Abstract: Technical corrections and clarifications to IEEE Std 802.11 for wireless local area networks (WLANs) as well as enhancements to the existing medium access control (MAC) and physical layer (PHY) functions are specified in this revision. Amendments 1 to 7 published in 2021 to 2024 have also been incorporated into this revision.

Keywords: 2.4 GHz, 256-QAM, 3650 MHz, 4.9 GHz, 5 GHz, 5.9 GHz, 60 GHz, advanced encryption standard, AES, audio, beamforming, carrier sense multiple access/collision avoidance, CCMP, channel switching, clustering, contention based access period, Counter Mode with Cipher-block chaining Message authentication code Protocol, confidentiality, CSMA/CA, DFS, direct link, directional multi-gigabit, dynamic allocation of service period, dynamic extension of service period, dynamic frequency selection, dynamic truncation of service period, E911, EDCA, emergency alert system, emergency services, fast session transfer, forwarding, GCMP, generic advertisement service, high throughput, IEEE 802.11™, international roaming, interworking, interworking with external networks, LAN, local area network, MAC, management, measurement, medium access control, media-independent handover, medium access controller, mesh, MIS, millimeter-wave, MIMO, MIMO-OFDM, multi-band operation, multi-hop, multi-user MIMO, multiple input multiple output, network advertisement, network discovery, network management, network selection, noncontiguous frequency segments, OCB, path-selection, personal basic service set, PHY, physical layer, power saving, QoS, quality of service, quality-of-service management frame, radio, radio frequency, RF, radio resource, radio management, relay operation, spatial sharing, SSPN, subscriber service provider, television white spaces, TPC, transmit power control, video, wireless access in vehicular environments, wireless LAN, wireless local area network, WLAN, wireless network management, zero-knowledge proof

Important Notices and Disclaimers Concerning IEEE Standards Documents

IEEE Standards documents are made available for use subject to important notices and legal disclaimers. These notices and disclaimers, or a reference to this page (https://standards.ieee.org/ipr/disclaimers.html), appear in all standards and may be found under the heading "Important Notices and Disclaimers Concerning IEEE Standards Documents."

Notice and Disclaimer of Liability Concerning the Use of IEEE Standards Documents

IEEE Standards documents are developed within IEEE Societies and subcommittees of IEEE Standards Association (IEEE SA) Board of Governors. IEEE develops its standards through an accredited consensus development process, which brings together volunteers representing varied viewpoints and interests to achieve the final product. IEEE standards are documents developed by volunteers with scientific, academic, and industry-based expertise in technical working groups. Volunteers are not necessarily members of IEEE or IEEE SA and participate without compensation from IEEE. While IEEE administers the process and establishes rules to promote fairness in the consensus development process, IEEE does not independently evaluate, test, or verify the accuracy of any of the information or the soundness of any judgments contained in its standards.

IEEE makes no warranties or representations concerning its standards, and expressly disclaims all warranties, express or implied, concerning this standard, including but not limited to the warranties of merchantability, fitness for a particular purpose and non-infringement. IEEE Standards documents do not guarantee safety, security, health, or environmental protection, or guarantee against interference with or from other devices or networks. In addition, IEEE does not warrant or represent that the use of the material contained in its standards is free from patent infringement. IEEE Standards documents are supplied "AS IS" and "WITH ALL FAULTS."

Use of an IEEE standard is wholly voluntary. The existence of an IEEE standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard.

In publishing and making its standards available, IEEE is not suggesting or rendering professional or other services for, or on behalf of, any person or entity, nor is IEEE undertaking to perform any duty owed by any other person or entity to another. Any person utilizing any IEEE Standards document, should rely upon their own independent judgment in the exercise of reasonable care in any given circumstances or, as appropriate, seek the advice of a competent professional in determining the appropriateness of a given IEEE standard.

IN NO EVENT SHALL IEEE BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO: THE NEED TO PROCURE SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE PUBLICATION, USE OF, OR RELIANCE UPON ANY STANDARD, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE AND REGARDLESS OF WHETHER SUCH DAMAGE WAS FORESEEABLE.

Translations

The IEEE consensus balloting process involves the review of documents in English only. In the event that an IEEE standard is translated, only the English version published by IEEE is the approved IEEE standard.

Use by artificial intelligence systems

In no event shall material in any IEEE Standards documents be used for the purpose of creating, training, enhancing, developing, maintaining, or contributing to any artificial intelligence systems without the express, written consent of IEEE SA in advance. "Artificial intelligence" refers to any software, application, or other system that uses artificial intelligence, machine learning, or similar technologies, to analyze, train, process, or generate content. Requests for consent can be submitted using the Contact Us form.

Official statements

A statement, written or oral, that is not processed in accordance with the IEEE SA Standards Board Operations Manual shall not be considered or inferred to be the official position of IEEE or any of its committees and shall not be considered to be, nor be relied upon as, a formal position of IEEE. At lectures, symposia, seminars, or educational courses, an individual presenting information on IEEE standards shall make it clear that the presenter's views should be considered the personal views of that individual rather than the formal position of IEEE, IEEE SA, the Standards Committee, or the Working Group. Statements made by volunteers may not represent the formal position of their employer(s) or affiliation(s).

Comments on standards

Comments for revision of IEEE Standards documents are welcome from any interested party, regardless of membership affiliation with IEEE or IEEE SA. However, **IEEE does not provide interpretations, consulting information, or advice pertaining to IEEE Standards documents**.

Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Since IEEE standards represent a consensus of concerned interests, it is important that any responses to comments and questions also receive the concurrence of a balance of interests. For this reason, IEEE and the members of its Societies and subcommittees of the IEEE SA Board of Governors are not able to provide an instant response to comments, or questions except in those cases where the matter has previously been addressed. For the same reason, IEEE does not respond to interpretation requests. Any person who would like to participate in evaluating comments or in revisions to an IEEE standard is welcome to join the relevant IEEE working group. You can indicate interest in a working group using the Interests tab in the Manage Profile & Interests area of the IEEE SA myProject system.[1] An IEEE Account is needed to access the application.

Comments on standards should be submitted using the Contact Us form.[2]

Laws and regulations

Users of IEEE Standards documents should consult all applicable laws and regulations. Compliance with the provisions of any IEEE Standards document does not constitute compliance to any applicable regulatory requirements. Implementers of the standard are responsible for observing or referring to the applicable

[1] Available at: https://development.standards.ieee.org/myproject-web/public/view.html#landing.

[2] Available at: https://standards.ieee.org/content/ieee-standards/en/about/contact/index.html.

regulatory requirements. IEEE does not, by the publication of its standards, intend to urge action that is not in compliance with applicable laws, and these documents may not be construed as doing so.

Data privacy

Users of IEEE Standards documents should evaluate the standards for considerations of data privacy and data ownership in the context of assessing and using the standards in compliance with applicable laws and regulations.

Copyrights

IEEE draft and approved standards are copyrighted by IEEE under U.S. and international copyright laws. They are made available by IEEE and are adopted for a wide variety of both public and private uses. These include both use, by reference, in laws and regulations, and use in private self-regulation, standardization, and the promotion of engineering practices and methods. By making these documents available for use and adoption by public authorities and private users, neither IEEE nor its licensors waive any rights in copyright to the documents.

Photocopies

Subject to payment of the appropriate licensing fees, IEEE will grant users a limited, non-exclusive license to photocopy portions of any individual standard for company or organizational internal use or individual, non-commercial use only. To arrange for payment of licensing fees, please contact Copyright Clearance Center, Customer Service, 222 Rosewood Drive, Danvers, MA 01923 USA; +1 978 750 8400; https://www.copyright.com/. Permission to photocopy portions of any individual standard for educational classroom use can also be obtained through the Copyright Clearance Center.

Updating of IEEE Standards documents

Users of IEEE Standards documents should be aware that these documents may be superseded at any time by the issuance of new editions or may be amended from time to time through the issuance of amendments, corrigenda, or errata. An official IEEE document at any point in time consists of the current edition of the document together with any amendments, corrigenda, or errata then in effect.

Every IEEE standard is subjected to review at least every 10 years. When a document is more than 10 years old and has not undergone a revision process, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE standard.

In order to determine whether a given document is the current edition and whether it has been amended through the issuance of amendments, corrigenda, or errata, visit IEEE Xplore or contact IEEE.[3] For more information about the IEEE SA or IEEE's standards development process, visit the IEEE SA Website.

Errata

Errata, if any, for all IEEE standards can be accessed on the IEEE SA Website.[4] Search for standard number and year of approval to access the web page of the published standard. Errata links are located under the

[3] Available at: https://ieeexplore.ieee.org/browse/standards/collection/ieee.

Additional Resources Details section. Errata are also available in IEEE Xplore. Users are encouraged to periodically check for errata.

Patents

IEEE standards are developed in compliance with the IEEE SA Patent Policy.[5]

Attention is called to the possibility that implementation of this standard may require use of subject matter covered by patent rights. By publication of this standard, no position is taken by the IEEE with respect to the existence or validity of any patent rights in connection therewith. If a patent holder or patent applicant has filed a statement of assurance via an Accepted Letter of Assurance, then the statement is listed on the IEEE SA Website at https://standards.ieee.org/about/sasb/patcom/patents.html. Letters of Assurance may indicate whether the Submitter is willing or unwilling to grant licenses under patent rights without compensation or under reasonable rates, with reasonable terms and conditions that are demonstrably free of any unfair discrimination to applicants desiring to obtain such licenses.

Essential Patent Claims may exist for which a Letter of Assurance has not been received. The IEEE is not responsible for identifying Essential Patent Claims for which a license may be required, for conducting inquiries into the legal validity or scope of Patents Claims, or determining whether any licensing terms or conditions provided in connection with submission of a Letter of Assurance, if any, or in any licensing agreements are reasonable or non-discriminatory. Users of this standard are expressly advised that determination of the validity of any patent rights, and the risk of infringement of such rights, is entirely their own responsibility. Further information may be obtained from the IEEE Standards Association.

IMPORTANT NOTICE

Technologies, application of technologies, and recommended procedures in various industries evolve over time. The IEEE standards development process allows participants to review developments in industries, technologies, and practices, and to determine what, if any, updates should be made to the IEEE standard. During this evolution, the technologies and recommendations in IEEE standards may be implemented in ways not foreseen during the standard's development. IEEE standards development activities consider research and information presented to the standards development group in developing any safety recommendations. Other information about safety practices, changes in technology or technology implementation, or impact by peripheral systems also may be pertinent to safety considerations during implementation of the standard. Implementers and users of IEEE Standards documents are responsible for determining and complying with all appropriate safety, security, environmental, health, and interference protection practices and all applicable laws and regulations.

Participants

At the time this revision was sent to SA ballot, the IEEE 802.11 Working Group (WG) had the following officers:

Dorothy V. Stanley, *Chair*
Jon Walter Rosdahl, *1st Vice Chair*
Robert Stacey, *2nd Vice Chair*
Stephen McCann, *Secretary*

The officers of the WG Task Group me and the members of the WG ballot group for this revision are as follows:

Michael Montemurro, *Chair*
Mark Hamilton *Vice Chair*
Mark Rison, *Vice Chair*
Jon W. Rosdahl, *Secretary*
Emily H. Qi, *Technical Co-Editor*
Edward Au, *Technical Co-Editor*

Introduction

This introduction is not part of IEEE Std 802.11-2024, IEEE Standard for Information Technology—Telecommunications and Information Exchange between Systems—Local and Metropolitan Area Networks—Specific Requirements—Part 11: Wireless LAN Medium Access Control (MAC) and Physical Layer (PHY) Specifications.

This revision gives users, in one document, the IEEE 802.11 standard for wireless local area networks (WLANs) with all of the amendments that have been published to date.

Incorporating published amendments

The original standard was published in 1997, revised in 1999 with MIB changes, and reaffirmed in 2003.

A revision was published in 2007, which incorporated into the 1999 edition the following amendments:

- IEEE Std 802.11a™-1999: High-speed Physical Layer in the 5 GHz Band (Amendment 1)
- IEEE Std 802.11b™-1999: Higher-Speed Physical Layer Extension in the 2.4 GHz Band (Amendment 2)
- IEEE Std 802.11b-1999/Corrigendum 1-2001: Higher-speed Physical Layer (PHY) extension in the 2.4 GHz band (Corrigendum 1 to Amendment 2)
- IEEE Std 802.11d™-2001: Specification for operation in additional regulatory domains (Amendment 3)
- IEEE Std 802.11g™-2003: Further Higher Data Rate Extension in the 2.4 GHz Band (Amendment 4)
- IEEE Std 802.11h™-2003: Spectrum and Transmit Power Management Extensions in the 5 GHz band in Europe (Amendment 5)
- IEEE Std 802.11i™-2004: Medium Access Control (MAC) Security Enhancements (Amendment 6)
- IEEE Std 802.11j™-2004: 4.9 GHz–5 GHz Operation in Japan (Amendment 7)
- IEEE Std 802.11e™-2005: Medium Access Control (MAC) Quality of Service Enhancements (Amendment 8)

A revision was published in 2012, which incorporated into the 2007 revision the following amendments:

- IEEE Std 802.11k™-2008: Radio Resource Measurement of Wireless LANs (Amendment 1)
- IEEE Std 802.11r™-2008: Fast Basic Service Set (BSS) Transition (Amendment 2)
- IEEE Std 802.11y™-2008: 3650–3700 MHz Operation in USA (Amendment 3)
- IEEE Std 802.11w™-2009: Protected Management Frames (Amendment 4)
- IEEE Std 802.11n™-2009: Enhancements for Higher Throughput (Amendment 5)
- IEEE Std 802.11p™-2010: Wireless Access in Vehicular Environments (Amendment 6)
- IEEE Std 802.11z™-2010: Extensions to Direct-Link Setup (DLS) (Amendment 7)
- IEEE Std 802.11v™-2011: Wireless Network Management (Amendment 8)
- IEEE Std 802.11u™-2011: Interworking with External Networks (Amendment 9)
- IEEE Std 802.11s™-2011: Mesh Networking (Amendment 10)

A revision was published in 2016, which incorporated into the 2012 revision the following amendments:

- IEEE Std 802.11ae™-2012: Prioritization of Management Frames (Amendment 1)
- IEEE Std 802.11aa™-2012: MAC Enhancements for Robust Audio Video Streaming (Amendment 2)

— IEEE Std 802.11ad™-2012: Enhancements for Very High Throughput in the 60 GHz Band (Amendment 3)
— IEEE Std 802.11ac™-2013: Enhancements for Very High Throughput for Operation in Bands below 6 GHz (Amendment 4)
— IEEE Std 802.11af™-2013: Television White Spaces (TVWS) Operation (Amendment 5)

A revision was published in 2020, which incorporated into the 2016 revision the following amendments:

— IEEE Std 802.11ai™-2016 (second printing): Fast Initial Link Setup (Amendment 1)
— IEEE Std 802.11ah™-2016: Sub 1 GHz License Exempt Operation (Amendment 2)
— IEEE Std 802.11aj™-2018: Enhancements for Very High Throughput to Support Chinese Millimeter Wave Frequency Bands (60 GHz and 45 GHz) (Amendment 3)
— IEEE Std 802.11ak™-2018: Enhancements for Transit Links Within Bridged Networks (Amendment 4)
— IEEE Std 802.11aq™-2018: Preassociation Discovery (Amendment 5)

This revision is based on IEEE Std 802.11-2020, into which the following amendments have been incorporated:

— IEEE Std 802.11ax™-2021: Enhancements for High Efficiency WLAN (Amendment 1)
— IEEE Std 802.11ay™-2021: Enhanced Throughput for Operations in License-exempt Bands above 45 GHz (Amendment 2)
— IEEE Std 802.11ba™-2021: Wake-Up Radio Operation (Amendment 3)
— IEEE Std 802.11az™-2022: Enhancements for Positioning (Amendment 4)
— IEEE Std 802.11bd™-2022: Enhancements for Next Generation V2X (Amendment 5)
— IEEE Std 802.11bb™-2023: Light Communications (Amendment 6)
— IEEE Std 802.11bc™-2024: Enhanced Broadcast Services (Amendment 7)

Technical corrections, clarifications, and enhancements

In addition, this revision specifies technical corrections and clarifications to IEEE Std 802.11 as well as enhancements to the existing medium access control (MAC) and physical layer (PHY) functions. In addition, this revision removes some features previously marked as obsolete and adds new indications of other obsolete features.

Generally, features that are marked deprecated or obsolete are not maintained; there might be technical errors in the material describing these features.

Renumbering of clauses and annexes

The numbering of certain clauses and annexes has been modified since IEEE Std 802.11-2012

The evolution of this numbering is shown in Figure 1.

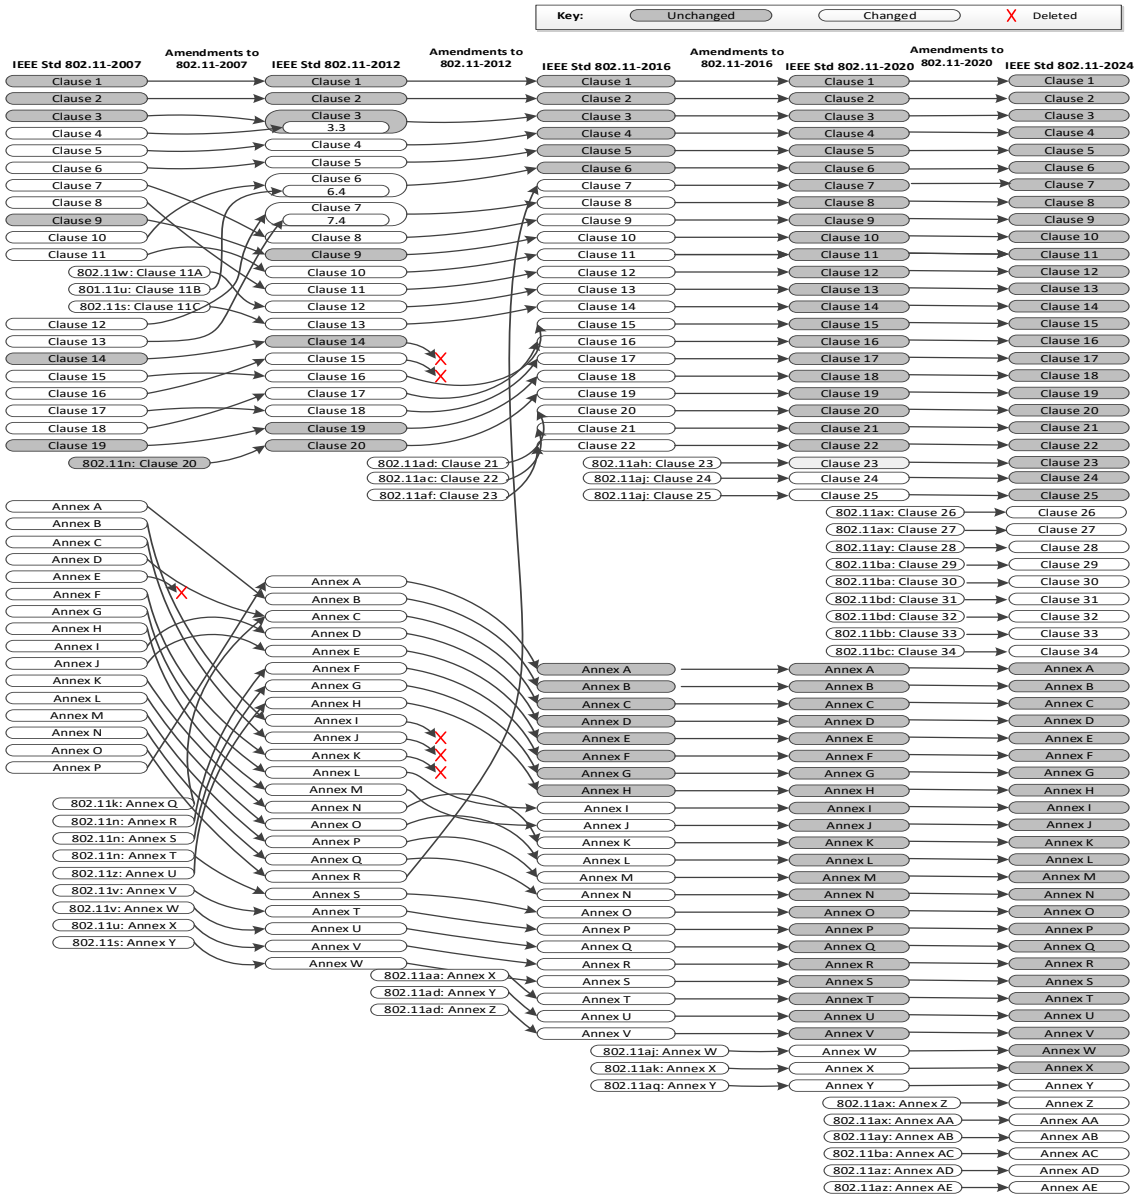

Figure 1—The evolution of numbering in IEEE Std 802.11

9.4.2.99 Congestion Notification element 1211
9.4.2.100 Mesh Peering Management element 1211
9.4.2.101 Mesh Channel Switch Parameters element 1213
9.4.2.102 Mesh Awake Window element 1214
9.4.2.103 Beacon Timing element 1214
9.4.2.104 MCCAOP Setup Request element 1215
9.4.2.105 MCCAOP Setup Reply element 1216
9.4.2.106 MCCAOP Advertisement Overview element 1217
9.4.2.107 MCCAOP Advertisement element 1218
9.4.2.108 MCCAOP Teardown element 1220
9.4.2.109 GANN element 1221
9.4.2.110 RANN element 1221
9.4.2.111 PREQ element 1222
9.4.2.112 PREP element 1224
9.4.2.113 PERR element 1226
9.4.2.114 PXU element 1227
9.4.2.115 PXUC element 1228
9.4.2.116 Authenticated Mesh Peering Exchange element 1229
9.4.2.117 MIC element 1230
9.4.2.118 Quality-of-Service Management Frame Policy element 1230
9.4.2.119 Intra-Access Category Priority element 1231
9.4.2.120 SCS Descriptor element 1232
9.4.2.121 QLoad Report element 1233
9.4.2.122 HCCA TXOP Update Count element 1235
9.4.2.123 Higher Layer Stream ID element 1236
9.4.2.124 GCR Group Address element 1237
9.4.2.125 DMG BSS Parameter Change element 1237
9.4.2.126 DMG Capabilities element 1238
9.4.2.127 DMG Operation element 1248
9.4.2.128 DMG Beam Refinement element 1249
9.4.2.129 DMG Wakeup Schedule element 1253
9.4.2.130 Extended Schedule element 1254
9.4.2.131 STA Availability element 1258
9.4.2.132 DMG TSPEC element 1258
9.4.2.133 CMMG TSPEC element 1262
9.4.2.134 Next DMG ATI element 1263
9.4.2.135 Channel Measurement Feedback element 1263
9.4.2.136 Awake Window element 1267
9.4.2.137 Multi-band element 1267
9.4.2.138 ADDBA Extension element 1270
9.4.2.139 Next PCP List element 1271
9.4.2.140 PCP Handover element 1271
9.4.2.141 DMG Link Margin element 1272
9.4.2.142 DMG Link Adaptation Acknowledgment element 1277
9.4.2.143 Switching Stream element 1278
9.4.2.144 Session Transition element 1279
9.4.2.145 Cluster Report element 1281
9.4.2.146 Relay Capabilities element 1283
9.4.2.147 Relay Transfer Parameter Set element 1284
9.4.2.148 Quiet Period Request element 1285
9.4.2.149 Quiet Period Response element 1286
9.4.2.150 BeamLink Maintenance element 1286
9.4.2.151 MMS element 1286
9.4.2.152 U-PID element 1288

9.4.2.153 ECAPC Policy element 1289
9.4.2.154 Cluster Time Offset element 1290
9.4.2.155 Antenna Sector ID Pattern element 1291
9.4.2.156 VHT Capabilities element 1292
9.4.2.157 VHT Operation element 1300
9.4.2.158 Extended BSS Load element 1302
9.4.2.159 Wide Bandwidth Channel Switch element 1304
9.4.2.160 Transmit Power Envelope element 1304
9.4.2.161 Channel Switch Wrapper element 1308
9.4.2.162 AID element 1309
9.4.2.163 Quiet Channel element 1309
9.4.2.164 Operating Mode Notification element 1310
9.4.2.165 UPSIM element 1310
9.4.2.166 FTM Parameters element 1311
9.4.2.167 Device Location element 1319
9.4.2.168 White Space Map element 1319
9.4.2.169 Reduced Neighbor Report element 1320
9.4.2.170 TVHT Operation element 1324
9.4.2.171 FTM Synchronization Information element 1325
9.4.2.172 Estimated Service Parameters Inbound element 1326
9.4.2.173 Future Channel Guidance element 1328
9.4.2.174 Association Delay Info element 1328
9.4.2.175 CAG Number element 1329
9.4.2.176 FILS Request Parameters element 1329
9.4.2.177 FILS Key Confirmation element 1332
9.4.2.178 FILS Session element 1333
9.4.2.179 FILS Public Key element 1333
9.4.2.180 AP Configuration Sequence Number (AP-CSN) element 1333
9.4.2.181 FILS Indication element 1334
9.4.2.182 FILS HLP Container element 1335
9.4.2.183 FILS IP Address Assignment element 1336
9.4.2.184 Key Delivery element 1340
9.4.2.185 DILS element 1340
9.4.2.186 Wrapped Data element 1342
9.4.2.187 Fragment element 1342
9.4.2.188 FILS Nonce element 1343
9.4.2.189 S1G Open-Loop Link Margin Index element 1343
9.4.2.190 RPS element 1344
9.4.2.191 Page Slice element 1349
9.4.2.192 AID Request element 1351
9.4.2.193 AID Response element 1353
9.4.2.194 S1G Sector Operation element 1354
9.4.2.195 S1G Beacon Compatibility element 1356
9.4.2.196 Short Beacon Interval element 1357
9.4.2.197 Change Sequence element 1357
9.4.2.198 TWT element 1357
9.4.2.199 S1G Capabilities element 1368
9.4.2.200 SST element 1380
9.4.2.201 Authentication Control element 1382
9.4.2.202 TSF Timer Accuracy element 1384
9.4.2.203 S1G Relay element 1384
9.4.2.204 Reachable Address element 1385
9.4.2.205 S1G Relay Activation element 1386
9.4.2.206 S1G Relay Discovery element 1387

9.4.2.207 AID Announcement element 1389
9.4.2.208 PV1 Probe Response Option element 1389
9.4.2.209 EL Operation element 1394
9.4.2.210 Sectorized Group ID List element 1394
9.4.2.211 S1G Operation element 1395
9.4.2.212 Header Compression element 1396
9.4.2.213 SST Operation element 1398
9.4.2.214 MAD element 1399
9.4.2.215 Password Identifier element 1399
9.4.2.216 Max Channel Switch Time element 1399
9.4.2.217 Vendor Specific Request element 1400
9.4.2.218 CDMG Capabilities element 1400
9.4.2.219 Dynamic Bandwidth Control element 1403
9.4.2.220 CDMG Extended Schedule element 1404
9.4.2.221 SSW Report element 1406
9.4.2.222 Cluster Probe element 1407
9.4.2.223 Extended Cluster Report element 1408
9.4.2.224 Cluster Switch Announcement element 1408
9.4.2.225 Enhanced Beam Tracking element 1409
9.4.2.226 SPSH Report element 1411
9.4.2.227 Clustering Interference Assessment element 1412
9.4.2.228 CMMG Capabilities element 1412
9.4.2.229 CMMG Operation element 1421
9.4.2.230 CMMG Operating Mode Notification element 1422
9.4.2.231 CMMG Link Margin element 1422
9.4.2.232 CMMG Link Adaptation Acknowledgment element 1423
9.4.2.233 GLK-GCR Parameter Set element 1424
9.4.2.234 Estimated Service Parameters Outbound element 1426
9.4.2.235 OCI element 1427
9.4.2.236 Service Hint element 1428
9.4.2.237 Service Hash element 1429
9.4.2.238 GAS Extension element 1429
9.4.2.239 Non-Inheritance element 1431
9.4.2.240 RSNXE 1431
9.4.2.241 TCLAS Mask element 1433
9.4.2.242 MSCS Descriptor element 1434
9.4.2.243 Supplemental Class 2 Capabilities element 1435
9.4.2.244 OCT Source element 1436
9.4.2.245 Rejected Groups element 1436
9.4.2.246 Anti-Clogging Token Container element 1437
9.4.2.247 HE Capabilities element 1437
9.4.2.248 HE Operation element 1459
9.4.2.249 UORA Parameter Set element 1462
9.4.2.250 MU EDCA Parameter Set element 1463
9.4.2.251 Spatial Reuse Parameter Set element 1463
9.4.2.252 NDP Feedback Report Parameter Set element 1465
9.4.2.253 BSS Color Change Announcement element 1466
9.4.2.254 Quiet Time Period element 1466
9.4.2.255 ESS Report element 1469
9.4.2.256 OPS element 1470
9.4.2.257 TWT Constraint Parameters element 1471
9.4.2.258 HE BSS Load element 1471
9.4.2.259 Multiple BSSID Configuration element 1472
9.4.2.260 Known BSSID element 1473

9.4.2.261 Short SSID List element 1474
9.4.2.262 HE 6 GHz Band Capabilities element 1474
9.4.2.263 UL MU Power Capabilities element 1475
9.4.2.264 EDMG Capabilities element 1476
9.4.2.265 EDMG Operation element 1486
9.4.2.266 EDMG Extended Schedule element 1488
9.4.2.267 EDMG Channel Measurement Feedback element 1491
9.4.2.268 EDMG Group ID Set element 1496
9.4.2.269 EDMG BRP Request element 1497
9.4.2.270 EDMG Training Field Schedule element 1499
9.4.2.271 EDMG Partial Sector Level Sweep element 1500
9.4.2.272 MIMO Setup Control element 1501
9.4.2.273 MIMO Poll Control element 1502
9.4.2.274 MIMO Feedback Control element 1503
9.4.2.275 MIMO Selection Control element 1506
9.4.2.276 EDMG Flow Control Extension Configuration element 1510
9.4.2.277 QoS-TU element 1513
9.4.2.278 Unsolicited Block Ack Extension element 1514
9.4.2.279 SAR Configuration element 1515
9.4.2.280 TDD Slot Structure element 1516
9.4.2.281 TDD Slot Schedule element 1517
9.4.2.282 TDD Route element 1518
9.4.2.283 Digital BF Feedback element 1522
9.4.2.284 TDD Bandwidth Request element 1533
9.4.2.285 TDD Synchronization element 1534
9.4.2.286 EDMG Wide Bandwidth Channel Switch element 1535
9.4.2.287 DMG Discovery Assistance element 1535
9.4.2.288 Extended Link Measurement element 1536
9.4.2.289 DMG STA Directional Transmit Activity Report element 1540
9.4.2.290 WUR Capabilities element 1544
9.4.2.291 WUR Operation element 1546
9.4.2.292 WUR Mode element 1547
9.4.2.293 WUR Discovery element 1552
9.4.2.294 WUR PN Update element 1553
9.4.2.295 AKM Suite Selector element 1554
9.4.2.296 Originator Preferred MCS element 1554
9.4.2.297 Known STA Identification element 1555
9.4.2.298 ISTA Availability Window element 1555
9.4.2.299 RSTA Availability Window element 1556
9.4.2.300 Ranging Parameters element 1558
9.4.2.301 Secure HE-LTF Parameters element 1565
9.4.2.302 Direction Measurement Results element 1566
9.4.2.303 Multiple Best AWV ID element 1567
9.4.2.304 Multiple AOD Feedback element 1568
9.4.2.305 PASN Parameters element 1569
9.4.2.306 ISTA Passive TB Ranging Measurement Report element 1570
9.4.2.307 RSTA Passive TB Ranging Measurement Report element 1572
9.4.2.308 Passive TB Ranging LCI Table element 1573
9.4.2.309 LOS Likelihood element 1574
9.4.2.310 DMG OCB element 1574
9.4.2.311 Non-AP STA Regulatory Connectivity element 1575
9.4.2.312 Diffie-Hellman Parameter element 1577
9.4.2.313 EBCS Parameters element 1577
9.4.2.314 EBCS TIM element 1578

11.24.2.1 Overview ... 2813
11.24.2.2 QMF policy change in an infrastructure BSS or in an MBSS ... 2814
11.24.2.3 QMF policy configuration in an infrastructure BSS ... 2815
11.24.2.4 QMF policy configuration in an IBSS or OCB ... 2816
11.24.2.5 QMF policy configuration in an MBSS ... 2816
11.24.3 Interpreting QMF access categories ... 2816
11.25 Robust AV streaming ... 2817
11.25.1 Robust AV streaming dependencies ... 2817
11.25.2 SCS procedures ... 2817
11.25.3 MSCS procedures ... 2819
11.26 Procedures to manage OBSS ... 2822
11.26.1 General ... 2822
11.26.2 QLoad Report element ... 2823
11.26.2.1 Introduction ... 2823
11.26.2.2 Calculating field values ... 2823
11.26.2.3 Requesting QLoad Reports using radio measurement requests ... 2825
11.26.3 HCCA TXOP negotiation ... 2825
11.26.4 HCCA AP timing synchronization for HCCA TXOP advertisement ... 2829
11.26.4.1 General ... 2829
11.26.4.2 Timing offset ... 2829
11.26.4.3 Clock drift adjustment ... 2829
11.27 DMG beamformed link and BSS maintenance ... 2830
11.27.1 Beamformed link maintenance ... 2830
11.27.1.1 General ... 2830
11.27.1.2 EDMG partial SLS ... 2832
11.27.2 PCP Handover ... 2834
11.27.2.1 General ... 2834
11.27.2.2 Explicit handover procedure ... 2835
11.27.2.3 Implicit handover procedure ... 2835
11.28 DMG BSS peer and service discovery ... 2836
11.28.1 Information Request and Response ... 2836
11.28.2 Peer Service Discovery ... 2837
11.29 Changing DMG BSS parameters ... 2837
11.29.1 General ... 2837
11.29.2 Moving the TBTT ... 2837
11.29.3 Changing beacon interval duration ... 2838
11.29.4 Maintaining synchronization in an AP or PCP cluster ... 2839
11.29.5 Recommending DMG BSS parameters to the AP or PCP ... 2840
11.30 Spatial sharing and interference mitigation for DMG STAs ... 2840
11.30.1 General ... 2840
11.30.2 Spatial sharing and interference assessment ... 2841
11.30.3 Achieving spatial sharing and interference mitigation ... 2843
11.30.4 PBSS and infrastructure BSS stability in OBSS scenarios ... 2844
11.30.5 Directional transmit activity report ... 2844
11.31 Multi-band operation ... 2846
11.31.1 General ... 2846
11.31.2 General FST rules ... 2847
11.31.3 FST setup protocol ... 2848
11.31.3.1 General ... 2848
11.31.3.2 Transitioning between states ... 2849
11.31.3.3 FST TS switching ... 2855
11.31.4 FST teardown ... 2857
11.31.5 On-channel Tunneling (OCT) operation ... 2857
11.31.6 FST payload ... 2862

28.1.2 Scope ... 4398
28.1.3 EDMG PHY functions ... 4398
28.1.3.1 General ... 4398
28.1.3.2 PHY management entity (PLME) ... 4398
28.1.3.3 Service specification method ... 4398
28.1.4 PPDU formats ... 4399
28.2 EDMG PHY service interface ... 4399
28.2.1 General ... 4399
28.2.2 TXVECTOR and RXVECTOR parameters ... 4399
28.2.3 PHYCONFIG_VECTOR parameters ... 4417
28.2.4 Support for NON_EDMG formats ... 4418
28.2.4.1 General ... 4418
28.2.4.2 EDMG STA PHY entity configuration for transmission ... 4418
28.2.4.3 EDMG STA PHY entity configuration for reception ... 4419
28.2.4.4 EDMG STA PHY entity channel bandwidth configuration ... 4421
28.2.4.5 EDMG STA PHY CCA ... 4422
28.2.5 TXSTATUS parameters ... 4422
28.3 Common parameters ... 4422
28.3.1 Introduction ... 4422
28.3.2 EDMG PPDU format ... 4424
28.3.2.1 General ... 4424
28.3.2.2 EDMG A-PPDU format ... 4426
28.3.3 EDMG preamble ... 4426
28.3.3.1 General ... 4426
28.3.3.2 Non-EDMG portion of EDMG format preamble ... 4426
28.3.3.3 EDMG portion of EDMG format preamble ... 4433
28.3.3.4 Mathematical description of signals ... 4449
28.3.4 Channelization ... 4450
28.3.5 Transmit mask ... 4452
28.3.6 LDPC parity matrices ... 4460
28.3.6.1 General ... 4460
28.3.6.2 Rate-7/8 LDPC code matrix H = 84 rows x 672 columns, Z = 42 ... 4465
28.3.6.3 Rate-1/2 LDPC code matrix H = 672 rows x 1344 columns, Z = 42 4465
28.3.6.4 Rate-5/8 LDPC code matrix H = 504 rows x 1344 columns, Z = 42 4466
28.3.6.5 Rate-3/4 LDPC code matrix H = 336 rows x 1344 columns, Z = 42 4467
28.3.6.6 Rate-13/16 LDPC code matrix H = 252 rows x 1344 columns, Z = 42 ... 4468
28.3.6.7 Rate-7/8 LDPC code matrix H = 168 rows x 1344 columns, Z = 42 4468
28.3.7 Control trailer ... 4469
28.3.8 CCA sensitivity ... 4474
28.3.9 Common requirements ... 4474
28.3.9.1 Introduction ... 4474
28.3.9.2 Received channel power indicator (RCPI) measurement ... 4474
28.3.9.3 Transmit center frequency and symbol clock frequency tolerance ... 4474
28.3.9.4 Transmit center frequency leakage ... 4475
28.3.9.5 Transmit rampup and rampdown ... 4475
28.3.9.6 Antenna setting ... 4475
28.3.9.7 Maximum input requirement ... 4475
28.3.9.8 Receiver minimum input level sensitivity ... 4475
28.3.9.9 Spectral flatness test for the EDMG OFDM mode ... 4479
28.3.9.10 Receiver co-channel interference (CCI) resilience ... 4480
28.4 EDMG and non-EDMG control mode ... 4480
28.4.1 General ... 4480
28.4.2 Transmitter block diagram ... 4481

28.4.2.1 General ... 4481
28.4.2.2 Non-EDMG PPDU transmission ... 4481
28.4.2.3 EDMG PPDU transmission ... 4482
28.4.3 PPDU format ... 4482
28.4.4 Non-EDMG portion of the EDMG control mode PPDU ... 4483
28.4.5 EDMG portion of the EDMG control mode PPDU ... 4483
28.4.5.1 General ... 4483
28.4.5.2 Data field ... 4483
28.4.6 Non-EDMG control trailer encoding and modulation ... 4484
28.4.7 PPDU transmission ... 4485
28.4.7.1 General ... 4485
28.4.7.2 Non-EDMG PPDU transmission ... 4485
28.4.7.3 EDMG PPDU transmission ... 4488
28.4.8 Performance requirements ... 4493
28.5 EDMG and non-EDMG SC mode ... 4494
28.5.1 General ... 4494
28.5.2 Signal parameters ... 4494
28.5.2.1 General ... 4494
28.5.2.2 Timing-related parameters ... 4494
28.5.3 Transmitter block diagram ... 4495
28.5.3.1 General ... 4495
28.5.3.2 Non-EDMG PPDU transmission ... 4496
28.5.3.3 EDMG PPDU transmission ... 4496
28.5.4 EDMG-STF definition ... 4497
28.5.4.1 General ... 4497
28.5.4.2 Definition ... 4498
28.5.5 EDMG-CEF definition ... 4500
28.5.5.1 General ... 4500
28.5.5.2 Definition ... 4500
28.5.6 Encoding of EDMG-Header-B ... 4502
28.5.7 Encoding of EDMG-Header-A for EDMG A-PPDU transmission ... 4502
28.5.8 Modulation and coding scheme (MCS) ... 4503
28.5.9 Data field ... 4506
28.5.9.1 Guard interval definition ... 4506
28.5.9.2 Symbol blocking and guard insertion ... 4508
28.5.9.3 Scrambler ... 4513
28.5.9.4 Encoding ... 4514
28.5.9.5 Modulation mapping ... 4521
28.5.10 PPDU transmission ... 4527
28.5.10.1 General ... 4527
28.5.10.2 Spatial mapping ... 4527
28.5.10.3 Non-EDMG PPDU transmission ... 4528
28.5.10.4 EDMG SU PPDU transmission ... 4531
28.5.10.5 EDMG MU PPDU transmission ... 4542
28.5.11 Performance requirements ... 4544
28.5.11.1 Transmit requirements ... 4544
28.5.11.2 Receive requirements ... 4548
28.6 EDMG OFDM mode ... 4548
28.6.1 General ... 4548
28.6.2 OFDM signal parameters ... 4548
28.6.2.1 General ... 4548
28.6.2.2 Timing related parameters ... 4549
28.6.2.3 DC relative shift to carrier frequency ... 4549
28.6.2.4 Pilot tones ... 4551

28.6.2.6 Pilot sequences ... 4558
28.6.3 Transmitter block diagram ... 4559
28.6.3.1 General ... 4559
28.6.3.2 EDMG PPDU transmission ... 4560
28.6.4 EDMG-STF definition ... 4562
28.6.4.1 General ... 4562
28.6.4.2 Definition ... 4562
28.6.5 EDMG-CEF definition ... 4563
28.6.5.1 General ... 4563
28.6.5.2 Definition ... 4563
28.6.6 Encoding of EDMG-Header-B ... 4565
28.6.7 Encoding of EDMG-Header-A for EDMG A-PPDU transmission ... 4565
28.6.8 Modulation and coding scheme (MCS) ... 4566
28.6.9 Data field ... 4570
28.6.9.1 Scrambler ... 4570
28.6.9.2 Encoding ... 4570
28.6.9.3 Modulation mapping ... 4574
28.6.10 PPDU transmission ... 4582
28.6.10.1 General ... 4582
28.6.10.2 Spatial mapping ... 4582
28.6.10.3 EDMG SU PPDU transmission ... 4583
28.6.10.4 EDMG MU PPDU transmission ... 4585
28.6.11 Performance requirements ... 4586
28.6.11.1 Transmit requirements ... 4586
28.6.11.2 Receive requirements ... 4588
28.7 EDMG transmit procedure ... 4588
28.8 EDMG receive procedure ... 4592
28.9 EDMG beamforming ... 4598
28.9.1 Short SSW PPDU ... 4598
28.9.1.1 General ... 4598
28.9.1.2 Short Scrambled BSSID subfield definition ... 4601
28.9.1.3 Short SSW Payload field example ... 4601
28.9.2 Beam refinement ... 4602
28.9.2.1 General ... 4602
28.9.2.2 EDMG BRP PPDU ... 4602
28.9.3 EDMG secure ranging PPDU ... 4614
28.9.3.1 General ... 4614
28.9.3.2 EDMG secure ranging PPDU structure ... 4614
28.9.3.3 EDMG secure ranging PPDU header fields ... 4614
28.9.3.4 EDMG secure ranging PPDU duration ... 4614
28.9.3.5 TRN field definition with Secure TRN subfields ... 4614
28.9.3.6 Secure TRN subfield definition for EDMG secure ranging PPDU ... 4615
28.9.3.7 Transmission of an EDMG secure ranging PPDU ... 4615
28.10 Golay sequences ... 4616
28.10.1 General ... 4616
28.10.2 Sequences of length 32, 64, 128, 256, 512, and 1024 ... 4616
28.10.3 Sequences of length 96, 192, 384, and 768 ... 4649
28.11 OFDM sequences ... 4667
28.11.1 EDMG-STF sequence ... 4667
28.11.1.1 General ... 4667
28.11.1.2 Sequence definition ... 4667
28.11.2 EDMG-CEF sequence ... 4682
28.11.2.1 General ... 4682

28.11.2.2 Sequences definition 4682
28.12 EDMG PLME 4703
28.12.1 PLME SAP sublayer management primitives 4703
28.12.2 PHY MIB 4703
28.12.3 TXTIME calculation 4703
28.12.3.1 General 4703
28.12.3.2 TXTIME calculation for EDMG control mode 4703
28.12.3.3 TXTIME calculation for EDMG SC mode 4705
28.12.3.4 TXTIME calculation for EDMG OFDM mode 4707
28.12.3.5 TXTIME calculation for non-EDMG control mode 4709
28.12.3.6 TXTIME calculation for non-EDMG SC mode 4709
28.12.4 EDMG PHY characteristics 4710

29. Wake-Up Radio (WUR) MAC specification 4711

29.1 Introduction 4711
29.2 WUR channel, WUR primary channel, and WUR discovery channel 4711
29.3 Channel access 4711
29.4 Discarding a WUR frame 4712
29.5 Setting the identifiers of WUR frames 4712
29.5.1 General 4712
29.5.2 Compressed BSSID 4713
29.5.3 Transmitter ID 4713
29.5.4 WUR Group ID 4714
29.5.5 WUR ID 4714
29.5.6 Nontransmitter ID 4715
29.6 Synchronization using WUR Beacon frame 4715
29.6.1 General 4715
29.6.2 WUR Beacon frame generation 4715
29.6.3 Maintaining TSF timer synchronization with WUR Beacon frame 4716
29.7 WUR duty cycle operation 4717
29.8 WUR power management procedure 4719
29.8.1 General 4719
29.8.2 WUR mode setup 4720
29.8.3 WUR power management operation for a WUR AP 4723
29.8.4 WUR power management operation for a WUR non-AP STA 4724
29.9 Wake-up operation 4725
29.9.1 General 4725
29.9.2 WUR Short Wake-up frame operation 4726
29.9.3 WUR AP operation 4727
29.9.4 WUR non-AP STA operation 4729
29.10 WUR frame protection 4729
29.10.1 General 4729
29.10.2 Protected WUR frame transmission 4731
29.10.3 Protected WUR frame reception 4732
29.10.4 Generation and construction of PN for WUR frames 4733
29.10.4.1 Generation of the PN by a WUR AP 4733
29.10.4.2 Construction of the PN by a WUR non-AP STA 4734
29.10.4.3 WUR PN update procedure 4735
29.11 WUR FDMA operation 4735
29.11.1 WUR FDMA channel access 4736
29.12 WUR discovery 4737

30. Wake-Up Radio (WUR) PHY specification 4739

30.1 Introduction 4739
30.2 WUR PHY service interface 4740
30.2.1 Introduction 4740
30.2.2 TXVECTOR and RXVECTOR parameters 4740
30.2.3 PHY-CONFIG_VECTOR parameters 4740
30.3 WUR PHY 4740
30.3.1 Introduction 4740
30.3.2 WUR Basic PPDU format 4744
30.3.3 WUR FDMA PPDU format 4744
30.3.4 Transmitter block diagram 4745
30.3.4.1 WUR Basic PPDU waveform generation for WUR-Sync field and WUR-Data field with WUR HDR 4747
30.3.4.2 WUR Basic PPDU waveform generation for WUR-Data field with WUR LDR 4748
30.3.4.3 WUR FDMA PPDU WUR-Data field waveform generation 4749
30.3.4.4 Symbol Randomizer and Per-transmit chain Cyclic Shift 4749
30.3.5 Overview of the PPDU encoding process 4750
30.3.5.1 General 4750
30.3.5.2 Construction of the L-STF 4750
30.3.5.3 Construction of the L-LTF 4750
30.3.5.4 Construction of the L-SIG field 4751
30.3.5.5 Construction of the BPSK-Mark1 4751
30.3.5.6 Construction of the BPSK-Mark2 4752
30.3.5.7 Construction of the WUR-Sync for a single 20 MHz channel 4752
30.3.5.8 Construction of the WUR-Data for a single 20 MHz channel 4752
30.3.5.9 Construction of the WUR-Sync and WUR-Data for the FDMA transmission 4753
30.3.6 WUR data rates 4753
30.3.7 Timing related parameters 4753
30.3.8 Mathematical description of signals 4753
30.3.9 WUR preamble 4757
30.3.9.1 Introduction 4757
30.3.9.2 Non-WUR portion of WUR PHY preamble 4758
30.3.9.3 WUR-Sync field 4761
30.3.10 WUR-Data field 4762
30.3.10.1 Cyclic Shift for WUR-Data field 4762
30.3.10.2 WUR-Data field for WUR LDR and WUR HDR 4762
30.3.11 WUR Padding field for a WUR FDMA PPDU 4763
30.3.12 WUR transmit specification 4763
30.3.12.1 Transmit spectrum mask 4763
30.3.12.2 Spectral flatness 4766
30.3.12.3 Transmit center frequency and symbol clock frequency tolerance 4766
30.3.12.4 Transmit On and Off symbols power ratio 4766
30.3.12.5 Correlation test on WUR OOK symbols 4767
30.3.13 WUR receiver specification 4767
30.3.13.1 Receiver minimum input sensitivity 4767
30.3.13.2 Adjacent channel rejection 4767
30.3.13.3 Nonadjacent channel rejection 4768
30.3.13.4 Receiver maximum input level 4768
30.3.13.5 CCA sensitivity 4768
30.3.14 WUR transmit procedure 4768
30.3.15 WUR receive procedure 4771
30.4 WUR PLME 4774
30.4.1 TXTIME and PSDU length calculation 4774

30.4.2 Table of time and length characteristics 4775
30.5 Parameters for WUR Data Rates 4775

31. Next Generation V2X (NGV) MAC specification 4776

31.1 Introduction 4776
31.2 Operation in the 5.9 GHz band 4776
31.2.1 Coexistence with non-NGV STAs 4776
31.2.2 Channel access and transmission methods for 20 MHz OCB transmission 4776
31.2.3 A-MSDU operation, A-MPDU operation, and BA operation 4778
31.2.4 NON_NGV_10 repetition transmission 4779
31.2.5 Non-NGV duplication operation 4779
31.3 Operation in the 60 GHz band 4780
31.3.1 DMG beamforming outside the context of a BSS 4780
31.4 NGV ranging 4781
31.5 NGV MAC data service 4782
31.6 Radio environment measurement 4783

32. Next Generation V2X (NGV) PHY specification 4784

32.1 Introduction 4784
32.1.1 Introduction to NGV PHY 4784
32.1.2 Scope 4784
32.1.3 NGV PHY functions 4785
32.1.3.1 General 4785
32.1.3.2 PHY layer management entity (PLME) 4785
32.1.3.3 Service specification method 4785
32.1.4 PPDU Formats 4785
32.2 NGV PHY service interface 4785
32.2.1 Introduction 4785
32.2.2 TXVECTOR and RXVECTOR 4786
32.2.3 PHY CONFIG_VECTOR 4790
32.2.4 Effects of CH_BANDWIDTH parameter on PPDU format 4790
32.2.5 Support for NON_NGV format 4791
32.2.5.1 General 4791
32.2.5.2 Repetition transmission of NON_NGV_10 PPDU 4794
32.2.5.3 TXSTATUS parameters 4794
32.3 NGV PHY 4795
32.3.1 Introduction 4795
32.3.2 NGV PPDU format 4795
32.3.3 Transmitter block diagram 4796
32.3.4 Overview of the PPDU encoding process 4797
32.3.4.1 General 4797
32.3.4.2 Construction of L-STF 4798
32.3.4.3 Construction of the L-LTF 4798
32.3.4.4 Construction of the L-SIG and RL-SIG 4798
32.3.4.5 Construction of the NGV-SIG and RNGV-SIG 4799
32.3.4.6 Construction of NGV-STF 4799
32.3.4.7 Construction of NGV-LTF 4800
32.3.4.8 Construction of the Data field in an NGV PPDU 4800
32.3.5 NGV modulation and coding schemes 4800
32.3.6 Timing related parameters 4801
32.3.7 Mathematical description of signals 4802
32.3.7.1 Notation 4802

32.3.7.3 Transmitted signal 4802
32.3.7.4 Definition of tone rotation 4805
32.3.8 NGV preamble 4806
32.3.8.1 Introduction 4806
32.3.8.2 Cyclic shift 4806
32.3.8.3 L-STF definition 4806
32.3.8.4 L-LTF definition 4807
32.3.8.5 L-SIG definition 4808
32.3.8.6 RL-SIG definition 4809
32.3.8.7 NGV-SIG definition 4809
32.3.8.8 RNGV-SIG definition 4811
32.3.8.9 NGV-STF definition 4811
32.3.8.10 NGV-LTF definition 4812
32.3.9 Data field 4816
32.3.9.1 General 4816
32.3.9.2 SERVICE field 4816
32.3.9.3 Scrambler 4817
32.3.9.4 Coding 4817
32.3.9.5 Stream parser 4817
32.3.9.6 Constellation mapping 4817
32.3.9.7 Pilot subcarriers 4817
32.3.9.8 OFDM modulation 4818
32.3.9.9 Midambles 4820
32.3.9.10 Non-NGV duplicate transmission 4820
32.3.10 SU-MIMO 4821
32.3.11 Transmit specification 4821
32.3.11.1 Transmit spectrum mask 4821
32.3.11.2 Spectral flatness 4822
32.3.11.3 Transmit center frequency and symbol clock frequency tolerance 4823
32.3.11.4 Modulation accuracy 4823
32.3.12 Receiver specification 4825
32.3.12.1 General 4825
32.3.12.2 Receiver minimum input sensitivity 4826
32.3.12.3 Adjacent channel rejection 4826
32.3.12.4 Nonadjacent channel rejection 4828
32.3.12.5 Receiver maximum input level 4828
32.3.12.6 CCA sensitivity 4828
32.3.13 NGV transmit procedure 4829
32.3.14 NGV receive procedure 4831
32.3.15 Regulatory requirements 4835
32.3.16 NGV ranging NDP 4835
32.4 NGV PLME 4836
32.4.1 PLME-SAP 4836
32.4.2 PHY MIB 4837
32.4.3 TXTIME and PSDU_LENGTH calculation 4837
32.4.4 NGV PHY 4838
32.5 Parameters for NGV-MCSs 4838

33. Light communication (LC) MAC and PHY specification 4841

33.1 LC MAC specification 4841
33.1.1 Introduction 4841
33.1.2 LC MAC 4841

33.2 LC PHY specification 4841
33.2.1 General 4841
33.2.2 LC PHY service interface 4841
33.2.3 LC PHY 4841
33.2.3.1 Introduction 4841
33.2.3.2 Transmitter block diagram 4841
33.2.3.3 Mathematical description of signals 4843
33.2.3.4 Channel numbering 4843
33.2.3.5 Multiple transmit chains and multiple receive chains 4846
33.2.3.6 Receive specification 4849
33.2.3.7 CCA for LC 4849
33.2.3.8 Regulatory requirements 4850

34. Enhanced broadcast services MAC specification 4851

34.1 Overview 4851
34.1.1 Introduction 4851
34.2 EBCS addressing 4851
34.3 EBCS DL procedures 4852
34.3.1 General 4852
34.3.2 EBCS DL procedure at an EBCS AP 4853
34.3.3 EBCS DL procedure at an EBCS receiver 4854
34.3.4 EBCS Info frame generation and usage 4855
34.3.5 EBCS Info frame fragmentation 4856
34.3.6 EBCS Info frame defragmentation 4857
34.3.7 EBCS negotiation for associated STAs 4857
34.3.8 EBCS negotiation for unassociated STAs 4858
34.3.9 EBCS termination notice and extension negotiation 4859
34.4 EBCS UL procedure 4861
34.4.1 General 4861
34.4.2 EBCS UL procedure at an EBCS relaying STA 4861
34.4.3 EBCS UL procedure at an EBCS non-AP STA 4861
34.4.4 EBCS UL procedure at an EBCS proxy 4862

Annex A (informative) Bibliography 4863

Annex B (normative) Protocol Implementation Conformance Statement (PICS) proforma 4867
B.1 Introduction 4867
B.2 Abbreviations and special symbols 4867
B.2.1 Symbols for Status column 4867
B.2.2 General abbreviations for Item and Support columns 4867
B.3 Instructions for completing the PICS proforma 4868
B.3.1 General structure of the PICS proforma 4868
B.3.2 Additional information 4869
B.3.3 Exception information 4869
B.3.4 Conditional status 4870
B.4 PICS proforma—IEEE Std 802.11-2024 4871
B.4.1 Implementation identification 4871
B.4.2 Protocol summary 4871
B.4.3 IUT configuration 4872
B.4.4 MAC protocol 4876
B.4.4.1 MAC protocol capabilities 4876
B.4.4.2 MAC frames 4885
B.4.4.3 Frame exchange sequences 4897

Annex C (normative) ASN.1 encoding of the MAC and PHY MIB 5019
C.1 General 5019
C.2 Guidelines for IEEE 802.11 MIB authors/editors 5019
C.3 MIB detail 5019

Annex D (normative) Regulatory references 5641
D.1 External regulatory references 5641
D.2 Radio performance specifications 5643
D.2.1 Transmit and receive in-band and out-of-band spurious emissions 5643
D.2.2 Transmit power levels 5643
D.2.3 Transmit spectrum mask 5645
D.2.4 Transmit Mask M 5646
D.2.5 CCA-OCSED threshold 5647

Annex E (normative) Country elements and operating classes 5648
E.1 Country information and operating classes 5648
E.2 Band-specific operating requirements 5668
E.2.1 General 5668
E.2.2 3650–3700 MHz band in the United States and its territories 5668
E.2.3 5.9 GHz band in the United States and its territories (5.850–5.925 GHz) 5669
E.2.4 5.9 GHz band in Europe (5.855–5.925 GHz) 5669
E.2.5 TVWS band in the United States and its territories and Canada (54–698 MHz) 5669
E.2.6 TVWS band in Europe 5672
E.2.7 6 GHz band 5672

Annex F (normative) HT LDPC matrix definitions 5678

Annex G (informative) Frame exchange sequences 5681
G.1 General 5681
G.2 Basic sequences 5683
G.3 EDCA and HCCA sequences 5684
G.4 HT, VHT, S1G, and DMG sequences 5686
G.5 HE sequences 5696
G.6 NGV sequences 5697

Annex H (normative) Usage of EtherType 89-0d 5698

Annex I (informative) Examples of encoding a frame for OFDM PHYs, DMG PHYs, and EDMG PHY 5699
I.1 Example 1—BCC encoding 5699
I.1.1 Introduction 5699
I.1.2 The message for the BCC example 5699

I.1.3 Generation of the preamble 5700
I.1.3.1 Generation of the short sequences 5701
I.1.3.2 Generation of the long sequences 5703
I.1.4 Generation of the SIGNAL field 5706
I.1.4.1 SIGNAL field bit assignment 5706
I.1.4.2 Coding the SIGNAL field bits 5706
I.1.4.3 Interleaving the SIGNAL field bits 5707
I.1.4.4 SIGNAL field frequency domain 5707
I.1.4.5 SIGNAL field time domain 5709
I.1.5 Generating the DATA bits for the BCC example 5710
I.1.5.1 Delineating, SERVICE field prepending, and zero padding 5710
I.1.5.2 Scrambling the BCC example 5711
I.1.6 Generating the first DATA symbol for the BCC example 5713
I.1.6.1 Coding the DATA bits 5713
I.1.6.2 Interleaving the DATA bits 5715
I.1.6.3 Mapping into symbols 5718
I.1.7 Generating the additional DATA symbols 5719
I.1.8 The entire PPDU for the BCC example 5720
I.2 Generating encoded DATA bits—LDPC example 1 5728
I.2.1 General 5728
I.2.2 The message for LDPC example 1 5728
I.2.3 Prepending the SERVICE field for LDPC example 1 5729
I.2.4 Scrambling LDPC example 1 5730
I.2.5 Inserting shortening bits for LDPC example 1 5732
I.2.6 Encoding data for LDPC example 1 5734
I.2.7 Removing shortening bits and puncturing for LDPC example 1 5737
I.3 Generating encoded DATA bits—LDPC example 2 5739
I.3.1 General 5739
I.3.2 The message for LDPC example 2 5739
I.3.3 Prepending the SERVICE field for LDPC example 2 5741
I.3.4 Scrambling LDPC example 2 5742
I.3.5 Inserting the shortening bits for LDPC example 2 5744
I.3.6 Encoding the data for LDPC example 2 5746
I.3.7 Removing shortening bits and repetition for LDPC example 2 5746
I.4 DMG example data vectors 5754
I.5 DMG Example 1—DMG control mode encoding 5754
I.5.1 DMG control mode preamble 5754
I.5.2 Control mode header 5755
I.5.2.1 General 5755
I.5.2.2 DMG control mode header and payload bits 5755
I.5.2.3 DMG control mode scrambled header and payload bits 5756
I.5.2.4 DMG control mode LDPC encoded header bits 5756
I.5.2.5 DMG control mode differentially encoded header symbols 5756
I.5.2.6 DMG control mode header samples 5757
I.5.3 DMG control mode payload 5757
I.5.3.1 General 5757
I.5.3.2 DMG control mode payload bits 5757
I.5.3.3 DMG control mode scrambled payload bits 5757
I.5.3.4 DMG control mode LDPC encoded payload bits 5758
I.5.3.5 DMG control mode differentially encoded payload symbols 5758
I.5.3.6 DMG control mode payload samples 5758
I.6 DMG Example 2—DMG SC mode encoding 5758
I.6.1 DMG SC mode preamble 5758
I.6.2 DMG SC mode header 5759

I.6.2.1 General ... 5759
I.6.2.2 DMG SC control header bits ... 5759
I.6.2.3 DMG SC mode scrambled header bits ... 5760
I.6.2.4 DMG SC mode LDPC encoded header bits ... 5760
I.6.2.5 DMG SC mode LDPC data shortened bits ... 5760
I.6.2.6 DMG SC mode CS1/CS2 sequence bits ... 5760
I.6.2.7 DMG SC mode header samples ... 5761
I.6.3 DMG SC mode payload ... 5761
I.6.3.1 General ... 5761
I.6.3.2 DMG SC mode MCS 1 payload ... 5761
I.6.3.3 DMG SC mode MCS 5 payload ... 5763
I.6.3.4 DMG SC mode MCS 7 payload ... 5764
I.6.3.5 DMG SC mode MCS 12 payload ... 5765
I.7 DMG Example 3—DMG low-power SC mode encoding ... 5766
I.7.1 Introduction ... 5766
I.7.2 DMG low-power SC mode preamble ... 5766
I.7.3 DMG low-power SC mode header ... 5766
I.7.4 DMG low-power SC mode MCS 26 payload ... 5766
I.7.4.1 General ... 5766
I.7.4.2 Payload bits ... 5766
I.7.4.3 Scrambled payload bits ... 5766
I.7.4.4 RS(224,208) encoded payload bits ... 5767
I.7.4.5 (12,8) block coded payload bits ... 5767
I.7.4.6 Interleaved payload bits ... 5768
I.7.4.7 Payload samples ... 5768
I.7.5 DMG low-power SC mode MCS 30 payload ... 5768
I.7.5.1 Payload bits ... 5768
I.7.5.2 Scrambled payload bits ... 5768
I.7.5.3 RS(224,208) encoded payload bits ... 5768
I.7.5.4 Spc(9,8) block coded payload bits ... 5768
I.7.5.5 Interleaved payload bits ... 5769
I.7.5.6 Payload samples ... 5769
I.8 EDMG example data vectors ... 5769

Annex J (informative) RSNA reference implementations and test vectors ... 5771
J.1 TKIP temporal key mixing function reference implementation and test vector ... 5771
J.1.1 TKIP temporal key mixing function reference implementation ... 5771
J.1.2 Test vectors ... 5781
J.2 Michael reference implementation and test vectors ... 5783
J.2.1 Michael test vectors ... 5783
J.2.1.1 Introduction ... 5783
J.2.1.2 Block function ... 5783
J.2.1.3 Michael ... 5783
J.2.2 Sample code for michael ... 5784
J.3 PRF reference implementation and test vectors ... 5791
J.3.1 PRF reference code ... 5791
J.3.2 PRF test vectors ... 5792
J.4 Suggested pass-phrase-to-PSK mapping ... 5792
J.4.1 Introduction ... 5792
J.4.2 Test vectors ... 5793
J.5 Suggestions for random number generation ... 5793
J.5.1 General ... 5793
J.5.2 Software sampling ... 5794

J.14 LTF Sequence Generation Test Vectors 5831

Annex K (informative) TSPECs and Admission control 5834
K.1 Example use of TSPEC for admission control 5834
K.2 Recommendation for implementation of contention based admission control 5835
K.2.1 Use of ACM (admission control mandatory) subfield 5835
K.2.2 Deriving medium time 5835
K.3 Guidelines and reference design for sample scheduler and admission control unit 5837
K.3.1 Guidelines for deriving service schedule parameters 5837
K.3.2 Reference design for sample scheduler and admission control unit 5838
K.3.2.1 General 5838
K.3.2.2 Sample scheduler 5838
K.3.2.3 Admission control unit 5840
K.4 TSPEC construction 5840
K.4.1 General 5840
K.4.2 Surplus Bandwidth Allocation 5841
K.4.3 Minimum and Maximum Service Interval 5845
K.4.3.1 Scheduled traffic 5845
K.4.3.2 Use of Maximum Service Interval with Aggregation of Packets 5845
K.4.4 Minimum, Mean, and Peak Data Rate 5846

Annex L(informative) Examples and sample code for encoding a TIM Partial Virtual Bitmap 5847
L.1 Introduction 5847
L.2 Examples 5847
L.3 Sample C code 5855

Annex M (informative) EPD and LPD headers and the integration function 5862
M.1 Introduction 5862
M.2 Integration function header conversions 5862
M.3 A-MSDU subframes 5862
M.4 Integration service versus bridging 5864

Annex N (informative) AP Functional description 5865
N.1 Introduction 5865

N.2 Terminology ... 5865
N.3 Primary ACM_STA functions ... 5869
N.4 Primary AP functions ... 5869
N.5 Primary DS functions ... 5871
N.6 Primary portal function ... 5871

Annex O (informative) Additional HT, VHT, and S1G information ... 5872
O.1 HT, VHT, and S1G waveform generator tool ... 5872
O.2 A-MPDU deaggregation ... 5873
O.3 Example of RD frame exchanges ... 5874
O.4 Illustration of determination of NDP addresses ... 5875
O.5 20/40 MHz BSS establishment and maintenance ... 5876
O.5.1 Signaling 20/40 MHz BSS capability and operation ... 5876
O.5.2 Establishing a 20/40 MHz BSS ... 5876
O.5.3 Monitoring channels for other BSS operation ... 5877

Annex P (informative) Location and Time Difference accuracy test ... 5879
P.1 Location via Time Difference of arrival ... 5879
P.2 Time Difference of departure accuracy test ... 5879
P.3 Differential Distance Computation using FTM frames ... 5881

Annex Q (informative) Example use of the Destination URI for Event and Diagnostic Reports ... 5885
Q.1 Destination URI payload ... 5885
Q.2 Use of HTTP (or HTTPS) for Destination URI of Event and Diagnostic Reports ... 5885

Annex R (informative) Interworking with external networks ... 5886
R.1 General ... 5886
R.2 Network discovery and selection ... 5886
R.2.1 General ... 5886
R.2.2 Airport ... 5886
R.2.3 Shopping ... 5888
R.2.4 Sales meeting ... 5888
R.2.5 Museum ... 5889
R.2.6 Emergency call ... 5890
R.2.7 Emergency alert ... 5890
R.3 QoS mapping guidelines for interworking with external networks ... 5891
R.3.1 General ... 5891
R.3.2 Determination of the mapping for a STA ... 5891
R.3.3 QoS mapping and GLK ... 5892
R.4 Interworking and SSPN interface support ... 5893
R.4.1 General ... 5893
R.4.2 SSPN interface parameters ... 5893
R.4.2.1 General ... 5894
R.4.2.2 Non-AP STA MAC ... 5895
R.4.2.3 Non-AP STA User ID ... 5895
R.4.2.4 Non-AP STA Interworking Capability ... 5895
R.4.2.5 Link Layer Encryption Method ... 5895
R.4.2.6 Authorized Priority ... 5896
R.4.2.7 Authorized Maximum Rate ... 5896
R.4.2.8 Authorized Service Access Type ... 5896
R.4.2.9 Authorized Delay ... 5896
R.4.2.10 Authorized Service Access Information ... 5897
R.4.2.11 Non-AP STA Transmission Count ... 5897
R.4.2.12 Non-AP STA Location Information ... 5897

R.4.2.13 Non-AP STA State Information ... 5898
R.5 Interworking with external networks and emergency call support ... 5898
R.5.1 General ... 5898
R.5.2 Background on emergency call support over IEEE 802.11 infrastructure ... 5898
R.5.3 System aspects for emergency call support ... 5899
R.5.4 Description of the Expedited Bandwidth Request element ... 5900
R.5.5 Access to emergency services in an RSN ... 5901
R.6 Peer information ... 5901
R.7 Calculating Estimated Throughput ... 5902

Annex S (informative) Mesh BSS Operation ... 5906
S.1 Clarification of mesh Data frame format ... 5906
S.2 Operational considerations for interworking ... 5906
S.3 Power save parameters selection ... 5906
S.3.1 General ... 5906
S.3.2 Selecting the mesh power management mode based on traffic load ... 5907
S.3.3 Scanning of mesh BSSs ... 5907
S.3.4 Default parameters ... 5907
S.3.5 MSDU forwarding in an MBSS containing mesh STAs in light or deep sleep mode ... 5908
S.3.6 Synchronization maintenance of mesh STAs in deep sleep mode ... 5908
S.4 SIV key wrapping test vector ... 5909
S.5 Airtime link metric usage example ... 5910
S.6 Link metric report example ... 5910
S.7 Generation of proactive PREP elements in the proactive PREQ mechanism of HWMP ... 5911
S.7.1 General ... 5911
S.7.2 Additions to forwarding information ... 5911
S.7.3 Actions when sending Data frames as source mesh STA ... 5911
S.7.4 Actions on receipt of a proactive PREQ element ... 5912
S.7.5 Generation of proactive PREP elements ... 5912
S.8 Generation of PREQ elements in proactive RANN mechanism of HWMP ... 5912
S.8.1 General ... 5912
S.8.2 Additions to forwarding information ... 5912
S.8.3 Actions when sending Data frames as source mesh STA ... 5912
S.8.4 Actions on receipt of proactive RANN element ... 5913
S.8.5 Actions on receipt of a PREP element ... 5913

Annex T (informative) Overlapping BSS (OBSS) management ... 5914
T.1 Introduction ... 5914
T.2 QLoad Report element ... 5914
T.2.1 General ... 5914
T.2.2 Calculating medium time ... 5915
T.2.3 Calculation of potential traffic self ... 5915
T.2.4 Calculation of allocated traffic self ... 5917
T.2.5 Calculation of allocated traffic shared ... 5918
T.2.6 Calculation of EDCA Access Factor ... 5918
T.2.7 EDCA Overhead Factor ... 5919
T.2.8 Calculation of HCCA Access Factor ... 5919
T.3 Channel selection using QLoad report ... 5920
T.3.1 General ... 5920
T.3.2 AP with admission control mandatory ... 5920
T.3.3 AP with an HC ... 5920
T.3.4 Channel selection procedures ... 5921

IEEE Standard for Information Technology—
Telecommunications and Information Exchange between Systems
Local and Metropolitan Area Networks—
Specific Requirements

Part 11: Wireless LAN Medium Access Control (MAC) and Physical Layer (PHY) Specifications

1. Overview

1.1 Scope

The scope of this standard is to define one medium access control (MAC) and several physical layer (PHY) specifications for wireless connectivity for fixed, portable, and moving stations (STAs) within a local area.

1.2 Purpose

The purpose of this standard is to provide wireless connectivity for fixed, portable, and moving stations within a local area. This standard also offers regulatory bodies a means of standardizing access to one or more frequency bands for the purpose of local area communication.

1.3 Supplementary information on purpose

Specifically, in the context of IEEE 802.11™-compliant devices, this standard

- Describes the functions and services required by a device to operate within independent, personal, and infrastructure networks as well as the aspects of device mobility (transition) within those networks.
- Describes the functions and services that allow a device to communicate directly with another such device outside of an independent or infrastructure network.
- Defines the MAC procedures to support the MAC service data unit (MSDU) delivery services.
- Defines several PHY signaling techniques and interface functions that are controlled by the MAC.
- Permits the operation of a device within a wireless local area network (WLAN) that coexists with multiple overlapping IEEE 802.11 WLANs.
- Describes the requirements and procedures to provide data confidentiality of user information and MAC management information being transferred over the wireless medium (WM) and authentication of devices.
- Defines mechanisms for dynamic frequency selection (DFS) and transmit power control (TPC) that may be used to satisfy regulatory requirements for operation in any band.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Defines the MAC procedures to support local area network (LAN) applications with quality-of-service (QoS) requirements, including the transport of voice, audio, and video.
— Defines mechanisms and services for wireless network management of devices that include BSS transition management, channel usage and coexistence, collocated interference reporting, diagnostic, multicast diagnostic and event reporting, flexible multicast, efficient beacon mechanisms, proxy ARP advertisement, location, timing measurement, directed multicast, extended sleep modes, traffic filtering, and management notification.
— Defines functions and procedures aiding network discovery and selection by devices, information transfer from external networks using QoS mapping, and a general mechanism for the provision of emergency services.
— Defines the MAC procedures that are necessary for wireless multi-hop communication to support wireless LAN mesh topologies.
— Defines medium access control mechanisms to support the prioritization of Management frames.
— Defines mechanisms to improve audio video (AV) streaming QoS while maintaining data and voice performance.
— Defines the PHY signaling, MAC, and beamforming procedures required for operation with directional antenna patterns.
— Defines the PHY and MAC enhancements to enable operation in the Chinese millimeter wave frequency bands (60 GHz and 45 GHz).
— Defines the mechanisms for communications over the wireless medium used as a link in an IEEE 802.1Q™ bridged network.
— Defines mechanisms to enable delivery of preassociation service discovery information to IEEE 802.11 stations (STAs).
— Defines a mechanism to enable IEEE 802.11 STAs to operate at extremely low power consumption and to react to incoming traffic with low latency through a wake-up signal.
— Defines mechanisms for the determination of absolute and relative position with secure measurement and measurement results exchange.
— Defines a mechanism to enable IEEE 802.11 stations to transmit and receive broadcast content, both in cases when the transmitter(s) and the receiver(s) are associated in an infrastructure BSS and when they are not; and a mechanism to enable uplink content to be relayed to a specified destination typically within an external network.

1.4 Word usage

In this document, the word *shall* is used to indicate a mandatory requirement. The word *should* is used to indicate a recommendation. The word *may* is used to indicate a permissible action. The word *can* is used for statements of possibility and capability. The words *need(s) to* are used to indicate a requirement on an entity outside the scope of this standard.

The construction "between *x* and *y*", "*x* to *y*" or "*x*–*y*" represents an inclusive range (i.e., the range includes both values *x* and *y*). The construction "B*x*–B*y*" represents bits *x* to *y*; it is not the subtraction of bit *y* from bit *x*.

The construction "up to *y*" represents an inclusive upper bound (i.e., the range includes the value *y)*.

Any action specified as relating to a SAP primitive is to be interpreted as an action on an invocation or instance of that primitive.

If <x> represents a scalar field, scalar subfield, scalar parameter or scalar MIB attribute:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

- if "<x> is" is used in a context that relates to the testing or setting the value of "<x>" this usage is to be interpreted as though written "the value of <x> is"
- "<x> indicate(s)" is to be interpreted as though written "the value of <x> indicate(s)"
- "indicated by <x>" is to be interpreted as though written "indicated by the value of <x>"
- "<x> that indicate" is to be interpreted as though written "<x> whose value indicates"

If <x> represents a frame, element, subelement, structured field, structured subfield, structured parameter or structured MIB attribute:

- "<x> indicate(s)" is to be interpreted as though written "the contents of <x> indicate"
- "indicated by <x>" is to be interpreted as though written "indicated by the contents of <x>"
- "<x> that indicate" is to be interpreted as though written "<x> whose contents indicate"

A reference to a value of a MIB attribute of the form "if <MIB attribute> is <x>" is to be interpreted as though written "if <MIB attribute> is present and is <x>". A reference to a value of a MIB attribute of the form "if <MIB attribute> is not <x>" is to be interpreted as though written "if <MIB attribute> is not present, or is present and is not <x>".

If <x> represents a SAP primitive:

- "<x> indicate(s)" is to be interpreted as though written "the (or an) invocation of <x> indicates"
- "indicated by <x>" is to be interpreted as though written "indicated by the (or an) invocation of <x>"

The construction of descriptions for uses of the SHA family of hash algorithms [HMAC-]SHA-<1,256,384>[-*n*] is used to refer to hash algorithms/HMACs where square brackets indicate optional information, and *n* is an integer indicating the length, in bits, of the output when truncating.

A construction of the form "the x element can be included in a, b and c frames" or "the x element can be present in a, b and c frames" is not to be understood as being a complete list of frames in which the element might be present.

Constructions of the form that a frame, MPDU or A-MPDU is transmitted with a certain TXVECTOR parameter, or received with a certain RXVECTOR parameter, are to be understood as referring to the TXVECTOR or RXVECTOR parameter, respectively, corresponding to the PSDU containing the frame, MPDU or A-MPDU. Similarly, constructions of the form that a PPDU is transmitted with a certain TXVECTOR parameter, or received with a certain RXVECTOR parameter, are to be understood as referring to the TXVECTOR or RXVECTOR parameter, respectively, corresponding to the PSDU contained in the PPDU.

References in this standard to a "<name> frame", where <name> corresponds to one of the Management frame subtypes, are to be understood as being to a "<name> MMPDU, where the MMPDU is carried in the frame body of one or more Management frames with the Subtype field value corresponding to <name>, plus information from the MPDU headers (the Management frame subtype and the addresses)".

References in this standard to a "<name> Action frame", where <name> corresponds to a category identified in Table 9-81, are to be understood as being to an "Action frame whose Category field indicates <name>", and references in this standard to a "<name> frame", where <name> corresponds to an Action frame subtype identified by the octet immediately after the Category field (the <something> Action field identified in the subclauses of 9.6), are to be understood as being to "an Action frame with that <something> Action field (and the corresponding Category field)". For example, frames in the QoS category are called QoS Action frames, and frames in the QoS category with a QoS Action subfield of ADDTS Request are called ADDTS Request frames. Vendor Specific Public Action frames are a special case in that they use the "<name> Public Action frame" construction instead of the "<name> frame" above.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

References in this standard to a "<name> request", where <name> corresponds to one of the Measurement Types in Table 9-136 is equivalent to (according to context) a) "a Spectrum Measurement Request frame or Radio Measurement Request frame carrying a Measurement Request element with the Measurement Type field equal to <name>" or b) "a Measurement Request element with the measurement type field equal to <name>".

References in this standard to a "<name> report", where <name> corresponds to one of the Measurement Types in Table 9-163 is equivalent to (according to context) a) "a Measurement Report frame or Radio Measurement Report frame carrying a Measurement Report element with the Measurement Type field equal to <name>" or b) "a Measurement Report element with the Measurement Type field equal to <name>".

An ASCII or UTF-8 string is a sequence of ASCII or UTF-8 encoded code points, respectively, without a terminating null. ASCII refers to 7-bit US-ASCII per IETF RFC 20.

References in this standard to "<adjective> STA" correspond to a specific instance of a STA implementation that can statically support and execute the <adjective> feature or role for the lifetime of the instance. Such a STA implementation may be capable of a different configuration where <adjective> is not supported (or even a mutually exclusive state is supported instead), but the switch from support to nonsupport of <adjective> is beyond the scope of this standard. The <adjective> support is to be understood as static for the lifetime of the instance, unless explicitly discussed otherwise.

References in this standard to "FILS authentication frame" or "SAE authentication frame" are to be understood as references to an Authentication frame that contains fields and elements for FILS or SAE (respectively) operation per Table 9-71.

References in this standard to a "beacon" (with a lowercase initial letter) are to be understood as being to a Beacon, DMG Beacon or S1G Beacon frame, as the context permits.

A construction of the form "silently discarding a frame" means that the STA shall discard the frame without further processing and without any externally observable notification that it has done so.

References to the operating class of a BSS or STA are to be understood as being references to the operating class pertaining to the channel on which the BSS or STA operates.

A construction of the form "AKM [is] [not] 00-0F-AC:<n>" is to be interpreted as referring to the AKMP identified by AKM suite selector 00-0F-AC:<n>. A construction of the form "intended AKM" or "negotiated AKM" is to be interpreted as referring to the AKMP.

Where a transition is shown a state machine figure, but no transition condition is shown, the transition occurs as soon as all the state actions have been performed.

1.5 Terminology for mathematical, logical, and bit operations

Floor (x), also written as $\lfloor x \rfloor$, is the largest integer smaller than or equal to x. For example, Floor (2.3) is 2 and Floor (–2.3) is –3. The two parameter form, Floor (x, y), is the largest multiple of y smaller than or equal to x; this operator is not used in this standard if y is negative. For example, Floor (3.3, 2) is 2 and Floor (–3.3, 2) is –4.

Ceil (x), also written as $\lceil x \rceil$ is the smallest integer larger than or equal to x. For example, Ceil (2.3) is 3 and Ceil (–2.3) is –2. The two parameter form, Ceil (x, y), is the smallest multiple of y larger than or equal to x; this operator is not used in this standard if y is negative. For example, Ceil (2.3, 2) is 4 and Ceil (–2.3, 2) is –2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Round (*x*) is the integer closest to *x*, rounding values with a fractional part of 0.5 away from zero. For example, Round (2.3) is 2, Round (2.5) is 3, Round (–2.3) is –2 and Round (–2.5) is –3.

x mod *y* is the remainder when *x* is divided by *y*; this operator is not used in this standard if *y* is negative; the result is positive even if *x* is negative. For example, 5 mod 3 is 2 and –5 mod 3 is 1.

The symbol ⊕ represents bitwise exclusive OR (XOR).

log2 (*x*) is the logarithm of *x* to the base 2. For example, log2 (32) is 5.

log10 (*x*) is the logarithm of *x* to the base 10. For example, log10 (100) is 2..

ln (*x*) is the logarithm of *x* to the base of natural logarithms. For example, ln (10) is approximately 2.3.

Re (*z*) is the real part of complex number *z*. Im (*z*) is the imaginary part of complex number *z* (not including the factor *i*). For example, Re (1 – 2*i*) is 1 and Im (1 – 2*i*) is –2.

x && *y* is the short-circuiting Boolean AND.

x || *y* is the concatenation of *x* and *y*, except in code, where it sometimes is the short-circuiting Boolean OR (as determined by the context).

!*x* is the Boolean NOT.

x >> *y* is *x* logically shifted right (i.e., zeros are inserted at the most significant end) by *y*; this operator is not used in this standard if *y* is negative.

x << *y* is *x* shifted left (i.e., zeros are inserted at the least significant end) by *y*; this operator is not used in this standard if *y* is negative.

x == y is Boolean equality.

x != y is Boolean inequality.

x & *y*, where *x* and *y* are numbers, is the bitwise AND of *x* and *y*.

x | *y*, where *x* and *y* are numbers, is the bitwise OR of *x* and *y*.

0x introduces a hexadecimal number. For example, 0x12 is 18 decimal.

ExtractBits(*S*, *F*, *N*) is bits *F* to *F*+*N*–1 of the bit string *S* starting from the left, using the IEEE 802.11 bit conventions from 9.2.2.

Truncate-*N*(*S*) is bits 0 to *N*–1 of the bit string *S* starting from the left, using the IEEE 802.11 bit conventions from 9.2.2). Other bits are irretrievably deleted.

exp(*x*) is *e* to the power *x*, where *e* is the base of natural logarithms.

A[*b*:*c*] is the bit string consisting of bits *b* to *c* of *A*, where bit 0 of the output is the value of bit *b*. This operator is not used in this standard with *b* larger than *c*.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

int(*S*) is the numeric value of bit string *S*, where bit 0 of S is the least significant bit, using the IEEE 802.11 bit conventions from 9.2.2.

NOTE—The *int* operator applied to a (portion of a) MAC address implies that octet 0 of the MAC address is the least significant octet under this operator.[6]

bin[*x*, *k*] is the operator that casts decimal value *x* into *k* bits binary vector, where *x* is less than 2^k.

A construction of the form "*x* shall be ignored upon reception" (and similar expressions) is to be understood as meaning that the state of any receiving STA is unaffected by *x*.

[6] NOTEs in text, tables, and figures of a standard are given for information only and do not contain requirements needed to implement the standard. Lettered footnotes to tables and figures, however, are normative.

3. Definitions, acronyms, and abbreviations

3.1 Definitions

For the purposes of this standard, the following terms and definitions apply. The *IEEE Standards Dictionary Online* should be referenced for terms not defined in this clause.[20]

access control: The prevention of unauthorized usage of resources.

access point: (AP) An entity that contains one station (STA) and provides access to the distribution system services, via the wireless medium (WM) for associated STAs. An AP comprises a STA and a distribution system access function (DSAF).

access point (AP) reachability: [AP reachability] An AP is reachable by a station (STA) if preauthentication messages can be exchanged between the STA and the target AP via the distribution system (DS).

NOTE—Preauthentication is defined in 12.6.8.2.

additional authentication data (ADD): Data that are not encrypted, but are cryptographically protected.

admission control: An algorithm intended to prevent the violation of parameterized service commitments made by the network to admitted flows by controlling the admittance of a new flow into a resource constrained network.

aggregate medium access control (MAC) protocol data unit: [A-MPDU] A structure that contains one or more MPDUs and is transported by a physical layer (PHY) as a single PHY service data unit (PSDU).

aggregate medium access control (MAC) protocol data unit (A-MPDU) subframe: [A-MPDU subframe] A portion of an A-MPDU that contains a delimiter and optionally contains an MPDU plus any necessary padding.

aggregate medium access control (MAC) service data unit (A-MSDU): [A-MSDU] A structure that contains one or more MSDUs and is transmitted in one or more QoS Data frames with the same sequence number.

aggregate medium access control (MAC) service data unit (A-MSDU) subframe: [A-MSDU subframe] A portion of an A-MSDU that contains a header and associated MSDU.

antenna connector: The measurement point of reference for radio frequency (RF) measurements in a station (STA). The antenna connector is the point in the STA architecture comprising a) a receive antenna connector representing the input of the receiver (output of the antenna) for radio reception and b) a transmit antenna connector representing the input of the antenna (output of the transmitter) for radio transmission. In systems using multiple antennas or antenna arrays, the antenna connector is a virtual point representing the aggregate output of (and input to) the multiple antennas. In systems using active antenna arrays with processing, the transmit antenna connector or receive antenna connector is respectively the input or output of the active array, which includes any processing gain of the active antenna subsystem. In systems using light communications, the antenna connector is a virtual point representing the intermediate frequency (IF) interface of the light communication (LC) optical antenna. In the receive direction, the signal at this virtual point is the output of the LC optical receive (RX) antenna and includes any processing gain from the LC optical RX antenna.

[20] *IEEE Standards Dictionary Online* is available at http://dictionary.ieee.org/. An IEEE account is required for access to the dictionary, and one can be created at no charge on the dictionary sign-in page.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—The receive antenna connector and transmit antenna connector might be the same measurement point.

NOTE 2—In contexts in which transmission or reception is the subject "antenna connector" is an implicit reference to the transmit antenna connector or receive antenna connector, respectively.

antenna selection (ASEL) receiver: [ASEL receiver] A station (STA) that uses an antenna selection procedure to perform the mapping of signals at RF chains onto antenna elements when the number of RF chains is smaller than the number of antenna elements.

antenna selection (ASEL) transmitter: [ASEL transmitter] A station (STA) that performs transmit ASEL.

antenna weight vector (AWV): A vector of weights describing the excitation (amplitude and phase) for each element of an antenna array.

association: The service used to establish a mapping between an access point (AP) or personal basic service set (PBSS) control point (PCP), and a station (STA) and enable STA invocation of the distribution system services (DSSs).

authenticated encryption with associated data (AEAD): A cipher mode that performs authenticated encryption of a plaintext, with associated data that is authenticated but not encrypted.

authentication: The service used to establish the identity of one station (STA) as a member of the set of STAs authorized to associate with another STA.

Authentication Server (AS): An entity that provides an authentication service to an Authenticator. This service determines, from the credentials provided by the Supplicant, whether the Supplicant is authorized to access the services provided by the Authenticator. (IEEE Std 802.1X-2020)[21]

Authenticator: An entity at one end of a point-to-point local area network (LAN) segment that facilitates Authentication of the entity attached to the other end of that link. (IEEE Std 802.1X-2020)

Authenticator address (AA): The medium access control (MAC) address of the IEEE 802.1X Authenticator's station (STA).

authorization: The act of determining whether a particular right, such as access to a resource, is granted to an entity.

NOTE—See IETF RFC 2903 [B35].

authorized: To be explicitly allowed.

average noise plus interference power indicator (ANIPI): A medium access control (MAC) indication of the average noise plus interference power measured on a channel that meets the two simultaneous conditions: 1) the station (STA) is not transmitting a frame, and 2) the station (STA) is not receiving a frame addressed to it.

azimuth: The horizontal orientation of the front surface of a station or of a radio antenna system's main lobe measured clockwise from true north.

basic service area (BSA): The area in which the members of a basic service set (BSS) are able to communicate with each other such that necessary services of the BSS can be provided, such as synchronization and data transfer.

NOTE—The extent of a given BSA is unlikely to be strictly definable, nor static. See 4.3.6 for further discussion.

[21] Information on references can be found in Clause 2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

basic service set (BSS): A set of stations (STAs) that have successfully synchronized using the MLME-JOIN.request service primitive and one STA that has used the MLME-START.request primitive. Alternatively, a set of STAs that have used the MLME-START.request primitive specifying matching mesh profiles where the match of the mesh profiles has been verified via the scanning procedure. Membership in a BSS does not imply that wireless communication with all other members of the BSS is possible.

basic service set (BSS) max idle period: [BSS max idle period] A time period during which the access point (AP) does not disassociate a station (STA) due to nonreceipt of frames from that STA.

basic service set (BSS) transition: [BSS transition] Change of association by a station (STA) from one BSS to another BSS in the same extended service set (ESS).

beamformee: A station (STA) that receives a physical layer (PHY) protocol data unit (PPDU) that was transmitted using a beamforming steering matrix.

beamformer: A station (STA) that transmits a physical layer (PHY) protocol data unit (PPDU) using a beamforming steering matrix.

beamforming (BF): A spatial filtering mechanism used at a transmitter to improve the received signal power or signal-to-noise ratio (SNR) at an intended receiver. *Syn:* **beam steering**.

beamforming steering matrix: A matrix determined using knowledge of the channel between a transmitter and an intended receiver that maps from space-time streams to transmit antennas with the goal of improving the signal power or signal-to-noise ratio (SNR) at the intended receiver.

big endian: The concept that, for a given multi-octet numeric representation, the most significant octet has the lowest address.

broadcast address: A unique group address that specifies all stations (STAs).

calibration initiator: A station (STA) that initiates a calibration sequence.

calibration responder: A station (STA) that transmits during a calibration sequence in response to a transmission by a calibration initiator.

candidate peer mesh station (STA): [candidate peer mesh STA] A neighbor mesh STA to which a mesh peering has not been established but meets eligibility requirements to become a peer mesh STA.

certificate authority (CA): An entity that vouches for the binding between a device's identity, its public key, and associated keying material (such as key validity period and key usage).

channel: An instance of use of the wireless medium (WM) for the purpose of passing physical layer (PHY) protocol data units (PDUs) between two or more stations (STAs).

channel spacing: The difference between the center frequencies of two nonoverlapping and adjacent channels of the radio transmitter.

cipher suite: A set of one or more algorithms, designed to provide data confidentiality, data authenticity or integrity, and/or replay protection.

clear channel assessment (CCA) function: The logical function in the physical layer (PHY) that determines the current state of use of the wireless medium (WM).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

colocated interference: Interference that is caused by another radio or station (STA) emitting radio energy located in the same physical device as the reporting STA, where the reported characteristics of the interference are known a priori without interference detection, measurement, or characterization by the reporting STA.

colocated radio: A radio capable of emitting radio-frequency energy located in the same physical device as the reporting station (STA), where the radio's type and some link characteristics are known without signal detection or measurement by the reporting STA.

configuration profile: A collection of parameters identified by a profile nontransmitter identifier (ID) that represent a current or available configuration of a station (STA).

contiguous transmission: A transmission that uses only one frequency segment.

coordination function: The logical function that determines when a station (STA) is permitted to transmit protocol data units (PDUs) via the wireless medium (WM).

Counter Mode with cipher-block chaining message authentication code (CCM): A symmetric key block cipher mode providing confidentiality using Counter Mode (CTR) and data origin authenticity using cipher-block chaining message authentication code (CBC-MAC).

NOTE—See IETF RFC 3610.

cryptographic encapsulation: The process of generating the cryptographic payload from the plaintext data. This comprises the cipher text as well as any associated cryptographic state required by the receiver of the data, e.g., initialization vectors (IVs), sequence numbers, message integrity codes (MICs), key identifiers.

data confidentiality: A property of information that prevents disclosure to unauthorized individuals, entities, or processes.

deauthentication service: The service that voids an existing authentication relationship.

decapsulate: To recover an unprotected frame from a protected one.

decapsulation: The process of generating plaintext data by decapsulating an encapsulated frame.

dependent station (STA): A STA that is not registered and whose operational parameters are dictated by messages it receives from an enabling STA. Once enabled by the dynamic STA enablement (DSE) process, a dependent STA's continued operation becomes contingent upon being able to receive messages from its enabling STA over the wireless medium (WM).

destination mesh station (STA): A mesh STA that is the final destination of a medium access control (MAC) service data unit (MSDU). This mesh STA might reside in a proxy mesh gate that might forward the MSDU to a STA outside of the mesh basic service set (MBSS). A destination mesh STA might be an end station as defined in IEEE Std 802.

direct link: A bidirectional link from one quality-of-service (QoS) station (STA) to another QoS STA operating in the same QoS independent basic service set (IBSS), or infrastructure QoS basic service set (BSS) that does not pass through a QoS access point (AP).

directed multicast service (DMS): A service in which the access point (AP) transmits group addressed frames as individually addressed frames to the requesting non-AP station (STA).

disassociation service: The service that removes an existing association.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

distributed coordination function (DCF): A class of coordination function where the same coordination function logic is active in every station (STA) in the basic service set (BSS) whenever the network is in operation.

distribution system (DS): A system used to interconnect a set of basic service sets (BSSs) and integrated local area networks (LANs) to create an extended service set (ESS).

distribution system access function (DSAF): A function within an access point (AP) or mesh gate that uses the medium access control (MAC) service and distribution system service (DSS) to provide access between the distribution system (DS) and the wireless medium (WM). Within a general link (GLK) AP or GLK mesh station (STA), the DSAF also switches GLK traffic to the GLK convergence function and from there to the IEEE 802.1Q bridge port.

distribution system medium (DSM): The medium or set of media used by a distribution system (DS) for communications between access points (APs), mesh gates, and the portal of an extended service set (ESS).

distribution system service (DSS): The set of services provided by the distribution system (DS) that enable the medium access control (MAC) to transport MAC service tuples between stations (STAs) that are not in direct communication with each other over a single instance of the wireless medium (WM).

NOTE 1—These services include transport of MAC service tuples between the access points (APs) of basic service sets (BSSs) within an extended service set (ESS), transport of MAC service tuples between the portal and BSSs within an ESS, transport of MAC service tuples between mesh gates in the same or different mesh basic service sets (MBSSs), transport of MAC service tuples between mesh gates and APs, transport of MAC service tuples between mesh gates and a portal, and transport of MAC service tuples between STAs in the same BSS when the MAC service tuples has a group destination address or the destination is an individual address and the STA is associated with an AP.

NOTE 2—DSSs are provided between pairs of MACs not on the same instance of the WM.

dynamic frequency selection (DFS): Facilities mandated to satisfy requirements in some regulatory domains for radar detection and uniform channel spreading in the 5 GHz band. These facilities might also be used for other purposes, such as automatic frequency planning.

dynamic station (STA) enablement (DSE): [DSE] The process by which an enabling STA grants permission and dictates operational procedures to STAs that are subject to its control.

effective isotropic radiated power (EIRP): The equivalent power of a transmitted signal in terms of an isotropic (omnidirectional) radiator. The EIRP equals the product of the transmitter power and the antenna gain (reduced by any coupling losses between the transmitter and antenna).

emergency alert system (EAS): A United States and its territories national public warning system.

enabling station (STA): [enabling STA] A registered STA that has the authority to control when and how a dependent STA can operate. An enabling STA communicates an enabling signal to its dependents over the wireless medium (WM). An enabling STA chooses whether other dynamic STA enablement (DSE) messages are exchanged over the air, over the distribution system (DS), or by mechanisms that rely on transport via higher layers.

encapsulate: To construct a protected frame from an unprotected frame.

encapsulation: The process of generating a protected frame by encapsulating plaintext data.

extended service area: The area within which members of an extended service set (ESS) can communicate. An extended service area is larger than or equal to a basic service area (BSA) and might involve several basic service sets (BSSs) in overlapping, disjointed, or both configurations.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

extended service set (ESS): A set of one or more basic service sets (BSSs) that are interconnected by a single distribution system (DS); an ESS appears as a single IEEE Std 802™ access domain to the logical link control (LLC) sublayer.

extended service set (ESS) transition: [ESS transition] Change of association by a station (STA) from one basic service set (BSS) in one ESS to another BSS in a different ESS.

fast basic service set (BSS) transition: [fast BSS transition, FT] Change of association by a station (STA) that is from one BSS in one extended service set (ESS) to another BSS in the same ESS and that minimizes the amount of time that the data connectivity is lost between the STA and the distribution system (DS).

fast session transfer (FST): The transfer of a session from a channel to another channel, in the same or different frequency bands. The term "session" refers to non-physical layer state information kept by a pair of stations (STAs) that communicate directly (i.e., excludes forwarding).

fixed station (STA): [fixed STA] A STA that is physically attached to a specific location. In licensed bands, a fixed STA might be authorized to operate only at a specific location.

forwarding information: The information maintained by a mesh station (STA) that allows the mesh STA to perform its path selection and forwarding functions.

frame: A unit of data exchanged between medium access control (MAC) entities. *Syn:* **medium access control (MAC) protocol data unit (MPDU)**.

frame exchange sequence: A sequence of frames that maintains control of the wireless medium.

NOTE—Control of the wireless medium might be maintained across multiple frame exchange sequences through other mechanisms, see, for example, 10.23.2.8.

frequency segment: A contiguous block of spectrum used by a transmission or a block of spectrum used by a transmission that would be contiguous were it not punctured.

Gaussian frequency shift keying (GFSK): A modulation scheme in which the data are first filtered by a Gaussian filter in the baseband and then modulated with a simple frequency modulation.

geolocation: A location within an earth-centric frame of reference.

group: The entities in a wireless network, e.g., an access point (AP) and its associated stations (STAs), or all of the STAs in an independent basic service set (IBSS) network.

group address: A medium access control (MAC) address that has the group bit equal to 1. *Syn*: **multicast address**.

group addressed: When applied to a medium access control (MAC) service data unit (MSDU), it is an MSDU with a group address as the destination address (DA). When applied to a MAC protocol data unit (MPDU), it is an MPDU with a group address in the Address 1 field. *Syn*: **multicast**.

HeSS: A collection of basic service sets (BSSs) that provide access to a set of higher layer services using a given set of authentication credentials.

NOTE 1—HeSS is an orthogonal concept to extended service set (ESS). Membership of a given BSS in an HeSS is independent of any ESS membership.

NOTE 2—"HeSS" is not an abbreviation for anything.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

hidden station (STA): [hidden STA] A STA whose transmissions are not detected using carrier sense (CS) by a second STA, but whose transmissions interfere with transmissions from the second STA to a third STA.

idle power indicator (IPI): [IPI] A physical layer (PHY) indication of the total channel power (noise and interference) as measured in the channel at the receiving antenna connector while the station (STA) is idle, i.e., neither transmitting nor receiving a frame.

IEEE 802.1X authentication: Extensible Authentication Protocol (EAP) authentication transported by the IEEE 802.1X protocol.

independent basic service set (IBSS): [IBSS] A basic service set (BSS) that forms a self-contained network, and in which no access to a distribution system (DS) is available.

independent basic service set (IBSS) station (STA): [IBSS STA] A STA that has started or joined an IBSS.

individual address: A medium access control (MAC) address in which the group bit is 0.

individually addressed: When applied to a medium access control (MAC) service data unit (MSDU), it is an MSDU with an individual address as the destination address (DA). When applied to a MAC protocol data unit (MPDU), it is an MPDU with an individual address in the Address 1 field.

infrastructure: An infrastructure comprises a distribution system (DS), one or more access points (APs), zero or one portals, and zero or more mesh gates. It is also the logical location of distribution and integration service functions of an extended service set (ESS).

infrastructure authorization information: The information that specifies the access rights of the user of a non–access point (non-AP) station (STA). This information might include the rules for routing the user traffic, a set of permissions about services that a user is allowed to access, quality-of-service (QoS) configuration information, or the accounting policy to be applied by the infrastructure.

infrastructure basic service set (BSS): A BSS that includes an access point (AP), which enables access to a distribution system (DS).

integration service: The service that enables delivery of medium access control (MAC) service data units (MSDUs) between the distribution system (DS) and a local area network (LAN) (via a portal).

link margin: Ratio of the received signal power to the minimum required by the station (STA). The STA might incorporate rate information and channel conditions, including interference, into its computation of link margin. The specific algorithm for computing the link margin is implementation dependent.

link metric: A criterion used to characterize the performance, quality, and eligibility of a link.

little endian: The concept that, for a given multi-octet numeric representation, the least significant octet has the lowest address.

liveness: A demonstration that the peer is actually participating in this instance of communication.

location subject local: The term used when a location request is for the location of the requesting station (STA), i.e., when the requesting STA asks, “Where am I?”

location subject remote: The term used when a location request is for the location of the reporting station (STA), i.e., when the requesting STA asks, “Where are you?”

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

location subject third party: The term used when the location request is for the location of a station (STA) other than the requesting STA or the requested STA, (i.e., when the requesting STA asks, "Where is station A?")

master session key (MSK): Keying material that is derived between the Extensible Authentication Protocol (EAP) peer and exported by the EAP method to the Authentication Server (AS).

NOTE—In this standard, this key is at least 64 octets in length.

medium access control (MAC) protocol data unit (MPDU): [MPDU] The unit of data exchanged between two peer MAC entities using the services of the physical layer (PHY). *Syn:* **medium access control (MAC) frame**.

medium access control (MAC) service data unit (MSDU): [MSDU] Information that is delivered as a unit between MAC service access points (SAPs).

medium access control (MAC) service tuple: [MAC service tuple] The collection of a MAC service data unit (MSDU) along with the associated source address, destination address, priority, drop eligibility, service class, station vector, and MSDU format, which are all passed as parameters across the MAC service access point (SAP) and are all except the station vector delivered across the distribution system between access points (APs), mesh gates, and the portal of an extended service set (ESS).

mesh basic service set (MBSS): A basic service set (BSS) that forms a self-contained network of mesh stations (STAs) that use the same mesh profile. An MBSS contains zero or more mesh gates, and can be formed from mesh STAs that are not in direct communication.

mesh facility: The set of enhanced functions, channel access rules, frame formats, mutual authentication methods, and managed objects used to provide data transfer among autonomously operating stations (STAs) that might not be in direct communication with each other over a single instance of the wireless medium. Communication between STAs using the mesh facility takes place using only the wireless medium. The mesh facility transports a medium access control (MAC) service data unit (MSDU) between source and destination STAs over potentially multiple hops of the wireless medium without transiting the MAC service access point (SAP) at intermediate STAs.

mesh gate: Any entity that has a mesh station (STA) function and a distribution system access function (DSAF) to provide access to a single distribution system for the mesh basic service set (MBSS).

mesh link: A link from one mesh station (STA) to a neighbor mesh STA that have a mesh peering with each other.

mesh neighborhood: The set of all neighbor mesh stations (STAs) of a particular mesh STA.

mesh path: A concatenated set of mesh links from a source mesh station (STA) to a destination mesh STA.

mesh path selection: The process of selecting a mesh path.

mesh peering: A relationship between two mesh stations (STAs) that is required for direct communication over a single instance of the wireless medium (WM). A mesh peering is established with a mesh peering protocol.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

mesh profile: A set of values of parameters that identifies the attributes of the mesh basic service set (MBSS) and that is used in a single MBSS.

NOTE—The mesh profile consists of the identifiers that are the values for the parameters: mesh identifier (ID), active path selection protocol, active path selection metric, congestion control mode, synchronization method, and authentication protocol.

mesh services: The set of services that enable the creation and operation of a mesh basic service set (MBSS).

mesh station (STA): [mesh STA] A quality-of-service (QoS) STA that implements the mesh facility.

message integrity code (MIC): A value generated by a cryptographic function. If the input data are changed, a new value cannot be correctly computed without knowledge of the cryptographic key(s) used by the cryptographic function.

NOTE—This is traditionally called a *message authentication code* (MAC), but the acronym MAC is already reserved for another meaning in this standard.

mobile station (STA): [mobile STA] A type of STA that uses network communications while in motion.

mobility domain: A set of basic service sets (BSSs), within the same extended service set (ESS), that support fast BSS transitions between themselves and that are identified by the set's mobility domain identifier (MDID).

mobility domain identifier (MDID): An identifier that names a mobility domain.

multicast: *See:* **group addressed**.

multicast address: *See:* **group address**.

multicast-group address: A medium access control (MAC) address associated by higher level convention with a group of logically related stations (STAs). The group of STAs is referred to a multicast group.

multi-level precedence and preemption (MLPP): A framework used with admission control for the treatment of traffic streams based on precedence, which supports the preemption of an active traffic stream by a higher precedence traffic stream when resources are limited. Preemption is the act of forcibly removing a traffic stream in progress in order to free up resources for another higher precedence traffic stream.

multiple basic service set identifier (BSSID) capability: [multiple BSSID capability] The capability to advertise information for multiple BSSIDs using a single Beacon or Probe Response frame instead of using multiple Beacon or Probe Response frames, each corresponding to a single BSSID, and the capability to indicate buffered frames for these multiple BSSIDs using a single traffic indication map (TIM) element in a single Beacon or TIM frame.

multiple input, multiple output (MIMO): A physical layer (PHY) configuration in which the transmitter uses multiple antennas and the receiver might use multiple antennas.

multiple medium access control (MAC) station management entity (SME): [MM-SME] Component of station management that manages multiple cooperating stations (STAs).

multi-user multiple input, multiple output: [MU-MIMO] A technique by which multiple stations (STAs), each with one or more antennas, either simultaneously transmit to a single STA or simultaneously receive from a single STA independent PSDUs over the same subcarriers.

neighbor access point (AP): [neighbor AP] Any AP that is a potential service set transition candidate.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

neighbor station (STA): [neighbor AP] A STA in the following relationship: STA A is a neighbor to STA B if STA A can both directly transmit to and receive from STA B over the wireless medium.

network access identifier: [NAI] The user identity submitted by the Supplicant during IEEE 802.1X authentication.

NOTE—See IETF RFC 4282.

network access server (NAS) client: [NAS client] The client component of a NAS that communicates with the Authentication Server (AS).

network allocation vector (NAV): An indicator, maintained by each station (STA), of time periods when transmission onto the wireless medium (WM) is not initiated by the STA regardless of whether the STA's clear channel assessment (CCA) function senses that the WM is busy.

next-hop mesh station (STA): [next-hop mesh STA] The next peer mesh STA on the mesh path to the destination mesh STA.

non–access point (non-AP) station (STA): [NAS client] A STA that is not contained within an access point (AP).

nonce: A numeric value, used in cryptographic operations associated with a given cryptographic key, that is not to be reused with that key, including over all reinitializations of the system through all time.

noncontiguous transmission: A transmission that uses nonadjacent frequency segments.

noninfrastructure basic service set (BSS): [noninfrastructure BSS] A BSS that is not an infrastructure BSS.

nonoperating channel: A channel that is not the operating channel of the basic service set (BSS) of which the station (STA) is a member.

non-quality-of-service (non-QoS) access point (AP): [non-QoS AP] An AP that does not support the quality-of-service (QoS) facility.

non-quality-of-service (non-QoS) basic service set (BSS): [non-QoS BSS] A BSS that does not support the quality-of-service (QoS) facility.

non-quality-of-service (non-QoS) station (STA): [non-QoS STA] A STA that does not support the quality-of-service (QoS) facility.

operating channel: The operating channel is the channel in which beacons are transmitted.

NOTE—In IEEE Std 802.11, the serving access point (AP) of an infrastructure basic service set (BSS) or the dynamic frequency selection (DFS) owner of an independent basic service set (IBSS) transmit beacons.

operating channel width: The channel width in which the station (STA) is currently able to receive.

optical front-end (OFE): Optoelectronic module that, in a transmitter, converts an intermediate frequency (IF) electrical signal to an intensity modulated optical signal, and, in a receiver, converts the intensity modulated optical signal to an IF electrical signal.

orthogonal frequency division multiple access (OFDMA): An orthogonal frequency division multiplexing (OFDM)-based multiple access technique by which multiple stations (STAs) either simultaneously transmit to a single STA, or simultaneously receive from a single STA, independent PSDUs over different groups of subcarriers.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

overlapping basic service set (OBSS): A basic service set (BSS) operating on the same channel as the station's (STA's) BSS and within (either partly or wholly) its basic service area (BSA).

over-the-air fast basic service set (BSS) transition (FT): [over-the-air fast BSS transition, over-the-air FT] An FT method in which the station (STA) communicates over a wireless medium (WM) link to the target access point (AP).

over-the-distribution-system (over-the-DS) fast basic service set (BSS) transition (FT): [over-the-DS fast BSS transition, over-the-DS FT] An FT method in which the station (STA) communicates with the target access point (AP) via the current AP.

pairwise: Referring to, or an attribute of, two entities that are associated with each other, e.g., an access point (AP) and an associated station (STA), or two STAs in an independent basic service set (IBSS) network. This term is used to refer to a type of encryption key hierarchy pertaining to keys shared by only two entities.

pass-phrase: A secret text string employed to corroborate the user's identity.

password: A shared, secret, and potentially low-entropy word, phrase, code, or key used as a credential for authentication purposes.

NOTE—The method of distribution of a password to the units in the system is outside the scope of this standard.

path metric: An aggregate multi-hop criterion used to characterize the performance, quality, and eligibility of a mesh path.

peer mesh station (STA): [peer mesh STA] A mesh STA to which a mesh peering has been established.

peer-to-peer (PTP) link: [PTP link] A station-to-station (STA-to-STA) link between tunneled direct link setup (TDLS) peer STAs in an infrastructure basic service set (BSS) or between STAs in a noninfrastructure BSS.

peer-to-peer (P2P) traffic specification (PTP TSPEC): [PTP TSPEC] The quality-of-service (QoS) characteristics of a data flow between non-access point (non-AP) QoS stations (STAs).

perfect forward secrecy (PFS): A property of a key agreement protocol that protects a session key derived from a set of long-term public and private keys from being compromised if one of the (long-term) private keys is compromised in the future.

per-frame encryption key: A unique encryption key constructed for each medium access control (MAC) protocol data unit (MPDU).

physical layer (PHY) protocol data unit: [PPDU] The unit of data exchanged between PHY entities to provide the PHY data service.

piggyback: The overloading of data with an acknowledgment of a previously received frame to the station (STA) to which the data is directed.

portable station (STA): [portable STA] A type of station (STA) that might be moved from location to location, but that uses network communications only while at a fixed location.

portal: The logical point at which the integration service is provided.

NOTE—For the purposes of this Standard, there is at most one portal in a given extended service set's (ESS's) infrastructure. In an implementation, a single logical portal function might be provided by multiple devices that provide integration services for the ESS. How such multiple devices coordinate to appear as a single logical portal is implementation dependent.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

precursor mesh station (STA): [precursor mesh STA] A neighbor peer mesh STA on the mesh path to the destination mesh STA, that identifies the mesh STA as the next-hop mesh STA.

preshared key (PSK): A static key that is distributed to the units in the system by some out-of-band means.

primary channel: The common channel of operation for all stations (STAs) that are members of the basic service set (BSS). For example, in a 20 MHz, 40 MHz, 80 MHz, 160 MHz or 80+80 MHz BSS the primary channel is a primary 20 MHz channel.

prioritized quality of service (QoS): [prioritized QoS] The provisioning of service in which the medium access control (MAC) protocol data units (MPDUs) with higher priority are given a preferential treatment over MPDUs with a lower priority.

NOTE—Prioritized QoS is provided through the enhanced distributed channel access (EDCA) mechanism.

protection mechanism: Any procedure that attempts to update the network allocation vector (NAV) of all receiving stations (STAs) prior to the transmission of a frame that might or might not be detected as valid network activity by the physical layer (PHY) entities at those receiving STAs.

protection mechanism frame: Any frame that is sent as part of a protection mechanism procedure.

protocol instance: An execution of a particular protocol that consists of the state of the communicating parties as well as the messages exchanged.

proxy mesh gate: A mesh gate acting as an intermediary for IEEE 802 stations (STAs) outside the mesh basic service set (MBSS).

pseudorandom function (PRF): A function that hashes various inputs to derive a pseudorandom value. In order to ensure liveness of a communication in which a pseudorandom value is used, a nonce is used as one of the inputs to the function.

public safety answering point (PSAP): A physical location where emergency calls are received and routed to the appropriate emergency service dispatch center.

NOTE—See NENA 08-002 [B65].

quadrature binary phase shift keying (QBPSK): A binary phase shift keying modulation in which the binary data is mapped onto the imaginary (Q) axis.

quality-of-service (QoS) access point (AP): [QoS AP] An AP that supports the QoS facility.

NOTE—In IEEE Std 802.11, the functions of a QoS AP are a superset of the functions of a non-QoS AP, and thus a QoS AP is able to function as a non-QoS AP to non-QoS stations (STAs).

quality-of-service (QoS) basic service set (BSS): [QoS BSS] A BSS that provides the QoS facility. An infrastructure QoS BSS contains a QoS access point (AP).

quality-of-service (QoS) facility: [QoS facility] The set of enhanced functions, channel access rules, frame formats, frame exchange sequences and managed objects used to provide parameterized and prioritized QoS.

quality-of-service (QoS) independent basic service set (IBSS): [QoS IBSS] An IBSS in which one or more of its stations (STAs) support the QoS facility.

quality-of-service (QoS) station (STA): [QoS STA] A STA that implements the QoS facility.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—A QoS STA acts as a non-QoS STA when associated in a non-QoS basic service set (BSS).

radio frequency (RF) chain: [RF chain] The physical entity that is able to act as a receive chain or transmit chain, or both.

reassembly: The process of combining a set of segmented medium access control (MAC) protocol data units (MPDUs) into a larger medium access control (MAC) service data unit (MSDU).

reassociation service: The service that enables an established association [between access point (AP) and station (STA)] to be transferred from one AP to another (or the same) AP.

receive (RX) chain: [RX chain] The physical entity that implements any necessary signal processing to provide the received signal to the digital baseband. Such signal processing includes filtering, amplification, down-conversion, and sampling.

receive (RX) power: [RX power] Mean power measured at the antenna connector.

received channel power indicator (RCPI): An indication of the total channel power (signal, noise, and interference) of a received physical layer (PHY) protocol data unit (PPDU) measured on the channel and at the antenna connector used to receive the PPDU.

received power indicator (RPI): A quantized measure of the received power level as seen at the antenna connector.

registered location: The geolocation of a station (STA) registered in accordance with the requirements for the regulatory domain.

registered location query protocol (RLQP): The query protocol for registered location information that is received and transported by generic advertisement service (GAS) Public Action frames.

registered location secure server (RLSS): An entity that accesses and manages a database that organizes storage of information by geographic location and securely holds the location and some operating parameters of one or more basic service sets (BSSs).

registered station (STA): [registered STA] A STA for which information needs to be submitted to an appropriate regulatory or coordination authority before it is allowed to transmit.

remote request broker (RRB): The component of the station management entity (SME) of an access point (AP) that supports fast basic service set (BSS) transitions over the distribution system (DS).

roaming consortium: A group of subscription service providers (SSPs) having inter-SSP roaming agreements.

segmentation: The process of partitioning a large medium access control (MAC) service data unit (MSDU) into a sequence of MAC protocol data units (MPDUs), each carrying an MSDU segment. The inverse process of combining a set of segmented MPDUs into an MSDU is known as reassembly.

service hash: A value used for representing a service. This value is formed from a hash of the service name.

service set identifier (SSID): A string used to identify the infrastructure basic service sets (BSSs) that comprise an extended service set (ESS), or to identify a noninfrastructure BSS.

NOTE—All BSSs in an ESS have the same SSID (see 4.3.5.2), but two BSSs with the same SSID might not be in the same ESS.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

service set transition: A station (STA) movement from one basic service set (BSS) to another BSS, i.e., either a BSS transition or an extended service set (ESS) transition.

serving access point (AP): The AP to which the station (STA) is associated.

single input, single output (SISO): A physical layer (PHY) configuration in which both transmitter and receiver use a single antenna.

single-user multiple input, multiple output (SU-MIMO): A technique by which a station (STA) with more than one antenna either transmits to or receives from a single STA independent space-time streams over the same radio frequencies.

single-user (SU) physical layer (PHY) protocol data unit (PPDU): [SU PPDU] A PPDU with a format that is capable of carrying only a single PHY service data unit (PSDU), or no PSDU.

sounding: The use of preamble training fields to measure the channel for purposes other than demodulation of the Data portion of the physical layer (PHY) protocol data unit (PPDU) containing the training fields.

NOTE—These uses include calculation of transmit steering, calculation of recommended modulation and coding scheme (MCS), and calculation of calibration parameters.

source mesh station (STA): [source mesh STA] A mesh STA from which a medium access control (MAC) service data unit (MSDU) enters the mesh basic service set (MBSS). A source mesh STA is either a mesh STA that is the source of an MSDU or a proxy mesh gate that receives an MSDU from a STA outside of the MBSS and forwards the MSDU on a mesh path.

space-time stream (STS): Stream of modulation symbols created by applying a combination of spatial and temporal processing to one or more spatial streams of modulation symbols.

spatial multiplexing (SM): A transmission technique in which data streams are transmitted on multiple spatial channels that are provided through the use of multiple antennas at the transmitter and the receiver.

spatial stream: One of several streams of bits or modulation symbols that might be transmitted over multiple spatial dimensions that are created by the use of multiple antennas at both ends of a communications link.

station (STA): A logical entity that is a singly addressable instance of a medium access control (MAC) and physical layer (PHY) interface to the wireless medium (WM).

NOTE—For IEEE 802.11 purposes, a station is any MAC/PHY entity providing the IEEE 802.11 MAC services. This differs from the IEEE 802 definition of ‘station,’ which includes bridges (or ‘end stations’) that are endpoints of link layer data traffic.

station service: The set of services that support transport of medium access control (MAC) service data units (MSDUs) between stations (STAs) within a basic service set (BSS)

station vector: A set of service_access_point_identifiers.

subscription service provider (SSP): An organization (operator) offering connection to network services, perhaps for a fee.

subscription service provider network (SSPN): The network controlled by a subscription service provider (SSP). The network maintains user subscription information.

Supplicant: An entity at one end of a point-to-point local area network (LAN) segment that is being authenticated by an Authenticator attached to the other end of that link. (IEEE Std 802.1X-2020)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Supplicant address (SPA): The medium access control (MAC) address of the IEEE 802.1X Supplicant's station (STA).

television white spaces (TVWS): The opportunistic use of allocated but not assigned spectrum—spectrum allocated for broadcast television, but with no assignment at a particular location.

time unit (TU): A measurement of time equal to 1024 μs.

traffic category (TC): A label for medium access control (MAC) service data units (MSDUs) that have a distinct user priority (UP), as viewed by higher layer entities, relative to other MSDUs provided for delivery over the same link. Traffic categories are meaningful only to MAC entities that support quality of service (QoS) within the MAC data service. These MAC entities determine the UP for MSDUs belonging to a particular traffic category using the priority value provided with those MSDUs at the MAC service access point (MAC SAP).

traffic classification (TCLAS): The specification of one of several types of matching filter to classify protocol data units (PDUs) or medium access control (MAC) service data units (MSDUs) as belonging to a particular traffic stream (TS). Depending on the type of classification, the filter is applied within the MAC sublayer management entity (MLME), above the MAC, or within the MAC itself.

traffic filter: A set of traffic specifications defined by the use of traffic classification (TCLAS) elements that are utilized by the traffic filtering service (TFS) to identify specific allowed frames.

traffic filtering service (TFS): A service provided by an access point (AP) to a non-AP station (STA) to reduce the number of frames sent to the non-AP STA by not forwarding individually addressed frames addressed to the non-AP STA that do not match traffic filters specified by the non-AP STA.

traffic identifier (TID): Any of the identifiers usable by higher layer entities to distinguish medium access control (MAC) service data units (MSDUs) to MAC entities that support quality of service (QoS) within the MAC data service.

NOTE—There are 16 possible TID values; eight identify traffic categories (TCs), and the other eight identify parameterized traffic streams (TSs). The TID is assigned to an MSDU in the layers above the MAC.

traffic specification (TSPEC): The quality-of-service (QoS) characteristics of a data flow to and from a QoS station (STA).

traffic stream (TS): A set of medium access control (MAC) service data units (MSDUs) to be delivered subject to the quality-of-service (QoS) parameter values provided to the MAC in a particular traffic specification (TSPEC). TSs are meaningful only to MAC entities that support QoS within the MAC data service. These MAC entities determine the TSPEC applicable for delivery of MSDUs belonging to a particular TS using the priority parameter provided with those MSDUs at the MAC service access point (MAC SAP).

transmission opportunity (TXOP): An interval of time during which a particular quality-of-service (QoS) station (STA) has the right to initiate frame exchange sequences onto the wireless medium (WM).

NOTE—A TXOP is defined by a starting time and a maximum duration.

transmit (TX) chain: [TX chain] The physical entity that implements any necessary signal processing to generate the transmit signal from the digital baseband. Such signal processing includes digital to analog conversion, filtering, amplification and upconversion.

trusted third party (TTP): An entity that is relied upon to vouch for two parties in a pairwise authentication protocol.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

type/length/value (TLV): A format that consists of a type, a length, and a value.

unauthorized disclosure: The process of making information available to unauthorized individuals, entities, or processes.

unauthorized resource use: The use of a resource not consistent with the defined security policy.

uniform spreading: A regulatory requirement for a channel selection mechanism that provides uniform usage across a minimum set of channels in the regulatory domain.

unreachable destination: A destination mesh station (STA) for which the link to the next hop of the mesh path to this destination mesh STA is no longer usable.

user priority (UP): A value associated with an medium access control (MAC) service data unit (MSDU) that indicates how the MSDU is to be handled. The UP is assigned to an MSDU in the layers above the MAC.

validated access point (AP): [validated AP] An AP that has either been explicitly configured as a neighbor or learned through a mechanism such as the Beacon report.

wildcard basic service set identifier (BSSID): [wildcard BSSID] A BSSID value used to represent all BSSIDs.

NOTE—In IEEE Std 802.11, this is represented by all binary 1s.

wildcard service set identifier (SSID): [wildcard SSID] An SSID value used to represent all SSIDs.

NOTE—In IEEE Std 802.11, this is represented by the value “null”.

wireless medium (WM): The medium used to implement the transfer of protocol data units (PDUs) between peer physical layer (PHY) entities of a wireless local area network (LAN).

3.2 Definitions specific to IEEE Std 802.11

The following terms and definitions are specific to terms or references in this standard and are not appropriate for inclusion in the *IEEE Standards Dictionary Online*.

1 MHz mask physical layer (PHY) protocol data unit (PPDU): [1 MHz mask PPDU] A PPDU that is transmitted using the 1 MHz transmit spectral mask defined in Clause 23 and that is a 1 MHz sub 1 GHz (S1G) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW1).

1 MHz physical layer (PHY) protocol data unit (PPDU): [1 MHz PPDU] A Clause 23 1 MHz sub 1 GHz (S1G) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW1).

2 MHz mask physical layer (PHY) protocol data unit (PPDU): [2 MHz mask PPDU] A PPDU that is transmitted using the 2 MHz transmit spectral mask defined in Clause 23 and that is one of the following:

a) A 1 MHz sub 1 GHz (S1G) non-duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW1).
b) A 2 MHz S1G non-duplicate or S1G 1 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW2).

2 MHz physical layer (PHY) protocol data unit (PPDU): [2 MHz PPDU] A Clause 23 PPDU that is one of the following:

a) A 2 MHz sub 1 GHz (S1G) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW2).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

b) A 2 MHz S1G 1 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW2).

2.16 GHz mask physical layer (PHY) protocol data unit (PPDU): [2.16 GHz mask PPDU] A PPDU defined in Clause 20 or Clause 28 that is transmitted using the transmit spectral mask defined in Clause 20.

2.16 GHz physical layer (PHY) protocol data unit (PPDU): [2.16 GHz PPDU] A PPDU that is one of the following:

a) A Clause 20 directional multi-gigabit (DMG) PPDU.

b) A Clause 28 2.16-GHz enhanced directional multi-gigabit (EDMG) PPDU (TXVECTOR parameter FORMAT equal to EDMG).

c) A Clause 28 2.16-GHz nonenhanced directional multi-gigabit (non-EDMG) PPDU (TXVECTOR parameter FORMAT equal to NON_EDMG).

2.16+2.16 GHz mask physical layer (PHY) protocol data unit (PPDU): [2.16+2.16 mask PPDU] A PPDU defined in Clause 28 that is transmitted using the 2.16+2.16 GHz transmit spectral mask defined in the same clause.

2.16+2.16 GHz physical layer (PHY) protocol data unit (PPDU): [2.16+2.16 PPDU] A PPDU that is one of the following:

a) A Clause 28 2.16+2.16 GHz enhanced directional multi-gigabit (EDMG) PPDU (TXVECTOR parameter FORMAT equal to EDMG).

b) A Clause 28 2.16+2.16 GHz nonenhanced directional multi-gigabit (non-EDMG) PPDU (TXVECTOR parameter FORMAT equal to NON_EDMG).

4 MHz mask physical layer (PHY) protocol data unit (PPDU): [4 MHz mask PPDU] A PPDU that is transmitted using the 4 MHz transmit spectral mask defined in Clause 23 and that is one of the following:

a) A 1 MHz sub 1 GHz (S1G) non-duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW1).

b) A 2 MHz S1G non-duplicate or S1G 1 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW2).

c) A 4 MHz S1G non-duplicate, S1G 1 MHz duplicate, or S1G 2 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW4).

4 MHz physical layer (PHY) protocol data unit (PPDU): [4 MHz PPDU] A Clause 23 (Sub 1 GHz (S1G) PHY specification PPDU that is one of the following:

a) A 4 MHz sub 1 GHz (S1G) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW4).

b) A 4 MHz S1G 1 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW4).

c) A 4 MHz S1G 2 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW4).

4-way handshake: A pairwise key management protocol defined by this standard. This handshake confirms mutual possession of a pairwise master key (PMK) by two parties, derives a pairwise transient key (PTK) and distributes one or more keys including a group temporal key (GTK).

4.32 GHz mask physical layer (PHY) protocol data unit (PPDU): [4.32 GHz mask PPDU] A PPDU defined in Clause 28 that is transmitted using the 4.32 GHz transmit spectral mask defined in the same clause.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

4.32 GHz physical layer (PHY) protocol data unit (PPDU): [4.32 GHz PPDU] A PPDU that is one of the following:

a) A Clause 28 4.32-GHz enhanced directional multi-gigabit (EDMG) PPDU (TXVECTOR parameter FORMAT equal to EDMG).

b) A Clause 28 4.32-GHz nonenhanced directional multi-gigabit (non-EDMG) PPDU (TXVECTOR parameter FORMAT equal to NON_EDMG).

4.32+4.32 GHz mask physical layer (PHY) protocol data unit (PPDU): [4.32+4.32 GHz mask PPDU] A PPDU defined in Clause 28 that is transmitted using the 4.32+4.32 GHz transmit spectral mask defined in the same clause.

4.32+4.32 GHz physical layer (PHY) protocol data unit (PPDU): [4.32+4.32 GHz PPDU] A PPDU that is one of the following:

a) A Clause 28 4.32+4.32 GHz enhanced directional multi-gigabit (EDMG) PPDU (TXVECTOR parameter FORMAT equal to EDMG).

b) A Clause 28 4.32+4.32 GHz nonenhanced directional multi-gigabit (non-EDMG) PPDU (TXVECTOR parameter FORMAT equal to NON_EDMG).

6 GHz band: The frequency band between 5.925 GHz and 7.125 GHz.

6.48 GHz mask physical layer (PHY) protocol data unit (PPDU): [6.48 GHz mask PPDU] A PPDU defined in Clause 28 that is transmitted using the 6.48 GHz transmit spectral mask defined in the same clause.

6.48 GHz physical layer (PHY) protocol data unit (PPDU): [6.48 GHz PPDU] A PPDU that is one of the following:

a) A Clause 28 6.48-GHz enhanced directional multi-gigabit (EDMG) PPDU (TXVECTOR parameter FORMAT equal to EDMG).

b) A Clause 28 6.48-GHz nonenhanced directional multi-gigabit (non-EDMG) PPDU (TXVECTOR parameter FORMAT equal to NON_EDMG).

8 MHz mask physical layer (PHY) protocol data unit (PPDU): [8 MHz mask PPDU] A PPDU that is transmitted using the 8 MHz transmit spectral mask defined in Clause 23 and that is one of the following:

a) A 1 MHz sub 1 GHz (S1G) non-duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW1).

b) A 2 MHz S1G non-duplicate or S1G 1 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW2).

c) A 4 MHz S1G non-duplicate, S1G 1 MHz duplicate, or S1G 2 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW4).

d) An 8 MHz S1G non-duplicate, S1G 1 MHz duplicate, or S1G 2 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW8).

8 MHz physical layer (PHY) protocol data unit (PPDU): [8 MHz PPDU] A Clause 23 PPDU that is one of the following:

a) An 8 MHz sub 1 GHz (S1G) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW8).

b) An 8 MHz S1G 1 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW8).

c) An 8 MHz S1G 2 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW8).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

8.64 GHz mask physical layer (PHY) protocol data unit (PPDU): [8.64 GHz mask PPDU] A PPDU defined in Clause 28 that is transmitted using the 8.64 GHz transmit spectral mask defined in the same clause.

8.64 GHz physical layer (PHY) protocol data unit (PPDU): [8.64 GHz PPDU] A PPDU that is one of the following:

a) A Clause 28 8.64-GHz enhanced directional multi-gigabit (EDMG) PPDU (TXVECTOR parameter FORMAT equal to EDMG).

b) A Clause 28 8.64-GHz nonenhanced directional multi-gigabit (non-EDMG) PPDU (TXVECTOR parameter FORMAT equal to NON_EDMG).

16 MHz mask physical layer (PHY) protocol data unit (PPDU): [16 MHz mask PPDU] A PPDU that is transmitted using the 16 MHz transmit spectral mask defined in Clause 23 and that is one of the following:

a) A 1 MHz sub 1 GHz (S1G) non-duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW1).

b) A 2 MHz S1G non-duplicate or S1G 1 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW2).

c) A 4 MHz S1G non-duplicate, S1G 1 MHz duplicate, or S1G 2 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW4).

d) An 8 MHz S1G non-duplicate, S1G 1 MHz duplicate, or S1G 2 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW8).

e) A 16 MHz S1G non-duplicate, S1G 1 MHz duplicate, or S1G 2 MHz duplicate (TXVECTOR parameter CH_BANDWIDTH equal to CBW16).

16 MHz physical layer (PHY) protocol data unit (PPDU): [16 MHz PPDU] A Clause 23 PPDU that is one of the following:

a) A 16 MHz sub 1 GHz (S1G) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW16).

b) A 16 MHz S1G 1 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW16).

c) A 16 MHz S1G 2 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW16).

20 MHz basic service set (BSS): [20 MHz BSS] A BSS in which there is a primary 20 MHz channel and no secondary channel.

20 MHz high throughput (HT): [20 MHz HT] A Clause 19 transmission with the TXVECTOR parameter FORMAT equal to HT_MF or HT_GF and TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20.

20 MHz mask physical layer (PHY) protocol data unit (PPDU): [20 MHz mask PPDU] One of the following PPDUs:

a) A Clause 17 PPDU transmitted using the 20 MHz transmit spectral mask defined in Clause 17.

b) A Clause 18 orthogonal frequency division multiplexing (OFDM) PPDU transmitted using the transmit spectral mask defined in Clause 18.

c) A high throughput (HT) PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20 and the CH_OFFSET parameter equal to CH_OFF_20 transmitted using the 20 MHz transmit spectral mask defined in Clause 19.

d) A very high throughput (VHT) PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to CBW20 transmitted using the 20 MHz transmit spectral mask defined in Clause 21.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

e) A Clause 17 PPDU transmitted by a VHT station (STA) using the 20 MHz transmit spectral mask defined in Clause 21.

f) An HT PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20 and the CH_OFFSET parameter equal to CH_OFF_20 transmitted by a VHT STA using the 20 MHz transmit spectral mask defined in Clause 21.

g) A high-efficiency (HE) PPDU with TXVECTOR parameter CH_BANDWIDTH equal to CBW20 transmitted using the 20 MHz transmit spectral mask defined in Clause 27.

h) A Clause 17 PPDU transmitted by an HE STA using the 20 MHz transmit spectral mask defined in Clause 27.

20 MHz-only non–access point (non-AP) high-efficiency station (HE STA): [20 MHz-only non-AP HE STA] A non-AP HE STA that indicates in the Supported Channel Width Set subfield in the HE PHY Capabilities Information field in the HE Capabilities element that it does not support a channel width greater than 20 MHz.

20 MHz operating non–access point (non-AP) high-efficiency station (HE STA): [20 MHz operating non-AP HE STA] A non-AP HE STA operating in a 20 MHz channel width mode, such as a 20 MHz-only non-AP HE STA or an HE STA that has reduced its operating channel width to 20 MHz using operating mode indication (OMI).

20 MHz physical layer (PHY) protocol data unit (PPDU): [20 MHz PPDU] A PPDU that is one of the following:

a) A Clause 15 PPDU.

b) A Clause 16 PPDU.

c) A Clause 17 PPDU (when using 20 MHz channel spacing).

d) A Clause 18 orthogonal frequency division multiplexing (OFDM) PPDU.

e) A Clause 19 20 MHz high throughput (HT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20).

f) A Clause 21 20 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW20).

g) A Clause 27 20 MHz high-efficiency (HE) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW20).

20/40 MHz basic service set (BSS): [20/40 MHz BSS] A BSS in which the supported channel width of the access point (AP) or dynamic frequency selection (DFS) owner (DO) station (STA) is 20 MHz and 40 MHz (Channel Width field is equal to 1) and the Secondary Channel Offset field is equal to a value of secondary channel above (SCA) or secondary channel below (SCB).

40 MHz high throughput (HT): [40 MHz HT] A Clause 19 transmission with the TXVECTOR parameter FORMAT equal to HT_MF or HT_GF and TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40.

40 MHz mask physical layer (PHY) protocol data unit (PPDU): [40 MHz mask PPDU] One of the following PPDUs:

a) A 40 MHz high throughput (HT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40) transmitted using the 40 MHz transmit spectral mask defined in Clause 19.

b) A 40 MHz non-HT duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to NON_HT_CBW40) transmitted by a non-very high throughput (non-VHT) station (STA) using the 40 MHz transmit spectral mask defined in Clause 19.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

c) A 40 MHz non-HT duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW40) transmitted by a very high throughput (VHT) STA using the 40 MHz transmit spectral mask defined in Clause 21.

d) A 20 MHz HT PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20 and the CH_OFFSET parameter equal to either CH_OFF_20U or CH_OFF_20L transmitted using the 40 MHz transmit spectral mask defined in Clause 19.

e) A 20 MHz VHT PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to CBW20 transmitted using the 40 MHz transmit spectral mask defined in Clause 21.

f) A 40 MHz VHT PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to CBW40 transmitted using the 40 MHz transmit spectral mask defined in Clause 21.

g) A 40 MHz HT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40) transmitted by a VHT STA using the 40 MHz transmit spectral mask defined in Clause 21.

h) A 20 MHz non-HT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW20) transmitted using the 40 MHz transmit spectral mask defined in Clause 19.

i) A 20 MHz non-HT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW20) transmitted by a VHT STA using the 40 MHz transmit spectral mask defined in Clause 21.

j) A 40 MHz high-efficiency (HE) PPDU with TXVECTOR parameter CH_BANDWIDTH equal to CBW40 transmitted using the 40 MHz transmit spectral mask defined in Clause 27.

k) A 40 MHz VHT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW40) transmitted by an HE STA using the 40 MHz transmit spectral mask defined in Clause 21.

l) A 40 MHz non-HT duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW40) transmitted by an HE STA using the 40 MHz transmit spectral mask defined in Clause 19.

40 MHz physical layer (PHY) protocol data unit (PPDU): [40 MHz PPDU] A PPDU that is one of the following:

a) A 40 MHz high throughput (HT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40).

b) A 40 MHz non-HT duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to NON_HT_CBW40 or TXVECTOR parameter CH_BANDWIDTH equal to CBW40).

c) A 40 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW40).

d) A Clause 27 40 MHz high-efficiency (HE) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW40).

40-MHz-capable (40MC) high throughput (HT) access point (AP): [40MC HT AP] An HT AP that included a value of 1 in the Supported Channel Width Set subfield (indicating its capability to operate on a 40 MHz channel) of its most recent transmission of a frame containing an HT Capabilities element.

40-MHz-capable (40MC) high throughput (HT) access point (AP) 2G4: [40MC HT AP 2G4] An HT AP 2G4 that is also a 40MC HT AP.

40-MHz-capable (40MC) high throughput (HT) access point (AP) 5G: [40MC HT AP 5G] An HT AP 5G that is also a 40MC HT AP.

40-MHz-capable (40MC) high throughput (HT) station (STA): [40MC HT STA] An HT STA that included a value of 1 in the Supported Channel Width Set subfield (indicating its capability to operate on a 40 MHz channel) of its most recent transmission of a frame containing an HT Capabilities element.

40-MHz-capable (40MC) high throughput (HT) station (STA) 2G4: [40MC HT STA 2G4] An HT STA 2G4 that is also a 40MC HT STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

40-MHz-capable (40MC) high throughput (HT) station (STA) 5G: [40MC HT STA 5G] An HT STA 5G that is also a 40MC HT STA.

80 MHz mask physical layer (PHY) protocol data unit (PPDU): [80 MHz mask PPDU] One of the following PPDUs:

a) An 80 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80) transmitted using the 80 MHz transmit spectral mask defined in Clause 21.

b) An 80 MHz non-high-throughput (non-HT) duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80) transmitted using the 80 MHz transmit spectral mask defined in Clause 21.

c) A 20 MHz non-HT, high throughput (HT), or VHT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW20) transmitted using the 80 MHz transmit spectral mask defined in Clause 21.

d) A 40 MHz non-HT duplicate, HT, or VHT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW40) transmitted using the 80 MHz transmit spectral mask defined in Clause 21.

e) An 80 MHz high-efficiency (HE) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80) transmitted using the 80 MHz transmit spectral mask defined in Clause 27.

80 MHz operating non–access point (non-AP) high-efficiency station (HE STA): [80 MHz operating non-AP HE STA] A non-AP HE STA that is operating in 80 MHz channel width mode, such as a non-AP STA (excluding the 20 MHz-only non-AP HE STA) that is not capable of 160 MHz operation or a non-AP STA that has reduced its operating channel width to 80 MHz using an operating mode indication (OMI).

80 MHz physical layer (PHY) protocol data unit (PPDU): [80 MHz PPDU] A PPDU that is one of the following:

a) A Clause 21 80 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80).

b) A Clause 21 80 MHz non-high-throughput (non-HT) duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80).

c) A Clause 27 80 MHz high-efficiency (HE) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80).

80+80 MHz mask physical layer (PHY) protocol data unit (PPDU): [80+80 MHz mask PPDU] One of the following PPDUs:

a) An 80+80 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80+80) transmitted using the 80+80 MHz transmit spectral mask defined in Clause 21.

b) An 80+80 MHz non-high-throughput (non-HT) duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80+80) transmitted using the 80+80 MHz transmit spectral mask defined in Clause 21.

c) An 80+80 MHz high-efficiency (HE) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80+80) transmitted using the 80+80 MHz transmit spectral mask defined in Clause 27.

80+80 MHz physical layer (PHY) protocol data unit (PPDU): [80+80 MHz PPDU] A PPDU that is one of the following:

a) A Clause 21 80+80 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80+80).

b) A Clause 21 80+80 MHz non-high-throughput (non-HT) duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80+80).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

c) A Clause 27 80+80 MHz high-efficiency (HE) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80+80).

160 MHz mask physical layer (PHY) protocol data unit (PPDU): [160 MHz mask PPDU] One of the following PPDUs:

a) A 160 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW160) transmitted using the 160 MHz transmit spectral mask defined in Clause 21.

b) A 160 MHz non-high-throughput (non-HT) duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW160) transmitted using the 160 MHz transmit spectral mask defined in Clause 21.

c) A 20 MHz non-HT, high throughput (HT), or VHT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW20) transmitted using the 160 MHz transmit spectral mask defined in Clause 21.

d) A 40 MHz non-HT duplicate, HT, or VHT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW40) transmitted using the 160 MHz transmit spectral mask defined in Clause 21.

e) An 80 MHz non-HT duplicate or VHT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80) transmitted using the 160 MHz transmit spectral mask defined in Clause 21.

f) A 160 MHz high-efficiency (HE) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW160) transmitted using the 160 MHz transmit spectral mask defined in Clause 27.

160 MHz physical layer (PHY) protocol data unit (PPDU): [160 MHz PPDU] A PPDU that is one of the following:

a) A Clause 21 160 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW160).

b) A Clause 21 160 MHz non-high- throughput (non-HT) duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW160).

c) A Clause 27 160 MHz high-efficiency (HE) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW160).

access category (AC): A label for the common set of enhanced distributed channel access (EDCA) parameters that are used by a quality-of-service (QoS) station (STA) to contend for the channel in order to transmit medium access control (MAC) service data units (MSDUs) with certain priorities.

access network query protocol (ANQP): The query protocol for access network information retrieval transported by generic advertisement service (GAS) Public Action frames.

access period: A time period during a beacon interval established in a directional multi-gigabit (DMG) basic service set (BSS).

access point (AP) path: [AP path] Path between two tunneled direct link setup (TDLS) peer stations (STAs) via the AP with which the STAs are currently associated.

ack-enabled single traffic identifier (TID) aggregate medium access control (MAC) protocol data unit (A-MPDU): [ack-enabled single-TID A-MPDU] An A-MPDU that contains at least two A-MPDU subframes, where the TIDs differ and where only one of the A-MPDU subframes includes a tagged MPDU that solicits the acknowledgment context.

NOTE—For the purpose of this definition, a Management frame is treated as if it had TID 15.

ack-enabled multi traffic identifier (TID) aggregate medium access control (MAC) protocol data unit (A-MPDU): [ack-enabled multi-TID A-MPDU] An A-MPDU where at least one tagged MPDU that solicits

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

acknowledgment context is aggregated in the A-MPDU, and MPDUs from more than one TID that solicit Ack acknowledgment or Block Ack acknowledgment context are aggregated in the A-MPDU.

NOTE—For the purpose of this definition, a Management frame is treated as if it had TID 15.

active mode: A power management mode of an associated station (STA) in which an access point (AP) might transmit physical layer (PHY) protocol data units (PPDUs) to an associated STA at any time. For a mesh STA, it is a mesh power management mode in which a neighbor peer mesh STA might transmit PPDUs to the mesh STA at any time.

NOTE—This mode is equivalent to an associated STA or mesh STA being continuously in the awake state.

advanced groupcast with retries (GCR): [advanced GCR] A set of features comprising the GCR block acknowledgment retransmission policy and the GCR service period (GCR-SP) delivery method.

advertisement protocol: Access network query protocol (ANQP) and higher layer protocols defined external to this standard that are used for network and service discovery.

advertisement server: A logical server that provides the information repository for a specific advertisement protocol. The location of the physical server that instantiates the advertisement server is outside the scope of this standard.

aggregate physical layer (PHY) protocol data unit: [A-PPDU] A sequence of two or more PPDUs transmitted without an interframe space (IFS). The PPDU(s) transmitted following the first PPDU in the sequence do not contain PHY preamble(s), only PHY header(s) and PHY service data unit(s) (PSDU(s)).

aggregated schedule: The aggregation of delivery and/or poll schedules by the quality-of-service (QoS) access point (AP) for a particular QoS station (STA) into a single service period (SP).

attached bridge: An IEEE 802.1Q bridge that has one or more bridge port Enhanced Internal Sublayer Service (EISS) interfaces supported by general links (GLKs) provided by a GLK access point (AP), GLK non-AP station (STA), GLK mesh STA, or GLK independent basic service set (IBSS) STA.

authentication and key management (AKM) suite: [AKM suite] A set of one or more algorithms designed to provide authentication and key management, either individually or in combination with higher layer authentication and key management algorithms outside the scope of this standard.

average noise power indicator (ANPI): A medium access control (MAC) indication of the average noise plus interference power measured when the channel is idle as defined by three simultaneous conditions: 1) the virtual carrier sense (CS) mechanism indicates idle channel, 2) the station (STA) is not transmitting a frame, and 3) the STA is not receiving a frame.

awake beacon interval (A-BI): In a directional multi-gigabit (DMG) basic service set (BSS) or personal basic service set (PBSS), a beacon interval of a power save mode wakeup schedule during which a station (STA) is expected to be in the awake state during several portions of the beacon interval.

bandwidth signaling transmitter address (TA): [bandwidth signaling TA] A TA that is used by a very high throughput (VHT) station (STA), a high-efficiency (HE) STA, or a next generation vehicle-to-everything (NGV) STA to indicate the presence of additional signaling related to the bandwidth to be used in subsequent transmission in an enhanced distributed channel access (EDCA) transmission opportunity (TXOP). It is the individual address of the transmitting STA but with the Individual/Group bit set to 1.

base channel: Primary channel of the basic service set (BSS) of the access point (AP) with which the tunneled direct link setup (TDLS) peer station (STA) is associated with an access point (AP).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

basic channel unit (BCU): For television very high throughput (TVHT) operation, 6 MHz, 7 MHz, or 8 MHz, depending on the regulatory domain.

basic modulation and coding scheme (MCS): [basic MCS] An MCS that belongs to the basic MCS set.

basic modulation and coding scheme (MCS) set: [basic MCS set] A set of MCSs designated by the station (STA) that started the basic service set (BSS) and fixed for the lifetime of the BSS. The basic MCS set is typically advertised in the element(s) that contains the physical layer (PHY) operation parameters (among others), e.g., high throughput (HT) and very high throughput (VHT) Operation elements. All STAs in a BSS are capable of, or have signaled that they are capable of, receiving and transmitting using all MCSs in the basic MCS set.

basic rate: A data rate that belongs to the basic rate set.

basic rate set: A set of data rates designated by the station (STA) that started the basic service set (BSS) and fixed for the lifetime of the BSS. The basic rate set is advertised in the Supported Rates and BSS Membership Selectors element and, if present, the Extended Supported Rates and BSS Membership Selectors element. All STAs in a BSS are capable of, or have signaled that they are capable of, receiving and transmitting using all rates in the basic rate set.

basic service set (BSS) color: [BSS color] An identifier for a BSS or for a set of BSSs belonging to a multiple basic service set identifier (BSSID) set or a co-hosted BSSID set.

basic service set (BSS) identifier: [BSSID] An identifier for a BSS.

basic space-time block coding (STBC) modulation and coding scheme (MCS): [basic STBC MCS] An MCS value and STBC encoder specification used in the transmission of STBC-encoded Control frames and STBC-encoded group addressed frames.

beacon header interval (BHI): The period of time that starts at the target beacon transmission time (TBTT) of a beacon interval of a directional multi-gigabit (DMG) basic service set (BSS) and that ends no later than the beginning of the data transfer interval (DTI) of the beacon interval.

beacon integrity group temporal key (BIGTK): A random value, assigned by the access point (AP), that is used to protect Beacon frames from that AP.

beacon interval: The time interval between two consecutive target beacon transmission times (TBTTs).

beacon transmission interval (BTI): The time interval between the start of the first Directional Multi-gigabit (DMG) Beacon frame transmission by a DMG station (STA) in a beacon interval to the end of the last DMG Beacon frame transmission by the STA in the same beacon interval.

broadcast resource unit (RU): [broadcast RU] A resource unit in a high-efficiency (HE) multi-user (MU) physical layer (PHY) protocol data unit (PPDU) transmitted by an access point (AP) that is intended for either unassociated STAs or more than one associated STA in the basic service set (BSS) or in any of the other BSSs in the multiple BSSID set to which the AP's BSS belongs.

broadcast target wake time (TWT): [broadcast TWT] A specific time or set of times broadcast by an access point (AP) to multiple non-AP stations (STAs) at which the non-AP STAs are expected to be awake in order to exchange frames with the AP.

broadcast wake-up radio (WUR) wake-up frame: [broadcast WUR wake-up frame] A WUR Wake-up frame with the ID field set to transmitter identifier (ID) or nontransmitter ID.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

bufferable medium access control (MAC) management protocol data unit (MMPDU): [bufferable MMPDU] An MMPDU that is eligible to be queued for delivery using a power saving mechanism.

bufferable unit (BU): A medium access control (MAC) service data unit (MSDU), aggregate MAC service data unit (MSDU) [quality-of-service (QoS) stations (STAs) only], or bufferable MAC management protocol data unit (MMPDU).

centralized authentication controlled (CAC) station (STA): [CAC STA] A sub 1 GHz (S1G) non-access point (non-AP) STA that supports a CAC access point (AP) to alleviate wireless medium contention when a large number of STAs are trying to, or are expected to, reconnect to the AP at about the same time.

centralized authentication controller (CAC) access point (AP): [CAC AP] A sub 1 GHz (S1G) AP that is able to alleviate wireless medium contention when a large number of stations (STAs) are trying to, or are expected to, reconnect to the AP at about the same time.

centralized coordination service root (CCSR): An entity that provides synchronization and configuration services to synchronization access points (S-APs).

centralized coordination service set (CCSS): The collection of one centralized coordination service root (CCSR) and a set of one or more synchronization access points (S-APs) that are stationary with respect to their local environment while operating and are connected to the CCSR.

channel-usage-aiding basic service set (BSS): [channel-usage-aiding BSS] An infrastructure BSS whose AP performs channel coordination with at least one other non-co-hosted AP that has an overlapping BSS service area (BSA).

channel-usage-aidable basic service set (BSS): [channel-usage-aidable BSS] A BSS that is not a channel-usage-aiding BSS.

China directional multi-gigabit: Pertaining to directional multi-gigabit (DMG) operation and where the channel is contained within the Chinese 60 GHz frequency band.

China directional multi-gigabit (CDMG) physical layer (PHY) protocol data unit (PPDU): [CDMG PPDU] A Clause 24 PPDU.

China directional multi-gigabit small band beacon interval (CDMG SBBI): A value, in units of time units (TUs) represents the length of a beacon interval operating on a 1.08 GHz channel.

China millimeter-wave multi-gigabit (CMMG): Pertaining to operation in a frequency band containing a channel in 42.3 GHz to 47.3 GHz or 47.2 GHz to 48.4 GHz frequency bands.

China millimeter-wave multi-gigabit (CMMG) basic service set (BSS): [CMMG BSS] A BSS in which directional multi-gigabit (DMG) Beacon frames are transmitted by CMMG stations (STAs).

China millimeter-wave multi-gigabit (CMMG) beamformee: [CMMG beamformee] A CMMG station (STA) that receives a CMMG physical layer (PHY) protocol data unit (PPDU) that was transmitted using a beamforming steering matrix and that supports the CMMG transmit beamforming feedback mechanism as described in 10.32.

China millimeter-wave multi-gigabit (CMMG) beamformer: [CMMG beamformer] A CMMG station (STA) that transmits a CMMG physical layer (PHY) protocol data unit (PPDU) using a beamforming steering matrix.

China millimeter-wave multi-gigabit (CMMG) duplicate physical layer (PHY) protocol data unit (PPDU) format: [CMMG duplicate PPDU] A PPDU format that duplicates the transmission of a 540 MHz signal over two 540 MHz frequency segments.

China millimeter-wave multi-gigabit (CMMG) physical layer (PHY) protocol data unit (PPDU): [CMMG PPDU] A Clause 25 PPDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

China millimeter-wave multi-gigabit (CMMG) single medium access control (MAC) protocol data unit (CMMG single MPDU): [CMMG single MPDU] An MPDU that is the only MPDU in an aggregate MPDU (A-MPDU) carried in a CMMG physical layer (PHY) protocol data unit (PPDU) and that is carried in an A-MPDU subframe with the EOF/Tag subfield of the MPDU delimiter field equal to 1.

co-hosted basic service set identifier (BSSID) set: [co-hosted BSSID set] A collection of access points (APs) such that all APs use a common operating class, channel, receive antenna connector, and transmit antenna connector, and each AP advertises information for its BSSID using Beacon or Probe Response frames.

colocated access point (AP) set: [colocated AP set] A set of two or more APs in the same physical device.

NOTE 1—APs in the colocated set might be operating on the same or different channel.

NOTE 2—The APs that are part of a colocated AP set and that are operating on the same channel might form a co-hosted basic service set identifier (BSSID) set or multiple BSSID set.

compressed basic service set identifier (BSSID): [compressed BSSID] A 32-bit Basic Service Set (BSS) identifier derived from a BSSID or a transmitted BSSID as defined in 29.5.2.

concealed groupcast with retries (GCR) frame: [concealed GCR frame] A group addressed frame that is transmitted using the aggregate medium access control (MAC) service data unit (A-MSDU) format with the destination address (DA) field set to the GCR concealment address.

content identifier (ID): An identifier of an enhanced broadcast services (EBCS) traffic stream.

contention based access period (CBAP): The time period in the data transfer interval (DTI) of a directional multi-gigabit (DMG) basic service set (BSS) during which enhanced distributed channel access (EDCA) is used.

controlled access phase (CAP): A time period during which the hybrid coordinator (HC) maintains control of the medium. It might span multiple consecutive hybrid coordination function (HCF) controlled channel access (HCCA) transmission opportunities (TXOPs).

data physical layer (PHY) protocol data unit (PPDU): [data PPDU] A PPDU containing at least one medium access control (MAC) service data unit (MSDU) or fragment of an MSDU.

deep sleep mode: A mesh power management mode with respect to a neighbor peer mesh station (STA) in which a mesh STA alternates between awake and doze states and is not expected to receive beacons from this neighbor peer mesh STA.

delivery-enabled access category (AC): [delivery-enabled AC] A quality-of-service (QoS) access point (AP) AC where the AP is allowed to use enhanced distributed channel access (EDCA) to deliver traffic from the AC to a QoS station (STA) in an unscheduled service period (SP) triggered by the STA.

delivery traffic indication map (DTIM) beacon: [DTIM beacon] A special case for a Beacon frame, DMG Beacon or S1G Beacon frame, where the DTIM Count field in the TIM element is equal to zero. A DTIM beacon might be followed by buffered group addressed bufferable units (BUs).

delivery traffic indication map (DTIM) interval: [DTIM interval] The interval between the consecutive target beacon transmission times (TBTTs) of DTIM beacons. The value, expressed in time units, is equal to the product of the value in the Beacon Interval field and the value in the DTIM Period field.

NOTE 1—If the AP corresponds to a nontransmitted BSSID in a multiple BSSID set, the DTIM Period field is the one contained in the Multiple BSSID-Index element carried in the nontransmitted BSSID profile for that AP. Otherwise, the DTIM Period field is the one contained in the TIM element carried in the Beacon frame or S1G Beacon frame transmitted by that AP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 2—In a multiple BSSID set, the Beacon Interval field is the one contained in the Beacon frame transmitted by the AP corresponding to the transmitted BSSID in a multiple BSSID set.

destination directional multi-gigabit (DMG) station (STA): [destination DMG STA] A DMG STA that is expected to receive during a time division duplex (TDD) slot, or a DMG STA identified by the destination association identifier (AID) field contained in a Grant frame or Extended Schedule element that caused the allocation of a service period (SP) or a contention based access period (CBAP).

differentiated initial link setup (DILS): A mechanism for restricting fast initial link setup (FILS) to certain categories of stations.

direct sequence spread spectrum/complementary code keying (DSSS/CCK): A Clause 15 or Clause 16 transmission.

direct sequence spread spectrum/complementary code keying (DSSS/CCK) physical layer (PHY) protocol data unit (PPDU): [D SSS/CCK PPDU]A Clause 15 or Clause 16 PPDU.

direct sequence spread spectrum (DSSS) physical layer (PHY) protocol data unit (PPDU): [DSSS PPDU] A Clause 15 PPDU.

directional multi-gigabit: [DMG] Pertaining to operation in a radio frequency (RF) frequency band containing a channel with the channel starting frequency above 45 GHz.

NOTE—The channel starting frequency for IEEE 802.11 stations (STAs) is defined in Annex E.

directional multi-gigabit (DMG) aggregate physical layer (PHY) protocol data unit (A-PPDU): [DMG A-PPDU] An A-PPDU where all constituent PPDUs are DMG PPDUs.

directional multi-gigabit (DMG) antenna: [DMG antenna] A DMG antenna is a phased array, a single element antenna, or a set of switched beam antennas covered by a quasi-omni antenna pattern.

directional multi-gigabit (DMG) basic service set (BSS): [DMG BSS] A BSS in which DMG Beacon frames are transmitted by DMG stations (STAs).

directional multi-gigabit (DMG) frame: [DMG frame] A frame transmitted or received within a DMG physical layer (PHY) protocol data unit (PPDU) or within an enhanced directional multi-gigabit (EDMG) PPDU.

directional multi-gigabit (DMG) physical layer (PHY) protocol data unit (PPDU): [DMG PPDU] A Clause 20 PPDU.

directional transmission: A transmission that does not use an omnidirectional antenna pattern or quasi-omni antenna pattern.

downlink: A unidirectional link from an access point (AP) to one or more non-AP stations (STAs) or a unidirectional link from a non-AP destination directional multi-gigabit (DMG) STA to a non-AP source DMG STA.

downlink (DL) high-efficiency (HE) multi-user (MU) physical layer (PHY) protocol data unit (PPDU): [DL HE MU PPDU] An HE MU PPDU transmitted by an access point (AP). This PPDU carries one or more PHY service data units (PSDUs) for one or more users.

downlink multi-user multiple input, multiple output [DL MU-MIMO]**:** A technique by which an access point (AP) with more than one antenna transmits a physical layer (PHY) protocol data unit (PPDU) to

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

multiple receiving non-AP stations (STAs) over the same radio frequencies, wherein each non-AP STA simultaneously receives one or more distinct space-time streams.

downlink multi-user multiple input, multiple output (DL MU-MIMO) physical layer (PHY) protocol data unit (PPDU): [DL MU-MIMO PPDU] A PPDU using the DL MU-MIMO technique.

doze beacon interval (D-BI): In a directional multi-gigabit (DMG) basic service set (BSS) or personal basic service set (PBSS), a beacon interval of a power save mode wakeup schedule during which a station (STA) is expected to be in the doze state for most of the portions of the beacon interval.

dynamic bandwidth operation: A feature of a very high throughput (VHT) station (STA) or a next generation vehicle-to-everything (NGV) STA in which the request-to-send/clear-to-send (RTS/CTS) exchange, using non-high-throughput (non-HT) duplicate physical layer (PHY) protocol data units (PPDUs or non-NGV duplicate PPDUs), negotiates a potentially reduced channel width (compared to the channel width indicated by the RTS) for subsequent transmissions within the current transmission opportunity (TXOP).

dynamic frequency selection (DFS) owner: [DFS owner] A station (STA) in an independent basic service set (IBSS) or off-channel tunneled direct link setup (TDLS) direct link that takes responsibility for selecting the next channel after radar is detected operating in a channel. Due to the nature of IBSSs, it cannot be guaranteed that there is a single DFS owner at any particular time and the protocol is robust to this situation.

EAPOL-Key frame: A Data frame that carries all or part of an IEEE 802.1X Extensible Authentication Protocol (EAP) over local area network (LAN) (EAPOL) protocol data unit (PDU) of type EAPOL-Key.

EAPOL-Key request frame: A Data frame that carries all or part of an IEEE 802.1X EAPOL-Key protocol data unit (PDU) with the Request bit in the Key Information field in the IEEE 802.11 Key Descriptor set to 1 and the Error bit set to 0.

EAPOL-Start frame: A Data frame that carries all or part of an IEEE 802.1X Extensible Authentication Protocol (EAP) over local area network (LAN) (EAPOL) protocol data unit (PDU) of type EAPOL-Start.

emergency services association: A robust security network association (RSNA) between an access point (AP) and a non-AP station (STA) without security credentials; the non-AP STA is granted access to emergency services using unprotected frames via this association.

energy limited (EL) station (STA): [EL STA] A sub 1 GHz (S1G) STA whose limited energy supply requires the STA to transmit or receive in certain intervals of time determined by an EL Operation element.

enhanced broadcast services (EBCS): Services that enable the relaying of uplink broadcast traffic to a specified destination and enhanced broadcasting of downlink streams to both associated and unassociated stations (STAs).

enhanced broadcast services (EBCS) access point (AP) group: A group of one or more EBCS APs such that all EBCS APs in the group use common EBCS content identifiers (IDs). An EBCS AP group is a subgroup of an EBCS certificate group if the member APs use AP certificates.

enhanced broadcast services (EBCS) access point (AP) group identifier (ID): An identifier (ID) of an EBCS AP group that can be used by EBCS receivers to filter EBCS traffic streams.

enhanced broadcast services (EBCS) certificate group: A group of one or more EBCS access points (APs) such that all EBCS APs in the group use a common certificate for EBCS traffic streams.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

enhanced broadcast services (EBCS) content MAC address: A MAC address used in a frame header to identify an EBCS Data or EBCS uplink (UL) frame. See 34.2.

enhanced broadcast services (EBCS) Data frame: A Data frame used to carry data for an EBCS downlink traffic stream.

enhanced broadcast services (EBCS) downlink (DL): A broadcast from an EBCS access point (AP) carrying an EBCS traffic stream.

NOTE—This broadcast can be received by another EBCS AP.

enhanced broadcast services (EBCS) downlink (DL) content server: An entity reachable via the distribution system (DS) that is the source of an EBCS DL traffic stream.

enhanced broadcast services (EBCS) info MAC address: A MAC address used in a frame header to identify an EBCS Info frame. See 34.2.

enhanced broadcast services (EBCS) proxy: A logical component affiliated with an EBCS relaying station (STA), which might be collocated with the EBCS relaying STA, that can relay a higher layer protocol (HLP) payload carried in an EBCS uplink (UL) frame received by the EBCS relaying STA to a destination specified in the frame, typically within an external network.

enhanced broadcast services (EBCS) receiver: A station (STA) that can receive and process EBCS Data frames or EBCS uplink (UL) frames.

enhanced broadcast services (EBCS) relaying station: An EBCS receiver that is affiliated with an EBCS proxy and provides a relaying service as described in 4.5.12.3 and 34.4.

NOTE—An EBCS relaying station (STA) can be an access point (AP) that has established its own infrastructure basic service set (BSS) or a STA that provides a relaying service without establishing an infrastructure BSS.

enhanced broadcast services (EBCS) service period: A period of time during which an EBCS access point (AP) intends to conduct EBCS transmissions associated with one or more content identifiers (IDs).

enhanced broadcast services (EBCS) traffic stream: A traffic stream that carries content on EBCS.

enhanced broadcast services (EBCS) transmitter: A station (STA) that can transmit EBCS Data frames or EBCS uplink (UL) frames.

enhanced broadcast services (EBCS) uplink (UL): A broadcast from an EBCS non-access point (non-AP) station (STA) carrying higher layer protocol (HLP) payload intended to be relayed by one or more EBCS relaying STAs to a destination specified in the broadcast.

NOTE—An EBCS relaying STA might not be in range.

enhanced directional multi-gigabit (EDMG): Pertaining to an enhanced feature operation in directional multi-gigabit (DMG).

enhanced directional multi-gigabit (EDMG) aggregate physical layer (PHY) protocol data unit (A-PPDU): [EDMG A-PPDU] An A-PPDU where all constituent PPDUs are EDMG PPDUs.

enhanced directional multi-gigabit (EDMG) basic service set (BSS): [EDMG BSS] A directional multi-gigabit (DMG) BSS in which a DMG Beacon frame transmitted by an EDMG station (STA) has the EDMG Supported field equal to 1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

enhanced directional multi-gigabit (EDMG) physical layer (PHY) protocol data unit (PPDU): [EDMG PPDU] A Clause 28 PPDU transmitted with the TXVECTOR parameter FORMAT equal to EDMG.

enhanced directional multi-gigabit (EDMG) secure ranging physical layer (PHY) protocol data unit (PPDU): An EDMG single user (SU) PPDU that contains secure training (TRN) subfields in the training (TRN) field to enable secure ranging with physical layer (PHY) level security.

enhanced distributed channel access (EDCA): The prioritized carrier sense multiple access with collision avoidance (CSMA/CA) access mechanism used by quality-of-service (QoS) stations (STAs) in a QoS basic service set (BSS) and STAs operating outside the context of a BSS. This access mechanism is also used by the QoS access point (AP) and operates concurrently with hybrid coordination function (HCF) controlled channel access (HCCA).

enhanced distributed channel access function (EDCAF): A logical function in a quality-of-service (QoS) station (STA) that determines, using enhanced distributed channel access (EDCA), when a frame in the transmit queue with the associated access category (AC) is permitted to be transmitted via the wireless medium (WM). There is one EDCAF per AC.

enhanced multiple basic service set identifier (BSSID) advertisement (EMA) access point (AP): [EMA AP] An AP that uses enhancements related to the discovery of nontransmitted BSSIDs.

extended centralized access point (AP) or personal basic service set (PBSS) control point (PCP) cluster: [ECAPC] The collection of 1) a single centralized coordination service set (CCSS), 2) the set of centralized AP or PCP clusters such that each synchronization AP (S-AP) of a centralized AP or PCP cluster is within the CCSS, and 3) all stations (STAs) within the basic service sets (BSSs) of the S-APs and member APs and PCPs of the centralized AP or PCP clusters.

extended channel switching (ECS): A procedure that is used to announce a pending change of operating channel, operating class, or both.

extended range (ER) beacon: [ER beacon] A Beacon frame transmitted in a high-efficiency (HE) ER single-user (SU) physical layer (PHY) protocol data unit (PPDU) to form an ER basic service set (BSS).

extended rate physical layer (ERP): A physical layer (PHY) compliant with Clause 18.

extended rate physical layer (ERP) physical layer (PHY) protocol data unit (PPDU): [ERP PPDU] A Clause 18 PPDU that is not a Clause 16 PPDU.

extended rate physical layer (PHY) using complementary code keying (CCK) modulation: [ERP-CCK] A mode of operation of a PHY operating under Clause 18 rules, where the TXVECTOR parameter MODULATION is equal to ERP-CCK.

extended rate physical layer (PHY) using direct sequence spread spectrum (DSSS) modulation: [ERPDSSS] A PHY operating under Clause 18 rules, where the TXVECTOR parameter MODULATION is equal to ERP-DSSS.

extended rate physical layer (PHY) using direct sequence spread spectrum (DSSS) or complementary code keying (CCK) modulation: [ERP-DSSS/CCK] A PHY operating under Clause 18 rules, where the TXVECTOR parameter MODULATION is equal to ERP-CCK or ERP-DSSS.

extended rate physical layer (PHY) using orthogonal frequency division multiplexing (OFDM) modulation: [ERP-OFDM] A mode of operation of a PHY operating under Clause 18 rules, where the TXVECTOR parameter MODULATION is equal to ERP-OFDM.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

extended service set (ESS) link: [ESS link] In the context of an IEEE 802.11 medium access control (MAC) entity, a connection path through the wireless medium between a non–access point (non-AP) station (STA) and one of the APs that is a member of the ESS.

Extensible Authentication Protocol (EAP) reauthentication protocol (EAP-RP): [EAP-RP] A protocol, using the EAP framework, that allows single round trip reauthentication with an Authentication Server after an initial EAP authentication.

NOTE—IETF RFC 6696 uses "ERP" for the abbreviation of EAP reauthentication protocol; IEEE Std 802.11 uses "EAP-RP" because "ERP" stands for "Extended Rate PHY" in IEEE Std 802.11.

fast basic service set (BSS) transition (FT) 4-way handshake: [FT 4-way handshake] A pairwise key management protocol used during FT initial mobility domain association. This handshake confirms mutual possession of a pairwise master key (PMK), the PMK-R1, by two parties and distributes a group temporal key (GTK).

fast basic service set (BSS) transition (FT) initial mobility domain association: [fast BSS transition initial mobility domain association, FT initial mobility domain association] The first association or first reassociation procedure within a mobility domain, during which a station (STA) indicates its intention to use the FT procedures.

fast basic service set (BSS) transition (FT) originator: [FTO] A station (STA) that initiates the FT protocol by sending an FT Request frame or an Authentication frame with Authentication Algorithm Number field equal to Fast BSS Transition.

fast initial link setup (FILS): A collection of mechanisms that enable IEEE Std 802.11 networks to minimize initial link setup time.

fast initial link setup (FILS) access point (AP): [FILS AP] An access point that implements FILS.

fast initial link setup (FILS) association: [FILS association] A type of association used in fast initial link setup.

fast initial link setup (FILS) authentication: [FILS authentication] A type of authentication used in fast initial link setup.

fast initial link setup (FILS) station (STA): [FILS STA] A station that implements FILS.

fine timing measurement (FTM) procedure: [FTM procedure] A procedure that allows a station (STA) to determine its distance from another STA.

flexible multicast service (FMS): A service that enables a non–access point (non-AP) station (STA) to request a multicast delivery interval longer than the delivery traffic indication map (DTIM) interval for the purposes of lengthening the period of time a STA can be in a power save state.

flexible multicast service (FMS) stream: [FMS stream] A succession of frames transmitted by the access point (AP) that correspond to a single flexible multicast stream identifier (FMSID).

flexible multicast service (FMS) stream set: [FMS stream set] A collection of FMS streams identified by the value of the FMS Token field, used during the FMS request procedure.

flexible multicast stream (FMS) identifier: [FMSID] An identifier assigned by the access point (AP) to a particular group addressed stream subsequent to a successful FMS request procedure.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

fragmentation: The process of partitioning a medium access control (MAC) service data unit (MSDU), aggregate MAC service data unit (A-MSDU) or MAC management protocol data unit (MMPDU) into a sequence of smaller MAC protocol data units (MPDUs) prior to transmission. The process of recombining a set of fragment MPDUs into an MSDU, A-MSDU, or MMPDU is known as defragmentation.

future channel guidance: future channel guidance communicates likely future channel information so that stations (STAs) can efficiently move their activity when the absence of Beacon frames is noticed.

general link (GLK): A point-to-point connection between two instances of the IEEE 802.1AC Internal Sublayer Service that uses an IEEE 802.11 wireless link between stations (STAs). A general link is suitable for use in an IEEE 802.1Q bridged network.

general link (GLK) convergence function: [GLK convergence function] The convergence function defined in IEEE Std 802.1AC™-2016 between an IEEE 802.11 medium access control (MAC) and an IEEE 802.1Q bridge.

general link groupcast with retries (GLK-GCR): A variant of GCR that specifies the use of GCR for general link.

general link (GLK) station (STA): [GLK STA] A STA that implements GLK functionality.

generic advertisement service (GAS): An over-the-air transportation service that provides over-the-air transportation for frames of higher layer advertisements between stations (STAs) or between an advertisement server and a non–access point (non-AP) STA. The protocol(s) used to relay frames between an AP, portal, and advertisement server is outside the scope of this standard. GAS supports higher layer protocols that employ a query/response mechanism.

geolocation database (GDB): A database whose operation is mandated or authorized by a regulatory authority and that organizes storage of information by geographic location.

geolocation database dependent (GDD): A modifier describing when station (STA) operation is dependent on information received from a geolocation database (GDB).

geolocation database dependent (GDD) access point (AP): [GDD AP] A station (STA) dependent on information received from a geolocation database (GDB) in order to initiate and maintain a network.

geolocation database dependent (GDD) dependent station (STA): [GDD dependent STA] A STA that is under the control of a GDD enabling STA.

geolocation database dependent (GDD) enabling station (STA): [GDD enabling STA] A STA that has the authority to control the operation of GDD dependent STAs after obtaining available spectrum for use at its own location.

geolocation database dependent (GDD) fixed station (STA): [GDD fixed STA] A STA whose geographical location information is fixed and maintained in a geolocation database (GDB) and whose operation depends on information received from that database.

geolocation database dependent (GDD) geolocated non-access point (non-AP) station (STA): [GDD geolocated non-AP STA]A STA that is not an AP and is authorized by a geolocation database (GDB) to operate at its current location.

geolocation database dependent (GDD) non-access point (non-AP) station (STA): [GDD non-AP STA] A STA that is not an AP but operates under the control of a GDD enabling STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

global operating class: An operating class value that is any of the nonreserved values in Table E-4.

group addressed quality-of-service (QoS) management frame: [GQMF] A group addressed Management frame that is transmitted using the quality-of-service management frame (QMF) service.

group addressed transmission service (GATS): A mechanism comprising directed multicast service (DMS) and groupcast with retries (GCR), for delivery of group addressed frames.

group addressed wake-up radio (WUR) wake-up frame: [group addressed WUR wake-up frame] A WUR Wake-up frame with the ID field set to group identifier (ID).

group key: A key that is used to protect information exchanged in group addressed frames.

group key handshake: A group key management protocol defined by this standard. It is used only to issue a new group temporal key (GTK) to peers with whom the local station (STA) has already formed security associations.

group master key (GMK): An auxiliary key that might be used to derive a group temporal key (GTK).

group temporal key (GTK): A temporal key that is used to protect information exchanged in group addressed Data frames.

group temporal key security association (GTKSA): The context resulting from a successful group temporal key (GTK) distribution exchange via either a group key handshake, a 4-way handshake, or fast initial link setup (FILS) authentication.

groupcast with retries (GCR) active (GCR-A) delivery: [GCR-A delivery] A delivery method for a group addressed stream subject to a GCR agreement wherein the frames are transmitted without regard to the power state of non–access point (non-AP) stations (STAs).

groupcast with retries (GCR) concealment address: [GCR concealment address] A medium access control (MAC) address that is used to prevent group addressed frames transmitted via the GCR unsolicited retry or GCR block ack retransmission policies from being passed up the medium access control service access point (MAC SAP) of GCR-incapable stations (STAs).

groupcast with retries (GCR) frame: [GCR frame] A group addressed frame subject to a GCR agreement between the access point (AP) and at least one station (STA) within the infrastructure basic service set (BSS) or between peer mesh STAs in a mesh BSS.

groupcast with retries (GCR) group address: [GCR group address] A group address subject to a GCR agreement between the access point (AP) and at least one station (STA) within the basic service set (BSS) or between peer mesh STAs in a mesh BSS.

groupcast with retries (GCR) service: [GCR service] A means for transmission and retransmission of medium access control (MAC) service data units (MSDUs) to a destination that is a group address. The GCR service provides greater reliability by using group addressed retransmissions, concealed from GCR-incapable stations (STAs).

groupcast with retries (GCR) service period (GCR-SP) aggregate medium access control (MAC) service data unit (A-MSDU): [GCR-SP A-MSDU] An A-MSDU subject to the GCR service with the delivery method equal to GCR-SP.

groupcast with retries (GCR) service period (GCR-SP) frame: [GCR-SP frame] A frame subject to the GCR service when the delivery method is GCR-SP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

groupcast with retries (GCR) service period (GCR-SP) medium access control (MAC) service data unit (MSDU): [GCR-SP MSDU] An MSDU subject to the GCR service with the delivery method equal to GCR-SP.

groupcast with retries (GCR) transmission opportunity (TXOP): [GCR TXOP] An interval of time during which an access point (AP) or a mesh station (STA) has the right to initiate frame exchange sequences onto the wireless medium (WM) for the purpose of transmitting multiple frames that are subject to the GCR service.

HE-LTF repetitions: Multiple transmissions of HE-LTF symbols in an HE Ranging NDP or HE TB Ranging NDP, where an HE-LTF repetition value of 1 indicates no repetitions, and, for example, a value of 2 or 3 would indicate twice or three times as many HE-LTF symbols, respectively.

high-efficiency (HE) basic service set (BSS): [HE BSS] A BSS in which the transmitted Beacon frame includes an HE Operation element.

high-efficiency (HE) beacon: [HE beacon] A Beacon frame transmitted in a HE single-user (SU) physical layer (PHY) protocol data unit (PPDU).

high-efficiency (HE) beamformee: [HE beamformee] An HE station (STA) that receives an HE physical layer (PHY) protocol data unit (PPDU) that was transmitted using a beamforming steering matrix.

high-efficiency (HE) beamformer: [HE beamformer] An HE station (STA) that transmits an HE physical layer (PHY) protocol data unit (PPDU) using a beamforming steering matrix.

high-efficiency (HE) extended range (ER) single-user (SU) physical layer (PHY) protocol data unit (PPDU): [HE ER SU PPDU] A PPDU transmitted with HE ER SU PPDU format. This PPDU carries a single PHY service data unit (PSDU).

high-efficiency (HE) masked HE-long training field (HE-LTF) sequence mode: [HE masked HE-LTF sequence mode] An HE-LTF mode used in an HE TB PPDU. The masked HE-LTF sequence mode does not have any pilot subcarriers in the HE-LTF field and uses a masked HE-LTF sequence generated by multiplying an orthogonal code (distinct to each spatial stream) over groups of subcarriers.

high-efficiency (HE) modulation and coding scheme: [HE-MCS] A specification of the HE physical layer (PHY) parameters that consists of modulation order (BPSK, QPSK, 16-QAM, 64-QAM, 256-QAM, 1024-QAM) and forward error correction (FEC) coding rate (1/2, 2/3, 3/4, 5/6) and that is used in an HE PHY protocol data unit (PPDU).

high-efficiency (HE) multi-user (MU) physical layer (PHY) protocol data unit (PPDU): [HE MU PPDU] A PPDU transmitted with HE MU PPDU format.

high-efficiency (HE) no pilot HE-long training field (HE-LTF) mode: [HE no pilot HE-LTF mode] An HE-LTF mode used in an HE triggered-based (TB) PPDU. The no pilot HE-LTF mode does not have any pilot subcarriers in the HE-LTF field and does not use a masked HE-LTF sequence. *See also:* **high-efficiency (HE) masked HE-long training field (HE-LTF) sequence mode**.

high-efficiency (HE) physical layer (PHY) protocol data unit (PPDU): [HE PPDU] A Clause 27 PPDU that is not a Clause 21 PPDU.

high-efficiency (HE) single stream pilot: [HE single stream pilot] The same pilot sequence is applied to all spatial time streams for a given resource allocation.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

high-efficiency (HE) single stream pilot HE-long training field (HE-LTF) mode: [HE single stream pilot HE-LTF mode] An HE-LTF mode used in an HE single-user (SU), HE extended range (ER) SU, HE multi-user (MU) and optionally HE trigger-based (TB) PPDU.

high-efficiency (HE) single-user (SU) physical layer (PHY) protocol data unit (PPDU): [HE SU PPDU] A PPDU transmitted with HE SU PPDU format. This PPDU carries a single PHY service data unit (PSDU).

high-efficiency (HE) trigger-based (TB) physical layer (PHY) protocol data unit (PPDU): [HE TB PPDU] A PPDU transmitted with HE TB PPDU format. This PPDU carries a single PHY service data unit (PSDU).

high rate direct sequence spread spectrum (HR/DSSS) physical layer (PHY) protocol data unit (PPDU): [HR/DSSS PPDU] A Clause 16 PPDU that is not a Clause 15 PPDU.

high throughput (HT) basic service set (BSS): [HT BSS] A BSS in which Beacon frames transmitted by an HT station (STA) include the HT Capabilities element.

high throughput (HT) beamformee: [HT beamformee] An HT station (STA) that receives an HT physical layer (PHY) protocol data unit (PPDU) that was transmitted using a beamforming steering matrix and that supports an HT transmit beamforming feedback mechanism.

high throughput (HT) beamformer: [HT beamformer] An HT station (STA) that transmits an HT physical layer (PHY) protocol data unit (PPDU) using a beamforming steering matrix.

high throughput (HT) greenfield (HT-greenfield) format: [HT-greenfield format] A physical layer (PHY) protocol data unit (PPDU) format of the HT PHY using the HT-greenfield format preamble.

high throughput (HT) immediate (HT-immediate) block acknowledgment (Ack): [HT immediate block ack] An immediate block ack mechanism that requires the use of the compressed BlockAck frame and an implicit block ack request and allows partial-state operation at the recipient. This block ack scheme is negotiated between two HT or directional multi-gigabit (DMG) stations (STAs).

high throughput (HT) mixed (HT-mixed) format: [HT-mixed format] A physical layer (PHY) protocol data unit (PPDU) format of the HT PHY using the HT-mixed format preamble.

high throughput (HT) modulation and coding scheme: [HT-MCS] A specification of the HT physical layer (PHY) parameters that consists of modulation order (e.g., BPSK, QPSK, 16-QAM, 64-QAM), forward error correction (FEC) coding rate (e.g., 1/2, 2/3, 3/4, 5/6), and number of spatial streams (NSS) and that is used in an HT PHY protocol data unit (PPDU).

high throughput (HT) null data physical layer (PHY) protocol data unit (PPDU) (NDP) announcement: [HT NDP announcement] A PPDU that contains one or more +HTC frames (i.e., frames with an HT Control field) that have the HT NDP Announcement subfield equal to 1.

high throughput (HT) physical layer (PHY) protocol data unit (PPDU): [HT PPDU] A Clause 19 PPDU that is not a Clause 15, Clause 16, Clause 17, or Clause 18 PPDU.

high throughput (HT) station (STA) 2G4: [HT STA 2G4] An HT STA that is also a STA 2G4.

high throughput (HT) station (STA) 5G: [HT STA 5G] An HT STA that is also a STA 5G.

hybrid coordination function (HCF): A coordination function that combines and enhances aspects of the contention based and contention free access methods to provide quality-of-service (QoS) stations (STAs) with prioritized and parameterized QoS access to the wireless medium (WM), while continuing to support non-QoS STAs for best-effort transfer. The HCF includes the functionality provided by both enhanced distributed channel access (EDCA) and HCF controlled channel access (HCCA).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

hybrid coordination function (HCF) controlled channel access: [HCCA] The channel access mechanism utilized by the hybrid coordinator (HC) to coordinate contention free media use by quality-of-service (QoS) stations (STAs) for downlink individually addressed, uplink, and direct link transmissions.

hybrid coordinator (HC): A type of coordinator, defined as part of the quality-of-service (QoS) facility, that implements the frame exchange sequences and medium access control (MAC) service data unit (MSDU) handling rules defined by the hybrid coordination function (HCF).

identifier (ID): An identifier used by a wake-up radio (WUR) access point (AP) to identify broadcast WUR frames that are addressed to all WUR non-AP stations (STAs) associated with an AP corresponding to a nontransmitted basic service set identifier (BSSID) from the multiple BSSID set when multiple BSSID operation is supported.

IEEE 802.11 access network: A network that provides access to an external network reachable via the basic service set (BSS).

IEEE 802.11 station (STA): [IEEE 802.11 STA] Any station that is compliant with IEEE Std 802.11. Any reference to the term station (STA) in this standard that is not qualified by the term *IEEE 802.11* implicitly refers to an IEEE 802.11 station.

individual target wake time (TWT): A specific time or set of times negotiated between two individual stations (STAs) at which the STAs are expected to be awake in order to exchange frames with each other.

individually addressed resource unit (RU): A resource unit in a high-efficiency (HE) multi-user (MU) physical layer (PHY) protocol data unit (PPDU) transmitted by an access point (AP) or a tunneled direct link setup (TDLS) peer station (STA) that is intended for a single associated non-AP STA or a TDLS peer STA, respectively.

individually addressed quality-of-service management frame (IQMF): An individually addressed Management frame that is transmitted using the quality-of-service management frame (QMF) service.

integrity check key (ICK): A key used to integrity check FILS Authentication frames.

integrity group temporal key (IGTK): A random value, assigned by the broadcast/multicast source station (STA), which is used to protect group addressed medium access control (MAC) management protocol data units (MMPDUs) from that source STA.

interworking service: A service that supports use of an IEEE 802.11 network with non-IEEE-802.11 networks. Functions of the interworking service assist non–access point (non-AP) stations (STAs) in discovering and selecting IEEE 802.11 networks, in using appropriate quality-of-service (QoS) settings for transmissions, in accessing emergency services, and in connecting to subscription service providers (SSPs).

key confirmation key (KCK): A key used to integrity check various frames related to key management.

key counter: A 256-bit (32-octet) counter that is used in the pseudorandom function (PRF) to generate initialization vectors (IVs). There is a single key counter per station (STA) that is global to that STA.

key data encapsulation (KDE): A format for data other than elements in the EAPOL-Key Data field.

key encryption key (KEK): A key used to encrypt various fields related to key management.

key management service: A service to distribute and manage cryptographic keys within a robust security network (RSN).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

light communications station (LC STA): A station (STA) that operates in the light band with wavelengths in the range 800 nm to 1000 nm.

light sleep mode: A mesh power management mode with respect to a neighbor peer mesh station (STA) in which a mesh STA alternates between awake and doze states and is expected to receive beacons from this neighbor peer mesh STA.

link: In the context of an IEEE 802.11 medium access control (MAC) entity, a physical path consisting of exactly one traversal of the wireless medium (WM) that is usable to transfer MAC service data units (MSDUs) between two stations (STAs) that have established a relationship.

link setup: The process of discovering an extended service set (ESS), (secure) association and authentication, and gaining the ability to send higher layer [e.g., Internet Protocol (IP)] traffic with a valid higher layer address through an access point (AP).

location configuration information (LCI): As defined in IETF RFC 6225: includes latitude, longitude, and altitude, with uncertainty indicators for each.

medium access control (MAC) management protocol data unit (MMPDU): [MMPDU] The unit of data exchanged between two peer MAC entities, using services of the physical layer (PHY), to implement the MAC management protocol. The MMPDU is transported in one or more Management frames. The MMPDU might include a Mesh Control field, a management message integrity code (MIC) element (MME), or a MIC element, but does not include a MAC header, a frame check sequence (FCS), or any other security encapsulation overhead.

mesh awake window: A period of time during which the mesh station (STA) operates in awake state after its Beacon or Probe Response frame transmission that contained the Mesh Awake Window element.

mesh coordination function (MCF): A coordination function that combines aspects of the contention based and scheduled access methods. The MCF includes the functionality provided by both enhanced distributed channel access (EDCA) and MCF controlled channel access (MCCA).

mesh coordination function (MCF) controlled channel access: [MCCA] A coordination function for the mesh basic service set (MBSS).

mesh coordination function (MCF) controlled channel access opportunity: [MCCAOP] A period of time scheduled for frame transmissions between mesh stations (STAs) using MCF controlled channel access (MCCA).

mesh data frame: A Data frame that is transmitted by a mesh station (STA).

mesh peer service period: A period of time during which one or more individually addressed frames are transmitted between two peer mesh stations (STAs) with at least one of those mesh STAs operating in light sleep or deep sleep mode. A mesh peer service period is directional and might contain one or more transmission opportunities (TXOPs).

mesh peer service period owner: A mesh station (STA) that obtains transmission opportunities (TXOPs), transmits individually addressed frames to the recipient mesh STA in the mesh peer service period, and terminates the mesh peer service period.

mesh peering management: A group of protocols to facilitate mesh peering establishment and closure.

mesh power management mode: The activity level identifier of a mesh station (STA) set per mesh peering or for nonpeer neighbor STAs. A lower activity level enables a mesh STA to reduce its power consumption.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

mesh power management mode tracking: Operation to observe the peering-specific mesh power management modes from the peer mesh stations (STAs) and to maintain the peering-specific mesh power management modes for each peer mesh STA.

message integrity code (MIC) key: [MIC key] Temporal key integrity protocol (TKIP) only: The portion of a transient key used to validate the integrity of medium access control (MAC) service data units (MSDUs) or MAC protocol data units (MPDUs).

method-specific service access point (SAP): [MS SAP] The point at which an instance of the IEEE 802.11 method-specific medium access control (MAC) service is offered.

michael: The message integrity code (MIC) for the temporal key integrity protocol (TKIP).

modulation and coding scheme (MCS): A specification of the physical layer (PHY) parameters that consists of modulation order (e.g., BPSK, QPSK, 16-QAM, 64-QAM, and 256-QAM), forward error correction (FEC) coding rate (e.g., 1/2, 2/3, 3/4, 5/6), and, depending on the context, the number of space-time streams.

modulation and coding scheme 32 (MCS 32) format: [MCS 32 format] A physical layer (PHY) protocol data unit (PPDU) format of the high throughput (HT) PHY in which signals in two halves of the occupied channel width contain the same information. This HT PPDU format supports the lowest rate.

modulation and coding scheme (MCS) feedback (MFB) requester: [MFB requester] A station (STA) that transmits a physical layer (PHY) protocol data unit (PPDU) containing an HT Control field in which the MCS request (MRQ) subfield is equal to 1.

modulation and coding scheme (MCS) feedback (MFB) responder: [MFB responder] A station (STA) that transmits a physical layer (PHY) protocol data unit (PPDU) containing an HT Control field with the MFB field containing an MCS index or the value 127 in response to a PPDU containing an HT Control field in which the MCS request (MRQ) subfield is equal to 1.

multicarrier on-off keying (MC-OOK) symbol: [MC-OOK symbol] A wake up receiver (WUR) OOK symbol generated using multiple carriers, either an WUR OOK On symbol where a signal constructed from multiple subcarriers is present or an WUR OOK Off symbol where no signal is present.

multiple basic service set identifier (BSSID) set: [BSSID set] A collection of access points (APs), such that all of the APs use a common operating class, channel, receive antenna connector, and transmit antenna connector and advertise information for multiple BSSIDs using Beacon or Probe Response frames sent by the AP corresponding to the transmitted BSSID.

multiple medium access control (MAC) sublayers link: [MMSL] A link between two stations (STAs), wherein one of the STAs is coordinated by a multiple MAC station management entity (MM-SME) that delivered a multiple MAC sublayers (MMS) element to the peer STA.

multiple medium access control (MAC) sublayers link (MMSL) cluster: [MMSL cluster] The set of all MMSLs between a pair of stations (STAs).

multi-band device: A logical entity that supports operation over more than one frequency band or channel using fast session transfer (FST).

multi-user (MU) beamformee: [MU beamformee] A non–access point (non-AP) station (STA) that receives a physical layer (PHY) protocol data unit (PPDU) that was transmitted using a multi-user beamforming steering matrix and that supports the very high throughput (VHT) transmit beamforming feedback mechanism with a VHT null data PPDU (NDP) Announcement frame that includes more than one STA Info field.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

multi-user (MU) beamformer: [MU beamformee] An access point (AP) that transmits a physical layer (PHY) protocol data unit (PPDU) using a multi-user beamforming steering matrix.

multi-user (MU) physical layer (PHY) protocol data unit (PPDU): [MU beamformee] A PPDU that carries one or more PHY service data units (PSDUs) for one or more stations (STAs) using the downlink multi-user multiple input, multiple output (DL MU-MIMO) technique, orthogonal frequency division multiple access (DL OFDMA) technique, or a combination of the two techniques, or that carries a PSDU for an AP, a TDLS STA on a direct link or an IBSS STA and is in high-efficiency (HE) MU PPDU format.

next generation vehicle-to-everything (V2X) (NGV) physical layer (PHY) protocol data unit (PPDU): A Clause 32 PPDU with the TXVECTOR parameter FORMAT equal to NGV or NON_NGV_10.

no acknowledgment/no retry (No-Ack/No-Retry): A retransmission policy for group addressed frames in which each frame is transmitted once and without acknowledgment.

non-40-MHz-capable (non-40MC) high throughput (HT) station (STA): [non-40MC HT STA] A STA that is not a 40-MHz-capable (40MC) HT STA.

non-ack-enabled single traffic identifier (TID) aggregate medium access control (MAC) protocol data unit (A-MPDU): [non-ack-enabled single-TID A-MPDU] A legacy A-MPDU with the exception that a Trigger frame can be aggregated.

non-ack-enabled multi traffic identifier (TID) aggregate medium access control (MAC) protocol data unit (A-MPDU): [(non-ack-enabled multi-TID A-MPDU] An A-MPDU where tagged MPDUs are not aggregated and the aggregated untagged MPDUs from at least two TIDs solicit block acknowledgment.

nonaggregate medium access control (MAC) protocol data unit (non-A-MPDU) frame: [non-A-MPDU frame] A frame that is transmitted in a Clause 15 physical layer (PHY) protocol data unit (PPDU), Clause 17 PPDU, Clause 16 PPDU, or Clause 18 orthogonal frequency division multiplexing (OFDM) PPDU; or is transmitted with the TXVECTOR AGGREGATION parameter present and equal to NOT_AGGREGATED; or is a single medium access control (MAC) protocol data unit (S-MPDU).

nonbandwidth signaling transmitter address (TA): An address in the TA field of an medium access control (MAC) protocol data unit (MPDU) in which the Individual/Group bit has the value 0.

nonbufferable medium access control (MAC) management protocol data unit (MMPDU): [nonbufferable MMPDU] An MMPDU that is not a bufferable MMPDU.

nonconcealed groupcast with retries (GCR) frame: [nonconcealed GCR frame] A group addressed frame that is not transmitted to the GCR concealment address.

nondirectional multi-gigabit: [non-DMG] A modifier meaning not directional multi-gigabit (DMG), not enhanced directional multi-gigabit (EDMG), and not China directional multi-gigabit (CDMG).

nonenhanced directional multi-gigabit: [non-EDMG] A modifier meaning directional multi-gigabit (DMG) and that includes neither EDMG enhancement nor CDMG enhancements.

nonenhanced directional multi-gigabit (non-EDMG) duplicate transmission format: [non-EDMG duplicate transmission format] A transmission format of the physical layer (PHY) that duplicates a 2.16 GHz non-EDMG transmission in two or more 2.16 GHz channels and allows a station (STA) in a DMG basic service set (BSS) on any one of the 2.16 GHz channels to receive the transmission. A non-EDMG duplicate format is one of the following:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— 4.32 GHz non-EDMG duplicate transmission format: A transmission format of the PHY that replicates a 2.16 GHz non-EDMG transmission in two adjacent 2.16 GHz channels.
— 6.48 GHz non-EDMG duplicate transmission format: A transmission format of the PHY that replicates a 2.16 GHz non-EDMG transmission in three adjacent 2.16 GHz channels.
— 8.64 GHz non-EDMG duplicate transmission format: A transmission format of the PHY that replicates a 2.16 GHz non-EDMG transmission in four adjacent 2.16 GHz channels.
— 2.16+2.16 GHz non-EDMG duplicate transmission format: A transmission format of the PHY that replicates a 2.16 GHz non-EDMG transmission in two, not necessarily adjacent, 2.16 GHz channels.
— 4.32+4.32 GHz non-EDMG duplicate transmission format: A transmission format of the PHY that replicates a 2.16 GHz non-EDMG transmission in two frequency segments of two adjacent 2.16 GHz channels where the two frequency segments of channels are not necessarily adjacent.

nonextended rate physical layer (PHY): [non-ERP] A physical layer (PHY) compliant with Clause 15 or Clause 16, but not with Clause 18.

nongroupcast with retries: [non-GCR] A method for delivering group addressed frames without using the groupcast with retries (GCR) unsolicited retry retransmission policy, the GCR block acknowledgment retransmission policy, or the GCR service period (GCR-SP) delivery method.

nongroupcast with retries service period (SP): [non-GCR-SP] A method for the delivery of group addressed frames without the use of a groupcast with retries service period (GCR-SP).

non-high-efficiency (non-HE) physical layer (PHY) protocol data unit (PPDU): [non-HEPPDU] A PPDU that is transmitted using a PPDU format defined in Clause 15, Clause 16, Clause 17, Clause 18, Clause 19 or Clause 21.

non-high-throughput (non-HT): [non-HT] A modifier meaning not high throughput (HT), not very high throughput (VHT), not high efficiency (HE), and not directional multi-gigabit (DMG).

non-high-throughput (non-HT) duplicate: [non-HT duplicate] A transmission format of the physical layer (PHY) that duplicates a 20 MHz non-HT transmission in two or more 20 MHz channels and allows a station (STA) in a non-HT basic service set (BSS) on any one of the 20 MHz channels to receive the transmission. A non-HT duplicate format is one of the following:

a) 40 MHz non-HT duplicate: A transmission format of the PHY that replicates a 20 MHz non-HT transmission in two adjacent 20 MHz channels.
b) 80 MHz non-HT duplicate: A transmission format of the PHY that replicates a 20 MHz non-HT transmission in four adjacent 20 MHz channels.
c) 160 MHz non-HT duplicate: A transmission format of the PHY that replicates a 20 MHz non-HT transmission in eight adjacent 20 MHz channels.
d) 80+80 MHz non-HT duplicate: A transmission format of the PHY that replicates a 20 MHz non-HT transmission in two frequency segments of four adjacent 20 MHz channels where the two frequency segments of channels are not adjacent.

non-high-throughput (non-HT) duplicate frame: [non-HT duplicate frame] A frame transmitted in a non-HT duplicate physical layer (PHY) protocol data unit (PPDU).

non-high-throughput (non-HT) duplicate in television white spaces (TVWS) band: [non-HT duplicate in TVWS band] A transmission format of the physical layer (PHY) that duplicates a single basic channel unit (BCU) non-HT transmission in two or more BCUs and allows a station (STA) in a non-HT basic service set (BSS) on any one BCU to receive the transmission. A non-HT duplicate format is one of the following:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

a) TVHT_W non-HT duplicate: A PHY transmission that replicates a non-HT PHY protocol data unit (PPDU) two times in a single BCU.
b) TVHT_2W non-HT duplicate: A PHY transmission that replicates a non-HT PPDU four times in two contiguous BCUs.
c) TVHT_4W non-HT duplicate: A PHY transmission that replicates a non-HT PPDU eight times in four contiguous BCUs.
d) TVHT_W+W non-HT duplicate: A PHY transmission that replicates a non-HT PPDU two times in each single BCU.
e) TVHT_2W+2W non-HT duplicate: A PHY transmission that replicates a non-HT PPDU four times in each of two contiguous BCUs.

non-high-throughput (non-HT) duplicate physical layer (PHY) protocol data unit (PPDU): [non-HT duplicate PPDU]A PPDU transmitted with the TXVECTOR FORMAT parameter equal to NON_HT and the NON_HT_MODULATION parameter equal to NON_HT_DUP_OFDM.

non-high-throughput (non-HT) duplicate physical layer (PHY) protocol data unit (PPDU) in television white spaces (TVWS) band: [non-HT duplicate PPDU in TVWS band] A PPDU transmitted by a Clause 22 PHY with the TXVECTOR parameter FORMAT set to NON_HT and the TXVECTOR parameter CH_BANDWIDTH set to TVHT_W, TVHT_2W, TVHT_4W, TVHT_W+W, or TVHT_2W+2W.

non-high-throughput (non-HT) physical layer (PHY) protocol data unit (PPDU): [non-HT PPDU] A PPDU that is transmitted using a PPDU format defined in Clause 15, Clause 16, Clause 17 or Clause 18.

non-high-throughput (non-HT) signal field (L-SIG) transmit opportunity (TXOP) protection: [non-HT L-SIG TXOP protection] A protection mechanism in which protection is established by the non-HT SIG Length and Rate fields indicating a duration that is longer than the duration of the physical layer (PHY) protocol data unit (PPDU) itself.

non-next generation vehicle-to-everything (V2X) (non-NGV) duplicate: A transmission format of the physical layer (PHY) that duplicates a 10 MHz non-NGV transmission in two adjacent 10 MHz channels and allows a station (STA) communicating outside the context of a basic service set (BSS)(OCB) on either of the 10 MHz channels to receive the transmission.

non-next generation vehicle-to-everything (V2X) (non-NGV) physical layer (PHY) protocol data unit (PPDU): A PPDU with 10 MHz channel width that is transmitted outside the context of a basic service set (BSS) (OCB) in the 5.9 GHz band and that is not a next generation V2X (NGV) PPDU.

non-next generation vehicle-to-everything (V2X) (non-NGV) station (STA): A STA that transmits or receives non-NGV physical layer (PHY) protocol data units (PPDUs) and that is not able to transmit next generation V2X (NGV) PPDUs.

non-orthogonal frequency division multiple access (non-OFDMA) high-efficiency (HE) physical layer (PHY) protocol data unit (PPDU): [non-OFDMA HE PPDU] A 20 MHz HE PPDU with a 242-tone resource unit (RU), a 40 MHz HE PPDU with a 484-tone RU, an 80 MHz HE PPDU with a 996-tone RU, or a 160 MHz or 80+80 MHz HE PPDU with a 2×996-tone RU.

nonpeer mesh power management mode: The activity level identifier of a mesh station (STA) toward nonpeer neighbor mesh STAs. Two nonpeer mesh power management modes are defined: active mode and deep sleep mode.

non-personal basic service set (BSS) control point (non-PCP) station (STA): [non-OFDMA HE PPDU] A STA that is not a personal BSS control point (PCP).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

nonprimary channel: In a 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz basic service set (BSS), any 20 MHz channel other than the primary 20 MHz channel.

non-quality-of-service management frame (non-QMF) access point (AP): [non-QMF AP] An AP that does not implement the quality-of-service management frame (QMF) service.

non-quality-of-service management frame (non-QMF) station (STA): [non-QMF STA] A STA that does not implement the quality-of-service management frame (QMF) service.

non-sensor station (STA): [non-sensor STA] A sub 1 GHz (S1G) non-access point (non-AP) STA transmitting or receiving Data frames not subject to limitation of payload size. A non-sensor STA might not have the power and traffic volume limitation expected for a sensor STA.

non-space-time-block-coding (non-STBC) frame: [non-STBC frame] A frame that is transmitted in a physical layer (PHY) protocol data unit (PPDU) that has the TXVECTOR STBC parameter equal to 0, or a frame that is received in a PPDU that has the RXVECTOR STBC parameter equal to 0.

non-spatial reuse group (non-SRG): An adjective indicating the quality of not being a member of a particular spatial reuse group or the quality of not originating from a station (STA) that is a member of a basic service set (BSS) that is part of a particular spatial reuse group.

non-TB ranging: A ranging measurement procedure that uses NDP, and is not initiated by a Ranging Trigger frame.

non-traffic indication map (non-TIM) mode: [non-TIM mode] A sub 1 GHz (S1G) non-access point (non-AP) station (STA) power save mode in which a non-AP S1G STA need not listen for traffic indication map (TIM) Beacon frames but transmits at least one PS-Poll or trigger frame to the associated access point (AP) every listen interval.

non-traffic indication map (non-TIM) station (STA): [non-TIM STA] A sub 1 GHz (S1G) non-access point (non-AP) STA that has entered the non-TIM mode.

nontransmitted basic service set (BSS) identifier (BSSID): [nontransmitted BSSID] A BSSID corresponding to one of the basic service sets (BSSs) when the multiple BSSID capability is supported that is not transmitted explicitly, but that can be derived from the information encoded in Probe Response, Beacon and directional multi-gigabit (DMG) Beacon frames and neighbor reports.

null data physical layer (PHY) protocol data unit (PPDU): [NDP] A PPDU that carries no Data field.

null data physical layer (PHY) protocol data unit (PPDU) (NDP) 1M: [NDP_1M] An NDP carrying medium access control (MAC) information (CMI) frame that is transmitted using the S1G_1M format.

null data physical layer (PHY) protocol data unit (PPDU) (NDP) 2M: [NDP_1M] An NDP carrying medium access control (MAC) information (CMI) frame that is transmitted using the S1G_SHORT format.

null data physical layer (PHY) protocol data unit (PPDU) (NDP) carrying medium access control information (CMAC) PPDU: [NDP CMAC PPDU] A PPDU with no Data field used by the PHY to provide to the medium access control (MAC) the service of carrying MAC information in the SIGNAL field of the sub 1 GHz (S1G) PPDU.

Null-SAC-HE-LTF: An HE-LTF present in an initiating STA (ISTA) to a responding STA (RSTA) null data PPDU (NDP), or RSTA to ISTA NDP in the ranging frame exchange, resulting from a mismatch of sequence authentication code (SAC) subfield in the STA Info field of a Ranging NDP Announcement frame, or the SAC subfield in the Trigger Dependent User Info field in the Ranging Secure Sounding Trigger frame, with either the value of the Validation SAC subfield in the Secure HE-LTF Parameters element in the last transmitted FTM frame, or the last transmitted LMR frame to the ISTA, or is equal to 0. The TXVECTOR LTF_KEY and LTF_IV parameter corresponding to this LTF are set to generate any secure HE-LTF or null.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

off-channel: A channel used by a station (STA) that does not overlap with the channel(s) used by the BSS of which the STA is a member.

operating class: An E.1 (Country information and operating classes) index into a set of values for radio operation in one or more regulatory domains.

operational modulation and coding scheme (MCS): [operational MCS] An MCS that belongs to the operational MCS set.

operational modulation and coding scheme (MCS) set: [operational MCS set] The set of MCSs that a station (STA) is capable of receiving. The operational MCS set is typically advertised in the physical layer (PHY) capabilities element(s), e.g. HT and VHT Capabilities elements.

operational rate: A rate that belongs to the operational rate set.

operational rate set: The set of data rates that a station (STA) is capable of receiving. The operational rate set is advertised in the Supported Rates and BSS Membership Selectors element and, if present, the Extended Supported Rates and BSS Membership Selectors element.

opportunistic power save (OPS) access point (AP): [OPS AP] A high-efficiency (HE) AP that supports the OPS mechanism.

opportunistic power save (OPS) mechanism: [OPS mechanism] A power save mechanism to allow OPS non–access point (non-AP) stations (STAs) to opportunistically go to doze state or be unavailable for a defined period.

opportunistic power save (OPS) non–access point (non-AP) station (STA): [OPS non-AP STA] A non-AP high-efficiency (HE) STA that supports the OPS mechanism.

opportunistic power save (OPS) period: [OPS period] A period during which an OPS non–access point (non-AP) station (STA) is allowed to go to doze state or be unavailable if it received an indication that it will not be scheduled by its associated OPS access point (AP).

orthogonal frequency division multiple access (OFDMA) high-efficiency (HE) physical layer (PHY) protocol data unit (PPDU): [OFDMA HE PPDU] A 20 MHz HE PPDU with resource units (RUs) smaller than 242-tone, or a 40 MHz HE PPDU with RUs smaller than 484-tone, or an 80 MHz HE PPDU with RUs smaller than 996-tone, or a 160 MHz or 80+80 MHz HE PPDU with RUs smaller than 2×996-tone.

orthogonal frequency division multiplexing (OFDM) physical layer (PHY) protocol data unit (PPDU): [OFDM PPDU] A Clause 17 PPDU.

outside the context of a basic service set (BSS): [OCB] A mode of operation in which a station (STA) is not a member of a BSS and does not utilize IEEE 802.11 authentication, association, or data confidentiality services.

outside the context of a basic service set (OCB) primary channel: A 10 MHz channel that is designated by a higher layer (via medium access control (MAC) sublayer management entity (MLME) primitives and/or management information base (MIB) parameters). The OCB primary channel and OCB secondary channel are contiguous and together form a 20 MHz channel for transmission of 20 MHz next generation vehicle-to-everything (V2X) (NGV) physical layer (PHY) protocol data units (PPDUs).

outside the context of a basic service set (OCB) secondary channel: A 10 MHz channel that is designated by a higher layer (via medium access control (MAC) sublayer management entity (MLME) primitives and/or management information base (MIB) parameters). The OCB secondary channel and the OCB primary channel are contiguous and together form a 20 MHz channel for the transmission of 20 MHz next generation vehicle-to-everything (V2X) (NGV) physical layer (PHY) protocol data units (PPDUs).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

overlapping basic service set (OBSS) packet detect (PD): [OBSS PD] A packet detection level used for the spatial reuse procedure.

paged association identifier (AID): [paged AID] An AID of a sub 1 GHz (S1G) non-access point (non-AP) station (STA) whose corresponding bit value in a transmitted traffic indication map (TIM) encoded in AID with differential encoding (ADE) mode is 1.

pairwise master key (PMK): The key derived from a key generated by an Extensible Authentication Protocol (EAP) method or obtained directly from a preshared key (PSK).

pairwise master key (PMK) R0: [PMK-R0] The key at the first level of the fast basic service set (BSS) transition (FT) key hierarchy.

pairwise master key (PMK) R0 (PMK-R0) name: [PMKR0Name] An identifier that names the PMK-R0.

pairwise master key (PMK) R1: [PMK-R1] A key at the second level of the fast basic service set (BSS) transition (FT) key hierarchy.

pairwise master key (PMK) R1 (PMK-R1) name: [PMKR1Name] An identifier that names a PMK-R1.

pairwise master key security association: [PMKSA] The context resulting from a successful IEEE 802.1X authentication exchange between the peer and Authentication Server (AS) or from a preshared key (PSK).

pairwise transient key (PTK): A concatenation of session keys derived from the pairwise master key (PMK) or from the PMK R1 (PMK-R1), including a temporal key that is used to protect information exchanged in individually addressed frames.

pairwise transient key (PTK) name: [PTKName] An identifier that names the PTK.

pairwise transient key security association (PTKSA): The context resulting from a successful 4-way handshake between a peer and Authenticator or from a successful fast initial link setup (FILS) authentication.

parameterized quality of service (QoS): [parameterized QoS] The treatment of the medium access control (MAC) protocol data units (MPDUs) depends on the parameters associated with the MPDU. Parameterized QoS is primarily provided through the hybrid coordination function (HCF) controlled channel access (HCCA) mechanism, but is also provided by the enhanced distributed channel access (EDCA) mechanism if used with a traffic specification (TSPEC) for admission control.

parameterized spatial reuse reception (PSRR) physical layer (PHY) protocol data unit (PPDU): [PSRR PPDU] A PPDU that contains a Trigger frame that has a value in the UL Spatial Reuse subfield of the Common Info field that is neither PSR_DISALLOW nor PSR_AND_NON_SRG_OBSS_PD_PROHIBITED.

PASN Authentication frame: Authentication frame used in preassociation security negotiation.

Passive Sounding Ranging Trigger frame: A Ranging Trigger frame of Passive Sounding subvariant.

parameterized spatial reuse transmission (PSRT) physical layer (PHY) protocol data unit (PPDU) (PSRT PPDU): [PSRT PPDU] A PPDU that is transmitted during a parameterized spatial reuse (PSR) opportunity by an HE STA when PSR conditions for PSR-based spatial reuse operation are satisfied and that has the SR PPDU subfield of the CAS Control field equal to 1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

payload protected (PP) aggregate medium access control (MAC) service data unit (A-MSDU): [PP AMSDU] A-MSDU that is protected with Counter Mode (CTR) with cipher-block chaining message authentication code (CBC-MAC) protocol (CCMP) or Galois/Counter Mode (GCM) protocol (GCMP) but does not include the A-MSDU Present field (bit 7 of the QoS Control field) in the construction of the additional authentication data (AAD).

peer-specific mesh power management mode: The activity level identifier of a mesh station (STA) set per mesh peering. Three peer-specific mesh power management modes are defined: active mode, light sleep mode, and deep sleep mode.

peer trigger frame: A mesh Data or quality-of-service (QoS) Null frame that initiates a mesh peer service period.

personal basic service set (PBSS): A directional multi-gigabit (DMG) basic service set (BSS) that includes one station (STA) that is in a PBSS control point (PCP), and in which access to a distribution system (DS) is not present.

personal basic service set (PBSS) control point: [PCP] An entity that contains one station (STA) and coordinates access to the wireless medium (WM) by STAs that are members of a PBSS.

personal basic service set (PBSS) control point (PCP) or access point (AP) cluster: [PCP or AP cluster] A single directional multi-gigabit (DMG) synchronization AP or synchronization PCP, plus zero or more neighboring DMG APs or PCPs (or a mixture of both) that join as member APs and PCPs to the synchronization AP or synchronization PCP.

physical layer (PHY) header: [PHY header] The portion of a PHY protocol data unit (PPDU) up to and excluding the first symbol that contains part of the PHY service data unit (PSDU).

physical layer (PHY) protocol data unit (PPDU)[+SigExt]: [PPDU[+SigExt]] A PPDU plus a signal extension that immediately follows the PPDU if the signal extension is present, and a PPDU otherwise.

Poll Ranging Trigger frame: A Ranging Trigger frame of Poll subvariant.

power save (PS) mode: [PS mode] A power management mode in which a nonmesh station (STA) alternates between awake and doze states.)

power save (PS) station (STA): [PS STA] A station that is in power save mode.

preassociation security negotiation (PASN): A mechanism to establish security association and allow management frame protection prior to association.

preassociation security negotiation station (STA): A STA that implements preassociation security negotiation (PASN).

pre-robust security network association (pre-RSNA): The type of association used by a pair of stations (STAs) if the procedure for establishing authentication or association between them did not include the 4-way handshake, was not fast initial link setup (FILS) authentication, and did not use the fast basic service set (BSS) transition (FT) protocol.

pre-robust security network association (pre-RSNA) station (STA): A STA that is not able to create robust security network associations (RSNAs).

primary 1 MHz channel: In a 2 MHz, 4 MHz, 8 MHz, or 16 MHz sub 1 GHz (S1G) basic service set (BSS), the 1 MHz channel that is used to transmit 1 MHz physical layer (PHY) protocol data units (PPDUs).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

primary 2 MHz channel: In a 4 MHz, 8 MHz, or 16 MHz sub 1 GHz (S1G) basic service set (BSS), the 2 MHz channel that is used to transmit 2 MHz physical layer (PHY) protocol data units (PPDUs).

primary 4 MHz channel: In an 8 MHz or 16 MHz sub 1 GHz (S1G) basic service set (BSS), the 4 MHz channel that is used to transmit 4 MHz physical layer (PHY) protocol data units (PPDUs).

primary 8 MHz channel: In a 16 MHz sub 1 GHz (S1G) basic service set (BSS), the 8 MHz channel that is used to transmit 8 MHz physical layer (PHY) protocol data units (PPDUs).

primary 20 MHz channel: In a 20 MHz, 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz basic service set (BSS), the 20 MHz channel that is used to transmit 20 MHz physical layer (PHY) protocol data units (PPDUs).

primary 40 MHz channel: In an 80 MHz, 160 MHz, or 80+80 MHz basic service set (BSS), the 40 MHz channel that is used to transmit 40 MHz physical layer (PHY) protocol data units (PPDUs).

primary 80 MHz channel: In a 160 MHz or 80+80 MHz basic service set (BSS), the 80 MHz channel that is used to transmit 80 MHz physical layer (PHY) protocol data units (PPDUs).

primary access category (AC): [primary AC] The AC that is the AC of the enhanced distributed channel access function (EDCAF) that gains channel access.

NOTE—If an EDCAF gains channel access, and an RDG is granted to another STA, that STA is transmitting under the primary AC.

protected frame: A frame that has been encrypted and/or whose integrity can be verified cryptographically.

protocol version 0 (PV0) medium access control (MAC) protocol data unit (MPDU): [PV0 MPDU] An MPDU that has the Protocol Version field of the Frame Control field of the MPDU header equal to 0.

protocol version 1 (PV1) medium access control (MAC) protocol data unit (MPDU): [PV1 MPDU] An MPDU that has the Protocol Version field of the Frame Control field of the MPDU header equal to 1.

quality-of-service (QoS) frame: [QoS frame] A frame containing the QoS Control field.

quality-of-service (QoS) management frame: [QMF] A Management frame that is transmitted using the QMF service.

quality-of-service (QoS) management frame (QMF) access point (AP): [QMF AP] A quality-of-service AP that implements the QMF service.

quality-of-service (QoS) management frame (QMF) policy: [QMF policy] A policy defining the access category of Management frames. QMF stations (STAs) transmit their Management frames using the access category defined by the policy.

quality-of-service (QoS) management frame (QMF) service: [QMF service] A service in which the enhanced distributed channel access (EDCA) access category with which a Management frame is sent is determined according to a configured policy.

quality-of-service (QoS) management frame (QMF) station (STA): [QMF STA] A quality-of-service STA that implements the QMF service.

quasi-omni antenna pattern: A directional multi-gigabit (DMG) antenna operating mode with the widest beamwidth attainable.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

R0 key holder (R0KH): The component of robust security network association (RSNA) key management of the Authenticator that is authorized to derive and hold the pairwise master key (PMK) R0 (PMK-R0), derive the PMK R1s (PMK-R1s), and distribute the PMK-R1s to the R1 key holders (R1KHs).

R0 key holder identifier (R0KH-ID): An identifier that names the holder of the pairwise master key (PMK) R0 (PMK-R0) in the Authenticator.

R1 key holder (R1KH): The component of robust security network association (RSNA) key management of the Authenticator that receives a pairwise master key (PMK) R1 (PMK-R1) from the R0 key holder (R0KH), holds the PMK-R1, and derives the pairwise transient keys (PTKs).

R1 key holder identifier (R1KH-ID): An identifier that names the holder of a pairwise master key (PMK) R1 (PMK-R1) in the Authenticator.

random access resource unit (RA-RU): A resource unit (RU) allocated in a Trigger frame to support the uplink (UL) orthogonal frequency division multiple access (OFDMA) based random access (UORA) procedure.

receive (RX) sector sweep (SSW): [RXSS] Reception of SSW frames via different sectors, in which a sweep is performed between consecutive receptions.

received signal-to-noise indicator (RSNI): An indication of the signal-to-noise plus interference ratio of a received frame.

Report Ranging Trigger frame: A Ranging Trigger frame of Report subvariant.

reported access point (AP): [reported AP] An AP that is described in an element such as a Neighbor Report element or a Reduced Neighbor Report element.

reporting access point (AP): An AP that is transmitting an element, such as a Neighbor Report element or a Reduced Neighbor Report element, describing a reported AP.

resource information container (RIC): A sequence of elements that include resource request and response parameters.

resource unit (RU): A group of 26, 52, 106, 242, 484, 996, or 2×996 subcarriers as an allocation of subcarriers for transmission.

restricted access window (RAW): A medium access interval for a group of stations (STAs) during which a STA in the RAW group indicated by the RAW parameter set (RPS) element is allowed to contend for access to the medium.

reverse direction (RD) initiator: [RD initiator] A station (STA) that is a transmit opportunity (TXOP) holder that transmits a medium access control (MAC) protocol data unit (MPDU) in which the reverse direction grant/more physical layer protocol data unit (RDG/More PPDU) subfield is equal to 1.

reverse direction (RD) responder: [RD responder] A station (STA) that is not the RD initiator and whose medium access control (MAC) address matches the value of the Address 1 field of a received MAC protocol data unit (MPDU) in which the RDG/More PPDU subfield is equal to 1.

robust action frame: An Action or Action No Ack frame with a category value specified in 9.4.1.11, in Table 9-81 with Yes in the Robust column.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

robust Action No Ack frame: An Action No Ack frame with a category value specified in 9.4.1.11 (Table 9-81) of IEEE Std 802.11 with Yes in the Robust column.

robust management frame: A Management frame that is in the subset of Management frames that are eligible for management frame protection. See 12.2.7.

NOTE—A Beacon frame is eligible for beacon protection, not management frame protection..

robust security network (RSN): A security network that allows only the creation of robust security network associations (RSNAs). An RSN can be identified by the inclusion of the RSN element (RSNE) in Beacon frames.

robust security network association (RSNA): The type of association used by a pair of stations (STAs) if the procedure to establish authentication or association between them includes the 4-way handshake or the fast basic service set (BSS) transition (FT) protocol, or is fast initial link setup (FILS) authentication. Note that existence of an RSNA between two STAs does not of itself provide robust security. Robust security is provided when all STAs in the network use RSNAs.

robust security network association (RSNA) key management: [RSNA key management] Key management that includes the 4-way handshake, the group key handshake, authenticated mesh peering exchange, mesh group key handshake, and the tunneled direct link setup (TDLS) PeerKey (TPK) handshake. If fast basic service set (BSS) transition (FT) is enabled, the FT 4-way handshake and FT authentication sequence are also included. If fast initial link setup (FILS) is enabled, FILS authentication is also included.

S0 key holder (S0KH): The component of robust security network association (RSNA) key management of the Supplicant that derives and holds the pairwise master key (PMK) R0 (PMK-R0), derives the PMK R1s (PMK-R1s), and provides the PMK-R1s to the S1 key holder (S1KH).

S0 key holder identifier (S0KH-ID): An identifier that names the holder of the pairwise master key (PMK) R0 (PMK-R0) in the Supplicant.

S1 key holder (S1KH): The component of robust security network association (RSNA) key management in the Supplicant that receives a pairwise master key (PMK) R1 (PMK-R1) from the S0 key holder (S0KH), holds the PMK-R1, and derives the pairwise transient keys (PTKs).

S1 key holder identifier (S1KH-ID): An identifier that names the holder of the pairwise master key (PMK) R1 (PMK-R1) in the Supplicant.

scheduled service period (SP): An SP that is scheduled by a quality-of-service (QoS) access point (AP) or a personal basic service set (PBSS) control point (PCP).

secondary 1 MHz channel: In a 2 MHz sub 1 GHz (S1G) basic service set (BSS), the 1 MHz channel adjacent to the primary 1 MHz channel that with the primary 1 MHz channel forms the 2 MHz channel of the 2 MHz S1G BSS. In a 4 MHz, 8 MHz, and 16 MHz S1G BSS, the 1 MHz channel adjacent to the primary 1 MHz channel that together form the primary 2 MHz channel of the S1G BSS.

secondary 2 MHz channel: In a 4 MHz sub 1 GHz (S1G) basic service set (BSS), the 2 MHz channel adjacent to the primary 2 MHz channel that with the primary 2 MHz channel forms the 4 MHz channel of the 4 MHz S1G BSS. In an 8 MHz and 16 MHz S1G BSS, the 2 MHz channel adjacent to the primary 2 MHz channel that together form the primary 4 MHz channel of the S1G BSS.

secondary 4 MHz channel: In an 8 MHz sub 1 GHz (S1G) basic service set (BSS), the 4 MHz channel adjacent to the primary 4 MHz channel that with the primary 4 MHz channel forms the 8 MHz channel of the 8 MHz S1G BSS. In a 16 MHz S1G BSS, the 4 MHz channel adjacent to the primary 4 MHz channel that together form the primary 8 MHz channel.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

secondary 8 MHz channel: In a 16 MHz sub 1 GHz (S1G) basic service set (BSS), the 8 MHz channel adjacent to the primary 8 MHz channel that with the primary 8 MHz channel forms the 16 MHz channel of the 16 MHz S1G BSS.

secondary 20 MHz channel: In a 40 MHz very high throughput (VHT) basic service set (BSS), the 20 MHz channel adjacent to the primary 20 MHz channel that together form the 40 MHz channel of the 40 MHz VHT BSS. In an 80 MHz VHT BSS, the 20 MHz channel adjacent to the primary 20 MHz channel that together form the primary 40 MHz channel of the 80 MHz VHT BSS. In a 160 MHz or 80+80 MHz VHT BSS, the 20 MHz channel adjacent to the primary 20 MHz channel that together form the primary 40 MHz channel of the 160 MHz or 80+80 MHz VHT BSS. In a VHT BSS, the secondary 20 MHz channel is also the secondary channel.

secondary 40 MHz channel: In an 80 MHz very high throughput (VHT) basic service set (BSS), the 40 MHz channel adjacent to the primary 40 MHz channel that together form the 80 MHz channel of the 80 MHz VHT BSS. In a 160 MHz or 80+80 MHz VHT BSS, the 40 MHz channel adjacent to the primary 40 MHz channel that together form the primary 80 MHz channel.

secondary 80 MHz channel: In a 160 MHz or 80+80 MHz very high throughput (VHT) basic service set (BSS), the 80 MHz channel not including the primary 20 MHz channel, that together with the primary 80 MHz channel form the 160 MHz or 80+80 MHz channel of the 160 MHz or 80+80 MHz VHT BSS.

secondary access category (AC): [secondary AC] An AC that is not associated with the enhanced distributed channel access function (EDCAF) that gains channel access.

NOTE—Traffic associated with a secondary AC can be included in a multi-user (MU) physical layer (PHY) protocol data unit (MU PPDU) that includes traffic associated with the primary AC. There could be multiple secondary ACs at a given time.

secondary channel: A channel associated with a primary channel used to create a channel wider than the primary channel. In a 40 MHz, 80 MHz, 160 MHz or 80+80 MHz basic service set (BSS) the secondary channel is a secondary 20 MHz channel. A 2.16 GHz channel associated with a primary channel used by enhanced directional multi-gigabit (EDMG) STAs for the purpose of creating a 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, or 4.32+4.32 GHz channel.

secondary1 channel: A 2.16 GHz channel associated with a primary channel and a secondary channel used by enhanced directional multi-gigabit (EDMG) stations (STAs) for the purpose of creating a 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, or 4.32+4.32 GHz channel.

secondary2 channel: A 2.16 GHz channel associated with a primary channel, a secondary channel, and a secondary1 channel used by enhanced directional multi-gigabit (EDMG) stations (STAs) for the purpose of creating an 8.64 GHz channel, 2.16+2.16 GHz, or 4.32+4.32 GHz channel.

NOTE—For the assignment and relationship of EDMG primary, secondary, secondary1, and secondary2 channels, refer to Table 8-6 and Table 8-6.

sector: A transmit or receive antenna pattern corresponding to a sector identifier (ID).

Secure Sounding Ranging Trigger frame: A Ranging Trigger frame of Secure Sounding subvariant.

security network: A basic service set (BSS) in which the station (STA) starting the BSS provides information about the security capabilities and configuration of the BSS by including the robust security network element (RSNE) in Beacon frames.

sensor station (STA): [sensor STA] A sub 1 GHz (S1G) non-access point (non-AP) STA that has certain traffic and device characteristics (e.g., limited payload size, limited traffic volume, battery operated device) and is allowed to associate with an access point (AP) that transmits an S1G Beacon, a Probe Response, or a PV1 Probe Response frame containing the S1G Capabilities element with the STA Type Support subfield indicating a sensor basic service set (BSS) or a mixed BSS.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

service information client: [SIC] A logical entity that initiates station (STA) service discovery.

service information registry (SIR): Logical entity that contains caches of information about services that are available via the basic service set (BSS).

service interval (SI): The interval between the starts of two successive scheduled service periods (SPs).

service period (SP): A period of time during which one or more downlink individually addressed frames are transmitted to a quality-of-service (QoS) station (STA) and/or one or more transmission opportunities (TXOPs) are granted to the same STA. SPs are either scheduled or unscheduled.

NOTE—A non–access point (non-AP) STA can have at most one nongroupcast with retries SP (non-GCR-SP) active at any time.

session key: A key that is generated for a single session, to be used, e.g., for encryption and integrity protection, such as a temporal key (TK), group temporal key (GTK), key encryption key (KEK) or key confirmation key (KCK).

NOTE—A session key is not necessarily a temporal key.

shared bands: Radio frequency bands in which dissimilar services are permitted.

short beacon interval: The interval between the consecutive target short beacon transmission times (TSBTTs) of beacons containing a minimal set of elements.

short sector sweep (SSW) physical layer (PHY) protocol data unit (PPDU): [Short SSW PPDU] A directional multi-gigabit (DMG) control mode physical layer (PHY) protocol data unit (PPDU) that has the Length field in the PHY header equal to 6 and the PPDU Type subfield within the Short SSW Payload field equal to 0.

signaling and payload protected (SPP) aggregate medium access control (MAC) service data unit (A-MSDU): [SSP A-MSDU] An A-MSDU that is protected with Counter Mode (CTR) with cipher-block chaining message authentication code (CBC-MAC) protocol (CCMP) or Galois/Counter Mode (GCM) protocol (GCMP) and that includes the A-MSDU Present field (bit 7 of the QoS Control field) in the construction of the additional authentication data (AAD).

single input, single output (SISO) identifier (ID) subset: [SISO ID subset] A tuple comprising the values of the AWV feedback ID, TX antenna ID, RX antenna ID and BRP CDOWN subfields.

single medium access control (MAC) protocol data unit (S-MPDU): [S-MPDU] An MPDU that is the only MPDU in an aggregate MPDU (A-MPDU) and that is carried in an A-MPDU subframe with the EOF/ Tag subfield of the MPDU delimiter field equal to 1.

sounding physical layer (PHY) protocol data unit (PPDU): [sounding PPDU] A PPDU that is intended by the transmitting station (STA) to enable the receiving STA to estimate the channel between the transmitting STA and the receiving STA. The Not Sounding field in the high throughput SIGNAL field (HT-SIG) is equal to 0 in sounding PPDUs.

Sounding Ranging Trigger frame: A Ranging Trigger frame of Sounding subvariant.

source directional multi-gigabit (DMG) station (STA): [source DMG STA] A DMG STA that is expected to transmit during a time division duplex (TDD) slot, or a DMG STA identified by the source association identifier (AID) field contained in a Grant frame or Extended Schedule element that caused the allocation of a service period (SP) or contention based access period (CBAP).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

space-time block coding (STBC) beacon: [STBC beacon] A beacon that is transmitted using the basic STBC modulation and coding scheme (MCS) to enable discovery of the basic service set (BSS) by high throughput (HT) stations (STAs) that support the HT STBC feature in order to extend the range of the BSS.

space-time block coding (STBC) delivery traffic indication map (DTIM) beacon: [STBC DTIM beacon] An STBC beacon transmission that is a DTIM beacon.

space-time block coding (STBC) frame: [STBC frame] A frame that is transmitted in a physical layer (PHY) protocol data unit (PPDU) that has a nonzero value of the TXVECTOR STBC parameter, or a frame that is received in a PPDU that has a nonzero value of the RXVECTOR STBC parameter.

spatial multiplexing (SM) power save: [STBC frame] A mode of operation that allows a station (STA) to listen using one radio frequency (RF) chain, then switch on additional RF chains for subsequent single-user multiple input, multiple output (SU-MIMO) operation.

spatial reuse (SR): The transmission of a physical layer (PHY) protocol data unit (PPDU) on the medium under certain conditions when a PPDU has been detected that would otherwise have prevented the transmission.

spatial reuse group (SRG): A group of basic service sets (BSSs) identified by their BSS colors or partial basic service set identifiers (BSSIDs) for overlapping basic service set packet detect (OBSS PD) based spatial reuse operation with SRG OBSS PD level.

spatial sharing (SPSH): Use of a frequency channel by multiple stations (STAs) that are located in the same vicinity, and whose directional transmissions might overlap in time.

staggered preamble: A physical layer (PHY) preamble in a sounding PHY protocol data unit (PPDU) that is not a null data PPDU (NDP) and that includes one or more Data Long Training fields (DLTFs) and one or more Extension Long Training fields (ELTFs).

staggered sounding: The use of a sounding physical layer (PHY) protocol data unit (PPDU) that is not a null data PPDU (NDP) and that includes one or more Data Long Training fields (DLTFs) and one or more Extension Long Training fields (ELTFs).

station (STA) 2G4: [STA 2G4] A STA that is operating on a channel that belongs to any operating class that has a value of 25 or 40 for the entry in the Channel spacing column and that has a value of 2.407 or 2.414 for the entry in the Channel starting frequency column of any of the tables found in E.1.

station (STA) 5G: [STA 5G] A STA that is operating on a channel that belongs to any operating class that has a value of 20 or 40 for the entry in the Channel spacing column and that has a value of 5 for the entry in the Channel starting frequency column of any of the tables found in E.1.

station (STA) 6G: [STA 6G] A STA that is operating on a channel that belongs to any operating class that has a value of 5.925 or 5.950 for the entry in the Channel starting frequency column of Table E-4.

sub 1 GHz (S1G) band: [S1G band] Frequency band for which an S1G operating class is defined in Annex E.

sub 1 GHz 1M (S1G_1M) physical layer (PHY) protocol data unit (PPDU): [S1G_1M PPDU] A 1 MHz PPDU or 1 MHz duplicate PPDU that is transmitted with S1G_1M preamble.

sub 1 GHz long (S1G_LONG) physical layer (PHY) protocol data unit (PPDU): [S1G_LONG PPDU] A Clause 23 PPDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

sub 1 GHz modulation and coding scheme (S1G-MCS): [S1G-MCS] A specification of the S1G physical layer (PHY) parameters that consists of modulation order (e.g., BPSK, QPSK, 16-QAM, 64-QAM, 256-QAM, 1024-QAM) and forward error correction (FEC) coding rate (e.g., 1/2 rep2, 1/2, 2/3, 3/4, 5/6) that is used in an S1G PHY protocol data unit (PPDU).

sub 1 GHz (S1G) physical layer (PHY) protocol data unit (PPDU): [S1G PPDU] A PPDU transmitted with the TXVECTOR parameter FORMAT equal to S1G, S1G_DUP_1M, or S1G_DUP_2M. The PPDU is transmitted with the S1G_SHORT, S1G_LONG, or S1G_1M preamble.

sub 1 GHz short (S1G_SHORT) physical layer (PHY) protocol data unit (PPDU): [S1G_SHORT PPDU] A 2 MHz, 4 MHz, 8 MHz, 16 MHz, or 2 MHz duplicate PPDU with short preamble format.

subchannel selective transmission (SST) channel: [SST channel] A channel that is permitted for the subchannel selective transmission indicated by either an SST element or an RPS element.

subscription service provider (SSP) roaming: [SSP roaming] The use by a station (STA) of an SSP's IEEE 802.11 infrastructure, with which the terminal has no direct agreement, based on a subscription and formal agreement with the STA's own SSP.

successful transmission: A transmission and the reception of its expected immediate response or a transmission for which no immediate response is expected.

sweep: A sequence of transmissions, separated by a short beamforming interframe space (SBIFS), in which the antenna configuration at the transmitter or receiver is changed between transmissions.

synchronization access point (AP): [S-AP] An AP that provides synchronization and other services to an AP cluster or personal basic service set (PBSS) control point (PCP).

synchronization personal basic service set (PBSS) control point (PCP): [S-PCP] A PCP that provides synchronization and other services to an access point (AP) cluster or PCP cluster.

synchronizing access point (AP) or personal basic service set (PBSS) control point (PCP): [synchronizing AP or PCP] A China directional multi-gigabit (CDMG) AP or PCP that is operating on a 1.08 GHz channel but still transmitting its DMG Beacon frames on the relevant 2.16 GHz channel with the AP or PCP Role subfield of the Dynamic Bandwidth Control element (9.4.2.219) set to 0 and providing synchronization service to a synchronized AP or PCP on the relevant 2.16 GHz channel.

synchronized access point (AP) or personal basic service set (PBSS) control point (PCP): [synchronized AP or PCP] A China directional multi-gigabit (CDMG) AP or PCP that is operating on a 1.08 GHz channel but still transmitting its DMG Beacon frames on the relevant 2.16 GHz channel with the AP or PCP Role subfield of the Dynamic Bandwidth Control element [9.4.2.219 (Dynamic Bandwidth Control element)] set to 1 and synchronizing with the synchronizing AP or PCP on the relevant 2.16 GHz channel.

synthetic receiver address (SYNRA): A constructed group address used by a general link (GLK) access point (AP) as a receiver address to forward frames to a subset of GLK non-AP stations (STAs), as required by IEEE 802.1Q bridges.

tagged media access control (MAC) protocol data unit (MPDU): [tagged MPDU] An MPDU carried in an aggregate MPDU (A-MPDU) subframe that has the EOF/Tag field in the MPDU delimiter set to 1.

target beacon transmission time (TBTT) scheduled station (STA): [TBTT scheduled STA] A non-access point (non-AP) STA that has negotiated the TBTT of the first Beacon frame and the wake interval between subsequent Beacon frames that it intends to receive.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

target beacon transmission time (TBTT) scheduling access point (AP): [TBTT scheduling AP] An AP that has negotiated with a non-AP station (STA) the TBTT of the first Beacon frame and the wake interval between subsequent Beacon frames that the non-AP STA intends to receive.

target wake time (TWT) requester: [TWT requester] A station (STA) that has had a requested TWT agreement accepted by another STA and that receives TWT service period (SP) start times from that STA.

target wake time (TWT) responder: [TWT responder] A station (STA) that has accepted a TWT agreement that was requested by another STA and that assigns TWT service period (SP) start times to the requesting STA.

target wake time (TWT) scheduled station (STA): [TWT scheduled STA] A STA that follows the broadcast TWT schedules provided in a broadcast TWT element.

target wake time (TWT) scheduling access point (AP): [TWT scheduling AP] An AP that schedules broadcast TWTs and provides these broadcast TWT schedules in a broadcast TWT element.

target wake time (TWT) service period (SP): [TWT SP] A period of time during which a TWT station (STA) is expected to be awake to transmit and/or receive frames.

target wake time (TWT) service period (SP) start time: [TWT SP start time] The value of the timing synchronization function (TSF) at the beginning of a TWT SP.

television very high throughput 2W (TVHT_2W): Two contiguous basic channel units (BCUs) in television white spaces (TVWS).

television very high throughput 2W+2W (TVHT_2W+2W): Two noncontiguous frequency segments, each of which comprises two contiguous basic channel units (BCUs) in television white spaces (TVWS).

television very high throughput 4W (TVHT_4W): Four contiguous basic channel units (BCUs) in television white spaces (TVWS).

television very high throughput (TVHT) basic service set (BSS): [TVHT BSS] A set of stations (STAs) that consists of a geolocation database dependent (GDD) enabling STA operating in television white spaces (TVWS) and one or more of its GDD STAs.

television very high throughput W (TVHT_W): One basic channel unit in television white spaces (TVWS).

television very high throughput W+W (TVHT_W+W): Two noncontiguous basic channel units (BCUs) in television white spaces (TVWS).

temporal encryption key: A group temporal key (GTK) or the portion of a pairwise transient key (PTK) used directly or indirectly to encrypt data in medium access control (MAC) protocol data units (MPDUs).

temporal key (TK): Temporal key integrity protocol (TKIP) only: The combination of temporal encryption key and a message integrity code (MIC) key. Non-TKIP only: A temporal encryption key.When abbreviated this is, unless explicitly shown otherwise, specifically the key used to protect individually addressed frames, as distinct from e.g., the TK that is the group temporal key (GTK).

NOTE—A temporal key is a session key.

time division duplex (TDD) service period (SP): [TDD SP] An SP that uses the TDD channel access within the SP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—TDD channel access is defined in 10.38.6.2.2.

time priority management frame: A Management frame that is transmitted outside of the normal MAC queuing process. See 10.2.3.1.

traffic indication map (TIM) broadcast: [TIM broadcast] A service that enables a non–access point (non-AP) station (STA) to request periodic transmission of a TIM frame by the AP. TIM frames have shorter duration than Beacon frames and can be transmitted at a higher physical layer (PHY) rate, which allows the STA to save additional power while periodically checking for buffered traffic in standby mode, relative to the power consumed if the station (STA) were to periodically transition to awake state to receive a Beacon frame.

traffic stream identifier (TSID): Any of the identifiers usable by higher layer entities to distinguish medium access control (MAC) service data units (MSDUs) to MAC entities for parameterized quality of service (QoS) [i.e., the traffic stream (TS) with a particular traffic specification (TSPEC)] within the MAC data service. The TSID is assigned to an MSDU in the layers above the MAC.

transmission opportunity (TXOP) holder: [TXOP holder] A quality-of-service (QoS) station (STA) that has either been granted a TXOP by the hybrid coordinator (HC) or successfully contended for a TXOP.

transmission opportunity (TXOP) responder: A station (STA) that transmits a frame in response to a frame received from a TXOP holder during a frame exchange sequence, but that does not acquire a TXOP in the process.

transmit (TX) power: [TX power] The effective isotropic radiated power (EIRP) when referring to the operation of an orthogonal frequency division multiplexing (OFDM) physical layer (PHY) in a country where so regulated.

transmit (TX) sector sweep (SSW): [TXSS] Transmission of SSW or DMG Beacon frames via different sectors, in which a sweep is performed between consecutive transmissions.

transmit (TX) sector sweep (TXSS) contention based access period (CBAP): [TXSS CBAP] A CBAP that is available to all stations (STAs) in an extended centralized personal basic service set (PBSS) control point (PCP) or access point (AP) cluster outside which TXSSs in the data transfer interval (DTI) can be prohibited.

transmitted basic service set identifier (BSSID): [transmitted BSSID] The BSSID included in the medium access control (MAC) header Address 2 field of a Beacon frame when the multiple BSSID capability is supported.

transmitter identifier (ID): [transmitter ID] An identifier that identifies a wake-up radio (WUR) access point (AP) and used in broadcast WUR frames that are addressed to all WUR non-AP stations (STAs) associated with the WUR AP when multiple BSSID operation is not supported or that are addressed to all WUR non-AP STAs associated with the transmitted basic service set identifier (BSSID) of a multiple BSSID set when multiple BSSID operation is supported or that are addressed to all WUR non-AP STAs that intend to discover or synchronize with the WUR AP.

trigger-enabled access category (AC): A quality-of-service (QoS) station (STA) AC where frames of subtype QoS Data and QoS Null from the STA that map to the AC trigger an unscheduled service period (SP) if one is not in progress.

trigger frame: A frame type or a frame transmission intended to solicit the peer entity into a responding action.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

triggered uplink access (TUA): A mechanism by which one or more non–access point (non-AP) stations (STAs) simultaneously participate in an uplink (UL) transmission to an access point (AP) using resource units (RUs) allocated in the preceding Trigger frame.

triggering frame: A Trigger frame or a frame carrying a TRS Control subfield.

triggering physical layer (PHY) protocol data unit (PPDU): [triggering PPDU] A PPDU carrying a triggering frame.

tunneled direct link setup (TDLS): A protocol that uses a specific EtherType encapsulation to tunnel frames through an access point (AP) to establish a TDLS direct link.

tunneled direct link setup (TDLS) direct link: [TDLS direct link] Direct link between two non–access point (non-AP) stations (STAs) that has been established using the TDLS protocol.

tunneled direct link setup (TDLS) frame: [TDLS frame] A Data frame carrying all or part of the encapsulation of a TDLS Action field in an MSDU with EtherType 89-0d.

tunneled direct link setup (TDLS) initiator station (STA): [TDLS initiator STA] A STA that transmits a TDLS Setup Request frame or a TDLS Discovery Request frame.

tunneled direct link setup (TDLS) peer power save mode (PSM): [TDLS peer PSM] A PSM that is based on periodically scheduled service periods (SPs), which can be used between two stations (STAs) that have set up a TDLS direct link.

tunneled direct link setup (TDLS) peer power save mode (PSM) initiator: [TDLS peer PSM initiator] A station (STA) that transmits a TDLS Peer PSM Request frame.

tunneled direct link setup (TDLS) peer power save mode (PSM) responder: [TDLS peer PSM responder] A station (STA) that transmits a TDLS Peer PSM Response frame.

tunneled direct link setup (TDLS) peer station (STA): [TDLS peer STA] A STA with which another STA has, or is in the process of establishing, a TDLS direct link.

tunneled direct link setup (TDLS) peer unscheduled automatic power save delivery (U-APSD): [TDLS peer U-APSD, TPU] A power save mode based on unscheduled service periods that can be used between two stations (STAs) that have set up a TDLS direct link.

tunneled direct link setup (TDLS) peer unscheduled automatic power save delivery (U-APSD) [TDLS peer U-APSD (TPU)] buffer station (STA): [TPU buffer STA] A TDLS peer STA that buffers traffic for a TPU sleep STA.

tunneled direct link setup (TDLS) peer unscheduled automatic power save delivery (U-APSD) [TDLS peer U-APSD (TPU)] sleep station (STA): [TPU sleep STA] A TDLS STA that entered power save mode on a TDLS direct link and that is using TPU for the delivery of buffered traffic.

tunneled direct link setup (TDLS) power save mode (PSM): [TDLS PSM] TDLS peer PSM or peer unscheduled automatic power save delivery (U-APSD).

tunneled direct link setup (TDLS) responder station (STA): [TDLS responder STA] A STA that receives or is the intended recipient of a TDLS Setup Request frame or TDLS Discovery Request frame.

TVHT_2W mask physical layer (PHY) protocol data unit (PPDU): [TVHT_2W mask PPDU] One of the following PPDUs in Clause 22 transmitted using the TVHT_2W transmit spectral mask defined in 22.3.17.1:

a) A TVHT_2W very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_2W and TXVECTOR parameter FORMAT set to VHT).

b) A TVHT_2W non-high-throughput (non-HT) PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_2W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM).

c) A TVHT_W VHT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W and TXVECTOR parameter FORMAT set to VHT).

d) A TVHT_W non-HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM).

TVHT_2W+2W mask physical layer (PHY) protocol data unit (PPDU): [TVHT_2W+2W mask PPDU] One of the following PPDUs in Clause 22 transmitted using the TVHT_2W+2W transmit spectral mask defined in 22.3.17.1:

a) A TVHT_2W+2W very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_2W+2W and TXVECTOR parameter FORMAT set to VHT).

b) A TVHT_2W+2W non-high-throughput (non-HT) PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_2W+2W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM).

c) A TVHT_2W VHT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_2W and TXVECTOR parameter FORMAT set to VHT).

d) A TVHT_2W non-HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_2W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM).

e) A TVHT_W VHT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W and TXVECTOR parameter FORMAT set to VHT).

f) A TVHT_W non-HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM).

TVHT_4W mask physical layer (PHY) protocol data unit (PPDU): [TVHT_4W mask PPDU] One of the following PPDUs in Clause 22 transmitted using the TVHT_4W transmit spectral mask defined in 22.3.17.1:

a) A TVHT_4W very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_4W and TXVECTOR parameter FORMAT set to VHT).

b) A TVHT_4W non-high-throughput (non-HT) PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_4W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM).

c) A TVHT_2W VHT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_2W and TXVECTOR parameter FORMAT set to VHT).

d) A TVHT_2W non-HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_2W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM).

e) A TVHT_W VHT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W and TXVECTOR parameter FORMAT set to VHT).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

f) A TVHT_W non-HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM).

TVHT_MODE_1 physical layer (PHY) protocol data unit (PPDU): [TVHT_MODE_1 PPDU] One of the following PPDUs: A Clause 22 TVHT_W Very High Throughput (VHT) PPDU or TVHT_W non-high-throughput (non-HT) PPDU.

TVHT_MODE_2C physical layer (PHY) protocol data unit (PPDU): [TVHT_MODE_2C PPDU] One of the following PPDUs: A Clause 22 TVHT_2W Very High Throughput (VHT) PPDU or TVHT_2W non-high-throughput (non-HT) PPDU.

TVHT_MODE_2N physical layer (PHY) protocol data unit (PPDU): [TVHT_MODE_2N PPDU] One of the following PPDUs: A Clause 22 TVHT_W+W Very High Throughput (VHT) PPDU or TVHT_W+W non-high-throughput (non-HT) PPDU.

TVHT_MODE_4C physical layer (PHY) protocol data unit (PPDU): [TVHT_MODE_4C PPDU] One of the following PPDUs: A Clause 22 TVHT_4W Very High Throughput (VHT) PPDU or TVHT_4W non-high-throughput (non-HT) PPDU.

TVHT_MODE_4N physical layer (PHY) protocol data unit (PPDU): [TVHT_MODE_4N PPDU] One of the following PPDUs: A Clause 22 TVHT_2W+2W Very High Throughput (VHT) PPDU or TVHT_2W+2W non-high-throughput (non-HT) PPDU.

TVHT_W mask physical layer (PHY) protocol data unit (PPDU): [TVHT_W mask PPDU] One of the following PPDUs in Clause 22 transmitted using the TVHT_W transmit spectral mask defined in 22.3.17.1:

a) A TVHT_W very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W and TXVECTOR parameter FORMAT set to VHT).

b) A TVHT_W non-high-throughput (non-HT) PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM).

TVHT_W+W mask physical layer (PHY) protocol data unit (PPDU): [TVHT_W+W mask PPDU] One of the following PPDUs in Clause 22 transmitted using the TVHT_W+W transmit spectral mask defined in 22.3.17.1:

a) A TVHT_W+W very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W+W and TXVECTOR parameter FORMAT set to VHT).

b) A TVHT_W+W non-high-throughput (non-HT) PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W+W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM).

c) A TVHT_W VHT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W and TXVECTOR parameter FORMAT set to VHT) .

d) A TVHT_W non-HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM).

unassociated range negotiation and measurement management frame protection required (URNM-MFPR): A security policy that specifies whether ranging frames are required to be protected without association.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

unassociated range negotiation and measurement management frame protection required exempt 20 MHz (URNM-MFPR-X20): A security policy that specifies whether ranging frames are required to be protected without association if bandwidth greater than 20 MHz is used.

unscheduled service period (SP): [unscheduled SP] The period that is started when a quality-of-service (QoS) station (STA) transmits a trigger frame to the QoS access point (AP).

untagged medium access control (MAC) protocol data unit (MPDU): [untagged MPDU] An MPDU carried in an aggregate MPDU (A-MPDU) subframe that has the EOF/Tag field in the MPDU delimiter set to 0.

uplink (UL): A unidirectional link from a non-access point (non-AP) station (STA) to an access point (AP) or a unidirectional link from a non-AP source directional multi-gigabit (DMG) STA to a non-AP destination DMG STA.

uplink (UL) high-efficiency (HE) multi-user (MU) physical layer (PHY) protocol data unit (PPDU): [UL HE MU PPDU] An HE MU PPDU transmitted by a non–access point (non-AP) station (STA) intended for an AP. This PPDU carries a single PHY service data unit (PSDU).

NOTE—The UL HE MU PPDU has an HE-SIG-B field that contains additional information (e.g., the identifier of the transmitter) that can be used by the recipient of the UL HE MU PPDU to determine the transmitter of the PPDU even in cases where the Data field of the PPDU is not received. For example, this allows the originator of persistently failing PPDUs to be identified.

uplink (UL) orthogonal frequency division multiple access (OFDMA)-based random access: [UORA] A random access mechanism for non–access point (non-AP) high-efficiency (HE) stations (STAs) to participate in uplink OFDMA transmissions in one or more designated random access resource units (RUs).

upstream network: An integrated local area network (LAN) to which an access point (AP) is connected through a portal.

very high throughput (VHT) basic service set (BSS): [VHT BSS] A BSS in which a Beacon frame transmitted by a VHT station (STA) includes the VHT Operation element.

very high throughput (VHT) beamformee: [VHT beamformee] A VHT station (STA) that receives a VHT physical layer (PHY) protocol data unit (PPDU) that was transmitted using a beamforming steering matrix and that supports the VHT transmit beamforming feedback mechanism.

very high throughput (VHT) beamformer: [VHT beamformer] A VHT station (STA) that transmits a VHT physical layer (PHY) protocol data unit (PPDU) using a beamforming steering matrix.

very high throughput (VHT) modulation and coding scheme: [VHT-MCS] A specification of the VHT physical layer (PHY) parameters that consists of modulation order (e.g., BPSK, QPSK, 16-QAM, 64-QAM, 256-QAM) and forward error correction (FEC) coding rate (e.g., 1/2, 2/3, 3/4, 5/6) and that is used in a VHT PHY protocol data unit (PPDU).

very high throughput (VHT) multi-user (MU) physical layer (PHY) protocol data unit (PPDU): [VHTMU PPDU] A VHT PPDU that is capable of carrying up to four PHY service data units (PSDUs) for up to four users and is transmitted using the downlink multi-user multiple input, multiple output (DL MU-MIMO) technique.

very high throughput (VHT) physical layer (PHY) protocol data unit (PPDU): [VHT PPDU] A Clause 21 PPDU that is not a Clause 17 or Clause 19 PPDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

very high throughput (VHT) single-user-only (SU-only) beamformee: [VHT SU-only beamformee] A VHT beamformee that does not receive VHT multi-user (MU) physical layer (PHY) protocol data units (PPDUs).

very high throughput (VHT) single-user-only (SU-only) beamformer: [VHT SU-only beamformee] A VHT beamformer that does not transmit VHT multi-user (MU) physical layer (PHY) protocol data units (PPDUs).

very high throughput (VHT) single-user (SU) physical layer (PHY) protocol data unit (PPDU): [VHT SU PPDU] A VHT PPDU that carries one PHY service data unit (PSDU) for one user and is not transmitted using the downlink multi-user multiple input, multiple output (DL MU-MIMO) technique.

wake-up radio (WUR) 80 MHz channel: [VHT SU PPDU] The 80 MHz channel that is used to transmit 80 MHz WUR Frequency Division Multiple Access (FDMA) physical layer (PHY) protocol data units (PPDUs).

wake-up radio (WUR) basic physical layer (PHY) protocol data unit (PPDU): [WUR basic PPDU] A PPDU transmitted with the TXVECTOR parameter FORMAT equal to WUR_BASIC and TXVECTOR parameter CH_BANDWIDTH equal to WUR_CBW_20.

wake-up radio (WUR) channel: [WUR channel] A channel in which a WUR access point (AP) transmits WUR Short Wake-up frames, WUR Wake-up frames, and WUR Vendor Specific frames.

wake-up radio (WUR) discovery channel: [WUR discovery channel] The channel used by a WUR access point (AP) to transmit WUR Discovery frames.

wake-up radio (WUR) duty cycle period: [WUR duty cycle period] The interval between the starting time of two successive WUR duty cycle service periods.

wake-up radio (WUR) duty cycle service period (SP): [WUR duty cycle service period] A period of time of an established WUR duty cycle operation between a WUR access point (AP) and a WUR non-AP station (STA) during which one or more WUR frames can be transmitted to the WUR non-AP STA from the WUR AP.

wake-up radio (WUR) frequency division multiple access (FDMA) physical layer (PHY) protocol data unit (PPDU): [WUR FDMA PPDU] A PPDU transmitted with the TXVECTOR parameter FORMAT equal to WUR_FDMA and TXVECTOR parameter CH_BANDWIDTH equal to WUR_CBW_40 or WUR_CBW_80 or WUR_CBW_PUNC80-PRI or WUR_CBW_PUNC80-SEC or WUR_CBW_PUNC80-PRI-SEC-1 or WUR_CBW_PUNC80-PRI-SEC-2.

wake-up radio (WUR) integrity group temporal key: [WIGTK] A random value, assigned by a WUR access point (AP) that is used to protect broadcast and group addressed WUR frames from that AP.

wake-up radio (WUR) mode: [WUR mode] A negotiation status between a WUR access point (AP) and a WUR non-AP station (STA) in which the WUR power state of the WUR non-AP STA in power save mode alternates between the WUR awake state and the WUR doze state or stays in the WUR awake state based on the negotiated WUR parameters.

wake-up radio (WUR) primary 40 MHz channel: [WUR primary 40 MHz channel] The 40 MHz channel that is used to transmit 40 MHz WUR Frequency Division Multiple Access (FDMA) physical layer (PHY) protocol data units (PPDUs).

wake-up radio (WUR) primary channel: [WUR primary channel] The channel used by a WUR access point (AP) to transmit WUR Beacon frames.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

wake-up radio (WUR) scanning: [WUR scanning] The process of scanning WUR discovery channels for WUR Discovery frames.

wake-up radio (WUR) secondary 40 MHz channel: [WUR secondary 40 MHz channel] 40 MHz channel adjacent to the WUR primary 40 MHz channel that together form the WUR 80 MHz channel.

wake-up radio (WUR) secondary channel: [WUR secondary channel] The 20 MHz channel adjacent to the WUR primary channel that together form the WUR primary 40 MHz channel.

wake-up radio (WUR) temporal key: [WTK] A temporal key used to protect individually addressed WUR Wake-up frames.

white space map (WSM): Information on identified available frequencies that is obtained from a geolocation database (GDB) and that is used by IEEE 802.11 stations (STAs).

wireless network management (WNM) sleep mode: [WNM sleep mode] An extended power save mode for non–access point (non-AP) stations (STAs) whereby a non-AP STA need not listen for every delivery traffic indication map (DTIM) beacon and does not perform group temporal key/integrity group temporal key/beacon integrity group temporal key (GTK/IGTK/BIGTK) updates.

3.3 Definitions specific to IEEE 802.11 operation in some regulatory domains

ISO 3166-1 defines the international two-letter designation for country names, and these designations are included [in square brackets] at the end of each definition that has clear attribution to a regulatory domain. US is to be understood as also including the United States' territories, and EU is to be understood as including all CEPT member states.

contact verification signal (CVS): A signal sent by a geolocation database dependent (GDD) enabling station (STA) to validate the list of available frequencies and to verify that the receiving GDD STA is within reception range of the master white space device (WSD) [US].

personal/portable station (STA): A STA that uses network communications at unspecified locations [US].

television band device (TVBD): An intentional radiator that operates on an unlicensed basis on available channels in the broadcast television frequency bands [US].

white space device (WSD): An entity that employs cognitive facilities to use white space spectrum without causing harmful interference to protected services [EU].

3.4 Acronyms and abbreviations

3GPP	3rd Generation Partnership Project
40MC	40-MHz-capable
802.x LAN	IEEE 802-based local area networks such as IEEE Std 802.3 and IEEE Std 802.11
AA	Authenticator address
AAA	authentication, authorization, and accounting
AAD	additional authentication data
AAI	administratively assigned identifier
A-BFT	association beamforming training
A-BI	awake beacon interval
AC	access category

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

ACI	access category index
Ack	acknowledgment
ACM	admission control mandatory
A-Control	aggregated control
ACU	admission control unit
ADDBA	add block acknowledgment
ADDTS	add traffic stream
ADE	AID with differential encoding
AEAD	authenticated encryption with associated data
AES	advanced encryption standard
AES-128-CMAC	advanced encryption standard (with 128-bit key) cipher-based message authentication code
AFC	automatic frequency control
AGC	automatic gain control
AID	association identifier
AIFS	arbitration interframe space
AIFSN	arbitration interframe space number
AKM	authentication and key management
AKMP	authentication and key management protocol
A-MPDU	aggregate MAC protocol data unit
AMPE	authenticated mesh peering exchange
A-MSDU	aggregate MAC service data unit
ANIPI	average noise plus interference power indicator
ANO	access network options
ANonce	Authenticator nonce
ANPI	average noise power indicator
ANQP	access network query protocol
AP	access point
AP-CSN	AP configuration sequence number
APSD	automatic power save delivery
A-PPDU	aggregate physical layer protocol data unit
ARP	Address Resolution Protocol
AS	authentication server
ASEL	antenna selection
ASN.1	Abstract Syntax Notation One
ASRA	additional step required for access
ATI	announcement transmission interval
ATIM	announcement traffic indication message
AV	audio video
AWV	antenna weight vector
BA	block acknowledgment
BAR	block acknowledgment request
BAT	block acknowledgment TWT
BC	beam combining
BCC	binary convolutional code
BCE	broadcast/multicast integrity protocol (BIP) compact encapsulation

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

BCU	basic channel unit
BDT	bidirectional TXOP
BF	beamforming
BFRP	beamforming report poll
BHI	beacon header interval
BIGTK	beacon integrity group temporal key
BIGTKSA	beacon integrity group temporal key security association
BIP	broadcast/multicast integrity protocol
BIPN	BIGTK packet number
BPN	base packet number
BPSK	binary phase shift keying
BQR	bandwidth query report
BQRP	bandwidth query report poll
BRP	beam refinement protocol
BRPIFS	beam refinement protocol interframe space
BSA	basic service area
BSR	buffer status report
BSRP	buffer status report poll
BSS	basic service set
BSSID	basic service set identifier
BT	bit time
BTI	beacon transmission interval
BU	bufferable unit
BW	bandwidth
CA	certificate authority
CAC	centralized authentication controller (for access points) or controlled (for stations)
CAG	common advertisement group
CAP	controlled access phase
CAQ	channel availability query
CAS	command and status
CBAP	contention based access period
CBC	cipher-block chaining
CBC-MAC	cipher-block chaining message authentication code
CBP	contention based protocol
CCA	clear channel assessment
CCDF	complementary cumulative distribution function
CCK	complementary code keying
CCM	CTR with CBC-MAC
CCMP	CTR with CBC-MAC protocol
CCSR	centralized coordination service root
CCSS	centralized coordination service set
CDMG	China directional multi-gigabit
CEF	channel estimation field
CF	contention free
CID	Company ID
CMMG	China millimeter-wave multi-gigabit

C-MPDU	coded MPDU
C-PSDU	coded PSDU
CQI	channel quality indication
CRC	cyclic redundancy code
CS	carrier sense
CSD	cyclic shift diversity
CSI	channel state information
CSM	channel schedule management
CSMA/CA	carrier sense multiple access with collision avoidance
CTR	Counter Mode
CTS	clear to send
CTS1	clear to send 1
CTS2	clear to send 2
CVS	contact verification signal
CW	contention window
DA	destination address
DBC	dynamic bandwidth control
D-BI	doze beacon interval
DBPSK	differential binary phase shift keying
DC	direct current
DCF	distributed coordination function
DCLA	dc level adjustment
DCM	dual carrier modulation
DCS	dynamic channel selection
DEI	drop eligibility indicator
DELBA	delete block acknowledgment
DELTS	delete traffic stream
DFS	dynamic frequency selection
DFT	discrete Fourier transform
DIFS	distributed (coordination function) interframe space
DILS	differentiated initial link setup
DL	downlink
DLL	data link layer
DL MU	downlink multi-user
DL MU-MIMO	downlink multi-user multiple input, multiple output
DLTF	Data Long Training field
DMG	directional multi-gigabit
DMS	directed multicast service
DMSID	directed multicast service identifier
DN	destination network
DO	DFS owner
DQPSK	differential quadrature phase shift keying
DR	data rate
DS	distribution system
DSAF	distribution system access function
DSCP	differentiated services code point

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

DSE	dynamic station enablement
DSM	distribution system medium
DSS	distribution system service
DSSS	direct sequence spread spectrum
DST	daylight saving time
DTI	data transfer interval
DTIM	delivery traffic indication map
EAP	Extensible Authentication Protocol (IETF RFC 3748)
EAPOL	Extensible Authentication Protocol over LANs (IEEE Std 802.1X-2020)
EAP-RP	EAP reauthentication protocol
EAS	emergency alert system
EBR	expedited bandwidth request
EBCS	enhanced broadcast services
ECAPC	extended centralized AP or PCP cluster
ECS	extended channel switching
ED	energy detection
EDCA	enhanced distributed channel access
EDCAF	enhanced distributed channel access function
EDMG	enhanced directional multi-gigabit
EDT	eastern daylight time
EHCC	extended hyperbolic congruence code
EIFS	extended interframe space
EIRP	equivalent isotropically radiated power
EL	energy limited
ELI	extended local identifier
ELTF	Extension Long Training field
EMA	enhanced multiple BSSID advertisement
EOF	end-of-frame
EOM	end of multi-user
EOSP	end of service period
EPD	EtherType Protocol Discrimination (IEEE Std 802)
ER	extended range
ERP	extended rate PHY
ERP-CCK	extended rate PHY using CCK modulation
ERP-DSSS	extended rate PHY using DSSS modulation
ERP-DSSS/CCK	extended rate PHY using DSSS or CCK modulation
ERP-OFDM	extended rate PHY using OFDM modulation
ESP	estimated service parameters
ESR	emergency services reachable
ESS	extended service set
EST	eastern standard time
EVM	error vector magnitude
FCS	frame check sequence
FD	FILS discovery
FD-AF	full-duplex amplify-and-forward
FDMA	frequency division multiple access

FEC	forward error correction
FFC	finite field cryptography
FFE	finite field element
FFT	Fast Fourier Transform
FIFO	first in first out
FILS	fast initial link setup
FL	fixed-length
FMS	flexible multicast service
FMSID	flexible multicast stream identifier
FOV	field of view
FPBT	first path beamforming training
FSM	finite state machine
FST	fast session transfer
FSTS	fast session transfer session
FT	fast BSS transition
FTAA	fast BSS transition authentication algorithm
FTE	fast BSS transition element
FTM	fine timing measurement
FTMR	fine timing measurement request
FTO	fast BSS transition originator
GANN	gate announcement
GAS	generic advertisement service
GATS	group addressed transmission service
GCM	Galois/Counter Mode
GCMP	Galois/Counter Mode protocol
GCR	groupcast with retries
GCR-A	groupcast with retries active
GCR-SP	groupcast with retries service period
GDB	geolocation database
GDD	geolocation database dependent
GFSK	Gaussian frequency shift key or keying
GI	guard interval
GID	group identifier
GLK	general link
GLK-GCR	general link groupcast with retries
GMK	group master key
GNonce	group nonce
GP	grant period
GPRS	general packet radio service
GPS	Global Positioning System
GQMF	group addressed quality-of-service Management frame
GTK	group temporal key
GTKSA	group temporal key security association
HC	hybrid coordinator
HCC	hyperbolic congruence code
HCCA	HCF controlled channel access

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

HCF	hybrid coordination function
HCFA	hash chain frame authentication
HD-DF	half-duplex decode-and-forward
HDR	high data rate
HE	high efficiency
HEC	header error check
HELD	HTTP-enabled location delivery
HEMM	HCCA, EDCA mixed mode
HESSID	HeSS identifier
HIPERLAN	high-performance radio local area network
HLP	higher layer protocol
HLSA	higher layer source authentication
HPA	high power amplifier
HR/DSSS	high rate direct sequence spread spectrum using the long preamble and header
HR/DSSS/short	high rate direct sequence spread spectrum using the optional short preamble and header mode
HT	high throughput
HTC	high throughput control
HT-GF-STF	high throughput Greenfield Short Training field
HT-SIG	high throughput SIGNAL field
HT-STF	high throughput Short Training field
HTTP	hyptertext transfer protocol
HTTPS	hyptertext transfer protocol secure
HWMP	hybrid wireless mesh protocol
IBSS	independent basic service set
I2R	ISTA to RSTA
ICK	integrity check key
ICMP	Internet Control Message Protocol
ICV	integrity check value
IDFT	inverse discrete Fourier transform
IF	intermediate frequency
IFFT	inverse Fast Fourier Transform
IFS	interframe space
IFTM	initial fine timing measurement
IFTMR	initial fine timing measurement request
IGTK	integrity group temporal key
IGTKSA	integrity group temporal key security association
IMp	intermodulation protection
INonce	initiator nonce
IPI	idle power indicator
IPN	IGTK packet number
I/Q	in phase and quadrature
IQMF	individually addressed quality-of-service Management frame
ISM	industrial, scientific, and medical
ISS	initiator sector sweep
ISTA	initiating STA

IUT	implementation under test
IV	initialization vector
KCK	key confirmation key
KDE	key data encapsulation
KDF	key derivation function
KDK	key derivation key
KEK	key encryption key
LAN	local area network
LBIFS	long beamforming interframe space
LC	light communications
LCI	location configuration information
LDPC	low-density parity check
LDR	low data rate
LFSR	linear feedback shift register
LGR	legendre symbol
LLC	logical link control
L-LTF	non-HT Long Training field
LME	layer management entity
LMR	Location Measurement Report
LNA	low noise amplifier
LP	low power
LPD	LLC Protocol Discrimination (IEEE Std 802)
LRC	long retry count
LSB	least significant bit
L-SIG	non-HT SIGNAL field
L-STF	non-HT Short Training field
LTF	Long Training field
MAC	medium access control
MAC_I	initiator MAC address
MAC_P	peer MAC address
MAD	maximum away duration
MAF	MCCA access fraction
MBCA	mesh beacon collision avoidance
MBIFS	medium beamforming interframe space
MBSS	mesh basic service set
MC-OOK	multicarrier on-off keying
MCCA	MCF controlled channel access
MCCAOP	MCF controlled channel access opportunity
MCF	mesh coordination function
MCS	modulation and coding scheme
MDE	mobility domain element
MDID	mobility domain identifier
MFB	MCS feedback
MFPC	management frame protection capable
MFPR	management frame protection required
MFSI	MCS feedback sequence identifier

MGTK	mesh group temporal key
MIB	management information base
MIC	message integrity code
MID	multiple sector identifier
MIDC	multiple sector identifier capture
MIMO	multiple input, multiple output
MIS	media independent service
MLME	MAC sublayer management entity
MLPP	multi-level precedence and preemption
MME	management MIC element
MMPDU	MAC management protocol data unit
MMS	multiple MAC sublayers
MMSL	multiple MAC sublayers link
MM-SME	multiple MAC station management entity
MPDU	MAC protocol data unit
MPM	mesh peering management
MRQ	MCS request
MSB	most significant bit
MSDU	MAC service data unit
MSGCF	MAC state generic convergence function
MSI	MRQ sequence identifier
MSK	master session key
MS SAP	method specific service access point
MTK	mesh temporal key
MU	multi-user
MU-BAR	multi-user block ack request
MUEDCATimer	multi-user EDCA timer
MU-MIMO	multi-user multiple input, multiple output
MU-RTS	multi-user request to send
N/A	not applicable
NAI	network access identifier
NAS	network access server
NAV	network allocation vector
NCC	network channel control
NDP	null data PPDU
NFRP	NDP feedback report poll
NGV	next generation vehicle-to-everything (V2X)
non-ERP	nonextended rate PHY
NSS	number of spatial streams
NTP	Network Time Protocol (IETF RFC 5905 [B49])
NUC	nonuniform constellation
OBSS	overlapping basic service set
OBO	orthogonal frequency division multiple access (OFDMA) random access backoff
OCB	outside the context of a BSS
OCEF	OFDM channel estimation field
OCI	operating channel information

OCT	on-channel tunneling
OCVC	operating channel validation capable or operating channel validation capability
OCW	orthogonal frequency division multiple access (OFDMA) contention window
OFDM	orthogonal frequency division multiplexing
OFDMA	orthogonal frequency division multiple access
OI	organization identifier
OLB	offset length bitmap
OM	operating mode
OMI	operating mode indication
OSI	Open Systems Interconnection (ISO/IEC 7498-1:1994)
OSTF	OFDM short training field
OUI	Organizationally Unique Identifier
PAD	preassociation discovery
PAE	port access entity (IEEE Std 802.1X-2020)
PBAC	protected block ack agreement capable
PBSS	personal basic service set
PCP	PBSS control point
PCPS	PBSS control point service
PD	packet detect
PDU	protocol data unit
PER	PSDU error ratio
PERR	path error
PFS	perfect forward secrecy
PHB	per-hop behavior
PHY	physical layer
PHYCS	PHY carrier sense
PHYED	PHY energy detection
PICS	protocol implementation conformance statement
PIFS	priority interframe space
PKFA	public key frame authentication
PLME	physical layer management entity
PLW	PSDU length word
PMK	pairwise master key
PMKID	pairwise master key identifier
PMK-R0	pairwise master key R0 (first level)
PMK-R1	pairwise master key R1 (second level)
PMKSA	pairwise master key security association
PN	packet number
PN	pseudonoise (code sequence)
PNonce	peer nonce
PP	polling period
PP A-MSDU	payload protected aggregate MAC service data unit
PPDU	PHY protocol data unit
PPE	physical layer (PHY) packet extension
PPET	physical layer (PHY) packet extension threshold
PPN	partial packet number

PRAW	periodic restricted access window
PREP	path reply
PREQ	path request
PRF	pseudorandom function
PRNG	pseudorandom number generator
PS	power save (mode)
PSAP	public safety answering point
PSDU	PHY service data unit
PSF	PHY Signaling field
PSK	preshared key
PSM	power save mode)
PSR	parameterized spatial reuse
PSTA	passive STA
PSTOA	phase shift time of arrival
PTI	peer traffic indication
PTID	partial TID (the 3 LSBs of a TID)
PTK	pairwise transient key
PTKSA	pairwise transient key security association
PTP	peer-to-peer
PV0	protocol version 0
PV1	protocol version 1
PWE	password element of a finite cyclic group
PXU	proxy update
PXUC	proxy update confirmation
QAB	quieting adjacent BSS
QACM	QMF access category mapping
QAM	quadrature amplitude modulation
QBPSK	quadrature binary phase shift keying
QMF	quality-of-service Management frame
QoS	quality of service
QoS-TU	QoS triggered unscheduled
QPSK	quadrature phase shift keying
QSRC	QoS STA retry count
QTP	quiet time period
R0KH	R0 key holder (PMK-R0 key holder in the Authenticator)
R0KH-ID	R0 key holder identifier (PMK-R0 key holder identifier in the Authenticator)
R1KH	R1 key holder (PMK-R1 key holder in the Authenticator)
R1KH-ID	R1 key holder identifier (PMK-R1 key holder identifier in the Authenticator)
R2I	RSTA to ISTA
RA	receiver address or receiving station address
RADIUS	remote authentication dial-in user service (IETF RFC 2865 [B33])
RANN	root announcement
RA-RU	random access resource unit
RAV	resource allocation vector
RAW	restricted access window
RCPI	received channel power indicator

RD	reverse direction
RDE	RIC data element
RDG	reverse direction grant
RDP	reverse direction protocol
RDS	relay DMG STA
REDS	relay endpoint DMG STA
RF	radio frequency
RFC	request for comments
RIC	resource information container
RID	response indication deferral
RIFS	reduced interframe space
RLAN	radio local area network
RLQP	registered location query protocol
RLS	relay link setup
RLSS	registered location secure server
ROC	relay operation type change
ROM	receive operating mode
RPI	receive power indicator
RPL	received power level
RPS	RAW parameter set
RRB	remote request broker
RSC	receive sequence counter
RSID	ranging session Identifier
RSN	robust security network
RSNA	robust security network association
RSNE	RSN element
RSNI	received signal-to-noise indicator
RSNXE	RSN extension element
RSPI	receiver service period initiated
RSS	responder sector sweep
RSSI	receive signal strength indicator
RSTA	responding STA
RTS	request to send
RTT	round trip time
RU	resource unit
RX	receive or receiver
RXASSI	receive antenna selection sounding indication
RXASSR	receive antenna selection sounding request
RXSS	receive sector sweep
S0KH	S0 key holder (PMK-R0 key holder in the Supplicant)
S0KH-ID	S0 key holder identifier (PMK-R0 key holder identifier in the Supplicant)
S1G	sub 1 GHz
S1KH	S1 key holder (PMK-R1 key holder in the Supplicant)
S1KH-ID	S1 key holder identifier (PMK-R1 key holder identifier in the Supplicant)
SA	source address
SAC	sequence authentication code

SAE	simultaneous authentication of equals
SAI	standard assigned identifier
S-AP	synchronization access point
SAP	service access point
S-APSD	scheduled automatic power save delivery
SA Query	security association query
SAR	segmentation and reassembly
SBBI	small band beacon interval
SBIFS	short beamforming interframe space
SC	single carrier
SCA	secondary channel above
SCB	secondary channel below
SCEF	single carrier channel estimation field
SCN	no secondary channel
SCS	stream classification service
SCSID	stream classification service identifier
SDL	specification and description language
SDU	service data unit
SEMM	SPCA-EDCA mixed mode
SF	scaling factor
SFD	start frame delimiter
SI	service interval
SIC	service information client
SID	short identifier
SIFS	short interframe space
SIR	service information registry
SISO	single input, single output
SLAP	structured local address plan
SLRC	station long retry count
SLS	sector-level sweep
SM	spatial multiplexing
SMBT	single user multiple input, multiple output beamforming training
SME	station management entity
S-MPDU	single MAC protocol data unit
SMT	station management
SN	sequence number
SNAP	Sub-Network Access Protocol
SNonce	Supplicant nonce
SNR	signal-to-noise ratio
SP	service period
SPA	Supplicant address
SPCA	service period channel access
S-PCP	synchronization PBSS control point
SPP A-MSDU	signaling and payload protected aggregate MAC service data unit
SPR	service period request
SPSH	spatial sharing

SQ	signal quality (PN code correlation strength)
SR	spatial reuse
SRC	short retry count
SRG	spatial reuse group
SS	spatial stream
SSID	service set identifier
SSP	subscription service provider
SSPN	subscription service provider network
SSRC	station short retry count
SST	subchannel selective transmission
SSW	sector sweep
STA	station
STACK	short TWT acknowledgment
STBC	space-time block coding
STF	Short Training field
STS	space-time stream
STT	selective translation table
SU	single-user
SU-MIMO	single-user multiple input, multiple output
SYNC	synchronization
SYNRA	synthetic receiver address
TA	transmitter address or transmitting station address
TACK	TWT acknowledgment
TAI	Temps Atomique International (International Atomic Time)
TB	trigger-based
TBTT	target beacon transmission time
TC	traffic category
TCLAS	traffic classification
TDD	time division duplex
TDDTI	time division data transfer interval
TDLS	tunneled direct link setup
TFS	traffic filtering service
TID	traffic identifier
TIE	timeout interval element
TIM	traffic indication map
TK	temporal key
TKIP	temporal key integrity protocol
TLV	type/length/value
TMPTT	target measurement pilot transmission time
TOA	time of arrival
TOD	time of departure
TOM	transmit operating mode
TPA	transmission time-point adjustment
TPC	transmit power control
TPK	TDLS PeerKey
TPKSA	TDLS PeerKey security association

TPK-TK	TPK transient key
TPU	TDLS peer U-APSD
TRN-R	receive training
TRN-T	transmit training
TRQ	training request
TRS	triggered response scheduling
TS	traffic stream
TSBTT	target short beacon transmission time
TSC	TKIP sequence counter
TSF	timing synchronization function
TSID	traffic stream identifier
TSPEC	traffic specification
TTAK	TKIP-mixed transmitter address and key
TTL	time to live
TTP	trusted third party
TTTT	target TIM transmission time
TU	time unit
TUA	triggered uplink access
TVHT	television very high throughput
TVWS	television white spaces
TWT	target wake time
TX	transmit or transmitter
TXASSI	transmit antenna selection sounding indication
TXASSR	transmit antenna selection sounding request
TXE	transmit enable
TXOP	transmission opportunity
TXSS	transmit sector sweep
U-APSD	unscheduled automatic power save delivery
UCT	unconditional transition
UESA	unauthenticated emergency service accessible
UL	uplink
UL MU	uplink multi-user
ULS	Universal Licensing System
U-NII	unlicensed national information infrastructure
UORA	uplink orthogonal frequency division multiple access (OFDMA) based random access
UP	user priority
UPH	uplink (UL) power headroom
U-PID	upper layer protocol identification
UPSIM	unscheduled power save indication map
URI	Uniform Resource Identifier
URL	Universal Resource Locator
URN	Uniform Resource Name
UTC	Coordinated Universal Time
V2X	vehicle-to-everything
VHT	very high throughput

VL	variable-length
VLAN	virtual local area network
VoIP	voice over Internet Protocol (IP)
WIGTK	wake-up radio integrity group temporal key
WIGTKSA	wake-up radio integrity group temporal key security association
WIPN	wake-up radio IGTK packet number
WLAN	wireless local area network
WM	wireless medium
WNM	wireless network management
WS	wakeup schedule
WSM	white space map
WTK	wake-up radio temporal key
WTPN	wake-up radio TK packet number
WUR	wake-up radio
ZCZ	zero correlation zone

3.5 Acronyms and abbreviations in some regulatory domains

ISO 3166-1 defines the international two-letter designation for country names, and these designations are included [in square brackets] at the end of each abbreviation that has clear attribution to a regulatory domain. US is to be understood as also including the United States' territories, and EU is to be understood as including all CEPT member states.

PLMR/CRS	private land mobile radio/cellular radio service [US]
TVBD	television band device [US]
WSD	white space device [EU]

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

4. General description

4.1 General description of the architecture

This clause presents the concepts and terminology used within this standard. Specific terms are defined in Clause 3. Illustrations convey key IEEE 802.11 concepts and the interrelationships of the architectural components. IEEE Std 802.11 uses an architecture to describe functional components of an IEEE 802.11 LAN. The architectural descriptions are not intended to represent any specific physical implementation of IEEE Std 802.11.

4.2 How wireless local area networks (WLANs) are different

4.2.1 Introduction

Wireless networks have fundamental characteristics that make them significantly different from traditional wired LANs.

4.2.2 Wireless station (STA)

In the design of wired LANs it is implicitly assumed that an address is equivalent to a physical location. In wireless networks, this is not always the case. In IEEE Std 802.11, the addressable unit is a station (STA). Physical and operational characteristics are defined by modifiers that are placed in front of the term STA. For example, in the case of location and mobility, the addressable units are the fixed STA, the portable STA, and the mobile STA. The STA is an addressable destination, but not (in general) a fixed location.

A STA might take on multiple distinct characteristics, each of which shape its function. For example, a single addressable unit might simultaneously be a portable STA, a quality-of-service (QoS) STA, a dependent STA, and a hidden STA.

4.2.3 Media impact on design and performance

The PHYs used in IEEE Std 802.11 are fundamentally different from wired media. Thus IEEE 802.11 PHYs:

a) Use a medium that has neither absolute nor readily observable boundaries outside of which STAs with PHY transceivers are known to be unable to receive network frames
b) Are unprotected from other signals that are sharing the medium
c) Communicate over a medium significantly less reliable than wired PHYs
d) Have dynamic topologies
e) Lack full connectivity, and therefore the assumption normally made that every STA can hear every other STA is invalid (i.e., STAs might be “hidden” from each other)
f) Have time-varying and asymmetric propagation properties
g) Might experience interference from logically disjoint IEEE 802.11 networks operating in overlapping areas

Because of limitations on wireless PHY ranges, WLANs intended to cover reasonable geographic distances can be built from basic coverage building blocks. When providing QoS services, the MAC endeavors to provide QoS “service guarantees” within the limitations of the medium properties identified above. In other words, particularly in unlicensed spectrum, true guarantees are often not possible. However, gradations of service are always possible; and in sufficiently controlled environments, QoS guarantees are possible.

4.2.4 The impact of handling mobile STAs

One of the requirements of IEEE Std 802.11 is to handle *mobile* as well as *portable* STAs. A *portable* STA is one that is moved from location to location, but that is used only while at a fixed location. *Mobile* STAs access the LAN while in motion.

For technical reasons, it is not sufficient to handle only portable STAs. Propagation effects blur the distinction between portable and mobile STAs; stationary STAs often appear to be mobile due to propagation effects.

Mobile STAs typically are battery powered. Hence power management is an important consideration. For example, it cannot be presumed that a STA's receiver is always powered on.

4.2.5 Interaction with other IEEE 802® layers

IEEE Std 802.11 is required to appear to higher layers [logical link control (LLC) sublayer] as a general-purpose IEEE 802 LAN. This requires that the IEEE 802.11 network handle STA mobility within the MAC sublayer. To meet reliability assumptions (that LLC makes about lower layers), it is necessary for IEEE Std 802.11 to incorporate functionality that is untraditional for MAC sublayers.

In a robust security network association (RSNA), IEEE Std 802.11 provides functions to protect Data frames, IEEE Std 802.1X-2020 provides authentication and a Controlled Port, and IEEE Std 802.11 and IEEE Std 802.1X-2020 collaborate to provide key management. All STAs in an RSNA have a corresponding IEEE 802.1X entity that handles these services. This standard defines how an RSNA utilizes IEEE Std 802.1X-2020 to access these services. Within IEEE Std 802.11, EAPOL PDUs are carried as MSDUs within one or more Data frames, as described in Clause 12 of IEEE Std 802.1X-2020. Within this standard, Data frames used for this purpose are generally referred to as *EAPOL-Key frames*, *EAPOL-Key request frames*, and *EAPOL-Start frames*.

When used to support applications that have QoS requirements, each IEEE 802.11 LAN provides a link within an end-to-end QoS environment that can be established between, and managed by, higher layer entities. To handle QoS traffic in a manner comparable to other IEEE 802 LANs, the IEEE 802.11 QoS facility requires the IEEE 802.11 MAC sublayers to incorporate functionality that is not traditional for MAC sublayers. In addition, it might be necessary for certain higher layer management entities to be "WLAN aware" at least to the extent of understanding that the available bandwidth and other QoS characteristics of a WLAN are subject to frequent, and sometimes substantial, dynamic changes due to causes other than traffic load and are outside the direct control of network management entities.

4.2.6 Interaction with non-IEEE-802 protocols

An RSNA utilizes non-IEEE-802 protocols for its authentication and key management (AKM) services. Some of these protocols are defined by other standards organizations, such as the Internet Engineering Task Force (IETF).

4.3 Components of the IEEE 802.11 architecture

4.3.1 General

The IEEE 802.11 architecture consists of several components that interact to provide a WLAN that supports STA mobility transparently to upper layers.

The basic service set (BSS) is the basic building block of an IEEE 802.11 LAN. Figure 4-1 shows two BSSs, each of which has two STAs that are members of the BSS.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

It is useful to think of each oval depicting a BSS as the coverage area within which all the member STAs of the BSS can remain in communication. (The concept of area, while not precise, is often good enough.) This area is called the *basic service area (BSA)*. If a STA moves out of the BSA, it can no longer directly communicate with all the other STAs present in the BSA.

NOTE—In the case of transmissions such as in a directional multi-gigabit (DMG) BSS, the individual coverage area of a transmission from one member STA to another can be thought of as a cone and hence is referred to as a *directional transmission*. The intersection of all possible directional transmissions by all the member STA defines the coverage area.

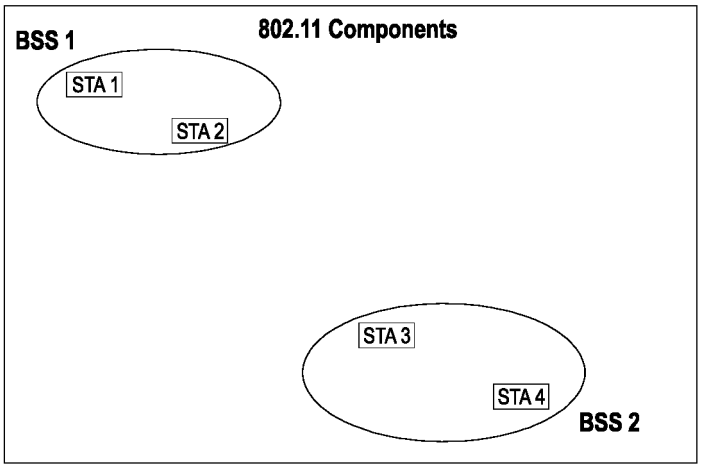

Figure 4-1—BSSs

4.3.2 Independent BSS (IBSS)

The IBSS is the most basic type of IEEE 802.11 LAN. Since the BSSs shown in Figure 4-1 are simple and lack other components (contrast this with Figure 4-2), the two can be taken to be representative of two IBSSs.

This mode of operation is possible when IEEE 802.11 STAs are able to communicate directly. This type of IEEE 802.11 LAN is often formed without preplanning.

4.3.3 Personal BSS (PBSS)

Similar to the IBSS, the PBSS is a type of IEEE 802.11 LAN in which STAs communicate directly with each other.

In contrast to the IBSS, in the PBSS one STA assumes the role of the PBSS control point (PCP). The PCP provides the basic timing for the PBSS through DMG Beacon and Announce frames as well as allocation of service periods and contention based access periods.

A PBSS can be established only by DMG STAs. Not every DMG BSS is a PBSS. A DMG BSS can be a PBSS, an infrastructure BSS, or an IBSS.

4.3.4 STA membership in a BSS is dynamic

A STA’s membership in a BSS is dynamic (STAs turn on, turn off, come within range, and go out of range). To become a member of an infrastructure BSS or an IBSS, a STA joins the BSS using the synchronization procedure described in 11.1.4.5. To start a new mesh BSS or to become a member of a mesh BSS, a STA starts the transmission of Beacon frames and performs the synchronization maintenance procedure described in 14.14. To access all of the services of an infrastructure BSS, a STA becomes “associated.” These

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

associations are dynamic and involve the use of the distribution system service (DSS), which is described in 4.4.4. A mesh STA does not become associated as there is no central entity in a mesh BSS (MBSS). Instead, a mesh STA peers with other mesh STAs.

4.3.5 Distribution system (DS) concepts

4.3.5.1 Overview

PHY limitations determine the direct station-to-station distance that is supported. For some networks this distance is sufficient; for other networks, increased coverage is required. Instead of existing independently, an infrastructure BSS might also form a component of an extended form of network that is built with multiple BSSs. The architectural component used to interconnect infrastructure BSSs is the DS for non-general link (non-GLK) operation. The DS and extended service set (ESS) are mechanisms for expanding connectivity for non-GLK operation. For GLK operation, an IEEE 802.1Q™ bridge might be used to form an extended network (see 4.3.31).

IEEE Std 802.11 logically separates the WM from the distribution system medium (DSM). Each logical medium is used for different purposes, by a different component of the architecture. The IEEE 802.11 definitions neither preclude, nor demand, that the multiple media be either the same or different.

Recognizing that the multiple media are *logically* different is key to understanding the flexibility of the architecture. The IEEE 802.11 LAN architecture is specified independently of the physical characteristics of any specific implementation.

The DS enables mobile device support by providing the logical services necessary to handle address to destination mapping and seamless integration of multiple BSSs.

An access point (AP) is any entity that has STA functionality and a distribution system access function (DSAF), which enables access to the DS, via the WM for associated STAs. To access the DS, a non-AP STA joins a BSS and associates with the AP operating that BSS. The AP notifies the DS at the completion of the association so that a destination mapping for that non-AP STA’s address is established. The non-AP STA moves to another BSS operated by an AP connected to the same DS in another location by reassociating with this new AP. The new AP notifies the DS at the completion of the reassociation so that the destination mapping for that non-AP STA’s address is updated.

The STA’s location information is internal to the DS, thus STA mobility is transparent to upper layers. See 4.3.5.2.

Figure 4-2 adds the DS, DSM, and AP components to the IEEE 802.11 architecture picture.

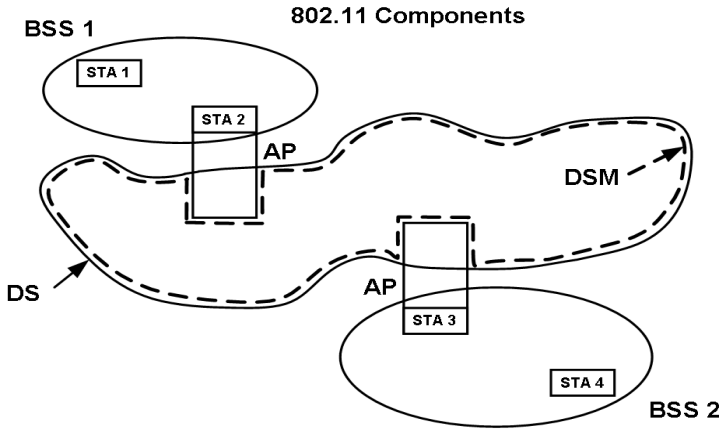

Figure 4-2—DSs and APs

Data move between a BSS and the DS via the DSAF in an AP. An AP contains a STA and is addressable on the WM using its STA address. The addresses used by an AP for communication on the WM and on the DSM are not necessarily the same.

Data sent to the AP's STA address by one of the STAs associated with it are always received at the Uncontrolled Port for processing by the IEEE 802.1X port access entity. In addition, if the Controlled Port is authorized, these frames conceptually transit the DS.

4.3.5.2 Extended service set (ESS): the large coverage network

The DS and infrastructure BSSs allow IEEE Std 802.11 to create a wireless network of arbitrary size and complexity. IEEE Std 802.11 refers to this type of network as the ESS. An ESS is the union of the infrastructure BSSs with the same SSID connected by a single DS. All BSSs in an ESS have the same SSID. The ESS does not include the DS.

The key concept is that the ESS appears to be a single IEEE Std 802™ access domain to the LLC sublayer. STAs within an ESS can communicate and mobile STAs might move from one BSS to another (within the same ESS) transparently to the LLC sublayer.

If multiple BSSs are configured with the same SSID, but the APs are not interconnected by a common DS, there is no guarantee of seamless mobility for STAs between those BSSs. However, such a deployment might have a common LLC sublayer interconnection, in which case communication with location transparency to the LLC sublayer (a single access domain) is generally still possible, but such communication could be disrupted at times when a mobile STA moves between BSSs.

Owing to its distributed nature, a mesh BSS (MBSS) has no central entity like the AP of an infrastructure BSS. Instead, an MBSS forms a single set of independent mesh STAs. This set is indivisible and cannot be further unified. The ESS concept does not apply to the MBSS. However, it is possible to use a Mesh BSS as all or part of the DS that connects an ESS.

Nothing is assumed by IEEE Std 802.11 about the relative physical locations of the BSSs in Figure 4-3 .

All of the following are possible:

a) The BSSs partially overlap. This is commonly used to arrange coverage within a physical volume.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

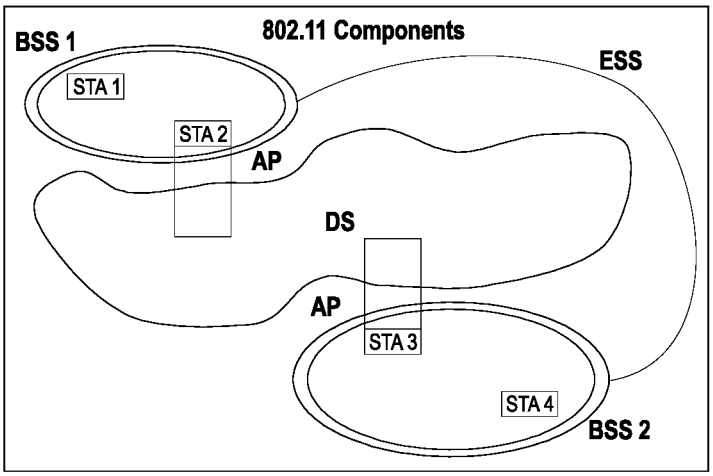

Figure 4-3—ESS

b) The BSSs could be physically disjoint. Logically there is no limit to the distance between BSSs.

c) The BSSs are physically colocated. This could be done to provide redundancy.

d) One (or more) IBSSs or ESSs are physically present in the same location as one (or more) ESSs. This could arise for a number of reasons. Some examples are when an IBSS is operating in a location that also has an ESS, when physically overlapping IEEE 802.11 networks have been set up by different organizations, and when two or more different access and security policies are needed in the same location.

4.3.6 Area concepts

For wireless PHYs, well-defined coverage areas simply do not exist. Propagation characteristics are dynamic and unpredictable. Small changes in position or direction might produce dramatic differences in signal strength. Similar effects occur whether a STA is stationary or mobile (as moving objects might impact station-to-station propagation).

Figure 4-4 shows a signal strength map for a simple square room with a standard metal desk and an open doorway. This figure is a static snapshot; the propagation patterns change dynamically as STAs and objects in the environment move. The dark (solid) blocks in the lower left are a metal desk and there is a doorway at the top right of the figure. The figure indicates relative differences in field strength with different intensities and indicates the variability of field strength even in a static environment. The difference between the greatest signal strength and the least signal strength in this figure is 50 dB.

While the architecture diagrams show sharp boundaries for BSSs, this is an artifact of the pictorial representation, not a physical reality. Because dynamic three-dimensional field strength pictures are difficult to draw, well-defined shapes are used by IEEE 802.11 architectural diagrams to represent the coverage of a BSS.

Further description difficulties arise when attempting to describe colocated coverage areas. Consider Figure 4-5 , in which STA 6 could belong to BSS 2 or BSS 3.

While the concept of sets of STAs is correct, it is often convenient to talk about areas. For many topics the concept of area is sufficient. *Volume* is a more precise term than area, though still not technically correct. For historical reasons and convenience, this standard uses the common term *area*.

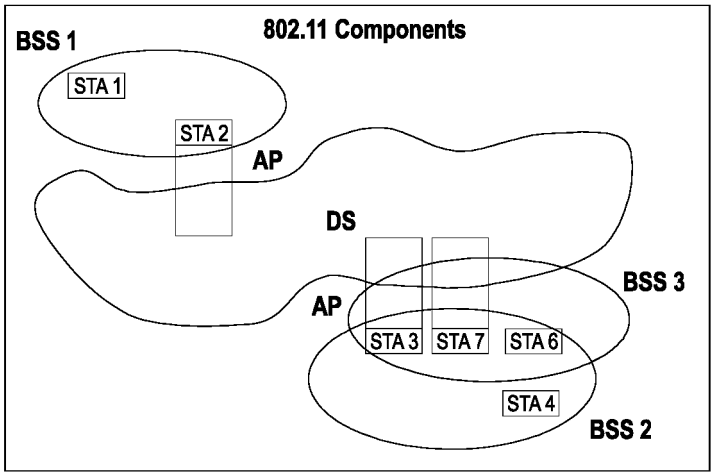

Figure 4-5—Colocated coverage areas

4.3.7 Integration with non-IEEE-802.11 LANs

To integrate the IEEE 802.11 non-GLK architecture with a non-IEEE-802.11 LAN, including a traditional wired LAN, a final logical architectural component is introduced—a *portal*. The IEEE 802.11 GLK architecture (see 4.3.31) does not include the concept of a portal.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A portal is the logical point at which the integration service is provided. All data from or to non-IEEE-802.11 LANs enter or leave the IEEE 802.11 architecture via a portal. The integration service is responsible for any addressing changes or other logical mappings that might be required when MSDUs pass between the DS and the integrated LAN. It is possible for one device to offer both the functions of an AP and a portal. For example, a portal to a wired IEEE 802 LAN is shown in Figure 4-6 .

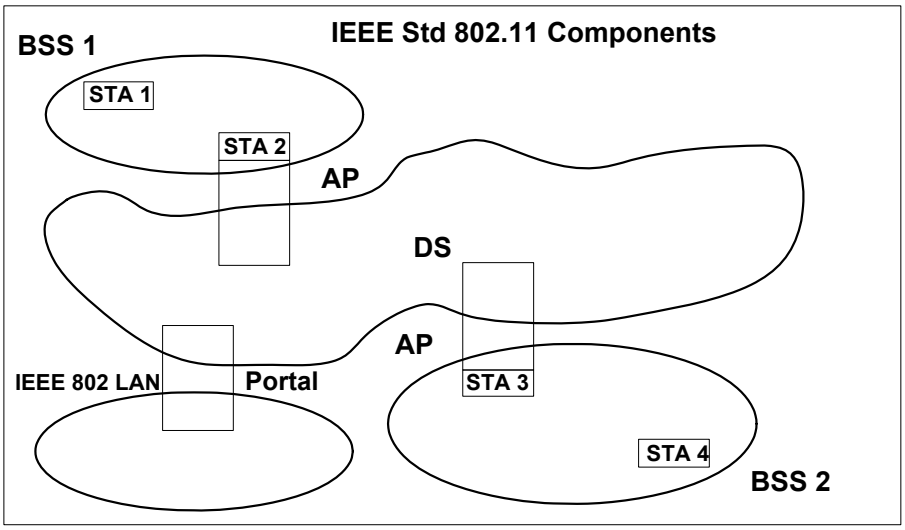

Figure 4-6—Connecting to other IEEE 802 LANs

4.3.8 Robust security network association (RSNA)

The following features are defined for an RSNA:

- Authentication mechanisms for STAs
- Key management algorithms
- Cryptographic key establishment
- Cryptographic mechanisms, such as Counter Mode with cipher-block chaining message authentication code protocol (CCMP) and Galois/Counter Mode protocol (GCMP)
- Fast basic service set (BSS) transition (FT) mechanism
- Cryptographic encapsulation mechanisms for robust Management frames

An RSNA might rely on components external to the IEEE 802.11 architecture.

The first component is an IEEE 802.1X port access entity (PAE). PAEs are present on all STAs in an RSNA and control the forwarding of data to and from the medium access control (MAC). An AP always implements the Authenticator PAE and Extensible Authentication Protocol (EAP) Authenticator roles, and a non-AP STA always implements the Supplicant PAE and EAP peer roles. In an IBSS or PBSS, each STA implements both the Authenticator PAE and Supplicant PAE roles and both EAP Authenticator and EAP peer roles.

A second component is the Authentication Server (AS). The AS authenticates the elements of the RSNA itself, i.e., the STAs provide material that the RSNA elements use to authenticate each other. The AS communicates through the IEEE 802.1X Authenticator with the IEEE 802.1X Supplicant on each STA, enabling the STA to be authenticated to the AS and vice versa. An RSNA depends upon the use of an EAP

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

method that supports mutual authentication of the AS and the STA, such as those that meet the requirements in IETF RFC 4017. In certain applications, the AS might be integrated into the same physical device as the AP, or into a STA in an IBSS or PBSS.

In some applications, there is no need for a PAE or AS, and a STA and AP, or two IBSS STAs, or two mesh STAs in an MBSS, might authenticate each other using a password.

An RSNA using fast BSS transition relies on an external protocol to distribute keys between the pairwise master key (PMK) R0 key holder (R0KH) and PMK-R1 key holder (R1KH) Authenticator components. The requirements for this protocol are described in 13.2.2.

4.3.9 Centralized coordination service set (CCSS) and extended centralized AP or PCP clustering (ECAPC)

AP or PBSS control point (PCP) clustering is a protocol between a DMG synchronization AP or DMG synchronization PCP (S-AP or S-PCP) and other APs and PCPs within the cluster, known as member APs and PCPs. This protocol is used to improve spatial sharing and interference mitigation among the DMG BSSs of the S-AP or S-PCP and member APs and PCPs. AP or PCP clustering allows an AP or PCP within a cluster to schedule transmissions in nonoverlapping time periods with respect to other APs and PCPs that are in the same cluster. There are two types of clustering:

— In decentralized AP or PCP clustering, there is a single S-AP or S-PCP in the BSA of the S-AP or S-PCP.
— In centralized AP or PCP clustering, there can be multiple S-APs in the BSA of any one S-AP and all S-APs are coordinated via a single centralized coordination service set (CCSS).

A CCSS comprises a centralized coordination service root (CCSR) and a set of one or more synchronization APs that while operating are stationary with respect to their local environment and are connected to the CCSR via, for instance, one of the following:

— The DS to an AP (or beyond, to a STA associated to the AP)
— A combination of distribution system, portal, and external network

The CCSR provides coordination services for the CCSS, such as selecting the target beacon transmission time of S-APs within the CCSS to minimize interference. The CCSR might logically reside within an S-AP or in another entity as long as it has a globally administered MAC address. A CCSS is suited to an area and a frequency band having the following propagation characteristics:

— The BSAs of the S-APs within the CCSS cover the area, and
— Transmissions within the area are isolated to a high degree.

An extended centralized AP or PCP cluster (ECAPC) comprises a single CCSS and an accompanying set of centralized AP or PCP clusters. Each S-AP of one of the centralized AP or PCP clusters is inside the CCSS. The ECAPC also includes all STAs in the BSSs of the S-APs and member APs and PCPs of the centralized AP or PCP clusters. An example is shown in Figure 4-7 , in which:

— STA3a and STA3b are two STAs coordinated by a one MM-SME component.
— STA4a and STA4b are two STAs coordinated by a second MM-SME component.
— The CCSR happens to be located in an external network.

The CCSS might contain whole ESSs, subsets of ESSs, or some combination of them.

Decentralized AP or PCP clustering can be employed without establishing a CCSS, CCSR, or ECAPC.

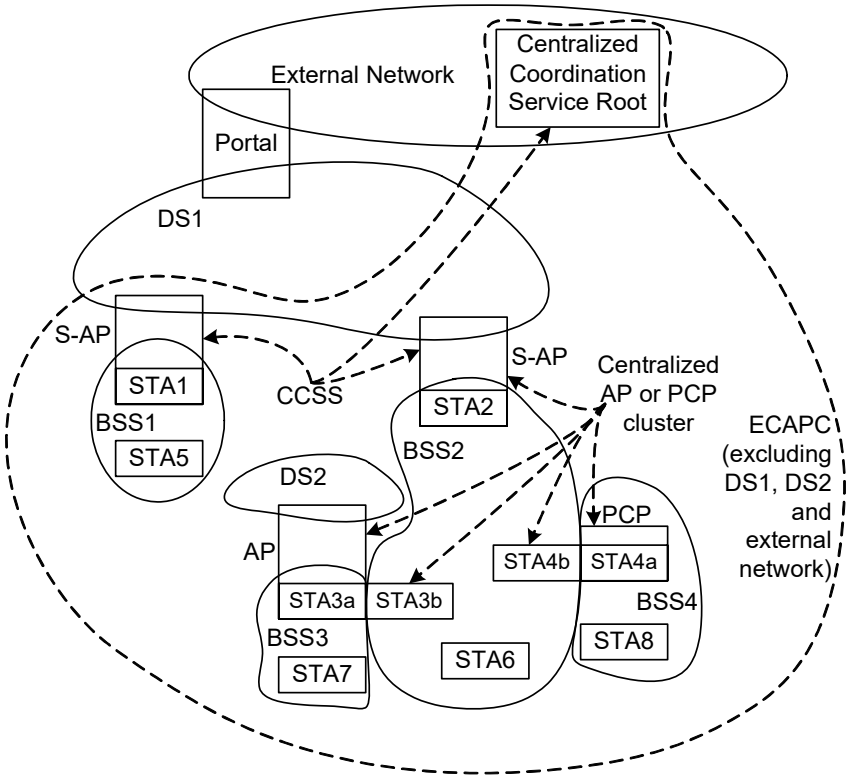

Figure 4-7—CCSS and ECAPC

4.3.10 QoS BSS

The IEEE 802.11 QoS facility provides MAC enhancements to support LAN applications with QoS requirements. The QoS enhancements are available to QoS STAs associated with a QoS access point or PCP in a QoS BSS. A subset of the QoS enhancements is available for use between STAs that are members of the same QoS IBSS.

Similarly, a subset of the QoS enhancements is available for use between neighbor peer mesh STAs. A mesh BSS is one type of QoS BSS and it is described in 4.3.24.

A QoS STA that is a non-DMG STA might associate with a non-QoS access point in a non-QoS BSS, to provide the non-QoS MAC data service, for example, when there is no QoS access point with which to associate.

As a mesh STA does not implement the necessary service, the mesh STA does not associate with any access point.

A DMG STA is a QoS STA. A DMG BSS is a QoS BSS.

The enhancements that distinguish QoS STAs from non-QoS STAs and QoS APs from non-QoS APs are collectively termed the *QoS facility*. Which of the QoS-specific mechanisms a QoS STA supports might vary among QoS implementations, as well as between QoS STAs and QoS APs, over ranges specified in subsequent clauses. All service primitives, frame formats, coordination function and frame exchange rules, and management interface functions except for the block acknowledgment (block ack) function, and

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

automatic power save delivery (APSD) are part of the core QoS facility. A QoS STA or QoS AP implements those core QoS facility necessary for its QoS functions to interoperate with other QoS STAs. Functions such as the block ack, and APSD are separate from the core QoS facility; and the presence of these functions is indicated by STAs separately from the core QoS facility.

For infrastructure BSS and IBSS, this standard provides four mechanisms for the support of applications with QoS requirements.

The first mechanism, designated the *enhanced distributed channel access* (EDCA), delivers traffic based on differentiating user priorities (UPs). This differentiation is achieved by varying the following for different UP values:

— Amount of time a STA senses the channel to be idle before backoff or transmission, or
— The length of the contention window to be used for the backoff, or
— The duration a STA transmits after it acquires the channel.

These transmissions might also be subject to certain channel access restrictions in the form of admission control. A DMG STA uses EDCA only within a contention based access period (CBAP). Details of EDCA are provided in 10.23.2 and, for DMG STAs, additional details are provided in 10.38.4, 10.38.5, and 10.38.6.3.

The second mechanism, designated the *hybrid coordination function* (HCF) *controlled channel access* (HCCA), which is not applicable to DMG STAs, allows for the reservation of transmission opportunities (TXOPs) with the hybrid coordinator (HC). A STA requests the HC for TXOPs, both for its own transmissions as well as for transmissions from the AP to it.[22] The request is initiated by the station management entity (SME) of the STA. The HC, which is colocated at the AP, either accepts or rejects the request based on an admission control policy. If the request is accepted, the HC schedules TXOPs for both STAs (both the AP and the non-AP STA). For transmissions from the non-AP STA, the HC polls the STA based on the parameters supplied by the STA at the time of its request. For transmissions to the STA, the AP directly obtains TXOPs from the colocated HC and delivers the queued frames to the STA, again based on the parameters supplied by the STA. Details of the mechanism are provided in 10.23.3 and 11.4. This mechanism might be used for applications such as voice and video, which need periodic service from the HC. If the application constraints dictate the use of this mechanism, the application initiates this mechanism by using the management service primitives.

The third mechanism, designated the *service period* (SP) *access* or *service period channel access* (SPCA), is applicable only to DMG STAs and allows for the reservation of channel time by the AP or PCP. A non-AP and non-PCP STA requests SPs from an AP or PCP. These SPs can be used for transmission to any other STA in the BSS. The request is initiated by the SME of the non-AP and non-PCP STA. The AP or PCP either accepts or rejects the request based on an admission control policy. If the request is accepted, the AP or PCP uses the Extended Schedule element to schedule SPs for communication between the source and destination DMG STAs indicated within the request. Details of this mechanism are provided in 10.38.6.2, 10.38.6.4, 10.38.6.6, and 11.4.

The fourth mechanism, designated as *dynamic allocation*, is applicable only to DMG STAs and allows for near-real-time reservation of channel time with an AP or PCP. This type of access is used in addition to the service period and contention based access period mechanisms. An AP or PCP can poll a STA and receive requests for channel time allocation. Based on the received requests, the AP or PCP can accept a request and immediately allocate (within the same beacon interval) channel time for the STA to communicate with another STA by using a Grant frame. Details of this mechanism are provided in 10.38.7, 10.38.8, and 10.38.9.

[22] In the case of downlink traffic streams (TSs).

The AP of a QoS BSS might allow non-QoS STAs to associate. All individually addressed frames that are sent to non-QoS STAs by an AP do not use the frame formats associated with the QoS facility.

A QoS STA associated in a non-QoS BSS acts as a non-QoS STA.

4.3.11 Wireless LAN radio measurements

4.3.11.1 General

Wireless LAN (WLAN) radio measurements enable STAs to observe and gather data on radio link performance and on the radio environment. A STA can choose to make measurements locally, request a measurement from another STA, or be requested by another STA to make one or more measurements and return the results. Radio measurement data is made available to STA management and upper protocol layers where it might be used for a range of applications. The measurements enable adjustment of STA operation to better suit the radio environment. The radio measurement service includes measurements that extend the capability, reliability, and maintainability of WLANs by providing standard measurements across vendors, and the service provides the resulting measurement data to upper layers in the communications stack.

In addition to featuring standard measurements and delivering measurement information to upper layers, there are applications that require quantifiable radio environment measurements in order to attain the necessary performance levels. These applications include VoIP, video over IP, location based applications, as well as applications requiring mitigation of harsh radio environments (e.g., multifamily dwellings, airplanes, factories, municipalities). Radio measurements address most of the existing issues in using unlicensed radio spectrum to meet the requirements of these emerging technologies.

To address the mobility requirements of technologies, such as VoIP and video streaming, radio measurements, such as Channel Load request/report and the Neighbor request/report, can be used to collect transition information, which can drastically speed up handoffs between BSSs within the same ESS. By accessing and using this information, the STAs (either in APs or in non-AP STAs) can make intelligent decisions about the most effective way to utilize the available spectrum, power, and bandwidth for their communications.

The request/report measurements are as follows:

— Beacon
— Frame
— Channel Load
— Noise Histogram
— STA Statistics
— LCI (location configuration information)
— Neighbor Report
— Link Measurement
— Transmit Stream/Category Measurement

The request-only mechanism is as follows:

— Measurement Pause

The report-only mechanism is as follows:

— Measurement Pilot

These measurement mechanisms provide the capability for a STA to manage and query its radio environment, and to make appropriate assessments about its health and efficiency. It is the first step in

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

making WLAN smart and capable of making appropriate decisions for fast transition, for mesh connectivity, and for managing the radio environment for all wireless devices.

4.3.11.2 Beacon

The Beacon request/report pair enables a STA to request from another STA a list of APs whose beacons it can receive on a specified channel or channels. The Beacon report request/response provides a means for a requesting STA to obtain received beacon, probe response, and measurement pilot information from a responding STA.

4.3.11.3 Measurement pilot

The Measurement Pilot frame provides a subset of the information provided in a Beacon frame, is smaller than a Beacon frame, and is transmitted more often than a Beacon frame. The purpose of the Measurement Pilot frame is to assist a STA with scanning.

4.3.11.4 Frame

The Frame request/report pair returns a picture of all of the channel traffic and a count of all of the frames received at the measuring STA. For each unique transmitter address, the STA reports the transmitter address, number of frames received from this transmitter, average power level (RCPI) for PPDUs containing these frames, and BSSID indicated by the transmitter.

4.3.11.5 Channel load

The Channel Load request/report pair returns the channel utilization measurement as observed by the measuring STA.

4.3.11.6 Noise histogram

The Noise Histogram request/report pair returns a power histogram measurement of non-IEEE-802.11 noise power by sampling the channel when virtual carrier sense indicates idle and the STA is neither transmitting nor receiving a frame.

4.3.11.7 STA statistics

The STA Statistics request/report pair returns groups of values for STA counters and for BSS Average Access Delay. The STA counter group values include transmitted fragment counts, group addressed transmitted frame counts, failed counts, retry counts, multiple retry counts, frame duplicate counts, Request to Send (RTS) success counts, RTS failure counts, Acknowledgment (Ack) failure counts, received fragment counts, group addressed received frame counts, FCS error counts, and transmitted frame counts. BSS Average Access Delay group values include AP average access delay, average access delay for each access category, associated STA count, and channel utilization.

4.3.11.8 Location

The Location request/report pair returns a requested location in terms of latitude, longitude, and altitude. It includes types of altitude such as floors. A requested location can be the location of the requester (e.g., “Where am I?”) or the location of the reporting STA (e.g., “Where are you?”) or the location of another STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

4.3.11.9 Measurement pause

The Measurement Pause request is defined, but no report comes back from this request. The measurement pause permits the inclusion of a quantified delay between the execution of individual measurements that are provided in a series within a Radio Measurement Request frame. The measurement pause used as the last measurement in a frame provides control of the measurement period when Radio Measurement Request frames are to be repeated.

4.3.11.10 Neighbor report

The neighbor report request is sent to an AP, which returns a neighbor report containing information about known neighbor APs that are candidates for a service set transition. This request/report pair enables a STA to gain information about the neighbors of the associated AP to be used as potential BSS transition candidates.

4.3.11.11 Link measurement

The link measurement request/report exchange provides measurements of the RF characteristics of a STA-to-STA link. This measurement indicates the instantaneous quality of a link.

4.3.11.12 Transmit stream/category measurement

When two QoS STAs have an ongoing traffic stream between them, the Transmit Stream/Category Measurement request/report pair enables either STA to query the other about the conditions of the stream. The transmit stream/category measurement report provides the transmit-side performance metrics for the measured traffic stream. Trigger conditions included in the Transmit Stream/Category Measurement request can initiate triggered Transmit Stream/Category Measurement reports upon detection of the trigger condition.

4.3.12 Operation in licensed frequency bands

4.3.12.1 General

IEEE 802.11 devices can operate on frequencies that are licensed by national regulatory bodies. Although this standard has been generalized so that it is independent of license type, band, and country of operation, only the bands and associated regulations listed in Annex D have been specifically considered.

4.3.12.2 Dynamic STA enablement (DSE) in licensed bands

The DSE operating procedures are used to automate the channel provisioning and regulatory controls needed for unregistered IEEE 802.11 STAs to operate as dependent STAs in licensed spectrum.[23]

4.3.12.3 Contention based protocol (CBP) in nonexclusively licensed bands

The granting of licenses on a nonexclusive, uncoordinated basis in the same area leads to the possibility of overlapping networks. When overlapping networks cause co-channel interference, regulations, such as those governing the 3650 MHz band in the United States and its territories, require the use of a CBP “by which a

[23] In some licensed frequency bands, wireless equipment can be owned and operated by individuals who do not hold a license. In such instances, devices are permitted to operate only if they are either communicating with, or receiving permission to transmit from, a STA that is maintained by a licensed operator. The Japanese 4.9 GHz band and the United States and its territories 4.94–4.99 GHz public safety band are examples in which IEEE 802.11 STAs operate under such arrangements.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

transmitter provides reasonable opportunities for other transmitters to operate."[24] IEEE 802.11 carrier sense multiple access with collision avoidance (CSMA/CA) is suitable for this purpose in most situations.

4.3.12.4 Using DSE STA identification to resolve interference

When CSMA/CA is not able to sufficiently sense the presence of another licensee's STA (i.e., a hidden STA) or if a secondary licensee causes inference to a primary licensee, the secondary licensee is obliged to resolve complaints that result from interference caused by any STA under its control (including dependent STAs). In order to facilitate the interference resolution processes, all STAs operating in nonexclusively licensed spectrum use the DSE STA and location information procedures.

The STA identification and location information procedures are tied because, by default, registered STAs broadcast their actual location as their unique identifier. Dependent STAs broadcast the location of the STA that has enabled them as well as a unique code selected by the licensee. This method puts a victim of the interference in contact with the party responsible for rectifying the problem, and, at the same time, it protects the privacy of the dependent STA's operator.

4.3.12.5 Further coexistence enhancements in nonexclusively licensed bands

While not explicitly required to meet specific rules, a number of optional IEEE 802.11 mechanisms, when used together, are able to meet general requirements for spectrum sharing, incumbent detection, and other cognitive radio functions in licensed bands. The specific mechanisms for each band are detailed in E.2.

4.3.13 High Throughput (HT) STA

The IEEE 802.11 HT STA provides PHY and MAC features that can support a throughput of 100 Mb/s and greater, as measured at the MAC data service access point (SAP). An HT STA supports HT features as identified in Clause 10 and Clause 19. An HT STA operating in the 5 GHz band supports transmission and reception of frames that are compliant with mandatory PHY specifications as defined in Clause 17. An HT STA operating in the 2.4 GHz band supports transmission and reception of frames that are compliant with mandatory PHY specifications as defined in Clause 16 and Clause 18. An HT STA is also a QoS STA. The HT features are available to HT STAs associated with an HT AP. A subset of the HT features is available for use between two HT STAs that are members of the same IBSS. Similarly, a subset of the HT features is available for use between two HT STAs that have established mesh peering (see 9.4.2.54 for details).

An HT STA has PHY features consisting of the modulation and coding scheme (MCS) set described in 19.3.5 and physical layer (PHY) protocol data unit (PPDU) formats described in 19.1.4. Some PHY features that distinguish an HT STA from a non-HT STA are referred to as *multiple input, multiple output (MIMO)* operation; spatial multiplexing (SM); spatial mapping (including transmit beamforming); space-time block coding (STBC); low-density parity check (LDPC) encoding; and antenna selection (ASEL). The allowed PPDU formats are non-HT format, HT-mixed format, and HT-greenfield format (see 19.1.4). The PPDUs can be transmitted with 20 MHz bandwidth and might be transmitted with 40 MHz bandwidth.

An HT STA has MAC features that include frame aggregation, some block ack features, reverse direction (RD), and protection mechanisms supporting coexistence with non-HT STAs.

4.3.14 Sub 1 GHz (S1G) STA

4.3.14.1 Overview

The IEEE 802.11 S1G STA operates in frequency bands below 1 GHz excluding the TV White Space bands.

[24] Definition of CBP from FCC 05-56, Report and Order and Memorandum Opinion and Order, clause 58.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An S1G STA supports S1G features identified in Clause 9, Clause 10, Clause 11, Clause 12, and Clause 23.

The main PHY features in an S1G STA are the following:

- Mandatory support for 1 MHz and 2 MHz channel width
- Mandatory support for S1G_1M PPDU
- Mandatory support for S1G_SHORT PPDU
- Mandatory support for S1G_LONG PPDU if ≥ 4 MHz channel width is supported
- Mandatory support for detection and decode of SIG-A field of the S1G_LONG preamble
- Mandatory support for single spatial stream S1G-MCS 0 to S1G-MCS 2 and S1G-MCS 10 (for 1 MHz PPDU only)
- Mandatory support for single spatial stream S1G-MCS 3 to S1G-MCS 7 in an S1G AP
- Mandatory support for binary convolutional code (BCC) coding
- Mandatory support for normal guard interval
- Mandatory support for fixed pilots
- Optional support for 2, 3, and 4 spatial streams (transmit and receive)
- Optional support for S1G_LONG PPDU if ≥ 4 MHz channel width is not supported
- Optional support for beamforming sounding (by sending an S1G NDP)
- Optional support for compressed beamforming feedback
- Optional support for STBC, LDPC (transmit and receive)
- Optional support for S1G MU PPDUs (transmit and receive)
- Optional support for 4 MHz, 8 MHz, or 16 MHz channel width
- Optional support for S1G-MCSs 8 and 9 (transmit and receive)
- Optional support for short guard interval
- Optional support for traveling pilots

The main MAC features supported for S1G STA are the following:

- Mandatory support for NDP Ack, NDP BlockAck, and NDP CTS frames; mandatory support for the reception of NDP Probe Request frame for S1G AP; optional support for other NDP CMAC PPDUs
- Mandatory support for the reception of PV1 MPDUs but optional support for the transmission of PV1 MPDUs
- Mandatory support for the second virtual carrier sensing mechanism, i.e., response indication deferral (RID)
- Mandatory support for the hierarchical structure of TIM element by an S1G AP
- Mandatory support for extended BSS max idle periods and extended listen intervals with unified scaling factor
- Optional support for RAW
- Optional support for relay
- Optional support for grouping of non-AP STAs and group AID
- Optional support for TWT
- Optional support for BDT
- Optional support for sectorization
- Optional support for non-TIM mode
- Optional support for asymmetric BA, fragment BA
- Optional support for page slicing, dynamic AID assignment for an S1G AP
- Optional support for authentication control

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Optional support for SST
— Optional support for rescheduling STA's awake/dozecycle
— Optional support for either a sensor STA or a non-sensor STA
— Optional support for an EL STA

NOTE—Some NDP CMAC PPDUs are mandatory under certain conditions as indicated in B.4.4.2.

Most S1G features help either reduce a STA's energy consumption or increase the usable range between an AP and a non-AP STA.

An S1G STA is a nonmesh STA, and a QoS STA that does not support HCCA.

4.3.14.2 S1G relay

The S1G relay is a mechanism for expanding the coverage area of an AP. The AP is referred to as the root AP. An S1G relay consists of an S1G relay AP and an S1G relay STA. An S1G relay forwards frames between STAs associated to its S1G relay AP and the AP to which its S1G relay STA is associated.

4.3.15 Very high throughput (VHT) STA

A VHT STA is an HT STA that, in addition to features supported as an HT STA, supports VHT features identified in Clause 9, Clause 10, Clause 11, Clause 14, Clause 17, and Clause 21, but operates only in the 5 GHz band.

The main PHY features in a VHT STA that are not present in an HT STA are the following:

— Mandatory support for 40 MHz and 80 MHz channel widths
— Mandatory support for VHT single-user (SU) PPDUs
— Optional support for 160 MHz and 80+80 MHz channel widths
— Optional support for VHT sounding protocol to support beamforming
— Optional support for VHT multi-user (MU) PPDUs
— Optional support for VHT-MCSs 8 and 9

The main MAC features in a VHT STA that are not present in an HT STA are the following:

— Mandatory support for the A-MPDU padding of a VHT PPDU
— Mandatory support for S-MPDU
— Mandatory support for responding to a bandwidth indication (provided by the RXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT) in a non-HT and non-HT duplicate RTS frame
— Optional support for MPDUs of up to 11 454 octets
— Optional support for A-MPDU pre-end-of-frame (pre-EOF) padding (see 9.7.1) of up to 1 048 575 octets
— Optional support for VHT link adaptation

Most VHT features, among other benefits, increase the maximum throughput achievable between two VHT STAs over that achievable using HT features alone. The VHT features are available to VHT STAs associated with a VHT AP. A subset of the VHT features is available for use between two VHT STAs that are members of the same IBSS. Similarly, a subset of the VHT features is available for use between two VHT STAs that have established mesh peering. A subset of the VHT features is available for use between two VHT STAs that have established a TDLS direct link.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The support for VHT transmit beamforming sounding and VHT MU PPDUs in a VHT AP and more than one VHT STA within a VHT BSS enables the optional use of downlink MU multiple input, multiple output (DL MU-MIMO). With DL MU-MIMO the AP can create up to four A-MPDUs, each carrying MPDUs destined for an associated MU beamformee capable STA. The AP uses group identifiers (GIDs) to signal potential recipient STAs. The AP transmits the A-MPDUs simultaneously in separate space-time streams such that each recipient STA is able to demodulate the space-time streams carrying its A-MPDU. The simultaneous transmission of A-MPDUs in a single VHT MU PPDU provides a means to increase aggregate throughput over that achieved by sending the A-MPDUs in separate SU PPDUs.

The use of certain HT features, such as reduced interframe space (RIFS), is not permitted for VHT STAs.

4.3.16 High-efficiency (HE) STA

The IEEE 802.11 HE STA operates in frequency bands between 1 GHz and 7.125 GHz.

In the 5 GHz and 6 GHz bands, the following apply:

- An HE STA is also a VHT STA if operating in the 5 GHz band, except that a 20 MHz-only HE STA does not support 40 MHz and 80 MHz channel widths
- An HE STA is also a STA that supports the OFDM PHY defined in Clause 17 if operating in the 6 GHz band
- Support for 20 MHz operating channel width is mandatory in an HE STA
- Support for 40 MHz and 80 MHz operating channel width is mandatory in an HE STA that is not a 20 MHz-only non-AP HE STA
- Support for 160 MHz and 80+80 MHz operating channel width is optional in an HE STA

In the 2.4 GHz band, the following apply:

- An HE STA is also an HT STA
- Support for 20 MHz operating channel width is mandatory in an HE STA
- Support for 40 MHz operating channel width is optional in an HE STA

The main PHY features in an HE STA that are not present in VHT STA or HT STA are the following:

- Mandatory support for DL and UL OFDMA
- Mandatory support for DL MU-MIMO by an HE AP that supports 4 or more spatial streams when MU-MIMO is done on the entire PPDU bandwidth
- Mandatory support for DL MU-MIMO reception for a non-AP HE STA
- Mandatory support for the HE sounding protocol to support beamforming for a non-AP STA beamformee and optional otherwise
- Optional support for HE-MCSs 10 and 11
- Optional support for UL MU-MIMO
- Optional support for preamble puncturing

NOTE—Preamble puncturing is a mechanism whereby OFDMA is used to avoid transmissions in certain subcarriers.

The main MAC features in an HE STA that are not present in VHT STA or HT STA are the following:

- In an AP, mandatory support for the role of operating mode indication (OMI) responder and optional support for the role of OMI initiator
- In an AP, mandatory support for individual target wake time (TWT) operation
- In a non-AP STA, mandatory support for two NAV operation
- In a non-AP STA, mandatory support for multiple BSSID operation

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— In an AP, optional support for two NAV operation
— In a non-AP STA, optional support for the roles of OMI initiator and responder
— In a non-AP STA, optional support for individual TWT operation
— Optional support for dynamic fragmentation levels 1, 2, and 3
— Optional support for broadcast TWT
— Optional support for UL OFDMA-based random access (UORA)
— Optional support for spatial reuse operation
— Optional support for multi-TID A-MPDU operation
— Optional support for ER BSS
— Optional support for the NDP feedback report

An HE AP sends a Trigger frame to initiate UL MU operation using UL OFDMA or UL MU-MIMO transmissions or a frame containing a TRS Control subfield to initiate UL OFDMA transmissions. The frame initiating these transmissions in the uplink direction is a triggering frame. The triggering frame identifies non-AP STAs participating in UL MU operation and assigns RUs and/or spatial streams to these STAs. Multi-STA BlockAck frames can be used by the AP to acknowledge the frames transmitted by multiple non-AP STAs. The scheduling of these Trigger frames can be set up between a non-AP STA and the AP using TWT operation to save power and reduce collisions.

These features can reduce protocol overhead and increase aggregate network throughput (e.g., DL and UL OFDMA, DL/UL MU-MIMO), enhance peak link throughput (e.g., HE-MCS 10, 11), enhance dense network efficiency (e.g., spatial reuse), and/or enhance power conservation (e.g., TWT). These features can improve the average throughput per STA in a BSS by a factor of four, compared to VHT.

4.3.17 Wake-up radio (WUR) AP and WUR non-AP STA

A WUR non-AP STA is a non-HT, HT, VHT, or HE non-AP STA that is capable of receiving WUR PPDUs and supports the WUR operation. A WUR non-AP STA has a capability to receive a WUR PPDU at a power consumption of less than 1 milliwatt.

A WUR AP is a non-HT, HT, VHT, or HE AP that is capable of transmitting WUR PPDUs and supports the WUR operation.

A WUR Basic PPDU carries a WUR frame. A WUR FDMA PPDU carries more than one WUR frame. A WUR AP transmits a WUR PPDU to an intended recipient WUR non-AP STA or multiple intended recipient WUR non-AP STAs. There are five types of WUR frames that provide the following functions:

— WUR Beacon frames are transmitted by a WUR AP and used by a WUR non-AP STA to maintain timing synchronization to support the WUR duty cycle operation.
— WUR Wake-up frames provide notification to one or more WUR non-AP STA(s) that a WUR AP has buffered data and/or critical update of BSS parameters for the WUR non-AP STA(s), which enables the WUR non-AP STAs to remain in power save when there is no data to receive and enables the WUR non-AP STAs to react promptly to incoming traffic and critical update of BSS parameters.
— WUR Short Wake-up frames are shortened version of the WUR Wake-up frames.
— WUR Discovery frames support the discovery of WUR APs by a WUR non-AP STA at low power consumption.
— WUR Vendor Specific frames support vendor specific operations.

WUR PPDUs are either WUR Basic PPDUs or WUR FDMA PPDUs. The transmission and reception of WUR PPDUs is defined for the 2.4 GHz and 5 GHz bands. The transmission of 40 MHz WUR FDMA

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

PPDUs is defined for the 2.4 GHz and 5 GHz bands and the transmission of 80 MHz WUR FDMA PPDUs is defined for the 5 GHz band.

The details of the WUR power management procedure are defined in 29.8.

A WUR AP has the following mandatory main features:

- Transmission of a WUR Basic PPDU on a 20 MHz channel at low data rate (LDR).
- Transmission of a WUR Basic PPDU on a 20 MHz channel at high data rate (HDR).
- Support of the WUR power management procedure.
- Support of the WUR wake-up operation.
- Support of the WUR duty cycle operation.
- Transmission of an individually addressed fixed-length (FL) WUR Wake-up frame.
- Transmission of a broadcast FL WUR Wake-up frame.
- WUR Beacon frame generation.

A WUR AP has the following optional main features:

- Transmission of a WUR FDMA PPDU on a 40 MHz or 80 MHz channel.
- Transmission of a variable-length (VL) WUR frame.
- Support for WUR frame protection.
- Transmission of a WUR Wake-up frame with a WUR group ID.
- Transmission of a WUR Short Wake-up frame.
- Support for WUR Discovery.

A WUR non-AP STA has the following mandatory main features:

- Reception of a WUR Basic PPDU on a 20 MHz channel at LDR.
- Support of the WUR power management procedure.
- Support of the WUR wake-up operation.
- Reception of an individually addressed FL WUR Wake-up frame.
- Reception of a broadcast FL WUR Wake-up frame.
- Synchronization using WUR Beacon frame.

A WUR non-AP STA has the following optional main features:

- Reception of a WUR Basic PPDU on a 20 MHz channel at HDR.
- Support of the WUR FDMA operation (see 29.11).
- Support of the WUR duty cycle operation (see 29.7).
- Reception of a VL WUR frame.
- Support for WUR frame protection.
- Reception of a WUR Wake-up frame with a WUR group ID.
- Reception of a WUR Short Wake-up frame.
- Support for WUR Discovery.

4.3.18 Television very high throughput (TVHT) STA

The IEEE 802.11 TVHT STA operates in television white spaces (TVWS) bands.

A TVHT STA supports all mandatory features of a VHT STA as mandatory features except for HT-mixed format PPDUs and 20 MHz, 40 MHz, and 80 MHz channel widths. A TVHT STA supports all optional

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

features of a VHT STA as optional features except for HT-greenfield format PPDUs, 160 MHz or 80+80 MHz channel widths, more than 4 spatial streams, and Short GI (which is mandatory).

The 20 MHz, 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz channel widths and more than 4 spatial streams are not used in STAs operating as TVHT STAs. The features and behaviors of VHT STAs specified in Clause 6, Clause 8, Clause 9, Clause 10, Clause 11, Clause 14, and Annex G apply to TVHT STAs as well, unless stated otherwise.

For Clause 6, Clause 8, Clause 9, Clause 10, Clause 11, and Clause 14, the following replacements are applied for TVHT STAs:

- "TVHT_W/TVHT_2W" replaces "20/40 MHz".
- "TVHT_W/TVHT_2W/TVHT_4W" replaces "20/40/80/160 MHz".
- "TVHT_W", "TVHT_2W", and "TVHT_4W" replace "20 MHz", "40 MHz", and "80 MHz," respectively.
- "TVHT_W" replaces "CBW20".
- "TVHT_2W" replaces "CBW40".
- "TVHT_4W" replaces "CBW80" and "CBW80+80".
- "secondaryTVHT_2W" replaces "secondary40".
- "TVHT STA" replaces "VHT STA".
- "TVHT AP" replaces "VHT AP".
- "TVHT BSS" replaces "VHT BSS".
- "TVHT-MCS" replaces "VHT-MCS".
- "TVHT Operation" replaces "VHT Operation".
- "dot11TVHTOptionImplemented" replaces "dot11VHTOptionImplemented".
- "dot11TVHTControlFieldOptionImplemented" replaces both "dot11VHTControlFieldOptionImplemented" and "dot11HTControlFieldSupported".
- "dot11TVHTShortGIOptionIn4WActivated" replaces "dot11VHTShortGIOptionIn80Activated".
- "dot11TVHTSUBeamformerOptionImplemented" replaces "dot11VHTSUBeamformerOptionImplemented".
- "dot11TVHTSUBeamformeeOptionImplemented" replaces "dot11VHTSUBeamformeeOptionImplemented".
- "dot11TVHTMUBeamformerOptionImplemented" replaces "dot11VHTMUBeamformerOptionImplemented".
- "dot11TVHTMUBeamformeeOptionImplemented" replaces "dot11VHTMUBeamformeeOptionImplemented".
- "dot11TVHTTXOPPowerSaveOptionImplemented" replaces "dot11VHTTXOPPowerSaveOptionImplemented".
- "dot11TVHTOBSSScanCount" replaces "dot11VHTOBSSScanCount".
- "dot11TVHTExtendedNSSBWCapable" replaces "dot11VHTExtendedNSSBWCapable".
- Reference to 9.4.1.48 replaces reference to 9.4.1.47.
- Reference to 9.4.1.50 replaces reference to 9.4.1.49.
- Reference to 9.4.2.170 replaces reference to 9.4.2.157.
- Reference to 11.41 replaces reference to 11.38.1.
- Reference to Clause 22 and its subclauses replace reference to Clause 21 and its subclauses.

For Annex G, the following replacements are applied for TVHT STAs:

- "TVHT" replaces "VHT".

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— “tvht” replaces “vht”.

The main PHY features in a TVHT STA that are not present in a VHT STA are the following:

— Mandatory support for TVHT_W channel width.
— Optional support for TVHT_W+W channel width.
— Optional support for TVHT_2W channel width.
— Optional support for TVHT_4W channel width.
— Optional support for TVHT_2W+2W channel width.

These TVHT features are available to TVHT STAs associated with a TVHT AP. A subset of the TVHT features is available for use between two TVHT STAs that are members of the same IBSS.

4.3.19 STA transmission of Data frames outside the context of a BSS

In addition to defining procedures for STA communication within a BSS, this standard also defines procedures for a STA that is not a member of a BSS to transmit Data frames. Such Data frames are defined as being transmitted outside the context of a BSS (OCB). A STA transmits a Data frame outside the context of a BSS only if dot11OCBActivated is true.

NOTE—The specific frame subtypes that a STA is allowed to send when it has dot11OCBActivated true are specified in 11.18.

When dot11OCBActivated is true, a Data frame can be sent to either an individual or a group destination MAC address. This type of communication is possible only between STAs that are able to communicate directly over the wireless medium. It allows immediate communication, avoiding the latency associated with establishing a BSS. When dot11OCBActivated is true, a STA is not a member of a BSS and it does not utilize the IEEE 802.11 authentication, association, or data confidentiality services. This capability is particularly well suited for use in rapidly varying communication environments such as those involving mobile STAs in which the interval over which the communication exchanges take place is of very short duration (e.g., on the order of tens or hundreds of milliseconds). Since IEEE 802.11 MAC sublayer authentication services are not used when dot11OCBActivated is true, any required authentication services are provided by the station management entity (SME) or by applications outside of the MAC sublayer, such as those described in the IEEE 1609 [B20] family of standards.

A STA whose MIB does not include dot11OCBActivated operates as if the attribute is false.

Communication of Data frames when dot11OCBActivated is true might take place in a frequency band that is dedicated for its use, and such a band might require licensing depending on the regulatory domain (see Annex E). A STA for which dot11OCBActivated is true initially transmits and receives on a channel known in advance, either through regulatory designation or some other out-of-band communication. A STA’s SME determines PHY parameters, as well as any changes in the operating channel, e.g., using information obtained via out-of-band communication or over-the-air frame exchange. When dot11OCBActivated is true, a sending STA sets the BSSID field to the wildcard BSSID(#3522)(see 9.2.4.3.4).

A STA with dot11OCBActivated equal to true might operate as a DMG STA. A DMG STA with dot11DMGOCBActivated equal to true supports the MAC and MLME functions defined in 31.3 in addition to the MAC functions defined in Clause 10 and the MLME functions defined in Clause 11 for DMG STAs. A DMG STA operating OCB might support EDMG features.

A STA whose MIB does not include the dot11DMGOCBActivated attribute operates as if the attribute is false.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Vendor Specific Action frame (see 9.6.5) provides one means for STAs to exchange management information prior to communicating Data frames outside the context of a BSS.

4.3.20 Next generation vehicle-to-everything (V2X) (NGV) STA

A next generation vehicle-to-everything (NGV) STA provides MAC and PHY features as defined in Clause 31 and Clause 32. An NGV STA supports at least twice the throughput and at least 3 dB better receiver minimum input sensitivity than a non-NGV STA when operating OCB in high mobility channel environments in the 5.9 GHz band as defined in Annex E.2.3 and Annex E.2.4. The double throughput and higher receiver minimum input sensitivity might not be supported simultaneously. In an NGV STA dot11NGVOptionImplemented is true. In a non-NGV STA with dot11NGVOptionImplemented, the attribute is false. A STA whose MIB does not include the dot11NGVOptionImplemented attribute operates as if the attribute is false.

An NGV STA might be co-located with a DMG STA for which dot11DMGOCBActivated is true in the 60 GHz frequency band (57 GHz to 71 GHz) as defined in E.1. The NGV STA might assist the DMG STA in performing DMG discovery OCB by communicating with a peer NGV STA to exchange the higher layer information that contains information of a peer DMG STA with which the peer NGV STA is co-located. The information is provided from/to a DMG STA through the MLME SAP interface. The protocol to exchange this higher layer information is outside the scope of this standard.

An NGV STA supports interoperability, coexistence, backward compatibility, and fairness in contending for the medium with non-NGV STAs when operating OCB in the 5.9 GHz band. An NGV STA is also a non-NGV STA that supports transmission and reception of non-NGV PHY PPDUs when operating OCB in the 5.9 GHz band.

An NGV STA is capable of transmitting and receiving frames OCB as specified in 11.18.

The main PHY features of an NGV STA that are not present in a non-NGV STA are the following:

- Mandatory support for the 10 MHz NGV PPDU format and optional support for the 20 MHz NGV PPDU and 20 MHz non-NGV duplicate PPDU formats
- For the 20 MHz and 10 MHz NGV PPDU, mandatory support for LDPC coding, midambles, BPSK-DCM, and 256-QAM
- Mandatory support for transmit spectral mask C2 by a STA that transmits a 20 MHz NGV PPDU or 20 MHz non-NGV duplicate PPDU
- Mandatory support for repetitive NON_NGV_10 PPDU
- Mandatory support for coexistence with non-NGV STAs operating in the same channel
- Mandatory support for transmit spectral mask C by a STA that transmits a 10 MHz NGV PPDU and belongs to transmit power class C
- Optional support for transmission and reception of SU MIMO with two spatial streams

Additional NGV STA PHY features are:

- Mandatory support for a single spatial stream
- Mandatory support for Clause 17 10 MHz PPDU
- Optional support for Classes A, B, and D of spectrum mask requirement for 10 MHz bandwidth

The main MAC features of an NGV STA that are not present in a non-NGV STA are the following:

- Mandatory support for coexistence with non-NGV STAs operating in the same channel
- Mandatory support for extended MAC service interface to provide higher layers with the ability to control NGV transmissions and receive status regarding NGV receptions and the radio environment

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Mandatory support for NGV capability indication for non-NGV PPDUs encoded in the Duration/ID field of the MAC header
— Mandatory support for block ack
— Mandatory support for reception of frame aggregation when communicating OCB
— Optional support for transmission of frame aggregation when communicating OCB
— Optional support for 20 MHz OCB communication
— For optional 20 MHz OCB communication an NGV STA supports 20 MHz channel access with 10 MHz primary and 10 MHz secondary channels
— Optional support for 20 MHz non-NGV duplicate operation

Additional NGV STA MAC features are:

— Mandatory support for 10 MHz OCB communication

An NGV STA might support positioning based on NGV ranging, which consists of a subset of fine timing measurement (FTM) functionalities as defined in 11.21.6 and Annex P.3:

— FTM procedure negotiation and termination for non-TB ranging as defined in 11.21.6.3 and non-TB ranging as described in 11.21.6.4.4
— Differential distance computation as detailed in P.3

An NGV STA might be co-located with a STA operating outside the 5.9 GHz band that supports the FTM procedure as defined in 11.21.6.

4.3.21 Tunneled direct link setup

Tunneled direct link setup (TDLS) is characterized by the use of signaling frames that are encapsulated in Data frames so that the signaling frames are transmitted through an AP transparently. Therefore, the AP does not need to be TDLS direct link aware, nor does it have to support the same set of capabilities that are used on the TDLS direct link, in order for TDLS to be used. To allow a STA to enter a TDLS power save mode, TDLS provides two power save mechanisms: TDLS peer unscheduled automatic power save delivery (U-APSD) (TPU) and TDLS peer power save mode (PSM). TDLS allows STAs to use the TDLS PeerKey (TPK) handshake to provide data confidentiality and message authentication. STAs that set up a TDLS direct link remain associated with the AP and transmit frames directly to the other TDLS peer STA.

4.3.22 Wireless network management

4.3.22.1 Overview

Wireless network management (WNM) enables STAs to exchange information for the purpose of improving the overall performance of the wireless network. STAs use WNM protocols to exchange operational data so that each STA is aware of the network conditions, allowing STAs to be more cognizant of the topology and state of the network. WNM protocols provide a means for STAs to be aware of the presence of colocated interference, and enable STAs to manage RF parameters based on network conditions.

In addition to providing information on network conditions, WNM also provides a means to exchange location information, provide support for the multiple BSSID capability on the same wireless infrastructure, support efficient delivery of group addressed frames, and enable a WNM sleep mode in which a STA can sleep for long periods of time without receiving frames from the AP.

The WNM service includes the following:

— BSS max idle period management
— BSS transition management

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Channel usage
— Colocated interference reporting
— Diagnostic reporting
— Directed multicast service (DMS)
— Event reporting
— Flexible multicast service (FMS)
— Location services
— Multicast diagnostic reporting
— Multiple BSSID capability
— Proxy Address Resolution Protocol (ARP)
— QoS traffic capability
— SSID list
— Triggered STA statistics
— TIM broadcast
— Timing measurement
— Traffic filtering service
— U-APSD coexistence
— WNM notification
— WNM sleep mode

4.3.22.2 BSS max idle period management

BSS max idle period management enables an AP to indicate a time period during which the AP does not disassociate a STA due to nonreceipt of frames from the STA. This supports improved STA power saving and AP resource management.

NOTE—The AP might disassociate the STA if, for example, that STA does not respond to group key handshake message 1. The STA might use WNM sleep mode (see 4.3.22.23) to avoid getting disassociated in such a case.

4.3.22.3 BSS transition management

BSS transition management enables an AP to request non-AP STAs to transition to a specific AP, or to indicate to a non-AP STA a set of preferred APs, due to network load balancing or BSS termination.

4.3.22.4 Channel usage

Channel usage information is provided by the AP to the non-AP STA to recommend channels for BSSs that are not infrastructure BSSs or an off-channel TDLS direct link. The non-AP STAs can use the channel usage information as part of channel selection processing for a BSS that is not an infrastructure BSS or an off-channel TDLS direct link.

4.3.22.5 Colocated interference reporting

Colocated interference reporting enables the requesting STA to obtain information on interference due to colocated radios at the reporting STA. The requesting STA can use that information to schedule its transmissions to minimize the effects of the interference.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

4.3.22.6 Diagnostic reporting

Diagnostic requests enable a STA to request a non-AP STA to report information that might be helpful in diagnosing and resolving problems with the WLAN. Diagnostic reports include information on hardware, configuration, and STA capabilities.

4.3.22.7 Directed multicast service (DMS)

The DMS enables a non-AP STA to request the AP to transmit group addressed frames destined to the requesting STA as individually addressed frames.

4.3.22.8 Event reporting

Event requests enable a STA to request a non-AP STA to send particular real-time event reports. The types of events include transition, RSNA, WNM log, BSS color collision, BSS color in use, and peer-to-peer link events. A transition event is transmitted after a non-AP STA successfully completes a BSS transition. Transition events are used to diagnose transition performance problems. An RSNA event report describes the type of Authentication used for the RSNA. RSNA events are used to diagnose security and authentication performance problems. A WNM log event report enables a non-AP STA to transmit a set of WNM log event messages to the requesting STA. WNM log event reports are used to access the contents of a STA's WNM log. A BSS color collision event report enables a non-AP HE STA to signal BSS color collision to its associated AP. A BSS color in use event report enables a non-AP HE STA to signal a BSS color in use by the non-AP HE STA to its associated AP. A peer-to-peer link event report enables a non-AP STA to inform the requesting STA that a peer-to-peer link has been established. Peer-to-peer link event reports are used to monitor the use of peer-to-peer links in the network.

4.3.22.9 Flexible multicast service (FMS)

The flexible multicast service enables a non-AP STA to request an alternate delivery traffic indication map (DTIM) beacon delivery interval for one or more sets of group addressed streams that the non-AP STA receives. This enables the non-AP STA to transition to awake state at the alternate DTIM interval rather than every DTIM beacon and enables significant power saving when a non-AP STA receives group addressed traffic. The FMS also enables a STA to establish a data rate and delivery interval for group addressed traffic higher than the minimum data rate available.

4.3.22.10 Location services

Location Configuration Request and Response frames enable STAs to configure a collection of location related parameters for Location Track Notification frames. The AP can indicate that it can provide location data to support applications such as emergency services. Location services also provide the ability for STAs to exchange location information using Radio Measurement Request and Radio Measurement Report frames. The protocol supports exchange-by-value and exchange-by-reference mechanisms. Exchange-by-value can be performed in geospatial (LCI) and civic formats. Exchange-by-reference can be performed using a URL that defines from where the location value is retrieved (in a location identifier report).

4.3.22.11 Multicast Diagnostic report

Multicast Diagnostic reports enable a non-AP STA to report statistics for multicast traffic it received from a transmitting STA. This can be used by an AP to measure quality of multicast reception by a non-AP STA.

4.3.22.12 Multiple BSSID capability

The Multiple BSSID capability enables the advertisement of information for BSSIDs using a single Beacon or Probe Response frame instead of multiple Beacon and Probe Response frames, each corresponding to a

single BSSID. The Multiple BSSID capability also enables the indication of buffered frames for multiple BSSIDs using a single TIM element in a single beacon.

4.3.22.13 Proxy ARP

The IETF has defined a Proxy ARP function for IPv4 (IETF RFC 1027) and an IPv6 Neighbor Discovery (ND) Proxy function for IPv6 (IETF RFC 4389) where the proxy impersonates the target by replying to IPv4 ARP and IPv6 ND query respectively with its own MAC address for devices that are effectively reachable but not bridgeable beyond self. But those functions differ from the ones provided by the Proxy ARP service where the proxy would reply on behalf of the target. Therefore, the term Proxy ARP service in this standard does not refer to the functions defined in those RFCs. However, the Proxy ARP service in this standard for both IPv4 and IPv6 is similar to the function described in IETF RFC 7342.

The Proxy ARP service enables an AP to avoid forwarding to the BSS broadcast ARP frames for IPv4 (IETF RFC 826) and IP layer multicast packets IPv6 ND messages for IPv6 (IETF RFC 4861 and IETF RFC 4862) which target not match the address of an associated STA. If the target matches the address of an associated non-AP STAs, the Proxy ARP service can either respond on behalf of the non-AP STA, or preferably send the frames as individually addressed frames to the target STA(s) only. As a result, an associated STA that is not a target is not exposed to extraneous IPv4 ARP frames or IPv6 Neighbor Discovery packets. This way, the Proxy ARP service reduces the amount of broadcast transmissions and enables associated STAs to remain in power save for longer periods of time.

For IPv6, the Proxy ARP service follows the recommendations in section 7 of IETF RFC 4389. In contrast to IPv4 ARP, IPv6 ND is still in evolution, and it might be hazardous for a proxy function to answer on behalf of the STA, when the STA might desire to use specific options in its own responses that the proxy ARP service is not aware of. For that reason, the Proxy ARP service for IPv6 effectively follows IETF RFC 8929 which recommended that the AP just turns the broadcast into a frame individually addressed to the targeted STA as suggested by IETF RFC 6085, rather than responds on its behalf.

4.3.22.14 QoS traffic capability

QoS traffic capability procedures enable the QoS STA to indicate that it is capable of transmitting traffic belonging to the corresponding UP from applications that require generation of such traffic. The QoS Traffic Capability might be used for example as an input to estimate the blocking probability of a voice application based on the number of voice capable non-AP STAs.

4.3.22.15 SSID list

The SSID List element enables the non-AP STA to request information on a list of SSIDs. This is intended to reduce the number of Probe Request frames sent by the non-AP STA.

4.3.22.16 Triggered STA statistics

The Triggered STA Statistics reporting capability enables generation of a STA statistics report (see 4.3.11.9) when the statistics of interest reach a predefined threshold.

4.3.22.17 TIM broadcast

The TIM broadcast protocol defines a mechanism to enable a STA to receive an indication of buffered individually addressed traffic, independent of the Beacon frame, reducing the wake time of the STA.

4.3.22.18 Timing measurement

Timing Measurement frames allow a recipient STA to accurately measure the offset of its clock relative to a clock in the sending STA. With the regular transfer of Timing Measurement frames from one STA to another, it is possible for the recipient STA to track changes in the offset of its clock with respect to the sending STA over time and thus detect and compensate for any drift between the clocks.

4.3.22.19 FTM

The FTM procedure allows a STA to accurately measure the round trip time (RTT) between it and another STA. f used with multiple peer STAs, the STA can track changes in its relative position with those peer STAs. If the absolute position of the peer STAs is known, then the STA can determine its absolute position. A STA executes the FTM procedure with multiple peers and uses the resulting relative location estimates along with the absolute position of each of the peers to determine its position in geospatial coordinates.

The STA can also estimate the direction of the transmission (angle of departure) of frames transmitted to and reception (angle of arrival) of frames received from a peer STA, allowing for estimating position using measurements obtained from frame exchanges with a single peer.

An FTM session is negotiated to determine range estimates by executing one of the measurement exchanges listed below:

— EDCA based exchange of FTM frames where location estimates are based on time of departure and time of arrival of the exchanged FTM frames and their corresponding acknowledgments. When the negotiated FTM session is over EDMG, security parameters can be negotiated to ensure that the measurement exchange is executed with the intended peer.

— Trigger-based (TB) measurement where location estimates are based on the execution of the trigger-based measurement exchange. This mode of operation allows for the execution of the measurement exchange between a responding STA (RSTA) and multiple initiating STAs (ISTAs) at the same time. Optionally, the TB measurement session can be negotiated to enable security parameters enabling mechanisms to ensure that the measurement exchange is executed with the intended peer.

— Non-Trigger-based (non-TB) measurement where location estimates are based on the execution of the non-TB measurement exchange. Optionally, the non-TB measurement session can be negotiated to enable security parameters enabling mechanisms to ensure that the measurement exchange is executed with the intended peer.

— A passive trigger-based (TB) Ranging measurement exchange is defined where a STA can determine its location based on periodic measurement reports from other STAs that execute the passive TB ranging measurement exchange amongst themselves.

The preassociation security negotiation protocol establishes a PTKSA for the exchange of protected frames without association, for example for establishing a secure FTM session and performing the corresponding secure measurement exchange between two unassociated peers.

4.3.22.20 Traffic filtering service

The traffic filtering service enables an AP to determine if MSDUs and Management frames destined for a STA match a specific set of traffic filters that are enabled at the AP per the request of the STA. Individually addressed frames that do not match any of the traffic filters in the set are discarded. Individually addressed frames that do match at least one of the set of the enabled traffic filters are delivered to the STA. The STA can also negotiate to have a notification frame sent prior to the delivery of the frame matching the traffic filter.

4.3.22.21 U-APSD coexistence

The U-APSD coexistence capability enables the non-AP STA to indicate a requested transmission duration to the AP for use of U-APSD service periods. Use of the transmission duration enables the AP to transmit frames during the service period and improve the likelihood that the non-AP STA receives the frames when the non-AP STA is experiencing interference. The U-APSD coexistence capability reduces the likelihood that the AP transmits frames during the service period that are not received.

4.3.22.22 WNM notification

WNM notification provides a mechanism for a STA to notify another STA of a management event. The following events are defined:

— Firmware update notification
— Beacon protection failure

4.3.22.23 WNM sleep mode

WNM sleep mode is an extended power save mode for non-AP STAs in which a non-AP STA need not listen for every DTIM beacon, and need not perform GTK/IGTK/BIGTK updates. WNM sleep mode enables a non-AP STA to signal to an AP that it might sleep for a specified length of time. This enables a non-AP STA to reduce power consumption and remain associated while the non-AP STA has no traffic to send to or receive from the AP.

4.3.23 Subscription service provider network (SSPN) interface

An AP can interact with external networks using a SSPN interface for the purpose of authenticating users and provisioning services, as shown in Figure 4-8 . The exchange of authentication and provisioning information between the SSPN and the AP passes transparently through the portal. The protocol used to exchange this information is outside the scope of this standard. The logical SSPN interface provides the means for an AP to consult an SSPN for authenticating and authorizing a specific non-AP STA and to report statistics and status information to the SSPN. Authentication and provisioning information for non-AP STAs received from the SSPN are stored in the AP management information base (MIB) and are used to limit layer-2 services provided to that non-AP STA. Detailed interactions describing the SSPN interface are provided in 11.22.5.

The SSPN interface provides the non-AP STA access to the services provisioned in the SSPN via the currently associated BSS. Services might include virtual local area network (VLAN) mapping and tunnel establishment that are transparent to the non-AP STA and outside the scope of this standard. The SSPN interface also allows the non-AP STA to access services in destination networks (DNs) other than the SSPN. An example of a DN other than SSPN is the provision of Internet access via the IEEE 802 LAN, or an intermediary network that connects the IEEE 802.11 infrastructure and the SSPN.

NOTE—The SSPN Interface Service is not supported in an IBSS.

4.3.24 Mesh BSS

4.3.24.1 General

The IEEE 802.11 mesh facility provides MAC enhancements to support wireless LAN mesh topologies. The mesh facilities are available to mesh STAs that belong to a mesh BSS (MBSS). Only the mesh discovery service is available to a mesh STA that has not become a member of an MBSS. The enhancements that distinguish mesh STAs from nonmesh STAs are collectively termed the “mesh facility.” The mesh-specific mechanisms vary among implementations.

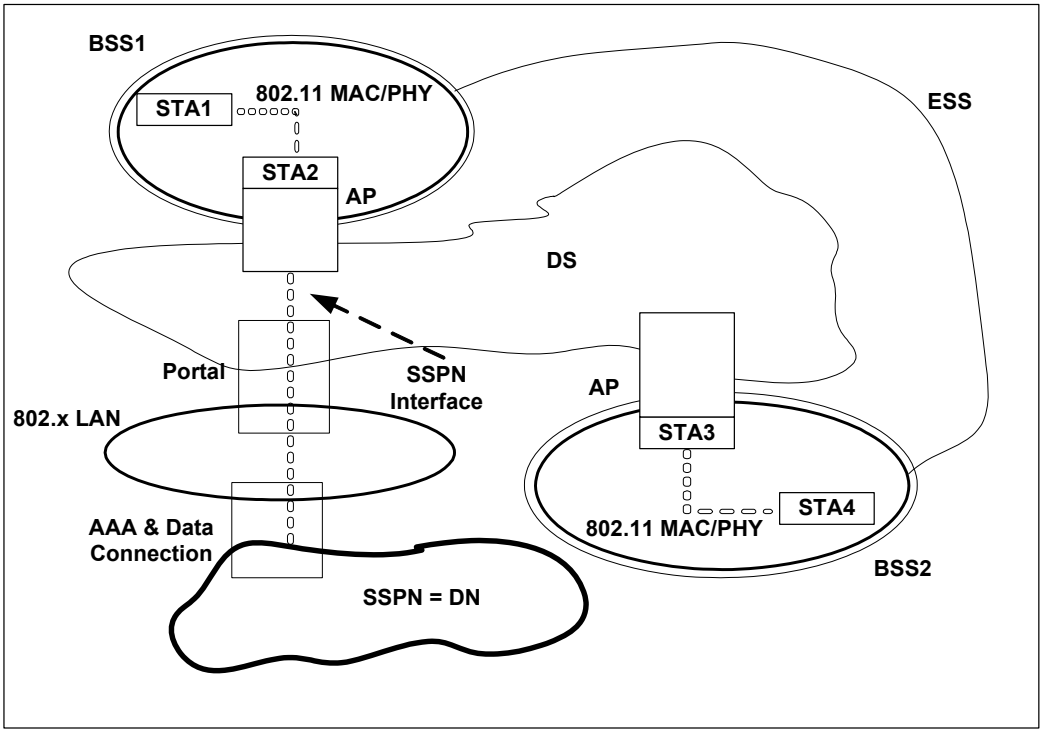

Figure 4-8—SSPN interface service architecture

4.3.24.2 Overview of the mesh BSS

A mesh BSS is an IEEE 802.11 LAN consisting of autonomous STAs. Inside the mesh BSS, all STAs establish wireless links with neighbor STAs to mutually exchange MSDUs. Further, using the multi-hop capability, MSDUs and Management frames can be transferred between STAs that are not in direct communication with each other over a single instance of the wireless medium. From the data delivery point of view, the MAC service of a STA in an MBSS appears to provide the exchange of MSDUs directly to any other STA in the MBSS, even if the STAs are not within range of each other. The multi-hop capability enhances the range of the STAs and benefits wireless LAN deployments.

STAs in a mesh BSS might be sources, sinks, or propagators of traffic; some mesh STAs might propagate traffic for other STAs, but do not act as a source or sink of traffic. As described in 4.3.24.4, a mesh BSS might have interfaces to external networks and can be a DSM for infrastructure BSSs.

Within a mesh BSS, STAs utilize the mesh coordination function (MCF) to access the channel. MCF is based on the core QoS facility described in 4.3.10, and a mesh BSS is categorized as one type of QoS BSS. MCF is specified in 10.24.

4.3.24.3 Mesh STA

A STA that belongs to a mesh BSS is termed a “mesh station” (mesh STA). Mesh STAs are QoS STAs that support mesh services, i.e., they participate in formation and operation of a mesh basic service set (MBSS). A mesh STA implements a subset of the QoS functionality:

— Use of QoS frame format
— EDCA (as a part of MCF)
— Block acknowledgment (optional)
— No acknowledgment (optional)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Use of TSPEC, TCLAS, and TCLAS Processing elements to establish DMS or GCR agreements (optional)

A mesh BSS does not incorporate the full hybrid coordinator (HC) and BSS QoS functionality. MBSSs do not incorporate the following:

— HCCA
— Traffic stream (TS) management
— Admission control
— Automatic power save delivery (APSD)
— Tunneled direct link setup (TDLS)

4.3.24.4 IEEE 802.11 components and mesh BSS

Example mesh and infrastructure BSSs are illustrated in Figure 4-9 . Only mesh STAs participate in mesh functionalities such as formation of the mesh BSS, path selection, and forwarding. Accordingly, a mesh STA is not a member of an IBSS or an infrastructure BSS. Consequently, mesh STAs do not communicate with nonmesh STAs.

However, instead of existing independently, an MBSS might also interconnect with other BSSs through the distribution system (DS) or a bridged LAN. Then, mesh STAs can communicate with nonmesh STAs. A logical architectural component is introduced in order to integrate the non-GLK mesh STA with the DS: the mesh gate. Data move between a non-GLK MBSS and the DS via one or more mesh gates. Thus the mesh gate is the logical point at which MSDUs from a non-GLK MBSS enter the DS. In a GLK MBSS, mesh STAs can communicate with nonmesh STAs via a GLK mesh STA with an attached bridge port and from there to the bridged LAN. Once an MBSS contains a mesh gate that connects it to the DS or a GLK mesh STA that connects it to an attached bridge port, the MBSS can be integrated with other infrastructure BSSs, given that their APs connect to the same DS or bridged network. Several mesh gates are shown in Figure 4-9 connecting different MBSSs to the DS.

When an MBSS accesses the DS or a bridged network, the MBSS can be integrated with a non-IEEE-802.11 LAN. To integrate a DS to which this MBSS connects, the DS needs to contain a portal. See 4.3.7. Consequently, mesh gate and portal are different entities. The portal integrates the IEEE 802.11 architecture with a non-IEEE-802.11 LAN (e.g., a traditional wired LAN). The mesh gate integrates the MBSS with the DS. A GLK mesh STA integrates the MBSS with a bridged network.

It is possible for one device to offer any combination of the functions of an AP, a portal, and a mesh gate; see 14.12.5. An example device combining the functions of an AP and a mesh gate is shown in Figure 4-10 . The implementation of such colocated entities is beyond the scope of this standard. The configuration of a mesh gate that is colocated with an access point allows the utilization of the mesh BSS as a distribution system medium. In this case, two different entities (mesh STA and access point) exist in the colocated device and the mesh BSS is hidden to STAs that associate to the access point. The mesh STA collocation is outlined in 14.12.5, which states that the usage of a distinct MAC address for each colocated STA avoids ambiguities.

4.3.24.5 Introduction to mesh functions

4.3.24.5.1 General

A mesh BSS is formed and operated by the set of services called *mesh services*. Mesh services are provided by the following major mesh facilities:

— Mesh discovery
— Mesh peering management

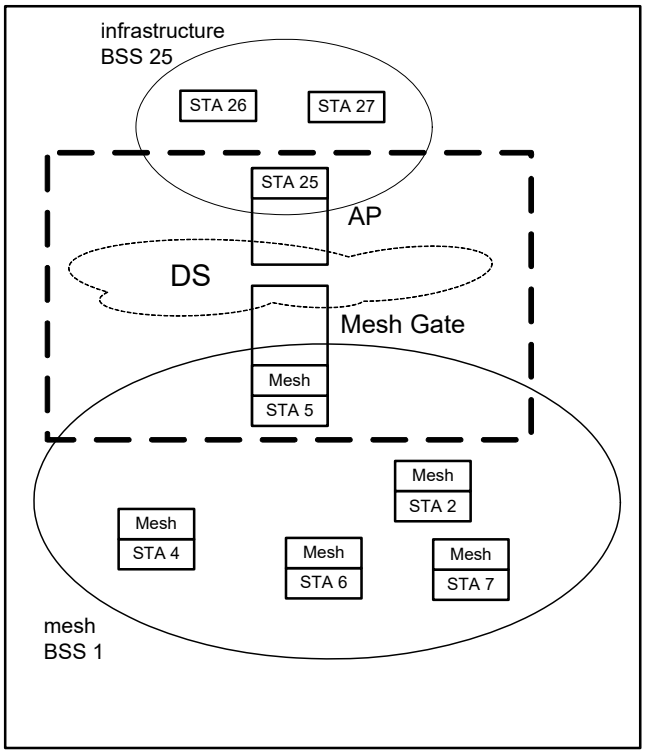

Figure 4-10—Example device consisting of mesh STA and AP STA to connect an MBSS and an infrastructure BSS

— Emergency service support in mesh BSS

4.3.24.5.2 Mesh discovery

A mesh STA performs either active scanning or passive scanning to discover an operating mesh BSS. Each mesh STA transmits Beacon frames periodically and responds with Probe Response frames when a Probe Request frame is received, so that neighbor mesh STAs can perform mesh discovery appropriately. The identification of the mesh BSS is given by the Mesh ID element contained in the Beacon and the Probe Response frames. The details for the mesh discovery facility are described in 14.3.

4.3.24.5.3 Mesh peering management (MPM)

Within a mesh BSS, direct communication between neighbor mesh STAs is allowed only when they are peer mesh STAs. After mesh discovery, two neighbor mesh STAs agree to establish a mesh peering to each other, and, after successfully establishing the mesh peering, they become peer mesh STAs. A mesh STA can establish a mesh peering with multiple neighbor mesh STAs. The mesh peering management (MPM) facilitates the mesh peering establishment and closure of the mesh peerings. The details of MPM are described in 14.4.

4.3.24.5.4 Mesh security

In an MBSS, mesh link security protocols are used to authenticate a pair of mesh STAs and to establish session keys between them. Mesh authentication protocols establish a shared, common pairwise master key (PMK), and authenticate a peer mesh STA. The authenticated mesh peering exchange protocol relies on the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

existence of the PMK between the two mesh STAs to establish an authenticated peering and derive session keys. The details of mesh security are described in 12.4, 14.4.3, 14.6, and 14.7.

4.3.24.5.5 Mesh beaconing and synchronization

In order to assist mesh discovery, mesh power management, and synchronization in a mesh BSS, all mesh STAs periodically transmit Beacon frames. Synchronization in a mesh BSS is maintained by the MBSS's active synchronization method. The default synchronization method is the neighbor offset synchronization method. Mesh beacon collision avoidance (MBCA) mitigates collisions of Beacon frames among hidden nodes. The details of mesh beaconing and synchronization are described in 14.14.

4.3.24.5.6 Mesh coordination function (MCF)

A mesh STA uses the mesh coordination function (MCF) for channel access. MCF consists of EDCA (contention based channel access defined in 10.24.2) and MCCA (controlled channel access defined in 10.24.3). MCCA is a reservation based channel access method and aims to optimize the efficiency of frame exchange sequences in a mesh BSS.

4.3.24.5.7 Mesh power management

A mesh STA can manage the activity level of its links per mesh peering. A mesh STA sets the activity level of each of its mesh peerings to either active mode, light sleep mode, or deep sleep mode. The mesh STA performs mesh power management mode tracking for each of its neighbor peer mesh STAs, and delivers the frames based on the rules defined in 14.15.

4.3.24.5.8 Mesh channel switching

When a mesh STA switches the operating channel, it uses the channel switching protocol defined in 11.8.8 and 11.9. The channel switching protocol enables the propagation of channel switch notifications throughout the mesh BSS, prior to the channel switch execution.

4.3.24.5.9 Frame addressing in an MBSS

Three address, four address, and extended address frame formats enable the distribution of MSDUs over multiple instances of the wireless medium within a mesh BSS and integration to the ESS. Frame format details are described in Clause 9 and 9.3.5.

4.3.24.5.10 Mesh path selection and forwarding

Mesh path selection enables path discovery over multiple instances of the wireless medium within a mesh BSS. The overview of the mesh path selection framework is described in 14.9. The hybrid wireless mesh protocol (HWMP) is defined as the default path selection protocol for the mesh BSS. HWMP provides both proactive path selection and reactive path selection. The details of HWMP are described in 14.11. The path selection protocol uses link metrics in the assessment of a mesh path to the destination. The details of link metrics are described in Table 14.10. The airtime link metric is the default link metric. The high PHY rate airtime link metric is another link metric intended for mesh STAs that are capable of transmitting frames with PHY rate higher than 54 Mb/s. The details of the airtime link metric and high PHY rate airtime link metric are described in 14.10.2.

Once the mesh path of a particular pair of the source mesh STA and the destination mesh STA is found through the mesh path selection function, mesh STAs propagate the data by the forwarding function. The details of the forwarding function are described in 10.37.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

As a result of the mesh path selection and forwarding, MSDUs are transmitted among all of the mesh STAs in a mesh BSS, even if the mesh STAs are not neighbor STAs of each other. Figure 4-11 depicts the MSDU transfer within a mesh BSS.

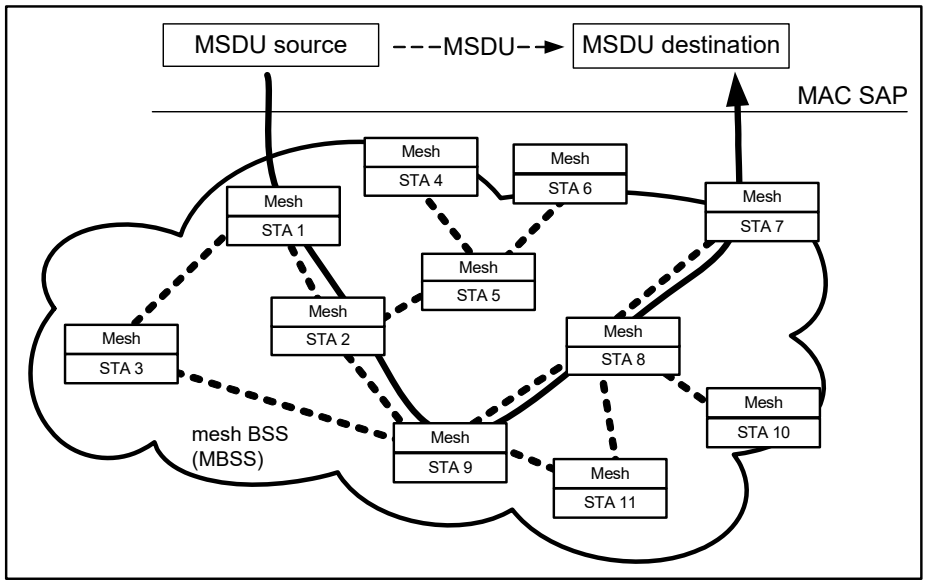

Figure 4-11—MAC data transport over an MBSS

4.3.24.5.11 Interworking with the DS

A mesh BSS might contain one or more mesh gates that connect to one or more distribution systems. A mesh gate can announce its presence in the mesh BSS by sending Gate Announcement frames. Alternatively a mesh gate can announce its presence in the mesh BSS by sending HWMP Path Selection frames with the RANN element or the PREQ element indicating mesh gate announcement, when it is configured as a root mesh STA. Typically a mesh gate announces its presence when it is colocated with a portal or it has access to a portal. Gate announcements allow mesh STAs to select the appropriate mesh gate and build a path toward it. Note that, when multiple mesh gates that have access to the same DS are present in the mesh BSS, proper configuration is necessary.

When a mesh gate has access to IEEE 802 STAs outside the mesh BSS, the mesh gate acts as a proxy for the IEEE 802 STAs outside the MBSS. Such a mesh gate is called a *proxy mesh gate*. The details of the proxy functionality are described in 14.12.3.

The details of the mesh BSS interworking are described in 14.12.

4.3.24.5.12 Intra-mesh congestion control

Intra-mesh congestion control is used to provide flow control over the multi-hop communication. Intra-mesh congestion control is useful to mitigate wasteful wireless medium utilization caused by buffer overflow at mesh STAs. Intra-mesh congestion control consists of three main mechanisms: local congestion monitoring and congestion detection, congestion control signaling, and local rate control. The details of the intra-mesh congestion control are described in 14.13.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

4.3.24.5.13 Emergency service support in mesh BSS

Depending on regulations, emergency services support might be mandated over the mesh network. In this case the Beacon and Probe Response frames inform whether a mesh STA supports emergency services, advertising to other mesh STAs that mesh peering for emergency services is possible. If a mesh STA subsequently requires emergency services, an emergency indication is then set within the Mesh Peering Open frame. Mesh STAs that support emergency services, accept peering from other mesh STAs requiring emergency services, transferring frames to an emergency server (such as a PSAP).

4.3.25 DMG STA

The IEEE 802.11 DMG STA provides PHY and MAC features that can support a throughput of 1 Gb/s and greater, as measured at the MAC data service access point (SAP). A DMG STA supports DMG features as identified in Clause 10, Clause 11, and Clause 20. Optionally, a DMG STA with dot11DMGOCBActivated equal to true supports features as identified in 31.3. A DMG STA operates in a DMG BSS and supports transmission and reception of frames that are compliant with PHY specifications as defined in Clause 20. A DMG STA is also a QoS STA. The basic channel access of a DMG STA (see 10.38) allows it to operate in an Infrastructure BSS, in an IBSS, and in a PBSS. Certain DMG features such as service period allocation are available only to DMG STAs that are associated with an AP or with a PCP, while other DMG features such as EDCA operation in a PBSS and DMG STAs operating OCB do not require association. A DMG STA supports beamforming (BF) as described in 10.41 and 20.9 and GCM encryption as described in 12.5.4.

A DMG STA supports the PHY signaling as described in 20.4, 20.5, and 20.6. At a minimum, a DMG STA supports the mandatory modulation and coding scheme (MCS) and PHY protocol data unit (PPDU) formats described in 20.4 and 20.5. A DMG STA has PHY features that include a low-density parity check (LDPC) encoding, a preamble making use of Golay sequences, and beamforming. The PPDUs are always transmitted with the same channel spacing as described in Annex E.

A DMG STA supports MAC features that provide channel access in an environment in which transmissions use a directional antenna pattern. The MAC entity of a DMG STA provides frame aggregation, block acknowledgment, service periods, contention based access periods, DMG protected period, AP or PCP clustering, dynamic channel time management (see 10.38.7, 10.38.8, and 10.38.9), reverse direction, spatial sharing, beamforming, discovery assistance, TDD channel access, and fast session transfer in a multi-band device, transmission of Data frames OCB (see 11.18), and DMG discovery OCB (see 11.1.4.7). A DMG STA is not a mesh STA. A DMG STA does not use any of the following: HCCA, TDLS, GCR.

4.3.26 DMG relay

The IEEE 802.11 DMG relay function allows a source relay endpoint DMG STA (REDS) to transmit frames to a destination REDS with the assistance of another DMG STA, the relay DMG STA (RDS), as shown in Figure 4-12 . Relaying can improve the reliability of communication in a DMG BSS in the case the direct link between the source REDS and the destination REDS has poor quality or is disrupted. Following the DMG relay setup procedures, a source REDS can discover and select an appropriate RDS to act as the relay for a particular destination REDS, prior to Data frame transmission using the relay. A relay operating as a link switching type of relay uses the RDS to forward frames between the source and destination REDS if the direct link between the REDS is disrupted. In a link cooperation of relay operation, the RDS simultaneously repeats the transmission of frames between the source and destination REDS, which can possibly increase the signal quality received at the destination REDS.

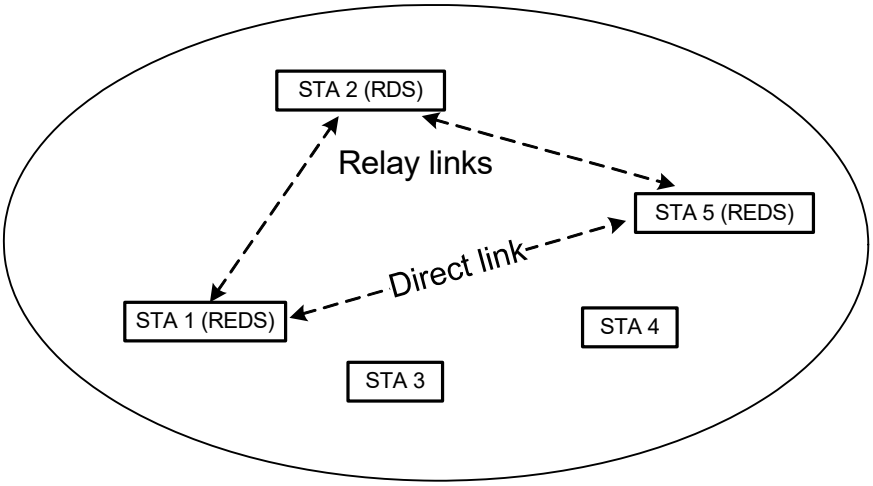

Figure 4-12—DMG relay in a DMG BSS

4.3.27 Robust audio video (AV) streaming

4.3.27.1 Introduction

Robust AV streaming improves AV streaming performance when using IEEE Std 802.11 for consumer and enterprise applications.

4.3.27.2 Groupcast with retries (GCR)

The GCR service allows a STA to request greater reliability for one or more group addressed streams that the STA receives. Greater reliability is provided via unsolicited retries or the block ack mechanism. A non-AP STA can request delivery so that the AP transmits the frames via EDCA within GCR service periods when all associated non-AP STAs are in active mode or the awake state of the PS mode.

4.3.27.3 Stream classification service (SCS)

SCS enables the establishment of a classification using layer 2 and/or layer 3 signaling to match incoming individually addressed MSDUs. Once classified, individually addressed MSDUs matching the classification are assigned to an access category and are tagged with their drop eligibility. When intra-access category prioritization is enabled (see 4.3.27.7), SCS allows MSDUs matching the classification to be assigned to the primary or alternate EDCA transmit queues so that finer grained prioritization can be applied.

4.3.27.4 Mirrored stream classification service (MSCS)

MSCS enables the establishment of classification using layer 2 and/or layer 3 signaling to classify incoming individually addressed MSDUs into streams. Once classified, individually addressed MSDUs in each stream are assigned to a user priority based on the user priority of MSDUs matching the stream in the reverse direction.

4.3.27.5 Overlapping BSS (OBSS) management

The objective of OBSS management is to facilitate cooperative sharing of the medium between APs that operate in the same channel and that are able to receive or obtain frames from each other, including Beacon

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

frames. These frames might be received directly or via associated STAs that support the Beacon request capability (see 11.10.10).

OBSS management provides the means to

— Provide additional information for channel selection
— Extend the admission control mechanism to a distributed environment
— Enable the coordination of scheduled TXOPs between OBSSs

OBSS management enables stationary and portable APs to provide to neighboring APs information for the selection of a channel and for the cooperative sharing of that channel. The main component of OBSS management is the QLoad report that provides information on

— The reporting AP's overlap situation
— The reporting AP's QoS traffic load
— The total QoS traffic load of BSSs directly overlapping the reporting AP's BSS

This information might be used to aid an AP when searching for a channel and also when sharing a channel in an overlap situation.

To coordinate the TXOPs of overlapping HCCA APs, OBSS management provides a means for an AP to advertise its TXOP allocations so another AP might schedule its own TXOPs to avoid those already scheduled.

4.3.27.6 Interworking with IEEE 802.1Q Stream Reservation Protocol (SRP)

Support for SRP from IEEE Std 802.1Q enables integration of the TSPEC ADDTS request/response protocol with IEEE 802.1Q SRP to enable end-to-end SRP reservations when one or more IEEE 802.11 links are part of a path from IEEE 802.1Q Talker to IEEE 802.1Q Listener.

4.3.27.7 Intra-access category prioritization

Intra-access category prioritization provides six transmit queues that map to four enhanced distributed channel access functions (EDCAFs) to enable differentiation between traffic streams that are in the same access category in order for finer grained prioritization to be applied between individual AV streams or voice streams.

4.3.28 Operation under geolocation database (GDB) control

Regulators designate television broadcast bands for the deployment of dynamic sharing technologies. Different schemes result in different times that elapse from the moment an authorized database is told to change access to a particular slice of spectrum and the time that sharing radios are required to change their operations.

One current system design allows the GDBs to utilize a fully populated map of all protected services, and the databases have precalculated maps that are effective on timescales of one to two days.

Another system design allows the protected services to negotiate with controllers of unlicensed devices so that both can share available broadcast channels and facilitate response times of less than an hour where necessary and even within minutes if desired.

Another system design has the GDB fully control all white space devices by requiring them to tell the database their intended location and emissions footprint and receive permission before any broadcast band transmission starts. Any change of intended frequencies or powers is told to the database, and permission is received before the change takes place.

The architectural role of components depends on the security and timeliness requirements in particular regulatory domains. Figure 4-13 shows two infrastructure BSSs in which APs are geolocation database dependent (GDD) enabling STAs and the other STAs are GDD dependent STAs.

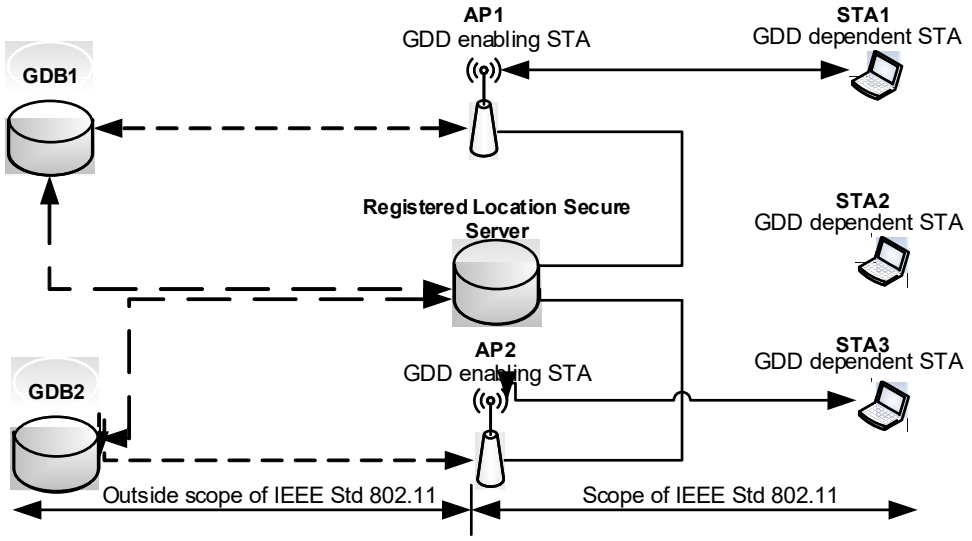

Figure 4-13—Multiple APs and multiple GDBs

In most regulatory domains, GDD enabling STAs are required to

- Securely communicate with GDBs
- Maintain the white space maps (WSMs) and other information received from GDBs
- Create and transmit a contact verification signal to inform GDD dependent STAs that the map they received is still valid

A registered location query protocol (RLQP) is provided to share the WSMs and current channel use among GDD enabling STAs in a neighborhood. GDD dependent STAs can query both their GDD enabling STA and the registered location secure server (RLSS) about WSMs and channel utilization. In some regulatory domains, a RLSS can provide GDBs with the current channel use information for all of the BSSs and IBSSs that communicate with it. In some regulatory domains, the RLSS communicates with controllers of other white space systems to coordinate emissions footprints of their services. By accessing and using this information, the STAs can make intelligent decisions about the most effective way to utilize the available spectrum, power, and bandwidth for their communications.

The specific mechanisms are as follows:

- Channel availability query, used to obtain one or more WSMs of available channels for an area or a geolocation
- Channel schedule management, used to obtain start and ending times for each available white space channel
- Contact verification signal, used by a GDD dependent STA to verify it is still receiving frames from its GDD enabling STA
- GDD enablement, the procedure where a GDD enabling STA forms a network and maintains the network under the control of a GDB
- Network channel control, used to inform a local channel controller that has a view of nearby transmitters and their emissions footprints
- WSM, used to retrieve the available white space channels and their transmit power restrictions

The use of the mechanisms in a particular regulatory domain depends on the specific regulatory requirements. Table 4-1 gives a view of the use of specific mechanisms to meet regulatory requirements in terms of daily, hourly, and minute timescales. Implementers are referred to the regulatory sources in Table D.1 for further information. Operation in countries within defined regional regulatory domains might be subject to additional or alternative national regulations.

Table 4-1—GDD mechanisms and timescales

Mechanism	Daily consultation required	Hourly consultation required	Minute responsiveness
Channel availability query	Informative	Informative	Not applicable
Channel schedule management	Informative	Informative	Not applicable
Contact verification signal	Required to be secure	Might be secure	Loss of consecutive signals requires action
GDD enablement	Required	Required	Required
Network channel control	Informative	Informative	Not applicable
WSM	Required for GDD enabling STA, might be translated for GDD dependent STA	Required for GDD enabling STA, might be translated for GDD dependent STA	Required for GDD enabling STA, might be translated for GDD dependent STA

These mechanisms allow a BSS to manage and query its radio environment and a GDB to control the radio environment for all wireless services.

4.3.29 CDMG STA

An IEEE 802.11 CDMG STA is a DMG STA that supports CDMG operation in the Chinese 60 GHz frequency band, and has dot11CDMGOptionImplemented equal to true. In addition to CDMG features, a CDMG STA supports DMG features as described in 4.3.25. A CDMG STA also supports CDMG features as identified in Clause 10, Clause 11, and Clause 24. A CDMG STA supports transmission and reception of frames that are compliant with PHY specifications as defined in Clause 24. A CDMG STA is also a QoS STA. The basic channel access of a CDMG STA (see 10.38 and 10.63) allows it to operate in an Infrastructure BSS or in an IBSS or in a PBSS.

Besides supporting DMG PHY features defined in Clause 20, a CDMG STA also supports the PHY signaling as described in 24.4, 24.5, and 24.6. At a minimum, a CDMG STA supports the mandatory modulation and coding scheme (MCS) and PHY protocol data unit (PPDU) formats described in 24.4 and 24.5.

4.3.30 CMMG STA

The IEEE 802.11 CMMG STA operates in 42.3 GHz to 47.3 GHz or 47.2 GHz to 48.4 GHz frequency bands.

The main PHY features in a CMMG STA are the following:

— 540 MHz channel width
— Control mode and SC mode (directional transmit and receive)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Single spatial stream MCS 0 (control mode transmit and receive) in all supported channel widths
— Single spatial stream MCSs 1 to 3 (SC mode transmit and receive) in all supported channel widths
— LDPC coding with length 672
— Normal guard interval as defined in Table 25-3
— Optional support for 1080 MHz channel width
— Optional support for CMMG-MCSs 4 to 8 (SC mode transmit and receive)
— Optional support for CMMG-MCSs 9 to 16 (CMMG OFDM mode transmit and receive)
— Optional support for short guard interval (transmit and receive)
— Optional support for LDPC coding with length 2016
— Optional support MIMO transmission (CMMG SC mode and CMMG OFDM mode transmit and receive)
— Optional support for STBC (transmit and receive)
— Optional support for transmit beamforming sounding (by sending a CMMG NDP)
— Optional support for responding to transmit beamforming sounding

The CMMG STA provides PHY and MAC features that can support a throughput of 1 Gb/s and greater, as measured at the MAC data service access point (SAP). A CMMG STA supports CMMG features as identified in Clause 10, Clause 11, and Clause 25. A CMMG STA operates in a CMMG BSS and supports transmission and reception of frames that are compliant with PHY specifications as defined in Clause 25. A CMMG STA is also a QoS STA. The basic channel access of a CMMG STA (see 10.38) allows it to operate in an Infrastructure BSS, in an IBSS, or in a PBSS. Certain CMMG features such as service period allocation are available only to CMMG STAs that are associated with an AP or with a PCP, while other CMMG features such as EDCA operation in a PBSS do not require association. A CMMG STA supports beamforming (BF) as described in 10.41 and 20.10 and GCM encryption as described in 12.5.4.

A CMMG STA supports the PHY signaling as described in 25.4, 25.5, and 25.6. At a minimum, a CMMG STA supports the mandatory modulation and coding scheme (MCS) and PHY protocol data unit (PPDU) formats described in 25.4 and 25.5. A CMMG STA has PHY features that include a low-density parity check (LDPC) encoding, a preamble making use of zero correlation zone (ZCZ) sequences, and beamforming. The PPDUs are always transmitted with the same channel spacing as described in Annex E.

A CMMG STA supports MAC features that provide channel access in an environment in which transmissions use a directional antenna pattern or use multiple input multiple output antenna pattern. A CMMG STA has MAC features that include frame aggregation, block ack features, service periods, contention based access periods, CMMG protected period, AP or PCP clustering, dynamic channel time management, reverse direction, spatial sharing, beamforming, and fast session transfer in a multi-band device. A CMMG STA is not a mesh STA. A CMMG STA follows the same channel access rules irrespective of the type of BSS in which it operates.

4.3.31 General link (GLK)

4.3.31.1 General

GLK STAs establish general links with other GLK STAs. These general links are suitable to be used as links inside an IEEE 802.1Q network. For an infrastructure general link example, see Figure 4-15 (in 4.3.31.3.3).

A GLK STA coordinates with a GLK convergence function to provide the Internal Sublayer Service, as defined in IEEE Std 802.1AC-2016, to an IEEE 802.1Q bridge for each peer GLK STA with which it is communicating. GLK STAs also provides link metrics for the use of external path selection protocols such as spanning tree protocol.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

GLK operation does not involve a DS and does not involve an ESS. Instead, the general links formed with GLK operation are a point-to-point connection between pairs of instances of Internal Sublayer Service SAPs, which in turn can be used within an IEEE 802.1Q bridged network.

A GLK STA that starts a BSS uses membership selector values to set the BSS policy of requiring or not requiring general link or EtherType protocol discrimination (EPD) support for any STA that joins the BSS.

A non-AP STA acts as either a GLK STA or a non-GLK STA. A GLK AP might permit associations from non-GLK STAs and acts as a non-GLK AP for those associated non-GLK STAs. GLK DMG STAs can establish a general link through a DMG relay. GLK S1G STAs cannot use or be an S1G relay.

The four-address MAC header can be used in GLK transmissions of Data frames. The use of the four-address MAC header or Basic A-MSDU format is necessary for such MPDUs if the frame's SA, TA, RA, and DA fields (source address, transmitter address, receiver address, and destination address, respectively) are all different from each other. The three-address frame format can be used, as defined by Table 9-3, provided the addresses are consistent with Table 9-60.

A SYNRA is an RA that is a group address used by a GLK AP to forward frames to a subset of GLK non-AP STAs, as required by IEEE 802.1Q bridges. The use of a SYNRA can improve bandwidth usage in some cases. SYNRAs are used in GLK AP transmissions.

As described in 4.3.31.2, when a GLK AP transmits a Data frame with a four-address MAC header whose RA field contains a group address, the RA is a synthetic receiver address (SYNRA), and therefore its RA and DA fields are not equal. A GLK non-AP STA supports selective reception of group addressed frames by supporting SYNRA reception.

4.3.31.2 Selective reception of group addressed frames

For the reasons given below, when transmitting a Data frame that has an RA that is a group address to a set of receiving STAs, the GLK transmitter needs to transmit those MSDUs so that they are accepted by a specified subset of the associated GLK STAs indicated by the IEEE 802.1Q bridge.

The reason for such selective reception is to support requirements of IEEE 802.1Q bridges and can include the MAC service requirements that, when an MSDU is sent, it is not subsequently received and processed by the transmitting station or to break loops in the network topology. When a GLK STA associated with a GLK AP sends an MSDU to that AP with a group address destination, the AP retransmits it and uses the selective reception facility to stop the originating GLK STA from accepting it. Also, since the AP Internal Sublayer Service SAPs are mapped to IEEE 802.1Q bridge ports, loop prevention might need the traffic to be blocked to one or more of the associated GLK STAs. Such blocking can be implemented by the selective reception facility.

Implementation of this selective reception facility in a BSS case includes use of an RA that is a synthetic group address (SYNRA addressing, see 9.3.2.1.2). As an alternative to the use of a SYNRA, selective reception includes sending a copy of the Data frame to each intended receiver using individually addressed MPDUs. In either case, an appropriate address format is needed because the DA is different from the RA (since the RA is either the SYNRA or a serial individual RA). SYNRA addressed MPDUs are transmitted by APs only.

All GLK non-AP STAs in an infrastructure BSS support receipt of SYNRAs (see 9.3.2.1.2 and 10.64). A GLK AP that is requested to deliver an MPDU to multiple GLK STAs can choose to construct and transmit a SYNRA addressed MPDU, use a sequence of individually addressed MPDUs, or both.

Parameters exchanged during the association (or reassociation) of a GLK STA with a GLK AP determine the mechanism used by the GLK AP to enable selective reception at the GLK STA of group addressed

frames transmitted by the GLK AP. One such mechanism is GLK-GCR, which is a subset of GCR customized for general links (see 11.21.16). In GLK-GCR the group address is a SYNRA. Features of GCR that do not apply to GLK-GCR are as follows:

a) DMS Request and DMS Response frame exchange to set up GLK-GCR service
b) ADDBA Request/Response frame exchange to setup block ack agreement
c) GCR-SP delivery method
d) Unsolicited DMS Response frame for “GCR Advertise”
e) Concealment address

4.3.31.3 GLK Service Sets

4.3.31.3.1 Provision of the MAC service

MAC service data unit (MSDU) delivery services in an IEEE 802.1Q network can be supported by the IEEE 802.1AC™ MAC service. GLK STAs coordinate with an IEEE 802.1AC-compliant GLK convergence function, to provide access to the WM via one or more Internal Sublayer Service SAPs. The routing of all MSDUs that are provided by an IEEE 802.1Q relay entity via GLK STAs is controlled by the routing protocols of the IEEE 802.1Q network to which the GLK STA is attached. This enables the routing protocols to use all the general links available to the GLK STA.

4.3.31.3.2 GLK IBSS and PBSS

A GLK IBSS or GLK PBSS can provide access to the WM via general links that are suitable for use in an IEEE 802.1Q network. Figure 4-14 shows an example of a GLK IBSS (or equivalently a PBSS) involving three GLK non-AP STAs. Each participating STA provides MAC services at the MS SAP, with the inclusion of a station vector that is then mapped to one or more Internal Sublayer Service SAPs by the IEEE 802.1AC GLK Convergence Function. Three general links are shown that connect three pairs of Internal Sublayer Service SAPs in a point-to-point manner. Each of the Internal Sublayer Service SAPs is then mapped to either an Enhanced Internal Sublayer Service (EISS) SAP or MAC SAP, by the IEEE 802.1Q Media Independent Function or the Internal Sublayer Service to MAC SAP function, respectively. The EISS SAP provides EISS services to the MAC relay entity of a VLAN bridge component (IEEE 802.1Q MAC Relay Entity). The MAC SAP provides services to the LLC Sublayer.

NOTE—IEEE Std 802.11 does not specify the details of the IEEE 802.1AC GLK Convergence Function, the IEEE 802.1Q Media Independent Function, the Internal Sublayer Service to MAC SAP function, the IEEE 802.1Q MAC Relay Entity, and the LLC Sublayer. These entities are specified in other documents such as IEEE Std 802.1AC-2016 and IEEE Std 802.1Q-2018. These entities are shown with dashed outlines in the figure. Entities that IEEE Std 802.11 does specify are shown with solid outlines and are within the box labeled “802.11 GLK IBSS/PBSS”.

A difference from a non-GLK STA’s IEEE 802.11 IBSS/PBSS is that either or both MAC SAPs could directly connect to an IEEE 802.1Q bridge.

For example, each of the STAs and attached bridges (including the IEEE 802.1Q MAC Relay Entities) shown could be at the top of a rack in a data center to provide inter-rack connectivity. The two MAC SAPs shown could even be safely connected to the same IEEE 802.1Q network, since such a network provides protection from loops.

Also, shown in the figure is the possibility to provide a point-to-point link between two LLC Sublayer entities that are each attached to a GLK non-AP STA. For example, this link could allow a computer attached to a GLK STA to directly connect to a network attached storage device attached to a GLK STA.

4.3.31.3.3 Infrastructure BSS with general links

A GLK infrastructure BSS can provide access to the WM via general links that are suitable for use in an IEEE 802.1Q network. Figure 4-15 shows an example of a GLK infrastructure BSS with three GLK non-AP STAs and one GLK AP. Each participating STA provides MAC services at the MS SAP, with the inclusion of a station vector that is then mapped to one or more Internal Sublayer Service SAPs by the IEEE 802.1AC GLK Convergence Function. Four general links are shown that connect four pairs of Internal Sublayer Service SAPs in a point-to-point manner. Each of the Internal Sublayer Service SAPs is then mapped, by the IEEE 802.1Q Media Independent Function or the Internal Sublayer Service to MAC SAP function, to either an EISS SAP or a MAC SAP, respectively. The EISS SAP provides EISS services to the MAC relay entity of a VLAN bridge component (IEEE 802.1Q MAC Relay Entity). The MAC SAP provides services to the LLC Sublayer.

NOTE—IEEE Std 802.11 does not specify the details of the IEEE 802.1AC GLK Convergence Function, the IEEE 802.1Q Media Independent Function, the Internal Sublayer Service to MAC SAP function, the IEEE 802.1Q MAC Relay Entity, and the LLC Sublayer. These entities are specified in other documents such as IEEE Std 802.1AC-2016 and IEEE Std 802.1Q. These entities are shown with dashed outlines in the figure. Entities that IEEE Std 802.11 does specify are shown with solid outlines and are with in the box labeled “802.11 BSS”.

Although transmissions by an AP are typically received by all STAs associated with that AP, the service provided by a GLK infrastructure BSS might be considered as separate point-to-point links between the corresponding Internal Sublayer Service SAPs. Provisioning of such apparent point-to-point links is natural for MPDUs with an RA that is an individual address. In order to provide such apparent point-to-point links for group addressed frames, the GLK AP can transmit them so that they are accepted by a subset of the associated GLK STAs. Such selective transmission can be provided through the GLK SYNRA addressing facility (see 4.3.31.2) or by serial transmissions to the desired receivers.

Three types of example general links are shown in Figure 4-15 :

— The first type is an infrastructure general link that connects a non-AP GLK STA attached bridge port of an IEEE 802.1Q MAC Relay Entity with an GLK AP attached bridge (two of these general links are shown in the figure). These links could be used to enhance the reliability and routing options of an IEEE 802.1Q-compliant LAN by providing redundant wireless links between the bridges in the LAN.

— The second type is a non-AP GLK STA to non-AP GLK STA link that connects the STAs’ attached bridges (IEEE 802.1Q MAC Relay Entities). This type of general link is similar to the IBSS or PBSS STA to STA link.

— The third type of general link is a “leaf-node” type of general link that connects entities in the LLC layer attached to a non-AP GLK STA via a general link and an IEEE 802.1Q bridge attached to the GLK AP to another entity available via the IEEE 802.1Q network attached to the GLK AP. Such a general link could provide a connection between a network printer attached to the LAN and a computer attached to the non-AP GLK STA.

A difference between a GLK AP’s IEEE 802.11 links and a non-GLK AP’s IEEE 802.11 links, which can only be connected to an Internal Sublayer Service SAP via a DS and portal, is that an Internal Sublayer Service SAP could directly connect to an IEEE 802.1Q bridge.

4.3.31.3.4 Infrastructure BSSs with general links in the presence of an ESS

BSSs that support general links can be components of an extended form of network by using the general links within an IEEE 802.1Q bridged network. In such a bridged network, the concept of the DS in an ESS is replaced by the other components of the IEEE 802.1Q network. However, such a GLK topology is more general than the non-GLK infrastructure mode. For example, Figure 4-16 shows a network consisting of three types of BSSs: a GLK infrastructure BSS (with only GLK STAs), an infrastructure BSS (with both GLK and non-GLK STAs), and an infrastructure BSS (containing only non-GLK STAs). The example ESS

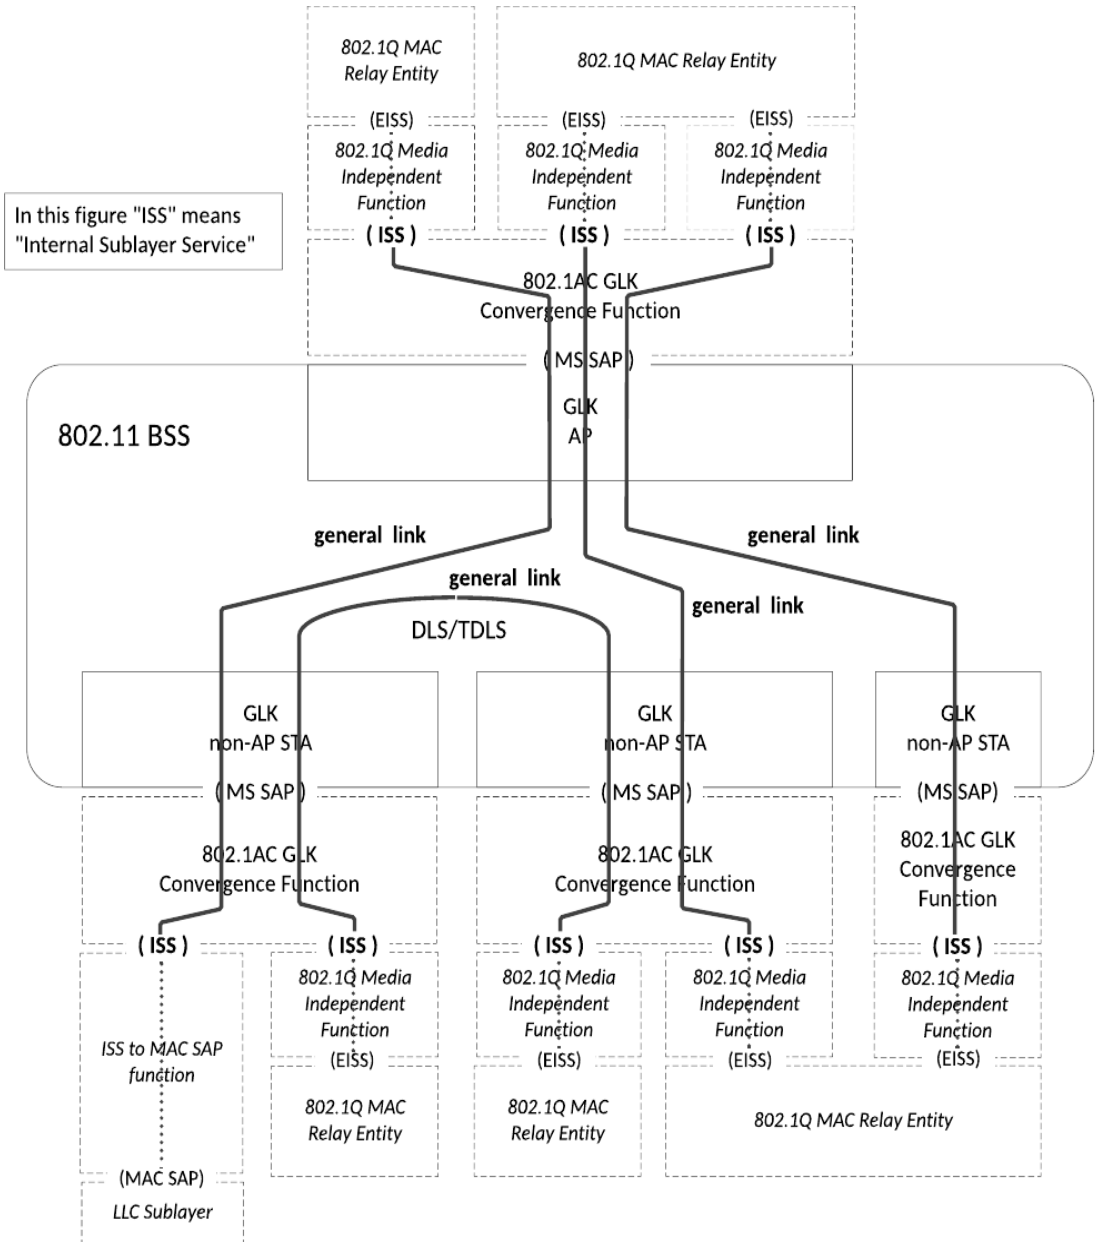

Figure 4-15—Example of infrastructure BSS with general links

shown in the figure consists of all the non-GLK non-AP STAs, the non-GLK AP, and the portion of the GLK AP that has associated non-GLK non-AP STAs. In the ESS the portal that is connected to the DS does not show any additional connection because the portal could be connected to any type of bridge, switch, or LAN. Hence no specific interconnection is shown. The general links shown in Figure 4-16 are similar to those shown in Figure 4-15 and provide point-to-point links as described in 4.3.31.3.3. Also, shown in the figure is an example of the possible configuration of more than one IEEE 802.1Q MAC relay entity being attached to a GLK AP or GLK non-AP STA and the possible configuration of more than one GLK AP or

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

GLK non-AP STA being attached to the same IEEE 802.1Q MAC relay entity. These configurations show the flexibility available with general links.

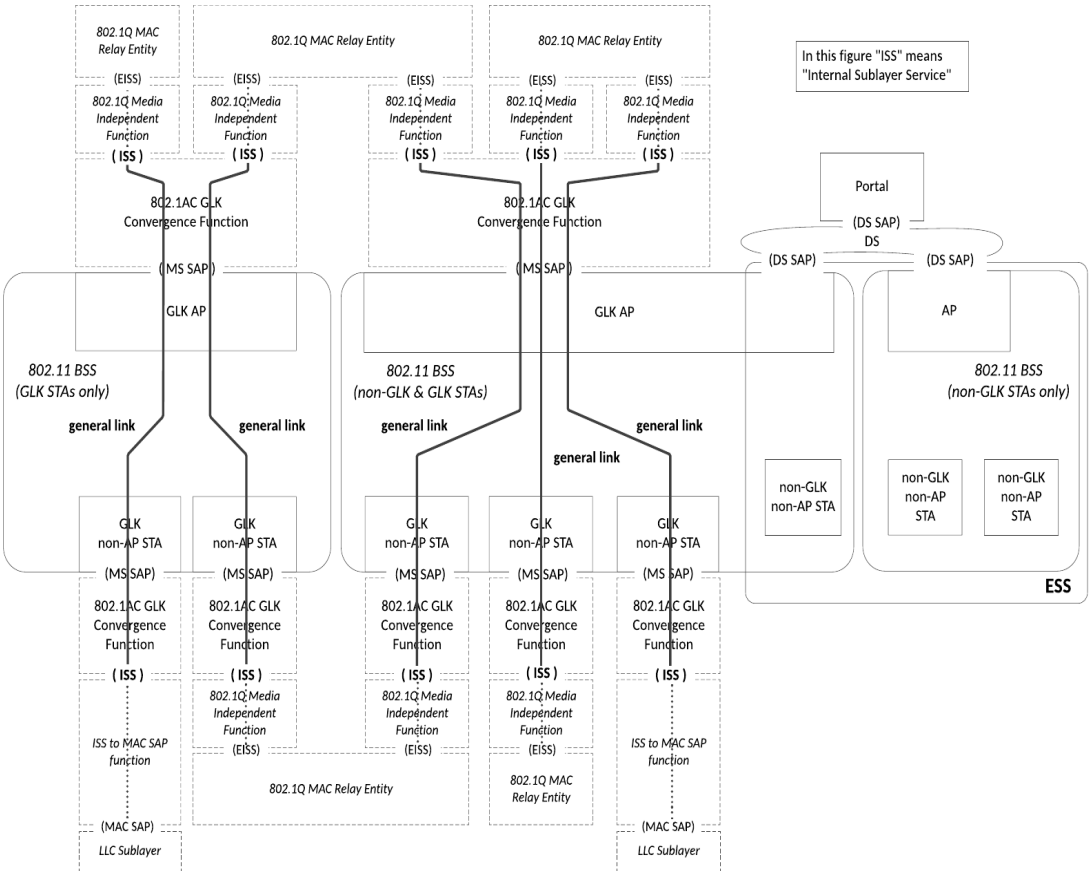

Figure 4-16—Example of an ESS and extended network with general links

NOTE—IEEE Std 802.11 explicitly does not specify the details of the IEEE 802.1AC GLK Convergence Function, the IEEE 802.1Q Media Independent Function, the Internal Sublayer Service to MAC SAP function, the IEEE 802.1Q MAC Relay Entity, and the LLC Sublayer. These entities are specified in other documents such as IEEE Std 802.1AC-2016 and IEEE Std 802.1Q-2018. These entities are shown with dashed outlines in the figure. Entities that IEEE Std 802.11 does specify are shown with solid outlines.

4.3.32 EtherType protocol discrimination (EPD)

IEEE Std 802 describes the two LLC sublayer protocols: EtherType protocol discrimination (EPD) and LLC protocol discrimination (LPD). LPD is the default for IEEE 802.11 MSDUs with the exception of the 5.9 GHz bands where EPD is used for the transmission of all MSDUs (see E.2.3 and E.2.4). While not the default, EPD might be used in other bands when it is known that the addressed STAs and the transmitting STA support EPD.

An EPD STA is a STA that supports EPD format MSDUs. EPD STAs, other than those operating in the 5.9 GHz bands, indicate their support through a bit in the Capability Information field, DMG STA Capability Information field, and Relay Capabilities element. An EPD STA, when transmitting an MPDU with an RA that is an individual address, uses EPD if the recipient supports EPD; otherwise, such individually addressed transmissions use LPD.

In an MPDU transmitted with a group RA, the choice between of EPD or LPD format of MSDUs in the MPDU is controlled by the policy of the BSS (see 5.1.4).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

4.3.33 EDMG STA

The IEEE 802.11 enhanced directional multi-gigabit (EDMG) STA is a DMG STA that provides PHY and MAC features that can support a throughput of at least 20 Gb/s, as measured at the MAC data service access point (SAP). An EDMG STA supports DMG and EDMG features as identified in Clause 10, Clause 11, Clause 12, Clause 20, and Clause 28. An EDMG STA supports transmission and reception of frames that are compliant with PHY specifications as defined in Clause 20 and Clause 28.

The main features in an EDMG STA that are not present in a DMG STA are the following:

— Mandatory support of the EDMG format (transmit and receive) using SC modulation.
— Mandatory support of 4.32 GHz channel width.
— Mandatory support of single spatial stream (transmit and receive) in all supported channel widths.
— Mandatory support of non-EDMG duplicate format transmission of non-EDMG portion of EDMG format preamble.
— Mandatory support of the BRP transmit sector sweep.
— Mandatory support of the Short SSW PPDUs.
— Mandatory support of the EDMG power save enhancements.
— Optional support of EDMG SU PPDUs (transmit and receive) using OFDM modulation.
— Optional support of two or more spatial streams (transmit and receive) using SC or OFDM modulations.
— Optional support of EDMG MU PPDUs (transmit and receive) using SC or OFDM modulations.
— Optional support of 2.16+2.16 GHz channel width.
— Optional support of 4.32+4.32 GHz channel width.
— Optional support of 6.48 GHz channel width.
— Optional support of 8.64 GHz channel width.
— Optional support of a 64-point nonuniform constellation.
— Optional support for 8-PSK using SC modulation.
— Optional support of the beamforming for asymmetric links.
— Optional support of the first path beamforming.
— Optional support of the EDMG multi-TID aggregation.

An EDMG STA is equipped with one or more DMG antennas. When the STA is equipped with more than one DMG antenna, each DMG antenna can be configured to cover overlapping or nonoverlapping spatial sectors (i.e., DMG antennas can be sectorized). Therefore, transmissions from different DMG antennas can reach different sets of STAs. Under the control of the MAC sublayer, transmissions from each DMG antenna can be synchronized to, for example, achieve MIMO communication (see 10.38.12.4).

4.3.34 Light communication (LC) STA

An LC STA operates in the light band with wavelengths in the range of 800 nm to 1000 nm.

An LC STA has one of three levels of support: HT, VHT, or HE. An LC STA with an LC PHY that has HT support is an HT STA (see 4.3.13) except that it operates in the light band. An LC STA with an LC PHY that has VHT support is a VHT STA (see 4.3.15) except that it operates in the light band. An LC STA with an LC PHY that has HE support is an HE STA (see 4.3.16) except that it operates in the light band.

An LC STA has support for MAC features such as frame aggregation, block ack, beamforming, and fast session transfer in a multi-band device.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Simultaneous use of multiple transmit chains and multiple receive chains within the LC PHY is supported (see 33.2.3.5).

Channels defined for 2.4 GHz operation of HT and HE PHYs do not apply to an LC PHY with HT and HE support, respectively. The channels that apply to LC are defined in Table 33-1.

4.4 Logical service interfaces

4.4.1 General

IEEE Std 802.11 explicitly does not specify the details of implementations. Instead, IEEE Std 802.11 specifies services to aid understanding how the architectural components are logically organized. The services are associated with different components of the architecture. There are three categories of IEEE 802.11 service—the station service, the PCP service (PCPS), and the distribution system service (DSS). These categories of service are used by the IEEE 802.11 MAC sublayer.

The complete set of IEEE 802.11 architectural services are as follows:

a) Authentication
b) Association
c) Deauthentication
d) Disassociation
e) Distribution
f) Integration
g) Data confidentiality
h) Reassociation
i) MSDU delivery
j) DFS
k) TPC
l) Higher layer timer synchronization (QoS facility only)
m) QoS traffic scheduling (QoS facility only)
n) Radio measurement
o) DSE

This set of services is divided into three groups: the station service, the PCPS, and the DSS. The station service is part of every STA. The PCPS is provided by the PCP of a PBSS. The DSS is provided by the DS.

4.4.2 Station service

The service provided by STAs is known as the station service.

The station service is present in every IEEE 802.11 STA (including APs, as APs include STA functionality). The station service is specified for use by MAC sublayer entities. All STAs provide the station service.

The station service is as follows:

a) Authentication (not used when dot11OCBActivated is true)
b) Deauthentication (not used when dot11OCBActivated is true)
c) Data confidentiality (not used when dot11OCBActivated is true)
d) MSDU delivery

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

e) DFS
f) TPC
g) Higher layer timer synchronization (QoS facility only)
h) QoS traffic scheduling (QoS facility only)
i) Radio measurement
j) DSE

4.4.3 PBSS control point service (PCPS)

The service provided by the PCP of a PBSS is known as the PCPS. Since each STA within a PBSS can operate as a PCP, each STA in the PBSS is capable of providing the PCPS, if it becomes the PCP of the PBSS. Non-PCP STAs do not provide the PCPS.

The services that comprise the PCPSs are the following:

a) Association
b) Disassociation
c) Reassociation
d) QoS traffic scheduling (optional)

The PCPS is specified for use by MAC sublayer entities.

4.4.4 DSS

The service provided by the DS is known as the DSS. IEEE Std 802.11 explicitly does not specify the details of DS implementation structure. Instead, IEEE Std 802.11 specifies the services that are provided by a DS implementation. A DS can be created from many different technologies including current IEEE 802 wired LANs. IEEE Std 802.11 does not constrain the DS to be either data link or network layer based. Nor does IEEE Std 802.11 constrain a DS to be either centralized or distributed in nature.

This service is represented in the IEEE 802.11 architecture by arrows within APs and mesh gates, indicating that the service is used to cross media and possibly address space logical boundaries. An AP and a mesh gate are logical entities, and the functions described might be shared by one or more physical entities.

The services that comprise the DSS are as follows:

a) Association (not mesh facility)
b) Disassociation (not mesh facility)
c) Distribution
d) Integration
e) Reassociation (not mesh facility)
f) QoS traffic scheduling (QoS facility only)
g) DSE
h) Interworking with the DS (mesh facility only)

DSSs are specified for use by MAC sublayer entities.

Figure 4-17 combines the components from previous figures with the three types of services to show the IEEE 802.11 architecture for infrastructure BSS and PBSS.

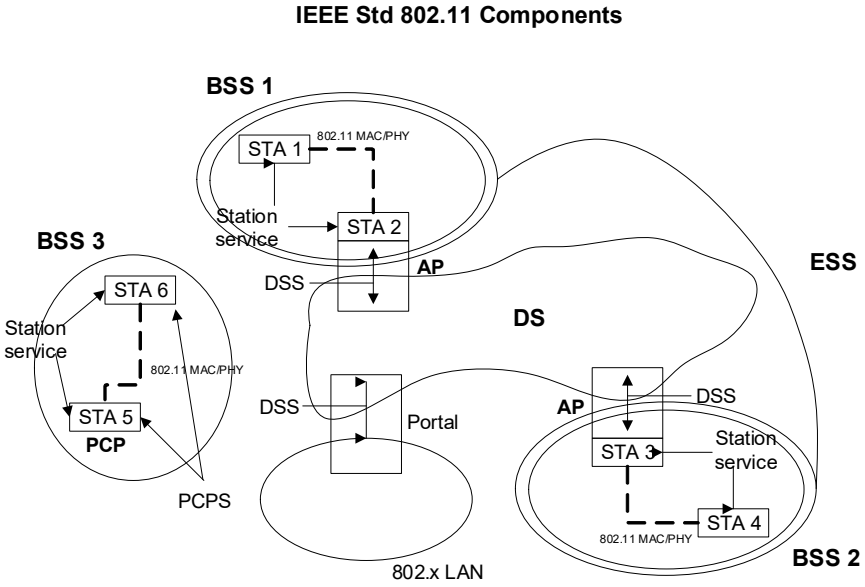

Figure 4-17—IEEE 802.11 architecture for infrastructure BSS and PBSS

4.5 Overview of the services

4.5.1 General

There are many services specified by IEEE Std 802.11. Six of the services are used to support medium access control (MAC) service data unit (MSDU) delivery between STAs. Three of the services are used to control IEEE 802.11 LAN access and confidentiality. Two of the services are used to provide spectrum management. One of the services provides support for LAN applications with QoS requirements. Another of the services provides support for higher layer timer synchronization. One of the services is used for radio measurement.

This subclause presents the services, an overview of how each service is used, and a description of how each service relates to other services and the IEEE 802.11 architecture. The services are presented in an order designed to help build an understanding of the operation of an IEEE 802.11 network. As a result, the services that comprise the station service and DSS are intermixed in order (rather than being grouped by category). The services that comprise the PCPS are a subset of the services provided by the station service and DSS.

Each of the services is supported by one or more MAC frame types. Some of the services are supported by MAC management PDUs, which are transported in Management frames. The MSDU delivery service is supported by Data frames. All of these frames gain access to the WM via the IEEE 802.11 MAC sublayer medium access method specified in Clause 10.

The IEEE 802.11 MAC sublayer uses four types of frame—*Data*, *Management*, *Extension,* and *Control* (see Clause 9). Data frames are handled by the MAC data plane (see Figure 5-1).

Management frames and Extension frames (see 9.3.4) are handled via the MAC management plane.

Control frames are used to support the delivery of IEEE 802.11 Data, Management, and Extension frames.

The examples here assume an ESS environment. The differences among the ESS, the PBSS, and the IBSS environments are discussed separately in 4.7.

4.5.2 Distribution of MSDUs within a DS

4.5.2.1 Distribution

This is the primary service used by IEEE 802.11 non-GLK STAs. It is conceptually invoked by every data message to or from an IEEE 802.11 non-GLK STA operating in an ESS (when the frame is sent via the DS). Distribution is via the DSS.

Refer to the ESS in Figure 4-18 and consider an MSDU being sent from STA 1 to STA 4. One or more frames containing the MSDU are sent from STA 1 and received by STA 2 (the "input" AP). The AP gives a MAC service tuple containing the MSDU to the DSS. It is the job of the distribution system to deliver the MAC service tuple within the DS in such a way that it arrives at the appropriate DS destination for the intended recipient. In this example, the MAC service tuple is distributed to STA 3 (the "output" AP) and STA 3 accesses the WM to send one or more frames containing the MSDU to STA 4 (the intended destination).

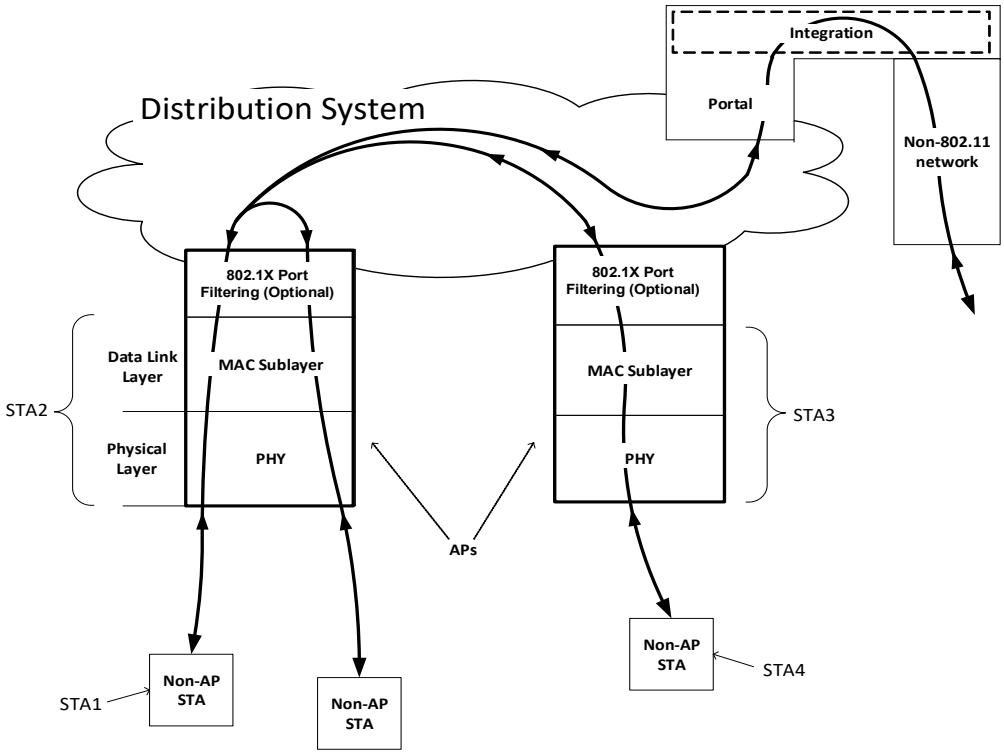

Figure 4-18—IEEE 802.11 Infrastructure model

The previous example was a case in which the AP that invoked the distribution system service was different from the AP that received the distributed MAC service tuple. If the MSDU had been intended for a STA that was a member of the same BSS as the sending STA, then the "input" and "output" APs for the MAC service tuple would have been the same.

If a MAC service tuple with a group addressed destination is provided to the DS, the DS is responsible for delivering that MAC service tuple to all appropriate APs in the ESS, including the "input" AP, to allow the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

AP to send frame(s) containing the MSDU to other associated non-AP STAs in its BSS. Generally, the DS delivers the MAC service tuple to all the APs in the ESS. Optionally, an implementation specific or higher layer filtering might be applied to restrict the delivery to a known subset of the APs in the ESS; such filtering is beyond the scope of this standard.

How the MAC service tuple is distributed within the DS is not specified by IEEE Std 802.11. All IEEE Std 802.11 is required to do is to provide the DS with enough information for the DS to be able to determine the "output" point that corresponds to the intended recipient. The necessary information is provided to the DS by the three association related services (association, reassociation, and disassociation).

In all the examples above, the distribution system service was logically invoked. Whether the MAC service tuple actually had to traverse the physical DSM or not is a DS implementation matter and is not specified by this standard.

While IEEE Std 802.11 does not specify DS implementations, it does recognize and support the use of the WM as one possible DSM. This is specifically supported by the IEEE 802.11 frame formats. (Refer to Clause 9 for details.) A mesh BSS might form an entire DS or a part of a DS using the WM, as shown in Figure 4-9 . Mesh services are used to form a mesh BSS and distribute MSDUs. Clause 14 defines how mesh BSSs are formed and how MSDUs are distributed through a mesh BSS.

4.5.2.2 Integration

When the distribution system service determines that the intended recipient of an MSDU is a member of an integrated LAN, the "output" point of the DS is a portal instead of an AP.

MAC service tuples that are distributed to a portal cause the DS to invoke the Integration function (conceptually after the distribution system service). The Integration function is responsible for accomplishing whatever is needed to deliver a MAC service tuple from the DSM to the integrated LAN media (including any required media or address space translations).

MSDUs received from an integrated LAN invoke the Integration function before the MAC service tuple is distributed by the distribution system.

The details of an Integration function are dependent on a specific portal implementation and are outside the scope of this standard.

4.5.2.3 QoS traffic scheduling

QoS traffic scheduling provides intra-BSS QoS frame transfers under the HCF, using either contention based or controlled channel access. At each TXOP, a traffic scheduling entity at the STA selects a frame for transmission, from the set of frames at the heads of a plurality of traffic queues, based on requested UP and/or parameter values in the traffic specification (TSPEC) for the requested MSDU. Additional information is available in 10.23.

4.5.3 Connectivity-related services

4.5.3.1 General

The primary purpose of a MAC sublayer is to transfer MSDUs between MAC sublayer entities. The information required for the distribution system service to operate is provided by the association services. Before an MSDU can be handled by the distribution system service, a STA is "associated."

To understand the concept of association, it is necessary first to understand the concept of mobility.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

4.5.3.2 Mobility types

The two transition types that are supported within this standard that describe the mobility of non-GLK STAs within a network are as follows:

a) ***No-transition:*** In this type, two subclasses that are usually indistinguishable are identified:
   1) Static—no motion.
   2) Local movement—movement within the PHY range of the communicating STAs, i.e., movement within a basic service area (BSA).

b) ***BSS-transition:*** This type is defined as a STA movement from one BSS in one ESS to another BSS within the same ESS. A fast BSS transition is a BSS transition that establishes the state necessary for data connectivity before the reassociation rather than after the reassociation.

NOTE—A nonmobility based transition from a BSS to the same BSS (same AP or PCP) is also supported. See 11.3.5.4.

A third type of transition is STA movement from a BSS in one ESS to a BSS in a different ESS. Maintenance of upper layer connections during transition between ESSs cannot be guaranteed by IEEE Std 802.11; disruption of service is likely to occur.

The FT protocol provides a mechanism for a STA to perform a BSS transition between access points (APs) in a robust security network (RSN) or when quality-of-service (QoS) admission control is enabled in the ESS.

The different association services support the different categories of non-GLK mobility.

In GLK operation, association services establish a general link between a pair of instances of Internal Sublayer Service SAPs. For these links there is no DS to provide the distribution service. Association services coordinate with higher layer services to create and maintain an IEEE 802.1Q network. Mobility of GLK links is managed (if supported at all) by the ability of the associated IEEE 802.1Q bridged network and the associated GLK convergence function (shim layer) to support remapping a general link from one IEEE 802.1Q bridge port to another. Such operation is outside the scope of IEEE 802.11, but see 4.5.3.4 for some concepts used for GLK link mobility.

4.5.3.3 Association

To deliver an MSDU within an ESS via the DS, the DS needs to know which AP within the ESS to deliver the MSDU to, so that the MSDU might ultimately be delivered to the addressed IEEE 802.11 STA. This information is provided to the DS by the concept of association. Association is necessary, but not sufficient, to support BSS-transition mobility. Association is sufficient to support no-transition mobility. Association is one of the services in the DSS.

Before a STA is allowed to send an MSDU via an AP, it first becomes associated with the AP.

For a non-GLK STA, the act of becoming associated invokes the association service, which provides the STA to AP mapping to the DS. How the information provided by the association service is stored and managed within the DS is not specified by this standard.

For a GLK STA, the act of becoming associated invokes the association service, which establishes a general link between two instances of the IEEE 802.1AC Internal Sublayer Service. This link provides a point-to-point link between the two Internal Sublayer Service SAPs. The GLK AP STA and the GLK non-AP STA each coordinate with higher layer services and each other to create the point-to-point link. The higher layer services create or enable the Internal Sublayer Service SAPs, inform the GLK convergence function of the mapping of the Internal Sublayer Service SAPs, and inform the network routing protocol of the existence of the general link. The GLK AP and the GLK non-AP STA each establish a service_access_point_identifier

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

for each general link, for their respective MS SAPs. This process allows for the establishment of a point-to-point link suitable for use in an IEEE 802.1Q network.

Within a robust security network (RSN), association is handled differently. In an RSNA, the IEEE 802.1X Port determines when to allow data traffic across an IEEE 802.11 link. A single IEEE 802.1X Port maps to one association, and each association maps to an IEEE 802.1X Port. An IEEE 802.1X Port consists of an IEEE 802.1X Controlled Port and an IEEE 802.1X Uncontrolled Port. The IEEE 802.1X Controlled Port is blocked from passing general data traffic between two STAs until an IEEE 802.1X authentication procedure completes successfully over the IEEE 802.1X Uncontrolled Port. Once the AKM completes successfully, data protection is enabled to prevent unauthorized access, and the IEEE 802.1X Controlled Port unblocks to allow protected data traffic. IEEE 802.1X Supplicants and Authenticators exchange protocol information via the IEEE 802.1X Uncontrolled Port. It is expected that most other protocol exchanges use the IEEE 802.1X Controlled Ports. However, a given protocol might need to bypass the authorization function and make use of the IEEE 802.1X Uncontrolled Port.

NOTE—See IEEE Std 802.1X-2020 for a discussion of Controlled Port and Uncontrolled Port.

At any given instant, a STA is associated with no more than one AP. This allows the DS to determine a unique answer to the question, “Which AP is serving STA X?” Once an association is completed, a STA can make full use of a DS (via the AP) to communicate. Association is always initiated by the non-AP STA, not the AP.

An AP might be associated with many STAs at the same time.

A STA learns what APs are present and what operational capabilities are available from each of those APs and then invokes the association service to establish an association. A FILS STA is able to discover, authenticate and associate with the AP with a reduced number of frame transmissions. For details of how a STA learns about what APs are present, see 11.1.4.

4.5.3.4 Reassociation

Association is sufficient for no-transition MSDU delivery between IEEE 802.11 STAs. Additional functionality is needed to support BSS-transition mobility. The additional required functionality is provided by the reassociation service. Reassociation is one of the services in the DSS.

The reassociation service is invoked to “move” a current association of a non-AP STA from one AP to another. In an ESS, the reassociation service informs the DS of the current mapping between AP and STA as the STA moves from BSS to BSS within the ESS. For a general link in an IEEE 802.1Q network, the reassociation service informs higher layer services how the link is reconfigured, commonly, with which BSS the GLK non-AP STA is a member of. The higher layer services will then destroy, disable, or maintain the existing Internal Sublayer Service SAPs, create or enable new Internal Sublayer Service SAPs, inform the GLK convergence function of the reconfigured general link mapping of the Internal Sublayer Service SAPs, and inform the network routing protocol of the updated general link. The GLK AP and GLK non-AP STA each then establish or maintain a service_access_point_identifier for the reconfigured general link, for their respective MS SAPs. Reassociation also enables changing association attributes of an established association while the non-AP STA remains associated with the same AP. Reassociation is always initiated by the non-AP STA.

Only the fast BSS transition facility can move an RSNA during reassociation. Therefore, if FT is not used, the old RSNA is deleted and a new RSNA is constructed.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

4.5.3.5 Disassociation

The disassociation service is invoked when an existing association is to be terminated. Disassociation is one of the services in the DSS.

For a non-GLK STA, the act of becoming disassociated invokes the disassociation service, which voids any existing STA to AP mapping known to the DS, for the disassociating STA. How the information provided by the disassociation service is managed within the DS is not specified by this standard. For a general link, disassociation removes or disables the corresponding Internal Sublayer Service SAPs that were configured for the general link. The IEEE 802.1Q bridge uses this information to update bridging for the GLK non-AP STA.

For an IEEE 802.11 link that is the basis of a general link, the disassociation service informs higher layer services of the IEEE 802.1Q network that the general link has been destroyed. The GLK AP and the GLK non-AP STA each coordinate with higher layer services and each other to destroy the point-to-point link. The higher layer services destroy or disable the Internal Sublayer Service SAPs, inform the GLK convergence function of the deletion of the mapping of the Internal Sublayer Service SAPs, and inform the network routing protocol of the destruction of the general link, for their respective MS SAPs. This process destroys the previously existing point-to-point link that was suitable for use in an IEEE 802.1Q network.

The disassociation service can be invoked by either party in an association (non-AP STA or AP). Disassociation is a notification, not a request. Disassociation cannot be refused by the receiving STA except when management frame protection is negotiated and the message integrity check fails.

An AP can disassociate STAs to enable the AP to be removed from a network for service or for other reasons.

STAs attempt to disassociate when they leave a network. However, the MAC protocol does not depend on STAs invoking the disassociation service. (MAC management is designed to accommodate loss of communication with an associated STA.)

4.5.4 Access control and data confidentiality services

4.5.4.1 General

Two services are required for IEEE Std 802.11 to provide functionality equivalent to that which is inherent to wired LANs. The design of wired LANs assumes the physical attributes of wire. In particular, wired LAN design assumes the physically closed and controlled nature of wired media. The physically open medium nature of an IEEE 802.11 LAN violates those assumptions.

In a WLAN that does not support RSNA, two services, authentication and data confidentiality, are defined. IEEE 802.11 authentication is used instead of the wired media physical connection.

An RSNA uses the IEEE 802.1X authentication service along with RSNA mechanisms, such as CCMP and GCMP, to provide access control. The IEEE 802.11 station management entity (SME) provides key management via an exchange of EAPOL-Key PDUs. Data confidentiality and data integrity are provided by RSN key management together with the RSNA mechanisms.

4.5.4.2 Authentication

IEEE 802.11 authentication operates at the link level between IEEE 802.11 STAs. IEEE Std 802.11 does not provide either end-to-end (MSDU origin to MSDU destination) or user-to-user authentication.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

IEEE Std 802.11 attempts to control LAN access via the authentication service. IEEE 802.11 authentication is a station service. This service might be used by all STAs to establish their identity to STAs with which they communicate, in both ESSs and IBSSs. If a mutually acceptable level of authentication has not been established between two STAs, an association is not established.

IEEE Std 802.11 defines five IEEE 802.11 authentication methods: Open System authentication, FT authentication, simultaneous authentication of equals (SAE), FILS authentication and preassociation security negotiation (PASN) authentication. Open System authentication admits any STA to the DS. FT authentication relies on keys derived during the initial mobility domain association to authenticate the stations as defined in Clause 13. SAE authentication uses finite field cryptography to prove knowledge of a shared password. FILS authentication allows for faster connection to the network for FILS non-AP STAs by providing authentication, association, and key confirmation information in an efficient number of frame exchanges (see 4.10.3.6). PASN authentication allows for the protection of Management frames without association by establishing a PTKSA using authentication frames. The IEEE 802.11 authentication mechanism also allows definition of new authentication methods, or any combination of these authentication methods.

An RSNA might support one or more of the following authentication methods: SAE authentication, FILS authentication, or PASN authentication. An RSNA also supports authentication based on IEEE Std 802.1X-2020, or preshared keys (PSKs) after Open System authentication. IEEE 802.1X authentication utilizes the EAP to authenticate STAs and the AS with one another. This standard does not specify an EAP method that is mandatory to implement. See 12.6.4 for a description of the IEEE 802.1X authentication and PSK usage within an IEEE 802.11 IBSS.

In an RSNA, IEEE 802.1X Supplicants and Authenticators exchange protocol information via the IEEE 802.1X Uncontrolled Port. The IEEE 802.1X Controlled Port is blocked from passing general data traffic between two STAs until an IEEE 802.1X authentication procedure completes successfully over the IEEE 802.1X Uncontrolled Port.

SAE authentication and Open System IEEE 802.11 authentication are used by STAs in an RSN for an infrastructure BSS. FILS authentication can be used by FILS STAs in an RSN for an infrastructure BSS. SAE authentication, Open System IEEE 802.11 authentication, or no IEEE 802.11 authentication is used in an RSN for an IBSS. SAE authentication is used for an MBSS. In an RSN for DMG BSS, Open System IEEE 802.11 authentication is not used (12.2.4).

A STA might be authenticated with many other STAs at the same time.

Because the IEEE 802.1X authentication process could be time-consuming (depending on the authentication protocol in use), the authentication service can be invoked independently of the association service.

This type of preauthentication is typically done by a STA while it is already associated with an AP (with which it previously authenticated). IEEE Std 802.11 does not require that STAs preauthenticate with APs. However, authentication is required before an association establishment is complete.

If the authentication is left until reassociation time, this might impact the speed with which a STA reassociates between APs, limiting BSS-transition mobility performance. The use of preauthentication takes the authentication service overhead out of the time-critical reassociation process.

SAE authentication is performed prior to association and a STA can take advantage of the fact that it can be IEEE 802.11 authenticated to many APs simultaneously by completing the SAE protocol with any number of APs while still being associated to another AP. RSNA security can be established after association using the resulting shared key.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

PASN authentication is used in an RSN for an infrastructure BSS when it is based on a PMKSA established by another RSN authentication protocol. Otherwise, it does not guarantee mutual authentication, and can be used as a non-RSN protocol in an infrastructure BSS.

4.5.4.3 Deauthentication

The deauthentication service is invoked when an existing Open System, FT, SAE, or FILS authentication is to be terminated. Deauthentication is a station service.

In an ESS, because authentication is a prerequisite for association, the act of deauthentication causes the STA to be disassociated. The deauthentication service can be invoked by either authenticated party (non-AP STA or AP). Deauthentication is not a request; it is a notification. The association at the transmitting STA is terminated when the STA sends a deauthentication notice to an associated STA. Deauthentication cannot be refused by the receiving STA except when management frame protection is negotiated and the message integrity check fails or there is no MIC to check, i.e., the frame is not protected.

In an RSN ESS, deauthentication results in termination of any association for the deauthenticated STA. It also results in the IEEE 802.1X Controlled Port for that STA, if used for this association, being disabled and deletes the pairwise transient key security association (PTKSA). The deauthentication notification is provided by the MLME to the SME. The SME then notifies the 802.1X Authenticator or Supplicant, and the 802.1X entity blocks the IEEE 802.1X Controlled Port from passing any further general data traffic.

In an RSNA, deauthentication also deletes any related PTKS, group temporal key security association (GTKSA), TPK security association (TPKSA), integrity group temporal key security association (IGTKSA), beacon integrity group temporal key security association (BIGTKSA), wake-up radio integrity group temporal key security association (WIGTKSA), mesh GTKSA, and mesh PTKSA that exist in the STA and closes the associated IEEE 802.1X Controlled Port, if used for this association. If pairwise master key security association (PMKSA) caching is not enabled, deauthentication also deletes the PMKSA or mesh PMKSA.

In an RSN IBSS, Open System authentication is optional, but a STA is required to recognize Deauthentication frames. Deauthentication results in the IEEE 802.1X Controlled Port for that STA being disabled and deletes the PTKSA.

4.5.4.4 Data confidentiality

In a wired LAN, only those STAs physically connected to the wire can send or receive LAN traffic. With a wireless shared medium, there is no physical connection, and all STAs and certain other RF devices in or near the LAN might be able to send, receive, and/or interfere with the LAN traffic. A STA receives traffic that is within range and transmits to any other STA within range. Thus, the connection of a single wireless link (without data confidentiality) to an existing wired LAN might seriously degrade the security level of the wired LAN.

To bring the security of the WLAN up to the level implicit in wired LAN design, IEEE Std 802.11 provides the ability to protect the contents of frames. This functionality is provided by the data confidentiality service. Data confidentiality is a station service.

IEEE Std 802.11 provides several cryptographic algorithms to protect data traffic, including TKIP, CCMP, and GCMP. IEEE Std 802.11 provides several cryptographic algorithms to protect management traffic, including CCMP, GCMP, BIP-CMAC, and BIP-GMAC. TKIP is based on the ARC4 algorithm, and CCMP and GCMP are based on the advanced encryption standard (AES). A means is provided for STAs to select the algorithm(s) to be used for a given association.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

IEEE Std 802.11 provides the following security protocols for protection of individually addressed robust Management frames: CCMP and GCMP. This standard provides data confidentiality for certain Action frames as indicated in Table 9-81.

IEEE Std 802.11 provides one security protocol, CCMP, for protection of individually addressed and group addressed Data frames between mesh STAs.

The default data confidentiality state for all IEEE 802.11 STAs is “in the clear,” i.e., without protection. If the data confidentiality service is not invoked, all frames are sent unprotected. If this policy is unacceptable to the sender, it does not send Data frames; and if the policy is unacceptable to the receiver, it discards any received Data frames. Unprotected Data frames and unprotected robust Management frames received at a STA configured for mandatory data confidentiality, as well as protected Data frames and protected robust Management frames using a key not available at the receiving STA, are discarded without an indication to LLC (or without indication to distribution system services in the case of “To DS” frames received at an AP). These frames are acknowledged on the WM [if received without frame check sequence (FCS) error] to avoid wasting WM bandwidth on retries of frames that are being discarded.

4.5.4.5 Key management

The enhanced data confidentiality, data authentication, and replay protection mechanisms require fresh cryptographic keys and corresponding security associations. The procedures defined in this standard provide fresh keys by means of protocols called the 4-way handshake, FT 4-way handshake, FT protocol, FT resource request protocol, group key handshake, and FILS authentication protocol.

4.5.4.6 Data origin authenticity

The data origin authenticity mechanism defines a means by which a STA that receives a Data or robust Management frame can determine which STA transmitted the MAC protocol data unit (MPDU). This feature is required in an RSNA to prevent one STA from masquerading as a different STA.

Data origin authenticity is applicable only to individually addressed Data frames, individually addressed robust Management frames, and group addressed EBCS Data, EBCS Info, and EBCS UL frames. The protocols do not guarantee data origin authenticity for group addressed frames that are not EBCS Data, EBCS Info, or EBCS UL frames.

4.5.4.7 Replay detection

The replay detection mechanism defines a means by which a STA that receives a Data or robust Management frame from another STA can detect whether the received frame is an unauthorized retransmission. This replay protection mechanism is provided for Data frames for STAs that use RSNA mechanisms. The replay protection mechanism is also provided for robust Management frames for STAs that use CCMP, GCMP, and broadcast/multicast integrity protocol (BIP).

4.5.4.8 Fast BSS transition

The FT mechanism defines a means for a STA to set up security and QoS parameters prior to reassociation to a new AP. This mechanism allows time-consuming operations to be removed from the time-critical reassociation process. During a handover across mobility domains, the overhead incurred during the FT initial mobility domain association in an RSN can be reduced using FILS authentication.

4.5.4.9 Management frame protection

Robust Management frames are a subset of Management frames that can be protected by the management frame protection service (see 12.2.7 for a list of the robust Management frames).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Management frame protection protocols in an infrastructure BSS, IBSS or PBSS apply to transmission and reception of individually addressed robust Management frames after delivery of the PTK, transmission of group addressed robust Management frames, reception of group addressed robust Management frames after delivery of the IGTK, transmission of Beacon frames in an infrastructure BSS, and reception of Beacon frames in an infrastructure BSS after delivery of the BIGTK.

Management frame protection protocols in an MBSS apply to the following frames:

— Individually addressed robust Management frames, after establishment of the MTK,
— Group addressed Action and Action No Ack frames of a category specified with Yes in the Group addressed privacy column of Table 9-81, after establishment of the MGTK, and
— Group addressed robust Management frames that are not Action and Action No Ack frames of a category specified with Yes in the Group addressed privacy column of Table 9-81, after establishment of the IGTK.

See 14.8 for details.

Management frame protection is implemented by CCMP, GCMP, and BIP confidentiality protocols and the SA Query procedure.

4.5.4.10 MAC privacy enhancements

When a non-AP STA searches for, and connects to, an infrastructure BSS, IBSS, or PBSS or attempts to discover services on a network preassociation, it selects a MAC address for the particular connection. If the STA uses a fixed MAC address it is trivial to track the STA. An MSDU transmitted by a STA is assigned a sequence number that, if never reset, can also be used to track a device irrespective of the MAC address. If OFDM is used, the PHY DATA scrambler used can enable tracking of a device irrespective of the MAC address if it is not reseeded. The dynamic nature of BSS membership combined with this tracking information allows for construction of a network of connections, locations, and behavior. This network can be used to glean private and sensitive information regarding the individual behind the device.

Furthermore, even without establishing a connection, a mobile or portable STA that gratuitously transmits Probe Request frames containing SSIDs of favored infrastructure BSS networks, or announces the existence of IBSS networks, can reveal potentially sensitive information about its location and location history.

To mitigate this sort of traffic analysis a STA can support the ability to periodically and randomly change its MAC addresses and reset counters and seeds prior to association. While discovering networks, a STA can refrain from gratuitously transmitting Probe Request frames containing SSIDs of favored BSS networks.

4.5.5 Spectrum management services

4.5.5.1 General

Two services are required to satisfy requirements in some regulatory domains (see Annex D and Annex E) for operation in the 5 GHz band. These services are called *transmit power control (TPC)* and *dynamic frequency selection (DFS)*.

4.5.5.2 TPC

Regulations that apply to the 5 GHz band in certain regulatory domains require RLANs operating in the 5 GHz band to use transmitter power control, involving specification of a regulatory maximum transmit power and a mitigation requirement for each allowed channel. The TPC service is used to satisfy this regulatory requirement.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The TPC service provides for the following:

— Association of STAs with an AP based on the STAs' power capability
— Specification of regulatory and local maximum transmit power levels for the current channel
— Selection of a transmit power for each transmission in a channel within constraints imposed by regulatory requirements
— Adaptation of transmit power based on a range of information, including path loss and link margin estimates

4.5.5.3 DFS

Regulations that apply to the 5 GHz band in certain regulatory domains require RLANs operating in the 5 GHz band to avoid co-channel operation with radar systems and to provide uniform utilization of available channels. The DFS service is used to satisfy these regulatory requirements.

The DFS service provides for the following:

— Association of STAs with an AP based on the STAs' supported channels.
— Quieting the current channel so it can be tested for the presence of radar with less interference from other STAs.
— Testing channels for radar before using a channel and while operating in a channel.
— Discontinuing operations after detecting radar in the current channel to avoid interference with radar.
— Detecting radar in the current and other channels based on regulatory requirements.
— Requesting and reporting of measurements in the current and other channels.
— Selecting and advertising a new channel to assist the migration of a BSS after radar is detected.

4.5.6 Traffic differentiation and QoS support

4.5.6.1 General

IEEE Std 802.11 uses a shared medium and provides differentiated control of access to the medium to handle data transfers with QoS requirements. The QoS facility (per MSDU traffic category and TSPEC negotiation) allows an IEEE 802.11 LAN to become part of a larger network providing end-to-end QoS delivery or to function as an independent network providing transport on a per-link basis with specified QoS commitments. The specifications regarding the integration and operability of the QoS facility with any other end-to-end QoS delivery mechanism like Resource Reservation Protocol (RSVP) are beyond the scope of this standard.

4.5.6.2 Quality-of-service management frame support

When the quality-of-service management frame (QMF) service is enabled, some Management frames might be transmitted using an access category other than the access category assigned to voice traffic (access category AC_VO, see 9.4.2.27) in order to improve the quality of service of other traffic streams. This is achievable by the use of a QMF policy. A QMF policy defines the access categories of different Management frames. Only QoS STAs are able to implement QMF policy. A non-AP QMF STA uses the default QMF policy or the QMF policy accepted from a peer QMF STA to transmit Management frames to that peer QMF STA. A QMF AP sets its own QMF policy for the transmission of QMFs to its associated STAs. A QMF STA uses access category AC_VO to transmit Management frames to STAs that do not support the QMF service.

4.5.7 Support for higher layer timer synchronization

Some applications, e.g., the transport and rendering of audio or video streams, require synchronized timers shared among different STAs. Greater accuracy (in terms of jitter bounds) or finer timer granularity than that provided by a BSS timing synchronization function (TSF) might be an additional requirement. In support of such applications, this standard defines a MAC service that enables layers above the MAC to accurately synchronize application-dependent timers shared among STAs. The service is usable by more than one application at a time.

Although the timer synchronization methods and accuracy requirements are application-dependent and are beyond the scope of this standard, they rely on an indication from each MAC that is provided essentially simultaneously, via group addressed transmissions, to the STAs. The MAC accomplishes this by indicating the occurrence of the end of the PPDU[+SigExt] containing particular Data frames; the Data frames of interest are identified by their MAC header Address 1 field when it contains a group address previously registered with the MAC. The end of the PPDU[+SigExt] is observed[25] on the WM by STAs within a BSS while the delay between the observation and the delivery of the indication is known within a MAC by design (and communicated to the application by implementation dependent means). The common reference point in time provided by the end of the PPDU[+SigExt] indication is the essential building block upon which a variety of application-dependent timer synchronization methods might be based.

4.5.8 Radio measurement service

The Radio measurement service provides the following:

- The ability to request and report radio measurements in supported channels.
- The ability to perform radio measurements in supported channels.
- An interface for upper layer applications to retrieve radio measurements using MLME primitives and/or MIB access.
- Information about neighbor APs.

4.5.9 Interworking with external networks

4.5.9.1 General

The interworking service allows non-AP STAs to access services provided by an external network according to the subscription or other characteristics of that external network. An IEEE 802.11 non-AP STA might have a subscription relationship with an external network, e.g., with an SSPN.

An overview of the interworking functions addressed in this standard is provided below:

- Network discovery and selection
  - Discovery of suitable networks through the advertisement of access network type, roaming consortium and venue information, via Management frames
  - Selection of a suitable IEEE 802.11 infrastructure using advertisement services (e.g., access network query protocol (ANQP) or an IEEE 802.21™ Information Server) in the BSS or in an external network reachable via the BSS.
  - Selection of an SSPN or external network with its corresponding IEEE 802.11 infrastructure
- Preassociation discovery (PAD)
  - Discovery of services offered by a BSS or an external network reachable via that BSS
- Emergency services
  - Emergency Call and Network Alert support at the link level

[25] The synchronization indication (observed time) within the BSS varies slightly due to propagation.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— QoS mapping distribution
— SSPN interface service between the AP and the SSPN

The generic advertisement service (GAS), described in 4.5.10, provides both support for a STA's network discovery and selection, and support for a conduit for communication by a non-AP STA with other information resources in a network before joining the wireless LAN.

The interworking service supports emergency services by providing methods for users to access emergency services via the IEEE 802.11 infrastructure, advertising that emergency services are supported (see 11.22.6) and identifying that a traffic stream is used for emergency services.

The interworking service provides QoS mapping for SSPNs and other external networks. Since each SSPN or other external network might have its own layer-3 end-to-end packet marking practice (e.g., differentiated services code point (DSCP) usage conventions), a means to remap the layer-3 service levels to a common over-the-air service level is necessary. The QoS Map service provides STAs a mapping of network-layer QoS packet marking to over-the-air QoS frame marking (i.e., user priority).

The SSPN Interface service supports service provisioning and transfer of user permissions from the SSPN to the AP. The method and protocol by which these permissions are transferred from the SSPN are outside the scope of this standard.

4.5.9.2 Preassociation discovery (PAD)

4.5.9.2.1 Introduction

PAD is an interworking function provided by a BSS to allow a non-AP and non-PCP STA, prior to association, to discover information concerning services that might be available to the STA when it is associated with the BSS. PAD provides a method for the STA to gather information to aid in the decision to select a BSS with which to become a member.

4.5.9.2.2 Architecture

Figure 4-19 and Figure 4-20 show the functional flow of MAC messaging and service information between a service information client (SIC) and a service information registry (SIR). These entities are described in 4.5.9.2.3, 4.5.9.2.4, and 4.5.9.2.5. The active components within the architecture differ depending upon whether unsolicited or solicited PAD is being used.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—A SIR can be either colocated with the AP or outside the AP. An SIR can only be colocated with a PCP. The communications between the SIR and the AP, together with the SIR and the advertisement server are out of the scope of this standard.

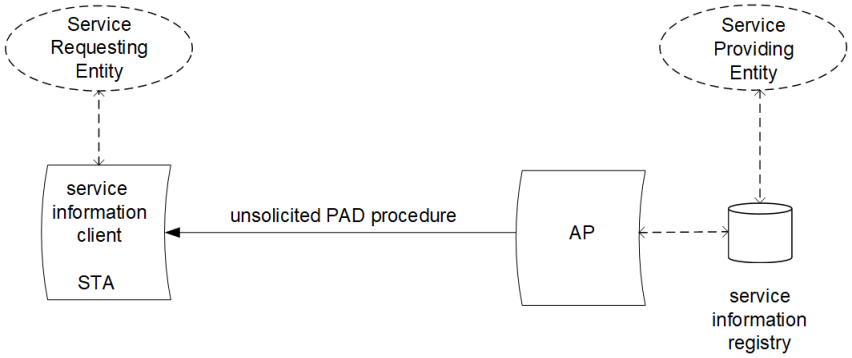

Figure 4-19—Unsolicited PAD architecture

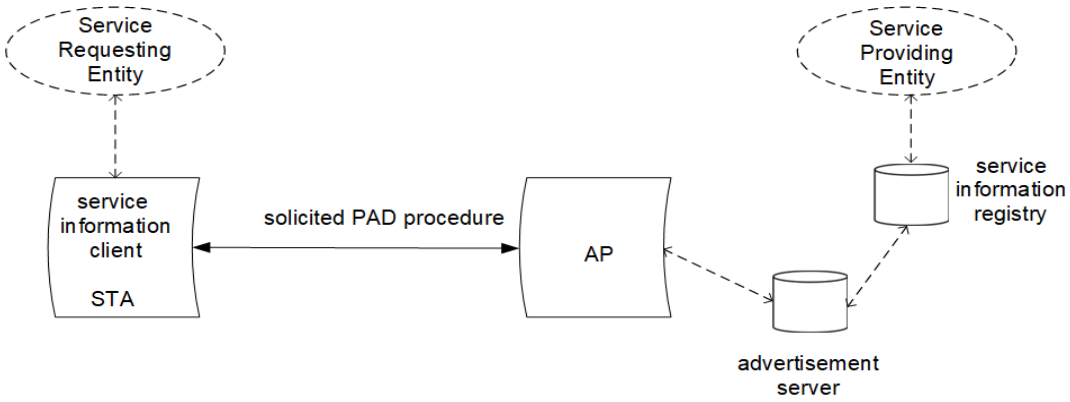

Figure 4-20—Solicited PAD architecture

The unsolicited PAD procedure is described in 11.23.2 and solicited PAD procedure is described in 11.23.3.

4.5.9.2.3 Service information entities

The SIC and SIR are used to exchange PAD service information. The PAD procedures operate between the SIC and SIR.

4.5.9.2.4 Service information registry (SIR)

The SIR caches information about services that might be reachable via the BSS and therefore might be available to the STA once the STA is associated with that BSS. How the SIR obtains the information about services is outside the scope of this standard.

There is typically one SIR assigned to each ESS. It can be addressed by each AP and each service within that ESS. It includes supporting service discovery requests and responses from the BSS.

The SIR communicates with the advertisement server to respond to ANQP requests.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

4.5.9.2.5 Service information client (SIC)

The SIC initiates service discovery. The SIC exchanges service discovery requests and responses between the SME and applications.

The SME determines whether to use unsolicited PAD or solicited PAD procedures. The SME also composes ANQP requests for solicited PAD procedures.

4.5.10 Generic advertisement service (GAS)

GAS provides functionality that enables STAs to discover the availability of information related to desired network services, e.g., information about services such as provided in an IBSS, local access services, available subscription service providers (SSPs) and/or SSPNs or other external networks. GAS uses a generic container to advertise network services' information over an IEEE 802.11 network. Public Action frames are used to transport this information.

While the specification of network services information is outside the scope of this standard, in an infrastructure BSS there is a need for STAs to query for information on network services provided by SSPNs or other external networks beyond an AP, before they associate with the wireless LAN. The exchange of information can also be performed after associating to the BSS.

In an IBSS/PBSS, GAS functionality enables a STA to access the availability and information related to desired services provided by other STAs in the IBSS/PBSS. Exchange of information using GAS can be performed either prior to joining an IBSS/PBSS or after joining the IBSS/PBSS.

There are a number of reasons why providing information to a STA in a preassociated state is beneficial:

— It supports more informed decision making about an IEEE 802.11 infrastructure BSS or PBSS of which to become a member. This is generally more efficient than requiring a non-AP and non-PCP STA to associate with an AP or PCP before discovering the information and then deciding whether to stay associated.
— It is possible for the non-AP and non-PCP STA to query multiple networks in parallel.
— The non-AP STA can discover information about APs that are not part of the same administrative group as the AP with which it is associated, supporting the selection of an AP belonging to a different IEEE 802.11 infrastructure that has an appropriate SSP roaming agreement in place.

4.5.11 Wake-up radio (WUR) services

The WUR service allows non-AP STAs to have access to basic services provided by a BSS while operating at very low power. The basic WUR services that the BSS might provide to non-AP STAs include discovery, synchronization, and wake up instructions (scheduled or unscheduled).

4.5.12 Enhanced broadcast services

4.5.12.1 General

Enhanced broadcast services (EBCS) provide the enhanced transmission and reception of broadcast content, both while associated with an infrastructure BSS and while not associated with an infrastructure BSS. EBCS provides a service in which an EBCS proxy affiliated with an EBCS relaying STA can relay the contents of a higher layer protocol (HLP) payload received from an EBCS non-AP STA to a destination typically within an external network. The relaying EBCS proxy can embed additional information.

When there is an association, EBCS provides additional means for protecting broadcast traffic and the privacy of the stations receiving that traffic, including data origin authenticity.

4.5.12.2 EBCS DL service

4.5.12.2.1 General

The EBCS DL service provides a mechanism for an EBCS AP to broadcast one or more EBCS traffic streams. The service allows the receiver of an EBCS traffic stream to authenticate the transmitter irrespective of whether the receiver and transmitter are associated with the EBCS AP.

4.5.12.2.2 EBCS traffic stream mapper

The EBCS traffic stream mapper is used to map multicast traffic arriving from an EBCS DL content server to EBCS traffic streams. The EBCS traffic stream mapper exists only in an EBCS AP. The location of the EBCS traffic stream mapper is shown in Figure 5-1 . It inspects the inbound traffic and assigns the content ID and the corresponding EBCS content MAC address according to dot11EBCSTrafficStreamTable.

4.5.12.2.3 EBCS filter

The EBCS filter exists only in an EBCS receiver. The EBCS filter is located in the MAC data plane as shown in Figure 5-1 . It filters the received EBCS traffic streams by their EBCS content MAC address according to dot11EBCSTrafficStreamTable. Details are described in 34.3.3.

4.5.12.2.4 Example of EBCS DL operation

Figure 4-21 provides an example of EBCS DL operation.

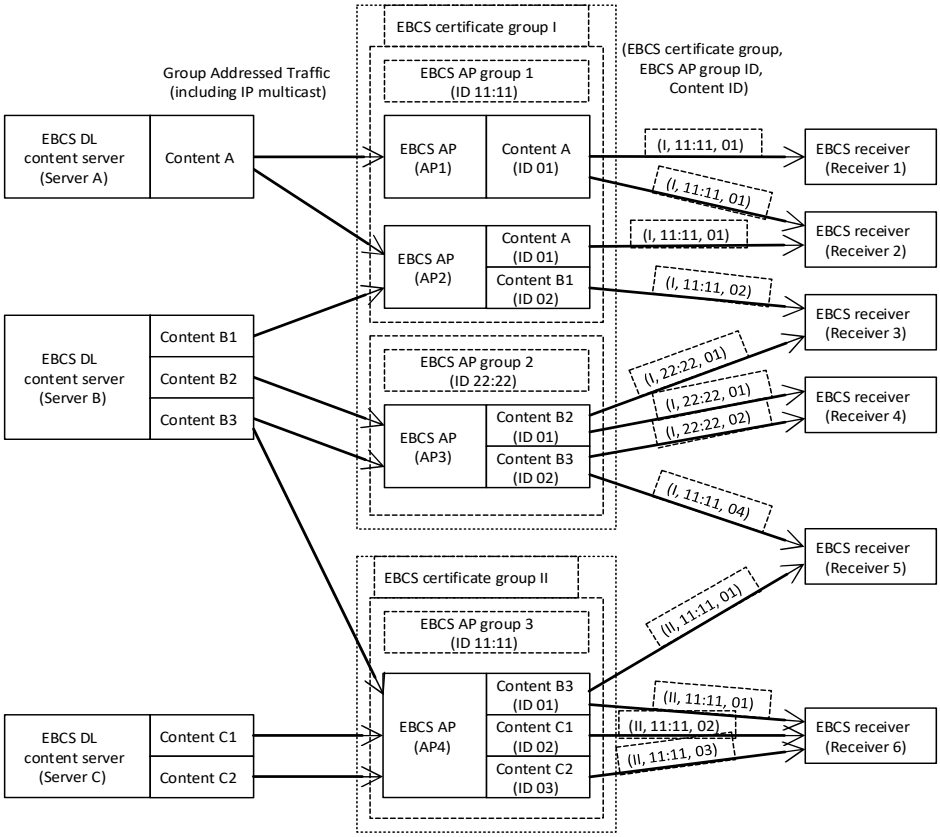

Figure 4-21—Example of EBCS DL operation

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

EBCS DL content servers are distributing group addressed traffic streams. Each EBCS DL content server can distribute multiple traffic streams that can be identified by the source MAC address and the destination MAC address. If a traffic stream is an IP multicast traffic stream, the traffic stream is identified by the source IP address, the destination IP address, and the destination UDP port.

Server A in Figure 4-21 distributes Content A. Server B distributes Content B1, Content B2, and Content B3. Server C distributes Content C1 and Content C2.

An EBCS AP can receive multiple traffic streams from one or more EBCS DL content server(s). The SME in an EBCS AP selects traffic streams to be broadcast by setting the appropriate values in dot11EBCSTrafficStreamTable. An EBCS AP broadcasts the selected traffic streams as EBCS traffic streams. An EBCS AP can add authentication information to the streams.

AP1, AP2, and AP3 belong to the EBCS certificate group I. AP1 and AP2 belong to EBCS AP group 1 with an AP group ID of 11:11. AP3 belongs to the EBCS AP group 2 with a group ID of 22:22. AP4 belongs to the EBCS certificate group II and the EBCS AP group 3 with an AP group ID of 11:11. Although both the EBCS AP group 1 and EBCS AP group 3 use the EBCS AP group ID of 11:11, they are different EBCS AP groups as they belong to different EBCS certificate groups.

AP1 in Figure 4-21 receives and broadcasts Content A. AP2 receives and broadcasts Content A and Content B1. AP3 receives and broadcasts Content B2 and Content B3. AP4 receives and broadcasts Content B3, Content C1, and Content C2.

An EBCS receiver can receive multiple EBCS traffic streams from one or more EBCS AP(s). An EBCS receiver filters EBCS traffic streams to be consumed using the EBCS filter. Each EBCS traffic stream can be authenticated if the transmitting EBCS AP adds authentication information.

Receiver 1 in Figure 4-21 can receive Content A from AP1. Receiver 2 can receive Content A from both AP1 and AP2. Receiver 3 can receive Content B1 from AP2 and Content B2 from AP3. Receiver 4 can receive both Content B2 and Content B3 from AP3. Receiver 5 can receive Content B3 from both AP3 and AP4. Receiver 6 can receive Content B3, Content C1, and Content C2 from AP4.

Receiver 2 can potentially recognize the presence of multiple copies of Content A by receiving from 2 APs as both EBCS traffic streams from AP1 and AP2 belong to the same EBCS certificate group and the same EBCS AP group, and have the same Content ID. Receiver 5 cannot recognize the presence of multiple copies of Content B3 as the EBCS traffic streams from AP3 and AP4 belong to the different EBCS certificate groups and different EBCS AP groups. Receiver 5 has to assume the two versions include different content.

4.5.12.3 EBCS relaying service

4.5.12.3.1 General

The EBCS relaying service facilitates EBCS UL operation (as described in 34.4) by providing a mechanism for an EBCS non-AP STA to transmit an EBCS UL frame containing an HLP payload that is intended to be relayed by one or more EBCS relaying STAs to a destination specified in the frame.

4.5.12.3.2 EBCS proxy operation

An EBCS proxy, as a part of providing relaying service, evaluates certain criteria before relaying the HLP payload carried in an EBCS UL frame to the destination specified in the frame. Such criteria can include, but are not limited to, verifying the STA certificate, if present, to determine whether the STA transmitting the frame is authorized to send an HLP payload to the specified destination, performing replay checking, and limiting the per destination amount (e.g., octets) or per destination frequency (e.g., packets per second) of

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

HLP payload that is relayed to the specified destination. The evaluation of the criteria can be based on local policies installed at the EBCS proxy and/or based on a relationship established with an entity at the specified destination. The establishment of such a relationship is out of scope of this standard.

An EBCS proxy can establish more than one relationship, each relationship with entities residing at a different destination and potentially requiring different evaluation criteria. An EBCS proxy can establish more than one relationship with the same entity, each matching a different destination URI and requiring evaluation of different criteria.

An EBCS proxy can also embed additional information before it relays the HLP payload. The format and content of the information embedded are based on the agreement with the specified destination. The relaying service is best effort and the EBCS proxy can decide not to relay the HLP payload if any of the implemented criteria for relaying are not satisfied or for any other reason.

For example, an AP vendor (or an operator) that has one or more APs deployed at a certain venue (such as an airport or a hotel) can establish a business relationship with one or more cloud providers (such as the one that specializes in baggage tracking or logging of sensor data). The AP vendor (or the operator) can configure (default) rules at an EBCS proxy (which is affiliated with the APs at the venue) for providing the relaying service while additional (destination specific) rules are set up based on the service agreement with the cloud provider. Based on these rules an EBCS proxy determines whether to relay the HLP payload carried in an EBCS UL frame that it receives. For example, if it receives an EBCS UL frame with a destination that is not part of any agreement, then based on local policies, it will not relay the HLP payload carried in the frame. Similarly, if the authentication of the EBCS UL frame fails, then based on the relationship with the entity at the specified destination, it will not relay the HLP payload carried in the frame.

NOTE 1 —The communication between an EBCS relaying STA and its affiliated EBCS proxy and the communication between an EBCS proxy and a specified destination are out of scope of this standard.

NOTE 2 —An EBCS proxy evaluating various criteria before it relays an HLP payload helps reduce the likelihood of a DoS attack on the specified destination.

NOTE 3—An operator can install one or more EBCS relaying STAs at a certain location with the intention of only providing relaying service. In such a deployment scenario, the EBCS relaying STAs will not beacon or establish an infrastructure BSS.

4.5.12.3.3 Example configurations for EBCS proxy

The figures in this subclause show EBCS APs each affiliated with their respective EBCS proxy providing relaying service. However, the same explanation would apply if any of the EBCS APs is replaced with an EBCS relaying STA that does not transmit a Beacon frame.

Figure 4-22 provides an example of the relaying service based on a relationship with a specified destination.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

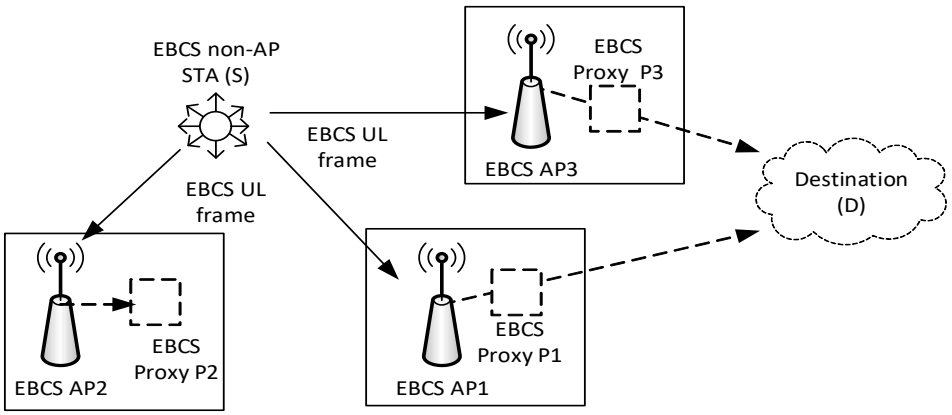

Figure 4-22—Illustration of relaying operation at EBCS APs with collocated EBCS proxy

In this figure, EBCS proxies P1, P2 and P3 are collocated with EBCS APs A1, A2, and A3, respectively. EBCS proxy P1 and EBCS proxy P3 have established a relationship with a destination (D). An EBCS non-AP STA (S) transmits an EBCS UL frame that is received by EBCS APs in the neighborhood (i.e., AP1, AP2, and AP3). The EBCS UL frame carries the HLP payload, a field carrying the address of D and other fields for security. P1 and P3 verify the certificate of S based on their agreement with D and perform a replay check to determine whether the criteria for relaying the HLP payload to D are met. If the local policy or the agreement with D requires limiting the amount or frequency of payloads being sent to D, then P1 and P3 determine whether or not to relay their received payloads to D, based on whether or not prior transmissions have reached the limit. If the agreement with D requires the inclusion of additional information, P1 and P3 embed appropriate information, before relaying the HLP payload. In Figure 4-22 , EBCS AP2 discards the EBCS UL frame. This could be for any number of reasons such as that the AP does not provide a relaying service, that the AP's collocated proxy has not established a relationship with D, or that one or more criteria for relaying have not been satisfied.

NOTE—If an entity at a destination has relationships with multiple EBCS proxies, it might, as part of the agreement with each proxy, set a relaying limit (e.g., amount or frequency of relaying per proxy) so that the aggregate from all the proxies is below a certain threshold. In addition, EBCS proxies might collaborate to limit the aggregate payload being relayed to the specified destination. Such mechanisms are out of scope of this standard.

In another example, depicted in Figure 4-23 , the EBCS proxy (P) is not collocated with either EBCS AP1 or EBCS AP3, but resides on an entity (such as a network controller) in the LAN that AP1 and AP3 belong to. EBCS AP1 and EBCS AP3 send the contents of the EBCS UL frame to P, which evaluates whether the criteria for relaying are met before it relays a single copy of the HLP payload to the specified destination.

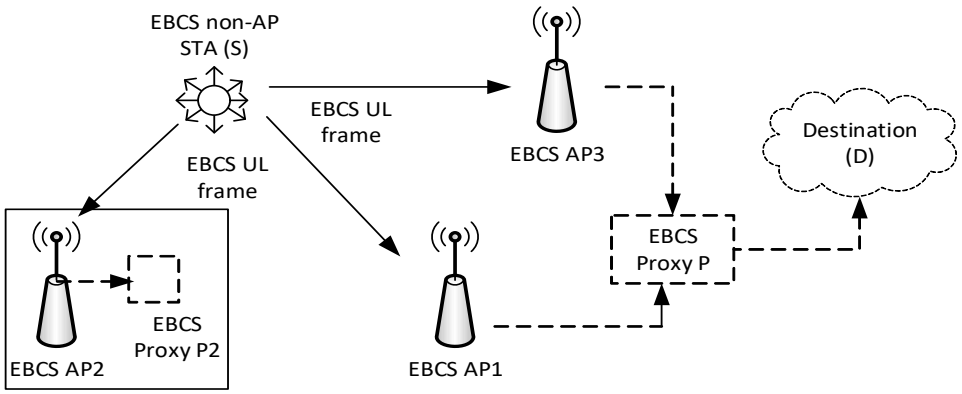

Figure 4-23—Illustration of relaying when EBCS proxy is not collocated within an EBCS AP

The configuration shown in Figure 4-23 could be prevalent in commercial deployments, such as airports, train stations, malls, or a warehouse, where multiple EBCS APs are likely to be connected to a single entity on a common LAN (such as a network controller), which provides access to destinations outside the LAN. In such a configuration, the EBCS proxy resides on an entity in the LAN. On the other hand, the configuration shown in Figure 4-22 could be prevalent in residential deployments where an EBCS AP has direct connectivity to destinations outside the LAN.

4.6 Multiple logical address spaces

Just as the IEEE 802.11 architecture allows for the possibility that the WM, DSM, and an integrated non-IEEE-802.11 LAN might all be different physical media, it also allows for the possibility that each of these components might be operating within different address spaces. IEEE Std 802.11 uses and specifies only the use of the WM address space.

Each IEEE 802.11 PHY operates in a single medium—the WM. The IEEE 802.11 MAC operates in a single address space. MAC addresses are used on the WM in the IEEE 802.11 architecture. Therefore, it is unnecessary for the standard to explicitly specify that its addresses are “WM addresses.” This is assumed throughout this standard.

IEEE Std 802.11 has chosen to use the IEEE 802 48-bit address space (see 9.2.4.3.2). Thus IEEE 802.11 addresses are compatible with the address space used by the IEEE 802 LAN family.

The IEEE 802.11 choice of address space implies that for many instantiations of the IEEE 802.11 architecture, the non-IEEE-802.11 LAN MAC address space and the IEEE 802.11 MAC address space might be the same. In the situations where a DS that uses MAC-level IEEE 802 addressing is appropriate, all three of the logical address spaces used within a system could be identical. While this is a common case, it is not the only combination allowed by the architecture. The IEEE 802.11 architecture allows for all three logical address spaces to be distinct. In the GLK case, IEEE 802.1Q bridges are included in the network topology; therefore, the wired LAN MAC address space and IEEE 802.11 MAC address space are the same

A multiple address space example is one in which the DS implementation uses network layer addressing. In this case, the WM address space and the DS address space are different.

Note that IEEE 802.11 STAs within a single ESS share the same address space, fulfilling the transparency requirement from the definition of the DS. The DSS uses this same address space, even in the case where the DSM uses a different address space.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The ability of the architecture to handle multiple logical media and address spaces is key to the ability of IEEE Std 802.11 to be independent of the DS implementation and to interface cleanly with network layer mobility approaches. The implementation of the DS is unspecified and is beyond the scope of this standard.

4.7 Differences among ESS, PBSS, and IBSS LANs

In 4.3.2 the concept of the IBSS LAN was introduced, and in 4.3.3 the concept of the PBSS LAN was introduced. In an IBSS or PBSS, a STA communicates directly with one or more other STAs.

Consider the full IEEE 802.11 architecture as shown in Figure 4-24 .

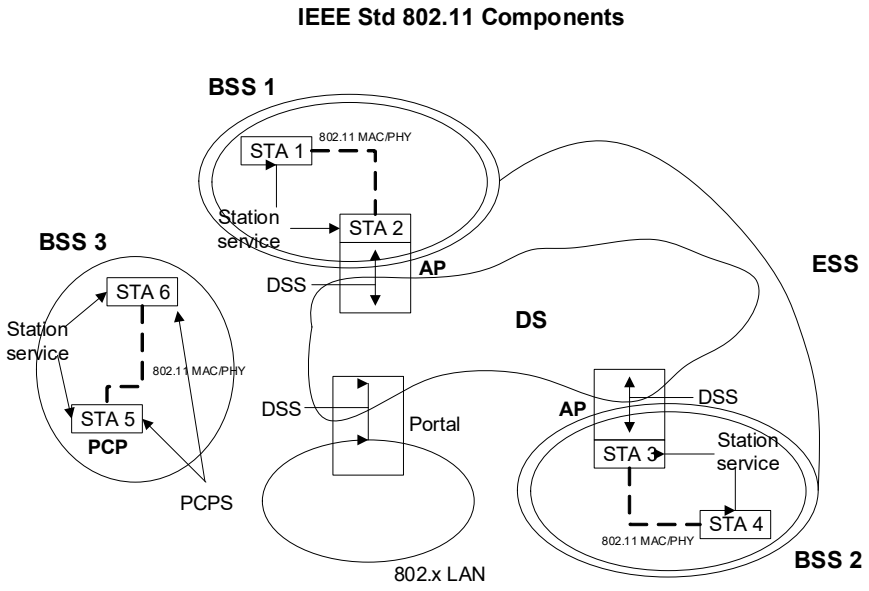

Figure 4-24—IEEE 802.11 architecture (again)

An IBSS consists of STAs that are directly connected. Thus there is (by definition) only one BSS. Further, because there is no physical DS, there is no portal, integrated non-IEEE-802.11 LAN, or DSS. The logical picture reduces to Figure 4-25 .

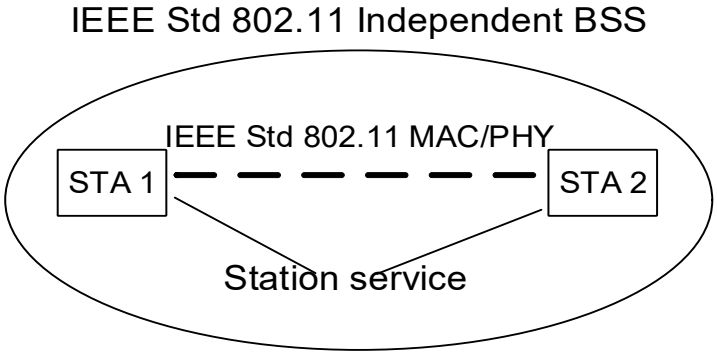

Figure 4-25—Logical architecture of an IBSS

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An important difference between the IBSS and the PBSS is that, within the PBSS, Beacon frames are not transmitted by every STA and instead only a single STA, namely the PCP, is responsible for DMG Beacon frame transmission. Within the IBSS, all STAs are responsible for Beacon frame transmission. When compared to the infrastructure BSS, the PBSS does not provide certain DSSs as described in 4.4.3.

There can be more than one PBSS in the same BSA. One of the STAs within each PBSS assumes the role of the PCP. The logical picture of the PBSS reduces to Figure 4-26 .

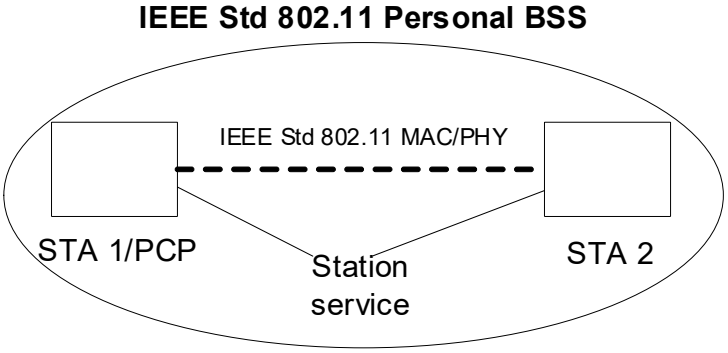

Figure 4-26—Logical architecture of a PBSS

Only the minimum two STAs are shown in Figure 4-25 . An IBSS can have an arbitrary number of members. In an IBSS only Class 1 and Class 2 frames are allowed because there is no DS in an IBSS.

The services that apply to an IBSS are the SSs. A QoS IBSS supports operation under the HCF using TXOPs gained through the EDCA mechanism. The parameters that control differentiation of the delivery of MSDUs with different priority using EDCA are fixed. A QoS IBSS has no HC and does not support polled TXOP operation and setting up of TSPEC.

The services that apply to the PBSS are the SSs and the PCPSs as described in 4.4.3. A PBSS supports operation under the HCF using TXOPs gained through the EDCA mechanism. In a PBSS, the EDCA mechanism is used only within CBAPs. The parameters that control differentiation of traffic classes using EDCA can be configured by the PCP in a PBSS. The PCP of a PBSS has no HC, but can support TSPEC setup, DMG TSPEC setup, and service periods.

In an IBSS, each STA enforces a uniform security policy across all STAs. In an infrastructure BSS or a PBSS, an AP or a PCP, respectively, enforce a uniform security policy across all STAs, for all links to the AP or PCP.

4.8 Differences between ESS and MBSS LANs

In 4.3.24, the concept of the MBSS LAN was introduced. It was noted that, using the multi-hop capability, the MAC service of a STA in an MBSS appears to provide the exchange of MSDUs directly to any other STA in the MBSS, even if the STAs are not within range of each other. This is different from an IBSS, where STAs cannot communicate if they are not within range of each other.

Unlike the IBSS, an MBSS might have access to one or more DSs. An MBSS connects through one or more mesh gates to one or more DSs.

Since in an MBSS it appears at the MAC service interface as if all mesh STAs provide the direct exchange of MSDUs, the MBSS can be used as a DSM. APs, a portal, and mesh gates might use the MBSS as a DSM

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

to provide the DSS. Thus, different infrastructure BSSs can unite over the MBSS to form an ESS for example.

An AP identifies the infrastructure BSS that it forms. This is different from the MBSS where no such central entity exists. Whereas infrastructure BSSs need the ESS and thus the DS to unite, the MBSS appears the same to an LLC layer without the need for access to a DS. However, if an MBSS has one or more mesh gates providing access to the DS(s), the MBSS might exist in disjointed areas and yet form a single network.

4.9 Reference model

4.9.1 General

This standard presents the architectural view, emphasizing the separation of the system into two major parts: the MAC of the data link layer (DLL) and the PHY. These layers are intended to correspond closely to the lowest layers of the ISO/IEC basic reference model of Open Systems Interconnection (OSI) (ISO/IEC 7498-1:1994). The layers and sublayers described in this standard are shown in Figure 4-27 .

There is an interface between the IEEE 802.1X Supplicant and Authenticator and the SME not shown in Figure 4-27 . This interface is described in IEEE Std 802.1X-2020.

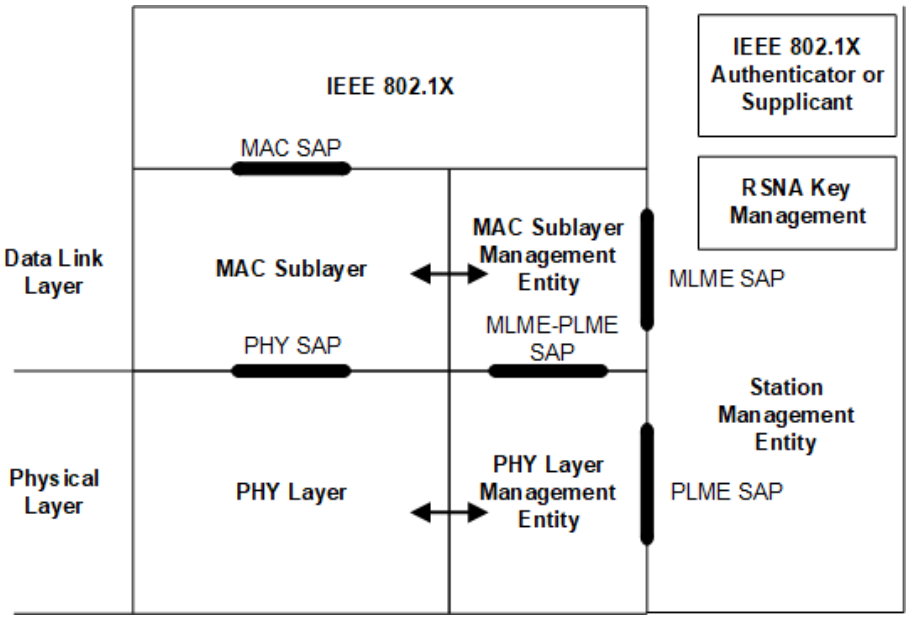

Figure 4-27—Portion of the ISO/IEC basic reference model covered in this standard

4.9.2 Interworking reference model

The MAC state generic convergence function (MSGCF) provides services to higher layer protocols based on MAC state machines and interactions between the layers.

Interworking functions might require correlating information from multiple management entities. It is the function of the MSGCF to correlate information for higher layer entities. The MSGCF observes the interactions between the MLME and SME, and between the PLME and SME. After correlation of lower-layer MLME and PLME events, the MSGCF might synthesize indications to higher layer entities.

Figure 4-28 shows an entity, the MSGCF, defined in 6.4, that has access to all management information through exposure to the MAC sublayer and PHY management entities, and provides management information to higher level entities, such as Mobility Managers, supporting heterogeneous medium mobility.

An example of how the MSGCF interfaces to these higher layer entities, is provided by the media independent service (MIS) interface, as defined in IEEE Std 802.21-2017.

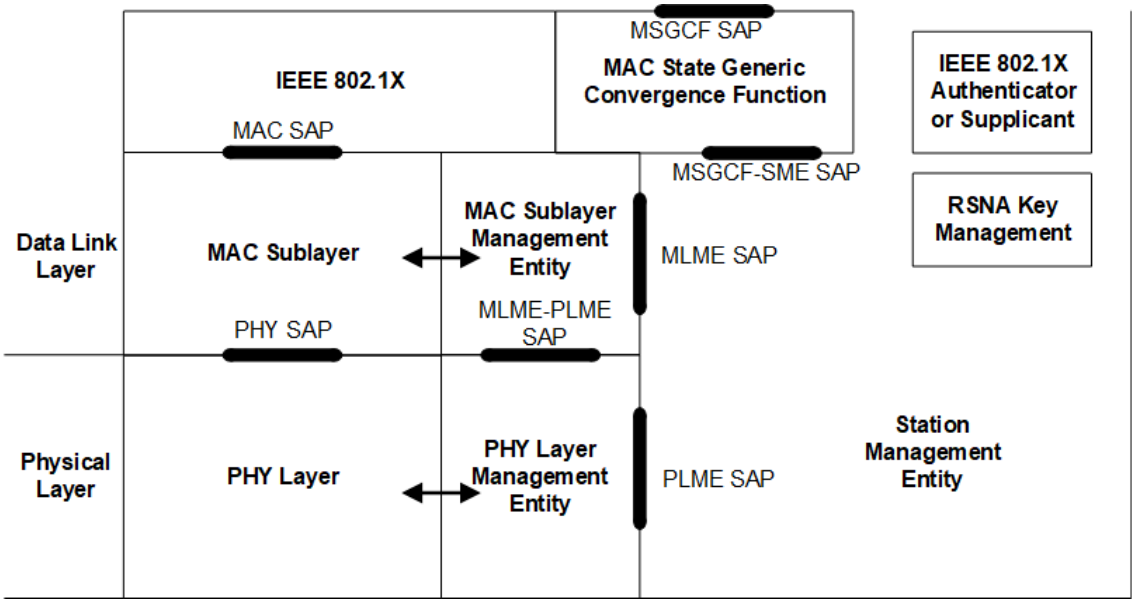

Figure 4-28—Interworking reference model

The MSGCF is designed to provide the status of the connection of a non-AP STA to a set of BSSs comprising a single ESS. Figure 4-29 illustrates the concept of an ESS link. This reflects the state of a connection to an ESS independent of any particular access point. In Figure 4-29 , STA3 is associated with either AP1 or AP2. The state of the ESS link is up when STA3 is associated with any of the APs comprising an ESS.

4.9.3 Reference model for supporting multiple MAC sublayers

An MM-SME function interfaces with the SMEs of the coordinating STAs. STAs managed under the MM-SME share the same antennas and PHY and optionally unify power management. The reference model for supporting multiple MAC sublayers is shown in Figure 4-30 .

An MM-SME coordinates the management of multiple MAC sublayers. Each MAC sublayer has a separate MAC SAP and MLME SAP. A MAC SAP together with its corresponding MLME SAP is identified by a MAC address.

Even when coordinated by an MM-SME, each MAC retains its single MAC address, and each STA contains a single MAC; therefore, the MM-SME coordinates multiple STAs as well as multiple MACs.

Multiple STAs coordinated by an MM-SME have a single PHY that is shared by the multiple MAC sublayers. Transmission attempts of different MAC sublayers can collide internally if the STAs share a single PHY, and a backoff procedure is invoked in this case. Since multiple STAs coordinated by the same MM-SME share the PHY, the STAs cannot directly exchange frames with each other.

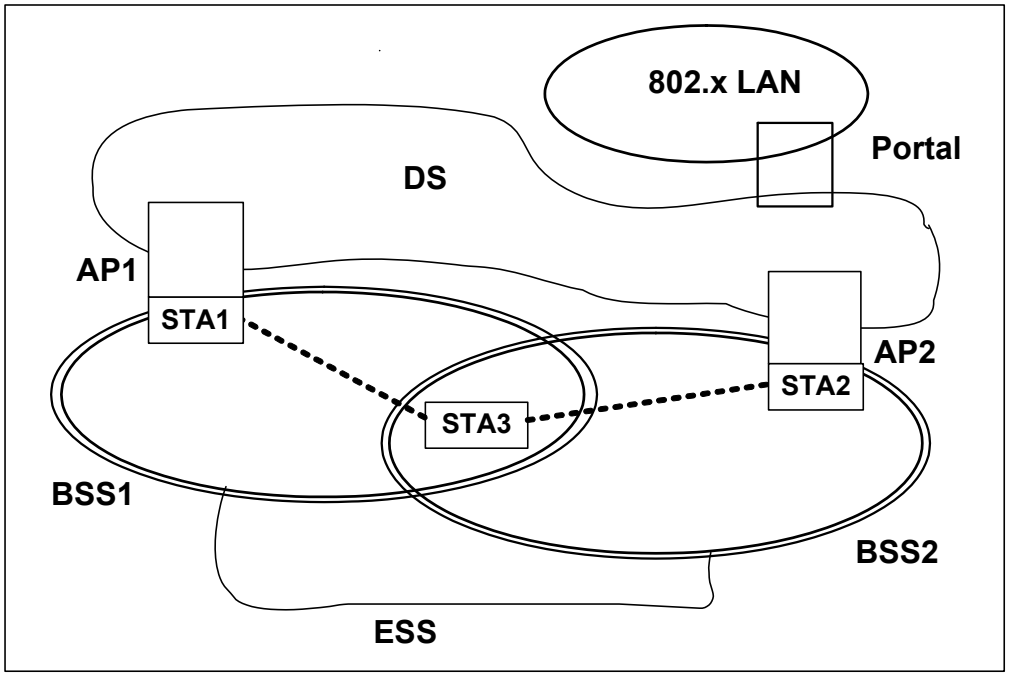

Figure 4-29—ESS link illustration

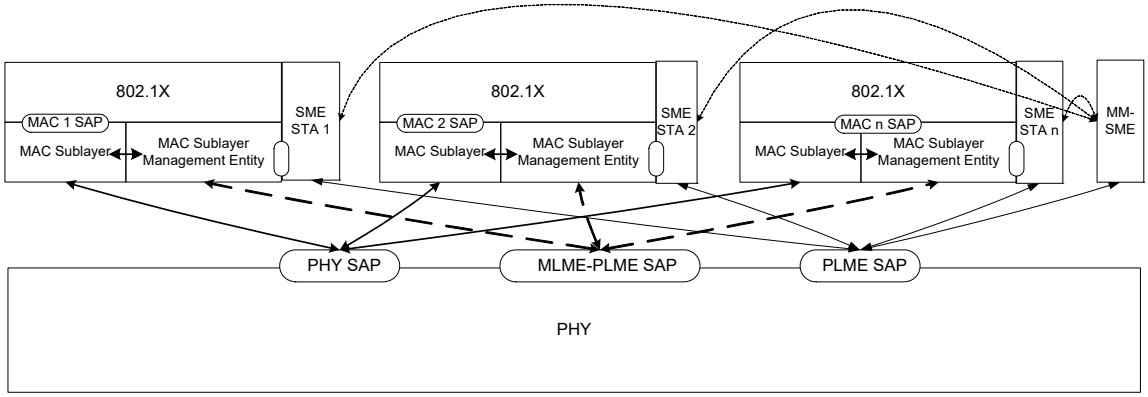

Figure 4-30—Reference model for supporting multiple MAC sublayers

NOTE—The multiple MAC reference model shown in Figure 4-30 defines how multiple STAs can share the same physical layer entity. If this model is used in conjunction with the reference model for multi-band operation (see 4.9.4), the multiple MAC reference model applies within each physical layer entity contained in the multi-band device, whereas the multi-band operation reference model applies to different physical layers.

The MM-SME accesses each of the MLME SAPs of the coordinated STAs separately to deliver MLME SAP primitives. STAs that are coordinated by the same MM-SME can establish a multiple MAC sublayers link (MMSL) with a peer STA. The set of all MMSLs between a pair of STAs creates an MMSL cluster.

An MM-SME controls the power management mode, DMG antenna configuration, and other parameters and states of the coordinated STAs to eliminate unnecessary duplication of functions. A change in the power management mode of the STAs coordinated by an MM-SME is signaled to a peer STA via any one of the STAs' MAC sublayer. Also, a beamforming link established between STAs can be used by all of the MAC

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

sublayers of any of the STAs coordinated by the same MM-SME. For these purposes, an MMS element is used.

The MMS element contains multiple MAC addresses of the MACs coordinated by the same MM-SME. The element can be included in any frame that advertises the MM-SME capabilities, such as Probe Request and Probe Response frames and Information Request and Information Response frames, and the frames that establish communication agreements, such as Association, ADDTS Request, ADDTS Response, BlockAckReq, and BlockAck.

4.9.4 Reference model for multi-band operation

The reference model of a device that is multi-band capable (see 11.31) and that supports transparent fast session transfer (FST) is shown in Figure 4-31 . The reference model of a device that is multi-band capable and that supports nontransparent FST is shown in Figure 4-32 .

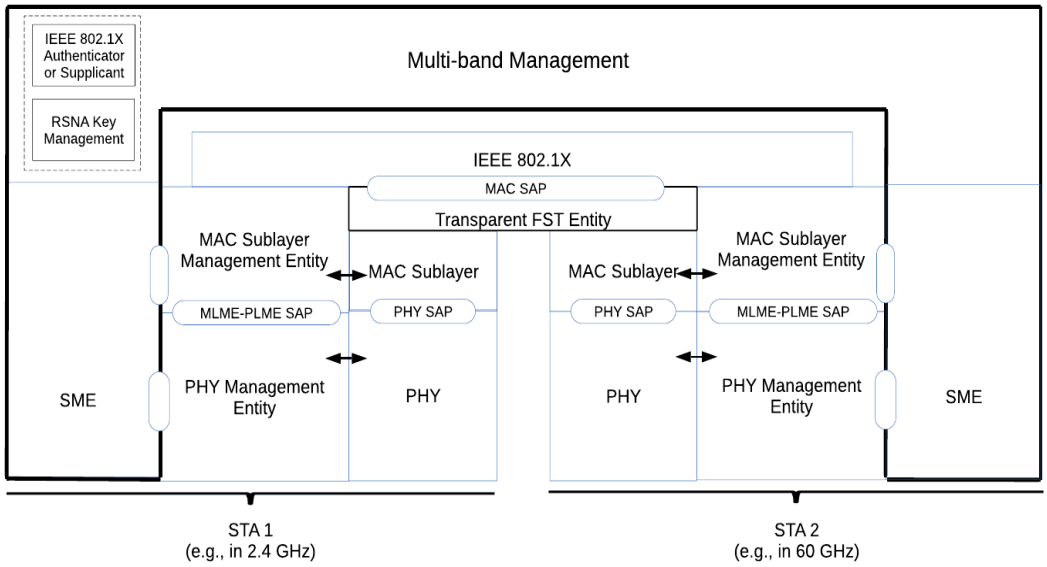

Figure 4-31—Reference model for a multi-band capable device (transparent FST)

A multi-band capable device can manage operation over more than one frequency band/channel. The operation across the different frequency bands/channels can be simultaneous or nonsimultaneous.

A multi-band capable device can also support multiple MAC sublayers; in this case, it is coordinated by an MM-SME.

NOTE—For simplicity, Figure 4-31 and Figure 4-32 depict the reference model when there is a one-to-one mapping between PHYs and MACs. However, the reference model for a multi-band capable device can be applied in conjunction with the reference model for STAs that support multiple MAC sublayers (see 4.9.3).

When used in the context of FST, the term “session” refers to non-PHY state information that is kept in a pair of STAs that communicate directly (i.e., excludes forwarding) and that is available prior to and following a fast session transfer. This state information is different depending if transparent or nontransparent is used. For transparent FST, a shared multi-band management entity has access to the local information within each SME; and in this case the state information includes sequence numbers, block ack agreements, TSs, association state, RSNA, security keys, replay counters, and PN counters. For nontransparent FST, the function of the multi-band management entity is restricted to coordinating the setup

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

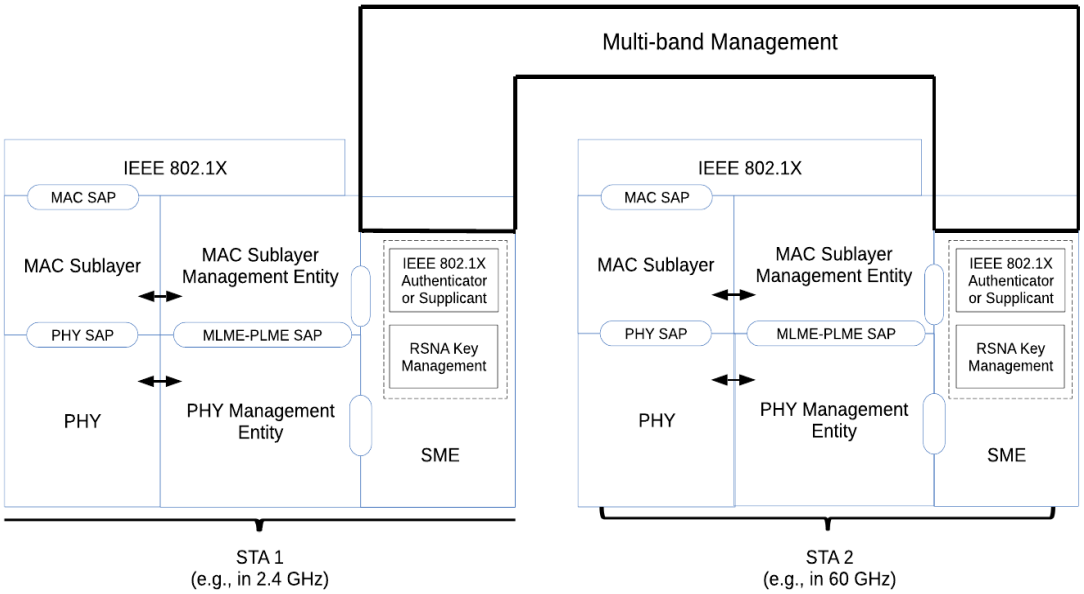

Figure 4-32—Reference model for a multi-band capable device (nontransparent FST)

and teardown of a fast session transfer with no access to other local information within each SME. Therefore, with nontransparent FST, any information local to an SME needs to be reestablished for the new band/channel, and this can be done either prior to or following the fast session transfer (see 11.31).

The SME of a multi-band capable device contains a multi-band management entity that is responsible for coordinating the setup, configuration, teardown, and transfer of FST sessions from a band/channel to another band/channel supported by the multi-band capable device. If using nontransparent FST, the multi-band management entity can employ a combination of the source and destination MAC addresses in both the old and new band/channel to configure the routing of MSDUs and MLME primitives within the STA. If using transparent FST, in addition to the MAC addresses, the multi-band management entity can employ the TID of an FST session for this routing.

The multi-band procedures (see 11.31) allow a pair of multi-band capable devices to discover, synchronize, (de)authenticate, (re)associate, disassociate, and manage resources with each other on any common band/channel that is supported by both STAs.

By using the on-channel tunneling (OCT) multi-band procedure described in 11.31.5, the SME of a multi-band capable device can instruct one of its MLMEs to use the OCT services provided by another MLME of the same multi-band capable device to communicate with a peer MLME of a peer multi-band capable device. This enables the SMEs of a pair of multi-band capable devices to provide a seamless FST, including performing (de)authentication and (re)association across bands/channels. The MLMEs that use the OCT services provided by another MLME within the same multi-band capable device to communicate are referred to as being *over-the-WM disabled* with respect to each other. Following a frame exchange on the new band/channel (e.g., after FST), two peer over-the-WM disabled MLMEs can become over-the-WM enabled with respect to each other.

By using the discovery assistance feature described in 11.31.7, the SME of a multi-band capable device can trigger one of its MLMEs to start the discovery assistance procedure for its operating band upon reception of a multi-band discovery assistance request from another MLME of the same multi-band capable device. The

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

multi-band discovery assistance request is an FST Setup Request frame including the DMG Discovery Assistance element. The SME of a multi-band capable device can trigger one of its MLMEs to start scanning its operating band upon reception of a multi-band discovery assistance response from another MLME of the same multi-band capable device. The multi-band discovery assistance response is an FST Setup Response frame including the DMG Discovery Assistance element. This enables multi-band capable devices to trigger the discovery assistance and scanning procedure on one band upon receiving the DMG Discovery Assistance element on another band. The multi-band discovery assistance procedure can be used to expedite the scanning procedure of a multi-band capable device that includes a DMG STA (see 11.31.1).

As described in 5.1.5, a MAC address is not unique within the multi-band capable device when transparent FST is intended to be used. When transparent FST is used, a single MAC SAP at each peer is presented to the higher layers of that peer for all of the frequency bands/channels that are identified by the same MAC address at that peer. When nontransparent FST is used, different MAC SAPs are presented to higher layers since different MAC addresses are used prior to and following an FST. Therefore, when nontransparent FST is used, higher layers are responsible for managing the FST.

Each MAC SAP is controlled by a separate and independent RSNA key management entity and IEEE 802.1X Authenticator or Supplicant unless transparent FST is used, in which case the multi-band management entity is responsible for coordinating with each of the SMEs to ensure that a single RSNA key management entity and IEEE 802.1X Authenticator or Supplicant are shared among the MACs and that a single IEEE 802.1X entity is controlled.

4.9.5 Reference model for co-channel coordinated management operation

The reference model for a device that uses the co-channel coordinated management operation is shown in Figure 4-33 . The reference model for co-channel coordinated management operation allows a device to operate on the same channel with more than one STA, where each STA is associated with a different antenna or DMG antenna configuration. Each STA can have its own PHY and MAC sublayer for channel access and MPDU processing.

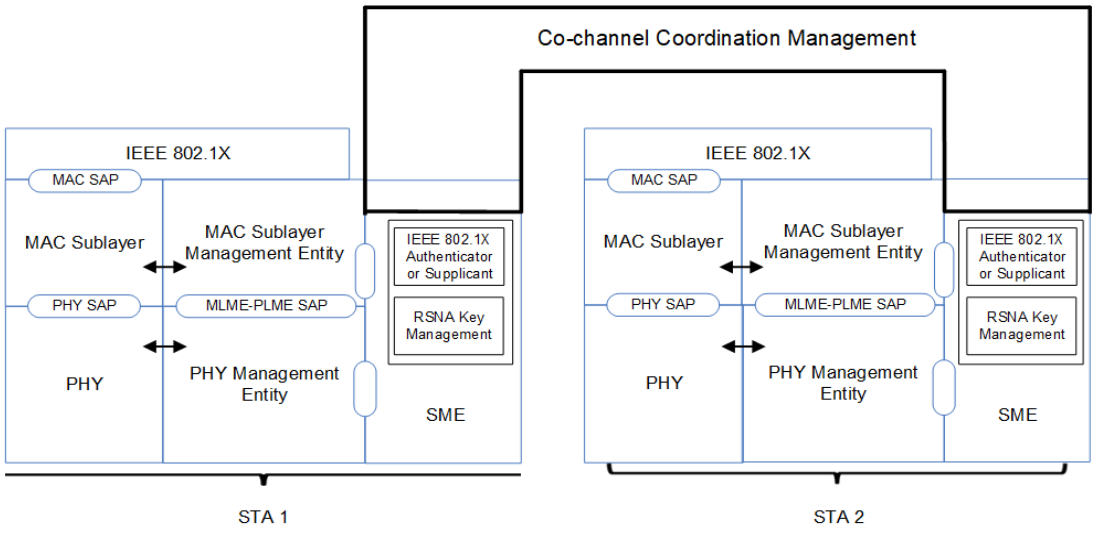

Figure 4-33—Reference model for co-channel coordinated management operation

The co-channel coordinated management operation reference model can be used by a device to provide TDD channel access as defined in11.54 and in 10.38.6.2.2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The SME of a device that uses the co-channel coordinated management operation contains a coordinated management entity that is responsible for coordinating the setup, configuration, time synchronization and scheduling of STAs belonging to the device.

Different MAC SAPs are presented to higher layers if different MAC addresses are used by each STA. Each MAC SAP is controlled by a separate and independent RSNA key management entity. The coordinated management entity is responsible for coordinating with each of the SMEs if a single IEEE 802.1X entity of the IEEE 802.1X Authenticator/Supplicant is shared among the MACs.

4.10 IEEE Std 802.11 and IEEE Std 802.1X-2020

4.10.1 General

An RSNA relies on IEEE Std 802.1X-2020 to provide authentication services and uses the IEEE 802.11 key management scheme defined in 12.7. The IEEE 802.1X access control mechanisms apply to the association between a STA and an AP and to the relationship between the IBSS STA and STA peer. The AP's SME performs the Authenticator and, optionally, the Supplicant and AS roles. In an infrastructure BSS, a non-AP STA's SME performs the Supplicant role. In an IBSS the SME takes on both the Supplicant and Authenticator roles and might take on the AS role.

4.10.2 IEEE 802.11 usage of IEEE Std 802.1X-2020

IEEE Std 802.11 depends upon IEEE Std 802.1X-2020 to control the flow of MAC service data units (MSDUs) between the DS and STAs by use of the IEEE 802.1X Controlled/Uncontrolled Port model. IEEE 802.1X EAPOL PDUs are transmitted in one or more IEEE 802.11 Data frames and passed via the IEEE 802.1X Uncontrolled Port. The IEEE 802.1X Controlled Port is blocked from passing general data traffic between two STAs until an IEEE 802.1X authentication procedure completes successfully over the IEEE 802.1X Uncontrolled Port. It is the responsibility of both the Supplicant and the Authenticator to implement port blocking. Each association between a pair of STAs creates a unique pair of IEEE 802.1X Ports, and authentication takes place relative to those ports alone.

IEEE Std 802.11 depends upon IEEE Std 802.1X-2020 and various IEEE 802.11 protocols and handshakes, described in Clause 12 and Clause 13, to establish and change cryptographic keys. Keys are established after authentication has completed. Keys might change for a variety of reasons, including expiration of an IEEE 802.1X authentication timer, key compromise, danger of compromise, or policy.

4.10.3 Infrastructure functional model overview

4.10.3.1 General

This subclause summarizes the system setup and operation of an RSN, in three cases: when a password or PSK is used during IEEE 802.11 authentication, when an IEEE 802.1X AS is used after Open System authentication, and when a PSK is used after Open System authentication. In an RSN, an AP includes an Authenticator, and each associated STA includes a Supplicant.

4.10.3.2 AKM operations with AS

The following AKM operations are carried out when an IEEE 802.1X AS is used:

a) Prior to any use of IEEE Std 802.1X-2020, IEEE Std 802.11 assumes that the Authenticator and AS have established a secure channel. The security of the channel between the Authenticator and the AS is outside the scope of this standard.

   Authentication credentials are distributed to the Supplicant and AS prior to association.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

b) A STA discovers the AP's security policy through passively monitoring Beacon frames or through active probing. If IEEE 802.1X authentication is used, the EAP authentication process starts when the Authenticator sends the EAP-Request or the Supplicant sends the EAPOL-Start PDU (in one or more EAPOL-Start frames). EAP messages pass between the Supplicant and AS via the Authenticator and Supplicant's Uncontrolled Ports as described in 12.7.

c) The Supplicant and AS authenticate each other and generate a PMK. The PMK is sent from the AS to the Authenticator over the secure channel as described in 12.7.

A 4-way handshake or FT 4-way handshake utilizing EAPOL-Key PDUs is initiated by the Authenticator to do the following:

— Confirm that a live peer holds the PMK.
— Confirm that the PMK is current.
— In the case of fast BSS transition, derive PMK-R0s and PMK-R1s.
— Derive a fresh pairwise transient key (PTK) from the PMK or, in the case of fast BSS transition, from the PMK-R1, the derived PTK including the key derivation key (KDK) if WUR frame protection is negotiated.
— If WUR frame protection is negotiated, derive a fresh WTK from the KDK.
— Install the pairwise encryption and integrity keys, and if WUR frame protection is negotiated, the WTK.
— Transport the group keys and sequence number from Authenticator to Supplicant and install the group keys and sequence number in the STA and, if not already installed, in the AP.
— Verify that the RSN capabilities negotiated are valid as defined in 9.4.2.23.4.
— Confirm the cipher suite selection.

Installing the PTK, and where applicable the group keys GTK causes the MAC to encrypt and decrypt all subsequent MSDUs irrespective of their path through the Controlled or Uncontrolled Ports. Installing the WTK when WUR frame protection is negotiated causes the MAC to integrity protect subsequent individually addressed WUR Wake-up frames at the AP or to validate subsequent individually addressed WUR Wake-up frames at the non-AP STA.

Upon successful completion of the 4-way handshake, the Authenticator and Supplicant have authenticated each other; and the IEEE 802.1X Controlled Ports are unblocked to permit general data traffic as described in 12.7.

If the Authenticator later changes one or more group keys, it sends the new group keys and sequence number to the Supplicant using the group key handshake to allow the Supplicant to continue to receive group addressed frames and, optionally, to transmit and receive individually addressed frames. EAPOL-Key PDUs are used to carry out this exchange as described in 12.7.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

4.10.3.3 AKM operations with a password or PSK

The following AKM operations are carried out when authentication is accomplished using a password or PSK:

— A STA discovers the AP's security policy through passively monitoring the Beacon frames or through active probing. After discovery the STA performs SAE authentication using Authentication frames with the AP (see Figure 4-34).

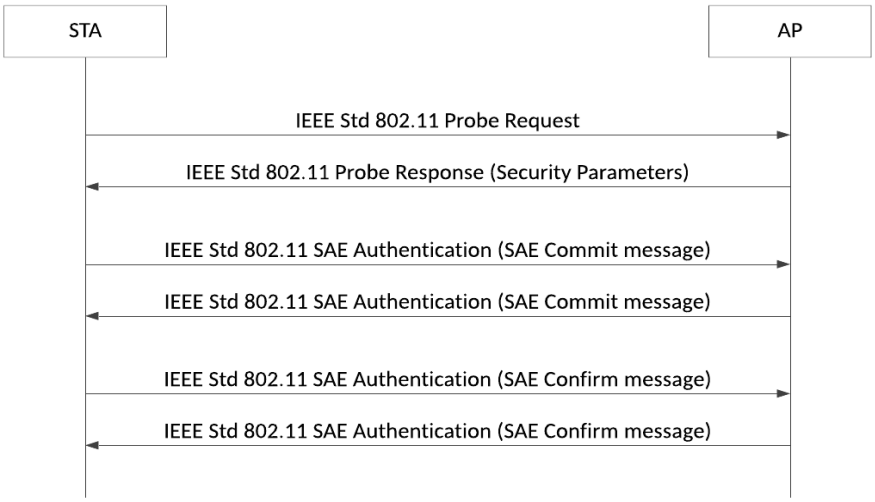

Figure 4-34—Example using SAE authentication

— Upon the successful conclusion of SAE, both the STA and AP generate a PMK. The STA then associates with an AP and negotiates security policy. The AKM in the Association Request and Response frames is confirmed to be the AKM of SAE or of fast BSS transition.

— The PMK generated by SAE is used in a 4-way handshake using EAPOL-Key PDUs, just as with IEEE 802.1X authentication when an AS is present.

— The GTK and GTK sequence number are sent from the Authenticator to the Supplicant just as in the AS case.

— If WUR frame protection is negotiated, the WIGTK and WIPN are sent from the Authenticator to the Supplicant just as in the AS case.

4.10.3.4 Alternate operations with PSK

The following AKM operations represent an alternate operation of using a PSK. This operation has security vulnerabilities if used with a low-entropy key and is recommended to be used only after taking that into account. When this operation is carried out, the PMK is a PSK:

— A STA discovers the AP's security policy through passively monitoring Beacon frames or through active probing. A STA associates with an AP and negotiates a security policy. The PMK is the PSK.

— The 4-way handshake using EAPOL-Key PDUs is used, just as with IEEE 802.1X authentication, when an AS is present.

— The GTK and GTK sequence number are sent from the Authenticator to the Supplicant just as in the AS case.

— If management frame protection is negotiated, the IGTK and IGTK packet number are sent from the Authenticator to the Supplicant just as in the AS case. If beacon protection is enabled, the BIGTK and BIPN are sent from the Authenticator to the Supplicant just as in the AS case.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

4.10.3.5 Disassociation

Disassociation initiated by either STA in an RSNA causes the deletion of the PTKSA at both ends and the deletion of the GTKSA in a non-AP STA. The Controlled and Uncontrolled Ports created for this association are also deleted.

4.10.3.6 AKM operations using FILS authentication

4.10.3.6.1 General

FILS authentication allows faster link setup to the network by performing authentication, association, and key confirmation using four frames—two Authentication frames, one (Re)Association Request frame, and one (Re)Association Response frame.

The following three FILS authentication methods are defined:

a) FILS Shared Key authentication performed without perfect forward security (PFS)
b) FILS Shared Key authentication performed with PFS
c) FILS Public Key authentication with PFS

FILS Shared Key authentication with and without PFS is described in 4.10.3.6.2.

FILS Public Key authentication exchange is described in 4.10.3.6.3.

4.10.3.6.2 AKM operations using FILS Shared Key authentication

A non-AP STA and a trusted third party (TTP) using FILS Shared Key authentication verify mutual possession of a shared key (rRK) (as defined in IETF RFC 5295 and IETF RFC 6696) using Extensible Authentication Protocol (EAP) reauthentication protocol (EAP-RP) signaling. EAP-RP signaling is encapsulated using wrapped data in an Authentication frame as shown in Figure 4-35 . A valid rRK is derived using a prior full authentication using the full EAP as defined in 4.10.3.2. This rRK can be used for multiple runs of EAP-RP authentications as specified in IETF RFC 5295 and IETF RFC 6696.

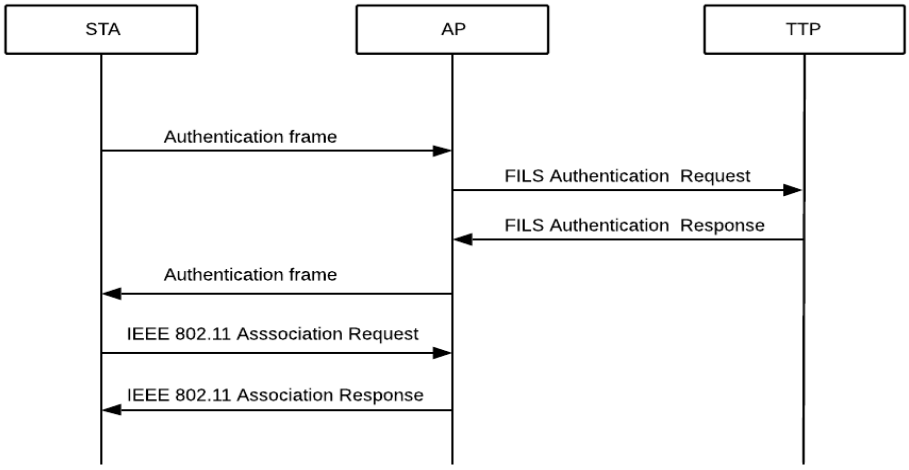

Figure 4-35—FILS authentication using TTP

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

4.10.3.6.3 AKM operations using FILS Public Key authentication

When using FILS Public Key authentication, it is assumed that both STAs using FILS have either:

— Obtained a public key certificate from a certificate authority (CA) and are capable of verifying each other's certificate during execution of FILS authentication procedures; or

— A priori knowledge of, and trust in, an uncertified public key.

The manner in which trust is obtained in certificates is outside the scope of this standard.

4.10.3.7 Opportunistic Wireless Encryption

The following AKM operations are carried out when opportunistic encryption is accomplished using a Diffie-Hellman key exchange.

— The STA discovers the AP's security policy indicating support for Opportunistic Wireless Encryption through passively monitoring Beacon frames or through actively probing. After discovery in a non-DMG infrastructure BSS, the STA performs Open System Authentication with the AP.

— The STA (re)associates with the AP and provides an ephemeral Diffie-Hellman public key in its (Re)Association Request frame. The AP responds with an ephemeral Diffie-Hellman public key in its (Re)Association Response frame.

— The STA and AP complete the Diffie-Hellman key exchange and generate a PMK.

— The 4-way handshake using EAPOL-Key frames is used, just as with IEEE Std 802.1X authentication, when an AS is present.

4.10.4 IBSS functional model description

4.10.4.1 General

This subclause summarizes the system setup and operation of an RSNA in an IBSS. An IBSS RSNA is specified in 12.6.9.

4.10.4.2 Key usage

In an IBSS the individually addressed Data frames between two STAs are protected with a pairwise key. The key is part of the PTK, which is derived during a 4-way handshake. In an IBSS the 4-way handshake can follow IEEE 802.11 authentication of one STA to another. Such authentication might be used by the peer to cause deletion of the PTKSA and block the Controlled Port, resetting any previous handshake.

In an IBSS group addressed Data frames are protected by a key, e.g., named B1, that is generated by the STA transmitting the group addressed frame. To allow other STAs to decrypt group addressed frames, B1 is sent to all of the other STAs in the IBSS. B1 is sent in an EAPOL-Key PDU, encrypted under the PTK key encryption key (PTK-KEK), and protected from modification by the PTK key confirmation key (PTK-KCK).

In an IBSS the SME responds to Deauthentication frames from a STA by deleting the PTKSA associated with that STA.

4.10.4.3 Sample IBSS 4-way handshakes

In this example (see Figure 4-36), there are three STAs: S1, S2, S3. The group addressed frames sent by S1 are protected by B1; similarly B2 for S2, and B3 for S3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

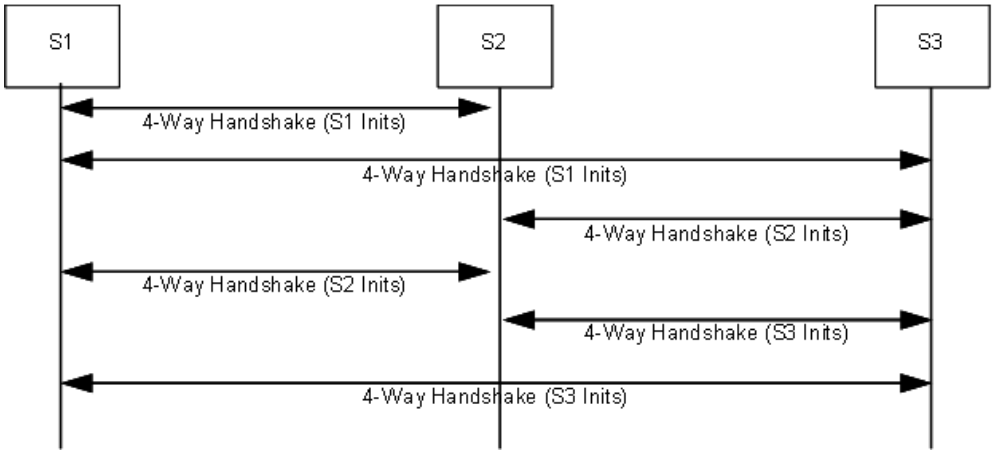

Figure 4-36—Sample 4-way handshakes in an IBSS

For STAs S2 and S3 to decrypt group addressed frames from S1, B1 is sent to S2 and S3. This is done using the 4-way handshake initially and using the group key handshake for GTK updates.

The 4-way handshake from S1 to S2 allows S1 to send group addressed frames to S2, but does not allow S2 to send group addressed frames to S1 because S2 has a different transmit GTK. Therefore, S2 needs to initiate a 4-way handshake to S1 to allow S1 to decrypt S2's group addressed frames. Similarly, S2 also needs to initiate a 4-way handshake to S3 to enable S3 to receive group addressed frames from S2.

In a similar manner S3 needs to complete the 4-way handshake with S1 and S2 to deliver B3 to S1 and S2.

In this example, there are six 4-way handshakes. In general, N Supplicants require $N(N–1)$ 4-way handshakes.

NOTE—In principle the PTK-KCK and PTK-KEK from a single 4-way handshake can be used for the group key handshake in both directions, but using two 4-way handshakes means the Authenticator key state machine does not need to be different between IBSS and ESS.

The group key handshake can be used to send the GTKs to the correct STAs. The 4-way handshake is used to derive the pairwise key and to send the initial GTK. Because in an IBSS there are two 4-way handshakes between any two Supplicants and Authenticators, the pairwise key used between any two STAs is from the 4-way handshake initiated by the STA Authenticator with the higher MAC address (see 12.7.1 for the notion of address comparison).

In an IBSS a secure link exists between two STAs when both 4-way handshakes have completed successfully. The Supplicant and Authenticator 4-way handshake state machines interact so the IEEE 802.1X variable portValid is not set to 1 until both 4-way handshakes complete.

If a fourth STA comes within range and its SME decides to initiate a security association with the three peers, its Authenticator initiates 4-way handshakes with each of the other three Supplicants. Similarly, the original three STA Authenticators in the IBSS need to initiate 4-way handshakes to the fourth STA Supplicant. A STA learns that a peer STA is RSNA-enabled and the peer's security policy (e.g., whether the Authentication and Key Management Protocol (AKMP) is SAE, PSK, or IEEE 802.1X authentication) from the Beacon or Probe Response frame. The initiation might start for a number of reasons:

a) The fourth STA receives a Beacon or Probe Response frame from a MAC address with which it has not completed a 4-way handshake.

b) An SME receives an MLME-PROTECTEDFRAMEDROPPED.indication primitive from a MAC address with which it has not completed a 4-way handshake. This could be a group addressed Data

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

frame transmitted by any of the STAs. In order to set up a security association to the peer STA, an SME that does not know the security policy of the peer can send a Probe Request frame to the peer STA to find its security policy before setting up a security association to the peer STA.

c) An SME receives message 1 of the 4-way handshake sent to a STA because the initiator received a broadcast Data frame, Beacon frame, or Probe Response frame from that STA. In order to set up a security association to the peer STA, a STA that received a 4-way handshake but does not know the security policy of the peer can send a Probe Request frame to the peer STA to find its security policy before setting up a security association to the peer STA.

4.10.4.4 IBSS IEEE 802.1X example

When IEEE 802.1X authentication is used, each STA needs to include an IEEE 802.1X Authenticator and AS. A STA learns that a peer STA is RSNA-enabled and the peer's security policy (e.g., whether the AKMP is PSK or IEEE 802.1X authentication) from the Beacon or Probe Response frame.

Each Supplicant sends an EAPOL-Start PDU (in one or more EAPOL-Start frames) to every other STA to which it intends to authenticate, and each STA's Authenticator responds with the identity of the credential it intends to use.

The EAPOL-Start and EAP-Request/Identity messages are initiated when a protected Data frame (indicated via an MLME-PROTECTEDFRAMEDROPPED.indication primitive), an IEEE 802.1X message, Beacon frame, or Probe Response frame is received from a MAC address with which the STA has not completed IEEE 802.1X authentication. In order to set up a security association to the peer STA, an SME that does not know the security policy of the peer can send a Probe Request frame to the peer STA to find its security policy before setting up a security association to the peer STA.

Although Figure 4-37 shows the two IEEE 802.1X exchanges serialized, they might occur interleaved.

4.10.5 PBSS functional model description

This subclause summarizes the system setup and operation of an RSNA in a PBSS.

If a non-PCP STA chooses to associate with the PCP of the PBSS, the non-PCP STA establishes an RSNA with the PCP following the infrastructure functional model as specified in 4.10.3.

If a non-PCP STA wants to establish an RSNA with the PCP without association or if the non-PCP STA wants to establish an RSNA with another non-PCP STA, it can directly initiate an RSNA authentication with the peer STA, followed by a 4-way handshake. One difference between this model and the IBSS functional model is that only one RSNA authentication and one 4-way handshake are performed between two STAs. If both STAs initiate an RSNA setup at the same time, the RSNA setup initiated by the STA with the lower MAC address is carried through, while the RSNA setup initiated by the STA with the higher MAC address is terminated.

Figure 4-38 shows an example of the RSNA setup in a PBSS. An initiator STA discovers a peer STA's RSNA policies through the DMG Beacon frames from the peer STA if the peer STA is the PCP or through the Probe Response or Information Response frames from the peer STA. In this example, the initiator STA does not associate with the peer STA. The initiator STA performs RSNA authentication with the peer STA to derive a PMK. A 4-way handshake is then started to complete the RSNA setup.

4.10.6 Authenticator-to-AS protocol

The Authenticator-to-AS authentication definition is out of the scope of this standard, but, to provide security assurances, the protocol needs to support the following functions:

a) Mutual authentication between the Authenticator and AS
b) A channel for the Supplicant and AS authentication
c) The ability to pass the generated key from the AS to the Authenticator in a manner that provides authentication of the key source, preserves integrity of the key transfer, and preserves data confidentiality of the key from all other parties

Suitable protocols include, but are not limited to, remote authentication dial-in user service (RADIUS) (IETF RFC 2865 [B33]) and Diameter (IETF RFC 3588 [B41]).

4.10.7 PMKSA caching

The Authenticator and Supplicant can cache PMKSAs, which include the IEEE 802.1X state. A PMKSA can be deleted from the cache for any reason and at any time.

A STA can supply a list of PMK identifiers in the (Re)Association Request frame or first FILS Authentication frame. Each PMK identifier names a PMKSA. The Authenticator can specify the selected PMK identifier in message 1 of the 4-way handshake or the second FILS Authentication frame. The selection of the PMK identifiers to be included by the STA and Authenticator is out of the scope of this standard.

A FILS authentication exchange results in a PMKSA, which can be cached. A FILS STA can benefit from such caching, as a FILS STA performing subsequent authentications can supply a list of PMK identifiers in its initial Authentication frame. FILS APs that support PMK caching can identify themselves using a cache identifier. A FILS STA that has successfully established a PMKSA at an AP identifying a particular cache identifier can attempt to use PMK caching in a subsequent attempt with any AP that uses the same cache identifier.

4.10.8 Protection of group addressed robust Management frames

When management frame protection is negotiated, all group addressed robust Management frames are encapsulated using the procedures defined in 11.12. This service provides integrity protection of group addressed robust Management frames using BIP.

5. MAC service definition

5.1 Overview of MAC services

5.1.1 Data service

5.1.1.1 General

This service provides peer LLC sublayer entities or IEEE 802.1Q bridge ports with the ability to exchange MSDUs. To support this service, the local MAC uses the underlying PHY-level services to transport an MSDU to a peer MAC entity, where it is delivered to the peer LLC sublayer or bridge port. Such asynchronous MSDU transport is performed on a connectionless basis. By default, MSDU transport is on a best-effort basis. However, the QoS facility uses a traffic identifier (TID) to specify differentiated services on a per-MSDU basis. The QoS facility also permits more synchronous behavior to be supported on a connection-oriented basis using TSPECs. There are no guarantees that the submitted MSDU will be delivered successfully. Group addressed transport is part of the data service provided by the MAC. Due to the characteristics of the WM, group addressed MSDUs might experience a lower QoS, compared to that of individually addressed MSDUs. All STAs support the data service, but only QoS STAs in a QoS BSS differentiate their MSDU delivery according to the designated traffic category or traffic stream (TS) of individual MSDUs. QoS STAs that support the QMF service differentiate their MMPDU delivery according to the MMPDU's access category. The access category of each MMPDU is designated by the transmitter's current QMF policy.

There are two service classes available in a QoS STA: QoSAck and QoSNoAck. The service classes are used to signal if the MSDU is to be transmitted with or without using the MAC-level acknowledgment.

In QoS STAs either associated in a BSS or having membership in an IBSS, the MAC uses a set of rules that tends to cause higher UP MSDUs in a BSS to be sent before lower UP MSDUs in the BSS. The MAC sublayer entities determine the UPs for MSDUs based on the TID values provided with those MSDUs. If a TSPEC has been provided for a TS, via the MAC sublayer management entity, the MAC attempts to deliver MSDUs belonging to that TS in accordance with the QoS parameter values contained in the TSPEC. In a BSS with some STAs supporting the QoS facility and others not supporting the QoS facility, in delivering an MSDU to a non-QoS STA, the QoS STA uses the access category (AC) corresponding to the UP of the MSDU.

5.1.1.2 Determination of UP

The QoS facility supports eight priority values, referred to as UPs. The values a UP may take are the integer values from 0 to 7, which form an ordered sequence of priorities, with 1 being the lowest value, 7 the highest value, and 0 falling between 2 and 3. An MSDU with a particular integer priority is said to belong to a traffic category (TC) with a numerically equal UP. The UP is provided with each MSDU at the medium access control service access point (MAC SAP) either directly, in the priority parameter, or indirectly, in a TSPEC or SCS Descriptor element designated by the priority parameter. For the transmission of an MSDU that was provided to the Internal Sublayer Service SAP associated with a general link, the UP is determined by the GLK convergence function based on the priority parameter of the MA-UNITDATA.request primitive. (See Annex R for recommended mapping guidelines.)

5.1.1.3 Interpretation of priority parameter in MAC service primitives

The value of the priority parameter in the MAC service primitives (see 5.2) may be a noninteger value of Contention or may be any integer value in the range 0 to 15.

When the priority parameter has an integer value, it is used in the TID subfields that appear in certain frames that are used to deliver and to control the delivery of QoS data across the WM.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Priority parameter and TID subfield values 0 to 7 are interpreted as UPs for the MSDUs. Outgoing MSDUs with UP values 0 to 7 are handled by MAC entities at STAs in accordance with the UP.

Priority parameter and TID subfield values 8 to 15 specify TIDs that are also TS identifiers (TSIDs) and select the TSPEC for the TS designated by the TID. Outgoing MSDUs with priority parameter values 8 to 15 are handled by MAC entities at STAs in accordance with the UP value determined from the UP subfield as well as other parameter values in the selected TSPEC. When an MSDU arrives with a priority value between 8 and 15 and for which there is no TSPEC defined, then the MSDU shall be sent with priority parameter set to 0.

The noninteger value of the priority parameter is allowed at all non-QoS STAs. The integer values of the priority parameter (i.e., TID) are supported only at QoS STAs that are in a QoS BSS. A range of 0 to 15 is supported by QoS STAs that are members of a QoS BSS that is not an IBSS; whereas a range of 0 to 7 is supported by QoS STAs that are members of a QoS IBSS. If a QoS STA is associated in a non-QoS BSS, the STA is functioning as a non-QoS STA, so the priority value is always Contention.

At QoS STAs associated in a QoS BSS, MSDUs with a priority of Contention are considered equivalent to MSDUs with TID 0. At STAs associated in a non-QoS BSS, all MSDUs with an integer priority are considered equivalent to MSDUs with a priority of Contention.

Data frames received by a QoS STA may be of:

a) Non-QoS subtypes, in which case the STA shall assign to them a priority of Contention.
b) QoS subtypes, in which case the STA shall infer the UP value from the TID in the QoS Control field directly for TID values between 0 and 7. For TID values between 8 and 15 the STA shall extract the UP value in the UP subfield of the TS Info field in the associated TSPEC or from the UP field in the associated TCLAS element, as applicable.

QoS APs deliver the UP with the received MSDUs to the DS or bridge port.

5.1.1.4 Interpretation of service class parameter in MAC service primitives in a STA

In QoS STAs, the value of the service class parameter in the MAC service primitive (see 5.2) may be a noninteger value of QoSAck or QoSNoAck.

When an MSDU is received from the MAC SAP with one of the following service class indications, and the recipient STA is a single QoS STA or all recipient STAs are QoS STAs:

— QoSAck, the MSDU is transmitted using one or more QoS Data frame(s) with an ack policy other than No Ack.
— QoSNoAck, the MSDU is transmitted using one or more QoS Data frame(s) with an ack policy of No Ack.

Otherwise, the MSDU is transmitted using one or more non-QoS Data frame(s).

When a QoS Data frame is received from another STA, the service class parameter in the MA-UNITDATA.indication primitive is set to

— QoSAck, if the frame is a QoS Data frame with an ack policy other than No Ack; this includes when the frame was delivered via the DMS or the GCR block ack retransmission policy.
— QoSNoAck, if the frame is a QoS Data frame with an ack policy of No Ack. This service class is also used when the DA parameter is a group address unless the frame is received by an AP or PCP or was delivered via DMS or the GCR block ack retransmission policy.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When a non-QoS Data frame is received at a QoS STA, the service class parameter in the MA-UNITDATA.indication primitive is set to

— QoSAck, if the frame is an individually addressed frame (and so is acknowledged by the STA).
— QoSNoAck, if the frame is a group addressed frame (and so is not acknowledged by the STA).

NOTE—This includes a non-AP STA transmission of an MSDU with a group DA, at the AP.

In non-QoS STAs, the value of the service class parameter in invoked MAC service primitives (see 5.2) is ignored. The value of the service class parameter in generated MAC service primitives is set to ReorderableGroupAddressed.

5.1.2 Security services

Security services in IEEE Std 802.11 are provided by the authentication service and the CCMP, GCMP, and BIP. The scope of the security services provided is limited to station-to-station data and robust Management frame transmissions. When CCMP or GCMP is used, the data confidentiality service is provided for Data frames and individually addressed robust Management frames. For the purposes of this standard, CCMP, GCMP, and BIP are viewed as logical services located within the MAC sublayer as shown in the reference model, Figure 4-27 (in 4.9). Actual implementations of CCMP, GCMP, and BIP are transparent to the LLC sublayer and other layers above the MAC sublayer.

The security services provided by CCMP and GCMP in IEEE Std 802.11 are as follows:

a) Data Confidentiality;
b) Authentication; and
c) Access control in conjunction with layer management.

BIP provides message integrity and access control for group addressed robust Management frames.

During the authentication exchange, both parties exchange authentication information as described in Clause 12 and Clause 13.

The MAC sublayer security services provided by CCMP, GCMP, and BIP rely on information from non MAC sublayer management or system entities. Management entities communicate information to CCMP, GCMP, and BIP through a set of MAC sublayer management entity (MLME) interfaces and MIB attributes; in particular, the decision tree for CCMP, GCMP, and BIP is driven by MIB attributes.

The use of TKIP is obsolete. The TKIP algorithm is unsuitable for the purposes of this standard.

5.1.3 MSDU ordering

The services provided by the MAC sublayer permit, and might in certain cases require, the reordering of MSDUs.

In a non-QoS STA, the MAC does not intentionally reorder MSDUs except as might be necessary to improve the likelihood of successful delivery based on the current operational (“power management,” FMS, DMS) mode of the designated recipient STA(s). The sole effect of this reordering (if any), for the set of MSDUs received at the MAC service interface of any single STA, is a change in the delivery order of group addressed MSDUs, relative to individually addressed MSDUs, originating from a single source STA address.

The MSDUs are reordered, not only to improve the likelihood of successful delivery based on the current operational mode of the designated recipient STA(s), but also to honor the priority parameters, specified in the MA-UNITDATA.request primitive, of the individual MSDUs. The effects of this reordering (if any), for the set of MSDUs received at the MAC service interface of any single STA, are:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

a) A change in the delivery order of group addressed MSDUs, relative to individually addressed MSDUs, and
b) The reordering of MSDUs with different TID values, originating from a single source STA address.

There shall be no reordering of individually addressed MSDUs with the same TID value and addressed to the same destination.

STAs operating in a non-QoS BSS shall follow the reordering rules as defined for a non-QoS STA.

In order for the MAC to operate properly, the DS needs to meet the MSDU ("object") reordering requirements of IEEE Std 802.1AC-2012 [B17].

Operational restrictions that provide the appropriate ordering of MSDUs are specified in 10.7.

When MSDU or A-MSDU reordering is performed, the information in the MAC service tuple(s) for the MSDU(s) shall be maintained and reordered as a unit.

5.1.4 MSDU format

Logical Link Control (LLC) sublayer entities use the MAC sublayer service to exchange PDUs with peer LLC sublayer entities. These PDUs are termed MAC sublayer SDUs (MSDUs) when sent to the MAC sublayer. There are two LLC sublayer protocols used (see IEEE Std 802): LLC Protocol Discrimination (LPD) (see ISO/IEC 8802-2:1998) and EtherType Protocol Discrimination (EPD) (see IEEE Std 802.3-2022). MSDUs are formatted in accordance with LPD or with EPD, as determined by the first condition below that is true. After a true condition has been found, subsequent conditions are ignored.

a) In the 5.9 GHz band in the United States and its territories (see E.2.3) use EPD.
b) For OCB communications outside of the 5.9 GHz bands, use LPD.
c) Within Data frames with RAs that are individual addresses, if both the transmitter and receiver are EPD STAs, use EPD.
d) Within Data frames with RAs that are individual addresses, if either the transmitter or the receiver are not EPD STAs, use LPD.
e) If the transmitting AP accepts association only from an EPD STA, use EPD.
f) If the transmitting mesh STA peers only with an EPD mesh STA, use EPD.
g) For EBCS transmissions, use EPD.
h) For all other cases, use LPD.

When LPD is used, in order to achieve interoperability, implementers are recommended to apply the procedures described in ISO/IEC 11802-5:1997 (previously known as IEEE Std 802.1H, 1997 Edition [B18]), along with a selective translation table (STT) that handles a few specific network protocols, with specific attention to the operations required when passing MSDUs to or from LANs or operating system components that use the Ethernet frame format (EPD). Note that such translations might be required in a STA.

5.1.5 MAC data service architecture

5.1.5.1 General

When transparent FST is not being used, the MAC data plane architecture (i.e., processes that involve transport of all or part of an MSDU) is shown in Figure 5-1. When transparent FST is being used, the MAC data plane architecture is shown in Figure 5-2.

The dotted line box labeled "Role-specific behaviors" is replaced by one of several options, depending on the role of the STA. See the following subclauses

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

During transmission, an MSDU goes through some or all, as applicable, of the processes shown in the left-hand side of Figure 5-1. When transparent FST is used, an MSDU first goes, as shown in Figure 5-2, through an additional transparent FST entity that contains a demultiplexing process that forwards the MSDU down to the selected TX MSDU Rate Limiting process and from there to MAC data plane processing as described in the previous sentence. IEEE Std 802.1X-2020 may block the MSDU at the Controlled Port before the preceding processing occurs. Otherwise, at some point, the Data frames that contain all or part of the MSDU are queued per AC/TS.

During reception, a received Data frame goes through some or all, as applicable, of the processes shown in the right-hand side of Figure 5-1. Then, one or more MSDUs are delivered to the MAC SAP or, via the DSAF, to either the DS or an IEEE 802.1Q bridge port. When transparent FST is used, MSDUs originating from different PHY SAPs go, as shown in Figure 5-2, through a final step of a transparent FST entity that contains a multiplexing process before delivering the MSDU. The IEEE 802.1X Controlled/Uncontrolled Ports discard any received MSDU if the Controlled Port is not enabled and if the MSDU does not represent an EAPOL PDU.

NOTE—Many of the processes shown in Figure 5-1 also apply to MMPDU flows for the MAC control plane architecture, and the processes shown at the bottom also apply to Control and Extension frames.

When transparent FST is used, the same security keys and PN counters are used by the MAC data plane to encrypt the MPDU prior to and following an FST, and the same security keys and replay counters are used to check the integrity and perform the protection of MPDUs. When nontransparent FST is used, independent RSNAs, security keys, replay counters, and PN counters have to be established for each MAC data plane to be used prior to and following an FST. When transparent FST is used, a single MAC SAP at each peer is presented to the higher layers of that peer for all of the frequency bands/channels that are identified by the same MAC address at that peer. When nontransparent FST is used, different MAC SAPs are presented to higher layers since different MAC addresses are used prior to and following an FST.

5.1.5.2 Non-GLK non-AP STA role

The MAC data plane architecture of a non-GLK non-AP STA is completed by replacing the role-specific behavior block with the block shown in Figure 5-3. The function of this block in a non-AP STA is to perform destination address filtering as described in 10.2.8.

NOTE—In implementations, the DA address filtering function might be done "lower in the stack." It is shown in the role-specific behavior block location for simplicity, and any implementation choice needs to provide equivalent behavior.

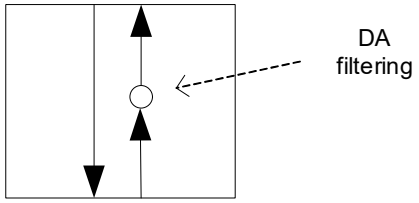

Figure 5-3—Role-specific behavior block for a non-GLK non-AP STA

5.1.5.3 Non-GLK AP role

In a non-GLK AP, the MAC data plane architecture includes distribution system access in its role-specific behavior block, as shown in Figure 5-4. This block provides access to the DS for associated non-AP STAs as described in 4.5.2.1.

NOTE—This behavior block indicates that there is no access through the Controlled Port to or from the local upper-layers (the LLC sublayer) at an AP. Any such access is logically achieved in the architecture via transition of the DS and Portal to an integrated LAN. In actual implementations, this is likely to be optimized, and Data frames appear to be delivered directly to one or more local LLC sublayer entities on the same physical device as the AP. Such optimization is effectively distributing the functions of the DS and Portal, and it is the responsibility of the implementation to ensure the logical behavior of these entities is maintained.

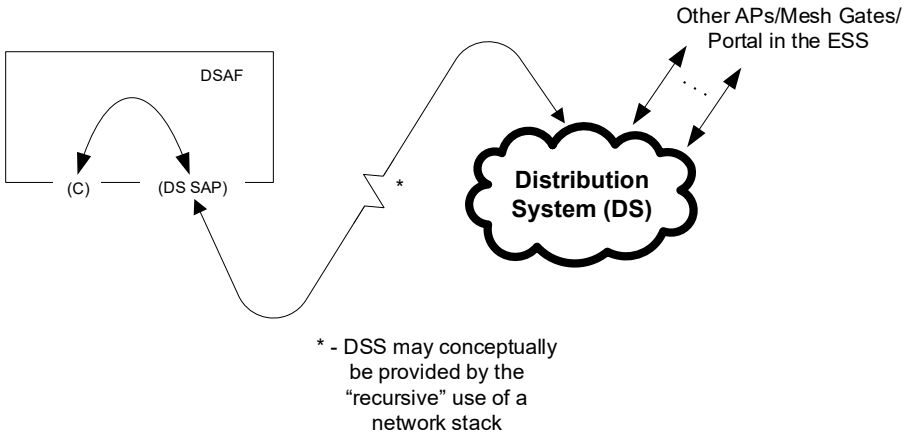

Figure 5-4—Role-specific behavior block for a non-GLK AP

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

5.1.5.4 Non-GLK mesh STA role

The MAC data plane architecture of a mesh STA is completed by replacing the role-specific behavior block with that shown in Figure 5-5. The function of this block in a mesh STA is described in 10.37. This role is not applicable when transparent FST is used, and does not apply to Figure 5-2.

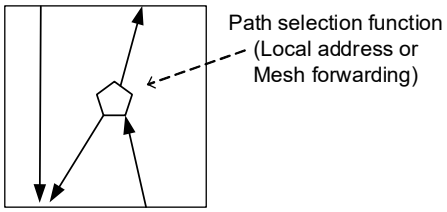

Figure 5-5—Role-specific behavior block for mesh STA

5.1.5.5 Mesh gate role

The MAC data plane architecture of a mesh gate is completed by replacing the role-specific behavior block with that shown in Figure 5-6. The function of this block in a mesh gate is described in 14.12. This role is not applicable when transparent FST is used and does not apply to Figure 5-2.

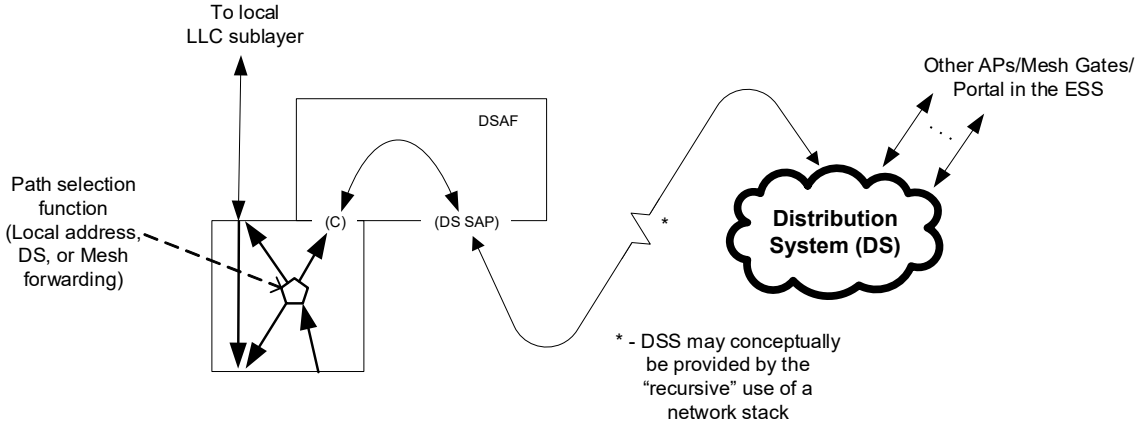

Figure 5-6—Role-specific behavior block for mesh gate

5.1.5.6 S1G relay

An S1G relay comprises a relay AP, a relay STA and a relay function (see Figure 5-7).

A relay STA is a non-AP STA associated to a root AP or the relay AP of another relay. A relay AP is an AP that offers the relay function to its associated non-AP STAs, and provides access to the DS indirectly through the relay STA’s path to the root AP. The relay function performs local reception or selective forwarding of MSDUs between the relay STA and relay AP, based on the destination address, as described in 10.53.

The MAC data plane architecture of an S1G relay is shown in Figure 5-7. During transmission, an MSDU goes through some or all, as applicable, of the processes shown in the left-hand side of Figure 5-7. During

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

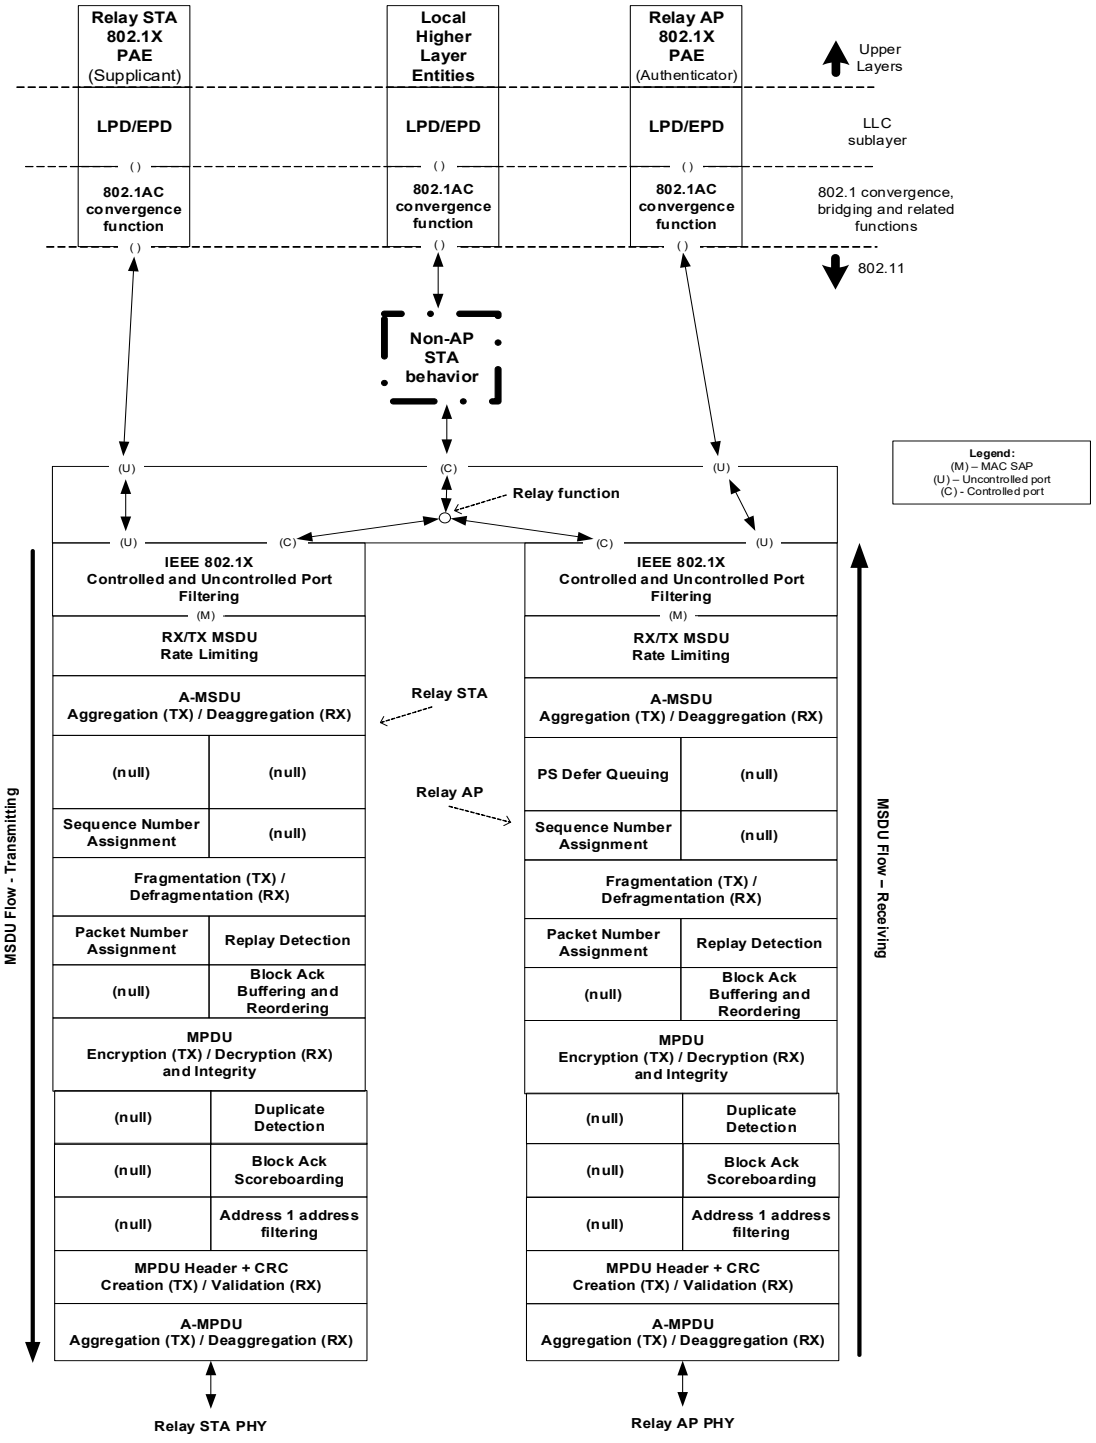

Figure 5-7—S1G relay data plane architecture

Copyright © 2025 IEEE. All rights reserved.

reception, a received Data frame goes through some or all, as applicable, of the processes shown in the right-hand side of Figure 5-7.

5.1.5.7 GLK STA role

In a GLK STA's MAC data plane architecture, the role-specific behavior block is as shown in Figure 5-8. The MAC service interface to this block includes a station vector, to provide the selective delivery service to a GLK convergence function. This block performs destination address filtering, as described in 10.2.8, and provides access to the GLK convergence function and ultimately to the bridge ports.

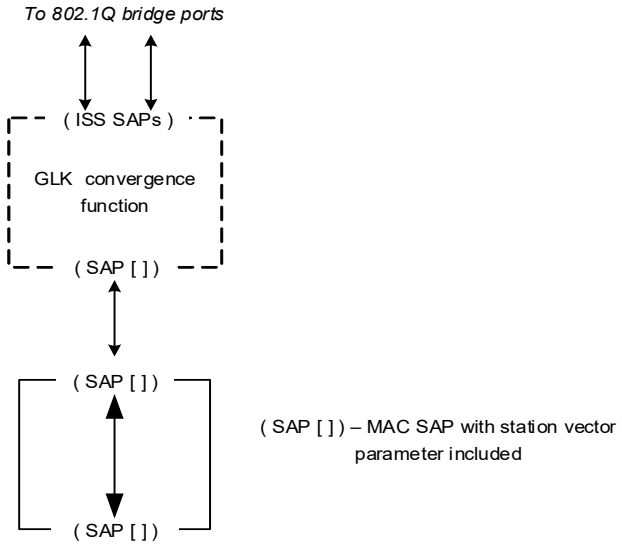

Figure 5-8—Role-specific behavior block for a GLK STA

5.1.5.8 GLK AP role

A GLK AP that supports only general links (dot11GLKRequired is true) has the same general architectural structure as described in 5.1.5.7 for a general GLK STA.

A GLK AP that supports both general links and non-GLK links provides access between the bridge ports and general links, and between the DS and non-GLK links. The DSAF behavior of such an AP is extended by adding a switching function to direct received MSDUs to either the DS or toward a bridge port, as appropriate, as shown in Figure 5-9.

5.1.5.9 GLK mesh STA role

The only type of mesh STA that has explicit support for GLK is the GLK mesh STA, which is the equivalent of a mesh gate, except it is attached to a bridge rather than a DS. Other mesh STA types implicitly may support general links with the role specific structure shown in 5.1.5.4.

The MAC data plane architecture of a GLK mesh STA, like that for a non-GLK mesh STA, is completed by replacing the role-specific behavior block with that shown in Figure 5-10. In a GLK mesh STA, the function of this block is described in 10.37, to provide access to bridge ports, through provision of the station vector parameter, rather than access to only the local DA like a non-GLK mesh STA.

This role is not applicable when transparent FST is used and does not apply to Figure 5-2.

5.2 MAC data service specification

5.2.1 General

The IEEE 802.11 MAC supports the following service primitives as defined in ISO/IEC 8802-2:1998:

— MA-UNITDATA.request
— MA-UNITDATA.indication
— MA-UNITDATA-STATUS.indication

IEEE Std 802.11 places restrictions and semantics on the parameter values for these primitives, as described in 5.2.4 to 5.2.6.

5.2.2 GLK MAC data service specification

A GLK STA coordinates with the GLK convergence function to create a virtual point-to-point LAN for each general link to an associated or peered GLK STA. This point-to-point LAN is presented by the convergence function as a unique Internal Sublayer Service SAP, which is ultimately mapped to an IEEE 802.1Q bridge port. Each such SAP is identified by a locally unique service_access_point_identifier (as defined in IEEE Std 802.1Q), generated by the STA and the convergence function.

When GLK is in use, the MAC service makes use of the parameter station vector in the MA-UNITDATA primitives. In an MA-UNITDATA.request primitive, this parameter is a set of service_access_point_identifiers specifying the one or more general links that are to carry the MSDU. In an MA-UNITDATA.indication primitive, it is a set of exactly one service_access_point_identifier specifying the general link that carried the MSDU.

When GLK is in use, the MAC service also makes use of the MSDU format parameter. In an MA-UNITDATA.request primitive, this parameter indicates the format of the supplied MSDU (EPD or LPD). If the format is inappropriate for the transmission that carries this MSDU as described in 5.1.4, the MAC service converts the format before transmission. In an MA-UNITDATA.indication primitive, this parameter indicates the format of the received MSDU, which is determined as described in 5.1.4. The MAC service user uses this information to parse the MSDU correctly.

5.2.3 NGV MAC data service specification

An NGV STA coordinates with higher layer ITS entities (e.g., IEEE 1609 [B20] family of standards) to provide wireless communications services via the LLC sublayer. The MA-UNITDATA primitives contain the radio environment request vector to facilitate the coordination.

5.2.4 MA-UNITDATA.request

5.2.4.1 Function

This primitive requests a transfer of an MSDU from a local LLC sublayer entity to a single peer LLC sublayer entity or bridge port, or multiple peer LLC sublayer entities or bridge port in the case of group addresses.

5.2.4.2 Semantics of the service primitive

The parameters of the primitive are as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

MA-UNITDATA.request(
source address,
destination address,
routing information,
data,
priority,
drop eligible,
service class,
station vector,
MSDU format,
radio environment request vector
)

The source address (SA) parameter specifies an individual MAC sublayer address of the sublayer entity from which the MSDU is being transferred.

The destination address (DA) parameter specifies either an individual or a group MAC sublayer entity address.

The routing information parameter specifies the route for the data transfer (a null value indicates source routing is not to be used). For IEEE Std 802.11, the routing information parameter shall be null.

The data parameter specifies the MSDU to be transmitted by the MAC sublayer entity. The length of the MSDU shall be less than or equal to the value shown in Table 9-34.

The priority parameter specifies the requested priority of the data transfer. The allowed values of priority are described in 5.1.1.3.

NOTE—For a GLK STA, the bridge port provides the priority. That priority might have been derived from a priority tag in the frame arriving on another port of the bridge or from the configuration of that port if the frame arrived there untagged.

The drop eligible parameter is a Boolean that indicates whether this MSDU can be discarded in preference to other MSDUs when there are insufficient resources in a STA. If drop eligible is true, the MSDU can be discarded in preference to other MSDUs for which drop eligible is false.

The service class parameter specifies the requested service class of the data transfer. The allowed values of service class are described in 5.1.1.4 and 5.1.3.

If dot11GLKImplemented is true, the station vector parameter is a set of service_access_point_identifiers (see 5.2.2) that indicates the set of virtual point-to-point LANs for these data transfers, which are mapped to the set of general links over which the MSDU is transmitted; it is null otherwise.

In an EPD STA, the MSDU format parameter indicates the format of the supplied MSDU (EPD or LPD); it is ignored otherwise.

The radio environment request vector parameter contains information that allows higher layer entities to configure the PPDU format, encoding, and MPDU handling for NGV transmission. This parameter is present when dot11NGVOptionImplemented is true or dot11NONNGVRadioEnvironmentImplemented is true, and absent otherwise.

The radio environment request vector parameter contains the following members pertaining to the transmission of the MPDU that contains the MSDU associated with the request containing the vector:

— PPDU format (non-NGV/NGV)
— data rate/NGV-MCS
— number of spatial streams

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— permitted aggregation
— number of repetitions
— expiry time
— channel
— primary channel
— channel width
— fallback enabled
— transmit power spectral density

The PPDU format member indicates the format of the PPDU as defined in Table 5-1 that is used to transmit the MSDU.

Table 5-1—PPDU format values

PPDU format value	Description
0	Non-NGV PPDU
1	NGV PPDU
2	The PPDU format decided by the MAC sublayer

The data rate/NGV-MCS member indicates the data rate of the PPDU carrying the MSDU if the PPDU format has value 0. The data rate can be either 0 (decided by MAC sublayer), 3 Mb/s, 4.5 Mb/s, 6 Mb/s, 9 Mb/s, 12 Mb/s, 18 Mb/s, 24 Mb/s, or 27 Mb/s as defined in Table 17-4. If the PPDU format has value 1, the data rate/NGV-MCS member indicates the NGV-MCS index as defined in 32.5 with an exception that the value 14 means that the actual MCS is decided by the MAC sublayer.If the PPDU format has value 2, the data rate/NGV-MCS member is set to value 14 indicating that the actual data-rate/MCS is decided by the MAC sublayer.

The number of spatial streams member with value 1 or 2 indicates the number of spatial streams being used to transmit the PPDU carrying the MSDU. The number of spatial streams member with value 0 means that the number of spatial streams is decided by the MAC sublayer. The permitted aggregation member indicates whether A-MPDU aggregation can be applied to the MSDU. The value 0 means that aggregation is not applied, the value 1 means that aggregation can be applied, while the value 2 means that it is up to the MAC sublayer to decide whether the aggregation can be applied.

The number of repetitions member indicates the maximal number of repetitions that can be used to transmit the MSDU in a broadcast MPDU of a non-NGV PPDU in a 10 MHz channel width where the values can be in the range 0 to 3 or 15. The value 15 means that it is up to the MAC sublayer to decide whether the repetition is applied to the MSDU. This parameter is reserved when the MSDU is not in a broadcast MPDU in 10 MHz channel width.

The expiry time member indicates the time in milliseconds until the MSDU is discarded if still not transmitted, where the value 0 means that it is up to the MAC sublayer to decide the expiry time of the MSDU.

NOTE 1—When an MSDU reaches its expiry time and is discarded, the CW state variable of the EDCAF associated with that MSDU is unchanged.

The channel member indicates the channel where the MSDU is transmitted in the 5.9 GHz band as defined in Annex E.2.3 and Annex E.2.4 with the exception for value 0, which means that the MAC sublayer selects the channel.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The primary channel indicates the primary 10 MHz channel where the MSDU is transmitted, where the value 0 means that the MAC sublayer selects the primary channel. This member is present when dot11NGVOptionImplemented is true and when the channel width member is 20 MHz and is absent otherwise.

The channel width member indicates either 10 MHz or 20 MHz channel width used to transmit the MSDU as defined in Table 5-2. When the channel width indicates 20 MHz, the primary channel member indicates the OCB primary channel.

NOTE 2—An NGV STA transmitting in a 20 MHz channel maintains a single primary channel at any given time.

Table 5-2—Channel width values

Channel width value	Description
0	10 MHz
1	20 MHz
2	The channel width is decided by the MAC sublayer

The fallback enabled member indicates whether the transmission of a 10 MHz PPDU in the OCB primary channel is allowed by an NGV STA while the NGV STA performs channel access to transmit a 20 MHz NGV PPDU. The value 0 means that the fallback to 10 MHz can be applied to the MSDU, the value 1 means that the fallback to 10 MHz cannot be applied to the MSDU, while the value 3 means that it is up to the MAC sublayer to decide whether the fallback is applied to the MSDU. This member is present when dot11NGVOptionImplemented is true and when the channel width member is 20 MHz and is absent otherwise.

The transmit power spectral density member indicates the combined transmit power at the transmit antenna connector of all the antennas used to transmit the MSDU in units of dBm/10 MHz. The transmit power is described with a resolution of 1 dB, with values in the range 0 to 60 representing –20 dBm/10 MHz to 40 dBm/10 MHz, respectively. Values from 61 to 126 are reserved. The value 127 means that it is up to the MAC sublayer to decide the transmit power of the MSDU.

5.2.4.3 When generated

This primitive is generated by the LLC sublayer entity when an MSDU is to be transferred to a peer LLC sublayer entity or entities or to a peer bridge or bridges.

5.2.4.4 Effect of receipt

On receipt of this primitive, the MAC sublayer entity determines whether it is able to fulfill the request according to the requested parameters. A request that cannot be fulfilled according to the requested parameters is discarded, and this action is indicated to the LLC sublayer entity using an MA-UNITDATA-STATUS.indication primitive that describes why the MAC was unable to fulfill the request. If the request can be fulfilled according to the requested parameters, the MAC sublayer entity properly formats a frame and passes it to the lower layers for transfer to a peer MAC sublayer entity or entities (see 5.1.4), and indicates this action to the LLC sublayer entity or bridge port using an MA-UNITDATA-STATUS.indication primitive with transmission status set to Successful.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an MA-UNITDATA.request primitive having a destination address that is an individual address and a priority of Contention, the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

dot11NonAPStationMaxAuthBestEffortRate in the dot11InterworkingEntry identified by the destination MAC address of the frame to be transmitted. The specific mechanism to perform rate limiting is outside the scope of this standard.

— If the rate limiting mechanism does not discard the frame, then dot11NonAPStationBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an MA-UNITDATA.request primitive having a destination address that is an individual address for which the priority is an integer in the range 0 to 7, then the AP's MAC sublayer shall derive the access category from the priority using the mapping in Table 10-1. The AP's MAC sublayer shall retrieve the MIB attributes listed below from the dot11InterworkingEntry identified by the destination MAC address of the frame to be transmitted and perform the following operations:

— If the access category is AC_VO, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVoiceRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate limiting mechanism does not discard the frame, then dot11NonAPStationVoiceMSDUCount shall be incremented by 1 and dot11NonAPStationVoiceOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVoiceMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedVoiceOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_VI, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVideoRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationVideoMSDUCount shall be incremented by 1 and dot11NonAPStationVideoOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVideoMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedVideoOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_BE, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_BK, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBackgroundRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationBackgroundOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBackgroundMSDUCount shall be incremented by 1 and

dot11NonAPStationDroppedBackgroundOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an MA-UNITDATA.request primitive having a destination address that is an individual address whose priority is an integer in the range 8 to 15, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationAuthMaxHCCAHEMMRate; the specific mechanism to perform rate limiting is outside the scope of this standard.

— If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationHCCAHEMMMSDUCount shall be incremented by 1, and dot11NonAPStationHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedHCCAHEMMMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

5.2.5 MA-UNITDATA.indication

5.2.5.1 Function

This primitive defines the transfer of an MSDU from the MAC sublayer entity to the LLC sublayer entity or bridge port, or entities or bridge ports in the case of group addresses. In the absence of error, the contents of the data parameter are logically complete and unchanged relative to the data parameter in the associated MA-UNITDATA.request primitive.

5.2.5.2 Semantics of the service primitive

The parameters of the primitive are as follows:

```
MA-UNITDATA.indication(
                        source address,
                        destination address,
                        routing information,
                        data,
                        reception status,
                        priority,
                        drop eligible,
                        service class,
                        station vector,
                        MSDU format,
                        radio environment status vector
                        )
```

The SA parameter is an individual address as specified by the SA field of the incoming frame.

The DA parameter is either an individual or a group address as specified by the DA field of the incoming frame.

The routing information parameter specifies the route that was used for the data transfer. The MAC sublayer entity shall set this field to null.

The data parameter specifies the MSDU as received by the local MAC entity.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The reception status parameter indicates the success or failure of the received frame. The MAC always reports "success" because all failures of reception are discarded without generating MA-UNITDATA.indication primitive.

The drop eligible parameter is a Boolean that indicates whether the received MSDU was designated as drop eligible in the DEI subfield of the HT variant HT Control field of the incoming frame, if present. If no HT variant HT Control field was present, the parameter value is false.

The priority parameter specifies the receive processing priority that was used for the data transfer. The allowed values of priority are described in 5.1.1.3.

The service class parameter specifies the receive service class that was used for the data transfer. The allowed values of service class are described in 5.1.1.4 and 5.1.3.

If dot11GLKImplemented is true, the station vector parameter is a set of service_access_point_identifiers (see 5.2.2) that indicates the single virtual point-to-point LAN for this data transfer, which is mapped from the general link over which the MSDU was received; it is null otherwise.

In an EPD STA, the MSDU format parameter indicates the format of the received MSDU (EPD or LPD); it indicates LPD otherwise. See 5.1.4 for how the MSDU format is determined upon arrival of an MSDU.

The radio environment status vector parameter provides information to higher layer entities about the current radio environment and the most recent reception. This parameter is present when dot11NGVOptionImplemented is true or dot11NONNGVRadioEnvironmentImplemented is true, and absent otherwise.

The radio environment status vector parameter contains the following members pertaining to the reception of the MPDU that contained the MSDU associated with the indication containing the vector:

— PPDU format (non-NGV/NGV)
— data rate/NGV-MCS
— aggregation
— channel
— primary channel
— channel width
— RSSI

The PPDU format member indicates the format of the received PPDU that carries the MSDU as defined in Table 5-1.

The data rate/NGV-MCS member indicates the data rate of the PPDU carrying the MSDU if the PPDU format has value 0. The data rate can be one of 3 Mb/s, 4.5 Mb/s, 6 Mb/s, 9 Mb/s, 12 Mb/s, 18 Mb/s, 24 Mb/s, or 27 Mb/s as defined in Table 17-4. If the PPDU format has value 1, the data rate/NGV-MCS member indicates the NGV-MCS index as defined in 32.5.

The aggregation member indicates whether A-MPDU aggregation is applied to the received MSDU. The value 0 means that aggregation is not applied, while the value 1 means that aggregation is applied.

The channel member indicates the channel where the MSDU is transmitted in the 5.9 GHz band as defined in Annex E.2.3 and Annex E.2.4 with the exception for value 0, which means that the MAC sublayer selects the channel.

The primary channel member indicates the primary 10 MHz channel where the MSDU is received.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The channel width member indicates either 10 MHz or 20 MHz channel width of the PPDU carrying the received MSDU as defined in Table 5-2. When the channel width indicates 20 MHz, the primary channel parameter indicates the OCB primary channel.

The RSSI parameter indicates the receive signal power, measured at the STA's antenna connector and averaged over the antennas, for the NGV portion of the received NGV PPDU and is defined in Table 5-3.

Table 5-3—RSSI values

RSSI	Description
0 to 90	The RSSI, in units of dBm, is –113 + F_{val} , where F_{val} is the subfield value
91 to 127	Reserved

5.2.5.3 When generated

The MA-UNITDATA.indication primitive is passed from the MAC sublayer entity to the LLC sublayer entity or entities to, or bridge port or ports, indicate the arrival of an MSDU at the local MAC sublayer entity. Frames are reported only if they are validly formatted at the MAC sublayer, received without error, received with valid (or null) security and integrity information, and their destination address designates the local MAC sublayer entity. The MA-UNITDATA.indication primitive might also be passed from the MAC sublayer entity, in coordination with the MAC sublayer management entity, to the LLC sublayer entity to indicate the arrival of a FILS higher layer protocol (HLP) Container element.

5.2.5.4 Effect of receipt

The effect of receipt of this primitive by the LLC sublayer or bridge port is dependent on the content of the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of a frame with the Type subfield equal to Data having a group DA, the AP's MAC sublayer shall discard the frame if dot11NonAPStationAuthSourceMulticast is false in the dot11InterworkingEntry identified by the source MAC address of the received frame. If dot11NonAPStationAuthSourceMulticast is true, the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationAuthMaxSourceMulticastRate in the dot11InterworkingEntry identified by the source MAC address of the received frame. The specific mechanism to perform rate limiting is outside the scope of this standard.

— If the rate limiting mechanism does not discard the frame, then dot11NonAPStationMulticastMSDUCount shall be incremented by 1 and dot11NonAPStationMulticastOctetCount shall be incremented by the number of octets in the MSDU.
— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedMulticastMSDUCount. shall be incremented by 1 and dot11NonAPStationDroppedMulticastOctetCount. shall be incremented by the number of octets in the MSDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an individually addressed frame with the Type subfield equal to Data and a priority of Contention, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate in the dot11InterworkingEntry identified by the source MAC address of the received frame. The specific mechanism to perform rate limiting is outside the scope of this standard.

— If the rate limiting mechanism does not discard the frame, then dot11NonAPStationBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an individually addressed frame with the Type subfield equal to Data, for which the priority is an integer in the range 0 to 7, then the AP's MAC sublayer shall derive the access category from the priority using the mapping in Table 10-1. The AP's MAC sublayer shall retrieve the MIB attributes from the dot11InterworkingEntry identified by the source MAC address of the received frame and perform the following operations:

— If the access category is AC_VO, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVoiceRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationVoiceMSDUCount shall be incremented by 1 and dot11NonAPStationVoiceOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVoiceMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedVoiceOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_VI, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVideoRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationVideoMSDUCount shall be incremented by 1 and dot11NonAPStationVideoOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVideoMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedVideoOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_BE, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_BK, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBackgroundRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationBackgroundOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

dot11NonAPStationDroppedBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBackgroundOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an individually addressed frame with the Type subfield equal to Data for which the priority is an integer in the range 8 to 15, the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationAuthMaxHCCAHEMMRate; the specific mechanism to perform rate limiting is outside the scope of this standard.

— If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationHCCAHEMMMSDUCount shall be incremented by 1, and dot11NonAPStationHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedHCCAHEMMMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

5.2.6 MA-UNITDATA-STATUS.indication

5.2.6.1 Function

This primitive has local significance and provides the LLC sublayer or bridge port with status information for the corresponding preceding MA-UNITDATA.request primitive.

5.2.6.2 Semantics of the service primitive

The parameters of the primitive are as follows:

MA-UNITDATA-STATUS.indication(
source address,
destination address,
transmission status,
provided priority,
provided service class,
radio environment request vector)

The SA parameter is an individual MAC sublayer entity address as specified in the associated MA-UNITDATA.request primitive.

The DA parameter is either an individual or group MAC sublayer entity address as specified in the associated MA-UNITDATA.request primitive.

The transmission status parameter is used to pass status information back to the local requesting LLC sublayer entity or bridge port. IEEE Std 802.11 specifies the following values for transmission status:

a) Successful.
b) Undeliverable (excessive data length).
c) Undeliverable (non-null source routing).
d) Undeliverable: unsupported priority (for priorities other than Contention at a non-QoS STA; or for priorities other than Contention, or an integer in the range 0 to 15 at a QoS STA).
e) Undeliverable: unsupported service class (for service classes other than ReorderableGroupAddressed for non-QoS STAs and service classes other than QoSAck or QoSNoAck for QoS STAs).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

f) Unavailable priority (for an integer in the range 1 to 15 at a STA that is associated in a non-QoS BSS, or an integer in the range 8 to 15 at an IBSS STA, in which case the MSDU is transmitted with a provided priority of Contention).

g) Undeliverable: unavailable service class.

h) Undeliverable (no BSS available).

i) Undeliverable (cannot encrypt with a null key).

j) In a STA in which dot11RejectUnadmittedTraffic is true, Undeliverable: unadmitted traffic (for a requested priority in the range 0 to 7 because there is no admitted TS for this priority and admission control is required for the AC).

k) In an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationMaxAuthVoiceRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

l) In an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationMaxAuthVideoRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

m) In an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationMaxAuthBestEffortRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

n) In an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationAuthMaxBackgroundRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

o) In an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationAuthMaxHCCAHEMMRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

If the transmission status parameter is Successful, the provided priority parameter specifies the priority used for the associated data transfer (Contention or an integer in the range 0 to 15); otherwise the provided priority parameter is not present.

If the transmission status parameter is Successful, the provided service class parameter specifies the class of service for the associated data transfer; otherwise the provided service class parameter is not present. In non-QoS STAs, the value of this parameter is ReorderableGroupAddressed. In QoS STAs, it is QoSAck or QoSNoAck.

The radio environment request vector parameter (see 5.2.4.2) contains information that is used by the MAC entity to report the used format, encoding, and MPDU handling for NGV transmission. This parameter is present when dot11NGVOptionImplemented is true or dot11NONNGVRadioEnvironmentImplemented is true, and absent otherwise.

5.2.6.3 When generated

The MA-UNITDATA-STATUS.indication primitive is passed from the MAC sublayer entity to the LLC sublayer entity or bridge port to indicate the status of the service provided for the corresponding MA-UNITDATA.request primitive.

5.2.6.4 Effect of receipt

The effect of receipt of this primitive by the LLC sublayer or bridge port is dependent upon the type of operation employed by the LLC sublayer entity or bridge port.

6. Layer management

6.1 Overview of management model

Both the MAC sublayer and PHY conceptually include management entities, called *MLME* and *PLME*, respectively. These entities provide the layer management service interfaces through which layer management functions are invoked.

In order to provide correct MAC operation, an SME is present within each STA. The SME is a layer-independent entity that resides in a separate management plane or resides "off to the side." Some of the functions of the SME are specified in this standard. Typically this entity is responsible for such functions as the gathering of layer-dependent status from the various layer management entities (LMEs), and similarly setting the value of layer-specific parameters. The SME typically performs such functions on behalf of general system management entities and would implement standard management protocols. Figure 4-27 (in 4.9) depicts the relationship among management entities.

The various entities within this model interact in various ways. Certain of these interactions are defined explicitly within this standard, via a SAP across which defined primitives are exchanged. This definition includes the GET and SET operations between MLME, PLME and SME as well as other individually defined service primitives, represented as double arrows within Figure 6-1. Other interactions are not defined explicitly within this standard, such as the interfaces between the MAC and MLME and between the PLME and PHY; the specific manner in which these MAC and PHY LMEs are integrated into the overall MAC sublayer and PHY is not specified within this standard. A STA includes only one instance of a PHY entity.

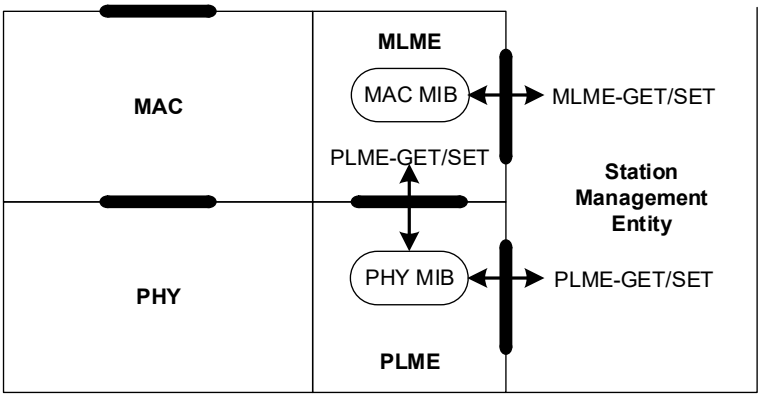

Figure 6-1—GET and SET operations

The management SAPs within this model are the following:

— SME-MLME SAP
— SME-PLME SAP
— MLME-PLME SAP

The latter two SAPs support identical primitives, and in fact might be viewed as a single SAP (called the *PLME SAP*) that is used either directly by MLME or by SME. In this fashion, the model reflects what is anticipated to be a common implementation approach in which PLME functions are controlled by the MLME (on behalf of SME).

6.2 Generic management primitives

The management information specific to each of the MAC sublayer and PHY layer is represented as a MIB for each. The MLME and PLME are viewed as "containing" the MIB for each. The generic model of MIB related management primitives exchanged across the management SAPs is to allow the SAP user-entity to either GET the value of a MIB attribute, or to SET the value of a MIB attribute. The invocation of a SET.request primitive might require that the entity perform certain defined actions.

Figure 6-1 depicts these generic primitives.

The GET and SET primitives are represented as REQUESTs with associated CONFIRM primitives. These primitives are prefixed by MLME or PLME depending upon whether the MAC sublayer or PHY management SAP is involved. In the following, XX denotes MLME or PLME:

XX-GET.request(MIBattribute)
: Requests the value of the given MIBattribute.

XX-GET.confirm(status, MIBattribute, MIBattributevalue)
: Returns the appropriate MIB attribute value if status = "success," otherwise returns an error indication in the Status field. Possible error status values include "invalid MIB attribute" and "attempt to get write-only MIB attribute."

XX-SET.request(MIBattribute, MIBattributevalue)
: Requests that the indicated MIB attribute be set to the given value. If this MIBattribute implies a specific action, then this requests that the action be performed.

XX-SET.confirm(status, MIBattribute)
: If status = "success," this confirms that the indicated MIB attribute was set to the requested value; otherwise it returns an error condition in status field. If this MIBattribute implies a specific action, then this confirms that the action was performed. Possible error status values include "invalid MIB attribute" and "attempt to set read-only MIB attribute."

Additionally, there are certain requests that can be invoked across a given SAP that do not involve the setting or getting of a specific MIB attribute. One of these is supported by each SAP, as follows:

— XX-RESET.request: where XX is MLME or PLME as appropriate

This service is used to initialize the management entities, the MIBs, and the datapath entities. It might include a list of attributes for items to be initialized to nondefault values.

Other SAP-specific primitives are identified in 6.3.

6.3 MLME SAP interface

6.3.1 Introduction

The services provided by the MLME to the SME are specified in Table 6-1. These services are described in an abstract way (following the model described in ITU-T Recommendation X.210 [B64]) and do not imply any particular implementation or exposed interface. MLME SAP primitives are of the general form ACTION.request primitive followed by ACTION.confirm primitive (for an exchange initiated by the SAP client) and ACTION.indication primitive followed by ACTION.response primitive (for an exchange initiated by the MLME). The SME uses the services provided by the MLME through the MLME SAP.

The primitives generally include a STA Address or a Peer STA address parameter. The response and .confirm primitives generally contain a ResultCode parameter. A high-level description of the primitives is

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

provided in 6.4. The description in 6.4 is a guide to the detailed formats of the primitives and other parameters. Information that is known to the MLME is not passed in the primitive parameters.

There are seven general forms of MLME-SAP interface primitives.

6.3.2 Type 1

Figure 6-2 depicts Type 1. The Type 1 general form is used for the exchange of request/response frames between an initiating STA and a peer STA.

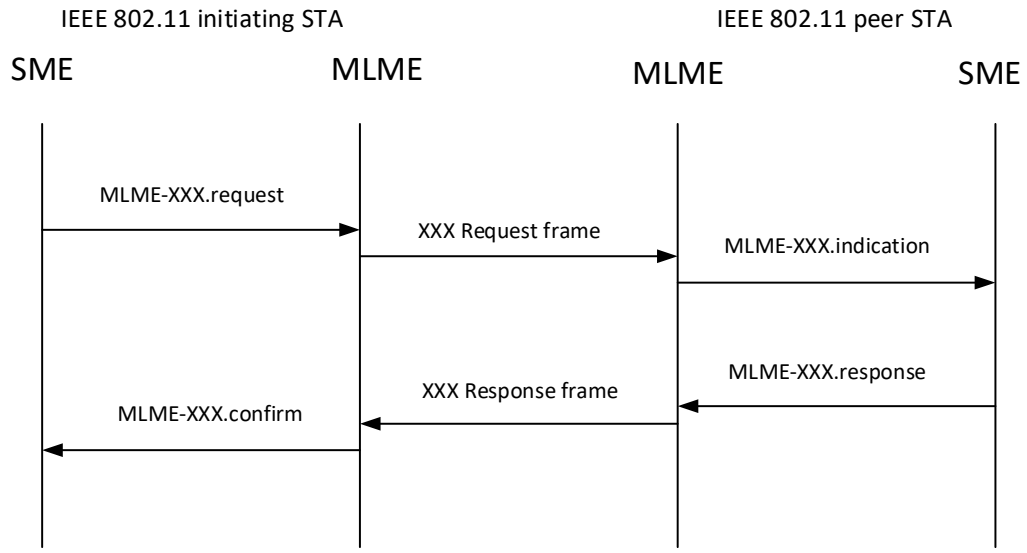

Figure 6-2—Type 1 form of MLME SAP primitives for request/response process

The .request primitive is generated by the SME of the initiating STA to request that a request frame is sent to a peer STA.

The .indication primitive is generated by the MLME of the peer STA when the request frame is received.

The .response primitive is generated by the SME of the peer to request that a response frame be sent to the initiating STA.

The .confirm primitive includes a Result Code parameter reporting success or failure of the request, and is generated by the MLME of the initiating STA when either the response frame from the peer STA is acknowledged, or the (re)transmission of the request frame fails.

6.3.3 Type 2

Figure 6-3 depicts Type 2. The Type 2 general form is used for the transmission of a frame from one STA to a peer STA that does not require a response from the peer STA but does require a confirmation that the frame was transmitted and either acknowledged or timed out.

The .request primitive is generated by the SME of the initiating STA to request that a request frame is sent to a peer STA.

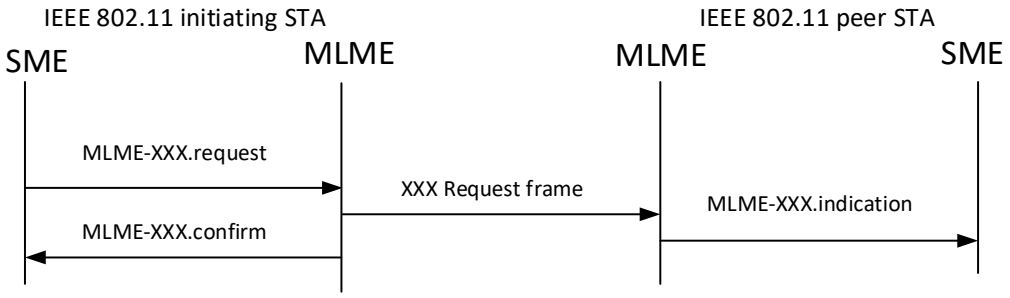

Figure 6-3—Type 2 form of MLME SAP primitives for frame transmission not requiring a response, but requiring a confirmation

The .confirm primitive generally includes a Result Code parameter reporting success or failure of the request, and is generated by the MLME when the requested action or process is completed, or fails.

The .indication primitive is generated by the MLME of the peer STA when the request frame is received.

6.3.4 Type 3

Figure 6-4 depicts Type 3. The Type 3 general form is used for the transmission of a frame from one STA to a peer STA that does not require a response from the peer STA or a confirmation.

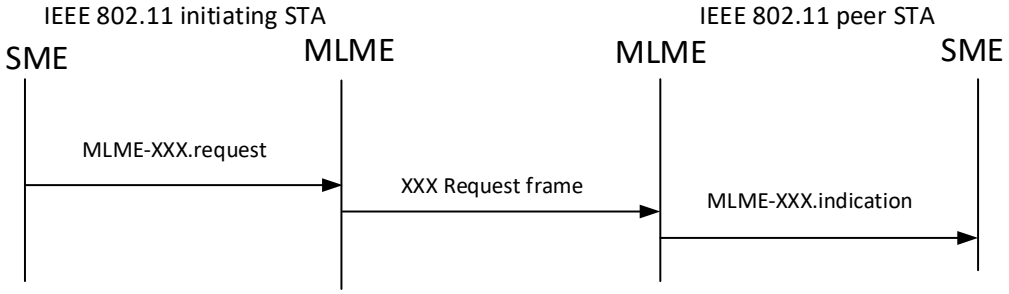

Figure 6-4—Type 3 form of MLME SAP primitives for frame transmission not requiring a response or a confirmation

The .request primitive is generated by the SME of the initiating STA to request that a request frame is sent to a peer STA.

The .indication primitive is generated by the MLME of the peer STA when the request frame is received.

6.3.5 Type 4

Figure 6-5 depicts Type 4. The Type 4 general form is used for the transmission of a frame that does not require a response, but does require a confirmation that it was sent.

The .request primitive is generated by the SME to request that the MLME transmits a frame.

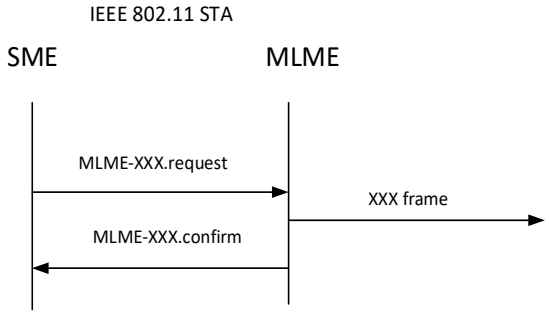

Figure 6-5—Type 4 form of MLME SAP primitives for a frame transmission from a STA, but does require a confirmation that it was sent

The .confirm primitive generally includes a Result Code parameter reporting success or failure of the request, and is generated by the MLME when the requested frame transmission is completed, or fails.

6.3.6 Type 5

Figure 6-6 depicts Type 5. The Type 5 general form is used when the SME requests a process to be initiated or information to be provided by the MLME.

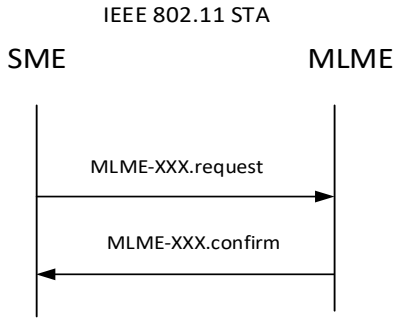

Figure 6-6—Type 5 form of MLME SAP primitives for SME requesting MLME to perform a process

The .request primitive is generated by the SME to request that a process is initiated by the MLME or information is requested to be provided by the MLME.

The .confirm primitive generally includes a Result Code parameter reporting success or failure of the request, and is generated by the MLME when the request completes or fails.

6.3.7 Type 6

Figure 6-7 depicts Type 6. The Type 6 general form is used when the SME requests a process to be initiated by the MLME and the SME does not require a confirmation.

The .request primitive is generated by the SME to request that a process is initiated by the MLME.

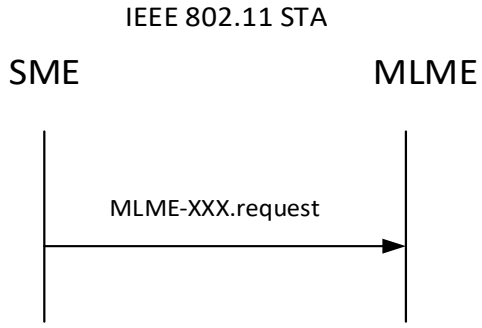

Figure 6-7—Type 6 form of MLME SAP primitives for SME requesting MLME to perform a process not requiring a confirmation

6.3.8 Type 7

Figure 6-8 depicts Type 7. The Type 7 general form is used when the MLME informs the SME of an event.

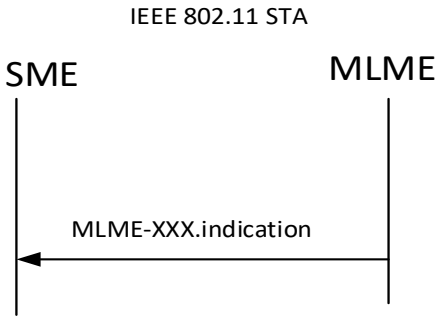

Figure 6-8—Type 7 form of MLME SAP primitives for MLME informing SME of an event

The .indication primitive is generated by the MLME to inform the SME of an event.

6.4 Table of MLME SAP interfaces

Table 6-1lists the service name, the MLME SAP interface name (MLME-XXX), the Type as defined in 6.3, together with references that can be used to derive the primitive's parameters, triggers, and semantics.

The Protected parameter is of Boolean type. If true or not present, this specifies that a Protected Dual of a Public Action frame is used; otherwise, a Public Action frame is used. The presence of the Protected parameter is indicated in the Comments column of Table 6-1.

6.5 MLME SAP primitives

6.5.1 Introduction

MLME SAP primitives are detailed in this clause when they do not directly correspond to frame exchanges described in subsequent clauses, where the primitive parameters differ significantly from the fields in the respective frames, or when the primitives might not be clear from the descriptions in those clauses.

6.5.2 Power management

6.5.2.1 Introduction

This mechanism supports the process of establishment and maintenance of the power management mode of a STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.2.2 MLME-POWERMGT.request

6.5.2.2.1 Function

This primitive requests a change in the power management mode.

6.5.2.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-POWERMGT.request(
                        PowerManagementMode,
                        ReceiveDTIMBeacons
                        )
```

Name	Type	Valid range	Description
PowerManagementMode	Enumeration	ACTIVE, POWER_SAVE	An enumerated type that describes the requested power management mode of the STA.
ReceiveDTIMBeacons	Boolean	true, false	Non-DMG BSS: When true, this parameter causes the STA to awaken to receive all DTIM beacons. When false, the STA is not required to awaken for every DTIM beacon. DMG BSS: Not applicable

6.5.2.2.3 When generated

This primitive is generated by the SME to implement the power saving strategy of an implementation.

6.5.2.2.4 Effect of receipt

This request sets the STA's power management parameters. The MLME subsequently issues an MLME-POWERMGT.confirm primitive that reflects the results of the power management change request.

6.5.2.3 MLME-POWERMGT.confirm

6.5.2.3.1 Function

This primitive confirms the change in power management mode.

6.5.2.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-POWERMGT.confirm(
                        ResultCode
                        )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, NOT_SUPPORTED	Indicates the result of the MLME-POWERMGT.request primitive.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.2.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-POWERMGT.request primitive to establish a new power management mode. It is not generated until the change has completed as defined in 11.2.3.

6.5.2.3.4 Effect of receipt

The SME is notified of the change of power management mode.

6.5.3 Scan

6.5.3.1 Introduction

This mechanism supports the process of determining the characteristics of the available BSSs.

6.5.3.2 MLME-SCAN.request

6.5.3.2.1 Function

This primitive requests a survey of potential BSSs that the STA can later elect to try to join.

6.5.3.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SCAN.request(
BSSType,
BSSID,
SSID,
ScanType,
ActiveScanType,
ProbeDelay,
ChannelList,
MinChannelTime,
MaxChannelTime,
RequestInformation,
SSID List,
ChannelUsage,
AccessNetworkType,
HESSID,
MeshID,
DiscoveryMode,
FILSRequestParameters,
ReportingOption,
APConfigurationSequenceNumber,
S1GRelayDiscovery,
PV1ProbeResponseOption,
S1GCapabilities,
ChangeSequence,
ELOperation,
MaxAwayDuration,
Multi-band local,
Multi-band peer,
GeneralLinkType,

OperationalRateSet,
HT Capabilities,
VHT Capabilities,
Short SSID List,
HE Capabilities,
HE 6 GHz Band Capabilities,
ScanAntennaSectorList,
SectorDwellTime,
EDMG Capabilities,
Unsolicited Block Ack Extension,
WUR Capabilities,
VendorSpecificInfo
)

Name	Type	Valid range	Description
BSSType	Enumeration	INFRASTRUCTURE, PERSONAL, INDEPENDENT, MESH, ANY_BSS	Determines whether infrastructure BSS, PBSS, IBSS, MBSS, or all, are included in the scan.
BSSID	MAC address	Any valid individual address, or broadcast address	Identifies a specific or wildcard BSSID.
SSID	Octet string	0–32 octets	Specifies the desired SSID or the wildcard SSID.
ScanType	Enumeration	ACTIVE, PASSIVE,TDD PASSIVE	Indicates active, passive, or TDD passive scanning.
ActiveScanType	Enumeration	FRAME, NDP	Indicates active scanning type by the transmission of either Probe Request frames or NDP Probe Request frames. This parameter is optionally present if dot11S1GOptionImplemented is true and if ScanType is ACTIVE; otherwise not present.
ProbeDelay	Integer	N/A	Delay (in microseconds) to be used prior to transmitting a probe request during active scanning.
ChannelList	Set of integers	Each channel is selected from the valid channel range for the appropriate PHY and carrier set.	Specifies a list of channels that are examined when scanning for a BSS. If the Multi-band local and Multi-band peer parameters are present in the primitive, the ChannelList parameter specifies the channels used by the TR-MLME and the Multi-band peer parameter contains the channels to be scanned (see 11.31.5).
MinChannelTime	Integer	N/A	The minimum time (in TU) to spend on each channel when scanning.
MaxChannelTime	Integer	≥ MinChannelTime	The maximum time (in TU) to spend on each channel when scanning.
RequestInformation	A list of element identifiers	As defined in 9.4.2.8 and 9.4.2.9.	This parameter is optionally present if dot11RadioMeasurementActivated is true and is placed in a Probe Request frame to request that the responding STA include the requested information in the Probe Response frame.
SSID List	A set of SSID element	As defined in 9.4.2.2.	One or more SSID elements that are optionally present when dot11SSIDListActivated is true.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
ChannelUsage	A set of Channel Usage element	As defined in 9.4.2.84	Specifies request types for the channel usage request.
AccessNetworkType	As defined in Table 9-276	0 to 15	Specifies the target specific access network type or the wildcard access network type. This field is present when dot11InterworkingServiceActivated is true.
HESSID	MAC address	Any valid individual address or the broadcast address	Specifies the target specific HESSID network identifier or the wildcard network identifier. This field is present when dot11InterworkingServiceActivated is true.
Mesh ID	Octet string	0–32 octets	Present only if BSSType = MESH or BSSType = ANY_BSS. Specifies the target mesh ID or wildcard mesh ID.
DiscoveryMode	Integer	0–1	Indicates, if equal to 1, that a DMG Beacon frame is transmitted during active scanning with the Discovery Mode field set to 1 and, if equal to 0, that a DMG Beacon frame is not transmitted during active scanning. Present only when dot11DMGOptionImplemented is true.
FILSRequestParameters	As defined in 9.4.2.176	As defined in 9.4.2.176	Used in determining whether to transmit a Probe Response frame. This parameter is optionally present if dot11FILSActivated is true; otherwise not present.
ReportingOption	Enumeration	IMMEDIATE, CHANNEL_ SPECIFIC, AT_END	Indicates the result reporting mode as described in 11.1.4. This parameter is optionally present if dot11FILSActivated is true; otherwise not present.
APConfigurationSequenceNumber	Integer	As defined in 9.4.2.180	Indicates the configuration sequence number for the static information fields and elements as described in 11.1.4.3.11. This parameter is optionally present if dot11FILSActivated is true and BSSID is an individual address; otherwise not present.
S1GRelayDiscovery	S1G Relay Discovery element	As defined in 9.4.2.206	Indicates link budget information and QoS requirements for relay discovery. This element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
PV1ProbeResponseOption	PV1 Probe Response Option element	As defined in 9.4.2.208	Indicates which optional information is requested to be included in the PV1 Probe Response frame. This element is optionally present if dot11PV1ProbeResponseOptionImplemented is true; otherwise not present.
S1GCapabilities	S1G Capabilities element	As defined in 9.4.2.199	Indicates S1G capabilities of an S1G STA. The S1G Capabilities element is present if dot11S1GOptionImplemented is true; otherwise not present.
ChangeSequence	Change Sequence element	As defined in 9.4.2.197	Specifies the parameters within the Change Sequence element that are supported by the MAC entity. The parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
ELOperation	EL Operation element	As defined in 9.4.2.209	Specifies the parameters within the EL Operation element that are supported by the MAC entity. The parameter is present if dot11S1GELOperationActivated is true; otherwise not present.
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.
Multi-band local	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are used to deliver messages to the peer MAC entity. The parameter is present if OCT is being used and is absent otherwise.
GeneralLinkType	Enumeration	GLK_SUPPORTED, GLK_UNSPECIFIED	This parameter is present if dot11GLKImplemented is true. If GLK_SUPPORTED, a BSS in which the AP supports GLK is requested. If GLK_UNSPECIFIED, the GLK nature of the BSS is ignored.
OperationalRateSet	Non-DMG BSS: Set of integers DMG BSS: Set of numbers	Non-DMG BSS: a value in dot11SupportedDataRatesRxTable, for each member of the set DMG BSS: 0-12, 9.1, 12.1-12.6, or 25-31, for each member of the set	Non-DMG BSS: The set of data rates (in units of 500 kb/s) that the STA is able to use for communication within the BSS. The STA is able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter of the SelectedBSS parameter. DMG BSS: The set of MCS indices that the STA uses for communication within the BSS. Present only if ScanType = ACTIVE.
HT Capabilities	As defined in frame format HT Capabilities element	As defined in 9.4.2.54; the HT-MCSs in the element are present in dot11SupportedHTMCSRxTable and the highest supported data rate in the element does not exceed dot11HighestSupportedDataRate	Specifies the parameters in the HT Capabilities element that are supported by the STA. The parameter is present if dot11HighThroughputOptionImplemented is true; otherwise, this parameter is not present. Present only if ScanType = ACTIVE.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
VHT Capabilities	As defined in VHT Capabilities element	As defined in 9.4.2.156; the VHT-MCSs in the element are present in dot11VHTRxVHTMCSMap/ dot11VHTTxVHTMCSMap and the highest supported rates in the element do not exceed dot11VHTRxHighestDataRateSupported/ dot11VHTTxHighestDataRateSupported	Specifies the parameters in the VHT Capabilities element that are supported by the STA. The parameter is present if dot11VHTOptionImplemented is true and not present otherwise. Present only if ScanType = ACTIVE.
Short SSID List	A list of short SSIDs	As defined in 9.4.2.261	One or more short SSIDs that are optionally present if dot11ShortSSIDList is true.
HE Capabilities	As defined in HE Capabilities element	As defined in 9.4.2.247	Specifies the parameters in the HE Capabilities element that are supported by the STA. The parameter is present if dot11HEOptionImplemented is true; otherwise, it is not present.
HE 6 GHz Band Capabilities	As defined in HE 6 GHz Band Capabilities element	As defined in 9.4.2.262	Specifies the parameters in the HE 6 GHz Band Capabilities element that are supported by the STA. The parameter is present if dot11HE6GOptionImplemented is true; otherwise, it is not present.
ScanAntennaSectorIDList	List of DMG antenna and sector configurations	Each DMG antenna and sector configuration is a valid configuration for the scanning STA.	Present if dot11TDDOptionImplemented is true and absent otherwise. Contains an ordered list of DMG antennas and sector configurations to be used during the scan using TDD beamforming (see 11.36.2).
SectorDwellTime	Integer	N/A	Present if dot11TDDOptionImplemented is true and absent otherwise. The time (in microseconds) to dwell on each sector during TDD beamforming (see 11.36.2).
EDMG Capabilities	EDMG Capabilities element	As defined in 9.4.2.264	Specifies the parameters within the EDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
Unsolicited Block Ack Extension	Unsolicited Block Ack Extension element	As defined in 9.4.2.278	Specifies the parameters within the Unsolicited Block Ack Extension element that are supported by the MAC entity. Optionally present if dot11UnsolicitedBAActivated is true and is absent otherwise.
WUR Capabilities	As defined in WUR Capabilities element	As defined in 9.4.2.290	Specifies the parameters within the WUR Capabilities element that are supported by the STA. The parameter is present if dot11WUROptionImplemented is true and ScanType = ACTIVE; otherwise, this parameter is not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.3.2.3 When generated

This primitive is generated by the SME for a STA to determine if there are other BSSs that it can join.

6.5.3.2.4 Effect of receipt

This request initiates the scan process when the current frame exchange sequence is completed.

6.5.3.3 MLME-SCAN.confirm

6.5.3.3.1 Function

This primitive returns the descriptions of the set of BSSs detected by the scan process. Multiple MLME-SCAN.confirm primitives can be issued when the value of the ReportingOption parameter in the MLME-SCAN.request primitive is CHANNEL_SPECIFIC or IMMEDIATE. When the value of the ReportingOption parameter is AT_END, or the ReportingOption parameter is not present, a single MLME-SCAN.confirm primitive is issued.

6.5.3.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SCAN.confirm(
BSSDescriptionSet,
BSSDescriptionFromMeasurementPilotSet,
BSSDescriptionFromFDSet,
ResultCode,
Multi-band local,
Multi-band peer,
ScannedChannelList,
VendorSpecificInfo
)

Name	Type	Valid range	Description
BSSDescriptionSet	Set of BSSDescriptions	N/A	The BSSDescriptionSet is returned to indicate the results of the scan request. It is a set containing zero or more instances of a BSSDescription.
BSSDescriptionFromMeasurementPilotSet	Set of BSSDescriptionFromMeasurementPilots	N/A	The BSSDescriptionFromMeasurementPilotSet is returned to indicate the results of the scan request derived from Measurement Pilot frames. It is a set containing zero or more instances of a BSSDescriptionFromMeasurementPilot. Present if dot11RMMeasurementPilotActivated is nonzero; otherwise not present.
BSSDescriptionFromFDSet	Set of BSSDescriptionFromFDs	N/A	The BSSDescriptionFromFDSet is returned to indicate the results of the scan request derived from FILS Discovery frames. It is a set containing zero or more instances of a BSSDescriptionFromFD. Present if dot11FILSActivated is true; otherwise not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, INTERMEDIATE_SCAN_RESULT, NOT_SUPPORTED, PARTIAL_SCAN	Indicates the result of the MLME-SCAN.confirm primitive. The INTERMEDIATE_SCAN_RESULT is used to report the discovered BSSs when the value of the ReportingOption parameter in the MLME-SCAN.request primitive is CHANNEL_SPECIFIC or IMMEDIATE and is valid if dot11FILSActivated is true. The PARTIAL_SCAN is used to report that not all channels have been scanned as specified in the ChannelList parameter, if present, of the corresponding MLME-SCAN.request primitive. The ScannedChannelList parameter contains the list of scanned channels.
Multi-band local	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are used to deliver messages to the peer MAC entity. The parameter is present if OCT is being used and is absent otherwise.
ScannedChannelList	Each channel is selected from the valid channel range for the appropriate PHY and carrier set	Each channel is selected from the valid channel range for the appropriate PHY and carrier set	This parameter is valid only if the ResultCode parameter has a value of PARTIAL_SCAN, and specifies a list of channels that were scanned. This list of channels is a subset of the channels present in the ChannelList parameter of the corresponding MLME-SCAN.request primitive.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

Each BSSDescription consists of the parameters shown in the following table, in which the term *peer STA* refers to the STA transmitting the Beacon frame, S1G Beacon frame, Probe Response frame, or PV1 Probe Response frame from which the BSSDescription was determined and the term *local STA* refers to the STA performing the scan, and in which the IBSS adoption column indicates whether

a) This parameter is adopted by a STA that is joining an IBSS.

b) This parameter is adopted by a STA that is a member of an IBSS that receives a beacon or S1G beacon from a STA that is a member of the same IBSS and that has a timestamp value that is greater than the local TSF value (see 11.1.5).

Name	Type	Valid range	Description	IBSS adoption
BSSID	MAC address	N/A	The BSSID of the found BSS or the MAC address of the found mesh STA.	Adopt
SSID	Octet string	0–32 octets	The SSID of the found BSS.	Adopt
BSSType	Enumeration	INFRASTRUCTURE, PERSONAL, INDEPENDENT, MESH	The type of the found BSS.	Adopt

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description	IBSS adoption
Beacon Period	Integer	N/A	The beacon period (in TU) of the found BSS if the BSSType is not MESH, or of the found mesh STA if the BSSType = MESH.	Adopt
DTIM Period	Integer	As defined in 9.4.2.5	The DTIM period (in beacon periods) of the BSS if the BSSType is not MESH, or of the mesh STA if the BSSType = MESH.	Adopt
Timestamp	Integer	N/A	The timestamp of the received frame (Probe Response/ Beacon or PV1 Probe Response/S1G Beacon) from the found BSS. When a PV1 Probe Response or an S1G Beacon frame is received, the timestamp is reconstructed as described in 11.1.3.10.3. If the Multi-band local and Multi-band peer parameters are present in the MLME-SCAN.confirm primitive, the Timestamp parameter is reserved.	Adopt
Local Time	Integer	N/A	The value of the local STA's TSF timer at the start of reception of the first octet of the timestamp field of the received frame (Probe Response or Beacon) from the found BSS.	Do not adopt
PHY Parameter Set	As defined in frame format or according to the relevant PHY clause.	As defined in frame format or according to the relevant PHY clause.	The parameter sets relevant to the PHY from the received Beacon or Probe Response frame. If no PHY Parameter Set element is present in the received frame, this parameter contains the channel number on which the frame was received. Valid channel numbers are defined in the relevant PHY clause.	Adopt
IBSS Parameter Set	IBSS Parameter Set element	As defined in 9.4.2.6	The parameter set for the IBSS, if found BSS is an IBSS.	Adopt
CapabilityInformation	Capability Information field	As defined in 9.4.1.4	The advertised capabilities of the BSS.	Do not adopt
BSSBasicRateSet	Set of integers	Non-DMG BSS: 1–127 excluding values from Table 9-131, for each member of the set	Non-DMG BSS: The set of data rates (in units of 500 kb/s) that all STAs in the BSS are able to use for communication. All STAs in the BSS are able to receive and transmit at each of the data rates listed in the set. DMG BSS: Empty.	Adopt

Name	Type	Valid range	Description	IBSS adoption
OperationalRateSet	Non-DMG BSS: Set of integers DMG BSS: Set of numbers	Non-DMG BSS: 1–127 excluding values from Table 9-131, for each member of the set DMG BSS: 0–12, 9.1, 12.1–12.6, or 25–31, for each member of the set	Non-DMG BSS: The set of data rates (in units of 500 kb/s) that the peer STA is able to use for communication within the BSS. The peer STA is able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter. DMG BSS: The set of MCS indices that the peer STA uses for communication within the BSS.	Do not adopt
Country	As defined in the Country element	As defined in the Country element	The information required to identify the regulatory domain in which the peer STA is located and to configure its PHY for operation in that regulatory domain. Present if TPC functionality is required, as specified in 11.7, or dot11MultiDomainCapabilityActivated is true or dot11RadioMeasurementActivated is true; otherwise not present.	Adopt
IBSS DFS Recovery Interval	Integer	1–255	The time interval that is used for DFS recovery. Present if DFS functionality is required, as specified in 11.8 and BSSType = INDEPENDENT; otherwise not present.	Adopt
RSN	RSNE	As defined in 9.4.2.23	A description of the cipher suites and AKM suites supported in the BSS.	Do not adopt
BSS Load	BSS Load element	As defined in 9.4.2.26	The values from the BSS Load element. The parameter is present if dot11QoSOptionImplemented and dot11QBSSLoadImplemented are both true and a BSS Load element was present in the Probe Response or Beacon frame from which the BSSDescriptionSet was determined. Otherwise, the parameter is not present.	Do not adopt

Name	Type	Valid range	Description	IBSS adoption
Extended BSS Load	Extended BSS Load element	As defined in 9.4.2.158	The values from the Extended BSS Load element. The parameter is present if dot11QBSSLoadImplemented and dot11VHTOptionImplemented are both true and an Extended BSS Load element was present in the Probe Response or Beacon frame from which the BSSDescriptionSet was determined. Otherwise, the parameter is not present.	Do not adopt
EDCAParameterSet	EDCA Parameter Set element	As defined in 9.4.2.27	The values from the EDCA Parameter Set element if such an element was present in the Probe Response or Beacon frame, else null.	Adopt
QoSCapability	QoS Capability element	As defined in 9.4.2.33	The values from the QoS Capability element if such an element was present in the Probe Response, PV1 Probe Response, S1G Beacon, DMG Beacon or Beacon frame, else null.	Adopt
AP Channel Report	Set of AP Channel Report elements	As defined in 9.4.2.34	The values from the AP Channel Report element(s) if present in the Probe Response or Beacon frame, else null.	Adopt
BSS Average Access Delay	BSS Average Access Delay element	As defined in 9.4.2.37	The values from the BSS Average Access Delay element if such an element was present in Probe Response or Beacon frame, else null.	Adopt
Antenna	Antenna element	As defined in 9.4.2.38	The values from the Antenna element if such an element was present in the Probe Response or Beacon frame, else null.	Adopt
BSS Available Admission Capacity	BSS Available Admission Capacity element	As defined in 9.4.2.41	The values from the BSS Available Admission Capacity element if such an element was present in the Probe Response or Beacon frame, else null.	Adopt
BSS AC Access Delay	BSS AC Access Delay element	As defined in 9.4.2.42	The values from the BSS AC Access Delay element if such an element was present in the Probe Response or Beacon frame, else null.	Adopt
Measurement Pilot Transmission Information	Measurement Pilot Transmission element	As defined in 9.4.2.40	The values from the Measurement Pilot Transmission element if such an element was present in the Probe Response or Beacon frame, else null.	Adopt
Multiple BSSID	A set of Multiple BSSID elements	As defined in 9.4.2.44	The values from the Multiple BSSID element(s) present in the Probe Response, Beacon, DMG Beacon or S1G Beacon frame, if any, else null.	Do not adopt

Name	Type	Valid range	Description	IBSS adoption
RM Enabled Capabilities	RM Enabled Capabilities element	As defined in 9.4.2.43	The values from the RM Enabled Capabilities element if such an element was present in the Probe Response or Beacon frame, else null.	Adopt
RCPIMeasurement	Integer	As defined in 9.4.2.36	The RCPI of the received PPDU containing the frame.	Adopt
RSNIMeasurement	Integer	As defined in 9.4.2.39	The RSNI of the received PPDU containing the frame.	Adopt
Requested elements	Set of elements	As defined in 9.4.1.33	Elements requested by the Request element or Extended Request element of the Probe Request frame.	Adopt
DSERegisteredLocation	DSE Registered Location element	As defined in 9.4.2.50	The information from the DSE Registered Location element, if such a field is present in the Probe Response or Beacon frame, else null. Present if DSE functionality is required, as specified in 11.11, or dot11LCIDSERequired is true; otherwise not present.	Adopt
HT Capabilities	As defined in frame format	As defined in 9.4.2.54	The values from the HT Capabilities element if such an element was present in the Probe Response or Beacon frame, else null. The parameter is optionally present if dot11HighThroughputOptionImplemented is true; otherwise not present.	Do not adopt
HT Operation	As defined in frame format	As defined in 9.4.2.55	The values from the HT Operation element if such an element was present in the Probe Response or Beacon frame, else null. The parameter is optionally present if dot11HighThroughputOptionImplemented is true; otherwise not present.	Adopt
BSSMembershipSelectorSet	Set of integers	A value from Table 9-131 for each member of the set	The set of features that are supported by all STAs joining this BSS.	Adopt
Extended Capabilities	As defined in frame format	As defined in 9.4.2.25	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.	Do not adopt
20/40 BSS Coexistence	As defined in frame format	As defined in 9.4.2.58	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistence-ManagementSupport is true.	Do not adopt

Name	Type	Valid range	Description	IBSS adoption
Overlapping BSS Scan Parameters	As defined in frame format	As defined in 9.4.2.57	Specifies the parameters within the Overlapping BSS Scan Parameters element that are indicated by the MAC entity. This parameter is optionally present if dot11FortyMHzOptionImplemented is true and is not present if dot11FortyMHzOptionImplemented is false.	Adopt
FMSDescriptor	FMS Descriptor element	As defined in 9.4.2.73	The values from the FMS Descriptor element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
QoSTrafficCapability	QoS Traffic Capability element	As defined in 9.4.2.76	The values from the QoS Traffic Capability element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
ChannelUsage	A set of Channel Usage element	As defined in 9.4.2.84	Specifies parameters for the channel usage.	Do not adopt
TimeAdvertisement	Time Advertisement element	As defined in 9.4.2.59	The values from the Time Advertisement element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
TimeZone	Time Zone element	As defined in 9.4.2.85	The values from the Time Zone element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
MeshID	Mesh ID element	As defined in 9.4.2.97	The value of MeshID element if such element was present in the Probe Response or Beacon frame, else null.	Do not adopt
MeshConfiguration	Mesh Configuration element	As defined in 9.4.2.96	The values from the Mesh Configuration element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
Mesh Awake Window	Mesh Awake Window element	As defined in 9.4.2.102	The values from the Mesh Awake Window element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
BeaconTiming	Beacon Timing element	As defined in 9.4.2.103	The values from the Beacon Timing element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
MCCAOP Advertisement Overview	MCCAOP Advertisement Overview element	As defined in frame format	The values from the Beacon Timing element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt

Name	Type	Valid range	Description	IBSS adoption
MCCAOP Advertisement	MCCAOP Advertisement	As defined in frame format	The values from the Beacon Timing element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
QMFPolicy	QMF Policy element	As defined in 9.4.2.118	The values from the QMF Policy element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
QLoad Report	As defined in frame format	As defined in 9.4.2.121	The values from the QLoad Report element if such an element was present in the Probe Response frame, else null.	Do not adopt.
Sector Sweep	As defined in frame format	As defined in 9.3.4.2	The values from the SSW field from the DMG Beacon frame, else null. The parameter is present only if dot11DMGOptionImplemented is true.	Adopt
Beacon Interval Control	As defined in frame format	As defined in 9.3.4.2	The values from the Beacon Interval Control field from the DMG Beacon frame, else null. The parameter is present only if dot11DMGOptionImplemented is true.	Adopt
DMG Parameters	As defined in frame format	As defined in 9.3.4.2	The values from the DMG Parameters field from the DMG Beacon frame, else null. The parameter is present only if dot11DMGOptionImplemented is true.	Adopt
Clustering Control	As defined in frame format	As defined in 9.3.4.2	The values from the Clustering Control field from the DMG Beacon frame, else null. The parameter is present only if dot11DMGOptionImplemented is true.	Do not adopt
DMG Capabilities	As defined in frame format	As defined in 9.4.2.126	The values from the DMG Capabilities element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present if dot11DMGOptionImplemented is true.	Do not adopt

Name	Type	Valid range	Description	IBSS adoption
DMG Operation	As defined in frame format	As defined in 9.4.2.126	The values from the DMG Operation element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present if dot11DMGOptionImplemented is true.	Adopt
Extended Schedule	As defined in frame format	As defined in 9.4.2.130	The values from the Extended Schedule element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present if dot11DMGOptionImplemented is true.	Adopt
Next DMG ATI	As defined in frame format	As defined in 9.4.2.134	The values from the Next DMG ATI element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present if dot11DMGOptionImplemented is true.	Adopt
DMG BSS Parameter Change	As defined in frame format	As defined in 9.4.2.125	The values from the DMG BSS Parameter Change element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present if dot11DMGOptionImplemented is true.	Adopt
Multi-band	As defined in frame format	As defined in 9.4.2.137	The values from the Multi-band element if such an element was present in the Probe Response or DMG Beacon frame, else null. The Multi-band element is optionally present if dot11MultibandImplemented is true.	Adopt
DMG Wakeup Schedule	As defined in frame format	As defined in 9.4.2.129	The values from the DMG Wakeup Schedule element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present if dot11DMGOptionImplemented is true.	Adopt

Name	Type	Valid range	Description	IBSS adoption
Antenna Sector ID Pattern	As defined in frame format	As defined in 9.4.2.155	The values from the Antenna Sector ID Pattern element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present if dot11DMGOptionImplemented is true.	Adopt
Relay Capabilities	As defined in frame format	As defined in 9.4.2.146	The values from the Relay Capabilities element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present if dot11RelayActivated is true.	Do not adopt
VHT Capabilities	As defined in frame format	As defined in 9.4.2.156	The values from the VHT Capabilities element. The parameter is present if dot11VHTOptionImplemented is true and a VHT Capabilities element was present in the Probe Response or Beacon frame from which the BSSDescription was determined. The parameter is not present otherwise.	Do not adopt
VHT Operation	As defined in frame format	As defined in 9.4.2.157	The values from the VHT Operation element. The parameter is present if dot11VHTOptionImplemented is true and a VHT Operation element was present in the Probe Response or Beacon frame from which the BSSDescription was determined. The parameter is not present otherwise.	Adopt
TVHT Operation	As defined in frame format	As defined in 9.4.2.170	The values from the TVHT Operation element if such an element was present in the Probe Response or Beacon frame; otherwise, null. The parameter is optionally present if dot11TVHTOptionImplemented is true.	Adopt
CAG Number	As defined in 9.4.2.175	As defined in 9.4.2.175	One or more Common Advertisement Group (CAG) tuples. Each CAG Tuple describes the CAG Version, Scope, and partial advertisement protocol ID. This parameter is optionally present when dot11FILSActivated is true; otherwise not present.	Do not adopt.

Name	Type	Valid range	Description	IBSS adoption
DILS	As defined in 9.4.2.185	As defined in 9.4.2.185	The values from the DILS element. It is optionally present when dot11FILSActivated is true and if such an element was present in the Probe Response or Beacon frame; otherwise not present.	Do not adopt
Short SSID	Integer	N/A	The Short SSID of the received frame (PV1 Probe Response or S1G Beacon) from the found BSS. This parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.	Adopt
Next TBTT	Integer	N/A	Highest 3 octets of the 4 least significant octets of the next TBTT. This parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.	Adopt
S1G Relay Discovery	As defined in frame format	As defined in 9.4.2.206	The values from the S1G Relay Discovery element if such an element was present in the Probe Response, PV1 Probe Response, or S1G Beacon frame. More description is provided in 10.53.6.	Do not adopt
RPS	RPS element	As defined in 9.4.2.190	The parameter set for group-based restricted medium access, if such element was present in the S1G Beacon, PV1 Probe Response, or Probe Response frame, else null. The support of the feature is described on RAW-based medium access 10.23.5.	Do not adopt
Page Slice	Page Slice element	As defined in 9.4.2.191	The set of page slices present in DTIM interval, if such element was present in the S1G Beacon, or Probe Response, or PV1 Probe Response frame, else null. The support of the feature is described 10.50.	Do not adopt
S1G Capabilities	As defined in frame format	As defined in 9.4.2.199	The values from the S1G Capabilities element. The parameter is present if dot11S1GOptionImplemented is true and an S1G Capabilities element was present in the S1G Beacon, or Probe Response, or PV1 Probe Response frame from which the BSSDescription was determined; otherwise not present.	Adopt

Name	Type	Valid range	Description	IBSS adoption
TSF Timer Accuracy	TSF Timer Accuracy element	As defined in 9.4.2.202	The values from the TSF Timer Accuracy element if such an element was present in the Probe Response, PV1 Probe Response, or S1G Beacon frame, else null. The parameter is optionally present if dot11TSFTimerAccuracyImplemented is true; otherwise not present.	Adopt
Change Sequence	As defined in frame format	As defined in 9.4.2.197	A Change Sequence element indicates the change of system information within a BSS. The support of the feature is described 10.45.2.	Do not adopt
S1GRelay	As defined in frame format	As defined in 9.4.2.203	The S1G Relay element is present in the S1G Beacon frame if dot11RelayAPOperationActivated is true or if dot11RelayAPImplemented is true; otherwise not present. The S1G Relay element is optionally present in Probe Response, or PV1 Probe Response, if dot11RelayAPImplemented is true. More description is provided in 10.53.	Do not adopt
S1GOperation	As defined in frame format	As defined in 9.4.2.211	The values from the S1G Operation element if such an element was present in the Probe Response, PV1 Probe Response, or S1G Beacon frame, else null. The parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.	Adopt
ShortBeaconPeriod	As defined in frame format	As defined in 9.4.2.196	The short beacon period, in TUs, of the found BSS if the Short Beacon Interval element was present in the Probe Response, PV1 Probe Response, or S1G Beacon frame, else null. The parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.	Adopt
ShortBeaconDTIM Period	As defined in frame format	As defined in 9.4.2.5	The values from the TIM element if such an element was present in the S1G Beacon frame, else null. The parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.	Adopt

Name	Type	Valid range	Description	IBSS adoption
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.	Do not adopt
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.218	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true; otherwise not present.	Do not adopt
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.228	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.	Do not adopt
CMMG Operation	CMMG Operation element	As defined in 9.4.2.229	Specifies the parameters within the CMMG Operation element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.	Do not adopt
ServiceHint	Service Hint element	As defined in 9.4.2.236	Provides an indication of the services advertised in Beacon frames and Probe Response frames. The values from the Service Hint element, if such an element was present in the Beacon or Probe Response frame; else null.	Do not adopt
ServiceHash	Service Hash element	As defined in 9.4.2.237	Specifies services advertised in Beacon and Probe Response frames. The values from the Service Hash element, if such an element was present in the Beacon or Probe Response frame; else null.	Do not adopt
Reduced Neighbor Report	One or more Reduced Neighbor Report elements	As defined in 9.4.2.169	The information of the Reduced Neighbor Information field of the received Beacon or Probe Response frame. This parameter is optional.	Do not adopt

Name	Type	Valid range	Description	IBSS adoption
TWT	As defined in frame format	As defined in 9.4.2.198	The value from the TWT element. The parameter is optionally present if dot11HEOptionImplemented is true, dot11TWTOptionActivated is true, and a TWT element was present in the broadcast Probe Response or Beacon frame from which the BSSDescriptionSet was determined. Otherwise, the parameter is not present.	Do not adopt
HE Capabilities	As defined in frame format	As defined in 9.4.2.247	The value from the HE Capabilities element. The parameter is present if dot11HEOptionImplemented is true and an HE Capabilities element was present in the Probe Response or Beacon frame from which the BSSDescription was determined. Otherwise, the parameter is not present.	Do not adopt
HE 6 GHz Band Capabilities	As defined in frame format	As defined in 9.4.2.262	The value from the HE 6 GHz Band Capabilities element. The parameter is present if dot11HE6GOptionImplemented is true and an HE 6 GHz Band Capabilities element was present in the Probe Response or Beacon frame from which the BSSDescription was determined. Otherwise, the parameter is not present.	Do not adopt
HE Operation	As defined in frame format	As defined in 9.4.2.248	The value from the HE Operation element. The parameter is present if dot11HEOptionImplemented is true and an HE Operation element was present in the Probe Response or Beacon frame from which the BSSDescriptionSet was determined. Otherwise, the parameter is not present.	Adopt
UORA Parameter Set	As defined in frame format	As defined in 9.4.2.249	The value from the UORA Parameter Set element. The parameter is optionally present if dot11OFDMARandom-AccessOptionImlemented is true and a UORA Parameter Set element was present in the Probe Response or Beacon frame from which the BSSDescriptionSet was determined. Otherwise, the parameter is not present.	Do not adopt

Name	Type	Valid range	Description	IBSS adoption
MU EDCA Parameter Set	As defined in frame format	As defined in 9.4.2.250	The value from the MU EDCA Parameter Set element. The parameter is optionally present if dot11HEOptionImplemented is true and a MU EDCA Parameter Set element was present in the Probe Response or Beacon frame from which the BSSDescriptionSet was determined. Otherwise, the parameter is not present.	Do not adopt
Spatial Reuse Parameter Set	As defined in frame format	As defined in 9.4.2.251	The value from the Spatial Reuse Parameter Set element. The parameter is optionally present if dot11HEOptionImplemented is true and a Spatial Reuse Parameter Set element was present in the Probe Response or Beacon frame from which the BSSDescriptionSet was determined. Otherwise, the parameter is not present.	Do not adopt
NDP Feedback Report Parameter Set	As defined in frame format	As defined in 9.4.2.252	The value from the NDP Feedback Report Parameter Set element. The parameter is optionally present if dot11HEOptionImplemented is true and an NDP Feedback Report Parameter Set element was present in the Probe Response or Beacon frame from which the BSSDescriptionSet was determined. Otherwise, the parameter is not present.	Do not adopt
BSS Color Change Announcement	As defined in frame format	As defined in 9.4.2.253	The value from the BSS Color Change Announcement element. The parameter is optionally present if dot11HEOptionImplemented is true and a BSS Color Change Announcement element was present in the Probe Response or Beacon frame from which the BSSDescriptionSet was determined. Otherwise, the parameter is not present.	Do not adopt
ESS Report	As defined in frame format	As defined in 9.4.2.255	The value from the ESS Report element. The parameter is optionally present if an ESS Report element was present in the Probe Response or Beacon frame from which the BSSDescriptionSet was determined. Otherwise, the parameter is not present.	Do not adopt

Name	Type	Valid range	Description	IBSS adoption
HE BSS Load	As defined in frame format	As defined in 9.4.2.258	The value from the HE BSS Load element. The parameter is present if dot11QBSSLoadImplemented and dot11HEOptionImplemented are both true and an HE BSS Load element was present in the Probe Response or Beacon frame from which the BSSDescriptionSet was determined. Otherwise, the parameter is not present.	Do not adopt
Multiple BSSID Configuration	As defined in frame format	As defined in 9.4.2.259	The value from the Multiple BSSID Configuration element. The parameter is present if dot11MultiBSSIDImplemented is true and the Multiple BSSID Configuration element was present in the Probe Response or Beacon frame from which the BSSDescription was determined. Otherwise, the parameter is not present.	Do not adopt
WUR Capabilities	As defined in frame format	As defined in 9.4.2.290	The value from WUR Capabilities element. The parameter is present if dot11WUROptionImplemented is true and a WUR Capabilities element was present in the Probe Response or Beacon frame from which the BSSDescription was determined; otherwise, the parameter is not present.	Do not adopt
WUR Operation	As defined in frame format	As defined in 9.4.2.291	The value from WUR Operation element. The parameter is present if dot11WUROptionImplemented is true and a WUR Operation element was present in the Probe Response or Beacon frame from which the BSSDescriptionSet was determined; otherwise, the parameter is not present.	Do not adopt
WUR Discovery	As defined in frame format	As defined in 9.4.2.293	The value from WUR Discovery element. The parameter is present if dot11WUROptionImplemented is true and a WUR Discovery element was present in the Probe Response or Beacon frame from which the BSSDescriptionSet was determined; otherwise, the parameter is not present.	Do not adopt

Each BSSDescriptionFromMeasurementPilot consists of the following parameters, in which the term *peer STA* refers to the STA transmitting the Measurement Pilot frame from which the BSSDescription was determined and the term *local STA* refers to the STA performing the scan:

Name	Type	Valid range	Description
BSSID	MAC address	N/A	The BSSID of the found BSS.
BSS Type	Enumeration	INFRASTRUCTURE	The type of the found BSS.
Local Time	Integer	N/A	The value of the local STA's TSF timer at the start of reception of the first octet of the timestamp field of the received frame from the found BSS.
Condensed Capability Information	Condensed Capability Information field	As defined in 9.6.7.3	The advertised condensed capabilities of the BSS.
Condensed Country String	Condensed Country String field	As defined in 9.6.7.3	Together with the Operating Class, the information required to identify the regulatory domain in which the peer STA is located and to configure its PHY for operation in that regulatory domain.
Operating Class	Operating Class field	The field is defined in 9.6.7.3, valid values for the field are defined in Annex E.	Together with the Condensed Country String, the information required to identify the regulatory domain in which the peer STA is located and to configure its PHY for operation in that regulatory domain.
Channel	Channel field	The field is defined in 9.6.7.3, valid values for the field are defined in Annex E.	The operating channel of the BSS indicated in the received frame.
Measurement Pilot Interval	Measurement Pilot Interval field	As defined in 9.6.7.3	The measurement pilot interval of the BSS indicated in the received frame.
Multiple BSSID	A set of Multiple BSSID elements	As defined in 9.4.2.44	The values from the Multiple BSSID element(s) present in the Measurement Pilot frame, if any, else null.
PHY Type	Integer	As defined in Annex C	The dot11PHYType of the received frame.
RCPIMeasurement	Integer	As defined in 9.4.2.36	The RCPI of the received PPDU containing the frame.
RSNIMeasurement	Integer	As defined in 9.4.2.39	The RSNI of the received PPDU containing the frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The BSSDescriptionFromFDSet parameter is present if dot11FILSActivated is true; otherwise, it is not present. Each BSSDescriptionFromFD consists of the parameters shown in the following table:

Name	Type	Valid range	Description
BSSID	MAC address	N/A	The BSSID of the found BSS.
SSID	Octet String	As defined in 9.4.2.2	The SSID of the found BSS. This parameter is present if the Short SSID Indicator field in the received FILS Discovery frame is equal to 0.
Short SSID	Integer	As defined in the 9.4.2.169	The short SSID of the found BSS. This parameter is present if the Short SSID Indicator field in the received FILS Discovery frame is equal to 1.
FD Capability	As defined in 9.6.7.36	As defined in 9.6.7.36	The FD Capability contains the capabilities and operational indications of the BSS. This parameter is optional.
Operating class	Integer	As defined in 9.4.1.34	The operating class of the advertised BSS.
Access Network Options	As defined in 9.4.2.90	As defined in 9.4.2.90	The advertised access network options of the BSS. This parameter is optional.
Primary Channel	Integer	1–255	The Primary Channel of the advertised BSS. The Primary Channel is defined within the indicated Operating Class as shown in Annex E. This parameter is optional.
FD RSN Information	As defined in 9.6.7.36	As defined in 9.6.7.36	The information for robust security network. This parameter is optional.
Channel Center Frequency Segment 1	Integer	1–255	The channel number of the 80 MHz channel of frequency segment 1 when the BSS operates on an 80+80 MHz operating channel width. This parameter is optional.
AP-CSN	Integer	As defined in 9.4.2.180	The value of the Configuration Sequence Number in the found BSS. This parameter is optional.
AP's next TBTT Offset	Integer	As defined in 9.6.7.36	The information of next target beacon transmission time of the found BSS. This parameter is optional.
Reduced Neighbor Report	One or more Reduced Neighbor Report elements	As defined in 9.4.2.169	The information related to APs in the neighborhood of the reporting AP or APs colocated with the reporting AP. This parameter is optional.
FILS Indication	As defined in 9.4.2.181	As defined in 9.4.2.181	The information related to FILS authentication and upper layer set up capabilities of the found AP. This parameter is optional.

6.5.3.3.3 When generated

This primitive is generated by the MLME to report the operating environment of the STA. It is issued after receiving an MLME-SCAN.request primitive or, if dot11FILSActivated is true, after receiving an MLME-SCAN-STOP.request primitive following an MLME-SCAN.request primitive.

6.5.3.3.4 Effect of receipt

The SME is notified of the results of the scan procedure. If dot11FILSActivated is true, these results might be intermediate results, according to the value of ResultCode.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.3.4 MLME-SCAN-STOP.request

6.5.3.4.1 Function

This primitive terminates any ongoing scan.

6.5.3.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SCAN-STOP.request(
                        Multi-band local,
                        Multi-band peer
                        )
```

Name	Type	Valid range	Description
Multi-band local	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band elemen	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are used to deliver messages to the peer MAC entity. The parameter is present if OCT is being used and is absent otherwise.

6.5.3.4.3 When generated

This primitive is generated by the SME in order to stop all ongoing active or passive scan processes in the STA.

6.5.3.4.4 Effect of receipt

This request terminates all ongoing scan procedures.

6.5.4 Synchronization

6.5.4.1 Introduction

This mechanism supports the process of selection of a peer in the authentication process.

6.5.4.2 MLME-JOIN.request

6.5.4.2.1 Function

This primitive requests synchronization with a nonmesh BSS.

6.5.4.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-JOIN.request(
                        SelectedBSS,
                        JoinFailureTimeout,
                        NAVSyncDelay,
```

Name	Type	Valid range	Description
SelectedBSS	BSSDescription	N/A	The BSSDescription of the BSS to join. The SelectedBSS is a member of the set of descriptions that was returned as a result of an MLME-SCAN.request primitive.
JoinFailureTimeout	Integer	≥ 1	The time limit, in units of beacon intervals, after which the join procedure is terminated.
NAVSyncDelay	Integer	≥ 0	Delay (in microseconds) to be used prior to transmitting when changing from doze to awake state and when changing channel, if no frame is detected by which the network allocation vector (NAV) can be set.
OperationalRateSet	Non-DMG BSS: Set of integers DMG BSS: Set of numbers	Non-DMG BSS: a value in dot11SupportedDataRatesRxTable, for each member of the set DMG BSS: 0-12, 9.1, 12.1-12.6, or 25-31, for each member of the set	Non-DMG BSS: The set of data rates (in units of 500 kb/s) that the STA is able to use for communication within the BSS. The STA is able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter of the SelectedBSS parameter. DMG BSS: The set of MCS indices that the STA uses for communication within the BSS.
CapabilityInformation	Capability Information field	As defined in 9.4.1.4	Specifies the parameters in the Capability Information field that are supported by the STA.
HT Capabilities	As defined in frame format HT Capabilities element	As defined in 9.4.2.54; the HT-MCSs in the element are present in dot11SupportedHTMCSRxTable and the highest supported data rate in the element does not exceed dot11HighestSupportedDataRate	Specifies the parameters in the HT Capabilities element that are supported by the STA. The parameter is present if dot11HighThroughputOptionImplemented is true; otherwise, this parameter is not present.

Name	Type	Valid range	Description
VHT Capabilities	As defined in VHT Capabilities element	As defined in 9.4.2.156; the VHT-MCSs in the element are present in dot11VHTRxVHTMCSMap/ dot11VHTTxVHTMCSMap and the highest supported rates in the element do not exceed dot11VHTRxHighestDataRateSupported/ dot11VHTTxHighestDataRateSupported	Specifies the parameters in the VHT Capabilities element that are supported by the STA. The parameter is present if dot11VHTOptionImplemented is true and not present otherwise.
DMG Capabilities	DMG Capabilities element	As defined in 9.4.2.126	Specifies the parameters within the DMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise.
S1G Capabilities	As defined in frame format	As defined in 9.4.2.199	Specifies the parameters in the S1G Capabilities element that are supported by the STA. The parameter is present if dot11S1GOptionImplemented is true; otherwise not present.
Extended Capabilities	As defined in frame format	As defined in 9.4.2.25	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.
20/40 BSS Coexistence	As defined in frame format	As defined in 9.4.2.58	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistence-ManagementSupport is true.
InterworkingInfo	As defined in frame format	As defined in Interworking element in 9.4.2.90	Specifies the interworking capabilities of STA. This field is present when dot11InterworkingServiceActivated is true.
AdvertisementProtocolInfo	Integer or Sequence of integers	As defined in Advertisement Protocol element in Table 9-277	Identifies zero or more advertisement protocols and advertisement control to be used in the BSSs. This field is present when dot11InterworkingServiceActivated is true.
HE Capabilities	As defined in HE Capabilities element	As defined in 9.4.2.247	Specifies the parameters within the HE Capabilities element that are supported by the STA. The parameter is present if dot11HEOptionImplemented is true; otherwise, this parameter is not present.
HE 6 GHz Band Capabilities	As defined in HE 6 GHz Band Capabilities element	As defined in 9.4.2.262	Specifies the parameters within the HE 6 GHz Band Capabilities element that are supported by the STA. The parameter is present if dot11HE6GOptionImplemented is true; otherwise, this parameter is not present.
EDMG Capabilities	EDMG Capabilities element	As defined in 9.4.2.264	Specifies the parameters within the EDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.

Name	Type	Valid range	Description
WUR Capabilities	As defined in WUR Capabilities element	As defined in 9.4.2.290	Specifies the parameters within the WUR Capabilities element that are supported by the STA. The parameter is present if dot11WUROptionImplemented is true; otherwise, this parameter is not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.4.2.3 When generated

This primitive is generated by the SME for a STA to establish synchronization with a BSS.

6.5.4.2.4 Effect of receipt

This primitive initiates a synchronization procedure once the current frame exchange sequence is complete. The MLME synchronizes its timing with the specified BSS based on the information provided in the SelectedBSS parameter. The MLME subsequently issues an MLME-JOIN.confirm primitive that reflects the results.

If the MLME of a non-DMG STA receives an MLME-JOIN.request primitive with the SelectedBSS parameter containing a BSSBasicRateSet parameter that contains any unsupported rates, the MLME response in the resulting MLME-JOIN.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of an HT STA receives an MLME-JOIN.request primitive with the SelectedBSS parameter containing a Basic HT-MCS Set field in the HT Operation parameter that contains any unsupported MCSs, the MLME response in the resulting MLME-JOIN.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of a VHT STA receives an MLME-JOIN.request primitive with a SelectedBSS parameter containing a Basic VHT-MCS And NSS Set field in the VHT Operation parameter that contains any unsupported <VHT-MCS, NSS> tuple, the MLME response in the resulting MLME-JOIN.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of a DMG STA receives an MLME-JOIN.request primitive with the SelectedBSS parameter containing a BSSBasicRateSet parameter that is not empty, or with the OperationalRateSet parameter containing any unsupported MCSs, the MLME response in the resulting MLME-JOIN.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of an S1G STA receives an MLME-JOIN.request primitive with a SelectedBSS parameter containing a Basic S1G-MCS and NSS Set field in the S1GOperation parameter that contains any unsupported <S1G-MCS, NSS> tuple, the MLME response in the resulting MLME-JOIN.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of an HE STA receives an MLME-JOIN.request primitive with a SelectedBSS parameter containing a Basic HE-MCS And NSS Set field in the HE Operation parameter that contains any unsupported <HE-MCS, NSS> tuple, then the MLME response in the resulting MLME-JOIN.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

6.5.4.3 MLME-JOIN.confirm

6.5.4.3.1 Function

This primitive confirms synchronization with a BSS.

6.5.4.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-JOIN.confirm(
ResultCode,
VendorSpecificInfo
)

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, JOIN_FAILURE_TIMEOUT	Indicates the result of the MLME-JOIN.request primitive.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.4.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-JOIN.request primitive to establish synchronization with a BSS.

6.5.4.3.4 Effect of receipt

The SME is notified of the results of the synchronization procedure.

6.5.5 Authenticate

6.5.5.1 Introduction

This mechanism supports the process of establishing an authentication relationship with a peer MAC entity.

6.5.5.2 MLME-AUTHENTICATE.request

6.5.5.2.1 Function

This primitive requests authentication with a specified peer MAC entity.

6.5.5.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-AUTHENTICATE.request(
PeerSTAAddress,
AuthenticationType,
AuthenticateFailureTimeout,
Content of FT Authentication elements,
Content of SAE Authentication frame,
Multi-band local,
Multi-band peer,
Content of FILS Authentication frame,

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Content of PASN Authentication frame,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity with which to perform the authentication process.
AuthenticationType	Enumeration	OPEN_SYSTEM, SHARED_KEY, FAST_BSS_TRANSITION, SAE, FILS_SHARED_KEY WITHOUT_PFS, FILS_SHARED KEY_WITH_PFS, FILS_PUBLIC_KEY	Specifies the type of authentication algorithm to use during the authentication process.
AuthenticateFailureTimeout	Integer	≥ 1	Specifies a time limit (in TU) after which the authentication procedure is terminated.
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements to be included in the first message of the FT authentication sequence, as described in 13.8.2. Present if dot11FastBSSTransitionActivated is true; otherwise not present.
Content of SAE Authentication frame	Sequence of elements and fields	As defined in 9.4.1.35, 9.4.1.36, 9.4.1.37, 9.4.1.38, 9.4.1.39, and 9.4.1.40	The set of elements and fields to be included in the SAE Commit message or SAE Confirm message. Present if AuthenticationType indicates SAE authentication; otherwise not present.
Multi-band local	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are used to deliver messages to the peer MAC entity. This parameter is present if OCT is being used and is absent otherwise.
Content of FILS Authentication frame	Sequence of elements and fields	As defined in 9.4.1.40, 9.4.1.38, 9.4.2.23, 9.4.2.178, 9.4.2.186, and 9.4.2.188	The set of elements and fields to be included in the first message of the FILS authentication sequence, as described in 12.11. Present if AuthenticationType indicates FILS SHARED KEY WITHOUT PFS, FILS SHARED KEY WITH PFS, or FILS PUBLIC KEY; otherwise not present.
Content of PASN Authentication frame	Sequence of elements and fields	As defined in 12.13.3.2, 9.4.2.24, 9.4.2.48, 9.4.2.187, 9.4.2.241, and 9.4.2.203	The set of elements and fields to be included in PASN Authentication frames. Present if AuthenticationType indicates PASN authentication and dot11PASNActivated is true, otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.5.2.3 When generated

This primitive is generated by the SME for a STA to establish authentication with a specified peer MAC entity in order to permit Class 2 frames, or mesh peering Management frames for AMPE utilizing SAE authentication, to be exchanged between the two STAs. During the authentication procedure, the SME might generate additional MLME-AUTHENTICATE.request primitives.

If dot11S1GCentralizedAuthenticationControlActivated is true and a STA's MAC variable AuthenticationRequestTransmission is false, then the STA shall not invoke this primitive.

6.5.5.2.4 Effect of receipt

This primitive initiates an authentication procedure. In the case that a response is received from the responder STA, the MLME subsequently issues an MLME-AUTHENTICATE.confirm primitive that reflects the results.

6.5.5.3 MLME-AUTHENTICATE.confirm

6.5.5.3.1 Function

This primitive reports the results of an authentication attempt with a specified peer MAC entity.

6.5.5.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-AUTHENTICATE.confirm(
PeerSTAAddress,
AuthenticationType,
ResultCode,
Content of FT Authentication elements,
Content of SAE Authentication frame,
Multi-band local,
Multi-band peer,
Content of FILS Authentication frame,
Content of PASN Authentication frame,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity with which the authentication process was attempted. This value matches the peerSTAAddress parameter specified in the corresponding MLME-AUTHENTICATE.request primitive.
AuthenticationType	Enumeration	OPEN_SYSTEM, SHARED_KEY FAST_BSS_TRANSITION, SAE, FILS_SHARED KEY_WITHOUT_PFS, FILS_SHARED_KEY_WITH_PFS, FILS_PUBLIC_KEY, PASN	Specifies the type of authentication algorithm that was used during the authentication process. This value matches the AuthenticationType parameter specified in the corresponding MLME-AUTHENTICATE.request primitive.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, REFUSED_REASON_UNSPECIFIED, ANTI_CLOGGING_TOKEN_REQUIRED, FINITE_CYCLIC_GROUP_NOT_SUPPORTED, AUTHENTICATION_REJECTED, AUTH_FAILURE_TIMEOUT	Indicates the result of the MLME-AUTHENTICATE.request primitive.
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements included in the second message of the FT authentication sequence, as described in 13.8.3. Present if dot11FastBSSTransitionActivated is true; otherwise not present.
Content of SAE Authentication frame	Sequence of elements	As defined in 9.4.1.35, 9.4.1.36, 9.4.1.37, 9.4.1.38, 9.4.1.39, and 9.4.1.40	The set of elements to be included in the SAE Commit message or SAE Confirm message. Present if AuthenticationType indicates SAE authentication; otherwise not present.
Multi-band local	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that identify the local MAC entity. This parameter is present if OCT is being used and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are supported by the peer MAC entity. This parameter is present if OCT is being used and is absent otherwise.
Content of FILS Authentication frame	Sequence of elements and fields	As defined in 9.4.1.40, 9.4.1.38, 9.4.2.23, 9.4.2.174, 9.4.2.178, 9.4.2.186, and 9.4.2.188	The set of elements and fields included in the second message of the FILS authentication sequence, as described in 12.11. Present if AuthenticationType indicates FILS SHARED KEY WITHOUT PFS, FILS SHARED KEY WITH PFS, or FILS PUBLIC KEY; otherwise not present.
Content of PASN Authentication frame	Sequence of elements and fields	As defined in 12.13.3.2, 9.4.2.24, 9.4.2.48, 9.4.2.187, 9.4.2.241, and 9.4.2.303	The set of elements and fields to be included in PASN Authentication frames. Present if AuthenticationType indicates PASN authentication and dot11PASNActivated is true, otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.5.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-AUTHENTICATE.request primitive to authenticate with a specified peer MAC entity.

6.5.5.3.4 Effect of receipt

The SME is notified of the results of the authentication procedure.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.5.4 MLME-AUTHENTICATE.indication

6.5.5.4.1 Function

This primitive indicates receipt of a request from a specific peer MAC entity to establish an authentication relationship with the STA processing this primitive.

6.5.5.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-AUTHENTICATE.indication(
PeerSTAAddress,
AuthenticationType,
Content of FT Authentication elements,
Content of SAE Authentication frame,
Multi-band local,
Multi-band peer,
Content of FILS Authentication frame,
Content of PASN Authentication frame,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity from which the authentication request was received.
AuthenticationType	Enumeration	OPEN_SYSTEM, SHARED_KEY, FAST_BSS_ TRANSITION, SAE, FILS_SHARED_KEY_WITHOUT_PFS, FILS_SHARED_KEY_WITH_PFS, FILS_PUBLIC_KEY, PASN	Specifies the type of authentication algorithm that was used during the authentication process.
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements included in the first message of the FT authentication sequence, as described in 13.8.2. Present if dot11FastBSSTransitionActivated is true; otherwise not present.
Content of SAE Authentication frame	Sequence of elements	As defined in 9.4.1.35, 9.4.1.36, 9.4.1.37, 9.4.1.38, 9.4.1.39, and 9.4.1.40	The set of elements to be included in the SAE Commit message or SAE Confirm message. Present if AuthenticationType indicates SAE authentication; otherwise not present.
Multi-band local	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that identify and are supported by the local MAC entity. This parameter is present if OCT is being used and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that identify and are supported by the peer MAC entity. This parameter is present if OCT is being used and is absent otherwise.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Content of FILS Authentication frame	Sequence of elements and fields	As defined in 9.4.1.40, 9.4.1.38, 9.4.2.23, 9.4.2.174, 9.4.2.178, 9.4.2.186, and 9.4.2.188	The set of elements and fields included in the first message of the FILS authentication sequence, as described in 12.11. Present if AuthenticationType indicates FILS SHARED KEY WITHOUT PFS, FILS SHARED KEY WITH PFS, or FILS PUBLIC KEY; otherwise not present.
Content of PASN Authentication frame	Sequence of elements and fields	As defined in 12.3.3.2, 9.4.2.24, 9.4.2.48, 9.4.2.187, 9.4.2.241, and 9.4.2.303	The set of elements and fields to be included in PASN Authentication frames. Present if AuthenticationType indicates PASN authentication and dot11PASNActivated is true, otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.5.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of an authentication request from a specific peer MAC entity.

6.5.5.4.4 Effect of receipt

The SME is notified of the receipt of the authentication request.

6.5.5.5 MLME-AUTHENTICATE.response

6.5.5.5.1 Function

This primitive is used to send a response to a specific peer MAC entity that requested authentication with the STA that issued this primitive.

6.5.5.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-AUTHENTICATE.response(
                                    PeerSTAAddress,
                                    ResultCode,
                                    Content of FT Authentication elements,
                                    Content of SAE Authentication frame,
                                    Multi-band local,
                                    Multi-band peer,
                                    Content of FILS Authentication frame,
                                    Content of PASN Authentication frame,
                                    VendorSpecificInfo
                                    )
```

6.5.5.5.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-AUTHENTICATE.indication primitive.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity from which the authentication request was received.
ResultCode	Enumeration	SUCCESS, REFUSED_REASON_UNSPECIFIED, ANTI_CLOGGING_TOKEN_REQUIRED, FINITE_CYCLIC_GROUP_NOT_SUPPORTED, AUTHENTICATION_REJECTED	Indicates the result response to the authentication request from the peer MAC entity.
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements to be included in the second message of the FT authentication sequence, as described in 13.8.3. Present if dot11FastBSSTransitionActivated is true; otherwise not present.
Content of SAE Authentication frame	Sequence of elements	As defined in 9.4.1.35, 9.4.1.36, 9.4.1.37, 9.4.1.38, 9.4.1.39, and 9.4.1.40	The set of elements to be included in the SAE Commit message or SAE Confirm message. Present if the AuthenticationType of the MLME-AUTHENTICATE.indication primitive that generated this response indicated SAE authentication; otherwise not present.
Multi-band local	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are used to deliver messages to the peer MAC entity. This parameter is present if OCT is being used and is absent otherwise.
Content of FILS Authentication frame	Sequence of elements and fields	As defined in 9.4.1.40, 9.4.1.38, 9.4.2.23, 9.4.2.178, 9.4.2.186, and 9.4.2.188	The set of elements and fields to be included in the second message of the FILS authentication sequence, as described in 12.11. Present if AuthenticationType indicates FILS SHARED KEY WITHOUT PFS, FILS SHARED KEY WITH PFS, or FILS PUBLIC KEY; otherwise not present.
Content of PASN Authentication frame	Sequence of elements and fields	As defined in 12.13.3.2, 9.4.2.24, 9.4.2.48, 9.4.2.187, 9.4.2.241, and 9.4.2.303	The set of elements and fields to be included in PASN Authentication frames. Present if AuthenticationType indicates PASN authentication and dot11PASNActivated is true, otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.5.5.4 Effect of receipt

This primitive initiates transmission of a response to the specific peer MAC entity that requested authentication.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.6 Deauthenticate

6.5.6.1 Introduction

This mechanism supports the process of invalidating an authentication relationship with a peer MAC entity.

6.5.6.2 MLME-DEAUTHENTICATE.request

6.5.6.2.1 Function

This primitive requests that the authentication relationship with a specified peer MAC entity be invalidated.

6.5.6.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DEAUTHENTICATE.request(
                                    PeerSTAAddress,
                                    ReasonCode,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address, or the broadcast address	Specifies the address of the peer MAC entity or entities with which to perform the deauthentication process.
ReasonCode	Reason Code field	As defined in 9.4.1.7	Specifies the reason for initiating the deauthentication procedure.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.6.2.3 When generated

This primitive is generated by the SME for a STA to invalidate authentication with a specified peer MAC entity in order to prevent the exchange of Class 2 frames, or mesh peering Management frames for AMPE utilizing SAE authentication, between the two STAs. During the deauthentication procedure, the SME might generate additional MLME-DEAUTHENTICATE.request primitives.

6.5.6.2.4 Effect of receipt

This primitive initiates a deauthentication procedure. The MLME subsequently issues an MLME-DEAUTHENTICATE.confirm primitive that reflects the results.

6.5.6.3 MLME-DEAUTHENTICATE.confirm

6.5.6.3.1 Function

This primitive reports the results of a deauthentication attempt with a specified peer MAC entity.

6.5.6.3.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-DEAUTHENTICATE.confirm(
                                    PeerSTAAddress
                                    )
```

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address, or the broadcast address	Specifies the address of the peer MAC entity or entities with which the deauthentication process was attempted.

6.5.6.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-DEAUTHENTICATE.request primitive to invalidate the authentication relationship with a specified peer MAC entity.

6.5.6.3.4 Effect of receipt

The SME is notified of the results of the deauthentication procedure.

6.5.6.4 MLME-DEAUTHENTICATE.indication

6.5.6.4.1 Function

This primitive reports the invalidation of an authentication relationship with a specific peer MAC entity.

6.5.6.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DEAUTHENTICATE.indication(
                                    PeerSTAAddress,
                                    ReasonCode,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity with which the authentication relationship was invalidated.
ReasonCode	Reason Code field	As defined in 9.4.1.7	Specifies the reason the deauthentication procedure was initiated.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.6.4.3 When generated

This primitive is generated by the MLME as a result of the invalidation of an authentication relationship with a specific peer MAC entity.

6.5.6.4.4 Effect of receipt

The SME is notified of the invalidation of the specific authentication relationship.

6.5.7 Associate

6.5.7.1 Introduction

The following primitives describe how a STA becomes associated with an AP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.7.2 MLME-ASSOCIATE.request

6.5.7.2.1 Function

This primitive requests association with a specified peer MAC entity that is within an AP.

6.5.7.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ASSOCIATE.request(
PeerSTAAddress,
ListenInterval,
Supported Channels,
RSN,
QoSCapability,
Content of FT Authentication elements,
SupportedOperatingClasses,
SM Power Save,
QoSTrafficCapability,
TIMBroadcastRequest,
EmergencyServices,
Multi-band local,
Multi-band peer,
MMS,
FILSHLPContainer,

)

Additional parameters needed to perform the association procedure are not included in the primitive parameter list since the MLME already has that data (maintained as internal state).

6.5.7.2.3 When generated

This primitive is generated by the SME when a STA wishes to establish association with an AP or PCP.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity with which to perform the association process.
ListenInterval	Integer	≥ 0	Specifies how often the STA transitions to the awake state to listen for the next Beacon frame, if it enters power save mode.
Supported Channels	As defined in the Supported Channels element	As defined in the Supported Channels element	The list of channels in which the STA is capable of operating. Present if DFS functionality is required, as specified in 11.8; otherwise optionally present.
RSN	RSNE	As defined in 9.4.2.23	A description of the cipher suites and AKM suites selected by the STA.
QoSCapability	QoS Capability element	As defined in 9.4.2.33	Specifies the parameters within the QoS Capability element that are supported by the MAC entity. The parameter is present if dot11QosOptionImplemented is true; otherwise not present.
Content of FT Authentication elements	Sequence of elements	As defined in 13.4	The set of elements to be included in the initial mobility domain association request, as described in 13.4. Present if dot11FastBSSTransitionActivated is true; otherwise not present.
SupportedOperating Classes	As defined in the Supported Operating Classes element	As defined in 9.4.2.52	Specifies the supported operating classes of the STA. This parameter is present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true; otherwise not present.
SM Power Save	Integer	As defined in Table 9-224	Indicates the spatial multiplexing power save mode that is in operation immediately after association.
QoS Traffic Capability	As defined in the QoS Traffic Capability element	As defined in 9.4.2.76	Specifies the QoS traffic capability flags of the non-AP STA. This parameter is optionally present if dot11ACStationCountActivated is true and is not present otherwise.
TIMBroadcastRequest	As defined in the TIM Broadcast Request element	As defined in 9.4.2.81	Specifies the proposed service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and is not present otherwise.
EmergencyServices	Boolean	true, false	Specifies that the non-AP STA intends to associate for the purpose of unauthenticated access to emergency services. The parameter is optionally present if dot11InterworkingServiceActivated is true and is not present otherwise.
Multi-band local	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are used to deliver messages to the peer MAC entity. The parameter is present if OCT is being used and is absent otherwise.

Name	Type	Valid range	Description
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.151	Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise.
FILSHLPContainer	As defined in 9.4.2.182	As defined in 9.4.2.182	A set of elements containing encapsulated data of higher layer protocol frames (e.g., DHCP message) that is transported in FILS association. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
FILSIPAddressAssignment	As defined in 9.4.2.183	As defined in 9.4.2.183	An explicit request for an IP address. The request is either for a new IP address or for a specified IP address. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
AID Request	AID Request element	As defined in 9.4.2.192	Indicates the device characteristic of the non-AP STA requesting AID assignment. This parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
TWT	TWT element	As defined in 9.4.2.198	Specifies the parameters in the TWT element. This parameter is optionally present if dot11TWTOptionActivated is true; otherwise not present.
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.205	Indicates if a STA with dot11RelaySTAImplemented equal to true requests to operate as a relay (in a request) and an AP with dot11RelayAPImplemented equal to true requests/confirms operation as a relay. The parameter is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
ReachableAddress	Reachable Address element	As defined in 9.4.2.204	The Reachable Address element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.218	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true; otherwise not present.
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.228	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.

Name	Type	Valid range	Description
GLK-GCR Parameter Set	GLK-GCR Parameter Set element	As defined in 9.4.2.233	This parameter is present if dot11GLKGCRImplemented is true and not present otherwise. Specifies the GLK-GCR capabilities supported by the STA.
MSCS Descriptor	As defined in the MSCS Descriptor element	As defined in 9.4.2.242	The parameters used to classify streams using the procedures defined in 11.25.3. Optionally present if dot11MSCSActivated is true; otherwise not present.
HE Capabilities	As defined in HE Capabilities element	As defined in 9.4.2.247	Specifies the parameters in the HE Capabilities element that are supported by the STA. The parameter is present if dot11HEOptionImplemented is true; otherwise, it is not present.
HE 6 GHz Band Capabilities	As defined in HE 6 GHz Band Capabilities element	As defined in 9.4.2.262	Specifies the parameters in the HE 6 GHz Band Capabilities element that are supported by the STA. The parameter is present if dot11HE6GOptionImplemented is true; otherwise, it is not present.
Channel Switch Timing	As defined in the Channel Switch Timing element	As defined in 9.4.2.62	Provides information regarding the channel switch timing. The parameter is optionally present if dot11HESubchannelSelectiveTransmissionImplemented is true; otherwise, it is not present.
UL MU Power Capabilities	As defined in UL MU Power Capabilities element	As defined in 9.4.2.263	Provides information regarding the UL MU power capabilities for the non-AP STA. The UL MU Power Capabilities element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
EDMG Capabilities	EDMG Capabilities element	As defined in 9.4.2.264	Specifies the parameters within the EDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
QoS Triggered Unscheduled	QoS Triggered Unscheduled element	As defined in 9.4.2.277	Specifies the parameters within the QoS Triggered Unscheduled element that are supported by the MAC entity. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
Unsolicited Block Ack Extension	Unsolicited Block Ack Extension element	As defined in 9.4.2.278	Specifies the parameters within the Unsolicited Block Ack Extension element that are supported by the MAC entity. Optionally present if dot11UnsolicitedBAActivated is true and is absent otherwise.
TDD Slot Schedule	TDD Slot Schedule element	As defined in 9.4.2.281	Present if dot11TDDOptionImplemented is true and absent otherwise. Specifies the TDD slot availability of the STA.
WUR Mode	WUR Mode element	As defined in 9.4.2.292	Specifies the proposed service parameters for the WUR Mode Setup request. The parameter is optionally present if dot11WUROptionImplemented is true; otherwise, this parameter is not present.

Name	Type	Valid range	Description
Diffie-Hellman Parameter	Diffie-Hellman Parameter element	As defined in 9.4.2.312	Provides a public key for use in the OWE exchange. Present if OWE is being performed; otherwise it is not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.7.2.4 Effect of receipt

This primitive initiates an association procedure. In the case that a response is received from the responder STA, the MLME subsequently issues an MLME-ASSOCIATE.confirm primitive that reflects the results.

6.5.7.3 MLME-ASSOCIATE.confirm

6.5.7.3.1 Function

This primitive reports the results of an association attempt with a specified peer MAC entity that is in an AP or PCP.

6.5.7.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ASSOCIATE.confirm(
PeerSTAAddress
ResultCode,
CapabilityInformation,
AssociationID,

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity to which the association request was sent.
ResultCode	Enumeration	SUCCESS, REFUSED_REASON_UNSPECIFIED, REFUSED_NOT_AUTHENTICATED, REFUSED_CAPABILITIES_MISMATCH, REFUSED_EXTERNAL_REASON, REFUSED_AP_OUT_OF_MEMORY, REFUSED_BASIC_RATES_MISMATCH, REJECTED_EMERGENCY_SERVICES_ NOT_SUPPORTED, REFUSED_TEMPORARILY	Indicates the result of the MLME-ASSOCIATE.request primitive.
Capability-Information	Capability Information field	As defined in 9.4.1.4	Specifies the operational capabilities advertised by the AP or PCP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
AssociationID	Integer	Non-DMG: 1–2007 DMG: 1–254	If the association request result was SUCCESS, then AssociationID specifies the association ID value assigned by the AP or PCP. This parameter is not present if dot11S1GOptionImplemented is true.
EDCAParameter Set	EDCA Parameter Set element	As defined in 9.4.2.27	Specifies the EDCA parameter set that the STA should use. The parameter is present if dot11QosOptionImplemented is true; otherwise not present.
RCPI of Request	Integer	As defined in 9.4.2.36	Indicates the RCPI value contained in the received Association Response frame. This value represents the RCPI that the AP or PCP measured of the receiving PPDU containing the corresponding Association Request frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present.
RSNI of Request	Integer	As defined in 9.4.2.39	Indicates the RSNI value contained in the received Association Response frame. This value represents the RSNI that the AP or PCP measured of the received PPDU containing the corresponding Association Request frame. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present.
RCPI of Response	Integer	As defined in 9.4.2.36	The RCPI value represents the measured RCPI of the received PPDU containing the corresponding Association Response frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present.
RSNI of Response	Integer	As defined in 9.4.2.39	RSNI at the time the corresponding Association Response frame was receive. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present.
RMEnabledCapabilities	RM Enabled Capabilities element	As defined in 9.4.2.43	Specifies the RM enabled capabilities advertised by the AP or PCP. The element is present if dot11RadioMeasurementActivated is true; otherwise not present.

Name	Type	Valid range	Description
Content of FT Authentication elements	Sequence of elements	As defined in 13.4	The set of elements included in the initial mobility domain association response, as described in 13.4. Present if dot11FastBSSTransitionActivated is true; otherwise not present.
SupportedOperatingClasses	As defined in the Supported Operating Classes element	As defined in 9.4.2.52	Indicates the supported operating classes of the AP or PCP. This parameter is optionally present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true; otherwise not present.
Extended Capabilities	As defined in frame format	As defined in 9.4.2.25	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.
20/40 BSS Coexistence	As defined in frame format	As defined in 9.4.2.58	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistence-ManagementSupport is true.
TimeoutInterval	TIE, as defined in frame format	As defined in 9.4.2.47	This parameter is present when ResultCode is REFUSED_TEMPORARILY.
BSSMaxIdlePeriod	As defined in BSS Max Idle Period element	As defined in 9.4.2.77	Indicates the BSS max idle period parameters of the AP or PCP. This parameter is present if dot11WirelessManagementImplemented and dot11BSSMaxIdlePeriodIndicationByNonAPSTA are true, or dot11S1GOptionImplemented is true and the BSS Max Idle Period element was present in the Association Response frame; is not present otherwise.
TIMBroadcastResponse	As defined in TIM Broadcast Response element	As defined in 9.4.2.82	Specifies the service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and the TIM Broadcast Request element is present in the corresponding Association Request frame; this parameter is not present otherwise.
QoSMapSet	As defined in frame format	As defined in 9.4.2.93	Specifies the QoS Map the non-AP and non-PCP STA should use.
QMFPolicy	QMF Policy element	As defined in 9.4.2.118	The values from the QMF Policy element if such an element was present in the Association Response frame; otherwise, null.
DMG Capabilities	DMG Capabilities element	As defined in 9.4.2.126	Specifies the parameters within the DMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Multi-band local	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that identify and are supported by the local MAC entity. The parameter is present if OCT is being used and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that identify and are supported by the peer MAC entity. This parameter is present if OCT is being used and is absent otherwise.
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.151	Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise.
FILSHLPContainer	As defined in 9.4.2.182	As defined in 9.4.2.182	A set of elements containing encapsulated data of higher layer protocol (HLP) frames (e.g., DHCP message) that is transported in FILS association. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
FILSIPAddressAssignment	As defined in 9.4.2.183	As defined in 9.4.2.183	The IP address of a network layer entity associated with the STA. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
KeyDelivery	As defined in 9.4.2.184	As defined in 9.4.2.184	KDE(s) and the current GTK RSC. The parameter is present if dot11FILSActivated is true; otherwise not present.
S1G Sector Operation	S1G Sector Operation element	As defined in 9.4.2.194	Specifies the sectorization scheme, period, subperiod sector intervals, and sector training.
S1G Capabilities	As defined in frame format	As defined in 9.4.2.199	Specifies the parameters in the S1G Capabilities element that are supported by the AP. The parameter is present if dot11S1GOptionImplemented is true and the S1G Capabilities element is present in the Association Response frame received from the AP; otherwise not present.
AID Response	AID Response element	As defined in 9.4.2.193	Parameters describing an AID assignment. This parameter is present if dot11S1GOptionImplemented is true; otherwise not present.
TSF Timer Accuracy	TSF Timer Accuracy element	As defined in 9.4.2.202	Indicates the information about the TSF timer accuracy. The parameter is optionally present if dot11TSFTimerAccuracyImplemented is true; otherwise not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
TWT	TWT element	As defined in 9.4.2.198	Specifies the parameters in the TWT element. This parameter is optionally present if dot11TWTOptionActivated is true and the TWT element is present in the Association Request frame that elicited the Association Response frame or the TWT Requester Support field in the HE Capabilities element in the Association Request frame that elicited the Association Response frame is 1; otherwise not present.
Sectorized Group ID List	Sectorized Group ID List element	As defined in 9.4.2.210	Specifies the parameters in the Sectorized Group ID List element. This parameter is optionally present if dot11S1GSectorizationActivated is true; otherwise not present.
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.205	Indicates if a STA with dot11RelaySTAImplemented equal to true requests to operate as a relay (in a request) and an AP with dot11RelayAPImplemented equal to true requests/confirms operation as a relay. The parameter is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
S1GOperation	S1G Operation element	As defined in 9.4.2.211	The S1G Operation element is present if dot11S1GOptionImplemented is true; otherwise not present.
SSTOperation	SST Operation element	As defined in 9.4.2.213	The SST Operation element is optionally present if dot11SelectiveSubchannelTransmissionPermitted is true; otherwise not present.
S1GRelay	S1G Relay element	As defined in 9.4.2.203	Indicates the support of the relay operation by the STA transmitting the element.
HeaderCompression	Header Compression element	As defined in 9.4.2.212	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true; otherwise not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.218	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true; otherwise not present.
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.228	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.
GLK-GCR Parameter Set	GLK-GCR Parameter Set element	As defined in 9.4.2.233	Specifies the values from the GLK-GCR Parameter Set element if such an element was present in the Association Response frame, otherwise null.
MSCS Descriptor	As defined in the MSCS Descriptor element	As defined in 9.4.2.242	The parameters used to classify streams using the procedures defined in 11.25.3. Optionally present if dot11MSCSActivated is true; otherwise not present.
HE Capabilities	As defined in HE Capabilities element	As defined in 9.4.2.247	Specifies the parameters within the HE Capabilities element that are supported by the STA. The parameter is present if dot11HEOptionImplemented is true; otherwise, this parameter is not present.
HE 6 GHz Band Capabilities	As defined in HE 6 GHz Band Capabilities element	As defined in 9.4.2.262	Specifies the parameters within the HE 6 GHz Band Capabilities element that are supported by the STA. The parameter is present if dot11HE6GOptionImplemented is true; otherwise, this parameter is not present.
HE Operation	As defined in HE Operation element	As defined in 9.4.2.248	Provides additional information for operating the HE BSS. The parameter is present if dot11HEOptionImplemented is true; otherwise, it is not present.
UORA Parameter Set	As defined in UORA Parameter Set element	As defined in 9.4.2.249	Indicates the metrics of the OFDMA-based random access mechanism. The parameter is optionally present if dot11OFDMARandomAccessOptionImlemented is true; otherwise, it is not present.
MU EDCA Parameter Set	As defined in MU EDCA Parameter Set element	As defined in 9.4.2.250	Indicates MU EDCA parameters. The parameter is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
Spatial Reuse Parameter Set	As defined in Spatial Reuse Parameter Set element	As defined in 9.4.2.251	Indicates parameters needed by STAs when performing OBSS PD-based spatial reuse. The parameter is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
NDP Feedback Report Parameter Set	As defined in NDP Feedback Report Parameter Set element	As defined in 9.4.2.252	Indicates NDP Feedback Report parameter values. The parameter is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
BSS Color Change Announcement	As defined in BSS Color Change Announcement element	As defined in 9.4.2.253	Indicates information on BSS Color Change. The parameter is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
ESS Report	As defined in ESS Report element	As defined in 9.4.2.255	Provides information on ESS to assist BSS transition. The parameter is optionally present.
EDMG Capabilities	EDMG Capabilities element	As defined in 9.4.2.264	Specifies the parameters within the EDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
EDMG Operation	EDMG Operation element	As defined in 9.4.2.265	Specifies the parameters within the EDMG Operation element that are used in the BSS. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
QoS Triggered Unscheduled	QoS Triggered Unscheduled element	As defined in 9.4.2.277	Specifies the parameters within the QoS Triggered Unscheduled element that are supported by the MAC entity. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
Unsolicited Block Ack Extension	Unsolicited Block Ack Extension element	As defined in 9.4.2.278	Specifies the parameters within the Unsolicited Block Ack Extension element that are supported by the MAC entity. Optionally present if dot11UnsolicitedBAActivated is true and is absent otherwise.
TDD Slot Structure	TDD Slot Structure element	As defined in 9.4.2.280	Present if dot11TDDOptionImplemented is true and absent otherwise. Specifies the parameters within the TDD Slot Structure element corresponding to a target STA.
TDD Slot Schedule	TDD Slot Schedule element	As defined in 9.4.2.281	Present if dot11TDDOptionImplemented is true and absent otherwise. Specifies the TDD slot schedule of the STA.
WUR Capabilities	As defined in WUR Capabilities element	As defined in 9.4.2.290	Specifies the parameters within the WUR Capabilities element that are supported by the WUR AP. The parameter is present if dot11WUROptionImplemented is true; otherwise, this parameter is not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
WUR Operation	As defined in WUR Operation element	As defined in 9.4.2.291	Provides additional information for WUR operation. The parameter is present if dot11WUROptionImplemented is true; otherwise, this parameter is not present.
WUR Mode	As defined in WUR Mode element	As defined in 9.4.2.292	Specifies the proposed service parameters for the WUR Mode Setup request. The parameter is present if dot11WUROptionImplemented is true and the WUR Mode element is present in the Association Response frame received from the AP; otherwise, this parameter is not present.
Diffie-Hellman Parameter	Diffie-Hellman Parameter element	As defined in 9.4.2.312	Provides a public key for the AP from the Association Response frame that is used in the OWE exchange. Present if OWE is being performed; otherwise it is not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.7.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-ASSOCIATE.request primitive or receipt of an Association Response frame from the peer MAC entity to associate with a specified peer MAC entity that is in an AP or PCP.

6.5.7.3.4 Effect of receipt

The SME is notified of the results of the association procedure.

6.5.7.4 MLME-ASSOCIATE.indication

6.5.7.4.1 Function

This primitive indicates that a specific peer MAC entity is requesting association with the local MAC entity, which is in an AP or PCP.

6.5.7.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ASSOCIATE.indication(
                                    PeerSTAAddress,
                                    CapabilityInformation,
                                    BSSMaxIdlePeriod,
                                    ListenInterval,
                                    SSID,
                                    OperationalRateSet,
                                    BSSMembershipSelectorSet,
                                    RSN,
```

6.5.7.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of an association request from a specific peer MAC entity.

6.5.7.4.4 Effect of receipt

The SME is notified of the receipt of the association request.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity from which the association request was received.
Capability-Information	Capability Information field	As defined in 9.4.1.4	Specifies the operational capability definitions provided by the peer MAC entity as part of the association request.
BSSMaxIdlePeriod	BSS Max Idle Period element	As defined in 9.4.2.77	Indicates the preferred BSS max idle period parameters. This parameter is present if the BSS Max Idle Period element was present in the Association Request frame and if dot11WirelessManagementImplemented and dot11BSSMaxIdlePeriodIndicationByNonAP STA are true, or dot11S1GOptionImplemented is true; is not present otherwise.
ListenInterval	Integer	≥ 0	Specifies the listen interval provided by the peer MAC entity as part of the association request.
SSID	Octet string	0–32 octets	Specifies the SSID provided by the peer MAC entity as part of the association request.
OperationalRateSet	Non-DMG BSS: Set of integers DMG BSS: Set of numbers	Non-DMG BSS: 1-127 excluding values from Table 9-131 for each member of the set DMG BSS: 0-12, 9.1, 12.1-12.6, or 25-31, for each member of the set	The set of data rates (in units of 500 kb/s) that the STA that is requesting association is able to use for communication within the BSS. The STA is able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter. DMG BSS: The set of MCS indices that the AP or PCP uses for communication within the BSS.
BSSMembershipSelectorSet	Set of integers	A value from Table 9-131, for each member of the set	The set of features that the STA that is requesting association is able to use for communication
RSN	RSNE	As defined in 9.4.2.23	A description of the cipher suites and AKM suites selected by the STA.
QoSCapability	QoS Capability element	As defined in 9.4.2.33	Specifies the parameters within the QoSCapability that are supported by the peer MAC entity. The parameter is optionally present if dot11QosOptionImplemented is true; otherwise not present.
RCPI	Integer	As defined in 9.4.2.36	The RCPI value represents the measured RCPI of the received PPDU containing the corresponding Association Request frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present.
RSNI	Integer	As defined in 9.4.2.39	The RSNI value represents the measured RSNI of the received PPDU containing the corresponding Association Request frame. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present.
RMEnabledCapabilities	RM Enabled Capabilities element	As defined in 9.4.2.43	Specifies the RM enabled capabilities advertised by the AP or PCP. The element is present if dot11RadioMeasurementActivated is true; otherwise not present.

Name	Type	Valid range	Description
Content of FT Authentication elements	Sequence of elements	As defined in 13.4	The set of elements included in the initial mobility domain association, as described in 13.4. Present if dot11FastBSSTransitionActivated is true; otherwise not present.
SupportedOperating Classes	As defined in the Supported Operating Classes element	As defined in 9.4.2.52	Indicates the supported operating classes of the STA. This parameter is optionally present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true; otherwise not present.
DSERegisteredLocation	As defined in the DSE Registered Location element	As defined in 9.4.2.50	Indicates the DSE registered location including the dependent enablement identifier assigned by the enabling STA. This parameter is optionally present if dot11LCIDSERequired is true; otherwise not present.
HT Capabilities	As defined in frame format	As defined in 9.4.2.54	Specifies the parameters within the HT Capabilities element that are supported by the MAC entity. The parameter is optionally present if dot11HighThroughputOptionImplemented is true; otherwise not present.
Extended Capabilities	As defined in frame format	As defined in 9.4.2.25	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.
20/40 BSS Coexistence	As defined in frame format	As defined in 9.4.2.58	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistenceManagementSupport is true.
QoS Traffic Capability	As defined in the QoS Traffic Capability element	As defined in 9.4.2.76	Specifies the QoS traffic capability flags of the non-AP and non-PCP STA. This parameter is optionally present if dot11ACStationCountActivated is true and is not present otherwise.
TIMBroadcastRequest	As defined in TIM Broadcast Request element	As defined in 9.4.2.81	Specifies the proposed service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and is not present otherwise.
EmergencyServices	Boolean	true, false	Specifies the setting of the UESA field received from the non-AP and non-PCP STA, if an Interworking element was present in the Association Request frame. The parameter is present if dot11InterworkingServiceActivated is true; otherwise not present.
DMG Capabilities	DMG Capabilities element	As defined in 9.4.2.126	Specifies the parameters within the DMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise.
Multi-band local	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that identify and are supported by the local MAC entity. The parameter is present if OCT is being used and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that identify and are supported by the peer MAC entity. This parameter is present if OCT is being used and is absent otherwise.

Name	Type	Valid range	Description
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.151	Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise.
VHT Capabilities	As defined in VHT Capabilities element	As defined in 9.4.2.156	Specifies the parameters in the VHT Capabilities element that are supported by the STA. The parameter is present if dot11VHTOptionImplemented is true and the VHT Capabilities element is present in the Association Request frame received from the STA. The parameter is not present otherwise.
FILSHLPContainer	As defined in 9.4.2.182	As defined in 9.4.2.182	A set of elements containing encapsulated data of higher layer protocol frames (e.g., DHCP message) that is transported in FILS association. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
FILSIPAddressAssignment	As defined in 9.4.2.183	As defined in 9.4.2.183	An explicit request for an IP address. The request is for a new IP address or a specified IP address. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
AID Request	AID Request element	As defined in 9.4.2.192	Indicates the device characteristic of the non-AP STA requesting AID assignment. This parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
S1G Capabilities	As defined in frame format	As defined in 9.4.2.199	Specifies the parameters in the S1G Capabilities element that are supported by the STA. The parameter is present if dot11S1GOptionImplemented is true and the S1G Capabilities element is present in the Association Request frame received from the STA; otherwise not present.
TWT	TWT element	As defined in 9.4.2.198	Specifies the parameters in the TWT element. This parameter is optionally present if dot11TWTOptionActivated is true; otherwise not present.
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.205	Indicates if a STA with dot11RelaySTAImplemented equal to true requests to operate as a relay (in a request) and an AP with dot11RelayAPImplemented equal to true requests/confirms operation as a relay. The parameter is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
ReachableAddress	Reachable Address element	As defined in 9.4.2.204	The Reachable Address element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.218.	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true; otherwise not present.
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.228.	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.
GLK-GCR Parameter Set	GLK-GCR Parameter Set element	As defined in 9.4.2.233	Specifies the values from the GLK-GCR Parameter Set element if such an element was present in the Association Request frame, otherwise not present.
MSCS Descriptor	As defined in the MSCS Descriptor element	As defined in 9.4.2.242	The parameters used to classify streams using the procedures defined in 11.25.3. Optionally present if dot11MSCSActivated is true; otherwise not present.
HE Capabilities	As defined in HE Capabilities element	As defined in 9.4.2.247	Specifies the parameters within the HE Capabilities element that are supported by the peer STA. The parameter is present if dot11HEOptionImplemented is true and the HE Capabilities element is present in the Association Request frame received from the STA; otherwise, this parameter is not present.
HE 6 GHz Band Capabilities	As defined in HE 6 GHz Band Capabilities element	As defined in 9.4.2.262	Specifies the parameters within the HE 6 GHz Band Capabilities element that are supported by the peer STA. The parameter is present if dot11HE6GOptionImplemented is true and the HE 6 GHz Band Capabilities element is present in the Association Request frame received from the STA; otherwise, this parameter is not present.
Channel Switch Timing	As defined in the Channel Switch Timing element	As defined in 9.4.2.62	Provides information regarding the channel switch timing. The parameter is optionally present if dot11HESubchannelSelectiveTransmissionImplemented is true and the Channel Switch Timing element is present in the Association Request frame received from the STA; otherwise, it is not present.
UL MU Power Capabilities	As defined in UL MU Power Capabilities element	As defined in 9.4.2.263	Provides information regarding the UL MU power capabilities for the non-AP STA. The UL MU Power Capabilities element is present if dot11HEOptionImplemented is true and the HE Capabilities element and UL MU Power Capabilities element is present in the Association Request frame received from the STA; otherwise, it is not present.
EDMG Capabilities	EDMG Capabilities element	As defined in 9.4.2.264	Specifies the parameters within the EDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
QoS Triggered Unscheduled	QoS Triggered Unscheduled element	As defined in 9.4.2.277	Specifies the parameters within the QoS Triggered Unscheduled element that are supported by the MAC entity. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Unsolicited Block Ack Extension	Unsolicited Block Ack Extension element	As defined in 9.4.2.278	Specifies the parameters within the Unsolicited Block Ack Extension element that are supported by the MAC entity. Optionally present if dot11UnsolicitedBAActivated is true and is absent otherwise.
TDD Slot Schedule	TDD Slot Schedule element	As defined in 9.4.2.281	Present if dot11TDDOptionImplemented is true and absent otherwise. Specifies the TDD slot schedule of the STA.
WUR Capabilities	As defined in WUR Capabilities element	As defined in 9.4.2.290	Specifies the parameters within the WUR Capabilities element that are supported by the peer STA. The parameter is present if it is present in the Association Request frame received from the STA; otherwise, this parameter is not present.
WUR Mode	As defined in WUR Mode element	As defined in 9.4.2.292	Specifies the proposed service parameters for the WUR Mode Setup request. The parameter is present if dot11WUROptionImplemented is true and the WUR Mode element is present in the Association Request frame received from the STA; otherwise, this parameter is not present.
Diffie-Hellman Parameter	Diffie-Hellman Parameter element	As defined in 9.4.2.312	Provides a public key from the peer MAC entity for use in the OWE exchange. Present if OWE is being performed; otherwise it is not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.7.5 MLME-ASSOCIATE.response

6.5.7.5.1 Function

This primitive is used to send a response to a specific peer MAC entity that requested an association with the STA that issued this primitive, which is in an AP or PCP.

6.5.7.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ASSOCIATE.response(
PeerSTAAddress,
ResultCode,
AssociationID,
RCPI,
RSNI,
RMEnabledCapabilities,
Content of FT Authentication elements,
SupportedOperatingClasses,
TimeoutInterval,
TIMBroadcastResponse,
QoSMapSet,
Multi-band local,
Multi-band peer,
MMS,
FILSHLPContainer,

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity from which the association request was received.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, REFUSED_REASON_UNSPECIFIED, REFUSED_CAPABILITIES_MISMATCH, REFUSED_EXTERNAL_REASON, REFUSED_AP_OUT_OF_MEMORY, REFUSED_BASIC_RATES_MISMATCH, REJECTED_EMERGENCY_SERVICES_NOT_SUPPORTED, REFUSED_TEMPORARILY, GLK_NOT_AUTHORIZED	Indicates the result response to the association request from the peer MAC entity.
AssociationID	Integer	Non-DMG: 1–2007 DMG: 1–254	If the association request result was SUCCESS and dot11S1GOptionImplemented is not true, then AssociationID specifies the association ID value assigned to the peer MAC entity by the AP or PCP; otherwise not present.
RCPI	Integer	As defined in 9.4.2.36	The RCPI value represents the measured RCPI of the received PPDU containing corresponding Association Request frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present.
RSNI	Integer	As defined in 9.4.2.39	The RSNI value represents the measured RSNI of the received PPDU containing the corresponding Association Request frame. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present.
RMEnabledCapabilities	RM Enabled Capabilities element	As defined in 9.4.2.43	Specifies the RM enabled capabilities advertised by the AP or PCP. The element is present if dot11RadioMeasurementActivated is true; otherwise not present.
Content of FT Authentication elements	Sequence of elements	As defined in 13.4	The set of elements to be included in the initial mobility domain association response, as described in 13.4. Present if dot11FastBSSTransitionActivated is true; otherwise not present.
SupportedOperatingClasses	As defined in the Supported Operating Classes element	As defined in 9.4.2.52	Specifies the supported operating classes of the AP or PCP. This parameter is present if dot11ExtendedChannelSwitchActivated ot dot11OperatingClassesRequired is true; otherwise not present.
TimeoutInterval	TIE, as defined in frame format	As defined in 9.4.2.47	This parameter is present when ResultCode is REFUSED_TEMPORARILY.
TIMBroadcastResponse	As defined in TIM Broadcast Response element	As defined in 9.4.2.82	Specifies the service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and the TIM Broadcast Request element is present in the corresponding Association Request frame; this parameter is not present otherwise.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
QoSMapSet	As defined in frame format	As defined in 9.4.2.93	Specifies the QoS Map the non-AP and non-PCP STA should use.
Multi-band local	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are used to deliver messages to the peer MAC entity. The parameter is present if OCT is being used and is absent otherwise.
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.151	Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity, and negotiated for the association. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise.
FILSHLPContainer	As defined in 9.4.2.182	As defined in 9.4.2.182	A set of elements containing encapsulated data of higher layer protocol frames (e.g., a DHCP message) transported in FILS association. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
FILSIPAddressAssignment	As defined in 9.4.2.183	As defined in 9.4.2.183	The IP address of a network layer entity associated with the STA. The parameter is optionally present if dot11FILSActivated is true; otherwise not present
KeyDelivery	As defined in 9.4.2.184	As defined in 9.4.2.184	KDE(s) and the current GTK RSC. The parameter is present if dot11FILSActivated is true; otherwise not present.
S1G Sector Operation	S1G Sector Operation element	As defined in 9.4.2.194	Specifies the sectorization scheme, period, subperiod sector intervals, and sector training.
S1G Capabilities	As defined in frame format	As defined in 9.4.2.199	Specifies the parameters in the S1G Capabilities element that are supported by the AP. The parameter is present if dot11S1GOptionImplemented is true and the S1G Capabilities element is present in the Association Response frame received from the AP; otherwise not present.
AID Response	AID Response element	As defined in 9.4.2.193	Parameters describing an AID assignment. This parameter is present if dot11S1GOptionImplemented is true; otherwise not present.
TSF Timer Accuracy	TSF Timer Accuracy element	As defined in 9.4.2.202	Indicates the information about the TSF timer accuracy. The parameter is optionally present if dot11TSFTimerAccuracyImplemented is true; otherwise not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
TWT	TWT element	As defined in 9.4.2.198	Specifies the parameters in the TWT element. This parameter is optionally present if dot11TWTOptionActivated is true and the TWT element is present in the Association Request frame that elicited the Association Response frame or the TWT Requester Support field in the HE Capabilities element in the Association Request frame that elicited the Association Response frame is 1; otherwise not present.
Sectorized Group ID List	Sectorized Group ID List element	As defined in 9.4.2.210	Specifies the parameters in the Sectorized Group ID List element. This parameter is optionally present if dot11S1GSectorizationActivated is true; otherwise not present.
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.
S1GRelay	S1G Relay element	As defined in 9.4.2.203	Indicates the support of the relay operation by the STA transmitting the element.
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.205	Indicates if a STA with dot11RelaySTAImplemented equal to true requests to operate as a relay (in a request) and an AP with dot11RelayAPImplemented equal to true requests/confirms operation as a relay. The parameter is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
S1GOperation	S1G Operation element	As defined in 9.4.2.211	The S1G Operation element is present if dot11S1GOptionImplemented is true; otherwise not present.
HeaderCompression	Header Compression element	As defined in 9.4.2.212	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true; otherwise not present.
SSTOperation	SST Operation element	As defined in 9.4.2.213	The SST Operation element is optionally present if dot11SelectiveSubchannelTransmissionPermitted is true; otherwise not present.
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.218.	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true; otherwise not present.
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.228.	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
GLK-GCR Parameter Set	GLK-GCR Parameter Set element	As defined in 9.4.2.233	This parameter is present only if the AP selects GLK-GCR for group transmissions (either unsolicited retry or block ack) over the general link. Describes the parameters that define how GLK-GCR operates.
MSCS Descriptor	As defined in the MSCS Descriptor element	As defined in 9.4.2.242	The parameters used to classify streams using the procedures defined in 11.25.3. Optionally present if dot11MSCSActivated is true; otherwise not present.
HE Capabilities	As defined in HE Capabilities element	As defined in 9.4.2.247	Specifies the parameters within the HE Capabilities element that are supported by the STA. The parameter is present if dot11HEOptionImplemented is true; otherwise, this parameter is not present.
HE 6 GHz Band Capabilities	As defined in HE 6 GHz Band Capabilities element	As defined in 9.4.2.262	Specifies the parameters within the HE 6 GHz Band Capabilities element that are supported by the STA. The parameter is present if dot11HE6GOptionImplemented is true; otherwise, this parameter is not present.
HE Operation	As defined in HE Operation element	As defined in 9.4.2.248	Provides additional information for operating the HE BSS. The parameter is present if dot11HEOptionImplemented is true; otherwise, it is not present.
UORA Parameter Set	As defined in UORA Parameter Set element	As defined in 9.4.2.249	Indicates the metrics of the OFDMA-based random access mechanism. The parameter is optionally present if dot11OFDMARandomAccessOptionImlemented is true; otherwise, it is not present.
MU EDCA Parameter Set	As defined in MU EDCA Parameter Set element	As defined in 9.4.2.250	Indicates MU EDCA parameters. The parameter is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
Spatial Reuse Parameter Set	As defined in Spatial Reuse Parameter Set element	As defined in 9.4.2.251	Indicates parameters needed by STAs when performing OBSS PD-based spatial reuse. The parameter is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
NDP Feedback Report Parameter Set	As defined in NDP Feedback Report Parameter Set element	As defined in 9.4.2.252	Indicates NDP Feedback Report parameter values. The parameter is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
BSS Color Change Announcement	As defined in BSS Color Change Announcement element	As defined in 9.4.2.253	Indicates information on BSS Color Change. The parameter is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
ESS Report	As defined in ESS Report element	As defined in 9.4.2.255	Provides information on ESS to assist BSS transition. The parameter is optionally present.
EDMG Capabilities	EDMG Capabilities element	As defined in 9.4.2.264	Specifies the parameters within the EDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
EDMG Operation	EDMG Operation element	As defined in 9.4.2.265	Specifies the parameters within the EDMG Operation element that are used in the BSS. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
QoS Triggered Unscheduled	QoS Triggered Unscheduled element	As defined in 9.4.2.277	Specifies the parameters within the QoS Triggered Unscheduled element that are supported by the MAC entity. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
Unsolicited Block Ack Extension	Unsolicited Block Ack Extension	As defined in 9.4.2.278	Specifies the parameters within the Unsolicited Block Ack Extension element that are supported by the MAC entity. Optionally present if dot11UnsolicitedBAActivated is true and is absent otherwise.
TDDSlotStructure	TDD Slot Structure element	As defined in 9.4.2.280	Present if dot11TDDOptionImplemented is true and absent otherwise. Specifies the parameters within the TDD Slot Structure element corresponding to a target STA.
TDD Slot Schedule	TDD Slot Schedule element	As defined in 9.4.2.281	Present if dot11TDDOptionImplemented is true and absent otherwise. Specifies the TDD slot schedule of the STA.
WUR Capabilities	As defined in WUR Capabilities element	As defined in 9.4.2.290	Specifies the parameters within the WUR Capabilities element that are supported by the STA. The parameter is present if dot11WUROptionImplemented is true; otherwise, this parameter is not present.
WUR Operation	As defined in WUR Operation element	As defined in 9.4.2.291	Provides additional information for WUR operation. The parameter is present if dot11WUROptionImplemented is true; otherwise not present.
WUR Mode	As defined in WUR Mode element	As defined in 9.4.2.292	Specifies the proposed service parameters for the WUR Mode Setup request. The parameter is optionally present if dot11WUROptionImplemented is true; otherwise, this parameter is not present.
Diffie-Hellman Parameter	Diffie-Hellman Parameter element	As defined in 9.4.2.312	Provides a public key for the STA that issued this primitive, it is used in the OWE exchange. Present if OWE is being performed; otherwise it is not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

Additional parameters needed to perform the association response procedure are not included in the primitive parameter list since the MLME already has that data (maintained as internal state).

6.5.7.5.3 When generated

This primitive is generated by the SME of a STA that is in an AP or PCP as a response to an MLME-ASSOCIATE.indication primitive.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.7.5.4 Effect of receipt

This primitive initiates transmission of an AssociationResponse to the specific peer MAC entity that requested association.

6.5.8 Reassociate

6.5.8.1 Introduction

The following primitives describe how a STA becomes associated with another AP or PCP.

6.5.8.2 MLME-REASSOCIATE.request

6.5.8.2.1 Function

This primitive requests a change in association to a specified new peer MAC entity that is in an AP or PCP.

6.5.8.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-REASSOCIATE.request(
NewPeerSTAAddress,
ListenInterval,
Supported Channels
RSN,
QoSCapability,
Content of FT Authentication elements,
SupportedOperatingClasses,
SM Power Save,
QoSTrafficCapability,
TIMBroadcastRequest,
FMSRequest,
DMSRequest,
EmergencyServices,
Multi-band local,
Multi-band peer,
MMS,
FILSHLPContainer,
FILSIPAddressAssignment,
AID Request,
TWT,
Sectorized Group ID List,
MaxAwayDuration,
S1GRelayActivation,
ELOperation,
S1GRelay,
HeaderCompression,
ReachableAddress,
S1GOperation,
SSTOperation,
CDMG Capabilities,
CMMG Capabilities,
GLK-GCR Parameter Set,
MSCS Descriptor,

HE Capabilities,
HE 6 GHz Band Capabilities,
Channel Switch Timing,
UL MU Power Capabilities,
EDMG Capabilities,
QoS Triggered Unscheduled,
Unsolicited Block Ack Extension,
TDD Slot Schedule,
WUR Mode,
Diffie-Hellman Parameter,
VendorSpecificInfo
)

Name	Type	Valid range	Description
NewPeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity with which to perform the reassociation process.
ListenInterval	Integer	≥ 0	Specifies how often the STA transitions to the awake state to listen for the next Beacon frame,, if it enters power save mode.
Supported Channels	As defined in the Supported Channels element	As defined in the Supported Channels element	The list of channels in which the STA is capable of operating. Present if DFS functionality is required, as specified in 11.8; otherwise optionally present.
RSN	RSNE	As defined in 9.4.2.23	A description of the cipher suites and AKM suites selected by the STA.
QoSCapability	QoS Capability element	As defined in 9.4.2.33	Specifies the parameters within the QoS Capability element that are supported by the MAC entity. The parameter is present if dot11QosOptionImplemented is true; otherwise not present.
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements to be included in the third message of the FT authentication sequence, as described in 13.8.4. Present if dot11FastBSSTransitionActivated is true; otherwise not present.
SupportedOperating Classes	As defined in the Supported Operating Classes element	As defined in 9.4.2.52	Specifies the supported operating classes of the STA. This parameter is present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true; otherwise not present.
SM Power Save	Integer	As defined in Table 9-224	Indicates the spatial multiplexing power save mode that is in operation immediately after reassociation.
QoS Traffic Capability	As defined in the QoS Traffic Capability element	As defined in 9.4.2.76	Specifies the QoS traffic capability flags of the non-AP and non-PCP STA. This parameter is optionally present if dot11ACStationCountActivated is true and is not present otherwise.
TIMBroadcastRequest	As defined in TIM Broadcast Request element	As defined in 9.4.2.81	Specifies the proposed service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and is not present otherwise.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
FMSRequest	As defined in FMS Request element	As defined in 9.4.2.74	Specifies the proposed multicast parameters for FMS request procedure. This parameter is optionally present if dot11FMSActivated is true and is not present otherwise.
DMSRequest	Sequence of DMS Request elements	As defined in 9.4.2.86	Specifies the proposed multicast parameters for DMS Request. This parameter is optionally present if dot11DMSActivated is true and is not present otherwise.
EmergencyServices	Boolean	true, false	Specifies that the non-AP and non-PCP STA intends to reassociate for the purpose of unauthenticated access to emergency services. The parameter shall be present only if dot11InterworkingServiceActivated is true.
Multi-band local	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are used to deliver messages to the peer MAC entity. The parameter is present if OCT is being used and is absent otherwise.
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.151	Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise.
FILSHLPContainer	As defined in 9.4.2.182	As defined in 9.4.2.182	A set of elements containing encapsulated data of higher layer protocol frames (e.g., a DHCP message) that is transported in FILS association. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
FILSIPAddressAssignment	As defined in 9.4.2.183	As defined in 9.4.2.183	An explicit request for an IP address. The request may be for a new IP address or a specified IP address. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
AID Request	AID Request element	As defined in 9.4.2.192	Indicates the device characteristic of the non-AP STA requesting AID assignment. This parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
TWT	TWT element	As defined in 9.4.2.198	Specifies the parameters in the TWT element. This parameter is optionally present if dot11TWTOptionActivated is true; otherwise not present.
Sectorized Group ID List	Sectorized Group ID List element	As defined in 9.4.2.210	Specifies the parameters in the Sectorized Group ID List element. This parameter is optionally present if dot11S1GSectorizationActivated is true; otherwise not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.205	Indicates if a STA with dot11RelaySTAImplemented equal to true requests to operate as a relay (in a request) and an AP with dot11RelayAPImplemented equal to true requests/confirms operation as a relay. The parameter is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
ELOperation	EL Operation element	As defined in 9.4.2.209	The EL Operation element is optionally present if dot11S1GELOperationActivated is true; otherwise not present.
S1GRelay	S1G Relay element	As defined in 9.4.2.203	Specifies the parameters within the S1G Relay element that are supported by the MAC entity. The parameter is present if dot11RelaySTAImplemented is true; otherwise not present.
HeaderCompression	Header Compression element	As defined in 9.4.2.212	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true; otherwise not present.
ReachableAddress	Reachable Address element	As defined in 9.4.2.204	The Reachable Address element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
S1GOperation	S1G Operation element	As defined in 9.4.2.211	The S1G Operation element is present if dot11S1GOptionImplemented is true; otherwise not present.
SSTOperation	SST Operation element	As defined in 9.4.2.213	The SST Operation element is optionally present if dot11SelectiveSubchannelTransmissionPermitted is true; otherwise not present.
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.218	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true; otherwise not present.
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.228	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.
GLK-GCR Parameter Set	GLK-GCR Parameter Set element	As defined in 9.4.2.233	This parameter is present if dot11GLKGCRImplemented is true and not present otherwise. Specifies the GLK-GCR capabilities supported by the STA.
MSCS Descriptor	As defined in the MSCS Descriptor element	As defined in 9.4.2.242	The parameters used to classify streams using the procedures defined in 11.25.3. Optionally present if dot11MSCSActivated is true; otherwise not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
HE Capabilities	As defined in HE Capabilities element	As defined in 9.4.2.247	Specifies the parameters in the HE Capabilities element that are supported by the STA. The parameter is present if dot11HEOptionImplemented is true; otherwise, it is not present.
HE 6 GHz Band Capabilities	As defined in HE 6 GHz Band Capabilities element	As defined in 9.4.2.262	Specifies the parameters in the HE 6 GHz Band Capabilities element that are supported by the STA. The parameter is present if dot11HE6GOptionImplemented is true; otherwise, it is not present.
Channel Switch Timing	As defined in the Channel Switch Timing element	As defined in 9.4.2.62	Provides information regarding the channel switch timing. The parameter is optionally present if dot11HESubchannelSelectiveTransmissionImplemented is true; otherwise, it is not present.
UL MU Power Capabilities	As defined in UL MU Power Capabilities element	As defined in 9.4.2.263	Provides information regarding the UL MU power capabilities for the non-AP STA. The UL MU Power Capabilities element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
EDMG Capabilities	EDMG Capabilities element	As defined in 9.4.2.264	Specifies the parameters within the EDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
QoS Triggered Unscheduled	QoS Triggered Unscheduled element	As defined in 9.4.2.277	Specifies the parameters within the QoS Triggered Unscheduled element that are supported by the MAC entity. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
Unsolicited Block Ack Extension	Unsolicited Block Ack Extension	As defined in 9.4.2.278	Specifies the parameters within the Unsolicited Block Ack Extension element that are supported by the MAC entity. Optionally present if dot11UnsolicitedBAActivated is true and is absent otherwise.
TDD Slot Schedule	TDD Slot Schedule element	As defined in 9.4.2.281	Present if dot11TDDOptionImplemented is true and absent otherwise. Specifies the TDD slot availability of the STA.
WUR Mode	As defined in WUR Mode element	As defined in 9.4.2.292	Specifies the proposed service parameters for the WUR Mode Setup request. The parameter is optionally present if dot11WUROptionImplemented is true; otherwise, this parameter is not present.
Diffie-Hellman Parameter	Diffie-Hellman Parameter element	As defined in 9.4.2.312	Provides a public key for use in the OWE exchange. Present if OWE is being performed; otherwise it is not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

Additional parameters needed to perform the reassociation procedure are not included in the primitive parameter list since the MLME already has that data (maintained as internal state).

6.5.8.2.3 When generated

This primitive is generated by the SME for a STA to change association to a specified new peer MAC entity that is in an AP or PCP.

6.5.8.2.4 Effect of receipt

This primitive initiates a reassociation procedure. In the case that a response is received from the responder STA, the MLME subsequently issues an MLME-REASSOCIATE.confirm primitive that reflects the results.

6.5.8.3 MLME-REASSOCIATE.confirm

6.5.8.3.1 Function

This primitive reports the results of a reassociation attempt with a specified peer MAC entity that is in an AP or PCP.

6.5.8.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-REASSOCIATE.confirm(
PeerSTAAddress,
ResultCode,
CapabilityInformation,
AssociationID,
EDCAParameterSet,
RCPI of Request,
RSNI of Request,
RCPI of Response,
RSNI of Response,
RMEnabledCapabilities,
Content of FT Authentication elements,
SupportedOperatingClasses,
Extended Capabilities,
20/40 BSS Coexistence,
TimeoutInterval,
BSSMaxIdlePeriod,
TIMBroadcastResponse,
FMSResponse,
DMSResponse,
QoSMapSet,
QMFPolicy,
DMG Capabilities,
Multi-band local,
Multi-band peer,
MMS,
FILSHLPContainer,
FILSIPAddressAssignment,
KeyDelivery,
S1G Sector Operation,
S1G Capabilities,

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity to which the reassociation request was sent.
ResultCode	Enumeration	SUCCESS, REFUSED_REASON_UNSPECIFIED, REFUSED_NOT_AUTHENTICATED, REFUSED_CAPABILITIES_MISMATCH, REFUSED_EXTERNAL_REASON, REFUSED_AP_OUT_OF_MEMORY, REFUSED_BASIC_RATES_MISMATCH, REJECTED_EMERGENCY_SERVICES_NOT_SUPPORTED, REFUSED_TEMPORARILY	Indicates the result of the MLME-REASSOCIATE.request primitive.
Capability-Information	Capability Information field	As defined in 9.4.1.4	Specifies the operational capabilities advertised by the AP or PCP.
AssociationID	Integer	Non-DMG: 1–2007 DMG: 1–254	If the association request result was SUCCESS, then AssociationID specifies the association ID value assigned by the AP or PCP. This parameter is not present if dot11S1GOptionImplemented is true.
EDCAParameterSet	EDCA Parameter Set element	As defined in 9.4.2.27	Specifies the EDCA parameter set that the STA should use. The parameter is present if dot11QosOptionImplemented is true; otherwise not present.
RCPI of Request	Integer	As defined in 9.4.2.36	Indicates the RCPI value contained in the received Reassociation Response frame. This value represents the RCPI that the AP or PCP measured of the received PPDU containing the corresponding Reassociation Request frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present.
RSNI of Request	Integer	As defined in 9.4.2.39	Indicates the RSNI value contained in the received Reassociation Response frame. This value represents the RSNI that the AP or PCP measured of the received PPDU containing the corresponding Reassociation Request frame. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present.
RCPI of Response	Integer	As defined in 9.4.2.36	The RCPI value represents the measured RCPI of the received PPDU containing the corresponding Reassociation Response frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
RSNI of Response	Integer	As defined in 9.4.2.39	RSNI at the time the corresponding Reassociation Response frame was received. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present.
RMEnabledCapabilities	RM Enabled Capabilities element	As defined in 9.4.2.43	Specifies the RM enabled capabilities advertised by the AP or PCP. The element is present if dot11RadioMeasurementActivated is true; otherwise not present.
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements included in the fourth message of the FT authentication sequence, as described in 13.8.5. This includes an optional response to a resource request (RIC). Present if dot11FastBSSTransitionActivated is true; otherwise not present.
SupportedOperatingClasses	As defined in the Supported Operating Classes element	As defined in 9.4.2.52	Indicates the supported operating classes of the AP or PCP. This parameter is optionally present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true; otherwise not present.
Extended Capabilities	As defined in frame format	As defined in 9.4.2.25	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.
20/40 BSS Coexistence	As defined in frame format	As defined in 9.4.2.58	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistenceManagementSupport is true.
TimeoutInterval	TIE, as defined in frame format	As defined in 9.4.2.47	This parameter is present when ResultCode is REFUSED_TEMPORARILY.
BSSMaxIdlePeriod	BSS Max Idle Period element	As defined in 9.4.2.77	Indicates the BSS max idle period parameters of the AP or PCP. This parameter is present if dot11WirelessManagementImplemented and dot11BSSMaxIdlePeriodIndicationByNonAPSTA are true or dot11S1GOptionImplemented is true; otherwise not present.
TIMBroadcastResponse	As defined in TIM Broadcast Response element	As defined in 9.4.2.82	Specifies the service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and the TIM Broadcast Request element is present in the corresponding Association Request frame; this parameter is not present otherwise.
FMSResponse	As defined in FMS Response element	As defined in 9.4.2.75	Specifies the multicast parameters for FMS Response. This parameter is optionally present if dot11FMSActivated is true and the FMS Request element is present in the corresponding Association Request frame; this parameter is not present otherwise.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
DMSResponse	Sequence of DMS Response elements	As defined in 9.4.2.87	Specifies the multicast parameters for DMS Response. This parameter is optionally present if dot11DMSActivated is true and the DMS Request element is present in the corresponding Association Request frame; this parameter is not present otherwise.
QoSMapSet	As defined in frame format	As defined in 9.4.2.93	Specifies the QoS Map the non-AP and non-PCP STA should use.
QMFPolicy	QMF Policy element	As defined in 9.4.2.118	Describes the QMF policy of the AP. This parameter is present when dot11QMFActivated is true and is not present otherwise.
DMG Capabilities	DMG Capabilities element	As defined in 9.4.2.126	Specifies the parameters within the DMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise.
Multi-band local	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that identify and are supported by the local MAC entity. The parameter is present if OCT is being used and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that identify and are supported by the peer MAC entity. This parameter is present if OCT is being used and is absent otherwise.
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.151	Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise.
FILSHLPContainer	As defined in 9.4.2.182	As defined in 9.4.2.182	A set of elements containing encapsulated data of higher layer protocol frames (e.g., a DHCP message) that is transported in FILS association. The parameter is present if dot11FILSActivated is true; otherwise not present.
FILSIPAddressAssignment	As defined in 9.4.2.183	As defined in 9.4.2.183	The IP address assigned to the STA for higher layer communication. The parameter is present if dot11FILSActivated is true; otherwise not present.
KeyDelivery	As defined in 9.4.2.184	As defined in 9.4.2.184	KDE(s) and the current GTK RSC. The parameter is present if dot11FILSActivated is true; otherwise not present.
S1G Sector Operation	S1G Sector Operation element	As defined in 9.4.2.194	Specifies the sectorization scheme, period, subperiod sector intervals, sector training.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
S1G Capabilities	As defined in frame format	As defined in 9.4.2.199	Specifies the parameters in the S1G Capabilities element that are supported by the AP. The parameter is present if dot11S1GOptionImplemented is true and the S1G Capabilities element is present in the (Re)Association Response frame received from the AP; otherwise not present.
AID Response	AID Response element	As defined in 9.4.2.193	Parameters describing an AID assignment. This parameter is present if dot11S1GOptionImplemented is true; otherwise not present.
TSF Timer Accuracy	TSF Timer Accuracy element	As defined in 9.4.2.202	Indicates the information about the TSF Timer Accuracy. The parameter is optionally present if dot11TSFTimerAccuracyImplemented is true; otherwise not present.
TWT	TWT element	As defined in 9.4.2.198	Specifies the parameters in the TWT element. This parameter is optionally present if dot11TWTOptionActivated is true and the TWT element is present in the Reassociation Request frame that elicited the Reassociation Response frame or the TWT Requester Support field in the HE Capabilities element in the Reassociation Request frame that elicited the Reassociation Response frame is 1; otherwise not present.
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.205	Indicates if a STA with dot11RelaySTAImplemented equal to true requests to operate as a relay (in a request) and an AP with dot11RelayAPImplemented equal to true requests/confirms operation as a relay. The parameter is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
ELOperation	EL Operation element	As defined in 9.4.2.209	The EL Operation element is optionally present if dot11S1GELOperationActivated is true; otherwise not present.
S1GRelay	S1G Relay element	As defined in 9.4.2.203	Specifies the parameters within the S1G Relay element that are supported by the MAC entity. The parameter is present if dot11RelaySTAImplemented is true; otherwise not present.
HeaderCompression	Header Compression element	As defined in 9.4.2.212	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true; otherwise not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
S1GOperation	S1G Operation element	As defined in 9.4.2.211	The S1G Operation element is present if dot11S1GOptionImplemented is true; otherwise not present.
SectorizedGroupID List	Sectorized Group ID List element	As defined in 9.4.2.210	Specifies the parameters in the Sectorized Group ID List element. This parameter is optionally present if dot11S1GSectorizationActivated is true; otherwise not present.
SSTOperation	SST Operation element	As defined in 9.4.2.213	The SST Operation element is optionally present if dot11SelectiveSubchannelTransmissionPermitted is true; otherwise not present.
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.218	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true; otherwise not present.
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.228	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.
GLK-GCR Parameter Set	GLK-GCR Parameter Set element	As defined in 9.4.2.233	Specifies the values from the GLK-GCR Parameter Set element if such an element was present in the Reassociation Response frame, otherwise not present.
MSCS Descriptor	As defined in the MSCS Descriptor element	As defined in 9.4.2.242	The parameters used to classify streams using the procedures defined in 11.25.3. Optionally present if dot11MSCSActivated is true; otherwise not present.
HE Capabilities	As defined in HE Capabilities element	As defined in 9.4.2.247	Specifies the parameters within the HE Capabilities element that are supported by the STA. The parameter is present if dot11HEOptionImplemented is true; otherwise, this parameter is not present.
HE 6 GHz Band Capabilities	As defined in HE 6 GHz Band Capabilities element	As defined in 9.4.2.262	Specifies the parameters within the HE 6 GHz Band Capabilities element that are supported by the STA. The parameter is present if dot11HE6GOptionImplemented is true; otherwise, this parameter is not present.
HE Operation	As defined in HE Operation element	As defined in 9.4.2.248	Provides additional information for operating the HE BSS. The parameter is present if dot11HEOptionImplemented is true; otherwise, it is not present.
UORA Parameter Set	As defined in UORA Parameter Set element	As defined in 9.4.2.249	Indicates the metrics of the OFDMA-based random access mechanism. The parameter is optionally present if dot11OFDMARandomAccessOptionImlemented is true; otherwise, it is not present.
MU EDCA Parameter Set	As defined in MU EDCA Parameter Set element	As defined in 9.4.2.250	Indicates MU EDCA parameters. The parameter is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Spatial Reuse Parameter Set	As defined in Spatial Reuse Parameter Set element	As defined in 9.4.2.251	Indicates parameters needed by STAs when performing OBSS PD-based spatial reuse. The parameter is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
NDP Feedback Report Parameter Set	As defined in NDP Feedback Report Parameter Set element	As defined in 9.4.2.252	Indicates NDP Feedback Report parameter values. The parameter is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
BSS Color Change Announcement	As defined in BSS Color Change Announcement element	As defined in 9.4.2.253	Indicates information on BSS Color Change. The parameter is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
ESS Report	As defined in ESS Report element	As defined in 9.4.2.255	Provides information on ESS to assist BSS transition. The parameter is optionally present.
EDMG Capabilities	EDMG Capabilities element	As defined in 9.4.2.264	Specifies the parameters within the EDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
EDMG Operation	EDMG Operation element	As defined in 9.4.2.265	Specifies the parameters within the EDMG Operation element that are used in the BSS. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
QoS Triggered Unscheduled	QoS Triggered Unscheduled element	As defined in 9.4.2.277	Specifies the parameters within the QoS Triggered Unscheduled element that are supported by the MAC entity. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
Unsolicited Block Ack Extension	Unsolicited Block Ack Extension element	As defined in 9.4.2.278	Specifies the parameters within the Unsolicited Block Ack Extension element that are supported by the MAC entity. Optionally present if dot11UnsolicitedBAActivated is true and is absent otherwise.
TDD Slot Structure	TDD Slot Structure element	As defined in 9.4.2.280	Present if dot11TDDOptionImplemented is true and absent otherwise. Specifies the parameters within the TDD Slot Structure element corresponding to a target STA.
TDD Slot Schedule	TDD Slot Schedule element	As defined in 9.4.2.281	Present if dot11TDDOptionImplemented is true and absent otherwise. Specifies the TDD slot schedule of the STA.
WUR Capabilities	As defined in WUR Capabilities element	As defined in 9.4.2.290	Specifies the parameters within the WUR Capabilities element that are supported by the WUR AP. The parameter is present if dot11WUROptionImplemented is true; otherwise, this parameter is not present.

Name	Type	Valid range	Description
WUR Operation	As defined in WUR Operation element	As defined in 9.4.2.291	Provides additional information for WUR operation. The parameter is present if dot11WUROptionImplemented is true; otherwise not present.
WUR Mode	As defined in WUR Mode element	As defined in 9.4.2.292	Specifies the proposed service parameters for the WUR Mode Setup request. The parameter is present if dot11WUROptionImplemented is true and the WUR Mode element is present in the Reassociation Response frame received from the AP; otherwise, this parameter is not present.
Diffie-Hellman Parameter	Diffie-Hellman Parameter element	As defined in 9.4.2.312	Provides a public key for the AP from the Reassociation Response frame that is used in the OWE exchange. Present if OWE is being performed; otherwise it is not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.8.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-REASSOCIATE.request primitive to reassociate with a specified peer MAC entity that is in an AP or PCP.

6.5.8.3.4 Effect of receipt

The SME is notified of the results of the reassociation procedure.

6.5.8.4 MLME-REASSOCIATE.indication

6.5.8.4.1 Function

This primitive indicates that a specific peer MAC entity is requesting reassociation with the local MAC entity, which is in an AP or PCP.

6.5.8.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-REASSOCIATE.indication(
                                    PeerSTAAddress,
                                    CurrentAPAddress,
                                    CapabilityInformation,
                                    BSSMaxIdlePeriod,
                                    ListenInterval,
                                    SSID,
                                    OperationalRateSet,
                                    BSSMembershipSelectorSet,
                                    RSN,
                                    QoSCapability,
                                    RCPI,
                                    RSNI,
                                    RMEnabledCapabilities,
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity from which the reassociation request was received.
CurrentAPAddress	MAC address	Any valid individual address	Specifies the address of the AP or PCP with which the peer STA is currently associated.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Capability-Information	Capability Information field	As defined in 9.4.1.4	Specifies the operational capability definitions provided by the peer MAC entity as part of the reassociation request.
BSSMaxIdlePeriod	BSS Max Idle Period element	As defined in 9.4.2.77	Indicates the preferred BSS max idle period parameters. This parameter is present if the BSS Max Idle Period element was present in the Reassociation Request frame and if dot11WirelessManagementImplemented and dot11BSSMaxIdlePeriodIndicationByNonAPSTA are true, or dot11S1GOptionImplemented is true; is not present otherwise.
ListenInterval	Integer	≥ 0	Specifies the listen interval provided by the peer MAC entity as part of the reassociation request.
SSID	Octet string	0–32 octets	Specifies the desired SSID provided by the peer MAC entity as part of the reassociation request.
OperationalRateSet	Non-DMG BSS: Set of integers DMG BSS: Set of numbers	Non-DMG BSS: 1–127 excluding values from Table 9-131 for each member of the set DMG BSS: 0–12, 9.1, 12.1–12.6, or 25–31, for each member of the set	The set of data rates (in units of 500 kb/s) that the STA that is requesting association is able to use for communication within the BSS. The STA is able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter. DMG BSS: The set of MCS indices that the AP or PCP uses for communication within the BSS.
BSSMembershipSelectorSet	Set of integers	A value from Table 9-131, for each member of the set	The set of features that the STA that is requesting association is able to use for communication.
RSN	RSNE	As defined in 9.4.2.23	A description of the cipher suites and AKM suites selected by the STA.
QoSCapability	QoS Capability element	As defined in 9.4.2.33	Specifies the parameters within the QoS Capability that are supported by the peer MAC entity. The parameter is present if dot11QosOptionImplemented is true; otherwise not present.
RCPI	Integer	As defined in 9.4.2.36	The RCPI value represents the measured RCPI of the received PPDU containing the corresponding Reassociation Request frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present.
RSNI	Integer	As defined in 9.4.2.39	The RSNI value represents the measured RSNI of the received PPDU containing the corresponding Reassociation Request frame. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present.
RMEnabledCapabilities	RM Enabled Capabilities element	As defined in 9.4.2.43	Specifies the RM enabled capabilities advertised by the AP or PCP. The element is present if dot11RadioMeasurementActivated is true; otherwise not present.

Name	Type	Valid range	Description
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements included in the third message of the FT authentication sequence, as described in 13.8.4. Present if dot11FastBSSTransitionActivated is true; otherwise not present.
SupportedOperatingClasses	As defined in the Supported Operating Classes element	As defined in 9.4.2.52	Indicates the supported operating classes of the STA. This parameter is optionally present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true; otherwise not present.
DSERegisteredLocation	As defined in the DSE Registered Location element	As defined in 9.4.2.50	Indicates the DSE registered location including the dependent enablement identifier assigned by the enabling STA. This parameter is optionally present if dot11LCIDSERequired is true; otherwise not present.
HT Capabilities	As defined in frame format	As defined in 9.4.2.54	Specifies the parameters within the HT Capabilities element that are supported by the MAC entity. The parameter is optionally present if dot11HighThroughputOptionImplemented is true.
Extended Capabilities	As defined in frame format	As defined in 9.4.2.25	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.
20/40 BSS Coexistence	As defined in frame format	As defined in 9.4.2.58	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistenceManagementSupport is true.
QoS Traffic Capability	As defined in the QoS Traffic Capability element	As defined in 9.4.2.76	Specifies the QoS traffic capability flags of the non-AP and non-PCP STA. This parameter is optionally present if dot11ACStationCountActivated is true and is not present otherwise.
TIMBroadcastRequest	As defined in TIM Broadcast Request element	As defined in 9.4.2.81	Specifies the proposed service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and is not present otherwise.
FMSRequest	As defined in FMS Request element	As defined in 9.4.2.74	Specifies the proposed multicast parameters for the FMS request procedure. This parameter is optionally present if dot11FMSActivated is true and is not present otherwise.
DMSRequest	Sequence of DMS Request elements	As defined in 9.4.2.86	Specifies the proposed multicast parameters for DMS Request. This parameter is optionally present if dot11DMSActivated is true and is not present otherwise.
EmergencyServices	Boolean	true, false	Specifies the setting of the UESA field received from the non-AP and non-PCP STA, if an Interworking element was present in the Reassociation Request frame. The parameter is present if dot11InterworkingServiceActivated is true; otherwise not present.

Name	Type	Valid range	Description
DMG Capabilities	DMG Capabilities element	As defined in 9.4.2.126	Specifies the parameters within the DMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise.
Multi-band local	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that identify the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are supported by the peer MAC entity. This parameter is present if OCT is being used and is absent otherwise.
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.151	Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise.
VHT Capabilities	As defined in VHT Capabilities element	As defined in 9.4.2.156	Specifies the parameters in the VHT Capabilities element that are supported by the STA. The parameter is present if dot11VHTOptionImplemented is true and the VHT Capabilities element is present in the Reassociation Request frame received from the STA. The parameter is not present otherwise.
FILSHLPContainer	As defined in 9.4.2.182	As defined in 9.4.2.182	A set of elements containing encapsulated data of higher layer protocol frames (e.g., a DHCP message) that is transported in FILS reassociation. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
FILSIPAddressAssignment	As defined in 9.4.2.183	As defined in 9.4.2.183	An explicit request for an IP address. The request may be for a new IP address or a specified IP address. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
AID Request	AID Request element	As defined in 9.4.2.192	Indicates the device characteristic of the non-AP STA requesting AID assignment. This parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
S1G Capabilities	As defined in frame format	As defined in 9.4.2.199	Specifies the parameters in the S1G Capabilities element that are supported by the STA. The parameter is present if dot11S1GOptionImplemented is true and the S1G Capabilities element is present in the Reassociation Request frame received from the STA; otherwise not present.
TWT	TWT element	As defined in 9.4.2.198	Specifies the parameters in the TWT element. This parameter is optionally present if dot11TWTOptionActivated is true; otherwise not present.

Name	Type	Valid range	Description
Sectorized Group ID List	Sectorized Group ID List element	As defined in 9.4.2.210	Specifies the parameters in the Sectorized Group ID List element. This parameter is optionally present if dot11S1GSectorizationActivated is true; otherwise not present.
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.205	Indicates if a STA with dot11RelaySTAImplemented equal to true requests to operate as a relay (in a request) and an AP with dot11RelayAPImplemented equal to true requests/confirms operation as a relay. The parameter is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
ELOperation	EL Operation element	As defined in 9.4.2.209	The EL Operation element is optionally present if dot11S1GELOperationActivated is true; otherwise not present.
S1GRelay	S1G Relay element	As defined in 9.4.2.203	Specifies the parameters within the S1G Relay element that are supported by the MAC entity. The parameter is present if dot11RelaySTAImplemented is true; otherwise not present.
HeaderCompression	Header Compression element	As defined in 9.4.2.212	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true; otherwise not present.
ReachableAddress	Reachable Address element	As defined in 9.4.2.204	The Reachable Address element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
S1GOperation	S1G Operation element	As defined in 9.4.2.211	The S1G Operation element is present if dot11S1GOptionImplemented is true; otherwise not present.
SSTOperation	SST Operation element	As defined in 9.4.2.213	The SST Operation element is optionally present if dot11SelectiveSubchannelTransmissionPermitted is true; otherwise not present.
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.218	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true; otherwise not present.
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.228	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.
GLK-GCR Parameter Set	GLK-GCR Parameter Set element	As defined in 9.4.2.233	The GLK-GCR Parameter Set element from the received Reassociation Request frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
MSCS Descriptor	As defined in the MSCS Descriptor element	As defined in 9.4.2.242	The parameters used to classify streams using the procedures defined in 11.25.3. Optionally present if dot11MSCSActivated is true; otherwise not present.
HE Capabilities	As defined in HE Capabilities element.	As defined in 9.4.2.247	Specifies the parameters within the HE Capabilities element that are supported by the peer STA. The parameter is present if dot11HEOptionImplemented is true and the HE Capabilities element is present in the Reassociation Request frame received from the STA; otherwise, this parameter is not present.
HE 6 GHz Band Capabilities	As defined in HE 6 GHz Band Capabilities element	As defined in 9.4.2.262	Specifies the parameters within the HE 6 GHz Band Capabilities element that are supported by the STA. The parameter is present if dot11HE6GOptionImplemented is true and the HE 6 GHz Band Capabilities element is present in the Reassociation Request frame received from the STA; otherwise, this parameter is not present.
Channel Switch Timing	As defined in the Channel Switch Timing element	As defined in 9.4.2.62	Provides information regarding the channel switch timing. The parameter is optionally present if dot11HESubchannelSelectiveTransmissionImplemented is true and the Channel Switch Timing element is present in the Reassociation Request frame received from the STA; otherwise, it is not present.
UL MU Power Capabilities	As defined in UL MU Power Capabilities element	As defined in 9.4.2.263	Provides information regarding the UL MU power capabilities for the non-AP STA. The UL MU Power Capabilities element is present if dot11HEOptionImplemented is true and the HE Capabilities element and UL MU Power Capabilities element is present in the Association Request frame received from the STA; otherwise, it is not present.
EDMG Capabilities	EDMG Capabilities element	As defined in 9.4.2.264	Specifies the parameters within the EDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
QoS Triggered Unscheduled	QoS Triggered Unscheduled element	As defined in 9.4.2.277	Specifies the parameters within the QoS Triggered Unscheduled element that are supported by the MAC entity. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
Unsolicited Block Ack Extension	Unsolicited Block Ack Extension element	As defined in 9.4.2.278	Specifies the parameters within the Unsolicited Block Ack Extension element that are supported by the MAC entity. Optionally present if dot11UnsolicitedBAActivated is true and is absent otherwise.
TDD Slot Schedule	TDD Slot Schedule element	As defined in 9.4.2.281	Present if dot11TDDOptionImplemented is true and absent otherwise. Specifies the TDD slot schedule of the STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
WUR Capabilities	As defined in WUR Capabilities element	As defined in 9.4.2.290	Specifies the parameters within the WUR Capabilities element that are supported by the peer STA. The parameter is present if it is present in the Association Request frame received from the STA; otherwise, this parameter is not present.
WUR Mode	As defined in WUR Mode element	As defined in 9.4.2.292	Specifies the proposed service parameters for the WUR Mode Setup request. The parameter is present if dot11WUROptionImplemented is true and the WUR Mode element is present in the Reassociation Request frame received from the STA; otherwise, this parameter is not present.
Diffie-Hellman Parameter	Diffie-Hellman Parameter element	As defined in 9.4.2.312	Provides a public key from the peer MAC entity for use in the OWE exchange. Present if OWE is being performed; otherwise it is not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.8.4.3 When generated

This primitive is generated by the MLME as a result of the establishment of a reassociation with a specific peer MAC entity that resulted from a reassociation procedure that was initiated by that specific peer MAC entity.

6.5.8.4.4 Effect of receipt

The SME is notified of the establishment of the reassociation.

6.5.8.5 MLME-REASSOCIATE.response

6.5.8.5.1 Function

This primitive is used to send a response to a specific peer MAC entity that requested a reassociation with the STA that issued this primitive, which is in an AP or PCP.

6.5.8.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-REASSOCIATE.response(
PeerSTAAddress,
ResultCode,
AssociationID,
RCPI,
RSNI,
RMEnabledCapabilities,
Content of FT Authentication elements,
SupportedOperatingClasses,
TimeoutInterval,
TIMBroadcastResponse,
FMSResponse,

Copyright © 2025 IEEE. All rights reserved.

WUR Mode,
Diffie-Hellman Parameter,
VendorSpecificInfo
)

Additional parameters needed to perform the reassociation response procedure are not included in the primitive parameter list since the MLME already has that data (maintained as internal state).

6.5.8.5.3 When generated

This primitive is generated by the SME of a STA that is in an AP or PCP as a response to an MLME-REASSOCIATE.indication primitive.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity from which the reassociation request was received.
ResultCode	Enumeration	SUCCESS, REFUSED_REASON_UNSPECIFIED, REFUSED_CAPABILITIES_MISMATCH, REFUSED_EXTERNAL_REASON, REFUSED_AP_OUT_OF_MEMORY, REFUSED_BASIC_RATES_MISMATCH, REJECTED_EMERGENCY_SERVICES_NOT_SUPPORTED, REFUSED_TEMPORARILY	Indicates the result response to the reassociation request from the peer MAC entity.
AssociationID	Integer	Non-DMG: 1–2007 DMG: 1–254	If the reassociation request result was SUCCESS, then AssociationID specifies the association ID value assigned to the peer MAC entity by the AP or PCP. This parameter is not present if dot11S1GOptionImplemented is true.
RCPI	Integer	As defined in 9.4.2.36	The RCPI value represents the measured RCPI of the received PPDU containing the corresponding Reassociation Request frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present.
RSNI	Integer	As defined in 9.4.2.39	The RSNI value represents the measured RSNI of the received PPDU containing the corresponding Reassociation Request frame. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present.
RMEnabledCapabilities	RM Enabled Capabilities element	As defined in 9.4.2.43	Specifies the RM enabled capabilities advertised by the AP or PCP. The element is present if dot11RadioMeasurementActivated is true; otherwise not present.
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements to be included in the fourth message of the FT authentication sequence, as described in 13.8.5. This includes an optional response to a resource request (RIC). Present if dot11FastBSSTransitionActivated is true; otherwise not present.
SupportedOperatingClasses	As defined in the Supported Operating Classes element	As defined in 9.4.2.52	Specifies the supported operating classes of the AP or PCP. This parameter is present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true; otherwise not present.
TimeoutInterval	TIE, as defined in frame format	As defined in 9.4.2.47	This parameter is present when ResultCode is REFUSED_TEMPORARILY.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
TIMBroadcastResponse	As defined in TIM Broadcast Response element	As defined in 9.4.2.82	Specifies the service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and the TIM Broadcast Request element is present in the corresponding Association Request frame; this parameter is not present otherwise.
FMSResponse	As defined in FMS Response element	As defined in 9.4.2.75	Specifies the multicast parameters for FMS Response. This parameter is optionally present if dot11FMSActivated is true and the FMS Request element is present in the corresponding Association Request frame; this parameter is not present otherwise.
DMSResponse	Sequence of DMS Response elements	As defined in 9.4.2.87	Specifies the multicast parameters for DMS Response. This parameter is optionally present if dot11DMSActivated is true and the DMS Request element is present in the corresponding Association Request frame; this parameter is not present otherwise.
QoSMapSet	As defined in frame format	As defined in 9.4.2.93	Specifies the QoS Map the non-AP and non-PCP STA should use.
Multi-band local	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are used to deliver messages to the peer MAC entity. The parameter is present if OCT is being used and is absent otherwise.
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.151	Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity, and negotiated for the association. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise.
FILSHLPContainer	As defined in 9.4.2.182	As defined in 9.4.2.182	A set of elements containing encapsulated data of higher layer protocol frames (e.g., a DHCP message) that is transported in FILS reassociation. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
FILSIPAddressAssignment	As defined in 9.4.2.183	As defined in 9.4.2.183	The IP address of a network layer entity associated with the STA. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
KeyDelivery	As defined in 9.4.2.184	As defined in 9.4.2.184	KDE(s) and the current GTK RSC. The parameter is present if dot11FILSActivated is true; otherwise not present.

Name	Type	Valid range	Description
S1G Sector Operation	S1G Sector Operation element	As defined in 9.4.2.194	Specifies the sectorization scheme, period, subperiod sector intervals, and sector training.
S1G Capabilities	As defined in frame format	As defined in 9.4.2.199	Specifies the parameters in the S1G Capabilities element that are supported by the STA. The parameter is present if dot11S1GOptionImplemented is true; otherwise not present.
AID Response	AID Response element	As defined in 9.4.2.193	Parameters describing an AID assignment. This parameter is present if dot11S1GOptionImplemented is true; otherwise not present.
TSF Timer Accuracy	TSF Timer Accuracy element	As defined in 9.4.2.202	Indicates the information about the TSF timer accuracy. The parameter is optionally present if dot11TSFTimerAccuracyImplemented is true; otherwise not present.
TWT	TWT element	As defined in 9.4.2.198	Specifies the parameters in the TWT element. This parameter is optionally present if dot11TWTOptionActivated is true and the TWT element is present in the Reassociation Request frame that elicited the Reassociation Response frame or the TWT Requester Support field in the HE Capabilities element in the Reassociation Request frame that elicited the Reassociation Response frame is 1; otherwise not present.
Sectorized Group ID List	Sectorized Group ID List element	As defined in 9.4.2.210	Specifies the parameters in the Sectorized Group ID List element. This parameter is optionally present if dot11S1GSectorizationActivated is true; otherwise not present.
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.
S1GRelay	S1G Relay element	As defined in 9.4.2.203	Indicates the support of the relay operation by the STA transmitting the element.
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.205	Indicates if a STA with dot11RelaySTAImplemented equal to true requests to operate as a relay (in a request) and an AP with dot11RelayAPImplemented equal to true requests/confirms operation as a relay. The parameter is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
S1GOperation	S1G Operation element	As defined in 9.4.2.211	Provides additional information for operating the S1G BSS. The parameter is present if dot11S1GOptionImplemented is true; otherwise not present.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
HeaderCompression	Header Compression element	As defined in 9.4.2.212	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true; otherwise not present.
SSTOperation	SST Operation element	As defined in 9.4.2.213	The SST Operation element is optionally present if dot11SelectiveSubchannelTransmissionPermitted is true; otherwise not present.
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.218	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true; otherwise not present.
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.228.	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.
GLK-GCR Parameter Set	GLK-GCR Parameter Set element	As defined in 9.4.2.233	This parameter is present only if the AP selects GLK-GCR for group transmissions (either unsolicited retry or block ack) over the general link. Describes the parameters that define how GLK-GCR operates.
MSCS Descriptor	As defined in the MSCS Descriptor element	As defined in 9.4.2.242	The parameters used to classify streams using the procedures defined in 11.25.3. Optionally present if dot11MSCSActivated is true; otherwise not present.
HE Capabilities	As defined in HE Capabilities element	As defined in 9.4.2.247	Specifies the parameters within the HE Capabilities element that are supported by the STA. The parameter is present if dot11HEOptionImplemented is true; otherwise, this parameter is not present.
HE 6 GHz Band Capabilities	As defined in HE 6 GHz Band Capabilities element	As defined in 9.4.2.262	Specifies the parameters within the HE 6 GHz Band Capabilities element that are supported by the STA. The parameter is present if dot11HE6GOptionImplemented is true; otherwise, this parameter is not present.
HE Operation	As defined in HE Operation element	As defined in 9.4.2.248	Provides additional information for operating the HE BSS. The parameter is present if dot11HEOptionImplemented is true; otherwise, it is not present.
UORA Parameter Set	As defined in UORA Parameter Set element	As defined in 9.4.2.249	Indicates the metrics of the OFDMA-based random access mechanism. The parameter is optionally present if dot11OFDMARandomAccessOptionImlemented is true; otherwise, it is not present.
MU EDCA Parameter Set	As defined in MU EDCA Parameter Set element	As defined in 9.4.2.250	Indicates MU EDCA parameters. The parameter is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Spatial Reuse Parameter Set	As defined in Spatial Reuse Parameter Set element	As defined in 9.4.2.251	Indicates parameters needed by STAs when performing OBSS PD-based spatial reuse. The parameter is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
NDP Feedback Report Parameter Set	As defined in NDP Feedback Report Parameter Set element	As defined in 9.4.2.252	Indicates NDP Feedback Report parameter values. The parameter is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
BSS Color Change Announcement	As defined in BSS Color Change Announcement element	As defined in 9.4.2.253	Indicates information on BSS Color Change. The parameter is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
ESS Report	As defined in ESS Report element	As defined in 9.4.2.255	Provides information on ESS to assist BSS transition. The parameter is optionally present.
EDMG Capabilities	EDMG Capabilities element	As defined in 9.4.2.264	Specifies the parameters within the EDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
EDMG Operation	EDMG Operation element	As defined in 9.4.2.265	Specifies the parameters within the EDMG Operation element that are used in the BSS. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
QoS Triggered Unscheduled	QoS Triggered Unscheduled element	As defined in 9.4.2.277	Specifies the parameters within the QoS Triggered Unscheduled element that are supported by the MAC entity. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
Unsolicited Block Ack Extension	Unsolicited Block Ack Extension	As defined in 9.4.2.278	Specifies the parameters within the Unsolicited Block Ack Extension element that are supported by the MAC entity. Optionally present if dot11UnsolicitedBAActivated is true and is absent otherwise.
TDDSlotStructure	TDD Slot Structure element	As defined in 9.4.2.280	Present if dot11TDDOptionImplemented is true and absent otherwise. Specifies the parameters within the TDD Slot Structure element corresponding to a target STA.
TDD Slot Schedule	TDD Slot Schedule element	As defined in 9.4.2.281	Present if dot11TDDOptionImplemented is true and absent otherwise. Specifies the TDD slot schedule of the STA.
WUR Capabilities	As defined in WUR Capa-bilities ele-ment	As defined in 9.4.2.290	Specifies the parameters within the WUR Capabilities element that are supported by the STA. The parameter is present if dot11WUROptionImplemented is true; otherwise, this parameter is not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
WUR Operation	As defined in WUR Operation element	As defined in 9.4.2.291	Provides additional information for WUR operation. The parameter is present if dot11WUROptionImplemented is true; otherwise not present.
WUR Mode	As defined in WUR Mode element	As defined in 9.4.2.292	Specifies the proposed service parameters for the WUR Mode Setup request. The parameter is optionally present if dot11WUROptionImplemented is true; otherwise, this parameter is not present.
Diffie-Hellman Parameter	Diffie-Hellman Parameter element	As defined in 9.4.2.312	Provides a public key for the STA that issued this primitive, it is used in the OWE exchange. Present if OWE is being performed; otherwise it is not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.8.5.4 Effect of receipt

This primitive initiates transmission of a response to the specific peer MAC entity that requested reassociation.

6.5.9 Disassociate

6.5.9.1 MLME-DISASSOCIATE.request

6.5.9.1.1 Function

This primitive requests disassociation with a specified peer MAC entity.

6.5.9.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DISASSOCIATE.request(
                                PeerSTAAddress,
                                ReasonCode,
                                VendorSpecificInfo
                                )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address, or the broadcast address	Specifies the address of the peer MAC entity or entities with which to perform the disassociation process.
ReasonCode	Reason Code field	As defined in 9.4.1.7	Specifies the reason for initiating the disassociation procedure.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.9.1.3 When generated

This primitive is generated by the SME for a STA to disassociate from a STA with which it has an association.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.9.1.4 Effect of receipt

This primitive initiates a disassociation procedure. The MLME subsequently issues an MLME-DISASSOCIATE.confirm primitive that reflects the results.

6.5.9.2 MLME-DISASSOCIATE.confirm

6.5.9.2.1 Function

This primitive reports the results of a disassociation procedure with a specific peer MAC entity.

6.5.9.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DISASSOCIATE.confirm(
                                    ResultCode,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, INVALID_PARAMETERS	Indicates the result of the MLME-DISASSOCIATE.request primitive
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.9.2.3 When generated

This primitive is generated by the MLME as a result of an MLME-DISASSOCIATE.request primitive to disassociate from a specified peer MAC entity.

6.5.9.2.4 Effect of receipt

The SME is notified of the results of the disassociation procedure.

6.5.9.3 MLME-DISASSOCIATE.indication

6.5.9.3.1 Function

This primitive reports disassociation with a specific peer MAC entity.

6.5.9.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DISASSOCIATE.indication(
                                    PeerSTAAddress,
                                    ReasonCode,
                                    VendorSpecificInfo
                                    )
```

6.5.9.3.3 When generated

This primitive is generated by the MLME as a result of the invalidation of an association relationship with a specific peer MAC entity.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity with which the association relationship was invalidated.
ReasonCode	Reason Code field	As defined in 9.4.1.7	Specifies the reason the disassociation procedure was initiated.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.9.3.4 Effect of receipt

The SME is notified of the invalidation of the specific association relationship.

6.5.10 Reset

6.5.10.1 Introduction

This mechanism supports the process of resetting the MAC.

6.5.10.2 MLME-RESET.request

6.5.10.2.1 Function

This primitive requests that the MAC entity be reset.

6.5.10.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RESET.request(
                        STAAddress,
                        SetDefaultMIB
                        )
```

Name	Type	Valid range	Description
STAAddress	MAC address	Any valid individual address	Specifies the MAC address that is to be used by the MAC entity that is being reset. This value can be used to provide a locally administered STA address.
SetDefaultMIB	Boolean	true, false	If true, all MIB attributes are set to their default values. The default values are implementation dependent. If false, the MAC is reset, but all MIB attributes retain the values that were in place prior to the generation of the MLME-RESET.request primitive.

6.5.10.2.3 When generated

This primitive is generated by the SME to reset the MAC to initial conditions. The MLME-RESET.request primitive shall be used prior to use of the MLME-START.request primitive. The MLME-RESET.request primitive shall be used prior to the first use of the MLME-JOIN.request primitive, or any time a STA's state is to be reinitialized.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.10.2.4 Effect of receipt

This primitive sets the MAC to initial conditions, clearing all MAC variables to the default values. MIB attributes can be reset to their implementation dependent default values by setting the SetDefaultMIB flag to true.

If dot11OCBActivated is true and if the SetDefaultMIB parameter is false, MAC operation shall resume in less than 2 TU after the STAAddress parameter is changed.

6.5.11 Start

6.5.11.1 Introduction

This mechanism supports the process of starting a new BSS or becoming a member of an MBSS.

6.5.11.2 MLME-START.request

6.5.11.2.1 Function

This primitive requests that the MAC entity start a new BSS or become a member of an MBSS.

6.5.11.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-START.request(
SSID,
BSSType,
BeaconPeriod,
DTIMPeriod,
PHY parameter set,
IBSS parameter set,
NAVSyncDelay,
CapabilityInformation,
BSSBasicRateSet,
OperationalRateSet,
Country,
IBSS DFS Recovery Interval,
EDCAParameterSet,
DSERegisteredLocation,
HT Capabilities,
HT Operation,
BSSMembershipSelectorSet,
Extended Capabilities,
20/40 BSS Coexistence,
Overlapping BSS Scan Parameters,
Multiple BSSID,
InterworkingInfo,
AdvertisementProtocolInfo,
RoamingConsortiumInfo,
Mesh ID,
Mesh Configuration,
QMFPolicy,
DMG Capabilities,
Multi-band,

)

Name	Type	Valid range	Description
SSID	Octet string	0–32 octets	The SSID of the BSS.
BSSType	Enumeration	INFRASTRUCTURE, INDEPENDENT, MESH, PERSONAL	The type of the BSS.
Beacon Period	Integer	≥ 1	The beacon period (in TU) of the BSS if the BSSType is not MESH, or of the mesh STA if the BSSType is MESH.
DTIM Period	Integer	As defined in 9.4.2.5	The DTIM Period (in beacon periods) of the BSS if the BSSType is not MESH, or of the mesh STA if the BSSType is MESH.
PHY parameter sets	DSSS Parameter Set element	As defined in 9.4.2.4	The parameter sets relevant to the PHY.
IBSS parameter set	IBSS Parameter Set element	As defined in 9.4.2.6	The parameter set for the IBSS, if BSS is an IBSS.
NAVSyncDelay	Integer	≥ 0	Delay (in microseconds) to be used, while the STA is a member of this BSS, prior to transmitting when changing from doze to awake state and when changing channel, if no frame is detected by which the NAV can be set.

Name	Type	Valid range	Description
CapabilityInformation	Capability Information field	As defined in 9.4.1.4	The STA capabilities to be advertised for the BSS.
BSSBasicRateSet	Set of integers	Non-DMG BSS: a value in both dot11SupportedDataRatesRxTable and dot11SupportedDataRatesTxTable for each member of the set	Non-DMG BSS: The set of data rates (in units of 500 kb/s) that all STAs in the BSS are able to use for communication. All STAs in the BSS, including the STA that is starting the BSS, are able to receive and transmit at each of the data rates listed in the set. DMG BSS: Empty.
OperationalRateSet	Non-DMG BSS: Set of integers DMG BSS: Set of numbers	Non-DMG BSS: a value in dot11SupportedDataRatesRxTable for each member of the set DMG BSS: 0-12, 9.1, 12.1-12.6, or 25-31, for each member of the set	Non-DMG BSS: The set of data rates (in units of 500 kb/s) that the STA is able to use for communication within the BSS. The STA is able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter. DMG BSS: The set of MCS indices that the STA uses for communication within the BSS.
Country	As defined in the Country element	As defined in the Country element	The information required to identify the regulatory domain in which the STA is located and to configure its PHY for operation in that regulatory domain. Present if TPC functionality is required, as specified in 11.7 or dot11MultiDomainCapabilityActivated is true; otherwise not present.
IBSS DFS Recovery Interval	Integer	1–255	The time interval that is used for DFS recovery. Present if DFS functionality is required, as specified in 11.8 and BSSType = INDEPENDENT; otherwise not present.
EDCAParameterSet (QoS only)	EDCA Parameter Set element	As defined in 9.4.2.27	The initial EDCA parameter set values to be used in the BSS. The parameter is present if dot11QosOptionImplemented is true and dot11MeshActivated is true; otherwise not present.
DSERegisteredLocation	As defined in the DSE Registered Location element	As defined in 9.4.2.50	The information for the DSE Registered Location element. The parameter is present if dot11LCIDSERequired is true.
HT Capabilities	As defined in frame format HT Capabilities element	As defined in 9.4.2.54; the HT-MCSs in the element are present in dot11SupportedHTMCSRxTable and the highest supported data rate in the element does not exceed dot11HighestSupportedDataRate	The STA's HT capabilities to be advertised for the BSS. The parameter is present if dot11HighThroughputOptionImplemented is true; otherwise, this parameter is not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
HT Operation	As defined in frame format HT Operation element	As defined in 9.4.2.55; the HT-MCSs in the element are present in both dot11SupportedHTMCSRxTable and dot11SupportedHTMCSTxTable	Provides additional information for operating the HT BSS. The parameter is present if dot11HighThroughputOptionImplemented is true; otherwise, this parameter is not present.
BSSMembershipSelectorSet	Set of integers	A value from Table 9-131 for each member of the set	The set of features that are supported by all STAs in the BSS, including the STA that is starting the BSS.
Extended Capabilities	As defined in frame format	As defined in 9.4.2.25	Specifies the parameters within the Extended Capabilities element to be advertised for the BSS.
20/40 BSS Coexistence	As defined in frame format	As defined in 9.4.2.58	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistence-ManagementSupport is true.
Overlapping BSS Scan Parameters	As defined in frame format	As defined in 9.4.2.57	Specifies the parameters within the Overlapping BSS Scan Parameters element that are indicated by the MAC entity. This parameter is optionally present if dot11FortyMHzOptionImplemented is true; otherwise, it is not present.
Multiple BSSID	A set of Multiple BSSID elements	As defined in 9.4.2.44	One or more elements are present if the AP is a member of a multiple BSSID set (see 11.10.14) with two or more members and any of the following conditions are true: • dot11MultiBSSIDImplemented is true • dot11MultiBSSIDImplemented is false and dot11RMMeasurementPilotActivated is between 2 and 7 • dot11FILSActivated is true • dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID exists
InterworkingInfo	As defined in frame format	As defined in Interworking element in 9.4.2.90	Specifies the interworking capabilities of STA. This field is present when dot11InterworkingServiceActivated is true.
AdvertisementProtocolInfo	Integer or Sequence of integers	As defined in Advertisement Protocol element in Table 9-277	Identifies zero or more advertisement protocols and advertisement control to be used in the BSSs. This field is present when dot11InterworkingServiceActivated is true.
RoamingConsortiumInfo	As defined in frame format	As defined in roaming consortium element in 9.4.2.94	Specifies identifying information for SSPs whose security credentials can be used to authenticate with the AP. This field is optionally present when dot11InterworkingServiceActivated is true.
Mesh ID	Octet string	0–32 octets	The value of mesh ID. This element is present if the BSSType = MESH; otherwise not present.
Mesh Configuration	As defined in frame format	As defined in 9.4.2.96	Specifies the configuration of the mesh STA. This element is present if the BSSType = MESH; otherwise not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
QMFPolicy	QMF Policy element	As defined in 9.4.2.118	This element is present when dot11QMFActivated is true and BSSType = INFRASTRUCTURE or MESH, and it is not present otherwise. The element is provided by the SME to signal to the MLME the QMF policy to be used for this BSS.
DMG Capabilities	DMG Capabilities element	As defined in 9.4.2.126	Specifies the parameters within the DMG Capabilities element to be advertised for the BSS. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise.
Multi-band	Multi-band element	As defined in 9.4.2.137	Specifies the parameters within the Multi-band element that are supported by the MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.151	Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise.
DMG Operation	DMG Operation element	As defined in 9.4.2.126	Provides additional information for operating the DMG BSS. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise.
Clustering Control	Clustering Control field	As defined in 9.3.4.2	Specifies the parameters within the Clustering Control field that are supported by the MAC entity. The parameter is present if dot11ClusteringActivated is true and is absent otherwise.
CBAP Only	Integer	0 or 1	Specifies the setting of the CBAP Only field as defined in 9.3.4.2
PCP Association Ready	Integer	0 or 1	Specifies the setting of the PCP Association Ready field as defined in 9.3.4.2
VHT Capabilities	As defined in VHT Capabilities element	As defined in 9.4.2.156; the VHT-MCSs in the element are present in dot11VHTRxVHTMCSMap/ dot11VHTTxVHTMCSMap and the highest supported data rates in the element do not exceed dot11VHTRxHighestDataRateSupported/ dot11VHTTxHighestDataRateSupported	Specifies the parameters in the VHT Capabilities element to be advertised for the BSS. The parameter is present if dot11VHTOptionImplemented is true and not present otherwise.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
VHT Operation	As defined in VHT Operation element	As defined in 9.4.2.157; the VHT-MCSs in the element are present in both dot11VHTRxVHTMCSMap and dot11VHTTxVHTMCSMap	Provides additional information for operating the VHT BSS. The parameter is present if dot11VHTOptionImplemented is true and not present otherwise.
Known OUIs	A set of OUIs, each of which is defined in 9.4.1.29	N/A	Zero or more OUIs that specify the OUIs considered known by the AP, in the context of determining if it should respond to certain Probe Request frames, as defined in 11.1.4.3.4.
S1G Capabilities	As defined in frame format	As defined in 9.4.2.199	Specifies the parameters in the S1G Capabilities element to be advertised for the BSS. The parameter is present if dot11S1GOptionImplemented is true; otherwise not present.
S1GOperation	As defined in frame format	As defined in 9.4.2.211	Provides additional information for operating the S1G BSS. The parameter is present if dot11S1GOptionImplemented is true; otherwise not present.
ShortBeaconPeriod	As defined in frame format	As defined in 9.4.2.196	Provides the short beacon period of the S1G BSS. The parameter is present if dot11ShortBeaconInterval is true; otherwise not present.
ShortBeaconDTIMPeriod	As defined in frame format	As defined in 9.4.2.5	Provides the DTIM period (in short beacon periods) of the S1G BSS. The parameter is present if dot11ShortBeaconInterval is true; otherwise not present.
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.218	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true.
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.228	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true and is absent otherwise.
CMMG Operation	CMMG Operation element	As defined in 9.4.2.229.	Specifies the parameters within the CMMG Operation element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.
ServiceHint	Service Hint element	As defined in 9.4.2.236	Provides an indication of the services advertised in Beacon and Probe Response frames. The element is optionally present if dot11UnsolicitedPADActivated is true and absent otherwise.
ServiceHash	Service Hash element	As defined in 9.4.2.237	Specifies services advertised in Beacon and Probe Response frames. The element is optionally present if dot11UnsolicitedPADActivated is true and absent otherwise.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
HE Capabilities	As defined in HE Capabilities element.	As defined in 9.4.2.247	Specifies the parameters within the HE Capabilities element that are supported by the STA. The parameter is present if dot11HEOptionImplemented is true; otherwise, this parameter is not present.
HE 6 GHz Band Capabilities	As defined in HE 6 GHz Band Capabilities element	As defined in 9.4.2.262	Specifies the parameters within the HE 6 GHz Band Capabilities element that are supported by the STA. The parameter is present if dot11HE6GOptionImplemented is true; otherwise, this parameter is not present.
HE Operation	As defined in HE Operation element.	As defined in 9.4.2.248	Provides additional information for operating the HE BSS. The parameter is present if dot11HEOptionImplemented is true; otherwise, this parameter is not present.
EDMG Capabilities	EDMG Capabilities element	As defined in 9.4.2.264	Specifies the parameters within the EDMG Capabilities element to be advertised for the BSS. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
EDMG Operation	EDMG Operation element	As defined in9.4.2.265	Provides additional information for operating the BSS. The parameter is present if dot11EDMGOptionImplemented is true and is absent otherwise.
Unsolicited Block Ack Extension	Unsolicited Block Ack Extension element	As defined in 9.4.2.278	Specifies the parameters within the Unsolicited Block Ack Extension element that are supported by the MAC entity. Optionally present if dot11UnsolicitedBAActivated is true and is absent otherwise.
TDDSlotStructure	TDD Slot Structure element	As defined in 9.4.2.280	Present if dot11TDDOptionImplemented is true and absent otherwise. Specifies the parameters within the TDD Slot Structure element.
TDD Slot Schedule	TDD Slot Schedule element	As defined in 9.4.2.281	Present if dot11TDDOptionImplemented is true and absent otherwise. Specifies the parameters within the TDD Slot Schedule element.
WUR Capabilities	As defined in WUR Capabil-ities element	As defined in 9.4.2.290	Specifies the parameters within the WUR Capabilities element that are supported by the STA. The parameter is present if dot11WUROptionImplemented is true; otherwise, this parameter is not present.
WUR Operation	As defined in WUR Opera-tion element	As defined in 9.4.2.291	Provides additional information for WUR operation. The parameter is present if dot11WUROptionImplemented is true; otherwise not present.
WUR Discovery	A defined in WUR Discov-ery element	As defined in 9.4.2.293	Specifies the parameters used for transmission of WUR Discovery frames. The parameter is present if dot11WUROptionImplemented is true and dot11WURDiscoveryImplemented is true; otherwise, this parameter is not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.11.2.3 When generated

This primitive is generated by the SME to start an infrastructure BSS (with the MAC entity within an AP), an IBSS (with the MAC entity acting as the first STA in the IBSS), or an MBSS (with the MAC entity acting as the first mesh STA in the MBSS) or to become a member of an existing MBSS or a PBSS (with the MAC entity within a PCP). In an MBSS, this primitive starts the process of mesh beaconing.

The MLME-START.request primitive in an MBSS shall be generated before any synchronization or mesh peering have been attempted.

The MLME-START.request primitive shall not be used after successful use of the MLME-START.request primitive or successful use of the MLME-JOIN.request primitive without generating an intervening MLME-RESET.request primitive.

6.5.11.2.4 Effect of receipt

This primitive initiates the BSS initialization procedure once the current frame exchange sequence is complete. The MLME subsequently issues an MLME-START.confirm primitive that reflects the results of the creation procedure.

If the MLME of a non-DMG STA receives an MLME-START.request primitive with a BSSBasicRateSet parameter containing any unsupported rates, the MLME response in the resulting MLME-START.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of an HT STA receives an MLME-START.request primitive with the Basic HT-MCS Set field of the HT Operation parameter containing any unsupported MCSs, the MLME response in the resulting MLME-START.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of a VHT STA receives an MLME-START.request primitive with a Basic VHT-MCS And NSS Set field in the VHT Operation parameter containing any unsupported <VHT-MCS, NSS> tuple, the MLME response in the resulting MLME-START.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of a CMMG STA receives an MLME-START.request primitive with a Basic CMMG-MCS and NSS Set field in the CMMG Operation parameter containing any unsupported <CMMG-MCS, NSS> tuple, the MLME response in the resulting MLME-START.confirm primitive contains a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of a DMG STA receives an MLME-START.request primitive with a BSSBasicRateSet parameter containing any rates, or with the OperationalRateSet parameter containing any unsupported MCSs, the MLME response in the resulting MLME-START.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of an S1G STA receives an MLME-START.request primitive with a Basic S1G-MCS and NSS Set field in the S1GOperation parameter containing any unsupported <S1G-MCS, NSS> tuple, the MLME response in the resulting MLME-START.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of an HE STA receives an MLME-START.request primitive with a Basic HE-MCS And NSS Set field in the HE Operation parameter that contains any unsupported <HE-MCS, NSS> tuple, then the MLME response in the resulting MLME-START.confirm primitive shall not contain a ResultCode parameter that is set to SUCCESS.

6.5.11.3 MLME-START.confirm

6.5.11.3.1 Function

This primitive reports the results of a BSS creation procedure or a procedure to become a member of an MBSS.

6.5.11.3.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-START.confirm(
                                    ResultCode
                                    )
```

Name	Type	Valid range	resetDescription
ResultCode	Enumeration	SUCCESS, BSS_ALREADY_STARTED_OR_JOINED, RESET_REQUIRED_BEFORE_ START, NOT_SUPPORTED	Indicates the result of the MLME-START.request primitive.

6.5.11.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-START.request primitive to create a new BSS or to become a member of an MBSS.

6.5.11.3.4 Effect of receipt

The SME is notified of the results of the BSS creation procedure or a procedure to become a member of an MBSS.

6.5.12 Stop

6.5.12.1 General

This mechanism supports the process of terminating an existing BSS.

6.5.12.2 MLME-STOP.request

6.5.12.2.1 Function

This primitive requests that the MAC entity stop a BSS previously started by using an MLME-START.request primitive

6.5.12.2.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-STOP.request(
                                SSID
                                )
```

Name	Type	Valid range	Description
SSID	Octet string	0–32 octets	The SSID of the BSS to be stopped.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.12.2.3 When generated

This primitive is generated by the SME to terminate an infrastructure BSS (with the MAC entity within an AP) or a PBSS (with the MAC entity within the PCP). The MLME-STOP.request primitive shall be generated only after successful use of an MLME-START.confirm primitive.

The MLME-STOP termination procedure does not reset the MAC to initial conditions. An MLME-RESET.request primitive shall be issued prior to use of the MLME-START.request primitive and subsequent to the use of an MLME-STOP.request primitive.

The SME should notify associated non-AP STAs of imminent infrastructure BSS termination before issuing the MLME-STOP.request primitive. This can be done with the BSS transition management procedure, using the Termination information.

6.5.12.2.4 Effect of receipt

This primitive initiates the termination of the BSS. All services provided by the AP to an infrastructure BSS, including Beacon and Probe Response frame transmissions and access to the DS, are stopped by the termination. All STAs in an infrastructure BSS are deauthenticated by the termination. In a PBSS, all of the services provided by the PCP, including DMG Beacon frames, are stopped by the termination. All of the STAs in a PBSS have their RSNA unestablished by the termination.

6.5.13 Protocol layer model for spectrum management and radio measurement

The layer management extensions for measurement, TPC, and channel switching assume a certain partition of functionality between the MLME and SME. This partitioning assumes that policy decisions (e.g., regarding measurement and channel switching) reside in the SME, while the protocol for measurement, switch timing, and the associated frame exchanges resides within the MLME (see Figure 6-9).

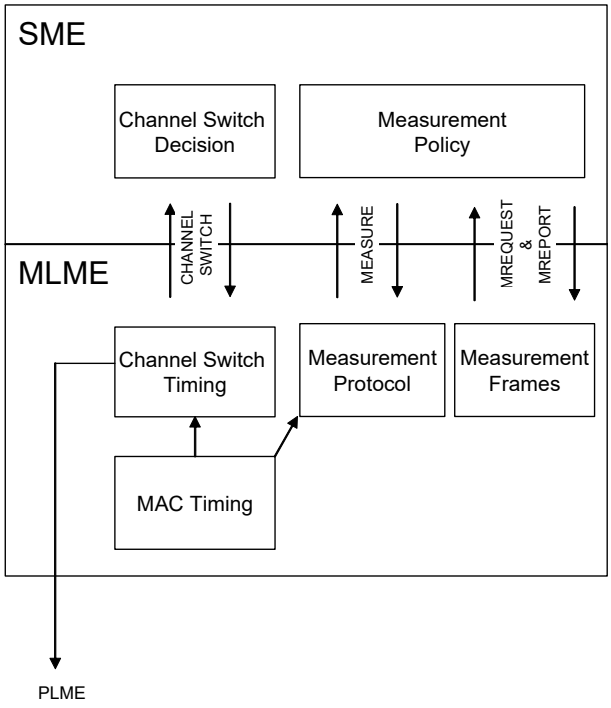

Figure 6-9—Layer management model

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The diagrams within this subclause further illustrate the protocol layer model adopted. Figure 6-10 and Figure 6-11 depict the measurement process for a peer STA to accept and reject a measurement request, respectively. Figure 6-12 illustrates the TPC adaptation process. Lastly, Figure 6-13 depicts the management process for a channel switch using a Channel Switch Announcement frame.

Note that these diagrams are intended as examples and do not depict all possible protocol scenarios, e.g., a measurement request may result in more than one Spectrum or Radio Measurement Report frame as described in 11.8.7 and 11.10.

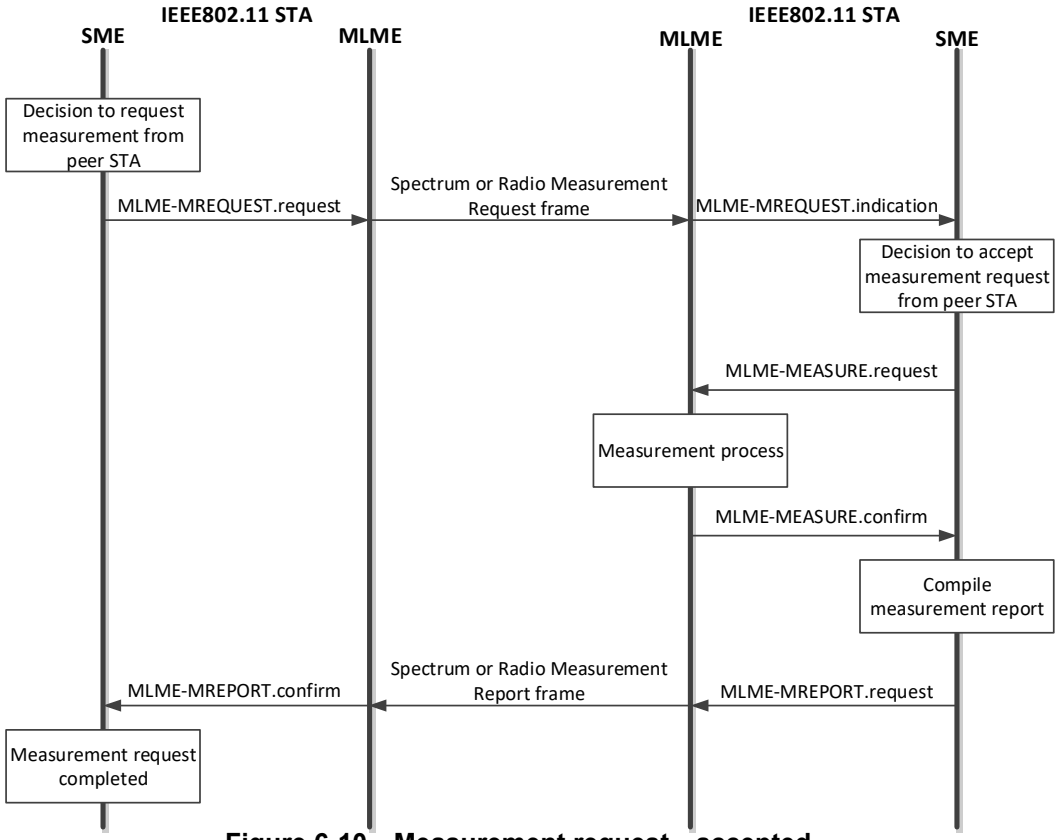

Figure 6-10—Measurement request—accepted

6.5.14 SetKeys

6.5.14.1 MLME-SETKEYS.request

6.5.14.1.1 Function

This primitive causes the keys identified in the parameters of the primitive to be set in the MAC and enabled for use.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

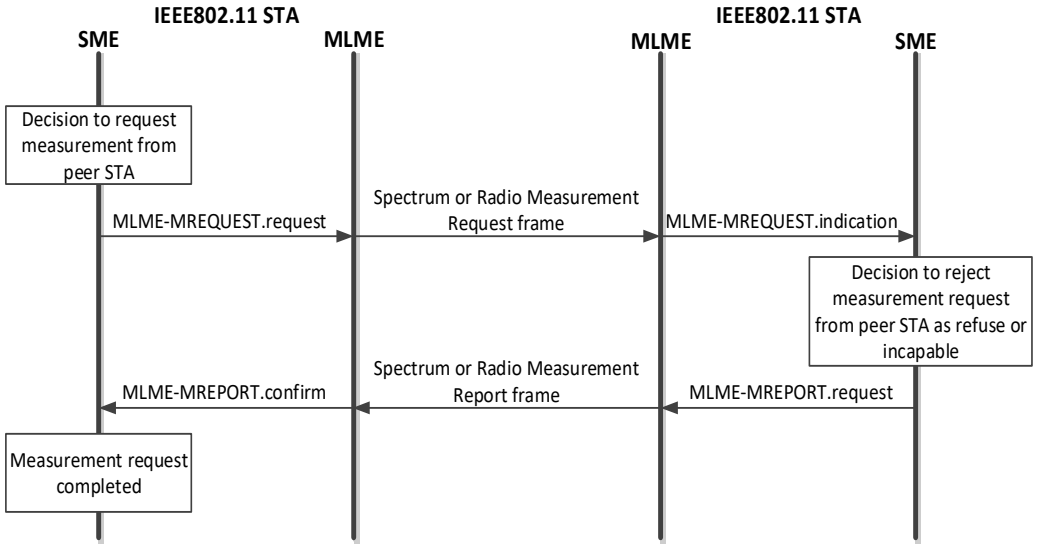

Figure 6-11—Measurement request—rejected

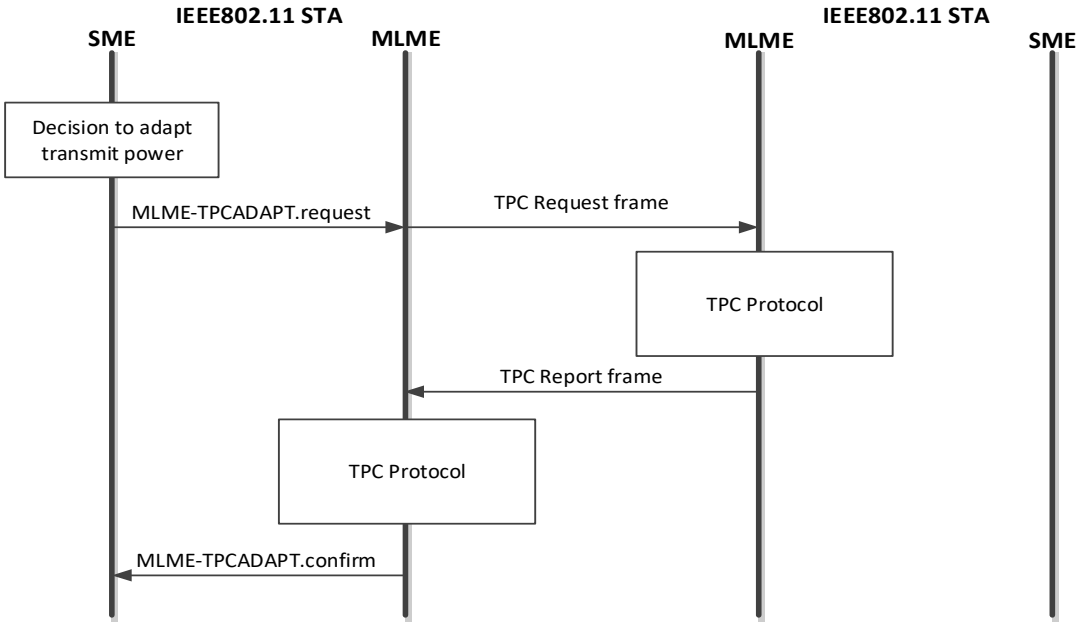

Figure 6-12—TPC adaptation

6.5.14.1.2 Semantics of the service primitive

The primitive parameter is as follows:

MLME-SETKEYS.request(
Keylist
)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

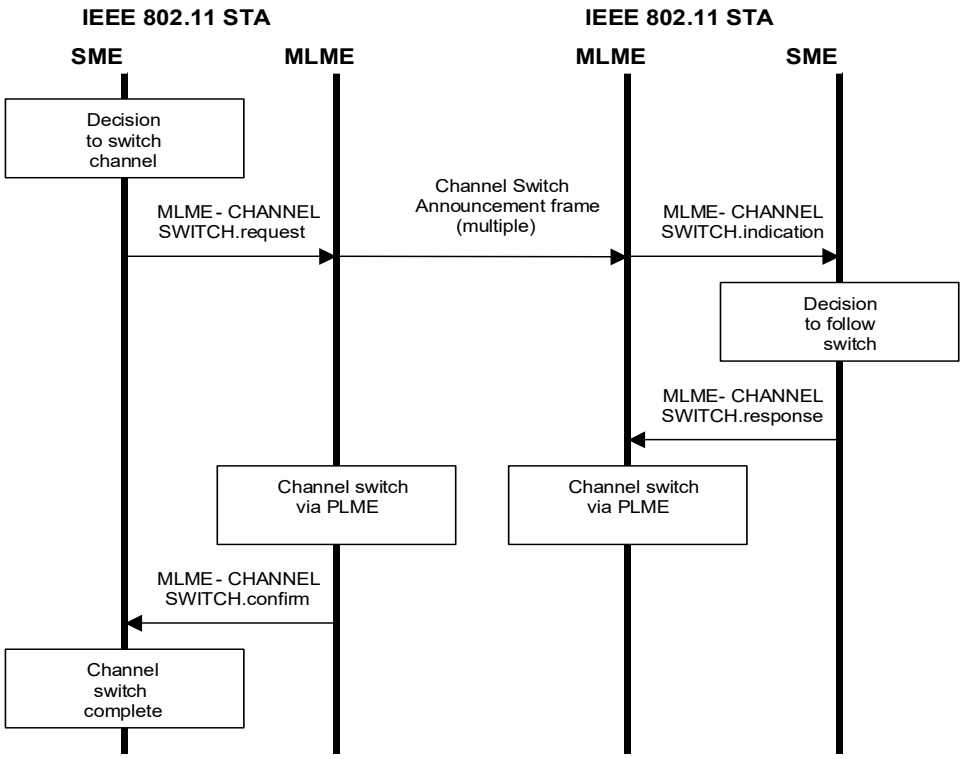

Figure 6-13—Channel switching

Name	Type	Valid range	Description
Keylist	A set of SetKeyDescriptors	N/A	The list of keys to be used by the MAC.

Each SetKeyDescriptor consists of the following parameters:

Name	Type	Valid range	Description
Key	Bit string	N/A	The temporal key value
Length	Integer	N/A	The number of bits in the Key to be used.
Key ID	Integer	0–3 shall be used with TKIP, CCMP, and GCMP; 4–5 with BIP for IGTK; 6-7 with BIP for BIGTK; 8–9 with BIP for WIGTK; and 10–4095 are reserved	Key identifier
Key Type	Enumeration	Group, Pairwise, PeerKey, IGTK, BIGTK, WIGTK	Defines whether this key is a GTK, TK, TPK-TK, IGTK, BIGTK, or WIGTK respectively.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Address	MAC address	Any valid individual address	This parameter is valid only when the Key Type value is one of: — Pairwise, — Group and the STA is in an IBSS or PBSS (but not an MBSS), — PeerKey.
Receive Sequence Counter	8 octets	N/A	Initialization value of the replay counter(s). This parameter is valid only when the Key Type is Group, IGTK, BIGTK, or WIGTK.

6.5.14.1.3 When generated

This primitive is generated by the SME at any time when one or more keys are to be set in the MAC.

6.5.14.1.4 Effect of receipt

When the Key Type is Group, IGTK, BIGTK, or WIGTK, and the key matches the GTK, IGTK, BIGTK, or WIGTK, if any, installed as a result of EAPOL-Key PDUs (see 12.7.7.4) or exiting WNM sleep mode (see 11.2.3.15.1) receipt of this primitive shall have no effect except updating the RSC(s) when they are greater than those currently stored. Otherwise, irrespective of the Key Type parameter, when the Key parameter is the same as a key installed as a result of EAPOL-Key PDUs or exiting WNM sleep mode, receipt of this primitive shall have no effect. Otherwise, receipt of this primitive causes the MAC to apply the keys as follows, subject to the MLME-SETPROTECTION.request primitive:

— The MAC uses the key and key ID for the transmission of subsequent frames to which the key and key ID apply (as defined by the Key Type and Address parameters).

NOTE—If more than one key (and key ID) can be used for transmission for a particular key type and address, the MAC chooses the key and key ID to use.

— The MAC installs the key with the associated key ID such that received frames for that cipher, of the appropriate type, and containing the matching key ID are processed using that key and its associated state information.

— When the Key Type parameter is Pairwise or PeerKey, and the Key, Key ID, and Address (where valid) parameters identify a new key to be set, the MAC shall initialize the transmitter TSC/PN counter and the receiver replay counter(s) to 0. When the Key Type parameter is not Pairwise, PeerKey, or BIGTK, and the Key, Key ID, and Address (where valid) parameters identify a new key to be set, the MAC shall initialize, depending on the direction of the traffic, the transmitter TSC/PN/IPN/WIPN counter to 0 or 1 (see Clause 12 and Clause 29) or the receiver replay counter(s) to the value in the Receive Sequence Count parameter. When the Key Type parameter is BIGTK, and the Key and Key ID parameters identify a new key to be set, the MAC shall initialize, depending on the direction of the traffic, the transmitter BIPN counter as specified in 12.5.3.4 or the receiver replay counter to the value in the Receive Sequence Count parameter. When the Key Type, Key, Key ID, and Address (where valid) parameters identify an existing key, the MAC shall not change the transmitter TSC/PN/IPN/BIPN/WIPN counter or the receiver replay counter(s) associated with that key.

NOTE—A new key is identified by virtue of having a different Key parameter than any of the currently configured keys used by the MAC. Additionally, it ought to have a different Key parameter than any key that has ever been used by the MAC for the current link.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.15 DeleteKeys

6.5.15.1 MLME-DELETEKEYS.request

6.5.15.1.1 Function

This primitive causes the keys identified in the parameters of the primitive to be deleted from the MAC and thus disabled for use.

6.5.15.1.2 Semantics of the service primitive

The primitive parameter is as follows:

MLME-DELETEKEYS.request(
Keylist
)

Name	Type	Valid range	Description
Keylist	A set of DeleteKeyDescriptors	N/A	The list of keys to be deleted from the MAC.

Each DeleteKeyDescriptor consists of the following parameters:

Name	Type	Valid range	Description
Key ID	Integer	0–3 shall be used with TKIP, CCMP, and GCMP; 4–5 with BIP for IGTK; 6-7 with BIP for BIGTK; 8–9 with BIP for WIGTK; and 10–4095 are reserved	Key identifier.
Key Type	Enumeration	Group, Pairwise, PeerKey, IGTK, BIGTK, WIGTK	Defines whether this key is a GTK, TK, TPK-TK, IGTK, BIGTK, or WIGTK respectively.
Address	MAC address	Any valid individual address	This parameter is valid only when the Key Type value is one of: — Pairwise, — Group and the STA is in an IBSS or PBSS (but not an MBSS), — PeerKey.
Encapsulation Mode	Enumeration	Normal, BCE	This parameter is valid only when the Key Type value is BIGTK

6.5.15.1.3 When generated

This primitive is generated by the SME at any time when keys for a security association are to be deleted in the MAC.

6.5.15.1.4 Effect of receipt

Receipt of this primitive causes the MAC to delete all the temporal keys identified by each DeleteKeyDescriptor in the Keylist (as defined by the Key Type, Key ID and Address parameters), and to cease using them.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.16 SetProtection

6.5.16.1 MLME-SETPROTECTION.request

6.5.16.1.1 Function

This primitive indicates whether protection is required for frames sent to and received from the indicated MAC address.

6.5.16.1.2 Semantics of the service primitive

The primitive parameter is as follows:

MLME-SETPROTECTION.request(
Protectlist
)

Name	Type	Valid range	Description
Protectlist	A set of ProtectDescriptors	N/A	The list of how each key is being used currently.

Each ProtectDescriptor consists of the following parameters:

Name	Type	Valid range	Description
Address	MAC address	Any valid individual address	This parameter is valid only when the Key Type value is one of: — Pairwise, — Group and the STA is in an IBSS or PBSS (but not an MBSS), — PeerKey.
ProtectType	Enumeration	None, Rx, Tx, Rx_Tx	The protection value for this MAC.
Key Type	Enumeration	Group, Pairwise, PeerKey, IGTK, BIGTK, WIGTK	Defines whether this key is a GTK, TK, TPK-TK, IGTK, BIGTK, or WIGTK respectively.

6.5.16.1.3 When generated

This primitive is generated by the SME when protection is required for frames sent to and received from the indicated MAC address.

6.5.16.1.4 Effect of receipt

Receipt of this primitive causes the MAC to set the protection and to protect Data frames as indicated in the ProtectType parameter of the Protectlist parameter:

— None: Specifies that Data frames to and from the MAC address are not protected.

— Rx: Specifies that Data frames from the MAC address are protected (i.e., any Data frames without protection received from the MAC address are discarded) but Data frames to the MAC address are not protected.

— Tx: Specifies that Data frames to the MAC address are protected but Data frames from the MAC address are not protected.

— Rx_Tx: Specifies that Data frames to and from the MAC address are protected.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Once Data frames are protected to and/or from the specified MAC address, the MLME-SETPROTECTION.request primitive is used to reset the prior setting. Invocation of the MLME-SETPROTECTION.request primitive with a ProtectType of None deletes a protection state.

6.5.17 PN event report

6.5.17.1 General

This subclause describes the management procedures associated with PN event report.

6.5.17.2 MLME-PN-EXHAUSTION.indication

6.5.17.2.1 Function

This primitive indicates that the PN associated with a temporal key exceeds the threshold that is defined in dot11PNExhaustionThresholdLow and dot11PNExhaustionThresholdHigh.

6.5.17.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-PN-EXHAUSTION.indication(
Key ID,
Key Type,
Address
)

Name	Type	Valid range	Description
Key ID	Integer	0-3 shall be used with CCMP and GCMP; 4-5 with BIP for IGTK; 6-7 with BIP for BIGTK; 8–9 with BIP for WIGTK; and 10-4095 are reserved	Key identifier.
Key Type	Enumeration	Group, Pairwise, PeerKey, IGTK, BITGK, WIGTK	Defines whether this key is a GTK, TK, TPK-TK, IGTK, BIGTK, or WIGTK respectively.
Address	MAC address	Any valid individual address	This parameter is valid only when the Key Type value is one of: — Pairwise, — Group and the STA is in an IBSS or PBSS (but not an MBSS), — PeerKey.

6.5.17.2.3 When generated

This primitive is generated by the MLME when the PN associated with a temporal key exceeds the threshold that is defined in dot11PNExhaustionThresholdLow and dot11PNExhaustionThresholdHigh.

6.5.17.2.4 Effect of receipt

On receipt of this primitive, the SME deletes the temporal key associated with the PN.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.17.3 MLME-PN-WARNING.indication

6.5.17.3.1 Function

This primitive indicates that the PN associated with a temporal key exceeds the threshold that is defined in dot11PNWarningThresholdLow and dot11PNWarningThresholdHigh.

6.5.17.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-PN-WARNING.indication(
                    Key ID,
                    Key Type,
                    Address
                    )
```

Name	Type	Valid range	Description
Key ID	Integer	0-3 shall be used with CCMP and GCMP; 4-5 with BIP for IGTK; 6-7 with BIP for BIGTK; 8–9 with BIP for WIGTK; and 10-4095 are reserved	Key identifier.
Key Type	Enumeration	Group, Pairwise, PeerKey, IGTK, BIGTK, WIGTK	Defines whether this key is a GTK, TK, TPK-TK, IGTK, BIGTK, or WIGTK respectively.
Address	MAC address	Any valid individual address	This parameter is valid only when the Key Type value is one of: — Pairwise, — Group and the STA is in an IBSS or PBSS (but not an MBSS), — PeerKey.

6.5.17.3.3 When generated

This primitive is generated by the MLME when the PN associated with a temporal key exceeds the threshold that is defined in dot11PNWarningThresholdLow and dot11PNWarningThresholdHigh.

6.5.17.3.4 Effect of receipt

On receipt of this primitive, the SME can create a new temporal key before the PN space is exhausted.

6.5.18 Event request

6.5.18.1 General

This set of primitives supports the exchange of Event Request and Event Report frames. The diagram in Figure 6-14 shows the Event Request and Event Report process.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

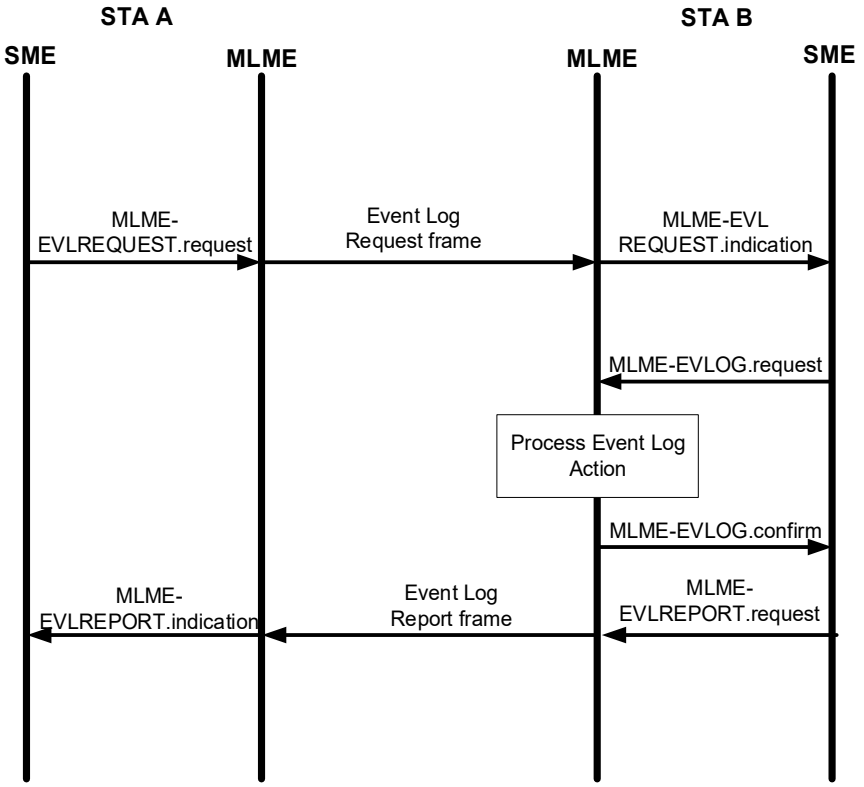

Figure 6-14—Event protocol exchange

6.5.18.2 MLME-EVLREQUEST.request

6.5.18.2.1 Function

This primitive requests the transmission of an event request to a peer STA.

6.5.18.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EVLREQUEST.request(
                        Peer MAC Address,
                        Dialog Token,
                        Event Request Set,
                        Destination URI,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual address	The address of the peer MAC entity to which the event request is sent.
Dialog Token	Integer	1–255	The dialog token to identify the event transaction.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Event Request Set	Set of event elements	Set of event elements	A set of event elements describing the requested event.
Destination URI	Destination URI element	Destination URI element	The Destination URI element as defined in 9.4.2.88.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.18.2.3 When generated

This primitive is generated by the SME to request that an Event Request frame be sent to a peer STA to initiate one or more transactions.

6.5.18.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an Event Request frame containing the set of event elements specified. This frame is then scheduled for transmission.

6.5.18.3 MLME-EVLREQUEST.indication

6.5.18.3.1 Function

This primitive indicates that an Event Request frame requesting an event transaction has been received.

6.5.18.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EVLREQUEST.indication(
                    Peer MAC Address,
                    Dialog Token,
                    Event Request Set,
                    Destination URI,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual address	The address of the peer MAC entity from which the event request was received.
Dialog Token	Integer	1–255	The dialog token to identify the event transaction.
Event Request Set	Set of event elements	Set of event elements	A set of event elements describing the requested event.
Destination URI	Destination URI element	Destination URI element	The Destination URI element as defined in 9.4.2.88.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.18.3.3 When generated

This primitive is generated by the MLME when an Event Request frame is received.

6.5.18.3.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the event transaction.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.19 Event report

6.5.19.1 General

This set of primitives supports the signaling of event reports.

6.5.19.2 MLME-EVLREPORT.request

6.5.19.2.1 Function

This primitive supports the signaling of event reports between peer SMEs.

6.5.19.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EVLREPORT.request(
                        Peer MAC Address,
                        Dialog Token,
                        Event Report Set,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual address	The address of the peer MAC entity to which the event report is sent.
Dialog Token	Integer	1–255	The dialog token to identify the event transaction.
Event Report Set	Set of event elements	Set of event elements	A set of event elements describing the response to the event request.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.19.2.3 When generated

This primitive is generated by the SME to request that an Event Report frame be sent to a peer STA to report the results of one or more transactions.

6.5.19.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an Event Report frame containing the set of event elements. This frame is then scheduled for transmission.

6.5.19.3 MLME-EVLREPORT.indication

6.5.19.3.1 Function

This primitive indicates that an Event Report frame has been received from a peer STA.

6.5.19.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EVLREPORT.indication(
                        Peer MAC Address,
                        Dialog Token,
```

Event Report Set,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual address	The address of the peer MAC entity from which the event report was received.
Dialog Token	Integer	1–255	The dialog token to identify the event transaction.
Event Report Set	Set of event elements	Set of event elements	A set of event elements describing the response to the event request.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.24	Zero or more elements.

6.5.19.3.3 When generated

This primitive is generated by the MLME when an Event Report frame is received.

6.5.19.3.4 Effect of receipt

On receipt of this primitive, the event data can be made available for SME processes.

6.5.20 Event

6.5.20.1 General

This set of primitives supports the requesting and reporting of event data.

6.5.20.2 MLME-EVLOG.request

6.5.20.2.1 Function

This primitive is generated by the SME to request that the MLME identify specific events.

6.5.20.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EVLOG.request(
Dialog Token,
Event Request Set
)

Name	Type	Valid range	Description
Dialog Token	Integer	1–255	The dialog token to identify the event transaction.
Event Request Set	Set of event elements	Set of event elements	A set of event elements describing the response to the event request.

6.5.20.2.3 When generated

This primitive is generated by the SME to request that the MLME initiate the specified event.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.20.2.4 Effect of receipt

On receipt of this primitive, the MLME commences the identification of events.

6.5.20.3 MLME-EVLOG.confirm

6.5.20.3.1 Function

This primitive reports the result of an event.

6.5.20.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EVLOG.confirm(
Dialog Token,
Event Report Set
)

Name	Type	Valid range	Description
Dialog Token	Integer	1–255	The dialog token to identify the event transaction.
Event Report Set	Set of event report elements	Set of event report elements	A set of event report elements describing the reported event.

6.5.20.3.3 When generated

This primitive is generated by the MLME to report the results when event identification completes.

6.5.20.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the result and, if appropriate, stores the events pending communication to the requesting entity or for local use.

6.5.21 On-channel Tunneling operation

6.5.21.1 General

On-channel tunneling (OCT) primitives are used as part of multi-band operation (see 11.31). OCT frames are used to transport Management frames between peer MLME entities of multi-band capable devices.

The operation of the OCT is illustrated in Figure 6-15.

An initiator MLME of a STA that might not be currently enabled to transmit generates an MLME-OCTunnel.request primitive to a local MLME entity of a STA that is enabled to transmit. This request carries the contents of a Management frame and replaces transmission over the WM of that frame.

The recipient MLME generates the MLME-OCTunnel.indication primitive to the local MLME entity identified in the On-channel Tunnel Request frame.

The direct MLME-to-MLME primitive exchange should be viewed as shorthand for an exchange through the SMEs and multi-band entity, i.e., an MLME addresses another local MLME entity by sending that primitive through its SME and the multi-band entity to the SME of the MLME entity of a STA that is enabled to transmit, which reflects that primitive to the appropriate recipient.

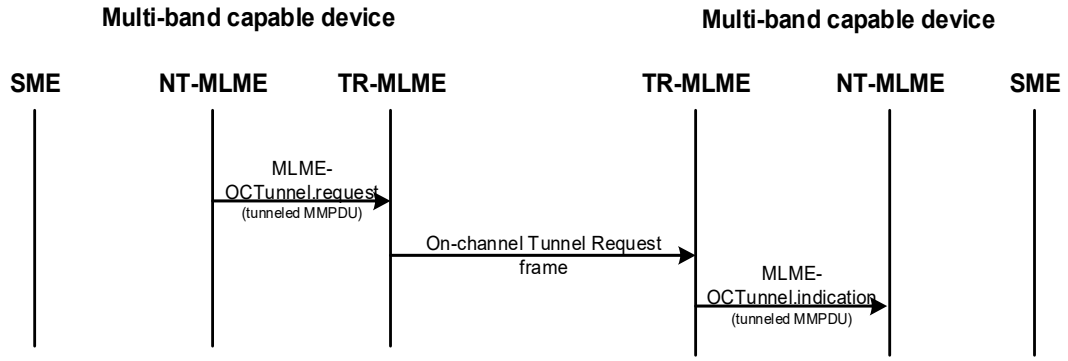

Figure 6-15—Operation of OCT

6.5.21.2 MLME-OCTunnel.request

6.5.21.2.1 Function

This primitive requests transmission of an On-channel Tunnel Request frame.

6.5.21.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-OCTunnel.request(
PeerSTAAddress,
OCT MMPDU,
Multi-band peer,
OCT source
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the MAC address of the STA to which the On-channel Tunnel Request frame is transmitted.
OCT MMPDU	OCT MMPDU Descriptor field	As defined in the On-channel Tunnel Request frame format (see 9.6.20.7)	The OCT MMPDU carries the MMPDU to be tunneled to the specified MLME entity of the specified STA.
Multi-band peer	Multi-band element	As defined in the Multi-band element format (see 9.4.2.137)	The Multi-band element identifies the peer MLME entity that should receive the OCT MMPDU.
OCT source	OCT Source element	As defined in the OCT Source element format (see 9.4.2.244)	The OCT Source element identifies the MLME entity that generated (i.e., is the source) of the OCT MMPDU.

6.5.21.2.3 When generated

This primitive is generated by another MLME to request that an On-channel Tunnel Request frame be sent to another STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.21.2.4 Effect on receipt

On receipt of this primitive, the MLME constructs and attempts to transmit an On-channel Tunnel Request frame.

6.5.21.3 MLME-OCTunnel.indication

6.5.21.3.1 Function

This primitive indicates that an On-channel Tunnel Request frame was received.

6.5.21.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-OCTunnel.indication(
PeerSTAAddress,
OCT MMPDU,
Multi-band local,
OCT source,
Tunneled RXVECTOR
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the MAC address of the STA from which the On-channel Tunnel Request frame was received.
OCT MMPDU	OCT MMPDU Descriptor field	As defined in the On-channel Tunnel Request frame format (see 9.6.20.7)	The OCT MMPDU carries the MMPDU that is being tunneled to the local MLME entity.
Multi-band local	Multi-band element	As defined in the Multi-band element format (see 9.4.2.137)	The Multi-band element identifies the local MLME entity that should receive the OCT MMPDU.
OCT source	OCT Source element	As defined in the OCT Source element format (see 9.4.2.244)	The OCT Source element identifies the MLME entity that generated (i.e., is the source) of the OCT MMPDU.
Tunneled RXVECTOR	RXVECTOR	As defined by the PHY of the STA	A copy of the RXVECTOR that the PHY passes to the MAC upon reception of the On-channel Tunnel Request frame.

6.5.21.3.3 When generated

This primitive is generated by the MLME to notify another MLME when an On-channel Tunnel Request frame is received.

6.5.21.3.4 Effect on receipt

The recipient of this primitive is an MLME entity in a multi-band device.

On receipt of this primitive, the MLME retrieves the tunneled frame and processes it as though it were received over the WM.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.21.4 MLME-OCTunnel.confirm

6.5.21.4.1 Function

This primitive reports the results of a request to transmit an On-channel Tunnel Request frame.

6.5.21.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-OCTunnel.confirm(
                        ResultCode
                        )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, FAILURE	Indicates the result of the OCTunnel.request primitive.

6.5.21.4.3 When generated

This primitive is generated by the MLME as a result of an MLME-OCTunnel.request primitive to transmit an On-channel Tunnel Request frame.

6.5.21.4.4 Effect of receipt

The MLME is notified of the results of the frame transmission.

6.5.22 DMG beamforming

6.5.22.1 SISO beamforming

6.5.22.1.1 General

This subclause describes the management procedures associated with DMG beamforming.

6.5.22.1.2 MLME-BF-TRAINING.request

6.5.22.1.2.1 Function

This primitive requests that beamforming training occur with a peer STA.

6.5.22.1.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BF-TRAINING.request(
                                PeerSTAAddress,
                                RequestBRP,
                                BRPRequest,
                                DMGBeamRefinement,
                                EDMGPartialSLS,
                                EDMGBRPRequest
                        )
```

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity with which to perform beamforming training.
RequestBRP	Boolean	true, false	If true, the beam refinement protocol (BRP) is performed as part of the beamforming training. If false, only sector-level sweep (SLS) is performed.
BRPRequest	A set of information subfields	As defined in 9.5.4	Specifies the parameters of a BRP request
DMGBeamRefinement	A set of elements	As defined in 9.4.2.128	Zero or more elements
EDMGBRPRequest	A set of elements	As defined in 9.4.2.269	Zero or more elements
EDMGPartialSLS	A set of elements	As defined in 9.4.2.271	Zero or more elements

6.5.22.1.2.3 When generated

This primitive is generated by the SME to request that beamforming training be performed with a peer STA.

6.5.22.1.2.4 Effect on receipt

On receipt of this primitive, the MLME invokes the MAC sublayer beamforming training procedures defined in 10.41.

6.5.22.1.3 MLME-BF-TRAINING.confirm

6.5.22.1.3.1 Function

This primitive reports the outcome of a requested beamforming training procedure.

6.5.22.1.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BF-TRAINING.confirm(
                        PeerSTAAddress,
                        ResultCode,
                        DMGBeamRefinement,
                        MeasFeedback,
                        EDMGMeasFeedback
                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity with which beamforming training was performed or attempted.
ResultCode	Enumeration	SUCCESS, BF_TIMEOUT	Indicates the result of the beamforming procedure.
DMGBeamRefinement	A set of elements	As defined in 9.4.2.128	Zero or more elements
MeasFeedback	A set of elements	As defined in 9.4.2.135	Zero or more elements
EDMGMeasFeedback	A set of elements	As defined in 9.4.2.267	Zero or more elements

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.22.1.3.3 When generated

This primitive is generated by the MLME to report the result of beamforming training with a peer STA.

6.5.22.1.3.4 Effect on receipt

The SME is notified of the result of the procedure.

6.5.22.1.4 MLME-BF-TRAINING.indication

6.5.22.1.4.1 Function

This primitive indicates that beamforming training with a peer STA, and at the request of that peer, has completed.

6.5.22.1.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BF-TRAINING.indication(
                                PeerSTAAddress,
                                ResultCode,
                                DMGBeamRefinement,
                                MeasFeedback,
                                EDMGMeasFeedback
                            )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity with which beamforming training was performed or attempted.
ResultCode	Enumeration	SUCCESS, BF_TIMEOUT	Indicates the result of the beamforming procedure.
DMGBeamRefinement	A set of elements	As defined in 9.4.2.128	Zero or more elements
MeasFeedback	A set of elements	As defined in 9.4.2.135	Zero or more elements
EDMGMeasFeedback	A set of elements	As defined in 9.4.2.267	Zero or more elements

6.5.22.1.4.3 When generated

This primitive is generated by the MLME to indicate successful completion of a beamforming training procedure requested by a peer STA.

6.5.22.1.4.4 Effect on receipt

The SME is notified of the result of the procedure.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.22.2 SU-MIMO beamforming

6.5.22.2.1 General

This subclause describes the management procedures associated with SU-MIMO beamforming.

6.5.22.2.2 MLME-SU-MIMO-BF-TRAINING.request

6.5.22.2.2.1 Function

This primitive requests that SU-MIMO beamforming training occurs with a peer STA.

6.5.22.2.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SU-MIMO-BF-TRAINING.request(
                                    PeerSTAAddress,
                                    RequestMIMOBRP,
                                    MIMOSetupControl
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity with which to perform SU-MIMO beamforming training.
RequestMIMOBRP	Boolean	true, false	If true, the MIMO BRP procedure is performed as part of the SU-MIMO beamforming training. If false, the SISO feedback procedure is performed as part of the SU-MIMO beamforming training.
MIMOSetupControl	A set of information fields	As defined in 9.4.2.272	Specifies the parameters of the SU-MIMO BF setup

6.5.22.2.2.3 When generated

This primitive is generated by the SME to request that SU-MIMO beamforming training be performed with a peer STA.

6.5.22.2.2.4 Effect on receipt

On receipt of this primitive, the MLME invokes the MAC sublayer SU-MIMO beamforming training procedures defined in 10.41.10.2.2.

6.5.22.2.3 MLME-SU-MIMO-BF-TRAINING.confirm

6.5.22.2.3.1 Function

This primitive reports the outcome of a requested SU-MIMO beamforming training procedure.

6.5.22.2.3.2 Semantics of the service primitive

The primitive parameters are as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

MLME-SU-MIMO-BF-TRAINING.confirm(
PeerSTAAddress,
ResultCode,
MIMOFeedbackControl,
MeasFeedback,
EDMGMeasFeedback
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity with which SU-MIMO beamforming training was performed or attempted.
ResultCode	Enumeration	SUCCESS, FAILURE	Indicates the result of the beamforming procedure, i.e., SUCCESS in case BF was successfully performed and FAILURE otherwise.
MIMOFeedbackControl	MIMO Feedback Control element	As defined in 9.4.2.274	Zero or more elements
MeasFeedback	Channel Measurement Feedback element	As defined in 9.4.2.135	Zero or more elements
EDMGMeasFeedback	EDMG Channel Measurement Feedback element	As defined in 9.4.2.267	Zero or more elements

6.5.22.2.3.3 When generated

This primitive is generated by the MLME to report the result of SU-MIMO beamforming training with a peer STA.

6.5.22.2.3.4 Effect on receipt

The SME is notified of the result of the procedure.

6.5.22.2.4 MLME-SU-MIMO-BF-TRAINING.indication

6.5.22.2.4.1 Function

This primitive indicates that SU-MIMO beamforming training with a peer STA, and at the request of that peer, has completed.

6.5.22.2.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SU-MIMO-BF-TRAINING.indication(
PeerSTAAddress,
ResultCode,
MIMOFeedbackControl,
MeasFeedback,
EDMGMeasFeedback
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity with which SU-MIMO beamforming training was performed or attempted.
ResultCode	Enumeration	SUCCESS, FAILURE	Indicates the result of the beamforming procedure, i.e., SUCCESS in case BF was successfully performed and FAILURE otherwise.
MIMOFeedbackControl	MIMO Feedback Control element	As defined in 9.4.2.274	Zero or more elements
MeasFeedback	Channel Measurement Feedback element	As defined in 9.4.2.135	Zero or more elements
EDMGMeasFeedback	EDMG Channel Measurement Feedback element	As defined in 9.4.2.267	Zero or more elements

6.5.22.2.4.3 When generated

This primitive is generated by the MLME to indicate successful completion of a SU-MIMO beamforming training procedure requested by a peer STA.

6.5.22.2.4.4 Effect on receipt

The SME is notified of the result of the procedure.

6.5.22.3 MU-MIMO beamforming

6.5.22.3.1 General

This subclause describes the management procedures associated with MU-MIMO beamforming.

6.5.22.3.2 MLME-MU-MIMO-BF-TRAINING.request

6.5.22.3.2.1 Function

This primitive requests that MU-MIMO beamforming training occurs with a group of peer STAs.

6.5.22.3.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MU-MIMO-BF-TRAINING.request(
                                    EDMGGroupID,
                                    RequestInitiatorTXSS,
                                    MIMOSetupControl
                                    )
```

6.5.22.3.2.3 When generated

This primitive is generated by the SME to request that MU-MIMO beamforming training be performed with a group of peer STAs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
EDMGGroupID	Integer	As defined in 9.4.2.268	Specifies the group of peer MAC entities with which to perform MU-MIMO beamforming training.
RequestMIMOBRP	Boolean	true, false	If true, the initiator TXSS procedure is performed as part of the MU-MIMO beamforming training. If false, the TXSS procedure is performed as part of the MU-MIMO beamforming training.
MIMOSetupControl	A set of information fields	As defined in 9.4.2.272	Specifies the parameters of the MU-MIMO BF setup

6.5.22.3.2.4 Effect on receipt

On receipt of this primitive, the MLME invokes the MAC sublayer MU-MIMO beamforming training procedures defined in 10.41.10.2.3.

6.5.22.3.3 MLME-MU-MIMO-BF-TRAINING.confirm

6.5.22.3.3.1 Function

This primitive reports the outcome of a requested MU-MIMO beamforming training procedure.

6.5.22.3.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MU-MIMO-BF-TRAINING.confirm(
EDMGGroupID,
ResultCode,
DMGBeamRefinement,
MIMOFeedbackControl,
MeasFeedback,
EDMGMeasFeedback
)

Name	Type	Valid range	Description
EDMGGroupID	Integer	As defined in 9.4.2.268	Specifies the group of peer MAC entities with which MU-MIMO beamforming training was performed or attempted.
ResultCode	Enumeration	SUCCESS, FAILURE	Indicates the result of the MU-MIMO beamforming procedure, i.e., SUCCESS in case BF was successfully performed and FAILURE otherwise.
DMGBeamRefinement	DMG Beam Refinement element	As defined in 9.4.2.128	Zero or more elements
MIMOFeedbackControl	MIMO Feedback Control element	As defined in 9.4.2.274	Zero or more elements

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
MeasFeedback	Channel Measurement Feedback elements	As defined in 9.4.2.135	Zero or more elements
EDMGMeasFeedback	EDMG Channel Measurement Feedback elements	As defined in 9.4.2.267	Zero or more elements

6.5.22.3.3.3 When generated

This primitive is generated by the MLME to report the result of MU-MIMO beamforming training with a group of peer STAs.

6.5.22.3.3.4 Effect on receipt

The SME is notified of the result of the procedure.

6.5.22.3.4 MLME-MU-MIMO-BF-TRAINING.indication

6.5.22.3.4.1 Function

This primitive indicates that MU-MIMO beamforming training with a peer STA, and at the request of that peer, has completed.

6.5.22.3.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MU-MIMO-BF-TRAINING.indication(
                                    PeerSTAAddress,
                                    ResultCode,
                                    MIMOSelectionControl,
                                    EDMGGroupIDSet
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity with which MU-MIMO beamforming training was performed or attempted.
ResultCode	Enumeration	SUCCESS, FAILURE	Indicates the result of the MU-MIMO beamforming procedure, i.e., SUCCESS in case BF was successfully performed and FAILURE otherwise.
MIMOFeedbackControl	MIMO Feedback Control element	As defined in 9.4.2.274	Zero or more elements
EDMGGroupIDSet	EDMG Group ID Set element	As defined in 9.4.2.268	Zero or more elements

6.5.22.3.4.3 When generated

This primitive is generated by the MLME to indicate successful completion of an MU-MIMO beamforming training procedure requested by a peer STA.

6.5.22.3.4.4 Effect on receipt

The SME is notified of the result of the procedure.

6.5.22.4 SU-MIMO hybrid beamforming

6.5.22.4.1 General

This subclause describes the management procedures associated with SU-MIMO hybrid beamforming.

6.5.22.4.2 MLME-SU-MIMO-HYBRID-BF-PROTOCOL.request

6.5.22.4.2.1 Function

This primitive requests that the SU-MIMO hybrid beamforming protocol occurs with a peer STA.

6.5.22.4.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SU-MIMO-HYBRID-BF-PROTOCOL.request(
PeerSTAAddress,
SoundingType,
ControlTrailer
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity with which the SU-MIMO hybrid beamforming protocol was performed or attempted.
SoundingType	Boolean	true, false	If true, the BRP frames are used for the hybrid beamforming protocol. If false, tracking is used for the SU-MIMO hybrid beamforming protocol.
ControlTrailer	A set of information fields	As defined in 28.3.7	Specifies the parameters of an SU-MIMO hybrid beamforming announcement in the SU-MIMO hybrid beamforming protocol

6.5.22.4.2.3 When generated

This primitive is generated by the SME to request that the SU-MIMO hybrid beamforming protocol be performed with a peer STA.

6.5.22.4.2.4 Effect on receipt

On receipt of this primitive, the MLME invokes the MAC sublayer SU-MIMO hybrid beamforming protocol procedures defined in 10.41.10.2.4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.22.4.3 MLME-SU-MIMO-HYBRID-BF-PROTOCOL.confirm

6.5.22.4.3.1 Function

This primitive reports the outcome of a requested SU-MIMO hybrid beamforming protocol procedure.

6.5.22.4.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SU-MIMO-HYBRID-BF-PROTOCOL.confirm(
PeerSTAAddress,
ResultCode,
MIMOFeedbackControl,
MeasFeedback,
EDMGMeasFeedback,
DigitalBFFeedback
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity with which the SU-MIMO hybrid beamforming protocol was performed or attempted.
ResultCode	Enumeration	SUCCESS, FAILURE	Indicates the result of the SU-MIMO hybrid beamforming procedure, i.e., SUCCESS in case BF was successfully performed and FAILURE otherwise.
MIMOFeedbackControl	MIMO Feedback Control element	As defined in 9.4.2.274	Zero or more elements
MeasFeedback	Channel Measurement Feedback element	As defined in 9.4.2.135	Zero or more elements
EDMGMeasFeedback	EDMG Channel Measurement Feedback element	As defined in 9.4.2.267	Zero or more elements
DigitalBFFeedback	Digital BF Feedback elements	As defined in 9.4.2.283	Zero or more elements

6.5.22.4.3.3 When generated

This primitive is generated by the MLME to report the result of the SU-MIMO hybrid beamforming protocol with a peer STA.

6.5.22.4.3.4 Effect on receipt

The SME is notified of the result of the procedure.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.22.4.4 MLME-SU-MIMO-HYBRID-BF-PROTOCOL.indication

6.5.22.4.4.1 Function

This primitive indicates that the SU-MIMO hybrid beamforming protocol with a peer STA, and at the request of that peer, has completed.

6.5.22.4.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SU-MIMO-HYBRID-BF-PROTOCOL.indication(
PeerSTAAddress,
ResultCode,
MIMOFeedbackControl,
MeasFeedback,
EDMGMeasFeedback,
DigitalBFFeedback
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity with which to perform the SU-MIMO hybrid beamforming protocol.
ResultCode	Enumeration	SUCCESS, FAILURE	Indicates the result of the SU-MIMO hybrid beamforming procedure, i.e., SUCCESS in case BF was successfully performed and FAILURE otherwise.
MIMOFeedbackControl	MIMO Feedback Control element	As defined in 9.4.2.274	Zero or more elements
MeasFeedback	Channel Measurement Feedback element	As defined in 9.4.2.135	Zero or more elements
EDMGMeasFeedback	EDMG Channel Measurement Feedback element	As defined in 9.4.2.267	Zero or more elements
DigitalBFFeedback	Digital BF Feedback elements	As defined in 9.4.2.283	Zero or more elements

6.5.22.4.4.3 When generated

This primitive is generated by the MLME to indicate successful completion of an SU-MIMO hybrid beamforming protocol procedure requested by a peer STA.

6.5.22.4.4.4 Effect on receipt

The SME is notified of the result of the procedure.

Copyright © 2025 IEEE. All rights reserved.

6.5.22.5 MU-MIMO hybrid beamforming

6.5.22.5.1 General

This subclause describes the management procedures associated with MU-MIMO hybrid beamforming.

6.5.22.5.2 MLME-MU-MIMO-HYBRID-BF-PROTOCOL.request

6.5.22.5.2.1 Function

This primitive requests that the MU-MIMO hybrid beamforming protocol occurs with a peer STA.

6.5.22.5.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MU-MIMO-HYBRID-BF-PROTOCOL.request(
EDMGGroupID,
ControlTrailer
)

Name	Type	Valid range	Description
EDMGGroupID	Integer	As defined in 9.4.2.268	Specifies the group of peer MAC entities with which to perform the MU-MIMO hybrid beamforming protocol.
ControlTrailer	A set of information fields	As defined in 28.3.7	Specifies the parameters of an SU-MIMO hybrid beamforming announcement in the SU-MIMO hybrid beamforming protocol

6.5.22.5.2.3 When generated

This primitive is generated by the SME to request that the MU-MIMO hybrid beamforming protocol be performed with a group of STAs.

6.5.22.5.2.4 Effect on receipt

On receipt of this primitive, the MLME invokes the MAC sublayer MU-MIMO hybrid beamforming protocol procedures defined in 10.41.10.2.4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.22.5.3 MLME-MU-MIMO-HYBRID-BF-PROTOCOL.confirm

6.5.22.5.3.1 Function

This primitive reports the outcome of a requested MU-MIMO hybrid beamforming protocol procedure.

6.5.22.5.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MU-MIMO-HYBRID-BF-PROTOCOL.confirm(
EDMGGroupID,
ResultCode,
MIMOFeedbackControl,
MeasFeedback,
EDMGMeasFeedback,
DigitalBFFeedback
)

Name	Type	Valid range	Description
EDMGGroupID	Integer	As defined in 9.4.2.268	Specifies the group of peer MAC entities with which the MU-MIMO hybrid beamforming protocol was performed or attempted.
ResultCode	Enumeration	SUCCESS, FAILURE	Indicates the result of the MU-MIMO hybrid beamforming procedure, i.e., SUCCESS in case BF was successfully performed and FAILURE otherwise.
MIMOFeedbackControl	MIMO Feedback Control element	As defined in 9.4.2.274	Zero or more elements
MeasFeedback	Channel Measurement Feedback element	As defined in 9.4.2.135	Zero or more elements
EDMGMeasFeedback	EDMG Channel Measurement Feedback element	As defined in 9.4.2.267	Zero or more elements
DigitalBFFeedback	Digital BF Feedback elements	As defined in 9.4.2.283	Zero or more elements

6.5.22.5.3.3 When generated

This primitive is generated by the MLME to report the result of the MU-MIMO hybrid beamforming protocol with a group of STAs.

6.5.22.5.3.4 Effect on receipt

The SME is notified of the result of the procedure.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.22.5.4 MLME-MU-MIMO-HYBRID-BF-PROTOCOL.indication

6.5.22.5.4.1 Function

This primitive indicates that the MU-MIMO hybrid beamforming protocol with a peer STA, and at the request of that peer, has completed.

6.5.22.5.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MU-MIMO-HYBRID-BF-PROTOCOL.indication(
                                    PeerSTAAddress,
                                    ResultCode,
                                    MIMOSelectionControl,
                                    EDMGGroupIDSet,
                                    DigitalBFFeedback
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the address of the peer MAC entity with which the MU-MIMO hybrid beamforming protocol was performed or attempted.
ResultCode	Enumeration	SUCCESS, FAILURE	Indicates the result of the SU MIMO hybrid beamforming procedure, i.e., SUCCESS in case BF was successfully performed and FAILURE otherwise.
MIMOSelectionControl	MIMO Selection Control element	As defined in 9.4.2.275	Zero or more elements
EDMGGroupIDSet	EDMG Group ID Set element	As defined in 9.4.2.268	Zero or more elements
DigitalBFFeedback	Digital BF Feedback elements	As defined in 9.4.2.283	Zero or more elements

6.5.22.5.4.3 When generated

This primitive is generated by the MLME to indicate successful completion of an MU-MIMO hybrid beamforming protocol procedure requested by a peer STA.

6.5.22.5.4.4 Effect on receipt

The SME is notified of the result of the procedure.

6.5.23 Estimated Throughput

6.5.23.1 General

The following set of MLME primitives support the transport of an estimate of the achievable throughput for a potential or an existing link between two STAs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.23.2 MLME-ESTIMATED-THROUGHPUT.request

6.5.23.2.1 Function

This primitive is generated by the SME to request that the MLME provide an estimate of the achievable throughput for a potential or an existing link between two STAs.

6.5.23.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ESTIMATED-THROUGHPUT.request (
                    PeerSTAAddress,
                    AverageMSDUSizeOutbound,
                    AverageMSDUSizeInbound
                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the MAC address of the STA for which throughput is to be estimated assuming an association to that STA if an association with that STA does not currently exist.
AverageMSDUSizeInbound	An ordered set of integers	–1 to 7920, for each member of the set	A set of integers providing an estimate of the average number of octets per MSDU expected to be delivered over the wireless medium to this STA by the STA corresponding to the PeerMACAddress to this STA, specified per access category in the order AC_VO, AC_VI, AC_BE, AC_BK. A value of –1 means that the size is unspecified, a value of 0 means that no MSDUs are expected to be delivered for this access category.
AverageMSDUSizeOutbound	An ordered set of integers	–1 to 7920, for each member of the set	A set of integers providing an estimate of the average number of octets per MSDU expected to be delivered over the wireless medium by this STA to the STA corresponding to the PeerMACAddress, specified per access category in the order AC_VO, AC_VI, AC_BE, AC_BK. A value of –1 means that the size is unspecified, a value of 0 means that no MSDUs are expected to be delivered for this access category.

6.5.23.2.3 When generated

This primitive is generated by the SME to request that the MLME provide an estimate of throughput for MSDUs sent between this STA and the STA that corresponds to the PeerMACAddress provided in the parameter list.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.23.2.4 Effect of receipt

On receipt of this primitive, the MLME generates a set of estimates of throughput for MSDUs sent between the STA that corresponds to the PeerMACAddress provided in the parameter list and this STA.

6.5.23.3 MLME-ESTIMATED-THROUGHPUT.confirm

6.5.23.3.1 Function

This primitive reports the result of a request to provide a set of estimated throughput values for a potential or existing link.

6.5.23.3.2 Semantics of the service primitive

The primitive uses the following parameters:

```
MLME-ESTIMATED-THROUGHPUT.confirm (
                    PeerSTAAddress,
                    EstimatedThroughputOutbound,
                    EstimatedThroughputInbound
                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual address	Specifies the MAC address of the STA for which throughput is to be estimated assuming a link with that STA if a link with that STA does not currently exist.
EstimatedThroughputOutbound	An ordered set of Real Numbers	Non-negative real numbers	The estimated throughput in the direction from this STA to the STA corresponding to the PeerMACAddress with units of MSDU b/s, specified per access category in the order AC_VO, AC_VI, AC_BE, AC_BK. A value of 0 means no estimate is available.
EstimatedThroughputInbound	An ordered set of Real Numbers	Non-negative real numbers	The estimated throughput in the direction from the STA corresponding to the PeerMACAddress to this STA with units of MSDU b/s, specified per access category in the order AC_VO, AC_VI, AC_BE, AC_BK. A value of 0 means no estimate is available.

6.5.23.3.3 When generated

This primitive is generated by the MLME to provide a set of estimates of throughput for MSDUs sent between the STA that corresponds to the PeerMACAddress indicated in the parameter list and this STA.

6.5.23.3.4 Effect of receipt

On receipt of this primitive, the SME may use the reported estimates to make link, association, and forwarding decisions.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.24 Update

6.5.24.1 Introduction

This mechanism supports the process of updating one or more parameters used in the BSS without restarting the BSS.

6.5.24.2 MLME-UPDATE.request

6.5.24.2.1 Function

This primitive requests that the MAC entity to initiate a BSS update procedure to update one or more parameters used in the BSS without restarting the BSS.

6.5.24.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-UPDATE.request(
ServiceHint,
ServiceHash,
VendorSpecificInfo)

Name	Type	Valid range	Description
ServiceHint	Service Hint element	As defined in 9.4.2.236	If null, requests that Service Hint element be removed from Beacon and Probe Response frames. Otherwise, provides an indication of the services advertised in Beacon and Probe Response frames. The parameter is optionally present if dot11UnsolicitedPADActivated is true and absent otherwise.
ServiceHash	Service Hash element	As defined in 9.4.2.237	If null, requests that Service Hash element be removed from Beacon and Probe Response frames. Otherwise, specifies services advertised in Beacon and Probe Response frames. The parameter is optionally present if dot11UnsolicitedPADActivated is true and absent otherwise.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.26	Zero or more elements.

6.5.24.2.3 When generated

This primitive is generated by the SME of an AP or PCP STA when one or more parameters used in the BSS are to be changed without restarting the BSS.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.24.2.4 Effect of receipt

If the MLME of an AP or PCP STA receives an MLME-UPDATE.request primitive with ServiceHint and or ServiceHash parameters, the AP or PCP STA shall use these parameters to update or remove the Service Hint element and/or Service Hash element in Beacon and Probe Response frames that the AP transmits or in DMG Beacon, Announce, and Probe Response frames that the PCP STA transmits.

6.5.24.3 MLME-UPDATE.confirm

6.5.24.3.1 Function

This primitive reports the results of a BSS update procedure.

6.5.24.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-UPDATE.confirm(
                                    ResultCode
                                    )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, BSS_NOT_STARTED, NOT_SUPPORTED, UPDATE_FAILED	Indicates the result of the MLME-UPDATE.request primitive.

6.5.24.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-UPDATE.request primitive to update one or more parameters used in the BSS without restarting the BSS.

6.5.24.3.4 Effect of receipt

The SME is notified of the results of the BSS update procedure.

6.5.25 WUR Discovery

6.5.25.1 General

The following MLME primitives support the WUR discovery procedure described in 29.12.

6.5.25.2 MLME-WURDISCOVERY.request

6.5.25.2.1 Function

This primitive requests to initiate WUR scanning.

6.5.25.2.2 Semantics of the service primitive

This primitive parameters are as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

MLME-WURDISCOVERY.request(

WURDiscoveryChannelList,

MinChannelTime,

MaxChannelTime,

Transmitter ID,

CompressedBSSID_MSB,

Compressed SSID)

Name	Type	Valid range	Description
WURDiscoveryChannel-List	A set of operating class and channel information as defined in 9.4.1.22.	Each channel is selected from the valid channel range for the appropriate PHY and carrier set.	Specifies the WUR discovery channels that are examined when scanning for a WUR Discovery frame.
MinChannelTime	Integer	N/A	The minimum time (in TU) to spend on each WUR discovery channel when scanning for WUR Discovery frames.
MaxChannelTime	Integer	>=MinChannelTime	The maximum time (in TU) to spend on each WUR discovery channel when scanning for WUR Discovery frames.
Transmitter ID	Integer	As defined in 29.5.3	The Transmitter ID of the WUR AP to be discovered. This parameter is optionally present.
CompressedBSSID_MSB	Integer	As defined in 9.9.3.3	The 12 MSBs of the compressed BSSID of the WUR AP to be discovered. This parameter is optionally present.
Compressed SSID	Integer	As defined in 9.9.3.3	The 16 LSBs of the short SSID of the WUR AP to be discovered. This parameter is optionally present.

6.5.25.2.3 When generated

This primitive is generated by the SME for a WUR non-AP STA to determine if there are other BSSs that it can join.

6.5.25.2.4 Effect of receipt

This request initiates the WUR discovery procedure.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.25.3 MLME-WURDISCOVERY.confirm

6.5.25.3.1 Function

This primitive indicates the receipt of a WUR Discovery frame during WUR discovery procedure.

6.5.25.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-WURDISCOVERY.confirm(

BSSDescriptionFromWDSet,

ResultCode)

Name	Type	Valid range	Description
BSSDescription-FromWDSet	Set of BSSDescription-FromWDs	N/A	The BSSDescriptionFromWDSet is returned to indicate the results of the WUR discovery derived from WUR Discovery frames. It is a set containing zero or more instances of a BSSDescriptionFromWD. Present if both dot11WUROptionImplemented and dot11WURDiscoveryImplemented are true; otherwise, not present.
ResultCode	Enumeration	SUCCESS, NOT_SUPPORTED	Indicates the result of the MLME-WURDISCOVERY.confirm primitive.

Each BSSDescriptionFromWD consists of the parameters shown in the following table for a WUR AP discovered.

Name	Type	Valid range	Description
Transmitter ID	Integer	As defined in 29.5.3	The Transmitter ID of the WUR AP carried in the ID field of the WUR Discovery frame.
CompressedBSSID_MSB	Integer	As defined in 9.9.3.3	The 12 MSBs of the compressed BSSID of the WUR AP carried in the Type Dependent Control field of the WUR Discovery frame.
Compressed SSID	Integer	As defined in 9.9.3.3	The 16 LSBs of the short SSID of the WUR AP.
Operating Channel	Operating class and channel information as defined in 9.4.1.22	As defined in 9.9.3.3	Specifies the primary channel of the WUR AP.
RSSI	Integer	0 to 255 as defined in Table 30-1.	Specifies the RSSI from the discovered WUR AP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.25.3.3 When generated

This primitive is generated by the MLME to report the operating environment of the STA. It is issued after receiving an MLME-WURDISCOVERY.request primitive.

6.5.25.4 Effect of receipt

The SME is notified of the results of the WUR discovery procedure.

6.5.26 Cancel transmissions of MSDUs

6.5.26.1 Introduction

This primitive allows higher layer entities (e.g., entities based on the IEEE 1609 [B22] family of standards) to cancel transmission of MSDUs that were previously sent to the STA and are still in the MAC entity's transmit queue.

6.5.26.2 MLME-CANCELTX.request

6.5.26.2.1 Function

Requests cancellation of transmission of all queued MSDUs belonging to the specified access category.

6.5.26.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CANCELTX.request(
                        AccessCategoryIndex
                        )
```

Name	Type	Valid range	Description
AccessCategoryIndex	Integer	0–4	Specifies the access category index of the MSDUs that are to be removed from the transmit queue. Index 0–3 is the value of the access category in Table 9-276 and index 4 indicates all access categories.

6.5.26.2.3 When generated

This primitive is generated by the SME of an OCB STA when the SME receives a request (from a higher layer entity) to remove MSDUs from the transmit queue.

6.5.26.2.4 Effect of receipt

The receipt of this primitive by the MAC entity causes the MAC entity to remove MSDUs of the specified access category index from the transmit queue.

6.5.26.3 MLME-CANCELTX.confirm

6.5.26.3.1 Function

This primitive reports completion of the removal of MSDUs from the transmit queue.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.26.3.2 Semantics of the service primitive

This primitive has no parameters.

6.5.26.3.3 When generated

The primitive is generated by the MLME to inform the SME that an MLME-CANCELTX.request primitive has been completed, so that the SME can inform the requesting entity (a higher layer entity).

6.5.26.3.4 Effect of receipt

The SME is notified that the MAC entity has completed the requested removal of MSDUs of the specified access category, if any, from the transmit queue.

6.5.27 NGV radio environment measurement

6.5.27.1 General

This primitive provides a report on the STA's radio environment.

6.5.27.2 MLME-RADIOENVIRONMENT.request

6.5.27.2.1 Function

This primitive is used to request the status information on the state of the STA's radio environment.

6.5.27.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RADIOENVIRONMENT.request (
                    RadioEnvironmentMeasurementPeriod,
                    StationMeasurementPeriod
                    )
```

Name	Type	Valid range	Description
RadioEnvironmentMeasurementPeriod	Integer	0 or 100–1000	Specifies the amount of time in milliseconds during which the NGV STA measures the channel busy percentage measurement. When equal to 0, measurements are not made.
StationMeasurementPeriod	Integer	0 or 100–1000	Specifies the amount of time in milliseconds during which the NGV STA measures the number of neighboring STAs and the number of neighboring NGV STAs. When equal to 0, measurements are not made.

6.5.27.2.3 When generated

The primitive is generated when a higher layer entity wants to acquire the status information on the state of the STA's radio environment.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.5.27.3 MLME-RADIOENVIRONMENT.indication

6.5.27.3.1 Function

This primitive provides status information on the state of the STA's radio environment.

6.5.27.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-RADIOENVIRONMENT.indication(
StationCount,
NGVCapabilityPercentage,
ChannelBusyPercentage
)

Name	Type	Valid range	Description
StationCount	Integer	0–65 535	Indicates the number of unique individual station MAC addresses detected during the most recent measurement period of duration dot11RadioEnvironmentMeasurementPeriod.
NGVCapabilityPercentage	Integer	0–100	Indicates the percentage of the stations indicated in StationCount whose transmissions contain indication of NGV capability. When StationCount is equal to 0, the NGVCapabilityPercentage shall be set to 0.
ChannelBusyPercentage	Integer	0–100	The percentage of time the channel was busy during the most recent measurement of duration dot11RadioEnvironmentMeasurementPeriod. The channel is busy when the NGV STA is either transmitting or its clear channel assessment function indicates the channel is busy. It is calculated as follows: $\frac{100 \times \text{duration as indicated channel busy}}{\text{dot11RadioEnvironmentMeasurementPeriod}}$

6.5.27.3.3 When generated

The primitive is generated by the MAC entity every dot11RadioEnvironmentMeasurementPeriod if dot11NGVOptionImplemented is true.

6.5.28 MLME-EBCSINFO procedures

6.5.28.1 General

This subclause describes the management procedures associated with EBCS Info frames.

6.5.28.2 MLME-EBCSINFO.request

6.5.28.2.1 Function

This primitive requests the transmission of an EBCS Info frame. It is valid only at an EBCS transmitter.

6.5.28.2.2 Semantics of the service primitive

The primitive parameters are as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

MLME-EBCSINFO.request(
EBCSInfoAuthenticationAlgorithm,
PrivateKey,
Certificate,
EBCSTIM,
ContentInformationSet
)

Name	Type	Valid range	Description
EBCSInfoAuthenti-cationAlgorithm	Integer	As defined in 9.6.7.54	Specifies the authentication algorithm of the EBCS Info frame.
PrivateKey	Sequence of octets	As defined in 12.14.1	Specifies the private key for signature generation.
Certificate	Sequence of octets	As defined in 9.6.7.54	Specifies the certificate to be included in the EBCS Info frame. Present if the EBCS Info Authentication Algorithm subfield indicates that a certificate is present.
EBCSTIM	EBCS TIM element	As defined in 9.4.2.314	The information for the EBCS TIM.
ContentInforma-tionSet	Set of Content Information fields as defined in the EBCS Info frame format	As defined in 9.6.7.54	A set of Content Information fields, each representing a content information EBCS transmitter advertised.

6.5.28.2.3 When generated

This primitive is generated by the SME to request the transmission of an EBCS Info frame.

6.5.28.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an EBCS Info frame. The STA then attempts to broadcast this frame.

6.5.28.3 MLME-EBCSINFO.indication

6.5.28.3.1 Function

This primitive indicates that an EBCS Info frame was received. It is valid only at a STA with dot11EBCSSupportActivated equal to true.

6.5.28.3.2 Semantics of the service primitive

The primitive parameters are as follows:
MLME-EBCSINFO.indication(
PeerSTAAddress,
EBCSInfoSequenceNumber,
Timestamp,
EBCSInfoAuthenticationAlgorithm,
EBCSTIM,
ContentInformationSet

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

)

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC address	The MAC address of the STA from which an EBCS Info frame was received.
EBCSInfoSequenceNumber	Integer	$0 – 2^{32}–1$	Indicates the EBCS Info sequence number of the EBCS Info frame.
Timestamp	Integer	$0 – 2^{64}–1$	Indicates the timestamp of the EBCS Info frame.
EBCSInfoAuthenticationAlgorithm	Integer	As defined in 9.6.7.54	Indicates the authentication algorithm of the EBCS Info frame.
EBCSTIM	EBCS TIM element	As defined in 9.4.2.314	Indicates the information for the EBCS TIM.
ContentInformationSet	Set of Content Information fields as defined in the EBCS Info frame format	As defined in 9.6.7.54	A set of Content Information fields, each representing a content information item advertised by the EBCS transmitter.

6.5.28.3.3 When generated

This primitive is generated by the MLME when an EBCS Info frame is received.

6.5.28.3.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 34.3.4.

6.5.29 EBCS UL relaying

6.5.29.1 General

The following MLME primitives support transmission and reception of the EBCS UL frame.

6.5.29.2 MLME-EBCSUL.request

6.5.29.2.1 Function

This primitive requests that an EBCS UL frame be sent. It is valid only at an EBCS non-AP STA.

6.5.29.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EBCSUL.request(
DestinationURI,
HLPPayload,
STACertificate,
FrameTxTime,
FrameCount,
PrivateKey
)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
DestinationURI	Destination URI field as defined in 9.6.7.53	As defined in 9.6.7.53	Specifies the destination to which the HLP payload is to be relayed.
HLPPayload	Sequence of octets	As defined in 9.6.7.53	Specifies the HLP payload to be relayed to the specified destination.
STACertificate	Sequence of octets	As defined in 9.6.7.53	This parameter is optionally present; when present, specifies the certificate for the STA.
FrameTxTime	Frame Tx Time field as defined in 9.6.7.53	As defined in 9.6.7.53	This parameter is optionally present; when present, specifies the time when an EBCS UL frame is queued for transmission.
FrameCount	Frame Count field as defined in 9.6.7.53	As defined in 9.6.7.53	This parameter is optionally present; when present, specifies a count of the number of EBCS UL frame transmissions.
PrivateKey	Sequence of octets	As defined in 12.15.2.5	This parameter is optionally present; when present, specifies the private key for signature generation.

6.5.29.2.3 When generated

This primitive is generated by the SME to request an EBCS UL frame be sent.

6.5.29.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an EBCS UL frame and then attempts to transmit it (also see 34.4.4).

6.5.29.3 MLME-EBCSUL.indication

6.5.29.3.1 Function

This primitive indicates that an EBCS UL frame was received. It is valid only at an EBCS relaying STA.

6.5.29.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EBCSUL.indication(
                        DestinationURI,
                        HLPPayload,
                        FrameTxTime,
                        FrameCount
                        )
```

6.5.29.3.3 When generated

This primitive is generated by the MLME when an EBCS UL frame is received.

6.5.29.3.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 34.4.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
DestinationURI	Destination URI field as defined in 9.6.7.53	As defined in 9.6.7.53	Specifies the destination to which the HLP payload is to be relayed.
HLPPayload	Sequence of octets	As defined in 9.6.7.53	Specifies the HLP payload to be relayed to the specified destination.
FrameTxTime	Frame Tx Time field as defined in 9.6.7.53	As defined in 9.6.7.53	Present when Frame Tx Time subfield was present in the receive EBCS UL frame; when present, specifies the time when an EBCS UL frame is queued for transmission.
FrameCount	Frame Count field as defined in 9.6.7.53	As defined in 9.6.7.53	Present when Frame Count subfield was present in the receive EBCS UL frame; when present, specifies a count of the number of EBCS UL frame transmissions.

6.6 MAC state generic convergence function (MSGCF)

6.6.1 Overview of the convergence function

The MSGCF provides an abstraction of a link between a non-AP STA and an ESS (an ESS link) to its higher layer entity. The MSGCF provides control of an ESS link and generates events based on the state of an ESS link. A non-AP STA that transitions between two APs in the same ESS can operate transparently to the LLC sublayer, and does not change state in the state machine defined within 6.4.

This clause defines interactions between the MSGCF and MLME and PLME through the MLME SAP and PLME SAP respectively, as well as with the SME via the MSGCF-SME SAP. The detailed manner in which the SAPs are implemented is not specified within this standard.

6.6.2 Overview of convergence function state machine

The convergence function maintains information on the state of the ESS, using the state machine shown in Figure 6-16. Because Figure 6-16 is defined in terms of ESS connectivity, it is not affected by changes in association provided that the transition was an intra-ESS transition.

6.6.3 Convergence function state list

6.6.3.1 ESS_CONNECTED

In the ESS_CONNECTED state, a non-AP STA has completed all layer 2 setup activities and is able to send Class 3 frames to peer LLC entities. A non-AP STA remains in this state as long as it is possible to send Class 3 frames through any AP within an ESS. A non-AP STA does not leave this state upon successful intra-ESS transitions.

6.6.3.2 ESS_DISCONNECTED

In the ESS_DISCONNECTED state, a non-AP STA is unable to send Class 3 frames to peer LLC entities. Higher layer network protocols are unavailable. In this state, a non-AP STA may use GAS to perform network discovery and selection.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

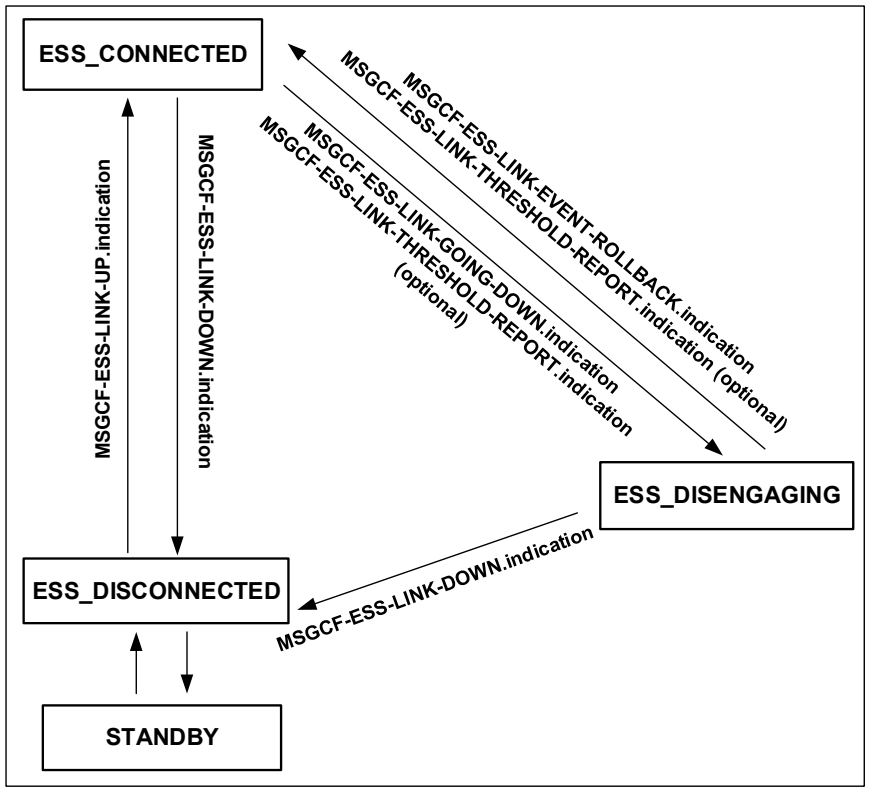

Figure 6-16—MSGCF state machine

6.6.3.3 ESS_DISENGAGING

In the ESS_DISENGAGING state, the non-AP STA's SME anticipates that links to all APs within the ESS will be lost in a defined time interval, but the non-AP STA is still able to send Class 3 frames to peer LLC entities. The predictive failure of the link might be due to explicit disassociation by the peer, the imminent invalidation of cryptographic keys because of usage limits (such as PN exhaustion), or predictive signal strength algorithms. In this state, it is recommended that a non-AP STA also initiate a search to find a new ESS.

6.6.3.4 STANDBY

In the STANDBY state, the non-AP STA is powered down and unable to communicate with any other STAs.

6.6.4 Convergence function state transitions

6.6.4.1 Transitions to ESS_CONNECTED

6.6.4.1.1 From ESS_DISCONNECTED

To make this transition, a non-AP STA completes the network selection process and the relevant procedures to attach to the ESS, including IEEE 802.11 authentication, IEEE 802.11 association, and, if required, IEEE

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

802.11 RSN procedures. When this transition is completed, the MSGCF sends an MSGCF-ESS-LINK-UP.indication primitive to higher layers.

6.6.4.1.2 From ESS_DISENGAGING

To make this transition, the SME cancels a previous event that predicted an ESS link failure. This might be due to network parameters indicating renewed link strength or a successful renewal of an expiring security association (by rekeying; see 12.6.19). When this transition is complete, the MSGCF sends an MSGCF-ESS-LINK-EVENT-ROLLBACK.indication primitive to indicate that a prior link failure predictive event is no longer valid. If the transition was due to network parameters crossing a threshold, the MSGCF also sends an MSGCF-ESS-LINK-THRESHOLD-REPORT.indication primitive to higher layers.

6.6.4.2 Transitions to ESS_DISCONNECTED

6.6.4.2.1 From ESS_CONNECTED

This transition indicates that administrative action was taken to shut down the link, a sudden loss of signal strength or that a security association expired and could not be renewed (by rekeying; see 12.6.19). At the conclusion of this transition, the MSGCF sends an MSGCF-ESS-LINK-DOWN.indication primitive to higher layer protocols.

6.6.4.2.2 From ESS_DISENGAGING

This transition indicates that the predictive link failure event has occurred. At the conclusion of this transition, the MSGCF issues an MSGCF-ESS-LINK-DOWN.indication primitive to higher layer protocols.

6.6.4.2.3 From STANDBY

This transition occurs when the non-AP STA is powered on and initialized. No event is issued by the MSGCF.

6.6.4.3 Transitions to ESS_DISENGAGING

6.6.4.3.1 From ESS_CONNECTED

When the parameters as defined in Table 6-7 change or imminent action is taken to bring down the link, the SME may predict an imminent link failure and initiate a transition. Upon completion of this transition, the MSGCF issues an MSGCF-ESS-LINK-GOING-DOWN event. If the cause of the transition was the degradation of network parameters beyond the thresholds stored in the MIB, an MSGCF-ESS-LINK-THRESHOLD-REPORT.indication primitive is also issued to higher layers.

6.6.4.4 Transitions to STANDBY

6.6.4.4.1 From ESS_DISCONNECTED

When the non-AP STA has disconnected from an ESS, it may be administratively powered off to extend battery life. No events are issued by the MSGCF upon completion of this transition.

6.6.5 Convergence function informational events

Informational events may occur in any state. When they occur, the SME updates the convergence function MIB with new parameters. Informational events do not cause state changes in the MSGCF state machine (see Figure 6-16). Informational events are generated when new potential ESS links are discovered, when the network parameter thresholds are set or read, and when higher layer protocols issue commands to the non-AP STA through the MSGCF-ESS-LINK-COMMAND.request primitive.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.6.6 MAC state generic convergence SAP

The MAC state generic convergence SAP is the interface between the convergence function and higher layer protocols. It presents a standardized interface for higher layer protocols to access the state of the MAC, whether that state information is available in the MLME, PLME, or SME.

Some events on the MAC state generic convergence SAP require event identifiers for use as a dialog token in event sequencing and rollback. The EventID is an unsigned integer that is initialized to 1 when the non-AP STA leaves the STANDBY state.

6.6.7 ESS status reporting

6.6.7.1 MSGCF-ESS-LINK-UP.indication

6.6.7.1.1 Function

This event is triggered when a new ESS has been made available for sending frames.

6.6.7.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-ESS-LINK-UP.indication(
ESSIdentifier
)

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier composed of the string value of the SSID element concatenated with the value of the HESSID if it is in use. The HESSID is encoded in upper-case ASCII characters with the octet values separated by dash characters, as described in IETF RFC 3580 [B40].

6.6.7.1.3 When generated

This primitive is generated when the ESS link to a network of APs is available to exchange Data frames. The generation of this primitive may vary depending on the setting of dot11RSNAOptionImplemented.

If dot11RSNAOptionImplemented is false, then the network does not use encryption. This event is generated upon receipt of an MLME-ASSOCIATE.confirm primitive with a result code of success.

If dot11RSNAOptionImplemented is true, then the network requires the use of encryption on the link. Before declaring that the link is ready to exchange Data frames, the convergence function receives an MLME-ASSOCIATE.confirm primitive with a result code of success and the SME emits an MLME-SETKEYS.request primitive. The latter primitive is used to determine that the RSN 4-way handshake has completed.

This event is not triggered by MLME-REASSOCIATE.confirm primitives because MLME-REASSOCIATE.confirm primitives are defined as transitions within the same ESS.

The MLME-ASSOCIATE.confirm primitive may be issued upon AP transitions. It is the objective of the MSGCF to generate this event only upon the initial connection to an IEEE 802.11 network, when the MSGCF state machine moves into the ESS_CONNECTED state.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.6.7.1.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by higher layers are outside of scope of this standard, but may include router discovery, IP configuration, and other higher layer protocol operations.

6.6.7.2 MSGCF-ESS-LINK-DOWN.indication

6.6.7.2.1 Function

This event is triggered to indicate that the connection to an ESS is no longer available for sending frames.

6.6.7.2.2 Semantics of the service primitive

The event's parameters are as follows:

MSGCF-ESS-LINK-DOWN.indication (
ESSIdentifier,
ReasonCode
)

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier composed of the string value of the SSID element concatenated with the value of the HESSID if it is in use.
ReasonCode	Enumerated	EXPLICT_DISCONNECT, KEY_EXPIRATION, LOW_POWER, VENDOR_SPECIFIC	Reason code, drawn from Table 6-2.

Table 6-2—Reason codes for network down

Name	Description
EXPLICIT_DISCONNECT	An explicit disconnection operation (disassociation or deauthentication) was initiated by the non-AP STA or the non-AP STA's current serving AP (the AP with which the STA is associated) and the non-AP STA was unable to (re)associate with an alternate AP in the same ESS.
KEY_EXPIRATION	A security association has expired due to time or traffic limitations, or TKIP countermeasures have invalidated the key hierarchy.
LOW_POWER	If the SME reports that the interface was shut down to conserve power, that event may be reported to higher level protocols.
VENDOR_SPECIFIC	Vendor-specific usage.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.6.7.2.3 When generated

This event is generated when the SME declares that connectivity to an ESS is lost. It may be generated in the case of an explicit disconnection from the link peer, received as an MLME-DEAUTHENTICATE.indication or an MLME-DISASSOCIATE.indication primitive. The SME should wait for a period of dot11ESSDisconnectFilterInterval before declaring connectivity lost to confirm that a non-AP STA is unable to (re)associate with any alternate AP within the ESS.

6.6.7.2.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard, but may include removing entries from routing and forwarding tables, and attempting to initiate handover of open application connections to network interfaces that are still active.

6.6.7.3 MSGCF-ESS-LINK-GOING-DOWN.indication

6.6.7.3.1 Function

This event is triggered to indicate the expectation that the connection to an ESS will no longer be available for sending frames in the near future.

6.6.7.3.2 Semantics of the service primitive

The event parameters are as follows:

MSGCF-ESS-LINK-GOING-DOWN.indication(
ESSIdentifier,
EventID,
TimeInterval,
ReasonCode
)

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier composed of the string value of the SSID element concatenated with the value of the HESSID if it is in use.
EventID	Integer	N/A	An integer used to identify the event that is used in the case of event rollback.
TimeInterval	Integer	N/A	Time Interval, in time units, in which the link is expected to go down. Connectivity is expected to be available at least for time specified by TimeInterval.
Reason Code	Enumerated	EXPLICT_DISCONNECT, KEY_EXPIRATION, LOW_POWER, VENDOR_SPECIFIC	Indicates the reason the link is expected to go down, drawn from Table 6-3.

6.6.7.3.3 When generated

This notification is generated by the MSGCF when the ESS link is currently established and is expected to go down within the specified time interval. The network can be expected to go down because of an event whose timing is well understood, such as an explicit disconnection event observed on the MLME SAP. It can also be expected as the result of a predictive algorithm that monitors link quality. The details of such a predictive algorithm used are beyond the scope of this standard.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 6-3—Reason codes for ESS link down

Name	Description
EXPLICIT_DISCONNECT	An explicit disconnection operation (Disassociation or Deauthentication) was initiated by the non-AP STA or the non-AP STA's current serving AP.
KEY_EXPIRATION	A security association has expired due to time or traffic limitations, or TKIP countermeasures have invalidated the key hierarchy.
LOW_POWER	If the SME reports that the interface is going to be shut down to conserve power, that event may be reported to higher level protocols.
VENDOR_SPECIFIC	Vendor-specific usage.

The convergence function should attempt to deliver this event at least dot11ESSLinkDownTimeInterval time units before the link is predicted to go down. Different higher layer network protocols might need different levels of advance notice, and might configure dot11ESSLinkDownTimeInterval accordingly.

Not all thresholds in the dot11MACStateParameterTable are supported by every PHY. In the case when a threshold parameter is not supported it is not applied.

6.6.7.3.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard, but may include beginning preparations for handover.

6.6.7.4 MSGCF-ESS-LINK-EVENT-ROLLBACK.indication

6.6.7.4.1 Function

This event is used to indicate that specific previous reports or events are no longer valid and should be disregarded.

6.6.7.4.2 Semantics of the service primitive

The event parameters are as follows:

```
MSGCF-ESS-LINK-EVENT-ROLLBACK.indication(
                                        ESSIdentifier,
                                        EventID
                                        )
```

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
EventID	Integer	N/A	An integer used to identify the event that is used in the case of event rollback.

6.6.7.4.3 When generated

This event is generated when a previous predictive event is no longer valid within its expiration time.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The MSGCF-ESS-LINK-EVENT-ROLLBACK.indication primitive is used in conjunction with the MSGCF-ESS-LINK-GOING-DOWN.indication primitive. The MSGCF-ESS-LINK-EVENT-ROLLBACK.indication primitive is issued when the prediction of link failure is no longer valid. Algorithms used to determine that link failure predictions are beyond the scope of this standard.

6.6.7.4.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function to cancel any actions begun by the previous event. Actions taken by those higher layers are outside the scope of this standard, but may include canceling any handover procedures started by the MSGCF-ESS-LINK-GOING-DOWN event.

6.6.7.5 MSGCF-ESS-LINK-DETECTED.indication

6.6.7.5.1 Function

This event reports on the presence of a new ESS.

6.6.7.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-ESS-LINK-DETECTED.indication(
ESSIdentifier,
ESSDescription
)

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID used to identify the network, concatenated with the value of the HESSID if it is in use.
ESSDescription	As defined in Table 6-4	N/A	A set of information about the ESS.

Table 6-4—ESS description

Name	Syntax	Description
SSID	String	The SSID used by the ESS.
InformationServiceSupport	As described in Table 6-5	A set of values indicating the type of information services supported on this network.
TriggerSupport	As described in Table 6-5	A set of values indicating the support for the types of triggers that can be used to propose that the station take action.
RSN	As defined in 9.4.2.23	The RSN configuration of the ESS.
Interworking	As defined in 9.4.2.90	Interworking configuration of the ESS.

6.6.7.5.3 When generated

Support for MIS is indicated by the presence or absence of the relevant advertisement protocol IDs in the Advertisement Protocol element.To maintain the list of detected networks, the SME issues recurring MLME-SCAN.request primitives to the MLME. The SME may schedule these requests to avoid interruption of user

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 6-5—Trigger support values

Name	Description
MIS_CS_ES_Support	This network supports the IEEE 802.21 MIS Command Service and Event Service.
Vendor_Specific_Trigger_Support	This network supports a vendor-specific trigger service.

traffic. Responses to these requests, received in the MLME-SCAN.confirm primitives, contain a list of detected networks. Each network is stored in dot11MACStateESSLinkDetectedTable. This table holds a list of networks, organized by Network Identifier. Each entry in the table contains a list of BSSIDs within the network, as well as indications of support for MIS. Support for MIS is indicated by the presence or absence of the relevant advertisement protocol IDs in the Advertisement Protocol element. Each entry in the table is held for at least dot11ESSLinkDetectionHoldInterval time units. When a non-AP STA has not observed an ESS for longer than dot11ESSLinkDetectionHoldInterval, it may be removed from the table.

This event is generated when a new entry is made into the dot11MACStateESSLinkDetectedTable. Modifications to existing entries in the list, such as an update to the BSSID list, do not trigger this event.

6.6.7.5.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard.

6.6.7.6 MSGCF-ESS-LINK-SCAN.request

6.6.7.6.1 Function

This function is used by higher layer protocols to request that the SME perform a scan operation for available ESSs.

6.6.7.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-LINK-SCAN.request(
                                    SSID,
                                    HESSID,
                                    AccessNetworkType
                                    )
```

Name	Type	Valid range	Description
SSID	Octet string	0–32 octets	Specific or wildcard.
HESSID	As defined in 9.4.2.90	As defined in 9.4.2.90	The HESSID to search for. It can be set to all 1s for use as a wildcard to match all available HESSID values.
AccessNetworkType	As defined in 9.4.2.90	As defined in 9.4.2.90	This may be a specific value to match one type of networks, or all 1s to match all access network types.

6.6.7.6.3 When generated

This request is generated when higher protocol layers request a list of available ESSs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.6.7.6.4 Effect of receipt

The SME generates a corresponding MLME-SCAN.request primitive to find available networks.

6.6.7.7 MSGCF-ESS-LINK-SCAN.confirm

6.6.7.7.1 Function

This function reports information on available ESSs to higher protocol layers.

6.6.7.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-LINK-SCAN.confirm(
                                    ESSIdentifiers,
                                    ESSDescriptions
                                    )
```

Name	Type	Valid range	Description
ESSIdentifiers	Set of Strings	N/A	An identifier for the network composed of the string value of the SSID used to identify the network, concatenated with the value of the HESSID if it is in use.
ESSDescriptions	Set of ESSDescriptions, as defined in Table 6-4	N/A	A set of information about each discovered ESS.

6.6.7.7.3 When generated

This primitive is generated when scan results are available for reporting to higher protocol layers, in response to an MSGCF-ESS-LINK-SCAN.request primitive.

6.6.7.7.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard.

6.6.8 Network configuration

6.6.8.1 MSGCF-ESS-LINK-CAPABILITY.request

6.6.8.1.1 Function

This primitive requests a list of the capabilities supported by a network.

6.6.8.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-LINK-CAPABILITY.request(
                                    ESSIdentifier
                                    )
```

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.

6.6.8.1.3 When generated

This primitive is issued to service higher layer protocols by reporting on the capabilities of a particular network.

6.6.8.1.4 Effect of receipt

The convergence function retrieves the capabilities and reports them via the MSGCF-ESS-LINK-CAPABILITY.confirm primitive.

6.6.8.2 MSGCF-ESS-LINK-CAPABILITY.confirm

6.6.8.2.1 Function

This primitive reports the convergence function capabilities of the network to higher layer protocols.

6.6.8.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-ESS-LINK-CAPABILITY.confirm(
ESSIdentifier,
EssLinkParameterSet,
ReasonCode
)

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
EventCapability Set	As defined in Table 6-6	N/A	list of supported events.
ReasonCode	Enumerated	SUCCESS, UNKNOWN_NETWORK, UNKNOWN_CAPABILITIES	An error code, if applicable.

Table 6-6—Event Capability Set

Name	Type	Valid range	Description
NonAPSTAMACAddress	MAC address	Any valid individual address	The MAC address of the non-AP STA that is reporting the new network.
ESS-Link-Up	Boolean	true, false	Indicates whether the MSGCF-ESS-LINK-UP.indication primitive as defined in 6.6.7.1 is supported.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 6-6—Event Capability Set *(continued)*

Name	Type	Valid range	Description
ESS-Link-Down	Boolean	true, false	Indicates whether the MSGCF-ESS-LINK-DOWN.indication primitive as defined in 6.6.7.2 is supported.
ESS-Link-Going-Down	Boolean	true, false	Indicates whether the MSGCF-ESS-LINK-GOING-DOWN primitive as defined in 6.6.7.3 is supported.
ESS-Link-Event-Rollback	Boolean	true, false	Indicates whether the MSGCF-ESS-LINK-EVENT-ROLLBACK.indication primitive as defined in 6.6.7.4 is supported.
ESS-Link-Detected	Boolean	true, false	Indicates whether the MSGCF-ESS-LINK-DETECTED.indication primitive as defined in 6.6.7.5 is supported.
ESS-Link-Threshold-Report	Boolean	true, false	Indicates whether the MSGCF-ESS-LINK-THRESHOLD-REPORT.indication primitive as defined in 6.6.9.1 is supported.
ESS-Link-Command	Boolean	true, false	Indicates whether the MSGCF-ESS-LINK-COMMAND.request primitive as defined in 6.6.10.1 is supported.

6.6.8.2.3 When generated

This primitive is generated in response to the MSGCF-ESS-LINK-CAPABILITY.request primitive to report whether specific events are supported.

6.6.8.2.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function.

6.6.8.3 MSGCF-ESS-LINK-PARAMETERS.request

6.6.8.3.1 Function

This primitive sets thresholds for reporting of network events.

6.6.8.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-LINK-PARAMETERS.request(
                                    ESSIdentifier,
                                    EssLinkParameterSet
                                    )
```

The ESSLinkParameterSet parameter is defined in Table 6-7. It may include any or all of the parameters in Table 6-7.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
ESSLinkParameterSet	As defined in Table 6-7	N/A	The EssLinkParameterSet is used to configure when event reports are sent to higher protocol layers.

Table 6-7—ESS Link Parameter Set

Name	Type	Valid range	Description
PeakOperationalRate	Integer	As defined in 9.4.2.3	The integer representing the target peak modulation data rate used for Data frame transmission.
MinimumOperationalRate	Integer	As defined in 9.4.2.3	The integer encoding of the target minimum modulation data rate used in Data frame transmission.
NetworkDowntimeInterval	Integer	0–65 535	Target advance warning time interval, in TUs, for MSGCF-ESS-LINK-GOING-DOWN events.
BeaconRSSI	Integer	–100 to 40	The received signal strength in dBm of Beacon frames received on the channel. This may be time-averaged over recent history by a vendor-specific smoothing function.
BeaconSNR	Integer	0–100	The signal-to-noise ratio of the received Beacon frames, in dB. This may be time-averaged over recent history by a vendor-specific smoothing function.
DataFrameSNR	Integer	0–100	The signal-to-noise ratio of the received Data frames, in dB. This may be time-averaged over recent history by a vendor-specific smoothing function.
DataThroughput	Integer	0–65 535	The data throughput in Mb/s, rounded to the nearest megabit. This may be time-averaged over recent history by a vendor-specific smoothing function.
MissedBeaconRate	Real	N/A	The rate at which beacons have not been received in missed beacons per second. This may be time-averaged over recent history by a vendor-specific smoothing function.
FrameErrorRate	Real	N/A	The frame error rate of the network in errors per second. This may be time-averaged over recent history by a vendor-specific smoothing function.
VendorSpecific	Vendor Specific	As defined by 9.4.2.24	Additional vendor-specific parameters may be included in this event.

6.6.8.3.3 When generated

This event is generated when higher protocol layers wish to set the performance parameters for a network. Higher protocol layers are responsible for ensuring that the set of configured network parameters is consistent with all subscribers to those higher layer protocols.

6.6.8.3.4 Effect of receipt

Parameters supplied in the event are stored in the MIB, either in the dot11MACStateConfigTable or the dot11MACStateParameterTable.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.6.8.4 MSGCF-ESS-LINK-PARAMETERS.confirm

6.6.8.4.1 Function

This primitive indicates whether network parameters were accepted.

6.6.8.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-ESS-LINK-PARAMETERS.confirm(
ESSIdentifier,
EssLinkParameterSet,
)

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
EssLinkParameterSet	As defined in Table 6-7	N/A	The EssLinkParameterSet is used to configure when event reports are sent to higher protocol layers.

6.6.8.4.3 When generated

This primitive is generated in response to the MSGCF-ESS-LINK-PARAMETERS.request primitive and is used to indicate whether the parameter set was accepted.

6.6.8.4.4 Effect of receipt

The SME is notified of the new parameter set.

6.6.8.5 MSGCF-GET-ESS-LINK-PARAMETERS.request

6.6.8.5.1 Function

This primitive retrieves the current network parameters for a specific network.

6.6.8.5.2 Semantics of the service primitive

The primitive parameter is as follows:

MSGCF-GET-ESS-LINK-PARAMETERS.request(
ESSIdentifier
)

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.

6.6.8.5.3 When generated

This primitive is used by higher layers to retrieve the currently stored parameters for a network.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.6.8.5.4 Effect of receipt

The SME retrieves the network parameters and makes them available through the MSGCF-GET-ESS-LINK-PARAMETERS.confirm primitive.

6.6.8.6 MSGCF-GET-ESS-LINK-PARAMETERS.confirm

6.6.8.6.1 Function

This primitive reports the current network parameters.

6.6.8.6.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-GET-ESS-LINK-PARAMETERS.confirm(
ESSIdentifier,
EssLinkParameterSet,
)

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
EssLinkParameterSet	As defined 6.6.8.3	N/A	The EssLinkParameterSet is used to configure when event reports are sent to higher protocol layers.

6.6.8.6.3 When generated

This primitive is generated by the MSGCF as a result of the MSGCF-GET-ESS-LINK-PARAMETERS.request primitive.

6.6.8.6.4 Effect of receipt

The higher layer protocols are notified of the current network parameters.

6.6.9 Network events

6.6.9.1 MSGCF-ESS-LINK-THRESHOLD-REPORT.indication

6.6.9.1.1 Function

This event reports that the layer 2 network performance has crossed a threshold set by the operations described in Table 6-5.

6.6.9.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-ESS-LINK-THRESHOLD-REPORT.indication(
ESSIdentifier,
EssLinkParameterSet,
ThresholdCrossingDirectionSet
)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
EssLinkParameterSet	As defined in Table 6-7	N/A	A list of EssLinkParameterSets and their current values that have crossed preset thresholds for alerts.
ThresholdCrossingDirectionSet	Set of ThresholdCrossing Directions, one for each value in the EssLinkParameterSet	UPWARD, DOWNWARD	Whether the parameter has crossed the threshold while rising or falling.

6.6.9.1.3 When generated

The convergence function is responsible for monitoring network performance. If the monitored parameters cross the configured threshold, this event is generated to inform higher layer protocols.

6.6.9.1.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard, but may include preparations for handover or assessing whether handover should be imminent.

6.6.10 Network command interface

6.6.10.1 MSGCF-ESS-LINK-COMMAND.request

6.6.10.1.1 Function

This primitive requests that a STA take action for a network.

6.6.10.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-LINK-COMMAND.request(
                                ESSIdentifier,
                                CommandType
                                )
```

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
CommandType	Enumerated	DISCONNECT, LOW_POWER, POWER_UP, POWER_DOWN, SCAN	Type of command to perform on the link as described in the following subclauses.

6.6.10.1.3 When generated

This primitive is generated by a higher layer protocol.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.6.10.1.4 Effect of receipt

The convergence function issues commands to the SME to implement the requested action on behalf of higher layers.

When the DISCONNECT command type is specified, the higher layer is requesting that the STA disconnect from its peer. When the SME on a non-AP STA receives this command, the SME issues an MLME-DEAUTHENTICATE.request primitive to disconnect from the network, and the SME refrains from reconnecting to that network.

When the POWER_DOWN command type is specified, the SME powers down the non-AP STA. Before doing so, it may choose to notify the AP.

When the POWER_UP command type is specified, the SME starts the non-AP STA.

When the LOW_POWER command type is specified, the higher layer is requesting that the interface be placed in a low power mode. This action is accomplished by issuing an MLME-POWERMGT.request primitive with the PowerManagementMode parameter set to POWER_SAVE.

When the SCAN command type is specified, the higher layer is requesting that the STA search for networks. This action is accomplished by issuing an MLME-SCAN.request primitive. Detected networks are made available in the dot11MACStateESSLinkDetectedTable, as well as through the MSGCF-ESS-LINK-DETECTED.indication primitive.

6.6.11 MAC state SME SAP—mobility management

6.6.11.1 MSSME-ESS-LINK-GOING-DOWN.indication

6.6.11.1.1 Function

This primitive indicates that the SME is predicting a link failure.

6.6.11.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MSSME-ESS-LINK-GOING-DOWN.indication(
NonAPSTAMACAddress,
ESSIdentifier,
TimeInterval,
ReasonCode
)

Name	Type	Valid range	Description
NonAPSTAMACAddress	MAC address	Any valid individual address	The MAC address of the non-AP STA that is reporting that an ESS is expected to go down.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
TimeInterval	Integer	N/A	Time Interval, in time units, in which the link is expected to go down. Connectivity is expected to be available at least for time specified by *TimeInterval*.
Reason Code	Enumerated	EXPLICIT_DISCONNECT, LINK_PARAMETER_DEGRADATION, KEY_EXPIRATION, LOW_POWER, QOS_UNAVAILABLE, VENDOR_SPECIFIC	Indicates the reason the link is expected to go down.

6.6.11.1.3 When generated

This notification is generated by the SME when the network connection is currently established and is expected to go down. The details of the predictive algorithm used are beyond the scope of this standard. One method of implementing this function would be to generate this indication when link quality is fading and no better AP can be found.

6.6.11.1.4 Effect of receipt

This indication is received by the MSGCF and is used to generate the MSGCF-ESS-LINK-DOWN.indication primitive due to link parameter degradation.

6.7 PLME SAP interface

6.7.1 General

The PHY management service interface consists of the generic PLMEGET and PLMESET primitives on PHY MIB attributes, as described previously, together with the PLME-RESET and PLME-CHARACTERISTICS primitives and the following specific primitives.

6.7.2 PLME-RESET.request

6.7.2.1 Function

This primitive is a request by the SME to reset the PHY. The PHY is always reset to the receive state to avoid accidental data transmission.

6.7.2.2 Semantics of the service primitive

This primitive has no parameters.

6.7.2.3 When generated

This primitive is generated at any time to reset the PHY.

6.7.2.4 Effect of receipt

Receipt of this primitive by the PHY causes the PHY entity to reset both the transmit and the receive state machines and places the PHY into the receive state.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.7.3 PLME-CHARACTERISTICS.request

6.7.3.1 Function

This primitive is a request by the SME to provide PHY operational characteristics.

6.7.3.2 Semantics of the service primitive

This primitive has no parameters.

6.7.3.3 When generated

This primitive is generated by the SME, at initialization time, to request the PHY entity to provide its operational characteristics.

6.7.3.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is the generation of a PLME-CHARACTERISTICS.confirm primitive that conveys its operational characteristics.

6.7.4 PLME-CHARACTERISTICS.confirm

6.7.4.1 Function

This primitive provides PHY operational characteristics.

6.7.4.2 Semantics of the service primitive

The primitive provides the following parameters:

PLME-CHARACTERISTICS.confirm(
aSlotTime,
aSIFSTime,
aSignalExtension,
aCCATime,
aCCAMidTime,
aRxPHYStartDelay,
aRxTxTurnaroundTime,
aTxPHYDelay,
aRxPHYDelay,
aRxTxSwitchTime,
aTxRampOnTime,
aAirPropagationTime,
aMACProcessingDelay,
aRIFSTime,
aSymbolLength,
aPSDUMaxLength,
aPSDUMaxLengthWithNoAggregation,
aPPDUMaxTime,
aCWmin,
aCWmax,
aMaxCSIMatricesReportDelay
aMaxTODError,
aMaxTOAError,
aTxPHYTxStartRFDelay,

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

aTxPHYTxStartRMS,
aMaxTODFineError,
aMaxTOAFineError,
aAPEPMaxLengthVHTMU20,
aAPEPMaxLengthVHTMU40,
aAPEPMaxLengthVHTMU80orMore,
aCMMGPPMinListeningTime
)

The values assigned to the parameters are as specified in the PLME SAP interface specification contained within each PHY subclass of this standard. Not all parameters are used by all PHYs defined within this standard.

Name	Type	Description
aSlotTime	Integer	The slot time (in microseconds) that the MAC uses for defining IFSs. See 10.3.7.
aSIFSTime	Integer	The nominal time (in microseconds) that the MAC and PHY require from reception of the end of a PPDU[+SigExt] on the WM, until the MAC and PHY have processed any frame(s) therein, and responded with the start on the WM of the PPDU containing the earliest possible response frame. See 10.3.7.
aSignalExtension	Integer	Duration (in microseconds) of the signal extension (i.e., a period of no transmission) that is included immediately after certain PPDU formats; see 19.3.2 and 10.3.8.
aCCATime	Integer	For Clause 15 to Clause 18 PHYs and Clause 20 PHYs, the maximum time (in microseconds) the CCA mechanism has available to assess the medium to determine whether the medium is busy or idle. For Clause 19 and Clause 21 PHYs, the maximum time (in microseconds) that the CCA mechanism has available to detect the start of an IEEE 802.11 transmission within the primary channel and to assess the energy on the medium within the primary, secondary, secondary40 (Clause 21 PHY only), and secondary80 (Clause 21 PHY only) channels that fall inside the operating channel, in order to determine the values of the STATE and channel-list parameters of the PHY-CCA.indication primitive.
aCCAMidTime	Integer	For Clause 21 PHYs, the maximum time (in microseconds) the CCA mechanism has available to assess the medium to determine whether an IEEE 802.11 transmission is present on a nonprimary channel.
aRxPHYStartDelay	Integer(s)	One or more integer delay values for each supported PHY clause, where each delay, in microseconds, is from the start of the PPDU at the receiver's antenna to the issuance of earlier of the PHY-RXEARLYSIG.indication if sent or the PHY-RXSTART.indication primitive.
aRxTxTurnaroundTime	Integer	The maximum time (in microseconds) that the PHY requires to change from receiving to transmitting the start of the first symbol. See 10.3.7.
aTxPHYDelay	Integer	The nominal time (in microseconds) that the PHY uses from when a PHY-TXSTART.request primitive is issued until the PHY begins transmission of the requested PPDU at the air interface.
aRxPHYDelay	Integer	The nominal time (in microseconds) that the PHY takes to generate the PHY-RXEND.indication for a received PPDU to the MAC from the end of the PPDU[+SigExt] on the WM.
aRxTxSwitchTime	Integer	The nominal time (in microseconds) that the PHY takes to switch from receive to transmit.
aTxRampOnTime	Integer	The maximum time (in microseconds) that the PHY takes to turn the transmitter on.
aAirPropagationTime	Integer	Twice the propagation time (in microseconds) for a signal to cross the maximum distance between the most distant allowable STAs that are slot synchronized.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Description
aMACProcessingDelay	Integer	The maximum time (in microseconds) available for the MAC to issue a PHY-TXSTART.request primitive pursuant to a PHY-RXEND.indication primitive (for response after a SIFS) or PHY-CCA.indication(IDLE) primitive (for response at any slot boundary following a SIFS). This constraint on MAC performance is defined as a PHY-specific parameter because of its use, along with other PHY-specific time delays, in calculating the two PHY characteristics of primary concern to the MAC: aSlotTime and aSIFSTime. See 10.3.7.
aRIFSTime	Integer	Value of the reduced interframe space (in microseconds), which is the time by which multiple transmissions from a single transmitter may be separated, when no SIFS-separated response transmission is expected. See 10.3.2.3.2.
aSymbolLength	Integer	The current PHY's Symbol length (in microseconds). If the actual value of the length is not an integer number of μs, the value is rounded up to the next higher value.
aPSDUMaxLength	Integer	The maximum number of octets in a PSDU that can be conveyed by a PPDU.
aPSDUMaxLengthWithNoAggregation	Integer	The maximum number of octets in a PSDU that can be conveyed by an S1G PPDU when the Aggregation field is 0.
aPPDUMaxTime	Integer	The maximum duration of a PPDU in milliseconds.
aCWmin	Integer	The minimum size of the CW, in units of aSlotTime.
aCWmax	Integer	The maximum size of the CW, in units of aSlotTime.
aMaxCSIMatricesReportDelay	Integer	The maximum time (in milliseconds) between the reception of a PSDU containing a frame containing a CSI Feedback Request or an HT NDP announcement and the transmission of the PSDU containing a first CSI frame containing channel state information measured from the received Sounding Complete frame. See 10.33.2.4.4.
aMaxTODError	Integer	An estimate of the maximum error (in 10 ns units) in the TX_START_OF_FRAME_OFFSET value in the PHY-TXSTART.confirm primitive. The estimated maximum error includes any error due to implementation component and environmental (including temperature) variability.
aMaxTOAError	Integer	An estimate of the maximum error (in 10 ns units) in the RX_START_OF_FRAME_OFFSET value in the PHY-RXSTART.indication primitive. The estimated maximum error includes any error due to implementation component and environmental (including temperature) variability.
aTxPHYTxStartRFDelay	Integer	The delay (in units of 0.5 ns) between a PHY-TXSTART.request primitive being issued and the first PPDU energy sent by the transmitting port, for the current channel.
aTxPHYTxStartRMS	Integer	The RMS time of departure error (in units of 0.5 ns), where the time of departure error equals the difference between TIME_OF_DEPARTURE and the time of departure measured by a reference entity using a clock synchronized to the start time and mean frequency of the local PHY entity's clock.
aMaxTODFineError	Integer	An estimate of the maximum error (in units of picoseconds) in the TX_START_OF_FRAME_OFFSET value in the PHY-TXSTART.confirm primitive. The estimated maximum error includes any error due to implementation component and environmental (including temperature) variability.
aMaxTOAFineError	Integer	An estimate of the maximum error (in units of picoseconds) in the RX_START_OF_FRAME_OFFSET value in the PHY-RXSTART.indication primitive. The estimated maximum error includes any error due to implementation component and environmental (including temperature) variability.
aAPEPMaxLengthVHTMU20	Integer	Maximum APEP_LENGTH value allowed for 20 MHz VHT MU PPDUs.
aAPEPMaxLengthVHTMU40	Integer	Maximum APEP_LENGTH value allowed for 40 MHz VHT MU PPDUs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Description
aAPEPMaxLengthVHTMU80orMore	Integer	Maximum APEP_LENGTH value allowed for 80 MHz, 160 MHz, and 80+80 MHz VHT MU PPDUs.
aCMMGPPMinListeningTime	Integer	The minimum time (in microseconds) CMMG STA moves to and stays in listening mode.

6.7.4.3 When generated

This primitive is issued by the PHY entity in response to a PLME-CHARACTERISTICS.request primitive.

6.7.4.4 Effect of receipt

The receipt of this primitive provides PHY operational characteristics. The MAC determines aRxPHYStartDelay by excluding values of aRxPHYStartDelay for each supported PHY clause that are not allowed in the current context, then setting aRxPHYStartDelay to the maximum of the remaining values.

6.7.5 PLME-TXTIME.request

6.7.5.1 Function

This primitive is a request for the PHY to calculate the time required to transmit onto the WM a PPDU containing a specified length PSDU, and using a specified format, data rate, and signaling.

6.7.5.2 Semantics of the service primitive

This primitive provides the following parameter:

```
PLME-TXTIME.request(
                                    TXVECTOR
                                    )
```

The TXVECTOR represents a list of parameters that the MAC sublayer provides to the local PHY entity in order to transmit a PSDU. The minimum required PHY parameters are listed in 8.3.4.4.

6.7.5.3 When generated

This primitive is issued by the MAC sublayer to the PHY entity when the MAC sublayer needs to determine the time required to transmit a particular PSDU.

6.7.5.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is to generate a PLME-TXTIME.confirm primitive that conveys the required transmission time.

6.7.6 PLME-TXTIME.confirm

6.7.6.1 Function

This primitive indicates the time required to transmit the PPDU described in the corresponding PLME-TXTIME.request primitive.

When the TXVECTOR parameter FORMAT in the corresponding PLME-TXTIME.request primitive is VHT, the primitive also provides the number of octets, per user, required to fill the PPDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.7.6.2 Semantics of the service primitive

This primitive provides the following parameter:

```
PLME-TXTIME.confirm(
                        TXTIME,
                        PSDU_LENGTH[]
                        )
```

The TXTIME represents the time, in microseconds, required to transmit the PPDU described in the corresponding PLME-TXTIME.request primitive. If the calculated time includes a fractional microsecond and the TXVECTOR parameter FORMAT in the corresponding PLME-TXTIME.request primitive is not HE_SU, HE_MU, HE_TB, or HE_ER_SU, a non-DMG STA rounds the TXTIME value to the next higher integer. A non-DMG STA does not round the TXTIME value up or down if the TXVECTOR parameter FORMAT in the corresponding PLME-TXTIME.request primitive is HE_SU, HE_MU, HE_TB, or HE_ER_SU. A DMG STA does not round the TXTIME value up or down.

The PSDU_LENGTH[] parameter is an array of size TXVECTOR parameter NUM_USERS if the TXVECTOR parameter FORMAT is VHT. If the TXVECTOR parameter FORMAT is HE_SU, HE_ER, or HE_TB, the size of the parameter PSDU_LENGTH[] array is always 1. If the TXVECTOR parameter FORMAT is HE_MU, the size of the parameter PSDU_LENGTH[] array is determined by TXVECTOR parameters RU_ALLOCATION and STA_ID. Each value in the array indicates the number of octets required to fill the PPDU for the user represented by that array index. The parameter is present only when the TXVECTOR parameter FORMAT is VHT, HE_SU, HE_ER_SU, HE_MU, or HE_TB.

6.7.6.3 When generated

This primitive is issued by the local PHY entity in response to a PLME-TXTIME.request primitive.

6.7.6.4 Effect of receipt

The receipt of this primitive provides the MAC sublayer with the PPDU transmission time.

6.7.7 PLME-MINPAYLOADSTAT.request

6.7.7.1 Function

This primitive is a request for the PHY to start measuring the signal power of received PPDUs and compute metrics such as EVM, SNR and LDPC over iterations of PPDUs that exceed the prescribed PSDU length (see 10.42.5).

6.7.7.2 Semantics of the service primitive

This primitive provides the following parameter:

```
PLME-MINPAYLOADSTAT.request(
                        PSDU_MIN_LENGTH
                        )
```

The PSDU_MIN_LENGTH parameter represents the smallest PSDU length, in octets, that PPDUs are required to have for the PHY to compute the required metrics.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.7.7.3 When generated

This primitive is issued by the SME to the PHY entity to require the PHY to proceed with parameters measurement of received PPDUs that have a PSDU length no less than PSDU_MIN_LENGTH. The SME also issues the primitive to change the value of PSDU_MIN_LENGTH.

6.7.7.4 Effect on receipt

The effect of receipt of this primitive by the PHY entity is to start measuring signal power and to compute the metrics measured over PPDUs with a PSDU length no less than PSDU_MIN_LENGTH.

6.7.8 PLME-MINPAYLOADSTAT.confirm

6.7.8.1 Function

This primitive indicates that the PHY is ready to proceed with the measurement over received PPDUs and that the threshold has been set to PSDU_MIN_LENGTH.

6.7.8.2 Semantics of the service primitive

This primitive provides the following parameter:

```
PLME-MINPAYLOADSTAT.confirm(
                                    PSDU_MIN_LENGTH
                                    )
```

The PSDU_MIN_LENGTH parameter represents the smallest PSDU length, in octets, that PPDUs are required to have for the PHY to compute the required metrics.

6.7.8.3 When generated

This primitive is issued by the local PHY entity in response to a PLME-MINPAYLOADSTAT.request primitive.

6.7.8.4 Effect on receipt

The receipt of this primitive indicates to the SME that the PHY is ready to proceed with the measurement over received PPDUs that have a PSDU length no less than PSDU_MIN_LENGTH.

6.7.9 PLME- MINPAYLOADSTATRESET.request

6.7.9.1 Function

This primitive is a request by the SME to reset the PHY counters corresponding to the PLME-MINPAYLOADSTAT primitive. No other PHY functionality is impacted by the primitive.

6.7.9.2 Semantics of the service primitive

This primitive has no parameters.

6.7.9.3 When generated

This primitive is generated to reset the PHY measurements initiated by the PLME-MINPAYLOADSTAT.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6.7.9.4 Effect on receipt

Receipt of this primitive by the PHY causes it to reset the PHY counters of received PPDUs.

6.7.10 PLME- MINPAYLOADSTATSTOP.request

6.7.10.1 Function

This primitive is a request by the SME for the PHY to stop all measurements corresponding to the PLME-MINPAYLOADSTAT primitive. No other PHY functionality is impacted by the primitive.

6.7.10.2 Semantics of the service primitive

This primitive has no parameters.

6.7.10.3 When generated

This primitive is generated to stop the PHY measurements initiated by the PLME-MINPAYLOADSTAT.

6.7.10.4 Effect on receipt

Receipt of this primitive by the PHY causes it to stop the PHY measurements of received PPDUs.

7. DS SAP specification

7.1 Introduction

The DS SAP is the interface between the DS SAP service users and the DS SAP service provider. The DS SAP service users are the connected APs, mesh gates, and the portal. The DS SAP service provider is the DS. Figure 7-1 shows the location of the DS in the IEEE 802.11 architecture. The DS SAP is indicated in this Figure by the lines connecting the DS to its service users. In Figure 7-1, the DS has four users, two APs, a mesh gate, and a portal, so the DS is shown passing behind the MAC/PHYs of the STAs.

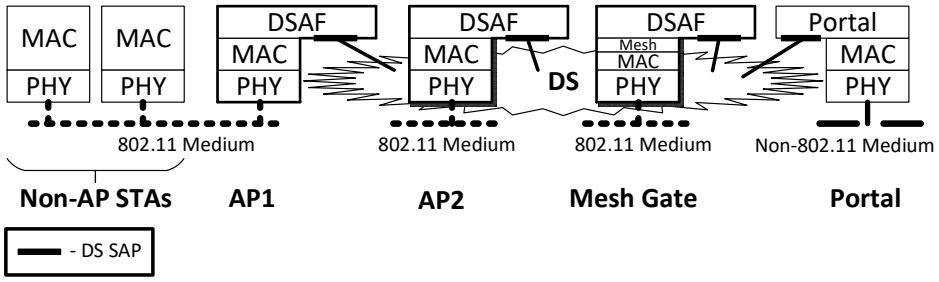

Figure 7-1—DS architecture

The DS SAP interface specification describes the primitives required to get MAC service tuples in and out of the DS and update the DS's mapping of STAs to APs or to mesh gates. Describing the DS itself or the functions thereof is out of scope of this standard.

The DS SAP actions are as follows:

a) Accept MSDUs (as part of MAC service tuples) from APs, mesh gates, and the portal.
b) Deliver MSDUs (as part of MAC service tuples) to APs, mesh gates, or the portal.
c) Accept STA-to-AP mapping updates from the APs.
d) Accept STA-to-mesh gate mapping updates from the mesh gates.

When the DS delivers the MAC service tuples to an AP, the AP then determines when and how to deliver the MAC service tuples to the AP's MAC (via the MAC SAP). When the DS delivers the MAC service tuples to a mesh gate, the mesh gate then determines when and how to deliver the MAC service tuples to the mesh gate's MAC (via the MAC SAP).

7.2 SAP primitives

7.2.1 General

The DS SAP service interface primitives are as follows:

a) DS-UNITDATA.request
b) DS-UNITDATA.indication
c) DS-STA-NOTIFY.request

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

7.2.2 MSDU transfer

7.2.2.1 General

The DS-UNITDATA primitives accept and deliver IEEE 802.11 MAC service tuples, including all of the parameters and data as defined in 5.2.4.2.

7.2.2.2 DS-UNITDATA.request

7.2.2.2.1 Function

This primitive requests distribution of a MAC service tuple across the DS.

7.2.2.2.2 Semantics of the service primitive

The primitive parameters are as follows:

DS-UNITDATA.request(
MAC service tuple,
SourceType
)

Name	Type	Valid range	Description
MAC service tuple	IEEE 802.11 MSDU	Any valid data unit according to 5.2.4.2, including data and all parameters	Specifies the MAC service tuple to be distributed via the DS.
SourceType	Enumeration	SRC_AP, SRC_MESH_GATE, SRC_PORTAL	Specifies the type of entity that is requesting distribution of a MAC service tuple.

7.2.2.2.3 When generated

This primitive is generated by an AP, mesh gate, or portal to submit a MAC service tuple to the DS for distribution.

7.2.2.2.4 Effect of receipt

This primitive initiates distribution of the MAC service tuple through the DS. A MAC service tuple with a destination that is an individual address from an AP, mesh gate, or portal is distributed through the DS to the corresponding AP, mesh gate, or portal. A MAC service tuple that has a destination address that is a group address and that is delivered to the DS from an AP or mesh gate is distributed to the portal, if any, and to all APs and mesh gates connected to the DS, including the originating AP or mesh gate. A MAC service tuple that has a destination address that is a group address and that is delivered to the DS from a portal is distributed to all APs and mesh gates connected to the DS.

7.2.2.3 DS-UNITDATA.indication

7.2.2.3.1 Function

This primitive indicates delivery of a MAC service tuple from the DS to an AP, mesh gate, or portal.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

7.2.2.3.2 Semantics of the service primitive

The primitive parameters are as follows:

DS-UNITDATA.indication(
MAC service tuple
)

Name	Type	Valid range	Description
MAC service tuple	IEEE 802.11 MSDU	Any valid data unit according to 5.2.4.2, including data and all parameters	Specifies the MAC service tuple that is being delivered by the DS.

7.2.2.3.3 When generated

This primitive is generated by the DS to deliver a MAC service tuple to an AP, mesh gate, or portal.

7.2.2.3.4 Effect of receipt

This primitive delivers a MAC service tuple to an AP, mesh gate, or portal.

7.2.3 Mapping updates

7.2.3.1 General

The DS-STA-NOTIFY primitive is used to maintain the STA-to-AP and mesh STA-to-mesh gate mapping data of the DS.

7.2.3.2 DS-STA-NOTIFY.request

7.2.3.2.1 Function

This primitive requests an update to the DS's STA-to-AP map or mesh STA-to-mesh gate map.

7.2.3.2.2 Semantics of the service primitive

The primitive parameters are as follows:

DS-STA-NOTIFY.request(
STAAddress,
UpdateType
)

Name	Type	Valid range	Description
STAAddress	MAC address	Any valid individual address	When generated by an AP, specifies the address of the STA whose association status with the AP has changed. When generated by a mesh gate, specifies the address of the mesh STA whose reachability status through the mesh gate has changed.
UpdateType	Enumeration	ADD, MOVE, DELETE	Specifies the DS mapping update operation to be performed.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

7.2.3.2.3 When generated

This primitive is generated by an AP or mesh gate to update the DS's STA-to-AP map or mesh STA-to-mesh gate map.

7.2.3.2.4 Effect of receipt

When generated by an AP, this primitive updates the DS's STA-to-AP map, which controls to which AP the DS delivers MAC service tuples that are destined for a given STA.

When generated by a mesh gate, this primitive updates the DS's mesh STA-to-mesh gate map, which controls to which mesh gate the DS delivers MAC service tuples that are destined for a given mesh STA. The mesh STA-to-mesh gate map can be incomplete.

There are many mechanisms to implement this mapping update for the cases of ADD and MOVE. One example mechanism, in the case where the DS is an IEEE 802 LAN, is to use an XID null frame (see ISO/IEC 8802-2:1998).

8. PHY service specification

8.1 Scope of PHY services

The PHY services provided to the MAC are described in this clause. Different PHYs are defined as part of this standard. Each PHY can consist of the following protocol functions:

a) A function that defines a method of mapping the PSDUs into a PPDU format suitable for sending and receiving data, management, and control information between two or more STAs.

b) A function that defines the characteristics of, and method of transmitting and receiving data through, a WM between two or more STAs.

8.2 PHY functions

The protocol reference model for the IEEE 802.11 architecture is shown in Figure 4-27 (in 4.9). Most PHY definitions contain two functional entities: the PHY function and the layer management function.

The PHY service is provided to the MAC entity at the STA through a SAP, called the *PHY SAP*, as shown in Figure 4-27.

8.3 Detailed PHY service specifications

8.3.1 Scope and field of application

The services provided by the PHY to the MAC are specified in this subclause. These services are described in an abstract way and do not imply any particular implementation or exposed interface.

8.3.2 Overview of the service

The function of the PHY is to provide a mechanism for transferring PSDUs between two or more STAs.

8.3.3 Overview of interactions

The primitives associated with communication between the MAC sublayer and the PHY fall into two basic categories:

a) Service primitives that support MAC peer-to-peer interactions

b) Service primitives that have local significance and support interactions between the MAC sublayer and the PHY layer

8.3.4 Basic service and options

8.3.4.1 PHY SAP peer-to-peer service primitives

Table 8-1 indicates the primitives for peer-to-peer interactions.

Table 8-1—PHY SAP peer-to-peer service primitives

Primitive	Request	Indication	Confirm
PHY-DATA	X	X	X

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

8.3.4.2 PHY SAP inter-(sub)layer service primitives

Table 8-2 indicates the primitives for interactions between the MAC sublayer and the PHY layer.

Table 8-2—PHY SAP inter-(sub)layer service primitives

Primitive	Request	Indication	Confirm
PHY-TXSTART	X		X
PHY-TXEND	X		X
PHY-CCARESET	X		X
PHY-CCA		X	
PHY-RXEARLYSIG		X	
PHY-RXSTART		X	
PHY-RXEND		X	
PHY-CONFIG	X		X
PHY-TXHEADEREND		X	
PHY-TRIGGER	X		
PHY-RXLTFSEQUENCE	X		
PHY-RXTRNSEQUENCE	X		

8.3.4.3 PHY SAP service primitives parameters

Table 8-3 shows the parameters used by one or more of the PHY SAP service primitives.

Table 8-3—PHY SAP service primitive parameters

Parameter	Associated primitive	Value
DATA	PHY-DATA.request PHY-DATA.indication	Octet value X'00'–X'FF'
TXVECTOR	PHY-TXSTART.request	A set of parameters
STATE	PHY-CCA.indication	(BUSY[, channel-list[, per20bitmap[, antenna-list]]]) (IDLE[, per20bitmap])
RXVECTOR	PHY-RXSTART.indication	A set of parameters
RCPI	PHY-RXEND.indication	Clauses 15–19 and 21–23: 0–255; Clauses 20, 24, and 25: not present
RXERROR	PHY-RXEND.indication	NoError, FormatViolation, CarrierLost, UnsupportedRate, Filtered, IntegrityCheckError
IPI-STATE	PHY-CCARESET.request PHY-CCARESET.confirm	IPI-ON, IPI-OFF

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 8-3—PHY SAP service primitive parameters *(continued)*

Parameter	Associated primitive	Value
IPI-REPORT	PHY-CCA.indication PHY-CCARESET.confirm	A set of IPI values for the preceding time interval
PHYCONFIG_VECTOR	PHY-CONFIG	A set of parameters
TXSTATUS	PHY-TXSTART.confirm	A set of parameters
USER_INDEX	PHY-DATA.request	0 to TXVECTOR parameter NUM_USERS – 1
TRIGVECTOR	PHY-TRIGGER.request	A set of parameters
LTFVECTOR	PHY-RXLTFSEQUENCE.request	A set of parameters needed to receive and process the HE Ranging NDP and HE TB Ranging NDP (see Table 27-3).

8.3.4.4 Vector descriptions

Several service primitives include a parameter vector. This vector is a list of parameters that may vary depending on the PHY type. Table 8-4 lists the minimum parameter values required by the MAC or PHY in each of the parameter vectors.

Table 8-4—Vector descriptions

Parameter	Associated vector	Value
DATARATE	TXVECTOR, RXVECTOR	PHY dependent. The name of the field used to specify the Tx data rate and report the Rx data rate may vary for different PHYs.
LENGTH	TXVECTOR, RXVECTOR	PHY dependent.
ACTIVE_RXCHAIN_SET	PHYCONFIG_VECTOR	The ACTIVE_RXCHAIN_SET parameter indicates which receive chains of the available receive chains are active.
OPERATING_CHANNEL	PHYCONFIG_VECTOR	The operating channel the PHY is configured use.
SECONDARY_CHANNEL_OFFSET	PHYCONFIG_VECTOR	Enumerated type: SECONDARY_CHANNEL_NONE indicates operation in 20 MHz HT STAs. SECONDARY_CHANNEL_ABOVE indicates operation in 40 MHz with the secondary channel above the primary. SECONDARY_CHANNEL_BELOW indicates operation in 40 MHz with the secondary channel below the primary.
ANT_CONFIG	PHYCONFIG_VECTOR	Indicates which antenna configuration(s) is to be used when receiving PPDUs and which configuration is to be used when switching configurations during the reception of a PPDU. Values are implementation dependent.
SECURE_TRN_SEQUENCE	TRNVECTOR	Indicates the Secure TRN bit sequences used in the EDMG secure ranging PPDU. The Secure TRN bit sequences generation is defined in 12.2.12.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The HT PHY TXVECTOR and RXVECTOR contain additional parameters related to the operation of the HT PHY modes of operation as described in 19.2. In certain modes of operation, the DATARATE parameter is replaced by MCS, CH_BANDWIDTH and GI_TYPE parameters. The mapping from these values to data rate is defined in 19.5.

The VHT PHY TXVECTOR and RXVECTOR contain additional parameters related to the operation of the VHT PHY modes of operation as described in 21.2. In certain modes of operation, the DATARATE parameter is replaced by MCS, CH_BANDWIDTH, NUM_STS, STBC and GI_TYPE parameters. The mapping from these values to data rate is defined in 21.5, where VHT-MCS is MCS and N_{SS} is NUM_STS / (STBC + 1).

The HE PHY TXVECTOR and RXVECTOR contain additional parameters related to the HE PHY modes of operation as described in 27.2. In certain modes of operation, the DATARATE parameter is replaced by MCS, CH_BANDWIDTH, RU_ALLOCATION, NUM_STS, STBC, GI_TYPE, and DCM values. The mapping from these values to data rate is defined in 27.5, where HE-MCS is MCS and N_{SS} is NUM_STS / (STBC + 1).

The HE PHY TRIGVECTOR contains parameters for UL MU operation (see Table 27-2).

8.3.5 PHY SAP detailed service specification

8.3.5.1 Introduction

Subclause 8.3.5 describes the services provided by each PHY primitive.

8.3.5.2 PHY-DATA.request

8.3.5.2.1 Function

This primitive defines the transfer of an octet of data from the MAC sublayer to the local PHY entity.

8.3.5.2.2 Semantics of the service primitive

The primitive provides the following parameter:

```
PHY-DATA.request(
                        DATA,
                        USER_INDEX,
                        STA_INDEX
                        )
```

The DATA parameter is an octet of value X'00' to X'FF'.

The USER_INDEX parameter (typically identified as *u* for a VHT STA; for MU usage, see the NOTE at the end of Table 21-1) is present for a VHT MU PPDU and indicates the index of the user in the TXVECTOR to which the accompanying DATA octet applies; otherwise, this parameter is not present.

The STA_INDEX parameter (identified as the STA_ID parameter; see STA_ID parameter in Table 27-1 and 26.11.1) is present for an HE MU PPDU; otherwise, this parameter is not present. If the TXVECTOR parameter UPLINK_FLAG is 0, this parameter indicates the STA or group of STAs that is the recipient of an RU to which the accompanying DATA octet applies. If the TXVECTOR parameter UPLINK_FLAG is 1, this parameter indicates the STA that is the transmitter of an RU to which the accompanying DATA octet applies.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

8.3.5.2.3 When generated

This primitive is generated by the MAC sublayer to transfer an octet of data to the PHY entity. This primitive can be issued only following a transmit initialization response (a PHY-TXSTART.confirm primitive) from the PHY.

8.3.5.2.4 Effect of receipt

The receipt of this primitive by the PHY entity causes the PHY transmit state machine to transmit an octet of data. When the PHY entity receives the octet, it issues a PHY-DATA.confirm primitive to the MAC sublayer.

8.3.5.3 PHY-DATA.indication

8.3.5.3.1 Function

This primitive indicates the transfer of data from the PHY to the local MAC entity.

8.3.5.3.2 Semantics of the service primitive

The primitive provides the following parameter:

```
PHY-DATA.indication(
                    DATA,
                    STA_INDEX
                    )
```

The DATA parameter is an octet of value X'00' to X'FF'.

The STA_INDEX parameter (identified as an AID of the transmitter of the DATA contained in an HE TB PPDU; see STA_ID parameter in Table 27-1) is present for an HE TB PPDU and indicates the STA of an RU from which the accompanying DATA octet applies; otherwise, this parameter is not present.

8.3.5.3.3 When generated

The PHY-DATA.indication primitive is generated by a receiving PHY entity to transfer the received octet of data to the local MAC entity. The time between receipt of the last bit of the last provided octet from the WM and the receipt of this primitive by the MAC entity is aRxPHYDelay.

8.3.5.3.4 Effect of receipt

The receipt of this primitive by the MAC entity causes the MAC to collect the data octet provided by the PHY in the current receive flow (see Figure 5-1).

8.3.5.4 PHY-DATA.confirm

8.3.5.4.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm the transfer of data from the MAC entity to the PHY.

8.3.5.4.2 Semantics of the service primitive

The semantics of the primitive are as follows:

```
PHY-DATA.confirm
```

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

This primitive has no parameters.

8.3.5.4.3 When generated

This primitive is issued by the PHY to the MAC entity when the transfer of data from the MAC entity to the PHY has completed. The PHY issues this primitive in response to every PHY-DATA.request primitive issued by the MAC sublayer.

8.3.5.4.4 Effect of receipt

The receipt of this primitive by the MAC causes the MAC to start the next MAC entity request.

8.3.5.5 PHY-TXSTART.request

8.3.5.5.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity to start the transmission of a PSDU.

8.3.5.5.2 Semantics of the service primitive

The primitive provides the following parameter:

```
PHY-TXSTART.request(
                    TXVECTOR
                    )
```

The TXVECTOR represents a list of parameters that the MAC sublayer provides to the local PHY entity in order to transmit a PSDU. The minimum required PHY parameters are listed in 8.3.4.4.

See 1.4 for interpretation of references to frames, MPDUs, A-MPDUs and PPDUs being transmitted with a certain TXVECTOR.

8.3.5.5.3 When generated

This primitive is issued by the MAC sublayer to the PHY entity when the MAC sublayer needs to begin the transmission of a PSDU.

8.3.5.5.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is to start the local transmit state machine.

The behavior expected by the MAC pursuant to the issuance of PHY-TXSTART.request primitive is shown in Figure 10-25 (in 10.3.7) and Figure 10-29.

8.3.5.6 PHY-TXSTART.confirm

8.3.5.6.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm the start of a transmission and to indicate parameters related to the start of the transmission. The PHY issues this primitive in response to every PHY-TXSTART.request primitive issued by the MAC sublayer.

8.3.5.6.2 Semantics of the service primitive

The semantics of the primitive are as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

PHY-TXSTART.confirm(
TXSTATUS
)

The TXSTATUS represents a list of parameters that the local PHY entity provides to the MAC sublayer related to the transmission of a PPDU. The list of parameters is PHY-dependent.

8.3.5.6.3 When generated

This primitive is issued by the PHY to the MAC entity once all of the following conditions are met:

— The PHY has received a PHY-TXSTART.request primitive from the MAC entity.
— The PHY is ready to begin accepting outgoing data octets from the MAC.

If dot11TODImplemented and dot11TODActivated are both true or dot11TimingMsmtActivated is true; and the parameter TIME_OF_DEPARTURE_REQUESTED in the TXVECTOR specified in the PHY-TXSTART.request primitive is true, then the PHY shall include the TIME_OF_DEPARTURE corresponding to the time when the first frame energy is sent by the transmitting port and TIME_OF_DEPARTURE_ClockRate parameters in the TXSTATUS, if the PHY includes these parameters in the TXSTATUS.

If dot11TimingMsmtActivated is true, then the PHY shall include TX_START_OF_FRAME_OFFSET in the TXSTATUS, if the PHY includes this parameter in the TXSTATUS.
NOTE—A more precise name for TX_START_OF_FRAME_OFFSET would be TX_START_OF_PPDU_TO_-PHY_TXSTART_PRIMITIVE_OFFSET. Similarly, a more precise name for RX_START_OF_FRAME_OFFSET would be RX_START_OF_PPDU_TO_PHY_RXSTART_PRIMITIVE_OFFSET.

8.3.5.6.4 Effect of receipt

The receipt of this primitive by the MAC entity causes the MAC to start the transfer of data octets. Parameters in the TXSTATUS are returned to the MAC which can then include them in transmitted MPDUs. See Annex P for use of TXSTATUS parameters for timing.

8.3.5.7 PHY-TXEND.request

8.3.5.7.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity that the current transmission of the PSDU be completed.

8.3.5.7.2 Semantics of the service primitive

The semantics of the primitive are as follows:
PHY-TXEND.request

This primitive has no parameters.

8.3.5.7.3 When generated

This primitive is generated when the MAC sublayer has received the last PHY-DATA.confirm primitive from the local PHY entity for the PSDU currently being transferred.

8.3.5.7.4 Effect of receipt

The effect of receipt of this primitive by the local PHY entity is to stop the transmit state machine.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

8.3.5.8 PHY-TXEND.confirm

8.3.5.8.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm the completion of a transmission. The PHY issues this primitive in response to every PHY-TXEND.request primitive issued by the MAC sublayer.

8.3.5.8.2 Semantics of the service primitive

The semantics of the primitive are as follows:

```
PHY-TXEND.confirm(
                    SCRAMBLER_OR_CRC
                    )
```

The SCRAMBLER_OR_CRC parameter is present if dot11S1GOptionImplemented is true. The value of SCRAMBLER_OR_CRC parameter depends on the type of the transmitted frame:

- When transmitting a PPDU that is not an NDP CMAC PPDU, the value of the SCRAMBLER_OR_CRC parameter is the scrambler initialization value in the SERVICE field after scrambling (i.e., [B0:B6] of the SERVICE field) (as defined in 23.3.9.2) of the frame.
- When transmitting an NDP CMAC PPDU, the value of the SCRAMBLER_OR_CRC parameter is the calculated CRC value in the SIG/SIG-A field (as defined in 23.3.8.2.2.6) as follows:
  - When the frame is an NDP_1M CMAC PPDU, the value of SCRAMBLER_OR_CRC parameter is equal to [B26:B29] of the SIG field.
  - When the frame is an NDP_2M CMAC PPDU, the value of SCRAMBLER_OR_CRC parameter is equal to [B38:B41] of the ≥2 MHz SIG-A field.

8.3.5.8.3 When generated

This primitive is issued by the PHY to the MAC entity when the PHY has received a PHY-TXEND.request primitive immediately after transmitting the end of the last bit of the last data octet indicating that the symbol containing the last data octet has been transferred and any signal extension has expired.

8.3.5.8.4 Effect of receipt

The receipt of this primitive by the MAC entity provides the time reference for the contention backoff protocol.

8.3.5.9 PHY-TXHEADEREND.indication

8.3.5.9.1 Function

This primitive indicates the transmission completion of the PHY header to the local MAC entity.

8.3.5.9.2 Semantics of the service primitive

The semantics of the primitive are as follows:

```
PHY-TXHEADEREND.indication
```

This primitive has no parameters.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

8.3.5.9.3 When generated

The PHY-TXHEADEREND.indication primitive is generated by a transmitter PHY entity at the end of transmission of the last symbol containing the PHY header.

8.3.5.9.4 Effect of receipt

The receipt of this primitive by the MAC entity causes the MAC to record the time when this primitive is received only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding PHY-TXSTART.request primitive.

8.3.5.10 PHY-CCARESET.request

8.3.5.10.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity to reset the PHY to the state appropriate for the end of a received frame and to turn IPI reporting on and off by means of the IPI-STATE parameter.

8.3.5.10.2 Semantics of the service primitive

The primitive provides the following parameter:

```
PHY-CCARESET.request(
                        IPI-STATE
                        )
```

The IPI-STATE parameter is present if dot11RadioMeasurementActivated is true. The IPI-STATE parameter can be one of two values: IPI-ON or IPI-OFF. The parameter value is IPI-ON when the MAC sublayer is requesting the PHY entity to report IPI values when the PHY is neither receiving nor transmitting a PPDU. IPI-ON turns on IPI reporting in the PHY entity. IPI-OFF turns off IPI reporting in the PHY entity.

8.3.5.10.3 When generated

This primitive is generated by the MAC sublayer for the local PHY entity at the end of a NAV and at a time indicated in 10.3.2.1 after each MAC slot boundary, which is described in 10.3.7 and 10.23.2.4. This request can be used by some PHY implementations that may synchronize antenna diversity with slot timings.

This primitive is also generated by the MAC sublayer for the local PHY entity when the spatial reuse conditions defined in 26.10 are met.

8.3.5.10.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is to reset the PHY to the state appropriate for the end of a received frame and to initiate a new CCA evaluation cycle. If IPI-STATE parameter is IPI-ON, the PHY entity collects IPI values when it is not transmitting or receiving and provides those values to the MAC sublayer using the IPI-REPORT parameter.

8.3.5.11 PHY-CCARESET.confirm

8.3.5.11.1 Function

This primitive is issued by the PHY to the local MAC entity to provide observed IPI values if IPI reporting was turned on prior to the receipt of the latest PHY-CCARESET.request primitive. This primitive is not

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

issued by the PHY if IPI reporting was turned off prior to the receipt of the latest PHY-CCARESET.request primitive.

8.3.5.11.2 Semantics of the service primitive

The primitive provides the following parameters:

```
PHY-CCARESET.confirm(
                        IPI-REPORT
                        )
```

The IPI-REPORT parameter provides a set of IPI values for a time interval. The set of IPI values are recent values observed by the PHY entity since the generation of the most recent PHY-TXEND.confirm, PHY-RXEND.indication, PHY-CCARESET.confirm, or PHY-CCA.indication primitive, whichever occurred latest.

8.3.5.11.3 When generated

This primitive is issued by the PHY to the MAC entity when IPI reporting was turned on prior to the receipt of the latest PHY-CCARESET.request primitive.

8.3.5.11.4 Effect of receipt

The receipt of this primitive by the MAC entity causes the MAC to collect IPI values when IPI reporting was turned on prior to the receipt of the latest PHY-CCARESET.request primitive.

8.3.5.12 PHY-CCA.indication

8.3.5.12.1 Function

This primitive is an indication by the PHY to the local MAC entity of the current state of the medium and to provide observed IPI values when IPI reporting is turned on.

8.3.5.12.2 Semantics of the service primitive

The primitive provides the following parameters:

```
PHY-CCA.indication(
                        STATE,
                        IPI-REPORT,
                        channel-list,
                        per20bitmap,
                        RX-antenna-ID
                        )
```

The STATE parameter can be one of two values: BUSY or IDLE. The parameter value is BUSY if the assessment of the channel(s) by the PHY determines that the channel(s) are not available. Otherwise, the value of the parameter is IDLE.

The IPI-REPORT parameter is present if dot11RadioMeasurementActivated is true and if IPI reporting has been turned on by the IPI-STATE parameter. The IPI-REPORT parameter provides a set of IPI values for a time interval. The set of IPI values may be used by the MAC sublayer for radio measurement purposes. The set of IPI values are recent values observed by the PHY entity since the generation of the most recent PHY-TXEND.confirm, PHY-RXEND.indication, PHY-CCARESET.confirm, or PHY-CCA.indication primitive, whichever occurred latest.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When STATE is IDLE or when, for the type of PHY in operation, CCA is determined by a single channel, the channel-list parameter is absent. Otherwise, it carries a set indicating which channels are busy. The channel-list parameter in a PHY-CCA.indication primitive generated by a VHT or S1G STA contains at most a single entry. Table 8-5 defines the members of this set. For an EDMG STA, the channel-list parameter contains the primary and secondary channels and may contain the secondary1 and secondary2 channels, while the RX-antenna-ID parameter indicates a set of IDs of the DMG antennas in which the channel indication is provided.

Table 8-5—The channel-list parameter entries

Channel-list parameter entry	Meaning
primary	In an HT STA that is neither a VHT STA nor an HE STA, indicates that the primary channel is busy according to the rules specified in 19.3.19.6. In a VHT STA that is not an HE STA, indicates that the primary 20 MHz channel is busy according to the rules specified in 21.3.18.5.3. In a TVHT STA, indicates that the primary channel is busy according to the rules specified in 22.3.18.6.2. In an HE STA, indicates that the primary 20 MHz channel is busy according to the rules specified in 27.3.22.6.3. In an EDMG STA, indicates that the primary 2.16 GHz channel is busy according to the rules specified in 28.3.8.
secondary	In an HT STA that is neither a VHT STA nor an HE STA, indicates that the secondary channel is busy according to the rules specified in 19.3.19.6.5. In a VHT STA that is not an HE STA, indicates that the secondary 20 MHz channel is busy according to the rules specified in 21.3.18.5.4. In a TVHT STA, indicates that the secondary channel is busy according to the rules specified in 22.3.18.6.3. In an HE STA, indicates that the secondary 20 MHz channel is busy according to the rules specified in 27.3.22.6.4. In an EDMG STA, indicates that the secondary 2.16 GHz channel is busy according to the rules specified in 28.3.8
secondary40	In a VHT STA that is not an HE STA, indicates that the secondary 40 MHz channel is busy according to the rules specified in 21.3.18.5.4. In a TVHT STA, indicates that the secondary TVHT_2W channel is busy according to the rules specified in 22.3.18.6.3. In an HE STA, indicates that the secondary 40 MHz channel is busy according to the rules specified in 27.3.22.6.3.
secondary80	In a VHT STA that is not an HE STA, indicates that the secondary 80 MHz channel is busy according to the rules specified in 21.3.18.5.4. In an HE STA, indicates that the secondary 80 MHz channel is busy according to the rules specified in 27.3.22.6.3.
primary1	In an S1G STA, indicates that the primary 1 MHz channel is busy according to the rules specified in 23.3.18.5.3
primary2	In an S1G STA, indicates that the primary 2 MHz channel is busy according to the rules specified in 23.3.18.5.3.
secondary1	In an EDMG STA, indicates that the second secondary 2.16 GHz channel is busy according to the rules specified in 28.3.8.
secondary2	In an S1G STA, indicates that the secondary 2 MHz channel is busy according to the rules specified in 23.3.18.5.4. In an EDMG STA, indicates that the third secondary 2.16 GHz channel is busy according to the rules specified in 28.3.8.
secondary4	In an S1G STA, indicates that the secondary 4 MHz channel is busy according to the rules specified in 23.3.18.5.4.
secondary8	In an S1G STA, indicates that the secondary 8 MHz channel is busy according to the rules specified in 23.3.18.5.4.

For a TVHT STA, the relationship of the channel-list parameter entries to the TVHT_4W and TVHT_2W+2W BSS operating channel is illustrated in Figure 8-4.

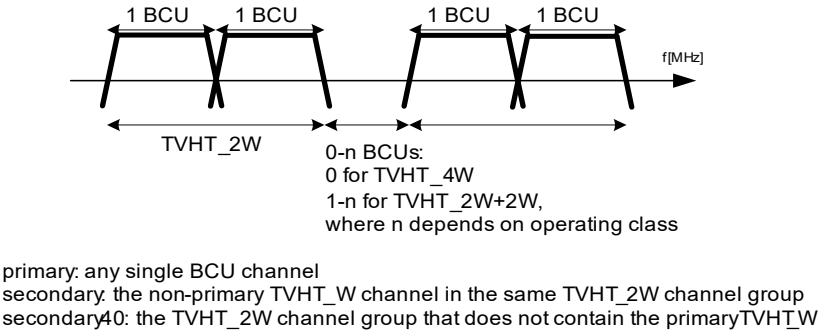

Figure 8-4—TVHT channel-list parameter entry and channel bandwidth for TVHT_4W and TVHT_2W+2W

For an S1G STA, the relationship of the channel-list parameter entries to the 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz BSS operating channel is illustrated by example Figure 8-5.

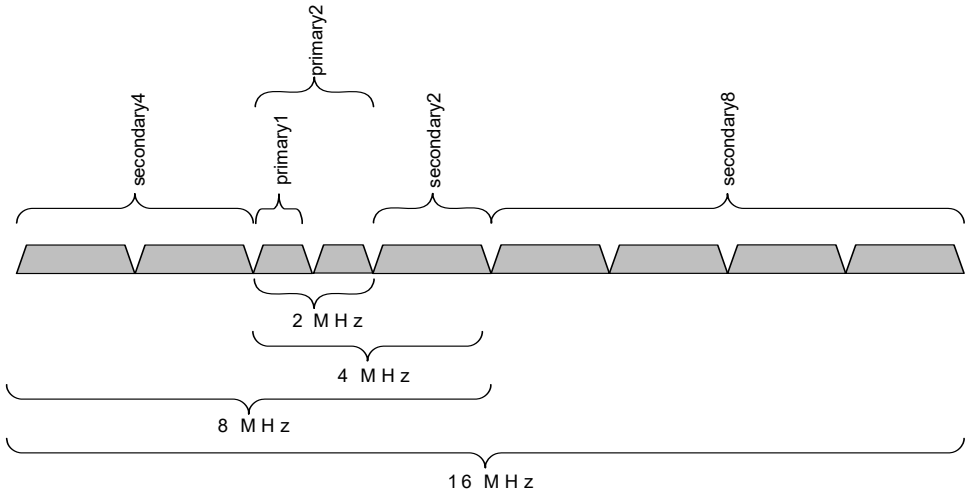

Figure 8-5—The channel-list parameter entries for the 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz channel width

If the STA is an HE STA with an operating channel width greater than 20 MHz, then the per20bitmap parameter is present; otherwise, it is absent. If present, the per20bitmap parameter is a bitmap where each bit represents the busy/idle status of a 20 MHz subchannel in the operating channel width as defined in 27.3.22.6.5.

Table 8-6 defines the assignment of secondary, secondary1 and secondary2 channels in relation to the BSS Operating Channels field and Primary Channel field within the EDMG Operation element transmitted by an EDMG AP or an EDMG PCP. In Table 8-6, the following conventions are used:

— The BSS Operating Channels field is indicated as $Ch(i)$, $Ch(k)$, $Ch(l)$, and $Ch(m)$, where $Ch(i) < Ch(k) < Ch(l) < Ch(m)$.

For an EDMG STA, the relationship of the channel-list parameter elements to the 4.32 GHz, 6.48 GHz, and 8.64 GHz BSS operating channel is illustrated by example in Figure 8-6.

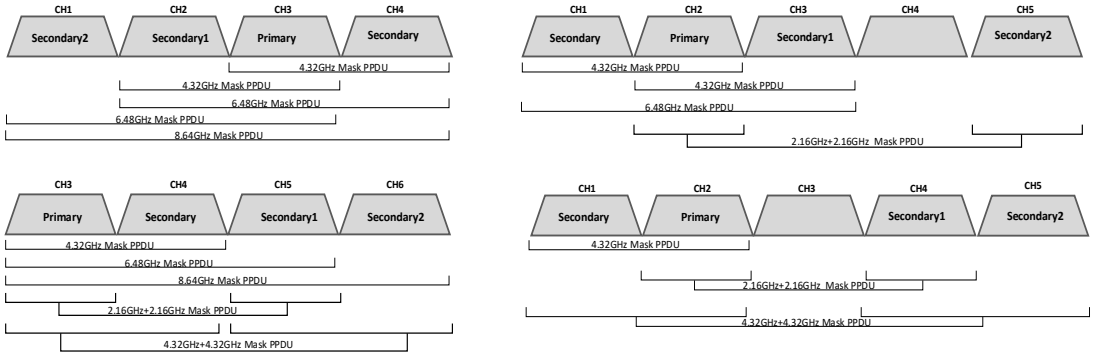

Figure 8-6—Example channel-list parameter element for various BSS operating channels

8.3.5.12.3 When generated

For Clause 15 to Clause 20 PHYs, this primitive is generated within aCCATime of the occurrence of a change in the status of the primary channel from channel idle to channel busy or from channel busy to channel idle or when the entries of the channel-list parameter change. For Clause 21 and Clause 22 PHYs, this primitive is generated when the status of the channel(s) changes from channel idle to channel busy or from channel busy to channel idle or when the entries of the channel-list parameter change. This includes the period of time when the PHY is receiving data. For Clause 27 PHYs, this primitive is generated when the status of the channel(s) changes from channel idle to channel busy or from channel busy to channel idle, when the entries of the channel-list parameter change, or when the per20bitmap parameter changes. The

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

timing of PHY-CCA.indication primitives related to transitions on secondary channel(s) is PHY specific. Refer to specific PHY clauses for details about CCA behavior for a given PHY.

If the STA is an HT STA but not a VHT STA and the operating channel width is 20 MHz, the PHY maintains the channel busy indication until the period indicated by the LENGTH field has expired, where the LENGTH field is

— In a valid SIG field if the PPDU is a non-HT PPDU
— In a valid HT-SIG field if the PPDU is an HT PPDU

If the STA is an HT STA but not a VHT STA and the operating channel width is 40 MHz, the PHY maintains the channel busy indication until the period indicated by the LENGTH field has expired, where the LENGTH field is

— In a valid SIG field if the PPDU is a non-HT PPDU and received in the primary channel
— In a valid HT-SIG field if the PPDU is an HT PPDU and either a 20 MHz PPDU received in the primary channel or a 40 MHz PPDU

When the PHY is supporting one or more MAC entities that are coordinated by an MM-SME, this primitive is generated upon PHY-TXSTART or PHY-TXEND actions from those MAC entities. A PHY-CCA.indication primitive with STATE set to BUSY is generated when the PHY issues a PHY-TXSTART.confirm primitive to one of the MAC entities coordinated by an MM-SME, and it is generated to all coordinated MAC entities except to the one to which it responds with the PHY-TXSTART.confirm primitive. A PHY-CCA.indication primitive with STATE set to IDLE is generated when the PHY issues a PHY-TXEND.confirm primitive to one of the MAC entities coordinated by an MM-SME, and it is generated to all coordinated MAC entities except to the one to which it responds with the PHY-TXEND.confirm primitive. The ICI-REPORT parameter of the PHY-CCA.indication primitive is set as described above. The channel-list parameter is set to indicate the channels in use per the TXVECTOR of a PHY-TXSTART.request primitive from a coordinated MAC entity, or is not present when the PHY-CCA.indication primitive is generated in response to a PHY-TXEND.confirm primitive from a coordinated MAC entity.

8.3.5.12.4 Effect of receipt

The receipt of this primitive by the MAC entity causes the MAC to update the physical CS state, and to collect IPI values when IPI reporting was turned on.

8.3.5.13 PHY-RXEARLYSIG.indication

8.3.5.13.1 Function

This primitive is an early indication by the PHY to the local MAC entity that the PHY has received a valid start of a PPDU.

NOTE—This primitive might be generated before the PHY has narrowed down the PPDU format to a single possibility, such as either of non-HT or VHT.

8.3.5.13.2 Semantics of the service primitive

The primitive does not include any parameters:

```
PHY-RXEARLYSIG.indication(
        )
```

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

8.3.5.13.3 When generated

This primitive is generated by the local PHY entity to the MAC sublayer when the PHY has successfully validated an early SIG field in the PHY and the validation of the SIG field does not cause the issuance of the PHY-RXSTART.indication. The early SIG field is the first SIG field in the PPDU except:

— If the HT-SIG field is present in an HT_GF format PPDU, then the HT-SIG field is validated instead of the L-SIG field (and so the PHY-RXEARLYSIG.indication is not issued)

— If the RL-SIG field is present, then the pair of L-SIG and RL-SIG fields is validated instead of the L-SIG field

After generating a PHY-RXEARLYSIG.indication primitive, the PHY is expected to maintain physical medium busy status (not generating a PHY-CCA.indication (IDLE) primitive) until the issuance of the next PHY-RXSTART.indication or PHY-RXEND.indication.

8.3.5.13.4 Effect of receipt

The receipt of this primitive by the MAC entity causes the MAC to determine that there is no NAV, CTS, Ack or similar timeout (see 10.3.2.4, 10.3.2.9, 10.3.2.11, 26.2.4, and 26.2.6.2).

8.3.5.14 PHY-RXSTART.indication

8.3.5.14.1 Function

This primitive is an indication by the PHY to the local MAC entity that the PHY has received a valid start of a PPDU, including a valid PHY header.

NOTE—This primitive is not generated until the PHY has determined the PPDU format (e.g., a VHT PPDU, which starts with an HT PHY header).

8.3.5.14.2 Semantics of the service primitive

The primitive provides the following parameter:

```
PHY-RXSTART.indication(
                        RXVECTOR
                        )
```

The RXVECTOR represents a list of parameters that the PHY provides the local MAC entity when receiving a PSDU. The required parameters are listed in 8.3.4.4.

NOTE—The RXVECTOR is associated with a received PSDU, in the same way as the TXVECTOR is associated with a transmitted PSDU (see 8.3.5.5.2).

See 1.4 for interpretation of references to frames, MPDUs, A-MPDUs and PPDUs being received with a certain RXVECTOR.

8.3.5.14.3 When generated

This primitive is generated by the local PHY entity to the MAC sublayer when the PHY has successfully validated the PHY header at the start of a new PPDU.

After generating a PHY-RXSTART.indication primitive, the PHY is expected to maintain physical medium busy status (not generating a PHY-CCA.indication(IDLE) primitive) during the period required by that PHY to transfer a frame of the indicated LENGTH at the indicated DATARATE. This physical medium busy condition should be maintained even if a PHY-RXEND.indication(CarrierLost) primitive or a PHY-RXEND.indication(FormatViolation) primitive is generated by the PHY prior to the end of this period.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

8.3.5.14.4 Effect of receipt

The receipt of this primitive by the MAC entity causes the MAC to prepare for a new receive flow (see Figure 5-1).

8.3.5.15 PHY-RXEND.indication

8.3.5.15.1 Function

This primitive is an indication by the PHY to the local MAC entity that the PPDU currently being received is complete.

8.3.5.15.2 Semantics of the service primitive

The primitive provides the following parameters:

```
PHY-RXEND.indication(
                        RXERROR,
                        RCPI
                        )
```

The RXERROR parameter can convey NoError or one or more values indicating an error condition. A number of error conditions may occur after the PHY's receive state machine has detected what appears to be a valid preamble and SFD. The following describes the parameter returned for each of those error conditions:

- *NoError.* This value is used to indicate that no error occurred during the receive process in the PHY.
- *FormatViolation.* This value is used to indicate that the format of the received PPDU was in error.
- *CarrierLost.* This value is used to indicate that during the reception of the incoming PSDU, the carrier was lost and no further processing of the PSDU can be accomplished.
- *UnsupportedRate.* This value is used to indicate that during the reception of the incoming PPDU, a nonsupported date rate was detected.
- *Filtered*. This value is used to indicate that during the reception of the PPDU, the PPDU was filtered out due to a condition set in the PHYCONFIG_VECTOR.

  NOTE 1—The filtered condition might occur:

  - in a VHT STA due to group ID or partial AID filtering in the PHY.
  - in an HE STA due to BSS color filtering in the PHY.
- *IntegrityCheckError*. This value is used to indicate that during the reception of the HE Ranging NDP or HE TB Ranging NDP, an integrity check was performed and failed.

RCPI is a parameter included in the PHY-RXEND.indication primitive that the PHY provides the local MAC entity. If present, RCPI is a measure of the received RF power averaged over all of the receive chains in the data portion of the received PPDU. RCPI is an included parameter only when dot11RadioMeasurementActivated is true and the PHY is not a DMG, CDMG, or CMMG PHY. The required parameters are listed in 8.3.4.4.

NOTE 2—When dot11RadioMeasurementActiviated is true, for DMG, CDMG, or CMMG PHYs, RCPI is included in the RXVECTOR parameter of the PHY-RXSTART.indication primitive instead.

8.3.5.15.3 When generated

This primitive is generated by the PHY for the local MAC entity after the receive state machine has completed a reception with or without errors. When reception is completed without error, the primitive is

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

generated after the PHY has delivered the last bit of all received PSDUs to the MAC. When a signal extension is present, the primitive is generated after the end of the signal extension.

In the case of an RXERROR value of NoError, the MAC uses the PHY-RXEND.indication primitive as reference for channel access timing, as shown in Figure 10-25 (in 10.3.7) and Figure 10-29.

8.3.5.15.4 Effect of receipt

The effect of receipt of this primitive is for the MAC to begin interframe space processing, as described in 10.3.7 and 10.23.2.4.

8.3.5.16 PHY-CONFIG.request

8.3.5.16.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity to configure the PHY.

8.3.5.16.2 Semantics of the service primitive

The primitive provides the following parameter:

```
PHY-CONFIG.request(
                    PHYCONFIG_VECTOR
                    )
```

8.3.5.16.3 When generated

This primitive is generated by the MAC sublayer for the local PHY entity when it desires to change the configuration of the PHY.

8.3.5.16.4 Effect of receipt

The effect of receipt of this primitive by the PHY is to apply the parameters provided with the primitive and to configure the PHY for future operation.

8.3.5.17 PHY-TRIGGER.request

8.3.5.17.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity to set parameters for the receipt of HE TB PPDU.

8.3.5.17.2 Semantics of the service primitive

The primitive provides the following parameter:

```
PHY-TRIGGER.request (
                    TRIGVECTOR
                    )
```

The TRIGVECTOR parameter provides the PHY with the information needed to demodulate of the expected HE TB PPDUs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

8.3.5.17.3 When generated

This primitive is issued by the MAC sublayer to the PHY entity after issuing PHY-TXSTART.request and before receiving HE TB PPDU.

8.3.5.17.4 Effect of receipt

On receipt of this primitive, the PHY entity configures the receiver module for the expected arrival of the HE TB PPDUs.

8.3.5.17 PHY-ABORT.request

8.3.5.17.1 Function

This primitive is a request by the MAC to reset the PHY. The PHY is always reset to the receive state.

8.3.5.17.2 Semantics of the service primitive

This primitive has no parameters.

8.3.5.17.3 When generated

This primitive is generated at any time to reset the PHY.

8.3.5.17.4 Effect of receipt

Receipt of this primitive by the PHY causes the PHY entity to reset both the transmit and the receive state machines and places the PHY into the receive state.

8.3.5.18 PHY-RXLTFSEQUENCE.request

8.3.5.18.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity to provide the parameters shown in 27-3 for the receipt of an HE Ranging NDP or HE TB Ranging NDP.

8.3.5.18.2 Semantics of the service primitive

The primitive provides the following parameter:

```
PHY-RXLTFSEQUENCE.request(
                                LTFVECTOR
                                )
```

The LTFVECTOR represents a list of parameters needed to receive an HE Ranging NDP or HE TB Ranging NDP, including the HE-LTF configuration and information on how to generate the secure HE-LTF symbols as described in 27.3.20.6.

8.3.5.18.3 When generated

This primitive is issued by the MAC sublayer to the PHY entity before receiving HE Ranging NDP and HE TB Ranging NDP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

8.3.5.18.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is to be aware of the number of spatial streams and HE-LTF repetitions that are not signaled in the HE SIG-A of the HE Ranging NDP and HE TB Ranging NDP, as well as to be able to generate the secure LTF symbols based on the parameters in the LTFVECTOR as described in 27.3.20.6, if secure HE-LTF is used.

8.3.5.19 PHY-RXTRNSEQUENCE.request

8.3.5.19.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity with a TRNVECTOR parameter to provide the Secure TRN bit sequences for the receipt of the EDMG secure ranging PPDU.

8.3.5.19.2 Semantics of the service primitive

The primitive provides the following parameter:

```
PHY-RXTRNSEQUENCE.request(
                                TRNVECTOR
                                )
```

The TRNVECTOR represents the Secure TRN bit sequences used in the EDMG secure ranging PPDU.

8.3.5.19.3 When generated

This primitive is issued by the MAC sublayer to the PHY entity before receiving the secure TRN subfield of the EDMG secure ranging PPDU.

8.3.5.19.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is to make a secure ranging waveform based on the TRNVECTOR.

8.4 PHY management

The MIB comprises the managed objects, attributes, actions, and notifications required to manage a STA. The definition of these managed objects, attributes, actions, and notifications, as well as their structure, is presented in Annex C.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9. Frame formats

9.1 General requirements

The format of the MAC frames is specified in this clause. A STA shall properly construct a subset of the frames specified in this clause for transmission and decode a (potentially different) subset of the frames specified in this clause upon validation following reception. The particular subset of these frames that a STA constructs and decodes is determined by the functions supported by that particular STA. A STA shall validate every received frame using the frame check sequence (FCS) and interpret certain fields from the MAC headers of all frames.

A STA shall transmit frames using only the frame formats described in Clause 9.

9.2 MAC frame formats

9.2.1 Basic components

Each frame consists of the following basic components:

a) A *MAC header*, which comprises frame control, optional duration (not in PS-Poll frames), address, optional sequence control information, optional QoS Control information (only in QoS Data frames), and optional HT Control fields (only in +HTC frames);
b) A variable length *frame body*, which contains information specific to the frame *type* and *subtype*;
c) An *FCS*, which contains a 32-bit CRC based on ITU-T Recommendation V.42 [B63] (see 9.2.4.9).

9.2.2 Conventions

Structures defined in the MAC sublayer are described as a sequence of components (e.g., fields, subfields, elements and subelements) in specific order. Each figure and table in Clause 9 depicts the components as they appear in the MAC frame and in the order in which they are passed to the physical layer (PHY), from left to right and then from top to bottom.

Unless specified otherwise, a number in a field is encoded as an unsigned integer.

A field or subfield within the figure depiction of a frame format that includes a value (decimal, if numeric) within parentheses indicates that this field or subfield is set to the indicated value upon transmission.

In figures, all bits within fields are numbered, from 0 to k, where the length of the field is $k + 1$ bits. Bits within numeric fields that are longer than a single bit are depicted in increasing order of significance, i.e., with the lowest numbered bit having the least significance. The octet boundaries within a field can be obtained by taking the bit numbers of the field modulo 8. Octets within numeric fields that are longer than a single octet are depicted in increasing order of significance, from lowest numbered bit to highest numbered bit. The octets in fields longer than a single octet are sent to the PHY in order from the octet containing the lowest numbered bits to the octet containing the highest numbered bits.

Any field containing a CRC is an exception to this convention and is transmitted commencing with the coefficient of the highest-order term. There are other exceptions; these are explicitly indicated in the description of the field in question.

MAC addresses are assigned as ordered sequences of bits. The Individual/Group bit is always transferred first and is bit 0 of the MAC address. Bit 47 of the MAC address is always transferred last. This is illustrated in Figure 9-1. Also see Clause 8 of IEEE Std 802-2014.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

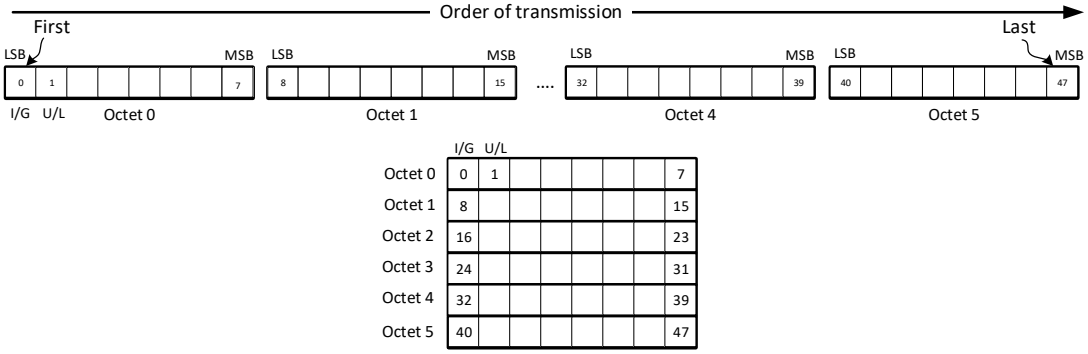

Figure 9-1—Representation of a 48-bit MAC address

A MAC address can be represented using hexadecimal values separated by hyphens, as described in IEEE Std 802.

Organizationally Unique Identifiers (OUIs), Company IDs (CIDs), and Organization Identifiers are specified in two forms: an ordered sequence of octets, and a numeric form. Treating the OUI, CID, or Organization Identifier as an ordered sequence of octets, the leftmost octet is always transferred first. This is equivalent to transmitting the most significant octet of the numeric form first.

Values specified in decimal are coded with bit n representing 2^n unless otherwise stated. The values in Table 9-1 and Table 9-2 are in binary, with the bit assignments shown in the table. Values in other tables are shown in decimal notation, unless all the values in the table only contain the digits 0 and 1, in which case they are typically shown in binary notation.

ASCII and UTF-8 strings are defined in 1.4.

For evaluation purposes a nonce is interpreted as a sequence of octets with the most significant octet first and the most significant bit of an octet first.

Reception, in references to frames or fields within frames (e.g., received Beacon frames or a received Duration/ID field), applies to MPDUs indicated from the PHY without error and validated by FCS within the MAC sublayer.

Without further qualification, *reception* by the MAC sublayer implies that the frame contents are valid, and that the protocol version is supported (see 9.2.4.1.2), with no implication regarding whether the frame type or other fields in the MAC header are meaningful to the MAC entity, where the frame is addressed to the STA (individually addressed or group addressed).

Unless explicitly specified, a group addressed frame might or might not, depending on the context, be considered "addressed to" a particular STA. Additionally, in certain contexts a frame individually addressed to a STA might be considered "received" by another STA (see e.g., 10.3.2.4).

A frame that contains the HT Control field is referred to as a *+HTC frame*. A Control Wrapper frame is a +HTC frame.

A QoS Data frame that is transmitted by a mesh STA is referred to as a *mesh Data frame*.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—Subclause 9.2.4.1.4 constrains the setting of the From DS and To DS subfields in mesh Data frames.

Parentheses enclosing portions of names or acronyms are used to designate a set of related names that vary based on the inclusion of the parenthesized portion. For example,

- *QoS +CF-Poll frame* refers to the three QoS data subtypes that include "+CF-Poll": the QoS Data +CF-Poll frame, subtype 1010; QoS Data +CF-Ack +CF-Poll frame, subtype 1011; and QoS CF-Ack +CF-Poll frame, subtype 1111.
- *QoS CF-Poll frame* refers specifically to the QoS CF-Poll frame, subtype 1110.
- *QoS (+)CF-Poll frame* refers to all four QoS data subtypes with CF-Poll: the QoS CF-Poll frame, subtype 1110; the QoS CF-Ack +CF-Poll frame, subtype 1111; the QoS Data +CF-Poll frame, subtype 1010; and the QoS Data +CF-Ack +CF-Poll frame, subtype 1011.
- *QoS (+)Null frame* refers to all three QoS data subtypes with an empty frame body: the QoS Null frame, subtype 1100; the QoS CF-Poll frame, subtype 1110; and the QoS CF-Ack +CF-Poll frame, subtype 1111.
- *QoS +CF-Ack frame* refers to the three QoS data subtypes that include "+CF-Ack": the QoS Data +CF-Ack frame, subtype 1001; QoS Data +CF-Ack +CF-Poll frame, subtype 1011; and QoS CF-Ack +CF-Poll frame, subtype 1111.
- *(NDP) CTS* refers to CTS and NDP CTS.
- *(NDP) CF-End* refers to CF-End and NDP CF-End.
- *(NDP) PS-Poll* refers to PS-Poll and NDP PS-Poll.
- *(NDP) Ack* refers to Ack and NDP Ack.
- *NDP (PS-Poll-)Ack* refers to NDP Ack and NDP PS-Poll-Ack.
- *(NDP) Block Ack* refers to Block Ack and NDP Block Ack.
- *PS-Poll(+BDT)* refers to PS-Poll and PS-Poll+BDT.

Reserved fields and subfields defined in this clause are set to 0 upon transmission and are ignored upon reception.

NOTE 2—This applies to reserved fields and subfields in MAC headers. Reserved fields and subfields in PHY headers might be set to a nonzero value upon transmission, and might not be ignored upon reception.

During transmission, a field or a subfield is not set to a value that is reserved for that field or subfield. Upon reception of a reserved value in a field or subfield, the behavior is, unless otherwise specified, undefined.

9.2.3 General frame format

The MAC frame format comprises a set of fields that occur in a fixed order in all frames. Figure 9-2 depicts the general MAC frame format for protocol version 0 (PV0) MPDUs, and Figure 9-1333 (in 9.8.2) depicts the general MAC frame format for protocol version 1 (PV1) frames. The first 2 bits of the first subfield (Protocol Version) of the Frame Control field and the last field (FCS) in Figure 9-2 are present in all PV0 MPDUs and PV1 MPDUs, including reserved types and subtypes. Figure 9-1349 depicts the general MAC frame format for Wake-up Radio (WUR) frames.

For PV0 MPDUs, the first three fields (Frame Control, Duration/ID, and Address 1) and the last field (FCS) in Figure 9-2 constitute the minimal frame format and are present in all these frames, including reserved types and subtypes. The fields Address 2, Address 3, Sequence Control, Address 4, QoS Control, HT Control, and Frame Body are present only in certain frame types and subtypes. Each field is defined in 9.2.4. For PV1 MPDUs, the fields constituting the minimal frame format are defined in 9.8.2. The format of each of the individual subtypes of each frame type is defined in 9.3, the format of each PV1 frame type is defined in 9.8. The components of (PV0) Management frame bodies are defined in 9.4. The formats of Action frame bodies (PV0 and PV1) are defined in 9.6. The formats of WUR frames are defined in 9.9.

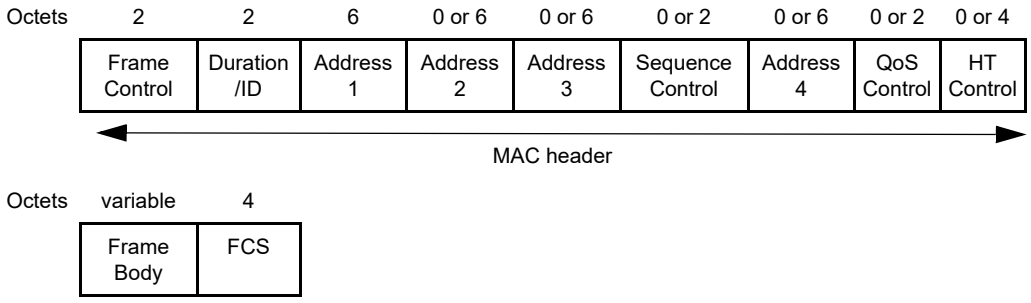

Figure 9-2—MAC frame format

The Frame Body field is of variable size, constrained as defined in 9.2.4.8.1.

9.2.4 Frame fields

9.2.4.1 Frame Control field

9.2.4.1.1 General

The first three subfields of the Frame Control field of a PV0 frame are Protocol Version, Type, and Subtype. The remaining subfields of the Frame Control field depend on the setting of the Type and Subtype subfields.

For a frame carried in a non-S1G PPDU, when the Type subfield is not 1 or the Subtype subfield is not 6, the remaining subfields within the Frame Control field are To DS, From DS, More Fragments, Retry, Power Management, More Data, Protected Frame, and +HTC. In this case, the format of the Frame Control field is shown in Figure 9-3.

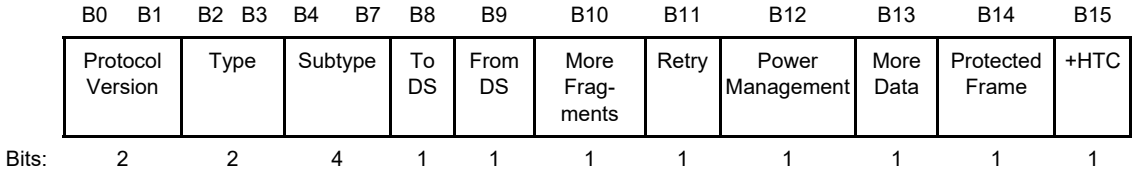

Figure 9-3—Frame Control field format in non-S1G PPDUs when Type subfield is not equal to 1 or Subtype subfield is not equal to 6

For a frame carried in a non-S1G PPDU, when the Type subfield is 1 and the Subtype subfield is 6, the remaining subfields within the Frame Control field are the following: Control Frame Extension, Power Management, More Data, Protected Frame, and +HTC. In this case, the format of the Frame Control field is shown in Figure 9-4.

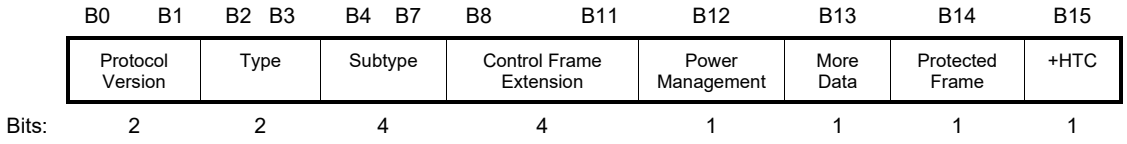

Figure 9-4—Frame Control field format in non-S1G PPDUs when Type subfield is equal to 1 and Subtype subfield is equal to 6

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For a frame carried in an S1G PPDU, when the Type subfield is 0 or 2, the remaining subfields within the Frame Control field are: To DS, From DS, More Fragments, Retry, Power Management, More Data, Protected Frame, and +HTC. In this case, the format of the Frame Control field is shown in Figure 9-5).

	B0 B1	B2 B3	B4 B7	B8	B9	B10	B11	B12	B13	B14	B15

Bits:	2	2	4	1	1	1	1	1	1	1	1

Figure 9-5—Frame Control field format in S1G PPDUs when Type subfield is equal to 0 or 2

When the Type subfield is equal to 3 and the Subtype subfield is equal to 1, the format of the Frame Control field is shown in Figure 9-6.

	B0 B1	B2 B3	B4 B7	B8	B9	B10	B11 B13	B14	B15
	Protocol Version	Type	Subtype	Next TBTT Present	Short SSID Present	ANO Present	BSS BW	Security	AP PM
Bits:	2	2	4	1	1	1	3	1	1

Figure 9-6—Frame Control field format when Type subfield is equal to 3 and Subtype subfield is equal to 1

9.2.4.1.2 Protocol Version subfield

The Protocol Version subfield is invariant in size and placement across all revisions of this standard. For this standard, the value of the protocol version is 0 for MAC frames as described in 9.2 and 1 for PV1 MAC frames as described in 9.8. All other values are reserved. The revision level is incremented only when a fundamental incompatibility exists between a new revision and the prior edition of the standard. See 10.28.2.

9.2.4.1.3 Type and Subtype subfields

The Type and Subtype subfields together identify the function of the frame. There are three frame types: control, data, and management. Each of the frame types has several defined subtypes. In Data frames, the most significant bit (MSB) of the Subtype subfield, B7, is defined as the QoS subfield. Table 9-1 defines the valid combinations of type and subtype.

Each Subtype subfield bit position is used to indicate a specific modification of the basic Data frame (subtype 0). Frame Control bit 4 is set to 1 in data subtypes that include +CF-Ack, bit 5 is set to 1 in data subtypes that include +CF-Poll, bit 6 is set to 1 in data subtypes that contain no Frame Body field, and bit 7 is set to 1 in the QoS data subtypes, which have QoS Control fields in their MAC headers.

The Control Frame Extension subtype is used to increase the subtype space by reusing B8–B11. These additional Control frames are defined in Table 9-2.

9.2.4.1.4 To DS and From DS subfields

The meaning of the combinations of values for the To DS and From DS subfields in Data frames are shown in Table 9-3.

Table 9-3—Combinations of To DS subfield and From DS subfield in Data frames

To DS subfield and From DS subfield values	Meaning
To DS = 0 From DS = 0	A Data frame from one STA to another STA within the same IBSS or the same PBSS, a Data frame direct from one non-AP STA to another non-AP STA within the same infrastructure BSS, or a Data frame outside the context of a BSS. This is the only valid combination for Data frames transmitted: a) by an IBSS or PBSS STA, b) on the direct path of a TDLS direct link, or c) outside the context of a BSS.
To DS = 1 From DS = 0	A Data frame destined for the DS or being sent by a STA associated with an AP to the Port Access Entity in that AP.
To DS = 0 From DS = 1	A Data frame exiting the DS or being sent by the Port Access Entity in an AP, or a group addressed mesh Data frame with the Mesh Control field present using the three-address MAC header format. This is the only valid combination for Data frames transmitted by a non-GLK AP and group addressed Data frames transmitted by a mesh STA.
To DS = 1 From DS = 1	A Data frame using the four-address MAC header format. This standard defines procedures for using this combination of field values in mesh BSSs (see 10.37), by S1G relays (see 10.53) or by a GLK STA (see 10.64). This is the only valid combination for individually addressed Data frames transmitted by a mesh STA.

The meanings of the combinations of values of the Management frame To DS and From DS subfields are shown in Table 9-4.

In Control frames, To DS and From DS subfields, when present, are both zero.

NOTE—In Control frames of subtype Control Frame Extension, the To DS and From DS subfields are not defined, and their bit positions are part of the Control Frame Extension field (see 9.2.4.1.3, Table 9-2).

Table 9-4—Combinations of To DS and From DS subfields in Management frames

To DS subfield and From DS subfield values	Meaning
To DS = 0 From DS = 0	All Management frames that are not QMFs.
To DS = 1 From DS = 0	All QMFs
To DS = 0 From DS = 1	This combination is reserved.
To DS = 1 From DS = 1	This combination is reserved.

9.2.4.1.5 More Fragments subfield

The More Fragments subfield is set to 1 in all Data or Management frames that have another fragment of the current MSDU or current MMPDU to follow. It is set to 0 in all other frames in which the More Fragments subfield is present.

NOTE—In Control frames of subtype Control Frame Extension, the More Fragments subfield is not present, and its bit position is part of the Control Frame Extension field (see 9.2.4.1.3, Table 9-2).

9.2.4.1.6 Retry subfield

The Retry subfield is set to 1 in any Data or Management frame that is a retransmission of an earlier frame. It is set to 0 in all other frames in which the Retry subfield is present. A receiving STA uses this indication to aid in the process of eliminating duplicate frames. These rules do not apply for frames that are not non-A-MPDUs and that are sent by a non-DMG STA under a block ack agreement.

NOTE—In Control frames of subtype Control Frame Extension, the Retry subfield is not present, and its bit position is part of the Control Frame Extension field (see 9.2.4.1.3, Table 9-2).

9.2.4.1.7 Power Management subfield

The Power Management subfield is used to indicate the power management mode of a STA. The subfield is either reserved (as defined below) or remains constant in each frame from a particular STA within a frame exchange sequence. The value indicates the mode of the STA after the successful completion of the frame exchange sequence.

In an infrastructure BSS or PBSS, the following applies:

- In certain frame exchanges, as described in 11.2.3 and 11.2.7, the Power Management subfield is set to 1 to indicate that the STA will be in PS mode and set to 0 to indicate that the STA will be in active mode.
- The Power Management subfield is reserved in all Management frames transmitted by a STA to an AP or PCP with which it is not associated.
- The Power Management subfield is reserved in all frames transmitted by the AP.

In an IBSS, the Power Management subfield is valid only in certain frames as described in 11.2.4.4. In such frames, the Power Management subfield set to 1 indicates that the STA will be in PS mode. The Power Management subfield set to 0 indicates that the STA will be in active mode.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In an MBSS, the Power Management subfield is valid only in frame exchanges as described per the mesh power management mode transitions rules in 14.15. In such exchanges, the value indicates the STA's power management mode (see 14.15).

9.2.4.1.8 More Data subfield

The More Data subfield is used differently by a DMG, an S1G STA, and a non-DMG non-S1G STA.

A non-DMG and non-S1G STA uses the More Data subfield to indicate to a STA in PS mode that more BUs are buffered for that STA at the AP. The More Data subfield is valid in individually addressed Data or Management frames transmitted by an AP to a STA in PS mode. The More Data subfield is set to 1 to indicate that at least one additional buffered BU is present for the same STA.

An AP optionally sets the More Data subfield to 1 in Ack frames sent to a non-DMG non-S1G non-HE STA and in Ack, BlockAck, and Multi-STA BlockAck frames sent to an HE STA. An HE AP indicates that it supports setting the More Data subfield to 1 in these control response frames by setting the More Data Ack subfield to 1 in the QoS Info field of elements it includes in frames transmitted to the STA.

The AP can set the More Data subfield to 1 to indicate that it has a pending transmission for the STA if it has received a frame that contains a QoS Info field in which the More Data Ack subfield is equal to 1 from the STA and one of the following conditions is true:

— The STA is in PS mode and has one or more ACs that are delivery enabled (see 11.2.3.6).
— The STA is in PS mode and is a TWT requester or a TWT scheduled STA (see 26.8).

A TDLS peer STA optionally sets the More Data subfield to 1 in Ack frames sent to a non-HE STA and in Ack, BlockAck, and Multi-STA BlockAck frames sent to an HE STA. An HE TDLS peer STA indicates that it supports setting the More Data subfield to 1 in these control response frames by setting the More Data Ack subfield to 1 in the QoS Info field of the QoS Capability element it includes in frames transmitted to the STA.

The TDLS peer STA can set the More Data subfield to 1 to indicate that it has a pending transmission for the STA if it has received from the STA a TDLS Setup Request frame or TDLS Setup Response frame that has the More Data Ack subfield equal to 1 in the QoS Info field of the QoS Capability element and one of the following conditions is true:

— The STA has TDLS peer PSM enabled (see 11.2.3.6).
— The STA is in PS mode and is a TWT requester or a TWT scheduled STA (see 26.8).

The More Data subfield is 1 in individually addressed frames transmitted by a mesh STA to a peer mesh STA that is either in light sleep mode or in deep sleep mode for the corresponding mesh peering, when additional BUs remain to be transmitted to this peer mesh STA.

The More Data subfield is set to 1 in individually addressed frames transmitted by a VHT AP to a VHT STA when both support the VHT TXOP power save feature (as determined from their VHT Capabilities elements) to indicate that at least one additional buffered BU is present for the STA. See 11.2.3.16.

A non-DMG and non-S1G STA sets the More Data subfield to 0 in all other individually addressed frames.

A non-DMG and non-S1G STA sets the More Data subfield to 1 in non-GCR-SP group addressed frames transmitted by the AP when additional group addressed bufferable units (BUs) that are not part of an active GCR-SP remain to be transmitted by the AP during this beacon interval. The More Data subfield is set to 0 in non-GCR-SP group addressed frames transmitted by the AP when no more group addressed BUs that are not part of an active GCR-SP remain to be transmitted by the AP during this beacon interval and in all group addressed frames transmitted by non-AP STAs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An S1G STA sets the More Data subfield to 1 in individually addressed frames to indicate that the S1G STA has MSDUs, MMPDU or A-MSDUs buffered for transmission to the frame's recipient during the current SP or TXOP. An S1G STA does not set the More Data subfield to 1 in individually addressed frames if it does not have any MSDUs, MMPDU or A-MSDUs buffered for transmission to the frame's recipient during the current SP or TXOP.

An S1G AP sets the More Data subfield to 1 in group addressed frames when additional group addressed BUs remain to be transmitted by the AP during this beacon interval or short beacon interval (see 11.1.3.10.2). The S1G AP sets the More Data subfield to 0 in group addressed frames transmitted by the AP when no more group addressed BUs remain to be transmitted by the AP during this beacon interval or short beacon interval.

The More Data subfield is set to 1 in GCR-SP group addressed frames transmitted by the AP when additional group addressed BUs that are part of an active GCR-SP remain to be transmitted by the AP during this GCR-SP. The More Data subfield is set to 0 in GCR-SP group addressed frames transmitted by the AP when no more group addressed BUs that are part of an active GCR-SP remain to be transmitted by the AP during this GCR-SP.

The More Data subfield is 1 in group addressed frames transmitted by a mesh STA when additional group addressed BUs remain to be transmitted. The More Data subfield is 0 in group addressed frames transmitted by a mesh STA when no more group addressed BUs remain to be transmitted.

A DMG STA sets the More Data subfield as follows:

— In individually addressed frames, it is set to 1 to indicate that the STA has MSDUs or A-MSDUs buffered for transmission to the frame's recipient during the current SP or TXOP.
— It is set to 1 in group addressed frames transmitted by the AP when additional group addressed BUs remain to be transmitted by the AP during this beacon interval. The More Data subfield is set to 0 in group addressed frames transmitted by the AP when no more group addressed BUs remain to be transmitted by the AP during this beacon interval.

A DMG STA does not set the More Data bit to 1 if it does not have any MSDUs or A-MSDUs buffered for transmission to the frame's recipient during the current SP or TXOP.

The More Data subfield is set to 1 in individually addressed frames transmitted by a CMMG AP to a CMMG STA when both support the CMMG TXOP power save feature (as determined from their CMMG Capabilities elements) to indicate that at least one additional buffered BU is present for the STA, see 11.2.3.18.

9.2.4.1.9 Protected Frame subfield

The Protected Frame subfield (see 12.2.6) is set to 1 if the Frame Body field contains information that has been processed by a cryptographic encapsulation algorithm. The Protected Frame subfield is reserved in Control frames of subtype Control Frame Extension. When the Protected Frame subfield is equal to 1, the Frame Body field is protected utilizing the cryptographic encapsulation algorithm and expanded as defined in Clause 12. The Protected Frame subfield is set to 0 in Data frames of subtype Null, QoS Null, QoS CF-Poll, and QoS CF-Ack +CF-Poll (see, for example, 12.3.4.2 and 12.5.2.1 that show that the frame body needs to be 1 octet or longer to apply the encapsulation).

9.2.4.1.10 +HTC subfield

The +HTC subfield is set as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— It is set to 1 in a QoS Data or Management frame transmitted with the FORMAT parameter of the TXVECTOR set to HT_GF, HT_MF, VHT or S1G to indicate that the frame contains an HT Control field.
— It is set to 1 in an RTS frame transmitted with the FORMAT parameter of the TXVECTOR set to S1G to indicate that the intended recipient of the frame has permission to extend the TXOP as described in 10.53.5.4.
— It is set to 1 in a QoS Data or Management frame transmitted by a CMMG STA to indicate that the frame contains a CMMG variant HT Control field.
— It is set to 1 in a QoS Data, QoS Null, or Management frame transmitted by an HE STA to another HE STA to indicate that the frame contains an HT Control field.

Otherwise, the +HTC subfield is set to 0.

NOTE—The +HTC subfield is always set to 0 for frames transmitted by a DMG STA.

9.2.4.1.11 Bandwidth Indication and Dynamic Indication subfields

The Bandwidth Indication subfield identifies the bandwidth of the PPDU. The Bandwidth Indication and Dynamic Indication subfields are used to negotiate the bandwidth of PPDUs within a TXOP. Table 9-5 defines the bandwidth used for exchanging PPDUs between a TXOP holder and a TXOP responder.

Table 9-5—Bandwidth Indication subfield encoding

Bandwidth Indication encoding	Meaning
0	1 MHz
1	2 MHz
2	4 MHz
3	8 MHz
4	16 MHz
5–7	Reserved

Table 9-6 indicates whether the bandwidth used for exchanging PPDUs in a TXOP is static or can change dynamically.

Table 9-6—Dynamic Indication subfield encoding

Dynamic Indication encoding	Meaning
0	Static
1	Dynamic

9.2.4.1.12 Next TWT Info Present subfield

The Next TWT Info Present subfield is set to 1 if the Next TWT Info/Suspend Duration field is present in the frame. Otherwise, it is set to 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.2.4.1.13 Flow Control subfield

The Flow Control subfield is used for flow suspension signaling as described in 10.60.

9.2.4.1.14 Poll Type subfield

The Poll Type subfield is defined in Table 9-7 if the Power Management subfield is 1 in PS-Poll frame. Otherwise, the Poll Type subfield is reserved.

Table 9-7—Poll Type subfield encoding

Poll Type subfield	Description
0	Request for a buffered frame without a request to reschedule the awake/doze cycle
1	Request for the information of change sequence of the beacon and partial timestamp
2	Request for a duration to a TBTT or Next TWT to reschedule awake/doze cycle
3	Request for a duration to a service period to reschedule awake/doze cycle

9.2.4.1.15 Next TBTT Present subfield

The Next TBTT Present subfield is set to 1 if the Next TBTT field is present; otherwise, it is set to 0.

9.2.4.1.16 Short SSID Present subfield

The Short SSID Present subfield is set to 1 if the Short SSID field is present; otherwise, it is set to 0.

9.2.4.1.17 ANO Present subfield

The ANO Present subfield is set to 1 if the Access Network Options field is present; otherwise, it is set to 0.

9.2.4.1.18 BSS BW subfield

The BSS BW subfield indicates the minimum and the maximum operating bandwidths of the BSS as defined in Table 9-8.

9.2.4.1.19 Security subfield

The Security subfield is set to 1 if the AP is an RSNA AP.

9.2.4.1.20 AP-PM subfield

The AP-PM subfield indicates whether the AP can go to Power Save mode until the next TBTT or TSBTT. If the AP-PM subfield is equal to 1, the AP can go to Power Save mode until the next TBTT or TSBTT unless otherwise is indicated by restricted access windows (RAWs) or TWTs. If the AP-PM subfield is equal to 0, the AP does not go to Power Save mode until the next TBTT or TSBTT.

9.2.4.2 Duration/ID field

The contents of the Duration/ID field vary with frame type and subtype, and with the QoS capabilities of the sending STA. The contents of the field are defined as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-8—Frame Control field BSS BW setting

BSS BW	Minimum BSS BW (MHz)	Maximum BSS BW (MHz)
0	1	2
1	Equal to the BW of the PPDU carrying the BSS BW field	Equal to the BW of the PPDU carrying the BSS BW field
2	1	4
3	2	4
4	1	8
5	2	8
6	1	16
7	2	16

a) In Control frames of subtype PS-Poll other than PS-Poll+BDT frames, and for broadcast transmissions in S1G PPDUs, the Duration/ID field carries the association identifier (AID) of the STA that transmitted the frame in the 14 least significant bits (LSB), and the 2 most significant bits (MSB) both set to 1.

b) In Data and Management frames sent by QoS STAs, the Duration/ID field contains a duration value as defined for each frame type in 9.2.5.

c) In Extension frames the Duration/ID field contains a duration value as defined in 9.3.4.

d) In all other frames, the Duration/ID field contains a duration value as defined for each frame type in 9.3.

See 10.28.3 on the processing of this field in received frames.

The encoding of the Duration/ID field is given in Table 9-9.

Table 9-9—Duration/ID field encoding

Bits 0–13	Bit 14	Bit 15	Usage
0–32 767		0	Duration value (in microseconds) within all frames except PS-Poll frames that are not PS-Poll+BDT
0–16 383	0	1	Reserved
0	1	1	AID 0 is used for broadcast transmission in S1G PPDU, reserved if not in S1G PPDU.
1–2007	1	1	AID in PS-Poll frames other than PS-Poll+BDT.
2008–8191	1	1	Additional AIDs in S1G PS-Poll frames other than PS-Poll+BDT. Reserved if not in S1G PS-Poll frames.
8192–16 383	1	1	Reserved

See also 9.7.3 on the setting of the Duration/ID field of MAC headers of MPDUs in an A-MPDU.

9.2.4.3 Address fields

9.2.4.3.1 General

There are four address fields in the MAC frame format. These fields are used to indicate the basic service set identifier (BSSID), source address (SA), destination address (DA), transmitting address (TA), and receiving address (RA). Certain frames might not contain some of the address fields.

Certain address field usage is specified by the relative position of the address field (1–4) within the MAC header, independent of the type of address present in that field. Specifically, the Address 1 field always identifies the intended receiver(s) of the frame, and the Address 2 field, where present, always identifies the transmitter of the frame.

NOTE—In the case of a bandwidth signaling TA the Address 2 field is not equal to the MAC address of the transmitter.

9.2.4.3.2 Address representation

Each Address field contains an address as defined in Clause 8 of IEEE Std 802-2014.

9.2.4.3.3 Address designation

A MAC sublayer address is one of the following two types:

a) *Individual address.* The address assigned to a particular STA on the network.
b) *Group address.* A multidestination address, which might be in use by one or more STAs on a given network. The two kinds of group addresses are as follows:
    1) *Multicast-group address.* An address associated by higher level convention with a group of logically related STAs.
    2) *Broadcast address.* A distinguished, predefined group address that always denotes the set of all STAs on a given LAN. All 1s are interpreted to be the broadcast address. This group is predefined for each communication medium to consist of all STAs actively connected to that medium; it is used to broadcast to all of the active STAs on that medium.

The address space is also partitioned into locally administered and universal (globally administered) addresses. The nature of a body and the procedures by which it administers these universal (globally administered) addresses is beyond the scope of this standard. See IEEE Std 802 for more information.

9.2.4.3.4 BSSID field

The BSSID field is of the same format as a MAC address. When dot11OCBActivated is false and dot11MeshActivated is false, this field uniquely identifies each BSS.

This field, in an infrastructure BSS, is the MAC address currently in use by the STA in the AP of the BSS.

This field in a PBSS is set to the MAC address of the PCP.

This field in an IBSS is set to a locally administered MAC address formed from a 46-bit random number generated according to the procedure defined in 11.1.4. The Individual/Group bit of the address is set to 0. The Universal/Local bit of the address is set to 1. This mechanism is used to provide a high probability of selecting a unique BSSID.

This field in an MBSS is set to the MAC address of the mesh STA transmitting the frame containing the field.

NOTE—This means the BSSID field has the same value as the TA field (see 9.3.2.1.2).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

This field is set to all 1s to indicate the wildcard BSSID. The wildcard value is not used in the BSSID field except where explicitly permitted in this standard. When dot11OCBActivated is true, the wildcard value is used in the BSSID field. When dot11OCBActivated is false and the BSSID field contains the wildcard value, the Address 1 (DA) field is also set to all 1s to indicate the broadcast address.

9.2.4.3.5 DA field

The DA field contains a MAC address that identifies the MAC entity or entities intended as the final recipient(s) of the MSDU (or fragment thereof) or A-MSDU (or fragment thereof), as defined in 9.3.2.1, contained in the frame body field.

9.2.4.3.6 SA field

The SA field contains an individual address that identifies the MAC entity from which the transfer of the MSDU (or fragment thereof) or A-MSDU, as defined in 9.3.2.1, contained in the frame body field was initiated. The Individual/Group bit is always transmitted as a 0 in the source address.

9.2.4.3.7 RA field

The RA field contains a MAC address that identifies the intended immediate recipient STA(s), on the WM, for the information contained in the frame body field.

9.2.4.3.8 TA field

The TA field contains a MAC address that identifies the STA that has transmitted, onto the WM, the MPDU contained in the frame body field. If the Individual/Group bit is 0, then the TA field is the individual address of the STA; otherwise, the TA field is a bandwidth signaling TA, indicating that the frame carries additional information in the scrambling sequence (see 9.3.1.2, 9.3.1.5.1, 9.3.1.7.1, 9.3.1.8.1, 9.3.1.19, 9.3.1.20, 10.6.6.6, and 10.6.12).

9.2.4.4 Sequence Control field

9.2.4.4.1 Sequence Control field structure when SAR is not used

If segmentation and reassembly (see 10.69) is not established between the transmitting and receiving STA, the Sequence Control field has the format shown in Figure 9-7.

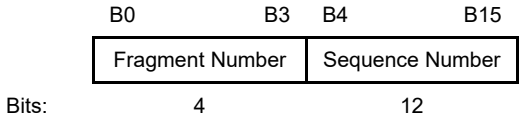

Figure 9-7—Sequence Control field format when SAR is not used

9.2.4.4.2 Sequence Control field structure when SAR is used

If segmentation and reassembly (see 10.69) is established between the transmitting and receiving STA, the Sequence Control field has the format shown in Figure 9-8.

The Start of MSDU subfield is set to 1 to indicate that the MPDU contains the first segment of an MSDU or A-MSDU. It is set to 0 otherwise.

The End of MSDU subfield is set to 1 to indicate that the MPDU contains the last segment of an MSDU or A-MSDU. It is set to 0 otherwise.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

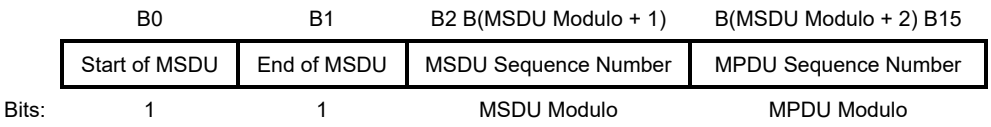

Figure 9-8—Sequence Control field format when SAR is used

The MSDU Sequence Number subfield indicates the sequence number value associated with the respective MSDU or A-MSDU segment. The length of the MSDU Sequence Number subfield is equal to the value of the MSDU Modulo subfield within the SAR Configuration element contained in the intended recipient's ADDBA Response frame (see 10.25.2).

The MPDU Sequence Number subfield indicates the MPDU sequence number that carries the MSDU or A-MSDU segment. The length of the MPDU Sequence Number subfield is equal to the value of the MPDU Modulo subfield within the SAR Configuration element contained in the intended recipient's ADDBA Response frame (see 10.25.2).

9.2.4.4.3 Sequence Number field

Each MSDU (if not in an A-MSDU), A-MSDU, or MMPDU is assigned a sequence number. See 10.3.2.14.

The Sequence Number field in Data frames indicates the sequence number of the MSDU (if not in an A-MSDU) or A-MSDU.

The Sequence Number field in QMFs comprises the QMF Sequence Number subfield and the AC Index (ACI) subfield. The QMF Sequence Number subfield indicates the sequence number of the frame. The ACI subfield indicates the ACI of the frame. The format of the Sequence Number field in QMFs is shown in Figure 9-9.

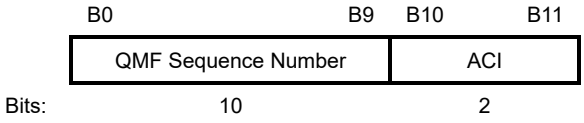

Figure 9-9—Sequence Number field format in QMFs

The ACI subfield represents the ACI of the frame as defined in 9.4.2.27.

The Sequence Number field in Management frames that are not QMFs indicates the sequence number of the frame.

Each fragment of an MSDU (not in an A-MSDU), A-MSDU or MMPDU contains a copy of the sequence number assigned to that MSDU, A-MSDU or MMPDU. The sequence number remains constant in all retransmissions of the MSDU, A-MSDU, MMPDU, or fragment thereof, except when the MSDU is delivered via both DMS and group addressed delivery via NoAck, GCR unsolicited retry, or GCR block ack retransmission policies. In such cases, the sequence numbers assigned to the MSDUs (re)transmitted using group addressed delivery need not match the sequence number of the corresponding A-MSDUs (re)transmitted using individually addressed delivery via DMS.

9.2.4.4.4 Fragment Number field

The Fragment Number field indicates the number of each fragment of an MSDU or MMPDU. The fragment number is set to 0 in the first or only fragment of an MSDU or MMPDU and is incremented by one for each

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

successive fragment of that MSDU or MMPDU. The fragment number is set to 0 in an MPDU containing an A-MSDU, and in an MPDU containing an MSDU or MMPDU that is not fragmented. The fragment number remains constant in all retransmissions of the fragment.

9.2.4.5 QoS Control field

9.2.4.5.1 QoS Control field structure

The QoS Control field identifies the TC or TS to which the frame belongs as well as various other QoS-related, A-MSDU related, and mesh-related information about the frame that varies by frame type, subtype, and type of transmitting STA. The QoS Control field is present in all Data frames in which the QoS subfield of the Subtype subfield is equal to 1 (see 9.2.4.1.3).

When not transmitted within a DMG PPDU, each QoS Control field comprises five or eight subfields, as defined for the particular sender (HC or non-AP STA) and frame type and subtype. The usage of these subfields and the various possible layouts of the QoS Control field are described in 9.2.4.5.2 to 9.2.4.5.12 and shown in Table 9-10.

Table 9-10—QoS Control field

Applicable frame (sub)types	Bits 0–3	Bit 4	Bits 5–6	Bit 7	Bits 8	Bit 9	Bit 10	Bits 11–15
QoS CF-Poll and QoS CF-Ack +CF-Poll frames sent by HC	TID	EOSP	Ack Policy Indicator	Reserved	TXOP Limit			
QoS Data +CF-Poll and QoS Data +CF-Ack +CF-Poll frames sent by HC	TID	EOSP	Ack Policy Indicator	A-MSDU Present	TXOP Limit			
QoS Data and QoS Data +CF-Ack frames sent by HC	TID	EOSP	Ack Policy Indicator	A-MSDU Present	AP PS Buffer State			
QoS Null frames sent by HC	TID	EOSP	Ack Policy Indicator	Reserved	AP PS Buffer State			
QoS Data and QoS Data +CF-Ack frames sent in a nonmesh BSS by non-AP STAs that are not a TPU buffer STA or a TPU sleep STA	TID	0	Ack Policy Indicator	A-MSDU Present	TXOP Duration Requested			
	TID	1	Ack Policy Indicator	A-MSDU Present	Queue Size			
QoS Null frames sent in a nonmesh BSS by non-AP STAs that are not a TPU buffer STA or a TPU sleep STA	TID	0	Ack Policy Indicator	Reserved	TXOP Duration Requested			
	TID	1	Ack Policy Indicator	Reserved	Queue Size			
QoS Data and QoS Data +CF-Ack frames sent by TPU buffer STAs	TID	EOSP	Ack Policy Indicator	A-MSDU Present	Reserved			

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-10—QoS Control field *(continued)*

Applicable frame (sub)types	Bits 0–3	Bit 4	Bits 5–6	Bit 7	Bits 8	Bit 9	Bit 10	Bits 11–15
QoS Null frames sent by TPU buffer STAs	TID	EOSP	Ack Policy Indicator	Reserved	Reserved			
QoS Data and QoS Data +CF-Ack frames sent by TPU sleep STAs	TID	Reserved	Ack Policy Indicator	A-MSDU Present	Reserved			
QoS Null frames sent by TPU sleep STAs	TID	Reserved	Ack Policy Indicator	Reserved	Reserved			
All frames sent by mesh STAs in a mesh BSS	TID	EOSP	Ack Policy Indicator	A-MSDU Present	Mesh Control Present	Mesh Power Save Level	RSPI	Reserved

See 10.12.1 for constraints on the contents of the QoS Control field when present in an A-MPDU.

The format of the QoS Control field for MPDUs transmitted within a DMG PPDU is provided in Table 9-11. Data subtypes not shown in the table are not transmitted within a DMG PPDU.

Table 9-11—QoS Control field for frames transmitted within a DMG PPDU

Applicable frame (sub)types	Bits 0–3	Bit 4	Bits 5–6	Bit 7	Bit 8	Bit 9	Bits 10–13	Bit 14	Bit 15
QoS Data	TID	EOSP	Ack Policy Indicator	A-MSDU Present	A-MSDU Type	RDG/ More PPDU	Buffered AC	Reserved	AC Constraint
QoS Null	TID	EOSP	Ack Policy Indicator	Reserved	Reserved	RDG/ More PPDU	Buffered AC	Reserved	AC Constraint

9.2.4.5.2 TID subfield

The TID subfield identifies the TC or TS to which the corresponding MSDU (or fragment thereof) or A-MSDU (or fragment thereof) in the Frame Body field belongs. The TID subfield also identifies the TC or TS of traffic for which a TXOP is being requested, through the setting of TXOP duration requested or queue size. The encoding of the TID subfield depends on the access policy (see 9.4.2.28) and is shown in Table 9-12. Additional information on the interpretation of the contents of this field appears in 5.1.1.3.

Table 9-12—TID subfield

Access policy	Usage	Allowed values
EDCA	UP for either TC or TS, regardless of whether admission control is required	0–7
HCCA, SPCA	TSID	8–15
HEMM, SEMM	TSID, regardless of the access mechanism used	8–15

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In QoS Data +CF-Poll frames, the TID subfield in the QoS Control field indicates the TID of the data. In QoS (+)CF-Poll frames of subtype Null, the TID subfield in the QoS Control field indicates the TID for which the poll is intended. The requirement to respond to that TID is nonbinding, and a STA can respond with any frame (see 10.23.3.5.1). For STAs where dot11OCBActivated is true, traffic streams are not used and the TID always corresponds to a TC.

9.2.4.5.3 EOSP (end of service period) subfield

The EOSP subfield is used by the HC to indicate the end of the current service period (SP) and by a DMG STA to indicate the end of the current SP or the end of the current allocated CBAP with a destination AID that is not the broadcast AID. The HC sets the EOSP subfield to 1 in its transmission and retransmissions of the SP's final frame to end an SP and sets it to 0 otherwise. To end an SP allocation or a CBAP allocation with a destination AID that is not the broadcast AID, the DMG STA sets the EOSP subfield to 1 in its final frame transmission and retransmissions within the allocation; otherwise, the DMG STA sets the EOSP subfield to 0.

The mesh STA uses the EOSP subfield to indicate the end of the current mesh peer service period in which it operates as the owner. The mesh STA sets the EOSP subfield to 1 in its transmission and retransmissions of the mesh peer service period's final frame to end a mesh peer service period, and sets it to 0 otherwise. See 14.15.9.4 for details.

If dot11RobustAVStreamingImplemented is true, then the HC sets the EOSP subfield to 1 in a GCR-SP group addressed frame in order to indicate that no more GCR-SP frames of that group address are to be transmitted by the AP until the next scheduled SP for this GCR-SP stream.

NOTE—As GCR frames sent using the GCR-A procedures are sent outside of any SP (see 11.21.16.3.8), the EOSP subfield is set to 0 in such frames.

9.2.4.5.4 Ack Policy Indicator subfield

The Ack Policy Indicator subfield, together with other information, as shown in Table 9-13, identifies the ack policy, i.e. the behavior followed upon the delivery of the MPDU.

9.2.4.5.5 TXOP Limit subfield

The TXOP Limit subfield is present in QoS Data frames of subtypes that include CF-Poll and specifies the time limit on a TXOP granted by a QoS (+)CF-Poll frame from an HC in an infrastructure BSS. In QoS Data frames with subtypes that include CF-Poll, the addressed STA is granted a TXOP that begins a SIFS after this frame and lasts no longer than the number of 32 μs periods specified by the TXOP Limit subfield value. The range of time values is 32 μs to 8160 μs. A TXOP Limit subfield set to 0 indicates that only one MPDU or one QoS Null frame is to be transmitted immediately following the QoS (+)CF-Poll frame.

9.2.4.5.6 Queue Size subfield

The Queue Size subfield indicates the amount of buffered traffic for a given TC or TS:

— at a non-AP non-HE STA sending the frame that contains this subfield, or
— at a non-AP HE STA for transmission to the HE STA identified by the receiver address of the frame that contains this subfield.

The Queue Size subfield is present in QoS Data frames with bit 4 of the QoS Control field set to 1 sent by a non-AP STAs and in QoS Null frames with bit 4 of the QoS Control field set to 1 sent by a non-AP HE STA. The AP might use information contained in the Queue Size subfield to determine the TXOP duration assigned to the STA or to determine the UL resources assigned to the non-AP HE STA (see 26.5.2).

Table 9-13—Ack policy

Ack policy	Ack Policy Indicator subfield		Other conditions	Meaning
	Bit 0	Bit 1		
Normal Ack	0	0	MPDU is a non-A-MPDU frame	Where the frame contains a fragment and both the originator and the addressed recipient support fragment BA : The addressed recipient returns an NDP BlockAck or BAT frame after a SIFS, according to the procedures defined in 10.3.2.12 and 10.46.2. The addressed recipient that is a DMG STA operating in an SP with TDD channel access (see 10.38.6.2.2) returns an Ack frame according to the procedures defined in 10.3.2.11. Otherwise: The addressed recipient returns an Ack, STACK, or QoS +CF-Ack frame after a short interframe space (SIFS), according to the procedures defined in 10.3.2.11, 10.46.2, and 10.23.3.5. A non-DMG STA uses this ack policy for individually addressed QoS Null frames.
Implicit BAR	0	0	MPDU is not a non-A-MPDU frame NOTE—This MPDU is sent under a block ack agreement.	The addressed recipient returns a BlockAck, TACK or BAT frame, either individually or as part of an A-MPDU starting a SIFS after the PPDU carrying the frame, according to the procedures defined in 10.3.2.11, 10.25.6.5, 10.29.3, 10.29.4, 10.46.2, and 10.33.3. The addressed recipient that is a DMG STA operating in an SP with TDD channel access (see 10.38.6.2.2) returns an BlockAck frame, either individually or as part of an A-MPDU according to the procedures defined in 10.25.6.5.
No Ack	1	0	None	The addressed recipient takes no action upon receipt of the frame. More details are provided in 10.26. This ack policy is used in all frames in which the sender does not require any acknowledgment. It is not used for QoS Data frames with a TID for which a block ack agreement exists.
No Explicit Acknowledgment	0	1	Bit 6 of the Frame Control field (see 9.2.4.1.3) is equal to 1 and the frame is not carried in an HE MU PPDU, HE SU PPDU, or HE ER SU PPDU that contains a frame that solicits a response in an HE TB PPDU	There might be a response frame to the frame that is received, but it is neither the Ack frame nor any Data frame of subtype +CF-Ack. This ack policy is used for QoS CF-Poll and QoS CF-Ack +CF-Poll Data frames. NOTE—Bit 6 of the Frame Control field (see 9.2.4.1.3) indicates the absence of a Frame Body field in a QoS Data frame. When equal to 1, the QoS Data frame contains no Frame Body field, and any response is generated in response to a QoS CF-Poll or QoS CF-Ack +CF-Poll frame, but does not signify an acknowledgment of data.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-13—Ack policy *(continued)*

Ack policy	Ack Policy Indicator subfield		Other conditions	Meaning
	Bit 0	Bit 1		
HETP Ack	0	1	The frame is carried in an HE MU PPDU, HE SU PPDU, or HE ER SU PPDU that contains a frame that solicits a response in an HE TB PPDU	The addressed recipient returns an Ack, Compressed BlockAck, or Multi-STA BlockAck frame carried in an HE TB PPDU a SIFS after the PPDU, subject to reception of a triggering frame in the PPDU, as defined in 10.3.2.13.2and 26.5.2.
Block Ack	1	1	None	The addressed recipient takes no action upon the receipt of the frame except for recording the state. The recipient can expect a BlockAckReq frame or implicit block ack request in the future to which it responds using the procedure described in 10.25.
Scheduled Ack	0	1	Bit 6 of the Frame Control field (see 9.2.4.1.3) is equal to 0	The acknowledgment for a frame indicating Scheduled Ack when it appears in an EDMG PPDU is to be received in a scheduled time slot as described in 10.3.2.13, 10.29.4, and 10.29.5.

In a frame sent by a non-HE STA or sent to a non-HE STA, the following apply:

— The queue size value is the approximate total size, rounded up to the nearest multiple of 256 octets and expressed in units of 256 octets, of all MSDUs and A-MSDUs buffered at the STA (excluding the MSDU or A-MSDU of the present QoS Data frame) in the delivery queue used for MSDUs and A-MSDUs with TID values equal to the value in the TID subfield of this QoS Control field.

— A queue size value of 0 is used solely to indicate the absence of any buffered traffic in the queue used for the specified TID.

— A queue size value of 254 is used for all sizes greater than 64 768 octets.

— A queue size value of 255 is used to indicate an unspecified or unknown size.

In a frame sent by a non-AP HE STA to an HE STA, the remainder of the subclause applies.

The queue size, *QS*, is the approximate total size in octets, of all MSDUs and A-MSDUs buffered at the STA (including the MSDUs or A-MSDUs in the same PSDU as the frame containing the Queue Size subfield) in the delivery queue used for MSDUs and A-MSDUs with TID values equal to the value in the TID subfield of this QoS Control field.

NOTE 1—The queue size is based on data received by the STA at the MAC SAP (MA-UNITDATA.request).

NOTE 2—Buffered MSDUs are those that have been received in an MA-UNITDATA.request but that have not been successfully transmitted and have not been discarded.

The Queue Size subfield consists of a Scaling Factor subfield in B14–B15 of the QoS Control subfield and an unscaled value, *UV*, in B8–B13 of the QoS Control subfield. The Scaling Factor subfield provides the scaling factor, *SF*, with an encoding that is shown in Table 9-33 (in 9.2.4.7.4). A non-AP HE STA sets the Queue Size subfield in a QoS frame it transmits as shown in Table 9-14.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-14—Queue Size subfield encoding by a non-AP HE STA

Queue Size subfields		Queue Size, *QS*
Scaling Factor	**UV**	
0	0	0
0	Ceil (*QS*, 16) / 16	$0 < QS \leq 1008$
1	0	$1008 < QS \leq 1024$
1	Ceil (*QS* – 1024, 256) / 256	$1024 < QS \leq 17\,152$
2	0	$17\,152 < QS \leq 17\,408$
2	Ceil (*QS* – 17 408, 2048) / 2048	$17\,408 < QS \leq 146\,432$
3	0	$146\,432 < QS \leq 148\,480$
3	Ceil (*QS* – 148 480, 32 768) / 32 768	$148\,480 < QS \leq 2\,147\,328$
3	62	$QS > 2\,147\,328$
3	63	Unspecified or unknown

An HE STA obtains the queue size, *QS*, from a received QoS Control field, which contains a scaling factor and an unscaled value, as follows:

$$QS = \begin{cases} 16 \times UV, \text{ if the Scaling Factor subfield is 0} \\ 1024 + 256 \times UV, \text{ if the Scaling Factor subfield is 1} \\ 17\,408 + 2048 \times UV, \text{ if the Scaling Factor subfield is 2} \\ 148\,480 + 32\,768 \times UV, \text{ if the Scaling Factor subfield is 3 and UV subfield is} < 62 \\ > 2\,147\,328, \text{ if the Scaling Factor subfield is 3 and UV subfield is 62} \\ \textit{Unspecified} \text{ or } \textit{Unknown}, \text{ if the Scaling Factor subfield is 3 and UV subfield is 63} \end{cases} \quad (9\text{-}1)$$

The queue size value of QoS Data frames containing fragments might remain constant in all fragments even if the amount of queued traffic changes as successive fragments are transmitted (see 10.23.3.5.1). If the QoS Data frames containing fragments are carried in an A-MPDU, the queue size values of the MPDU containing the fragments are set according to the rules in 10.12.1.

9.2.4.5.7 TXOP Duration Requested subfield

The TXOP Duration Requested subfield indicates the duration, in units of 32 μs, that the sending STA determines it needs for its next TXOP for the specified TID. The TXOP Duration Requested subfield is set to 0 to indicate that no TXOP is requested for the specified TID in the current SP. The TXOP Duration Requested subfield is set to a nonzero value to indicate a requested TXOP duration in the range 32 μs to 8160 μs in increments of 32 μs. See 10.23.3.5.2.

9.2.4.5.8 AP PS Buffer State subfield

The AP PS Buffer State subfield, defined in Figure 9-10, indicates the PS buffer state at the AP for a STA. The AP PS Buffer State subfield is further subdivided into three subfields: Buffer State Indicated, Highest Priority Buffered AC, and AP Buffered Load.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

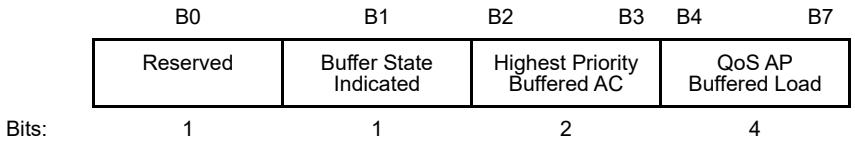

Figure 9-10—QoS AP PS Buffer State subfield format

The Buffered State Indicated subfield is used to indicate whether the AP PS buffer state is specified. This subfield is set to 1 to indicate that the AP PS buffer state is specified.

The Highest Priority Buffered AC subfield is used to indicate the AC of the highest priority traffic remaining that is buffered at the AP, excluding the MSDU or A-MSDU of the present frame.

The AP Buffered Load subfield is used to indicate the total buffer size, rounded up to the nearest multiple of 4096 octets and expressed in units of 4096 octets, of all MSDUs and A-MSDUs buffered at the QoS AP (excluding the MSDU or A-MSDU of the present QoS Data frame). An AP Buffered Load field set to 15 indicates that the buffer size is greater than 57 344 octets. An AP Buffered Load subfield set to 0 is used solely to indicate the absence of any buffered traffic for the indicated highest priority buffered AC when the Buffer State Indicated bit is 1.

When the Buffered State Indicated subfield is equal to 0, the Highest Priority Buffered AC subfield and the AP Buffered Load subfield are reserved.

9.2.4.5.9 A-MSDU Present subfield

The A-MSDU Present subfield indicates the presence of an A-MSDU. The A-MSDU Present subfield is set to 1 to indicate that the Frame Body field contains an entire A-MSDU as defined in 9.3.2.2. The A-MSDU Present subfield is set to 0 to indicate that the Frame Body field contains an MSDU or fragment thereof as defined in 9.3.2.1.

NOTE—A DMG STA, when the A-MSDU Present subfield is set to 1, can use one of two A-MSDU formats in the Frame Body. The specific A-MSDU format present is indicated by the A-MSDU Type subfield.

9.2.4.5.10 Mesh Control Present subfield

The Mesh Control Present subfield indicates the presence of a Mesh Control field in the frame body. When the Mesh Control Present subfield is 1, the Frame Body field contains a Mesh Control field as defined in 9.2.4.8.3. The mesh STA sets the Mesh Control Present subfield to 1 in the mesh Data frame containing an unfragmented MSDU, an A-MSDU, or the first fragment of an MSDU.

9.2.4.5.11 Mesh Power Save Level subfield

The Mesh Power Save Level subfield indicates whether the mesh STA’s peer-specific mesh power management mode will be deep sleep mode or light sleep mode after the successful completion of the frame exchange sequence.

When the Power Management subfield in the Frame Control field in the frame is 1, the following applies:

In individually addressed mesh Data frames, the Mesh Power Save Level subfield is set to of 0 to indicate that the mesh STA’s peer-specific mesh power management mode for the recipient mesh STA will be light sleep mode (see 14.15.8.4). In individually addressed mesh Data frames, the Mesh Power Save Level subfield is set to 1 to indicate that the mesh STA’s peer-specific mesh power management mode for the recipient mesh STA will be deep sleep mode (see 14.15.8.5).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In group addressed mesh Data frames, the Mesh Power Save Level subfield is set to 0 to indicate that none of the peer-specific mesh power management modes of the mesh STA are deep sleep mode. In group addressed mesh Data frames, the Mesh Power Save Level subfield is set to 1 to indicate that at least one of the peer-specific mesh power management modes of the mesh STA is deep sleep mode.

The Mesh Power Save Level subfield is reserved if the Power Management subfield in the Frame Control field is 0.

9.2.4.5.12 Receiver Service Period Initiated (RSPI) subfield

The Receiver Service Period Initiated (RSPI) subfield is set to 0 to indicate that the mesh peer service period, of which the receiver of this frame is the owner, is not initiated. The subfield is set to 1 to indicate that the mesh peer service period, of which the receiver of this frame is the owner, is initiated. The use of the RSPI subfield is described in 14.15.9.2. The RSPI subfield is reserved in group addressed frames.

9.2.4.5.13 A-MSDU Type subfield

The A-MSDU Type subfield indicates the type of A-MSDU present in the Frame Body field. When the A-MSDU Type subfield is set to 0, the Frame Body field contains a Basic A-MSDU as defined in 9.3.2.2.2. When the A-MSDU Type subfield is set to 1, the Frame Body field contains a Short A-MSDU as defined in 9.3.2.2.4. The A-MSDU Type subfield is reserved if the A-MSDU Present subfield is set to 0.

9.2.4.5.14 RDG/More PPDU subfield

The RDG/More PPDU subfield of the QoS Control field for DMG frames is interpreted differently depending on whether it is transmitted by a reverse direction (RD) initiator or an RD responder, as defined in Table 9-17.

9.2.4.5.15 AC Constraint subfield

The AC Constraint subfield of the QoS Control field for DMG frames indicates whether the mapped AC of an RD Data frame is constrained to a single AC, as defined in Table 9-16.

9.2.4.5.16 Buffered AC subfield

The Buffered AC subfield indicates buffered traffic for four ACs as defined in Figure 9-11. At least one BU for the indicated AC is buffered if the related subfield is 1. The Buffered AC subfield is reserved except in QoS Data frames and QoS Null frames. A non-AP and non-PCP STA can use information contained in the Buffered AC subfield to determine the ACs for which BU are buffered for it.

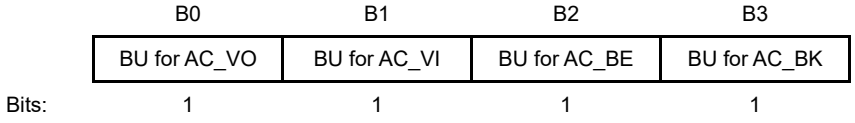

Figure 9-11—Buffered AC subfield format

9.2.4.6 HT Control field

9.2.4.6.1 General

The HT Control field is always present in a Control Wrapper frame and is present in QoS Data, QoS Null, and Management frames as determined by the +HTC subfield of the Frame Control field as defined in 9.2.4.1.10.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—The only control frame subtype for which HT Control field is present is the Control Wrapper frame. A Control frame that is described as +HTC (e.g., an RTS+HTC, CTS+HTC, BlockAck+HTC or BlockAckReq+HTC frame) implies the use of the Control Wrapper frame to carry that Control frame.

The format of the HT Control field transmitted by a non-CMMG STA is shown defined in Table 9-15.

Table 9-15—HT Control field format

Variant	B0	B1	B2–B29	B30	B31
HT	0	HT Control Middle		AC Constraint	RDG/More PPDU
VHT	1	0	VHT Control Middle	AC Constraint	RDG/More PPDU
HE	1	1	A-Control		

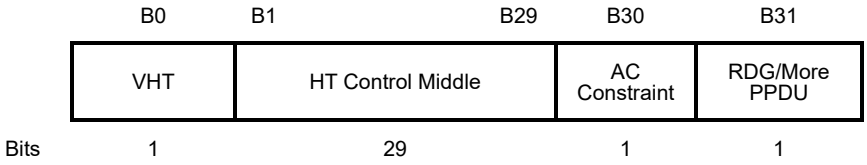

Figure 9-12—Non-CMMG variant HT Control field format

The HT Control field transmitted by a non-CMMG STA has three variants: the HT variant, the VHT variant, and the HE variant. The variant formats are differentiated by the values of B0 and B1 as defined in Table 9-15.

The HT Control Middle subfield is defined in 9.2.4.6.2, and the VHT Control Middle subfield is defined in 9.2.4.6.3. The A-Control subfield is defined in 9.2.4.6.4.

The HT Control field transmitted by a CMMG STA has one form, the CMMG variant HT Control. The format of the HT Control field transmitted by a CMMG STA is shown in Figure 9-23.

The AC Constraint subfield of the HT Control field indicates whether the mapped AC of an RD Data frame is constrained to a single AC, as defined in Table 9-16.

Table 9-16—AC Constraint subfield values

Value	Description
0	The response to a reverse direction grant (RDG) contains Data frames from any TID; see 10.29.4.
1	The response to an RDG contains Data frames only from the same AC as the last Data frame received from the RD initiator; see 10.29.4.

NOTE 2—The AC of the last Data frame received from the RD initiator is determined directly from the TID of the received frame if the TID is between 0 and 7 or from the UP field of the TSPEC identified by the TID of the received frame if the TID is between 8 and 15.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The RDG/More PPDU subfield of the HT Control field is interpreted differently depending on whether it is transmitted by an RD initiator or an RD responder, as defined in Table 9-17.

Table 9-17—RDG/More PPDU subfield values

Value	Role of transmitting STA	Interpretation of value
0	Not an RD responder	No reverse grant
	RD responder	The PPDU carrying the frame is the last transmission by the RD responder
1	RD initiator	An RDG is present
	RD responder	The PPDU carrying the frame is followed by another PPDU

9.2.4.6.2 HT variant

The format of the HT Control Middle subfield of the HT variant HT Control field is shown in Figure 9-13.

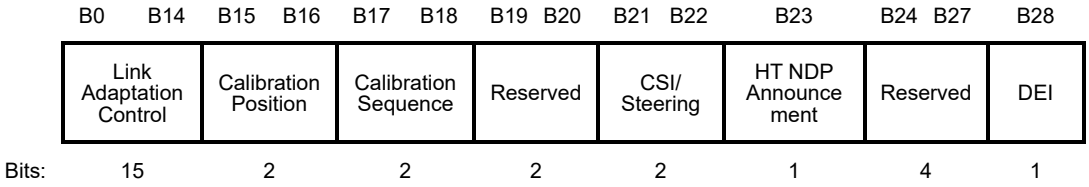

Figure 9-13—HT Control Middle subfield of the HT variant HT Control field format

The format of the Link Adaptation Control subfield of the HT variant HT Control field is defined in Figure 9-14.

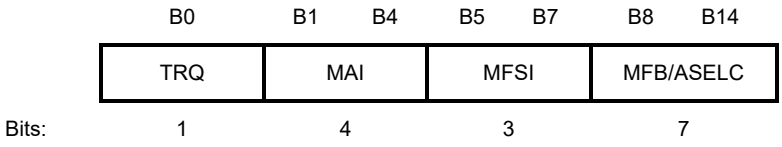

Figure 9-14—Link Adaptation Control subfield format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The subfields of the Link Adaptation Control subfield are defined in Table 9-18.

Table 9-18—Subfields of Link Adaptation Control subfield

Subfield	Meaning	Definition
TRQ	Training request	Set to 1 to request the responder to transmit a sounding PPDU. Set to 0 to indicate that the responder is not requested to transmit a sounding PPDU. See 10.33.2 and 10.35.2.
MAI	MCS request (MRQ) or ASEL indication	Set to 14 (indicating ASELI) to indicate that the MFB/ASELC subfield is interpreted as ASELC. Otherwise, the MAI subfield is interpreted as shown in Figure 9-15, and the MFB/ASELC subfield is interpreted as MCS feedback (MFB).
MFSI	MCS feedback sequence identifier	Set to the received value of MSI contained in the frame to which the MFB information refers. Set to 7 for unsolicited MFB.
MFB/ASELC	MCS feedback and antenna selection command/data	When the MAI subfield is equal to the value ASELI, this subfield is interpreted as defined in Figure 9-16 and Table 9-20. Otherwise, this subfield contains recommended MFB. Set to 127 to indicate that no feedback is present.

The structure of the MAI subfield of the Link Adaptation Control subfield is defined in Figure 9-15. The subfields of the MAI subfield are defined in Table 9-19.

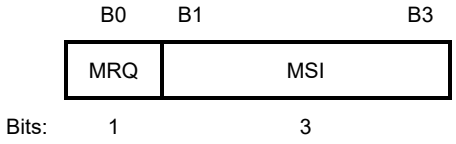

Figure 9-15—MAI subfield format

Table 9-19—Subfields of the MAI subfield

Subfield	Meaning	Definition
MRQ	MCS request	Set to 1 to indicate that MFB is requested. Set to 0 to indicate that no MFB is requested.
MSI	MRQ sequence identifier	When the MRQ subfield is equal to 1, the MSI subfield contains a sequence number in the range 0 to 6 that identifies the specific request. When the MRQ subfield is equal to 0, the MSI subfield is reserved.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The ASELC subfield of the Link Adaptation Control subfield contains the ASEL Command and ASEL Data subfields, as shown in Figure 9-16. The encoding of these subfields is shown in Table 9-20.

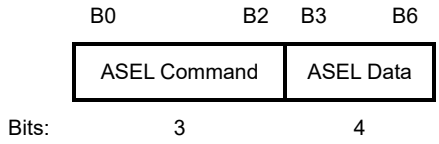

Figure 9-16—ASELC subfield format

Table 9-20—ASEL Command and ASEL Data subfields

ASEL Command	Interpretation of ASEL Command	ASEL Data
0	Transmit Antenna Selection Sounding Indication (TXASSI)	Number of remaining sounding PPDUs to be transmitted See NOTE
1	Transmit Antenna Selection Sounding Request (TXASSR) or Transmit ASEL Sounding Resumption	0 when the command is Transmit ASEL Sounding Request A number in the range 1 to 15, the number being the number of the first sounding PPDU to be transmitted when the command is Transmit ASEL Sounding Resumption, where 0 corresponds to the first sounding PPDU in the original ASEL training sequence
2	Receive Antenna Selection Sounding Indication (RXASSI)	Number of remaining sounding PPDUs to be received See NOTE
3	Receive Antenna Selection Sounding Request (RXASSR)	Number of sounding PPDUs required
4	Sounding Label	Sequence number of the sounding PPDU corresponding to a channel state information (CSI) frame in ASEL feedback
5	No Feedback Due to ASEL Training Failure or Stale Feedback	The number of the first sounding PPDU that was not received properly, where 0 corresponds to the first sounding PPDU in the ASEL training sequence, or 0 if no sounding PPDUs were received properly, or 0 if this is a request for a full retraining sequence
6	Transmit Antenna Selection Sounding Indication requesting feedback of explicit CSI (TXASSI-CSI)	Number of remaining sounding PPDUs to be transmitted See NOTE
7	Reserved	Reserved

NOTE—If the HT variant HT Control field is carried in a sounding PPDU, then the ASEL Data field contains the remaining number of sounding frames following the current one. If null data PPDU (NDP) sounding PPDU is used, then the ASEL Data field contains the number of NDPs following a non-NDP+HTC. The HT NDP Announcement subfield in the HT Control field is set to 1 to indicate NDP sounding.

The Calibration Position and Calibration Sequence subfields of the HT variant HT Control field are defined in Table 9-21.

Table 9-21—Calibration control subfields

Subfield	Meaning	Definition
Calibration Position	Position in calibration sounding frame exchange sequence	Set to 0 indicates this is not a calibration frame. Set to 1 indicates calibration start. Set to 2 indicates sounding response. Set to 3 indicates sounding complete.
Calibration Sequence	Calibration sequence identifier	The field is included in each frame within the calibration procedure and its value is unchanged for the frame exchanges during one calibration procedure. See 10.33.2.4.3.

The Calibration Sequence subfield identifies an instance of the calibration procedure. The subfield is included in each frame within a calibration procedure, and its value is unchanged for frames within the same calibration procedure.

The CSI/Steering subfield of the HT variant HT Control field indicates the type of feedback, as shown in Table 9-22.

Table 9-22—CSI/Steering subfield values

Value	Definition
0	No feedback required
1	CSI
2	Noncompressed beamforming
3	Compressed beamforming

The HT NDP Announcement subfield of the HT variant HT Control field indicates that an NDP will be transmitted after the frame (according to the rules described in 10.35). It is set to 1 to indicate that an NDP will follow; otherwise, it is set to 0.

The DEI subfield of the HT Control field is set by the transmitting STA to indicate the suitability of the corresponding MSDU or A-MSDU to be discarded if there are insufficient resources at the receiving STA, per the value of the drop eligible parameter in the MA-UNITDATA.request. See 10.8 and 11.25.2. In a Management frame, the DEI subfield is reserved.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.2.4.6.3 VHT variant

In a non-S1G STA, the format of the VHT Control Middle subfield of the VHT variant HT Control field is shown in Figure 9-17.

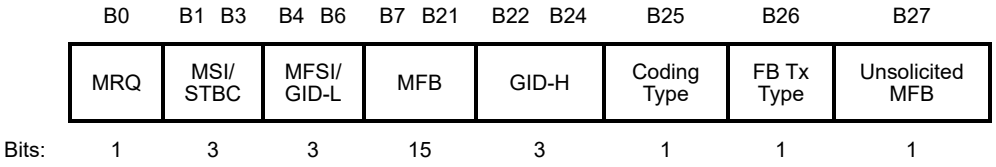

Figure 9-17—HT Control Middle subfield of the VHT variant HT Control field format

The subfields of VHT variant HT Control field are defined in Table 9-23.

Table 9-23—VHT variant HT Control field subfields

Subfield	Meaning	Definition
MRQ	VHT-MCS feedback request	Set to 1 to request VHT-MCS feedback (solicited MFB); otherwise, set to 0.
MSI/STBC	MRQ sequence identifier/STBC indication	If the Unsolicited MFB subfield is 0 and the MRQ subfield is 1, the MSI/STBC subfield contains a sequence number in the range 0 to 6 that identifies the specific MCS feedback request. If the Unsolicited MFB subfield is 0 and the MRQ subfield is 0, the MSI/STBC subfield is reserved. If the Unsolicited MFB subfield is 1 and the MFB does not contain the value representing "no feedback is present," the MSI/STBC field contains the Compressed MSI and STBC Indication subfields as shown in Figure 9-18. The STBC Indication subfield indicates whether the estimate in the MFB subfield is computed based on a PPDU using STBC encoding: Set to 0 if the PPDU was not STBC encoded Set to 1 if the PPDU was STBC encoded The Compressed MSI subfield contains a sequence number that identifies the specific MCS feedback request. It is in the range 0 to 3 if STBC Indication equals 0 or in the range 0 to 2 if STBC Indication equals 1. Otherwise, the MSI/STBC subfield is reserved.
MFSI/GID-L	MFB sequence identifier/LSBs of group ID	If the Unsolicited MFB subfield is 0, the MFSI/GID-L subfield contains the received value of MSI contained in the frame to which the MFB information refers. If the Unsolicited MFB subfield is 1, the MFB does not contain the value representing "no feedback is present," and the MFB is estimated from a VHT MU PPDU, then the MFSI/GID-L subfield contains the lowest 3 bits of group ID of that PPDU from which the MFB was estimated (bit 0 of the group ID appears in the lowest numbered bit of the field MFSI/GID-L). If the unsolicited MFB is estimated from an SU PPDU, the MFSI/GID-L subfield is set to all 1s. Otherwise, this subfield is reserved.

Table 9-23—VHT variant HT Control field subfields *(continued)*

Subfield	Meaning	Definition
MFB	NUM_STS, VHT-MCS, BW and SNR feedback	MFB subfield is interpreted as defined in Table 9-24. This subfield contains the recommended MFB. The combination of VHT-MCS=15 and NUM_STS=7 indicates that no feedback is present.
GID-H	MSBs of group ID	If the Unsolicited MFB subfield is 1, the MFB does not contain the value representing "no feedback is present," and the unsolicited MFB is estimated from a VHT MU PPDU, then the GID-H subfield contains the highest 3 bits of group ID of the PPDU from which the unsolicited MFB was estimated (bit 3 of the group ID appears in the lowest numbered bit of the field GID-H). If the unsolicited MFB is estimated from an SU PPDU, the GID-H subfield is set to all 1s. Otherwise, this subfield is reserved.
Coding Type	Coding type of the measured PPDU	If the Unsolicited MFB subfield is 1 and the MFB does not contain the value representing "no feedback is present," the Coding Type subfield contains the Coding information (0 for BCC and 1 for LDPC) of the PPDU from which the unsolicited MFB was estimated. Otherwise, this subfield is reserved.
FB Tx Type	Transmission type of the measured PPDU	If the Unsolicited MFB subfield is 1, the MFB does not contain the value representing "no feedback is present," and FB Tx Type subfield is 0, then the unsolicited MFB is estimated from a VHT PPDU with the RXVECTOR parameter BEAMFORMED equal to 0. If the Unsolicited MFB subfield is 1, the MFB does not contain the value representing "no feedback is present," and the FB Tx Type subfield is 1, then the unsolicited MFB is estimated from a VHT PPDU with the RXVECTOR parameter BEAMFORMED equal to 1. Otherwise, this subfield is reserved.
Unsolicited MFB	Unsolicited VHT-MCS feedback indicator	Set to 1 if the MFB is not a response to an MRQ. Set to 0 if the MFB is a response to an MRQ.

The format of the MSI/STBC subfield when the Unsolicited subfield is 1 is shown in Figure 9-18.

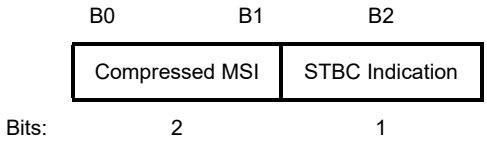

Figure 9-18—MSI/STBC subfield format when the Unsolicited MFB subfield is 1

The format of the MFB subfield in the VHT variant HT Control field is shown in Figure 9-19.

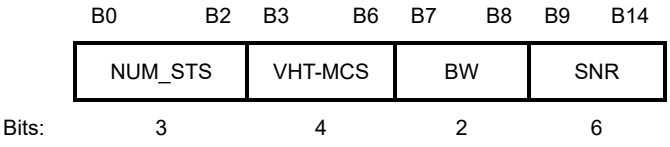

Figure 9-19—MFB subfield format in the VHT variant HT Control field

In an S1G STA, the format of the MFB subfield in the VHT variant HT Control field is shown in Figure 9-20.

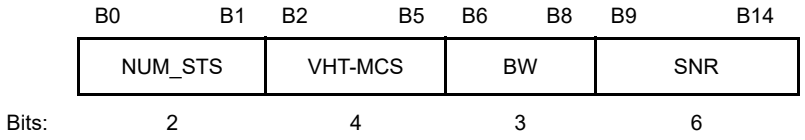

Figure 9-20—MFB subfield format in the VHT variant HT Control field when carried in S1G PPDU

The subfields of the MFB subfield in the VHT variant HT Control field are defined in Table 9-24.

Table 9-24—MFB subfield in the VHT variant HT Control field

Subfield	Meaning	Definition
NUM_STS	Recommended NUM_STS	Indicates the recommended NUM_STS as defined in 10.31.3. The NUM_STS subfield contains an unsigned integer representing the number of space-time streams minus 1.
VHT-MCS	Recommended VHT-MCS	Indicates the recommended VHT-MCS as defined in 10.31.3. The VHT-MCS subfield contains an unsigned integer in the range 0 to 9 representing a VHT-MCS Index value (defined in 21.5).
BW	Bandwidth of the recommended VHT-MCS or S1G-MCS	If the Unsolicited MFB subfield is 1, the BW subfield indicates the bandwidth for which the recommended VHT-MCS or S1G-MCS is intended, as defined in 10.31.3: For a VHT STA: Set to 0 for 20 MHz Set to 1 for 40 MHz Set to 2 for 80 MHz Set to 3 for 160 MHz and 80+80 MHz. For a TVHT STA: Set to 0 for TVHT_W Set to 1 for TVHT_2W and TVHT_W+W Set to 2 for TVHT_4W and TVHT_2W+2W The value 3 is reserved. In an S1G STA: Set to 0 for 1 MHz Set to 1 for 2 MHz Set to 2 for 4 MHz Set to 3 for 8 MHz. Set to 4 for 16 MHz. The values 5 to 7 are reserved. If the Unsolicited MFB subfield is 0, the BW subfield is reserved.
SNR	Average SNR	Indicates the average SNR, which is an SNR averaged over data subcarriers and space-time streams. The SNR is averaged over all of the space-time streams and data subcarriers and is encoded as a 6-bit 2s complement number of SNR_average – 22, where SNR_average is the sum of the values of SNR per frequency subcarrier (in decibels) per space-time stream divided by the product of the number of space-time streams, as indicated in the NUM_STS subfield, and the number of frequency subcarriers represented in the bandwidth in which the MFB was estimated. This encoding covers the SNR range from –10 dB to 53 dB in 1 dB steps.

9.2.4.6.4 HE variant

The format of the A-Control subfield of the HE variant HT Control field is shown in Figure 9-21.

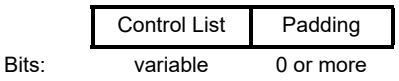

Figure 9-21—A-Control subfield of the HE variant HT Control field format

The Control List subfield contains one or more Control subfields. The format of each Control subfield is shown in Figure 9-22.

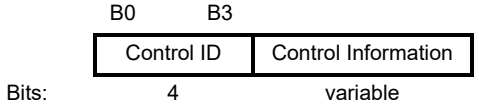

Figure 9-22—Control subfield format

The Control ID subfield indicates the type of information carried in the Control Information subfield. The length of the Control Information subfield is fixed for each value of the Control ID subfield that is not reserved. The values of the Control ID subfield and the associated length of the Control Information subfield are defined in Table 9-25.

Table 9-25—Control ID subfield values

Control ID value	Meaning	Length of the Control Information subfield (bits)	Content of the Control Information subfield
0	Triggered response scheduling (TRS)	26	See 9.2.4.7.1.
1	Operating mode (OM)	12	See 9.2.4.7.2.
2	HE link adaptation (HLA)	26	See 9.2.4.7.3.
3	Buffer status report (BSR)	26	See 9.2.4.7.4.
4	UL power headroom (UPH)	8	See 9.2.4.7.5.
5	Bandwidth query report (BQR)	10	See 9.2.4.7.6.
6	Command and status (CAS)	8	See 9.2.4.7.7.
7–14	Reserved		
15	Ones need expansion surely (ONES)	26	Set to all 1s.

The Padding subfield, if present, follows the last Control subfield and is set to a sequence of 0s so that the length of the A-Control subfield carried in the HT Control field is 30 bits.

9.2.4.6.5 CMMG variant HT Control field

The format of the CMMG variant HT Control field is shown in Figure 9-23.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

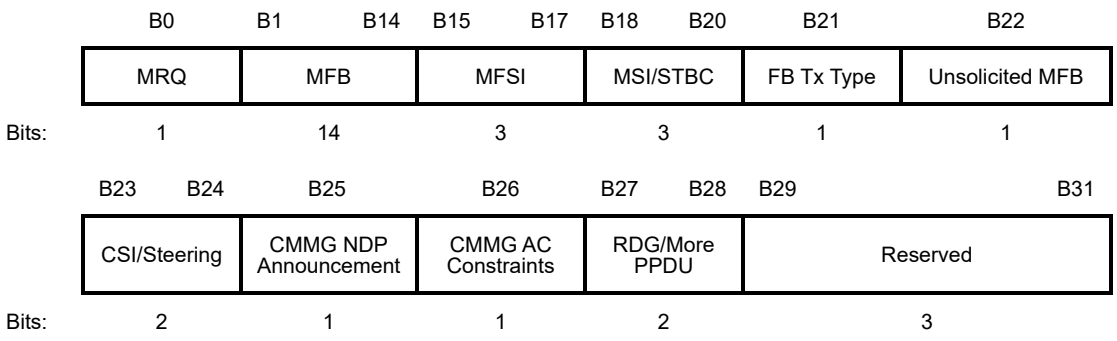

Figure 9-23—CMMG variant HT Control field format

The link adaptation related subfields including the first six subfields are defined in Table 9-26.

Table 9-26—Subfields corresponding to link adaptation

Subfield	Meaning	Definition
MRQ	CMMG-MCS Feedback request	Set to 1 to request CMMG-MCS feedback (solicited MFB); otherwise, set to 0.
MFB	NUM_STS, CMMG-MCS, BW and SNR feedback	MFB subfield is interpreted as defined in Table 9-27. This subfield contains the recommended MFB. The combination of CMMG-MCS=31 and NUM_STS=3 indicates that no feedback is present.
MFSI	MFB sequence identifier	Set to the received value of MSI contained in the frame to which the MFB information refers. Set to 7 for unsolicited MFB.
MSI/STBC	MSI/STBC	If the Unsolicited MFB subfield is 0 and the MRQ subfield is 1, the MSI/STBC subfield contains a sequence number in the range 0 to 6 that identifies the specific MCS feedback request. If the Unsolicited MFB subfield is 0 and the MRQ subfield is 0, the MSI/STBC subfield is reserved. If the Unsolicited MFB subfield is 1 and the MFB does not contain the value representing “no feedback is present,” the MSI/STBC field contains the Compressed MSI and STBC Indication subfields as shown in Figure 9-25. The STBC Indication subfield indicates whether the estimate in the MFB subfield is computed based on a PPDU using STBC encoding: Set to 0 if the PPDU was not STBC encoded. Set to 1 if the PPDU was STBC encoded. The Compressed MSI subfield contains a sequence number that identifies the specific MCS feedback request. It is in the range 0 to 3 if STBC Indication equals 0 or in the range 0 to 2 if STBC Indication equals 1. Otherwise, the MSI/STBC subfield is reserved.
FB Tx Type	Transmission type of the measured PPDU	If the Unsolicited MFB subfield is 1 and FB Tx Type subfield is 0, then the unsolicited MFB is estimated from a CMMG PPDU with the RXVECTOR parameter BEAMFORMED equal to 0. If the Unsolicited MFB subfield is 1, the MFB does not contain the value representing “no feedback is present,” and the FB Tx Type subfield is 1, then the unsolicited MFB is estimated from a CMMG PPDU with the RXVECTOR parameter BEAMFORMED equal to 1. Otherwise, this subfield is reserved.
Unsolicited MFB	Unsolicited CMMG-MCS feedback indicator	Set to 1 if the MFB is not a response to an MRQ. Set to 0 if the MFB is a response to an MRQ.

The format of the MFB subfield in the CMMG variant HT Control field is shown in Figure 9-24.

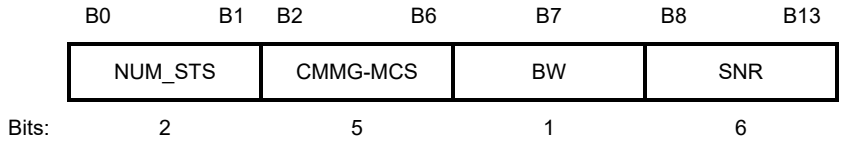

Figure 9-24—MFB subfield in the CMMG variant HT Control field format

The subfields of the MFB subfield in the CMMG variant HT Control field are defined in Table 9-27.

Table 9-27—MFB subfield in the CMMG variant HT Control field

Subfield	Meaning	Definition
NUM_STS	Recommended NUM_STS	Indicates the recommended NUM_STS as defined in 10.31.4. The NUM_STS subfield contains an unsigned integer representing the number of space-time streams minus 1.
CMMG-MCS	Recommended CMMG-MCS	Indicates the recommended CMMG-MCS as defined in(10.31.4. The CMMG-MCS subfield contains an unsigned integer representing a CMMG-MCS Index value (defined in 25.15).
BW	Bandwidth of the recommended CMMG-MCS	If the Unsolicited MFB subfield is 1, the BW subfield indicates the bandwidth for which the recommended CMMG-MCS is intended, as defined in (10.31.4: Set to 0 for 540 MHz. Set to 1 for 1080 MHz. If the Unsolicited MFB subfield is 0, the BW subfield is reserved.
SNR	Average SNR	The SNR subfield of the MFB subfield in the CMMG variant HT Control field is defined in Table 9-24.

The format of the MSI/STBC subfield when the Unsolicited MFB subfield is 1 is shown in Figure 9-25.

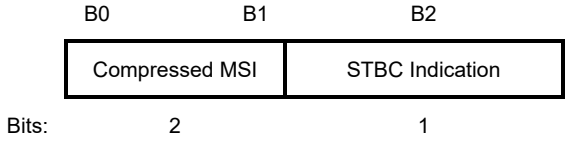

Figure 9-25—MSI/STBC subfield format when the Unsolicited MFB subfield is 1

The CSI/Steering subfield of the CMMG variant HT Control field is defined in Table 9-22.

The CMMG NDP Announcement subfield of the CMMG variant HT Control field is set to 1 to indicate that a CMMG NDP frame will follow (according to the rules described in 10.36.1); otherwise, it is set to 0.

The CMMG AC Constraint subfield of the CMMG variant HT Control field is the same as defined in Table 9-16.

The RDG/More PPDU subfield of the CMMG variant HT Control field is defined in Table 9-17.

9.2.4.7 Control subfield variants of an A-Control subfield

9.2.4.7.1 TRS Control

The Control Information subfield in a TRS Control subfield contains triggered response scheduling (TRS) information for soliciting an HE TB PPDU that follows an HE MU PPDU, HE SU PPDU, or HE ER SU PPDU carrying the Control subfield (see 26.5.2.2). See 26.5.2.4 for details on allowed content in an A-MPDU carried in an HE TB PPDU. The format of the subfield is shown in Figure 9-26.

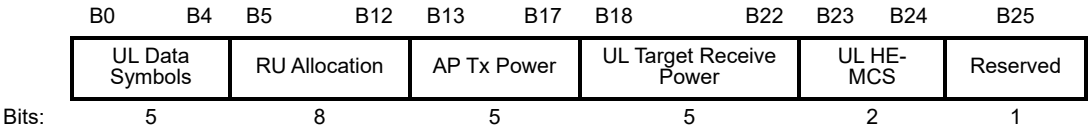

Figure 9-26—Control Information subfield format in a TRS Control subfield

NOTE—A TRS Control subfield is not included in a non-HE PPDU.

The UL Data Symbols subfield indicates the number of OFDM symbols in the Data field of the HE TB PPDU response and is set to the number of OFDM symbols minus 1.

The RU Allocation subfield indicates the resource unit (RU) assigned for transmitting the HE TB PPDU response and the encoding is defined in 9.3.1.22.1.

The AP Tx Power subfield indicates the AP's combined transmit power at the transmit antenna connector of all the antennas used to transmit the triggering PPDU in units of dBm/20 MHz. The transmit power in dBm/20 MHz, P_{TX}, is calculated as $P_{TX} = -20 + 2 \times F_{Val}$, where F_{Val} is the value of the AP Tx Power subfield, except for the value 31, which is reserved.

The UL Target Receive Power subfield indicates the expected receive signal power, measured at the AP's antenna connector and averaged over the antennas, for the HE portion of the HE TB PPDU transmitted on the assigned RU as defined in Table 9-28.

Table 9-28—UL Target Receive Power subfield in TRS Control field

UL Target Receive Power subfield	Description
0–30	The expected receive signal power, in units of dBm, is $Target_{pwr} = -90 + 2 \times F_{val}$, where F_{val} is the subfield value
31	The STA transmits the HE TB PPDU at the STA's maximum transmit power for the assigned HE-MCS. NOTE—The expected receive signal power is then the STA's maximum transmit power for the assigned HE-MCS minus the path loss.

The UL HE-MCS subfield indicates the HE-MCS, in the range HE-MCS 0 to 3, to be used by the receiving STA for the HE TB PPDU is set to the HE-MCS index (see 27.5).

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.2.4.7.2 OM Control

The Control Information subfield in an OM Control subfield contains information related to the operating mode (OM) change of the STA transmitting the frame containing this information (see 26.9). The format of the subfield is shown in Figure 9-27.

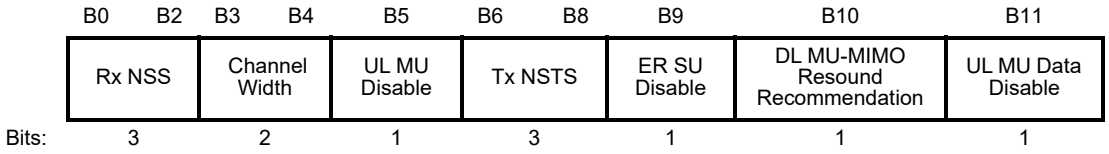

Figure 9-27—Control Information subfield format in an OM Control subfield

If the operating channel width of the STA is greater than 80 MHz, then the Rx NSS subfield indicates the maximum number of spatial streams, N_{SS}, that the STA supports in reception for PPDU bandwidths less than or equal to 80 MHz and is set to $N_{SS} - 1$. If the operating channel width of the STA is less than or equal to 80 MHz, then the Rx NSS subfield indicates the maximum number of spatial streams, N_{SS}, that the STA supports in reception and is set to $N_{SS} - 1$.

If the operating channel width of the STA is greater than 80 MHz, then the maximum number of spatial streams that the STA supports in reception for PPDU bandwidths greater than 80 MHz is defined in 26.9.

The Channel Width subfield indicates the operating channel width supported by the STA for both reception and transmission. It is set to 0 for 20 MHz, 1 for primary 40 MHz, 2 for primary 80 MHz, and 3 for 160 MHz and 80+80 MHz. The value 0 indicates a primary 20 MHz, unless the STA is an HE SST STA in which case it indicates any of the negotiated 20 MHz subchannels of the SST operation (see 26.8.7).

The allowed UL MU operations and frame types that can be transmitted as a response to a triggering frame are determined by the UL MU Disable subfield, UL MU Data Disable subfield and the recipient's setting of the OM Control UL MU Data Disable RX Support subfield in the HE Capabilities element, as indicated in Table 9-29.

If the OM Control field is transmitted by an HE AP, then the UL MU Disable and UL MU Data Disable subfields are reserved.

A non-AP STA sets the Tx NSTS subfield to $N_{STS} - 1$, where N_{STS} is the maximum number of space-time streams that the non-AP STA supports in transmission. If the OM Control field is transmitted by an HE AP, then the Tx NSTS subfield is reserved.

A non-AP HE STA sets the ER SU Disable subfield to 1 to indicate that 242-tone HE ER SU PPDU reception is disabled and to 0 to indicate that 242-tone HE ER SU PPDU reception is enabled. If the OM Control field is transmitted by an HE AP, then the ER SU Disable subfield is reserved.

A non-AP HE STA sets the DL MU-MIMO Resound Recommendation subfield to 1 to indicate that the STA suggests that the AP either resound the channel or increase the channel sounding frequency with the STA. The subfield is set to 0 to indicate that the non-AP HE STA has no recommendation on the AP channel sounding frequency. If the OM Control field is transmitted by an HE AP, then the DL MU-MIMO Resound Recommendation subfield is reserved.

Table 9-29—UL MU Disable and UL MU Data Disable subfields encoding

UL MU Disable subfield	UL MU Data Disable subfield	Interpretation by an AP that transmits a value of 0 in the OM Control UL MU Data Disable RX Support	Interpretation by an AP that transmits a value of 1 in the OM Control UL MU Data Disable RX Support
0	0	All trigger based UL MU transmissions are enabled by the STA as defined in 26.5.2.	All trigger based UL MU transmissions are enabled by the STA as defined in 26.5.2.
0	1	N/A	Trigger based UL MU Data frame transmissions in response to a Basic Trigger frame are suspended by the STA as defined in 26.9.3. Other trigger based UL MU transmissions remain enabled by the STA as defined in 26.9.3.
1	0	All trigger based UL MU transmissions are suspended by the STA. The STA will not respond to a received triggering frame.	All trigger based UL MU transmissions are suspended by the STA. The STA will not respond to a received triggering frame.
1	1	Reserved	Reserved

9.2.4.7.3 HLA Control

The Control Information subfield in an HLA Control subfield contains information related to the HE link adaptation (HLA) procedure (see 26.13). The format of the subfield is shown in Figure 9-28.

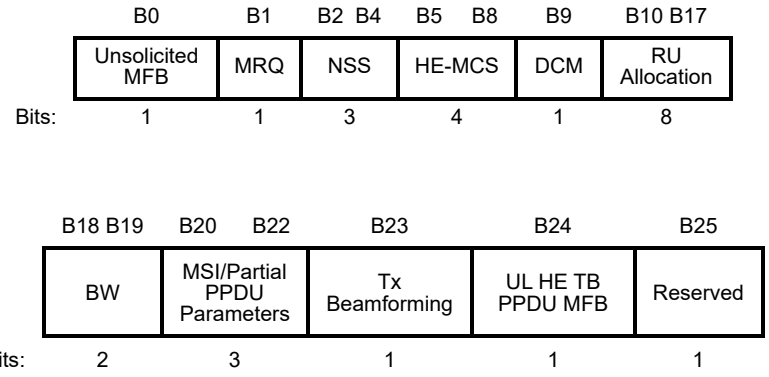

Figure 9-28—Control Information subfield format in an HLA Control subfield

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The HLA Control subfields are defined in Table 9-30.

Table 9-30—HLA Control subfields

Subfield	Meaning	Definition
Unsolicited MFB	Unsolicited MFB indicator	Set to 1 if the HLA Control is an unsolicited MFB. Set to 0 if the HLA Control is an MRQ or a solicited MFB.
MRQ	HLA feedback request indicator	Set to 1 and set Unsolicited MFB subfield to 0 to request an HLA feedback. Set to 0 and set Unsolicited MFB subfield to 0 to respond to an HLA request. If the Unsolicited MFB subfield is 1, the MRQ subfield is reserved.
NSS	Recommended number of spatial stream	If the Unsolicited MFB subfield is 1 and the UL HE TB PPDU MFB subfield is 0 or if the Unsolicited MFB subfield is 0 and the MRQ subfield is 0, the NSS subfield indicates the recommended number of spatial streams to the PPDU sent to the STA, N_{SS}, and is set to $N_{SS} - 1$. If the Unsolicited MFB subfield is 1 and the UL HE TB PPDU MFB subfield is 1, the NSS subfield indicates the recommended number of spatial streams to the HE TB PPDU sent from the STA, N_{SS}, and is set to $N_{SS} - 1$. Otherwise, this subfield is reserved.
HE-MCS	Recommended HE-MCS	If the Unsolicited MFB subfield is 1 and the UL HE TB PPDU MFB subfield is 0 or if the Unsolicited MFB subfield is 0 and the MRQ subfield is 0, the HE-MCS subfield indicates the recommended HE-MCS of the PPDU sent to the STA, and is set to the HE-MCS index (see 27.5). If the Unsolicited MFB subfield is 1 and the UL HE TB PPDU MFB subfield is 1, the HE-MCS subfield indicates the recommended HE-MCS of the HE TB PPDU sent from the STA, and is set to the HE-MCS index (see 27.5). Otherwise, this subfield is reserved.
DCM	Recommended usage of dual carrier modulation (DCM)	If the Unsolicited MFB subfield is 1 and the UL HE TB PPDU MFB subfield is 0 or if the Unsolicited MFB subfield is 0 and the MRQ subfield is 0, the DCM subfield indicates the recommended usage of DCM. This subfield is set to 1 if DCM is recommended for the PPDU sent to the STA and is set to 0 otherwise. If the Unsolicited MFB subfield is 1 and the UL HE TB PPDU MFB subfield is 1, the DCM subfield indicates the recommended usage of DCM. This subfield is set to 1 if DCM is recommended to the HE TB PPDU sent from the STA and is set to 0 otherwise. Otherwise, this subfield is reserved.

Table 9-30—HLA Control subfields *(continued)*

Subfield	Meaning	Definition
RU Allocation	RU of the recommended HE-MCS/RU specified by MFB requester to get feedback	If the Unsolicited MFB subfield is 1 and the UL HE TB PPDU MFB subfield is 0, the RU Allocation subfield indicates the RU for which the recommended HE-MCS applies to the PPDU sent to the STA, as defined in 26.13. If the Unsolicited MFB subfield is 0 and the MRQ subfield is 1, the RU subfield indicates the RU requested by the MFB requester to get feedback. The RU Allocation subfield is interpreted with the BW subfield to specify the RU. The RU index encoding is as defined in Table 9-53. If the Unsolicited MFB subfield is 1 and the UL HE TB PPDU MFB subfield is 1, the RU Allocation subfield indicates the RU for which the recommended HE-MCS applies to the HE TB PPDU sent from the STA, as defined in 26.13 and that the actual allocation of the RU can be ignored by the recipient. Otherwise, this subfield is reserved.
BW	Bandwidth of the recommended HE-MCS/Bandwidth specified by MFB requester to get feedback	If the Unsolicited MFB subfield is 1 and the UL HE TB PPDU MFB subfield is 0, the BW subfield indicates the bandwidth for which the recommended HE-MCS applies to the PPDU sent to the STA, as defined in 26.13. If the Unsolicited MFB subfield is 1 and the UL HE TB PPDU MFB subfield is 1, the BW subfield indicates the bandwidth for which the recommended HE-MCS applies to the HE TB PPDU sent from the STA, as defined in 26.13. If the Unsolicited MFB subfield is 0 and the MRQ subfield is 1, the BW subfield indicates the bandwidth requested by the MFB requester to get feedback. Set to 0 for 20 MHz. Set to 1 for 40 MHz. Set to 2 for 80 MHz. Set to 3 for 160 MHz or 80+80 MHz. Otherwise, this subfield is reserved.
MSI/Partial PPDU Parameters	Partial parameters of the measured PPDU/ MRQ sequence identifier	If the Unsolicited MFB subfield is 0 and the MRQ subfield is 1, the MSI/Partial PPDU Parameters subfield contains a sequence number in the range 0 to 6 that identifies the specific HE-MCS feedback request. If the Unsolicited MFB subfield is 0 and the MRQ subfield is 0, the MSI/Partial PPDU Parameters subfield contains a sequence number in the range 0 to 6 that responds to the specific solicited HE-MCS feedback request. If the Unsolicited MFB subfield is 1, the MSI/Partial PPDU Parameters subfield contains the PPDU Format and Coding Type subfields as shown in Figure 9-29.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-30—HLA Control subfields *(continued)*

Subfield	Meaning	Definition
Tx Beamforming	Transmission type of the measured PPDU	If the Unsolicited MFB subfield is 1 and the UL HE TB PPDU MFB subfield is 0, then the Tx Beamforming subfield indicates whether the PPDU from which the unsolicited MFB was estimated is beamformed. Set to 0 for non-beamformed PPDU. Set to 1 for beamformed PPDU. Otherwise, this subfield is reserved.
UL HE TB PPDU MFB	UL HE TB PPDU MFB indication	If the Unsolicited MFB subfield is 1, a value of 1 in this subfield indicates that the NSS, HE-MCS, DCM, BW and RU Allocation fields represent the recommended MFB for the HE TB PPDU sent from the STA as defined in 26.13. Otherwise, this subfield is reserved.

The format of the MSI/Partial PPDU Parameters subfield is defined in Figure 9-29.

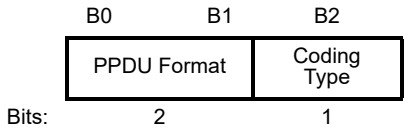

Figure 9-29—MSI/Partial PPDU Parameters subfield format if the Unsolicited MFB subfield is 1

The PPDU Format subfield indicates the format of the PPDU from which the unsolicited MFB was estimated:

— Set to 0 for an HE SU PPDU.
— Set to 1 for an HE MU PPDU.
— Set to 2 for an HE ER SU PPDU.
— Set to 3 for an HE TB PPDU.

The Coding Type subfield contains the coding information of the PPDU from which the unsolicited MFB was estimated:

— Set to 0 for BCC.
— Set to 1 for LDPC.

9.2.4.7.4 BSR Control

The Control Information subfield in a BSR Control subfield contains buffer status information used for UL MU operation (see 26.5.2). The format of the subfield is shown in Figure 9-30.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

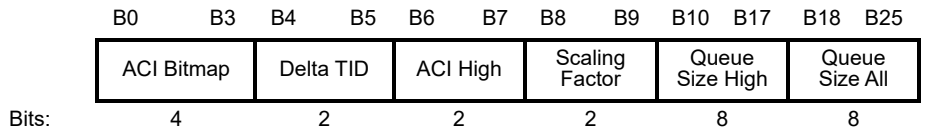

Figure 9-30—Control Information subfield format in a BSR Control subfield

The ACI Bitmap subfield indicates the access categories for which the buffer status is reported and its encoding is shown in Table 9-31. Each bit of the ACI Bitmap subfield is set to 1 to indicate that the buffer status of the corresponding AC is included in the Queue Size All subfield, and set to 0 otherwise, except that if the ACI Bitmap subfield is 0 and the Delta TID subfield is 3, then the buffer status of all 8 TIDs is included (see Table 9-32).

Table 9-31—ACI Bitmap subfield encoding

B0	B1	B2	B3
AC_BE	AC_BK	AC_VI	AC_VO

The Delta TID subfield, together with the values of the ACI Bitmap subfield, indicate the number of TIDs for which the STA is reporting the buffer status. The encoding of the Delta TID subfield is defined in Table 9-32.

Table 9-32—Delta TID subfield encoding

Number of bits in the ACI Bitmap subfield that are set to 1	Mapping of Delta TID subfield value and number of TIDs, N_{TID}
0	Values 0 to 2 are not applicable; Value 3 indicates 8 TIDs (i.e., all ACs have traffic).
1	Value 0 indicates 1 TID; Value 1 indicates 2 TIDs; Values 2 to 3 are not applicable.
2	Value 0 indicates 2 TID; Value 1 indicates 3 TIDs; Value 2 indicates 4 TIDs; Value 3 is not applicable.
3	Value 0 indicates 3 TID; Value 1 indicates 4 TIDs; Value 2 indicates 5 TIDs; Value 3 indicates 6 TIDs.
4	Value 0 indicates 4 TID; Value 1 indicates 5 TIDs; Value 2 indicates 6 TIDs; Value 3 indicates 7 TIDs.

NOTE 1—The number of TIDs can be obtained as $N_{TID} = N_{ones} + D_{Val}$, where N_{ones} is the number of bits set to one in the AC Bitmap subfield, and D_{Val} is the value of the Delta TID subfield, except if N_{ones} is equal to 0 for which there is the $N_{TID} = 8$ case.

NOTE 2—The Delta TID might be used by an AP to determine the setting of the TID Aggregation Limit field in the User Info field addressed to the STA in a subsequent Basic Trigger frame.

The ACI High subfield indicates the ACI of the AC for which the BSR is indicated in the Queue Size High subfield. The ACI to AC mapping is shown in 9-193.

NOTE 1—It is up to the non-AP STA that reports the buffer status to determine the queue that deserves higher priority with respect to the other queues. The determination might be based on the time the traffic has been outstanding, QoS delay requirements, amount of buffered traffic, etc., and is beyond the scope of this standard.

The Scaling Factor subfield indicates the unit *SF*, in octets, of the Queue Size High and Queue Size All subfields. The encoding of the Scaling Factor subfield is shown in Table 9-33.

Table 9-33—Scaling Factor subfield encoding

Scaling Factor subfield	Scaling factor, *SF* (octets)
0	16
1	256
2	2 048
3	32 768

The Queue Size High subfield indicates the amount of buffered traffic, in units of *SF* octets, for the AC identified by the ACI High subfield that is intended for the STA identified by the receiver address of the frame containing the BSR Control subfield.

The Queue Size All subfield indicates the amount of buffered traffic, in units of *SF* octets, for all the ACs identified by the ACI Bitmap subfield that is intended for the STA identified by the receiver address of the frame containing the BSR Control subfield.

The queue size values in the Queue Size High and Queue Size All subfields are the total sizes, rounded up to the nearest multiple of *SF* octets, of all MSDUs and A-MSDUs buffered at the STA (including the MSDUs or A-MSDUs in the same PSDU as the frame containing the BSR Control subfield) in the delivery queues used for MSDUs and A-MSDUs with AC(s) that are specified in the ACI High and ACI Bitmap subfields, respectively.

NOTE 2—The queue size is based on data received by the STA at the MAC SAP (MA-UNITDATA.request). Any data in layers above the MAC is not taken into account.

NOTE 3—Buffered MSDUs are those that have been received in an MA-UNITDATA.request but that have not been successfully transmitted and have not been discarded.

A queue size value of 254 in the Queue Size High and Queue Size All subfields indicates that the amount of buffered traffic is greater than 254 × *SF* octets. A queue size value of 255 in the Queue Size High and Queue Size All subfields indicates that the amount of buffered traffic is an unspecified or unknown size.

The queue size value of the QoS Data frames containing the fragments might remain constant in all fragments even if the amount of queued traffic changes as successive fragments are transmitted (see 10.23.3.5.1). If the QoS Data frames containing fragments are carried in the A-MPDU, the queue size values of the MPDUs containing the fragments are set according to the rules in 10.8.

9.2.4.7.5 UPH Control

The Control Information subfield in an UPH Control subfield contains the UL power headroom (UPH) used for power precorrection (see 26.5.2.4). The format of the subfield is shown in Figure 9-31.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

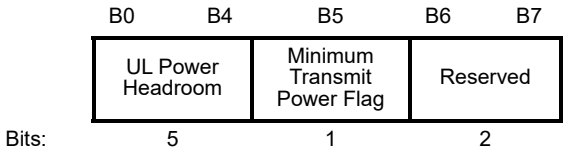

Figure 9-31—Control Information subfield format in a UPH Control subfield

The UL Power Headroom subfield indicates the available UL power headroom, in units of dB, for the current HE-MCS (see 26.5.2.4). The UL Power Headroom subfield carries a value 0 to 31 that maps to 0 dB to 31 dB.

The Minimum Transmit Power Flag subfield is set to 1 to indicate that the minimum transmit power for the current HE-MCS is reached by the STA and set to 0 otherwise.

9.2.4.7.6 BQR Control

The Control Information subfield in a BQR Control subfield contains the bandwidth query report (BQR) used for bandwidth query report operation to assist HE MU transmission (see 26.5.2). The format of the subfield is shown in Figure 9-32.

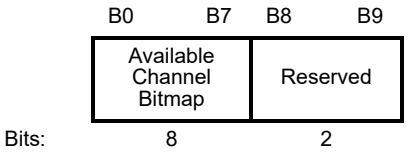

Figure 9-32—Control Information subfield format in a BQR Control subfield

The Available Channel Bitmap subfield contains a bitmap indicating the subchannels available at the STA transmitting the BQR. Each bit in the bitmap corresponds to a 20 MHz subchannel within the operating channel width of the BSS in which the STA is associated, with the LSB corresponding to the lowest numbered operating subchannel of the BSS. The bit in position X in the bitmap is set to 1 to indicate that the subchannel $X+1$ is idle; otherwise, it is set to 0 to indicate that the subchannel is busy or unavailable. Availability of each 20 MHz subchannel is based on the ED-based CCA defined in 27.3.22.6.5 and is reported for the 20 MHz subchannels located in the operating channel of the reporting STA when the WM is idle as defined in 10.3.2.1 and in 26.5.2.5.

9.2.4.7.7 CAS Control

The Control Information subfield in a CAS Control subfield contains the command and status (CAS) control. The format of the subfield frame is shown in Figure 9-33.

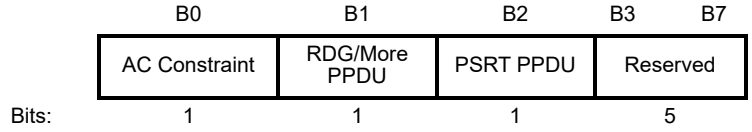

Figure 9-33—Control Information subfield format in a CAS Control subfield

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The AC Constraint subfield is defined in Table 9-16, except that a value of 1 indicates to an HE STA that the response can contain RD Data frames from the same AC or higher priority ACs as defined in 10.29.4.

The RDG/More PPDU subfield is defined in Table 9-17.

The PSRT PPDU subfield indicates whether the PPDU carrying the frame with the CAS Control subfield is an PSRT PPDU. The PSRT PPDU subfield is set to 1 if the PPDU is an PSRT PPDU; otherwise, it is set to 0.

9.2.4.8 Frame Body field

9.2.4.8.1 General

The Frame Body field is a variable length field that contains information specific to individual frame types and subtypes. The minimum length of the frame body is 0 octets. The maximum length of the frame body is constrained or affected by the following:

— The maximum MMPDU, MSDU, A-MSDU, and MPDU sizes supported by the recipient(s) for the PPDU format in use, as specified in Table 9-34.
— The maximum PPDU duration [e.g., HT-mixed format L-SIG L_LENGTH, HT-greenfield format, VHT, TVHT, S1G, or DMG aPPDUMaxTime (see Table 9-34); any nonzero TXOP limit; any regulatory constraints (e.g., CS4-msBehavior)].
— The fields present in the MAC header (e.g., QoS Control, Address 4, HT Control).
— The presence of security encapsulation (e.g., TKIP, CCMP or GCMP header and MIC).
— The presence of Mesh Control fields (see 9.2.4.8.3).

NOTE 1—In an A-MSDU, the Mesh Control field is located in the A-MSDU Subframe Header (see Figure 9-124). In an MMPDU, the Mesh Control field is located within the MMPDU (see 9.6.17). Such Mesh Control fields need to be taken into account if a maximum A-MSDU or MMPDU size constraint applies as well as if a maximum MPDU size constraint applies.

NOTE 2—TKIP is not allowed with A-MSDUs (see 12.2.5) or MMPDUs (see 12.5.3.1) and, therefore, need not be taken into account if a maximum A-MSDU or MMPDU size constraint applies.

Table 9-34—Maximum data unit sizes and durations *(continued)*

	Non-HT non-VHT non-HE non-S1G non-DMG PPDU and non-HT duplicate PPDU	HT PPDU	VHT PPDU	HE PPDU	S1G PPDU	DMG PPDU	EDMG PPDU	NGV PPDU
NOTE 1—No direct constraint on the maximum MMPDU size; indirectly constrained by the maximum MPDU size (see 9.3.3.1). NOTE 2—Indirect constraint from the maximum PSDU size: 2^{12}–1 octets minus the minimum QoS Data frame overhead (26 octets for the MAC header and 4 octets for the FCS). NOTE 3—No direct constraint on the maximum A-MSDU size; indirectly constrained by the maximum MPDU size. NOTE 4—No direct constraint on the maximum MPDU size; indirectly constrained by the maximum MSDU, MMPDU or (for HT STAs only) A-MSDU size. NOTE 5—No direct constraint on the maximum MPDU size; indirectly constrained by the maximum A-MSDU/MMPDU size. NOTE 6—No direct constraint on the maximum duration, but an L_LENGTH value above 2332 might not be supported by some receivers (see NOTE 2 in 10.27.4). NOTE 7—The maximum MPDU size might be greater than the size declared as supported by the recipient if the MPDU is an HE Compressed Beamforming/CQI frame. NOTE 8—No direct constraint on the maximum MSDU or A-MSDU size; indirectly constrained by the maximum PSDU size. Each MPDU in an A-MPDU of the PSDU that contains the MSDU or A-MSDU generates an overhead of MPDU Header (26 octets), FCS (4 octets), GCMP Header (8 octets), MIC (16 octets), and MPDU delimiter (4 octets). NOTE 9—Indirect constraint from the maximum MPDU size in an A-MPDU in an HT PPDU: 2^{12}–1 octets minus the minimum QoS Data frame overhead (26 octets for the MAC header and 4 octets for the FCS). NOTE 10—The maximum MMPDU or MPDU size can preclude the use of the corresponding PPDU format for certain sounding feedback configurations. See 10.33, 10.35, and 26.7. NOTE 11—The maximum MMPDU size is: — if there is one recipient, then the size of the MPDU that contains an A-MSDU with size equal to the maximum size supported by the recipient less the shortest Management frame MAC header and FCS, or — if there is more than one recipient, then the size of the MPDU that contains an A-MSDU with size equal to the smallest among the maximum sizes supported by the recipients less the shortest Management frame MAC header and FCS. NOTE 12—Some implementations might not support 2304-octet Beacon frames.

9.2.4.8.2 Overhead for encryption

The overhead for encryption is described in Clause 12. When the Mesh Control field is present in the frame body, the Mesh Control field is encrypted as a part of data.

9.2.4.8.3 Mesh Control field

The Mesh Control field is present in a mesh Data frame containing an unfragmented MSDU or the first fragment of a fragmented MSDU and is present in a Multihop Action frame transmitted by a mesh STA.

In mesh Data frames, when the Mesh Control Present subfield in the QoS Control field is 1, the Mesh Control field is prepended to the MSDU and located as follows:

— When the frame body contains an MSDU (or a fragment thereof) and the frame is not encrypted, the Mesh Control field is located in the first octets of the frame body.
— When the frame body contains an MSDU (or a fragment thereof) and the frame is encrypted, the Mesh Control field is located in the first octets of the encrypted data portion.
— When the frame body contains an A-MSDU, the Mesh Control field is located in the A-MSDU subframe header as shown in Figure 9-124.

In the Multihop Action frame, the Mesh Control field is present as specified in 9.6.17.

The Mesh Control field is of variable length (6, 12, or 18 octets). The structure of the Mesh Control field is defined in Figure 9-34.

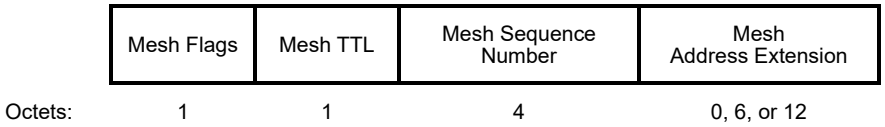

Figure 9-34—Mesh Control field format

The Mesh Flags subfield contains the Address Extension Mode subfield. The structure of the Mesh Flags subfield is shown in Figure 9-35.

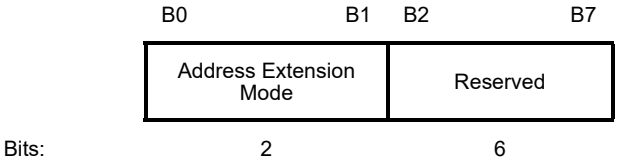

Figure 9-35—Mesh Flags subfield format

The Address Extension Mode subfield indicates the contents of the Mesh Address Extension subfield. Table 9-35 defines valid values for the Address Extension Mode and describes the corresponding contents of the Mesh Address Extension subfield.

The Mesh TTL subfield contains a nonzero unsigned integer corresponding to the remaining number of hops the MSDU/MMPDU is forwarded. How the Mesh TTL is used in both individually and group addressed frames is described in 10.37.3 and 10.37.4.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-35—Valid values for the Address Extension Mode subfield

Address extension mode value	Address extension mode name	Address extension mode description	Mesh Address Extension subfield length (octets)	Applicable frame types
0	None	No Mesh Address Extension subfield	0	Data, Management (Multihop Action, group addressed)
1	Address4	Mesh Address Extension subfield contains Address 4	6	Management (Multihop Action, individually addressed), Data (proxied, group addressed)
2	Address5&6	Mesh Address Extension subfield contains Address 5 and Address 6	12	Data (proxied, individually addressed)
3		Reserved	—	—

The Mesh Sequence Number subfield contains an unsigned integer sequence number counter value. Source mesh STAs assign mesh sequence numbers from a single modulo 2^{32} counter, starting at 0 and incrementing by 1 for each MSDU (if not in an A-MSDU), A-MSDU or MMPDU that is transmitted with a Mesh Control field. Usage of the Mesh Sequence Number is described in 10.37.6.

NOTE 1—It is believed that a 32-bit sequence number is sufficient as the rollover would occur after a period of 5 days assuming a source continuously transmitting at a rate of 10^4 frames/s.

The Mesh Address Extension subfield, shown in Figure 9-36, is present only when the Address Extension Mode subfield of the Mesh Flags subfield is a nonzero nonreserved value. The Mesh Address Extension subfield provides additional address fields for mesh address extension as defined in Table 9-35. The interpretation of the extended Address fields is described in 9.3.5.

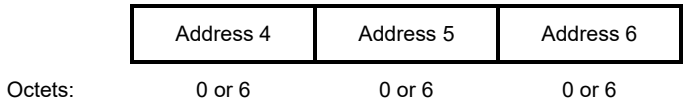

Figure 9-36—Mesh Address Extension subfield format

The Address 4 subfield is present when the Address Extension Mode subfield in the Mesh Flags subfield is 1. It carries a fourth address that is not included as a part of the MAC header for these frames.

The Address 5 subfield and Address 6 subfield are present when the Address Extension Mode subfield in the Mesh Flags subfield is 2. It carries the addresses of source and destination end station of the end-to-end IEEE 802 communication if either (or both) of the end stations are not mesh STAs at the beginning or end of a single mesh path. (See Figure 9-136.)

NOTE 2—This is useful, for example, when the end stations of IEEE 802 communication are nonmesh, external STAs that communicate over a mesh BSS via proxy mesh gates.

Details on the usage of these optional address fields are given in 14.11.8.4.

9.2.4.9 FCS field

The FCS field contains a 32-bit CRC. The FCS field value is calculated over all of the fields of the MAC header and the Frame Body field. These are referred to as the *calculation fields*.

The FCS field value is calculated using the following standard generator polynomial of degree 32:

$$G(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$$

The FCS field value is the 1s complement of the sum (modulo 2) of the following:

a) The remainder of $x^k \times (x^{31} + x^{30} + x^{29} + \ldots + x^2 + x + 1)$ divided (modulo 2) by $G(x)$, where k is the number of bits in the calculation fields, and

b) The remainder after multiplication of the contents (treated as a polynomial) of the calculation fields by x^{32} and then division by $G(x)$.

The FCS field is transmitted commencing with the coefficient of the highest-order term.

As a typical implementation, at the transmitter, the initial remainder of the division is preset to all 1s and is then modified by division of the calculation fields by the generator polynomial $G(x)$. The 1s complement of this remainder is transmitted, with the highest-order bit first, as the FCS field.

At the receiver, the initial remainder is preset to all 1s and the serial incoming bits of the calculation fields and FCS, when divided by $G(x)$, results (in the absence of transmission errors) in a unique nonzero remainder value. The unique remainder value is the polynomial:

$$x^{31} + x^{30} + x^{26} + x^{25} + x^{24} + x^{18} + x^{15} + x^{14} + x^{12} + x^{11} + x^{10} + x^8 + x^6 + x^5 + x^4 + x^3 + x + 1$$

9.2.5 Duration/ID field (QoS STA)

9.2.5.1 General

The value in the Duration/ID field within Poll, SPR, Grant, Grant Ack, DMG CTS, DMG DTS, SSW, SSW-Feedback, and SSW-Ack frames transmitted by a DMG STA are described in 9.3.1.10 to 9.3.1.18. The value in the Duration/ID field within DMG Beacon frames transmitted by a DMG STA is described in 9.3.4.2.

The value in the Duration/ID field in a frame transmitted by a QoS STA is defined in 9.2.5.2 to 9.2.5.7.

Unless stated otherwise, all times are calculated in μs. If the value calculated for the Duration/ID field is not an integer, the value inserted in the Duration/ID field is rounded up to the next higher integer. If the value calculated for the Duration/ID field is negative, the value inserted in the Duration/ID field is 0.

The value in the Duration field of NDP Ack, and NDP CTS frames transmitted by an S1G STA is defined in 9.2.5.6. Setting the Duration field is additionally constrained by the same rules that apply to the Duration/ID field of Ack, and CTS frames as described in 9.2.5.2 and 9.2.5.7.

The value in the Duration field for the NDP_1M Ack frame when the Idle Indication field is 0, the NDP_1M CTS frame and the NDP_1M CF-End frame is calculated in multiples of 40 μs. See 23.3.12.2.4.2 (NDP_1M Ack) for the value in the Duration field for the NDP_1M Ack frame when the Idle Indication field is 1. See 23.3.12.2.5.2 for the value in the Duration field for the NDP_1M PS-Poll-Ack frame.

The value in the Duration field for the NDP_2M Ack frame when the Idle Indication field is 0, the NDP_2M PS-Poll-Ack frame when the Idle Indication field is 0, the NDP_2M CTS frame, and the NDP_2M CF-End frame is calculated in microseconds. See 23.3.12.2.4.3 for the value in the Duration field for the NDP_2M

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Ack frame when the Idle Indication field is 1. See 23.3.12.2.5.3 for the value in the Duration field for the NDP_2M PS-Poll-Ack frame when the Idle Indication field is 1.

The value in the Duration/ID field in a frame transmitted by an NGV STA is further defined in 31.2.1.

9.2.5.2 Setting for single and multiple protection under enhanced distributed channel access (EDCA)

In transmissions under EDCA by a STA that initiates a TXOP, there are two classes of duration settings: single protection and multiple protection. In single protection, the Duration/ID field of the frame can set a network allocation vector (NAV) value at receiving STAs that protects up to the end of any following Data, Management, or response frame plus any additional overhead frames as described below. In multiple protection, the Duration/ID field of the frame can set a NAV that protects up to the estimated end of a sequence of multiple frames.

The STA selects between single and multiple protection when it transmits the first frame of a TXOP. All subsequent frames transmitted by the STA in the same TXOP use the same class of duration settings. A STA always uses multiple protection in a TXOP that includes the following:

— Frames that have the RDG/More PPDU subfield equal to 1
— VHT/HE NDP Announcement frames, Beamforming Report Poll frames, or BFRP Trigger frames
— S1G Beacon frames
— Frames transmitted by an S1G STA with the TXVECTOR parameter RESPONSE INDICATION equal to Long Response

For S1G STAs, Duration/ID field determination rules are further specified in 10.3.2.15.

The Duration/ID field is set as follows:

a) Single protection settings.
   1) In an RTS frame that is not part of a dual clear-to-send (CTS) exchange and is not part of a BDT exchange, the Duration/ID field is set to the estimated time, in microseconds, required to transmit the pending frame, plus one CTS frame, plus one Ack or BlockAck frame if required, plus any NDPs required, plus explicit feedback if required, plus applicable IFSs.
   2) In an MU-RTS Trigger frame, the Duration/ID field is set to the estimated time, in microseconds, required to transmit the pending frame(s), plus one CTS frame, plus the time to transmit the solicited HE TB PPDU if required, plus the time to transmit the acknowledgment for the solicited HE TB PPDU if required, plus applicable IFSs.

NOTE 1—The pending frame(s) include a triggering frame if required.

   3) In all CTS frames sent by STAs as the first frame in the exchange under EDCA and with the receiver address (RA) matching the MAC address of the transmitting STA, the Duration/ID field is set to one of the following:
      i) If there is a response frame, the estimated time required to transmit the pending frame, plus one SIFS, plus the response frame (Ack or BlockAck), plus any NDPs required, plus explicit feedback if required, plus an additional SIFS
      ii) If there is no response frame, the time required to transmit the pending frame, plus one SIFS
   4) In an MU-BAR Trigger frame, BSRP Trigger frame, GCR MU-BAR Trigger frame, BQRP Trigger frame, and NFRP Trigger frame, the Duration/ID field is set to the time required to transmit the solicited HE TB PPDU plus one SIFS.
   5) In a BlockAckReq frame, the Duration/ID field is set to the estimated time required to transmit one Ack or BlockAck frame, as applicable, plus one SIFS.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

6) In a BlockAck frame that is not sent in response to a BlockAckReq frame or an implicit block ack request, the Duration/ID field is set to the estimated time required to transmit an Ack frame plus a SIFS.

7) In a Basic Trigger frame, the Duration/ID field is set to the estimated time required to transmit the solicited HE TB PPDU, plus the estimated time required to transmit the acknowledgment for the solicited HE TB PPDU if required, plus applicable SIFSs.

8) In Management frames, non-QoS Data frames (i.e., with bit 7 of the Frame Control field equal to 0), and individually addressed Data frames with an ack policy other than No Ack or Block Ack, the Duration/ID field is set to one of the following:

   i) If the frame is the final frame of the TXOP, the estimated time required for the transmission of one Ack or BlockAck frame, as appropriate (including appropriate IFSs)

   ii) Otherwise, the estimated time required for the transmission of one Ack or BlockAck frame, as appropriate plus the time required for the transmission of the following frame and its response if required, plus applicable IFSs.

9) In individually addressed QoS Data frames with an ack policy of No Ack or Block Ack, for Action No Ack frames, and for group addressed frames, the Duration/ID field is set to one of the following:

   i) If the frame is the final frame of the TXOP, 0

   ii) Otherwise, the estimated time required for the transmission of the following frame and its response frame, if required (including appropriate IFSs)

b) Multiple protection settings. The Duration/ID field is set to a value D as follows:

1) If $T_{TXOP} = 0$ and $T_{END\text{-}NAV} = 0$, then $D = T_{SINGLE\text{-}MSDU} - T_{\text{PPDU}}$

2) Else if $T_{TXOP} = 0$ and $T_{END\text{-}NAV} > 0$, then $D = \max(0, T_{END\text{-}NAV} - T_{PPDU})$

3) Else if $T_{END\text{-}NAV} = 0$, then $\min(T_{PENDING}, T_{TXOP} - T_{PPDU}) \le D \le T_{TXOP} - T_{PPDU}$

4) Else $T_{END\text{-}NAV} - T_{PPDU} \le D \le T_{TXOP\text{-}REMAINING} - T_{PPDU}$

where

$T_{SINGLE\text{-}MSDU}$ is the estimated time required for the transmission of the allowed frame exchange sequence defined in 10.23.2.9 (for a TXOP limit of 0), including applicable IFSs

$T_{PENDING}$ is the estimated time required for the transmission of

- Pending MPDUs
- Any associated immediate response frames
- Any HT NDP, VHT NDP, HE sounding NDP, or Beamforming Report Poll frame transmissions and explicit feedback response frames
- Applicable IFSs
- Any RDG
- Any BDT
- Any pending QoS Null frame exchange sequences by paged STAs
- Any pending PS-Poll or NDP PS-Poll frame exchanges by paged STAs

T_{TXOP} is the duration given by dot11EDCATableTXOPLimit (dot11QAPEDCATableTXOPLimit for the AP) for that AC

$T_{TXOP\text{-}REMAINING}$ is T_{TXOP} less the time already used within the TXOP

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$T_{END\text{-}NAV}$	is the remaining duration of any NAV set by the TXOP holder, or 0 if no NAV has been established
T_{PPDU}	is the time required for transmission of the current PPDU

NOTE 2—The rules allowing or disallowing the transmission of MPDUs with different ACs are described in 10.23.2.7, 10.23.2.8, and 26.6.3.

NOTE 3—The estimated time to transmit an acknowledgment in response to the frames carried in a solicited HE TB PPDU might be inexact. The TXOP holder might use the maximum time required to transmit the acknowledgment as the estimated time.

The estimated time required for transmission of a VHT Compressed Beamforming frame response is determined by assuming the following:

— All feedback segments (as defined in 10.35.5.3) are transmitted, even if a Beamforming Report Poll frame is used and not all of the bits in the included Feedback Segment Retransmission Bitmap field are equal to 1.

— The subfield values of the VHT MIMO Control field are as follows:
  — The Feedback Type, Nr Index, and Channel Width fields are as specified in 10.35.5.
  — The Nc Index field is as specified in 10.35.5 if the Feedback Type field is MU, or to the greatest value allowed by 10.35.5 if the Feedback Type field is SU.
  — The Grouping field indicates no grouping.
  — The Codebook Information field has the value 1.

NOTE 4—Estimated times might prove to be inexact, if the TXOP responder has a choice of PHY options (e.g., BCC v. LDPC, use of STBC, use of short GI, PHY header/preamble format options) or MAC options (e.g., use of HT Control). Heuristics such as the TXOP responder's previous choices and channel conditions might be used to minimize the inexactitude.

NOTE 5—If a TXOP includes the transmission of a VHT Compressed Beamforming frame by the TXOP responder, the TXOP holder can, if the duration estimates prove excessive, indicate truncation of the TXOP by using a CF-End frame, provided that the remaining duration of the TXOP after the transmission of the last frame can accommodate the CF-End frame (see 10.23.2.10).

In a PS-Poll+BDT frame or an RTS frame generated by an S1G STA as part of a BDT exchange the Duration/ID field is set as follows:

— In a PS-Poll+BDT frame, the Duration/ID field is set to the estimated time required for the transmission of one Ack frame, plus the estimated time required for the transmission of its following MPDUs and their responses if required, plus applicable IFS durations.

— In an RTS frame that is sent as a response to the PS-Poll+BDT frame, the Duration/ID field is set to a value D: min ($T_{END\text{-}NAV} + T_{PENDING} - T_{PPDU}$; $T_{TXOP\text{-}REMAINING} - T_{PPDU}$) ≤ D ≤ $T_{TXOP\text{-}REMAINING} - T_{PPDU}$.

In any frame that includes a Duration/ID field, transmitted by an S1G STA as a response to PV1 frames that are not part of a BDT exchange, the Duration/ID field of the frame is set to 0. For any frame transmitted by a BDT initiator that is the TXOP holder as a response to PV1 frames, the Duration/ID field of the frame is set to the value of the TXNAV timer minus the estimated time required to transmit the frame. In any frame transmitted by a BDT initiator that is not the TXOP holder as a response to PV1 frames, the Duration/ID field of the frame is set to the remaining duration of the TXOP.

9.2.5.3 Setting for QoS CF-Poll frames

Within a Data frame containing QoS CF-Poll, the Duration/ID field value is set to one of the following:

a) One SIFS plus the TXOP limit, if the TXOP limit is nonzero, or

b) The time required for the transmission of one MPDU of nominal MSDU size and the associated Ack frame plus two SIFSs, if the TXOP limit is 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.2.5.4 Setting for frames sent by a TXOP holder under HCCA

Within a frame sent by a TXOP holder under hybrid coordination function (HCF) controlled channel access (HCCA), to provide NAV protection for the entire controlled access phase (CAP), the Duration/ID field is set to one of the following values:

a) In an RTS frame
   1) If the pending frame is the final frame, the time required to transmit the pending frame, plus one CTS frame, plus one Ack frame if required, plus three SIFSs
   2) If the pending frame is not the final frame in the TXOP, the remaining duration of the TXOP
b) In a CTS frame
   1) If the pending frame is the sole frame in the TXOP, one of the following:
      i) If there is a response frame, the time required to transmit the pending frame, plus one SIFS, plus the response frame (Ack or BlockAck), plus an additional SIFS
      ii) If there is no response frame, the time required to transmit the pending frame, plus one SIFS
   2) If the pending frame is not the final frame in the TXOP, the remaining duration of the TXOP
c) Otherwise
   1) If the frame is a nonfinal frame in a TXOP with multiple frame exchanges, the remaining duration of the TXOP
   2) If the frame is the sole or final frame in the TXOP, the actual remaining time needed for this frame exchange sequence

9.2.5.5 Settings within a dual CTS sequence

Within a frame (“Frame1”) (excluding a second CTS (CTS2) transmission, as defined in 10.3.2.10) sent by a QoS STA that is not a TXOP holder in a PPDU that contains an immediate response or that is sent by an RD responder, the Duration/ID field is set to the Duration/ID value from the frame(s) (“Frames2”) that elicited the response or that carried the RDG minus the time interval between the end of the PPDU that carried Frame1 and the end of the PPDU that carries Frames2.

Within a frame (“Frame1”) (excluding a CTS2 transmission, as defined in 10.3.2.10) sent by a QoS STA that is a TXOP holder, the Duration/ID field is set according to the rules in the following subclauses:

— 9.2.5.2 rule b) for multiple protection if Frame1 is not a QoS +CF-Poll frame and the TXOP holder is not operating under HCCA
— 9.2.5.3 if Frame1 is a QoS +CF-Poll frame and the TXOP holder is not operating under HCCA
— 9.2.5.4 if the TXOP holder is operating under HCCA

Within the CTS2 of a dual CTS exchange, defined in 10.3.2.10, the Duration/ID field is set to the value of the Duration/ID field of the RTS frame that initiated the exchange minus the time required to transmit the first clear-to-sent (CTS1), CTS2, and the applicable IFSs.

9.2.5.6 Setting for control response frames

This subclause describes how to set the Duration/ID field for CTS, Ack, and BlockAck frames transmitted by a QoS STA.

In a CTS frame that is not part of a dual CTS sequence transmitted in response to an RTS frame, the Duration/ID field is set to the value obtained from the Duration/ID field of the RTS frame that elicited the response minus the time, in microseconds, between the end of the PPDU carrying the RTS frame and the end of the PPDU carrying the CTS frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In a CTS frame that is transmitted in response to an MU-RTS Trigger frame, the Duration/ID field is set to the value obtained from the Duration/ID field of the MU-RTS Trigger frame that elicited the CTS frame minus the time, in microseconds, between the end of the PPDU carrying the MU-RTS Trigger frame and the end of the PPDU carrying the CTS frame.

In an Ack frame, the Duration/ID field is set to the value obtained from the Duration/ID field of the frame that elicited the response minus the time, in microseconds between the end of the PPDU carrying the frame that elicited the response and the end of the PPDU carrying the Ack frame.

In a BlockAck frame transmitted in response to a BlockAckReq frame, MU-BAR Trigger frame, frame containing an implicit block ack request, or frame carried in HE TB PPDU under single protection settings, the Duration/ID field is set to the value obtained from the Duration/ID field of the frame that elicited the response minus the time, in microseconds between the end of the PPDU carrying the frame that elicited the response and the end of the PPDU carrying the BlockAck frame.

Under multiple protection settings, the Duration/ID field in a BlockAck frame transmitted in response to a frame carried in HE TB PPDU is set according to the multiple protection settings defined in 9.2.5.2.

In an NDP CTS frame transmitted in response to an RTS frame, the Duration field is set to the value obtained from the Duration/ID field of the RTS frame that elicited the response minus the time, in microseconds, between the end of the PPDU carrying the RTS frame and the end of the NDP CTS frame except as described in 10.53.5.4.

In an NDP Ack frame with the Idle Indication field equal to 0, the Duration field is set to the value obtained from the Duration/ID field of the frame that elicited the response minus the time, in microseconds, between the end of the PPDU carrying the frame that elicited the response and the end of the NDP Ack frame except when the eliciting frame is a PS-Poll frame in which case the Duration field can be set as described in 10.3.2.15.

In an NDP Ack frame with the Idle Indication field equal to 1, the Duration field is set to the duration of time, in milliseconds, during which an idle period is expected from the STA that elicited the response, starting from the end of NDP Ack frame response.

In a TACK frame, the Duration/ID field is set to the value obtained from the Duration/ID field of the frame that elicited the response minus the time, in microseconds, between the end of the PPDU carrying the frame that elicited the response and the end of the PPDU carrying the TACK frame.

9.2.5.7 Setting for other response frames

In any frame transmitted by a STA that is not the TXOP holder and is not specified by 9.2.5.1 to 9.2.5.6, the Duration/ID field is set to the value obtained from the Duration/ID field of the frame that elicited the response minus the time, in microseconds, between the end of the PPDU carrying the frame that elicited the response and the end of the PPDU carrying the frame. If the frame is contained in an HE TB PPDU, the time is equal to SIFS plus the duration of the HE TB PPDU, where the duration of the HE TB PPDU is defined in Equation (27-147).

9.3 Format of individual frame types

9.3.1 Control frames

9.3.1.1 Format of Control frames

In the following descriptions, “immediately previous” frame means a frame whose reception concluded within the SIFS preceding the start of the current frame.

The Frame Control, Duration and Address 1 (RA) fields are present in all control frame subtypes. The Address 2 (TA) field is present in some control frame subtypes.

The subfields within the Frame Control field of Control frames carried in a non-S1G PPDU are set as shown in Figure 9-37.

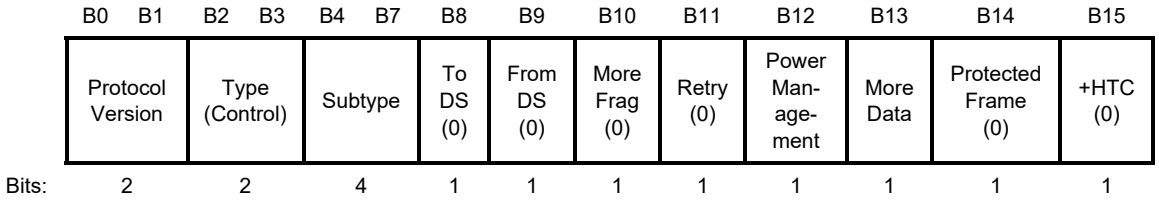

Figure 9-37—Frame Control field subfield values within Control frames carried in a non-S1G PPDU

In a Control frame carried in an S1G PPDU, when the Subtype subfield is not equal to 3 and not equal to 10, the format of the Frame Control field is shown in Figure 9-38.

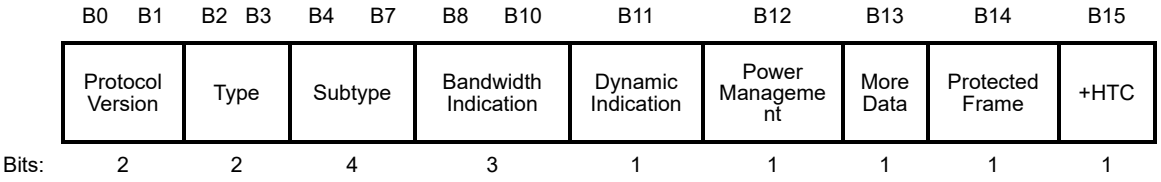

Figure 9-38—Frame Control field format in Control frames carried in an S1G PPDU when Subtype subfield is not equal to 3 and not equal to 10

In a Control frame carried in an S1G PPDU, when the Subtype subfield is equal to 3, the format of the Frame Control field is shown in Figure 9-39.

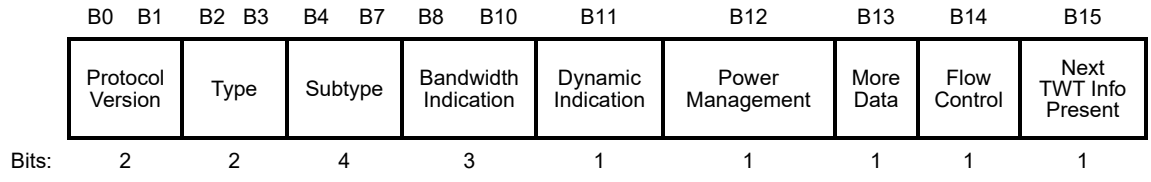

Figure 9-39—Frame Control field format in Control frames carried in an S1G PPDU when Subtype subfield is equal to 3

In a Control frame carried in an S1G PPDU, when the Subtype subfield is equal to 10, the format of the Frame Control field is shown in Figure 9-40.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

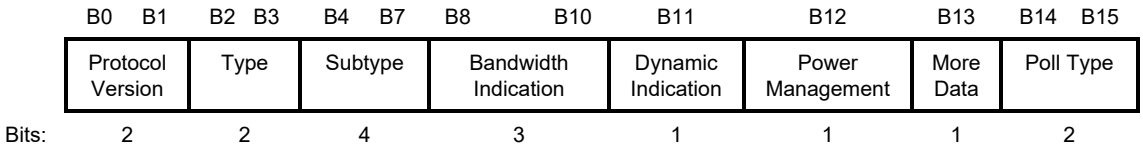

Figure 9-40—Frame Control field format in Control frames carried in an S1G PPDU when Subtype subfield is equal to 10

9.3.1.2 RTS frame format

The frame format for the RTS frame is defined in Figure 9-41.

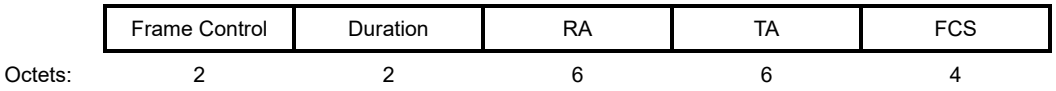

Figure 9-41—RTS frame format

The RA field of the RTS frame is the address of the STA that is the intended immediate recipient of a pending individually addressed frame.

The TA field is the address of the STA transmitting the RTS frame or the bandwidth signaling TA of the STA transmitting the RTS frame. In an RTS frame transmitted by a VHT STA or an HE STA in a non-HT or non-HT duplicate format to another VHT STA or HE STA, the scrambling sequence carries the TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT (see 10.3.2.7) and the TA field is a bandwidth signaling TA.

For all RTS frames sent by non-QoS STAs, the Duration field is the time, in microseconds, required to transmit the pending Data or Management frame, plus one CTS frame, plus one Ack frame, plus three SIFSs. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer. For RTS frames sent by QoS STAs, see 9.2.5.

9.3.1.3 CTS frame format

The frame format for the CTS frame is defined in Figure 9-42.

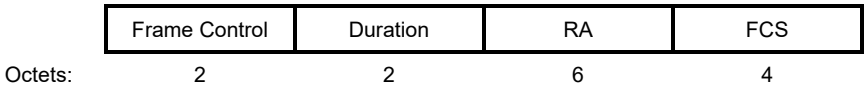

Figure 9-42—CTS frame format

If the CTS frame is a response to an RTS frame, the RA field of the CTS frame is set to the address from the TA field of the RTS frame with the Individual/Group bit set to 0. If the CTS frame is the first frame in a frame exchange, the RA field is set to the MAC address of the transmitter. If the CTS frame is a response to an MU-RTS Trigger frame, the RA field of the CTS frame is set to the address from the TA field of the MU-RTS Trigger frame.

For all CTS frames transmitted by a non-QoS STA in response to RTS frames, the Duration field is the value obtained from the Duration field of the immediately previous RTS frame, minus the time, in microseconds, required to transmit the CTS frame and its SIFS. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

At a non-QoS STA, if the CTS frame is the first frame in the exchange and the pending Data or Management frame requires acknowledgment, the Duration field is the time, in microseconds, required to transmit the pending Data or Management frame, plus two SIFSs plus one Ack frame. At a non-QoS STA, if the CTS frame is the first frame in the exchange and the pending Data or Management frame does not require immediate acknowledgment, the Duration field is the time, in microseconds, required to transmit the pending Data or Management frame, plus one SIFS. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer.

For other CTS frame transmissions by a QoS STA, the Duration field is set as defined in 9.2.5.

A CTS-to-self frame is a CTS frame in which the RA field is equal to the transmitter's MAC address.

A CTS-to-AP frame is a CTS frame that is not transmitted in response to an RTS frame and in which the RA field is equal to the MAC address of the AP with which the STA is associated.

9.3.1.4 Ack frame format

The frame format for the Ack frame is defined in Figure 9-43.

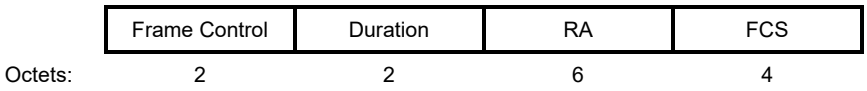

Figure 9-43—Ack frame format

The RA field of the Ack frame is the nonbandwidth signaling TA from the Address 2 field of the immediately previous individually addressed Data, Management, BlockAckReq, BlockAck, or PS-Poll frames.

For Ack frames sent by non-QoS STAs, if the More Fragments bit was equal to 0 in the Frame Control field of the immediately previous individually addressed Data or Management frame, the Duration field is set to 0. In other Ack frames sent by non-QoS STAs, the Duration field is the value obtained from the Duration/ID field of the immediately previous Data, Management, BlockAckReq, or BlockAck frame minus the time, in microseconds, required to transmit the Ack frame and its SIFS. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer.

In all other Ack frames, the Duration field is specified by 9.2.5.

9.3.1.5 PS-Poll frame format

9.3.1.5.1 General

The frame format for the PS-Poll frame is defined in Figure 9-44.

Figure 9-44—PS-Poll frame format

The BSSID (RA) field is set to the address of the STA contained in the AP. The TA field is the address of the STA transmitting the frame or a bandwidth signaling TA. In a PS-Poll frame transmitted by a VHT STA

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

or an HE STA in a non-HT or non-HT duplicate format and where the scrambling sequence carries the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT, the TA field is a bandwidth signaling TA.

9.3.1.5.2 Non-BDT variant of the PS-Poll frame format

The Duration/ID field contains the AID value assigned to the STA transmitting the frame by the AP in the (Re)Association Response frame that established that STA's current association, with the two MSBs set to 1.

9.3.1.5.3 BDT variant of the PS-Poll frame format

A PS-Poll frame with the Duration/ID field that contains a duration value as described in 9.2.5 is a BDT variant of the PS-Poll frame and is referred to as PS-Poll+BDT frame.

The Poll Type field in the Frame Control field of the PS-Poll+BDT frame is set to 0.

Bit 15 of the Duration/ID field of a PS-Poll+BDT frame is set to 0.

A non-S1G STA does not transmit PS-Poll+BDT frames.

9.3.1.6 CF-End frame format

The frame format for the CF-End frame is defined in Figure 9-45.

	Frame Control	Duration	RA	BSSID(TA)	FCS
Octets:	2	2	6	6	4

Figure 9-45—CF-End frame format

When transmitted by a non-DMG and non-S1G STA, the Duration field is set to 0. When transmitted by a DMG STA, the Duration field is set to the time required to complete the CF-End truncation sequence of which it is part (see 10.38.8): Duration = (i – 1) × (TXTIME(CF-End) + SIFS), where i is in the range 1 to 3 and indicates the order of the CF-End frame in the truncation sequence in the reverse direction (i.e., i=1 corresponds to the last CF-End frame in the sequence). When transmitted by an S1G STA, the Duration field is set to either 0 or a truncated time as described in 10.23.2.9.

When transmitted by a non-DMG STA, the RA field is the broadcast address. When transmitted by a DMG STA, the RA field is the MAC address of the STA that is the intended immediate recipient of the individually addressed Data or Management frame, or the broadcast address.

If transmitted by a non-DMG STA, the BSSID (TA) field is the address of the STA contained in the AP except that the Individual/Group bit of the BSSID (TA) field is set to 1 in a CF-End frame transmitted by a VHT STA to a VHT AP or an HE STA to an HE AP in a non-HT or non-HT duplicate format to indicate that the scrambling sequence carries the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT. If transmitted by a DMG STA, the TA field is the MAC address of the STA transmitting the frame.

9.3.1.7 BlockAckReq frame format

9.3.1.7.1 Overview

The frame format of the BlockAckReq frame is defined in Figure 9-46.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

	Frame Control	Duration	RA	TA	BAR Control	BAR Information	FCS
Octets:	2	2	6	6	2	variable	4

Figure 9-46—BlockAckReq frame format

The Duration field value is set as defined in 9.2.5.

The RA field of the BlockAckReq frame is the address of the recipient STA.

The TA field is the address of the STA transmitting the BlockAckReq frame or a bandwidth signaling TA. In a BlockAckReq frame transmitted by a VHT STA or an HE STA in a non-HT or non-HT duplicate format and where the scrambling sequence carries the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT, the TA field is a bandwidth signaling TA.

The BAR (for block acknowledgment request) Control field is shown in Figure 9-47.

	B0	B1	B4	B5	B11	B12	B15
	Reserved	BAR Type		Reserved		TID_INFO	
Bits:	1	4		7		4	

Figure 9-47—BAR Control field format

The BAR Type subfield indicates the BlockAckReq frame variant, as defined in Table 9-36.

Table 9-36—BlockAckReq frame variant encoding

BAR Type	BlockAckReq frame variant
0	Reserved
1	Extended Compressed
2	Compressed
3	Multi-TID
4–5	Reserved
6	GCR
7–9	Reserved
10	GLK-GCR
11–15	Reserved

DMG STAs use only the Compressed BlockAckReq variant and the Extended Compressed BlockAckReq variant.

The meaning of the TID_INFO subfield of the BAR Control field depends on the BlockAckReq frame variant type. The meaning of this subfield is explained within the subclause for each of the BlockAckReq frame variants.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The meaning of the BAR Information field of the BlockAckReq frame depends on the BlockAckReq frame variant type. The meaning of this field is explained within the subclause for each of the BlockAckReq frame variants.

NOTE—Reference to "a BlockAckReq" frame without any other qualification from other subclauses applies to any of the variants, unless specific exclusions are called out.

9.3.1.7.2 Compressed BlockAckReq variant

The TID_INFO subfield of the BAR Control field of the Compressed BlockAckReq frame contains the TID for which a BlockAck frame is requested.

The BAR Information field of the Compressed BlockAckReq frame contains the Block Ack Starting Sequence Control subfield, as shown in Figure 9-48. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAckReq frame is sent. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

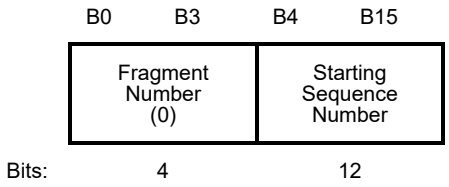

Figure 9-48—Block Ack Starting Sequence Control subfield format

9.3.1.7.3 Extended Compressed BlockAckReq variant

The TID_INFO subfield of the BAR Control field of the Extended Compressed BlockAckReq frame contains the TID for which a BlockAck frame is requested.

The BAR Information field of the Extended Compressed BlockAckReq frame contains the Block Ack Starting Sequence Control subfield, as shown in Figure 9-48. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAckReq frame is sent. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

9.3.1.7.4 Multi-TID BlockAckReq variant

The TID_INFO subfield of the BAR Control field of the Multi-TID BlockAckReq frame determines the number of TIDs present in the Multi-TID BlockAckReq frame as given by TID_INFO + 1, e.g., a 2 in the TID_INFO subfield means that three TID values are present in the Multi-TID BlockAckReq frame's BAR Information field.

The BAR Information field of the Multi-TID BlockAckReq frame comprises multiple sets of Per TID Info subfields and Block Ack Starting Sequence Control subfields, as shown in Figure 9-49. The Per TID Info subfield is shown in Figure 9-50. The Block Ack Starting Sequence Control subfield is shown in Figure 9-48. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A MSDU for which this BlockAckReq frame is sent. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

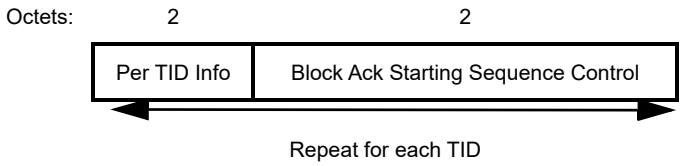

Figure 9-49—BAR Information field format (Multi-TID BlockAckReq)

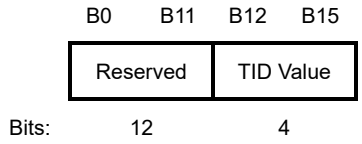

Figure 9-50—Per TID Info subfield format

9.3.1.7.5 GCR BlockAckReq variant

The TID_INFO subfield of the BAR Control field of the GCR BlockAckReq frame is set to 0.

The BAR Information field of the GCR BlockAckReq frame contains the Block Ack Starting Sequence Control subfield and GCR Group Address subfield, as shown in Figure 9-51. The Block Ack Starting Sequence Control subfield is shown in Figure 9-48. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAckReq frame is sent. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

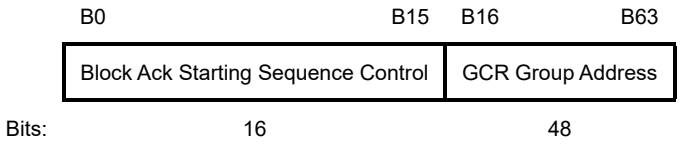

Figure 9-51—BAR Information field format (GCR BlockAckReq)

The GCR Group Address subfield contains the MAC address of the group for which reception status is being requested.

9.3.1.7.6 GLK-GCR BlockAckReq variant

For the BlockAckReq variant, the TID_INFO subfield in the BAR Control field in the GLK-GCR BlockAckReq frame is 0.

The BAR Information field in the GLK-GCR BlockAckReq frame contains the Block Ack Starting Sequence Control subfield as shown in Figure 9-48. The Starting Sequence Number subfield in the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this GLK-GCR BlockAckReq frame is sent. The Fragment Number subfield in the Block Ack Starting Sequence Control subfield is 0.

9.3.1.8 BlockAck frame format

9.3.1.8.1 Overview

The frame format of the BlockAck frame is defined in Figure 9-52.

	Frame Control	Duration	RA	TA	BA Control	BA Information	FCS
Octets:	2	2	6	6	2	variable	4

Figure 9-52—BlockAck frame format

The Duration field value is set as defined in 9.2.5.

The RA field of a BlockAck frame that is not a Multi-STA BlockAck variant is set to the TA field of the soliciting frame or the address of the recipient STA from which Data frames are acknowledged. The RA field of a Multi-STA BlockAck frame is set as described in 9.3.1.8.6.

The TA field is the address of the STA transmitting the BlockAck frame.

The BA Control field is defined in Figure 9-53.

	B0	B1 B4	B5 B8	B9	B10	B11	B12 B15

Table 9-37—BlockAck frame variant encoding

10	GLK-GCR
11	Multi-STA
12–15	Reserved

NOTE—Reference to "a BlockAck" frame without any other qualification from other subclauses applies to any of the variants, unless specific exclusions are called out.

The GCR BlockAck frame is used in response to a GCR BlockAckReq frame, and the GLK-GCR BlockAck frame is used in response to a GLK-GCR BlockAckReq frame.

An EDMG STA sets the No Memory Kept subfield to 1 to indicate that the free memory space indicated in the last RBUFCAP subfield might not be kept at the start of the next frame exchange sequence; otherwise, if set to 0, free memory space indicated by the RBUFCAP subfield is kept by the receiver for the next frame exchange sequence for the corresponding TID(s). The No Memory Kept subfield is reserved if transmitted by a STA that is not an EDMG STA.

For an EDMG STA, the Memory Configuration Tag subfield indicates one out of two memory configurations as indicated in Memory Configuration Tag field in the recipient's EDMG Flow Control Extension Configuration element (9.4.2.276). For other types of STAs, this subfield is reserved.

The Management Ack subfield is set to 1 to indicate that a frame of type Management and subtype that is not Action No Ack is acknowledged. This subfield is reserved if the BlockAck variant used is not the EDMG Multi-TID BlockAck variant.

The meaning of the TID_INFO subfield of the BA Control field depends on the BlockAck frame variant type. The meaning of this subfield is explained within the subclause for each of the BlockAck frame variants.

The meaning of the BA Information field depends on the BlockAck frame variant type. The meaning of this field is explained within the subclause for each of the BlockAck frame variants.

9.3.1.8.2 Compressed BlockAck variant

The TID_INFO subfield of the BA Control field of the Compressed BlockAck frame contains the TID for which this BlockAck frame is sent.

The BA Information field of the Compressed BlockAck frame is shown in Figure 9-54. The Block Ack Starting Sequence Control subfield is shown in Figure 9-48. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAck frame is sent. This subfield is defined in 10.25.6.5.

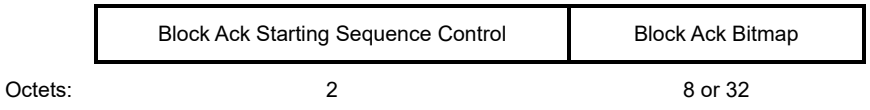

Figure 9-54—BA Information field format (Compressed BlockAck)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Fragment Number subfield of the Block Ack Starting Sequence Control field is set as defined in Table 9-38. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to all 0s if the Compressed BlockAck frame is sent to or from a non-HE STA.

Table 9-38—Fragment Number subfield encoding for the Compressed BlockAck variant

Fragment Number subfield			Fragmentation level 3 (ON/OFF)	Block Ack Bitmap subfield length (octets)	Maximum number of MSDUs/A-MSDUs that can be acknowledged
B3	B2–B1	B0			
0	0	0	OFF	8	64
0	1	0		Reserved	Reserved
0	2	0		32	256
0	3	0		Reserved	Reserved
0	0	1	ON	8	16
0	1	1		Reserved	Reserved
0	2	1		32	64
0	3	1		Reserved	Reserved
1	Any	Any		Reserved	Reserved

NOTE—A Compressed BlockAck frame with B0 of the Fragment Number subfield set to 1 is not sent to an HE STA whose Dynamic Fragmentation Support subfield in the HE Capabilities element it transmits is not set to 3 (see 26.3).

If B0 of the Fragment Number subfield is 0, the Block Ack Bitmap subfield of the BA Information field of the Compressed BlockAck frame indicates the receive status of up to 64 or 256 MSDUs and/or A-MSDUs depending upon the value of B2–B1 in the Fragment Number subfield as shown in Table 9-38. Each bit that is equal to 1 in the compressed Block Ack Bitmap subfield acknowledges the reception of a single MSDU or A-MSDU in the order of sequence number, with the first bit of the Block Ack Bitmap subfield corresponding to the MSDU (or fragment thereof) or A-MSDU (or fragment thereof) with the sequence number that matches the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield.

If B0 of the Fragment Number subfield is 1, the Block Ack Bitmap subfield of the BA Information field of the Compressed BlockAck frame indicates the receive status of up to 16 or 64 MSDUs and/or A-MSDUs depending upon the value B2–B1 in the Fragment Number subfield as shown in Table 9-38. If bit position n of the Block Ack Bitmap subfield is 1, it acknowledges receipt of an MPDU with sequence number value SN and fragment number value FN with $n = 4 \times (SN - SSN) + FN$, where SSN is the value of the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield and the operations on the sequence numbers are performed modulo 4096. If bit position n of the Block Ack Bitmap subfield is 0, it indicates that the MPDU has not been received.

NOTE—If the B0 of the Fragment Number subfield is equal to 1, then the Block Ack Bitmap subfield is split into (Block Ack Bitmap subfield length)/4 subbitmaps, each of which indicates receive status for 4 fragments of each of the MSDUs or A-MSDUs as indicated in Table 9-38.

9.3.1.8.3 Extended Compressed BlockAck variant

The TID_INFO subfield of the BA Control field of the Compressed BlockAck frame contains the TID for which a BlockAck frame is requested.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The BA Information field of the Extended Compressed BlockAck frame is shown in Figure 9-55. The Block Ack Starting Sequence Control subfield is shown in Figure 9-48. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAck frame is sent. This subfield is defined in 10.25.6.5. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

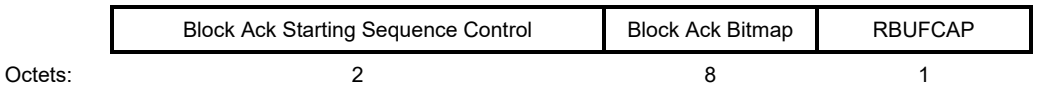

Figure 9-55—BA Information field format (Extended Compressed BlockAck)

The Block Ack Bitmap subfield of the BA Information field of the Extended Compressed BlockAck frame is used to indicate the received status of up to 64 entries, where each entry represents an MSDU or an A-MSDU. Each bit that is set to 1 in the Block Ack Bitmap subfield acknowledges the reception of a single MSDU or A-MSDU in the order of sequence number. The first bit of the Block Ack Bitmap subfield corresponds to the MSDU or A-MSDU with the sequence number that matches the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield.

The RBUFCAP field contains an unsigned integer that is the number of MPDU buffers available to store received MPDUs at the time of transmission of the Extended Compressed BlockAck frame (10.41.9).

9.3.1.8.4 GCR Block Ack variant

The TID_INFO subfield of the BA Control field of the GCR BlockAck frame contains the TID for which this BlockAck frame is sent.

The BA Information field of the GCR BlockAck frame comprises the Block Ack Starting Sequence Control, GCR Group Address, and the Block Ack Bitmap subfields, as shown in Figure 9-56. The Block Ack Starting Sequence Control subfield is shown in Figure 9-48. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first A-MSDU for which this BlockAck frame is sent. This subfield is defined in 10.25.8. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

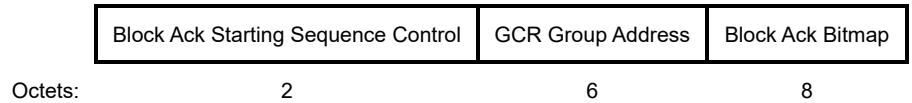

Figure 9-56—BA Information field format (GCR BlockAck)

The GCR Group Address subfield is set to the value from the Group Address subfield of the GCR BAR Information field in the BlockAckReq frame to which the BlockAck frame is sent in response. If the BlockAck frame is sent in response to a GCR MU-BAR Trigger frame, the GCR Group Address subfield is set to the value from the RA field in the GCR MU-BAR Trigger frame.

The Block Ack Bitmap subfield is used to indicate the received status of up to 64 entries, where each entry represents an MSDU or an A-MSDU. Each bit that is equal to 1 in the Block Ack Bitmap subfield acknowledges the reception of a single MSDU or A-MSDU in the order of sequence number, with the first bit of the Block Ack Bitmap subfield corresponding to the MSDU or A-MSDU with the sequence number that matches the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.3.1.8.5 GLK-GCR BlockAck variant

The TID_INFO subfield in the BA Control field in the GLK-GCR BlockAck frame contains the TID for which this BlockAck frame is sent.

The BA Information field in the GLK-GCR BlockAck frame comprises the Block Ack Starting Sequence Control and the Block Ack Bitmap subfields, as shown in Figure 9-57. The Block Ack Starting Sequence Control subfield is shown in Figure 9-57 The Starting Sequence Number subfield in the Block Ack Starting Sequence Control subfield contains the sequence number of the first A-MSDU for which this BlockAck frame is sent. This subfield is defined in 10.25.8. The Fragment Number subfield in the Block Ack Starting Sequence Control subfield is 0.

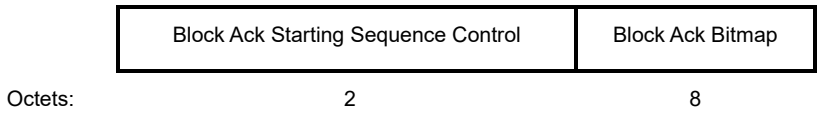

Figure 9-57—BA Information field format (GLK-GCR BlockAck)

The Block Ack Bitmap subfield is used to indicate the received status of up to 64 MSDUs and A-MSDUs. Each bit that is equal to 1 in the Block Ack Bitmap subfield acknowledges the reception of a single MSDU or A-MSDU in the order of sequence number, with the first bit of the Block Ack Bitmap subfield corresponding to the MSDU or A-MSDU with the sequence number that matches the Starting Sequence Number subfield in the Block Ack Starting Sequence Control subfield.

9.3.1.8.6 Multi-STA BlockAck variant

The Multi-STA BlockAck frame is supported if either UL MU or multi-TID A-MPDU operation is supported and acknowledges MPDUs carried in an HE TB PPDU or multi-STA multi-TID, multi-STA single-TID, or single-STA multi-TID A-MPDUs.

An HE AP that sends a Multi-STA BlockAck frame where the Per AID TID Info fields are addressed to more than one STA sets the RA field to the broadcast address. An HE AP that sends a Multi-STA BlockAck frame where the Per AID TID Info fields are all addressed to a single recipient STA and that is sent in response to an HE TB PPDU sets the RA field of the Multi-STA BlockAck frame to either the address of the recipient STA or to the broadcast address. An HE AP that sends a Multi-STA BlockAck frame where the Per AID TID Info fields are all addressed to a single recipient STA and that is not sent in response to an HE TB PPDU sets the RA field of the Multi-STA BlockAck frame to the address of the recipient STA.

A non-AP HE STA sets the RA field to the TA field of the soliciting frame or to the address of the recipient STA whose Data or Management frames are acknowledged.

The TID_INFO subfield of the BA Control field of the Multi-STA BlockAck frame is reserved.

The BA Information field of the Multi-STA BlockAck frame comprises one or more Per AID TID Info subfields as defined in Figure 9-58.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

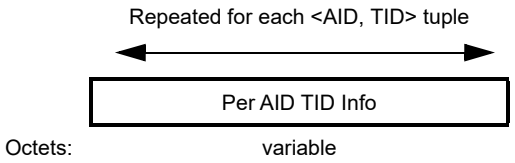

Figure 9-58—BA Information field format (Multi-STA BlockAck)

The AID TID Info subfield is shown in Figure 9-59.

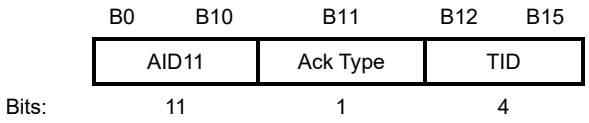

Figure 9-59—AID TID Info subfield format

The AID11 subfield carries the 11 LSBs of the AID of the non-AP STA for which the Per AID TID Info subfield is intended. The format of the Per AID TID Info subfield depends on the value of the AID11 subfield. If the Multi-STA BlockAck frame is sent to an AP, the AID11 subfield is set to 0. A value of 2045 in the AID11 subfield is used as an identifier for any unassociated STA. If the AID11 subfield is set to 2045, then the Ack Type subfield and TID subfield are set to 0 and 15, respectively.

NOTE 1—More than one Per AID TID Info subfield with the same value in the AID11 subfield but different values in the TID subfield can be present in the Multi-STA BlockAck frame.

If the AID11 subfield of the AID TID Info subfield is not 2045, then the Per AID TID Info subfield has the format shown in Figure 9-60.

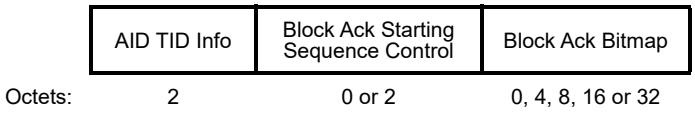

Figure 9-60—Per AID TID Info subfield format if the AID11 subfield is not 2045

If the AID11 subfield is not 2045, then the context and the presence of each optional subfield in a Per AID TID Info subfield in a Multi-STA BlockAck frame is defined in Table 9-39.

Table 9-39—Context of the Per AID TID Info subfield and presence of optional subfields if the AID11 subfield is not 2045

Ack Type subfield values	TID subfield values	Presence of Block Ack Starting Sequence Control subfield and Block Ack Bitmap subfields	Context of a Per AID TID Info subfield in a Multi-STA BlockAck frame
0	0–7	Present	Block acknowledgment context: Sent as an acknowledgment to QoS Data frames that solicit a BlockAck frame response or to a BlockAckReq frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-39—Context of the Per AID TID Info subfield and presence of optional subfields if the AID11 subfield is not 2045 *(continued)*

Ack Type subfield values	TID subfield values	Presence of Block Ack Starting Sequence Control subfield and Block Ack Bitmap subfields	Context of a Per AID TID Info subfield in a Multi-STA BlockAck frame
1	0–7	Not present	Acknowledgment context: Sent as an acknowledgment to a QoS Data or QoS Null frame that solicits an Ack frame response.
0 or 1	8–13	N/A	Reserved
0	14	N/A	Reserved
1	14	Not present	All ack context: Sent as an acknowledgment to an A-MPDU that contains an MPDU that solicits an immediate response and all MPDUs contained in the A-MPDU are received successfully.
0	15	N/A	Reserved
1	15	Not present	Management/PS-Poll frame acknowledgment context: Sent as an acknowledgment to a Management or PS-Poll frame.

NOTE 1—Additional rules for acknowledgment, block acknowledgment and the all ack context are defined in 26.4.2 for a multi-TID A-MPDU.

NOTE 2—As HE STAs do not use HCCA (see 10.23.1), TID values from 8 to 15 are not used in QoS Data frames.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the Ack Type subfield is 0, the Fragment Number subfield encoding indicates the length of the BlockAck bitmap subfield as defined in Table 9-40.

Table 9-40—Fragment Number subfield encoding for the Multi-STA BlockAck variant

Fragment Number subfield			Fragmentation level 3 (ON/OFF)	Block Ack Bitmap subfield length (octets)	Maximum number of MSDUs/A-MSDUs that can be acknowledged
B3	B2–B1	B0			
0	0	0	OFF	8	64
0	1	0		16	128
0	2	0		32	256
0	3	0		4	32
0	0	1	ON	8	16
0	1	1		16	32
0	2	1		32	64
0	3	1		4	8
1	Any	Any		Reserved	Reserved

NOTE—A Multi-STA BlockAck frame with B0 of the Fragment Number subfield set to 1 cannot be sent to an HE STA, unless the HE Capabilities element received from the HE STA has the Dynamic Fragmentation Support subfield equal to 3 (see 26.3).

If B0 of the Fragment Number subfield of the Block Ack Starting Sequence Control subfield is 0, the BA Information field of the Multi-STA BlockAck frame contains an 8-octet, 16-octet, 32-octet, or 4-octet Block Ack Bitmap subfield depending on B2–B1 of the Fragment Number subfield as defined in Table 9-40 indicating the receive status of up to 64, 128, 256, or 32 MSDUs (or fragments thereof) and/or A-MSDUs (or fragments thereof), respectively. Each bit that is equal to 1 in the Block Ack Bitmap subfield acknowledges the reception of a single MSDU (or fragment thereof) or A-MSDU (or fragment thereof) in the order of sequence number with the first bit of the Block Ack Bitmap subfield corresponding to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield.

If B0 of the Fragment Number subfield of the Block Ack Starting Sequence Control subfield is 1, the Block Ack Bitmap subfield of the BA Information field of the Multi-STA BlockAck frame indicates the receive status of up to 16, 32, 64, or 8 MSDUs and/or A-MSDUs depending on B2–B1 of the Fragment Number subfield as shown in Table 9-40. If bit position n of the Block Ack Bitmap subfield is 1, it acknowledges receipt of an MPDU with sequence number value SN and fragment number value FN with $n = 4 \times (SN - SSN) + FN$, where SSN is the value of the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield and the operations on the sequence numbers are performed modulo 4096. If bit position n of the Block Ack Bitmap subfield is 0, it indicates that the MPDU has not been received.

NOTE 2—If B0 of the Fragment Number subfield is 1, then the Block Ack Bitmap subfield is split into (Block Ack Bitmap subfield length)/4 subbitmaps, each of which indicates receive status for 4 fragments of each of the MSDUs or A-MSDUs as indicated in Table 9-40. For an A-MSDU, only the first bit of the subbitmap is used if fragmentation is not allowed in an A-MSDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the AID11 subfield of the AID TID Info subfield is 2045, then the Per AID TID Info subfield has the format shown in Figure 9-61, where the RA subfield indicates the MAC address of an unassociated STA for which the Per AID TID Info subfield is intended.

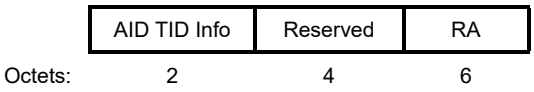

Figure 9-61—Per AID TID Info subfield format if the AID11 subfield is 2045

NOTE 3—An associated non-AP HE STA that receives a Multi-STA BlockAck frame as a response from its AP and does not support the UORA procedure ignores the 10 octets following the AID TID Info subfield that are the remainder of the Per AID TID Info subfield if the AID11 subfield is 2045 and parses the following Per AID TID Info subfields if any.

9.3.1.8.7 EDMG Compressed BlockAck variant

The TID_INFO subfield of the BA Control field of the EDMG Compressed BlockAck frame contains the TID for which a BlockAck frame is requested.

The BA Information field of the EDMG Compressed BlockAck frame variant is formatted as indicated in Figure 9-62.

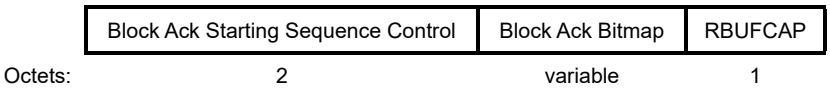

Figure 9-62—BA Information field format (EDMG Compressed BlockAck)

For a block ack agreement that does not use segmentation and reassembly (see 10.69), the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAck frame is sent. The value of this subfield is defined in 10.25.6.5. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is reserved.

The Block Ack Bitmap subfield of the BA Information field is used to indicate the received status of MSDUs, where each entry represents an MSDU or an A-MSDU. The size of the Block Ack Bitmap subfield is negotiated during the block ack agreement establishment (see 10.25). Each bit that is set to 1 in the Block Ack Bitmap subfield acknowledges the successful reception of a single MSDU or A-MSDU in the order of sequence number. The first bit of the Block Ack Bitmap subfield corresponds to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield.

The RBUFCAP subfield is defined in Table 9-41.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-41—RBUFCAP subfield encoding for the EDMG Compressed BlockAck variant

RBUFCAP value	RBUFCAP value name	Definition
0	Receiver Buffer Empty	Indicates that the recipient's memory is not less than the length indicated by the Maximum A-MPDU Length Exponent subfield (Table 9-384).
255	Receiver Buffer Full	Indicates no space in the recipient's memory.
1–254	Receiver Buffer Available	Indicates the size of recipient's current memory that the originator can use to transmit MPDUs to the recipient; measured in units indicated by the Buffer Unit Size field (9.4.2.276).

9.3.1.8.8 EDMG Multi-TID BlockAck variant

The TID_INFO subfield of the BA Control field of the EDMG Multi-TID BlockAck frame contains the number of TIDs minus one for which information is reported in the BA Information field. For example, a value of two in the TID_INFO subfield means that information for three TIDs is present in the frame.

The BA Information field of the EDMG Multi-TID BlockAck frame comprises one or more instances of the Per TID Info, Block Ack Starting Sequence Control, Block Ack Bitmap subfields and RBUFCAP subfield. The BA Information field is formatted as indicated in Figure 9-63.

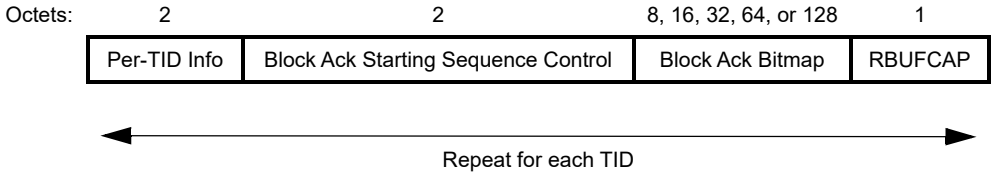

Figure 9-63—BA Information field format (EDMG Multi-TID BlockAck)

The Per-TID Info subfield is defined in Figure 9-64.

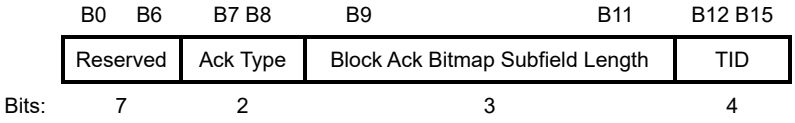

Figure 9-64—Per-TID Info subfield format

If the Ack Type subfield is not 0, the Block Ack Bitmap Subfield Length field is reserved. The Ack Type subfield is defined in Table 9-42.

The Block Ack Bitmap Subfield Length subfield is an integer in the range 0 to 4 that is used to calculate the number of octets of the bitmap represented by the Block Ack Bitmap subfield in the BA Information field. The bitmap length is equal to 2(3+ Block Ack Bitmap Subfield Length) octets, as negotiated during the block ack agreement establishment (10.25) for the TID indicated in the TID subfield of the Per-TID Info subfield.

The TID subfield contains the value of the TID to which the value of the Block Ack Bitmap subfield carried in this BA Information field relates.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-42—Ack Type subfield definition

Ack Type subfield value	TID subfield value	Presence of Block Ack Starting Sequence Control subfield and Block Ack Bitmap subfields	Context of a Per TID Info subfield in a Multi-STA BlockAck frame
0	0–15	Present	Block acknowledgment context is sent in response: — To MPDUs in an A-MPDU that solicits an immediate block acknowledgment or — To a BlockAckReq frame or to A-MPDU with ack policy set to Scheduled Ack.
1	0–15	Not present	Ack context: Sent as a response to an MPDU that has a TID that does not have BA agreement and with ack policy set to Scheduled Ack
2	0–15	Not present	All-ack context: Sent as a response to an A-MPDU that contains an MPDU with Ack Policy set to Normal Ack or Scheduled Ack, and all MPDUs for a given TID contained in the A-MPDU are received successfully.
3	N/A	N/A	Reserved

The Block Ack Starting Sequence Control subfield is shown in Figure 9-48. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield is the sequence number of the first MSDU or A-MSDU for which this BlockAck frame is sent. The value of this subfield is defined in 10.25.6.5. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is reserved and set to 0.

The Block Ack Bitmap subfield of the BA Information field is used to indicate the received status of MSDUs, where each entry represents an MSDU or an A-MSDU. The size of the Block Ack Bitmap subfield is negotiated during the block ack agreement establishment (see 10.25) and can contain 8, 16, 32, 64, or 128 octets. Each bit that is set to 1 in the Block Ack Bitmap subfield acknowledges the successful reception of a single MSDU or A-MSDU in the order of sequence number. The first bit of the Block Ack Bitmap subfield corresponds to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield. The maximum size of all Block Ack Bitmap subfields appended for all TIDs in one EDMG Multi-TID BlockAck frame is 256 octets.

The RBUFCAP subfield is defined in 9.3.1.8.7.

9.3.1.9 Control Wrapper frame format

The format of the Control Wrapper frame is shown in Figure 9-65.

	Frame Control	Duration/ ID	Address 1	Carried Frame Control	HT Control	Carried Frame	FCS
Octets:	2	2	6	2	4	variable	4

Figure 9-65—Control Wrapper frame format

The Control Wrapper frame is used to wrap any other Control frame (i.e., excluding the Control Wrapper frame) together with an HT Control field.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Duration/ID field of the Control Wrapper frame is generated by following the rules for the Duration/ID field of the Control frame that is being wrapped.

The Address 1 field of the Control Wrapper frame is generated by following the rules for the Address 1 field of the Control frame that is being wrapped.

The Carried Frame Control field contains the value of the Frame Control field of the wrapped Control frame.

The HT Control field is defined in 9.2.4.6.

The Carried Frame field contains the fields that follow the Address 1 field of the Control frame that is being wrapped, excluding the FCS field.

The FCS field is defined in 9.2.4.9.

9.3.1.10 Poll frame format

The format of the Poll frame is shown in Figure 9-66.

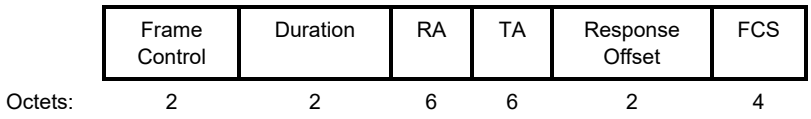

Figure 9-66—Poll frame format

The Duration field is set to include the duration, in microseconds, of the remaining Poll frame transmissions (see 10.38.7.2), plus all appropriate IFSs (10.3.2.3), plus the duration of the SPR frame transmissions.

The RA field contains the MAC address of the STA being polled.

The TA field contains the MAC address of the AP or PCP.

The Response Offset field indicates the offset, in units of 1 μs, beginning SIFS after the end of the Poll frame when the SPR frame in response to this Poll frame is transmitted.

9.3.1.11 SPR frame format

The format of the service period request (SPR) frame is shown in Figure 9-67.

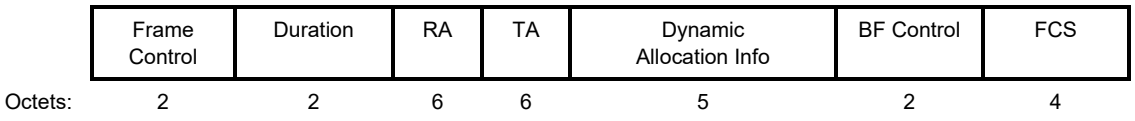

Figure 9-67—SPR frame format

When an SPR frame is sent in response to a Poll frame (see 10.38.7), the Duration field in the SPR frame is set to the value of the Duration field contained in the Poll frame, minus the value of the Response Offset field contained in the Poll frame multiplied by its unit as specified in 9.3.1.10, minus SIFS, minus the time taken to transmit the SPR frame. When the SPR frame is not sent in response to a Poll frame (see 10.38.9 and 11.4.12) and transmitted within an SP or a TXOP allocation, the Duration field is set to the time left in the allocation excluding the SPR transmission time. In all other cases, the Duration field is set to 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The RA field contains the MAC address of the AP or PCP.

The TA field contains the MAC address of the STA transmitting the SP request.

The Dynamic Allocation Info field is defined in 9.5.2.

The BF Control field is defined in 9.5.5.

9.3.1.12 Grant frame format

The format of the Grant frame is shown in Figure 9-68.

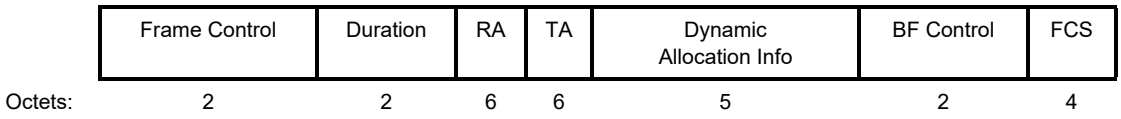

Figure 9-68—Grant frame format

For individually addressed Grant frames:

— If the Grant frame is used to obtain a TXOP, the Duration field is set to a value subject to the TXOP limit as described in 10.23.2.9. In all other cases within a CBAP, the Duration field is set to the Duration field of the immediately preceding frame minus TXTIME(Grant frame) minus aSIFSTime.

— If the Grant frame is sent within an SP, the Duration field is set according to the rules in 10.38.7, 10.38.8, and 10.38.9 as appropriate depending on the Grant frame usage.

— If the Grant frame is sent within an ATI, the Duration field is set according to the rules in 10.38.3.

For group addressed Grant frames, the Duration field is set to the time between PHY-TXEND.indication primitive of the Grant frame and the start of the allocation as indicated by the Allocation Duration subfield within the Dynamic Allocation Info field.

The RA field contains the MAC address of the STA receiving the SP grant.

The TA field contains the MAC address of the STA that has transmitted the Grant frame.

The Dynamic Allocation Info field is defined in 9.5.2.

The BF Control field is defined in 9.5.5.

9.3.1.13 DMG CTS frame format

The frame format for the DMG CTS frame is defined in Figure 9-69.

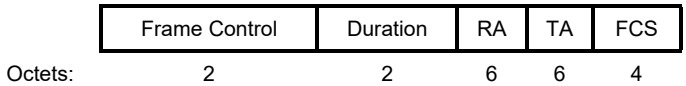

Figure 9-69—DMG CTS frame format

When the DMG CTS frame is a response to an RTS frame, the RA field of the DMG CTS frame is set to the address from the TA field of the RTS frame. When the DMG CTS frame is the first frame in a frame exchange, the RA field is set to the MAC address of the transmitter.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A DMG CTS-to-self frame is a DMG CTS frame in which the RA field is equal to the transmitter's MAC address.

For DMG CTS frames other than DMG CTS-to-self frames, the Duration field is set to the value of the Duration field of the immediately previous RTS frame, minus the time, in microseconds, required to transmit the DMG CTS frame and its SIFS. For DMG CTS-to-self frames, the Duration field is set to the remaining duration of the TXOP or SP.

For DMG CTS frames other than DMG CTS-to-self frames, the TA field is the MAC address of the STA transmitting the DMG CTS frame. For DMG CTS-to-self frames, the TA field is set to the individual address of the recipient or the group address of the recipients of the frame that the DMG STA intends to transmit after the DMG CTS-to-self frame.

9.3.1.14 DMG DTS frame format

The frame format for the DMG Denial to Send (DTS) frame is defined in Figure 9-70.

	Frame Control	Duration	RA	NAV-SA	NAV-DA	FCS
Octets:	2	2	6	6	6	4

Figure 9-70—DMG DTS frame format

The Duration field is set to the value of the transmitting STA's NAV – (TXTIME(DMG DTS) + SIFS) or the remaining time in the SP at the end of the DMG DTS frame transmission, whichever is smaller. The transmitting STA's NAV is the value of its NAV at the start of the DMG DTS frame transmission.

The RA field of the frame is copied from the TA field of the immediately previous RTS frame to which the DMG DTS frame is a response.

The NAV-SA and the NAV-DA fields contain the MAC addresses of the source DMG STA and the destination DMG STA, respectively, whose exchange of an RTS and DMG CTS frame caused the last update to the NAV at the transmitting STA.

9.3.1.15 SSW frame format

The frame format for the sector sweep (SSW) frame is defined in Figure 9-71.

	Frame Control	Duration	RA	TA	SSW	SSW Feedback	FCS
Octets:	2	2	6	6	3	3	4

Figure 9-71—SSW frame format

The Duration field is set to the time until the end of the current SSW slot when the SSW frame is transmitted within an association beamforming training (A-BFT). Otherwise, it is set to the time until the end of the SSW frame transmission that has the CDOWN subfield within the SSW field equal to 0, plus MBIFS, or until the end of the current allocation (see 10.41), whichever comes first.

The RA field contains the MAC address of the STA that is the intended receiver of the SSW frame.

The TA field contains the MAC address of the transmitter STA of the SSW frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The SSW field is defined in 9.5.1.

The SSW Feedback field is defined in 9.5.3.

9.3.1.16 SSW-Feedback frame format

The format of the sector sweep feedback (SSW-Feedback) frame is shown in Figure 9-72.

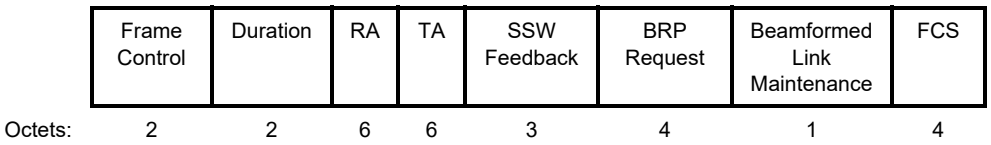

Figure 9-72—SSW-Feedback frame format

The Duration field is set to 0 when the SSW-Feedback frame is transmitted within an association beamforming training (A-BFT). When transmitted within a DTI, the Duration field is set to one of the following:

a) If a BRP phase is requested through the BRP Request field, the Duration field is set to the time, in microseconds, required to transmit an SSW-Ack frame plus 2×MBIFS (10.41.3.1).

b) If a BRP phase is not requested, the Duration field is set to the time, in microseconds, required to transmit an SSW-Ack frame, plus MBIFS (10.41.3.1) or the time until the end of the current allocation, whichever comes earlier.

The RA field contains the MAC address of the STA that is the intended destination of the SSW-Feedback frame.

The TA field contains the MAC address of the STA transmitting the SSW-Feedback frame.

The SSW Feedback field is defined in 9.5.3.

The BRP Request field is defined in 9.5.4.

The Beamformed Link Maintenance field is defined in 9.5.6.

9.3.1.17 SSW-Ack frame format

The format of the sector sweep acknowledgement (SSW-Ack) frame is shown in Figure 9-73.

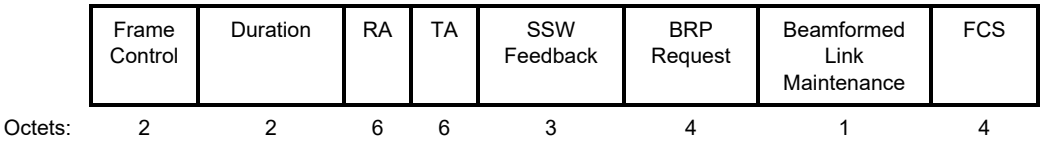

Figure 9-73—SSW-Ack frame format

The Duration field is set to the value of the Duration field of the immediately preceding SSW-Feedback frame, minus MBIFS, minus the time required to transmit the SSW-Ack frame.

The RA field contains the MAC address of the STA that is the intended destination of the SSW-Ack frame.

The TA field contains the MAC address of the STA transmitting the SSW-Ack frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The SSW Feedback field is defined in 9.5.3.

The BRP Request field is defined in 9.5.4.

The Beamformed Link Maintenance field is defined in 9.5.6.

9.3.1.18 Grant Ack frame format

The format of the Grant Ack frame is shown in Figure 9-74. The Grant Ack frame is sent as a response to the reception of a Grant frame.

	Frame Control	Duration	RA	TA	Reserved	BF Control	FCS
Octets:	2	2	6	6	5	2	4

Figure 9-74—Grant Ack frame format

The Duration field is set to the value obtained from the Duration field of the immediately previous Grant frame minus the time, in microseconds, required to transmit the Grant Ack frame and its SIFS.

The RA field of the Grant Ack frame is copied from the Address 2 field of the immediately previous Grant frame.

The TA field contains the MAC address of the STA that has transmitted the Grant Ack frame.

The BF Control field is defined in 9.5.5.

9.3.1.19 VHT/HE/Ranging NDP Announcement frame format

The VHT/HE/Ranging NDP Announcement frame has three variants, the VHT NDP Announcement frame, the HE NDP Announcement frame, and the Ranging NDP Announcement frame. The three formats are distinguished by the setting of the NDP Announcement Type subfield in the Sounding Dialog Token field.

The frame format of the VHT NDP Announcement frame is shown in Figure 9-75.

	Frame Control	Duration	RA	TA	Sounding Dialog Token	STA Info List	FCS
Octets:	2	2	6	6	1	$n \times 2$	4

Figure 9-75—VHT NDP Announcement frame format

The Duration field is set as defined in 9.2.5.

The VHT/HE/Ranging NDP Announcement frame contains at least one STA Info field. If the VHT/HE/Ranging NDP Announcement frame contains only one STA Info field with AID/RSID equal or less than 2007, then in the case of VHT or HE NDP Announcement frames the RA field is set to the address of the STA that can provide feedback (see 10.35.5.2), while in the case of Ranging NDP Announcement frames, the RA address is set to the address of the RSTA or ISTA that is the intended recipient of the frame. If the VHT/HE/Ranging NDP Announcement frame contains more than one STA Info field with AID/RSID equal or less than 2007, then the RA field is set to the broadcast address.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The TA field is set to the address of the STA transmitting the VHT/HE/Ranging NDP Announcement frame or the bandwidth signaling TA of the STA transmitting the VHT/HE/Ranging NDP Announcement frame. In a VHT/HE/Ranging NDP Announcement frame transmitted by a VHT or HE STA in a non-HT or non-HT duplicate format and where the scrambling sequence carries the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT, the TA field is set to a bandwidth signaling TA. If a Ranging NDP Announcement frame is addressed to a set of ISTAs in which at least two ISTAs have a TB ranging measurement exchange with a different BSSID in the Multiple BSSID set of the RSTA, then the TA field is the transmitted BSSID.

The format of the Sounding Dialog Token field is shown in Figure 9-76.

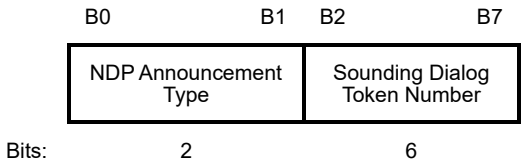

Figure 9-76—Sounding Dialog Token field format

The NDP Announcement Type field in the Sounding Dialog Token field identifies the NDP Announcement frame variant as defined in Table 9-28f (NDP Announcement frame variant encoding).

Table 9-43—NDP Announcement frame variant encoding

NDP Announcement Type subfield	NDP Announcement frame variant
0	VHT NDP Announcement frame
1	Ranging NDP Announcement frame
2	HE NDP Announcement frame
3	Reserved

The Sounding Dialog Token Number subfield in the Sounding Dialog Token field contains a value selected by the beamformer to identify the VHT NDP Announcement frame.

The STA Info List field contains one or more (*n*) STA Info fields.

If the VHT NDP Announcement frame is transmitted by a non-S1G STA, then the format of the STA Info field is shown in Figure 9-77.

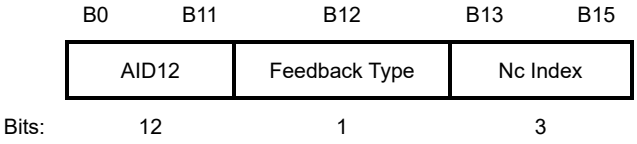

Figure 9-77—STA Info field format in a non-S1G STA

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The subfields in the STA Info field are described in Table 9-44.

Table 9-44—STA Info subfields

Subfield	Description
AID12	Contains the 12 least significant bits of the AID of a STA expected to process the following VHT NDP and prepare the sounding feedback. Equal to 0 if the STA is an AP, mesh STA, or IBSS STA.
Feedback Type	Indicates the type of feedback requested. Set to 0 for SU. Set to 1 for MU.
Nc Index	If the Feedback Type field indicates MU, then Nc Index indicates the number of columns minus 1, ($Nc - 1$), in the compressed beamforming feedback matrix. Reserved if the Feedback Type field indicates SU.

If the VHT NDP Announcement frame is transmitted in an S1G PPDU, the frame is referred to as an S1G NDP Announcement frame, and the format of the STA Info field is shown in Figure 9-78. The Feedback Type and Nc Index subfields are defined in Table 9-44, wherein the Nc Index field does not indicate a value that is more than 4. The AID13 subfield contains the least significant bits of the AID of the STA that could process the following S1G NDP and prepare sounding feedback. The AID13 subfield is equal to 0 if the STA is an AP or is in an IBSS.

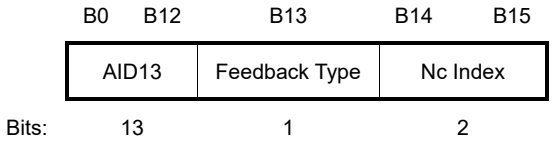

Figure 9-78—STA Info field format in an S1G STA

The format of the HE NDP Announcement frame is shown in Figure 9-75.

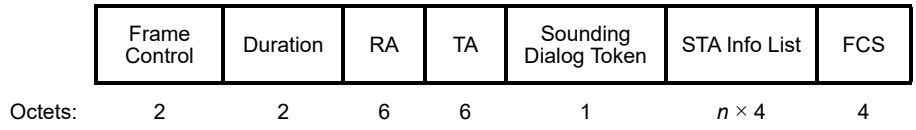

Figure 9-79—HE NDP Announcement frame format

The Duration, RA, and TA fields are set as in a VHT NDP Announcement frame.

The Sounding Dialog Token Number field in the Sounding Dialog Token field contains a value selected by the beamformer to identify the HE NDP Announcement frame.

The STA Info List field contains one or more (n) STA Info fields

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The format of the STA Info field in an HE NDP Announcement Frame if the AID11 subfield is not set to 2047 is defined in Figure 9-80.

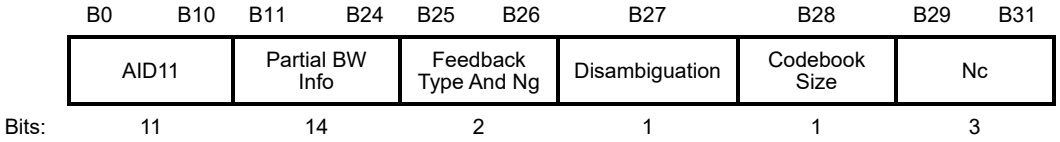

Figure 9-80—STA Info field format in an HE NDP Announcement frame if the AID11 subfield is not 2047

An HE NDP Announcement frame contains at most 1 STA Info field per STA.

If the AID11 subfield is not 2047, then it contains an identifier of a STA expected to process the following HE sounding NDP and prepare the sounding feedback.

The Partial BW Info subfield is defined in Figure 9-81.

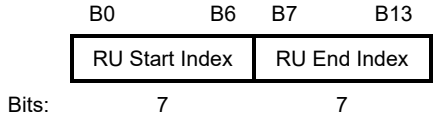

Figure 9-81—Partial BW Info subfield format

The RU Start Index subfield in the Partial BW Info subfield indicates the first 26-tone RU for which the HE beamformer is requesting feedback. The RU End Index subfield of the Partial BW Info subfield indicates the last 26-tone RU for which the HE beamformer is requesting feedback. The value of the RU Start Index subfield is less than or equal to the value of the RU End Index subfield. The RU Start Index subfield and RU End Index subfield depend on the bandwidth of the PPDU carrying the HE NDP Announcement frame, which is indicated by the TXVECTOR parameter CH_BANDWIDTH if the frame is carried in an HE, VHT, or HT PPDU and by the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT if the frame is carried in a non-HT duplicate PPDU, and is 20 MHz if the frame is carried in non-HT PPDU. The values of the RU Start Index subfield and RU End Index subfield are each selected from the following:

— Values 0 to 8 if the bandwidth of the PPDU carrying the HE NDP Announcement frame is 20 MHz, where 0 indicates 26-tone RU 1 and 8 indicates 26-tone RU 9. Values 9–127 are reserved. See Table 27-8.

— Values 0 to 17 if the bandwidth of the PPDU carrying the HE NDP Announcement frame is 40 MHz, where 0 indicates 26-tone RU 1 and 17 indicates 26-tone RU 18. Values 18–127 are reserved. See Table 27-9.

— Values 0 to 36 if the bandwidth of the PPDU carrying the HE NDP Announcement frame is 80 MHz, where 0 indicates 26-tone RU 1 and 36 indicates 26-tone RU 37. Values 37–127 are reserved. See Table 27-10.

— Values 0 to 73 if the bandwidth of the PPDU carrying the HE NDP Announcement frame is 160 MHz, where 0 indicates 26-tone RU 1 and 73 indicates 26-tone RU 74. Values 74–127 are reserved.

— Values 0 to 73 if the bandwidth of the PPDU carrying the HE NDP Announcement frame is 80+80 MHz, where 0 indicates 26-tone RU 1 in the lower 80 MHz frequency segment, 36 indicates 26-tone RU 37 in the lower 80 MHz frequency segment, 37 indicates 26-tone RU 1 in the upper 80 MHz frequency segment, and 73 indicates 26-tone RU 37 in the upper 80 MHz frequency segment. Values 74–127 are reserved. For 80+80 MHz, feedback is not requested for the gap between the 80 MHz segments. See Table 27-10.

The Feedback Type And Ng and Codebook Size subfields for HE TB sounding are defined in Table 9-45.

Table 9-45—Feedback Type And Ng subfield and Codebook Size subfield encoding for HE TB sounding

Feedback Type And Ng		Codebook Size	Description
B25	B26	B28	
0	0	0	SU, $Ng = 4$, quantization resolution $(\phi, \psi) = \{4, 2\}$
0	0	1	SU, $Ng = 4$, quantization resolution $(\phi, \psi) = \{6, 4\}$
0	1	0	SU, $Ng = 16$, quantization resolution $(\phi, \psi) = \{4, 2\}$
0	1	1	SU, $Ng = 16$, quantization resolution $(\phi, \psi) = \{6, 4\}$
1	0	0	MU, $Ng = 4$, quantization resolution $(\phi, \psi) = \{7, 5\}$
1	0	1	MU, $Ng = 4$, quantization resolution $(\phi, \psi) = \{9, 7\}$
1	1	0	CQI
1	1	1	MU, $Ng = 16$, quantization resolution $(\phi, \psi) = \{9, 7\}$

The Feedback Type And Ng and Codebook Size subfields for HE non-TB sounding are defined in Table 9-46.

Table 9-46—Feedback Type And Ng subfield and Codebook Size subfield encoding for HE non-TB sounding

Feedback Type And Ng		Codebook Size	Description
B25	B26	B28	
0	Reserved	Reserved	SU
1	1	0	CQI

The Disambiguation subfield is set to 1.

NOTE—Setting the Disambiguation subfield to 1 prevents a non-HE VHT STA from wrongly identifying its AID in the HE NDP Announcement frame. The Disambiguation subfield coincides with the MSB of the AID12 subfield of a VHT NDP Announcement frame if the HE NDP Announcement field is parsed as VHT NDP Announcement frame by a non-HE VHT STA. The MSB of the AID12 subfield is always 0 since the maximum AID is 2007.

In a broadcast HE NDP Announcement frame that has more than one STA Info field with a value other than 2047 in the AID11 field the following applies to each STA Info subfield with a value other than 2047:

— If the Feedback Type And Ng subfield indicates SU or MU, the Nc subfield indicates the number of columns in the compressed beamforming feedback matrix minus one, $Nc - 1$

— If the Feedback Type And Ng subfield indicates CQI, the Nc subfield indicates the number of space-time streams in the CQI report minus one, $Nc - 1$

In an individually addressed HE NDP Announcement frame with a single STA Info field, the STA Info field having a value in the AID11 field other than 2047, the Nc subfield is reserved.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The format of the STA Info field in an HE NDP Announcement frame if the AID11 subfield is set to 2047 is defined in Figure 9-82.

Figure 9-82—STA Info subfield format in an HE NDP Announcement frame if the AID11 subfield is 2047

The Disallowed Subchannel Bitmap subfield indicates the 20 MHz subchannels and the 242-tone RUs that are present in HE sounding NDPs announced by the HE NDP Announcement frame and the 242-tone RUs that are to be included in requested sounding feedback. A 20 MHz subchannel is as defined in Clause 17 for the portions of the PPDU that use a tone plan as specified in Clause 17 and a 242-tone RU is as defined in 27.3.2). The lowest numbered bit of the Disallowed Subchannel Bitmap subfield corresponds to the 20 MHz subchannel that lies within the BSS bandwidth and that has the lowest frequency of the set of all 20 MHz subchannels within the BSS bandwidth. Each successive bit in the bitmap corresponds to the next higher frequency 20 MHz subchannel. A bit in the bitmap is set to 1 to indicate that for the corresponding 20 MHz subchannel, no energy is present in the HE sounding NDP associated with this HE NDP Announcement frame. For each disallowed 20 MHz subchannel, the 242-tone RU that is most closely aligned in frequency with the 20 MHz subchannel is disallowed for PPDUs that use a tone plan as specified in Clause 27. STAs addressed by the HE NDP Announcement frame do not include tones from disallowed 242-tone RUs when determining the average SNR of space time streams 1 to *Nc* and when generating requested sounding feedback. If a 20 MHz subchannel and its corresponding 242-tone RU is not disallowed, the corresponding bit in the bitmap is set to 0.

The Ranging NDP Announcement frame uses the same Frame Control subtype as the VHT NDP Announcement frame. The frame format of the Ranging NDP Announcement frame is the same as the HE NDP Announcement frame shown in Figure 9-79.

The Duration, RA, and TA fields are set as in a VHT NDP Announcement frame.

The Sounding Dialog Token Number subfield in the Sounding Dialog Token (SDT) field contains a value in the range of 0 to 63, which identifies the Measurement Sounding phase of which this transmitted Ranging NDP Announcement frame is part; see 11.21.6.4.3 and 11.21.6.4.4.

The format of the STA Info field in a Ranging NDP Announcement frame, when the AID11 subfield is equal or less than 2007, is defined in Figure 9-83.

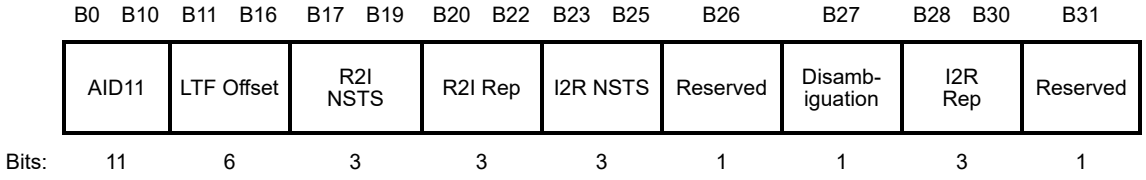

Figure 9-83—STA Info field format in a Ranging NDP Announcement frame when the AID11 subfield is equal or less than 2007

A Ranging NDP Announcement frame contains one STA Info field with AID11 subfield equal or less than 2007 per STA that is intended to receive this frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In the case of the non-TB ranging measurement exchange (see 11.21.6.4.4), there is always only one intended receiver and the RA field is set to the address of that STA.

In the case of the TB ranging measurement exchange (see 11.21.6.4.3), the RA field is set to the broadcast address if more than one STA is intended to receive this frame; otherwise the RA field is set to the address of the STA that is intended to receive this frame.

If the AID11 subfield is equal or less than 2007, it identifies a STA that is intended to receive this frame and assigns the parameters within this STA Info field to this STA. In case of the TB ranging measurement exchange, see 11.21.6.4.3, the AID11 subfield contains the 11 least significant bits of the AID of an associated STA, or the RSID of an unassociated STA, when it is expected to process the following NDP. In case of the non-TB ranging measurement exchange (see 11.21.6.4.4), the intended receiver is identified by the RA field and the AID11 subfield is set to 0.

When used as part of the TB ranging measurement exchange (see 11.21.6.4.3), the LTF Offset, R2I NSTS, and R2I Rep subfields are used to indicate the following R2I NDP's HE-LTF configuration (see 27.3.19.1); the I2R NSTS and the I2R Rep subfields are reserved.

When used as part of the non-TB ranging measurement exchange, the I2R NSTS and I2R Rep subfields are used to indicate the following I2R NDP's HE-LTF configuration, see 27.3.19.1, while the R2I NSTS and R2I Rep subfields indicate the HE-LTF configuration of the R2I NDP sent in response by the RSTA, see 11.21.6.4.4.

The LTF Offset subfield is used in the TB ranging measurement exchange protocol with secure LTF see 11.21.6.4.5.2; it indicates the number of HE-LTF to skip when processing the following NDP. The LTF Offset subfield is set to 0 in all other cases.

The R2I NSTS and I2R NSTS subfields indicate the number of spatial streams of the corresponding NDP and is set to the number of spatial streams minus 1.

The R2I Rep and I2R Rep subfields are set to the number of HE-LTF repetitions of the corresponding HE Ranging NDP minus 1; see 27.3.19.1. If the I2R and R2I Rep subfields have a value equal to 0, then there is no HE-LTF repetition in the I2R and R2I NDP respectively.

The Disambiguation subfield is set to 1 as in the STA Info field in an HE NDP Announcement frame regardless of the value of the AID11 subfield.

The format of the STA Info field in a Ranging NDP Announcement frame when the AID is equal to 2043 is shown in Figure 9-84. It is used in the non-TB ranging measurement exchange with secure LTF to carry the sequence authentication code (SAC).

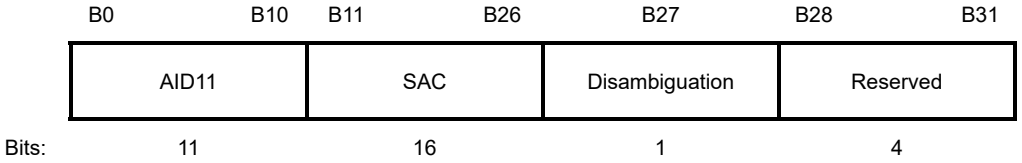

Figure 9-84—STA Info field format in a Ranging NDP Announcement frame if the AID11 subfield is 2043

The SAC subfield contains the 16-bit SAC used in the non-TB ranging measurement exchange with secure LTF; see 11.21.6.4.5.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The format of the STA Info field in a Ranging NDP Announcement frame if the AID11 subfield is equal to 2044 as is shown in Figure 9-85.

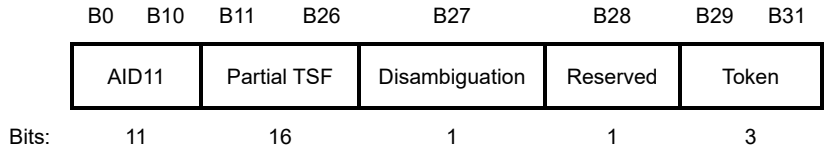

Figure 9-85—STA Info field format in a Ranging NDP Announcement frame (if the AID11 subfield is equal to 2044)

The STA Info field, with AID11 subfield equal to 2044, is present in Ranging NDP Announcement frames when part of the TB ranging measurement exchange. It is used to carry the Partial TSF subfield. The Partial TSF subfield contains 16 bits of the RSTA's TSF time, TSF[21:6], when the RSTA transmitted the TF Ranging Poll that preceded the Ranging NDP Announcement frame, carrying this STA Info field with AID subfield equal to 2044.

The Token subfield is set to the value of the Token subfield of the TF Ranging Poll whose partial transmission TSF time is carried.

The format of the STA Info field with AID11 subfield equal to 2045 is shown in Figure 9-86.

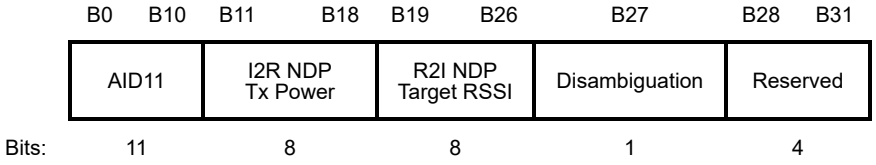

Figure 9-86—STA Info field format in a Ranging NDP Announcement frame if the AID11 subfield is 2045

The STA Info field with AID11 subfield equal to 2045 is used in the non-TB ranging measurement exchange, see 11.21.6.4.4, to carry the I2R NDP Tx Power and R2I NDP Target RSSI subfields.

The I2R NDP Tx Power subfield indicates the combined average power per 20 MHz bandwidth referenced to the antenna connector, of all antennas used to transmit the following I2R NDP. The transmit power is reported with a resolution of 1 dB, with values in the range 0 to 60 representing –20 dBm to 40 dBm, respectively. Values above 60 are reserved.

The R2I NDP Target RSSI subfield indicates the preferred receive signal power, averaged over the ISTA's antenna connectors, for future R2I NDPs to be transmitted by the RSTA. The preferred receive signal power in units of dBm is TargetRSSI = –110 + FVal, where FVal is the value of the R2I NDP Target RSSI subfield, except that values above 90 indicate that the ISTA has no receive signal power preference for the R2I NDPs.

9.3.1.20 Beamforming Report Poll frame format

The Beamforming Report Poll frame is shown in Figure 9-87.

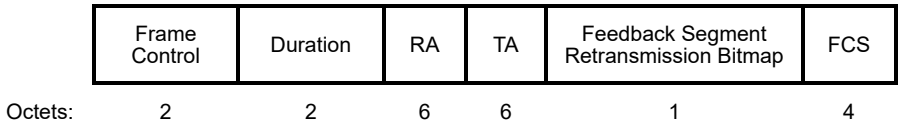

Figure 9-87—Beamforming Report Poll frame format

The Duration field is set as defined in 9.2.5.

The RA field is set to the address of the intended recipient.

The TA field is set to the address of the STA transmitting the Beamforming Report Poll or a bandwidth signaling TA. In a Beamforming Report Poll frame transmitted by a VHT STA in a non-HT or non-HT duplicate format and where the scrambling sequence carries the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT, the TA field is set to a bandwidth signaling TA.

The Feedback Segment Retransmission Bitmap field indicates the requested feedback segments of VHT compressed beamforming feedback (see 10.35.5.3). If the bit in position *n* (*n=0* for LSB and *n=7* for MSB) is 1, then the feedback segment with the Remaining Feedback Segments subfield in the VHT MIMO Control field equal to *n* is requested. If the bit in position *n* is 0, then the feedback segment with the Remaining Feedback Segments subfield in the VHT MIMO Control field equal to *n* is not requested.

9.3.1.21 TACK frame format

The frame format of the TACK frame is defined in Figure 9-88.

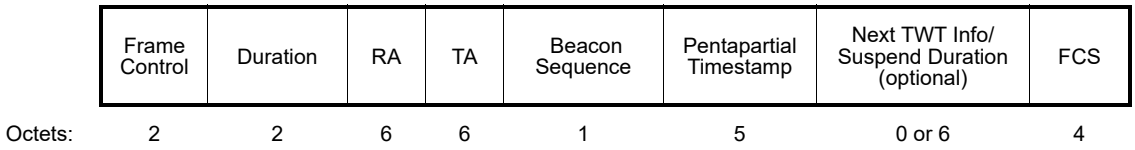

Figure 9-88—TACK frame format

The Duration field is described in 9.2.5.6.

The RA field contains the address of the intended recipient of the frame.

The TA field contains the address of the transmitter sending the frame.

The Beacon Sequence field contains the value of the Change Sequence field from the most recently transmitted S1G Beacon frame.

The Pentapartial Timestamp field contains the value of the 5 least significant octets of the STA's TSF timer at the time that the start of the data symbol containing the first bit of the Pentapartial Timestamp field appears at the transmit antenna connector.

The format for the optional Next TWT Info/Suspend Duration field is defined in Figure 9-89.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

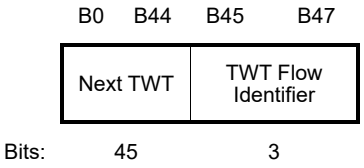

Figure 9-89—Next TWT Info/Suspend Duration field format

If the Next TWT Info Present field of the Frame Control field is equal to 1 and the Flow Control field of the Frame Control field is equal to 0, then the Next TWT Info/Suspend Duration field is present and is set to 0 or contains the 45 MSBs of the value of the 6 least significant octets of the TSF timer corresponding to the next scheduled TWT SP for the TWT agreement identified by the TWT Flow Identifier subfield for the STA that is the intended recipient of the frame. If the Next TWT Info/Suspend Duration field is 0, the transmitter does not currently have a Next TWT value available for transmission for the TWT agreement identified by the TWT Flow Identifier subfield for the STA that is the intended recipient of the frame.

If the Next TWT Info Present field of the Frame Control field is equal to 1 and the Flow Control field of the Frame Control field is equal to 1, then the Next TWT Info/Suspend Duration field is present and contains a flow suspension duration in microseconds during which the intended recipient TWT STA is not allowed to transmit Data frames to the STA identified by the TA field of the TACK frame.

If the Next TWT Info Present field is equal to 0 in the Frame Control field, the Next TWT Info/Suspend Duration field is not present in the TACK frame.

9.3.1.22 Trigger frame format

9.3.1.22.1 General

A Trigger frame allocates resources for and solicits one or more HE TB PPDU transmissions. The Trigger frame also carries other information required by the responding STA to send an HE TB PPDU.

The format for the Trigger frame is defined in Figure 9-90.

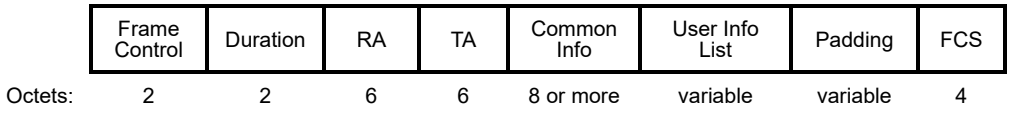

Figure 9-90—Trigger frame format

The Duration field is set as defined in 9.2.5.

The RA field is set as follows:

— For a Trigger frame that is not a GCR MU-BAR, NFRP or MU-RTS Trigger frame, and that has one User Info field and the AID12 subfield of the User Info field contains the AID of a non-AP STA, the RA field is set to the address of that STA

— For a Trigger frame that has at least one User Info field with the AID12 subfield that allocates an RA-RU, the RA field is set to the broadcast address

— For a Trigger frame that is not a GCR MU-BAR Trigger frame and that has more than one User Info field, the RA field is set to the broadcast address

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— For a Trigger frame that is an NFRP Trigger frame or MU-RTS Trigger frame, the RA field is set to the broadcast address
— For a Trigger frame that is a GCR MU-BAR Trigger frame, the RA field is set to the MAC address of the group for which reception status is being requested

The TA field is the address of the STA transmitting the Trigger frame if the Trigger frame is addressed to STAs that belong to a single BSS. The TA field is the transmitted BSSID if the Trigger frame is addressed to STAs from at least two different BSSs of the multiple BSSID set. The rules for setting of the TA field are defined in 26.5.2.2.4.

The Common Info field is defined in Figure 9-91.

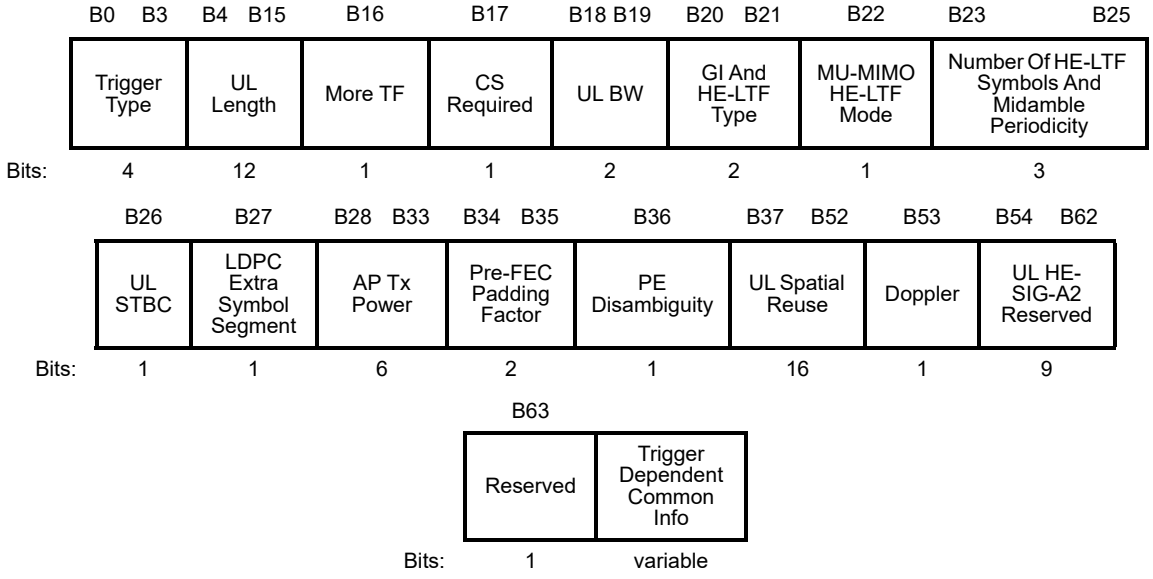

Figure 9-91—Common Info field format

The Trigger Type subfield identifies the Trigger frame variant and its encoding is defined in Table 9-47.

Table 9-47—Trigger Type subfield encoding

Trigger Type subfield value	Trigger frame variant
0	Basic
1	Beamforming Report Poll (BFRP)
2	MU-BAR
3	MU-RTS
4	Buffer Status Report Poll (BSRP)
5	GCR MU-BAR
6	Bandwidth Query Report Poll (BQRP)

Copyright © 2025 IEEE. All rights reserved.

Table 9-47—Trigger Type subfield encoding

7	NDP Feedback Report Poll (NFRP)
8	Ranging
9–15	Reserved

The UL Length subfield of the Common Info field indicates the value of the L-SIG LENGTH field of the solicited HE TB PPDU.

The More TF subfield of the Common Info field indicates whether or not a subsequent Trigger frame is scheduled for transmission. The More TF subfield is set as defined in 26.8.2, 26.8.3.2, and 11.21.6.4.3.

The CS Required subfield of the Common Info field is set to 1 to indicate that the STAs identified in the User Info fields are required to use ED to sense the medium and to consider the medium state and the NAV in determining whether to respond. The CS Required subfield is set to 0 to indicate that the STAs identified in the User Info fields are not required to consider the medium state or the NAV in determining whether to respond. See 26.5.2.3 and 26.5.2.5 for details.

The UL BW subfield of the Common Info field indicates the bandwidth in the HE-SIG-A field of the HE TB PPDU and is defined in Table 9-48.

Table 9-48—UL BW subfield encoding

UL BW subfield value	Description
0	20 MHz
1	40 MHz
2	80 MHz
3	80+80 MHz or 160 MHz

The GI And HE-LTF Type subfield of the Common Info field indicates the GI and HE-LTF type of the HE TB PPDU response. The GI And HE-LTF Type subfield encoding is defined in Table 9-49.

Table 9-49—GI And HE-LTF Type subfield encoding

GI And HE-LTF Type subfield value	Description
0	1x HE-LTF + 1.6 μs GI
1	2x HE-LTF + 1.6 μs GI
2	4x HE-LTF + 3.2 μs GI
3	Reserved

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The MU-MIMO HE-LTF Mode subfield of the Common Info field indicates the HE-LTF mode for an HE TB PPDU that has an RU that spans the entire bandwidth and that is assigned to more than one non-AP STA (i.e., for UL MU-MIMO) when the GI And HE-LTF Type subfield of the Common Info field indicates either 2x HE-LTF + 1.6 μs GI or 4x HE-LTF + 3.2 μs GI, as defined in Table 9-49. Otherwise, this subfield is set to indicate HE single stream pilot HE-LTF mode. See Table 9-50.

Table 9-50—MU-MIMO HE-LTF Mode subfield encoding

MU-MIMO HE-LTF subfield value	Description
0	HE single stream pilot HE-LTF mode
1	HE masked HE-LTF sequence mode

If the Doppler subfield of the Common Info field is 0, then the Number Of HE-LTF Symbols And Midamble Periodicity subfield of the Common Info field indicates the number of HE-LTF symbols present in the HE TB PPDU and is encoded as follows:

— 0 for 1 HE-LTF symbol
— 1 for 2 HE-LTF symbols
— 2 for 4 HE-LTF symbols
— 3 for 6 HE-LTF symbols
— 4 for 8 HE-LTF symbols
— 5–7 are reserved

If the Doppler subfield of the Common Info field is 1, then the Number Of HE-LTF Symbols And Midamble Periodicity subfield indicates the number of HE-LTF symbols and the periodicity of the midamble and is encoded as follows:

— 0 for 1 HE-LTF symbol and 10 symbol midamble periodicity
— 1 for 2 HE-LTF symbols and 10 symbol midamble periodicity
— 2 for 4 HE-LTF symbols and 10 symbol midamble periodicity
— 4 for 1 HE-LTF symbol and 20 symbol midamble periodicity
— 5 for 2 HE-LTF symbols and 20 symbol midamble periodicity
— 6 for 4 HE-LTF symbols and 20 symbol midamble periodicity
— 3 and 7 are reserved

The UL STBC subfield of the Common Info field indicates the status of STBC encoding for the solicited HE TB PPDUs. It is set to 1 to indicate STBC encoding and set to 0 otherwise.

The LDPC Extra Symbol Segment subfield of the Common Info field indicates the status of the LDPC extra symbol segment. It is set to 1 if the LDPC extra symbol segment is present in the solicited HE TB PPDUs and set to 0 otherwise.

The AP Tx Power subfield of the Common Info field indicates the AP's combined transmit power at the transmit antenna connector of all the antennas used to transmit the triggering PPDU in units of dBm/20 MHz. The transmit power in dBm/20 MHz, P_{TX}, is calculated as $P_{TX} = -20 + F_{Val}$, where F_{Val} is the value of the AP Tx Power subfield, except for the values above 60, which are reserved.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Pre-FEC Padding Factor and PE Disambiguity subfields are defined in Table 9-51 and have the same encoding as their respective subfields in HE SIG-A (see Table 27-21).

Table 9-51—Pre-FEC Padding Factor and PE Disambiguity subfields

Subfield	Description	Encoding
Pre-FEC Padding Factor	Indicates the pre-FEC padding factor	Set to 0 to indicate a pre-FEC padding factor of 4 Set to 1 to indicate a pre-FEC padding factor of 1 Set to 2 to indicate a pre-FEC padding factor of 2 Set to 3 to indicate a pre-FEC padding factor of 3
PE Disambiguity	Indicates PE disambiguity	Set to 1 if the condition in Equation (27-118) is met; otherwise, it is set to 0

The UL Spatial Reuse subfield of the Common Info field carries the values to be included in the Spatial Reuse fields in the HE-SIG-A field of the solicited HE TB PPDUs. The format of the UL Spatial Reuse subfield is shown in Figure 9-92, where each Spatial Reuse *n* subfield, $1 \leq n \leq 4$, is set to the same value as its corresponding subfield in the HE-SIG-A field of the HE TB PPDU, which are defined in Table 27-22.

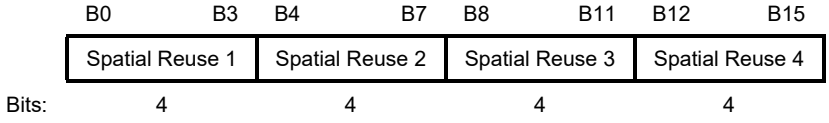

Figure 9-92—UL Spatial Reuse subfield format

The Doppler subfield of the Common Info field is set to 1 to indicate that a midamble is present in the HE TB PPDU and set to 0 otherwise.

The UL HE-SIG-A2 Reserved subfield of the Common Info field carries the value to be included in the Reserved field in the HE-SIG-A2 subfield of the solicited HE TB PPDUs. An HE AP sets the UL HE-SIG-A2 Reserved subfield to all 1s.

The Trigger Dependent Common Info subfield in the Common Info field is optionally present based on the value of the Trigger Type field (see 9.3.1.22.2 to 9.3.1.22.9).

The User Info List field contains zero or more User Info fields.

The User Info field is defined in Figure 9-93 for all Trigger frame variants, except the NFRP Trigger frame, which is defined in 9.3.1.22.9 and the Ranging Trigger frame, which is defined in 9.3.1.22.10.

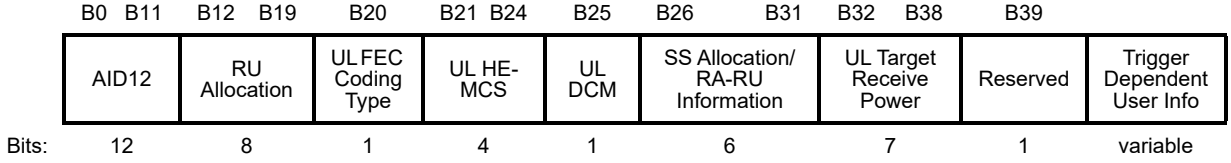

Figure 9-93—User Info field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The AID12 subfield in the User Info field is encoded as defined in Table 9-52:

Table 9-52—AID12 subfield encoding

AID12 subfield	Description
0	User Info field allocates one or more contiguous RA-RUs for associated STAs
1–2007	User Info field is addressed to an associated STA whose AID is equal to the value in the AID12 subfield
2008–2044	Reserved
2045	User Info field allocates one or more contiguous RA-RUs for unassociated STAs
2046	Unallocated RU
2047–4094	Reserved
4095	Start of Padding field

If the AID12 subfield is 2046, then the remaining subfields in the User Info field are reserved, except for the RU Allocation subfield, which indicates the RU location of the unallocated RU.

If the AID12 subfield is 4095, then the remaining subfields in the User Info field are not present.

The RU Allocation subfield along with the UL BW subfield in the Common Info field identifies the size and the location of the RU. If the UL BW subfield indicates 20 MHz, 40 MHz, or 80 MHz PPDU, then B0 of the RU Allocation subfield is set to 0. If the UL BW subfield indicates 80+80 MHz or 160 MHz, then B0 of the RU Allocation subfield is set to 0 to indicate that the RU allocation applies to the primary 80 MHz channel and set to 1 to indicate that the RU allocation applies to the secondary 80 MHz channel. The mapping of B7–B1 of the RU Allocation subfield for a Trigger frame that is not an MU-RTS Trigger frame is defined in Table 9-53.

See 9.3.1.22.5 for the encoding of the RU Allocation subfield in an MU-RTS Trigger frame.

If the UL BW subfield indicates 20 MHz, the mapping of the RU index to RU is defined in Table 27-8 in increasing order.

If the UL BW subfield indicates 40 MHz, the mapping of the RU index to RU is defined in Table 27-9 in increasing order.

If the UL BW subfield indicates 80 MHz, 160 MHz, or 80+80 MHz, the mapping of the RU index to RU is defined in Table 27-10 in increasing order.

If the UL BW subfield indicates 160 MHz or 80+80 MHz, B7–B1 of the RU Allocation subfield is set to 68 and B0 is set to 1 to indicate a 2×996-tone RU. A non-AP STA ignores B0 for 2×996-tone RU indication.

If the AID12 subfield is in the range 1 to 2007, then the RU Allocation subfield indicates the RU allocated to the STA identified by the AID12 subfield. If the AID12 subfield is 0 or 2045, then the RU Allocation subfield indicates the starting RU of one or more contiguous RA-RUs allocated by the User Info field. If the AID12 subfield is 2046, then the RU Allocation subfield indicates an unallocated RU.

If there is more than one RA-RU (i.e., the Number Of RA-RU subfield of this User Info field has a value greater than 0), then the allocated RUs are contiguous and the RU sizes of all RA-RUs are the same and

Table 9-53—B7–B1 of the RU Allocation subfield

B7–B1 of the RU Allocation subfield	UL BW subfield	RU size	RU Index
0–8	20 MHz, 40 MHz, 80 MHz, 80+80 MHz or 160 MHz	26	RU1 to RU9, respectively
9–17	40 MHz, 80 MHz, 80+80 MHz or 160 MHz		RU10 to RU18, respectively
18–36	80 MHz, 80+80 MHz or 160 MHz		RU19 to RU37, respectively
37–40	20 MHz, 40 MHz, 80 MHz, 80+80 MHz or 160 MHz	52	RU1 to RU4, respectively
41–44	40 MHz, 80 MHz, 80+80 MHz or 160 MHz		RU5 to RU8, respectively
45–52	80 MHz, 80+80 MHz or 160 MHz		RU9 to RU16, respectively
53, 54	20 MHz, 40 MHz, 80 MHz, 80+80 MHz or 160 MHz	106	RU1 and RU2, respectively
55, 56	40 MHz, 80 MHz, 80+80 MHz or 160 MHz		RU3 and RU4, respectively
57–60	80 MHz, 80+80 MHz or 160 MHz		RU5 to RU8, respectively
61	20 MHz, 40 MHz, 80 MHz, 80+80 MHz or 160 MHz	242	RU1
62	40 MHz, 80 MHz, 80+80 MHz or 160 MHz		RU2
63, 64	80 MHz, 80+80 MHz or 160 MHz		RU3 and RU4, respectively
65	40 MHz, 80 MHz, 80+80 MHz or 160 MHz	484	RU1
66	80 MHz, 80+80 MHz or 160 MHz		RU2
67	80 MHz, 80+80 MHz or 160 MHz	996	RU1
68	80+80 MHz or 160 MHz	2×996	RU1

NOTE—If the UL BW subfield indicates 80+80 MHz or 160 MHz, the description indicates the RU index for the primary 80 MHz channel or secondary 80 MHz channel as indicated by B0 of the RU Allocation subfield.

equal to the size of the first RU. Further, all the remaining subfields of the User Info field apply to all the RA-RUs.

The UL FEC Coding Type subfield of the User Info field indicates the code type of the solicited HE TB PPDU. The UL FEC Coding Type subfield is set to 0 to indicate BCC and set to 1 to indicate LDPC.

The UL HE-MCS subfield of the User Info field indicates the HE-MCS of the solicited HE TB PPDU. The encoding of the UL HE-MCS subfield is defined in 27.3.7.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The UL DCM subfield of the User Info field indicates DCM of the solicited HE TB PPDU. The UL DCM subfield is set to 1 to indicate that DCM is used in the solicited HE TB PPDU as defined in 27.3.12.15. The UL DCM subfield is set to 0 to indicate that DCM is not used. The UL DCM subfield is set to 0 if the UL STBC subfield of the Common Info field is set to 1.

If the AID12 subfield is either 0 or 2045, then B26–B31 of the User Info field is the RA-RU Information subfield; otherwise, B26–B31 of the User Info field is the SS Allocation subfield.

The SS Allocation subfield of the User Info field indicates the spatial streams of the solicited HE TB PPDU and the format is defined in Figure 9-94.

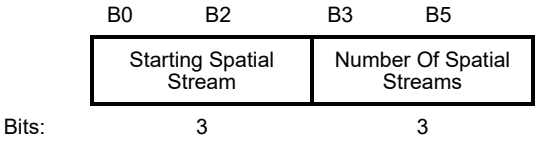

Figure 9-94—SS Allocation subfield format

The Starting Spatial Stream subfield indicates the starting spatial stream and is set to the starting spatial stream minus 1 (see 26.5.2.3.3).

The Number Of Spatial Streams subfield indicates the number of spatial streams, and is set to the number of spatial streams minus 1.

The RA-RU Information subfield of the User Info field indicates the RA-RU information and the format is defined in Figure 9-95.

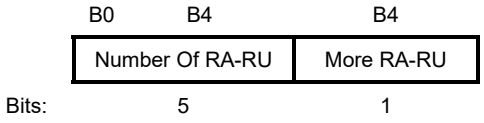

Figure 9-95—RA-RU Information subfield format

The Number Of RA-RU subfield indicates the number of contiguous RUs allocated for UORA. The value of the Number Of RA-RU subfield is equal to the number of contiguous RA-RUs minus 1.

NOTE—The starting spatial stream and the number of spatial streams of the HE TB PPDU transmitted on each RA-RU are 1.

The More RA-RU subfield is set to 1 to indicate that RA-RUs of the type indicated by the AID12 subfield in this User Info field (see Table 9-52) are allocated in subsequent Trigger frames that are sent until the end of the TWT SP in which the Trigger frame carrying this field is sent. Otherwise, the subfield is set to 0. The More RA-RU subfield is reserved if the More TF field in the Common Info field is set to 0.

The UL Target Receive Power subfield indicates the expected receive signal power, measured at the AP's antenna connector and averaged over the antennas, for the HE portion of the HE TB PPDU transmitted on the assigned RU and is defined in Table 9-54.

Table 9-54—UL Target Receive Power subfield in Trigger frame

UL Target Receive Power subfield	Description
0–90	The expected receive signal power, in units of dBm, is $Target_{pwr} = -110 + F_{val}$, where F_{val} is the subfield value
91–126	Reserved
127	The STA transmits the HE TB PPDU at the STA's maximum transmit power for the assigned HE-MCS. If the Trigger frame is a Sounding or Passive Sounding Ranging Trigger frame that does not assign an HE-MCS, then the STA's transmit power is that used for HE-MCS 0. If the Trigger frame is a Secured Sounding Ranging Trigger frame that does not assign an HE-MCS, the assigned HE-MCS is assumed to be HE-MCS 6 in terms of setting the STA's transmit power. NOTE—The expected receive signal power is then the STA's maximum transmit power for the assigned HE-MCS minus the path loss.

The Trigger Dependent User Info subfield in the User Info field is optionally present based on the value of the Trigger Type field (see 9.3.1.22.2 to 9.3.1.22.9).

The Padding field is optionally present in a Trigger frame to extend the frame length to give the recipient STAs enough time to prepare a response for transmission a SIFS after the frame is received. The Padding field, if present, is at least two octets in length and is set to all 1s. If the Padding field is present in a Trigger frame, its length is computed as described in 26.5.2.2.3.

9.3.1.22.2 Basic Trigger frame format

The Trigger Dependent Common Info subfield is not present in the Basic Trigger frame. The Trigger Dependent User Info subfield of the Basic Trigger frame is defined in Figure 9-96.

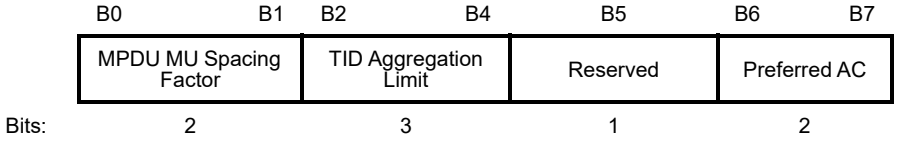

Figure 9-96—Trigger Dependent User Info subfield format in the Basic Trigger frame

The MPDU MU Spacing Factor subfield is used for calculating the value by which the minimum MPDU start spacing is multiplied (see 10.12.3).

The TID Aggregation Limit subfield indicates the MPDUs allowed in an A-MPDU carried in the HE TB PPDU and the maximum number of TIDs that can be aggregated by the STA in the A-MPDU and is set as defined in 26.5.2.2.4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The value in the TID Aggregation Limit subfield in Trigger frame is less than or equal to $MT + 1$, where MT is the value indicated in the Multi-TID Aggregation Tx Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element transmitted by the non-AP STA that is the intended receiver of the User Info field.

The Preferred AC subfield indicates the lowest AC that is recommended for aggregation of MPDUs in the A-MPDU contained in the HE TB PPDU sent as a response to the Trigger frame. The encoding of the Preferred AC subfield is as defined in Table 9-193.

9.3.1.22.3 BFRP Trigger frame format

The Trigger Dependent Common Info subfield is not present in the BFRP Trigger frame. The Trigger Dependent User Info subfield of the BFRP Trigger frame is defined in Figure 9-97.

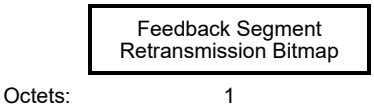

Figure 9-97—Trigger Dependent User Info subfield format in the BFRP Trigger frame

The Feedback Segment Retransmission Bitmap subfield indicates the requested feedback segments of an HE compressed beamforming/CQI report. If the bit in position n ($n = 0$ for LSB and $n = 7$ for MSB) is 1, then the feedback segment with the Remaining Feedback Segments subfield in the HE MIMO Control field equal to n is requested. If the bit in position n is 0, then the feedback segment with the Remaining Feedback Segments subfield in the HE MIMO Control field equal to n is not requested.

9.3.1.22.4 MU-BAR Trigger frame format

The Trigger Dependent Common Info subfield is not present in the MU-BAR Trigger frame. The Trigger Dependent User Info subfield for the MU-BAR Trigger frame is defined in Figure 9-98.

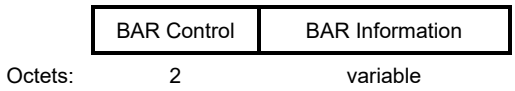

Figure 9-98—Trigger Dependent User Info subfield format in the MU-BAR Trigger frame

The BAR Control subfield is defined in 9.3.1.7 and indicates either a Compressed BlockAckReq variant or a Multi-TID BlockAckReq variant.

The BAR Information subfield is defined in 9.3.1.7.

9.3.1.22.5 MU-RTS Trigger frame format

The Trigger Dependent Common Info subfield and Trigger Dependent User Info subfield are not present in the MU-RTS Trigger frame.

The UL BW subfield in the Common Info field indicates the bandwidth of the PPDU carrying the MU-RTS Trigger frame and is defined in Table 9-48.

The UL Length, GI And HE-LTF Type, MU-MIMO HE-LTF Mode, Number Of HE-LTF Symbols And Midamble Periodicity, UL STBC, LDPC Extra Symbol Segment, AP Tx Power, Pre-FEC Padding Factor,

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

PE Disambiguity, UL Spatial Reuse, Doppler and UL HE-SIG-A2 Reserved subfields in the Common Info field are reserved.

The UL HE-MCS, UL FEC Coding Type, UL DCM, SS Allocation/RA-RU Information and UL Target Receive Power fields in the User Info field are reserved.

The RU Allocation subfield in the User Info field addressed to the STA indicates whether the CTS frame is transmitted on the primary 20 MHz channel, primary 40 MHz channel, primary 80 MHz channel, 160 MHz channel, or 80+80 MHz channel.

B0 of the RU Allocation subfield is set to 0 to indicate primary 20 MHz channel, primary 40 MHz channel and primary 80 MHz channel. For 160 MHz and 80+80 MHz indication, B0 of the RU Allocation subfield is set to 1. A non-AP STA ignores B0 for 160 MHz and 80+80 MHz indication.

B7–B1 of the RU Allocation subfield is set to indicate the primary 20 MHz channel as follows:

— 61 if the primary 20 MHz channel is the only 20 MHz channel or the lowest frequency 20 MHz channel in the primary 40 MHz channel or primary 80 MHz channel
— 62 if the primary 20 MHz channel is the second lowest frequency 20 MHz channel in the primary 40 MHz channel or primary 80 MHz channel
— 63 if the primary 20 MHz channel is the third lowest frequency 20 MHz channel in the primary 80 MHz channel
— 64 if the primary 20 MHz channel is the fourth lowest frequency 20 MHz channel in the primary 80 MHz channel

B7–B1 of the RU Allocation subfield is set to indicate the primary 40 MHz channel as follows:

— 65 if the primary 40 MHz channel is the only 40 MHz channel or the lowest frequency 40 MHz channel in the primary 80 MHz channel
— 66 if the primary 40 MHz channel is the second lowest frequency 40 MHz channel in the primary 80 MHz channel

B7–B1 of the RU Allocation subfield is set to 67 to indicate the primary 80 MHz channel.

B7–B1 of the RU Allocation subfield is set to 68 to indicate the primary and secondary 80 MHz channel.

The settings for B7–B1 of the RU Allocation subfield are illustrated in Figure 9-99.

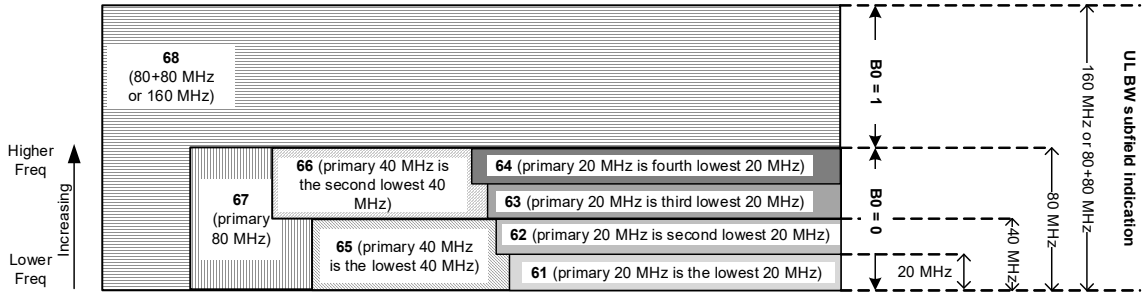

Figure 9-99—UL BW subfield and B7–B1 of RU Allocation subfield in MU-RTS Trigger frame

9.3.1.22.6 BSRP Trigger frame format

The Trigger Dependent Common Info subfield and Trigger Dependent User Info subfield are not present in the BSRP Trigger frame.

9.3.1.22.7 GCR MU-BAR Trigger frame format

The Trigger Dependent Common Info subfield of the GCR MU-BAR Trigger frame is defined in Figure 9-100. The Trigger Dependent User Info subfield is not present in the GCR MU-BAR Trigger frame.

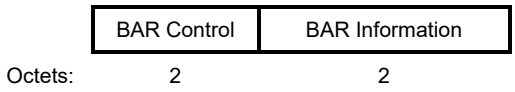

Figure 9-100—Trigger Dependent Common Info subfield format in the GCR MU-BAR Trigger frame

The BAR Control subfield is defined in 9.3.1.7 and indicates a GCR BlockAckReq variant.

The BAR Information subfield is defined in 9.3.1.7.5, except that the GCR Group Address field is not present.

NOTE—A GCR MU-BAR Trigger frame is not a type of MU BAR Trigger frame.

9.3.1.22.8 BQRP Trigger frame format

The Trigger Dependent Common Info subfield and Trigger Dependent User Info subfield are not present in the BQRP Trigger frame.

9.3.1.22.9 NFRP Trigger frame format

The UL BW subfield in the Common Info field indicates the bandwidth of the NDP feedback report response.

The UL STBC, LDPC Extra Symbol Segment, Pre-FEC Padding Factor, PE Disambiguity, UL Spatial Reuse, and Doppler subfields in the Common Info field are reserved.

The Number Of HE-LTF Symbols And Midamble Periodicity subfield in the Common Info field indicates the number of HE-LTF symbols present in the NDP feedback report response and is set to 1.

The GI And HE-LTF Type subfield in the Common Info field is set to 2.

The Trigger Dependent Common Info subfield is not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The User Info field for NFRP Trigger frame is defined in Figure 9-101.

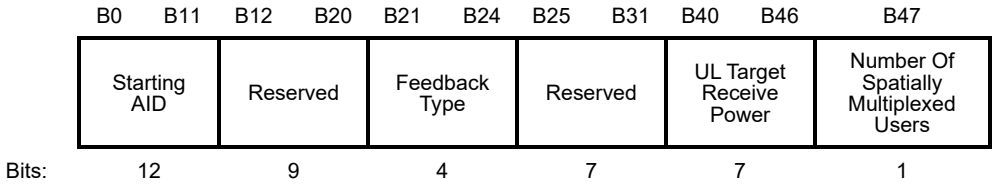

Figure 9-101—User Info field format in the NFRP Trigger frame

The Feedback Type subfield encoding is defined in Table 9-55.

Table 9-55—Feedback Type subfield encoding

Value	Description
0	Resource request
1–15	Reserved

The scheduled non-AP HE STAs are identified by a range of AIDs. The Starting AID field defines the first AID of the range of AIDs that are scheduled to respond to the NFRP Trigger frame.

The UL Target Receive Power subfield indicates the expected receive signal power, measured at the AP's antenna connector and averaged over the antennas, for the HE portion of the HE TB PPDU transmitted on the assigned RU and is defined in Table 9-54.

The Number Of Spatially Multiplexed Users subfield indicates the number of STAs that are multiplexed on the same set of tones in the same RU, and is encoded as the number of STAs minus 1.

The number of STAs, N_{STA}, that are scheduled to respond to the NFRP Trigger frame is calculated using Equation (9-2).

$$N_{STA} = 18 \times 2^{BW} \times (MultiplexingFlag + 1) \quad (9\text{-}2)$$

where BW is the value of the UL BW subfield in the Common Info field of the NFRP Trigger frame, and $MultiplexingFlag$ is the value of the Number Of Spatially Multiplexed Users subfield.

9.3.1.22.10 Ranging Trigger variant

The Ranging Trigger Subtype subfield value in the Trigger Dependent Common Info field of the Ranging Trigger frame, see Table 9-56, signals the Ranging Trigger frame subvariants, which can be one of five frame types: Poll, Sounding, Secure Sounding, Report, and Passive Sounding Ranging Trigger frame.

The format of the Trigger Dependent Common Info subfield for the Poll, Sounding, Secure Sounding, and Report Ranging Trigger frame, is shown in Figure 9-102. The Token field in the Trigger Dependent Common Info subfield is used in a Poll Ranging Trigger frame to match it with the partial TSF time in a following Ranging NDP Announcement frame. It is reserved in all other Ranging Trigger subvariants.

The format of the Trigger Dependent Common Info subfield of Ranging Trigger frame of subvariant Passive Sounding is shown in Figure 9-103. The Sounding Dialog Token Number subfield contains a value in the

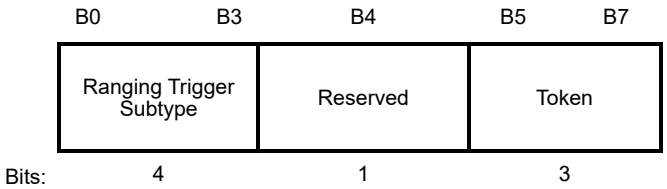

Figure 9-102—Trigger Dependent Common Info subfield format for the Ranging Trigger subvariants Poll, Sounding, Secure Sounding, and Report

range of 0 to 63 which identifies a Measurement Sounding phase (I2RNDP and R2I NDP announced by a Sounding Trigger frame and the Ranging NDP Announcement frame, respectively), and the same value is included in the Sounding Dialog Token field of the Ranging NDP Announcement frame transmitted within the same availability window; see 9.3.1.19.

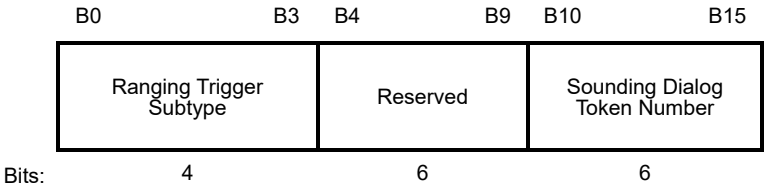

Figure 9-103—Trigger Dependent Common Info subfield format of the Passive Sounding Ranging Trigger frame

The value of the Ranging Trigger Subtype subfield for the Ranging Trigger frame is defined in Table 9-56.

Table 9-56—Ranging Trigger Subtype subfield encoding

Ranging Trigger Subtype subfield value	Ranging Trigger frame subvariant
0	Poll
1	Sounding
2	Secure Sounding
3	Report
4	Passive Sounding
5–15	Reserved

The RA field, and the CS Required and UL BW subfields in the Common Info field of the Ranging Trigger frame are identical to the Basic Trigger frame described in 26.5.2 and 9.3.1.22, except that the RA field in Ranging Trigger frames with only one User Info field is either an individual address or the broadcast address.

The More TF subfield of the Common Info field of the Ranging Trigger frame indicates whether a subsequent Poll Ranging Trigger is scheduled for transmission within the availability window as defined in 11.21.6.4.3.

When a Ranging Trigger frame is addressed to ISTAs that all have a TB ranging measurement exchange, see 11.21.6.4.3, with the same RSTA's BSSID, the TA field of the Ranging Trigger frame is set to the RSTA's address. The TA field is set to the transmitted BSSID, if the Trigger frame is addressed to a set of ISTAs in which at least two ISTAs have a TB ranging measurement exchange with different BSSIDs in the Multiple BSSID set of the RSTA.

9.3.1.23 Subvariants of Ranging Trigger variant

9.3.1.23.1 Poll subvariant

The format of the User Info field in the Poll Ranging Trigger frame is defined in Figure 9-104.

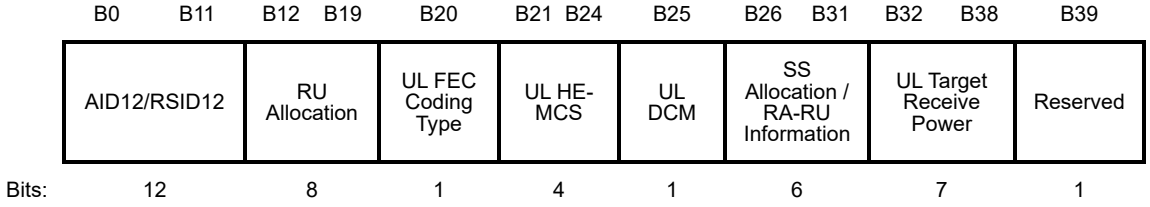

Figure 9-104—User Info field format for the Poll and Report Ranging Trigger

The AID12/RSID12 subfield carries either the 12 LSBs of the AID for an associated ISTA or the 12 LSBs of the RSID for an unassociated ISTA. The RU Allocation, UL FEC Coding Type, UL HE-MCS, UL DCM, SS Allocation/RA-RU Information, UL Target Receive Power subfields are identical to the corresponding subfield in the Basic Trigger frame; see 9.3.1.22.

The Trigger Dependent User Info subfield is not present in the Poll Ranging Trigger frame.

9.3.1.23.2 Sounding subvariant

The format of the User Info field in the Sounding Ranging Trigger frame is defined in Figure 9-105.

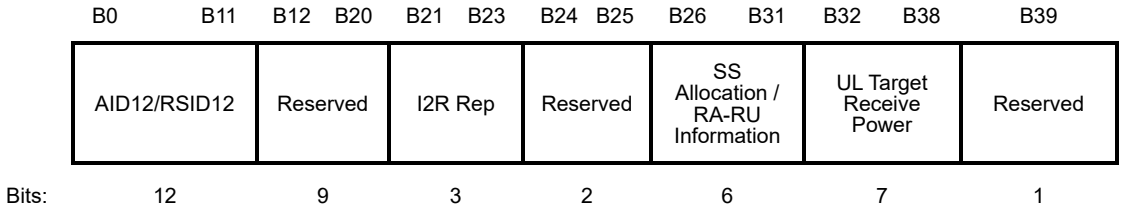

Figure 9-105—User Info field format for Sounding subvariant

The Trigger Dependent User Info subfield is not present in the Sounding Ranging Trigger frame.

The AID12/RSID12 subfield is identical to the corresponding subfield in the Poll Ranging Trigger frame.

The I2R Rep subfield indicates the number of HE-LTF repetitions in the corresponding HE TB Ranging NDP from the STA indicated in the AID12/RSID12 subfield; the I2R Rep subfield is set to the number of HE-LTF repetitions minus 1. The value of the I2R Rep subfield is the same in all User Info fields in a single Trigger frame. The SS Allocation/RA-RU Information and UL Target Receive Power subfields are identical to the corresponding subfields in the Basic Trigger frame; see 9.3.1.22.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In the Common Info field, the UL STBC, LDPC Extra Symbol Segment, Pre-FEC Padding Factor, and PE Disambiguity subfields are reserved.

The GI And HE-LTF Type subfield in the Common Info field is set to 1 (2x HE-LTF + 1.6 μs GI). The MU-MIMO HE-LTF Mode subfield in the Common Info field is set to 0 (HE single stream pilot HE-LTF mode).

The Doppler subfield in the Common Info field is set to 0.

NOTE—The UL Length subfield of a Trigger frame is computed using Equation (27-11) (see 26.5.2.2.4), which is based on the TXTIME computed in 27.4.3. In case of Sounding Ranging Trigger frame, the resulting UL Length value is equivalent to $13 + 6 \times N_{LTF\_REP} \times N_{HE\text{-}LTF}$, where $N_{LTF\text{-}REP}$ is the number of HE-LTF repetitions (given by the I2R Rep subfield value plus 1) and $N_{HE\text{-}LTF}$ is the number of HE-LTF symbols (given by the Number Of HE-LTF Symbols And Midamble Periodicity subfield).

9.3.1.23.3 Secure sounding subvariant

The format of the User Info field in the Secure Sounding Ranging Trigger is defined in Figure 9-106. There is a single User Info field in a Secure Sounding Ranging Trigger frame.

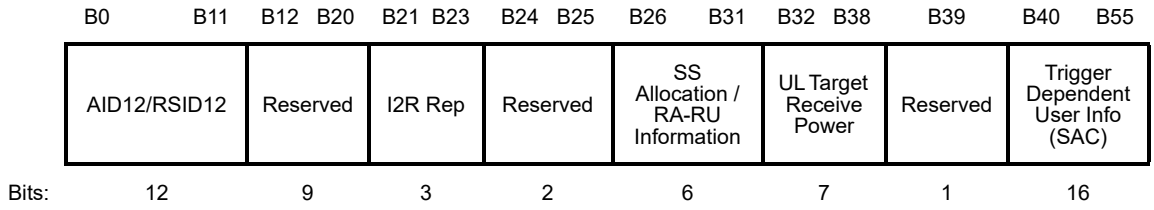

Figure 9-106—User Info field for Secure Sounding subvariant

The AID12/RSID12 subfield is identical to the corresponding subfield in the Poll Ranging Trigger frame.

The I2R Rep subfield is identical to the corresponding subfield in the Sounding Ranging Trigger frame.

The SS Allocation/RA-RU Information and UL Target Receive Power subfields are identical to the corresponding subfields in the Basic Trigger frame; see 9.3.1.22.

The Trigger Dependent User Info subfield is present in the Secure Sounding Ranging Trigger frame. The Trigger Dependent User Info subfield carries the Sequence Authentication Code (SAC) field. The SAC subfield provides the authentication information for the LTF Sequence Generation information used for the I2R sounding associated with the measurement instance; see 11.21.6.4.5. The length of this subfield is 16 bits.

NOTE—For measurement exchange with secure HE-LTF, the I2R Rep is set to the RSTA Assigned I2R Rep; see 11.21.6.3.4.

In the Common Info field, the MU-MIMO HE-LTF Mode, UL STBC, LDPC Extra Symbol Segment, Pre-FEC Padding Factor, and PE Disambiguity subfields are reserved. The GI And HE-LTF Type and Doppler subfields in the Common Info field are set as in the Sounding Ranging Trigger frame.

9.3.1.23.4 Report subvariant

The format of the User Info field in the Report Ranging Trigger frame is defined in Figure 9-104 and the subfields of the User Info field are identical to the corresponding subfields in the Poll Ranging Trigger frame.

The Trigger Dependent User Info subfield is not present in the Report Ranging Trigger frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.3.1.23.5 Passive sounding subvariant

The Passive Sounding Ranging Trigger frame follows the definition of the Sounding Ranging Trigger frame except that the RA field is always set to the broadcast address. There is a single User Info field in a Passive Sounding Ranging Trigger frame.

9.3.1.24 Sector Ack frame format

The frame format for the Sector Ack frame is defined in Figure 9-107.

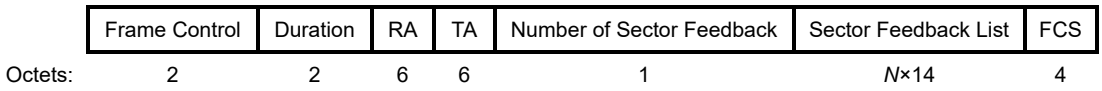

Figure 9-107—Sector Ack frame format

The Duration field is set to the time until the end of the current beamforming training allocation (see 10.41.10.3.3).

If the value of the Number of Sector Feedback field is 1, the RA field contains the MAC address of the STA that is the intended destination of the Sector Ack frame. If the value of the Number of Sector Feedback field is greater than 1, the RA field is set to the broadcast address.

The TA field contains the MAC address of the STA transmitting the Sector Ack frame.

The Number of Sector Feedback field indicates the number, *N*, of Sector Feedback fields within the Sector Feedback List field.

The Sector Feedback List field contains *N* Sector Feedback fields as defined in 9.5.9.

9.3.1.25 Block Ack Schedule frame format

The frame format for the Block Ack Schedule frame is defined in Figure 9-108.

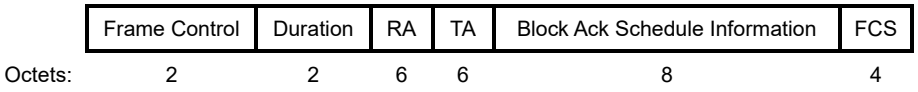

Figure 9-108—Block Ack Schedule frame format

The Duration field is set to the time until the end of the TXOP or SP.

The RA field contains the MAC address of the STA that is the intended receiver of the Block Ack Schedule frame.

The TA field contains the MAC address of the STA transmitting the Block Ack Schedule frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Block Ack Schedule Information field is defined in Figure 9-109.

	B0 B15	B16 B31	B32 B47	B48 B51	B52 B53	B54 B63
	Response Offset	Response Duration	Next PPDU Start offset	TID Aggregation Limit	Preferred AC	Reserved
Bits:	16	16	16	4	2	10

Figure 9-109—Block Ack Schedule Information field format

The Response Offset subfield indicates the offset, in units of 1 μs, from the end of transmitted PPDU to the time when the response is expected to be transmitted by the intended responder.

The Response Duration subfield indicates the maximum duration of the responder transmission in units of 1 μs.

The Next PPDU Start Offset subfield indicates the offset, in units of 1 μs, from the end of the transmitted PPDU to when the initiator is expected to start transmitting its next PPDU. If the transmitter does not intend to transmit its next PPDU to a responder, the Next PPDU Start Offset field is set to 0.

If the EDMG Multi-TID Aggregation Support subfield is greater than 0 in the STA's EDMG Capabilities element, the TID Aggregation Limit subfield indicates the maximum number of TIDs that can be aggregated in an A-MPDU by the RD responder as part of an RDG. Otherwise, the TID Aggregation Limit subfield is reserved.

If the EDMG Multi-TID Aggregation Support subfield is greater than 0 in the EDMG Capabilities element of the STA that is transmitting this element, the Preferred AC subfield indicates the lowest priority AC for aggregation of MPDUs in an A-MPDU sent as part of an RDG. Otherwise, the Preferred AC subfield is reserved. The Preferred AC subfield is reserved if the AC Constraint subfield is equal to 0. The Preferred AC subfield is encoded as the AC index (ACI) defined in Table 9-193.

9.3.1.26 TDD Beamforming frame format

9.3.1.26.1 Overview

The frame format for the TDD Beamforming frame is defined in Figure 9-110.

	Frame Control	Duration	RA	TA	TDD Beamforming Control	TDD Beamforming Information	FCS
Octets:	2	2	6	6	1	variable	4

Figure 9-110—TDD Beamforming frame format

The Duration field is set to the time until the end of the current TDD slot.

The RA field is set to the MAC address of the intended receiver of the TDD Beamforming frame, or to the broadcast address when the intended receiver MAC address is unknown or there is more than one intended receiver.

The TA field is set to the MAC address of the transmitter STA of the TDD Beamforming frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The TDD Beamforming Control field is defined as shown in Figure 9-111.

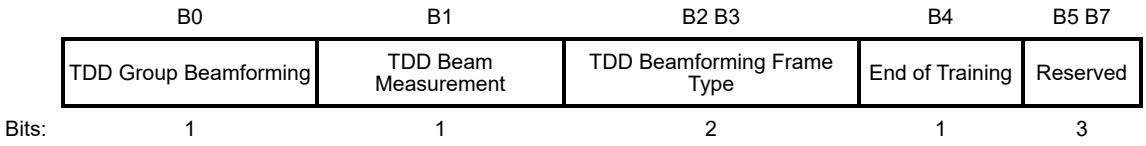

Figure 9-111—TDD Beamforming Control field format

Collectively, the TDD Group Beamforming, TDD Beam Measurement, and RA field values indicate a TDD Beamforming frame usage, as listed in Table 9-57.

Table 9-57—TDD Beamforming frame usage

TDD Group Beamforming field value	TDD Beam Measurement field value	RA field value	Beamforming procedure
0	0	Individual address	TDD individual BF with a known STA
0	0	Broadcast address	TDD individual BF with an unknown STA
0	1	Individual address	TDD beam measurement with a known STA
0	1	Broadcast address	TDD beam measurement with all neighboring STAs
1	0	Individual address	Reserved
1	0	Broadcast address	TDD group BF with two or more STAs
1	1	Individual address	Reserved
1	1	Broadcast address	Reserved

The TDD Beamforming Frame Type subfield is defined as shown in Table 9-58.

The End of Training subfield is set as follows:

— The End of Training subfield is set to 1 in a TDD SSW frame to indicate that the initiator intends to end the TDD individual beamforming training or the TDD beam measurement after the transmission of the remaining TDD SSW frames with the current Sector ID; this subfield is set to 0 otherwise.

— The End of Training subfield is set to 1 in a TDD SSW Feedback frame sent as part of a TDD individual beamforming training if the TDD SSW Feedback frame is sent in response to a TDD SSW frame in which its End of Training subfield was set to 1; this subfield is set to 0 otherwise.

— The End of Training subfield is set to 1 in a TDD SSW Ack frame to indicate that the TDD individual beamforming training has completed; otherwise, this subfield is set to 0.

For TDD group BF, the End of Training subfield is reserved.

Table 9-58—TDD Beamforming Frame Type subfield definition

Value	Meaning
0	TDD SSW (Sector Sweep). The TDD Beamforming Frame Type subfield is set to this value to indicate a TDD SSW frame (see 10.41.11).
1	TDD SSW Feedback. The TDD Beamforming Frame Type subfield is set to this value to indicate a TDD SSW Feedback frame (see 10.41.11).
2	TDD SSW Ack. The TDD Beamforming Frame Type subfield is set to this value to indicate a TDD SSW Ack frame (see 10.41.11).
3	Reserved

The definition of the TDD Beamforming Information field depends on the type of frame indicated by the TDD Beamforming Frame Type subfield and is specified in 9.3.1.26.2, 9.3.1.26.3, and 9.3.1.26.4.

The length of the TDD Beamforming Information field is 6 octets when the TDD Group Beamforming subfield is 0 and is $5 + 4 \times R$ octets otherwise, where R is the number of target responders. The length of the TDD Beamforming Information field does not change during TDD group BF, even after beamforming training with one or more of target responders has completed. For the target responder that has completed beamforming training, the corresponding Responder Info subfield that has the Responder Info Valid subfield equal to 0 is reserved.

9.3.1.26.2 TDD SSW frame

The TDD Beamforming Information field of a TDD SSW frame when TDD individual BF is used is shown in Figure 9-112. The TDD Beamforming Information field of a TDD SSW frame when TDD group BF is used is shown in Figure 9-113. The TDD Beamforming Information field of a TDD SSW frame when TDD beam measurement is used is shown in Figure 9-114.

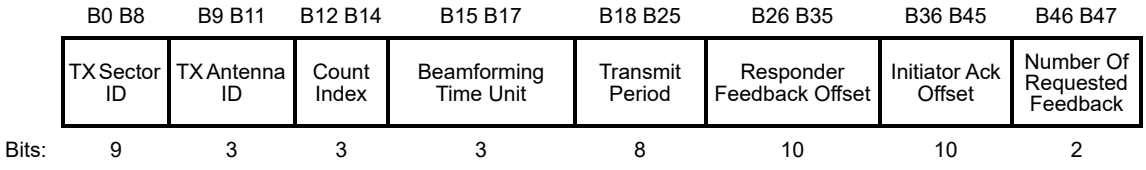

Figure 9-112—TDD Beamforming Information field format (TDD individual BF)

	B0 B8	B9 B11	B12 B14	B15 B17	B18 B25	B26 B35	B36	B37 B47
	TX Sector ID	TX Antenna ID	Count Index	Beamforming Time Unit	Transmit Period	TDD Slot CDOWN	Feedback Requested	Reserved
Bits:	9	3	3	3	8	10	1	11

Figure 9-114—TDD Beamforming Information field format (TDD beam measurement)

The TX Sector ID subfield is set to indicate the antenna sector through which the TDD SSW frame is transmitted.

NOTE—The size of sector ID fields in TDD beamforming frames are smaller than EDMG beamforming frames.

The TX Antenna ID subfield indicates the DMG antenna ID through which the TDD SSW frame is transmitted.

The Count Index subfield indicates the index of TDD Beamforming frames transmitted by the initiator within a TDD slot, with the subfield set to 0 for the first transmission and increased by one for each successive transmission within a TDD slot.

The Beamforming Time Unit (BTU) subfield is defined in Table 9-59. The BTU subfield indicates the beamforming time unit for the Transmit Period, Responder Feedback Offset and Initiator Ack Offset subfields in the TDD Beamforming Information field of TDD SSW frames. The BTU subfield also defines the time unit for the Transmit Period, Initiator Transmit Offset and Responder Transmit Offset subfields in the TDD Beamforming Information field of TDD SSW Ack frames.

Table 9-59—Beamforming Time Unit subfield

Value	Time unit
0	1 μs
1	100 μs
2	400 μs
3–7	Reserved

The Transmit Period subfield indicates the time interval, in units of BTUs, between TDD SSW transmissions with the same Count Index subfield value in different TDD slots. If the Transmit Period Offset subfield is 0, the transmission periodicity is unknown.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Responder Feedback Offset subfield indicates the offset, in units of BTUs, from the beginning of the first TDD SSW frame in a TDD slot to when the first TDD SSW Feedback frame is to be transmitted by the responder. This subfield is reserved when the TDD SSW frame is transmitted exclusively for TDD beam measurement.

The Initiator Ack Offset subfield indicates the offset, in units of BTUs, from the beginning of the first TDD SSW frame in a TDD slot to when the first TDD SSW Ack frame is to be transmitted by the initiator. This subfield is reserved when the TDD SSW frame is transmitted exclusively for TDD beam measurement.

The Number Of Requested Feedback subfield indicates the number of TDD SSW Feedback frames the responder is required to transmit in response. Value of 0 indicates one frame to be sent, value of 1 indicates two frames and so on.

The Ack Count Index subfield indicates the number of the TDD SSW Ack frames that have been sent before the current TDD SSW frame within the same TDD slot. The Ack Count Index subfield is set to 0 if no TDD SSW Ack frame is transmitted before the current TDD SSW frame in the same TDD slot, and increases by one for each transmission of a TDD SSW Ack frame within the same TDD slot.

The Number of Responders subfield indicates the number of responders, *N*, with which the initiator intends to do TDD beamforming.

The Responder Info List subfield contains *N* Responder Info subfields. Each Responder Info subfield is defined in Figure 9-115.

	B0 B9	B10 B19	B20 B29	B30	B31
	Responder ID	Responder Feedback Offset	Initiator Ack Offset	End of Training	Responder Info Valid
Bits:	10	10	10	1	1

Figure 9-115—Responder Info subfield format

The Responder ID subfield indicates the ID of the responder. The content of this subfield is derived from the responder's MAC address, based on the scheme in 10.41.11.4.

The Responder Feedback Offset subfield and the Initiator Ack Offset subfield are as defined above in this subclause.

The End of Training subfield set to 1 in the Responder Info subfield of a TDD SSW frame for TDD Group beamforming training indicates that the initiator intends to end the TDD beamforming training with the corresponding responder after the transmission of the remaining TDD SSW frames with the current Sector ID; this subfield is set to 0 otherwise.

The Responder Info Valid subfield is set to 1 to indicate that the Responder Info subfield values are valid and is set to 0 otherwise.

The TDD Slot CDOWN subfield is a down counter indicating the number of remaining TDD SP slots to the end of the TDD beam measurement. This subfield is set to 0 in the last TDD SSW frame transmission.

The Feedback Requested subfield set to 1 requests that the responder(s) send a TDD Route element to the initiator as a feedback to the TDD beam measurement.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.3.1.26.3 TDD SSW Feedback frame

The TDD Beamforming Information field of a TDD SSW Feedback frame is shown in Figure 9-116.

	B0 B8	B9 B11	B12 B20	B21 B23	B24 B31	B32 B33	B34 B47
	TX Sector ID	TX Antenna ID	Decoded TX Sector ID	Decoded TX Antenna ID	SNR Report	Feedback Count Index	Reserved
Bits:	9	3	9	3	8	2	14

Figure 9-116—TDD Beamforming Information field format

The TX Sector ID subfield is set to indicate the sector through which the TDD SSW Feedback frame is transmitted.

The TX Antenna ID subfield indicates the DMG antenna ID through which the TDD SSW Feedback frame is transmitted.

The Decoded TX Sector ID subfield contains the value of the TX Sector ID subfield from the TDD SSW frame that the feedback frame is sent in response to and that the TDD SSW frame was received from the initiator with the best quality.

The Decoded TX Antenna ID subfield contains the value of the TX Antenna ID subfield from the TDD SSW frame that the feedback frame is sent in response to and that was received with the best quality.

The SNR Report subfield is set to the value of the SNR achieved while decoding the TDD SSW frame received with the best quality and which is indicated in the Decoded TX Sector ID subfield. The value of the SNR Report subfield is referenced to a level of –8 dB. Each step is 0.25 dB. SNR values less than or equal to –8 dB are represented as 0. SNR values greater than or equal to 55.75 dB are represented as 0xFF.

The Feedback Count Index subfield is counter indicating the index of the TDD SSW Feedback frame transmission during a TDD slot. Value 0 is used in the first transmitted TDD SSW Feedback frame and this subfield value is increased by 1 for each subsequent transmitted frame.

9.3.1.26.4 TDD SSW Ack frame

The TDD Beamforming Information field of a TDD SSW Ack frame when TDD individual BF is used is shown in Figure 9-117. The TDD Beamforming Information field of a TDD SSW Ack frame when TDD group BF is used is shown in Figure 9-118.

	B0 B8	B9 B11	B12 B14	B15 B22	B23 B30	B31 B38	B39 B46	B47
	Decoded TX Sector ID	Decoded TX Antenna ID	Count Index	Transmit Period	SNR Report	Initiator Transmit Offset	Responder Transmit Offset	Reserved
Bits:	9	3	3	8	8	8	8	1

Figure 9-117—TDD Beamforming Information field format (TDD individual BF)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

	B0 B8	B9 B11	B12 B14	B15 B22	B23 B30	B31 B38	B39 B46	B47 B49	B50 B55
	Decoded TX Sector ID	Decoded TX Antenna ID	Count Index	Transmit Period	SNR Report	Initiator Transmit Offset	Responder Transmit Offset	Ack Count Index	Reserved
Bits:	9	3	3	8	8	8	8	3	6

Figure 9-118—TDD Beamforming Information field format (TDD group BF)

The Decoded TX Sector ID subfield contains the value of the TX Sector ID subfield from the TDD SSW Feedback frame that was received from the responder.

The Decoded TX Antenna ID subfield contains the value of the TX Antenna ID subfield from the TDD SSW Feedback frame that was received from the responder.

The Count Index subfield indicates the index of the TDD Beamforming frame transmitted by the initiator within a TDD slot, with the subfield set to 0 for the first frame transmission and increased by one for each successive frame transmission within a TDD slot.

The Transmit Period subfield is reserved when the End of Training subfield in the TDD SSW Ack frame is 0. Otherwise, it indicates the interval, in units of BTUs, between successive transmit opportunities for the initiator to transmit frames other than TDD Beamforming frames to the responder, and also between successive transmit opportunities for the responder to transmit frames other than TDD Beamforming frames to the initiator, after completion of the unscheduled beamforming procedure, as defined in 10.41.11.

The SNR Report subfield is set to the value of the SNR achieved while decoding the TDD SSW Feedback frame. The value of the SNR Report subfield is referenced to a level of –8 dB. Each step is 0.25 dB. SNR values less than or equal to –8 dB are represented as 0. SNR values greater than or equal to 55.75 dB are represented as 0xFF.

The Initiator Transmit Offset subfield is reserved when the End of Training subfield in the TDD SSW Ack frame is 0. Otherwise, it indicates the offset, in units of BTUs, from the beginning of the first TDD Beamforming frame that is sent in the same TDD slot as the TDD SSW Ack frame (which can be the TDD SSW Ack frame itself), to the first transmit opportunity for the initiator to transmit a frame other than a TDD beamforming frame (i.e., a non-beamforming frame) to the responder. The Initiator Transmit Offset subfield is set to 0 to indicate that the initiator will transmit non-beamforming frames to the responder according to a TDD slot schedule available to the initiator and the responder.

The Responder Transmit Offset subfield is reserved when the End of Training subfield in the TDD SSW Ack frame is 0. Otherwise, it indicates the offset, in units of BTUs, from the beginning of the first TDD Beamforming frame that is sent in the same TDD slot as the TDD SSW Ack frame (which can be the TDD SSW Ack frame itself), to the first transmit opportunity for the responder to transmit a frame other than a TDD beamforming frame (i.e., a non-beamforming frame) to the initiator. The Responder Transmit Offset subfield is set to 0 to indicate that the responder will transmit non-beamforming frames to the initiator according to a TDD slot schedule available to the responder and the initiator.

The Ack Count Index subfield indicates the number of the TDD SSW Ack frames that have been sent before the current TDD SSW Ack frame within the same TDD slot. The Ack Count Index subfield is set to 0 if no TDD SSW Ack frame is transmitted before the current TDD SSW Ack frame in the same TDD slot, and increases by one for each transmission of a TDD SSW Ack frame within the same TDD slot.

9.3.2 Data frames

9.3.2.1 Format of Data frames

9.3.2.1.1 General

The format of a Data frame is defined in Figure 9-119. The Frame Control, Duration, Address 1, Address 2, Address 3, and Sequence Control fields are present in all data frame subtypes. The presence of the Address 4 field is determined by the setting of the To DS and From DS subfields of the Frame Control field (see below). The presence of the QoS Control field is determined by the setting of the QoS subfield of the Subtype subfield (see 9.2.4.1.3 of the Frame Control field. The presence of the HT Control field is determined by the setting of the +HTC subfield of the Frame Control field (see 9.2.4.1.10).

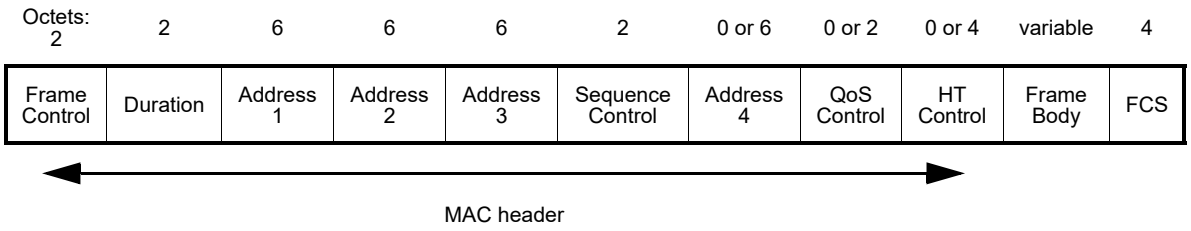

Figure 9-119—Data frame format

NOTE 1—The maximum frame body size shown in Figure 9-119 is for GCMP encryption of a maximum-size A-MSDU (note that TKIP encryption is not allowed in this case and any Mesh Control fields are part of the A-MSDU subframes). The corresponding maximum for CCMP encryption is 7951 octets. The maximum frame body size if A-MSDUs are not used is 2346 octets for GCMP encryption of a maximum-size MSDU, 2338 octets for CCMP encryption of a maximum-size MSDU and 2342 octets for TKIP encryption of a maximum-size MSDU, including in both cases an 18-octet Mesh Control field. The frame body size might in all cases be greater if a vendor-specific cipher suite is used.

Data frames with the QoS subfield of the Subtype subfield (see 9.2.4.1.3) set to 1 contain *QoS* in their names and contain a QoS Control field in the MAC header. Depending on the context, *QoS Data frame* either refers to any such frame, or refers specifically to the Data frame with subtype 1000. References nearby to other specific Data frames with *QoS* in their name (e.g., QoS Null or QoS Data +CF-Poll) typically suggest the latter interpretation. A STA sets the QoS subfield as defined in 10.2.3.1.

9.3.2.1.2 Address and BSSID fields

The content of the address fields of Data frames is dependent upon the values of the To DS and From DS subfields in the Frame Control field and whether the Frame Body field contains either an MSDU (or fragment thereof) or an A-MSDU (or fragment thereof), as determined by the A-MSDU Present subfield of the QoS Control field (see 9.2.4.5.9). The content of the address fields transmitted by nonmesh STAs is defined in Table 9-60. The content of the address fields transmitted by mesh STAs is defined in 9.3.5, and the content of the fields transmitted by GLK STAs is defined in 10.64. Where the content of a field is shown as not applicable (N/A), the field is omitted. Note that Address 1 always holds the receiver address of the intended receiver (or, in the case of group addressed frames, receivers) and that Address 2 always holds the address of the STA that is transmitting the frame. Note also that the address fields can be referred to by their contents, e.g., the Address 1 field can be referred to as the RA field and the Address 3 field for a Data frame transmitted by a nonmesh non-GLK STA with To DS and From DS subfields equal to 0 can be referred to as the BSSID field.

A STA uses the contents of the Address 2 field to direct the acknowledgment if an acknowledgment is necessary.

Table 9-60—Address field contents for Data frames transmitted by nonmesh STAs

To DS	From DS	Address 1	Address 2	Address 3		Address 4	
				MSDU and Short A-MSDU case	Basic A-MSDU and Dynamic A-MSDU case	MSDU and Short A-MSDU case	Basic A-MSDU and Dynamic A-MSDU case
0	0	RA = DA	TA = SA	BSSID	BSSID	N/A	N/A
0	1	RA (see NOTE 1)	TA = BSSID	SA	BSSID	N/A	N/A
1	0	RA = BSSID	TA (see NOTE 2)	DA	BSSID	N/A	N/A
1	1	RA	TA	DA	BSSID	SA	BSSID

NOTE 1—The Address 1 field of a frame with the To DS subfield equal to 0 and the From DS subfield equal to 1 is equal to the DA, except when a frame containing an A-MSDU is used (for DMS, DMG relay or S1G relay the frame is individually addressed; for GCR, it is (group) addressed to the GCR concealment address), in which case the destination address of the MSDU is indicated in the DA or Mesh DA field of the A-MSDU subframe (see 11.21.16, 10.11, 10.44, 10.53, and 10.64). In an MBSS, this is the only combination used for group addressed Data frames, and a combination only used for group addressed Data frames (see Table 9-3, Table 9-4, and Table 9-77).

NOTE 2—The Address 2 field of a frame with the To DS subfield equal to 1 and the From DS subfield equal to 0 is equal to the SA, except when an individually addressed frame containing an A-MSDU is used in GLK, DMG relay or S1G relay, in which case the source address of the MSDU is indicated in the SA or Mesh SA field of the A-MSDU subframe (see 10.11, 10.44, 10.53, and 10.64). In an MBSS, this combination is not used for Data frames (see Table 9-3 and Table 9-77).

The DA field contains the destination of the MSDU (or fragment thereof) or A-MSDU (or fragment thereof) in the Frame Body field.

NOTE 1—A SYNRA is never the DA. When a GLK AP uses a SYNRA as the RA, the actual DA is carried in another field. See 10.64.

The SA field contains the address of the MAC entity that initiated the MSDU (or fragment thereof) or A-MSDU (or fragment thereof) in the Frame Body field.

When a Data frame carries an MSDU (or fragment thereof), the DA and SA related to that MSDU are carried in the Address 1, Address 2, Address 3, and Address 4 fields (according to the setting of the To DS and From DS subfields) as defined in Table 9-60.

When a Data frame carries a Basic A-MSDU (or fragment thereof), the DA and SA related to each MSDU carried by the A-MSDU are carried within the A-MSDU subframe header. Zero, one, or both of these fields are present in the Address 1 and Address 2 fields as indicated in Table 9-60.

The RA field is the individual address of the STA that is the immediate intended receiver of the frame or the group address of the STAs that are the immediate intended receivers of the frame.

When a GLK Data frame is sent with a four-address MAC header with a group RA, the RA is a SYNRA (see 10.64). A SYNRA is also used when the DA is not known by the corresponding IEEE 802.1Q bridge. The format of the RA field when it carries a SYNRA is shown in Figure 9-120.

NOTE 2—IEEE Std 802 and IEEE Std 802c-2017 define group addresses with a similar format to a SYNRA, but group addresses are DAs in the context of IEEE Std 802.11. Since SYNRAs only occur in the RA field, the similar formats are disambiguated by virtue of being used within an RA or DA.

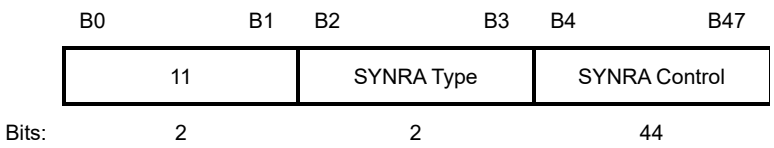

Figure 9-120—Format of an RA field carrying a SYNRA

The SYNRA Type subfield is used to select between multiple possible SYNRA formats. The SYNRA types and the format of the SYNRA Control subfield for each type are listed in Table 9-61.

The SYNRA Control subfield format is specified separately for each SYNRA type, as defined in Table 9-61.

Table 9-61—SYNRA Type field encoding

Value	Description	SYNRA Control subfield format
0	Basic SYNRA	See Figure 9-121.
1–3	Reserved	—

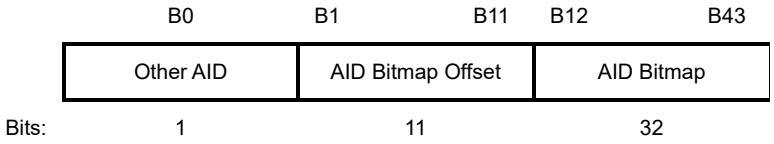

Figure 9-121—Basic SYNRA Control subfield format

The AID Bitmap Offset subfield in a Basic SYNRA Control subfield is used to indicate the starting AID value, which is associated with bit 0 of the AID Bitmap subfield. Its value is multiplied by 4 to find the starting AID value, and it has a value from 0 to 494 for a non-S1G STA, or 0 to 2040 for an S1G STA. Other values are reserved.

NOTE 3—These match the maximum AID values of 2007 (for non-S1G STAs) and 8191 (for S1G STAs).

The AID Bitmap subfield in a Basic SYNRA Control subfield provides the accept/discard indication for a range of 32 consecutive AIDs. B12 to B43 represent AID values in the range AID Bitmap Offset × 4 + 1 to AID Bitmap Offset × 4 + 32, respectively. For each bit in the AID Bitmap subfield, a 1 indicates acceptance, and a 0 indicates discarding.

The Other AID subfield in a Basic SYNRA Control subfield provides the accept/discard indication for AIDs outside the range of values covered by the AID Bitmap subfield. A 1 indicates acceptance, and a 0 indicates discarding.

The TA field is the address of the STA that is transmitting the frame.

The BSSID field of the Data frame is set as follows:

a) If the STA is contained within an AP or is associated with an AP, the BSSID is the address currently in use by the STA contained in the AP.
b) If the STA is an IBSS STA, the BSSID is that selected by the STA that started the IBSS.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

c) If the STA is transmitting a Data frame when dot11OCBActivated is true, the BSSID is the wildcard BSSID.

d) If the STA is a member of an MBSS, the BSSID is the address of the transmitter and is equal to the Data frame's TA.

e) If the STA participates in a PBSS, the BSSID is the address of the STA contained in the PCP.

9.3.2.1.3 Other MAC Header fields

The Sequence Control field is defined in 9.2.4.4.

The QoS Control field is defined in 9.2.4.5. The presence of the QoS Control field is determined by the Subtype subfield of the Frame Control field, as specified in 9.2.4.1.3.

The HT Control field is defined in 9.2.4.6. The presence of the HT Control field is determined by the +HTC subfield of the Frame Control field, as specified in 9.2.4.1.10.

9.3.2.1.4 The frame body

The frame body consists of either of the following:

— The MSDU (or a fragment thereof), the Mesh Control field (present if the frame is transmitted by a mesh STA and the Mesh Control Present subfield of the QoS Control field is 1, otherwise absent), and a security header and trailer (present if the Protected Frame subfield in the Frame Control field is 1, otherwise absent)

— The A-MSDU and a security header and trailer (present if the Protected Frame subfield in the Frame Control field is 1, otherwise absent)

The presence of an A-MSDU in the frame body is indicated by setting the A-MSDU Present subfield of the QoS Control field to 1, as shown in Table 9-10.

For Data frames of subtype Null, QoS Null, QoS CF-Ack, QoS CF-Poll, and QoS CF-Ack +CF-Poll, the Frame Body field is null (i.e., has a length of 0 octets); these subtypes are used for MAC control purposes. For Data frames of subtype Data, the Frame Body field contains all of, or a fragment of, an MSDU after any encapsulation for security. For Data frames of subtypes QoS Data, QoS Data +CF-Ack, QoS Data +CF-Poll, and QoS Data +CF-Ack +CF-Poll, the Frame Body field contains an MSDU (or fragment thereof) or A-MSDU after any encapsulation for security. For Data frames of subtype QoS Data that are transmitted by a mesh STA, the Frame Body field also contains a Mesh Control field, as described in 9.2.4.8.3. For Data frames of subtype EBCS Data, the Frame Body field contains an MSDU and fields for authentication in case of PKFA or HCFA, as described in 12.15.2.3 (PKFA MPDU format) or 12.15.3.3 (HCFA MPDU), respectively; in the case of HLSA, the Frame Body field contains an MSDU only.EQXX

The maximum length of the Frame Body field can be determined from the maximum MSDU length plus the length of the Mesh Control field (if present) plus any overhead from encapsulation for encryption (i.e., it is always possible to send a maximum length MSDU, with any encapsulations provided by the MAC within a single Data frame). When the frame body carries an A-MSDU, the size of the Frame Body field is limited by:

— The PHY's maximum PHY service data unit (PSDU) length

— If A-MPDU aggregation is used by a non-VHT and non-DMG STA, a maximum MPDU length of 4095 octets (see 9.6.35)

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.3.2.1.5 Duration field

Within all Data frames sent by the QoS STA, the Duration field contains a duration value as defined in 9.2.5. Within all Data frames sent by non-QoS STAs, the Duration field is set according to the following rules:

— If the Address 1 field contains a group address, the Duration field is set to 0.

— If the More Fragments bit is 0 in the Frame Control field of a frame and the Address 1 field contains an individual address, the Duration field is set to the time, in microseconds, required to transmit one Ack frame, plus one SIFS.

— If the More Fragments bit is 1 in the Frame Control field of a frame and the Address 1 field contains an individual address, the Duration field is set to the time, in microseconds, required to transmit the next fragment of this Data frame, plus two Ack frames, plus three SIFSs.

The Duration field calculation for the Data frame is based on the rules in 10.6 that determine the data rate at which the Control frames in the frame exchange sequence are transmitted. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer. All STAs process Duration field less than or equal to 32 767 from valid Data frames (without regard for the RA, DA, and/or BSSID fields that might be present in these frames) to update their NAV settings as appropriate under the coordination function rules.

NOTE 1—The QoS Data and QoS Null subtypes are the only Data subtypes transmitted by a DMG STA.

NOTE 2—The HT Control field is not present in frames transmitted by a DMG STA.

9.3.2.2 Aggregate MSDU (A-MSDU) format

9.3.2.2.1 General

An A-MSDU is a sequence of A-MSDU subframes as shown in Figure 9-122. Each A-MSDU subframe consists of an A-MSDU subframe header followed by an MSDU and 0 to 3 octets of padding as shown in Figure 9-123 (in 9.3.2.2.2), Figure 9-125 (in 9.3.2.2.4), and Figure 9-126 (in 9.3.2.2.5).

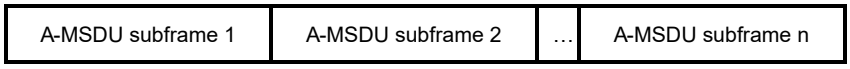

Figure 9-122—A-MSDU structure

Three A-MSDU subframe formats are defined: the Basic A-MSDU subframe described in 9.3.2.2.2, the Short A-MSDU subframe described in 9.3.2.2.4, and the Dynamic A-MSDU subframe described in 9.3.2.2.5. Unless otherwise noted, in this standard, the term A-MSDU applies to any of the Basic A-MSDU, the Short A-MSDU, and the Dynamic A-MSDU. The Basic A-MSDU uses only the Basic A-MSDU subframe format, the Short A-MSDU uses only the Short A-MSDU subframe format, and the Dynamic A-MSDU uses only the Dynamic A-MSDU subframe format.

An A-MSDU contains only MSDUs whose DA and SA parameter values (in the MA-UNITDATA.request primitive) map to the same receiver address (RA) and same transmitter address (TA) field (see 10.11), respectively.

NOTE —The Address 1 (RA) and Address 2 (TA) fields in a Data frame identify the STA(s) receiving the frame and the STA transmitting the frame, respectively, whether or not the frame body carries an A-MSDU and, if it does, whether or not the source or destination of the MSDU(s) are those STAs.

9.3.2.2.2 Basic A-MSDU subframe format

The structure of a Basic A-MSDU subframe when not in a mesh Data frame is shown in Figure 9-123.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

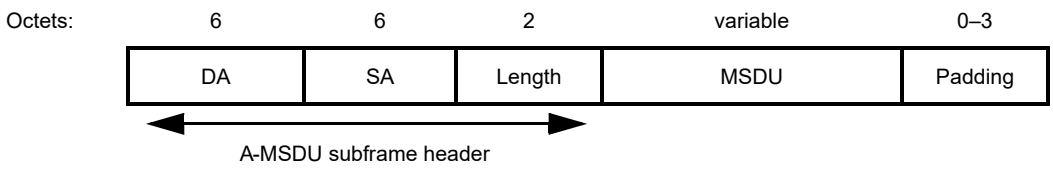

Figure 9-123—Basic A-MSDU subframe structure when not in a mesh Data frame

In the Basic A-MSDU subframe, each A-MSDU subframe (except the last) is padded so that its length is a multiple of 4 octets. The last A-MSDU subframe has no padding.

The A-MSDU subframe header contains three fields: DA, SA, and Length. The order of these fields and the bits within these fields are the same as the IEEE 802.3™ frame format. The DA and SA fields of the A-MSDU subframe header contain the values passed in the MA-UNITDATA.request and MA-UNITDATA.indication primitives. The Length field contains the length in octets of the MSDU.

The MPDU containing the A-MSDU is carried in any of the following data frame subtypes: QoS Data, QoS Data +CF-Ack, QoS Data +CF-Poll, QoS Data +CF-Ack +CF-Poll. The A-MSDU structure is contained in the frame body of a single MPDU. If encrypted, the MPDU is encrypted as a single unit.

NOTE—The TID present in the QoS Control field of the MPDU carrying the A-MSDU indicates the TID for all MSDUs in the A-MSDU. Because this TID is common to all MSDUs in the A-MSDU, only MSDUs delivered to the MAC by an MA-UNITDATA.request primitive with an integer priority parameter that maps to the same TID can be aggregated together using A-MSDU.

9.3.2.2.3 Mesh A-MSDU subframe format

The structure of a Basic A-MSDU subframe when in a mesh Data frame is shown in Figure 9-124.

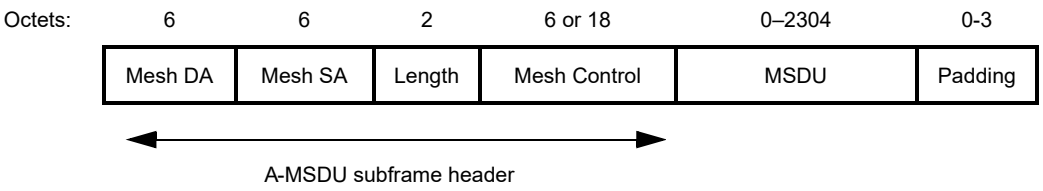

Figure 9-124—Basic A-MSDU subframe structure when in a mesh Data frame

The Mesh DA and Mesh SA fields contain the addresses of the destination mesh STA and the source mesh STA, respectively, determined in 9.3.5.

The Length field contains the length in octets of the MSDU.

NOTE—The octet order of the Length field is little endian in a mesh Data frame, which is different from the nonmesh Data frame case. Furthermore, the Mesh Control field following the Length field is not included in the length.

The format of the Mesh Control field is described in 9.2.4.8.3.

9.3.2.2.4 Short A-MSDU subframe format

The Short A-MSDU subframe is shown in Figure 9-125. In the Short A-MSDU subframe, each A-MSDU subframe (except the last) is padded so that its length excluding the A-MSDU subframe header is a multiple of 4 octets. The last A-MSDU subframe has no padding.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

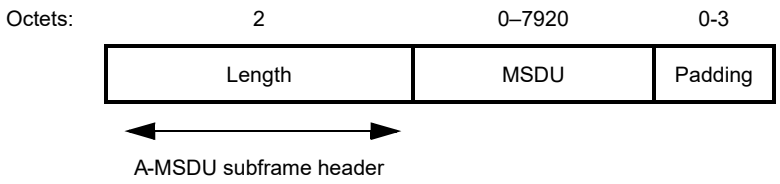

Figure 9-125—Short A-MSDU subframe structure

The Short A-MSDU subframe header consists of a Length field that contains the length in octets of the MSDU.

NOTE—The Short A-MSDU subframe format is not transmitted by non-DMG STAs.

9.3.2.2.5 Dynamic A-MSDU format

The structure of a Dynamic A-MSDU subframe is shown in Figure 9-126. In the Dynamic A-MSDU subframe, each A-MSDU subframe (except the last) is padded, so that its length is a multiple of 4 octets. The last A-MSDU subframe has no padding.

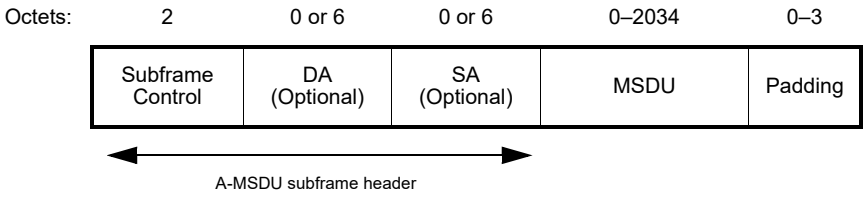

Figure 9-126—Dynamic A-MSDU subframe structure

The A-MSDU subframe header contains the Subframe Control field and optionally the DA and SA fields. A Dynamic A-MSDU subframe has 0, 1, or 2 addresses associated with it, as governed by the Subframe Control field.

The Subframe Control field is defined in Figure 9-127 and contains the Length, DA Present, and SA Present subfields.

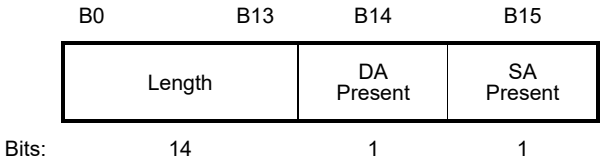

Figure 9-127—Subframe Control field format

The Length subfield contains the length in octets of the MSDU.

The DA Present field is set to 1 when the DA field is present in the Dynamic A-MSDU subframe header and is set to 0 when the DA field is not present.

The SA Present field is set to 1 when the SA field is present in the Dynamic A-MSDU subframe header and is set to 0 when the SA field is not present.

If present, the DA field of the Dynamic A-MSDU subframe header contains the destination address of the MSDU. When the DA field is not present, the DA of the MSDU is defined by the rules in 10.11.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If present, the SA field of the Dynamic A-MSDU subframe header contains the source address of the MSDU. When the SA field is not present in a Dynamic A-MSDU subframe, the SA is defined by the rules in 10.11.

The MSDU field contains the MSDU that is carried in the Dynamic A-MSDU subframe.

The Padding field contains 0 to 3 octets of padding, so that the length of the Dynamic A-MSDU subframe is a multiple of 4 octets, except for the last Dynamic A-MSDU subframe in a Dynamic A-MSDU, which has no padding.

9.3.3 (PV0) Management frames

9.3.3.1 Format of (PV0) Management frames

The format of a Management frame is defined in Figure 9-128. The Frame Control, Duration, Address 1, Address 2, Address 3, and Sequence Control fields are present in all management frame subtypes. The maximum size of an MMPDU that is not carried in a VHT or S1G PPDU, or an HE PPDU not sent in the 2.4 GHz band is defined in Table 9-34. The presence of the HT Control field is determined by the setting of the +HTC subfield of the Frame Control field (see 9.2.4.1.10. The maximum size of an MMPDU that is carried in one or more VHT or S1G PPDUs, or an HE PPDU not sent in the 2.4 GHz band (in whole or in part) is:

— if there is one recipient, then the maximum MPDU size supported by the recipient less the shortest Management frame MAC header and FCS, or,

— if there is more than one recipient, then the smallest of the maximum MPDU sizes supported by the recipients less the shortest Management frame MAC header and FCS.

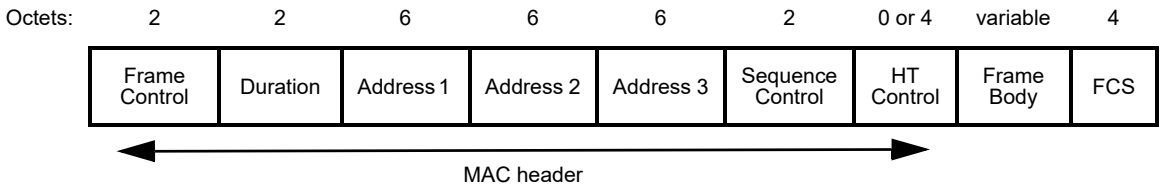

Figure 9-128—Management frame format

NOTE 1—In an MMPDU carried in one or more PPDUs, all of which are VHT or S1G PPDUs, the presence of encryption overhead (i.e., the MMPDU is transmitted in protected robust Management frames) or an HT Control field might cause an MMPDU to be fragmented that would not otherwise need to be fragmented.

A STA uses the contents of the Address 1 field to perform the address matching for receive decisions. In the case where the Address 1 field contains a group address and the frame subtype is other than Beacon or the frame subtype Action, Category Multihop Action (Multihop Action frame), the Address 3 field also is validated to verify that the group addressed frame originated from a STA in the BSS of which the receiving STA is a member or from a mesh STA to which mesh peering is maintained. Details of addressing and forwarding of the group addressed frame in an MBSS are defined in 10.37.4. When the Address 1 field contains a group address and the frame subtype is either Probe Request or Action with Category Public, a wildcard BSSID matches all receiving STA's BSSs' BSSIDs. If the frame subtype is Beacon, other address matching rules apply, as specified in 11.1.3.7. Frames of subtype Probe Request are additionally processed as described in 11.1.4.3.2 for non-DMG STAs and 11.1.4.3.3 for DMG STAs. If the frame subtype is Action, the Category is Public, and the Action is 20/40 BSS Coexistence Management, then additional address matching rules for receive decisions apply as specified in 11.15 and 11.16.

The address fields for all Management frames except Multihop Action frames are as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

a) The Address 1 field of the Management frame is the RA (=DA) and is the destination of the frame.

b) The Address 2 field of the Management frame is the TA (=SA) and is the address of the STA transmitting the frame.

   1) If the STA is an AP with dot11MultiBSSIDImplemented set to false, then this address is the BSSID.

   2) If the STA is an AP with dot11MultiBSSIDImplemented set to true and the Address 1 field is not set to the broadcast address, then this address is the BSSID of the AP's BSS (which is either the transmitted BSSID or a nontransmitted BSSID).

   3) If the STA is an AP with dot11MultiBSSIDImplemented set to true and the Address 1 field is set to the broadcast address, then this address is the transmitted BSSID.

c) The Address 3 field of the Management frame is set and determined as follows:

   1) In Probe Request frames, the Address 3 field can be the wildcard BSSID as defined in the procedures specified in 11.1.4. If Address 3 is not the wildcard BSSID, then it is (for a nonmesh STA) the BSSID of the BSS of the intended recipient(s), or (for a mesh STA) the MAC address of the intended recipient.

      NOTE 2—Per 11.1.4.3.4, a mesh STA does not examine the Address 3 field in Probe Request frames it receives. Using an individual address, however, might prevent unwanted responses from other STAs.

   2) In Public Action frames, the Address 3 field is the BSSID, set according to 11.17.

   3) If dot11OCBActivated is true, the Address 3 field is the wildcard BSSID.

   4) Otherwise:

      i) If the STA is an AP or PCP, the Address 3 field is the same as the Address 2 field.

      ii) If the STA is transmitting the Management frame to an AP that is not in a multiple BSSID set or to a PCP, the Address 3 field is the BSSID, irrespective of whether the STA is associated with that AP or PCP.

      iii) If the STA is transmitting the Management frame to an AP that is in a multiple BSSID set, the Address 3 field is the BSSID of the AP's BSS (which is either the transmitted BSSID or a nontransmitted BSSID), irrespective of whether the STA is associated with that AP.

      iv) If the STA is transmitting the Management frame to one or more IBSS STAs, the Address 3 field is the BSSID.

      v) If the STA is a mesh STA, the Address 3 field is the TA.

      vi) If the STA is a TDLS STA transmitting the Management frame to a TDLS peer STA, and the AP to which they are associated is not in a multiple BSSID set, the Address 3 field is the BSSID.

      vii) If the STA is a TDLS STA transmitting the Management frame to a TDLS peer STA, and the AP to which they are associated is in a multiple BSSID set, the Address 3 field is the BSSID of the AP's BSS (which is either the transmitted BSSID or a nontransmitted BSSID).

The address fields for Multihop Action frames are described in 9.3.5.

Within all Management frames sent by the QoS STA, the Duration field contains a duration value as defined in 9.2.5. Within all Management frames sent by non-QoS STAs, the Duration field is set according to the following rules:

— If the DA field contains a group address, the Duration field is set to 0.

— If the More Fragments bit is 0 in the Frame Control field of a frame and the DA field contains an individual address, the Duration field is set to the time, in microseconds, required to transmit one Ack frame, plus one SIFS.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— If the More Fragments bit is 1 in the Frame Control field of a frame, and the DA field contains an individual address, the Duration field is set to the time, in microseconds, required to transmit the next fragment of this Management frame, plus two Ack frames, plus three SIFSs.

The Duration field calculation for the Management frame is based on the rules in 10.6 that determine the data rate at which the Control frames in the frame exchange sequence are transmitted. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer. All STAs process Duration field values less than or equal to 32 767 from valid Management frames to update their NAV settings as appropriate under the coordination function rules.

The HT Control field is defined in 9.2.4.6. The presence of the HT Control field is determined by the +HTC subfield of the Frame Control field, as specified in 9.2.4.1.10.

A Management frame is an IQMF when both

— The RA of the Management frame corresponds to an individual address; and
— The To DS subfield is equal to 1 and the From DS subfield of the Frame Control field is equal to 0.

A Management frame is a GQMF when both

— The RA of the Management frame corresponds to a group address; and
— The To DS subfield is equal to 1 and the From DS subfield of the Frame Control field is equal to 0.

The frame body consists of fields and elements as defined for each management frame subtype. All fields and elements are mandatory unless stated otherwise. Fields and elements appear in the specified, relative order, skipping fields or elements that are not present. STAs that encounter an element ID they do not recognize in the frame body of a received Management frame ignore that element and continue to parse the remainder of the management frame body (if any) for additional elements with recognizable element IDs. See 10.28.7.

9.3.3.2 Beacon frame format

The frame body of a Beacon frame contains the information shown in Table 9-62.

Table 9-62—Beacon frame body

Order	Information	Notes
1	Timestamp	See 9.4.1.10 for Timestamp field format.
2	Beacon Interval	See 9.4.1.3 for Beacon Interval field format.
3	Capability Information	See 9.4.1.4 for Capability Information field format.
4	Service Set Identifier (SSID)	If dot11MeshActivated is true, the SSID element is the wildcard value as described in 9.4.2.2.
5	Supported Rates and BSS Membership Selectors	
6	DSSS Parameter Set	The element is optionally present. The DSSS Parameter Set element is present within Beacon frames generated by STAs using Clause 15, Clause 16, and Clause 18 PHYs. The element is present within Beacon frames generated by STAs using a Clause 19 PHY in the 2.4 GHz band.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-62—Beacon frame body *(continued)*

Order	Information	Notes
7	IBSS Parameter Set	The IBSS Parameter Set element is present only within Beacon frames generated by IBSS STAs.
8	Traffic indication map (TIM)	The TIM element is present only within Beacon frames generated by APs or mesh STAs.
9	Country	The Country element is present if dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
10	Power Constraint	The Power Constraint element is present if dot11SpectrumManagementRequired is true and is optionally present if dot11RadioMeasurementActivated is true.
11	Channel Switch Announcement	The Channel Switch Announcement element is optionally present if dot11SpectrumManagementRequired is true or dot11ExtendedChannelSwitchActivated is true.
12	Quiet	The Quiet element is optionally present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
13	IBSS DFS	IBSS DFS element is present if dot11SpectrumManagementRequired is true in an IBSS.
14	TPC Report	The TPC Report element is present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
15	ERP	The ERP element is present within Beacon frames generated by STAs using extended rate PHYs (ERPs) defined in Clause 18 and is optionally present in other cases.
16	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if the number of supported rates and BSS membership selectors together exceed eight; it is optional otherwise.
17	RSN	The RSNE is present if dot11RSNAActivated is true; otherwise not present.
18	BSS Load	The BSS Load element is present if dot11QosOptionImplemented and dot11QBSSLoadImplemented are both true.
19	EDCA Parameter Set	The EDCA Parameter Set element is present if dot11QosOptionImplemented is true, dot11MeshActivated is false, and the QoS Capability element is not present; otherwise, it is not present.
20	QoS Capability	The QoS Capability element is present if dot11QosOptionImplemented is true, dot11MeshActivated is false, and neither the EDCA Parameter Set element nor the MU EDCA Parameter Set element is present; otherwise, it is not present.
21	AP Channel Report	If dot11RMAPChannelReportActivated is true, one AP Channel Report element is present for each operating class that has at least 1 channel to report.
22	BSS Average Access Delay	The BSS Average Access Delay element is present if dot11RMBSSAverageAccessDelayActivated is true and the AP Average Access Delay field is not equal to 255 (measurement not available); otherwise, the BSS Average Access Delay element is optionally present if dot11RMBSSAverageAccessDelayActivated is true.

Table 9-62—Beacon frame body *(continued)*

Order	Information	Notes
23	Antenna	The Antenna element is present if dot11RMAntennaInformationActivated is true and the Antenna ID field is not equal to 0 (unknown antenna); otherwise, the Antenna element is optionally present if dot11RMAntennaInformationActivated is true.
24	BSS Available Admission Capacity	The BSS Available Admission Capacity element is present if dot11RMBSSAvailableAdmissionCapacityActivated is true with the following exceptions: 1) when Available Admission Capacity Bitmask equals 0 (Available Admission Capacity List contains no entries), or 2) when the BSS Load element is present and the Available Admission Capacity Bitmask states that only AC_VO is present in the Available Admission Capacity List field.
25	BSS AC Access Delay	The BSS AC Access Delay element is present if dot11RMBSSAverageAccessDelayActivated is true and at least one field of the element is not equal to 255 (measurement not available); otherwise, the BSS AC Access Delay element is optionally present if dot11RMBSSAverageAccessDelayActivated is true.
26	Measurement Pilot Transmission	The Measurement Pilot Transmission element is present if dot11RMMeasurementPilotActivated is a value between 2 and 7.
27	Multiple BSSID	One or more Multiple BSSID elements are present if the AP is a member of multiple BSSID set (see 11.10.14) with two or more members and any of the following conditions are true: • dot11MultiBSSIDImplemented is true • dot11MultiBSSIDImplemented is false and dot11RMMeasurementPilotActivated is between 2 and 7 • dot11FILSActivated is true • dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID exists
28	RM Enabled Capabilities	RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true.
29	Mobility Domain	The MDE is present if dot11FastBSSTransitionActivated is true.
30	DSE registered location	The DSE Registered Location element is present if dot11LCIDSERequired is true.
31	Extended Channel Switch Announcement	The Extended Channel Switch Announcement element is optionally present if dot11ExtendedChannelSwitchActivated is true.
32	Supported Operating Classes	The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true. The Supported Operating Classes element is optionally present if dot11TVHTOptionImplemented is true.
33	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true and the STA is not a STA 6G.
34	HT Operation	The HT Operation element is included by an AP and a mesh STA when dot11HighThroughputOptionImplemented is true and the AP or mesh STA is not a STA 6G.
35	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true.
36	Overlapping BSS Scan Parameters	The Overlapping BSS Scan Parameters element is optionally present if dot11FortyMHzOptionImplemented is true.

Table 9-62—Beacon frame body *(continued)*

Order	Information	Notes
37	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero.
38	FMS Descriptor	The FMS Descriptor element is present if dot11FMSActivated is true.
39	QoS Traffic Capability	The QoS Traffic Capability element is optionally present if dot11ACStationCountActivated is true.
40	Time Advertisement	The Time Advertisement element is present every dot11TimeAdvertisementDTIMInterval if dot11UTCTSFOffsetActivated is true.
41	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true.
42	Advertisement Protocol	Advertisement Protocol element is present if dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID MIB attribute exists.
43	Roaming Consortium	The Roaming Consortium element is present if dot11InterworkingServiceActivated is true and the dot11RoamingConsortiumTable has at least one entry.
44	Emergency Alert Identifier	One or more Emergency Alert Identifier elements are present if dot11EASActivated is true and there are one or more EAS message(s) active in the network.
45	Mesh ID	The Mesh ID element is present if dot11MeshActivated is true.
46	Mesh Configuration	The Mesh Configuration element is present if dot11MeshActivated is true.
47	Mesh Awake Window	The Mesh Awake Window element is optionally present if dot11MeshActivated is true.
48	Beacon Timing	The Beacon Timing element is optionally present if both dot11MeshActivated and dot11MBCAActivated are true.
49	MCCAOP Advertisement Overview	The MCCAOP Advertisement Overview element is optionally present if both dot11MeshActivated and dot11MCCAActivated are true.
50	MCCAOP Advertisement	One or more MCCAOP Advertisement elements are optionally present if both dot11MeshActivated and dot11MCCAActivated are true.
51	Mesh Channel Switch Parameters	The Mesh Channel Switch Parameters element is present when dot11MeshActivated is true and either Channel Switch Announcement element or Extended Channel Switch Announcement element is present.
52	QMF Policy	Indicates the QMF policy parameters of the transmitting STA. The QMF Policy element is present when dot11QMFActivated is true and the transmitting STA is an AP or a mesh STA. This element is not present otherwise.
53	QLoad Report	The QLoad Report element is present every dot11QLoadReportIntervalDTIM DTIM intervals if dot11QLoadReportActivated is true.
54	HCCA TXOP Update Count	The HCCA TXOP Update Count element is present if both dot11PublicHCCATXOPNegotiationActivated is true and an HC is colocated with the AP.

Table 9-62—Beacon frame body *(continued)*

Order	Information	Notes
55	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.
56	VHT Capabilities	The VHT Capabilities element is present in the 5 GHz band when dot11VHTOptionImplemented is true.
57	VHT Operation	The VHT Operation element is present when dot11VHTOptionImplemented is true and the STA is not a STA 6G and is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
58	Transmit Power Envelope	One Transmit Power Envelope element is present for each distinct combination of values of the Maximum Transmit Power Interpretation subfield and Maximum Transmit Power Category subfield that is supported for the BSS if both of the following conditions are met: Either dot11VHTOptionImplemented or dot11ExtendedSpectrumManagementImplemented is true. Either dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true. Otherwise, this element is not present. NOTE—In a 6 GHz HE AP, both dot11VHTOptionImplemented (see 26.17.1) and dot11SpectrumManagementRequired (see 26.17.2.1) are true.
59	Channel Switch Wrapper	The Channel Switch Wrapper element is optionally present if dot11VHTOptionImplemented or dot11ExtendedSpectrumManagementImplemented is true and at least one of a Channel Switch Announcement element or an Extended Channel Switch Announcement element is also present in the Beacon frame and the Channel Switch Wrapper element contains at least one subelement.
60	Extended BSS Load	The Extended BSS Load element is optionally present if dot11QBSSLoadImplemented and dot11VHTOptionImplemented are both true.
61	Quiet Channel	Either one Quiet Channel element containing an AP Quiet Mode field equal to 0 or, in an infrastructure BSS, one or more Quiet Channel elements each containing an AP Quiet Mode field equal to 1 are optionally present if dot11VHTOptionImplemented is true, and either dot11SpectrumManagementRequired or dot11RadioMeasurementActivated is true.
62	Operating Mode Notification	The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true.
63	Reduced Neighbor Report	One or more Reduced Neighbor Report elements are optionally present if dot11TVHTOptionImplemented, dot11FILSActivated, or dot11ColocatedRNRImplemented is true; otherwise, they are not present.
64	TVHT Operation	The TVHT Operation element is present for a STA when dot11TVHTOptionImplemented is true; otherwise it is not present.
65	Estimated Service Parameters Inbound	The Estimated Service Parameters Inbound element is present if dot11EstimatedServiceParametersInboundOptionImplemented is true.
66	Future Channel Guidance	The Future Channel Guidance element is optionally present if dot11FutureChannelGuidanceActivated is true.
67	Common Advertisement Group (CAG) Number	The CAG Number element is optionally present if dot11FILSActivated is true; otherwise not present.

Table 9-62—Beacon frame body *(continued)*

Order	Information	Notes
68	FILS Indication	The FILS Indication element is present if dot11FILSActivated is true; otherwise not present.
69	AP-CSN	The AP-CSN element is optionally present if dot11FILSActivated is true; otherwise not present.
70	DILS	The DILS element is optionally present if dot11FILSActivated is true; otherwise not present.
71	Max Channel Switch Time	The Max Channel Switch Time element is optionally present when a Channel Switch Announcement or an Extended Channel Switch Announcement element is also present.
72	Estimated Services Parameters Outbound	The Estimated Service Parameters Outbound element is optionally present if dot11EstimatedServiceParametersOutboundOptionImplemented is true.
73	Service Hint	The Service Hint element is optionally present if dot11UnsolicitedPADActivated is true.
74	Service Hash	The Service Hash element is optionally present if dot11UnsolicitedPADActivated is true.
75	RSN Extension	The RSNXE is present if any subfield of the Extended RSN Capabilities field in this element is nonzero, except the Field Length subfield.
76	Multiple BSSID Configuration	The Multiple BSSID Configuration element is optionally present if dot11MultiBSSIDImplemented is true.
77	HE Capabilities	The HE Capabilities element is present if dot11HEOptionImplemented is true; otherwise, it is not present.
78	HE Operation	The HE Operation element is present if dot11HEOptionImplemented is true; otherwise, it is not present.
79	TWT	The TWT element is optionally present if dot11TWTOptionActivated is true; otherwise, it is not present.
80	UORA Parameter Set	The UORA Parameter Set element is optionally present if dot11OFDMARandomAccessOptionImplemented is true; otherwise, it is not present.
81	BSS Color Change Announcement	The BSS Color Change Announcement element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
82	Spatial Reuse Parameter Set	The Spatial Reuse Parameter Set element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
83	MU EDCA Parameter Set	The MU EDCA Parameter Set element is present if dot11HEOptionImplemented is true, dot11MeshActivated is false, dot11MUEDCAParametersActivated is true, and the QoS Capability element is not present; otherwise, it is not present.
84	ESS Report	The ESS Report element is optionally present.
85	NDP Feedback Report Parameter Set	The NDP Feedback Report Parameter Set element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
86	HE BSS Load	The HE BSS Load element is optionally present if dot11QBSSLoadImplemented and dot11HEOptionImplemented are true.

Table 9-62—Beacon frame body *(continued)*

Order	Information	Notes
87	HE 6 GHz Band Capabilities	The HE 6 GHz Band Capabilities element is present if dot11HEOptionImplemented and dot11HE6GOptionImplemented are true.
88	TWT Constraint Parameters	The TWT Constraint Parameters element is optionally present if dot11TWTOptionActivated is true; otherwise, it is not present.
89	WUR Capabilities	The WUR Capabilities element is present when dot11WUROptionImplemented is true; otherwise it is not present.
90	WUR Operation	The WUR Operation element is present when dot11WUROptionImplemented is true; otherwise it is not present.
91	WUR Discovery	The WUR Discovery element is optionally present if dot11WUROptionImplemented is true and either dot11WURDiscoveryImplemented or dot11WURNeighborDiscoveryImplemented is true; otherwise it is not present.
92	RSTA Availability Window	The RSTA Availability Window element is optionally present if dot11PassiveTBRangingResponderImplemented is true and a passive TB ranging availability window is present.
93	EBCS Parameters	This element is present if dot11EBCSSupportActivated is true and the length of dot11EBCSTrafficStreamTable is larger than 0, otherwise not present.
94	EBCS TIM	The EBCS TIM is present if dot11EBCSSupportActivated is true, dot11EBCSTIMInBeaconActivated is true, and one or more BUs for an EBCS traffic stream for which dot11EBCSTrafficStreamBuffered is true are buffered, otherwise not present.
Last – 1	Vendor Specific	One or more Vendor Specific elements are optionally present.
Last	MME	The MME is present if dot11BeaconProtectionEnabled is true at the AP.

NOTE—The MME appears last in the frame body to protect the frames as specified in 12.5.3. Since it appears last and has a fixed size, it can readily be located without parsing all the elements in the frame.

9.3.3.3 ATIM frame format

The frame body of an ATIM frame is null.

9.3.3.4 Disassociation frame format

The frame body of a Disassociation frame contains the information shown in Table 9-63.

Table 9-63—Disassociation frame body

Order	Information
1	Reason code
Last – 1	One or more Vendor Specific elements are optionally present.
Last	The MME is present when management frame protection is enabled at the STA transmitting the frame and the frame is a group addressed frame.
NOTE—The MME appears last in the frame body to protect the frames as specified in 12.5.3. Since it appears last and has a fixed size, it can readily be located without parsing all the elements in the frame.

9.3.3.5 Association Request frame format

The frame body of an Association Request frame contains the information shown in Table 9-64.

Table 9-64—Association Request frame body

Order	Information	Notes
1	Capability Information	See 9.4.1.4 for Capability Information field format.
2	Listen Interval	
3	SSID	
4	Supported Rates and BSS Membership Selectors	See 11.1.4.6 for details on the inclusion of this element when dot11S1GOptionImplemented or dot11DMGOptionImplemented is true.
5	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if the number of supported rates and BSS membership selectors together exceed eight; it is optional otherwise. See 11.1.4.6 for details on the inclusion of this element when dot11S1GOptionImplemented or dot11DMGOptionImplemented is true.
6	Power Capability	The Power Capability element is present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
7	Supported Channels	The Supported Channels element is present if dot11SpectrumManagementRequired is true and dot11ExtendedChannelSwitchActivated is false. The Supported Channels element is optionally present, otherwise.
8	RSN	The RSNE is present if dot11RSNAActivated is true; otherwise not present.
9	QoS Capability	The QoS Capability element is present if dot11QosOptionImplemented is true.
10	RM Enabled Capabilities	RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true.
11	Mobility Domain	The MDE is present in an Association Request frame if dot11FastBSSTransitionActivated is true and if the frame is being sent to an AP that advertised its FT capability in the MDE in its Beacon or Probe Response frame (i.e., AP also has dot11FastBSSTransitionActivated equal to true).
12	Supported Operating Classes	The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true.
13	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true and the STA is not a STA 6G.
14	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true.
15	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-64—Association Request frame body *(continued)*

Order	Information	Notes
16	QoS Traffic Capability	The QoS Traffic Capability element is present if dot11QoSTrafficCapabilityActivated is true.
17	TIM Broadcast Request	The TIM Broadcast Request element is present if dot11TIMBroadcastActivated is true.
18	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true and the non-AP STA is requesting unauthenticated access to emergency services (see 11.3.5).
19	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.
20	DMG Capabilities	The DMG Capabilities element is present if dot11DMGOptionImplemented is true.
21	Multiple MAC Sublayers	The Multiple MAC Sublayers element is present if dot11MultipleMACActivated is true.
22	VHT Capabilities	The VHT Capabilities element is present in the 5 GHz band when dot11VHTOptionImplemented is true.
23	Operating Mode Notification	The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true.
24	FILS Session	The FILS Session element is optionally present if dot11FILSActivated is true; otherwise not present.
25	FILS Public Key	The FILS Public Key element is present if dot11FILSActivated is true and FILS Public Key authentication is used; otherwise not present.
26	FILS Key Confirmation	The FILS Key Confirmation element is present if dot11FILSActivated is true and FILS authentication is used; otherwise not present.
27	FILS HLP Container	One or more FILS HLP Container elements are optionally present if dot11FILSActivated is true; otherwise not present.
28	FILS IP Address Assignment	The FILS IP Address Assignment element is optionally present if dot11FILSActivated is true; otherwise not present.
29	TWT	The TWT element is optionally present if dot11TWTOptionActivated is true; otherwise not present.
30	AID Request	The AID Request element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
31	S1G Capabilities	The S1G Capabilities element is present if dot11S1GOptionImplemented is true; otherwise not present.
32	EL Operation	The EL Operation element is optionally present if dot11S1GELOperationActivated is true; otherwise not present.
33	S1G Relay	The S1G Relay element is present if dot11RelaySTAImplemented is true; otherwise not present.
34	BSS Max Idle Period	The BSS Max Idle Period element is optionally present if dot11WirelessManagementImplemented and dot11BSSMaxIdlePeriodIndicationByNonAPSTA are true, or if dot11S1GOptionImplemented is true; otherwise not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-64—Association Request frame body *(continued)*

Order	Information	Notes
35	Header Compression	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true.
36	MAD	The MAD element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
37	Reachable Address	The Reachable Address element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
38	S1G Relay Activation	The S1G Relay Activation element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
39	CDMG Capabilities	The CDMG Capabilities element is present if dot11CDMGOptionImplemented is true; otherwise not present.
40	CMMG Capabilities	The CMMG Capabilities element is present when dot11CMMGOptionImplemented is true; otherwise not present.
41	GLK-GCR Parameter Set	The GLK-GCR Parameter Set element is present if dot11GLKImplemented is true to indicate the number of reorder buffers the STA has to support GLK-GCR with GCR block ack and respond to corresponding GLK-GCR BlockAckReq frames. Otherwise this element is not present.
42	Fast BSS Transition	An FTE is present in an Association Request frame if dot11FastBSSTransitionActivated is true, dot11RSNAAuthenticationSuiteSelected is 00-0F-AC:16 or 00-0F-AC:17, and FT initial mobility domain association over FILS in an RSN is being performed.
43	RSN Extension	The RSNXE is present if any subfield of the Extended RSN Capabilities field in this element is nonzero, except the Field Length subfield.
44	Supplemental Class 2 Capabilities	The Supplemental Class 2 Capabilities element is present when dot11Class2CapabilitiesOptionImplemented is true; otherwise not present.
45	MSCS Descriptor	The MSCS Descriptor element is optionally present if dot11MSCSActivated is true; otherwise not present.
46	HE Capabilities	The HE Capabilities element is present if dot11HEOptionImplemented is true; otherwise, it is not present.
47	Channel Switch Timing	The Channel Switch Timing element is optionally present if dot11HESubchannelSelectiveTransmissionImplemented is true; otherwise, it is not present.
48	HE 6 GHz Band Capabilities	The HE 6 GHz Band Capabilities element is present if dot11HEOptionImplemented and dot11HE6GOptionImplemented are true; otherwise, it is not present.
49	UL MU Power Capabilities	The UL MU Power Capabilities element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
50	TWT Constraint Parameters	The TWT Constraint Parameters element is optionally present if dot11TWTOptionActivated is true; otherwise, it is not present.
51	EDMG Capabilities	The EDMG Capabilities element is present if dot11EDMGOptionImplemented is true.

Table 9-64—Association Request frame body *(continued)*

Order	Information	Notes
52	QoS Triggered Unscheduled	The QoS Triggered Unscheduled element is optionally present if dot11EDMGOptionImplemented is true.
53	Unsolicited Block Ack Extension	The Unsolicited Block Ack Extension element is optionally present if dot11UnsolicitedBAActivated is true and is absent otherwise.
54	TDD Slot Schedule	The TDD Slot Schedule element is optionally present if dot11DMGOptionImplemented is true.
55	TDD Route	This element is optionally present if dot11TDDOptionImplemented is true; otherwise, not present. If present, the element specifies the TDD beamforming results.
56	WUR Capabilities	The WUR Capabilities element is present when dot11WUROption-Implemented is true; otherwise it is not present.
57	WUR Mode	The WUR Mode element is optionally present when dot11WUROptionImplemented is true; otherwise, it is not present.
58	Diffie-Hellman Parameter	The Diffie-Hellman Parameter element is optionally present when performing OWE; otherwise it is not present.
59	Known STA Identification	The Known STA Identification element is optionally present if dot11RSNAActivated is true and the recipient of the frame has indicated support for this element in its Extended Capabilities field; otherwise not present.
60	Non-AP STA Regulatory Connectivity	The Non-AP STA Regulatory Connectivity element is optionally present if dot11ExtendedRegInfoSupport is true.
Last	Vendor Specific	One or more Vendor Specific elements are optionally present.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.3.3.6 Association Response frame format

The frame body of an Association Response frame contains the information shown in Table 9-65.

Table 9-65—Association Response frame body

Order	Information	Notes
1	Capability Information	See 9.4.1.4 for Capability Information field format.
2	Status Code	
3	AID	This field is not present when dot11S1GOptionImplemented is true.
4	Supported Rates and BSS Membership Selectors	See 11.1.4.6 for details on the inclusion of this element when dot11S1GOptionImplemented or dot11DMGOptionImplemented is true.
5	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if the number of supported rates and BSS membership selectors together exceed eight; it is optional otherwise. See 11.1.4.6 for details on the inclusion of this element when dot11S1GOptionImplemented or dot11DMGOptionImplemented is true.
6	EDCA Parameter Set	The EDCA Parameter Set element is present if dot11QosOptionImplemented is true; otherwise not present.
7	RCPI	The RCPI element is present if dot11RMRCPIMeasurementActivated is true.
8	RSNI	The RSNI element is present if dot11RMRSNIMeasurementActivated is true.
9	RM Enabled Capabilities	RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true.
10	RSN	The RSNE is present if dot11FILSActivated is true or if performing OWE; otherwise not present.
11	Mobility Domain	An MDE is present in an Association Response frame when dot11FastBSSTransitionActivated is true and this frame is a response to an Association Request frame that contained an MDE (i.e., an FT initial mobility domain association exchange).
12	Fast BSS Transition	An FTE is present in an Association Response frame when dot11FastBSSTransitionActivated is true, dot11RSNAActivated is true, and this frame is a response to an Association Request frame that contained an MDE (i.e., an FT initial mobility domain association exchange in an RSN).
13	DSE registered location	The DSE Registered Location element is present if dot11LCIDSERequired is true.
14	Timeout Interval (association comeback time)	A TIE containing the association comeback time is present when dot11RSNAActivated is true, dot11RSNAProtectedManagementFramesActivated is true, and either the association request is rejected with a status code REFUSED_TEMPORARILY or the association request is accepted with a status code 0 and when dot11S1GOptionImplemented is true.

Table 9-65—Association Response frame body *(continued)*

Order	Information	Notes
15	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true and the STA is not a STA 6G.
16	HT Operation	The HT Operation element is included by an AP and a mesh STA when dot11HighThroughputOptionImplemented is true and the STA is not a STA 6G.
17	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true.
18	Overlapping BSS Scan Parameters	The Overlapping BSS Scan Parameters element is optionally present if dot11FortyMHzOptionImplemented is true.
19	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero.
20	BSS Max Idle Period	The BSS Max Idle Period element is present if dot11WirelessManagementImplemented is true and the BSS max idle period is nonzero, or optionally present if dot11S1GOptionImplemented is true.
21	TIM Broadcast Response	The TIM Broadcast Response element is present if dot11TIMBroadcastActivated is true and the TIM Broadcast Request element is present in the Association Request frame that elicited this Association Response frame.
22	QoS Map	The QoS Map element is present if dot11QosMapActivated is true and the QoS Map field in the Extended Capabilities element of the corresponding Association Request frame is 1.
23	QMF Policy	The QMF Policy element is present if dot11QMFActivated is true and the QMFActivated subfield is 1 in the Extended Capabilities element in the Association Request frame that elicited this Association Response frame.
24	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.
25	DMG Capabilities	The DMG Capabilities element is present if dot11DMGOptionImplemented is true.
26	DMG Operation	The DMG Operation element is present if dot11DMGOptionImplemented is true.
27	Multiple MAC Sublayers	The Multiple MAC Sublayers element is present if dot11MultipleMACActivated is true.
28	Neighbor Report	One or more Neighbor Report elements is present if the Status Code field is REJECTED_WITH_SUGGESTED_BSS_TRANSITION.
29	VHT Capabilities	The VHT Capabilities element is present in the 5 GHz band when dot11VHTOptionImplemented is true.
30	VHT Operation	The VHT Operation element is present when dot11VHTOptionImplemented is true and the STA is not a STA 6G and is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
31	Operating Mode Notification	The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-65—Association Response frame body *(continued)*

Order	Information	Notes
32	Future Channel Guidance	The Future Channel Guidance element is optionally present if dot11FutureChannelGuidanceActivated is true.
33	FILS Session	The FILS Session element is present if dot11FILSActivated is true; otherwise not present.
34	FILS Public Key	The FILS Public Key element is present if dot11FILSActivated is true and FILS Public Key authentication is used; otherwise not present.
35	FILS Key Confirmation	The FILS Key Confirmation element is present if dot11FILSActivated is true and FILS authentication is used; otherwise not present.
36	FILS HLP Container	One or more FILS HLP Container elements are optionally present if dot11FILSActivated is true; otherwise not present.
37	FILS IP Address Assignment	The FILS IP Address Assignment element is optionally present if dot11FILSActivated is true; otherwise not present.
38	Key Delivery	The Key Delivery element is present if dot11FILSActivated is true; otherwise not present.
39	S1G Sector Operation	The S1G Sector Operation element is optionally present if dot11S1GSectorizationActivated is true; otherwise not present.
40	TWT	The TWT element is present if dot11TWTOptionActivated is true, dot11HEOptionImplemented is not true, and the TWT element is present in the Association Request frame that elicited this Association Response frame. The TWT element is optionally present if dot11TWTOptionActivated is true, dot11HEOptionImplemented is true, and the TWT Requester Support field in the HE Capabilities element in the Association Request frame that elicited this Association Response frame is 1. Otherwise, the TWT element is not present.
41	TSF Timer Accuracy	The TSF Timer Accuracy element is optionally present when dot11TSFTimerAccuracyImplemented is true; otherwise not present.
42	S1G Capabilities	The S1G Capabilities element is present if dot11S1GOptionImplemented is true; otherwise not present.
43	S1G Operation	The S1G Operation element is present if dot11S1GOptionImplemented is true; otherwise not present.
44	AID Response	The AID Response element is present when dot11S1GOptionImplemented is true.
45	Sectorized Group ID List	The Sectorized Group ID List element is optionally present when dot11S1GSectorizationActivated is true; otherwise not present.
46	S1G Relay	The S1G Relay element is optionally present if dot11RelayAPImplemented is true; otherwise not present.
47	Header Compression	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true.

Table 9-65—Association Response frame body *(continued)*

Order	Information	Notes
48	SST Operation	The SST Operation element is present if dot11SelectiveSubchannelTransmissionPermitted is true.
49	MAD	The MAD element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
50	S1G Relay Activation	The S1G Relay Activation element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
51	CDMG Capabilities	The CDMG Capabilities element is present if dot11CDMGOptionImplemented is true; otherwise not present.
52	CMMG Capabilities	The CMMG Capabilities element is present when dot11CMMGOptionImplemented is true; otherwise not present.
53	CMMG Operation	The CMMG Operation element is present when dot11CMMGOptionImplemented is true; otherwise not present.
54	GLK-GCR Parameter Set	The GLK-GCR Parameter Set element is present if dot11GLKimplemented is true and the AP has set up a GLK-GCR for group transmissions over the underlying general link. Otherwise this element is not present.
55	RSN Extension	The RSNXE is present if any subfield of the Extended RSN Capabilities field in this element is nonzero, except the Field Length subfield.
56	MSCS Descriptor	The MSCS Descriptor element is optionally present if dot11MSCSActivated is true; otherwise not present.
57	HE Capabilities	The HE Capabilities element is present if dot11HEOptionImplemented is true; otherwise, it is not present.
58	HE Operation	The HE Operation element is present if dot11HEOptionImplemented is true; otherwise, it is not present.
59	BSS Color Change Announcement	The BSS Color Change Announcement element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
60	Spatial Reuse Parameter Set	The Spatial Reuse Parameter Set element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
61	MU EDCA Parameter Set	The MU EDCA Parameter Set element is present if dot11HEOptionImplemented and dot11MUEDCAParametersActivated are true; otherwise, it is not present.
62	UORA Parameter Set	The UORA Parameter Set element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
63	ESS Report	The ESS Report element is optionally present.
64	NDP Feedback Report Parameter Set	The NDP Feedback Report Parameter Set element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
65	HE 6 GHz Band Capabilities	The HE 6 GHz Band Capabilities element is present if dot11HEOptionImplemented and dot11HE6GOptionImplemented are true.
66	TWT Constraint Parameters	The TWT Constraint Parameters element is optionally present if dot11TWTOptionActivated is true; otherwise, it is not present.

Table 9-65—Association Response frame body *(continued)*

Order	Information	Notes
67	EDMG Capabilities	The EDMG Capabilities element is present if dot11EDMGOptionImplemented is true.
68	EDMG Operation	The EDMG Operation element is present if dot11EDMGOptionImplemented is true.
69	QoS Triggered Unscheduled	The QoS Triggered Unscheduled element is optionally present if dot11EDMGOptionImplemented is true.
70	Unsolicited Block Ack Extension	The Unsolicited Block Ack Extension element is optionally present if dot11UnsolicitedBAActivated is true and is absent otherwise.
71	TDD Slot Structure	The TDD Slot Structure element is optionally present if dot11DMGOptionImplemented is true.
72	TDD Slot Schedule	The TDD Slot Schedule element is optionally present if dot11DMGOptionImplemented is true.
73	TDD Route	This element is optionally present if dot11TDDOptionImplemented is true; otherwise, not present. If present, the element specifies the TDD sector switch configuration.
74	WUR Capabilities	The WUR Capabilities element is present when dot11WUROptionImplemented is true; otherwise it is not present.
75	WUR Operation	The WUR Operation element is present when dot11WUROptionImplemented is true; otherwise it is not present.
76	WUR Mode	The WUR Mode element is present when dot11WUROptionImplemented is true, and the WUR Mode element is present in the Association Request frame that solicited this Association Response frame; otherwise it is not present.
77	Diffie-Hellman Parameter	The Diffie-Hellman Parameter element is optionally present when performing OWE; otherwise it is not present.
Last	Vendor Specific	One or more Vendor Specific elements are optionally present.

9.3.3.7 Reassociation Request frame format

The frame body of a Reassociation Request frame contains the information shown in Table 9-66.

Table 9-66—Reassociation Request frame body

Order	Information	Notes
1	Capability Information	See 9.4.1.4 for Capability Information field format.
2	Listen Interval	
3	Current AP address	
4	SSID	
5	Supported Rates and BSS Membership Selectors	See 11.1.4.6 for details on the inclusion of this element when dot11S1GOptionImplemented or dot11DMGOptionImplemented is true.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-66—Reassociation Request frame body *(continued)*

Order	Information	Notes
6	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if the number of supported rates and BSS membership selectors together exceed eight; it is optional otherwise. See 11.1.4.6 for details on the inclusion of this element when dot11S1GOptionImplemented or dot11DMGOptionImplemented is true.
7	Power Capability	The Power Capability element is present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
8	Supported Channels	The Supported Channels element is present if dot11SpectrumManagementRequired is true and dot11ExtendedChannelSwitchActivated is false. The Supported Channels element is optionally present, otherwise.
9	RSN	The RSNE is present if dot11RSNAActivated is true; otherwise not present.
10	QoS Capability	The QoS Capability element is present if dot11QosOptionImplemented is true.
11	RM Enabled Capabilities	RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true.
12	Mobility Domain	The MDE is present in a Reassociation Request frame if dot11FastBSSTransitionActivated is true and the frame is being sent to an AP that advertised its FT Capability in the MDE in its Beacon or Probe Response frame (i.e., AP also has dot11FastBSSTransitionActivated is true).
13	Fast BSS Transition	An FTE is present in a Reassociation Request frame if dot11FastBSSTransitionActivated is true and dot11RSNAAuthenticationSuiteSelected is equal to an AKM suite selector value for which the Authentication type column indicates FT authentication. See Table 9-190 (i.e., part of a fast BSS transition in an RSN).
14	Resource information container (RIC)	The set of elements that formulate a RIC-Request is optionally present in a Reassociation Request frame if — dot11FastBSSTransitionActivated is true, — The FT resource request protocol is not used, — The frame is being sent to an AP that advertised its FT capability in the MDE in its Beacon or Probe Response frame (i.e., AP also has dot11FastBSSTransitionActivated is true), and — dot11RSNAAuthenticationSuiteSelected is equal to an AKM suite selector value for which the Authentication type column indicates FT authentication, or dot11RSNAActivated is flase (i.e., not in an RSN). See Table 9-190 (i.e., part of a fast BSS transition in an RSN).
15	Supported Operating Classes	The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true.
16	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true and the STA is not a STA 6G.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-66—Reassociation Request frame body *(continued)*

Order	Information	Notes
17	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true.
18	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero.
19	QoS Traffic Capability	The QoS Traffic Capability element is present if dot11QoSTrafficCapabilityActivated is true.
20	TIM Broadcast Request	The TIM Broadcast Request element is present if dot11TIMBroadcastActivated is true.
21	FMS Request	The FMS Request element is optionally present if dot11FMSActivated is true.
22	DMS Request	The DMS Request element is optionally present if dot11DMSActivated is true.
23	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true and the non-AP STA is requesting unauthenticated access to emergency services (see 11.3.5).
24	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.
25	DMG Capabilities	The DMG Capabilities element is present if dot11DMGOptionImplemented is true.
26	Multiple MAC Sublayers	The Multiple MAC Sublayers element is present if dot11MultipleMACActivated is true.
27	VHT Capabilities	The VHT Capabilities element is present in the 5 GHz band when dot11VHTOptionImplemented is true.
28	Operating Mode Notification	The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true.
29	FILS Session	The FILS Session element is optionally present if dot11FILSActivated is true; otherwise not present.
30	FILS Public Key	The FILS Public Key element is present if dot11FILSActivated is true and FILS Public Key authentication is used; otherwise not present.
31	FILS Key Confirmation	The FILS Key Confirmation element is present if dot11FILSActivated is true and FILS authentication is used; otherwise not present.
32	FILS HLP Container	One or more FILS HLP Container elements are optionally present if dot11FILSActivated is true; otherwise not present.
33	FILS IP Address Assignment	The FILS IP Address Assignment element is optionally present if dot11FILSActivated is true; otherwise not present.
34	TWT	The TWT element is optionally present if dot11TWTOptionActivated is true; otherwise not present.
35	AID Request	The AID Request element is present when dot11S1GOptionImplemented is true.
36	S1G Capabilities	The S1G Capabilities element is present if dot11S1GOptionImplemented is true; otherwise not present.

Copyright © 2025 IEEE. All rights reserved.

Table 9-66—Reassociation Request frame body *(continued)*

Order	Information	Notes
37	EL Operation	The EL Operation element is present if dot11S1GELOperationActivated is true.
38	BSS Max Idle Period	The BSS Max Idle Period element is optionally present if dot11WirelessManagementImplemented and dot11BSSMaxIdlePeriodIndicationByNonAPSTA are true, or if dot11S1GOptionImplemented is true; otherwise not present.
39	S1G Relay	The S1G Relay element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
40	Header Compression	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true.
41	MAD	The MAD element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
42	Reachable Address	The Reachable Address element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
43	S1G Relay Activation element	The S1G Relay Activation element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
44	CDMG Capabilities	The CDMG Capabilities element is present if dot11CDMGOptionImplemented is true; otherwise not present.
45	CMMG Capabilities	The CMMG Capabilities element is present when dot11CMMGOptionImplemented is true; otherwise not present.
46	OCI	OCI element is present if dot11FILSActivated and dot11RSNAOperatingChannelValidationActivated are both true; otherwise not present.
47	GLK-GCR Parameter Set	The GLK-GCR Parameter Set element is present if dot11GLKImplemented is true to indicate the number of reorder buffers the STA has to support GLK-GCR with GCR block ack and respond to corresponding GLK-GCR BlockAckReq frames. Otherwise this element is not present.
48	RSN Extension	The RSNXE is present if any subfield of the Extended RSN Capabilities field in this element is nonzero, except the Field Length subfield and, in the case of FT reassociation, the rules for FT reassociation in Table 13-1 do not omit the RSNXE from the third message.
49	Supplemental Class 2 Capabilities	The Supplemental Class 2 Capabilities element is present when dot11Class2CapabilitiesOptionImplemented is true; otherwise not present.
50	MSCS Descriptor	The MSCS Descriptor element is optionally present if dot11MSCSActivated is true; otherwise not present.
51	HE Capabilities	The HE Capabilities element is present if dot11HEOptionImplemented is true; otherwise, it is not present.
52	Channel Switch Timing	The Channel Switch Timing element is optionally present if dot11HESubchannelSelectiveTransmissionImplemented is true; otherwise, it is not present.
53	HE 6 GHz Band Capabilities	The HE 6 GHz Band Capabilities element is present if dot11HEOptionImplemented and dot11HE6GOptionImplemented are true.

Table 9-66—Reassociation Request frame body *(continued)*

Order	Information	Notes
54	UL MU Power Capabilities	The UL MU Power Capabilities element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
55	EDMG Capabilities	The EDMG Capabilities element is present if dot11EDMGOptionImplemented is true.
56	QoS Triggered Unscheduled	The QoS Triggered Unscheduled element is optionally present if dot11EDMGOptionImplemented is true.
57	Unsolicited Block Ack Extension	The Unsolicited Block Ack Extension element is optionally present if dot11UnsolicitedBAActivated is true and is absent otherwise.
58	TDD Slot Schedule	The TDD Slot Schedule element is optionally present if dot11DMGOptionImplemented is true.
59	TDD Route	This element is optionally present if dot11TDDOptionImplemented is true; otherwise, not present. If present, the element specifies the TDD beamforming results.
60	WUR Capabilities	The WUR Capabilities element is present when dot11WUROptionImplemented is true; otherwise it is not present.
61	WUR Mode	The WUR Mode element is optionally present when dot11WUROptionImplemented is true; otherwise, it is not present.
62	Diffie-Hellman Parameter	The Diffie-Hellman Parameter element is optionally present when performing OWE; otherwise it is not present.
63	Known STA Identification	The Known STA Identification element is optionally present if dot11RSNAActivated is true and the recipient of the frame has indicated support for this element in its Extended Capabilities field; otherwise not present.
64	Non-AP STA Regulatory Connectivity	The Non-AP STA Regulatory Connectivity element is optionally present if dot11ExtendedRegInfoSupport is true.
Last	Vendor Specific	One or more Vendor Specific elements are optionally present.

9.3.3.8 Reassociation Response frame format

The frame body of a Reassociation Response frame contains the information shown in Table 9-67.

Table 9-67—Reassociation Response frame body

Order	Information	Notes
1	Capability Information	See 9.4.1.4 for Capability Information field format.
2	Status Code	
3	AID	This field is not present when dot11S1GOptionImplemented is true.
4	Supported Rates and BSS Membership Selectors	See 11.1.4.6 for details on the inclusion of this element when dot11S1GOptionImplemented or dot11DMGOptionImplemented is true.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-67—Reassociation Response frame body *(continued)*

Order	Information	Notes
5	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if the number of supported rates and BSS membership selectors together exceed eight; it is optional otherwise. See 11.1.4.6 for details on the inclusion of this element when dot11S1GOptionImplemented or dot11DMGOptionImplemented is true.
6	EDCA Parameter Set	The EDCA Parameter Set element is present if dot11QosOptionImplemented is true; otherwise not present.
7	RCPI	The RCPI element is present if dot11RMRCPIMeasurementActivated is true.
8	RSNI	The RSNI element is present if dot11RMRSNIMeasurementActivated is true.
9	RM Enabled Capabilities	RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true.
10	RSN	An RSNE is present in a Reassociation Response frame if dot11FastBSSTransitionActivated is true, dot11RSNAActivated is true, and this frame is a response to a Reassociation Request frame that contained an FTE (i.e., part of a fast BSS transition in an RSN); or if dot11FILSActivated is true; or if performing OWE. Otherwise, not present.
11	Mobility Domain	An MDE is present in a Reassociation Response frame if dot11FastBSSTransitionActivated is true and this frame is a response to a Reassociation Request frame that contained an MDE (i.e., either an FT initial mobility domain association exchange or part of a fast BSS transition).
12	Fast BSS Transition	An FTE is present in a Reassociation Response frame if dot11FastBSSTransitionActivated is true, dot11RSNAActivated is true, and this frame is a response to a Reassociation Request frame that contained an MDE (i.e., either an FT initial mobility domain association exchange or part of a fast BSS transition in an RSN).
13	RIC	The set of elements that formulate a RIC-Response is present in a Reassociation Response frame if dot11FastBSSTransitionActivated is true and this frame is a response to a Reassociation Request frame that contained a RIC-Request.
14	DSE registered location	The DSE Registered Location element is present if dot11LCIDSERequired is true.
15	Timeout Interval (association comeback time)	A TIE containing the association comeback time is present when dot11RSNAActivated is true, dot11RSNAProtectedManagementFramesActivated is true, and either the reassociation is rejected with status code REFUSED_TEMPORARILY or the reassociation request is accepted with a status code 0 and when dot11S1GOptionImplemented is true.
16	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true and the STA is not a STA 6G.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-67—Reassociation Response frame body *(continued)*

Order	Information	Notes
17	HT Operation	The HT Operation element is included by an AP when dot11HighThroughputOptionImplemented is true and the AP is not a STA 6G.
18	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true.
19	Overlapping BSS Scan Parameters	The Overlapping BSS Scan Parameters element is optionally present if dot11FortyMHzOptionImplemented is true.
20	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero.
21	BSS Max Idle Period	The BSS Max Idle Period element is present if dot11WirelessManagementImplemented is true or optionally present if dot11S1GOptionImplemented is true.
22	TIM Broadcast Response	The TIM Broadcast Response element is present if dot11TIMBroadcastActivated is true and the TIM Broadcast Request element is present in the Reassociation Request frame that elicited this Reassociation Response frame.
23	FMS Response	The FMS Response element is present if dot11FMSActivated is true and the FMS Request element is present in the Reassociation Request frame that elicited this Reassociation Response frame.
24	DMS Response	The DMS Response element is present if dot11DMSActivated is true and the DMS Request element is present in the Reassociation Request frame that elicited this Reassociation Response frame.
25	QoS Map	The QoS Map element is present if dot11QosMapActivated is true and the QoS Map field in the Extended Capabilities element of the corresponding Reassociation Request frame is 1.
26	QMF Policy	The QMF Policy element is present if dot11QMFActivated is true and the QMFActivated subfield is 1 in the Extended Capabilities element in the Reassociation Request that elicited this Reassociation Response frame.
27	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.
28	DMG Capabilities	The DMG Capabilities element is present if dot11DMGOptionImplemented is true.
29	DMG Operation	The DMG Operation element is present if dot11DMGOptionImplemented is true.
30	Multiple MAC Sublayers	The Multiple MAC Sublayers element is present if dot11MultipleMACActivated is true.
31	Neighbor Report	One or more Neighbor Report elements is present if the Status Code field is REJECTED_WITH_SUGGESTED_BSS_TRANSITION.
32	VHT Capabilities	The VHT Capabilities element is present in the 5 GHz band when dot11VHTOptionImplemented is true.
33	VHT Operation	The VHT Operation element is present when dot11VHTOptionImplemented is true and the STA is not a STA 6G and is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.

Table 9-67—Reassociation Response frame body *(continued)*

Order	Information	Notes
34	Operating Mode Notification	The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true.
35	Future Channel Guidance	The Future Channel Guidance element is optionally present if dot11FutureChannelGuidanceActivated is true.
36	FILS Session	The FILS Session element is present if dot11FILSActivated is true and FILS authentication is used; otherwise not present.
37	FILS Public Key	The FILS Public Key element is present if dot11FILSActivated is true and FILS Public Key authentication is used; otherwise not present.
38	FILS Key Confirmation	The FILS Key Confirmation element is present if dot11FILSActivated is true and FILS authentication is used; otherwise not present.
39	FILS HLP Container	One or more FILS HLP Container elements are optionally present if dot11FILSActivated is true; otherwise not present.
40	FILS IP Address Assignment	The FILS IP Address Assignment element is optionally present if dot11FILSActivated is true; otherwise not present.
41	Key Delivery	The Key Delivery element is present if dot11FILSActivated is true and FILS authentication is used; otherwise not present.
42	S1G Sector Operation	The S1G Sector Operation element is optionally present if dot11S1GSectorizationActivated is true; otherwise not present.
43	TWT	The TWT element is present if dot11TWTOptionActivated is true, dot11HEOptionImplemented is not true, and the TWT element is present in the Reassociation Request frame that elicited this Reassociation Response frame. The TWT element is optionally present if dot11TWTOptionActivated is true, dot11HEOptionImplemented is true, and the TWT Requester Support field in the HE Capabilities element in the Reassociation Request frame that elicited this Reassociation Response frame is 1. Otherwise, the TWT element is not present.
44	TSF Timer Accuracy	The TSF Timer Accuracy element is optionally present when dot11TSFTimerAccuracyImplemented is true; otherwise not present.
45	S1G Capabilities	The S1G Capabilities element is present if dot11S1GOptionImplemented is true; otherwise not present.
46	S1G Operation	The S1G Operation element is present when dot11S1GOptionImplemented is true; otherwise not present.
47	AID Response	The AID Response element is present when dot11S1GOptionImplemented is true.
48	Sectorized Group ID List	The Sectorized Group ID List element is optionally present when dot11S1GSectorizationActivated is true; otherwise not present.
49	S1G Relay	The S1G Relay element is optionally present if dot11RelayAPImplemented is true; otherwise not present.
50	Header Compression	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true.

Table 9-67—Reassociation Response frame body *(continued)*

Order	Information	Notes
51	SST Operation	The SST Operation element is present if dot11SelectiveSubchannelTransmissionPermitted is true.
52	MAD	The MAD element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
53	S1G Relay Activation	The S1G Relay Activation element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
54	CDMG Capabilities	The CDMG Capabilities element is present if dot11CDMGOptionImplemented is true; otherwise not present.
55	CMMG Capabilities	The CMMG Capabilities element is present when dot11CMMGOptionImplemented is true; otherwise not present.
56	CMMG Operation	The CMMG Operation element is present when dot11CMMGOptionImplemented is true; otherwise not present.
56	OCI	The OCI element is present if dot11FILSActivated and dot11RSNAOperatingChannelValidationActivated are both true; otherwise not present.
58	GLK-GCR Parameter Set	The GLK-GCR Parameter Set element is present if dot11GLKimplemented is true and the AP has set up a GLK-GCR for group transmissions over the underlying general link. Otherwise this element is not present.
59	RSN Extension	The RSNXE is present if any subfield of the Extended RSN Capabilities field in this element is nonzero, except the Field Length subfield and, in the case of FT reassociation, the rules for FT reassociation in Table 13-1 do not omit the RSNXE from the fourth message.
60	MSCS Descriptor	The MSCS Descriptor element is optionally present if dot11MSCSActivated is true; otherwise not present.
61	HE Capabilities	The HE Capabilities element is present if dot11HEOptionImplemented is true; otherwise, it is not present.
62	HE Operation	The HE Operation element is present if dot11HEOptionImplemented is true; otherwise, it is not present.
63	BSS Color Change Announcement	The BSS Color Change Announcement element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
64	Spatial Reuse Parameter Set	The Spatial Reuse Parameter Set element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
65	MU EDCA Parameter Set	The MU EDCA Parameter Set element is present if dot11HEOptionImplemented is true and dot11MUEDCAParametersActivated is true; otherwise, it is not present.
66	UORA Parameter Set	The UORA Parameter Set element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
67	ESS Report	The ESS Report element is optionally present.
68	NDP Feedback Report Parameter Set	The NDP Feedback Report Parameter Set element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.

Table 9-67—Reassociation Response frame body *(continued)*

Order	Information	Notes
69	HE 6 GHz Band Capabilities	The HE 6 GHz Band Capabilities element is present if dot11HEOptionImplemented and dot11HE6GOptionImplemented are true.
70	EDMG Capabilities	The EDMG Capabilities element is present if dot11EDMGOptionImplemented is true.
71	EDMG Operation	The EDMG Operation element is present if dot11EDMGOptionImplemented is true.
72	QoS Triggered Unscheduled	The QoS Triggered Unscheduled element is optionally present if dot11EDMGOptionImplemented is true.
73	Unsolicited Block Ack Extension	The Unsolicited Block Ack Extension element is optionally present if dot11UnsolicitedBAActivated is true and is absent otherwise.
74	TDD Slot Structure	The TDD Slot Structure element is optionally present if dot11DMGOptionImplemented is true.
75	TDD Slot Schedule	The TDD Slot Schedule element is optionally present if dot11DMGOptionImplemented is true.
76	TDD Route	This element is optionally present if dot11TDDOptionImplemented is true; otherwise, not present. If present, the element specifies the TDD sector switch configuration.
77	WUR Capabilities	The WUR Capabilities element is present when dot11WUROptionImplemented is true; otherwise it is not present.
78	WUR Operation	The WUR Operation element is present when dot11WUROptionImplemented is true; otherwise it is not present.
79	WUR Mode	The WUR Mode element is present when dot11WUROptionImplemented is true, and the WUR Mode element is present in the Reassociation Request frame that solicited this Reassociation Response frame; otherwise it is not present.
80	Diffie-Hellman Parameter	The Diffie-Hellman Parameter element is optionally present when performing OWE; otherwise it is not present.
Last	Vendor Specific	One or more Vendor Specific elements are optionally present.

9.3.3.9 Probe Request frame format

The frame body of a Probe Request frame contains the information shown in Table 9-68.

Table 9-68—Probe Request frame body

Order	Information	Notes
1	SSID	If dot11MeshActivated is true, the SSID element is the wildcard value as described in 9.4.2.2.
2	Supported Rates and BSS Membership Selectors	See 11.1.4.6 for details on the inclusion of this element when dot11S1GOptionImplemented or dot11DMGOptionImplemented is true.
3	Request	The Request element is optionally present.
4	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if the number of supported rates and BSS membership selectors together exceed eight; it is optional otherwise. See 11.1.4.6 for details on the inclusion of this element when dot11S1GOptionImplemented or dot11DMGOptionImplemented is true.
5	DSSS Parameter Set	The element is optionally present. The DSSS Parameter Set element is present within Probe Request frames generated by STAs using Clause 15, Clause 16, or Clause 18 PHYs if dot11RadioMeasurementActivated is true. The DSSS Parameter Set element is present within Probe Request frames generated by STAs using a Clause 19 PHY in the 2.4 GHz band if dot11RadioMeasurementActivated is true. The DSSS Parameter Set element is optionally present within Probe Request frames generated by STAs using Clause 15, Clause 16, or Clause 18 PHYs if dot11RadioMeasurementActivated is false. The DSSS Parameter Set element is optionally present within Probe Request frames generated by STAs using a Clause 19 PHY in the 2.4 GHz band if dot11RadioMeasurementActivated is false.
6	Supported Operating Classes	The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true. The Supported Operating Classes element is optionally present if dot11TVHTOptionImplemented is true.
7	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true and the STA is not a STA 6G.
8	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true.
9	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero.
10	SSID List	The SSID List element is optionally present if dot11SSIDListActivated is true.
11	Channel Usage	One or more Channel Usage elements are optionally present if dot11ChannelUsageActivated is true.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-68—Probe Request frame body *(continued)*

Order	Information	Notes
12	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true.
13	Mesh ID	The Mesh ID element is present if dot11MeshActivated is true.
14	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.
15	DMG Capabilities	The DMG Capabilities element is present if dot11DMGOptionImplemented is true.
16	Multiple MAC Sublayers	The Multiple MAC Sublayers element is present if dot11MultipleMACActivated is true.
17	VHT Capabilities	The VHT Capabilities element is present in the 5 GHz band when dot11VHTOptionImplemented is true.
18	Estimated Service Parameters Inbound	The Estimated Service Parameters Inbound element is optionally present if dot11EstimatedServiceParametersInboundOptionImplemented is true.
19	Extended Request	One or more Extended Request elements are optionally present (if more than one Extended Request element is present the Requested Element ID fields differ).
20	FILS Request Parameters	The FILS Request Parameters element is optionally present if dot11FILSActivated is true; otherwise not present.
21	AP-CSN	The AP-CSN element is optionally present if dot11FILSActivated is true; otherwise not present.
22	Change Sequence	The Change Sequence element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
23	S1G Relay Discovery	The S1G Relay Discovery element is optionally present if dot11RelayDiscoveryOptionImplemented is true; otherwise not present.
24	PV1 Probe Response Option	The PV1 Probe Response Option element is optionally present if dot11PV1ProbeResponseOptionImplemented is true; otherwise not present.
25	S1G Capabilities	The S1G Capabilities element is present if dot11S1GOptionImplemented is true; otherwise not present.
26	EL Operation	The EL Operation element is present if dot11S1GELOperationActivated is true.
27	MAD	The MAD element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
28	Vendor Specific Request	The Vendor Specific Request element is optionally present.
29	CDMG Capabilities	The CDMG Capabilities element is present if dot11CDMGOptionImplemented is true; otherwise not present.
30	Cluster Probe	The Cluster Probe element is optionally present if dot11ClusteringActivated is true; otherwise not present.
31	CMMG Capabilities	The CMMG Capabilities element is present when dot11CMMGOptionImplemented is true; otherwise not present.

Table 9-68—Probe Request frame body *(continued)*

Order	Information	Notes
32	Estimated Services Parameters Outbound	The Estimated Service Parameters Outbound element is optionally present if dot11EstimatedServiceParametersOutboundOptionImplemented is true.
33	Supplemental Class 2 Capabilities	The Supplemental Class 2 Capabilities element is present when dot11Class2CapabilitiesOptionImplemented is true; otherwise not present.
34	HE Capabilities	The HE Capabilities element is present if dot11HEOptionImplemented is true; otherwise, it is not present.
35	Known BSSID	The Known BSSID element is optionally present if dot11MultiBSSIDImplemented is true.
36	HE 6 GHz Band Capabilities	The HE 6 GHz Band Capabilities element is present if dot11HEOptionImplemented and dot11HE6GOptionImplemented are true.
37	Short SSID List	The Short SSID List element is optionally present if dot11ShortSSIDListImplemented is true; otherwise, it is not present.
38	TWT Constraint Parameters	The TWT Constraint Parameters element is optionally present if dot11TWTOptionActivated is true; otherwise, it is not present.
39	EDMG Capabilities	The EDMG Capabilities element is present if dot11EDMGOptionImplemented is true.
40	Unsolicited Block Ack Extension	The Unsolicited Block Ack Extension element is optionally present if dot11UnsolicitedBAActivated is true and is absent otherwise.
41	WUR Capabilities	The WUR Capabilities element is present when dot11WUROptionImplemented is true; otherwise it is not present.
42	Non-AP STA Regulatory Connectivity	The Non-AP STA Regulatory Connectivity element is optionally present if dot11ExtendedRegInfoSupport is true.
Last	Vendor Specific	One or more Vendor Specific elements are optionally present.

9.3.3.10 Probe Response frame format

The frame body of a Probe Response frame contains the information shown in Table 9-69. See additional details and procedures in 11.1.4.

Table 9-69—Probe Response frame body

Order	Information	Notes
1	Timestamp	See 9.4.1.10 for Timestamp field format.
2	Beacon Interval	See 9.4.1.3 for Beacon Interval field format.
3	Capability Information	See 9.4.1.4 for Capability Information field format.
4	SSID	If dot11MeshActivated is true, the SSID element is the wildcard value as described in 9.4.2.2.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-69—Probe Response frame body *(continued)*

Order	Information	Notes
5	Supported Rates and BSS Membership Selectors	See 11.1.4.6 for details on the inclusion of this element when dot11S1GOptionImplemented or dot11DMGOptionImplemented is true.
6	DSSS Parameter Set	The element is optionally present. The DSSS Parameter Set element is present within Probe Response frames generated by STAs using Clause 15, Clause 16, and Clause 18 PHYs. The DSSS Parameter Set element is present within Probe Response frames generated by STAs using a Clause 19 PHY in the 2.4 GHz band.
7	IBSS Parameter Set	The IBSS Parameter Set element is present only within Probe Response frames generated by IBSS STAs.
8	Country	The Country element is present if dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
9	Power Constraint	The Power Constraint element is present if dot11SpectrumManagementRequired is true and is optionally present if dot11RadioMeasurementActivated is true.
10	Channel Switch Announcement	The Channel Switch Announcement element is optionally present if dot11SpectrumManagementRequired is true or dot11ExtendedChannelSwitchActivated is true.
11	Quiet	The Quiet element is optionally present if dot11SpectrumManagementRequired is true or if dot11RadioMeasurementActivated is true.
12	IBSS DFS	The IBSS DFS element is present if dot11SpectrumManagementRequired is true in an IBSS.
13	TPC Report	The TPC Report element is present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
14	ERP	The ERP element is present within Probe Response frames generated by STAs using ERPs and is optionally present otherwise.
15	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if the number of supported rates and BSS membership selectors together exceed eight; it is optional otherwise. See 11.1.4.6 for details on the inclusion of this element when dot11S1GOptionImplemented or dot11DMGOptionImplemented is true.
16	RSN	The RSNE is present if dot11RSNAActivated is true; otherwise not present.
17	BSS Load	The BSS Load element is present if dot11QosOptionImplemented and dot11QBSSLoadImplemented are both true.
18	EDCA Parameter Set	The EDCA Parameter Set element is present if dot11QosOptionImplemented is true and dot11MeshActivated is false.
19	Measurement Pilot Transmission	The Measurement Pilot Transmission element is present if dot11RMMeasurementPilotActivated is between 2 and 7.

Table 9-69—Probe Response frame body *(continued)*

Order	Information	Notes
20	Multiple BSSID	One or more Multiple BSSID elements are present if the AP is a member of a multiple BSSID set (see 11.10.14) with two or more members and any of the following conditions are true: • dot11MultiBSSIDImplemented is true • dot11MultiBSSIDImplemented is false and dot11RMMeasurementPilotActivated is between 2 and 7 • dot11FILSActivated is true • dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID exists
21	RM Enabled Capabilities	The RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true.
22	AP Channel Report	If dot11RMAPChannelReportActivated is true, one AP Channel Report element is optionally present for each operating class that has at least 1 channel to report.
23	BSS Average Access Delay	The BSS Average Access Delay element is optionally present if dot11RMBSSAverageAccessDelayActivated is true and the AP Average Access Delay field is not equal to 255 (measurement not available).
24	Antenna	The Antenna element is optionally present if dot11RMAntennaInformationActivated is true and the Antenna ID field is not equal to 0 (unknown antenna).
25	BSS Available Admission Capacity	The BSS Available Admission Capacity element is optionally present if dot11RMBSSAvailableAdmissionCapacityActivated is true with the following exceptions: 1) when Available Admission Capacity Bitmask equals 0 (Available Admission Capacity List contains no entries), or 2) when the BSS Load element is present and the Available Capacity Bitmask equals 256 (Available Admission Capacity List contains only the AC_VO entry).
26	BSS AC Access Delay	The BSS AC Access Delay element is optionally present if dot11RMBSSAverageAccessDelayActivated is true and at least one field of the element is not equal to 255 (measurement not available).
27	Mobility Domain	The MDE is present if dot11FastBSSTransitionActivated is true.
28	DSE registered location	The DSE Registered Location element is present if dot11LCIDSERequired is true.
29	Extended Channel Switch Announcement	The Extended Channel Switch Announcement element is optionally present if dot11ExtendedChannelSwitchActivated is true.
30	Supported Operating Classes	The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true. The Supported Operating Classes element is optionally present if dot11TVHTOptionImplemented is true.
31	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true and the STA is not a STA 6G.
32	HT Operation	The HT Operation element is included by an AP and a mesh STA when dot11HighThroughputOptionImplemented is true and the AP is not a STA 6G.
33	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true.

Table 9-69—Probe Response frame body *(continued)*

Order	Information	Notes
34	Overlapping BSS Scan Parameters	The Overlapping BSS Scan Parameters element is optionally present if dot11FortyMHzOptionImplemented is true.
35	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero.
36	QoS Traffic Capability	The QoS Traffic Capability element is optionally present if dot11ACStationCountActivated is true.
37	Channel Usage	One or more Channel Usage elements are present if at least one Channel Usage element is present in the Probe Request frame and dot11ChannelUsageActivated is true.
38	Time Advertisement	The Time Advertisement element is present if dot11UTCTSFOffsetActivated is true.
39	Time Zone	The Time Zone element is present if dot11UTCTSFOffsetActivated is true.
40	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true.
41	Advertisement Protocol	Advertisement Protocol element is present if dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID exists.
42	Roaming Consortium	The Roaming Consortium element is present if dot11InterworkingServiceActivated is true and the dot11RoamingConsortiumTable has at least one entry.
43	Emergency Alert Identifier	One or more Emergency Alert Identifier elements are present if dot11EASActivated is true and there are one or more EAS message(s) active in the network.
44	Mesh ID	The Mesh ID element is present if dot11MeshActivated is true.
45	Mesh Configuration	The Mesh Configuration element is present if dot11MeshActivated is true.
46	Mesh Awake Window	The Mesh Awake Window element is optionally present if dot11MeshActivated is true.
47	Beacon Timing	The Beacon Timing element is optionally present if both dot11MeshActivated and dot11MBCAActivated are true.
48	MCCAOP Advertisement Overview	The MCCAOP Advertisement Overview element is optionally present if both dot11MeshActivated and dot11MCCAActivated are true.
49	MCCAOP Advertisement	One or more MCCAOP Advertisement elements are optionally present if both dot11MeshActivated and dot11MCCAActivated are true.
50	Mesh Channel Switch Parameters	The Mesh Channel Switch Parameters element is present if dot11MeshActivated is true and either Channel Switch Announcement element or Extended Channel Switch Announcement element is present.
51	QMF Policy	The QMF Policy element is present if dot11QMFActivated is true and the QMFActivated subfield is 1 in the Extended Capabilities element in the Probe Request that elicited this Probe Response frame.

Table 9-69—Probe Response frame body *(continued)*

Order	Information	Notes
52	QLoad Report	The QLoad Report element is present if dot11QLoadReportActivated is true.
53	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.
54	DMG Capabilities	The DMG Capabilities element is present if dot11DMGOptionImplemented is true.
55	DMG Operation	The DMG Operation element is present if dot11DMGOptionImplemented is true.
56	Multiple MAC Sublayers	The Multiple MAC Sublayers element is present if dot11MultipleMACActivated is true.
57	Antenna Sector ID Pattern	The Antenna Sector ID Pattern element is optionally present if dot11DMGOptionImplemented is true.
58	VHT Capabilities	The VHT Capabilities element is present in the 5 GHz band when dot11VHTOptionImplemented is true.
59	VHT Operation	The VHT Operation element is present when dot11VHTOptionImplemented is true and the STA is not a STA 6G and is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
60	Transmit Power Envelope element	One Transmit Power Envelope element is present for each distinct combination of values of the Maximum Transmit Power Interpretation subfield and Maximum Transmit Power Category subfield that is supported for the BSS if both of the following conditions are met: Either dot11VHTOptionImplemented or dot11ExtendedSpectrumManagementImplemented is true. Either dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true. Otherwise, this element is not present. NOTE—In a 6 GHz HE AP, both dot11VHTOptionImplemented (see 26.17.1) and dot11SpectrumManagementRequired (see 26.17.2.1) are true.
61	Channel Switch Wrapper element	The Channel Switch Wrapper element is optionally present if dot11VHTOptionImplemented or dot11ExtendedSpectrumManagementImplemented is true and at least one of a Channel Switch Announcement element or an Extended Channel Switch Announcement element is also present in the Probe Response frame and the Channel Switch Wrapper element contains at least one subelement. The Channel Switch Wrapper element is optionally present if dot11S1GOptionImplemented is true and Extended Channel Switch Announcement element is present in the Probe Response frame.
62	Extended BSS Load element	The Extended BSS Load element is optionally present if dot11QBSSLoadImplemented and dot11VHTOptionImplemented are both true.
63	Quiet Channel	Either one Quiet Channel element containing an AP Quiet Mode field equal to 0 or, in an infrastructure BSS, one or more Quiet Channel elements each containing an AP Quiet Mode field equal to 1 are optionally present if dot11VHTOptionImplemented is true, and either dot11SpectrumManagementRequired or dot11RadioMeasurementActivated is true.

Table 9-69—Probe Response frame body *(continued)*

Order	Information	Notes
64	Operating Mode Notification	The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true.
65	Reduced Neighbor Report	One or more Reduced Neighbor Report elements are optionally present if dot11TVHTOptionImplemented, dot11FILSActivated, or dot11ColocatedRNRImplemented is true; otherwise, they are not present.
66	TVHT Operation	The TVHT Operation element is present for a TVHT STA when dot11TVHTOptionImplemented is true; otherwise it is not present.
67	Estimated Service Parameters Inbound	The Estimated Service Parameters Inbound element is optionally present if dot11EstimatedServiceParametersInboundOptionImplemented is true.
68	Relay Capabilities	The Relay Capabilities element is present if dot11RelayActivated is true; otherwise not present.
69	CAG Number	The CAG Number element is optionally present if dot11FILSActivated is true; otherwise not present.
70	FILS Indication	The FILS Indication element is present if dot11FILSActivated is true; otherwise not present.
71	AP-CSN	The AP-CSN element is optionally present if dot11FILSActivated is true; otherwise not present.
72	DILS	The DILS element is optionally present if dot11FILSActivated is true; otherwise not present.
73	RPS	The RPS element is optionally present if dot11RAWOperationActivated is true; otherwise not present.
74	Page Slice	The Page Slice element is optionally present if dot11PageSlicingActivated is true; otherwise not present.
75	Change Sequence	The Change Sequence element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
76	TSF Timer Accuracy	The TSF Timer Accuracy element is optionally present when dot11TSFTimerAccuracyImplemented is true; otherwise not present.
77	S1G Relay Discovery	The S1G Relay Discovery element is optionally present if dot11RelayDiscoveryOptionImplemented is true; otherwise not present.
78	S1G Capabilities	The S1G Capabilities element is present if dot11S1GOptionImplemented is true; otherwise not present.
79	S1G Operation	The S1G Operation element is present when dot11S1GOptionImplemented is true; otherwise not present.
80	MAD	The MAD element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
81	Short Beacon Interval	The Short Beacon Interval element is present if dot11ShortBeaconInterval is true.
82	S1G Open-Loop Link Margin Index	The S1G Open-Loop Link Margin Index element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-69—Probe Response frame body *(continued)*

Order	Information	Notes
83	S1G Relay	The S1G Relay element is optionally present if dot11RelayAPImplemented is true; otherwise not present.
84	Max Channel Switch Time	The Max Channel Switch Time element is optionally present when a Channel Switch Announcement or an Extended Channel Switch Announcement element is also present.
85	CDMG Capabilities	The CDMG Capabilities element is present if dot11CDMGOptionImplemented is true; otherwise not present.
86	Extended Cluster Report	The Extended Cluster Report element is optionally present if dot11ClusteringActivated is true; otherwise not present.
87	CMMG Capabilities	The CMMG Capabilities element is present when dot11CMMGOptionImplemented is true; otherwise not present.
88	CMMG Operation	The CMMG Operation element is present when dot11CMMGOptionImplemented is true; otherwise not present.
89	Estimated Services Parameters Outbound	The Estimated Service Parameters Outbound element is optionally present if dot11EstimatedServiceParametersOutboundOptionImplemented is true.
90	Service Hint	The Service Hint element is optionally present if dot11UnsolicitedPADActivated is true.
91	Service Hash	The Service Hash element is optionally present if dot11UnsolicitedPADActivated is true.
92	RSN Extension	The RSNXE is present if any subfield of the Extended RSN Capabilities field in this element is nonzero, except the Field Length subfield.
93	Multiple BSSID Configuration	The Multiple BSSID Configuration element is optionally present if dot11MultiBSSIDImplemented is true.
94	HE Capabilities	The HE Capabilities element is present if dot11HEOptionImplemented is true; otherwise, it is not present.
95	HE Operation	The HE Operation element is present if dot11HEOptionImplemented is true; otherwise, it is not present.
96	TWT	The TWT element is optionally present within broadcast Probe Response frames if dot11TWTOptionActivated, dot11HEOptionImplemented and dot11FILSOmitReplicateProbeResponses are true; otherwise, it is not present. If the TWT element is present, then the Negotiation Type subfield of the TWT element is 2.
97	UORA Parameter Set	The UORA Parameter Set element is optionally present if dot11OFDMARandomAccessOptionImplemented is true; otherwise, it is not present.
98	BSS Color Change Announcement	The BSS Color Change Announcement element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
99	Spatial Reuse Parameter Set	The Spatial Reuse Parameter Set element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.

Table 9-69—Probe Response frame body *(continued)*

Order	Information	Notes
100	MU EDCA Parameter Set	The MU EDCA Parameter Set element is present if dot11HEOptionImplemented is true and dot11MUEDCAParametersActivated is true; otherwise, it is not present.
101	ESS Report	The ESS Report element is optionally present.
102	NDP Feedback Report Parameter Set	The NDP Feedback Report Parameter Set element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
103	HE BSS Load	The HE BSS Load element is optionally present if dot11QBSSLoadImplemented and dot11HEOptionImplemented are true.
104	HE 6 GHz Band Capabilities	The HE 6 GHz Band Capabilities element is present if dot11HEOptionImplemented and dot11HE6GOptionImplemented are true.
105	TWT Constraint Parameters	The TWT Constraint Parameters element is optionally present if dot11TWTOptionActivated is true; otherwise, it is not present.
106	EDMG Capabilities	The EDMG Capabilities element is present if dot11EDMGOptionImplemented is true.
107	EDMG Operation	The EDMG Operation element is present if dot11EDMGOptionImplemented is true.
108	Unsolicited Block Ack Extension	The Unsolicited Block Ack Extension element is optionally present if dot11UnsolicitedBAActivated is true and is absent otherwise.
109	WUR Capabilities	The WUR Capabilities element is present when dot11WUROption-Implemented is true; otherwise it is not present.
110	WUR Operation	The WUR Operation element is present when dot11WUROption-Implemented is true; otherwise it is not present.
111	WUR Discovery	The WUR Discovery element is optionally present if dot11WUROptionImplemented is true and either dot11WURDiscoveryImplemented or dot11WURNeighborDiscoveryImplemented is true; otherwise it is not present.
112	Authentication Control	The Authentication Control element is optionally present when dot11S1GCentralizedAuthenticationControlActivated is true or dot11S1GDistributedAuthenticationControlActivated is true; otherwise it is not present.
113	EBCS Parameters	This element is present if dot11EBCSSupportActivated is true and the length of dot11EBCSTrafficStreamTable is larger than 0, otherwise not present.
Last–1	Vendor Specific	One or more Vendor Specific elements are optionally present.
Last	Requested elements	Elements requested by the Request element or Extended Request element(s) of the Probe Request frame are present if dot11MultiDomainCapabilityActivated or dot11EstimatedServiceParametersInboundOptionImplemented is true. See 11.1.4.3.2 and 11.44.

9.3.3.11 Authentication frame format

The frame body of an Authentication frame contains the information shown in Table 9-70. FT authentication is used when FT support is advertised by the AP and dot11FastBSSTransitionActivated is true in the STA. SAE authentication is used when dot11MeshActiveAuthenticationProtocol is sae (1). FILS authentication is used if support for FILS authentication is advertised by the AP and dot11FILSActivated is true in the STA.

Table 9-70—Authentication frame body

Order	Information	Notes
1	Authentication algorithm number	
2	Authentication transaction sequence number	
3	Status Code	The status code information is reserved in certain Authentication frames as defined in Table 9-71.
4	Finite Cyclic Group	An unsigned integer indicating a finite cyclic group as described in 9.4.1.40. This is present only in certain Authentication frames as defined in Table 9-71.
5	Anti-Clogging Token	A random bit string used for anti-clogging purposes as described in 12.4.6. This is present only in certain Authentication frames as defined in Table 9-71.
6	Send-Confirm	A binary encoding of an integer used for anti-replay purposes as described in 12.4.7.4. This is present only in certain Authentication frames as defined in Table 9-71.
7	Scalar	An unsigned integer encoded as described in 12.4.7.3. This is present only in certain Authentication frames as defined in Table 9-71.
8	FFE	An element in a finite field encoded as described in 12.4.7.3. This is present only in certain Authentication frames as defined in Table 9-71.
9	Confirm	An unsigned integer encoded as described in 12.4.7.4. This is present only in certain Authentication frames as defined in Table 9-71.
10	RSN	An RSNE is present only in certain Authentication frames as defined in Table 9-71.
11	Mobility Domain	An MDE is present only in certain Authentication frames as defined in Table 9-71.
12	Fast BSS Transition	An FTE is present only in certain Authentication frames as defined in Table 9-71.
13	Timeout Interval (reassociation deadline)	A TIE containing the reassociation deadline interval is present only in certain Authentication frames as defined in Table 9-71.
14	RIC	A resource information container, containing a variable number of elements, is present only in certain Authentication frames as defined in Table 9-71.
15	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.

Table 9-70—Authentication frame body *(continued)*

Order	Information	Notes
16	Neighbor Report	One or more Neighbor Report elements are present only in certain Authentication frames as defined in Table 9-71.
17	FILS Nonce	The FILS Nonce element is present in FILS Authentication frames as defined in Table 9-71.
18	FILS Session	The FILS Session element is present in FILS Authentication frames as defined in Table 9-71.
19	Wrapped Data	The Wrapped Data element is present in FILS Authentication frames as defined in Table 9-71.
20	Association Delay Info	The Association Delay Info element is present in FILS Authentication frames as defined in Table 9-71.
21	Password Identifier	The Password Identifier element is optionally present in certain Authentication frames as defined in Table 9-71.
22	RSNXE	The RSNXE is present only in certain Authentication frames as defined in Table 9-71
23	Rejected Groups	The Rejected Groups element is present only in certain Authentication frames as defined in Table 9-71.
24	Anti-Clogging Token Container	The Anti-Clogging Token Container element is present only in certain Authentication frames as defined in Table 9-71.
25	AKM Suite Selector	The AKM Suite Selector element is present only in certain Authentication frames as defined in Table 9-71.
26	PASN Parameters	A PASN element is present only in certain Authentication frames as defined in Table 9-71.
27	Tunneled PASN	A Tunneled PASN element is present only in certain Authentication frames as defined in Table 9-71.
Last-1	Vendor Specific	One or more Vendor Specific elements are optionally present.
Last	MIC	A MIC element is present only in certain Authentication frames as defined in Table 9-71.

Table 9-71—Presence of fields and elements in Authentication frames

Authentication algorithm	Authentication transaction sequence number	Status Code	Presence of fields and elements indicated as conditional in Table 9-70
Open System	1	Reserved	Not present
Open System	2	Not REJECTED_WITH_SUGGESTED_BSS_TRANSITION	Not present
Open System	2	REJECTED_WITH_SUGGESTED_BSS_TRANSITION	One or more Neighbor Report element(s) is present

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-71—Presence of fields and elements in Authentication frames *(continued)*

Authentication algorithm	Authentication transaction sequence number	Status Code	Presence of fields and elements indicated as conditional in Table 9-70
FT	1	Reserved	The MDE is present. The FTE and RSNE(s) are present if dot11RSNAActivated is true. The RSNXE is present if any subfield of the Extended RSN Capabilities field in this element is nonzero, except the Field Length subfield.
FT	2	Not REJECTED_WITH_SUGGESTED_BSS_TRANSITION	The MDE is present if the Status Code field is 0. The FTE and RSNE(s) are present if the Status Code field is 0 and dot11RSNAActivated is true.
FT	2	REJECTED_WITH_SUGGESTED_BSS_TRANSITION	One or more Neighbor Report element(s) is present
FT	3	Reserved	The MDE is present. The FTE and RSNE(s) are present if dot11RSNAActivated is true. The RIC element is optionally present.
FT	4	Any	The MDE is present if the Status Code field is 0. The FTE and RSNE(s) are present if dot11RSNAActivated is true. The RIC element is optionally present if the Status Code field is 0. The TIE (reassociation deadline) is present if a RIC element is present.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-71—Presence of fields and elements in Authentication frames *(continued)*

Authentication algorithm	Authentication transaction sequence number	Status Code	Presence of fields and elements indicated as conditional in Table 9-70
SAE	1	Any	The Scalar field is present if the Status Code field is zero or 126. The FFE field is present if the Status Code field is zero or 126. When the hunting-and-pecking method is used to drive the PWE, the Anti-Clogging Token field is present if the Status Code field is ANTI_CLOGGING_TOKEN_REQUIRED or if the Authentication frame is in response to a previous rejection with the Status Code field equal to ANTI_CLOGGING_TOKEN_REQUIRED. The Finite Cyclic Group field is present if the Status Code field is zero, ANTI_CLOGGING_TOKEN_REQUIRED, 77 or 126. The Password Identifier element is optionally present if the Status Code field is zero, 123 or 126. If the Status Code field is 126, the Rejected Groups element is conditionally present as described in 12.4.7.3; otherwise the Rejected Groups element is not present. When the hash-to-element method is used to derive the PWE, the Anti-Clogging Token Container element is present if the Status Code field is ANTI_CLOGGING_TOKEN_REQUIRED or if the Authentication frame is in response to a previous rejection with the Status Code field equal to ANTI_CLOGGING_TOKEN_REQUIRED. The AKM Suite Selector element is present if the intended AKM is 00-0F-AC:24 or 00-0F-AC:25 (see 12.4.5.3 and 12.4.5.4); otherwise, it is not present.
SAE	2	Not REJECTED_WITH_SUGGESTED_BSS_TRANSITION	The Send-Confirm field is present. The Confirm field is present.
SAE	2	REJECTED_WITH_SUGGESTED_BSS_TRANSITION	One or more Neighbor Report element(s) are present
FILS Shared Key authentication without PFS	1	Reserved	The RSNE is present. The MDE is present if the FILS authentication is used for FT initial mobility domain association. The FILS Nonce element is present. The FILS Session element is present. The Wrapped Data element is present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-71—Presence of fields and elements in Authentication frames *(continued)*

Authentication algorithm	Authentication transaction sequence number	Status Code	Presence of fields and elements indicated as conditional in Table 9-70
FILS Shared Key authentication without PFS	2	Status	The RSNE is present. The MDE and the FTE are present if the Status Code field is 0 and FILS authentication is used for FT initial mobility domain association. The FILS Nonce element is present if the Status Code field is 0. The FILS Session element is present if the Status Code field is 0. The Wrapped Data element is present if the Status Code field is 0. The Association Delay Info element is present if the Status Code field is 0 and the AP expects that the (Re)Association Response frame will be transmitted more than 1 TU after the (Re)Association Request frame.
FILS Shared Key authentication with PFS	1	Reserved	The Finite Cyclic Group field is present. The FFE field is present. The RSNE is present. The MDE is present if the FILS authentication is used for FT initial mobility domain association. The FILS Nonce element is present. The FILS Session element is present. The Wrapped Data element is present.
FILS Shared Key authentication with PFS	2	Status	The Finite Cyclic Group field is present if the Status Code field is 0. The FFE field is present if the Status Code field is 0. The RSNE is present. The MDE and the FTE are present if the Status Code field is 0 and FILS authentication is used for FT initial mobility domain association. The FILS Nonce element is present if the Status Code field is 0. The FILS Session element is present if the Status Code field is 0. The Wrapped Data element is present if the Status Code field is 0. The Association Delay Info element is present if the Status Code field is 0 and the AP expects that the (Re)Association Response frame will be transmitted more than 1 TU after the (Re)Association Request frame.

Table 9-71—Presence of fields and elements in Authentication frames *(continued)*

Authentication algorithm	Authentication transaction sequence number	Status Code	Presence of fields and elements indicated as conditional in Table 9-70
FILS Public Key authentication	1	Reserved	The Finite Cyclic Group field is present. The FFE field is present. The RSNE is present. The MDE is present if the FILS authentication is used for FT initial mobility domain association. The FILS Nonce element is present. The FILS Session element is present.
FILS Public Key authentication	2	Status	The Finite Cyclic Group field is present if the Status Code field is 0. The FFE field is present if the Status Code field is 0. The RSNE is present. The MDE and the FTE are present if the Status Code field is 0 and FILS authentication is used for FT initial mobility domain association. The FILS Nonce element is present if the Status Code field is 0. The FILS Session element is present if the Status Code field is 0. The Association Delay Info element is present if the Status Code field is 0 and the AP expects that the (Re)Association Response frame will be transmitted more than 1 TU after the (Re)Association Request frame.
PASN Authentication	1	Reserved	RSNE is present. RSNXE is present if any subfield of the Extended RSN Capabilities field in this element, except the Field Length subfield, is nonzero. PASN Parameters element is present. Timeout Interval element is optionally present. Wrapped Data element is present if wrapped data format in PASN Parameters element is nonzero and not reserved. Fragment element is optionally present if any of the elements are fragmented. Tunneled PASN element may be present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-71—Presence of fields and elements in Authentication frames *(continued)*

Authentication algorithm	Authentication transaction sequence number	Status Code	Presence of fields and elements indicated as conditional in Table 9-70
PASN Authentication	2	Status	RSNE is present and PASN Parameters element is present if Status Code field is 0. RSNXE is present if any subfield of the Extended RSN Capabilities field in this element, except the Field Length subfield, is nonzero. Timeout Interval element is optionally present. Wrapped data element is present if wrapped data format in PASN Parameters element is nonzero and not reserved and Status Code field is 0. MIC element is present. Fragment element may be present if any of the elements are fragmented and Status Code field is 0. Tunneled PASN element is optionally present.
PASN Authentication	3	Status	PASN Parameters element is present if Status Code field is 0. Wrapped data element is present if wrapped data format in PASN Parameters element is nonzero and not reserved; and Status Code field is 0. MIC element is present. Fragment element may be present if any of the elements are fragmented and Status Code field is 0.

9.3.3.12 Deauthentication

The frame body of a Deauthentication frame contains the information shown in Table 9-72.

Table 9-72—Deauthentication frame body

Order	Information
1	Reason code
Last – 1	One or more Vendor Specific elements are optionally present.
Last	The MME is present when management frame protection is enabled at the STA transmitting the frame and the frame is a group addressed frame.
NOTE—The MME appears last in the frame body to protect the frames as specified in 12.5.3. Since it appears last and has a fixed size, it can readily be located without parsing all the elements in the frame.	

9.3.3.13 Action frame format

The frame body of an Action frame contains the information shown in Table 9-73.

9.3.3.14 Action No Ack frame format

The frame body of an Action No Ack frame contains the information shown in Table 9-73.

NOTE—The selection of Action or Action No Ack is made per frame that uses these formats.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-73—Action frame body and Action No Ack frame body

Order	Information
1	Action
Last – 3	One or more Vendor Specific elements are optionally present. These elements are absent when the Category subfield of the Action field is Vendor-Specific, Vendor-Specific Protected, or when the Category subfield of the Action field is VHT and the VHT Action subfield of the Action field is VHT Compressed Beamforming or when the Category subfield of the Action field is HE and the HE Action subfield of the Action field is HE Compressed Beamforming/CQI.
Last – 2	The MME is present when management frame protection is enabled at the AP and the frame is a group addressed robust Action or Action No Ack frame not of a category specified with Yes in the Group addressed privacy column of Table 9-81; otherwise not present.
Last – 1	The MIC element is present in a Self-protected Action frame if a shared PMK exists between the sender and recipient of this frame; otherwise not present.
Last	The Authenticated Mesh Peering Exchange element is present in a Self-protected Action frame if a shared PMK exists between the sender and recipient of this frame; otherwise not present.
NOTE 1—The MME appears last in the frame body to protect the frames as specified in 12.5.3. Since it appears last and has a fixed size, it can readily be located without parsing all the elements in the frame. NOTE 2—The MIC element and the Authenticated Mesh Peering Exchange element appear after any fields that they protect in an individually addressed frame. Therefore, they appear last in the frame body. The Authenticated Mesh Peering Exchange element is encrypted and authenticated as specified in 14.6.3.	

Unless specified as allowing the use of the Action No Ack management frame subtype, a frame described as an “Action frame” uses only the Action subtype.

9.3.3.15 Timing Advertisement frame format

The frame body of a Timing Advertisement frame contains the information shown in Table 9-74.

Table 9-74—Timing Advertisement frame body

Order	Information	Notes
1	Timestamp	See 9.4.1.10 for Timestamp field format.
2	Capability Information	See 9.4.1.4 for Capability Information field format.
3	Country	The Country element is present if dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true.
4	Power Constraint	The Power Constraint element is optionally present if the Country element is present; otherwise not present.
5	Time Advertisement	The Time Advertisement element is optionally present. See 9.4.2.59.
6	Extended Capabilities	The Extended Capabilities element is present.
Last	Vendor specific	One or more Vendor Specific elements are optionally present.

9.3.4 Extension frames

9.3.4.1 Format of Extension frames

The format of Extension frames is defined in Figure 9-129. The MAC header of an Extension frame starts with the Frame Control field followed by the Duration field. The MAC header of different Extension frames can have different number and types of fields following the Duration field.

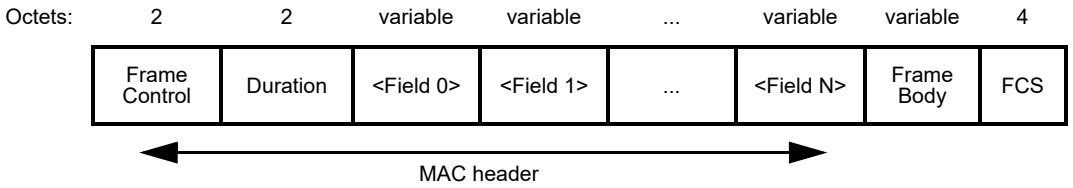

Figure 9-129—Extension frame format

9.3.4.2 DMG Beacon

The format of the DMG Beacon frame is shown in Figure 9-130.

In addition to supporting functions such as network synchronization (see 11.1), the DMG Beacon frame can also be used as a training frame for beamforming (see 10.41).

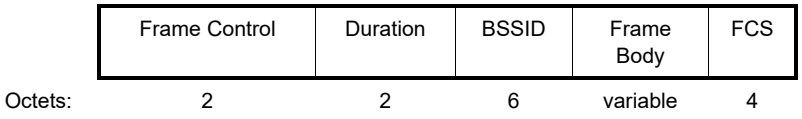

Figure 9-130—DMG Beacon frame format

The Duration field is set to the time remaining until the end of the beacon transmission interval (BTI).

The BSSID field contains the BSSID.

The Frame Body field of the DMG Beacon frame contains the elements listed in Table 9-75.

The format of the Beacon Interval Control field when the Next A-BFT subfield is 0 is shown in Figure 9-131. The format of the Beacon Interval Control field when the Next A-BFT subfield is nonzero is shown in Figure 9-132. The difference between the two formats is in the definition of the field occupying B14.

The CC Present subfield is set to 1 to indicate that the Clustering Control field is present in the DMG Beacon frame. Otherwise, the Clustering Control field is not present.

The Discovery Mode subfield is set to 1 if the STA is generating the DMG Beacon frame following the procedure described in 11.1.3.4. Otherwise, this subfield is set to 0.

The Next Beacon subfield indicates the number of beacon intervals following the current beacon interval during which the DMG Beacon frame will not be transmitted.

The ATI Present subfield is set to 1 to indicate that the announcement transmission interval (ATI) is present in the current beacon interval. Otherwise, the ATI is not present.

Table 9-75—DMG Beacon frame body

Order	Information	Notes
1	Timestamp	See 9.4.1.10
2	Sector Sweep	See 9.5.1
3	Beacon Interval	See 9.4.1.3
4	Beacon Interval Control	See Figure 9-131.
5	DMG Parameters	See 9.4.1.44
6	Clustering Control	Optional. See Figure 9-133 and Figure 9-134.
7	DMG Capabilities	The DMG Capabilities element is optionally present.
8	Extended Schedule	The Extended Schedule element is optionally present.
9	RSN	The RSNE is optionally present if dot11RSNAActivated is true.
10	Multiple BSSID	One or more Multiple BSSID elements are present if the AP is a member of a multiple BSSID set (see 11.10.14) with two or more members and any of the following conditions are true: • dot11MultiBSSIDImplemented is true • dot11MultiBSSIDImplemented is false and dot11RMMeasurementPilotActivated is between 2 and 7 • dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID exists
11	DMG Operation	The DMG Operation element is optionally present.
12	Next DMG ATI	The Next DMG ATI element is optionally present.
13	DMG BSS Parameter Change	The DMG BSS Parameter Change element is optionally present.
14	Multi-band	Zero or more Multi-band elements are present if dot11MultibandImplemented is true.
15	Awake Window	The Awake Window element is optionally present. If present, this element specifies the characteristics of the awake window of a CBAP (see 11.2.7).
16	DMG Wakeup Schedule	The DMG Wakeup Schedule element is optionally present (see 11.2.7.3.3.
17	UPSIM	The UPSIM element is optionally present (see 11.2.7.2.2).
18	SSID	The SSID element is optionally present.
19	IBSS Parameter Set	The IBSS Parameter Set element is present only within DMG Beacon frames generated by IBSS STAs.
20	Country	The Country element is optionally present if dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
21	BSS Load	The BSS Load element is optionally present if dot11QBSSLoadImplemented is true; otherwise not present.
22	EDCA Parameter Set	The EDCA Parameter Set element is optionally present if the QoS Capability element is not present.

Copyright © 2025 IEEE. All rights reserved.

Table 9-75—DMG Beacon frame body *(continued)*

Order	Information	Notes
23	Power Constraint	The Power Constraint element is optionally present if dot11SpectrumManagementRequired is true and is optionally present if dot11RadioMeasurementActivated is true.
24	Neighbor Report	The Neighbor Report element is optionally present.
25	Quiet	The Quiet element is optionally present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
26	QoS Capability	The QoS Capability element is optionally present if the EDCA Parameter Set element is not present.
27	Extended Channel Switch Announcement	The Extended Channel Switch Announcement element is optionally present if dot11ExtendedChannelSwitchActivated is true.
28	BSS Average Access Delay	The BSS Average Access Delay element is optionally present.
29	RM Enabled Capabilities	The RM Enabled Capabilities element is optionally present if dot11RadioMeasurementActivated is true.
30	Nontransmitted BSSID Capability	The Nontransmitted BSSID Capability element is optionally present.
31	Interworking	The Interworking element is optionally present if dot11InterworkingServiceActivated is true.
32	Advertisement Protocol	The Advertisement Protocol element is optionally present if dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID exists.
33	Roaming Consortium	The Roaming Consortium element is optionally present if dot11InterworkingServiceActivated is true and the dot11RoamingConsortiumTable has at least one entry.
34	STA Availability	The STA Availability element is optionally present.
35	Next PCP List	The Next PCP List element is optionally present.
36	PCP Handover	The PCP Handover element is optionally present.
37	Antenna Sector ID Pattern	The Antenna Sector ID Pattern element is optionally present.
38	CDMG Capabilities	The CDMG Capabilities element is present if dot11CDMGOptionImplemented is true; otherwise not present.
39	Dynamic Bandwidth Control	The Dynamic Bandwidth Control element is optionally present if a STA operates as an AP or PCP and dot11CDMGOptionImplemented is true; otherwise not present.
40	Cluster Probe	The Cluster Probe element is optionally present if dot11ClusteringActivated is true; otherwise not present.
41	Extended Cluster Report	The Extended Cluster Report element is optionally present if dot11ClusteringActivated is true; otherwise not present.
42	Cluster Switch Announcement	The Cluster Switch Announcement element is optionally present if dot11ClusteringActivated is true; otherwise not present.
43	Extended Cluster Report	The Extended Cluster Report element is optionally present if dot11ClusteringActivated is true; otherwise not present.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-75—DMG Beacon frame body *(continued)*

Order	Information	Notes
44	Cluster Switch Announcement	The Cluster Switch Announcement element is optionally present if dot11ClusteringActivated is true; otherwise not present.
45	SPSH Report	The SPSH Report element is optionally present if dot11ClusteringActivated is true; otherwise not present.
46	Clustering Interference Assessment	The Clustering Interference Assessment element is optionally present if dot11ClusteringActivated is true; otherwise not present.
47	CMMG Capabilities	The CMMG Capabilities element is present when dot11CMMGOptionImplemented is true; otherwise not present.
48	CMMG Operation	The CMMG Operation element is present if dot11CMMGOptionImplemented is true; otherwise not present.
49	Power Constraint	The Power Constraint element is present if dot11SpectrumManagementRequired is true and is optionally present if dot11RadioMeasurementActivated is true; otherwise not present.
50	TPC Report	The TPC Report element is present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true; otherwise not present.
51	CDMG Extended Schedule	The CDMG Extended Schedule element is optionally present.
52	Service Hint	The Service Hint element is optionally present if dot11UnsolicitedPADActivated is true.
53	Service Hash	The Service Hash element is optionally present if dot11UnsolicitedPADActivated is true.
54	Multiple BSSID Configuration	The Multiple BSSID Configuration element is optionally present if dot11MultiBSSIDImplemented is true.
55	TDD Slot Structure	This element is optionally present if dot11TDDOptionImplemented is true.
56	TDD Slot Schedule	This element is optionally present if dot11TDDOptionImplemented is true.
57	EDMG Capabilities	This element is optionally present if dot11EDMGOptionImplemented is true.
58	EDMG Operation	This element is optionally present if dot11EDMGOptionImplemented is true.
59	EDMG Extended Schedule	This element is optionally present if dot11EDMGOptionImplemented is true.
60	EDMG Group ID Set	This element is optionally present if dot11EDMGOptionImplemented is true.
61	EDMG Training Field Schedule	This element is optionally present if dot11EDMGOptionImplemented is true.
62	Time Advertisement	This element is optionally present if dot11UTCTSFOffsetActivated is true.
63	DMG OCB	This element is present if dot11DMGOCBActivated is true; otherwise not present.
Last	Vendor Specific	One or more Vendor Specific elements are optionally present.

Bits:	1	7	4	6	6	1	2	2

Figure 9-131—Beacon Interval Control field format when the Next A-BFT subfield is 0

	B0	B1	B2 B5	B6	B7B9	B10 B13	B14	B15 B18
	CC Present	Discovery Mode	Next Beacon	ATI Present	A-BFT Length	FSS	Unsolicited RSS Enabled	Next A-BFT
Bits:	1	1	4	1	3	4	1	4

	B19	B20 B26	B27 B30	B31 B36	B37 B42	B43	B44 B45	B46 B47
	Fragmented TXSS	TXSS Span	N BIs A-BFT	A-BFT Count	N A-BFT in Ant	PCP Association Ready	A-BFT Multiplier	A-BFT in Secondary Channel
Bits:	1	7	4	6	6	1	2	2

Figure 9-132—Beacon Interval Control field format when the Next A-BFT subfield is nonzero

The A-BFT Length subfield indicates the number of sector sweep slots (10.41.5) in the A-BFT following the BTI, minus 1.

The FSS subfield indicates the number of SSW frames or Short SSW PPDUs allowed per sector sweep slot (10.41.5). The subfield contains the number of SSW frames allowed minus one. The range of this subfield is 0 to 15.

The IsResponderTXSS subfield is present when the Next A-BFT subfield is 0. The IsResponderTXSS is set to 1 to indicate the A-BFT following the BTI is used for responder transmit sector sweep (TXSS). This field is set to 0 to indicate responder receive sector sweep (RXSS). When this subfield is set to 0, the FSS subfield specifies the length of a complete receive sector sweep by the STA sending the DMG Beacon frame.

The Unsolicited RSS Enabled subfield is present when the Next A-BFT subfield is nonzero. The Unsolicited RSS Enabled subfield is set to 1 to indicate that the STA is capable of receiving an unsolicited RSS in response to its BTI. This subfield is set to 0 otherwise. This subfield is ignored when received by a non-EDMG STA or when received from a non-EDMG STA.

The Next A-BFT subfield indicates the number of beacon intervals during which the A-BFT is not present. This subfield is set to 0 if the A-BFT immediately follows this BTI.

The Fragmented TXSS subfield is set to 1 to indicate the TXSS is a fragmented sector sweep and is set to 0 to indicate the TXSS is a complete sector sweep.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The TXSS Span subfield indicates the number of beacon intervals it takes for the STA sending the DMG Beacon frame to complete the TXSS phase. This subfield is always greater than or equal to 1.

The N BIs A-BFT subfield indicates the interval, in number of beacon intervals, at which the STA sending the DMG Beacon frame allocates an A-BFT. The subfield is set to 1 if every beacon interval contains an A-BFT.

The A-BFT Count subfield indicates the number of A-BFTs since the STA sending the DMG Beacon frame last switched RX DMG antennas for an A-BFT. The subfield is set to 0 if the DMG antenna used in the forthcoming A-BFT differs from the DMG antenna used in the last A-BFT. This subfield is reserved if the Number of RX DMG Antennas field within the STA's DMG Capabilities element is 1.

The N A-BFT in Ant subfield indicates how many A-BFTs the STA sending the DMG Beacon frame receives from each DMG antenna in the DMG antenna receive rotation. This subfield is reserved if the Number of RX DMG Antennas field within the STA's DMG Capabilities element is 1.

The PCP Association Ready subfield is set to 1 to indicate that the PCP is ready to receive Association Request frames from non-PCP STAs and is set to 0 otherwise. This subfield is reserved when transmitted by a non-PCP STA.

The A-BFT Multiplier subfield allows expanding the total length of the A-BFT. The total length of the A-BFT is equal to the value of the A-BFT Length subfield plus the multiplication of the value of the A-BFT Multiplier subfield and the value of the A-BFT Length subfield. This subfield is reserved if the value of the Next A-BFT subfield is nonzero.

The A-BFT in Secondary Channel subfield indicates that the A-BFT is allocated on an adjacent secondary channel, in addition to being allocated on the primary channel. If set to 0, the A-BFT is not allocated on any secondary channel. If set to a nonzero value, the A-BFT is allocated on an adjacent secondary channel as follows:

— If set to 1, the A-BFT is also present on the lower secondary channel adjacent to the primary channel.
— If set to 2, the A-BFT is also present on the upper secondary channel adjacent to the primary channel.
— If set to 3, the A-BFT is also present on both the lower and upper secondary channels adjacent to the primary channel.

The A-BFT in Secondary Channel subfield is reserved if the value of the Next A-BFT subfield is nonzero.

The DMG Parameters field is defined in 9.4.1.44.

If the Discovery Mode field is 0, the Clustering Control field is formatted as shown in Figure 9-133. If the Discovery Mode field is 1, the Clustering Control field is formatted as shown in Figure 9-134.

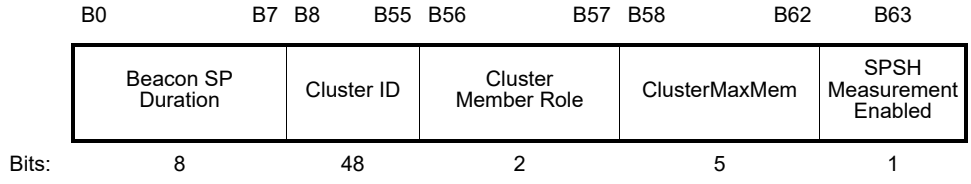

Figure 9-133—Clustering Control field format if the Discovery Mode field is 0

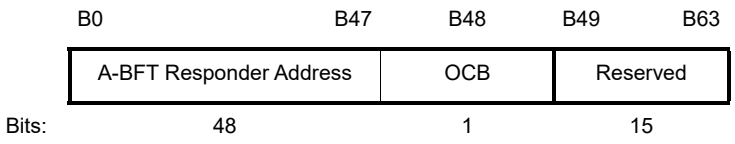

Figure 9-134—Clustering Control field format if the Discovery Mode field is 1

If ECAPC Policy Enforced field is set to 0, the Beacon SP Duration subfield indicates the duration, in units of 8 μs, of the Beacon SPs in the cluster. If ECAPC Policy Enforced field is set to 1, the Beacon SP Duration subfield indicates the maximum duration, in units of 8 μs, of the beacon header interval (BHI) of the BSS, and the minimum duration of Beacon SPs in the cluster (see 10.39.2.2).

The cluster to which the transmitter of the Clustering Control field belongs is identified by the Cluster ID subfield. The MAC address of the S-AP or synchronization PCP (S-PCP) is the Cluster ID of the cluster.

The Cluster Member Role subfield identifies the role that the transmitting STA assumes within the cluster. A 0 means that the STA is currently not participating in clustering. A 1 means that the STA acts as the S-AP or S-PCP of the cluster. A 2 means that the STA participates in the cluster, but not as the S-AP or S-PCP. The value 3 is reserved.

The ClusterMaxMem subfield defines the maximum number of PCPs and/or APs, including the S-AP or S-PCP, that can participate in the cluster. The ClusterMaxMem subfield is computed in relation to the beacon interval value (10.41.2). The value 0 is reserved. Values 8 and above are reserved if the ECAPC Policy Enforced field is set to 0. The value 1 is assigned to the S-AP or S-PCP.

The SPSH Measurement Enabled subfield is used by a CDMG S-AP or S-PCP to indicate whether the member APs or member PCPs in an AP or PCP cluster are allowed to perform channel measurement to achieve spatial sharing. If the SPSH Measurement Enabled subfield is 1, a SPSH measurement period starts. In this period, the member APs or member PCPs in an AP or PCP cluster can perform channel measurement in its BSS and spatial reuse is not allowed. If the SPSH Measurement Enabled subfield is 0, SPSH measurement terminates and SP reuse is conducted in the following time interval, i.e., APs or PCPs of the AP or PCP cluster are allowed to allocate time-overlapping SPs among different BSSs. In a DMG Beacon frame transmitted by a non-CDMG S-AP or S-PCP, the SPSH Measurement Enabled subfield is reserved.

The A-BFT Responder Address subfield contains the MAC address of the STA that is allowed to transmit during the A-BFT, if present, that follows the BTI. If all bits of the A-BFT Responder Address subfield are equal to 1 and the OCB subfield is equal to 1, any STA is allowed to transmit during the A-BFT, if present.

The OCB subfield is set to 1 to indicate the support of communication outside the context of a BSS by the STA transmitting the DMG Beacon frame.

9.3.4.3 S1G Beacon frame format

The format of the S1G Beacon is shown in Figure 9-135.

	Frame Control	Duration	SA	Time-stamp	Change Sequence	Next TBTT (optional)	Short SSID (optional)	Access Network Options (optional)	Frame Body	FCS
Octets:	2	2	6	4	1	0 or 3	0 or 4	0 or 1	variable	4

The Duration field is set to the duration of time, in microseconds, required by the paged STAs to transmit any pending QoS Null, PS-Poll or NDP PS-Poll frames as specified in 9.2.5.2.

The SA field is the address of the STA transmitting the S1G Beacon frame.

The Timestamp field contains the value of the 4 least significant octets of the STA's TSF timer at the time that the start of the data symbol containing the first bit of the Timestamp field appears at the transmit antenna connector.

The Change Sequence field is defined as an unsigned integer, initialized to 0, that increments when a critical update to the Beacon frame has occurred (see 10.45.2).

The Next TBTT field is present if the Next TBTT Present field in the Frame Control field is 1 and indicates the most significant 3 octets of the 4 least significant octets of the next TBTT. Otherwise, it is not present.

The Short SSID field is present if the Short SSID Present field in the Frame Control is 1 and indicates a 32-bit CRC calculated over the SSID contained in the S1G Beacon frame (calculation is performed as defined in 9.2.4.9 where the SSID is the calculation fields). Otherwise, it is not present.

The Access Network Options field is present if the ANO field in the Frame Control field is 1 and it is defined in 9.4.2.90 (see Figure 9-565). Otherwise, it is not present.

The Frame Body field contains the optional elements listed in Table 9-76. The minimum set of optional elements is included in an S1G Beacon frame transmitted at a TSBTT that is not a TBTT and the full set of optional elements is included in an S1G Beacon frame that is transmitted at a TBTT (see 11.1.3.10.1). See 10.28.6 on the parsing of the elements.

Table 9-76—Minimum and full set of optional elements

Order	Information	Notes	Allowed in minimum set	Allowed in full set
1	S1G Beacon Compatibility	The S1G Beacon Compatibility element is present within S1G Beacon frames generated at TBTTs.	No	Yes
2	Traffic indication map (TIM)	The TIM element is present within S1G Beacon frames generated by APs at TBTTs and is optionally present otherwise.	Yes	Yes
3	FMS Descriptor	The FMS Descriptor element is present if dot11FMSActivated is true.	Yes	Yes
4	RPS	The RPS element is optionally present if dot11RAWOperationActivated is true.	Yes	Yes
5	SST Operation	The SST Operation element is present if dot11SelectiveSubchannelTransmissionPermitted is true.	No	Yes
6	Subchannel Selective Transmission	The SST element is optionally present if dot11SubchannelSelectiveTransmissionActivated is true.	Yes	Yes
7	S1G Relay	The S1G Relay element is optionally present if dot11RelayAPImplemented is true.	Yes	Yes
8	Page Slice	The Page Slice element is optionally present if dot11PageSlicingActivated is true.	Yes	Yes

Table 9-76—Minimum and full set of optional elements

Order	Information	Notes	Allowed in minimum set	Allowed in full set
9	S1G Sector Operation	The S1G Sector Operation element is optionally present if dot11S1GSectorizationActivated is true.	No	Yes
10	Authentication Control	The Authentication Control element is optionally present when dot11S1GCentralizedAuthenticationControlActivated is true or dot11S1GDistributedAuthenticationControlActivated is true.	No	Yes
11	TSF Timer Accuracy	The TSF Timer Accuracy element is optionally present when dot11TSFTimerAccuracyImplemented is true.	No	Yes
12	S1G Relay Discovery	The S1G Relay Discovery element is optionally present if dot11RelayDiscoveryOptionImplemented is true.	No	Yes
13	S1G Capabilities	The S1G Capabilities element is present if dot11S1GOptionImplemented is true; otherwise not present.	No	Yes
14	S1G Operation	The S1G Operation element is present when dot11S1GOptionImplemented is true; otherwise not present.	No	Yes
15	Short Beacon Interval	The Short Beacon Interval element is present if dot11ShortBeaconInterval is true.	No	Yes
16	Multiple BSSID	One or more Multiple BSSID elements are present if the AP is a member of a multiple BSSID set (see 11.10.14) with two or more members and any of the following conditions are true: • dot11MultiBSSIDImplemented is true • dot11MultiBSSIDImplemented is false and dot11RMMeasurementPilotActivated is between 2 and 7 • dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID exists Otherwise not present.	No	Yes
17	Multiple BSSID Configuration	The Multiple BSSID Configuration element is optionally present if dot11MultiBSSIDImplemented is true.	No	Yes
Last–2	One or more elements can appear in this frame.	Optionally, element(s) that are not listed in this table, but are allowed in Beacon frame, in the order they appear in the Beacon frame (see Table 9-62).	No	Yes

Table 9-76—Minimum and full set of optional elements

Order	Information	Notes	Allowed in minimum set	Allowed in full set
Last–1	Vendor Specific	One or more Vendor Specific elements are optionally present.	Yes	Yes
Last	MME or MIC element	The MIC element is present if dot11BIPCompactEncapsulation is true. The MME is present if dot11BIPCompactEncapsulation is false and dot11BeaconProtectionEnabled is true. Otherwise neither is present.	Yes	Yes

9.3.5 Frame addressing in an MBSS

Mesh Data frames and Multihop Action frames enable multihop MSDU and MMPDU forwarding in an MBSS using the Mesh Control field described in 9.2.4.8.3.

Table 9-77 shows the valid combinations of address fields in mesh Data frames and Multihop Action frames along with the corresponding value of the Address Extension Mode subfield in the Mesh Control field.

Table 9-77—Address field contents for mesh Data and Multihop Action frames

Supported frames	To DS	From DS	Address extension mode	Address 1	Address 2	Address 3	Address 4	Address 5	Address 6
Mesh Data (individually addressed)	1	1	None	RA	TA	DA = Mesh DA	SA = Mesh SA	*Not Present*	*Not Present*
Mesh Data (group addressed)	0	1	None	DA	TA	SA = Mesh SA	*Not Present*	*Not Present*	*Not Present*
Mesh Data (proxied, individually addressed)	1	1	Address5&6	RA	TA	Mesh DA	Mesh SA	DA	SA
Mesh Data (proxied, group addressed)	0	1	Address4	DA	TA	Mesh SA	SA	*Not Present*	*Not Present*
Multihop Action (individually addressed)	0	0	Address4	RA	TA	DA = Mesh DA	SA = Mesh SA	*Not Present*	*Not Present*
Multihop Action (group addressed)	0	0	None	DA	TA	SA = Mesh SA	*Not Present*	*Not Present*	*Not Present*

NOTE 1—To DS and From DS subfields are located in the Frame Control field (see 9.2.4.1.4). The Address Extension Mode subfield is located in the Mesh Flags subfield in the Mesh Control field (see 9.2.4.8.3). Address 1, Address 2, and Address 3 fields are located in the MAC header (see 9.2.3). The Address 4 field is located in the MAC header if both To DS and From DS subfields are 1; otherwise, the Address 4 field is located in the Mesh Address Extension subfield of the Mesh Control field (see 9.2.3 and 9.2.4.8.3). Address 5 and Address 6 fields are located in the Mesh Control field if they are present (see 9.2.4.8.3).
