Short/Long LDPC	1	14	Corresponds to the TXVECTOR parameter LDPC_CW_LENGTH. Indicates the LDPC codeword length used in the PSDU. Set to 0 for LDPC codeword of length 672, 624, 504, or 468. Set to 1 for LDPC codeword of length 1344, 1248, 1008, or 936.
STBC Applied	1	15	Corresponds to the TXVECTOR parameter STBC. If set to 1, indicates that STBC was applied at the transmitter. Otherwise, set to 0. If set to 1, the DCM BPSK Applied and the Phase Hopping fields shall be set to 0.
PSDU Length	22	16	Length of the PSDU field in octets.
Number of SS	3	38	Generated from the TXVECTOR parameters NUM_STS and STBC. The value of this field plus one indicates the number of SSs transmitted in the PPDU.
EDMG-MCS	21	41	Generated from TXVECTOR parameter EDMG_MCS. If the Number of SS field is 0, the EDMG-MCS field is as defined in Table 28-13. Otherwise, the EDMG-MCS field is as defined in Table 28-14.

Table 28-12—EDMG-Header-A field structure and definition for an SU PPDU *(continued)*

Field	Number of bits	Start bit	Description
DCM BPSK Applied	1	62	Corresponds to the TXVECTOR parameter DCM_BPSK. If set to 1 and the PSDU is encoded using the EDMG SC mode, it indicates that DCM π/2-BPSK modulation defined in 28.5.9.5.3 (Dual carrier modulation (DCM) π/2-BPSK) was applied at the transmitter. If set to 1 and the PSDU is encoded using the EDMG OFDM mode with two spatial streams, it indicates that Dual Stream DCM BPSK modulation defined in 28.6.9.3.4 (Dual Stream DCM BPSK modulation) was applied at the transmitter. If set to 1, the STBC Applied and the Phase Hopping fields shall be set to 0. In all other cases, this field is set to 0.
NUC Applied	1	63	Corresponds to the TXVECTOR parameter NUC_MOD. If this field is set to 1, π/2-64-NUC is applied at the transmitter for all MCSs indicated within the EDMG-MCS field, if supported. If a Differential EDMG-MCS indicated within the EDMG-MCS field does not support π/2-64-NUC, then π/2-64-QAM uniform constellation is applied for this particular MCS. If set to 0, π/2-64-QAM uniform constellation is applied for all MCSs signaled in the EDMG-MCS field.
EDMG TRN Length	8	64	Corresponds to the TXVECTOR parameter EDMG_TRN_LEN. Indicates the number of TRN-Units present in the TRN field of the PPDU or, as defined in 10.41.7 (Beam tracking), a requested number of TRN-Units for receive beam tracking.
RX TRN-Units per Each TX TRN-Unit	8	72	Corresponds to TXVECTOR parameter RX_TRN_PER_TX_TRN. This field is reserved if the value of the EDMG TRN Length field is 0. Otherwise, the value of this field plus one indicates the number of consecutive TRN-Units in the TRN field for which the transmitter remains with the same transmit AWV (see 28.9.2.2.5 (TRN field definition)).

Table 28-12—EDMG-Header-A field structure and definition for an SU PPDU *(continued)*

Field	Number of bits	Start bit	Description
EDMG TRN-Unit P	2	80	Corresponds to TXVECTOR parameter EDMG_TRN_P. For EDMG BRP-TX and EDMG BRP-RX/TX PPDUs, the value of this field describes the number of TRN subfields in a TRN-Unit that are transmitted using the same AWV used in the transmission of the preamble and Data fields, except for the case when the DMG antenna used in the transmission of the PPDU changes at the beginning of the TRN field, as defined in 28.9.2.2.5 (TRN field definition). Possible values for this field are as follows: 0 indicates zero TRN subfields. 1 indicates one TRN subfield. 2 indicates two TRN subfields. 3 indicates four TRN subfields. For EDMG BRP-RX PPDUs, this field is reserved.
EDMG TRN-Unit M	4	82	Corresponds to TXVECTOR parameter EDMG_TRN_M. For EDMG BRP-TX PPDUs, as defined in 28.9.2.2 (EDMG BRP PPDU), the transmitter may change the AWV at the beginning of each set of *N* TRN subfields present in the last *M* TRN subfields of each TRN-Unit in the TRN field, where *M* is the value of this field plus one and the value of *N* is indicated by the TXVECTOR parameter EDMG_TRN_N. For EDMG BRP-RX/TX PPDUs, the value of this field plus one indicates the number of TRN subfields in a TRN-Unit transmitted with the same AWV following a possible AWV change, as defined in 28.9.2.2.5 (TRN field definition). For EDMG BRP-RX PPDUs, this field is reserved. For EDMG BRP-TX PPDUs transmitted with EDMG Beam Tracking Request Type field set to 1, this field is reserved.
EDMG TRN-Unit N	2	86	Corresponds to TXVECTOR parameter EDMG_TRN_N. For EDMG BRP-TX PPDUs, the value of this field indicates the number of consecutive TRN subfields within EDMG TRN-Unit M that are transmitted using the same AWV, as defined in 28.9.2.2.5 (TRN field definition). Possible values for this field are as follows: 0 indicates one TRN subfield. 1 indicates two TRN subfields. 2 indicates three TRN subfields if EDMG TRN-Unit M is equal to 2, 5, 8, 11 or 14; indicates eight TRN subfields if EDMG TRN-Unit M is equal to 7 or 15. 3 indicates four TRN subfields. For EDMG BRP-RX and EDMG BRP-RX/TX PPDUs, this field is reserved. For EDMG BRP-TX PPDUs transmitted with EDMG Beam Tracking Request Type field set to 1, this field is reserved.

Table 28-12—EDMG-Header-A field structure and definition for an SU PPDU *(continued)*

Field	Number of bits	Start bit	Description
TRN Subfield Sequence Length	2	88	Corresponds to TXVECTOR parameter TRN_SEQ_LENGTH. For an EDMG SC mode PPDU, this field is reserved if the value of the EDMG TRN Length field is 0. Otherwise, this field indicates the length of the Golay sequence used to transmit the TRN subfields present in the TRN field of the PPDU and is set as follows: — Set to 0 to indicate normal sequence length of $128 \times N_{CB}$. — Set to 1 to indicate long sequence length of $256 \times N_{CB}$. — Set to 2 to indicate short sequence length of $64 \times N_{CB}$. — Value of 3 is reserved. N_{CB} is defined in Table 28-2 and, in this case, represents the integer number of contiguous 2.16 GHz channels over which the TRN subfield is transmitted. For an EDMG OFDM mode PPDU, this field is reserved if the value of the EDMG TRN Length field is 0. Otherwise, this field indicates the number of basic TRN subfield repetitions used to transmit the TRN subfields present in the TRN field of the PPDU and is set as follows: — Set to 0 to indicate normal TRN subfield composed of 2 repetitions of the basic TRN subfield. — Set to 1 to indicate long TRN subfield composed of 4 repetitions of the basic TRN subfield. — Set to 2 to indicate short TRN subfield composed of 1 repetition of the basic TRN subfield. — Value of 3 is reserved.
TRN-Unit RX Pattern	1	90	Corresponds to TXVECTOR parameter TRN_RX_PATTERN. If set to 1 in a BRP-TX PPDU, indicates that the measurements of the TRN-Units is to be done using a quasi-omni antenna pattern. Otherwise, if set to 0 in a BRP-TX PPDU, indicates that the measurements of the TRN-Units is to be done using a directional AWV receive antenna configuration. For all other cases, this field is reserved.
EDMG Beam Tracking Request	1	91	Corresponds to the TXVECTOR parameter EDMG_BEAM_TRACKING_REQUEST. Set to 1 to indicate the need for beam tracking (10.41.7 (Beam tracking)); otherwise, set to 0. The EDMG Beam Tracking Request field is reserved when the EDMG TRN Length field is 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 28-12—EDMG-Header-A field structure and definition for an SU PPDU *(continued)*

Field	Number of bits	Start bit	Description
EDMG Beam Tracking Request Type	1	92	Corresponds to the TXVECTOR parameter EDMG_BEAM_TRACKING_TYPE. Set to 0 to indicate analog beam tracking (10.41.7 (Beam tracking)); set to 1 to indicate baseband beam tracking (10.41.7 (Beam tracking)). This field is reserved when the EDMG Beam Tracking Request field is reserved or 0.
Phase Hopping	1	93	Corresponds to TXVECTOR parameter PHASE_HOPPING. If set to 1 in an EDMG OFDM mode PPDU, this field indicates that phase hopping modulation (see 28.6.9.3.8 (Phase hopping modulation)) is used. Otherwise, this field is set to 0. If set to 1, the STBC Applied and the DCM BPSK Applied fields shall be set to 0. This field is reserved in an EDMG SC mode PPDU, or if the transmitter or receiver do not support phase hopping.
Open Loop Precoding	1	94	Corresponds to TXVECTOR parameter OPEN_LOOP_PC. If the Phase Hopping field is set to 1, this field indicates if open loop precoding is used. If this field is 1, open loop precoding (see 28.6.9.3.8 (Phase hopping modulation)) is used. Otherwise, open loop precoding is not used. If the Phase Hopping field is reserved, this field is also reserved.
Additional EDMG PPDU	1	95	Corresponds to TXVECTOR parameter EDMG-ADD-PPDU. A value of 1 indicates that this EDMG PPDU is immediately followed by another EDMG PPDU with no IFS or preamble in between the PPDUs. A value of 0 indicates that no additional EDMG PPDU follows this EDMG PPDU.

Table 28-12—EDMG-Header-A field structure and definition for an SU PPDU *(continued)*

Field	Number of bits	Start bit	Description
Superimposed Code Applied	1	96	Corresponds to TXVECTOR parameter LDPC_SUPERIMPOSED. If the LDPC code rate is 7/8 and this field is set to 0, it indicates puncturing code with codeword length 624 or 1248 is applied (see 28.5.9.4.3 (LDPC encoding) and 28.6.9.2.3 (LDPC encoding)). If the LDPC code rate is 7/8 and this field is set to 1, it indicates that superimposed code with codeword length 672 or 1344 is applied (see 28.3.6.2 (Rate-7/8 LDPC code matrix H = 84 rows x 672 columns, Z = 42) and 28.3.6.7 (Rate-7/8 LDPC code matrix H = 168 rows x 1344 columns, Z = 42)). If the EDMG-MCS field indicates a value of 13 and the π/2-8-PSK Applied field is 1, then this field indicates the 7/8 code employed in the encoding procedure with codeword shortening to achieve the effective code rate of 5/6 as defined in 28.5.9.4.3 (LDPC encoding). In all other cases, this field is reserved.
π/2-8-PSK Applied	1	97	Corresponds to TXVECTOR parameter PSK_APPLIED. If this field is set to 1, π/2-8-PSK with corresponding LDPC shortening code with rates 2/3 or 5/6 is applied at the transmitter for MCS 12 or 13, respectively, as indicated within the EDMG-MCS field. If set to 0, π/2-16-QAM constellation with regular LDPC code with rates 1/2 or 5/8 is applied at the transmitter for MCS 12 or 13, respectively, as indicated in the EDMG-MCS field.
Number of Transmit Chains	3	98	Corresponds to TXVECTOR parameter NUM_TX_CHAINS. The value of this field plus 1 indicates the number of transmit chains used in the transmission of the PPDU. The value of the field plus 1 also indicates the total number of orthogonal sequences in a TRN field (see 28.9.2.2.5 (TRN field definition)). This field is reserved when the EDMG TRN Length field is 0, or when the EDMG Beam Tracking Request field is 1 and the PPDU is an EDMG BRP-RX PPDU.
DMG TRN	1	101	Corresponds to TXVECTOR parameter DMG_TRN. When set to 1, indicates that the TRN field appended to this PPDU has the structure of a DMG training field containing an AGC training field and a TRN field as defined in 20.9.2.2.2 (BRP PPDU structure). In this case, the RX TRN-Units per Each TX TRN-Unit, the EDMG TRN-Unit P, the EDMG TRN-Unit M, the EDMG TRN-Unit N, and the TRN Subfield Sequence Length fields are reserved. This field is reserved when the EDMG TRN Length field is equal to 0.

Table 28-12—EDMG-Header-A field structure and definition for an SU PPDU *(continued)*

Field	Number of bits	Start bit	Description
Reserved	10	102	Set to 0 by the transmitter and ignored by the receiver.
CRC	16	112	Header Check sequence. Calculation of the header check sequence is defined in 20.3.7 (HCS calculation for headers of DMG control mode and DMG SC mode).

Table 28-13—EDMG-MCS field definition when the Number of SS field is 0

Subfield	Number of bits	Start bit	Description
Base MCS	5	0	Indicates the index of the modulation and coding scheme that is used to define the modulation and coding scheme of the spatial stream.
First Path Training	1	5	Corresponds to the TXVECTOR parameter FIRST_PATH_TRAINING. When set to 1, indicates that the TRN field appended to this PPDU is used for first path beamforming training (see 10.41.10.6 (First path beamforming training)). Set to 0 otherwise. This field is reserved when the EDMG TRN Length field is equal to 0.
Dual Polarization TRN Training	1	6	Corresponds to the TXVECTOR parameter DUAL_POL_TRAINING. If set to 1, indicates that the TRN subfields appended to this PPDU have different polarization for the same AWV (see 28.9.2.2.5 (TRN field definition)). If set to 0, indicates that the TRN field appended to this PPDU does not change polarization.
Secure TRN	1	7	Corresponds to the TXVECTOR parameter SECURED_TRN. When set to 1 (TXVECTOR parameter SECURED_TRN equals SECURED_TRN), indicates that the TRN field contains secure TRN sequences specified in 28.9.3.5. Otherwise, (TXVECTOR parameter SECURED_TRN equals NON_SECURED_TRN) the TRN field uses the format specified in 28.9.2.2.5. This field is reserved when the EDMG TRN Length field is equal to 0.
First Path AWV TRN	1	8	When set to 1, indicates that the TRN field is transmitted (and shall be received) using the first path AWV antenna setting. Otherwise the TRN field is transmitted and shall be received using the best path AWV antenna setting.

Table 28-14—EDMG-MCS field definition when the Number of SS field is greater than 0

Subfield	Number of bits	Start bit	Description
Base MCS	5	0	Indicates the lowest index of the modulation and coding scheme that is used to define the modulation and coding scheme of the spatial streams.
Differential EDMG-MCS1	2	5	Generated from TXVECTOR parameter EDMG_MCS. Each Differential EDMG-MCSi subfield, $1 \le i \le 8$, defines the modulation and coding scheme for spatial stream i, respectively. All spatial streams have the same code rate and repetition factor defined by the Base MCS subfield. A Differential EDMG-MCSi subfield is reserved if spatial stream i is not defined. The rules for setting each Differential EDMG-MCS subfield are defined in Table 28-15 and Table 28-16 for the EDMG SC and the EDMG OFDM modes, respectively. Each Differential EDMG-MCS subfield indicates a possible modulation change relative to one defined by the Base MCS subfield.
Differential EDMG-MCS2	2	7	
Differential EDMG-MCS3	2	9	
Differential EDMG-MCS4	2	11	
Differential EDMG-MCS5	2	13	
Differential EDMG-MCS6	2	15	
Differential EDMG-MCS7	2	17	
Differential EDMG-MCS8	2	19	

Table 28-15—Rules for differential EDMG-MCS signaling for the EDMG SC mode

Base MCS modulation type	Differential EDMG-MCS = 0	Differential EDMG-MCS = 1	Differential EDMG-MCS = 2	Differential EDMG-MCS = 3
π/2-BPSK with repetition factor 2	π/2-BPSK	N/A	N/A	N/A
π/2-BPSK with repetition factor 1	π/2-BPSK	π/2-QPSK	π/2-16-QAM	π/2-64-QAM or π/2-64-NUC
π/2-QPSK	π/2-QPSK	π/2-16-QAM	π/2-64-QAM or π/2-64-NUC	N/A
π/2-8-PSK	π/2-8-PSK	N/A	N/A	N/A
DCM π/2-BPSK	DCM π/2-BPSK	N/A	N/A	N/A
π/2-16-QAM	π/2-16-QAM	π/2-64-QAM or π/2-64-NUC	N/A	N/A
π/2-64-QAM	π/2-64-QAM	N/A	N/A	N/A
π/2-64-NUC	π/2-64-NUC	N/A	N/A	N/A

NOTE 1—The π/2-64-QAM or π/2-64-NUC modulation type is selected based on the NUC Applied field in the EDMG-Header-A.

NOTE 2—An "N/A" entry denotes a disallowed mode of transmission.

NOTE 3—The DCM π/2-BPSK modulation type is selected by setting the Base MCS modulation type to π/2-BPSK and the DCM BPSK Applied field to 1 in the EDMG-Header-A. This type of modulation can only be applied to SU PPDUs.

Table 28-16—Rules for differential EDMG-MCS signaling for the EDMG OFDM mode

Base MCS modulation type	Differential EDMG-MCS = 0	Differential EDMG-MCS = 1	Differential EDMG-MCS = 2	Differential EDMG-MCS = 3
DCM BPSK	DCM BPSK	DCM QPSK	16-QAM	64-QAM
DCM QPSK	DCM QPSK	16-QAM	64-QAM	N/A
16-QAM	16-QAM	64-QAM	N/A	N/A
64-QAM	64-QAM	N/A	N/A	N/A
NOTE—An "N/A" entry denotes a disallowed mode of transmission.				

Table 28-17—EDMG-Header-A field structure and definition for an MU PPDU

Field	Number of bits	Start bit	Description
SU/MU Format	1	0	See Table 28-12.
Channel Aggregation	1	1	See Table 28-12.
BW	8	2	See Table 28-12.
Primary Channel Number	3	10	See Table 28-12.
SS Descriptor Set 0	9	13	Describes the SS assignment to the first STA addressed within the MU PPDU. This field is formatted as described in Table 28-18.
SS Descriptor Set 1	9	22	Describes the SS assignment to the first STA addressed within the MU PPDU. This field is formatted as described in Table 28-18.
SS Descriptor Set 2	9	31	Describes the SS assignment to the first STA addressed within the MU PPDU. This field is formatted as described in Table 28-18.
SS Descriptor Set 3	9	40	Describes the SS assignment to the first STA addressed within the MU PPDU. This field is formatted as described in Table 28-18.
SS Descriptor Set 4	9	49	Describes the SS assignment to the first STA addressed within the MU PPDU. This field is formatted as described in Table 28-18.
SS Descriptor Set 5	9	58	Describes the SS assignment to the first STA addressed within the MU PPDU. This field is formatted as described in Table 28-18.
SS Descriptor Set 6	9	67	Describes the SS assignment to the first STA addressed within the MU PPDU. This field is formatted as described in Table 28-18.
SS Descriptor Set 7	9	76	Describes the SS assignment to the first STA addressed within the MU PPDU. This field is formatted as described in Table 28-18.
EDMG TRN Length	8	85	See Table 28-12.
RX TRN-Units per Each TX TRN-Unit	8	93	See Table 28-12.

Table 28-17—EDMG-Header-A field structure and definition for an MU PPDU *(continued)*

Field	Number of bits	Start bit	Description
EDMG TRN-Unit P	2	101	See Table 28-12.
EDMG TRN-Unit M	4	103	See Table 28-12.
EDMG TRN-Unit N	2	107	See Table 28-12.
TRN Subfield Sequence Length	2	109	See Table 28-12.
Reserved	1	111	
CRC	16	112	Header Check sequence. Calculation of the header check sequence is defined in 20.3.7 (HCS calculation for headers of DMG control mode and DMG SC mode).

The SS Descriptor Set field is defined in Table 28-18.

Table 28-18—SS Descriptor Set field

	AID	Number of SS
Bits	8	1

The AID subfield indicates the AID of a STA addressed by an MPDU contained within the MU PPDU and corresponds to TXVECTOR parameter MU_AID. The AID of a STA shall not appear more than once across all SS Descriptor Set fields included in the EDMG-Header-A. The SS Descriptor Set field is reserved if the value of the AID subfield is 0.

The value of the Number of SS subfield plus one indicates the number of SSs transmitted to the STA indicated by the AID subfield. This subfield value is generated from the TXVECTOR parameters NUM_STS and STBC. SSs are assigned sequentially across all STAs addressed by the MU PPDU.

28.3.3.3.2.4 Encoding and modulation

For an EDMG SC mode PPDU or an EDMG OFDM mode PPDU, the EDMG-Header-A field is encoded and modulated using two SC blocks of 448 chips with 64 guard symbols. The bits are scrambled and encoded as follows:

- The input 112 header bits are appended with 16 HCS bits calculated as defined in 20.3.7.
- The resulting 128 bits (including CRC) are scrambled as described in 20.3.9, starting from the first bit using a continuation of the scrambler bit sequence from the L-Header.
- The scrambled bits are divided into two parts $\mathbf{b1} = \left(B_1, B_2, ..., B_{64}\right)$ and $\mathbf{b2} = \left(B_{65}, B_{66}, ..., B_{128}\right)$ of 64 bits each. Each part is encoded taking the following steps:
  - For each data word $\mathbf{b} = \mathbf{b1}$ or $\mathbf{b} = \mathbf{b2}$, append 440 zero bits $\mathbf{0} = \left(0_1, 0_2, ..., 0_{440}\right)$ and generate 168 parity bits $\mathbf{p} = \left(p_1, p_2, ..., p_{168}\right)$ to create a codeword $\mathbf{c} = \left(\mathbf{b}, \mathbf{0}, \mathbf{p}\right)$, such that $\mathbf{H} \cdot \left(\mathbf{c}\right)^T = \mathbf{0}$, parity bits are computed applying L_{CW} = 672, R = 3/4 LDPC matrix defined in 20.5.3.2.3.2 (Parity check matrices).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

- Remove zero-valued bits and discard (puncture) the last 8 parity bits to create a codeword $\mathbf{cs1} = \left(b_1, b_2, ..., b_{64}, p_1, p_2, ..., p_{160}\right)$ of length 224 bits.
- Remove zero-valued bits and discard (puncture) the second to last 8 parity bits to create a codeword $\mathbf{cs2} = \left(b_1, b_2, ..., b_{64}, p_1, p_2, ..., p_{152}, p_{161}, p_{162}, ..., p_{168}\right)$ of length 224 bits and then XOR with a PN sequence that is generated from the LFSR used for data scrambling defined in 20.3.9 (Scrambler). The LFSR is initialized to the all 1s vector.
- Concatenate **cs1** and **cs2** to create the output codeword $\mathbf{cs} = (\mathbf{cs1}, \mathbf{cs2})$ of length 448 bits.

— The resulting codewords **cs** for **b1** and **b2** of 448 bits each are then modulated applying π/2-BPSK modulation as defined in 20.5.3.2.4.2 (π/2-BPSK modulation). This creates two SC data blocks EDMG-Header-A_1 and EDMG-Header-A_2, respectively.

— Each of the resulting two SC data blocks is prepended with 64 guard symbols to create SC symbol blocks. The second SC data block, EDMG-Header-A_2, is appended with the appropriate number of guard symbols as described in 28.5.9.2 (Symbol blocking and guard insertion).

The EDMG-Header-A encoding and modulation for an EDMG SC mode and an EDMG OFDM mode A-PPDU is defined in 28.5.7 (Encoding of EDMG-Header-A for EDMG A-PPDU transmission) and 28.6.7 (Encoding of EDMG-Header-A for EDMG A-PPDU transmission), respectively.

The EDMG-Header-A encoding and modulation for an EDMG control mode PPDU is defined in 28.4.5 (EDMG portion of the EDMG control mode PPDU).

28.3.3.3.3 EDMG-STF definition

For EDMG SC mode PPDU transmissions, the EDMG-STF field is defined in 28.5.4 (EDMG-STF definition). For EDMG OFDM mode PPDU transmissions, the EDMG-STF field is defined in 28.6.4 (EDMG-STF definition). The EDMG-STF field is not present in EDMG control mode PPDUs.

28.3.3.3.4 EDMG-CEF definition

For EDMG SC mode PPDU transmissions, the EDMG-CEF field is defined in 28.5.5 (EDMG-CEF definition). For EDMG OFDM mode PPDU transmissions, the EDMG-CEF field is defined in 28.6.5 (EDMG-CEF definition). The EDMG-CEF field is not present in EDMG control mode PPDUs.

28.3.3.3.5 EDMG-Header-B definition

28.3.3.3.5.1 General

The EDMG-Header-B is transmitted only in EDMG MU PPDUs and on a per STA basis. The EDMG-Header-B field is defined in Table 28-19.

Table 28-19—EDMG-Header-B field structure and definition

Field	Number of bits	Start bit	Description
Scrambler Seed	7	0	
PSDU Length	22	7	Length of the PSDU field in octets in the range 1 to 4 194 303.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 28-19—EDMG-Header-B field structure and definition *(continued)*

Field	Number of bits	Start bit	Description
Base MCS	5	29	Generated from TXVECTOR parameter EDMG_MCS. Indicates the lowest index of the modulation and coding scheme that is used to define the modulation and coding scheme of the spatial streams.
Differential EDMG-MCS	2	34	Generated from TXVECTOR parameter EDMG_MCS. The Base MCS field defines the modulation and coding scheme for the spatial stream 1. The Differential EDMG-MCS field defines a possible modulation level change for the spatial stream 2 relative to the modulation level of spatial stream 1. The rules for setting the Differential EDMG-MCS field are defined in Table 28-15 and Table 28-16 for the EDMG SC and the EDMG OFDM modes, respectively. All spatial streams have the same code rate defined by the Base MCS field. If the number of spatial streams is 1 (per user), then the Differential EDMG-MCS field is reserved.
Superimposed Code Applied	1	36	See Table 28-12.
Short/Long LDPC	1	37	See Table 28-12.
STBC Applied	1	38	See Table 28-12.
NUC Applied	1	39	Corresponds to the TXVECTOR parameter NUC_MOD. If this field is set to 1, π/2-64-NUC is applied at the transmitter for the MCSs indicated by the Base MCS and Differential EDMG-MCS fields, if supported. If an indicated MCS does not support π/2-64-NUC, then π/2-64-QAM uniform constellation is applied for this particular MCS. If set to 0, π/2-64-QAM uniform constellation is applied for MCSs signaled in the Base MCS and Differential EDMG-MCS fields.
π/2-8-PSK Applied	1	40	See Table 28-12.
Spoofing Error Length Indicator	1	41	If set to 0 in an EDMG OFDM PPDU, indicates that the spoofing error, defined as the difference between the PPDU duration calculated based on L-Header and the actual PPDU duration, is smaller than $T_{OFDM\text{-}SYM}$, where $T_{OFDM\text{-}SYM} = T_{DFT} + T_{GI}$, T_{DFT} is the OFDM IDFT/DFT period and T_{GI} is the guard interval duration, which is determined by bits B2 and B3 of the Last RSSI field within the L-Header of the PPDU. Otherwise, if set to 1 in an EDMG OFDM PPDU, indicates that the spoofing error is greater than or equal to $T_{OFDM\text{-}SYM}$. For an EDMG SC PPDU, this field is reserved.
Beamformed	1	42	See Table 28-12.

Table 28-19—EDMG-Header-B field structure and definition *(continued)*

Field	Number of bits	Start bit	Description
Number of Transmit Chains	3	43	See Table 28-12.
Reserved	2	46	
CRC	16	48	Header Check sequence. Calculation of the header check sequence is defined in 20.3.7 (HCS calculation for headers of DMG control mode and DMG SC mode).

The value of the Spoofing Error Length Indicator subfield within all EDMG-Header-B fields present in an EDMG MU PPDU shall be the same.

Reserved bits in the EDMG-Header-B field shall be set to 0 by the transmitter and shall be ignored by the receiver.

28.3.3.3.5.2 Transmission

The encoding of EDMG-Header-B in an EDMG SC mode PPDU is specified in 28.5.6 (Encoding of EDMG-Header-B). The encoding of EDMG-Header-B in an EDMG OFDM mode PPDU is specified in 28.6.6 (Encoding of EDMG-Header-B).

28.3.3.4 Mathematical description of signals

28.3.3.4.1 General

The transmitted signal is described in complex baseband signal notation. The actual transmitted signal in the i_{TX} transmit chain is related to the complex baseband signal $r^{i_{TX}}(t)$ by the following relation:

$$r_{RF}^{i_{TX}}(t) = Re\left\{ r_{PPDU}^{i_{TX}}(t) \exp\left(j2\pi f_c(t) \right) \right\}$$

where

f_c is the carrier center frequency

The transmitted signal is generated by modulating the complex baseband signal, which consists of the fields defined in 28.3.2.1 (General) and 28.3.2.2 (EDMG A-PPDU format). The waveform $r_{PPDU}^{i_{TX}}(nT_c)$ is defined for various control and EDMG SC mode PPDU formats in 28.4.7.2 (Non-EDMG PPDU transmission), 28.4.7.3 (EDMG PPDU transmission), 28.5.3.3.1 (Pre-EDMG modulated fields of PPDU transmission), 28.5.3.3.2 (EDMG modulated fields of SU PPDU transmission), and 28.5.3.3.3 (EDMG modulated fields of MU PPDU transmission). The waveform $r_{PPDU}^{i_{TX}}(nT_s)$ is defined in 28.6.10.3 (EDMG SU PPDU transmission) and 28.6.10.4 (EDMG MU PPDU transmission) for EDMG OFDM mode PPDU formats.

28.3.3.4.2 Channel aggregation

For a PPDU with TXVECTOR parameter CHANNEL_AGGREGATION set to AGGREGATED, the following shall apply:

— The number of transmit chains N_{TX} is even.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The lower half $N_{TX}/2$ transmit chains (i.e., those with lower indices) are used in the primary channel for a 2.16+2.16 GHz PPDU transmission, or in the primary and secondary channels for a 4.32+4.32 GHz PPDU transmission.
— The upper half $N_{TX}/2$ transmit chains (i.e., those with higher indices) are used in the secondary channel for a 2.16+2.16 GHz PPDU transmission, or in the secondary1 and secondary2 channels for a 4.32+4.32 GHz PPDU transmission.

In this case, the transmitted signal is as follows:

$$r_{RF}^{i_{TX}}(t) = \begin{cases} Re\left\{ r_{PPDU}^{i_{TX}}(t) \exp\left(j2\pi f_{c_p}(t) \right) \right\} & i_{TX} \le \frac{N_{TX}}{2} \\ Re\left\{ r_{PPDU}^{i_{TX}}(t) \exp\left(j2\pi f_{c_s}(t) \right) \right\} & i_{TX} > \frac{N_{TX}}{2} \end{cases}$$

where

f_{c_p} is the carrier center frequency of the primary channel for a 2.16+2.16 GHz PPDU transmission, or of the primary and secondary channels for a 4.32+4.32 GHz PPDU transmission

f_{c_s} is the carrier center frequency of the secondary channel for a 2.16+2.16 GHz PPDU transmission, or of the secondary1 and secondary2 channels for a 4.32+4.32 GHz PPDU transmission

28.3.4 Channelization

A channel used by an EDMG STA is specified by the four PLME MIB fields defined in Table 28-20.

Table 28-20—Parameters that specify a channel used by an EDMG STA

Field	Meaning
dot11EDMGCurrentChannelWidth	Channel width. Possible values represent 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, and 4.32+4.32 GHz.
dot11EDMGCurrentChannelCenterFrequencyIndex0	For a 2.16 GHz, 4.32 GHz, 6.48 GHz, and 8.64 GHz channel, denotes the channel center frequency. For a 2.16+2.16 GHz channel, denotes the center frequency of the primary channel. For a 4.32+4.32 GHz channel, denotes the center frequency of the 4.32 GHz channel containing the primary 2.16 GHz channel. Value range is 1 to 15.
dot11EDMGCurrentChannelCenterFrequencyIndex1	For a 2.16+2.16 GHz channel, denotes the center frequency of the secondary channel. For a 4.32+4.32 GHz channel, denotes the center frequency of the 4.32 GHz channel that contains the secondary 2.16 GHz channels only. For a 2.16 GHz, 4.32 GHz, 6.48 GHz, and 8.64 GHz channel, it is undefined. Value range is 1 to 15.

Table 28-20—Parameters that specify a channel used by an EDMG STA *(continued)*

Field	Meaning
dot11EDMGCurrentPrimaryChannel	Denotes the location of the primary 2.16 GHz channel. Value range is 1 to 15.

The channelization used by an EDMG STA is shown in Figure 28-7 (Channelization used by EDMG STAs).

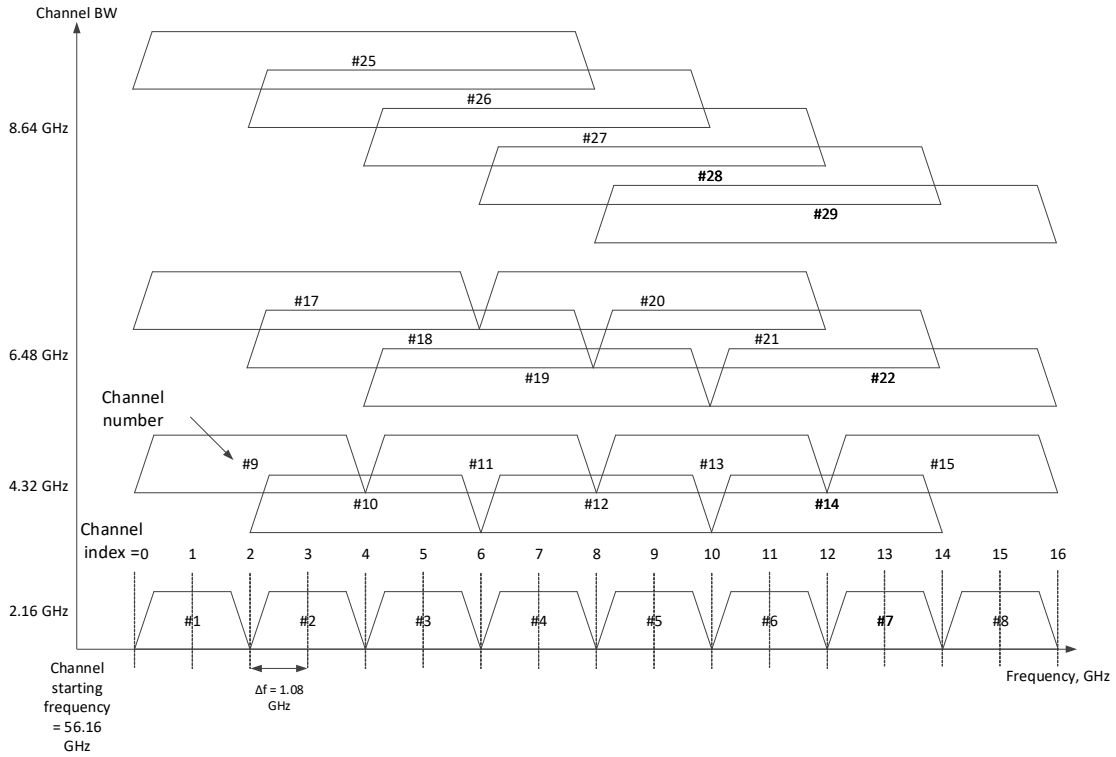

Figure 28-7—Channelization used by EDMG STAs

An EDMG STA can use any of the channels shown in Figure 28-7 (Channelization used by EDMG STAs). The channel number is shown in the center of the trapezoid defining the particular channel location.

The support of the 2.16 GHz channel number 2, and the 4.32 GHz channel number 10 with channel number 2 as a primary channel is mandatory. The support of other channels is optional.

Table 28-21 defines the valid configurations for 2.16 GHz, 4.32 GHz, 6.48 GHz, and 8.64 GHz channels. Table 28-22 defines the valid configurations for 2.16+2.16 GHz channel. Table 28-23 defines the valid configurations for 4.32+4.32 GHz channel.

dot11CurrentChannelCenterFrequencyIndex0 and dot11CurrentChannelCenterFrequencyIndex1 columns in Table 28-21, Table 28-22, and Table 28-23 provide the channel index. The definition of the channel index and channel number is shown in Figure 28-7 (Channelization used by EDMG STAs). The channel index is defined in the range 0 to 16 and is indicated as Channel Idx in the figure. The increment of the channel index by 1 corresponds to the frequency step equal to the half of channel spacing Δf = 1.08 GHz depicted in the horizontal axis corresponding to the frequency in GHz.

The current center frequency for the channel containing the primary 2.16 GHz channel is defined as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Channel center frequency0 [GHz] = (*Channel starting frequency* + *Δf*) + *Δf* × *dot11EDMGCurrentChannelCenterFrequencyIndex0*

where

Channel starting frequency is given by the operating class (see Annex E)

For 2.16+2.16 GHz and 4.32+4.32 GHz channel configurations, the current center frequency for the channel containing the secondary 2.16 GHz channels only is defined as follows:

Channel center frequency1 [GHz] = (*Channel starting frequency* + *Δf*) + *Δf* × *dot11EDMGCurrentChannelCenterFrequencyIndex1*

For 4.32 GHz, 6.48 GHz, and 8.64 GHz channels, the dot11EDMGCurrentChannelCenterFrequencyIndex1 is not defined and is marked as N/A in Table 28-21.

The center frequency of the primary 2.16 GHz channel is given as follows:

Primary 2.16 GHz channel center frequency [GHz] = (*Channel starting frequency* + *Δf*) + *Δf* × *dot11EDMGCurrentPrimaryChannel*

The circumstances in which a channel can be used in a regulatory domain is determined by local regulatory rules and any additional rules prescribed by this standard.

28.3.5 Transmit mask

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements and the mask defined in this subclause.

NOTE 2—Transmit spectral mask figures in this subclause are not drawn to scale.

NOTE 3—For rules regarding TX center frequency leakage levels, see 28.3.9.4 (Transmit center frequency leakage). The spectral mask requirements in this subclause do not apply to the RF LO leakage and its harmonics.

An EDMG PPDU transmission shall comply with the TX masks defined in this subclause. An EDMG PPDU transmission that partially occupies a channel shall comply with the TX mask defined for the wider channel. For example, a 2.16 GHz PPDU transmission that partially occupies a 4.32 GHz channel shall not exceed the 4.32 GHz channel mask.

A 2.16 GHz PPDU of EDMG and non-EDMG format shall adhere to the transmit spectrum mask shown in Figure 20-1 (Transmit mask).

For a 4.32 GHz mask PPDU or a 2.16+2.16 GHz mask PPDU spanning adjacent channels, the transmit spectral mask shall have a 0 dBr bandwidth of 4.04 GHz, –17 dBr at 2.40 GHz frequency offset, –22 dBr at 5.40 GHz frequency offset, and –30 dBr at 6.12 GHz frequency offset and above. The transmit spectral mask for frequency offsets in between 2.02 and 2.40 GHz, 2.40 and 5.40 GHz, and 5.40 and 6.12 GHz shall be linearly interpolated in decibels from the requirements for 2.02 GHz, 2.40 GHz, 5.40 GHz, and 6.12 GHz frequency offsets. Figure 28-8 (Example transmit spectral mask for a 4.32 GHz mask PPDU) shows an example of the resulting overall spectral mask.

For a 6.48 GHz mask PPDU, the transmit spectral mask shall have a 0 dBr bandwidth of 6.20 GHz, –17 dBr at 3.60 GHz frequency offset, –22 dBr at 8.10 GHz frequency offset, and –30 dBr at 9.18 GHz frequency offset and above. The transmit spectral mask for frequency offsets in between 3.10 and 3.60 GHz, 3.60 and 8.10 GHz, and 8.10 and 9.18 GHz shall be linearly interpolated in decibels from the requirements for 3.10 GHz, 3.60 GHz, 8.10 GHz, and 9.18 GHz frequency offsets. Figure 28-9 (Example transmit spectral mask for a 6.48 GHz mask PPDU)shows an example of the resulting overall spectral mask.

114	00001001		8				9
115	00000101		8				11
116	00000011		8				13

For an 8.64 GHz mask PPDU or a 4.32+4.32 GHz mask PPDU spanning adjacent channels, the transmit spectral mask shall have a 0 dBr bandwidth of 8.36 GHz, –17 dBr at 4.80 GHz frequency offset, –22 dBr at 10.80 GHz frequency offset, and –30 dBr at 12.24 GHz frequency offset and above. The transmit spectral mask for frequency offsets in between 4.18 and 4.80 GHz, 4.80 and 10.80 GHz, and 10.80 and 12.24 GHz shall be linearly interpolated in decibels from the requirements for 4.18 GHz, 4.80 GHz, 10.80 GHz, and 12.24 GHz frequency offsets. Figure 28-10 (Example transmit spectral mask for an 8.64 GHz mask PPDU) shows an example of the resulting overall spectral mask.

For 2.16+2.16 GHz or 4.32+4.32 GHz mask PPDUs spanning non-adjacent channels, the overall transmit spectral mask is constructed in the following manner. First, the 2.16 (or 4.32) GHz spectral mask is placed on each of the two 2.16 (or 4.32) GHz segments. Then, for each frequency at which both of the 2.16 (or 4.32) GHz spectral masks have values greater than –30 dBr and less than –17 dBr, the sum of the two mask values (summed in power) shall be taken as the overall spectral mask value. Next, for each frequency at which neither of the two 2.16 (or 4.32) GHz masks have values greater than or equal to –17 dBr and less than or equal to 0 dBr, the higher value of the two masks shall be taken as the overall spectral value.

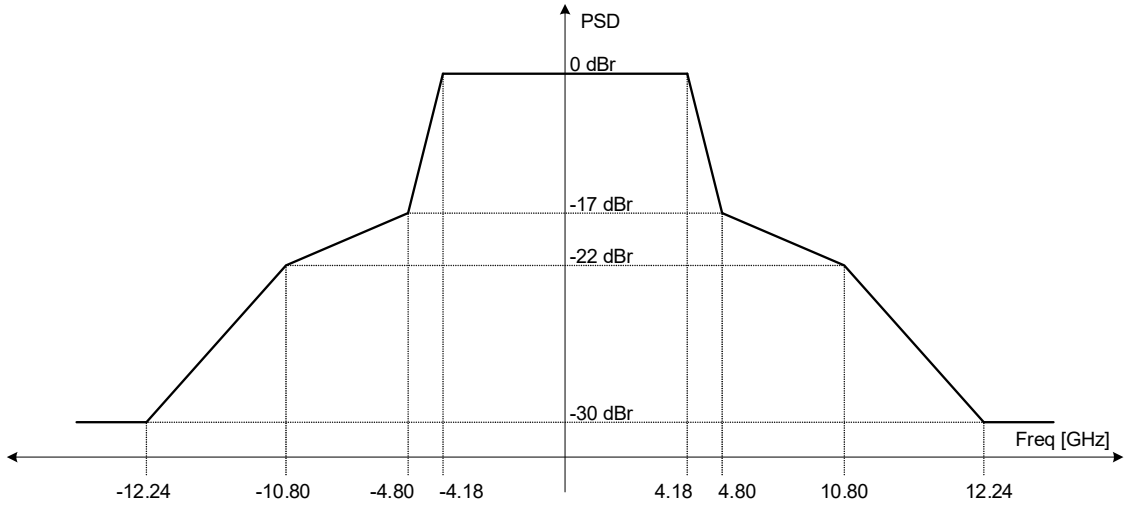

Figure 28-10—Example transmit spectral mask for an 8.64 GHz mask PPDU

Finally, for any frequency region where the mask value has not been defined yet, linear interpolation (in decibels) between the nearest two frequency points with the spectral mask value defined shall be used to define the spectral mask value.

Different center frequency separation between the two 2.16 GHz frequency segments of the spectral mask as well as different peak levels of each 2.16 GHz frequency segment of the spectral mask are possible, in which case a similar procedure in determining the spectral mask as in Figure 28-11 (Example transmit spectral mask for a 2.16+2.16 GHz mask PPDU) is followed.

The transmit spectral mask for noncontiguous transmissions using two nonadjacent channels is applicable only in regulatory domains that allow for such transmissions.

Measurements shall be made using a 1 MHz resolution bandwidth and a 300 kHz video bandwidth.

28.3.6 LDPC parity matrices

28.3.6.1 General

The EDMG PHY shall support the LDPC parity matrices specified in 20.3.8 (Common LDPC parity matrices) and may support the additional matrices described in this subclause.

The EDMG PHY defines an additional rate-7/8 LDPC code matrix for a codeword of size equal to 672 bits, which is the same codeword size used in the DMG PHY. The definition of this LDPC code matrix follows the approach specified in 20.3.8 (Common LDPC parity matrices).

In addition, the EDMG PHY also defines an LDPC codeword of size equal to 1344 bits through the use of lifting matrices. A lifting matrix acts on the code matrix to generate a larger matrix as follows:

— A nonblank ‘0’ element in the lifting matrix acts on the $Z \times Z$ cyclic permutation matrix P_i in the code matrix (at the same location) to create the $2Z \times 2Z$ matrix:
— A nonblank ‘1’ element in the lifting matrix acts on the $Z \times Z$ cyclic permutation matrix P_i in the code matrix (at the same location) to create the $2Z \times 2Z$ matrix:
— A blank entry in the lifting matrix acts on the blank entry in the code matrix representing the $Z \times Z$ zero matrix (at the same location) to create the blank entry representing the $2Z \times 2Z$ zero matrix:

28.3.6.2 Rate-7/8 LDPC code matrix H = 84 rows x 672 columns, *Z* = 42

The rate-7/8 LDPC code matrix with codeword length 672 is defined in Table 28-24. It is derived using the rate-3/4 LDPC code matrix specified in Table 20-8 by rows 1 and 3, 2 and 4 modulo-2 addition of the original rate-3/4 LDPC matrix.

Table 28-24—Rate 7/8 LDPC code matrix

37⊕35	31⊕19	18⊕41	23⊕22	11⊕40	21⊕41	6⊕39	20⊕6	32⊕28	9⊕18	12⊕17	29⊕3	28	0	13	
25⊕29	22⊕30	4⊕0	34⊕8	31⊕33	3⊕22	14⊕17	15⊕4	4⊕27	28	14⊕20	18⊕27	13⊕24	13⊕23	22	24

NOTE—Each nonblank element i or $i \oplus j$ is the cyclic permutation matrix P_i of size $Z \times Z$ or the modulo-2 addition of the cyclic permutation matrices P_i and P_j of size $Z \times Z$ (denoted by $P_i \oplus P_j$), respectively; blank entries represent the zero matrix of size $Z \times Z$.

28.3.6.3 Rate-1/2 LDPC code matrix H = 672 rows x 1344 columns, *Z* = 42

The rate-1/2 LDPC code matrix with codeword length 1344 is defined in Table 28-25. It is derived using rate-1/2 LDPC code matrix specified in Table 20-6 by application of the lifting matrix specified in Table 28-26.

28.3.6.7 Rate-7/8 LDPC code matrix H = 168 rows x 1344 columns, *Z* = 42

The rate-7/8 LDPC code matrix with codeword length 1344 is defined in Table 28-33. This code matrix is derived using rate-3/4 LDPC code matrix specified in Table 20-8 by applying two steps. In the first step, the lifting matrix in Table 28-34 is applied to the rate-3/4 LDPC code matrix. In the second step, rows 1 and 5, 2 and 6, 3 and 7, and 4 and 8 modulo-2 addition of the lifted matrix is performed to produce the resulting rate-7/8 LDPC code matrix specified in Table 28-33.

28.3.7 Control trailer

If the TXVECTOR parameter SCRAMBLER_INIT_SETTING is equal to CONTROL_TRAILER for a non-EDMG control mode PPDU, a control trailer shall be inserted in the PPDU immediately following the Data field of the PPDU. The control trailer is one LDPC codeword with 18 data octets and 21 parity octets. The control trailer is added after the Data field of a non-EDMG control mode PPDU, using and continuing the control mode modulation and encoding. The scrambler is used to generate the control trailer and its initial state is the final state of the scrambler from the Data field of the PPDU.

To indicate the presence of a control trailer in a non-EDMG control mode PPDU, the Scrambler Initialization field in the L-Header shall be set as indicated in Table 28-5 and the value of the Training Length field in the L-Header shall be incremented by 2 to account for the presence of the control trailer. If the value of the Training Length field is equal to 2, the control trailer takes the place of the AGC and TRN fields following the Data field. If the value of the Training Length field is greater than 2, the AGC and TRN fields are appended after the control trailer.

The format of the control trailer depends on the value of the TXVECTOR parameter CT_TYPE. Each control trailer starts with a CT Format Type field, whose value depends on the value of the CT_TYPE parameter as shown in Table 28-35. Table 28-36 defines the control trailer format when the CT_TYPE parameter is equal to CTS_DTS. Table 28-37 defines the control trailer format when the CT_TYPE parameter is equal to GRANT_RTS_CTS2self. Table 28-38 defines the control trailer format when the CT_TYPE parameter is equal to SPR. Table 28-39 defines the control trailer format when the CT_TYPE parameter is equal to SSW_FEEDBACK, BLOCK_ACK or ACK.

Table 28-35—CT Format Type field value

CT_TYPE parameter value	CT Format Type field value
CTS_DTS	0
GRANT_RTS_CTS2self	1
SPR	2
SSW_FEEDBACK, BLOCK_ACK or ACK	3
Reserved	4–15

Table 28-36—Control trailer definition when CT_TYPE is CTS_DTS

Field	Number of bits	Start bit	Description
CT Format Type	4	0	Indicates the format of the control trailer. This field takes the value defined in Table 28-35 for CT_TYPE = CTS_DTS.
Channel Aggregation	1	4	See Table 28-12.

Table 28-36—Control trailer definition when CT_TYPE is CTS_DTS *(continued)*

Field	Number of bits	Start bit	Description
BW	8	5	See Table 28-12.
Primary Channel Number	3	13	See Table 28-12.
SISO/MIMO	1	16	Corresponds to the TXVECTOR parameter NEXT_TX_SISO. Set to 0 to indicate that the following transmission from this STA is performed with a single antenna. Set to 1 to indicate that the following transmission from this STA is performed with multiple antennas.
SU/MU MIMO	1	17	Corresponds to the TXVECTOR parameter MU_MIMO_NEXT. Set to 0 to indicate SU-MIMO, and set to 1 to indicate MU-MIMO. Reserved when the SISO/MIMO field is 0.
EDMG Group ID	8	18	Corresponds to the TXVECTOR parameter EDMG_GROUP_ID. This field indicates the group of STAs that are involved in the following MU-MIMO transmission. Reserved when the SU/MU MIMO field is 0.
TX Sector Combination Index	6	26	Indicates the TX sector combination (as defined in 9.4.2.267) and the corresponding RX AWVs to be used in the SU-MIMO transmission from the EDMG STA transmitting the CTS to the EDMG STA that transmitted the RTS. Reserved if the SISO/MIMO field is 0, if the SU/MU MIMO field is 1 or if the control trailer is sent with a DMG DTS frame.
HBF	1	32	Corresponds to the TXVECTOR parameter HBF_TRAINING. Set to 0 to indicate that the following transmission from this STA is not hybrid beamforming training. Set to 1 to indicate that the following transmission from this STA is hybrid beamforming training. Reserved when the SISO/MIMO field is 0.
Reserved	95	33	Set to 0 by the transmitter and ignored by the receiver.
CTCS	16	128	Control Trailer Check Sequence (CTCS) is a CRC-16 computed over the content of the control trailer. The CRC-16 is computed as defined in 20.3.7 (HCS calculation for headers of DMG control mode and DMG SC mode).

Table 28-37—Control trailer definition when CT_TYPE is GRANT_RTS_CTS2self

Field	Number of bits	Start bit	Description
CT Format Type	4	0	Indicates the format of the control trailer. This field takes the value defined in Table 28-35 for CT_TYPE = GRANT_RTS_CTS2self.
Channel Aggregation	1	4	See Table 28-12.
BW	8	5	See Table 28-12.
Primary Channel Number	3	13	See Table 28-12.

Table 28-37—Control trailer definition when CT_TYPE is GRANT_RTS_CTS2self

Field	Number of bits	Start bit	Description
SISO/MIMO	1	16	See Table 28-36.
SU/MU MIMO	1	17	See Table 28-36.
TX Sector Combination Index	6	18	Indicates the TX sector combination (as defined in 9.4.2.267) and the corresponding RX AWVs to be used in the following SU-MIMO transmission. Reserved if the SISO/MIMO field is 0 or the SU/MU MIMO field is 1.
EDMG Group ID	8	24	See Table 28-36.
MU-MIMO Transmission Configuration Type	1	32	Corresponds to the TXVECTOR parameter MU_MIMO_TX_CONFIG_TYPE. Set to 1 to indicate that the MU-MIMO transmission configuration was obtained from the reciprocal MU-MIMO BF training; set to 0 to indicate that the MU-MIMO transmission configuration was obtained from the nonreciprocal MU-MIMO BF training. Reserved if the SISO/MIMO field is 0 or the SU/MU MIMO field is 0.
MU-MIMO Transmission Configuration Index	3	33	Corresponds to the TXVECTOR parameter MU_MIMO_TX_CONFIG_INDEX. Indicates the MU-MIMO transmission configuration (as defined in 9.4.2.275) to be used in the following MU-MIMO transmission. Reserved if the SISO/MIMO field is 0 or the SU/MU MIMO field is 0.
Total Number of Sectors MSB	4	36	This field is prepended to the Total Number of Sectors subfield in the BF Control field to form a single 11-bit field indicating the total number of sectors the initiator or the responder uses during an SLS. This field is reserved and set to 0 when the PPDU does not carry a Grant or Grant Ack frame with the Beamforming Training field equal to 1.
Number of RX DMG Antennas MSB	1	40	This field is prepended to the Number of RX DMG Antennas subfield in the BF Control field to form a single 3-bit field indicating the total number of repetitions of the TXSS that the initiator or the responder uses during the SLS. This field is reserved and set to 0 when the PPDU does not carry a Grant or Grant Ack frame with the Beamforming Training field equal to 1.
HBF	1	41	See Table 28-36.
Reserved	86	42	Set to 0 by the transmitter and ignored by the receiver.
CTCS	16	128	Control Trailer Check Sequence (CTCS) is a CRC-16 computed over the content of the control trailer. The CRC-16 is computed as defined in 20.3.7 (HCS calculation for headers of DMG control mode and DMG SC mode).

Table 28-38—Control trailer definition when CT_TYPE is SPR

Field	Number of bits	Start bit	Description
CT Format Type	4	0	Indicates the format of the control trailer. This field takes the value defined in Table 28-35 for CT_TYPE = SPR.
Channel Aggregation	1	4	See Table 28-12.
BW	8	5	Corresponds to the TXVECTOR parameter BW_IN_CT. Indicates the requested channel width or channel number of the allocation. If the Is Channel Number field is 1, the BW field indicates the requested channel number for the allocation per the channel numbers defined in Annex E. If the Is Channel Number field is 0, the BW field indicates a channel width using the bitmap format of the BW field defined in Table 28-12. In this case, the channel width can be allocated on any channel number.
Primary Channel Number	3	13	See Table 28-12.
Is Channel Number	1	16	Corresponds to the TXVECTOR parameter IS_CHANNEL_NUMBER. Indicates whether the value in the BW subfield represents a channel width or a channel number (see 11.4.12.3).
Total Number of Sectors	11	17	Corresponds to the TXVECTOR parameter NUM_SECTORS. This field indicates the total number of sectors the initiator or the unsolicited RSS responder uses during an SLS. This field is reserved and set to 0 when the PPDU does not carry an SPR frame with the Beamforming Training field equal to 1.
Number of RX DMG Antennas	3	28	Corresponds to the TXVECTOR parameter NUM_ANT. This field indicates the total number of repetitions of the TXSS that the responder uses during the SLS. This field is reserved and set to 0 when the PPDU does not carry an SPR frame with the Beamforming Training field equal to 1.
Reserved	97	31	Set to 0 by the transmitter and ignored by the receiver.
CTCS	16	128	Control Trailer Check Sequence (CTCS) is a CRC-16 computed over the content of the control trailer. The CRC-16 is computed as defined in 20.3.7 (HCS calculation for headers of DMG control mode and DMG SC mode).

Table 28-39—Control trailer definition when CT_TYPE is SSW_FEEDBACK, BLOCK_ACK, or ACK

Field	Number of bits	Start bit	Description
CT Format Type	4	0	Indicates the format of the control trailer. This field takes the value defined in Table 28-35 for CT_TYPE = SSW_FEEDBACK, BLOCK_ACK or ACK.
Number of reported Streams	3	4	Indicates the total number of reported streams minus one. This value should match the Number of SS field in the PHY header of the PPDU to which this Control frame is responding.
Stream 1 SNR	4	7	Range 0 to 30 dB in 2 dB steps.
Stream 1 RSSI	3	11	Range –70 dBm to –42 dBm in 4 dB steps.
Stream 2 SNR	4	14	Range 0 to 30 dB in 2 dB steps. If unused, these bits are reserved.
Stream 2 RSSI	3	18	Range –70 dBm to –42 dBm in 4 dB steps. If unused, these bits are reserved.
Stream 3 SNR	4	21	Range 0 to 30 dB in 2 dB steps. If unused, these bits are reserved.
Stream 3 RSSI	3	25	Range –70 dBm to –42 dBm in 4 dB steps. If unused, these bits are reserved.
Stream 4 SNR	4	28	Range 0 to 30 dB in 2 dB steps. If unused, these bits are reserved.
Stream 4 RSSI	3	32	Range –70 dBm to –42 dBm in 4 dB steps. If unused, these bits are reserved.
Stream 5 SNR	4	35	Range 0 to 30 dB in 2 dB steps. If unused, these bits are reserved.
Stream 5 RSSI	3	39	Range –70 dBm to –42 dBm in 4 dB steps. If unused, these bits are reserved.
Stream 6 SNR	4	42	Range 0 to 30 dB in 2 dB steps. If unused, these bits are reserved.
Stream 6 RSSI	3	46	Range –70 dBm to –42 dBm in 4 dB steps. If unused, these bits are reserved.
Stream 7 SNR	4	49	Range 0 to 30 dB in 2 dB steps. If unused, these bits are reserved.
Stream 7 RSSI	3	53	Range –70 dBm to –42 dBm in 4 dB steps. If unused, these bits are reserved.
Stream 8 SNR	4	56	Range 0 to 30 dB in 2 dB steps. If unused, these bits are reserved.
Stream 8 RSSI	3	60	Range –70 dBm to –42 dBm in 4 dB steps. If unused, these bits are reserved.
Reserved	65	63	Set to 0 by the transmitter and ignored by the receiver.
CTCS	16	128	Contains the CRC-16 computed over the content of the control trailer. This field is computed as defined in 20.3.7 (HCS calculation for headers of DMG control mode and DMG SC mode).

28.3.8 CCA sensitivity

The start of a valid 2.16 GHz EDMG PPDU and of a valid 2.16 GHz non-EDMG PPDU at a receive power level greater than the minimum sensitivity for a 2.16 GHz SC PPDU using MCS 1 shall cause the receiver to issue a PHY-CCA.indication(BUSY) primitive with a probability > 90% within aCCAtime. The PHY-CCA.indication(BUSY) primitive shall be maintained for the duration of the PPDU. The receiver shall issue the PHY-CCA.indication(BUSY) primitive for any signal 20 dB above the minimum sensitivity for a 2.16 GHz PPDU using SC MCS 1 for at least aDMGCCAEDDetectTime.

For a receiver using a 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, or 4.32+4.32 GHz channel, the start of a valid EDMG PPDU and of a valid non-EDMG PPDU at a receive power level greater than the minimum sensitivity for a 2.16 GHz SC PPDU using MCS 1 at the primary channel shall cause the receiver to issue a PHY-CCA.indication(BUSY) primitive with a probability > 90% within aCCAtime. The PHY-CCA.indication(BUSY) primitive shall be maintained for the duration of the PPDU. The receiver shall issue the PHY-CCA.indication(BUSY, primary/secondary/secondary1/secondary2) primitive for any signal 20 dB above the minimum sensitivity for a 2.16 GHz PPDU using SC MCS 1 at any of the channels (primary/secondary/secondary1/secondary2) the receiver is open to receive in for at least aDMGCCAEDDetectTime.

A receiver that has more than one active RX chain shall issue PHY-CCA.indication(BUSY, RX-Antenna-ID, primary/secondary/secondary1/secondary2) primitive if the condition above applies to any DMG antenna connected to an active receive chain.

28.3.9 Common requirements

28.3.9.1 Introduction

This subclause describes common requirement to all EDMG and non-EDMG modes, specifically EDMG and non-EDMG control mode, EDMG and non-EDMG SC mode, and EDMG OFDM mode.

28.3.9.2 Received channel power indicator (RCPI) measurement

The RCPI is a measure of the received RF power (in dBm) in the selected channel as measured at the DMG antenna output, including the antenna gain that is used to receive the PPDU. This parameter shall be measured by the PHY over the preamble of the received PPDU, that is, L-STF or L-CEF, or both, or, if present, EDMG-STF or EDMG-CEF. The measurement shall be done over the same bandwidth as the PSDU of the PPDU. When multiple RF chains are used to receive the PPDU, RCPI is measured per each RF chain.

The RCPI for each RF chain shall be equal to the received RF power in dBm at each RF chain with an accuracy of ± 5 dB with 95% confidence interval within the specified dynamic range of the receiver. The relative error between RCPI measurements made per RF chain within a one second interval should be less than ± 1 dB.

28.3.9.3 Transmit center frequency and symbol clock frequency tolerance

The requirements defined in 20.3.3.2 (Center frequency tolerance) for the center frequency tolerance and center frequency convergence and in 20.3.3.3 (Symbol clock tolerance) for the symbol clock tolerance apply for all EDMG and non-EDMG modes. The transmit center frequency and the symbol clock frequency for all transmit chains and channels shall be derived from the same reference oscillator. Transmit signals with TXVECTOR parameter CHANNEL_AGGREGATION set to AGGREGATED may be generated using two separate RF LOs, one for each channel, with the constraint that all RF LOs shall be locked to a common source.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

28.3.9.4 Transmit center frequency leakage

The transmit center frequency leakage is specified per transmit chain.

For transmissions with TXVECTOR parameter CHANNEL_AGGREGATION set to NOT_AGGREGATED, the transmitter center frequency leakage shall not exceed –23 dB relative to the transmit power per transmit chain regardless of the relationship between the RF LO and center of the transmitted PPDU BW. Equivalently, for the EDMG OFDM mode, the transmitter center frequency leakage shall not exceed $P + 2.5 - 10\log10(N_{SD} + N_{SP})$ measured over a subcarrier spacing bandwidth regardless of the relationship between the RF LO and center of the transmitted PPDU bandwidth, where P is the transmit power per transmit chain in dBm and N_{SD} and N_{SP} are defined in Table 28-62.

For transmissions with TXVECTOR parameter CHANNEL_AGGREGATION set to AGGREGATED, the transmitter center frequency leakage shall meet the following requirements for all EDMG and non-EDMG formats:

— When the RF LO falls within one of the two frequency segments, the transmitter center frequency leakage requirement is the same as the one for transmissions with TXVECTOR parameter CHANNEL_AGGREGATION set to NOT_AGGREGATED.
— When the RF LO falls outside both frequency segments, the RF LO shall follow the spectral mask requirements as defined in 28.3.5 (Transmit mask).

28.3.9.5 Transmit rampup and rampdown

The requirements defined in 20.3.3.5 (Transmit rampup and rampdown) for transmit power on ramp and power down ramp apply for all EDMG and non-EDMG modes.

28.3.9.6 Antenna setting

Antenna setting shall remain constant for the transmission of the entire PPDU, except for the case of transmission of EDMG BRP-TX PPDUs, EDMG BRP-RX/TX PPDUs and, when transmitted during a SISO BRP TXSS (see 10.41.10.5 (BRP transmit sector sweep (BRP TXSS))), EDMG BRP-RX PPDUs. In these cases, the antenna setting shall remain constant for the transmission of all fields up to the TRN field. The transmission of the TRN field is defined in 28.9.2.2.5 (TRN field definition).

28.3.9.7 Maximum input requirement

The requirement defined in 20.3.3.7 (Maximum input requirement) for the receiver maximum input level apply for all EDMG and non-EDMG modes.

28.3.9.8 Receiver minimum input level sensitivity

For the EDMG control mode and non-EDMG control mode, the PER shall be less than 5% for a PSDU length of 256 octets and with the input level listed in Table 28-40 defined at the antenna connector(s). If the TXVECTOR parameter NON_EDMG_MODULATION is equal to NON_EDMG_DUP_SC_MODE, the minimum sensitivity listed in Table 28-40 shall be met in the reception of each 2.16 GHz channel.

For the non-EDMG SC mode, EDMG SC mode, and EDMG OFDM mode, the PER shall be less than 1% for a PSDU length of 4096 octets with the MCS and mode dependent input levels listed in Table 28-41 through Table 28-45 defined at the antenna connector(s).

When an EDMG STA has multiple DMG RX antennas, each DMG antenna shall be tested in SISO non-STBC mode, using a spatial expansion matrix that directs the single spatial stream to the tested DMG antenna. All other DMG antennas shall be covered with absorptive material. If covering a DMG antenna

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

with absorptive material is not possible, the STA shall disable all DMG antennas besides the one being tested.

For transmissions with TXVECTOR parameter CHANNEL_AGGREGATION set to AGGREGATED, the minimum sensitivity listed in Table 28-41 through Table 28-45 (values corresponding to 2.16 GHz PPDU or 4.32+4.32 GHz PPDU) shall be met in the reception of each channel. For transmissions with TXVECTOR parameter NON_EDMG_MODULATION set to NON_EDMG_DUP_SC_MODE, the minimum sensitivity listed in Table 28-41 through Table 28-45 (values corresponding to 2.16 GHz PPDU) shall be met in the reception of each channel.

NOTE—For RF power measurements performed over the air, the input level has to be corrected to compensate for the antenna gain in the implementation. The gain of the antenna is the maximum estimated gain by the manufacturer. In the case of the phased array antenna, the gain of the phased array antenna is the maximum sum of estimated element gain minus 3 dB implementation loss.

Header-A is equal to 1 and the number of spatial streams is 2 is the same one defined in Table 28-45 for the coding scheme used (MCSs 1 to 20).

28.3.9.9 Spectral flatness test for the EDMG OFDM mode

Spectral flatness measurements shall be conducted using DCM BPSK modulated EDMG OFDM PPDUs only while transmitting OFDM symbols. See 28.6.11.1.1 (Transmit modulation accuracy (EVM) test and requirements) for the demodulation procedure and the number of PPDUs and OFDM symbols to be used for testing. Spectral flatness shall be evaluated using the subcarrier received values or the magnitude of channel estimates obtained with the EDMG-CEF field.

Let $E_{i,avg}$ denote the magnitude of the channel estimation on subcarrier i or the average constellation energy of a DCM BPSK modulated subcarrier i. In an EDMG OFDM PPDU having TXVECTOR parameter CH_BANDWIDTH listed in Table 28-46, $E_{i,avg}$ of each of the subcarriers with indices listed as tested subcarrier indices shall not deviate by more than the specified maximum deviation in Table 28-46 from the average of $E_{i,avg}$ over subcarrier indices listed as averaging subcarrier indices. Averaging of $E_{i,avg}$ is done in the linear domain.

Table 28-46—Maximum transmit spectral flatness deviations

TXVECTOR parameter CH_BANDWIDTH (CHANNEL_AGGREGATION = NOT_AGGREGATED)	Average subcarrier indices (inclusive)	Tested subcarrier indices (inclusive)	Maximum deviation (dB)
One bit set to 1	–146 to –2 and 2 to 146	–146 to –2 and 2 to 146	± 2
		–177 to –147 and 147 to 177	+2/–4
Two bits set to 1	–355 to –2 and 2 to 355	–325 to –2 and 2 to 325	± 2
		–386 to –326 and 326 to 386	+2/–4
Three bits set to 1	–565 to –2 and 2 to 565	–505 to –2 and 2 to 505	± 2
		–596 to –506 and 506 to 596	+2/–4
Four bits set to 1	–774 to –2 and 2 to 774	–684 to –2 and 2 to 684	± 2
		–805 to –685 and 685 to 805	+2/–4

For transmit signals with TXVECTOR parameter CHANNEL_AGGREGATION set to AGGREGATED and CH_BANDWIDTH parameter with two bits set to 1, each frequency segment shall meet the spectral flatness requirement for a transmission with TXVECTOR parameter CH_BANDWIDTH with one bit set to 1. For transmit signals with TXVECTOR parameter CHANNEL_AGGREGATION set to AGGREGATED and CH_BANDWIDTH parameter with four bits set to 1, each frequency segment shall meet the spectral flatness requirement for a transmission with TXVECTOR parameter CH_BANDWIDTH with two bits set to 1.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For the spectral flatness test, the transmitting STA shall be configured to use a spatial mapping matrix Q_k (see 28.6.10 (PPDU transmission)) with flat frequency response. Each output port under test of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation.

28.3.9.10 Receiver co-channel interference (CCI) resilience

Co-channel interference resilience is defined as the ability of a STA to correctly receive an intended PPDU in the presence of an interfering transmission on the same channel and overlapping in time.

In the presence of CCI originating from a DMG PPDU transmission, a DMG STA operating in a TDD SP should decode an intended PPDU as long as all of the following conditions hold:

— The RCPI of the intended PPDU is at least 3 dB above actual receiver sensitivity.
— The RCPI of the CCI is at least 6 dB below the RCPI of the intended PPDU.
— The intended PPDU has sufficient signal to noise plus interference ratio to be decodable.

NOTE—An intended PPDU is a PPDU that contains at least one MPDU with the RA field set to the MAC address of the receiving STA.

In addition, a DMG STA operating in a TDD SP may abort a PPDU reception (see 8.3.5.17) at the trailing boundary of any TDD slot after which the STA is scheduled to receive from a different transmitting STA.

28.4 EDMG and non-EDMG control mode

28.4.1 General

Transmission and reception of 2.16 GHz PPDU using EDMG and non-EDMG control mode and 4.32 GHz PPDU using EDMG duplicate and non-EDMG duplicate control mode is mandatory.

Transmission and reception of a 2.16+2.16 GHz PPDU using EDMG and non-EDMG control mode is optional. Transmission and reception of a 6.48 GHz PPDU, 8.64 GHz PPDU, and 4.32+4.32 GHz PPDU using EDMG duplicate and non-EDMG duplicate control mode is optional.

The transmission block diagrams for non-EDMG and EDMG control modes are illustrated in 28.4.2.2 (Non-EDMG PPDU transmission) and 28.4.2.3 (EDMG PPDU transmission), respectively. The PPDU format, non-EDMG portion and EDMG portion of the EDMG control mode PPDU are defined in 28.4.3 (PPDU format), 28.4.4 (Non-EDMG portion of the EDMG control mode PPDU), and 28.4.5 (EDMG portion of the EDMG control mode PPDU), respectively.

The non-EDMG and EDMG PPDU transmissions are defined in 28.4.7.2 (Non-EDMG PPDU transmission) and 28.4.7.3 (EDMG PPDU transmission), respectively.

The non-EDMG control trailer encoding and modulation is defined in 28.4.6 (Non-EDMG control trailer encoding and modulation).

The non-EDMG and EDMG control mode PPDUs are transmitted using MCS 0 and EDMG-MCS 0 modulation and coding schemes, respectively.

The performance requirements are defined in 28.4.8 (Performance requirements).

28.4.2 Transmitter block diagram

28.4.2.1 General

EDMG and non-EDMG control mode PPDU transmissions may be generated using a transmitter consisting of the following blocks:

— Scrambler scrambles the data to reduce the probability of long sequences of 0s and 1s; see 28.4.5.2.2 (Scrambler).

— LDPC encoder encodes the data to enable error correction; see 28.4.5.2.3 (Encoder).

— Constellation mapper maps the sequence of bits to constellation points; see 28.4.5.2.4 (Modulation and spreading).

— Spreader spreads out a single constellation point to 32 chips applying the Ga Golay sequence of length 32; see 28.4.5.2.4 (Modulation and spreading).

— Golay builder builds π/2-BPSK modulated Ga and Gb Golay sequences comprising the L-STF, L-CEF, and TRN units; see 28.10 (Golay sequences).

— Cyclic shift diversity (CSD) prevents the signal from unintentional beamforming. CSD is specified per transmitter chain for EDMG and non-EDMG duplicate PPDU transmissions.

— Pulse shaping performs convolution of constellation points with shape filter impulse response with possible sampling rate change. For duplicate transmissions, pulse shaping may include a relative time delay between the primary and secondary channels. The exact definition of shape filter impulse response is implementation dependent.

28.4.2.2 Non-EDMG PPDU transmission

Figure 28-12 (Control mode transmitter block diagram for a non-EDMG PPDU transmission) shows the transmitter blocks used to generate a non-EDMG PPDU. The L-STF, L-CEF, and TRN units of the PPDU are generated using the Golay builder block. The L-Header and Data fields of the PPDU are generated using the scrambler, LDPC encoder, constellation mapper, and spreader. The encoded and modulated bit stream is mapped to N_{TX} transmit chains applying spatial expansion with relative cyclic shift over the chains as defined in 28.4.7.2 (Non-EDMG PPDU transmission).

28.4.2.3 EDMG PPDU transmission

Figure 28-13 (Control mode transmitter block diagram for an EDMG PPDU transmission) shows the transmitter blocks used to generate an EDMG PPDU. The L-STF, L-CEF, and TRN units of the PPDU are generated using the Golay builder block. The L-Header, EDMG-Header-A, and Data fields of PPDU are generated using the scrambler, LDPC encoder, constellation mapper, and spreader. The encoded and modulated bit stream is mapped to the N_{TX} transmit chains applying spatial expansion with relative cyclic shift over the transmit chains as defined in 28.4.7.3 (EDMG PPDU transmission). The cyclic shift is not applied to TRN units included in the TRN field and each transmit chain transmits its own TRN field as defined in 28.9.2.2.6 (TRN subfield definition for EDMG SC PPDUs and EDMG control mode PPDUs).

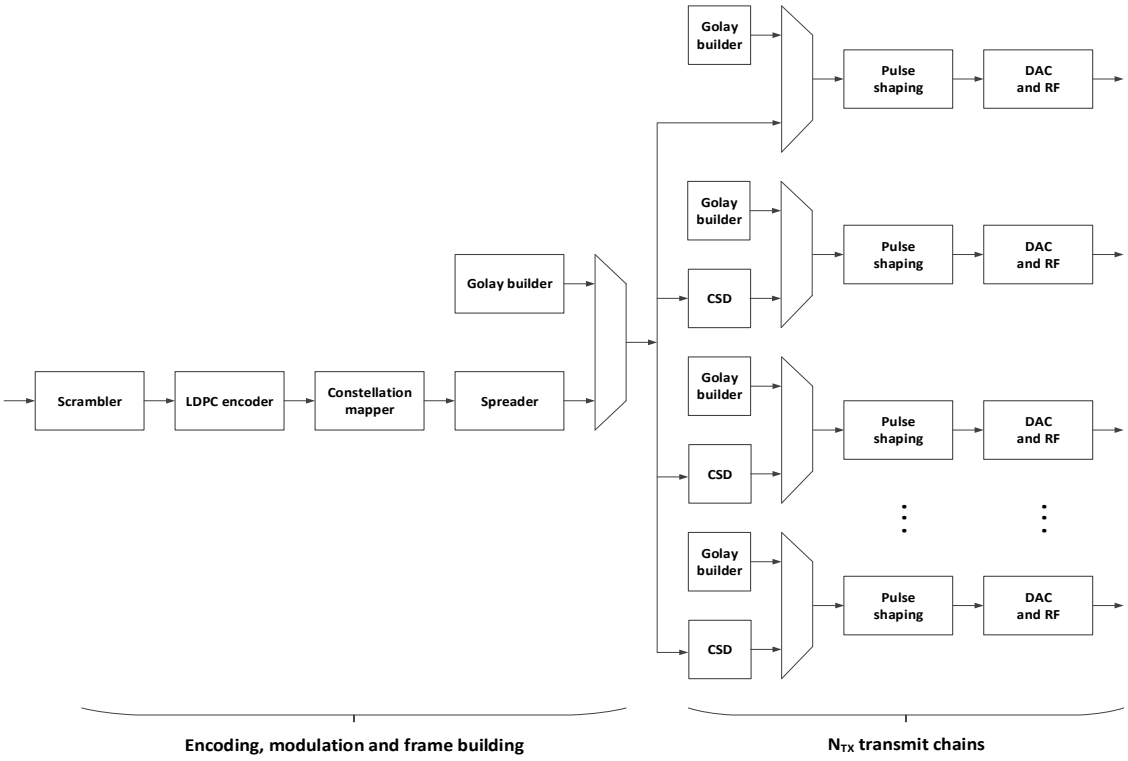

Figure 28-13—Control mode transmitter block diagram for an EDMG PPDU transmission

28.4.3 PPDU format

An EDMG control mode PPDU shall contain the L-STF, L-CEF, L-Header, and EDMG-Header-A fields, but shall not contain the EDMG-STF, EDMG-CEF or EDMG-Header-B fields.

An EDMG control mode PPDU may contain a TRN field as defined in 28.9.2.2.5 (TRN field definition).

An EDMG control mode PPDU may contain the DMG AGC and TRN fields defined in 20.9.2.2.5 (AGC field) and 20.9.2.2.6 (TRN field), respectively, indicated by the DMG TRN field in the EDMG-Header-A. In this case, the TRN field defined in 28.9.2.2.5 (TRN field definition) shall not be transmitted.

A non-EDMG PPDU format shall be as defined in 20.4.2 (PPDU format).

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

28.4.4 Non-EDMG portion of the EDMG control mode PPDU

The non-EDMG portion of the EDMG control mode PPDU is composed of the L-STF, the L-CEF, and the L-Header. These fields are defined at the DMG SC chip rate F_c and transmitted in the EDMG control mode for 2.16 GHz and 2.16+2.16 GHz channels, and in the EDMG duplicate control mode for 4.32 GHz, 6.48 GHz, 8.64 GHz, and 4.32+4.32 GHz channels as defined in 28.4.7.3.2 (EDMG preamble and Data field transmission over a 2.16 GHz and 2.16+2.16 GHz channel) and 28.4.7.3.3 (EDMG duplicate preamble and Data field transmission over a 4.32 GHz, 6.48 GHz, 8.64 GHz, and 4.32+4.32 GHz channel).

The L-STF, L-CEF and L-Header fields of an EDMG control mode PPDU are defined in 28.3.3.2.2 (L-STF definition), 28.3.3.2.3 (L-CEF definition), and 28.3.3.2.4 (L-Header definition), respectively.

28.4.5 EDMG portion of the EDMG control mode PPDU

28.4.5.1 General

The EDMG portion of the EDMG control mode PPDU is composed of the EDMG-Header-A field, the Data field, and the TRN field.

The EDMG-Header-A and the Data fields are defined at the DMG SC chip rate F_c and transmitted in the EDMG control mode for 2.16 GHz and 2.16+2.16 GHz channels, and in the EDMG duplicate control mode for 4.32 GHz, 6.48 GHz, 8.64 GHz, and 4.32+4.32 GHz channels as defined in 28.4.7.3.2 (EDMG preamble and Data field transmission over a 2.16 GHz and 2.16+2.16 GHz channel) and 28.4.7.3.3 (EDMG duplicate preamble and Data field transmission over a 4.32 GHz, 6.48 GHz, 8.64 GHz, and 4.32+4.32 GHz channel).

The TRN field, if present, is transmitted at the EDMG SC chip rate $F_{c\ EDMG}$ as defined in 28.4.7.3.4 (TRN field transmission over a 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, and 4.32+4.32 GHz channel)

The EDMG control mode PPDU transmission with TRN field is defined in 28.4.7.3.5 (EDMG PPDU transmission with TRN field transmission over a 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, and 4.32+4.32 GHz channel).

The case of an EDMG control mode PPDU transmission with DMG AGC and TRN fields is defined in 28.4.7.3.6 (EDMG PPDU transmission with DMG AGC and TRN fields over a 2.16 GHz channel).

28.4.5.2 Data field

28.4.5.2.1 General

The Data field contains the PSDU. The PSDU shall be scrambled, encoded, modulated and spread as described in the following subclauses.

28.4.5.2.2 Scrambler

The operation of the scrambler is defined in 20.3.9 (Scrambler). Bits x1, x2, x3, x4 of the scrambler shift register shall be initialized using the bits in the scrambler initialization bits from the L-Header and bits x5, x6, x7 shall be set to 1. The L-Header is scrambled starting from bit 5. The scrambling of the EDMG-Header-A shall continue the scrambling of the L-Header with no reset. The scrambling of the Data field shall continue the scrambling of the EDMG-Header-A with no reset.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

28.4.5.2.3 Encoder

The L-Header, EDMG-Header-A, and Data field are encoded using an effective LDPC code rate less than or equal to 1/2, generated from the data PHY rate 3/4 LDPC parity check matrix, with shortening. The maximum number of data bits in each LDPC codeword is L_{CWD} = 168. The following steps are used for the encoding:

— $L_{L\text{-}Header}$ = 5 is the length of L-Header in octets. $L_{EDMG\text{-}Header\text{-}A1}$ = 6 is the length of EDMG-Header-A_1 subfield in octets. Therefore, the total number of bits in the first LDPC codeword is $L_{DPFCW} = (L_{L\text{-}Header} + L_{EDMG\text{-}Header\text{-}A1}) \times 8 = 88$ bits.

— $L_{EDMG\text{-}Header\text{-}A2}$ = 3 is the length of EDMG-Header-A_2 subfield in octets. The EDMG-Header-A_2 subfield is transmitted in the second LDPC codeword.

— The number of LDPC codewords is $N_{CW} = 1 + \left\lceil \frac{(Length + L_{EDMG-Header-A2}) \times 8}{L_{CWD}} \right\rceil$, where Length is the value of the PSDU Length subfield in the EDMG-Header-A field.

— The number of bits in the second and, if present, any subsequent LDPC codeword except the last one is $L_{DPCW} = \left\lceil \frac{(Length + L_{EDMG-Header-A2}) \times 8}{N_{CW} - 1} \right\rceil$.

— The number of bits in the last LDPC codeword is $L_{DPLCW} = (Length + L_{EDMG\text{-}Header\text{-}A2}) \times 8 - (N_{CW} - 2) \times L_{DPCW}$.

NOTE—For example, if Length is 128 octets, then N_{CW} = 8, L_{DPCW} = 150, and L_{DPLCW} = 148. In the first LDPC block, the L_{DPFCW} = 88 bits consist of 40 bits from the L-Header field along with 48 bits from the EDMG-Header-A_1 subfield. In the second LDPC block, the L_{DPCW} = 150 bits consist of 24 bits from the EDMG-Header-A_2 subfield along with 126 data bits.

28.4.5.2.4 Modulation and spreading

The scrambled and coded bit stream shall be converted into a stream of complex constellation points by using the procedure defined in 20.4.3.3.4 (Modulation). The constellation points shall then be spread using the sequence $Ga^3{}_2(n)$, as defined in 20.4.3.3.5 (Spreading).

28.4.6 Non-EDMG control trailer encoding and modulation

If a control trailer is present in a transmitted PPDU (see 28.3.7 (Control trailer)), the control trailer has a length of 18 data octets. The control trailer continues scrambling of the Data field with no seed reset as defined in 20.4.3.3.2 (Scrambler). The control trailer is encoded using the rate 3/4 LDPC parity check matrix defined in 20.3.8.4 (Rate 3/4 LDPC code matrix H = 168 rows x 672 columns, Z = 42) with shortening to achieve the effective LDPC code rate of 6/13.

The encoding procedure includes the following steps:

— The input 144 data bits (18 octets) are padded with 360 0s to get an LDPC codeword length of 504 bits.

— Compute the 168 parity bits applying the rate-3/4 LDPC parity check matrix.

— Discard the padded 360 zero bits and form the output LDPC codeword of length 312 bits.

The control trailer LDPC codeword continues the DBPSK modulation as defined in 20.4.3.3.4 (Modulation) and then applies the spreading as defined in 20.4.3.3.5 (Spreading).

28.4.7 PPDU transmission

28.4.7.1 General

This subclause defines the waveform for a control mode PPDU transmitted using the non-EDMG format and EDMG format over a 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, and 4.32+4.32 GHz channel using N_{TX} transmit chains. The non-EDMG PPDU transmission shall be as defined in 28.4.7.2 (Non-EDMG PPDU transmission). The EDMG PPDU transmission shall be as defined in 28.4.7.3 (EDMG PPDU transmission).

28.4.7.2 Non-EDMG PPDU transmission

28.4.7.2.1 Non-EDMG PPDU transmission over a 2.16 GHz and 2.16+2.16 GHz channel

The non-EDMG control mode PPDU waveform shall be defined at the DMG SC chip rate F_c and include the following modulated fields:

$$r_{non\text{-}EDMG}\left(nT_c\right) = r_{L\text{-}STF}\left(nT_c\right) + r_{L\text{-}CEF}\left(nT_c - t_{L\text{-}CEF}\right) + r_{L\text{-}Header}\left(nT_c - t_{L\text{-}Header}\right)$$
$$+ r_{Data}\left(nT_c - t_{Data}\right) + r_{AGC\ \ TRN}\left(nT_c - t_{AGC\ \ TRN}\right)$$

where

$t_{L\text{-}CEF} = T_{L\text{-}STF}$ is the duration of the L-STF field of the PPDU

$t_{L\text{-}Header} = t_{L\text{-}CEF} + T_{L\text{-}CEF}$ is the total duration of the L-STF and L-CEF fields of the PPDU

$t_{Data} = t_{L\text{-}Header} + T_{L\text{-}Header}$ is the total duration of the L-STF, L-CEF, and L-Header fields of the PPDU

$t_{AGC\ \ TRN} = t_{Data} + T_{Data}$ is the total duration of the L-STF, L-CEF, L-Header, and Data fields of the PPDU

In the non-EDMG control mode PPDU waveform, the AGC and TRN fields may be present in a 2.16 GHz non-EDMG PPDU transmission and shall not be present in a 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, or 4.32+4.32 GHz non-EDMG PPDU transmission.

In a 2.16 GHz non-EDMG PPDU transmission, a control trailer can be present in place of the AGC and TRN fields (see 28.3.7 (Control trailer)).

In a 4.32 GHz, 6.48 GHz, 8.64 GHz 2.16+2.16 GHz, or 4.32+4.32 GHz non-EDMG PPDU transmission, the Training Length field in the L-Header of the non-EDMG PPDU shall not have a value that is different from 0 or 2. If the Training Length field is equal to 2, a control trailer is present in place of the AGC and TRN fields as defined in 28.3.7 (Control trailer).

Unless specified, the chip index n is defined in the range [0, $N_{Field} - 1$], where N_{Field} defines the total number of samples for a given signal field. The definition of the L-STF, L-CEF, and L-Header fields is provided in 28.3.3.2.2 (L-STF definition), 28.3.3.2.3 (L-CEF definition), and 28.3.3.2.4 (L-Header definition), respectively. The definition of the AGC and TRN fields is provided in 20.9.2.2.5 (AGC field) and 20.9.2.2.6 (TRN field), respectively. The L-Header and Data fields encoding and modulation is provided in 20.4.3.2.3 (Header encoding and modulation) and 20.4.3.3 (Data field), respectively.

To transmit a non-EDMG waveform using multiple transmit chains, a spatial expansion with cyclic shift diversity (CSD) is applied. The non-EDMG PPDU waveform for the i_{TX}^{th} transmit chain includes a CSD, $T_{SC}^{i_{TX}}$, that is dependent on the particular transmit chain number. The cyclic shift, $T_{SC}^{i_{TX}}$, is defined in SC chip units as $(i_{TX} - 1) \times N_c \times T_c$, where N_c is equal to 4 chips and T_c is a chip time duration.

$$r_{non\text{-}EDMG}^{i_{TX}\ (1)}\left(nT_c\right)=\begin{cases} r_{non\text{-}EDMG}\left(nT_c+T_{SC}^{i_{TX}}\right), & n=0,1,...,N-1-T_{SC}^{i_{TX}}/T_c \\ r_{non\text{-}EDMG}\left(nT_c-\left(NT_c-T_{SC}^{i_{TX}}\right)\right), & n=N-T_{SC}^{i_{TX}}/T_c,...,N-1 \end{cases}, \quad 1\le i_{TX}\le N_{TX}$$

where

N is the total number of chips in the non-EDMG PPDU waveform $r_{non\text{-}EDMG}$

T_c is the chip time duration

The non-EDMG PPDU waveform for i_{TX}^{th} transmit chain is obtained by upsampling and filtering and then appropriate carrier frequency shift of the $r_{non-EDMG}^{i_{TX}\ (1)}\left(nT_c\right)$ waveform, if required. The upsampling procedure is applied using a factor of N_{up}. The filtering procedure is performed with a pulse shaping filter, $h_{SC\ CB}$, defined at the $N_{up} \times F_c$ sampling rate as follows:

$$r_{non\text{-}EDMG}^{i_{TX}(2)}\left(n\frac{T_c}{N_{up}}\right)=\begin{cases} r_{non\text{-}EDMG}^{i_{TX}(1)}\left(n\frac{T_c}{N_{up}}\right), & n=0, N_{up}, 2\times N_{up} \\ 0, & otherwise \end{cases}$$

$$r_{non\text{-}EDMG}^{i_{TX}(3)}\left(n\frac{T_c}{N_{up}}\right)=\sum_{k=0}^{K-1} r_{non\text{-}EDMG}^{i_{TX}(2)}\left((n-k)\frac{T_c}{N_{up}}\right)h_{SC\ CB}(k),\ n=0,\ 1,\ \ldots$$

$$r_{non\text{-}EDMG}^{i_{TX}(4)}\left(n\frac{T_c}{N_{up}}\right)=r_{non\text{-}EDMG}^{i_{TX}(3)}\left(\left(n+\frac{K-1}{2}\right)\frac{T_c}{N_{up}}\right),\ n=0,\ 1,\ \ldots$$

where

K is the length of $h_{SC\ CB}$ in samples

$$r_{non\text{-}EDMG}^{i_{TX}\ (2)}\left(n\frac{T_c}{N_{up}}\right)=0,\ \text{for}\ n<0\ \text{and}\ n\ge N\times N_{up}$$

N is the total number of chips in the non-EDMG PPDU waveform $r_{non\text{-}EDMG}^{i_{TX}\ (1)}$

T_c is the chip time duration

The pulse shaping filter impulse response, $h_{SC\ CB}$, and the N_{up} parameter definition are implementation dependent.

The non-EDMG PPDU waveform for the i_{TX}^{th} transmit chain with transmission over a 2.16 GHz or 2.16+2.16 GHz channel shall be defined as follows:

$$r_{PPDU}^{i_{TX}}\left(n\frac{T_c}{N_{up}}\right)=r_{non\text{-}EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}\right),1\le i_{TX}\le N_{TX}$$

For a 2.16+2.16 GHz PPDU transmission, the total number of transmit chains, N_{TX}, shall be an even number. The first $N_{TX}/2$ transmit chains shall be used for transmission on the primary channel and the second $N_{TX}/2$ transmit chains shall be used for transmission on the secondary channel (see 28.3.4 (Channelization)).

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

28.4.7.2.2 Non-EDMG duplicate PPDU transmission over a 4.32 GHz, 6.48 GHz, 8.64 GHz, and 4.32+4.32 GHz channel

The non-EDMG PPDU waveform for the i_{TX}^{th} transmit chain with duplicate transmission over a 4.32 GHz or 4.32+4.32 GHz channel shall be defined as follows:

$$r_{PPDU}^{i_{TX}}\left(n\frac{T_c}{N_{up}}\right) = r_{non\text{-}EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}+\Delta t_1\right)\cdot\frac{1}{\sqrt{2}}\exp\left(-j2\pi\left(\frac{\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right)$$
$$+r_{non\text{-}EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}+\Delta t_2\right)\cdot\frac{1}{\sqrt{2}}\exp\left(+j2\pi\left(\frac{\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right), 1\le i_{TX}\le N_{TX}$$

where

ΔF	defines the channel spacing and is equal to 2.16 GHz
Δt_1 and Δt_2	are in the range $[0, T_c]$
Δt_i equal to 0	corresponds to the primary channel

For 4.32+4.32 GHz transmission, the total number of transmit chains, N_{TX}, shall be an even number. The first $N_{TX}/2$ transmit chains shall be used for transmission on the primary and secondary channels and the second $N_{TX}/2$ transmit chains shall be used for transmission on the secondary1 and secondary2 channels (see 28.3.4 (Channelization)).

The non-EDMG PPDU waveform for the i_{TX}^{th} transmit chain with duplicate transmission over a 6.48 GHz channel shall be defined as follows:

$$r_{PPDU}^{i_{TX}}\left(n\frac{T_c}{N_{up}}\right) = r_{non\text{-}EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}+\Delta t_1\right)\cdot\frac{1}{\sqrt{3}}\exp\left(-j2\pi\Delta F\left(\frac{T_c}{N_{up}}\right)n\right)$$
$$+r_{non\text{-}EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}+\Delta t_2\right)\cdot\frac{1}{\sqrt{3}}$$
$$+r_{non\text{-}EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}+\Delta t_3\right)\cdot\frac{1}{\sqrt{3}}\exp\left(+j2\pi\Delta F\left(\frac{T_c}{N_{up}}\right)n\right), 1\le i_{TX}\le N_{TX}$$

where

Δt_1, Δt_2, and Δt_3	are in the range $[0, T_c]$
Δt_i equal to 0	corresponds to the primary channel

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The non-EDMG PPDU waveform for the i_{TX}^{th} transmit chain with duplicate transmission over an 8.64 GHz channel shall be defined as follows:

$$r_{PPDU}^{i_{TX}}\left(n\frac{T_c}{N_{up}}\right) = r_{non\text{-}EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}+\Delta t_1\right)\cdot\frac{1}{\sqrt{4}}\exp\left(-j2\pi\left(\frac{3\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right)$$
$$+r_{non\text{-}EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}+\Delta t_2\right)\cdot\frac{1}{\sqrt{4}}\exp\left(-j2\pi\left(\frac{\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right)$$
$$+r_{non\text{-}EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}+\Delta t_3\right)\cdot\frac{1}{\sqrt{4}}\exp\left(+j2\pi\left(\frac{\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right)$$
$$+r_{non\text{-}EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}+\Delta t_4\right)\cdot\frac{1}{\sqrt{4}}\exp\left(+j2\pi\left(\frac{3\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right), 1\le i_{TX}\le N_{TX}$$

where

Δt_1, Δt_2, Δt_3, and Δt_4	are in the range [0, T_c]
Δt_i equal to 0	corresponds to the primary channel

28.4.7.3 EDMG PPDU transmission

28.4.7.3.1 General

The EDMG control mode PPDU is composed of a preamble, a Data field and a TRN field. The total number of transmit chains, N_{TX}, used for transmission shall be constant over the different fields of EDMG PPDU.

For the case of DMG AGC and TRN fields transmission over a 2.16 GHz channel, indicated by the DMG TRN field in the EDMG-Header-A, the EDMG control mode PPDU is composed of a preamble, a Data field, and DMG AGC and TRN fields.

28.4.7.3.2 EDMG preamble and Data field transmission over a 2.16 GHz and 2.16+2.16 GHz channel

The preamble and Data fields shall be defined at the DMG SC chip rate F_c and include the following modulated fields:

$$r_{EDMG\text{-}Pream,\,Data}\left(nT_c\right) = r_{L\text{-}STF}\left(nT_c\right) + r_{L\text{-}CEF}\left(nT_c - t_{L\text{-}CEF}\right) + r_{L\text{-}Header}\left(nT_c - t_{L\text{-}Header}\right)$$
$$+r_{EDMG\text{-}Header\text{-}A}\left(nT_c - t_{EDMG\text{-}Header\text{-}A}\right) + r_{Data}\left(nT_c - t_{Data}\right)$$

where

$t_{L\text{-}CEF} = T_{L\text{-}STF}$	is the duration of the L-STF field of the PPDU
$t_{L\text{-}Header} = t_{L\text{-}CEF} + T_{L\text{-}CEF}$	is the total duration of the L-STF and L-CEF fields of the PPDU
$t_{EDMG\text{-}Header\text{-}A} = t_{L\text{-}Header} + T_{L\text{-}Header}$	is the total duration of L-STF, L-CEF, and L-Header fields of the PPDU
$t_{Data} = t_{EDMG\text{-}Header\text{-}A} + T_{EDMG\text{-}Header\text{-}A}$	is the total duration of the L-STF, L-CEF, L-Header, and EDMG-Header-A fields of the PPDU

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The definition of the L-STF, L-CEF, and L-Header fields is provided in 28.3.3.2.2 (L-STF definition), 28.3.3.2.3 (L-CEF definition), and 28.3.3.2.4 (L-Header definition), respectively. The definition of EDMG-Header-A is provided in 28.3.3.3.2.2 (Definition for EDMG control mode PPDU) and 28.3.3.3.2.4 (Encoding and modulation). The definition of the Data field is provided in 28.4.5.2 (Data field).

To transmit the preamble and Data fields using multiple transmit chains, a spatial expansion with cyclic shift diversity (CSD) is applied. The preamble and Data fields of the PPDU waveform for the i_{TX}^{th} transmit chain includes a cyclic shift, $T_{SC}^{i_{TX}}$, dependent on the particular transmit chain number. The cyclic shift, $T_{SC}^{i_{TX}}$, is defined in SC chip units as $(i_{TX} - 1) \times N_c \times T_c$, where N_c is equal to 4 chips and T_c is a chip time duration.

$$r_{EDMG\text{-}Pream,\,Data}^{i_{TX}\,(1)}\left(nT_c\right) = \begin{cases} r_{EDMG\text{-}Pream,\,Data}\left(nT_c + T_{SC}^{i_{TX}}\right), & n = 0,1,\ldots,N-1-T_{SC}^{i_{TX}}/T_c \\ r_{EDMG\text{-}Pream,\,Data}\left(nT_c - \left(NT_c - T_{SC}^{i_{TX}}\right)\right), & n = N - T_{SC}^{i_{TX}}/T_c,\ldots,N-1 \end{cases}, \quad 1 \le i_{TX} \le N_{TX}$$

where

N is the total number of chips in the EDMG preamble and Data fields $r_{EDMG\text{-}Pream,\,Data}$ of the EDMG PPDU waveform

T_c is a chip time duration

The EDMG PPDU waveform for the i_{TX}^{th} transmit chain is obtained by upsampling and filtering and then appropriate carrier frequency shift of the $r_{EDMG\text{-}Pream,\,Data}^{i_{TX}\,(1)}\left(nT_c\right)$ waveform, if required. The upsampling procedure is applied using a factor of N_{up}. The filtering procedure is performed with a pulse shaping filter, $h_{SC\,CB}$, defined at the $N_{up} \times F_c$ sampling rate as follows:

$$r_{EDMG\text{-}Pream,\,Data}^{i_{TX}(2)}\left(n\frac{T_c}{N_{up}}\right) = \begin{cases} r_{EDMG\text{-}Pream,\,Data}^{i_{TX}(1)}\left(n\frac{T_c}{N_{up}}\right), & n=0,\ N_{up},\ 2\times N_{up} \\ 0, & otherwise \end{cases}$$

$$r_{EDMG\text{-}Pream,\,Data}^{i_{TX}(3)}\left(n\frac{T_c}{N_{up}}\right) = \sum_{k=0}^{K-1} r_{EDMG\text{-}Pream,\,Data}^{i_{TX}(2)}\left((n-k)\frac{T_c}{N_{up}}\right) h_{SC\,CB}(k),\ n=0,\ 1,\ \ldots$$

$$r_{EDMG\text{-}Pream,\,Data}^{i_{TX}(4)}\left(n\frac{T_c}{N_{up}}\right) = r_{EDMG\text{-}Pream,\,Data}^{i_{TX}(3)}\left(\left(n+\frac{K-1}{2}\right)\frac{T_c}{N_{up}}\right),\ n=0,\ 1,\ \ldots$$

where

K is the length of $h_{SC\,CB}$ in samples

$$r_{EDMG\text{-}Pream,\,Data}^{i_{TX}\,(2)}\left(n\frac{T_c}{N_{up}}\right) = 0, \text{ for } n < 0 \text{ and } n \ge N \times N_{up}$$

N is the total number of chips in the EDMG preamble and Data fields $r_{EDMG\text{-}Pream,\,Data}^{i_{TX}\,(1)}$ of the EDMG PPDU waveform

T_c is a chip time duration

The pulse shaping filter impulse response, $h_{SC\,CB}$, and N_{up} parameter definition is implementation dependent.

The preamble and Data fields of the EDMG PPDU waveform for the i_{TX}^{th} transmit chain with transmission over a 2.16 GHz or 2.16+2.16 GHz channel shall be defined as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$r^{i_{TX}}_{EDMG-Pream,\,Data}\left(n\frac{T_c}{N_{up}}\right)=r^{i_{TX}\,(4)}_{EDMG-Pream,\,Data}\left(n\frac{T_c}{N_{up}}\right),1\le i_{TX}\le N_{TX}$$

For a 2.16+2.16 GHz PPDU transmission, the total number of transmit chains, N_{TX}, shall be an even number. The first $N_{TX}/2$ transmit chains shall be used for transmission on the primary channel and the second $N_{TX}/2$ transmit chains shall be used for transmission on the secondary channel (see 28.3.4 (Channelization)).

28.4.7.3.3 EDMG duplicate preamble and Data field transmission over a 4.32 GHz, 6.48 GHz, 8.64 GHz, and 4.32+4.32 GHz channel

The preamble and Data fields of the EDMG PPDU waveform for the i_{TX}^{th} transmit chain with duplicate transmission over a 4.32 GHz or 4.32+4.32 GHz channel shall be defined as follows:

$$r^{i_{TX}}_{EDMG-Pream,\,Data}\left(n\frac{T_c}{N_{up}}\right)=r^{i_{TX}\,(4)}_{EDMG-Pream,\,Data}\left(n\frac{T_c}{N_{up}}+\Delta t_1\right)\cdot\frac{1}{\sqrt{2}}\exp\left(-j2\pi\left(\frac{\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right)$$
$$+r^{i_{TX}\,(4)}_{EDMG-Pream,\,Data}\left(n\frac{T_c}{N_{up}}+\Delta t_2\right)\cdot\frac{1}{\sqrt{2}}\exp\left(+j2\pi\left(\frac{\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right),1\le i_{TX}\le N_{TX}$$

where

ΔF	defines the channel spacing and is equal to 2.16 GHz
Δt_1 and Δt_2	are in the range [0, T_c]
Δt_i equal to 0	corresponds to the primary channel

For 4.32+4.32 GHz transmission, the total number of transmit chains, N_{TX}, shall be an even number. The first $N_{TX}/2$ transmit chains shall be used for transmission on the primary and secondary channels and the second $N_{TX}/2$ transmit chains shall be used for transmission on the secondary1 and secondary2 channels (see 28.3.4 (Channelization)).

The preamble and Data fields of the EDMG PPDU waveform for the i_{TX}^{th} transmit chain with duplicate transmission over a 6.48 GHz channel shall be defined as follows:

$$r^{i_{TX}}_{EDMG-Pream,\,Data}\left(n\frac{T_c}{N_{up}}\right)=r^{i_{TX}\,(4)}_{EDMG-Pream,\,Data}\left(n\frac{T_c}{N_{up}}+\Delta t_1\right)\cdot\frac{1}{\sqrt{3}}\exp\left(-j2\pi\Delta F\left(\frac{T_c}{N_{up}}\right)n\right)$$
$$+r^{i_{TX}\,(4)}_{EDMG-Pream,\,Data}\left(n\frac{T_c}{N_{up}}+\Delta t_2\right)\cdot\frac{1}{\sqrt{3}}$$
$$+r^{i_{TX}\,(4)}_{EDMG-Pream,\,Data}\left(n\frac{T_c}{N_{up}}+\Delta t_3\right)\cdot\frac{1}{\sqrt{3}}\exp\left(+j2\pi\Delta F\left(\frac{T_c}{N_{up}}\right)n\right),1\le i_{TX}\le N_{TX}$$

where

Δt_1, Δt_2, and Δt_3	are in the range [0, T_c]
Δt_i equal to 0	corresponds to the primary channel

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The preamble and Data fields of the EDMG PPDU waveform for the i_{TX}^{th} transmit chain with duplicate transmission over an 8.64 GHz channel shall be defined as follows:

$$r_{EDMG-Pream,\,Data}^{i_{TX}}\left(n\frac{T_c}{N_{up}}\right)=r_{EDMG-Pream,\,Data}^{i_{TX}\,(4)}\left(n\frac{T_c}{N_{up}}+\Delta t_1\right)\cdot\frac{1}{\sqrt{4}}\exp\left(-j2\pi\left(\frac{3\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right)$$
$$+r_{EDMG-Pream,\,Data}^{i_{TX}\,(4)}\left(n\frac{T_c}{N_{up}}+\Delta t_2\right)\cdot\frac{1}{\sqrt{4}}\exp\left(-j2\pi\left(\frac{\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right)$$
$$+r_{EDMG-Pream,\,Data}^{i_{TX}\,(4)}\left(n\frac{T_c}{N_{up}}+\Delta t_3\right)\cdot\frac{1}{\sqrt{4}}\exp\left(+j2\pi\left(\frac{\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right)$$
$$+r_{EDMG-Pream,\,Data}^{i_{TX}\,(4)}\left(n\frac{T_c}{N_{up}}+\Delta t_4\right)\cdot\frac{1}{\sqrt{4}}\exp\left(+j2\pi\left(\frac{3\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right),1\le i_{TX}\le N_{TX}$$

where

Δt_1, Δt_2, Δt_3, and Δt_4 are in the range $[0, T_c]$

Δt_i equal to 0 corresponds to the primary channel

28.4.7.3.4 TRN field transmission over a 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, and 4.32+4.32 GHz channel

The TRN field, $r_{TRN}^{i_{TX}\,(1)}\left(n\frac{T_c}{N_{CB}}\right)$, shall be defined at the EDMG SC chip rate $F_{c\ EDMG}$ per i_{TX}^{th} transmit chain as defined in 28.9.2.2.6 (TRN subfield definition for EDMG SC PPDUs and EDMG control mode PPDUs). The TRN field is defined using N_{TX} orthogonal waveforms and transmitted over the entire channel bandwidth.

The TRN field is filtered and resampled with conversion rate ratio N_{up}/N_{CB}. For example, the resampling procedure for the ratio N_{up}/N_{CB} equal to 3/2 can be defined as follows:

$$r_{TRN}^{i_{TX}\,(2)}\left(n\frac{T_c}{3N_{CB}}\right)=\begin{cases}r_{TRN}^{i_{TX}\,(1)}\left(n\frac{T_c}{3N_{CB}}\right), n=0,3,6... \\ 0 \quad \text{otherwise}\end{cases}$$
$$r_{TRN}^{i_{TX}\,(3)}\left(n\frac{T_c}{3N_{CB}}\right)=\sum_{k=0}^{K-1}r_{TRN}^{i_{TX}\,(2)}\left((n-k)\frac{T_c}{3N_{CB}}\right)h_{SC\,CB}(k), n=0,1,...$$
$$r_{TRN}^{i_{TX}}\left(n\frac{2T_c}{3N_{CB}}\right)=r_{TRN}^{i_{TX}\,(3)}\left(\left(2n+\frac{K-1}{2}\right)\frac{T_c}{3N_{CB}}\right), n=0,1,...$$

where

K is the length of $h_{SC\,CB}$ in samples

$r_{TRN}^{i_{TX}\,(2)}\left(n\frac{T_c}{3N_{CB}}\right)=0$, for $n<0$ and $n\ge N\times 3$

N is the total number of chips in the TRN field $r_{TRN}^{i_{TX}\,(1)}$

T_c/N_{CB} is the chip time duration

28.4.7.3.5 EDMG PPDU transmission with TRN field transmission over a 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, and 4.32+4.32 GHz channel

The EDMG control mode PPDU waveform for the i_{TX}^{th} transmit chain concatenates the preamble and Data fields defined in 28.4.7.3.2 (EDMG preamble and Data field transmission over a 2.16 GHz and 2.16+2.16 GHz channel) and 28.4.7.3.3 (EDMG duplicate preamble and Data field transmission over a 4.32 GHz, 6.48 GHz, 8.64 GHz, and 4.32+4.32 GHz channel) with the TRN field defined in 28.4.7.3.4 (TRN field transmission over a 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, and 4.32+4.32 GHz channel) and shall be defined as follows:

$$r_{PPDU}^{i_{TX}}\left(n\frac{T_c}{N_{up}}\right)=r_{EDMG\text{-}Pream,\,Data}^{i_{TX}}\left(n\frac{T_c}{N_{up}}\right)+r_{TRN}^{i_{TX}}\left(n\frac{T_c}{N_{up}}-t_{TRN}\right),1\le i_{TX}\le N_{TX}$$

where

$t_{TRN}=t_{Data}+T_{Data}$ is the total duration of the L-STF, L-CEF, L-Header, EDMG-Header-A, and Data fields of the PPDU

28.4.7.3.6 EDMG PPDU transmission with DMG AGC and TRN fields over a 2.16 GHz channel

For the case of DMG AGC and TRN fields transmission over a 2.16 GHz channel, indicated by the DMG TRN field in the EDMG-Header-A, the EDMG control mode PPDU is composed of a preamble, a Data field and DMG AGC and TRN fields.

The EDMG control mode PPDU shall be defined at the DMG SC chip rate F_c and include the following modulated fields:

$$r_{EDMG\text{-}PPDU}\left(nT_c\right)=r_{L\text{-}STF}\left(nT_c\right)+r_{L\text{-}CEF}\left(nT_c-t_{L\text{-}CEF}\right)+r_{L\text{-}Header}\left(nT_c-t_{L\text{-}Header}\right)$$
$$+r_{EDMG\text{-}Header\text{-}A}\left(nT_c-t_{EDMG\text{-}Header\text{-}A}\right)+r_{Data}\left(nT_c-t_{Data}\right)+r_{AGC\ TRN}\left(nT_c-t_{AGC\ TRN}\right)$$

where

$t_{L\text{-}CEF}=T_{L\text{-}STF}$ is the duration of the L-STF field of the PPDU

$t_{L\text{-}Header}=t_{L\text{-}CEF}+T_{L\text{-}CEF}$ is the total duration of the L-STF and L-CEF fields of the PPDU

$t_{EDMG\text{-}Header\text{-}A}=t_{L\text{-}Header}+T_{L\text{-}Header}$ is the total duration of L-STF, L-CEF, and L-Header fields of the PPDU

$t_{Data}=t_{EDMG\text{-}Header\text{-}A}+T_{EDMG\text{-}Header\text{-}A}$ is the total duration of the L-STF, L-CEF, L-Header, and EDMG-Header-A fields of the PPDU

$t_{AGC\ TRN}=t_{Data}+T_{Data}$ is the total duration of the L-STF, L-CEF, L-Header, EDMG-Header-A, and Data fields of the PPDU

The definition of the L-STF, L-CEF, and L-Header fields is provided in 28.3.3.2.2 (L-STF definition), 28.3.3.2.3 (L-CEF definition), and 28.3.3.2.4 (L-Header definition), respectively. The definition of EDMG-Header-A is provided in 28.3.3.3.2.2 (Definition for EDMG control mode PPDU) and 28.3.3.3.2.4 (Encoding and modulation). The definition of the Data field is provided in 28.4.5.2 (Data field). The definition of the DMG AGC and TRN fields is provided in 20.9.2.2.5 (AGC field) and 20.9.2.2.6 (TRN field), respectively.

To transmit an EDMG PPDU using multiple transmit chains, a spatial expansion with cyclic shift diversity (CSD) is applied. The EDMG PPDU waveform for the i_{TX}^{th} transmit chain includes a cyclic shift, $T_{SC}^{i_{TX}}$, dependent on the particular transmit chain number. The cyclic shift, $T_{SC}^{i_{TX}}$, is defined in SC chip units as $(i_{TX}-1) \times N_c \times T_c$, where N_c is equal to 4 chips and T_c is a chip time duration.

$$r_{EDMG\text{-}PPDU}^{i_{TX}\,(1)}\left(nT_c\right)=\begin{cases} r_{EDMG\text{-}PPDU}\left(nT_c+T_{SC}^{i_{TX}}\right), & n=0,1,\ldots,N-1-T_{SC}^{i_{TX}}/T_c \\ r_{EDMG\text{-}PPDU}\left(nT_c-\left(NT_c-T_{SC}^{i_{TX}}\right)\right), & n=N-T_{SC}^{i_{TX}}/T_c,\ldots,N-1 \end{cases}, \quad 1\le i_{TX}\le N_{TX}$$

where

N is the total number of chips in the EDMG PPDU waveform $r_{EDMG\text{-}PPDU}$

T_c is a chip time duration

The EDMG PPDU waveform for the i_{TX}^{th} transmit chain is obtained by upsampling and filtering. The upsampling procedure is applied using a factor of N_{up}. The filtering procedure is performed with a pulse shaping filter, $h_{SC\,CB}$, defined at the $N_{up} \times F_c$ sampling rate as follows:

$$r_{EDMG\text{-}PPDU}^{i_{TX}\,(2)}\left(n\frac{T_c}{N_{up}}\right)=\begin{cases} r_{EDMG\text{-}PPDU}^{i_{TX}\,(1)}\left(n\frac{T_c}{N_{up}}\right), & n=0,N_{up},2*N_{up}\ldots \\ 0 & \text{otherwise} \end{cases}$$

$$r_{EDMG\text{-}PPDU}^{i_{TX}\,(3)}\left(n\frac{T_c}{N_{up}}\right)=\sum_{k=0}^{K-1} r_{EDMG\text{-}PPDU}^{i_{TX}\,(2)}\left(\left(n-k\right)\frac{T_c}{N_{up}}\right)h_{SC\,CB}\left(k\right), n=0,1,\ldots$$

$$r_{PPDU}^{i_{TX}}\left(n\frac{T_c}{N_{up}}\right)=r_{EDMG\text{-}PPDU}^{i_{TX}\,(3)}\left(\left(n+\frac{K-1}{2}\right)\frac{T_c}{N_{up}}\right), n=0,1,\ldots$$

where

K is the length of $h_{SC\,CB}$ in samples

$$r_{EDMG\text{-}PPDU}^{i_{TX}\,(2)}\left(n\frac{T_c}{N_{up}}\right)=0, \text{ for } n<0 \text{ and } n\ge N\times N_{up}$$

N is the total number of chips in the EDMG PPDU waveform $r_{EDMG\text{-}PPDU}^{i_{TX}\,(1)}$

T_c is a chip time duration

The pulse shaping filter impulse response, $h_{SC\,CB}$, and the N_{up} parameter definition are implementation dependent.

28.4.8 Performance requirements

The transmit EVM performance requirement of EDMG and non-EDMG control mode PPDUs shall be the same as that of DMG control mode PPDUs defined in 20.4.4.1.2 (Transmit EVM).

In the transmit EVM accuracy test, each transmit chain of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. If the TXVECTOR parameter CH_BANDWIDTH has more than one bit set to 1, the duplicate transmission in the two or more 2.16 GHz channels may be tested independently. In this case, the transmit EVM accuracy of each 2.16 GHz channel shall meet the required value defined in 20.4.4.1.2 (Transmit EVM) using only the signal within the corresponding channel.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Receive requirement of EDMG and non-EDMG control mode PPDUs are defined in 28.3.8 (CCA sensitivity).

28.5 EDMG and non-EDMG SC mode

28.5.1 General

Transmission and reception of the following modes are mandatory:

— 2.16 GHz SU PPDU using the EDMG SC mode MCSs 1 to 5 and 7 to 10 with single spatial stream
— 2.16 GHz PPDU using the non-EDMG SC mode MCSs 1 to 4
— 4.32 GHz SU PPDU using the EDMG SC mode MCSs 1 to 5 and 7 to 10 with single spatial stream
— 4.32 GHz PPDU using the non-EDMG duplicate SC mode MCSs 1 to 4

Transmission and reception of all other modes are optional.

28.5.2 Signal parameters

28.5.2.1 General

This subclause defines the main EDMG SC signal parameters for 2.16 GHz (N_{CB} = 1), 4.32 GHz (N_{CB} = 2), 6.48 GHz (N_{CB} = 3), 8.64 GHz (N_{CB} = 4), 2.16+2.16 GHz (N_{CB} = 1), and 4.32+4.32 GHz (N_{CB} = 2) PPDU transmissions.

28.5.2.2 Timing-related parameters

Table 28-47 provides a summary of the EDMG SC mode timing-related parameters.

Table 28-47—EDMG SC mode timing-related parameters

Parameter	Value			
	N_{CB} = 1	N_{CB} = 2	N_{CB} = 3	N_{CB} = 4
N_{SPB}: number of symbols per SC symbol block for short GI length	480	960	1440	1920
N_{SPB}: number of symbols per SC symbol block for normal GI length	448	896	1344	1792
N_{SPB}: number of symbols per SC symbol block for long GI length	384	768	1152	1536
$N_{GI\ short}$: short guard interval length	32	64	96	128
$N_{GI\ normal}$: normal guard interval length	64	128	192	256
$N_{GI\ long}$: long guard interval length	128	256	384	512
F_c: DMG SC chip rate	1.76 GHz	1.76 GHz	1.76 GHz	1.76 GHz
$F_{c\ EDMG}$: EDMG SC chip rate	1.76 GHz	3.52 GHz	5.28 GHz	7.04 GHz
T_c: DMG SC chip time duration	0.57 ns	0.57 ns	0.57 ns	0.57 ns

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 28-47—EDMG SC mode timing-related parameters *(continued)*

Parameter	Value			
	$N_{CB} = 1$	$N_{CB} = 2$	$N_{CB} = 3$	$N_{CB} = 4$
$T_{c\ EDMG}$: EDMG SC chip time duration	0.57 ns	0.28 ns	0.19 ns	0.14 ns
N_{DFT}: DFT size	512	1024	1536	2048
T_{DFT}: SC IDFT/DFT period	0.291 μs	0.291 μs	0.291 μs	0.291 μs
$T_{GI\ short}$: short guard interval duration	18.18 ns	18.18 ns	18.18 ns	18.18 ns
$T_{GI\ normal}$: normal guard interval duration	36.36 ns	36.36 ns	36.36 ns	36.36 ns
$T_{GI\ long}$: long guard interval duration	72.72 ns	72.72 ns	72.72 ns	72.72 ns

NOTE 1—The non-EDMG and pre-EDMG modulated fields are defined at the DMG SC chip rate F_c and the corresponding chip time duration T_c. The EDMG modulated fields are defined at the EDMG SC chip rate $F_{c\ EDMG} = F_c \times N_{CB}$ and the corresponding chip time duration $T_{c\ EDMG} = T_c/N_{CB}$.

NOTE 2—The values given for parameters $N_{GI\ short}$, $N_{GI\ normal}$, and $N_{GI\ long}$ correspond to the number of elements in the GI for each GI length and N_{CB} value.

28.5.3 Transmitter block diagram

28.5.3.1 General

EDMG and non-EDMG SC PPDU transmissions can be generated using a transmitter consisting of the following blocks:

- Scrambler scrambles the data to reduce the probability of long sequences of 0s and 1s; see 28.5.9.3 (Scrambler).
- LDPC encoder encodes the data to enable error correction. It pads the data with 0s to get an integer number of codewords and SC symbol blocks; see 28.5.9.4 (Encoding).
- Stream parser divides the output of the LDPC encoder into the groups of bits that are sent to different mapping devices. The sequence of the bits sent to different mapping devices is called a spatial stream; see 28.5.9.4 (Encoding).
- Constellation mapper and π/2-rotation block map the sequence of bits in each spatial stream to constellation points (complex numbers); see 28.5.9.5 (Modulation mapping).
- Interleaver performs interleaving inside an SC symbol block; see 28.5.9.5.5 (Block interleaver).
- STBC encoder spreads constellation points from N_{SS} spatial streams into N_{STS} space-time streams using a space-time block code. EDMG SC mode defines STBC schemes with $N_{STS} = 2 \times N_{SS}$; see 28.5.9.5.4 (Space-time block coding (STBC)).
- GI insertion prepends the SC symbol block with guard interval defined as a π/2-BPSK modulated Golay sequence; see 28.5.9.2 (Symbol blocking and guard insertion)
- Preamble builder builds π/2-BPSK modulated Ga and Gb Golay sequences comprising the L-STF, L-CEF, EDMG-STF, and EDMG-CEF fields; see 28.10 (Golay sequences).
- Spatial mapper maps space-time streams to transmit chains. This may include one of the following, see 28.5.10.2 (Spatial mapping):

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

  - Direct mapping: constellation points from each space-time stream are mapped directly to the transmit chains.
  - Indirect mapping: constellation points from each space-time stream are mapped to each transmit chain.
  - Digital beamforming: each vector of constellation points from all of the space-time streams is multiplied by a matrix of steering vectors to produce the input to the transmit chains.
- Cyclic shift diversity (CSD) prevents the signal transmission from unintentional beamforming. A cyclic shift is specified per transmitter chain for non-EDMG duplicate PPDU transmission; see 28.5.3.2 (Non-EDMG PPDU transmission) and 28.5.3.3.1 (Pre-EDMG modulated fields of PPDU transmission).
- Pulse shaping performs convolution of constellation points with shape filter impulse response with possible sampling rate change. For duplicate channel transmission, pulse shaping may include a relative time delay between the primary and secondary channels. The exact definition of shape filter impulse response is beyond the scope of this standard and is implementation specific.

28.5.3.2 Non-EDMG PPDU transmission

Figure 28-14 (Transmitter block diagram for non-EDMG PPDU transmission) shows the transmitter blocks used to generate the non-EDMG PPDU. The L-STF, L-CEF fields and TRN units of PPDU are generated using Golay builder block. The L-Header and data part of PPDU are generated using scrambler, LDPC encoder, constellation mapper, and GI insertion blocks. A single spatial stream is mapped to the N_{TX} transmit chains applying relative cyclic shift over the chains as defined in 28.5.9 (Data field).

28.5.3.3 EDMG PPDU transmission

28.5.3.3.1 Pre-EDMG modulated fields of PPDU transmission

Figure 28-14 (Transmitter block diagram for non-EDMG PPDU transmission) shows the transmitter blocks used to generate the pre-EDMG modulated fields of the EDMG PPDU preamble. The L-STF and L-CEF fields are generated using Golay builder block. The L-Header and EDMG-Header-A are generated using scrambler, LDPC encoder, constellation mapper, and GI insertion blocks. A single spatial stream is mapped to the N_{TX} transmit chains applying relative cyclic shift over the chains as defined in 28.5.10 (PPDU transmission).

28.5.3.3.2 EDMG modulated fields of SU PPDU transmission

Figure 28-15 (Transmitter block diagram for the EDMG modulated fields of an SU PPDU transmission) shows the transmitter blocks used to generate the EDMG modulated fields of an SU PPDU. The EDMG-STF and EDMG-CEF fields are generated using the Preamble builder block. The TRN field is generated using TRN builder block. The EDMG-Header-A field in the PPDU starting from the second PPDU in the EDMG A-PPDU and Data field of the PPDU are generated using the scrambler, LDPC encoder, constellation mapper, interleaver, and GI insertion blocks. If STBC encoder is applied, then N_{SS} spatial streams are mapped to $2 \times N_{SS}$ space-time streams as defined in 28.5.9.5.4 (Space-time block coding (STBC)). The N_{STS} space-time streams are further mapped to N_{TX} transmit chains, where $N_{STS} \leq N_{TX}$.

NOTE—Interleaver is applied to π/2-64-QAM and π/2-64-NUC modulations only. π/2-rotation is applied to the 64-QAM and 64-NUC symbols at the output of the interleaver block.

28.5.3.3.3 EDMG modulated fields of MU PPDU transmission

Figure 28-16 (Transmitter block diagram for the EDMG modulated fields of an MU PPDU transmission) shows the transmitter blocks used to generate the EDMG modulated fields of an MU PPDU. The EDMG-STF and EDMG-CEF fields are generated using the Preamble builder block. The TRN field is generated using TRN builder block. The EDMG-Header-B and Data field of the PPDU are generated using scrambler, LDPC encoder, constellation mapper, interleaver, and GI insertion blocks. The PPDU encoding uses seed value defined in the EDMG-Header-B and has independent flows per user. The EDMG-Header-B encoding is defined in 28.5.6 (Encoding of EDMG-Header-B). The space-time streams mapping is defined in 28.5.9.4.4 (MU PPDU padding and space-time streams mapping). The total number of space-time streams per user shall be less than or equal to 2. If STBC encoder is applied, then a single spatial stream is mapped to two space-time streams as defined in 28.5.9.5.4 (Space-time block coding (STBC)). The N_{STS} space-time streams are further mapped to N_{TX} transmit chains, where $N_{STS} \leq N_{TX}$.

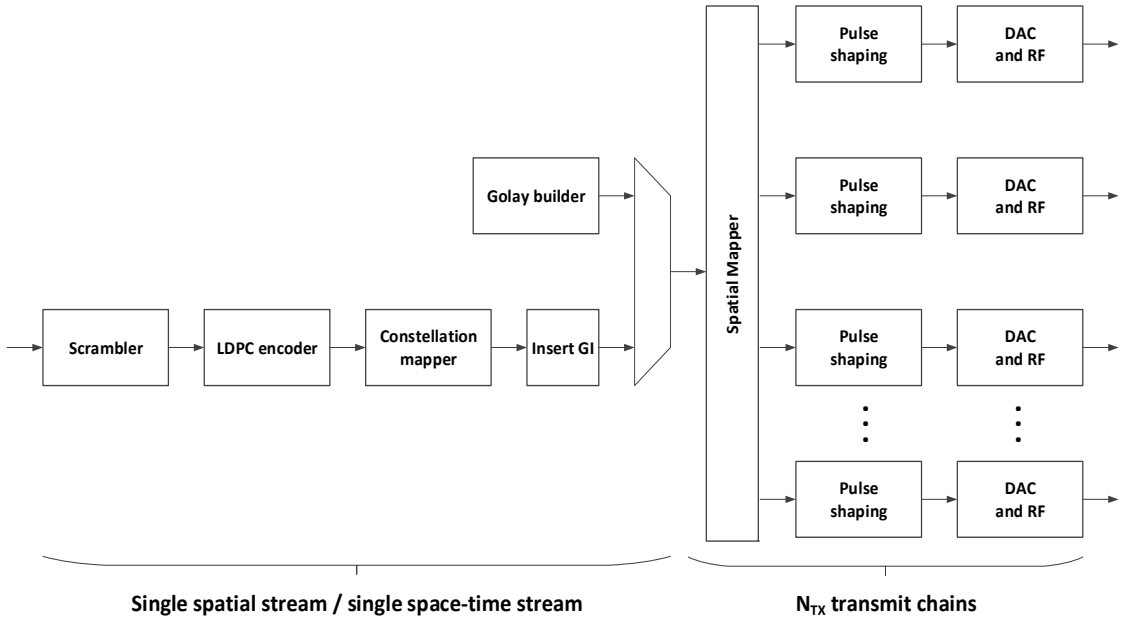

Figure 28-14—Transmitter block diagram for non-EDMG PPDU transmission

NOTE—Interleaver is applied to π/2-64-QAM and π/2-64-NUC modulations only. π/2-rotation is applied to the 64-QAM and 64-NUC symbols at the output of the interleaver block.

28.5.4 EDMG-STF definition

28.5.4.1 General

The structure of the EDMG-STF field depends on the number of contiguous 2.16 GHz channels over which an EDMG PPDU is transmitted and the index i_{STS} of the i_{STS}^{th} space-time stream.

For single space-time stream EDMG PPDU transmissions using the EDMG SC mode over a single 2.16 GHz channel, the EDMG-STF field is not present.

For EDMG SC transmissions, the EDMG-STF field shall be modulated using π/2-BPSK.

The Golay sequences used in the definition of the EDMG-STF are found in 28.10 (Golay sequences).

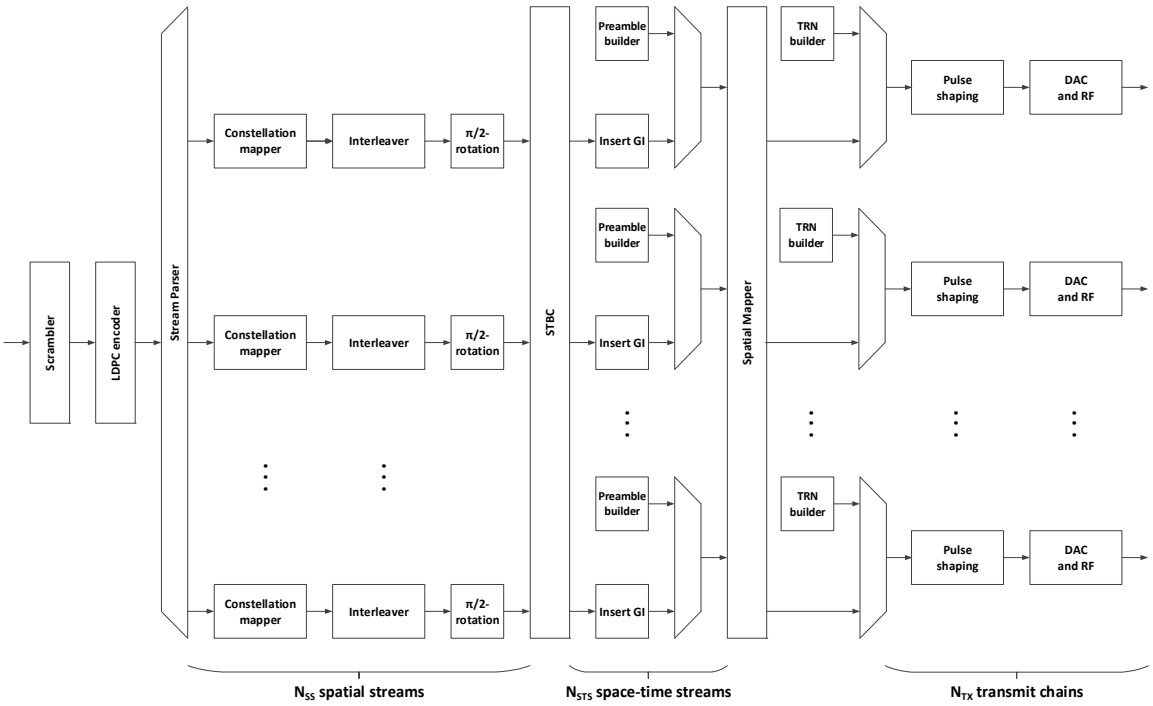

Figure 28-15—Transmitter block diagram for the EDMG modulated fields of an SU PPDU transmission

28.5.4.2 Definition

The EDMG-STF field transmit waveform in time domain shall be defined at the EDMG SC chip rate $F_{c\ EDMG}$ and chip time duration $T_{c\ EDMG}$. The EDMG-STF field for the i_{TX}^{th} transmit chain is defined as follows:

$$r_{EDMG\text{-}STF}^{i_{TX}}\left(q\frac{T_c}{N_{CB}}\right)=\frac{1}{\sqrt{N_{STS}}}\sum_{i_{STS}=1}^{N_{STS}}\left[Q_{EDMG}\right]_{i_{TX},i_{STS}}r_{STF}^{i_{STS}}\left(q\frac{T_c}{N_{CB}}\right)$$

where

N_{STS} is a total number of space-time streams

$r_{STF}^{i_{STS}}\left(q\frac{T_c}{N_{CB}}\right)$ is the short training field definition for i_{STS}^{th} space-time stream

Q_{EDMG} is a spatial mapping matrix

$[\ ]_{m,n}$ is a matrix element from m^{th} row and n^{th} column

For spatial expansion, $N_{STS} = 1 \leq N_{TX}$, the spatial mapping matrix Q is defined as the column vector composed of all 1s of size N_{TX} by 1. The spatial expansion is performed by application of CSD over different transmit chains as defined in 28.5.10 (PPDU transmission).

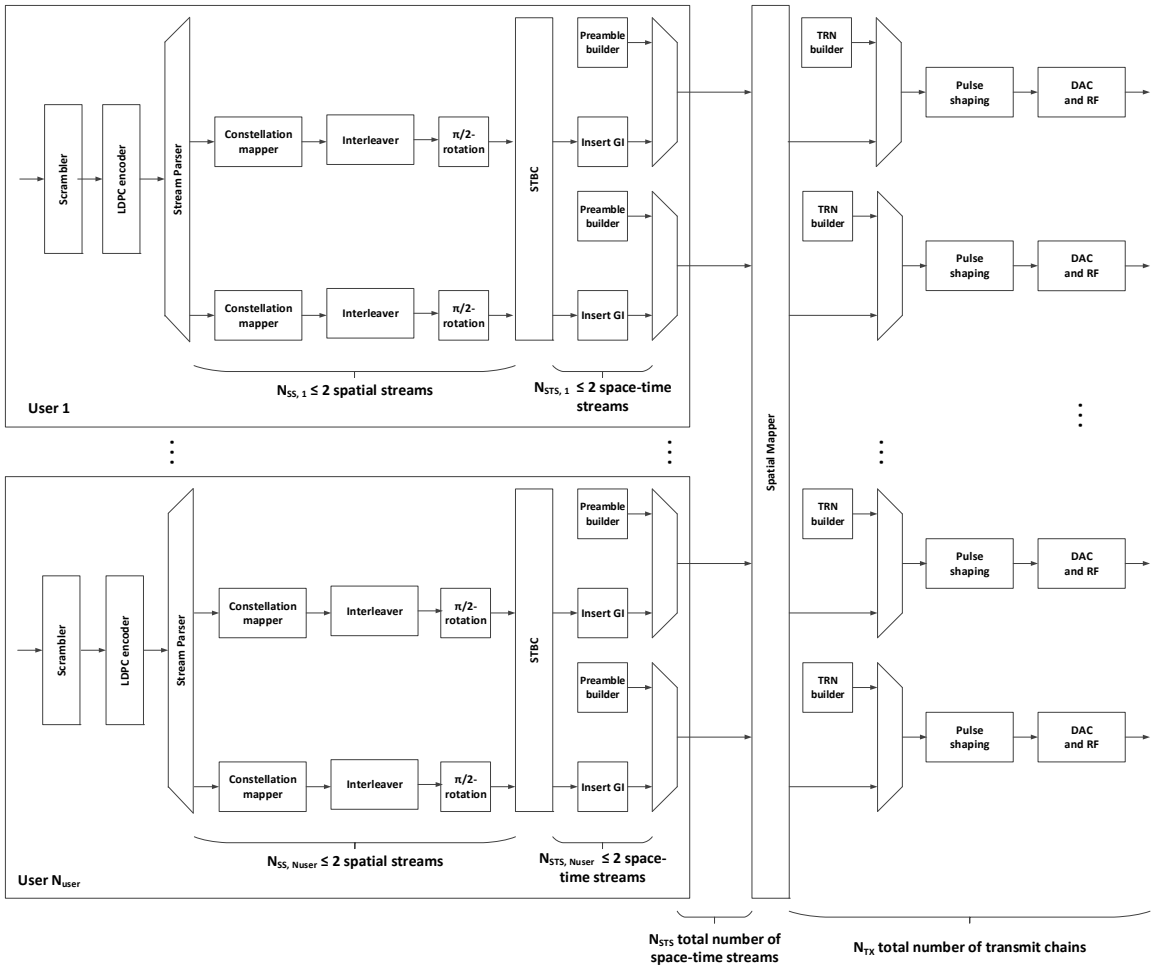

Figure 28-16—Transmitter block diagram for the EDMG modulated fields of an MU PPDU transmission

The EDMG-STF field is composed of 18 repetitions of $Ga^{i_{STS}}_{128\times N_{CB}}$ followed by one with inverse sign $-Ga^{i_{STS}}_{128\times N_{CB}}$. The waveform for the EDMG-STF field, $r^{i_{STS}}_{STF}\left(qT_c\right)$, is defined as follows:

$$r^{i_{STS}}_{STF}\left(q\frac{T_c}{N_{CB}}\right)=\left(\sum_{n=1}^{18}Ga^{i_{STS}}_{128\times N_{CB}}\left(q-128\times(n-1)\times N_{CB}\right)-Ga^{i_{STS}}_{128\times N_{CB}}\left(q-128\times 18\times N_{CB}\right)\right)$$

Note that sequence $Ga^{i_{STS}}_{128\times N_{CB}}\left(n\right)$ is defined for $0 \le n \le 128 \times N_{CB} - 1$. For other values of n, $Ga^{i_{STS}}_{128\times N_{CB}}\left(n\right)$ is set to 0.

28.5.5 EDMG-CEF definition

28.5.5.1 General

The structure of the EDMG-CEF field depends on the number of contiguous 2.16 GHz channels over which an EDMG PPDU is transmitted and the number, i_{STS}, of space-time streams.

For single space-time stream EDMG PPDU transmissions using the EDMG SC mode over a single 2.16 GHz channel, the EDMG-CEF field is not present.

For EDMG SC transmissions, the EDMG-CEF field shall be modulated using π/2-BPSK.

The pairs of Golay complementary sequences ($Ga^{iSTS}{}_{128}$, $Gb^{iSTS}{}_{128}$), ($Ga^{iSTS}{}_{256}$, $Gb^{iSTS}{}_{256}$), ($Ga^{iSTS}{}_{384}$, $Gb^{iSTS}{}_{384}$) and ($Ga^{iSTS}{}_{512}$, $Gb^{iSTS}{}_{512}$) used in the definition of the EDMG-CEF field for different space-time streams are specified in 28.10 (Golay sequences).

28.5.5.2 Definition

The EDMG-CEF field transmit waveform in time domain shall be defined at the EDMG SC chip rate $F_{c\ EDMG}$ and chip time duration $T_{c\ EDMG}$. The EDMG-CEF field is composed of $N^{N_{STS}}_{EDMG\text{-}CEF}$ subfields for the i_{TX}^{th} transmit chain is defined as follows:

$$r^{i_{TX}}_{EDMG\text{-}CEF}\left(q\frac{T_c}{N_{CB}}\right)=\frac{1}{\sqrt{N_{STS}}}\sum_{n=1}^{N^{N_{STS}}_{EDMG\text{-}CEF}}\sum_{i_{STS}=1}^{N_{STS}}\left[Q_{EDMG}\right]_{i_{TX},i_{STS}}\left[P_{EDMG\text{-}CEF}\right]_{i_{STS},n}r^{i_{STS}}_{CE,m}\left(q\frac{T_c}{N_{CB}}-nT_{EDMG\text{-}CEF,m}\right),$$

$$m=1\ for\ n=1;\ m=2\ for\ n>1$$

$$T_{EDMG\text{-}CEF,1}=1152\times T_c\ ,\ T_{EDMG\text{-}CEF,2}=1280\times T_c$$

where

$N^{N_{STS}}_{EDMG\text{-}CEF}$	is the total number of EDMG-CEF subfields, where index n defines a subfield number
N_{STS}	is a total number of space-time streams
$r^{i_{STS}}_{CE,m}\left(q\frac{T_c}{N_{CB}}\right)$	is a channel estimation field definition for the i_{STS}^{th} space-time stream, where m = 1 for n = 1 and m = 2 for n > 1
$T_{EDMG\text{-}CEF}$	is the EDMG-CEF subfield duration
$P_{EDMG\text{-}CEF}$	is an EDMG-CEF mapping matrix
Q_{EDMG}	is a spatial mapping matrix
$[\ ]_{m,n}$	is a matrix element from m^{th} row and n^{th} column

For spatial expansion, $N_{STS} = 1 \le N_{TX}$, the spatial mapping matrix Q is defined as the column vector composed of all 1s of size N_{TX} by 1. The spatial expansion is performed by application of CSD over different transmit chains as defined in 28.5.10 (PPDU transmission).

The waveform for the channel estimation subfield, $r^{i_{STS}}_{CE,1}\left(q\frac{T_c}{N_{CB}}\right)$, is defined as follows:

$$r^{i_{STS}}_{CE,1}\left(q\frac{T_c}{N_{CB}}\right)=\left(Gu^{i_{STS}}_{512\times N_{CB}}\left(q\right)+Gv^{i_{STS}}_{512\times N_{CB}}\left(q-512\times N_{CB}\right)-Gb^{i_{STS}}_{128\times N_{CB}}\left(q-1024\times N_{CB}\right)\right)$$

$$\cdot\exp\left(j\left(\pi/2\right)q\right),q=0,1,...,1152\times N_{CB}-1$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The waveform for the channel estimation subfield, $r_{CE,2}^{i_{STS}}\left(q\frac{T_c}{N_{CB}}\right)$, is defined as follows:

$$r_{CE,2}^{i_{STS}}\left(q\frac{T_c}{N_{CB}}\right)=\left(-Ga_{128\times N_{CB}}^{i_{STS}}(q)+Gu_{512\times N_{CB}}^{i_{STS}}\left(q-128\times N_{CB}\right)+Gv_{512\times N_{CB}}^{i_{STS}}\left(q-640\times N_{CB}\right)\right.$$
$$\left.-Gb_{128\times N_{CB}}^{i_{STS}}\left(q-1152\times N_{CB}\right)\right)\cdot\exp\left(j\left(\pi/2\right)q\right),q=0,1,...,1280\times N_{CB}-1$$

Note that sequences $Ga_{128\times N_{CB}}^{i_{STS}}(n)$ and $Gb_{128\times N_{CB}}^{i_{STS}}(n)$, i_{STS} = 1, 2, …, 8, are defined for $0 \le n \le 128 \times N_{CB} - 1$. For other values of n, $Ga_{128\times N_{CB}}^{i_{STS}}(n)$ and $Gb_{128\times N_{CB}}^{i_{STS}}(n)$ are set to 0.

The sequences $Gu_{512\times N_{CB}}^{i_{STS}}(n)$ and $Gv_{512\times N_{CB}}^{i_{STS}}(n)$ are defined as follows:

$$Gu_{512\times N_{CB}}^{i_{STS}}=\left[-Gb_{128\times N_{CB}}^{i_{STS}}\quad -Ga_{128\times N_{CB}}^{i_{STS}}\quad +Gb_{128\times N_{CB}}^{i_{STS}}\quad -Ga_{128\times N_{CB}}^{i_{STS}}\right],\text{ for } i_{STS}=1, 2, 3, 4, 5, 6, 7, 8$$

$$Gv_{512\times N_{CB}}^{i_{STS}}=\left[-Gb_{128\times N_{CB}}^{i_{STS}}\quad +Ga_{128\times N_{CB}}^{i_{STS}}\quad -Gb_{128\times N_{CB}}^{i_{STS}}\quad -Ga_{128\times N_{CB}}^{i_{STS}}\right],\text{ for } i_{STS}=1, 2, 3, 4, 5, 6, 7, 8$$

Note that sequences $Gu_{512\times N_{CB}}^{i_{STS}}(n)$ and $Gv_{512\times N_{CB}}^{i_{STS}}(n)$ are defined for $0 \le n \le 512 \times N_{CB} - 1$. For other values of n, $Gu_{512\times N_{CB}}^{i_{STS}}(n)$ and $Gv_{512\times N_{CB}}^{i_{STS}}(n)$ are set to 0.

The EDMG-CEF mapping matrix for N_{STS} = 1, 2 is defined as follows:

$$P_{EDMG-CEF}=\begin{bmatrix}+1\\+1\end{bmatrix},\ N_{EDMG-CEF}^{N_{STS}}=1$$

The EDMG-CEF mapping matrix for N_{STS} = 3, 4 is defined as follows:

$$P_{EDMG-CEF}=\begin{bmatrix}+1 & +1\\+1 & +1\\+1 & -1\\+1 & -1\end{bmatrix},\ N_{EDMG-CEF}^{N_{STS}}=2$$

The EDMG-CEF mapping matrix for N_{STS} = 5, 6, 7, and 8 is defined as follows:

$$P_{EDMG-CEF}=\begin{bmatrix}+1 & +1 & +1 & +1\\+1 & +1 & +1 & +1\\+1 & -1 & +1 & -1\\+1 & -1 & +1 & -1\\+1 & +1 & -1 & -1\\+1 & +1 & -1 & -1\\+1 & -1 & -1 & +1\\+1 & -1 & -1 & +1\end{bmatrix},\ N_{EDMG-CEF}^{N_{STS}}=4$$

28.5.6 Encoding of EDMG-Header-B

The EDMG-Header-B for the i_{user}^{th} user shall be encoded as follows:

— The input 64 bits of the EDMG-Header-B, $\mathbf{b} = (b_1, b_2, ..., b_{64})$, are scrambled with the PN sequence described in 20.3.9 (Scrambler), starting from the eighth bit to create the $\mathbf{bq} = (bq_1, bq_2, ..., bq_{64})$ sequence. The scrambler seed value is initialized by the first seven bits of the EDMG-Header-B.

— The LDPC codeword of length 672 bits is created by concatenating the 440 0s to the scrambled header bits $\mathbf{bq} = (bq_1, bq_2, ..., bq_{64})$ and then computing 168 parity bits $\mathbf{p} = (p_1, p_2, ..., p_{168})$ using the LDPC matrix with R = 3/4 and L_{CW} = 672 defined in 20.3.8.4 (Rate 3/4 LDPC code matrix H = 168 rows x 672 columns, Z = 42). The LDPC codeword is defined as $(bq_1, bq_2, ..., bq_{64}, 0_1, 0_2, ..., 0_{440}, p_1, p_2, ..., p_{168})$.

— The zero padded bits are discarded and the output codeword is defined as $\mathbf{c} = (\mathbf{c}_1, \mathbf{c}_2)$, where

  — $\mathbf{c}_1 = (bq_1, bq_2, ..., bq_{64}, p_1, p_2, ..., p_{160})$

  — $\mathbf{c}_2 = (bq_1, bq_2, ..., bq_{64}, p_1, p_2, ..., p_{152}, p_{161}, p_{162}, ..., p_{168})$

— For a PPDU transmitted over a N_{CB} × 2.16 GHz channel, where $1 \le N_{CB} \le 4$, the data block is defined as a repetition of codeword **c** by N_{CB} times:

  — **cb** = **c** for N_{CB} = 1

  — **cb** = (**c**, **c**) for N_{CB} = 2

  — **cb** = (**c**, **c**, **c**) for N_{CB} = 3

  — **cb** = (**c**, **c**, **c**, **c**) for N_{CB} = 4

— For a PPDU transmitted using N_{STS} (N_{STS} = 1, 2) space-time streams, the data block **cb** is repeated N_{STS} times. Then, the N_{STS} data blocks are scrambled continuously with the PN sequence defined in 28.5.9.3.2 (Scrambler for EDMG-Header-A in SU EDMG A-PPDU, EDMG-Header-B, and EDMG SC MCS1 coded bits) without seed reset. The initial seed value is equal to all 1s $(1_1, 1_2, ..., 1_7)$. The scrambling starts at the 225^{th} bit and ends at the $(N_{STS} \times 448 \times N_{CB})^{th}$ bit. The first scrambled **cb** block is mapped to the first space-time stream and the second scrambled **cb** block to the second space-time stream.

The SC data blocks shall be modulated using π/2-BPSK modulation as defined in 20.5.3.2.4 (Modulation mapping). Each SC data block is prepended with a guard interval as defined in 28.5.9.2 (Symbol blocking and guard insertion).

The EDMG-Header-B field is transmitted by applying EDMG transmission format defined in 28.5.9.5.2 (Transmission in EDMG format).

28.5.7 Encoding of EDMG-Header-A for EDMG A-PPDU transmission

The EDMG-Header-A field in the first EDMG PPDU in an EDMG SC mode A-PPDU (i.e., i_{PPDU} = 1, where i_{PPDU} represents the index of the PPDU into the EDMG A-PPDU) is encoded and modulated as specified in 28.3.3.3.2.4 (Encoding and modulation).

For the i_{PPDU}^{th} EDMG PPDU in the EDMG SC mode A-PPDU, $i_{PPDU} > 1$, the EDMG-Header-A field shall be encoded and modulated as follows:

— The input 112 header bits are appended with 16 HCS bits calculated as defined in 20.3.7 (HCS calculation for headers of DMG control mode and DMG SC mode).

— The resulting 128 bits including CRC, **b** = (b_1, b_2,…, b_{128}), are scrambled with the PN sequence as described in 20.3.9 (Scrambler), starting from the first bit using a continuation of the scrambler bit

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

sequence from the Data field of preceding EDMG PPDU in the EDMG SC mode A-PPDU to create the **bq** = (bq_1, bq_2,…, bq_{128}) sequence.

— The scrambled header bits, **bq**, are divided into two parts **bq1** = (bq_1, bq_2,…, bq_{64}) and **bq2** = (bq_{65}, bq_{66},…, bq_{128}) of 64 bits each.

— Two LDPC codewords of length 672 bits each are created by concatenating the 440 0s to each part, **bq1** and **bq2**, and then computing 168 parity bits **p1** = ($p1_1$, $p1_2$,…, $p1_{168}$) and **p2** = ($p2_1$, $p2_2$,…, $p2_{168}$) for **bq1** and **bq2**, respectively, using the LDPC matrix with R = 3/4 and L_{CW} = 672 defined in 20.3.8.4 (Rate 3/4 LDPC code matrix H = 168 rows x 672 columns, Z = 42). The LDPC codewords are defined as follows:

  — **cw1** = (bq_1, bq_2,…, bq_{64}, 0_1, 0_2,…, 0_{440}, $p1_1$, $p1_2$,…, $p1_{168}$)
  — **cw2** = (bq_{65}, bq_{66},…, bq_{128}, 0_1, 0_2,…, 0_{440}, $p2_1$, $p2_2$,…, $p2_{168}$)

— The padded 0s are discarded and two output codewords are defined as **c1** = ($c1_1$, $c1_2$) and **c2** = ($c2_1$, $c2_2$), where

  — $\mathbf{c1_1}$ = (bq_1, bq_2,…, bq_{64}, $p1_1$, $p1_2$,…, $p1_{160}$)
  — $\mathbf{c1_2}$ = (bq_1, bq_2,…, bq_{64}, $p1_1$, $p1_2$,…, $p1_{152}$, $p1_{161}$, $p1_{162}$,…, $p1_{168}$)
  — $\mathbf{c2_1}$ = (bq_{65}, bq_{66},…, bq_{128}, $p2_1$, $p2_2$,…, $p2_{160}$)
  — $\mathbf{c2_2}$ = (bq_{65}, bq_{66},…, bq_{128}, $p2_1$, $p2_2$,…, $p2_{152}$, $p2_{161}$, $p2_{162}$,…, $p2_{168}$)

— For a PPDU transmitted over an N_{CB} × 2.16 GHz channel, where $1 \le N_{CB} \le 4$, the data blocks are defined as a repetition of codeword **c1** and **c2** by N_{CB} times:

  — **cb1** = c1, **cb2** = c2 for N_{CB} = 1
  — **cb1** = (c1, c1), **cb2** = (c2, c2) for N_{CB} = 2
  — **cb1** = (c1, c1, c1), **cb2** = (c2, c2, c2) for N_{CB} = 3
  — **cb1** = (c1, c1, c1, c1), **cb2** = (c2, c2, c2, c2) for N_{CB} = 4

— For a PPDU transmitted using N_{STS} (N_{STS} = 1, 2, …, 8) space-time streams, the data blocks **cb1** and **cb2** are concatenated as **cb** = (**cb1**, **cb2**) and the data block **cb** is repeated N_{STS} times. Then, the N_{STS} data blocks **cb** are scrambled continuously with the PN sequence defined in 28.5.9.3.2 (Scrambler for EDMG-Header-A in SU EDMG A-PPDU, EDMG-Header-B, and EDMG SC MCS1 coded bits) without seed reset. The initial seed value is equal to all 1s (1_1, 1_2,…, 1_7). The scrambling starts at the 225^{th} bit and ends at the $(N_{STS} \times 896 \times N_{CB})^{th}$ bit. The first scrambled **cb** block is mapped to the first space-time stream and the second scrambled **cb** block to the second space-time stream, and so on.

The data blocks shall be modulated using π/2-BPSK modulation as defined in 20.5.3.2.4 (Modulation mapping). Each of the modulated data blocks **cb1** and **cb2** is prepended with 64 × N_{CB} guard symbols, and the data block **cb2** is appended with appropriate number of guard symbols as described in 28.5.9.2.3 (SU A-PPDU transmission).

The EDMG-Header-A field for $i_{PPDU} > 1$ is transmitted by applying the EDMG transmission format defined in 28.5.9.5.2 (Transmission in EDMG format).

28.5.8 Modulation and coding scheme (MCS)

The MCS is a value that determines the modulation and coding. For an EDMG PPDU, the MCS value is carried in the EDMG-Header-A field and in the EDMG-Header-B field. The data rate provided by an MCS depends on the guard interval length, the number of spatial streams, N_{SS} ($1 \le N_{SS} \le 8$), and the number of contiguous 2.16 GHz channels, N_{CB} ($1 \le N_{CB} \le 4$), that make up the signal bandwidth of an EDMG PPDU.

The set of MCSs for an EDMG SC mode PPDU are defined in Table 28-48, where N_{CB} is as defined above. If the π/2-8-PSK Applied field in the EDMG-Header-A of an SU PPDU is 1, then MCS 12 and 13 shall use π/2-8-PSK modulation as indicated inTable 28-49. If the π/2-64-NUC Applied field in the EDMG-Header-A or in the EDMG-Header-B is 1, then MCS 17 through 21 shall use π/2-64-NUC modulation as indicated in Table 28-50. If the DCM BPSK Applied field in the EDMG-Header-A of an SU PPDU is 1, then MCS 2 through 6 shall use DCM BPSK modulation as indicated in Table 28-51.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For a given type of guard interval used in the transmission of an EDMG SC mode PPDU, the total transmission data rate, ρ, provided by the PPDU is defined as follows:

$$\rho = \sum_{i_{ss}=1}^{N_{ss}} Data\_rate_{i_{ss}}$$

where

N_{SS} is as defined above

$Data\_rate_{i_{ss}}$ is the data rate provided by the MCS of spatial stream i_{ss} as defined in Table 28-48

Transmit and receive support for MCSs 1 to 5 and 7 to 10 are mandatory. Other MCSs are optional. MCS indices exceeding the largest MCS index defined in Table 28-48 are reserved.

NOTE 1—The LDPC code with rate 7/8 can use a superimposed or puncturing code selected by the Superimposed Code Applied field defined in the EDMG-Header-A or EDMG-Header-B, as appropriate. The encoding procedure for both cases is described in 28.5.9.4.3 (LDPC encoding).

NOTE 2—The LDPC code with rate 2/3 is generated by employing the original LDPC code with rate 3/4 and applying the codeword shortening procedure to achieve the effective code rate. The LDPC code with rate 5/6 is generated by employing the original LDPC code with rate 7/8 and applying the codeword shortening procedure to achieve the effective code rate. Therefore, similar to the LDPC code with rate 7/8, the LDPC code with rate 5/6 is obtained by using a superimposed or puncturing code selected by the Superimposed Code Applied field defined in the EDMG-Header-A or EDMG-Header-B, as appropriate. The encoding procedure for both cases is described in 28.5.9.4.3 (LDPC encoding).

Table 28-48—EDMG-MCSs for the EDMG SC mode

EDMG-MCS index	Modulation	N_{CBPS}	Repetition	Code rate	Data rate per spatial stream (Mb/s)		
					Normal GI	Short GI	Long GI
1	π/2-BPSK	1	2	1/2	N_{CB}×385.00	N_{CB}×412.50	N_{CB}×330.00
2	π/2-BPSK	1	1	1/2	N_{CB}×770.00	N_{CB}×825.00	N_{CB}×660.00
3	π/2-BPSK	1	1	5/8	N_{CB}×962.50	N_{CB}×1031.25	N_{CB}×825.00
4	π/2-BPSK	1	1	3/4	N_{CB}×1155.00	N_{CB}×1237.50	N_{CB}×990.00
5	π/2-BPSK	1	1	13/16	N_{CB}×1251.25	N_{CB}×1340.63	N_{CB}×1072.50
6	π/2-BPSK	1	1	7/8	N_{CB}×1347.50	N_{CB}×1443.75	N_{CB}×1155.00
7	π/2-QPSK	2	1	1/2	N_{CB}×1540.00	N_{CB}×1650.00	N_{CB}×1320.00

28.5.9 Data field

28.5.9.1 Guard interval definition

Three types of GIs are defined: short, normal and long. An EDMG STA shall support the normal GI for each combination of channel bandwidth and number of spatial streams supported by the EDMG STA. All GI sequences are defined at the $N_{CB} \times F_c$ sampling rate, where N_{CB} is the integer number of 2.16 GHz channels that make up the channel bandwidth and $1 \leq N_{CB} \leq 4$.

The following GI nomenclature is used: $GI^{iSTS}{}_N$ and $GIe^{iSTS}{}_N$. Here, i_{STS} represents the space-time stream number, and N represents the sequence length.

The GIs definitions utilize $GI^{iSTS}{}_{64}$ and $GIe^{iSTS}{}_{\mathrm{N}}$. $GI^{iSTS}{}_{64}$ shall be equal to $+Ga^{iSTS}{}_{64}$ for all cases. However, the definition of $GIe^{iSTS}{}_N$ depends on the value of N_{CB}. Table 28-52, Table 28-53, Table 28-54, and Table 28-55 define $GIe^{iSTS}{}_N$ for $N_{CB} = 1$, $N_{CB} = 2$, $N_{CB} = 3$, and $N_{CB} = 4$, respectively.

Table 28-52—*GIe* definition for 2.16 GHz or 2.16+2.16 GHz (N_{CB} = 1) channel

Space-time stream number (i_{STS})	Short GI	Normal GI	Long GI
1	$GIe^1{}_{32} = -Gc^1{}_{32}$	$GIe^1{}_{64} = +Ga^1{}_{64}$	$GIe^1{}_{128} = -Gc^1{}_{128}$
2	$GIe^2{}_{32} = -Gc^2{}_{32}$	$GIe^2{}_{64} = +Ga^2{}_{64}$	$GIe^2{}_{128} = -Gc^2{}_{128}$
3	$GIe^3{}_{32} = -Gc^3{}_{32}$	$GIe^3{}_{64} = +Ga^3{}_{64}$	$GIe^3{}_{128} = -Gc^3{}_{128}$
4	$GIe^4{}_{32} = -Gc^4{}_{32}$	$GIe^4{}_{64} = +Ga^4{}_{64}$	$GIe^4{}_{128} = -Gc^4{}_{128}$

28.5.9.2 Symbol blocking and guard insertion

28.5.9.2.1 General

This subclause defines the symbol blocking and guard interval structure for each type of EDMG SC mode PPDU. The GIs used to define symbol blocking structure for the pre-EDMG modulated fields, EDMG-Header-B and Data field are defined in 28.5.9.1 (Guard interval definition).

The SU PPDU symbol blocking and guard interval structure shall be as defined in 28.5.9.2.2 (SU PPDU transmission). The SU A-PPDU symbol blocking and guard interval structure shall be as defined in 28.5.9.2.3 (SU A-PPDU transmission).

The MU PPDU symbol blocking and guard interval structure shall be as defined in 28.5.9.2.4 (MU PPDU transmission).

28.5.9.2.2 SU PPDU transmission

28.5.9.2.2.1 General

This subclause defines an SU PPDU transmission over a 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, or 4.32+4.32 GHz channel with one or more space-time streams.

The SU PPDU structure for a 2.16 GHz PPDU transmission and a single space-time stream transmission (N_{STS} = 1) is defined in 28.5.9.2.2.2 (SU PPDU transmission over a 2.16 GHz or a 2.16+2.16 GHz channel with NSTS = 1). The SU PPDU structure for a 2.16 GHz or a 2.16+2.16 GHz PPDU transmission with more than one space-time streams (N_{STS} > 1) and 4.32 GHz, 6.48 GHz, 8.64 GHz, or 4.32+4.32 GHz PPDU transmissions with one or more space-time streams (N_{STS} ≥ 1) is defined in 28.5.9.2.2.3 (SU PPDU transmission over a 2.16 GHz or 2.16+2.16 GHz channel with NSTS > 1 and over a 4.32 GHz, 6.48 GHz, 8.64 GHz, or 4.32+4.32 GHz channel with NSTS ≥ 1).

28.5.9.2.2.2 SU PPDU transmission over a 2.16 GHz or a 2.16+2.16 GHz channel with N_{STS} = 1

An SU PPDU transmitted over a 2.16 GHz or a 2.16+2.16 GHz channel with a single space-time stream (N_{STS} = 1) shall be defined at the DMG SC chip rate F_c. The PPDU of this type does not include the EDMG-STF and EDMG-CEF fields and the symbol blocking structure defined for the Data field continues the symbol blocking structure of the pre-EDMG modulated fields.

The EDMG SC mode SU PPDU symbol blocking structure for the short, normal and long GI shall be as shown in Figure 28-17 (SU PPDU structure: 2.16 GHz or 2.16+2.16 GHz channel, NSTS = 1, short GI), Figure 28-18 (SU PPDU structure: 2.16 GHz or 2.16+2.16 GHz channel, NSTS = 1, normal GI), and Figure 28-19 (SU PPDU structure: 2.16 GHz or 2.16+2.16 GHz channel, NSTS = 1, long GI), respectively. An EDMG STA shall support the SU PPDU structure with normal GI as shown in Figure 28-18 (SU PPDU structure: 2.16 GHz or 2.16+2.16 GHz channel, NSTS = 1, normal GI).

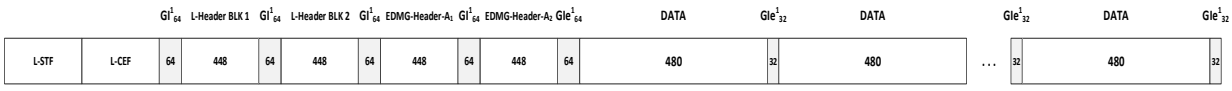

Figure 28-17—SU PPDU structure: 2.16 GHz or 2.16+2.16 GHz channel, N_{STS} = 1, short GI

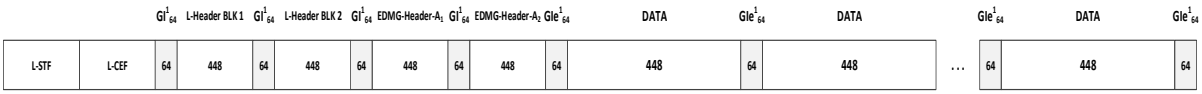

Figure 28-18—SU PPDU structure: 2.16 GHz or 2.16+2.16 GHz channel, N_{STS} = 1, normal GI

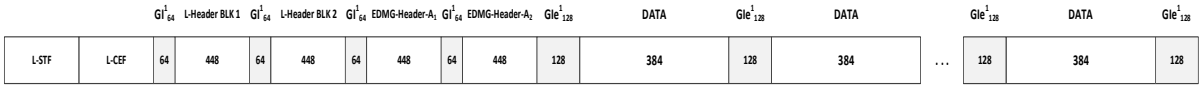

Figure 28-19—SU PPDU structure: 2.16 GHz or 2.16+2.16 GHz channel, N_{STS} = 1, long GI

The single space-time stream of an SU PPDU may be mapped to $N_{TX} \geq 1$ transmit chains applying direct, indirect spatial mapping or digital beamforming as defined in 28.5.10.4.2 (EDMG PPDU transmission over a 2.16 GHz or 2.16+2.16 GHz channel with NSTS = 1). The single space-time stream may be mapped to $N_{TX} \geq 1$ transmit chains applying spatial expansion as defined in 28.5.10.4.4 (EDMG PPDU transmission over a 2.16 GHz or 2.16+2.16 GHz channel with NSTS > 1 and 4.32 GHz, 6.48 GHz, 8.64 GHz or 4.32+4.32 GHz channel with NSTS ≥ 1).

A TRN field per transmit chain (see 28.9.2.2.6 (TRN subfield definition for EDMG SC PPDUs and EDMG control mode PPDUs)) may be appended to an SU PPDU.

A Secure TRN field (see 28.9.3.5) shall be appended to an SU PPDU for EDMG secure ranging PPDU.

28.5.9.2.2.3 SU PPDU transmission over a 2.16 GHz or 2.16+2.16 GHz channel with N_{STS} > 1 and over a 4.32 GHz, 6.48 GHz, 8.64 GHz, or 4.32+4.32 GHz channel with N_{STS} ≥ 1

An SU PPDU transmitted over a 2.16 GHz or 2.16+2.16 GHz channel with more than one space-time stream ($N_{STS} > 1$) and an SU PPDU transmission over a 4.32 GHz, 6.48 GHz, 8.64 GHz, or 4.32+4.32 GHz channel with one or more space-time streams ($N_{STS} \geq 1$) shall have a sampling rate of $N_{CB} \times F_c$.

A PPDU of this type includes the EDMG-STF and EDMG-CEF fields separating the symbol blocking structure of the Data field and pre-EDMG modulated fields.

The symbol blocking structure for pre-EDMG modulated fields transmitted over a 2.16 GHz or 2.16+2.16 GHz channel shall be defined at the DMG SC chip rate F_c as shown in Figure 28-20 (SU PPDU structure: pre-EDMG modulated fields symbol blocking, 2.16 GHz or 2.16+2.16 GHz channel).

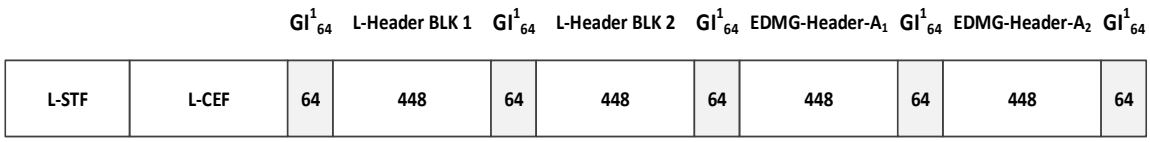

Figure 28-20—SU PPDU structure: pre-EDMG modulated fields symbol blocking, 2.16 GHz or 2.16+2.16 GHz channel

To transmit pre-EDMG modulated fields over a 4.32 GHz, 6.48 GHz, 8.64 GHz, or 4.32+4.32 GHz channel, the duplicate format defined in 28.5.10.4.4 (EDMG PPDU transmission over a 2.16 GHz or 2.16+2.16 GHz

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

channel with NSTS > 1 and 4.32 GHz, 6.48 GHz, 8.64 GHz or 4.32+4.32 GHz channel with NSTS ≥ 1) shall be used.

To transmit pre-EDMG modulated fields using N_{TX} > 1 transmit chains, the format using cyclic shift diversity (CSD) defined in 28.5.10.4.4 (EDMG PPDU transmission over a 2.16 GHz or 2.16+2.16 GHz channel with NSTS > 1 and 4.32 GHz, 6.48 GHz, 8.64 GHz or 4.32+4.32 GHz channel with NSTS ≥ 1) shall be used.

The symbol blocking structure for the Data field of an SU PPDU for the short, normal and long GI shall be as shown in Figure 28-21 (SU PPDU structure: Data field symbol blocking, (2.16 GHz or 2.16+2.16 GHz, NSTS > 1) or (4.32 GHz, 6.48 GHz, 8.64 GHz or 4.32+4.32 GHz, NSTS ≥ 1), short GI), Figure 28-22 (SU PPDU structure: Data field symbol blocking, (2.16 GHz or 2.16+2.16 GHz, NSTS > 1) or (4.32 GHz, 6.48 GHz, 8.64 GHz or 4.32+4.32 GHz, NSTS ≥ 1), normal GI), and Figure 28-23 (SU PPDU structure: Data field symbol blocking, (2.16 GHz or 2.16+2.16 GHz, NSTS > 1) or (4.32 GHz, 6.48 GHz, 8.64 GHz or 4.32+4.32 GHz, NSTS ≥ 1), long GI), respectively.

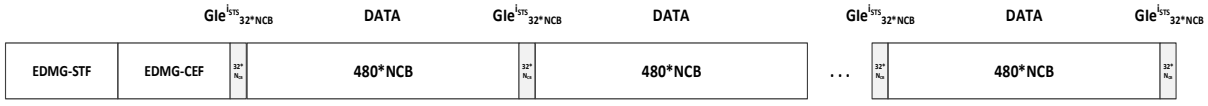

Figure 28-21—SU PPDU structure: Data field symbol blocking, (2.16 GHz or 2.16+2.16 GHz, N_{STS} > 1) or (4.32 GHz, 6.48 GHz, 8.64 GHz or 4.32+4.32 GHz, N_{STS} ≥ 1), short GI

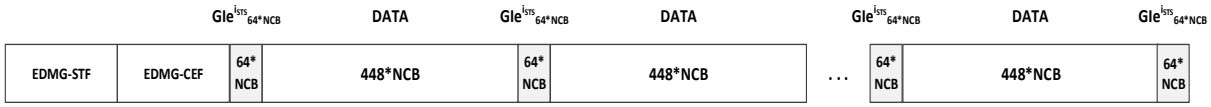

Figure 28-22—SU PPDU structure: Data field symbol blocking, (2.16 GHz or 2.16+2.16 GHz, N_{STS} > 1) or (4.32 GHz, 6.48 GHz, 8.64 GHz or 4.32+4.32 GHz, N_{STS} ≥ 1), normal GI

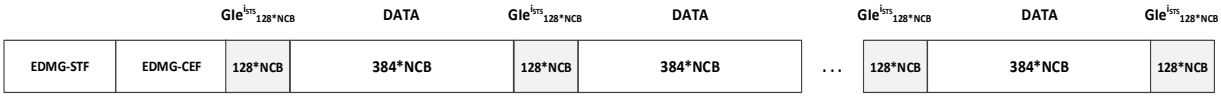

Figure 28-23—SU PPDU structure: Data field symbol blocking, (2.16 GHz or 2.16+2.16 GHz, N_{STS} > 1) or (4.32 GHz, 6.48 GHz, 8.64 GHz or 4.32+4.32 GHz, N_{STS} ≥ 1), long GI

The N_{STS} space-time streams of an SU PPDU may be mapped to N_{TX} ($N_{STS} \leq N_{TX}$) transmit chains applying direct, indirect spatial mapping or digital beamforming as defined in 28.5.10.4.2 (EDMG PPDU transmission over a 2.16 GHz or 2.16+2.16 GHz channel with NSTS = 1). The single space-time stream may be mapped to $N_{TX} \geq 1$ transmit chains applying spatial expansion as defined in 28.5.10.4.4 (EDMG PPDU transmission over a 2.16 GHz or 2.16+2.16 GHz channel with NSTS > 1 and 4.32 GHz, 6.48 GHz, 8.64 GHz or 4.32+4.32 GHz channel with NSTS ≥ 1).

A TRN field per transmit chain (see 28.9.2.2.6 (TRN subfield definition for EDMG SC PPDUs and EDMG control mode PPDUs)) may be appended to an SU PPDU.

28.5.9.2.3 SU A-PPDU transmission

The SU PPDU structures for EDMG A-PPDU transmission described in this subclause cover all the combination of channel bandwidth and number of spatial streams.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The SU PPDU structures for the first EDMG PPDU (i.e., $i_{PPDU} = 1$) within the EDMG A-PPDU are as shown in Figure 28-17 (SU PPDU structure: 2.16 GHz or 2.16+2.16 GHz channel, NSTS = 1, short GI) through Figure 28-23 (SU PPDU structure: Data field symbol blocking, (2.16 GHz or 2.16+2.16 GHz, NSTS > 1) or (4.32 GHz, 6.48 GHz, 8.64 GHz or 4.32+4.32 GHz, NSTS ≥ 1), long GI). The SU PPDU structure for the EDMG PPDUs following the first EDMG PPDU (i.e., $2 \le i_{PPDU} \le N_{PPDU}$) when using the short GI, normal GI and long GI shall be as shown in Figure 28-24 (SU PPDU structure: EDMG A-PPDU, 2 ≤ iPPDU ≤ NPPDU, short GI), Figure 28-25 (SU PPDU structure: EDMG A-PPDU, 2 ≤ iPPDU ≤ NPPDU, normal GI), and Figure 28-26 (SU PPDU structure: EDMG A-PPDU, 2 ≤ iPPDU ≤ NPPDU, long GI), respectively. The final block transmitted of each EDMG PPDU within the EDMG A-PPDU is followed by the same GI as the Data field regardless of the value of the Additional EDMG PPDU field within the EDMG-Header-A.

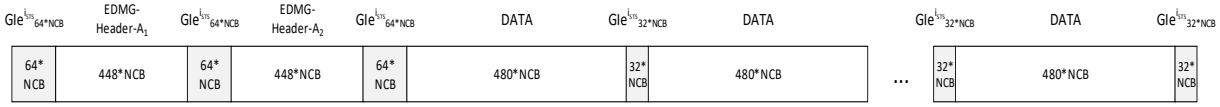

Figure 28-24—SU PPDU structure: EDMG A-PPDU, $2 \le i_{PPDU} \le N_{PPDU}$, short GI

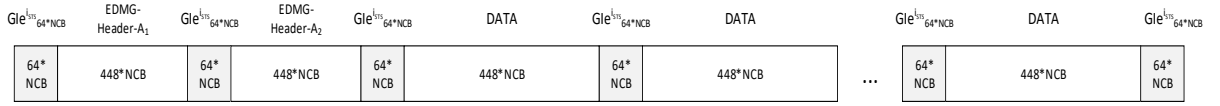

Figure 28-25—SU PPDU structure: EDMG A-PPDU, $2 \le i_{PPDU} \le N_{PPDU}$, normal GI

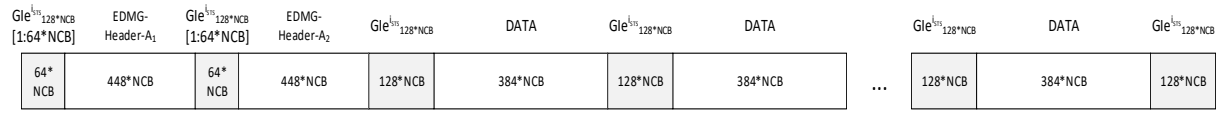

Figure 28-26—SU PPDU structure: EDMG A-PPDU, $2 \le i_{PPDU} \le N_{PPDU}$, long GI

28.5.9.2.4 MU PPDU transmission

28.5.9.2.4.1 General

This subclause defines an MU PPDU transmission over a 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, or 4.32+4.32 GHz channel with more than one space-time stream ($N_{STS} > 1$) transmitted to two or more users ($N_{user} > 1$).

An MU PPDU transmission shall be as defined in 28.5.9.2.4.2 (MU PPDU transmission).

28.5.9.2.4.2 MU PPDU transmission

As opposed to an SU PPDU, an MU PPDU includes the EDMG-Header-B. Similar to an SU PPDU transmission, the EDMG-Header-B and data symbol blocking structure is separated from the pre-EDMG modulated fields' symbol blocking structure by the EDMG-STF and EDMG-CEF fields.

The symbol blocking structure for pre-EDMG modulated fields transmitted over a 2.16 GHz or 2.16+2.16 GHz channel shall be defined at the DMG SC chip rate F_c as shown in Figure 28-20 (SU PPDU structure: pre-EDMG modulated fields symbol blocking, 2.16 GHz or 2.16+2.16 GHz channel).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

To transmit pre-EDMG modulated fields over a 4.32 GHz, 6.48 GHz, 8.64 GHz, or 4.32+4.32 GHz channel, the duplicate format defined in 28.5.10.4.4 (EDMG PPDU transmission over a 2.16 GHz or 2.16+2.16 GHz channel with NSTS > 1 and 4.32 GHz, 6.48 GHz, 8.64 GHz or 4.32+4.32 GHz channel with NSTS ≥ 1) shall be used.

To transmit pre-EDMG modulated fields using $N_{TX} > 1$ transmit chains, the format using cyclic shift diversity (CSD) defined in 28.5.10.4.4 (EDMG PPDU transmission over a 2.16 GHz or 2.16+2.16 GHz channel with NSTS > 1 and 4.32 GHz, 6.48 GHz, 8.64 GHz or 4.32+4.32 GHz channel with NSTS ≥ 1) shall be used.

The symbol blocking structure for the EDMG-Header-B and Data field of an MU PPDU for the short, normal and long GI shall be as shown in Figure 28-27 (MU PPDU structure: EDMG-Header-B and Data field symbol blocking, (2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz or 4.32+4.32 GHz, NSTS > 1), short GI), Figure 28-28 (MU PPDU structure: EDMG-Header-B and Data field symbol blocking, (2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz or 4.32+4.32 GHz, NSTS > 1), normal GI), and Figure 28-29 (MU PPDU structure: EDMG-Header-B and Data field symbol blocking, (2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz or 4.32+4.32 GHz, NSTS > 1), long GI), respectively.

Figure 28-27—MU PPDU structure: EDMG-Header-B and Data field symbol blocking, (2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz or 4.32+4.32 GHz, N_{STS} > 1), short GI

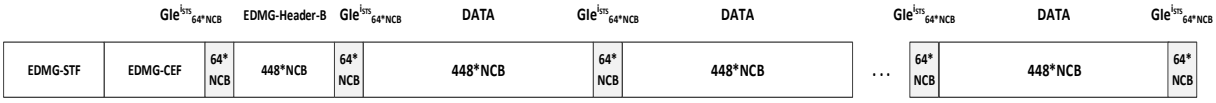

Figure 28-28—MU PPDU structure: EDMG-Header-B and Data field symbol blocking, (2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz or 4.32+4.32 GHz, N_{STS} > 1), normal GI

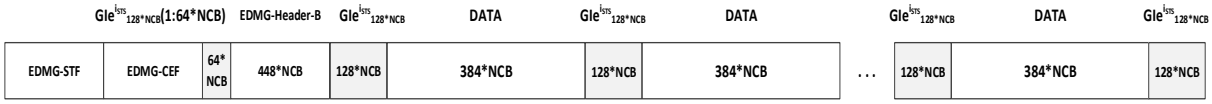

Figure 28-29—MU PPDU structure: EDMG-Header-B and Data field symbol blocking, (2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz or 4.32+4.32 GHz, N_{STS} > 1), long GI

The N_{STS} space-time streams of an MU PPDU may be mapped to N_{TX} ($N_{STS} \leq N_{TX}$) transmit chains applying direct, indirect spatial mapping or digital beamforming as defined in 28.5.10.4.2 (EDMG PPDU transmission over a 2.16 GHz or 2.16+2.16 GHz channel with NSTS = 1).

A TRN field per transmit chain (see 28.9.2.2.6 (TRN subfield definition for EDMG SC PPDUs and EDMG control mode PPDUs)) may be appended to an MU PPDU.

28.5.9.3 Scrambler

28.5.9.3.1 Scrambler for the Data field, L-Header, EDMG-Header-A, and EDMG-Header-B data bits and non-EDMG SC MCS1 coded bits

The Data field, L-Header, EDMG-Header-A, and EDMG-Header-B data bits and non-EDMG SC MCS1 coded bits (see 20.5.3.2.3 (Encoding)) shall be scrambled applying scrambler defined in 20.3.9 (Scrambler).

The scrambling of the Data field of an SU PPDU continues the scrambling of the L-Header and the EDMG-Header-A fields. The initial seed value is defined in the L-Header field.

The scrambling of the Data field of an MU PPDU is performed on a per user basis and continues the scrambling of the EDMG-Header-B field with reset of the seed value. The initial seed value is defined in the EDMG-Header-B field on a per user basis.

For an SU EDMG A-PPDU, the initial seed value is defined in the L-Header field and the scrambling of the $i_{PPDU}{}^{\text{th}}$ PPDU continues the scrambling of $(i_{PPDU}-1)^{\text{th}}$ PPDU with no seed reset.

For non-EDMG SC MCS1 with codeword length equal to 672 bits, the 168 repeated systematic bits shall be scrambled in turn starting from bit 1 and ending with bit 168 (see 20.5.3.2.3 (Encoding)). For each codeword, the transmitter shall reload the seed value to all 1s (bits x_1 through x_7).

28.5.9.3.2 Scrambler for EDMG-Header-A in SU EDMG A-PPDU, EDMG-Header-B, and EDMG SC MCS1 coded bits

The EDMG Header-A transmitted in an SU EDMG A-PPDU (excluding the first PPDU) coded bits, EDMG-Header-B coded bits, and repeated systematic part of an LDPC codeword using EDMG SC MCS1 encoding shall be scrambled by XORing each bit in turn with a length 127 periodic sequence generated by polynomial $S(x)=x^7+x+1$. The generation of the sequence and the XOR operation are shown in Figure 28-30 (EDMG-Header-A in SU EDMG A-PPDU, EDMG-Header-B, and EDMG SC MCS1 coded bits sequence scrambler). Each data or header bit is XORed with the scrambler output $(x_1 \oplus x_7)$ and the scrambler content is shifted once. The 127-bit sequence generated repeatedly by the scrambler shall be (leftmost used first), 01010100 11001110 11101001 01100011 01111011 01011011 00100100 01110000 10111110 01010111 00110100 01001111 00010100 00110000 01000000 1111111, when the all 1s (bits x_1 through x_7) initial state is used.

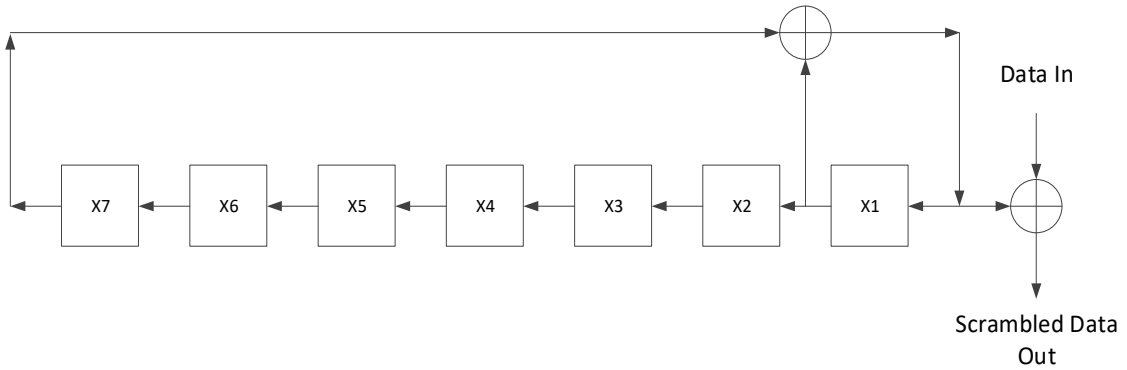

Figure 28-30—EDMG-Header-A in SU EDMG A-PPDU, EDMG-Header-B, and EDMG SC MCS1 coded bits sequence scrambler

For an EDMG-Header-A of an SU EDMG A-PPDU (excluding the first PPDU) using the EDMG SC mode, the scrambling of the coded bits starts at the 225^{th} bit and ends at the $(N_{STS} \times 896 \times N_{CB})^{\text{th}}$ bit (see 28.5.7

(Encoding of EDMG-Header-A for EDMG A-PPDU transmission)). The initial seed value is equal to all 1s (bits x_1 through x_7).

For an EDMG-Header-A of an SU EDMG A-PPDU (excluding the first PPDU) using the EDMG OFDM mode, the scrambling of the coded bits starts at the 225th bit and ends at the $(N_{STS} \times 4 \times N_{SD})^{th}$ bit (see 28.6.7 (Encoding of EDMG-Header-A for EDMG A-PPDU transmission)). The initial seed value is equal to all 1s (bits x_1 through x_7).

In an MU PPDU transmission using the EDMG SC mode, the scrambling of the EDMG-Header-B coded bits starts at the 225th bit and ends at the $(N_{STS} \times 448 \times N_{CB})^{th}$ bit (see 28.5.6 (Encoding of EDMG-Header-B)). The initial seed value is equal to all 1s (bits x_1 through x_7).

In an MU PPDU transmission using the EDMG OFDM mode, the scrambling of the EDMG-Header-B coded bits starts at the 225th bit and ends at the $(N_{STS} \times 2 \times N_{SD})^{th}$ bit (see 28.6.6 (Encoding of EDMG-Header-B)). The initial seed value is equal to all 1s (bits x_1 through x_7).

For EDMG SC MCS1 with codeword length equal to 672 bits, the 168 repeated systematic bits shall be scrambled in turn starting from bit 1 and ending with bit 168. For EDMG SC MCS1 scrambling and codeword length equal to 1344 bits, the 336 repeated systematic bits shall be scrambled in turn starting from bit 1 and ending with bit 336. For each codeword, the transmitter shall reload the seed value to all 1s (bits x_1 through x_7).

28.5.9.4 Encoding

28.5.9.4.1 General

An EDMG SC mode PSDU is encoded by a systematic LDPC block code. Each data word of L_{CWD} information bits is concatenated with L_{CWP} parity bits to create a codeword of total length $L_{CW} = L_{CWD} + L_{CWP}$ bits. The EDMG LDPC encoding can employ the codeword lengths L_{CW} = 468, 504, 624, 672, 936, 1008, 1248, and 1344 and code rates R = 1/2, 5/8, 2/3, 3/4, 13/16, 5/6, and 7/8. The set of code rates is defined in Table 28-56.

Table 28-56—LDPC code rates

Code rate	Codeword size (L_{CW})		Number of data bits (L_{CWD})	
	Short	Long	Short	Long
1/2	672	1344	336	672
5/8	672	1344	420	840
2/3	504	1008	336	672
3/4	672	1344	504	1008
13/16	672	1344	546	1092
5/6	468 or 504	936 or 1008	390 or 420	780 or 840
7/8	624 or 672	1248 or 1344	546 or 588	1092 or 1176

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The LDPC encoding with codeword length L_{CW} = 672 and 1344 is performed by solving the linear system of equations $\mathbf{H} \cdot \left(\mathbf{c}^{(m)}\right)^T = \mathbf{0}$ defined by the parity matrix H of size L_{CWP} by L_{CW}, where $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{p}^{(m)}\right)$ defines the m^{th} LDPC codeword, $\mathbf{b}^{(m)} = \left(b_1^{(m)}, b_2^{(m)}, ..., b_{L_{CWD}}^{(m)}\right)$ defines the m^{th} data word, and $\mathbf{p}^{(m)} = \left(p_1^{(m)}, p_2^{(m)}, ..., p_{L_{CWP}}^{(m)}\right)$ defines parity bits for m^{th} LDPC codeword.

The LDPC encoding with codeword length L_{CW} = 624 and 1248 employs the matrices H with L_{CW} = 672 and 1344 for code rate R = 13/16, and then applies a puncturing procedure to get to a desired code rate R = 7/8. For L_{CW} = 624, first 48 parity bits are discarded; for L_{CW} = 1248, first 96 parity bits are discarded.

The LDPC encoding for code rate 2/3 with codeword length L_{CW} = 504 and 1008 employs the matrices H with L_{CW} = 672 and 1344 for code rate R = 3/4, and then applies a shortening procedure to get to a desired code rate R = 2/3. For L_{CW} = 504, 168, 0s are appended to 336 data bits before encoding; for L_{CW} = 1008, 336, 0s are appended to 672 data bits before encoding. After encoding the zero bits are discarded and not transmitted.

The LDPC encoding for code rate 5/6 with codeword length L_{CW} = 504 and 1008 employs the matrices H with L_{CW} = 672 and 1344 for code rate R = 7/8. For L_{CW} = 504, 168, 0s are appended to 420 data bits before encoding; for L_{CW} = 1008, 336, 0s are appended to 840 data bits before encoding. After encoding, the zero bits are discarded and not transmitted.

The LDPC encoding for code rate 5/6 with codeword length L_{CW} = 468 and 936 employs the matrices H with L_{CW} = 672 and 1344 for code rate R = 13/16. For L_{CW} = 468, 156, 0s are appended to 390 data bits before encoding; for L_{CW} = 936, 312, 0s are appended to 780 data bits before encoding. After encoding, the zero bits are discarded; for L_{CW} = 468, the first 48 parity bits are discarded (punctured); for L_{CW} = 936, the first 96 parity bits are discarded and not transmitted.

Table 28-57 defines the number of coded bits per SC symbol block, N_{CBPB}, for different types of GI.

Table 28-57—Values of N_{CBPB} for different types of GI

Symbol mapping	Short GI	Normal GI	Long GI
π/2-BPSK	480	448	384
π/2-QPSK	960	896	768
π/2-8-PSK	1440	1344	1152
π/2-16-QAM	1920	1792	1536
π/2-64-QAM/π/2-64-NUC	2880	2688	2304

Table 28-47 defines the number of symbols (constellation points) per SC symbol block, N_{SPB}, for different types of GI.

28.5.9.4.2 Parity check matrices

28.5.9.4.3 LDPC encoding

This subclause defines the PSDU encoding process for an SU PPDU and the PSDU per user basis encoding for an MU PPDU. The LDPC encoding may employ codeword lengths L_{CW} = 468, 504, 624, 672, 936, 1008, 1248, or 1344 and code rates R = 1/2, 5/8, 2/3, 3/4, 13/16, 5/6 or 7/8.

The LDPC encoding process for the i_{user}^{th} user shall be as follows:

a) Compute the number of data pad bits, $N_{DATA\_PAD\,i_{user}}$, using the number of LDPC codewords, $N_{CW\,i_{user}}$, as follows:

$$N_{CW\,i_{user}} = \left\lceil \frac{Length_{i_{user}} \cdot 8}{L_{CW\,i_{user}} \cdot \frac{R_{i_{user}}}{\rho_{i_{user}}}} \right\rceil$$

$$N_{DATA\_PAD\,i_{user}} = N_{CW\,i_{user}} \cdot L_{CW\,i_{user}} \cdot \left(\frac{R_{i_{user}}}{\rho_{i_{user}}} \right) - Length_{i_{user}} \cdot 8$$

The scrambled PSDU is concatenated with $N_{DATA\_PAD\,i_{user}}$ zero bits. They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU input bits.

b) Convert the scrambled PSDU bits to LDPC codewords as follows:

1) If ρ = 1 and L_{CW} = 672 or 1344, R = 1/2, 5/8, 3/4, 13/16, or 7/8:

i) The output stream of scrambler is broken into the blocks of length $L_{CWD} = L_{CW} \times R$ bits such that the m^{th} data word is $\mathbf{b}^{(m)} = \left(b_1^{(m)}, b_2^{(m)}, ..., b_{L_{CWD}}^{(m)} \right), m \le N_{CW\,i_{user}}$.

ii) To each data word, parity bits $\mathbf{p}^{(m)} = \left(p_1^{(m)}, p_2^{(m)}, ..., p_{L_{CWP}}^{(m)} \right)$, $L_{CWP} = L_{CW} - L_{CWD}$, are added to create the codeword $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{p}^{(m)} \right), m \le N_{CW\,i_{user}}$ such that $\mathbf{H} \cdot \left(\mathbf{c}^{(m)} \right)^T = \mathbf{0}$.

2) If ρ = 1 and L_{CW} = 624, R = 7/8:

i) The output stream of scrambler is broken into the blocks of length 546 bits such that the m^{th} data word is $\mathbf{b}^{(m)} = \left(b_1^{(m)}, b_2^{(m)}, ..., b_{546}^{(m)} \right), m \le N_{CW\,i_{user}}$.

ii) To each data word, parity bits $\mathbf{p}^{(m)} = \left(p_1^{(m)}, p_2^{(m)}, ..., p_{126}^{(m)} \right)$ are added to create the codeword $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{p}^{(m)} \right), m \le N_{CW\,i_{user}}$ such that $\mathbf{H} \cdot \left(\mathbf{c}^{(m)} \right)^T = \mathbf{0}$, parity bits are computed applying L_{CW} = 672, R = 13/16 LDPC matrix.

iii) Finally, the first 48 parity bits are discarded (punctured) to create the output codeword $\mathbf{c}^{(m)} = \left(b_1^{(m)}, b_2^{(m)}, ..., b_{546}^{(m)}, p_{49}^{(m)}, p_{50}^{(m)}, ..., p_{126}^{(m)} \right), m \le N_{CW\,i_{user}}$.

3) If ρ = 1 and L_{CW} = 1248, R = 7/8:

i) The output stream of scrambler is broken into the blocks of length 1092 bits such that the m^{th} data word is $\mathbf{b}^{(m)} = \left(b_1^{(m)}, b_2^{(m)}, ..., b_{1092}^{(m)} \right), m \le N_{CW\,i_{user}}$.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

ii) To each data word, parity bits $\mathbf{p}^{(m)} = \left(p_1^{(m)}, p_2^{(m)}, ..., p_{252}^{(m)}\right)$ are added to create the codeword $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{p}^{(m)}\right), m \le N_{CW\,i_{user}}$ such that $\mathbf{H} \cdot \left(\mathbf{c}^{(m)}\right)^T = \mathbf{0}$, parity bits are computed applying L_{CW} = 1344, R = 13/16 LDPC matrix.

iii) Finally, the first 96 parity bits are discarded (punctured) to create the output codeword $\mathrm{c}^{(m)} = (b_1^{(m)}, b_2^{(m)}, ..., b_{1092}^{(m)}, p_{97}^{(m)}, p_{98}^{(m)}, ..., p_{252}^{(m)}), m \le N_{CW\,i_{user}}$.

4) If ρ = 2 and L_{CW} = 672, R = 1/2:

i) The output stream of scrambler is broken into the blocks of length 168 bits such that the m^{th} data word is $\mathbf{b}^{(m)} = \left(b_1^{(m)}, b_2^{(m)}, ..., b_{168}^{(m)}\right), m \le N_{CW\,i_{user}}$.

ii) To each data word, zero bits $\mathbf{0}^{(m)} = \left(0_1^{(m)}, 0_2^{(m)}, ..., 0_{168}^{(m)}\right)$ and parity bits $\mathbf{p}^{(m)} = \left(p_1^{(m)}, p_2^{(m)}, ..., p_{336}^{(m)}\right)$ are added to create the codeword $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{0}^{(m)}, \mathbf{p}^{(m)}\right), m \le N_{CW\,i_{user}}$ such that $\mathbf{H} \cdot \left(\mathbf{c}^{(m)}\right)^T = \mathbf{0}$.

iii) Finally, the zero bits are replaced with word $\mathbf{b}^{(m)}$ repetition XORed by PN sequence that is generated from the LFSR used for MCS 1 scrambling as defined in 28.5.9.3.2 (Scrambler for EDMG-Header-A in SU EDMG A-PPDU, EDMG-Header-B, and EDMG SC MCS1 coded bits). The LFSR is initialized to all 1s initial seed value and reinitialized to the same seed after every codeword.

5) If ρ = 2 and L_{CW} = 1344, R = 1/2:

i) The output stream of scrambler is broken into the blocks of length 336 bits such that the m^{th} data word is $\mathbf{b}^{(m)} = \left(b_1^{(m)}, b_2^{(m)}, ..., b_{336}^{(m)}\right), m \le N_{CW\,i_{user}}$.

ii) To each data word, zero bits $\mathbf{0}^{(m)} = \left(0_1^{(m)}, 0_2^{(m)}, ..., 0_{336}^{(m)}\right)$ and parity bits $\mathbf{p}^{(m)} = \left(p_1^{(m)}, p_2^{(m)}, ..., p_{672}^{(m)}\right)$ are added to create the codeword $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{0}^{(m)}, \mathbf{p}^{(m)}\right), m \le N_{CW\,i_{user}}$ such that $\mathbf{H} \cdot \left(\mathbf{c}^{(m)}\right)^T = \mathbf{0}$.

iii) Finally, the zero bits are replaced with word $\mathbf{b}^{(m)}$ repetition XORed by PN sequence that is generated from the LFSR used for MCS 1 scrambling as defined in 28.5.9.3.2 (Scrambler for EDMG-Header-A in SU EDMG A-PPDU, EDMG-Header-B, and EDMG SC MCS1 coded bits). The LFSR is initialized to all 1s initial seed value and reinitialized to the same seed after every codeword.

6) If ρ = 1 and L_{CW} = 504, R = 2/3:

i) The output stream of scrambler is broken into the blocks of length 336 bits such that the m^{th} data word is $\mathbf{b}^{(m)} = \left(b_1^{(m)}, b_2^{(m)}, ..., b_{336}^{(m)}\right), m \le N_{CW\,i_{user}}$.

ii) To each data word, zero bits $\mathbf{0}^{(m)} = \left(0_1^{(m)}, 0_2^{(m)}, ..., 0_{168}^{(m)}\right)$ and parity bits $\mathbf{p}^{(m)} = \left(p_1^{(m)}, p_2^{(m)}, ..., p_{168}^{(m)}\right)$ are added to create the codeword $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{0}^{(m)}, \mathbf{p}^{(m)}\right), m \le N_{CW\,i_{user}}$ such that $\mathbf{H} \cdot \left(\mathbf{c}^{(m)}\right)^T = \mathbf{0}$, parity bits are computed applying L_{CW} = 672, R = 3/4 LDPC matrix.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

iii) Finally, the zero bits are discarded to create the output codeword $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{p}^{(m)}\right), m \le N_{CW\,i_{user}}$.

7) If $\rho = 1$ and $L_{CW} = 1008$, $R = 2/3$:

i) The output stream of scrambler is broken into the blocks of length 672 bits such that the m^{th} data word is $\mathbf{b}^{(m)} = \left(b_1^{(m)}, b_2^{(m)}, ..., b_{672}^{(m)}\right), m \le N_{CW\,i_{user}}$.

ii) To each data word, zero bits $\mathbf{0}^{(m)} = \left(0_1^{(m)}, 0_2^{(m)}, ..., 0_{336}^{(m)}\right)$ and parity bits $\mathbf{p}^{(m)} = \left(p_1^{(m)}, p_2^{(m)}, ..., p_{336}^{(m)}\right)$ are added to create the codeword $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{0}^{(m)}, \mathbf{p}^{(m)}\right), m \le N_{CW\,i_{user}}$ such that $\mathbf{H} \cdot \left(\mathbf{c}^{(m)}\right)^T = \mathbf{0}$, parity bits are computed applying $L_{CW} = 1344$, $R = 3/4$ LDPC matrix.

iii) Finally, the zero bits are discarded to create the output codeword $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{p}^{(m)}\right), m \le N_{CW\,i_{user}}$.

8) If $\rho = 1$ and $L_{CW} = 504$, $R = 5/6$:

i) The output stream of scrambler is broken into the blocks of length 420 bits such that the m^{th} data word is $\mathbf{b}^{(m)} = \left(b_1^{(m)}, b_2^{(m)}, ..., b_{420}^{(m)}\right), m \le N_{CW\,i_{user}}$.

ii) To each data word, zero bits $\mathbf{0}^{(m)} = \left(0_1^{(m)}, 0_2^{(m)}, ..., 0_{168}^{(m)}\right)$ and parity bits $\mathbf{p}^{(m)} = \left(p_1^{(m)}, p_2^{(m)}, ..., p_{84}^{(m)}\right)$ are added to create the codeword $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{0}^{(m)}, \mathbf{p}^{(m)}\right), m \le N_{CW\,i_{user}}$ such that $\mathbf{H} \cdot \left(\mathbf{c}^{(m)}\right)^T = \mathbf{0}$, parity bits are computed applying for $L_{CW} = 672$, $R = 7/8$ LDPC matrix.

iii) Finally, the zero bits are discarded to create the output codeword $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{p}^{(m)}\right), m \le N_{CW\,i_{user}}$.

9) If $\rho = 1$ and $L_{CW} = 1008$, $R = 5/6$:

i) The output stream of scrambler is broken into the blocks of length 840 bits such that the m^{th} data word is $\mathbf{b}^{(m)} = \left(b_1^{(m)}, b_2^{(m)}, ..., b_{840}^{(m)}\right), m \le N_{CW\,i_{user}}$.

ii) To each data word, zero bits $\mathbf{0}^{(m)} = \left(0_1^{(m)}, 0_2^{(m)}, ..., 0_{336}^{(m)}\right)$ and parity bits $\mathbf{p}^{(m)} = \left(p_1^{(m)}, p_2^{(m)}, ..., p_{168}^{(m)}\right)$ are added to create the codeword $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{0}^{(m)}, \mathbf{p}^{(m)}\right), m \le N_{CW\,i_{user}}$ such that $\mathbf{H} \cdot \left(\mathbf{c}^{(m)}\right)^T = \mathbf{0}$, parity bits are computed applying $L_{CW} = 1344$, $R = 7/8$ LDPC matrix.

iii) Finally, the zero bits are discarded to create the output codeword $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{p}^{(m)}\right), m \le N_{CW\,i_{user}}$.

10) If $\rho = 1$ and $L_{CW} = 468$, $R = 5/6$:

i) The output stream of scrambler is broken into the blocks of length 390 bits such that the m^{th} data word is $\mathbf{b}^{(m)} = \left(b_1^{(m)}, b_2^{(m)}, ..., b_{390}^{(m)}\right), m \le N_{CW\,i_{user}}$.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

ii) To each data word, zero bits $\mathbf{0}^{(m)} = \left(0_1^{(m)}, 0_2^{(m)}, ..., 0_{156}^{(m)}\right)$ and parity bits $\mathbf{p}^{(m)} = \left(p_1^{(m)}, p_2^{(m)}, ..., p_{126}^{(m)}\right)$ are added to create the codeword $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{0}^{(m)}, \mathbf{p}^{(m)}\right), m \le N_{CW\,i_{user}}$ such that $\mathbf{H} \cdot \left(\mathbf{c}^{(m)}\right)^T = \mathbf{0}$, parity bits are computed applying $L_{CW} = 672$, $R = 13/16$ LDPC matrix.

iii) Finally, the zero bits are discarded and the first 48 parity bits are discarded (punctured) to create the output codeword $\mathrm{c}^{(m)} = (b_1^{(m)}, b_2^{(m)}, ..., b_{390}^{(m)}, p_{49}^{(m)}, p_{50}^{(m)}, ..., p_{126}^{(m)}), m \le N_{CW\,i_{user}}$.

11) If $\rho = 1$ and $L_{CW} = 936$, $R = 5/6$:

i) The output stream of scrambler is broken into the blocks of length 780 bits such that the m^{th} data word is $\mathbf{b}^{(m)} = \left(b_1^{(m)}, b_2^{(m)}, ..., b_{780}^{(m)}\right), m \le N_{CW\,i_{user}}$.

ii) To each data word, zero bits $\mathbf{0}^{(m)} = \left(0_1^{(m)}, 0_2^{(m)}, ..., 0_{312}^{(m)}\right)$ and parity bits $\mathbf{p}^{(m)} = \left(p_1^{(m)}, p_2^{(m)}, ..., p_{252}^{(m)}\right)$ are added to create the codeword $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{0}^{(m)}, \mathbf{p}^{(m)}\right), m \le N_{CW\,i_{user}}$ such that $\mathbf{H} \cdot \left(\mathbf{c}^{(m)}\right)^T = \mathbf{0}$, parity bits are computed applying $L_{CW} = 1344$, $R = 13/16$ LDPC matrix.

iii) Finally, the zero bits are discarded and the first 96 parity bits are discarded (punctured) to create the output codeword $\mathrm{c}^{(m)} = (b_1^{(m)}, b_2^{(m)}, ..., b_{780}^{(m)}, p_{97}^{(m)}, p_{98}^{(m)}, ..., p_{252}^{(m)}), m \le N_{CW\,i_{user}}$.

c) Concatenate LDPC codewords one after the other to create the coded bits stream $\left(\mathbf{c}^{(1)}, \mathbf{c}^{(2)}, ..., \mathbf{c}^{\left(N_{CW\,i_{user}}\right)}\right)$.

d) Compute the number of coded pad bits, $N_{BLK\_PAD\,i_{user}}$, using the number of SC symbol blocks, $N_{BLKS\,i_{user}}$, as follows:

$$N_{BLKS\,i_{user}} = \left\lceil \frac{N_{CW\,i_{user}} \cdot L_{CW\,i_{user}}}{N_{SPB} \cdot \sum_{i_{SS}=1}^{N_{SS\,i_{user}}} N_{CBPS\,i_{user}\,i_{ss}}} \right\rceil$$

If (BRP PPDU) and $N_{BLKS\,i_{user}} < N_{BLKS\,\min}$, then $N_{BLKS\,i_{user}} = N_{BLKS\,\min}$.

If last PPDU in A-PPDU, then $N_{BLKS\,i_{user}} = N_{BLKSspoof}$.

If STBC applied and $N_{BLKS\,i_{user}}$ is odd, then $N_{BLKS\,i_{user}} = N_{BLKS\,i_{user}} + 1$.

$$N_{BLK\_PAD\,i_{user}} = N_{BLKS\,i_{user}} \cdot N_{SPB} \cdot \sum_{i_{SS}=1}^{N_{SS\,i_{user}}} N_{CBPS\,i_{user}\,i_{SS}} - N_{CW\,i_{user}} \cdot L_{CW\,i_{user}}$$

Concatenate coded bits with $N_{BLK\_PAD\,i_{user}}$ zero bits. They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU bits and data pad bits in step a).

e) Distribute the encoded and padded bits over the $N_{SS\,i_{user}}$ spatial streams on a group basis with the number of $N_{CBPS\,i_{user}\,i_{ss}}$ bits in a group. The first group of bits goes to the first spatial stream, the second group of bits goes to the second spatial stream, and so on. The procedure is repeated when

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the maximum number of spatial streams, $N_{SS\,i_{user}}$, is reached. The procedure ends when all PSDU encoded bits, including $N_{BLK\_PAD\,i_{user}}$ pad bits, are distributed over the $N_{SS\,i_{user}}$ spatial streams.

For each user, if STBC coding is applied, then $N_{SS\,i_{user}}$ spatial streams are mapped to $N_{STS\,i_{user}} = 2N_{SS\,i_{user}}$ space-time streams as defined in 28.5.9.5.4 (Space-time block coding (STBC)). Otherwise, a one-to-one mapping of $N_{SS\,i_{user}}$ spatial streams to $N_{STS\,i_{user}}$ space-time streams shall be applied.

NOTE—For a PPDU carrying a BRP frame, the value of $N_{BLKS\,\min}$ is specified in 28.9.2.2.4 (EDMG BRP PPDU duration).

28.5.9.4.4 MU PPDU padding and space-time streams mapping

For an MU PPDU transmission, all user PPDUs shall be aligned in time. If necessary, PSDUs within the MU PPDU shall be padded according to the following steps:

a) Compute the maximum number of SC symbol blocks over all users $N_{BLKS\,\max} = \max_{i_{user}}\left(N_{BLKS\,i_{user}}\right)$ for $i_{user} = 1, 2, \ldots, N_{user}$.

b) Update the number of SC symbol blocks at step e) in 28.5.9.4.3 (LDPC encoding) as $N_{BLKS\,i_{user}} = N_{BLKS\,\max}$ for $i_{user} = 1, 2, \ldots, N_{user}$. Update the number of pad bits for the i_{user}^{th} user accordingly.

c) The number of pad SC symbol blocks for the MU PPDU transmission for the i_{user}^{th} user is defined as $N_{PAD\_BLKS\,i_{user}} = N_{BLKS\,\max} - N_{BLKS\,i_{user}}$.

The number of pad blocks $N_{PAD\_BLKS\,i_{user}}$ takes into account the MU PPDU padding only and does not include the regular padding described in 28.5.9.4.3 (LDPC encoding).

The space-time stream index per user, $i_{STS\,i_{user}}$, is mapped to the space-time stream index over all users, i_{STS}, as follows:

$$i_{STS}\left(i_{user}, i_{STS\,i_{user}}\right) = \sum_{m=0}^{i_{user}-1} Num_m + i_{STS\,i_{user}},\ 1 \le i_{STS\,i_{user}} \le N_{STS\,i_{user}},\ 1 \le i_{user} \le N_{user}$$

$Num_m = N_{STS\,m}$ for $m > 0$ and $Num_m = 0$ otherwise

NOTE—i_{STS} is a function of i_{user} and $i_{STS\,i_{user}}$ indices. However, to simplify the notation, this dependence is not indicated explicitly in other equations.

28.5.9.4.5 SU A-PPDU padding

For the last PPDU in an EDMG A-PPDU, $N_{BLKSspoof}$ shall be set, at step d) in 28.5.9.4.3 (LDPC encoding), so that the spoofing error is non-negative and smaller than one SC symbol block (i.e., T_{DFT}, defined in Table 28-47. If the last PPDU in an EDMG A-PPDU contains a BRP frame, $N_{BLKSspoof}$ shall be equal to or greater than $N_{BLKS\,\min}$. $N_{BLKSspoof}$ is calculated as follows:

$$T_{Data\,\max}^{(N_{PPDU})} = TXTIME_{spoof} - \left(T_{L\text{-}STF} + T_{L\text{-}CEF} + T_{L\text{-}Header} + N_{PPDU} \cdot T_{EDMG\text{-}Header\text{-}A} + T_{EDMG\text{-}STF} + T_{EDMG\text{-}CEF} + \sum_{i_{PPDU}=1}^{N_{PPDU}-1} T_{Data}^{(i_{PPDU})} + T_{TRN}\right)$$

$$N_{BLKSspoof} = \left\lfloor \frac{T_{Data\,\max}^{(N_{PPDU})}}{T_{DFT}} \right\rfloor$$

where

i_{STS} is the space-time stream number and $1 \le i_{STS} \le 8$

$TXTIME_{spoof}$ is the spoofed PPDU duration calculated based on L-Header

$T_{L\text{-}STF}$, $T_{L\text{-}CEF}$, $T_{L\text{-}Header}$, $T_{EDMG\text{-}STF}$, $T_{EDMG\text{-}CEF}$, $T_{EDMG\text{-}Header\text{-}A}$, and T_{TRN} are the durations of the L-STF, L-CEF, L-Header, EDMG-STF, EDMG-CEF, EDMG-Header-A, and TRN fields as defined in 28.12.3.3 (TXTIME calculation for EDMG SC mode)

T_{DFT} is defined in Table 28-47

$T_{Data}^{(i_{PPDU})}$, for i_{PPDU} =1, …, N_{PPDU} − 1, is the duration of the Data field of the i_{PPDU}^{th} PPDU, except for the last PPDU, as defined in 28.12.3.3 (TXTIME calculation for EDMG SC mode)

$T_{Data\,\max}^{(N_{PPDU})}$ is the maximum duration of the last PPDU that fulfills the spoofing error requirement

For an EDMG A-PPDU transmission, the spoofed values of the L-Header fields and the duration of the PPDUs except the last PPDU shall be determined so that $N_{BLKSspoof}$ is equal to or greater than $N_{BLKS\,\min}$.

28.5.9.5 Modulation mapping

28.5.9.5.1 General

The coded and padded bit stream is converted into a stream of complex constellation points, following the rules defined in 20.5.3.2.4 (Modulation mapping) for π/2-BPSK, π/2-QPSK, π/2-16-QAM, and π/2-64-QAM. The π/2-64-NUC nonuniform constellation (NUC) modulation is defined in 28.5.9.5.6 (π/2-64-NUC nonuniform constellation modulation). For π/2-8-PSK, follow the rules defined in 28.5.9.5.7 (π/2-8-PSK modulation).

28.5.9.5.2 Transmission in EDMG format

The EDMG data transmit waveform for i_{TX}^{th} transmit chain in time domain shall be defined at the EDMG SC chip rate $F_{c\,EDMG}$ as follows:

$$r_{Data}^{i_{TX}}\left(q\frac{T_c}{N_{CB}}\right)=\frac{1}{\sqrt{N_{STS}}}\sum_{n=0}^{N_{EDMG\text{-}DATA}-1}\sum_{i_{STS}=1}^{N_{STS}}\left[Q_{EDMG}\right]_{i_{TX},i_{STS}}d\left(i_{STS},n\right)\delta\left(\left(n-q\right)\frac{T_c}{N_{CB}}\right)$$

where

$N_{EDMG\text{-}DATA}$ is the total number of chips

N_{STS} is the total number of space-time streams

Q_{EDMG} is a spatial mapping matrix independent of the n^{th} chip time index that is described in 28.5.10.2 (Spatial mapping)

$[\ ]_{m,n}$ is a matrix element from m^{th} row and n^{th} column

$d(i_{STS}, n)$ is the data sequence, it includes data payload symbols as well as the guard interval symbols

$\delta\left(\left(n-q\right)\frac{T_c}{N_{CB}}\right)$ is the delta function, which is equal to 1 if $n = q$, and is equal to 0 otherwise

q is a time sample index

28.5.9.5.3 Dual carrier modulation (DCM) π/2-BPSK

A frequency domain diversity scheme based on DCM π/2-BPSK may be applied to an EDMG PPDU transmission over 2.16+2.16 GHz or 4.32+4.32 GHz channels. An EDMG STA shall only apply DCM π/2-BPSK to an EDMG PPDU transmitted to a peer EDMG STA if the DCM π/2-BPSK Supported field in the peer STA's EDMG Capabilities element is 1.

The DCM π/2-BPSK modulation is applied to an EDMG PPDU if, in the EDMG-Header-A, the BW field indicates a bandwidth configuration 2.16+2.16 GHz or 4.32+4.32 GHz, the Channel Aggregation field is set to 1, the Number of SS field indicates 2 spatial streams, and the DCM BPSK Applied field is set to 1. The value of the Differential EDMG-MCS1 and Differential EDMG-MCS2 fields in the EDMG-Header-A shall be the same. The resulting EDMG-MCS index shall be in the range from 2 to 6 as defined in Table 28-51.

The DCM π/2-BPSK modulation is defined as follows:

— After LDPC encoding, the bit stream of the first spatial stream (i_{SS} = 1) and the second spatial stream (i_{SS} = 2) is broken into two groups of $N_{CBPB} \times N_{CB}$ bits as $\left(c_0^{(i_{SS}=1,q)}, c_1^{(i_{SS}=1,q)}, ..., c_{N_{CBPB}\times N_{CB}-1}^{(i_{SS}=1,q)}\right)$ and $\left(c_0^{(i_{SS}=2,q)}, c_1^{(i_{SS}=2,q)}, ..., c_{N_{CBPB}\times N_{CB}-1}^{(i_{SS}=2,q)}\right)$, respectively, where q denotes the SC symbol block number and q =0, 1, …, N_{BLKS} − 1. N_{CBPB} is defined as in Table 28-57 for the π/2-BPSK case, N_{CB} = 1 for a 2.16+2.16 GHz channel and N_{CB} = 2 for a 4.32+4.32 GHz channel.

— Each pair of bits $\left(c_k^{(i_{SS}=1,q)}, c_k^{(i_{SS}=2,q)}\right)$ of the q^{th} SC data block, k = 0, 1, $N_{CBPB} \times N_{CB}$ − 1, is converted into a pair of constellation points $d_k^{(i_{SS}=1,q)} == \frac{1}{\sqrt{2}}\left(\left(2\times c_k^{(i_{SS}=1,q)} - 1\right) + j\left(2\times c_k^{(i_{SS}=2,q)} - 1\right)\right) e^{j\pi k/2}$ and $d_k^{(i_{SS}=2,q)} == \frac{1}{\sqrt{2}}\left(\left(2\times c_k^{(i_{SS}=1,q)} - 1\right) - j\left(2\times c_k^{(i_{SS}=2,q)} - 1\right)\right) e^{j\pi k/2}$.

— Finally, the q^{th} SC data block of the first spatial stream $d_k^{(i_{SS}=1,q)}$, k = 0, 1, …, $N_{CBPB} \times N_{CB}$ − 1, is assigned to the channel containing the primary 2.16 GHz channel and the second spatial stream $d_k^{(i_{SS}=2,q)}$, k = 0, 1, …, $N_{CBPB} \times N_{CB}$ − 1, is assigned to the channel that does not contain the primary channel.

The DCM π/2-BPSK modulation uses the same symbol blocking structure as for an SU PPDU defined in 28.5.9.2.2.3 (SU PPDU transmission over a 2.16 GHz or 2.16+2.16 GHz channel with NSTS > 1 and over a 4.32 GHz, 6.48 GHz, 8.64 GHz, or 4.32+4.32 GHz channel with NSTS ≥ 1).

28.5.9.5.4 Space-time block coding (STBC)

An EDMG STA shall only apply STBC to an EDMG PPDU transmitted to a peer EDMG STA if the STBC Type field in the peer STA's EDMG Capabilities element is nonzero.

STBC performs mapping of N_{SS} spatial streams to $2 \times N_{SS}$ space-time streams. STBC is applied to an EDMG PPDU if, in the EDMG-Header-A of the PPDU, the STBC field is equal to 1. The number of STBC modulated spatial streams N_{SS} is given by the Number of SS field in the EDMG-Header-A. N_{SS} shall not exceed four for an SU PPDU and one per user for an MU PPDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The mapping of each spatial stream, $i_{SS} = 1, \ldots, N_{SS}$, includes the following steps:

— The input encoded bits stream of spatial stream i_{SS} is broken into groups of $N_{CBPB\ i_{SS}} \times N_{CB}$ bits, $\left(c_0^{(i_{SS},q)}, c_1^{(i_{SS},q)}, \ldots, c_{N_{CBPB\ i_{SS}} \times N_{CB}-1}^{(i_{SS},q)} \right)$, where q denotes the group number. The STBC applies the encoding procedure defined in 28.5.9.4.3 (LDPC encoding). The padding procedure requires that the total number of groups of $N_{CBPB\ i_{SS}} \times N_{CB}$ bits shall be an even number.

— Each group of bits $\left(c_{N_{CBPS\ i_{SS}} \cdot k}^{(i_{SS},q)}, c_{N_{CBPS\ i_{SS}} \cdot k+1}^{(i_{SS},q)}, \ldots, c_{N_{CBPS\ i_{SS}} \cdot k+N_{CBPS\ i_{SS}}-1}^{(i_{SS},q)} \right)$, $k = 0, 1, \ldots, N_{SPB} - 1$, is converted to the constellation point $d_k^{(i_{SS},q)}$ following the rules defined in 20.5.3.2.4 (Modulation mapping), 28.5.9.5.6 (π/2-64-NUC nonuniform constellation modulation), and 28.5.9.5.7 (π/2-8-PSK modulation).

— STBC operates with symbol blocks $d^{(i_{SS},q)} = \left(d_0^{(i_{SS},q)}, d_1^{(i_{SS},q)}, \ldots, d_{N_{SPB}-1}^{(i_{SS},q)} \right)$, $q = 0, 1, \ldots, N_{BLKS} - 1$, and with blocks with reversed symbols order $d_{inv}^{(i_{SS},q)} = \left(d_{N_{SPB}-1}^{(i_{SS},q)}, d_{N_{SPB}-2}^{(i_{SS},q)}, \ldots, d_0^{(i_{SS},q)} \right)$ of spatial stream i_{SS} and assigns these blocks to two space-time streams.

— The modulated data symbols for the odd space-time stream are defined as follows:

$$s^{(i_{STS}=2\times i_{SS}-1)} = \left(d^{(i_{SS},0)}, d^{(i_{SS},1)}, d^{(i_{SS},2)}, d^{(i_{SS},3)}, \ldots, d^{(i_{SS},N_{BLKS}-2)}, d^{(i_{SS},N_{BLKS}-1)} \right)$$

— The modulated data symbols for the even space-time stream are defined as follows:

$$s^{(i_{STS}=2\times i_{SS})} = \left(\begin{array}{l} -conj\left(d_{inv}^{(i_{SS},1)} \right), conj\left(d_{inv}^{(i_{SS},0)} \right), -conj\left(d_{inv}^{(i_{SS},3)} \right), conj\left(d_{inv}^{(i_{SS},2)} \right), \ldots \\ \ldots, -conj\left(d_{inv}^{(i_{SS},N_{BLKS}-1)} \right), conj\left(d_{inv}^{(i_{SS},N_{BLKS}-2)} \right) \end{array} \right)$$

— STBC uses the same symbol blocking structure for an SU PPDU and an MU PPDU defined in 28.5.9.2.2.3 (SU PPDU transmission over a 2.16 GHz or 2.16+2.16 GHz channel with NSTS > 1 and over a 4.32 GHz, 6.48 GHz, 8.64 GHz, or 4.32+4.32 GHz channel with NSTS ≥ 1) and 28.5.9.2.4 (MU PPDU transmission), respectively.

28.5.9.5.5 Block interleaver

The block interleaver is defined for π/2-64-QAM and π/2-64-NUC modulations. The block interleaver performs modulated complex symbols interleaving inside an SC symbol block and its parameters depend on the N_{SPB}, N_{CB}, $N_{SS\ i_{user}}$, $L_{CW\ i_{user}}$, and $N_{CBPS\ i_{user}\ i_{SS}}$ parameters.

The input to the interleaver for the i^{th} spatial stream is an SC symbol block $d_{in}^{(i_{SS},q)}$ of length N_{SPB} and composed of 64-QAM or 64-NUC symbols (before application of π/2-rotation) $d_{in}^{(i_{SS},q)} = \left(d_0^{(i_{SS},q)}, d_1^{(i_{SS},q)}, \ldots, d_{N_{SPB}-1}^{(i_{SS},q)} \right)$, where q denotes the SC symbol block number, $q = 0, 1, \ldots, N_{BLKS\ i_{user}} - 1$.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The output of the interleaver for the i^{th} spatial stream is a permuted SC symbol block $d_{out}^{(i_{SS},q)}$ of length N_{SPB} and defined as $d_{out}^{(i_{SS},q)} = \left(d_{idx(0)}^{(i_{SS},q)}, d_{idx(1)}^{(i_{SS},q)}, ..., d_{idx(N_{SPB}-1)}^{(i_{SS},q)} \right)$, where *idx*() defines the array of permutation indices.

The array of permutation indices, *idx*(), is constructed as follows:

Let $x = \left(N_{SPB} \times \sum_{i_{SS}=1}^{N_{SS\,i_{user}}} N_{CBPS\,i_{user}\,i_{SS}} \right) / L_{CW\,i_{user}}$.

Moreover, for each x, let $N_x = \begin{cases} 2 \times N_{CB}, & \text{if } x \le 3 \times N_{CB} \\ 4 \times N_{CB}, & \text{if } 3 \times N_{CB} < x \le 6 \times N_{CB} \\ 8 \times N_{CB}, & \text{if } 6 \times N_{CB} < x \le 12 \times N_{CB} \\ 16 \times N_{CB}, & \text{if } 12 \times N_{CB} < x \le 24 \times N_{CB} \\ 32 \times N_{CB}, & \text{if } 24 \times N_{CB} < x \end{cases}$ and $N_y = N_{SPB} / N_x$.

Then, $idx\left(j \times N_x + i\right) = N_y \times i + j$, where $i = 0, 1, \ldots, N_x - 1$ and $j = 0, 1, \ldots, N_y - 1$.

The symbols of the output interleaver SC symbol block are then rotated by π/2 as defined in 20.5.3.2.4.5 (π/2-16-QAM modulation) and 28.5.9.5.6 (π/2-64-NUC nonuniform constellation modulation) to produce the π/2-64-QAM and π/2-64-NUC constellation points, respectively.

28.5.9.5.6 π/2-64-NUC nonuniform constellation modulation

An EDMG STA shall only apply nonuniform constellation (NUC) to an EDMG PPDU transmitted to a peer EDMG STA if the NUC RX Supported field in the peer STA's EDMG Capabilities element is nonzero.

In π/2-64-NUC NUC modulation, the input bit stream is grouped in sets of 6 bits and mapped according to the following equation:

Each output symbol is then rotated according to the equation $s_k = \tilde{s}_k \cdot e^{\frac{j\pi k}{2}}$. The constellation bit encoding for the 64-NUC is depicted in Figure 28-31 (64-NUC nonuniform constellation bit encoding).

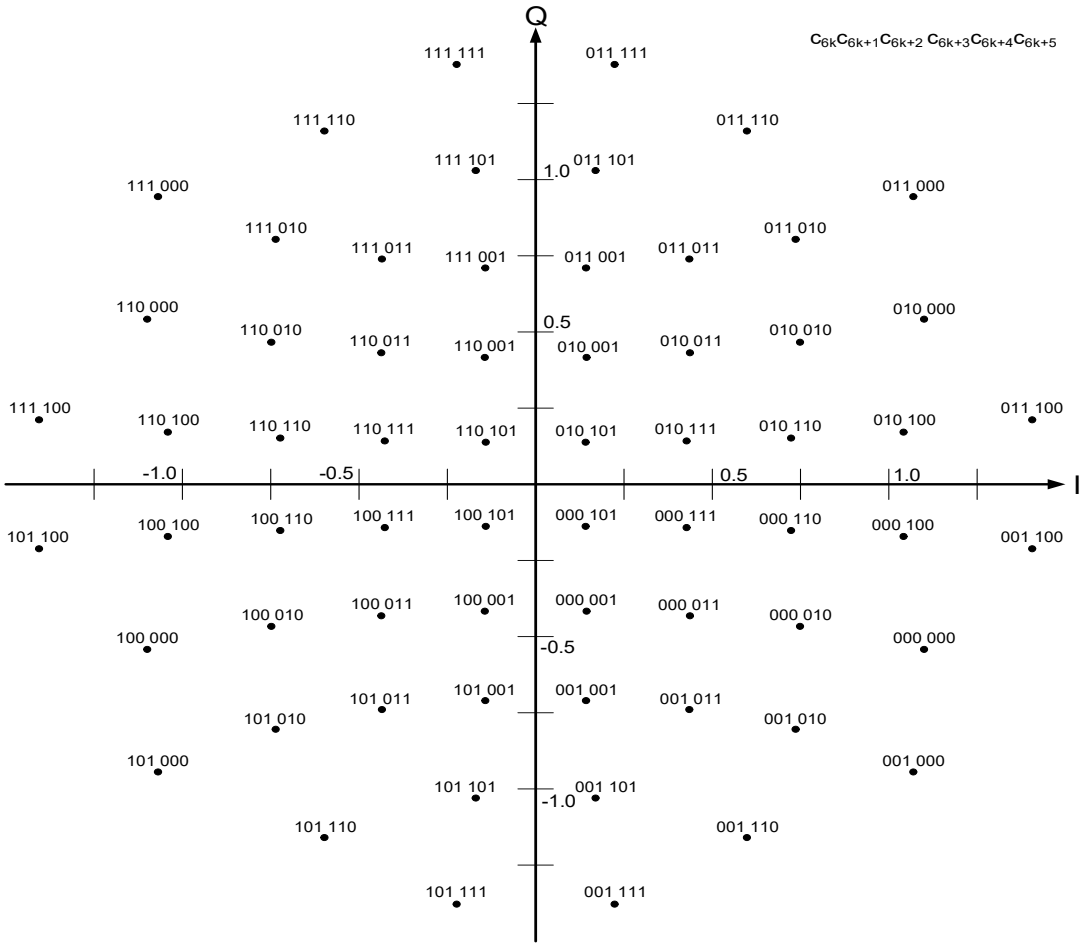

Figure 28-31—64-NUC nonuniform constellation bit encoding

NOTE—The π/2-64-NUC is quadrant symmetric and has an average power of one.

28.5.9.5.7 π/2-8-PSK modulation

An EDMG STA shall only apply π/2-8-PSK modulation to an EDMG PPDU transmitted to a peer EDMG STA if the π/2-8-PSK Supported field in the peer STA's EDMG Capabilities element is nonzero.

In π/2-8-PSK modulation, the input stream is grouped into sets of 3 bits and mapped according to the following equation:

$$\tilde{s}_k = \exp\left(j\frac{\pi}{4}\left(c_{3k} - 3c_{3k+1} - c_{3k+2} - 2c_{3k}c_{3k+1} + 2c_{3k+1}c_{3k+2} + 2c_{3k}c_{3k+2} + 4c_{3k}c_{3k+1}c_{3k+2} + 4\right)\right)$$

where

k is the symbol output index, $k = 0, 1, \ldots$.

28.5.10 PPDU transmission

28.5.10.1 General

This subclause defines the waveform for the EDMG SC mode and the non-EDMG PPDU transmission over a 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, or 4.32+4.32 GHz channel using N_{TX} transmit chains.

The definition of the spatial mapping methods is provided in 28.5.10.2 (Spatial mapping). The non-EDMG PPDU transmission shall be as defined in 28.5.10.3 (Non-EDMG PPDU transmission). The EDMG SU PPDU transmission shall be as defined in 28.5.10.4 (EDMG SU PPDU transmission). The EDMG MU PPDU transmission shall be as defined in 28.5.10.5 (EDMG MU PPDU transmission).

28.5.10.2 Spatial mapping

Spatial mapping defines the method of N_{STS} space-time streams to N_{TX} transmit chains mapping, where $N_{STS} \leq N_{TX}$, which may be implemented by means of a spatial mapping matrix Q of size N_{TX} by N_{STS} and by cyclic shift diversity (CSD), if applied. The spatial mapping matrix Q is independent of the chip time index or subcarrier index and is constant in time.

This standard defines four basic mappings for the EDMG PHY, namely, direct mapping, indirect mapping, digital beamforming and spatial expansion. Provided below are examples of spatial mapping methods and Q matrices that might be used in different cases.

- Direct mapping, $N_{STS} = N_{TX}$: the spatial mapping matrix Q is a square diagonal complex value matrix of size N_{TX} that might be defined as follows:
  - $[Q]_{i,i} = 1, i = 1, 2, ..., N_{TX}$, the identity matrix
  - $[Q]_{i,i} = \exp\left(j 2\pi\phi_i\right), i = 1, 2, ..., N_{TX}$, exponential matrix
- Indirect mapping, $N_{STS} = N_{TX}$: the spatial mapping matrix Q is a square matrix of size N_{TX} composed of complex values that might be defined as follows:
  - Normalized discrete Fourier matrix

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

  - Normalized Hadamard matrix
  - Normalized direct mapping diagonal matrix with permutated rows and/or columns
- Digital beamforming, $N_{STS} \leq N_{TX}$: the spatial mapping matrix Q is a rectangular matrix of size N_{TX} by N_{STS} composed of complex values that might be defined based on some knowledge of the channel.
- Spatial expansion, $N_{STS} = 1 < N_{TX}$: the spatial expansion is performed by multiplication by matrix Q, which is defined as a column vector of size N_{TX} by 1 and composed of all 1s, and application of CSD over different transmit chains. The CSD is applied to the fields of PPDU with the exception of the TRN field. This enables duplication of the transmission of PPDU fields over the N_{TX} transmit chains and avoids unintentional beamforming that exists with a coherent signal transmission. The spatial expansion technique is not applied to the TRN field, which is transmitted using an orthogonal sequence set.
- Channel aggregation, in this case N_{TX} is an even number: the transmit chains 1 through $N_{TX}/2$ are assigned to the primary or primary and secondary channels and transmit chains $N_{TX}/2 + 1$ are assigned to the secondary or secondary1 and secondary2 channels. The mapping of space-time streams to the transmit chains is defined by the spatial mapping matrix Q, which is implementation specific.

The spatial mapping matrix Q may be different for the pre-EDMG and EDMG modulated fields, except for the case of an EDMG SU PPDU transmitted over a 2.16 GHz or a 2.16+2.16 GHz channel with single space-time stream ($i_{STS} = 1$). The spatial mapping matrix Q shall be normalized to have the same average power per transmit chain for pre-EDMG and EDMG modulated fields.

28.5.10.3 Non-EDMG PPDU transmission

28.5.10.3.1 Non-EDMG PPDU transmission over a 2.16 GHz or 2.16+2.16 GHz channel

The non-EDMG PPDU waveform shall be defined at the DMG SC chip rate F_c and include the following modulated fields:

$$r_{non\text{-}EDMG}(nT_c) = r_{L\text{-}STF}(nT_c) + r_{L\text{-}CEF}(nT_c - t_{L\text{-}CEF}) + r_{L\text{-}Header}(nT_c - t_{L\text{-}Header}) + r_{Data}(nT_c - t_{Data}) + r_{AGC\ TRN}(nT_c - t_{AGC\ TRN})$$

where

$t_{L\text{-}CEF} = T_{L\text{-}STF}$ is the duration of the L-STF field of the PPDU

$t_{L\text{-}Header} = t_{L\text{-}CEF} + T_{L\text{-}CEF}$ is the total duration of the L-STF and L-CEF fields of the PPDU

$t_{Data} = t_{L\text{-}Header} + T_{L\text{-}Header}$ is the total duration of the L-STF, L-CEF, and L-Header fields of the PPDU

$t_{AGC\ TRN} = t_{Data} + T_{Data}$ is the total duration of the L-STF, L-CEF, L-Header, and Data fields of the PPDU

In the non-EDMG duplicate PPDU waveform, the AGC and TRN fields may be present in a 2.16 GHz non-EDMG PPDU transmission and shall not be present in a 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, or 4.32+4.32 GHz non-EDMG PPDU transmission.

Unless specified, the chip index n is defined in the range [0, $N_{Field} - 1$], where N_{Field} defines the total number of samples for a given signal field. The definition of the L-STF, L-CEF, and L-Header fields is provided in 28.3.3.2.2 (L-STF definition), 28.3.3.2.3 (L-CEF definition), and 28.3.3.2.4 (L-Header definition), respectively. The definition of the AGC and TRN fields is provided in 20.9.2.2.5 (AGC field)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

and 20.9.2.2.6 (TRN field), respectively. The L-Header and Data fields encoding and modulation is provided in 20.5.3.1.4 (Header encoding and modulation) and 20.5.3.2 (Data field), respectively.

The non-EDMG PPDU waveform for the i_{TX}^{th} transmit chain shall be defined as follows:

$$r_{non\text{-}EDMG}^{i_{TX}\,(1)}\left(nT_c\right) = \left[Q_{non\text{-}EDMG}\right]_{i_{TX},1} \cdot r_{non\text{-}EDMG}\left(nT_c\right), 1 \le i_{TX} \le N_{TX}$$

where

$Q_{non\text{-}EDMG}$ is a spatial mapping matrix

$[\ ]_{m,n}$ is a matrix element from m^{th} row and n^{th} column

For spatial expansion, the non-EDMG waveform for the i_{TX}^{th} transmit chain includes a cyclic shift, $T_{SC}^{i_{TX}}$, dependent on the particular transmit chain number. The cyclic shift, $T_{SC}^{i_{TX}}$, is defined in SC chip units as $(i_{TX}-1) \times N_c \times T_c$, where N_c is equal to 4 chips and T_c is a chip time duration.

$$r_{non\text{-}EDMG}^{i_{TX}\,(1)}\left(nT_c\right) = \begin{cases} r_{non\text{-}EDMG}^{i_{TX}\,(1)}\left(nT_c + T_{SC}^{i_{TX}}\right), & n = 0,1,\ldots,N-1-T_{SC}^{i_{TX}}/T_c \\ r_{non\text{-}EDMG}^{i_{TX}\,(1)}\left(nT_c - \left(NT_c - T_{SC}^{i_{TX}}\right)\right), & n = N-T_{SC}^{i_{TX}}/T_c,\ldots,N-1 \end{cases}, \quad 1 \le i_{TX} \le N_{TX}$$

where

N is the total number of chips in the non-EDMG PPDU waveform

The non-EDMG waveform for the i_{TX}^{th} transmit chain is obtained by upsampling and filtering and then appropriate carrier frequency shift of the $r_{non\text{-}EDMG}^{i_{TX}\,(1)}\left(nT_c\right)$ waveform, if required. The upsampling procedure is applied using a factor of N_{up}. The filtering procedure is performed with a pulse shaping filter, $h_{SC\,CB}$, defined at the $N_{up} \times F_c$ sampling rate as follows:

$$r_{non\text{-}EDMG}^{i_{TX}(2)}\left(n\frac{T_c}{N_{up}}\right) = \begin{cases} r_{non\text{-}EDMG}^{i_{TX}(1)}\left(n\frac{T_c}{N_{up}}\right), & n=0, N_{up}, 2\times N_{up} \\ 0, & otherwise \end{cases}$$

$$r_{non\text{-}EDMG}^{i_{TX}(3)}\left(n\frac{T_c}{N_{up}}\right) = \sum_{k=0}^{K-1} r_{non\text{-}EDMG}^{i_{TX}(2)}\left((n-k)\frac{T_c}{N_{up}}\right) h_{SC\,CB}(k),\ n=0,\ 1,\ \ldots$$

$$r_{non\text{-}EDMG}^{i_{TX}(4)}\left(n\frac{T_c}{N_{up}}\right) = r_{non\text{-}EDMG}^{i_{TX}(3)}\left(\left(n+\frac{K-1}{2}\right)\frac{T_c}{N_{up}}\right),\ n=0,\ 1,\ \ldots$$

where

K is the length of $h_{SC\,CB}$ in samples

$r_{non\text{-}EDMG}^{i_{TX}\,(2)}\left(n\dfrac{T_c}{N_{up}}\right) = 0,$ for $n < 0$ and $n \ge N \times N_{up}$

N is the total number of chips in the non-EDMG PPDU waveform

The non-EDMG waveform for the i_{TX}^{th} transmit chain when transmitted over a 2.16 GHz or 2.16+2.16 GHz channel shall be defined as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$r_{PPDU}^{i_{TX}}\left(n\frac{T_c}{N_{up}}\right)=r_{non\text{-}EDMG}^{i_{TX}(4)}\left(n\frac{T_c}{N_{up}}\right),1\le i_{TX}\le N_{TX}$$

For a 2.16+2.16 GHz transmission, the total number of transmit chains, N_{TX}, shall be an even number. The first $N_{TX}/2$ transmit chains shall be used for transmission on the primary channel and the second $N_{TX}/2$ transmit chains shall be used for transmission on the secondary channel (see 28.3.4 (Channelization)).

28.5.10.3.2 Non-EDMG duplicate PPDU transmission over a 4.32 GHz, 6.48 GHz, 8.64 GHz, or 4.32+4.32 GHz channel

The non-EDMG waveform for the i_{TX}^{th} transmit chain when transmitted using duplicate transmission over a 4.32 GHz or 4.32+4.32 GHz channel shall be defined as follows:

$$r_{PPDU}^{i_{TX}}\left(n\frac{T_c}{N_{up}}\right)=r_{non\text{-}EDMG}^{i_{TX}(4)}\left(n\frac{T_c}{N_{up}}+\Delta t_1\right)\cdot\frac{1}{\sqrt{2}}\exp\left(-j2\pi\left(\frac{\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right)+r_{non\text{-}EDMG}^{i_{TX}(4)}\left(n\frac{T_c}{N_{up}}+\Delta t_2\right)$$
$$\cdot\frac{1}{\sqrt{2}}\exp\left(+j2\pi\left(\frac{\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right),1\le i_{TX}\le N_{TX}$$

where

ΔF	defines the channel spacing and is equal to 2.16 GHz
Δt_1 and Δt_2	are in the range [0, T_c]
Δt_i equal to 0	corresponds to the primary channel

For 4.32+4.32 GHz transmission, the total number of transmit chains, N_{TX}, shall be an even number. The first $N_{TX}/2$ transmit chains shall be used for transmission on the primary and secondary channels and the second $N_{TX}/2$ transmit chains shall be used for transmission on the secondary1 and secondary2 channels (see 28.3.4 (Channelization)).

The non-EDMG waveform for the i_{TX}^{th} transmit chain when transmitted using duplicate transmission over a 6.48 GHz channel shall be defined as follows:

$$r_{PPDU}^{i_{TX}}\left(n\frac{T_c}{N_{up}}\right)=r_{non\text{-}EDMG}^{i_{TX}(4)}\left(n\frac{T_c}{N_{up}}+\Delta t_1\right)\cdot\frac{1}{\sqrt{3}}\exp\left(-j2\pi\Delta F\left(\frac{T_c}{N_{up}}\right)n\right)+r_{non\text{-}EDMG}^{i_{TX}(4)}\left(n\frac{T_c}{N_{up}}+\Delta t_2\right)$$
$$\cdot\frac{1}{\sqrt{3}}+r_{non\text{-}EDMG}^{i_{TX}(4)}\left(n\frac{T_c}{N_{up}}+\Delta t_3\right)\cdot\frac{1}{\sqrt{3}}\exp\left(+j2\pi\Delta F\left(\frac{T_c}{N_{up}}\right)n\right),1\le i_{TX}\le N_{TX}$$

where

Δt_1, Δt_2, and Δt_3	are in the range [0, T_c]
Δt_i equal to 0	corresponds to the primary channel

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The non-EDMG waveform for the i_{TX}^{th} transmit chain when transmitted using duplicate transmission over an 8.64 GHz channel shall be defined as follows:

$$r_{PPDU}^{i_{TX}}\left(n\frac{T_c}{N_{up}}\right) = r_{non\text{-}EDMG}^{i_{TX}(4)}\left(n\frac{T_c}{N_{up}}+\Delta t_1\right)$$
$$\cdot\frac{1}{\sqrt{4}}\exp\left(-j2\pi\left(\frac{3\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right)+r_{non\text{-}EDMG}^{i_{TX}(4)}\left(n\frac{T_c}{N_{up}}+\Delta t_2\right)$$
$$\cdot\frac{1}{\sqrt{4}}\exp\left(-j2\pi\left(\frac{\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right)+r_{non\text{-}EDMG}^{i_{TX}(4)}\left(n\frac{T_c}{N_{up}}+\Delta t_3\right)$$
$$\cdot\frac{1}{\sqrt{4}}\exp\left(+j2\pi\left(\frac{\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right)+r_{non\text{-}EDMG}^{i_{TX}(4)}\left(n\frac{T_c}{N_{up}}+\Delta t_2\right)$$
$$\cdot\frac{1}{\sqrt{4}}\exp\left(+j2\pi\left(\frac{3\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right), 1\le i_{TX}\le N_{TX}$$

where

Δt_1, Δt_2, Δt_3, and Δt_4	are in the range [0, T_c]
Δt_i equal to 0	corresponds to the primary channel

The definition of the pulse shaping filter impulse response, $h_{SC\,CB}$, and the N_{up} parameter are implementation dependent.

28.5.10.4 EDMG SU PPDU transmission

28.5.10.4.1 General

An EDMG SC mode SU PPDU transmitted over a 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, or 4.32+4.32 GHz channel with single and multiple space-time streams ($i_{STS} \ge 1$) is composed of pre-EDMG modulated fields, EDMG preamble, Data field and TRN field. The EDMG preamble and TRN field might not be present in a transmitted SU PPDU depending on particular transmission parameters. The total number of transmit chains, N_{TX}, shall be constant over the different fields of a transmitted EDMG SU PPDU.

28.5.10.4.2 EDMG PPDU transmission over a 2.16 GHz or 2.16+2.16 GHz channel with N_{STS} = 1

An EDMG SC mode SU PPDU transmitted over a 2.16 GHz or 2.16+2.16 GHz channel with single space-time stream (N_{STS} = 1) is composed of pre-EDMG, Data, and TRN fields.

For a single PPDU transmission, the pre-EDMG and Data fields include the following modulated fields:

$$r_{pre\text{-}EDMG,\,Data}\left(nT_c\right) = r_{L\text{-}STF}\left(nT_c\right)+r_{L\text{-}CEF}\left(nT_c-t_{L\text{-}CEF}\right)+r_{L\text{-}Header}\left(nT_c-t_{L\text{-}Header}\right)$$
$$+r_{EDMG\text{-}Header\text{-}A}\left(nT_c-t_{EDMG\text{-}Header\text{-}A}\right)+r_{Data}\left(nT_c-t_{Data}\right)$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

where

$t_{L\text{-}CEF} = T_{L\text{-}STF}$ is the duration of the L-STF field of the PPDU

$t_{L\text{-}Header} = t_{L\text{-}CEF} + T_{L\text{-}CEF}$ is the total duration of the L-STF and L-CEF fields of the PPDU

$t_{EDMG\text{-}Header\text{-}A} = t_{L\text{-}Header} + T_{L\text{-}Header}$ is the total duration of the L-STF, L-CEF, and L-Header fields of the PPDU

$t_{Data} = t_{EDMG\text{-}Header\text{-}A} + T_{EDMG\text{-}Header\text{-}A}$ is the total duration of the L-STF, L-CEF, L-Header, and EDMG-Header-A fields of the PPDU

The definition of the L-STF, L-CEF, and L-Header fields is provided in 28.3.3.2.2 (L-STF definition), 28.3.3.2.3 (L-CEF definition), and 28.3.3.2.4 (L-Header definition), respectively.

For an EDMG A-PPDU transmission of N_{PPDU} PPDUs, the pre-EDMG, the EDMG modulated field of the EDMG preamble, and Data fields include the following modulated fields:

$$r_{pre\text{-}EDMG,\,Data}\left(nT_c\right) = r_{L\text{-}STF}\left(nT_c\right) + r_{L\text{-}CEF}\left(nT_c - t_{L\text{-}CEF}\right) + r_{L\text{-}Header}\left(nT_c - t_{L\text{-}Header}\right)$$
$$+ r_{EDMG\text{-}Header\text{-}A_1}\left(nT_c - t_{EDMG\text{-}Header\text{-}A_1}\right) + r_{Data_1}\left(nT_c - t_{Data_1}\right)$$
$$+ r_{EDMG\text{-}Header\text{-}A_2}\left(nT_c - t_{EDMG\text{-}Header\text{-}A_2}\right) + r_{Data_2}\left(nT_c - t_{Data_2}\right)$$
$$+ \ldots$$
$$+ r_{EDMG\text{-}Header\text{-}A_{N_{PPDU}}}\left(nT_c - t_{EDMG\text{-}Header\text{-}A_{N_{PPDU}}}\right) + r_{Data_{N_{PPDU}}}\left(nT_c - t_{Data_{N_{PPDU}}}\right)$$

where

$t_{L\text{-}CEF} = T_{L\text{-}STF}$ is the duration of L-STF field of the PPDU

$t_{L\text{-}Header} = t_{L\text{-}CEF} + T_{L\text{-}CEF}$ is the total duration of L-STF and L-CEF fields of the PPDU

$t_{EDMG\text{-}Header\text{-}A_1} = t_{L\text{-}Header} + T_{L\text{-}Header}$ is the total duration of L-STF, L-CEF, and L-Header fields of the PPDU

$t_{Data_1} = t_{EDMG\text{-}Header\text{-}A_1} + T_{EDMG\text{-}Header\text{-}A_1}$ is the total duration of L-STF, L-CEF, L-Header, and EDMG-Header-A_1 fields of the PPDU

$t_{EDMG\text{-}Header\text{-}A_2} = t_{Data_1} + T_{Data_1}$ is the total duration of L-STF, L-CEF, L-Header, EDMG-Header-A_1, and $Data_1$ fields of the PPDU

$t_{Data_2} = t_{EDMG\text{-}Header\text{-}A_2} + T_{EDMG\text{-}Header\text{-}A_2}$ is the total duration of L-STF, L-CEF, L-Header, EDMG-Header-A_1, $Data_1$, and EDMG-Header-A_2 fields of the PPDU

…

$t_{EDMG\text{-}Header\text{-}A_{N_{PPDU}}} = t_{Data_{N_{PPDU}-1}} + T_{Data_{N_{PPDU}-1}}$ is the total duration of L-STF, L-CEF, L-Header, EDMG-Header-A_1, $Data_1$, EDMG-Header-A_2, $Data_2$, …, and $Data_{NPPDU–1}$ fields of the PPDU

$t_{Data_{N_{PPDU}}} = t_{EDMG\text{-}Header\text{-}A_{N_{PPDU}}} + T_{EDMG\text{-}Header\text{-}A_{N_{PPDU}}}$ is the total duration of L-STF, L-CEF, L-Header, EDMG-Header-A_1, $Data_1$, EDMG-Header-A_2, $Data_2$, …, $Data_{NPPDU–1}$, and EDMG-Header-A_{NPPDU} fields of the PPDU

The PPDU waveform of the pre-EDMG and Data fields for the i_{TX}^{th} transmit chain shall be defined as follows:

$$r_{pre\text{-}EDMG,\,Data}^{i_{TX}}\left(nT_c\right)=\left[Q_{EDMG}\right]_{i_{TX},1}\cdot r_{pre\text{-}EDMG,\,Data}\left(nT_c\right),1\le i_{TX}\le N_{TX}$$

where

Q_{EDMG} is a spatial mapping matrix

$[\ ]_{m,n}$ is a matrix element from m^{th} row and n^{th} column

For spatial expansion, the PPDU waveform of the pre-EDMG and Data fields for the i_{TX}^{th} transmit chain includes a cyclic shift, $T_{SC}^{i_{TX}}$, dependent on the particular transmit chain number. The cyclic shift, $T_{SC}^{i_{TX}}$, is defined in SC chip units as $(i_{TX}-1)\times N_c\times T_c$, where N_c is equal to 4 chips and T_c is a chip time duration.

$$r_{pre\text{-}EDMG,\,Data}^{i_{TX}}\left(nT_c\right)=\begin{cases} r_{pre\text{-}EDMG,\,Data}^{i_{TX}}\left(nT_c+T_{SC}^{i_{TX}}\right), & n=0,1,\ldots,N-1-T_{SC}^{i_{TX}}/T_c \\ r_{pre\text{-}EDMG,\,Data}^{i_{TX}}\left(nT_c-\left(NT_c-T_{SC}^{i_{TX}}\right)\right), & n=N-T_{SC}^{i_{TX}}/T_c,\ldots,N-1 \end{cases},\quad 1\le i_{TX}\le N_{TX}$$

where

N is the total number of chips in the pre-EDMG and Data fields of the EDMG PPDU

The TRN field, $r_{TRN}^{i_{TX}}\left(nT_c\right)$, shall be defined at the DMG SC chip rate F_c per i_{TX}^{th} transmit chain as defined in 28.9.2.2.6 (TRN subfield definition for EDMG SC PPDUs and EDMG control mode PPDUs).

The resulting SU PPDU waveform for a 2.16 GHz or 2.16+2.16 GHz channel and single space-time stream (N_{STS} = 1) for the i_{TX}^{th} transmit chain concatenates the preamble and Data fields with the TRN field and shall be defined as follows:

$$r_{EDMG}^{i_{TX}\,(1)}\left(nT_c\right)=r_{pre\text{-}EDMG,\,Data}^{i_{TX}}\left(nT_c\right)+r_{TRN}^{i_{TX}}\left(nT_c-t_{TRN}\right),1\le i_{TX}\le N_{TX}$$

where

$t_{TRN}=t_{Data}+T_{Data}$ is the total duration of the L-STF, L-CEF, L-Header, EDMG-Header-A, and Data fields of the PPDU

For a 2.16+2.16 GHz transmission, the total number of transmit chains, N_{TX}, shall be an even number. The first $N_{TX}/2$ transmit chains shall be used for transmission on the primary channel and the second $N_{TX}/2$ transmit chains shall be used for transmission on the secondary channel (see 28.3.4 (Channelization)).

The filtering procedure is performed with a pulse shaping filter, $h_{SC\,CB}$, defined at the $N_{up}\times F_c$ sampling rate as follows:

$$r_{EDMG}^{i_{TX}\,(2)}\left(n\frac{T_c}{N_{up}}\right)=\begin{cases} r_{EDMG}^{i_{TX}\,(1)}\left(n\frac{T_c}{N_{up}}\right), & n=0,N_{up},2*N_{up}\ldots \\ 0 & \text{otherwise} \end{cases}$$

$$r_{EDMG}^{i_{TX}\,(3)}\left(n\frac{T_c}{N_{up}}\right)=\sum_{k=0}^{K-1}r_{EDMG}^{i_{TX}\,(2)}\left(\left(n-k\right)\frac{T_c}{N_{up}}\right)h_{SC\,CB}\left(k\right),n=0,1,\ldots$$

$$r_{EDMG}^{i_{TX}}\left(n\frac{T_c}{N_{up}}\right)=r_{EDMG}^{i_{TX}\,(3)}\left(\left(n+\frac{K-1}{2}\right)\frac{T_c}{N_{up}}\right),n=0,1,\ldots$$

where

K is the length of $h_{SC\,CB}$ in samples

$$r_{EDMG}^{i_{TX}(2)}\left(n\frac{T_c}{N_{up}}\right)=0, \text{for } n<0 \text{ and } n\geq N\times N_{up}$$

N is the total number of chips in the EDMG PPDU

The definition of the pulse shaping filter impulse response, $h_{SC\,CB}$, and the N_{up} parameter are implementation dependent.

28.5.10.4.3 EDMG PPDU transmission with DMG AGC and TRN fields over a 2.16 GHz channel with N_{STS} = 1

For the case of DMG AGC and TRN field transmission over a 2.16 GHz channel, indicated by the DMG TRN field in the EDMG-Header-A, the EDMG SU PPDU is transmitted with a single space-time stream and composed of pre-EDMG, Data, DMG AGC and TRN fields.

For a single PPDU transmission, the pre-EDMG, Data, AGC, and TRN fields include the following modulated fields:

$$r_{pre\text{-}EDMG,\,Data,AGC\ TRN}\left(nT_c\right)=r_{L\text{-}STF}\left(nT_c\right)+r_{L\text{-}CEF}\left(nT_c-t_{L\text{-}CEF}\right)+r_{L\text{-}Header}\left(nT_c-t_{L\text{-}Header}\right)$$
$$+r_{EDMG\text{-}Header\text{-}A}\left(nT_c-t_{EDMG\text{-}Header\text{-}A}\right)+r_{Data}\left(nT_c-t_{Data}\right)+r_{AGC\ TRN}\left(nT_c-t_{AGC\ TRN}\right)$$

where

$t_{L\text{-}CEF}=T_{L\text{-}STF}$ is the duration of the L-STF field of the PPDU

$t_{L\text{-}Header}=t_{L\text{-}CEF}+T_{L\text{-}CEF}$ is the total duration of the L-STF and L-CEF fields of the PPDU

$t_{EDMG\text{-}Header\text{-}A}=t_{L\text{-}Header}+T_{L\text{-}Header}$ is the total duration of the L-STF, L-CEF, and L-Header fields of the PPDU

$t_{Data}=t_{EDMG\text{-}Header\text{-}A}+T_{EDMG\text{-}Header\text{-}A}$ is the total duration of the L-STF, L-CEF, L-Header, and EDMG-Header-A fields of the PPDU

$t_{AGC\ TRN}=t_{Data}+T_{Data}$ is the total duration of the L-STF, L-CEF, L-Header, EDMG-Header-A, and Data fields of the PPDU

The definition of the L-STF, L-CEF, and L-Header fields is provided in 28.3.3.2.2 (L-STF definition), 28.3.3.2.3 (L-CEF definition), and 28.3.3.2.4 (L-Header definition) respectively. The definition of the AGC and TRN fields is provided in 20.9.2.2.5 (AGC field) and 20.9.2.2.6 (TRN field), respectively.

For an EDMG A-PPDU transmission of N_{PPDU} PPDUs, the pre-EDMG, the EDMG modulated field of the EDMG preamble, Data AGC and TRN fields include the following modulated fields:

$$r_{pre\text{-}EDMG,\,Data,\,AGC\ TRN}\left(nT_c\right) = r_{L\text{-}STF}\left(nT_c\right) + r_{L\text{-}CEF}\left(nT_c - t_{L\text{-}CEF}\right) + r_{L\text{-}Header}\left(nT_c - t_{L\text{-}Header}\right)$$
$$+ r_{EDMG\text{-}Header\text{-}A_1}\left(nT_c - t_{EDMG\text{-}Header\text{-}A_1}\right) + r_{Data_1}\left(nT_c - t_{Data_1}\right)$$
$$+ r_{EDMG\text{-}Header\text{-}A_2}\left(nT_c - t_{EDMG\text{-}Header\text{-}A_2}\right) + r_{Data_2}\left(nT_c - t_{Data_2}\right)$$
$$+ \ldots$$
$$+ r_{EDMG\text{-}Header\text{-}A_{N_{PPDU}}}\left(nT_c - t_{EDMG\text{-}Header\text{-}A_{N_{PPDU}}}\right) + r_{Data_{N_{PPDU}}}\left(nT_c - t_{Data_{N_{PPDU}}}\right)$$
$$+ r_{AGC\ TRN}\left(nT_c - t_{AGC\ TRN}\right)$$

where

$t_{L\text{-}CEF} = T_{L\text{-}STF}$ is the duration of L-STF field of the PPDU

$t_{L\text{-}Header} = t_{L\text{-}CEF} + T_{L\text{-}CEF}$ is the total duration of L-STF and L-CEF fields of the PPDU

$t_{EDMG\text{-}Header\text{-}A_1} = t_{L\text{-}Header} + T_{L\text{-}Header}$ is the total duration of L-STF, L-CEF, and L-Header fields of the PPDU

$t_{Data_1} = t_{EDMG\text{-}Header\text{-}A_1} + T_{EDMG\text{-}Header\text{-}A_1}$ is the total duration of L-STF, L-CEF, L-Header, and EDMG-Header-A_1 fields of the PPDU

$t_{EDMG\text{-}Header\text{-}A_2} = t_{Data_1} + T_{Data_1}$ is the total duration of L-STF, L-CEF, L-Header, EDMG-Header-A_1, and $Data_1$ fields of the PPDU

$t_{Data_2} = t_{EDMG\text{-}Header\text{-}A_2} + T_{EDMG\text{-}Header\text{-}A_2}$ is the total duration of L-STF, L-CEF, L-Header, EDMG-Header-A_1, $Data_1$, and EDMG-Header-A_2 fields of the PPDU

$t_{EDMG\text{-}Header\text{-}A_{N_{PPDU}}} = t_{Data_{N_{PPDU}-1}} + T_{Data_{N_{PPDU}-1}}$ is the total duration of L-STF, L-CEF, L-Header, EDMG-Header-A_1, $Data_1$, EDMG-Header-A_2, $Data_2$, …, and $Data_{NPPDU}$–1 fields of the PPDU

$t_{Data_{N_{PPDU}}} = t_{EDMG\text{-}Header\text{-}A_{N_{PPDU}}} + T_{EDMG\text{-}Header\text{-}A_{N_{PPDU}}}$ is the total duration of L-STF, L-CEF, L-Header, EDMG-Header-A_1, $Data_1$, EDMG-Header-A_2, $Data_2$, …, $Data_{NPPDU}$–1, and EDMG-Header-A_{NPPDU} fields of the PPDU

$t_{AGC\ TRN} = t_{Data_{N_{PPDU}}} + T_{Data_{N_{PPDU}}}$ is the total duration of L-STF, L-CEF, L-Header, EDMG-Header-A_1, $Data_1$, EDMG-Header-A_2, $Data_2$, …, $Data_{NPPDU}$–1, EDMG-Header-A_{NPPDU}, and $Data_{NPPDU}$ fields of the PPDU

The EDMG PPDU waveform for the i_{TX}^{th} transmit chain shall be defined as follows:

$$r_{EDMG,}^{i_{TX}(1)}\left(nT_c\right) = \left[Q_{EDMG}\right]_{i_{TX},1} \cdot r_{pre-EDMG,\,Data,\,AGC\ TRN}\left(nT_c\right), 1 \le i_{TX} \le N_{TX}$$

where

Q_{EDMG} is a spatial mapping matrix

$[\ ]_{m,n}$ is a matrix element from m^{th} row and n^{th} column

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For spatial expansion, the EDMG PPDU waveform for the i_{TX}^{th} transmit chain includes a cyclic shift, $T_{SC}^{i_{TX}}$, dependent on the particular transmit chain number. The cyclic shift, $T_{SC}^{i_{TX}}$, is defined in SC chip units as $(i_{TX} - 1) \times N_c \times T_c$, where N_c is equal to 4 chips and T_c is a chip time duration:

$$r_{EDMG}^{i_{TX}}(1)\left(nT_c\right) = \begin{cases} r_{pre\text{-}EDMG,\,Data,\,AGC\ TRN}^{i_{TX}}(1)\left(nT_c + T_{SC}^{i_{TX}}\right), & n = 0,1,\ldots,N-1-T_{SC}^{i_{TX}}/T_c \\ r_{pre\text{-}EDMG,\,Data,\,AGC\ TRN}^{i_{TX}}(1)\left(nT_c - \left(NT_c - T_{SC}^{i_{TX}}\right)\right), & n = N - T_{SC}^{i_{TX}}/T_c,\ldots,N-1 \end{cases}, \quad 1 \le i_{TX} \le N_{TX}$$

where

N is the total number of chips in the pre-EDMG, Data, AGC, and TRN fields

The filtering procedure is performed with a pulse shaping filter, $h_{SC\,CB}$, defined at the $N_{up} \times F_c$ sampling rate as follows:

$$r_{EDMG}^{i_{TX}}(2)\left(n\frac{T_c}{N_{up}}\right) = \begin{cases} r_{EDMG}^{i_{TX}}(1)\left(n\frac{T_c}{N_{up}}\right), & n = 0, N_{up}, 2*N_{up}\ldots \\ 0 & \text{otherwise} \end{cases}$$

$$r_{EDMG}^{i_{TX}}(3)\left(n\frac{T_c}{N_{up}}\right) = \sum_{k=0}^{K-1} r_{EDMG}^{i_{TX}}(2)\left((n-k)\frac{T_c}{N_{up}}\right) h_{SC\,CB}(k), n = 0,1,\ldots$$

$$r_{EDMG}^{i_{TX}}\left(n\frac{T_c}{N_{up}}\right) = r_{EDMG}^{i_{TX}}(3)\left(\left(n + \frac{K-1}{2}\right)\frac{T_c}{N_{up}}\right), n = 0,1,\ldots$$

where

K is the length of $h_{SC\,CB}$ in samples

$r_{non\text{-}EDMG}^{i_{TX}}(2)\left(n\frac{T_c}{N_{up}}\right) = 0$, for $n < 0$ and $n \ge N \times N_{up}$

N is the total number of chips in the EDMG PPDU waveform

The definition of the pulse shaping filter impulse response, $h_{SC\,CB}$, and the N_{up} parameter are implementation dependent.

28.5.10.4.4 EDMG PPDU transmission over a 2.16 GHz or 2.16+2.16 GHz channel with $N_{STS} > 1$ and 4.32 GHz, 6.48 GHz, 8.64 GHz or 4.32+4.32 GHz channel with $N_{STS} \ge 1$

28.5.10.4.4.1 General

An EDMG SC mode SU PPDU transmitted over a 2.16 GHz or 2.16+2.16 GHz channel with more than one stream ($N_{STS} > 1$) or over a 4.32 GHz, 6.48 GHz, 8.64 GHz, or 4.32+4.32 GHz channels with one or more space-time streams ($N_{STS} \ge 1$) is composed of pre-EDMG modulated fields, EDMG preamble, Data field and TRN field. The total number of transmit chains, N_{TX}, shall be constant over the different fields of the EDMG SU PPDU.

28.5.10.4.4.2 Pre-EDMG modulated fields transmission

The pre-EDMG modulated fields of the PPDU includes the following modulated fields:

$$r_{pre\text{-}EDMG}\left(nT_c\right) = r_{L\text{-}STF}\left(nT_c\right) + r_{L\text{-}CEF}\left(nT_c - t_{L\text{-}CEF}\right) + r_{L\text{-}Header}\left(nT_c - t_{L\text{-}Header}\right)$$
$$+ r_{EDMG\text{-}Header\text{-}A}\left(nT_c - t_{EDMG\text{-}Header\text{-}A}\right)$$

where

$t_{L\text{-}CEF} = T_{L\text{-}STF}$ is the duration of the L-STF field of the PPDU

$t_{L\text{-}Header} = t_{L\text{-}CEF} + T_{L\text{-}CEF}$ is the total duration of the L-STF and L-CEF fields of the PPDU

$t_{EDMG\text{-}Header\text{-}A} = t_{L\text{-}Header} + T_{L\text{-}Header}$ is the total duration of the L-STF, L-CEF, and L-Header fields of the PPDU

The definition of the L-STF, L-CEF, and L-Header fields is provided in 28.3.3.2.2 (L-STF definition), 28.3.3.2.3 (L-CEF definition), and 28.3.3.2.4 (L-Header definition), respectively.

The PPDU waveform of the pre-EDMG modulated fields for the i_{TX}^{th} transmit chain shall be defined as follows:

$$r_{pre\text{-}EDMG}^{i_{TX}\ (1)}\left(nT_c\right) = \left[Q_{pre\text{-}EDMG}\right]_{i_{TX},1} \cdot r_{pre\text{-}EDMG}\left(nT_c\right), 1 \le i_{TX} \le N_{TX}$$

where

$Q_{pre\text{-}EDMG}$ is a spatial mapping matrix

$[\ ]_{m,n}$ is a matrix element from m^{th} row and n^{th} column

For spatial expansion, the PPDU waveform of the pre-EDMG modulated fields for the i_{TX}^{th} transmit chain includes a cyclic shift, $T_{SC}^{i_{TX}}$, dependent on the particular transmit chain number. The cyclic shift, $T_{SC}^{i_{TX}}$, is defined in SC chip units as $(i_{TX} - 1) \times N_c \times T_c$, where N_c is equal to 4 chips and T_c is a chip time duration.

$$r_{pre\text{-}EDMG}^{i_{TX}\ (1)}\left(nT_c\right) = \begin{cases} r_{pre\text{-}EDMG}^{i_{TX}\ (1)}\left(nT_c + T_{SC}^{i_{TX}}\right), & n = 0,1,\ldots,N-1-T_{SC}^{i_{TX}}/T_c \\ r_{pre\text{-}EDMG}^{i_{TX}\ (1)}\left(nT_c - \left(NT_c - T_{SC}^{i_{TX}}\right)\right), & n = N - T_{SC}^{i_{TX}}/T_c,\ldots,N-1 \end{cases}, \quad 1 \le i_{TX} \le N_{TX}$$

where

N is the total number of chips in the pre-EDMG field of the EDMG PPDU waveform

The waveform for the pre-EDMG modulated fields for i_{TX}^{th} transmit chain is obtained by upsampling and filtering and then appropriate carrier frequency shift of the $r_{pre-EDMG}^{i_{TX}\ (1)}\left(nT_c\right)$ waveform, if required. The upsampling procedure is applied using a factor of N_{up}. The filtering procedure is performed with a pulse shaping filter, $h_{SC\ CB}$, defined at the $N_{up} \times F_c$ sampling rate as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$r_{pre-EDMG}^{i_{TX}\ (2)}\left(n\frac{T_c}{N_{up}}\right)=\begin{cases} r_{pre-EDMG}^{i_{TX}\ (1)}\left(n\frac{T_c}{N_{up}}\right), n=0,N_{up},2*N_{up}... \\ 0 \qquad\qquad otherwise \end{cases}$$

$$r_{pre-EDMG}^{i_{TX}\ (3)}\left(n\frac{T_c}{N_{up}}\right)=\sum_{k=0}^{K-1} r_{pre-EDMG}^{i_{TX}\ (2)}\left((n-k)\frac{T_c}{N_{up}}\right)h_{SC\,CB}(k), n=0,1,...$$

$$r_{pre-EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}\right)=r_{pre-EDMG}^{i_{TX}\ (3)}\left(\left(n+\frac{K-1}{2}\right)\frac{T_c}{N_{up}}\right), n=0,1,...$$

where

K is the length of $h_{SC\,CB}$ in samples

$$r_{pre\text{-}EDMG}^{i_{TX}\ (2)}\left(n\frac{T_c}{N_{up}}\right)=0, \text{ for } n<0 \text{ and } n\geq N\times N_{up}$$

N is the total number of chips in the pre-EDMG field of the EDMG PPDU

The waveform of the pre-EDMG modulated fields for the i_{TX}^{th} transmit chain when transmitted over a 2.16 GHz or 2.16+2.16 GHz channel shall be defined as follows:

$$r_{pre-EDMG}^{i_{TX}}\left(n\frac{T_c}{N_{up}}\right)=r_{pre-EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}\right), 1\leq i_{TX}\leq N_{TX}$$

For a 2.16+2.16 GHz transmission, the total number of transmit chains, N_{TX}, shall be an even number. The first $N_{TX}/2$ transmit chains shall be used for transmission on the primary channel and the second $N_{TX}/2$ transmit chains shall be used for transmission on the secondary channel (see 28.3.4 (Channelization)).

The waveform of the pre-EDMG modulated fields for the i_{TX}^{th} transmit chain when transmitted using duplicate transmission over a 4.32 GHz or 4.32+4.32 GHz channel shall be defined as follows:

$$r_{pre\text{-}EDMG}^{i_{TX}}\left(n\frac{T_c}{N_{up}}\right)=r_{pre\text{-}EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}+\Delta t_1\right)\cdot\frac{1}{\sqrt{2}}\exp\left(-j2\pi\left(\frac{\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right)$$

$$+r_{pre\text{-}EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}+\Delta t_2\right)\cdot\frac{1}{\sqrt{2}}\exp\left(+j2\pi\left(\frac{\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right), 1\leq i_{TX}\leq N_{TX}$$

where

ΔF	defines the channel spacing and is equal to 2.16 GHz
Δt_1 and Δt_2	are in the range [0, T_c]
Δt_i equal to 0	corresponds to the primary channel

For a 4.32+4.32 GHz transmission, the total number of transmit chains, N_{TX}, shall be an even number. The first $N_{TX}/2$ transmit chains shall be used for transmission on the primary and secondary channels and the second $N_{TX}/2$ transmit chains shall be used for transmission on the secondary1 and secondary2 channels (see 28.3.4 (Channelization)).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The waveform of the pre-EDMG modulated fields for the i_{TX}^{th} transmit chain when transmitted using duplicate transmission over a 6.48 GHz channel shall be defined as follows:

$$r_{pre\text{-}EDMG}^{i_{TX}}\left(n\frac{T_c}{N_{up}}\right) = r_{pre\text{-}EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}+\Delta t_1\right)\cdot\frac{1}{\sqrt{3}}\exp\left(-j2\pi\Delta F\left(\frac{T_c}{N_{up}}\right)n\right)$$
$$+r_{pre\text{-}EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}+\Delta t_2\right)\cdot\frac{1}{\sqrt{3}}$$
$$+r_{pre\text{-}EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}+\Delta t_3\right)\cdot\frac{1}{\sqrt{3}}\exp\left(+j2\pi\Delta F\left(\frac{T_c}{N_{up}}\right)n\right), 1\le i_{TX}\le N_{TX}$$

where

Δt_1, Δt_2, and Δt_3 are in the range $[0, T_c]$
Δt_i equal to 0 corresponds to the primary channel

The waveform of the pre-EDMG modulated fields for the i_{TX}^{th} transmit chain when transmitted using duplicate transmission over an 8.64 GHz channel shall be defined as follows:

$$r_{pre\text{-}EDMG}^{i_{TX}}\left(n\frac{T_c}{N_{up}}\right) = r_{pre\text{-}EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}+\Delta t_1\right)\cdot\frac{1}{\sqrt{4}}\exp\left(-j2\pi\left(\frac{3\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right)$$
$$+r_{pre\text{-}EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}+\Delta t_2\right)\cdot\frac{1}{\sqrt{4}}\exp\left(-j2\pi\left(\frac{\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right)$$
$$+r_{pre\text{-}EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}+\Delta t_3\right)\cdot\frac{1}{\sqrt{4}}\exp\left(+j2\pi\left(\frac{\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right)$$
$$+r_{pre\text{-}EDMG}^{i_{TX}\ (4)}\left(n\frac{T_c}{N_{up}}+\Delta t_4\right)\cdot\frac{1}{\sqrt{4}}\exp\left(+j2\pi\left(\frac{3\Delta F}{2}\right)\left(\frac{T_c}{N_{up}}\right)n\right), 1\le i_{TX}\le N_{TX}$$

where

Δt_1, Δt_2, Δt_3, and Δt_4 are in the range $[0, T_c]$
Δt_i equal to 0 corresponds to the primary channel

The definition of the pulse shaping filter impulse response, $h_{SC\,CB}$, and the N_{up} parameter are implementation dependent.

28.5.10.4.4.3 EDMG preamble and Data field transmission

For a single PPDU transmission, the EDMG modulated field of the EDMG preamble and Data field of an SU PPDU is defined for the i_{TX}^{th} transmit chain at the EDMG SC chip rate $F_{c\ EDMG}$ and includes the following modulated fields:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$r^{i_{TX}}_{EDMG\text{-}Pream,\,Data}\left(n\frac{T_c}{N_{CB}}\right)=r^{i_{TX}}_{EDMG\text{-}STF}\left(n\frac{T_c}{N_{CB}}\right)+r^{i_{TX}}_{EDMG\text{-}CEF}\left(n\frac{T_c}{N_{CB}}-t_{EDMG\text{-}CEF}\right)$$
$$+r^{i_{TX}}_{Data}\left(n\frac{T_c}{N_{CB}}-t_{Data}\right),\ 1\le i_{TX}\le N_{TX}$$

where

$t_{EDMG\text{-}CEF}=T_{EDMG\text{-}STF}$ is the duration of the EDMG-STF field of the PPDU

$t_{Data}=t_{EDMG\text{-}CEF}+T_{EDMG-CEF}$ is the total duration of the EDMG-STF and EDMG-CEF fields of the PPDU

The EDMG-STF, EDMG-CEF, and Data field transmission is defined in 28.5.4 (EDMG-STF definition), 28.5.5 (EDMG-CEF definition), and 28.5.9.5.2 (Transmission in EDMG format), respectively.

For an EDMG A-PPDU transmission of N_{PPDU} PPDUs, the EDMG modulated field of the EDMG preamble and Data field of an SU PPDU is defined for i_{TX}^{th} transmit chain at the $F_{c\ EDMG}$ and includes the following modulated fields:

$$r^{i_{TX}}_{EDMG\text{-}Pream,\,Data}\left(n\frac{T_c}{N_{CB}}\right)=r^{i_{TX}}_{EDMG\text{-}STF}\left(n\frac{T_c}{N_{CB}}\right)+r^{i_{TX}}_{EDMG\text{-}CEF}\left(n\frac{T_c}{N_{CB}}-t_{EDMG\text{-}CEF}\right)$$
$$+r^{i_{TX}}_{Data_1}\left(n\frac{T_c}{N_{CB}}-t_{Data_1}\right)$$
$$+r^{i_{TX}}_{EDMG\text{-}Header\text{-}A_2}\left(n\frac{T_c}{N_{CB}}-t_{EDMG\text{-}Header\text{-}A_2}\right)+r^{i_{TX}}_{Data_2}\left(n\frac{T_c}{N_{CB}}-t_{Data_2}\right)$$
$$+\ldots$$
$$+r^{i_{TX}}_{EDMG\text{-}Header\text{-}A_{N_{PPDU}}}\left(n\frac{T_c}{N_{CB}}-t_{EDMG\text{-}Header\text{-}A_{N_{PPDU}}}\right)+r^{i_{TX}}_{Data_{N_{PPDU}}}\left(n\frac{T_c}{N_{CB}}-t_{Data_{N_{PPDU}}}\right),\ 1\le i_{TX}\le N_{TX}$$

where

$t_{EDMG\text{-}CEF}=T_{EDMG\text{-}STF}$ is the duration of the EDMG-STF field of the PPDU

$t_{Data_1}=t_{EDMG\text{-}CEF}+T_{EDMG\text{-}CEF}$ is the total duration of the EDMG-STF and EDMG-CEF fields of the PPDU

$t_{EDMG\text{-}Header\text{-}A_2}=t_{Data_1}+T_{Data_1}$ is the total duration of the EDMG-STF, EDMG-CEF, and $Data_1$ fields of the PPDU

$t_{Data_2}=t_{EDMG\text{-}Header\text{-}A_2}+T_{EDMG\text{-}Header\text{-}A_2}$ is the total duration of the EDMG-STF, EDMG-CEF, $Data_1$, and EDMG-Header-A_2 fields of the PPDU

…

$t_{EDMG\text{-}Header\text{-}A_{N_{PPDU}}}=t_{Data_{N_{PPDU}-1}}+T_{Data_{N_{PPDU}-1}}$ is the total duration of the EDMG-STF, EDMG-CEF, $Data_1$, EDMG-Header-A_2, $Data_2$, …, and $Data_{NPPDU–1}$ fields of the PPDU

$t_{Data_{N_{PPDU}}}=t_{EDMG\text{-}Header-A_{N_{PPDU}}}+T_{EDMG\text{-}Header-A_{N_{PPDU}}}$ is the total duration of the EDMG-STF, EDMG-CEF, $Data_1$, EDMG-Header-A_2, $Data_2$, …, $Data_{NPPDU–1}$, and EDMG-Header-A_{NPPDU} fields of the PPDU

Copyright © 2025 IEEE. All rights reserved.

The EDMG-STF, EDMG-CEF, Data, and EDMG-Header-A field transmission is defined in 28.5.4 (EDMG-STF definition), 28.5.5 (EDMG-CEF definition), 28.5.9.5.2 (Transmission in EDMG format), and 28.5.7 (Encoding of EDMG-Header-A for EDMG A-PPDU transmission), respectively.

For spatial expansion, the PPDU waveform of the EDMG preamble and Data field for the i_{TX}^{th} transmit chain includes a cyclic shift, $T_{SC}^{i_{TX}}$, dependent on the particular transmit chain number. The cyclic shift, $T_{SC}^{i_{TX}}$, is defined in SC chip units as $(i_{TX}-1) \times N_c \times T_c$, where N_c is equal to 4 chips and T_c is a chip time duration.

$$r_{EDMG\text{-}Pream,\,Data}^{i_{TX}}\left(n\frac{T_c}{N_{CB}}\right) =$$

$$= \begin{cases} r_{EDMG\text{-}Pream,\,Data}^{i_{TX}}\left(n\left(\frac{T_c}{N_{CB}}\right)+T_{SC}^{i_{TX}}\right), & n=0,1,\ldots,N-1-T_{SC}^{i_{TX}}/\left(T_c/N_{CB}\right) \\ r_{EDMG\text{-}Pream,\,Data}^{i_{TX}}\left(n\left(\frac{T_c}{N_{CB}}\right)-\left(N\left(\frac{T_c}{N_{CB}}\right)-T_{SC}^{i_{TX}}\right)\right), & n=N-T_{SC}^{i_{TX}}/\left(T_c/N_{CB}\right),\ldots,N-1 \end{cases}, \quad 1 \le i_{TX} \le N_{TX}$$

where

N is the total number of chips in the EDMG preamble and Data fields of the EDMG PPDU

28.5.10.4.4.4 TRN field transmission

The TRN field, $r_{TRN}^{i_{TX}}\left(n\frac{T_c}{N_{CB}}\right)$, shall be defined at the EDMG SC chip rate $F_{c\ EDMG}$ per i_{TX}^{th} transmit chain as defined in 28.9.2.2.6 (TRN subfield definition for EDMG SC PPDUs and EDMG control mode PPDUs).

28.5.10.4.4.5 Filtering procedure

The EDMG preamble, Data field, and TRN field for the i_{TX}^{th} transmit chain are defined as follows:

$$r_{EDMG\text{-}Pream,\,Data,\,TRN}^{i_{TX}\,(1)}\left(n\frac{T_c}{N_{CB}}\right) = r_{EDMG\text{-}Pream,\,Data}^{i_{TX}}\left(n\frac{T_c}{N_{CB}}\right)$$

$$+ r_{TRN}^{i_{TX}}\left(n\frac{T_c}{N_{CB}} - t_{TRN}\right), 1 \le i_{TX} \le N_{TX}$$

where

$t_{TRN} = t_{Data} + T_{Data}$ is the total duration of the EDMG-STF, EDMG-CEF, and Data fields of the PPDU

The EDMG preamble, Data field, and TRN field are filtered and resampled with a conversion rate ratio N_{up}/N_{CB}. For example, the resampling procedure for a ratio N_{up}/N_{CB} equal to 3/2 can be defined as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$r^{i_{TX}\ (2)}_{EDMG\text{-}Pream,\ Data,\ TRN}\left(n\frac{T_c}{3N_{CB}}\right)=\begin{cases} r^{i_{TX}\ (1)}_{EDMG\text{-}Pream,\ Data,\ TRN}\left(n\frac{T_c}{3N_{CB}}\right), n=0,3,6... \\ 0 \quad \text{otherwise} \end{cases}$$

$$r^{i_{TX}\ (3)}_{EDMG\text{-}Pream,\ Data,\ TRN}\left(n\frac{T_c}{3N_{CB}}\right)=\sum_{k=0}^{K-1} r^{i_{TX}\ (2)}_{EDMG\text{-}Pream,\ Data,\ TRN}\left((n-k)\frac{T_c}{3N_{CB}}\right)h_{SC\,CB}(k), n=0,1,...$$

$$r^{i_{TX}}_{EDMG\text{-}Pream,\ Data,\ TRN}\left(n\frac{2T_c}{3N_{CB}}\right)=r^{i_{TX}\ (3)}_{EDMG\text{-}Pream,\ Data,\ TRN}\left(\left(2n+\frac{K-1}{2}\right)\frac{T_c}{3N_{CB}}\right), n=0,1,...$$

where

K is the length of $h_{SC\,CB}$ in samples

$$r^{i_{TX}\ (2)}_{EDMG\text{-}Pream,Data,TRN}\left(n\frac{T_c}{3N_{CB}}\right)=0, \text{ for } n<0 \text{ and } n\geq N\times 3$$

N is the total number of chips in the EDMG preamble, Data field, and TRN field of the EDMG PPDU

The EDMG SC mode SU PPDU waveform for the i_{TX}^{th} transmit chain concatenates the pre-EDMG modulated fields, EDMG preamble, Data field, and TRN field and shall be defined as follows:

$$r^{i_{TX}}_{PPDU}\left(n\frac{T_c}{N_{up}}\right)=r^{i_{TX}}_{pre\text{-}EDMG}\left(n\frac{T_c}{N_{up}}\right)+r^{i_{TX}}_{EDMG\text{-}Pream,\ Data,\ TRN}\left(n\frac{T_c}{N_{up}}-t_{EDMG\text{-}STF}\right), 1\leq i_{TX}\leq N_{TX}$$

where

$t_{EDMG\text{-}STF}=t_{EDMG\text{-}Header\text{-}A}+T_{EDMG\text{-}Header\text{-}A}$ is the total duration of the L-STF, L-CEF, L-Header, and EDMG-Header-A fields of the PPDU

The definition of the pulse shaping filter impulse response, $h_{SC\,CB}$, and the N_{up} parameter are implementation dependent.

28.5.10.5 EDMG MU PPDU transmission

28.5.10.5.1 General

The EDMG SC mode MU PPDU transmitted over a 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, or 4.32+4.32 GHz channel with multiple space-time streams (N_{STS} > 1) for two or more users (N_{user} > 1) is composed of pre-EDMG modulated fields, EDMG preamble, EDMG-Header-B field, Data field and TRN field. The TRN field might not be present in a transmitted MU PPDU depending on particular transmission parameters. The total number of transmit chains, N_{TX}, shall be constant over the different fields of a transmitted EDMG MU PPDU.

28.5.10.5.2 Pre-EDMG modulated fields transmission

The pre-EDMG modulated fields of the PPDU shall be transmitted as specified in 28.5.10.4.4.2 (Pre-EDMG modulated fields transmission).

28.5.10.5.3 EDMG preamble, EDMG-Header-B, and Data field transmission

The EDMG preamble, EDMG-Header-B and Data field of an EDMG MU PPDU is defined for i_{TX}^{th} transmit chain at the EDMG SC chip rate $F_{c\,EDMG}$ and includes the following modulated fields:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$r^{i_{TX}}_{EDMG\text{-}Pream,\,EDMG\text{-}Header\text{-}B,\,Data}\left(n\frac{T_c}{N_{CB}}\right)=r^{i_{TX}}_{EDMG\text{-}STF}\left(n\frac{T_c}{N_{CB}}\right)+r^{i_{TX}}_{EDMG\text{-}CEF}\left(n\frac{T_c}{N_{CB}}-t_{EDMG\text{-}CEF}\right)$$
$$+r^{i_{TX}}_{EDMG\text{-}Header\text{-}B}\left(n\frac{T_c}{N_{CB}}-t_{EDMG\text{-}Header\text{-}B}\right)+r^{i_{TX}}_{Data}\left(n\frac{T_c}{N_{CB}}-t_{Data}\right),\ 1\le i_{TX}\le N_{TX}$$

where

$t_{EDMG\text{-}CEF}=T_{EDMG\text{-}STF}$ is the duration of the EDMG-STF field of the PPDU

$t_{EDMG\text{-}Header\text{-}B}=t_{EDMG\text{-}CEF}+T_{EDMG\text{-}CEF}$ is the total duration of the EDMG-STF and EDMG-CEF fields of the PPDU

$t_{Data}=t_{EDMG\text{-}Header\text{-}B}+T_{EDMG\text{-}Header\text{-}B}$ is the total duration of the EDMG-STF, EDMG-CEF, and EDMG-Header-B fields of the PPDU

The EDMG-STF, EDMG-CEF, Data, and EDMG-Header-B field transmission is defined in 28.5.4 (EDMG-STF definition), 28.5.5 (EDMG-CEF definition), 28.5.9.5.2 (Transmission in EDMG format), and 28.5.6 (Encoding of EDMG-Header-B), respectively.

28.5.10.5.4 TRN field transmission

The TRN field, $r^{i_{TX}}_{TRN}\left(n\frac{T_c}{N_{CB}}\right)$, shall be defined at the EDMG SC chip rate $F_{c\ EDMG}$ per i_{TX}^{th} transmit chain as defined in 28.9.2.2.6 (TRN subfield definition for EDMG SC PPDUs and EDMG control mode PPDUs).

28.5.10.5.5 Filtering procedure

The EDMG preamble, EDMG-Header-B, Data field, and TRN field for the i_{TX}^{th} transmit chain are defined as follows:

$$r^{i_{TX}\ (1)}_{EDMG\text{-}Pream,\,EDMG\text{-}Header\text{-}B,\,Data,\,TRN}\left(n\frac{T_c}{N_{CB}}\right)=r^{i_{TX}}_{EDMG\text{-}Pream,\,EDMG\text{-}Header\text{-}B,\,Data}\left(n\frac{T_c}{N_{CB}}\right)$$
$$+r^{i_{TX}}_{TRN}\left(n\frac{T_c}{N_{CB}}-t_{TRN}\right),\ 1\le i_{TX}\le N_{TX}$$

where

$t_{TRN}=t_{Data}+T_{Data}$ is the total duration of the EDMG-STF, EDMG-CEF, EDMG-Header-B, and Data fields of the PPDU

The EDMG preamble, EDMG-Header-B, Data field and TRN field are filtered and resampled with a conversion rate ratio N_{up}/N_{CB}. For example, the resampling procedure for a ratio N_{up}/N_{CB} equal to 3/2 can be defined as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$r^{i_{TX}\ (2)}_{EDMG\text{-}Pream,\ Header\text{-}B,\ Data,\ TRN}\left(n\frac{T_c}{3N_{CB}}\right)=\begin{cases} r^{i_{TX}\ (1)}_{EDMG\text{-}Pream,\ EDMG\text{-}Header\text{-}B,\ Data,\ TRN}\left(n\frac{T_c}{3N_{CB}}\right), n=0,3,6... \\ 0 \quad \text{otherwise} \end{cases}$$

$$r^{i_{TX}\ (3)}_{EDMG\text{-}Pream,\ Header\text{-}B,\ Data,\ TRN}\left(n\frac{T_c}{3N_{CB}}\right)=\sum_{k=0}^{K-1} r^{i_{TX}\ (2)}_{EDMG\text{-}Pream,\ Header\text{-}B,\ Data,\ TRN}\left((n-k)\frac{T_c}{3N_{CB}}\right)h_{SC\,CB}(k), n=0,1,...$$

$$r^{i_{TX}}_{EDMG\text{-}Pream,\ Header\text{-}B,\ Data,\ TRN}\left(n\frac{2T_c}{3N_{CB}}\right)=r^{i_{TX}\ (3)}_{EDMG\text{-}Pream,\ Header\text{-}B,\ Data,\ TRN}\left(\left(2n+\frac{K-1}{2}\right)\frac{T_c}{3N_{CB}}\right), n=0,1,...$$

where

K is the length of $h_{SC\,CB}$ in samples

$$r^{i_{TX}\ (2)}_{EDMG\text{-}Pream,Header\text{-}B,Data,TRN}\left(n\frac{T_c}{3N_{CB}}\right)=0, \text{ for } n<0 \text{ and } n\geq N\times 3$$

N is the total number of chips in the EDMG preamble, EDMG-Header-B, Data, and TRN fields of the EDMG PPDU

The EDMG SC mode MU PPDU waveform for the i_{TX}^{th} transmit chain concatenates the pre-EDMG modulated fields, EDMG preamble, EDMG-Header-B, Data field, and TRN field and shall be defined as follows:

$$r^{i_{TX}}_{PPDU}\left(n\frac{T_c}{N_{up}}\right)=r^{i_{TX}}_{pre\text{-}EDMG}\left(n\frac{T_c}{N_{up}}\right)+r^{i_{TX}}_{EDMG\text{-}Pream,\ Header\text{-}B,\ Data,\ TRN}\left(n\frac{T_c}{N_{up}}-t_{EDMG\text{-}STF}\right), 1\leq i_{TX}\leq N_{TX}$$

where

$t_{EDMG\text{-}STF}=t_{EDMG\text{-}Header\text{-}A}+T_{EDMG\text{-}Header\text{-}A}$ is the total duration of the L-STF, L-CEF, L-Header, and EDMG-Header-A fields of the PPDU

The definition of the pulse shaping filter impulse response, $h_{SC\,CB}$, and the N_{up} parameter are implementation dependent.

28.5.11 Performance requirements

28.5.11.1 Transmit requirements

28.5.11.1.1 Transmit modulation accuracy (EVM) test and requirements

This subclause specifies the EVM test and corresponding requirements for the following:

— PPDUs transmitted with the TXVECTOR parameter EDMG_MODULATION equal to EDMG_SC_MODE and with TXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION equal to any valid combination indicated in Table 28-21, Table 28-22, or Table 28-23.

— PPDUs transmitted with the TXVECTOR parameter NON_EDMG_MODULATION equal to NON_EDMG_DUP_SC_MODE and with TXVECTOR parameter CH_BANDWIDTH with at least 2 bits equal one.

The transmit modulation accuracy test shall be performed by instrumentation capable of converting the transmitted signals into a stream of complex samples at sampling rate greater than or equal to the SC chip rate, with the following exceptions:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— If the TXVECTOR parameter NON_EDMG_MODULATION is equal to NON_EDMG_DUP_SC_MODE, the transmission in the two or more 2.16 GHz channels may be tested independently.
— If the TXVECTOR parameter CHANNEL_AGGREGATION is equal to AGGREGATED, the transmission in the two (adjacent or non-adjacent) 2.16 GHz channels or 4.32 GHz channels may be tested independently.

In the two cases indicated above, transmit modulation accuracy of each 2.16 GHz channel (when NON_EDMG_MODULATION is equal to NON_EDMG_DUP_SC_MODE or when CHANNEL_AGGREGATION is equal to AGGREGATED) or of each 4.32 GHz channel (when CHANNEL_AGGREGATION is equal to AGGREGATED) shall meet the required value in Table 28-58 through Table 28-61 using only the signal within the corresponding channel.

If the TXVECTOR parameter EDMG_MODULATION is equal to EDMG_SC_MODE, the TXVECTOR parameters NUM_STS and NUM_TX_CHAINS shall be equal, and the value of both parameters shall be equal to the number of utilized testing instrumentation input ports or antennas, if ports are not available on the STA under test. In the test, $N_{SS} = N_{STS}$ (no STBC) shall be used. If the TXVECTOR parameter NUM_STS is equal to a value greater than 1, the two or more space-time streams shall have the same modulation type. The identity matrix should be used as the expansion matrix. Each port or antenna connected to a transmit chain of the transmitting STA shall be assigned to a port or antenna of the testing instrumentation in a way that makes signal coupling between the different transmit signal paths negligible.

The instrumentation used in the transmit EVM accuracy test shall have sufficient accuracy in terms of I/Q arm amplitude and phase balance, DC offsets, phase noise, and analog-to-digital quantization noise, so as not to mask or degrade the true EVM measurement. A possible embodiment of such a setup is converting the signals to a low IF frequency with a microwave synthesizer, sampling the signal with a digital oscilloscope and decomposing it digitally into quadrature components. The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or equivalent procedure:

— Detect the start of the PPDU.
— Establish fine timing.
— Estimate the coarse and fine frequency offsets.
— De-rotate the frame according to the estimated frequency offset.
— Estimate the complex channel impulse response for each of the transmit chains using the EDMG-CEF field, if present. If not, channel estimation is performed using the L-CEF field.
— For each SC symbol block, estimate time-dependent phase variations using guard interval symbols (for example, by interpolating the phase between the prefix and postfix GI samples), and de-rotate the corresponding symbol samples accordingly.
— For each SC symbol block, perform demodulation and apply a minimum mean square error equalization matrix generated from the channel estimate. Group the demodulated symbols from each SC symbol block, and combine the demodulated data from each spatial stream into a vector.
— For each element of the vector, find the closest constellation point and compute the Euclidian distance from it.
— Compute the average relative constellation RMS error (EVM) across PPDUs according to the formula:

$$EVM = 20\log_{10}\left(\frac{1}{N_f}\sum_{f=1}^{N_f}\sqrt{\frac{\sum_{n=0}^{N_{BLKS}-1}\sum_{j=1}^{N_{ss}}\sum_{k=0}^{N_{SPB}-1}\left(I(f,n,j,k)-I^{*}(f,n,j,k)-I_0(f,j)\right)^2+\left(Q(f,n,j,k)-Q^{*}(f,n,j,k)-Q_0(f,j)\right)^2}{N_{BLKS}\times N_{SS}\times N_{SPB}\times P_0}}\right)$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

where

N_f is the number of frames for the measurement

N_{BLKS} is the number of SC symbol blocks within each frame

N_{SS} is the number of spatial streams of each frame

N_{SPB} is the number of data modulated symbols per SC symbol block

P_0 is the average power of the constellation

$I(f,n,j,k)$ and $Q(f,n,j,k)$
denote the observed symbol point in the complex plane for the k^{th} symbol of the n^{th} SC symbol block and j^{th} spatial stream within the f^{th} frame

$I^*(f,n,j,k)$ and $Q^*(f,n,j,k)$
denote the ideal symbol point in the complex plane for the k^{th} symbol of the n^{th} SC symbol block and j^{th} spatial stream within the f^{th} frame

$I_0(f,j)$ and $Q_0(f,j)$
are the complex DC term chosen to minimize the EVM, which may be dependent on the frame index (f) and spatial stream index (j)

The total number of symbols used in the test is equal to $N_f \times N_{BLKS} \times N_{SS} \times N_{SPB}$ with the constraint that N_{BLKS} shall be at least 20 and that N_f shall be at least 20. Random data shall be used for the symbols and frames.

The test equipment shall use a root-raised cosine filter with roll-off factor of 0.25 for the pulse shaping filter when conducting EVM measurements.

The transmit pulse shaping filter impulse response is implementation specific.

The EVM shall not exceed an MCS dependent value provided in Table 28-58 through Table 28-61.

Transmit requirements of PPDUs transmitted with TXVECTOR parameter NON_EDMG_MODULATION equal to DMG_SC_MODE are defined in 20.5.4 (Performance requirements).

28.5.11.1.2 Time of Departure accuracy

The RMS accuracy of the time of departure provided in TIME_OF_DEPARTURE shall be less than or equal to 80 ns.

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is set to aDMGChipRate.
— FIRST_TRANSITION_FIELD is L-STF of the waveform transmitted in the primary channel.
— SECOND_TRANSITION_FIELD is L-CEF of the waveform transmitted in the primary channel.
— TRAINING_FIELD is L-CEF of the waveform transmitted in the primary channel.
— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is set to aDMGTimeOfDepartureAccuracyThresh.

28.5.11.2 Receive requirements

CCA sensitivity requirements are defined in 28.3.8 (CCA sensitivity).

28.6 EDMG OFDM mode

28.6.1 General

Transmission and reception of 2.16 GHz PPDU, 4.32 GHz PPDU, 6.48 GHz PPDU, 8.64 GHz PPDU, 2.16+2.16 GHz PPDU, and 4.32+4.32 GHz PPDU using the EDMG OFDM mode are optional. This applies to SU and MU PPDUs with one or more spatial streams.

28.6.2 OFDM signal parameters

28.6.2.1 General

This subclause defines main EDMG OFDM signal parameters for 2.16 GHz (N_{CB} = 1), 4.32 GHz (N_{CB} = 2), 6.48 GHz (N_{CB} = 3), 8.64 GHz (N_{CB} = 4), 2.16+2.16 GHz (N_{CB} = 1), and 4.32+4.32 GHz (N_{CB} = 2) transmissions.

28.6.2.2 Timing related parameters

Table 28-62 provides a summary of the timing related parameters of the EDMG OFDM mode.

Table 28-62—EDMG OFDM mode timing related parameters1

Parameter	Value			
	$N_{CB} = 1$	$N_{CB} = 2$	$N_{CB} = 3$	$N_{CB} = 4$
N_{SD}: Number of data subcarriers	336	734	1134	1532
N_{SP}: Number of pilot subcarriers	16	36	56	76
N_{DC}: Number of DC subcarriers	3	3	3	3
N_{ST}: Total number of subcarriers	355	773	1193	1611
N_{SR}: Number of subcarriers occupying half of the overall bandwidth	177	386	596	805
$N_{GI\ short}$: short guard interval length	48	96	144	192
$N_{GI\ normal}$: normal guard interval length	96	192	288	384
$N_{GI\ long}$: long guard interval length	192	384	576	768
Δ_F: Subcarrier frequency spacing	5.15625 MHz	5.15625 MHz	5.15625 MHz	5.15625 MHz
F_s: EDMG OFDM sample rate	2.64 GHz	5.28 GHz	7.92 GHz	10.56 GHz
T_s: EDMG OFDM sample time duration	0.38 ns	0.19 ns	0.13 ns	0.09 ns
N_{DFT}: DFT size	512	1024	1536	2048
T_{DFT}: OFDM IDFT/DFT period	0.194 μs	0.194 μs	0.194 μs	0.194 μs
$T_{GI\ short}$: short guard interval duration	18.18 ns	18.18 ns	18.18 ns	18.18 ns
$T_{GI\ normal}$: normal guard interval duration	36.36 ns	36.36 ns	36.36 ns	36.36 ns
$T_{GI\ long}$: long guard interval duration	72.72 ns	72.72 ns	72.72 ns	72.72 ns

NOTE—The values given for parameters $N_{GI\ short}$, $N_{GI\ normal}$, and $N_{GI\ long}$ correspond to the number of elements in the GI for each GI length and N_{CB} value.

The pre-EDMG modulated fields are defined at the DMG SC chip rate F_c and the corresponding chip time duration T_c (see Table 28-47). Then, the resampling procedure is applied with 3/2 sample rate conversion ratio to achieve the effective sample rate of $(3/2) \times f_c$ and sample time duration of $(2/3) \times 1/f_c$.

The EDMG modulated fields are defined at the EDMG OFDM sample rate $F_s = 2.64 \times N_{CB}$ GHz and the corresponding sample time duration $T_s = 1 / (2.64 \times N_{CB})$ ns.

28.6.2.3 DC relative shift to carrier frequency

The DC relative frequency shift is applied in digital domain to the EDMG-STF, EDMG-CEF, Data, and TRN fields of an EDMG OFDM mode PPDU. The DC relative shift is frequency channel dependent, and denoted as $(f_{DC} - f_c)$, where f_c is the center frequency of the carrier and f_{DC} is the DC subcarrier frequency. f_{DC} and the DC relative shift are defined in Table 28-63.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—By applying the DC relative shift, each of the subcarrier frequencies for any channel numbers can be denoted as $64.8 + \Delta_F \times n$ GHz, where n is an integer. This makes the space between DC subcarrier frequencies of any two channels an integer multiple of the OFDM subcarrier spacing, and the subcarrier frequencies for 4.32 GHz or wider channels are aligned with the subcarriers in 2.16 GHz channels. In all cases, the relative shift between the DC subcarrier frequency and the center frequency of the carrier does not exceed half of the subcarrier spacing.

Table 28-63—DC relative shift to carrier frequency

Number of contiguous 2.16 GHz channels (N_{CB})	Channel number	Center frequency of the carrier, f_c (GHz)	DC subcarrier frequency, f_{DC} (GHz)	DC relative shift, ($f_{DC} - f_c$) (MHz)
1	1	58.32	$64.8 - \Delta_F \times 3 \times 419$	–1.4063

28.6.2.5 Data tones

Data tones $M_d(k)$ are frequency channel dependent and defined in Table 28-65. In the table, the notation m:n denotes an array of integer values starting with m (inclusive) and ending with n (inclusive), and with a step equal to 1.

Table 28-65—Data tones definition

Number of contiguous 2.16 GHz channels (N_{CB})	Channel number	Data tones – $M_d(k)$

28.6.2.6 Pilot sequences

The pilot sequence $P(i_{STS}, n, k)$ is created by inserting a sequence of 0s corresponding to tones $-N_{SR}$ to N_{SR}. The pilots are then inserted at the tone indices $M_p(k)$ defined in 28.6.2.4 (Pilot tones), which are frequency channel and bandwidth dependent, but independent of the space-time stream or OFDM symbol number as follows:

$$P\left(i_{STS}, n, M_p\left(k\right)\right) = P_{N_{SP}}\left(i_{STS}, n, k\right), k = 0,1,..., N_{SP} - 1$$

The pilot value $P_{N_{SP}}\left(i_{STS}, n, k\right)$ depends on the i_{STS}^{th} space-time stream number, n^{th} OFDM symbol, and k^{th} subcarrier index and defined as follows:

$$P_{N_{SP}}\left(i_{STS}, n, k\right) = W\left(i_{STS}, n \bmod N_{STS}\right) \times \left(2 \times p\left(n\right) - 1\right) \times P_{N_{SP}}\left(i_{STS}, k\right)$$

where

$P_{N_{SP}}\left(i_{STS}, k\right)$	defines the pilot for i_{STS}^{th} space-time stream and k^{th} subcarrier
$W(i_{STS}, n) \times (2 \times p(n) - 1)$	defines a common phase shift (over subcarriers) for the i_{STS}^{th} space-time stream and n^{th} OFDM symbol, $p(n)$ defines a bit coming from the scrambler defined in 28.6.9.1 (Scrambler) with shift register x1, x2,…, x7 initialized to all 1s at the zeroth (i.e., $n = 0$) OFDM symbol
N_{STS}	defines the total number of space-time streams

The common phase shift is composed as a product of deterministic shift $W(i_{STS}, n)$ repeated with period N_{STS} over the time and random shift defined by $(2 \times p(n) - 1)$, which is scrambler output dependent. The random component depends on the n^{th} OFDM symbol number only and does not depend on the particular i_{STS}^{th} space-time stream number.

The pilot sequence $P_{N_{SP}}\left(i_{STS}, :\right)$ for a given number of contiguous channel bandwidth, N_{CB}, is defined in Table 28-66.

Table 28-66—Pilot sequence ($P_{N_{SP}}$) definition

N_{CB}	$P_{N_{SP}}\left(i_{STS}, :\right)$
1	$P_{16}(i_{STS},:)$
2	$P_{36}(i_{STS},:) = [P_{12}(i_{STS},:), P_{12}(i_{STS},:), P_{12}(i_{STS},:)]$
3	$P_{56}(i_{STS},:) = [P_{16}(i_{STS},:), P_{12}(i_{STS},:), P_{12}(i_{STS},:), P_{16}(i_{STS},:)]$
4	$P_{76}(i_{STS},:) = [P_{16}(i_{STS},:), P_{16}(i_{STS},:), P_{12}(i_{STS},:), P_{16}(i_{STS},:), P_{16}(i_{STS},:)]$

The pilot sequences $P_{16}(i_{STS},:)$ and $P_{12}(i_{STS},:)$ are defined in Table 28-67 .

The deterministic component of common phase shift, $W(i_{STS}, n)$, is defined as follows:

$$W\left(i_{STS}, n\right) = \exp\left(-j\frac{2\pi}{N_{STS}} \cdot \left(i_{STS} - 1\right) \cdot n\right), i_{STS} = 1,2,..., N_{STS}; n = 0,1,..., N_{SYM} - 1$$

N_{SYM} is the total number of OFDM symbols

28.6.3 Transmitter block diagram

28.6.3.1 General

An EDMG OFDM PPDU transmission may be generated using a transmitter consisting of the following blocks:

a) Scrambler scrambles the data to reduce the probability of long sequences of 0s and 1s; see 28.6.9.1 (Scrambler).
b) LDPC encoder encodes the data to enable error correction. Data is padded with 0s to get an integer number of codewords and OFDM symbols; see 28.6.9.2 (Encoding).
c) Stream parser divides the output of the LDPC encoder into the groups of bits that are sent to different mapping devices. The sequence of the bits sent to different mapping devices is called a spatial stream; see 28.6.9.2 (Encoding).
d) Constellation mapper maps the sequence of bits in each spatial stream to constellation points (complex numbers); see 28.6.9.3 (Modulation mapping).
e) Interleaver performs interleaving inside an OFDM symbol; see 28.6.9.3.9 (Interleaver).
f) STBC encoder spreads constellation points from N_{SS} spatial streams into N_{STS} space-time streams using a space-time block code. EDMG OFDM mode defines STBC schemes with $N_{STS} = 2 \times N_{SS}$; see 28.6.9.3.10 (Space-time block coding).
g) Preamble builder builds symbols of EDMG-STF and EDMG-CEF fields in frequency domain; see 28.6.4 (EDMG-STF definition) and 28.6.5 (EDMG-CEF definition).
h) TRN builder builds symbols of TRN field; see 28.9.2.2.5 (TRN field definition).
i) Spatial mapper maps space-time streams to transmit chains. The spatial mapping is applied per subcarrier basis and may include one of the following (see 28.6.10.2 (Spatial mapping)):
    1) Direct mapping: constellation points from each space-time stream are mapped directly to the transmit chains.
    2) Indirect mapping: constellation points from each space-time stream are mapped to each transmit chain.
    3) Digital beamforming: each vector of constellation points from all of the space-time streams is multiplied by a matrix of steering vectors to produce the input to the transmit chains.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

j) Cyclic shift (CSD) insertion prevents the transmission from unintentional beamforming. A cyclic shift is specified per transmitter chain for pre-EDMG portion of PPDU transmission; see 28.5.3.3.1 (Pre-EDMG modulated fields of PPDU transmission).

k) IDFT applies Inverse Discrete Fourier Transform to the input block of subcarriers.

l) GI insertion and windowing prepends the OFDM symbol with a guard interval defined as a cyclic extension of the OFDM symbol in time domain and applies a window function; see 28.6.9.3 (Modulation mapping).

28.6.3.2 EDMG PPDU transmission

28.6.3.2.1 Pre-EDMG modulated fields of PPDU transmission

See 28.5.3.3.1 (Pre-EDMG modulated fields of PPDU transmission).

28.6.3.2.2 EDMG modulated fields of SU PPDU transmission

Figure 28-33 (Transmitter block diagram for the EDMG modulated fields of an SU PPDU transmission) shows the transmitter blocks used to generate the EDMG modulated fields of an SU PPDU. The EDMG-STF and EDMG-CEF fields are generated using the preamble builder, IDFT, and GI insertion blocks. The TRN field is generated using the TRN builder, IDFT, and GI insertion blocks. The EDMG-Header-A field in the PPDU starting from the second PPDU in the EDMG A-PPDU and Data field of the PPDU are generated using the scrambler, the LDPC encoder, the constellation mapper, the interleaver, IDFT, and GI insertion blocks. If the STBC encoder is applied, then N_{SS} spatial streams are mapped to $2 \times N_{SS}$ space-time streams as defined in 28.6.9.3.10 (Space-time block coding). The N_{STS} space-time streams are further mapped to N_{TX} transmit chains, where $N_{STS} \leq N_{TX}$.

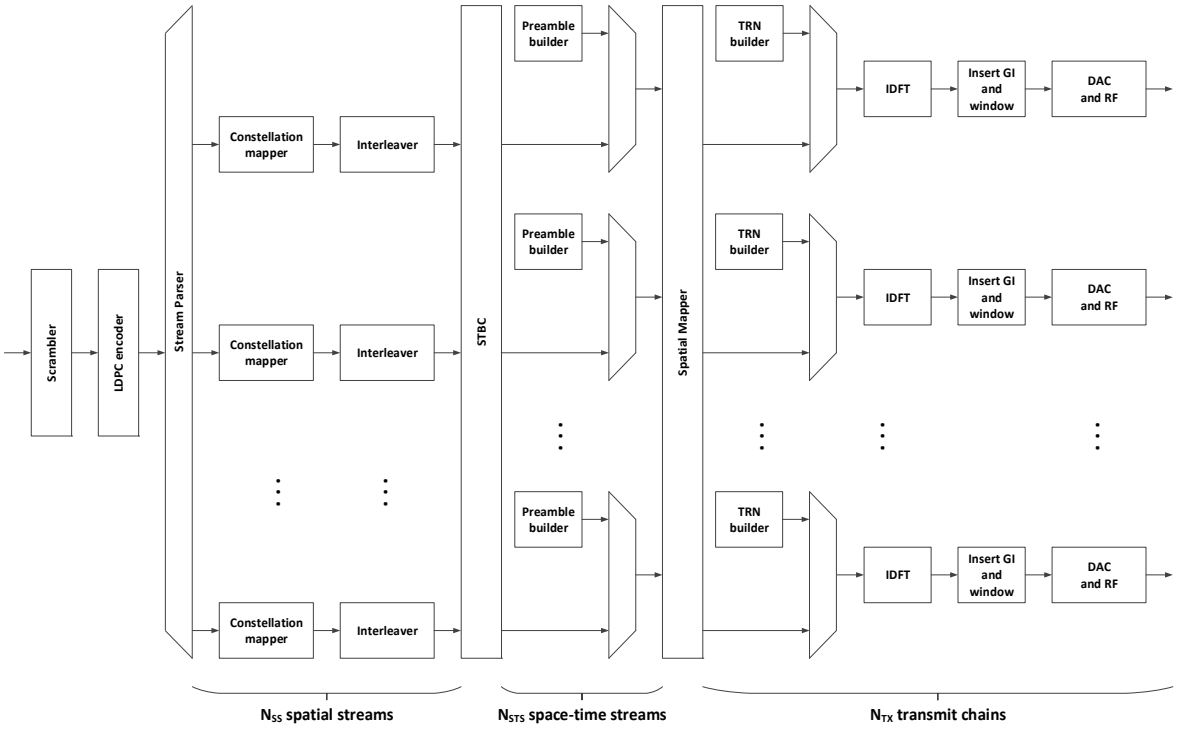

Figure 28-33—Transmitter block diagram for the EDMG modulated fields of an SU PPDU transmission

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—The interleaver is applied to 16-QAM and 64-QAM modulations only.

28.6.3.2.3 EDMG modulated fields of MU PPDU transmission

Figure 28-34 (Transmitter block diagram for the EDMG modulated fields of an MU PPDU transmission) shows the transmitter blocks used to generate the EDMG modulated fields of an MU PPDU. The EDMG-STF and EDMG-CEF fields are generated using the preamble builder, IDFT, and GI insertion blocks. The TRN field is generated using the TRN builder, IDFT, and GI insertion blocks. The EDMG-Header-B and Data fields are generated using the scrambler, the LDPC encoder, the constellation mapper, the interleaver, IDFT, and GI insertion blocks. The PPDU encoding uses the seed value defined in the EDMG-Header-B and has an independent flow per user. However, the transmitter keeps a common space-time stream enumeration over all users. If the STBC encoder is applied, then a single spatial stream is mapped to two space-time streams as defined in 28.6.9.3.10 (Space-time block coding). The N_{STS} space-time streams are further mapped to N_{TX} transmit chains, where $N_{STS} \leq N_{TX}$.

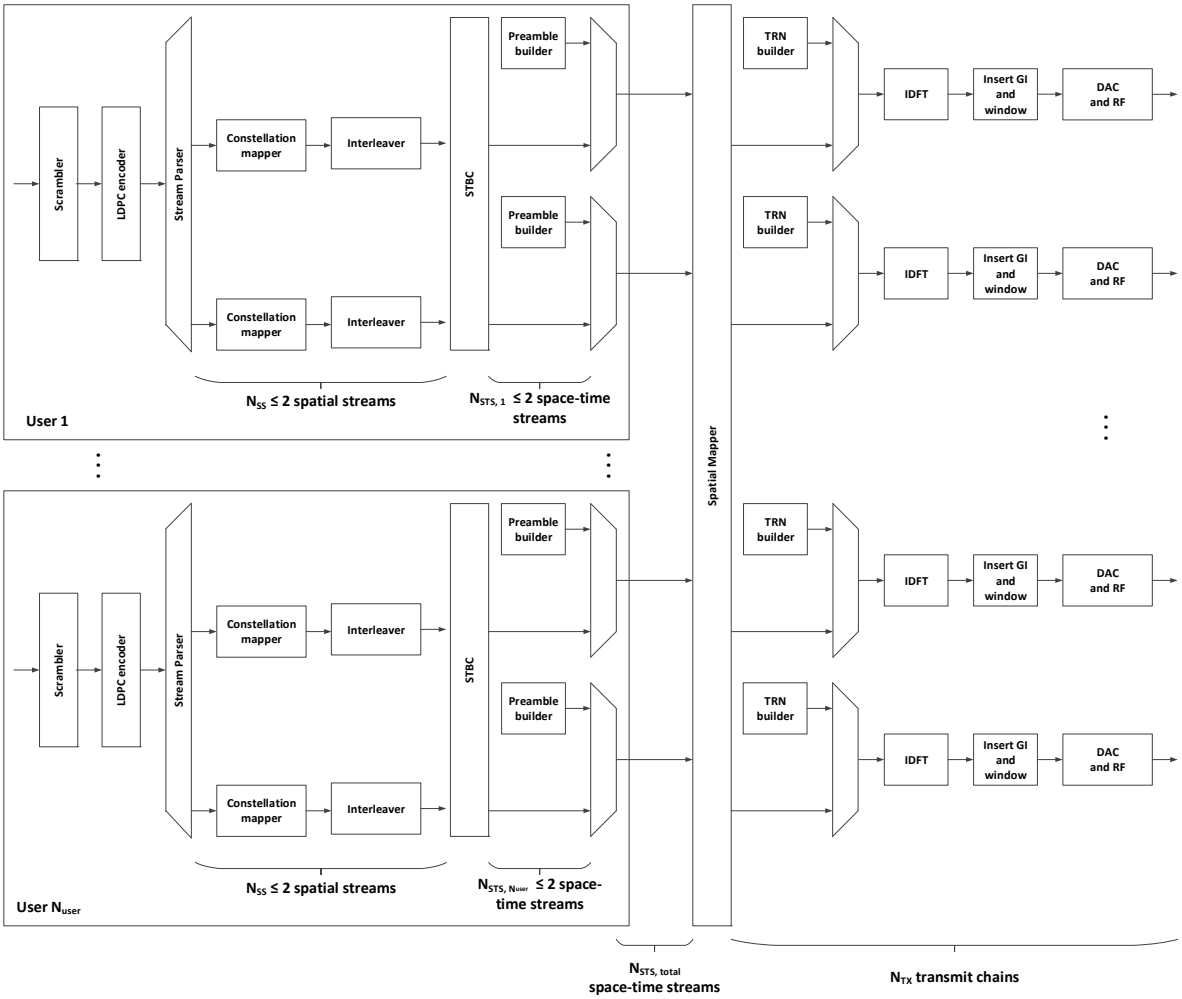

Figure 28-34—Transmitter block diagram for the EDMG modulated fields of an MU PPDU transmission

NOTE—The interleaver is applied to 16-QAM and 64-QAM modulations only.

28.6.4 EDMG-STF definition

28.6.4.1 General

The EDMG-STF field has a fixed time duration independent on the number of space-time streams. The structure of the EDMG-STF field depends on the number of contiguous 2.16 GHz channels over which an EDMG PPDU is transmitted and the space-time stream number i_{STS}, where $1 \le i_{STS} \le 8$.

$EDMGS^{i_{STS}}_{left,N}$ and $EDMGS^{i_{STS}}_{right,N}$, the sequences of length N used in the definition of the EDMG-STF field for different space-time streams, are defined in 28.11.1 (EDMG-STF sequence).

28.6.4.2 Definition

For EDMG OFDM transmissions using a single 2.16 GHz channel, the frequency sequence used to construct the EDMG-STF field for the i_{STS}^{th} space-time stream is given as follows:

$$EDMG\text{-}STF^{i_{STS}}_{-177,177} = \{ EDMGS^{i_{STS}}_{left,176}, 0, 0, 0, \ EDMGS^{i_{STS}}_{right,176} \}$$

For EDMG OFDM transmissions using a single 4.32 GHz channel, the frequency sequence used to construct the EDMG-STF field for the i_{STS}^{th} space-time stream is given as follows:

$$EDMG\text{-}STF^{i_{STS}}_{-386,386} = \{ EDMGS^{i_{STS}}_{left,385}, 0, 0, 0, \ EDMGS^{i_{STS}}_{right,385} \}$$

For EDMG OFDM transmissions using a single 6.48 GHz channel, the frequency sequence used to construct the EDMG-STF field for the i_{STS}^{th} space-time stream is given as follows:

$$EDMG\text{-}STF^{i_{STS}}_{-596,596} = \{ EDMGS^{i_{STS}}_{left,595}, 0, 0, 0, \ EDMGS^{i_{STS}}_{right,595} \}$$

For EDMG OFDM transmissions using a single 8.64 GHz channel, the frequency sequence used to construct the EDMG-STF field for the i_{STS}^{th} space-time stream is given as follows:

$$EDMG\text{-}STF^{i_{STS}}_{-805,805} = \{ EDMGS^{i_{STS}}_{left,804}, 0, 0, 0, \ EDMGS^{i_{STS}}_{right,804} \}$$

The EDMG-STF field transmit waveform in time domain shall be defined at the OFDM sampling rate F_s and sample time duration T_s as follows:

$$r^{i_{TX}}_{EDMG\text{-}STF}\left(qT_s\right) = \frac{1}{\sqrt{N_{STS} \cdot N^{Tone}_{EDMG\text{-}STF}}} w\left(qT_s\right)$$
$$\cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} \left[Q_{EDMG\,k} \right]_{i_{TX}, i_{STS}} EDMG\text{-}STF^{i_{STS}}_{k} \exp\left(j2\pi k \Delta_F \left(qT_s \right) \right)$$

where

$N^{Tone}_{EDMG\text{-}STF}$	is 88 192 296 and 400 for N_{CB} = 1, 2, 3, and 4, respectively
N_{STS}	is the total number of space-time streams
$Q_{EDMG\,k}$	is the spatial mapping matrix per k^{th} subcarrier
$[\ ]_{m,n}$	is a matrix element from m^{th} row and n^{th} column
$w(qT_s)$	is a window function applied to smooth the transitions between consecutive OFDM symbols and its definition is implementation dependent
q	is the time sample index, $q = 0,1,...,30 \times \left(N_{DFT} / 4 \right) - 1$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The fact that only spectral lines of $EDMG\text{-}STF_k^{i_{STS}}$ with indices that are a multiple of four have nonzero amplitude results in a periodicity of $T_{DFT}/4 = 48.48$ ns. The interval TEDMG-STF is equal to thirty 48.48 ns periods (i.e., 1.455 μs).

28.6.5 EDMG-CEF definition

28.6.5.1 General

The structure of the EDMG-CEF field depends on the number of contiguous 2.16 GHz channels over which an EDMG PPDU is transmitted and the space-time stream number, i_{STS}.

$Seq_{left,N}^{i_{STS}}$ and $Seq_{right,N}^{i_{STS}}$, the sequences of length N used in the definition of the EDMG-CEF field for different space-time streams, are defined in 28.11.2 (EDMG-CEF sequence).

28.6.5.2 Definition

For an EDMG PPDU transmission using the EDMG OFDM mode over a 2.16 GHz channel, the EDMG-CEF sequence is defined in frequency domain for the i^{th} space-time stream as follows:

$$EDMG\text{-}CEF_{-177,177}^{i_{STS}} = \{ Seq_{left,176}^{i_{STS}}, 0, 0, 0, Seq_{right,176}^{i_{STS}} \}$$

For an EDMG PPDU transmission using the EDMG OFDM mode over a 4.32 GHz channel, the EDMG-CEF sequence is defined in frequency domain for the i^{th} space-time stream as follows:

$$EDMG\text{-}CEF_{-386,386}^{i_{STS}} = \{ Seq_{left,385}^{i_{STS}}, 0, 0, 0, Seq_{right,385}^{i_{STS}} \}$$

For an EDMG PPDU transmission using the EDMG OFDM mode over a 6.48 GHz channel, the EDMG-CEF sequence is defined in frequency domain for the i^{th} space-time stream as follows:

$$EDMG\text{-}CEF_{-596,596}^{i_{STS}} = \{ Seq_{left,595}^{i_{STS}}, 0, 0, 0, Seq_{right,595}^{i_{STS}} \}$$

For an EDMG PPDU transmission using the EDMG OFDM mode over an 8.64 GHz channel, the EDMG-CEF sequence is defined in frequency domain for the i^{th} space-time stream as follows:

$$EDMG\text{-}CEF_{-805,805}^{i_{STS}} = \{ Seq_{left,804}^{i_{STS}}, 0, 0, 0, Seq_{right,804}^{i_{STS}} \}$$

The EDMG-CEF field transmit waveform in time domain shall be defined at the OFDM sampling rate F_s and sample time duration T_s as follows:

$$r_{EDMG\text{-}CEF}^{i_{TX}}\left(qT_s\right) = \frac{1}{\sqrt{N_{STS} \cdot N_{EDMG\text{-}CEF}^{Tone}}} \sum_{n=0}^{N_{EDMG-CEF}^{N_{STS}}-1} w\left(qT_s - nT_{SYM}\right)$$

$$\cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} \left[Q_{EDMG\,k} \right]_{i_{TX},i_{STS}} \left[P_{EDMG\text{-}CEF} \right]_{i_{STS},n} EDMG\text{-}CEF_k^{i_{STS}} \exp\left(j2\pi k\Delta_F \left(qT_s - nT_{SYM} - T_{GI\,long} \right) \right)$$

where

$N_{EDMG\text{-}CEF}^{Tone} = N_{ST} - N_{DC}$ is the total number of active tones

N_{STS} is the total number of space-time streams

$T_{SYM} = T_{DFT} + T_{GI\,long}$ is the OFDM symbol duration in time domain

$T_{GI\,long}$ is the long guard interval time duration

$Q_{EDMG\,k}$	is the spatial mapping matrix per k^{th} subcarrier
$P_{EDMG\text{-}CEF}$	is the EDMG-CEF mapping matrix defined below
$N_{EDMG\text{-}CEF}^{N_{STS}}$	is the number of OFDM symbols in the EDMG-CEF for a given total number of space-time streams N_{STS} defined below
$[\ ]_{m,n}$	is a matrix element from m^{th} row and n^{th} column
$w(qT_s)$	is the window function applied to smooth the transitions between consecutive OFDM symbols and its definition is implementation dependent
q	is the time sample index, $q = 0,1,...,\left(N_{DFT} + N_{GI\,long}\right) \times N_{EDMG\text{-}CEF}^{N_{STS}} - 1$

The EDMG-CEF mapping matrix for $N_{STS} = 1$ is defined as follows:

$$P_{EDMG\text{-}CEF} = \begin{bmatrix} +1 & -1 \end{bmatrix},\ N_{EDMG\text{-}CEF}^{N_{STS}} = 2$$

The EDMG-CEF mapping matrix for $N_{STS} = 2$ is defined as follows:

$$P_{EDMG\text{-}CEF} = \begin{bmatrix} +1 & -1 \\ +1 & +1 \end{bmatrix},\ N_{EDMG\text{-}CEF}^{N_{STS}} = 2$$

The EDMG-CEF mapping matrix for $N_{STS} = 3$ is defined as follows:

$$P_{EDMG\text{-}CEF} = \begin{bmatrix} +1 & -1 & +1 \\ +1 & -w_3^1 & w_3^2 \\ +1 & -w_3^2 & w_3^4 \end{bmatrix},\ w_3 = \exp\left(-j2\pi/3\right),\ N_{EDMG\text{-}CEF}^{N_{STS}} = 3$$

The EDMG-CEF mapping matrix for $N_{STS} = 4$ is defined as follows:

$$P_{EDMG\text{-}CEF} = P_{4x4} = \begin{bmatrix} +1 & -1 & +1 & +1 \\ +1 & +1 & -1 & +1 \\ +1 & +1 & +1 & -1 \\ -1 & +1 & +1 & +1 \end{bmatrix},\ N_{EDMG\text{-}CEF}^{N_{STS}} = 4$$

The EDMG-CEF mapping matrix for $N_{STS} = 5$ or 6 is defined as follows:

$$P_{EDMG\text{-}CEF} = \begin{bmatrix} +1 & -1 & +1 & +1 & +1 & -1 \\ +1 & -w_6^1 & w_6^2 & w_6^3 & w_6^4 & -w_6^5 \\ +1 & -w_6^2 & w_6^4 & w_6^6 & w_6^8 & -w_6^{10} \\ +1 & -w_6^3 & w_6^6 & w_6^9 & w_6^{12} & -w_6^{15} \\ +1 & -w_6^4 & w_6^8 & w_6^{12} & w_6^{16} & -w_6^{20} \\ +1 & -w_6^5 & w_6^{10} & w_6^{15} & w_6^{20} & -w_6^{25} \end{bmatrix},\ w_6 = \exp\left(-j2\pi/6\right),\ N_{EDMG\text{-}CEF}^{N_{STS}} = 6$$

The EDMG-CEF mapping matrix for $N_{STS} = 7$ or 8 is defined as follows:

$$P_{EDMG\text{-}CEF} = \begin{bmatrix} P_{4x4} & P_{4x4} \\ P_{4x4} & -P_{4x4} \end{bmatrix},\ N_{EDMG\text{-}CEF}^{N_{STS}} = 8$$

28.6.6 Encoding of EDMG-Header-B

The EDMG-Header-B for the i_{user}^{th} shall be encoded as follows:

— The input 64 bits of the EDMG-Header-B, $\mathbf{b} = (b_1, b_2, ..., b_{64})$, are scrambled with the PN sequence described in 20.3.9 (Scrambler), starting from the eighth bit to create the $\mathbf{bq} = (bq_1, bq_2, ..., bq_{64})$ sequence. The scrambler seed value is initialized by the first seven bits of the EDMG-Header-B.

— The LDPC codeword of length 672 bits is created by concatenating the 440 0s to the scrambled header bits $\mathbf{bq} = (bq_1, bq_2, ..., bq_{64})$ and then computing 168 parity bits $\mathbf{p} = (p_1, p_2, ..., p_{168})$ using the LDPC matrix with R = 3/4 and L_{CW} = 672 defined in 20.3.8.4 (Rate 3/4 LDPC code matrix H = 168 rows x 672 columns, Z = 42). The LDPC codeword is defined as $(bq_1, bq_2, ..., bq_{64}, 0_1, 0_2, ..., 0_{440}, p_1, p_2, ..., p_{168})$.

— The zero padded bits are discarded and the output codeword is defined as $\mathbf{c} = (\mathbf{c}_1, \mathbf{c}_2, \mathbf{c}_3)$, where

  — $\mathbf{c}_1 = (bq_1, bq_2, ..., bq_{64}, p_9, p_{10}, ..., p_{168})$

  — $\mathbf{c}_2 = (bq_1, bq_2, ..., bq_{64}, p_1, p_2, ..., p_{84}, p_{93}, p_{94}, ..., p_{168})$

  — $\mathbf{c}_3 = (bq_1, bq_2, ..., bq_{64}, p_1, p_2, ..., p_{160})$

— For a PPDU transmitted over a N_{CB} × 2.16 GHz channel, where $1 \le N_{CB} \le 4$, the data block is defined as a repetition of codeword **c** bits as follows:

  — **cb** = **c** for N_{CB} = 1

  — **cb** = (**c**, **c**, $\mathbf{c_{1:124}}$) for N_{CB} = 2

  — **cb** = (**c**, **c**, **c**, $\mathbf{c_{1:252}}$) for N_{CB} = 3

  — **cb** = (**c**, **c**, **c**, **c**, $\mathbf{c_{1:376}}$) for N_{CB} = 4

— For a PPDU transmitted using N_{STS} (N_{STS} = 1, 2) space-time streams, the data block **cb** is repeated N_{STS} times. Then the N_{STS} data blocks are scrambled continuously with PN sequence defined in 28.5.9.3.2 (Scrambler for EDMG-Header-A in SU EDMG A-PPDU, EDMG-Header-B, and EDMG SC MCS1 coded bits) without seed reset. The initial seed value is equal to all 1s $(1_1, 1_2, ..., 1_7)$. The scrambling starts at the 225th bit and ends at the $(N_{STS} \times 2 \times N_{SD})^{th}$ bit. The first scrambled **cb** block is mapped to the first space-time stream and the second scrambled **cb** block to the second space-time stream.

In the description above, the $\mathbf{c_{1:}}_{\boldsymbol{m}}$ notation defines an array of vector **c** elements, starting from the first bit (inclusive) and ending at the m^{th} bit (inclusive).

The data blocks shall be modulated using DCM QPSK modulation. The EDMG-Header-B shall use the OFDM modulation as defined for the Data field of the PPDU (see 28.6.9.3 (Modulation mapping)).

28.6.7 Encoding of EDMG-Header-A for EDMG A-PPDU transmission

The EDMG-Header-A field in the first EDMG PPDU in an EDMG OFDM mode A-PPDU (i.e., i_{PPDU} = 1, where i_{PPDU} represents the index of the PPDU into the EDMG A-PPDU) is encoded and modulated as specified in 28.3.3.3.2.4 (Encoding and modulation).

For the i_{PPDU}^{th} EDMG PPDU in the EDMG SC mode A-PPDU, $i_{PPDU} > 1$, the EDMG-Header-A field shall be encoded and modulated using two OFDM symbols. The encoding and modulation shall be as follows:

— The input 112 header bits are appended with 16 HCS bits calculated as defined in 20.3.7 (HCS calculation for headers of DMG control mode and DMG SC mode).

— The resulting 128 bits including CRC, **b** = (b_1, b_2,…, b_{128}), are scrambled with the PN sequence as described in 20.3.9 (Scrambler), starting from the first bit using a continuation of the scrambler bit

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

sequence from the Data field of preceding EDMG PPDU in the EDMG OFDM mode A-PPDU to create the **bq** = (bq_1, bq_2,…, bq_{128}) sequence.

— The scrambled header bits, **bq**, are divided into two parts **bq1** = (bq_1, bq_2,…, bq_{64}) and **bq2** = (bq_{65}, bq_{66},…, bq_{128}) of 64 bits each.

— Two LDPC codewords of length 672 bits each are created by concatenating the 440 0s to each part, **bq1** and **bq2**, and then computing 168 parity bits **p1** = ($p1_1$, $p1_2$,…, $p1_{168}$) and **p2** = ($p2_1$, $p2_2$,…, $p2_{168}$) for **bq1** and **bq2**, respectively, using the LDPC matrix with R = 3/4 and L_{CW} = 672 defined in 20.3.8.4 (Rate 3/4 LDPC code matrix H = 168 rows x 672 columns, Z = 42). The LDPC codewords are defined as follows:

  — **cw1** = (bq_1, bq_2,…, bq_{64}, 0_1, 0_2,…, 0_{440}, $p1_1$, $p1_2$,…, $p1_{168}$)
  — **cw2** = (bq_{65}, bq_{66},…, bq_{128}, 0_1, 0_2,…, 0_{440}, $p2_1$, $p2_2$,…, $p2_{168}$)

— The padded 0s are discarded and two output codewords are defined as **c1** = ($c1_1$, $c1_2$, $c1_3$) and **c2** = ($c2_1$, $c2_2$, $c2_3$), where

  — $\mathbf{c1_1}$ = (bq_1, bq_2,…, bq_{64}, $p1_9$, $p1_{10}$,…, $p1_{168}$)
  — $\mathbf{c1_2}$ = (bq_1, bq_2,…, bq_{64}, $p1_1$, $p1_2$,…, $p1_{84}$, $p1_{93}$, $p1_{94}$,…, $p1_{168}$)
  — $\mathbf{c1_3}$ = (bq_1, bq_2,…, bq_{64}, $p1_1$, $p1_2$,…, $p1_{160}$)
  — $\mathbf{c2_1}$ = (bq_{65}, bq_{66},…, bq_{128}, $p2_9$, $p2_{10}$,…, $p2_{168}$)
  — $\mathbf{c2_2}$ = (bq_{65}, bq_{66},…, bq_{128}, $p2_1$, $p2_2$,…, $p2_{84}$, $p2_{93}$, $p2_{94}$,…, $p2_{168}$)
  — $\mathbf{c2_3}$ = (bq_{65}, bq_{66},…, bq_{128}, $p2_1$, $p2_2$,…, $p2_{160}$)

— For a PPDU transmitted over an N_{CB} × 2.16 GHz channel, where $1 \le N_{CB} \le 4$, the data blocks are defined as a repetition of codeword **c1** and **c2** as follows:

  — **cb1** = $c1$, **cb2** = $c2$ for N_{CB} = 1
  — **cb1** = ($c1$, $c1$, $c1_{1:124}$), **cb2** = ($c2$, $c2$, $c2_{1:124}$) for N_{CB} = 2
  — **cb1** = ($c1$, $c1$, $c1$, $c1_{1:252}$), **cb2** = ($c2$, $c2$, $c2$, $c2_{1:252}$) for N_{CB} = 3
  — **cb1** = ($c1$, $c1$, $c1$, $c1$, $c1_{1:376}$), **cb2** = ($c2$, $c2$, $c2$, $c2$, $c2_{1:376}$) for N_{CB} = 4

— For a PPDU transmitted using N_{STS} (N_{STS} = 1, 2, …, 8) space-time streams, the data blocks **cb1** and **cb2** are concatenated as **cb** = (**cb1**, **cb2**) and the data block **cb** is repeated N_{STS} times. Then, the N_{STS} data blocks **cb** are scrambled continuously with the PN sequence defined in 28.5.9.3.2 (Scrambler for EDMG-Header-A in SU EDMG A-PPDU, EDMG-Header-B, and EDMG SC MCS1 coded bits)without seed reset. The initial seed value is equal to all 1s (1_1, 1_2,…, 1_7). The scrambling starts at the 225th bit and ends at the (N_{STS} × 4 × N_{SD})th bit. The first scrambled **cb** block is mapped to the first space-time stream and the second scrambled **cb** block to the second space-time stream, and so on.

In the above description, the $\mathbf{c1_{1:}}_{\boldsymbol{m}}$ and $\mathbf{c2_{1:}}_{\boldsymbol{m}}$ notations define an array of vector **c1** and **c2** elements starting from the first bit (inclusive) and ending at the m^{th} bit (inclusive).

The data blocks shall be modulated using DCM QPSK modulation. The EDMG-Header-A field shall use an OFDM modulation as defined for the Data field of the PPDU in 28.6.9.3 (Modulation mapping).

28.6.8 Modulation and coding scheme (MCS)

The MCS is a value that determines modulation and coding. For an EDMG PPDU, the MCS value is carried in the EDMG-Header-A field and in the EDMG-Header-B field. The data rate provided by an MCS depends on the guard interval length, the number of spatial streams, N_{SS} ($1 \le N_{SS} \le 8$), and the number of N_{SD} data subcarriers defined per OFDM symbol.

Table 28-68 defines the set of MCSs for an EDMG OFDM mode PPDU. MCS indicess exceeding the largest MCS index defined in Table 28-68 are reserved.

Table 28-68—EDMG-MCSs for the EDMG OFDM mode

EDMG-MCS index	Modulation	NBPSC	Code rate
1	DCM BPSK	1	1/2
2	DCM BPSK	1	5/8
3	DCM BPSK	1	3/4
4	DCM BPSK	1	13/16
5	DCM BPSK	1	7/8
6	DCM QPSK	2	1/2
7	DCM QPSK	2	5/8
8	DCM QPSK	2	3/4
9	DCM QPSK	2	13/16
10	DCM QPSK	2	7/8
11	16-QAM	4	1/2
12	16-QAM	4	5/8
13	16-QAM	4	3/4
14	16-QAM	4	13/16
15	16-QAM	4	7/8
16	64-QAM	6	1/2
17	64-QAM	6	5/8
18	64-QAM	6	3/4
19	64-QAM	6	13/16
20	64-QAM	6	7/8

For a given type of guard interval used in the transmission of an EDMG OFDM mode PPDU, the total transmission data rate, ρ, provided by the PPDU is defined as follows:

$$\rho = \sum_{i_{SS}=1}^{N_{SS}} Data\_rate_{i_{SS}}$$

where

N_{SS} is as defined in this subclause

$Data\_rate_{i_{SS}}$ is the data rate provided by the MCS of spatial stream i_{SS} as defined in Table 28-69 and Table 28-70

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 28-69 and Table 28-70 define the data rate for a given number of data subcarriers, N_{SD}, and guard interval type.

Table 28-69—Data rate for the EDMG OFDM mode with N_{SD} = 336, 734

MCS	Data rate per spatial stream (Mb/s)					
	N_{SD} = 336			N_{SD} = 734

28.6.9 Data field

28.6.9.1 Scrambler

The operation of the scrambler applied for the data bits is defined in 20.3.9 (Scrambler). The scrambling of an SU PSDU continues the scrambling of L-Header and EDMG-Header-A. The initial seed value is defined in the L-Header.

The scrambling of an MU PSDU is performed on a per user basis and continues the scrambling of EDMG-Header-B with reset of the seed value. The initial seed value is defined in the EDMG-Header-B on a per user basis.

28.6.9.2 Encoding

28.6.9.2.1 General

An EDMG OFDM PSDU is encoded by a systematic LDPC block code. Each data word of L_{CWD} information bits is concatenated with L_{CWP} parity bits to create a codeword of length $L_{CW} = L_{CWD} + L_{CWP}$ bits. The EDMG LDPC encoding can employ the codeword lengths L_{CW} = 624, 672, 1248, and 1344 and code rates R = 1/2, 5/8, 3/4, 13/16, and 7/8.

Table 28-71 provides a summary of LDPC code rates.

Table 28-71—LDPC code rates

Code rate	Codeword length (L_{CW})		Number of data bits (L_{CWD})	
	Short	Long	Short	Long
1/2	672	1344	336	672
5/8	672	1344	420	840
3/4	672	1344	504	1008
13/16	672	1344	546	1092
7/8	624 or 672	1248 or 1344	546 or 588	1092 or 1176

The LDPC encoding with codeword length L_{CW} = 672 and 1344 is performed by solving the linear system of equations $\mathbf{H} \cdot \left(\mathbf{c}^{(m)}\right)^T = \mathbf{0}$ defined by the parity matrix H of size L_{CWP} by L_{CW}, where $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{p}^{(m)}\right)$ defines the m^{th} LDPC codeword, $\mathbf{b}^{(m)} = \left(b_1^{(m)}, b_2^{(m)}, ..., b_{L_{CWD}}^{(m)}\right)$ defines the data bits of the m^{th} LDPC codeword (or data word), and $\mathbf{p}^{(m)} = \left(p_1^{(m)}, p_2^{(m)}, ..., p_{L_{CWP}}^{(m)}\right)$ defines parity bits for m^{th} LDPC codeword.

The LDPC encoding with codeword length L_{CW} = 624 and 1248 employs the matrices H with L_{CW} = 672 and 1344 for code rate R = 13/16 and then applies puncturing procedure to get a desired code rate R = 7/8. For L_{CW} = 624, the first 48 parity bits are discarded; and for L_{CW} = 1248, the first 96 parity bits are discarded.

Table 28-72 defines the number of coded bits per OFDM symbol, N_{CBPS}, for different modulation types and number of data subcarriers, N_{SD}.

Table 28-72—Values of N_{CBPS} for different modulation types and number of data subcarriers

Symbol mapping	N_{SD} = 336	N_{SD} = 734	N_{SD} = 1134	N_{SD} = 1532
DCM BPSK	336	734	1134	1532
DCM QPSK	672	1468	2268	3064
16-QAM	1344	2936	4536	6128
64-QAM	2016	4404	6804	9192

28.6.9.2.2 Parity check matrices

See 28.3.6 (LDPC parity matrices).

28.6.9.2.3 LDPC encoding

This subclause defines the EDMG SU PSDU and EDMG MU PSDU per user basis LDPC encoding. The LDPC encoding can employ the codeword lengths L_{CW} = 624, 672, 1248, and 1344 and code rates R = 1/2, 5/8, 3/4, 13/16, and 7/8.

The LDPC encoding process for the i_{user}^{th} user includes the following steps:

a) Compute the number of data pad bits, $N_{DATA\_PAD\,i_{user}}$, using the number of LDPC codewords, $N_{CW\,i_{user}}$, as follows:

$$N_{CW\,i_{user}} = \left\lceil \frac{Length_{i_{user}} \cdot 8}{L_{CW\,i_{user}} \cdot R_{i_{user}}} \right\rceil$$

$$N_{DATA\_PAD\,i_{user}} = N_{CW\,i_{user}} \cdot L_{CW\,i_{user}} \cdot R_{i_{user}} - Length_{i_{user}} \cdot 8$$

The scrambled PSDU is concatenated with $N_{DATA\_PAD\,i_{user}}$ zero bits. They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU input bits.

b) Convert the scrambled PSDU bits to LDPC codewords as follows:

1) If L_{CW} = 672 or 1344, R = 1/2, 5/8, 3/4, 13/16, or 7/8:

i) The output stream of scrambler is broken into the blocks of length $L_{CWD} = L_{CW} \times R$ bits such that the m^{th} data word is $\mathbf{b}^{(m)} = \left(b_1^{(m)}, b_2^{(m)}, ..., b_{L_{CWD}}^{(m)}\right), m \le N_{CW\,i_{user}}$.

ii) To each data word, parity bits $\mathbf{p}^{(m)} = \left(p_1^{(m)}, p_2^{(m)}, ..., p_{L_{CWP}}^{(m)}\right)$, $L_{CWP} = L_{CW} - L_{CWD}$, are added to create the codeword $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{p}^{(m)}\right), m \le N_{CW\,i_{user}}$ such that $\mathbf{H} \cdot \left(\mathbf{c}^{(m)}\right)^T = \mathbf{0}$.

2) If L_{CW} = 624, R = 7/8:

i) The output stream of scrambler is broken into the blocks of length 546 bits such that the m^{th} data word is $\mathbf{b}^{(m)} = \left(b_1^{(m)}, b_2^{(m)}, ..., b_{546}^{(m)}\right), m \le N_{CW\,i_{user}}$.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

ii) To each data word, parity bits $\mathbf{p}^{(m)} = \left(p_1^{(m)}, p_2^{(m)}, ..., p_{126}^{(m)}\right)$ are added to create the codeword $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{p}^{(m)}\right), m \le N_{CW\,i_{user}}$ such that $\mathbf{H} \cdot \left(\mathbf{c}^{(m)}\right)^T = \mathbf{0}$; parity bits are computed applying the $L_{CW} = 672$, $R = 13/16$ LDPC matrix.

iii) Finally, the first 48 parity bits are discarded (punctured) to create the output codeword $\mathrm{c}^{(m)} = (b_1^{(m)}, b_2^{(m)}, ..., b_{546}^{(m)}, p_{49}^{(m)}, p_{50}^{(m)}, ..., p_{126}^{(m)}), m \le N_{CW\,i_{user}}$.

3) If $L_{CW} = 1248$, $R = 7/8$:

i) The output stream of scrambler is broken into the blocks of length 1092 bits such that the m^{th} data word is $\mathbf{b}^{(m)} = \left(b_1^{(m)}, b_2^{(m)}, ..., b_{1092}^{(m)}\right), m \le N_{CW\,i_{user}}$.

ii) To each data word, parity bits $\mathbf{p}^{(m)} = \left(p_1^{(m)}, p_2^{(m)}, ..., p_{252}^{(m)}\right)$ are added to create the codeword $\mathbf{c}^{(m)} = \left(\mathbf{b}^{(m)}, \mathbf{p}^{(m)}\right), m \le N_{CW\,i_{user}}$ such that $\mathbf{H} \cdot \left(\mathbf{c}^{(m)}\right)^T = \mathbf{0}$; parity bits are computed applying the $L_{CW} = 1344$, $R = 13/16$ LDPC matrix.

iii) Finally, the first 96 parity bits are discarded (punctured) to create the output codeword $\mathrm{c}^{(m)} = (b_1^{(m)}, b_2^{(m)}, ..., b_{1092}^{(m)}, p_{97}^{(m)}, p_{98}^{(m)}, ..., p_{252}^{(m)}), m \le N_{CW\,i_{user}}$.

c) For each spatial stream concatenate LDPC codewords one after the other to create the coded bit stream $\left(\mathbf{c}^{(1)}, \mathbf{c}^{(2)}, ..., \mathbf{c}^{\left(N_{CW\,i_{user}}\right)}\right)$.

d) Compute the number of coded pad bits, $N_{SYM\_PAD\,i_{user}}$, using the number of OFDM symbols, $N_{SYMS\,i_{user}}$, as follows:

$$N_{SYMS\,i_{user}} = \left\lceil \frac{N_{CW\,i_{user}} \cdot L_{CW\,i_{user}}}{N_{SD} \cdot \sum_{i_{SS}=1}^{N_{SS\,i_{user}}} N_{BPSC\,i_{user}\,i_{SS}}} \right\rceil$$

If (BRP PPDU) and $N_{SYMS\,i_{user}} < N_{SYMS\,\min}$, then $N_{SYMS\,i_{user}} = N_{SYMS\,\min}$.

If last PPDU in A-PPDU, then $N_{SYMS\,i_{user}} = N_{SYMSspoof}$.

If STBC applied and $N_{SYMS\,i_{user}}$ is odd, then $N_{SYMS\,i_{user}} = N_{SYMS\,i_{user}} + 1$.

$$N_{SYM\_PAD\,i_{user}} = N_{SYMS\,i_{user}} \cdot N_{SD} \cdot \sum_{i_{SS}=1}^{N_{SS\,i_{user}}} N_{BPSC\,i_{user}\,i_{SS}} - N_{CW\,i_{user}} \cdot L_{CW\,i_{user}}$$

e) For an MU PPDU transmission, update the number of OFDM symbols $N_{SYMS\,i_{user}}$ as described in 28.6.9.2.4 (MU PPDU padding and space-time streams mapping), then update the number of pad bits $N_{SYM\_PAD\,i_{user}}$ as described in step d) using updated number of OFDM symbols $N_{SYMS\,i_{user}}$.

f) Concatenate coded bits with $N_{SYM\_PAD\,i_{user}}$ zero bits. They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU input bits and data pad bits in step a).

g) Distribute the encoded and padded bits over the $N_{SS\,i_{user}}$ spatial streams on a group basis with the number of $N_{CBPS\,i_{user}\,i_{ss}}$ bits in a group. The first group of bits goes to the first spatial stream, the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

second group of bits goes to the second spatial stream, and so on. The procedure is repeated when the maximum number of spatial streams, $N_{SS\,i_{user}}$, is reached. The procedure ends when all PSDU encoded bits, including $N_{SYM\_PAD\,i_{user}}$ pad bits, are distributed over the $N_{SS\,i_{user}}$ spatial streams.

For each user, if STBC coding is applied, then $N_{SS\,i_{user}}$ space-time streams are mapped to $N_{STS\,i_{user}} = 2N_{SS\,i_{user}}$ space-time streams as defined in 28.6.9.3.10 (Space-time block coding). Otherwise, a one-to-one mapping of $N_{SS\,i_{user}}$ spatial streams to $N_{STS\,i_{user}}$ space-time streams shall be applied.

NOTE—For a PPDU carrying a BRP frame, the value of $N_{SYMS\,\min}$ is specified in 28.9.2.2.4 (EDMG BRP PPDU duration).

28.6.9.2.4 MU PPDU padding and space-time streams mapping

For an MU PPDU transmission, all user PPDUs shall be aligned in time. If necessary, user PSDUs shall be padded according to the following steps:

— Compute the maximum number of OFDM symbols over all users $N_{SYMS\,\max} = \max_{i_{user}}\left(N_{SYMS\,i_{user}}\right)$ for $i_{user} = 1, 2, \ldots, N_{user}$.

— Update the number of OFDM symbols at step e) in 28.6.9.2.3 (LDPC encoding) as $N_{SYMS\,i_{user}} = N_{SYMS\,\max}$ for $i_{user} = 1, 2, \ldots, N_{user}$. Update the number of pad bits for the i_{user}^{th} user, $N_{SYM\_PAD\,i_{user}}$, accordingly.

— The number of pad OFDM symbols for the MU PPDU transmission for the i_{user}^{th} user is defined as $N_{PAD\_SYMS\,i_{user}} = N_{SYMS\,\max} - N_{SYMS\,i_{user}}$.

The number of pad symbols $N_{PAD\_SYMS\,i_{user}}$ takes into account MU PPDU padding only and does not include the regular padding described in 28.6.9.2.3 (LDPC encoding).

A receiver can compute the number of pad OFDM symbols, $N_{PAD\_SYMS\,i_{user}}$, using the overall PPDU time duration computed using the MCS and PSDU Length fields defined in the L-Header, MCS, and PSDU Length fields defined in EDMG-Header-B, and TRN field duration defined in the EDMG-Header-A.

— For a nonzero spoofing error and if the spoofing error duration is shorter than one OFDM symbol duration ($T_{SYM} = T_{DFT} + T_{GI}$), the fractional part of OFDM symbol is discarded.

— For a nonzero spoofing error and if the spoofing error duration is longer than or equal to an OFDM symbol duration, then one OFDM symbol and possible fractional part of OFDM symbol are discarded; this is signaled by the Spoofing Error Length Indicator field in the EDMG-Header-B.

This procedure also allows a receiver to determine the beginning of a TRN field if one is present in a received MU PPDU.

The space-time stream index per user, $i_{STS\,i_{user}}$, is mapped to the space-time stream index over all users, i_{STS}, as follows:

$$i_{STS}\left(i_{user}, i_{STS\,i_{user}}\right) = \sum_{m=0}^{i_{user}-1} Num_m + i_{STS\,i_{user}},\ 1 \le i_{STS\,i_{user}} \le N_{STS\,i_{user}},\ 1 \le i_{user} \le N_{user}$$

$$Num_m = N_{STS\,m} \text{ for } m > 0 \text{ and } Num_m = 0 \text{ otherwise}$$

NOTE—i_{STS} is a function of i_{user} and $i_{STS\,i_{user}}$ indices. However, to simplify notations, this dependence is not indicated explicitly in other equations.

28.6.9.2.5 SU A-PPDU padding

For the last PPDU in an EDMG A-PPDU, $N_{SYMSspoof}$ shall be set, at step d) in 28.6.9.2.3 (LDPC encoding), so that the spoofing error is non-negative and smaller than one SC symbol block (i.e., T_{DFT}, defined in Table 28-47). If the last PPDU in an EDMG A-PPDU contains a BRP frame, $N_{SYMSspoof}$ shall be equal to or greater than $N_{SYMS\,\min}$ and set so that the spoofing error is smaller than one OFDM symbol duration (i.e., $T_{SYM} = T_{DFT} + T_{GI}$, where T_{DFT} and T_{GI} are defined in Table 28-62) to enable the receiver to determine the start of the TRN field. $N_{SYMSspoof}$ is calculated as follows:

$$T_{Data\,\max}^{(N_{PPDU})} = TXTIME_{spoof} - \Big(T_{L\text{-}STF} + T_{L\text{-}CEF} + T_{L\text{-}Header} + T_{EDMG\text{-}Header\text{-}A} + T_{EDMG\text{-}STF} + T_{EDMG\text{-}CEF} + \big(N_{PPDU} - 1\big) T_{EDMG\text{-}Header\text{-}A}^{(OFDM)} + \sum_{i_{PPDU}=1}^{N_{PPDU}-1} T_{Data}^{(i_{PPDU})} + T_{TRN} \Big)$$

$$N_{SYMSspoof} = \left\lfloor \frac{T_{Data\,\max}^{(N_{PPDU})}}{T_{SYM}} \right\rfloor$$

where

$TXTIME_{spoof}$ is the spoofed PPDU duration calculated based on L-Header

$T_{L\text{-}STF}$, $T_{L\text{-}CEF}$, $T_{L\text{-}Header}$, $T_{EDMG\text{-}STF}$, $T_{EDMG\text{-}CEF}$, $T_{EDMG\text{-}Header\text{-}A}$, and T_{TRN} are the durations of the L-STF, L-CEF, L-Header, EDMG-STF, EDMG-CEF, EDMG-Header-A, and TRN fields as defined in 28.12.3.4 (TXTIME calculation for EDMG OFDM mode)

$T_{SYM} = T_{DFT} + T_{GI}$ where T_{DFT} and T_{GI} are defined in Table 28-62; T_{GI} can be equal to $T_{GI\,short}$, $T_{GI\,normal}$, or $T_{GI\,long}$

$T_{EDMG\text{-}Header\text{-}A}^{(OFDM)}$ is the duration of the EDMG-Header-A of the second to the last PPDU using OFDM modulation (see 28.6.7 (Encoding of EDMG-Header-A for EDMG A-PPDU transmission))

$T_{Data}^{(i_{PPDU})}$, for $i_{PPDU} = 1, \ldots, N_{PPDU} - 1$, is the duration of the Data field of $i_{PPDU}{}^{\text{th}}$ PPDU, except for the last PPDU, as defined in 28.12.3.4 (TXTIME calculation for EDMG OFDM mode)

$T_{Data\,\max}^{(N_{PPDU})}$ is the maximum duration of the last PPDU that fulfills the spoofing error requirement

For an EDMG A-PPDU transmission, the spoofed values of the L-Header fields and the duration of the PPDUs except the last PPDU shall be determined so that $N_{SYMSspoof}$ is equal to or greater than $N_{SYMS\,\min}$.

NOTE—The EDMG Header-A field in the first PPDU is modulated with EDMG SC mode while the EDMG Header-A fields in the following PPDUs are modulated with EDMG OFDM mode as described in 28.6.7 (Encoding of EDMG-Header-A for EDMG A-PPDU transmission). The duration of the fields might be different from that of the field in the first PPDU.

28.6.9.3 Modulation mapping

28.6.9.3.1 General

This subclause defines the OFDM transmission for the data part of a PPDU over 2.16 GHz, 4.32 GHz, 6.48 GHz, and 8.64 GHz channels with $i_{STS} = 1, 2, 3, 4, 5, 6, 7$, or 8.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The coded and padded bit stream is converted into a stream of complex constellation points, following the rules defined in this subclause for BPSK, Dual Stream DCM BPSK, DCM QPSK, 16-QAM, 64-QAM, and phase hopping modulations.

The DCM BPSK, Dual Stream DCM BPSK, and DCM QPSK modulations use the tone pairing mechanism to extract channel frequency diversity as defined in 28.6.9.3.3 (DCM BPSK modulation), 28.6.9.3.4 (Dual Stream DCM BPSK modulation), and 28.6.9.3.5 (DCM QPSK modulation), respectively. The 16-QAM and 64-QAM modulations use the interleaver defined in 28.6.9.3.9 (Interleaver).

28.6.9.3.2 Transmission in EDMG format

The EDMG data transmit waveform for i_{TX}^{th} transmit chain in time domain shall be defined at the OFDM sampling rate F_s as follows:

$$r_{Data}^{i_{TX}}\left(qT_s\right) = \frac{1}{\sqrt{N_{STS}\cdot N_{EDMG\text{-}DATA}^{Tone}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}\left(qT_s - nT_{SYM}\right)$$

$$\cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} \left[Q_{EDMG\,k}\right]_{i_{TX},i_{STS}} \left(D\left(i_{STS},n,k\right) + P\left(i_{STS},n,k\right)\right) \exp\left(j2\pi k\Delta_F\left(qT_s - nT_{SYM} - T_{GI}\right)\right)$$

where

$N_{EDMG\text{-}DATA}^{Tone} = N_{SD} + N_{SP}$ is the total number of active tones

N_{STS} is the total number of space-time streams

$T_{SYM} = T_{DFT} + T_{GI}$ is the OFDM symbol duration in time domain

T_{GI} is the guard interval duration

$Q_{EDMG\,k}$ is the spatial mapping matrix per k^{th} subcarrier

$[\ ]_{m,n}$ is a matrix element from m^{th} row and n^{th} column

$w_{T_{SYM}}\left(qT_s\right)$ is a window function applied to smooth the transitions between consecutive OFDM symbols and its definition is implementation specific

$D\left(i_{STS},n,k\right)$ is the data sequence, it is defined by inserting 0s from $-N_{SR}$ to N_{SR}, and then inserting data at the $M_d(k)$ tones defined in 28.6.2.5 (Data tones), $D(i_{STS}, n, M_d(k)) = d(i_{STS}, n, k)$, for $k = 0, 1, \ldots, N_{SD} - 1$

$P\left(i_{STS},n,k\right)$ is the pilot sequence defined in 28.6.2.6 (Pilot sequences)

q is a time sample index

NOTE—For EDMG-Header-B transmission, the zeroth OFDM symbol corresponds to the EDMG-Header-B, $n = 0$, and the numbering of OFDM symbols for the data part starts from $n = 1$.

28.6.9.3.3 DCM BPSK modulation

The input encoded bits belonging to the i_{SS}^{th} spatial stream are broken into the groups of N_{CBPS} bits, $\left(c_0^{(q)}, c_1^{(q)}, \ldots, c_{N_{CBPS}-1}^{(q)}\right)$, where q denotes the group number. Each pair of bits $\left(c_{2k}^{(q)}, c_{2k+1}^{(q)}\right)$, $k = 0, 1, \ldots, N_{SD}/2 - 1$, is converted into the pair of complex points $\left(d\left(i_{SS},q,k\right), d\left(i_{SS},q,P(k)\right)\right)$. The modulation is performed in two steps:

— First, two BPSK points are modulated as $x_{2k}^{(q)} = \left(2\times c_{2k}^{(q)} - 1\right)$, $x_{2k+1}^{(q)} = \left(2\times c_{2k+1}^{(q)} - 1\right)$.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Second, two BPSK points $\left(x_{2k}^{(q)}, x_{2k+1}^{(q)}\right)$ are converted to two QPSK points $\left(d\left(i_{SS},q,k\right), d\left(i_{SS},q,P(k)\right)\right)$ by multiplication on mapping matrix W as follows:

$$\begin{bmatrix} d\left(i_{SS},q,k\right) \\ d\left(i_{SS},q,P(k)\right) \end{bmatrix} = W \cdot \begin{bmatrix} x_{2k}^{(q)} \\ x_{2k+1}^{(q)} \end{bmatrix}, W = \frac{1}{\sqrt{2}} \begin{bmatrix} 1 & j \\ 1 & -j \end{bmatrix}$$

where the tone pairing index $P(k)$ is defined as $P(k) = k + N_{SD}/2$ in the range $N_{SD}/2$ to $N_{SD} - 1$. The q^{th} modulated data block of the $i_{SS}{}^{\text{th}}$ spatial stream is mapped to N_{SD} data subcarriers of the q^{th} OFDM symbol of the $i_{SS}{}^{\text{th}}$ spatial stream.

28.6.9.3.4 Dual Stream DCM BPSK modulation

Dual Stream DCM BPSK modulation is applied if the number of spatial streams, N_{SS}, is equal to 2 and the DCM BPSK Applied field in EDMG-Header-A is set to 1.

The input encoded bits of $i_{SS}{}^{\text{th}}$ spatial stream are broken into the groups of N_{CBPS} bits, $\left(c_0^{(i_{SS},q)}, c_1^{(i_{SS},q)}, ..., c_{N_{CBPS}-1}^{(i_{SS},q)}\right)$, where q denotes the group number. Each pair of bits $\left(c_{2k}^{(i_{SS},q)}, c_{2k+1}^{(i_{SS},q)}\right)$, $k = 0, 1, \ldots, N_{SD}/2 - 1$, is converted into the complex point $d\left(i_{SS},q,k\right)$.

For 2.16 GHz, 4.32 GHz, 6.48 GHz, and 8.64 GHz channel configurations, the modulation is performed as follows:

$$d\left(i_{SS}=1,q,k\right) = \frac{1}{\sqrt{2}}\left(\left(2\times c_{2k}^{(i_{SS}=1,q)} - 1\right) + j\left(2\times c_{2k+1}^{(i_{SS}=1,q)} - 1\right)\right)$$

$$d\left(i_{SS}=1,q,P(k)\right) = \frac{1}{\sqrt{2}}\left(\left(2\times c_{2k}^{(i_{SS}=2,q)} - 1\right) - j\left(2\times c_{2k+1}^{(i_{SS}=2,q)} - 1\right)\right)$$

$$d\left(i_{SS}=2,q,k\right) = \frac{1}{\sqrt{2}}\left(\left(2\times c_{2k}^{(i_{SS}=2,q)} - 1\right) + j\left(2\times c_{2k+1}^{(i_{SS}=2,q)} - 1\right)\right)$$

$$d\left(i_{SS}=2,q,P(k)\right) = \frac{1}{\sqrt{2}}\left(\left(2\times c_{2k}^{(i_{SS}=1,q)} - 1\right) - j\left(2\times c_{2k+1}^{(i_{SS}=1,q)} - 1\right)\right)$$

where the tone pairing index $P(k)$ is defined as $P(k) = k + N_{SD}/2$ in the range $N_{SD}/2$ to $N_{SD} - 1$. The q^{th} modulated data block of the $i_{SS}{}^{\text{th}}$ spatial stream is mapped to N_{SD} data subcarriers of the q^{th} OFDM symbol of the $i_{SS}{}^{\text{th}}$ spatial stream.

For 2.16+2.16 GHz and 4.32+4.32 GHz channel configurations, the modulation is performed as follows:

$$d\left(i_{SS}=1,q,k\right) = \frac{1}{\sqrt{2}}\left(\left(2\times c_{2k}^{(i_{SS}=1,q)} - 1\right) + j\left(2\times c_{2k+1}^{(i_{SS}=1,q)} - 1\right)\right)$$

$$d\left(i_{SS}=1,q,P(k)\right) = \frac{1}{\sqrt{2}}\left(\left(2\times c_{2k}^{(i_{SS}=2,q)} - 1\right) + j\left(2\times c_{2k+1}^{(i_{SS}=2,q)} - 1\right)\right)$$

$$d\left(i_{SS}=2,q,k\right) = \frac{1}{\sqrt{2}}\left(\left(2\times c_{2k}^{(i_{SS}=1,q)} - 1\right) - j\left(2\times c_{2k+1}^{(i_{SS}=1,q)} - 1\right)\right)$$

$$d\left(i_{SS}=2,q,P(k)\right) = \frac{1}{\sqrt{2}}\left(\left(2\times c_{2k}^{(i_{SS}=2,q)} - 1\right) - j\left(2\times c_{2k+1}^{(i_{SS}=2,q)} - 1\right)\right)$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

where the tone pairing index *P(k)* is defined as $P(k) = k + N_{SD}/2$ in the range $N_{SD}/2$ to $N_{SD} - 1$. The q^{th} modulated data block of the i_{SS}^{th} spatial stream is mapped to N_{SD} data subcarriers of the q^{th} OFDM symbol of the i_{SS}^{th} spatial stream.

28.6.9.3.5 DCM QPSK modulation

The input encoded bits of the i_{SS}^{th} spatial stream are broken into the groups of N_{CBPS} bits, $\left(c_0^{(q)}, c_1^{(q)}, ..., c_{N_{CBPS}-1}^{(q)}\right)$, where q denotes the group number. Each four bits $\left(c_{4k}^{(q)}, c_{4k+1}^{(q)}, c_{4k+2}^{(q)}, c_{4k+3}^{(q)}\right)$, $k = 0, 1, \ldots, N_{SD}/2 - 1$, are converted into the pair of complex points $\left(d\left(i_{SS}, q, k\right), d\left(i_{SS}, q, P\left(k\right)\right)\right)$. The modulation is performed in two steps:

— First, two QPSK points are modulated as $x_{2k}^{(q)} = \frac{1}{\sqrt{2}}\left(\left(2 \times c_{4k}^{(q)} - 1\right) + j\left(2 \times c_{4k+2}^{(q)} - 1\right)\right)$, $x_{2k+1}^{(q)} = \frac{1}{\sqrt{2}}\left(\left(2 \times c_{4k+1}^{(q)} - 1\right) + j\left(2 \times c_{4k+3}^{(q)} - 1\right)\right)$.

— Second, two QPSK points $\left(x_{2k}^{(q)}, x_{2k+1}^{(q)}\right)$ are converted to two 16-QAM points $\left(d\left(i_{SS}, q, k\right), d\left(i_{SS}, q, P\left(k\right)\right)\right)$ by multiplication on mapping matrix W as follows:

$$\begin{bmatrix} d\left(i_{SS}, q, k\right) \\ d\left(i_{SS}, q, P\left(k\right)\right) \end{bmatrix} = W \cdot \begin{bmatrix} x_{2k}^{(q)} \\ x_{2k+1}^{(q)} \end{bmatrix}, \; W = \frac{1}{\sqrt{5}} \begin{bmatrix} 1 & 2 \\ -2 & 1 \end{bmatrix}$$

where the tone pairing index *P(k)* is defined as $P(k) = k + N_{SD}/2$ in the range $N_{SD}/2$ to $N_{SD} - 1$. The q^{th} modulated data block of the i_{SS}^{th} spatial stream is mapped to N_{SD} data subcarriers of the q^{th} OFDM symbol of the i_{SS}^{th} spatial stream.

28.6.9.3.6 16-QAM modulation

The input encoded bits of the i_{SS}^{th} spatial stream are broken into the groups of N_{CBPS} bits, $\left(c_0^{(q)}, c_1^{(q)}, ..., c_{N_{CBPS}-1}^{(q)}\right)$, where q denotes the group number. Each four bits $\left(c_{4k}^{(q)}, c_{4k+1}^{(q)}, c_{4k+2}^{(q)}, c_{4k+3}^{(q)}\right)$, $k = 0, 1, \ldots, N_{SD} - 1$, are converted into the single constellation point $d\left(i_{SS}, q, k\right)$. The modulation is performed as follows:

$$d\left(i_{SS}, q, k\right) = \frac{1}{\sqrt{10}}\left(\left(2 \times \left(2c_{4k}^{(q)} - 1\right) - \left(2c_{4k}^{(q)} - 1\right) \times \left(2c_{4k+1}^{(q)} - 1\right)\right)\right.$$
$$\left. + j\left(2 \times \left(2c_{4k+2}^{(q)} - 1\right) - \left(2c_{4k+2}^{(q)} - 1\right) \times \left(2c_{4k+3}^{(q)} - 1\right)\right)\right)$$

The q^{th} modulated data block of the i_{SS}^{th} spatial stream is mapped to N_{SD} data subcarriers of the q^{th} OFDM symbol of the i_{SS}^{th} spatial stream.

28.6.9.3.7 64-QAM modulation

The input encoded bits of the i_{SS}^{th} spatial stream are broken into the groups of N_{CBPS} bits, $\left(c_0^{(q)}, c_1^{(q)}, ..., c_{N_{CBPS}-1}^{(q)}\right)$, where q denotes the group number. Each six bits $\left(c_{6k}^{(q)}, c_{6k+1}^{(q)}, c_{6k+2}^{(q)}, c_{6k+3}^{(q)}, c_{6k+4}^{(q)}, c_{6k+5}^{(q)}\right)$, $k = 0, 1, \ldots, N_{SD} - 1$, are converted into the single constellation point $d\left(i_{SS}, q, k\right)$. The modulation is performed as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$d\left(i_{SS},q,k\right)=\frac{1}{\sqrt{42}}\left(\left(4\times\left(2c_{6k}^{(q)}-1\right)-2\times\left(2c_{6k}^{(q)}-1\right)\times\left(2c_{6k+1}^{(q)}-1\right)+\left(2c_{6k}^{(q)}-1\right)\times\left(2c_{6k+1}^{(q)}-1\right)\times\left(2c_{6k+2}^{(q)}-1\right)\right)\right.$$
$$\left.+j\left(4\times\left(2c_{6k+3}^{(q)}-1\right)-2\times\left(2c_{6k+3}^{(q)}-1\right)\times\left(2c_{6k+4}^{(q)}-1\right)+\left(2c_{6k+3}^{(q)}-1\right)\times\left(2c_{6k+4}^{(q)}-1\right)\times\left(2c_{6k+5}^{(q)}-1\right)\right)\right)$$

The q^{th} modulated data block of the $i_{SS}{}^{\text{th}}$ spatial stream is mapped to N_{SD} data subcarriers of the q^{th} OFDM symbol of the $i_{SS}{}^{\text{th}}$ spatial stream.

28.6.9.3.8 Phase hopping modulation

The phase hopping modulation is applied if the number of spatial streams is equal to two (i.e., $N_{SS} = 2$) and the Phase Hopping field in the EDMG-Header-A is equal to 1.

The phase hopping modulation shall use the (BPSK, BPSK), (QPSK, QPSK), (QPSK, 16-QAM), (16-QAM, QPSK), (16-QAM, 16-QAM), or (64-QAM, 64-QAM) modulations for the first and the second spatial streams accordingly.

For each modulation type, the encoded bits of $i_{SS}{}^{\text{th}}$ spatial stream are broken into groups of $N_{CBPSi_{SS}}$ bits, $\left(c_0^{(i_{SS},q)},c_1^{(i_{SS},q)},...,c_{N_{CBPSi_{SS}}-1}^{(i_{SS},q)}\right)$, where q denotes the group number.

For (BPSK, BPSK) configuration, the modulation is performed in two steps:

— First, BPSK points are modulated as $x_k^{(i_{SS},q)}=\left(2\times c_k^{(i_{SS},q)}-1\right)$, $i_{SS}=1,2$, $k = 0, 1, \ldots, N_{SD} - 1$.

— Second, two BPSK points $\left(x_k^{(i_{SS}=1,q)},x_k^{(i_{SS}=2,q)}\right)$ are converted to two modulation points $\left(d\left(i_{SS}=1,q,k\right),d\left(i_{SS}=2,q,k\right)\right)$ by multiplication with mapping matrix Q and phase hopping matrix $W(k)$ as follows:

$$\begin{bmatrix} d\left(i_{SS}=1,q,k\right) \\ d\left(i_{SS}=2,q,k\right) \end{bmatrix}=W\left(k\right)\cdot Q\cdot\begin{bmatrix} x_k^{(i_{SS}=1,q)} \\ x_k^{(i_{SS}=2,q)} \end{bmatrix}$$

If the Open Loop Precoding field in the EDMG-Header-A is equal to 1, then matrix Q is defined as $Q=\frac{1}{\sqrt{2}}\begin{bmatrix} 1 & j \\ 1 & -j \end{bmatrix}$. Otherwise, it is defined as an identity matrix.

For (QPSK, QPSK) configuration, the modulation is performed in two steps:

— First, QPSK points are modulated as $x_k^{(i_{SS},q)}=\frac{1}{\sqrt{2}}\left(\left(2\times c_{2k}^{(i_{SS},q)}-1\right)+j\left(2\times c_{2k+1}^{(i_{SS},q)}-1\right)\right)$, $i_{SS}=1,2$, $k = 0, 1, \ldots, N_{SD} - 1$.

— Second, two QPSK points $\left(x_k^{(i_{SS}=1,q)},x_k^{(i_{SS}=2,q)}\right)$ are converted to two modulation points $\left(d\left(i_{SS}=1,q,k\right),d\left(i_{SS}=2,q,k\right)\right)$ by multiplication with mapping matrix Q and phase hopping matrix $W(k)$ as follows:

$$\begin{bmatrix} d\left(i_{SS}=1,q,k\right) \\ d\left(i_{SS}=2,q,k\right) \end{bmatrix}=W\left(k\right)\cdot Q\cdot\begin{bmatrix} x_k^{(i_{SS}=1,q)} \\ x_k^{(i_{SS}=2,q)} \end{bmatrix}$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the Open Loop Precoding field in the EDMG-Header-A is equal to 1, then matrix Q is defined as $Q = \frac{1}{\sqrt{2}}\begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix}$. Otherwise, it is defined as an identity matrix.

For (QPSK, 16-QAM) and (16-QAM, QPSK) configuration, the modulation is performed in two steps:

— First QPSK and 16-QAM points are modulated as follows:

  — QPSK points are modulated as $x_k^{(i_{SS},q)} = \frac{1}{\sqrt{2}}\left(\left(2\times c_{2k}^{(i_{SS},q)} - 1\right) + j\left(2\times c_{2k+1}^{(i_{SS},q)} - 1\right)\right)$.

  — 16-QAM points are modulated as defined in 28.6.9.3.6 (16-QAM modulation).

— Second, two (QPSK, 16-QAM) or (16-QAM, QPSK) points $\left(x_k^{(i_{SS}=1,q)}, x_k^{(i_{SS}=2,q)}\right)$ are converted to two modulation points $\left(d\left(i_{SS}=1,q,k\right), d\left(i_{SS}=2,q,k\right)\right)$ by multiplication with mapping matrix Q and phase hopping matrix $W(k)$ as follows:

$$\begin{bmatrix} d\left(i_{SS}=1,q,k\right) \\ d\left(i_{SS}=2,q,k\right) \end{bmatrix} = W\left(k\right)\cdot Q \cdot \begin{bmatrix} x_k^{(i_{SS}=1,q)} \\ x_k^{(i_{SS}=2,q)} \end{bmatrix}$$

If the Open Loop Precoding field in the EDMG-Header-A is equal to 1 and the modulation configuration is (QPSK, 16-QAM), then matrix Q is defined as $Q = \frac{1}{\sqrt{2}}\begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix}\cdot\begin{bmatrix} \sqrt{2/3} & 0 \\ 0 & \sqrt{4/3} \end{bmatrix}$. Otherwise, it is defined as an identity matrix.

If the Open Loop Precoding field in the EDMG-Header-A is equal to 1 and the modulation configuration is (16-QAM, QPSK), then matrix Q is defined as $Q = \frac{1}{\sqrt{2}}\begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix}\cdot\begin{bmatrix} \sqrt{4/3} & 0 \\ 0 & \sqrt{2/3} \end{bmatrix}$. Otherwise, it is defined as an identity matrix.

For (16-QAM, 16-QAM) and (64-QAM, 64-QAM) configurations, the modulation is performed in two steps:

— First, 16-QAM or 64-QAM points are modulated as defined in 28.6.9.3.6 (16-QAM modulation) or 28.6.9.3.7 (64-QAM modulation), respectively.

— Second, two 16-QAM or 64-QAM points $\left(x_k^{(i_{SS}=1,q)}, x_k^{(i_{SS}=2,q)}\right)$ are converted to two modulation points $\left(d\left(i_{SS}=1,q,k\right), d\left(i_{SS}=2,q,k\right)\right)$ by multiplication with mapping matrix Q and phase hopping matrix $W(k)$ as follows:

$$\begin{bmatrix} d\left(i_{SS}=1,q,k\right) \\ d\left(i_{SS}=2,q,k\right) \end{bmatrix} = W\left(k\right)\cdot Q \cdot \begin{bmatrix} x_k^{(i_{SS}=1,q)} \\ x_k^{(i_{SS}=2,q)} \end{bmatrix}$$

If the Open Loop Precoding field in the EDMG-Header-A is equal to 1, then matrix Q is defined as $Q = \frac{1}{\sqrt{2}}\begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix}$. Otherwise, it is defined as an identity matrix.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The phase hopping matrix $W(k)$ depends on k and is defined as follows:

$$W(k)=\begin{bmatrix}1 & 0\\ 0 & e^{j\phi(y(k))}\end{bmatrix},\ \phi(y(k))=\frac{3\pi\cdot y(k)}{4}$$

where

$y(k)$ is initialized to the value 0 at $(x_k^{(i_{SS}=1,q)}, x_k^{(i_{SS}=2,q)})$ including a first bit of the LDPC codeword; otherwise, $y(k)$ is incremented by 1 for every $(x_k^{(i_{SS}=1,q)}, x_k^{(i_{SS}=2,q)})$ inside the LDPC codeword

28.6.9.3.9 Interleaver

This subclause defines a symbol interleaver for 16-QAM and 64-QAM modulations. The interleaver performs modulated complex symbols interleaving inside an OFDM symbol and its parameters depend on the N_{SD}, N_{CB}, $N_{SS\,i_{user}}$, $L_{CW\,i_{user}}$, and $N_{BPSC\,i_{user}\,i_{SS}}$ parameters.

The input to the interleaver for the i_{SS}^{th} spatial stream is an OFDM data block $d_{in}^{(i_{SS},q)}$ of length N_{SD} composed of 16-QAM or 64-QAM symbols $d_{in}^{(i_{SS},q)}=\left(d_0^{(i_{SS},q)}, d_1^{(i_{SS},q)}, ..., d_{N_{SD}-1}^{(i_{SS},q)}, 0_0, 0_1, ..., 0_{N_p-1}\right)$, where q denotes the OFDM symbol number and $q = 0, 1, \ldots, N_{SYM} - 1$.

The interleaving is performed inside the block of length $N_{SD} + N_p$, where N_p is equal to 0, 34, 18, and 4 for N_{CB} equal to 1, 2, 3, and 4, respectively.

The output of the interleaver scheme for the i_{SS}^{th} spatial stream is a permutated OFDM data block of length N_{SD} and defined as $d_{out}^{(i_{SS},q)}=\left(d_{idx(0)}^{(i_{SS},q)}, d_{idx(1)}^{(i_{SS},q)}, ..., d_{idx\left(\left(N_{SD}+N_p\right)-1\right)}^{(i_{SS},q)}\right)$, where $idx()$ defines the array of permutation indices.

The array of permutation indices, $idx()$, is constructed as follows:

Let $x=\left(\left(N_{SD}+N_p\right)\times\sum_{i_{SS}=1}^{N_{SS\,i_{user}}} N_{BPSC\,i_{user}\,i_{SS}}\right)/L_{CW\,i_{user}}$.

Moreover, for each x, let $N_x=\begin{cases}2\times N_{CB} & \text{if } x<2.5\times N_{CB}\\ 3\times N_{CB} & \text{if } 2.5\times N_{CB}\le x<3.5\times N_{CB}\\ 4\times N_{CB} & \text{if } 3.5\times N_{CB}\le x<5\times N_{CB}\\ 6\times N_{CB} & \text{if } 5\times N_{CB}\le x<7\times N_{CB}\\ 8\times N_{CB} & \text{if } 7\times N_{CB}\le x<10\times N_{CB}\\ 12\times N_{CB} & \text{if } 10\times N_{CB}\le x<14\times N_{CB}\\ 16\times N_{CB} & \text{if } 14\times N_{CB}\le x<20\times N_{CB}\\ 24\times N_{CB} & \text{if } x\ge 20\times N_{CB}\end{cases}$ and $N_y = (N_{SD} + N_p)/N_x$.

Then, $idx\left(j\times N_x+i\right)=N_y\times i+j$, where $i = 0, 1, \ldots, N_x - 1$ and $j = 0, 1, \ldots, N_y - 1$.

After permutation, the padded 0s at the first step are discarded (punctured) to form the output array of length N_{SD}.

28.6.9.3.10 Space-time block coding

An EDMG STA shall only apply STBC to an EDMG PPDU transmitted to a peer EDMG STA if the STBC Type field in the peer STA's EDMG Capabilities element is nonzero.

The space-time block coding (STBC) for the EDMG OFDM mode maps N_{SS} spatial streams to $2 \times N_{SS}$ space-time streams. STBC is applied to an EDMG PPDU if, in the EDMG-Header-A of the PPDU, the STBC field is equal to 1. The number of STBC modulated spatial streams N_{SS} is given by Number of SS field in the EDMG-Header-A. N_{SS} shall not exceed four for an SU PPDU and one per user for an MU PPDU.

The mapping of each spatial stream, $i_{SS} = 1, \ldots, N_{SS}$, includes the following steps for the data subcarriers mapping:

a) The input bits of spatial stream i_{SS} are broken into the groups of $N_{CBPS}(i_{SS})$ bits, $\left(c_0^{(q)}, c_1^{(q)}, ..., c_{N_{CBPS}(i_{SS})-1}^{(q)}\right)$, where q denotes the group number. The STBC applies the encoding procedure defined in 28.6.8 (Modulation and coding scheme (MCS)). The padding procedure requires that the total number of groups of $N_{CBPS}(i_{SS})$ bits shall be an even number.

b) Each group of bits $\left(c_{N_{BPSC}(i_{SS})\cdot k}^{(q)}, c_{N_{BPSC}(i_{SS})\cdot k+1}^{(q)}, ..., c_{N_{BPSC}(i_{SS})\cdot k+N_{BPSC}(i_{SS})-1}^{(q)}\right)$, $k = 0, 1, \ldots, N_{SD} - 1$ is converted to the constellation point $d\left(i_{SS}, q, k\right)$, $q = 0, 1, \ldots, N_{SYM} - 1$, following the rules defined in 28.6.9.3.3 (DCM BPSK modulation), 28.6.9.3.5 (DCM QPSK modulation), 28.6.9.3.6 (16-QAM modulation), and 28.6.9.3.7 (64-QAM modulation).

c) The modulated data sequence $D(i_{STS} = 2 \times i_{SS} - 1, n, k)$ for the odd space-time stream is defined by inserting 0s from $-N_{SR}$ to N_{SR} and then inserting data at tones $M_d(k)$ defined in 28.6.2.5 (Data tones) as follows:

$$D\left(i_{STS} = 2i_{SS} - 1, 2n, M_d\left(k\right)\right) = d\left(i_{SS}, 2n, k\right),$$
$$D\left(i_{STS} = 2i_{SS} - 1, 2n+1, M_d\left(k\right)\right) = d\left(i_{SS}, 2n+1, k\right), k = 0, 1, \ldots, N_{SD} - 1$$

d) The modulated data sequence $D(i_{STS} = 2 \times i_{SS}, n, k)$ for the even space-time stream is defined by inserting 0s from $-N_{SR}$ to N_{SR} and then inserting data at tones $M_d(k)$ defined in 28.6.2.5 (Data tones) as follows:

$$D\left(i_{STS} = 2i_{SS}, 2n, M_d\left(k\right)\right) = -conj\left(d\left(i_{SS}, 2n+1, k\right)\right),$$
$$D\left(i_{STS} = 2i_{SS}, 2n+1, M_d\left(k\right)\right) = conj\left(d\left(i_{SS}, 2n, k\right)\right), k = 0, 1, \ldots, N_{SD} - 1$$

e) The modulated pilot sequence $P(i_{STS} = 2 \times i_{SS} - 1, n, k)$ for the odd space-time stream is defined by inserting 0s from $-N_{SR}$ to N_{SR} and then inserting pilots at tones $M_p(k)$ defined in 28.6.2.4 (Pilot tones) as follows:

$$P\left(i_{STS} = 2i_{SS} - 1, 2n, M_p\left(k\right)\right) = P_{N_{SP}}\left(i_{STS} = 2i_{SS} - 1, k\right) \cdot \left(2p\left(2n\right) - 1\right),$$
$$P\left(i_{STS} = 2i_{SS} - 1, 2n+1, M_p\left(k\right)\right) = P_{N_{SP}}\left(i_{STS} = 2i_{SS}, k\right) \cdot \left(2p\left(2n+1\right) - 1\right), k = 0, 1, \ldots, N_{SP} - 1$$

f) The modulated pilot sequence $P(i_{STS} = 2 \times i_{SS}, n, k)$ for the even space-time stream is defined by inserting 0s from $-N_{SR}$ to N_{SR} and then inserting pilots at tones $M_p(k)$ defined in 28.6.2.4 (Pilot tones) as follows:

$$P\left(i_{STS} = 2i_{SS}, 2n, M_p\left(k\right)\right) = -P_{N_{SP}}\left(i_{STS} = 2i_{SS}, k\right) \cdot \left(2p\left(2n\right) - 1\right),$$
$$P\left(i_{STS} = 2i_{SS}, 2n+1, M_p\left(k\right)\right) = P_{N_{SP}}\left(i_{STS} = 2i_{SS} - 1, k\right) \cdot \left(2p\left(2n+1\right) - 1\right), k = 0, 1, \ldots, N_{SP} - 1$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In the above procedure, index n = 0, 1, …, N_{SYM} / 2 – 1, pilot sequences $P_{N_{SP}}\left(i_{STS} = 2\times i_{SS} - 1, k\right)$ and $P_{N_{SP}}\left(i_{STS} = 2\times i_{SS}, k\right)$ are defined in 28.6.2.6 (Pilot sequences) and $p(n)$ defines a bit coming from the scrambler defined in 28.6.9.1 (Scrambler) with shift register x_1, x_2,…, x_7 initialized to all 1s for the n = 0 OFDM symbol.

28.6.10 PPDU transmission

28.6.10.1 General

This subclause defines the waveform for an EDMG OFDM mode PPDU transmission over a 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, or 4.32+4.32 GHz channel using N_{TX} transmit chains.

The spatial mapping methods are defined in 28.6.10.2 (Spatial mapping). The EDMG SU PPDU transmission shall be as defined in 28.6.10.3 (EDMG SU PPDU transmission). The EDMG MU PPDU transmission shall be as defined in 28.6.10.4 (EDMG MU PPDU transmission).

28.6.10.2 Spatial mapping

Spatial mapping defines the method of N_{STS} space-time streams to N_{TX} transmit chains mapping, where $N_{STS} \leq N_{TX}$. This may be implemented by means of spatial mapping matrix Q_k of size N_{TX} by N_{STS} defined per subcarrier basis and cyclic shift diversity (CSD), if applied.

The standard defines four basic mappings, including direct mapping, indirect mapping, digital beamforming, and spatial expansion. Examples of spatial mapping methods and Q_k matrices that might be used in different cases are as follows:

- Direct mapping, $N_{STS} = N_{TX}$: spatial mapping matrix Q_k is a square diagonal complex value matrix of size N_{TX} that might be defined as follows:
  - $\left[Q_k\right]_{i,i} = 1, i = 1, 2, ..., N_{TX}$, the identity matrix
  - $\left[Q_k\right]_{i,i} = \exp\left(j2\pi\phi_i\right), i = 1, 2, ..., N_{TX}$, the exponential matrix
- Indirect mapping, $N_{STS} = N_{TX}$: spatial mapping matrix Q_k is a square matrix of size N_{TX} composed of complex values that might be defined as follows:
  - Normalized discrete Fourier matrix
  - Normalized Hadamard matrix
  - Normalized direct mapping diagonal matrix with permuted rows and/or columns
- Digital beamforming, $N_{STS} \leq N_{TX}$: spatial mapping matrix Q_k is a rectangular matrix of size N_{TX} by N_{STS} composed of complex values that might be defined based on the knowledge of the channel.
- Spatial expansion, $N_{STS} = 1 < N_{TX}$: spatial expansion that might be applied to the pre-EDMG fields is performed by multiplication by matrix Q, which is defined as a column vector of size N_{TX} by 1 and composed of all 1s and application of CSD over different transmit chains. The cyclic shift is applied to the number of consecutive fields in the PPDU. This allows duplication of the PPDU fields transmission over the N_{TX} transmit chains and avoids unintentional beamforming existing with a coherent signal transmission.
- Channel aggregation, in this case N_{TX} is an even number: the transmit chains 1 through $N_{TX}/2$ are assigned to the primary or primary and secondary channels and transmit chains $N_{TX}/2 + 1$ are assigned to the secondary or secondary1 and secondary2 channels. The mapping of space-time streams to the transmit chains is defined by the spatial mapping matrix Q_k, which is implementation specific.

28.6.10.3 EDMG SU PPDU transmission

28.6.10.3.1 General

An EDMG OFDM mode SU PPDU transmitted over a 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, or 4.32+4.32 GHz channel with single and multiple space-time streams ($1 \le i_{STS} \le N_{STS}$) is composed of pre-EDMG, EDMG preamble, Data field and TRN field.

The pre-EDMG modulated fields of the EDMG PPDU includes the L-STF, L-CEF, L-Header, and EDMG-Header-A and shall be transmitted using SC modulation as defined in 28.5.10.4.4.2 (Pre-EDMG modulated fields transmission). The EDMG-STF, EDMG-CEF, Data field, and TRN field shall be transmitted using OFDM modulation as defined in 28.6.4 (EDMG-STF definition), 28.6.5 (EDMG-CEF definition), 28.6.9 (Data field), and 28.9.2.2.5 (TRN field definition), respectively.

The total number of transmit chains, N_{TX}, shall be constant over the different fields of a transmitted EDMG SU PPDU.

28.6.10.3.2 Pre-EDMG modulated fields transmission

See 28.5.10.4.4.2 (Pre-EDMG modulated fields transmission). The upsampling factor shall be equal to $N_{up} = (3/2) \times N_{CB}$.

28.6.10.3.3 EDMG preamble, Data field, and TRN field transmission

For a single PPDU transmission, the EDMG modulated field of the EDMG preamble, Data field, and TRN field of an SU PPDU is defined for the i_{TX}^{th} transmit chain at the F_s sampling rate and sample time duration T_s and includes the following modulated fields:

$$r_{EDMG\text{-}Pream,\,Data,\,TRN}^{i_{TX}}\left(nT_s\right) = r_{EDMG\text{-}STF}^{i_{TX}}\left(nT_s\right) + r_{EDMG\text{-}CEF}^{i_{TX}}\left(nT_s - t_{EDMG\text{-}CEF}\right)$$
$$+ r_{Data}^{i_{TX}}\left(nT_s - t_{Data}\right) + r_{TRN}^{i_{TX}}\left(nT_s - t_{TRN}\right), 1 \le i_{TX} \le N_{TX}$$

where

$t_{EDMG\text{-}CEF} = T_{EDMG\text{-}STF}$	is the duration of the EDMG-STF field of the PPDU
$t_{Data} = t_{EDMG\text{-}CEF} + T_{EDMG\text{-}CEF}$	is the total duration of the EDMG-STF and the EDMG-CEF fields of the PPDU
$t_{TRN} = t_{Data} + T_{Data}$	is the total duration of the EDMG-STF, the EDMG-CEF, and Data fields of the PPDU

For an EDMG A-PPDU transmission of N_{PPDU} PPDUs, the EDMG modulated field of the EDMG preamble, Data field, and TRN field of an SU PPDU is defined for i_{TX}^{th} transmit chain at the F_s sampling rate, sample time duration T_s and includes the following modulated fields:

$$r^{i_{TX}}_{EDMG\text{-}Pream,\,Data,\,TRN}\left(nT_s\right) = r^{i_{TX}}_{EDMG\text{-}STF}\left(nT_s\right) + r^{i_{TX}}_{EDMG\text{-}CEF}\left(nT_s - t_{EDMG\text{-}CEF}\right)$$
$$+ r^{i_{TX}}_{Data_1}\left(nT_s - t_{Data_1}\right)$$
$$+ r^{i_{TX}}_{EDMG\text{-}Header\text{-}A_2}\left(nT_s - t_{EDMG\text{-}Header\text{-}A_2}\right) + r^{i_{TX}}_{Data_2}\left(nT_s - t_{Data_2}\right)$$
$$+ \ldots$$
$$+ r^{i_{TX}}_{EDMG\text{-}Header\text{-}A_{N_{PPDU}}}\left(nT_s - t_{EDMG\text{-}Header\text{-}A_{N_{PPDU}}}\right) + r^{i_{TX}}_{Data_{N_{PPDU}}}\left(nT_s - t_{Data_{vN_{PPDU}}}\right)$$
$$+ r^{i_{TX}}_{TRN}\left(nT_s - t_{TRN}\right), 1 \le i_{TX} \le N_{TX}$$

where

$t_{EDMG\text{-}CEF} = T_{EDMG\text{-}STF}$ is the duration of the EDMG-STF field of the PPDU

$t_{DATA_1} = t_{EDMG\text{-}CEF} + T_{EDMG\text{-}CEF}$ is the total duration of the EDMG-STF and EDMG-CEF fields of the PPDU

$t_{EDMG\text{-}Header\text{-}A_2} = t_{Data_1} + T_{Data_1}$ is the total duration of the EDMG-STF, EDMG-CEF, and $Data_1$ fields of the PPDU

$t_{Data_2} = t_{EDMG\text{-}Header\text{-}A_2} + T_{EDMG\text{-}Header\text{-}A_2}$ is the total duration of the EDMG-STF, EDMG-CEF, $Data_1$, and EDMG-Header-A_2 fields of the PPDU

…

$t_{EDMG\text{-}Header\text{-}A_{N_{PPDU}}} = t_{Data_{N_{PPDU}-1}} + T_{Data_{N_{PPDU}-1}}$ is the total duration of the EDMG-STF, EDMG-CEF, $Data_1$, EDMG-Header-A_2, $Data_2$, …, and $Data_{NPPDU-1}$ fields of the PPDU

$t_{Data_{N_{PPDU}}} = t_{EDMG\text{-}Header\text{-}A_{N_{PPDU}}} + T_{EDMG\text{-}Header\text{-}A_{N_{PPDU}}}$ is the total duration of the EDMG-STF, EDMG-CEF, $Data_1$, EDMG-Header-A_2, $Data_2$, …, $Data_{NPPDU-1}$, and EDMG-Header-A_{NPPDU} fields of the PPDU

$t_{TRN} = t_{Data_{N_{PPDU}}} + T_{Data_{N_{PPDU}}}$ is the total duration of the EDMG-STF, EDMG-CEF, $Data_1$, EDMG-Header-A_2, $Data_2$, …, $Data_{NPPDU-1}$, EDMG-Header-A_{NPPDU}, and $Data_{NPPDU}$ fields of the PPDU

The EDMG OFDM mode SU PPDU waveform for the i_{TX}^{th} transmit chain concatenates the pre-EDMG, EDMG preamble, Data field and TRN field, with DC relative shift applied to the EDMG modulated fields as described in 28.6.2.3 (DC relative shift to carrier frequency), and shall be defined as follows:

$$r^{i_{TX}}_{PPDU}\left(nT_s\right) = r^{i_{TX}}_{pre\text{-}EDMG}\left(nT_s\right) + r^{i_{TX}}_{EDMG\text{-}Pream,\,Data,\,TRN}\left(nT_s - t_{EDMG}\right)\cdot e^{j2\pi\left(f_{DC}-f_c\right)\cdot nT_s}, 1 \le i_{TX} \le N_{TX}$$

where

$t_{EDMG} = T_{pre\text{-}EDMG}$ is the total duration of the L-STF, the L-CEF, the L-Header, and the EDMG-Header-A fields of the PPDU

f_c is the center frequency of the carrier

f_{DC} is the DC subcarrier frequency defined in 28.6.2.3 (DC relative shift to carrier frequency)

The definition of the pulse shaping filter impulse response, $h_{SC\,CB}$, used for the transmission of the pre-EDMG modulated fields is implementation specific and beyond the scope of this standard.

28.6.10.4 EDMG MU PPDU transmission

28.6.10.4.1 General

An EDMG OFDM mode MU PPDU transmission over a 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, or 2.16+2.16 GHz channel with single and multiple space-time streams ($1 \le i_{STS} \le N_{STS}$) is composed of pre-EDMG, EDMG preamble, Data field and TRN field.

The pre-EDMG modulated fields of the PPDU includes the L-STF, L-CEF, L-Header, and EDMG-Header-A and shall be transmitted using SC modulation as defined in 28.5.10.4.4.2 (Pre-EDMG modulated fields transmission). The EDMG-STF, EDMG-CEF, EDMG-Header-B, Data field, and TRN field shall be transmitted using OFDM modulation as defined in 28.6.4 (EDMG-STF definition), 28.6.5 (EDMG-CEF definition), 28.6.6 (Encoding of EDMG-Header-B), 28.6.9 (Data field), and 28.9.2.2.5 (TRN field definition), respectively.

The total number of transmit chains, N_{TX}, shall be constant over the different fields of a transmitted EDMG MU PPDU.

28.6.10.4.2 Pre-EDMG modulated fields transmission

See 28.5.10.4.4.2 (Pre-EDMG modulated fields transmission). The upsampling factor shall be equal to $N_{up} = (3/2) \times N_{CB}$.

28.6.10.4.3 EDMG preamble, Data field, and TRN field transmission

The EDMG preamble, Data field, and TRN field of an MU PPDU is defined for the i_{TX}^{th} transmit chain at the F_s sampling rate and sample time duration T_s and includes the following modulated fields:

$$r^{i_{TX}}_{EDMG\text{-}Pream,\,Data,\,TRN}\left(nT_s\right) = r^{i_{TX}}_{EDMG\text{-}STF}\left(nT_s\right) + r^{i_{TX}}_{EDMG\text{-}CEF}\left(nT_s - t_{EDMG\text{-}CEF}\right)$$
$$+ r^{i_{TX}}_{EDMG\text{-}Header\text{-}B}\left(nT_s - t_{EDMG\text{-}Header\text{-}B}\right) + r^{i_{TX}}_{Data}\left(nT_s - t_{Data}\right) + r^{i_{TX}}_{TRN}\left(nT_s - t_{TRN}\right), 1 \le i_{TX} \le N_{TX}$$

where

$t_{EDMG\text{-}CEF} = T_{EDMG\text{-}STF}$ is the duration of the EDMG-STF field of the PPDU

$t_{EDMG\text{-}Header\text{-}B} = t_{EDMG\text{-}CEF} + T_{EDMG\text{-}CEF}$ is the total duration of the EDMG-STF and EDMG-CEF fields of the PPDU

$t_{Data} = t_{EDMG\text{-}Header\text{-}B} + T_{EDMG\text{-}Header\text{-}B}$ is the total duration of the EDMG-STF, EDMG-CEF, and EDMG-Header-B fields of the PPDU

$t_{TRN} = t_{Data} + T_{Data}$ is the total duration of the EDMG-STF, EDMG-CEF, EDMG-Header-B, and Data fields of the PPDU

The Data field of an MU PPDU shall be modulated using $N_{SYM\,i_{user}}$ OFDM symbols for the i_{user}^{th} user as defined in 28.6.9 (Data field).

The EDMG OFDM mode MU PPDU waveform for the i_{TX}^{th} transmit chain concatenates the pre-EDMG, EDMG preamble, Data field and TRN field, with DC relative shift applied to the EDMG modulated fields as described in 28.6.2.3 (DC relative shift to carrier frequency), and shall be defined as follows:

$$r^{i_{TX}}_{PPDU}\left(nT_s\right) = r^{i_{TX}}_{pre\text{-}EDMG}\left(nT_s\right) + r^{i_{TX}}_{EDMG\text{-}Pream,\,Data,\,TRN}\left(nT_s - t_{EDMG}\right) \cdot e^{j2\pi\left(f_{DC} - f_c\right)\cdot nT_s}, 1 \le i_{TX} \le N_{TX}$$

where

$t_{EDMG} = T_{pre\text{-}EDMG}$ is the total duration of the L-STF, the L-CEF, the L-Header, and the EDMG-Header-A fields of the PPDU

f_c is the center frequency of the carrier

f_{DC} is the DC subcarrier frequency defined in 28.6.2.3 (DC relative shift to carrier frequency)

The definition of the pulse shaping filter impulse response, $h_{SC\ CB}$, used for the transmission of the pre-EDMG modulated fields is implementation specific and beyond the scope of this standard.

28.6.11 Performance requirements

28.6.11.1 Transmit requirements

28.6.11.1.1 Transmit modulation accuracy (EVM) test and requirements

This subclause specifies the EVM test and corresponding requirements for PPDUs transmitted with the TXVECTOR parameter EDMG_MODULATION equal to EDMG_OFDM_MODE and TXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION equal to any valid combination indicated in Table 28-21, Table 28-22, or Table 28-23.

The transmit modulation accuracy test shall be performed by instrumentation capable of converting the transmitted signals into a stream of complex samples at sampling rate greater than or equal to the OFDM sampling rate F_S. The TXVECTOR parameters NUM_STS and NUM_TX_CHAINS shall be equal, and the value of both parameters shall be equal to the number of utilized testing instrumentation input ports or antennas. Each port or antenna connected to a transmit chain of the transmitting STA shall be assigned to a port or antenna of the testing instrumentation in a way that makes signal coupling between the different transmit signal paths negligible. In the test, $N_{SS} = N_{STS}$ (i.e., no STBC) shall be used. If the TXVECTOR parameter NUM_STS is greater than 1, the two or more space-time streams shall have the same modulation type.

The instrumentation used shall have sufficient accuracy in terms of I/Q arm amplitude and phase balance, DC offsets, phase noise, and analog-to-digital quantization noise, so as not to mask or degrade the true EVM measurement. A possible embodiment of such a setup is converting the signals to a low IF frequency with a microwave synthesizer, sampling the signal with a digital oscilloscope and decomposing it digitally into quadrature components. The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or equivalent procedure:

— Detect the start of the PPDU.
— Establish fine timing.
— Estimate coarse and fine frequency offsets.
— De-rotate the symbols in the PPDU according to the estimated frequency offset.
— Estimate the complex channel for each of the subcarriers and each of the spatial streams using the EDMG-CEF field.
— For each of the OFDM symbols: transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, de-rotate the subcarrier values according to the estimated phase, group the results from all RF chains in each subcarrier to a vector, and multiply the vector by an equalization matrix generated from the estimated channel.
— For each data-carrying subcarrier and each spatial stream, find the closest constellation point and compute the Euclidean distance from it.
— Compute the average relative constellation RMS error (EVM) across PPDUs according to the formula:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$EVM = 20\log_{10}\left(\frac{1}{N_f}\sum_{f=1}^{N_f}\sqrt{\frac{\sum_{n=0}^{N_{SYMS}-1}\sum_{j=1}^{N_{SS}}\sum_{k\epsilon M_d(k)}\left(I(f,n,j,k)-I^*(f,n,j,k)\right)^2+\left(Q(f,n,j,k)-Q^*(f,n,j,k)\right)^2}{N_{SYMS}\times N_{SS}\times N_{SD}\times P_0}}\right)$$

where

N_f is the number of frames for the measurement

N_{SYMS} is the number of OFDM symbols

N_{SS} is the number of spatial streams

$M_d(k)$ is set of data subcarriers defined in 28.6.2.5 (Data tones)

N_{SD} is the number of data subcarriers

P_0 is the average power of the constellation

$I(f,n,j,k)$ and $Q(f,n,j,k)$
denote the observed symbol point in the complex plane for the k^{th} subcarrier of the n^{th} OFDM symbol and j^{th} spatial stream within the f^{th} frame

$I^*(f,n,j,k)$ and $Q^*(f,n,j,k)$
denote the ideal symbol point in the complex plane for the k^{th} subcarrier of the n^{th} OFDM symbol and j^{th} spatial stream within the f^{th} frame

The total number of symbol points used in the test, which is equal to $N_f \times N_{SYMS} \times N_{SS} \times N_{SD}$, shall be at least 1000, with the constraint that N_{SYMS} shall be at least 16 and that N_f shall be at least 20. Random data shall be used for the symbols and frames.

The EVM shall not exceed an MCS dependent value provided in Table 28-73. If the TXVECTOR parameter CHANNEL_AGGREGATION is equal to AGGREGATED, the transmission in the two 2.16 GHz channels or 4.32 GHz channels may be tested independently. In this case, the transmit modulation accuracy of each 2.16 GHz channel or of each 4.32 GHz channel shall meet the required value in Table 28-73.

28.6.11.1.2 Time of Departure accuracy

The RMS accuracy of the time of departure provided in TIME_OF_DEPARTURE shall be less than or equal to 80 ns.

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is set to aDMGChipRate.
— FIRST_TRANSITION_FIELD is L-STF of the waveform transmitted in the primary channel.
— SECOND_TRANSITION_FIELD is L-CEF of the waveform transmitted in the primary channel.
— TRAINING_FIELD is L-CEF of the waveform transmitted in the primary channel.
— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is set to aDMGTimeOfDepartureAccuracyThresh.

28.6.11.2 Receive requirements

CCA sensitivity requirements are defined in 28.3.8 (CCA sensitivity).

28.7 EDMG transmit procedure

This subclause defines the PHY transmit procedure for EDMG and non-EDMG duplicate format. The format selection is performed based on the FORMAT parameter of the PHY-TXSTART.request(TXVECTOR) primitive.

There are two paths for the transmit PHY procedure:

— The first path is selected if the FORMAT parameter is EDMG. In this case, the modulation is defined by EDMG_MODULATION parameter. If EDMG_MODULATION parameter is set to EDMG_C_MODE, EDMG_SC_MODE, or EDMG_OFDM_MODE, then it indicates EDMG control mode, EDMG SC mode, or EDMG OFDM mode defined in 28.4 (EDMG and non-EDMG control mode), 28.5 (EDMG and non-EDMG SC mode), and 28.6 (EDMG OFDM mode), respectively. An example of the EDMG PHY transmit procedure provided in this subclause does not

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

include optional features like EDMG A-PPDU, SU with multiple space-time streams, STBC, Dual Stream DCM BPSK, DCM π/2-BPSK and MU transmission.

— The second path is selected if the FORMAT parameter is non-EDMG. In this case, the modulation is defined by NON_EDMG_MODULATION parameter. If NON_EDMG_MODULATION is set to DMG_C_MODE or DMG_SC_MODE, then it indicates DMG control mode or DMG SC mode defined in Clause 20, respectively. If NON_EDMG_MODULATION is set to NON_EDMG_DUP_C_MODE or NON_EDMG_DUP_SC_MODE, then it indicates non-EDMG duplicate control mode or non-EDMG duplicate SC mode defined in 28.4 (EDMG and non-EDMG control mode) and 28.5 (EDMG and non-EDMG SC mode), respectively.

In both paths, in order to transmit data, the MAC generates a PHY-TXSTART.request primitive, which causes the PHY entity to enter the transmit state. Further, the PHY is set to operate at the appropriate frequency through station management via the PLME as specified in EDMG PLME. Other transmit parameters, such as EDMG-MCS, PSDU Length, and others are set via the PHY SAP using the PHY-TXSTART.request(TXVECTOR) primitive, as described in 28.2 (EDMG PHY service interface).

The PHY indicates the state of the 2.16 GHz primary channel and any secondary channels, including 2.16 GHz Secondary, 2.16 GHz secondary1, and 2.16 GHz secondary2 via a PHY-CCA.indication primitive as defined in 8.3.5.12. Transmission of the PPDU shall be initiated by the PHY after receiving the PHY-TXSTART.request(TXVECTOR) primitive. The TXVECTOR parameters for the PHY-TXSTART.request primitive are specified in 28.2.2 (TXVECTOR and RXVECTOR parameters) (Table 28-1).

Figure 28-35 (PHY transmit procedure for the control mode) shows PHY transmit procedure for EDMG_C_MODE mode with schematic diagram of primitives exchange between the MAC and PHY layers through PHY SAP interface. Figure 28-36 (PHY transmit procedure for the SU EDMG SC and OFDM modes)shows PHY transmit procedure for SU PPDU format for EDMG_SC_MODE or EDMG_OFDM_MODE. The fields of the PPDU highlighted by dotted line might not be present for some particular parameters configuration.

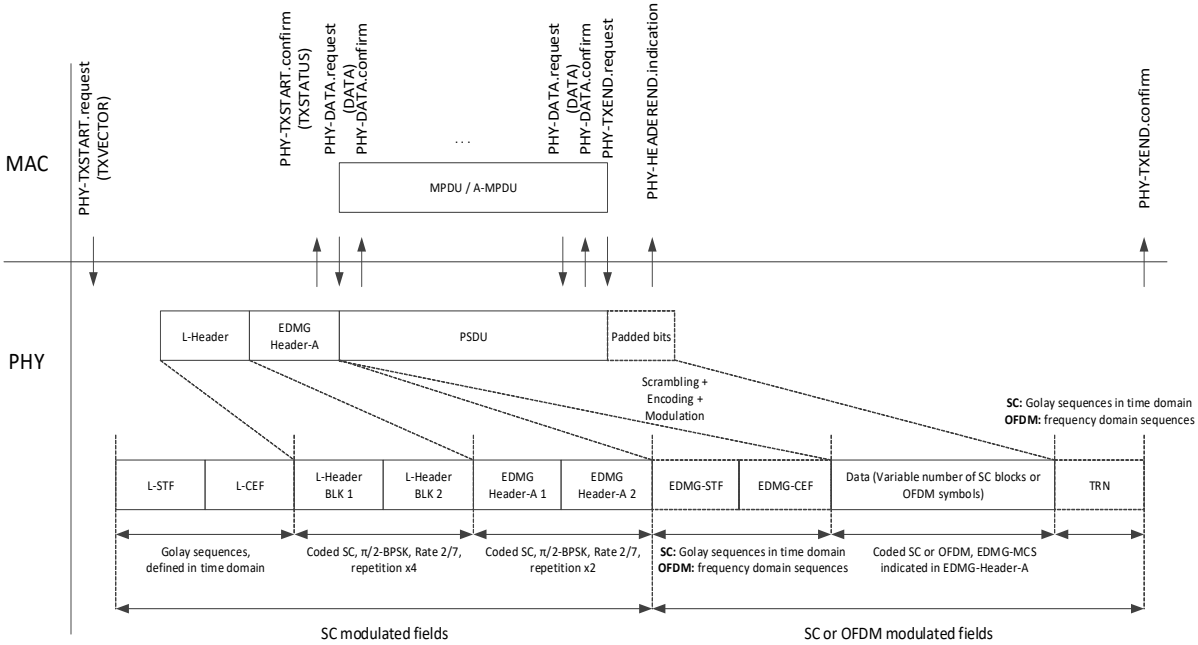

Figure 28-36—PHY transmit procedure for the SU EDMG SC and OFDM modes

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

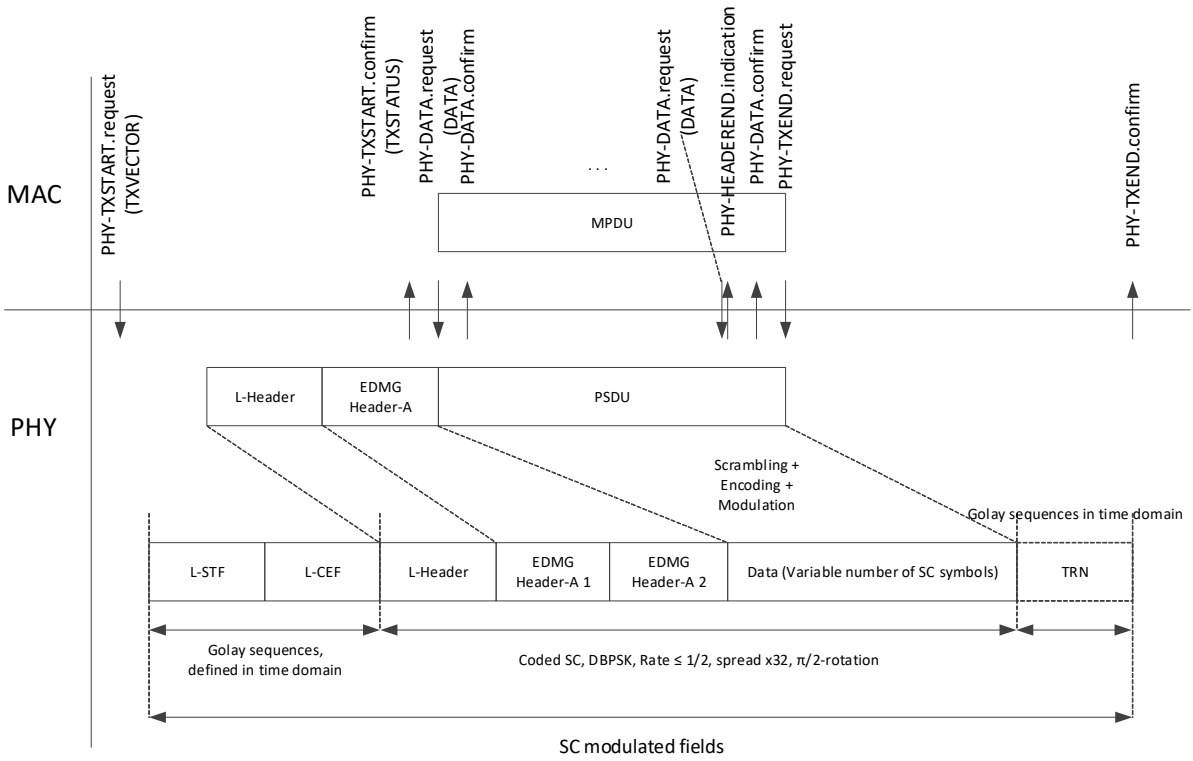

Figure 28-35—PHY transmit procedure for the control mode

The EDMG-STF and EDMG-CEF fields are not transmitted if EDMG_MODULATION parameter is set to EDMG_C_MODE.

The EDMG-STF and EDMG-CEF fields are not transmitted if the number of bits set to 1 in the CH_BANDWIDTH parameter is equal to 1, EDMG_MODULATION parameter is set to EDMG_SC_MODE, the number of space-time streams NUM_STS is set to 1, and STBC is set to 0 (see 28.2.2 (Table 28-1)).

The TRN field is not transmitted if EDMG_TRN_LEN is 0 (see 28.2.2 (Table 28-1)) or, as defined in 10.12.7, if EDMG_TRN_LEN is greater than 0, BEAM_TRACKING_REQUEST is set to 0, EDMG_BEAM_TRACKING_REQUEST is set to 1, and EDMG_PPDU_TYPE is set to EDMG-TRN-R. It may also not be transmitted if EDMG_TRN_LEN > 0 and beam tracking request was initiated [see 28.9 (EDMG beamforming)].

NOTE 1—This procedure does not describe the operation of optional features, such as A-PPDU, SU multiple space-time streams, STBC, DCM BPSK, DCM π/2-BPSK, and MU transmission.

The PHY entity performs TXVECTOR parsing to extract the transmission parameters and build up the L-Header and EDMG-Header-A bit content. It computes CRC per each header separately.

If the EDMG_MODULATION parameter isequal to EDMG_C_MODE, all fields are transmitted using SC modulation. The L-STF and L-CEF fields are transmitted using π/2-BPSK modulated Golay complementary sequences defined in time domain as specified in 20.4.3.1.2 (Short Training field) and 20.4.3.1.3 (Channel Estimation field), respectively. The L-Header, EDMG-Header-A composed of two parts EDMG-Header-A_1 and EDMG-Header-A_2, and data (PSDU) are transmitted by applying scrambling, LDPC code with effective

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

rate less or equal to 1/2, DBPSK modulation, 32× spreading applying Golay sequences, and π/2-rotation as defined in 28.4.5.2 (Data field). The TRN field is transmitted using π/2-BPSK modulated Golay complementary sequences in time domain as defined in 28.9.2.2.5 (TRN field definition).

If the EDMG_MODULATION parameter is equal to EDMG_SC_MODE or EDMG_OFDM_MODE, the L-STF, L-CEF, L-Header, and EDMG-Header-A are transmitted using SC modulation. The rest of the frame, including EDMG-STF, EDMG-CEF, Data (PSDU), and TRN field can be transmitted using SC or OFDM modulation.

The L-STF and L-CEF fields are transmitted using π/2-BPSK modulated Golay complementary sequences defined in time domain as specified in 28.3.3.2.2 (L-STF definition) and 28.3.3.2.3 (L-CEF definition), respectively. The L-Header is transmitted by applying LDPC code with effective rate 2/7, π/2-BPSK modulation, and codeword repetition 4× times. The transmission of L-Header occupies two SC symbol blocks. The EDMG-Header-A is transmitted by applying the LDPC code with effective rate 2/7, π/2-BPSK modulation, and codeword repetition 2× times. It is composed of two parts: EDMG-Header-A_1 and EDMG-Header-A_2. The transmission of EDMG-Header-A occupies two SC symbol blocks.

The SC symbol blocks used for the L-Header and EDMG-Header-A transmission are prepended with Guard Intervals (GIs). The extra GI is inserted at the end of EDMG-Header-A_2 block. This creates the blocking structure when each SC symbol block is surrounded by two GIs. The GI is defined using π/2-BPSK modulated Golay sequence in time domain as specified in 28.5.9.1 (Guard interval definition).

If the EDMG_MODULATION parameter is equal to EDMG_SC_MODE, the EDMG-STF and EDMG-CEF are defined using π/2-BPSK modulated Golay complementary sequences in time domain as specified in 28.6.4 (EDMG-STF definition) and 28.6.5 (EDMG-CEF definition), respectively. The data (PSDU) is padded and scrambled to get an integer number of LDPC codewords and SC symbol blocks and then encoded as defined in 28.5.9.4 (Encoding). The encoded bits are modulated as defined in 28.5.9.5 (Modulation mapping). The modulated symbols are grouped into the SC symbol blocks and prepended with GIs as defined in 28.5.9.2 (Symbol blocking and guard insertion). The extra GI is inserted at the end of last SC symbol block. This creates the blocking structure when each SC symbol block is surrounded by two GIs. The GI is defined using π/2-BPSK modulated Golay sequence in time domain as specified in 28.5.9.1 (Guard interval definition). The TRN field is defined using π/2-BPSK modulated Golay complementary sequences in time domain as specified in 28.9.2.2.5 (TRN field definition).

If the EDMG_MODULATION parameter is equal to EDMG_OFDM_MODE, the EDMG-STF and EDMG-CEF are defined using 4-PSK modulated sequences in frequency domain as specified in EDMG-STF definition and EDMG-CEF definition, respectively. The data (PSDU) is padded and scrambled to get an integer number of LDPC codewords and OFDM symbols and then encoded as defined in 28.6.9.2 (Encoding). The encoded bits are modulated as defined in 28.6.9.3 (Modulation mapping). The modulated symbols are grouped into the OFDM data blocks, supplemented with pilots and converted to time domain applying IDFT. The OFDM symbol in time domain is prepended with GI, which is in fact a cyclic extension of OFDM symbol.

Transmission of the PHY preamble may start if TIME_OF_DEPARTURE_REQUESTED is false, and shall start immediately if TIME_OF_DEPARTURE_REQUESTED is true, based on the parameters passed in the PHY-TXSTART.request primitive.

The PHY layer shall issue a PHY-TXSTART.confirm primitive to the MAC in response to the PHY-TXSTART.request(TXVECTOR) primitive when it is ready to receive an MPDU/A-MPDU from the MAC. The receipt of this primitive by the MAC entity causes the MAC to start the transfer of data octets.

The PHY-TXSTART.confirm(TXSTATUS) primitive shall contain the TXSTATUS vector defined in Table 20-2, if the conditions below are met:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— If dot11TODImplemented and dot11TODActivated are both true or dot11TimingMsmtActivated is true; and the parameter TIME_OF_DEPARTURE_REQUESTED in the TXVECTOR specified in the PHY-TXSTART.request is true, then the PHY shall include the TIME_OF_DEPARTURE corresponding to the time when the first frame energy is sent by the transmitting port and TIME_OF_DEPARTURE_ClockRate parameters in the TXSTATUS vector (see Table 20-2).
— If dot11TimingMsmtActivated is true, then the PHY shall include TX_START_OF_FRAME_OFFSET in the TXSTATUS vector (see Table 20-2).

Once a PHY-TXSTART.confirm primitive is issued, the MAC initiates data (MPDU octets) exchange with the PHY entity. The data shall be exchanged between the MAC and the PHY through a series of PHY-DATA.request(DATA) primitives issued by the MAC, and PHY-DATA.confirm primitives issued by the PHY.

If TIME_OF_DEPARTURE_REQUESTED is true, the PHY entity shall generate the PHY-TXHEADEREND.indication primitive at the end of transmission of the last symbol containing the PHY EDMG-Header-A for an SU PPDU and the last symbol containing the PHY EDMG-Header-B for an MU PPDU. The receipt of this primitive by the MAC entity causes the MAC to record the time when this primitive is received.

Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. The PSDU transmission is terminated by receiving a PHY-TXEND.request primitive. Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY. In an SU transmission, normal termination occurs after the transmission and confirmation of the last PSDU octet.

Once the PPDU transmission is completed the PHY entity issues PHY-TXEND.confirm primitive and enters the receive state.

A typical transmit state machine for an SU transmission with NUM_STS = 1 and no TRN field is shown in Figure 28-37 (PHY transmit state machine for SU transmission (NUM_STS = 1 and no TRN field)).

NOTE 2—PSDU encoding and modulation can be started in parallel with preamble transmission and depends on the particular hardware pipeline implementation.

28.8 EDMG receive procedure

This subclause defines the PHY receive procedure for the EDMG format. The receive procedure for the non-EDMG duplicate format is defined in 20.9 (Beamforming).

Figure 28-38 (PHY receive procedure for the EDMG control mode) shows the PHY receive procedure for the EDMG_C_MODE mode with a schematic diagram of primitives exchange between the MAC and PHY layers through PHY SAP interface. Figure 28-39 (PHY receive procedure for the SU EDMG SC and SU EDMG OFDM modes) shows the PHY receive procedure for an SU PPDU format for the EDMG_SC_MODE or the EDMG_OFDM_MODE. The fields of the PPDU highlighted by dotted line might not be present for some particular parameters configuration.

NOTE—This procedure does not describe the operation of optional features, such as A-PPDU, SU multiple space-time streams, STBC, DCM BPSK, DCM π/2-BPSK, and MU reception.

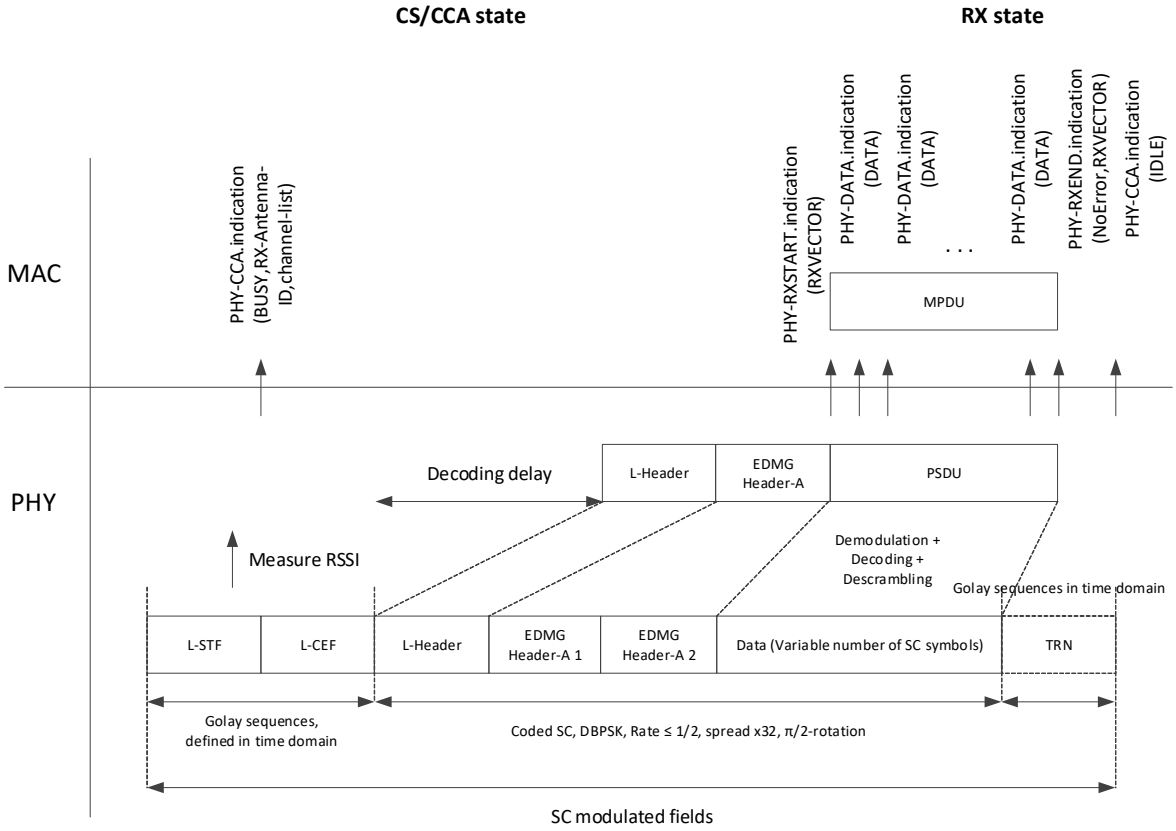

Figure 28-38—PHY receive procedure for the EDMG control mode

Upon receiving the transmitted PHY preamble over the primary 2.16 GHz channel, the PHY measures a receive signal strength. The PHY indicates this activity to the MAC by issuing a PHY-CCA.indication primitive. A PHY-CCA.indication(BUSY, RX-Antenna-ID, channel-list) primitive is also issued as an initial indication of reception of a signal as defined in 8.3.5.12. The channel-list parameter of the CCA-PHY.indication primitive is absent when the operating channel width is 2.16 GHz. The channel-list parameter is present and includes the element primary when operating channel width is 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, or 4.32+4.32 GHz. The RX-Antenna-ID parameter is present if the PHY entity has more than one active RX chain and the CCA sensitivity condition defined in 28.3.8 applies to any DMG antenna connected to an active receive chain.

The PHY includes the most recently measured RSSI value in the PHY-RXSTART.indication(RXVECTOR) primitive issued to the MAC.

After the PHY-CCA.indication(BUSY, channel-list) primitive is issued, the PHY entity shall continue receiving the pre-EDMG part of the PPDU, including L-STF, L-CEF, L-Header, and EDMG-Header-A fields.

For an EDMG control mode PPDU, the L-Header contains the channel bandwidth indication field, the EDMG-Header-A indication field that indicates that the PPDU is an EDMG control mode PPDU, and the control trailer indication field as defined in 28.3.3.2.4 (Table 28-5 and Table 28-6).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

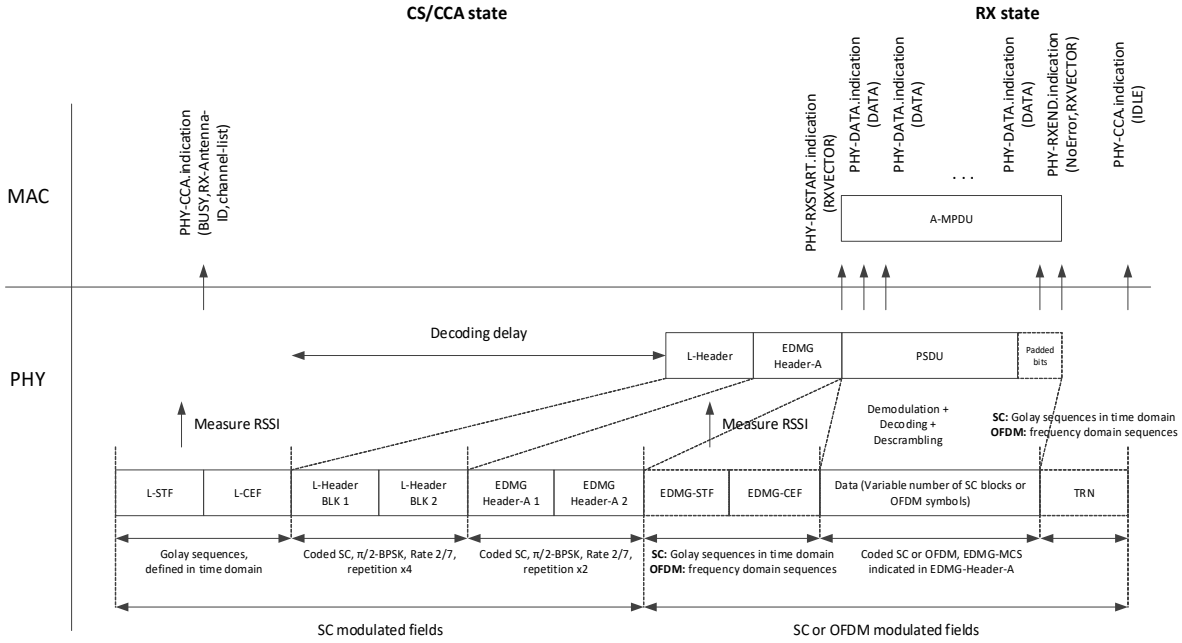

Figure 28-39—PHY receive procedure for the SU EDMG SC and SU EDMG OFDM modes

For an EDMG SC or EDMG OFDM mode PPDU, the L-Header contains the IsSC field indicating the EDMG SC or EDMG OFDM modulation type, the IsSISO field indicating the single or multiple spatial streams transmission, the GI length field indicating the type of GI used for the data (PSDU) transmission, and the compressed bandwidth indication as defined in 28.3.3.2.4 (L-Header definition) (Table 28-7, Table 28-8, and Table 28-9).

If the check of the L-Header CRC bits is not valid, a PHY-RXSTART.indication primitive is not issued, and instead the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive. If a check of the L-Header CRC bits is valid, the EDMG PHY shall maintain the PHY-CCA.indication(BUSY, channel-list) primitive for the predicted duration of the transmitted PPDU, as defined by RXTIME parameter, for all supported modes, unsupported modes, and invalid EDMG-Header-A CRC.

If the check of the EDMG-Header-A CRC bits is not valid, a PHY-RXSTART.indication primitive is not issued, and instead the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive. For an EDMG STA, if the EDMG-Header-A indicates an unsupported mode, the PHY shall issue a PHY-RXEND.indication(UnsupportedRate) primitive.

After receiving a valid L-Header and EDMG-Header-A indicating a supported mode, the PHY entity shall begin reception of the EDMG portion of the PPDU. For an EDMG STA and EDMG control mode PPDU, the EDMG portion of the PPDU includes the data (PSDU) and possible TRN field as defined in 28.4 (EDMG and non-EDMG control mode).

For an EDMG STA and EDMG SC mode PPDU, if the SU/MU Format field in the EDMG-Header-A indicates an SU PPDU, the Number of SS field indicates a single spatial stream, the STBC Applied field is 0, and the BW field indicates a single 2.16 GHz channel, then the EDMG part of the frame includes data (PSDU) and possibly a TRN field.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For an EDMG STA and EDMG SC mode PPDU, if the SU/MU Format field in the EDMG-Header-A indicates an SU PPDU and the Number of SS field indicates multiple spatial streams, or STBC Applied field is 1, or the BW field indicates 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, or 4.32+4.32 GHz channel, then the EDMG part of the frame includes EDMG-STF, EDMG-CEF, data (PSDU), and possibly a TRN field as defined in 28.5 (EDMG and non-EDMG SC mode).

For an EDMG STA and EDMG OFDM mode PPDU, if the SU/MU Format field in the EDMG-Header-A indicates an SU PPDU, then the EDMG part of the frame includes EDMG-STF, EDMG-CEF, data (PSDU), and possibly a TRN field as defined in 28.6 (EDMG OFDM mode).

For an EDMG STA and EDMG SC or OFDM mode PPDU, if the SU/MU Format field in the EDMG-Header-A indicates an MU PPDU, then the EDMG part of the frame includes EDMG-STF, EDMG-CEF, EDMG-Header-B, data (PSDU), and possibly a TRN field as defined in 28.5 (EDMG and non-EDMG SC mode) and 28.6 (EDMG OFDM mode).

If an MU PPDU is indicated in the EDMG-Header-A, the EDMG STA verifies the AIDs included into the SS descriptors. If there is no match between the STA's AID and one included in any of the SS descriptors, then PHY shall issue a PHY-RXEND.indication(Filtered) primitive. If AID verification is successful, then the STA continues with EDMG-Header-B decoding.

If the check of the EDMG-Header-B CRC bits is not valid, a PHY-RXSTART.indication primitive is not issued, and instead the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive. For an EDMG STA, if the EDMG-Header-B indicates an unsupported mode, the PHY shall issue a PHY-RXEND.indication(UnsupportedRate) primitive.

For successful decoding of the L-Header, the EDMG-Header-A, and the EDMG-Header-B (for MU only), the PHY shall issue a PHY-RXSTART.indication(RXVECTOR) primitive to the MAC containing the RXVECTOR parameters as defined in 28.2.2 (TXVECTOR and RXVECTOR parameters) (Table 28-1).

After successful decoding of the header fields, the PHY performs decoding of the PSDU and initiates the series of PHY-DATA.indication(DATA) primitive exchanges. The decoded PSDU bits are assembled into octets and any pad bits added at the stage of encoding are discarded. If the PSDU decoding is successful, then the PHY shall issue the PHY-RXEND.indication(NoError, RXVECTOR) primitive.

If signal loss occurs during reception prior to completion of the PPDU reception, the error condition shall be reported to the MAC using a PHY-RXEND.indication(CarrierLost) primitive. After waiting for the intended end of the PPDU as determined by the RXTIME parameter, including possibly a TRN field, the PHY shall generate a PHY-CCA.indication(IDLE) primitive and return to the IDLE state. If the decoding of the L-Header is unsuccessful, then the RXTIME parameter cannot be determined. In this case, the PHY-CCA(BUSY) shall be maintained as long as the detected energy is 20 dB above the minimum sensitivity for a 2.16 GHz PPDU using the SC MCS 1. The PHY entity shall switch to the IDLE state immediately after the energy drops below the specified threshold.

A typical receive state machine for an SU PPDU reception with NUM_STS = 1 and no TRN field is shown in Figure 28-40 (PHY receive state machine for an SU PPDU reception (NUM_STS = 1, no TRN field)).

For an EDMG STA and EDMG and non-EDMG control mode PPDUs, the RXTIME parameter shall be computed using the Length and Training Length fields defined in the L-Header field (see Table 20-11). The minimum value for the Length field is equal to 14 octets, with the exception for the Short SSW PPDU where the minimum value for the Length field is equal to 6 octets, and the Training Length (*TRN_LEN*) can be equal to 0. In the latter case, the TRN field is not appended to the PPDU.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

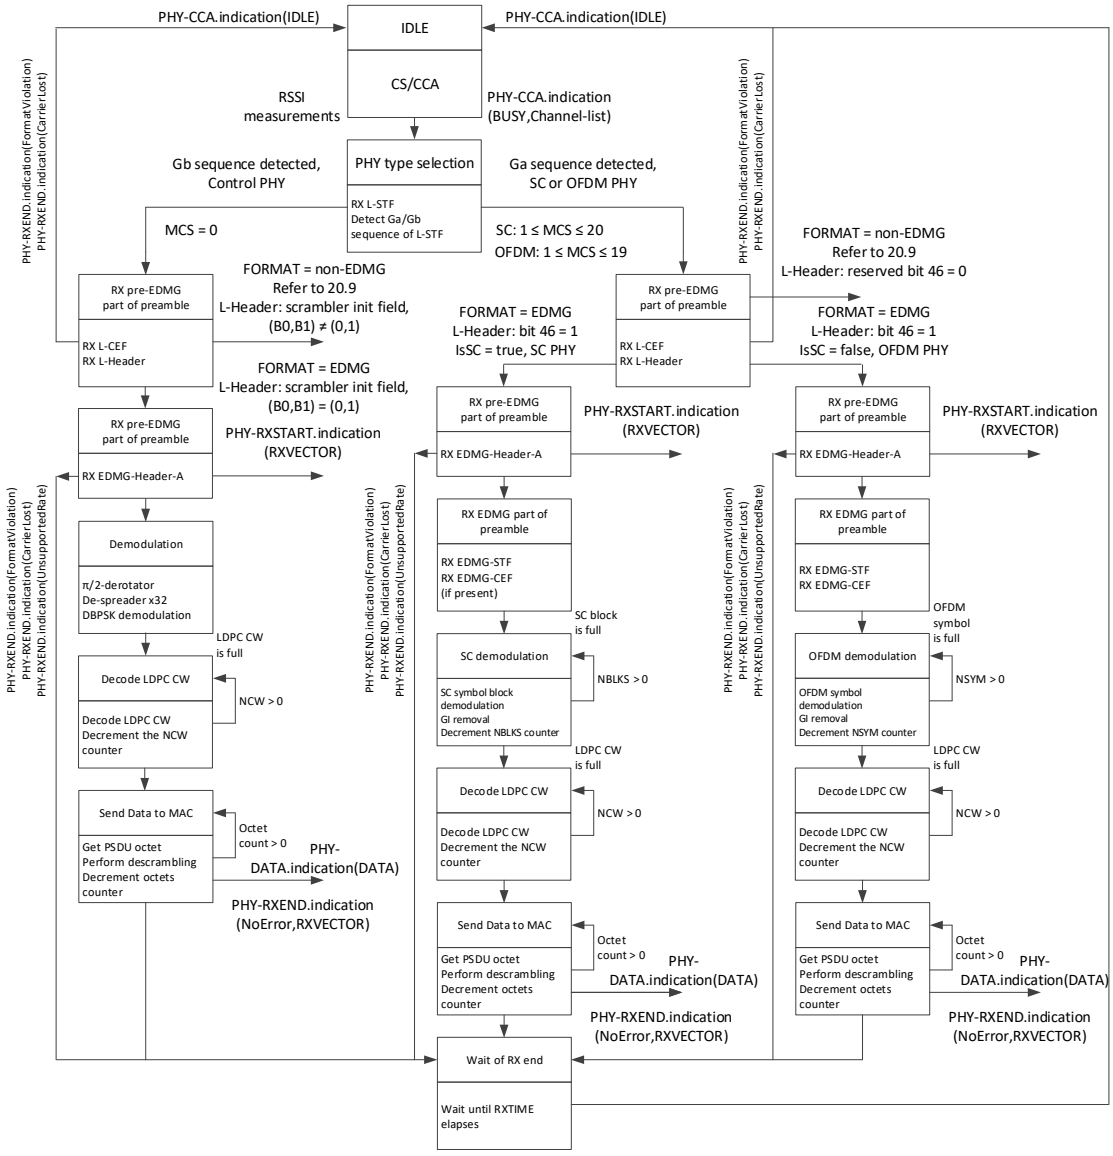

Figure 28-40—PHY receive state machine for an SU PPDU reception (NUM_STS = 1, no TRN field)

The RXTIME parameter shall be defined in microseconds as follows:

$$RXTIME\ (\mu s) = T_{L\text{-}STF} + T_{L\text{-}CEF} + T_{L\text{-}Header+Data} + T_{TRN}$$

where

$T_{L\text{-}STF} = 6400 \times$ aDMGChipTimeDuration ~ 3.63 μs

$T_{L\text{-}CEF} = 1152 \times$ aDMGChipTimeDuration ~ 0.65 μs

$T_{L\text{-}Header+Data} = ((Length + L_{L\text{-}Header}) \times 8 + 168 \times N_{CW}) \times 32 \times$ aDMGChipTimeDuration μs

$$N_{CW} = 1 + \left\lceil \frac{(Length - 6) \times 8}{168} \right\rceil$$

$L_{L\text{-}Header} = 5$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

T_{TRN} = (4992 × *TRN_LEN*) × aDMGChipTimeDuration μs

For an EDMG and non-EDMG PPDU transmission, the RXTIME computation using the above equation shall cause a spoofing error less than or equal to 0.15 μs, except for PPDU durations between 347.56 μs and 347.93 μs and between 349.10 μs and 350.76 μs where the maximum spoofing error can be 0.37 μs and 1.66 μs, respectively, as defined in 28.3.3.2.4.1 (General). Spoofing error is defined as the difference between the PPDU duration calculated based on the L-Header and the actual PPDU duration.

For an EDMG STA and EDMG and non-EDMG SC mode PPDUs, the RXTIME parameter shall be computed using the Base MCS, Length, Extended SC MCS Indication, and Training Length fields of the L-Header (see Table 20-13).

The RXTIME parameter shall be defined in microseconds as follows:

RXTIME (μs) = $T_{L\text{-}STF} + T_{L\text{-}CEF} + T_{L\text{-}Header} + T_{Data} + T_{TRN}$

where
$T_{L\text{-}STF}$ = 2176 × aDMGChipTimeDuration ~ 1.24 μs
$T_{L\text{-}CEF}$ = 1152 × aDMGChipTimeDuration ~ 0.65 μs
$T_{L\text{-}Header}$ = 1024 × aDMGChipTimeDuration μs ~ 0.58 μs
T_{Data} = (N_{BLKS} × 512 + 64) × aDMGChipTimeDuration μs
T_{TRN} = (4992 × *TRN_LEN*) × aDMGChipTimeDuration μs

The number of SC symbol blocks, N_{BLKS}, shall be as defined in 20.5.3.2.3.3 (LDPC encoding process).

For a DMG A-PPDU reception (i.e., Additional PPDU field is equal to 1), the RXTIME parameter shall be updated every time when receiving the next L-Header field. For an EDMG A-PPDU, the RXTIME parameter predicts the reception time for the entire EDMG A-PPDU. In both cases, the TRN field can be appended only once at the very end of the A-PPDU.

For an EDMG and non-EDMG PPDU transmission, the RXTIME computation using the above equation shall cause a spoofing error less than one SC symbol block, i.e., 512×aDMGChipTimeDuration as defined in 28.3.3.2.4.1 (General). Spoofing error is defined as the difference between the PPDU duration calculated based on the L-Header and the actual PPDU duration.

Optionally, an EDMG STA can estimate more accurately the actual RXTIME parameter for an EDMG PPDU by using the fields within the EDMG-Header-A.

28.9 EDMG beamforming

28.9.1 Short SSW PPDU

28.9.1.1 General

A Short SSW PPDU is a DMG control mode PPDU (see 20.4 (DMG control mode)) that has the Length field in the PHY header equal to 6 and the PPDU Type subfield within the Short SSW Payload field equal to 0.

The contents of the Short SSW Payload field, which consists of 6 octets and shall be transmitted following the PHY header, depend on whether the Short SSW PPDU is transmitted as part of an I-TXSS or R-TXSS, and whether it is used for MU-MIMO beamforming training.

The Short SSW Payload field of a Short SSW PPDU that is transmitted as part of an I-TXSS for SISO beamforming training is shown in Figure 28-41 (Short SSW Payload field when the Direction field is 0 (I-TXSS) and Addressing Mode field is 0). The Short SSW Payload field of a Short SSW PPDU that is transmitted as part of an I-TXSS for MU-MIMO beamforming training is shown in Figure 28-42 (Short SSW Payload field when the Direction field is 0 (I-TXSS) and Addressing Mode field is 1). The Short SSW Payload field of a Short SSW PPDU that is transmitted as part of an R-TXSS is shown in Figure 28-43 (Short SSW Payload field when the Direction field is 1 (R-TXSS)). The subfields of the Short SSW Payload field are defined in Table 28-74.

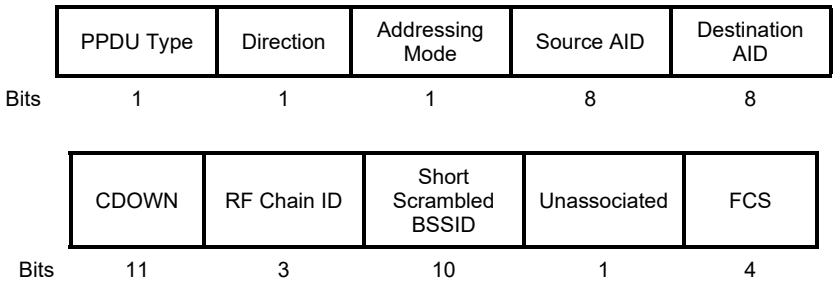

Figure 28-41—Short SSW Payload field when the Direction field is 0 (I-TXSS) and Addressing Mode field is 0

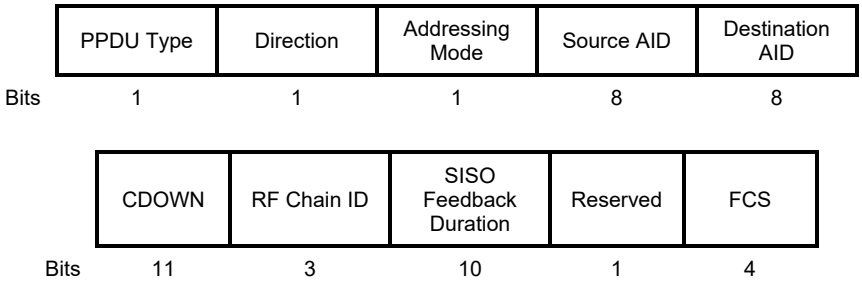

Figure 28-42—Short SSW Payload field when the Direction field is 0 (I-TXSS) and Addressing Mode field is 1

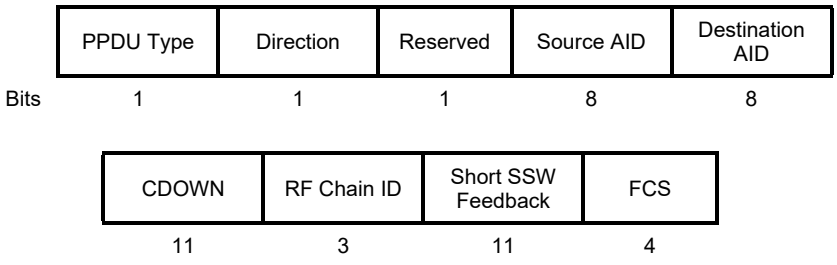

Figure 28-43—Short SSW Payload field when the Direction field is 1 (R-TXSS)

Table 28-74—Short SSW Payload field definition

Subfield	Definition
PPDU Type	Indicates the type of the PPDU. Possible values: 0: Short SSW 1: Reserved
Direction	Corresponds to TXVECTOR parameter SSSW_DIR. Indicates the direction of the transmission. The Direction field is set to 0 to indicate that the frame is transmitted by the beamforming initiator and set to 1 to indicate that the frame is transmitted by the beamforming responder.
Addressing Mode	Corresponds to TXVECTOR parameter SSSW_ADD_MODE. If set to 0, this indicates that the Destination AID field contains an individual address. Otherwise, the Destination AID field contains a group address. For an individual address, the SISO beamforming training is used. Otherwise, the MU-MIMO beamforming training is used.
Source AID	Corresponds to TXVECTOR parameter SSSW_SOURCE_AID. In an ISS, contains the AID of the STA that transmits the Short SSW PPDU, except if the transmitting STA is a PCP or an AP in which case this field contains the BSS AID (see 9.4.2.265) or the transmitting STA is not associated to intended recipient in which case this field contains a random value in the range 0 to 255. In an RSS, contains the AID of the STA that transmits the Short SSW PPDU, except if the transmitting STA is a PCP or an AP in which case this field contains the BSS AID (see 9.4.2.265) or the transmitting STA is not associated to the intended recipient in which case this field contains the value contained in the Source AID field in the received Short SSW PPDU during the preceding ISS.
Destination AID	Corresponds to TXVECTOR parameter SSSW_DESTINATION_AID. In an ISS, contains the AID of the STA addressed by the Short SSW PPDU, except if the addressed STA is a PCP or an AP in which case this field contains the BSS AID (see 9.4.2.265) or the transmitting STA is not associated to the intended recipient in which case this field contains a random value in the range 0 to 255. In an RSS, contains the AID of the STA that transmits the Short SSW PPDU, except if the transmitting STA is a PCP or an AP in which case this field contains the BSS AID (see 9.4.2.265) or the transmitting STA is not associated to the intended recipient in which case this field contains the value contained in the Destination AID field in the received Short SSW PPDU during the preceding ISS.
CDOWN	Corresponds to TXVECTOR parameter SSSW_CDOWN. A down counter indicating the number of remaining Short SSW PPDU transmissions and LBIFSs to the end of the TXSS/RXSS across all antennas. This field is set to 0 in the last Short SSW PPDU transmission.
RF Chain ID	Corresponds to TXVECTOR parameter SSSW_RF_CHAIN_ID. The content of this field is set to the value of the RF_CHAIN_ID parameter minus one. Identifies the transmit chain currently being used for the transmission.
Short Scrambled BSSID	Derived from the TXVECTOR parameter SSSW_BSSID. The content of this field is defined in 28.9.1.2 (Short Scrambled BSSID subfield definition).
Unassociated	Corresponds to TXVECTOR parameter SSSW_UNASSOCIATED. Indicates whether the transmitting STA is associated to the intended recipient. This field is set to 1 if the transmitting STA is not associated to the intended recipient. Otherwise, it is set to 0.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 28-74—Short SSW Payload field definition *(continued)*

Subfield	Definition
SISO Feedback Duration	Corresponds to TXVECTOR parameter SSSW_SISO_FEEDBACK_DURATION. Specifies the duration, in microseconds, of the SISO Feedback subphase that starts following the Short SSW PPDU transmission with CDOWN field equal to 0.
Short SSW Feedback	Corresponds to TXVECTOR parameter SSSW_FEEDBACK. In an RSS, contains the value of the CDOWN field of the Short SSW PPDU that was received with the best quality in the immediately preceding sector sweep. The determination of which PPDU was received with the best quality is implementation dependent.
FCS	The four MSBs of the FCS. The FCS is calculated as defined in 9.2.4.8.

28.9.1.2 Short Scrambled BSSID subfield definition

The process for generating the Short Scrambled BSSID subfield is depicted in Figure 28-44.

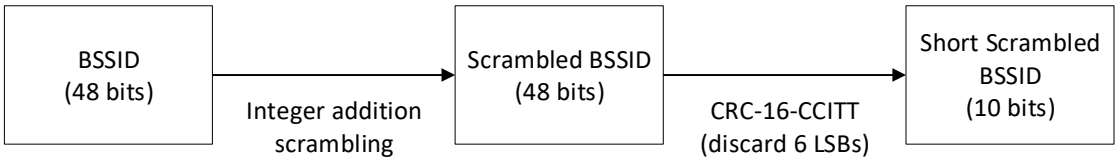

Figure 28-44—Generation of Short Scrambled BSSID subfield

The process starts by using the BSSID to generate the scrambled BSSID. The BSSID is divided into three words, $word_i$ ($0 \le i \le 2$), of 16 bits each, where $word_0$ is the 16 MSB of the BSSID and $word_2$ is the 16 LSB of the BSSID. For each $word_i$, a $scrambled\_word_i$ is created as follows:

$$scrambled\_word_i = (word_i + scramble\_pattern) \bmod 2^{16}$$

where

$word_i$ is the corresponding 16 bit word from the BSSID

scramble_pattern is $((0x5795 \times seed\_value) \bmod 2^{15})$, where *seed_value* is the value of the Scrambler Initialization field in the L-Header of the PPDU carrying the Short SSW PPDU

The scrambled BSSID is generated by the consecutive concatenation of $scrambled\_word_0$, $scrambled\_word_1$, and $scrambled\_word_2$.

Finally, the Short Scrambled BSSID subfield is generated by taking the 10 MSBs of CRC-16-CCITT computed over the scrambled BSSID. The CRC-16 is computed as defined in 20.3.7 (HCS calculation for headers of DMG control mode and DMG SC mode).

28.9.1.3 Short SSW Payload field example

This subclause describes an example configuration of a Short SSW Payload field using the following configuration as input:

- BSSID = 0B-25-4D-00-B8-6A
- L-Header:
  - Scrambler Initialization = 1

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Short SSW Payload field:
  — PPDU Type = 0
  — Direction = 0
  — Addressing Mode = 0
  — Source AID = 0x15
  — Destination AID = 1
  — CDOWN = 0x3F
  — RF Chain ID = 3
  — Short Scrambled BSSID = 0x02D
  — Unassociated = 0
  — FCS = 0xE

Using the above configuration, the Short SSW Payload field encoding using the convention in 9.2.2 is as follows: 00010101 00010000 00011111 10000011 01011010 00000111.

28.9.2 Beam refinement

28.9.2.1 General

An EDMG STA shall support the beam refinement procedure and PPDUs defined in 20.9.2 (Beamforming PPDU format) in addition to the mechanisms described in this subclause.

An EDMG PPDU shall not include a TRN field

— If the EDMG TRN Length field is equal to 0; or

— If the EDMG TRN Length field is greater than 0, the Beam Tracking Request field is equal to 0, the EDMG Beam Tracking Request field is equal to 1, the PPDU Type field is equal to 0, and the RX TRN-Units per Each TX TRN-Unit field is equal to 0. As defined in 10.41.7 (Beam tracking), this configuration corresponds to a request for receive beam tracking.

28.9.2.2 EDMG BRP PPDU

28.9.2.2.1 General

An EDMG BRP PPDU is an EDMG PPDUs that contains a TRN field and enable antenna configuration training for transmission and/or reception. There are three types of EDMG BRP PPDUs: EDMG BRP-RX PPDUs, EDMG BRP-TX PPDUs, and EDMG BRP-RX/TX PPDUs:

— EDMG BRP-RX PPDU are used for receive AWV training. All TRN subfields of an EDMG BRP-RX PPDU are transmitted with the same AWV.

— EDMG BRP-TX PPDU are used for transmit AWV training. The transmitter may change the AWV at the beginning of each set of *N* TRN subfields present in the last *M* TRN subfields of each TRN-Unit present in the TRN field. The transmitter may transmit all TRN subfields of a TRN field with the same AWV. The receiver performs measurements during the reception of the EDMG BRP-TX PPDU and sends feedback to the STA that transmitted the PPDU.

— EDMG BRP-RX/TX PPDUs are used for simultaneous training of the transmitter's transmit AWV and the receiver's receive AWV. To enable simultaneous receive and transmit training using the same EDMG BRP-RX/TX PPDU, different from an EDMG BRP-TX PPDU, the transmitter sends a number of consecutive TRN-Units in which the last *M* TRN subfields of each TRN-Unit are transmitted with the same AWV configuration.

NOTE—An EDMG BRP PPDU does not necessarily have to include a BRP frame in the PSDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

28.9.2.2.2 EDMG BRP PPDU structure

The EDMG_TRN_LEN parameter in the TVXVECTOR of an EDMG BRP PPDU shall be greater than 0.

As defined in 28.9.2.2.6 (TRN subfield definition for EDMG SC PPDUs and EDMG control mode PPDUs) for EDMG SC PPDUs and EDMG control mode PPDUs, and in 28.9.2.2.7 (TRN subfield definition for EDMG OFDM PPDUs) for EDMG OFDM PPDUs, if beam refinement is performed on a 4.32 GHz, 6.48 GHz, or 8.64 GHz channel, the TRN field in EDMG BRP PPDUs sent as part of beam refinement shall occupy 2, 3, or 4 contiguous 2.16 GHz channels, respectively. Also, if beam refinement is performed on a 2.16+2.16 GHz or 4.32+4.32 GHz channel, the TRN field in EDMG BRP PPDUs sent as part of beam refinement shall occupy one or two contiguous 2.16 GHz channels, respectively, for each of the two aggregated channels.

28.9.2.2.3 EDMG BRP PPDU Header field

The PPDU Type field within the L-Header together with the indication that the PPDU is an EDMG PPDU as defined in28.3.3.2.4 (L-Header definition) are used to indicate that a PPDU is an EDMG BRP PPDU. In the EDMG-Header-A of an EDMG PPDU, as defined in Table 28-12, the fields EDMG TRN Length, RX TRN-Units per Each TX TRN-Unit, the EDMG TRN-Unit P, EDMG TRN-Unit M and EDMG TRN-Unit N are used to indicate the length of the training field, the EDMG BRP-RX/TX PPDU configuration, the number of TRN subfields in a TRN-Unit that are used for channel estimation, the number of TRN subfields in a TRN-Unit that are used for beamforming training, and the number of consecutive TRN subfields within EDMG TRN-Unit M that are transmitted using the same AWV, respectively.

An EDMG STA that has the DMG TRN RX Only Capable subfield in its EDMG Capabilities element equal to 0 shall support the following transmit and receive configurations of the EDMG TRN-Unit P, EDMG TRN-Unit M and EDMG TRN-Unit N fields in a PPDU:

— EDMG TRN-Unit P = 2, EDMG TRN-Unit M = 5 and EDMG TRN-Unit N = 2
— EDMG TRN-Unit P = 2, EDMG TRN-Unit M = 7 and EDMG TRN-Unit N = 0
— EDMG TRN-Unit P = 0, EDMG TRN-Unit M = 2, 5, 8, 11, and 14, and EDMG TRN-Unit N = 2
— EDMG TRN-Unit P = 0, EDMG TRN-Unit M = 0 through 15, and EDMG TRN-Unit N = 0

All other configurations are optionally supported by an EDMG STA. In all cases, the value of the EDMG TRN-Unit M field plus one shall be an integer multiple of the value indicated in the EDMG TRN-Unit N field.

A value of 0 in the PPDU Type field, a value of 0 in the Beam Tracking Request field, a value of 0 in the EDMG Beam Tracking Request field, a value of 0 in the RX TRN-Units per Each TX TRN-Unit field, and a value greater than 0 in the EDMG TRN Length field indicate an EDMG BRP-RX PPDU.

A value of 1 in the PPDU Type field, a value of 0 in the Beam Tracking Request field, a value of 0 in the RX TRN-Units per Each TX TRN-Unit field, and a value greater than 0 in the EDMG TRN Length field indicate an EDMG BRP-TX PPDU.

A value of 1 in the PPDU Type field, a value of 0 in the Beam Tracking Request field, a value greater than 0 in the RX TRN-Units per Each TX TRN-Unit field, and a value greater than 0 in the EDMG TRN Length field indicate an EDMG BRP-RX/TX PPDU.

A value in the EDMG TRN Length field of an EDMG BRP-RX PPDU shall be equal to the value of the L-RX field requested by the intended receiver of the EDMG BRP-RX PPDU in the last received EDMG BRP Request element (see 9.4.2.269). A value in the RX TRN-Units per Each TX TRN-Unit field of an EDMG BRP-RX/TX PPDU shall be equal to the value of the L-TX-RX field requested by the intended receiver of the EDMG BRP-RX/TX PPDU in the last received EDMG BRP Request element (see 9.4.2.269).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When the DMG TRN field is equal to 1 in an EDMG PPDU that has the EDMG TRN Length field greater than 0, the TRN field appended to the PPDU has the structure of a DMG training field containing an AGC training field and a TRN field as defined in 20.9.2.2.2 (BRP PPDU structure). In this case, the value of the EDMG TRN Length field is smaller than 32 and only one bit is set to 1 in the BW field.

28.9.2.2.4 EDMG BRP PPDU duration

The minimum duration of the Data field of an EDMG BRP PPDU sent in EDMG SC mode or in EDMG OFDM mode is specified by the TXVECTOR parameter EDMG_BRP_MIN_SC_BLOCKS.

If the BRP PPDU is sent in EDMG SC mode, the number of the minimum SC symbol blocks, $N_{BLKS\,\min}$ (see 28.5.9.4.3 (LDPC encoding)), shall be equal to the value of the TXVECTOR parameter EDMG_BRP_MIN_SC_BLOCKS. If necessary, the Data field of the EDMG BRP PPDU shall be extended by extra zero padding to generate the required number of EDMG SC blocks.

If the BRP PPDU is sent in EDMG OFDM mode, the number of the minimum OFDM symbol blocks, $N_{SYMS\,\min}$ (see 28.6.9.2.3 (LDPC encoding)), is defined as follows:

$$N_{SYMS\,\min} = \left\lceil N_{SCBLKS\,\min} \cdot \frac{T_{DFT}^{(SC)}}{T_{DFT}^{(OFDM)} + T_{GI}^{(OFDM)}} \right\rceil$$

where

$N_{SCBLKS\,\min}$ is the value of the TXVECTOR parameter EDMG_BRP_MIN_SC_BLOCKS

$T_{DFT}^{(SC)}$ is the SC IDFT/DFT period defined in 28.5.2.2 (Timing-related parameters)

$T_{DFT}^{(OFDM)}$ is the OFDM IDFT/DFT period defined in 28.6.2.2 (Timing related parameters)

$T_{GI}^{(OFDM)}$ is the guard interval duration of the EDMG PPDU

If necessary, the Data field of the EDMG BRP PPDU shall be extended by extra zero padding to generate the required number of EDMG OFDM symbols.

The value of the PSDU Length field within the EDMG-Header-A of an EDMG BRP PPDU sent in EDMG control mode shall be greater than or equal to 19.

NOTE—The above requirement can be met by, for example, including a BRP frame in the PSDU.

28.9.2.2.5 TRN field definition

The TRN field enables transmit and receive AWV training by EDMG STAs. The TRN field has the same form for all EDMG PHY modes (EDMG control, EDMG SC, and EDMG OFDM). The TRN field structure of EDMG BRP-TX PPDUs, of EDMG BRP-RX/TX PPDUs, and of EDMG BRP-RX PPDUs are shown in Figure 28-45 (TRN field structure of EDMG BRP-TX PPDUs), Figure 28-46 (TRN field structure of EDMG BRP-RX/TX PPDUs), and Figure 28-47 (TRN field structure of EDMG BRP-RX PPDUs), respectively.

The total number of TRN-Units present in the TRN field of an EDMG PPDU is equal to the value of the EDMG TRN Length field contained in the EDMG-Header-A field of the PPDU.

For EDMG BRP-TX and EDMG BRP-RX/TX PPDUs, each TRN-Unit comprises *P* plus *M* repetitions of the TRN subfield defined in 28.9.2.2.6 (TRN subfield definition for EDMG SC PPDUs and EDMG control mode PPDUs), where *P* is the value indicated by the EDMG TRN-Unit P field and *M* is the value of the EDMG TRN-Unit M field in the EDMG-Header-A plus one. The first *P* TRN subfields of each TRN-Unit shall be transmitted using the same AWV as the preamble and Data fields of the PPDU, except for the case when the DMG antenna used in the transmission of an EDMG BRP-TX PPDU changes at the beginning of the TRN field, as described in 10.41.10.5.2 (BRP TXSS configuration) for the BRP TXSS procedure. In this particular case, the AWV used in the transmission of the first *P* TRN subfields of each TRN-Unit is selected in an implementation dependent manner and should be the same for all TRN-Units.

For EDMG BRP-TX PPDUs, the transmitter may change the AWV at the beginning of each set of *N* TRN subfields present in the last *M* TRN subfields of each TRN-Unit in the TRN field, where *N* is the value indicated by the EDMG TRN-Unit N field within the EDMG-Header-A. The *N* consecutive TRN subfields that comprise each set of *N* TRN subfields shall be transmitted with the same AWV. For EDMG BRP-RX/TX PPDUs, the transmitter may change AWV once at the beginning of the last *M* TRN subfields of each TRN-Unit with the constraint that the same AWV configuration shall be used in the transmission of *R* TRN-Units, where *R* is the value of the RX TRN-Units per Each TX TRN-Unit field in the EDMG-Header-A plus one. Any transmit signal transients that occur due to TX AWV configuration changes at the beginning of a TRN subfield shall settle within $64 \times T_c$ from the beginning of the TRN subfield.

In an EDMG BRP-RX PPDU, all TRN subfields of all TRN-Units shall be transmitted using the same AWV as the preamble and Data fields of the PPDU. Moreover, each TRN-Unit shall have 10 TRN subfields.

The transmission of the TRN field starts with *T* repetitions of the TRN subfield, which should be transmitted with the same AWV that is used for the transmission of the first *P* TRN subfields of each TRN-Unit. The *T* repetitions of the TRN subfield at the beginning of the TRN field are defined to provide a transition interval between the processing of the data and TRN fields. As such, the *T* repetitions of the TRN subfield shall not be used for AWV training and shall not be used to compute channel measurement feedback. For EDMG BRP-TX PPDUs and EDMG BRP-RX/TX PPDUs, *T* is determined by the value of the TRN Subfield Sequence Length field in EDMG-Header-A of the PPDU. If the TRN Subfield Sequence Length field is 0, *T* shall be equal to 2. If the TRN Subfield Sequence Length field is 1, *T* shall be equal to 1. If the TRN Subfield Sequence Length field is 2, *T* shall be equal to 4. For EDMG BRP-RX PPDUs or if the value of the EDMG TRN Length field contained in the EDMG-Header-A is 0, *T* shall be equal to 0.

NOTE 1—The duration of *T* repetitions of the TRN subfield is the same for all values of the TRN Subfield Sequence Length field in the EDMG-Header-A.

In EDMG BRP-TX and EDMG BRP-RX/TX PPDUs, following the transmission of all TRN-Units as indicated by the value of the EDMG TRN Length field, there are *P* repetitions of the TRN subfield, which shall be transmitted with the same AWV that is used for the transmission of the preamble and Data fields of the PPDU containing the TRN field, except for the case when the DMG antenna used in the transmission of an EDMG BRP-TX PPDU changes at the beginning of the TRN field, as described in 10.41.10.5.2 (BRP TXSS configuration) for the BRP TXSS procedure. In this particular case, the AWV used in the transmission of the *P* repetitions of the TRN subfield is selected in an implementation dependent manner.

In an EDMG BRP-TX PPDU that has the value of the EDMG TRN-Unit N field in the EDMG-Header-A equal to 0, the EDMG TRN Length field in the EDMG-Header-A shall be less than or equal to $2040/M$, where *M* is the value of the EDMG TRN-Unit M field in the EDMG-Header-A of the PPDU plus one.

The concept of AWV feedback ID is defined to indicate TRN subfields transmitted with the same AWV in the feedback of measurements made with EDMG BRP-TX and EDMG BRP-RX/TX PPDUs. For EDMG BRP-TX and EDMG BRP-RX/TX PPDUs, a TRN subfield with index *i* is defined as the $(i + 1)^{\text{th}}$ TRN subfield transmitted in the TRN field of the PPDU, where $i = 0, 1, \ldots, (M \times L) - 1$, *M* is the value of the EDMG TRN-Unit M field in the EDMG-Header-A plus one, and *L* is the value of the EDMG TRN Length

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

field in the EDMG-Header-A. The *P* TRN subfields at the start of each TRN-Unit transmitted with the same AWV are not indexed, where *P* is the value indicated by the EDMG TRN-Unit P field in the EDMG-Header-A of the PPDU.

An AWV feedback ID of value a indicates the TRN subfields transmitted with the $(a + 1)^{th}$ AWV used in the transmission of the TRN field. For EDMG BRP-TX PPDUs in which the value of the EDMG TRN-Unit N field in the EDMG-Header-A is greater than 0, a TRN subfield with index *i* shall have AWV feedback ID equal to the following:

$$a = \lfloor i / N \rfloor$$

where

N is the number of consecutive TRN subfields within a TRN-Unit that are transmitted with the same AWV configuration, which can be equal to 1, 2, 3, 4, or 8, as indicated by the EDMG TRN-Unit M and EDMG TRN-Unit N fields in the EDMG-Header-A

For EDMG BRP-TX PPDUs in which the value of the EDMG TRN-Unit N field in the EDMG-Header-A is greater than 0, $a = 0, 1, \ldots, (M \times L)/N - 1$.

For EDMG BRP-TX PPDUs in which the value of the EDMG TRN-Unit N field in the EDMG-Header-A is equal to 0, $a = i$ and $a = 0, 1, \ldots, (M \times L) - 1$. For EDMG BRP-RX/TX PPDUs, a TRN subfield with index *i* shall have AWV feedback ID a equal to the following:

$$a = \lfloor i / (C \times M) \rfloor$$

where

M is as defined above
N is as defined above
C is the value of the RX TRN-Units per Each TX TRN-Unit field in the EDMG-Header-A
L is as defined above

For EDMG BRP-RX/TX PPDUs, $a = 0, 1, \ldots, L/C - 1$.

NOTE 2—When processing the TRN field of an EDMG BRP PPDU, the repeated transmission of TRN subfields with the same AWV, which could be obtained by setting the EDMG TRN-Unit P field and/or EDMG TRN-Unit N field in the EDMG-Header-A to values greater than 0, can be used for AGC.

If the Dual Polarization TRN Training field is 1 and the value *N* indicated by the EDMG TRN-Unit N field in the EDMG-Header-A of an EDMG BRP-RX, EDMG BRP-TX or EDMG BRP-RX/TX PPDU is even, the transmitter changes the antenna polarization at the end of each group of *N*/2 TRN subfields, in the last *M* subfields in each TRN unit, where *M* is the value of EDMG TRN-Unit M plus one. The antenna polarization change shall be done while keeping the same AWV. The antenna polarization change should take no more time than the settling time for the change of an AWV.

The receiver shall also switch polarization at the end of each *k* TRN subfields within the last *M* subfields in each TRN unit, where *k* is *N*/2, *M* is the value of EDMG TRN-Unit M plus one, and *N* is the value indicated by the EDMG TRN-Unit N field in the EDMG-Header-A of the received PPDU.

28.9.2.2.6 TRN subfield definition for EDMG SC PPDUs and EDMG control mode PPDUs

The TRN subfield shall consist of N_{TX} orthogonal waveforms, where N_{TX} is the total number of transmit chains used in the transmission of the EDMG PPDU. The total number of transmit chains is indicated by the value of the TXVECTOR or RXVECTOR parameter NUM_TX_CHAINS.

The basic SC TRN subfield waveform for the i_{TX}^{th} transmit chain in time domain shall be defined at the EDMG SC chip rate $F_{c\ EDMG}$ and chip time duration T_c/N_{CB} as follows:

$$r_{TRN\_BASIC}^{i_{TX}}\left(q\frac{T_c}{N_{CB}}\right)=\left(Ga_{TRN\_BL\times N_{CB}}^{i_{TX}}\left(q\right)-Gb_{TRN\_BL\times N_{CB}}^{i_{TX}}\left(q-TRN\_BL\times N_{CB}\right)\right.$$
$$+Ga_{TRN\_BL\times N_{CB}}^{i_{TX}}\left(q-2\times TRN\_BL\times N_{CB}\right)+Gb_{TRN\_BL\times N_{CB}}^{i_{TX}}\left(q-3\times TRN\_BL\times N_{CB}\right)$$
$$\left.+Ga_{TRN\_BL\times N_{CB}}^{i_{TX}}\left(q-4\times TRN\_BL\times N_{CB}\right)-Gb_{TRN\_BL\times N_{CB}}^{i_{TX}}\left(q-5\times TRN\_BL\times N_{CB}\right)\right)$$

Sequences $Ga_{TRN\_BL\times N_{CB}}^{i_{TX}}\left(n\right)$ and $Gb_{TRN\_BL\times N_{CB}}^{i_{TX}}\left(n\right)$, i_{TX} = 1, 2, …, 8, are defined for $0 \le n \le TRN\_BL \times N_{CB} - 1$. For other values of n, $Ga_{TRN\_BL\times N_{CB}}^{i_{TX}}\left(n\right)$ and $Gb_{TRN\_BL\times N_{CB}}^{i_{TX}}\left(n\right)$ are set to 0.

If the $TRN\_BL \times N_{CB}$ length is equal to 64 (TRN_BL = 64 and N_{CB} = 1), then the basic TRN subfield waveform for the i_{TX}^{th} transmit chain in time domain shall be defined at the DMG SC chip rate F_c and chip time duration T_c as follows:

$$r_{TRN\_BASIC}^{i_{TX}}\left(qT_c\right)=\left(Gc_{64}^{i_{TX}}\left(q\right)-Gd_{64}^{i_{TX}}\left(q-64\right)\right.$$
$$+Gc_{64}^{i_{TX}}\left(q-2\times 64\right)+Gd_{64}^{i_{TX}}\left(q-3\times 64\right)$$
$$\left.+Gc_{64}^{i_{TX}}\left(q-4\times 64\right)-Gd_{64}^{i_{TX}}\left(q-5\times 64\right)\right)$$

Sequences $Gc_{64}^{i_{TX}}\left(n\right)$ and $Gd_{64}^{i_{TX}}\left(n\right)$, i_{TX} = 1, 2, …, 8, are defined for $0 \le n \le 63$. For other values of n, $Gc_{64}^{i_{TX}}\left(n\right)$ and $Gd_{64}^{i_{TX}}\left(n\right)$ are set to 0.

TRN_BL represents the length of the Golay sequence used in the TRN subfield and depends on the value of the TRN Subfield Sequence Length field in the EDMG-Header-A of the PPDU. If the TRN Subfield Sequence Length field is 0, *TRN_BL* is equal to 128. If the TRN Subfield Sequence Length field is 1, *TRN_BL* is equal to 256. If the TRN Subfield Sequence Length field is 2, *TRN_BL* is equal to 64.

Moreover, N_{CB} = 1 for a 2.16 GHz or a 2.16+2.16 GHz channel, N_{CB} = 2 for a 4.32 GHz or a 4.32+4.32 GHz channel, N_{CB} = 3 for a 6.48 GHz channel, and N_{CB} = 4 for an 8.64 GHz channel.

An EDMG STA shall support Golay sequences of length 128 and 256 (i.e., *TRN_BL* equal to 128 and N_{CB} equal to 1 or 2). Other lengths are optional and support is indicated in the STA's EDMG Capabilities element.

The pairs of Golay complementary sequences (Gc^i_{64}, Gd^i_{64}), (Ga^i_{128}, Gb^i_{128}), (Ga^i_{192}, Gb^i_{192}), (Ga^i_{256}, Gb^i_{256}), (Ga^i_{384}, Gb^i_{384}), (Ga^i_{512}, Gb^i_{512}), (Ga^i_{768}, Gb^i_{768}), and (Ga^i_{1024}, Gb^i_{1024}) are defined in 28.10 (Golay sequences). These sequences shall be transmitted using π/2-BPSK modulation.

The TRN subfield waveform for the i_{TX}^{th} transmit chain is defined as follows:

$$r_{TRN\_SUBFIELD}^{i_{TX}}\left(q\frac{T_c}{N_{CB}}\right)=\sum_{n=1}^{N_{TRN}^{TX}}\left[P_{TRN}\right]_{i_{TX},n}r_{TRN\_BASIC}^{i_{TX}}\left(q\frac{T_c}{N_{CB}}-\left(n-1\right)\times T_{BASIC}\right)$$

where

P_{TRN} is the TRN mapping matrix

$N_{TRN}^{N_{TX}}$ is the number of SC TRN basic subfields in a TRN subfield for the given total number of transmit chains N_{TX}

$[\ ]_{m,n}$ is a matrix element from m^{th} row and n^{th} column

T_{BASIC} is the duration of the basic TRN subfield

q is a chip time index, $q = 0,1,\ldots,TRN\_BL \times N_{CB} \times 6 \times N_{TRN}^{TX} - 1$

The TRN mapping matrix used in the TRN subfield definition for a 2.16 GHz, 4.32 GHz, 6.48 GHz, and 8.64 GHz PPDU transmission is defined as follows:

— The TRN mapping matrix for N_{TX} = 1, 2 is defined as follows:

$$P_{TRN} = \begin{bmatrix} +1 \\ +1 \end{bmatrix},\ N_{TRN}^{N_{TX}} = 1$$

— The TRN mapping matrix for N_{TX} = 3, 4 is defined as follows:

$$P_{TRN} = \begin{bmatrix} +1 & +1 \\ +1 & +1 \\ +1 & -1 \\ +1 & -1 \end{bmatrix},\ N_{TRN}^{N_{TX}} = 2$$

— The TRN mapping matrix for N_{TX} = 5, 6, 7, and 8 is defined as follows:

$$P_{TRN} = \begin{bmatrix} +1 & +1 & +1 & +1 \\ +1 & +1 & +1 & +1 \\ +1 & -1 & +1 & -1 \\ +1 & -1 & +1 & -1 \\ +1 & +1 & -1 & -1 \\ +1 & +1 & -1 & -1 \\ +1 & -1 & -1 & +1 \\ +1 & -1 & -1 & +1 \end{bmatrix},\ N_{TRN}^{N_{TX}} = 4$$

The TRN mapping matrix used in the TRN subfield definition for a 2.16+2.16 GHz and a 4.32+4.32 GHz PPDU transmission is defined as follows:

— The TRN mapping matrix for N_{TX} = 2, 4 is defined as follows:

$$P_{TRN} = \begin{bmatrix} +1 \\ +1 \\ +1 \\ +1 \end{bmatrix},\ N_{TRN}^{N_{TX}} = 1$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The TRN mapping matrix for N_{TX} = 6, 8 is defined as follows:

$$P_{TRN} = \begin{bmatrix} +1 & +1 \\ +1 & +1 \\ +1 & -1 \\ +1 & -1 \\ +1 & +1 \\ +1 & +1 \\ +1 & -1 \\ +1 & -1 \end{bmatrix}, \; N_{TRN}^{N_{TX}} = 2$$

The TRN field waveform for the i_{TX}^{th} transmit chain in an EDMG control PPDU or EDMG SC PPDU is defined as follows:

$$r_{TRN}^{i_{TX}}\left(q\frac{T_c}{N_{CB}}\right) = \sum_{n=1}^{N_{SUBFIELD}} r_{TRN\_SUBFIELD}^{i_{TX}}\left(q\frac{T_c}{N_{CB}} - (n-1)\times T_{SUBFIELD}\right)$$

where

$r_{TRN\_SUBFIELD}^{i_{TX}}\left(q\frac{T_c}{N_{CB}}\right)$ is the TRN subfield waveform defined in this subclause

$T_{SUBFIELD}$ is the time duration of the TRN subfield

$N_{SUBFIELD}$ is the total number of TRN subfields transmitted in the TRN field

q is a chip time index, $q = 0,1,\ldots, N_{SUBFIELD}\times TRN\_BL\times N_{CB}\times 6\times N_{TRN}^{TX} - 1$

28.9.2.2.7 TRN subfield definition for EDMG OFDM PPDUs

For EDMG PPDU transmissions using the EDMG OFDM mode over a 2.16 GHz or 2.16+2.16 GHz channel, the OFDM *TRN_BASIC* sequence is defined in frequency domain for the i_{TX}^{th} transmit chain as follows:

— $TRN\_BASIC^{iTX}_{-177,\,177} = [Seq^{iTX}_{left,\,176}, 0, 0, 0, Seq^{iTX}_{right,\,176}]$, for i_{TX} =1, 2, 3, 4, 5, 6, 7, 8

For EDMG PPDU transmissions using the EDMG OFDM mode over a 4.32 GHz or 4.32+4.32 GHz channel, the OFDM *TRN_BASIC* sequence is defined in frequency domain for the i_{TX}^{th} transmit chain as follows:

— $TRN\_BASIC^{iTX}_{-386,\,386} = [Seq^{iTX}_{left,\,385}, 0, 0, 0, Seq^{iTX}_{right,\,385}]$, for i_{TX} =1, 2, 3, 4, 5, 6, 7, 8

For EDMG PPDU transmissions using the EDMG OFDM mode over a 6.48 GHz channel, the OFDM *TRN_BASIC* sequence is defined in frequency domain for the i_{TX}^{th} transmit chain as follows:

— $TRN\_BASIC^{iTX}_{-596,\,596} = [Seq^{iTX}_{left,\,595}, 0, 0, 0, Seq^{iTX}_{right,\,595}]$, for i_{TX} =1, 2, 3, 4, 5, 6, 7, 8

For EDMG PPDU transmissions using the EDMG OFDM mode over an 8.64 GHz channel, the OFDM *TRN_BASIC* sequence is defined in frequency domain for the i_{TX}^{th} transmit chain as follows:

— $TRN\_BASIC^{iTX}_{-805,\,805} = [Seq^{iTX}_{left,\,804}, 0, 0, 0, Seq^{iTX}_{right,\,804}]$, for i_{TX} =1, 2, 3, 4, 5, 6, 7, 8

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The basic OFDM TRN subfield waveform for the i_{TX}^{th} transmit chain in time domain shall be defined at the OFDM sampling rate F_s and sample time duration T_s as follows:

$$r_{TRN\_BASIC}^{i_{TX}}\left(qT_s\right)=\sum_{n=1}^{N_{TRN}^{N_{TX}}} r_{TRN}^{n,i_{TX}}\left(qT_s-(n-1)\cdot\left(T_{DFT}+T_{GI\ long}\right)\right)$$

where

$$r_{TRN}^{n,i_{TX}}\left(qT_s\right)=\frac{1}{\sqrt{N_{TRN}^{Tone}}}w\left(qT_s\right)$$

$$\cdot\sum_{k=-N_{SR}}^{N_{SR}}\left[P_{TRN}\right]_{i_{TX},n} TRN\_BASIC_k^{i_{TX}}\exp\left(j2\pi k\Delta_F\left(qT_s-T_{GI\,long}\right)\right),1\le n\le N_{TRN}^{N_{TX}}$$

$N_{TRN}^{Tone}=N_{ST}-N_{DC}$ is the total number of active tones

P_{TRN} is the TRN mapping matrix (see below)

$N_{TRN}^{N_{TX}}$ is the number of OFDM symbols in a TRN subfield for the given total number of transmit chains N_{TX} (see below)

$[\ ]_{m,n}$ is a matrix element from m^{th} row and n^{th} column

$w(qT_s)$ is window function applied to smooth the transitions between consecutive OFDM symbols and its definition is implementation specific

q is a time sample index

The TRN subfield waveform for the i_{TX}^{th} transmit chain is defined as follows:

$$r_{TRN\_SUBFIELD}^{i_{TX}}\left(qT_S\right)=\sum_{n=1}^{N_{SEQ\_LEN}} r_{TRN\_BASIC}^{i_{TX}}\left(qT_s-(n-1)\cdot T_{BASIC}\right)$$

where

$r_{TRN\_BASIC}^{i_{TX}}\left(qT_S\right)$ is the basic TRN subfield waveform for the i_{TX}^{th} transmit chain

T_{BASIC} is the duration of the basic TRN subfield

N_{SEQ_LEN} shall be set to 2 if the value of the TXVECTOR parameter TRN_SEQ_LENGTH of the PPDU is equal to Normal; or to 1 if TRN_SEQ_LENGTH is equal to Short; or to 4 if TRN_SEQ_LENGTH is equal to Long

q is a time sample index

The TRN field transmit waveform for i_{TX}^{th} transmit chain in an EDMG OFDM PPDU is defined as follows:

$$r_{TRN}^{i_{TX}}\left(qT_s\right)=\sum_{n=1}^{N_{SUBFIELD}} r_{TRN\_SUBFIELD}^{i_{TX}}\left(qT_s-(n-1)\times T_{SUBFIELD}\right)$$

where

$r_{TRN\_SUBFIELD}^{i_{TX}}\left(qT_s\right)$ is the TRN subfield waveform defined in this subclause

$T_{SUBFIELD}$ is the time duration of the TRN subfield

$N_{SUBFIELD}$ is the total number of TRN subfields transmitted in the TRN field

q is a sample time index,

$$q=0,1,\ldots,N_{SUBFIELD}\times\left(N_{DFT}+N_{GI\,long}\right)\times N_{TRN}^{N_{TX}}\times N_{SEQ\_LEN}-1$$

Copyright © 2025 IEEE. All rights reserved.

If the Maximum OFDM MCS subfield in a STA's EDMG Capabilities element is greater than 0, the STA shall support 2 repetitions of the basic TRN subfield. Other repetitions are optional and support is indicated in the STA's EDMG Capabilities element.

The OFDM TRN mapping matrix for $N_{TX} = 1$ is defined as follows:

$$P_{TRN} = \begin{bmatrix} +1 & -1 \end{bmatrix},\ N_{TRN}^{N_{TX}} = 2$$

The OFDM TRN mapping matrix for $N_{TX} = 2$ is defined as follows:

$$P_{TRN} = \begin{bmatrix} +1 & -1 \\ +1 & +1 \end{bmatrix},\ N_{TRN}^{N_{TX}} = 2$$

The OFDM TRN mapping matrix for $N_{TX} = 3$ is defined as follows:

$$P_{TRN} = \begin{bmatrix} +1 & -1 & +1 \\ +1 & -w_3^1 & w_3^2 \\ +1 & -w_3^2 & w_3^4 \end{bmatrix},\ w_3 = \exp\left(-j2\pi/3\right),\ N_{TRN}^{N_{TX}} = 3$$

The OFDM TRN mapping matrix for $N_{TX} = 4$ is defined as follows:

$$P_{TRN} = P_{4x4} = \begin{bmatrix} +1 & -1 & +1 & +1 \\ +1 & +1 & -1 & +1 \\ +1 & +1 & +1 & -1 \\ -1 & +1 & +1 & +1 \end{bmatrix},\ N_{TRN}^{N_{TX}} = 4$$

The OFDM TRN mapping matrix for $N_{TX} = 5, 6$ is defined as follows:

$$P_{TRN} = \begin{bmatrix} +1 & -1 & +1 & +1 & +1 & -1 \\ +1 & -w_6^1 & w_6^2 & w_6^3 & w_6^4 & -w_6^5 \\ +1 & -w_6^2 & w_6^4 & w_6^6 & w_6^8 & -w_6^{10} \\ +1 & -w_6^3 & w_6^6 & w_6^9 & w_6^{12} & -w_6^{15} \\ +1 & -w_6^4 & w_6^8 & w_6^{12} & w_6^{16} & -w_6^{20} \\ +1 & -w_6^5 & w_6^{10} & w_6^{15} & w_6^{20} & -w_6^{25} \end{bmatrix},\ w_6 = \exp\left(-j2\pi/6\right),\ N_{TRN}^{N_{TX}} = 6$$

The OFDM TRN mapping matrix for $N_{TX} = 7, 8$ is defined as follows:

$$P_{TRN} = \begin{bmatrix} P_{4x4} & P_{4x4} \\ P_{4x4} & -P_{4x4} \end{bmatrix},\ N_{TRN}^{N_{TX}} = 8$$

For 2.16+2.16 GHz and 4.32+4.32 GHz PPDU transmission, the OFDM TRN mapping matrix for each channel is determined by the number of transmit chains per channel, which is half of the total number of transmit chains.

If the number of transmit chains per channel is 1 (N_{TX} = 2), the OFDM TRN mapping matrix for each channel is defined as follows:

$$P_{TRN} = \begin{bmatrix} +1 & -1 \end{bmatrix},\ N_{TRN}^{N_{TX}} = 2$$

If the number of transmit chains per channel is 2 (N_{TX} = 4), the OFDM TRN mapping matrix for each channel is defined as follows:

$$P_{TRN} = \begin{bmatrix} +1 & -1 \\ +1 & +1 \end{bmatrix},\ N_{TRN}^{N_{TX}} = 2$$

If the number of transmit chains per channel is 3 (N_{TX} = 6), the OFDM TRN mapping matrix for each channel is defined as follows:

$$P_{TRN} = \begin{bmatrix} +1 & -1 & +1 \\ +1 & -w_3^1 & w_3^2 \\ +1 & -w_3^2 & w_3^4 \end{bmatrix},\ w_3 = \exp\left(-j2\pi/3\right),\ N_{TRN}^{N_{TX}} = 3$$

If the number of transmit chains per channel is 4 (N_{TX} = 8), the OFDM TRN mapping matrix for each channel is defined as follows:

$$P_{TRN} = P_{4x4} = \begin{bmatrix} +1 & -1 & +1 & +1 \\ +1 & +1 & -1 & +1 \\ +1 & +1 & +1 & -1 \\ -1 & +1 & +1 & +1 \end{bmatrix},\ N_{TRN}^{N_{TX}} = 4$$

$TRN\_BASIC^{i_{TX}}$ for the first $N_{TX}/2$ transmit chains shall be correspond to the transmit chain number i_{TX} = 1, …, $N_{TX}/2$ and $TRN\_BASIC^{i_{TX}}$ for the second $N_{TX}/2$ transmit chains shall be correspond to the transmit chain number $i_{TX} = N_{TX}/2 + 1, \ldots, N_{TX}$.

28.9.2.2.8 Channel measurement

The autocorrelation properties of the Golay sequence used in the TRN field allow for the estimation of the impulse response of the channel between transmitter and receiver. When the channel measurement is performed using an EDMG BRP-TX PPDU, the receiver should determine the channel tap with largest magnitude using the first *P* TRN subfields of the first TRN-Unit of the PPDU, where *P* is the number of TRN subfields indicated in the EDMG TRN-Unit P field within the EDMG-Header-A of the PPDU. The receiver then selects the set of taps that is measured around the tap with the largest magnitude, according to dot11ChanMeasFBCKNtaps. It can select a contiguous set of taps or select a noncontiguous set of taps, and include the delays of the selected taps in the Tap Delay field of the Channel Measurement Feedback element. The receiver then measures the amplitude of the corresponding channel taps in each of the last *M* TRN subfields of all TRN-Units in the PPDU if *N* is equal to 0, where *M* and *N* are the number of TRN subfields indicated in the EDMG TRN-Unit M field and in the EDMG TRN-Unit N field within the EDMG-Header-A of the PPDU, respectively. If *N* is greater than 0, one set of amplitudes are obtained for each group of *N* consecutive TRN subfields that have the same AWV feedback ID, as defined in 28.9.2.2.5 (TRN field definition). The in-phase and quadrature components of the selected taps measured using the k^{th} TRN subfield (if *N* is equal to 0) or k^{th} group of *N* consecutive TRN subfields that have the same AWV feedback ID (if *N* is greater than 0) included in the Channel Measurement *k* subfield of the Channel Measurement field within the Channel Measurement Feedback element. As defined in 9.4.2.135, the in-phase and quadrature values in the Channel Measurement field are normalized with respect to the tap with largest magnitude over all measurements made using the TRN field of the EDMG BRP-TX PPDU.

28.9.3 EDMG secure ranging PPDU

28.9.3.1 General

EDMG secure ranging PPDUs are used for secure RTT measurement. The EDMG secure ranging PPDU is defined for single space-time stream ($i_{STS} = 1$) PPDUs only.

28.9.3.2 EDMG secure ranging PPDU structure

An EDMG secure ranging PPDU shall be composed of a non-EDMG portion containing an L-STF, an L-CEF, and L-Header, and of an EDMG portion containing an EDMG-Header-A, a Data field, and a TRN field that contains Secure TRN subfields only. An EDMG secure ranging PPDU may include an EDMG-STF and an EDMG-CEF.

If beam refinement has been performed on a 4.32 GHz, 6.48 GHz, or 8.64 GHz channel, the Secure TRN subfields in the TRN field of EDMG secure ranging PPDUs shall be transmitted over the entire signal bandwidth of the channel.

28.9.3.3 EDMG secure ranging PPDU header fields

An EDMG secure ranging PPDU is indicated by setting the Secure TRN field to 1 in EDMG-Header A.

28.9.3.4 EDMG secure ranging PPDU duration

The duration of an EDMG secure ranging PPDU follows the same calculation procedure as an EDMG SU PPDU with TRN field appended as described in 28.9.2.2.4. Each Secure TRN subfield is of the same duration as each TRN subfield as described in 28.9.3.6.

28.9.3.5 TRN field definition with Secure TRN subfields

The Secure TRN subfields enable secure ranging measurements by an EDMG STA.

28.9.3.5.1 TRN field structure with Secure TRN subfields

The TRN field structure containing the Secure TRN subfields in EDMG secure ranging PPDU is shown in Figure 28-45 (TRN field structure of EDMG BRP-TX PPDUs). The header fields related to TRN should be set according to the Table 28-75.

Table 28-75—EDMG-A header fields setting for secure DMG TRNs

Header field	Value
PPDU Type	1
EDMG Beam Tracking Request	0
EDMG TRN Length	1
RX TRN-Units per Each TX TRN-Unit	0
EDMG TRN-Unit P	0
EDMG TRN-Unit M	3
EDMG TRN-Unit N	3

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 28-75—EDMG-A header fields setting for secure DMG TRNs

Header field	Value
TRN Subfield Sequence Length	0

EDMG secure ranging PPDUs are EDMG BRP-TX PPDUs. In such PPDUs, all TRN subfields of all TRN-Units shall be transmitted using the same AWV as the preamble and data field of the PPDU. The EDMG TRN-Unit M field in the EDMG-A header shall be set to 3 so that each TRN-Unit shall have 4 secure TRN subfields that contain Secure TRN sequences.

28.9.3.6 Secure TRN subfield definition for EDMG secure ranging PPDU

An EDMG secure ranging PPDU transmission over a 2.16 GHz, 4.32 GHz, 6.48 GHz, and 8.64 GHz channel is defined at the NCB × 1.76 GHz chip rate. The symbol blocking structure for the normal GI is as shown in Figure 28-48 (DMG secure ranging TRN subfield structure over 2.16 GHz, 4.32 GHz, 6.48 GHz, and 8.64 GHz channel). An EDMG STA that supports secure TRN shall support the TRN field structure with normal GI as shown in Figure 28-48 (DMG secure ranging TRN subfield structure over 2.16 GHz, 4.32 GHz, 6.48 GHz, and 8.64 GHz channel).

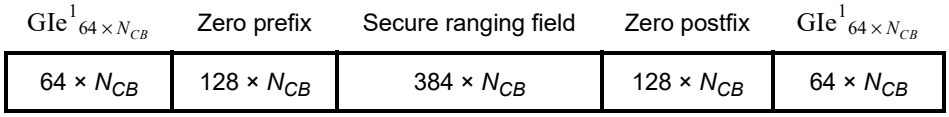

Figure 28-48—DMG secure ranging TRN subfield structure over 2.16 GHz, 4.32 GHz, 6.48 GHz, and 8.64 GHz channel

An EDMG secure ranging PPDU shall have a single spatial stream (i_{STS} = 1) mapped to a single transmit chain (i_{TX} = 1) as defined in 28.5.10.2. The single transmit chain is chosen by the first path beamforming training procedure in 10.41.10.6. All fields of EDMG secure ranging PPDU shall be transmitted with the same single transmit chain and AWV chosen by the first path beamforming training procedure.

As shown in Figure 28-48 (DMG secure ranging TRN subfield structure over 2.16 GHz, 4.32 GHz, 6.48 GHz, and 8.64 GHz channel), each secure TRN subfield shall consist of five consecutive segments:

1) GI: The $\text{GIe}^{1}_{64 \times N_{CB}}$ as defined in 28.5.9.1.
2) Zero prefix: A prefix of 128 × N_{CB} zero channel symbols.
3) Secure Ranging field: A secure ranging waveform composed of 384 × N_{CB} π/2-BPSK modulated channel symbols. The modulated symbols are based on bit sequences of length 384 × N_{CB} which are taken from the binary pseudorandom sequence SECURE_TRN_SEQUENCE in the TXVECTOR parameters as defined in Table 28-1. Each group of 384 × N_{CB} bits is taken consecutively without overlap from the sequence. The constellation mapper maps the sequence of bits to constellation points; see 20.5.3.2.4.2.
4) Zero postfix: A postfix of 128 × N_{CB} zero channel symbols.
5) GI: The $\text{GIe}^{1}_{64 \times N_{CB}}$ as defined in 28.5.9.1.

The overall length of each Secure TRN subfield is the same as each TRN subfield defined in 28.9.2.2.6.

28.9.3.7 Transmission of an EDMG secure ranging PPDU

Transmission of an EDMG secure ranging PPDU follows the same procedure as EDMG SU PPDU transmission in 28.5.10.4 with the TRN field containing secure TRN sequences.

28.10 Golay sequences

28.10.1 General

The EDMG PHY uses the pairs of complementary sequences defined in 20.11 (DMG PLME) and defines new sequences. The use of each sequence depends on the transmitted channel bandwidth, number of transmitted space-time streams or transmit chains and the field of the PPDU.

28.10.2 Sequences of length 32, 64, 128, 256, 512, and 1024

Golay sequences of length 32, 64, 128, 256, 512, and 1024 are generated using the procedure and notation specified in 20.11 (DMG PLME). The i^{th} index defines the space-time stream or the transmit chain number.

The value of the D_K vector for each of the EDMG sequences are as follows:

— For Gc^i_{32} and Gd^i_{32}: D_K = [2 1 4 8 16]
— For Ga^i_{64} and Gb^i_{64}: D_K = [2 1 4 8 16 32]
— For Gc^i_{64} and Gd^i_{64}: D_K = [1 8 2 4 16 32]
— For Ga^i_{128} and Gb^i_{128}: D_K = [1 8 2 4 16 32 64]
— For Gc^i_{128} and Gd^i_{128}: D_K = [2 1 4 8 16 32 64]
— For Ga^i_{256} and Gb^i_{256}: D_K = [1 8 2 4 16 32 64 128]
— For Ga^i_{512} and Gb^i_{512}: D_K = [1 8 2 4 16 32 64 128 256]
— For Ga^i_{1024} and Gb^i_{1024}: D_K = [1 8 2 4 16 32 64 128 256 512]

NOTE 1—The sequences Gc^i_{32}, Gd^i_{32}, Gc^i_{64}, Gd^i_{64}, Gc^i_{128}, Gd^i_{128} are different from the corresponding Ga^i_{32}, Gb^i_{32}, Ga^i_{64}, Gb^i_{64}, Ga^i_{128}, Gb^i_{128} sequences defined in 20.11 for the DMG PHY.

NOTE 2—For i = 1, the sequences Ga^i_{64} and Gb^i_{64} are equal to the corresponding Ga_{64} and Gb_{64} sequences defined in 20.11 (DMG PLME) for the DMG PHY. Similarly, for i = 1, the sequences Ga^i_{128} and Gb^i_{128} are equal to the corresponding Ga_{128} and Gb_{128} sequences defined in 20.11 (DMG PLME) for the DMG PHY.

As opposed to the D_K vector, the value of the W_K vector depends on the space-time stream number or transmit chain number used to define the Golay pair (Ga^i_N, Gb^i_N). Table 28-76 shows the value of the W_K vector defined for each space-time stream or transmit chain and sequence lengths of 32, 64, and 128. Table 28-77 shows the value of the W_K vector defined for each space-time stream or transmit chain and sequence lengths of 256, 512, and 1024.

28.10.3 Sequences of length 96, 192, 384, and 768

The Golay sequences of length 96, 192, 384, and 768 use a quadri-phase complex Golay complementary pair and are generated using the following recursive procedure, where i is the index of the space-time stream or transmit chain number:

- $Ga_3 = [+1, +1, -1]$
- $Gb_3 = [+1, +j, +1]$
- If (i = 1, 3, 5, or 7), then $(A^{i}_{0}(n), B^{i}_{0}(n)) = (+Ga_3(2 - n), +Gb_3(2 - n))$. Otherwise, if ($i$ = 2, 4, 6, or 8), then $(A^{i}_{0}(n), B^{i}_{0}(n)) = (+\text{conj}(Gb_3(n)), -\text{conj}(Ga_3(n)))$
- $A^{i}_{k}(n) = W^{i}_{k}A^{i}_{k-1}(n) + B^{i}_{k-1}(n - D_k)$
- $B^{i}_{k}(n) = W^{i}_{k}A^{i}_{k-1}(n) - B^{i}_{k-1}(n - D_k)$

In the paragraph above, $A^{i}_{k}(n)$ and $B^{i}_{k}(n)$ are zero for $n < 0$ and for $n > 3 \times 2k$.

Starting with $k = 1$ and making 5, 6, 7, and 8 iterations, corresponding sequences of length 96, 192, 384, and 768 are obtained.

The Golay sequences are defined as follows, where i is the space-time stream or transmit chain number and $1 \le i \le 8$:

- $Ga^{i}_{96}(n) = \text{conj}(A^{i}_{5}(95 - n))$ and $Gb^{i}_{96} = \text{conj}(B^{i}_{5}(95 - n))$
- $Ga^{i}_{192}(n) = \text{conj}(A^{i}_{6}(191 - n))$ and $Gb^{i}_{192} = \text{conj}(B^{i}_{6}(191 - n))$

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— $Ga^i_{384}(n) = \text{conj}(A^i_7(383 - n))$ and $Gb^i_{384} = \text{conj}(B^i_7(383 - n))$
— $Ga^i_{768}(n) = \text{conj}(A^i_8(767 - n))$ and $Gb^i_{768} = \text{conj}(B^i_8(767 - n))$

The value of the D_K vector for each of the sequences are defined as follows, where i is the space-time stream or transmit chain number and $1 \leq i \leq 8$:

— For Ga^i_{96} and Gb^i_{96}: D_K = [3 24 6 12 48].
— For Ga^i_{192} and Gb^i_{192}: D_K = [3 24 6 12 48 96].
— For Ga^i_{384} and Gb^i_{384}: D_K = [3 24 6 12 48 96 192].
— For Ga^i_{768} and Ga^i_{768}: D_K = [3 24 6 12 48 96 192 384].

As opposed to the D_K vector, the value of the W^i_k vector depends on the space-time stream or transmit chain number used to define the Golay pair (Ga^i_{96}, Gb^i_{96}), (Ga^i_{192}, Gb^i_{192}), (Ga^i_{384}, Gb^i_{384}), and (Ga^i_{768}, Ga^i_{768}). Table 28-94 shows the value of the W^i_k vector defined for each space-time stream or transmit chain.

Table 28-94—W^i_K vector value to generate Golay sequences of length 96, 192, 384, and 768

Space-time stream/ transmit chain number (i)	W^i_K for Ga^i_{96} and Gb^i_{96}	W^i_K for Ga^i_{192} and Gb^i_{192}	W^i_K for Ga^i_{384} and Gb^i_{384}	W^i_K for Ga^i_{768} and Ga^i_{768}
1	[–1,–1,–1,–1,+1]	[–1,–1,–1,–1,+1,+1]	[–1,–1,–1,–1,+1,–1, –1]	[–1,–1,–1,–1,+1,–1, –1,+1]

8				

The sequence $Ga_{96}(n) = \text{conj}(A_5(95 - n))$ and the sequence $Gb_{96}(n) = \text{conj}(B_5(95 - n))$, $n = 0, 1, \ldots, 95$.

The sequence $Ga_{192}(n) = \text{conj}(A_6(191 - n))$ and the sequence $Gb_{192}(n) = \text{conj}(B_6(191 - n))$, $n = 0, 1, \ldots, 191$.

The sequence $Ga_{384}(n) = \text{conj}(A_7(383 - n))$ and the sequence $Gb_{384}(n) = \text{conj}(B_7(383 - n))$, $n = 0, 1, \ldots, 383$.

The sequence $Ga_{768}(n) = \text{conj}(A_8(767 - n))$ and the sequence $Gb_{768}(n) = \text{conj}(B_8(767 - n))$, $n = 0, 1, \ldots, 767$.

The sequences are defined from Table 28-95 through Table 28-102. The sequences in the tables are normative; the description above is informative.

28.12 EDMG PLME

28.12.1 PLME SAP sublayer management primitives

Table 28-119 lists the MIB attributes that may be accessed by the PHY entities and the intra-layer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.7.

Table 28-119—EDMG PHY MIB attribute default values

Managed object	Default range/value	Operational semantics
dot11PHYOperationTable		
dot11PHYType	EDMG	Static
dot11PHYEDMGTable		

28.12.2 PHY MIB

All EDMG PHY MIB attributes are defined in Annex C, with specific values defined in Table 28-119. The Operational semantics column in Table 28-119 contains two types: static and dynamic. Static MIB attributes are fixed and cannot be modified for a given PHY implementation. Dynamic MIB attributes can be modified by some management entity.

28.12.3 TXTIME calculation

28.12.3.1 General

This subclause defines the TXTIME parameter calculation for EDMG control, SC, and OFDM modes of an EDMG STA PHY entity. The TXTIME parameter is returned from the PHY to the MAC entity using the PLME-TXTIME.confirm primitive issued in response to a PLME-TXTIME.request(TXVECTOR) primitive. The TXTIME represents the time, in microseconds, required to transmit PPDU configured using the indicated TXVECTOR parameters.

28.12.3.2 TXTIME calculation for EDMG control mode

If the FORMAT parameter of TXVECTOR is EDMG, then the modulation is defined by the EDMG_MODULATION parameter. If the EDMG_MODULATION parameter is to EDMG_C_MODE, the TXTIME parameter shall be defined in microseconds as follows:

$$TXTIME\left(\mu s\right) = T_{L\text{-}STF} + T_{L\text{-}CEF} + T_{L\text{-}Header+EDMG\text{-}Header\text{-}A+Data} + T_{TRN}$$

where

$T_{L\text{-}STF} = 6400 \times \text{aDMGChipTimeDuration} \approx 3.63\ \mu s$

$T_{L\text{-}CEF} = 1152 \times \text{aDMGChipTimeDuration} \approx 0.65\ \mu s$

$$T_{L\text{-}Header+EDMG\text{-}Header\text{-}A+Data} = \left(\left(Length + L_{L\text{-}Header} + L_{EDMG\text{-}Header\text{-}A}\right) \times 8 + 168 \times N_{CW}\right) \times 32 \times \text{aDMGChipTimeDuration}\ \mu s$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$N_{CW} = 1 + \left\lceil \frac{\left(Length + L_{EDMG-Header-A2}\right) \times 8}{168} \right\rceil$$

$L_{L-Header}$ = 5 octets

$L_{EDMG-Header-A}$ = 9 octets

$L_{EDMG-Header-A2}$ = 3 octets

The parameter Length (EDMG_LENGTH in TXVECTOR) indicates the number of data octets in the PSDU and ranges from 14 to 1023.

If the CH_BANDWIDTH parameter has a single bit set to 1, the number of space-time streams NUM_STS is equal to 1, and DMG-TRN parameter is equal to 1, then the TRN field duration is defined as follows:

$$T_{TRN} = \left(4992 \times EDMG\_TRN\_LEN\right) \times \text{aDMGChipTimeDuration}\,\mu\text{s}$$

The EDMG_TRN_LEN parameter indicates the length of the training field in the range 0 to 31.

For other values of the CH_BANDWIDTH parameter, the TRN field duration is defined as follows:

$$T_{TRN} = \Big(L_T + \left(L_{TRN\text{-}Unit\text{-}P} + L_{TRN\text{-}Unit\text{-}M} \right) \times TRN\_BASIC\_LENGTH \times EDMG\_TRN\_LEN + L_{TRN\text{-}Unit\text{-}P} \times TRN\_BASIC\_LENGTH \Big) \times \text{aDMGChipTimeDuration}\,\mu\text{s}$$

where

$TRN\_BASIC\_LENGTH = 6 \times TRN\_BL \times N_{TRN}^{N_{TX}}$

If EDMG_TRN_LEN > 0, EDMG-TRN-T or EDMG-TRN-R/T, then $L_T = 6 \times 256 \times N_{TRN}^{N_{TX}}$, $L_{TRN\text{-}Unit\text{-}P}$ = 0, 1, 2, or 4, and $L_{TRN\text{-}Unit\text{-}M}$ = 1, 2, ..., or 16

If EDMG_TRN_LEN > 0, EDMG-TRN-R, then L_T = 0, $L_{TRN\text{-}Unit\text{-}P}$ = 0, and $L_{TRN\text{-}Unit\text{-}M}$ = 10

If EDMG_TRN_LEN = 0, then L_T = 0, $L_{TRN\text{-}Unit\text{-}P}$ = 0, and $L_{TRN\text{-}Unit\text{-}M}$ = 0

If the TRN_SEQ_LENGTH parameter is equal to NORMAL, then *TRN_BL* is set to 128. If the TRN_SEQ_LENGTH parameter is equal to LONG, then *TRN_BL* is set to 256. If the TRN_SEQ_LENGTH parameter is equal to SHORT, then *TRN_BL* is set to 64.

If the CHANNEL_AGGREGATION parameter is equal to AGGREGATED and the NUM_TX_CHAINS parameter is equal to 2 or 4, then $N_{TRN}^{N_{TX}}$ is set to 1. If the CHANNEL_AGGREGATION parameter is equal to AGGREGATED and the NUM_TX_CHAINS parameter is equal to 6 or 8, then $N_{TRN}^{N_{TX}}$ is set to 2.

If the CHANNEL_AGGREGATION parameter is equal to NOT_AGGREGATED and the NUM_TX_CHAINS parameter is equal to 1 or 2, then $N_{TRN}^{N_{TX}}$ is set to 1. If the CHANNEL_AGGREGATION parameter is equal to NOT_AGGREGATED and the NUM_TX_CHAINS parameter is equal to 3 or 4, then $N_{TRN}^{N_{TX}}$ is set to 2. If the CHANNEL_AGGREGATION parameter is equal to NOT_AGGREGATED and the NUM_TX_CHAINS parameter is equal to 5, 6, 7, or 8, then $N_{TRN}^{N_{TX}}$ is set to 4.

If the EDMG_TRN_LEN parameter is greater than 0 and the EDMG_PPDU_TYPE parameter is equal to EDMG-TRN-T or EDMG-TRN-R/T, then $L_T = 6 \times 256 \times N_{TRN}^{N_{TX}}$, $L_{TRN\text{-}Unit\text{-}P}$ = 0, 1, 2, or 4, and $L_{TRN\text{-}Unit\text{-}M}$ = 1, 2, ..., or 16.

If the EDMG_TRN_LEN parameter is greater than 0 and the EDMG_PPDU_TYPE parameter is equal to EDMG-TRN-R, then L_T = 0, $L_{TRN\text{-}Unit\text{-}P}$ = 0, and $L_{TRN\text{-}Unit\text{-}M}$ = 10.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the EDMG_TRN_LEN parameter is equal to 0, then $L_T = 0$, $L_{TRN\text{-}Unit\text{-}P} = 0$, and $L_{TRN\text{-}Unit\text{-}M} = 0$.

The EDMG_TRN_LEN parameter indicates the length of the training field in the range 0 to 255.

28.12.3.3 TXTIME calculation for EDMG SC mode

If the EDMG_MODULATION parameter is set to EDMG_SC_MODE, the TXTIME parameter shall be defined in microseconds as follows:

$$TXTIME(\mu s) = T_{L\text{-}STF} + T_{L\text{-}CEF} + T_{L\text{-}Header} + T_{EDMG\text{-}Header\text{-}A} + T_{EDMG\text{-}STF} + T_{EDMG\text{-}CEF} + T_{EDMG\text{-}Header\text{-}B} + T_{Data} + T_{TRN}$$

where

$T_{L\text{-}STF} = 2176 \times \text{aDMGChipTimeDuration} \approx 1.24\ \mu s$

$T_{L\text{-}CEF} = 1152 \times \text{aDMGChipTimeDuration} \approx 0.65\ \mu s$

$T_{L\text{-}Header} = 1024 \times \text{aDMGChipTimeDuration} \approx 0.58\ \mu s$

If EDMG_ADD_PPDU = NO-ADD-PPDU, NUM_USERS = 1, CH_BANDWIDTH has a single bit set to 1, and NUM_STS = 1, then $T_{EDMG\text{-}Header\text{-}A} = 1024 \times \text{aDMGChipTimeDuration} \approx 0.58\ \mu s$

If EDMG_ADD_PPDU = NO-ADD-PPDU, NUM_USERS ≥ 1, CH_BANDWIDTH has more than 1 bit set to 1 and/or NUM_STS ≠ 1, then $T_{EDMG\text{-}Header\text{-}A} = 1088 \times \text{aDMGChipTimeDuration} \approx 0.62\ \mu s$

If EDMG_ADD_PPDU = ADD-PPDU, i_{PPDU} = 1, CH_BANDWIDTH has a single bit set to 1, and NUM_STS = 1, then $T_{EDMG\text{-}Header\text{-}A} = 1024 \times \text{aDMGChipTimeDuration} \approx 0.58\ \mu s$

If EDMG_ADD_PPDU = ADD-PPDU, i_{PPDU} = 1, CH_BANDWIDTH has more than 1 bit set to 1 and/or NUM_STS ≠ 1, then $T_{EDMG\text{-}Header\text{-}A} = 1088 \times \text{aDMGChipTimeDuration} \approx 0.62\ \mu s$

If EDMG_ADD_PPDU = ADD-PPDU, $i_{PPDU} > 1$, then $T_{EDMG\text{-}Header\text{-}A} = 1024 \times \text{aDMGChipTimeDuration} \approx 0.58\ \mu s$

If NUM_USERS = 1, CH_BANDWIDTH has a single bit set to 1, and NUM_STS = 1, then $T_{EDMG\text{-}STF}$ = 0 and $T_{EDMG\text{-}CEF} = 0$

If NUM_USERS ≥ 1, CH_BANDWIDTH has more than 1 bit set to 1 and/or NUM_STS ≠ 1, then $T_{EDMG\text{-}STF} = 2432 \times \text{aDMGChipTimeDuration} \approx 1.38\ \mu s$ and $T_{EDMG-CEF} = \left(1152 + 1280 \times \left(N_{EDMG-CEF}^{N_{STS}} - 1\right)\right) / \left(1.76 \times 10^3\right)$

If NUM_USERS = 1, then $T_{EDMG\text{-}Header\text{-}B} = 0$

If NUM_USERS > 1, then $T_{EDMG\text{-}Header\text{-}B} = 512 \times \text{aDMGChipTimeDuration} \approx 0.29\ \mu s$

$T_{Data} = \left(N_{BLKS} \times 512 + N_{GI}\right) \times \text{aDMGChipTimeDuration}\ \mu s$

If the NUM_USERS parameter is equal to 1, the CH_BANDWIDTH parameter has a single bit set to 1, and the NUM_STS parameter is equal to 1, then the EDMG-STF and EDMG-CEF fields are not transmitted and $T_{EDMG\text{-}STF} = 0$ and $T_{EDMG\text{-}CEF} = 0$.

If the NUM_USERS parameter is greater than or equal to 1 and the CH_BANDWIDTH parameter has more than 1 bit set to 1 and/or the NUM_STS parameter is not equal to 1, then the EDMG-STF and EDMG-CEF fields are transmitted with a time duration specified above.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the NUM_USERS parameter is equal to 1, then the EDMG-Header-B is not transmitted and TEDMG-Header-B = 0. If the NUM_USERS is equal to a value greater than 1, then the EDMG-Header-B is transmitted with a time duration specified above.

If the NUM_STS parameter is equal to 1 or 2, then the $N_{EDMG-CEF}^{N_{STS}}$ parameter is set to 1. If the NUM_STS parameter is equal to 3 or 4, then the $N_{EDMG-CEF}^{N_{STS}}$ parameter is set to 2. If the NUM_STS parameter is equal to 5, 6, 7, or 8, then the $N_{EDMG-CEF}^{N_{STS}}$ parameter is set to 4.

The number of SC symbol blocks, N_{BLKS}, depends on the EDMG_LENGTH, MCS and other parameters in the TXVECTOR and shall be as defined in 28.5.9.4 (Encoding).

If the EDMG_ADD_PPDU parameter is equal to NO-ADD-PPDU, the NUM_USERS parameter is equal to 1, the CH_BANDWIDTH parameter has a single bit set to 1, and the NUM_STS is equal to 1, then

— If the GI_TYPE parameter is equal to SHORT, $N_{GI} = 64$.
— If the GI_TYPE is equal to NORMAL, $N_{GI} = 64$.
— If the GI_TYPE is equal to LONG, $N_{GI} = 128$.

If the EDMG_ADD_PPDU parameter is equal to NO-ADD-PPDU, the NUM_USERS parameter is equal to 1, the CH_BANDWIDTH parameter has more than 1 bit set to 1 and/or the NUM_STS parameter is not equal to 1, then

— If the GI_TYPE parameter is equal to SHORT, $N_{GI} = 32$.
— If the GI_TYPE is equal to NORMAL, $N_{GI} = 64$.
— If the GI_TYPE is equal to LONG, $N_{GI} = 128$.

If the EDMG_ADD_PPDU parameter is equal to NO-ADD-PPDU and the NUM_USERS parameter is greater than 1, then

— If the GI_TYPE parameter is equal to SHORT, $N_{GI} = 64$.
— If the GI_TYPE is equal to NORMAL, $N_{GI} = 64$.
— If the GI_TYPE is equal to LONG, $N_{GI} = 128$.

If the EDMG_ADD_PPDU parameter is equal to ADD-PPDU, i_{PPDU} is equal to 1, the CH_BANDWIDTH parameter has a single bit set to 1, and the NUM_STS is equal to 1, then

— If the GI_TYPE parameter is equal to SHORT, $N_{GI} = 64$.
— If the GI_TYPE is equal to NORMAL, $N_{GI} = 64$.
— If the GI_TYPE is equal to LONG, $N_{GI} = 128$.

If the EDMG_ADD_PPDU parameter is equal to ADD-PPDU, i_{PPDU} is equal to 1, the CH_BANDWIDTH parameter has more than 1 bit set to 1 and/or the NUM_STS parameter is not equal to 1, then

— If the GI_TYPE parameter is equal to SHORT, $N_{GI} = 32$.
— If the GI_TYPE is equal to NORMAL, $N_{GI} = 64$.
— If the GI_TYPE is equal to LONG, $N_{GI} = 128$.

If the EDMG_ADD_PPDU parameter is equal to ADD-PPDU and i_{PPDU} is greater than 1, then

— If the GI_TYPE parameter is equal to SHORT, $N_{GI} = 64$.
— If the GI_TYPE is equal to NORMAL, $N_{GI} = 64$.
— If the GI_TYPE is equal to LONG, $N_{GI} = 128$.

The TRN field duration shall be as defined in 28.12.3.2 (TXTIME calculation for EDMG control mode).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the L_BEAM_TRACKING_REQUEST parameter is equal to BEAM-TRACKING-NOT-REQUESTED, the L_PPDU_TYPE parameter is equal to TRN-R, the EDMG_BEAM_TRACKING_REQUEST parameter is equal to Beam_Tracking_Requested, the EDMG_PPDU_TYPE parameter is equal to EDMG-TRN-R, and the EDMG_TRN_LEN parameter is greater than 0, then $L_T = 0$, $L_{TRN\text{-}Unit\text{-}P} = 0$, and $L_{TRN\text{-}Unit\text{-}M} = 0$.

If the EDMG_ADD_PPDU parameter is equal to ADD-PPDU, then the TXTIME parameter shall be updated every time a PLME-TXTIME.request(TXVECTOR) primitive is received for each consecutive PPDU. The TXTIME shall be increased by the duration of ($T_{EDMG\text{-}Header\text{-}A} + T_{Data}$) every time the PHY entity receives a new PPDU transmitted as a part of the A-PPDU.

If present in an A-PPDU, the TRN field shall be appended only once at the last PPDU of the A-PPDU.

28.12.3.4 TXTIME calculation for EDMG OFDM mode

If the EDMG_MODULATION parameter is equal to EDMG_OFDM_MODE, the TXTIME parameter shall be defined in microseconds as follows:

$$TXTIME(\mu s) = T_{L\text{-}STF} + T_{L\text{-}CEF} + T_{L\text{-}Header} + T_{EDMG\text{-}Header\text{-}A} + T_{EDMG\text{-}STF} + T_{EDMG\text{-}CEF} + T_{EDMG\text{-}Header\text{-}B} + T_{Data} + T_{TRN}$$

where

$T_{L\text{-}STF} = 2176 \times \text{aDMGChipTimeDuration} \approx 1.24\ \mu s$

$T_{L\text{-}CEF} = 1152 \times \text{aDMGChipTimeDuration} \approx 0.65\ \mu s$

$T_{L\text{-}Header} = 1024 \times \text{aDMGChipTimeDuration} \approx 0.58\ \mu s$

If EDMG_ADD_PPDU is equal to NO-ADD-PPDU, then $T_{EDMG\text{-}Header\text{-}A} = 1088 \times \text{aDMGChipTimeDuration} \approx 0.62\ \mu s$

If EDMG_ADD_PPDU is equal to ADD-PPDU and i_{PPDU} = 1, then $T_{EDMG\text{-}Header\text{-}A} = 1088 \times \text{aDMGChipTimeDuration} \approx 0.62\ \mu s$

$T_{EDMG\text{-}CEF} = \left(704 \times N_{EDMG\text{-}CEF}^{N_{STS}}\right) \times \text{aDMGSampleTimeDuration}\ \mu s$

If NUM_USERS = 1, then $T_{EDMG\text{-}Header\text{-}B} = 0$

If NUM_USERS > 1, then $T_{EDMG\text{-}Header\text{-}B} = \left(512 + N_{GI}\right) \times \text{aDMGSampleTimeDuration}\ \mu s$

$T_{Data} = \left(N_{SYMS} \times (512 + N_{GI})\right) \times \text{aDMGSampleTimeDuration}\ \mu s$

$$T_{TRN} = \Big(L_T + \left(L_{TRN\text{-}Unit\text{-}P} + L_{TRN\text{-}Unit\text{-}M}\right) \times TRN\_BASIC\_LENGTH \times EDMG\_TRN\_LEN + L_{TRN\text{-}Unit\text{-}P} \times TRN\_BASIC\_LENGTH\Big) \times \text{aDMGSampleTimeDuration}\ \mu s$$

$TRN\_BASIC\_LENGTH = TRN\_BL \times N_{TRN}^{N_{TX}}$

If EDMG_TRN_LEN > 0, EDMG-TRN-T or EDMG-TRN-R/T, then $L_T = 4 \times 704 \times N_{TRN}^{N_{TX}}$, $L_{TRN\text{-}Unit\text{-}P}$ = 0, 1, 2, or 4, and $L_{TRN\text{-}Unit\text{-}M}$ = 1, 2, ..., or 16

If EDMG_TRN_LEN > 0 and EDMG-TRN-R, then $L_T = 0$, $L_{TRN\text{-}Unit\text{-}P} = 0$, and $L_{TRN\text{-}Unit\text{-}M} = 10$

If EDMG_TRN_LEN = 0, then $L_T = 0$, $L_{TRN\text{-}Unit\text{-}P} = 0$, and $L_{TRN\text{-}Unit\text{-}M} = 0$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the NUM_STS parameter is equal to 1 or 2, then the $N_{EDMG\text{-}CEF}^{N_{STS}}$ parameter is set to 2. If the NUM_STS parameter is equal to 3, then the $N_{EDMG\text{-}CEF}^{N_{STS}}$ parameter is set to 3. If the NUM_STS parameter is equal to 4, then the $N_{EDMG\text{-}CEF}^{N_{STS}}$ parameter is set to 4. If the NUM_STS parameter is equal to 5 or 6, then the $N_{EDMG\text{-}CEF}^{N_{STS}}$ parameter is set to 6. If the NUM_STS parameter is equal to 7 or 8, then the $N_{EDMG\text{-}CEF}^{N_{STS}}$ parameter is set to 8.

If the NUM_USERS parameter is equal to 1, then the EDMG-Header-B is not transmitted and $T_{EDMG\text{-}Header\text{-}B} = 0$. If the NUM_USERS parameter is equal to a value greater than 1, then the EDMG-Header-B is transmitted with time a duration specified above.

If the GI_TYPE parameter is equal to SHORT, $N_{GI} = 48$. If the GI_TYPE parameter is equal to NORMAL, $N_{GI} = 96$. If the GI_TYPE parameter is equal to LONG, $N_{GI} = 192$.

The number of OFDM symbols, N_{SYMS}, depends on the EDMG_LENGTH, MCS and other parameters in the TXVECTOR and shall be as defined in 28.6.9.2 (Encoding).

If the TRN_SEQ_LENGTH parameter is equal to NORMAL, then *TRN_BL* is set to 2×704. If the TRN_SEQ_LENGTH parameter is equal to LONG, then *TRN_BL* is set to 4×704. If the TRN_SEQ_LENGTH parameter is equal to SHORT, then *TRN_BL* is set to 704.

If the NUM_TX_CHAINS parameter is equal to 1 or 2, then $N_{TRN}^{N_{TX}}$ is set to 2. If the NUM_TX_CHAINS parameter is equal to 3, then $N_{TRN}^{N_{TX}}$ is set to 3. If the NUM_TX_CHAINS parameter is equal to 4, then $N_{TRN}^{N_{TX}}$ is set to 4. If the NUM_TX_CHAINS parameter is equal to 5 or 6, then $N_{TRN}^{N_{TX}}$ is set to 6. If the NUM_TX_CHAINS parameter is equal to 7 or 8, then $N_{TRN}^{N_{TX}}$ is set to 8.

If the EDMG_TRN_LEN parameter is greater than 0 and the EDMG_PPDU_TYPE parameter is equal to EDMG-TRN-T or EDMG-TRN-R/T, then $L_T = 4 \times 704 \times N_{TRN}^{N_{TX}}$, $L_{TRN\text{-}Unit\text{-}P} = 0$, 1, 2, or 4, and $L_{TRN\text{-}Unit\text{-}M} =$ 1, 2, ..., or 16.

If the EDMG_TRN_LEN parameter is greater than 0 and the EDMG_PPDU_TYPE parameter is equal to EDMG-TRN-R, then $L_T = 0$, $L_{TRN\text{-}Unit\text{-}P} = 0$, and $L_{TRN\text{-}Unit\text{-}M} = 10$.

If the EDMG_TRN_LEN parameter is equal to 0, then $L_T = 0$, $L_{TRN\text{-}Unit\text{-}P} = 0$, and $L_{TRN\text{-}Unit\text{-}M} = 0$.

If the L_BEAM_TRACKING_REQUEST parameter is equal to BEAM-TRACKING-NOT-REQUESTED, the L_PPDU_TYPE parameter is equal to TRN-R, the EDMG_BEAM_TRACKING_REQUEST parameter is equal to Beam_Tracking_Requested, the EDMG_PPDU_TYPE parameter is equal to EDMG-TRN-R, and the EDMG_TRN_LEN parameter is greater than 0, then $L_T = 0$, $L_{TRN\text{-}Unit\text{-}P} = 0$, and $L_{TRN\text{-}Unit\text{-}M} = 0$.

If the EDMG_ADD_PPDU parameter is equal to ADD-PPDU, then the TXTIME parameter shall be updated every time a PLME-TXTIME.request(TXVECTOR) is received for each consecutive PPDU. The TXTIME shall be increased by the duration of ($T_{EDMG\text{-}Header\text{-}A} + T_{Data}$) every time the PHY entity receives a new PPDU to be transmitted as a part of the A-PPDU.

The duration of the EDMG-Header-A starting from the second PPDU aggregated in an A-PPDU is defined in microseconds as follows:

$$T_{EDMG\text{-}Header\text{-}A} = \left(1024 + 2 \times N_{GI}\right) \times \text{aDMGSampleTimeDuration } \mu\text{s}$$

where

N_{GI} depends on the GI_TYPE parameter as defined above

If present in an A-PPDU, the TRN field shall be appended only once at the last PPDU of the A-PPDU.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

28.12.3.5 TXTIME calculation for non-EDMG control mode

If the FORMAT parameter of the TXVECTOR is NON_EDMG, then the modulation is defined by the NON_EDMG_MODULATION parameter. If the NON_EDMG_MODULATION parameter is equal to DMG_C_MODE or NON_EDMG_DUP_C_MODE, then the TXTIME parameter shall be defined in microseconds as follows:

$$TXTIME(\mu s) = T_{L\text{-}STF} + T_{L\text{-}CEF} + T_{L\text{-}Header+Data} + T_{TRN}$$

where

$T_{L\text{-}STF} = 6400 \times \text{aDMGChipTimeDuration} \approx 3.63\ \mu s$

$T_{L\text{-}CEF} = 1152 \times \text{aDMGChipTimeDuration} \approx 0.65\ \mu s$

$T_{L\text{-}Header+Data} = \left(\left(Length + L_{L\text{-}Header}\right) \times 8 + 168 \times N_{CW}\right) \times 32 \times \text{aDMGChipTimeDuration}\ \mu s$

$N_{CW} = 1 + \left\lceil \frac{(Length - 6) \times 8}{168} \right\rceil$

$L_{L\text{-}Header}$ = 5 octets

$T_{TRN} = \left(4992 \times TRN\_LEN\right) \times \text{aDMGChipTimeDuration}\ \mu s$

The parameter Length (LENGTH parameter in the TXVECTOR) indicates the number of data octets in the PSDU in the range 14 to 1023. The TRN_LEN parameter indicates the length of the training field in the range 0 to 16.

28.12.3.6 TXTIME calculation for non-EDMG SC mode

If the NON_EDMG_MODULATION parameter is equal to DMG_SC_MODE or NON_EDMG_DUP_SC_MODE, the TXTIME parameter shall be defined in microseconds as follows:

$$TXTIME(\mu s) = T_{L\text{-}STF} + T_{L\text{-}CEF} + T_{L\text{-}Header} + T_{Data} + T_{GI} + T_{TRN}$$

where

$T_{L\text{-}STF} = 2176 \times \text{aDMGChipTimeDuration} \approx 1.24\ \mu s$

$T_{L\text{-}CEF} = 1152 \times \text{aDMGChipTimeDuration} \approx 0.65\ \mu s$

$T_{L\text{-}Header} = 1024 \times \text{aDMGChipTimeDuration} \approx 0.58\ \mu s$

$T_{Data} = \left(N_{BLKS} \times 512\right) \times \text{aDMGChipTimeDuration}\ \mu s$

$T_{GI} = 64 \times \text{aDMGChipTimeDuration} \approx 0.036\ \mu s$

$T_{TRN} = \left(4992 \times TRN\_LEN\right) \times \text{aDMGChipTimeDuration}\ \mu s$

The number of SC symbol blocks, N_{BLKS}, depends on the LENGTH and MCS parameters in the TXVECTOR and shall be as defined in 20.5.3.2.3.3 (LDPC encoding process).

The LENGTH parameter indicates the number of data octets in the PSDU in the range 1 to 262143.

The MCS parameter indicates the modulation type and coding scheme used in the transmission of the PPDU. For an EDMG SC mode transmission, the MCS parameter is in the range 1 to 12, with possible extension to 9.1, 12.1, 12.2, 12.3, 12.4, 12.5, and 12.6 MCS subset.

The TRN_LEN parameter indicates the length of the training field in the range 0 to 16.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the L_BEAM_TRACKING_REQUEST is equal to BEAM-TRACKING-REQUESTED, the L_PPDU_TYPE parameter is equal to TRN-R, and the L_TRN_LEN parameter is greater than 0, then $T_{TRN} = 0$.

If the ADD_PPDU parameter is equal to ADD-PPDU, then the TXTIME parameter shall be updated every time a PLME-TXTIME.request(TXVECTOR) primitive is received for each consecutive PPDU. The TXTIME shall be increased by a duration of (TL-Header + TData) every time the PHY entity receives a new PPDU to be transmitted as a part of the A-PPDU.

If present in an A-PPDU, the TRN field shall be appended only once at the last PPDU of the A-PPDU.

28.12.4 EDMG PHY characteristics

The EDMG PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, are shown in Table 20-30 unless otherwise listed in Table 28-120. The definitions for these characteristics are given in 6.7.4.

Table 28-120—EDMG PHY characteristics

PHY parameter	Value
aTxPHYDelay	Implementation dependent
aRxPHYDelay	Implementation dependent
aCCATime	Implementation dependent
aDMGChipRate	1760 MHz
aDMGTimeOfDepartureAccuracyThresh	0.5 ns
aDMGChipTimeDuration	1/1760 μs
aDMGSampleTimeDuration	1/2640 μs
aDMGCCAEDDetectTime	4 μs

29. Wake-Up Radio (WUR) MAC specification

29.1 Introduction

A WUR STA has dot11WUROptionImplemented equal to true.

A WUR STA supports the MAC and MLME functions defined in this clause in addition to the MAC functions defined in Clause 10, the MLME functions defined in Clause 11, the security functions defined in Clause 12. When the WUR STA is an HE STA, the WUR STA supports the HE MAC functions defined in Clause 26. Where the functional specifications in this clause conflict with Clause 10, Clause 11, Clause 12, or Clause 26, this clause takes precedence.

A WUR AP that transmits a WUR PPDU shall include a WUR frame in the WUR PPDU as defined in 30.3.2 or 30.3.3.

29.2 WUR channel, WUR primary channel, and WUR discovery channel

A WUR primary channel of a WUR AP is the channel in which the WUR AP transmits WUR Beacon frames (see 29.6.2). The WUR primary channel is indicated in the WUR Operating Class and the WUR Channel subfields in the WUR Operation element contained in a Beacon, Association Response, Reassociation Response, or Probe Response frame transmitted by the WUR AP.

A WUR channel of a WUR AP is the channel in which the WUR AP transmits WUR Short Wake-up frames, WUR Wake-up frames, and WUR Vendor Specific frames to an associated WUR non-AP STA.

When the WUR FDMA operation is used, the WUR channel may be different from the WUR primary channel (see 29.11). Otherwise, the WUR channel is equal to the WUR primary channel.

A WUR AP shall not set the WUR Operating Class subfield in the WUR Operation element it transmits to an operating class for which the behavior limits set, listed in Annex E, includes the DFS_50_100_Behavior (see 30.1).

A WUR AP shall not set the WUR Discovery Operating Class field in the WUR Discovery element it transmits to an operating class for which the behavior limits set, listed in Annex E, includes the DFS_50_100_Behavior (see 30.1).

A WUR channel and a WUR primary channel should be in the same band as the primary channel of the BSS.

NOTE—Transmissions in a WUR channel and a WUR primary channel that are in the same band as the primary channel of the BSS provide similar range.

A WUR discovery channel of a WUR AP is a channel in which the WUR AP transmits WUR Discovery frames. The WUR discovery channel may be indicated in a WUR Discovery element in Beacon and Probe Response frames (see 29.12). WUR discovery channel may be different from the WUR channel and the WUR primary channel.

29.3 Channel access

Before transmitting a WUR frame, a WUR AP shall contend for the medium as defined in 10.23.3) and 10.3.2:

— The WUR AP may use any AC for sending a WUR frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The WUR AP should initiate a TXOP that contains one or more WUR frames with a frame that sets NAV for the duration of the TXOP (see 10.3.2.15).
— A WUR AP that sent one or more WUR frames using the EDCAF of a particular AC shall not update the CW and the retry counters for that AC as a result of the WUR frame transmission.
— A WUR AP that supports the WUR FDMA operation is defined in 29.11.1.

If the WUR primary channel is the same as the primary channel of the BSS, the WUR AP shall use the EDCAF that is also used for transmitting non-WUR frames on the primary channel of the BSS (e.g. using the CCA on the primary channel of the BSS).

If the WUR primary channel is different from the BSS primary channel, the WUR AP shall use a separate EDCAF that uses the CCA on the WUR primary channel.

After moving to a new WUR channel (see 29.11), the WUR AP shall perform CCA until a frame is detected by which it can set its NAV, or until a period of time indicated by the NAVSyncDelay parameter in the most recent MLME-START.request primitive has transpired.

NOTE—When the WUR Channel Offset subfield is equal to 0, the WUR Channel is the same as the WUR primary channel, i.e., the WUR Short Wake-up frame, the WUR Wake-up frame, the WUR Vendor Specific frame, and the WUR Beacon frame are transmitted on the same channel. Otherwise, the WUR Channel can be different from the WUR primary channel (see 29.11).

29.4 Discarding a WUR frame

If the PHY of a WUR non-AP STA issues a PHY-RXSTART.indication due to a WUR PPDU reception, then the MAC sublayer of the WUR non-AP STA should discard a WUR frame contained in the WUR PPDU once the WUR frame satisfies any of the following:

— The Type subfield of a WUR frame with a value that is not supported by the WUR non-AP STA
— The Frame Body Present subfield of a WUR frame with a value that is not supported by the WUR non-AP STA
— The Protected subfield of a WUR frame with a value that is not supported by the WUR non-AP STA
— The ID subfield of a WUR frame with a value that is not maintained by the WUR non-AP STA (see 29.5.1)
— A STA Info field of a VL WUR Wake-up frame where the WUR ID field of the STA Info field is greater than the WUR ID assigned to the WUR non-AP STA and none of the WUR ID field in the previous STA Info fields contains the WUR ID assigned to the WUR non-AP STA (see 29.9.3)
— The last STA Info field of a VL WUR Wake-up frame where the WUR ID field of the STA Info field is less than the WUR ID assigned to the WUR non-AP STA (see 29.9.4)

NOTE 1—A WUR non-AP STA that receives a WUR frame that does not satisfy the above conditions follows other rules, which depend on the type of the received WUR frame (see Clause 29).

NOTE 2—A WUR non-AP STA that encounters a field or a subfield that is reserved ignores that field as described in 9.2.2.

29.5 Setting the identifiers of WUR frames

29.5.1 General

The ID field of WUR frames contains an identifier (ID) that is selected from the identifier's space, which consists of all integer values between 0 and 4095 (see 9.9.2.2.2).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A WUR AP that maintains a list of multiple IDs shall ensure that each ID that is included in a transmitted WUR frame is either a transmitter ID (see 29.5.3), a WUR group ID (see 29.5.4), a WUR ID (see 29.5.5), a nontransmitter ID (see 29.5.6) or a portion of the OUI or CID (see 9.9.3.4).

NOTE—A WUR AP might dynamically change the identifiers used within the BSS sporadically and randomly to provide a certain degree of security and privacy.

A WUR non-AP STA that is in WUR mode or in WUR mode suspend maintains a list of multiple IDs. A WUR non-AP STA is configured to receive one or more WUR frames that contain any of these IDs when the WUR power state of the WUR non-AP STA is in the WUR awake state.

The list of IDs maintained by the WUR non-AP STA includes:

— A WUR ID for WUR Short Wake-up frames and individually addressed FL WUR Wake-up frames.
— A transmitter ID for WUR Beacon, WUR Discovery frames, and for broadcast WUR Wake-up frames sent by the AP corresponding to the transmitted BSSID.
— A nontransmitter ID for broadcast WUR Wake up frames sent by the AP corresponding to the non-transmitted BSSID.
— A set containing zero or more instances of 12 LSBs of an OUI or CID for WUR Vendor Specific frames.
— A set containing zero or more instances of a group ID for group addressed FL WUR frames and for VL WUR Wake-up frames.

29.5.2 Compressed BSSID

The compressed BSSID is used by a WUR STA to obtain several of the identifiers defined in the remaining subclauses.

The compressed BSSID is equal to the 32-bit CRC calculated over the BSSID contained in Beacon frames transmitted by the WUR AP if dot11MultiBSSIDImplemented is false or calculated over the transmitted BSSID of the multiple BSSID set (see 11.1.3.8) if dot11MultiBSSIDImplemented is true (calculation is performed as defined in 9.2.4.8 where the BSSID is the *calculation fields*).

29.5.3 Transmitter ID

A transmitter ID identifies the WUR AP transmitting the WUR frame.

A WUR Wake-up frame is a broadcast WUR Wake-up frame if the WUR Wake-up frame has a transmitter ID in the ID field. The broadcast WUR Wake-up frame is addressed to all the WUR non-AP STAs that are associated with the WUR AP if dot11MultiBSSIDImplemented is false or addressed to all the WUR non-AP STAs that are associated with the AP corresponding to the transmitted BSSID if dot11MultiBSSIDImplemented is true.

WUR Beacon frames and WUR Discovery frames sent by a WUR AP shall have a transmitter ID in the ID field.

NOTE—WUR non-AP STAs associated to a nontransmitted BSSID are identified by the nontransmitter ID (see 29.5.6). These WUR non-AP STAs associated with the AP corresponding to a nontransmitted BSSID in a multiple BSSID set are expected to receive WUR Beacons and WUR Discovery frames sent with the a transmitter ID in the ID field and are not expected to receive other types of WUR frames sent with a transmitter ID in the ID field.

A WUR AP shall use the 12 LSBs of the compressed BSSID as the transmitter ID of WUR frames it transmits.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

29.5.4 WUR Group ID

A WUR group ID identifies a group of one or more WUR non-AP STAs and is selected from a WUR group ID space, which is a subset of consecutive values obtained from the identifier's space. A FL WUR Wake-up frame with WUR group ID in the ID field is defined as a group addressed WUR frame that is addressed to all the WUR non-AP STAs identified by that WUR group ID. A VL WUR Wake-up frame is a group addressed WUR frame that is addressed to all the WUR non-AP STAs that are identified by the WUR IDs included in the Frame Body field and belong to the group identified by the WUR group ID indicated in the ID field.

A WUR AP shall randomly select the starting value of the WUR group ID space from the identifier's space before the WUR AP starts to assign any WUR group ID(s) to any WUR non-AP STA. All WUR group IDs shall not match any of the assigned WUR IDs, transmitter ID, and nontransmitter IDs (if any).

A WUR AP may assign one or more WUR group IDs to a WUR non-AP STA if the WUR non-AP STA has set the WUR Group IDs Support field of the WUR Capabilities element it transmits to a nonzero value and may assign a single WUR group ID to the WUR non-AP STA if the WUR non-AP STA has set the WUR Group IDs Support subfield of the WUR Capabilities element to 0 and has set VL WUR Frame Support subfield of the WUR Capabilities element to 1; otherwise the WUR AP shall not assign a WUR group ID to the WUR non-AP STA.

A WUR AP shall indicate the WUR group IDs assigned to a WUR non-AP STA in the WUR Group ID List subfield of the WUR Parameters field of the WUR Mode element that is sent to the WUR non-AP STA. The difference between the largest WUR group ID and the lowest WUR group ID assigned by the WUR AP to a WUR non-AP STA shall not exceed the value indicated in the WUR Group IDs Support field of the WUR Capabilities element sent by the WUR non-AP STA, where the comparison performed between the two WUR group IDs is circular modulo 4096.

A WUR non-AP STA that has indicated support for WUR group IDs shall obtain the assigned WUR group IDs from the WUR Group ID List subfield of the WUR Parameters field in the most recent WUR Mode element received from the WUR AP if the Action Type field in the most recently received WUR Mode element is equal to "Enter WUR Mode Response" or "Enter WUR Mode Suspend Response" and the WUR Mode Response Status field is equal to "Accept". Otherwise, the WUR non-AP STA shall not obtain the assigned WUR group IDs from the WUR Group ID List subfield of the WUR Parameters field in the most recent WUR Mode element received from the WUR AP.

29.5.5 WUR ID

A WUR ID identifies the WUR non-AP STA that is the intended recipient of the WUR frame. A WUR frame with a WUR ID in the ID field is defined as an individually addressed WUR frame that is addressed to the WUR non-AP STA identified by that WUR ID.

A WUR AP shall assign to each WUR non-AP STA a WUR ID that uniquely identifies the WUR non-AP STA within the BSS of the WUR AP if dot11MultiBSSIDImplemented is false. A WUR AP shall assign to each WUR non-AP STA a WUR ID that uniquely identifies the WUR non-AP STA within BSSs of the Multiple BSSID set that the WUR AP is a member if dot11MultiBSSIDImplemented is true. The WUR AP shall either select the WUR ID randomly from the identifier's space or calculate the WUR ID as *AID* + *transmitter ID*, where *AID* is the association identifier of the WUR non-AP STA, *transmitter ID* is the transmitter ID of the WUR AP as defined in 29.5.3 and the addition performed between the two identifiers is circular modulo 2^{12}. The WUR AP shall verify that the selected or calculated WUR ID is not any of WUR Group ID, the transmitter ID of the WUR AP, or any nontransmitter ID (if any). The WUR AP shall indicate the WUR ID assigned to a WUR non-AP STA in the WUR ID field of the WUR Mode element it sends to the WUR non-AP STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A WUR non-AP STA shall obtain the WUR ID from the WUR ID field of the most recent WUR Mode element received from the WUR AP.

29.5.6 Nontransmitter ID

A nontransmitter ID identifies a nontransmitted BSSID from the multiple BSSID set (see 11.1.3.8).

A WUR Wake-up frame is a broadcast WUR Wake-up frame if the WUR Wake-up frame has a nontransmitter ID in the ID field. The WUR Wake-up frame is addressed to all the WUR non-AP STAs that are associated with the AP corresponding to a nontransmitted BSSID in a multiple BSSID set.

A WUR AP that operates a multiple BSSID set containing a nontransmitted BSSID and a WUR non-AP STA that is a member of a BSS corresponding to a nontransmitted BSSID shall calculate the nontransmitter ID as k + transmitter ID, where k is equal to the BSSID index field corresponding to that BSS (see 9.4.2.72 for the nontransmitted BSSID, the transmitter ID is defined in 29.5.3, and the addition performed between the two identifiers is circular modulo 2^{12}.

29.6 Synchronization using WUR Beacon frame

29.6.1 General

A WUR non-AP STA that is in WUR mode expects to receive WUR Beacon frames every dot11WURBeaconPeriod and expects to receive WUR Beacon frames within WUR duty cycle service periods negotiated with the WUR AP if the WUR AP has accepted to transmit keep-alive WUR frames (see 29.8.2.

NOTE 1—A WUR STA's TSF timer has the same TSF timer accuracy requirement, which is accurate to within ±100 ppm, defined in 11.1.3.9 for a non-DMG STA.

If a WUR non-AP STA that is in WUR mode and doze state (see 11.2.1) does not receive WUR Beacon frames for a time period, the WUR non-AP STA should perform WUR scanning (see 29.12) or transition to awake state (see 11.2.1). The methods by which the WUR non-AP STA determines the exact value of the time period are implementation specific and out of scope of this standard.

NOTE 2—If a WUR non-AP STA does not perform any action while not receiving WUR Beacon frames for a time period, the WUR non-AP STA might not discover that it is already out of range of the WUR AP sending the WUR Beacon frames.

A WUR AP sending a WUR Beacon frame shall set the Type Dependent Control field of the WUR Beacon frame to the TSF timer [5:16] of the WUR AP's TSF timer at the time that the start of the first WUR On-Off Keying (OOK) symbol containing the first bit of the Type Dependent Control field is transmitted by the PHY plus the WUR AP's delays through its local PHY from the MAC-PHY interface to its interface with the WM.

29.6.2 WUR Beacon frame generation

A WUR AP shall define the timing for the WUR operations by transmitting WUR Beacon frames according to dot11WURBeaconPeriod and the Offset Of TWBTT subfield of the WUR Operation element that the WUR AP transmits. This defines a series of target WUR beacon transmission times exactly dot11WURBeaconPeriod TUs apart. Additionally, the WUR AP may transmit WUR Beacon frames as keep-alive WUR frames during WUR duty cycle service periods negotiated with a WUR non-AP STA (see 29.8.3).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—The method to determine the value of dot11WURBeaconPeriod is implementation specific and might be chosen based on the considerations of overhead, timing correction requirement, and other implementation specific reasons.

If dot11MultiBSSIDImplemented is true, among all BSS in a multiple BSSID set (see 11.10.14), the WUR AP with BSSID equal to transmitted BSSID in a multiple BSSID set transmits WUR Beacon frames, and other WUR APs with BSSID not equal to transmitted BSSID in the multiple BSSID set shall not transmit WUR Beacon frames.

At each target WUR beacon transmission time, the WUR AP shall schedule a WUR Beacon frame on the WUR primary channel indicated by the WUR Operating Class and WUR Channel subfields in the WUR Operation element if all the following conditions are met:

- dot11MultiBSSIDImplemented is false or dot11MultiBSSIDImplemented is true, and the BSSID of the WUR AP is equal to transmitted BSSID in a multiple BSSID set
- None of the following conditions are met:
  - There are no WUR non-AP STAs associated with the WUR AP if dot11MultiBSSIDImplemented is false.
  - There are no WUR non-AP STAs associated with any WUR APs in the multiple BSSID set if dot11MultiBSSIDImplemented is true.
  - The WUR AP does not provide WUR power management service to any associated WUR non-AP STA (see 29.8).
  - All associated WUR non-AP STAs are in Active mode.

If the WUR AP schedules a WUR Beacon frame, the WUR Beacon frame shall be the next frame for transmission according to the medium access rules specified in Clause 10 unless a Beacon frame is scheduled for transmission as defined in 11.1.3.2 in which case the Beacon frame is the next frame for transmission and the WUR Beacon frame is the next frame for transmission after transmitting the Beacon frame and non-GCR-SP group addressed BUs if the Beacon frame is a DTIM beacon (see 11.2.3.1).

NOTE 2—To achieve this requirement of scheduling a WUR Beacon frame, the WUR AP suspends any pending transmissions until the WUR Beacon frame has been transmitted.

A WUR AP shall indicate the WUR beacon period in the WUR Operation element that the WUR AP transmits. A WUR non-AP STA shall adopt that WUR beacon period when joining the BSS, i.e., the WUR non-AP STA shall set the dot11WURBeaconPeriod to the WUR Beacon Period subfield of the received WUR Operation element.

NOTE 3—Though the transmission of a WUR Beacon frame might be delayed because of CSMA deferrals, subsequent WUR Beacon frames are scheduled at the undelayed nominal WUR beacon period.

If dot11MultiBSSIDImplemented is false, a WUR AP shall transmit a WUR Beacon frame with a data rate that is supported by all WUR non-AP STAs that have negotiated WUR power management service (see 29.8).

If dot11MultiBSSIDImplemented is true, the WUR AP with BSSID equal to the transmitted BSSID in a multiple BSSID set (see 11.10.14 (Multiple BSSID set)) shall transmit a WUR Beacon frame with a data rate that is supported by all WUR non-AP STAs that have negotiated WUR power management service to any members in the multiple BSSID set (see 29.8).

29.6.3 Maintaining TSF timer synchronization with WUR Beacon frame

Upon receiving a WUR Beacon frame with a valid FCS and transmitter ID that matches the transmitter ID of the WUR AP to which a WUR non-AP STA is associated if dot11MultiBSSIDImplemented is false or the transmitter ID of the WUR AP corresponding to the transmitted BSSID of the multiple BSSID set, where the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

WUR AP to which a WUR non-AP STA is associated is a member, if dot11MultiBSSIDImplemented is true (see 29.5.3), the WUR non-AP STA shall update its TSF timer according to the algorithm described below.

The received partial TSF timestamp, obtained from the Type Dependent Control field of the WUR Beacon frame, is adjusted to consider the WUR non-AP STA's delay as shown below:

— Create a temporary timestamp by concatenating the received partial TSF timestamp with 5 bits containing an implementation specific value that represents the assumed value of bit position 0 to 4 of the temporary timestamp.
— Add an amount equal to the receiving WUR non-AP STA's delay through its local PHY components plus the time since the first bit of the Partial TSF field was received at the MAC/PHY interface to the temporary timestamp.
— The adjusted value of the received partial TSF timestamp is set as the value of bit position 5 to 16 of the temporary timestamp.

If the most significant bit (MSB) of the adjusted value of the received partial TSF timestamp is not equal to the bit 16 of the local TSF timer, then the value of bits 17 to 63 of the local TSF timer shall be adjusted to account for roll over as follows:

— The value shall be increased by one unit (modulo 2^{47}) if LT[5:16] > AT and LT[5:16] > ((AT+ 2^{11}) (modulo 2^{12})).
— The value shall be decreased by one unit (modulo 2^{47}) if LT[5:16] < AT and LT[5:16] < ((AT – 2^{11}) (modulo 2^{12})).

where AT is the adjusted value of the received partial TSF timestamp and LT[5:16] is the value of bits 5 to 16 of the local TSF timer.

The bits 5 to 16 of the WUR non-AP STA's local TSF timer shall be set to the adjusted value of the received partial TSF timestamp.

29.7 WUR duty cycle operation

WUR duty cycle operation identifies the required amount of time that the WUR power state of a WUR non-AP STA utilizing WUR mode needs to be in the WUR awake state after the WUR non-AP STA enters the doze state (see 11.2.1 and 29.8). An illustration of state transition diagram of WUR power state is shown in Figure 29-1. WUR duty cycle operation also allows a WUR AP to manage WUR activity in the BSS by scheduling a WUR non-AP STA to receive WUR frames at different times.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

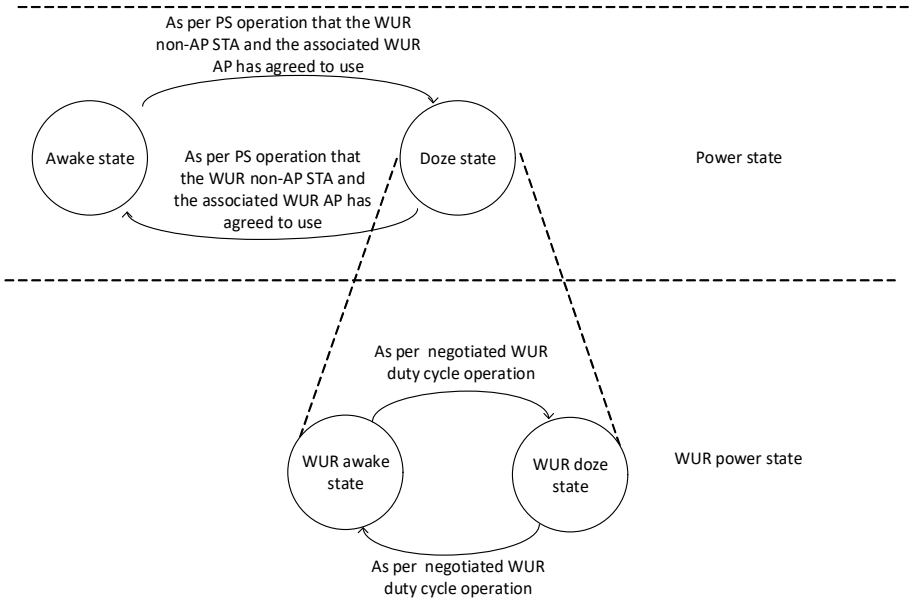

Figure 29-1—State transition diagram of WUR power state of a WUR non-AP STA in WUR mode

A WUR AP shall support WUR duty cycle operation.

A WUR non-AP STA establishes WUR duty cycle operation with the WUR AP to which it is associated through WUR mode setup as described in 29.8.2.

WUR duty cycle operation is determined by the following parameters: start point, WUR duty cycle service period, and duty cycle period (see Figure 29-2).

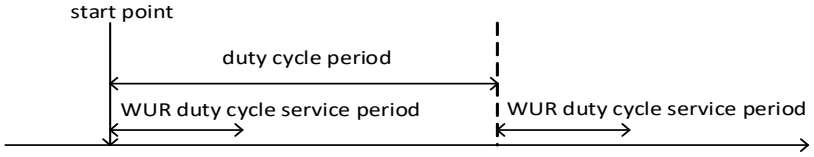

Figure 29-2—WUR Duty Cycle

The start point indicates the start time of a WUR duty cycle service period. For any WUR duty cycle service period, the start time of the next WUR duty cycle service period is equal to the start time of the WUR duty cycle service period plus the duty cycle period.

A WUR AP indicates the minimum wake-up duration in the Minimum Wake-up Duration subfield of the WUR Operation element and the duty cycle period unit in the Duty Cycle Period Units subfield of the WUR Operation element.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In the response frame sent by the WUR AP during a WUR mode setup (see 29.8.2), the WUR Duty Cycle Start Time present subfield of the WUR Parameters Control field in the WUR Mode element within the response frame shall be set to 1 if the WUR Mode Response Status field of the carrying WUR Mode element within a response frame is equal to "Accept," and the WUR duty cycle service period indicated in the WUR Duty Cycle Service Period subfield of the WUR Parameters field in the WUR Mode element within the request frame is smaller than the duty cycle period indicated in the Duty Cycle Period subfield of the WUR Parameters field in the WUR Mode element within the request frame. Otherwise, the WUR Duty Cycle Start Time present subfield of the WUR Parameters Control field in the WUR Mode element within the response frame shall be set to 0.

In the request frame sent by the WUR non-AP STA during a WUR mode setup (see 29.8.2), the WUR Duty Cycle Start Time present subfield of the WUR Parameters Control field in the WUR Mode element within the request frame shall be set to 0.

After a WUR non-AP STA establishes WUR duty cycle operation with a WUR AP through WUR mode setup as described in 29.8.2:

— the duty cycle period is indicated in the Duty Cycle Period subfield of the WUR Parameters field in the WUR Mode element transmitted by the WUR non-AP STA.
— the WUR duty cycle service period is indicated in the WUR Duty Cycle Service Period subfield of the WUR Parameters field in the WUR Mode element transmitted by the WUR non-AP STA.
— the start point is indicated in the WUR Duty Cycle Start Time subfield of the WUR Parameters field in the WUR Mode element transmitted by the WUR AP.

A WUR non-AP STA shall set the WUR Duty Cycle Service Period subfield of the WUR Parameters field in the WUR Mode element to indicate a duration that is larger than or equal to the duration indicated by the Minimum Wake-up Duration subfield in the most recently received WUR Operation element from the associated WUR AP.

A WUR non-AP STA shall set the WUR Duty Cycle Service Period subfield of the WUR Parameters field in a WUR Mode element to indicate a duration that is smaller than or equal to the duty cycle period indicated in the Duty Cycle Period subfield of the WUR parameters field in the WUR Mode element.

If a WUR non-AP STA is in WUR mode, and the WUR non-AP STA is in the doze state (see 11.2.1), the WUR power state of the WUR non-AP STA shall be in the WUR awake state within the WUR duty cycle service period of a WUR duty cycle period.

29.8 WUR power management procedure

29.8.1 General

A WUR AP may provide WUR power management service to its associated WUR non-AP STAs as defined in 29.8.2, 29.8.3, 29.8.4, and 29.9.

A WUR non-AP STA is in WUR mode or WUR mode suspend while using WUR power management service provided by a WUR AP.

A WUR STA shall follow the power management procedure defined in 11.2.3 except that some of the rules are relaxed as defined in 29.8.3 and 29.8.4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

29.8.2 WUR mode setup

To use the WUR power management service, a WUR non-AP STA initiates a successful frame exchanges with its associated WUR AP. Table 29-1 defines the frames used in the WUR mode setup frame exchange and the status after the exchange. These frames contain the WUR Mode elements necessary to define the WUR power management service in WUR Mode Setup frames or (Re)Association Request/Response frames with a WUR AP. Table 29-1 and Table 29-2 define the frames used in the WUR Mode Setup frame and WUR Mode Teardown frame exchanges.

Table 29-1—Settings for WUR mode setup frame exchange - Request and Response

Request frame: Action Type field of the WUR Mode element within a request frame transmitted from a WUR non-AP STA to a WUR AP	Response frame: Action Type field of the WUR Mode element within a response frame transmitted from a WUR AP to a WUR non-AP STA	Response frame: WUR Mode Response Status field of the WUR Mode element within a response frame transmitted from a WUR AP to a WUR non-AP STA	Status after the completion of the successful frame transmission
Enter WUR Mode Request	Enter WUR Mode Response	Accept	The WUR non-AP STA enters WUR mode.
Enter WUR Mode Suspend Request	Enter WUR Mode Suspend Response	Accept	The WUR non-AP STA enters WUR mode suspend.
Enter WUR Mode Request	Enter WUR Mode Response	Denied	WUR power management service is not provided by the WUR AP to the WUR non-AP STA at this time.
Enter WUR Mode Suspend Request	Enter WUR Mode Suspend Response	Denied	WUR power management service is not provided by the WUR AP to the WUR non-AP STA at this time.

NOTE 1—If WUR power management service is not provided by the WUR AP to the WUR non-AP STA, the WUR non-AP STA is not in WUR mode or WUR mode suspend.

NOTE 2—The definition of WUR mode and WUR mode suspend is described in 29.8.4 and 29.9.

Table 29-2—WUR Mode Setup frame or WUR Mode Teardown frame transmission

Frame type carrying the WUR Mode element (and Action Type field of the WUR Mode element) transmitted from a WUR non-AP STA to a WUR AP	Frame type carrying the WUR Mode element (and Action Type field of the WUR Mode element) transmitted from a WUR AP to a WUR non-AP STA	Status after the completion of the exchange
WUR Mode Setup frame (Action Type = Enter WUR Mode)	N/A	The WUR non-AP STA enters WUR mode from WUR mode suspend.
WUR Mode Setup frame (Action Type = Enter WUR Mode Suspend)	N/A	The WUR non-AP STA enters WUR mode suspend from WUR mode.
N/A	WUR Mode Setup frame (Action Type = Enter WUR Mode Response)	The WUR non-AP STA that is in WUR mode updates the WUR Parameters.
N/A	WUR Mode Setup frame (Action Type = Enter WUR Mode Suspend Response)	The WUR non-AP STA that is in WUR mode suspend updates the WUR Parameters.
WUR Mode Teardown frame	N/A	The WUR non-AP STA tears down WUR power management service.
N/A	WUR Mode Teardown frame	The WUR AP tears down WUR power management service.

NOTE 3—See 9.4.2.292 for the definition of Action Type field in WUR Mode element.

A request frame in Table 29-1 is successfully transmitted from a WUR non-AP STA to a WUR AP if an Ack frame is received by the WUR non-AP STA for the request frame.

A response frame in Table 29-1 is successfully transmitted from a WUR AP to a WUR non-AP STA if an Ack frame is received by the WUR AP for the response frame.

If the WUR AP denies the WUR mode setup, the WUR Mode Response Status field in the corresponding WUR Mode element shall be set to one of the values with meaning “Denied” shown in Table 9-408.

If the WUR AP accepts the request for WUR mode setup with the WUR Parameters field in the WUR Mode Setup frame, the WUR Mode Response Status field in the corresponding WUR Mode element is set to “Accept”. If the WUR non-AP STA receives the WUR Mode element, which contains WUR Mode Response Status field equal to “Accept”, WUR power management service is negotiated between the WUR non-AP STA and the WUR AP with WUR parameters, which are indicated in the WUR Mode elements.

After a WUR non-AP STA has negotiated WUR power management service with a WUR AP, the WUR non-AP STA may switch from WUR mode to WUR mode suspend by initiating and completing a successful frame exchange exchange, which includes a WUR Mode Setup frame with Action Type field of the carrying WUR Mode element equal to “Enter WUR Mode Suspend” from the WUR non-AP STA and an Ack frame from the WUR AP as described in Table 29-2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

After a WUR non-AP STA has negotiated WUR power management service with a WUR AP, the WUR non-AP STA may switch from WUR mode suspend to WUR mode by initiating and completing a successful frame exchange sequence, which includes a WUR Mode Setup frame with Action Type field of the carrying WUR Mode element equal to “Enter WUR Mode” from the WUR non-AP STA and an Ack frame from the WUR AP as described in Table 29-2.

The Action Type field in the WUR Mode element of the WUR Mode Setup frame sent by the WUR non-AP STA in this frame exchange sequence indicates the status that the WUR non-AP STA shall adopt upon successful completion of the frame exchange sequence.

A WUR non-AP STA may indicate in the WUR Mode element its recommendation on which WUR channel to assign for itself if the WUR FDMA Support subfield in the WUR Capabilities element sent by the WUR non-AP STA is equal to 1; otherwise, the WUR non-AP STA shall not recommend a WUR channel. The WUR non-AP STA may indicate in the WUR Mode element its recommendation on which data rate (LDR or HDR) to use for WUR Short Wake-up frames or individually or group addressed WUR Wake-up frames transmitted to the WUR non-AP STA if the 20 MHz WUR PPDU with HDR Support subfield in the WUR Capabilities element sent by the WUR non-AP STA is equal to 1; otherwise, the WUR non-AP STA shall not recommend a WUR data rate and shall set the Recommended WUR Short Wake-up Frame or WUR Wake-up Frame Rate field to 0 if a Proposed WUR Parameter subfield is included in the WUR Parameter field in a WUR Mode element it transmits. The WUR non-AP STA should avoid repeatedly renegotiating WUR power management with the same proposed WUR parameters in the WUR Mode element for the remainder of the association if the WUR AP does not use the recommended value(s) from the WUR non-AP STA.

A WUR non-AP STA may set the Requested Keep-Alive WUR Frame field to 1 in the WUR Mode element to request the WUR AP to generate a keep-alive WUR frame during the WUR duty cycle service periods that are negotiated with the WUR non-AP STA.

A WUR AP may assign the WUR channel to WUR non-AP STAs or select the data rate of the transmitted WUR PPDU based on the values contained in the Proposed WUR Parameters subfields received from these WUR non-AP STAs.

After a WUR non-AP STA has negotiated WUR power management service with a WUR AP, the WUR AP may update the WUR parameters with the WUR non-AP STA in WUR mode by initiating and completing a successful frame exchange sequence, which includes an unsolicited WUR Mode Setup frame with the Action Type in WUR Mode element equal to “Enter WUR Mode Response” from the WUR AP and an Ack frame from the WUR non-AP STA as described in Table 29-2.

After a WUR non-AP STA has negotiated WUR power management service with a WUR AP, the WUR AP may update the WUR parameters with the WUR non-AP STA in WUR mode suspend by initiating and completing a successful frame exchange sequence, which includes an unsolicited WUR Mode Setup frame with the Action Type in WUR Mode element equal to “Enter WUR Mode Suspend Response” from the WUR AP and an Ack frame from the WUR non-AP STA as described in Table 29-2.

The WUR non-AP STA that sent the Ack frame in response to the unsolicited WUR Mode Setup frame shall update the WUR parameters to the parameters included in the received WUR Mode Setup frame. The WUR non-AP STA may teardown WUR operation as described below if the WUR non-AP STA does not intend to use the parameters.

After a WUR non-AP STA negotiates WUR power management service with a WUR AP, the WUR non-AP STA may tear down WUR power management service by initiating and completing a successful frame exchange sequence, which includes a WUR Mode Teardown frame from the WUR non-AP STA and an Ack frame from the WUR AP as described in Table 29-2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

After a WUR non-AP STA negotiates WUR power management service with a WUR AP, the WUR AP may tear down WUR power management service by initiating and completing a successful frame exchange sequence, which includes a WUR Mode Teardown frame from the WUR AP and an Ack frame from the WUR non-AP STA as described in Table 29-2.

A WUR STA that successfully finishes WUR mode setup shall operate as defined in 29.8.3, 29.8.4, and 29.9.

29.8.3 WUR power management operation for a WUR AP

For each WUR non-AP STA that requests WUR power management service from an associated WUR AP, the WUR AP shall maintain a WUR status that indicates whether the WUR non-AP STA is in WUR mode or WUR mode suspend.

If a WUR non-AP STA is in WUR mode, then:

- The negotiated WUR parameters between the WUR AP and the WUR non-AP STA are maintained by the WUR AP.
- The WUR AP shall schedule for transmission a WUR Wake-up frame or a WUR Short Wake-up frame for the WUR non-AP STA during a WUR duty cycle service period that is negotiated with the WUR non-AP STA to notify the WUR non-AP STA that the WUR AP intends to have operation with the WUR non-AP STA as described in 29.9.3 and 29.9.4 if the WUR non-AP STA is in the doze state (see 11.2.1). The WUR Short Wake-up frame or the WUR Wake-up frame classifies as a keep-alive WUR frame for a WUR non-AP STA that has requested the transmission of keep-alive WUR frames during WUR mode setup.
- The WUR AP shall schedule for transmission a WUR Beacon frame during a WUR duty cycle service period that is negotiated with the WUR non-AP STA as a keep-alive WUR frame if the WUR AP does not schedule for transmission a WUR Short Wake-up frame or a WUR Wake-up frame for the WUR non-AP STA during that WUR duty cycle service period and the WUR non-AP STA has requested the transmission of keep-alive WUR frames during a successful WUR mode setup (see 29.8.2).
- The negotiated service periods between the WUR AP and the WUR non-AP STA for the WUR non-AP STA's schedule are suspended, i.e., the WUR non-AP STA is not required to be in the awake state (see 11.2.1) during the negotiated service period:
  - After the WUR AP transmits a WUR Short Wake-up frame or a WUR Wake-up frame addressed to the WUR non-AP STA with an indication of individually addressed buffered BU(s), the WUR AP expects that the WUR non-AP STA is in the awake state (see 11.2.1) at the earliest service period, which has end time larger than the received time of the frame plus the transition delay indicated by the WUR non-AP STA in the WUR Capabilities elements, following the PS operation (e.g., individual TWT) agreed between the WUR AP and the WUR non-AP STA.
  - The parameters of the negotiated service period for the WUR non-AP STA's schedule between the WUR AP and the WUR non-AP STA are maintained by the WUR AP.
- The WUR AP shall follow the wake-up operation defined in 29.9.

NOTE 1—The WUR non-AP STA might not wake up at the exact start time of the earliest service period.

NOTE 2—A WUR AP can generate keep-alive WUR frames, which are WUR beacon frames, in the WUR primary channel, and a WUR AP cannot generate keep-alive WUR frames, which are WUR beacon frames, in a WUR channel that is not the WUR primary channel. Hence, the AP can assign these WUR non-AP STAs in the WUR primary channel to enable generation of the keep-alive WUR frames, and the AP cannot assign these WUR non-AP STAs in a WUR channel that is not the WUR primary channel to enable the keep-alive operation.

NOTE 3—If the WUR non-AP STA is in power save mode, then the WUR AP still buffer individually addressed BUs (see 11.2.3.1) as described in 29.1 and deliver them in designated time as described in 29.9.3 and 29.9.4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If a WUR non-AP STA is in WUR mode suspend, then the negotiated WUR parameters between the WUR AP and the WUR non-AP STA are maintained by the WUR AP.

NOTE 4—A WUR non-AP STA in WUR mode suspend does not need to follow the WUR duty cycle service period agreed between the WUR AP and the WUR non-AP STA.

29.8.4 WUR power management operation for a WUR non-AP STA

In addition to the two power states defined in 11.2.1 that differentiate the functionality of being able to receive or not being able to receive non-WUR frames, two WUR power states are defined to differentiate the functionality of being able to receive or not being able to receive WUR frames.

The WUR power state of a WUR non-AP STA can be in one of two WUR power states:

- WUR awake: the WUR non-AP STA is able to receive WUR frames.
- WUR doze: the WUR non-AP STA is not able to receive WUR frames.

NOTE 1—A WUR non-AP STA can be in the awake or doze state as defined in 11.2.1 while in the power save mode regardless of whether the WUR non-AP STA has negotiated WUR power management service to be in WUR mode or WUR mode suspend. A WUR non-AP STA can be in active mode or power save (PS) mode as defined in 11.2.3.2 regardless of whether the WUR non-AP STA has negotiated WUR power management service to be in WUR mode or WUR mode suspend. The change of power management mode and the change of negotiated WUR power management service to be in WUR mode or WUR mode suspend are independent.

If a WUR non-AP STA is in WUR mode, then:

- The negotiated WUR parameters between the WUR AP and the WUR non-AP STA are maintained by the WUR non-AP STA.
- If the WUR non-AP STA is considered by the WUR AP to be in the doze state (see 11.2.1), the WUR power state of the WUR non-AP STA shall be in the WUR awake state during the WUR duty cycle service period agreed between WUR AP and WUR non-AP STA. Otherwise, the WUR power state of the WUR non-AP STA may be in the WUR doze state.
- The WUR power state of the WUR non-AP STA may be in the WUR doze state after the WUR non-AP STA completes a successful frame exchange sequence with the WUR AP, and the frame exchange sequence informs the WUR AP that the WUR non-AP STA is in the awake state (see 11.2.1).
- The WUR non-AP STA may wake up to receive Beacon frame if the WUR non-AP STA is in PS mode (see 11.2.3.1).
- The negotiated service periods between WUR AP and WUR non-AP STA for the WUR non-AP STA's schedule are suspended, and the WUR non-AP STA may be in the doze state (see 11.2.1) during the negotiated service periods until the schedule is resumed as described below:
  - After the WUR non-AP STA receives a WUR Short Wake-up frame or a WUR Wake-up frame addressed to it from the WUR AP with an indication of individually addressed BU(s), the WUR non-AP STA shall be in the awake state (see 11.2.1) at the earliest service period, which has end time larger than the received time of the frame plus the transition delay indicated by the WUR non-AP STA in the WUR Capabilities element, following the PS operation (e.g., individual TWT) agreed between the WUR AP and the WUR non-AP STA.
  - The parameters of the negotiated service period for the WUR non-AP STA's schedule between the WUR AP and the WUR non-AP STA are maintained by the WUR non-AP STA.
  - The WUR non-AP STA shall follow the wake-up operation defined in 29.9.

NOTE 2—The WUR duty cycle service period agreed between WUR AP and WUR non-AP STA can be that the WUR power state of the WUR non-AP STA is always in the WUR awake state.

NOTE 3—Examples of the negotiated service period between WUR AP and WUR non-AP STA for the WUR non-AP STA's schedule include individual TWT and schedule for WNM sleep mode.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 4—The WUR power state of a WUR non-AP STA is implementation specific if the WUR non-AP STA is in the awake state (see 11.2.1).

NOTE 5—The WUR non-AP STA might not wake up at the exact start time of the earliest service period.

If a WUR non-AP STA is in WUR mode suspend, then:

— The WUR power state of the WUR non-AP STA may be in the WUR doze state.
— The negotiated WUR parameters between the WUR AP and the WUR non-AP STA are maintained by the WUR non-AP STA.

NOTE 6—If a WUR non-AP STA is in WUR mode suspend, the negotiated service period between WUR AP and WUR non-AP STA for the WUR non-AP STA's schedule is active.

29.9 Wake-up operation

29.9.1 General

A WUR AP may send a WUR Wake-up frame or a WUR Short Wake-up frame (see 29.9.2) to an associated WUR non-AP STA as described in 29.9 and 29.8.3 to notify the WUR non-AP STA that the WUR AP intends to have operation with the WUR non-AP STA as described in 29.9.3 and 29.9.4.

A WUR AP shall not send a WUR Short Wake-up frame or a WUR Wake-up frame or a WUR Vendor Specific frame with HDR to associated WUR non-AP STA(s) that does not support HDR as indicated by the 20 MHz WUR PPDU with HDR Support subfield in the WUR Capabilities element sent by the WUR non-AP STA(s).

If a WUR AP and an associated WUR non-AP STA support traffic filtering service (TFS) as specified in 11.22.12, then the WUR AP and the WUR non-AP STA may use the traffic filter established according to the traffic filtering agreement between the WUR AP and the associated WUR non-AP STA sets to control the WUR Short Wake-up frame or the WUR Wake-up frame transmission as described in 29.9.3.

A WUR AP may transmit a WUR Wake-up frame to an associated WUR non-AP STA to indicate that individually addressed BU(s) are available for the non-AP STA. The WUR Wake-up frame shall satisfy any of the conditions below:

— The ID field of the WUR Wake-up frame contains a WUR ID that identifies the WUR non-AP STA.
— If the WUR Wake-up frame is FL WUR Wake-up frame, the ID field of the WUR Wake-up frame contains a WUR group ID that identifies a group of WUR non-AP STAs that include the WUR non-AP STA.
— If the WUR Wake-up frame is VL WUR Wake-up frame, the ID field of the WUR Wake-up frame contains a WUR group ID that identifies a group of WUR non-AP STAs that include the WUR non-AP STAs, and one of the identifiers in the Frame Body field identifies the WUR non-AP STA (see 9.9.3.2).

A WUR AP may transmit a WUR Short Wake-up frame to an associated WUR non-AP STA to indicate that individually addressed BU(s) are available for the non-AP STA.

A WUR AP may transmit a broadcast WUR Wake-up frame (see 29.5.3 and 29.5.6) with the Group Addressed BU subfield of the Miscellaneous subfield equal to 1 to indicate that group addressed BU(s) of the WUR AP (see 11.2.3.4) are available for all the associated WUR non-AP STA(s).

A WUR AP may transmit a broadcast WUR Wake-up frame (see 29.5.3 and 29.5.6) to associated WUR non-AP STA(s) to indicate that a critical update to the BSS parameters of the WUR AP has occurred for the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

associated WUR non-AP STA (see 29.9.3). The critical update is indicated in the Counter subfield of the Type Dependent Control field.

29.9.2 WUR Short Wake-up frame operation

When a WUR non-AP STA and its WUR AP both set WUR Short Wake-up Frame Support subfield to 1 in their WUR Capabilities Information field (indicating support WUR Short Wake-up frames):

- The WUR AP may transmit WUR Short Wake-up frames instead of WUR Wake-up frames to the WUR non-AP STA. WUR Wake-up frames and WUR Short Wake-up frames may be used interchangeably in this case according to the rules outlined in this subclause.
- The WUR non-AP STA shall act on received WUR Short Wake-up frames with a matching WUR ID and FCS in the same way it acts on received WUR Wake-up frames with a matching WUR ID and FCS according to the rules outlined in this subclause.

Otherwise, a WUR AP shall not transmit WUR Short Wake-up frames to a WUR non-AP STA and the WUR non-AP STA shall discard received WUR Short Wake-up frames with a matching WUR ID and FCS.

When a WUR AP transmits WUR Short Wake-up frames to a WUR non-AP STA and the WUR AP has a secure association with the non-AP STA, the following rules apply:

- The WUR AP shall select the WUR non-AP STA's WUR ID randomly.
- The WUR AP shall configure a new random WUR ID at the WUR non-AP STA when the WUR AP receives one or more frames from the WUR non-AP STA, but not a WUR Wake-up Indication frame with a WUR Wake-up Indication field indicating UNSOLICITED_WAKEUP.
  - When the WUR AP receives one or more frames from the WUR non-AP STA, but not a WUR Wake-up Indication frame with a WUR Wake-up Indication field indicating UNSOLICITED_WAKEUP from the WUR non-AP STA and the WUR AP did not transmit a prior WUR Short Wake-up frame to the WUR non-AP STA, the WUR AP should invoke a timeout before configuring a new WUR ID at the WUR non-AP STA. During this time, the WUR AP uses WUR Wake-up frames to wake up the WUR non-AP STA, using the current WUR ID. The WUR AP should double this interval upon each consecutive unsolicited wake-up event in which no WUR Wake-up Indication frame with a WUR Wake-up Indication field indicating UNSOLICITED_WAKEUP is received.
- The WUR AP should not retransmit a WUR Short Wake-up frame. The WUR AP may retransmit a WUR Wake-up frame instead.
- The WUR non-AP STA shall discard received WUR Short Wake-up frames with a matching WUR ID and FCS after the WUR non-AP STA received a WUR Short Wake-up frame with a matching WUR ID and FCS, until a new WUR ID has been configured at the WUR non-AP STA by the WUR AP.
- The WUR non-AP STA may transmit a WUR Wake-up Indication frame with a WUR Wake-up Indication field indicating UNSOLICITED_WAKEUP as the first frame when it wakes up without receiving a prior WUR Short Wake-up frame or WUR Wake-up frame so that the WUR AP does not configure a new WUR ID at the WUR non-AP STA.

NOTE 1—On a secure link with dot11RSNAProtectedManagementFramesActivated equal to false, the new WUR ID might still be overheard. Therefore, for full protection, dot11RSNAProtectedManagementFramesActivated needs to be true.

NOTE 2—On a secure link, the WUR ID is changed by the WUR AP after each use in a WUR Short Wake-up frame or after an unsolicited wake-up not indicating UNSOLICITED_WAKEUP. In case of an unsolicited wake-up not indicating UNSOLICITED_WAKEUP, the WUR AP invokes an increasing timeout before configuring a new WUR ID, to avoid that repeated false positive WUR Short Wake-up frames cause the battery at the WUR non-AP STA to drain (like in the event that an adversary repeatedly plays out all WUR IDs). After an unsolicited wake-up not indicating UNSOLICITED_WAKEUP, the WUR non-AP STA might not respond to WUR Short Wake-up frames, and the WUR

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

AP uses regular secure WUR Wake-up frames to wake up the WUR non-AP STA, using the current WUR ID, until the timeout expired and a new WUR ID has been configured.

29.9.3 WUR AP operation

A WUR AP that transmits a WUR Short Wake-up frame or a WUR Wake-up frame to a WUR non-AP STA that indicates the availability of individually addressed BU(s) shall follow the PS operation defined in 11.2 and 26.8 that the WUR AP and the WUR non-AP STA has agreed to use (e.g., active mode and PS mode change, U-APSD, TWT, etc.), to deliver individually addressed BU(s) to the WUR non-AP STA and follow the timing information (e.g., the next service period) that is provided along with the agreed PS operation.

NOTE 1—As described in 29.3, a WUR AP can transmit multiple WUR Wake-up frames in a TXOP (see 10.23.2.8).

If the WUR AP schedules a transmission that is not a WUR PPDU to the WUR non-AP STA, the WUR AP shall verify that either of the conditions below is met:

— The transition delay indicated by the WUR non-AP STA in the WUR Capabilities elements following the most recent transmitted WUR Short Wake-up frame or WUR Wake-up frame intended to the WUR non-AP STA has expired.
— The WUR non-AP STA has indicated that it is in the awake state (see 11.2.1) by transmitting a frame to the WUR AP.

NOTE 2—The frames scheduled by the WUR AP to be delivered are not limited to individually addressed BU(s).

NOTE 3—The WUR non-AP STA indicates that it is in the awake state by transmitting a frame to the WUR AP and following the PS operation after receiving a WUR Wake-up frame addressed to it with an indication of individually addressed BU(s) (see 29.9.4).

A WUR AP that generates a VL WUR Wake-up frame with two or more STA Info fields shall order the STA Info fields in the Frame Body field so that the WUR IDs appear in increasing order. The WUR AP shall not include the WUR ID of a WUR non-AP STA that does not support reception of VL WUR frames. (see 9.4.2.290).

NOTE 4—Inclusion of the STA Info fields in a VL WUR Wake-up frame in increasing order allows a WUR STA to stop processing the WUR frame once the STA locates a User Info field that contains the WUR ID of the STA or a WUR ID that is greater than the WUR ID of the STA.

A WUR AP that transmits a broadcast WUR Wake-up frame to a WUR non-AP STA that indicates the availability of group addressed BU(s) shall follow the PS operation that the WUR AP and the WUR non-AP STA has agreed to use (e.g., DTIM, FMS, etc.), to deliver group addressed BU(s) to the WUR non-AP STA and follow the timing information (e.g., the next DTIM TBTT) that is provided along with the agreed PS operation.

If the WUR AP schedules a transmission of group addressed BU(s) to the WUR non-AP STA(s), the WUR AP shall verify that the following condition is met:

— The maximum transition delay following the most recently transmitted WUR Wake-up frame indicating buffered group addressed BU(s) has expired. The maximum transition delay is defined as the maximum value of the transition delay values in the WUR Capabilities elements indicated by all the WUR non-AP STAs that are not in the awake state (see 11.2.1), have negotiated WUR power management service with the WUR AP, and are in WUR mode.

A WUR AP that sends a WUR Wake-up frame to the WUR non-AP STA(s) may send a frame (for example, a Trigger frame) to solicit response frames from one or more WUR non-AP STAs that support the reception of the frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If a traffic filtering agreement is established for a WUR non-AP STA in WUR mode, the WUR non-AP STA is in doze state (see 11.2.1), and Bit 1 of the TFS Action Code field is equal to 1, then the WUR AP should transmit a WUR Wake-up frame to the WUR non-AP STA if the WUR AP receives an individually addressed BU destined to the WUR non-AP STA that matches the traffic filter set.

If a traffic filtering agreement is established for a WUR non-AP STA in WUR mode, the WUR non-AP STA is in doze state (see 11.2.1), and Bit 1 of the TFS Action Code field is equal to 0, then the WUR AP should not transmit a WUR Wake-up frame to the WUR non-AP STA if the WUR AP receives an individually addressed BU destined to the WUR non-AP STA that matches the traffic filter set.

A WUR AP shall maintain a BSS parameter update counter. The WUR AP shall increase the BSS parameter update counter if a critical update occurs to any of the elements inside the Beacon frame. The following events shall be classified as a critical update:

— Inclusion of a Channel Switch announce element
— Inclusion of an Extended Channel Switch announce element
— Inclusion of a Wide Bandwidth Channel Switch element
— Inclusion of an Operating Mode Notification element
— Modification of the EDCA parameters
— Modification of the HT Operation element
— Modification of the VHT Operation element
— Modification of the HE Operation element
— Modification of the DSSS Parameter Set
— Inclusion of a Channel Switch Wrapper element

NOTE 5—The list of elements for critical update advertised by a broadcast WUR Wake-up frame aligns with the list of elements for critical update advertised in Check Beacon field in the TIM frame(s) (see 11.2.3.14).

The WUR AP shall include the current value of the BSS parameter update counter in the WUR Parameter field in the WUR Operation element. The WUR AP shall include a WUR Operation element in the WUR Mode Setup frames if the Counter subfield in the WUR Operation element has been recently updated.

The WUR AP shall include the current value of the BSS parameter update counter in the Counter subfield of the Type Dependent Control field in all transmitted broadcast WUR Wake-up frames.

A WUR AP may classify other changes in the Beacon frame as critical updates, which may include modification of the RSNE (see 9.4.2.23) or those that are described in 11.2.3.5.

After a WUR AP sends a WUR Short Wake-up frame or a WUR Wake-up frame with the ID field equal to a WUR ID that identifies a WUR non-AP STA, the WUR AP waits for a timeout interval that is larger than the transition delay indicated by the WUR non-AP STA in the WUR Capabilities elements:

— If the WUR AP receives any transmission from the WUR non-AP STA within the timeout interval, then the WUR Short Wake-up frame or the WUR Wake-up frame transmission is successful.
— Otherwise, the WUR Short Wake-up frame or the WUR Wake-up frame transmission fails, and the WUR AP may retransmit the WUR Wake-up frame to the WUR non-AP STA.

The methods by which a WUR AP determines the exact value of the timeout interval and determines the number of retries after the transmission of individually addressed WUR Wake-up frame fails are implementation specific and out of scope of this standard.

NOTE 6—The WUR AP might take into account the wake up timing information (e.g., the next service period) that is provided along with the agreed PS operation to determine the value of the timeout interval.

NOTE 7—A WUR AP might disassociate a WUR non-AP STA by following the operation based on BSS max idle period (see 11.21.13.

29.9.4 WUR non-AP STA operation

A WUR non-AP STA that receives a WUR Short Wake-up frame or a WUR Wake-up frame addressed to it with an indication of individually addressed BU(s) (see 29.9.1) shall follow the PS operation defined in 11.2 and 26.8 that the associated WUR AP and the WUR non-AP STA has agreed to use (e.g., power management mode change, U-APSD, TWT, etc.), to retrieve individually addressed BU(s) and follow the wake up timing information (e.g., the next service period) that is provided along with the agreed PS operation. In this case, the WUR non-AP STA may be in the doze state (see 11.2.1) until the time indicated by the wake up timing information (e.g., the next service period) that is provided along with the agreed PS operation.

NOTE 1—For example, rule b), c), and d) in 11.2.3.7 describes one operation for a WUR non-AP STA to retrieve individually addressed BU(s) using PS-Poll or U-APSD.

NOTE 2—To use both PS-Poll and U-APSD, the WUR non-AP STA can set all ACs as delivery-enabled as defined in 11.2.3.7.

NOTE 3—The WUR non-AP STA might follow the procedures in 11.2.3.2 to change the power management mode to active mode.

A WUR non-AP STA that receives a WUR Wake-up frame with an indication of buffered group addressed BU(s) (see 29.9.1) shall follow the PS operation that the associated WUR AP and the WUR non-AP STA has agreed to use (e.g., DTIM, FMS, etc.) to receive group addressed BU(s) and follow the wake up timing information (e.g., the next DTIM TBTT) that is provided along with the agreed PS operation. In this case, the WUR non-AP STA may be in the doze state (see 11.2.1) until the time indicated by the wake up timing information (e.g., the next DTIM TBTT) that is provided along with the agreed PS operation.

NOTE 4—For example, rule e) in 11.2.3.7 describes one operation for a WUR non-AP STA to receive group addressed frame.

A WUR non-AP STA shall maintain a BSS parameter update counter. The WUR non-AP STA shall update its BSS parameter update counter to the Counter subfield contained in the latest WUR Operation element received from the WUR AP with which it is associated. A WUR non-AP STA that receives the Counter subfield of the Type Dependent Control field in a broadcast WUR Wake-up frame that contains a value that is different from its BSS parameter update counter shall follow the procedure defined in 11.2.3.14 to attempt to receive the Beacon information. In this case, the WUR non-AP STA may be in the doze state) until the time indicated by the next TBTT.

29.10 WUR frame protection

29.10.1 General

WUR frame protection cannot be applied until the PTKSA (see 12.6.1.1.6) and WIGTKSA (12.6.1.1.12) have been established.

WUR frame protection is enabled when dot11RSNAWURFrameProtectionActivated is true, and is disabled otherwise. When WUR frame protection is enabled at a WUR AP, the WUR AP shall advertise such capability by setting to 1 the Protected WUR Frame Support subfield of the RSNXE in its Beacon and Probe Response frames. When WUR frame protection is enabled at a WUR non-AP STA, the WUR non-AP STA shall indicate such capability by setting to 1 the Protected WUR Frame Support subfield of the RSNXE in its (Re)Association Request frames.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

WUR frame protection is negotiated between a WUR AP and a WUR non-AP STA if the following conditions are met:

— Management frame protection is negotiated
— Both parties set the Protected WUR Frame Support subfield to 1 in their respective RSNXEs in the (re)association procedure
— It is successfully verified that the WUR Frame Protection Support subfield is equal to 1 in the Extended RSN Capabilities field in the RSNXE received during the 4-way handshake, FT 4-way handshake, FT fast BSS transition protocol, or (re)association procedure of FILS authentication.

Otherwise, WUR frame protection is not negotiated.

WUR Short Wake-up frames are not protected.

If WUR frame protection is negotiated between a WUR AP and a WUR non-AP STA, the WUR AP shall protect all individually addressed WUR Wake-up frames that are transmitted to the WUR non-AP STA; otherwise the WUR AP shall not transmit a protected individually addressed WUR Wake-up frame to the WUR non-AP STA.

If a WUR non-AP STA negotiated WUR frame protection for an association, it shall discard any unprotected WUR Wake-up frames received from the WUR AP associated. If the WUR non-AP STA did not negotiate WUR frame protection for an association, it shall discard any protected WUR Wake-up frames received from the WUR AP.

The WUR AP may transmit a protected WUR Wake-up frame addressed to more than one WUR non-AP STAs if WUR frame protection is negotiated with, and the WIGTK has been transported to, any WUR non-AP STAs that are being addressed. The WUR AP may transmit an unprotected WUR Wake-up frame addressed to more than one WUR non-AP STAs if WUR frame protection is not negotiated with or the WIGTK has not been transported to, any WUR non-AP STAs that are being addressed. The WUR AP shall not transmit a protected broadcast or group addressed WUR Wake-up frame to a WUR non-AP STA if all the WUR non-AP STAs that are being addressed have not negotiated WUR frame protection with the WUR AP.

NOTE—If the WUR non-AP STAs associated with a WUR AP consist of both WUR non-AP STAs that negotiated WUR frame protection and WUR non-AP STAs that did not negotiated WUR frame protection, the WUR AP can transmit a protected broadcast WUR Wake-up frame and an unprotected broadcast WUR Wake-up frame, in order to wake up all associated WUR non-AP STAs. If a WUR AP assigns a group ID to both WUR non-AP STAs that negotiated WUR frame protection and WUR non-AP STAs that did not negotiated WUR frame protection, the WUR AP can transmit a protected group addressed WUR Wake-up frame and an unprotected group addressed WUR Wake-up frame, both containing that group ID, in order to wake up that group of WUR non-AP STAs.

The WUR AP shall not transmit a protected individually addressed WUR Wake-up frame to the WUR non-AP STA until the WTK is installed at the WUR non-AP STA, and should not transmit a protected broadcast or group addressed WUR Wake-up frame until the WIGTK is installed at all WUR non-AP STAs with which the WUR AP has negotiated WUR frame protection.

A WUR AP that installs the WTK for a WUR non-AP STA (see 12.7.6) shall use the WTK to protect all subsequent individually addressed WUR Wake-up frames transmitted to the WUR non-AP STA. A WUR AP that installs the WIGTK (see 12.7.6 or 12.7.7) shall use the WIGTK to protect all subsequent protected broadcast or group addressed WUR Wake-up frames.

A WUR non-AP STA that installs WTK (see 12.7.6) shall use the WTK to process all subsequently received protected individually addressed WUR Wake-up frames. The WUR non-AP STA shall discard any protected WUR frames received before the WTK is installed. A WUR non-AP STA shall identify the appropriate WIGTK and associated state based on the Key ID subfield of the received protected broadcast or group

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

addressed FL WUR Wake-up frames. If no such WIGTK exists, the WUR non-AP STA shall silently discard the frame and terminate BIP processing for this reception. A WUR non-AP STA shall use the latest installed WIGTK to process all subsequently received protected group addressed VL WUR Wake-up frame.

A WUR AP shall set the Protected subfield of the Frame Control field of transmitted WUR Wake-up frames to 1 if the WUR frame is protected; otherwise the WUR AP shall set the Protected subfield of the Frame Control field of the WUR frame to 0.

A WUR STA with dot11RSNAWURFrameProtectionActivated equal to true shall set dot11RSNAProtectedManagementFramesActivated to true.

A WUR AP that transmits a protected WUR Wake-up frame shall protect the WUR Wake-up frame using the BIP protocol as defined in 12.5.3 except that:

— The WUR AP shall use BIP-CMAC-128 to provide data integrity and replay protection and shall use an integrity key to compute the MIC of the WUR Wake-up frame, which is defined below:
  — Broadcast and group addressed WUR Wake-up frames shall be protected using a WIGTK that is negotiated as defined in 12.7.7 Individually addressed WUR Wake-up frames shall be protected using a WTK that is negotiated as defined in 12.7.6.
— The CMAC output for BIP-CMAC-128 shall be truncated to 16 bits: MIC = Truncate-16 (CMAC Output). The MIC shall be included in the FCS field of the protected WUR Wake-up frame.
— The AAD shall have a length of 40 bits consisting of the following:
— the Frame Control, and the ID field, which are obtained from the WUR Wake-up frame,
— the Counter field, which is obtained from the Type Dependent Control field of the WUR Wake-up frame if it is broadcast; otherwise it is reserved, and
— the Embedded BSSID field, which is equal to the 16 MSBs of the compressed BSSID (see 29.5.2.

The AAD is as shown in Figure 29-3.

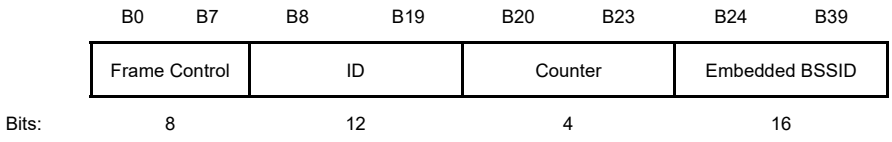

Figure 29-3—AAD construction for WUR frames

29.10.2 Protected WUR frame transmission

A WUR AP that sends a protected WUR frame shall follow the rules in 12.5.3.5 except that the WUR AP shall:

— Select the appropriate integrity key associated to protected WUR frames (see 29.10), key ID that is equal to the corresponding WIGTK or WTK key ID, a WUR PN that is generated and partially included in the WUR frame as defined in 29.10.4.1. If the Miscellaneous subfield is present in the protected WUR Wake-up frame, the Key ID subfield is set to the value representing the corresponding WIGTK (see 9.9.3.2).
— Construct the AAD as defined in Figure 29-3.
— Compute an integrity value over the concatenation of AAD, the Frame Body field (if present), and the WUR PN, and insert the 16-bit truncated output, which is the MIC, into the FCS field of the WUR frame. The integrity value is computed using AES-128-CMAC.
— Transmit the protected WUR frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A WUR AP that sends a protected group addressed VL WUR Wake-up frame should include WUR ID(s) of the WUR non-AP STA(s) that have already been provided with the WIGTK used to protect the group addressed VL WUR Wake-up frame and should not include WUR ID(s) of the WUR non-AP STA(s) that have not been provided with the WIGTK used to protect the group addressed VL WUR Wake-up frame.

If the most recently transmitted WUR Operation element has the Common PN subfield equal to 1, in order not to reuse the same WIPN for protection of group addressed or broadcast WUR frames with the same WIGTK, a WUR AP shall not transmit more than one protected group addressed or broadcast WUR frames that have different contents in a WUR FDMA PPDU.

NOTE—Since the reuse of a PN with the same temporal key voids the security guarantees, such cases need to be avoided. However, repeating the same protected group addressed or broadcast WUR frames in a WUR FDMA PPDU does not void the security guarantees, and therefore, is allowed.

29.10.3 Protected WUR frame reception

A WUR non-AP STA with WUR frame protection negotiated that receives a protected WUR Wake-up frame shall follow the rules in 12.5.3.6 except that the WUR non-AP STA shall:

- Use the appropriate integrity key associated to protected WUR Wake-up frames (see 29.10), and associated state based on key ID equal to the corresponding WIGTK or WTK key ID.
- Perform replay protection on the received WUR Wake-up frame as defined in 12.5.3.4 except that the WUR non-AP STA shall construct the PN locally as defined in 29.10.4.2, and the WUR non-AP STA shall maintain a separate replay counters (RC) for each WIGTK and WTK when the most recently received WUR Operation element has the Common PN subfield equal to 0. The WUR non-AP STA shall initialize the replay counter to the initial value of the corresponding PN prior to any update due to WUR Wake-up frames. The WUR non-AP STA shall also initialize the replay counter to the initial value of the corresponding PN when it resets the WIGTK or WTK. If PN is less than or equal to corresponding *RC* then the WUR non-AP STA shall discard the WUR Wake-up frame, increment its internal dot11RSNAStatsCMACWURReplays counter by 1, and terminate BIP processing for this reception.
- Construct the AAD as defined in Figure 29-3.
- Extract and save the received MIC value from the FCS field of the WUR Wake-up frame and compute a verifier over the concatenation of AAD, Frame Body field (if present), and the locally constructed PN. If the result does not match the received MIC value, then the receiver shall discard the frame, increment its internal MIC error counter by 1, and terminate BIP processing for this reception.
- Update the *RC* for the integrity key associated to protected WUR Wake-up frames identified by key ID equal to the corresponding WIGTK or WTK key ID with the corresponding PN.
- If the Common PN subfield is equal to 1, update the local TSF timer as follows:
  - The received partial TSF timestamp, obtained from the Sequence Number subfield of the Type Dependent Control field of the WUR Wake-up frame, is adjusted to consider the WUR non-AP STA's delay as shown below:
    - Create a temporary timestamp by concatenating the received partial TSF timestamp with 9 bits containing an implementation specific value that represents the assumed value of bit position 0 to 8 of temporary timestamp;
    - Add an amount equal to the receiving WUR non-AP STA's delay through its local PHY components plus the time since the first bit of the Partial TSF field was received at the MAC/PHY interface to the temporary timestamp
    - The adjusted value of the received partial TSF timestamp is set as the value of bit position 9 to 16 of the temporary timestamp.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

- If the most significant bit (MSB) of the adjusted value of the received partial TSF timestamp is not equal to the bit 16 of the local TSF timer then the value of bits 17 to 63 of the local TSF timer shall be adjusted to account for roll over as follows:
  - The value shall be increased by one unit (modulo 2^{47}) if LT [9:16] > AT and LT [9:16] > ((AT + 2^7) (modulo 2^8))
  - The value shall be decreased by one unit (modulo 2^{47}) if LT [9:16] < AT and LT [9:16] < ((AT–2^7) (modulo 2^8))

    where AT is the adjusted value of the received partial TSF timestamp and LT [9:16] is the value of bits 9 to 16 of the local TSF timer
  - The bits 9 to 16 of the WUR non-AP STA's local TSF timer shall be set to the adjusted value of the received partial TSF timestamp.
- If the Common PN subfield is equal to 0, update the local WIPN or WTPN to the locally constructed PN used to receive the WUR frame (see 29.10.4.2)

NOTE 1—Before the adjusted value of the received partial TSF timestamp is set as the value of bit position 9 to 16 of the temporary timestamp, the temporary timestamp might be further compensated for a clock drift offset between the WUR AP and the WUR non-AP STA, which is determined by multiplying the estimated clock drift by the time between receiving the latest TSF from the WUR AP and the time at which the WUR frame is received from the WUR AP, where the estimated clock draft is determined based on two or more received TSF values from the WUR AP and comparing these to the internal TSF at the WUR non-AP STA.

NOTE 2—When the most recently received WUR Operation element has the Common PN subfield equal to 1, a single common replay counter is maintained for both WIGTK and WTK.

29.10.4 Generation and construction of PN for WUR frames

The PN for WIGTK is defined as WIPN and the PN for WTK is defined as WTPN. When the Common PN subfield in the WUR Operation element sent by the WUR AP is equal to 1 then WIPN and WTPN are derived in the same way and are equal.

29.10.4.1 Generation of the PN by a WUR AP

A WUR AP that intends to transmit protected WUR frames shall set the Common PN subfield in the WUR Operation element it transmits to 0 if it intends to maintain separate PN counters for each WIGTK and WTK and shall set the Common PN subfield to 1 if it intends to maintain a common PN for all protected WUR frames generated within its BSS.

The WUR AP that intends to transmit a protected WUR frame shall construct the PN as follows:

- If the Common PN subfield is equal to 1:
  - PN = PN0||PN1||PN2||PN3||PN4||PN5 = TSF timer [9: 56], where the TSF timer is obtained as defined in 29.6.1.
  - The PN shall never repeat for protected WUR frames generated using the same WIGTK or WTK
  - The WUR AP shall include PN0, i.e., the PPN, which is equal to its TSF timer [9: 16], in the Sequence Number subfield of the Type Dependent Control field of the WUR Wake-up frame
- If the Common PN subfield is equal to 0:
  - PN = PN0||PN1||PN2||PN3||PN4||PN5, where PN shall be incremented by one for each transmitted WUR frame using the same WIGTK or WTK.
  - The PN shall never repeat for protected WUR frames generated using the same WIGTK or WTK
  - If the WUR Wake-up frame is not broadcast,
    - PPN = PN0||PN1[0:3]. The WUR AP shall include PN0 (i.e., the 8 LSBs of the PPN) in the Sequence Number subfield of the Type Dependent Control field of the WUR Wake-up frame. The AP shall include PN1[0:3] (i.e., the 4 MSBs of the PPN) in the Counter subfield of the Type Dependent field of the WUR Wake-up frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

- If the WUR Wake-up frame is broadcast:
  - PPN = PN0. The WUR AP shall include PN0 (i.e., the PPN) in the Sequence Number subfield of the Type Dependent Control field of the WUR Wake-up frame.

If the most recently transmitted WUR Operation element has the Common PN subfield equal to 0, the local WTPN at the WUR AP is initialized to 0 and the local WIPN at the WUR AP is initialized to the WIPN provided in the WIGTK KDE (Figure 12-50) when the corresponding integrity key (WTK or WIGTK) is set in the MAC (see 12.7.6 and 12.7.7).

If the most recently transmitted WUR Operation element has the Common PN subfield equal to 1, the local WTPN and WIPN at the WUR AP, which are the same in this case, are initialized to the value of the local TSF timer [9: 56] when the corresponding integrity key (WTK or WIGTK) is set in the MAC (see 12.7.6 and 12.7.7).

29.10.4.2 Construction of the PN by a WUR non-AP STA

The full PN is not present in protected WUR frames, depending on the Common PN subfield of the most recently received WUR Operation element, and is constructed locally at the WUR non-AP STA as follows:

- If the Common PN subfield is equal to 1, the PN is obtained as follows:
  - PN0 is set as the Sequence Number subfield of the Type Dependent Control field of the WUR Wake-up frame
  - BPN is set as the value of bits 17 to 56 of the local TSF timer
  - If the most significant bit (MSB) of the PN0 is not equal to the bit 16 of the local TSF timer then the value BPN shall be adjusted to account for roll over as follows:
    - The value shall be increased by one unit (modulo 2^{40}) if LT[9:16] > PN0 and LT[9:16] > ((PN0 + 2^7) (modulo 2^8))
    - The value shall be decreased by one unit (modulo 2^{40}) if LT[9:16] < PN0 and LT[9:16] < ((PN0 – 2^7) (modulo 2^8)), where LT[9:16] is the value of bits 9 to 16 of the local TSF timer
  - The PN=PN0||BPN where PN1||PN2||PN3||PN4||PN5 = BPN
- If the Common PN subfield is equal to 0, the PN is obtained as follows:
  - If the WUR Wake-up frame is not broadcast:
    - The PN is obtained as PPN||BPN, where PPN is equal to the Type Dependent Control field of the received WUR frame, and BPN is retrieved from the locally stored PN at the receiver for the corresponding WIGTK or WTK.
    - PN0||PN1[0:3] = PPN, and PN1[4:7]||PN2||PN3||PN4||PN5 = BPN.
  - If the WUR Wake-up frame is broadcast:
    - The PN is obtained as PPN||BPN, where the PPN is equal to the Sequence Number subfield of the Type Dependent Control field of the received WUR frame, and BPN is retrieved from the locally stored PN at the receiver for the corresponding WIGTK or WTK.
    - PN0 = PPN, and PN1||PN2||PN3||PN4||PN5 = BPN.
  - The portion of the computed PN corresponding to the BPN shall be incremented by 1 to account for roll over when the PPN in the received WUR frame is less than the portion of the locally stored PN corresponding to the PPN.

If the most recently received WUR Operation element has the Common PN subfield equal to 0, the locally stored WTPN at the WUR non-AP STA is initialized to 0 and the local WIPN at the WUR non-AP STA is initialized to the WIPN provided in the WIGTK KDE (Figure 12-47a) when the corresponding integrity key (WTK or WIGTK) is set in the MAC (see 12.7.6 and 12.7.7).

If the most recently received WUR Operation element has the Common PN subfield equal to 1, the locally stored WTPN and WIPN, which are the same in this case, at the WUR non-AP STA is initialized to the value of the local TSF timer [9: 56] when the corresponding integrity key (WTK or WIGTK) is set in the MAC (see 12.7.6 and 12.7.7).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the most recently received WUR Operation element has the Common PN subfield equal to 0, the WTPN or WIPN may be updated explicitly through a secure WUR mode setup request/response frame exchange as described in 29.10.4.3.

29.10.4.3 WUR PN update procedure

The WUR PN update procedure enables a WUR AP and a WUR non-AP with WUR frame protection negotiated with the WUR AP to update the locally stored PN at the WUR non-AP STA.

If the most recently transmitted WUR Operation element has the Common PN subfield equal to 0, a WUR AP may indicate the PN maintained by the WUR AP to a WUR non-AP by including one or more WUR PN Update elements in the WUR Mode Setup frame with the Action Type in WUR Mode element equal to "Enter WUR Mode Response."

If the most recently received WUR Operation element has the Common PN subfield equal to 0, a WUR non-AP STA that receives a WUR Mode Setup frame that includes a WUR PN Update element shall update the locally stored PN value corresponding to the key ID indicated in the Key Info field to the received PN value.

A WUR non-AP STA may request a PN update by sending a WUR Mode Setup frame with Action Type field of the carrying WUR Mode element equal to "Enter WUR Mode Request" and includes a WUR PN Update element that indicates a key ID corresponding to a integrity key currently used by the WUR non-AP STA and optionally includes the corresponding locally stored PN.

If the most recently transmitted WUR Operation element has the Common PN subfield equal to 0, a WUR AP that receives a WUR Mode Setup frame with Action Type field of the carrying WUR Mode element equal to "Enter WUR Mode Request" and that includes a WUR PN Update element shall respond with a WUR Mode Setup frame with Action Type field of the carrying WUR Mode element equal to "Enter WUR Mode Response" and includes a WUR PN Update element indicating the PN maintained by the WUR AP corresponding to the requested key ID if any of the following conditions apply:

— The WUR non-AP STA has negotiated WUR power management service with the WUR AP
— The WUR non-AP STA has not negotiated WUR power management service with the WUR AP and the WUR AP accepts the negotiation

All optional subfields of the WUR Parameters field in the WUR Mode element may be omitted.

29.11 WUR FDMA operation

When dot11WURFDMAChannelSwitchImplemented is true, a WUR non-AP STA shall set the WUR FDMA Support subfield of the WUR Capabilities Information field of the WUR Capabilities element that it transmits to a WUR AP to 1. Otherwise, it shall set the WUR FDMA Support subfield to 0.

If a WUR AP receives from a WUR non-AP STA a WUR Capabilities element of which the WUR FDMA Support subfield of the WUR Capabilities Information field is equal to 0, the WUR AP shall set the WUR Channel Offset subfield of the WUR Parameters field of the WUR Mode element that it transmits to the WUR non-AP STA to 0.

If a WUR AP receives from a WUR non-AP STA a WUR Capabilities element of which the WUR FDMA Channel Switching subfield of the WUR Capabilities Information field is equal to 1, the WUR AP may set the WUR Channel Offset subfield of the WUR Parameters field of the WUR Mode element that it transmits to a nonzero value as defined in Table 9-409, subject to the following constraints:

— The negotiated WUR duty cycle service period does not overlap with the target WUR beacon transmission times at which the WUR AP schedules transmission of WUR Beacon frames, except for the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

case when the value indicated in the WUR Duty Cycle Service Period subfield of the WUR Parameters field in the WUR Mode element received from the WUR non-AP STA is equal to the value indicated in the Duty Cycle Period subfield

— The WUR AP shall not transmit in the WUR secondary channel and WUR secondary 40 MHz channel any WUR frame addressed to the WUR non-AP STA for aPPDUMaxTime defined in Table 30-13 from the target WUR beacon transmission times.

If dot11WURFDMAChannelSwitchImplemented of a WUR non-AP STA is equal to false, the WUR channel of the WUR non-AP STA shall be same as the channel on which the WUR Beacon frames are transmitted.

The WUR channel of a WUR non-AP STA with dot11WURFDMAChannelSwitchImplemented equal to true is defined by the WUR Channel Offset subfield of the WUR Parameters field of the WUR Mode element that it receives from its associated WUR AP.

NOTE—A WUR non-AP STA might indicate its recommendation in the WUR Mode element on which WUR channel to assign for the WUR non-AP STA (see 29.8.2).

29.11.1 WUR FDMA channel access

A WUR AP may send multiple WUR Wake-up frames in a WUR FDMA PPDU.

If a WUR AP intends to transmit a WUR FDMA PPDU (as defined in 10.23.2.4 and 29.3), the WUR AP shall perform exactly one of the following actions:

a) Transmit a 40 MHz WUR FDMA PPDU in the WUR primary 40 MHz channel if the following conditions are met:
   1) The WUR secondary channel was idle during an interval of PIFS immediately preceding the start of the TXOP.
   2) The WUR AP schedules at least one WUR frame transmission on each of 20 MHz subchannels of the WUR primary 40 MHz channel.

b) Transmit an 80 MHz WUR FDMA PPDU on the WUR 80 MHz channel if the following conditions are met:
   1) Both the WUR secondary channel and the WUR secondary 40 MHz channel were idle during an interval of PIFS immediately preceding the start of the TXOP.
   2) The WUR AP schedules at least one WUR frame transmission on each of 20 MHz subchannels of the WUR 80 MHz channel.

c) Transmit an 80 MHz subchannel punctured WUR FDMA PPDU on the WUR 80 MHz channel if the following conditions are met:
   1) At least one of the 20 MHz subchannels of the WUR secondary channel and the WUR secondary 40 MHz channel were idle during an interval of PIFS immediately preceding the start of the TXOP.
   2) The WUR AP schedules at least one WUR frame transmission on each of 20 MHz subchannels of the WUR 80 MHz channel, except when the subchannel was not idle or the WUR AP does not have a pending WUR frame intended for WUR non-AP STAs listening on that subchannel.

In any of the above actions, if the WUR AP does not have a pending WUR frame intended for WUR non-AP STAs on the WUR primary channel, then the WUR AP shall transmit a WUR frame on the WUR primary channel, which may be any WUR frame that does not cause a WUR non-AP STA to transition to awake state on the primary channel.

29.12 WUR discovery

A WUR AP with dot11WURDiscoveryImplemented equal to true shall periodically schedule WUR Discovery frames on the WUR AP's WUR discovery channel for transmission to assist WUR non-AP STAs in WUR AP discovery. The WUR AP may transmit a WUR Discovery element in Beacon and Probe Response frames to indicate the WUR discovery channel used by the WUR AP to transmit WUR Discovery frames. The WUR AP may include a WUR Discovery element in a Probe Response frame that is transmitted in response to a Probe Request frame that contains a WUR Capability element. The WUR AP's WUR discovery channel may be indicated in the transmitted WUR Discovery elements by the WUR Discovery Operating Class and WUR Discovery Channel fields in the WUR AP Information subfield in which the Transmitting WUR AP subfield is equal to 1. WUR Discovery frames shall be scheduled for transmission by the WUR AP with a periodicity as indicated in the WUR Discovery Period field in the WUR AP Parameters subfield of the WUR Discovery element in which the Transmitting WUR AP subfield is equal to 1.

NOTE 1—Though the transmission of a WUR Discovery frame might be delayed because of CSMA deferrals, subsequent WUR Discovery frames are scheduled at the undelayed nominal WUR Discover Period value indicated in the WUR AP Parameters subfield.

The WUR discovery channel(s) that are used to transmit the WUR Discovery frames should be selected from channel 1 in the 2.4 GHz frequency band and channel 40, 44, 149 and 153 in the 5 GHz frequency band as specified in Table E-4 in Annex E.

NOTE 2—The purpose of the above recommendation is to encourage adoption of a common set of WUR discovery channels that are available in most of the regulatory domains to reduce WUR scanning latency.

A WUR AP with dot11WURNeighborDiscoveryImplemented equal to true may transmit a WUR Discovery element in Beacon and Probe Response frames to advertise the WUR discovery channel(s) used by neighboring WUR APs. The WUR AP may include a WUR Discovery element in a Probe Response frame that is transmitted in response to a Probe Request frame that contains a WUR Capability element. A WUR AP may use the WUR Discovery elements transmitted by neighboring WUR APs to compile the WUR discovery channel(s) used by the neighboring WUR APs. A WUR AP should include a single WUR AP Information subfield for a WUR discovery channel in a WUR Discovery element.

A WUR non-AP STA with dot11WURDiscoveryImplemented equal to true may perform WUR scanning to discover WUR APs. Upon receipt of the MLME-WURDISCOVERY.request primitive, the WUR non-AP STA performs WUR scanning according to the parameters given in the primitive. The WURDiscoveryChannelList parameter indicates the WUR discovery channel(s) to be scanned. The WUR non-AP STA shall scan a WUR discovery channel for a period of time no less than MinChannelTime. The MaxChannelTime parameter indicates the maximum time (in TU) to spend on each WUR discovery channel within the WURDiscoverChannelList parameter when scanning for WUR Discovery frames. The Transmitter ID parameter, if present in the primitive, indicates the Transmitter ID of the WUR AP to be discovered. The CompressedBSSID_MSB parameter, if present in the primitive, indicates the 12 MSBs of the compressed BSSID of the WUR AP to be discovered. The Compressed SSID parameter, if present in the primitive, indicates the 16 LSBs of the short SSID of the WUR AP to be discovered, as defined in 9.4.2.169.3. When none of the Transmitter ID, CompressedBSSID_MSB, and Compressed SSID parameters are present in the MLME-WURDISCOVERY.request primitive, the WUR non-AP STA scans for WUR Discovery frames from any WUR APs. After scanning one WUR discovery channel, the WUR non-AP STA initiates scanning in another WUR discovery channel if at least one WUR discovery channel within the WURDiscoveryChannelList parameter has not yet been scanned. When the WUR non-AP STA has completed scanning all indicated WUR discovery channels, it returns the scan results via an MLME-WURDISCOVERY.confirm primitive.

NOTE 3—A WUR non-AP STA might perform WUR scanning at any time except during any active WUR duty cycle service period agreed between the WUR non-AP STA and the WUR AP.

A WUR non-AP STA with dot11WURDiscoveryImplemented equal to true receiving the WUR Discovery element may use the information of the WUR discovery channels to schedule WUR scanning. The WUR non-AP STA may limit the WUR scanning to the WUR discovery channels listed in the WUR Discovery element.

30. Wake-Up Radio (WUR) PHY specification

30.1 Introduction

Clause 30 specifies the PHY entity for wake-up radio (WUR) systems. In addition to the requirements in Clause 30, a WUR STA that supports WUR PHY specification shall support transmitting and receiving PPDUs that are compliant with the mandatory requirements of the following PHY specifications:

— Clause 17 if a WUR STA is a non-HT STA
— Clause 19 if a WUR STA is an HT STA
— Clause 21 if a WUR STA is a VHT STA
— Clause 27 if a WUR STA is an HE STA

The transmission and reception of WUR PPDUs is defined in the 2.4 GHz and 5 GHz bands. The transmission of 40 MHz WUR FDMA PPDUs is defined in the 2.4 GHz and 5 GHz bands and the transmission of 80 MHz WUR FDMA PPDUs is defined in the 5 GHz band.

A WUR AP shall support transmitting a WUR Basic PPDU.

A WUR non-AP STA shall support receiving a WUR Basic PPDU.

NOTE—The capability to transmit a WUR PPDU by a WUR non-AP STA is implementation specific and is out of scope of the standard.

The WUR PHY is based on the PHY defined in Clause 17.

The WUR PHY provides support for data rates of 62.5 kb/s and 250 kb/s. WUR low data rate (LDR) indicates 62.5 kb/s, and WUR high data rate (HDR) indicates 250 kb/s.

The WUR PHY provides support for WUR encoding, which shall be applied to all data rates for the WUR-Data field.

The WUR PHY provides support for 20 MHz and optionally 40 MHz and 80 MHz contiguous channel widths depending on the frequency band and capability. For the channel width equal to 80 MHz, the WUR PHY may support subchannel puncturing transmission where one or more of the non-primary WUR 20 MHz channels are zeroed out.

The WUR PHY uses on-off keying (OOK) modulation for WUR-Sync and WUR-Data fields. The WUR OOK modulation may be generated by using the multicarrier on-off keying (MC-OOK) modulation technique with a signal constructed from multiple subcarriers. When MC-OOK is used to generate the WUR OOK signal MC-OOK should use 13 contiguous subcarriers, centered within a 20 MHz channel, with a subcarrier spacing of 312.5 kHz and the center subcarrier being null. The subcarrier coefficients may take values from the BPSK, QPSK, 16-QAM, 64-QAM, or 256-QAM constellations.

A WUR AP shall support the following features:

— Transmission of a WUR Basic PPDU with 20 MHz channel width, WUR LDR, and single stream.
— Transmission of a WUR Basic PPDU with 20 MHz channel width, WUR HDR, and single stream.

A WUR non-AP STA shall support the following features:

— Reception of a WUR Basic PPDU with 20 MHz channel width, WUR LDR, and single stream.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A WUR AP may support the following features:

— Transmission of a WUR FDMA PPDU with 40 MHz and 80 MHz contiguous channel widths.
— Transmission of a WUR FDMA PPDU with subchannel puncturing for 80 MHz.

A WUR non-AP STA may support the following features:

— Reception of a WUR Basic PPDU with 20 MHz channel width, WUR HDR, and single stream.
— Reception of a WUR Beacon frame in one channel at one time and a WUR Short Wake-up frame or a WUR Wake-up frame or a WUR Vendor Specific frame in a different channel at a different time (see 29.11).

A WUR AP shall not transmit a WUR PPDU in an operating class for which the behavior limits set listed in Annex E includes the DFS_50_100_Behavior.

30.2 WUR PHY service interface

30.2.1 Introduction

The WUR PHY provides an interface to the WUR MAC. The interface includes TXVECTOR, RXVECTOR and PHY-CONFIG_VECTOR.

Using the TXVECTOR, the MAC supplies the PHY with per PPDU transmit parameters. Using the RXVECTOR, the PHY informs the MAC of the received PPDU parameters. Using the PHY-CONFIG_VECTOR, the MAC configures the PHY for operation, independent of frame transmission or reception.

30.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 30-1 are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication and PHY_RXEND.indication primitives.

30.2.3 PHY-CONFIG_VECTOR parameters

The PHY-CONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a WUR PHY contains an OPERATING_CHANNEL parameter, which identifies the operating channel. The PHY shall set dot11CurrentFrequency to this parameter.

30.3 WUR PHY

30.3.1 Introduction

This subclause provides the procedure by which PSDUs are converted to and from transmissions on the wireless medium.

During transmission, a single PSDU (in the WUR Basic PPDU case) or multiple PSDUs (in the WUR FDMA PPDU case) are processed and appended to the WUR PHY preamble including L-STF, L-LTF, L-SIG, BPSK-Mark1, BPSK-Mark2, and WUR-Sync field to create the WUR PPDU. At the receivers, the L-STF, L-LTF, L-SIG fields are accordingly processed to aid in protection of the WUR-Sync and the PSDU. The WUR-Sync field is accordingly processed to aid in the detection, demodulation, and delivery of the PSDU.

Table 30-1—TXVECTOR and RXVECTOR parameters

Parameter	Condition	Value	TXVECTOR	RXVECTOR
FORMAT		Determines the format of the PPDU. Enumerated type: — WUR_BASIC indicates WUR Basic PPDU format in TXVECTOR. — WUR_FDMA indicates WUR FDMA PPDU format in TXVECTOR. — WUR indicates WUR PPDU format in RXVECTOR.	Y	Y
L_LENGTH	FORMAT is WUR_BASIC	Indicates the value used to set the LENGTH field in L-SIG field. NOTE—The length field of the L-SIG field in WUR Basic PPDU is defined in Equation (30-16) using the TXTIME value defined by Equation (30-13).	Y	N
	FORMAT is WUR_FDMA	Indicates the value used to set the LENGTH field in L-SIG field. NOTE—The length field of the L-SIG field in WUR FDMA PPDU is defined in Equation (30-16) using the TXTIME value defined by Equation (30-17).		
L_DATARATE	FORMAT is WUR_BASIC or WUR_FDMA	Indicates the value used to set the RATE field in L-SIG field. NOTE—The rate field in the L-SIG field in WUR Basic PPDU and WUR FDMA PPDU is set to value representing 6Mb/s in the 20 MHz channel spacing column of Table 17-6.	Y	N
CH_BANDWIDTH	FORMAT is WUR_BASIC or WUR_FDMA	Indicates whether the PPDU is transmitted using 20 MHz or 40 MHz or 80 MHz channel width. Enumerated type: — WUR_CBW_20 for 20 MHz. — WUR_CBW_40 for 40 MHz. — WUR_CBW_80 for 80 MHz. — WUR_CBW_PUNC80-PRI for subchannel puncturing in 80 MHz, where in the preamble the secondary 20 MHz is punctured. — WUR_CBW_PUNC80-SEC for subchannel puncturing in 80 MHz, where in the preamble one of the two 20 MHz subchannels in secondary 40 MHz is punctured. — WUR_CBW_PUNC80-PRI-SEC-1 for subchannel puncturing in 80 MHz, where in the preamble the secondary 20 MHz and the lower 20 MHz subchannel in secondary 40 MHz is punctured. — WUR_CBW_PUNC80-PRI-SEC-2 for subchannel puncturing in 80 MHz, where in the preamble the secondary 20 MHz and the higher 20 MHz subchannel in secondary 40 MHz is punctured.	Y	N

Table 30-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
WUR_DATARATE	FORMAT is WUR_BASIC or WUR_FDMA	Determines the transmission rate of the WUR Basic PPDU and WUR FDMA PPDU. Enumerated type: — WUR_LDR indicates the data rate 62.5 kb/s. — WUR_HDR indicates the data rate 250 kb/s.	MU	Y
PSDU_LENGTH	FORMAT is WUR_BASIC or WUR_FDMA	Indicates the number of octets in the WUR PPDU in the range 0 to aPSDUMaxLength octets.	MU	N
RSSI	FORMAT is WUR_BASIC or WUR_FDMA	The allowed values for the RSSI parameter are in the range 0 to 255 inclusive. This parameter is a measurement by the PHY of the power observed at the antennas used to receive the current WUR PPDU. RSSI shall be measured during the reception of the WUR-Sync. RSSI is intended to be used in a relative manner, and it is a monotonically increasing function of the received power.	N	Y

Table 30-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
WUR_CH_OFFSET	FORMAT is WUR_BASIC or WUR_FDMA	Determines the WUR channel. Enumerated type: — 0 indicates the WUR Short Wake-up frame or the WUR Wake-up frame or the WUR Vendor Specific frame is to be transmitted in the WUR primary channel. — 1 indicates the WUR Short Wake-up frame or the WUR Wake-up frame or the WUR Vendor Specific frame is to be transmitted in first higher frequency 20 MHz channel relative to the WUR primary channel. — 2 indicates the WUR Short Wake-up frame or the WUR Wake-up frame or the WUR Vendor Specific frame is to be transmitted in first lower frequency 20 MHz channel relative to the WUR primary channel. — 3 indicates the WUR Short Wake-up frame or the WUR Wake-up frame or the WUR Vendor Specific frame is to be transmitted in second higher frequency 20 MHz channel relative to the WUR primary channel. — 4 indicates the WUR Short Wake-up frame or the WUR Wake-up frame or the WUR Vendor Specific frame is to be transmitted in second lower frequency 20 MHz channel relative to the WUR primary channel. — 5 indicates the WUR Short Wake-up frame or the WUR Wake-up frame or the WUR Vendor Specific frame is to be transmitted in third higher frequency 20 MHz channel relative to the WUR primary channel. — 6 indicates the WUR Short Wake-up frame or the WUR Wake-up frame or the WUR Vendor Specific frame is to be transmitted in third lower frequency 20 MHz channel relative to the WUR primary channel.	MU	N

NOTE 1—In the TXVECTOR column, the following apply:

— "Y" means that the parameter is present.
— "N" means that the parameter is not present.
— "MU" means that the parameter is present for WUR Basic PPDU and is present per user for WUR FDMA PPDU.

NOTE 2—In the RXVECTOR column, the following apply:

— "Y" means that the parameter is present for WUR Basic PPDU.
— "N" means that the parameter is not present.

30.3.2 WUR Basic PPDU format

The WUR Basic PPDU format is defined for the 20 MHz channel bandwidth. Figure 30-1 shows the WUR Basic PPDU format.

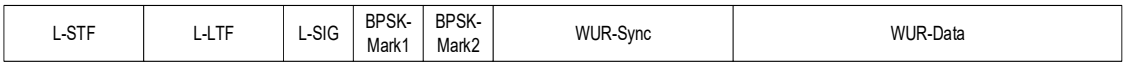

Figure 30-1—WUR Basic PPDU format

The fields of the WUR Basic PPDU format are summarized in Table 30-2.

Table 30-2—Fields of the WUR Basic PPDU

Field	Description
L-STF	Non-HT Short Training field (see 21.3.4.2)
L-LTF	Non-HT Long Training field (see 21.3.4.3)
L-SIG	Non-HT SIGNAL field (see 21.3.4.4 and 21.3.8.2.4
BPSK-Mark1	A BPSK modulated OFDM symbol (see 30.3.9.2.4)
BPSK-Mark2	A BPSK modulated OFDM symbol (see 30.3.9.2.5)
WUR-Sync	WUR Synchronization field (see 30.3.9.3)
WUR-Data	WUR Data field carrying the PSDU (see 30.3.10)

The WUR-Sync field is either 64 μs or 128 μs long, which is determined by the rate of the WUR-Data field.

30.3.3 WUR FDMA PPDU format

The examples of WUR FDMA PPDUs with 40 MHz and 80 MHz channel bandwidths are illustrated in Figure 30-2 and Figure 30-3, respectively.

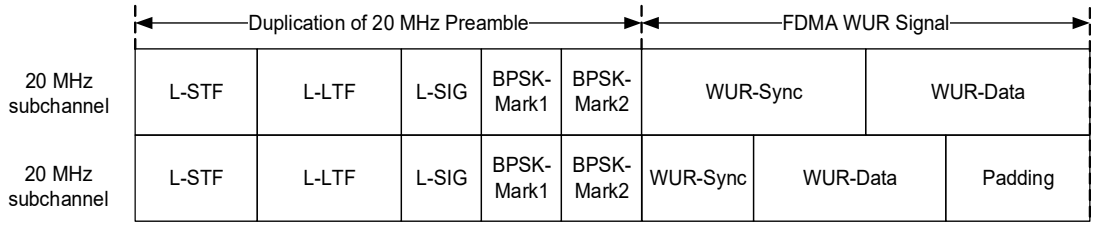

Figure 30-2—An example of a WUR FDMA PPDU for 40 MHz channel widths

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

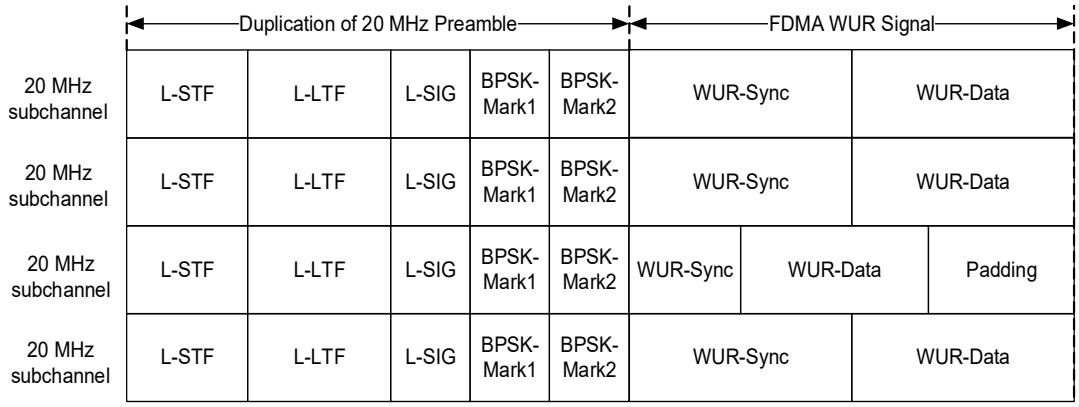

Figure 30-3—An example of a WUR FDMA PPDU for 80 MHz channel widths

For the WUR FDMA PPDUs with 40 MHz and 80 MHz channel bandwidth, different WUR-Sync field according to the rate of the WUR-Data field may be applied to each 20 MHz subchannel.

The preamble of the WUR FDMA PPDU with 40 MHz or 80 MHz channel bandwidth before the WUR-Sync field is the duplication of 20 MHz preamble, which is composed of L-STF, L-LTF, L-SIG, BPSK-Mark1, and BPSK-Mark2 fields. In each 20 MHz subchannel with duplicated 20 MHz preamble, one WUR signal centered in the 20 MHz subchannel is transmitted following the 20 MHz preamble.

In FDMA transmission, the WUR transmission on each nonpunctured 20 MHz subchannel has equal duration of transmission, and if the duration of WUR transmission on any of the nonpunctured 20 MHz subchannels is shorter than the length indicated by the LENGTH field described in 30.4.1, then padding is used such that WUR transmissions on each nonpunctured 20 MHz subchannel always have the length indicated by the LENGTH field in the L-SIG field.

30.3.4 Transmitter block diagram

The WUR-Sync field generation uses an On waveform generator (On-WG) and an Off waveform generator (Off-WG).

The WUR-Data field generation uses the On-WG, the Off-WG, and WUR encoder.

Figure 30-4, Figure 30-5, and 30.3.4.1 through 30.3.4.4 show an example of transmitter block diagram for the WUR-Sync field and the WUR-Data field. The actual waveform generation of these fields is

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

implementation dependent. The waveform generation for L-STF, L-LTF, L-SIG, BPSK-Mark1, and BPSK-Mark2 fields is described in 30.3.5.

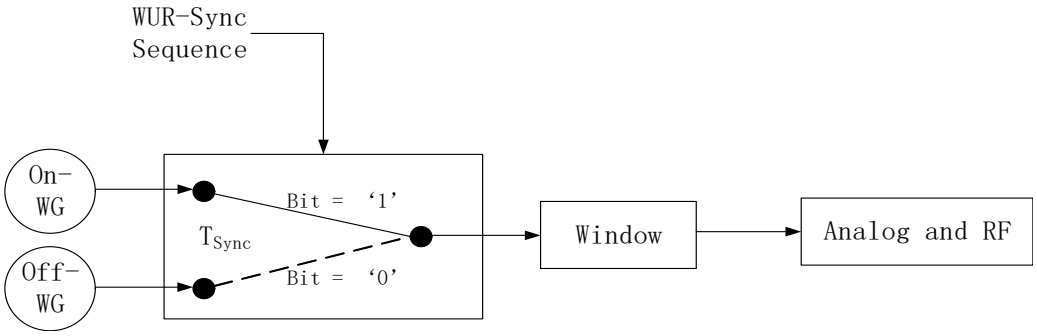

Figure 30-4—An example of a WUR signal generator for the WUR-Sync field

In Figure 30-4, the WUR-Sync sequence is used to switch between the On-WG and the Off-WG. An example of an On-WG and an Off-WG for the WUR-Sync field is given in 30.3.4.1. The corresponding mathematical description of the On-WG for the WUR-Sync field is described as SymHDROn in 30.3.8.

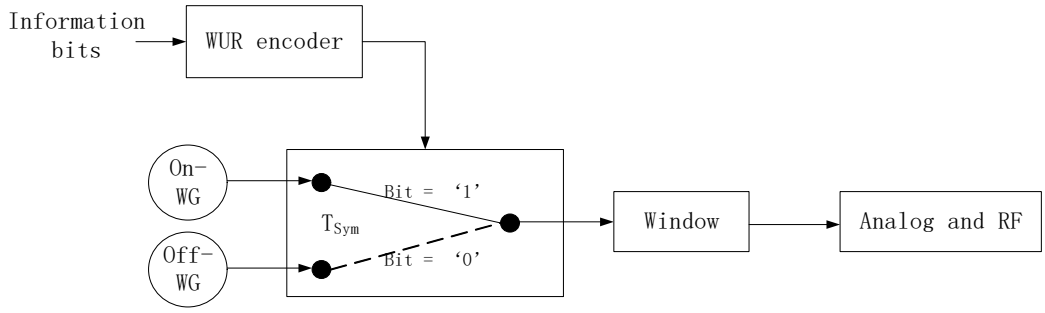

Figure 30-5—An example of a WUR signal generator for the WUR-Data field

An example of a WUR signal generator for the WUR-Data field is shown in Figure 30-5. The information bits are mapped to coded bits by a WUR encoder. Each coded bit is then used to switch between the On-WG and the Off-WG. An example of an On/Off-WG for the WUR-Data field with WUR HDR and WUR-Data field with WUR LDR are given in 30.3.4.1 and 30.3.4.2, respectively. The corresponding mathematical descriptions of the On-WG for the WUR-Data field with WUR HDR and WUR-Data field with WUR LDR are described as SymHDROn and SymLDROn, respectively, in 30.3.8.

NOTE—The waveform generators are different for different data rates.

Copyright © 2025 IEEE. All rights reserved.

30.3.4.1 WUR Basic PPDU waveform generation for WUR-Sync field and WUR-Data field with WUR HDR

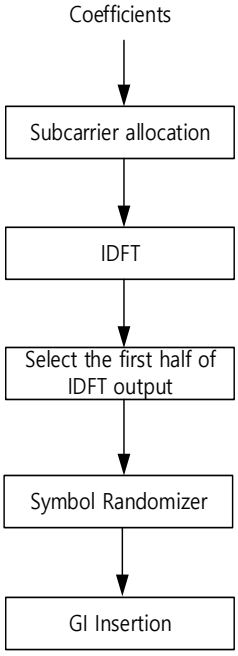

Figure 30-6—An example of an On-WG for the WUR-Sync and WUR-Data fields with WUR HDR

For a single 20 MHz WUR channel the 2 μs WUR OOK On symbol shall have a 2 μs duration. The 2 μs WUR OOK On symbol may be constructed using MC-OOK with the On-WG using the center 13 subcarriers of a 64-point IDFT, sampling at 20 MHz as follows:

— The six subcarriers with subcarrier indices $k = (-6, -4, -2, 2, 4, 6)$ are used with nonzero input. Other subcarriers are null.
— The coefficients of the nonzero subcarriers are selected from the symbols of any of the following constellations: BPSK, QPSK, 16-QAM, 64-QAM, and 256-QAM.
— The first 32 values of the 64-point IDFT output are selected.
— Those 32 values are processed by the Symbol Randomizer as described in 30.3.4.4.
— The last 8 samples of those 32 samples are prepended to the 32 samples generating 40 samples. This step corresponds to the GI Insertion in Figure 30-6.

For a single 20 MHz WUR channel the 2 μs WUR OOK Off symbol shall have a 2 μs duration. The 2 μs WUR OOK Off symbol may be constructed using MC-OOK with the Off-Waveform Generator (Off-WG) as zero for 2 μs.

For 2 μs WUR OOK On and Off symbols, the PPDU correlation test is defined in 30.3.12.5.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

30.3.4.2 WUR Basic PPDU waveform generation for WUR-Data field with WUR LDR

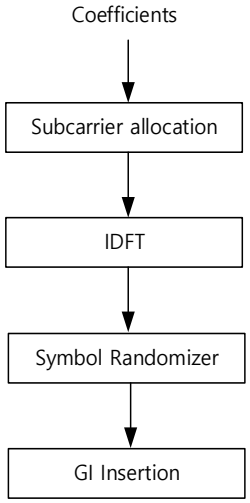

Figure 30-7—An example of an On-WG for the WUR-Data fields with WUR LDR

For a single 20 MHz WUR channel the 4 µs WUR OOK On symbol shall have a 4 µs duration. The 4 µs WUR OOK On symbol may be constructed using MC-OOK with the On-WG using the center 13 subcarriers of a 64-point IDFT, sampling at 20 MHz as follows:

— The 12 subcarriers with subcarrier indices k = (–6, –5, … –1, 1, 2, … 6) are used with nonzero input. Other subcarriers are null.

— The coefficients of the nonzero subcarriers are selected from the symbols of any of the following constellations: BPSK, QPSK, 16-QAM, 64-QAM, and 256-QAM.

— The 64 values from the 64-point IDFT are processed by the Symbol Randomizer as described in 30.3.4.4.

— The last 16 values of the 64-point IDFT output are prepended to the 64 samples generating 80 samples. This step corresponds to the GI Insertion in Figure 30-7.

For a single 20 MHz WUR channel the 4 µs duration WUR OOK Off symbol may be constructed using MC-OOK with the Off-Waveform Generator (Off-WG) as zero for 4 µs.

For 4 µs WUR OOK On and Off symbols, the PPDU correlation test is defined in 30.3.12.5.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

30.3.4.3 WUR FDMA PPDU WUR-Data field waveform generation

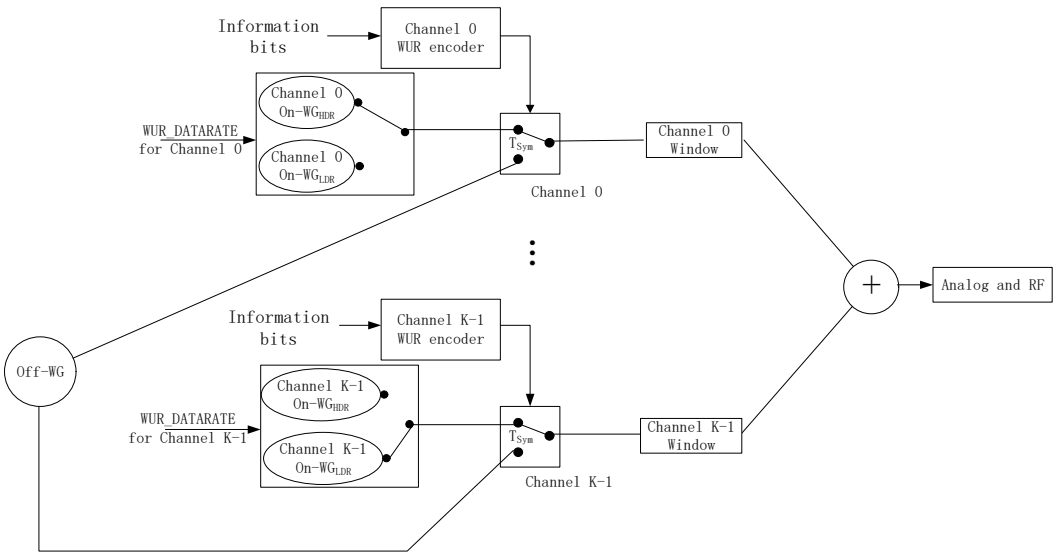

Figure 30-8—An example of a WUR-Data field signal generator for the FDMA transmission

The WUR OOK On symbol for the 20 MHz WUR waveform shall be generated according to 30.3.4.1 or 30.3.4.2 depending on WUR_DATARATE. The 40 MHz or 80 MHz WUR FDMA PPDU should be generated by multiplexing multiple 20 MHz WUR waveforms in the corresponding channel as shown in Figure 30-8.

30.3.4.4 Symbol Randomizer and Per-transmit chain Cyclic Shift

The spectral lines in the WUR PPDU spectrum are removed by the symbol randomizer.

The Symbol Randomizer, shown in Figure 30-9, uses a linear feedback shift register (LFSR) with a generator polynomial $G(z) = z^{-7} + z^{-4} + 1$ to generate a sequence of pseudo random bits. The state of the LFSR is first updated at the end of the first symbol in the WUR-Sync field.

The seventh bit of LFSR state is converted to an integer *m*, with a value of either plus or minus one. A logical zero bit is converted to plus one and a logical one bit is converted to minus one. The input waveform is then multiplied by either plus or minus one, based on the logical bit.

Three of the bits from the LFSR are converted to an integer value between zero and seven, indicated by *n* in Figure 30-9. In Figure 30-9, b0 is the least significant bit (LSB) of the integer *n*, while b2 is the most significant bit of the integer *n*. This integer is used to lookup a cyclic shift value, from a cyclic shift lookup table, which shows cyclic shift values corresponding to the integer *n*. The pseudorandom cyclic shift values according to the cyclic shift integer *n* are given in Table 30-6 for the WUR-Sync field and the WUR-Data field with WUR HDR and in Table 30-7 for the WUR-Data field with WUR LDR.

The cyclic shift value, obtained from the lookup table, is applied to the input waveform.

Then the per-transmit chain cyclic shift is applied to the input waveform. Example values of such cyclic shift diversity are provided in Annex AC.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The symbol randomizer is used for both the WUR-Sync field and the WUR-Data field. The state of the LFSR is updated every T_{Sync} during the WUR-Sync field and updated every T_{Sym} during the WUR-Data field.

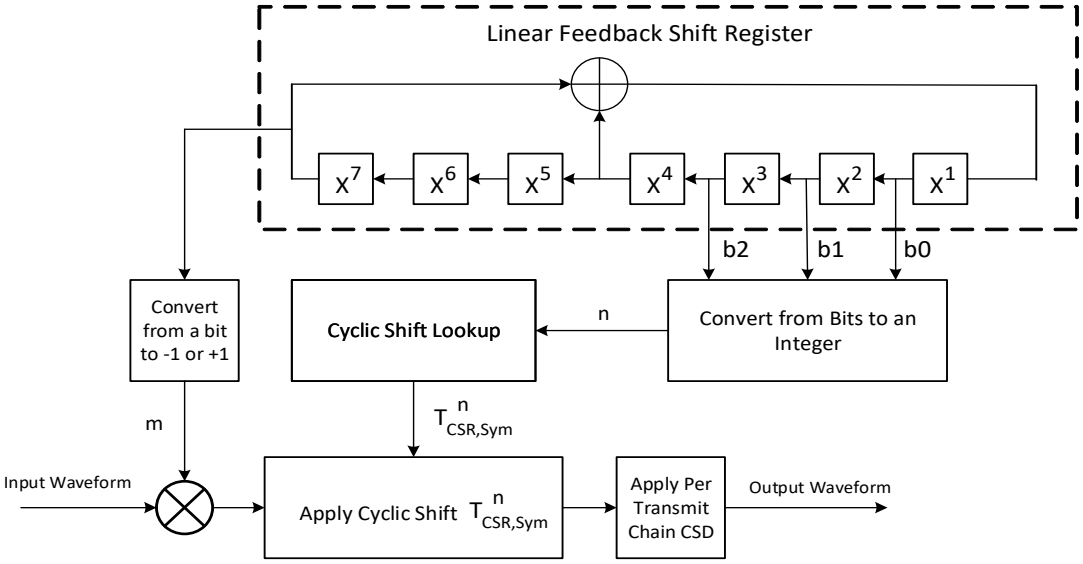

Figure 30-9—Symbol Randomizer

30.3.5 Overview of the PPDU encoding process

30.3.5.1 General

This subclause provides an overview of the WUR PPDU encoding process.

30.3.5.2 Construction of the L-STF

Construct the L-STF field as defined in 30.3.9.2.1 with the following highlights:

a) Determine the channel bandwidth from the TXVECTOR parameter CH_BANDWIDTH.
b) Sequence generation: Generate the L-STF sequence over the CH_BANDWIDTH as described in 30.3.9.2.1.
c) Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.
d) IDFT: Compute the inverse discrete Fourier transform.
e) CSD: Apply CSD for each transmit chain as described in 21.3.8.2.1.
f) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4.
g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 for details.

30.3.5.3 Construction of the L-LTF

Construct the L-LTF field as defined in 30.3.9.2.2 with the following highlights:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

a) Determine the CH_BANDWIDTH from the TXVECTOR.
b) Sequence generation: Generate the L-LTF sequence over the CH_BANDWIDTH as described in 30.3.9.2.2.
c) Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.
d) IDFT: Compute the inverse discrete Fourier transform.
e) CSD: Apply CSD for each transmit chain as described in 21.3.8.2.1.
f) Insert GI and apply windowing: Prepend a GI (2 x LONG_GI) and apply windowing as described in 21.3.7.4.
g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

30.3.5.4 Construction of the L-SIG field

Construct the L-SIG field as defined in 30.3.9.2.3 with the following highlights:

a) In a WUR PPDU, set the RATE subfield in the SIGNAL field to 6 Mb/s. Set the Length, Parity, and Tail bits in the SIGNAL field as described in 30.3.9.2.3.
b) BCC encoder: Encode the L-SIG field by a convolutional encoder at the rate of R=1/2 as described in 21.3.10.5.3.
c) BCC interleaver: Interleave as described in 21.3.10.8.
d) Constellation Mapper: BPSK modulate as described in 21.3.10.9.
e) Pilot insertion: Insert pilots as described in 21.3.10.10.
f) Duplication and phase rotation: Duplicate the L-SIG field over the occupied 20 MHz subchannel of the CH_BANDWIDTH. Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.
g) IDFT: Compute the inverse discrete Fourier transform.
h) CSD: Apply CSD for each transmit chain as described in 21.3.7.4.
i) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4.
j) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

30.3.5.5 Construction of the BPSK-Mark1

Construct the BPSK-Mark1 field as derived from the L-SIG field as defined in 30.3.9.2.4 with the following highlights:

a) In a WUR PPDU, set the BPSK-Mark1 field as described in 30.3.9.2.4.
b) BCC encoder: Encode the BPSK-Mark1 field by a convolutional encoder at the rate of R=1/2 as described in 21.3.10.5.3.
c) BCC interleaver: Interleave as described in 21.3.10.8.
d) Exclusive OR (XOR) each of the output bits of the BCC interleaver with 1.
e) Constellation Mapper: BPSK modulate as described in 21.3.10.9.
f) Pilot insertion: Insert pilots as described in 21.3.10.10.
g) Duplication and phase rotation: Duplicate the BPSK-Mark1 field over each occupied 20 MHz of the CH_BANDWIDTH. Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

h) IDFT: Compute the inverse discrete Fourier transform.

i) CSD: Apply CSD for each transmit chain as described in 21.3.8.2.1.

j) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4.

k) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

30.3.5.6 Construction of the BPSK-Mark2

Construct the BPSK-Mark2 field as derived from the L-SIG field as defined in 30.3.9.2.5 with the following highlights:

a) In a WUR PPDU, set the BPSK-Mark2 field as described in 30.3.9.2.5.

b) BCC encoder: Encode the BPSK-Mark2 field by a convolutional encoder at the rate of R=1/2 as described in 21.3.10.5.3.

c) BCC interleaver: Interleave as described in 21.3.10.8.

d) Exclusive OR (XOR) each of the output bits of the BCC interleaver with 1.

e) Constellation Mapper: BPSK modulate as described in 21.3.10.9.

f) Pilot insertion: Insert pilots as described in 21.3.10.10.

g) Duplication and phase rotation: Duplicate the BPSK-Mark2 field over each occupied 20 MHz of the CH_BANDWIDTH. Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.

h) IDFT: Compute the inverse discrete Fourier transform.

i) CSD: Apply CSD for each transmit chain and frequency segment as described in 21.3.8.2.1.

j) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4.

k) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

30.3.5.7 Construction of the WUR-Sync for a single 20 MHz channel

Construct the WUR-Sync field for a single 20 MHz channel defined in 30.3.9.3 as follows:

a) Set the WUR_DATARATE from the TXVECTOR.

b) WUR-Sync sequence generation: Generate the Sync-bit sequence according to the WUR_DATA-RATE as described in 30.3.9.3.

c) Waveform generation: Generate the WUR OOK waveform by using either On-WG or Off-WG according to the WUR-Sync. The samples in Off-WG shall have zero energy. WUR-Sync bit duration T_{Sync} is 2 μs. Symbol randomization and per-transmit-chain CSD is applied within the waveform generation step.

d) Windowing: Apply windowing.

e) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit.

30.3.5.8 Construction of the WUR-Data for a single 20 MHz channel

Construct the WUR-Data waveform as follows:

a) Information bits are encoded using a WUR encoder as described in 30.3.10.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

b) The output of WUR encoder determines whether to take samples from On-WG or Off-WG. Each symbol duration, $T_{Sym}=T_{SYM\text{-}HDR}$ is 2 μs for WUR HDR, and $T_{Sym}=T_{SYM\text{-}LDR}$ is 4 μs for WUR LDR.

c) Apply the windowing.

d) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal based on the center frequency of the desired channel.

30.3.5.9 Construction of the WUR-Sync and WUR-Data for the FDMA transmission

Construct the WUR-Sync and WUR-Data waveform for the FDMA transmission as follows:

a) Determine the WUR_DATARATE from the TXVECTOR for each 20 MHz subchannel.

b) WUR-Sync sequence generation and WUR encoder for each 20 MHz subchannel: Generate the WUR-Sync sequence according to the WUR_DATARATE as described in 30.3.9.3 and WUR encoded bits, which follow the WUR-Sync sequence according to the input bits as described in 30.3.10 for each 20 MHz subchannel.

c) Waveform generation for the WUR-Sync field: Generate the WUR OOK waveform for the WUR-Sync field by using either On-WG or Off-WG according to the WUR-Sync bit for each 20 MHz sub-channel. The samples in Off-WG shall have zero energy. Each WUR-Sync bit duration, T_{Sync} is 2 μs.

d) Waveform generation for the WUR-Data field: The output of the k^{th} WUR encoder determines whether to sample from the k^{th} On-WG or from the Off-WG, depending on the encoded bit of the corresponding 20 MHz subchannel, where k, $0 \le k \le K-1$, is the index of the 20 MHz subchannel. The samples in Off-WG shall have zero energy. Each symbol duration, $T_{Sym}=T_{SYM\text{-}HDR}$ is 2 μs for WUR HDR, and $T_{Sym}=T_{SYM\text{-}LDR}$ is 4 μs for WUR LDR.

e) Append the padding on nonpunctured 20 MHz subchannel: If the duration of WUR transmission on any nonpunctured 20 MHz subchannel is shorter than the indicated L_LENGTH as described in 30.4.1, generate the padding according to 30.3.11 to align the length indicated by the LENGTH field in the L-SIG field, and the padding is not applied to the punctured 20 MHz subchannel.

f) Windowing: Apply windowing for each 20 MHz subchannel.

g) The outputs per 20 MHz subchannel are added across the 20 MHz subchannels, sample by sample, after applying appropriate subchannel frequency offset.

h) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit.

30.3.6 WUR data rates

The WUR data rate represents the data rate used in the WUR-Data field of the WUR PPDU. There are two data rates: 62.5 kb/s and 250 kb/s, respectively, which are denoted as WUR LDR and WUR HDR. WUR LDR and WUR HDR are distinguished by the predefined sequence in the WUR-Sync field. Rate-dependent parameters are shown in Table 30-14.WUR encoding is applied to both WUR data rates.

30.3.7 Timing related parameters

Table 30-3 defines the timing-related parameters for WUR PPDU formats.

Table 30-4 defines parameters used frequently in Clause 30.

30.3.8 Mathematical description of signals

The transmitted signal is described in complex baseband signal notation. The actual transmitted signal on transmit chain i_{TX}, $r_{\text{RF}}^{(i_{TX})}(t)$, is related to the complex baseband signal by the relation shown in Equation (30-1).

Table 30-3— Timing-related constants

Parameter	Value	Description
$\Delta_{F,\ \mathrm{WUR}}$	312.5 kHz	Subcarrier frequency spacing for WUR PPDU when MC-OOK is used
$T_{DFT,WUR}$	3.2 μs	IDFT/DFT period for the WUR PPDU when MC-OOK is used
$T_{GI,WUR}$	0.8 μs for 4 μs duration WUR OOK symbols; 0.4 μs for 2 μs duration WUR OOK symbols	Guard interval duration for the WUR PPDU when MC-OOK is used
$T_{GI,2}$	1.6 μs	Guard interval duration for the L-LTF field when MC-OOK is used
$T_{Sym\text{-}LDR}$	4 μs	Duration of WUR LDR OOK symbol in WUR-Data field
$T_{Sym\text{-}HDR}$	2 μs	Duration of WUR HDR OOK symbol in WUR-Data field
T_{Sym}	$T_{Sym\text{-}LDR}$ or $T_{Sym\text{-}HDR}$ depending on WUR data rate	Duration of WUR OOK symbol in WUR-Data field
T_{Sync}	2 μs	Duration of WUR OOK symbol in WUR-Sync field
$T_{L\text{-}STF}$	8 μs = 10 × $T_{DFT,WUR}$ /4	Non-HT Short Training field duration
$T_{L\text{-}LTF}$	8 μs = 2 × $T_{DFT,WUR}$ + $T_{GI,L\text{-}LTF}$	Non-HT Long Training field duration
$T_{L\text{-}SIG}$	4 μs	Non-HT SIGNAL field duration
$T_{BPSK\text{-}Mark1}$	4 μs	BPSK-Mark1 field duration
$T_{BPSK\text{-}Mark2}$	4 μs	BPSK-Mark2 field duration
$T_{WUR\text{-}Sync\text{-}LDR}$	128 μs	WUR-Sync field duration for WUR LDR
$T_{WUR\text{-}Sync\text{-}HDR}$	64 μs	WUR-Sync field duration for WUR HDR
$T_{WUR\text{-}Sync}$	$T_{WUR\text{-}Sync\text{-}LDR}$ or $T_{WUR\text{-}Sync\text{-}HDR}$ depending on WUR data rate	WUR-Sync field duration for WUR PPDU

Table 30-4— Frequently used parameters

Symbol	Explanation
N_{SPDB}	Number of WUR OOK symbols per information data bit. For WUR LDR, N_{SPDB} =4. For WUR HDR, N_{SPDB} =2.
N_{TX}	Number of transmit chains
$N_{WUR\text{-}Sync}$	Number of WUR OOK symbols in the WUR-Sync field. For WUR LDR, $N_{WUR\text{-}Sync}$=64. For WUR HDR, $N_{WUR\text{-}Sync}$=32.

$$r_{\mathrm{RF}}^{(i_{TX})}(t) = Re(r_{WUR-Basic-PPDU}^{(i_{TX})}(t)\exp(j2\pi f_c t)) \quad (30\text{-}1)$$

where

$Re(\ldots)$ represents the real part of a complex variable

f_c is the center frequency

$r_{WUR-Basic-PPDU}^{(i_{TX})}(t)$ is the baseband WUR signal on transmit chain i_{TX}

The transmitted RF signal is obtained by up-converting the complex baseband signal, which consists of several fields. The timing boundaries for the various fields are shown in Figure 30-10 where $N_{WUR\text{-}Sync}$ is the number of WUR OOK symbols in the WUR-Sync field and is defined in Table 30-4.

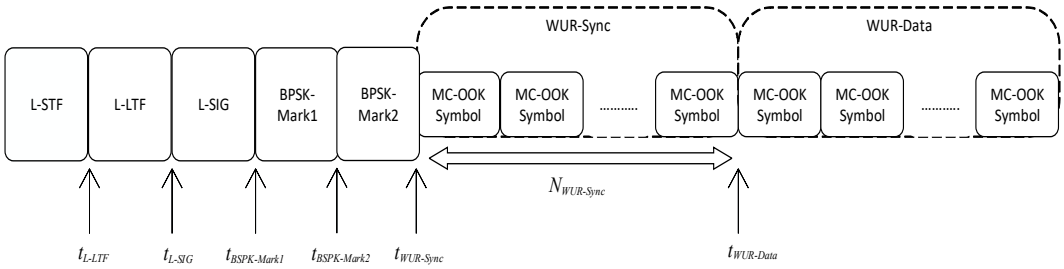

Figure 30-10—Timing boundaries for the WUR Basic PPDU fields

The time offset, t_{Field}, determines the starting time of the corresponding field relative to the start of L-STF ($t = 0$).

The baseband signal is constructed by the concatenation of several fields as shown in Figure 30-10. It shall be as shown in Equation (30-2):

$$\begin{aligned} r_{WUR-Basic-PPDU}^{(i_{TX})}(t) = {} & r_{L-STF}^{(i_{TX})}(t) + r_{L-LTF}^{(i_{TX})}(t - t_{L-LTF}) + r_{L-SIG}^{(i_{TX})}(t - t_{L-SIG}) \\ & + r_{BPSK-Mark1}^{(i_{TX})}(t - t_{BPSK-Mark1}) + r_{BPSK-Mark2}^{(i_{TX})}(t - t_{BPSK-Mark2}) + \\ & r_{WUR-Sync}^{(i_{TX})}(t - t_{WUR-Sync}) + r_{WUR-Data}^{(i_{TX})}(t - t_{WUR-Data}), \\ & 0 \le t \le T_{WUR-Basic-PPDU} \end{aligned} \quad (30\text{-}2)$$

The timing offset values for various fields are given below:

$t_{L\text{-}LTF} = T_{L\text{-}STF}$

$t_{L\text{-}SIG} = t_{L\text{-}LTF} + T_{L\text{-}LTF}$

$t_{BSPK\text{-}Mark1} = t_{L\text{-}SIG} + T_{L\text{-}SIG}$

$t_{BSPK\text{-}Mark2} = t_{BPSK\text{-}Mark1} + T_{BPSK\text{-}Mark1}$

$t_{WUR\text{-}Sync} = t_{BSPK\text{-}Mark2} + T_{BSPK\text{-}Mark2}$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$t_{WUR\text{-}Data} = t_{WUR\text{-}Sync} + T_{WUR\text{-}Sync}$
$T_{WUR\text{-}Basic\text{-}PPDU} = t_{WUR\text{-}Data} + T_{WUR\text{-}Data}$

where T_{Field} is the duration of the field, $T_{WUR\text{-}Sync}$ is the duration of WUR-Sync field, as defined in Table 30-3. $T_{WUR\text{-}Data}$ is the duration of WUR-Data field, with $T_{WUR\text{-}Data}=N_{sym}$ x $T_{sym,}$ where N_{sym} is the number of WUR OOK symbols in the WUR-Data field, as given in Equation (30-14).

The duration of different fields of the WUR Basic PPDU are provided in Table 30-3.

For the L-STF, L-LTF, L-SIG, BPSK-Mark1, and BPSK-Mark2 fields, the baseband signal is constructed as described in 30.3.9.2.

The WUR-Sync and WUR-Data fields comprises of WUR OOK symbols as described in 30.3.9.3 and 30.3.10, respectively. For the WUR OOK On symbols in the WUR-Sync field (WUR-Sync On symbols) and the WUR OOK On symbols in the WUR-Data field (SymLDROn and SymHDROn), the baseband signal may be obtained by the MC-OOK modulation technique of taking the Inverse Discrete Fourier Transform (IDFT) of a set of subcarrier coefficients, which is described by Equation (30-3). This general representation holds for WUR-Sync and WUR-Data fields, and the field specific parameters are provided in Table 30-5.

$$r_{Field}^{(i_{TX})}(t) = \frac{\sqrt{2}}{\sqrt{N_{Field}^{Tone} N_{TX}}} w_{T_{Field}}(t) m \sum_{k=-6}^{6} X_{Field}(k) \exp(j2\pi k \Delta_{F,\,\mathrm{WUR}}(t - T_{GI,\,WUR} - T_{CS,\,Field}^{i_{TX}} - T_{CSR,\,Field}^{n})) \quad (30\text{-}3)$$

where

$\sqrt{2}$ is the scaling factor to compensate for 50% duty cycle from WUR OOK.

N_{TX} is the number of transmit chains as defined in Table 30-4.

$w_{T_{Field}}(t)$ is a windowing function of duration T used to control spectral leakage. Refer to 17.3.2.5 for a discussion of windowing functions.

m and *n* are described in 30.3.4.4. These parameter values may vary across WUR OOK symbols within the field.

$\Delta_{F,\,\mathrm{WUR}}$ is the subcarrier frequency spacing and is given in Table 30-3.

$T_{GI,\,WUR}$ is the length of cyclic prefix.

$T_{CS,\,Field}^{i_{TX}}$ is the cyclic shift applied to the signal from transmit chain i_{TX}, and equals either T_{CS}^{HDR} or T_{CS}^{LDR}, as given in Table 30-5. T_{CS}^{HDR} and T_{CS}^{LDR} are implementation dependent, and example values are given in Table AC-3 and Table AC-4.

$T_{CSR,\,Field}^{n}$ is the pseudorandom cyclic shift with cyclic shift index *n* described in 30.3.4.4. Its values are specified in Table 30-6 and Table 30-7.

$\{X_{Field}(k), -6 \le k \le 6\}$ are the field specific subcarrier coefficients, and equals either S^{HDR} or S^{LDR}, as given in Table 30-5. S^{HDR} and S^{LDR} are implementation dependent sequences, and example values for these sequences are given in Table AC-1 and Table AC-2

N_{Field}^{Tone} is a tone scaling factor.

For the WUR OOK Off symbols in the WUR-Sync and WUR-Data fields, $r_{Field}^{(i_{TX})}(t) = 0$.

NOTE—The expression in Equation (30-3) is provided for a single 20 MHz WUR channel.

7	–1400

Table 30-7 provides, for each value of the index *n*, the cyclic shift values, $T_{CSR,\,Sym}^{n}$, for the LDR WUR-Data field.

Table 30-8 provides the values of the LFSR, the three bits (b2, b1, b0), the index value *n*, and the time delay value of $T_{CSR,\,Sym}^{n}$ for the first seven states of the LFSR.

30.3.9 WUR preamble

30.3.9.1 Introduction

The WUR PHY supports two data rates for the WUR-Data field: (i) 62.5 kb/s, which is denoted as WUR LDR. (ii) 250 kb/s, which is denoted as WUR HDR.

Copyright © 2025 IEEE. All rights reserved.

7	1 0 0 0 0 1 1	0 1 1	3	–600

The data rate of the WUR-Data field of a WUR PPDU is indicated by the WUR-Sync field. There is no explicit field in a WUR PPDU to indicate the data rate. To indicate WUR LDR for the WUR-Data field of a WUR PPDU, a repeated sequence ([*W W*]) is transmitted. Here, *W* is a 32-bit sequence and 64 μs long as defined in Equation (30-9). To indicate WUR HDR for the WUR-Data field of a WUR PPDU, a bitwise complement of the sequence *W* is transmitted.

30.3.9.2 Non-WUR portion of WUR PHY preamble

The Non-WUR portion of the WUR PHY preamble consists of five fields: L-STF, L-LTF, L-SIG, BPSK-Mark1, and BPSK-Mark2.

30.3.9.2.1 L-STF definition

The time domain representation of the L-STF field, transmitted on transmit chain i_{TX}, shall be as specified in Equation (30-4).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$r_{L-STF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{L-STF}^{Tone} N_{TX}}} w_{T_{L-STF}}(t) \sum_{i_{BW} \in \Omega_{20MHz}} \sum_{k=-26}^{26} (\Upsilon_{(k-K_{shift}(i_{BW})),BW} S_{k,20} \exp(j2\pi(k-K_{shift}(i_{BW}))\Delta_f(t-T_{CS}^{i_{TX}}))) \quad (30\text{-}4)$$

where

N_{L-STF}^{Tone} has the value given in Table 21-8.

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmitter chain i_{TX} with a value given in Table 21-10.

Ω_{20MHz} is the set of 20 MHz subchannels that are occupied.

i_{BW} is the index of 20 MHz subchannels, $0 \le i_{BW} \le N_{20MHz}$, and N_{20MHz} is the number of 20 MHz subchannels in the bandwidth indicated by dot11CurrentChannelWidth.

$S_{k,20}$ is defined as $S_{-26,26}$ in Equation (19-8).

$\Upsilon_{k,BW}$ is defined by Equation (21-14), Equation (21-15), and Equation (21-16).

$K_{shift}(i) = 32 \times (N_{20MHz} - 1 - 2i)$.

Δ_f is the subcarrier frequency spacing given in Table 21-5.

30.3.9.2.2 L-LTF definition

The time domain representation of the L-LTF field, transmitted on transmit chain i_{TX}, shall be as specified in Equation (30-5).

$$r_{L-LTF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{L-LTF}^{Tone} N_{TX}}} w_{T_{L-LTF}}(t) \sum_{i_{BW} \in \Omega_{20MHz}} \sum_{k=-26}^{26} (\Upsilon_{(k-K_{shift}(i_{BW})),BW} L_{k,20} \exp(j2\pi(k-K_{shift}(i_{BW}))\Delta_f(t-T_{GI,2}-T_{CS}^{i_{TX}}))) \quad (30\text{-}5)$$

where

N_{L-LTF}^{Tone} has the value given in Table 21-8.

$L_{k,20}$ is defined as $L_{-26,26}$ in Equation (17-8).

$T_{GI,2}$ is the GI duration for L-LTF defined in Table 21-5.

Other variables are defined below Equation (30-4).

30.3.9.2.3 L-SIG field definition

The L-SIG field is used to communicate rate and length information. The structure of the L-SIG field is defined in Figure 17-5.

In a WUR PPDU, the RATE field shall be set to the value representing 6 Mb/s in the 20 MHz channel spacing column of Table 17-6.

The LENGTH field shall be set to the value given by Equation (21-24). The value of TXTIME is described in 30.4.1.

The LSB of the binary expression of the Length value shall be mapped to B5.

The Reserved (R) field shall be set to 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Parity (P) field has the even parity of bits 0–16.

The SIGNAL TAIL field shall be set to 0.

The L-SIG field shall be encoded, interleaved, and mapped following the steps described in 17.3.5.6, 17.3.5.7, and 17.3.5.8. The stream of 48 complex numbers generated by these steps is denoted by $d_k, k = 0, \ldots, 47$. Pilots shall be inserted as described in 17.3.5.9.

The time domain representation of the L-SIG field, transmitted on transmit chain i_{TX}, shall be as specified in Equation (30-6).

$$r_{L-SIG}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{L-SIG}^{Tone} N_{TX}}} w_{T_{L-SIG}}(t) \sum_{i_{BW} \in \Omega_{20MHz}} \sum_{k=-26}^{26} (\Upsilon_{(k-K_{shift}(i_{BW})), BW}(D_{k,20} + p_0 P_k) \exp(j2\pi(k - K_{shift}(i_{BW}))\Delta_f(t - T_{GI} - T_{CS}^{i_{TX}}))) \quad (30\text{-}6)$$

where

N_{L-SIG}^{Tone} has the value given in Table 21-8.

$$D_{k,20} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M_{20}^r(k)}, otherwise \end{cases}$$

$$M_{20}^r(k) = \begin{cases} k+26, -26 \le k \le -22 \\ k+25, -20 \le k \le -8 \\ k+24, -6 \le k \le -1 \\ k+23, 1 \le k \le 6 \\ k+22, 8 \le k \le 20 \\ k+21, 22 \le k \le 26 \end{cases}.$$

p_0 is the first pilot value in the sequence defined in 17.3.5.10.

P_k is defined in 17.3.5.10.

T_{GI} is the GI duration defined in Table 21-5.

Other variables are defined below Equation (30-4).

30.3.9.2.4 BPSK-Mark1 definition

The BPSK-Mark1 field is derived from the L-SIG field and is used to spoof HT STAs from false PPDU format detection.

The time domain waveform of the BPSK-Mark1 field, transmitted on transmit chain i_{TX}, shall be as specified in Equation (30-7).

$$r_{BPSK-Mark1}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{L-SIG}^{Tone} N_{TX}}} w_{T_{BPSK-Mark1}}(t) \sum_{i_{BW} \in \Omega_{20MHz}} \sum_{k=-26}^{26} (\Upsilon_{(k-K_{shift}(i_{BW})), BW}(-D_{k,20} + p_1 P_k) \exp(j2\pi(k - K_{shift}(i_{BW}))\Delta_f(t - T_{GI} - T_{CS}^{i_{TX}}))) \quad (30\text{-}7)$$

where

p_1 is the second pilot value in the sequence defined in 17.3.5.10.

Other variables are defined below Equation (30-4) and Equation (30-6).

30.3.9.2.5 BPSK-Mark2 definition

The BPSK-Mark2 field is derived from the L-SIG field and is used to spoof VHT STAs from false PPDU format detection.

The time domain waveform of the BPSK-Mark2 field, transmitted on transmit chain i_{TX}, shall be as specified in Equation (30-8).

$$r_{BPSK-Mark2}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{L-SIG}^{Tone} N_{TX}}} w_{T_{BPSK-Mark2}}(t) \sum_{i_{BW} \in \Omega_{20MHz}} \sum_{k=-26}^{26} (\Upsilon_{(k-K_{shift}(i_{BW})),\,BW}(-D_{k,\,20} + p_2 P_k) \exp(j2\pi(k - K_{shift}(i_{BW}))\Delta_f(t - T_{GI} - T_{CS}^{i_{TX}}))) \quad (30\text{-}8)$$

where

p_2 is the third pilot value in the sequence defined in 17.3.5.10.

Other variables are defined below Equation (30-4) and Equation (30-6).

30.3.9.3 WUR-Sync field

30.3.9.3.1 Introduction

The structure of the WUR-Sync field depends on the data rate of the WUR-Data field. For WUR LDR, the duration of the WUR-Sync field is 128 μs. For WUR HDR, the duration of the WUR-Sync field is 64 μs. The WUR-Sync field is used by the receiver for PPDU detection, symbol timing recovery and determination of the data rate.

30.3.9.3.2 Cyclic Shift for WUR-Sync field

A cyclic shift should be applied to the WUR-Sync field when multi-antenna WUR OOK signals are transmitted to minimize unintentional beamforming.

When MC-OOK is used to generate the WUR OOK symbols the recommended cycle shift diversity (CSD) values for the WUR-Sync field, which is constructed from 2 μs duration WUR OOK symbols, are provided in Annex AC.

30.3.9.3.3 WUR-Sync field for WUR LDR

For WUR LDR, the WUR-Sync field shall be constructed as a WUR OOK signal. The WUR-Sync sequence is constructed by concatenating two copies of the 32-bit sequence W, where each bit in the sequence is mapped to a WUR OOK symbol of duration 2 μs, and W is defined in Equation (30-9).

$$W = [1\ 0\ 1\ 0\ 0\ 1\ 0\ 0\ 1\ 0\ 1\ 1\ 1\ 0\ 1\ 1\ 0\ 0\ 0\ 1\ 0\ 1\ 1\ 1\ 0\ 0\ 1\ 1\ 1\ 0\ 0\ 0] \quad (30\text{-}9)$$

This WUR-Sync sequence is used to construct the WUR-Sync field waveform as shown in Figure 30-4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

30.3.9.3.4 WUR-Sync field for WUR HDR

For WUR HDR, the WUR-Sync field shall be constructed as a WUR OOK signal. The WUR-Sync sequence is constructed as the bitwise complement of the 32-bit sequence W, where each bit in the sequence is mapped to a WUR OOK symbol of duration 2 μs, and W is defined in Equation (30-9). This bitwise complement sequence is defined in Equation (30-10).

$$\overline{W} = \left[0\ 1\ 0\ 1\ 1\ 0\ 1\ 1\ 0\ 1\ 0\ 0\ 0\ 1\ 0\ 0\ 1\ 1\ 1\ 0\ 1\ 0\ 0\ 0\ 1\ 1\ 0\ 0\ 0\ 1\ 1\ 1\right] \quad (30\text{-}10)$$

This Sync-bit sequence is used to construct the WUR-Sync field waveform as shown in Figure 30-4.

30.3.10 WUR-Data field

30.3.10.1 Cyclic Shift for WUR-Data field

A cyclic shift should be applied to the WUR-Data field when multi-antenna WUR OOK signals are transmitted to minimize unintentional beamforming.

When MC-OOK is used to generate the WUR OOK symbols the recommended cycle shift diversity (CSD) values for the WUR-Data field with WUR LDR, which is constructed from 4 μs duration WUR OOK symbols, are provided in Annex AC.

When MC-OOK is used to generate the WUR OOK symbols the recommended cycle shift diversity (CSD) values for the WUR-Data field with WUR HDR, which is constructed from 2 μs duration WUR OOK symbols, are provided in Annex AC.

30.3.10.2 WUR-Data field for WUR LDR and WUR HDR

The WUR-Data field shall be encoded by WUR encoding. Encoded bits corresponding to each input bit are shown in Table 30-9 and Table 30-10 for WUR LDR and WUR HDR, respectively.

Table 30-9—WUR encoded bits for WUR LDR

Input bit	Encoded bits
0	1010
1	0101

Table 30-10—WUR encoded bits for WUR HDR

Input bit	Encoded bits
0	10
1	01

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The encoded binary data shall be modulated so that encoded bits 0 and 1 shall be represented by Off and On symbols, respectively. The duration of the WUR OOK symbol corresponding to each encoded bit is dependent on WUR data rate: 4 μs for WUR LDR and 2 μs for WUR HDR.

For WUR LDR, 4 μs duration WUR OOK Off and On symbols are denoted as SymLDROff and SymLDROn, respectively. For WUR HDR, 2 μs duration WUR OOK Off and On symbols are denoted as SymHDROff and SymHDROn, respectively.

SymLDROn and SymHDROn should be generated using 13 contiguous subcarriers, centered within a 20 MHz channel, with a subcarrier spacing of 312.5 kHz and the center subcarrier being null. The subcarrier coefficients may take values from the BPSK, QPSK, 16-QAM, 64-QAM, or 256-QAM constellations.

When a single 20 MHz WUR channel is used for transmission of a WUR Basic PPDU, SymHDROn and SymLDROn are described in 30.3.8. The generation of SymHDROn and SymLDROn is described in 30.3.4.1 and 30.3.4.2, respectively.

For a FDMA transmission, the WUR OOK waveform generation is described in 30.3.4.3.

30.3.11 WUR Padding field for a WUR FDMA PPDU

For a WUR FDMA PPDU, if padding is needed on any 20 MHz subchannels, the padding waveform shall be generated by repeating the WUR OOK waveform of WUR HDR information bit 1 as described in Table 30-14. The symbol randomizer as described in 30.3.4.4 should be used in the padding field continued from the WUR-Data field. The state of the LSFR is updated every $T_{Sym-HDR}$ during the padding field.

For a nonpunctured WUR FDMA 20 MHz subchannel, i_{BW}, the number of padding WUR HDR bits is calculated as:

$$N_{pad,\,i_{BW}} = \frac{\max\limits_{j_{BW} \in \Omega_{20MHz}} \left\{ T_{WUR-Sync,\,j_{BW}} + T_{Sym,\,j_{BW}} \times N_{Sym,\,j_{BW}} \right\} - \left(T_{WUR-Sync,\,i_{BW}} + T_{Sym,\,i_{BW}} \times N_{Sym,\,i_{BW}} \right)}{4} \quad (30\text{-}11)$$

where

$T_{WUR-Sync,\,i_{BW}}$ and $T_{Sym,\,i_{BW}}$ denote $T_{WUR-Sync}$ and T_{Sym} for 20 MHz subchannel i_{BW}, respectively. $T_{WUR-Sync}$ and T_{Sym} are defined in Table 30-3.

$N_{Sym,\,i_{BW}}$ is the number of WUR OOK symbols in the WUR-Data field for 20 MHz subchannel. It is a function of the length of WUR MAC frame in the WUR-Data field (WUR_MPDU_LENGTH) for 20 MHz subchannel i_{BW} and N_{SPDB} as defined in Equation (30-14).

30.3.12 WUR transmit specification

30.3.12.1 Transmit spectrum mask

For operation using 20 MHz channel spacing, the transmitted spectrum of the L-STF, L-LTF, L-SIG, BPSK-Mark1, and BSPK-Mark2 fields shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 18 MHz, –20 dBr at 11 MHz frequency offset, –28 dBr at 20 MHz frequency offset, and the maximum of –40 dBr and –53 dBm/MHz at 30 MHz frequency offset and above. The transmitted spectral density of the L-STF, L-LTF, L-SIG, BPSK-Mark1, and BPSK-Mark2 fields of the transmitted signal shall fall within the spectral mask, as shown in Figure 17-13.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements and the mask defined in this subclause.

NOTE 2—Transmit spectral mask in Figure 17-13 is not drawn to scale.

NOTE 3—For rules regarding TX center frequency leakage levels, the power measured at the center of transmission BW using resolution BW 312.5 kHz cannot exceed *P*-17.5, where *P* is the transmit power per antenna in dBm during transmission of the L-SIG field.

For operation using 20 MHz channel spacing, the transmitted spectrum of the WUR-Sync and WUR-Data fields shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 4.5 MHz, –15 dBr at 3.5 MHz frequency offset, –20 dBr at 11 MHz frequency offset, –28 dBr at 20 MHz frequency offset, and the maximum of –40 dBr and –53 dBm/MHz at 30 MHz frequency offset and above.

The transmitted spectral density of the WUR-Sync and WUR-Data fields of the transmitted signal shall fall within the spectral mask, as shown in Figure 30-11.

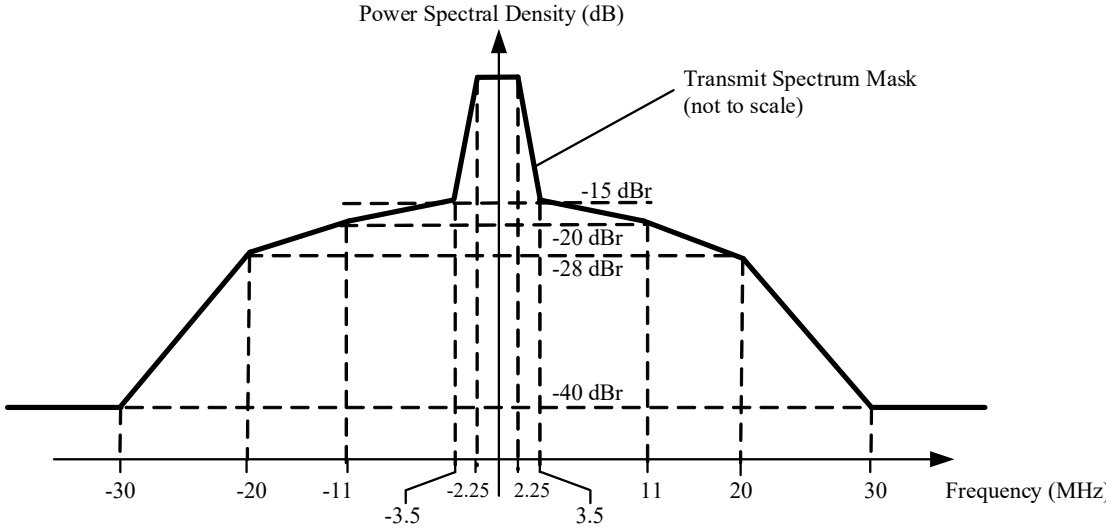

Figure 30-11—Transmit spectrum mask for WUR-Sync and WUR-Data fields of WUR Basic PPDU transmission

For a WUR FDMA PPDU, the spectrum mask within each 20 MHz subchannel is the same as the spectrum mask of 20 MHz WUR Basic PPDU as defined above. The spectrum outside the WUR FDMA PPDU channel bandwidth is the same as spectrum mask of 40 MHz or 80 MHz as defined in 21.3.17.1.

For a 40 MHz mask WUR FDMA PPDU, the transmitted spectrum of the L-STF, L-LTF, L-SIG, BPSK-Mark1, and BPSK-Mark2 fields shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 38 MHz, –20 dBr at 21 MHz frequency offset, –28 dBr at 40 MHz frequency offset, and the maximum of –40 dBr and –56 dBm/MHz at 60 MHz frequency offset and above. The transmitted spectral density of the L-STF, L-LTF, L-SIG, BPSK-Mark1, and BPSK-Mark2 fields of the transmitted signal shall fall within the spectral mask, as shown in Figure 21-30.

For a 40 MHz mask WUR FDMA PPDU, the transmitted spectrum of the WUR-Sync and WUR-Data fields within each 20 MHz subchannel shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 4.5 MHz from the center of the 20 MHz subchannel, –15 dBr at 3.5 MHz,

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

and –20 dBr at 11 MHz frequency offset from the center of the 20 MHz subchannel. The transmitted spectrum of the WUR-Sync and WUR-Data fields shall have –28 dBr at 40 MHz frequency offset, and the maximum of –40 dBr and –56 dBm/MHz at 60 MHz frequency offset and above. The transmitted spectral density of the WUR-Sync and WUR-Data fields of the transmitted signal shall fall within the spectral mask, as shown in Figure 30-12.

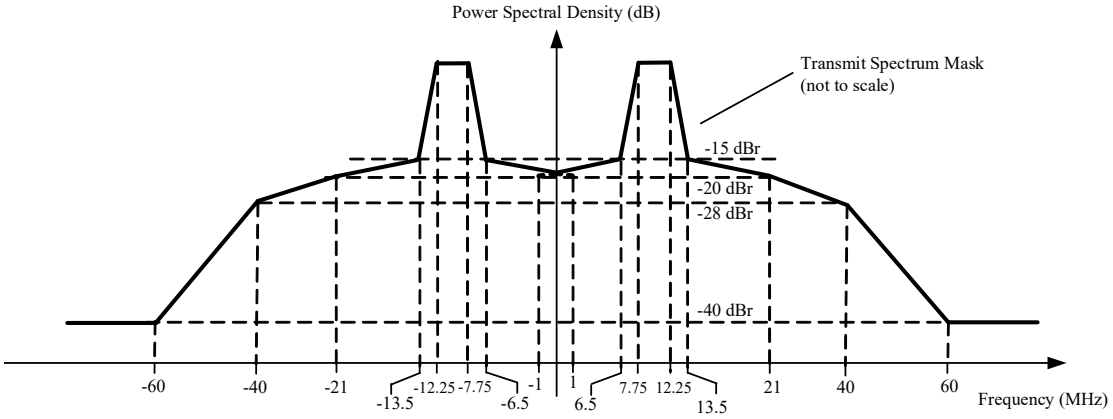

Figure 30-12—Transmit spectrum mask for WUR-Sync and WUR-Data fields of 40 MHz WUR FDMA PPDU transmission

For a 80 MHz mask WUR FDMA PPDU, the transmitted spectrum of the L-STF, L-LTF, L-SIG, BPSK-Mark1, and BPSK-Mark2 fields shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 78 MHz, –20 dBr at 41 MHz frequency offset, –28 dBr at 80 MHz frequency offset, and the maximum of –40 dBr and –59 dBm/MHz at 120 MHz frequency offset and above. The transmitted spectral density of the L-STF, L-LTF, L-SIG, BPSK-Mark1, and BPSK-Mark2 fields of the transmitted signal shall fall within the spectral mask, as shown in Figure 21-31.

For an 80 MHz mask WUR FDMA PPDU, the transmitted spectrum of the WUR-Sync and WUR-Data fields within each 20 MHz subchannel shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 4.5 MHz from the center of the 20 MHz subchannel, –15 dBr at 3.5 MHz, –20 dBr at 11 MHz frequency offset from the center of the 20 MHz subchannel. The transmitted spectrum of the WUR-Sync and WUR-Data fields shall have –28 dBr at 80 MHz frequency offset, and the maximum of –40 dBr and –59 dBm/MHz at 120 MHz frequency offset and above. The transmitted spectral density of the WUR-Sync and WUR-Data fields of the transmitted signal shall fall within the spectral mask, as shown in Figure 30-13.

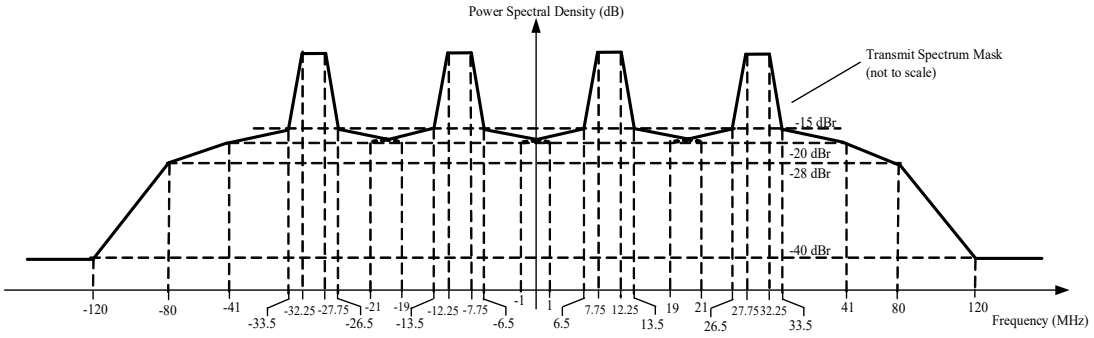

Figure 30-13—Transmit spectrum mask for WUR-Sync and WUR-Data fields of 80 MHz WUR FDMA PPDU transmission

30.3.12.2 Spectral flatness

The spectral flatness is measured by comparing the power in any contiguous 1 MHz segment within the center 4 MHz of the 20 MHz channel to the total transmitted power in the center 4 MHz.

The transmitted power is measured in the manner described in 5.4.3.2.1 of [B10] for equipment with continuous and noncontinuous transmissions.

Let P_{4MHz} indicate the total power in the center 4 MHz. The average power over a 1 MHz segment, within the center 4 MHz, is given by, $P_{ave} = P_{4MHz} - 6$ dB. The requirement is that the power in any 1 MHz segment, within the center 4 MHz, is in the range [$P_{ave} - 6$ dB, $P_{ave} + 3$ dB].

For FDMA transmission, this applies to each 20 MHz channel.

30.3.12.3 Transmit center frequency and symbol clock frequency tolerance

The symbol clock frequency and transmit center frequency tolerance shall be ±20 ppm maximum. The transmit center frequency and the symbol clock frequency for all transmit antennas and frequency segments shall be derived from the same reference oscillator.

30.3.12.4 Transmit On and Off symbols power ratio

For each input bit of the WUR-Data field transmitted at WUR HDR, the ratio between the averaged power of the On symbol and the averaged power of the Off symbol of the transmit signal in the WUR-Data field shall be at least 20 dB.

For each input bit of the WUR-Data field transmitted at WUR LDR, the ratio between the averaged power over On symbols and the averaged power over Off symbols of the transmit signal in the WUR-Data field shall be at least 20 dB.

For the WUR-Sync field transmission, the ratio between the averaged power over all On symbols and the averaged power over all Off symbols in the WUR-Sync field shall be at least 20 dB.

For FDMA transmission, the above requirement on the transmit On and Off symbols power ratio applies to each 20 MHz channel.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

30.3.12.5 Correlation test on WUR OOK symbols

An autocorrelation metric indicative of that used for L-STF detection in non-WUR receivers is defined. The correlation metric is given in Equation (30-12),

$$C(n)=\left|\left(\frac{N}{N-1}\right)\frac{\sum_{k=0}^{M(N-1)-1} x(n+k)x^*(n+k+M)}{\sum_{k=0}^{MN-1}|x(n+k)|^2}\right| \quad (30\text{-}12)$$

where M = 16, which is the number of samples in an 800 ns time period, sampled at 20 MHz, and N=6, which is the number of 800 ns time periods over which the correlation metric is calculated.

This metric is calculated over the WUR-Sync and WUR-Data fields, at a sampling rate of 20 MHz using the WUR OOK symbols. Hence, the value of n spans from the beginning of the WUR-Sync field to the end of the WUR-Data field. The PPDU should be tested for both the WUR LDR and WUR HDR with a 6-byte data field of random data. The maximum value of the correlation metric should be less than 0.4.

30.3.13 WUR receiver specification

The input levels are measured at the antenna connectors and are referenced as the average power per receive antenna.

30.3.13.1 Receiver minimum input sensitivity

The packet error ratio (PER) shall be less than 10% for a PSDU length of 6 octets with the rate-dependent input levels listed in Table 30-11.

Table 30-11—Receiver minimum input level sensitivity

Modulation	Minimum sensitivity (dBm)
WUR LDR	–82
WUR HDR	–77

30.3.13.2 Adjacent channel rejection

Adjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate dependent sensitivity specified in Table 30-11 and raising the power of the interfering signal of 20 MHz bandwidth until 10% PER is caused for a WUR PSDU length of 6 octets. The power difference between the interfering and desired channel is the corresponding adjacent channel rejection. The center frequency of the adjacent channel shall be placed 20 MHz away from the center frequency of the desired signal.

The interfering signal in the adjacent channel shall be a conformant OFDM signal, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. The interfering signal shall be derived from a separate signal source. For a conforming OFDM PHY, the corresponding rejection shall be no less than specified in Table 30-12.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 30-12—Minimum required adjacent and nonadjacent channel rejection levels

Modulation	Adjacent channel rejection (dB)	Nonadjacent channel rejection (dB)
WUR LDR	16	32
WUR HDR	11	27

30.3.13.3 Nonadjacent channel rejection

Nonadjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate dependent sensitivity specified in Table 30-11 and raising the power of the interfering signal of 20 MHz bandwidth until 10% PER is caused for a WUR PSDU length of 6 octets. The power difference between the interfering and desired channel is the corresponding nonadjacent channel rejection. The center frequency of the nonadjacent channel shall be placed 40 MHz away from the center frequency of the desired signal.

The interfering signal in the nonadjacent channel shall be a conformant OFDM signal, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. The interfering signal shall be derived from a separate signal source. For a conforming OFDM PHY, the corresponding rejection shall be no less than specified in Table 30-12.

30.3.13.4 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a WUR PSDU length of 6 octets, for a maximum input level of -30 dBm in 5 GHz band and –20 dBm in 2.4 GHz band, measured at each antenna for any baseband WUR modulation.

30.3.13.5 CCA sensitivity

The CCA sensitivity shall follow each CCA sensitivity specification for the attached non-WUR PHY as defined in 17.3.10.6 for OFDM, 19.3.19.6 for HT, 21.3.18.5 for VHT and 27.3.22.6 for HE depending on the Capabilities Element.

30.3.14 WUR transmit procedure

There are two options for the PHY transmit procedure: single channel and FDMA. The typical transmit procedures are shown in Figure 30-14 and Figure 30-15. The first option is selected if the TXVECTOR CH_BANDWIDTH parameter is equal to WUR_CBW_20.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The second option is for the optional FDMA to transmit at a wider bandwidth if the TXVECTOR CH_BANDWIDTH parameter is not equal to WUR_CBW_20 (see Table 30-1). In this option WUR PPDU is simultaneously generated and transmitted on each of the 20 MHz channels.

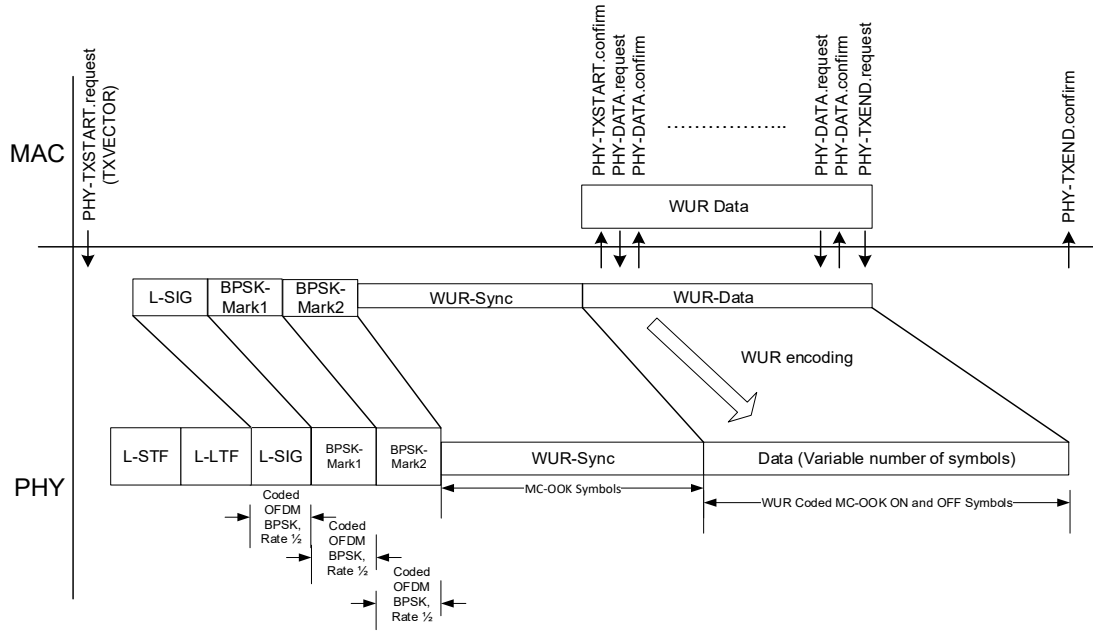

Figure 30-14—PHY transmit procedure for a WUR Basic PPDU

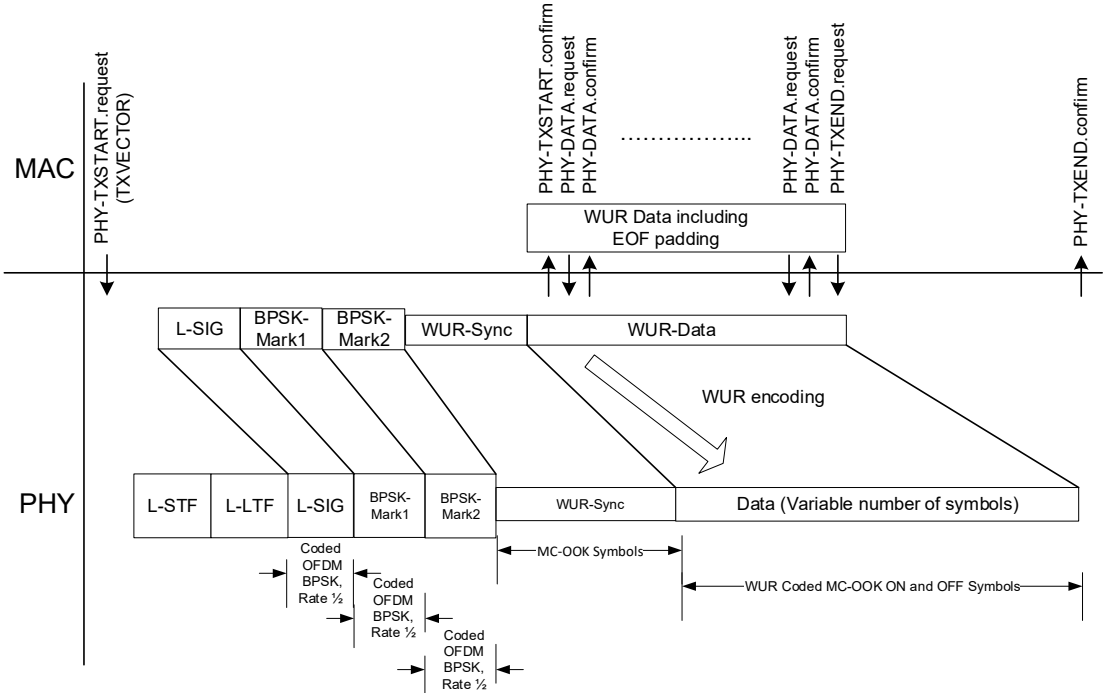

Figure 30-15—PHY transmit procedure for a WUR FDMA PPDU

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For both options, in order to transmit data, the MAC generates a PHY-TXSTART.request primitive, which causes the PHY entity to enter the transmit state. Further, the PHY is set to operate at the appropriate frequency through station management via the PLME, as specified in 30.4. Other transmit parameters, such as transmit power, are set via the PHY-SAP using the PHY-TXSTART.request(TXVECTOR) primitive, as described in 30.2.2.

The PHY indicates the state of the primary channel and other channels for FDMA case via the PHY-CCA.indication primitive (see 30.3.13.5 and 8.3.5.12). Transmission of the PPDU shall be initiated by the PHY after receiving the PHY-TXSTART.request(TXVECTOR) primitive. The TXVECTOR elements for the PHY-TXSTART.request primitive are specified in Table 30-1.

After the PHY L-STF, L-LTF and L-SIG field transmission are started, the PHY entity immediately initiates BPSK-Mark1 transmission and performs any required scrambling and data encoding if needed as defined by parameters of the TXVECTOR, as described in 30.2.2. After the BPSK-Mark1 transmission the PHY entity immediately initiates BPSK-Mark2 transmission and performs any required scrambling and data encoding if needed as defined by parameters of the TXVECTOR, as described in 30.2.2. After BPSK-Mark2 transmission is started, the PHY entity initiates transmission of WUR-Sync field according to the data rate defined in TXVECTOR. The Sync transmission is followed by WUR encoding of WUR-Data field as described in 30.3.4. The data shall be exchanged between the MAC and the PHY through a series of PHY-DATA.request(DATA) primitives issued by the MAC, and PHY-DATA.confirm primitives issued by the PHY. In FDMA case, PHY padding bits are appended, as needed, to each 20 MHz channel to make the length of the PPDU equal to the Length indicated in L-SIG field.

A transmission may be prematurely terminated by the MAC through the PHY-TXEND.request primitive.

A WUR transmission is terminated by receiving a PHY-TXEND.request primitive. Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY. In a single channel WUR transmission, normal termination occurs after the transmission of the final bit of the last WUR octet indicated by N_{octet}, which is defined as the WUR MPDU LENGTH in octets. The maximum value of the parameter is given in 30.4.2. In WUR FDMA transmission, normal termination occurs after the transmission of the final bit of the last WUR octet indicated by N_{max_octet}, which is defined as the maximum of WUR MPDU LENGTH in octets, over the 20 MHz channels. For a single channel WUR, $N_{max\_octet} = N_{octet}$.

When the WUR transmission is completed, the PHY entity enters the receive state.

A typical state machine implementation of the transmit PHY for a WUR transmission is provided in Figure 30-16. Request (.request) and confirmation (.confirm) primitives are issued once per state as shown.

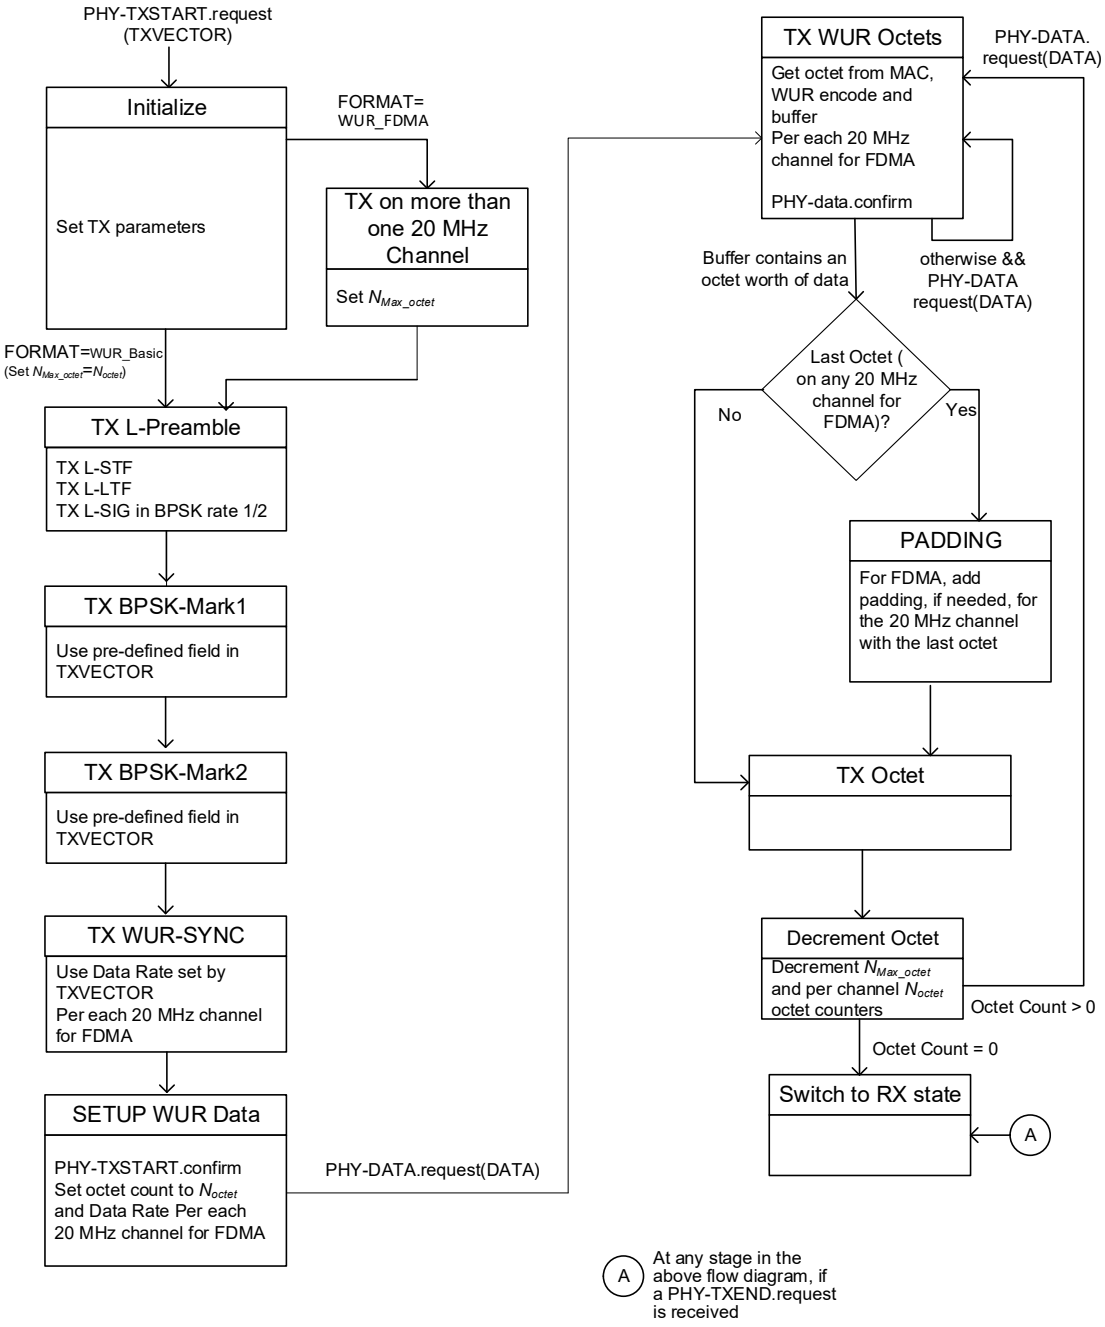

Figure 30-16—PHY transmit state machine

30.3.15 WUR receive procedure

A typical PHY receive procedure is shown for WUR_Basic format in Figure 30-17. A typical state machine implementation of the receive PHY is given in Figure 30-18. The PHY is set to operate at the appropriate

frequency through station management via the PLME, as specified in 30.4. The receive parameters, such as RSSI, may be accessed via the PHY-SAP.

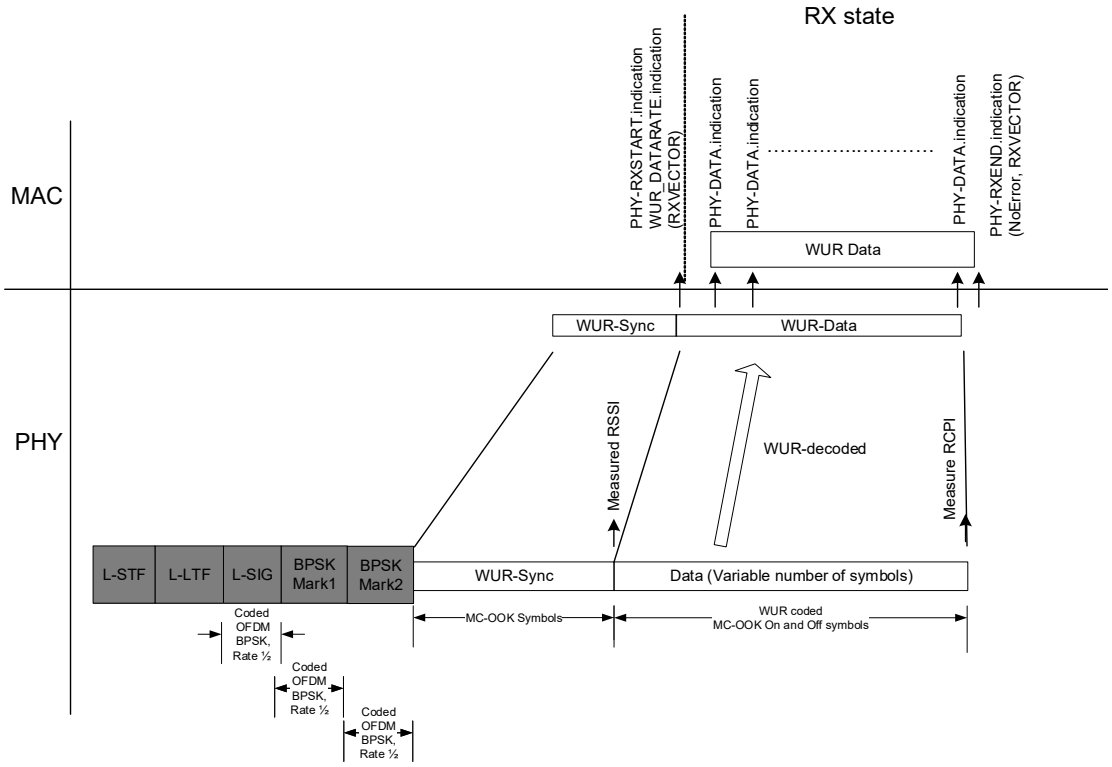

Figure 30-17—PHY receive procedure for WUR Basic PPDU

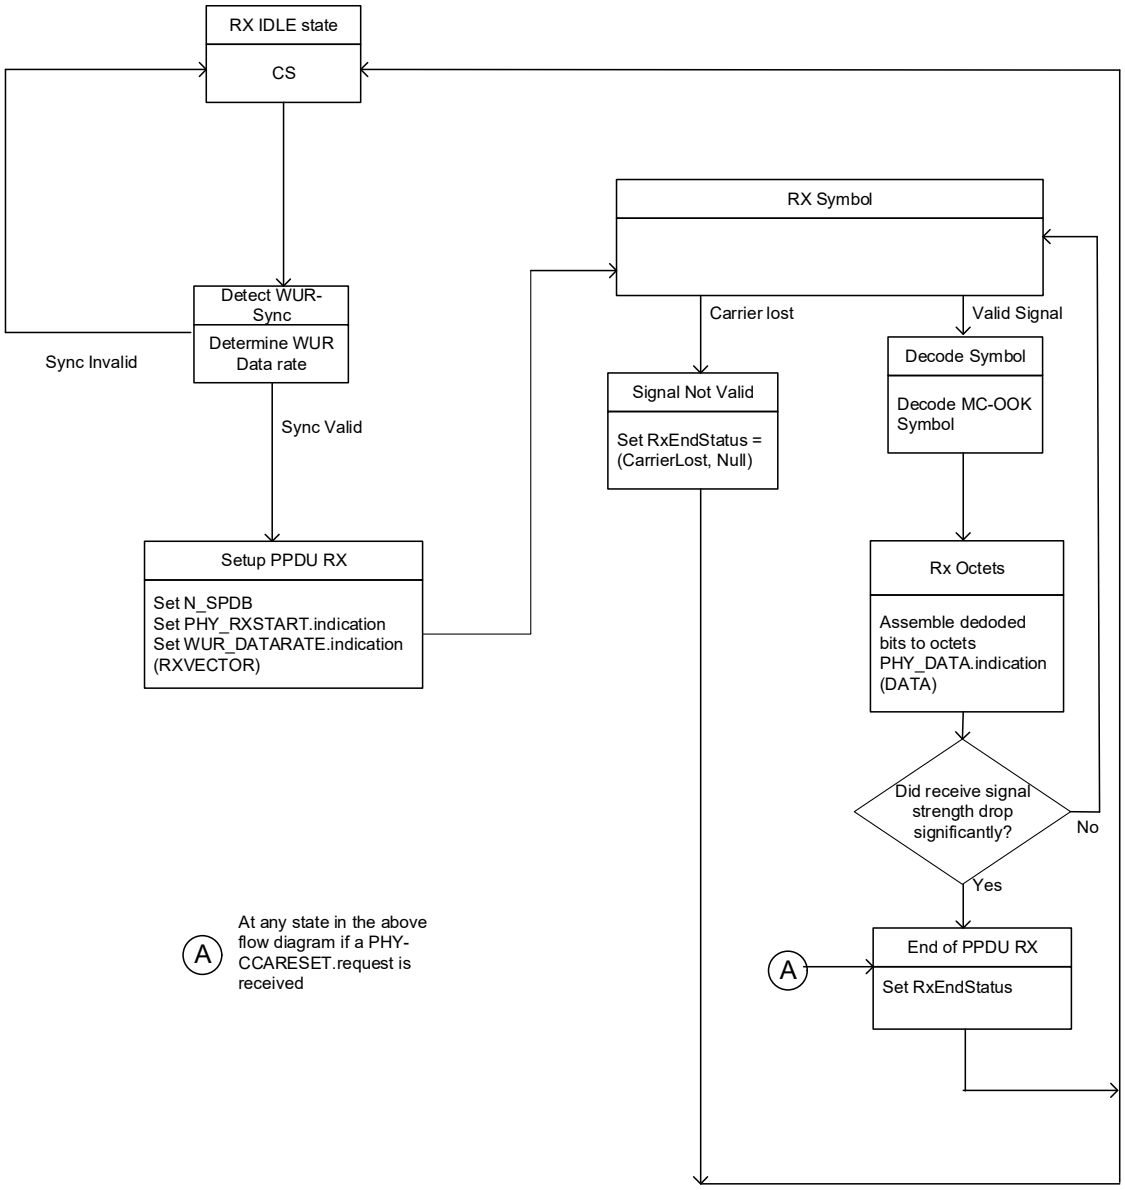

Figure 30-18—PHY receive state machine

The PHY measures a receive signal strength and searches for a valid WUR-Sync sequence, in order to acquire WUR Basic PPDU, to determine the WUR data rate and the start of the WUR-Data field. If a valid WUR-Sync sequence is detected, WUR PHY issues PHY-RXSTART.indication primitive along with the WUR_DATARATE.indication. If the WUR-Sync sequence detection fails, a PHY-RXSTART.indication primitive is not issued, and WUR PHY goes back to RX IDLE state. RSSI measurement is made during the reception of the WUR-Sync field. Based on the WUR data rate, the PHY sets the N_{SPDB} parameter as given in Table 30-4.

The PHY entity shall begin receiving the WUR OOK symbols in the WUR-Data field. If signal loss occurs during reception, prior to completion of the PPDU reception, the error condition PHY-RXEND.indication (CarrierLost) shall be reported to the MAC. The received PPDU bits are decoded, assembled into octets and presented to the MAC using a series of PHY-DATA.indication (DATA) primitive exchanges. Any

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

remaining bits, which could not be assembled into a complete octet are discarded. RCPI measurement is made during the reception of the WUR-Sync field as described in 19.3.19.7. Since the WUR PHY is not aware of the end of the WUR PPDU, the PHY shall keep decoding until receive signal strength drops significantly. Alternatively, the WUR MAC may also indicate the end of WUR PPDU to PHY by means of PHY-CCARESET.request primitive. On termination, the WUR PHY enters the RX IDLE state. If the WUR PHY terminates due to reduction of the receive signal strength, a PHY-RXEND.indication (NoError) primitive shall be issued. If it terminates due to PHY-CCARESET.request, a PHY-RXEND.indication (MAC Request) primitive shall be issued.

30.4 WUR PLME

30.4.1 TXTIME and PSDU length calculation

For a WUR Basic PPDU, the value of the TXTIME parameter shall be calculated as follows:

$$\text{TXTIME} = T_{L-STF} + T_{L-LTF} + T_{L-SIG} + T_{BPSK-Mark1} + T_{BPSK-Mark2} + T_{WUR-Sync} + T_{Sym} \times N_{Sym} \quad (30\text{-}13)$$

where

$T_{L\text{-}STF}$, $T_{L\text{-}LTF}$, $T_{L\text{-}SIG}$, $T_{BSPK\text{-}Mark1}$, $T_{BSPK\text{-}Mark2,}$ $T_{WUR\text{-}Sync}$, and T_{Sym} are defined in Table 30-3, and N_{Sym} is the number of WUR OOK symbols in the WUR-Data field.

The number of WUR OOK symbols is a function of the length of WUR MAC frame in the WUR-Data field (WUR_MPDU_LENGTH) and N_{SPDB} and is calculated as follows:

$$N_{Sym} = 8 \times \text{WUR\_MPDU\_LENGTH} \times N_{SPDB} \quad (30\text{-}14)$$

where

N_{SPDB} is defined in Table 30-4

The value of the PSDU_LENGTH parameter is calculated as follows:

$$\text{PSDU\_LENGTH} = \text{WUR\_MPDU\_LENGTH} \quad (30\text{-}15)$$

In a WUR PPDU, the RATE field of L-SIG field shall be set to the value representing 6 Mb/s in the 20 MHz channel spacing column of Table 17-6. The Length field set in the L-SIG (L_LENGTH) is calculated as follows:

$$\text{L\_LENGTH} = \frac{\text{TXTIME} - 20}{4} \times 3 - 3 \quad (30\text{-}16)$$

For the FDMA transmission, the value of the TXTIME and PSDU_LENGTH for each WUR transmission in a 20 MHz subchannel shall be calculated according to the longest WUR transmissions among all 20 MHz subchannels.

The value of the TXTIME parameter for a WUR FDMA transmission shall be calculated as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$\text{TXTIME} = T_{L-STF} + T_{L-LTF} + T_{L-SIG} + T_{BPSK-Mark1} + T_{BPSK-Mark2} + \max_{i_{BW} \in \Omega_{20MHz}} \left\{ T_{WUR-Sync, i_{BW}} + T_{Sym, i_{BW}} \times N_{Sym, i_{BW}} \right\}$$

(30-17)

30.4.2 Table of time and length characteristics

Table 30-13—WUR PPDU Time and Length Characteristics

Characteristics	Value
aCCAMidTime	25 μs
aPPDUMaxTime	2972 μs
aPSDUMaxLength	22 octets (see NOTE 1)
aRxPHYStartDelay	92 μs (see NOTE 2)
NOTE 1—This is the maximum length in octets for a WUR Basic PPDU with WUR LDR. NOTE 2—This value arises from the time to the end of the WUR-Sync field with WUR HDR.	

30.5 Parameters for WUR Data Rates

The rate-dependent parameters for 62.5 kb/s and 250 kb/s are given in Table 30-14. WUR encoding shall be used for all the data rates for the WUR-Data field of a WUR PPDU.

Table 30-14—WUR PPDU data rates

Data rate	Modulation	Symbol structure		Equivalent information bit duration	N_{SPDB}	Data rate (kb/s)
WUR LDR	WUR OOK	Information 0	[SymLDROn, SymLDROff, SymLDROn, SymLDROff]	16 μs	4	62.5
		Information 1	[SymLDROff, SymLDROn, SymLDROff, SymLDROn]			
WUR HDR	WUR OOK	Information 0	[SymHDROn, SymHDROff]	4 μs	2	250
		Information 1	[SymHDROff, SymHDROn]

31. Next Generation V2X (NGV) MAC specification

31.1 Introduction

An NGV STA supports the MAC and MLME functions defined in 31.2 in addition to the MAC functions defined in Clause 10 and the MLME functions defined in Clause 11 for STAs communicating Data frames OCB.

If dot11DMGOCBActivated is true, a DMG STA shall support the features defined in 31.3, the MAC functions defined in Clause 10, and the MLME functions defined in Clause 11 for DMG or EDMG STAs communicating Data frames OCB.

31.2 Operation in the 5.9 GHz band

31.2.1 Coexistence with non-NGV STAs

In order to enable coexistence and interoperability with non-NGV STAs, if dot11NGVOptionImplemented is true then dot11OCBActivated shall be true. Moreover, the non-NGV PPDUs transmitted by NGV STAs carry an indication that informs the receiving NGV STAs that the transmitter is an NGV STA. This indication is carried in the Duration/ID field of the MAC header.

NOTE 1—An NGV STA that wishes to communicate OCB with one or more neighboring non-NGV STAs is recommended to use the non-NGV PPDU format.

When an NGV STA transmits an Ack frame solicited by an individually addressed Management or QoS Data frame in a non-NGV PPDU and the Duration field value specified in 9.2.5.7 is 0, the Duration/ID field in the Ack frame shall be set to 2. When an NGV STA transmits an individually addressed Management or QoS Data frame in a non-NGV PPDU as the last frame of a TXOP, the Duration/ID field of the Management or QoS Data frame shall be set to the sum of 4, SIFS, and the transmission time of the responding Ack frame as defined in 10.6.

NOTE 2—An NGV STA can transmit either a non-NGV PPDU or an NGV PPDU. The value of the Duration field carried in a non-NGV PPDU indicates to a receiving NGV STA whether the transmitter is an NGV STA or a non-NGV STA.

When an NGV STA transmits a group addressed frame in a non-NGV PPDU, the Duration/ID field in the group addressed frame shall be set to 2.

An NGV STA determines that a received non-NGV PPDU was transmitted by an NGV STA if the non-NGV PPDU contains one of the following frames:

— An Ack or BlockAck frame with Duration/ID field equal to 2.
— An individually addressed frame with Duration/ID field equal to the sum of 4, SIFS, and the transmission time of the responding Ack or BlockAck frame as defined in 10.6.
— A group addressed frame with Duration/ID field equal to 2.

31.2.2 Channel access and transmission methods for 20 MHz OCB transmission

An NGV 20 MHz channel consists of two contiguous 10 MHz channels: the OCB primary channel and the OCB secondary channel.

The OCB primary channel is designated by the primary channel parameter of the radio environment vector in the MA-UNITDATA.request primitive (see 5.2.4).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An NGV STA transmitting a 20 MHz NGV PPDU or 20 MHz non-NGV duplicate PPDU shall contend for the medium using EDCA as defined in 10.2.3.2 and 10.3.2 based on the medium sensing results of two contiguous 10 MHz channels, OCB primary channel and OCB secondary channel in an NGV 20 MHz channel. An NGV STA performing 20 MHz channel access determines that the 20 MHz medium is idle if all of the following conditions are met:

— The CS mechanism (see 10.3.2.1) indicates that the OCB primary channel is idle.
— The PHY-CCA.indication primitive indicates that the OCB secondary channel is idle.
— The virtual CS mechanism (see 10.3.2.1) indicates that the OCB secondary channel is idle, if dot11VirtualCSonOCBSecondaryImplemented is true.

Otherwise, the NGV STA performing 20 MHz channel access determines that the 20 MHz medium is busy.

NOTE—An NGV STA transmitting a 20 MHz NGV PPDU or 20 MHz non-NGV duplicate PPDU follows rules defined in 31.2.2 and does not follow rules defined in 11.15.9.

If either the medium of the OCB primary channel or the OCB secondary channel is determined to be busy, an NGV STA shall invoke the random backoff procedure as described in 10.23.2.2.

When the random backoff procedure is invoked, an NGV STA transmitting a 20 MHz NGV PPDU or 20 MHz non-NGV duplicate PPDU shall perform as described in 10.23.2.4, with the exception of the definition of the slot boundaries. In this subclause, the slot boundaries are defined as follows:

a) Following AIFSN[AC] × aSlotTime – aRxTxTurnaroundTime of idle medium on the 20 MHz channel after a SIFS (not necessarily idle medium during the SIFS) after the last busy medium on the antenna that was the result of reception of a frame with a correct FCS.
b) Following EIFS – DIFS + AIFSN[AC] × aSlotTime + aSIFSTime – aRxTxTurnaroundTime of idle medium on the 20 MHz channel after the last indicated busy medium as determined by the physical CS mechanism that was the result of a frame reception that has resulted in FCS error, or of a frame reception that has resulted in a PHY-RXEND.indication (RXERROR) primitive where the value of RXERROR is not NoError.
c) When any other EDCAF at this STA transmitted a frame requiring immediate acknowledgment, the earlier of:
    1) The end of the AckTimeout interval timed from the PHY-TXEND.confirm primitive, followed by AIFSN[AC] × aSlotTime + aSIFSTime – aRxTxTurnaroundTime of idle medium on the 20 MHz channel.
    2) The end of the first AIFSN[AC] × aSlotTime – aRxTxTurnaroundTime of idle medium on the 20 MHz channel after a SIFS (not necessarily medium idle during the SIFS, the start of the SIFS implied by the length in the PHY header of the previous frame) when a PHY-RXEND.indication primitive occurs as specified in 10.3.2.11.
d) Following AIFSN[AC] × aSlotTime – aRxTxTurnaroundTime of idle medium on the 20 MHz channel after a SIFS (not necessarily medium idle during the SIFS) after the last busy medium on the antenna that was the result of transmission of a frame for any EDCAF and that did not require an acknowledgment and after the expiration of the TXNAV timer if nonzero.
e) Following AIFSN[AC] × aSlotTime + aSIFSTime – aRxTxTurnaroundTime of idle medium on the 20 MHz channel after the last indicated busy medium as indicated by the CS mechanism on the OCB primary channel that is not covered by a) to d).
f) Following EIFS – DIFS + AIFSN[AC] × aSlotTime + aSIFSTime – aRxTxTurnaroundTime of idle medium on the 20 MHz channel after the last indicated busy medium as indicated by the CCA mechanism on the OCB secondary channel that is not covered by a) to d), when the duration of channel busy is not known.
g) Following AIFSN[AC] × aSlotTime + aSIFSTime – aRxTxTurnaroundTime of idle medium on the 20 MHz channel after the last indicated busy medium as indicated by the CS mechanism on the OCB secondary channel that is not covered by a) to d), when the duration of channel busy is known.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

h) Following aSlotTime of idle medium on the 20 MHz channel, which occurs immediately after any of these conditions, a) to g), is met for the EDCAF.

If an NGV STA is unable to transmit a 20 MHz NGV PPDU or 20 MHz non-NGV duplicate PPDU because the medium of the OCB secondary channel is busy and the fallback enabled member of the radio environment request vector so allows, the STA may instead use the medium access procedure to transmit a 10 MHz PPDU on the OCB primary channel. The medium of the OCB secondary channel is busy if a PHY-CCA.indication(BUSY, {secondary}) primitive occurs or the virtual CS indicates that the medium is busy on the OCB secondary channel, if dot11VirtualCSonOCBSecondaryImplemented is true.

31.2.3 A-MSDU operation, A-MPDU operation, and BA operation

NGV STA frame aggregation parameters are fixed and are defined in this clause. This provides the ability to transmit an A-MPDU and an A-MSDU outside the context of a BSS (OCB). An NGV STA may transmit an A-MPDU or A-MSDU and shall support the reception of an A-MSDU or A-MPDU with aggregation parameters as defined in this clause.

An NGV STA shall support receiving an MPDU of length equal to or less than the maximum NGV MPDU length in Table 31-1. An NGV STA shall not transmit an MPDU with a length greater than the maximum NGV MPDU length shown in Table 31-1.

Table 31-1—Maximum NGV MPDU length

NGV-MCS	1SS 10 MHz (octets)	2SS 10 MHz (octets)	1SS 20 MHz (octets)	2SS 20 MHz (octets)
0	4524	7991	7991	7991
1	7991	7991	7991	7991
2	7991	7991	7991	7991
3	7991	7991	7991	7991
4	7991	7991	7991	7991
5	7991	7991	7991	7991
6	7991	7991	7991	7991
7	7991	7991	7991	7991
8	7991	7991	7991	7991
9	N/A	N/A	7991	7991
15	2192	4524	4386	7991

NOTE 1—The maximum MPDU length is determined based on a maximum PPDU duration of 10 968 μs.

NOTE 2—The maximum PPDU duration may be reduced by regulatory authorities in some regulatory domains. If the maximum PPDU duration is less than 10 968 μs, the maximum MPDU length may be limited to a lower value for some MCSs.

An NGV STA shall transmit adjacent MPDUs in an A-MPDU with a minimum of 2 μs between the MPDUs.

An NGV STA shall support block ack and does so without exchanging capabilities or creating a block ack agreement. An NGV STA shall have the following block ack configuration:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— A-MSDU is supported
— Block ack policy is HT-immediate block ack
— No timeout
— The number of buffers available is 32
— Each buffer is capable of holding 7935 octets (the maximum size of an A-MSDU)
— The block ack frame is a Compressed BlockAck frame (see 9.3.1.8.1 and 9.3.1.8.2).

31.2.4 NON_NGV_10 repetition transmission

The NON_NGV_10 repetition transmission mode supports OCB broadcast service to both NGV STAs and non-NGV STAs with improved frame reception reliability.

This mode allows an NGV STA to repeat one NON_NGV_10 PPDU, defined in 32.1.4, multiple times with a time gap of SIFS between every two transmissions.

For a group addressed MPDU containing only group addressed MPDUs, the number of repetitions of the NON_NGV_10 PPDU is decided by a higher layer and indicated by the number of repetitions element of the radio environment request vector (5.2.4) in the MAC SAP.Otherwise, the number of repetitions of the NON_NGV_10 PPDU is fixed to 0 by the MAC.The MAC sets the number of repetitions, N_PPDU_REP, via the PHY service interface using the PHY-TXSTART.request(TXVECTOR) primitive, as described in Table 32-1.

NOTE—The Duration setting of the Duration/ID field in NON_NGV_10 repetition transmission does not follow the rules in 9.2.5. An NGV STA that transmits the frames in NON_NGV_10 repetition transmission mode follows the rules in 10.23.2.9.

31.2.5 Non-NGV duplication operation

A 20 MHz NGV STA may transmit RTS frames in non-NGV duplicate PPDUs to protect a 20 MHz NGV PPDU.

A 20 MHz NGV STA that is addressed by an RTS frame in a non-NGV or non-NGV duplicate PPDU that has a bandwidth signaling TA and that has the RXVECTOR parameter DYN_BANDWIDTH_IN_NON_NGV equal to Static behaves as follows:

— If the NAV indicates idle and CCA indicates idle for the secondary 10 MHz channel when the RTS frame's RXVECTOR parameter CH_BANDWIDTH_IN_NON_NGV is equal to CBW20, then the STA shall respond with a CTS frame carried in a non-NGV duplicate PPDU after a SIFS. The CTS frame's TXVECTOR parameters CH_BANDWIDTH and CH_BANDWIDTH_IN_NON_NGV shall be set to CBW20.
— If the NAV indicates idle when the RTS frame's RXVECTOR parameter CH_BANDWIDTH_IN_NON_NGV is equal to CBW10, then the STA shall respond with a CTS frame carried in a non-NGV PPDU after a SIFS. The CTS frame's TXVECTOR parameters CH_BANDWIDTH and CH_BANDWIDTH_IN_NON_NGV shall be set to CBW10.
— Otherwise, the STA shall not respond with a CTS frame.

A 20 MHz NGV STA that is addressed by an RTS frame in a non-NGV or non-NGV duplicate PPDU that has a bandwidth signaling TA and that has the RXVECTOR parameter DYN_BANDWIDTH_IN_NON_NGV equal to Dynamic behaves as follows:

— If the NAV indicates idle and the CCA indicates idle for the secondary 10 MHz channel when the RTS frame's RXVECTOR parameter CH_BANDWIDTH_IN_NON_NGV is equal to CBW20, then the 20 MHz NGV STA shall respond with a CTS frame in a non-NGV duplicate PPDU after a

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

SIFS. The CTS frame's TXVECTOR parameters CH_BANDWIDTH and CH_BANDWIDTH_IN_NON_NGV shall be set to CBW20.

— If the NAV indicates idle and the CCA indicates busy for the secondary 10 MHz channel when the RTS frame's RXVECTOR parameter CH_BANDWIDTH_IN_NON_NGV is equal to CBW20, then the 20 MHz NGV STA shall respond with a CTS frame in a non-NGV PPDU after a SIFS. The CTS frame's TXVECTOR parameters CH_BANDWIDTH and CH_BANDWIDTH_IN_NON_NGV shall be set to CBW10.
— If the NAV indicates idle when the RTS frame's RXVECTOR parameter CH_BANDWIDTH_IN_NON_NGV is equal to CBW10, then the 20 MHz NGV STA shall respond with a CTS frame in a non-NGV PPDU after a SIFS. The CTS frame's TXVECTOR parameters CH_BANDWIDTH and CH_BANDWIDTH_IN_NON_NGV shall be set to CBW10.
— Otherwise, the STA shall not respond with a CTS frame.

If a 20 MHz NGV STA receives a frame that solicits a response and is carried in a 20 MHz NGV PPDU, it should transmit the response in a 20 MHz non-NGV duplicate PPDU.

31.3 Operation in the 60 GHz band

31.3.1 DMG beamforming outside the context of a BSS

A DMG STA with dot11DMGOCBActivated equal to true may transmit DMG Beacon frames as described in 10.42.4 outside the context of a BSS. The DMG STA shall set the Discovery Mode field and OCB subfield in the Clustering Control field to 1 in each of the DMG Beacon frames when the STA performs beamforming training with the DMG Beacon frame outside of the context of a BSS.The STA may set all the bits in the A-BFT Responder Address subfield to 1 in a DMG Beacon frame to allow any STAs to transmit SSW or Short SSW frames during A-BFT that follows the BTI in which the DMG Beacon frame is transmitted, or set the A-BFT Responder Address subfield to an individual address to indicate the STA that is allowed to transmit during the A-BFT. A DMG OCB element is optionally present in a DMG Beacon frame to indicate the STA transmitting the DMG Beacon frame supports optional features used during communication outside the context of a BSS.

When a DMG STA with dot11DMGOCBActivated equal to true receives a DMG beacon frame with the OCB subfield equal to 1, the STA may perform beamforming training as described in 10.42.5.When the DMG STA transmits SSW frames during the A-BFT after a BTI in which the STA received a DMG beacon frame with the OCB subfield equal to 1, the STA shall set the OCB subfield to 1 in the SSW frames transmitted during the A-BFT.

If a responder DMG STA that receives a DMG beacon frame with the OCB subfield equal to 1 has successfully completed an SLS or a BRP with the initiator STA that transmitted the DMG Beacon frame recently, the responder STA should not transmit SSW frames during the A-BFT following the BTI to avoid collisions during the A-BFT.

A DMG STA with dot11DMGOCBActivated equal to true may transmit SSW frames as described in 10.42.6 outside the context of a BSS. The DMG STA shall set the OCB subfield to 1 in the SSW frames during beamforming training outside of the context of a BSS.

A DMG STA with dot11DMGOCBActivated equal to true shall support Beamformed link maintenance procedure as described in 11.27.1.1.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

31.4 NGV ranging

An NGV STA may support NGV ranging. NGV ranging is a subset of FTM functionalities defined in 11.21.6; the supported functionalities are as follows:

- FTM procedures, including FTM procedure negotiation and FTM session termination for non-TB ranging as defined in 11.21.6.3 and in 11.21.6.6, with the modifications specified in this subclause.
- Non-TB ranging as described in 11.21.6.4.4 with the modifications specified in this subclause. PHY security is not specified for NGV STAs.
- NGV STAs may support differential distance computation as detailed in P.3.

Additionally, if an NGV STA is co-located with a STA that supports FTM functionalities as defined in 11.21.6, it may support FTM procedure outside the 5.9 GHz frequency band.

The capability discovery for whether an NGV STA supports ranging as specified in this subclause is out of the scope of IEEE Std 802.11 and is expected to be conducted by higher layers. The higher layer exchanges are over the 5.9 GHz frequency band. The higher layer negotiations are expected to identify the following:

- Whether an NGV STA supports non-TB ranging in the 5.9 GHz band.
- Whether an NGV STA is co-located with a STA that supports ranging on IEEE 802.11 bands outside the 5.9 GHz band and if so the type of ranging: non-TB ranging and/or EDCA based ranging (see 11.21.6.1.1 and 11.21.6.1.2).
- For an NGV STA co-located with a STA that supports ranging on 802.11 bands outside the 5.9 GHz band, whether the co-located STA supports PASN, and if so, the contents of the PASN Parameters element, or alternatively the security context required for exchange of protected frames.
- The channel number for ranging exchanges between peer STAs.
- Role of STA: ISTA or RSTA.
- LMR Feedback policy.

NOTE—The channel number is not limited to the 5.9 GHz band.

The FTM procedure negotiation is performed by an NGV STA as specified in 11.21.6.3 with the following differences:

- For ranging in the 5.9 GHz band, in the Ranging Parameters element included in the IFTMR frame:
  - Status indication subfield and Value subfield are reserved.
  - Max R2I STS > 80 MHz subfield is reserved.
  - Max I2R STS > 80 MHz subfield is reserved.
  - BSS Color Information subfield is reserved.
- For ranging in the 5.9 GHz band, a non-TB ranging measurement exchange is used by NGV STAs as defined in 11.21.6.4.4 with the following changes:
  - An NGV ranging NDP is transmitted instead of an HE ranging NDP.
  - A Ranging NDP Announcement frame (9.3.1.19) is transmitted. The following differences in the subfields of the STA Info fields of the Ranging NDP Announcement frame apply compared to 9.3.1.19:
    - LTF Offset is set to 0.
    - R2I N_STS subfield is set to the number of spatial streams of the R2I NGV ranging NDP minus 1.
    - R2I Rep subfield is set to 0 if the NGV-LTF in the R2I NGV ranging NDP is not repeated and is set to 1 if the NGV-LTF in the R2I NGV ranging NDP is repeated.
    - I2R N_STS subfield is set to the number of spatial streams of the I2R NGV ranging NDP minus 1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

- I2R Rep subfield is set to 0 if the NGV-LTF in the I2R NGV ranging NDP is not repeated and is set to 1 if the NGV-LTF in the I2R NGV ranging NDP is repeated.
- The I2R N_STS and I2R Rep subfields are used to indicate the following I2R NGV ranging NDP's NGV-LTF configuration, 32.3.16, while the R2I N_STS and R2I Rep subfields indicate the NGV-LTF configuration of the R2I NGV ranging NDP sent in response by the RSTA, see 11.21.6.4.4.
- When the TXVECTOR parameter CH_BANDWIDTH is CBW10, the I2R NDP Tx Power subfield indicates the combined average power per 10 MHz bandwidth referenced to the antenna connector, of all antennas used to transmit the following I2R NDP.

For ranging on IEEE Std 802.11 bands outside the 5.9 GHz band, whether PASN is required is indicated by higher layers. Two STAs co-located with NGV STAs may establish PASN authentication if so indicated by higher layers using the procedures as defined in 12.13 with the following change: the exchanges between ISTA and RSTA are done by two STAs each co-located with an NGV STA. Alternatively, the security association between the two STAs may be established by higher layer exchanges in the 5.9 GHz band.

31.5 NGV MAC data service

An NGV STA shall follow the rules in 10.2.7 and the additional rules as defined in this subclause.

When a member in radio environment request vector represents "selection within MAC sublayer", the NGV STA shall select the related member value by itself. Otherwise the following rules shall be applied:

- When transmitting an MPDU that encapsulates an MSDU, an NGV STA shall use the PPDU format indicated by the PPDU format member of the radio environment request vector related to the MSDU.
- When transmitting an MPDU that encapsulates an MSDU, an NGV STA shall use the data rate/NGV-MCS indicated by the data rate/NGV-MCS member of the radio environment request vector related to the MSDU in the initial transmission of the MPDU. In the retransmission of the MPDU, the data rate/NGV-MCS shall be no more than data rate/NGV-MCS indicated by the data rate/NGV-MCS member of the radio environment request vector related to the MSDU.
- When transmitting an MPDU that encapsulates an MSDU, an NGV STA shall use the number of spatial streams indicated by the number of spatial streams member of the radio environment request vector related to the MSDU in the initial transmission of the MPDU. In the retransmission of the MPDU, the number of spatial streams shall be no more than the number of spatial streams indicated by the number of spatial streams member of the radio environment request vector related to the MSDU.
- An NGV STA shall transmit a frame that encapsulates an MSDU in an A-MPDU if the permitted aggregation member of the radio environment request vector related to the MSDU is equal to 1. Otherwise the NGV STA shall not aggregate the frame in an A-MPDU.
- An NGV STA shall set the lifetime of an MSDU to the value of expiry time member of the radio environment request vector related to the MSDU.
- An NGV STA shall transmit an MPDU that encapsulates an MSDU in the channel defined by the channel member, primary channel member, and channel width member of the radio environment request vector related to the MSDU with the following exception:
  - If the channel width indicates 20 MHz channel width and the fallback enabled parameter indicates 1, the channel can be 10 MHz channel.
- An NGV STA shall transmit an MPDU that encapsulates an MSDU with the transmit power indicated by the transmit power spectral density member of the radio environment request vector related to the MSDU.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—The higher layer sets the parameters in the radio environment request vector based on the NGV STA's capabilities.

When reporting a received MSDU to a higher layer, an NGV STA shall report the radio environment status vector of the received MSDU as defined in 5.2.5.

31.6 Radio environment measurement

An NGV STA provides periodic reports on the radio environment.

If requested by a higher layer, an NGV STA with dot11RadioEnvironmentMeasurementPeriod not equal to 0 shall measure the channel busy percentage and report the measurement results to a higher layer as defined in 6.5.27.

If requested by a higher layer, an NGV STA with dot11StationMeasurementPeriod not equal to 0 shall measure the number of neighboring STAs (non-NGV STAs and NGV-STAs) and the number of neighboring NGV STAs, and report these measurement results to a higher layer as defined in 6.5.27.

An NGV STA with both dot11StationMeasurementPeriod and dot11RadioEnvironmentMeasurementPeriod not equal to 0 shall start a STA measurement period at the same time as a radio environment measurement period.

32. Next Generation V2X (NGV) PHY specification

32.1 Introduction

32.1.1 Introduction to NGV PHY

Clause 32 specifies the PHY entity for an NGV orthogonal frequency division multiplexing (OFDM) system. In addition to the requirements in Clause 32, an NGV STA shall be capable of transmitting and receiving 10 MHz PPDUs specified in Clause 17.

The NGV PHY is mainly based on the VHT PHY defined in Clause 21, which in turn is based on the HT PHY defined in Clause 19, which in turn is further based on the OFDM PHY defined in Clause 17. The NGV PHY preamble structure, BPSK-dual carrier modulation (DCM), and midamble structure are based on the HE PHY defined in Clause 27.

The NGV PHY provides support for both 10 MHz and contiguous 20 MHz channel widths. The NGV PHY data subcarrier frequency spacing is a half of VHT PHY and HT PHY subcarrier frequency spacing defined in Clause 21 and Clause 19, respectively.

The NGV PHY data subcarriers are modulated using binary phase shift keying (BPSK), BPSK-DCM, quadrature phase shift keying (QPSK), 16-quadrature amplitude modulation (16-QAM), 64-QAM, and 256-QAM. The NGV PHY preamble is encoded by a convolutional encoder and the NGV PHY data payload is encoded by an LDPC encoder. STBC is not employed.

The NGV PHY supports the regulatory requirements in 32.3.15.

An NGV STA shall support the following features:

- Single spatial stream
- NGV-MCS 0 to 9 and NGV-MCS 15
- Three LTF formats: NGV-LTF-1x, NGV-LTF-2x, and NGV-LTF-2x-Repeat
- LDPC coding (transmit and receive)
- Midamble periodicity of 4, 8, 16 OFDM symbols
- 10 MHz NGV PPDU
- NON_NGV_10 PPDU and repetitive NON_NGV_10 PPDU
- Transmit spectrum mask C2 when transmitting a 20 MHz NGV PPDU or 20 MHz non-NGV duplicate PPDU, if 20 MHz NGV PPDU is supported
- Transmit spectrum mask A, B, C, or D when transmitting a 10 MHz NGV PPDU, if the STA belongs to transmit power class A, B, C, or D, respectively

An NGV STA may support the following features:

- Transmission and reception of SU MIMO with two spatial streams
- NGV ranging NDP for NGV ranging as described in 31.4
- 20 MHz NGV PPDU or 20 MHz non-NGV duplicate PPDU

32.1.2 Scope

The services provided to the MAC by the NGV PHY consist of the following protocol functions:

a) A function that maps the PSDU received from the MAC into a PPDU for transmission to one or more receiving STAs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the PPDU format, these STAs support a mixture of NGV and Clause 17 PHYs.

32.1.3 NGV PHY functions

32.1.3.1 General

The NGV PHY contains two functional entities: the PHY function, and the physical layer management function (via the PLME). These functions are described in detail in 32.3 and 32.4, respectively. The NGV PHY service is provided to the MAC through the PHY service primitives defined in Clause 8. The NGV PHY service interface is described in 32.2.

32.1.3.2 PHY layer management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

32.1.3.3 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation.

The service of a layer is the set of capabilities that it offers to a user in the next higher layer. Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

32.1.4 PPDU Formats

The structure of the PPDU transmitted by an NGV STA is determined by the TXVECTOR parameters as defined in Table 32-1.

In an NGV STA the FORMAT parameter determines the overall structure of the PPDU and can take one of the following values:

— Non-NGV format of 10 MHz bandwidth (NON_NGV_10), for the PPDU format as specified in Clause 17 for 10 MHz channel spacing including non-NGV duplicate format.

— NGV format (NGV), for the PPDU format as specified in Clause 32.

NOTE—Required support for these formats is defined in 17.1 and 32.1.1.

32.2 NGV PHY service interface

32.2.1 Introduction

The PHY provides an interface to the MAC through an extension of the generic PHY service interface defined in 8.3.4. The interface includes TXVECTOR, RXVECTOR, and PHYCONFIG_VECTOR.

The MAC uses the TXVECTOR to supply the PHY with per-PPDU transmit parameters. The PHY uses the RXVECTOR to inform the MAC of the received PPDU parameters. The MAC uses the PHYCONFIG_VECTOR to configure the PHY for operation that is independent of frame transmission or reception.

32.2.2 TXVECTOR and RXVECTOR

The parameters in Table 32-1 are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitives.

Table 32-1—TXVECTOR and RXVECTOR parameters

Parameter	Condition	Value	TXVECTOR	RXVECTOR
FORMAT		Determines the format of the PPDU. Enumerated type: NON_NGV_10 indicates the PPDU format for 10 MHz channel spacing as defined in Clause 17 or non-NGV duplicate PPDU format as defined in 32.3.9.10. NGV indicates NGV PPDU format as defined in Clause 32.	Y	Y
L_LENGTH	FORMAT is NGV	Not present. NOTE—The value of the Length field of the L-SIG in an NGV PPDU is calculated as in Equation (32-8).	N	N
	Otherwise	Indicates the length of the PSDU in octets in the range 1 to 4095. The value is used by the PHY to determine the number of octet transfers that occur between the MAC and the PHY.	Y	Y
L_DATARATE	FORMAT is NGV	Not present. NOTE—The RATE field in the L-SIG field in an NGV PPDU is set to the value representing 3 Mb/s in the 10 MHz channel spacing column of Table 17-6.	N	N
	Otherwise	Indicates the rate, in Mb/s, used to transmit the PSDU. See corresponding entry in Table 17-1 and Table 17-2.	Y	Y
SERVICE	FORMAT is NGV	Not present.	N	N
	Otherwise	Scrambler initialization, null.	Y	N
TXPWR_LEVEL_INDEX	FORMAT is NGV	The allowed values for the TXPWR_LEVEL_INDEX parameter are in the range 1 to *N*/2, where *N* is the number of octets in dot11TxPowerLevelExtended. This parameter is used to indicate the available transmit output power levels defined in dot11TxPowerLevelExtended that shall be used for the current transmission.	Y	N
	Otherwise	1–8 Refer to 17.2.2 for the definition of TXPWR_LEVEL_INDEX.	Y	N

Table 32-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
RSSI	FORMAT is NGV	The allowed values for the RSSI parameter are in the range 0 to 255. This parameter is a measure by the PHY of the power observed at the antenna connector used to receive the current PPDU measured during the reception of the NGV-LTF field. RSSI is intended to be used in a relative manner, and it shall be a monotonically increasing function of the received power.	N	Y
	Otherwise	0–RSSI maximum. See 17.2.3 for the definition of RSSI.	N	Y
NGV-MCS	FORMAT is NGV	Indicates the modulation and coding scheme used in the transmission of the PPDU. Integer in the range: 0 to 8 and 15 for 10 MHz PPDU. 0 to 9 and 15 for 20 MHz PPDU. NOTE—Set to 0 for NGV ranging NDP. See 32.3.16	Y	Y
	Otherwise	Not present.	N	N
CH_BANDWIDTH	FORMAT is NGV	Indicates the channel width of the transmitted PPDU. Enumerated type: CBW10 for 10 MHz. CBW20 for 20 MHz.	Y	Y
	Otherwise	Not present.	N	N
N_TX	FORMAT is NGV	Indicates the number of transmit chains.	Y	N
	Otherwise	Not present.	N	N
MIDAMBLE_PERIODICITY	FORMAT is NGV	Indicates the midamble periodicity in the Data field. Integer values: Set to 0 to indicate the midamble periodicity of 4 OFDM symbols. Set to 1 to indicate the midamble periodicity of 8 OFDM symbols. Set to 2 to indicate the midamble periodicity of 16 OFDM symbols. Other values are reserved.	Y	Y
	Otherwise	Not present.	N	N

Table 32-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
NGV_LTF_TYPE	FORMAT is NGV	Indicates the type of NGV-LTF. Set to 0 to indicate NGV-LTF-2x is used in the transmitted PPDU. Set to 1 to indicate NGV-LTF-1x is used in the transmitted PPDU. NOTE—When NGV-MCS 15 is indicated in 10 MHz, Repeated NGV-LTF-2x is used in the transmitted PPDU. See 32.3.8.10.	Y	Y
	Otherwise	Not present.	N	N
N_PPDU_REP	FORMAT is NGV	Not present.	N	N
	FORMAT is NON_NGV_10	Indicates the number of repetitive transmissions of NON_NGV_10 PPDU after the initial transmission. The allowed values are in the range 0 to 3.	Y	Y
NUM_SS	FORMAT is NGV	Indicates the number of spatial streams. The allowed value: Set to 0 to indicate the number of spatial streams is one. Set to 1 to indicate the number of spatial streams is two	Y	Y
	Otherwise	Not present.	N	N
NON_NGV_MODULATION	FORMAT is NON_NGV_10	In the TXVECTOR, indicates the format of the transmitted non-NGV PPDU. In the RXVECTOR, indicates the estimated format of the received non-NGV PPDU. Enumerated type: OFDM indicates Clause 17 format. NON_NGV_10_DUP_OFDM indicates non-NGV duplicate PPDU format.	Y	Y
	Otherwise	Not present.	N	N
APEP_LENGTH	FORMAT is NGV	If 0, indicates an NGV ranging NDP. Otherwise, indicates the number of octets in the range 1 to aPSDUMaxLength in the A-MPDU pre-EOF padding (see Table 32-20) that is carried in the PSDU.	Y	N
	Otherwise	Not present.	N	N

Table 32-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
PSDU_LENGTH	FORMAT is NGV	Indicates the number of octets in the range 0 to aPSDUMaxLength octets (see Table 32-20) in the NGV PSDU. The value of 0 indicates an NGV ranging NDP.	N	Y
	Otherwise	Not present.	N	N
DYN_BANDWIDTH_IN_NON_NGV	FORMAT is NON_NGV_10	In the TXVECTOR, if present, indicates whether the transmitter is capable of Static or Dynamic bandwidth operation. In the RXVECTOR, if valid, indicates whether the transmitter is capable of Static or Dynamic bandwidth operation. Enumerated type: Static if the transmitter is capable of Static bandwidth operation. Dynamic if the transmitter is capable of Dynamic bandwidth operation. NOTE—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the received MPDU.	O	Y
	Otherwise	Not present.	N	N
CH_BANDWIDTH_IN_NON_NGV	FORMAT is NON_NGV_10	In the TXVECTOR, if present, indicates the channel width of the transmitted PPDU, which is signaled via the scrambling sequence. In the RXVECTOR, if valid, indicates the channel width of the received PPDU, which is signaled via the scrambling sequence. Enumerated type: CBW10, CBW20. NOTE—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the currently received MPDU (e.g., RTS) or the previous MPDU in an exchange (e.g., RTS preceding a CTS).	O	Y
	Otherwise	Not present.	N	N

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 32-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
TIME_OF_DEPARTURE_REQUESTED	Enumerated type: true indicates that the MAC entity requests that the PHY entity measures and reports time of departure parameters corresponding to the time when the first frame energy is sent by the transmitting port. false indicates that the MAC entity requests that the PHY entity neither measures nor reports time of departure parameters.		O	N
LTF_REP	FORMAT is NGV and APEP_LENGTH is 0	Indicates the number of repetitions of the NGV-LTF symbols. Set to the number of repetitions.	O	N
	Otherwise	Not present.	N	N

NOTE—In the "TXVECTOR" and "RXVECTOR" columns, the following apply:
Y = Present;
N = Not present;
O = Optional.

32.2.3 PHY CONFIG_VECTOR

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for the NGV PHY contains an OPERATING_CHANNEL parameter, which identifies the operating or primary channel. The PHY shall set dot11CurrentPrimaryChannel to the value of parameter OPERATING_CHANNEL.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for the NGV PHY contains a SECONDARY_CHANNEL_OFFSET parameter, which takes one of the following values:

— SECONDARY_CHANNEL_NONE if no secondary channel is present; in this case the PHY shall set dot11CurrentSecondaryChannel to 0.
— SECONDARY_CHANNEL_ABOVE if the channel number of the secondary channel is greater than the channel number of the primary channel; in this case the PHY shall set dot11CurrentSecondaryChannel to dot11CurrentPrimaryChannel + 2.
— SECONDARY_CHANNEL_BELOW if the channel number of the secondary channel is smaller than the channel number of the primary channel; in this case the PHY shall set dot11CurrentSecondaryChannel to dot11CurrentPrimaryChannel – 2.

32.2.4 Effects of CH_BANDWIDTH parameter on PPDU format

Table 32-2 shows the valid combinations of the FORMAT, NON_NGV_MODULATION, and CH_BANDWIDTH parameters and the corresponding PPDU format.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 32-2— Interpretation of FORMATNON_NGV_MODULATION, and CH_BANDWIDTH parameters

FORMAT	NON_NGV_MODULATION	CH_BANDWIDTH	PPDU format
NGV	N/A	CBW10	The STA transmits an NGV PPDU of 10 MHz bandwidth.
NGV	N/A	CBW20	The STA transmits an NGV PPDU of 20 MHz bandwidth.
NON_NGV_10	OFDM	N/A	The STA transmits a non-NGV PPDU of 10 MHz bandwidth.
NON_NGV_10	NON_NGV_10_DUP_OFDM	N/A	The STA transmits a NON_NGV_10 PPDU with NON_NGV_MODULATION set to NON_NGV_10_DUP_OFDM using two adjacent 10 MHz channels as defined in 32.3.9.10. The 10 MHz channel higher in frequency is rotated +90º relative to the 10 MHz channel lower in frequency as defined in Equation (32-5).

32.2.5 Support for NON_NGV format

32.2.5.1 General

An NGV STA logically contains Clause 17 and Clause 32 PHYs. The MAC interfaces to the PHYs via the Clause 17 and Clause 32 PHY service interfaces as shown in Figure 32-1, Figure 32-2, and Clause 32.

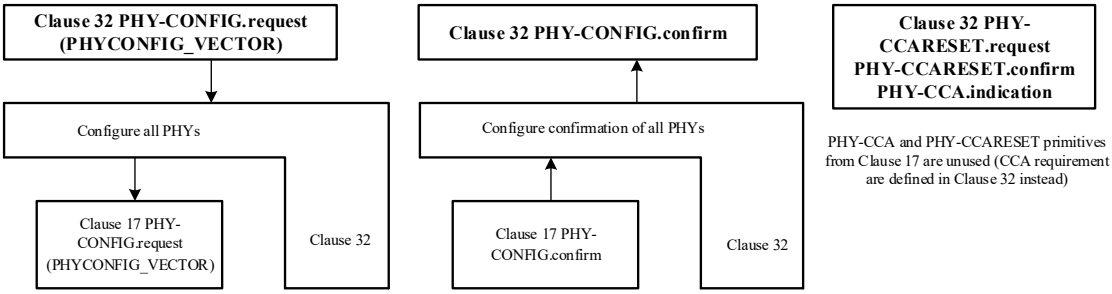

Figure 32-3—PHY-CONFIG and CCA interaction with Clause 17 and Clause 32

When a PHY-TXSTART.request(TXVECTOR) primitive with the FORMAT parameter equal to NON_NGV_10 is issued, the behavior of the NGV PHY is defined in Clause 17 with additional requirements described in the following subclauses:

— 32.3.11.1 instead of 17.3.9.3
— 32.3.11.4.2 instead of 17.3.9.7.2

where the Clause 32 TXVECTOR parameters in Table 32-1 are mapped to Clause 17 TXVECTOR parameters in Table 17-1 according to Table 32-3.

When the NGV PHY receives a Clause 32 PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive, the NGV PHY shall, for the purpose of OFDM PPDU transmission and reception, behave as if it were a Clause 17 PHY that had received a PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive but with the SECONDARY_CHANNEL_OFFSET parameter discarded from PHYCONFIG_VECTOR.

As defined in 32.3.14, once a PPDU is received and detected as a non-NGV PPDU, the behavior of the NGV PHY is defined in Clause 17. The RXVECTOR parameters from the Clause 17 PHY-RXSTART.indication primitive are mapped to the Clause 32 RXVECTOR parameters as defined in Table 32-3. NGV PHY parameters not listed in the table are not present.

Table 32-3—Mapping of the NGV PHY parameters for non-NGV operation

NGV parameters	5.9 GHz operation defined by Clause 17	Parameter list
L_LENGTH	L_LENGTH	TXVECTOR/RXVECTOR
L_DATARATE	L_DATARATE	TXVECTOR/RXVECTOR
TXPWR_LEVEL_INDEX	TXPWR_LEVEL_INDEX	TXVECTOR
RSSI	RSSI	RXVECTOR
SERVICE	SERVICE	TXVECTOR/RXVECTOR
OPERATING_CHANNEL	OPERATING_CHANNEL	PHYCONFIG_VECTOR
SECONDARY_CHANNEL_OFFSET	Discarded	PHYCONFIG_VECTOR

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

32.2.5.2 Repetition transmission of NON_NGV_10 PPDU

NGV STA shall support NON_NGV_10 PPDU repetition transmission mode. When a PHY-TXSTART.request(TXVECTOR) primitive with the FORMAT parameter equal to NON_NGV_10 and N_PPDU_REP being nonzero, the NON_NGV_10 repetition transmission mode shall be used by the PHY layer.

In this mode, the NON_NGV_10 PPDU is transmitted 1 + N_PPDU_REP times in sequence, where N_PPDU_REP is the number of repetitions following the first transmission, and N_PPDU_REP is indicated through TXVECTOR.

The time separation between every two repeated transmissions is indicated by parameter *aSIFSTime* (see Table 32-20), as illustrated in Figure 32-4.

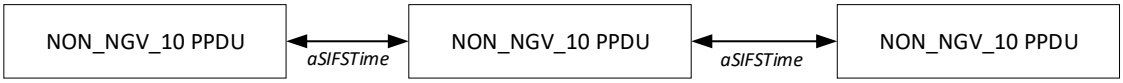

Figure 32-4—Example of NON_NGV_10 repetition transmission with N_PPDU_REP = 2

NOTE—All the following N_PPDU_REP repetition PPDUs use the same scrambler as the first NON_NGV_10 PPDU.

32.2.5.3 TXSTATUS parameters

The parameters listed in Table 32-4 are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm(TXSTATUS) service primitive.

Table 32-4—TXSTATUS parameters

Parameter	Value
TIME_OF_DEPARTURE	0 to $2^{32} - 1$. The locally measured time when the first frame energy is sent by the transmitting port, in units equal to 1/ TIME_OF_DEPARTURE_ClockRate. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TIME_OF_DEPARTURE_ClockRate	0 to $2^{16} - 1$. The clock rate, in units of MHz, is used to generate the TIME_OF_DEPARTURE value. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TX_START_OF_FRAME_OFFSET	0 to $2^{32} - 1$. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the frame was transmitted at the transmit antenna connector to the point in time at which this primitive is issued to the MAC.

32.3 NGV PHY

32.3.1 Introduction

This subclause provides the procedure by which PSDUs are converted to and from transmissions on the wireless medium.

During transmission, a single PSDU is processed and appended to the NGV PHY preamble including L-STF, L-LTF, L-SIG, RL-SIG, NGV-SIG, RNGV-SIG, NGV-STF, and NGV-LTF fields to create the NGV PPDU. At the receivers, the PHY preamble is processed to aid in the detection, demodulation, and delivery of the PSDU.

32.3.2 NGV PPDU format

A single PPDU format is defined for this PHY: the NGV PPDU format. The format of NGV PPDU is defined in Figure 32-5.

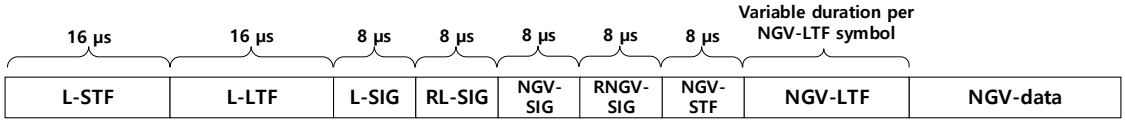

Figure 32-5—NGV PPDU format

The fields of the NGV PPDU format are summarized in Table 32-5.

Table 32-5—Fields of the NGV PPDU

Field	Description
L-STF	Non-HT Short Training field
L-LTF	Non-HT Long Training field
L-SIG	Non-HT SIGNAL field
RL-SIG	Repeated Non-HT SIGNAL field
NGV-SIG	NGV Signal field
RNGV-SIG	Repeated NGV Signal field
NGV-STF	NGV Short Training field
NGV-LTF	NGV Long Training field
Data	The Data field carrying the PSDU(s)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The RL-SIG, NGV-SIG, RNGV-SIG, NGV-STF, and NGV-LTF fields are present only in NGV PPDU formats. The RNGV-SIG field is equal to NGV-SIG field. The fields present in a non-NGV PPDU are the L-STF, L-LTF, L-SIG, and Data fields. The number of symbols in the NGV-LTF field, $N_{\text{NGV-LTF}}$, can be 1, 2, or 4 and is determined by the total number of spatial streams being transmitted in the NGV PPDU and whether the NGV-LTF is repeated in NGV ranging NDP (see Table 32-11).

32.3.3 Transmitter block diagram

The generation of each field in an NGV PPDU uses many of the following blocks:

a) PHY padding
b) Scrambler
c) FEC (BCC or LDPC) encoders
d) Stream parser
e) BCC interleaver
f) Constellation mapper
g) Pilot insertion
h) Replication over two 10 MHz channels (for BW = 20 MHz)
i) CSD per spatial stream insertion
j) Spatial mapper
k) IDFT
l) CSD per chain insertion
m) GI insertion
n) Windowing

Figure 32-6 and Figure 32-7 show example transmitter block diagrams. The actual structure of the transmitter is implementation dependent.

In particular, Figure 32-6 shows the transmit process for the L-SIG, RL-SIG, NGV-SIG, and RNGV-SIG fields of an NGV PPDU. The BCC encoder and interleaver are not used when generating the L-STF and L-LTF fields. The same BCC interleaver is applied to both the NGV-SIG field and the RNGV-SIG field such that the baseband signals of the NGV-SIG field symbol and the RNGV-SIG field symbol are exactly the same.

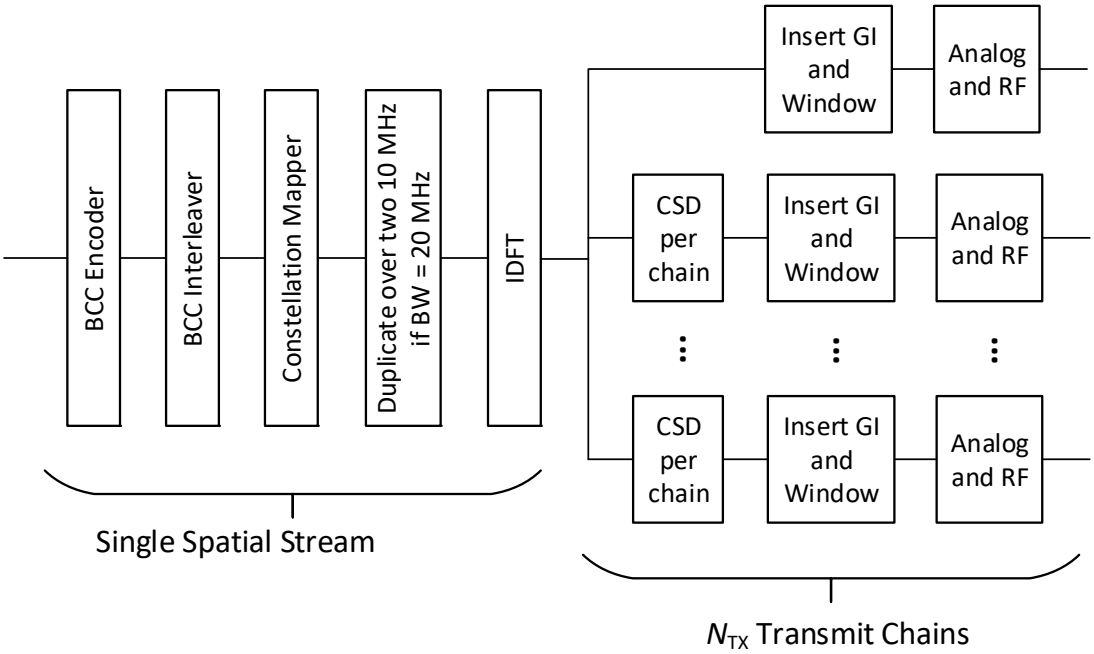

Figure 32-6—Transmitter block diagram for the L-SIG, RL-SIG, NGV-SIG, and RNGV-SIG fields for an NGV PPDU

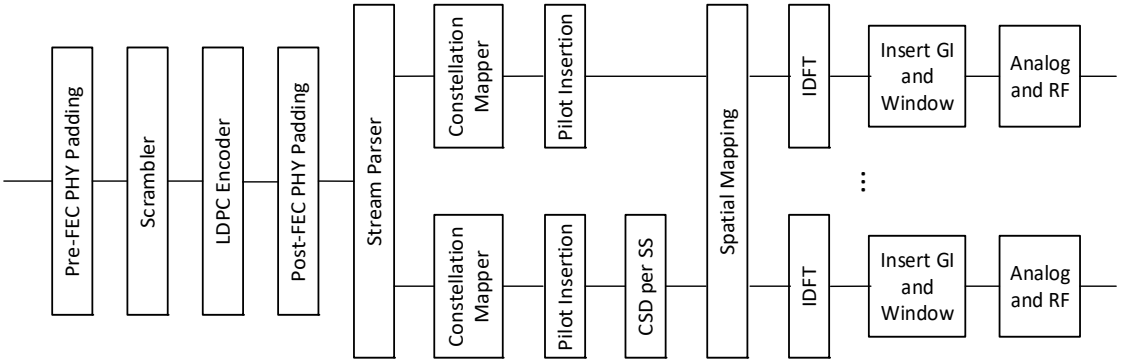
Figure 32-7 shows the transmitter blocks used to generate the Data field of an NGV transmission. The BPSK-DCM tone mapping, which is part of the constellation mapper block, is applied only if BPSK-DCM is indicated by NGV-MCS field value 15 in NGV-SIG field.



NOTE—Transmission with two spatial streams is optional.

Figure 32-7—Transmitter block diagram for the Data field of an NGV transmission

32.3.4 Overview of the PPDU encoding process

32.3.4.1 General

This subclause provides an overview of the NGV PPDU encoding process.

32.3.4.2 Construction of L-STF

Construct the L-STF field as defined in 32.3.8.3 with the following highlights:

a) Determine the CH_BANDWIDTH from the TXVECTOR.
b) Sequence generation: Generate the L-STF sequence over the CH_BANDWIDTH as described in 32.3.8.3.
c) Phase rotation: Apply appropriate phase rotation for each 10 MHz subchannel as described in 32.3.7.3 and 32.3.7.4.
d) IDFT: Compute the inverse discrete Fourier transform.
e) CSD: Apply CSD for each transmit chain as described in 32.3.8.2.1.
f) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 32.3.7.3.

Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 32.3.7.3 and 32.3.8 for details.

32.3.4.3 Construction of the L-LTF

Construct the L-LTF field as defined in 32.3.8.4 with the following highlights:

a) Determine the CH_BANDWIDTH from the TXVECTOR.
b) Sequence generation: Generate the L-LTF sequence over the CH_BANDWIDTH as described in 32.3.8.4.
c) Phase rotation: Apply appropriate phase rotation for each 10 MHz subchannel as described in 32.3.7.3 and 32.3.7.4.
d) IDFT: Compute the inverse discrete Fourier transform.
e) CSD: Apply CSD for each transmit chain as described in 32.3.8.2.1.
f) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 32.3.7.3.
g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 32.3.7.3 and 32.3.8 for details.

32.3.4.4 Construction of the L-SIG and RL-SIG

Construct the L-SIG field as the SIGNAL field defined in 32.3.8.5 with the following highlights:

a) In an NGV PPDU set the RATE subfield in the SIGNAL field to 3 Mb/s in the 10 MHz channel spacing column of Table 17-6. Set the Length, Parity, and Tail bits in the SIGNAL field as described in 32.3.8.5.
b) BCC encoder: Encode the SIGNAL field by a convolutional encoder at the rate of R=1/2 as described in 17.3.5.6.
c) BCC interleaver: Interleave as described in 17.3.5.7.
d) Constellation Mapper: BPSK modulate as described in 17.3.5.8.
e) Pilot insertion: Insert pilots as described in 17.3.5.9.
f) Duplication and phase rotation: Duplicate the L-SIG field over each 10 MHz of the CH_BANDWIDTH. Apply appropriate phase rotation for each 10 MHz subchannel as described in 32.3.7.3 and 32.3.7.4.
g) IDFT: Compute the inverse discrete Fourier transform.
h) CSD: Apply CSD for each transmit chain as described in 32.3.8.2.1.
i) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 32.3.7.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

j) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 32.3.7.3 and 32.3.8 for details.

Construct the RL-SIG field as the repeat SIGNAL field defined in 32.3.8.6 with the same process as for the L-SIG field.

32.3.4.5 Construction of the NGV-SIG and RNGV-SIG

The NGV-SIG field consists of one symbol as defined in 32.3.8.7 and is constructed as follows:

a) Obtain the NGV-SIG field values from the TXVECTOR entries of NGV-MCS, CH_BANDWIDTH, MIDAMBLE_PERIODICITY, NGV_LTF_TYPE, NUM_SS, and LTF_REP. Add the reserved bits, append the calculated CRC, then append the tail bits as shown in 32.3.8.7. This results in 24 uncoded bits.
b) BCC encoder: Encode the data by a convolutional encoder at the rate of R=1/2 as described in 17.3.5.6.
c) BCC interleaver: Interleave as described in 17.3.5.7.
d) Constellation Mapper: BPSK modulate the 48 interleaved bits as described in 17.3.5.8 to form the NGV-SIG symbol.
e) Pilot insertion: Insert pilots as described in 17.3.5.9.
f) Duplication and phase rotation: Duplicate NGV-SIG over each 10 MHz of the CH_BANDWIDTH. Apply appropriate phase rotation for each 10 MHz subchannel as described in 32.3.7.3 and 32.3.7.4.
g) IDFT: Compute the inverse discrete Fourier transform.
h) CSD: Apply CSD for each transmit chain as described in 32.3.8.2.1.
i) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 32.3.7.3.
j) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 32.3.7.3 and 32.3.8 for details.

Construct the RNGV-SIG field as the repeat NGV-SIG field defined in 32.3.8.8 with the same process as for the NGV-SIG field.

32.3.4.6 Construction of NGV-STF

The NGV-STF field is defined in 32.3.8.9 and is constructed as follows:

a) Sequence generation: Generate the NGV-STF in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 32.3.8.9.
b) Phase rotation: Apply appropriate phase rotation for each 10 MHz subchannel as described in 32.3.7.3 and 32.3.7.4.
c) CSD: Apply CSD for each spatial stream as described in 32.3.8.2.2.
d) Spatial mapping: Apply the Q matrix as described in 32.3.9.8.1.
e) IDFT: Compute the inverse discrete Fourier transform.
f) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 32.3.7.3.
g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 32.3.7.3 and 32.3.8 for details.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

32.3.4.7 Construction of NGV-LTF

The NGV-LTF field is defined in 32.3.8.10 and constructed as follows:

a) Sequence generation: Generate the NGV-LTF sequence in the frequency domain over the CH_BANDWIDTH as described in 32.3.8.10.
b) Phase rotation: Apply appropriate phase rotation for each 10 MHz subchannel as described in 32.3.7.3 and 32.3.7.4.
c) $A_{NGV\text{-}LTF}$ matrix mapping: Apply the $P_{NGV\text{-}LTF}$ matrix to the data tones of the NGV-LTF sequence and apply the $R_{NGV\text{-}LTF}$ matrix to the pilot tones as described in 32.3.8.10.
d) CSD: Apply CSD for each spatial stream as described in 32.3.8.2.2.
e) Spatial mapping: Apply the Q matrix as described in 32.3.9.8.1.
f) IDFT: Compute the inverse discrete Fourier transform.
g) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 32.3.7.3.
h) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 32.3.7.3 and 32.3.8 for details.

32.3.4.8 Construction of the Data field in an NGV PPDU

The construction of the Data field in an NGV PPDU proceeds as follows:

a) Construct the SERVICE field as described in 32.3.9.2 and append the PSDU to the SERVICE field.
b) PHY padding: Append the PHY pad bits to the PSDU. There are no tail bits.
c) Scrambler: Scramble the PHY padded data.
d) LDPC encoder: The scrambled bits are encoded using the LDPC code with the APEP_LENGTH in the TXVECTOR as described in 32.3.9.4.
e) Stream parser: The output of the LDPC encoder is rearranged into blocks as described in 32.3.9.5.
f) Phase rotation: Apply appropriate phase rotation for each 10 MHz subchannel as described in 32.3.7.3 and 32.3.7.4.
g) CSD: Apply CSD for each spatial stream as described in 32.3.8.2.2.
h) Spatial mapping: Apply the Q matrix as described in 32.3.9.8.1.
i) IDFT: Compute the inverse discrete Fourier transform.
j) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 32.3.7.3.
k) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 32.3.7.3 and 32.3.8 for details.

32.3.5 NGV modulation and coding schemes

The NGV-MCS is a value that determines the modulation and coding used in the Data field of the PPDU. It is a compact representation that is carried in the NGV-SIG field and RNGV-SIG field for NGV PPDUs. Rate dependent parameters for the full set of NGV-MCSs are shown in Table 32-21 to Table 32-24. These tables give rate-dependent parameters for NGV-MCSs with indices n, where $n = 0, ..., 15$, with number of spatial streams from 1 to 2 and bandwidth options of 10 MHz and 20 MHz. Equal modulation is applied to all streams.

The use of BPSK-DCM on the Data field of an NGV PPDU is indicated as NGV-MCS 15 in NGV-SIG field.

32.3.6 Timing related parameters

Table 32-6 defines the timing related parameters.

Table 32-6—Timing related constants

Parameter	CBW10	CBW20	Description
N_{SD}	52	108	Number of data subcarriers
N_{SP}	4	6	Number of pilot subcarriers
N_{ST}	56	114	Total number of subcarriers See NOTE
N_{SR}	28	58	Highest data subcarrier index
Δ_F	156.25 kHz		Subcarrier frequency spacing
T_{DFT}	6.4 μs		IDFT/DFT period
T_{GI}	1.6 μs = T_{DFT}/4		Guard interval duration
T_{GI2}	3.2 μs		Double guard interval
T_{SYM}	8 μs = T_{DFT} + T_{GI} = 1.25×T_{DFT}		Symbol interval
$T_{\text{L-STF}}$	16 μs = 10 × T_{DFT}/4		Non-HT Short Training field duration
$T_{\text{L-LTF}}$	16 μs = 2 × T_{DFT} + T_{GI2}		Non-HT Long Training field duration
$T_{\text{L-SIG}}$	8 μs		Non-HT SIGNAL field duration
$T_{\text{RL-SIG}}$	8 μs		Repeated Non-HT SIGNAL field duration
$T_{\text{NGV-SIG}}$	8 μs		NGV SIGNAL field duration
$T_{\text{RNGV-SIG}}$	8 μs		Repeated NGV SIGNAL field duration
$T_{\text{NGV-STF}}$	8 μs		NGV Short Training field duration
$T_{\text{NGV-LTF-2X}}$	8 μs		Duration of each NGV-LTF-2x symbol
$T_{\text{NGV-LTF-1X}}$	4.8 μs		Duration of each NGV-LTF-1x symbol
$T_{\text{NGV-LTF-2X-Repeat}}$	14.4 μs		Duration of each repeated NGV-LTF-2x symbol
$T_{\text{NGV-LTF}}$	$T_{\text{NGV-LTF-2X}}$, $T_{\text{NGV-LTF-1X}}$ or $T_{\text{NGV-LTF-2X-Repeat}}$ depending on the LTF format used		Duration of each OFDM symbol in NGV-LTF field
$N_{service}$	16		Number of bits in the SERVICE field
N_{tail}	6		Number of tail bits per BCC encoder
NOTE —$N_{ST} = N_{SD} + N_{SP}$			

Table 32-7 defines parameters used frequently in Clause 32.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 32-7—Frequently used parameters

Symbol	Explanation
N_{CBPS}	Number of coded bits per symbol
N_{CBPSS}	Number of coded bits per symbol per spatial stream
N_{DBPS}	Number of data bits per symbol
N_{BPSCS}	Number of coded bits per subcarrier per spatial stream
N_{RX}	Number of receive chains
N_{SS}	Number of spatial streams
N_{TX}	Number of transmit chains
$N_{\text{NGV-LTF}}$	Number of NGV-LTF symbols
R	R is the coding rate

32.3.7 Mathematical description of signals

32.3.7.1 Notation

For a description of the conventions used for the mathematical description of the signals, see 17.3.2.5, and 21.3.7.1.

32.3.7.2 Subcarrier indices in use

For a 10 MHz non-NGV PPDU, the signal is transmitted on subcarriers –26 to –1 and 1 to 26, with 0 being the center (DC) subcarrier. See 17.3.2.6.

For a 10 MHz NGV PPDU transmission, the 10 MHz is divided into 64 subcarriers. The signal is transmitted on subcarriers –28 to –1 and 1 to 28, with 0 being the center (DC) subcarrier.

For a 20 MHz NGV PPDU transmission, the 20 MHz is divided into 128 subcarriers. The signal is transmitted on subcarriers –58 to –2 and 2 to 58.

32.3.7.3 Transmitted signal

The transmitted signal is described in complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal by the relation shown in Equation (32-1).

$$r_{RF}^{i_{TX}} = \text{Re}\{r_{PPDU}^{i_{TX}}(t) \exp(j2\pi f_c t)\}, \quad i_{TX} = 1, \ldots, N_{TX} \tag{32-1}$$

where

$r_{PPDU}^{i_{TX}}(t)$ represents the complex baseband signal of transmit chain i_{TX}

f_c represents the center frequency of the PPDU

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The transmitted RF signal is derived by upconverting the complex baseband signal, which consists of several fields. The timing boundaries for the various fields are shown in Figure 32-8, where $N_{\text{NGV-LTF}}$ is the number of NGV-LTF symbols as defined in Table 32-11.

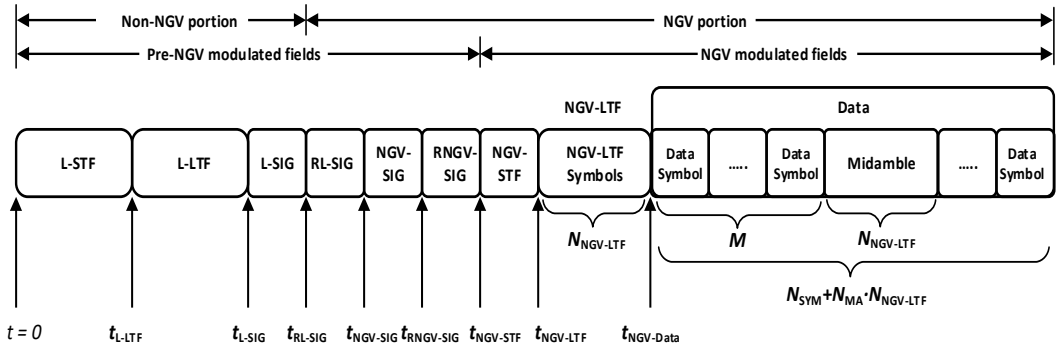

Figure 32-8—Timing boundaries for NGV PPDU fields

The time offset, t_{Field}, determines the starting time of the corresponding field relative to the start of L-STF ($t = 0$).

The signal transmitted on transmit chain i_{TX} shall be as shown in Equation (32-2).

$$\begin{aligned} r_{PPDU}^{i_{TX}}(t) = {} & r_{L\text{-}STF}^{i_{TX}}(t) + r_{L\text{-}LTF}^{i_{TX}}(t - t_{L\text{-}LTF}) \\ & + r_{L\text{-}SIG}^{i_{TX}}(t - t_{L\text{-}SIG}) + r_{RL\text{-}SIG}^{i_{TX}}(t - t_{RL\text{-}SIG}) + r_{NGV\text{-}SIG}^{i_{TX}}(t - t_{NGV\text{-}SIG}) \\ & + r_{RNGV\text{-}SIG}^{i_{TX}}(t - t_{RNGV\text{-}SIG}) + r_{NGV\text{-}STF}^{i_{TX}}(t - t_{NGV\text{-}STF}) + r_{NGV\text{-}LTF}^{i_{TX}}(t - t_{NGV\text{-}LTF}) \\ & + r_{NGV\text{-}Data}^{i_{TX}}(t - t_{NGV\text{-}Data}) \end{aligned} \tag{32-2}$$

where

$$1 \le i_{TX} \le N_{TX}$$

$$t_{L\text{-}LTF} = T_{L\text{-}STF}$$

$$t_{L\text{-}SIG} = t_{L\text{-}LTF} + T_{L\text{-}LTF}$$

$$t_{RL\text{-}SIG} = t_{L\text{-}SIG} + T_{L\text{-}SIG}$$

$$t_{NGV\text{-}SIG} = t_{RL\text{-}SIG} + T_{RL\text{-}SIG}$$

$$t_{RNGV\text{-}SIG} = t_{NGV\text{-}SIG} + T_{NGV\text{-}SIG}$$

$$t_{NGV\text{-}STF} = t_{RNGV\text{-}SIG} + T_{RNGV\text{-}SIG}$$

$$t_{NGV\text{-}LTF} = t_{NGV\text{-}STF} + T_{NGV\text{-}STF}$$

$$t_{NGV\text{-}Data} = t_{NGV\text{-}LTF} + N_{NGV\text{-}LTF} \cdot T_{NGV\text{-}LTF}.$$

Each field, $r_{Field}^{i_{TX}}(t)$, is defined as the summation of one or more subfields, where each subfield is defined to be an inverse discrete Fourier transform as specified in Equation (32-3).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$r_{Subfield}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{\text{Field}}^{\text{Tone}} \times N_{Norm}}} w_{T_{Subfield}}(t)\eta_{Field} \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{SS}} [Q_k]_{i_{TX},m} \Upsilon_{k,BW} X_k^m \exp(j2\pi k\Delta_F(t - T_{GI,Field} - T_{CS,NGV}(m))) \quad (32\text{-}3)$$

This general representation holds for all subfields. The total power of the time domain NGV modulated field signals summed over all transmit chains should not exceed the total power of the time domain pre-NGV modulated field signals summed over all transmit chains. For notational simplicity, the parameter BW is omitted from some bandwidth dependent terms.

In Equation (32-3), the following notations are used:

N_{Field}^{Tone} Table 32-8 summarizes the various values of N_{Field}^{Tone} as a function of bandwidth.

N_{Norm} For pre-NGV modulated fields, $N_{Norm} = N_{TX}$. For NGV modulated fields $N_{Norm} = N_{SS}$, where N_{SS} is given in Table 32-7.

$w_{T_{Subfield}}(t)$ is a windowing function. An example function, $w_{T_{Subfield}}(t)$, is given in 17.3.2.5. $T_{Subfield}$ is $T_{L\text{-}STF}$ for L-STF, $T_{L\text{-}LTF}$ for L-LTF, $T_{L\text{-}SIG}$ for L-SIG, $T_{RL\text{-}SIG}$ for RL-SIG, $T_{NGV\text{-}SIG}$ for NGV-SIG, $T_{RNGV\text{-}SIG}$ for RNGV-SIG, $T_{NGV\text{-}STF}$ for NGV-STF, $T_{NGV\text{-}LTF}$ for NGV-LTF symbol and midamble symbol, and T_{SYM} for Data symbol.

Q_k is the spatial mapping matrix for the subcarrier k. For pre-NGV modulated fields, Q_k is a column vector with N_{TX} elements with element i_{TX} being $e^{-j2\pi k\Delta_F T_{CS}^{i_{TX}}}$, where $T_{CS}^{i_{TX}}$ represents the cyclic shift for transmitter chain i_{TX} whose values are given in Table 21-10. For NGV modulated fields, Q_k is a matrix with N_{TX} rows and N_{SS} columns as further described in 32.3.9.8.1.

$\Upsilon_{k,BW}$ is defined in 32.3.7.4.

Δ_F is the subcarrier frequency spacing given in Table 32-6.

X_k^m is the frequency domain symbol in subcarrier k of spatial stream m. Some of the X_k^m within $-N_{SR} \le k \le N_{SR}$ have a value of 0. Examples of such cases include the DC tones, guard tones on each side of the transmit spectrum, as well as the unmodulated tones of L-STF and NGV-STF fields.

NOTE—The multiplication matrices $A_{NGV\text{-}LTF}^k$ and $P_{NGV\text{-}LTF}$ are included in the calculation of X_k^m for the NGV-LTF field.

$T_{GI,Field}$ is the guard interval duration used for each OFDM symbol in the field. For L-STF and NGV-STF, $T_{GI,Field} = T_{GI}$ but it can be omitted from Equation (32-3) due to the periodic property of L-STF and NGV-STF over every 1.6 μs. For the L-SIG, RL-SIG, NGV-SIG, RNGV-SIG, NGV-LTF, and Data fields, $T_{GI,Field}$ is defined in the "Guard interval duration" column of Table 32-8.

$T_{CS,NGV}(m)$ For pre-NGV modulated fields, $T_{CS,NGV}(m) = 0$. For NGV modulated fields, $T_{CS,NGV}(m)$ represents the cyclic shift per spatial stream, whose value is given in 21.3.8.3.2, where the row for $N_{STS,total} = 1$ corresponds to $N_{SS} = 1$ and the row for $N_{STS,total} = 2$ corresponds to $N_{SS} = 2$.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

η_{Field} is the power scale factor of a given field within an OFDM symbol for NGV PPDU. For the L-STF and L-LTF fields, η_{Field} is $\sqrt{2}$ when NGV-MCS 0 or NGV-MCS 15 and one spatial stream is used for data field in 10 MHz NGV PPDU; otherwise it is 1. For other fields of NGV PPDU, $\eta_{Field} = 1$.

Table 32-8—Tone scaling factor and guard interval duration values for PHY fields

Field	N_{Field}^{Tone}		Guard interval duration
	10 MHz	20 MHz	
L-STF	12	24	—
L-LTF	52	104	T_{GI2}
L-SIG	52	104	T_{GI}
RL-SIG	52	104	T_{GI}
NGV-SIG	52	104	T_{GI}
RNGV-SIG	52	104	T_{GI}
NGV-STF	12	24	—
NGV-LTF-1x	28	58	T_{GI}
NGV-LTF-2x	56	114	T_{GI}
NGV-LTF-2x-Repeat	56	114	T_{GI}
Data	56	114	T_{GI}
NON_NGV_10_DUP_OFDM-Data	—	104	T_{GI}

32.3.7.4 Definition of tone rotation

The function $\Upsilon_{k, BW}$ is used to represent a rotation of the tones. The value of BW in $\Upsilon_{k, BW}$ is determined by the TXVECTOR parameter CH_BANDWIDTH as defined in Table 32-9.

Table 32-9—CH_BANDWIDTH

CH_BANDWIDTH	$\Upsilon_{k, BW}$
CBW10	$\Upsilon_{k, 10}$
CBW20	$\Upsilon_{k, 20}$

For a 10 MHz NGV PPDU transmission:

$$\Upsilon_{k, 10} = 1 \quad (32\text{-}4)$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For a 20 MHz NGV PPDU transmission:

$$\Upsilon_{k,20} = \begin{cases} 1, & k < 0 \\ j, & k \geq 0 \end{cases} \quad (32\text{-}5)$$

32.3.8 NGV preamble

32.3.8.1 Introduction

An NGV preamble is defined to carry the required information to operate in a system with multiple transmit and multiple receive antennas. To maintain compatibility with non-NGV STAs, specific non-NGV fields are defined that can be received by non-NGV STAs compliant with Clause 17. The non-NGV fields are followed by NGV fields specific to NGV STAs.

32.3.8.2 Cyclic shift

32.3.8.2.1 Cyclic shift for pre-NGV modulated fields

The cyclic shift value $N_{CS}^{i_{TX}}$ for the L-STF, L-LTF, L-SIG, RL-SIG, NGV-SIG, and RNGV-SIG fields of the PPDU for transmit chain i_{TX} out of a total of N_{TX} are defined in Table 21-10.

32.3.8.2.2 Cyclic shift for NGV modulated fields

The cyclic shift values defined in this subclause apply to the NGV-STF, NGV-LTF, and Data fields of the NGV PPDU.

Throughout the NGV modulated fields of the preamble, cyclic shifts are applied to prevent unintended beamforming when correlated signals are transmitted in multiple spatial streams. The same cyclic shift is also applied to these streams during the transmission of the Data field of the NGV PPDU. The cyclic shift value for the NGV modulated fields for spatial stream *m* out of N_{SS}, the number of spatial streams, is shown in Table 21-11 where the values in the row for $N_{STS} = m$ is used.

32.3.8.3 L-STF definition

The frequency domain sequence of the L-STF field for a 10 MHz or 20 MHz transmission is defined by Equation (19-8) and Equation (19-9), respectively, in 19.3.9.3.3.

The time domain representation of the signal on transmit chain i_{TX} shall be as specified in Equation (32-6).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$r_{L\text{-}STF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \times N_{L\text{-}STF}^{Tone}}} w_{T_{L\text{-}STF}}(t) \eta_{L-STF} \sum_{i_{BW}=0}^{N_{10\,\mathrm{MHz}}-1} \sum_{k=-26}^{26} (\gamma_{(k-K_{shift}(i_{BW})),BW} S_{k,10} \times \exp(j2\pi(k-K_{shift}(i_{BW}))\Delta_F(t-T_{CS}^{i_{TX}}))) \quad (32\text{-}6)$$

where

η_{L-STF} is the modulation dependent power scaling factor for the L-STF field with the following value:

$$\eta_{L-STF} = \begin{cases} \sqrt{2}, & \text{when NGV-MCS 0 or NGV-MCS 15 and one spatial stream is used on Data field for 10 MHz transmission} \\ 1, & \text{otherwise} \end{cases}$$

$$N_{10\,\mathrm{MHz}} = \begin{cases} 1, & \text{If CH\_BANDWIDTH is CBW10} \\ 2, & \text{If CH\_BANDWIDTH is CBW20} \end{cases}$$

$K_{shift}(i) = (N_{10\,\mathrm{MHz}} - 1 - 2i) \times 32$

$T_{CS}^{(i_{TX})}$ represents the cyclic shift for transmit chain i_{TX} with a value given in 32.3.8.2.1

$\gamma_{k,BW}$ is defined in Equation (32-4) and Equation (32-5)

$N_{L\text{-}STF}^{Tone}$ has the value given in Table 32-8

$S_{k,10}$ is defined as $S_{-26,26}$ in Equation (19-8)

32.3.8.4 L-LTF definition

For a 10 MHz or 20 MHz transmission, the L-LTF pattern in the NGV preamble is defined by Equation (19-11) and Equation (19-12) in 19.3.9.3.4, respectively.

The time domain representation of the signal on transmit chain i_{TX} shall be as defined in Equation (32-7).

$$r_{L\text{-}LTF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \times N_{L\text{-}LTF}^{Tone}}} w_{T_{L\text{-}LTF}}(t) \eta_{L-LTF} \sum_{i_{BW}=0}^{N_{10\,\mathrm{MHz}}-1} \sum_{k=-26}^{26} (\gamma_{(k-K_{shift}(i_{BW})),BW} L_{k,10} \times \exp(j2\pi(k-K_{shift}(i_{BW}))\Delta_F(t-T_{CS}^{i_{TX}}))) \quad (32\text{-}7)$$

where

η_{L-LTF} is a modulation dependent scaling factor for the L-LTF field with the same value as η_{L-STF}

$T_{CS}^{(i_{TX})}$ represents the cyclic shift for transmit chain i_{TX} with a value given in 32.3.8.2.1

$\gamma_{k,BW}$ is defined in Equation (32-4) and Equation (32-5)

$N_{L\text{-}LTF}^{Tone}$ has the value given in Table 32-8

$N_{10\,\mathrm{MHz}}$ is defined in 32.3.8.3

$K_{shift}(i) = (N_{10\,\mathrm{MHz}} - 1 - 2i) \times 32$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$L_{k,\,10}$ is defined as $L_{-26,\,26}$ in Equation (19-11)

32.3.8.5 L-SIG definition

The L-SIG field is used to communicate rate and length information. The structure of the L-SIG field is defined in Figure 17-5.

In an NGV PPDU, the RATE field shall be set to the value representing 3 Mb/s in the 10 MHz channel spacing column of Table 17-6. In a non-NGV duplicate PPDU, the RATE field is defined in 17.3.4.2 using the L_DATARATE parameter in the TXVECTOR.

The Length field shall be set to the value given by Equation (32-8).

$$\text{Length} = \frac{\text{TXTIME} - 40}{8} \times 3 - 3 \tag{32-8}$$

where
TXTIME (in μs) is defined in 32.4.3.

The LSB of the binary expression of the value of the Length field shall be mapped to B5. In a non-NGV duplicate PPDU, the LENGTH field is defined in 17.3.4.3 using the L_LENGTH parameter in the TXVECTOR.

The Reserved (R) field shall be set to 0.

The Parity (P) field has the even parity of bits 0–16.

The SIGNAL TAIL field shall be set to 0.

The L-SIG field shall be encoded, interleaved, and mapped following the steps described in 17.3.5.6, 17.3.5.7, and 17.3.5.8. The stream of 48 complex numbers generated by these steps is denoted by $d_k, k = 0, \ldots, 47$ and are mapped to subcarriers [–26, 26]. Pilots shall be inserted as described in 17.3.5.9.

The time domain waveform of the L-SIG field shall be as given by Equation (32-9).

$$r_{L\text{-}SIG}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \times N_{L\text{-SIG}}^{Tone}}} w_{T_{L\text{-}SIG}}(t) \sum_{i_{BW}=0}^{N_{10\,\text{MHz}}-1} \sum_{k=-26}^{26} \gamma_{(k - K_{shift}(i_{BW})),\,BW}(D_{k,\,10} + p_0 P_k) \times \exp(j2\pi(k - K_{shift}(i_{BW}))\Delta_F(t - T_{GI} - T_{CS}^{i_{TX}})) \tag{32-9}$$

where
$N_{10\,\text{MHz}}$ is defined in 32.3.8.3
$K_{shift}(i) = (N_{10\,\text{MHz}} - 1 - 2i) \times 32$

$$D_{k,\,10} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M_{10}^r(k)}, \text{otherwise} \end{cases}$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$M_{10}^{r}(k) = \begin{cases} k+26, & -26 \le k \le -22 \\ k+25, & -20 \le k \le -8 \\ k+24, & -6 \le k \le -1 \\ k+23, & 1 \le k \le 6 \\ k+22, & 8 \le k \le 20 \\ k+21, & 22 \le k \le 26 \end{cases} \quad (32\text{-}10)$$

P_k is defined in 17.3.5.10

p_0 is the first pilot value in the sequence defined in 17.3.5.10

$N_{L\text{-}SIG}^{Tone}$ has the value given in Table 32-8

$\gamma_{k,BW}$ is defined in Equation (32-4) and Equation (32-5)

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} with a value given in 32.3.8.2.1

NOTE—$M_{10}^{r}(k)$ is a "reverse" function of the $M(k)$ defined in 17.3.5.10.

32.3.8.6 RL-SIG definition

The RL-SIG field is a repeat of the L-SIG field and is used to differentiate an NGV PPDU from a non-NGV PPDU. RL-SIG field shall be modulated the same as L-SIG field.

The time domain waveform of the RL-SIG field shall be as given by Equation (32-11).

$$r_{RL\text{-}SIG}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \times N_{RL\text{-SIG}}^{Tone}}} w_{T_{L\text{-}SIG}}(t) \sum_{i_{BW}=0}^{N_{10\,\mathrm{MHz}}-1} \sum_{k=-26}^{26} \gamma_{(k-K_{shift}(i_{BW})),\,BW}(D_{k,\,10} + p_1 P_k) \times \exp(j2\pi(k-K_{shift}(i_{BW}))\Delta_F(t - T_{GI} - T_{CS}^{i_{TX}})) \quad (32\text{-}11)$$

where

$N_{RL\text{-SIG}}^{Tone}$ has the value given in Table 32-8.

p_1 is the second pilot value in the sequence defined in 17.3.5.10

32.3.8.7 NGV-SIG definition

The NGV-SIG field carries information required to interpret NGV PPDUs. The NGV-SIG field contains the fields listed in Table 32-10.

The NGV-SIG field is composed of one OFDM symbol, containing 24 data bits, as shown in Table 32-10. NGV-SIG is transmitted before RNGV-SIG. The NGV-SIG symbol shall be BCC encoded at rate, R = 1/2, be interleaved, be mapped to a BPSK constellation, and have pilots inserted following the steps described in 17.3.5.6, 17.3.5.7, 17.3.5.8, and 17.3.5.9. The stream of 48 complex numbers generated by these steps (before pilot insertion) is denoted by $d_k, k = 0,\ldots,47$.

The time domain waveform for the NGV-SIG field in an NGV PPDU shall be as specified in Equation (32-12).

Table 32-10—Fields in the NGV-SIG field

Bit	Field	Number of bits	Description
B0–B1	PHY Version	2	Set to 0 for NGV PHY. Values 1–3 are reserved.
B2	Bandwidth	1	Set to 0 for 10 MHz, and set to 1 for 20 MHz.
B3–B6	NGV-MCS	4	For 10 MHz PPDU, set to *n* for NGV-MCS *n*, where $n = 0, 1, 2, \ldots, 8$, and 15. Value 9 is not valid and values 10–14 are reserved. For 20 MHz PPDU, set to *n* for NGV-MCS *n*, where $n = 0, 1, 2, \ldots, 9$, and 15. MCS 10–14 are reserved.
B7	N_{SS}	1	Set to 0 for one spatial stream, and set to 1 for two spatial streams.
B8–B9	Midamble Periodicity	2	Set to 0 for 4 symbols. Set to1 for 8 symbols. Set to 2 for 16 symbols. Value 3 is reserved.
B10	LTF Format	1	Set to 0 for NGV-LTF-2x. Set to 1 for NGV-LTF-1x. NOTE—If NGV-LTF-2x-Repeat is used (see 32.3.8.10) with B2 set to 0, B3–B6 set to 15 and B7 set to 0, this field is reserved and set to 1.
B11	LDPC Extra OFDM Symbol	1	Set to 1 if the LPDC PPDU encoding process results in an extra OFDM symbol as described in 21.3.10.5.4. Set to 0 otherwise.
B12	LTF Repetition	1	Set to 1 for NGV ranging NDP with NGV-LTF repetition. Set to 0 otherwise.
B13	Reserved	1	Reserved and set to 1.
B14–B17	CRC	4	CRC is calculated as in 27.3.11.7.3 with $L = 13$.
B18–B23	Tail	6	Used to terminate the trellis of the convolutional decoder. Set to 0.

$$r_{NGV\text{-}SIG}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \times N_{NGV\text{-}SIG}^{Tone}}} w_{T_{NGV\text{-}SIG}}(t) \sum_{i_{BW}=0}^{N_{10\,MHz}-1} \sum_{k=-26}^{26} \gamma_{(k-K_{shift}(i_{BW})),\,BW}(D_{k,\,10} + p_2 P_k) \times \exp(j2\pi(k - K_{shift}(i_{BW}))\Delta_F(t - T_{GI} - T_{CS}^{i_{TX}})) \quad (32\text{-}12)$$

where

$N_{10\,MHz}$ and $K_{shift}(i)$ are defined in 32.3.8.5

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$D_{k,10} = \begin{cases} 0, & k = 0, \pm 7, \pm 21 \\ d_{M_{10}^{r}(k)}, & \text{otherwise} \end{cases}$$

$M_{10}^{r}(k)$ is defined in Equation (32-10)

P_k and p_2 are defined in 17.3.5.10

$N_{NGV\text{-}SIG}^{Tone}$ has the value given in Table 32-8

$\Upsilon_{k,BW}$ is defined in Equation (32-4) and Equation (32-5)

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} with a value given in 32.3.8.2.1

NOTE—In NGV PPDUs, the NGV-SIG is transmitted with the same number of subcarriers and the same cyclic shifts as the preceding non-NGV portion of the preamble.

32.3.8.8 RNGV-SIG definition

The RNGV-SIG field is a repeat of the NGV-SIG field and is configured identically to the NGV-SIG.

The time domain waveform of the RNGV-SIG field shall be as given by Equation (32-13).

$$r_{RNGV\text{-}SIG}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \times N_{RNGV\text{-}SIG}^{Tone}}} w_{T_{RNGV\text{-}SIG}}(t) \sum_{i_{BW}=0}^{N_{10\,\mathrm{MHz}}-1} \sum_{k=-26}^{26} \Upsilon_{(k-K_{shift}(i_{BW})),\,BW}(D_{k,\,10} + p_3 P_k) \quad (32\text{-}13)$$

$$\times \exp(j2\pi(k - K_{shift}(i_{BW}))\Delta_F(t - T_{GI} - T_{CS}^{i_{TX}}))$$

where

$N_{RNGV\text{-}SIG}^{Tone}$ has the value given in Table 32-8

p_3 is the fourth pilot value in the sequence defined in 17.3.5.10

32.3.8.9 NGV-STF definition

The main purpose of the NGV-STF field is to improve automatic gain control estimation in a MIMO transmission. The duration of the NGV-STF field is 8 μs. The frequency domain sequence used to construct the NGV-STF field in a 10 MHz transmission is identical to the VHT-STF field for 20 MHz transmission. In a 20 MHz transmission, the NGV-STF field is constructed by using the frequency domain sequence for the VHT-STF field of 40 MHz transmission and applying appropriate phase rotations per 10 MHz subchannel.

For a 10 MHz transmission, the frequency domain sequence is given by Equation (32-14).

$$NGVS_{-28,28} = VHTS_{-28,28} \quad (32\text{-}14)$$

where $VHTS_{-28,28}$ is defined in Equation (21-29).

For a 20 MHz transmission, the frequency domain sequence is given by Equation (32-15).

$$NGVS_{-58,58} = VHTS_{-58,58} \quad (32\text{-}15)$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

where $VHTS_{-58,58}$ is defined in Equation (21-30).

NOTE—Equation (32-14) and Equation (32-15) do not show the phase rotation per 10 MHz subchannel.

The time domain representation of the signal on transmit chain i_{TX} shall be as specified in Equation (32-16).

$$r_{NGV\text{-}STF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{SS} \times N_{NGV\text{-}STF}^{Tone}}} w_{T_{NGV\text{-}STF}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{SS}} [Q_k]_{i_{TX},m} \gamma_{k,BW} NGVS_k \times \exp(j2\pi k\Delta_F(t - T_{CS,NGV}(m))) \quad (32\text{-}16)$$

where

$N_{NGV\text{-}STF}^{Tone}$ has the value given in Table 32-8

$T_{CS,NGV}(m)$ is given in 32.3.8.2.2

Q_k is defined in 32.3.7.3

$\gamma_{k,BW}$ is defined in defined in Equation (32-4) and Equation (32-5)

32.3.8.10 NGV-LTF definition

The NGV-LTF field provides means for the receiver to estimate the MIMO channel between the set of constellation mapper outputs and the receive chains. The transmitter provides training for N_{SS} spatial streams (spatial mapper inputs) used for the transmission of the PSDU(s). For each tone, the MIMO channel that can be estimated is an $N_{RX} \times N_{SS}$ matrix. An NGV transmission has a preamble that contains NGV-LTF symbols, where the data tones of each NGV-LTF symbol are multiplied by entries belonging to a matrix $P_{NGV\text{-}LTF}$, to enable channel estimation at the receiver. The pilot tones of each NGV-LTF symbol are multiplied by the entries of a matrix $R_{NGV\text{-}LTF}$ defined in the following text. The multiplication of the pilot tones in the NGV-LTF symbol by the $R_{NGV\text{-}LTF}$ matrix instead of the $P_{NGV\text{-}LTF}$ matrix allows receivers to track phase and frequency offset during MIMO channel estimation using the NGV-LTF. The number of NGV-LTF symbols, $N_{NGV\text{-}LTF}$, is a function of the number of spatial streams, N_{SS}, as shown in Table 32-11 and LTF_REP as shown in 32.3.16. As a result the NGV-LTF field consists of one, two, or four symbols.

Table 32-11—Number of NGV-LTFs required for different numbers of spatial streams

N_{SS}	$N_{NGV\text{-}LTF}$
1	1 × (LTF_REP + 1)
2	2 × (LTF_REP + 1)

An NGV PPDU supports three NGV-LTF formats: NGV-LTF-1x, NGV-LTF-2x, and NGV-LTF-2x-Repeat. NGV-LTF-2x is the default LTF format; NGV-LTF-1x is used for high efficiency transmission of one spatial stream and NGV-LTF-2x-Repeat is used for extended range transmissions. A transmitter shall use the NGV-LTF-2x-Repeat format if the NGV Data field of a 10 MHz NGV PPDU is modulated with BPSK-DCM and one spatial stream; the transmitter shall use the NGV-LTF-2x format if the NGV Data field

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

is modulated with two spatial streams; the transmitter shall use the NGV-LTF-2x format for an NGV ranging NDP; otherwise, the transmitter shall choose either NGV-LTF-2x or NGV-LTF-1x format. The NGV-LTF format of NGV-LTF-1x or NGV-LTF-2x is signaled by B10 in NGV-SIG field. The NGV-LTF-2x-Repeat format is signaled by the combination of B2 set to 0, B3–B6 set to 15 and B7 set to 0 in NGV-SIG field, and B10 is Reserved and set to 1. The duration of each NGV-LTF symbol is $T_{NGV\text{-}LTF}$, defined in Equation (32-17).

$$T_{\text{NGV-LTF}} = \begin{cases} T_{\text{NGV-LTF-1X}}, & \text{if NGV-LTF-1x} \\ T_{\text{NGV-LTF-2X}}, & \text{if NGV-LTF-2x} \\ T_{\text{NGV-LTF-2X-Repeat}}, & \text{if NGV-LTF-2x-Repeat} \end{cases} \quad (32\text{-}17)$$

Let LTF_{left} and LTF_{right} be the sequences defined in Equation (32-18) and Equation (32-19), respectively.

$$LTF_{left} = \{1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1\} \quad (32\text{-}18)$$

$$LTF_{right} = \{1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1, 1\} \quad (32\text{-}19)$$

NOTE 1— LTF_{left} is identical to the leftmost 26 elements of Equation (17-8), and LTF_{right} is identical to the rightmost 26 elements of Equation (17-8).

In a 10 MHz transmission, the NGV-LTF-1x sequence transmitted is given by Equation (32-20).

$$NGV\text{-}LTF_{-28,28} = \{1, 0, 1, 0, -1, 0, 1, 0, -1, 0, -1, 0, 1, 0, 1, 0, 1, 0, 1, 0, -1, 0, 1, 0, 1, 0, 1, 0, 1, 0, 0, 0, -1, 0, 1, 0, -1, 0, -1, 0, -1, 0, -1, 0, -1, 0, 1, 0, -1, 0, -1, 0, -1, 0, 1, 0, 1, 0, -1\} \quad (32\text{-}20)$$

In a 10 MHz transmission, the NGV-LTF-2x sequence transmitted is given by Equation (32-21).

$$\begin{aligned} NGV\text{-}LTF_{-28,28} &= \{1, 1, LTF_{left}, 0, LTF_{right}, -1, -1\} \\ &= VHT\text{-}LTF_{-28,28} \end{aligned} \quad (32\text{-}21)$$

where

$VHT\text{-}LTF_{-28,28}$ is defined in Equation (21-36).

In a 20 MHz transmission, the NGV-LTF-1x sequence transmitted is given by Equation (32-22).

$$\begin{aligned} NGV\text{-}LTF_{-58,58} = \{&1, 0, -1, 0, 1, 0, -1, 0, -1, 0, 1, 0, 1, 0, 1, 0, -1, 0, 1, 0, 1, 0, \\ &1, 0, 1, 0, 1, 0, -1, 0, 1, 0, -1, 0, -1, 0, -1, 0, -1, 0, -1, 0, 1, 0, -1, 0, -1, 0, -1, 0, \\ &1, 0, 1, 0, -1, 0, 1, 0, 0, 0, -1, 0, 1, 0, 1, 0, -1, 0, 1, 0, -1, 0, -1, 0, 1, 0, 1, 0, 1, 0, \\ &-1, 0, 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, -1, 0, 1, 0, -1, 0, -1, 0, -1, 0, -1, 0, -1, 0, 1, 0, -1, \\ &0, -1, 0, -1, 0, 1, 0, 1\} \end{aligned} \quad (32\text{-}22)$$

In a 20 MHz transmission, the NGV-LTF-2x sequence transmitted is given by Equation (32-23).

$$\begin{aligned} NGV\text{-}LTF_{-58,58} &= \{LTF_{left}, 1, LTF_{right}, -1, -1, -1, 1, 0, 0, 0, -1, 1, 1, -1, LTF_{left}, 1, LTF_{right}\} \\ &= VHT\text{-}LTF_{-58,58} \end{aligned} \quad (32\text{-}23)$$

where

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$VHT\text{-}LTF_{-58,58}$ is defined in Equation (21-37).

NOTE 2—Equation (32-20), Equation (32-21), Equation (32-22), and Equation (32-23) do not show the phase rotation per 10 MHz subchannel.

The generation of the time domain NGV-LTF symbols is shown in Figure 32-9.

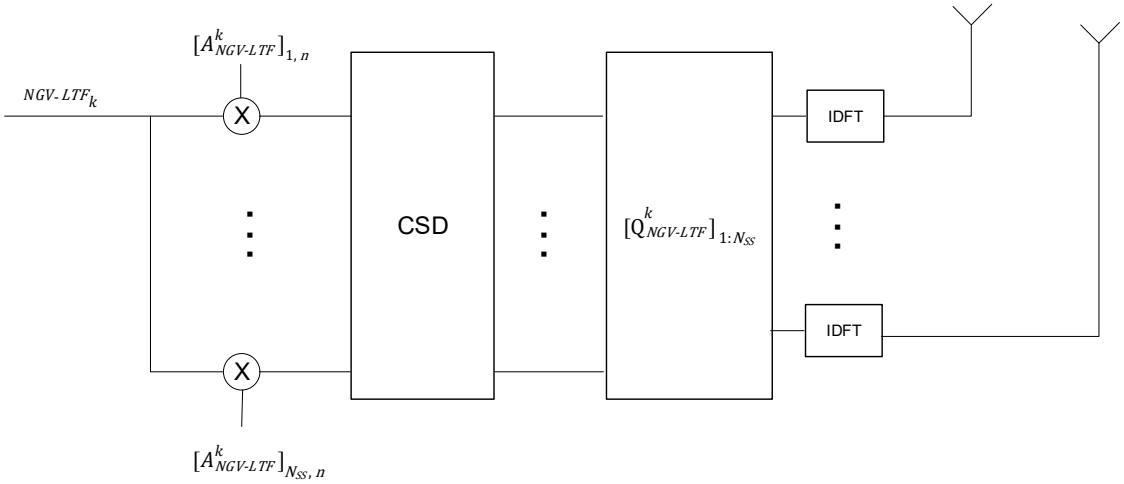

Figure 32-9—Generation of NGV-LTF symbols

The generation of a time domain symbol of NGV-LTF-1x is equivalent to modulating every other tone in an OFDM symbol of 6.4 μs excluding GI, and then only transmit the first half of the OFDM symbol in the time domain, as shown in Figure 32-10.

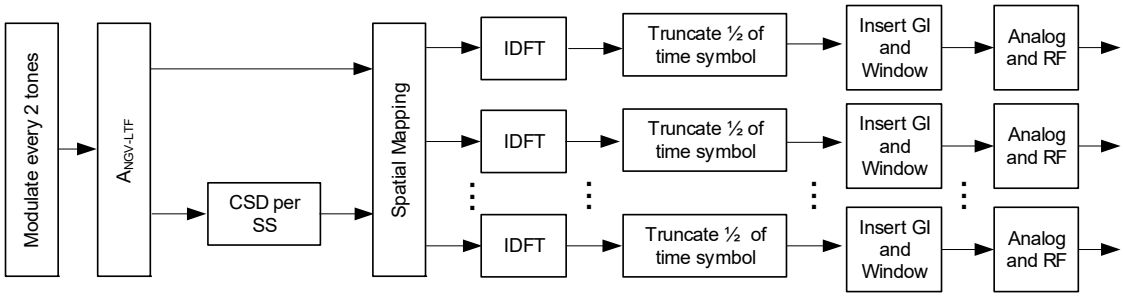

Figure 32-10—Generation of NGV-LTF-1x symbols

NGV-LTF-2x-Repeat is constructed by repeating the time domain symbol of NGV-LTF-2x excluding GI and preappend one cyclic prefix of duration 1.6 μs.The generation of a time domain symbol of NGV-LTF-

2x-Repeat is equivalent to modulating every tone in an OFDM symbol of 6.4 μs excluding GI, and then the OFDM symbol is repeated in the time domain, as shown in Figure 32-11.

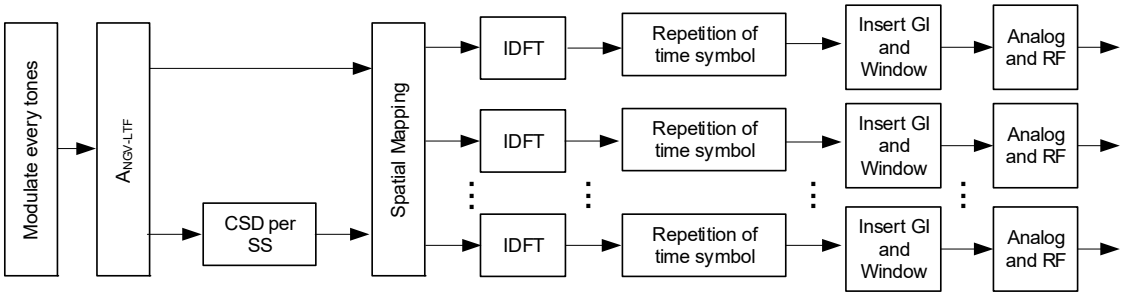

Figure 32-11—Generation of NGV-LTF-2x-Repeat symbols

$A^{k}_{NGV\text{-}LTF}$ is given by Equation (32-24).

$$A^{k}_{NGV\text{-}LTF} = \begin{cases} R_{NGV\text{-}LTF}, \text{ if } k \in K_{pilot} \\ P_{NGV\text{-}LTF}, \text{ otherwise} \end{cases} \tag{32-24}$$

where

K_{pilot} is the set of subcarrier indices for the pilot tones:
For a 10 MHz transmission, $K_{pilot} = \{\pm 8, \pm 22\}$
For a 20 MHz transmission, $K_{pilot} = \{\pm 12, \pm 26, \pm 54\}$

$R_{NGV\text{-}LTF}$ is an $N_{SS} \times N_{NGV\text{-}LTF}$ matrix whose elements are defined in Equation (32-25) and Equation (32-26)

$$[R_{NGV\text{-}LTF}]_{m,n} = [P_{NGV\text{-}LTF}]_{1,n}, 1 \le n \le N_{NGV\text{-}LTF}, 1 \le m \le N_{SS} \tag{32-25}$$

$$P_{NGV\text{-}LTF} = [P_{2\times 2} P_{2\times 2}] \tag{32-26}$$

where

$P_{2\times 2} = P_{4\times 4\{1:2\}\{1:2\}}$ is a submatrix of $P_{4\times 4}$ with elements of the first two rows and two columns of $P_{4\times 4}$, which is defined in Equation (19-27)

The time domain representation of the waveform transmitted on transmit chain i_{TX} shall be as described by Equation (32-27).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$r_{NGV\text{-}LTF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{SS} \times N_{NGV\text{-}LTF}^{Tone}}} \sum_{n=0}^{N_{NGV\text{-}LTF}-1} w_{T_{NGV\text{-}LTF}}(t - nT_{NGV\text{-}LTF})$$
$$\times \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{SS}} [Q_k]_{i_{TX},m} \gamma_{k,BW} [A_{NGV\text{-}LTF}^{k}]_{m,(n+1)} NGV\text{-}LTF_k \quad (32\text{-}27)$$
$$\times \exp(j2\pi k \Delta_F (t - nT_{NGV\text{-}LTF} - T_{GI} - T_{CS,NGV}(m)))$$

where

$N_{NGV\text{-}LTF}^{Tone}$ has the value given in Table 32-8

$T_{CS,NGV}(m)$ is given in 32.3.8.2.2

Q_k is defined in 32.3.7.3

$\gamma_{k,BW}$ is defined in Equation (32-4) and Equation (32-5)

$A_{NGV\text{-}LTF}^{k}$ is defined in Equation (32-24)

32.3.9 Data field

32.3.9.1 General

The number of OFDM symbols in the Data field is determined by the Length field in L-SIG (see Equation (32-8)), the preamble duration, and the setting of the NGV-LTF and Midamble field in NGV-SIG (see 32.3.8).

For LDPC encoding, the Data field shall consist of the SERVICE field, the PSDU, and the PHY pad bits. The padding flow is as follows. The MAC delivers a PSDU that fills the available octets in the Data field of the PPDU. The PHY determines the number of pad bits to add and appends them to the PSDU. The number of pad bits added always is 0 to 7. The PHY padding bits are calculated using Equation (32-28).

$$N_{PAD} = N_{SYM,init} N_{DBPS} - 8 \times \text{PSDU\_LENGTH} - N_{service} \quad (32\text{-}28)$$

where

PSDU_LENGTH is defined in 32.4.3

$N_{SYM,init}$ is given by Equation (21-62) with $m_{STBC} = 1$

32.3.9.2 SERVICE field

The SERVICE field is as shown in Table 32-12.

Table 32-12—SERVICE field

Bits	Field	**Description**
B0–B6	Scrambler Initialization	Set to 0
B7–B15	Reserved	Set to 0

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

32.3.9.3 Scrambler

The SERVICE, PSDU, and PHY pad parts of the Data field shall be scrambled by the scrambler defined in 17.3.5.5. The Clause 17 TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT are not present; therefore, the initial state of the scrambler is set to a pseudorandom nonzero seed.

32.3.9.4 Coding

The Data field of an NGV PPDU shall be encoded using LDPC coding. The LDPC code and encoding process shall follow as described in 21.3.10.5.4 for a VHT SU PPDU with parameter m_{STBC} set to 1 and the LDPC Extra Symbol field setting in NGV-SIG.

32.3.9.5 Stream parser

After coding and puncturing, the data bit streams at the output of the FEC encoder are processed in groups of N_{CBPS} bits. Each of these groups is rearranged into N_{SS} blocks of N_{CBPSS} bits. This operation is referred to as stream parsing and is described in 21.3.10.6 for a SU transmission.

32.3.9.6 Constellation mapping

The mapping between bits at the output of the stream parser and complex constellation points for BPSK, QPSK, 16-QAM, and 64-QAM follows the rules defined in 17.3.5.8 and 256-QAM follows the rules defined in 21.3.10.9.

The streams of complex numbers out of constellation mapping are denoted as shown in Equation (32-29).

$$d_{k,\,m,\,n}, \quad 0 \le k \le N_{SD} - 1; \;\; 1 \le m \le N_{SS}; \;\; 0 \le n \le N_{SYM} - 1 \tag{32-29}$$

For NGV data portion modulated with NGV-MCS 15, the input stream is broken into groups of N_{CBPS} bits $(B_0, B_1, \ldots, B_{N_{CBPS}-1})$. Each bit B_k is BPSK modulated to a sample d_k. This generates the samples for the lower half of the data subcarriers as $d_{k,\,1,\,n} = d_k$. For the upper half of the subcarriers, the samples are generated as $d_{k+N_{SD},\,1,\,n} = d_{k,\,1,\,n} \times e^{j(k+N_{SD})\pi}$, with $k = 0, 1, \ldots, N_{SD} - 1$. The N_{SD} here refers to the N_{SD} for NGV-MCS 15, which is half the value of N_{SD} for NGV-MCS 0.

32.3.9.7 Pilot subcarriers

In a 10 MHz transmission, four pilot tones shall be inserted in subcarriers $k = \{-22, -8, 8, 22\}$. The pilot mapping P_n^k for subcarrier k for symbol n shall be as specified in Equation (32-30).

$$\begin{aligned} P_n^{\{-22,\,-8,\,8,\,22\}} &= \{\Psi^{(1)}_{1,\,n \bmod 4} \;\; , \Psi^{(1)}_{1,\,(n+1) \bmod 4} \;\; , \Psi^{(1)}_{1,\,(n+2) \bmod 4} \;\; , \Psi^{(1)}_{1,\,(n+3) \bmod 4} \;\; \} \\ P_n^{k \ne \{-22,\,-8,\,8,\,22\}} &= 0 \end{aligned} \tag{32-30}$$

where

$\Psi^{(1)}_{1,\,m}$ is given by the $N_{STS} = 1$ row of Table 19-19

In a 20 MHz transmission, six pilot tones shall be inserted in subcarriers $k = \{-54, -26, -12, 12, 26, 54\}$. The pilot mapping P_n^k for subcarrier k for symbol n shall be as specified in Equation (32-31).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$\begin{aligned} P_n^{\{-54,\,-26,\,-12,\,12,\,26,\,54\}} &= \{\Psi^{(1)}_{1,\,n \bmod 6}\ ,\ \Psi^{(1)}_{1,\,(n+1) \bmod 6}\ ,\ \ldots,\ \Psi^{(1)}_{1,\,(n+5) \bmod 6}\ \} \\ P_n^{k \neq \{-54,\,-26,\,-12,\,12,\,26,\,54\}} &= 0 \end{aligned} \tag{32-31}$$

where

$\Psi^{(1)}_{1,\,m}$ is given by the $N_{STS} = 1$ row of Table 19-20

The above pilot mapping shall be copied to all spatial streams before the spatial stream cyclic shifts are applied.

The pilot subcarrier locations in the NGV-LTF field for NGV-LTF-1x, NGV-LTF-2x, and NGV-LTF-2x-Repeat are the same as the pilot subcarrier locations in the Data field.

32.3.9.8 OFDM modulation

32.3.9.8.1 Transmission in NGV format

The time domain waveform of the Data field of an NGV PPDU from transmit chain i_{TX}, $1 \le i_{TX} \le N_{TX}$ shall be as defined in Equation (32-32) and Equation (32-33).

$$\begin{aligned} r^{(i_{TX})}_{NGV\text{-Data}}(t) = \sum_{n=0}^{N_{SYM}-1} & w_{T_{\text{SYM}}}\left(t - nT_{SYM} - \left\lfloor \frac{n}{M} \right\rfloor T_{MA}\right) q_n r^{(i_{TX})}_{NGV\text{-Data},n}\left(t - \left\lfloor \frac{n}{M} \right\rfloor T_{MA}\right) + \\ & \sum_{i_{MA}=0}^{N_{MA}-1} p_{i_{MA}} r^{(i_{TX})}_{NGV\text{-}LTF}(t - (i_{MA}+1)M \cdot T_{SYM} - i_{MA}T_{MA}) \end{aligned} \tag{32-32}$$

$$\begin{aligned} r^{(i_{TX})}_{NGV\text{-Data},n}(t) = \frac{1}{\sqrt{N^{Tone}_{NGV\text{-}Data}\ N_{SS}}} \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{SS}} \Big(& \left[Q_k\right]_{i_{TX},\,m} \Upsilon_{k,BW}(D_{k,\,m,\,n,\,BW} + p_{n+4}P_n^k) \\ & \times \exp(j2\pi k\Delta_F(t - nT_{SYM} - T_{GI,\,Data} - T_{CS,\,NGV}(m))) \Big) \end{aligned} \tag{32-33}$$

where

$r^{(i_{TX})}_{NGV\text{-Data},n}(t)$ is the n^{th} OFDM data symbol in the Data field, $0 \le n < N_{SYM} - 1$

M is the midamble periodicity defined in 32.3.9.9

$r^{(i_{TX})}_{NGV\text{-}LTF}(t)$ is defined in Equation (32-27)

$T_{MA} = T_{NGV\text{-}LTF}N_{NGV\text{-}LTF}$ is the duration of one midamble

p_n is defined in 17.3.5.10

$$q_n = \begin{cases} 1, & \text{for } n < M \\ p_{\left\lfloor \frac{n-M}{M} \right\rfloor}, & \text{for } n \ge M \end{cases}$$

i_{MA} is the index for the midambles, $0 \le i_{MA} \le N_{MA} - 1$

P_n^k is defined in 32.3.9.7

$\Upsilon_{k,\,BW}$ is defined in Equation (32-4) and Equation (32-5)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$D_{k, m, n, BW}$	is the transmitted constellation at subcarrier k, spatial stream m, and Data field OFDM symbol n and is defined in Equation (32-34) and Equation (32-35)
$N_{NGV\text{-}Data}^{Tone}$	has the value given in Table 32-8
$T_{CS, NGV}(n)$	is defined in Table 21-11
$T_{GI, Data}$	is the guard interval duration. $T_{GI, Data} = T_{GI}$

In a 10 MHz NGV PPDU transmission:

$$D_{k, m, n, 10} = \begin{cases} 0, & k = 0, \pm 8, \pm 22 \\ d_{M^r_{10}(k), m, n}, & \text{otherwise} \end{cases} \quad (32\text{-}34)$$

where

$$M^r_{10}(k) = \begin{cases} k + 28, & -28 \le k \le -23 \\ k + 27, & -21 \le k \le -9 \\ k + 26, & -7 \le k \le -1 \\ k + 25, & 1 \le k \le 7 \\ k + 24, & 9 \le k \le 21 \\ k + 23, & 23 \le k \le 28 \end{cases}$$

In a 20 MHz NGV PPDU transmission:

$$D_{k, m, n, 20} = \begin{cases} 0, & k = 0, \pm 12, \pm 26, \pm 54 \\ d_{M^r_{20}(k), m, n}, & \text{otherwise} \end{cases} \quad (32\text{-}35)$$

where

$$M^r_{20}(k) = \begin{cases} k + 58, & -58 \le k \le -55 \\ k + 57, & -53 \le k \le -27 \\ k + 56, & -25 \le k \le -13 \\ k + 55, & -11 \le k \le -2 \\ k + 52, & 2 \le k \le 11 \\ k + 51, & 13 \le k \le 25 \\ k + 50, & 27 \le k \le 53 \\ k + 49, & 55 \le k \le 58 \end{cases}$$

Q_k is a spatial mapping/steering matrix with N_{TX} rows and N_{SS} columns for subcarrier k. Q_k may be frequency dependent. Refer to the examples of Q_k listed in 19.3.11.11.2 for examples of Q_k that could be used for NGV PPDU.

NOTE—Implementations are not restricted to the spatial mapping matrix examples listed in 19.3.11.11.2 and the number of transmit chains N_{TX} could be more than one. The beamforming steering matrices are implementation specific.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

32.3.9.9 Midambles

An NGV STA shall include midambles in an NGV PPDU transmission when the number of midamble periods, N_{MA}, is greater than zero in accordance with Equation (32-36). Midambles facilitate updating of the channel estimate during the NGV PPDU reception.

Midambles are present in the Data field of the NGV PPDU every *M* OFDM symbols, where *M* is either 4, 8, or 16 as indicated by the Midamble Periodicity field in the NGV-SIG field (see Table 32-10).

The Midamble field shall use the same format as the NGV-LTF field of the same PPDU, which format is signalled in the NGV-SIG field. The generation of midamble is defined in 32.3.8.10.

The midambles and succeeding Data field OFDM symbols shall be randomized to prevent the generation of spectral lines in the NGV PPDU spectrum. The *n*th midamble and *M* Data field OFDM symbols following immediately after the *n*th midamble shall be multiplied by p_n, $n = 0, \ldots, N_{MA} - 1$, where p_n is defined in 17.3.5.10. The midamble and the randomization procedure in an NGV PPDU are shown in Figure 32-12.

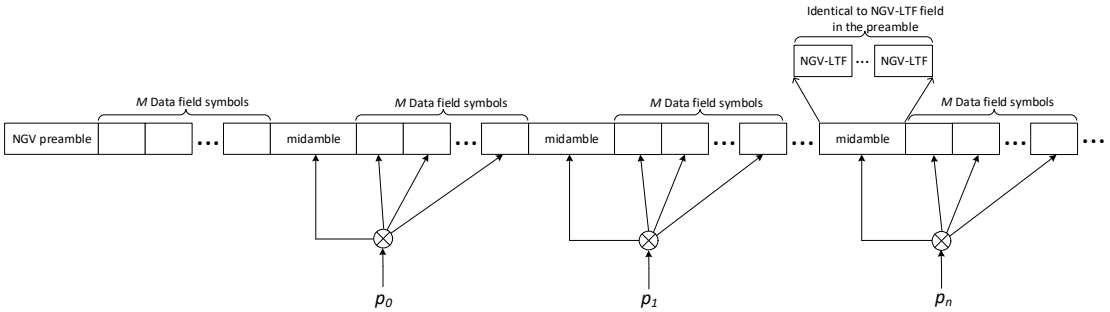

Figure 32-12—NGV PPDU with midamble and randomization procedure

If present, the number of midamble periods, N_{MA}, in a PPDU is calculated using Equation (32-36).

$$N_{MA} = \left\lfloor \frac{N_{SYM} - 1}{M} \right\rfloor \tag{32-36}$$

where N_{SYM} is the total number of data symbols in the Data field, is given in 21.3.10.5.4, and computed using Equation (19-41) in step d) of 19.3.11.7.5.

As shown in Figure 32-12, the first midamble is inserted immediately after the *M*th OFDM symbol in the Data field, and a midamble is not inserted after the last data OFDM symbol if mod $(N_{SYM}, M) = 0$.

32.3.9.10 Non-NGV duplicate transmission

When the TXVECTOR parameter FORMAT is NON_NGV_10 and the TXVECTOR parameter NON_NGV_MODULATION is NON_NGV_10_DUP_OFDM, the transmitted PPDU is a non-NGV duplicate. Non-NGV duplicate transmission is used to transmit to STAs that support non-NGV OFDM and may be present in a part of a 20 MHz channel (see Table 32-2). The RL-SIG, NGV-SIG, RNGV-SIG, NGV-STF, and NGV-LTF fields are not transmitted. The L-STF, L-LTF, and L-SIG fields shall be transmitted in the same way as in the NGV transmission, except that the L-SIG field's Rate and Length fields shall be as defined in 17.3.4. The Data field shall be as defined in Equation (32-37).

NOTE—For L-STF and L-LTF fields, the power scale factor is 1 in 20 MHz non-NGV duplicate PPDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$r_{\text{Non-NGV-Data}}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} N_{\text{NON\_NGV\_10\_DUP\_OFDM-Data}}^{Tone}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{\text{SYM}}}(t - nT_{SYM}) \quad (32\text{-}37)$$

$$\times \sum_{k=-26}^{26} (D_{k,n} + p_{n+1}P_k)(\exp(j2\pi(k-32)\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}^{i_{TX}})))$$

$$+ j \times \exp(j2\pi(k+32)\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}^{i_{TX}})))$$

where

P_k and p_n are defined in 17.3.5.10

$$D_{k,n} = \begin{cases} 0, & k = 0, \pm 7, \pm 21 \\ d_{M_{10}^r(k),1,n}, & \text{otherwise} \end{cases} \quad (32\text{-}38)$$

$M_{10}^r(k)$ is defined in Equation (32-10)

$T_{CS}^{i_{TX}}$ represents the cyclic shift of the transmit chain i_{TX} and is defined in 32.3.8.2.1

$N_{\text{NON\_NGV\_10\_DUP\_OFDM-Data}}^{Tone}$ has the value given in Table 32-8

32.3.10 SU-MIMO

SU-MIMO is defined for an NGV transmitter to transmit two spatial streams to an NGV receiver to improve throughput.

An NGV transmitter equipped with more than one antenna may use the SU-MIMO technique to transmit an NGV PPDU with two spatial streams. The choice of number of spatial streams is described in 31.5.

The steering matrix Q_k, defined in 32.3.7.3, used by the transmitter is implementation specific.

NOTE—The channel in the vehicular environment is fast-varying, so a SU-MIMO transmitter cannot obtain accurate channel information through sounding. Therefore, there is no explicit sounding protocol defined for an NGV transmitter to obtain the channel information prior to the transmission.

32.3.11 Transmit specification

32.3.11.1 Transmit spectrum mask

The transmit spectrum mask by regulatory domain is defined in Annex D and Annex E.

For any STA transmitting a 10 MHz NGV PPDU, the transmit spectrum mask is defined in 17.3.9.3.

For any STA using 20 MHz channel spacing and transmitting a 20 MHz NGV PPDU or 20 MHz non-NGV duplicate PPDU, the transmitted spectral density shall have a 0 dBr bandwidth not exceeding 19 MHz and shall not exceed the spectrum mask created using the permitted power spectral density levels listed in Table 32-13.

The transmission of a 20 MHz NGV PPDU or 20 MHz non-NGV duplicate PPDU shall meet transmit spectrum mask C2 regardless of the transmit power class to which the STA belongs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—In the presence of additional regulatory restrictions, the device needs to meet both the regulatory requirements and the mask defined in this subclause.

NOTE 2—For rules regarding TX center frequency leakage levels, see 32.3.11.4.2. The spectral mask requirements in this subclause do not apply to the RF LO.

Table 32-13—Spectrum mask data for 20 MHz channel spacing

STA transmit power class	Permitted power spectral density, dBr				
	± 9.5 MHz offset (±f1)	± 10.0 MHz offset (±f2)	± 10.5 MHz offset (±f3)	± 15 MHz offset (±f4)	± 25 MHz offset (±f5)
Any Class	0	–26	–32	–40	–50

32.3.11.2 Spectral flatness

Spectral flatness measurements shall be conducted using BPSK modulated PPDUs. Demodulate the PPDUs according to the following (or equivalent) procedure:

a) Start of PPDU shall be detected.
b) Transition from L-STF to L-LTF shall be detected and fine timing shall be established.
c) Coarse and fine frequency offsets shall be estimated.
d) Symbols in a PPDU shall be derotated according to estimated frequency offset.
e) For each NGV-LTF symbol, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, and derotate the subcarrier values according to the estimated phase.
f) For each of the data OFDM symbols: transform the symbol into subcarrier received values.

The spectral flatness test shall be performed over at least 20 PPDUs. The PPDUs under test shall be at least 16 data OFDM symbols long.

Evaluate spectral flatness using the subcarrier received values or the magnitude of the channel estimation.

Let $E_{i,avg}$ denote the magnitude of the channel estimation on subcarrier i or the average constellation energy of a BPSK modulated subcarrier i in an NGV data symbol.

For the spectral flatness test, the transmitting STA shall be configured to use a spatial mapping matrix Q_k (see 32.3.9.8) with flat frequency response. Each output port under test of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The requirements are defined in Table 32-14 and apply to both 10 MHz and 20 MHz transmissions.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 32-14—Maximum transmit spectral flatness deviations

Format	Bandwidth of transmission (MHz)	Average subcarrier indices (inclusive)	Tested subcarrier indices (inclusive)	Maximum deviation (dB)
NGV	10	–16 to –1 and +1 to +16	–16 to –1 and +1 to +16	±4
			–28 to –17 and +17 to +28	+4/–6
	20	–42 to –2 and +2 to +42	–42 to –2 and +2 to +42	±4
			–58 to –43 and +43 to +58	+4/–6

32.3.11.3 Transmit center frequency and symbol clock frequency tolerance

The symbol clock frequency and transmit center frequency tolerance shall be ±20 ppm maximum. The transmit center frequency and the symbol clock frequency for all transmit antennas and frequency segments shall be derived from the same reference oscillator.

32.3.11.4 Modulation accuracy

32.3.11.4.1 Introduction to modulation accuracy tests

Transmit modulation accuracy specifications are described in 32.3.11.4.2 and 32.3.11.4.3. The test method is described in 32.3.11.4.4.

32.3.11.4.2 Transmitter center frequency leakage

TX LO leakage shall meet the following requirements for all bandwidths:

— When the RF LO is in the center of the transmitted PPDU BW, the power measured at the center of transmission BW using resolution BW 156.25 kHz shall not exceed the average power per subcarrier of the transmitted PPDU, or equivalently, $(P - 10\log(N_{ST}))$, where P is the transmit power per antenna in dBm, and N_{ST} is defined in Table 32-6.

— When the RF LO is not at the center of the transmitted PPDU BW, the power measured at the location of the RF LO using resolution BW 156.25 kHz shall not exceed the maximum of –32 dB relative to the total transmit power and –20 dBm, or equivalently $\max(P - 32, -20)$, where P is the transmit power per antenna in dBm.

The transmit center frequency leakage is specified per antenna.

32.3.11.4.3 Transmitter constellation error

The relative constellation RMS error, calculated by first averaging over subcarriers, NGV PPDUs, and spatial streams (see Equation (19-89)) shall not exceed a data-rate dependent value according to Table 32-15. The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized testing instrumentation input ports. In the test, $N_{SS} = N_{STS}$ (no STBC) shall be used and no beamforming steering matrix shall be used. Each output port of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The requirements apply to both 10 MHz and 20 MHz transmissions.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

32.3.11.4.4 Transmitter modulation accuracy (EVM) test

The transmit modulation accuracy test shall be performed by instrumentation capable of converting the transmitted signals into a stream of complex samples at a sampling rate greater than or equal to the bandwidth of the signal being transmitted.

In this case, transmit modulation accuracy shall meet the required value in Table 32-15 using only the subcarriers within the channel width.

Table 32-15—Allowed relative constellation error versus constellation size and coding rate

Modulation	Coding rate	Relative constellation error (dB)
BPSK-DCM	1/2	–5
BPSK	1/2	–5
QPSK	1/2	–10
QPSK	3/4	–13
16-QAM	1/2	–16
16-QAM	3/4	–19
64-QAM	2/3	–22
64-QAM	3/4	–25
64-QAM	5/6	–27
256-QAM	3/4	–30
256-QAM	5/6	–32

The instrument shall have sufficient accuracy in terms of I/Q arm amplitude and phase balance, DC offsets, phase noise, and analog to digital quantization noise. A possible embodiment of such a setup is converting the signals to a low IF frequency with a microwave synthesizer, sampling the signal with a digital oscilloscope and decomposing it digitally into quadrature components. The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or equivalent procedure:

a) Start of PPDU shall be detected.
b) Transition from L-STF to L-LTF shall be detected and fine timing shall be established.
c) Coarse and fine frequency offsets shall be estimated.
d) Symbols in a PPDU shall be derotated according to estimated frequency offset.
e) For each NGV-LTF symbol, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, and derotate the subcarrier values according to the estimated phase.
f) Estimate the complex channel response coefficient for each of the subcarriers and each of the transmit streams. If midambles are present in the Data field of the PPDU, the channel response coefficients shall be based upon the most recently received midamble symbols.
g) For each of the data OFDM symbols: transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, derotate the subcarrier values according to the estimated phase, group the results from all of the receiver chains in each subcarrier to a vector, and multiply the vector by a zero-forcing equalization matrix generated from the estimated channel.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

h) For each data-carrying subcarrier in each spatial stream, find the closest constellation point and compute the Euclidean distance from it. If midambles are present in the Data field of the PPDU, the midamble symbols shall not be used to compute the Euclidean distance.

i) Compute the average across PPDUs of the RMS of all errors per PPDU as given by Equation (19-89).

The test shall be performed over at least 20 PPDUs [N_f as defined in Equation (19-89)]. The PPDUs under test shall be at least 16 data OFDM symbols long. Random data shall be used for the symbols.

32.3.11.4.5 Time of departure accuracy

The time of departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is:

$10 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{10\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW10

$20 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{10\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW20

where

f_H is the nominal center frequency in Hz of the highest channel in the channel set

f_L is the nominal center frequency in Hz of the lowest channel in the channel set. The channel set is the set of channels used for transmitting measurement frames, the channel set comprises channels uniformly spaced across $f_H - f_L \leq 50$ MHz.

— FIRST_TRANSITION_FIELD is L-STF.

— SECOND_TRANSITION_FIELD is L-LTF.

— TRAINING_FIELD is the long symbols windowed in a manner that should approximate the windowing described in 17.3.2.5 with T_{TR} = 100 ns for 20 MHz channel spacing, T_{TR} = 200 ns for 10 MHz channel spacing.

— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns.

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

32.3.12 Receiver specification

32.3.12.1 General

For receiver minimum input sensitivity, adjacent channel rejection, nonadjacent channel rejection, receiver maximum input level, and CCA sensitivity requirements described in this subclause, the input levels are measured at the antenna connector and are referenced as the average power per receive antenna. The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized device under test input ports. Each output port of the transmitting STA shall be connected through a cable to one input port of the device under test.

The requirements on receiver minimum input sensitivity in 32.3.12.2, adjacent channel rejection in 32.3.12.3, and nonadjacent channel rejection in 32.3.12.4 apply to NGV PPDUs. NGV-LTF-2x-Repeat format is used if the NGV PPDUs are modulated with NGV-MCS 15 and N_{SS} = 1 in 10 MHz, otherwise, NGV-LTF-2x format is used.

NOTE—Similar receiver minimum input sensitivity requirements, adjacent channel rejection requirements, and nonadjacent channel rejection requirements are defined for VHT PPDUs specified in 21.3.18.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

32.3.12.2 Receiver minimum input sensitivity

The packet error ratio (PER) shall be less than 10% for a PSDU with the rate dependent input levels listed in Table 32-16. The PSDU length shall be 2048 octets for BPSK-DCM or 4096 octets for all other modulations.

Table 32-16—Receiver minimum input level sensitivity

Modulation	Rate (R)	Minimum sensitivity (10 MHz PPDU) (dBm)	Minimum sensitivity (20 MHz PPDU) (dBm)
BPSK-DCM	1/2	–88	–82
BPSK	1/2	–85	–82
QPSK	1/2	–82	–79
QPSK	3/4	–80	–77
16-QAM	1/2	–77	–74
16-QAM	3/4	–73	–70
64-QAM	2/3	–69	–66
64-QAM	3/4	–68	–65
64-QAM	5/6	–67	–64
256-QAM	3/4	–62	–59
256-QAM	5/6	N/A	–57

32.3.12.3 Adjacent channel rejection

Adjacent channel rejection for *W* MHz channels (where *W* is 10 or 20) shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in 32.3.12.2 and raising the power of the interfering signal of *W* MHz bandwidth until 10% PER is caused for a PSDU length of 2048 octets for BPSK-DCM or 4096 octets for all other modulations. The difference in power between the signals in the interfering channel and the desired channel is the corresponding adjacent channel rejection. The center frequency of the adjacent channel shall be placed *W* MHz away from the center frequency of the desired signal.

The interfering signal in the adjacent channel shall be a signal compliant with the NGV PHY, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. The corresponding rejection shall be no less than specified in Table 32-17.

An optional enhanced performance specification is provided for systems requiring improved immunity to out-of-channel interfering emissions. If a STA has dot11ACRType equal to 2, the adjacent channel rejection shall be no less than specified in Table 32-18. The interfering signal in the adjacent channel shall be a signal compliant with the NGV PHY, using class C transmit mask for 10 MHz channel and C2 transmit mask for 20 MHz channel (see D.2.2), unsynchronized with the signal in the channel under test. The corresponding minimum receiver sensitivities for each modulation and coding rate are the same as in Table 32-16.

Table 32-17—Minimum required adjacent and nonadjacent channel rejection level

Modulation	Rate (R)	Adjacent channel rejection (dB) (10 MHz/20 MHz PPDU)	Nonadjacent channel rejection (dB) (10 MHz/20 MHz PPDU)
BPSK-DCM	1/2	19 (10 MHz), 16 (20 MHz)	35 (10 MHz), 32 (20 MHz)
BPSK	1/2	16	32
QPSK	1/2	13	29
QPSK	3/4	11	27
16-QAM	1/2	8	24
16-QAM	3/4	4	20
64-QAM	2/3	0	16
64-QAM	3/4	–1	15
64-QAM	5/6	–2	14
256-QAM	3/4	–7	9
256-QAM	5/6	–9	7
NOTE—The values defined for 256-QAM with 5/6 coding rate only apply to 20 MHz channel.			

Table 32-18—Optional enhanced minimum required adjacent and nonadjacent channel rejection level

Modulation	Rate (R)	Adjacent channel rejection (dB) (10 MHz/20 MHz PPDU)	Nonadjacent channel rejection (dB) (10 MHz/20 MHz PPDU)
BPSK-DCM	1/2	31 (10 MHz), 28 (20 MHz)	45 (10 MHz), 42 (20 MHz)
BPSK	1/2	28	42
QPSK	1/2	25	39
QPSK	3/4	23	37
16-QAM	1/2	20	34
16-QAM	3/4	16	30
64-QAM	2/3	12	26
64-QAM	3/4	11	25
64-QAM	5/6	10	24
256-QAM	3/4	5	19
256-QAM	5/6	3	17
NOTE—The values defined for 256-QAM with 5/6 coding rate only apply to 20 MHz channel.

32.3.12.4 Nonadjacent channel rejection

Nonadjacent channel rejection for *W* MHz channels (where *W* is 10 or 20) shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 32-16, and raising the power of the interfering signal of *W* MHz bandwidth until a 10% PER occurs for a PSDU length of 2048 octets for BPSK-DCM or 4096 octets for all other modulations. The difference in power between the signals in the interfering channel and the desired channel is the corresponding nonadjacent channel rejection. The nonadjacent channel rejection shall be met with any nonadjacent channels located at least 2 × *W* MHz away from the center frequency of the desired signal.

The interfering signal in the nonadjacent channel shall be a signal compliant with the NGV PHY, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. The corresponding rejection shall be no less than specified in Table 32-17.

An optional enhanced performance specification is provided for systems requiring improved immunity to out-of-channel interfering emissions. If a STA has dot11ACRType equal to 2, the nonadjacent channel rejection shall be no less than specified in Table 32-18. The interfering signal in the nonadjacent channel shall be a signal compliant with the NGV PHY, using class C transmit mask for 10 MHz channel and C2 transmit mask for 20 MHz channel (see D.2.2), unsynchronized with the signal in the channel under test. The corresponding minimum receiver sensitivities for each modulation and coding rate are the same as in Table 32-16.

32.3.12.5 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 2048 octets for BPSK-DCM or 4096 octets for all other modulations, for a maximum input level of –30 dBm, measured at each antenna connector for any baseband NGV modulation.

32.3.12.6 CCA sensitivity

32.3.12.6.1 General

The thresholds in this subclause are compared with the signal level at each receiving antenna.

32.3.12.6.2 CCA sensitivity for signals occupying the primary 10 MHz channel

An NGV STA with a *W* MHz operating channel width shall detect, with > 90% probability, the start of a PPDU that occupies at least the primary 10 MHz channel in an otherwise idle *W* MHz operating channel width, and issue a PHY CCA.indication(BUSY, {primary}) primitive within a period of aCCATime (see 17.4.4) if one of the following conditions is met:

— The start of a NON_NGV_10 PPDU as defined in 17.3.10.6.

— The start of a 20 MHz non-NGV duplicate or NGV PPDU for which the power measured within the primary 10 MHz channel is above –85 dBm.

The CCA signal shall be held busy (PHY-CCA.indication(BUSY, {primary}) primitive) for the duration of the PPDU.

The receiver shall issue a PHY-CCA.indication(BUSY, {primary}) primitive for any signal that exceeds a threshold of –65 dBm in the primary 10 MHz channel within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the receiver shall not issue a PHY-CCA.indication(BUSY, {secondary}), or PHYCCA.indication(IDLE) primitive while the threshold continues to be exceeded.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

32.3.12.6.3 CCA sensitivity for signals not occupying the primary 10 MHz channel

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary}) primitive if the conditions for issuing a PHY-CCA.indication(BUSY, {primary}) primitive are not present and one of the following conditions are present in an otherwise idle 20 MHz operating channel width:

— Any signal within the secondary 10 MHz channel at or above a threshold of –65 dBm within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

— A 10 MHz NON_NGV, or NGV PPDU detected in the secondary 10 MHz channel at or above –85 dBm with > 90% probability within a period aCCAMidTime (see 32.4.4).

32.3.13 NGV transmit procedure

There are two paths for the transmit PHY procedure:

— The first path, for which typical transmit procedures are shown in Figure 32-13, is selected if the FORMAT parameter of the PHY-TXSTART.request(TXVECTOR) primitive is NGV. These transmit procedures do not describe the operation of optional features, such as SU-MIMO.

— The second path is selected if the FORMAT parameter of the PHY-TXSTART.request(TXVECTOR) primitive is NON_NGV_10. Transmit parameter N_PPDU_REP is set via the PHY service interface using the PHY-TXSTART.request(TXVECTOR) primitive, as described in Table 32-1 to indicate the number of repetitions of NON_NGV_10 PPDU transmission.

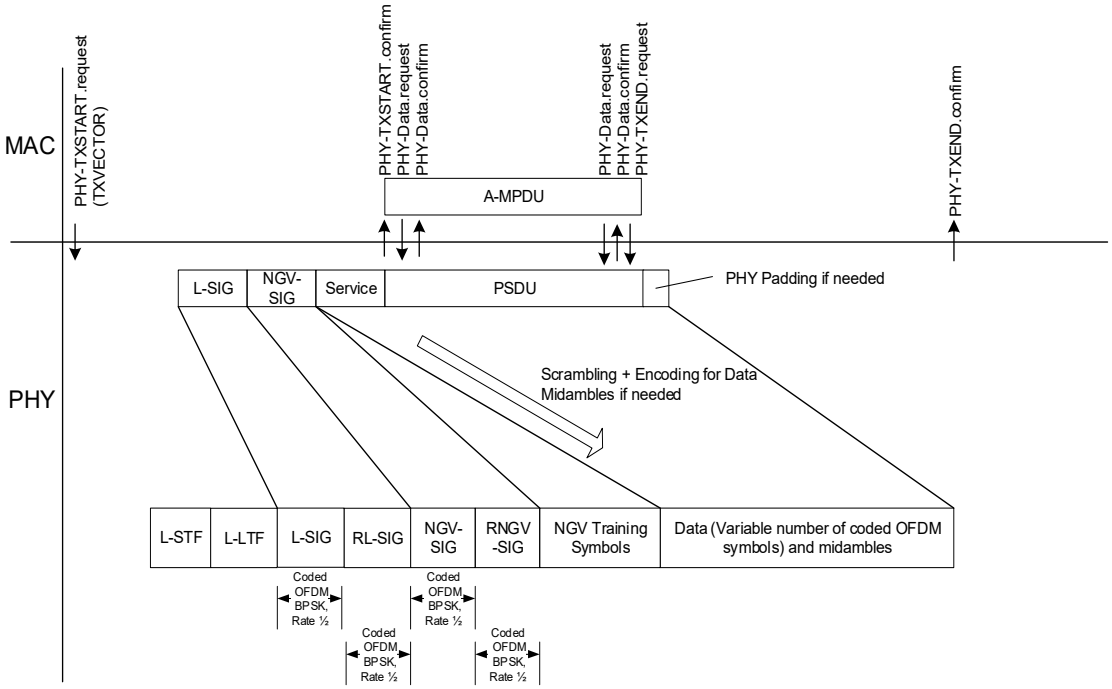

Figure 32-13—PHY transmit procedure for NGV transmission

In the second path, the transmission follows the transmit procedure in Clause 17 except that the signal referred to in Clause 17 is instead generated with the Duration/ID field to report transmitter is an NGV STA as defined in 31.2.1. If N_PPDU_REP is nonzero, the first NON_NGV_10 PPDU may be stored in the memory, and the same PPDU is transmitted N_PPDU_REP times after the initial transmission, with each repetition occurring after a SIFS following the previous NON_NGV_10 PPDU transmission.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In both paths, in order to transmit data, the MAC generates a PHY-TXSTART.request primitive, that causes the PHY entity to enter the transmit state. Further, the PHY is set to operate at the appropriate frequency through station management via PLME, as specified in 32.4. Other transmit parameters, such as NGV-MCS, Coding types, and transmit power, are set via the PHY SAP using the PHY-TXSTART.request(TXVECTOR) primitive, as described in Table 32-1. The remainder of the clause applies to the first path.

Transmission of the PPDU shall be initiated by the PHY after receiving the PHY-TXSTART.request(TXVECTOR) primitive. The TXVECTOR parameters for the PHY-TXSTART.request primitive are specified in Table 32-1.

Transmission of the PHY preamble shall start immediately provided that TIME_OF_DEPARTURE_REQUESTED is true, based on the parameters passed in the PHY-TXSTART.request primitive.

After the PHY preamble transmission is started, the PHY entity immediately initiates data scrambling and data encoding. The encoding method for the Data field is based on the CH_BANDWIDTH, NUM_SS, and NGV-MCS parameters of the TXVECTOR, as described in 32.3.2.

The SERVICE field and PSDU are scrambled and encoded as described in 32.3.3. The data shall be exchanged between the MAC and the PHY through a series of PHY-DATA.request(DATA) primitives issued by the MAC, and PHY-DATA.confirm primitives issued by the PHY. PHY padding bits are appended to the PSDU to make the number of bits in the coded SERVICE field and PSDU an integer multiple of the number of coded bits per OFDM symbol. Midambles are inserted every M OFDM symbols if present, where M is indicated by the Midamble Periodicity field in the NGV-SIG field.

Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PSDU transmission is terminated by receiving a PHY-TXEND.request primitive. Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY. Normal termination occurs after the transmission of the final bit of the last PSDU octet, according to the number of OFDM symbols indicated by N_{SYM} (see 21.3.10.5.4).

In the PHY, the GI is inserted in every data OFDM symbol as a countermeasure against delay spread.

When the PPDU transmission is completed the PHY entity enters the receive state.

A typical state machine implementation of the transmit PHY is provided in Figure 32-14. Request (.request) and confirmation (.confirm) primitives are issued as shown. This state machine does not describe the operation of optional features, such as SU-MIMO.

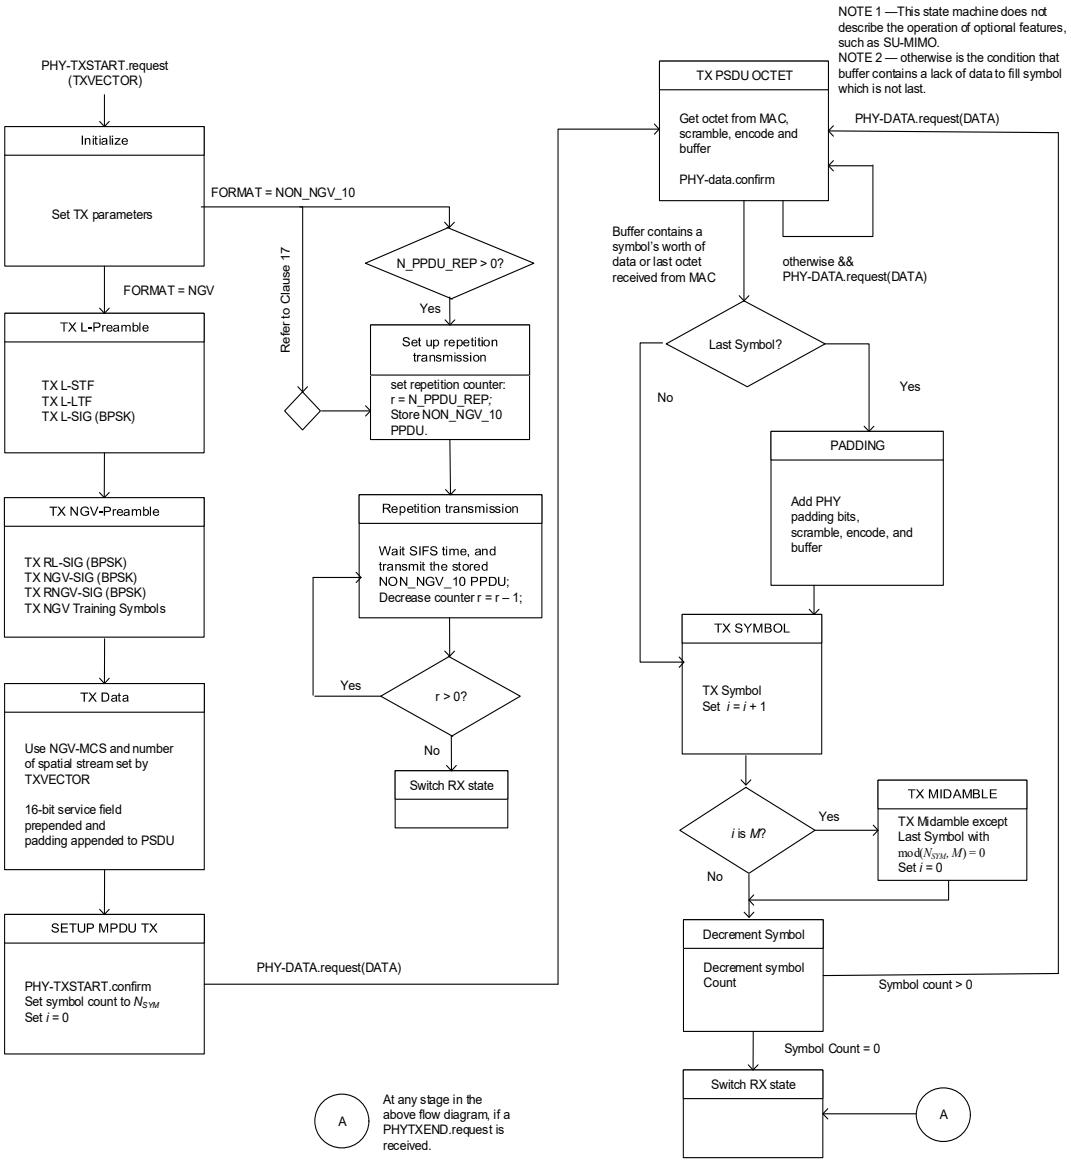

Figure 32-14—PHY transmit state machine

32.3.14 NGV receive procedure

A typical PHY receive procedure is shown in Figure 32-15 for NGV format. A typical state machine implementation of the receive PHY is given in Figure 32-16. This receive procedure and state machine do not describe the operation of optional features, such as SU-MIMO. If the detected format indicates a NON_NGV_10 PPDU:

— If combined detection of NON_NGV_10 PPDU with repetition is not considered, refer to the receive procedure and state machine in Clause 17.

— Else the receiver checks whether the currently received PPDU is qualified as a repetition of previously received NON_NGV_10 PPDU. The repetition may be determined by checking whether

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the gap between the time of arrival of the currently detected PPDU and the ending time of the previously received NON_NGV_10 PPDU is SIFS or not. Other repetition detection techniques may be exploited to improve the detection reliability.

— If the current reception is not a repetition, refer to the receive procedure and state machine in Clause 17 to decode the PPDU, and overwrite the memory with current PPDU for potential combining with next repetition.

— Else, the receiver may combine the currently received PPDU with the previously stored NON_NGV_10 PPDU and decode the combined PPDU according to the receive procedure and state machine in Clause 17. Update the memory with combined PPDU for potential reception of more repetitions.

Further, through station management (via the PLME) the PHY is set to the appropriate frequency, as specified in 32.4. Receive parameters, such as RSSI and indicated DATARATE, may be accessed via the PHY SAP.

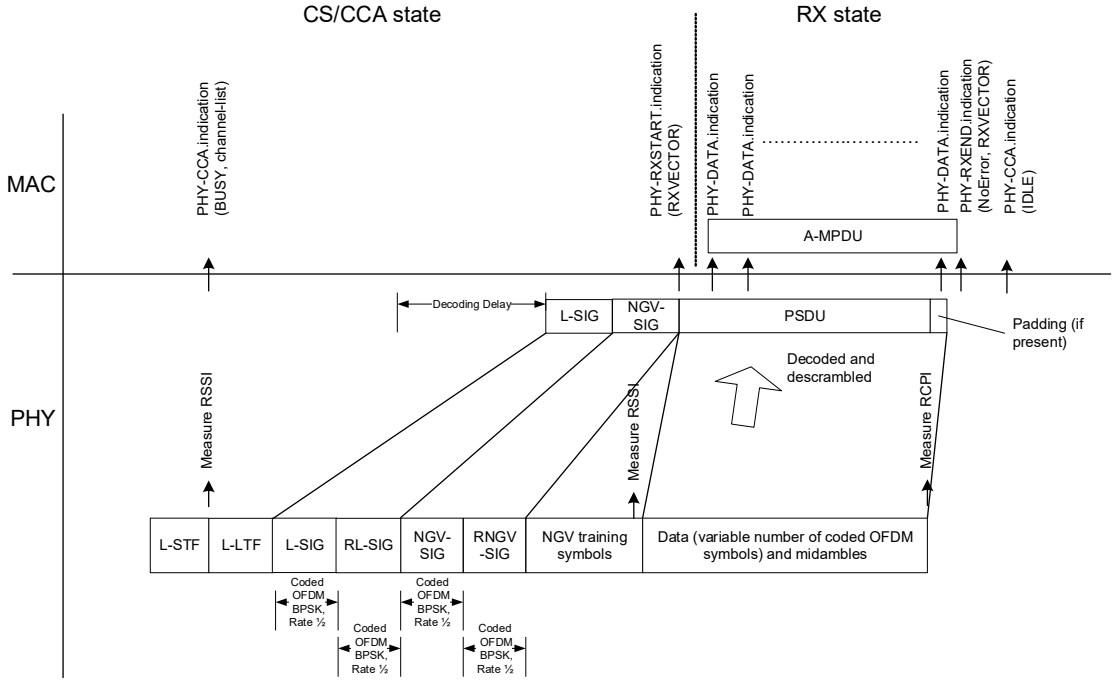

Figure 32-15—PHY receive procedure for NGV transmission

Upon receiving the transmitted PHY preamble in a greater than or equal to 10 MHz channel, the PHY measures a receive signal strength. This activity is indicated by the PHY to the MAC via a PHY-CCA.indication primitive. A PHY-CCA.indication(BUSY, channel-list) primitive is also issued as an initial indication of reception of a signal as specified in 32.3.12.6. The channel-list parameter of the PHY-CCA.indication primitive is absent when the operating channel width is 10 MHz. The channel-list parameter is present when the operating channel width is 20 MHz.

The PHY includes the most recently measured RSSI value in the PHY-RXSTART.indication(RXVECTOR) primitive issued to the MAC.

After the PHY-CCA.indication(BUSY, channel-list) primitive is issued, the PHY entity shall begin receiving the training symbols and searching for the preambles for non-NGV and NGV PPDUs. For detecting the NGV preamble, the PHY entity shall search for L-SIG and RL-SIG in order to set the maximum duration of the data stream. If RL-SIG is detected, the PHY entity should check the parity bit and RATE fields in L-SIG and RL-SIG. If RL-SIG detection fails, the check of the parity bit is invalid, or the RATE field is not equal to 3 Mb/s, a PHY-RXSTART.indication primitive is not issued, and instead the PHY should continue to detect the received signal using NON_NGV_10 Repetition check. If a valid parity bit and the RATE with 3 Mb/s are indicated in L-SIG and RL-SIG, the NGV PHY shall maintain the PHY-CCA.indication(BUSY, channel-list) primitive for the predicted duration of the transmitted PPDU, as defined by RXTIME in Equation (32-41), for all supported modes, unsupported modes, Reserved NGV-SIG Indication, and invalid SIG CRC. Reserved NGV-SIG Indication is defined as an NGV-SIG with the Reserved bits equal to 0 or any other NGV-SIG field bit combinations that do not correspond to modes of PHY operation defined in Clause 32. If the NGV-SIG indicates an unsupported mode, the PHY shall issue a PHY-RXEND.indication(UnsupportedRate) primitive. If the NGV-SIG indicates an invalid CRC or Reserved NGV-SIG indication, the PHY shall issue the error condition PHY-RXEND.inidcation(FormatViolation).primitive.

After receiving a valid L-SIG, RL-SIG, NGV-SIG, and RNGV-SIG indicating a supported mode, the PHY entity shall begin receiving the NGV training symbols.

The PHY entity shall check the PHY Version in the NGV-SIG field. If the PHY Version does not contain an intended value with 0 for NGV PHY in Table 32-10, the PHY entity shall issue a PHY-RXSTART.indication(RXVECTOR) and then issue a PHY-RXEND.indication(Filtered).

Following training fields, the Data field shall be received. The number of symbols in the Data field is determined by Equation (32-39).

$$N_{SYM,\,RX} = \begin{cases} N'_{SYM,\,RX}, & \text{if LDPC Extra Symbol = 0} \\ N'_{SYM,\,RX} - 1, & \text{if LDPC Extra Symbol = 1} \end{cases} \tag{32-39}$$

where

LDPC Extra Symbol is a field in the NGV-SIG field (see Table 32-10).

$$N'_{SYM,RX} = \left\lfloor \left(\frac{(\text{L\_LENGTH} + 3) \times 8}{3} - T_{NGV\text{-}PREAMBLE} - N_{MA,\,RX} \times N_{NGV\text{-}LTF} \times T_{NGV\text{-}LTF} \right) / T_{SYM} \right\rfloor$$

where

L_LENGTH is the LENGTH field in L-SIG

$T_{NGV\text{-}PREAMBLE} = T_{RL\text{-}SIG} + T_{NGV\text{-}SIG} + T_{RNGV\text{-}SIG} + T_{NGV\text{-}STF} + N_{NGV\text{-}LTF} \times T_{NGV\text{-}LTF}$

$T_{RL\text{-}SIG}$, $T_{NGV\text{-}SIG}$, $T_{RNGV\text{-}SIG}$, $T_{NGV\text{-}STF}$, and $T_{NGV\text{-}LTF}$, are defined in Table 32-6

$N_{NGV\text{-}LTF}$ is defined in Table 32-7

$N_{MA,\,RX}$ may be computed by multiple methods that get the same results, an example method is provided in Equation (32-40)

$$N_{MA,RX} = \left\lfloor \frac{\frac{(\text{L\_LENGTH} + 3) \times 8}{3} - T_{NGV\text{-}PREAMBLE} - T_{SYM}}{N_{NGV\text{-}LTF} \times T_{NGV\text{-}LTF} + M \times T_{SYM}} \right\rfloor \tag{32-40}$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

where M is the midamble periodicity as defined in Table 32-10.

If signal loss occurs during reception prior to completion of the PSDU reception, the error condition shall be reported to the MAC using a PHY-RXEND.indication(CarrierLost) primitive. After waiting for the intended end of the PSDU as determined by Equation (32-41), the PHY shall generate a PHY-CCA.indication(IDLE) primitive and return to RX IDLE state.

$$\text{RXTIME} = \left\lceil \frac{(\text{L\_LENGTH} + 3)}{3} \right\rceil \times 8 + 40 \tag{32-41}$$

The received PSDU bits are assembled into octets, decoded, and presented to the MAC using a series of PHY-DATA.indication(DATA) primitive exchanges. Any final bits that cannot be assembled into a complete octet are considered pad bits and discarded. After the reception of the final bit of the last PSDU octet, and possible padding, the receiver shall be returned to the RX IDLE state, as shown in Figure 32-16. A PHY-RXEND.indication(NoError) primitive shall be issued on entry to the RX IDLE state.

32.3.15 Regulatory requirements

Wireless LANs (WLANs) implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision or may be superseded. Requirements that are subject to local geographic regulations are annotated within the PHY specification. Regulatory requirements that do not affect interoperability are not addressed in this standard. Implementers are referred to the regulatory sources in Annex D for further information. Operation in countries within defined regulatory domains might be subject to additional or alternative national regulations.

32.3.16 NGV ranging NDP

The NGV ranging NDP is a variant of NGV PPDU but without the Data field. The format of an NGV ranging NDP is shown in Figure 32-17.

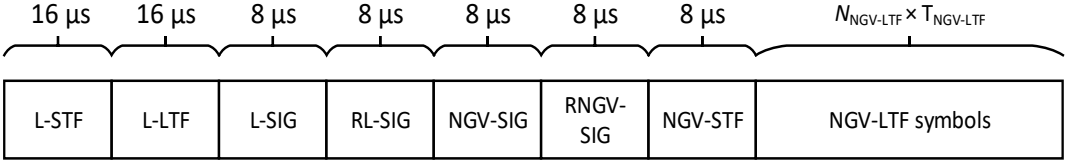

Figure 32-17—NGV ranging NDP format

The NGV ranging NDP has the following properties:

— The TXVECTOR parameter NUM_SS is used to encode the NSS field of the NGV-SIG and RNGV-SIG.

— The TXVECTOR parameter LTF_REP indicates the number of repetitions of the NGV-LTF symbols.

— The TXVECTOR parameter NGV-MCS shall be set to 0.

In an NGV ranging NDP, the NGV-LTF symbol format shall be NGV-LTF-2x.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The number of NGV-LTF symbols in an NGV ranging NDP is the product of the TXVECTOR parameter NUM_SS and (LTF_REP + 1), see Table 32-11.The number of LTF repetitions equals LTF_REP. When LTF repetition is used, LTF_REP is 1. Otherwise, LTF_REP is 0.

The construction of the NGV-LTFs in an NGV ranging NDP is done by performing the steps in 32.3.4.7 LTF_REP + 1 times. An example of NGV_LTF with two spatial streams and one LTF repetition is shown in Figure 32-18.

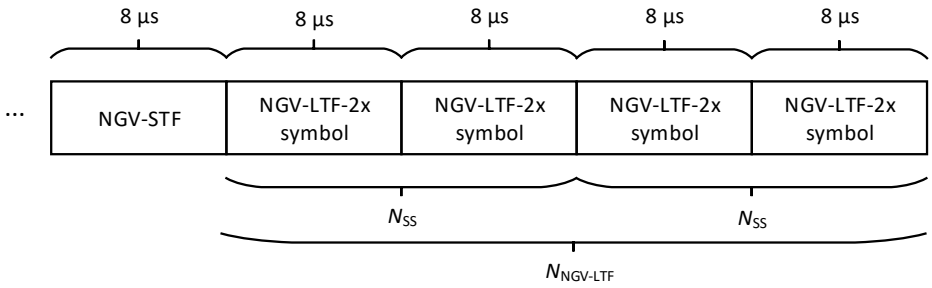

Figure 32-18—Example of NGV-LTF with N_{SS} = 2 and LTF_REP = 1

32.4 NGV PLME

32.4.1 PLME-SAP

Table 32-19 lists the MIB attributes that may be accessed by the PHY entities and the intralayer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.5.

Table 32-19—NGV PHY MIB attributes

dot11CurrentPrimaryChannel	Implementation dependent	Dynamic
dot11CurrentSecondaryChannel	Implementation dependent	Dynamic
dot11NGVDYN20MAllowed	Implementation dependent	Static

32.4.2 PHY MIB

NGV PHY MIB attributes are defined in C.3 with specific values defined in Table 32-19. The "Operational semantics" column in Table 32-19 contains two types: Static and Dynamic.

— Static MIB attributes are fixed and cannot be modified for a given PHY implementation.

— Dynamic MIB attributes are interpreted according to the MAX-ACCESS field of the MIB attribute. When MAX-ACCESS is read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is read-write, the MIB attribute may be read and written by management entities but shall not be updated by the PLME.

32.4.3 TXTIME and PSDU_LENGTH calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated for an NGV PPDU using Equation (32-42).

$$\begin{aligned}\text{TXTIME} = {} & 40 + T_{RL\text{-}SIG} + T_{NGV\text{-}SIG} + T_{RNGV\text{-}SIG} + T_{NGV\text{-}STF} + N_{SYM} \times T_{SYM} + \\ & 8 \times \left\lceil \frac{N_{NGV\text{-}LTF} \times T_{NGV\text{-}LTF} + N_{MA} \times N_{NGV\text{-}LTF} \times T_{NGV\text{-}LTF}}{8} \right\rceil\end{aligned} \tag{32-42}$$

where

$T_{RL\text{-}SIG}$, $T_{NGV\text{-}SIG}$, $T_{RNGV\text{-}SIG}$, $T_{NGV\text{-}STF}$, and T_{SYM} are defined in Table 32-6

$N_{NGV\text{-}LTF}$ is defined in Table 32-7

N_{MA} is defined in 32.3.9.9

For an NGV PPDU using LDPC encoding, the total number of data symbols in the Data field, N_{SYM}, is given in 21.3.10.5.4 and computed using Equation (19-41) in step d) of 19.3.11.7.5.

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for an NGV SU PPDU using LDPC encoding is calculated using Equation (32-43).

$$\text{PSDU\_LENGTH} = \left\lfloor \frac{N_{SYM,init}\, N_{DBPS} - N_{service}}{8} \right\rfloor \tag{32-43}$$

where

$N_{SYM,init}$ is given by Equation (21-62) with $m_{STBC} = 1$.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

32.4.4 NGV PHY

The static NGV PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, shall be as shown in Table 17-24 with 10 MHz channel spacing unless otherwise listed in Table 32-20. The definitions for these characteristics are given in 6.5.4.

Table 32-20—NGV PHY characteristics

Characteristics	Value
aSlotTime	If dot11OperatingClassesRequired is false, 13 μs. If dot11OperatingClassesRequired is true, 13 μs plus any coverage-class-dependent aAirPropagationTime (see Table 9-95).
aSIFSTime	32 μs
aCCAMidTime	45 μs
aPPDUMaxTime	10.968 ms
aPSDUMaxLength	244 800 octets (see NOTE 1)
aRxPHYStartDelay	64 μs (see NOTE 2)

NOTE 1—This is the maximum length in octets for an NGV PPDU with a bandwidth of 20 MHz, NGV-MCS 9, and two spatial streams, and limited by 1360 possible data symbols in aPPDUMaxTime. This is the maximum PSDU length an NGV PHY could support assuming no restrictions in MAC. See 10.3.2 and 9.2.4.7.1 for additional restrictions on the maximum number of octets the MAC could support.

NOTE 2—This value arises from the time to the end of RNGV-SIG (see Figure 32-5).

32.5 Parameters for NGV-MCSs

The rate-dependent parameters for 10 MHz and 20 MHz are given in Table 32-21 to Table 32-24.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

33. Light communication (LC) MAC and PHY specification

33.1 LC MAC specification

33.1.1 Introduction

An LC STA supports the MAC functions defined in Clause 10, the MLME functions defined in Clause 11, and the security functions defined in Clause 12.

33.1.2 LC MAC

An LC STA with HT support shall follow HT MAC procedures and requirements with an LC PHY. An LC STA with VHT support shall follow VHT MAC procedures and requirements with an LC PHY. An LC STA with HE support shall follow HE MAC procedures and requirements with an LC PHY.

33.2 LC PHY specification

33.2.1 General

This subclause specifies the PHY entity for a light communications (LC) orthogonal frequency division multiplexing (OFDM) system with an intensity modulation and direct detection (IM/DD) optical interface.

An LC PHY provides one of three levels of support: HT, VHT, or HE.

An LC PHY with HT support conforms to the requirements for an HT PHY as defined in Clause 19 except where the requirements in 33.2 supersede those requirements.

An LC PHY with VHT support conforms to the requirements for a VHT PHY as defined in Clause 21 except where the requirements in 33.2 supersede those requirements.

An LC PHY with HE support conforms to the requirements for an HE PHY as defined in Clause 27 except for the requirements in 33.2 that supersede those requirements.

33.2.2 LC PHY service interface

The LC PHY service is provided to the MAC through the PHY service primitive described in Clause 8.

33.2.3 LC PHY

33.2.3.1 Introduction

The procedure by which an LC PHY converts a PSDU into a PPDU is defined in 19.3, 21.3, and 27.3 for an LC PHY with HT, VHT and HE support, respectively, except for the differences described in the remainder of 33.2.3.

For the requirements in 21.3 and 27.3, the term *frequency segment* applies to the LC IF signal.

33.2.3.2 Transmitter block diagram

The transmitter block diagrams in 19.3.3, 21.3.3, and 27.3.5 show an Analog and RF block that is described as upconverting the complex baseband waveform associated with each transmit chain to an RF signal.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In the LC PHY, the complex baseband waveform associated with each transmit chain is instead upconverted to an LC IF signal, either directly or by up/down conversion. A DC bias is added to the LC IF signal which is then fed into an optical front end (OFE). The OFE converts the DC biased LC IF signal into an intensity modulated optical signal.

In comparison to an RF channel, which is characterized by multipath propagation, the LC channel is relatively transparent with a dominant LOS component usually 10s of decibels stronger than non-line-of-sight components.

In some implementations, the complex baseband waveform is upconverted directly to an LC IF signal as shown in Figure 33-1. In this example, the LC PHY TX/RX are HT/VHT/HE PHY TX/RX where the RF antennas are replaced by LC optical antennas.

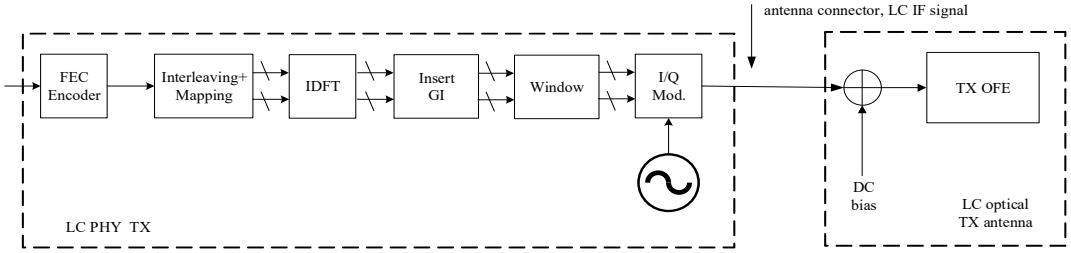

Figure 33-1—Direct conversion LC TX

In some implementations, the complex baseband waveform might first be upconverted to an RF signal and then downconverted to the LC IF signal as shown in Figure 33-2. The downconversion is defined to have unity gain.

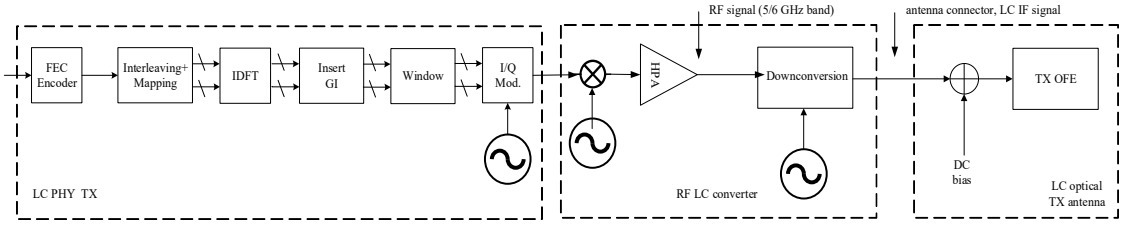

Figure 33-2—Up/down conversion LC TX

In this example, the RF signal from the HPA, which is in the frequency range 5 GHz to 6 GHz, is downconverted such that the center frequency aligns with the LC IF channel frequency defined in 33.2.3.4. The reference clock of the local oscillator for the downconversion at the LC optical TX antenna is the same as in the LC PHY TX.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A DC bias is added to the LC IF signal before the signal is fed to the transmitting OFE because the current through an SSL device can only be positive, as illustrated in Figure 33-3.

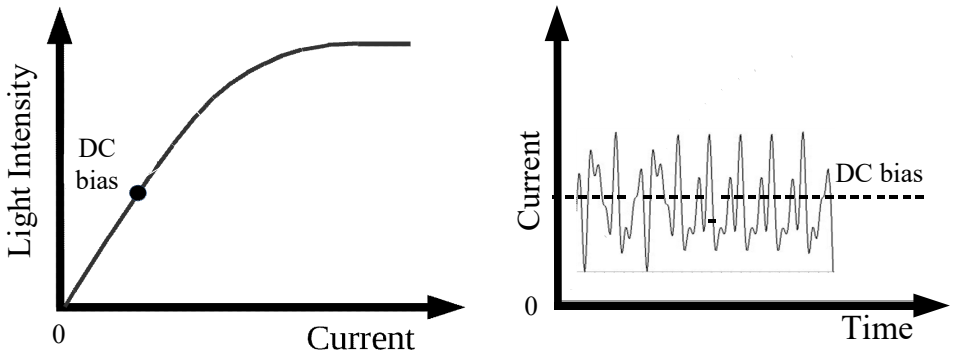

Figure 33-3—Operation of an SSL device with DC bias

An LC PHY supports the use of multiple transmit chains and multiple receive chains. An example of the LC PHY TX connected to multiple LC optical TX antennas is shown in Figure 33-4.

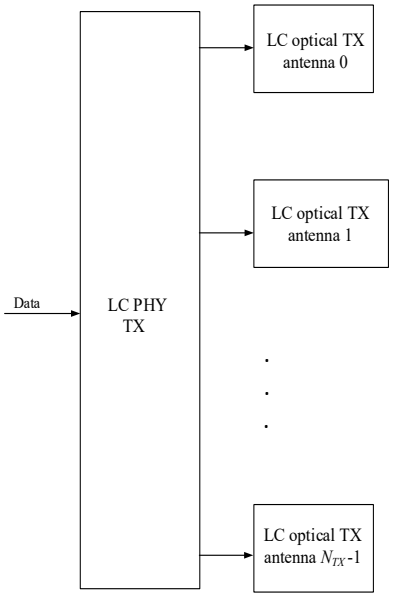

Figure 33-4—Connecting the LC PHY TX to multiple optical TX antennas

33.2.3.3 Mathematical description of signals

The LC IF signal is described by Equation (19-1), Equation (21-11), and Equation (27-1) for an LC PHY with HT, VHT or HE support, respectively, where f_c is the LC IF.

33.2.3.4 Channel numbering

In systems using light communications, the frequency segment refers to the LC IF signal.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

LC IF channel center frequencies are defined at integer multiples of 5 MHz above the LC IF channel starting frequency. The relationship between LC IF channel center frequency and channel number n_{ch} is given in Equation (33-1).

$$\text{LC IF channel center frequency} = \text{LC IF channel starting frequency} + 5 \times n_{ch} \text{ (MHz)}, \quad (33\text{-}1)$$

where

$n_{ch} = 1,\ldots, 64$ is the channel number or channel center frequency index

LC IF channel starting is defined in Annex E.

Equation (33-1) and the LC IF channel starting frequencies defined in Annex E divide the LC IF spectrum into two segments: frequencies in the range 16 MHz to 176 MHz that map from the 5 GHz band and frequencies in the range 176 MHz to 336 MHz that map from the 6 GHz band as shown in Table 33-1.

A channel number or channel center frequency index from the 5 GHz band shall not be greater than 64. A channel number or center frequency index from the 6 GHz band shall not be greater than 29.

33.2.3.5 Multiple transmit chains and multiple receive chains

33.2.3.5.1 General

The LC PHY may use multiple transmit chains and multiple receive chains to support spatial multiplexing and/or wavelength division multiplexing.

In an LC PHY that implements RF up/downconversion and has multiple transmit chains, the RF downconverters shall be synchronized to a common reference clock. In an LC PHY that implements RF up/downconversion and has multiple receive chains, the RF upconverters shall be synchronized to a common reference clock.

For an LC PHY with multiple optical TX antennas and HT support, the LC PHY TX shall use the procedures defined in 19.3, where N_{TX} transmit chains in the HT PHY shall be connected to N_{TX} LC optical TX antennas.

For an LC PHY with multiple optical TX antennas and VHT support, the LC PHY TX shall use the procedures defined in 21.3, where N_{TX} transmit chains in the VHT PHY shall be connected to N_{TX} LC optical TX antennas.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For an LC PHY with multiple optical TX antennas and HE support, the LC PHY TX shall use the procedures defined in 27.3, where N_{TX} transmit chains in the HE PHY shall be connected to N_{TX} LC optical TX antennas.

33.2.3.5.2 Spatial multiplexing

Spatial multiplexing is supported when LC optical RX antennas and LC optical TX antennas are positioned such that light transmitted by an LC optical TX antenna incident on an LC optical RX antenna is at least partially isolated from the light transmitted by another LC optical TX antenna that is incident on another LC optical RX antenna. The isolation might be achieved by directing the light at the optical TX antenna or capturing light from a particular direction at the optical RX antenna. The isolation might also be achieved by spatially separating the LC optical TX antennas and/or LC optical RX antennas. This principle is illustrated in Figure 33-5 (Spatial multiplexing with an LC PHY).

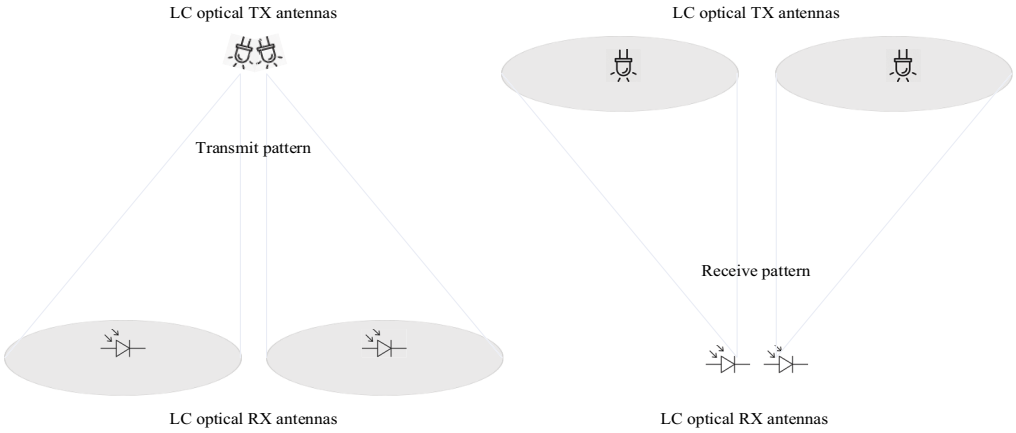

Figure 33-5—Spatial multiplexing with an LC PHY

33.2.3.5.3 Wavelength-division multiplexing

Wavelength division multiplexing is supported when the wavelength of the light transmitted by one LC optical TX antenna is different from the wavelength of the light transmitted by another LC optical TX antenna and, correspondingly, one LC optical RX antenna is sensitive to the light of the first wavelength but not the second wavelength and another LC optical RX antenna is sensitive to the light of the second wavelength but not the first wavelength. This principle is illustrated in Figure 33-6 (Wavelength division multiplexing with an LC PHY).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

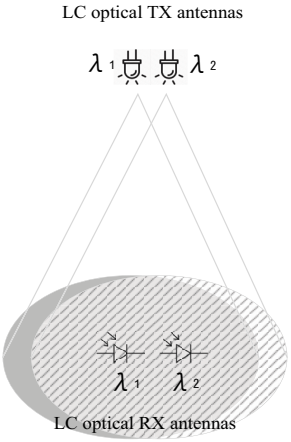

Figure 33-6—Wavelength division multiplexing with an LC PHY

For example, with two transmit chains, one operating at 950 nm and the other at 850 nm, a shortpass dicroic beam splitter with a cut-off wavelength of 900 nm can be used in front of both receive chains. The wavelength of the first transmit chain is longer than the cut-off wavelength. It is reflected and detected by the first receive chain. The wavelength of the second transmit chain is shorter than the cut-off wavelength. It passes through and is detected by the second receive chain.

An LC STA with a single transmit chain is interoperable with an LC STA with multiple transmit and multiple receive chains operating in wavelength division multiplexing mode. The sum of transmitted and reflected signals from a dicroic beamsplitter is approximately the same, independent of the wavelength.

For example, a first LC STA with a single optical antenna supports a single stream. This stream can be detected by both receive chains of a second LC STA with two optical antennas by combining their signals. In the reverse link direction, both transmit chains of the second LC STA are used to transmit a single stream which can be detected by the single receive chain of the first LC STA.

Note that when using LEDs with different wavelengths, their optical spectra might be wider and cause residual crosstalk at a receive chain. The crosstalk might be minimized by using multiple-transmit multiple-receive antenna processing.

In the above description, if the LC optical TX antennas are in one LC STA and the LC optical RX antennas are in another LC STA the arrangement supports SU-MIMO. If the LC optical antennas (TX or RX) at one end are in the same LC STA but the LC optical antennas (RX or TX) at the other end are in different LC STAs then the arrangement supports MU-MIMO.

An LC optical RX antenna shall be sensitive to light in one of the following wavelength ranges:

— 800 nm to 900 nm
— 900 nm to 1000 nm
— 800 nm to 1000 nm

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An LC PHY shall have at least one receive chain with an LC optical RX antenna sensitive to light in the 800 nm to 1000 nm range or at least two receive chains with one receive chain with an LC optical RX antenna sensitive to light in the 800 nm to 900 nm range and the other receive chain with an LC optical RX antenna sensitive to light in the 900 nm to 1000 nm range.

The maximum number of spatial streams supported by an LC PHY using wavelength division multiplexing is 2.

33.2.3.6 Receive specification

The minimum receive sensitivity of an LC PHY shall be –15 dBm_{opt} measured as the average incident optical power in the range 800 to 1000 nm at the LC optical RX antennas.

33.2.3.7 CCA for LC

33.2.3.7.1 CCA requirements

The CCA requirements for the LC PHY apply to the LC IF signal as measured at the antenna connector.

The CCA requirements for the HT PHY in 19.3.19.6 to detect a channel busy condition are applicable to the LC PHY with HT support.

The CCA requirements for the VHT PHY in 21.3.18.5 to detect a channel busy condition are applicable to the LC PHY with VHT support.

The CCA requirements for the HE PHY in 27.2.7 and 27.3.22 to detect a channel busy condition are applicable to LC PHY with HE support.

33.2.3.7.2 LC repetition

An LC STA transmission is directional, hence a non-AP LC STA might not be able to receive signals from peer non-AP LC STAs. LC repetition is an optional feature in an LC AP that effectively extends the area covered by a transmission from a non-AP LC STA to include the area covered by the LC AP. LC repetition together with other mechanisms, such as the RTS/CTS mechanism defined in 10.3, might reduce collisions in an LC BSS.

An LC AP may transmit at the TX OFE a repeat of the signal it receives at the RX OFE. The delay between the received signal and the repeated signal shall be less than 1 μs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Figure 33-7 illustrates an example of channel access with the LC repetition mechanism.

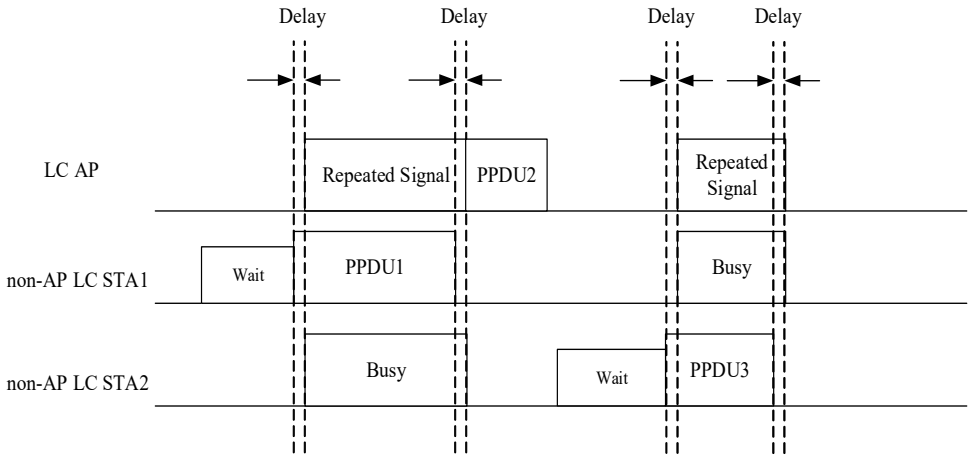

Figure 33-7—An example of channel access with LC repetition

The LC AP receives PPDU1 from non-AP LC STA1 and repeats the signal to non-AP LC STAs in its coverage area. The non-AP LC STA2 then detects a channel busy condition on receiving the repeated signal. After retransmitting PPDU1, the LC AP sends PPDU2 to non-AP LC STA1 in response to PPDU1. Non-AP LC STA2 sends PPDU3 to the LC AP after it detects an idle channel condition. The LC AP repeats the signal and, as a result, non-AP LC STA1 finds the channel busy.

33.2.3.8 Regulatory requirements

Wireless LANs (WLANs) implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision or may be superseded. Requirements that are subject to local geographic regulations are annotated within the PHY specification. Regulatory requirements that do not affect interoperability are not addressed in this standard.

Implementers are referred to the regulatory sources in Annex D and to IEC 60825-1 (or its relevant latest version) for further information.

34. Enhanced broadcast services MAC specification

34.1 Overview

34.1.1 Introduction

This clause describes EBCS procedures that are used for EBCS STAs. EBCS procedures are supported both where there is an association between the transmitter(s) and the receiver(s) in an infrastructure BSS and in cases where there is no association between transmitter(s) and receiver(s).

The EBCS procedures include the EBCS DL procedure and the EBCS UL procedure. With the EBCS DL procedure EBCS Data frames are broadcast by an EBCS AP to one or more EBCS receivers (see 34.3). With the EBCS UL procedure EBCS Data frames are broadcast by an EBCS non-AP STA to one or more EBCS relaying STAs, for subsequent delivery to a specified destination (see 34.4). The EBCS procedures are not supported for MBSS or GLK.

NOTE—EBCS DL and EBCS UL do not operate with DMG, CDMG, and EDMG.

34.2 EBCS addressing

EBCS Data frames shall use an EBCS content MAC address in the Address 1 field in the MAC header. EBCS UL frames shall use an EBCS content MAC address in the Address 3 field in the MAC header. EBCS Info frames shall use an EBCS info MAC address in the Address 3 field in the MAC header. Both the EBCS content MAC address and EBCS info MAC address are multicast addresses with the first three octets set to 01-0F-AC, and the remaining octets generated depending on the type of stream and the content ID.

The EBCS info MAC address used for EBCS Info frames shall be set to 01-0F-AC-*xx*-*yy*-00, where octets *xx*-*yy* are set to the EBCS AP group ID or 00-00 when the EBCS AP does not belong to any EBCS AP group.

The EBCS content MAC address for EBCS UL or EBCS Data frames shall be set to 01-0F-AC-*xx*-*yy*-*zz*.

For EBCS Data frames, the assigned content ID and the configured EBCS AP group ID are encoded into the Address fields in the MAC header by the EBCS traffic stream mapper as follows:

— octet *zz* is set by the EBCS traffic stream mapper to the content ID
— octets *xx*-*yy* are set by the EBCS traffic stream mapper to the EBCS AP group ID or 00-00 when the EBCS AP does not belong to an EBCS AP group.

NOTE 1—The EBCS DL traffic stream might originate from another STA in the ESS or from a device outside the ESS, through a portal.

For EBCS UL frames,

— octets *xx*, *yy* and *zz* are populated by the EBCS non-AP STA to a set of provisioned values that corresponds to the UL traffic stream.

NOTE 2—Although the octets *xx* and *yy* for EBCS DL traffic are expected to be set to a combination of values that are unique to the coverage area where the content is being broadcast, the uniqueness of the octets *xx* and *yy* is not guaranteed. It is recommended that the octets *xx*, *yy*, and *zz* for EBCS UL traffic be provisioned in EBCS non-AP STAs to values that are unique for each UL traffic stream. EBCS UL and EBCS Data frames can be differentiated because the EBCS UL frame is a management frame while the EBCS Data frame is a Data frame.

34.3 EBCS DL procedures

34.3.1 General

The EBCS DL procedure allows an EBCS AP to distribute multicast content to both associated and unassociated EBCS receivers with data origin authenticity.

The frame sequence of the EBCS DL procedure is shown in Figure 34-1 (EBCS DL frame sequence).

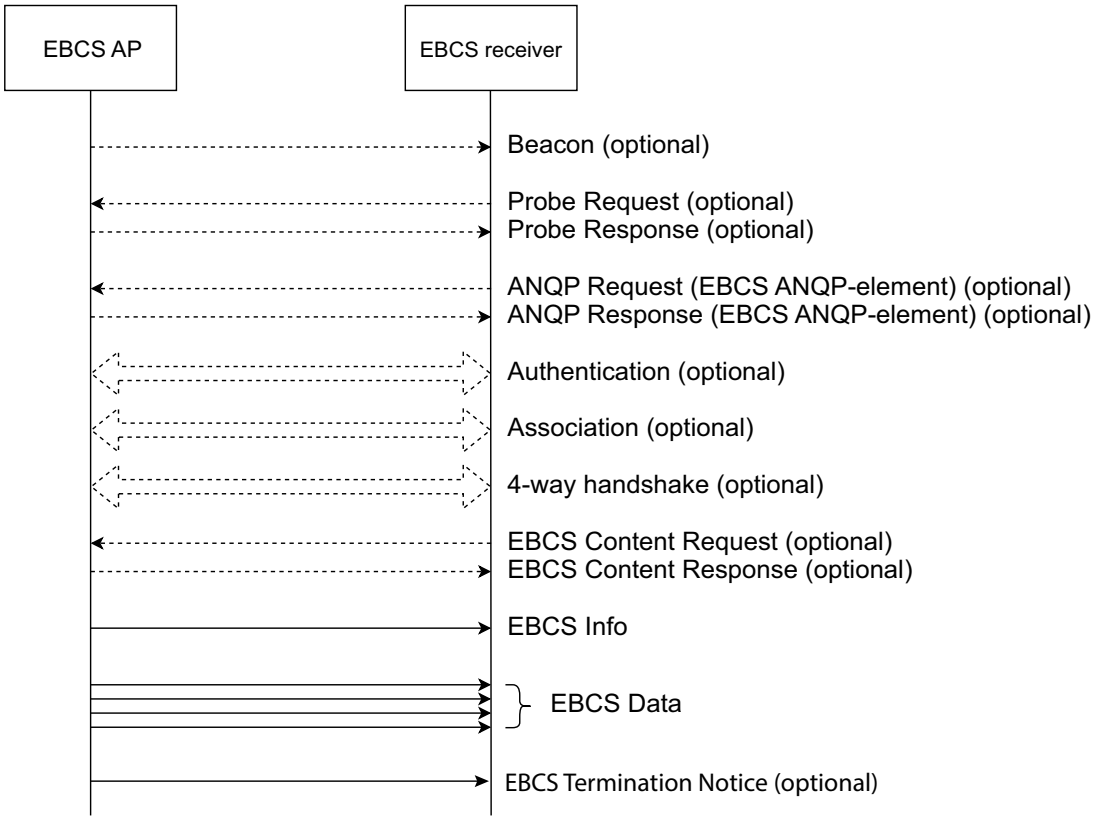

Figure 34-1—EBCS DL frame sequence

NOTE—An EBCS AP might transmit EBCS Info frames and EBCS Data frames that contain the same Frame Body field multiple times consecutively to increase redundancy.

Beacon, S1G Beacon, Probe Request/Response/PV1 Probe Response, and ANQP Request/Response frames are optional. Authentication, Association Request/Response, and EBCS Content Request Response frames and the 4-way handshake depend on the requirements and status of the desired EBCS traffic streams.

The usage of these frames is described in the following subclauses:

- Beacon, S1G Beacon, Probe Request/Response/PV1 Probe Response, FILS Discovery: 34.3.2 and 34.3.3
- ANQP Request/Response: 11.22.3.3.17 and 34.3.8
- EBCS Content Request/Response: 34.3.7
- EBCS Termination Notice: 34.3.9

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

34.3.2 EBCS DL procedure at an EBCS AP

EBCS DL procedure is enabled in an EBCS AP if the length of the dot11EBCSTrafficStreamTable is greater than 0. The EBCS traffic streams to be transmitted are specified in dot11EBCSTrafficStreamTable. The EBCS traffic streams are handled differently from other traffic. An EBCS content ID and EBCS content MAC address shall be assigned by the EBCS traffic stream mapper to identify each different traffic stream of content. Each content ID shall be unique in the EBCS AP group if the EBCS AP belongs to an EBCS AP group, otherwise each content ID shall be unique in the EBCS certificate group. If an EBCS AP does not belong to either an EBCS certificate group or an EBCS AP group, each content ID shall be unique in the EBCS AP. The content ID shall be nonzero.

NOTE 1—The content ID is contained in the EBCS content MAC address. To avoid conflict between the EBCS content MAC address and the EBCS info MAC address, the content ID is not set to 0.

An EBCS AP that has enabled EBCS DL may use an AP certificate. An EBCS AP using an AP certificate shall belong to an EBCS certificate group, otherwise it shall not belong to an EBCS certificate group. An EBCS AP that has enabled EBCS DL may belong to an EBCS AP group. An EBCS AP group is a subgroup in an EBCS certificate group. Each EBCS AP group is identified by a 2 octet EBCS AP group ID in the range of 00-01 to 7F-FF indicated in dot11EBCSAPGroupID.

NOTE 2—The EBCS AP group ID that is encoded in the EBCS content MAC address (Address 1 field in MAC header) helps EBCS receivers to filter undesired frames. If the EBCS AP group ID is unique, then the EBCS receiver can omit the corresponding Address 1 filter and hence avoid performing unnecessary authentication steps.

When an EBCS AP is an HE AP or S1G AP:

— The BSS color of EBCS Info frames shall be 0.
— The BSS color of EBCS Data frames shall be 0 if association is not required to consume EBCS traffic streams, otherwise the BSS color of EBCS Data frames shall be the same as that indicated in the HE Operation element in the most recent Beacon frame.

An EBCS AP, which is an S1G AP, may advertise its EBCS capabilities in the EBCS Support field in the Extended Capabilities element in S1G Beacon frames and PV1 Probe Response frames. An EBCS AP, which is an S1G AP, shall advertise its EBCS capabilities in the EBCS Support field in the Extended Capabilities element in Probe Response frames.

An EBCS AP, which is not an S1G AP, shall advertise its EBCS capabilities in the EBCS Support field in the Extended Capabilities element in Beacon frames and Probe Response frames. An EBCS AP that has EBCS DL enabled shall transmit EBCS Info frames periodically. The interval between two consecutive EBCS Info frames is specified by dot11EBCSInfoInterval. An EBCS AP shall advertise the timing of the next EBCS Info frame transmission in the EBCS Info Frame TX Countdown field in the EBCS Parameters element and shall not signal an upcoming EBCS Info frame via the TIM element or the EBCS TIM element. An EBCS AP shall advertise the certificate group in Beacon frames using the Compressed Certificate Group ID field in the EBCS parameters element if the EBCS AP belongs to an EBCS certificate group. An EBCS AP shall advertise the EBCS AP group by the EBCS Group ID field in the EBCS Parameters element in Beacon frames if the EBCS AP belongs to an EBCS AP group. The EBCS Info frame shall be transmitted among the set of group addressed frames transmitted immediately after the Beacon frame identified by the EBCS Info Frame TX Countdown field set equal to 1 in the EBCS Parameters element. Details of EBCS Info frame generation are described in 34.3.4.

NOTE 3—An EBCS AP might provide the timing of the next EBCS Info frame transmission for a reported AP by including a TBTT Information field (corresponding to the reported AP) carrying the EBCS Info Frame TX Countdown field within a Reduced Neighbor Report element.

In the MAC, MSDUs with a non-null EBCS content ID in the MA-UNITDATA.request shall bypass IEEE 802.1X filtering. If the destination address in the MA-UNITDATA.request is an EBCS content MAC

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

address, the MAC shall process the request as an EBCS content request, otherwise the MAC shall process the request as a non-EBCS request. For an MA-UNITDATA.request for EBCS content, the MAC shall use one of the following three frame authentication mechanisms according to the content ID that is encoded in the EBCS content MAC address (34.2).

— PKFA (12.15.2)
— HCFA (12.15.3)
— HLSA (12.15.4)

EBCS traffic streams are carried by EBCS Data frames. The EBCS AP shall set the RA of the EBCS Data frame to the EBCS content MAC address, the TA to its BSSID, and the SA to the group address assigned to the EBCS traffic stream by the EBCS DL content server. If the EBCS Data frame contains an IPv4 multicast packet or an IPv6 multicast packet, the SA shall be mapped according to IETF RFC 1112 or IETF RFC 2464, respectively.

If dot11EBCSTrafficStreamPHYType is not 255, an EBCS AP shall generate a PHY-TXSTART.request primitive with the transmission rate information specified by the dot11EBCSTrafficStreamPHYType and dot11EBCSTrafficStreamTxRate for each MPDU according to the EBCS content ID. If dot11EBCSTrafficStreamPHYType is 255, the AP shall select a transmission rate following the rules specified in 10.6.5.4.

NOTE 4—Rate selection for each EBCS traffic stream provides flexibility of operation. For example, one stream that provides a video streaming service can use HE for high throughput. Another stream that provides a directory of the venue can use HT to cover a large area.

When dot11EBCSTrafficStreamBufferableActivated for an EBCS traffic stream is true, an EBCS AP shall buffer the EBCS Data frames for that EBCS traffic stream and shall signal buffered EBCS Data frames via the EBCS TIM field or the EBCS TIM element (see 9.4.2.314) instead of the TIM element. The EBCS AP shall transmit the buffered EBCS Data frames after transmitting the EBCS Info frame or the Beacon frame that contains the EBCS TIM field or the EBCS TIM element indicating the EBCS traffic stream. The EBCS AP shall set the More Data subfield in the Frame Control field in the EBCS Data frame to 1 if more EBCS Data frames of the same EBCS traffic stream are buffered at the AP, otherwise the More Data subfield shall be set to 0.

When dot11EBCSTrafficStreamBufferableActivated for an EBCS traffic stream is false, an EBCS AP shall not buffer the EBCS Data frames and shall transmit the EBCS Data frames that contain the EBCS traffic stream as soon as possible and shall not signal via the EBCS TIM element or the TIM element.

An EBCS AP shall transmit the EBCS TIM element in Beacon frames or S1G Beacon frames if dot11EBCSTIMInBeaconActivated is true, in addition to EBCS Info frames.

NOTE 5—The TIM element has only 1 bit for signaling buffered group addressed frames and so cannot differentiate between different streams of traffic. If an EBCS AP were to use the TIM element, an associated non-AP STA that does not subscribe to any EBCS traffic stream would stay awake for the EBCS traffic streams. This would cause unnecessary power consumption at the STA. Similarly, using a TIM element would cause an unassociated non-AP STA that subscribes to an EBCS traffic stream to stay awake for any non-EBCS group addressed traffic.

34.3.3 EBCS DL procedure at an EBCS receiver

An EBCS receiver discovers an EBCS capable AP by receiving any of the following:

— a Beacon frame, an S1G Beacon frame, a Probe Response frame or a PV1 Probe Response frame with the EBCS Support field in the Extended Capability element equal to 1
— an EBCS Info frame
— an ANQP Response frame that includes the EBCS ANQP-element

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— a FILS Discovery frame that includes an EBCS Parameters element

In case of PKFA or HCFA, an EBCS receiver shall use the content of received EBCS Info frames to validate the source of an EBCS traffic stream as describe in 12.15.2 or 12.15.3. An EBCS receiver is able to know when the next EBCS Info frame is transmitted by inspecting the EBCS Info Frame TX Countdown field in the EBCS Parameters element in Beacon frames, S1G Beacon frames, PV1 Probe Response frames, and Probe Response frames, FILS Discovery frames or the Enhanced Broadcast Services ANQP-element in ANQP Response frames. An EBCS receiver may select the EBCS traffic streams to receive and consume. Details of the usage of the EBCS Info frame is described in 34.3.4. An EBCS receiver may need to request or register for one or more EBCS traffic streams by transmitting to an EBCS AP an EBCS Content Request frame or a frame containing an EBCS Content Request ANQP-element (see 34.3.7 and 34.3.8).

NOTE 1—An EBCS receiver might be able to receive EBCS content without transmitting any frames.

The SME of an EBCS receiver shall maintain the dot11EBCSTrafficStreamEntry entries in the dot11EBCSTrafficStreamTable table that corresponds to the Content Information subfields in the Content Information List field in the EBCS Info frame. The SME selects one or more EBCS traffic streams to receive, then sets its dot11EBCSTrafficStreamActivated accordingly and configures the EBCS filter in its MAC to pass through the EBCS Data frames that have the EBCS content MAC address corresponding to the selected EBCS traffic streams as the DA and to filter other EBCS data frames. If the HLP payload destination address is an IPv4 address or an IPv6 address, the SA is assumed to be mapped according to IETF RFC 1112 and IETF RFC 2464, respectively.

An EBCS receiver shall authenticate all EBCS Info frames and EBCS Data frames by the authentication mechanism specified in the EBCS Info Authentication Algorithm subfield in the EBCS Info Control field for the EBCS Info frame and the Content Authentication Algorithm subfield in the Content Information field for the EBCS Data frames, in the EBCS Info frame. Details of frame authentication procedures are described in 12.15.

An MSDU contained in an authenticated EBCS Data frame shall be forwarded to a higher layer via the EBCS filter. The EBCS filter shall be configured by the SME to filter out the undesired MSDUs if they do not have the corresponding EBCS content MAC address and the corresponding EBCS content ID. An EBCS traffic stream shall pass through the IEEE 802.1X Controlled Port even if the IEEE 802.1X Controlled Port is blocked (e.g., because the STA is not associated), and generate MA-UNITDATA.indication with the SA of the EBCS Data frame as the destination address and the TA of the EBCS Data frame as the source address.

An EBCS receiver may receive and consume an EBCS traffic stream that is transmitted by multiple EBCS APs. An EBCS receiver shall identify an EBCS traffic stream by its content ID and the BSSID of the EBCS AP, and optionally by its AP certificate and its AP group ID.

NOTE 2—The EBCS filter does not provide duplicate detection for EBCS traffic streams transmitted from multiple APs. Duplicate detection can be provided in a higher layer.

34.3.4 EBCS Info frame generation and usage

An EBCS AP that is not in a multiple BSSID set shall transmit an EBCS Info frame every dot11EBCSInfoInterval beacon periods with the Address 1 field set to the broadcast address, the Address 2 field set to the transmitting AP's MAC address, and the Address 3 field set to the EBCS info MAC address. In a multiple BSSID set, only the AP corresponding to the transmitted BSSID may have EBCS DL enabled and, if enabled, shall transmit an EBCS Info frame, with the Address 1 field set to the broadcast address, the Address 2 field set to the transmitted BSSID, and the Address 3 field set to the EBCS info MAC address every dot11EBCSInfoInterval beacon periods. The other APs in the multiple BSSID set shall not transmit EBCS Info frames. In a cohosted BSSID set, at most one AP may have EBCS DL enabled and, if enabled,

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

shall transmit an EBCS Info frame every dot11EBCSInfoInterval beacon periods. The other APs in the cohosted BSSID set shall not have EBCS DL enabled and shall not transmit an EBCS Info frame.

The EBCS Info Sequence Number subfield in the first EBCS Info frame shall be set to a random number and shall be incremented by 1 for each subsequent EBCS Info frame transmission. If the field value overflows, it shall be set to 0.

If any of the EBCS traffic streams made available by a single AP do not use HLSA as the content authentication algorithm, then the EBCS Info Authentication Algorithm field in the EBCS Info frame that it transmits shall not indicate None (see Table 9-507); otherwise it may indicate None.

If the EBCS Info Authentication Algorithm field value is not None nor Prenegotiated, the EBCS Info frame shall contain the certificate of the AP that is signed by the certificate of the CA or an intermediate certificate. If the certificate is signed by an intermediate certificate, the certificate of the AP shall contain the full certificate chain to the certificate of the CA.

If dot11EBCSInfoPHYType is not 255, an EBCS AP shall generate a PHY-TXSTART.request primitive with the transmission rate information specified by the dot11EBCSInfoPHYType and dot11EBCSInfoTxRate for EBCS Info frames. If dot11EBCSInfoPHYType is 255, the AP shall select a transmission rate following the rules specified in 10.6.5.4.

On reception of an EBCS Info frame, an EBCS receiver shall check the integrity of the EBCS Info frame as described in 12.15.2 if the EBCS Info Authentication Algorithm subfield in the EBCS Info frame does not indicate None.

If the integrity of the EBCS Info frame is verified, the EBCS receiver shall process each Content Information field according to the value of the Content Authentication Algorithm subfield:

The following processes are common in all authentication algorithms:

- The EBCS receiver shall cache the values of the Content Information List field.
- The EBCS receiver shall notify the SME of the cached information (see 6.3.129.3).

In the PKFA case,

- If the Vendor Specific Data subfield is present in the Content Information field, the EBCS receiver shall forward the MSDU in the Vendor Specific Data subfield to a higher layer and shall cache the certificate in the EBCS Info frame to authenticate PFKA MPDUs.

An EBCS STA may filter traffic based on the value carried in the Address 3 field of a received frame to determine that the frame is an EBCS Info frame.

In the HCFA case,

- The EBCS receiver shall cache the HCFA base key in the Content Information field.
- If instant authenticators are present in the content information, the EBCS receiver shall cache them.
- If HCFA base keys from a previous period are present in the Content Information field, the EBCS receiver shall authenticate the EBCS data frames of the previous HCFA period.

34.3.5 EBCS Info frame fragmentation

An EBCS Info frame may be fragmented into multiple MMPDUs. The length of each fragment shall be an even number of octets, except for the last fragment, which may have an odd length. The length of a fragment shall not be larger than dot11FragmentationThreshold.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An EBCS info frame is fragmented as follows:

1) Construct an unfragmented EBCS Info frame.
2) Select a fragment length such that the Fragment Hash Values field, the Certificate field, and the Signature field will fit in the first fragment.
3) Determine the number of fragments, *n,* and set the Number of Fragments subfield to *n*–1.
4) Insert space for *n*–1 Fragment Hash Values fields into the EBCS Info frame.
5) Divide the EBCS Info frame after the Fragment Hash Values field into fragments.
6) Set the Fragment Index subfield from 0 to *n*–1 for successive fragments.
7) Calculate the hash value of each fragment (see 12.15.2.1) except the first one and set the corresponding Fragment Hash Values field(s).
8) Calculate the signature value (see 12.15.2.1) and set the Signature field in the first fragment.
9) Transmit the fragments in order of the value of Fragment Index field. EBCS data frames shall not be transmitted before all of the fragments are transmitted.

The EBCS Info frame fragmentation is shown in Figure 34-2.

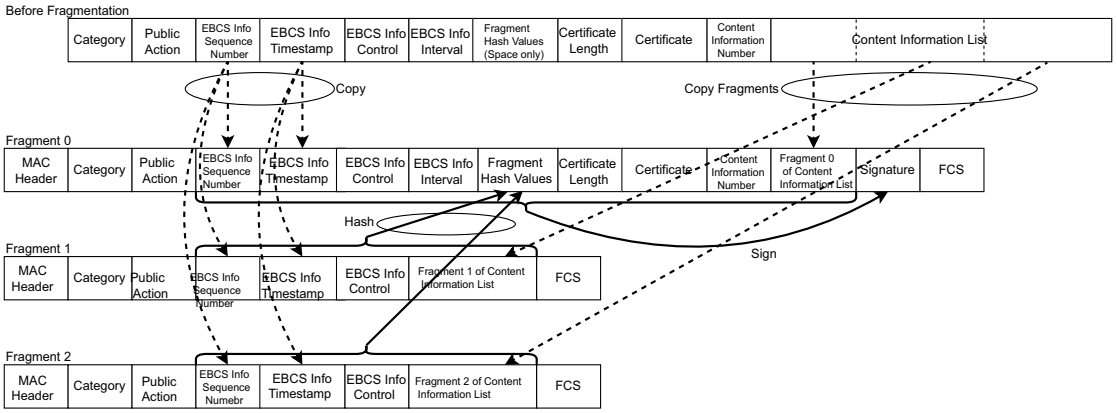

Figure 34-2—EBCS Info frame fragmentation

34.3.6 EBCS Info frame defragmentation

The EBCS Info frame defragmentation procedure is described in 12.15.2.2.

34.3.7 EBCS negotiation for associated STAs

To request one or more EBCS traffic streams provided by an EBCS AP, with which an EBCS non-AP STA is associated, the STA shall transmit an EBCS Content Request frame to the EBCS AP. To request one or more EBCS traffic streams that an EBCS AP has indicated require association, an unassociated EBCS non-AP STA shall associate with the EBCS AP and subsequently transmit an EBCS Content Request frame. A request for one or more EBCS traffic streams that does not require association may also be included in the same EBCS Content Request frame. When requesting an EBCS traffic stream using an EBCS Content Request frame, an EBCS non-AP STA may request an EBCS traffic stream with a certain time to termination as indicated in the Requested Time To Termination field included in the EBCS Content Request frame. In addition, the STA may indicate the MAC address of the AP it is currently receiving the service from, using the Broadcaster MAC Address subfield. The non-AP STA may include in the Broadcaster MAC Address subfield in the EBCS Content Request frame the MAC address of the AP currently serving the EBCS traffic stream, which may differ from the AP receiving the request. This information may be used to distribute the EBCS load transmitted by different EBCS APs in a certain area.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An EBCS STA that receives an EBCS Content Request Info subfield shall determine the presence of fields(s) based on the corresponding presence bits in the EBCS Content Request Info Control subfield.

NOTE 1—An EBCS receiving STA determines the end of the EBCS Content Request Info subfield based on the EBCS Content Request Info Length field and skips fields that it cannot decode.

After receiving an EBCS Content Request frame from an associated EBCS non-AP STA, an EBCS AP shall respond with an EBCS Content Response frame. The status of the request for the EBCS traffic stream identified by a content ID is indicated by the EBCS Content Request Status subfield in the EBCS Content Response Info subfield containing the same content ID. If the EBCS AP indicates in the EBCS Content Response frame that the request for an EBCS traffic stream is successful, it may include a Time To Termination field to indicate the time to termination for the EBCS traffic stream. It may also include EBCS SP duration and the EBCS SP interval for the EBCS traffic stream in the EBCS Content Response frame.

An EBCS STA that receives an EBCS Content Response Info field shall determine the presence of fields(s) based on the corresponding presence bits in the EBCS Content Request Info Control subfield.

NOTE 2—An EBCS receiving STA determines the end of the EBCS Content Request Info subfield based on the EBCS Content Request Info Length field and skips fields that it cannot decode.

An EBCS non-AP STA that receives an EBCS Content Response frame may negotiate for the extension of an EBCS traffic stream if the EBCS traffic stream indicated in one of the EBCS Content Response Info subfields terminates earlier than desired. The EBCS STA may negotiate the extension of the EBCS traffic stream by transmitting another EBCS Content Request frame to its associated AP by including a desired value in the Requested Time To Termination subfield in the EBCS Content Request Info subfield whose Content ID subfield corresponds to the EBCS traffic stream.

An EBCS non-AP STA that received an EBCS Termination Notice frame may negotiate for the extension of an EBCS traffic stream using an EBCS Content Request frame if the EBCS traffic stream indicated in one of the EBCS Termination Info subfields terminates earlier than desired and the Negotiation Method indicated in the same EBCS Termination Info subfield is set to 1 or 2. The EBCS STA may negotiate the extension of the EBCS traffic stream by transmitting an EBCS Content Request frame to its associated AP by including a desired value in the Requested Time To Termination subfield in the EBCS Content Request Info subfield whose Content ID subfield corresponds to the EBCS traffic stream.

NOTE 3—Which values of a received Time To Termination subfield are considered desirable is determined by the receiving EBCS non-AP STA and is beyond the scope of this standard.

NOTE 4—The EBCS transmitter of an EBCS traffic stream has the authority to determine the time to termination of the EBCS traffic stream.

34.3.8 EBCS negotiation for unassociated STAs

An unassociated EBCS STA may transmit an EBCS Content Request ANQP-element to an EBCS AP to register for one or more EBCS traffic streams when that AP has indicated that association is not required for those streams. When registering for an EBCS traffic stream using an EBCS Content Request ANQP-element, an EBCS STA may request a specific time to termination using the Requested Time To Termination subfield and may indicate the MAC address of the AP it is currently receiving the service from using the Broadcaster MAC Address subfield. The Broadcaster MAC Address subfield allows the non-AP STA to provide the MAC address of the AP currently serving the EBCS traffic stream, which might not be the same as the one receiving the request. This information might be used to distribute the EBCS load transmitted by different EBCS APs in a certain area.

After receiving an EBCS Content Request ANQP-element from an unassociated EBCS STA, an EBCS AP shall respond with EBCS Content Response ANQP-element indicating the acceptance or rejection of the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

request to start transmitting each EBCS traffic stream indicated in the EBCS Content Request ANQP-element. If the EBCS AP accepts a request for an EBCS traffic stream, it may include a Time To Termination subfield in the EBCS ANQP-element to indicate the time to termination for the EBCS traffic stream.

An unassociated EBCS STA that received an EBCS Termination Notice frame may negotiate for the extension of an EBCS traffic stream using an EBCS Content Request ANQP-element if the EBCS traffic stream indicated in one of the EBCS Termination Info subfields terminates earlier than desired and the Negotiation Method indicated in the same EBCS Termination Info subfield is set to 2. The EBCS STA may negotiate the extension of the EBCS traffic stream by transmitting an EBCS Content Request ANQP-element to the EBCS AP from which the EBCS Termination Notice frame is received by including a desired value in the Requested Time To Termination subfield in the EBCS Content Request Info subfield whose Content ID subfield corresponds to the EBCS traffic stream.

NOTE—The EBCS AP has the authority to determine the time to termination of the EBCS traffic stream. ANQP-elements received from unassociated STAs are not protected and hence the EBCS AP might exercise caution in accepting certain requested durations. An EBCS AP evaluates certain criteria before responding to the EBCS service request from an unassociated STA from which it receives an EBCS Content Request ANQP-element. Such criteria might include, but are not limited to, limiting the time duration and/or frequency of EBCS traffic stream requests. The evaluation of the criteria might be based on local policies installed at the EBCS AP, which is out of scope of this standard.

An EBCS STA that has registered for an EBCS traffic stream using an EBCS Content Request ANQP-element may deregister for the EBCS traffic stream when it no longer consumes the traffic stream. In order to deregister, the EBCS STA shall send a frame containing an EBCS Content Request ANQP-element to the EBCS AP that is transmitting the EBCS traffic stream. The Broadcast Action bit in the EBSCS Content Request Info Control subfield in the EBCS Content Request Info subfield containing the content ID of the EBCS traffic stream for which the EBCS STA attempts to deregister shall be set to 0.

An EBCS STA may combine registering for one or more EBCS traffic streams and deregistering for one or more EBCS traffic streams by sending one frame that contains one EBCS Content Request ANQP-element, in which one or more EBCS Content Request Info subfields contain a Broadcast Action bit set to 1 and one or more EBCS Content Request Info subfields containing a Broadcast Action bit set to 0.

After receiving an EBCS Content Request ANQP-element from an unassociated EBCS STA that registered for one or more EBCS traffic streams, with the Broadcast Action bit set to 0 in an EBCS Content Request Info subfield for one or more EBCS traffic streams, an EBCS AP shall respond with an EBCS Content Response ANQP-element with the EBCS Content Request Status bit set to 1 in the EBCS Content Response Info subfield containing the content ID for the traffic stream for which the EBCS STA is requesting deregistration.

The EBCS AP, after receiving an EBCS Content Request ANQP-element from an unassociated EBCS STA that registered for one or more EBCS traffic streams, with the Broadcast Action bit set to 0 in an EBCS Content Request Info subfield for one or more EBCS traffic streams, may terminate the transmission of the EBCS traffic streams. The EBCS AP shall follow the EBCS termination notice procedure (see 34.3.9) prior to termination the transmission of the EBCS traffic streams.

34.3.9 EBCS termination notice and extension negotiation

The EBCS termination notice procedure allows a STA that is a broadcaster of EBCS traffic streams to indicate that one or more of the EBCS traffic streams that it is broadcasting is to be terminated. In EBCS DL, a broadcaster of one or more EBCS traffic streams is an EBCS AP.

An EBCS STA shall start to transmit EBCS Termination Notice frames if one or more EBCS that it is transmitting will terminate within an interval that is equal to or shorter than

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

dot11EBCSTerminationNoticeTime, if the STA is not periodically transmitting a schedule for the EBCS traffic stream that is to be terminated. If the EBCS STA starts to transmit EBCS Termination Notice frames, the STA shall transmit the EBCS Termination Notice frames with a period that is larger than dot11EBCSTerminationNoticeMinimumInterval and smaller than dot11EBCSTerminationNoticeMaximumInterval.

The EBCS STA transmitting an EBCS Termination Notice frame shall indicate in the Time To Termination subfield in an EBCS Termination Info subfield the number of TBTTs before the EBCS traffic stream identified by the content ID contained in the Content ID subfield in the same EBCS Termination Info subfield terminates.

The EBCS STA transmitting an EBCS Termination Notice frame shall indicate in the Negotiation Method subfield in an EBCS Termination Info subfield the negotiation method that a STA should use to negotiate for the extension of the EBCS traffic stream identified by the content ID contained in the Content ID subfield in the same EBCS Termination Info subfield. The EBCS STA transmitting an EBCS Termination Notice frame may indicate in the Negotiation Address subfield in an EBCS Termination Info subfield the address associated with the negotiation method indicated in the Negotiation Method subfield in the same EBCS Termination Info subfield that a STA should use to negotiate for the extension of the EBCS traffic stream identified by the content ID contained in the Content ID subfield in the same EBCS Termination Info subfield.

After transmitting an EBCS Termination Notice frame, an EBCS STA shall transmit an EBCS Termination Notice frame with an updated value in the Time To Termination subfield in an EBCS Termination Info subfield if the EBCS traffic stream identified by the content ID in the Content ID subfield in the same EBCS Termination Info subfield has been negotiated to have a new time to termination value. If the negotiated duration for the EBCS traffic stream is longer than the maximum time to termination value, the transmitting STA shall set the Time To Termination subfield to 65 535.

An EBCS STA that receives an EBCS Termination Notice frame shall negotiate for the extension of an EBCS traffic stream if the EBCS traffic stream indicated in one of the EBCS Termination Info subfields terminates earlier than desired. If the EBCS STA negotiates the extension of the EBCS traffic stream, it shall use the negotiation method indicated in the Negotiation Method subfield in the EBCS Termination Info subfield (see 34.3.7 and 34.3.8).

An EBCS STA that receives an EBCS Termination Info subfield shall determine the presence of fields(s) based on the corresponding presence bits in the EBCS Termination Info Control subfield.

NOTE 1—An EBCS receiving STA determines the end of the EBCS Termination Info subfield based on the EBCS Termination Info Length field and skips fields that it cannot decode.

An EBCS STA shall not transmit an EBCS Content Request frame or a frame containing an EBCS Content Request ANQP-element requesting an EBCS traffic stream if the STA receives an EBCS Termination Notice frame with an acceptable time to termination value contained in the EBCS Termination Info subfield containing the content ID of the EBCS traffic stream.

NOTE 2—Whether a value in a received Time To Termination subfield is considered acceptable is determined by the receiving STA and is beyond the scope of this standard.

34.4 EBCS UL procedure

34.4.1 General

The EBCS UL procedure allows a non-AP STA to transmit an EBCS UL frame containing an HLP payload that is intended to be relayed by one or more EBCS relaying STAs to a destination specified in the frame. EBCS UL does not use Data frames and the EBCS DL Filtering block in Figure 5-1 does not apply.

NOTE—The relaying service is best effort with no guarantee that the HLP payload will be delivered to the specified destination.

34.4.2 EBCS UL procedure at an EBCS relaying STA

An EBCS relaying STA provides access to a relaying service (via its affiliated EBCS proxy) in which the HLP payload carried in an EBCS UL frame received from an EBCS non-AP STA is relayed to a destination specified in the frame (see 4.5.12.3 and 34.4.4).

NOTE 1—An EBCS relaying STA can be an AP that has established its own infrastructure BSS or a STA that provides a relaying service without establishing an infrastructure BSS.

NOTE 2—An EBCS AP that relays an HLP payload to the specified destination via its EBCS proxy can be in an unassociated state with the non-AP STA that transmitted the EBCS UL frame carrying the HLP payload.

An EBCS relaying STA shall have dot11EBCSRelayingServiceImplemented equal to true. Otherwise, dot11EBCSRelayingServiceImplemented shall not be true. Among all APs in a multiple BSSID set, only the AP corresponding to the transmitted BSSID may be affiliated with an EBCS proxy. Among all APs in a cohosted BSSID set, only one AP may be affiliated with an EBCS proxy.

An EBCS relaying STA may filter traffic based on the EBCS content MAC address carried in the Address 3 field of a received frame to determine that the frame is an EBCS UL frame. An EBCS relaying STA may further filter traffic based on the value carried in the Address 1 field of a received EBCS UL frame.

NOTE 3—An EBCS relaying STA that is affiliated with an EBCS proxy can ignore an EBCS UL frame whose Address 3 field does not match the one or more EBCS content MAC addresses that can be based on the relationship between the EBCS proxy and one or more destinations. Furthermore, an EBCS relaying STA can be configured to ignore EBCS UL frames based on the value carried in the Address 1 field.

34.4.3 EBCS UL procedure at an EBCS non-AP STA

An EBCS non-AP STA may transmit an EBCS UL frame without receiving a Beacon frame, S1G Beacon frame, PV1 Probe Response frame, or a Probe Response frame with the EBCS Relaying Supported field of the Extended Capabilities element set to 1. The address fields are defined in 9.3.3.1 where the Address 1 field of the frame shall be set to a group address. The EBCS content MAC address is formatted as described in 34.2.

NOTE—The group address value of the Address 1 field can be either set to a broadcast address or a multicast address to differentiate different types of EBCS UL traffic belonging to the same UL traffic stream. For example, an EBCS non-AP STA could transmit different EBCS UL frames, each carrying a different EBCS UL traffic and having the Address 1 field set to a different group address value. The Address 3 field is set to the EBCS content MAC address, which is unique to the UL traffic stream (see 34.2).

An EBCS non-AP STA should include its certificate in an EBCS UL frame to allow the EBCS proxy to authenticate the EBCS non-AP STA (see 12.15.2.6).

When an EBCS non-AP STA has time information, the Frame Tx Time field shall indicate the time when the EBCS UL frame is queued for transmission.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—How an EBCS non-AP STA, that transmits an EBCS UL frame while in an unassociated state, obtains time information is out of scope of this standard.

An EBCS non-AP STA should include the Frame Count field in an EBCS UL frame that it transmits to reduce the possibility of a successful replay attack. When the STA provides a frame count, the Frame Count field shall carry a value that is equal to 1 in the first EBCS UL frame that the STA transmits and shall be incremented for each subsequent transmission of an EBCS UL frame.

The Frame Signature field, if present in the EBCS UL frame, shall be computed as defined in 12.15.2.5.

34.4.4 EBCS UL procedure at an EBCS proxy

An EBCS proxy evaluates various criteria such as the ones described in 12.15.2.6 to decide whether to relay the HLP payload to the specified destination. An EBCS proxy may limit the amount or frequency of payloads that are relayed to the specified destination. An EBCS proxy may embed additional information before relaying the HLP payload to the specified destination. The evaluation of criteria, the decision to limit the amount or frequency of relaying, and the decision to embed additional information can be based on local policies or based on a relationship established with the specified destination.

NOTE 1—The establishment of such a relationship is out of scope of this standard.

NOTE 2—An EBCS proxy can decide to not relay the HLP payload for any reason such as not having a relationship with the specified destination or the implemented criteria for relaying not being satisfied.

An EBCS proxy that decides to relay an HLP payload shall generate and transmit one or more IP packets carrying the HLP payload addressed to the specified destination.

Annex B

(normative)

Protocol Implementation Conformance Statement (PICS) proforma

B.1 Introduction

The supplier of a protocol implementation that is claimed to comply with IEEE Std 802.11-2024 shall complete the following protocol implementation conformance statement (PICS) proforma.

A completed PICS proforma is the PICS for the implementation in question. The PICS is a statement of which capabilities and options of the protocol have been implemented. This annex might not be compatible with operation in any Regulatory Domain or describe combinations of usable features in any Regulatory Domain. The PICS has a number of uses, including use:

a) By the protocol implementer, as a checklist to reduce the risk of failure to comply with the standard through oversight;

b) By the supplier and acquirer, or potential acquirer, of the implementation, as a detailed indication of the capabilities of the implementation, stated relative to the common basis for understanding provided by the standard PICS proforma;

c) By the user, or potential user, of the implementation, as a basis for initially checking the possibility of interworking with another implementation (note that, while interworking is not guaranteed, failure to interwork can often be predicted from incompatible PICS proformas);

d) By a protocol tester, as the basis for selecting appropriate tests against which to assess the claim for compliance of the implementation.

B.2 Abbreviations and special symbols

B.2.1 Symbols for Status column

M mandatory
O optional
O.<n> optional — Support of at least one of the group of options labeled by the same numeral <n> is required. The scope of the group of options is limited to a single table (i.e., subclause) within the PICS.
pred: predicate identification

B.2.2 General abbreviations for Item and Support columns

N/A not applicable
AD address function
AVT audio video transport
CDMG-MChina directional multi-gigabit (CDMG) medium access control (MAC) features
CDMG-PChina directional multi-gigabit (CDMG) physical layer (PHY) features
CMMG-MChina Millimeter-wave multi-gigabit (CMMG) medium access control (MAC) features
CMMG-PChina Millimeter-wave multi-gigabit (CMMG) physical layer (PHY) features

CF implementation under test (IUT) configuration
DMG-Mdirectional multi-gigabit (DMG) medium access control (MAC) features
DMG-Pdirectional multi-gigabit (DMG) physical layer (PHY) features
DS direct sequence
DSE dynamic station enablement
EDMG-Menhanced directional multi-gigabit (EDMG) medium access control (MAC) features
EDMG-Penhanced directional multi-gigabit (EDMG) physical layer (PHY) features
ERP extended rate physical layer (PHY)
FILS fast initial link setup
FR frame reception
FS frame exchange sequence
FT frame transmission
HRDS high rate direct sequence
HEM high-efficiency (HE) medium access control (MAC) features
HEP high-efficiency (HE) physical layer (PHY) features
HTM high throughput (HT) medium access control (MAC) features
HTP high throughput (HT) physical layer (PHY) features
HWM hybrid wireless mesh protocol (HWMP) path selection protocol capability
IW interworking with external networks
LC Light communication
MD multidomain
MP mesh protocol
NGV Next Generation V2X
OC operating classes
OF orthogonal frequency division multiplexing (OFDM)
PAD preassociation discovery
PC protocol capability
QB quality-of-service (QoS) base functionality
QD quality-of-service (QoS) enhanced distributed channel access (EDCA)
QMF quality-of-service Management frame
QP quality-of-service (QoS) hybrid coordination function (HCF) controlled channel access (HCCA)
RL S1G Relay features
RM radio management
SIGM Sub 1 GHz (S1G) medium access control (MAC) features
SIGP Sub 1 GHz (S1G) physical layer (PHY) features
SM spectrum management
TDD-Mtime division duplex (TDD) medium access control (MAC) features
TDLS tunneled direct link setup
TVHTMtelevision very high throughput medium access control (MAC) features
TVHTPtelevision very high throughput physical layer (PHY) features
TVWStelevision white spaces
VHTMVery high throughput MAC
VHTP Very high throughput PHY
WNM wireless network management
WURMwake up radio (WUR) medium access control (MAC) features
WURPwake up radio (WUR) physical layer (PHY) features

B.3 Instructions for completing the PICS proforma

B.3.1 General structure of the PICS proforma

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The first parts of the PICS proforma, Implementation identification and Protocol summary, are to be completed as indicated with the information necessary to identify fully both the supplier and the implementation.

The main part of the PICS proforma is a fixed questionnaire, divided into subclauses, each containing a number of individual items. Answers to the questionnaire items are to be provided in the rightmost column, either by simply marking an answer to indicate a restricted choice (usually Yes or No) or by entering a value or a set or a range of values. (Note that there are some items where two or more choices from a set of possible answers may apply. All relevant choices are to be marked in these cases.)

Each item is identified by an item reference in the first column. The second column contains the question to be answered. The third column contains the reference or references to the material that specifies the item in the main body of this standard. The remaining columns record the status of each item, i.e., whether support is mandatory, optional, or conditional, and provide the space for the answers (see also B.3.4). Marking an item as supported is to be interpreted as a statement that all relevant requirements of the subclauses and normative annexes, cited in the References column for the item, are met by the implementation.

A supplier may also provide, or be required to provide, further information, categorized as either Additional Information or Exception Information. When present, each kind of further information is to be provided in a further subclause of items labeled A<*I*> or X<*I*>, respectively, for cross-referencing purposes, where <*I*> is any unambiguous identification for the item (e.g., simply a numeral). There are no other restrictions on its format or presentation.

A completed PICS proforma, including any Additional Information and Exception Information, is the PICS for the implementation in question.

NOTE—Where an implementation is capable of being configured in more than one way, a single PICS might be able to describe all such configurations. However, the supplier has the choice of providing more than one PICS, each covering some subset of the implementation's capabilities, if this makes for easier and clearer presentation of the information.

B.3.2 Additional information

Items of Additional Information allow a supplier to provide further information intended to assist in the interpretation of the PICS. It is not intended or expected that a large quantity of information will be supplied, and a PICS can be considered complete without any such information. Examples of such Additional Information might be an outline of the ways in which an (single) implementation can be set up to operate in a variety of environments and configurations, or information about aspects of the implementation that are outside the scope of this standard but have a bearing upon the answers to some items.

References to items of Additional Information may be entered next to any answer in the questionnaire, and may be included in items of Exception Information.

B.3.3 Exception information

It may happen occasionally that a supplier wishes to answer an item with mandatory status (after any conditions have been applied) in a way that conflicts with the indicated requirement. No preprinted answer is found in the Support column for this. Instead, the supplier shall write the missing answer into the Support column, together with an X<*I*> reference to an item of Exception Information, and shall provide the appropriate rationale in the Exception Information item itself.

An implementation for which an Exception Information item is required in this way does not comply with this standard.

NOTE—A possible reason for the situation described above is that a defect in this standard has been reported, a correction for which is expected to change the requirement not met by the implementation.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

B.3.4 Conditional status

The PICS proforma contains a number of conditional items. These are items for which both the applicability of the item itself, and its status if it does apply, mandatory or optional, are dependent upon whether certain other items are supported.

Where a group of items is subject to the same condition for applicability, a separate preliminary question about the condition appears at the head of the group, with an instruction to skip to a later point in the questionnaire if the N/A answer is selected. Otherwise, individual conditional items are indicated by a conditional symbol in the Status column.

A conditional symbol is of the form "<pred>:<S>" or "O" (or "O.<n>"), where "<pred>" is a predicate as described below, and "<S>" is one of the status symbols "M" or "O" (or "O.<n>").

If the value of a predicate is true, the conditional symbol is applicable, and yields the status given by S. If any applicable conditional symbol yields mandatory status, the conditional item has mandatory status. Otherwise, if any applicable conditional symbol [including one of the form "O" (or "O.<n>")] yields optional status, the conditional item has optional status. In either case, the support column is to be completed in the usual way. If no conditional symbol is applicable, the conditional item is not relevant and the N/A answer is to be marked.

A predicate is one of the following:

a) An item-reference for an item in the PICS proforma: the value of the predicate is true if the item is marked as supported and is false otherwise.

b) An expression constructed by combining item-references using the boolean operators (in decreasing order of precedence) "NOT", "AND", and "OR", with or without the use of parenthetical groupings: the value of the predicate is true if the expression evaluates to true and is false otherwise.

NOTE—If optional feature F1 requires features F2 and F3, this can be represented in the PICS in one of two ways:

— The status for conditional items F2 and F3 is "F1:M" and the status for conditional item F1 is "O", or
— The status for conditional item F1 is "F2 AND F3:O".

If feature F1 is required if feature F2 or F3 is supported, and is optional otherwise, this can be represented in the PICS in one way:

— The status for conditional item F1 is "F2 OR F3:M" and "O".

If feature F1 is required if feature F2 or F3 is supported, and is not relevant otherwise, this can be represented in the PICS in one way:

— The status for conditional item F1 is "F2 OR F3:M".

If feature F1 is required if feature F2 is supported, is optional if feature F3 is supported, and is not relevant otherwise, this can be represented in the PICS in one way:

— The status for conditional item F1 is "F2:M" and "F3:O".

Conditional symbols can be given in any order.

Each item referenced in a predicate, or in a preliminary question for grouped conditional items, is indicated by an asterisk in the Item column.

B.4 PICS proforma—IEEE Std 802.11-2024[63]

B.4.1 Implementation identification

Supplier	
Contact point for queries about the PICS	
Implementation Name(s) and Version(s)	
Other information necessary for full identification, e.g., name(s) and version(s) of the machines and/or operating system(s), system names	

NOTE 1—Only the first three items are required for all implementations. Other information might be completed as appropriate in meeting the requirement for full identification.

NOTE 2—The terms Name and Version need to be interpreted appropriately to correspond with a supplier's terminology (e.g., Type, Series, Model).

B.4.2 Protocol summary

Identification of protocol standard	IEEE Std 802.11-2024
Identification of amendments and corrigenda to this PICS proforma that have been completed as part of this PICS	Amd. : Corr. : Amd. : Corr. :
Have any exception items been required? (See B.3.3; the answer Yes means that the implementation does not comply with IEEE Std 802.11-2020.)	Yes ☐ No ☐

Date of statement (yyyy-mm-dd)	

[63] *Copyright release for PICS proforma:* Users of this standard may freely reproduce the PICS proforma in this annex so that it can be used for its intended purpose and may further publish the completed PICS.

B.4.4 MAC protocol

B.4.4.1 MAC protocol capabilities

Item	Protocol capability	References	Status	Support
	Are the following MAC protocol capabilities supported?			
*PC1	Authentication service	4.5.4.2, 4.5.4.3, 11.18, 12.2	CFInfraSTA AND NOT CFDMG:M CFIBSS OR CFDMG:M	Yes ☐ No ☐ N/A ☐
PC1.1	Authentication state	11.3	PC1:M	Yes ☐ No ☐
PC1.2	Open System authentication	12.2.2	PC1 AND NOT CFDMG:M	Yes ☐ No ☐
PC2	Reserved			
PC3	Distributed coordination function (DCF)	10.2, 10.3	M	Yes ☐ No ☐
PC3.1	Network allocation vector (NAV) function	10.3.2.1, 10.3.4	M	Yes ☐ No ☐
PC3.2	Interframe space usage and timing	10.3.2.3, 10.3.4, 10.3.7	M	Yes ☐ No ☐
PC3.3	Random backoff function	10.3.3	M	Yes ☐ No ☐
PC3.4	DCF access procedure	10.3.4.2, 10.3.4.5	M	Yes ☐ No ☐
PC3.5	Random backoff procedure	10.3.4.3	M	Yes ☐ No ☐
PC3.6	Recovery procedures and retransmit limits	10.3.4.4	M	Yes ☐ No ☐
PC3.7	Request to send (RTS)/clear to send (CTS) procedure	10.3.2.4, 10.3.2.6, 10.3.2.9	M	Yes ☐ No ☐
PC3.8	Individually addressed MAC protocol data unit (MPDU) transfer	10.3.5	M	Yes ☐ No ☐
PC3.9	Group addressed MPDU transfer	10.3.6	M	Yes ☐ No ☐
PC3.10	MAC-level acknowledgment	10.3.2.2, 10.3.2.11	M	Yes ☐ No ☐
PC3.11	Duplicate detection and recovery	10.3.2.14	M	Yes ☐ No ☐
PC3.12	Dynamic EIFS	10.3.7	O	Yes ☐ No ☐
PC4	*Reserved*			
PC5	*Reserved*			
PC6	Fragmentation	10.3, 10.4	M	Yes ☐ No ☐
PC7	Defragmentation	10.3, 10.5	M	Yes ☐ No ☐
PC8	MAC data service	10.2.8, 10.7	M	Yes ☐ No ☐
PC8.1	ReorderableGroupAddressed service class	10.7	M	Yes ☐ No ☐
PC9	Multirate support	10.6	M	Yes ☐ No ☐

B.4.4.1 MAC protocol capabilities *(continued)*

Item	Protocol capability	References	Status	Support
PC9.1	Rate selection using Rx Supported VHT-MCS and NSS Set / Tx Supported VHT-MCS and NSS Set	10.6.13.1, 10.6.13.2	CFVHT:M CFTVHT:M	Yes ☐ No ☐ N/A ☐
PC9.2	Rate selection constraints for VHT PPDUs	10.6.13.3	CFVHT:O CFTVHT:O	Yes ☐ No ☐ N/A ☐
* PC10	Multiple outstanding MAC service data unit (MSDU) support	10.7	O	Yes ☐ No ☐
PC10.1	Multiple outstanding MSDU transmission restrictions	10.7	PC10:M	Yes ☐ No ☐ N/A ☐
PC11	Timing synchronization function (TSF)	11.1	CFAP OR CFIndepSTA:M	Yes ☐ No ☐
PC11.1	Timing in an infrastructure network	11.1.2.1, 11.1.5	CFInfraSTA:M	Yes ☐ No ☐ N/A ☐
PC11.2	Timing in an independent basic service set (IBSS)	11.1.2.2, 11.1.5	CFIBSS:M	Yes ☐ No ☐ N/A ☐
PC11.3	Beacon generation function	11.1.3	CFAP OR CFIBSS OR CFPCP:M	Yes ☐ No ☐
PC11.4	TSF synchronization and accuracy	11.1.2, 11.1.3	CFAP OR CFIndepSTA:M	Yes ☐ No ☐ N/A ☐
PC11.5	Infrastructure basic service set (BSS) initialization	11.1.4	CFAP:M	Yes ☐ No ☐ N/A ☐
PC11.6	IBSS initialization	11.1.4	CFIBSS:M	Yes ☐ No ☐ N/A ☐
PC11.7	Passive scanning	11.1.4	(CFSTAofAP OR CFIBSS OR CFPBSSnotPCP):O.1	Yes ☐ No ☐ N/A ☐
PC11.8	Active scanning	11.1.4	(CFSTAofAP OR CFIBSS OR CFPBSSnotPCP):O.1	Yes ☐ No ☐ N/A ☐
PC11.9	Probe response	11.1.4	(NOT CFOCB):M	Yes ☐ No ☐ N/A ☐
PC12	Infrastructure power management	11.2.3	CFInfraSTA AND NOT CFDMG:M	Yes ☐ No ☐ N/A ☐
PC12.1	STA power management modes	11.2.3.2, 11.2.3.7	(CFSTAofAP OR CFIBSS):M	Yes ☐ No ☐ N/A ☐
PC12.2	Traffic indication map (TIM) transmission	11.2.3.3, 11.2.3.4	CFAP:M	Yes ☐ No ☐ N/A ☐
PC12.3	AP function	11.2.3.6	CFAP:M	Yes ☐ No ☐ N/A ☐
PC12.4	Reserved			
PC12.5	Non-AP STA receive function	11.2.3.7	CFSTAofAP:M	Yes ☐ No ☐ N/A ☐

B.4.4.1 MAC protocol capabilities *(continued)*

Item	Protocol capability	References	Status	Support
PC21	Monitor each received Short Time Slot subfield and take action as described in reference.	9.4.1.4	CFERP:M	Yes ☐ No ☐ N/A ☐
PC22	Transmit the ERP element in each transmitted Beacon or Probe Response frame in the format and with content as described in reference	9.4.1.4	CFERP:M	Yes ☐ No ☐ N/A ☐
PC23	Receive the ERP element and employ a protection mechanism when required prior to transmitting information using ERP-OFDM modulation	9.4.1.4	CFERP:M	Yes ☐ No ☐ N/A ☐
PC24	Determine the value of aCWmin based on the characteristic rate set as described in the reference	10.3.9	CFERP:M	Yes ☐ No ☐ N/A ☐
PC25	Transmit control response frames at the largest basic rates less than equal to the rate received and with the same PHY options or use the highest mandatory rate if no basic rate meets the above criterion	10.6	CFERP:M	Yes ☐ No ☐ N/A ☐
PC26	Transmit group addressed frames at a rate contained in the BSSBasicRateSet parameter	10.6	CFERP:M	Yes ☐ No ☐ N/A ☐
PC27	Transmit individually addressed frames at any supported rate selected by a rate switching mechanism as long as it is supported by the destination STA	10.6	CFERP:M	Yes ☐ No ☐ N/A ☐
PC28	*Reserved*			
PC29	Use ERP element to control use of protection mechanism as described in the reference	10.27	CFERP:M	Yes ☐ No ☐ N/A ☐
PC30	Updated NAV is long enough to cover frame and any response	10.27	CFERP:M	Yes ☐ No ☐ N/A ☐
PC31	Support transmission of CTS-to-self sequence as described in the references	10.3.2.15	CFERP:O CFTVHT:O	Yes ☐ No ☐ N/A ☐
PC32	Support reception of CTS-to-self sequence as described in the references	10.3.2.15	CFERP:M CFTVHT:M	Yes ☐ No ☐ N/A ☐
PC33	Update NAV	10.27	CFERP:M	Yes ☐ No ☐ N/A ☐
* PC34	Robust security network association (RSNA)	9.3.2.1, 9.4.1.4, 4.5.4.4, 11.3.4, 11.3.5, 12.5.2	O	Yes ☐ No ☐
*PC34.1	RSNE	9.4.2.23	PC34:M	Yes ☐ No ☐ N/A ☐
PC34.1.1	Group data cipher suite	9.4.2.23	PC34.1:M	Yes ☐ No ☐ N/A ☐
PC34.1.2	Pairwise cipher suite list	9.4.2.23	PC34.1:M	Yes ☐ No ☐ N/A ☐

B.4.4.3 Frame exchange sequences

Item	Frame exchange sequence	References	Status	Support
	Are the following frame exchange sequences supported?			
FS1	Basic frame exchange sequences	10.3.2.6, 10.3.2.9, 10.3.2.11, 10.3.5, 10.3.6	M	Yes ☐ No ☐

B.4.4.4 MAC addressing functions

Item	MAC Address function	References	Status	Support
	Are the following MAC Addressing functions supported?			
AD1	STA universal individual IEEE 802 address	9.2.4.3	M	Yes ☐ No ☐
AD2	BSS identification (BSSID) generation	9.2.4.3, 11.1.4	M	Yes ☐ No ☐
AD3	Receiver address matching	9.2.4.3, 9.3.2.1	M	Yes ☐ No ☐
AD4	Wildcard BSSID	9.2.4.3.4, 9.3.2	CFOCB:M	Yes ☐ No ☐ N/A ☐
AD5	MAC and PHY operation resumes with appropriate MIB attributes in less than 2 TU	11.18	CFOCB:M	Yes ☐ No ☐ N/A ☐
AD6	Group addressed mesh Data frame addressing (3 address frame)	9.2.3, 9.2.4.1, 9.2.4.3, 9.3.5	CFMBSS:M	Yes ☐ No ☐ N/A ☐
AD7	Individually addressed mesh Data frame addressing (4 address frame)	9.2.3, 9.2.4.1, 9.2.4.3, 9.3.5	CFMBSS:M	Yes ☐ No ☐ N/A ☐
AD8	Proxied group addressed mesh Data frame addressing (4 address frame)	9.2.3, 9.2.4.1, 9.2.4.3, 9.2.4.8.3, 9.3.5	CFMBSS:M	Yes ☐ No ☐ N/A ☐
AD9	Proxied individually addressed mesh Data frame addressing (6 address frame)	9.2.3, 9.2.4.1, 9.2.4.3, 9.2.4.8.3, 9.3.5	CFMBSS:M	Yes ☐ No ☐ N/A ☐
AD10	Multihop Action frame addressing (4 address frame)	9.2.3, 9.2.4.1, 9.2.4.3, 9.2.4.8.3, 9.6.17, 9.3.5	CFMBSS:M	Yes ☐ No ☐ N/A ☐
AD11	TA filtering for mesh STA	9.2.4.3, 9.3.2.1, 9.3.5	CFMBSS:M	Yes ☐ No ☐ N/A ☐
*AD12	Group addressed Data frame addressing (4 address frame)	9.2.3, 9.2.4.1, 9.2.4.3	CFS1GRelay: O RL2:O CFAP: O CFIndepSTA: O	Yes ☐ No ☐ N/A ☐

B.4.6 OFDM PHY functions *(continued)*

Item	Feature	References	Status	Support
OF10: Geographic Area Specific Requirements				
*OF10.1	Geographic areas	17.3.8.3, 17.3.8.4, 17.3.8.5,17.3.9.4	M	Yes ☐ No ☐
OF10.2	Regulatory domain extensions	17.3.8.4.3, 17.3.8.5, 17.3.9.2, 17.3.9.3, Annex E	CFOC:M	Yes ☐ No ☐ N/A ☐

B.4.7 High rate, direct sequence PHY functions

Item	PHY feature	References	Status	Support
	Are the following PHY features supported?			
HRDS1	Long preamble and header procedures	16.2	M	Yes ☐ No ☐
HRDS1.1	Long direct sequence preamble prepended on TX	16.2.1	M	Yes ☐ No ☐
HRDS1.2	Long PHY integrity check generation	16.2.3	M	Yes ☐ No ☐
HRDS1.3	TX rate change capability	16.2.3.4	M	Yes ☐ No ☐
HRDS1.4	Supported data rates	16.1, 16.2.3.4	M	Yes ☐ No ☐
HRDS1.5	Data scrambler	16.2.4	M	Yes ☐ No ☐
HRDS1.6	Scrambler initialization	16.2.4	M	Yes ☐ No ☐
HRDS2	*Reserved*			
*HRDS3	Short preamble and header procedures	16.2	O	Yes ☐ No ☐
HRDS3.1	Short preamble prepended on TX	16.2.2	HRDS3:M	Yes ☐ No ☐ N/A ☐
HRDS3.2	Short header transmission	16.2.3.9, 16.2.3.10, 16.2.3.11, 16.2.3.12, 16.2.3.13, 16.2.3.14, 16.2.3.15	HRDS3:M	Yes ☐ No ☐ N/A ☐
HRDS4	Long preamble process on RX	16.2.6	M	Yes ☐ No ☐
HRDS4.1	PHY format	16.2.6	M	Yes ☐ No ☐
HRDS4.2	PHY integrity check verify	16.2.6	M	Yes ☐ No ☐
HRDS4.3	RX Rate change capability	16.2.6	M	Yes ☐ No ☐
HRDS4.4	Data whitener descrambler	16.2.6	M	Yes ☐ No ☐
*HRDS5	Short preamble process on RX	16.2.6	HRDS3:M	Yes ☐ No ☐ N/A ☐
HRDS5.1	PHY format	16.2.6	HRDS5:M	Yes ☐ No ☐ N/A ☐
HRDS5.2	PHY integrity check verify	16.2.6	HRDS5:M	Yes ☐ No ☐ N/A ☐
HRDS5.3	RX rate change capability	16.2.6	HRDS5:M	Yes ☐ No ☐ N/A ☐
HRDS5.4	Data whitener descrambler	16.2.6	HRDS5:M	Yes ☐ No ☐ N/A ☐

B.4.12 QoS base functionality *(continued)*

Item	Protocol capability	References	Status	Support
QB4	Block acknowledgments (block ack)			
QB4.1	Immediate block ack	9.3.1.7.1, 9.3.1.8.1, 9.6.4, 10.25 (except 10.25.6), 11.5	CFQoS:O CFHT OR CFDMG OR CFTVHT:M	Yes ☐ No ☐ N/A ☐
QB4.2	*Reserved*			
QB4.3	Unsolicited block ack	9.4.2.278, 10.25.10	CFQoS:O	Yes ☐ No ☐ N/A ☐
QB4.3.1	Compressed Block Ack	9.3.1.7.2	CFQoS:O CFHT OR CFDMG OR CFTVHT:M	Yes ☐ No ☐ N/A ☐
QB4.3.2	Extended Compressed Block Ack	9.3.1.7.3	CFDMG:O	Yes ☐ No ☐ N/A ☐
QB4.3.3	EDMG Compressed BlockAck	9.3.1.8.7	CFEDMG:M	Yes ☐ No ☐ N/A ☐
QB4.4	Reserved			Yes ☐ No ☐ N/A ☐
QB4.4.1	Reserved			
QB4.4.2	EDMG Multi-TID BlockAck	9.3.1.8.8	CFEDMG:O	Yes ☐ No ☐ N/A ☐
QB4.5	Multi-STA BlockAck	9.3.1.8.6	CFHE:M	Yes ☐ No ☐ N/A ☐
*QB5	Automatic power save delivery (APSD)	9.6.3, 11.2.3	(CFAP AND CFQoS):O (CFIndepSTA AND CFQoS):O	Yes ☐ No ☐ N/A ☐

B.4.13 QoS enhanced distributed channel access (EDCA)

Item	Protocol capability	References	Status	Support
QD1	Support for four transmit queues with a separate channel access entity associated with each	10.2.3.2, 10.23.2.1	NOT CFDMG AND CFQoS:M CFS1G AND S1GM20.5: M CFS1G AND S1GM20.4:O	Yes ☐ No ☐ N/A ☐
QD2	Per-channel access function differentiated channel access	10.23.2.2, 10.23.2.4, 10.23.2.12	NOT CFDMG AND CFQoS:M	Yes ☐ No ☐ N/A ☐
QD3	Multiple frame exchange sequences in an ECDA TXOP support	10.23.2.8	CFQoS OR CFDMG OR CFS1G:O	Yes ☐ No ☐ N/A ☐
QD4	Maintenance of within-queue ordering, exhaustive retransmission when sending non-QoS Data frames	10.23.2.12	(CFQoS AND NOT CFS1G) OR CFDMG:M	Yes ☐ No ☐ N/A ☐

B.4.13 QoS enhanced distributed channel access (EDCA) *(continued)*

Item	Protocol capability	References	Status	Support
QD5	Interpretation of admission control mandatory (ACM) subfield in EDCA Parameter Set element	9.4.2.11, 10.23.4.2	(CFSTAofAP AND (CFQoS OR CFDMG)):M (CFPBSSnotPCP AND CFDMG):	Yes ☐ No ☐ N/A ☐
*QD6	Contention based admission control	9.4.2.12, 9.4.2.13, 9.6.3.2–9.6.3.4, 10.23.4.2, 11.4	(CFAP AND (CFQoS OR CFDMG)):O (CFSTAofAP AND (CFQoS OR CFDMG)):O (CFPCP AND CFDMG):O (CFPBSSnotPCP AND CFDMG):O	Yes ☐ No ☐ N/A ☐
QD7	Power management in an infra-structure BSS or in an IBSS	11.2	(CFAP AND CFQoS):O (CFIndepSTA AND CFQoS):O	Yes ☐ No ☐ N/A ☐
QD8	Default EDCA parameters for communications outside context of BSS	9.4.2.27, 10.23.2.2	CFOCB:M	Yes ☐ No ☐ N/A ☐
QD9	Duration/ID rules for QoS STA	9.2.5	CFQoS	Yes ☐ No ☐ N/A ☐
QD10	Mirrored Stream Classification Service (MSCS)	9.6.18.6, 9.6.18.7, 11.25.3	CFQoS:O	Yes ☐ No ☐ N/A ☐

B.4.14 QoS hybrid coordination function (HCF) controlled channel access (HCCA)

Item	Protocol capability	References	Status	Support
QP1	Traffic specification (TSPEC) and associated frame formats	9.6.3	(CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M	Yes ☐ No ☐ N/A ☐
*QP 2	HCCA rules	10.2.3.3, 10.23.3, 10.23.3.2–10.23.3.5	(CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M	Yes ☐ No ☐ N/A ☐
QP3	HCCA schedule generation and management	10.23.4	(CFAP AND CFQoS):M	Yes ☐ No ☐ N/A ☐
QP4	HCF frame exchange sequences	10.23.2	(CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M	Yes ☐ No ☐ N/A ☐
QP5	Traffic stream (TS) management	11.4	(CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M	Yes ☐ No ☐ N/A ☐

B.4.14 QoS hybrid coordination function (HCF) controlled channel access (HCCA)

Item	Protocol capability	References	Status	Support
QP6	Minimum TSPEC parameter set	10.23.4	(CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M	Yes ☐ No ☐ N/A ☐
QP7	Power management in an infrastructure BSS	11.2.3.5, 11.2.3.6, 11.2.3.6, 11.2.3.7, 11.2.3.7, 11.2.3.8, 11.2.3.9	(CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M	Yes ☐ No ☐ N/A ☐

B.4.15 Radio management extensions

Item	Protocol capability	References	Status	Support
	Are the following Radio Measurement capabilities supported?			
RM1	Radio measurement capability	9.4.1.4	CFRM:M	Yes ☐ No ☐ N/A ☐
RM2	Action frame protocol for measurements	9.5.7	CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.1	Radio Measurement Request frame	9.6.6.2	CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.2	Radio Measurement Report frame	9.6.6.3	CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.3	Link Measurement Request frame	9.6.6.4	CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.4	Link Measurement Report frame	9.6.6.5	CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.4.1	Link Measurement Report frame	9.6.6.5	NOT CF DMG AND CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.4.2	Link Measurement Report frame	9.6.6.5, 9.4.2.147, 9.4.2.148, 10.41.9	CFDMG AND CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.5	Neighbor Report Request			
RM2.5.1	Generate and transmit Neighbor Report Request	9.6.6.6	(CFRM AND CFSTAo-fAP):M	Yes ☐ No ☐ N/A ☐
RM2.5.2	Receive and process Neighbor Report Request	9.6.6.6	(CFRM AND CFAP):M	Yes ☐ No ☐ N/A ☐
RM2.6	Neighbor Report Response			
RM2.6.1	Generate and transmit Neighbor Report Response	9.4.2.35, 9.6.6.7	(CFRM AND CFAP):M	Yes ☐ No ☐ N/A ☐

B.4.15 Radio management extensions *(continued)*

Item	Protocol capability	References	Status	Support
RM2.6.2	Receive and process Neighbor Report Response	9.4.2.35, 9.6.6.7	(CFRM AND CFSTAo-fAP):M	Yes ☐ No ☐ N/A ☐
RM3	General protocol for requesting and reporting of measurements	9.4.2.19, 9.4.2.20, 11.10, 11.10.6	CFRM:M	Yes ☐ No ☐ N/A ☐
RM3.1	Parallel Measurements	9.4.2.19, 9.4.2.20, 11.10.6	CFRM:M	Yes ☐ No ☐ N/A ☐
RM3.2	Use of Enable, Request and Report subfields to enable/disable measurement requests and triggered autonomous reports Measurement Requests	9.4.2.19, 11.10.6, 11.10.8	CFRM:M	Yes ☐ No ☐ N/A ☐
RM3.3	Enable Autonomous Report	9.4.2.19, 11.10.8	CFRM:M	Yes ☐ No ☐ N/A ☐
RM3.4	Duration Mandatory	9.4.2.19, 11.10.4	CFRM:M	Yes ☐ No ☐ N/A ☐
RM3.5	Incapable Indication	9.4.2.20	CFRM:M	Yes ☐ No ☐ N/A ☐
RM3.6	Refused Indication	9.4.2.20, 11.10.5	CFRM:M	Yes ☐ No ☐ N/A ☐
RM3.7	Repeated Measurement	9.6.6.2, 11.10.7	CFRM:M	Yes ☐ No ☐ N/A ☐
RM3.8	Measurement Pause	9.4.2.19.12, 11.10.9.7	CFRM:M	Yes ☐ No ☐ N/A ☐
RM4	Beacon Measurement Type	11.10, 11.10.9.1	CFRM:M	Yes ☐ No ☐ N/A ☐
RM4.1	Beacon request	9.4.2.19.7	CFRM:M	Yes ☐ No ☐ N/A ☐
RM4.2	Passive Measurement mode	9.4.2.19.7, 11.10.9.1	CFRM:M	Yes ☐ No ☐ N/A ☐
RM4.3	Active Measurement mode	9.4.2.19.7, 11.10.9.1	CFRM:M	Yes ☐ No ☐ N/A ☐
RM4.4	Beacon table mode	9.4.2.19.7, 11.10.9.1	CFRM:M	Yes ☐ No ☐ N/A ☐
RM4.5	Reporting Conditions	9.4.2.19.7	CFRM:O	Yes ☐ No ☐ N/A ☐
RM4.6	Beacon report	9.4.2.19.7	CFRM:M	Yes ☐ No ☐ N/A ☐
RM4.7	Reporting Detail	9.4.2.19.7, 9.4.2.20.7, 9.4.2.34	CFRM:O	Yes ☐ No ☐ N/A ☐
* RM5	Frame Measurement Type	11.10, 11.10.9.2	CFRM:O	Yes ☐ No ☐ N/A ☐
RM5.1	Frame request	9.4.2.19.8	(CFRM AND RM5):M	Yes ☐ No ☐ N/A ☐
RM5.2	Frame report	9.4.2.20.8	(CFRM AND RM5):M	Yes ☐ No ☐ N/A ☐

B.4.15 Radio management extensions *(continued)*

Item	Protocol capability	References	Status	Support
RM6	Channel Load Measurement Type	11.10, 11.10.9.3	CFRM:M	Yes ☐ No ☐ N/A ☐
RM6.1	Channel Load request	9.4.2.19.5	CFRM:M	Yes ☐ No ☐ N/A ☐
RM6.2	Channel Load report	9.4.2.20.5	CFRM:M	Yes ☐ No ☐ N/A ☐
RM7	Noise Histogram Measurement Type	11.10, 11.10.9.4	CFRM:M	Yes ☐ No ☐ N/A ☐
RM7.1	Noise Histogram request	9.4.2.19.6	CFRM:M	Yes ☐ No ☐ N/A ☐
RM7.2	Noise Histogram report	9.4.2.20.6	CFRM:M	Yes ☐ No ☐ N/A ☐
RM8	STA Statistics Measurement Type	11.10, 11.10.9.5	CFRM:M	Yes ☐ No ☐ N/A ☐
RM8.1	STA Statistics request	9.4.2.19.9	CFRM:M	Yes ☐ No ☐ N/A ☐
RM8.2	STA Statistics report	9.4.2.20.9	CFRM:M	Yes ☐ No ☐ N/A ☐
RM9	LCI Measurement Type	11.10, 11.10.9.6	CFRM:M	Yes ☐ No ☐ N/A ☐
RM9.1	LCI request	9.4.2.19.10	CFRM:M	Yes ☐ No ☐ N/A ☐
RM9.1.1	Location Subject	9.4.2.19.10	CFRM:M	Yes ☐ No ☐ N/A ☐
RM9.1.1.1	Location Subject third party	9.4.2.19.10	CFRM:O	Yes ☐ No ☐ N/A ☐
RM9.2	LCI report	9.4.2.20.10	CFRM:M	Yes ☐ No ☐ N/A ☐
RM9.3	Azimuth	11.10, 11.10.9.6	CFRM:O	Yes ☐ No ☐ N/A ☐
RM9.3.1	Azimuth Request	9.4.2.19.10	CFRM:O	Yes ☐ No ☐ N/A ☐
RM9.3.2	Azimuth Response	9.4.2.20.10	CFRM:O	Yes ☐ No ☐ N/A ☐
*RM10	Transmit Stream/Category Measurement Type	11.10, 11.10.9.8	(CFRM AND (CFQoS OR CFDMG)):O	Yes ☐ No ☐ N/A ☐
RM10.1	Transmit Stream/Category Measurement request	9.4.2.19.11	RM10:M	Yes ☐ No ☐ N/A ☐
RM10.2	Transmit Stream/Category Measurement report	9.4.2.20.11	RM10:M	Yes ☐ No ☐ N/A ☐
RM10.3	Triggered Transmit Stream/Category Measurement report	9.4.2.20.11, 11.10.9.8	RM10:O	Yes ☐ No ☐ N/A ☐
RM11	AP Channel report	9.4.2.7, 9.4.2.34	(CFRM AND CFAP):M	Yes ☐ No ☐ N/A ☐
RM11.1	Generate and transmit AP Channel report	9.3.3.2, 9.3.3.10, 9.4.2.34	(CFRM AND CFAP):M	Yes ☐ No ☐ N/A ☐

B.4.17 High Throughput (HT) features

B.4.17.1 HT MAC features

Item	Protocol capability	References	Status	Support
	Are the following MAC protocol features supported?			
HTM1	HT capabilities signaling			
HTM1.1	HT Capabilities element	9.4.2.54.1	CFHT:M CFTVHT:M	Yes ☐ No ☐ N/A ☐
HTM1.2	Signaling of STA capabilities in Probe Request, (Re)Association Request frames	9.3.3.5, 9.3.3.7, 9.3.3.9, 9.4.2.54	(CFHT AND CFIndep-STA):M (CFTVHT AND CFIndep-STA):M	Yes ☐ No ☐ N/A ☐
HTM1.3	Signaling of STA and BSS capabilities in Beacon, Probe Response, (Re)Association Response frames	9.3.3.2, 9.3.3.6, 9.3.3.8, 9.3.3.10, 9.4.2.54	(CFHT AND CFAP):M (CFTVHT AND CFAP):M	Yes ☐ No ☐ N/A ☐
HTM2	Signaling of HT operation	9.4.2.55	(CFHT AND CFAP):M (CFTVHT AND CFAP):M	Yes ☐ No ☐ N/A ☐
HTM3	MPDU aggregation			
HTM3.1	Reception of A-MPDU	9.4.2.54.3, 10.12.2, 12.5	(CFHT AND NOT CFS1G):M CFS1G: O	Yes ☐ No ☐ N/A ☐
HTM3.2	A-MPDU format	9.7.1	(CFHT OR CFS1G):M	Yes ☐ No ☐ N/A ☐
HTM3.3	A-MPDU contents	9.7.3	(CFHT OR CFS1G):M	Yes ☐ No ☐ N/A ☐
HTM3.4	A-MPDU frame exchange sequences	10.23.2.8	(CFHT AND NOT CFS1G):M CFS1G: O	Yes ☐ No ☐ N/A ☐
HTM3.5	Transmission of A-MPDU	9.4.2.54.3, 12.5	CFHT:O CFVHT:M CFS1G: O	Yes ☐ No ☐ N/A ☐
HTM4	MSDU aggregation			
HTM4.1	Reception of A-MSDUs	9.2.4.5, 9.3.2.2	(CFHT AND NOT CFS1G):M CFS1G:O	Yes ☐ No ☐ N/A ☐

B.4.17.1 HT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
HTM5.3	HT-immediate block ack extensions	10.25.6	(CFHT AND NOT CFS1G):M CFVHT:M CFS1G:O (CFS1G AND (S1GM20.2 OR S1GM20.3 OR S1GM20.5)): M	Yes ☐ No ☐ N/A ☐
HTM5.4	*Reserved*			
HTM5.5	*Reserved*			Yes ☐ No ☐ N/A ☐
HTM6	Protection mechanisms for different HT PHY options			
HTM6.1	Protection of RIFS PPDUs in the presence of non-HT STAs	10.27.3.3	CFHT:M	Yes ☐ No ☐ N/A ☐
HTM6.2	Protection of RIFS PPDUs in an IBSS	10.27.3.3	CFHT:M	Yes ☐ No ☐ N/A ☐
HTM6.3	Protection of HT-greenfield format PPDUs in the presence of non-HT STAs	10.27.3.1	HTP1.3:M	Yes ☐ No ☐ N/A ☐
HTM6.4	Protection of HT-greenfield format PPDUs in an IBSS	10.27.3.1	CFHT:M	Yes ☐ No ☐ N/A ☐
HTM7	Duration/ID rules for A-MPDU	9.7.3	CFHT:M	Yes ☐ No ☐ N/A ☐
HTM8	Truncation of TXOP as TXOP holder	10.23.2.10	CFHT:O CFTVHT:O	Yes ☐ No ☐ N/A ☐
HTM9	Reception of +HTC frames	9.2.4.1.10, 9.4.2.54.5, 10.8	CFHT:O CFTVHT:O	Yes ☐ No ☐ N/A ☐
HTM10	Reverse direction (RD) aggregation exchanges	10.29	CFHT:O CFTVHT:O	Yes ☐ No ☐ N/A ☐
HTM10.1	Constraints regarding responses	10.29.4	HTM11:M	Yes ☐ No ☐ N/A ☐
*HTM11	Link adaptation			
HTM11.1	Use of the HT Control field for link adaptation in immediate response exchange	9.2.4.6, 9.3.3.14, 10.31.2	CFHT:O CFTVHT:O	Yes ☐ No ☐ N/A ☐
HTM11.2	Link adaptation using explicit feedback mechanism	9.3.3.14, 10.33.3	CFHT:O CFTVHT:O	Yes ☐ No ☐ N/A ☐
HTM12	Transmit beamforming			
*HTM12.1	Transmission of beamformed PPDUs	10.33	CFHT:O	Yes ☐ No ☐ N/A ☐
*HTM12.2	Reception of beamformed PPDUs	10.33	CFHT:O	Yes ☐ No ☐ N/A ☐
*HTM12.3	Initiate transmit beamforming frame exchange sequence with implicit feedback	10.33.2	HTM12.1:O	Yes ☐ No ☐ N/A ☐
HTM12.3.1	Reception of sounding PPDUs	10.33.2	HTM12.3:M	Yes ☐ No ☐ N/A ☐
*HTM12.4	Response to transmit beamforming frame exchange sequence with implicit feedback	10.33.2	HTM12.2:O	Yes ☐ No ☐ N/A ☐
HTM12.4.1	Transmission of sounding PPDUs	10.33.2	HTM12.4:M	Yes ☐ No ☐ N/A ☐

B.4.17.1 HT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
*HTM12.5	Initiate transmit beamforming frame exchange sequence with explicit feedback	9.6.11.4, 10.33.3	HTM12.1:O	Yes ☐ No ☐ N/A ☐
HTM12.5.1	Transmission of sounding PPDUs	10.33.3	HTM12.5:M	Yes ☐ No ☐ N/A ☐
*HTM12.6	Respond to transmit beamforming frame exchange sequence with explicit feedback	10.33.3	HTM12.2:O	Yes ☐ No ☐ N/A ☐
HTM12.6.1	Transmission of Action No Ack +HTC frame including Action payload of type CSI	9.6.11.4, 10.33.3	HTM12.6:O.1	Yes ☐ No ☐ N/A ☐
HTM12.6.2	Transmission of Action No Ack +HTC frame including Action payload of type “Noncompressed beamforming”	9.6.11.5, 10.33.3	HTM12.6:O.1	Yes ☐ No ☐ N/A ☐
HTM12.6.3	Transmission of Action No Ack +HTC frame including Action payload of type “Compressed beamforming”	9.6.11.6, 10.33.3	HTM12.6:O.1	Yes ☐ No ☐ N/A ☐
*HTM12.7	Calibration procedure	9.3.3.14, 10.33.2.4	HTM12:O	Yes ☐ No ☐ N/A ☐
HTM13	Antenna selection (ASEL)	9.2.4.6, 9.4.2.54.7, 9.6.11.7, 10.34	CFHT:O	Yes ☐ No ☐ N/A ☐
*HTM14	Null data PPDU (NDP)	10.35	CFHT:O	Yes ☐ No ☐ N/A ☐
*HTM15	Space-time block coding (STBC) support			
HTM15.1	STBC beacon transmission The use of the STBC beacon transmission mechanism is deprecated.	11.1.3.2	HTP2.11:O	Yes ☐ No ☐ N/A ☐
HTM15.2	Dual CTS protection The use of the dual CTS mechanism is obsolete.	10.3.2.10	HTP2.11 AND NOT CFS1G: O	Yes ☐ No ☐ N/A ☐
HTM16	SM power save support			
*HTM16.1	AP support for non-AP STA dynamic and static SM power save mode	11.2.6	(CFHT AND CFAP):M (CFTVHT AND CFAP):M	Yes ☐ No ☐ N/A ☐
*HTM16.2	STA support for local dynamic and static SM power save mode	11.2.6	(CFHT AND CFIndepSTA):O (CFTVHT AND CFIndepSTA):O	Yes ☐ No ☐ N/A ☐
HTM16.3	Transmit SM power save state information using HT Capabilities element, or SM Power Save frame	9.6.11.3, 11.2.6	HTM16.2:M	Yes ☐ No ☐ N/A ☐
HTM16.4	Receive SM power save state information and support frame exchanges with STAs in SM power save mode	11.2.6	HTM16.1:M	Yes ☐ No ☐ N/A ☐

B.4.17.1 HT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
HTM17	Mechanisms for coexistence of 20 MHz and 40 MHz channels	11.15	CFHT:M	Yes ☐ No ☐ N/A ☐
HTM18	Channel selection methods for 20/40 MHz operation	11.15.3	(HTP2.3.4 AND CFAP):M	Yes ☐ No ☐ N/A ☐
HTM19	20/40 MHz operation	11.15	HTP2.3.4:M	Yes ☐ No ☐ N/A ☐
HTM20	Management information base (MIB)			
HTM20.1	dot11PhyHTComplianceGroup	Annex C	CFHT:M	Yes ☐ No ☐ N/A ☐
HTM20.2	dot11PhyMCSGroup	Annex C	CFHT:M	Yes ☐ No ☐ N/A ☐

B.4.17.2 HT PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
HTP1	PHY operating modes			
HTP1.1	Operation according to Clause 17 (OFDM) and/or Clause 18 (ERP)	19.1.4	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP1.2	HT-mixed format	19.1.4	CFHT:M	Yes ☐ No ☐ N/A ☐
*HTP1.3	HT-greenfield format	19.1.4	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2	PHY frame format			
HTP2.1	HT-mixed format PPDU	19.3.2	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.2	HT-greenfield format PPDU	19.3.2	HTP1.3:M	Yes ☐ No ☐ N/A ☐
HTP2.3	Modulation and coding schemes (MCS)			
HTP2.3.1	MCS 0 to MCS 7 in 20 MHz with 800 ns guard interval (GI)			
HTP2.3.1.1	Support for 20 MHz with 800 ns GI MCS index 0	19.3.5, 19.5	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.3.1.2	Support for 20 MHz with 800 ns GI MCS index 1	19.3.5, 19.5	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.3.1.3	Support for 20 MHz with 800 ns GI MCS index 2	19.3.5, 19.5	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.3.1.4	Support for 20 MHz with 800 ns GI MCS index 3	19.3.5, 19.5	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.3.1.5	Support for 20 MHz with 800 ns GI MCS index 4	19.3.5, 19.5	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.3.1.6	Support for 20 MHz with 800 ns GI MCS index 5	19.3.5, 19.5	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.3.1.7	Support for 20 MHz with 800 ns GI MCS index 6	19.3.5, 19.5	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.3.1.8	Support for 20 MHz with 800 ns GI MCS index 7	19.3.5, 19.5	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.3.2	MCS 8 to MCS 15 in 20 MHz with 800 ns GI

B.4.17.2 HT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
HTP2.3.2.8	Support for 20 MHz with 800 ns GI MCS index 15	19.3.5, 19.5	(CFHT AND CFAP AND NOT CFVHT):M (CFVHT AND CFAP):O (CFHT AND NOT CFAP):O	Yes ☐ No ☐ N/A ☐
HTP2.3.3	Transmit and receive support for 400 ns GI	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
*HTP2.3.4	Operation at 40 MHz	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5	Support for MCS with indices 16 to 76			
HTP2.3.5.1	Support for MCS with index 16	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.2	Support for MCS with index 17	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.3	Support for MCS with index 18	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.4	Support for MCS with index 19	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.5	Support for MCS with index 20	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.6	Support for MCS with index 21	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.7	Support for MCS with index 22	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.8	Support for MCS with index 23	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.9	Support for MCS with index 24	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.10	Support for MCS with index 25	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.11	Support for MCS with index 26	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.12	Support for MCS with index 27	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.13	Support for MCS with index 28	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.14	Support for MCS with index 29	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.15	Support for MCS with index 30	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.16	Support for MCS with index 31	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.17	Support for MCS with index 32 The use of MCS with index 32 is deprecated.	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.18	Support for MCS with index 33	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.19	Support for MCS with index 34	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.20	Support for MCS with index 35	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.21	Support for MCS with index 36	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.22	Support for MCS with index 37	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.23	Support for MCS with index 38	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.24	Support for MCS with index 39	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.25	Support for MCS with index 40	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.26	Support for MCS with index 41	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.27	Support for MCS with index 42	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.28	Support for MCS with index 43	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐

B.4.17.2 HT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
HTP2.5.1	HT-mixed format preamble	19.3.9.2	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.5.2	HT-greenfield preamble	19.3.9.5	HTP1.3:M	Yes ☐ No ☐ N/A ☐
HTP2.5.3	Extension HT Long Training fields (HT-ELTFs)	19.3.9.4.6	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.6	HT Data field definition and coding	19.3.11	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.6.1	Use of LDPC codes	19.3.11.7	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.7	Beamforming	19.3.12	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.8	Sounding PPDUs			
HTP2.8.1	HT preamble format for sounding PPDUs	19.3.13	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.8.2	Sounding with an NDP	19.3.13.2	HTM15:O	Yes ☐ No ☐ N/A ☐
HTP2.8.3	Sounding PPDU for calibration	19.3.13.3	HTM12.7:M	Yes ☐ No ☐ N/A ☐
HTP2.9	Channel numbering and channelization			
HTP2.9.1	Channel allocation for 20 MHz channels at 5 GHz	17.3.8.4	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.9.2	Channel allocation for 20 MHz channels at 2.4 GHz	18.4.3	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.9.3	Channel allocation for 40 MHz channels at 5 GHz	19.3.15.3	HTP2.3.4:M	Yes ☐ No ☐ N/A ☐
HTP2.9.4	Channel allocation for 40 MHz channels at 2.4 GHz	19.3.15.2	HTP2.3.4:M	Yes ☐ No ☐ N/A ☐
HTP2.10	PHY transmit specification			
HTP2.10.1	PHY transmit specification for 20 MHz channel	19.3.18	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.10.2	PHY transmit specification for 40 MHz channel	19.3.18	HTP2.3.4:M	Yes ☐ No ☐ N/A ☐
*HTP2.11	Space-time block coding (STBC)	19.3.11.9.2	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.12	PHY receive specification			
HTP2.12.1	PHY receive specification for 20 MHz channel	19.3.19	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.12.2	PHY receive specification for 40 MHz channel	19.3.19	HTP2.3.4:M	Yes ☐ No ☐ N/A ☐
HTP2.13	PPDU reception with RIFS	19.3.19.8	CFHT:M	Yes ☐ No ☐ N/A ☐

B.4.18 Tunneled direct link setup extensions

Item	Protocol capability	References	Status	Support
TDLS1	Tunneled direct link setup	9.6.12, 11.20	CFIndepSTA AND CFT-DLS:M	Yes ☐ No ☐ N/A ☐
TDLS1.1	TDLS setup	9.4.2.60, 9.6.12.2, 9.6.12.3, 9.6.12.4, 11.20.4	CFIndepSTA AND CFT-DLS:M	Yes ☐ No ☐ N/A ☐
TDLS1.2	TDLS teardown	9.4.2.60, 9.6.12.5, 11.20.5	CFIndepSTA AND CFT-DLS:M	Yes ☐ No ☐ N/A ☐
TDLS1.3	TPK handshake	12.7.8	CFIndepSTA AND CFT-DLS:M	Yes ☐ No ☐ N/A ☐
TDLS1.4	TDLS peer PSM	9.4.2.60, 9.4.2.61, 9.6.12.9, 9.6.12.10, 11.2.3.11	CFIndepSTA AND CFT-DLS:O	Yes ☐ No ☐ N/A ☐
TDLS 1.5	TPU	9.4.2.60, 9.4.2.63, 9.4.2.64, 9.6.12.6, 9.6.12.11, 11.2.3.12	CFIndepSTA AND CFT-DLS:O	Yes ☐ No ☐ N/A ☐
TDLS 1.6	TDLS Channel Switching	9.4.2.60, 9.4.2.62, 9.6.12.7, 9.6.12.8, 11.20.6	CFIndepSTA AND CFMD AND CFOC AND CFTDLS:O	Yes ☐ No ☐ N/A ☐
TDLS1.7	TDLS Discovery	9.4.2.60, 9.6.7.17, 9.6.12.12, 11.20.3	CFIndepSTA AND CFMD AND CFOC AND CFTDLS:O	Yes ☐ No ☐ N/A ☐

B.4.19 WNM extensions

Item	Protocol capability	References	Status	Support
WNM1	Extended Capabilities element	9.4.2.25	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM2	STA Statistics (Triggered) and Multicast Diagnostics	11.10.8	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM2.1	Protocol for Triggered Measurements	11.10.8	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM2.2	Triggered STA Statistics	9.4.2.19.9, 9.4.2.20.9, 9.6.6.2, 9.6.6.3, 11.10.9.5	CFWNM:O	Yes ☐ No ☐ N/A ☐

B.4.19 WNM extensions *(continued)*

Item	Protocol capability	References	Status	Support
WNM2.3	Multicast Diagnostics	9.4.2.19.13, 9.4.2.20.12, 9.6.6.2, 9.6.6.3, 11.10.19	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM3	Event	11.21.2	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM3.1	Event Request frame	9.4.2.65, 9.6.13.2	(CFWNM AND CFAP):M	Yes ☐ No ☐ N/A ☐
WNM3.2	Event Report frame	9.4.2.66, 9.6.13.3	(CFWNM AND CFInde-pSTA):M	Yes ☐ No ☐ N/A ☐
WNM4	Diagnostic	11.21.3	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM4.1	Diagnostic Request frame	9.4.2.67, 9.6.13.4	(CFWNM AND CFAP):M	Yes ☐ No ☐ N/A ☐
WNM4.2	Diagnostic Report frame	9.4.2.68, 9.6.13.5	(CFWNM AND CFInde-pSTA):M	Yes ☐ No ☐ N/A ☐
WNM4.3	Configuration Profile Diagnostic Type	9.4.2.68.3, 11.21.3.2	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM4.4	Manufacturer Information STA Report Diagnostic Type	9.4.2.68.2, 11.21.3.3	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM4.5	Association Diagnostic Type	9.4.2.67.2, 9.4.2.68.4, 11.21.3.4	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM4.6	IEEE 802.1X Authentication Diagnostic Type	9.4.2.67.3, 9.4.2.68.5, 11.21.3.5	(CFWNM AND PC34):M	Yes ☐ No ☐ N/A ☐
WNM5	Location	9.4.2.69, 11.21.4	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM5.1	Location Civic request/report	11.10.9.9	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM5.2	Location Identifier request/report	11.10.9.10	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM5.3	Location Track Notification	9.6.7.18, 11.21.4	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM5.3.1	Time of Departure Notifications	9.4.2.69, 11.21.4	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM5.3.2	Motion Detection Notifications	9.4.2.69, 11.21.4	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM5.4	Location Configuration Request frame	9.4.2.69, 9.6.13.6	CFWNM:M	Yes ☐ No ☐ N/A ☐
WNM5.4.1	Normal Indication	9.4.2.69, 9.6.13.6	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM5.4.2	Motion Indication	9.4.2.69, 9.6.13.6	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM5.5	Location Configuration Response frame	9.4.2.69, 9.6.13.7	CFWNM:M	Yes ☐ No ☐ N/A ☐

B.4.19 WNM extensions *(continued)*

Item	Protocol capability	References	Status	Support
*WNM6	Multiple BSSID Support	11.1.3.8, 11.1.4, 11.10.14	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM6.1	Multiple BSSID element	9.4.2.44	WNM6:M	Yes ☐ No ☐ N/A ☐
WNM6.2	Multiple BSSID-Index element	9.4.2.72	WNM6:M	Yes ☐ No ☐ N/A ☐
WNM7	BSS transition management	11.21.7	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM7.1	Neighbor Report element	9.4.2.35	(CFWNM AND CFAP):M	Yes ☐ No ☐ N/A ☐
WNM7.2	BSS Transition Management Query frame	9.6.13.8	(CFWNM AND CFAP):M	Yes ☐ No ☐ N/A ☐
WNM7.3	BSS Transition Management Request frame	9.6.13.9	(CFWNM AND CFIndepSTA):M	Yes ☐ No ☐ N/A ☐
WNM7.4	BSS Transition Management Response frame	9.6.13.10	(CFWNM AND CFIndepSTA):M	Yes ☐ No ☐ N/A ☐
*WNM8	FMS	11.2.3.13	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM8.1	FMS Request frame	9.6.13.11	(CFIndepSTA AND WNM8):M	Yes ☐ No ☐ N/A ☐
WNM8.2	FMS Response frame	9.6.13.12	(CFAP AND WNM8):M	Yes ☐ No ☐ N/A ☐
WNM9	Proxy ARP	11.21.14	CFWNM:O	Yes ☐ No ☐ N/A ☐
*WNM10	Colocated Interference Reporting	11.21.10	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM10.1	Colocated Interference Request frame	9.6.13.13	WNM10:M	Yes ☐ No ☐ N/A ☐
WNM10.2	Colocated Interference Report frame	9.6.13.14	WNM10:M	Yes ☐ No ☐ N/A ☐
*WNM11	BSS max idle period	11.21.13	(CFWNM OR CFS1G):M	Yes ☐ No ☐ N/A ☐
WNM11.1	BSS Max Idle Period element	9.4.2.77	WNM11:M	Yes ☐ No ☐ N/A ☐
*WNM12	TFS	11.21.12	CFWNM:O	Yes ☐ No ☐ N/A ☐
WNM12.1	TFS Request frame	9.4.2.78, 9.6.13.15	WNM12:M	Yes ☐ No ☐ N/A ☐
WNM12.2	TFS Response frame	9.4.2.79, 9.6.13.16	WNM12:M	Yes ☐ No ☐ N/A ☐
WNM12.3	TFS Notify frame	9.6.13.17	(CFAP AND WNM12):M (CFIndepSTA AND WNM12):O	Yes ☐ No ☐ N/A ☐

B.4.20 Interworking (IW) with external networks extensions *(continued)*

Item	Protocol capability	References	Status	Support
IW2.4	GAS Initial Response frame	9.6.7.13	IW2:M	Yes ☐ No ☐ N/A ☐
IW2.5	GAS Comeback Request frame	9.6.7.14	IW2:M	Yes ☐ No ☐ N/A ☐
IW2.6	GAS Comeback Response frame	9.6.7.16	IW2:M	Yes ☐ No ☐ N/A ☐
IW2.7	Group Addressed GAS Request frame	9.6.7.14	O	Yes ☐ No ☐ N/A ☐
IW2.8	Group Addressed GAS Response frame	9.6.7.16	O EBCS1:M	Yes ☐ No ☐ N/A ☐
IW2.9	Retransmission of a query response fragment	11.22.3.2.1	O	Yes ☐ No ☐ N/A ☐
*IW3	QoS Mapping from External Networks	10.23.4.2, 10.23.4.3, 11.22.9	CFIW:O	Yes ☐ No ☐ N/A ☐
IW3.1	QoS Map element	9.4.2.93	IW3:M	Yes ☐ No ☐ N/A ☐
IW3.2	Transport of QoS Map	11.22.9	IW3:M	Yes ☐ No ☐ N/A ☐
IW3.3	QoS Map Configure	9.6.3.6	IW3:M	Yes ☐ No ☐ N/A ☐
*IW4	MIS Support	6.4, 11.22.4	CFIW:O	Yes ☐ No ☐ N/A ☐
IW4.1	MAC state generic convergence function support	6.4	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.2	Informational events	6.6.5	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.3	ESS status reporting	6.6.7	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.4	Network configuration	6.6.8	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.5	Network events	6.6.9	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.6	Network command interface	6.6.10	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.7	Mobility management	6.6.11	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.8	Network configuration	6.6.8	IW4:M	Yes ☐ No ☐ N/A ☐
IW5	Extended channel switching enabled	9.4.2.56, 11.1.4	(CF3G6 AND DSE9):M	Yes ☐ No ☐ N/A ☐
IW6	Expedited Bandwidth Request	9.4.2.92	CFIW:O	Yes ☐ No ☐ N/A ☐
IW7	SSPN Interface	11.22.5	CFIW:O	Yes ☐ No ☐ N/A ☐

B.4.21 Mesh protocol capabilities

B.4.21.1 General mesh support

Item	Protocol capability	Reference	Status	Support
*MP1	Support of mesh capability	4.3.24, 14.1	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP1.1	Mesh BSS scanning	14.3.2, 14.3.6	MP1:M	Yes ☐ No ☐ N/A ☐
MP1.2	Candidate peer mesh STA determination	14.3.7	MP1:M	Yes ☐ No ☐ N/A ☐
MP1.3	Active mesh profile determination	14.3.3, 14.3.4	MP1:M	Yes ☐ No ☐ N/A ☐
MP1.4	Establishing a mesh BSS	14.3.8	MP1:M	Yes ☐ No ☐ N/A ☐
MP1.5	Becoming a member of a mesh BSS	14.3.8	MP1:M	Yes ☐ No ☐ N/A ☐
MP1.6	Announcement of mesh profile and supplemental information for the mesh discovery	14.3.3, 14.3.5	MP1:M	Yes ☐ No ☐ N/A ☐
*MP2	Mesh peering management (MPM) framework	14.4	CFMBSS: M	Yes ☐ No ☐ N/A ☐
*MP2.1	Mesh peering management (MPM) protocol	14.4	MP2:M	Yes ☐ No ☐ N/A ☐
MP2.1.1	Processing of Mesh Peering Open frame	14.4.6	MP2.1:M	Yes ☐ No ☐ N/A ☐
MP2.1.2	Processing of Mesh Peering Confirm frame	14.4.7	MP2.1:M	Yes ☐ No ☐ N/A ☐
MP2.1.3	Processing of Mesh Peering Close frame	14.4.8	MP2.1:M	Yes ☐ No ☐ N/A ☐
MP2.1.4	MPM finite state machine	14.5	MP2.1:M	Yes ☐ No ☐ N/A ☐
*MP2.2	Authenticated mesh peering exchange (AMPE)	14.6	MP2:O	Yes ☐ No ☐ N/A ☐
MP2.2.1	Mesh authentication using SAE	12.4, 14.4.3	MP2.2:M	Yes ☐ No ☐ N/A ☐
MP2.2.2	Mesh authentication using IEEE Std 802.1X	4.10, 14.4.3	MP2.2:O	Yes ☐ No ☐ N/A ☐
MP2.2.3	Protected mesh peering management frame processing	14.6.3, 14.6.3	MP2.2:M	Yes ☐ No ☐ N/A ☐
MP2.2.4	Mesh pairwise master key security association (PMKSA) caching	12.6.10	MP2.2:M	Yes ☐ No ☐ N/A ☐
MP2.2.5	AMPE finite state machine	14.6.6	MP2.2:M	Yes ☐ No ☐ N/A ☐
MP2.2.6	MGTK distribution	14.6.4	MP2.2:M	Yes ☐ No ☐ N/A ☐
MP2.2.7	MGTK update	14.7	MP2.2:O	Yes ☐ No ☐ N/A ☐
MP3	Mesh STA beaconing	14.14.3	CFMBSS: M	Yes ☐ No ☐ N/A ☐
*MP4	Mesh STA synchronization	14.14.2	CFMBSS: M	Yes ☐ No ☐ N/A ☐
*MP4.1	Neighbor offset synchronization method	14.14.2	MP4:M	Yes ☐ No ☐ N/A ☐
MP4.1.1	Calculation of TSF offset	14.14.2.2.2	MP4.1:M	Yes ☐ No ☐ N/A ☐

B.4.21.1 General mesh support *(continued)*

Item	Protocol capability	Reference	Status	Support
MP4.1.2	Clock drift adjustment	14.14.2.2.3	MP4.1:M	Yes ☐ No ☐ N/A ☐
*MP4.2	Mesh beacon collision avoidance (MBCA)	14.14.4	MP4:O	Yes ☐ No ☐ N/A ☐
MP4.2.1	Beacon timing advertisement	14.14.4.2	MP4.2:M	Yes ☐ No ☐ N/A ☐
MP4.2.2	TBTT selection	14.14.4.3	MP4.2:M	Yes ☐ No ☐ N/A ☐
MP4.2.3	TBTT adjustment	14.14.4.4	MP4.2:M	Yes ☐ No ☐ N/A ☐
MP4.2.4	Frame transmission across reported TBTT	14.14.4.5	MP4.2:O	Yes ☐ No ☐ N/A ☐
MP4.2.5	Delayed beacon transmission	14.14.4.6	MP4.2:O	Yes ☐ No ☐ N/A ☐
*MP5	MCCA	10.24.3	CFMBSS: O	Yes ☐ No ☐ N/A ☐
MP5.1	MCCAOP advertisement	10.24.3.7	MP5:M	Yes ☐ No ☐ N/A ☐
MP5.2	Neighbor MCCAOP recognition	10.24.3.4, 10.24.3.5	MP5:M	Yes ☐ No ☐ N/A ☐
MP5.3	MCCAOP setup	10.24.3.6	MP5:M	Yes ☐ No ☐ N/A ☐
MP5.4	Access during MCCAOPs	10.24.3.9	MP5:M	Yes ☐ No ☐ N/A ☐
MP5.5	MCCAOP teardown	10.24.3.8	MP5:M	Yes ☐ No ☐ N/A ☐
*MP6	Intra mesh congestion control	14.13	CFMBSS: O	Yes ☐ No ☐ N/A ☐
MP6.1	Local congestion monitoring and detection	14.13	MP6:M	Yes ☐ No ☐ N/A ☐
MP6.2	Congestion control signaling	14.13	MP6:M	Yes ☐ No ☐ N/A ☐
MP6.3	Local rate control	14.13	MP6:M	Yes ☐ No ☐ N/A ☐
*MP7	MBSS channel switching procedure	11.8.8, 11.9.3	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP7.1	Transmission of channel switch advertisement	11.8.8, 11.9.3	MP7:M	Yes ☐ No ☐ N/A ☐
MP7.2	Propagation of channel switch advertisement	11.8.8, 11.9.3	MP7:M	Yes ☐ No ☐ N/A ☐
*MP8	Mesh power save operation (operation in light or deep sleep mode)	14.15	CFMBSS: O	Yes ☐ No ☐ N/A ☐
MP8.1	Link-specific mesh power management mode setting	14.15.2.2, 14.15.8	MP8:M	Yes ☐ No ☐ N/A ☐
MP8.2	Nonpeer mesh power management mode setting	14.15.2.3	MP8:M	Yes ☐ No ☐ N/A ☐
MP8.3	Light sleep mode operation	14.15.8.4	MP8:M	Yes ☐ No ☐ N/A ☐
MP8.4	Deep sleep mode operation	14.15.8.5	MP8:M	Yes ☐ No ☐ N/A ☐
MP8.5	STA power state transitions	14.15.3	MP8:M	Yes ☐ No ☐ N/A ☐
MP8.6	Mesh awake window operation	14.15.6	MP8:M	Yes ☐ No ☐ N/A ☐
*MP9	Mesh power save support	14.15	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP9.1	TIM transmission	14.15.4	MP9:M	Yes ☐ No ☐ N/A ☐

B.4.21.1 General mesh support *(continued)*

Item	Protocol capability	Reference	Status	Support
MP9.2	Link-specific mesh power management modes determination	14.15.2	MP9:M	Yes ☐ No ☐ N/A ☐
MP9.3	Group addressed frame transmission	14.15.7	MP9:M	Yes ☐ No ☐ N/A ☐
MP9.4	Frame transmission to a mesh STA in light sleep mode	14.15.7, 14.15.9	MP9:M	Yes ☐ No ☐ N/A ☐
MP9.5	Frame transmission to a mesh STA in deep sleep mode	14.15.7, 14.15.9	MP9:M	Yes ☐ No ☐ N/A ☐
*MP10	Link metric computation	14.10	CFMBSS:M	Yes ☐ No ☐ N/A ☐
MP10.1	Airtime link metric computation		MP10:M	Yes ☐ No ☐ N/A ☐
MP10.2	High PHY rate airtime link metric computation	14.10.2	MP10:O	Yes ☐ No ☐ N/A ☐
*MP11	Link metric reporting	14.9.3	CFMBSS:M	Yes ☐ No ☐ N/A ☐
MP11.1	Autonomous link metric reporting	14.9.3	MP11:O	Yes ☐ No ☐ N/A ☐
MP11.2	Link metric reporting upon request	14.9.3	MP11:M	Yes ☐ No ☐ N/A ☐
*MP12	Proxy operation	14.12.4	CFMBSS:O	Yes ☐ No ☐ N/A ☐
MP12.1	Data forwarding at proxy mesh gate	14.12.3	MP12:M	Yes ☐ No ☐ N/A ☐
MP12.2	Maintenance of proxy information	14.12.4.2	CFMBSS:M	Yes ☐ No ☐ N/A ☐
MP12.3	Proxy update using Proxy Update and Proxy Update Confirmation frames	14.12.4	CFMBSS:M	Yes ☐ No ☐ N/A ☐
MP12.4	Proxy update using HWMP Mesh Path Selection frames	14.11.9, 14.11.10, 14.11.11	HWM1:M	Yes ☐ No ☐ N/A ☐
*MP13	Gate announcement	14.12.2	CFMBSS:O	Yes ☐ No ☐ N/A ☐
MP13.1	GANN transmission	14.12.2	MP13:O	Yes ☐ No ☐ N/A ☐
MP13.2	GANN reception and propagation	14.12.2	CFMBSS:M	Yes ☐ No ☐ N/A ☐
*MP14	Mesh Control field handling	9.2.4.8.3	CFMBSS:M	Yes ☐ No ☐ N/A ☐
MP14.1	Address Extension recognition	9.2.4.8.3, 9.3.5	MP14:M	Yes ☐ No ☐ N/A ☐
MP14.2	Mesh TTL handling	9.2.4.8.3, 10.37.3, 10.37.4, 10.37.5	MP14:M	Yes ☐ No ☐ N/A ☐
MP14.3	Mesh Sequence Number handling	9.2.4.8.3, 10.37.3, 10.37.4, 10.37.5, 10.37.6	MP14:M	Yes ☐ No ☐ N/A ☐
*MP15	MSDU/MMPDU forwarding	10.37	CFMBSS:O	Yes ☐ No ☐ N/A ☐
MP15.1	Individually addressed MSDU forwarding	10.37.3	MP15:M	Yes ☐ No ☐ N/A ☐

B.4.21.1 General mesh support *(continued)*

Item	Protocol capability	Reference	Status	Support
MP15.2	Group addressed MSDU forwarding	10.37.4	MP15:M	Yes ☐ No ☐ N/A ☐
MP15.3	MMPDU forwarding	10.37.5	MP15:M	Yes ☐ No ☐ N/A ☐
MP15.4	Detection of duplicate MSDUs/ MMPDUs	10.37.6	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP15.5	Treatment of unknown destination	10.37.8	CFMBSS: M	Yes ☐ No ☐ N/A ☐

B.4.21.2 HWMP path selection protocol capabilities

Item	Protocol capability	Reference	Status	Support
*HWM1	Hybrid wireless mesh protocol (HWMP)	14.11	CFMBSS:M	Yes ☐ No ☐ N/A ☐
*HWM1.1	On-demand path selection	14.11.3	HWM1:M	Yes ☐ No ☐ N/A ☐
HWM1.1.1	PREQ processing for on-demand path selection	14.11.9	HWM1.1:M	Yes ☐ No ☐ N/A ☐
HWM1.1.2	PREP processing for on-demand path selection	14.11.10	HWM1.1:M	Yes ☐ No ☐ N/A ☐
HWM1.1.3	PERR processing for on-demand path selection	14.11.11	HWM1.1:M	Yes ☐ No ☐ N/A ☐
*HWM1.2	Proactive tree building	14.11.4	HWM1:M	Yes ☐ No ☐ N/A ☐
HWM1.2.1	PREQ processing for proactive tree building	14.11.9	HWM1.2:M	Yes ☐ No ☐ N/A ☐
HWM1.2.2	PREP processing for proactive tree building	14.11.10	HWM1.2:M	Yes ☐ No ☐ N/A ☐
HWM1.2.3	PERR processing for proactive tree building	14.11.11	HWM1.2:M	Yes ☐ No ☐ N/A ☐
HWM1.2.4	RANN processing	14.11.12	HWM1.2:M	Yes ☐ No ☐ N/A ☐
HWM2	Maintenance of forwarding information	10.37.2, 14.11.8.4	MP15:M	Yes ☐ No ☐ N/A ☐

B.4.22 QMF extensions

Item	Protocol capability	References	Status	Support
QMF1	Extended Capabilities element	9.4.2.25	CFQMF:M	Yes ☐ No ☐ N/A ☐
QMF2	Channel access procedures for QMFs	10.2.3.2	CFQMF:M	Yes ☐ No ☐ N/A ☐
QMF3	Duplicate detection and recovery for QMFs	10.3.2.14	CFQMF:M	Yes ☐ No ☐ N/A ☐
QMF4	QMF policy Configuration	11.24.2	CFQMF:M	Yes ☐ No ☐ N/A ☐

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

B.4.22 QMF extensions *(continued)*

Item	Protocol capability	References	Status	Support
QMF5	Interpreting QMF priority	11.24.3	CFQMF:M	Yes ☐ No ☐ N/A ☐
QMF6	CCMP cryptographic encapsulation for QMFs	12.5.2.3	(CFQMF AND PC34.1.10):M	Yes ☐ No ☐ N/A ☐

B.4.23 RobustAVT extensions

Item	Protocol capability	References	Status	Support
AVT1	Extended Capabilities element	9.4.2.25	CFAVT:M	Yes ☐ No ☐ N/A ☐
AVT2	Groupcast with Retries (GCR)	11.21.16.3.2, 11.21.16.3.3, 11.21.16.3.4, 11.21.16.3.5, 11.21.16.3.6	(CFHT AND CFAVT AND WNM19):M	Yes ☐ No ☐ N/A ☐
			(CFTVHT AND CFAVT AND WNM19):M	
			(CFAP AND CFAVT AND WNM19 AND HTM4.4):M	Yes ☐ No ☐ N/A ☐
AVT2.1	Advanced GCR	9.4.2.25, 10.25.8, 11.21.16.3.7, 11.21.16.3.8	(CFAVT AND QB5):O	Yes ☐ No ☐ N/A ☐
AVT3	Alternate EDCA transmit queues	10.2.3.2	CFAVT AND CFHT:O	Yes ☐ No ☐ N/A ☐
*AVT4	Stream Classification Service (SCS)	11.25.2	CFAVT:O	Yes ☐ No ☐ N/A ☐
AVT4.1	SCS Request frame	9.6.18.2	AVT4:M	Yes ☐ No ☐ N/A ☐
AVT4.2	SCS Response frame	9.6.18.3	AVT4:M	Yes ☐ No ☐ N/A ☐
AVT4.3	Drop eligibility indicator (DEI)	11.25.2	(CFHT AND AVT4):M	Yes ☐ No ☐ N/A ☐
			(CFTVHT AND AVT4):M	
*ATV5	Overlapping Basic Service Set (OBSS) Management	9.4.2.25, 11.26	(CFAP AND (QP2 OR QD6) AND CFAVT):M	Yes ☐ No ☐ N/A ☐
*ATV5.1	AP PeerKey	12.10	AVT5:O	Yes ☐ No ☐ N/A ☐
*ATV5.2	QLoad Report	11.26.2	AVT5:M	Yes ☐ No ☐ N/A ☐
AVT5.2.1	QLoad Report element	9.4.2.121	AVT5.2:M	Yes ☐ No ☐ N/A ☐
AVT5.2.2	QLoad Request frame	9.6.7.20	AVT5.2:M	Yes ☐ No ☐ N/A ☐
AVT5.2.3	QLoad Report frame	9.6.7.21	AVT5.2:M	Yes ☐ No ☐ N/A ☐
AVT5.2.4	Protected QLoad Report	9.6.7.21	(AVT5.2 AND AVT5.1):O	Yes ☐ No ☐ N/A ☐
*AVT5.3	HCCA TXOP Update Count element	9.4.2.122	(AVT5 AND QP2):O	Yes ☐ No ☐ N/A ☐
AVT5.3.1	HCCA TXOP Negotiation	11.26.3	AVT5.3:O	Yes ☐ No ☐ N/A ☐

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

B.4.23 RobustAVT extensions *(continued)*

Item	Protocol capability	References	Status	Support
AVT5.3.2	Protected HCCA TXOP Negotiation	11.26.3	(AVT5.3 AND ATV5.1):O	Yes ☐ No ☐ N/A ☐
AVT6	GCR for Mesh	9.4.2.25, 10.25.8, 11.21.16.3.6, 11.21.16.3.7	(WNM19 AND HTM4.4 AND CFHT AND CFAVT AND CFMBSS):O (WNM19 AND HTM4.4 AND CFTVHT AND CFAVT AND CFMBSS):O	Yes ☐ No ☐ N/A ☐

B.4.24 DMG features

B.4.24.1 DMG MAC features

Item	Protocol capability	References	Status	Support
	Are the following MAC protocol features supported?			
DMG-M1	DMG capabilities signaling			
DMG-M1.1	DMG Capabilities element	9.4.2.126	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M1.2	Signaling of STA capabilities in Probe Request, (Re)Association Request frames	9.3.3.5, 9.3.3.7, 9.3.3.9, 9.4.2.126	(CFDMG AND (CFSTAofAP OR CFIBSS OR CFPBSSnotPCP)):M	Yes ☐ No ☐ N/A ☐
DMG-M1.3	Signaling of STA and BSS capabilities in DMG Beacon, Probe Response, (Re)Association Response frames	9.3.3.6, 9.3.3.8, 9.3.3.10, 9.3.4.2, 9.4.2.126	(CFDMG AND (CFAP OR CFPCP)):M	Yes ☐ No ☐ N/A ☐
DMG-M2	Signaling of DMG operation	9.4.2.127	(CFDMG AND (CFAP OR CFPCP)):M	Yes ☐ No ☐ N/A ☐
DMG-M3	MSDU aggregation			
DMG-M3.1	Reception of Basic A-MSDUs	9.2.4.5, 9.3.2.2.2	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M3.2	Basic A-MSDU format	9.3.2.2.2	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M3.3	Basic A-MSDU content	9.3.2.2.2	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M3.4	Transmission of Basic A-MSDUs	9.2.4.5, 9.3.2.2.2	CFDMG:O	Yes ☐ No ☐ N/A ☐

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

B.4.24.1 DMG MAC features *(continued)*

Item	Protocol capability	References	Status	Support
*DMG-M3.5	Reception of Short A-MSDU	9.2.4.5, 9.3.2.2.2	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M3.6	Short A-MSDU format	9.3.2.2.4	(DMG-M3.5 OR DMG-M3.8):M	Yes ☐ No ☐ N/A ☐
DMG-M3.7	Short A-MSDU content	9.3.2.2.4	(DMG-M3.5 OR DMG-M3.8):M	Yes ☐ No ☐ N/A ☐
*DMG-M3.8	Transmission of Short A-MSDU	9.2.4.5, 9.3.2.2.4	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M3.9	Negotiation of Short A-MSDU usage	9.4.2.28	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M4	MPDU aggregation			
DMG-M4.1	Reception of A-MPDU	9.4.2.126.2, 10.12.2, 11.3	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M4.2	A-MPDU format	9.7.1	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M4.3	A-MPDU content	9.7.3	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M4.4	Transmission of A-MPDU	9.4.2.126.2, 10.12.2	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M5	A-PPDU aggregation	10.12-10.14		
*DMG-M5.1	Reception of A-PPDU	9.4.2.126.2	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M5.2	A-PPDU format	20.5.2, 20.5.2	(DMG-M5.1 OR DMG-M5.3):M	Yes ☐ No ☐ N/A ☐
*DMG-M5.3	Transmission of A-PPDU	9.4.2.126.2	CFDMG:O	Yes ☐ No ☐ N/A ☐
*DMG-M6	Reverse direction aggregation exchanges	9.4.2.126.2, 10.29	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M6.1	Constraints regarding responses	10.29.3	DMG-M6:M	Yes ☐ No ☐ N/A ☐
*DMG-M7	DMG channel access			
DMG-M7.1	ATI transmission			
DMG-M7.1.1	Transmission of request	10.38.3	CFDMG AND (CFAP OR CFPCP):O	Yes ☐ No ☐ N/A ☐
DMG-M7.1.2	Reception of request	10.38.3	CFDMG AND (CFSTAofAP OR CFPBSSnot-PCP):M	Yes ☐ No ☐ N/A ☐

B.4.24.1 DMG MAC features *(continued)*

Item	Protocol capability	References	Status	Support
DMG-M7.1.3	Transmission of response	10.38.3	CFDMG AND (CFSTAofAP OR CFPBSSnot-PCP):M	Yes ☐ No ☐ N/A ☐
DMG-M7.1.4	Reception of response	10.38.3	CFDMG AND (CFAP OR CFPCP):M	Yes ☐ No ☐ N/A ☐
DMG-M7.2	DTI transmission	10.38.4	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M7.3	Time allocation			
*DMG-M7.3.1	Service period (SP) allocation	9.4.2.130, 9.4.2.132, 9.4.2.136, 10.38.6.2	CFDMG AND (CFAP OR CFPCP):O	Yes ☐ No ☐ N/A ☐
*DMG-M7.3.2	CBAP allocation	9.4.2.130, 9.4.2.136, 10.38.6.2	CFDMG AND (CFAP OR CFPCP):O	Yes ☐ No ☐ N/A ☐
DMG-M7.3.3	Interpretation of allocation	9.4.2.130, 9.4.2.136, 10.38.5, 10.38.6.2	CFDMG AND (CFInfraSTA OR CFIBSS OR CFPCP OR CFPBSSnot-PCP):M	Yes ☐ No ☐ N/A ☐
*DMG-M7.4	Contention based access period	10.38.5, 10.38.6.2	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1	Distributed coordination function (DCF)			
DMG-M7.4.1.1	Network allocation vector (NAV) function	10.3.2.2, 10.3.4, 10.38.10	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1.2	Interframe space usage and timing	10.3.2.4, 10.3.4, 10.3.7	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1.3	Random backoff function	10.3.3	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1.4	DCF access procedure	10.3, 10.3.4.2, 10.3.4.5	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1.5	Random backoff procedure	10.3, 10.3.4.3	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1.6	Recovery procedures and retransmit limits	10.3.4.4	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1.7	Request to send (RTS)/DMG clear to send (DMG CTS) procedure	10.3.2.6, 10.3.2.9, 10.3.2.10, 10.38.10	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐

B.4.24.1 DMG MAC features *(continued)*

Item	Protocol capability	References	Status	Support
DMG-M7.4.1.8	Individually addressed MAC protocol data unit (MPDU) transfer	10.3.5	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1.9	Group addressed MPDU transfer	10.3.6	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1.10	MAC-level acknowledgment	10.3.2.3, 10.3.2.11	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1.11	Duplicate detection and recovery	10.3.2.14	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.2	Enhanced DCF (EDCA)			
*DMG-M7.4.2.1	Support for one transmit queue with AC_BE access category	10.2.3.2, 10.23.2.1	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.2.2	Support for four transmit queues with a separate channel access entity associated with each	10.2.3.2, 10.23.2.1	DMG-M7.4.2.1:O	Yes ☐ No ☐ N/A ☐
DMG-M7.4.2.3	AC_BE access category and differentiated channel access	10.23.2.2, 10.23.2.4, 10.23.2.12	DMG-M7.4.2.1:M	Yes ☐ No ☐ N/A ☐
DMG-M7.5	Pseudo-static allocation			
DMG-M7.5.1	Scheduling of pseudo-static allocation	9.4.2.111, 9.4.2.140, 10.38.6.2, 10.38.6.5, 11.4.12.2	DMG-M7.3.1:O	Yes ☐ No ☐ N/A ☐
DMG-M7.5.2	Operation within pseudo-static allocation	9.4.2.138, 9.4.2.140, 10.38.6.2, 10.38.6.4	CFDMG AND (CFAP OR CFSTAofAP OR CFPCP OR CFPBSSnot-PCP):M	Yes ☐ No ☐ N/A ☐
DMG-M7.6	Guard time	10.38.6.5	DMG-M7.3.1:M	Yes ☐ No ☐ N/A ☐
DMG-M7.7	DMG protected period			
*DMG-M7.7.1	Establishment of DMG protected period with RTS at source DMG STA	10.38.6.6	DMG-M7.3.1:O	Yes ☐ No ☐ N/A ☐
*DMG-M7.7.2	Establishment of DMG protected period using a DMG CTS frame at destination DMG STA	10.38.6.6	DMG-M7.3.1:M	Yes ☐ No ☐ N/A ☐
DMG-M7.7.3	Transmission of DMG DTS frame at destination DMG STA	10.38.6.6	DMG-M7.7.2:O	Yes ☐ No ☐ N/A ☐
DMG-M7.7.4	Reception of DMG DTS frame at source DMG STA	10.38.6.6	DMG-M7.7.1:M	Yes ☐ No ☐ N/A ☐
DMG-M7.8	Service period recovery	10.38.6.7	DMG-M7.3.1 AND (CFAP OR CFPCP):O	Yes ☐ No ☐ N/A ☐
DMG-M7.9	Dynamic allocation of service period	10.38.7

B.4.24.2 DMG PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
DMG-P1	PHY operating modes			
DMG-P1.1	Operation according to Clause 20	20	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-P2	PHY frame format			
*DMG-P2.1	DMG control mode format	20.4	CFDMG:M	Yes ☐ No ☐ N/A ☐
*DMG-P2.2	DMG SC mode format	20.5	CFDMG:M	Yes ☐ No ☐ N/A ☐
*DMG-P2.3	DMG low-power SC mode format. The DMG low-power SC mode is obsolete. Support for this mechanism might be removed in a later revision of the standard.	20.6	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-P2.4	Modulation and coding schemes (MCS)			
DMG-P2.4.1	MCS 0 of DMG control mode	20.4	DMG-P2.1:M	Yes ☐ No ☐ N/A ☐
DMG-P2.4.2	MCS 1-12 of DMG SC mode	20.5		
DMG-P2.4.2.1	MCS 1-4	20.5	DMG-P2.2:M	Yes ☐ No ☐ N/A ☐
DMG-P2.4.2.2	MCS 5-12	20.5	DMG-P2.2:O	Yes ☐ No ☐ N/A ☐
DMG-P2.4.2.3	π/2-8-PSK for MCS 10 and 11	20.5	DMG-P2.2:O	Yes ☐ No ☐ N/A ☐
DMG-P2.4.3	MCS 25-31 of DMG low-power SC mode The DMG low-power SC mode is obsolete. Support for this mechanism might be removed in a later revision of the standard.	20.6	DMG-P2.3:M	Yes ☐ No ☐ N/A ☐
DMG-P2.5	Common preamble format	20.3.6	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-P2.6	Use of LDPC codes	20.3.8	CFDMG:M	Yes ☐ No ☐ N/A ☐

B.4.25 Very high throughput (VHT) features

B.4.25.1 VHT MAC features

Item	Protocol capability	References	Status	Support
	Are the following MAC protocol features supported?			
VHTM1	VHT capabilities signaling			
VHTM1.1	VHT Capabilities element	9.4.2.156.1	CFVHT:M	Yes ☐ No ☐ N/A ☐

Copyright © 2025 IEEE. All rights reserved.

B.4.25.1 VHT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
VHTM1.2	Signaling of STA capabilities in Probe Request, (Re)Association Request frames	9.3.3.5, 9.3.3.7, 9.3.3.9, 9.4.2.156.1	(CFVHT AND CFIndep-STA):M (CFVHT AND CFMBSS):M	Yes ☐ No ☐ N/A ☐
VHTM1.3	Signaling of STA and BSS capabilities in Beacon, Probe Response, (Re)Association Response frames	9.3.3.2, 9.3.3.6, 9.3.3.8, 9.3.3.10, 9.4.2.156	(CFVHT AND CFAP):M (CFVHT AND CFMBSS):M	Yes ☐ No ☐ N/A ☐
VHTM2	Signaling of VHT operation	9.4.2.157	(CFVHT AND CFAP):M (CFVHT AND CFMBSS):M (CFVHT AND CFIBSS):M	Yes ☐ No ☐ N/A ☐
VHTM3	Link adaptation			
*VHTM3.1	Use of the VHT variant HT Control field for link adaptation in immediate response exchange.	9.2.4.6, 9.3.3.14, 10.31.3, 10.8	CFVHT:O, CFS1G:O	Yes ☐ No ☐ N/A ☐
VHTM4	Transmit beamforming			
*VHTM4.1	SU Beamformer Capable	9.4.2.156	CFVHT:O	Yes ☐ No ☐ N/A ☐
*VHTM4.2	SU Beamformee Capable	9.4.2.156	CFVHT:O	Yes ☐ No ☐ N/A ☐
*VHTM4.3	MU Beamformer Capable	9.4.2.156	CFAP AND VHTM4.1:O	Yes ☐ No ☐ N/A ☐
*VHTM4.4	MU Beamformee Capable	9.4.2.156	CFIndepSTA AND VHTM4.2:O	Yes ☐ No ☐ N/A ☐
VHTM4.5	Transmission of null data PPDU	10.35	VHTM4.1:M	Yes ☐ No ☐ N/A ☐
VHTM4.6	Reception of null data PPDU	10.35	VHTM4.2:M	
VHTM5	VHT Sounding Protocol			
VHTM5.1	VHT sounding protocol as SU beamformer	10.35.5	VHTM4.1:M	Yes ☐ No ☐ N/A ☐
VHTM5.2	VHT sounding protocol as SU beamformee	10.35.5	VHTM4.2:M	Yes ☐ No ☐ N/A ☐
VHTM5.3	VHT sounding protocol as MU beamformer	10.35.5	VHTM4.3:M	Yes ☐ No ☐ N/A ☐
VHTM5.4	VHT sounding protocol as MU beamformee	10.35.5	VHTM4.4:M	Yes ☐ No ☐ N/A ☐
VHTM6	TXOP Sharing			
VHTM6.1	Sharing of EDCA TXOP	10.23.2.7	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTM6.2	Use of Primary and Secondary AC	10.23.2.7	VHTM6.1:M	Yes ☐ No ☐ N/A ☐
VHTM7	VHT TXOP power saving	11.2.3.16	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTM8	BSS operation			
VHTM8.1	Use of primary 20 MHz, secondary 20 MHz, and secondary 40 MHz channels	10.3.2.7, 10.3.2.9	CFVHT:M	Yes ☐ No ☐ N/A ☐

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

B.4.25.1 VHT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
VHTM8.2	Use of secondary 80 MHz channels for 160 MHz and 80+80 MHz	11.38.1	(VHTP3.4 OR VHTP3.5):M	Yes ☐ No ☐ N/A ☐
VHTM8.3	CCA on primary 20 MHz, secondary 20 MHz, and secondary 40 MHz channels	11.38.5	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTM8.4	CCA on secondary 80 MHz channels for 160 MHz and 80+80 MHz	11.38.5	(VHTP3.4 OR VHTP3.5):M	Yes ☐ No ☐ N/A ☐
VHTM9	Group ID			
VHTM9.1	Transmission of Group ID Management frame	9.6.22.3	VHTM4.3:M	Yes ☐ No ☐ N/A ☐
VHTM9.2	Reception of Group ID Management frame	9.6.22.3	VHTM4.4:M	
VHTM10	Bandwidth signaling			
VHTM10.1	Support for non-HT bandwidth signaling and static operation	10.3.2.7	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTM10.2	Support for non-HT bandwidth signaling and dynamic operation	10.3.2.7	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTM11	S-MPDU format	10.12.7	CFVHT:M CGS1G:M	Yes ☐ No ☐ N/A ☐
VHTM12	Partial AID in VHT PPDU	10.19	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTM13	Extended BSS Load element	9.4.2.158	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTM13.1	Transmission of the Extended BSS Load element	9.4.2.158	CFAP AND CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTM14	Quiet Channel element			
VHTM14.1	Transmission of Quiet Channel element by an AP or mesh station in Beacon and Probe Response frames	9.3.3.2, 9.3.3.10, 9.4.2.163, 11.8.3	(CFAP OR CFMBSS) AND CFSM AND CFVHT AND VHTP3.4:O	Yes ☐ No ☐ N/A ☐
VHTM14.2	Transmission of Quiet Channel element by an independent station or mesh station in Beacon and Probe Response frames	9.3.3.2, 9.3.3.10, 9.4.2.163, 11.8.3	(CFIndepSTA OR CFMBSS) AND CFSM AND CFVHT AND VHTP3.4:O	Yes ☐ No ☐ N/A ☐
VHTM14.3	Reception of Quiet Channel element by an independent station or mesh station in Beacon and Probe Response frames	9.3.3.2, 9.3.3.10, 9.4.2.163, 11.8.3	(CFIndepSTA OR CFMBSS) AND CFSM AND CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTM15	Space-time block coding (STBC)			
VHTM15.1	STBC operation	9.4.2.156, 10.16	VHTP9:M	Yes ☐ No ☐ N/A ☐
VHTM15.2	Transmission of at least 2×1 STBC	9.4.2.156.2	VHTP9:O.1	Yes ☐ No ☐ N/A ☐
VHTM15.3	Reception of 1 STBC spatial stream	9.4.2.156.2	VHTP9:O.1	Yes ☐ No ☐ N/A ☐
VHTM15.4	Reception of 2 STBC spatial streams	9.4.2.156.2	VHTM15.3:O	Yes ☐ No ☐ N/A ☐
VHTM15.5	Reception of 3 STBC spatial streams	9.4.2.156.2	VHTM15.4:O	Yes ☐ No ☐ N/A ☐

B.4.25.1 VHT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
VHTM15.6	Reception of 4 STBC spatial streams	9.4.2.156.2	VHTM15.5:O	Yes ☐ No ☐ N/A ☐
VHTM16	Highest Supported Long GI Data Rate			
VHTM16.1	Tx Highest Supported Long GI Data Rate	9.4.2.156.3	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTM16.2	Rx Highest Supported Long GI Data Rate	9.4.2.156.3	CFVHT:M	Yes ☐ No ☐ N/A ☐
NOTE—Required support for MCS might be limited by the declaration of Tx and Rx Highest Supported Long GI Data Rates.				

B.4.25.2 VHT PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
VHTP1	PHY operating modes			
VHTP1.1	Operation according to Clause 17 (OFDM) and/or Clause 19 (high throughput)	21.1.4	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP2	VHT format	21.3.2	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP3	BSS bandwidth			
VHTP3.1	20 MHz operation	11.38.1	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP3.2	40 MHz operation	11.38.1	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP3.3	80 MHz operation	11.38.1	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP3.4	160 MHz operation	11.38.1	CFVHT:O VHTP3.5:M	Yes ☐ No ☐ N/A ☐
VHTP3.5	80+80 MHz operation	11.38.1	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP4	Bandwidth indication	17.3.5.5	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP5	PHY timing parameters			
VHTP5.1	Values in 20 MHz channel	21.3.6	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP5.2	Values in 40 MHz channel	21.3.6	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP5.3	Values in 80 MHz channel	21.3.6	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP5.4	Values in 160 MHz channel	21.3.6	VHTP3.4:M	Yes ☐ No ☐ N/A ☐
VHTP5.5	Values in 80+80 MHz channel	21.3.6	VHTP3.5:M	Yes ☐ No ☐ N/A ☐
VHTP6	VHT preamble	21.3.8	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP7	Use of LDPC Code	21.3.10.5.4	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8	Modulation and coding schemes (MCS)			
VHTP8.1	CBW20, CBW40, and CBW80	21.5

B.4.25.2 VHT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
VHTP8.1.1	VHT-MCS with Index 0-7 and $N_{SS} = 1$	21.5	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP8.1.2	VHT-MCS with Index 0-8 and $N_{SS} = 1$	21.5	VHTP8.1.1:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.3	VHT-MCS with Index 0-9 and $N_{SS} = 1$	21.5	VHTP8.1.2:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.4	VHT-MCS with Index 0-7 and $N_{SS} = 2$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.5	VHT-MCS with Index 0-8 and $N_{SS} = 2$	21.5	VHTP8.1.4:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.6	VHT-MCS with Index 0-9 and $N_{SS} = 2$	21.5	VHTP8.1.5:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.7	VHT-MCS with Index 0-7 and $N_{SS} = 3$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.8	VHT-MCS with Index 0-8 and $N_{SS} = 3$	21.5	VHTP8.1.7:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.9	VHT-MCS with Index 0-9 and $N_{SS} = 3$	21.5	VHTP8.1.7:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.10	VHT-MCS with Index 0-7 and $N_{SS} = 4$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.11	VHT-MCS with Index 0-8 and $N_{SS} = 4$	21.5	VHTP8.1.10:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.12	VHT-MCS with Index 0-9 and $N_{SS} = 4$	21.5	VHTP8.1.11:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.13	VHT-MCS with Index 0-7 and $N_{SS} = 5$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.14	VHT-MCS with Index 0-8 and $N_{SS} = 5$	21.5	VHTP8.1.13:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.15	VHT-MCS with Index 0-9 and $N_{SS} = 5$	21.5	VHTP8.1.14:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.16	VHT-MCS with Index 0-7 and $N_{SS} = 6$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.17	VHT-MCS with Index 0-8 and $N_{SS} = 6$	21.5	VHTP8.1.16:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.18	VHT-MCS with Index 0-9 and $N_{SS} = 6$	21.5	VHTP8.1.17:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.19	VHT-MCS with Index 0-7 and $N_{SS} = 7$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.20	VHT-MCS with Index 0-8 and $N_{SS} = 7$	21.5	VHTP8.1.19:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.21	VHT-MCS with Index 0-9 and $N_{SS} = 7$	21.5	VHTP8.1.20:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.22	VHT-MCS with Index 0-7 and $N_{SS} = 8$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.23	VHT-MCS with Index 0-8 and $N_{SS} = 8$	21.5	VHTP8.1.22:O	Yes ☐ No ☐ N/A ☐
VHTP8.1.24	VHT-MCS with Index 0-9 and $N_{SS} = 8$	21.5	VHTP8.1.23:O	Yes ☐ No ☐ N/A ☐

B.4.25.2 VHT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
VHTP8.2	CBW160	21.5		
VHTP8.2.1	VHT-MCS with Index 0-7 and $N_{SS} = 1$	21.5	VHTP3.4:M	Yes ☐ No ☐ N/A ☐
VHTP8.2.2	VHT-MCS with Index 0-8 and $N_{SS} = 1$	21.5	VHTP8.2.1:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.3	VHT-MCS with Index 0-9 and $N_{SS} = 1$	21.5	VHTP8.2.2:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.4	VHT-MCS with Index 0-7 and $N_{SS} = 2$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.5	VHT-MCS with Index 0-8 and $N_{SS} = 2$	21.5	VHTP8.2.4:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.6	VHT-MCS with Index 0-9 and $N_{SS} = 2$	21.5	VHTP8.2.5:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.7	VHT-MCS with Index 0-7 and $N_{SS} = 3$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.8	VHT-MCS with Index 0-8 and $N_{SS} = 3$	21.5	VHTP8.2.7:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.9	VHT-MCS with Index 0-9 and $N_{SS} = 3$	21.5	VHTP8.2.8:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.10	VHT-MCS with Index 0-7 and $N_{SS} = 4$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.11	VHT-MCS with Index 0-8 and $N_{SS} = 4$	21.5	VHTP8.2.10:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.12	VHT-MCS with Index 0-9 and $N_{SS} = 4$	21.5	VHTP8.2.11:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.13	VHT-MCS with Index 0-7 and $N_{SS} = 5$	21.5	CFVHT9:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.14	VHT-MCS with Index 0-8 and $N_{SS} = 5$	21.5	VHTP8.2.13:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.15	VHT-MCS with Index 0-9 and $N_{SS} = 5$	21.5	VHTP8.2.14:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.16	VHT-MCS with Index 0-7 and $N_{SS} = 6$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.17	VHT-MCS with Index 0-8 and $N_{SS} = 6$	21.5	VHTP8.2.16:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.18	VHT-MCS with Index 0-9 and $N_{SS} = 6$	21.5	VHTP8.2.17:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.19	VHT-MCS with Index 0-7 and $N_{SS} = 7$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.20	VHT-MCS with Index 0-8 and $N_{SS} = 7$	21.5	VHTP8.2.19:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.21	VHT-MCS with Index 0-9 and $N_{SS} = 7$	21.5	VHTP8.2.20:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.22	VHT-MCS with Index 0-7 and $N_{SS} = 8$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.2.23	VHT-MCS with Index 0-8 and $N_{SS} = 8$	21.5	VHTP8.2.22:O	Yes ☐ No ☐ N/A ☐

B.4.25.2 VHT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
VHTP8.3.23	VHT-MCS with Index 0-8 and $N_{SS} = 8$	21.5	VHTP8.3.22:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.24	VHT-MCS with Index 0-9 and $N_{SS} = 8$	21.5	VHTP8.3.23:O	Yes ☐ No ☐ N/A ☐
VHTP8.4	Transmit and receive support for 400 ns GI	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP9	Space-time block coding (STBC)	21.3.10.9.4	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP10	Non-HT duplicate format	21.3.10.12	CFVHT:M	Yes ☐ No ☐ N/A ☐

B.4.26 TVWS functions

Item	Protocol capability	References	Status	Support
TVWS 1	Fixed STA TVWS operation	11.42, Annex D, E.2.5	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVWS 2	Master STA TVWS operation	11.42, 11.42.2, Annex D, E.2.5	CFTVHT:O	Yes ☐ No ☐ N/A ☐
*TVWS3	Client STA TVWS operation	11.42.3, Annex D, E.2.5	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVWS 3.1	GDD dependent STA TVWS behavior	11.42.3, Annex D, E.2.5	WS3:M	Yes ☐ No ☐ N/A ☐
TVWS 4	Channel Availability Query	9.4.5.2, 9.6.7.25, 11.42.4	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVWS 5	Channel Schedule Management	9.4.5.3, 9.6.7.26, 11.42.5	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVWS 6	Contact Verification Signal	9.6.7.27, 11.42.6	CFTVHT:M	Yes ☐ No ☐ N/A ☐
*TVWS7	Network Channel Control	9.4.5.4, 9.6.7.30, 11.42.7	CFTVHT:M	
TVWS 7.1	NCC Requesting STA	11.42.7.2	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVWS 7.2	NCC Responding STA	11.42.7.3	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVWS 8	White Space Map Announcement	9.4.2.168, 9.6.7.31, 11.42.8	CFTVHT:M	Yes ☐ No ☐ N/A ☐

B.4.26.1 TVHT MAC features

Item	Protocol capability	References	Status	Support
	Are the following MAC protocol features supported?			
TVHTM1	TVHT Capabilities element			
TVHTM1.1	VHT Capabilities element	9.4.2.156.1	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM1.2	Signaling of STA capabilities in Probe Request, (Re)Association Request frames	9.3.3.5, 9.3.3.7, 9.3.3.9, 9.4.2.156.1	(CFTVHT AND CFIndep-STA):O (CFTVHT AND CFMBSS):O	Yes ☐ No ☐ N/A ☐
TVHTM1.3	Signaling of STA and BSS capabilities in Beacon, Probe Response, (Re)Association Response frames	9.3.3.2, 9.3.3.6, 9.3.3.8, 9.3.3.10, 9.4.2.156	(CFTVHT AND CFAP):O (CFTVHT AND CFMBSS):O	Yes ☐ No ☐ N/A ☐
TVHTM2	Signaling of VHT operation	9.4.2.157	(CFTVHT AND CFAP):O (CFTVHT AND CFMBSS):O (CFTVHT AND CFIBSS):O	Yes ☐ No ☐ N/A ☐
TVHTM3	Link adaptation			
TVHTM3.1	Use of the VHT variant HT Control field for link adaptation in immediate response exchange	9.2.4.6, 9.3.3.14, 10.29.3	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM4	Transmit beamforming			
*TVHTM4.1	SU Beamformer Capable	9.4.2.156	CFTVHT:O	Yes ☐ No ☐ N/A ☐
*TVHTM4.2	SU Beamformee Capable	9.4.2.156	CFTVHT:O	Yes ☐ No ☐ N/A ☐
*TVHTM4.3	MU Beamformer Capable	9.4.2.156	CFAP AND TVHTM4.1:O	Yes ☐ No ☐ N/A ☐
*TVHTM4.4	MU Beamformee Capable	9.4.2.156	CFIndepSTA AND TVHTM4.2:O	Yes ☐ No ☐ N/A ☐
TVHTM4.5	Transmission of null data PPDU	10.31	TVHTM4.1:M	Yes ☐ No ☐ N/A ☐
TVHTM4.6	Reception of null data PPDU	10.31	TVHTM4.2:M	Yes ☐ No ☐ N/A ☐
TVHTM5	VHT sounding protocol			
TVHTM5.1	VHT sounding protocol as SU beamformer	10.35.5	TVHTM4.1:M	Yes ☐ No ☐ N/A ☐

B.4.26.1 TVHT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
TVHTM5.2	VHT sounding protocol as SU beamformee	10.35.5	TVHTM4.2:M	Yes ☐ No ☐ N/A ☐
TVHTM5.3	VHT sounding protocol as MU beamformer	10.35.5	TVHTM4.3:M	Yes ☐ No ☐ N/A ☐
TVHTM5.4	VHT sounding protocol as MU beamformee	10.35.5	TVHTM4.4:M	Yes ☐ No ☐ N/A ☐
TVHTM6	TXOP Sharing			
TVHTM6.1	Sharing of EDCA TXOP	10.23.2.5	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM6.2	Use of Primary and Secondary AC	10.23.2.5	TVHTM6.1:M	Yes ☐ No ☐ N/A ☐
TVHTM7	VHT TXOP power saving	11.2.3.16	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM8	BSS Operation			
TVHTM8.1	Use of primary TVHT_W, secondary TVHT_W, and secondary TVHT_2W channels	11.41	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM8.2	CCA on primary TVHT_W, secondary TVHT_W, and secondary TVHT_2W channels	11.41	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM9	Group ID			
TVHTM9.1	Transmission of Group ID Management frame	9.6.22.3	TVHTM4.3:M	Yes ☐ No ☐ N/A ☐
TVHTM9.2	Reception of Group ID Management frame	9.6.22.3	TVHTM4.4:M	Yes ☐ No ☐ N/A ☐
TVHTM10	Bandwidth signaling			
TVHTM10.1	Support for non-HT bandwidth signaling and static operation	10.3.2.9	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTM10.2	Support for non-HT bandwidth signaling and dynamic operation	10.3.2.9	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM11	S-MPDU	10.12.8	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTM12	Partial AID in VHT PPDU	10.19	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTM13	Extended BSS Load element	9.4.2.158	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM13.1	Transmission of the Extended BSS Load element	9.4.2.158	CFAP AND CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM14	Quiet Channel element

B.4.26.1 TVHT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
TVHTM14.1	Transmission of Quiet Channel element by an AP or mesh STA in Beacon and Probe Response frames	9.3.3.2, 9.3.3.10, 9.4.2.163, 11.8.3	(CFAP OR CFMBSS) AND CFSM AND CFT-VHT AND TVHTP3.4:O	Yes ☐ No ☐ N/A ☐
TVHTM14.2	Transmission of Quiet Channel element by an independent STA or mesh STA in Beacon and Probe Response frames	9.3.3.2, 9.3.3.10, 9.4.2.163, 11.8.3	(CFIndepSTA OR CFMBSS) AND CFSM AND CFT-VHT AND TVHTP3.4:O	Yes ☐ No ☐ N/A ☐
TVHTM14.3	Reception of Quiet Channel element by an independent STA or mesh STA in Beacon and Probe Response frames	9.3.3.2, 9.3.3.10, 9.4.2.163, 11.8.3	(CFIndepSTA OR CFMBSS) AND CFSM AND CFT-VHT:O	Yes ☐ No ☐ N/A ☐
TVHTM15	Space-time block coding (STBC)			
TVHTM15.1	STBC operation	9.4.2.156, 10.14	TVHTP9:M	Yes ☐ No ☐ N/A ☐
TVHTM15.2	Transmission of at least 2×1 STBC	9.4.2.156	TVHTP9:O.1	Yes ☐ No ☐ N/A ☐
TVHTM15.3	Reception of 1 STBC spatial stream	9.4.2.156	TVHTP9:O.1	Yes ☐ No ☐ N/A ☐
TVHTM15.4	Reception of 2 STBC spatial stream	9.4.2.156	TVHTM15.3:O	Yes ☐ No ☐ N/A ☐
TVHTM15.5	Reception of 3 STBC spatial stream	9.4.2.156	TVHTM15.4:O	Yes ☐ No ☐ N/A ☐
TVHTM15.6	Reception of 4 STBC spatial stream	9.4.2.156	TVHTM15.5:O	Yes ☐ No ☐ N/A ☐
TVHTM16	Highest Supported Long GI Data Rate			
TVHTM16.1	Tx Highest Supported Long GI Data Rate	9.4.2.156.3	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM16.2	Rx Highest Supported Long GI Data Rate	9.4.2.156.3	CFTVHT:O	Yes ☐ No ☐ N/A ☐
NOTE—Required support for MCS might be limited by the declaration of Tx and Rx Highest Supported Long GI Data Rates.				

B.4.26.2 TVHT PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?

B.4.26.2 TVHT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
TVHTP1	PHY operating modes			Yes ☐ No ☐ N/A ☐
TVHTP2	VHT format	21.3.2	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP3	BSS bandwidth			
TVHTP3.1	TVHT_W operation	11.41	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP3.2	TVHT_2W operation	11.41	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP3.3	TVHT_W+W operation	11.41	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP3.4	TVHT_4W operation	11.41	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP3.5	TVHT_2W+2W operation	11.41	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP4	Bandwidth indication	17.3.5.5	CFVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP5	PHY timing parameters			
TVHTP5.1	Values in 6 MHz channel	22.3.6	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP5.2	Values in 7 MHz channel	22.3.6	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP5.3	Values in 8 MHz channel	22.3.6	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP5.4	Values in non-HT 6 MHz, 7 MHz, and 8 MHz channels	22.2.4	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP6	TVHT preamble	22.3.8	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP7	Use of LDPC Code	11.5.4, 21.3	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP8	Modulation and coding schemes (MCS)			
TVHTP8.1	TVHT_MODE_1	22.5		
TVHTP8.1.1	TVHT-MCS with Index 0-7 and $N_{SS} = 1$	22.5	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP8.1.2	TVHT-MCS with Index 0-8 and $N_{SS} = 1$	22.5	TVHTP8.1.1:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.3	TVHT-MCS with Index 0-9 and $N_{SS} = 1$	22.5	TVHTP8.1.2:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.4	TVHT-MCS with Index 0-7 and $N_{SS} = 2$	22.5	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.5	TVHT-MCS with Index 0-8 and $N_{SS} = 2$	22.5	TVHTP8.1.4:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.6	TVHT-MCS with Index 0-9 and $N_{SS} = 2$	22.5	TVHTP8.1.5:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.7	TVHT-MCS with Index 0-7 and $N_{SS} = 3$	22.5	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.8	TVHT-MCS with Index 0-8 and $N_{SS} = 3$	22.5	TVHTP8.1.7:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.9	TVHT-MCS with Index 0-9 and $N_{SS} = 3$	22.5	TVHTP8.1.7:O	Yes ☐ No ☐ N/A ☐

B.4.27 FILS features *(continued)*

Item	Protocol capability	References	Status	Support
* FILS4	FILS authentication	12.11, 9.4, 9.4.2.177, 9.4.2.178, 9.4.2.181, 9.4.2.188	(CFAP OR CFSTAofAP) AND CFFILS: M	Yes ☐ No ☐ N/A ☐
FILS4.1	FILS Shared Key authentication without PFS	9.4.2.186, 12.11.2.3	FILS4: O.1	Yes ☐ No ☐ N/A ☐
FILS4.2	FILS Shared Key authentication with PFS	9.4.2.186, 12.11.2.3	FILS4: O	Yes ☐ No ☐ N/A ☐
FILS4.3	FILS Public Key authentication	9.4.2.179, 9.4.2.187, 12.11.2.4	FILS4: O.1	Yes ☐ No ☐ N/A ☐
* FILS5	Higher Layer Setup during (re)association procedure	11.45.3	(CFAP OR CFSTAofAP) AND CFFILS: M	Yes ☐ No ☐ N/A ☐
FILS5.1	HLP Packet Encapsulation	11.45.3.2, 9.4.2.182	FILS5: M	Yes ☐ No ☐ N/A ☐
FILS5.2	FILS IP Address Configuration	11.45.3.3, 9.4.2.183	FILS5: O	Yes ☐ No ☐ N/A ☐
* FILS6	Scanning Enhancement	11.1.4	(CFAP OR CFSTAofAP) AND CFFILS: M	Yes ☐ No ☐ N/A ☐
FILS6.1	Probe Request Reduction	11.1.4.3.2	FILS6: M	Yes ☐ No ☐ N/A ☐
FILS6.2	Probe Response Reduction	11.1.4.3.4, 9.4.2.176	FILS6: M	Yes ☐ No ☐ N/A ☐
FILS6.3	OmitReplicateProbeResponses	11.1.4.3.9	FILS6: M	Yes ☐ No ☐ N/A ☐
FILS6.4	AP Configuration Sequence Number	9.4.2.180	FILS6: O	Yes ☐ No ☐ N/A ☐
FILS6.5	Reduced Neighbor Report	11.49, 9.4.2.169	FILS6: M	Yes ☐ No ☐ N/A ☐

B.4.28 Sub 1 GHz (S1G) features

B.4.28.1 S1G MAC features

Item	Protocol capability	References	Status	Support
	Are the following MAC protocol features supported?			
S1GM1	S1G capabilities signaling		CFS1G:M	Yes ☐ No ☐ N/A ☐
S1GM1.1	S1G Capabilities element	9.4.2.199	CFS1G:M	Yes ☐ No ☐ N/A ☐
S1GM1.2	Signaling of S1G capabilities in Probe Request, (Re)Association Request frames	9.4.2.199, 9.3.3.5, 9.3.3.7, 9.3.3.9	(CFIndepSTA AND CFS1G):M	Yes ☐ No ☐ N/A ☐

B.4.28.1 S1G MAC features *(continued)*

Item	Protocol capability	References	Status	Support
S1GM1.3	Signaling of S1G capabilities in S1G Beacon, Probe Response, (Re)Association Response frames	9.4.2.199, 9.3.4.3, 9.3.3.6, 9.3.3.8, 9.3.3.10	(CFAP AND CFS1G):M	Yes ☐ No ☐ N/A ☐
S1GM2	S1G operation		CFS1G:M	Yes ☐ No ☐ N/A ☐
S1GM2.1	S1G Operation element	9.4.2.211	CFS1G:M	Yes ☐ No ☐ N/A ☐
S1GM2.2	Signaling of S1G operation in S1G Beacon, Probe Response	9.4.2.211, 9.3.4.3, 9.3.3.10	((CFAP OR CFIndep-STA.2) AND CFS1G):M	Yes ☐ No ☐ N/A ☐
S1GM3	MSDU aggregation	10.11, 9.2.4.5, 9.8.3.2, 9.3.2.2.5	CFS1G:O	Yes ☐ No ☐ N/A ☐
S1GM3.1	Transmission of Dynamic A-MSDU		CFS1G:O (CFS1G AND HTM4.4):M	Yes ☐ No ☐ N/A ☐
S1GM3.2	Reception of Dynamic A-MSDU		CFS1G:O (CFS1G AND HTM4.1):M	Yes ☐ No ☐ N/A ☐
S1GM3.3	Transmission of Dynamic A-MSDU in PV1 frame		(CFS1G AND HTM4.4 AND FT45):M	Yes ☐ No ☐ N/A ☐
S1GM3.4	Reception of Dynamic A-MSDU in PV1 frame		(CFS1G AND HTM4.1 AND FT46):M	Yes ☐ No ☐ N/A ☐
S1GM3.5	Reception of Dynamic A-MSDU		(CFS1G AND (HTM4.1 OR HTM4.4 OR S1GM3.3 OR S1GM3.4)):M	Yes ☐ No ☐ N/A ☐
S1GM4	Timing synchronization function (TSF)		CFS1G:M	Yes ☐ No ☐ N/A ☐
S1GM4.1	Generation of S1G Beacon	11.1.3.10.2	(CFAP AND CFS1G): M	Yes ☐ No ☐ N/A ☐
S1GM4.1.1	S1G Beacon generation at TBTT		(CFAP AND CFS1G): M	
S1GM4.1.2	S1G Beacon generation at TSBTT		(CFAP AND CFS1G): O	Yes ☐ No ☐ N/A ☐
S1GM4.1.3	S1G Beacon reception at TBTT		(CFIndepSTA AND CFS1G): M	Yes ☐ No ☐ N/A ☐
S1GM4.1.4	S1G Beacon reception at TSBTT		(CFIndepSTA AND CFS1G): M	Yes ☐ No ☐ N/A ☐
S1GM4.2	TSF timer accuracy with S1G Beacon	11.1.3.10.3	CFS1G: M	Yes ☐ No ☐ N/A ☐
S1GM4.3	TSF timer accuracy with TACK, STACK, BAT, PV1 Probe Response frames		CFS1G: O	Yes ☐ No ☐ N/A ☐

B.4.28.1 S1G MAC features *(continued)*

Item	Protocol capability	References	Status	Support
S1GM4.4	Signaling PV1 Probe Response Option element in Probe Request frame		CFS1G: O	Yes ☐ No ☐ N/A ☐
S1GM4.5	Active scanning using NDP Probe Request frame	11.1.4.3.6	CFS1G: O	Yes ☐ No ☐ N/A ☐
S1GM4.6	Sending PV1 Probe Response frame	11.1.4.3.7, 11.1.4.3.6	(CFAP AND CFS1G): O	Yes ☐ No ☐ N/A ☐
S1GM5	Reverse direction protocol	10.29	CFS1G:O	Yes ☐ No ☐ N/A ☐
S1GM5.1	Initiation of RD protocol		CFS1G:O	Yes ☐ No ☐ N/A ☐
S1GM5.2	Response to RD request		CFS1G:O	Yes ☐ No ☐ N/A ☐
*S1GM6	Target wake time (TWT) operation	10.46	CFS1G:O	Yes ☐ No ☐ N/A ☐
*S1GM6.1	Assume the role of TWT requesting STA	10.46.1	S1GM6:O.1	Yes ☐ No ☐ N/A ☐
*S1GM6.2	Assume the role of TWT responding STA	10.46.1	S1GM6:O.1	Yes ☐ No ☐ N/A ☐
S1GM6.3	Request TWT Setup	10.46.1	S1GM6.1:O	Yes ☐ No ☐ N/A ☐
S1GM6.4	Response to TWT Setup request	10.46.1	S1GM6.2:M	Yes ☐ No ☐ N/A ☐
S1GM6.5	TWT Teardown	10.46.8	S1GM6:O	Yes ☐ No ☐ N/A ☐
S1GM6.6	TWT acknowledgment procedure	10.46.2	S1GM6:M	Yes ☐ No ☐ N/A ☐
S1GM6.7	Explicit TWT operation	10.46.3	S1GM6:O.2	Yes ☐ No ☐ N/A ☐
S1GM6.8	Implicit TWT operation	10.46.4	S1GM6:O.2	Yes ☐ No ☐ N/A ☐
S1GM6.9	Request NDP paging setup	10.46.6	S1GM6.1:O	Yes ☐ No ☐ N/A ☐
S1GM6.10	Accept the NDP paging setup request	10.46.6	S1GM6.2:O	Yes ☐ No ☐ N/A ☐
S1GM6.11	Schedule NDP Paging frame as the first frame in a TWT		S1GM10:M	Yes ☐ No ☐ N/A ☐
S1GM6.12	TWT grouping	10.46.5	S1GM6:O	Yes ☐ No ☐ N/A ☐
S1GM6.13	Protected TWT Operations	10.46.1	(PC 34.1.10 AND S1GM6):O	Yes ☐ No ☐ N/A ☐
S1GM7	Non-TIM operation	10.47	(CFIndepSTA AND CFS1G):O (CFAP AND CFS1G AND (S1GM20.1 OR S1GM20.3)): M	Yes ☐ No ☐ N/A ☐
S1GM7.1	Request non-TIM Mode	11.2.3.2	(CFIndepSTA AND S1GM7):O	Yes ☐ No ☐ N/A ☐
S1GM7.2	Response to non-TIM Mode request	11.2.3.2	(CFAP AND S1GM7):M	Yes ☐ No ☐ N/A ☐
S1GM7.3	Request rescheduling of awake/doze cycle	10.47.2	(CFIndepSTA AND S1GM7):O	Yes ☐ No ☐ N/A ☐

B.4.28.1 S1G MAC features *(continued)*

Item	Protocol capability	References	Status	Support
S1GM7.4	Reschedule awake/doze cycle of S1G STAs in non-TIM mode	10.47.2	(CFAP AND S1GM7):O	Yes ☐ No ☐ N/A ☐
S1GM7.5	Temporary PS Mode Switch to TIM mode	10.47.2	(CFIndepSTA AND S1GM7):O	Yes ☐ No ☐ N/A ☐
S1GM7.6	Listen interval update procedure for S1G STAs in non-TIM mode		S1GM7:O	Yes ☐ No ☐ N/A ☐
S1GM7.7	Resource protection for S1G STAs in non-TIM mode	10.47.1	(CFAP AND S1GM7):O	Yes ☐ No ☐ N/A ☐
S1GM7.8	Resource protection for S1G STAs in non-TIM mode using periodic RAW (PRAW) operation	10.47.1.2	(CFAP AND S1GM7):O	Yes ☐ No ☐ N/A ☐
S1GM8	Sync frame operation	10.48	CFS1G:O	Yes ☐ No ☐ N/A ☐
S1GM8.1	Request for a sync frame transmission	10.48	(CFIndepSTA AND S1GM8):O	Yes ☐ No ☐ N/A ☐
S1GM8.2	Schedule a sync frame transmission	10.48	(CFAP AND S1GM8):M	Yes ☐ No ☐ N/A ☐
S1GM8.3	Request for time slot protection	10.48	(CFIndepSTA AND S1GM8):O	Yes ☐ No ☐ N/A ☐
S1GM8.4	Protect the time slot assigned to the STA that requested for time slot protection.	10.48	(CFAP AND S1GM8):M	Yes ☐ No ☐ N/A ☐
S1GM8.5	Respond to sync frame	10.48	(CFIndepSTA AND S1GM8):M	Yes ☐ No ☐ N/A ☐
S1GM9	Bidirectional TXOP	10.49	CFS1G:O	Yes ☐ No ☐ N/A ☐
S1GM9.1	Act as BDT Initiator	10.49.2	S1GM9:O	Yes ☐ No ☐ N/A ☐
S1GM9.2	Act as BDT Responder		S1GM9:M	Yes ☐ No ☐ N/A ☐
S1GM10	Subchannel Selective Transmission (SST)	10.49	CFS1G:O	Yes ☐ No ☐ N/A ☐
S1GM11	Sectorized beam operation	10.52	CFS1G:O	Yes ☐ No ☐ N/A ☐
S1GM11.1	Support for Group Sectorization Operation	10.52.3	(CFAP AND S1GM11):O.3 (CFIndepSTA AND S1GM11):M	Yes ☐ No ☐ N/A ☐
S1GM11.2	Support for TXOP-based Sectorization Operation	10.52.4	(CFAP AND S1GM11):O.3 (CFIndepSTA AND S1GM11):M	Yes ☐ No ☐ N/A ☐
S1GM11.3	Transmission of S1G Sector Operation element with Sectorization Type field equal to 0	10.52.2	(CFAP AND S1GM11.1):M	Yes ☐ No ☐ N/A ☐
S1GM11.4	Transmission of S1G Sector Operation element with Sectorization Type field equal to 1	10.52.2	(CFAP AND S1GM11.2):M	Yes ☐ No ☐ N/A ☐

B.4.30.1 CDMG MAC features *(continued)*

Item	Protocol capability	References	Status	Support
CDMG-M6	CDMG AP or PCP clustering	10.39	CFCDMG:M	Yes ☐ No ☐ N/A ☐
CDMG-M7	CDMG protected period establishment and maintenance	10.38.6.6.3	CFCDMG:M	Yes ☐ No ☐ N/A ☐
CDMG-M8	Spatial sharing in a CDMG AP or PCP cluster	10.40.6	CFCDMG:M	Yes ☐ No ☐ N/A ☐
CDMG-M9	CDMG enhanced beam tracking	10.41.9, W.3	CFCDMG:O	Yes ☐ No ☐ N/A ☐
CDMG-M10	CDMG dynamic truncation of service period	10.38.8.2	CFCDMG:M	Yes ☐ No ☐ N/A ☐

B.4.30.2 CDMG PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
CDMG-P1	PHY operating modes			
CDMG-P1.1	Operation according to Clause 24	Clause 24	CFCDMG:M	Yes ☐ No ☐ N/A ☐
CDMG-P2	CDMG PHY frame format			
*CDMG-P2.1	CDMG control mode format	24.4	CFCDMG:M	Yes ☐ No ☐ N/A ☐
*CDMG-P2.2	CDMG SC mode format	24.5	CFCDMG:M	Yes ☐ No ☐ N/A ☐
*CDMG-P2.3	CDMG low-power SC mode format. The CDMG low-power SC mode is obsolete. Support for this mechanism might be removed in a later revision of the standard.	24.6	CFCDMG:O	Yes ☐ No ☐ N/A ☐
CDMG-P2.4	Modulation and coding schemes (MCSs)	24.4		Yes ☐ No ☐ N/A ☐
CDMG-P2.4.1	MCS 0 of CDMG control mode	24.4	CDMG-P2.1:M	Yes ☐ No ☐ N/A ☐
CDMG-P2.4.2	MCSs 1 to 16 of CDMG SC mode	24.5		Yes ☐ No ☐ N/A ☐
CDMG-P2.4.2.1	MCSs 1 to 9	24.5	CDMG-P2.2:M	Yes ☐ No ☐ N/A ☐
CDMG-P2.4.2.2	MCSs 10 to 16	24.5	CDMG-P2.2:O	Yes ☐ No ☐ N/A ☐
CDMG-P2.4.3	MCSs 17 to 23 of CDMG low-power SC mode. The CDMG low-power SC mode is obsolete. Support for this mechanism might be removed in a later revision of the standard.	24.6	CDMG-P2.3:M	Yes ☐ No ☐ N/A ☐

B.4.30.2 CDMG PHY features *(continued)*

Item	Protocol capability	References	Status	Support
CDMG-P2.5	Common preamble format	24.3	CFCDMG :M	Yes ☐ No ☐ N/A ☐
CDMG-P2.6	Enhanced mobile device support mode	24.5	CFCDMG :M	Yes ☐ No ☐ N/A ☐

B.4.31 CMMG features

B.4.31.1 CMMG PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
CMMG-P1	PHY operating modes			
CMMG-P1.1	Operation according to Clause 25	Clause 25	CFCMMG:M	
CMMG-P2	PHY frame format			
*CMMG-P2.1	CMMG control mode format	25.4	CFCMMG:M	Yes ☐ No ☐ N/A ☐
*CMMG-P2.2	CMMG SC mode format	25.5	CFCMMG:M	Yes ☐ No ☐ N/A ☐
*CMMG-P2.3	CMMG OFDM mode format	25.6	CFCMMG:O	Yes ☐ No ☐ N/A ☐
CMMG-P2.4	Modulation and coding schemes (MCSs)			
CMMG-P2.4.1	MCS 0 of CMMG control mode	25.4	CMMG-P2.1:M	Yes ☐ No ☐ N/A ☐
CMMG-P2.4.2	MCSs 1 to 8 of CMMG SC mode			
CMMG-P2.4.2.1	MCSs 1 to 3	25.5	CMMG-P2.2:M	Yes ☐ No ☐ N/A ☐
CMMG-P2.4.2.2	MCSs 4 to 8	25.5	CMMG-P2.2:O	Yes ☐ No ☐ N/A ☐
CMMG-P2.4.3	MCSs 9 to 16 of CMMG OFDM mode	25.6	CMMG-P2.3:M	Yes ☐ No ☐ N/A ☐

B.4.32 Preassociation discovery extensions

Item	Protocol capability	References	Status	Support
*PAD1	Unsolicited PAD procedure	11.23.2	CFPAD:M	Yes ☐ No ☐ N/A ☐
PAD1.1	Service Hint element	9.4.2.236	PAD1:M	Yes ☐ No ☐ N/A ☐
PAD1.2	Service Hash element	9.4.2.237	PAD1:M	Yes ☐ No ☐ N/A ☐
*PAD2	Solicited PAD procedure	11.23.3	(CFPAD AND IW2.2.2):M	Yes ☐ No ☐ N/A ☐
PAD2.1	Service information request	9.4.5.27	PAD2:M	Yes ☐ No ☐ N/A ☐
PAD2.2	Service information response	9.4.5.28	PAD2:M	Yes ☐ No ☐ N/A ☐

B.4.33 High-efficiency (HE) features

B.4.33.1 HE MAC features

Item	Protocol capability	References	Status	Support
	Are the following MAC protocol features supported?			
HEM1	HE capabilities signaling			
HEM1.1	HE Capabilities element	9.4.2.247	CFHE:M	Yes ☐ No ☐ N/A ☐
HEM1.2	Signaling of STA capabilities in Probe Request, (Re)Association Request frames	9.3.3.5, 9.3.3.7, 9.3.3.9, 9.4.2.247	(CFHE AND CFIndep-STA):M	Yes ☐ No ☐ N/A ☐
HEM1.3	Signaling of HE STA capabilities and HE BSS capabilities in Beacon, Probe Response, (Re)Association Response frames	9.3.3.2, 9.3.3.6, 9.3.3.8, 9.3.3.10, 9.4.2.247	(CFHE AND CFAP):M	Yes ☐ No ☐ N/A ☐
HEM2	Signaling of HE operation	9.4.2.248	(CFHE AND CFAP):M	Yes ☐ No ☐ N/A ☐
HEM3	A-MPDU with multiple TIDs	26.6.3	CFHE:O	Yes ☐ No ☐ N/A ☐
HEM4	HE variant HT Control			
HEM4.1	UL MU Response Scheduling	9.2.4.7.1	CFHE:O	Yes ☐ No ☐ N/A ☐
HEM4.2	Operating Mode	9.2.4.7.2	CFHE:O	Yes ☐ No ☐ N/A ☐
HEM4.3	HE Link Adaptation	9.2.4.7.3	CFHE:O	Yes ☐ No ☐ N/A ☐
HEM4.4	Buffer Status Report	9.2.4.7.4	CFHE:O	Yes ☐ No ☐ N/A ☐
HEM4.5	UL Power Headroom	9.2.4.7.5	CFHE:M	Yes ☐ No ☐ N/A ☐
HEM4.6	BQR Control	9.2.4.7.6	CFHE:O	Yes ☐ No ☐ N/A ☐
HEM4.7	CAS Control	9.2.4.7.7	CFHE:O	Yes ☐ No ☐ N/A ☐
HEM5	Trigger frame			
HEM5.1	Basic Trigger frame	9.3.1.22.2	CFHE:M	Yes ☐ No ☐ N/A ☐
HEM5.2	BFRP Trigger frame	9.3.1.22.3	CFHE:M	Yes ☐ No ☐ N/A ☐
HEM5.3	MU-BAR Trigger frame	9.3.1.22.4	CFHE:O	Yes ☐ No ☐ N/A ☐

B.4.33.1 HE MAC features *(continued)*

Item	Protocol capability	References	Status	Support
HEM5.4	MU-RTS Trigger frame transmission	9.3.1.22.5	CFHE:O	Yes ☐ No ☐ N/A ☐
HEM5.5	MU-RTS Trigger frame reception	9.3.1.22.5	CFHE:M	Yes ☐ No ☐ N/A ☐
HEM5.6	BSRP Trigger frame	9.3.1.22.6	CFHE:O	Yes ☐ No ☐ N/A ☐
HEM5.7	GCR MU-BAR Trigger frame	9.3.1.22.7	CFHE:O	Yes ☐ No ☐ N/A ☐
HEM5.8	BQRP Trigger frame	9.3.1.22.8	CFHE:O	Yes ☐ No ☐ N/A ☐
HEM5.9	NFRP Trigger frame	9.3.1.22.9	CFHE:O	Yes ☐ No ☐ N/A ☐
HEM6	Transmit beamforming			
*HEM6.1	SU beamformer capable if the supported maximum number of transmit spatial streams is less than 4	9.4.2.247	CFHE:O	Yes ☐ No ☐ N/A ☐
*HEM6.2	SU beamformer capable if the supported maximum number of transmit spatial streams is greater than or equal to 4	9.4.2.247	CFHE:M	Yes ☐ No ☐ N/A ☐
*HEM6.3	SU beamformee capable	9.4.2.247	CFHE:O	Yes ☐ No ☐ N/A ☐
*HEM6.4	MU beamformer capable if the supported maximum number of transmit spatial streams is less than 4	9.4.2.247	CFAP AND HEM6.1:O	Yes ☐ No ☐ N/A ☐
*HEM6.5	MU beamformer capable if the supported maximum number of transmit spatial streams is greater than or equal to 4	9.4.2.247	CFAP AND HEM6.2:M	Yes ☐ No ☐ N/A ☐
*HEM6.6	MU beamformee capable	9.4.2.247	CFIndepSTA AND VHTM7.2: O	Yes ☐ No ☐ N/A ☐
HEM6.7	Transmission of an HE sounding NDP	26.7	HEM6.1:M HEM6.2:M	Yes ☐ No ☐ N/A ☐
HEM6.8	Reception of an HE sounding NDP	26.7	HEM6.3:M	Yes ☐ No ☐ N/A ☐
*HEM6.9	Transmission of Trigger frame	26.7	HEM6.1:O HEM6.2:O	Yes ☐ No ☐ N/A ☐
HEM6.10	Reception of Trigger frame	26.7	HEM6.9:M	Yes ☐ No ☐ N/A ☐
HEM7	Sounding protocol			
HEM7.1	HE Sounding Protocol as SU beamformer	26.7	HEM6.1:M HEM6.2:M	Yes ☐ No ☐ N/A ☐
HEM7.2	HE Sounding Protocol as SU beamformee	26.7	HEM6.3:M	Yes ☐ No ☐ N/A ☐
HEM7.3	HE Sounding Protocol as MU beamformer	26.7	HEM6.4:M HEM6.5:M	Yes ☐ No ☐ N/A ☐
HEM7.4	HE Sounding Protocol as MU beamformee	26.7	HEM6.6:M	Yes ☐ No ☐ N/A ☐
HEM8	NAV update	26.2.4		
HEM8.1	Update basic NAV	26.2.4	CFHE:M	Yes ☐ No ☐ N/A ☐
HEM8.2	Update IntraBSS NAV	26.2.4	CFAP AND CFHE:O CFIndepSTA AND CFHE:M	Yes ☐ No ☐ N/A ☐
HEM9	OFDMA-based random access	26.5.4	CFHE:O	Yes ☐ No ☐ N/A ☐

B.4.33.1 HE MAC features *(continued)*

Item	Protocol capability	References	Status	Support
HEM10	TWT operation	26.8	CFHE:O	Yes ☐ No ☐ N/A ☐
HEM11	Quiet time period			
*HEM11.1	Responding AP procedure		CFAP AND CFHE:O	
HEM11.1.1	QTP AP capability	26.17.5.1	HEM11.1:M	Yes ☐ No ☐ N/A ☐
HEM11.1.2	QTP responding AP procedure	26.17.5.3	HEM11.1:M	Yes ☐ No ☐ N/A ☐
*HEM11.2	Requesting STA procedure		CFSTAof AP AND CFHE:O	
HEM11.2.1	QTP non-AP STA capability	26.17.5.1	HEM11.2:M	Yes ☐ No ☐ N/A ☐
HEM11.2.2	QTP requesting STA procedure	26.17.5.2	HEM11.2:M	Yes ☐ No ☐ N/A ☐
HEM12	HE BSS operation in the 6 GHz band			
HEM12.1	Scanning in the 6 GHz band	26.17.2.3	CFHE6G:O	Yes ☐ No ☐ N/A ☐
HEM12.2	Out of band discovery	11.53	(CF2G4n6G OR CF5Gn6G):O	Yes ☐ No ☐ N/A ☐

B.4.33.2 HE PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
HEP1	PHY operating modes			
HEP1.1	Operation according to Clause 17, Clause 19, and/or Clause 21	27.1.1	CFHE5G AND (CFAP OR CFHE80):M	Yes ☐ No ☐ N/A ☐
HEP1.2	Operation according to Clause 19 in the 5 GHz band	27.1.1	CFHE5G AND CFHE20:M	Yes ☐ No ☐ N/A ☐
HEP1.3	Operation according to Clause 19 in the 2.4 GHz band	27.1.1	CFHE2G4:M	Yes ☐ No ☐ N/A ☐
HEP1.4	Operation according to Clause 17 in the 6 GHz band	27.1.1	CFHE6G:M	Yes ☐ No ☐ N/A ☐
HEP2	HE PPDU format	27.1.4		
*HEP2.1	HE SU PPDU	27.1.4	CFHE:M	Yes ☐ No ☐ N/A ☐
*HEP2.2	HE ER SU PPDU	27.1.4	CFHE:M	Yes ☐ No ☐ N/A ☐
HEP2.3	HE MU PPDU	27.1.4		
*HEP2.3.1	DL OFDMA Tx	27.3.1.1	CFAP AND CFHE:M	Yes ☐ No ☐ N/A ☐
*HEP2.3.2	DL OFDMA Rx	27.3.1.1	CFSTAofAP AND CFHE:M	Yes ☐ No ☐ N/A ☐
*HEP2.3.3	DL MU-MIMO Tx	27.3.1.1	CFAP AND HEP9.1.10:M	Yes ☐ No ☐ N/A ☐
*HEP2.3.4	DL MU-MIMO Rx	27.3.1.1	CFSTAofAP AND CFHE:M	Yes ☐ No ☐ N/A ☐

B.4.33.2 HE PHY features *(continued)*

Item	Protocol capability	References	Status	Support
*HEP2.3.5	DL MU-MIMO within OFDMA Tx	27.3.1.1	CFAP AND CFHE:O	Yes ☐ No ☐ N/A ☐
*HEP2.3.6	DL MU-MIMO within OFDMA Rx	27.3.1.1	CFSTAofAP AND CFHE:O	Yes ☐ No ☐ N/A ☐
HEP2.3.7	Rx full BW with a single user using HE MU PPDU with compressed HE-SIG-B field	26.15.2	CFHE:O	Yes ☐ No ☐ N/A ☐
HEP2.3.8	Rx full BW with a single user using HE MU PPDU with noncompressed HE-SIG-B field	26.15.2	CFHE:O	Yes ☐ No ☐ N/A ☐
HEP2.4	HE TB PPDU	27.1.4		
HEP2.4.1	UL OFDMA Tx	27.3.1.1	CFSTAofAP AND CFHE:M	Yes ☐ No ☐ N/A ☐
HEP2.4.2	UL OFDMA Rx	27.3.1.1	CFAP AND CFHE:M	Yes ☐ No ☐ N/A ☐
*HEP2.4.3	UL MU-MIMO Tx	27.3.1.1	CFSTAofAP AND CFHE:O	Yes ☐ No ☐ N/A ☐
*HEP2.4.4	UL MU-MIMO Rx	27.3.1.1	CFAP AND CFHE:O	Yes ☐ No ☐ N/A ☐
HEP2.4.5	UL MU-MIMO within OFDMA Tx	27.3.1.1	CFSTAofAP AND CFHE:O	Yes ☐ No ☐ N/A ☐
HEP2.4.6	UL MU-MIMO within OFDMA Rx	27.3.1.1	CFAP AND CFHE:O	Yes ☐ No ☐ N/A ☐
HEP3	BSS bandwidth			
*HEP3.1	20 MHz operation	26.17	CFHE:M	Yes ☐ No ☐ N/A ☐
*HEP3.2	40 MHz operation	26.17	CFHE80 AND (CFHE5G OR CFHE6G):M CFHE2G4:O	Yes ☐ No ☐ N/A ☐
*HEP3.3	80 MHz operation	26.17	CFHE80 AND (CFHE5G OR CFHE6G):M	Yes ☐ No ☐ N/A ☐
*HEP3.4	160 MHz operation	26.17	CFHE80 AND (CFHE5G OR CFHE6G):O HEP3.5:M	Yes ☐ No ☐ N/A ☐
*HEP3.5	80+80 MHz operation	26.17	CFHE80 AND (CFHE5G OR CFHE6G):O	Yes ☐ No ☐ N/A ☐
HEP4	PHY timing information			
HEP4.1	Values in 20 MHz channel	27.3.9	CFHE:M	Yes ☐ No ☐ N/A ☐
HEP4.2	Values in 40 MHz channel	27.3.9	CFHE:M	Yes ☐ No ☐ N/A ☐
HEP4.3	Values in 80 MHz channel	27.3.9	CFHE:M	Yes ☐ No ☐ N/A ☐
HEP4.4	Values in 160 MHz channel	27.3.9	HEP3.4:M	Yes ☐ No ☐ N/A ☐
HEP4.5	Values in 80+80 MHz channel	27.3.9	HEP3.5:M	Yes ☐ No ☐ N/A ☐
HEP5	STBC	27.3.12.12	CFHE:O	Yes ☐ No ☐ N/A ☐

B.4.33.2 HE PHY features *(continued)*

Item	Protocol capability	References	Status	Support
HEP6	Tone allocation			
*HEP6.1	26-tone RU mapping	27.3.2.2, 27.3.2.3, and 27.3.2.4	CFHE:M	Yes ☐ No ☐ N/A ☐
*HEP6.2	52-tone RU mapping	27.3.2.2, 27.3.2.3, and 27.3.2.4	CFHE:M	Yes ☐ No ☐ N/A ☐
*HEP6.3	106-tone RU mapping	27.3.2.2, 27.3.2.3, and 27.3.2.4	CFHE:M	Yes ☐ No ☐ N/A ☐
*HEP6.4	242-tone RU mapping	27.3.2.2, 27.3.2.3, and 27.3.2.4	CFHE80:M CFHE20:O	Yes ☐ No ☐ N/A ☐
*HEP6.5	484-tone RU mapping	27.3.2.2, 27.3.2.3, and 27.3.2.4	CFHE80 AND HEP3.2:M	Yes ☐ No ☐ N/A ☐
*HEP6.6	996-tone RU mapping	27.3.2.2, 27.3.2.3, and 27.3.2.4	CFHE80 AND HEP3.3:M CFHE80 AND HEP3.4:M	Yes ☐ No ☐ N/A ☐
*HEP6.7	2×996-tone RU mapping	27.3.2.2, 27.3.2.3, and 27.3.2.4	CFHE80 AND HEP3.4:M	Yes ☐ No ☐ N/A ☐
HEP7	Coding			
HEP8.1	BCC with 4 or fewer spatial streams	27.3.12.5.1	(HEP6.1 OR HEP6.2 OR HEP6.3 OR HEP6.4):M (HEP3.1 AND HEP2.1):M	Yes ☐ No ☐ N/A ☐
HEP8.2	LDPC with more than 4 spatial streams	27.3.12.5.2	CFHE80:M CFHE20:M	Yes ☐ No ☐ N/A ☐
HEP8.3	LDPC with 4 or fewer spatial streams	27.3.12.5.2	(HEP6.5 OR HEP6.6 OR HEP6.7):M ((HEP3.2 OR HEP3.3 OR HEP3.4 OR HEP3.5) AND HEP2.1):M (HEP6.1 OR HEP6.2 OR HEP6.3 OR HEP6.4):O (HEP3.1 AND HEP2.1):O CFHE20:O	Yes ☐ No ☐ N/A ☐
HEP9	Coding and modulation schemes

B.4.33.2 HE PHY features *(continued)*

Item	Protocol capability	References	Status	Support
HEP9.1	For 26-, 52-, 106-, 242-, 484-, and 996-tone mapping			
*HEP9.1.1	HE-MCS with Index 0-7 and $N_{SS} = 1$	27.5	CFHE:M	Yes ☐ No ☐ N/A ☐
*HEP9.1.2	HE-MCS with Index 0-8 and $N_{SS} = 1$	27.5	HEP9.1.1:O	Yes ☐ No ☐ N/A ☐
HEP9.1.3	HE-MCS with Index 0-9 and $N_{SS} = 1$	27.5	HEP9.1.2:O	Yes ☐ No ☐ N/A ☐
*HEP9.1.4	HE-MCS with Index 0-7 and $N_{SS} = 2$	27.5	CFHE:O	Yes ☐ No ☐ N/A ☐
*HEP9.1.5	HE-MCS with Index 0-8 and $N_{SS} = 2$	27.5	HEP9.1.4:O	Yes ☐ No ☐ N/A ☐
HEP9.1.6	HE-MCS with Index 0-9 and $N_{SS} = 2$	27.5	HEP9.1.5:O	Yes ☐ No ☐ N/A ☐
*HEP9.1.7	HE-MCS with Index 0-7 and $N_{SS} = 3$	27.5	CFHE:O	Yes ☐ No ☐ N/A ☐
*HEP9.1.8	HE-MCS with Index 0-8 and $N_{SS} = 3$	27.5	HEP9.1.7:O	Yes ☐ No ☐ N/A ☐
HEP9.1.9	HE-MCS with Index 0-9 and $N_{SS} = 3$	27.5	HEP9.1.8:O	Yes ☐ No ☐ N/A ☐
*HEP9.1.10	HE-MCS with Index 0-7 and $N_{SS} = 4$	27.5	CFHE:O	Yes ☐ No ☐ N/A ☐
*HEP9.1.11	HE-MCS with Index 0-8 and $N_{SS} = 4$	27.5	HEP9.1.10:O	Yes ☐ No ☐ N/A ☐
HEP9.1.12	HE-MCS with Index 0-9 and $N_{SS} = 4$	27.5	HEP9.1.11:O	Yes ☐ No ☐ N/A ☐
*HEP9.1.13	HE-MCS with Index 0-7 and $N_{SS} = 5$	27.5	CFHE:O	Yes ☐ No ☐ N/A ☐
*HEP9.1.14	HE-MCS with Index 0-8 and $N_{SS} = 5$	27.5	HEP9.1.13:O	Yes ☐ No ☐ N/A ☐
HEP9.1.15	HE-MCS with Index 0-9 and $N_{SS} = 5$	27.5	HEP9.1.14:O	Yes ☐ No ☐ N/A ☐
*HEP9.1.16	HE-MCS with Index 0-7 and $N_{SS} = 6$	27.5	CFHE:O	Yes ☐ No ☐ N/A ☐
*HEP9.1.17	HE-MCS with Index 0-8 and $N_{SS} = 6$	27.5	HEP9.1.16:O	Yes ☐ No ☐ N/A ☐
HEP9.1.18	HE-MCS with Index 0-9 and $N_{SS} = 6$	27.5	HEP9.1.17:O	Yes ☐ No ☐ N/A ☐
*HEP9.1.19	HE-MCS with Index 0-7 and $N_{SS} = 7$	27.5	CFHE:O	Yes ☐ No ☐ N/A ☐
*HEP9.1.20	HE-MCS with Index 0-8 and $N_{SS} = 7$	27.5	HEP9.1.19:O	Yes ☐ No ☐ N/A ☐
HEP9.1.21	HE-MCS with Index 0-9 and $N_{SS} = 7$	27.5	HEP9.1.20:O	Yes ☐ No ☐ N/A ☐
*HEP9.1.22	HE-MCS with Index 0-7 and $N_{SS} = 8$	27.5	CFHE:O	Yes ☐ No ☐ N/A ☐
*HEP9.1.23	HE-MCS with Index 0-8 and $N_{SS} = 8$	27.5	HEP9.1.22:O	Yes ☐ No ☐ N/A ☐
HEP9.1.24	HE-MCS with Index 0-9 and $N_{SS} = 8$	27.5	HEP9.1.23:O	Yes ☐ No ☐ N/A ☐
HEP9.2	For 242-, 484-, and 996-tone plan			
*HEP9.2.1	HE-MCS with Index 0-10 and $N_{SS} = 1$	27.5	CFHE80:O	Yes ☐ No ☐ N/A ☐
HEP9.2.2	HE-MCS with Index 0-11 and $N_{SS} = 1$	27.5	HEP9.2.1:O	Yes ☐ No ☐ N/A ☐
*HEP9.2.3	HE-MCS with Index 0-10 and $N_{SS} = 2$	27.5	CFHE80:O	Yes ☐ No ☐ N/A ☐
HEP9.2.4	HE-MCS with Index 0-11 and $N_{SS} = 2$	27.5	HEP9.2.3:O	Yes ☐ No ☐ N/A ☐
*HEP9.2.5	HE-MCS with Index 0-10 and $N_{SS} = 3$	27.5	CFHE80:O	Yes ☐ No ☐ N/A ☐
HEP9.2.6	HE-MCS with Index 0-11 and $N_{SS} = 3$	27.5	HEP9.2.5:O	Yes ☐ No ☐ N/A ☐
*HEP9.2.7	HE-MCS with Index 0-10 and $N_{SS} = 4$	27.5	CFHE80:O	Yes ☐ No ☐ N/A ☐
HEP9.2.8	HE-MCS with Index 0-11 and $N_{SS} = 4$	27.5	HEP9.2.7:O	Yes ☐ No ☐ N/A ☐

B.4.34.1 EDMG MAC features *(continued)*

Item	Protocol capability	References	Status	Support
EDMG-M1.3	Signaling of STA capabilities in Probe Response, (Re)Association Response frames	9.3.3.6, 9.3.3.8, 9.3.3.10, 9.4.2.264	(CFEDMG AND (CFAP OR CFPCP)):M	Yes ☐ No ☐ N/A ☐
EDMG-M.2	Signaling of EDMG Capabilities, EDMG Operation	9.4.2.264, 9.4.2.264.1	(CFEDMG AND (CFAP OR CFPCP)):M	Yes ☐ No ☐ N/A ☐
EDMG-M3	MPDU aggregation			
EDMG-M3.1	Maximum A-MPDU Length Exponent	9.4.2.264.1	CFEDMG: M	Yes ☐ No ☐ N/A ☐
EDMG-M3.2	Negotiation of window sizes: 64; 128; 256; 512; 1024	9.4.2.264.1	CFEDMG: M	Yes ☐ No ☐ N/A ☐
EDMG-M3.3	A-MPDU with multiple TIDs	9.3.1.7.4, 9.3.1.8.8, 10.25.5, 10.70	CFEDMG: O	Yes ☐ No ☐ N/A ☐
EDMG-M4	EDMG flow control			
EDMG-M4.1	Flow control operation	10.25	CFEDMG:M	Yes ☐ No ☐ N/A ☐
EDMG-M4.2	EDMG Flow Control Extension Configuration element			
EDMG-M4.2.1	RBUFCAP values: 0, FF	9.4.2.276	CFEDMG: M	Yes ☐ No ☐ N/A ☐
EDMG-M4.2.2	RBUFCAP values: 1 – FE	9.4.2.276	CFEDMG: O	Yes ☐ No ☐ N/A ☐
EDMG-M4.2.3	Recipient Memory Configuration subelement	9.4.2.276	CFEDMG:O	Yes ☐ No ☐ N/A ☐
EDMG-M4.2.4	Advanced Recipient Memory Length Exponent	9.4.2.276	CFEDMG:O	Yes ☐ No ☐ N/A ☐
EDMG-M5	EDMG spatial stream feedback	10.42.4	EDMG-M9.1:O EDMG-M9.2:O	Yes ☐ No ☐ N/A ☐
EDMG-M6	Directional allocation	10.38.12.3	CFEDMG: O EDMG-M16.4:M	Yes ☐ No ☐ N/A ☐
EDMG-M7	EDMG AP or EDMG PCP distributed scheduling	10.68	CFEDMG:O	Yes ☐ No ☐ N/A ☐
EDMG-M8	Use of multiple channels			
EDMG-M8.1	CCA on the primary, secondary channels	8.3.5.12	CFEDMG: M	Yes ☐ No ☐ N/A ☐
EDMG-M8.2	CCA on secondary1 channels	8.3.5.12, 9.4.2.264.5	EDMG-P2.3 OR EDMG-P2.6:M	Yes ☐ No ☐ N/A ☐
EDMG-M8.3	CCA on secondary2 channels	8.3.5.12, 9.4.2.264.5	EDMG-P2.4 OR EDMG-P2.6:M	Yes ☐ No ☐ N/A ☐
EDMG-M8.4	RTS, DMG CTS, DMG DTS, Ack, Block Ack duplicate transmission	10.3.2	CFEDMG: M	Yes ☐ No ☐ N/A ☐
EDMG-M8.5	RTS, DMG CTS, DMG DTS bandwidth signaling	10.3.2, 10.38.12.2	CFEDMG: M	Yes ☐ No ☐ N/A ☐

EDMG-P7.4	Codeword = 1344, *R* = 1/2, 5/8, 3/4, 13/16	28.3.6	EDMG-P5.3 OR EDMG-P5.4:O	Yes ☐ No ☐ N/A ☐
EDMG-P7.5	Codeword = 1248, *R* = 7/8 punctured	28.5.9.4.3, 28.6.9.2.3	EDMG-P5.3 OR EDMG-P5.4:O EDMG-P7.6:M	Yes ☐ No ☐ N/A ☐
EDMG-P7.6	Codeword = 1344, *R* = 7/8 superimposed	28.3.6	EDMG-P5.3 OR EDMG-P5.4:O	Yes ☐ No ☐ N/A ☐

B.4.35 Time division duplex (TDD) features

Item	Protocol capability	References	Status	Support
	Are the following TDD protocol features supported?			
TDD-M1	TDD capabilities signaling			
TDD-M1.1	DMG Capabilities element	9.4.2.126	CFTDD:M	Yes ☐ No ☐ N/A ☐
TDD-M1.2	Signaling of STA capabilities in Probe Request, (Re)Association Request frames	9.3.3.5, 9.3.3.7, 9.3.3.9, 9.4.2.126	(CFTDD AND (CFSTAofAP OR CFIBSS OR CFPBSSnotPCP)):M	Yes ☐ No ☐ N/A ☐
TDD-M1.3	Signaling of STA capabilities in Probe Response, (Re)Association Response frames	9.3.3.6, 9.3.3.8, 9.3.3.10, 9.4.2.126	(CFTDD AND (CFAP OR CFPCP)):M	Yes ☐ No ☐ N/A ☐
TDD-M.2	TDD channel access

B.4.35 Time division duplex (TDD) features *(continued)*

Item	Protocol capability	References	Status	Support
TDD-M.2.1	SP with TDD channel access	10.38.6.2.1 10.38.6.2.2, 9.4.2.280, 9.4.2.281	CFTDD:M	Yes ☐ No ☐ N/A ☐
TDD-M.2.2	BlockAck procedure within a TDD SP	10.25.6.5	CFTDD:M	Yes ☐ No ☐ N/A ☐
TDD-M.2.3	Acknowledgment procedure within a TDD SP	10.3.2.11	CFTDD:M	Yes ☐ No ☐ N/A ☐
TDD-M.2.4	Beacon generation under TDD channel access	11.1.3.3.4	CFTDD:O	Yes ☐ No ☐ N/A ☐
TDD-M.2.5	Directional Transmit Activity Report frames transmission	11.30.5	CFTDD:M	Yes ☐ No ☐ N/A ☐
TDD-M3	MIMO			
*TDD-M3.1	SU-MIMO capable	9.4.2.264.2	CFTDD AND CFEDMG: O	Yes ☐ No ☐ N/A ☐
TDD-M3.2	SU-MIMO channel access in a TDD slot	10.38.12.4.2, 10.38.12.4.3	TDD-M3.1:M	Yes ☐ No ☐ N/A ☐
TDD-M4	TDD beamforming features			
TDD-M4.1	TDD beamforming	10.41.11	CFTDD:M	Yes ☐ No ☐ N/A ☐
TDD-M4.2	SU-MIMO beamforming	10.41.10.2.2	TDD-M3.1:M	Yes ☐ No ☐ N/A ☐

B.4.36 Wake-up Radio (WUR) features

B.4.36.1 WUR MAC features

Item	Protocol capability	References	Status	Support
	Are the following MAC protocol features supported?			
WURM1	WUR capabilities signaling		CFWUR:M	Yes ☐ No ☐ N/A ☐
WURM1.1	WUR Capabilities element	9.4.2.290	CFWUR:M	Yes ☐ No ☐ N/A ☐
WURM1.2	Signaling of STA capabilities in Probe Request, (Re)Association Request frames	9.3.3.5, 9.3.3.7, 9.3.3.9, 9.4.2.290	(CFWUR AND CFSTAo-fAP):M	Yes ☐ No ☐ N/A ☐
WURM1.3	Signaling of STA and BSS capabilities in Beacon, Probe Response, (Re)Association Response frames	9.3.3.2, 9.3.3.6, 9.3.3.8, 9.3.3.10, 9.4.2.290	(CFWUR AND CFAP):M	Yes ☐ No ☐ N/A ☐
WURM2	Signaling of WUR operation	9.4.2.291	(CFWUR AND CFAP):M	Yes ☐ No ☐ N/A ☐
WURM2.1	Signaling of WUR operation in Beacon, Probe Response, (Re)Association Response frames	9.3.3.2, 9.3.3.6, 9.3.3.8, 9.3.3.10, 9.4.2.291	(CFWUR AND CFAP):M	Yes ☐ No ☐ N/A ☐
WURM3	Signaling of WUR mode	9.4.2.292	CFWUR:M	
WURM3.1	Signaling of WUR mode in WUR Mode Setup, WUR Mode Teardown	9.6.33.2, 9.6.33.3, 9.4.2.292	CFWUR:M	Yes ☐ No ☐ N/A ☐

B.4.36.1 WUR MAC features *(continued)*

Item	Protocol capability	References	Status	Support
WURM4	WUR duty cycle operation	29.7	CFWUR:O	Yes ☐ No ☐ N/A ☐
WURM5	WUR mode setup in WUR power management procedure	29.8.2	CFWUR:M	Yes ☐ No ☐ N/A ☐
WURM6	WUR non-AP STA operation in WUR power management procedure	29.8.4	(CFWUR AND CFSTAo-fAP):M	Yes ☐ No ☐ N/A ☐
WURM7	WUR AP operation in WUR power management procedure	29.9	(CFWUR AND CFAP):M	Yes ☐ No ☐ N/A ☐
WURM8	Wake-up operation	29.9	CFWUR:M	Yes ☐ No ☐ N/A ☐
WURM8.1	Wake-up operation with a WUR Wake-up frame with a WUR group ID	29.9	CFWUR:O	Yes ☐ No ☐ N/A ☐
WURM9	Protected WUR frames	29.10	CFWUR:O	Yes ☐ No ☐ N/A ☐
WURM9.1	WUR PN update procedure	9.4.2.294, 29.10.4.3	(CFWUR AND WURM9):O	Yes ☐ No ☐ N/A ☐
WURM10	WUR FDMA operation	29.11	CFWUR:O	Yes ☐ No ☐ N/A ☐
WURM11	WUR discovery	29.12	CFWUR:O	Yes ☐ No ☐ N/A ☐
WURM12	WUR Short Wake-up frame operation	29.9.2	CFWUR:O	Yes ☐ No ☐ N/A ☐

B.4.36.2 WUR PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
WURP1	PHY operating modes			
WURP1.1	Operation according to Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification)	30.1	CFWUR:M	Yes ☐ No ☐ N/A ☐
WURP2	WUR PPDU format			
WURP2.1	WUR PPDU with 20 MHz channel width, WUR LDR, and single stream	30.1, 30.3.2	CFWUR:M	Yes ☐ No ☐ N/A ☐
WURP2.2	WUR preamble	30.3.9	CFWUR:M	Yes ☐ No ☐ N/A ☐
WURP2.3	WUR-Data field	30.3.10	CFWUR:M	Yes ☐ No ☐ N/A ☐
WURP2.4	WUR PPDU with WUR HDR	30.1, 30.3.2	(CFWUR AND CFAP):M (CFWUR AND CFSTAo-fAP):O	Yes ☐ No ☐ N/A ☐
WURP3	WUR FDMA PPDU	30.1, 30.3.3	CFWUR:O	Yes ☐ No ☐ N/A ☐
WURP4	WUR encoding for the Data field	30.3.10.2	CFWUR:M	Yes ☐ No ☐ N/A ☐

B.4.37 Enhanced positioning (Ranging) features

B.4.37.1 EP MAC features

Item	Protocol capability	References	Status	Support
	Are the following MAC protocol features supported?			
EP7	Passive TB ranging operation			
EP7.1	Passive TB ranging sequence	11.21.6.4.8	CFPTB:M CFHE:O	Yes ☐ No ☐ N/A ☐
EPM1	EP capability signaling			
EPM1.1	EP FTM support advertisement	11.21.6.2, 11.21.6.3.1	(CFTB OR CFNTB):M	Yes ☐ No ☐ N/A ☐
EPM1.2	EP FTM capability negotiation	11.21.6.3.1	(CFTB OR CFNTB):M	Yes ☐ No ☐ N/A ☐
EPM1.3	EP secured MAC operation negotiation	12.13, 11.21.6.4.5	CFPASN:M (CFTB OR CFNTB):M	Yes ☐ No ☐ N/A ☐
EPM2	TB ranging operation			
EPM2.1	TB measurement sequence	11.21.6.4.3	CFTB:M	Yes ☐ No ☐ N/A ☐
EPM2.2	Protected LMR exchange in TB ranging exchange	12.13, 11.21.6.4.5	(CFTB AND CFPASN): M CFPSEC:M	Yes ☐ No ☐ N/A ☐
EPM3	MAC support of PHY security			
EPM3.1	SAC exchange for TB operation	12.13, 11.21.6.4.5	CFTB:O CFPSEC:M	Yes ☐ No ☐ N/A ☐
EPM4	Non-TB ranging operation			
EPM4.1	non-TB ranging exchange	11.21.6.4.4	CFNTB:M	Yes ☐ No ☐ N/A ☐
EPM4.2	Protected LMR exchange in non-TB ranging exchange	12.13, 11.21.6.4.5	(CFNTB AND CFPASN):M CFPSEC:M	Yes ☐ No ☐ N/A ☐
EPM4.3	SAC exchange for non-TB ranging operation	12.13, 11.21.6.4.5	CFNTB:O CFPSEC:M	Yes ☐ No ☐ N/A ☐
EPM5	EDMG/DMG operation	11.21.6.4.2.2	O	Yes ☐ No ☐
EPM5.1	EDMG/DMG direction measurement as ISTA	11.21.6.4.2.3	CFISTA: O	Yes ☐ No ☐ N/A ☐
EPM5.2	EDMG/DMG direction measurement as RSTA	11.21.6.4.2.3	CFRSTA: O	Yes ☐ No ☐ N/A ☐
EPM5.3	EDMG FTM with first arrival path as ISTA	11.21.6.4.2.6	(CFISTA and EMDG-M16.7): M	Yes ☐ No ☐ N/A ☐
EPM5.4	EDMG FTM with first arrival path as RSTA	11.21.6.4.2.6	(CFRSTA and EMDG-M16.7): M	Yes ☐ No ☐ N/A ☐
EPM5.5	EDMG direction measurement with first arrival path as ISTA	11.21.6.4.2.3	(CFISTA and EMDG-M16.7): O	Yes ☐ No ☐ N/A ☐
EPM5.6	EDMG direction measurement with first arrival path as RSTA	11.21.6.4.2.3	(CFRSTA and EMDG-M16.7): O	Yes ☐ No ☐ N/A ☐

B.4.37.1 EP MAC features *(continued)*

Item	Protocol capability	References	Status	Support
EPM5.7	EDMG LOS assessment as ISTA	11.21.6.4.2.5	(CFISTA and EMDG-M16.7 and EDMG-M16.10):O	Yes ☐ No ☐ N/A ☐
EPM5.8	EDMG LOS assessment as RSTA	11.21.6.4.2.5	(CFISTA and EMDG-M16.7 and EDMG-M16.10):O	Yes ☐ No ☐ N/A ☐
EPM6	Secure EDMG FTM operation	11.21.6.4.8	(CFEDMG and (CFISTA or CFRSTA) and EPP4 and EPM1.3):	Yes ☐ No ☐ N/A ☐

B.4.37.2 EP PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
EPP1	EP TB and non-TB measurement exchange waveforms	27.3		
EPP1.1	HE ranging NDP	27.3.19.1	(CFTB OR CFNTB OR CFPTB):M	Yes ☐ No ☐ N/A ☐
EPP1.2	HE ranging NDP with secure HE-LTFs	27.3.19.1	(CFTB OR CFNTB):M CFPASN:M CFPSEC:M	Yes ☐ No ☐ N/A ☐
EPP1.3	HE TB ranging NDP	27.3.19.2	CFTB:M	Yes ☐ No ☐ N/A ☐
EPP1.4	HE TB ranging NDP with secure HE-LTFs	27.3.19.2	CFPASN:M CFPSEC:M CFTB:M	Yes ☐ No ☐ N/A ☐
EPP2	MIMO operation			
EPP2.1	Multi transmit streams	11.21.6.4.3, 11.21.6.4.4	(CFTB or CFNTB):M	Yes ☐ No ☐ N/A ☐
EPP2.2	Multi receive streams	11.21.6.4.3, 11.21.6.4.4	(CFTB or CFNTB):M	Yes ☐ No ☐ N/A ☐
EPP3	EDMG frame formats			
EPP4	Secure ranging EDMG TRN field	28.9.3.5, 28.9.3.6, 28.9.3.7		Yes ☐ No ☐ N/A ☐

B.4.38 NGV features

B.4.38.1 NGV MAC features

Item	Protocol capability	References	Status	Support
	Are the following MAC protocol features supported?			
NGVM1	Operating band			
NGVM1.1	NGV operation in the 5.9 GHz band	31.2	CFNGV:M	Yes ☐ No ☐ N/A ☐
NGVM1.2	NGV operation in the 60 GHz band	31.3	CFNGV60:M	Yes ☐ No ☐ N/A ☐
NGVM2	NGV fallback procedure			
NGVM2.1	20 MHz transmission fallback to 10 MHz	31.2.2	CFNGV:O	Yes ☐ No ☐ N/A ☐
NGVM3	DMG operation			
NGVM3.1	DMG OCB element	9.4.2.310	CFNGV60:M	Yes ☐ No ☐ N/A ☐
NGVM3.2	DMG beamforming outside the context of a BSS	31.3.1	CFNGV60:M	Yes ☐ No ☐ N/A ☐
NGVM4	NGV ranging			
NGVM4.1	Support for NGV ranging	31.4	CFNGV:O	Yes ☐ No ☐ N/A ☐
*NGVM4.2	Support for NGV ranging in the 5.9 GHz frequency band	31.4	(CFNGV AND CFNTB):O	Yes ☐ No ☐ N/A ☐

B.4.38.2 NGV PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
NGVP1	Operating bandwidth			
*NGVP1.1	10 MHz operation in the 5.9 GHz band	32.5	CFNGV:M	Yes ☐ No ☐ N/A ☐
*NGVP1.2	20 MHz operation in the 5.9 GHz band	32.5	CFNGV:O	Yes ☐ No ☐ N/A ☐
NGVP2	Modulation and coding schemes (MCS)			
NGVP2.1	NGV-MCS with Index = 0–8, or 15 and 10 MHz and N_{SS} = 1	32.5	NGVP1.1:M	Yes ☐ No ☐ N/A ☐
NGVP2.2	NGV-MCS with Index = 0–8 and 10 MHz and N_{SS} = 2	32.5	NGVP1.1:O	Yes ☐ No ☐ N/A ☐
NGVP2.3	NGV-MCS with Index = 0–9, or 15 and 20 MHz and N_{SS} = 1	32.5	NGVP1.2:M	Yes ☐ No ☐ N/A ☐
NGVP2.4	NGV-MCS with Index = 0–9 and 20 MHz and N_{SS} = 2	32.5	NGVP1.2:O	Yes ☐ No ☐ N/A ☐
NGVP3	Transmit spectrum masks			
NGVP3.1	Spectrum mask, Class A (10 MHz channel spacing)	D.2.3	CFNGV:O	Yes ☐ No ☐ N/A ☐

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

B.4.38.2 NGV PHY features *(continued)*

Item	Protocol capability	References	Status	Support
NGVP3.2	Spectrum mask, Class B (10 MHz channel spacing)	D.2.3	CFNGV:O	Yes ☐ No ☐ N/A ☐
NGVP3.3	Spectrum mask, Class C (10 MHz channel spacing)	D.2.3	NGVP1.1:M	Yes ☐ No ☐ N/A ☐
NGVP3.4	Spectrum mask C2, Class C (20 MHz channel spacing)	D.2.3	NGVP1.2:M	Yes ☐ No ☐ N/A ☐
NGVP3.5	Spectrum mask, Class D (10 MHz channel spacing)	D.2.3	CFNGV:O	Yes ☐ No ☐ N/A ☐
NGVP4	NGV PPDU format			
NGVP4.1	Midambles	32.3	CFNGV:M	Yes ☐ No ☐ N/A ☐
NGVP4.2	LDPC support	32.3	CFNGV:M	Yes ☐ No ☐ N/A ☐
NGVP4.3	NGV ranging NDP	31.4	NGVM4.2:M	Yes ☐ No ☐ N/A ☐

B.4.38.3 NGV extended MAC service features

Item	Feature	References	Status	Support
	Are the following NGV extended MAC service features supported?			
NGVE1	NGV extended MAC service features			
NGVE1.1	NGV extended MAC service features-MLME; 5.9 GHz band (MLME-CANCELTX)	10.2.3.2, 6.5.26		
NGVE1.2	NGV extended MAC service features—MLME; DMG (MLME-DMG-OCB-START, MLME-DMG-OCB-STOP, MLME-OCB-DMG-DISCOVERY, MLME-OCB-LINKSTATUS)	11.1.4, 11.27	CFNGV60:M	Yes ☐ No ☐ N/A ☐

B.4.39 Light communications (LC) features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
LCP1	LC PHY level of support			
*LCP1.1	LC PHY with HT support	33.2.1	CFHT5G: O.1	Yes □ No □ N/A □
*LCP1.2	LC PHY with VHT support	33.2.1	CFVHT: O.1	Yes □ No □ N/A □
*LCP1.3	LC PHY with HE support	33.2.1	CFHE5G OR CFHE6G: O.1	Yes □ No □ N/A □
LCP3	Channel numbering and channelization	33.2.3.4		
LCP3.1	5 GHz band mapping	33.2.3.4	CFLC: O.2	Yes □ No □ N/A □
LCP3.2	6 GHz band mapping	33.2.3.4	CFLC: O.2	Yes □ No □ N/A □
LCP4	Multiple transmit and receive chains	33.2.3.5		
LCP4.1	More than one transmit chain	33.2.3.5	CFLC: O	Yes □ No □ N/A □
LCP4.2	More than one receive chain	33.2.3.5	CFLC: O	Yes □ No □ N/A □
LCP5	LC CCA requirements	33.2.3.7.1	CFLC: M	Yes □ No □ N/A □
LCP6	LC repetition mechanism	33.2.3.7.2	CFLC: O	Yes □ No □ N/A □

B.4.40 Enhanced Broadcast Services (EBCS) features

Item	Protocol capability	References	Status	Support
*EBCS1	EBCS downlink procedure	34.3	CFEBCS:O.1 CFSTARXOnly: M	Yes ☐ No ☐ N/A ☐
EBCS1.1	EBCS Info frame	9.6.7.54	EBCS1:M	Yes ☐ No ☐ N/A ☐
*EBCS2	EBCS uplink procedure	34.4	CFEBCS:O.1	Yes ☐ No ☐ N/A ☐
EBCS2.1	EBCS UL frame	9.6.7.53	EBCS2:M	Yes ☐ No ☐ N/A ☐
*EBCS3	Frame authentication for EBCS	12.15	CFEBCS:M	Yes ☐ No ☐ N/A ☐
*EBCS3.1	PKFA	12.15.2	EBCS1 AND EBCS3:O.2 EBCS2 AND EBCS3:O.3	Yes ☐ No ☐ N/A ☐
EBCS3.1.1	PKFA MPDU	12.15.3	EBCS3.1: M	Yes ☐ No ☐ N/A ☐
*EBCS3.2	HCFA	12.15.3	EBCS1 AND EBCS3: O.2	Yes ☐ No ☐ N/A ☐
EBCS3.2.1	HCFA MPDU	12.15.3.3	EBCS3.2: M	Yes ☐ No ☐ N/A ☐
EBCS3.3	HLSA	12.15.4	EBCS1 AND EBCS3: O.2 EBCS2 AND EBCS3: O.3	Yes ☐ No ☐ N/A ☐
EBCS3.4	RSASSA-PSS	12.15.2.1, 12.15.2.2	EBCS3:O	
EBCS3.5	ECDSA	12.15.2.1, 12.15.2.2	EBCS3:M	
*EBCS4	EBCS DL negotiation procedures	34.3.8, 34.3.7	CFAP AND EBCS1: M CFSTAofAP AND EBCS1: M CFIndepSTA AND EBCS1:M	Yes ☐ No ☐ N/A ☐
EBCS4.1	EBCS Content Request frame	9.6.35.2	EBCS4: M	Yes ☐ No ☐ N/A ☐
EBCS4.2	EBCS Content Response frame	9.6.35.3	EBCS4: M	Yes ☐ No ☐ N/A ☐

Annex C

(normative)

ASN.1 encoding of the MAC and PHY MIB

C.1 General

The MIB for the current revision of IEEE Std 802.11 is available online at the following URL: http://www.ieee802.org/11/802.11mib.txt. The MAC and PHY MIBs are described in Abstract Syntax Notation One (ASN.1), defined in ISO/IEC 8824-1:1995, ISO/IEC 8824-2:1995, ISO/IEC 8824-3:1995 and ISO/IEC 8824-4:1995, and as adapted per Structure of Management Information Version 2 (SMIv2) specified in IETF RFC 2578.

NOTE 1—An external management entity is a component that is beyond the scope of this standard. The SME is not an external management entity.

NOTE 2—Certain MIB attributes for a TDLS STA only apply to the link with the AP.

C.2 Guidelines for IEEE 802.11 MIB authors/editors

The MIB may be compiled using the “smitools” package from the Institute of Operating Systems and Computer Networks at the Technical University of Braunschweig, Germany. These tools may be accessed online using the following URL: http://www.ibr.cs.tu-bs.de/bin/smitools.cgi.

Using this tool, the MIB should compile without generating warnings of severity 3 or lower.

Specific points that authors and editors should pay attention to:

- The MIB should compile as specified above prior to submission to IEEE SA RevCom.
- Use only the 7-bit US-ASCII character-set. In particular, use only straight single and double quotes.
- Do not use symbols such as <greek-mu> in units, instead spell out the units fully, i.e., "microseconds."
- Follow the guidelines for writing MIB modules in http://www.rfc-editor.org/rfc/rfc4181.txt (including any updates thereto).
- Pay attention to IETF recommendations on object types.
- When adding a lot of new objects, consider adding a new module.
- Consider seeking advice from an IETF MIB Doctor when creating significant new material. The IEEE has an arrangement with the IETF whereby the IEEE may ask for a MIB Advisor from the IETF MIB Doctors.
- When an object is deprecated, add a line to the Description indicating why (IETF convention).

C.3 MIB detail

dot11StationConfigEntry OBJECT-TYPE
   SYNTAX Dot11StationConfigEntry
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
      "An entry in the dot11StationConfigTable. It is possible for there to be
      multiple IEEE 802.11 interfaces on one agent, each with its unique MAC
      address. The relationship between an IEEE 802.11 interface and an
      interface in the context of the Internet-standard MIB is one-to-one. As
      such, the value of an ifIndex object instance can be directly used to
      identify corresponding instances of the objects defined herein.

      ifIndex - Each IEEE 802.11 interface is represented by an ifEntry.
      Interface tables in this MIB module are indexed by ifIndex."

dot11StationID OBJECT-TYPE
    SYNTAX MacAddress
    MAX-ACCESS read-write
    STATUS current
    DESCRIPTION
        "This is a control variable.
        It is written by the SME or external management entity.
        Changes take effect for the next MLME-START.request primitive.

        The purpose of dot11StationID is to allow a manager to identify a station
        for its own purposes. This attribute provides for that eventuality while
        keeping the true MAC address independent. Its syntax is MAC address, and
        the default value is the STA's assigned, unique MAC address."
    ::= { dot11StationConfigEntry 1 }

dot11MediumOccupancyLimit OBJECT-TYPE

        "This is a control variable.
        It is written by an external management entity.
        Changes take effect for the next MLME-SCAN.request primitive.

        This attribute reflects the service set identifier (SSID) used in the SSID
        parameter of the most recent MLME-SCAN.request primitive. This value may
        be modified by an external management entity and used by the local SME to
        make decisions about the Scanning process."
    ::= { dot11StationConfigEntry 9 }

dot11DesiredBSSType OBJECT-TYPE
    SYNTAX INTEGER { infrastructure(1), independent(2), any(3) }
    MAX-ACCESS read-write
    STATUS current
    DESCRIPTION
        "This is a control variable.
        It is written by an external management entity.
        Changes take effect for the next MLME-SCAN.request primitive.

        This attribute specifies the type of BSS the station uses when scanning
        for a BSS with which to synchronize. This value is used to filter Probe
        Response frames and Beacon frames. When equal to infrastructure, the
        station synchronizes only with a BSS in which the Capability Information
        field has the ESS subfield equal to 1. When equal to independent, the
        station synchronizes only with a BSS whose Capability Information field
        has the IBSS subfield equal to 1. When equal to any, the station may
        synchronize to either type of BSS."

    SYNTAX OCTET STRING (SIZE(1..126))
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
        "This is a status variable.
        It is written by the SME when joining or establishing a BSS.

        This attribute specifies the set of non-HT data rates at which the station
        is able to receive data. Each octet contains a value representing a rate.
        Each rate is within the range 2 to 127, corresponding to data rates in
        increments of 500 kb/s from 1 Mb/s to 63.5 Mb/s, and is supported (as
        indicated in the supported rates table) for receiving data. This value is
        reported in transmitted Beacon, Probe Request, Probe Response, Association
        Request, Association Response, Reassociation Request, and Reassociation
        Response frames, and is used to determine whether a BSS with which the
        station might synchronize is suitable. It is also used when starting a
        BSS, as specified in 6.5.4."

dot11WirelessMgmtOptionsTable OBJECT-TYPE
    SYNTAX SEQUENCE OF Dot11WirelessMgmtOptionsEntry
    MAX-ACCESS not-accessible
    STATUS current
    DESCRIPTION
        "Wireless Management attributes. In tabular form to allow for multiple
        instances on an agent. This table only applies to the interface if
        dot11WirelessManagementImplemented is equal to true in the
        dot11StationConfigTable."
    ::= { dot11smt 18 }

dot11WirelessMgmtOptionsEntry OBJECT-TYPE
    SYNTAX Dot11WirelessMgmtOptionsEntry
    MAX-ACCESS not-accessible
    STATUS current
    DESCRIPTION
        "An entry in the dot11WirelessMgmtOptionsTable. For all Wireless
        Management features, an Activated MIB attribute is used to activate/enable
        or deactivate/disable the corresponding feature. An Implemented MIB
        attribute is used for an optional feature to indicate whether the feature
        is implemented. A mandatory feature does not have a corresponding
        Implemented MIB attribute. It is possible for there to be multiple IEEE
        802.11 interfaces on one agent, each with its unique MAC address. The
        relationship between an IEEE 802.11 interface and an interface in the
        context of the Internet-standard MIB is one-to-one. As such, the value of
        an ifIndex object instance can be directly used to identify corresponding
        instances of the objects defined herein. ifIndex - Each IEEE 802.11
        interface is represented by an ifEntry. Interface tables in this MIB
        module are indexed by ifIndex."

-- ************************************************************************
-- * IEEE 802.11 RM and WNM Interface MIB
-- ************************************************************************

-- * The primary interface to the radio measurements and Wireless
-- * Network Management functions is meant to be real-time information
-- * obtained through the request/response mechanisms of RM and WNM.
-- * A secondary interface to the measurements and management functions
-- * is through retention of information in this MIB. Non-SNMP requests
-- * for information are obtained via object IDs (OIDs) through the NDIS
-- * or wireless interfaces in the operating systems. SNMP requests for
-- * information are obtained via SNMP SETs and GETs (see IETF RFC 1157 [B22]).

-- * dot11RMRequest and dot11RMReport Usage
-- *
-- * The dot11RMRequest and dot11RMReport portions of the RM MIB
-- * provide access to the Radio Measurement service. By performing
-- * SET operations on the various dot11RMRequest MIB objects,
-- * radio measurements may be initiated directly on the local STA or
-- * on any peer station within the same BSS. Subsequently, by
-- * performing GET operations on the various dot11RMReport MIB
-- * objects the results of the requested measurements may be
-- * retrieved.
-- *
-- * In the diagram below, a radio measurement could be initiated
-- * for STA x by performing a MIB.set operation on the RM MIB of
-- * STA x and specifying the MAC address of STA x in
-- * dot11RMRqstTargetAdd. Additionally, it is possible to have STA x
-- * request a measurement from STA y by performing a MIB.set operation
-- * on the SME MIB of STA x and specifying the MAC address of STA y in
-- * dot11RMRqstTargetAdd. In both cases the result of the measurements
-- * can be retrieved by performing a MIB.get operation on the RM MIB
-- * of STA x upon completion of the measurement.
-- *
-- *
-- *          MIB.Set                                          MIB.Set
-- *             or                                               or
-- *          MIB.Get                                          MIB.Get

-- *     |                   | <==Measurement Request==>  |                   |
-- *     |                   | <==Measurement Report===>  |                   |
-- *     | MLME              |                            | MLME              |
-- *     +===================+                            +===================+
-- *           STA x                                            STA y
-- *
-- * Each STA maintains a single dot11RMRequestTable in the SME MIB
-- * used to initiate RM Measurement Requests. Each dot11RMRequestEntry
-- * in the table represents an individual Measurement Request that
-- * makes up a complete Measurement Request frame.
-- * Multiple Measurement Requests may be concatenated into a single
```

```
-- * Measurement Request frame by setting the same
-- * dot11RMRqstToken value into multiple dot11RMRequestEntrys.
-- *
-- * Each row, dot11RMRequestEntry, of the dot11RMRequestTable
-- * provides read-create access for the initiation of a measurement
-- * request. The dot11RMRequestNextIndex object can be used to
-- * determine which is the next available row. Each row corresponding to
-- * one measurement in the sequence is created with a dot11RMRqstRowStatus
-- * equal to notInService. Once the dot11RMRequestEntry(s) have been
-- * created for a desired measurement sequence the corresponding
-- * dot11RMRqstRowStatus(s) objects are set to active to indicate that
-- * the SME can trigger the appropriate MLME primitives. Upon processing
-- * the request, the SME returns the corresponding dot11RMRqstRowStatus(s)
-- * object to notInService and are now available for additional
-- * measurement requests.
-- *
-- * After a radio measurement is complete the RM populates the RMReport
-- * objects with the results of the measurement. Each STA maintains a set
-- * of RMReport tables, one corresponding to each measurement type. The
-- * results of the entire measurement sequence are spread across the tables
-- * based on the type of measurements requested. Each xxxReportEntry
-- * within a xxxReportTable contains a xxxRprtRqstToken that corresponds
-- * to the original dot11RMRqstToken in the measurement request. So the
-- * results of the measurement can be collected by searching the appropriate
-- * xxxReportTables and retrieve any reports with the matching request
-- * token.
-- *
-- * Similar structures and mechanisms are used for WNM
-- * Request and Reports. The WNM MIB definitions follow the RM MIB definitions
-- * in this Annex.

dot11RMRequestNextIndex OBJECT-TYPE
   SYNTAX Unsigned32 (0..65535)
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
      "This is a status variable.
      It is written by the SME when able to accept a new request.

      Identifies a hint for the next value of dot11RMRqstIndex to be used in a
      row creation attempt for dot11RMRequestTable. If no new rows can be cre-
      ated for some reason, such as memory, processing requirements, etc., the
      SME sets this attribute to 0. It updates this attribute to a proper value
      other than 0 as soon as it is capable of receiving new measurement
      requests. The nextIndex is not necessarily sequential nor monotonically
      increasing."

```
    SYNTAX SEQUENCE OF Dot11RMRequestEntry
    MAX-ACCESS not-accessible
    STATUS current
    DESCRIPTION
        "This group contains the current list of requests for RM reports to be
        issued and have been issued until removed. A network manager adds an RM
        request by creating a row with createAndWait row status and then filling
        in the request parameters/attributes. The request becomes active to be
        issued when the row status is set to Active. The columnar objects or
        attributes other than the rowStatus are not written if the rowStatus is
        Active. The request rows can be deleted, if commanded by a network manager
        via changing the value of dot11RMRqstRowStatus to Destroy. This may leave
        orphaned rows if a manager crashes and forgets which rows are being used
        by it. One recommended way to manage orphaned or finished rows is to
        delete rows if their dot11RMRqstRowStatus remains other than Active for
        longer than a period (recommend at least 5 minutes, IETF RFC 2579). Or
        another recommended way is to delete older rows as needed based on their
        dot11RMRqstTimeStamp values. This can be done by the agent as well as the
        manager. "

```
        individual request. When this attribute is set to Active, AND a measure-
        ment request can be unambiguously created based on the parameters in the
        row, then the MLME may proceed to issue the request to its intended tar-
        gets when appropriate. If not, this attribute may be set to Not-ready
        immediately to indicate parametric errors. However, it is the network man-
        agers
        responsibility to correct the error. If the request is successfully issued
        to the target STA, then the rowStatus is set to notInService."
    ::= { dot11RMRequestEntry 2 }

dot11RMRqstToken OBJECT-TYPE
    SYNTAX OCTET STRING
    MAX-ACCESS read-create
    STATUS current
    DESCRIPTION
        "This is a control variable.
        It is written by an external management entity when the table entry is
        created, i.e., when requesting a measurement..
        Changes take effect when dot11RMRqstRowStatus is set to Active.

        This attribute indicates a unique string to identify a group of rows to be
        issued as parallel or sequential measurements. To guarantee the uniqueness
        of this token across multiple network managers, it is recommended that
        this token be prefixed with the IP address of the network manager creating
        this row. This token is not necessarily equivalent to the measurement
        tokens in RM request frames. If this attribute is an empty string, then
        this row of request is independent from other requests."

   STATUS current
   DESCRIPTION
   "This table contains the current list of Channel Load reports that have been
      received by the MLME. The report tables are maintained as a FIFO to pre-
      serve freshness, thus the rows in this table can be deleted for memory
      constraints or other implementation constraints determined by the vendor.
      New rows have different RprtIndex values than those deleted within the
      range limitation of the index. One easy way is to increment RprtIndex for
      new reports being written in the table."

    STATUS current
    DESCRIPTION
        "Identifies the next available index for managing the neighbor report
        table. If this attribute is 0, it indicates that the neighbor report fea-
        ture is not configurable via SNMP, or the table is full and new rows can-
        not be accepted."
    ::= { dot11RMConfig 2 }

dot11RMNeighborReportTable OBJECT-TYPE
    SYNTAX SEQUENCE OF Dot11RMNeighborReportEntry
    MAX-ACCESS not-accessible
    STATUS current
    DESCRIPTION
    "This table contains pertinent information on a collection of BSSIDs that are
        candidates to which STAs can roam. The rows are created using createAnd-
        Wait method and fill in the attributes. When the rowStatus is set to
        active, the row can be included in Neighbor Report elements. If there is
        an error, the rowStatus is set to notReady by SME. Since this table con-
        tains all Neighbor Report element entries for all interfaces enabled with
        the neighbor report feature, it is possible to have too many entries for
        one interface, while still remaining under the MaxTableSize. In that sit-
        uation, SME includes neighbor report entries only with lower dot11RM-
        NeighborReportIFIndex up to the maximum possible number of entries for a
        particular interface identified by ifIndex. SME sets the rowStatus to
        notInService for those rows that cannot be included in the Neighbor Report
        element for that interface."

```
        This variable indicates the maximum number of rows of CSI explicit feed-
        back from the beamformee or calibration responder or transmit ASEL
        responder that a beamformer or calibration initiator or transmit ASEL ini-
        tiator can support when SCI feedback is required, equal to 0 for a single
        row of CSI, equal to 1 for 2 rows of CSI, equal to 2 for 3 rows of CSI,
        equal to 3 for 4 rows of CSI. See 9.4.2.54.6"

dot11RMNeighborReportHTTransmitBeamformingChannelEstimationCap OBJECT-TYPE
    SYNTAX Unsigned32 (0..3)
    MAX-ACCESS read-create
    STATUS current
    DESCRIPTION
        "This is a status variable.
        It is written by the SME when a measurement report is completed.

        This variable indicates the maximum number of space-time streams for which
        channel dimensions can be simultaneously estimated when receiving an NDP
        sounding PPDU or the extension portion of the HT-LTFs in a staggered
        sounding PPDU. Equal to 0 for 1 space-time stream, equal to 1 for 2 space-
        time streams, equal to 2 for 3 space-time streams, equal to 3 for 4 space-
        time streams. See 9.4.2.54.6"
