in a single HE-SIG-B content channel	[–122:122]
40 MHz	The RU Allocation subfield in HE-SIG-B content channel 1	[–244:–3]
	The RU Allocation subfield in HE-SIG-B content channel 2	[3:244]

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 27-26—RUs associated with each RU Allocation subfield for each HE-SIG-B content channel and PPDU bandwidth

PPDU bandwidth	RU Allocation subfield and Center 26-tone RU subfield (if present)	RUs in the subcarrier range, or overlapping with the subcarrier range if the RU is larger than a 242-tone RU
80 MHz	The first RU Allocation subfield in HE-SIG-B content channel 1	[–500:–259]
	The first RU Allocation subfield in HE-SIG-B content channel 2	[–258:–17]
	Center 26-tone RU subfield in HE-SIG-B content channel 1 and 2	[–16:–4, 4:16]
	The second RU Allocation subfield in HE-SIG-B content channel 1	[17:258]
	The second RU Allocation subfield in HE-SIG-B content channel 2	[259:500]
160 MHz or 80+80 MHz	The first RU Allocation subfield in HE-SIG-B content channel 1	[–1012:–771]
	The first RU Allocation subfield in HE-SIG-B content channel 2	[–770:–529]
	Center 26-tone RU subfield for lower frequency 80 MHz in HE-SIG-B content channel 1	[–528:–516, –508:–496]
	The second RU Allocation subfield in HE-SIG-B content channel 1	[–495:–254]
	The second RU Allocation subfield in HE-SIG-B content channel 2	[–253:–12]
	The third RU Allocation subfield in HE-SIG-B content channel 1	[12:253]
	The third RU Allocation subfield in HE-SIG-B content channel 2	[254:495]
	Center 26-tone RU subfield for higher frequency 80 MHz in HE-SIG-B content channel 2	[496:508, 516:528]
	The fourth RU Allocation subfield in HE-SIG-B content channel 1	[529:770]
	The fourth RU Allocation subfield in HE-SIG-B content channel 2	[771:1012]

The mapping from the 8-bit RU Allocation subfield to the RU assignment and the number of User fields per RU contributed to the User Specific field in the same HE-SIG-B content channel as the RU Allocation subfield are defined in Table 27-27.

If a single RU in a 40 MHz PPDU overlaps the subcarrier ranges [–244:–3] and [3:244], the corresponding RU Allocation subfields in the respective content channels shall both refer to the same RU.

If a single RU in an 80 MHz PPDU overlaps more than one of the subcarrier ranges [–500:–259], [–258:–17], [17:258] or [259:500], the corresponding RU Allocation subfields in the respective content channels shall all refer to the same RU.

Table 27-27—RU Allocation subfield

RU Allocation subfield (B7 B6 B5 B4 B3 B2 B1 B0)	#1	#2	#3	#4	#5	#6	#7	#8	#9	Number of entries
If signaling RUs of size greater than 242 subcarriers, $y_2y_1y_0$ = 000–111 indicates the number of User fields in the HE-SIG-B content channel that contains the corresponding 8-bit RU Allocation subfield. Otherwise, $y_2y_1y_0$ = 000–111 indicates the number of users multiplexed in the 106-tone RU, 242-tone RU or the lower frequency 106-tone RU if there are two 106-tone RUs and one 26-tone RU is assigned between two 106-tone RUs. The binary vector $y_2y_1y_0$ indicates $N_{user}(r, c) = 2^2 \times y_2 + 2^1 \times y_1 + y_0 + 1$ users multiplexed in the RU. $z_2z_1z_0$ = 000–111 indicates the number of users multiplexed in the higher frequency 106-tone RU if there are two 106-tone RUs and one 26-tone RU is assigned between two 106-tone RUs. The binary vector $z_2z_1z_0$ indicates $N_{user}(r, c) = 2^2 \times z_2 + 2^1 \times z_1 + z_0 + 1$ users multiplexed in the RU. Similarly, y_1y_0 = 00–11 indicates the number of users multiplexed in the lower frequency 106-tone RU. The binary vector y_1y_0 indicates $N_{user}(r, c) = 2^1 \times y_1 + y_0 + 1$ users multiplexed in the RU. Similarly, z_1z_0 = 00–11 indicates the number of users multiplexed in the higher frequency 106-tone RU. The binary vector z_1z_0 indicates $N_{user}(r, c) = 2^1 \times z_1 + z_0 + 1$ users multiplexed in the RU. #1 to #9 (from left to the right) is ordered in increasing order of the absolute frequency. x_1x_0 = 00–11, $x_4x_3x_2x_1x_0$ = 00000–11111.										
'-' means no user in that RU, i.e., $N_{user}(r, c) = 0$. For RU r that is a 106-tone or larger RU, $N_{user}(r, c)$ is indicated by the letters (such as $y_2y_1y_0$ or $z_2z_1z_0$) in the RU allocation subfield above if the letters are present in the RU allocation subfield; otherwise $N_{user}(r, c) = 0$. For RU r that is a 26-tone or 52-tone RU, $N_{user}(r, c) = 1$.										

If a single RU in a 160 MHz or 80+80 MHz PPDU overlaps more than one of the subcarrier ranges [–1012:–771], [–770:–529], [–495:–254], [–253:–12], [12:253], [254:495], [529:770] or [771:1012], the corresponding RU Allocation subfields in the respective content channels shall all refer to the same RU.

In Table 27-27, the Number of entries column refers to the number of RU Allocation subfield values that refer to the same RU assignment to be used in the frequency domain but differ in the number of User fields per RU. The number of User fields per RU indicated by the RU Allocation subfields and the Center 26-tone RU subfield of an HE-SIG-B content channel indicate the number of User fields in the User Specific field of the HE-SIG-B content channel.

For an MU-MIMO allocation of RU size greater than 242 subcarriers, the dynamic split of User fields between HE-SIG-B content channel 1 and HE-SIG-B content channel 2 is decided by the AP (on a per case basis) and signaled by the AP using the RU Allocation subfields in each HE-SIG-B content channel. See Annex Z for examples.

The pre-HE modulated fields (see Figure 27-23) are not transmitted in 20 MHz subchannels in which the preamble is punctured (see 27.3.7).

If the Bandwidth field in the HE-SIG-A field of an HE MU PPDU is 4, 5, 6 or 7, then one or more 20 MHz subchannels of the preamble are punctured, as defined in Table 27-21. If two adjacent 20 MHz subchannels that constitute a 40 MHz subchannel in which a 484-tone RU is located are punctured, then B7–B0 of the RU Allocation subfields corresponding to the two 20 MHz subchannels shall both be set to 113 (242-tone RU is empty) or shall both be set to 114 (see Table 27-27) to indicate that the preamble is punctured in both

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the 20 MHz subchannels. Each punctured 20 MHz subchannel that does not have B7–B0 of its corresponding RU Allocation subfield set to 114 shall have B7–B0 of its RU Allocation subfield set to 113.

The center 26-tone RU in a preamble punctured 80 MHz, 160 MHz, or 80+80 MHz HE MU PPDU shall not be allocated to a user if either of the two 20 MHz subchannels that the center 26-tone RU straddles have the preamble punctured.

27.3.11.8.4 User Specific field

The User Specific field of an HE-SIG-B content channel consists of zero or more User Block fields followed by padding (if present) as shown in Figure 27-26. Each non-final User Block field is made up of two User fields that contain information for two STAs that is used to decode their payloads. The final User Block field contains information for one or two users depending on the number of users in the HE-SIG-B content channel. If the HE-SIG-B Compression field in the HE-SIG-A field of an HE MU PPDU is 0, then the number of User fields is indicated by the RU Allocation subfields and the Center 26-tone RU subfield in the same HE-SIG-B content channel. If the HE-SIG-B Compression field in the HE-SIG-A field of an HE MU PPDU is 1, then the number of users is indicated by the Number Of HE-SIG-B Symbols Or MU-MIMO Users field in the HE-SIG-A field.

If the HE-SIG-B Compression field in the HE-SIG-A field of an HE MU PPDU is 1 (indicating full-bandwidth MU-MIMO transmission) and the Number Of HE-SIG-B Symbols Or MU-MIMO Users field in the HE-SIG-A field of an HE MU PPDU is 0 (indicating 1 user), then the User Specific field in the HE-SIG-B field consists of a single User Block field containing one User field for a non-MU-MIMO allocation as shown in Table 27-29.

The User Block field is defined in Table 27-28.

Table 27-28—User Block field

Field	Number of fields	Number of bits per field	Description
User field	N	21	*N* User fields are present, where *N* = 1 if it is the final User Block field, and if there is only one user in the final User Block field. *N* = 2 otherwise. The User field format for a non-MU-MIMO allocation is defined in Table 27-29. The User field format for a MU-MIMO allocation is defined in Table 27-30.
CRC	1	4	The CRC is calculated over bits 0 to 20 for a User Block field that contains one User field and bits 0 to 41 for a User Block field that contains two User fields. See 27.3.11.7.3.
Tail	1	6	Used to terminate the trellis of the convolutional decoder. Set to 0.

If the HE-SIG-B Compression field in the HE-SIG-A field of an HE MU PPDU is 0, then for an MU-MIMO allocation of RU size greater than 242 subcarriers, the AP performs a dynamic split of the User fields between HE-SIG-B content channel 1 and HE-SIG-B content channel 2 as described in 27.3.11.8.3.

If the HE-SIG-B Compression field in the HE-SIG-A field of an HE MU PPDU is 1, for bandwidths larger than 20 MHz, the AP performs an equitable split of the User fields between two HE-SIG-B content

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

channels, i.e., User field k of a K user MU-MIMO PPDU is carried in HE-SIG-B content channel c, where c is defined in Equation (27-20).

$$c = \begin{cases} 1, & \text{if } k \in 1, \ldots, \lceil K/2 \rceil \\ 2, & \text{if } (k \in \lceil K/2 \rceil + 1, \ldots, K) \end{cases} \quad (27\text{-}20)$$

Since a single STA is not required to decode the data for more than one user (see 26.5.1.2), the signaling that enables a STA to decode its data is carried in only one User field.

The ordering of User fields in the User Specific field in an HE-SIG-B content channel is determined using the following three-step procedure:

a) If the HE-SIG-B Compression field in the HE-SIG-A field of an HE MU PPDU is 1, this first step is bypassed. Otherwise, the User fields in the User Specific field of an HE-SIG-B content channel are grouped into sets of User fields, where each set comprises the User fields indicated by one RU Allocation subfield or the Center 26-tone RU. These sets shall be ordered as follows:
   1) If the Bandwidth field in the HE-SIG-A field is 0 or 1, then there is only one set; therefore, the need for ordering in this first step does not arise.
   2) If the Bandwidth field in the HE-SIG-A field is 2, 4, or 5, then the set of User fields indicated by the first RU Allocation subfield is followed by the set of the User fields indicated by the second RU Allocation subfield; in turn, if the center 26-tone RU is assigned, then its User field is appended as the last User field to HE-SIG-B content channel 1 only.
   3) If the Bandwidth field in the HE-SIG-A field is 3, 6, or 7, then the set of User fields indicated by the first RU Allocation subfield is followed by the set of the User fields indicated by the second RU Allocation subfield; in turn these are followed by the set of the User fields indicated by the third RU Allocation subfield and then by the set of the User fields indicated by the fourth RU Allocation subfield. If the center 26-tone RU that spans subcarriers [–528:–516, –508:–496] is assigned, then its User field is appended to HE-SIG-B content channel 1. If the center 26-tone RU that spans subcarriers [496:508, 516:528] is assigned, then its User field is appended as the last User field to HE-SIG-B content channel 2.

b) If the HE-SIG-B Compression field in the HE-SIG-A field of an HE MU PPDU is 1, then this second step is bypassed. Otherwise, each subset of User fields indicated by an RU Allocation subfield shall be ordered by increasing frequency of RU, i.e., #1 to #9 in Table 27-27.

c) Without regard to the value of the HE-SIG-B Compression field, the ordering of User fields in the same RU shall follow the user ordering in Table 27-31.

In this way, RU Allocation subfields, Center 26-tone RU fields (if present), and the position of a user's User field in the User Specific field of an HE-SIG-B content channel indicate the user's RU assignment.

If the Bandwidth field in the HE-SIG-A field of an HE MU PPDU (see Table 27-21) is 4 or 5 (preamble is punctured), the content of HE-SIG-B content channels 1 and 2 shall be constructed as described above for an 80 MHz PPDU without preamble puncturing.

If the Bandwidth field in the HE-SIG-A field of an HE MU PPDU is 6 or 7 (preamble is punctured), the content of HE-SIG-B content channels 1 and 2 shall be constructed as described above for an 160 MHz PPDU without preamble puncturing.

An example for the mapping of the 8-bit RU Allocation subfield and the position of the User field to a user's data is illustrated in Figure 27-27. The RU Allocation subfield indicates an arrangement of one 106-tone RU followed by five 26-tone RUs and indicates that the 106-tone RU contains three User fields, i.e., the 106-tone RU supports multiplexing of three users using MU-MIMO. The 8 User fields in the User Specific field

thus map to the 6 RUs, with the first three User fields indicating MU-MIMO allocations in the first 106-tone RU followed by User fields corresponding to the each of the five 26-tone RUs.

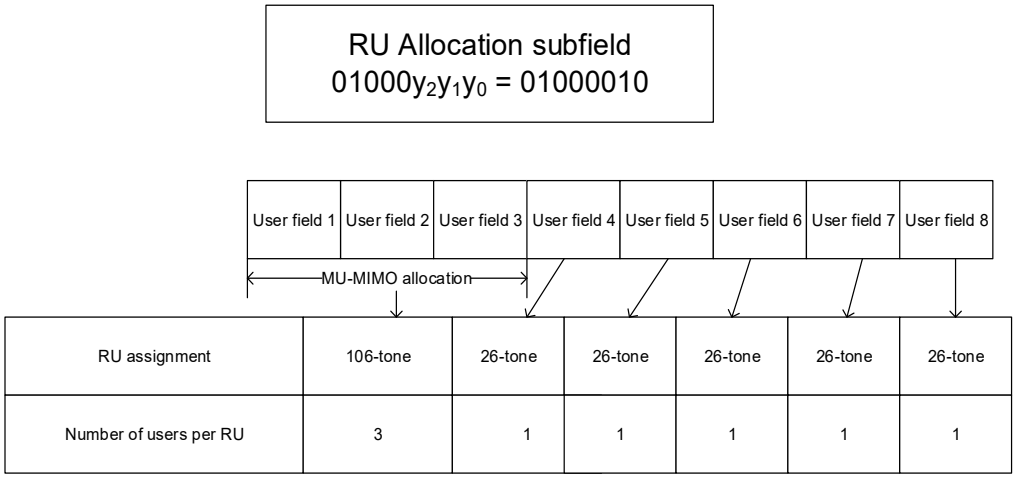

Figure 27-27—Example of the mapping of 8-bit RU Allocation subfield and the position of User field to user's assignment for one 20 MHz channel

The contents of the User field differ depending on whether the field addresses a user in a non-MU-MIMO allocation in an RU or a user in an MU-MIMO allocation in an RU. Irrespective of whether the allocation is for a user in a non-MU-MIMO or an MU-MIMO allocation, the size of the User field is the same.

The User field format for a non-MU-MIMO allocation is defined in Table 27-29.

The User field format for an MU-MIMO allocation is defined in Table 27-30.

A User field for an MU-MIMO allocation includes a 4-bit Spatial Configuration subfield that indicates the number of spatial streams for each user and the total number of spatial streams in the MU-MIMO allocation. The subfield shown in Table 27-31 is constructed by using the entries corresponding to the value of number of users (N_{user}) multiplexed using MU-MIMO in an RU.

If the HE-SIG-B Compression field in the HE-SIG-A field is 0 and MU-MIMO is used in an RU of size less than or equal to 242 subcarriers, the number of users (N_{user}) in an MU-MIMO allocation is equal to the number of User fields per RU signaled for the RU in the associated RU Allocation subfield of the Common field in the same HE-SIG-B content channel.

If the HE-SIG-B Compression field in the HE-SIG-A field is 0 and MU-MIMO is used in RUs of size greater than 242 subcarriers, the AP performs a dynamic split of the User fields corresponding to the same MU-MIMO allocations as described in 27.3.11.8.3 into two HE-SIG-B content channels, and the number of users (N_{user}) is computed as the sum of the number of User fields indicated for the RU by the 8-bit RU Allocation subfield in each HE-SIG-B content channel.

If the HE-SIG-B Compression field in the HE-SIG-A field is 1, then the number of users, N_{user}, is signaled by the Number Of HE-SIG-B Symbols Or MU-MIMO Users field in the HE-SIG-A field, and the AP performs an equitable split of the User fields following Equation (27-20).

The User field positions within an RU are defined to be logically continuous: the last User field corresponding to an RU in HE-SIG-B content channel 1 is immediately followed by the first User field corresponding to the same RU in HE-SIG-B content channel 2.

Table 27-29—User field format for non-MU-MIMO allocation

Bit	Subfield	Number of bits	Description
B0–B10	STA-ID	11	Set to a value of the TXVECTOR parameter STA_ID (see 26.11.1).
B11–B13	NSTS	3	If the STA-ID subfield is not 2046, indicates the number of space-time streams and is set to the number of space-time streams minus 1. Set to an arbitrary value if the STA-ID subfield is 2046.
B14	Beamformed	1	If the STA-ID subfield is not 2046, used in transmit beamforming: Set to 1 if a beamforming steering matrix is applied to the waveform in a non-MU-MIMO allocation. Set to 0 otherwise. Set to an arbitrary value if the STA-ID subfield is 2046.
B15–B18	HE-MCS	4	If the STA-ID subfield is not 2046, indicates the modulation and coding scheme: Set to *n* for HE-MCS *n*, where *n* = 0, 1, 2, …, 11. Values 12-15 are reserved. Set to an arbitrary value if the STA-ID subfield is 2046.
B19	DCM	1	If the STA-ID subfield is not 2046, indicates whether DCM is used: Set to 1 to indicate that the payload of the corresponding user of the HE MU PPDU is modulated with DCM for the HE-MCS. Set to 0 to indicate that the payload of the corresponding user of the PPDU is not modulated with DCM for the HE-MCS. Set to an arbitrary value if the STA-ID subfield is 2046.
B20	Coding	1	If the STA-ID subfield is not 2046, indicates whether BCC or LDPC is used: Set to 0 for BCC. Set to 1 for LDPC. Set to an arbitrary value if the STA-ID subfield is 2046.

Table 27-30—User field format for MU-MIMO allocation

Bit	Subfield	Number of bits	Description
B0–B10	STA-ID	11	Set to a value indicated from TXVECTOR parameter STA_ID (see 26.11.1).
B11–B14	Spatial Configuration	4	If the STA-ID subfield is not 2046, indicates the number of spatial streams for a user in an MU-MIMO allocation (see Table 27-31). Set to an arbitrary value if the STA-ID subfield is 2046.
B15–B18	HE-MCS	4	If the STA-ID subfield is not 2046, indicates the modulation and coding scheme: Set to *n* for HE-MCS *n*, where *n* = 0, 1, 2, …, 11. Values 12-15 are reserved. Set to an arbitrary value if the STA-ID subfield is 2046.

Table 27-30—User field format for MU-MIMO allocation *(continued)*

B19	Reserved	1	If the STA-ID subfield is not 2046, reserved and set to 0. Set to an arbitrary value if the STA-ID subfield is 2046.
B20	Coding	1	If the STA-ID subfield is not 2046, indicates whether BCC or LDPC is used: Set to 0 for BCC. Set to 1 for LDPC. Set to an arbitrary value if the STA-ID subfield is 2046.

Table 27-31—Spatial Configuration subfield encoding

N_{user}	B3…B0	N_{STS} [1]	N_{STS} [2]	N_{STS} [3]	N_{STS} [4]	N_{STS} [5]	N_{STS} [6]	N_{STS} [7]	N_{STS} [8]	Total N_{STS}	Number of entries
2	0000–0011	1–4	1							2–5	10
	0100–0110	2–4	2							4–6	
	0111–1000	3–4	3							6–7	
	1001	4	4							8	
3	0000–0011	1–4	1	1						3–6	13
	0100–0110	2–4	2	1						5–7	
	0111–1000	3–4	3	1						7–8	
	1001–1011	2–4	2	2						6–8	
	1100	3	3	2						8	
4	0000–0011	1–4	1	1	1					4–7	11
	0100–0110	2–4	2	1	1					6–8	
	0111	3	3	1	1					8	
	1000–1001	2–3	2	2	1					7–8	
	1010	2	2	2	2					8	
5	0000–0011	1–4	1	1	1	1				5–8	7
	0100–0101	2–3	2	1	1	1				7–8	
	0110	2	2	2	1	1				8	
6	0000–0010	1–3	1	1	1	1	1			6–8	4
	0011	2	2	1	1	1	1			8	
7	0000–0001	1–2	1	1	1	1	1	1		7–8	2
8	0000	1	1	1	1	1	1	1	1	8	1

For a given value of N_{user}, the four bits of the Spatial Configuration subfield are used as follows: A STA with a STA-ID that matches the 11-bit ID signaled in the User field for an MU-MIMO allocation derives the number of spatial streams allocated to it using the row corresponding to the signaled 4-bit Spatial

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Configuration subfield and the column corresponding to the User field position in the User Specific field. The starting stream index for the user is computed by summing the N_{STS} in the columns prior to the column indicated by the user's User field position.

The user ordering identified by the column headers $N_{STS}[s]$, s = 1, 2, 3, … in Table 27-31 shall be the same as the user index u, u = 0, 1, 2, … in Equation (27-38), Equation (27-59), and Equation (27-108), i.e., $u = s - 1$.

The total number of spatial streams (total N_{STS}) is computed by summing all columns for the row signaled by the Spatial Configuration field and is indicated in the Total N_{STS} column of Table 27-31.

27.3.11.8.5 Encoding and modulation

The bits in the Common field of each HE-SIG-B content channel shall be BCC encoded at rate R = 1/2.

In the User Specific field, each User Block field of each HE-SIG-B content channel shall be BCC encoded at rate R = 1/2. If the number of User fields in an HE-SIG-B content channel is odd, the CRC and tail bits are added immediately after the last User field; there is only one User field in the last User Block field (see Table 27-28. Padding bits are appended immediately after the tail bits corresponding to the final User Block field in each HE-SIG-B content channel to round up to the next multiple of number of data bits per HE-SIG-B OFDM symbol. The padding bits may be set to any value. Further padding bits are appended to each HE-SIG-B content channel so that the number of OFDM symbols after encoding and modulation in different 20 MHz bands ends at the same OFDM symbol. For both the Common field and User Block field, the information bits, tail bits, and padding bits (if present) are BCC encoded at rate R = 1/2 using the encoder described in 17.3.5.6. If the coding rate of the HE-SIG-B-MCS is not equal to 1/2, the convolutional encoder output bits for each field are concatenated, and then the concatenated bit streams are punctured as described in 17.3.5.6.

The coded bits are interleaved as in 27.3.12.8. The interleaved bits are mapped to constellation points from the HE-SIG-B-MCS field in the HE-SIG-A field following the steps described in 17.3.5.8 if the HE-SIG-B field in the HE-SIG-A field is 0, and 27.3.12.15 if the HE-SIG-B DCM field in the HE-SIG-A field is 1. N_{SD} is 52 if the HE-SIG-B DCM field in the HE-SIG-A field is 0. N_{SD} is 26 if the HE-SIG-B DCM field in the HE-SIG-A field is 1. Pilots are then inserted as described in 17.3.5.9.

The guard interval used for the HE-SIG-B field shall be 0.8 μs.

If the HE-SIG-B Compression field in the HE-SIG-A field is 0, then the number of OFDM symbols in the HE-SIG-B field, denoted by $N_{SYM,\text{HE-SIG-B}}$, shall be signaled by the Number Of HE-SIG-B Symbols Or MU-MIMO Users field in the HE-SIG-A field of an HE MU PPDU (see 27.3.11.7.2).

If the HE-SIG-B Compression field in the HE-SIG-A field is 1, then the number of OFDM symbols in the HE-SIG-B field is calculated based on the number of User fields in the HE-SIG-B content channel, the HE-MCS of the HE-SIG-B field, whether DCM is applied to the HE-SIG-B field, and the bandwidth of HE MU PPDU, all of which are indicated by the Number Of HE-SIG-B Symbols Or MU-MIMO Users field, HE-SIG-B-MCS field, HE-SIG-B DCM field, and Bandwidth field, respectively, in the HE-SIG-A field of an HE MU PPDU (see 27.3.11.7.2).

For the HE-SIG-B content channel c (c = 1 or 2), denote the complex number assigned to the k^{th} data subcarrier of the n^{th} symbol by $d_{k,n,c}$. The time domain waveform for the HE-SIG-B field, transmitted on frequency segment i_{Seg} and transmit chain i_{TX}, is given by Equation (27-21).

$$r_{\text{HE-SIG-B}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{\text{HE-SIG-B}}^{\text{Tone}} \cdot \frac{|\Omega_{20\text{MHz}}|}{N_{20\text{MHz}}}}} \sum_{n=0}^{N_{SYM,\,\text{HE-SIG\_B}}-1} w_{T_{\text{HE-SIG-B}}}(t - nT_{SYML}) \quad (27\text{-}21)$$

$$\sum_{i_{BW} \in \Omega_{20\text{MHz}}} \sum_{k=-28}^{28} \left(\begin{array}{l} \Upsilon_{(k - K_{\text{Shift}}(i_{BW})),\,\text{BW}} \left(\Gamma_{M_{20}^r(k)} D_{k,\,n,\,i_{BW}}^{i_{Seg}} + p_{n+4} P_k \right) \\ \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{\text{BW}}))\Delta_{F,\,\text{Pre-HE}}(t - nT_{SYML} - T_{GI,\,\text{Pre-HE}} - T_{CS}^{i_{TX}})) \end{array} \right)$$

where

$\Gamma_{M_{20}^r(k)}$ is the phase rotation value for HE-SIG-B field PAPR reduction. If the HE-SIG-B field is modulated with HE-SIG-B-MCS 0 and DCM=1, then $\Gamma_{M_{20}^r(k)} = 1$. For all other modulation schemes of the HE-SIG-B field,

$$\Gamma_{M_{20}^r(k)} = \begin{cases} 1 & 0 \le M_{20}^r(k) < 26 \\ (-1)^{M_{20}^r(k)} & 26 \le M_{20}^r(k) < 52 \end{cases}$$

$N_{\text{HE-SIG-B}}^{Tone}$ is given in Table 27-17

$K_{\text{Shift}}(i)$ is defined in 21.3.8.2.4

$$D_{k,\,n,\,i_{BW}}^{i_{Seg}} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M_{20}^r(k),\,n,\,(i_{BW} mod\ 2)+1}, \text{otherwise} \end{cases}$$

$$M_{20}^r(k) = \begin{cases} k + 28, -28 \le k \le -22 \\ k + 27, -20 \le k \le -8 \\ k + 26, -6 \le k \le -1 \\ k + 25, 1 \le k \le 6 \\ k + 24, 8 \le k \le 20 \\ k + 23, 22 \le k \le 28 \end{cases}$$

P_k and p_n are defined in 17.3.5.10

$N_{SYM,\,\text{HE-SIG-B}}$ is the number of OFDM symbols in the HE-SIG-B field

From Equation (27-21) and 27.3.11.8.2, a 20 MHz PPDU contains one HE-SIG-B content channel as shown in Figure 27-28.

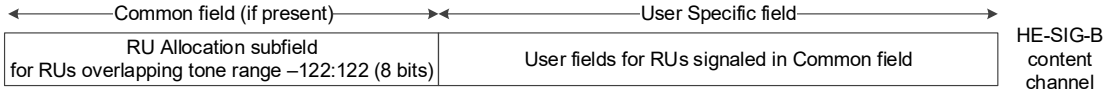

Figure 27-28—HE-SIG-B content channel for a 20 MHz PPDU

From Equation (27-21) and 27.3.11.8.2, a 40 MHz PPDU contains two HE-SIG-B content channels, each occupying a 20 MHz frequency segment as shown in Figure 27-29. HE-SIG-B content channel 1 occupies

the 20 MHz frequency subchannel that is lower in frequency. HE-SIG-B content channel 2 occupies the 20 MHz frequency subchannel that is upper in frequency.

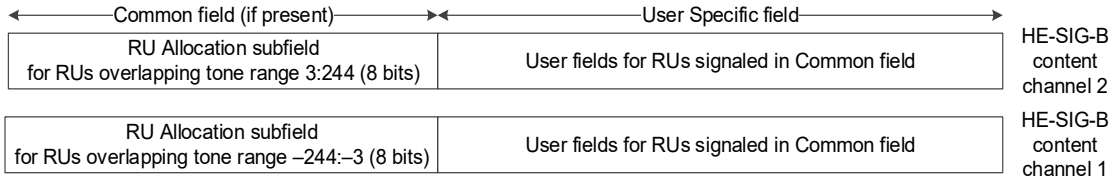

Figure 27-29—HE-SIG-B content channel for a 40 MHz PPDU

From Equation (27-21) and 27.3.11.8.2, an 80 MHz PPDU contains two HE-SIG-B content channels, each of which are duplicated once as shown in Figure 27-30. HE-SIG-B content channel 1 occupies the 20 MHz frequency subchannel that is lowest in frequency and is duplicated on the 20 MHz frequency segment that is third lowest in frequency. HE-SIG-B content channel 2 occupies the 20 MHz frequency segment that is second lowest in frequency and is duplicated on the 20 MHz frequency subchannel that is highest in frequency.

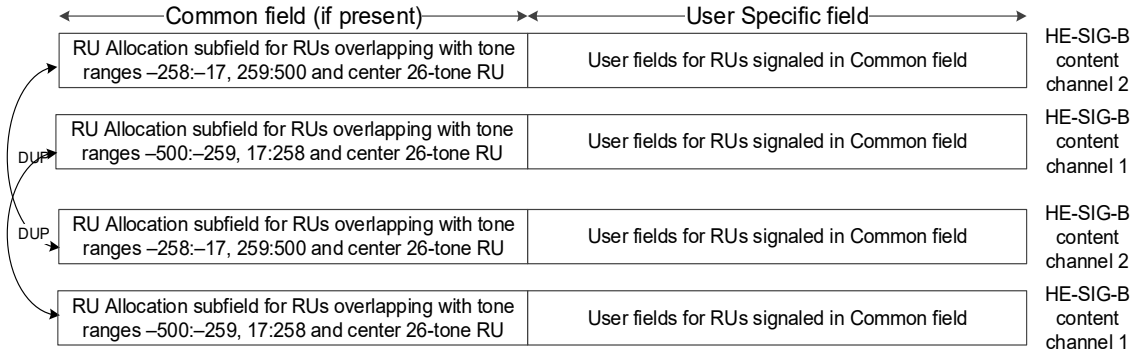

Figure 27-30—HE-SIG-B content channels and their duplication in an 80 MHz PPDU

From Equation (27-21) and 27.3.11.8.2, a 160 MHz PPDU contains two HE-SIG-B content channels, each of which are duplicated four times as shown in Figure 27-31. HE-SIG-B content channel 1 occupies the 20 MHz frequency subchannel that is lowest in frequency and is duplicated on the 20 MHz frequency subchannels that are third, fifth, and seventh lowest in frequency. HE-SIG-B content channel 2 occupies the 20 MHz frequency subchannel that is second lowest in frequency and is duplicated on the 20 MHz frequency subchannels that are fourth, sixth, and eighth lowest in frequency.

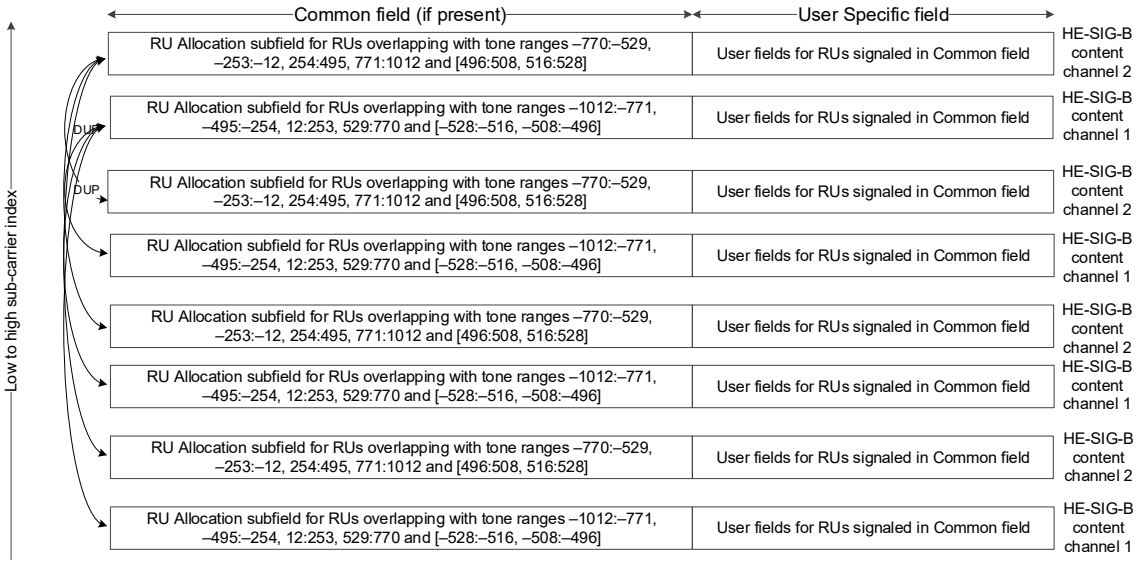

Figure 27-31—HE-SIG-B content channels and their duplication in a 160 MHz PPDU

If the Bandwidth field in the HE-SIG-A field of an HE MU PPDU (see Table 27-21) is 4 or 5 (preamble is punctured), the mapping of the HE-SIG-B content channels to 20 MHz segments shall be the same as for an 80 MHz PPDU (see Figure 27-30), with the exception that punctured 20 MHz channels shall be excluded.

If the Bandwidth field in the HE-SIG-A field of an HE MU PPDU (see Table 27-21) is 6 or 7 (preamble is punctured), the mapping of the HE-SIG-B content channels to 20 MHz segments shall be the same as for an 160 MHz PPDU (see Figure 27-31), with the exception that punctured 20 MHz channels shall be excluded.

27.3.11.9 HE-STF field

The main purpose of the HE-STF field is to improve automatic gain control estimation in a MIMO transmission. The duration of the HE-STF field for HE PPDUs that are not HE TB PPDUs is $T_{\text{HE-STF-NT}}$ (periodicity of 0.8 μs with 5 periods as given in Table 27-13), and the duration of the HE-STF field for an HE TB PPDU is $T_{\text{HE-STF-T}}$ (periodicity of 1.6 μs with 5 periods as given in Table 27-13).

For the HE-STF field, the M sequence is defined by Equation (27-22).

$$M = \{-1, -1, -1, 1, 1, 1, -1, 1, 1, 1, -1, 1, 1, -1, 1\} \quad (27\text{-}22)$$

The HE-STF field is constructed by mapping the M sequence(s) multiplied by $(1+j)/\sqrt{2}$ or $(-1-j)/\sqrt{2}$ to each 242-tone RU. For a transmission bandwidth greater than 40 MHz, $(1+j)/\sqrt{2}$ or $(-1-j)/\sqrt{2}$ is assigned to subcarrier indices that are inside the center 26-tone RUs.

For a 20 MHz transmission, the frequency domain sequence for HE PPDUs that are not HE TB PPDUs is given by Equation (27-23).

$$HES_{-112:16:112} = \{M\} \cdot (1+j)/\sqrt{2}$$
The value of the HE-STF sequence at null tone index 0 is $HES_0 = 0$ (27-23)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

where $HES_{a:b:c}$ means coefficients of the HE-STF on every b subcarrier indices from a to c subcarrier indices and coefficients on other subcarrier indices are set to zero.

For a 40 MHz transmission, the frequency domain sequence for HE PPDUs that are not HE TB PPDUs is given by Equation (27-24).

$$HES_{-240:16:240} = \{M, 0, -M\} \cdot (1 + j)/\sqrt{2} \tag{27-24}$$

For an 80 MHz transmission, the frequency domain sequence for HE PPDUs that are not HE TB PPDUs is given by Equation (27-25).

$$HES_{-496:16:496} = \{M, 1, -M, 0, -M, 1, -M\} \cdot (1 + j)/\sqrt{2} \tag{27-25}$$

For a 160 MHz transmission, the frequency domain sequence for HE PPDUs that are not HE TB PPDUs is given by Equation (27-26).

$$HES_{-1008:16:1008} = \{M, 1, -M, 0, -M, 1, -M, 0, -M, -1, M, 0, -M, 1, -M\} \cdot (1 + j)/\sqrt{2} \tag{27-26}$$

For an 80+80 MHz transmission, the lower 80 MHz segment for HE PPDUs that are not HE TB PPDUs shall use the HE-STF pattern for the 80 MHz defined in Equation (27-25).

For an 80+80 MHz transmission, the frequency domain sequence of the upper 80 MHz segment for HE PPDUs that are not HE TB PPDUs is given by Equation (27-27).

$$HES_{-496:16:496} = \{-M, -1, M, 0, -M, 1, -M\} \cdot (1 + j)/\sqrt{2} \tag{27-27}$$

For a 20 MHz transmission, the frequency domain sequence for HE TB PPDUs is given by Equation (27-28).

$$HES_{-120:8:120} = \{M, 0, -M\} \cdot (1 + j)/\sqrt{2} \tag{27-28}$$

For an HE TB feedback NDP in 20 MHz channel width, the frequency domain sequence is given by Equation (27-29).

$$HES^{\text{TB NDP}}_{-120:8:120} = HES_{-120:8:120} \tag{27-29}$$

For a 40 MHz transmission, the frequency domain sequence for HE TB PPDUs is given by Equation (27-30).

$$HES_{-248:8:248} = \{M, -1, -M, 0, M, -1, M\} \cdot (1 + j)/\sqrt{2}$$
The value of the HE-STF sequence at edge tone indices ±248 is $HES_{\pm 248} = 0$ (27-30)

For an HE TB feedback NDP in 40 MHz channel width, the frequency domain sequence is given by Equation (27-31).

$$HES^{\text{TB NDP}}_{-248:8:-8} = \{M, -1, -M\} \cdot (1 + j)/\sqrt{2}, \text{ if RU\_TONE\_SET\_INDEX} \le 18$$
$$HES^{\text{TB NDP}}_{8:8:248} = \{M, -1, M\} \cdot (1 + j)/\sqrt{2}, \text{ if RU\_TONE\_SET\_INDEX} > 18 \tag{27-31}$$
$$HES^{\text{TB NDP}}_{\pm 248} = 0$$

For an 80 MHz transmission, the frequency domain sequence for HE TB PPDUs is given by Equation (27-32).

$$HES_{-504:8:504} = \{M, -1, M, -1, -M, -1, M, 0, -M, 1, M, 1, -M, 1, -M\} \cdot (1+j)/\sqrt{2}$$
The value of the HE-STF sequence at edge tone indices ±504 is $HES_{\pm 504} = 0$ (27-32)

For an HE TB feedback NDP in 80 MHz channel width, the frequency domain sequence is given by Equation (27-33).

$$\begin{aligned}
HES^{\text{TB NDP}}_{-504:8:-264} &= \{M, -1, M\} \cdot (1+j)/\sqrt{2}, \text{ if RU_TONE_SET_INDEX} \le 18 \\
HES^{\text{TB NDP}}_{-248:8:-8} &= \{-M, -1, M\} \cdot (1+j)/\sqrt{2}, \text{ if } 18 < \text{RU_TONE_SET_INDEX} \le 36 \\
HES^{\text{TB NDP}}_{8:8:248} &= \{-M, 1, M\} \cdot (1+j)/\sqrt{2}, \text{ if } 36 < \text{RU_TONE_SET_INDEX} \le 54 \\
HES^{\text{TB NDP}}_{264:8:504} &= \{-M, 1, -M\} \cdot (1+j)/\sqrt{2}, \text{ if } 54 < \text{RU_TONE_SET_INDEX} \le 72 \\
HES^{\text{TB NDP}}_{\pm 504} &= 0
\end{aligned} \quad (27\text{-}33)$$

For a 160 MHz transmission, the frequency domain sequence for HE TB PPDUs is given by Equation (27-34).

$$\begin{aligned}
HES_{-1016:8:1016} = \{&M, -1, M, -1, -M, -1, M, 0, -M, 1, M, 1, -M, 1, -M, 0 \\
&-M, 1, -M, 1, M, 1, -M, 0, -M, 1, M, 1, -M, 1, -M\} \cdot (1+j)/\sqrt{2}
\end{aligned} \quad (27\text{-}34)$$
The value of the HE-STF sequence at edge tone indices ±8 and ±1016 is $HES_{\pm 8} = 0$, $HES_{\pm 1016} = 0$

For an HE TB feedback NDP in 160 MHz channel width, the frequency domain sequence is given by Equation (27-35).

$$\begin{aligned}
HES^{\text{TB NDP}}_{-1016:8:-776} &= \{M, -1, M\} \cdot (1+j)/\sqrt{2}, \text{ if RU_TONE_SET_INDEX} \le 18 \\
HES^{\text{TB NDP}}_{-760:8:-520} &= \{-M, -1, M\} \cdot (1+j)/\sqrt{2}, \text{ if } 18 < \text{RU_TONE_SET_INDEX} \le 36 \\
HES^{\text{TB NDP}}_{-504:8:-264} &= \{-M, 1, M\} \cdot (1+j)/\sqrt{2}, \text{ if } 36 < \text{RU_TONE_SET_INDEX} \le 54 \\
HES^{\text{TB NDP}}_{-248:8:-8} &= \{-M, 1, -M\} \cdot (1+j)/\sqrt{2}, \text{ if } 54 < \text{RU_TONE_SET_INDEX} \le 72 \\
HES^{\text{TB NDP}}_{8:8:248} &= \{-M, 1, -M\} \cdot (1+j)/\sqrt{2}, \text{ if } 72 < \text{RU_TONE_SET_INDEX} \le 90 \\
HES^{\text{TB NDP}}_{264:8:504} &= \{M, 1, -M\} \cdot (1+j)/\sqrt{2}, \text{ if } 90 < \text{RU_TONE_SET_INDEX} \le 108 \\
HES^{\text{TB NDP}}_{520:8:760} &= \{-M, 1, M\} \cdot (1+j)/\sqrt{2}, \text{ if } 108 < \text{RU_TONE_SET_INDEX} \le 126 \\
HES^{\text{TB NDP}}_{776:8:1016} &= \{-M, 1, -M\} \cdot (1+j)/\sqrt{2}, \text{ if } 126 < \text{RU_TONE_SET_INDEX} \le 144 \\
HES^{\text{TB NDP}}_{\pm 8} &= HES^{\text{TB NDP}}_{\pm 1016} = 0
\end{aligned} \quad (27\text{-}35)$$

For an 80+80 MHz transmission, the lower 80 MHz segment for HE TB PPDUs shall use the HE-STF pattern for the 80 MHz defined in Equation (27-32).

For an 80+80 MHz transmission, the frequency domain sequence of the upper 80 MHz segment for HE TB PPDUs is given by Equation (27-36).

$$HES_{-504:8:504} = \{-M, 1, -M, 1, M, 1, -M, 0, -M, 1, M, 1, -M, 1, -M\} \cdot (1+j)/\sqrt{2}$$
The value of the HE-STF sequence at edge tone indices ±504 is $HES_{\pm 504} = 0$ (27-36)

For an HE TB feedback NDP in the lower 80 MHz segment of an 80+80 MHz channel width, the frequency domain sequence is given by Equation (27-33).

For an HE TB feedback NDP in the upper 80 MHz segment of an 80+80 MHz channel width, the frequency domain sequence is given by Equation (27-37).

$$\begin{aligned}
HES^{\text{TB NDP}}_{-504:8:-264} &= \{-M, 1, -M\} \cdot (1+j)/\sqrt{2}, \text{ if RU_TONE_SET_INDEX} \le 90 \\
HES^{\text{TB NDP}}_{-248:8:-8} &= \{M, 1, -M\} \cdot (1+j)/\sqrt{2}, \text{ if } 90 < \text{RU_TONE_SET_INDEX} \le 108 \\
HES^{\text{TB NDP}}_{8:8:248} &= \{-M, 1, M\} \cdot (1+j)/\sqrt{2}, \text{ if } 108 < \text{RU_TONE_SET_INDEX} \le 126 \\
HES^{\text{TB NDP}}_{264:8:504} &= \{-M, 1, -M\} \cdot (1+j)/\sqrt{2}, \text{ if } 126 < \text{RU_TONE_SET_INDEX} \le 144 \\
HES^{\text{TB NDP}}_{\pm 504} &= 0
\end{aligned} \quad (27\text{-}37)$$

If a 20 MHz operating non-AP STA sends an HE TB feedback NDP report response (see 26.5.7) on a channel width greater than 20 MHz, the HE-STF subcarrier that overlaps the DC subcarrier of the 20 MHz operating non-AP STA is not transmitted.

For an OFDMA transmission, the coefficients in Equation (27-23) to Equation (27-36) are set to zero if those values correspond to subcarrier indices that fall within RUs that have no users assigned to them.

The time domain representation of the signal for an HE PPDU that is not an HE TB PPDU on frequency segment i_{Seg} and transmit chain i_{TX} shall be as specified in Equation (27-38).

$$r^{(i_{Seg}, i_{TX})}_{\text{HE-STF}}(t) = w_{T_{\text{HE-STF-NT}}}(t) \cdot \sum_{r=0}^{N_{RU}-1} \frac{\alpha_r \beta_r}{\sqrt{N_{STS,r,total}}} \sum_{k \in K_r} \eta_{\text{HE-STF},k} \sum_{u=0}^{N_{user,r}-1} \sum_{m=1}^{N_{STS,r,u}} \left(\left[Q_k^{(i_{Seg})} \right]_{i_{TX}, M_{r,u}+m} HES_k \cdot \exp(j2\pi k \Delta_{F,\text{HE}}(t - T_{CS,HE}(M_{r,u}+m))) \right) \quad (27\text{-}38)$$

where

α_r is defined in 27.3.10

$\eta_{\text{HE-STF},k}$ is an HE PPDU format-dependent scaling factor as defined by

$$\eta_{\text{HE-STF},k} = \begin{cases} \sqrt{2}, & \text{for an HE ER SU PPDU} \\ 1, & \text{otherwise} \end{cases}$$

β_r is the per-RU power normalization factor as defined by

$$\beta_r = \left(\sqrt{\frac{|K_r|}{|K_r^{\text{HE-STF}}|}} \right) \Big/ \left(\sqrt{\sum_{r=0}^{N_{RU}-1} \alpha_r^2 |K_r|} \right)$$

$|K_r|$ is the cardinality of the set of subcarriers K_r as defined in 27.3.10

$K_r^{\text{HE-STF}}$ is the set of subcarriers that have nonzero values within K_r in the HE-STF field

Copyright © 2025 IEEE. All rights reserved.

$T_{CS,\,\mathrm{HE}}(M_{r,\,u}+m)$
: represents the cyclic shift for space-time stream $M_{r,u}+m$ as defined in 27.3.11.2.2

$Q_k^{(i_{Seg})}$: is defined in 27.3.10

$w_{T_{\text{HE-STF-NT}}}$: is the windowing function for HE-STF field in the non-HE TB PPDU

$\left|K_r^{\text{HE-STF}}\right|$: is the cardinality of the set of subcarriers $K_r^{\text{HE-STF}}$

N_{RU}, $N_{STS,r,total}$, $N_{user,r}$, and $N_{STS,r,u}$
: are defined in Table 27-16

The time domain representation of the signal for an HE TB PPDU transmitted by user u in the r^{th} RU on frequency segment i_{Seg} and transmit chain i_{TX} shall be as specified in Equation (27-39).

$$r_{\text{HE-STF},\,r,\,u}^{(i_{Seg},\,i_{TX})}(t) = \frac{1}{\sqrt{\Gamma_r^{\text{HE-STF}} N_{STS,\,r,\,u}}} w_{T_{\text{HE-STF-T}}}(t) \sum_{k\,\in\,K_r} \sum_{m\,=\,1}^{N_{STS,\,r,\,u}} \left(\left[Q_{k,\,u}^{(i_{Seg})} \right]_{i_{TX},\,m} HES_k \cdot \exp(j2\pi k \Delta_{F,\,\mathrm{HE}}(t - T_{CS,\,HE}(M_{r,\,u}+m))) \right) \tag{27-39}$$

where

$w_{T_{\text{HE-STF-T}}}$: is the windowing function for HE-STF field in the HE TB PPDU

$Q_{k,\,u}^{(i_{Seg})}$: is defined in 27.3.10

HES_k : is the HE-STF sequence for HE TB PPDU applied on subcarrier k. For an HE TB feedback NDP, replace HES_k with $HES_k^{\text{TB\_NDP}}$ in Equation (27-39).

$M_{r,u}$: is given by the TXVECTOR parameter STARTING_STS_NUM

It is recommended that the spatial mapping matrix applied to HE-STF and beyond be chosen such that it preserves the smoothness of the physical channel, achieved by limiting the variation of each element's real and imaginary values in the spatial mapping matrix across successive tones within one RU.

27.3.11.10 HE-LTF field

The HE-LTF field provides a means for the receiver to estimate the MIMO channel between the set of constellation mapper outputs (or, if STBC is applied, the STBC encoder outputs) and the receive chains. In an HE SU PPDU and HE ER SU PPDU, the transmitter provides training for N_{STS} space-time streams (spatial mapper inputs) used for the transmission of the PSDU. In an HE MU PPDU, the transmitter provides training for $N_{STS,r,total}$ space-time streams used for the transmission of the PSDU(s) in the r^{th} RU. In an HE TB PPDU, the transmitter of user u in the r^{th} RU provides training for $N_{STS,r,u}$ space-time streams used for the transmission of the PSDU. For each subcarrier in the r^{th} RU, the MIMO channel that can be estimated is an $N_{RX} \times N_{STS,r,total}$ matrix. An HE transmission has a preamble that contains HE-LTF symbols, where the data tones of each HE-LTF symbol are multiplied by entries belonging to a matrix $P_{\text{HE-LTF}}$, to enable channel estimation at the receiver. When single stream pilot is used in HE-LTF, the pilot subcarriers of each HE-LTF symbol are multiplied by the entries of a matrix $R_{\text{HE-LTF}}$ defined below to allow receivers to track phase and/or frequency offset during MIMO channel estimation using the HE-LTF. Single stream pilots shall be used in the HE-LTF field for SU, DL, and UL OFDMA, DL MU-MIMO, and partial-bandwidth UL MU-MIMO transmissions. Single stream pilots shall be used in the HE-LTF field for a full-bandwidth UL MU-MIMO transmission if single stream pilot HE-LTF mode is selected.

In an HE SU PPDU, HE ER SU PPDU, and HE MU PPDU with a single RU (the RU having an MU-MIMO allocation or an SU allocation), the number of HE-LTF symbols, $N_{\text{HE-LTF}}$, is a function of the total number of space-time streams, N_{STS}, as shown in Table 21-13 in 21.3.8.3.5 with $N_{VHT\text{-}LTF}$ replaced by $N_{HE\text{-}LTF}$ and with $N_{STS,total}$ replaced by N_{STS}. In an HE MU PPDU, $N_{\text{HE-LTF}}$ is indicated in the HE-SIG-A field. In an HE MU PPDU with more than one RU, $N_{\text{HE-LTF}}$ may take a value 1, 2, 4, 6, or 8 that is greater than or equal to the maximum value of the initial number of HE-LTF symbols for each RU, where the initial number of HE-LTF symbols is calculated as a function of $N_{STS,r,total}$ (where r is the index of the RU) based on Table 21-13 in 21.3.8.3.5 with $N_{VHT\text{-}LTF}$ replaced by $N_{HE\text{-}LTF}$.

NOTE—An AP might use the HE MU PPDU With More Than One RU Rx Max N_HE-LTF subfield in the PHY Capabilities Information field in the HE Capabilities element received from a non-AP STA for OFDMA scheduling and selecting an appropriate $N_{\text{HE-LTF}}$ for an OFDMA transmission.

In an HE TB PPDU, $N_{\text{HE-LTF}}$ is indicated in the Trigger frame that triggers the transmission of the PPDU. In a non-OFDMA HE TB PPDU, the number of HE-LTF symbols, $N_{HE\text{-}LTF}$, is a function of the total number of space-time streams, N_{STS}, as shown in Table 21-13 in 21.3.8.3.5 with $N_{VHT\text{-}LTF}$ replaced by $N_{HE\text{-}LTF}$. For an OFDMA HE TB PPDU, $N_{HE\text{-}LTF}$ may be 1, 2, 4, 6, or 8 that is greater than or equal to the maximum value of the initial number of HE-LTF symbols for each RU r, which is calculated as a function of $N_{STS,r,total}$, separately based on Table 21-13 in 21.3.8.3.5 with $N_{VHT\text{-}LTF}$ replaced by $N_{HE\text{-}LTF}$.

An HE PPDU supports 3 HE-LTF types: 1x HE-LTF, 2x HE-LTF, and 4x HE-LTF. Table 27-32 defines whether a particular HE-LTF type and GI duration combination is mandatory, conditional mandatory, or optional for each HE PPDU format.

Table 27-32—HE-LTF type and GI duration combinations for various HE PPDU formats

HE-LTF type and GI duration combination	HE SU PPDU	HE MU PPDU	HE ER SU PPDU	HE TB PPDU	HE sounding NDP	HE TB feedback NDP
1x HE-LTF 0.8 μs GI	O	N/A	O	N/A	N/A	N/A
1x HE-LTF 1.6 μs GI	N/A	N/A	N/A	CM3	N/A	N/A
2x HE-LTF 0.8 μs GI	M	M	M	N/A	M	N/A
2x HE-LTF 1.6 μs GI	M	M	M	M	M	N/A
4x HE-LTF 0.8 μs GI	CM1	CM2	O	N/A	N/A	N/A
4x HE-LTF 3.2 μs GI	M	M	M	M	O	M

Legend
M = mandatory.
CM1 = Mandatory if the STA supports 4x HE-LTF 0.8 μs GI for HE ER SU PPDU. Otherwise, optional.
CM2 = For an AP, mandatory for transmission if the AP supports 4x HE-LTF 0.8 μs GI for HE ER SU PPDU. For a non-AP STA, mandatory for reception if the non-AP STA supports 4x HE-LTF 0.8 μs GI for HE ER SU PPDU. Otherwise, optional.
CM3 = Mandatory for full-bandwidth UL MU-MIMO if the STA supports UL MU-MIMO. Otherwise, not supported. N/A for partial-bandwidth UL MU-MIMO or UL OFDMA.
O = optional.
N/A = not supported by the PPDU format.

If a STA does not support transmission or reception of a particular PPDU format, then the M/CM/O designation is not applicable for the transmission or reception, respectively, of that PPDU format.

In an HE SU PPDU, HE MU PPDU, and HE ER SU PPDU, the combination of HE-LTF type and GI duration is indicated in HE-SIG-A field. In an HE TB PPDU, the combination of HE-LTF type and GI duration is indicated in the Trigger frame that triggers the transmission of the PPDU. If an HE PPDU is an HE sounding NDP, the combinations of HE-LTF types and GI durations are listed in 27.3.17. If an HE PPDU is an HE TB feedback NDP, the combinations of types and GI durations are listed in 27.3.18.

The duration of each HE-LTF symbol excluding GI is $T_{\text{HE-LTF}}$, defined in Equation (27-40).

$$T_{\text{HE-LTF}} = \begin{cases} T_{\text{HE-LTF-1X}}, \text{ if 1x HE-LTF} \\ T_{\text{HE-LTF-2X}}, \text{ if 2x HE-LTF} \\ T_{\text{HE-LTF-4X}}, \text{ if 4x HE-LTF} \end{cases} \tag{27-40}$$

where $T_{\text{HE-LTF-1X}}$, $T_{\text{HE-LTF-2X}}$, and $T_{\text{HE-LTF-4X}}$ are defined in Table 27-13.

In a 20 MHz transmission, the 1x HE-LTF sequence transmitted on subcarriers [–122: 122] is given by Equation (27-41).

$$\begin{aligned} HELTF_{-122,122} = \\ &\{0, 0, -1, 0, 0, 0, +1, 0, 0, 0, +1, 0, 0, 0, -1, 0, 0, 0, +1, 0, 0, 0, -1, 0, 0, 0, +1, 0, 0, 0, +1, \\ &0, 0, 0, +1, 0, 0, 0, +1, 0, 0, 0, -1, 0, 0, 0, -1, 0, 0, 0, +1, 0, 0, 0, +1, 0, 0, 0, +1, 0, 0, 0, - \\ &1, 0, 0, 0, -1, 0, 0, 0, -1, 0, 0, 0, +1, 0, 0, 0, -1, 0, 0, 0, -1, 0, 0, 0, +1, 0, 0, 0, +1, 0, 0, 0, \\ &-1, 0, 0, 0, -1, 0, 0, 0, +1, 0, 0, 0, -1, 0, 0, 0, -1, 0, 0, 0, +1, 0, 0, 0, -1, 0, 0, 0, 0, 0, 0, 0, \\ &-1, 0, 0, 0, +1, 0, 0, 0, +1, 0, 0, 0, +1, 0, 0, 0, +1, 0, 0, 0, +1, 0, 0, 0, +1, 0, 0, 0, -1, 0, 0, \\ &0, -1, 0, 0, 0, -1, 0, 0, 0, -1, 0, 0, 0, -1, 0, 0, 0, +1, 0, 0, 0, -1, 0, 0, 0, -1, 0, 0, 0, -1, 0, \\ &0, 0, +1, 0, 0, 0, -1, 0, 0, 0, -1, 0, 0, 0, +1, 0, 0, 0, -1, 0, 0, 0, -1, 0, 0, 0, +1, 0, 0, 0, -1, \\ &0, 0, 0, +1, 0, 0, 0, -1, 0, 0, 0, -1, 0, 0, 0, -1, 0, 0, 0, -1, 0, 0, 0, -1, 0, 0\} \end{aligned} \tag{27-41}$$

In a 20 MHz transmission, the 2x HE-LTF sequence transmitted on subcarriers [–122: 122] is given by Equation (27-42).

$$\begin{aligned} HELTF_{-122,122} = \\ &\{-1, 0, -1, 0, -1, 0, +1, 0, +1, 0, -1, 0, +1, 0, -1, 0, -1, 0, -1, 0, -1, 0, +1, 0, -1, 0, +1, 0, \\ &-1, 0, -1, 0, +1, 0, +1, 0, -1, 0, +1, 0, +1, 0, +1, 0, +1, 0, +1, 0, -1, 0, +1, 0, -1, 0, +1, 0, \\ &-1, 0, -1, 0, +1, 0, +1, 0, -1, 0, +1, 0, -1, 0, -1, 0, -1, 0, -1, 0, +1, 0, -1, 0, +1, 0, +1, 0, \\ &+1, 0, -1, 0, -1, 0, +1, 0, -1, 0, -1, 0, -1, 0, -1, 0, -1, 0, +1, 0, -1, 0, -1, 0, -1, 0, +1, 0, \\ &+1, 0, +1, 0, -1, 0, -1, 0, +1, 0, 0, 0, +1, 0, -1, 0, +1, 0, +1, 0, -1, 0, +1, 0, +1, 0, -1, 0, \\ &+1, 0, +1, 0, -1, 0, -1, 0, +1, 0, -1, 0, +1, 0, +1, 0, +1, 0, +1, 0, -1, 0, +1, 0, -1, 0, +1, 0, \\ &+1, 0, -1, 0, -1, 0, +1, 0, -1, 0, -1, 0, -1, 0, -1, 0, -1, 0, +1, 0, -1, 0, +1, 0, +1, 0, -1, 0, \\ &-1, 0, +1, 0, +1, 0, -1, 0, +1, 0, -1, 0, -1, 0, -1, 0, -1, 0, +1, 0, -1, 0, +1, 0, +1, 0, +1, 0, \\ &-1, 0, -1, 0, +1, 0, -1, 0, -1, 0, -1, 0, -1, 0, -1, 0, +1, 0, -1, 0, +1\} \end{aligned} \tag{27-42}$$

For an 80+80 MHz transmission using a 1x HE-LTF, the lower 80 MHz frequency segment shall use the 80 MHz 1x HE-LTF sequence, $HELTF_{-500,500} = LTF_{\text{80MHz\_lower\_1x}}$, and the upper 80 MHz frequency segment shall use the 80 MHz 1x HE-LTF sequence, $HELTF_{-500,500} = LTF_{\text{80MHz\_upper\_1x}}$.

For an 80+80 MHz transmission using a 2x HE-LTF, the lower 80 MHz frequency segment shall use the 80 MHz 2x HE-LTF sequence, $HELTF_{-500,500} = LTF_{\text{80MHz\_lower\_2x}}$, and the upper 80 MHz frequency segment shall use the 80 MHz 2x HE-LTF sequence, $HELTF_{-500,500} = LTF_{\text{80MHz\_upper\_2x}}$.

For an 80+80 MHz transmission using a 4x HE-LTF, the lower 80 MHz frequency segment shall use the 80 MHz 4x HE-LTF sequence, $HELTF_{-500,500} = LTF_{\text{80MHz\_lower\_4x}}$, and the upper 80 MHz frequency segment shall use the 80 MHz 4x HE-LTF sequence, $HELTF_{-500,500} = LTF_{\text{80MHz\_upper\_4x}}$.

For an OFDMA transmission, the values of HE-LTF sequence [defined in Equation (27-41) to Equation (27-56)] are set to zero if they are assigned to subcarriers within RUs that are not allocated to any user (see 27.3.10).

In a UL MU-MIMO transmission using the HE masked HE-LTF sequence mode, the HE-LTF sequence per frequency subblock is generated by masking the nonzero elements in the common HE-LTF sequence repeatedly with a distinct orthogonal code as defined by Equation (27-53).

$$HELTF^{\text{Mask}}_{k,u,m} = HELTF_k \cdot \left[P_{8\times 8}\right]_{M_{r,u}+m,\left(\left(\left\lceil \frac{k}{N_{\text{HE-LTF-Type}}} \right\rceil - 1\right) \bmod 8\right)+1} \tag{27-53}$$

where

$HELTF_k$ is the value of the common HE-LTF sequence on subcarrier k generated by one of the equations from Equation (27-41) to Equation (27-52) depending on the bandwidth and the HE-LTF type (excluding the 1x HE-LTF, which shall not be masked)

$\left[P_{8\times 8}\right]$ is defined in Equation (21-45)

$M_{r,u} + m$ is the row index of the $\left[P_{8\times 8}\right]$ corresponding to spatial time stream m of user u in the r^{th} RU

$$N_{\text{HE-LTF-Type}} = \begin{cases} 2, \text{ for 2x HE-LTF} \\ 1, \text{ for 4x HE-LTF} \end{cases}$$

In the HE TB feedback NDP, neither HE single stream pilot HE-LTF mode nor HE masked HE-LTF sequence mode is applied to the HE-LTF sequence. Only 4x HE-LTF shall be used in the HE TB feedback NDP. The 4x HE-LTF sequence is generated by Equation (27-54).

$$HELTF^{\text{TB\_NDP}}_{k,u} = \begin{cases} HELTF_k, \text{ if } k \in K_{\text{tone\_NDP}_u} \\ 0, \text{ otherwise} \end{cases} \tag{27-54}$$

where

$HELTF_k$ is the value of the common HE-LTF sequence on subcarrier k generated by one of the 4x HE-LTF equations [Equation (27-43), Equation (27-46), Equation (27-49), Equation (27-52)] according to the channel bandwidth

$K_{\text{tone\_NDP}u}$ is the set of subcarrier indices for user u and is defined in Table 27-33 according to the RU_TONE_SET_INDEX and FEEDBACK_STATUS

Table 27-33—HE-LTF subcarrier mapping for the HE TB feedback NDP *(continued)*

RU_TONE_SET_INDEX	80 MHz		40 MHz		20 MHz	
	$K_{\text{tone\_NDP}u}$ if FEEDBACK_STATUS is 1	$K_{\text{tone\_NDP}u}$ if FEEDBACK_STATUS is 0	$K_{\text{tone\_NDP}u}$ if FEEDBACK_STATUS is 1	$K_{\text{tone\_NDP}u}$ if FEEDBACK_STATUS is 0	$K_{\text{tone\_NDP}u}$ if FEEDBACK_STATUS is 1	$K_{\text{tone\_NDP}u}$ if FEEDBACK_STATUS is 0
19–36	Use 20 MHz FEEDBACK_STATUS = 1 Subcarrier Indices – 128	Use 20 MHz FEEDBACK_STATUS = 0 Subcarrier Indices – 128	Use 20 MHz FEEDBACK_STATUS = 1 Subcarrier Indices + 128	Use 20 MHz FEEDBACK_STATUS = 0 Subcarrier Indices + 128		
37–54	Use 20 MHz FEEDBACK_STATUS = 1 Subcarrier Indices + 128	Use 20 MHz FEEDBACK_STATUS = 0 Subcarrier Indices + 128				
55–72	Use 20 MHz FEEDBACK_STATUS = 1 Subcarrier Indices + 384	Use 20 MHz FEEDBACK_STATUS = 0 Subcarrier Indices + 384				
The RU_TONE_SET_INDEX for 80+80 MHz and 160 MHz shall use the 80 MHz RU_TONE_SET_INDEX definition for the lower and upper 80 MHz. The RU_TONE_SET_INDEX values 1–72 are mapped to the lower 80 MHz, and the RU_TONE_SET_INDEX values 73–144 are mapped to the upper 80 MHz.						

The generation of the time domain HE-LTF symbols per frequency segment in an HE SU PPDU, HE MU PPDU, and HE ER SU PPDU is shown in Figure 27-32 where $A^{k}_{\text{HE-LTF}}$ is given by Equation (27-55).

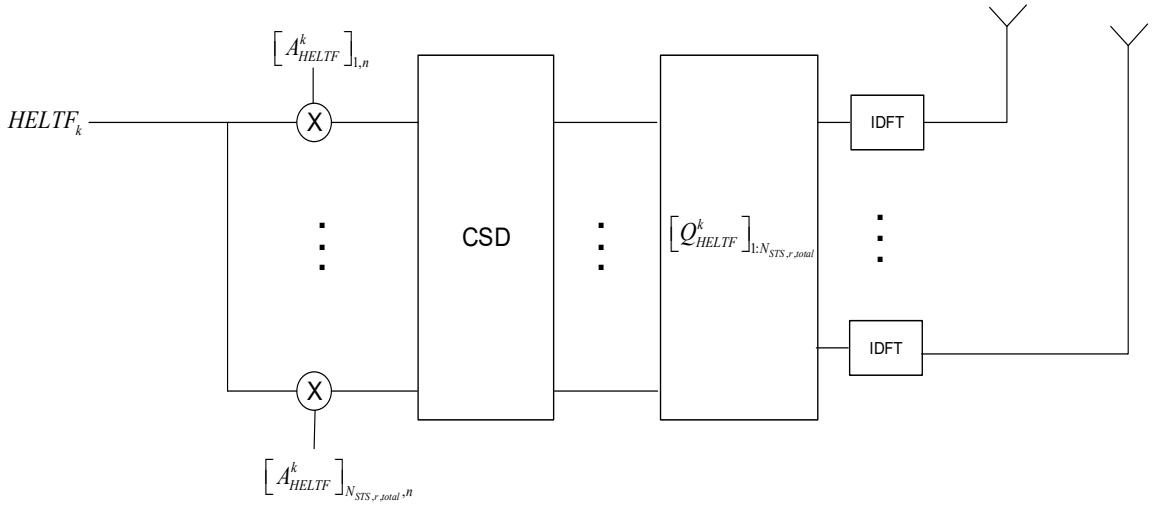

Figure 27-32—Generation of HE-LTF symbols per frequency segment in an HE SU PPDU, HE MU PPDU, and HE ER SU PPDU

The generation of the time domain HE-LTF symbols per frequency segment in an HE TB PPDU is shown in Figure 27-33.

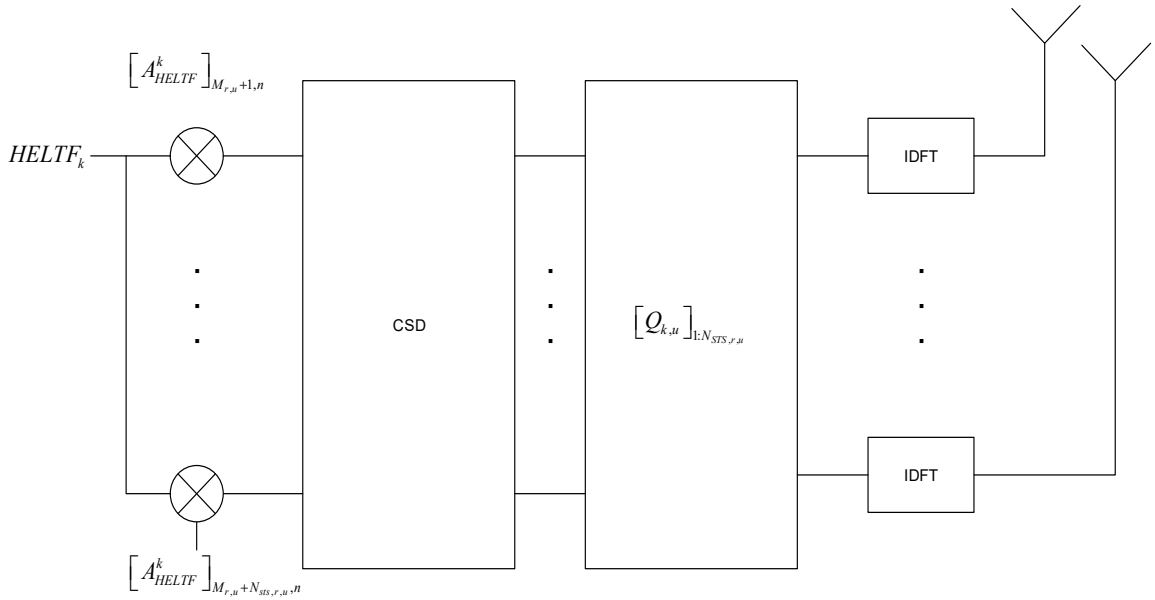

Figure 27-33—Generation of HE-LTF symbols per frequency segment in an HE TB PPDU for user *u* on RU *r*

The generation of the time domain symbol of a 1x HE-LTF is equivalent to modulating every 4 subcarriers in an OFDM symbol of 12.8 μs excluding GI and then transmitting only the first 1/4 of the OFDM symbol in the time domain, as shown in Figure 27-34.

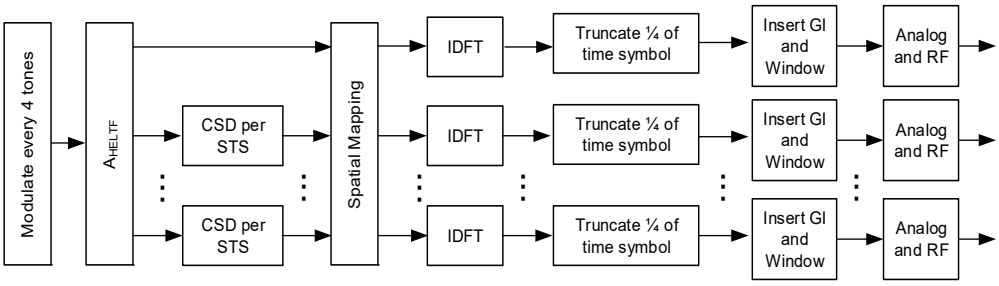

Figure 27-34—Generation of 1x HE-LTF symbols per frequency segment

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The generation of the time domain symbol of a 2x HE-LTF is equivalent to modulating every other subcarrier in an OFDM symbol of 12.8 μs excluding GI and then transmitting only the first half of the OFDM symbol in time domain, as shown in Figure 27-35.

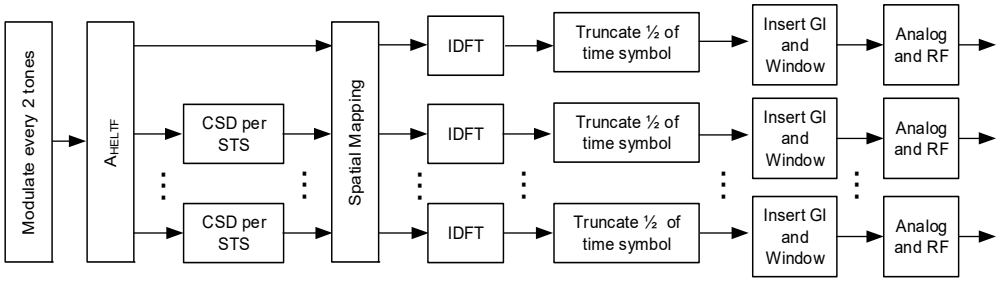

Figure 27-35—Generation of 2x HE-LTF symbols per frequency segment

$A^{k}_{\text{HE-LTF}}$ is given by Equation (27-55).

$$A^{k}_{\text{HE-LTF}} = \begin{cases} R_{\text{HE-LTF}}, \text{ if } k \in K_{\text{Pilot}} \text{ and HE single stream pilot HE-LTF mode is used} \\ P_{\text{HE-LTF}}, \text{ otherwise} \end{cases} \quad (27\text{-}55)$$

where

K_{Pilot} is the set of subcarrier indices for the pilot subcarriers as defined in 27.3.2.4

$R_{\text{HE-LTF}}$ is a $N_{\text{HE-LTF}} \times N_{\text{HE-LTF}}$ matrix whose elements are defined in Equation (27-56)

$$\left[R_{\text{HE-LTF}}\right]_{m,n} = \left[P_{\text{HE-LTF}}\right]_{1,n},\ 1 \le m, n \le N_{\text{HE-LTF}} \quad (27\text{-}56)$$

$P_{\text{HE-LTF}}$ is defined in Equation (27-57)

$$P_{\text{HE-LTF}} = \begin{cases} P_{4\times 4}, N_{\text{HE-LTF}} = 1, 2, 4 \\ P_{6\times 6}, N_{\text{HE-LTF}} = 6 \\ P_{8\times 8}, N_{\text{HE-LTF}} = 8 \end{cases} \quad (27\text{-}57)$$

where $P_{4\times 4}$ is defined in Equation (19-27), $P_{6\times 6}$ is defined in Equation (21-44), and $P_{8\times 8}$ is defined in Equation (21-45)

If the 1x HE-LTF is used for non-OFDMA UL MU-MIMO, the HE no pilot HE-LTF mode is used.

In an HE SU PPDU, HE MU PPDU, and HE ER SU PPDU, the time domain representation of the waveform, transmitted on frequency segment i_{Seg} and transmit chain i_{TX}, shall be as described by Equation (27-58).

$$r^{(i_{Seg}, i_{TX})}_{\text{HE-LTF}}(t) = \frac{1}{\sqrt{\sum_{r=0}^{N_{RU}-1} \alpha_r^2 |K_r|}} \sum_{n=0}^{N_{\text{HE-LTF}}-1} w_{T_{\text{HE-LTF-SYM}}}(t - nT_{\text{HE-LTF-SYM}}) \sum_{r=0}^{N_{RU}-1} \frac{\alpha_r \sqrt{|K_r|}}{\sqrt{N_{STS,r,total}\Gamma_r^{\text{HE-LTF}}}} \quad (27\text{-}58)$$

$$\sum_{k \in K_r} \eta_{\text{HE-LTF},k} \sum_{u=0}^{N_{user,r}-1} \sum_{m=1}^{N_{STS,r,u}} \left(\begin{array}{l} \left[Q_k^{(i_{Seg})}\right]_{i_{TX},(M_{r,u}+m)} \left[A^{k}_{\text{HE-LTF}}\right]_{(M_{r,u}+m),(n+1)} HELTF''_{k,u,m} \\ \cdot \exp(j2\pi k \Delta_{F,\text{HE}}(t - nT_{\text{HE-LTF-SYM}} - T_{GI,\text{HE-LTF}} - T_{CS,\text{HE}}(M_{r,u}+m))) \end{array} \right)$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In an HE TB PPDU, the time domain representation of the waveform of user u in the r^{th} RU, transmitted on frequency segment i_{Seg} and transmit chain i_{TX}, shall be as described by Equation (27-59).

$$r_{\text{HE-LTF},r,u}^{(i_{Seg},i_{TX})}(t) = \frac{1}{\sqrt{N_{STS,r,u}\Gamma_r^{\text{HE-LTF}}}} \sum_{n=0}^{N_{\text{HE-LTF}}-1} w_{T_{\text{HE-LTF}}}(t - nT_{\text{HE-LTF}}) \sum_{k\in K_r} \sum_{m=1}^{N_{STS,r,u}} \left(\begin{array}{c} \left[Q_{k,u}^{(i_{Seg})}\right]_{i_{TX},m} \left[A_{\text{HE-LTF}}^{k}\right]_{(M_{r,u}+m),(n+1)} HELTF''_{k,u,m} \\ \cdot \exp(j2\pi k\Delta_{F,\text{HE}}(t - nT_{\text{HE-LTF-SYM}} - T_{GI,\text{HE-LTF}} - T_{CS,\text{HE}}(M_{r,u}+m))) \end{array} \right) \quad (27\text{-}59)$$

In Equation (27-58) and Equation (27-59), the following notations are used:

$N_{user,r}$ is the number of HE MU PPDU recipients (see Table 27-16) in RU r

$HELTF''_{k,u,m}$ is the HE-LTF sequence applied on subcarrier k for spatial stream m of user u

$$HELTF''_{k,u,m} = \begin{cases} HELTF_{k,u,m}^{\text{Mask}}, \text{ if HE masked HE-LTF sequence mode is used} \\ HELTF_{k,u}^{\text{TB\_NDP}}, \text{ for an HE TB feedback NDP} \\ HELTF_k, \text{ otherwise} \end{cases}$$

α_r is defined in 27.3.10

$\eta_{\text{HE-LTF},k}$ is an HE PPDU format-dependent scaling factor, defined by

$$\eta_{\text{HE-LTF},k} = \begin{cases} \sqrt{2}, \text{ for an HE ER SU PPDU} \\ 1, \text{ otherwise} \end{cases}$$

$N_{\text{HE-LTF}}$ is the number of OFDM symbols in the HE-LTF field

$T_{CS,\text{HE}}(M_{r,u}+m)$ represents the cyclic shift for space-time stream $M_{r,u}+m$ as defined in 27.3.11.2.2

$Q_k^{(i_{Seg})}$ and $Q_{k,u}^{(i_{Seg})}$ are defined in 27.3.10

$A_{\text{HE-LTF}}^{k}$ is defined in Equation (27-55)

$M_{r,u}$ is given in Table 27-16 for HE SU PPDU, HE ER SU PPDU, and HE MU PPDU. For an HE TB PPDU it is given by the TXVECTOR parameter STARTING_STS_NUM.

K_r is the set of subcarrier indices for the tones in the RU r as defined in 27.3.10

$|K_r|$ and $\Gamma_r^{\text{HE-LTF}}$ are defined after Equation (27-5)

other variables are defined after Equation (27-1), Equation (27-3), Equation (27-4), Equation (27-6), Equation (27-8), Equation (27-12), and Equation (27-40)

27.3.12 Data field

27.3.12.1 General

The number of OFDM symbols in the Data field is determined by the LENGTH field in the L-SIG field (see Equation (27-11)), the preamble duration, and the settings of the GI+HE-LTF Size, Pre-FEC Padding Factor, and PE Disambiguity fields in the HE-SIG-A field (see 27.3.11.7) for an HE SU PPDU, HE ER SU PPDU, and HE MU PPDU or in the soliciting Triggering frame for an HE TB PPDU. Data field OFDM symbols in an HE PPDU shall use a DFT period of 12.8 μs and subcarrier spacing of 78.125 kHz. An HE STA shall support Data field OFDM symbols in an HE PPDU with guard interval durations of 0.8 μs, 1.6 μs,

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

and 3.2 μs. HE PPDUs shall have HE single stream pilot in the Data field. In UL MU-MIMO transmissions, all streams use the same pilot sequence.

If BCC encoding is used, the Data field shall consist of the SERVICE field, the PSDU, the pre-FEC PHY padding bits, the tail bits, and the post-FEC padding bits. If LDPC encoding is used, the Data field shall consist of the SERVICE field, the PSDU, the pre-FEC PHY padding bits, and the post-FEC padding bits. No tail bits are present if LDPC encoding is used.

The Data field of the HE PPDU contains data for one or more users.

27.3.12.2 Pre-FEC padding process

A two-step padding process is applied to an HE PPDU. A pre-FEC padding process including both pre-FEC MAC and pre-FEC PHY padding is applied before conducting FEC coding, and a post-FEC PHY padding process is applied on the FEC encoded bits.

Four pre-FEC padding boundaries partition the last one (in the case of non-STBC) or two (in the case of STBC) OFDM symbols of an HE PPDU into four symbol segments. The pre-FEC padding may pad toward one of the four possible boundaries. The four pre-FEC padding boundaries are represented by a pre-FEC padding factor parameter.

Figure 27-36 illustrates these four possible symbol segments in the last OFDM symbol of a non-STBC case, and the general padding process assuming the desired pre-FEC padding boundary, represented by the pre-FEC padding factor, is 1.

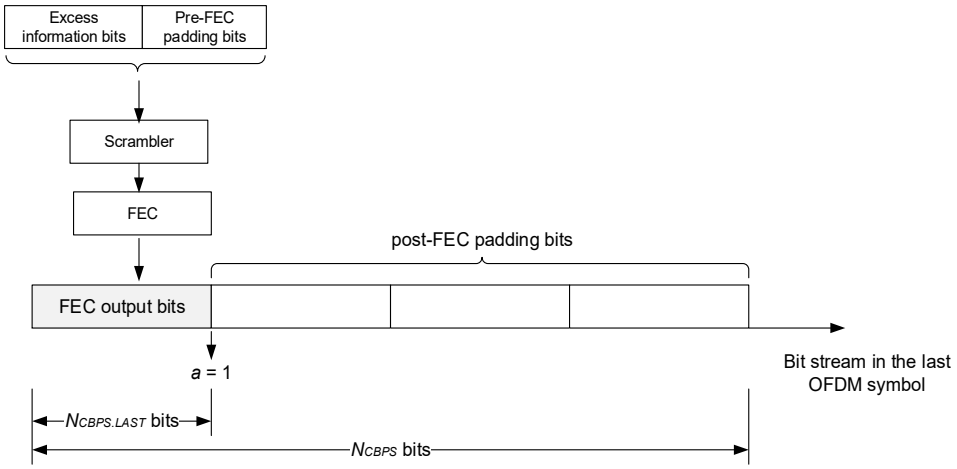

Figure 27-36—HE PPDU padding process in the last OFDM symbol (non-STBC) if *a* = 1

Figure 27-37 illustrates these four possible symbol segments in the last two OFDM symbols of an STBC case, and the general padding process assuming the desired pre-FEC padding boundary, represented by the pre-FEC padding factor, is 1. The FEC output bits are modulated into the last two OFDM symbols toward the pre-FEC padding boundary by STBC encoding, then the post-FEC padding bits are modulated into the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

last two OFDM symbols after the pre-FEC padding boundary by STBC encoding. The last two OFDM symbols have the same pre-FEC padding boundary.

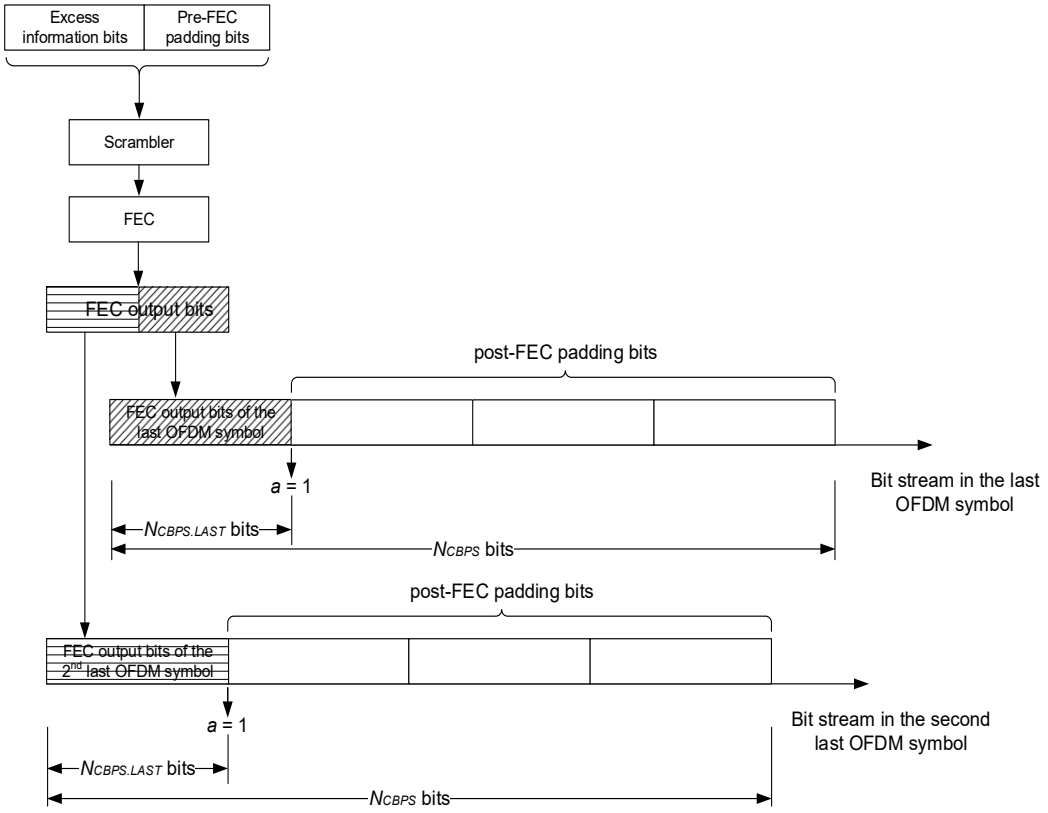

Figure 27-37—HE PPDU padding process in the last two OFDM symbols (STBC) if a = 1

The pre-FEC padding process is described in this subclause, and the encoding and post-FEC padding process are described in 27.3.12.5. While this subclause describes the pre-FEC padding processing of an SU transmission, its extension to MU transmission is described in 27.3.12.5.4 and 27.3.12.5.5.

In an HE SU PPDU and HE ER SU PPDU transmission, the transmitter first computes the number of bits left in the last OFDM symbol (non-STBC) or in the last two OFDM symbols (STBC) based on Equation (27-60).

$$N_{Excess} = mod(8 \times \text{APEP\_LENGTH} + N_{Tail} + N_{service}, m_{STBC} \cdot N_{DBPS}) \quad (27\text{-}60)$$

where

m_{STBC}	is 2 if STBC is used, and 1 otherwise
APEP_LENGTH	is the TXVECTOR parameter APEP_LENGTH
N_{Tail}	is the number of tail bits per encoder as defined in Table 27-13
$N_{service}$	is the number of bits in the SERVICE field as defined in Table 27-13
N_{DBPS}	is the number of data bits per symbol

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Based on N_{Excess}, compute the initial number of symbol segments in the last OFDM symbol (non-STBC) or in the last two OFDM symbols (STBC), initial pre-FEC padding factor value or a_{init}, as shown in Equation (27-61).

$$a_{init} = \begin{cases} 4, & \text{if } N_{Excess} = 0 \\ \min\left(\left\lceil \dfrac{N_{Excess}}{m_{STBC} \cdot N_{DBPS,short}} \right\rceil, 4\right), & \text{otherwise} \end{cases} \quad (27\text{-}61)$$

where

$N_{DBPS,short} = N_{CBPS,short} \cdot R$, where R is the coding rate and $N_{CBPS,short} = N_{SD,short} \cdot N_{SS} \cdot N_{BPSCS}$

The parameter $N_{SD,short}$ values for different RU sizes are as shown in Table 27-34.

Table 27-34—$N_{SD,short}$ values

RU size	$N_{SD,short}$	
	DCM = 0	DCM = 1
26-tone	6	2
52-tone	12	6
106-tone	24	12
242-tone	60	30
484-tone	120	60
996-tone	240	120
2×996-tone	492	246

Given the a_{init} values, the initial number of data bits per symbol and the initial number of coded bits per symbol in the last OFDM symbol (non-STBC) or in the last two OFDM symbols (STBC) are defined in Equation (27-62).

$$N_{DBPS,last,init} = \begin{cases} a_{init} N_{DBPS,short}, & \text{if } a_{init} < 4 \\ N_{DBPS}, & \text{if } a_{init} = 4 \end{cases}$$
$$N_{CBPS,last,init} = \begin{cases} a_{init} N_{CBPS,short}, & \text{if } a_{init} < 4 \\ N_{CBPS}, & \text{if } a_{init} = 4 \end{cases} \quad (27\text{-}62)$$

For an HE SU PPDU and HE ER SU PPDU, the number of pre-FEC pad bits is calculated using Equation (27-63).

$$N_{PAD,\text{Pre-FEC}} = (N_{SYM.init} - m_{STBC}) N_{DBPS} + m_{STBC} N_{DBPS,last,init} - 8 \times \text{APEP\_LENGTH} - N_{Tail} - N_{service} \quad (27\text{-}63)$$

where $N_{SYM,init}$ is the initial number of data OFDM symbols with BCC or LDPC encoding in an HE SU PPDU or HE ER SU PPDU as defined by Equation (27-64).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$N_{SYM,\,init} = m_{STBC} \cdot \left\lceil \frac{8 \times \text{APEP\_LENGTH} + N_{Tail} + N_{service}}{m_{STBC} N_{DBPS}} \right\rceil \quad (27\text{-}64)$$

Among the pre-FEC padding bits, the MAC delivers a PSDU that fills the available octets in the Data field of the HE PPDU (see A-MPDU padding for HE PPDUs in 26.6.2.2 and 26.6.2.3), toward the desired initial pre-FEC padding boundary, represented by a_{init} value, in the last OFDM symbol (non-STBC) or in the last two OFDM symbols (STBC). The number of pre-FEC pad bits added by the MAC is a multiple of 8. The PHY then determines the number of remaining pad bits to add and appends them to the PSDU. The number of pre-FEC pad bits added by PHY is 0 to 7. The procedure is defined in Equation (27-65).

$$\begin{aligned} N_{PAD,\,\text{Pre-FEC,MAC}} &= \left\lfloor \frac{N_{PAD,\,\text{Pre-FEC}}}{8} \right\rfloor \times 8 \\ N_{PAD,\,\text{Pre-FEC,PHY}} &= N_{PAD,\,\text{Pre-FEC}} \bmod 8 \end{aligned} \quad (27\text{-}65)$$

27.3.12.3 SERVICE field

The SERVICE field of HE PPDU is shown in Table 27-35.

Table 27-35—SERVICE field

Bits	Field	Description
B0–B6	Scrambler Initialization	Set to 0
B7–B15	Reserved	Set to 0

27.3.12.4 Scrambler

The SERVICE field, PSDU, and pre-FEC PHY padding of the Data field shall be scrambled by the scrambler defined in 17.3.5.5. The Clause 17 TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT, DYN_BANDWIDTH_IN_NON_HT, and SCRAMBLER_INITIAL_VALUE are not present; therefore, the first 7 bits of the scrambling sequence are set to a 7-bit nonzero pseudorandom integer. A different nonzero pseudorandom value may be used for each user in an HE MU PPDU.

27.3.12.5 Coding

The Data field shall be encoded using either the binary convolutional code (BCC) defined in 27.3.12.5.1 or the low-density parity check (LDPC) code defined in 27.3.12.5.2. The coding type is selected by the Coding field in the HE-SIG-A field in an HE SU PPDU or HE ER SU PPDU, by the Coding field in the HE-SIG-B field per user subfield(s) in an HE MU PPDU, or by the UL FEC Coding Type subfield in the User Info field in the corresponding Trigger frame in an HE TB PPDU, as defined in 27.3.11.7, 27.3.11.8, and 9.3.1.22, respectively.

When conducting BCC FEC encoding for an HE PPDU, the number of encoders is always 1.

LDPC is the only FEC coding scheme in the HE PPDU Data field for a 484-, 996-, and 2×996-tone RU. LDPC is the only FEC coding scheme in the HE PPDU Data field for HE-MCSs 10 and 11. Support for BCC coding is limited to less than or equal to four spatial streams and HE-MCSs 0 to 9 (per user in the case of MU-MIMO) and is mandatory (for both transmit and receive) for RU sizes less than or equal to a 242-tone RU. The LDPC Coding In Payload subfield in the HE Capabilities element indicates support for the transmission and reception of the LDPC encoded PPDUs. Support for LDPC coding (for both transmit and receive) is mandatory for HE STAs declaring support for at least one of HE 40/80/160/80+80 SU PPDU

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

bandwidths, for HE STAs declaring support for more than 4 spatial streams, or for HE STAs declaring support for HE-MCSs 10 and 11, according to the LDPC Coding In Payload subfield in the HE Capabilities element as defined in 9.4.2.247. Otherwise, support of LDPC coding for either transmit or receive is optional.

27.3.12.5.1 BCC coding and puncturing

The information bits and pre-FEC padding bits of user u are encoded by a rate $R = 1/2$ convolutional encoder defined in 17.3.5.6. After encoding, the encoded data is punctured by the method defined in 17.3.5.6 (except for rate 5/6) to achieve the rate selected by the modulation and coding scheme. When rate 5/6 coding is selected, the puncturing scheme is the same as described in 19.3.11.6.

If DCM is used with BPSK modulation in a 106-tone or 242-tone RU with $N_{SS} = 1$, then after every $2 \times N_{DBPS}$ coded bits, one padding bit is added. The padding bit may be set to any value.

For an HE SU PPDU and HE ER SU PPDU with BCC encoding,

$$N_{SYM} = N_{SYM,init} \tag{27-66}$$

and

$$a = a_{init} \tag{27-67}$$

where

$N_{SYM,init}$ is defined in Equation (27-64)
a_{init} is defined in Equation (27-61)
a is the pre-FEC padding factor

The number of data bits per symbol in the last OFDM symbol(s) of an HE SU PPDU or HE ER SU PPDU is $N_{DBPS,last} = N_{DBPS,last,init}$, where $N_{DBPS,last,init}$ is defined in Equation (27-62).

The number of coded bits per symbol in the last OFDM symbol(s) of an HE SU PPDU or HE ER SU PPDU is $N_{CBPS,last} = N_{CBPS,last,init}$, where $N_{CBPS,last,init}$ is defined in Equation (27-62).

27.3.12.5.2 LDPC coding

For an HE SU PPDU or HE ER SU PPDU using LDPC coding on the Data field, the LDPC coding process described in 19.3.11.7 shall be used with the following modifications:

First, all bits in the Data field including the scrambled SERVICE, PSDU, and pre-FEC pad bits are encoded. Thus, N_{pld} for HE PPDUs shall be computed using Equation (27-68) instead of Equation (19-35).

$$N_{pld} = (N_{SYM,init} - m_{STBC})N_{DBPS} + m_{STBC}N_{DBPS,last,init} \tag{27-68}$$

where $N_{SYM,init}$ is defined in Equation (27-64).

N_{avbits} shall be computed using Equation (27-69) instead of Equation (19-36).

$$N_{avbits} = (N_{SYM,init} - m_{STBC}) \cdot N_{CBPS} + m_{STBC} \cdot N_{CBPS,last,init} \tag{27-69}$$

In addition, in step d) of the LDPC encoding process in 19.3.11.7.5, if the following condition is met:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$(N_{punc} > 0.1 \times N_{CW} \times L_{LDPC} \times (1-R))$ AND $\left(N_{shrt} < 1.2 \times N_{punc} \times \frac{R}{1-R}\right)$ is true OR if $N_{punc} > 0.3 \times N_{CW} \times L_{LDPC} \times (1-R)$ is true,

then the LDPC Extra Symbol Segment field of the HE-SIG-A field shall be set to 1, N_{avbits} shall be increased according to the Equation (27-70) instead of Equation (19-39), and N_{punc} shall be recomputed as in Equation (19-40):

$$N_{avbits} = \begin{cases} N_{avbits} + m_{STBC} \cdot (N_{CBPS} - 3N_{CBPS,short}), & \text{if } a_{init} = 3 \\ N_{avbits} + m_{STBC} \cdot N_{CBPS,short}, & \text{otherwise} \end{cases} \quad (27\text{-}70)$$

and then compute the pre-FEC padding factor a and N_{SYM} using Equation (27-71).

$$\begin{cases} N_{SYM} = N_{SYM,init} + m_{STBC} \text{ and } a = 1, & \text{if } a_{init} = 4 \\ N_{SYM} = N_{SYM,init} \text{ and } a = a_{init} + 1, & \text{otherwise} \end{cases} \quad (27\text{-}71)$$

If in step d) of the LDPC encoding process in 19.3.11.7.5, the above mentioned condition is not met, then the LDPC Extra Symbol Segment field in the HE-SIG-A field shall be set to 0, and

$$\begin{aligned} N_{SYM} &= N_{SYM,init} \\ a &= a_{init} \end{aligned} \quad (27\text{-}72)$$

Using the pre-FEC padding factor a, compute N_{CBPS} of the last symbol using Equation (27-73).

$$N_{CBPS,last} = \begin{cases} a \cdot N_{CBPS,short}, & \text{if } a < 4 \\ N_{CBPS}, & \text{if } a = 4 \end{cases} \quad (27\text{-}73)$$

The number of data bits of the last symbol is calculated as $N_{DBPS,last} = N_{DBPS,last,init}$.

LDPC coding used in HE MU PPDUs shall also follow the definitions in 19.3.11.7. Refer to 27.3.12.5.4 for a description of the LDPC encoding process for HE MU PPDUs.

27.3.12.5.3 Post-FEC padding

The number of post-FEC padding bits in each of the last m_{STBC} symbols is computed by using Equation (27-74).

$$N_{PAD,Post\text{-}FEC} = N_{CBPS} - N_{CBPS,last} \quad (27\text{-}74)$$

The last m_{STBC} symbols shall consist of $N_{CBPS,last}$ bits from the FEC output followed by $N_{PAD,Post\text{-}FEC}$ post-FEC padding bits. The values of the post-FEC padding bits are not specified and are determined by the implementation.

27.3.12.5.4 Encoding process for an HE MU PPDU

For an HE MU PPDU, all the users shall use a common pre-FEC padding factor value and a common N_{SYM} value. The padding process is described as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

First compute initial pre-FEC padding factor value, $a_{init,u}$, for each user u using Equation (27-61) and the initial number of OFDM symbols, $N_{SYM,init,u}$, for each user u using Equation (27-64). Among all the users, derive the user index with the longest encoded duration, as in Equation (27-75).

$$u_{\max} = \arg\max_{u=0}^{N_{user,total}-1}\left(N_{SYM,init,u} - m_{STBC} + \frac{m_{STBC}a_{init,u}}{4}\right) \tag{27-75}$$

where

$\arg\max f(x) := \{x | x \in [0, N_{user,total} - 1] \wedge \forall y \in [0, N_{user,total} - 1]; f(y) \leq f(x)\}$

m_{STBC} is the common STBC setting among all the users, as described in 27.3.11.7

Then the common a_{init} and $N_{SYM,init}$ values among all the users are derived by Equation (27-76).

$$\begin{aligned} N_{SYM,init} &= N_{SYM,init,u_{\max}} \\ a_{init} &= a_{init,u_{\max}} \end{aligned} \tag{27-76}$$

Calculate each user's initial number of coded bits in its last symbol as in Equation (27-77).

$$\begin{aligned} N_{DBPS,last,init,u} &= \begin{cases} a_{init}N_{DBPS,short,u}, \text{ if } a_{init} < 4 \\ N_{DBPS,u}, \text{ if } a_{init} = 4 \end{cases} \\ N_{CBPS,last,init,u} &= \begin{cases} a_{init}N_{CBPS,short,u}, \text{ if } a_{init} < 4 \\ N_{CBPS,u}, \text{ if } a_{init} = 4 \end{cases} \end{aligned} \tag{27-77}$$

For each user with LDPC encoding, the number of pre-FEC padding bits is computed as in Equation (27-78).

$$\begin{aligned} N_{PAD,\text{Pre-FEC},u} = {} & (N_{SYM,init} - m_{STBC})N_{DBPS,u} + m_{STBC}N_{DBPS,last,init,u} \\ & - 8 \cdot \text{APEP\_LENGTH}_u - N_{service} \end{aligned} \tag{27-78}$$

For each user with LDPC encoding, the parameters $N_{pld,u}$ and $N_{avbits,u}$ are computed using Equation (27-79) and Equation (27-80), respectively.

$$N_{pld,u} = (N_{SYM,init} - m_{STBC})N_{DBPS,u} + m_{STBC}N_{DBPS,last,init,u} \tag{27-79}$$

$$N_{avbits,u} = (N_{SYM,init} - m_{STBC})N_{CBPS,u} + m_{STBC}N_{CBPS,last,init,u} \tag{27-80}$$

For each user with LDPC encoding, continue the LDPC encoding process in 19.3.11.7.5 starting with the parameters $N_{pld,u}$ and $N_{avbits,u}$. If there is at least one user with LDPC encoding for which step d) of the LDPC encoding process in 19.3.11.7.5 meets the following condition:

$(N_{punc,u} > 0.1 \times N_{CW,u} \times L_{LDPC,u} \times (1 - R_u))$ AND $\left(N_{shrt,u} < 1.2 \times N_{punc,u} \times \frac{R_u}{1 - R_u}\right)$ is true OR if

$N_{punc,u} > 0.3 \times N_{CW,u} \times L_{LDPC,u} \times (1 - R_u)$ is true,

where $N_{punc,u}$, $N_{CW,u}$, $L_{LDPC,u}$, and $N_{shrt,u}$ are the LDPC encoding parameters for user u, as defined in 19.3.11.7.5, and R_u is the coding rate of user u.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Then the LDPC Extra Symbol Segment field in the HE-SIG-A field shall be set to 1, and all the users with LDPC encoding shall increment N_{avbits} and recompute N_{punc} using Equation (27-81) and Equation (27-82) once.

$$N_{avbits,u} = \begin{cases} N_{avbits,u} + m_{STBC} \cdot (N_{CBPS,u} - 3N_{CBPS,short,u}), & \text{if } a_{init} = 3 \\ N_{avbits,u} + m_{STBC} \cdot N_{CBPS,short,u}, & \text{otherwise} \end{cases} \tag{27-81}$$

$$N_{punc,u} = \max(0, (N_{CW,u} \times L_{LDPC,u}) - N_{avbits,u} - N_{shrt,u}) \tag{27-82}$$

Update the common pre-FEC padding factor and N_{SYM} values for all users using Equation (27-83).

$$\begin{cases} N_{SYM} = N_{SYM,init} + m_{STBC} \text{ and } a = 1, & \text{if } a_{init} = 4 \\ N_{SYM} = N_{SYM,init} \text{ and } a = a_{init} + 1, & \text{otherwise} \end{cases} \tag{27-83}$$

If none of the users with LDPC encoding in step d) of 19.3.11.7.5 meet the condition that $(N_{punc,u} > 0.1 \times N_{CW,u} \times L_{LDPC,u} \times (1 - R_u))$ and $\left(N_{shrt,u} < 1.2 \times N_{punc,u} \times \frac{R_u}{1 - R_u}\right)$ are true or $N_{punc,u} > 0.3 \times N_{CW,u} \times L_{LDPC,u} \times (1 - R_u)$ is true, or if all the users in the HE MU PPDU are BCC encoded, then the LDPC Extra Symbol Segment field in the HE-SIG-A field shall be set to 0, and the common pre-FEC padding factor and N_{SYM} values for all users shall be updated by Equation (27-84).

$$a = a_{init}, N_{SYM} = N_{SYM,init} \tag{27-84}$$

For the users with LDPC encoding, $N_{DBPS,last,u} = N_{DBPS,last,init,u}$.

For the users with BCC encoding, update the N_{DBPS} of the last symbol as

$$N_{DBPS,last,u} = \begin{cases} a \cdot N_{DBPS,short,u}, & \text{if } a < 4 \\ N_{DBPS,u}, & \text{if } a = 4 \end{cases} \tag{27-85}$$

For each user with either LDPC or BCC encoding, update the N_{CBPS} of the last symbol as

$$N_{CBPS,last,u} = \begin{cases} a \cdot N_{CBPS,short,u}, & \text{if } a < 4 \\ N_{CBPS,u}, & \text{if } a = 4 \end{cases}$$

For the users with BCC encoding, the number of pre-FEC padding bits is shown in Equation (27-86).

$$\begin{aligned} N_{PAD,\text{Pre-FEC},u} = {} & (N_{SYM} - m_{STBC}) N_{DBPS,u} + m_{STBC} N_{DBPS,last,u} \\ & - 8 \cdot \text{APEP\_LENGTH}_u - N_{Tail} - N_{service} \end{aligned} \tag{27-86}$$

For each user with either LDPC or BCC encoding, the number of post-FEC padding bits in each of the last m_{STBC} symbol(s) is computed as in Equation (27-87).

$$N_{PAD,\text{Post-FEC},u} = N_{CBPS,u} - N_{CBPS,last,u} \tag{27-87}$$

Among the pre-FEC padding bits, the MAC delivers a PSDU that fills the available octets in the Data field of the HE PPDU, toward the desired initial pre-FEC padding boundary represented by a_{init} for users encoded by LDPC and the pre-FEC padding boundary represented by a for users encoded by BCC, in the last OFDM symbol(s). The PHY then determines the number of pad bits to add and appends them to the PSDU.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The number of pre-FEC pad bits added by PHY is 0 to 7. The procedure is defined in Equation (27-88) and Equation (27-89).

$$N_{PAD,\text{ Pre-FEC},MAC,u} = 8 \cdot \left\lfloor \frac{N_{PAD,\text{ Pre-FEC},u}}{8} \right\rfloor \tag{27-88}$$

$$N_{PAD,\text{ Pre-FEC},PHY,u} = N_{PAD,\text{ Pre-FEC},u} \bmod 8 \tag{27-89}$$

27.3.12.5.5 Encoding process for an HE TB PPDU

For an HE TB PPDU sent in response to a Trigger frame, the AP indicates the UL Length, GI And HE-LTF Type, Number Of HE-LTF Symbols And Midamble Periodicity, Pre-FEC Padding Factor, UL STBC, LDPC Extra Symbol Segment, PE Disambiguity, and Doppler fields in the Trigger frame. The common values T_{PE} and N_{SYM} are derived by non-AP STAs as shown in Equation (27-114) and Equation (27-115) (in 27.3.13). The AP should set the LDPC Extra Symbol Segment field in the Common Info field of the Trigger frame to 1 if the calculations described in the LDPC encoding process indicate the need for an LDPC extra symbol segment for any STA solicited by the AP for HE TB PPDU transmission using LDPC.

NOTE—The AP might set the LDPC Extra Symbol Segment field to 1 regardless of these calculations. The AP might select a value for the Pre-FEC Padding Factor field that differs from that derived from the calculations described in the BCC or LDPC encoding process.

For an HE TB PPDU sent in response to a frame containing a TRS Control subfield, the parameters used to derive the common values T_{PE} and N_{SYM} are described in 26.5.2.3.4.

For an HE TB PPDU with BCC encoding, follow the HE SU PPDU padding and encoding process introduced in 27.3.12.2, 27.3.12.5.1, and 27.3.12.5.3 with initial parameters as follows:

— If the TXVECTOR parameter TRIGGER_METHOD is TRIGGER_FRAME, the initial parameters are $N_{SYM,init} = N_{SYM}$ and $a_{init} = a$, where a is the TXVECTOR parameter PRE_FEC_PADDING_FACTOR and N_{SYM} is the common number of data OFDM symbols derived from the UL Length, Number Of HE-LTF Symbols And Midamble Periodicity, and Doppler subfields of the Common Info field in the Trigger frame.
— If the TXVECTOR parameter TRIGGER_METHOD is TRS, the initial parameters are $N_{SYM,init} = F_{VAL} + 1$ and $a_{init} = 4$, where F_{VAL} is the value of the UL Data Symbols subfield of the TRS Control subfield.

For an HE TB PPDU with LDPC encoding, follow the HE SU PPDU padding and encoding process introduced in 27.3.12.2, 27.3.12.5.2, and 27.3.12.5.3, with the following exceptions:

— If the TXVECTOR parameter TRIGGER_METHOD is TRIGGER_FRAME and the LDPC Extra Symbol Segment field in the Trigger frame is 1, set the initial parameters following Equation (27-90).

$$\begin{cases} a_{init} = 4 \text{ and } N_{SYM,\,init} = N_{SYM} - m_{STBC}, & \text{if } a = 1 \\ a_{init} = a - 1 \text{ and } N_{SYM,\,init} = N_{SYM}, & \text{otherwise} \end{cases} \tag{27-90}$$

where m_{STBC} is 2 if the Trigger frame indicates STBC and 1 otherwise. Then continue with the LDPC encoding process in 27.3.12.5.2, during which N_{avbits} is always incremented as in Equation (27-70) and N_{punc} is always recomputed as in Equation (19-40).

— If the TXVECTOR parameter TRIGGER_METHOD is TRIGGER_FRAME and the LDPC Extra Symbol Segment field in the Trigger frame is 0, then set the initial parameters to $N_{SYM,init} = N_{SYM}$, and $a_{init} = a$. Then continue with the LDPC encoding process as in 27.3.12.5.2, during which N_{avbits} and N_{punc} are not changed and $a = a_{init}$.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— If the TXVECTOR parameter TRIGGER_METHOD is TRS, then the parameter LDPC_EXTRA_SYMBOL is 1, and the initial parameters are set to $N_{SYM,init} = F_{VAL} + 1$ and $a_{init} = 3$, where F_{VAL} is the value of the UL Data Symbols subfield of the TRS Control subfield. Then continue with the LDPC encoding process as in 27.3.12.5.2, during which N_{avbits} is always incremented as in Equation (27-70) and N_{punc} is always recomputed as in Equation (19-40).

27.3.12.6 Stream parser

After scrambling, coding, puncturing, and post-FEC padding, the data bits are processed in groups of N_{CBPS} bits. Each of these groups is rearranged into N_{SS} blocks of N_{CBPSS} bits ($N_{SS,u}$ blocks of $N_{CBPSS,u}$ bits in the case of an HE MU transmission). This operation is referred to as *stream parsing* and is described in this subclause.

The description is given in terms of an SU transmission. For MU transmissions, the rearrangements are carried out in the same way per user.

The number of bits assigned to a single axis (real or imaginary) in a constellation point in a spatial stream is denoted by Equation (27-91).

$$s = max(1, \frac{N_{BPSCS}}{2}) \tag{27-91}$$

The sum of these over all streams is $S = N_{SS} \cdot s$.

Consecutive blocks of s bits are assigned to different spatial streams in a round robin fashion.

For the N_{CBPS} bits of each OFDM symbol, S bits from the output of the encoder are divided among all spatial streams, s bits per stream.

NOTE—For all RU sizes the coded bits per OFDM symbol are always evenly allocated to N_{SS} spatial streams.

The following equations are an equivalent description to the above procedure. Bit i at the output of the encoder is assigned to input bit k of spatial stream i_{SS} where

$$i = (i_{SS} - 1)s + S \cdot \left\lfloor \frac{k}{s} \right\rfloor + (k \bmod s)$$

$$i_{SS} = 1, 2, \ldots, N_{SS}$$

$$i = 0, 1, \ldots, N_{CBPS} - 1$$

$$k = 0, 1, \ldots, N_{CBPSS} - 1$$

27.3.12.7 Segment parser

The description in this subclause is for an SU transmission. For an MU transmissions, the rearrangements are carried out in the same way but per user.

For a 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz transmission with a 26-, 52-, 106-, 242-, 484-, or 996-tone RU, the segment parser is bypassed and the output bits are as specified in Equation (27-92).

$$y_{k,l} = x_k \tag{27-92}$$

where

x_k is bit k of a block of N_{CBPSS} bits, $k = 0$ to $N_{CBPSS} - 1$

l is the frequency subblock index and $l = 0$ for a 26-, 52-, 106-, 242-, 484-, and 996-tone RU

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$y_{k,l}$ is bit k of the frequency subblock l

For a 160 MHz and 80+80 MHz transmission with a 2×996-tone RU, the output bits of each stream parser are first divided into blocks of N_{CBPSS} bits ($N_{CBPSS,u}$ bits in the case of an MU transmission). Then, each block is further divided into two frequency subblocks of $N_{CBPSS}/2$ bits as shown in Equation (27-93).

$$y_{k,l} = x_m \tag{27-93}$$

$$m = 2s \cdot \left\lfloor \frac{k}{s} \right\rfloor + l \cdot s + (k \bmod s), \quad k = 0, 1, \ldots, \frac{N_{CBPSS}}{2} - 1 \tag{27-94}$$

where

x_m is bit m of a block of N_{CBPSS} bits and $m = 0, \ldots, N_{CBPSS} - 1$
l is the frequency subblock index and $l = 0, 1$
$y_{k,l}$ is bit k of the frequency subblock l
s is defined in Equation (27-91)

27.3.12.8 BCC interleavers

For ease of explanation, the operation of the interleaver is described only for the SU case. For user u of an MU transmission, the interleaver operates in the same way on the output bits for the user from the stream parser by replacing N_{SS}, N_{CBPSS}, N_{CBPS}, and N_{BPSCS} with $N_{SS,u}$, $N_{CBPSS,u}$, $N_{CBPS,u}$ and $N_{BPSCS,u}$, respectively. That is, the operation of the interleaver is the same as if the transmission were an SU one, consisting of bits from only that user.

The BCC interleaver operation is specified in 21.3.10.8. The interleaver parameters, N_{COL}, N_{ROW}, and N_{ROT}, for the Data field depend on the RU size and whether or not DCM is used and are defined in the RU size column of Table 27-36.

Table 27-36—BCC interleaver parameters

DCM	Parameter	RU size (tones)				HE-SIG-A/ HE-SIG-B (tones)
		26	52	106	242	56
Not used	N_{COL}	8	16	17	26	13
	N_{ROW}	$3 \times N_{BPSCS}$	$3 \times N_{BPSCS}$	$6 \times N_{BPSCS}$	$9 \times N_{BPSCS}$	$4 \times N_{BPSCS}$
	N_{ROT}	2	11	29	58	—
Used	N_{COL}	4	8	17	13	13
	N_{ROW}	$3 \times N_{BPSCS}$	$3 \times N_{BPSCS}$	$3 \times N_{BPSCS}$	$9 \times N_{BPSCS}$	$2 \times N_{BPSCS}$
	N_{ROT}	2	2	11	29	—

The interleaver parameters, N_{COL} and N_{ROW}, for the HE-SIG-A and HE-SIG-B fields are defined in the HE-SIG-A/HE-SIG-B column of Table 27-36.

NOTE—DCM is not used on the HE-SIG-A field.

27.3.12.9 Constellation mapping

The mapping between the input bits of the constellation mapper and complex constellation points for BPSK, QPSK, 16-QAM, 64-QAM, and 256-QAM is defined in 21.3.10.9.

For 1024-QAM, the mapping of the bits at the output of the stream parser or segment parser (if present) to the complex constellation points is defined in Figure 27-38, Figure 27-39, Figure 27-40, and Figure 27-41.

Figure 27-38—Constellation bit encoding for 1024-QAM (1st quadrant)

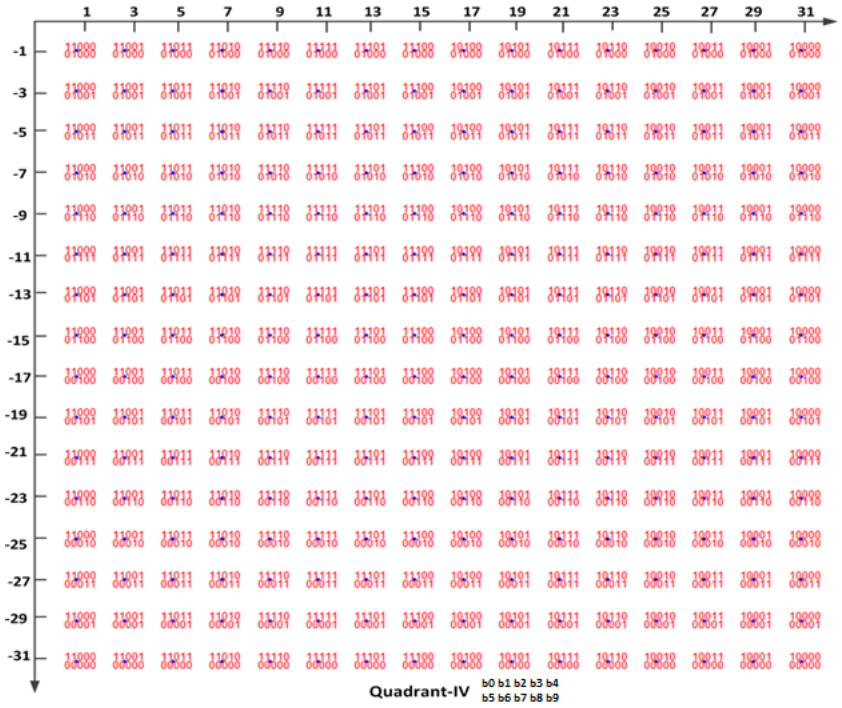

Figure 27-41—Constellation bit encoding for 1024-QAM (4th quadrant)

The bit string convention in Figure 27-38, Figure 27-39, Figure 27-40, and Figure 27-41 follows the bit string convention outlined in 17.3.5.8.

The normalization factor K_{mod} for 1024 QAM is $1/\sqrt{682}$.

DCM is an optional modulation scheme for the HE-SIG-B and Data fields. DCM can be applied to an HE SU PPDU and an HE ER SU PPDU. In an HE MU PPDU or HE TB PPDU, DCM can be applied to an RU containing data for one user but cannot be applied to an RU containing data for more than one user.

DCM is applicable to only HE-MCSs 0, 1, 3, and 4. DCM is applicable to only $N_{SS} = 1$ or $N_{SS} = 2$ (in the case of single-user RU in an HE MU PPDU, $N_{SS,r,u} = 1$ or $N_{SS,r,u} = 2$). DCM is not applicable with MU-MIMO or with STBC.

If DCM is employed, bit sequences are mapped to a pair of symbols $(d'_k, d'_{q(k)})$ where to exploit frequency diversity for a 996-tone or smaller RU, k is in the range $0 \le k \le N_{SD} - 1$ and $q(k)$ is in the range $N_{SD} \le q(k) \le 2N_{SD} - 1$ and, for a 2×996-tone RU, k is in the range $0 \le k \le N_{SD}/2 - 1$ and $q(k)$ is in the range $N_{SD}/2 \le q(k) \le N_{SD} - 1$. To maximize the frequency diversity, the indices of a pair of DCM subcarriers $(k, q(k))$ are given by $q(k) = k + N_{SD}$ for a 996-tone or smaller RU. To reduce the implementation complexity, the indices of a pair of DCM subcarriers $(k, q(k))$ are given by $q(k) = k + N_{SD}/2$ for a 2×996-tone RU. The N_{SD} here refers to the N_{SD} with DCM = 1, which is half the value of N_{SD} with DCM = 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Let $N_{80seg,ru}$ = 1 for a 996-tone RU or smaller and $N_{80seg,ru}$ = 2 for a 2×996-tone RU.

For BPSK modulation with DCM, the input stream is broken into groups of $N_{CBPS}/N_{80seg,ru}$ or $N_{CBPS,u}/N_{80seg,ru}$ bits $(B_0, B_1, \ldots, B_{N_{CBPS,u}/N_{80seg,ru}-1})$. Each bit B_k is BPSK modulated to a sample d'_k. This generates the samples for the lower half of the data subcarriers generated by the group. For the upper half of the data subcarriers generated by the group, the samples are generated as $d'_{k+N_{SD}/N_{80seg,ru}} = d'_k \times e^{j(k+N_{SD}/N_{80seg,ru})\pi}$, $k = 0, 1, \ldots, N_{SD}/N_{80seg,ru} - 1$. The N_{SD} here refers to the N_{SD} with DCM = 1, which is half the value of N_{SD} with DCM = 0.

For QPSK modulation with DCM, the input stream is broken into groups of $N_{CBPS}/N_{80seg,ru}$ or $N_{CBPS,u}/N_{80seg,ru}$ bits $(B_0, B_1, \ldots, B_{N_{CBPS,u}/N_{80seg,ru}-1})$. Each pair of bits (B_{2k}, B_{2k+1}) is QPSK modulated to a symbol d'_k. This generates the constellation points for the lower half of the data subcarriers generated by the group. For the upper half of the data subcarriers generated by the group, $d'_{k+N_{SD}/N_{80seg,ru}} = conj(d'_k)$, where *conj*() represents the complex conjugate operation. The N_{SD} here refers to the N_{SD} with DCM = 1, which is half the value of N_{SD} with DCM = 0.

For 16-QAM modulation with DCM, the input stream is broken into groups of $N_{CBPS}/N_{80seg,ru}$ or $N_{CBPS,u}/N_{80seg,ru}$ bits $(B_0, B_1, \ldots, B_{N_{CBPS,u}/N_{80seg,ru}-1})$. A group of 4 bits ($B_{4k}$, B_{4k+1}, B_{4k+2}, B_{4k+3}) is 16-QAM modulated to a sample d'_k as described in 17.3.5.8. This is the sample on subcarrier k in the lower half of the data subcarriers generated by the group. In the upper half of the data subcarriers generated by the group, the sample $d'_{k+N_{SD}/N_{80seg,ru}}$ on subcarrier $k + N_{SD}/N_{80seg,ru}$ is obtained by 16-QAM modulating a permutation of the bits (B_{4k}, B_{4k+1}, B_{4k+2}, B_{4k+3}). Specifically, $d'_{k+N_{SD}/N_{80seg,ru}}$ is obtained by applying the 16-QAM modulation procedure in 17.3.5.8 to the bit group (B_{4k+1}, B_{4k}, B_{4k+3}, B_{4k+2}). The N_{SD} here refers to the N_{SD} with DCM = 1, which is half the value of N_{SD} with DCM = 0.

27.3.12.10 LDPC tone mapper

The LDPC tone mapping shall be performed on all LDPC encoded streams mapped in an RU as described in this subclause. LDPC tone mapping shall not be performed on streams that are encoded using BCC. If DCM is applied to LDPC encoded streams, D_{TM_DCM} shall be applied on both the lower half data subcarriers in an RU and the upper half data subcarriers of the RU. The LDPC tone mapping distance parameters D_{TM} and D_{TM_DCM} are constant for each RU size, and the values for different RU sizes are given in Table 27-37.

Table 27-37—LDPC tone mapping distance for each RU size

Parameter	RU size (tones)						
	26	52	106	242	484	996	2×996
D_{TM}	1	3	6	9	12	20	20
D_{TM_DCM}	1	1	3	9	9	14	14

NOTE 1—The LDPC tone mapping parameters D_{TM} and D_{TM_DCM} are applied for each frequency subblock, l = 0 and l = 1.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For an HE PPDU without DCM, the LDPC tone mapping for the LDPC encoded stream for user u in the r^{th} RU is done by permuting the stream of complex numbers generated by the constellation mappers (see 27.3.12.9) as defined by Equation (27-95).

$$d''_{t(k),\,i,\,n,\,l,\,r,\,u} = d'_{k,\,i,\,n,\,l,\,r,\,u} \tag{27-95}$$

where

$$k = \begin{cases} 0, 1, \ldots, N_{SD} - 1 \text{ for a 26-, 52-, 106-, 242-, 484- and 996-tone RU} \\ 0, 1, \ldots, N_{SD}/2 - 1 \text{ for a 2×996-tone RU} \end{cases}$$

$$i = 1, \ldots, N_{SS,\,r,\,u}$$

$$n = 0, 1, \ldots, N_{SYM} - 1$$

$$l = \begin{cases} 0 \text{ for a 26-, 52-, 106-, 242-, 484- and 996-tone RU} \\ 0, 1 \text{ for a 2×996-tone RU} \end{cases}$$

$$u = 0, \ldots, N_{user,\,r} - 1$$

$$r = 0, \ldots, N_{RU} - 1$$

N_{SD} is the number of data tones in the r^{th} RU

$$t(k) = \begin{cases} D_{TM}\left(k \bmod \frac{N_{SD}}{D_{TM}}\right) + \left\lfloor \frac{k \cdot D_{TM}}{N_{SD}} \right\rfloor, \text{ for a 26-, 52-, 106-, 242-, 484- and 996-tone RU} \\ D_{TM}\left(k \bmod \frac{N_{SD}/2}{D_{TM}}\right) + \left\lfloor \frac{k \cdot D_{TM}}{N_{SD}/2} \right\rfloor, \text{ for a 2×996-tone RU} \end{cases}$$

For an HE PPDU with DCM applied to the Data field, the LDPC tone mapping for the LDPC encoded stream corresponding to user u in the r^{th} RU is done by permuting the stream of complex numbers generated by the constellation mappers (see 27.3.12.9) as defined by Equation (27-96).

$$d''_{t(k),\,i,\,n,\,l,\,r,\,u} = d'_{k,\,i,\,n,\,l,\,r,\,u} \tag{27-96}$$

where

$$k = \begin{cases} 0, 1, \ldots, 2N_{SD} - 1 \text{ for a 26-, 52-, 106-, 242-, 484- and 996-tone RU} \\ 0, 1, \ldots, N_{SD} - 1 \text{ for a 2×996-tone RU} \end{cases}$$

$$i = 1, \ldots, N_{SS,\,r,\,u}$$

$$n = 0, 1, \ldots, N_{SYM} - 1$$

$$l = \begin{cases} 0 \text{ for a 26-, 52-, 106-, 242-, 484- and 996-tone RU} \\ 0, 1 \text{ for a 2×996-tone RU} \end{cases}$$

$$u = 0, \ldots, N_{user,\,r} - 1$$

$$r = 0, \ldots, N_{RU} - 1$$

N_{SD} is the number of data tones in the r^{th} RU if DCM is applied

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$t(k)$ is as follows:

For a 26-, 52-, 106-, 242-, 484-, and 996-tone RU:

$$t(k) = \begin{cases} D_{TM\_DCM}\left(k \bmod \frac{N_{SD}}{D_{TM\_DCM}}\right) + \left\lfloor \frac{k \cdot D_{TM\_DCM}}{N_{SD}} \right\rfloor, & \text{for } k < N_{SD} \\ D_{TM\_DCM}\left((k - N_{SD}) \bmod \frac{N_{SD}}{D_{TM\_DCM}}\right) + \left\lfloor \frac{(k - N_{SD}) \cdot D_{TM\_DCM}}{N_{SD}} \right\rfloor + N_{SD}, & \text{for } k \geq N_{SD} \end{cases}$$

For a 2×996-tone RU:

$$t(k) = \begin{cases} D_{TM\_DCM}\left(k \bmod \frac{N_{SD}/2}{D_{TM\_DCM}}\right) + \left\lfloor \frac{k \cdot D_{TM\_DCM}}{N_{SD}/2} \right\rfloor, & \text{for } 0 \leq k < N_{SD}/2 \\ D_{TM\_DCM}\left((k - N_{SD}/2) \bmod \frac{N_{SD}/2}{D_{TM\_DCM}}\right) + \left\lfloor \frac{(k - N_{SD}/2) \cdot D_{TM\_DCM}}{N_{SD}/2} \right\rfloor + N_{SD}/2, & \text{for } N_{SD}/2 \leq k < N_{SD} \end{cases}$$

D_{TM_DCM}

is the LDPC tone mapping distance for the r^{th} RU if DCM is applied

NOTE 2—LDPC tone mapper for a 26-, 52-, 106-, 242-, 484-, and 996-tone RU is defined as one segment. LDPC tone mapping is performed separately for the upper and lower 80 MHz frequency subblocks of a 2×996-tone RU as indicated by the frequency subblock index l.

Since LDPC tone mapping is not performed on BCC coded streams, for BCC coded spatial streams, Equation (27-97) applies.

$$d''_{k,i,n,l,r,u} = d'_{k,i,n,l,r,u} \tag{27-97}$$

where

$k = 0, 1, \ldots, N_{SD} - 1$ for a 26-, 52-, 106-, and 242-tone RU

$i = 1, \ldots, N_{SS,r,u}$

$n = 0, 1, \ldots, N_{SYM} - 1$

$l = 0$ for a 26-, 52-, 106-, and 242-tone RU

$u = 0, \ldots, N_{user,r} - 1$

$r = 0, \ldots, N_{RU} - 1$

27.3.12.11 Segment deparser

For a 26-, 52-, 106-, 242-, 484-, and 996-tone RU, the segment deparsing is not performed, and $d^{(i_{Seg})}_{k,i,n,r,u}$ is specified in Equation (27-98).

$$d^{(i_{Seg})}_{k,i,n,r,u} = d''_{k,i,n,0,r,u}, \quad \text{if } 0 \leq k \leq N_{SD} - 1, i_{Seg} = 0 \tag{27-98}$$

For a 2×996-tone RU in a 160 MHz HE PPDU, the two frequency subblocks at the output of the LDPC tone mapper are combined into one frequency segment as specified in Equation (27-99).

$$d^{(i_{Seg})}_{k,i,n,r,u} = \begin{cases} d''_{k,i,n,0,r,u}, & \text{if } 0 \leq k \leq \frac{N_{SD}}{2} - 1 \\ d''_{k - \frac{N_{SD}}{2},i,n,l,r,u}, & \text{if } \frac{N_{SD}}{2} \leq k \leq N_{SD} - 1 \end{cases}, i_{Seg} = 0 \tag{27-99}$$

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For a 2×996-tone RU in an 80+80 MHz HE PPDU, the segment deparsing is not performed, and $d^{(i_{Seg})}_{k,\,i,\,n,\,r,\,u}$ is specified in Equation (27-100).

$$d^{(i_{Seg})}_{k,\,i,\,n,\,r,\,u} = d''_{k,\,i,\,n,\,i_{Seg},\,r,\,u}, \quad \text{if } 0 \le k \le N_{SD} - 1,\ i_{Seg} = 0, 1 \tag{27-100}$$

NOTE—As per Table 21-7, $f_c^{(0)}$ is always less than $f_c^{(1)}$ in the case of an 80+80 MHz HE PPDU. Hence, $d''_{k,\,i,\,n,\,0,\,r,\,u}$ (frequency subblock 0) is always transmitted in the frequency segment lower in frequency, while $d''_{k,\,i,\,n,\,1,\,r,\,u}$ (frequency subblock 1) is always transmitted in the frequency segment higher in frequency.

27.3.12.12 Space-time block coding

For an HE PPDU, STBC is applied with only 1 spatial stream and only if DCM is not applied. Its application is indicated by the STBC field in the HE-SIG-A field. In an HE MU PPDU, STBC coding is used in all RUs or not used in any of the RUs. If any RU in an HE MU PPDU uses DL MU-MIMO, STBC shall not be used in any RU in the HE MU PPDU.

The STBC encoding process is described in 21.3.10.9.4, with $N_{SS,0} = 1$ and $N_{STS,0} = 2$.

27.3.12.13 Pilot subcarriers

For a user transmitting on the i^{th} 26-tone RU in a given PPDU BW, two pilot subcarriers shall be inserted in subcarriers $k \in K_{R26_i}$, where K_{R26_i} is given by the i^{th} pilot index set in the row of given PPDU BW of Table 27-38.

Table 27-38—Pilot indices for a 26-tone RU

PPDU BW	K_{R26_i}
20 MHz, i = 1:9	{−116, −102}, {−90, −76}, {−62, −48}, {−36, −22}, {−10, 10}, {22, 36}, {48, 62}, {76, 90}, {102, 116}
40 MHz, i = 1:18	{−238, −224}, {−212, −198}, {−184, −170}, {−158, −144}, {−130, −116}, {−104, −90}, {−78, −64}, {−50, −36}, {−24, −10}, {10, 24}, {36, 50}, {64, 78}, {90, 104}, {116, 130}, {144, 158}, {170, 184}, {198, 212}, {224, 238}
80 MHz, i = 1:37	{−494, −480}, {−468, −454}, {−440, −426}, {−414, −400}, {−386, −372}, {−360, −346}, {−334, −320}, {−306, −292}, {−280, −266}, {−252, −238}, {−226, −212}, {−198, −184}, {−172, −158}, {−144, −130}, {−118, 104}, {−92, −78}, {−64, −50}, {−38, −24}, {−10, 10}, {24, 38}, {50, 64}, {78, 92}, {104, 118}, {130, 144}, {158, 172}, {184, 198}, {212, 226}, {238, 252}, {266, 280}, {292, 306}, {320, 334}, {346, 360}, {372, 386}, {400, 414}, {426, 440}, {454, 468}, {480, 494}
160 MHz, i = 1:74	{pilot subcarrier indices in 80 MHz −512, pilot subcarrier indices in 80 MHz +512}

The pilot mapping P_n^k for the subcarrier k for symbol n shall be as specified in Equation (27-101).

$$\begin{aligned} P_n^{k \in K_{R26_i}} &= \{\Psi_{n \bmod 2}, \Psi_{(n+1) \bmod 2}\} \\ P_n^{k \notin K_{R26_i}} &= 0 \end{aligned} \tag{27-101}$$

27.3.12.14 OFDM modulation

If midambles are not present, the time domain waveform of the Data field of an HE PPDU that is not an HE TB PPDU for transmit chain i_{TX}, where $1 \le i_{TX} \le N_{TX}$, and frequency segment i_{Seg} shall be as defined in Equation (27-108).

$$r_{\text{HE-Data}}^{(i_{Seg} i_{TX})}(t) = \frac{1}{\sqrt{\sum_{r=0}^{N_{RU}-1} \alpha_r^2 |K_r|}} \sum_{n=0}^{N_{SYM}-1} w_{T_{\text{HE-Data}}}(t - nT_{SYM}) \sum_{r=0}^{N_{RU}-1} \frac{\alpha_r}{\sqrt{N_{STS,r,total}}} \sum_{k \in K_r} \sum_{u=0}^{N_{user,r}-1} \sum_{m=1}^{N_{STS,r,u}} \left(\left[Q_k^{(i_{Seg})} \right]_{i_{TX}, (M_{r,u}+m)} (\tilde{D}_{k,m,n,r}^{(i_{Seg},u)} + p_{n+2+N_{\text{HE-SIG-A}}+N_{\text{HE-SIG-B}}} P_n^k) \cdot \exp(j2\pi k \Delta_{F,\text{HE}}(t - nT_{SYM} - T_{GI,Data} - T_{CS,\text{HE}}(M_{r,u}+m))) \right) \quad (27\text{-}108)$$

where

T_{SYM} is defined in Table 27-13

p_n is defined in 17.3.5.10

P_n^k can be selected from Equation (27-101) to Equation (27-107) defined in 27.3.12.13, depending on the corresponding RU size

$T_{CS,\text{HE}}(M_{r,u}+m)$ represents the cyclic shift for space-time stream $M_{r,u}+m$ as defined in 27.3.11.2.2

$T_{GI,Data}$ is the guard interval duration as defined in Table 27-13

$\tilde{D}_{k,m,n,r}^{(i_{Seg},u)}$ is the transmitted constellation for user u in the r^{th} RU at subcarrier k, space-time stream m, and Data field OFDM symbol n and is defined by Equation (27-109)

$$\tilde{D}_{k,m,n,r}^{(i_{Seg},u)} = \begin{cases} 0, k \in K_{\text{Pilot}} \\ \tilde{d}_{M_r(k),m,n,r,u}^{(i_{Seg})}, \text{otherwise} \end{cases} \quad (27\text{-}109)$$

where

K_{Pilot} is the set of pilot subcarrier indices for the Data field OFDM symbols as defined in 27.3.12.13

$M_r(k)$ is defined in Equation (27-110)

$$M_r(k) = k - K_{r,\min} - \left| \{k' : K_{r,\min} \le k' < k\} \cap K_{\text{Pilot}} \right| \quad (27\text{-}110)$$

where

$K_{r,min}$ is the minimum value of the set K_r

$|\Phi|$ is the cardinality of a set Φ

NOTE—$M_r(k)$ translates a subcarrier index ($k \in K_r$) into the index of data symbols in a transmission over RU r ($0 \le M_r(k) \le N_{SD}$). The subcarrier index k for the data subcarrier is first offset by the minimum value of subcarrier index $K_{r,min}$ (for the lower edge subcarrier) in this RU and then subtracted by the number of pilot subcarriers falling in between the data subcarrier and the edge subcarrier.

In a noncontiguous 80+80 MHz transmission, each frequency segment shall follow the 80 MHz HE subcarrier mapping as specified in 27.3.10.

If midambles are not present, the time domain waveform of the Data field of an HE TB PPDU for user u in the r^{th} RU from transmit chain i_{TX}, where $1 \le i_{TX} \le N_{TX}$, shall be as defined in Equation (27-111).

$$r^{(i_{Seg} i_{TX})}_{\text{HE-Data},\, r,\, u}(t) = \frac{1}{\sqrt{|K_r|}} \sum_{n=0}^{N_{SYM}-1} w_{T_{\text{HE-Data}}}(t - nT_{SYM}) \frac{1}{\sqrt{N_{STS,\, r,\, u}}} \sum_{k \in K_r} \sum_{m=1}^{N_{STS,\, r,\, u}} \left(\begin{array}{l} \left[Q^{(i_{Seg})}_{k,\, u} \right]_{i_{TX},\, m} (\tilde{D}^{(i_{Seg},\, u)}_{k,\, m,\, n,\, r} + p_{n+4} P^k_n) \\ \cdot \exp(\, j2\pi k \Delta_{F,\, \text{HE}} (t - nT_{SYM} - T_{GI,\, Data} - T_{CS,\, HE}(M_{r,\, u} + m))) \end{array} \right) \quad (27\text{-}111)$$

where

$Q^{(i_{Seg})}_{k,\, u}$ is defined in 27.3.10

$M_{r,u}$ is given by the TXVECTOR parameter STARTING_STS_NUM

27.3.12.15 Dual carrier modulation

DCM modulates the same information on a pair of subcarriers. DCM is an optional modulation scheme for the HE-SIG-B and Data fields. DCM is applicable to only HE-MCSs and HE-SIG-B-MCSs with indices 0, 1, 3, and 4.

The constellation mapper for DCM is defined in 27.3.12.9. The LDPC tone mapper for DCM is defined in 27.3.12.10. The BCC interleaver for DCM is defined in 27.3.12.8.

27.3.12.16 Midambles

An HE STA may include midambles in an HE PPDU transmission in fast varying channels, i.e., channels with high Doppler, to facilitate channel estimation update during the PPDU. Midambles are inserted only if $N_{STS} \le 4$. The recipient might use the midambles to compensate the channel estimation if it is varying fast in channels with high Doppler.

If the Doppler field of the HE-SIG-A field is 1 in an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU or if the Doppler subfield in the Common Info field in the Trigger frame preceding an HE TB PPDU is 1, then midambles are present in the Data field of the HE PPDU every M_{MA} OFDM symbols, where M_{MA} is either 10 or 20 as indicated by the NSTS And Midamble Periodicity field in the HE-SIG-A field (see 27.3.11.7) or by the Number Of HE-LTF Symbols And Midamble Periodicity subfield in the Common Info field in the Trigger frame (see 9.3.1.22).

Each midamble is the same as the HE-LTF field(s) in the preamble of the same PPDU as defined in 27.3.11.10, as shown in Figure 27-42.

An HE STA shall not transmit an HE MU PPDU with midambles if there is MU-MIMO on any RU.

The scrambling and encoding process of the bits in the Data field OFDM symbols is identical for transmissions with or without midamble.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If present, the number of midamble periods, N_{MA}, in a PPDU is calculated using Equation (27-112).

$$N_{MA} = max\left(0, \left\lceil \frac{N_{SYM} - 1}{M_{MA}} \right\rceil - 1\right) \quad (27\text{-}112)$$

where N_{SYM} is as defined in 27.3.12.5.

As shown in Figure 27-42, the first midamble is inserted immediately after the $M_{MA}{}^{th}$ OFDM symbol in the Data field, and a midamble is not inserted after the last data OFDM symbol if mod(N_{SYM}, M_{MA}) = 0. At the end of an HE PPDU, if mod(N_{SYM}, M_{MA}) = 1, there is also no midamble inserted before the last OFDM symbol, as shown in Figure 27-43.

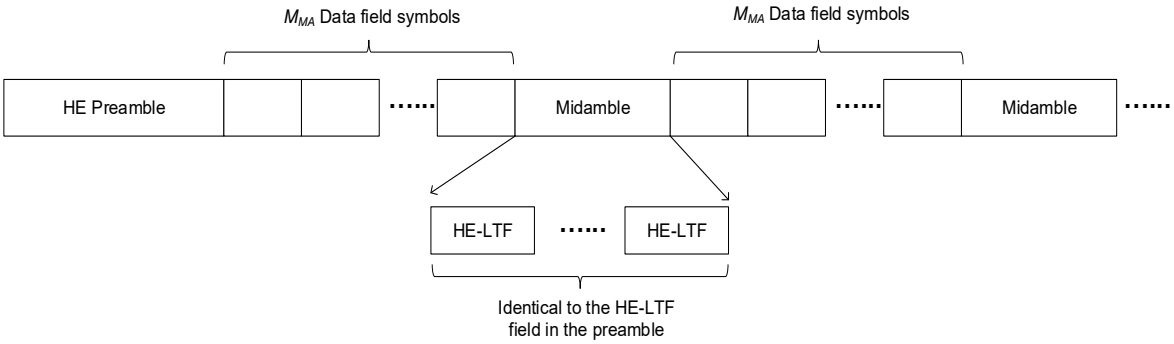

Figure 27-42—HE PPDU with midamble

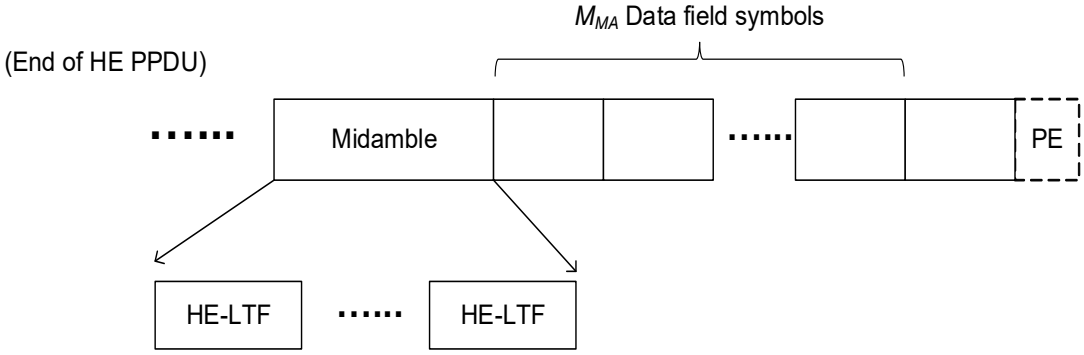

Figure 27-43—Midamble at the end of an HE PPDU

In an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU, if the Doppler field of the HE-SIG-A field is 1 and $N_{SYM} \leq M_{MA} + 1$, there is no midamble present in the current PPDU. In this case, the Doppler field setting to 1 indicates that the current channel between the transmitter and the recipient is with high channel Doppler and the transmitter recommends to the recipient that midamble may be used for the PPDUs of the reverse link.

27.3.13 Packet extension

A PE field of duration 0 μs, 4 μs, 8 μs, 12 μs, or 16 μs is present in an HE PPDU. The PE field provides additional receive processing time at the end of the HE PPDU. The PE field, if present, shall be transmitted with the same average power as the Data field and shall not cause significant power leakage outside of the spectrum used by the Data field. Other than that, its content is arbitrary. In an OFDMA HE PPDU, the spectrum used by the Data field for the purpose of packet extension is commensurate with the locations and sizes of the occupied RUs, not the PPDU bandwidth. For example, the Data field of an OFDMA HE PPDU using a 26-tone RU would have a spectrum that is approximately 2 MHz wide.

The duration of the PE field for an HE SU PPDU, HE ER SU PPDU, or HE MU PPDU is determined by both the pre-FEC padding factor value in the last OFDM symbol(s) of the Data field and the TXVECTOR parameter NOMINAL_PACKET_PADDING.

For an HE SU or HE ER SU PPDU, the nominal T_{PE} value ($T_{PE,nominal}$) is given by Table 27-47. In this case, a in Table 27-47 is given by Equation (27-71) or Equation (27-72).

For an HE MU PPDU, the nominal T_{PE} value ($T_{PE,nominal}$) is given by Equation (27-113).

$$T_{PE,nominal} = \max_u T_{PE,nominal,u} \quad (27\text{-}113)$$

where

$T_{PE,nominal,u}$ is the nominal T_{PE} value for user u and is also given by Table 27-47

$\max_u f(u)$ is the maximum value of $f(u)$ over all values of u

In this case, a in Table 27-47 is given by Equation (27-83) or Equation (27-84).

Table 27-47—Nominal T_{PE} values

a	TXVECTOR parameter NOMINAL_PACKET_PADDING (HE SU PPDU or HE ER SU PPDU) or NOMINAL_PACKET_PADDING[*u*] (HE MU PPDU)		
	0 μs	**8 μs**	**16 μs**
1	0 μs	0 μs	4 μs
2	0 μs	0 μs	8 μs
3	0 μs	4 μs	12 μs
4	0 μs	8 μs	16 μs

The duration of the PE field, T_{PE}, may take a value of 0, 4, 8, 12, or 16 μs. T_{PE} for an HE SU, HE ER SU, or HE MU PPDU shall not be less than $T_{PE,nominal}$. T_{PE} for an HE SU, HE ER SU, or HE MU PPDU should be equal to $T_{PE,nominal}$ to minimize the packet extension overhead. Figure 27-44 and Figure 27-45 show examples of the PE field duration in an HE SU PPDU or HE ER SU PPDU without midambles if the TXVECTOR parameter NOMINAL_PACKET_PADDING is 8 μs and 16 μs, respectively, and $T_{PE} = T_{PE,nominal}$. STBC is not used in these examples.

T_{PE} for an HE sounding NDP is 4 μs.

If transmitting an HE TB PPDU for which the TXVECTOR parameter TRIGGER_METHOD is TRIGGER_FRAME, each transmitter of an HE TB PPDU shall append a PE field with a duration T_{PE} calculated using Equation (27-114), except for an HE TB feedback NDP (see 27.3.4), which has $T_{PE} = 0$.

$$T_{PE} = \left\lfloor \frac{\left(\frac{\text{LENGTH} + m + 3}{3} \times 4 - T_{\text{HE-PREAMBLE}}\right) - N_{SYM} T_{SYM} - N_{MA} N_{\text{HE-LTF}} T_{\text{HE-LTF-SYM}}}{4} \right\rfloor \times 4 \quad (27\text{-}114)$$

where

$m = 2$ for an HE TB PPDU

LENGTH is the value indicated by the UL Length subfield in the Common Info field in the Trigger frame

$T_{\text{HE-PREAMBLE}}$ is the value for an HE TB PPDU in Equation (27-121)

$T_{\text{HE-STF-T}}$, $T_{\text{HE-LTF-SYM}}$, $T_{\text{RL-SIG}}$, and $T_{\text{HE-SIG-A}}$ are defined in Table 27-13

N_{MA} is the number of midamble periods in the current PPDU

$$N_{SYM} = \left\lfloor \left(\frac{\text{LENGTH} + m + 3}{3} \times 4 - T_{\text{HE-PREAMBLE}} - N_{MA} N_{\text{HE-LTF}} T_{\text{HE-LTF-SYM}}\right) / T_{SYM} \right\rfloor - b_{\text{PE-Disambiguity}} \quad (27\text{-}115)$$

$b_{\text{PE-Disambiguity}}$ is the value of the TXVECTOR parameter HE_TB_PE_DISAMBIGUITY

There are multiple methods for computing N_{MA} for an HE TB PPDU that yield the same result; one example is as follows. The duration of one midamble period is defined in Equation (27-116).

$$T_{MA} = M_{MA} T_{SYM} + N_{\text{HE-LTF}} T_{\text{HE-LTF-SYM}} \quad (27\text{-}116)$$

where M_{MA} is the midamble periodicity indicated by the Number of HE-LTF Symbols And Midamble Periodicity subfield of the Common Info field in the Trigger frame. Equation (27-117) for computing N_{MA} can be used instead of Equation (27-112).

$$N_{MA} = \begin{cases} 0, \text{ if Doppler} = 0 \\ max\left(0, \left\lfloor \left(\frac{LENGTH + 3 + m}{3} \times 4 - T_{\text{HE-PREAMBLE}} - (b_{\text{PE-Diambiguity}} + 2) \cdot T_{SYM}\right) / T_{MA} \right\rfloor\right), \text{ if Doppler} = 1 \end{cases} \quad (27\text{-}117)$$

where Doppler is indicated by the Doppler subfield of the Common Info field of the Trigger frame.

If transmitting an HE TB PPDU for which the TXVECTOR parameter TRIGGER_METHOD is TRS, each transmitter of the HE TB PPDU shall append a PE field with the duration T_{PE} equal to the value specified in the TXVECTOR parameter DEFAULT_PE_DURATION.

The PE Disambiguity field of the HE-SIG-A field for an HE SU, HE ER SU (see Table 27-19), or HE MU PPDU (see Table 27-21) shall be set to 1 if the condition in Equation (27-118) is met; otherwise, it shall be set to 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The PE Disambiguity subfield in the Common Info field of the Trigger frame (see Table 9-51) shall be set to 1 if the condition in Equation (27-118) is met for the HE TB PPDU solicited by the Trigger frame. Otherwise, it shall be set to 0.

(27-118)

$$T_{PE} + 4 \times \left(\left\lceil \frac{\text{TXTIME} - \mathit{SignalExtension} - 20}{4} \right\rceil - \left(\frac{\text{TXTIME} - \mathit{SignalExtension} - 20}{4} \right) \right) \geq T_{SYM}$$

where

T_{PE} is the PE field duration

T_{SYM} is the symbol duration of the Data field as defined in 27.3.9

TXTIME is defined in 27.4.3 (in μs)

SignalExtension is 0 μs if TXVECTOR parameter NO_SIG_EXTN is true and is aSignalExtension as defined in Table 27-61 if TXVECTOR parameter NO_SIG_EXTN is false

The receiver computes N_{SYM}, T_{PE}, and N_{MA} using Equation (27-119), Equation (27-120), and Equation (27-122), respectively.

(27-119)

$$N_{SYM} = \left\lfloor \left(\frac{\text{L\_LENGTH} + m + 3}{3} \times 4 - T_{\text{HE-PREAMBLE}} - N_{MA} N_{\text{HE-LTF}} T_{\text{HE-LTF-SYM}} \right) / T_{SYM} \right\rfloor - b_{\text{PE-Disambiguity}}$$

(27-120)

$$T_{PE} = \left\lfloor \frac{\left(\frac{\text{L\_LENGTH} + m + 3}{3} \times 4 - T_{\text{HE-PREAMBLE}} \right) - N_{SYM} T_{SYM} - N_{MA} N_{\text{HE-LTF}} T_{\text{HE-LTF-SYM}}}{4} \right\rfloor \times 4$$

where

L_LENGTH is the value indicated by the LENGTH field of the L-SIG field

$T_{\text{HE-PREAMBLE}}$ = (27-121)

$$\begin{cases} T_{\text{RL-SIG}} + T_{\text{HE-SIG-A}} + T_{\text{HE-STF-T}} + N_{\text{HE-LTF}} T_{\text{HE-LTF-SYM}}, \text{ for an HE TB PPDU} \\ T_{\text{RL-SIG}} + T_{\text{HE-SIG-A}} + T_{\text{HE-STF-NT}} + N_{\text{HE-LTF}} T_{\text{HE-LTF-SYM}}, \text{ for an HE SU PPDU} \\ T_{\text{RL-SIG}} + T_{\text{HE-SIG-A}} + N_{\text{HE-SIG-B}} T_{\text{HE-SIG-B}} + T_{\text{HE-STF-NT}} + N_{\text{HE-LTF}} T_{\text{HE-LTF-SYM}}, \text{ for an HE MU PPDU} \\ T_{\text{RL-SIG}} + T_{\text{HE-SIG-A-R}} + T_{\text{HE-STF-NT}} + N_{\text{HE-LTF}} T_{\text{HE-LTF-SYM}}, \text{ for an HE ER SU PPDU} \end{cases}$$

where

$T_{\text{RL-SIG}}$, $T_{\text{HE-STF-T}}$, $T_{\text{HE-STF-NT}}$, $T_{\text{HE-LTF-SYM}}$, $T_{\text{HE-SIG-A}}$, $T_{\text{HE-SIG-A-R}}$, and $T_{\text{HE-SIG-B}}$ are defined in Table 27-13

$N_{\text{HE-SIG-B}}$ and $N_{\text{HE-LTF}}$ are defined in Table 27-16

$b_{\text{PE-Disambiguity}}$ is the value indicated by the PE Disambiguity subfield of the HE-SIG-A field for an HE SU, HE ER SU, or HE MU PPDU or the value indicated by the PE Disambiguity subfield in the Common Info field in the Trigger frame (see Table 9-51) for an HE TB PPDU

N_{MA} may be computed by multiple methods that yield the same result, one example of which is given in Equation (27-122)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$N_{MA} = \begin{cases} 0, \text{ if Doppler} = 0 \\ max\left(0, \left\lfloor \left(\frac{\text{L\_LENGTH} + 3 + m}{3} \times 4 - T_{\text{HE-PREAMBLE}} - (b_{\text{PE-Diambiguity}} + 2) \cdot T_{SYM}\right) / T_{MA} \right\rfloor\right), \text{ if Doppler} = 1 \end{cases} \quad (27\text{-}122)$$

where

T_{MA} is defined in Equation (27-116), except that M_{MA} is the midamble periodicity indicated by the NSTS And Midamble Periodicity subfield of the HE-SIG-A field in an HE SU PPDU and HE ER SU PPDU or by the Number Of HE-LTF Symbols And Midamble Periodicity subfield of the HE-SIG-A field in an HE MU PPDU

Doppler is indicated by the Doppler field of HE-SIG-A field

27.3.14 Non-HT duplicate transmission

If the TXVECTOR parameter FORMAT is NON_HT and the TXVECTOR parameter NON_HT_MODULATION is NON_HT_DUP_OFDM, the transmitted PPDU is a non-HT duplicate. Non-HT duplicate transmission is used to transmit to non-HT STAs, HT STAs, VHT STAs, and HE STAs that may be present in a part of a 40 MHz, 80 MHz, or 160 MHz channel (see Table 21-2). The RL-SIG, HE-SIG-A, HE-SIG-B, HE-STF, HE-LTF, and PE fields are not transmitted.

The L-STF and L-LTF fields shall be transmitted in the same way as in the HE transmission. The L-SIG field shall be transmitted in the same way as in the HE transmission, with the following exceptions:

— The Rate and Length fields shall follow 17.3.4

— The four additional subcarriers at indices ± 27 and ± 28 are not modulated (no energy)

NOTE—The L-STF, L-LTF, and L-SIG fields are not transmitted in 20 MHz subchannels in which the preamble is punctured (see 27.3.7).

In a 40 MHz non-HT duplicate transmission, the Data field shall be as defined by Equation (19-61).

For 80 MHz and 160 MHz non-HT duplicate transmissions, the Data field shall be as defined by Equation (27-123).

$$r^{i_{TX}}_{\text{non-HT},\,BW}(t) = \frac{N_{20\text{MHz}}}{\sqrt{N^{\text{Tone}}_{\text{NON\_HT\_DUP\_OFDM-Data}} \cdot |\Omega_{20\text{MHz}}|}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - nT_{SYM}) \quad (27\text{-}123)$$

$$\cdot \sum_{i_{BW}=0}^{N_{20\text{MHz}}-1} \left(\begin{array}{c} (1 - \text{INACTIVE\_SUBCHANNELS}[i_{BW}]) \sum_{k=-26}^{26} \Upsilon_{(k - K_{\text{Shift}}(i_{BW})),\,BW}(D_{k,\,n} + p_{n+1}P_k) \\ \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{BW}))\Delta_F(t - nT_{SYM} - T_{GI} - T^{i_{TX}}_{\text{CS}})) \end{array} \right)$$

where

$N_{20\text{MHz}}$ and $K_{Shift}(i)$ are defined in 21.3.8.2.4

P_k and P_n are defined in 17.3.5.10

$D_{k,n}$ is defined in Equation (21-26)

$\Upsilon_{k,\,BW}$ is defined in Equation (21-16) and Equation (21-17)

$T^{i_{TX}}_{CS}$ represents the cyclic shift for transmit chain i_{TX} with a value given in Table 21-10

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$N_{\text{NON\_HT\_DUP\_OFDM-Data}}^{\text{Tone}}$
has the value given in Table 27-17

INACTIVE_SUBCHANNELS[x]
is bit x of the TXVECTOR parameter INACTIVE_SUBCHANNELS, if present, and is 0 otherwise.

$|\Omega_{20\text{MHz}}|$ is equal to the number of bits with value 0 in the TXVECTOR parameter INACTIVE_SUBCHANNELS, if present, and is equal to $N_{20\text{MHz}}$ otherwise

In a noncontiguous 80+80 MHz non-HT duplicate transmission, data transmission in each frequency segment shall be as defined for an 80 MHz non-HT duplicate transmission in Equation (27-123).

For each non-HT duplicate PPDU transmission that is a preamble punctured PPDU, each punctured 20 MHz subchannel is indicated as punctured by including the value of 113 (01110001 in binary representation) in the 8 bits of the TXVECTOR parameter RU_ALLOCATION corresponding to the 242-tone RU that is most closely aligned with the punctured 20 MHz subchannel. Each 20 MHz subchannel that is not punctured is indicated as such by including the value of 192 (11000000 in binary representation) in the 8 bits of the TXVECTOR parameter RU_ALLOCATION corresponding to the 242-tone RU that is most closely aligned with that 20 MHz subchannel.

27.3.15 Transmit requirements for PPDUs sent in response to a triggering frame

27.3.15.1 Introduction

An AP may solicit simultaneous HE TB PPDU transmissions or simultaneous non-HT or non-HT duplicate PPDU transmissions from multiple non-AP STAs using a triggering frame. Since there are multiple transmitters, precorrection of transmission time, frequency, sampling symbol clock, and power (in the case of an HE TB PPDU) by the non-AP STAs is necessary to mitigate synchronization and interference issues at the AP. Frequency and sampling clock precorrections are needed to prevent inter-carrier interference. Power precorrection is necessary to control interference between HE TB PPDU transmissions from the non-AP STAs. An AP may solicit simultaneous HE TB PPDU transmissions from both Class A and Class B devices. A non-AP STA that supports HE TB PPDU transmission shall support power precorrection as described in 27.3.15.2 and shall meet the precorrection accuracy requirements described in 27.3.15.3.

27.3.15.2 Power precorrection

A STA transmits an HE TB PPDU at the STA's maximum transmit power for the assigned HE-MCS if the UL Target Receive Power subfield of the User Info field in the Trigger frame that solicits the HE TB PPDU or the UL Target Receive Power subfield of the TRS Control field of the frame that solicits a response in an HE TB PPDU indicates that the maximum transmit power be used.

Otherwise, the STA calculates the transmit power, Tx_{pwr}^{STA}, of the HE TB PPDU for the assigned HE-MCS using Equation (27-124).

$$Tx_{pwr}^{STA} = PL_{DL} + TargetRx_{pwr} \quad (27\text{-}124)$$

where

PL_{DL} is the DL pathloss

$TargetRx_{pwr}$ is the expected receive signal power, in units of dBm, as indicated by the UL Target Receive Power subfield in the User Info field in the Trigger frame or by the UL Target Receive Power subfield in the TRS control field

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The STA computes PL_{DL} using Equation (27-125).

$$PL_{DL} = Tx_{pwr}^{AP} - Rx_{pwr} \quad (27\text{-}125)$$

where

Tx_{pwr}^{AP} is the AP's transmit power, in units of dBm/20 MHz, as indicated by the AP Tx Power subfield of the Common Info field in the Trigger frame, the encoding of which is specified in 9.3.1.22, or the AP Tx Power subfield of the TRS Control field, the encoding of which is specified in 9.2.4.7.1.

Rx_{pwr} is the receive signal power, in units of dBm/20 MHz, at the antenna connector of the STA of the triggering PPDU. Rx_{pwr} is an average of the receive signal power over the antennas on which the average PL_{DL} is being computed. If the triggering PPDU is a HT-mixed, VHT or HE PPDU, then the receive signal power is measured from the fields prior to the HT-STF, VHT-STF, or HE-STF, respectively.

NOTE 1—Tx_{pwr}^{AP} and Rx_{pwr} are in units of dBm/20 MHz, while Tx_{pwr}^{STA} and $TargetRx_{pwr}$ are in units of dBm.

A STA that applies beamforming (BF) in the UL should take the BF gain into account when calculating the transmit power needed to meet the target RSSI.

NOTE 2—An AP could account for its beamforming gain in Tx_{pwr}^{AP} or $Target_{RSSI}$ if the triggering PPDU used beamforming.

The transmit power of the HE TB PPDU is further subject to a STA's minimum and maximum transmit power limit due to hardware capability, regulatory requirements, local maximum transmit power levels (see 11.7.5), and non-IEEE-802.11 in-device coexistence requirements.

A STA includes its UL power headroom in the HE TB PPDU following the rules defined in 26.5.2.3.

27.3.15.3 Precorrection accuracy requirements

A STA that transmits an HE TB PPDU shall support per chain max(P–32, –10) dBm as the minimum transmit power, where P is the maximum power, in dBm, that the STA can transmit at the antenna connector of that chain using HE-MCS 0 while meeting the transmit EVM and spectral mask requirements.

A STA transmitting using HE-MCS 7 or lower, at or above the minimum power but below $P_{\text{max,MCS7}}$, shall meet the EVM requirements for HE-MCS 7 even if the HE-MCS used for the transmission is lower than HE-MCS 7, where $P_{\text{max,MCS7}}$ is the maximum transmit power supported by the STA for HE-MCS 7 in an HE TB PPDU.

A STA that transmits an HE TB PPDU shall support the absolute and relative transmit power requirements and the RSSI measurement accuracy requirements defined in Table 27-48.

The absolute transmit power accuracy is applicable for the entire range of transmit power that the STA is intending to use for the current band of operation. The RSSI accuracy requirements shall be applied to receive signal level range from –82 dBm to –20 dBm in the 2.4 GHz band and from –82 dBm to –30 dBm in the 5 GHz and 6 GHz bands. The requirements are for nominal (room) temperature conditions. The RSSI shall be measured during the reception of the non-HE portion of the HE PPDU preamble.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 27-48—Transmit power and RSSI measurement accuracy

Parameter	Minimum requirement		Comments
	Class A	Class B	
Absolute transmit power accuracy	± 3 dB	± 9 dB	Accuracy of achieving a specified transmit power.
RSSI measurement accuracy	± 3 dB	± 5 dB	The difference between the RSSI and the received power. Requirements are valid from minimum receive to maximum receive input power.
Relative transmit power accuracy	N/A	± 3 dB	Accuracy of achieving a change in transmit power for consecutive HE TB PPDU. The relative transmit power accuracy is applicable only to Class B devices.

A STA compensates for carrier frequency offset (CFO) error and symbol clock error with respect to the corresponding triggering PPDU when transmitting the following types of PPDUs:

— HE TB PPDU

— Non-HT or non-HT duplicate PPDU with the TXVECTOR parameter TRIGGER_RESPONDING set to true

NOTE 1—The MU-RTS Trigger frame solicits transmission of a non-HT or non-HT duplicate PPDU and not an HE TB PPDU. The non-HT or non-HT duplicate PPDU transmitted as a response to an MU-RTS Trigger frame carries a CTS frame.

NOTE 2—The PHY can compensate the HE TB PPDU autonomously of the MAC by applying frequency error measurement from the last PPDU received prior to the transmission of the HE TB PPDU, since that is the corresponding triggering PPDU.

After compensation, the absolute value of residual CFO error with respect to the corresponding triggering PPDU shall not exceed the following levels when measured at the 10% point of the complementary cumulative distribution function (CCDF) of CFO errors in AWGN at a received power of –60 dBm in the primary 20 MHz:

— 350 Hz for the data subcarriers of an HE TB PPDU

— 2 kHz for a non-HT PPDU or non-HT duplicate PPDU

The residual CFO error measurement on an HE TB PPDU shall be made after the HE-SIG-A field. The residual CFO error measurement on the non-HT or non-HT duplicate PPDU shall be made after the L-STF field. The symbol clock error shall be compensated by the same ppm amount as the CFO error.

A STA that transmits an HE TB PPDU, non-HT PPDU, or non-HT duplicate PPDU in response to a triggering PPDU shall ensure that the transmission start time of the HE TB PPDU, non-HT PPDU, or non-HT duplicate PPDU is within ± 0.4 μs + 16 μs from the end, at the STA's transmit antenna connector, of the last OFDM symbol of the triggering PPDU (if it contains no PE field) or of the PE field of the triggering PPDU (if the PE field is present).

NOTE 2—This end instant is before any signal extension; therefore, this is equivalent to HE TB PPDU transmission within 0.4 μs of SIFS after the end of the triggering PPDU including signal extension.

27.3.16 SU-MIMO and DL MU-MIMO beamforming

27.3.16.1 General

SU-MIMO and DL MU-MIMO beamforming are techniques used by a STA with multiple antennas (the beamformer) to steer signals using knowledge of the channel to improve throughput. With SU-MIMO beamforming, all space-time streams in the transmitted signal are intended for reception at a single STA in an RU. With DL MU-MIMO beamforming, disjoint subsets of the space-time streams are intended for reception at different STAs in an RU of size greater than or equal to 106 tones.

For SU-MIMO and DL MU-MIMO beamforming in RU r, the receive signal vector in subcarrier k (where subcarrier k is one of the subcarriers in RU r, K_r is the set of used subcarrier indices in RU r, and $k \in K_r$) at beamformee u, $\boldsymbol{y}_{k,u} = [y_{k,0}, y_{k,1}, \ldots, y_{k,N_{RX_u}-1}]^T$, is shown in Equation (27-126), where $\boldsymbol{x}_k = [\boldsymbol{x}_{k,0}^T, \boldsymbol{x}_{k,1}^T, \ldots, \boldsymbol{x}_{k,N_{user,r}-1}^T]^T$ denotes the transmit signal vector in subcarrier k for all $N_{user,r}$ beamformees, with $\boldsymbol{x}_{k,u} = [x_{k,0}, x_{k,1}, \ldots, x_{k,N_{STS,r,u}-1}]^T$ being the transmit signal for beamformee u.

$$\boldsymbol{y}_{k,u} = \boldsymbol{H}_{k,u} \times [Q_{k,0}, Q_{k,1}, \ldots, Q_{k,N_{user,r}-1}] \times \boldsymbol{x}_k + \boldsymbol{n} \quad (27\text{-}126)$$

where

$\boldsymbol{H}_{k,u}$ is the channel matrix from the beamformer to beamformee u in subcarrier k with dimensions $N_{RX_u} \times N_{TX}$

N_{RX_u} is the number of receive antennas at beamformee u

$Q_{k,u}$ is a steering matrix for beamformee u in subcarrier k with dimensions $N_{TX} \times N_{STS,r,u}$

$N_{user,r}$ is the number of HE MU PPDU recipients (see Table 27-16) in RU r

$\boldsymbol{n}$ is a vector of additive noise and may include interference

The DL MU-MIMO steering matrix $Q_k = [Q_{k,0}, Q_{k,1}, \ldots, Q_{k,N_{user,r}-1}]$ can be determined by the beamformer using the beamforming feedback for subcarrier k from beamformee u, where $u = 0, 1, \ldots, N_{user,r} - 1$. The feedback report format is described in 9.4.1.63 and 9.4.1.64. The steering matrix that is computed (or updated) using new beamforming feedback from some or all of participating beamformees might replace the existing steering matrix Q_k for the next DL MU-MIMO data transmission.

For SU-MIMO beamforming, the steering matrix Q_k can be determined from the beamforming feedback matrix V_k that is sent back to the beamformer by the beamformee using the compressed beamforming feedback matrix format as defined in 19.3.12.3.6. The feedback report format is described in 9.4.1.63.

27.3.16.2 Beamforming feedback matrix *V*

Upon receipt of an HE sounding NDP, the beamformee computes a set of matrices for feedback to the beamformer as described in 21.3.11.2. The eligible beamformees shall remove the space-time stream CSD in Table 21-11 from the measured channel before computing a set of matrices for feedback to the beamformer.

The beamforming feedback matrix, $V_{k,u}$, found by the beamformee u for subcarrier k in RU r shall be compressed in the form of angles using the method described in 19.3.12.3.6. The angles, $\phi(k,u)$ and $\psi(k,u)$, are quantized according to Table 9-92 with b_ϕ and b_ψ defined by the Codebook Information field of the HE

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

MIMO Control field (see 9.4.1.62). The compressed beamforming feedback matrix as defined in 19.3.12.3.6 is the only Clause 27 beamforming feedback matrix defined.

The beamformee shall generate the beamforming feedback matrices with the number of rows (*Nr*) equal to the N_{STS} of the HE sounding NDP.

After receiving the angle information, $\phi(k,u)$ and $\psi(k,u)$, the beamformer reconstructs $V_{k,u}$ using Equation (19-79). For SU-MIMO beamforming, the beamformer uses the $V_{k,0}$ matrix to determine the steering matrix Q_k. For DL MU-MIMO beamforming, the beamformer may calculate a steering matrix $Q_k = [Q_{k,0}, Q_{k,1}, \ldots, Q_{k,N_{user,r}-1}]$ using $V_{k,u}$ and $\Delta SNR_{k,u}$ ($0 \le u \le N_{user,r}-1$) in order to suppress crosstalk between transmissions to participating beamformees. The method used by the beamformer to calculate the steering matrix Q_k is implementation specific.

27.3.16.3 CQI feedback

If the HE NDP Announcement frame requests CQI feedback, then upon receipt of the HE sounding NDP, the beamformee computes CQI feedback as described in 9.4.1.65. The CQI feedback, $CQI_{s,r,u}$, for beamformee *u* in RU *r* for space-time stream *s* shall be estimated using the method described in 9.4.1.65. The CQI values to be fed back are derived from quantized SNRs according toTable 9-129. The beamformee shall transmit the CQI feedback for space-time stream 1, …, *Nc* for each of the RU indices for which the CQI report is being requested by the beamformer. The beamformer may use the CQI feedback to determine the best range of RUs for a compressed beamforming/CQI report or for RU assignment during a subsequent MU transmissions. The actual use is implementation specific.

27.3.17 HE sounding NDP

The HE sounding NDP is a variant of the HE SU PPDU. The format of an HE sounding NDP is defined in Figure 27-46.

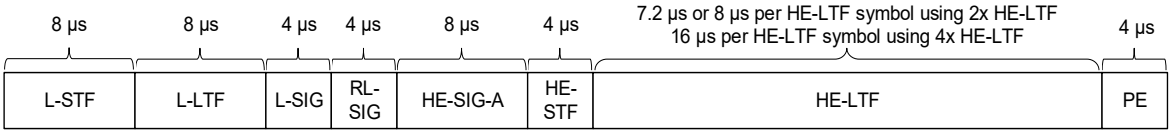

Figure 27-46—HE sounding NDP format

NOTE—The number of HE-LTF symbols in the HE sounding NDP is indicated in the NSTS And Midamble Periodicity field in the HE-SIG-A field.

The HE sounding NDP has the following properties:

— Uses the HE SU PPDU format but without the Data field

— Has a PE field that is 4 µs in duration

The HE sounding NDP overlapping the 242-tone RUs corresponding to bits with a value of 1 in the bitmap of the TXVECTOR parameter INACTIVE_SUBCHANNELS or overlapping a punctured center 26-tone RU of an HE sounding NDP is punctured. The center 26-tone RU of the HE sounding NDP is punctured if either one of the adjacent 242-tone RUs is punctured.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

It is mandatory to support the 2x HE-LTF with 0.8 μs GI and 2x HE-LTF with 1.6 μs GI. It is optional to support the 4x HE-LTF with 3.2 μs GI. The other combinations of HE-LTF type and GI duration are disallowed.

If the Beamformed field in the HE-SIG-A field of an HE sounding NDP is 1, then the receiver of the HE sounding NDP should not perform channel smoothing when generating the compressed beamforming feedback report.

27.3.18 HE TB feedback NDP

The HE TB feedback NDP is used to carry the NDP feedback report information as introduced in 26.5.7. The PPDU structure of an HE TB feedback NDP is shown in Figure 27-47.

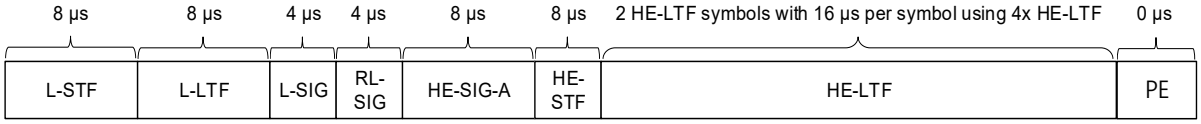

Figure 27-47—HE TB feedback NDP format

The HE TB feedback NDP has the following properties:

— Uses the HE TB PPDU format but without the Data field.
— The PE field has a duration of 0 μs.
— Has two 4x HE-LTF symbols.
— 4x HE-LTF with 3.2 μs GI is the only HE-LTF type and GI duration combination for the HE-LTF.
— The generation of HE-LTF symbols for the HE TB feedback NDP is defined in 27.3.11.10.
— The HE-STF and the pre-HE modulated fields are transmitted only on the 20 MHz channel where the STA is assigned.

27.3.19 HE Ranging NDP and HE TB Ranging NDP

This subclause describes the HE Ranging NDP and HE TB Ranging NDP.

27.3.19.1 HE Ranging NDP

The format of an HE Ranging NDP is shown in Figure 27-48.

Figure 27-48—HE Ranging NDP format

The HE Ranging NDP has the following properties:

— Uses the HE SU PPDU format but without the Data field.
— The L-STF and L-LTF fields in an HE Ranging NDP are the same as the L-STF and L-LTF fields in an HE SU PPDU. The subfields in L-SIG, RL-SIG and HE-SIG-A have the same bit assignments and definitions as the subfields in a HE SU PPDU unless specified otherwise.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The HE-STF field in an HE Ranging NDP is the same as the HE-STF field in an HE SU PPDU.

— Uses HE-LTFs or secure HE-LTFs when the TXVECTOR parameter SECURE_LTF_FLAG is equal to 0 or 1, respectively.

— Secure HE-LTFs use randomized HE-LTF sequences, pseudorandom and deterministic per stream phase rotation and, when the TXVECTOR parameter TX_WINDOW_FLAG is equal to 1, a frequency domain flat top window is used instead of the frequency domain rectangular window; see 27.3.20.6.

— Uses HE-LTF repetitions, if indicated in the TXVECTOR parameter LTF_REP by values larger than one.

— The HE-LTF field consists of one or more HE-LTF user blocks; each HE-LTF user block contains one or more HE-LTF repetition blocks, where the number of HE-LTF repetition blocks is equal to LTF_REP. An HE-LTF repetition block in an HE-LTF user block comprises one or more HE-LTF symbols, NHE-LTF, calculated using the number of space-time streams NUM_STS for this user, as defined in Table 21-13.

— When the TXVECTOR parameter SECURE_LTF_FLAG is equal to 0, the number of HE-LTF user blocks is equal to 1, and the same HE-LTF user block is applied to all users. When the TXVECTOR parameter SECURE_LTF_FLAG is equal to 1, an HE-LTF user block contains all HE-LTF symbols for one user, and the number of HE-LTF user blocks in the HE-LTF field is equal to the number of Users, NUM_USERS, and each HE-LTF user block contains all the HE-LTF symbols for one user.

— No beamforming steering matrix is applied to the waveform. The Beamformed field in HE- SIG-A of an HE Ranging NDP is always set to 0.

— For HE-STFs and HE-LTFs, if $N_{STS} = N_{TX}$, the spatial mapping matrix Q shall be a permutation matrix with N_{TX} rows and N_{TX} columns; if $N_{STS} < N_{TX}$, Q shall be a $P \times D$ matrix where P is a permutation matrix with N_{TX} rows and N_{TX} columns and D is a matrix with N_{TX} rows and N_{STS} columns where the first N_{STS} rows make up an identity matrix and the remaining rows make up a zero matrix.

— Has a Packet Extension (PE) field that is 4 μs in duration. No energy is transmitted during the first 1.6 μs of the PE field if the HE-LTF field is using the secure HE-LTF, similar to no energy being transmitted during the GI of HE-LTF symbols.

— For decoding the HE-LTF fields, a PHY-RXLTFSEQUENCE.request primitive issued from the MAC provides the LTF_REP, LTF_NSTS, and LTF_OFFSET parameters, which are not encoded in the HE-SIG-A, but included in the preceding Ranging NDP Announcement frame. The LTF_OFFSET parameter indicates the number of secure HE-LTF symbols to skip for receiving the corresponding user's HE-LTF user block.

— When the TXVECTOR parameter NUM_USERS is greater than 1, the TXVECTOR parameter NUM_STS[1] is used to encode the NSTS And Mid-amble Periodicity field of the HE-SIG-A1. Otherwise, the TXVECTOR parameter NUM_STS is used to encode the NSTS And Mid-amble Periodicity field of the HE-SIG-A1.

— The only supported mode is 2x HE-LTF with 1.6 μs GI. The other combinations of HE-LTF modes and GI duration are disallowed. No energy is transmitted during the GI of the HE-LTF symbols when secure HE-LTF are used, which is referred to as a zero-power GI.

— The number of HE-LTF symbols in the HE-LTF field in an HE Ranging NDP depends on the number of space-time streams NUM_STS, the number of HE-LTF repetitions, LTF-REP, and when secure HE-LTFs are used, the number of users NUM_USERS.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—See examples in Figure 27-49 and Figure 27-50.

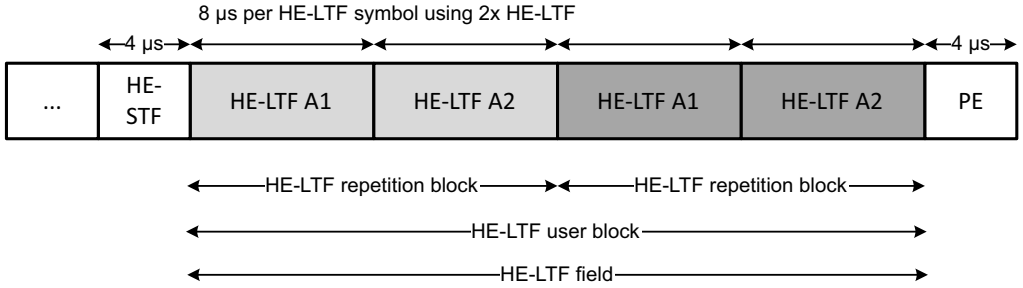

Figure 27-49—An example of HE-LTFs in an HE Ranging NDP with NUM_USERS = 1, NUM_STS = 2, and N_LTF_REP = 2

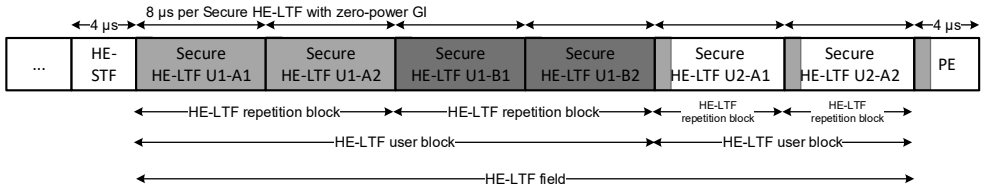

Figure 27-50—An example of secure HE-LTFs with NUM_USERS = 2, NUM_STS = [2,1], and LTF_REP = [2,2]

When the TXVECTOR parameter SECURE_LTF_FLAG is equal to 0, HE-LTFs as defined in 27.3.11.10 are used in the HE Ranging NDP. There is a single HE-LTF user block in an HE-LTF field, and the total number of HE-LTF symbols in the HE-LTF field is the product of the number of symbols in an HE-LTF repetition block, NHE-LTF, and the number of HE-LTF repetitions, given in LTF_REP.

The construction of the HE-LTFs in an HE Ranging NDP is done by repeating the steps in 27.3.6.9 LTF_REP times, that is, a value of LTF_REP equal to 1 indicates a single HE-LTF repetition block, and a value of LTF_REP greater than 1 indicates the use of repetitions, that is, multiple HE-LTF repetition blocks are included in an HE-LTF user block. If the TXVECTOR parameter SECURE_LTF_FLAG is set to 0, the TXVECTOR parameter NUM_USERS is not present, which is then assumed to be 1, and all the HE-LTF symbols belong to a single HE-LTF user block.

When the TXVECTOR parameter SECURE_LTF_FLAG is equal to 1, secure HE-LTFs as defined in 27.3.20.6, are used and the Packet Extension field will be partially replaced by a zero power GI in its first 1.6 µs, see Figure 27-51 (HE Ranging NDP format with secure HE-LTFs). For the secure HE-LTF symbol or Packet Extension field with zero power GI, the time domain signal has zero power during the period of the GI. The TXVECTOR parameters LTF_KEY, NUM_STS, and LTF_REP will be in array form with NUM_USERS entries. The repetitions of the HE-LTF symbols are repetitions of the HE-LTF repetition block. The randomized HE-LTF sequences are different in each of the HE-LTF repetition blocks. The total number of HE-LTF symbols in an HE-LTF user block is the product of the number of symbols in an HE-LTF repetition block, NHE-LTF, and the number of HE-LTF repetitions given in LTF_REP.

For secure HE-LTF transmissions, the number of HE-LTF repetitions given in LTF_REP shall be greater than 1, and there are a minimum of two HE-LTF repetition blocks in each HE-LTF user block.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

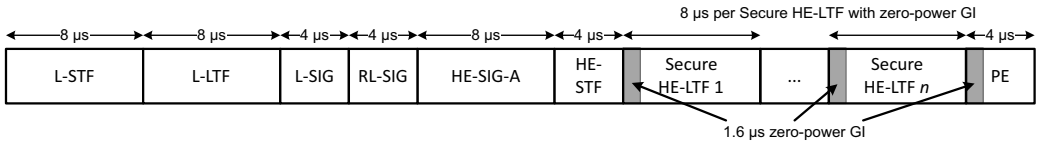

Figure 27-51—HE Ranging NDP format with secure HE-LTFs

NOTE 2—The intended receiver of the Secure HE-LTFs can use implementation specific methods to detect the occurrence of an attack. It can explore the HE-LTF repetitions to check the consistency of the channel estimation or the signal to interference ratio (SIR) drop from impact of an attack. Please see Annex AE for more details on SIR drop due to attack.

The secure HE-LTFs of each HE-LTF user block are concatenated one after another and form the HE-LTF field of an HE Ranging NDP; the total number of HE-LTF symbols in an HE-LTF field shall not exceed a maximum of 64 secure HE-LTF symbols over all users, all space-time streams. and number of HE-LTF repetitions.

In each HE-LTF user block within the HE-LTF field, the number of transmitted space-time streams is indicated in NUM_STS for the corresponding HE-LTF user block and may vary from one HE-LTF user block to another. Within the HE-STF Field, the number of transmitted space-time streams should match the first HE-LTF user block. In the pre-HE modulated fields, the number of transmitted space-time streams used shall be no less than the minimum number of transmitted space-time streams used in the HE modulated fields. The sum of the Tx power across all transmitted space-time streams shall remain constant throughout the entire HE Ranging NDP PPDU.

27.3.19.2 HE TB Ranging NDP

The format of an HE TB Ranging NDP is shown in Figure 27-52.

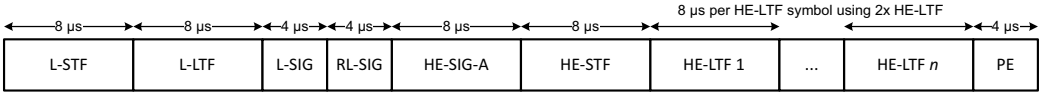

Figure 27-52—HE TB Ranging NDP format

The HE TB Ranging NDP has the following properties:

— Uses the HE TB PPDU format but without the Data field.
— The HE-STF field in HE TB Ranging NDP is the same as the HE-STF field in a HE TB PPDU.
— Uses HE-LTFs or secure HE-LTFs when the TXVECTOR parameter SECURE_LTF_FLAG is equal to 0 or 1, respectively.
— Secure HE-LTFs use randomized HE-LTF sequences, pseudorandom and deterministic per stream phase rotation and, when the TXVECTOR parameter TX_WINDOW_FLAG is equal to 1, a frequency domain flat top window is used instead of the frequency domain rectangular window; see 27.3.20.6.
— Uses HE-LTF repetitions, if indicated in the TXVECTOR parameter LTF_REP by values larger than one.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The HE-LTF field of an HE TB Ranging NDP consists of a single HE-LTF user block. The HE-LTF user block contains one or more HE-LTF repetition blocks, and the number of HE-LTF repetition blocks is equal to LTF_REP. Each HE-LTF repetition block in the HE-LTF user block comprises one or more HE-LTF symbols, $N_{HE\text{-}LTF}$ specified in the Common Info field within the Sounding Ranging Trigger frame.
— Has a Packet Extension (PE) field that is 4 μs in duration. No energy is transmitted during the first 1.6 μs of the PE field if the HE-LTF field is using the secure HE-LTF, similar to no energy being transmitted during the GI of HE-LTF symbols.
— No beamforming steering matrix is applied to the waveform.
— For transmission of HE-LTFs, i.if $N_{STS} = N_{TX}$, the spatial mapping matrix Q shall be a permutation matrix with N_{TX} rows and N_{TX} columns; if $N_{STS} < N_{TX}$, Q shall be a $P \times D$ matrix where P is a permutation matrix with N_{TX} rows and N_{TX} columns and D is a matrix with N_{TX} rows and N_{STS} columns where the first N_{STS} rows make up an identity matrix and the remaining rows make up a zero matrix.
— The only supported mode is the 2x HE-LTF with 1.6 μs GI. The other combinations of HE-LTF modes and GI duration are disallowed.

The number of HE-LTF symbols in an HE TB Ranging NDP is the product of the number of HE-LTF symbols in an HE-LTF repetition block, $N_{HE\text{-}LTF}$, and the number of HE-LTF repetitions, given in LTF_REP. A value of LTF_REP equal to 1 indicates no repetition, that is, a single HE-LTF repetition block is included in an HE-LTF user block, and a value of LTF_REP greater than 1 indicates the use of repetitions, that is, multiple HE-LTF repetition blocks are included in the HE-LTF user block. The sum of Tx power shall remain constant throughout the entire HE TB Ranging NDP PPDU.

When the TXVECTOR parameter SECURE_LTF_FLAG is equal to 0, HE-LTFs as defined in 27.3.11.10 are used in each HE-LTF repetition block.

When the TXVECTOR parameter SECURE_LTF_FLAG is equal to 1, secure HE-LTFs as defined in 27.3.20 are used in the HE-LTF repetition blocks, and the Packet Extension field will be partially replaced by a zero power GI in its first 1.6 μs; see Figure 27-53. The repetitions of the HE-LTF symbols form the HE-LTF repetition blocks. The randomized HE-LTF sequences are different in each HE-LTF repetition block.

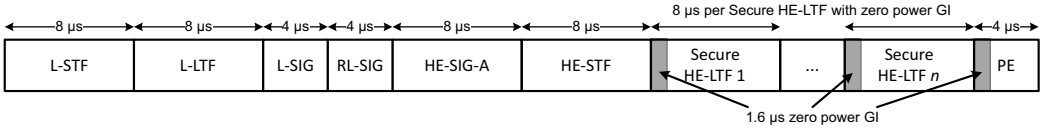

Figure 27-53—HE TB Ranging NDP with secure HE-LTFs

27.3.20 HE-LTF field using secure HE-LTF

27.3.20.1 Introduction

The HE-LTF field using secure HE-LTF is similar to the HE-LTF field, see 27.3.11.10, the main differences are as follows:

— The HE-LTF sequence is replaced by the randomized LTF sequence described in 27.3.20.2.
— The conventional GI is replaced by a zero power GI.
— There are no single stream pilot subcarriers in the secure HE-LTFs, all subcarriers are mapped using the $P_{HE\text{-}LTF}$ matrix.
— No CSD is applied to the space-time streams.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Each spatial stream has a per stream pseudorandom and deterministic phase rotation applied to all the subcarriers.
— A frequency domain flat top window is applied to the secure HE-LTF when configured.
— Only 2x HE-LTF and 1.6 μs GI is supported.
— No beamforming is applied. If $N_{STS} = N_{TX}$, the spatial mapping matrix Q is a permutation matrix with N_{TX} rows and N_{TX} columns. If $N_{STS} < N_{TX}$, Q is a $P \times D$ matrix where P is a permutation matrix with N_{TX} rows and N_{TX} columns and D is a matrix with N_{TX} rows and N_{STS} columns where the first N_{STS} rows make up an identity matrix and the remaining rows make up a zero matrix.

27.3.20.2 Generation of a randomized secure HE-LTF sequence

The secure HE-LTF sequence is constructed using pseudorandom 64-QAM modulation. Pseudorandom octets defined in 11.21.6.4.5.4 are used in the construction of the pseudorandom 64-QAM values.

The first seven pseudorandom octets ($Octet_0$–$Octet_6$) in the secure NDP are used for per stream phase rotations see 27.3.20.3.

NOTE—Each octet that is used for per stream phase rotation is mapped so that B7 is the most significant bit and B0 is the least significant bit.

Starting with $Octet_7$, these pseudorandom octets are used for construction of pseudorandom 64-QAM values in the secure HE-LTF sequences.

27.3.20.2.1 Randomized LTF sequence for 20 MHz secure NDP

There are 122 nonzero entries in the 20 MHz secure 2x HE-LTF sequence. This subclause describes the mapping of pseudorandom octets to the nonzero entries of the 20 MHz secure 2x HE-LTF sequence, and then the construction of the 64-QAM values for each nonzero entry of the secure HE-LTF sequence.

The indices of the nonzero entries of the 20 MHz secure 2x HE-LTF sequence are those of the nonzero entries in Equation (27-42). The indices for the nonzero entries are provided in Equation (27-127).

$$NZ_{20\,\mathrm{MHz}} = \{-122, -120, -118, -116, -114, -112, -110, -108, -106, -104, -102, -100, -98, -96, -94, -92, -90, -88, -86, -84, -82, -80, -78, -76, -74, -72, -70, -68, -66, -64, -62, -60, -58, -56, -54, -52, -50, -48, -46, -44, -42, -40, -38, -36, -34, -32, -30, -28, -26, -24, -22, -20, -18, -16, -14, -12, -10, -8, -6, -4, -2, 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 50, 52, 54, 56, 58, 60, 62, 64, 66, 68, 70, 72, 74, 76, 78, 80, 82, 84, 86, 88, 90, 92, 94, 96, 98, 100, 102, 104, 106, 108, 110, 112, 114, 116, 118, 120, 122\} \quad (27\text{-}127)$$

There are up to 64 secure HE-LTF sequences in an NDP. For notational convenience we indicate the LTF sequence number with the integer n, which is an integer between 1 and 64. Since each secure HE-LTF sequence is used to generate each of the LTF symbols, n also indicates the LTF symbol number. Table 27-49 provides the pseudorandom octet index for each nonzero subcarrier index in the nth 20 MHz secure HE-LTF sequence.

All entries in the 20 MHz secure HE-LTF sequence other than the entries with indices defined in Equation (27-127) shall be set to 0.

The six least significant bits (B_0, B_1, B_2, B_3, B_4, B_5) of an octet are used in the construction of the 64-QAM value, as specified in Table 17-18.

27.3.20.2.2 Randomized LTF sequence for 40 MHz secure NDP

There are 242 nonzero entries in the 40 MHz secure 2x HE-LTF sequence. This subclause describes the mapping of pseudorandom octets to the nonzero entries of the 40 MHz secure 2x HE-LTF sequence, and then the construction of the 64-QAM values for each nonzero entry of the secure HE-LTF sequence.

The indices of the nonzero entries of the 40 MHz secure 2x HE-LTF sequence are those of the nonzero entries in Equation (27-45). The indices for the nonzero entries are provided in Equation (27-128).

$$NZ_{40\ \mathrm{MHz}} = \{-244, -242, -240, -238, -236, -234, -232, -230, -228, -226, -224, -222, -220, -218, -216, -214, -212, -210, -208, -206, -204, -202, -200, -198, -196, -194, -192, -190, -188, -186, -184, -182, -180, -178, -176, -174, -172, -170, -168, -166, -164, -162, -160, -158, -156, -154, -152, -150, -148, -146, -144, -142, -140, -138, -136, -134, -132, -130, -128, -126, -124, -122, -120, -118, -116, -114, -112, -110, -108, -106, -104, -102, -100, -98, -96, -94, -92, -90, -88, -86, -84, -82, -80, -78, -76, -74, -72, -70, -68, -66, -64, -62, -60, -58, -56, -54, -52, -50, -48, -46, -44, -42, -40, -38, -36, -34, -32, -30, -28, -26, -24, -22, -20, -18, -16, -14, -12, -10, -8, -6, -4, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 50, 52, 54, 56, 58, 60, 62, 64, 66, 68, 70, 72, 74, 76, 78, 80, 82, 84, 86, 88, 90, 92, 94, 96, 98, 100, 102, 104, 106, 108, 110, 112, 114, 116, 118, 120, 122, 124, 126, 128, 130, 132, 134, 136, 138, 140, 142, 144, 146, 148, 150, 152, 154, 156, 158, 160, 162, 164, 166, 168, 170, 172, 174, 176, 178, 180, 182, 184, 186, 188, 190, 192, 194, 196, 198, 200, 202, 204, 206, 208, 210, 212, 214, 216, 218, 220, 222, 224, 226, 228, 230, 232, 234, 236, 238, 240, 242, 244\} \quad (27\text{-}128)$$

There are up to 64 secure HE-LTF sequences in an NDP. For notational convenience we indicate the LTF sequence number with the integer *n*, which is an integer between 1 and 64. Since each secure HE-LTF sequence is used to generate each of the LTF symbols, *n* also indicates the LTF symbol number. Table 27-50

provides the pseudorandom octet index for each nonzero subcarrier index in the *n*th 40 MHz secure HE-LTF sequence.

Table 27-50—Pseudorandom octet index for each nonzero subcarrier index in the *n*th 40 MHz secure HE-LTF sequence

Secure HE-LTF tone index	Pseudorandom octet index
–244	$7 + (n - 1) \times 242$
–242	$8 + (n - 1) \times 242$
–240	$9 + (n - 1) \times 242$
⋮	⋮
–6	$126 + (n - 1) \times 242$
–4	$127 + (n - 1) \times 242$
4	$128 + (n - 1) \times 242$
6	$129 + (n - 1) \times 242$
⋮	⋮
240	$246 + (n - 1) \times 242$
242	$247 + (n - 1) \times 242$
244	$248 + (n - 1) \times 242$

All entries in the 40 MHz secure HE-LTF sequence other than the entries with indices defined in Equation (27-128) shall be set to 0.

The six least significant bits (B_0, B_1, B_2, B_3, B_4, B_5) of an octet are used in the construction of the 64-QAM value, as specified in Table 17-18.

27.3.20.2.3 Randomized LTF sequence for 80 MHz secure NDP

There are 498 nonzero entries in the 80 MHz secure 2x HE-LTF sequence. This subclause describes the mapping of pseudorandom octets to the nonzero entries of the 80 MHz secure 2x HE-LTF sequence, and then the construction of the 64-QAM values for each nonzero entry of the secure HE-LTF sequence.

Table 27-51—Pseudorandom octet index for each nonzero subcarrier index in the *n*th 80 MHz secure HE-LTF sequence

Secure HE-LTF tone index	Pseudorandom octet index
–500	$7 + (n - 1) \times 498$
–498	$8 + (n - 1) \times 498$
–496	$9 + (n - 1) \times 498$
⋮	⋮
–6	$254 + (n - 1) \times 498$
–4	$255 + (n - 1) \times 498$
4	$256 + (n - 1) \times 498$
6	$257 + (n - 1) \times 498$
⋮	⋮
496	$502 + (n - 1) \times 498$
498	$503 + (n - 1) \times 498$
500	$504 + (n - 1) \times 498$

27.3.20.2.4 Randomized LTF sequence for the 160 MHz secure NDP and for the 80+80 MHz secure NDP

This subclause describes the mapping of pseudorandom octets to the nonzero entries of either the 160 MHz secure 2x HE-LTF sequence, or the 80+80 MHz secure 2x LTF sequence, and then the construction of the 64-QAM values for each nonzero entry of the secure HE-LTF sequence.

The construction of either the 160 MHz secure HE-LTF sequence, or the 80+80 MHz secure HE-LTF sequence, uses a segment parser to divide the pseudorandom octets between the sequence for the lower 80 MHz segment and the sequence for the upper 80 MHz segment. Figure 27-54 illustrates the segment parser distribution of pseudorandom octets between the sequence for the lower 80 MHz segment and the sequence for the upper 80 MHz segment.

Table 27-52—Pseudorandom octet index for each nonzero subcarrier index in the *n*th pair of lower and upper 80 MHz segments *(continued)*

80 MHz Segment	Secure HE-LTF tone index	Pseudorandom octet index
Upper	–4	$504 + (n - 1) \times 996$
Lower	4	$505 + (n - 1) \times 996$
Upper	4	$506 + (n - 1) \times 996$
Lower	6	$507 + (n - 1) \times 996$
Upper	6	$508 + (n - 1) \times 996$
⋮	⋮	⋮
Lower	496	$997 + (n - 1) \times 996$
Upper	496	$998 + (n - 1) \times 996$
Lower	498	$999 + (n - 1) \times 996$
Upper	489	$1000 + (n - 1) \times 996$
Lower	500	$1001 + (n - 1) \times 996$
Upper	500	$1002 + (n - 1) \times 996$

All entries in the 160 MHz secure HE-LTF sequence, or the 80+80 secure HE-LTF sequence, other than the nonzero entries shall be set to 0.

The six least significant bits (B_0, B_1, B_2, B_3, B_4, B_5) of an octet are used in the construction of the 64-QAM value, as specified in Table 17-15.

27.3.20.3 Pseudorandom and deterministic per spatial stream phase rotations

In each repetition of the secure HE-LTF symbols, each spatial stream has a phase rotation applied to all the subcarriers. The same phase rotation is applied to all subcarriers. The phase rotation can vary in different repetitions of the secure HE-LTF symbols.

The phase rotation for a given spatial stream consists of two components: a pseudorandom phase rotation and a deterministic phase rotation. For each spatial stream, the pseudorandom phase rotation is the same for all the repetitions of HE-LTF symbols within the secure NDP. As specified in 11.21.6.4.5.4, a stream of pseudorandom octets are provided by the AES-128 CTR Mode. The first seven pseudorandom octets are used in the construction of the pseudorandom phase rotations.

The deterministic phase rotation is a function of the repetition number within the secure NDP and the spatial stream number.

The total phase rotation applied to spatial stream *s* within repetition *r* is given by Equation (27-130).

$$\Theta_{r,s} = \alpha_s + \beta_{r,s} \tag{27-130}$$

In Equation (27-130) the term α_s is the pseudorandom phase rotation that is the same for the entire secure NDP and the term $\beta_{r,s}$ is the deterministic phase rotation that depends on the rotation value *r*.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The pseudorandom phase α_s is constructed using one of the pseudorandom octets defined in 11.21.6.4.5.4. The index of spatial streams, *s*, is a number between one and eight. For $s = 1$ the phase rotation is zero: $\alpha_1 = 0$. The first octet ($Octet_0$) is used to construct α_2, the second octet ($Octet_1$) is used to construct α_3. Table 27-53 provides a summary of pseudorandom octets used in construction of each of the pseudorandom phase rotations.

Table 27-53—Pseudorandom octets for generating per stream pseudorandom phase rotations

Pseudorandom octet	Spatial stream pseudorandom phase rotations
$Octet_0$	α_2
$Octet_1$	α_3
$Octet_2$	α_4
$Octet_3$	α_5
$Octet_4$	α_6
$Octet_5$	α_7
$Octet_6$	α_8

For STAs with fewer than eight spatial streams, not all of the pseudorandom octets up to $Octet_6$ are used.

The three most significant bits of the pseudorandom octet are used to construct the pseudorandom phase rotation. The integer *k* in Equation (27-131) is derived from the three MSBs of the pseudorandom octet.

$$k = (4 \times B_5) + (2 \times B_6) + B_7 \tag{27-131}$$

Equation (27-132) specifies the pseudorandom phase rotation as a function of the integer *k*.

$$\alpha_s = k \times \frac{\pi}{4} \tag{27-132}$$

The deterministic phase rotation $\beta_{r,s}$, which depends on both the spatial stream number *s* and the repetition number *r*, is provided in Table 27-54.

The steps in the process of the construction of the secure HE-LTF, including the application of the spatial stream phase rotation, are described in 27.3.20.6.

27.3.20.4 Frequency domain windowing in HE-LTF field using secure HE-LTF

In an HE Ranging NDP or HE TB Ranging NDP using secure HE-LTF a frequency domain windowing function $w_{FD}(k)$ is applied to the subcarriers modulated with the secure HE-LTF sequence $x_{k,n}^{m}$.

$r = 7$	0	$\frac{4\pi}{4}$	$\frac{7\pi}{4}$	$\frac{3\pi}{4}$	$\frac{2\pi}{4}$	$\frac{\pi}{4}$	$\frac{5\pi}{4}$	$\frac{6\pi}{4}$
$r = 8$	0	$\frac{5\pi}{4}$	$\frac{2\pi}{4}$	$\frac{7\pi}{4}$	$\frac{\pi}{4}$	$\frac{4\pi}{4}$	$\frac{6\pi}{4}$	$\frac{3\pi}{4}$

There are two frequency domain windowing functions defined, the rectangle window $w_{FD}(k) = 1$ and the flat top window defined by Equation (27-133) and Equation (27-134).

$$w_{FD}(k) = \sum_{n=-10}^{10} p(n)\exp\left(\frac{-j\pi kn}{N_{FD}}\right), \quad \text{where } k \in K_s \tag{27-133}$$

$$N_{FD} = \begin{cases} 512 & \text{for 20 MHz} \\ 1024 & \text{for 40 MHz} \\ 2048 & \text{for 80 MHz} \\ 4096 & \text{for 160 MHz} \end{cases} \tag{27-134}$$

where

$K_s = NZ_{BW}$ is the set of nonzero subcarriers for a given bandwidth defined in 27.3.20.2

$p(n)$ is the impulse response given by Equation (27-135)

$$p(n) = \sum_{m=0}^{4} a_m \cos\left(\frac{2m\pi(n+10)}{N_{WinFT}}\right) \quad \text{where } n = -10, \ldots, 10 \tag{27-135}$$

where

$a_0 = 0.21557895$

$a_1 = -0.41663158$

$a_2 = 0.277263158$

$a_3 = -0.083578947$
$a_4 = 0.006947368$
$N_{WinFT} = 20$

The $w_{FD}(k)$ shall be normalized to have unit RMS power.

27.3.20.5 Mathematical description of HE-LTF field using secure HE-LTF

In an HE Ranging NDP or HE TB Ranging NDP using secure HE-LTF, the time domain representation of the waveform of user u, transmitted on frequency segment i_{Seg}, and transmit chain i_{TX} shall be as described by Equation (27-136).

$$r_{\text{HE-LTF},u}^{(i_{Seg},\, i_{TX})}(t) = \frac{1}{\sqrt{\lvert K_s \rvert N_{STS,u}}} \sum_{r=0}^{N_{rep,u}-1} \sum_{n=0}^{N_{\text{HE-LTF},u}-1} w_{T_{\text{HE-LTF}}}(t-(n+rN_{\text{HE-LTF,u}})T_{\text{HE-LTF-SYM}} - T_{\text{GI,HE-LTF}}) \times \sum_{k \in K_s} \sum_{m=1}^{N_{STS,u}} \left(\begin{array}{l} [Q]_{i_{TX},m}[P_{\text{HE-LTF}}]_{m,(n+1)} w_{FD}(k) X^{u}_{k,(n+rN_{\text{HE-LTF},u})} \exp(j\Theta^{u}_{r+1,m}) \\ \exp(j2\pi k \Delta_{F,\text{HE}}(t-(n+rN_{\text{HE-LTF,u}})T_{\text{HE-LTF-SYM}} - T_{\text{GI,HE-LTF}})) \end{array} \right) \quad \text{(27-136)}$$

where

$K_s = NZ_{BW}$ is the set of nonzero subcarriers for a given bandwidth defined in 27.3.20.2

$N_{STS,u}$ is the number of spatial streams for user u

$N_{rep,u}$ is the number of HE-LTF repetitions for user u

$N_{\text{HE-LTF,u}}$ is the number of HE-LTF symbols $N_{\text{HE-LTF}}$ in one HE-LTF repetition block of user u

$w_{T_{\text{HE-LTF}}}(t)$ is the zero power GI windowing function, that avoids cyclic extension of the signal outside of $[0,\ T_{\text{HE-LTF}}]$

$T_{\text{HE-LTF}}$ is always set to $T_{\text{HE-LTF-2X}} = 6.4$ μs

$T_{\text{GI,HE-LTF}}$ is always set to 1.6 μs, accordingly $T_{\text{HE-LTF-SYM}} = 8.0$ μs

Q is an identity matrix, that is, $Q = I_{N_{TX}}$

$P_{\text{HE-LTF}}$ is defined in Equation (27-57)

$w_{FD}(k)$ is the frequency domain windowing function

$X^{u}_{k,(n+rN_{\text{HE-LTF},u})}$ is the kth subcarrier of the 64-QAM modulated $(n+rN_{\text{HE-LTF,u}})$ secure HE-LTF sequence for user u

$\Theta^{u}_{r+1,m}$ is the total phase rotation applied to spatial stream m within repetition $r+1$ for user u, defined in Equation (27-130)

The time domain representation of the waveform including all users, transmitted on frequency segment i_{Seg}, and transmit chain i_{TX} shall be as described by Equation (27-137).

$$r_{\text{HE-LTF}}^{(i_{Seg},\, i_{TX})}(t) \sum_{u=1}^{N_u} r_{\text{HE-LTF},u}^{(i_{Seg},\, i_{TX})}(t - T_{\text{HE-LTF},u}) \quad \text{(27-137)}$$

where

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

N_u is the total number of users (NUM_USERS)

$T_{\text{HE-LTF,u}}$ is the start time of the secure HE-LTF symbols for user u as defined by Equation (27-138) and Equation (27-139)

$$T_{\text{HE-LTF},\,u} = \sum_{k=1}^{u-1} N_{rep,\,k} N_{\text{HE-LTF},\,k} T_{\text{HE-LTF-SYM}} \quad (27\text{-}138)$$

$$T_{\text{HE-LTF},\,1} = 0 \quad (27\text{-}139)$$

27.3.20.6 Construction of secure HE-LTF symbols

The construction of the nth secure HE-LTF symbol is achieved as follows:

a) Sequence generation: Construct the nth randomized HE-LTF sequence $X^{u}_{k,\,r,\,n}$ in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 27.3.20.2.

b) Apply frequency domain window function $w_{FD}(k)$ to all the tones of the secure HE-LTF sequence. The frequency domain window can be the Rectangular window or flat top window, when the TXVECTOR parameter TX_WINDOW_FLAG is equal to 0 or 1, respectively.

c) Apply the $P_{\text{HE-LTF}}$ matrix to all tones of the secure HE-LTF sequence.

d) Apply per spatial stream phase rotation: Generate the pseudorandom phase rotation for each spatial stream. Apply the pseudorandom phase rotation along with the deterministic phase rotation to the spatial streams as described in 27.3.20.3.

e) Apply a zero CSD on each space-time stream, which is equivalent to no CSD per space-time stream.

f) If $N_{STS} = N_{TX}$, the spatial mapping matrix Q is a permutation matrix with N_{TX} rows and N_{TX} columns. If $N_{STS} < N_{TX}$, Q is a $P \times D$ matrix where P is a permutation matrix with N_{TX} rows and N_{TX} columns and D is a matrix with N_{TX} rows and N_{STS} columns where the first N_{STS} rows make up an identity matrix and the remaining rows make up a zero matrix.

g) IDFT: Compute the inverse discrete Fourier transform.

h) Insert zero power GI: Prepend values of zero, of length indicated by the TXVECTOR parameter GI_TYPE.

i) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 27.3.10.

The generation of the time domain secure HE-LTF symbol per repetition for repetition r, symbol n, and tone index k is shown in Figure 27-55.

27.3.21 Transmit specification

27.3.21.1 Transmit spectral mask

The bandwidth of the spectral mask applied to an HE SU PPDU, an HE TB PPDU, and an HE MU PPDU with the Bandwidth field of the HE-SIG-A field equal to 0, 1, 2, or 3 shall be determined by the bandwidth indicated in the Bandwidth field of the HE-SIG-A field. The bandwidth of the spectral mask applied to an HE ER SU PPDU is 20 MHz. The bandwidth of the spectral mask applied to an HE MU PPDU with the Bandwidth field of the HE-SIG-A field equal to 4 or 5 is 80 MHz. The bandwidth of the spectral mask applied to an HE MU PPDU with the Bandwidth field of the HE-SIG-A field equal to 6 or 7 is 160 MHz. All HE PPDU formats shall be compliant with the transmit spectral mask described in 27.3.21.

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements and the mask defined in this subclause.

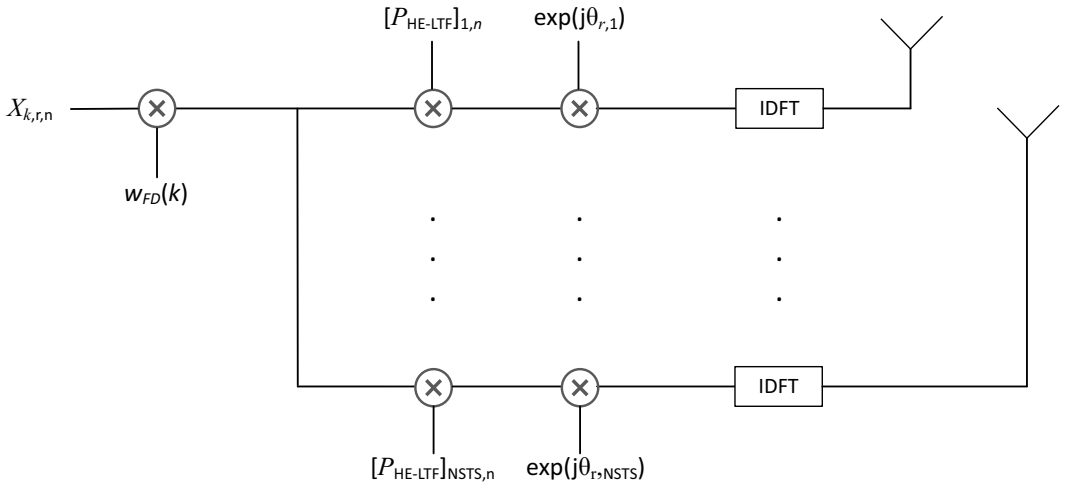

Figure 27-55—Generation of secure HE-LTF symbols per repetition in a HE Ranging NDP PPDU

NOTE 2—Transmit spectral mask figures in this subclause are not drawn to scale.

NOTE 3—For rules regarding transmit center frequency leakage levels, see 27.3.21.4.2. The spectral mask requirements in this subclause do not apply to the RF LO.

The overall transmit spectral mask is constructed using two components. First, an interim spectral mask is constructed whose mask level is determined relative to the maximum spectral density of the signal. Second, an absolute transmit spectral limit is computed based on the mask bandwidth. The overall transmit spectral mask is then constructed by taking the higher of the interim transmit spectral mask and the absolute transmit spectral limit at each frequency offset.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For a 20 MHz mask PPDU of HE format, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 19.5 MHz, –20 dBr at 10.5 MHz frequency offset, –28 dBr at 20 MHz frequency offset, and –40 dBr at 30 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets between 9.75 MHz and 10.5 MHz, 10.5 MHz and 20 MHz, and 20 MHz and 30 MHz shall be linearly interpolated in dB domain from the requirements for 9.75 MHz, 10.5 MHz, 20 MHz, and 30 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –53 dBm/MHz at any frequency offset in the 2.4 GHz band. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –39 dBm/MHz at any frequency offset in the 5 GHz and 6 GHz bands. Figure 27-56 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –53 dBm/MHz in the 2.4 GHz band or when the –40 dBr spectrum level is above –39 dBm/MHz in the 5 GHz and 6 GHz bands.

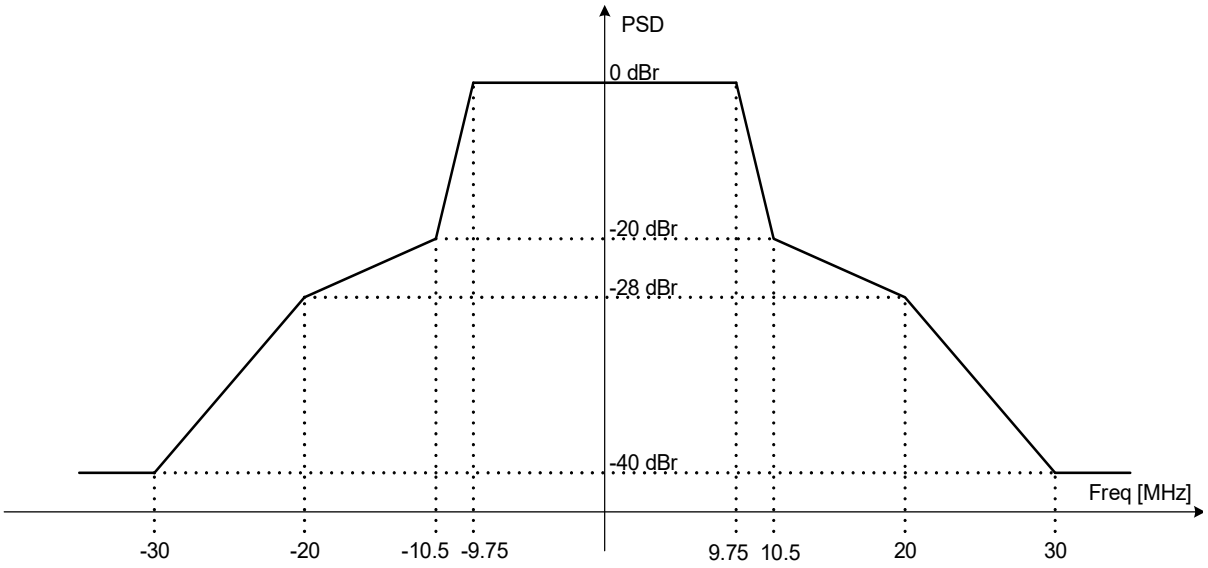

Figure 27-56—Example transmit spectral mask for a 20 MHz mask PPDU

For a 40 MHz mask PPDU of HE format, the interim transmit spectral mask shall have a 0 dBr bandwidth of 39 MHz, –20 dBr at 20.5 MHz frequency offset, –28 dBr at 40 MHz frequency offset, and –40 dBr at 60 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets between 19.5 MHz and 20.5 MHz, 20.5 MHz and 40 MHz, and 40 MHz and 60 MHz shall be linearly interpolated in dB domain from the requirements for 19.5 MHz, 20.5 MHz, 40 MHz, and 60 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –56 dBm/MHz at any frequency offset greater than 19.5 MHz in the 2.4 GHz band. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –39 dBm/MHz at any frequency offset in the 5 GHz and 6 GHz bands. Figure 27-57 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –56 dBm/MHz in the 2.4 GHz band or when the –40 dBr spectrum level is above –39 dBm/MHz in the 5 GHz and 6 GHz bands.

For an 80 MHz mask PPDU of HE format, the interim transmit spectral mask shall have a 0 dBr bandwidth of 79 MHz, –20 dBr at 40.5 MHz frequency offset, –28 dBr at 80 MHz frequency offset, and –40 dBr at 120 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets between 39.5 MHz and 40.5 MHz, 40.5 MHz and 80 MHz, and 80 MHz and 120 MHz shall be linearly interpolated in dB domain from the requirements for 39.5 MHz, 40.5 MHz, 80 MHz, and 120 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectrum mask and –39 dBm/MHz at any frequency offset. Figure 27-58 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –39 dBm/MHz.

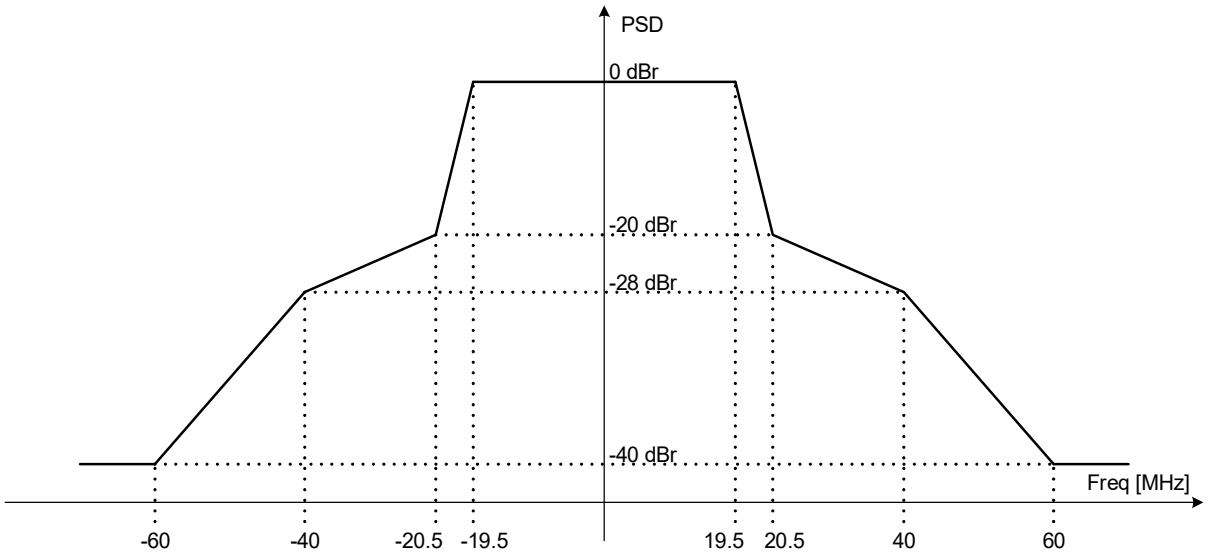

Figure 27-57—Example transmit spectral mask for a 40 MHz mask PPDU

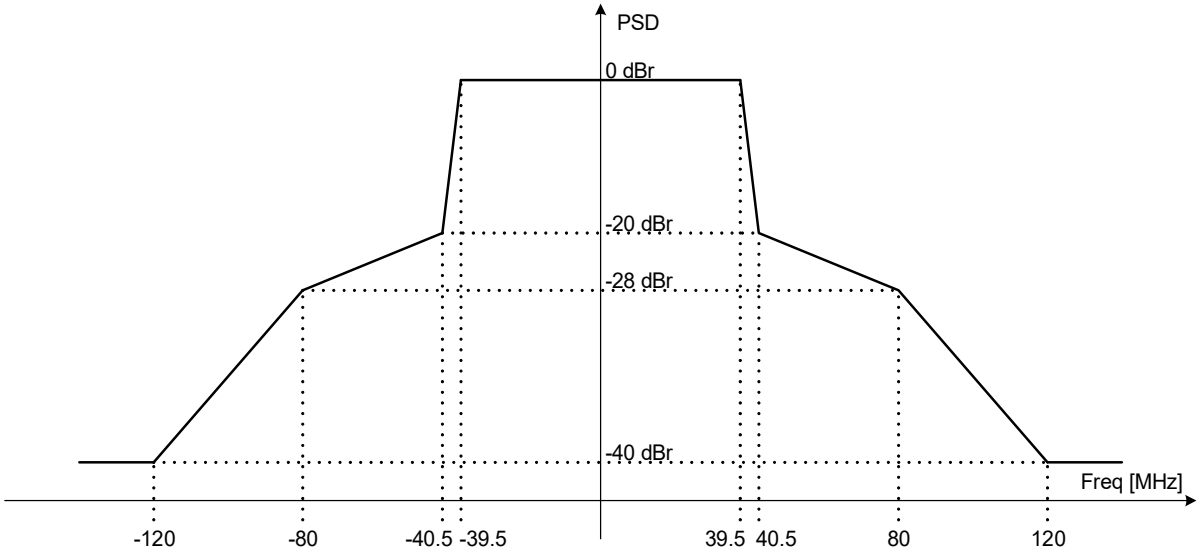

Figure 27-58—Example transmit spectral mask for an 80 MHz mask PPDU

For a 160 MHz mask PPDU of HE format, the interim transmit spectral mask shall have a 0 dBr bandwidth of 159 MHz, –20 dBr at 80.5 MHz frequency offset, –28 dBr at 160 MHz frequency offset, and –40 dBr at 240 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets between 79.5 MHz and 80.5 MHz, 80.5 MHz and 160 MHz, and 160 MHz and 240 MHz shall be linearly interpolated in dB domain from the requirements for 79.5 MHz, 80.5 MHz, 160 MHz, and 240 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectrum mask and –39 dBm/MHz at any frequency offset. Figure 27-59 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –39 dBm/MHz.

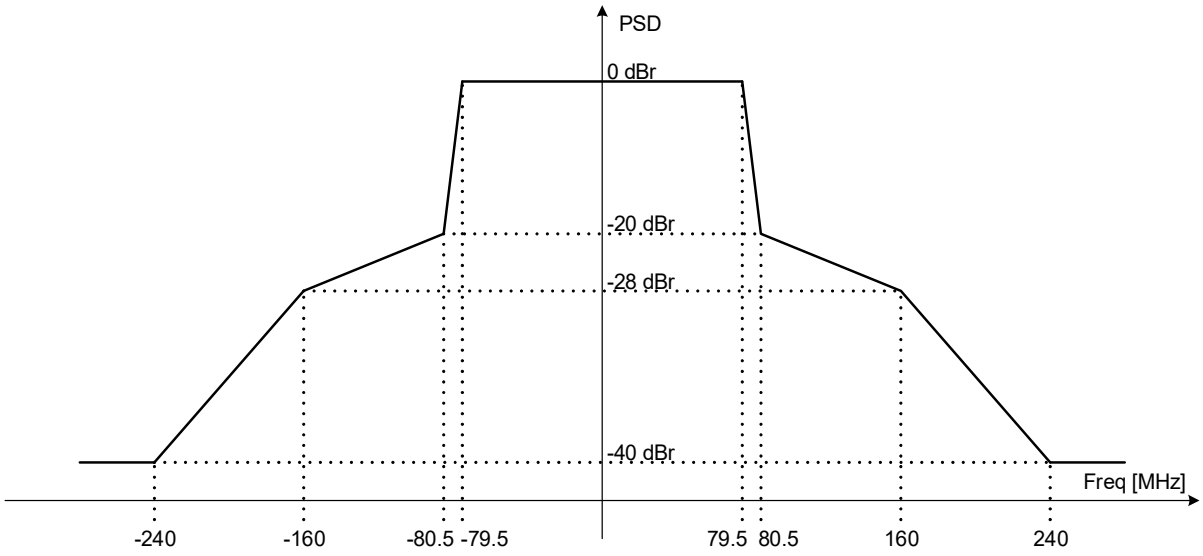

Figure 27-59—Example transmit spectral mask for a 160 MHz mask PPDU

For an 80+80 MHz mask PPDU of HE format, the overall transmit spectral mask is constructed in the following manner. First, the 80 MHz interim spectral mask is placed on each of the two 80 MHz segments. For each frequency at which either of the 80 MHz interim spectral mask has a value equal to 0 dBr, then 0 dBr shall be taken as the overall interim spectral mask value. Then, for each frequency at which both of the 80 MHz interim spectral masks have values greater than –40 dBr and less than –20 dBr, the sum of the two interim mask values (summed in linear domain) shall be taken as the overall interim spectral mask value. Next, for each frequency at which neither of the two 80 MHz interim masks has a value greater than or equal to –20 dBr, the higher value of the two interim masks shall be taken as the overall interim spectral mask value. Finally, for any frequency region where the overall interim spectral mask value has not been defined yet, linear interpolation (in dB domain) between the nearest two frequency points with the overall interim spectral mask value defined shall be used to define the overall interim spectral mask value. The transmit spectrum shall not exceed the maximum of the overall interim transmit spectrum mask and –39 dBm/MHz at any frequency offset. Figure 27-60 shows an example of a transmit spectral mask for a noncontiguous transmission using two 80 MHz channels where the center frequency of the two 80 MHz channels are separated by 160 MHz and the –40 dBr spectrum level is above –39 dBm/MHz.

Different center frequency separation between the two 80 MHz frequency segments of the spectral mask and different peak levels of each 80 MHz frequency segment of the spectral mask are possible. In such cases, a similar procedure in determining the spectral mask as in Figure 27-60 is followed.

The transmit spectral mask for noncontiguous transmissions using two nonadjacent 80 MHz channels is applicable only in regulatory domains that allow for such transmissions.

Measurements shall be made using a 100 kHz resolution bandwidth and a 7.5 kHz video bandwidth.

For preamble puncture, the signal leakage to the preamble punctured channel from the occupied subchannels shall be less than or equal to –20 dBr starting 0.5 MHz from the boundary of the preamble punctured channel. Denote the number of 20 MHz punctured channels by N.

An example transmit spectral mask for an N×20 MHz preamble punctured channel with transmission on the both the upper and lower subchannels is shown in Figure 27-61, where the X axis in the plot is centered in the middle of the punctured subbands.

An example transmit spectral mask for an 80 MHz HE PPDU with the highest 20 MHz subchannel punctured is shown in Figure 27-62.

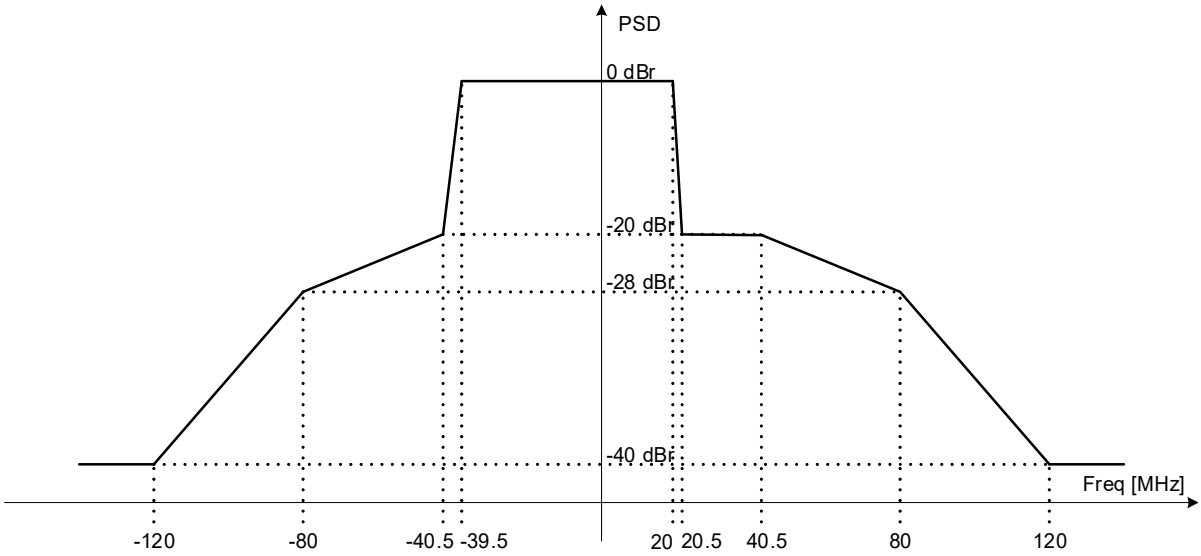

Figure 27-62—Example transmit spectral mask for an 80 MHz HE PPDU with the highest 20 MHz subchannel punctured

27.3.21.2 Spectral flatness

Spectral flatness measurements shall be conducted using BPSK modulated HE PPDUs. The HE PPDUs shall be demodulated using the following (or equivalent) procedure:

a) Start of PPDU shall be detected.

b) Transition from L-STF to L-LTF shall be detected, and fine timing shall be established.

c) Coarse and fine frequency offsets shall be estimated.

d) Symbols in a PPDU shall be manipulated to account for both frequency error and sampling offset drift.

e) For each HE-LTF symbol, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, and compensate the subcarrier values according to the estimated phase.

f) For each of the data OFDM symbols, transform the symbol into subcarrier received values.

The spectral flatness test shall be performed over at least 20 HE PPDUs. The PPDUs under test shall be at least 16 data OFDM symbols long.

Evaluate spectral flatness using the subcarrier received values or the magnitude of the channel estimation of the occupied subcarriers of the transmission HE PPDUs. Nonoccupied subcarriers of the transmitted HE PPDUs shall be ignored during averaging and testing. Resource unit power boosting and beamforming should not be used when measuring spectral flatness.

Let $E_{i,avg}$ denote the magnitude of the channel estimation on subcarrier i or the average constellation energy of a BPSK modulated subcarrier i in an HE data symbol. In a contiguous HE transmission having a bandwidth listed in Table 27-55, $E_{i,avg}$ of each of the subcarriers with indices listed as tested subcarrier indices shall not deviate by more than the specified maximum deviation in Table 27-55 from the average of $E_{i,avg}$ over subcarrier indices listed as averaging subcarrier indices. Averaging of $E_{i,avg}$ is done in the linear domain.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 27-55—Maximum transmit spectral flatness deviations

Bandwidth of transmission (MHz)	Averaging subcarrier indices (inclusive)	Tested subcarrier indices (inclusive)	Maximum deviation (dB)
20	–84 to –2 and +2 to +84	–84 to –2 and +2 to +84	± 4
		–122 to –85 and +85 to +122	+4/–6
40	–168 to –3 and +3 to +168	–168 to –3 and +3 to +168	± 4
		–244 to –169 and +169 to +244	+4/–6
80	–344 to –3 and +3 to +344	–344 to –3 and +3 to +344	± 4
		–500 to –345 and +345 to +500	+4/–6
160	–696 to –515, –509 to –166, +166 to +509, and +515 to +696	–696 to –515, –509 to –166, +166 to +509, and +515 to +696	± 4
		–1012 to –697, –165 to –12, +12 to +165, and +697 to +1012	+4/–6

In an 80+80 MHz transmission, each segment shall meet the spectral flatness requirement for an 80 MHz transmission.

For the spectral flatness test, the transmitting STA shall be configured to use a spatial mapping matrix Q_k (see 27.3.12.14) with flat frequency response. Each output port under test of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The requirements shall apply to 20 MHz, 40 MHz, 80 MHz, and 160 MHz contiguous transmissions as well as 80+80 MHz transmissions.

27.3.21.3 Transmit center frequency and symbol clock frequency tolerance

Transmit center frequency and the symbol clock frequency for all transmit antennas and frequency segments shall be derived from the same reference oscillator. The symbol clock frequency and transmit center frequency tolerance shall be ± 20 ppm in the 5 GHz and 6 GHz bands and ± 25 ppm in the 2.4 GHz band. HE TB PPDU format is subject to additional requirements as defined in 27.3.15.

Transmit signals with TXVECTOR parameter CH_BANDWIDTH set to CBW160 or CBW80+80 may be generated using two separate RF LOs, one for each of the lower and upper 80 MHz frequency portions.

NOTE—The signal phase of the two 80 MHz frequency portions might not be correlated.

27.3.21.4 Modulation accuracy

27.3.21.4.1 Introduction to modulation accuracy tests

Transmit modulation accuracy specifications are described in 27.3.21.4.2 and 27.3.21.4.3. The test method is described in 27.3.21.4.4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

27.3.21.4.2 Transmit center frequency leakage

For an 80+80 MHz transmission where the RF LO falls outside both frequency segments, the RF LO shall meet the spectral mask requirements as defined in 27.3.21.1. Otherwise, the power measured at the location of the RF LO using resolution BW 78.125 kHz shall not exceed the maximum of –32 dB relative to the total transmit power and –20 dBm, or equivalently max(P – 32, –20), where P is the transmit power per antenna in dBm. The transmit center frequency leakage is specified per antenna.

27.3.21.4.3 Transmitter constellation error

The relative constellation RMS error in the test, calculated by first averaging over subcarriers, frequency segments, HE PPDUs, and spatial streams (see Equation (27-140)) as described in 27.3.21.4.4 shall not exceed a data-rate-dependent value according to Table 27-56. The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized testing instrumentation input ports. In the test, $N_{SS} = N_{STS}$ (no STBC), and no beamforming steering matrix shall be used. Each output port of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The requirements shall apply to 20 MHz, 40 MHz, 80 MHz, and 160 MHz contiguous transmissions as well as 80+80 MHz noncontiguous transmissions.

Table 27-56—Allowed relative constellation error versus constellation size and coding rate

Modulation		Coding rate	Relative constellation error in an HE SU PPDU, HE ER SU PPDU, and HE MU PPDU (dB)	Relative constellation error in an HE TB PPDU when transmit power is larger than maximum power of HE-MCS 7 (dB)	Relative constellation error in an HE TB PPDU when transmit power is less than or equal to maximum power of HE-MCS 7 (dB)
Without DCM	With DCM				
N/A	BPSK	1/2	–5	–13	–27
BPSK	QPSK	1/2	–5	–13	–27
QPSK	16-QAM	1/2	–10	–13	–27
QPSK	16-QAM	3/4	–13	–13	–27
16-QAM	N/A	1/2	–16	–16	–27
16-QAM	N/A	3/4	–19	–19	–27
64-QAM	N/A	2/3	–22	–22	–27
64-QAM	N/A	3/4	–25	–25	–27
64-QAM	N/A	5/6	–27	–27	–27
256-QAM	N/A	3/4	–30	–30	–30
256-QAM	N/A	5/6	–32	–32	–32
1024-QAM	N/A	3/4	–35/–32	–35/–32	–35/–32
1024-QAM	N/A	5/6	–35/–32	–35/–32	–35/–32

NOTE—The maximum power of HE-MCS 7 can be measured by setting the UL Target Receive Power subfield as defined in Table 9-54 in the Trigger frame to 127 for the RU for which the EVM test is conducted.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For 1024-QAM, the relative constellation error shall meet either one of the following requirements:

— The relative constellation error shall be less than or equal to –35 dB if amplitude drift compensation is disabled in the test equipment.

— The relative constellation error shall be less than or equal to –35 dB with amplitude drift compensation enabled in the test equipment, and the relative constellation error shall be less than or equal to –32 dB with amplitude drift compensation disabled in the test equipment.

For all other constellations, the relative constellation error shall be less than or equal to the values in Table 27-56 regardless of whether amplitude drift compensation is enabled in the test equipment.

27.3.21.4.4 Transmitter modulation accuracy (EVM) test

The transmit modulation accuracy test shall be performed by instrumentation capable of converting the transmitted signals into a stream of complex samples at a sampling rate greater than or equal to the bandwidth of the signal being transmitted, except that for a noncontiguous transmissions each frequency segment may be tested independently.

In this case, transmit modulation accuracy of each segment shall meet the required value in Table 27-56 using only the occupied data subcarriers within the corresponding segment. For HE TB PPDU transmission, two sets of EVM requirements are defined in Table 27-56 for different transmission power levels to assist AP in better managing the interference among multiple STAs responding to a Trigger frame.

LO leakage that can potentially show up at the center frequency of the HE PPDU tone plan and within ± 3 neighboring subcarriers shall be excluded from the computation of the transmitter modulation accuracy test. The potential LO leakage subcarriers for 20 MHz operating devices are the center of primary 20 MHz of the HE PPDU tone plan and ± 3 subcarriers of it. The potential LO leakage subcarriers for 40 MHz operating devices are the center of the primary 40 MHz of the PPDU tone plan and ± 3 subcarriers. The potential LO leakage subcarriers for 80 MHz operating devices are the center of the primary 80 MHz of the PPDU tone plan and ± 3 subcarriers of it. The potential LO leakage tones for 160 MHz operating devices are the center of the 160 MHz of the PPDU tone plan and ± 3 subcarriers of it. The potential LO leakage tones for 80+80 MHz operating devices exist outside the PPDU bandwidth and should not affect the transmitter modulation accuracy test. For 40 MHz capable devices that transmit 20 MHz, the potential LO leakage subcarriers exist outside the PPDU bandwidth and should not affect the transmitter modulation accuracy test. For 80 MHz capable devices that transmit 20 MHz or 40 MHz PPDU, the potential LO leakage subcarriers exist outside the PPDU bandwidth and should not affect the transmitter modulation accuracy test. For 160 or 80+80 MHz capable devices that transmit 20 MHz or 40 MHz PPDU or 80 MHz PPDU, the potential LO leakage subcarriers exist outside the PPDU bandwidth and should not affect the transmitter modulation accuracy test.

The instrument shall have sufficient accuracy in terms of I/Q branch amplitude and phase balance, DC offsets, phase noise, and analog-to-digital quantization noise. A possible embodiment of such a setup is converting the signals to a low IF frequency with a microwave synthesizer, sampling the signal with a digital oscilloscope, and decomposing it digitally into quadrature components. The sampled signal shall be processed in a manner similar to an actual receiver using the following or equivalent procedure:

a) Start of PPDU shall be detected.

b) Transition from L-STF to L-LTF shall be detected, and fine timing shall be established.

c) Coarse and fine frequency offsets shall be estimated.

d) Symbols in a PPDU shall be derotated according to estimated frequency offset. Sampling offset drift shall be also compensated.

e) For each HE-LTF symbol, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, and derotate the subcarrier values according to the estimated phase.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

f) Estimate the complex channel response coefficient for each of the subcarriers and each of the transmit streams. If midambles are present in the Data field of the PPDU, the channel response coefficients shall be based upon the most recently received midamble symbols.

g) For each of the data OFDM symbols, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, compensate the subcarrier values according to the estimated phase, group the results from all of the receiver chains in each subcarrier to a vector, and multiply the vector by a zero-forcing equalization matrix generated from the estimated channel.

h) For each data-carrying subcarrier in each spatial stream of RU under test, find the closest constellation point, and compute the Euclidean distance from it. If midambles are present in the Data field of the PPDU, the midamble symbols shall not be used to compute the Euclidean distance.

i) Compute the average across PPDUs of the RMS of all errors per PPDU as given by Equation (27-140).

$$Error_{RMS} = \frac{1}{N_f}\sum_{i_f=1}^{N_f}\sqrt{\frac{\sum_{i_s=1}^{N_{SYM}}\sum_{i_{ss}=1}^{N_{SS}}\sum_{i_{sc}=1}^{N_{SD}}\left(I_e(i_f,i_s,i_{ss},i_{sc})-I_0(i_f,i_s,i_{ss},i_{sc})\right)^2+\left(Q_e(i_f,i_s,i_{ss},i_{sc})-Q_0(i_f,i_s,i_{ss},i_{sc})\right)^2}{N_{SYM}N_{SS}N_{SD}P_0}} \quad (27\text{-}140)$$

where

$I_0(i_f, i_s, i_{ss}, i_{sc})$ $Q_0(i_f, i_s, i_{ss}, i_{sc})$
: denotes the ideal symbol point in the complex plane in data subcarrier i_{sc} of the RU under test, spatial stream i_{ss}, and OFDM symbol i_s of PPDU i_f

$I_e(i_f, i_s, i_{ss}, i_{sc})$ $Q_e(i_f, i_s, i_{ss}, i_{sc})$
: denotes the equalized observed symbol point in the complex plane of the data subcarrier i_{sc} of the RU under test, spatial stream i_{ss}, and OFDM symbol i_s of PPDU i_f

P_0 is the average power of constellation

N_f is the number of tested PPDUs

N_{SD} is the number of data tones of the occupied RU. For an 80+80 MHz transmission, N_{SD} is the total number of data subcarriers in both 80 MHz frequency segments.

N_{SS} is the number of spatial streams of the data OFDM symbols

N_{SYM} is the number of data OFDM symbols

The test shall be performed over at least 20 PPDUs [N_f as defined in Equation (27-140)]. If the occupied RU has 26 tones, the PPDUs under test shall be at least 32 data OFDM symbols long. For occupied RUs that have more than 26 tones, the PPDUs under test shall be at least 16 data OFDM symbols long. Random data shall be used for the symbols.

For an HE TB PPDU with an RU smaller than a 2×996-tone RU, additional transmit modulation accuracy test for the unoccupied subcarriers of the PPDU shall be performed. The transmit modulation accuracy of unoccupied subcarriers of the PPDU test shall be performed by instrumentation capable of converting the transmitted signals into a stream of complex samples at a sampling rate greater than or equal to the bandwidth of the signal being transmitted, except that for noncontiguous transmissions, only the frequency segment with occupied subcarriers is tested. The transmit modulation accuracy of unoccupied subcarriers of the PPDU shall meet the relative constellation error staircase mask specified in Equation (27-144) for each modulation and coding rate using the unoccupied subcarriers within the corresponding segment.

The instrument shall have sufficient accuracy in terms of I/Q branch amplitude and phase balance, DC offsets, phase noise, and analog-to-digital quantization noise. A possible embodiment of such a setup is

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

converting the signals to a low IF frequency with a microwave synthesizer, sampling the signal with a digital oscilloscope and decomposing it digitally into quadrature components. The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or equivalent procedure:

a) Start of PPDU shall be detected.

b) Transition from L-STF to L-LTF shall be detected, and fine timing shall be established.

c) Coarse and fine frequency offsets shall be estimated.

d) Symbols in a PPDU shall be derotated according to estimated frequency offset. Sampling offset drift shall be also compensated.

e) For each of the data OFDM symbols, transform the symbol into subcarrier received values, and estimate the power of each subcarrier.

f) Compute the average unoccupied subcarrier error vector magnitude for each unoccupied 26-tone RU and average across PPDUs of the RMS of all errors per PPDU as given by Equation (27-141).

$$UnusedToneError_{RMS}(k) = \frac{1}{N_f}\sum_{i_f=1}^{N_f}\sqrt{\frac{\sum_{i_s=1}^{N_{SYM}}\sum_{i_{sc}\in\Omega_k}(I_u(i_f,i_s,i_{sc}))^2+(Q_u(i_f,i_s,i_{sc}))^2}{N_{SYM}\cdot 26\cdot P_S}} \quad (27\text{-}141)$$

where

$I_u(i_f, i_s, i_{sc})$ $Q_u(i_f, i_s, i_{sc})$
: denotes unequalized observed symbol point in the complex plane in subcarrier i_{sc} of the unoccupied 26-tone RU and OFDM symbol i_s of PPDU i_f

Ω_k
: is a set of subcarriers for k^{th} 26-tone RU as defined in Table 27-8, Table 27-9, and Table 27-10

P_S
: is the average data subcarrier power of the occupied RU under test and is given by Equation (27-142)

$$P_S = \frac{1}{N_{SYM}N_{SD}}\sum_{i_s=1}^{N_{SYM}}\sum_{i_{sc}=1}^{N_{SD}}(I_u(i_f,i_s,i_{SC}))^2+(Q_u(i_f,i_s,i_{SC}))^2 \quad (27\text{-}142)$$

N_f
: is the number of tested PPDUs

N_{SYM}
: is the number of data OFDM symbols

N_{SD}
: is the number of data subcarriers in the occupied RU

g) For all HE-MCSs, for an occupied RU bandwidth of r in units of a 26-tone RU as defined by Equation (27-143),

$$r = \begin{cases} 1, \text{ if 26-tone RU} \\ 2, \text{ if 52-tone RU} \\ 4, \text{ if 106-tone RU} \\ 9, \text{ if 242-tone RU} \\ 18, \text{ if 484-tone RU} \\ 37, \text{ if 996-tone RU} \end{cases} \quad (27\text{-}143)$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The average unused subcarrier error vector magnitude for each unoccupied 26-tone RU as calculated in step f) shall meet the staircase mask requirement in Equation (27-144) and Equation (27-145), where m defines the gap in the units of 26-tone RU to the occupied RU from either side with $m = \pm 1$ being the adjacent 26-tone RUs.

$$UnusedToneError(i_{RU26,\,start} + m) \leq \begin{cases} max(\varepsilon - 2, -35\text{ dB}), & \text{if } -r \leq m \leq -1 \\ max(\varepsilon - 12, -35\text{ dB}), & \text{if } -2r \leq m \leq -r - 1 \\ max(\varepsilon - 22, -35\text{ dB}), & \text{if } -3r \leq m \leq -2r - 1 \\ -35\text{ dB}, & \text{otherwise} \end{cases} \quad (27\text{-}144)$$

The valid range for m for Equation (27-144) is as follows:

$-i_{RU26,\,start} + 1 \leq m \leq -1$ for a 20 MHz, 40 MHz, 80 MHz, or 160 MHz PPDU

$-i_{RU26,\,start} + 1 \leq m \leq -1$ for an 80+80 MHz PPDU and $i_{RU26,\,start} \leq 37$

$-i_{RU26,\,start} + 38 \leq m \leq -1$ for an 80+80 MHz PPDU and $i_{RU26,\,start} > 37$

$$UnusedToneError(i_{RU26,\,end} + m) \leq \begin{cases} max(\varepsilon - 2, -35\text{ dB}), & \text{if } 1 \leq m \leq r \\ max(\varepsilon - 12, -35\text{ dB}), & \text{if } r + 1 \leq m \leq 2r \\ max(\varepsilon - 22, -35\text{ dB}), & \text{if } 2r + 1 \leq m \leq 3r \\ -35\text{ dB}, & \text{otherwise} \end{cases} \quad (27\text{-}145)$$

The valid range for m for Equation (27-145) is as follows:

$1 \leq m \leq N_{RU26} - i_{RU26,\,end}$ for a 20 MHz, 40 MHz, 80 MHz, or 160 MHz PPDU

$1 \leq m \leq 37 - i_{RU26,\,end}$ for an 80+80 MHz PPDU and $i_{RU26,\,start} \leq 37$

$1 \leq m \leq 74 - i_{RU26,\,end}$ for an 80+80 MHz PPDU and $i_{RU26,\,start} > 37$

where

$i_{RU26,start}$ is equal to i_{RU} if the occupied RU is a 26-tone RU and is defined in Table 27-57 for other RU sizes

Table 27-57—$i_{RU26,start}$ for RUs other than a 26-tone RU

29	66				
30	68				
31	71				
32	73				

$i_{RU26,end}$ is equal to $i_{RU26,start} + r - 1$
i_{RU} is the index of the occupied RU
N_{RU26} is the maximum number of 26-tone RUs for the given bandwidth of the HE TB PPDU as defined in Table 27-16
ε is the relative constellation error requirement for an occupied RU of an HE TB PPDU as defined in Table 27-56

NOTE—For an 80+80 MHz PPDU the unused subcarrier error is measured only in the 80 MHz segment in which the occupied RU is located. This leads to the different valid range for *m* in Equation (27-144) and Equation (27-145) for the 80+80 MHz PPDU.

The test shall be performed over at least 20 PPDUs [N_f as defined in Equation (27-140)]. The PPDUs under test shall be at least 16 data OFDM symbols long. The unequalized observed symbol of potential LO leakage subcarrier locations shall be treated as zero during unoccupied subcarriers transmit modulation accuracy test. Random data shall be used for the symbols.

27.3.21.5 Time of departure accuracy

The RMS accuracy of the time of departure provided in TIME_OF_DEPARTURE shall be less than or equal to 80 ns.

The time of departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is:

$20\times10^{6}\left(1+\left\lceil\frac{f_H-f_L}{20\text{ MHz}}\right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW20

$40\times10^{6}\left(1+\left\lceil\frac{f_H-f_L}{40\text{ MHz}}\right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW40

$80\times10^{6}\left(1+\left\lceil\frac{f_H-f_L}{80\text{ MHz}}\right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW80

$160\times10^{6}\left(1+\left\lceil\frac{f_H-f_L}{160\text{ MHz}}\right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW160 or CBW80+80

where

f_H is the nominal center frequency in Hz of the highest channel in the channel set

f_L is the nominal center frequency in Hz of the lowest channel in the channel set

the channel set is the set of channels upon which frames providing measurements are transmitted, the channel set comprises channels uniformly spaced across

— FIRST_TRANSITION_FIELD is L-STF

— SECOND_TRANSITION_FIELD is L-LTF

— TRAINING_FIELD is L-LTF windowed in a manner which should approximate the windowing described in 17.3.2.5 with TTR = 100 ns

— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

27.3.22 Receiver specification

27.3.22.1 General

For receiver minimum input sensitivity, adjacent channel rejection, nonadjacent channel rejection, receiver maximum input level, and CCA sensitivity requirements described in this subclause, the input levels are measured at the transmit antenna connector and are referenced as the average power per receive antenna. For tests in 27.3.22.2, 27.3.22.3, and 27.3.22.4, the number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized receiving STA antenna (input) ports. Except where otherwise noted, each output port of the transmitting STA shall be connected through a cable to one input port of the receiving STA.

NOTE—Additional test requirements and/or test methods may be needed to meet regulatory requirements.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The requirements on receiver minimum input sensitivity in 27.3.22.2, adjacent channel rejection in 27.3.22.3, and nonadjacent channel rejection in 27.3.22.4 apply to PPDUs that meet all the following conditions:

— STBC is not used.
— 0.8 μs GI is used.
— If the PPDU bandwidth is 20 MHz and the HE-MCS is less than 10, then BCC is used. Otherwise, LDPC is used.
— The PPDU is an HE SU PPDU.

27.3.22.2 Receiver minimum input level sensitivity

The PER shall be less than 10% for a PSDU with the rate-dependent input levels listed in Table 27-58. The PSDU length shall be 2048 octets for BPSK modulation with DCM or 4096 octets for all other modulations.

Table 27-58—Receiver minimum input level sensitivity

Modulation		Rate (*R*)	Minimum sensitivity (20 MHz PPDU) (dBm)	Minimum sensitivity (40 MHz PPDU) (dBm)	Minimum sensitivity (80 MHz PPDU) (dBm)	Minimum sensitivity (160 MHz or 80+80 MHz PPDU) (dBm)
Without DCM	With DCM					
N/A	BPSK	1/2	–82	–79	–76	–73
BPSK	QPSK	1/2	–82	–79	–76	–73
QPSK	16-QAM	1/2	–79	–76	–73	–70
QPSK	16-QAM	3/4	–77	–74	–71	–68
16-QAM	N/A	1/2	–74	–71	–68	–65
16-QAM	N/A	3/4	–70	–67	–64	–61
64-QAM	N/A	2/3	–66	–63	–60	–57
64-QAM	N/A	3/4	–65	–62	–59	–56
64-QAM	N/A	5/6	–64	–61	–58	–55
256-QAM	N/A	3/4	–59	–56	–53	–50
256-QAM	N/A	5/6	–57	–54	–51	–48
1024-QAM	N/A	3/4	–54	–51	–48	–45
1024-QAM	N/A	5/6	–52	–49	–46	–43

27.3.22.3 Adjacent channel rejection

Adjacent channel rejection for *W* MHz (where *W* is 20, 40, 80, or 160) shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 27-58 and raising the power of the interfering signal of W MHz bandwidth until 10% PER is caused for a PSDU length of 2048 octets for BPSK modulation with DCM or 4096 octets for all other modulations. The difference in power between the signals in the interfering channel and the desired channel is the corresponding adjacent channel rejection. The center frequency of the adjacent channel shall be placed *W* MHz away from the center frequency of the desired signal.

Adjacent channel rejection for 80+80 MHz channels shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 27-58. Then, an interfering signal of 80 MHz bandwidth is introduced, where the center frequency of the interfering signal is placed 80 MHz away

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

from the center frequency of the frequency segment lower in the frequency of the desired signal. The power of interfering signal is raised until 10% PER is caused for a PSDU length of 2048 octets for BPSK modulation with DCM or 4096 octets for all other modulations. Let ΔP_1 be the difference between the interfering and desired signal. Next, the interfering signal of 80 MHz bandwidth is moved to the frequency where the center frequency of the interfering signal is 80 MHz away from the center frequency of the frequency segment higher in frequency of the desired signal. The power of the interfering is raised until 10% PER is caused for a PSDU length of 2048 octets for BPSK modulation with DCM or 4096 octets for all other modulations. Let ΔP_2 be the power difference between the interfering and desired signal. The smaller value between ΔP_1 and ΔP_2 is the corresponding adjacent channel rejection.

The interfering signal in the adjacent channel shall be a signal compliant with the HE PHY, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. The corresponding rejection shall be no less than specified in Table 27-59.

Table 27-59—Minimum required adjacent and nonadjacent channel rejection levels

Modulation		Rate (*R*)	Adjacent channel rejection (dB)		Nonadjacent channel rejection (dB)	
Without DCM	With DCM		20/40/80/ 160 MHz channel	80+80 MHz channel	20/40/80/ 160 MHz channel	80+80 MHz channel
N/A	BPSK	1/2	16	13	32	29
BPSK	QPSK	1/2	16	13	32	29
QPSK	16-QAM	1/2	13	10	29	26
QPSK	16-QAM	3/4	11	8	27	24
16-QAM	N/A	1/2	8	5	24	21
16-QAM	N/A	3/4	4	1	20	17
64-QAM	N/A	2/3	0	–3	16	13
64-QAM	N/A	3/4	–1	–4	15	12
64-QAM	N/A	5/6	–2	–5	14	11
256-QAM	N/A	3/4	–7	–10	9	6
256-QAM	N/A	5/6	–9	–12	7	4
1024-QAM	N/A	3/4	–12	–15	4	1
1024-QAM	N/A	5/6	–14	–17	2	–1

The measurement of adjacent channel rejection for 160 MHz operation in regulatory domain is required only if such a frequency band plan is permitted in the regulatory domain.

27.3.22.4 Nonadjacent channel rejection

Nonadjacent channel rejection for *W* MHz channels (where *W* is 20, 40, 80, or 160) shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 27-58 and increasing the power of the interfering signal of *W* MHz bandwidth until a 10% PER occurs for a PSDU length of 2048 octets for BPSK modulation with DCM or 4096 octets for all other modulations. The

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

difference in power between the signals in the interfering channel and the desired channel is the corresponding nonadjacent channel rejection. The nonadjacent channel rejection shall be met with any nonadjacent channels located at least $2\times W$ MHz away from the center frequency of the desired signal.

Nonadjacent channel rejection for 80+80 MHz channels shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 27-58. Then, an interfering signal of 80 MHz bandwidth is introduced, where the center frequency of the interfering signal is placed at least 160 MHz away from the center frequency of the frequency segment lower in the frequency of the desired signal. The center frequency of the interfering signal shall also be at least 160 MHz away from the center frequency of the frequency segment higher in frequency of the desired signal. The power of the interfering signal is increased until 10% PER is caused for a PSDU length of 2048 octets for BPSK modulation with DCM or 4096 octets for all other modulations. Let ΔP_1 be the difference in power between the interfering and desired signal. Next, the interfering signal of 80 MHz bandwidth is moved to the frequency where the center frequency of the interfering signal is at least 160 MHz away from the center frequency of the frequency segment higher in frequency of the desired signal. The center frequency of the interfering signal shall also be at least 160 MHz away from the center frequency of the frequency segment lower in frequency of the desired signal. The power of the interfering signal is increased until 10% PER is caused for a PSDU length of 2048 octets for BPSK modulation with DCM or 4096 octets for all other modulations. Let ΔP_2 be the difference in power between the interfering and desired signal. The smaller value between ΔP_1 and ΔP_2 is the corresponding nonadjacent channel rejection.

The interfering signal in the nonadjacent channel shall be a signal compliant with the HE PHY, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. The corresponding rejection shall be no less than specified in Table 27-59.

The measurement of nonadjacent channel rejection for 160 MHz operation in regulatory domain is required only if such a frequency band plan is permitted in the regulatory domain.

27.3.22.5 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 2048 octets for BPSK modulation with DCM or 4096 octets for all other modulations, for a maximum input level of –30 dBm in the 5 GHz and 6 GHz bands and –20 dBm in the 2.4 GHz band, measured at each antenna for any baseband HE modulation.

27.3.22.6 CCA sensitivity

27.3.22.6.1 General

The thresholds in 27.3.22.6 are compared with the signal level at each receiving antenna.

27.3.22.6.2 CCA sensitivity for operating classes requiring CCA-OCSED

For the operating classes requiring CCA-Operating Class Specific Energy Detect (CCA-OCSED), the PHY shall indicate a medium busy condition if CCA-OCSED detects a channel busy condition. For improved spectrum sharing, CCA-OCSED is required in some bands. The behavior class indicating CCA-OCSED is given in Table D-2. The operating classes requiring the corresponding CCA-OCSED behavior class are given in E.1. The PHY of a STA that is operating within an operating class that requires CCA-OCSED shall operate with CCA-OCSED.

CCA-OCSED for a STA that is attempting a non-preamble puncturing transmission shall detect a channel busy condition if the received signal strength exceeds the CCA-OCSED threshold as given by dot11OFDMEDThreshold for the primary 20 MHz channel, dot11OFDMEDThreshold for the secondary 20 MHz channel (if present), dot11OFDMEDThreshold + 3 dB for the secondary 40 MHz channel (if present), and dot11OFDMEDThreshold + 6 dB for the secondary 80 MHz channel (if present). The

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

CCA-OCSED thresholds for the operating classes requiring CCA-OCSED are subject to the criteria in D.2.5.

CCA-OCSED for a STA that is attempting a preamble puncturing transmission shall detect a channel busy condition if the received signal strength exceeds the CCA-OCSED threshold as given by dot11OFDMEDThreshold for the primary 20 MHz channel and dot11OFDMEDThreshold for each nonprimary 20 MHz subchannel. The CCA-OCSED thresholds for the operating classes requiring CCA-OCSED are subject to the criteria in D.2.5.

For the HE TB PPDU transmission, for each of 20 MHz sub-channels that require CCA, CCA-OCSED shall detect a channel busy condition if the received signal strength exceeds the CCA-OCSED threshold as given by dot11OFDMEDThreshold. The CCA-OCSED thresholds for the operating classes requiring CCA-OCSED are subject to the criteria in D.2.5.

For transmissions that carry a frame that includes a BQR Control subfield (see 9.2.4.7), CCA-OCSED shall detect a channel busy condition if the received signal strength exceeds the CCA-OCSED threshold as given by dot11OFDMEDThreshold for primary 20 MHz channel and dot11OFDMEDThreshold for each nonprimary 20 MHz channel (if present). The CCA-OCSED thresholds for the operating classes requiring CCA-OCSED are subject to the criteria in D.2.5.

NOTE—The requirement to detect a channel busy condition as stated in 27.3.22.6.3 and 27.3.22.6.4 is a mandatory energy detect requirement on all Clause 27receivers. Support for CCA-OCSED is an additional requirement that relates specifically to the sensitivities described in D.2.5.

27.3.22.6.3 CCA sensitivity for the primary 20 MHz channel

An HE STA with a *W* MHz operating channel width shall detect, with > 90% probability, the start of a PPDU that occupies at least the primary 20 MHz channel in an otherwise idle *W* MHz channel width and issue a PHY-CCA.indication with the STATUS parameter set to BUSY within a period of aCCATime (see 21.4.4) if one of the following conditions is met:

- The start of a non-HT PPDU as defined in 17.3.10.6 if operating in the 5 GHz or 6 GHz band and 18.4.6 if operating in the 2.4 GHz band.
- The start of an HT PPDU as defined in 19.3.19.6.
- The start of a non-HT duplicate, VHT or HE PPDU for which the power measured within the primary 20 MHz channel is at or above –82 dBm.

The channel-list parameter is present and set to {primary} if the operating channel width is greater than 20 MHz. The CCA signal shall be held busy (not issue a PHY-CCA.indication primitive with the STATUS parameter set to IDLE) for the duration of the PPDU, unless it receives a PHY-CCARESET.request primitive before the end of the PPDU, for instance, during spatial reuse operation as described in 26.10.

The receiver shall issue a PHY-CCA.indication primitive with the STATUS parameter set to BUSY for any signal at or above –62 dBm in the primary 20 MHz channel within a period of aCCATime after the signal arrives at the receiver's antenna(s). If the operating channel width is greater than 20 MHz, then the channel-list parameter is present and shall be set to {primary}. Following the indication and while the threshold continues to be exceeded, the receiver shall not issue a PHY-CCA.indication primitive with the STATUS parameter set to IDLE or with a change in the channel-list parameter.

27.3.22.6.4 CCA sensitivity for signals not occupying the primary 20 MHz channel

The PHY shall issue a PHY-CCA.indication primitive with the STATUS parameter set to BUSY and with the channel-list parameter set to {secondary} if the conditions for issuing a PHY-CCA.indication primitive with the STATUS parameter set to BUSY as defined in 27.3.22.6.3 are not present and at least one of the

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

following conditions is present in an otherwise idle 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz operating channel width:

— Any signal within the secondary 20 MHz channel at or above a threshold of –62 dBm within a period of aCCATime after the signal arrives at the receiver's antenna(s).

— A 20 MHz non-HT, HT-mixed format, HT-greenfield format, VHT or HE PPDU is detected in the secondary 20 MHz channel at or above max(–72 dBm, $OBSS\_PD_{level}$) with > 90% probability within a period aCCAMidTime (see 27.4.4).

Following the indication and while the threshold continues to be exceeded, the receiver shall not issue a PHY-CCA.indication primitive with the STATUS parameter set to IDLE or with the STATUS parameter set to BUSY and the channel-list parameter set to {secondary40} or {secondary80}.

The PHY shall issue a PHY-CCA.indication primitive with the STATUS parameter set to BUSY and the channel-list parameter set to {secondary40} if the conditions for issuing a PHY-CCA.indication with the STATUS parameter set to BUSY as defined in 27.3.22.6.3 and above are not present and at least one of the following conditions is present in an otherwise idle 80 MHz, 160 MHz, or 80+80 MHz operating channel width:

— Any signal within the secondary 40 MHz channel at or above a threshold of –59 dBm within a period of aCCATime after the signal arrives at the receiver's antenna(s).

— A 40 MHz non-HT duplicate, HT-mixed format, HT-greenfield format, VHT or HE PPDU is detected in the secondary 40 MHz channel at or above max(–72 dBm, $OBSS\_PD_{level}$ + 3 dB) with > 90% probability within a period aCCAMidTime (see 27.4.4).

— A 20 MHz non-HT, HT-mixed format, HT-greenfield format, VHT or HE PPDU is detected in any 20 MHz subchannel of the secondary 40 MHz channel at or above max(–72 dBm, $OBSS\_PD_{level}$) with > 90% probability within a period aCCAMidTime.

Following the indication and while the threshold continues to be exceeded, the receiver shall not issue a PHY-CCA.indication primitive with the STATUS parameter set to IDLE or with the STATUS parameter set to BUSY and the channel-list parameter set to {secondary80}.

The PHY shall issue a PHY-CCA.indication primitive with the STATUS parameter set to BUSY and the channel-list parameter set to {secondary80} if the conditions for issuing a PHY-CCA.indication primitive with the STATUS parameter set to BUSY as defined in 27.3.22.6.3 and above are not present and at least one of the following conditions is present in an otherwise idle 160 MHz or 80+80 MHz operating channel width:

— Any signal within the secondary 80 MHz channel at or above –56 dBm.

— An 80 MHz non-HT duplicate, VHT or HE PPDU is detected in the secondary 80 MHz channel at or above max(–69 dBm, $OBSS\_PD_{level}$ + 6 dB) with > 90% probability within a period aCCAMidTime (see 27.4.4).

— A 40 MHz non-HT duplicate, HT-mixed format, HT-greenfield format, VHT or HE PPDU is detected in any 40 MHz subchannel of the secondary 80 MHz channel at or above max(–72 dBm, $OBSS\_PD_{level}$ + 3 dB) with > 90% probability within a period aCCAMidTime.

— A 20 MHz non-HT, HT-mixed format, HT-greenfield format, VHT or HE PPDU is detected in any 20 MHz subchannel of the secondary 80 MHz channel at or above max(–72 dBm, $OBSS\_PD_{level}$) with > 90% probability within a period aCCAMidTime.

$OBSS\_PD_{level}$ is defined in 26.10.2.4 and applied in the equations to define the detection level in this subclause if an HE STA has ignored a 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz inter-BSS PPDU following the procedure in 26.10.2.2 or 26.10.2.3. It is applied to any secondary channels within the PPDU bandwidth of the inter-BSS PPDU and during the RXTIME of the inter-BSS PPDU. Otherwise, $OBSS\_PD_{level}$ is not applied in the equations to define the detection level in this subclause.

27.3.22.6.5 Per 20 MHz CCA sensitivity

If the operating channel width is greater than 20 MHz and the PHY issues a PHY-CCA.indication primitive, the PHY shall set the per20bitmap to indicate the busy/idle status of each 20 MHz subchannel. A 20 MHz subchannel is busy if at least one of the following conditions is present in an otherwise idle 40 MHz, 80 MHz, 80+80 MHz, or 160 MHz channel:

— A signal is present on the 20 MHz subchannel at or above a threshold of –62 dBm at the receiver's antenna(s). The PHY shall indicate that the 20 MHz subchannel is busy a period aCCATime after the signal starts and shall continue to indicate the 20 MHz subchannel is busy while the threshold continues to be exceeded.

— The 20 MHz subchannel is in a channel on which an 80 MHz non-HT duplicate, VHT or HE PPDU at or above max(–69 dBm, $OBSS\_PD_{level}$ + 6 dB) at the receiver's antenna(s) is present. The PHY shall indicate that the 20 MHz subchannel is busy with > 90% probability within a period aCCAMidTime (see 27.4.4).

— The 20 MHz subchannel is in a channel on which a 40 MHz non-HT duplicate, HT-mixed format, HT-greenfield format, VHT or HE PPDU at or above max(–72 dBm, $OBSS\_PD_{level}$ + 3 dB) at the receiver's antenna(s) is present. The PHY shall indicate that the 20 MHz subchannel is busy with > 90% probability within a period aCCAMidTime (see 27.4.4).

— A 20 MHz non-HT, HT-mixed format, HT-greenfield format, VHT, or HE PPDU at or above max(–72 dBm, $OBSS\_PD_{level}$) at the receiver's antenna(s) is present on the 20 MHz subchannel. The PHY shall indicate that the 20 MHz subchannel is busy with > 90% probability within a period aCCAMidTime (see 27.4.4).

NOTE—Following the receipt of a Trigger frame with the CS Required subfield in the Common Info field set to 1, the HE PHY is required to only detect a signal at the –62 dBm threshold since the other conditions require more time than is available before the response is expected.

$OBSS\_PD_{level}$ is defined in 26.10.2.4 and applied in the equations to define the detection level in this subclause if an HE STA has ignored a 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz inter-BSS PPDU following the procedure in 26.10.2.2 or 26.10.2.3. It is applied to any secondary channels within the PPDU bandwidth of the inter-BSS PPDU and during the RXTIME of the inter-BSS PPDU. Otherwise, $OBSS\_PD_{level}$ is not applied in the equations to define the detection level in this subclause.

27.3.22.7 Received channel power indicator (RCPI) measurement

The RCPI is a measure of the received RF power in the selected channel for a received PPDU. This parameter shall be a measurement by the PHY of the received RF power in the channel measured over the HE-STF or HE-LTF field of the received PPDU. If the RCPI is measured for an HE ER SU PPDU, then the reported RCPI value is 3 dB less than the measured power over the HE-STF or HE-LTF field. The received power shall be the average of the power in all active receive chains.

NOTE—The HE-STF and HE-LTF fields in an HE ER SU PPDU have 3 dB higher power than the Data field, hence the reported RCPI value is subtracting 3 dB from the measured power.

RCPI shall equal the received RF power in dBm within an accuracy of ± 5 dB (95% confidence interval) within the specified dynamic range of the receiver.

27.3.23 HE transmit procedure

There are five options for the transmit PHY procedure. The first four options, for which typical transmit procedures are shown in Figure 27-63, Figure 27-64, Figure 27-65, and Figure 27-66, are selected if the FORMAT field of the PHY-TXSTART.request(TXVECTOR) primitive is equal to HE_SU, HE_MU, HE_ER_SU, or HE_TB, respectively. These transmit procedures do not describe the operation of optional features, such as DCM.

The fifth option is to follow the transmit procedure in Clause 17 or Clause 18 if the FORMAT parameter of the PHYTXSTART.request(TXVECTOR) primitive is NON_HT as follows:

— If the FORMAT parameter is NON_HT and the NON_HT_MODULATION parameter is OFDM, then the transmit procedure defined in Clause 17 is followed.

— If the FORMAT parameter is NON_HT and the NON_HT_MODULATION parameter is NON_HT_DUP_OFDM, then the transmit procedure defined in Clause 17 is followed, except that the signal is generated simultaneously on each of the 20 MHz channels identified by the CH_BANDWIDTH parameter as defined in 27.3.11 and 27.3.14.

— If the FORMAT parameter is NON_HT, the CH_BANDWIDTH parameter is NON_HT_CBW20, and the NON_HT_MODULATION parameter is not OFDM, then the transmit procedure defined in Clause 18 is followed.

NOTE 1—For an HE MU PPDU, the A-MPDU is per user in the MAC sublayer, and the HE Training Symbols and Data fields are per user in the PHY in Figure 27-65, with the number of HE Training Symbols depending on the maximum total number of space-time streams across all RUs.

NOTE 2—The transmit procedure for non-HT, HT-mixed, HT-greenfield, and VHT format are specified in 27.2.7.

In all options, in order to transmit data, the MAC generates a PHY-TXSTART.request primitive, which causes the PHY entity to enter the transmit state. Further, the PHY is set to operate at the appropriate frequency through station management via the PLME, as specified in 27.4. Other transmit parameters, such as HE-MCS, coding types, and transmit power, are set via the PHY-SAP using the PHYTXSTART.request(TXVECTOR) primitive, as described in 27.2.2. After transmitting a PPDU that carries a Trigger frame, the MAC sublayer issues a PHY-TRIGGER.request with a TRIGVECTOR parameter that provides the PHY entity with the information needed to demodulate the expected HE TB PPDU response. The remainder of this subclause applies to the first four options.

The PHY indicates the state of the primary channel and other channels (if any) via the PHY-CCA.indication primitive (see 21.3.18.5 and 8.3.5.12). Transmission of the PPDU shall be initiated by the PHY after receiving the PHY-TXSTART.request(TXVECTOR) primitive. The TXVECTOR parameters for the PHY-TXSTART.request primitive are specified in Table 27-1.

Transmission of the PHY preamble may start if TIME_OF_DEPARTURE_REQUESTED is false and shall start immediately if TIME_OF_DEPARTURE_REQUESTED is true, based on the parameters passed in the PHY-TXSTART.request primitive.

If all of the following conditions are met:

— If dot11TODImplemented and dot11TODActivated are true or if dot11TimingMsmtActivated is true

— The TXVECTOR parameter TIME_OF_DEPARTURE_REQUESTED is true

then the PHY shall issue a PHY-TXSTART.confirm(TXSTATUS) primitive to the MAC, forwarding the TIME_OF_DEPARTURE corresponding to the time when the first frame energy is sent by the transmitting port and TIME_OF_DEPARTURE_ClockRate parameter within the TXSTATUS vector. If dot11TimingMsmtActivated is true, then the PHY shall forward the value of TX_START_OF_FRAME_OFFSET in the TXSTATUS vector.

After the PHY preamble transmission is started, the PHY entity immediately initiates data scrambling and data encoding. The encoding method for the Data field is based on the FEC_CODING, CH_BANDWIDTH, NUM_STS, STBC, MCS, and NUM_USERS parameters of the TXVECTOR, as described in 27.3.4.

The SERVICE field and PSDU are encoded as described in 27.3.5. The data shall be exchanged between the MAC and the PHY through a series of PHY-DATA.request(DATA) primitives issued by the MAC and

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

PHY-DATA.confirm primitives issued by the PHY. PHY padding bits are appended to the PSDU to make the number of bits in the coded PSDU an integral multiple of the number of coded bits per OFDM symbol.

Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PSDU transmission is terminated by receiving a PHY-TXEND.request primitive. Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY.

A packet extension and/or a signal extension may be present in the PPDU. The PHY-TXEND.confirm primitive is generated at the latest of the actual ending time of the PPDU, the end of the packet extension if present, and the end of the signal extension if present.

In the PHY, the GI with GI duration indicated in GI_TYPE parameter of the TXVECTOR is inserted in every data OFDM symbol as a countermeasure against delay spread.

Once the PPDU transmission is completed, the PHY entity enters the receive state.

A typical state machine implementation for the transmission of an HE PPDU without midambles is shown in Figure 27-67. Request (.request) and confirmation (.confirm) primitives are issued once per state as shown. This state machine does not describe the operation of optional features, such as DCM.

27.3.24 HE receive procedure

Typical PHY receive procedures are shown in Figure 27-68, Figure 27-69, Figure 27-70, and Figure 27-71, respectively.

This receive procedure and state machine do not describe the operation of optional features, such as DCM, HE Ranging NDP, and HE TB Ranging NDP. If the detected format indicates a non-HT PPDU, refer to the receive procedure and state machine in Clause 15, Clause 16, Clause 17, and Clause 18. If the detected format indicates an HT PPDU format, refer to the receive procedure and state machine in Clause 19. If the detected format indicates a VHT PPDU format, refer to the receive procedure and state machine in Clause 21. Through station management (via the PLME), the PHY is set to the appropriate frequency, as specified in 27.4. The PHY has also been configured with BSS identification information and STA identification information (i.e., BSS color value and STA-ID in the BSS) so that it can receive data intended for the STA in the specific cell. Other receive parameters, such as RSSI and indicated DATARATE, may be accessed via the PHY-SAP.

Upon receiving the transmitted PHY preamble in a greater than or equal to 20 MHz BSS, the PHY measures a receive signal strength. This activity is indicated by the PHY to the MAC via a PHY-CCA.indication primitive. A PHY-CCA.indication(BUSY, channel-list) primitive is also issued as an initial indication of reception of a signal as specified in 27.3.22.6. The channel-list parameter of the PHY-CCA.indication primitive is absent when the operating channel width is 20 MHz. The channel-list parameter is present when the operating channel width is 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz.

The PHY shall not issue a PHY-RXEARLYSIG.indication nor a PHY-RXSTART.indication primitive in response to a PPDU that does not overlap the primary channel, unless the PHY at an AP receives the HE TB PPDU solicited by the AP. For the HE TB PPDU solicited by the AP, the PHY shall issue both a PHY-RXEARLYSIG.indication and a PHY-RXSTART.indication primitive for a PPDU received in the primary or at the secondary 20 MHz channel, the secondary 40 MHz channel, or the secondary 80 MHz channel.

The PHY includes the measured RSSI and RSSI_LEGACY value in the PHY-RXSTART.indication(RXVECTOR) primitive issued to the MAC.

After the PHY-CCA.indication(BUSY, channel-list) primitive is issued, the PHY entity shall begin receiving the training symbols and searching for the preambles for non-HT, HT, VHT, and HE PPDUs, respectively. If the constellation used in the first symbol after the first long training field is QBPSK, the PHY entity shall continue to detect the received signal using the receive procedure for HT-greenfield format depicted in Clause 19. Otherwise, for detecting the HE preamble, the PHY entity shall search for L-SIG and RL-SIG fields in order to set the duration of the PPDU. If an RL-SIG field is detected, the PHY entity should check the parity bit and RATE fields in the L-SIG and RL-SIG fields. If either the check of the parity bit is invalid or the RATE field is not set to 6 Mb/s in non-HT, no PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive is issued. If the check of the parity bit is valid and the RATE field indicates 6 Mb/s in non-HT but the LENGTH field value in the L-SIG field is a multiple of 3, no PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive is issued. In both cases, the PHY should continue to detect the received signal using non-HT, HT, and VHT receive procedure in Clause 17, Clause 19, and Clause 21, respectively.

If a valid parity bit and the RATE with 6 Mb/s in non-HT are indicated in the L-SIG and RL-SIG fields and the LENGTH field value in the L-SIG and RL-SIG fields meets the condition that the remainder is 1 after LENGTH divided by 3, the PHY entity shall issue a PHY-RXEARLYSIG.indication primitive and should begin receiving the sequence of HE-SIG-A, HE-STF, and HE-LTF fields for the HE SU PPDU and HE TB PPDU as shown in Figure 27-68 and Figure 27-71, respectively. After the RL-SIG field, the PHY entity shall receive two symbols of the HE-SIG-A field immediately followed by HE-STF.

The PHY entity shall check CRC of the HE-SIG-A field. If the CRC check is valid, the PHY entity shall report the TXOP and BSS color, check the Format field, and continue to receive HE-STF. The PHY entity shall report to the MAC entity the predicted duration of the TXOP in the HE-SIG-A field.

The PHY entity shall check the BSS color in the HE-SIG-A field. If the BSS color does not contain an intended value (i.e., the color value is not contained in the PHYCONFIG_VECTOR parameter

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

BSS_COLOR_LIST), the PHY entity shall issue a PHY-RXSTART.indication(RXVECTOR) and then issue a PHY-RXEND.indication(Filtered).

The PHY entity shall check the Format field in the HE-SIG-A field. If the Format field indicates an HE SU PPDU, the PHY entity shall receive HE-STF for 4 μs after the HE-SIG-A field. If the Format field indicates an HE TB PPDU, the PHY entity shall receive HE-STF for 8 μs after the HE-SIG-A field.

If the HE-SIG-A field indicates a valid CRC and a reserved HE-SIG-A indication is not indicated, for all supported modes and unsupported modes, the PHY entity shall maintain the PHY-CCA.indication(BUSY, channellist) primitive for the predicted duration of the transmitted PPDU, as defined by RXTIME in Equation (27-146), unless it receives a PHY-CCARESET.request primitive before the end of the PPDU, for instance, during spatial reuse operation as described in 26.10. If the HE-SIG-A field indicates an unsupported mode, the PHY shall issue a PHY-RXEND.indication(UnsupportedRate) primitive.

If the HE-SIG-A field indicates a reserved HE-SIG-A indication, the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive and maintain the PHY-CCA.indication(BUSY, channellist) primitive for the predicted duration of the transmitted PPDU derived from the LENGTH field in the L-SIG field, as defined in Equation (27-147), unless it receives a PHY-CCARESET.request primitive before the end of the PPDU, for instance, during spatial reuse operation as described in 26.10. A reserved HE-SIG-A indication is defined as an HE-SIG-A field with Reserved bits equal to 0 or any other HE-SIG-A field bit combinations that do not correspond to modes of PHY operation defined in Clause 27.

If the HE-SIG-A field indicates an invalid CRC, the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive and maintain the PHY-CCA.indication(BUSY, channellist) primitive for the predicted duration of the transmitted PPDU derived from the LENGTH field in the L-SIG field as defined in Equation (27-147).

If a valid parity bit of the L-SIG and RL-SIG fields is indicated and the LENGTH field value in the L-SIG and RL-SIG fields meets the condition that the remainder is 2 after LENGTH divided by 3, the PHY entity should detect the signal constellations in the second symbol after the RL-SIG field. If the constellation is QBPSK, the PHY entity shall continue receiving the sequence of HE-SIG-A, HE-STF, and HE-LTF fields for an HE ER SU PPDU shown in Figure 27-69. After the RL-SIG field, the PHY entity shall receive four symbols of HE-SIG-A immediately followed by HE-STF.

The PHY entity shall check the CRC of the HE-SIG-A field. If the CRC is valid, the PHY entity shall report TXOP and BSS color and continue to receive the HE-STF. The PHY entity shall report to the MAC entity the predicted duration of the TXOP in the HE-SIG-A field.

The PHY entity shall check the BSS color in the HE-SIG-A field. If the BSS color does not contain an intended value (i.e., the color value is not contained in the PHYCONFIG_VECTOR parameter BSS_COLOR_LIST), the PHY entity shall issue a PHY-RXSTART.indication(RXVECTOR) and then issue a PHY-RXEND.indication(Filtered).

The PHY entity shall receive the HE-STF for 4 μs after the HE-SIG-A field.

If the HE-SIG-A field indicates a valid CRC and a reserved HE-SIG-A indication is not indicated, for all supported mode and unsupported modes, the PHY entity shall maintain the PHY-CCA.indication(BUSY, channellist) primitive for the predicted duration of the transmitted PPDU, as defined by RXTIME in Equation (27-146), unless it receives a PHY-CCARESET.request primitive before the end of the PPDU, for instance, during spatial reuse operation as described in 26.10.

If the HE-SIG-A field indicates an unsupported mode, the PHY shall issue a PHY-RXEND.indication(UnsupportedRate) primitive.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the HE-SIG-A field indicates a reserved HE-SIG-A indication, the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive and maintain the PHY-CCA.indication(BUSY, channellist) primitive for the predicted duration of the transmitted PPDU derived from the LENGTH field in the L-SIG field, as defined in Equation (27-147), unless it receives a PHY-CCARESET.request primitive before the end of the PPDU, for instance, during spatial reuse operation as described in 26.10. A reserved HE-SIG-A indication is defined as an HE-SIG-A field with Reserved bits equal to 0 or any other HE-SIG-A field bit combinations that do not correspond to modes of PHY operation defined in Clause 27.

If the HE-SIG-A field indicates an invalid CRC, the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive and maintain the PHY-CCA.indication(BUSY, channellist) primitive for the predicted duration of the transmitted PPDU derived from the LENGTH field in the L-SIG field, as defined in Equation (27-147), unless it receives a PHY-CCARESET.request primitive before the end of the PPDU, for instance, during spatial reuse operation as described in 26.10.

If a STA receives an HE TB PPDU and the TRIGVECTOR parameters are not present in its PHY entity, the STA shall use Equation (27-147) to calculate the predicted duration of the HE TB PPDU.

If a valid parity bit of the L-SIG and RL-SIG fields is indicated and the LENGTH field value in the L-SIG and RL-SIG fields meets the condition that the remainder is 2 after LENGTH divided by 3, the PHY entity should detect the signal constellations in the second symbol after the RL-SIG field. If the constellation is BPSK, the PHY entity shall continue receiving the sequence of HE-SIG-A, HE-SIG-B, HE-STF, and HE-LTF fields for an HE MU PPDU shown in Figure 27-70. After the RL-SIG field, the PHY entity shall receive two symbols of the HE-SIG-A field immediately followed by the HE-SIG-B field.

The PHY entity shall check CRC of the HE-SIG-A field. If the CRC check is valid, the PHY entity shall report TXOP and BSS color and continue to receive the HE-SIG-B field. The PHY entity shall report to the MAC entity the predicted duration of the TXOP in the HE-SIG-A field.

The PHY entity shall check the BSS color in the HE-SIG-A field. If the BSS color does not contain an intended value (i.e., the color value is not contained in the PHYCONFIG_VECTOR parameter BSS_COLOR_LIST), the PHY entity shall issue a PHY-RXSTART.indication(RXVECTOR) and then issue a PHY-RXEND.indication(Filtered).

After the HE-SIG-A field, the PHY entity shall receive the HE-SIG-B field for the number of symbols predicted from the HE-SIG-A field. If the Common field is present in the HE-SIG-B field, the PHY entity shall check the CRC of the Common field. If the CRC in the Common field is valid or the Common field is not present, the PHY entity shall search for intended STA-ID in each User Specific subfield with a valid CRC. If no CRC is valid or no intended STA-ID is detected, the PHY entity shall issue a PHY-RXSTART.indication(RXVECTOR) and then issue a PHY-RXEND.indication(Filtered). If a complete allocation of an intended STA-ID is detected in block with valid CRC, the PHY entity shall continue receiving HE-STF for 4 μs after the HE-SIG-B field for the detected and intended STA.

If the HE-SIG-A field indicates a valid CRC and a reserved HE-SIG-A indication is not indicated, for all supported modes and unsupported modes, the PHY entity shall maintain the PHY-CCA.indication(BUSY, channellist) primitive for the predicted duration of the transmitted PPDU, as defined by RXTIME in Equation (27-146), unless it receives a PHY-CCARESET.request primitive before the end of the PPDU, for instance, during spatial reuse operation as described in 26.10.

If the HE-SIG-A field indicates an unsupported mode, the PHY shall issue a PHY-RXEND.indication(UnsupportedRate) primitive.

If the HE-SIG-A field indicates a reserved HE-SIG-A indication, the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive and maintain the PHY-CCA.indication(BUSY, channellist) primitive for the predicted duration of the transmitted PPDU derived from the LENGTH field in

the L-SIG field, as defined in Equation (27-147), unless it receives a PHY-CCARESET.request primitive before the end of the PPDU, for instance, during spatial reuse operation as described in 26.10. A reserved HE-SIG-A indication is defined as an HE-SIG-A field with Reserved bits equal to 0 or any other HE-SIG-A field bit combinations that do not correspond to modes of PHY operation defined in Clause 27.

If the HE-SIG-A field indicates an invalid CRC, the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive and maintain the PHY-CCA.indication(BUSY, channellist) primitive for the predicted duration of the transmitted PPDU derived from the LENGTH field in the L-SIG field, as defined in Equation (27-147), unless it receives a PHY-CCARESET.request primitive before the end of the PPDU, for instance, during spatial reuse operation as described in 26.10.

If signal loss occurs during reception prior to completion of the PSDU reception, the error condition PHY-RXEND.indication(CarrierLost) shall be reported to the MAC. After waiting for the end of the PPDU as determined by Equation (27-146), the PHY shall set the PHY-CCA.indication(IDLE) primitive and return to the RX IDLE state.

(27-146)

$$\text{RXTIME}(\mu\text{s}) = 20 + T_{\text{HE\_PREAMBLE}} + N_{SYM}T_{SYM} + N_{MA}N_{\text{HE-LTF}}T_{\text{HE-LTF-SYM}} + T_{PE} + SignalExtension$$

where

$T_{\text{HE-PREAMBLE}}$, N_{SYM}, T_{PE}, and N_{MA}
: are defined in Equation (27-119), Equation (27-120), Equation (27-121), and Equation (27-122), respectively

SignalExtension
: is defined in Table 27-61

$$\text{RXTIME}(\mu\text{s}) = \left\lceil \frac{\text{LENGTH} + 3}{3} \right\rceil \cdot 4 + 20 + SignalExtension \quad (27\text{-}147)$$

where

LENGTH
: is the LENGTH field in the L-SIG field

SignalExtension
: is defined in Table 27-61

Except in an HE sounding NDP and HE TB feedback NDP, a Data field follows the HE-STF and HE-LTF fields. The number of symbols in the Data field and the packet extension duration are computed from Equation (27-119) and Equation (27-120), respectively.

The received PSDU bits are assembled into octets, decoded, and presented to the MAC using a series of PHY-DATA.indication(DATA) primitive exchanges. Any final bits that cannot be assembled into a complete octet are considered pad bits and discarded. After the reception of the final bit of the last PSDU octet, and possible padding and tail bits, the PHY entity shall check whether packet extension and/or signal extension is applied. If packet extension and/or signal extension is applied, the PHY entity shall wait until the packet extension and/or signal extension expires before returning to the RX IDLE state, as shown in Figure 27-72.

27.3.25 Channel numbering

27.3.25.1 General

The STA may operate in the 2.4 GHz band, 5 GHz band, or 6 GHz band. The set of valid operating channel numbers by regulatory domain is defined in Annex E. Channel allocation for each band is defined in the following subclauses:

— In 19.3.15.2 for the 2.4 GHz band
— In 19.3.15.3 for the 5 GHz band
— In 27.3.25.2 for the 6 GHz band

27.3.25.2 Channel allocation in the 6 GHz band

Channel center frequencies are defined at every integer multiple of 5 MHz above the channel starting frequency. The relationship between center frequency and channel number is given in Equation (27-148).

$$\text{Channel center frequency} = \text{Channel starting frequency} + 5 \times n_{ch} \text{ (MHz)} \quad (27\text{-}148)$$

where
n_{ch} = 1, …, 233
Channel starting frequency is defined as dot11ChannelStartingFactor × 500 kHz

For example, a channel center frequency of 5.955 GHz is indicated by dot11ChannelStartingFactor = 11 900 and n_{ch} = 1. A channel center frequency of 5.935 GHz is indicated by dot11ChannelStartingFactor = 11 850 and n_{ch} = 2.

27.3.26 Regulatory requirements

Wireless LANs (WLANs) implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision or may be superseded. Requirements that are subject to local geographic regulations are annotated within the PHY specification. Regulatory requirements that do not affect interoperability are not addressed in this standard. Implementers are referred to the regulatory sources in Annex D for further information. Operation in countries within defined regulatory domains might be subject to additional or alternative national regulations.

27.4 HE PLME

27.4.1 PLME SAP sublayer management primitives

Table 27-60 lists the MIB attributes that may be accessed by the PHY entities and the intralayer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.7.

27.4.2 PHY MIB

HE PHY MIB attributes are defined in Annex C with specific values defined in Table 27-60. The Operational semantics column in Table 27-60 contains two types: static and dynamic.

— Static MIB attributes are fixed and cannot be modified for a given PHY implementation.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Dynamic MIB attributes are interpreted according to the MAX-ACCESS field of the MIB attribute. If MAX-ACCESS is equal to read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. if MAX-ACCESS is equal to read-write, the MIB attribute may be read and written by management entities.

27.4.3 TXTIME and PSDU_LENGTH calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated for an HE PPDU using Equation (27-149).

(27-149)

$$\text{TXTIME} = 20 + T_{\text{HE-PREAMBLE}} + N_{SYM}T_{SYM} + N_{MA}N_{\text{HE-LTF}}T_{\text{HE-LTF-SYM}} + T_{PE} + SignalExtension$$

where

$T_{\text{HE-PREAMBLE}}$ is defined as in Equation (27-121)

T_{SYM} is the symbol duration of the Data field as defined in 27.3.9

SignalExtension takes the value of aSignalExtension as defined in Table 27-61

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For an HE sounding NDP and HE TB feedback NDP, there is no Data field and $N_{SYM} = 0$.

For an HE TB Ranging NDP, TXTIME is defined by Equation (27-150).

$$\text{TXTIME} = 40 + T_{\text{HE-PREAMBLE}} + 8N_{\text{LTF-REP}}N_{\text{HE-LTF}} + T_{PE} + SignalExtension \quad (27\text{-}150)$$

where

$N_{\text{LTF-REP}}$ is given by the TXVECTOR parameter LTF_REP

$N_{\text{HE-LTF}}$ is given in Table 27-15

NOTE 1—The value 40 corresponds to the duration of L-STF, L-LTF, L-SIG, RL-SIG, HE-SIG-A, and HE-STF in µs. T_{PE} is 4 µs in an HE TB Ranging NDP (see 27.3.19.2).

For an HE Ranging NDP with the TXVECTOR parameter SECURE_LTF_FLAG equal to 0 or SECURE_LTF_FLAG equal to 1 and the TXVECTOR parameter NUM_USERS is equal to 1, TXTIME is defined by Equation (27-151).

$$\text{TXTIME} = 36 + 8N_{\text{LTF-REP}}N_{\text{HE-LTF}} + T_{PE} + SignalExtension \quad (27\text{-}151)$$

NOTE 2—The value 36 corresponds to the duration of L-STF, L-LTF, L-SIG, RL-SIG, HE-SIG-A, and HE-STF in µs. T_{PE} is 4 µs in an HE Ranging NDP (see 27.3.19.1).

For an HE Ranging NDP with the TXVECTOR parameter SECURE_LTF_FLAG equal to 1 and the TXVECTOR parameter NUM_USERS greater than 1, TXTIME is defined by Equation (27-152).

$$\text{TXTIME} = 36 + \sum_{n=1}^{\text{NUM\_USERS}} 8N_{\text{LTF\_REP}}(n)N_{\text{HE-LTF}}(n) + T_{PE} + SignalExtension \quad (27\text{-}152)$$

NOTE 3—The value 36 corresponds to the duration of L-STF, L-LTF, L-SIG, RL-SIG, HE-SIG-A, and HE-STF in µs. T_{PE} is 4 µs in an HE Ranging NDP (see 27.3.19.1).

For an HE SU PPDU and HE ER SU PPDU using BCC encoding, the total number of data OFDM symbols, N_{SYM}, is given by Equation (27-66).

For an HE SU PPDU and HE ER SU PPDU using LDPC encoding, the total number of data OFDM symbols, N_{SYM}, is given in 27.3.12.5.2.

For an HE MU PPDU (including both MU-MIMO and OFDMA), the total number of data OFDM symbols, N_{SYM}, is given in 27.3.12.5.4.

For an HE TB PPDU, the total number of data OFDM symbols, N_{SYM}, is given in 27.3.12.5.5.

T_{PE} is given in 27.3.13.

N_{MA} is the number of midambles. It is given by Equation (27-117) for an HE TB PPDU and by Equation (27-112) for an HE SU PPDU, HE ER SU PPDU, and HE MU PPDU if the TXVECTOR value DOPPLER is 1, and is 0 otherwise.

$N_{HE\text{-}LTF}$ and $T_{HE\text{-}LTF}$ are given in 27.3.9.

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for an HE SU PPDU, HE ER SU PPDU, and HE TB PPDU is calculated using Equation (27-153).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$\text{PSDU\_LENGTH} = \left\lfloor \frac{(N_{SYM,init} - m_{STBC})N_{DBPS} + m_{STBC}N_{DBPS,last,init} - N_{service} - N_{tail}}{8} \right\rfloor \quad (27\text{-}153)$$

where

$N_{SYM,init}$ is given by Equation (27-64) for BCC encoding, by Equation (27-64) for LDPC encoding for an HE SU PPDU and HE ER SU PPDU, and in 27.3.12.5.5 for an HE TB PPDU

m_{STBC} is 2 when STBC is used, and 1 otherwise

N_{DBPS} is given in 27.5

$N_{DBPS,last,init}$ is given by Equation (27-62)

The value of the PSDU_LENGTH parameter for user u returned in the PLME-TXTIME.confirm primitive for an HE MU PPDU is calculated using Equation (27-154) and Equation (27-155) for users using BCC and LDPC, respectively.

$$\text{PSDU\_LENGTH}_u = \left\lfloor \frac{(N_{SYM} - m_{STBC})N_{DBPS,u} + m_{STBC}N_{DBPS,last,u} - N_{service} - N_{tail}}{8} \right\rfloor \quad (27\text{-}154)$$

$$\text{PSDU\_LENGTH}_u = \left\lfloor \frac{(N_{SYM,init} - m_{STBC})N_{DBPS,u} + m_{STBC}N_{DBPS,last,init,u} - N_{service}}{8} \right\rfloor \quad (27\text{-}155)$$

where

$N_{SYM,init}$ is given by Equation (27-76)

$N_{DBPS,u}$ is given in Table 27-16

$N_{DBPS,last,u}$ is given by Equation (27-85)

$N_{DBPS,last,init,u}$ is given by Equation (27-77)

For an HE SU PPDU, HE ER SU PPDU, and HE TB PPDU, the value of the PSDU_LENGTH parameter returned in the RXVECTOR is calculated using Equation (27-156).

$$\text{PSDU\_LENGTH} = \left\lfloor \frac{(N_{SYM,RX} - m_{STBC})N_{DBPS} + m_{STBC}N_{DBPS,last,RX} - N_{service} - N_{tail}}{8} \right\rfloor \quad (27\text{-}156)$$

where

$N_{SYM,RX}$ is given by Equation (27-157)

$$N_{SYM,RX} = \begin{cases} N_{SYM} - m_{STBC}, & \text{if the Coding field is 1, the LDPC Extra Symbol Segment field is 1, and the Pre-FEC Padding Factor field is 1 in HE-SIG-A} \\ N_{SYM}, & \text{otherwise} \end{cases} \quad (27\text{-}157)$$

where

N_{SYM} is given by Equation (27-119)

m_{STBC} is 1 if the STBC field in the HE-SIG-A field is 0 and 2 if the STBC field is 1

$N_{DBPS,last,RX}$ is given by Equation (27-158)

$$N_{DBPS,last,RX} = \begin{cases} N_{DBPS}, & \text{if } a_{RX} = 4 \\ a_{RX} \cdot N_{SD,short} \cdot N_{SS} \cdot N_{BPSCS} \cdot R, & \text{otherwise} \end{cases} \quad (27\text{-}158)$$

where

a_{RX} is given by Equation (27-159)
$N_{SD,short}$ is defined in Table 27-34
N_{SS}, N_{BPSCS}, and R are defined in Table 27-16

$$a_{RX} = \begin{cases} 4, & \text{if } a = 1\text{, the Coding field is 1 and the LDPC Extra Symbol Segment field is 1 in HE-SIG-A} \\ a - 1, & \text{if } a > 1\text{, the Coding field is 1 and the LDPC Extra Symbol Segment field is 1 in HE-SIG-A} \\ a, & \text{otherwise} \end{cases} \quad (27\text{-}159)$$

where
a is the pre-FEC padding factor (ranging from 1 to 4) indicated in the HE-SIG-A field

N_{DBPS} is defined in Table 27-16
$N_{service}$ and N_{tail} are defined in Table 27-13

For an HE MU PPDU, the value of the RXVECTOR parameter PSDU_LENGTH returned for user u is calculated using Equation (27-160).

$$\text{PSDU\_LENGTH}_u = \left\lfloor \frac{(N_{SYM,RX,u} - m_{STBC})N_{DBPS,u} + m_{STBC}N_{DBPS,last,RX,u} - N_{service} - N_{tail,u}}{8} \right\rfloor \quad (27\text{-}160)$$

where
$N_{SYM,RX,u}$ is given by Equation (27-161)

$$N_{SYM,RX,u} = \begin{cases} N_{SYM} - m_{STBC}, & \text{if } a = 1\text{, the Coding field is 1 in the User field of the HE-SIG-B field corresponding to user u and LDPC Extra Symbol Segment field is 1 in HE-SIG-A field} \\ N_{SYM}, & \text{othewise} \end{cases} \quad (27\text{-}161)$$

where
N_{SYM} is given by Equation (27-119)

m_{STBC} is 1 if the STBC field in the HE-SIG-A field is 0 and 2 if the STBC field is 1
$N_{DBPS,last,RX,u}$ is given by Equation (27-162)

$$N_{DBPS,last,RX,u} = \begin{cases} N_{DBPS,u}, & \text{if } a_{RX,u} = 4 \\ a_{RX,u} \cdot N_{SD,short,u} \cdot N_{SS,u} \cdot N_{BPSCS,u} \cdot R_u, & \text{otherwise} \end{cases} \quad (27\text{-}162)$$

where
$a_{RX,u}$ is given by Equation (27-163)
$N_{SD,short,u}$ is $N_{SD,short}$ defined in Table 27-34 for user u
$N_{SS,u}$, $N_{BPSCS,u}$, and R_u are defined in Table 27-16

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$a_{RX,u} = \begin{cases} 4, & \text{if } a = 1, \text{ Coding field is 1 in User field of HE-SIG-B field corresponding to the user } u \text{ and LDPC Extra Symbol Segment field is 1 in HE-SIG-A} \\ a-1, & \text{if } a > 1, \text{ the Coding field is 1 in User field of HE-SIG-B field corresponding to the user } u \text{ and LDPC Extra Symbol Segment field is 1 in HE-SIG-A field} \\ a, & \text{otherwise} \end{cases} \quad (27\text{-}163)$$

where

a is the pre-FEC padding factor (ranging from 1 to 4) indicated in the HE-SIG-A field

$N_{DBPS,u}$ is defined in Table 27-16

$N_{service}$ and N_{tail} are defined in Table 27-13

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for an HE sounding NDP is 0.

27.4.4 HE PHY

The HE PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, are shown in Table 19-25 unless otherwise listed in Table 27-61. The definitions for these characteristics are given in 6.7.4.

27.5 Parameters for HE-MCSs

27.5.1 General

The rate-dependent parameters for 26-tone RU, 52-tone RU, 106-tone RU, 242-tone RU, and non-OFDMA 20 MHz; 484-tone RU and non-OFDMA 40 MHz; 996-tone RU and non-OFDMA 80 MHz; 2×996-tone RU and non-OFDMA 160 MHz and 80+80 MHz (N_{SS} = 1, …, 8) are provided in 27.5.2 through 27.5.8. Support for HE-MCS 8, 9, 10, and 11 is optional in all cases.

HE-MCSs are defined for both SU transmission and for user u of the r^{th} RU of an MU transmission. In the case of HE-MCSs for MU transmissions, the parameters, N_{SS}, R, N_{BPSCS}, N_{CBPS}, and N_{DBPS} are replaced with $N_{SS,u}$, R_u, $N_{BPSCS,u}$, $N_{CBPS,u}$, and $N_{DBPS,u}$, respectively.

N_{DBPS} is an integer and shall be computed as follows $N_{DBPS} = \lfloor N_{CBPS} \times R \rfloor$, where R is the coding rate.

27.5.2 HE-MCSs for 26-tone RU

The rate-dependent parameters for the 26-tone RU are provided in Table 27-62 through Table 27-69.

27.5.3 HE-MCSs for 52-tone RU

The rate-dependent parameters for the 52-tone RU are provided in Table 27-70 through Table 27-77.

27.5.4 HE-MCSs for 106-tone RU

The rate-dependent parameters for the 106-tone RU are provided in Table 27-78 through Table 27-85.

Table 27-61—HE PHY characteristics

Characteristic	Value
aTxPHYDelay	Implementation dependent
aRxPHYDelay	Implementation dependent
aSignalExtension	0 μs if operating in the 5 GHz or 6 GHz band 6 μs if operating in the 2.4 GHz band
aSlotTime	If operating in the 2.4 GHz band: If dot11OperatingClassesRequired is false, long = 20 μs If dot11OperatingClassesRequired is true, long = 20 μs plus any coverage-class-dependent aAirPropagationTime (see Table 9-95) If dot11OperatingClassesRequired is false, short = 9 μs If dot11OperatingClassesRequired is true, short = 9 μs plus any coverage-class-dependent aAirPropagationTime (see Table 9-95) If operating in the 5 GHz or 6 GHz band: If dot11OperatingClassesRequired is false, 9 μs If dot11OperatingClassesRequired is true, 9 μs plus any coverage-class-dependent aAirPropagationTime (see Table 9-95)
aSIFSTime	10 μs if operating in the 2.4 GHz band 16 μs if operating in the 5 GHz or 6 GHz band
aCCAMidTime	25 μs
aPPDUMaxTime	5.484 ms
aPSDUMaxLength	6 500 631 octets (see NOTE)
aRxPHYStartDelay	24 μs

NOTE—This is the maximum length in octets for an HE SU PPDU with a bandwidth of 160 MHz or 80+80 MHz using 2×996 RU, HE-MCS 11, 8 spatial streams, 0.8 μs GI duration, 1x HE-LTF, LDPC coding, 0 μs duration of the PE field, pre-FEC padding factor value of 4, and limited by 398 possible Data field OFDM symbols in aPPDUMaxTime. This is the maximum PSDU length an HE PHY could support assuming no restrictions in MAC. See 10.12.2 and 9.2.4.8.1 for additional restrictions on the maximum number of octets the MAC could support.

27.5.5 HE-MCSs for 242-tone RU

The rate-dependent parameters for the 242-tone RU are provided in Table 27-86 through Table 27-93.

27.5.6 HE-MCSs for 484-tone RU

The rate-dependent parameters for the 484-tone RU are provided in Table 27-94 through Table 27-101.

27.5.7 HE-MCSs for 996-tone RU

The rate-dependent parameters for the 996-tone RU are provided in Table 27-102 through Table 27-109.

27.5.8 HE-MCSs for 2×996-tone RU

The rate-dependent parameters for 2×996-tone RU are provided in Table 27-110 through Table 27-117.

28. Enhanced directional multi-gigabit (EDMG) PHY specification

28.1 Introduction

28.1.1 Introduction to EDMG PHY

This clause specifies the PHY entity for the enhanced directional multi-gigabit (EDMG) control, single carrier (SC) and orthogonal frequency division multiplexing (OFDM) modes.

The EDMG PHY is based on the DMG PHY defined in Clause 20. In addition to the requirements in this clause, an EDMG STA shall supporttransmitting and receiving PPDUs that are compliant with the mandatory PHY specifications defined in Clause 20.

The EDMG PHY adds support for multiple space-time streams, downlink multi-user (MU) transmissions and PPDU transmissions with multiple channel widths, including 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, and 4.32+4.32 GHz. The channels making up a 2.16+2.16 GHz and 4.32+4.32 GHz PPDU transmission may be contiguous or noncontiguous. The maximum number of spatial streams per STA is eight. An MU PPDU transmission supports up to eight STAs. For 2.16+2.16 GHz and 4.32+4.32 GHz transmissions, the maximum number of spatial streams in each 2.16 GHz channel and 4.32 GHz channel, respectively, is four.

An EDMG STA shall support the following features:

- EDMG format (transmit and receive)
- 2.16 GHz PPDU using EDMG control mode MCS 0 and EDMG SC mode MCSs 1 to 5 and 7 to 10 (transmit and receive)
- 4.32 GHz PPDU using EDMG control mode MCS 0 and EDMG SC mode MCSs 1 to 5 and 7 to 10 (transmit and receive)
- Single spatial stream (transmit and receive) in all channel widths that the EDMG STA supports
- Normal GI type
- 2.16 GHz PPDU using non-EDMG control mode MCS 0 and EDMG SC mode MCSs 1 to 4 (transmit and receive)
- 4.32 GHz PPDU using non-EDMG duplicate control mode MCS 0 and EDMG SC mode MCSs 1 to 4 (transmit and receive)

An EDMG STA may support the following features:

- 2.16 GHz PPDU using EDMG SC mode MCSs 6 and 11 to 21 and EDMG OFDM mode all MCSs (transmit and receive)
- 4.32 GHz PPDU using EDMG SC mode MCSs 6 and 11 to 21 and EDMG OFDM mode all MCSs (transmit and receive)
- Two or more spatial streams using EDMG SC and OFDM modes (transmit and receive)
- EDMG MU PPDUs using EDMG SC and OFDM modes (transmit and receive)
- 2.16+2.16 GHz PPDU using EDMG control mode MCS 0, EDMG SC and OFDM modes all MCSs (transmit and receive)
- EDMG SC and OFDM modes all MCSs (transmit and receive)
- 6.48 GHz PPDU using EDMG control mode MCS 0, EDMG SC and OFDM modes all MCSs (transmit and receive)
- 8.64 GHz PPDU using EDMG control mode MCS 0, EDMG SC and OFDM modes all MCSs (transmit and receive)

— 2.16+2.16 GHz PPDU using non-EDMG duplicate control mode MCS 0 and EDMG SC mode all MCSs (transmit and receive)
— 4.32+4.32 GHz PPDU using non-EDMG duplicate control mode MCS 0 and EDMG SC mode all MCSs (transmit and receive)
— 6.48 GHz PPDU using non-EDMG duplicate control mode MCS 0 and EDMG SC mode all MCSs (transmit and receive)
— 8.64 GHz PPDU using non-EDMG duplicate control mode MCS 0 and EDMG SC mode all MCSs (transmit and receive)
— Short GI type, long GI type, or both
— SU A-PPDU (transmit and receive)
— STBC (transmit and receive)
— DCM π/2-BPSK using EDMG SC mode (transmit and receive)
— π/2-64-NUC using EDMG SC mode (transmit and receive)
— π/2-8-PSK using EDMG SC mode (transmit and receive)
— 2.16 GHz, 4.32 GHz, 6.48 GHz, and 8.64 GHz EDMG secure ranging PPDU using EDMG SC mode (transmit and receive)

28.1.2 Scope

The services provided to the MAC by the EDMG PHY consist of the following protocol functions:

— A function that defines a method of mapping the PSDUs into a framing format (PPDU) suitable for sending and receiving PSDUs between two or more STAs.
— A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the PPDU format, these STAs support a mixture of EDMG and Clause 20 PHYs.

28.1.3 EDMG PHY functions

28.1.3.1 General

The EDMG PHY contains two functional entities: the PHY function and the physical layer management function (i.e., the PLME). These functions are described in detail in 28.4, 28.5, and 28.6.

The EDMG PHY service is provided to the MAC through the PHY service primitives defined in Clause 8. The EDMG PHY service interface is described in 28.2.

28.1.3.2 PHY management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

28.1.3.3 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation, but do not necessarily reflect any particular implementation.

The service of a layer is the set of capabilities that it offers to a user in the next higher layer. Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

28.1.4 PPDU formats

The structure of the PPDU transmitted by an EDMG STA is determined by the TXVECTOR parameters as defined in Table 28-1 (in 28.2.2).

For an EDMG STA, the FORMAT parameter determines the overall structure of the PPDU and includes the following:

— Non-EDMG format (NON_EDMG) based on Clause 20.

— EDMG format (EDMG). PPDUs of this format contain a preamble compatible with Clause 20 STAs. The non-EDMG portion of the EDMG format preamble (the parts of EDMG preamble preceding the EDMG-Header-A field) is defined so that it can be decoded by these STAs. An EDMG PPDU can be further categorized as an EDMG SU PPDU or an EDMG MU PPDU. An EDMG SU PPDU shall not contain the EDMG-Header-B field. An EDMG MU PPDU shall contain the EDMG-Header-B field.

28.2 EDMG PHY service interface

28.2.1 General

The PHY provides an interface to the MAC through an extension of the generic PHY service interface defined in 8.3.4. The interface includes TXVECTOR, RXVECTOR, and PHYCONFIG_VECTOR.

The TXVECTOR supplies the PHY with per-PPDU transmit parameters. Using the RXVECTOR, the PHY informs the MAC of the received PPDU parameters. Using the PHYCONFIG_VECTOR, the MAC configures the PHY for operation, independent of frame transmission or reception.

28.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 28-1 are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive.

The N_{CB} parameter represents the number of contiguous (i.e., bonded) 2.16 GHz channels used for a transmission. The value of the CH_BANDWIDTH and CHANNEL_AGGREGATION parameters in the TXVECTOR and RXVECTOR define the value of the N_{CB} parameter in the EDMG PHY definition throughout this clause as follows:

NOTE 1—Between 1 and 4 bits are set in the CH_BANDWIDTH parameter.

— If the CH_BANDWIDTH parameter has exactly one bit equal to 1 (e.g., “01000000”), then N_{CB} is set to 1.

NOTE 2—The CHANNEL_AGGREGATION parameter is ignored in this case.

— If the CH_BANDWIDTH parameter has exactly two bits equal to 1, then:
  — If the two bits are noncontiguous (e.g., “01001000”), then N_{CB} is set to 1.

NOTE 3—The CHANNEL_AGGREGATION parameter is ignored in this case.

  — If the two bits are contiguous (e.g., “01100000”), then if the CHANNEL_AGGREGATION parameter is equal to AGGREGATED, N_{CB} is set to 1, otherwise N_{CB} is set to 2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— If the CH_BANDWIDTH parameter has exactly three bits equal to 1 (e.g., “00111000”), then N_{CB} is set to 3.

NOTE 4—The three bits are necessarily contiguous in this case. The CHANNEL_AGGREGATION parameter is ignored in this case.

— If the CH_BANDWIDTH parameter has exactly four bits equal to 1 (e.g., “01111000”), then if the CHANNEL_AGGREGATION parameter is equal to AGGREGATED, N_{CB} is set to 2, otherwise N_{CB} is set to 4.

NOTE 5—The four bits are necessarily contiguous in this case.

The parameter TIME_OF_DEPARTURE_REQUESTED is common for both NON_EDMG and EDMG formats. The parameter RX_START_OF_FRAME_OFFSET is common for both NON_EDMG and EDMG formats.

Table 28-1—TXVECTOR and RXVECTOR parameters

Parameter	Condition	Value	TXVECTOR	RXVECTOR
FORMAT		Determines the format of the PPDU. Enumerated type: NON_EDMG indicates Clause 20 or non-EDMG duplicate format. In this case, the modulation is determined by the NON_EDMG_MODULATION parameter. EDMG indicates EDMG format. In this case, the modulation is determined by the EDMG_MODULATION parameter.	Y	Y
NON_EDMG_MODULATION	FORMAT is NON_EDMG.	In TXVECTOR, indicates the format type of the transmitted non-EDMG PPDU. In RXVECTOR, indicates the estimated format type of the received non-EDMG PPDU. Enumerated type: DMG_C_MODE indicates Clause 20 control mode format. DMG_SC_MODE indicates Clause 20 SC mode format. NON_EDMG_DUP_C_MODE indicates non-EDMG duplicate format of the Clause 20 control mode format. NON_EDMG_DUP_SC_MODE indicates non-EDMG duplicate format of the Clause 20 SC mode format.	Y	Y
L_LENGTH	FORMAT is NON_EDMG.	See LENGTH entry in Table 20-1.	Y	Y

Table 28-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
EDMG_MCS	FORMAT is EDMG.	In the TXVECTOR, indicates the modulation and coding scheme applied for the transmission of the PPDU. In the RXVECTOR, indicates the modulation and coding scheme of the received PPDU. Values are integers in the range 0 to 21. — If EDMG_MODULATION is EDMG_C_MODE, valid EDMG_MCS value is 0. — If EDMG_MODULATION is EDMG_SC_MODE, valid EDMG_MCS values are 1 to 21. — If EDMG_MODULATION is EDMG_OFDM_MODE, valid EDMG_MCS values are 1 to 20.	SU+ MU	Y
EDMG_LENGTH	FORMAT is EDMG.	Indicates the length of the PSDU in octets in the range 14 to 1023 for the Control mode and 1 to 4 194 303 for the EDMG SC and OFDM modes. This value is used by the PHY to determine the number of octet transfers that occur between the MAC and the PHY.	MU	Y
LDPC_CW_TYPE	FORMAT is EDMG.	Indicates the LDPC codeword type in terms of code word length. Enumerated type: SHORT: LDPC codeword length 672, 624, 504, or 468. LONG: LDPC codeword length 1344, 1248, 1008, or 936.	MU	Y
LDPC_SUPERIMPOSED	FORMAT is EDMG.	Indicates whether punctured or superimposed LDPC code is used for code rate 7/8 encoding. 0 indicates that punctured LDPC code is applied as described in 20.5.3.2.3 and 28.5.9.4.3. 1 indicates that superimposed LDPC code is applied as described in 28.5.9.4.3. If the EDMG_MCS parameter is 13 and the PSK_APPLIED parameter is PSK_APPLIED, then this parameter indicates the 7/8 code employed in the encoding procedure with codeword shortening to achieve the effective code rate of 5/6 as defined in 28.5.9.4.3.	MU	Y
STBC	FORMAT is EDMG.	Indicates whether STBC is used. 0 indicates no STBC ($N_{STS} = N_{SS}$ in the Data field). 1 indicates STBC is used ($N_{STS} = 2 \times N_{SS}$ and N_{SS} in the Data field).	MU	Y

Table 28-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
DCM_BPSK	FORMAT is EDMG, EDMG_MODULATION is EDMG_SC_MODE, CHANNEL_AGGREGATION is AGGREGATED, STBC is 0, NUM_STS is 2.	Indicates whether DCM BPSK modulation is applied. Enumerated type: DCM_BPSK_Not_Applied indicates that DCM π/2-BPSK is not applied. DCM_BPSK_Applied indicates that DCM π/2-BPSK is applied and that $N_{SS} = N_{STS} = 2$.	Y	Y
	FORMAT is EDMG, EDMG_MODULATION is EDMG_OFDM_MODE, STBC is 0, NUM_STS is 2.	Enumerated type: DCM_BPSK_Not_Applied indicates that Dual Stream DCM BPSK is not applied. DCM_BPSK_Applied indicates that Dual Stream DCM BPSK is applied and that $N_{SS} = N_{STS} = 2$.	Y	Y
NUC_MOD	FORMAT is EDMG, EDMG_MODULATION is EDMG_SC_MODE.	Indicates whether NUC modulation is applied. Enumerated type: NUCNotApplied indicates that NUC modulation is not applied. NUCApplied indicates that NUC modulation is applied.	MU	Y
PSK_APPLIED	FORMAT is EDMG, EDMG_MODULATION is EDMG_SC_MODE.	Indicates if π/2-8-PSK is applied for MCS 12 or MCS 13. Enumerated Type: PSK_APPLIED indicates that π/2-8-PSK is applied. PSK_NOT_APPLIED indicates that π/2-8-PSK is not applied.	MU	Y
PHASE_HOPPING	FORMAT is EDMG, EDMG_MODULATION is EDMG_OFDM_MODE.	Indicates whether phase hopping modulation is applied when $N_{STS} = N_{SS} = 2$. Enumerated type: PH_NOT_APPLIED indicates that phase hopping modulation is not applied. PH_APPLIED indicates that phase hopping modulation is applied.	Y	Y
OPEN_LOOP_PC	FORMAT is EDMG, EDMG_MODULATION is EDMG_OFDM_MODE.	Indicates whether open loop precoding is applied when $N_{STS} = N_{SS} = 2$. Enumerated type: OL_NOT_APPLIED indicates that open loop precoding is not applied. OL_APPLIED indicates that open loop precoding is applied.	Y	Y

Table 28-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
NUM_STS	FORMAT is EDMG, STBC is 0.	Indicates the number of space-time streams. Value is an integer in the range 1 to 8 for an SU PPDU. For an MU PPDU, values are integers in the range 1 to 2 per user in the TXVECTOR, and 0 to 2 per user in the RXVECTOR. The sum of NUM_STS over all users is in the range 1 to 8.	MU	Y
	FORMAT is EDMG, STBC is 1.	Indicates the number of space-time streams. The value of this parameter shall be an even number. Value is an even integer in the range 2 to 8 for an SU PPDU. For an MU PPDU, the value is 2 for each user in the TXVECTOR, and 0 or 2 for each user in the RXVECTOR. The sum of NUM_STS over all users is in the range 1 to 8.	MU	Y
NUM_USERS	FORMAT is EDMG.	Indicates the number of users with nonzero space-time streams. Integer: range 1 to 8. Range restrictions apply for SU PPDU or MU PPDU if at least one user employs STBC.	Y	N
MU_AID	FORMAT is EDMG.	Indicates the AID of each intended recipient addressed in an MU PPDU.	MU	O
EDMG_PPDU_TYPE	FORMAT is EDMG, EDMG_TRN_LEN > 0.	Enumerated type: EDMG-TRN-R indicates either a PPDU whose Data field is followed by one or more TRN subfields, all of which are transmitted with the same AWV, or a PPDU that is requesting TRN subfields to be appended to a future response PPDU, all of which are transmitted with the same AWV. EDMG-TRN-T indicates a PPDU whose Data field is followed by a TRN field. As defined in 28.9.2.2, the transmitter may change the AWV at the beginning of each set of *N* TRN subfields present in the last *M* TRN subfields of each TRN-Unit in the TRN field. EDMG-TRN-R/T indicates a PPDU whose Data field is followed by one or more TRN subfields. The transmitter sends a number of consecutive TRN-Units in which the same AWV is used in the transmission of the last *M* TRN subfields of each TRN-Unit.	Y	Y

Table 28-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
EDMG_TRN_LEN	FORMAT is EDMG.	Indicates the number of TRN-Units in the TRN field of a PPDU or, as defined in 10.41.7, a requested number of TRN-Units for receive beam tracking. Values are in the range 0 to 255 (see 28.9.2.2.5 (TRN field definition)).	Y	Y
RX_TRN_PER_TX_TRN	FORMAT is EDMG, EDMG_PPDU_TYPE is EDMG-TRN-R/T, EDMG_TRN_LEN > 0.	Indicates the number of consecutive TRN-Units in which the same AWV is used in the transmission of the last EDMG_TRN_M TRN subfields of each TRN-Unit. Values are in the range 2 to 255, and divisors of the value of EDMG_TRN_LEN including EDMG_TRN_LEN but excluding 1.	Y	Y
EDMG_TRN_P	FORMAT is EDMG, EDMG_PPDU_TYPE is EDMG-TRN-T or EDMG-TRN-R/T.	Indicates the number of TRN subfields at the beginning of a TRN-Unit that are transmitted with the same AWV. Values are in the range 0 to 3.	Y	Y
EDMG_TRN_M	FORMAT is EDMG, EDMG_PPDU_TYPE is EDMG-TRN-T or EDMG-TRN-R/T.	If EDMG_PPDU_TYPE is EDMG-TRN-T or EDMG-TRN-R/T, indicates the number of TRN subfields in a TRN-Unit that may be used for transmit training, as defined in 28.9.2.2 (EDMG BRP PPDU). Values are in the range 0 to 15. The parameter is reserved if TRN-LEN is 0. The parameter is reserved if EDMG_PPDU_TYPE is EDMG-TRN-R.	Y	Y
EDMG_TRN_N	FORMAT is EDMG, EDMG_PPDU_TYPE is EDMG-TRN-T.	Indicates the number of consecutive TRN subfields within the EDMG TRN-Unit M of a TRN-Unit that are transmitted using the same AWV. Values are in the range 0 to 3.	Y	Y

Table 28-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
TRN_SEQ_LENGTH	FORMAT is EDMG.	Indicates the length of the Golay sequence to be used to transmit the TRN subfields present in the TRN field of the PPDU. Enumerated type: Normal: The Golay sequence has a length of $128 \times N_{CB}$. Long: The Golay sequence has a length of $256 \times N_{CB}$. Short: The Golay sequence has a length of $64 \times N_{CB}$. N_{CB} represents the integer number of contiguous 2.16 GHz channels over which the TRN subfield is transmitted and $1 \leq N_{CB} \leq 4$.	Y	Y
TRN_RX_PATTERN	FORMAT is EDMG, EDMG_PPDU_TYPE is EDMG-TRN-T or EDMG-TRN-R/T.	Indicates the receive antenna pattern to be used when measuring TRN-Units present in a received PPDU. Enumerated type: QUASI_OMNI indicates that quasi-omni AWV should be used. DIRECTIONAL indicates that directed AWV should be used.	Y	Y
EDMG_BEAM_TRACKING_REQUEST	FORMAT is EDMG.	This parameter indicates whether beam tracking (see 10.41.7) is requested. Enumerated type: BEAM-TRACKING-REQUESTED BEAM-TRACKING-NOT-REQUESTED	Y	Y
EDMG_BEAM_TRACKING_TYPE	FORMAT is EDMG.	This parameter indicates if analog beam tracking or baseband beam tracking is requested. Enumerated type: Analog Beam Tracking Baseband Beam Tracking	Y	Y
EDMG_BRP_MIN_SC_BLOCKS	FORMAT is EDMG, EDMG_TRN_LEN > 0.	Indicates the minimum duration of the Data field in units of SC IDFT/DFT period.	Y	N

Table 28-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
SCRAMBLER_INIT_SETTING	FORMAT is EDMG.	Indicates that the PPDU is an EDMG control mode PPDU carrying the EDMG-Header-A. Enumerated type: EDMG-Header-A	Y	Y
	FORMAT is NON_EDMG.	Indicates the configuration of the Scrambler Initialization field of a control mode PPDU. Enumerated type: Channel_BW CONTROL_TRAILER	Y	Y
CT_TYPE	SCRAMBLER_INIT_SETTING is CONTROL_TRAILER.	Indicates the content of the control trailer: Enumerated type: CTS_DTS GRANT_RTS_CTS2self SPR SSW_FEEDBACK BLOCK_ACK ACK	Y	Y
CH_BANDWIDTH	FORMAT is EDMG.	In the TXVECTOR, indicates the set of channels on which the PPDU is transmitted and the value of the BW field in the EDMG Header-A. In the RXVECTOR, indicates the value of the BW field in the EDMG Header-A of a received PPDU. This parameter is a bitmap. Valid values for this parameter and the CHANNEL_AGGREGATION parameter are indicated in Table 28-21, Table 28-22, and Table 28-23.	Y	Y
	FORMAT is NON_EDMG.	In the TXVECTOR, indicates the set of channels on which the PPDU is transmitted. In the RXVECTOR, indicates the estimated set of channels on which PPDU was received. This parameter is a bitmap. Valid values for this parameter and the CHANNEL_AGGREGATION parameter are indicated in Table 28-21, Table 28-22, and Table 28-23.	Y	Y
CH_BANDWIDTH_SIGNALING	FORMAT is NON_EDMG, NON_EDMG_MODULATION is NON_EDMG_DUP_C_MODE.	Indicates the value of the Scrambler Initialization field, as defined in Table 28-6, of the PPDU transmitted in NON_EDMG_DUP_C_MODE.	O	Y

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 28-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
CHANNEL_AGGREGATION	FORMAT is EDMG.	Indicates the transmission and reception type of the PPDU in case the number of bits equal to 1 in the CH_BANDWIDTH parameter is greater than 1. Enumerated type: AGGREGATED NOT_AGGREGATED	Y	Y
EDMG_ADD_PPDU	FORMAT is EDMG.	Enumerated type: ADD-PPDU indicates that this EDMG PPDU is immediately followed by another EDMG PPDU with no IFS or preamble on the subsequent EDMG PPDU. NO-ADD-PPDU indicates no additional EDMG PPDU follows this EDMG PPDU.	Y	Y
NUM_TX_CHAINS		The value of this field indicates the number of transmit chains used in the transmission of the PPDU. Integer: range 1 to 8.	Y	Y
DMG_TRN	FORMAT is EDMG, NUM_TX_CHAINS = 1, $N_{CB} = 1$.	Indicates the configuration of the DMG TRN field (see Table 28-12). Possible values are 0 and 1. When set to 1, indicates that the TRN field appended to this PPDU has the structure of a DMG training field containing an AGC training field and a TRN field as defined in 20.9.2.2.2 (BRP PPDU structure). In this case, the RX_TRN_PER_TX_TRN, EDMG_TRN_P, EDMG_TRN_M, EDMG_TRN_N and TRN_SEQ_LENGTH parameters are reserved. The EDMG_TRN_LEN parameter has a value greater than 0 and less than 32.	Y	Y
TIME_OF_DEPARTURE_REQUESTED		Enumerated type: True indicates that the MAC entity requests that the PHY entity measures and reports time of departure parameters corresponding to the time when the first frame energy is sent by the transmitting port. False indicates that the MAC entity requests that the PHY entity neither measures nor reports time of departure parameters.	O	N

Table 28-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
RSSI	FORMAT is EDMG.	The allowed values for the RSSI parameter are in the range 0 through 255. This parameter is a measure by the PHY of the power observed at the input of the antennas plus the antenna gain, or equivalent antenna gain for a phased array antenna, used to receive the current PPDU. The RSSI shall be measured during the reception of the L-STF or EDMG-STF field. RSSI is intended to be used in a relative manner, and it shall be a monotonically increasing function of the received power with equidistant step equal to 0.25 dB.	N	Y
RCPI	FORMAT is EDMG.	Is a measure of the received RF power (in dBm) measured over the preamble of the current PPDU. Refer to 28.3.9.2 (Received channel power indicator (RCPI) measurement).	N	Y
FIRST_PATH_TRAINING	FORMAT is EDMG.	When set to 1, indicates that the TRN field appended to this PPDU, if any, is used for first path beamforming training. Set to 0 otherwise.	Y	Y
DUAL_POL_TRAINING	FORMAT is EDMG.	When set to 1, indicates that the TRN subfields in the TRN field appended to this PPDU have different polarizations for the same AWV. When set to 0, indicates that the TRN field appended to this PPDU does not change polarization.	Y	Y
GI_TYPE	FORMAT is EDMG.	Indicates the length of the guard interval. Enumerated type: SHORT NORMAL LONG	Y	Y
PRIMARY_CHANNEL	FORMAT is EDMG.	Indicates the primary channel number for the transmission. Values are 1 to 8.	Y	Y
BEAMFORMED	FORMAT is EDMG or FORMAT is NON_EDMG and NON_EDMG_MODULATION is NON_EDMG_DUP_SC_MODE.	Enumerated type: Beamformed Not_Beamformed If set to Beamformed, indicates that digital beamforming is applied. Set to Not_Beamformed otherwise.	Y	Y

Table 28-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
CSD_APPLIED	BEAMFORMED is Not_Beamformed.	Enumerated type: CSD_Applied CSD_Not_Applied If set to CSD_Applied, indicates that CSD is applied over different transmit chains. Set to CSD_Not_Applied otherwise.	Y	Y
TRN_AGGREGATION	FORMAT is EDMG and EDMG_TRN_LEN > 0.	Enumerated type: WidebandTRN: The BW field specifies that the TRN field of the PPDU is appended on a 2.16 GHz, 4.32 GHz, 6.48 GHz, or 8.64 GHz channel. AggregationTRN: The BW field specifies that the TRN field is transmitted over a 2.16+2.16 GHz or 4.32+4.32 GHz channel.	Y	Y
NEXT_TX_SISO	SCRAMBLER_INIT_ SETTING is CONTROL_TRAILER.	Indicates whether the following transmission from this STA is performed with a single DMG antenna or multiple DMG antennas. Enumerated type: NextTxSingleAntenna NextTxMultiAntenna	Y	Y
MU_MIMO_NEXT	SCRAMBLER_INIT_ SETTING is CONTROL_TRAILER.	Indicates whether the following transmission from this STA is performed in MU-MIMO. Enumerated type: NextMUMIMO NextNotMUMIMO	Y	Y
HBF_TRAINING	SCRAMBLER_INIT_ SETTING is CONTROL_TRAILER.	Indicates whether the following transmission from this STA is for hybrid beamforming training. Enumerated type: NextHBF NextNotHBF	Y	Y
TX_SECTOR_ CONFIG_INDEX	SCRAMBLER_INIT_ SETTING is CONTROL_TRAILER.	An integer identifying the TX sector combination index. Integer: range 0 to 63.	Y	Y

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 28-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
EDMG_GROUP_ID	MU_MIMO_NEXT is NextMUMIMO.	Indicates the identification of the MU-MIMO group of STAs that are involved in the following MU-MIMO transmission. Integer: range 0 to 255.	Y	Y
MU_MIMO_TX_CONFIG_TYPE	MU_MIMO_NEXT is NextMUMIMO.	Indicates whether the MIMO phase of MU-MIMO beamforming training consisted of a nonreciprocal MIMO phase or a reciprocal MIMO phase. Enumerated type: Non_reciprocal_MU_MIMO_BF Reciprocal_MU_MIMO_BF	Y	Y
MU_MIMO_TX_CONFIG_INDEX	MU_MIMO_NEXT is NextMUMIMO.	An integer identifying the MU-MIMO configuration. Integer: range 0 to 7.	Y	Y
IS_CHANNEL_NUMBER	SCRAMBLER_INIT_SETTING is CONTROL_TRAILER.	Indicates whether the value in the BW_IN_CT parameter represents a channel width or a channel number. Enumerated type: ChannelWidth ChannelNumber	Y	Y
BW_IN_CT	SCRAMBLER_INIT_SETTING is CONTROL_TRAILER.	If the IS_CHANNEL_NUMBER is ChannelWidth, indicates a channel width. In this case, the format of this parameter is the same as the CH_BANDWIDTH parameter. Otherwise, indicates a channel number. In this case, the format of this parameter is the same as the PRIMARY_CHANNEL parameter.	Y	Y
STREAM_FBCK	SCRAMBLER_INIT_SETTING is CONTROL_TRAILER.	Contains up to 8 pairs of spatial stream feedback. Each pair spatial stream feedback comprises an SNR and an RSSI and is defined as follows: — STREAM_SNR: as defined in Table 28-39. — STREAM_RSSI: as defined in Table 28-39.	Y	Y

Table 28-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
NUM_SECTORS_MSB	SCRAMBLER_INIT_SETTING is CONTROL_TRAILER, CT_TYPE is GRANT_RTS_CTS2self.	Indicates the value of the Total Number of Sectors MSB field in the control trailer of a Grant or Grant Ack frame. Integer: range 0 to 15.	Y	Y
NUM_ANT_MSB	SCRAMBLER_INIT_SETTING is CONTROL_TRAILER, CT_TYPE is GRANT_RTS_CTS2self.	Indicates the value of the Number of RX DMG Antennas MSB field in the control trailer of a Grant or Grant Ack frame.	Y	Y
NUM_SECTORS	SCRAMBLER_INIT_SETTING is CONTROL_TRAILER, CT_TYPE is SPR.	Indicates the value of the Total Number of Sectors field in the control trailer of an SPR frame.	Y	Y
NUM_ANT	SCRAMBLER_INIT_SETTING is CONTROL_TRAILER, CT_TYPE is SPR.	Indicates the value of the Number of RX DMG Antennas field in the control trailer of an SPR frame.	Y	Y
SSSW_DIR	FORMAT is NON_EDMG, NON_EDMG_MODULATION is DMG_C_MODE, L_LENGTH is 6.	Indicates the direction of the transmission of a Short SSW PPDU. Enumerated type: Initiator indicates the frame is transmitted by the initiator. Responder indicates the frame is transmitted by the responder.	Y	Y
SSSW_ADD_MODE	SSSW_DIR is Initiator.	Indicates the interpretation of the destination AID. Enumerated type: IndividualAddr: The destination AID field contains an individual address. GroupAddr: The destination AID field contains a group address.	Y	Y

Table 28-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
SSSW_SOURCE_AID	FORMAT is NON_EDMG, NON_EDMG_ MODULATION is DMG_C_MODE, L_LENGTH is 6.	When the SSSW_DIR is set to Initiator, contains the AID of the STA that transmits the Short SSW PPDU, except if the transmitting STA is a PCP or an AP in which case this field contains the BSS AID or the transmitting STA is not associated to intended recipient in which case this field contains a random value in the range 0 to 255. When the SSSW_DIR is set to Responder, contains the AID of the STA that transmits the Short SSW PPDU, except if the transmitting STA is a PCP or an AP in which case this field contains the BSS AID or the transmitting STA is not associated to the intended recipient in which case this field contains the value contained in the Source AID field in the received Short SSW PPDU during the preceding ISS.	Y	Y
SSSW_DESTINATION_AID	FORMAT is NON_EDMG, NON_EDMG_ MODULATION is DMG_C_MODE, L_LENGTH is 6.	When the SSSW_DIR is set to Initiator, contains the AID of the STA addressed by the Short SSW PPDU, except if the addressed STA is a PCP or an AP in which case this field contains the BSS AID or the transmitting STA is not associated to the intended recipient in which case this field contains a random value in the range 0 to 255. When the SSSW_DIR is set to Responder, contains the AID of the STA that transmits the Short SSW PPDU, except if the transmitting STA is a PCP or an AP in which case this field contains the BSS AID or the transmitting STA is not associated to the intended recipient in which case this field contains the value contained in the Destination AID field in the received Short SSW PPDU during the preceding ISS.	Y	Y
SSSW_CDOWN	FORMAT is NON_EDMG, NON_EDMG_ MODULATION is DMG_C_MODE, L_LENGTH is 6.	A down counter indicating the number of remaining Short SSW PPDU transmissions and LBIFSs to the end of the TXSS/RXSS across all DMG antennas. This parameter is set to 0 in the last Short SSW PPDU transmission.	Y	Y
SSSW_RF_CHAIN_ID	FORMAT is NON_EDMG, NON_EDMG_ MODULATION is DMG_C_MODE, L_LENGTH is 6.	Identifies the transmit chain currently being used for the transmission. Can take the values in the range 1 to 8.	Y	Y

Table 28-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
SSSW_BSSID	SSSW_DIR is Initiator, SSSW_ADD_MODE is IndividualAddr.	Contains the BSSID of the BSS.	Y	Y
SSSW_UNASSOCIATED	SSSW_DIR is Initiator, SSSW_ADD_MODE is IndividualAddr.	Indicates whether the transmitting STA is associated to the intended recipient. Enumerated type: Associated: if the transmitting STA is associated to the intended recipient. Unassociated: if the transmitting STA is not associated to the intended recipient.	Y	Y
SSSW_SISO_FEEDBACK_DURATION	SSSW_DIR is Initiator.	Specifies the duration, in microseconds, of the SISO Feedback subphase that starts following the Short SSW PPDU transmission with CDOWN field equal to 0.	Y	Y
SSSW_FEEDBACK	SSSW_DIR is Responder.	Contains the value of the CDOWN field of the Short SSW PPDU that was received with the best quality in the immediately preceding sector sweep. The determination of which PPDU was received with the best quality is implementation dependent.	Y	Y
EXPANSION_MAT	FORMAT is EDMG and EXPANSION_MAT_TYPE is COMPRESSED_SV.	Contains a set of compressed digital beamforming feedback matrices as defined in 9.4.2.283. The number of elements depends on the number of subcarriers, the number of spatial streams and the number of transmit chains.	Y	N
	FORMAT is EDMG and EXPANSION_MAT_TYPE is NON_COMPRESSED_SV.	Contains a set of noncompressed beamforming feedback matrices as defined in 9.4.2.283. The number of complex elements depends on the number of feedback taps per element of the SC feedback matrix, the number of columns, and the number of rows in each matrix.	Y	N
	FORMAT is EDMG and EXPANSION_MAT_TYPE is CSI_MATRICES.	Contains a set of CSI matrices as defined in 9.4.2.267. The number of complex elements depends on the number of feedback taps per element of the SC feedback matrix, the number of columns, and the number of rows in each matrix.	Y	N
	Otherwise	Not present	N	N

Table 28-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
EXPANSION_MAT_TYPE	EXPANSION_MAT is present.	Enumerated type: COMPRESSED_SV indicates that EXPANSION_MAT is a set of compressed beamforming feedback matrices. NON_COMPRESSED_SV indicates that EXPANSION_MAT is a set of noncompressed beamforming feedback matrices. CSI_MATRICES indicates that EXPANSION_MAT is a set of channel state matrices.	Y	N
CHANNEL_MEASUREMENT	FORMAT is EDMG.	Channel measurement, including real and imaginary parts, based on measurements performed on received TRN field.	N	Y
SCRAMBLER_RESET	FORMAT is EDMG or FORMAT is NON_EDMG.	Indicates that the scrambler has to be reset before the start of the PPDU. Enumerated Type: RESET_SCRAMBLER: The scrambler has to be reset. NO_SCRAMBLER_RESET: The scrambler does not have to be reset.	Y	N
SECURED_TRN	FORMAT is EDMG, EDMG_MODULATION is EDMG_SC_MODE, NUM_USERS is 1, NUM_STS is 1.	Indicates whether the TRN field, if present in the PPDU, contains Secure TRN sequences. Enumerated type: SECURED_TRN NON_SECURED_TRN	Y	Y
	Otherwise.	Not present.	N	N
SECURED_TRN SEQUENCES	FORMAT is EDMG, EDMG_MODULATION is EDMG_SC_MODE, NUM_USERS is 1, NUM_STS is 1.	Provides the secure TRN sequences used in the EDMG secure ranging PPDU.	Y	N
	Otherwise.	Not present.	N	N
FIRST_PATH_AWV_TR	FORMAT is EDMG, EDMG_MODULATION is EDMG_SC_MODE, NUM_USERS is 1, NUM_STS is 1.	Enumerated Type FIRST_PATH_AWV_ON_TRN BEST_PATH_AWV_ON_TRN Indicates whether the TRN field of the PPDU is transmitted using the first path AWV or the best path AWV.	Y	N
	Otherwise.	Not present.	N	N

Table 28-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
NOTE 1—In the TXVECTOR and RXVECTOR columns, the following apply: Y = Present; N = Not present: O = Optional; SU = indicates that the parameter is present for each spatial stream. Those parameters are conceptually supplied as an array of values indexed by values 0 to NUM_STS – 1 if STBC is not applied or indexed by 0 to (NUM_STS/2 – 1) if STBC is applied; MU = indicates that the parameter is present once for an EDMG SU PPDU and present per user for an EDMG MU PPDU. Parameters specified to be present per user are conceptually supplied as an array of values indexed by values 0 to NUM_USERS – 1; SU+MU = indicates that the parameter is present for each spatial stream and each user. Those parameters are conceptually supplied as a two dimensional array of values indexed by values 0 to NUM_STS – 1 if STBC is not applied or 0 to (NUM_STS/2 – 1) if STBC is applied by 0 to NUM_USERS – 1. NOTE 2—If the condition specified in the "Condition" is not satisfied, the parameter is not present in either the TXVECTOR or RXVECTOR. NOTE 3—"Y" if dot11TimingMsmtActivated is true; otherwise, "N".				

28.2.3 PHYCONFIG_VECTOR parameters

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for an EDMG PHY contains a CHANNEL_WIDTH parameter, which identifies the operating channel width and takes one of the values 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, or 4.32+4.32 GHz. The PHY shall set dot11EDMGCurrentChannelWidth to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for an EDMG PHY contains a CHANNEL_CENTER_CHANNEL_NUMBER_0 parameter, which identifies the center frequency of the 2.16 GHz, 4.32 GHz, 6.48 GHz, and 8.64 GHz channel. For 2.16+2.16 GHz channel configuration, it identifies the center frequency of the primary channel. For 4.32+4.32 GHz channel configuration, it identifies the center frequency of the 4.32 GHz channel containing the primary 2.16 GHz channel. The PHY shall set dot11EDMGCurrentChannelCenterFrequencyIndex0 to the value of this parameter defined in the range 1 to 15 (see Table 28-20).

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for an EDMG PHY contains a CHANNEL_CENTER_CHANNEL_NUMBER_1 parameter, which for 2.16+2.16 GHz channel configuration identifies the center frequency of the secondary channel. For 4.32+4.32 GHz channel configuration, it identifies the center frequency of the 4.32 GHz channel that contains the secondary 2.16 GHz channels only. The PHY shall set dot11EDMGCurrentChannelCenterFrequencyIndex1 to the value of this parameter defined in the range 1 to 15 (see Table 28-20).

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for an EDMG PHY contains an OPERATING_CHANNEL parameter, which identifies the operating or primary 2.16 GHz channel. The PHY shall set dot11EDMGCurrentPrimaryChannel to the value of this parameter defined in the range 1 to 15 (see Table 28-20).

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for an EDMG PHY contains a set of up to 8 RX_CHAIN_ID_ASSIGNMENT parameters, each taking values from the set {DMG_ANT1, DMG_ANT2, DMG_ANT3, DMG_ANT4, DMG_ANT5, DMG_ANT6, DMG_ANT7, DMG_ANT8}.

The valid channel configurations for an EDMG STA and configuration rules are defined in 28.3.4 (Channelization).

28.2.4 Support for NON_EDMG formats

28.2.4.1 General

An EDMG STA logically encompasses Clause 20 and Clause 28 PHYs. The MAC interfaces to the PHY via the Clause 28 PHY service interface, which in turn interacts with Clause 20 PHY service interface. The EDMG PHY TXVECTOR and RXVECTOR defined in 28.2.2 (TXVECTOR and RXVECTOR parameters) structurally include all fields of the DMG TXVECTOR and RXVECTOR accordingly defined in 20.2.2 (TXVECTOR and RXVECTOR parameters). The EDMG PHY TXSTATUS vector is identical to the TXSTATUS vector defined for DMG PHY in 20.2.3 (PHYCONFIG_VECTOR parameters). The EDMG PHYCONFIG_VECTOR defined in 28.2.3 (PHYCONFIG_VECTOR parameters) structurally includes all fields of the DMG PHYCONFIG_VECTOR.

28.2.4.2 EDMG STA PHY entity configuration for transmission

Figure 28-1 (EDMG STA PHY interaction on transmit for various PPDU formats) shows an EDMG STA PHY SAP interactions on transmit for different PPDU formats.

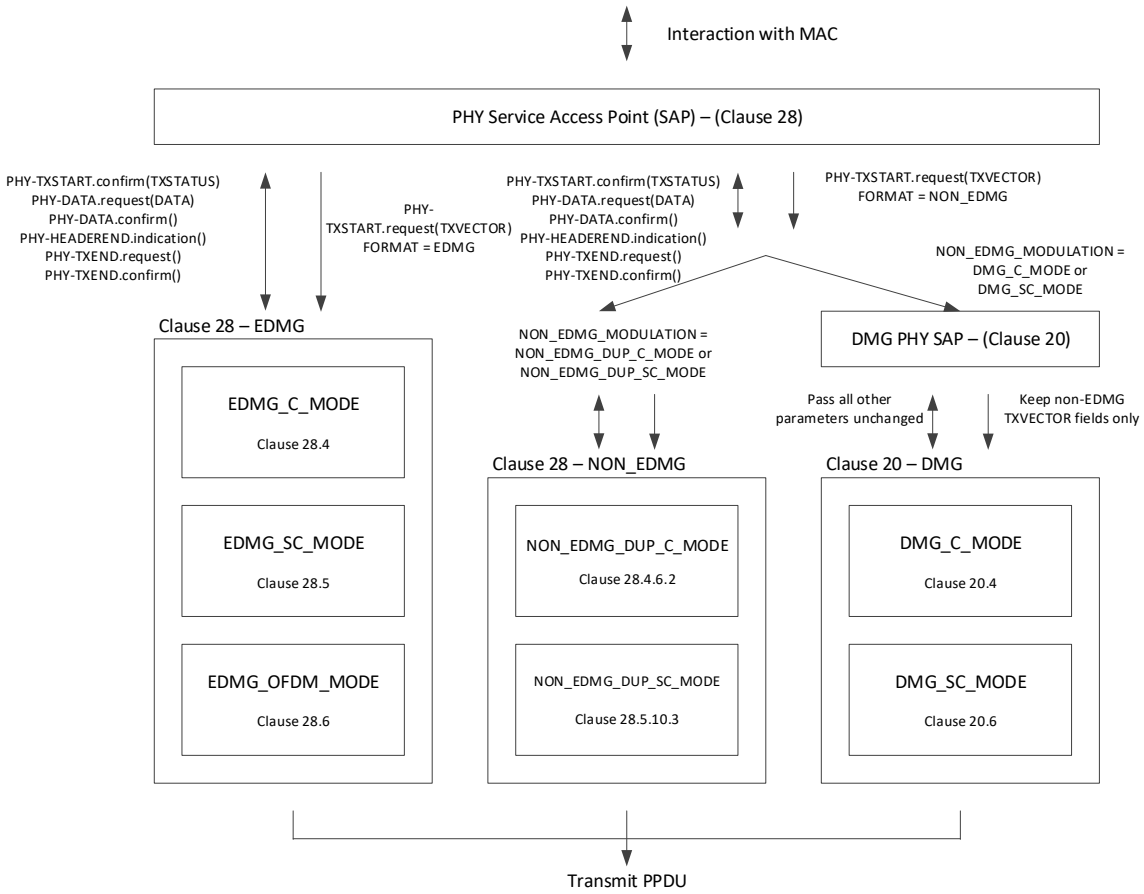

Figure 28-1—EDMG STA PHY interaction on transmit for various PPDU formats

The selection of the PHY type is based on the FORMAT parameter included into the TXVECTOR and transferred from MAC to PHY entity using PHY-TXSTART.request(TXVECTOR) primitive.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the FORMAT parameter is ()equal to EDMG, then Clause 28 PHY entity is used for transmission. The transmission mode is selected based on the TXVECTOR EDMG_MODULATION parameter and it can be set to EDMG_C_MODE for the EDMG control mode (28.4 (EDMG and non-EDMG control mode)), EDMG_SC_MODE for the EDMG SC mode (28.5 (EDMG and non-EDMG SC mode)), and EDMG_OFDM for EDMG OFDM mode (28.6 (EDMG OFDM mode)).

If the FORMAT parameter is equal to NON_EDMG and the TXVECTOR NON_EDMG_MODULATION parameter is equal to either NON_EDMG_DUP_C_MODE or NON_EDMG_DUP_SC_MODE, then Clause 28 PHY entity is used for transmission. If NON_EDMG_MODULATION parameter is equal to the NON_EDMG_DUP_C_MODE, then the non-EDMG control mode transmission defined in 28.4.7.2 (Non-EDMG PPDU transmission) is selected. If NON_EDMG_MODULATION parameter is equal to the NON_EDMG_DUP_SC_MODE, then the non-EDMG SC mode defined in 28.5.10.3 (Non-EDMG PPDU transmission) is selected.

If the FORMAT parameter is equal to NON_EDMG and NON_EDMG_MODULATION is equal to either DMG_C_MODE or DMG_SC_MODE, then Clause 20 PHY entity is used for transmission. The TXVECTOR content is filtered out while transferring to the Clause 20 PHY entity to keep the DMG fields only to define the TXVECTOR in accordance with DMG PHY SAP interface (see 20.2.2 (TXVECTOR and RXVECTOR parameters)). If NON_EDMG_MODULATION is equal to the DMG_C_MODE, then the DMG control mode defined in 20.4 (DMG control mode) is selected. If NON_EDMG_MODULATION is equal to the DMG_SC_MODE, then the DMG SC mode defined in 20.6 (DMG low-power SC mode) is selected.

28.2.4.3 EDMG STA PHY entity configuration for reception

Figure 28-2 (EDMG STA PHY interaction on receive for various PPDU formats) shows an EDMG STA PHY SAP interactions on receive for different PPDU formats.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

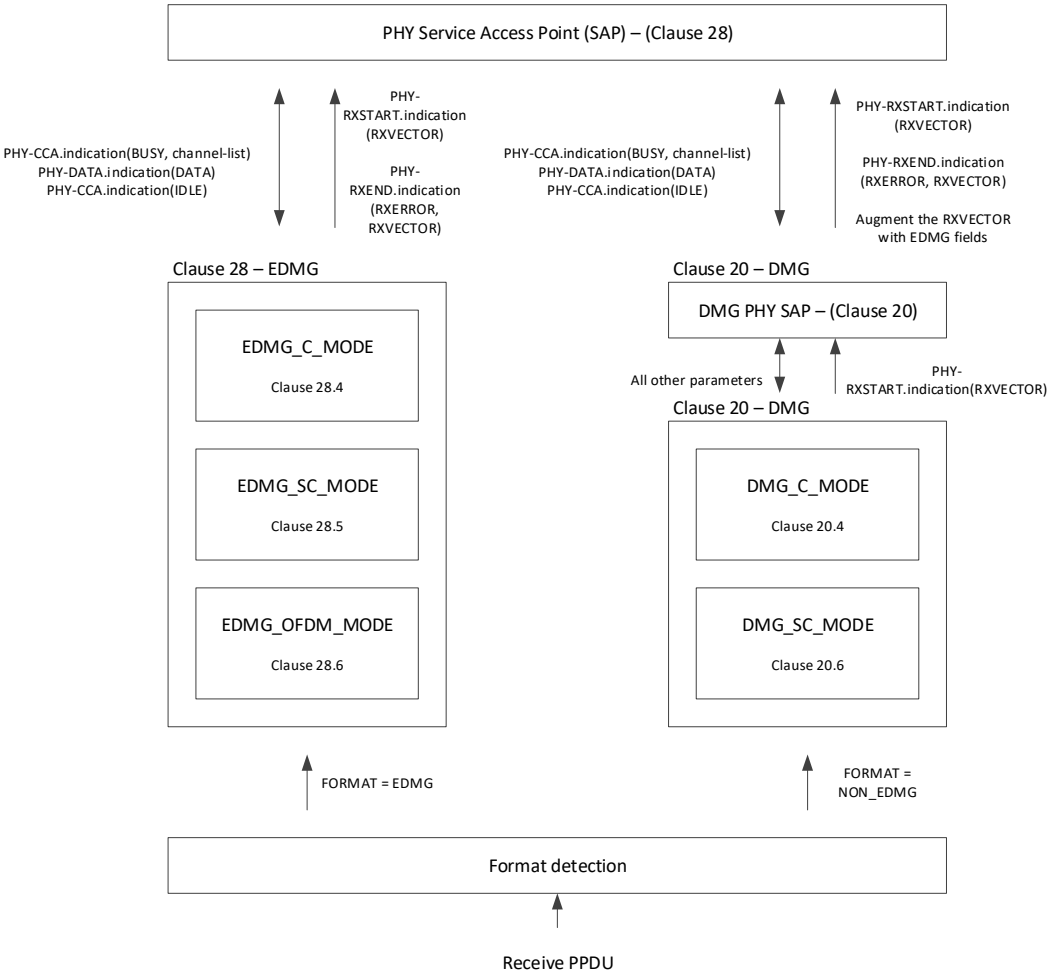

Figure 28-2—EDMG STA PHY interaction on receive for various PPDU formats

The selection of the PHY type at the reception is based on the FORMAT detection. For a control mode PPDU, if bits 22 and 23 of the L-Header are both 1, the Scrambler Initialization field B0 is 0, B1 is 1, B2 and B3 are reserved, and the Turnaround field is 0, then the FORMAT parameter is set to the EDMG. Otherwise, the FORMAT parameter is set to the NON_EDMG.

For an EDMG SC and an EDMG OFDM mode PPDU, if bit 46 of the L-Header is 1, then the FORMAT parameter is set to the EDMG. Otherwise, the FORMAT parameter is set to the NON_EDMG.

If the FORMAT is EDMG, then Clause 28 PHY entity is used for reception. If the FORMAT is EDMG and the PHY entity detects the Gb Golay sequence in the L-STF field, then the EDMG_MODULATION parameter is set to the EDMG_C_MODE. If the FORMAT is EDMG and the PHY entity detects the Ga Golay sequence in the L-STF field and the IsSC field of L-Header is 1, then the EDMG_MODULATION parameter is set to the EDMG_SC_MODE. If the FORMAT is EDMG and the PHY entity detects the Ga Golay sequence in the L-STF field and the IsSC field of L-Header is 0, then the EDMG_MODULATION parameter is set to the EDMG_OFDM_MODE.

If the FORMAT is NON_EDMG, then Clause 20 PHY entity is used for reception. If the FORMAT is NON_EDMG and PHY entity detects the Gb Golay sequence in the L-STF field, then the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NON_EDMG_MODULATION parameter is set to the DMG_C_MODE. If the FORMAT is NON_EDMG and the PHY entity detects the Ga Golay sequence in the L-STF field, then the NON_EDMG_MODULATION parameter is set to the DMG_SC_MODE. The RXVECTOR content is augmented with the EDMG fields to define the RXVECTOR in accordance with EDMG PHY SAP interface (see 28.2.2 (TXVECTOR and RXVECTOR parameters)). The augmented RXVECTOR is passed to the EDMG PHY SAP interface.

The EDMG STA performs the non-EDMG PPDU detection and reception in the primary 2.16 GHz channel only.

28.2.4.4 EDMG STA PHY entity channel bandwidth configuration

Figure 28-3 (EDMG STA PHY interaction on channel bandwidth configuration for Clause 28 (Enhanced directional multi-gigabit (EDMG) PHY specification) and Clause 20 PHYs) shows an EDMG STA PHY SAP operating channel bandwidth configuration using the PHYCONFIG_VECTOR parameters.

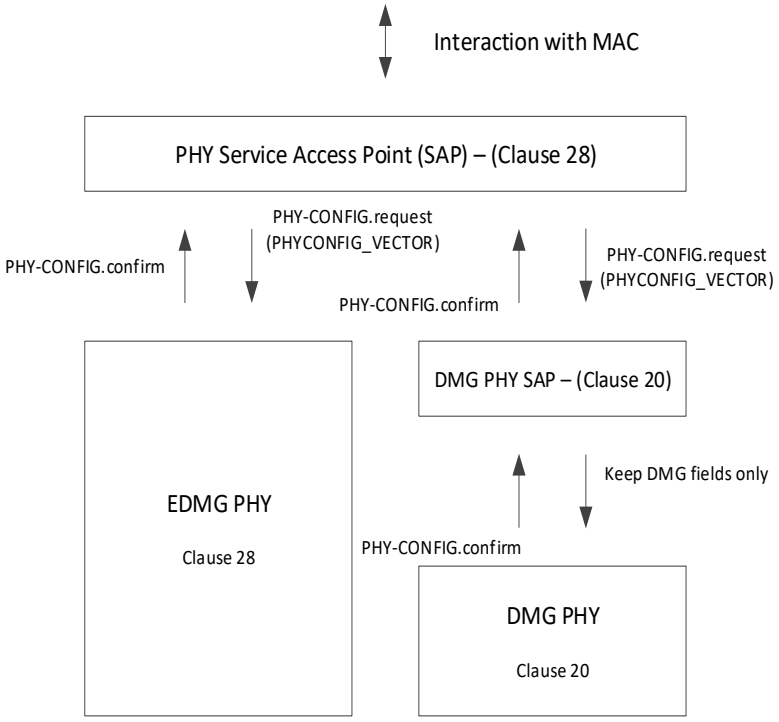

Figure 28-3—EDMG STA PHY interaction on channel bandwidth configuration for Clause 28 (Enhanced directional multi-gigabit (EDMG) PHY specification) and Clause 20 PHYs

The EDMG STA PHY entity configuration is performed using the PHYCONFIG_VECTOR parameters defined in 28.2.3 (PHYCONFIG_VECTOR parameters). The configuration of the Clause 28 PHY entity shall follow the rules defined in 28.3.4 (Channelization) for the configuration of the following PLME MIB parameters:

— dot11EDMGCurrentChannelWidth
— dot11ChannelCenterFrequencyIndex
— dot11EDMGCurrentChannelCenterFrequencyIndex0
— dot11EDMGCurrentChannelCenterFrequencyIndex1
— dot11EDMGCurrentPrimaryChannel

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The configuration of Clause 20 PHY entity by an EDMG STA is performed by setting the OPERATING_CHANNEL parameter, which identifies the operating or primary 2.16 GHz channel. The PHY shall set dot11EDMGCurrentPrimaryChannel to the value of this parameter defined in the range 1 to 15 (see Table 28-20). The configuration of OPERATING_CHANNEL parameter (dot11EDMGCurrentPrimaryChannel) shall follow the rules defined in 28.3.4 (Channelization). All other parameters of the EDMG PHYCONFIG_VECTOR are filtered out while transferring to the Clause 20 PHY entity to keep the DMG fields only to define the PHYCONFIG_VECTOR in accordance with the DMG PHY SAP interface.

28.2.4.5 EDMG STA PHY CCA

The EDMG STA shall follow the CCA requirements defined in 28.3.8 (CCA sensitivity) for both Clause 28 and Clause 20 PHY entities.

28.2.5 TXSTATUS parameters

The parameters listed in Table 20-2 (in 28.3.1 (Introduction)) are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm(TXSTATUS) primitive.

28.3 Common parameters

28.3.1 Introduction

Subclauses 28.4 (EDMG and non-EDMG control mode), 28.5 (EDMG and non-EDMG SC mode), and 28.6 (EDMG OFDM mode) provide a procedure for converting PSDUs to PPDUs. During transmission, the PSDU is processed (i.e., scrambled, coded and modulated) and appended to the PHY preamble to create the PPDU. At the receiver, the PHY preamble is processed to aid in demodulation and delivery of the PSDU.

Two preamble formats are defined. For EDMG format operation, the preamble has a non-EDMG portion and an EDMG portion. The non-EDMG portion of the EDMG format preamble enables detection of the PPDU and acquisition of carrier frequency and timing by both non-EDMG and EDMG STAs. To be decodable by non-EDMG and EDMG STAs compliant with Clause 20, the following applies:

— If the Short Training field and Channel Estimation field of the non-EDMG portion indicate a control mode transmission, the non-EDMG portion of the EDMG format preamble includes the Header field defined in Clause 20 for the DMG control mode (see 20.4 (DMG control mode)).

— In all other cases, the non-EDMG portion of the EDMG format preamble includes the Header field defined in Clause 20 for the DMG SC mode (see 20.6 (DMG low-power SC mode)).

The EDMG portion of the EDMG format preamble enables estimation of the channel to support demodulation of the PSDU transmitted over 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, and 4.32+4.32 GHz channels with single and multiple spatial streams. The EDMG portion of the EDMG format preamble includes the EDMG-Header-A field and may include EDMG-Header-B field.

Table 28-2 defines the symbol notations used throughout this clause.

Table 28-2—Frequently used parameters

Symbol	Explanation
i_{SS}	Spatial stream number.
N_{SS}	Total number of spatial streams.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 28-2—Frequently used parameters *(continued)*

Symbol	Explanation
$N_{SS\,i_{user}}$	Total number of spatial streams for i_{user}^{th} user.
i_{STS}	Space-time stream number.
N_{STS}	Total number of space-time streams.
$N_{STS\,i_{user}}$	Total number of space-time streams for i_{user}^{th} user.
$i_{STS\,i_{user}}$	Space-time stream number for i_{user}^{th} user.
i_{user}	User number.
N_{user}	Total number of users.
i_{TX}	Transmit chain number.
N_{TX}	Total number of transmit chains.
N_{up}	Upsampling factor.
N_{CB}	Number of contiguous 2.16 GHz channels, N_{CB} = 1 for 2.16 GHz and 2.16+2.16 GHz, N_{CB} = 2 for 4.32 GHz and 4.32+4.32 GHz, N_{CB} = 3 for 6.48 GHz, and N_{CB} = 4 for 8.64 GHz channel.
i_{PPDU}	PPDU number aggregated into the EDMG A-PPDU.
N_{PPDU}	Total number of PPDUs aggregated into the EDMG A-PPDU.
h_{SCCB}	Shaping filter impulse response defined at the $N_{up} \times F_c$ sampling rate, where F_c is defined in 28.5.2.2 (Timing-related parameters).
Q	Spatial mapping matrix of size N_{TX} by N_{STS}, independent of subcarrier index.
$Q_{non-EDMG}$	Spatial mapping matrix of size N_{TX} by N_{STS}, applied to a non-EDMG PPDU transmission and independent of subcarrier index.
$Q_{pre-EDMG}$	Spatial mapping matrix of size N_{TX} by N_{STS}, applied to the pre-EDMG fields of an EDMG PPDU transmission and independent of subcarrier index.
Q_{EDMG}	Spatial mapping matrix of size N_{TX} by N_{STS}, applied to the EDMG fields of an EDMG PPDU transmission and independent of subcarrier index.
Q_k	Spatial mapping matrix of size N_{TX} by N_{STS}, defined for k^{th} subcarrier.
$Q_{EDMG\,k}$	Spatial mapping matrix of size N_{TX} by N_{STS}, applied to the EDMG fields of an EDMG PPDU transmission and defined for the k^{th} subcarrier.
$Length_{i_{user}}$	PSDU length in octets for i_{user}^{th} user.
L_{CW}	LDPC codeword length in bits, it can be equal to 468, 504, 624, 672, 936, 1008, 1248, and 1344.
$L_{CW\,i_{user}}$	LDPC codeword length for the i_{user}^{th} user.
L_{CWD}	Number of systematic data bits per LDPC codeword.
L_{CWP}	Number of parity bits per LDPC codeword.
$R_{i_{user}}$	LDPC code rate for the i_{user}^{th} user and can be equal to1/2, 5/8, 2/3, 3/4, 13/16, 5/6, 7/8.
$\rho_{i_{user}}$	Repetition factor for i_{user}^{th} user; is equal to 2 for MCS 1 and equal to 1 for all other MCSs, applied for EDMG SC mode only.
$N_{CW\,i_{user}}$	Total number of LDPC codewords for the i_{user}^{th} user.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 28-2—Frequently used parameters *(continued)*

Symbol	Explanation
$N_{DATA\_PADi_{user}}$	Number of pad bits for i_{user}^{th} user to get integer number of LDPC codewords.
$N_{BLKS\ i_{user}}$	Total number of SC symbol blocks for the i_{user}^{th} user, applied for EDMG SC mode only.
$N_{SYMS\ i_{user}}$	Total number of OFDM symbols for i_{user}^{th} user, applied for EDMG OFDM mode only.
$N_{BLKS\min}$	Minimum number of total SC symbol blocks for a PPDU carrying a BRP frame transmission, applied for EDMG SC mode only.
$N_{SYMS\min}$	Minimum number of total OFDM symbols for PPDU carrying a BRP frame transmission, applied for EDMG OFDM mode only.
$N_{BLK\_PADi_{user}}$	Number of pad bits for the i_{user}^{th} user to reach an integer number of SC symbol blocks, applied for EDMG SC mode only.
$N_{SYM\_PADi_{user}}$	Number of pad bits for the i_{user}^{th} user to get integer number of OFDM symbols, applied for EDMG OFDM mode only.
N_{CBPB}	Total number of coded bits per SC symbol block, applied for EDMG SC mode only.
N_{CBPS}	Number of coded bits per symbol (constellation point) for EDMG SC mode and per OFDM symbol for EDMG OFDM mode.
$N_{CBPS\ i_{user}\ i_{SS}}$	Number of coded bits per symbol (constellation point) for the i_{user}^{th} user and i_{SS}^{th} spatial stream, applied for EDMG SC mode only.
N_{SPB}	Total number of symbols (constellation points) per SC symbol block, applied for EDMG SC mode only.
N_{BPSC}	Number of coded bits per constellation point, applied for EDMG OFDM mode only.
$N_{BPSC\ i_{user}\ i_{SS}}$	Number of coded bits per constellation point for the i_{user}^{th} user and i_{SS}^{th} spatial stream, applied for EDMG OFDM mode only.
$N_{BLKS\max}$	Maximum total number of SC symbol blocks over all users, applied for EDMG SC mode only.
$N_{SYMS\max}$	Maximum total number of OFDM symbols over all users, applied for EDMG OFDM mode only.
$N_{PAD\_BLKS\ i_{user}}$	The number of pad SC symbol blocks for the i_{user}^{th} user that is required to align PPDUs over different users in time, applied for EDMG SC mode only.
$N_{PAD\_SYMS\ i_{user}}$	The number of pad OFDM symbols for the i_{user}^{th} user required to align PPDUs over different users in time, applied for EDMG OFDM mode only.
$N_{BLKSspoof}$	Number of SC symbol blocks for the last PPDU in an EDMG A-PPDU to reach the spoofing EDMG A-PPDU duration, applied for EDMG SC mode only.
$N_{SYMSspoof}$	Number of OFDM symbols for the last PPDU in an EDMG A-PPDU to reach the spoofing EDMG A-PPDU duration, applied for EDMG OFDM mode only.

28.3.2 EDMG PPDU format

28.3.2.1 General

A single PPDU format is defined for all EDMG PHYs: the EDMG PPDU format. Figure 28-4 (EDMG PPDU format) shows the EDMG PPDU format and all possible fields. Not all fields are transmitted in an EDMG PPDU. Fields are included depending on whether the PPDU is an SU PPDU, an MU PPDU, or a part of an A-PPDU.

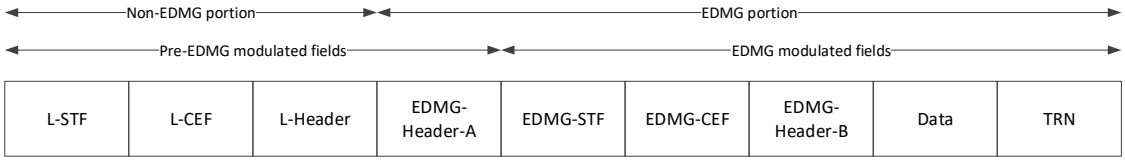

Figure 28-4—EDMG PPDU format

The fields of the EDMG PPDU format are summarized in Table 28-3.

Table 28-3—Fields of the EDMG PPDU

Field	Description
L-STF	Non-EDMG Short Training field
L-CEF	Non-EDMG Channel Estimation field
L-Header	Non-EDMG Header field
EDMG-Header-A	EDMG Header A field
EDMG-STF	EDMG Short Training field
EDMG-CEF	EDMG Channel Estimation field
EDMG-Header-B	EDMG Header B field
Data	The Data field carries the PSDU(s)
TRN	Training sequence field

NOTE—For EDMG secure ranging PPDU, the TRN field contains secure TRN sequences.

The EDMG-Header-A, EDMG-STF, EDMG-CEF, and EDMG-Header-B fields exist only in EDMG PPDUs.

Table 28-4 describes the content of the Data field of a PPDU depending on values of specific bits in the L-Header.

Table 28-4—Data field content based on the values of B46 and B37 in the L-Header field

B46	B37	Data field content
0	0	DMG MPDU
0	1	DMG A-MPDU
1	0	EDMG MPDU
1	1	EDMG A-MPDU

28.3.2.2 EDMG A-PPDU format

An EDMG A-PPDU is defined as a concatenation of EDMG PPDUs defined in 28.3.2.1 (General). An EDMG A-PPDU shall be transmitted to a single user and shall not be transmitted to multiple users. Figure 28-5 (EDMG A-PPDU format) shows the EDMG A-PPDU format and all possible fields. The first PPDU of an EDMG A-PPDU includes L-STF, L-CEF, L-Header, EDMG-Header-A, EDMG-STF, EDMG-CEF, and Data fields, and each subsequent PPDU includes EDMG-Header-A and Data fields only. The TRN field, if present, is appended only once at the end of an EDMG A-PPDU. Not all fields are transmitted in an EDMG A-PPDU. Fields are included depending on the values of N_{CB} and N_{STS}. The EDMG-Header-A field preceding a Data field defines the parameters of the PSDU transmitted in the Data field.

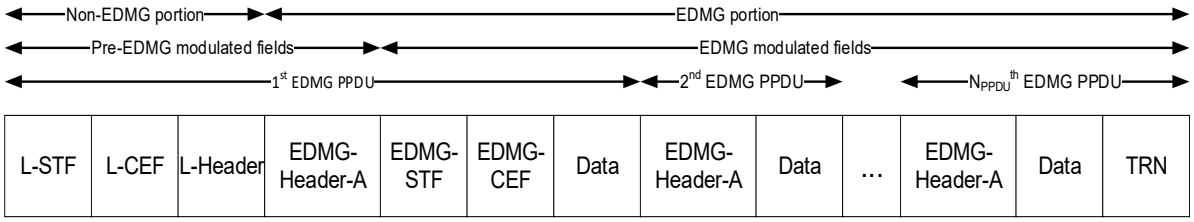

Figure 28-5—EDMG A-PPDU format

28.3.3 EDMG preamble

28.3.3.1 General

This subclause defines the EDMG format preamble, which includes a non-EDMG portion and an EDMG portion.

For a single PPDU transmission, the fields of the non-EDMG portion of the EDMG format preamble and the EDMG-Header-A field of the EDMG portion of the EDMG format preamble form the pre-EDMG modulated fields. The subsequent fields in the PPDU are referred to as EDMG modulated fields (see Figure 28-4 (EDMG PPDU format)).

For an EDMG A-PPDU transmission, the fields of the non-EDMG portion of the EDMG format preamble and the EDMG-Header-A field of the EDMG portion of the EDMG format preamble of the first EDMG PPDU form the pre-EDMG modulated fields, and subsequent fields in the EDMG A-PPDU are referred to as EDMG modulated fields (see Figure 28-5 (EDMG A-PPDU format)).

For 4.32 GHz, 6.48 GHz and 8.64 GHz EDMG PPDU transmissions, the pre-EDMG modulated fields shall be transmitted using the non-EDMG duplicate format (28.5.10.4.4.2 (Pre-EDMG modulated fields transmission)).

The pre-EDMG modulated fields when transmitted on each secondary channel shall have a relative delay with respect to the corresponding fields transmitted over the primary channel that is between zero (inclusive) and T_c (inclusive), where T_c is defined in Table 28-47. The relative delay applicable to each secondary channel transmission may be different from each other, so long as it follows this rule.

28.3.3.2 Non-EDMG portion of EDMG format preamble

28.3.3.2.1 General

The non-EDMG portion of the EDMG format preamble includes the L-STF, L-CEF and L-Header fields. These fields are defined at the DMG SC chip rate F_c in 20.4.3.1.2 (Short Training field), 20.3.6.2 (Short Training field), 20.3.6.3 (Channel Estimation field), 20.4.3.2 (Header), and 20.5.3.1 (Header).

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

28.3.3.2.2 L-STF definition

For an EDMG control mode PPDU, the L-STF is the same as the Short Training field used by DMG Control PPDUs defined in 20.4.3.1.2 (Short Training field). For other types of EDMG PPDUs, the L-STF is the same as the Short Training field used by DMG SC PPDUs defined in 20.3.6.2 (Short Training field).

28.3.3.2.3 L-CEF definition

The L-CEF for all types of EDMG PPDUs is the same as the Channel Estimation field used by DMG SC PPDUs defined in 20.3.6.3 (Channel Estimation field).

28.3.3.2.4 L-Header definition

28.3.3.2.4.1 General

For EDMG and non-EDMG PPDUs, spoofing error is defined as the difference between the PPDU duration calculated based on L-Header and the actual PPDU duration.

The structure of the L-Header field is defined as follows:

— For an EDMG control mode PPDU and a non-EDMG control mode PPDU transmitted with the control trailer or carrying bandwidth signaling information, the L-Header field is the same as the DMG control mode header field (see Table 20-11) except that the reserved bits 22 and 23 shall be both set to 1. In this case, the combination of the Turnaround field and the Scrambler Initialization field in the L-Header indicates the transmission mode:
  — If Turnaround field is 0, then the interpretation of the Scrambler Initialization field is defined in Table 28-5.
  — If Turnaround field is 1 and the PPDU contains an RTS, a DMG CTS, a DMG DTS, or a CF-End frame, then the interpretation of the Scrambler Initialization field is defined in Table 28-6 and indicates the channel bandwidth of the PPDU (corresponds to the TXVECTOR parameter SCRAMBLER_INIT_SETTING equal to Channel_BW). Otherwise, the Scrambler Initialization field is reserved.
— For an EDMG control mode PPDU and a non-EDMG control mode PPDU, the Length field and the Training Length field shall be set so that the spoofing error is non-negative and less than or equal to 150 ns, except for PPDU durations between 347.56 μs and 347.93 μs and between 349.10 μs and 350.76 μs where the maximum spoofing error shall be 0.37 μs and 1.66 μs, respectively.
— For an EDMG SC mode PPDU or an EDMG OFDM mode PPDU, the L-Header field is the same as the DMG SC mode PHY header (see Table 20-13) with the following changes:
  — The reserved bit 46 shall be set to 1 to indicate the presence of the EDMG-Header-A field. This implies that the PPDU is an EDMG PPDU.
  — The Last RSSI field shall be redefined as shown in Table 28-7.
  — The 5 LSBs of the Length field shall be redefined as shown in Table 28-8. Moreover, the remaining bits of the Length field together with the values of the Training Length field and of the MCS field shall be set so that the spoofing error is smaller than one SC symbol block ($512 \times T_c$) and non-negative.
  — The Additional PPDU field and the Beam Tracking Request field shall both be set to 0.
— For an EDMG SC mode A-PPDU or an EDMG OFDM mode A-PPDU, the definition of the L-Header field is the same as for the EDMG SC mode PPDU and the EDMG OFDM mode PPDU defined above with the following change:
  — If the actual A-PPDU duration is unknown at the point in time of L-Header transmission, the remaining bits of the Length field shall be set such that the PPDU duration calculated based on the L-Header shall be within the range of the actual PPDU duration of the first PPDU in the A-PPDU to the smaller of aPPDUMaxTime and remaining TXOP duration. Padding shall be

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

applied such that the spoofing error requirements are fulfilled. The padding for EDMG SC mode A-PPDU is defined in 28.5.9.4.3 (LDPC encoding). The padding for EDMG OFDM mode A-PPDU is defined in 28.6.9.2.3 (LDPC encoding).

— For a non-EDMG SC mode PPDU that has the TXVECTOR parameter NON_EDMG_MODULATION equal to NON_EDMG_DUP_SC_MODE, the L-Header field is the same as the DMG SC mode PHY header (see Table 20-13) with the following changes:
  — The Additional PPDU field shall be set to 0.

Table 28-5—Definition of Scrambler Initialization field when transmitted using the control mode and the Turnaround field is 0

Scrambler Initialization field				Definition
B0	B1	B2	B3	
0	0	R	R	Corresponds to the TXVECTOR parameter SCRAMBLER_INIT_SETTING equal to CONTROL_TRAILER. Indicates the presence of the control trailer in the PPDU. The content of the control trailer depends on the type of frame contained in the PPDU (see 28.3.7 (Control trailer)).
0	1	R	R	Corresponds to the TXVECTOR parameter SCRAMBLER_INIT_SETTING equal to EDMG-Header-A. Indicates the presence of the EDMG-Header-A field. This implies that the PPDU is an EDMG control mode PPDU.
1	0	R	R	Reserved
1	1	R	R	Reserved
NOTE—"R" indicates that this bit field is reserved.				

Table 28-6—Definition of Scrambler Initialization field when transmitted using the control mode and the Turnaround field is 1

Scrambler Initialization field				Requested channel bandwidth	2.16 GHz channel number(s) making up the requested channelization

Table 28-7—Definition of bit allocation of Last RSSI field when transmitted using the EDMG SC or EDMG OFDM mode

Bit number	Field name	Definition
B0	IsSC	If set to 1, this field indicates that the PSDU is modulated using SC (see 28.5 (EDMG and non-EDMG SC mode)). Otherwise, if set to 0, this field indicates that the PSDU is modulated using OFDM (see 28.6 (EDMG OFDM mode)). If modulated using SC, the PPDU is termed as EDMG SC (mode) PPDU. If modulated using OFDM, the PPDU is termed as EDMG OFDM (mode) PPDU.
B1	IsSISO	If set to 1, this field indicates that the PPDU is a single space-time stream PPDU. Otherwise, the PPDU encodes more than one space-time stream.
B2–B3	GI Length	This field indicates the type of GI used in the PPDU and is set as follows: set to 0 for short GI, set to 1 for normal GI, and set to 2 for long GI. Value of 3 is reserved.

Table 28-8—Definition of the 5 LSBs of the Length field when transmitted using the EDMG SC or EDMG OFDM mode

Bit number	Field name	Definition
B0–B4	Compressed BW	The Compressed BW field indicates the bandwidth over which the PPDU is transmitted. Possible values for this field are defined in Table 28-9. Values not listed in Table 28-9 are reserved.

Legend: “x” indicates that the channel is used; “—” indicates that the channel is not used.

28.3.3.2.4.2 Example of spoofing algorithm for EDMG SC PPDUs

The following is an informative algorithm for calculating the value of the Length field (referred to in this subclause as Length), the Training Length field, and the MCS field (referred to in this subclause as Base MCS) used in items a), b), c), d), and e) in the L-Header of an EDMG SC mode PPDU.

a) The tentative number of SC symbol blocks, N_{BLKS}', is calculated as $N_{BLKS}' = \left\lceil \frac{TXTIME - \left(T_{L-STF} + T_{L-CEF} + T_{L-Header}\right) - \left(64 \times T_c\right)}{512 \times T_c} \right\rceil$ where *TXTIME* is defined in 28.12.3 (TXTIME calculation) and $T_{L\text{-}STF}$, $T_{L\text{-}CEF}$, and $T_{L\text{-}Header}$ are defined in 28.5.10.4.4.2 (Pre-EDMG modulated fields transmission).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

b) The Base MCS field in the L-Header is set to the value such that the following conditions are met:

1) $N_{BLKS}' \le \left\lceil \left(2^{18}-1\right) \times 8 / \left(N_{CBPB} \times \frac{R}{\rho} \right) \right\rceil - 1$ where N_{CBPB}, R, and ρ are the parameters chosen based on the value of the Base MCS field as described in 20.5.3 (Transmission). If this condition is fulfilled, the Length to be calculated in steps d) and e) does not exceed the maximum value of the Length field in the L-Header, $2^{18} - 1$.

2) If N_{BLKS}' mod 3 = 1 and $N_{BLKS}' < 38$, the Base MCS field should be set to the value that is greater than 5 to apply algorithm in step c).

c) One of the combinations of the parameters N_{BLKS} and N_{TRN}, which denote, respectively, the number of SC symbol blocks and the Training Length in a DMG SC mode PPDU with the spoofed TXTIME of the EDMG PPDU, is calculated as follows:

If the Base MCS > 5 (π/2-QPSK, π/2-16-QAM and π/2- 64-QAM) **then**

$N_{BLKS} = N_{BLKS}'$

$N_{TRN} = 0$

Endif

If the Base MCS ≤ 5 (π/2-BPSK) **then**

If $N_{BLKS}' \bmod 3 \neq 1$ **then**

$N_{BLKS} = N_{BLKS}'$

$N_{TRN} = 0$

else if $N_{BLKS}' \geq 38$ **then**

$N_{TRN} = 2$

If $0 < \frac{TXTIME - \left(T_{L-STF} + T_{L-CE} + T_{L-Header}\right) - \left(64 \times T_c\right)}{T_c} \bmod 512 \leq 256$ **then**

$N_{BLKS} = N_{BLKS}' - 20$

else

$N_{BLKS} = N_{BLKS}' - 19$

endif

endif

endif

d) The maximum *Length* value that fulfills the requirement for the spoofing error specified in 28.3.3.2.4.1 (General), $Length_{max}$, is calculated as $Length_{max} = \left\lfloor \left\lfloor N_{BLKS} \cdot \frac{N_{CBPB}}{L_{CW}} \right\rfloor \cdot \frac{L_{CW}}{8} \cdot \frac{R}{\rho} \right\rfloor$, where L_{CW} is the parameter defined in 20.5.3.2.3 (Encoding), and the value is chosen based on the value of the Base MCS field as described in 20.5.3 (Transmission).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

e) The spoofed values of the Length and Training Length fields of the EDMG PPDU are calculated as follows:

$$Length = \begin{cases} \left\lfloor \frac{Length_{max}}{32} \right\rfloor \cdot 32 + compressed\_bw, \text{ if } Length_{max} \bmod 32 \geq compressed\_bw \\ \left(\left\lfloor \frac{Length_{max}}{32} \right\rfloor - 1 \right) \cdot 32 + compressed\_bw, \text{ otherwise} \end{cases}$$

$$Training\ Length = N_{TRN}$$

where

compressed_bw is the value of the Compressed BW field in the L-Header as described in 28.3.3.2.4.1 (General)

When the Base MCS field is equal to 1, the calculated length might not satisfy the requirement for the spoofing error defined in 28.3.3.2.4.1 (General). In that case, the Base MCS field shall be set to a value different from 1, and the Length and the Training Length fields shall be calculated by repeating steps c) to e).

28.3.3.3 EDMG portion of EDMG format preamble

28.3.3.3.1 General

The EDMG portion of the EDMG format preamble includes the EDMG-Header-A, EDMG-STF, EDMG-CEF and EDMG-Header-B fields. The EDMG-Header-A field is defined at the DMG SC chip rate F_c. The EDMG-STF, EDMG-CEF and EDMG-Header-B fields are not always transmitted as part of an EDMG PPDU transmission.

28.3.3.3.2 EDMG-Header-A definition

28.3.3.3.2.1 General

The EDMG-Header-A field carries information required to demodulate EDMG PPDUs. The definition of the EDMG-Header-A is the same for an EDMG SC mode and an EDMG OFDM mode PPDU, but is different from the definition for an EDMG control mode PPDU.

Reserved bits in the EDMG-Header-A field shall be set to 0 by the transmitter and shall be ignored by the receiver.

28.3.3.3.2.2 Definition for EDMG control mode PPDU

The contents of the EDMG-Header-A field are partitioned between the first and second LDPC codeword of an EDMG control mode PPDU as shown in Figure 28-6 (Structure of EDMG-Header-A in an EDMG control mode PPDU). The contents included in the first LDPC codeword are referred to as the EDMG-Header-A_1 subfield, which is defined in Table 28-10. The contents included in the second LDPC codeword are referred to as the EDMG-Header-A_2 subfield, which is defined in Table 28-11.

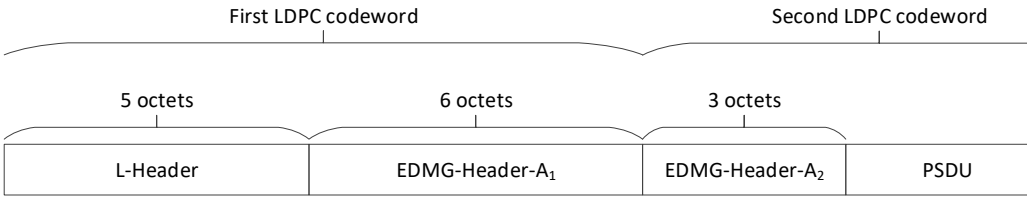

Figure 28-6—Structure of EDMG-Header-A in an EDMG control mode PPDU

Table 28-10—EDMG-Header-A_1 subfield definition

Field	Number of bits	Start bit	Description
BW	8	0	See Table 28-12 (in 28.3.3.3.2.3 (Definition for EDMG SC mode and EDMG OFDM mode PPDUs)).
Primary Channel Number	3	8	See Table 28-12.
PSDU Length	10	11	Length of the PSDU field in octets in the range 14 to 1023.
EDMG TRN Length	8	21	See Table 28-12.
RX TRN-Units per Each TX TRN-Unit	8	29	See Table 28-12.
EDMG TRN-Unit P	2	37	See Table 28-12.
EDMG TRN-Unit M	4	39	See Table 28-12.
EDMG TRN-Unit N	2	43	See Table 28-12.
TRN Subfield Sequence Length	2	45	See Table 28-12.
TRN-Unit RX Pattern	1	47	See Table 28-12.

Table 28-11—EDMG-Header-A_2 subfield definition

Field	Number of bits	Start bit	Description
TRN Aggregation	1	0	Corresponds to the TXVECTOR parameter TRN_AGGREGATION. If this field set to 0, the BW field specifies that the TRN field of the PPDU is appended on a 2.16 GHz, 4.32 GHz, 6.48 GHz, or 8.64 GHz channel. If this field set to 1, the BW field specifies that the TRN field is transmitted over a 2.16+2.16 GHz or 4.32+4.32 GHz channel. This field is reserved if the value of the EDMG TRN Length field is 0.
Number of Transmit Chains	3	1	See Table 28-12.

Table 28-11—EDMG-Header-A_2 subfield definition *(continued)*

Field	Number of bits	Start bit	Description
DMG TRN	1	4	See Table 28-12.
First Path Training	1	5	See Table 28-13 (in 28.3.3.3.2.3 (Definition for EDMG SC mode and EDMG OFDM mode PPDUs)).
Dual Polarization TRN Training	1	6	See Table 28-13.
Reserved	1	7	Set to 0 by the transmitter and ignored by the receiver.
CRC	16	8	Header Check sequence. Calculation of the header check sequence is defined in 20.3.7 (HCS calculation for headers of DMG control mode and DMG SC mode).

For 2.16+2.16 GHz and 4.32+4.32 GHz PPDU transmission, the total number of transmit chains, N_{TX}, is an even number. For 2.16+2.16 GHz PPDU transmission, the first $N_{TX}/2$ transmit chains are used for transmission on the primary channel and the second $N_{TX}/2$ transmit chains are used for transmission on the secondary channel. For 4.32+4.32 GHz PPDU transmission, the first $N_{TX}/2$ transmit chains are used for transmission on the primary and secondary channels and the second $N_{TX}/2$ transmit chains are used for transmission on the secondary1 and secondary2 channels. See also 28.3.3.4.2 (Channel aggregation).

The knowledge of the number of transmit chains to receive the preamble and Data fields of a PPDU is not required, because the data is duplicated over all transmit chains with CSD. The knowledge of the number of transmit chains is needed to perform beamforming training using TRN units included in the TRN field of a PPDU. The TRN units are defined using orthogonal sequences and allow channel estimation between N_{TX} transmit chains and N_{RX} receive chains. The receiver needs to know the number of TRN units (corresponding to N_{TX} chains) that were transmitted in order to perform channel measurements. Based on this information, the receiver can run the appropriate number of correlators for each receive chain.

28.3.3.3.2.3 Definition for EDMG SC mode and EDMG OFDM mode PPDUs

The EDMG-Header-A field has a fixed size of two DMG SC symbol blocks (see Clause 20) comprising 112 data bits followed by a 16 bit CRC.

Two types of EDMG-Header-A structures are defined, namely, one for EDMG SU PPDU and one for EDMG MU PPDU. The type of EDMG-Header-A structure used in an EDMG PPDU is indicated by the value of the SU/MU Format field.

The structure of the EDMG-Header-A field for an EDMG SU PPDU is shown in Table 28-12. The structure of the EDMG-Header-A field for an EDMG MU PPDU is shown in Table 28-17.

For multiple stream transmission, each spatial stream has an identical bandwidth configuration as defined in the EDMG-Header-A.

For 2.16+2.16 GHz and 4.32+4.32 GHz PPDU transmission, the total number of transmit chains, N_{TX}, is an even number. For 2.16+2.16 GHz PPDU transmission, the first $N_{TX}/2$ transmit chains are used for transmission on the primary channel and the second $N_{TX}/2$ transmit chains are used for transmission on the secondary channel. For 4.32+4.32 GHz PPDU transmission, the first $N_{TX}/2$ transmit chains are used for

transmission on the primary and secondary channels and the second $N_{TX}/2$ transmit chains are used for transmission on the secondary1 and secondary2 channels. See also 28.3.3.4.2 (Channel aggregation).

For an EDMG A-PPDU, the following apply:

- The SU/MU Format field shall be set to 0 for all EDMG PPDUs comprising the EDMG A-PPDU.
- The PSDU Length and EDMG-MCS fields may be set to different values for EDMG PPDUs comprising the EDMG A-PPDU.
- The Additional EDMG PPDU field shall be set to 1 for all EDMG PPDUs, except for the last EDMG PPDU where it shall be set to 0.
- The EDMG TRN Length field shall be set to 0 for all EDMG PPDUs, except for the last EDMG PPDU where it may be set to a nonzero value.
- The RX TRN-Units per Each TX TRN-Unit, EDMG TRN-Unit P, EDMG TRN-Unit M, EDMG TRN-Unit N, TRN Subfield Sequence Length, TRN-Unit RX Pattern, EDMG Beam Tracking Request, EDMG Beam Tracking Request Type, DMG TRN, First Path Training and Dual Polarization TRN Training fields are reserved for all EDMG PPDUs, except the last EDMG PPDU. For the last EDMG PPDU in the EDMG A-PPDU, the values of these fields may be set based on the TRN field parameters and EDMG TRN Length field value.
- The Channel Aggregation, BW, Primary Channel Number, Beamformed, Short/Long LDPC, STBC Applied, Number of SS, Number of Transmit Chains, and NUC Applied fields shall have the same value for all EDMG PPDUs comprising the EDMG A-PPDU.
- The DCM BPSK Applied field shall have the same value for all EDMG PPDUs comprising the EDMG A-PPDU. The conditions on DCM BPSK modulation usage shall be met as defined in 28.5.9.5.3 (Dual carrier modulation (DCM) π/2-BPSK) and 28.6.9.3.4 (Dual Stream DCM BPSK modulation) for the EDMG SC and EDMG OFDM modes, respectively. If conditions are not met, then the DCM BPSK Applied field is reserved for all EDMG PPDUs comprising the EDMG A-PPDU.
- The Phase Hopping and Open Loop Precoding fields shall have the same value for all EDMG PPDUs comprising the EDMG OFDM A-PPDU. The conditions on phase hopping modulation usage shall be met as defined in 28.6.9.3.8 (Phase hopping modulation). If conditions are not met, the Phase Hopping and Open Loop Precoding fields are reserved for all EDMG PPDUs comprising the EDMG A-PPDU.
- The Superimposed Code Applied field shall have the same value for all EDMG PPDUs comprising the EDMG A-PPDU. The receiver shall ignore the Superimposed Code Applied field if the EDMG-MCS field does not indicate the LDPC code rate-7/8.
- The π/2-8-PSK Applied field shall have the same value for all EDMG PPDUs comprising the EDMG A-PPDU. The receiver shall ignore the π/2-8-PSK Applied field if the EDMG-MCS field does not indicate EDMG-MCS 12 or 13.
- The Reserved field is reserved for all EDMG PPDUs comprising the EDMG A-PPDU.
- The CRC field is computed based on the EDMG-Header-A content for a given EDMG PPDU and may have different values for EDMG PPDUs comprising the EDMG A-PPDU.

Table 28-12—EDMG-Header-A field structure and definition for an SU PPDU

Field	Number of bits	Start bit	Description
SU/MU Format	1	0	Generated from the NUM_USERS parameter in the TXVECTOR. Indicates whether the PPDU is an SU PPDU or an MU PPDU. Set to 0 to indicate an SU PPDU and set to 1 otherwise.

Table 28-12—EDMG-Header-A field structure and definition for an SU PPDU *(continued)*

Field	Number of bits	Start bit	Description
Channel Aggregation	1	1	Generated from the CHANNEL_AGGREGATION parameter in the TXVECTOR. Set to 0 if the parameter is equal to NOT_AGGREGATED. Set to 1 if the parameter is equal to AGGREGATED.
BW	8	2	A bitmap as indicated by the CH_BANDWIDTH parameter in the TXVECTOR that indicates the 2.16 GHz channel(s) over which the PPDU is transmitted on. If a bit is set to 1, it indicates that the corresponding channel is used for the PPDU transmission; otherwise, if the bit is set to 0, the channel is not used. Bit 0 corresponds to channel 1, bit 1 corresponds to channel 2, and so on.
Primary Channel Number	3	10	Corresponds to the TXVECTOR parameter PRIMARY_CHANNEL. Contains the primary 2.16 GHz channel number of the BSS minus one.
Beamformed	1	13	Corresponds to the TXVECTOR parameter BEAMFORMED. Set to 1 to indicate that digital beamforming is applied. Set to 0 otherwise.
