The Service Level Agreement ANQP-element provides a STA with information about the type of roaming supported by the AP, and the service level agreement (SLA) offered by the AP for a given roaming type. The format of the SLA ANQP-element is shown in Figure 9-1153.

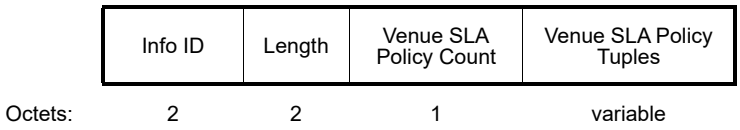

Figure 9-1153—Service Level Agreement ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Venue SLA Policy Count field specifies the number of Venue SLA Policy Tuple subfields.

The Venue SLA Policy Tuples subfield contains zero or more Venue SLA Policy Tuple subfields.

The format of a Venue SLA Policy Tuple subfield is shown in Figure 9-1154.

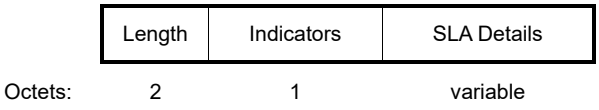

Figure 9-1154—Venue SLA Policy Tuple subfield format

The Length field contains the length of the remaining fields in octets.

The Indicators subfield indicates the roaming services accepted by the venue and their associated SLAs. The format of the Indicators subfield is shown in Figure 9-1155.

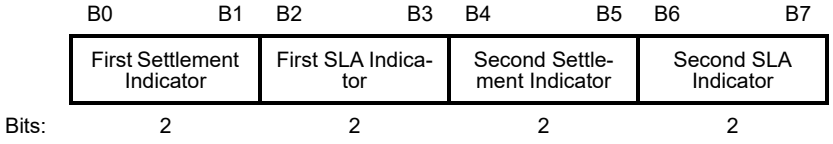

Figure 9-1155—Indicators subfield format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The First Settlement Indicator and Second Settlement Indicator subfields each indicate a type of roaming service accepted by the venue. The values of the First Settlement Indicator and Second Settlement Indicator subfields are specified in Table 9-444.

Table 9-444—Settlement indicator values

Value	Settlement Type
0	All
1	Free services
2	Paid services
3	Reserved

The First SLA Indicator and Second SLA Indicator subfields each indicate the SLA that the AP offers for the respective settlement type. The values of the First SLA Indicator and Second SLA Indicator subfields are specified in Table 9-445 and follow the Olympic model defined in IETF RFC 2597([B31]).

Table 9-445—SLA indicator values

Value	SLA
0	No Olympic SLA
1	Bronze
2	Silver
3	Gold

If the First SLA Indicator subfield is set to 0, the Second Settlement Indicator and Second SLA Indicator subfields are reserved. Otherwise, the First SLA Indicator and Second SLA Indicator subfields differ, and a nonzero value in the First SLA Indicator subfield takes precedence over a value of 0 in the Second SLA Indicator subfield, for the settlement type indicated by the First SLA Indicator subfield.

The SLA Details subfield is an optional vendor specific UTF-8 string that can be used to indicate the details of the SLA (e.g., minimum bandwidth, max jitter or delay, etc.). The content of this subfield is beyond the scope of this standard.

9.4.5.35 Excluded NAI Realm ANQP-Element

The Excluded NAI Realm ANQP-element provides a list of network access identifier (NAI) realms corresponding to SSPs or other entities whose networks or services are not accessible via this AP, even if they are members of a roaming consortium advertised by this AP. The format of the Excluded NAI Realm ANQP-element is shown in Figure 9-1156.

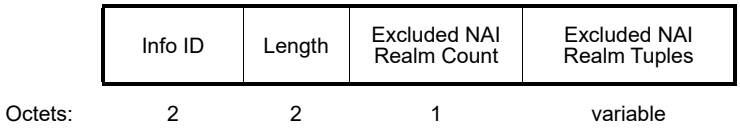

Figure 9-1156—Excluded NAI Realm ANQP-element format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Info ID and Length fields are defined in 9.4.5.1.

The Excluded NAI Realm Count field specifies the number of Excluded NAI Realm Tuple subfields.

The Excluded NAI Realm Tuples field contains zero or more Excluded NAI Realm Tuple subfields.

The format of an Excluded NAI Realm Tuple subfield is shown in Figure 9-1157.

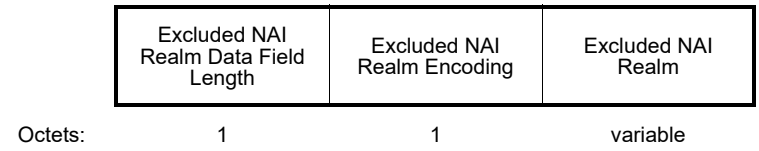

Figure 9-1157—Excluded NAI Realm Tuples subfield format

The Excluded NAI Realm Data Field Length subfield is equal to 1 plus the length in octets of the Excluded NAI Realm subfield.

The Excluded NAI Realm Encoding subfield is shown in Figure 9-1158.

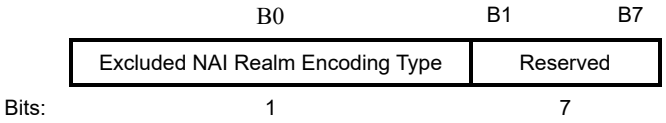

Figure 9-1158—Excluded NAI Realm Encoding subfield format

The Excluded NAI Realm Encoding Type subfield is set to 0 to indicate that the NAI realm(s) in the Excluded NAI Realm subfield is/are formatted in accordance with IETF RFC 4282. It is set to 1 to indicate that it/they might not be formatted in accordance with IETF RFC 4282.

The Excluded NAI Realm subfield contains one NAI realm formatted as defined in the Excluded NAI Realm Encoding Type subfield.

9.4.6 Registered location query protocol (RLQP) elements

9.4.6.1 General

RLQP-elements have a common format shown in Figure 9-1159. Each element is assigned a unique Info ID as defined in this standard.

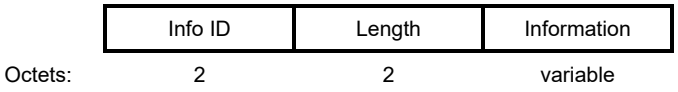

Figure 9-1159—RLQP-element format

Each RLQP-element in 9.4.6 is assigned a unique 2-octet Info ID. The set of valid Info IDs is defined in Figure 9-1159.

The Length field indicates the number of octets in the Information field.

The RLQP-elements are shown in Table 9-446.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-446—RLQP-element definitions

RLQP-element name	Info ID	RLQP-element (subclause)
Reserved	0–272	N/A
Channel Availability Query	273	9.4.6.2
Channel Schedule Management	274	9.4.6.3
Network Channel Control	275	9.4.6.4
Reserved	276–56 796	N/A
Vendor Specific	56 797	9.4.6.5
Reserved	56 798–65 535	N/A

9.4.6.2 Channel Availability Query RLQP-element

The Channel Availability Query element is used to exchange the requests and responses for the channel availability query process using the GAS protocol. The Channel Availability Query RLQP-element is included in a GAS query request or returned in a response to a GAS query request.

The element is in the format shown in Figure 9-1160.

	Info ID	Length	Requester STA Address	Responder STA Address	Reason Result Code	Channel Query Info	Device Class	Device Identification Information	Device Location Information	WSM Information
Octets:	2	2	6	6	1	1	variable	variable	variable	variable

Figure 9-1160—Channel Availability Query RLQP-element format

The Info ID and Length fields are defined in 9.4.6.1.

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the channel query process.

The ResponderSTAAddress field is the MAC address of the responding STA that responds to the channel query requesting STA.

The Reason Result Code field is used to indicate the reason that a channel availability query was generated. It also indicates the result of the query as successful or not and the reason when the query is not successful. The Reason Result Code field values that have been allocated are shown in Table 9-447.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-447—Reason Result Code field values

Reason Result Code field value	Name	Description
0		Reserved.
1		Channel availability list requested.
2	SUCCESS	Success with the available channel list result for a Device Location Information field.
3	SUCCESS_MULTIPLE	Success with an available channel list result for a bounded geographic area defined by multiple Device Location Information fields.
4	REFUSED	Request declined.
5	DEVICE_VERIFICATION_FAILURE	Request not successful because of device identification verification failure. NOTE—Failure of providing an authorized identification of the corresponding regulatory organization can cause the responding STA to reject the query and return such a Reason Result Code.
6	Continuation frame	This frame continues the fields from the previous CAQ frame.
7–255		Reserved.

The Channel Query Info field is used to indicate the type of Channel Query request and associated parameters. The format of the Channel Query Info field is shown in Figure 9-1161.

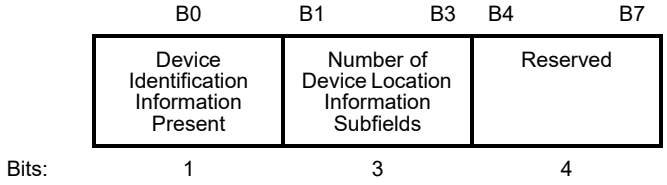

Figure 9-1161—Channel Query Info field format

The Device Identification Information Present subfield value is set to 1 to indicate that the Device Identification Information field is present in the Channel Availability Query element; otherwise it is set to 0 to indicate that the Device Identification Information field is not provided.

The Number of Device Location Information Subfields subfield indicates the number of device location information subfields presented in the Channel Availability Query element. When no device location is present, the Number of Device Location Information Subfields subfield is set to 0.

The Device Class field is used to indicate the characteristics of STA requesting the channel availability query. The format of the Device Class field is specified in 9.4.4.2.2. The Device Class field is present only when the Reason Result Code field value is 1.

The Device Identification Information field is used to indicate the identification of the STA requesting the channel availability query. The format of the Device Identification Information field is specified in 9.4.4.2.3.

The Device Location Information field is used to provide the location of the STA requesting the channel availability query, which is provided in the format specified in 9.4.4.2.4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The WSM Information field is defined in the White Space Map element (see 9.4.2.168). The WSM Information field is present only when the Reason Result Code field value is 2 or 3, as the successful result of the query.

9.4.6.3 Channel Schedule Management RLQP-element

The Channel Schedule Management element is used by an GDD enabling STA to query the RLSS or another GDD enabling STA for channel schedule information. The element is in the format shown in Figure 9-1162.

	Info ID	Length	Requester STA Address	Responder STA Address	Reason Result Code	Channel Schedule Management Mode	Device Identification Information	Channel Schedule Descriptor
Octets:	2	2	6	6	1	1	variable	variable

Figure 9-1162—Channel Schedule Management RLQP-element format

The Info ID and Length fields are defined in 9.4.6.1.

The Requester STA Address field is the MAC address of the requesting STA that initiates the channel schedule management process.

The Responder STA Address field is the MAC address of the STA that responds to the STA that requested channel schedule management.

The remaining fields are as defined in the Channel Schedule Management element (see 9.6.7.26).

9.4.6.4 Network Channel Control RLQP-element

The Network Channel Control element is used to request network channel control and respond to network channel requests using the GAS protocol. The element is in the format shown in Figure 9-1163.

							a Network Channel Control triplet		
	Info ID	Length	Requester STA Address	Responder STA Address	Reason Result Code	Number of Network Channel Control Triplets	Operating Class	Channel Number	Maximum Transmit Power
Octets:	2	2	6	6	1	1	1	1	1

Figure 9-1163—Network Channel Control RLQP-element format

The Info ID and Length fields are defined in 9.4.6.1.

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the network channel control process.

The ResponderSTAAddress field is the MAC address of the STA that responds to the STA that requested network channel control.

The Reason Result Code field is used to indicate the reason that a Network Channel Control frame was generated. The encoding of the Reason Result Code field is shown in Table 9-448.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-448—Reason Result Code field values

Reason Result Code field value	Name	Description
0	REQUEST	Network channel request.
1	SUCCESS	Success.
2	REFUSED	Request declined.
3	TOO_MANY_SIMULTANEOUS_REQUESTS	Network channel request denied because the GDD enabling STA is unable to handle additional GDD dependent STAs.
4	Continuation frame	This frame continues the fields from the previous NCC frame.
5–255		Reserved.

The Number of Network Channel Control Triplets field indicates the number of triplets of Operating Class, Channel Number, and Transmit Power Constraint fields.

The Operating Class field indicates the channel set for which the network channel control request applies. The Operating Class field and Channel Number field are used together to specify the channel frequency and channel bandwidth for which the network channel control applies. Values for the Operating Class field are shown in E.1.

In a request, the Channel Number field of a Network Channel Control frame indicates the channel that the requesting STA intends to operate on. In a response, the Channel Number field in the Network Channel Control frame indicates the channels that the responding STA permits the requesting STA to operate on. The Channel Number is defined within an Operating Class as shown in E.1.

The Maximum Transmit Power field gives the intended maximum transmit power in dBm for operation in the request frame and indicates the maximum allowable transmit power in dBm for operation in the response frame. The field is coded as a 2s complement signed integer in units of 0.5 dBm. The field is set to –128 when a requesting STA requests a responding STA to provide a network channel control response without specifying in the request the intended maximum transmit power.

9.4.6.5 Vendor Specific RLQP-element

The Vendor Specific RLQP-element is used to carry information not defined in this standard within a single defined format, so that reserved Info IDs are not usurped for nonstandard purposes and so that interoperability is more easily achieved in the presence of nonstandard information. The RLQP-element is in the format shown in Figure 9-1164.

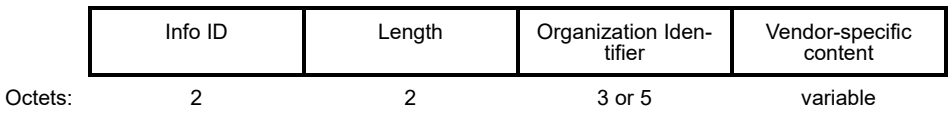

Figure 9-1164—Vendor Specific RLQP-element format

The Info ID and Length fields are defined in 9.4.6.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Organization Identifier field contains the identity of the entity that has defined the content of the Vendor Specific RLQP-element (see 9.4.1.29 for a description of the Organization Identifier field contents and length).

The Vendor-specific content field contains vendor specific content.

9.5 Fields used in Management and Extension frame bodies and Control frames

9.5.1 SSW field

When the SSW field is not transmitted in a DMG Beacon frame, the format of the SSW field is shown in Figure 9-1165. The format of the field when transmitted in a DMG Beacon frame is shown in Figure 9-1166.

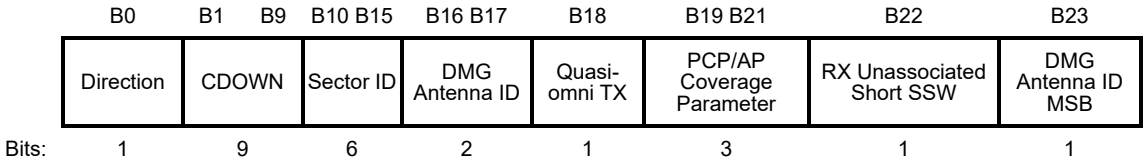

Figure 9-1166—SSW field format when transmitted in a DMG Beacon frame

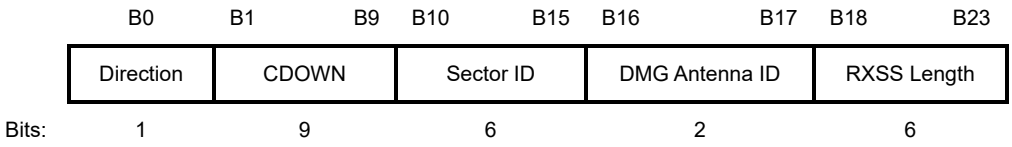

Figure 9-1165—SSW field format when not transmitted in a DMG Beacon frame

The Direction subfield is set to 0 to indicate that the frame is transmitted by the beamforming initiator and set to 1 to indicate that the frame is transmitted by the beamforming responder.

The CDOWN subfield is a down counter indicating the number of remaining DMG Beacon frame transmissions to the end of the TXSS, or the number of remaining SSW frame transmissions to the end of the TXSS/RXSS. This subfield is set to 0 in the last frame DMG Beacon and SSW frame transmission. Possible values range from 0 to 511.

The Sector ID subfield is set to indicate the sector number through which the frame containing this SSW field is transmitted.

The DMG Antenna ID subfield indicates the antenna (for a CMMG STA) or DMG antenna (for a DMG STA) the transmitter is currently using for this transmission.

The RXSS Length subfield is valid only when transmitted in a CBAP and is reserved otherwise. The RXSS Length subfield specifies the length of a receive sector sweep as required by the transmitting STA and is defined in units of an SSW frame. The length of the sector sweep is given by $(\text{RXSS Length} + 1) \times 2$.

The Quasi-omni TX subfield is set to 1 to indicate that the frame containing the SSW field is transmitted with a quasi-omni antenna pattern and is set to 0 to indicate that the frame is not transmitted with a quasi-omni antenna pattern.

The PCP/AP Coverage Parameter subfield contains the composite value describing the PCP or AP related link budget parameter specific for the sector and DMG antenna defined in Sector ID and DMG Antenna ID

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

fields. For values 1 through 7, the value of this field is interpreted as (4×PCP/AP Coverage Parameter + 14) and is measured in dBm. This covers a range from 18 dBm to 42 dBm in 4 dBm steps. A value of 0 in the PCP/AP Coverage Parameter subfield indicates that this field to be ignored. The usage of PCP/AP Coverage Parameter subfield is described in 10.38.12.6.

NOTE—An EDMG PCP or EDMG AP can set the PCP/AP Coverage Parameter subfield to EIRP – G_{omni_rx} – G_{add_gain}, where (a) EIRP is equal to $P + G_{tx}$, and P and G_{tx} are the transmit power and antenna gain, respectively, used in the DMG Beacon frame transmission; (b) G_{omni_rx} is the antenna gain of the AP or PCP receiver when in quasi-omni receive mode; and (c) G_{add_gain} is equal to $P_{min\_sensitivity} - P_{sensitivity}$, where $P_{min\_sensitivity}$ is the receiver sensitivity for MCS 0 defined in Table 20-3 and $P_{sensitivity}$ is the actual PCP or AP receiver sensitivity. Since the values of G_{omni_rx} and G_{tx} can change for different directions, the value of the PCP/AP Coverage Parameter subfield in DMG Beacon frames transmitted through different sectors can be different.

The RX Unassociated Short SSW subfield is set to 1 to indicate that the EDMG STA supports reception of Short SSW PPDUs from unassociated STAs during a CBAP. Otherwise, it is set to 0.

The DMG Antenna ID MSB subfield is prepended to the DMG Antenna ID subfield to create a single 3-bit field.

9.5.2 Dynamic Allocation Info field

The format of the Dynamic Allocation Info field is shown in Figure 9-1167.

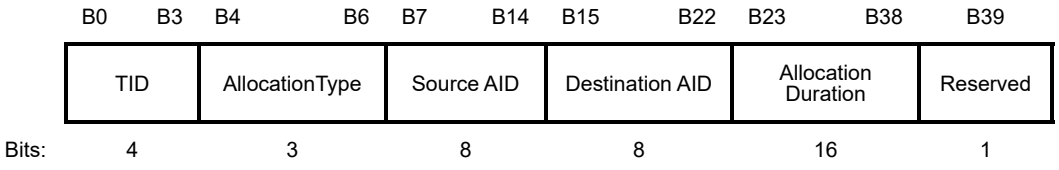

Figure 9-1167—Dynamic Allocation Info field format

The TID subfield identifies the TC or TS for the allocation request or grant.

NOTE—Unlike pseudo-static allocations, nonpseudo-static allocations are not labeled with an allocation ID, and are associated to a TID.

The AllocationType subfield is defined in 9.4.2.130.

The Source AID subfield identifies the STA that is the source of the allocation.

The Destination AID subfield identifies the STA that is the destination of the allocation.

When the Dynamic Allocation Info field is transmitted within an SPR frame, the Allocation Duration subfield contains the requested duration in microseconds. When the Dynamic Allocation Info subfield is transmitted within a Grant frame by an AP or PCP in an ATI or GP, the Allocation Duration subfield contains the granted duration of the SP or CBAP allocation in microseconds (see 10.38.3, 10.38.7, 10.38.8, and 10.38.9). Possible values range from 0 to 32 767 for an SP allocation and a CBAP allocation. Setting the Allocation Duration subfield transmitted to 0 within a Grant frame means that the STA can transmit one PPDU followed by any relevant acknowledgment plus one RTS/DMG CTS handshake.

When the Dynamic Allocation Info subfield is transmitted within a Grant frame in a CBAP, the value of the Allocation Duration field indicates the purpose of the Grant frame transmission. Two purposes are possible:

a) Beyond current TXOP: in this case, the Allocation Duration subfield values range from 0 to 32 767. The value of the Allocation Duration field plus the Duration field of the Grant frame indicates the time offset from the PHY-TXEND.indication primitive of the Grant frame when the STA

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

transmitting the Grant frame will attempt to initiate access for communication with the STA indicated by the RA field of the Grant frame.

b) Within current TXOP: in this case, the Allocation Duration subfield is set to 32 768.

When the Dynamic Allocation Info subfield is transmitted within a Grant frame with RA set to broadcast address by a source or destination STA of an SP, the Allocation Duration subfield values range from 0 to 32 767.

When the Dynamic Allocation Info subfield is transmitted within a Grant frame with RA set to individual address by a source STA of an SP, the Allocation Duration subfield is set to 32 768.

9.5.3 SSW Feedback field

When the SSW Feedback field is transmitted as part of an ISS, the format of the field is as shown in Figure 9-1168. Otherwise, the format of the SSW Feedback field is as shown in Figure 9-1168 when the EDMG Extension Flag subfield is 1 and in Figure 9-1170 when the EDMG Extension Flag subfield is 0.

	B0 B8	B9 B10	B11 B15	B16	B17	B18 B21	B22	B23
	Total Sectors in ISS	Number of RX DMG Antennas	Reserved	Poll Required	OCB	Reserved	Unsolicited RSS Enabled	Reserved
Bits:	9	2	5	1	1	4	1	1

Figure 9-1168—SSW Feedback field format when transmitted as part of an ISS

	B0B5	B6B7	B8B15	B16	B17 B21	B22	B23
	Sector Select	DMG Antenna Select	SNR Report	Poll Required	Sector Select MSB	DMG Antenna Select MSB	EDMG Extension Flag
Bits:	6	2	8	1	5	1	1

Figure 9-1169—SSW Feedback field format when not transmitted as part of an ISS and the EDMG Extension Flag subfield is 1

	B0 B5	B6 B7	B8 B15	B16	B17	B18 B21	B22	B23
	Sector Select	DMG Antenna Select	SNR Report	Poll Required	OCB	Reserved	Unsolicited RSS Enabled	EDMG Extension Flag
Bits:	6	2	8	1	1	4	1	1

Figure 9-1170—SSW Feedback field format when not transmitted as part of an ISS and the EDMG Extension Flag subfield is 0

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Total Sectors in ISS subfield indicates the total number of sectors that the initiator uses in the ISS, including any repetition performed as part of multi-antenna beamforming. Possible values range from 0 to 511, representing 1 to 512 sectors.

The Number of RX DMG Antennas subfield indicates the number of receive DMG antennas the initiator uses during the following RSS. This subfield is set to the number of receive DMG antennas used minus 1.

The EDMG Extension Flag subfield is 0 when the SSW Feedback field is transmitted within an SSW frame, and when transmitted within an SSW-Feedback and SSW-Ack frame sent in response to an ISS or an RSS that used the SSW frame. Otherwise, the EDMG Extension Flag subfield is 1.

The selected sector depends on the value of the EDMG Extension Flag subfield.

If the EDMG Extension Flag subfield is 0, the Sector Select subfield contains the value of the Sector ID subfield of the SSW field within the frame that was received with best quality in the immediately preceding sector sweep. The determination of which frame was received with best quality is implementation dependent.

If the EDMG Extension Flag subfield is 1, the Sector Select MSB subfield is prepended to the Sector Select subfield to form a single 11-bit subfield representing the value of the CDOWN field within the Short SSW PPDU that was received with the best quality in the immediately preceding sector sweep. The determination of which PPDU was received with the best quality is implementation dependent.

The interpretation of the DMG Antenna Select subfield depends on the value of the EDMG Extension Flag subfield.

If the EDMG Extension Flag subfield is 0, the DMG Antenna Select subfield indicates the value of the DMG Antenna ID subfield of the SSW field within the frame that was received with best quality in the immediately preceding sector sweep. The determination of which frame was received with best quality is implementation dependent.

If the EDMG Extension Flag subfield is 1, the DMG Antenna Select MSB subfield is prepended to the DMG Antenna Select subfield to form a single 3-bit subfield representing the value of the RF Chain ID field within the Short SSW PPDU that was received with the best quality in the immediately preceding sector sweep. The determination of which PPDU was received with the best quality is implementation dependent.

The Unsolicited RSS Enabled subfield is set to 1 to indicate that the STA is capable of receiving an unsolicited RSS and completing the SLS with any other STA that opportunistically receives this ISS or RSS, but that is not the STA addressed by this ISS or RSS (see 10.41.6.4). This subfield is set to 0 otherwise.

The SNR Report subfield is set to the value of the SNR from the frame that was received with best quality during the immediately preceding sector sweep and is indicated in the Sector Select field. This subfield is encoded as 8-bit 2s complement value of 4×(SNR-19), where SNR is measured in dB. This covers from –13 dB to 50.75 dB in 0.25 dB steps.

The Poll Required subfield is set to 1 by a non-AP and non-PCP STA to indicate that it requires the AP or PCP to initiate communication with the non-AP and non-PCP. This subfield is set to 0 to indicate that the non-AP and non-PCP has no preference about whether the AP or PCP initiates the communication. This subfield is reserved when transmitted by an AP or PCP.

The OCB subfield is set to 1 if dot11DMGOCBActivated is true, and is set to 0 otherwise. If equal to 1, this subfield indicates that the STA is operating outside the context of a BSS.

9.5.4 BRP Request field

The BRP Request field is defined in Figure 9-1171.

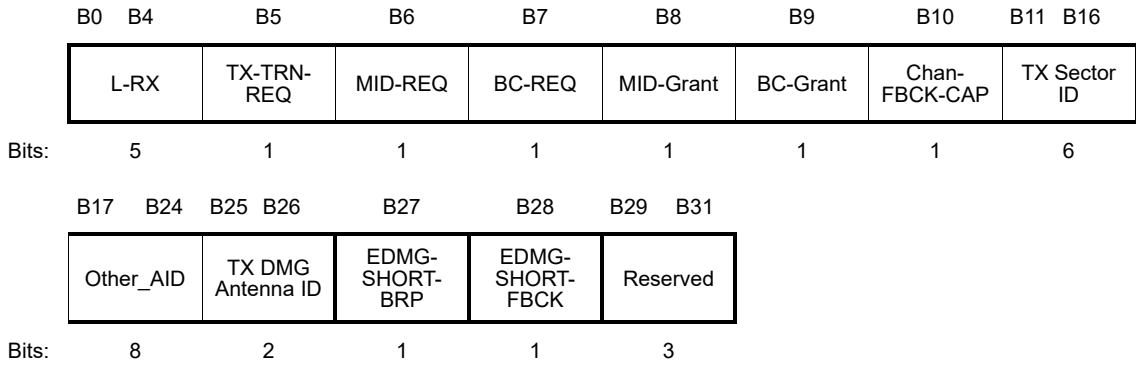

Figure 9-1171—BRP Request field format

If the MID-REQ subfield is set to 0, the L-RX subfield indicates the number of TRN units requested by the transmitting STA for RX training as part of beam refinement. The L-RX subfield contains an unsigned integer between 0 and 16. Values outside this range are reserved. The number of requested TRN-R subfields is equal to the value of the L-RX subfield multiplied by 4. Other values are reserved. If the subfield is set to 0, the transmitting STA does not request receive training as part of beam refinement. If the MID-REQ subfield is set to 1, the L-RX subfield indicates the number of TRN units the STA uses during the MID phase for each TX sector/AWV.

The TX-TRN-REQ subfield is set to 1 to indicate that the STA requests transmit training as part of beam refinement. Otherwise, it is set to 0.

A STA sets the MID-REQ subfield to 1 in SSW-Feedback or BRP frames to indicate a request for an I-MID subphase or R-MID subphase; otherwise, the STA sets the subfield to 0 to indicate it is not requesting an I-MID subphase or R-MID subphase. In case an R-MID subphase is requested, the STA can include information on the TX sector IDs to be used by the STA receiving this request. The STA receiving this request sets the MID-grant subfield in SSW-Ack or BRP frames to 1 to grant this request or otherwise sets it to 0.

A STA sets the BC-REQ subfield to 1 in SSW-Feedback or BRP frames to indicate a request for an I/R-BC subphase; otherwise, the STA sets the subfield to 0 to indicate it is not requesting an I/R-BC subphase. In case an R-BC subphase is requested, the STA can include information on the TX sector IDs to be used by the STA receiving this request. The STA receiving this request sets the BC-grant subfield in SSW-Ack or BRP frames to 1 to grant this request; otherwise, the STA sets it to 0 to reject the request.

The Chan-FBCK-CAP subfield is set to 1 to indicate the STA is capable to return channel measurement during beam refinement. The Chan-FBCK-CAP subfield is set to 0 to indicate the STA is able to return only BS-FBCK during beam refinement.

NOTE—Regardless of the value of the Chan-FBCK-CAP subfield, 10.41.6.4 requires a DMG STA to return the SNR values from the last TXSS if it receives a BRP frame with the TXSS-FBCK-REQ field and the SNR Requested subfield within the FBCK-REQ field both set to 1.

The TX Sector ID subfield indicates the sector ID that is used when transmitting the PPDU. If the PPDU is transmitted using a pattern that is not a sector that has been used in the sector sweep, this subfield is set to 0x63. This subfield is reserved if the BRP Request field is transmitted within an SSW-Feedback frame

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

with the EDMG Extension Flag subfield set to 1 or within an SSW-Ack frame with the EDMG Extension Flag subfield set to 1.

The Other_AID subfield is set to the AID of an additional STA referenced in the BRP procedure as described in 10.41.6.4.4 and 20.9.2.2.6. Otherwise, if the additional STA is not used, this subfield is set to 0.

The TX DMG Antenna ID subfield indicates the DMG antenna ID that is used when transmitting the PPDU.This subfield is reserved if the BRP Request field is transmitted within an SSW-Feedback frame with the EDMG Extension Flag subfield set to 1 or within an SSW-Ack frame with the EDMG Extension Flag subfield set to 1.

The EDMG-SHORT-BRP subfield is set to 1 to indicate that an EDMG BRP field is present following the BRP Request field. Otherwise, this field is set to 0.

The EDMG-SHORT-FBCK subfield is set to 1 to indicate that an EDMG Short FBCK field is present in the frame following the EDMG BRP field. Otherwise, this field is set to 0. This subfield is reserved if the EDMG-SHORT-BRP subfield is 0.

9.5.5 Beamforming Control field

The Beamforming Control field is formatted as shown in Figure 9-1172 when both the IsInitiatorTXSS and IsResponderTXSS subfields are equal to 1, and the Beamforming Control field is transmitted in either a Grant or Grant Ack frames. In all other cases, the Beamforming Control field is formatted as shown in Figure 9-1173.

	B0	B1	B2	B3 B9	B10 B11	B12	B13 B15
	Beamforming Training	IsInitiatorTXSS	IsResponderTXSS	Total Number of Sectors	Number of RX DMG Antennas	Unsolicited RSS	Reserved
Bits:	1	1	1	7	2	1	3

Bits:	1	1	1	6	1	2	1	3

Figure 9-1173—BF Control field format in all other cases

The Beamforming Training subfield is set to 1 to indicate that the source DMG STA intends to initiate beamforming training with the destination DMG STA at the start of the allocation and is set to 0 otherwise. If the Beamforming Training subfield is set to 0, all other subfields of the Beamforming Control field are reserved.

The IsInitiatorTXSS subfield is set to 1 to indicate that the source DMG STA starts the beamforming training with an initiator TXSS. This subfield is set to 0 to indicate that the source DMG STA starts the BF

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

training with an initiator RXSS. The IsInitiatorTXSS subfield is ignored if the Unsolicited RSS field is set to 1.

The IsResponderTXSS subfield is set to 1 to indicate that the destination DMG STA, or the source EDMG STA if the Unsolicited RSS subfield is set to 1, starts the RSS with a responder TXSS. This subfield is set to 0 to indicate that the destination DMG STA, or the source EDMG STA if the Unsolicited RSS subfield is set to 1, is to initiate the RSS with a responder RXSS.

The Unsolicited RSS subfield is set to 1 to indicate the source EDMG STA intends to initiate an unsolicited RSS at the start of the TXOP or SP. This subfield is set to 0 to indicate the source EDMG STA intends to initiate an SLS with the ISS at the start of the allocation.

The interpretation of the IsInitiatorTXSS, IsResponderTXSS, and Unsolicited RSS subfields are indicated in Table 9-449.

Table 9-449—IsInitiatorTXSS, IsResponderTXSS, and Unsolicited RSS subfields

Bit 1	Bit 2	Bit 12	Meaning
1	0	0	Initiator TXSS and Responder RXSS
0	1	0	Initiator RXSS and Responder TXSS
1	1	0	Initiator TXSS and Responder TXSS
0	0	0	Initiator RXSS and Responder RXSS
N/A	1	1	Responder TXSS only (no ISS)
N/A	0	1	Responder RXSS only (no ISS)

When the Beamforming Control field is transmitted within an Extended Schedule element, either the IsInitiatorTXSS subfield or the IsResponderTXSS subfield is set to 0, but not both.

The RXSS Length subfield is valid only if at least one of IsInitiatorTXSS subfield or IsResponderTXSS subfield is equal to 0 and is reserved otherwise. The value represented by the RXSS Length subfield specifies the total number of receive sectors combined over all receive DMG antennas of the STA, including any LBIFS as necessary for DMG antenna switching. The value represented by this subfield is in the range 2 to 128 and is given by (RXSS Length+1)×2.

The RXSSTxRate subfield is valid only if the RXSS Length subfield is valid and the value of the RXSS Length subfield is greater than 0. Otherwise, the RXSSTxRate subfield is reserved. The RXSSTxRate subfield is set to 0 to indicate that all frames transmitted as part of the RXSS use the DMG Control modulation class (10.6.7.1). The RXSSTxRate subfield is set to 1 to indicate that only the first frame transmitted as part of the RXSS use the DMG Control modulation class and the remaining frames use MCS 1 of the DMG SC modulation class. If both the IsInitiatorTXSS and IsResponderTXSS subfields are set to 0 and the BF Control field is sent within a Grant frame, the RXSSTxRate subfield refers to the RSS only. If both the IsInitiatorTXSS and IsResponderTXSS subfields are set to 0 and the BF Control field is sent within a Grant Ack frame, the RXSSTxRate subfield refers to the ISS only.

When the BF Control field is transmitted in a Grant frame, the Total Number of Sectors subfield indicates the total number of sectors the initiator uses during the ISS, including any LBIFS required for DMG antenna switching (see 10.41). When the BF Control field is transmitted in a Grant Ack frame, the Total Number of

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Sectors subfield indicates the total number of sectors the responder uses during the RSS. In both cases, this field is set to the total number of sectors used minus 1.

When the BF Control field is transmitted in a Grant frame, the Number of RX DMG Antennas subfield indicates the number of receive DMG antennas the initiator uses during the RSS. When the BF Control field is transmitted in a Grant Ack frame, the Number of RX DMG Antennas subfield indicates the number of receive DMG antennas the responder uses during the ISS. In both cases, this subfield is set to the number of receive DMG antennas used minus 1.

When the BF Control field is transmitted in a Grant Ack frame in response to a Grant frame with the Beamforming Training field equal to 0, the following fields are reserved: IsInitiatorTXSS, IsResponderTXSS, Total Number of Sectors, and Number of RX DMG Antennas.

9.5.6 Beamformed Link Maintenance field

The Beamformed Link Maintenance field is shown in Figure 9-1174 and provides a DMG STA with the value of dot11BeamLinkMaintenanceTime.

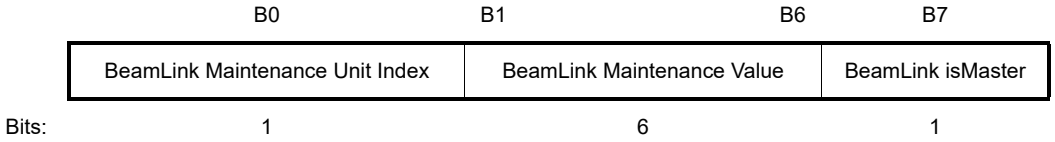

Figure 9-1174—Beamformed Link Maintenance field format

The encoding of the BeamLink Maintenance Unit Index subfield is specified in Table 9-450.

Table 9-450—Encoding of BeamLink Maintenance Unit Index

BeamLink Maintenance Unit Index	BeamLink Maintenance Unit (μs)
0	32
1	2000

If the content of the BeamLink Maintenance Value subfield is greater than 0, it is used to calculate dot11BeamLinkMaintenanceTime as follows:

$$dot11BeamLinkMaintenanceTime = BLMU \times BLMV$$

where

BLMU is the value of the BeamLink Maintenance Unit corresponding to the value of the BeamLink Maintenance Unit Index subfield (see Table 9-450)

BLMV is the value of the BeamLink Maintenance Value subfield

Otherwise, if the BeamLink Maintenance Value subfield is set to 0, the dot11BeamLinkMaintenanceTime is left undefined. An undefined value of the dot11BeamLinkMaintenanceTime indicates that the STA does not participate in beamformed link maintenance.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The BeamLink isMaster subfield is set to 1 to indicate that the STA is the master of the data transfer and set to 0 otherwise. The STAs use the BeamLink isMaster subfield to negotiate the dot11BeamLinkMaintenanceTime as specified in Table 9-451.

NOTE—In Table 9-451, STA-A and STA-B refer to any of the STAs performing the Beamformed Link Maintenance negotiation procedure in no particular order.

Table 9-451—The Beamformed Link Maintenance negotiation

BeamLink isMaster subfield (STA-A)	BeamLink isMaster subfield (STA-B)	dot11BeamLinkMaintenanceTime (STA-A) vs. dot11BeamLinkMaintenanceTime (STA-B)	Result
0	0	≥	dot11BeamLinkMaintenanceTime (STA-A)
1	0	>, <, =	dot11BeamLinkMaintenanceTime (STA-A)
1	1	=	dot11BeamLinkMaintenanceTime (STA-A)
0 or 1	0 or 1	If either dot11BeamLinkMaintenanceTime (STA-A) or dot11BeamLinkMaintenanceTime (STA-B) is undefined	Undefined

9.5.7 EDMG BRP field

The EDMG BRP field combines the EDMG BRP Request element and the DMG Beam Refinement element into a fixed size field for use in a fixed sized version of the BPR frame (see 9.6.21.3). The EDMG BRP field is defined in Figure 9-1175.

	B0	B1 B8	B9	B10	B11	B12	B13 B24	B25 B36	B37 B39	B40

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

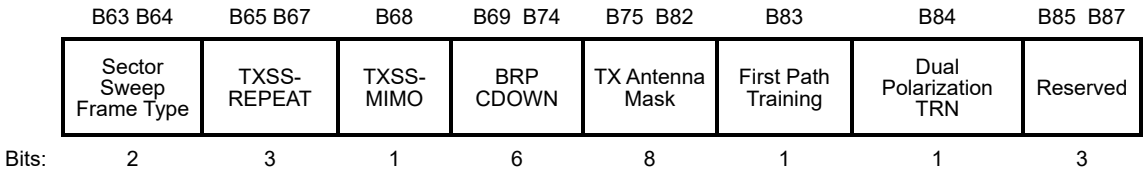

Figure 9-1175—EDMG BRP field format

The Initiator, TX-train-response, RX-train-response, TX-TRN-OK, TXSS-FBCK-REQ, BS-FBCK, BS-FBCK Antenna ID, Sector Sweep Frame Type, and MID Extension subfields are defined in 9.4.2.128.

The L-RX, TX Sector ID, L-TX-RX, Requested EDMG TRN-Unit P, Requested EDMG TRN-Unit M, Requested EDMG TRN-Unit N, BRP-TXSS, TXSS-INITIATOR, TXSS-PPDUs, TXSS-REPEAT, TXSS-MIMO, BRP CDOWN, TX Antenna Mask, First Path Training, and Dual Polarization TRN subfields are defined in 9.4.2.269.

9.5.8 Short BRP Feedback field

The Short BRP Feedback field carries feedback information of up to 16 sectors and is defined in Figure 9-1176.

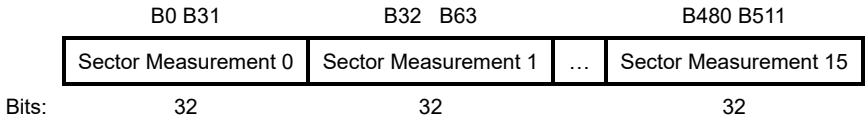

Figure 9-1176—Short BRP Feedback field format

Each Sector Measurement *i* subfield, $0 \leq i \leq 15$, has the same format and is defined in Figure 9-1177.

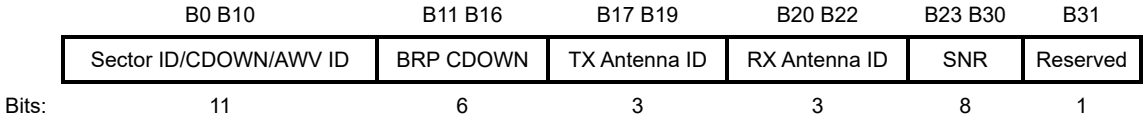

Figure 9-1177—Sector Measurement subfield format

If the Sector Measurement subfield contains the feedback for a sector sweep performed using SSW frames, or Short SSW PPDUs, or DMG Beacon frames, the Sector ID/CDOWN/AWV ID subfield indicates the Sector ID of a PPDU received in the sector sweep, the TX Antenna ID subfield indicates the DMG antenna ID indicated in the PPDU, and the RX Antenna ID subfield indicates the receive DMG antenna through which the SNR contained in the SNR subfield was measured.

If the Sector Measurement subfield contains the feedback for a sector sweep performed using BRP-TX PPDUs, the Sector ID/CDOWN/AWV ID subfield contains the AWV feedback ID of the TRN subfields over which the SNR in the SNR subfield was measured. The BRP CDOWN field contains the value of the BRP CDOWN field in the BRP frame through in which the SNR in the SNR subfield was measured. The TX Antenna ID subfield has the value of the TX Antenna Mask field in the received BRP frame and the RX Antenna ID subfield indicates the receive DMG antenna through which the SNR in the SNR subfield was measured.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The encoding of the SNR subfield is defined in 9.4.2.135. A value of 254 in the SNR subfield indicates SNR values greater than or equal to 55.5 dB. A value of 255 indicates that this Sector Measurement subfield is invalid.

9.5.9 Sector Feedback field

The Sector Feedback field is defined in Figure 9-1178.

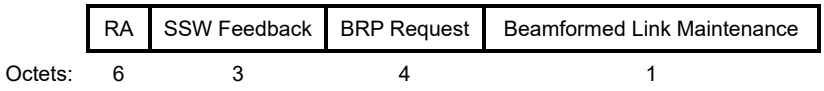

Figure 9-1178—Sector Feedback field format

The RA field contains the MAC address of the STA that is the intended destination of the Sector Feedback field.

The SSW Feedback field is defined in Figure 9-1168.

The BRP Request field is defined in 9.5.4.

The Beamformed Link Maintenance field is defined in 9.5.6.

9.6 Action frame format details

9.6.1 General

Subclause 9.6 describes the Action field formats allowed in each of the action categories defined in Table 9-81 in 9.4.1.11. The frames defined in this subclause are Action frames, unless stated explicitly to be Action No Ack frames.

In the Action field formats defined in 9.6, the fields and elements listed are always present unless stated otherwise.

9.6.2 Spectrum Management Action frame details

9.6.2.1 Spectrum Management Action field

Five Action frame formats are defined for spectrum management. A Spectrum Management Action field, in the field immediately after the Category field, differentiates the five formats. The Spectrum Management Action field values associated with each frame format are defined in Table 9-452.

9.6.2.2 Spectrum Measurement Request frame format

The Spectrum Measurement Request frame is transmitted to request another STA to measure one or more channels. The format of the Spectrum Measurement Request frame Action field is shown in Figure 9-1179 (Spectrum Measurement Request frame Action field format).

The Category field is defined in 9.4.1.11.

The Spectrum Management Action field is defined in 9.6.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-452—Spectrum Management Action field values

Spectrum Management Action field value	Description
0	Spectrum Measurement Request
1	Spectrum Measurement Report
2	TPC Request
3	TPC Report
4	Channel Switch Announcement
5–255	Reserved

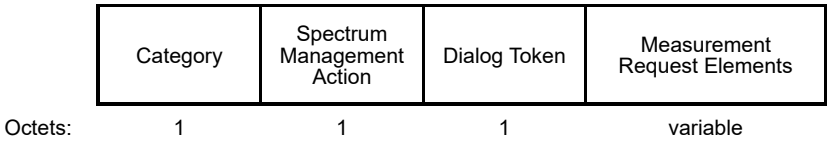

Figure 9-1179—Spectrum Measurement Request frame Action field format

The Dialog Token field is defined in 9.4.1.12. It is set to a nonzero value chosen by the STA sending the measurement request to identify the request/report transaction.

The Measurement Request Elements field contains one or more of the Measurement Request elements described in 9.4.2.19. The number and length of the Measurement Request elements in a Spectrum Measurement Request frame are limited by the maximum allowed MMPDU size.

9.6.2.3 Spectrum Measurement Report frame format

The Spectrum Measurement Report frame is transmitted in response to a Spectrum Measurement Request frame or transmitted autonomously providing measurement information. The format of the Spectrum Measurement Report frame Action field is shown in Figure 9-1180.

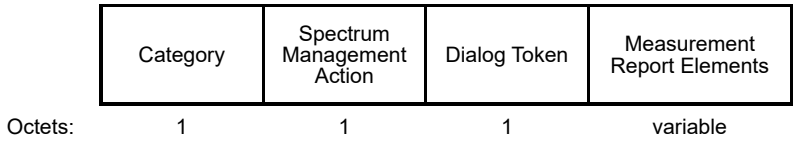

Figure 9-1180—Spectrum Measurement Report frame Action field format

The Category field is defined in 9.4.1.11.

The Spectrum Management Action field is defined in 9.6.2.1.

The Dialog Token field is defined in 9.4.1.12. It is set to the same value as the Dialog Token field of the corresponding Spectrum Measurement Request frame. If the Spectrum Measurement Report frame is not being transmitted in response to a Spectrum Measurement Request frame, then the dialog token is set to 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Measurement Report Elements field contains one or more of the Measurement Report elements described in 9.4.2.20. The number and length of the Measurement Report elements in a Spectrum Measurement Report frame are limited by the maximum allowed MMPDU size.

9.6.2.4 TPC Request frame format

The TPC Request frame is transmitted requesting another STA for transmit power and link margin information. The format of the TPC Request frame Action field is shown in Figure 9-1181.

	Category	Spectrum Management Action	Dialog Token	TPC Request element
Octets:	1	1	1	2

Figure 9-1181—TPC Request frame Action field format

The Category field is defined in 9.4.1.11.

The Spectrum Management Action field is defined in 9.6.2.1.

The Dialog Token field is defined in 9.4.1.12. It is set to a nonzero value chosen by the STA sending the request to identify the transaction.

The TPC Request element is set as described in 9.4.2.14.

9.6.2.5 TPC Report frame format

The TPC Report frame is transmitted in response to a TPC Request frame. The format of the TPC Report frame Action field is shown in Figure 9-1182.

	Category	Spectrum Management Action	Dialog Token	TPC Report element
Octets:	1	1	1	4

Figure 9-1182—TPC Report frame Action field format

The Category field is defined in 9.4.1.11.

The Spectrum Management Action field is defined in 9.6.2.1.

The Dialog Token field is defined in 9.4.1.12. It is set to the value of the Dialog Token field in the corresponding TPC Request frame.

The TPC Report element is set as described 9.4.2.15.

9.6.2.6 Channel Switch Announcement frame format

The Channel Switch Announcement frame is transmitted by a non-DMG AP, non-DMG IBSS STA, or mesh STA to advertise a channel switch. The format of the Channel Switch Announcement frame Action field is shown in Figure 9-1183.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

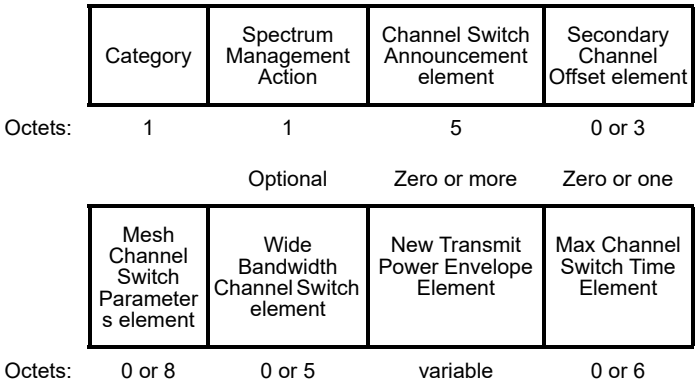

Figure 9-1183—Channel Switch Announcement frame Action field format

The Category field is defined in 9.4.1.11.

The Spectrum Management Action field is defined in 9.6.2.1.

The Channel Switch Announcement element is set as described 9.4.2.17.

The Secondary Channel Offset element is defined in 9.4.2.18. This element is present when switching to a 40 MHz or wider channel. It can be present when switching to a 20 MHz channel (in which case the Secondary Channel Offset field is set to SCN); see 11.38.4.

The Mesh Channel Switch Parameters element is defined in 9.4.2.101. This element is present when a mesh STA performs MBSS channel switching. Otherwise, the Mesh Channel Switch Parameters element is not present.

The Wide Bandwidth Channel Switch element is defined in 9.4.2.159. This element is present when switching to a channel width wider than 40 MHz.

Each New Transmit Power Envelope element that is present is defined to have the same format as the Transmit Power Envelope element (see 9.4.2.160) and includes a distinct value of the Local Maximum Transmit Power Unit Interpretation subfield. If present, the New Transmit Power Envelope element indicates the local maximum transmit powers for the BSS for the indicated bandwidths with an indicated unit interpretation after channel switching (see 11.38.1).

The Max Channel Switch Time Element field, if present, contains a Max Channel Switch Time element as defined in 9.4.2.216.

9.6.3 QoS Action frame details

9.6.3.1 QoS Action field

Several Action frame formats are defined for QoS purposes. These frames are identified by the single octet QoS Action field, which follows immediately after the Category field. The values of the QoS Action field are defined in Table 9-453.

Table 9-453—QoS Action field values

QoS Action field value	Meaning
0	ADDTS Request
1	ADDTS Response
2	DELTS
3	Schedule
4	QoS Map Configure
5	ADDTS Reserve Request
6	ADDTS Reserve Response
7–255	Reserved

Two variants are defined for the ADDTS frames: a Basic ADDTS frame variant and a DMG ADDTS frame variant. These variants use different TSPEC formats. The variant of the frame is indicated by the Element ID in the fourth field of the ADDTS Request frame Action field format (see Table 9-456 and Table 9-457) and sixth field of the ADDTS Response frame Action field format (see Table 9-458 and Table 9-459). The Element ID is the first octet of each of these fields. The encoding of the ADDTS frame variants is shown in Table 9-454 and Table 9-455.

Table 9-454—Encoding of the ADDTS Request frame variant

Element ID of fourth field of ADDTS Request frame	ADDTS Request frame variant
13 (TSPEC)	Basic ADDTS Request frame
146 (DMG TSPEC)	DMG ADDTS Request frame

Table 9-455—Encoding of the ADDTS Response frame variant

Element ID of sixth field of ADDTS Response frame	ADDTS Response frame variant
13 (TSPEC)	Basic ADDTS Response frame
146 (DMG TSPEC)	DMG ADDTS Response frame

9.6.3.2 Basic and DMG ADDTS Request frame format

9.6.3.2.1 Basic ADDTS Request frame variant

The ADDTS frames are used to carry TSPEC and optionally TCLAS elements to set up and maintain TSs using the procedures defined in 11.4.

The Action field of the ADDTS Request frame contains the information shown in Table 9-456.

Table 9-456—Basic ADDTS Request frame variant Action field format

Order	Information	Notes
1	Category	
2	QoS Action	
3	Dialog token	
4	TSPEC	
5	TCLAS	Optional
6	TCLAS Processing	Optional
7	U-APSD Coexistence	Optional
8	Expedited Bandwidth Request	Optional
9	Intra-Access Category Priority	Optional
10	Higher Layer Stream ID	Only in AP-initiated TS setup
11	Multi-band	Optional
12	U-PID	Optional
13	Multiple MAC Sublayers	Optional

The Category field is defined in 9.4.1.11.

The QoS Action field is defined in 9.6.3.1.

The values of the Dialog Token, TCLAS, and subsequent fields of this frame are the same as the values of the corresponding parameters in the invocation of the MLME-ADDTS.request primitive that causes the frame to be sent. Some of the TSPEC parameters have the same values as the corresponding parameters in the invocation of the MLME-ADDTS.request primitive, while the values of the other fields (i.e., Surplus Bandwidth Allowance, Minimum Service Interval, Maximum Service Interval, and Minimum PHY Rate) are generated within the MAC.

The TSPEC element, defined in 9.4.2.28, and the optional TCLAS element, defined in 9.4.2.29, contain the QoS parameters that define the TS. The TS is identified by the TSID and Direction fields within the TSPEC element. The TCLAS element is optional at the discretion of the STA that sends the ADDTS Request frame, regardless of the setting of the access policy (EDCA, SPCA, or HCCA). There are zero or more TCLAS elements in the ADDTS frame. The TCLAS Processing element is present when there is more than one TCLAS element and is defined in 9.4.2.31. An Expedited Bandwidth Request element is optionally present, which is defined in 9.4.2.92.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The U-APSD Coexistence element, defined in 9.4.2.89, contains the coexistence parameters requested by the non-AP STA when using the U-APSD coexistence capability as described in 11.2.3.5.2. The U-APSD Coexistence element is optionally present.

An Intra-Access Category Priority element is optionally present, which is defined in 9.4.2.119 and described in 11.4.1.

The Higher Layer Stream ID element (9.4.2.123) provides the stream identifier from a higher layer protocol. The Higher Layer Stream ID element is present only in the AP-initiated TS setup (11.4.4.3).

When present in an ADDTS Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the ADDTS Request frame applies and contains band-specific information.

When present in the ADDTS Request frame, the U-PID element indicates the upper layer protocol associated with the TID/TSID specified within the TSPEC element contained in this frame.

When present in the ADDTS Request frame, the Multiple MAC Sublayers element is used to establish an MMSL cluster.

9.6.3.2.2 DMG ADDTS Request frame variant

The DMG ADDTS Request frame is used by DMG STAs in a PBSS and in an infrastructure BSS. The Action field of the DMG ADDTS Request frame contains the information shown in Table 9-457.

Table 9-457—DMG ADDTS Request frame variant Action field format

Order	Information	Notes
1	Category	
2	Action	
3	Dialog Token	
4	DMG TSPEC	
5	TSPEC	Optional
6	TCLAS	Optional
7	TCLAS Processing	Optional
8	Multi-band	Optional
9	U-PID	Optional
10	Multiple MAC Sublayers	Optional
11	Higher Layer Stream ID	Optional

The values of the Dialog Token, DMG TSPEC, TSPEC, TCLAS, and subsequent fields of this frame are the same as the values of the corresponding parameters in the invocation of the MLME-ADDTS.request primitive that causes the frame to be sent.

The DMG TSPEC element contains the parameters that define an allocation. The allocation uniquely identified by the Source AID, Allocation ID, and Destination AID subfields within the DMG TSPEC element.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The optional TSPEC element defines a TS that can use the allocation if the allocation is created successfully.

The optional TCLAS element is used to identify the destination non-AP and non-PCP DMG STA of the ADDTS Request frame. If a TSPEC element is not present, then the TCLAS element is not present. There can be one or more TCLAS elements in the DMG ADDTS Request frame. The TCLAS Processing element is present if there is more than one TCLAS element.

When present in a DMG ADDTS Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the TS identified by the optional TSPEC element applies.

When present in the DMG ADDTS Request frame, the U-PID element indicates the upper layer protocol associated with the TS identified by the optional TSPEC element contained in this frame. If a TSPEC element is not present in the frame, the U-PID element is not present in the frame.

When present in the DMG ADDTS Request frame, the Multiple MAC Sublayers element is used to establish an MMSL cluster.

9.6.3.3 Basic and DMG ADDTS Response frame format

9.6.3.3.1 Basic ADDTS Response frame variant

The ADDTS Response frame is transmitted in response to an ADDTS Request frame. The Action field of the ADDTS Response frame contains the information shown in Table 9-458.

Table 9-458—Basic ADDTS Response frame variant Action field format

Order	Information	Notes
1	Category	
2	QoS Action	
3	Dialog Token	
4	Status Code	
5	TS Delay	
6	TSPEC	
7	TCLAS	Optional
8	TCLAS Processing	Optional
9	Schedule	Optionally present if the status code is equal to SUCCESS; otherwise not present
10	Expedited Bandwidth Request	Optional
11	Higher Layer Stream ID	Only in AP-initiated TS setup
12	Multi-band	Optional
13	U-PID	Optional
14	Multiple MAC Sublayers	Optional

The Category field is defined in 9.4.1.11.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The QoS Action field is defined in 9.6.3.1.

The Status Code field is defined in 9.4.1.9.

The values the Dialog Token, TS Delay, TSPEC, TCLAS, and subsequent fields in this frame are the same as the values of the corresponding parameters in the invocation of the MLME-ADDTS.response primitive that causes the frame to be sent. The TS Delay element is present in an ADDTS Response frame only if the status code is equal to REJECTED_FOR_DELAY_PERIOD.

The Schedule element, defined in 9.4.2.32, is present in an ADDTS Response frame only if the status code is equal to SUCCESS(i.e., when the TS is admitted).

The Higher Layer Stream ID element is present only in AP-initiated TS setup. The Higher Layer Stream ID element (9.4.2.123) contains the stream identifier provided by a higher layer protocol.

When present in an ADDTS Response frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the ADDTS Response frame applies and contains band-specific information.

When present in the ADDTS Response frame, the U-PID element indicates the upper layer protocol associated with the TID/TSID specified within the TSPEC contained in this frame.

When present in the ADDTS Response frame, the Multiple MAC Sublayers element is used to establish an MMSL cluster (see 11.32).

9.6.3.3.2 DMG ADDTS Response frame variant

The DMG ADDTS Response frame is used by DMG STAs in a PBSS and in an infrastructure BSS. The Action field of the DMG ADDTS Response frame contains the information shown in Table 9-459.

Table 9-459—DMG ADDTS Response frame variant Action field format

Order	Information	Notes
1	Category	
2	Action	
3	Dialog Token	
4	Status Code	
5	TS Delay	
6	DMG TSPEC	
7	TSPEC	Optional
8	TCLAS	Optional
9	TCLAS Processing	Optional
10	Multi-band	Optional
11	U-PID	Optional
12	Multiple MAC Sublayers	Optional
13	Higher Layer Stream ID	Optional

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The values of the Dialog Token, TS Delay, DMG TSPEC, TSPEC, TCLAS, and subsequent fields in this frame are the same as the values of the corresponding parameters in the invocation of the MLME-ADDTS.response primitive that causes the frame to be sent. The TS Delay element is present in a DMG ADDTS Response frame only if the status code is set to REJECTED_FOR_DELAY_PERIOD (9.4.1.9).

When present in a DMG ADDTS Response frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the TS identified by the optional TSPEC element applies.

When present in the DMG ADDTS Response frame, the U-PID element indicates the upper layer protocol associated with the TS identified by the optional TSPEC contained in this frame. If a TSPEC element is not present in the frame, the U-PID element is not present in the frame.

When present in the DMG ADDTS Response frame, the Multiple MAC Sublayers element is used to establish an MMSL cluster (see 11.32).

9.6.3.4 DELTS frame format

The DELTS frame is used to delete a TS or an allocation using the procedures defined in 11.4.8.

The Action field of a DELTS frame contains the information shown in Table 9-460.

Table 9-460—DELTS frame Action field format

Order	Information
1	Category
2	QoS Action
3	TS Info
4	Reason Code
5	DMG Allocation Info (optional)
6	Multi-band (optional)

The Category field is defined in 9.4.1.11.

The QoS Action field is defined in 9.6.3.1.

The TS Info field is defined in 9.4.2.28. Either the field identifies an existing TS created using the TSPEC element, or all its subfields are set to 0. The DMG Allocation Info field, defined in 9.4.2.132, is present when an existing DMG allocation is being deleted. When a DMG allocation is being deleted, the DMG Allocation Info field identifies an existing allocation created using the DMG TSPEC element. When a DMG allocation is not being deleted, all subfields in the DMG Allocation Info field are set to 0.

The Reason Code field is defined in 9.4.1.7.

A DELTS frame is used to delete a TS characterized by the TS Info field or to delete a DMG allocation identified by the DMG Allocation Info field in the frame. A DELTS frame can be sent from the HC or PCP to the source STA of that TS, or vice versa, to indicate an imperative request, to which no response is required from the recipient STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When present in an DELTS frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the DELTS frame applies.

9.6.3.5 Schedule frame format

The Schedule frame is transmitted by the HC to announce the schedule of delivery of data and polls. The Action field of the Schedule frame contains the information shown in Table 9-461.

Table 9-461—Schedule frame Action field format

Order	Information
1	Category
2	QoS Action
3	Schedule

The Category field is defined in 9.4.1.11.

The QoS Action field is defined in 9.6.3.1.

The Schedule element is defined in 9.4.2.32.

9.6.3.6 QoS Map Configure frame format

The QoS Map Configure frame is used by an AP to provide the QoS Map information to a non-AP STA using the procedures defined in 11.22.9.

The Action field of the QoS Map Configure frame contains the information shown in Table 9-462.

Table 9-462—QoS Map Configure frame Action field format

Order	Information
0	Category
1	QoS Action
2	QoS Map
3	Intra-Access Category Priority elements (optional)

The Category field is defined in 9.4.1.11.

The QoS Action field is defined in 9.6.3.1.

The QoS Map element is defined in 9.4.2.93.

Zero or more Intra-Access Category Priority elements are present, which are defined in 9.4.2.119.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.3.7 ADDTS Reserve Request frame format

The ADDTS Reserve Request frame is transmitted by an AP to a non-AP STA in response to a higher layer protocol. See 11.4.4.3.

The Action field of the ADDTS Reserve Request frame contains the information shown in Table 9-463.

Table 9-463—ADDTS Reserve Request frame Action field format

Order	Information
1	Category
2	QoS Action
3	TSPEC
4	Schedule
5	Higher Layer Stream ID

The Category field is defined in 9.4.1.11.

The QoS Action field is defined in 9.6.3.1.

The TSPEC element contains the QoS parameters that define the TS. The QoS parameters in the TSPEC are equivalent to the QoS parameters of the higher level stream identified by the Higher Level Stream ID. The TS is identified by the TSID and Direction fields within the TSPEC element.

The Schedule element is defined in 9.4.2.32 and set to reflect schedule information corresponding to the TSPEC specification.

The Higher Layer Stream ID element (defined in 9.4.2.123) provides the stream identifier from a higher layer protocol.

9.6.3.8 ADDTS Reserve Response frame format

An ADDTS Reserve Response frame is used by a non-AP STA to indicate the completion of an AP-initiated TS setup procedure (11.4.4.3). The Action field of the ADDTS Reserve Response frame contains the information shown in Table 9-464.

Table 9-464—ADDTS Reserve Response frame Action field format

Order	Information
1	Category
2	QoS Action
3	Higher Layer Stream ID
4	Status Code

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The QoS Action field is defined in 9.6.3.1.

The Higher Layer Stream ID field contains a Higher Layer Stream ID element (see 9.4.2.123).

The Status Code field is defined in 9.4.1.9.

9.6.4 Block Ack Action frame details

9.6.4.1 Block Ack Action field

ADDBA Request and ADDBA Response frames are used to set up or to modify block ack operationfor a specific TC, TS, or GCR group address. A Block Ack Action field, in the octet immediately after the Category field, differentiates the Block Ack Action frame formats. The Block Ack Action frames are used to negotiate several parameters of a block ack agreement and the type of BlockAck frames that are used: BlockAck, NDP BlockAck and Block Acknowledgment TWT frames (see 10.25.2). The Block Ack Action field values associated with each frame format within the Block Ack category are defined in Table 9-465.

Table 9-465—Block Ack Action field values

Block Ack Action field values	Meaning
0	ADDBA Request
1	ADDBA Response
2	DELBA
3	PBAC WinStart Update
4–127	Reserved
128	NDP ADDBA Request
129	NDP ADDBA Response
130	NDP DELBA
131	Reserved
132	BAT ADDBA Request
133	BAT ADDBA Response
134	BAT DELBA
135–255	Reserved

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.4.2 ADDBA Request frame format

An ADDBA Request frame is sent by an originator of block ack to another STA. The Action field of an ADDBA Request frame contains the information shown in Table 9-466.

Table 9-466—ADDBA Request frame Action field format

Order	Information
1	Category
2	Block Ack Action
3	Dialog Token
4	Block Ack Parameter Set
5	Block Ack Timeout Value
6	Block Ack Starting Sequence Control
7	GCR Group Address element (optional)
8	Multi-band (optional)
9	TCLAS (optional)
10	ADDBA Extension (optional)
11	EDMG Flow Control Extension Configuration (optional)
12	SAR Configuration (optional)

The Category field is defined in 9.4.1.11.

The Block Ack Action field is defined in 9.6.4.1 for each of the ADDBA request variants.

The Dialog Token field is defined in 9.4.1.12. For an unsolicited block ack extension agreement, the Dialog Token field is set to 0. Otherwise, it is set to a nonzero value chosen by the STA.

The Block Ack Parameter Set field is defined in 9.4.1.13.

The Block Ack Timeout Value field is defined in 9.4.1.14.

The Starting Sequence Number subfield of the Block Ack Starting Sequence Control field (see Figure 9-48 (Block Ack Starting Sequence Control subfield format)) contains the sequence number of the first or next (in the case of a renegotiation of a block ack agreement) MSDU (not in an A-MSDU) or A-MSDU to be sent under this block ack agreement. The Fragment Number subfield is set to 0.

If the GCR Group Address element is present, the TID field within the Block Ack Parameter Set field is reserved.

The GCR Group Address element contains the group address for which a block ack agreement is requested.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When present in an ADDBA Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the ADDBA Request frame applies and contains band-specific information.

The ADDBA Extension element is defined in 9.4.2.138.

The EDMG Flow Control Extension Configuration element is defined in 9.4.2.276.

The SAR Configuration element is defined in 9.4.2.279.

9.6.4.3 ADDBA Response frame format

The ADDBA Response frame is sent in response to an ADDBA Request frame. The Action field of an ADDBA Response frame contains the information shown in Table 9-467.

Table 9-467—ADDBA Response frame Action field format

Order	Information
1	Category
2	Block Ack Action
3	Dialog Token
4	Status Code
5	Block Ack Parameter Set
6	Block Ack Timeout Value
7	GCR Group Address element (optional)
8	Multi-band (optional)
9	TCLAS (optional)
10	ADDBA Extension (optional)
11	Reserved
12	EDMG Flow Control Extension Configuration (optional)
13	SAR Configuration (optional)
14	Originator Preferred MCS element (optional)

The Category field is defined in 9.4.1.11.

The Block Ack Action field is defined in 9.6.4.1 for each of the ADDBA response variants.

The Dialog Token field value is copied from the corresponding received ADDBA Request frame.

The Status Code field is defined in 9.4.1.9.

The Block Ack Parameter Set field is defined in 9.4.1.13.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Block Ack Timeout Value field is defined in 9.4.1.14.

If the GCR Group Address element is present, the TID field within the Block Ack Parameter Set field is reserved.

The GCR Group Address element contains the group address for which a block ack agreement is requested.

When present in an ADDBA Response frame, the Multi-band element indicates the frequency band ID, operating class, and channel number to which the ADDBA Response frame applies and contains band-specific information.

The ADDBA Extension element is defined in 9.4.2.138.

The Originator Preferred MCS field element is optionally present if dot11S1GOptionImplemented is true, and the Block Ack Action field is 1. Otherwise, it is not present.

The EDMG Flow Control Extension Configuration element is defined in 9.4.2.276.

The SAR Configuration element is defined in 9.4.2.279 and is included in the frame if a SAR Configuration element was included in the corresponding ADDBA Request frame.

9.6.4.4 DELBA frame format

The DELBA frame is sent by either the originator of the traffic or the recipient to terminate the block ack agreement. The Action field of a DELBA frame contains the information shown in Table 9-468.

Table 9-468—DELBA frame Action field format

Order	Information
1	Category
2	Block Ack Action
3	DELBA Parameter Set
4	Reason Code
5	DELBA GCR Group Address
6	Multi-band (optional)
7	TCLAS (optional)

The Category field is defined in 9.4.1.11.

The Block Ack Action field is defined in 9.6.4.1 for each of the DELBA variants.

The DELBA Parameter Set field is defined in 9.4.1.16.

The Reason Code field is defined in 9.4.1.7.

The DELBA GCR Group Address field is defined in 9.4.2.124 and contains the GCR group address whose block ack agreement is being terminated.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When present in an DELBA frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the DELBA frame applies.

9.6.4.5 PBAC WinStart Update frame format

The PBAC WinStart Update frame is sent by an originator to update $WinStart_B$ and $WinStart_R$ at the recipient for a protected block ack agreement (see 10.25.7). The Action field of a PBAC WinStart Update frame contains the information shown in Table 9-469.

Table 9-469—PBAC WinStart Update frame Action field format

Order	Information
1	Category
2	Block Ack Action
3	Block Ack Parameter Set
4	Block Ack Starting Sequence Control

The Category field is defined in 9.4.1.11.

The Block Ack Action field is defined in 9.6.4.1.

The Block Ack Parameter Set field is defined in 9.4.1.13.

The Starting Sequence Number subfield of the Block Ack Starting Sequence Control field (see Figure 9-48 (Block Ack Starting Sequence Control subfield format)) contains the sequence number of the next MSDU (not in an A-MSDU) or A-MSDU to be sent under this block ack agreement. The Fragment Number subfield is set to 0.

9.6.5 Vendor Specific Action frame and Vendor Specific Protected Action frame details

Vendor Specific Action and Vendor Specific Protected Action frames are defined for vendor-specific signaling. The format of the Action field of these frames is shown in Figure 9-1184.

NOTE—If management frame protection is negotiated, then Vendor Specific Protected Action frames (see Table 9-81) are protected; otherwise they are unprotected.

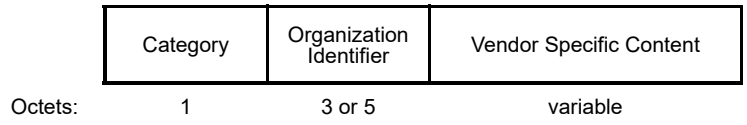

Figure 9-1184—Action field format of Vendor Specific Action and Vendor Specific Protected Action frames

The Category field is defined in 9.4.1.11.

The Organization Identifier field contains the identity of the entity that has defined the content of the Vendor Specific Action and Vendor Specific Protected Action frames (see 9.4.1.29 for a description of the Organization Identifier field contents and length).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Vendor Specific Content field contains vendor-specific field(s). The length of the vendor specific content in a Vendor Specific Action and Vendor Specific Protected Action frame is limited by the maximum allowed MMPDU size.

9.6.6 Radio Measurement Action frame details

9.6.6.1 Radio Measurement Action field

Several Action frame formats are defined for radio measurement purposes. A Radio Measurement Action field, in the field immediately after the Category field, differentiates the formats. The Radio Measurement Action field values associated with each frame format are defined in Table 9-470.

Table 9-470—Radio Measurement Action field values

Radio Measurement Action field value	Description
0	Radio Measurement Request
1	Radio Measurement Report
2	Link Measurement Request
3	Link Measurement Report
4	Neighbor Report Request
5	Neighbor Report Response
6–255	Reserved

9.6.6.2 Radio Measurement Request frame format

The Radio Measurement Request frame is transmitted to another STA to request that it makes one or more measurements on one or more channels. The format of the Action field in the Radio Measurement Request frame is shown in Figure 9-1185.

	Category	Radio Measurement Action	Dialog Token	Number of Repetitions	Measurement Request Elements
Octets:	1	1	1	2	variable

Figure 9-1185—Radio Measurement Request frame Action field format

The Category field is defined in 9.4.1.11.

The Radio Measurement Action field is defined in 9.6.6.1.

The Dialog Token field is defined in 9.4.1.12. It is set to a nonzero value chosen by the STA sending the radio measurement request to identify the request/report transaction.

The Number of Repetitions field contains the requested number of repetitions for all of the Measurement Request elements in this frame. Setting the Number of Repetitions field to 0 indicates Measurement Request elements are executed once without repetition. Setting the Number of Repetitions field to 65 535 indicates Measurement Request elements are repeated until the measurement is canceled or superseded.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Measurement Request Elements field contains zero or more of the Measurement Request elements described in 9.4.2.19. The number and length of the Measurement Request elements in a Measurement Request frame are limited by the maximum allowed MMPDU size.

9.6.6.3 Radio Measurement Report frame format

The Radio Measurement Report frame is transmitted in response to a Radio Measurement Request frame or by a STA providing a triggered autonomous measurement report. The format of the Action field in the Radio Measurement Report frame is shown in Figure 9-1186 (Radio Measurement Report frame Action field format).

	Category	Radio Measurement Action	Dialog Token	Measurement Report Elements
Octets:	1	1	1	variable

Figure 9-1186—Radio Measurement Report frame Action field format

The Category field is defined in 9.4.1.11.

The Radio Measurement Action field is defined in 9.6.6.1.

The Dialog Token field is defined in 9.4.1.12. It is set to the value in the corresponding Radio Measurement Request frame. If the Radio Measurement Report frame is not being transmitted in response to a Radio Measurement Request frame then the dialog token is set to 0.

The Measurement Report Elements field contains one or more Measurement Report elements described in 9.4.2.20. The number and length of the Measurement Report elements in a single Radio Measurement Report frame are limited by the maximum allowed MMPDU size. Subclause 11.10.6 describes the required behavior for multiframe Radio Measurement Report frame responses.

9.6.6.4 Link Measurement Request frame format

The Link Measurement Request frame is transmitted by a STA to request another STA to respond with a Link Measurement Report frame to enable measurement of link path loss and estimation of link margin. In a non-DMG BSS, a Link Measurement Request frame is an Action frame and in a DMG BSS, a Link Measurement Request frame is an Action or an Action No Ack frame. The format of the Action field in the Link Measurement Request frame is shown in Figure 9-1187.

	Category	Radio Measurement Action	Dialog Token	Transmit Power Used	Max Transmit Power	Extended Link Measurement
Octets:	1	1	1	1	1	variable

Figure 9-1187—Link Measurement Request frame Action field format

The Category field is defined in 9.4.1.11.

The Radio Measurement Action field is defined in 9.6.6.1.

The Dialog Token field is defined in 9.4.1.12. It is set to a nonzero value chosen by the STA sending the request to identify the transaction.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Transmit Power Used field is set to the transmit power used to transmit the frame containing the Link Measurement Request, as described in 9.4.1.20.

The Max Transmit Power field provides the upper limit on the transmit power as measured at the antenna connector to be used by the transmitting STA on its operating channel. This field is described in 9.4.1.19. The Max Transmit Power field is set to the minimum of the maximum powers at which the STA is permitted to transmit in the operating channel by device capability, policy, and regulatory authority.

The Extended Link Measurement field is optionally present. When present, it contains an Extended Link Measurement element.

9.6.6.5 Link Measurement Report frame format

The Link Measurement Report frame is transmitted in response to a Link Measurement Request frame. In a non-DMG BSS, a Link Measurement Report frame is an Action frame and in a DMG BSS, a Link Measurement Report frame is an Action or an Action No Ack frame. The format of the Action field in the Link Measurement Report frame is shown in Figure 9-1188.

	Category	Radio Measurement Action	Dialog Token	TPC Report element	Receive Antenna ID	Transmit Antenna ID	RCPI
Octets:	1	1	1	4	1	1	1

	RSNI	DMG Link Margin	DMG Link Adaptation Acknowledgment	Extended Link Measurement
Octets:	1	variable	variable	variable

Figure 9-1188—Link Measurement Report frame Action field format

The Category field is defined in 9.4.1.11.

The Radio Measurement Action field is defined in 9.6.6.1.

The Dialog Token field is defined in 9.4.1.12. It is set to the value of the Dialog Token field in the last received corresponding Link Measurement Request frame.

The TPC Report element is set as described in 9.4.2.15.

The Receive Antenna ID field contains the identifying number for the antenna(s) or DMG antenna used to receive the corresponding Link Measurement Request frame or the last received frame from the requesting STA within the corresponding report interval. The antenna ID or DMG antenna ID is defined in 9.4.2.38.

The Transmit Antenna ID field contains the identifying number for the antenna(s) or DMG antenna used to transmit this Link Measurement Report frame. The antenna ID or DMG antenna ID is defined in 9.4.2.38.

The RCPI field indicates the received channel power of the corresponding Link Measurement Request frame, which is a logarithmic function of the received signal power or the last received frame from the requesting STA within the corresponding report interval, as defined in 9.4.2.36.

The RSNI field indicates the received signal-to-noise indication for the corresponding Link Measurement Request frame or the last received frame from the requesting STA within the corresponding report interval, as described in 9.4.2.39.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The DMG Link Margin field is optionally present. When present, it contains a DMG Link Margin element (see 9.4.2.141).

The DMG Link Margin Adaptation Acknowledgment field is optionally present. When present, it contains a DMG Link Margin Adaptation Acknowledgment element (see 9.4.2.141.3).

The Extended Link Measurement field is optionally present. When present, it contains an Extended Link Measurement element.

9.6.6.6 Neighbor Report Request frame format

The Neighbor Report Request frame is transmitted requesting information in the neighbor report about neighboring APs. The format of the Action field in the Neighbor Report Request frame is shown in Figure 9-1189.

	Category	Radio Measurement Action	Dialog Token	SSID (optional)	LCI Measurement Request (optional)	Location Civic Measurement Request (optional)	Neighbor DMG Request (optional)
Octets:	1	1	1	variable	variable	variable	variable

Figure 9-1189—Neighbor Report Request frame Action field format

The Category field is defined in 9.4.1.11.

The Radio Measurement Action field is defined in 9.6.6.1.

The Dialog Token field is defined in 9.4.1.12. It is set to a nonzero value chosen by the STA sending the measurement request to identify the request/report transaction.

The SSID field is optionally present. If present, it contains an SSID element. The presence of an SSID element in a Neighbor Report Request frame indicates a request for a list of neighbor reports for the specified SSID in the SSID element. The absence of an SSID element indicates the request is for the ESS of which the transmitting STA is a member.

The LCI Measurement Request field is optionally present. If present, it contains a Measurement Request element with Measurement Type field equal to LCI (see Table 9-136), which indicates a request for a Measurement Report subelement with Measurement Type field equal to LCI for each Neighbor Report element (see 11.10.10.2). The Enable subfield in the Measurement Request Mode field in the Measurement Request element is set to 0. The Location Subject field in the Measurement Request field of the Measurement Request element is set to Location Subject Remote (see Table 9-148). The Request, Report and Duration Mandatory subfield within the Measurement Request Mode field in the Measurement Request element are reserved (see 9.4.2.19.1).

The Location Civic Measurement Request field is optionally present. If present, it contains a Measurement Request element with Measurement Type field equal to Location Civic (see Table 9-136). The element indicates a request for a Measurement Report subelement with Measurement Type field equal to Location Civic for each Neighbor Report element (see 11.10.10.2). The Enable subfield in the Measurement Request Mode field within the Measurement Request element is set to 0. The Location Subject field in the Measurement Request field of the Measurement Request element is equal to Location Subject Remote (see Table 9-148). The Location Service Interval Units field in the Measurement Request field of the Measurement Request element is set to 0. The Request, Report and Duration Mandatory subfield in the Measurement Request Mode field in the Measurement Request element are reserved (see 9.4.2.19.1).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Neighbor DMG Request field is optionally present. If present, it contains a Measurement Request element with Measurement Type field equal to neighboring DMG APs; see Table 9-136. The element indicates a request for Neighbor Report elements containing information about neighboring DMG APs supporting location services. The Enable bit in the Measurement Request Mode field within the Measurement Request element is set to 0.

9.6.6.7 Neighbor Report Response frame format

The Neighbor Report Response frame is transmitted in response to a Neighbor Report Request frame. The format of the Action field in the Neighbor Report Response frame is shown in Figure 9-1190.

	Category	Radio Measurement Action	Dialog Token	Neighbor Report Elements
Octets:	1	1	1	variable

Figure 9-1190—Neighbor Report Response frame Action field format

The Category field is defined in 9.4.1.11.

The Radio Measurement Action field is defined in 9.6.6.1.

The Dialog Token field set to the value in the corresponding Neighbor Report Request frame. If the Neighbor Report Response frame is not being transmitted in response to a Neighbor Report Request frame, then the dialog token is set to 0.

The Neighbor Report Elements field contains the Neighbor Report elements for validated APs described in 9.4.2.35. If the STA has no information in response to the Neighbor Report Request, the Neighbor Report elements are omitted. The number and length of the Neighbor Report elements in a Neighbor Report Response frame is limited by the maximum allowed MMPDU size.

NOTE—Under some circumstances, a Neighbor Report element is included for the STA transmitting the frame. See 11.10.10.3.

9.6.7 Public Action frame details

9.6.7.1 Public Action field

The Public Action frame is defined to allow the following:

— Inter-BSS and AP to unassociated-STA communications
— Intra-BSS communication
— GAS

A Public Action field, in the octet immediately after the Category field, differentiates the Public Action frame formats. The defined Public Action frames are listed in Table 9-471.

9.6.7.2 20/40 BSS Coexistence Management frame format

The format of the 20/40 BSS Coexistence Management frame Action field is defined in Table 9-472.

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

9.6.7.3 Measurement Pilot frame format

The format of the Action field of the Measurement Pilot frame is shown in Figure 9-1191.

	Category	Public Action	Condensed Capability Information	Condensed Country String	Operating Class	Channel	Measurement Pilot Interval	Optional Subelements
Octets:	1	1	1	2	1	1	1	variable

Figure 9-1191—Measurement Pilot frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Condensed Capability Information field contains two subfields as shown in Figure 9-1192.

	B0	B1	B2	B7
	Spectrum Management	Short Slot Time	Reserved	
Bits:	1	1	6	

Figure 9-1192—Condensed Capability Information field

The Spectrum Management subfield is set to 1 if dot11SpectrumManagementRequired is true; otherwise, it is set to 0.

The Short Slot Time subfield is set to 1 to indicate the short slot time value is currently used within this BSS. Otherwise, the Short Slot Time subfield is set to 0. See 10.3.2.16 and 11.1.3.2.

The Condensed Country String field is set to the first two octets of the value contained in dot11CountryString.

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class value for the operating channel. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for the operating channel. Valid operating classes are listed in Annex E, excluding Operating Classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the operating channel. Channel number is defined within an operating class as shown in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the operating channel, and the Operating Class and Channel Number fields together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Measurement Pilot Interval field is set to the value contained in dot11RMMeasurementPilotPeriod.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-473.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-473—Optional subelement IDs for Measurement Pilot frame

Subelement ID	Name	Extensible
0–70	Reserved	
71	Multiple BSSID	Subelements
72–162	Reserved	
163	Wide Bandwidth Channel Switch	Yes
164–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.159) with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Multiple BSSID and Vendor Specific subelements have the same format as the Multiple BSSID and Vendor Specific elements (see 9.4.2.44 and 9.4.2.24, respectively). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.6.7.4 DSE Enablement frame format

The DSE Enablement frame is transmitted as part of enablement. The format of the DSE Enablement frame Action field is shown in Figure 9-1193.

	Category	Public Action	Requester STA Address	Responder STA Address	Reason Result Code	Enablement Identifier
Octets:	1	1	6	6	1	2

Figure 9-1193—DSE Enablement frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the enablement process.

The ResponderSTAAddress field is the MAC address of the enablement responder.

The Reason Result Code field is used to indicate the reason that a DSE Enablement frame was generated. The reason result codes that have been allocated are shown in Table 9-474.

The Enablement Identifier field is assigned by an enabling STA to a dependent STA; otherwise, it is 0, set using the procedures defined in 11.11.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-474—Reason Result Code field values

Reason Result Code field value	Name	Description
0		Reserved
1		Reserved
2		Enablement requested
3	SUCCESS	Success
4	REFUSED	Request declined
5	INVALID_PARAMETERS	Request not successful as one or more parameters have invalid values
6	TOO_MANY_ SIMULTANEOUS_REQUESTS	Enablement denied because the enabling STA is unable to handle additional dependent STAs
7–255		Reserved

9.6.7.5 DSE Deenablement frame format

The DSE Deenablement frame is transmitted as part of deenablement. The format of the DSE Deenablement frame Action field is shown in Figure 9-1194.

	Category	Public Action	Requester STA Address	Responder STA Address	Reason Result Code
Octets:	1	1	6	6	1

Figure 9-1194—DSE Deenablement frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the deenablement process.

The ResponderSTAAddress field is the MAC address of the responding STA that becomes deenabled.

The Reason Result Code field is used to indicate the reason that a DSE Deenablement frame was generated. The reason result codes that have been allocated are shown in Table 9-475.

Table 9-475—Reason Result Code field values

Reason Result Code field value	Description
0	Reserved
1	Reserved
2	Deenablement requested
3–255	Reserved

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.7.6 DSE Registered Location Announcement frame format

The DSE Registered Location Announcement frame is transmitted by a dependent STA to advertise the registered location of its enabling STA. The format of the DSE Registered Location Announcement frame Action field is shown in Figure 9-1195.

	Category	Public Action	DSE Registered Location Information
Octets:	1	1	20

Figure 9-1195—DSE Registered Location Announcement frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The DSE Registered Location Information field is defined in 9.4.2.50.

9.6.7.7 Extended Channel Switch Announcement frame format

The Extended Channel Switch Announcement frame is transmitted by an AP, IBSS STA, or mesh STA to advertise a channel switch. The format of the Extended Channel Switch Announcement frame Action field is shown in Figure 9-1196.

	Category	Public Action	Channel Switch Mode	New Operating Class	New Channel Number	Channel Switch Count
Octets:	1	1	1	1	1	1
		Zero or one	Zero or one	Zero or more	Zero or one	
	Mesh Channel Switch Parameters element	New Country element	Wide Bandwidth Channel Switch element	New Transmit Power Envelope element	Max Channel Switch Time element	
Octets:	0 or 8	variable	variable	variable	0 or 6	

Figure 9-1196—Extended Channel Switch Announcement frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Channel Switch Mode, New Operating Class, New Channel Number, and Channel Switch Count fields are as described in the Extended Channel Switch Announcement element (see 9.4.2.51).

The Mesh Channel Switch Parameters element is defined in 9.4.2.101. This element is present when a mesh STA performs MBSS channel switching. The Mesh Channel Switch Parameters element is not included for channel switching other than for an MBSS channel switch.

The New Country element is present when an AP or mesh STA performs extended channel switching to a new Country, new Operating Class Table, or a changed set of operating classes relative to the contents of the Country element sent in the Beacon; otherwise, this element is not present. The format of the New Country element is defined to be the same as the format of the Country element (see 9.4.2.7), except that no Subband

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Triplet fields are present in the New Country element. The Country String field in the New Country element indicates the Country and Operating Class Table of the BSS after extended channel switching and Operating Triplet fields within the New Country element indicate the operating classes of the BSS after extended channel switching (see 11.38.1).

This Wide Bandwidth Channel Switch element is present when extended channel switching to a channel width wider than 40 MHz, or when extended channel switching is to a channel width wider than 1 MHz and the frame carrying the element is an S1G PPDU; otherwise, this element is not present. The Wide Bandwidth Channel Switch element is defined in 9.4.2.159. The Wide Bandwidth Channel Switch element indicates the BSS bandwidth after extended channel switching (see 11.38.1 and 10.45.1).

Each New Transmit Power Envelope element that is present is defined to have the same format as the Transmit Power Envelope element (see 9.4.2.160) and includes a distinct value of the Local Maximum Transmit Power Unit Interpretation subfield. If present, the New Transmit Power Envelope element indicates the maximum transmit powers for the BSS for the indicated bandwidths with an indicated unit interpretation after extended channel switching (see 11.38.1).

The Max Channel Switch Time Element field, if present, cotnains a Max Channel Switch Time element as defined in 9.4.2.216.

9.6.7.8 DSE Measurement Request frame format

The DSE Measurement Request frame requests a DSE measurement report. It is transmitted using the procedures defined in 11.11. The format of the DSE Measurement Request frame Action field is shown in Figure 9-1197.

	Category	Public Action	Requester STA Address	Responder STA Address	Operating Class	Channel Number	Measurement Start Time	Measurement Duration
Octets:	1	1	6	6	1	1	8	2

Figure 9-1197—DSE Measurement Request frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The RequesterSTAAddress field is the MAC address of the STA that requests the DSE measurement report.

The ResponderSTAAddress field is the MAC address of the responding STA that operates based on the enablement.

The Operating Class field indicates the channel set for which the measurement request applies. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the measurement request applies. Valid values for the Operating Class field are shown in Annex E.

The Measurement Start Time field is set to the timing synchronization function (TSF) at the time (± 1 TU) at which the requested DSE request measurement starts. Setting the field to 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in number of time units (TUs).

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.7.9 DSE Measurement Report frame format

The DSE Measurement Report frame is transmitted using the procedures defined in 11.11. The format of the DSE Measurement Report frame Action field is shown in Figure 9-1198.

	Category	Public Action	Requester STA Address	Responder STA Address	Length	Operating Class	Channel Number	Measurement Report Mode	Actual Measurement Start Time	Measurement Duration	Reported DSE LCI fields
Octets:	1	1	6	6	2	1	1	1	8	2	n × 26

Figure 9-1198—DSE Measurement Report frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The RequesterSTAAddress field is the MAC address of the STA that requested the DSE measurement report.

The ResponderSTAAddress field is the MAC address of the responding STA that operates based on the enablement.

The Length field indicates the length of the remaining frame fields in octets, and the value is variable. The minimum value of the Length field is 13.

The Operating Class field indicates the channel set for which the measurement report applies. The Operating Class and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid values for the Operating Class field are shown in Annex E.

The Measurement Report Mode field is defined in 9.4.2.20 (see Figure 9-290).

The Actual Measurement Start Time field is set to the value of the measuring STA's TSF timer at the time (± 1 TU) at which the DSE measurement started.

The Measurement Duration field is set to the duration over which the requested measurement was measured, expressed in number of TUs.

The reported DSE LCI fields contain the DSE LCI received at the measuring STA. If the reported DSE LCI fields would cause the frame to exceed the maximum MAC management protocol data unit (MMPDU) size, then the reported DSE LCI fields are truncated so that the last reported DSE LCI field is complete. The DSE LCI field format is shown in Figure 9-1199.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

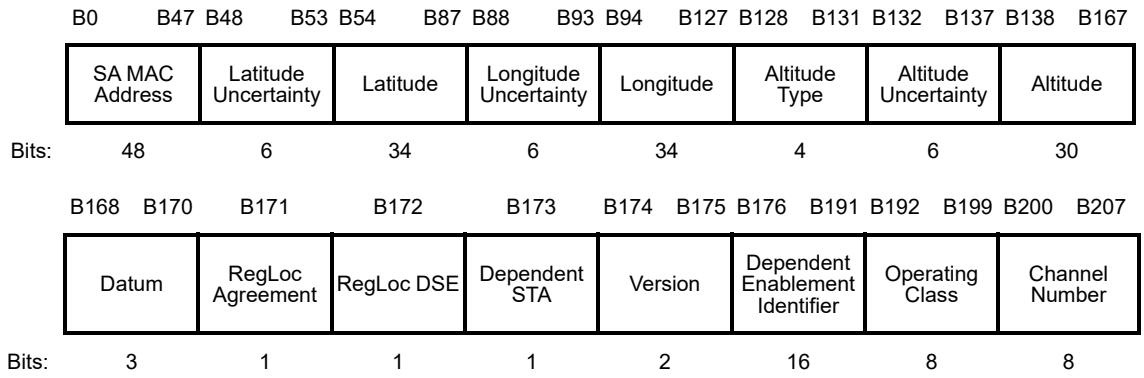

Figure 9-1199—DSE LCI field format

The SA MAC Address field contains the SA MAC address from the Beacon or Public Action frame containing a DSE Registered Location element being reported.

The remaining fields are as defined in the DSE Registered Location Information field (see 9.4.2.50).

9.6.7.10 DSE Power Constraint frame format

The DSE Power Constraint frame requests that a dependent STA constrain transmit power below the regulatory limit. It is transmitted by an enabling STA as part of enablement. The format of the DSE Power Constraint frame Action field is shown in Figure 9-1200.

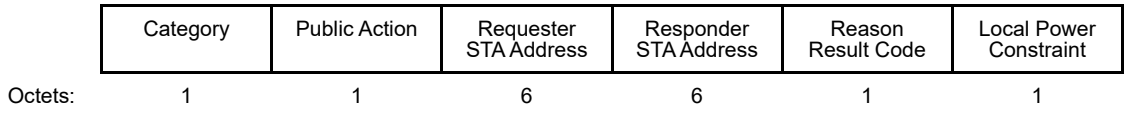

Figure 9-1200—DSE Power Constraint frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The RequesterSTAAddress field is the MAC address of the STA that requests the DSE power constraint.

The ResponderSTAAddress field is the MAC address of the responding STA that initiates the enablement.

The Reason Result Code field is used to indicate the reason that a DSE Power Constraint frame was generated. The reason result codes that have been allocated are shown in Table 9-476.

The Local Power Constraint field is coded as an unsigned integer in units of decibels relative to 1 mW. The local maximum transmit power for a channel is thus defined as the maximum transmit power level specified for the channel in the Country element minus the local power constraint specified for the channel in the DSE Power Constraint frame.

Table 9-476—Reason Result Code field values

Reason Result Code field value	Name	Description
0		Reserved
1		Reserved
2		Power constraint requested
3	SUCCESS	Success
4	REFUSED	Refused — no reason specified
5	INVALID_PARAMETERS	Request not successful as one or more parameters have invalid values
6–255		Reserved

9.6.7.11 Vendor Specific Public Action frame format

The Vendor Specific Public Action frame is defined for vendor-specific signaling between unassociated STAs. The format of the Action field of the Vendor Specific Public Action frame is shown in Figure 9-1201.

	Category	Public Action	Organization Identifier	Vendor Specific Content
Octets:	1	1	variable	variable

Figure 9-1201—Vendor Specific Public Action frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Organization Identifier field contains a organization identifier assigned by the IEEE and is specified in 9.4.1.29. The order of the Organization Identifier field is described in 9.2.2. The length of the Organization Identifier field is variable, as specified in 9.4.1.29.

The Vendor Specific Content field contains vendor-specific field(s). The length of the vendor specific content in a Vendor Specific Public Action frame is limited by the maximum allowed MMPDU size.

9.6.7.12 GAS Initial Request frame format

The GAS Initial Request frame is transmitted by a requesting STA to request information from another STA. The format of the GAS Initial Request frame Action field is shown in Table 9-477.

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA.

The Advertisement Protocol element is defined in 9.4.2.91. The Advertisement Protocol element includes exactly one advertisement protocol ID.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-477—GAS Initial Request frame Action field format

Order	Information
0	Category
1	Public Action
2	Dialog Token
3	Advertisement Protocol element
4	Query Request Length
5	Query Request
6	Multi-band (optional)
7	CAG Number (optional)
8	GAS Extension (optional)

The Query Request Length field is defined in Figure 9-1202. The value of the Query Request Length field is set to the total number of octets in the Query Request field.

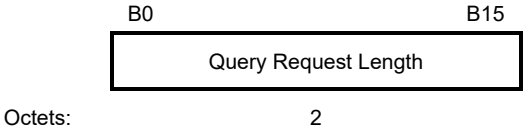

Figure 9-1202—Query Request Length field

The Query Request field is defined in Figure 9-1203 (Query Request field). The Query Request field is a generic container whose value is formatted in accordance with the protocol identified in the Advertisement Protocol element.

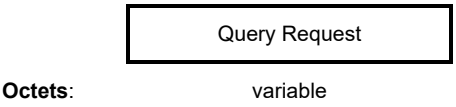

Figure 9-1203—Query Request field

When present in a GAS Initial Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Initial Request frame applies.

When present in a GAS Initial Request frame, the CAG Number element includes one or more Common Advertisement Group (CAG) tuples. Each CAG tuple specifies a pair of CAG Version and CAG Information Type cached by the requesting STA and associated with the query request contained in the Query Request field.

The GAS Extension element indicating the STA support for GAS extension in GAS frame exchanges is optionally present if dot11GASExtensionImplemented is true.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.7.13 GAS Initial Response frame format

The GAS Initial Response frame is transmitted in response to a GAS Initial Request frame or a Group Addressed GAS Request frame. The format of the GAS Initial Response frame Action field is shown in Table 9-478.

Table 9-478—GAS Initial Response frame Action field format

Order	Information
0	Category
1	Public Action
2	Dialog Token
3	Status Code
4	GAS Comeback Delay
5	Advertisement Protocol element
6	Query Response Length
7	Query Response (optional)
8	Multi-band (optional)
9	GAS Extension (optional)

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12. It is copied from the corresponding GAS Initial Request frame or Group Addressed GAS Request frame.

The Status Code field values are defined in Table 9-80.

The GAS Comeback Delay field specifies the delay time value in TUs. The GAS Comeback Delay field format is shown in Figure 9-1204. The behavior is described in 11.22.3.2. The value 0 is returned by the STA when a Query Response is provided in this frame.

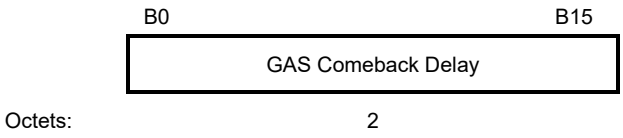

Figure 9-1204—GAS Comeback Delay field format

The Advertisement Protocol element is defined in 9.4.2.91. The Advertisement Protocol element includes exactly one advertisement protocol ID.

The Query Response Length field is defined in Figure 9-1205. The Query Response Length field is set to the total number of octets in the Query Response field. If the Query Response Length field is set to 0, then there is no Query Response included in this Action frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

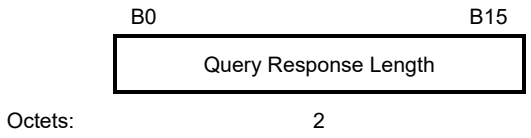

Figure 9-1205—Query Response Length field format

The Query Response field is defined in Figure 9-1206. The Query Response field is a generic container whose value is formatted in accordance with the protocol specified in the Advertisement Protocol element.

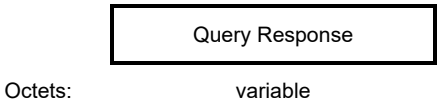

Figure 9-1206—Query Response field format

When present in a GAS Initial Response frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Initial Response frame applies.

The GAS Extension element indicating the STA support for GAS extension in GAS frame exchanges is optionally present if dot11GASExtensionImplemented is true. It is included as a response to a GAS Initial Request frame containing a GAS Extension element.

9.6.7.14 GAS Comeback Request frame format

The GAS Comeback Request frame is transmitted by a requesting STA to a responding STA. The format of the GAS Comeback Request frame Action field is shown in Table 9-479.

Table 9-479—GAS Comeback Request frame Action field format

Order	Information
0	Category
1	Public Action
2	Dialog Token
3	Multi-band (optional)
4	GAS Extension (optional)

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12. It is copied from the corresponding GAS Initial Request frame.

When present in a GAS Comeback Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Comeback Request frame applies.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When present in a GAS Comeback Request frame, the GAS Extension element indicates a request to retransmit a GAS query response fragment.

9.6.7.15 GAS Comeback Request Fragment frame format

The GAS Comeback Request Fragment frame is transmitted by a requesting STA to a responding STA. The format of the GAS Comeback Request Fragment frame Action field is shown in Table 9-480.

Table 9-480—GAS Comeback Request Fragment frame Action field format

Order	Information
0	Category
1	Public Action
2	Dialog Token
3	Status Code
4	GAS Query Fragment ID
5	Query Request Length
6	Query Request
7	Multi-band (optional)
8	GAS Extension (optional)

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12. It is copied from the corresponding GAS Initial Request frame. The same value of the Dialog Token field is present in all fragments of a multi-fragment query request.

The Status Code field values are defined in Table 9-80.

The GAS Query Fragment ID field is defined in 9.4.1.31. When there is more than one Query Request fragment, the requesting STA sets the GAS Query Fragment ID field to 0 for the initial fragment and increments it by 1 for each subsequent fragment in a multi-fragment query request. The More GAS Fragments field is set to 0 whenever the final fragment of a GAS query request is being transmitted. A GAS Query Fragment ID field having a nonzero GAS Fragment ID field and the More GAS Fragments field set to 1 indicates to the responding STA that another GAS Comeback Request and GAS Comeback Response frame exchange should be performed to continue the retrieval of the GAS query request.

The Query Request Length field is defined in 9.6.7.12.

The Query Request field is defined in 9.6.7.12.

When present in a GAS Comeback Request Fragment frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Comeback Request Fragment frame applies.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.7.16 GAS Comeback Response frame format

The GAS Comeback Response frame is transmitted by a responding STA to a requesting STA. The format of the GAS Comeback Response frame Action field is shown in Table 9-481.

Table 9-481—GAS Comeback Response frame Action field format

Order	Information
0	Category
1	Public Action
2	Dialog Token
3	Status Code
4	GAS Query Fragment ID
5	GAS Comeback Delay
6	Advertisement Protocol element
7	Query Response Length
8	Query Response (optional)
9	Multi-band (optional)
10	GAS Extension (optional)

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12. It is copied from the Dialog Token field of the corresponding GAS Comeback Request or GAS Comeback Request Fragment frame. The same value of the Dialog Token field is present in all fragments of a multi-fragment query response.

The Status Code field values are defined in Table 9-80. The same status code value is present in all fragments of a multi-fragment query response.

The GAS Query Fragment ID field is defined in 9.4.1.31. If the responding STA has not received a response to the query that it posted on behalf of a requesting STA, then the responding STA sets the GAS Query Fragment ID field to 0. When there is more than one query response fragment, the responding STA sets the GAS Query Fragment ID field to 0 for the initial fragment and increments it by 1 for each subsequent fragment in a multi-fragment query response. The More GAS Fragments field is set to 0 whenever the final fragment of a query response is being transmitted. A GAS Query Fragment ID field having a nonzero GAS Fragment ID field and the More GAS Fragments field set to 1 indicates to the requesting STA that another GAS Comeback Request and GAS Comeback Response frame exchange should be performed to continue the retrieval of the query response.

The GAS Comeback Delay field format is shown in Figure 9-1204. A nonzero GAS Comeback Delay field is returned by the responding STA in this frame to indicate that the GAS query request being carried out on behalf of the requesting STA is still in progress.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— A nonzero value indicates to the requesting STA that another GAS Comeback Request and GAS Comeback Response frame exchange should be performed after the expiration of the GAS comeback delay timer in order to retrieve the query response.
— This field is set to 0 for all GAS Comeback Response frames containing a query response or a fragment of a multi-fragment query response.

The Advertisement Protocol element is defined in 9.4.2.91. The Advertisement Protocol element includes exactly one advertisement protocol ID.

The Query Response Length field is defined in Figure 9-1205. The Query Response Length field is set to the total number of octets in the Query Response field. If the Query Response Length field is set to 0, then there is no Query Response included in this Action frame.

The Query Response field is defined in Figure 9-1206 (Query Response field format). The Query Response field is a generic container dependent on the advertisement protocol specified in the Advertisement Protocol element and the query itself. In a multi-fragment GAS query response, the response to the GAS query request posted on behalf of a requesting STA is fragmented such that each fragment to be transmitted fits within the MMPDU size limitation.

When present in a GAS Comeback Response frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Comeback Response frame applies.

9.6.7.17 TDLS Discovery Response frame format

The format of the TDLS Discovery Response frame Action field is shown in Table 9-482.

Table 9-482—TDLS Discovery Response frame Action field format

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	Public Action	The Public Action field is defined in 9.6.7.1.
3	Dialog Token	The dialog token is copied from the corresponding TDLS Discovery Request frame. The dialog token is specified in 9.4.1.12.
4	Capability	The Capability field indicates the capabilities of the STA. The Capability field is defined in 9.4.1.4.
5	Supported Rates and BSS Membership Selectors	The Supported Rates and BSS Membership Selectors element indicates the rates supported by the STA. The Supported Rates and BSS Membership Selectors element is defined in 9.4.2.3.
6	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if the number of supported rates and BSS membership selectors together exceed eight; it is optional otherwise. The Extended Supported Rates and BSS Membership Selectors element is defined in 9.4.2.11.
7	Supported Channels	The Supported Channels element is present if the TDLS Channel Switching subfield is equal to 1. The Supported Channels element is defined in 9.4.2.16.
8	RSNE	The RSNE is present if security is required on the TDLS direct link (see 12.7.8.1); otherwise not present. The RSNE is defined in 9.4.2.23.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-482—TDLS Discovery Response frame Action field format

Order	Information	Notes
9	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero. The Extended Capabilities element is defined in 9.4.2.25.
10	Timeout Interval (TPK key lifetime)	The TIE contains the TPK key lifetime. It is present if security is required on the TDLS direct link (see 12.7.8.1). The TIE is defined in 9.4.2.47.
11	Supported Operating Classes	The Supported Operating Classes element is present if the TDLS Channel Switching subfield is equal to 1.
12	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true. The HT Capabilities element is defined in 9.4.2.54.
13	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is present when dot112040BSSCoexistenceManagementSupport is true. The 20/40 BSS Coexistence element is defined in 9.4.2.58.
14	Link Identifier	The Link Identifier element is defined in 9.4.2.60.
15	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.
16	VHT Capabilities	VHT Capabilities element (optional). The VHT Capabilities element is present in the 5 GHz band if dot11VHTOptionImplemented is true.The VHT Capabilities element is defined in 9.4.2.156.
18	HE Capabilities	The HE Capabilities element is present if dot11HEOptionImplemented is true; otherwise, it is not present, The HE Capabilities element is defined in 9.4.2.247.
19	HE 6 GHz Band Capabilities	The HE 6 GHz Band Capabilities element is present if dot11HEOptionImplemented and dot11HE6GOptionImplemented are true; otherwise, it is not present.

9.6.7.18 Location Track Notification frame format

The Location Track Notification frame is transmitted to allow remote location determination to occur by another STA. The format of the Location Track Notification frame Action field is shown in Figure 9-1207.

	Category	Public Action	Location Parameters Element	Measurement Report Element (optional)
Octets:	1	1	variable	variable

Figure 9-1207—Location Track Notification frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Location Parameters Element field contains the Location Parameters subelements, described in Table 9-253. Table 9-483 defines the allowed Location Parameters subelements for a Location Parameters element that is included in the frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-483—Location Parameters Element field for Location Track Notification frame

Allowed subelements	Subelement ID	Notes
Location Indication Channels	2	The Location Indication Channels subelement is included in the Location Track Notification frame.
Radio Information	4	The Radio subelement is included in the Location Track Notification frame.
Motion	5	The Motion subelement is included in the Location Track Notification frame if dot11MotionDetectionActivated is true.
Time of Departure	7	The Time of Departure subelement is included in the Location Track Notification frame if dot11TODActivated is true.
Location Indication Options	8	The Location Indication Options subelement is included in the Location Track Notification frame if the successful Location Configuration Request frame that configured the STA included a Location Indication Options subelement.

The Measurement Report Element field contains a Measurement Report element of type Beacon report as defined in 9.4.2.20.7. The Measurement Report Element field is included in the Location Track Notification frame if the Location Parameters Element field contains a Location Indication Options subelement. The Measurement Report element Measurement Token field is set to the same value of the dialog token in the Location Configuration Request frame that configured the STA.

9.6.7.19 QMF Policy frame format

The QMF Policy frame is transmitted by a requesting STA to a receiving STA with the included QMF policy. It is either sent unsolicited by the requesting STA or in response to a QMF Policy Change frame from a receiving STA. The format of the Action field of the QMF Policy frame is shown in Figure 9-1208.

	Category	Public Action	Dialog Token	Status Code	QMF Policy element (optional)
Octets:	1	1	1	2	0 or 3-257

Figure 9-1208—QMF Policy frame Action field contents

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12. It is set to the value in the corresponding QMF Policy Change frame. If the QMF Policy frame is not being transmitted in response to a QMF Policy Change frame, then the Dialog Token field is set to 0.

The Status Code field is defined in Table 9.4.1.9.

The QMF Policy element is set as described in 9.4.2.118. It indicates the new access categories configured for Management frame(s). This field is included if the status code is SUCCESS and this frame is not being transmitted in response to a QMF Policy Change frame, and optionally included if the Status Code field is REQUEST_DECLINED.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.7.20 QMF Policy Change frame format

The QMF Policy Change frame is transmitted by a requesting STA to request a change to the QMF policy it most recently received from the destination STA. The format of the Action field of the QMF Policy Change frame is shown in Figure 9-1209.

	Category	Public Action	Dialog Token	QMF Policy element
Octets:	1	1	1	3-257

Figure 9-1209—QMF Policy Change frame Action field contents

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12. It is set to a nonzero value chosen by the STA sending the QMF Policy Change frame to identify the transaction.

The QMF Policy element is set as described in 9.4.2.118. It indicates the access categories requested for Management frame(s), including any changes to the QMF policy it most recently received from the destination STA.

9.6.7.20 QLoad Request frame format

The QLoad Request frame is transmitted by an AP to request information from another AP. The format of the Action field of the QLoad Request frame is shown in Table 9-484.

Table 9-484—QLoad Request frame Action field format

Order	Information
1	Category
2	Public Action
3	Dialog Token
4	QLoad Report element

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA to a nonzero value that is used for matching action responses with action requests. See 10.28.5.

The QLoad Report element is defined in 9.4.2.121 and contains the QLoad report corresponding to the AP sending the request.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.7.21 QLoad Report frame format

The QLoad Report frame is transmitted by an AP responding to a QLoad Request frame. The format of the Action field of the QLoad Report frame is shown in Table 9-485.

Table 9-485—QLoad Report frame Action field format

Order	Information
1	Category
2	Public Action
3	Dialog Token
4	QLoad Report element

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA to a nonzero value that is used for matching action responses with action requests. See 10.28.5. The Dialog Token field is set to 0 when an unsolicited QLoad Report frame is sent by the AP.

The QLoad Report element is defined in 9.4.2.121.

9.6.7.22 HCCA TXOP Advertisement frame

The HCCA TXOP Advertisement frame is transmitted by an AP to another AP to inform it of active and pending TXOP reservations. The format of the Action field of the HCCA TXOP Advertisement frame is shown in Figure 9-1210.

	Category	Public Action	Dialog Token	Number of Reported TXOP Reservations	Number of Pending TXOP Reservations	Active TXOP Reservations	Pending TXOP Reservations
Octets:	1	1	1	1	1	variable	variable

Figure 9-1210—HCCA TXOP Advertisement frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12 and is set by the AP to a nonzero value that is used for matching action responses with action requests. See 10.28.5.

The Number of Reported TXOP Reservations field contains a positive integer that specifies the number of active TXOP reservations reported in this frame. Setting the field to 0 indicates that no TXOP reservations are active.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Number of Pending Reported TXOP Reservations field contains a positive integer that specifies the number of pending TXOP reservations reported in this frame. Setting the field to 0 indicates that no TXOP reservations are in the process of being activated.

The Active TXOP Reservation field contains zero or more TXOP Reservation fields as defined in 9.4.1.41. This field indicates active HCCA TXOPs that the AP has scheduled. The Start Time subfield of the TXOP Reservation field is relative to the TSF of the sending AP.

The Pending TXOP Reservation field contains zero or more TXOP Reservation fields as defined in 9.4.1.41. This field indicates new HCCA TXOPs that the AP is scheduling. The Start Time subfield of the TXOP Reservation field is relative to the TSF of the sending AP.

The use of the HCCA TXOP Advertisement frame is described in 11.26.3.

9.6.7.23 HCCA TXOP Response frame

The HCCA TXOP Response frame is transmitted by an AP to another AP to respond to an HCCA TXOP Advertisement frame. The format of the Action field of the HCCA TXOP Response frame is shown in Figure 9-1211.

	Category	Public Action	Dialog Token	Status Code	Schedule Conflict	Alternate Schedule	Avoidance Request
Octets:	1	1	1	2	0 or 1	0 or 6	0 or 6

Figure 9-1211—HCCA TXOP Response frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12. It is set to the value of the Dialog Token field from the corresponding HCCA TXOP Advertisement frame.

The Status Code field is defined in 9.4.1.9 and is set to either the value SUCCESS or TS_SCHEDULE_CONFLICT.

The Schedule Conflict field is present only when the Status Code field is not SUCCESS. The Schedule Conflict field indicates the TXOP reservation from the HCCA TXOP Advertisement frame that conflicts with an existing or in-progress schedule. Its value is between 1 and the summation of the values from the Number of Reported TXOP Reservations and Number of Pending TXOP Reservations fields of the HCCA TXOP Advertisement frame. Setting the field to 1 indicates the first TXOP reservation in the HCCA TXOP Advertisement frame, setting the field to 2 indicates the second TXOP reservation in the HCCA TXOP Advertisement frame, and so on. The value of zero is reserved.

The optional Alternate Schedule field contains a TXOP Reservation field, as defined in 9.4.1.41 and is present only when the Status Code field is not SUCCESS. When the Alternate Schedule field is present, it contains an alternate to the TXOP reservation given in the corresponding HCCA TXOP Advertisement frame. The Start Time subfield of the Alternate Schedule field is relative to the TSF of the destination AP.

The optional Avoidance Request field contains a TXOP Reservation field, as defined in 9.4.1.41 and is optionally present when the Status Code field is not SUCCESS. When the Avoidance Request field is present, it indicates a TXOP schedule that the AP sending the TXOP Response frame is requesting to be

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

avoided by the AP that is the destination of the TXOP Response frame. The Start Time subfield of the Avoidance Request field is relative to the TSF of the destination AP.

The use of the HCCA TXOP Response frame is described in 11.26.3.

9.6.7.24 Public Key frame

The Public Key frame is transmitted by an AP to provide its public key to peer APs and to request the peer's public key. The format of the Public Key frame Action field is defined in Figure 9-1212.

	Category	Public Action	Public Key Frame Usage	Finite Cyclic Group	Public Key (optional)
Octets:	1	1	1	2	variable

Figure 9-1212—Public Key frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Public Key Frame Usage field is set to a number to signify the usage mode of this frame. The Request Types are shown in Table 9-486.

Table 9-486—Public Key Frame Usage field values

Public Key Frame Usage	Value
Request	0
Response	1
NAK	2
Refused	3
Reserved	4–255

The Public Key Frame Usage field is set to "Request" to indicate that a public key is being requested from a peer AP.

The Public Key Frame Usage field is set to "Response" to indicate that this frame is in response to a Public Key frame.

The Public Key Frame Usage field is set to "NAK" to indicate rejection of a received Public Key frame.

The Finite Cyclic Group field is used to indicate the cryptographic group used when generating the public key and is defined in 9.4.1.40), or the preferred group when the Public Key Frame Usage field is set to "NAK".

When the Public Key Frame Usage field is set to "NAK" or "Refused", the Public Key field is not included. In all other cases, the Public Key field contains the public key of the AP that is sending this Public Key frame encoded as an octet string according to 12.4.7.2.5.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The use of the Public Key frame is described in 12.10.

9.6.7.25 Channel Availability Query frame format

The Channel Availability Query frame is transmitted as part of a channel query. The format of the Channel Availability Query frame Action field is shown in Figure 9-1213.

	Category	Public Action	Requester STA Address	Responder STA Address	Reason Result Code	Length	Channel Query Info	Device Class	Device Identification Information	Device Location Information	WSM Information
Octets:	1	1	6	6	1	1	1	variable	variable	variable	variable

Figure 9-1213—Channel Availability Query frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Length field indicates the length of the remaining frame fields in octets, and the value is variable.

The remaining fields are as defined in the Channel Availability Query element (see 9.4.6.2) and White Space Map element (see 9.4.2.168).

9.6.7.26 Channel Schedule Management frame format

The Channel Schedule Management frame is transmitted to exchange the channel schedule information as part of the channel schedule management procedure. The format of the Channel Schedule Management frame Action field is shown in Figure 9-1214.

	Category	Public Action	Requester STA Address	Responder STA Address	Length	Reason Result Code	Channel Schedule Management Mode	Device Identification Information	Channel Schedule Descriptor
Octets:	1	1	6	6	1	1	1	variable	variable

Figure 9-1214—Channel Schedule Management frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Requester STA Address field is the MAC address of the requesting STA that initiates the Channel Schedule Management process.

The Responder STA Address field is the MAC address of the STA that responds to the STA that requested channel schedule management.

The Length field indicates the length of the remaining fields in octets, and the value is variable.

The Reason Result Code field indicates the reason for transmitting a query request for channel schedule information. It also indicates the result of a query as successful or not and the reason when the query is not successful. This field is defined in Table 9-487.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-487—Reason Result Code field values

Reason Result Code field values	Description
0	Request for channel schedule information from a RLSS.
1	Request for channel schedule information from a GDD enabling STA.
2	Success, returning full channel schedule information on the requested channels.
3	Success, returning additional timeslots from the list of the last query on the requested channels.
4	Success, returning timeslots deleted from the list of last query on the requested channels.
5	Success, returning deleted and added timeslots from the list of last query on the requested channels.
6	Success, returning no channel schedule changes from last query.
7	Request declined by the GDD enabling STA for unspecified reason.
8	Request declined by the GDD enabling STA because of no capability for providing schedule information on WLAN channels.
9	Request declined by RLSS for unspecified reason.
10	Request declined by RLSS because of no capability for providing schedule information on WLAN channels.
11	Unknown reason.
12	Continuation frame. This frame continues the fields from the previous CSM frame.
13–63	Reserved.

The Channel Schedule Management Mode field indicates if the schedule information of the channel availability is based on TV channels or WLAN channels. If the schedule information is based on WLAN channels, the optional Operating Class field is present in the Channel Schedule Descriptor field as defined in E.1. This field also indicates whether the optional Channel Availability Starting Time field is present in the Channel Schedule Descriptor field. This field is defined in Table 9-488.

Table 9-488—Channel Schedule Management Mode field values

Channel Schedule Management Mode value	Description
0	The channel schedule information is based on TV channels. The Reason Result Code field is set to either 0 or 1.
1	The channel schedule information is based on WLAN channels. The Reason Result Code field is set to either 0 or 1.
2–3	Reserved.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Device Identification Information field indicates the regulatory identification of the STA that is requesting the schedule information. The Device Identification Information field is present only when Reason Result Code is either 0 or 1. The field is defined in 9.4.4.2.3.

The Channel Schedule Descriptor field indicates the channels for which the schedule information is requested, and the channel schedule information is provided in the response. The field is defined in 9.4.4.2.5. The Channel Schedule Descriptor field is repeated, as determined by the Length field.

9.6.7.27 Contact Verification Signal frame format

The Contact Verification Signal frame is transmitted by a GDD enabling STA to notify whether the available channel information from the GDB has been updated. The format of the Contact Verification Signal frame Action field is shown in Figure 9-1215.

	Category	Public Action	Map ID
Octets:	1	1	1

Figure 9-1215—Contact Verification Signal frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Map ID field is set to a number that is equal to the Map ID of the recently received WSM. The WSM is defined in Table 9-424 in 9.4.4.2.6.

9.6.7.28 GDD Enablement Request frame format

The format of the Action field of the GDD Enablement Request frame is shown in Figure 9-1216.

	Category	Public Action	Dialog Token	Device Class	Device Identification Information
Octets:	1	1	1	1	variable

Figure 9-1216—GDD Enablement Request frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12. It is a nonzero value chosen by the STA sending the GDD Enablement Request frame to identify the request/response transaction.

The Device Class field is used to indicate the characteristic of the STA requesting the GDD Enablement Request frame. The format of the Device Class field is specified in 9.4.4.2.2.

The Device Identification Information field is used to indicate the identification of the STA requesting the GDD Enablement Request frame. The format of the Device Identification Information field is specified in 9.4.4.2.3.

9.6.7.29 GDD Enablement Response frame format

The format of the Action field of the GDD Enablement Response frame is shown in Figure 9-1217.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

	Category	Public Action	Dialog Token	Status Code	WSM Information
Octets:	1	1	1	2	variable

Figure 9-1217—GDD Enablement Response frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12. It is a nonzero value of the corresponding GDD Enablement Request frame. If a GDD Enablement Response frame is being transmitted other than in response to an GDD Enablement Request frame, then the Dialog Token field is 0.

The Status Code field contains the status code in response to a GDD Enablement Request frame as defined in Table 9-80.

The remaining field is defined in the WSM element (see 9.4.2.168).

9.6.7.30 Network Channel Control frame format

The Network Channel Control frame is transmitted by a GDD dependent STA and a GDD enabling STA as part of the procedure that allows a GDD enabling STA to control the frequency usage of a GDD dependent STA's WLAN channels. The format of the Network Channel Control frame is shown in Figure 9-1218.

								a Network Channel Control triplet		
	Category	Public Action	Length	Requester STA Address	Responder STA Address	Reason Result Code	Number of Network Channel Control Triplets	Operating Class	Channel Number	Maximum Transmit Power
Octets:	1	1	1	6	6	1	1	1	1	1

Figure 9-1218—Network Channel Control frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Length field indicates the length of the remaining frame fields in octets, and the value is variable. The minimum value of the Length field is 14.

The Requester STA Address field is the MAC address of the requesting STA that initiates the network channel control process.

The Responder STA Address field is the MAC address of the STA that responds to the STA that requested network channel control.

The Reason Result Code field is used to indicate the reason that a Network Channel Control frame was generated. The encoding of the Reason Result Code field is shown in Table 9-448.

The Number of Network Channel Control Triplets field indicates the number of triplets of Operating Class, Channel Number, and Maximum Transmit Power fields.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Operating Class field indicates the channel set for which the network channel control request applies. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the network channel control applies. Values for the Operating Class field are shown in E.1.

In a request, the Channel Number field of the Network Channel Control frame indicates the channel that the requesting STA intends to operate on. In the response, the Channel Number field in the Network Channel Control frame indicates the channels that the responding STA permits the requesting STA to operate on. The Channel Number is defined within an Operating Class as shown in E.1.

The Maximum Transmit Power field gives the intended maximum transmit power in dBm for operation in the request frame and indicates the maximum allowable transmit power in dBm for operation in the response frame. The field contains EIRP per channel bandwidth and is coded as a 2s complement signed integer in units of 0.5 dBm. The field is set to 0 when a requesting STA requests a responding STA to provide a network channel control response without specifying in the request the intended maximum transmit power.

9.6.7.31 White Space Map Announcement frame format

The format of the Action field of the White Space Map Announcement frame is shown in Figure 9-1219.

	Category	Public Action	Reason Result Code	White Space Map
Octets:	1	1	1	variable

Figure 9-1219—White Space Map Announcement frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

Setting the Reason Result Code field to 1 indicates the Public Action frame is a continuation of the previous WSM Public Action frame, and any other value indicates this is not a continuation of the previous WSM Public Action frame.

The White Space Map field contains a White Space Map element (see 9.4.2.168).

9.6.7.32 FTM Request frame format

The format of the FTMR frame Action field is shown in Figure 9-1220.

	Category	Public Action	Trigger	LCI Measurement Request (optional)	Location Civic Measurement Request (optional)	FTM Parameters (optional)
Octets:	1	1	1	variable	variable	variable

	Ranging Parameters (optional)	LCI Report (optional)	Location Civic Report (optional)
Octets:	variable	variable	variable

Figure 9-1220—FTM Request frame Action field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

When the Trigger field is set to 1, the ISTA requests that the RSTA start or continue sending FTM frames (see 11.21.6). When the Trigger field is set to 0, indicates that the ISTA requests that the RSTA stop sending FTM frames.

When the Trigger field is set to 2, an EDMG ISTA initiates an FTM exchange using the first path AWV; see 11.21.6.4.2.6. When the Trigger field is set to 3, an EDMG ISTA indicates that the following FTM burst is requested to contain LOS assessment measurements. If the FTM burst is performed over the first path AWV and is requested to contain LOS assessment measurements, the Trigger field is set to 4. Trigger field values 5–255 are reserved.

The LCI Measurement Request field is optionally present. If present, it contains a Measurement Request element with Measurement Type field equal to LCI (see Table 9-136), which indicates a request for a Measurement Report element with Measurement Type field equal to LCI (see 11.21.6.7). The Enable subfield in the Measurement Request Mode field in the Measurement Request element is set to 0. The Location Subject field in the Measurement Request field of the Measurement Request element is set to Location Subject Remote (see Table 9-148). The Request, Report and Duration Mandatory subfield in the Measurement Request Mode field in the Measurement Request element are reserved (see 9.4.2.19.1).

The Location Civic Measurement Request field is optionally present. If present, it contains a Measurement Request element with Measurement Type field equal to Location Civic (see Table 9-136), which indicates a request for a Measurement Report element with Measurement Type field equal to Location Civic (see 11.21.6.7). The Enable subfield in the Measurement Request Mode field in the Measurement Request element is set to 0. The Location Subject field in the Measurement Request field of the Measurement Request element is set to Location Subject Remote (see Table 9-148). The Location Service Interval Units field in the Measurement Request field of the Measurement Request element is set to 0. The Request, Report and Duration Mandatory subfield in the Measurement Request Mode field within the Measurement Request element are reserved (see 9.4.2.19.1).

The FTM Parameters field is optionally present. It is present in an IFTMR frame and its retransmissions when negotiating EDCA based ranging; see 11.21.6.3.2.

The Ranging Parameters field is present in the IFTMR frame, and its retransmissions, when the initiator requires negotiation of parameters with the responder in order to perform non-TB ranging, or TB ranging measurement exchange, see 11.21.6.3. If present, it contains a Ranging Parameters element as defined in 9.4.2.300.

The LCI Report field is optional in an IFTMR frame and is present if the frame contains a TB specific subelement with the Passive TB Ranging field set to 1. The Location Civic Report field is optional in an IFTMR frame and can be present if the frame contains a TB specific subelement with the Passive TB Ranging field set to 1. The LCI Report and Location Civic Report fields are not present in IFTMR frames without a TB specific subelement with the Passive TB Ranging field set to 1. The format of the LCI Report is defined in 9.4.2.20.1 and 9.4.2.20.10. The LCI Report contains the Antenna Placement And Calibration subelement if the ISTA has dot11PassiveTBRangingAoDImplemented equal to true, and does not contain the Antenna Placement And Calibration subelement if the ISTA has dot11PassiveTBRangingAoDImplemented equal to false. The format of the Location Civic Report is defined in 9.4.2.20.1 and 9.4.2.20.13.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.7.33 FTM frame format

The FTM frame is an Action frame, except when transmitted in an A-MPDU, where it is an Action No Ack frame. The FTM is used to support the FTM procedure described in 11.21.6. The format of the FTM frame Action field is shown in Figure 9-1221.

	TOD Error	TOA Error	LCI Report (optional)	Location Civic Report (optional)	FTM Parameters (optional)	FTM Synchronization Information (optional)	Ranging Parameters (optional)
Octets:	2	2	variable	variable	variable	variable	variable

	Secure HE-LTF Parameters (optional)	Channel Measurement Feedback Type (optional)	Channel Measurement Feedback (optional)	Direction Measurement Results (optional)	Multiple Best AWV ID (optional)	Multiple AOD Feedback (optional)	LOS Likelihood (optional)

Figure 9-1221—FTM frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The TOD Error field format is shown in Figure 9-1222.

	B0 B4	B5 B14	B15
	Max TOD Error Exponent	Reserved	TOD Not Continuous
Bits:	5	10	1

Figure 9-1222—TOD Error field format

The TOA Error field format is shown in Figure 9-1223.

	B0 B4	B5 B6	B7 B15
	Max TOA Error Exponent	Invalid Measurement	Reserved
Bits:	5	2	9

Figure 9-1223—TOA Error field format

The Dialog Token field is defined in 9.4.1.12. It is a nonzero value chosen by the responding STA to identify the FTM frame as the first of a pair, with the second or followup FTM frame to be sent later. The Dialog Token field is set to 0 to indicate the end of the FTM session (see 11.21.6.6 and 11.21.6.4).

The Follow Up Dialog Token field is the nonzero value of the Dialog Token field of the last transmitted FTM frame to indicate that it is the follow up FTM frame and that the TOD, TOA, Max TOD Error Exponent and Max TOA Error Exponent fields contain the values of the timestamps captured with the first FTM frame of the pair. The Follow Up Dialog Token field is 0 to indicate that the FTM frame is not a follow up to a last transmitted FTM frame. The value 0 in this field also indicates that TOD, TOA, TOD Error, and TOA Error fields are reserved. See 11.21.6.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The TOD and TOA fields are expressed in units of picoseconds.

The maximum errors in the TOD and TOA values are represented using the function defined in Equation (9-14).

$$E_{max} = \begin{cases} \text{unknown}, & F = 0 \\ 2^{F-1}, & 1 \le F \le 30 \\ \ge 2^{30}, & F = 31 \end{cases} \quad (9\text{-}14)$$

where

F is the Max Error Exponent

E_{max} is the maximum TOD or TOA error, respectively, in units of picoseconds

The TOD field contains a timestamp that represents the time, with respect to a time base, at which the start of the preamble of the last transmitted FTM frame appeared at the transmit antenna connector.

The TOA field contains a timestamp that represents the time, with respect to a time base, at which the start of the preamble of the Ack frame to the last transmitted FTM frame arrived at the receive antenna connector.

NOTE 1—The values specified in the TOD and TOA fields are described in MLME-FINETIMINGMSMT.request MLME-FINETIMINGMSMT.confirm and MLME-FINETIMINGMSMT.indication primitives.

The Max TOD Error Exponent field contains an upper bound for the error exponent in the value specified in the TOD field.

NOTE 2—For instance, setting the Max TOD Error Exponent field to 2 indicates that the value in the TOD field has a maximum error of ± 2 ps.

The TOD Not Continuous field indicates that the TOD value is with respect to a different underlying time base than the last transmitted TOA value. It is set to 1 when a discontinuity is present. Otherwise, it is set to 0.

The Max TOA Error Exponent field contains an upper bound for the error exponent in the value specified in the TOA field.

Setting the Max TOD Error Exponent or the Max TOA Error Exponent field to 1 indicates that the upper bound on the error in the corresponding TOD or TOA value is unknown. Setting either field to 31 indicates that the upper bound on the error is greater than or equal to 1.073 741 824 ms.

The Invalid Measurement field contains an indication of an invalid TOA field. The Invalid Measurement field is set to 1 to indicate that the TOA value is invalid, and is set to 0 to indicate that the TOA value is valid; values of 2 and 3 are reserved.

The LCI Report field is optionally present. If present, it contains a Measurement Report element with Measurement Type field equal to LCI (see Table 9-163), which either indicates the LCI of the transmitting STA and includes the Z and Usage Rules/Policy subelement or indicates an unknown LCI (see 11.21.6.7). The Late, Incapable and Refused bits in the Measurement Report Mode field are set to 0. The Colocated BSSID List subelement is present in the Measurement Report element with Measurement Type field equal to LCI, when there is at least one other BSS that shares the same antenna connector with the reporting BSS.

The Location Civic Report field is optionally present. If present, it contains a Measurement Report element with Measurement Type field equal to Location Civic (see Table 9-163), which either indicates the Civic address of the transmitting STA or an unknown Civic address (see 11.21.6.7). The Late, Incapable and

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Refused bits in the Measurement Report Mode field are set to 0. The Colocated BSSID List subelement is present in the Measurement Report element with Measurement Type field equal to LCI, when there is at least one other BSS that shares the same antenna connector with the reporting BSS. When the LCI Report field contains a Colocated BSSID List subelement, the Colocated BSSID List subelement is not present in the Location Civic Report field.

The FTM Parameters field is optionally present. It is present in an IFTM frame and its retransmissions when negotiating EDCA based ranging; see 11.21.6.3.2.

The FTM Synchronization Information field is present in the initial FTM frame and its retransmissions if any, and in the first FTM frame within each burst and its retransmissions if any; otherwise it is not present. If present, it contains an FTM Synchronization Information element with a TSF Sync Info field containing the 4 least significant octets of the TSF at the responding STA corresponding to the time the responding STA received the last FTM Request frame with the Trigger field equal to 1.

The Ranging Parameters element is optionally present. It is present in an IFTM frame and its retransmissions, when negotiating non-TB ranging; see 11.21.6.4.4 or 11.21.6.4.3. If present, it contains a Ranging Parameters element as defined in 9.4.2.300.

The Secure HE-LTF Parameters element is optionally present. It is present in an IFTM frame, if the IFTMR frame contained a Ranging Parameters element that included a Secure HE-LTF subelement. If present, it contains a Secure HE-LTF Parameters element as defined in 9.4.2.301.

The Channel Measurement Feedback Type field is present in the FTM frame if the Channel Measurement Feedback field is present. It describes the content of the Channel Measurement Feedback element contained in that field. The format of the Channel Measurement Feedback Type field is shown in Figure 9-1224. Each of the subfields is described in Table 9-296.

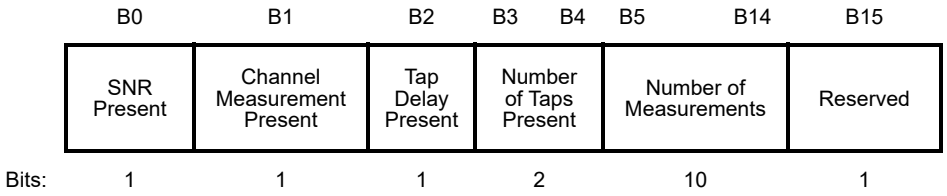

Figure 9-1224—Channel Measurement Feedback Type field format

The Channel Measurement Feedback element is present in the FTM frame if the frame is sent after a LOS Assessment Ack PPDU and optionally in response to an ISTA to RSTA angle of departure TRN field on an Ack frame. This field contains the Channel Measurement Feedback element (see 9.4.2.135).

The Direction Measurement Results field is present in the FTM frame when the frame is sent from an RSTA to an ISTA following an FTM exchange that included ISTA to RSTA AOA measurement. This field contains the Direction Measurement Results element.

The Multiple Best AWV ID field is present in the FTM frame when the frame is sent from an ISTA as part of an AOD feedback exchange after an FTM exchange; see 11.21.6.4.2.4. It contains the Multiple Best AWV ID elements.

The Multiple AOD Feedback element is present in the FTM frame when the frame is sent from an RSTA to an ISTA as part of an AOD feedback exchange after an FTM exchange; see 11.21.6.4.2.4. It contains the Multiple AOD Feedback element.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The LOS Likelihood element is optionally present in any FTM frame that contain TOA and TOD or Direction Measurement Results on measurements performed over DMG or EDMG PPDUs.

9.6.7.34 QAB Request frame format

The QAB Request frame is transmitted by an AP to another AP to schedule quiet periods that facilitate the detection of other system operating in the same band. The format of the QAB Request frame Action field is shown in Table 9-489.

Table 9-489—QAB Request frame Action field format

Order	Information
1	Category
2	Public Action
3	Dialog Token
4	RequesterAP Address
5	ResponderAP Address
6	Quiet Period Request element

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12. It is set to a nonzero value chosen by the AP.

The RequesterAP Address field is the MAC address of the AP that initiates the process. The length of this field is 6 octets.

The ResponderAP Address field is the MAC address of the responding AP. The length of this field is 6 octets. This field can be set to the broadcast address if the request is sent to multiple APs.

The Quiet Period Request element is defined in 9.4.2.148.

9.6.7.35 QAB Response frame format

A QAB Response frame is sent in response to a QAB Request frame. The format of a QAB Response frame Action field contains the information shown in Table 9-490.

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field value is copied from the corresponding received QAB Request frame.

The RequesterAP Address field is the MAC address of the AP that initiates the process. The length of this field is 6 octets.

9.6.7.36 FILS Discovery frame format

The format of the FILS Discovery frame Action field is defined in Table 9-491.

Table 9-491—FILS Discovery frame format

Order	Information	Notes
1	Category	
2	Public Action	
3	FILS Discovery Information field	
4	Reduced Neighbor Report element	One or more Reduced Neighbor Report elements are optionally present if dot11FILSActivated or dot11ColocatedRNRImplemented is true; otherwise, they are not present.
5	FILS Indication element	The FILS Indication element is optionally present if dot11FILSActivated is true; otherwise, it is not present.
6	Roaming Consortium element	The Roaming Consortium element is optionally present if dot11FILSActivated is true; otherwise, it is not present.
7	TIM element	The TIM element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
8	TWT element	The TWT element is optionally present if dot11HEOptionImplemented is true, otherwise, it is not present. If present, the Broadcast field of the TWT element is 1.
9	OPS element	The OPS element is optionally present if dot11HEOptionImplemented is true; otherwise, it is not present.
10	Transmit Power Envelope element	One Transmit Power Envelope element is optionally present for each distinct combination of values of the Maximum Transmit Power Interpretation subfield and Maximum Transmit Power Category subfield that is supported for the BSS if both of the following conditions are met: — Either dot11VHTOptionImplemented or dot11ExtendedSpectrumManagementImplemented is true. — Either dot11SpectrumManagementRequired or dot11RadioMeasurementActivated is true. NOTE—In a 6 GHz HE AP, both dot11VHTOptionImplemented (see 26.17.1) and dot11SpectrumManagementRequired (see 26.17.2.1) are true.
11	EBCS Parameters element	The EBCS Parameters element is optionally present if the transmitting STA has dot11EBCSSupport Activated set to true and a nonzero dot11EBCSTrafficStreamTable length. It is otherwise not present.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Category field indicates the public category specified in Table 9-81.

The Public Action field indicates the value of the FILS Discovery frame, as specified in Table 9-471 in Table 9.6.7.1.

The FILS Discovery Information field is shown in Figure 9-1225.

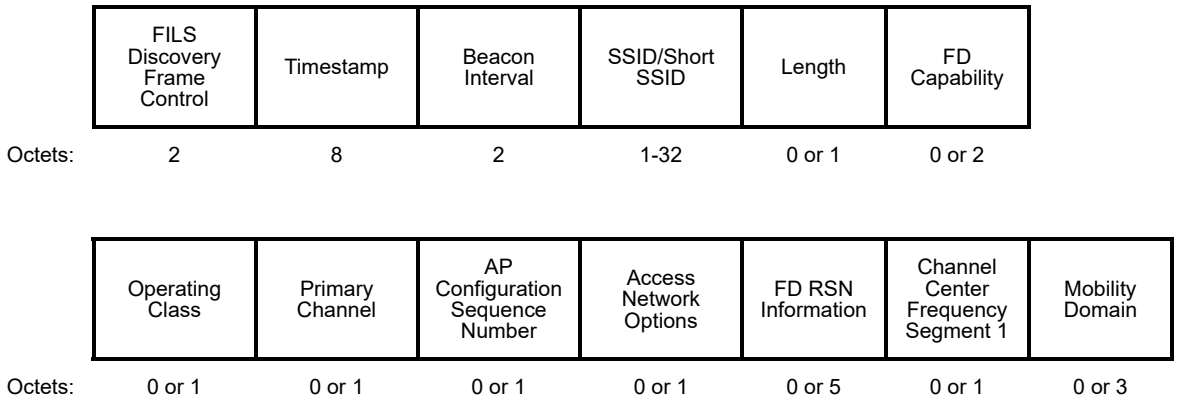

Figure 9-1225—FILS Discovery Information field format

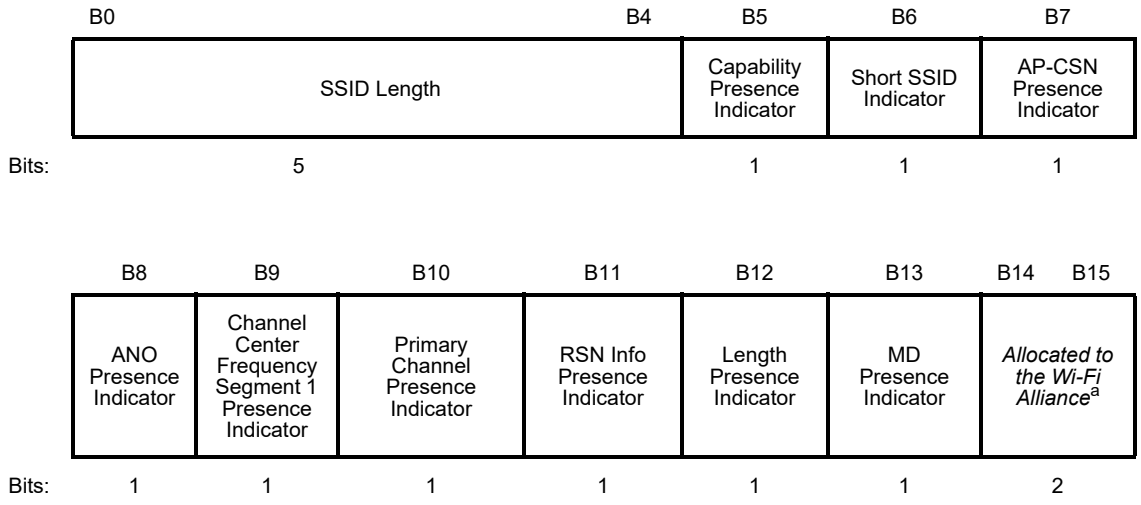
The format of the FILS Discovery Frame Control subfield is shown in Figure 9-1226.



[a] See http://www.wi-fi.org.

Figure 9-1226—FILS Discovery Frame Control subfield format

The SSID Length subfield of the FILS Discovery Frame Control subfield indicates the length, in octets, of the SSID/Short SSID subfield in the FILS Discovery frame. This subfield is equal to the length of the SSID/Short SSID subfield in octets minus 1.

NOTE 1—When the Short SSID Indicator subfield is equal to 1, the SSID Length subfield is equal to 3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When the Capability Presence Indicator subfield is set to 1, it indicates that the FILS Discovery (FD) Capability subfield is present in the FILS Discovery frame. Setting the subfield to 0 indicates that the FD capability subfield is not present in the FILS Discovery frame.

A value of 1 in the Short SSID Indicator subfield indicates that a short SSID is contained in the SSID/Short SSID field of the FILS Discovery frame. A value of 0 indicates that an SSID is contained in the SSID/Short SSID field of the FILS Discovery frame.

A value of 1 in the AP-CSN Presence Indicator subfield indicates that the AP Configuration Sequence Number subfield is present in the FILS Discovery frame. Setting the subfield to 0 indicates that the AP-CSN subfield is not present in the FILS Discovery frame.

A value of 1 in the Access Network Options (ANO) Presence Indicator subfield indicates that the Access Network Options subfield is present in the FILS Discovery frame. Setting the subfield to 0 indicates that the ANO subfield is not present in the FILS Discovery frame.

A value of 1 in the Channel Center Frequency Segment 1 Presence Indicator subfield indicates that the Channel Center Frequency Segment 1 subfield is present in the FILS Discovery frame. Setting the subfield to 0 indicates that Channel Center Frequency Segment 1 subfield is not present.

A value of 1 in the Primary Channel Presence Indicator subfield indicates that the Primary Channel and the Operating Class subfields are present in the FILS Discovery frame. Setting the subfield to 0 indicates that the Primary Channel and the Operating Class subfields are not present in the FILS Discovery frame.

A value of 1 in the RSN Info Presence Indicator subfield indicates that the FD RSN Information subfield is present in the FILS Discovery frame. Setting the subfield to 0 indicates that the FD RSN Information subfield is not present in the FILS Discovery frame.

A value of 1 in the Length Presence Indicator subfield indicates that the Length field is present in the FILS Discovery frame. Setting the subfield to 0 indicates that the Length field is not present in the FILS Discovery frame.

Setting the MD Presence Indicator subfield to 1 indicates that the Mobility Domain subfield is present in the FILS Discovery frame. Setting the subfield to 0 indicates that the Mobility Domain subfield is not present in the FILS Discovery frame.

The Timestamp subfield carries the value of the TSF timer at the time that the start of the data symbol containing the first bit of the Timestamp field appears at the transmit antenna connector.

The Beacon Interval subfield carries the beacon interval in TUs.

When the Short SSID Indicator subfield is 1, the SSID/Short SSID field contains a Short SSID field (see 9.4.1.71). Otherwise, the SSID/Short SSID field contains the SSID, whose length in octets is specified by the SSID Length subfield in the FILS Discovery Frame Control of the FILS Discovery frame.

The Length subfield indicates the length of the remaining fields in the FILS Discovery Information field in octets. Its value is variable.

NOTE 2—The Length field is used to facilitate STAs parsing the FILS Discovery frame in case of future expansions of the FILS Discovery Information field; STAs can determine the end of the FILS Discovery Information field using the value indicated in the Length field even if they do not recognize one or more subfields in the FILS Discovery Information field.

The FD Capability subfield contains the information that advertises the capabilities and operational indications of the STA transmitting the FILS Discovery frame. Its presence is indicated by the Capability

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Presence Indicator subfield in the FILS Discovery Frame Control subfield being equal to 1. The format of the FD Capability subfield is shown in Figure 9-1227.

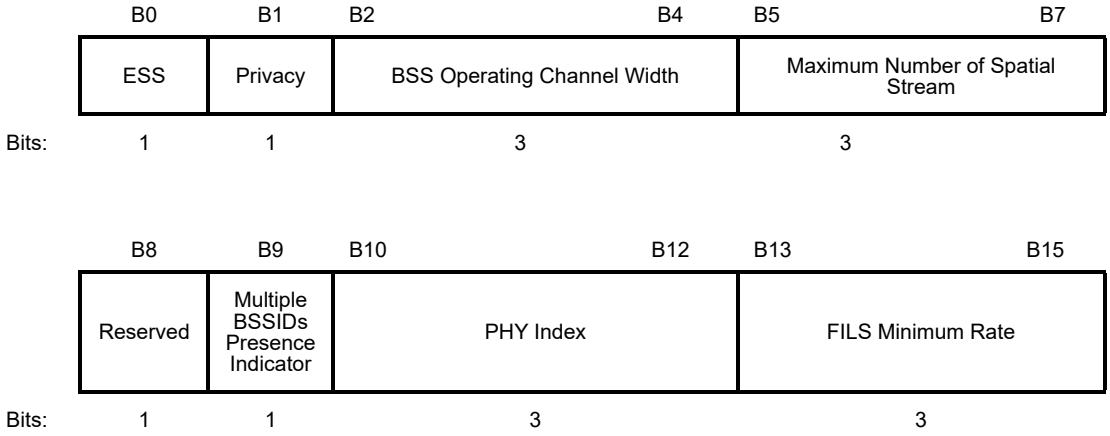


Figure 9-1227—FD Capability subfield format

The ESS and Privacy subfields are interpreted as specified in 9.4.1.4.

The BSS Operating Channel Width subfield indicates the BSS operating channel width as defined in Table 9-492.

Table 9-492—BSS Operating Channel Width

BSS Operating Channel Width field	HR/DSSS, OFDM, ERP, HT, VHT, HE BSS operating channel width	TVHT BSS operating channel width
0	20 MHz or 22 MHz	TVHT_W
1	40 MHz	TVHT_W+W
2	80 MHz	TVHT_2W
3	160 MHz or 80+80 MHz	TVHT_4W or TVHT_2W+2W
4–7	Reserved	Reserved

The Maximum Number of Spatial Streams subfield indicates the number of the spatial streams supported by the AP. The Maximum Number of Spatial Streams subfield is coded per Table 9-493.

The Multiple BSSIDs Presence Indicator subfield is set to 1 to indicate that the Multiple BSSID element is present in the Beacon and Probe Response frames. It is set to 0 to indicate that the Multiple BSSID element is not present in the Beacon and Probe Response frames.

The PHY Index subfield is defined as in Table 9-494.

The FILS Minimum Rate subfield indicates the minimum rate to be used by the AP transmitting the FILS Discovery frame and by FILS STAs in subsequent transmissions between the AP and FILS STAs. Depending on the PHY Index subfield of the received FILS Discovery frame, the minimum rate is represented as a bit rate value or as an MCS value as shown in Table 9-495. If an MCS value is provided, then the minimum rate is derived from the MCS value and the PHY Index in the FD Capability subfield.

5–7	Reserved	Reserved	Reserved	Reserved	Reserved

The Operating Class and Primary Channel subfields are present if the FILS Discovery frame is transmitted in a non-HT duplicate PPDU. Otherwise, the subfields are not present.

When present, the subfields indicate the following:

— If the operating class has a channel spacing other than 80 MHz
  • BSS bandwidth, equals the channel spacing

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

  - Center frequency of the channel on which the BSS operates
  - Center frequency of the primary channel
- If the operating class has a channel spacing of 80 MHz
  - BSS bandwidth, either 80 MHz or 80+80 MHz
  - Center frequency of the channel on which the BSS operates, if BSS bandwidth is 80 MHz
  - Center frequency of the primary 80 MHz channel, if BSS bandwidth is 80+80 MHz
  - Center frequency of the primary channel

NOTE 3—If a received FILS Discovery frame does not include the Primary Channel subfield, the primary channel is the channel on which the PPDU was received.

NOTE 4—A STA that receives a FILS Discovery frame containing an Operating Class subfield indicating a channel spacing of 80 MHz can determine the BSS bandwidth by receiving a Beacon or a Probe Response frame on the primary channel indicated in the FILS Discovery frame.

The AP Configuration Sequence Number (AP-CSN) subfield format is defined in 9.4.2.180.

The Access Network Options (ANO) subfield format is defined in Figure 9-565 (Access Network Options field format) (in 9.4.2.90).

The FD RSN Information subfield is defined in Figure 9-1228.

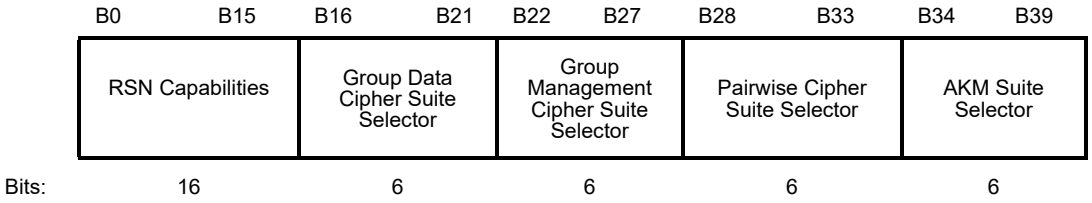

Figure 9-1228—FD RSN Information subfield format

The FD RSN Information subfield contains an RSN Capabilities) subfield, as specified in Figure 9-369 (in 9.4.2.23.4).

The FD RSN Information subfield also contains three cipher suite selectors. The Group Data Cipher Suite Selector subfield contains one group data cipher suite selector. The Group Management Cipher Suite Selector subfield contains one group management cipher suite selector. The Pairwise Cipher Suite Selector subfield contains one pairwise cipher suite selector. Each of these subfields contains a code identifying a Cipher Suite Type as specified in Table 9-188. The definition of the cipher suite selectors is shown in Table 9-496.

Table 9-496—Cipher suite selector definitions

Cipher suite selector	Cipher suite type
0–13	Cipher suite type 0 to 13 in Table 9-188
14–61	Reserved
62	Vendor Specific
63	No cipher suite selected

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The FD RSN Information subfield also contains one AKM suite selector. An AKM suite selector is a code identifying an AKMP as specified in Table 9-190. The definition of the AKM suite selectors is shown in Table 9-497.

Table 9-497—AKM suite selector definitions

AKM suite selector	AKMP
0	Use AKM from RSN IE Beacon/Probe Response frame
1	Set AKM 00-0F-AC: 14 of Table 9-190
2	Set AKM 00-0F-AC: 15 of Table 9-190
3	Set AKM 00-0F-AC: 14 or 00-0F-AC: 15 of Table 9-190
4	Set AKM 00-0F-AC: 17 of Table 9-190
5–61	Reserved
62	Vendor Specific
63	No AKMP selected

The Channel Center Frequency Segment 1 subfield is set to the index of the channel center frequency of the frequency segment 1 for an 80+80 MHz VHT or HE BSS if the FILS Discovery frame is transmitted as a non-HT duplicate PPDUs at an 80+80 MHz channel bandwidth; otherwise, the subfield is not present.

The format of the Mobility Domain subfield is shown in Figure 9-1229.

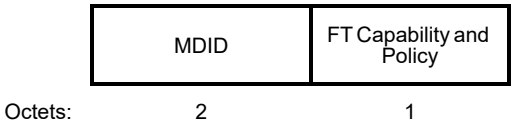

Figure 9-1229—Mobility Domain subfield format

The MDID field is defined in 9.4.2.45.

The FT Capability and Policy field is defined in 9.4.2.45.

The Reduced Neighbor Report element is defined in 9.4.2.169.

The FILS Indication element is defined in 9.4.2.181.

The Roaming Consortium element is defined in 9.4.2.94.

The TIM element is defined in 9.4.2.5 and is included for operation as defined in 26.14.3.

The TWT element is defined in 9.4.2.198 and is included with the Broadcast field set to 1 to aid an unassociated STA determine the target transmission time of Trigger frames that contain at least one User Info field that allocates RA-RUs for unassociated STAs (see 26.5.4.5 and 26.8.3.1).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The OPS element is defined in 9.4.2.256.

The Transmit Power Envelope element is defined in 9.4.2.160.

The EBCS Parameters element is defined in 9.4.2.313. When included in FILS Discovery frames, the element carries the EBCS Info Frame Tx Countdown field and can include the Compressed Certificate Group ID field and the EBCS AP Group ID field.

9.6.7.37 DCS Measurement Request frame format

The DCS Measurement Request frame is transmitted by a DCS requesting CDMG AP or PCP to a DCS responder CDMG AP or PCP to request all of the STAs in the DCS responder AP's infrastructure BSS or PCP's PBSS to measure a specified channel or all other channels within the supported operating class (as defined in 9.4.2.52). The format of the DCS Measurement Request frame Action field is shown in Figure 9-1230.

	Category	Public Action	Dialog Token	DCS Measurement Request Mode	Operating Class	Optional Subelements
Octets:	1	1	1	1	1	variable

Figure 9-1230—DCS Measurement Request frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA.

The Measurement Request Mode field is set to 1 to indicate that the DCS requesting AP or PCP requests all STAs within the DCS responder AP's or PCP's infrastructure BSS or PBSS to measure all channels within the operating class specified in the following Operating Class field. The Measurement Request Mode field is set to 2 to indicate that the DCS requesting AP or PCP requests all STAs within the DCS responder AP's infrastructure BSS or PCP's PBSS to measure the specified channel(s) indicated within the list of optional subelements. Other values are reserved.

The Operating Class field is valid when the Measurement Request Mode field is 1. In all other cases, the Operating Class field is reserved. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the DCS procedure applies. Valid values of the Operating Class field are shown in Annex E.

The Optional Subelements field is present when the Measurement Request Mode field is 2. The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3. The optional subelements are ordered by nondecreasing subelement ID.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Subelement ID field values for the defined optional subelements are shown in Table 9-498.

Table 9-498—Optional subelement IDs for DCS Measurement Request frame

Subelement ID	Name	Extensible
0	Reserved	
1	Channel Measurement Request	Yes
2–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Channel Measurement Request subelement is used to specify the channel(s) to be measured. The format of the DCS Channel Measurement Request subelement is shown in Figure 9-1231.

Figure 9-1231—DCS Channel Measurement Request subelement format

The Subelement ID field is defined in Figure 9-498 (Optional subelement IDs for DCS Measurement Request frame).

The Length field is defined in 9.4.3.

The Measurement Token field is set to a nonzero value that is unique among the Channel Measurement Request subelements in a particular DCS Measurement Request frame.

The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the DCS procedure applies. Valid values of the Operating Class field are shown in Annex E (Country elements and operating classes).

The Channel Number field is set to the channel number for which the Channel Measurement Request applies (as defined in 17.3.8.4.3).

9.6.7.38 DCS Measurement Response frame format

The DCS Measurement Response frame is transmitted by a DCS responder AP or PCP to a DCS requesting AP or PCP to report the results of measuring one or more channels. The format of the DCS Measurement Response frame Action field is shown in Figure 9-1232.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

	Category	Public Action	Dialog Token	DCS Measurement Report Mode	Operating Class	Optional Subelements
Octets:	1	1	1	1	1	variable

Figure 9-1232—DCS Measurement Response frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12. It is copied from the corresponding DCS Measurement Request frame.

The Measurement Report Mode field is set to 0 to indicate no clear channel to which the DCS responder AP's or PCP's BSS can move within the operating class specified in the following Operating Class field, or the DCS request has been declined by the DCS responder AP or PCP. The Measurement Report Mode field is set to 1 to indicate that all other channels within the operating class specified in the following Operating Class field are available for the DCS responder AP's or PCP's BSS. The Measurement Report Mode field is set to 2 to indicate that the clear channel for the DCS responder AP's or PCP's BSS is indicated by the Optional Subelement field in the DCS Measurement Response frame. Other values are reserved.

The Operating Class field is valid when the Measurement Report Mode field is 1. In all other cases, the Operating Class field is reserved. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the DCS procedure applies. Valid values of the Operating Class field are shown in Annex E.

The Optional Subelements field is present when the Measurement Report Mode field is 2. The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3. The optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 9-499.

Table 9-499—Optional subelement IDs for DCS Measurement Response frame

Subelement ID	Name	Extensible
0	Reserved	
1	Channel Measurement Report	Yes
2–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Channel Measurement Report subelement is used to report the number of available channel to which the DCS responder AP's or PCP's BSS can move. The DCS Channel Measurement Report subelement format is as shown in Figure 9-1233.

The Subelement ID field is defined in Table 9-499.

The Length field is defined in 9.4.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Figure 9-1233—DCS Channel Measurement Report subelement format

The Measurement Token field is copied from the corresponding Channel Measurement Request subelement in the received DCS Measurement Request frame.

The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the DCS procedure applies. Valid values of the Operating Class field are shown in Annex E.

The Channel Number field is set to the channel number to which the DCS responder AP's or PCP's BSS can move (as defined in 17.3.8.4.3).

9.6.7.39 DCS Request frame format

The DCS Request frame is transmitted by a DCS requesting AP or PCP to a DCS responder AP or PCP to request the DCS responder AP's or PCP's BSS to move to an available channel indicated in the DCS Measurement Response frame. The format of the DCS Request frame Action field is shown in Figure 9-1234.

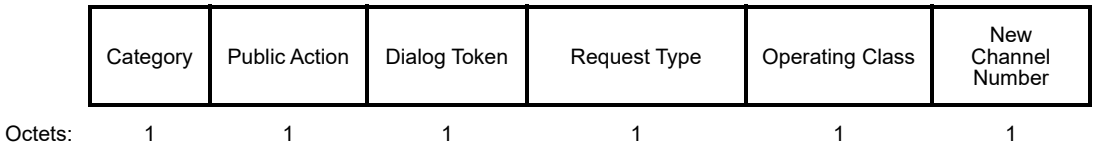

Figure 9-1234—DCS Request frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field value is copied from the corresponding DCS Measurement Response frame.

The Request Type field value is set to 0 to indicate that the requesting AP or PCP requests the responder AP or PCP to tear down the DCS procedure or the DCS request is refused by the responder AP or PCP; then the following Operation Class field and New Channel Number field are reserved. The Request Type field value is set to 1 to indicate that the DCS requesting AP or PCP to request the DCS responder AP's or PCP's BSS to move to an available channel indicated by the following Operating Class field and New Channel Number field. Other values are reserved.

The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the DCS procedure applies. Valid values of the Operating Class field are shown in Annex E. This field is valid when the Request Type field is set to 1; otherwise, it is reserved.

The New Channel Number field is set to the channel number to which the DCS requesting AP or PCP request the DCS responder AP's or PCP's BSS to move (as defined in 17.3.8.4.3). This field is valid when the Request Type field is set to 1; otherwise, it is reserved.

9.6.7.40 DCS Response frame format

The DCS Response frame is transmitted by a DCS responder AP or PCP to a DCS requesting AP or PCP to confirm that the DCS responder AP's or PCP's BSS is moving to the channel specified in the DCS request frame. The format of the DCS Response frame Action field is shown in Figure 9-1235.

	Category	Public Action	Dialog Token	Responder Type	Operating Class	New Channel Number	Channel Switch Count
Octets:	1	1	1	1		1	1

Figure 9-1235—DCS Response frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12. It is copied from the corresponding DCS Request frame.

The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the DCS procedure applies. Valid values of the Operating Class field are shown in Annex E.

The New Channel Number field is set to the channel number copied from the corresponding received DCS Request frame.

The Channel Switch Count field either is set to the number of TBTTs until the DCS responder AP or PCP sending the Channel Switch Announcement frame or element within its BSS switches to the new channel or is set to 0. It is set to 1 to indicate that the switch occurs immediately before the next TBTT. It is set to 0 to indicate that the switch occurs at any time after the frame containing the element is transmitted.

9.6.7.41 Extended Notification Period Request frame format

The format of the Extended Notification Period Request frame Action field is defined in Table 9-500.

Table 9-500—Extended Notification Period Request frame Action field format

Order	Information
0	Category
1	Public Action
2	Dialog Token
3	NP/BHI Duration

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The NP/BHI Duration field is set to the length of the NP/BHI duration requested by the STA intending to establish its BSS on a free 1.08 GHz channel to the peer STA operating on the adjacent 1.08 GHz channel. The length of this field is 2 octets.

9.6.7.42 Extended Notification Period Response frame format

The format of the Extended Notification Period Response frame Action field is defined in Table 9-501.

Table 9-501—Extended Notification Period Response frame Action field format

Order	Information
0	Category
1	Public Action
2	Dialog Token
3	Status Code
4	Dynamic Bandwidth Control

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12. It is copied from the corresponding Extended Notification Period Response frame.

The Status Code field indicates the result of the notification period allocation request and is defined in 9.4.1.9.

The Dynamic Bandwidth Control element specifies the information of the STA operating on a 1.08 GHz channel after channel splitting and is defined in 9.4.2.219. This element is present if the Status Code field indicates successful; otherwise, it is not present.

9.6.7.43 Extended Channel Splitting Request frame format

The format of the Extended Channel Splitting Request frame Action field is defined in Table 9-502.

Table 9-502—Extended Channel Splitting Request frame Action field format

Order	Information
0	Category
1	Public Action
2	Dialog Token
3	NP/BHI Duration

The Category field is defined in 9.4.1.11.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA.

The NP/BHI Duration field is set to the length of the NP/BHI duration requested by the STA intending to establish its BSS on a free 1.08 GHz channel to the peer STA operating on the adjacent 1.08 GHz channel. The length of this field is 2 octets.

9.6.7.44 Extended Channel Splitting Response frame format

The format of the Extended Channel Splitting Response frame Action field is defined in Table 9-503.

Table 9-503—Extended Channel Splitting Response frame Action field format

Order	Information
0	Category
1	Public Action
2	Dialog Token
3	Status Code
4	Channel Switch Announcement
5	Beacon Interval
6	Dynamic Bandwidth Control

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12. It is copied from the corresponding Extended Channel Splitting Response frame.

The Status Code field indicates the result of the notification period allocation request and is defined in 9.4.1.9.

The Channel Switch Announcement element is defined in 9.4.2.17. This element is present if the Status Code field indicates successful; otherwise, it is not present.

The Beacon Interval field specifies the beacon interval length on a 2.16 GHz channel set by the STA operating on one of the 1.08 GHz channel after channel splitting and is defined in 9.4.1.3. This field is present if the Status Code field indicates successful; otherwise, it is not present.

The Dynamic Bandwidth Control element specifies the information of the STA operating on a 1.08 GHz channel after channel splitting and is defined in 9.4.2.219. This element is present if the Status Code field indicates successful; otherwise, it is not present.

9.6.7.45 Group Addressed GAS Request frame format

The Group Addressed GAS Request frame is transmitted by a requesting STA to request information from another STA. The format of the Group Addressed GAS Request frame Action field is defined in Table 9-504.

Table 9-504—Group Addressed GAS Request frame Action field format

Order	Information
0	Category
1	Public Action
2	Dialog Token
3	Advertisement Protocol element
4	Query Request Length
5	Query Request
6	Multi-band (optional)
7	GAS Extension

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA.

The Advertisement Protocol element is defined in 9.4.2.91. The Advertisement Protocol element includes exactly one advertisement protocol ID.

The Query Request Length field format is provided in Figure 9-1202 (Query Request Length field). The Query Request Length field is set to the total number of octets in the Query Request field.

The Query Request field format is provided in Figure 9-1203 (Query Request field). The Query Request field is a generic container whose value is formatted in accordance with the protocol identified in the Advertisement Protocol element.

When present in a Group Addressed GAS Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the Group Addressed GAS Request frame applies.

The GAS Extension element indicates parameters that the STA transmitting the request is requesting the responder to use while processing this request.

9.6.7.46 Group Addressed GAS Response frame format

The Group Addressed GAS Response frame is transmitted in response to a GAS Initial Request frame or Group Addressed GAS Request frame. The format of the Group Addressed GAS Response frame Action field is defined in Table 9-505.

The Category field is defined in 9.4.1.11.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-505—Group Addressed GAS Response frame Action field format

Order	Information
0	Category
1	Public Action
2	Dialog Token
3	Status Code
4	Advertisement Protocol element
5	Query Response Length
6	Query Response
7	Multi-band (optional)
8	GAS Extension

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12. It is copied from the corresponding GAS Initial Request frame or Group Addressed GAS Request frame.

The Status Code values are defined in 9.4.1.9.

The Advertisement Protocol element is defined in 9.4.2.91. The Advertisement Protocol element includes exactly one advertisement protocol ID.

The Query Response Length field format is provided in Figure 9-1205 (Query Response Length field format). The value of the Query Response Length field is set to the total number of octets in the Query Response field.

The Query Response field format is provided in Figure 9-1206 (Query Response field format). The Query Response field is a generic container whose value is formatted in accordance with the protocol specified in the Advertisement Protocol element.

When present in a Group Addressed GAS Response frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Initial Response frame applies.

When present in a Group Addressed GAS Response frame, the GAS Extension element indicates parameters to which STA and which Query Request of the STA the response is responding.

9.6.7.47 On-channel Tunnel Request frame format

The On-channel Tunnel Request frame allows nonrobust STA-STA communications of the same information that is conveyed in the robust On-channel Tunnel Request frame (see 9.6.20.7).

The format of the robust and nonrobust On-channel Tunnel Request frame is the same and defined in 9.6.20.7. The Category field value differentiates whether an On-channel Tunnel Request frame is robust or not.

9.6.7.48 DMG STA Directional Transmit Activity Report frame format

The DMG STA Directional Transmit Activity Report frame is transmitted by a DMG STA to describe the transmit activity of the STA for a given antenna pattern and over a given observation period. The information included in the frame can help a receiving STA take actions to eliminate or mitigate both the interference caused by the STA transmitting the frame, and the interference caused by the receiving STA to the transmitting STA. The format of the DMG STA Directional Transmit Activity Report frame Action field is shown in Figure 9-1236.

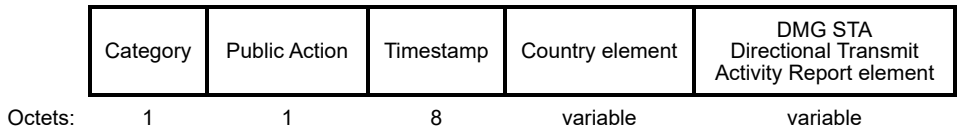

Figure 9-1236—DMG STA Directional Transmit Activity Report frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Timestamp field is defined in 9.4.1.10.

The Country element is defined in 9.4.2.7.

The DMG STA Directional Transmit Activity Report element is defined in 9.4.2.289.

9.6.7.49 LMR frame format

The LMR frame is an Action No Ack frame of category Public. The LMR frame is used to support the non-TB and TB ranging mechanisms of the FTM procedure described in 11.21.6. The format of the LMR Action field is shown in Figure 9-1237.

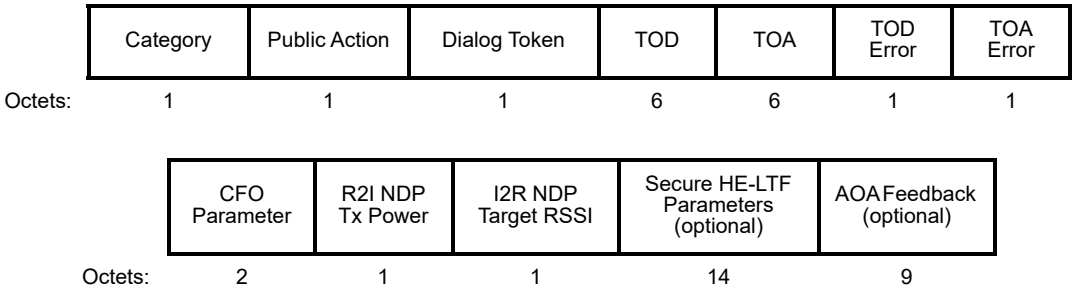

Figure 9-1237—LMR frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is used to link the LMR to the Measurement Sounding phase that was used for the reported measurement.

The TOD and TOA fields are expressed in units of picoseconds.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The TOD field contains a timestamp that represents the time, with respect to a time base, at which the start of the preamble of the corresponding NDP appeared at the transmit antenna connector. The corresponding NDP in an R2I LMR frame is an R2I NDP, while in an I2R LMR frame it is an I2R NDP. In both cases the corresponding NDP refers to a measurement exchange that included a Ranging NDP Announcement frame, which carried the matching dialog token that is also included in this LMR.

The TOA field contains a timestamp that represents the time, with respect to a time base, at which the start of the preamble of the corresponding NDP arrived at the receive antenna connector. The corresponding NDP in an R2I LMR frame is an I2R NDP, while in an I2R LMR frame it is an R2I NDP. In both cases the corresponding NDP refers to a measurement exchange that included a Ranging NDP Announcement frame, which carried the matching dialog token that is also included in this LMR.

The TOD Error field format is defined in Figure 9-1238.

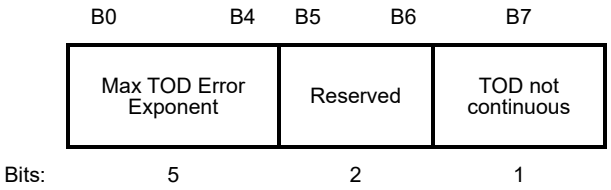

Figure 9-1238—TOD Error field format

The TOA Error field format is defined in Figure 9-1239.

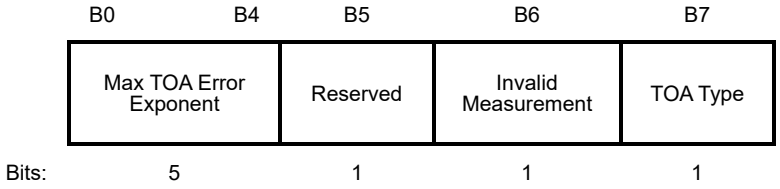

Figure 9-1239—TOA Error field format

The maximum errors in the TOD and TOA values are represented using the function defined in Equation (9-15).

$$E_{max} = \begin{cases} \text{unknown}, & F = 0 \\ 2^{F-1}, & 1 \le F \le 30 \\ \ge 2^{30}, & F = 31 \end{cases} \quad (9\text{-}15)$$

where

F is the Max Error Exponent

E_{max} is the maximum TOD or TOA error, respectively, in units of picoseconds

The Max TOD Error Exponent subfield contains an upper bound for the error exponent in the value specified in the TOD field.

The TOD Not Continuous subfield indicates that the TOD value is with respect to a different underlying time base than the last transmitted TOD value. It is set to 1 when a discontinuity is present. Otherwise, it is set to 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Max TOA Error Exponent subfield contains an upper bound for the error exponent in the value specified in the TOA field.

A value of 0 for the Max TOD Error Exponent or the Max TOA Error Exponent subfield indicates that the upper bound on the error in the corresponding TOD or TOA value is unknown. A value of 31 indicates that the upper bound on the error is greater than or equal to 1.073741824 ms.

The Invalid Measurement subfield indicates whether the TOA field contains a valid value. It is set to 1 to indicate that the TOA value is invalid and the value 0 in this subfield indicates that the TOA value is valid.

The TOA Type subfield indicates if the TOA timestamp was calculated based on the first arrival path of the channel impulse response or the average linear phase across the subcarriers.

In the I2R LMR, the CFO Parameter field indicates the clock rate difference between the ISTA and RSTA; the format is a signed value in units of 0.01 ppm. In the R2I LMR, the value of the CFO Parameter field is reserved.

When negotiated, the R2I NDP Tx Power and I2R NDP Target RSSI fields are used in the in R2I LMR as part of the non-TB ranging measurement exchange, see 11.21.6.4.4, otherwise their values are reserved.

The R2I NDP Tx Power field indicates the combined average power per 20 MHz bandwidth referenced to the antenna connector, of all antennas used to transmit the preceding R2I NDP. The transmit power is reported with a resolution of 1 dB, with values in the range 0 to 60 representing –20 dBm to 40 dBm, respectively. Values above 60 are reserved.

The I2R NDP Target RSSI field indicates the preferred receive signal power, averaged over the RSTA's antenna connectors, for future I2R NDPs transmitted by the ISTA. The preferred receive signal power in units of dBm is TargetRSSI = –110 + FVal, where FVal is the value of the Target RSSI field, except that values above 90 indicate that the RSTA has no preferred receive signal power for the I2R NDPs.

The Secure HE-LTF Parameters element is present if an ISTA and RSTA have negotiated an FTM session with secure HE-LTF measurement exchange mode; see 11.21.6.3.4. If present, it contains a Secure HE-LTF Parameters element as defined in 9.4.2.301.

The AOA Feedback field is optionally present. If present, it contains a Direction Measurement Results element as defined in 9.4.2.302.

9.6.7.50 ISTA Passive TB Ranging Measurement Report frame format

The ISTA Passive TB Ranging Measurement Report frame is an Action No Ack frame of category Public. The ISTA Passive TB Ranging Measurement Report frame is used to support the passive TB ranging mechanisms of the FTM procedure described in 11.21.6. The format of the ISTA Passive TB Ranging Measurement Report frame is shown in Figure 9-1240.

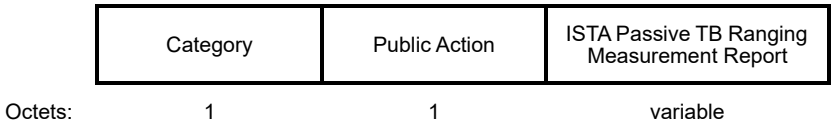

Figure 9-1240—ISTA Passive TB Ranging Measurement Report frame format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The ISTA Passive TB Ranging Measurement Report field is defined in 9.4.2.306.

9.6.7.51 Primary RSTA Broadcast Passive TB Ranging Measurement Report frame format

The Primary RSTA Broadcast Passive TB Ranging Measurement Report frame is an Action No Ack frame of category Public. The Primary RSTA Broadcast Passive TB Ranging Measurement Report frame is used to support the passive TB ranging mechanisms of the FTM procedure described in 11.21.6. The format of the Primary RSTA Broadcast Passive TB Ranging Measurement Report Action field is shown in Figure 9-1241.

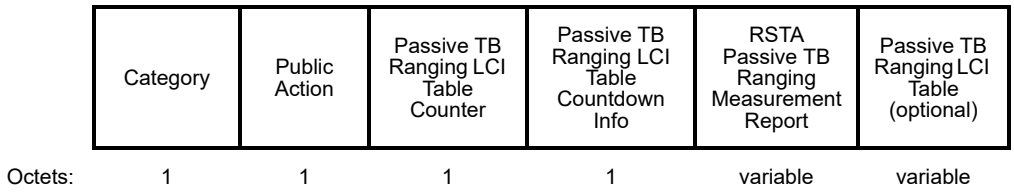

Figure 9-1241—Primary RSTA Broadcast Passive TB Ranging Measurement Report Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Passive TB Ranging LCI Table Counter field contains a number serving as a reference to the version of the latest Passive TB Ranging LCI Table element transmitted by the RSTA transmitting the Primary RSTA Broadcast Passive TB Ranging Measurement Report frame.

The Passive TB Ranging LCI Table Countdown Info field contains two subfields as shown in Figure 9-1242.

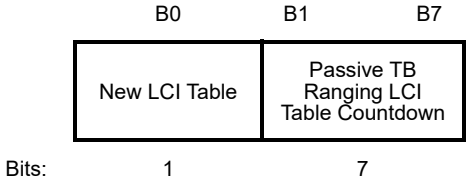

Figure 9-1242—Passive TB Ranging LCI Table Countdown Info field format

The New LCI Table subfield is set to 0 if the current LCI table and LCI table to be transmitted at the end of the countdown are the same, otherwise it is set to 1.

The Passive TB Ranging LCI Table Countdown subfield is an index pointing to the next passive TB ranging availability window where the Passive LCI Table element will be contained in the Primary RSTA Broadcast Passive TB Ranging Measurement Report frame. If the Passive TB Ranging LCI Table element is contained in the current availability window, then the index has the value 0, if the Passive TB Ranging LCI Table element is contained in the next availability window the index has the value 1, if the Passive TB Ranging LCI Table element is contained in the availability window after that the index has value 2, and so on.

The RSTA Passive TB Ranging Measurement Report element is defined in 9.4.2.307.

The Passive TB Ranging LCI Table field is defined in 9.4.2.308.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.7.52 Secondary RSTA Broadcast Passive TB Ranging Measurement Report frame format

The Secondary Broadcast RSTA Passive TB Ranging Measurement Report frame is an Action No Ack frame of category Public. The Secondary RSTA Broadcast Passive TB Ranging Measurement Report frame is used to support the passive TB ranging mechanisms of the FTM procedure described in 11.21.6. The format of the Secondary RSTA Broadcast Passive TB Ranging Measurement Report Action field is shown in Figure 9-1243.

	Category	Public Action	Number of ISTA Passive TB Ranging Measurement Reports	ISTA Passive TB Ranging Measurement Reports
Octets:	1	1	1	Variable

Figure 9-1243—Secondary RSTA Broadcast Passive TB Ranging Measurement Report Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Number of ISTA Passive TB Ranging Measurement Reports field indicates the number of following ISTA Passive TB Ranging Measurement Report fields.

The ISTA Passive TB Ranging Measurement Reports field contains the number of ISTA Passive TB Ranging Measurement Reports in the ISTA Passive TB Ranging Measurement Report elements. The ISTA Passive TB Ranging Measurement Reports element is defined in 9.4.2.306.

9.6.7.53 EBCS UL frame format

The EBCS UL frame is transmitted by an EBCS non-AP STA and carries an HLP payload intended for a destination specified within the frame. The format of the EBCS UL frame Action field is defined in Figure 9-1244.

	Category	Public Action	Control	Destination URI	HLP Payload Container	STA Certificate Container (optional)	Frame Tx Time (optional)	Frame Count (optional)	Frame Signature (optional)
Octets:	1	1	1	variable	variable	variable	0 or 4	0 or 6	variable

Figure 9-1244—EBCS UL frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The format of Control field is shown in Figure 9-1245.

The STA Certificate Present subfield is set to 1 when the STA Certificate Container field is carried in the frame. Otherwise, the subfield is set to 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

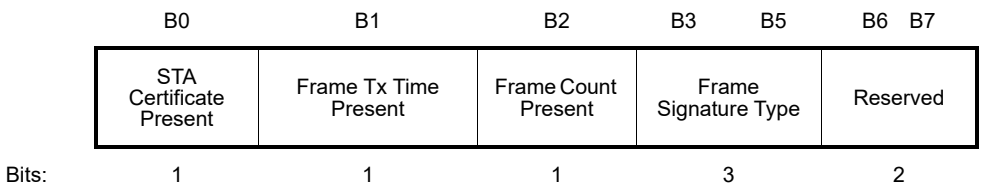

Figure 9-1245—Control field format

The Frame Tx Time Present subfield is set to 1 when the Frame Tx Time field is carried in the frame. Otherwise, the subfield is set to 0.

The Frame Count Present subfield is set to 1 when the Frame Count field is carried in the frame. Otherwise, the subfield is set to 0.

The encoding of the Frame Signature Type subfield is shown in Table 9-506.

Table 9-506—Encoding of Frame Signature Type subfield

Value	Algorithm	Frame signature length (octets)	Encoding
0	HLSA	—	The authentication of the HLP payload is provided by a higher layer and is included in the HLP Payload field.
1	RSASSA-PSS-2048	256	See 12.15.2.5
2	RSASSA-PSS-4096	512	
3	ECDSA-P256	variable	
4	ECDSA-P521	variable	
5–7	Reserved		

The format of the Destination URI field is shown in Figure 9-1246.

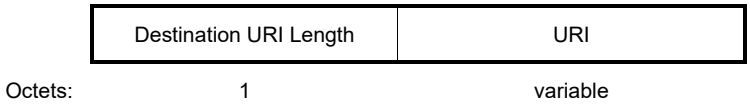

Figure 9-1246—Destination URI field format

The Destination URI Length subfield indicates the length of the URI subfield in octets.

The URI subfield carries the destination URI using the format defined in IETF RFC 3986.

The format of the HLP Payload Container field is shown in Figure 9-1247.

The HLP Payload Length subfield indicates the length of the HLP Payload subfield in octets.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

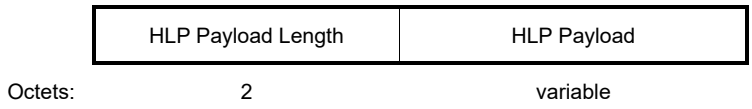

Figure 9-1247—HLP Payload Container field format

The HLP Payload subfield carries the HLP payload.

The format of the STA Certificate Container field is shown in Figure 9-1248.

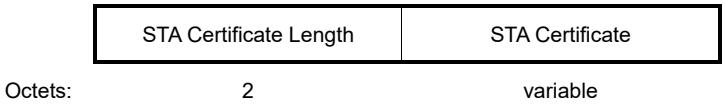

Figure 9-1248—STA Certificate Container field format

The STA Certificate Length subfield carries a nonzero value that indicates the length of the STA Certificate subfield in octets.

The STA Certificate subfield carries the X.509v3 certificate of the STA encoded according to IETF RFC 5280.

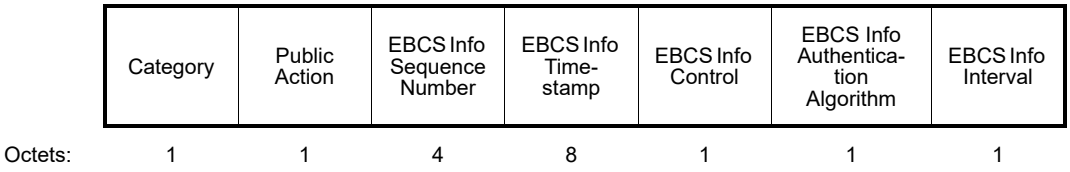
The Frame Tx Time subfield, if present, carries the time expressed as the number of seconds since 2020-01-01 00:00:00 UTC, when the frame is queued for transmission.

The Frame Count field, if present, carries a numeric value that is incremented for each EBCS UL frame transmission.

The Frame Signature field is not present if the Frame Signature Type subfield indicates HLSA. Otherwise, the Frame Signature field carries a signature of the EBCS UL frame (generated as described in 12.15.2.5). The length of the Frame Signature field is determined as defined in Table 9-506. In case of ECDSA, the Signature field contains the value *r* and *s* encoded in DER-encoded ASN.1 structure (a SEQUENCE of two INTEGERS, for *r* and *s*, in that order) that includes the length.

9.6.7.54 EBCS Info frame format

The format of the Action field of the EBCS Info frame is shown in Figure 9-1249.



The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The EBCS Info Sequence Number field contains the sequence number of the EBCS Info frame.

The EBCS Info Timestamp field is the elapsed time from 2020-01-01 00:00 UTC in milliseconds.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

	EBCS TIM Length	EBCS TIM	Fragment Hash Values	Certificate Length	Certificate	Content Information Number	Content Information List	Signature
Octets:	0 or 1	variable	$n \times 32$	0 or 2	variable	1	variable	variable

Figure 9-1249—EBCS Info frame Action field format

The EBCS Info Control field is shown in Figure 9-1250.

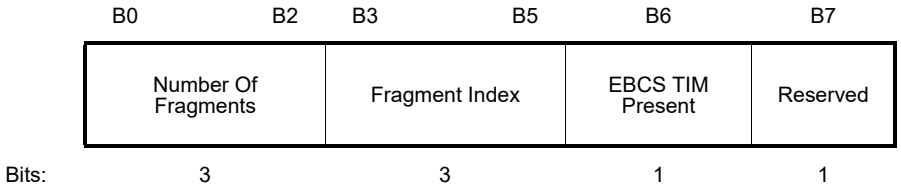


Figure 9-1250—EBCS Info Control field format

The Number Of Fragments subfield indicates the number of the EBCS Info frame fragments minus 1.

The Fragment Index subfield indicates the EBCS Info frame fragment number (see 34.3.5). The first fragment is fragment 0.

The EBCS TIM Present subfield is set to 1 if the EBCS TIM Length field and the EBCS TIM field are present and is set to 0 otherwise.

The EBCS Info Authentication Algorithm field indicates the algorithm used to authenticate the EBCS Info frame. This field is defined in Table 9-507.

Table 9-507—EBCS Info Authentication Algorithm field

Value	Algorithm	Certificate present
0	None	No
1	Prenegotiated	No
2	Digital signature	Yes
3–255	Reserved	-

Details of each algorithm are described in 12.15.2.1.

The EBCS Info Interval field indicates the EBCS Info frame transmission interval (from dot11EBCSInfoInterval), in units of a beacon interval.

NOTE—Even if PKFA is used, the EBCS Info frames are transmitted periodically to advertise EBCS availability.

The EBCS TIM Length field indicates the length in octets of the EBCS TIM field.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The EBCS TIM field contains an EBCS TIM element (9.4.2.314) excluding the Element ID field, the Length field and the Element ID Extension field.

The EBCS TIM Length field and the EBCS TIM field are present if dot11EBCSSupportActivated is true and one or more EBCS traffic streams have dot11EBCSTrafficStreamBufferableActivated set to true, otherwise not present.

The Fragment Hash Values field is only present if the Number Of Fragments subfield, *n*, is nonzero. It contains a sequence of *n* Fragment Hash Value subfields.

The Certificate Length field, the Certificate field and the Signature field are present if the EBCS Info Authentication Algorithm subfield indicates that a certificate is present, and are not present otherwise. The Certificate Length field indicates the length of the Certificate field in octets.

The Certificate field contains the X.509v3 certificate of the EBCS transmitter encoded according to IETF RFC 5280.

The Content Information Number field indicates the number of Content Information subfields included in the Content Information List field.

The Content Information List field contains one or more Content Information subfields. The format of each Content Information subfield is shown in Figure 9-1251.

	Content ID	Content Authentication Algorithm	Content Information Control	Content Address Type	Content Address Length	Content Address	Title Length	Title
Octets:	1	1	1	1	1	variable	1	variable

	Negotiation Method	Time To Termination (optional)	Next TX Schedule (optional)	Service URL Length (optional)	Service URL (optional)	Vendor Specific Data Length (optional)	Vendor Specific Data (optional)	Content Authentication Parameters (optional)
Octets:	1	0 or 2	0 or 2	0 or 1	variable	0 or 1	variable	variable

Figure 9-1251—Content Information field format

The Content ID subfield contains the content ID.

The Content Authentication Algorithm subfield is defined in Table 9-436.

The Content Information Control subfield is shown in Figure 9-1252.

The Time To Termination Present subfield indicates whether the Time To Termination field is present.

The Next Tx Schedule Present subfield indicates whether the Next Tx Schedule field is present.

The Service URL Present subfield is set to 1 if the Service URL Length subfield and the Service URL subfield are present and is set to 0 otherwise.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

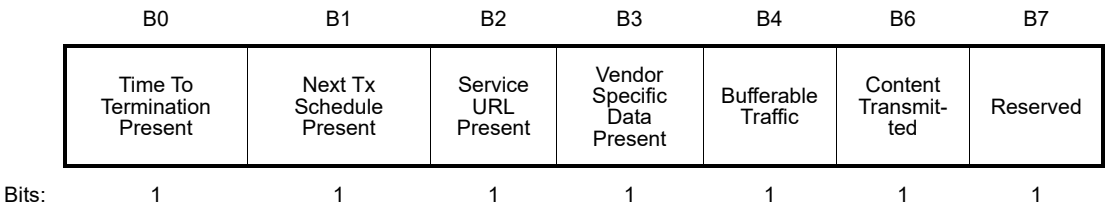

Figure 9-1252—Content Information Control subfield format

The Vendor Specific Data Present subfield is set to 1 if the Vendor Specific Data Length subfield and the Vendor Specific Data subfield are present and is set to 0 otherwise.

The Bufferable Traffic subfield is set to 1 if frames for the EBCS traffic stream are bufferable at the AP. This subfield is set to 0 otherwise.

The Content Transmitted subfield is set to 1 if the content is being transmitted at the moment (no request is needed), and it is set to 0 otherwise.

The Content Address Type subfield, the Content Address subfield, the Time To Termination subfield, and the Negotiation Method subfield are defined in 9.4.5.30.

The Title Length subfield indicates the length of the following Title subfield in octets. The Title subfield is a human readable title of the content as a UTF-8 string.The Next TX Schedule subfield indicates the number of TBTTs until the next expected broadcast of the EBCS traffic stream identified by the Content ID subfield. A value of 1 indicates that the transmission of the content identified by the Content ID subfield will begin in the beacon interval that starts at the following TBTT. A value of 0 is reserved. If the content identified by the Content ID subfield has no specific transmission starting time, the Next TX Schedule subfield is not included.

The Content Authentication Parameters subfield depends on the content authentication algorithm.

In case of PKFA, the Content Authentication Parameters subfield is present and its format is shown in Figure 9-1253.

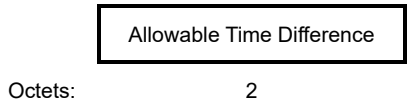

Figure 9-1253—Content Authentication Parameters subfield format for PKFA

The Allowable Time Difference subfield indicates the allowable time differencein milliseconds between the value in the EBCS Info Timestamp field and the reception time recorded by an EBCS receiver.

In case of HCFA, the Content Authentication Parameters subfield is present and its format is shown in Figure 9-1254.

The Allowable Time Difference subfield indicates the allowable time difference in milliseconds between the value in the EBCS Info Timestamp field and the reception time recorded by an EBCS receiver.

The HCFA Base Key subfield contains the first HCFA base key of the HCFA period that starts from this EBCS Info frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

	Allowable Time Difference	HCFA Base Key	Previous Period HCFA Base Key 0 Sequence	Previous Period HCFA Base Key 0	Previous Period HCFA Base Key 1 Sequence	Previous Period HCFA Base Key 1	HCFA Change Interval	Number of Instant Authenti-cators (optional)	Instant Authenti-cator List (optional)
Octets:	2	32	1	32	1	32	1	0 or 1	*n* x 33

Figure 9-1254—Content Authentication Parameters subfield format for HCFA

The Previous Period HCFA Base Key 0 Sequence subfield and the Previous Period HCFA Base Key 1 Sequence subfield indicate the key sequence number of the Previous Period HCFA Base Key 0 subfield and the Previous Period HCFA Base Key 1 subfield, respectively. The Previous Period HCFA Base Key 0 subfield and the Previous Period HCFA Base Key 1 subfield contain the HCFA base key to be disclosed for the previous HCFA period.

If the previous HCFA period does not exist, e.g., at the start of the EBCS transmission, the Previous Period HCFA Base Key 0 Sequence subfield, the Previous Period HCFA Base Key 0 subfield, the Previous Period HCFA Base Key 1 Sequence subfield, and the Previous Period HCFA Base Key 1 subfield are set to 0.

The HCFA Key Change Interval subfield indicates the EBCS HCFA key change interval in units of 10 ms (see dot11EBCSHCFAKeyChangeInterval).

The Number Of Instant Authenticators subfield and the Instant Authenticator List subfield are present if the Content Authentication Algorithm field indicates HCFA with instant authentication, and are not present otherwise.

The Number Of Instant Authenticators subfield, if present, indicates the number of Instant Authenticator subfields contained in the Instant Authenticator List subfield.

The Instant Authenticator List subfield, if present, contains one or more Instant Authenticator subfields.

The format of each Instant Authenticator subfield is shown in Figure 9-1255.

	Hash Distance	Hash Value
Octets:	1	32

Figure 9-1255—Instant Authenticator subfield format

The Hash Distance subfield indicates the hash distance of the instant authenticator. The Hash Value subfield contains the instant authenticator of the following EBCS Data frame of the hash distance that is indicated in the Hash Distance subfield.

In case of HLSA, the Content Authentication Parameters subfield is not present.

The Service URL Length subfield indicates the number of octets in the Service URL subfield.

The Service URL subfield indicates the URL at which information relevant to the corresponding EBCS traffic stream might be retrieved, including negotiation or registration for the service, formatted in accordance with IETF RFC 3986.

The Vendor Specific Data Length subfield indicates the number of octets in the Vendor Specific Data subfield.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Vendor Specific Data subfield is defined by application specific requirements and its contents are outside the scope of this standard.

The Signature field is the digital signature of the EBCS Info frame (see 12.15.2.1). The length of the Signature field is determined by the value of the EBCS Info Authentication Algorithm field as defined in Table 9-507. In case of ECDSA, the Signature field contains the values *r* and *s* encoded in DER-encoded ASN.1 structure (a SEQUENCE of two INTEGERs, for *r* and *s*, in that order) that includes the length. In case of Prenegotiated, the length of the Signature field is negotiated beforehand between the EBCS AP and the EBCS receiver. The Signature field is not present if the Fragment Index subfield is nonzero.

9.6.7.55 EBCS Termination Notice frame format

The EBCS Termination Notice frame is transmitted by a STA to announce the termination of one or more of the EBCS traffic streams transmitted by the STA. The format of the EBCS Termination Notice frame Action field is shown in Figure 9-1256.

	Category	Public Action	EBCS Termination Info Count	EBCS Termination Information Set
Octets:	1	1	1	variable

Figure 9-1256—EBCS Termination Notice frame Action Field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The EBCS Termination Info Count field indicates the number of EBCS Termination Info subfields contained in the EBCS Termination Information Set field.

The EBCS Termination Information Set field contains one or more EBCS Termination Info subfields.

The format of an EBCS Termination Info subfield is shown in Figure 9-1257.

	EBCS Termination Info Length	EBCS Termination Info Control	Content ID	Title Length	Title	Time To Termination	Negotiation Method	Negotiation Address Type	Negotiation Address
Octets:	1	1	1	0 or 1	variable	2	1	0 or 1	variable

Figure 9-1257—EBCS Termination Info subfield format

The EBCS Termination Info Length field indicates the length in octets of the EBCS Termination Info subfield including the EBCS Termination Info Length field.

The format of the EBCS Termination Info Control subfield is shown in Figure 9-1258.

A value of 1 in the Title Presence Indicator subfield indicates that a Title Length subfield and a Title subfield are present in the EBCS Termination Info subfield. A value of 0 indicates that a Title Length subfield and a Title subfield are not present in the EBCS Termination Info subfield.

A value of 1 in the Negotiation Address Presence Indicator subfield indicates that a Negotiation Address Type subfield and a Negotiation Address subfield are present in the EBCS Termination Info subfield. The

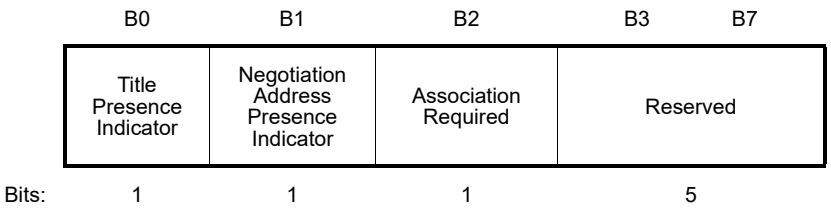

Figure 9-1258—EBCS Termination Info Control subfield format

value of 0 indicates that a Negotiation Address Type subfield and a Negotiation Address subfield are not present in the EBCS Termination Info subfield.

A value of 1 in the Association Required subfield indicates that an association is required to consume the EBCS traffic stream identified by the content ID contained in the Content ID subfield. A value of 0 indicates that an association is not required to consume the EBCS traffic stream identified by the content ID contained in the Content ID subfield.

The Content ID subfield indicates the ID of the EBCS traffic stream to be terminated.

The Title Length subfield indicates the length of the Title subfield in octets.

The Title subfield indicates the title in a UTF-8 string of the EBCS traffic stream identified by the content ID contained in the Content ID subfield.

The Time To Termination subfield is defined in 9.4.1.69.

NOTE—The Time To Termination subfield indicates the termination time for the transmitter STA of the EBCS traffic stream and does not indicate the termination time of the content associated with the EBCS traffic stream.

The Negotiation Method subfield indicates the negotiation method to request an extension of the EBCS traffic stream identified by the content ID contained in the Content ID subfield. The encoding of the Negotiation Method subfield is defined in Table 9-508.

The Negotiation Address Type subfield indicates the type of the address included in the Negotiation Address subfield. The encoding of the Negotiation Address Type subfield is defined in Table 9-509.

The Negotiation Address subfield indicates the address to be used for negotiating for the extension of the EBCS traffic stream identified by the content ID contained in the Content ID subfield. The format and the length of the Negotiation Address subfield depends on the value contained in the Negotiation Address Type subfield.

The Negotiation Address subfield contains a MAC address if the Negotiation Address Type subfield is equal to 0.

The format of the Negotiation Address subfield when the Negotiation Address Type subfield is equal to 1 is shown in Figure 9-1259.

The IPv4 Address subfield indicates an IPv4 address used for negotiating the extension of the EBCS traffic stream.

The Negotiation UDP Port subfield indicates the UDP port associated with the IPv4 address indicated in the IPv4 Address subfield in little endian format.

Table 9-508—Negotiation Method subfield encoding

Negotiation Method subfield value	Meaning	Notes
0	No negotiation	
1	Request through EBCS Content Request frames	EBCS traffic stream request by STAs that are associated with the broadcaster.
2	Request through EBCS Content Request ANQP-element / Request through EBCS Content Request frame	EBCS traffic stream extensions by STAs that are not associated with the broadcaster are requested using an EBCS Content Request ANQP-element. EBCS traffic stream extensions by STAs that are associated with the broadcaster are requested using either an EBCS Content Request ANQP-element or using an EBCS Content Request frame.
3	Request through IP request	Out of band IP request.
4–255	Reserved	

Table 9-509—Negotiation Address Type subfield encoding

Destination Address Type value	Meaning
0	MAC address
1	UDP/IPv4 address
2	UDP/IPv6 address
3	UDP/hostname
4–255	Reserved

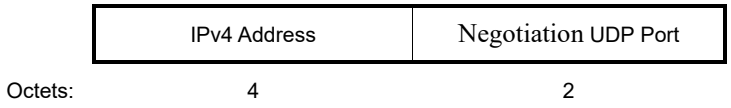

Figure 9-1259—Negotiation Address subfield format for a Negotiation Address Type of 1

The format of the Negotiation Address subfield when the Negotiation Address Type subfield is equal to 2 is shown in Figure 9-1260.

The IPv6 Address subfield indicates an IPv6 address used for negotiating the extension of the EBCS traffic stream.

The Negotiation UDP Port subfield indicates the UDP port associated with the IPv6 address indicated in the IPv6 Address subfield in little endian format.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

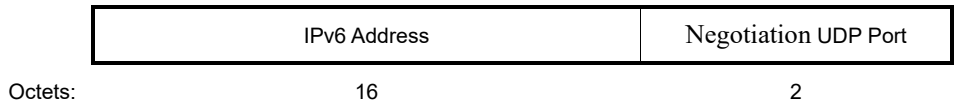

Figure 9-1260—Negotiation Address subfield format for a Negotiation Address Type of 2

The format of the Negotiation Address subfield when the Negotiation Address Type subfield is equal to 3 is shown in Figure 9-1261.

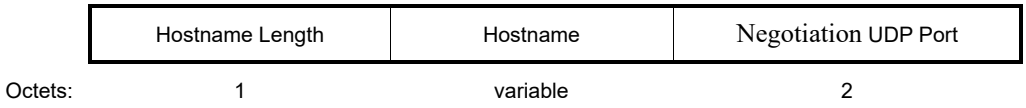

Figure 9-1261—Negotiation Address subfield format for a Negotiation Address Type of 3

The Hostname Length subfield indicates the length of the Hostname subfield in octets.

The Hostname subfield indicates the host name for negotiating the extension of the EBCS traffic stream in a UTF-8 string.

The Negotiation UDP Port subfield indicates the UDP port associated with the host name indicated in the Hostname subfield in little endian format.

9.6.8 FT Action frame details

9.6.8.1 FT Action field

Four Action frame formats are defined to support fast BSS transitions over the DS, which are initiated through the currently associated AP. The FT Action frames are sent over the air between the STA and the current AP. The Action frame is used as a transport mechanism for data that are destined for the target AP. An FT Action field, in the octet immediately after the Category field, differentiates the FT Action frame formats. The FT Action field values associated with each FT Action frame format are defined in Table 9-510.

Table 9-510—FT Action field values

FT Action field value	Description
0	Reserved
1	FT Request frames
2	FT Response frames
3	FT Confirm frames
4	FT Ack frames
5–255	Reserved

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.8.2 FT Request frame

The FT Request frame is sent by the STA to its associated AP to initiate an over-the-DS fast BSS transition.

Figure 9-1262 shows the format of the FT Request frame Action field.

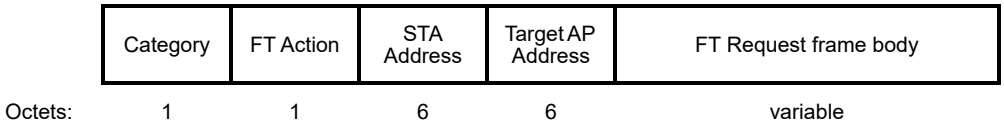

Figure 9-1262—FT Request frame Action field format

The Category field is defined in 9.4.1.11.

The FT Action field is defined in 9.6.8.1.

The STA Address field is set to the FTO's MAC address.

The Target AP Address field is set to the BSSID of the target AP's BSS.

The FT Request frame body contains the information shown in Table 9-511.

Table 9-511—FT Request frame body

Order	Information	Notes
1	RSN	A RSNE is present if dot11RSNAActivated is true.
2	Mobility Domain	The MDE is present.
3	Fast BSS Transition	An FTE is present if dot11RSNAActivated is true.
4	RSN Extension	An RSNXE is present if any subfield of the Extended RSN Capabilities field in this element is nonzero, except the Field Length subfield; otherwise, not present.

The usage of these elements is defined in 13.8.2.

9.6.8.3 FT Response frame

The FT Response frame is transmitted by the currently associated AP as a response to the STA's FT Request frame. Figure 9-1263 shows the format of the FT Response frame Action field.

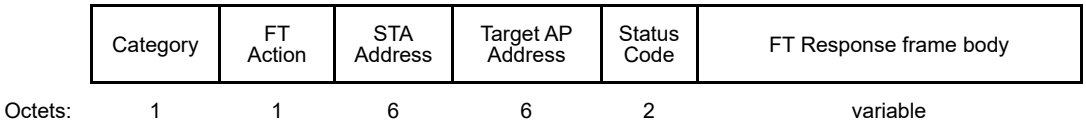

Figure 9-1263—FT Response frame Action field format

The Category field is defined in 9.4.1.11.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The FT Action field is defined in 9.6.8.1.

The STA Address field is set to the FTO's MAC address.

The Target AP Address field is set to the BSSID of the target AP's BSS.

The Status Code field is a value from the options listed in 9.4.1.9.

If the Status Code field is SUCCESS, then the FT Response frame body contains the information shown in Table 9-512.

Table 9-512—FT Response frame body

Order	Information	Notes
1	RSN	The RSNE is present if dot11RSNAActivated is true; otherwise not present.
2	Mobility Domain	The MDE is present.
3	Fast BSS Transition	An FTE is present if dot11RSNAActivated is true.

The usage of these elements is defined in 13.8.3.

9.6.8.4 FT Confirm frame

The FT Confirm frame in an RSN is confirmation to the target AP of receipt of the ANonce and indicates the liveness of the PTKSA. The FT Confirm frame is optionally used by the FTO to request resources. Figure 9-1264 shows the FT Confirm frame Action field format.

	Category	FT Action	STA Address	Target AP Address	FT Confirm frame body
Octets:	1	1	6	6	variable

Figure 9-1264—FT Confirm frame Action field format

The Category field is defined in 9.4.1.11.

The FT Action field is defined in 9.6.8.1.

The STA Address field is set to the FTO's MAC address.

The Target AP Address field is set to the BSSID of the target AP's BSS.

The FT Confirm frame body contains the information shown in Table 9-513.

The usage of these elements is defined in 13.8.4.

9.6.8.5 FT Ack frame

The FT Ack frame is transmitted by the currently associated AP as a response to the STA's FT Confirm frame. Figure 9-1265 shows the FT Ack frame Action field format.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-513—FT Confirm frame body

Order	Information	Notes
1	RSN	The RSNE is present if dot11RSNAActivated is true; otherwise not present.
2	Mobility Domain	The MDE is present.
3	Fast BSS Transition	An FTE is present if dot11RSNAActivated is true.
4	RIC	The RIC Request field is present if resources are being requested.

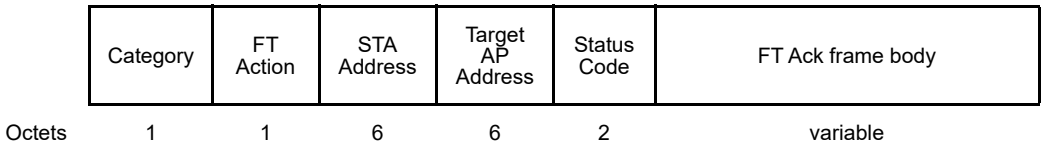

Figure 9-1265—FT Ack frame Action field format

The Category field is defined in 9.4.1.11.

The FT Action field is defined in 9.6.8.1.

The STA Address field is set to the FTO's MAC address.

The Target AP Address field is set to the BSSID of the target AP's BSS.

The Status Code field is a value from the options listed in 9.4.1.9.

If the Status Code field is SUCCESS, then the FT Ack frame body contains the information shown in Table 9-514.

Table 9-514—FT Ack frame body

Order	Information	Notes
1	RSN	The RSNE is present if dot11RSNAActivated is true; otherwise not present.
2	Mobility Domain	The MDE is present.
3	Fast BSS Transition	An FTE is present if dot11RSNAActivated is true.
4	Timeout Interval (reassociation deadline)	A TIE containing the reassociation deadline interval is present if resources were requested in the FT Confirm frame and dot11RSNAActivated is false.
5	RIC	The RIC Response field is present if resources were requested in the FT Confirm frame.

The usage of these elements is defined in 13.8.5.

Copyright © 2025 IEEE. All rights reserved.

9.6.9 SA Query Action frame details

9.6.9.1 SA Query Action field

Two Action frame formats are defined for the SA Query procedure. An SA Query Action field, in the field immediately after the Category field, differentiates the formats. The Action field values associated with each frame format are defined in Table 9-515.

NOTE—The SA query functionality defined in this standard is used to prevent the Association Lockout problem (defined in 11.3).

Table 9-515—SA Query Action field values

SA Query Action field value	Description
0	SA Query Request
1	SA Query Response

9.6.9.2 SA Query Request frame

The SA Query Request frame is used to request an SA Query Response from the receiving STA. The format of the Action field of the SA Query Request frame is shown in Figure 9-1266.

	Category	SA Query Action	Transaction Identifier	OCI Element
Octets:	1	1	2	6

Figure 9-1266—SA Query Request frame Action field format

The Category field is defined in 9.4.1.11.

The SA Query Action field is defined in 9.6.9.1.

The Transaction Identifier field is a counter value set by the STA sending the SA Query Request frame to identify any outstanding request/response transaction.

The OCI Element field includes the OCI element (see 9.4.2.235) and is included if dot11RSNAOperatingChannelValidationActivated is true.

9.6.9.3 SA Query Response frame

The SA Query Response frame is used to respond to an SA Query Request frame from another STA. The format of the Action field of the SA Query Response frame is shown in Figure 9-1267.

	Category	SA Query Action	Transaction Identifier	OCI Element
Octets:	1	1	2	6

Figure 9-1267—SA Query Response frame Action field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The SA Query Action field is defined in 9.6.9.1.

The Transaction Identifier field is set to the same value as the Transaction Identifier field in the corresponding SA Query Request frame.

The OCI Element field includes the OCI element (see 9.4.2.235) and is included if dot11RSNAOperatingChannelValidationActivated is true.

9.6.10 Protected Dual of Public Action frame details

The Protected Dual of Public Action frame is defined to allow robust STA-STA communications of the same information that is conveyed in Public Action frames. A Public Action field, in the octet immediately after the Category field, differentiates the Protected Dual of Public Action frame formats. The defined Protected Dual of Public Action frames are listed in Table 9-516.

The Action fields of Protected Dual of Public Action frames have the same format as those of the corresponding nonprotected Public Action frames.

Table 9-516—Public Action field values defined for Protected Dual of Public Action frames

Public Action field value	Description	Defined in
0	Reserved	
1	Protected DSE Enablement	9.6.7.4
2	Protected DSE Deenablement	9.6.7.5
3	Reserved	
4	Protected Extended Channel Switch Announcement	9.6.7.7
5	Protected Measurement Request	9.6.7.8
6	Protected Measurement Report	9.6.7.9
7	Reserved	
8	Protected DSE Power Constraint	9.6.7.10
9	Protected Vendor Specific	9.6.7.11
10	Protected GAS Initial Request	9.6.7.12
11	Protected GAS Initial Response	9.6.7.13
12	Protected GAS Comeback Request	9.6.7.14
13	Protected GAS Comeback Response	9.6.7.16
14–15	Reserved	
16	QAB Request	9.6.7.34
17	QAB Response	9.6.7.35
18	Protected QMF Policy	9.6.7.19

Table 9-516—Public Action field values defined for Protected Dual of Public Action frames *(continued)*

Public Action field value	Description	Defined in
20	Protected QLoad Request	9.6.7.20
21	Protected QLoad Report	9.6.7.21
22	Protected HCCA TXOP Advertisement	9.6.7.22
23	Protected HCCA TXOP Response	9.6.7.23
24	Reserved	
25	Protected Channel Availability Query	9.6.7.25
26	Protected Channel Schedule Management	9.6.7.26
27	Protected Contact Verification Signal	9.6.7.27
28	Protected GDD Enablement Request	9.6.7.28
29	Protected GDD Enablement Response	9.6.7.29
30	Protected Network Channel Control	9.6.7.30
31	Protected White Space Map Announcement	9.6.7.31
32	Protected DMG STA Directional Transmit Activity Report	9.6.7.48
33	EBCS Termination Notice	9.6.7.55
34	Protected GAS Comeback Request Fragment	9.6.7.15
35–255	Reserved	

9.6.11 HT Action frame details

9.6.11.1 HT Action field

Several Action frame formats are defined to support HT features. An HT Action field, in the octet immediately after the Category field, differentiates the HT Action frame formats. The HT Action field values associated with each frame format within the HT category are defined in Table 9-517. The frame formats are defined in 9.6.11.2 to 9.6.11.7.

9.6.11.2 Notify Channel Width frame format

A STA sends the Notify Channel Width frame to another STA if it wants to change the channel width of frames that the other STA sends to it. See definition in 11.15.2.

The format of the Notify Channel Width frame Action field is defined in Table 9-518.

This frame can be sent by both non-AP STA and AP.

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.11.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-517—HT Action field values

HT Action field value	Meaning	Time priority
0	Notify Channel Width	No
1	SM Power Save	No
2–3	Reserved	
4	CSI	Yes
5	Noncompressed Beamforming	Yes
6	Compressed Beamforming	Yes
7	ASEL Indices Feedback	Yes
8–255	Reserved	

Table 9-518—Notify Channel Width frame Action field format

Order	Information
1	Category
2	HT Action
3	Channel Width (see 9.4.1.21)

9.6.11.3 SM Power Save frame format

The SM Power Save frame is of category HT. The SM Power Save frame is used to manage SM power-saving state transitions as defined in 11.2.6.

The Action field of the SM Power Save frame is defined in Table 9-519.

Table 9-519—SM Power Save frame Action field format

Order	Information
1	Category
2	HT Action
3	SM Power Control (see 9.4.1.23)

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.11.1.

9.6.11.4 CSI frame format

The CSI frame is an Action or an Action No Ack frame of category HT. The format of its Action field is defined in Table 9-520.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-520—CSI frame Action field format

Order	Information
1	Category
2	HT Action
3	MIMO Control (see 9.4.1.24)
4	CSI Report (see 9.4.1.25)

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.11.1.

In a CSI frame, the fields of the MIMO Control field (see 9.4.1.24) are used as described in Table 9-85. The Codebook Information subfield is reserved in this frame.

9.6.11.5 Noncompressed Beamforming frame format

The Noncompressed Beamforming frame is an Action or an Action No Ack frame of category HT. The format of its Action field is defined in Table 9-521.

Table 9-521—Noncompressed Beamforming frame Action field format

Order	Information
1	Category
2	HT Action
3	MIMO Control (see 9.4.1.24)
4	Noncompressed Beamforming Report (see 9.4.1.26)

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.11.1.

In a Noncompressed Beamforming frame, the fields of the MIMO Control field (see 9.4.1.24) are used as described in Table 9-85. The Codebook Information subfield is reserved in this frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.11.6 Compressed Beamforming frame format

The Compressed Beamforming frame is an Action or an Action No Ack frame of category HT. The format of its Action field is defined in Table 9-522.

Table 9-522—Compressed Beamforming frame Action field format

Order	Information
1	Category
2	HT Action
3	MIMO Control (see 9.4.1.24)
4	Compressed Beamforming Report (see 9.4.1.27)

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.11.1.

In a Compressed Beamforming frame, the fields of the MIMO Control field (see 9.4.1.24) are used as described in Table 9-85. The Coefficient Size subfield is reserved in this frame.

9.6.11.7 Antenna Selection Indices Feedback frame format

The Antenna Selection Indices Feedback frame is an Action or Action No Ack frame of category HT. The format of its Action field is defined in Table 9-523.

Table 9-523—Antenna Selection Indices Feedback frame Action field format

Order	Information
1	Category
2	HT Action
3	Antenna Selection Indices (see 9.4.1.28)

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.11.1.

9.6.12 TDLS Action field formats

9.6.12.1 TDLS Action field

Several Action field formats are defined to support TDLS. A TDLS Action field, in the octet immediately after the Category field, differentiates the TDLS Action field formats. The TDLS Action field values associated with each Action field format within the TDLS category are defined in Table 9-524.

Table 9-524—TDLS Action field values

Action field value	Meaning
0	TDLS Setup Request
1	TDLS Setup Response
2	TDLS Setup Confirm
3	TDLS Teardown
4	TDLS Peer Traffic Indication
5	TDLS Channel Switch Request
6	TDLS Channel Switch Response
7	TDLS Peer PSM Request
8	TDLS Peer PSM Response
9	TDLS Peer Traffic Response
10	TDLS Discovery Request
11–255	Reserved

References to one of the TDLS Action field values as a frame, e.g., "TDLS Setup Request frame," denote a Data frame carrying a TDLS Action field and any Vendor Specific elements tunneled as described in 11.20.2.

NOTE—There is no TDLS Discovery Response TDLS Action field; the TDLS Discovery Response frame is not a Data frame but a Public Action frame.

9.6.12.2 TDLS Setup Request Action field format

The Action field of a TDLS Setup Request Action field contains the information shown in Table 9-525.

The TDLS Setup Request Action field is encapsulated in a Data frame and transmitted to the recipient STA through the AP to request the setup of a TDLS direct link. See 11.20.

9.6.12.3 TDLS Setup Response Action field format

The Action field of a TDLS Setup Response Action field contains the information shown in Table 9-526.

The TDLS Setup Response Action field is encapsulated in a Data frame and transmitted to the TDLS initiator STA through the AP in response to a TDLS Setup Request Action field. See 11.20.

9.6.12.4 TDLS Setup Confirm Action field format

The Action field of a TDLS Setup Confirm Action field contains the information shown in Table 9-527.

The TDLS Setup Confirm Action field is encapsulated in a Data frame and transmitted to the TDLS responder STA through the AP in response to a TDLS Setup Response Action field. See 11.20.

Table 9-525—Information for TDLS Setup Request Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Dialog Token	The Dialog Token field contains a unique nonzero value for the conversation between the STAs involved in this request. The dialog token is specified in 9.4.1.12.
4	Capability	The Capability field indicates the capabilities of the STA. The Capability field is defined in 9.4.1.4.
5	Supported Rates and BSS Membership Selectors	The Supported Rates and BSS Membership Selectors element indicates the rates that are supported by the STA. The Supported Rates and BSS Membership Selectors element is defined in 9.4.2.3.
6	Country	The Country element is present when dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true. The Country element is defined in 9.4.2.7.
7	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if the number of supported rates and BSS membership selectors together exceed eight; it is optional otherwise. The Extended Supported Rates and BSS Membership Selectors element is defined in 9.4.2.11.
8	Supported Channels	The Supported Channels element is present if the TDLS Channel Switching subfield is equal to 1. The Supported Channels element is defined in 9.4.2.16.
9	RSNE	The RSNE is present if security is required on the TDLS direct link (see 12.7.8.1); otherwise not present. The RSNE is defined in 9.4.2.23.
10	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero. The Extended Capabilities element is defined in 9.4.2.25.
11	QoS Capability	The QoS Capability element is present when dot11QosOptionImplemented is true and not present otherwise. The QoS Capability element is defined in 9.4.2.33.
12	FTE	The FTE is present if security is required on the TDLS direct link (see 12.7.8.1). The FTE is defined in 9.4.2.46.
13	Timeout Interval (TPK key lifetime)	The TIE contains the TPK key lifetime and is present if security is required on the TDLS direct link (see 12.7.8.1). The TIE is defined in 9.4.2.47.
14	Supported Operating Classes	The Supported Operating Classes element is present if the TDLS Channel Switching subfield is equal to 1.
15	HT Capabilities	The HT Capabilities element is defined in 9.4.2.54. The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true.

Table 9-525—Information for TDLS Setup Request Action field *(continued)*

Order	Information	Notes
16	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is defined in 9.4.2.58. The 20/40 BSS Coexistence element is optionally present.
17	Link Identifier	The Link Identifier element is specified in 9.4.2.60.
18	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.
19	AID	The AID element containing the AID of the STA sending the frame is present if dot11VHTOptionImplemented, dot11HEOptionImplemented, or dot11S1GOptionImplemented is true.
20	VHT Capabilities	The VHT Capabilities element is present in the 5 GHz band if dot11VHTOptionImplemented is true.
21	S1G Capabilities	S1G Capabilities element is optionally present if dot11S1GOptionImplemented is true.
22	EL Operation	EL Operation element is present if dot11S1GELOperationActivated is true.
23	HE Capabilities	The HE Capabilities element is present if dot11HEOptionImplemented is true; otherwise, it is not present. The HE Capabilities element is defined in 9.4.2.247.
24	TWT	The TWT element is optionally present if dot11TWTOptionActivated is true; otherwise, it is not present. The Trigger subfield and the Negotiation Type subfield of the TWT element are set to 0.
25	HE 6 GHz Band Capabilities	The HE 6 GHz Band Capabilities element is present if dot11HEOptionImplemented and dot11HE6GOptionImplemented are true; otherwise, it is not present.

Table 9-526—Information for TDLS Setup Response Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Status Code	The Status Code is defined in 9.4.1.9.
4	Dialog Token	The dialog token is copied from the corresponding TDLS Setup Request. The dialog token is specified in 9.4.1.12.
5	Capability	The Capability field indicates the capabilities of the STA and is present when the status code is SUCCESS and is not present otherwise. The Capability field is defined in 9.4.1.4.
6	Supported Rates and BSS Membership Selectors	The Supported Rates and BSS Membership Selectors element indicates the rates that are supported by the STA and is present when the status code is SUCCESS and is not present otherwise.The Supported Rates and BSS Membership Selectors element is defined in 9.4.2.3.
7	Country	The Country element is present when Status Code is SUCCESS and either dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true and is not present otherwise. The Country element is defined in 9.4.2.7.
8	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present when there are more than 8 supported rates and Status Code is SUCCESS. It is optionally present when there are less than 8 supported rates and Status Code is SUCCESS. Otherwise it is not present. The Extended Supported Rates and BSS Membership Selectors element is defined in 9.4.2.11.
9	Supported Channels	The Supported Channels element is defined in 9.4.2.16. It is present if the TDLS Channel Switching subfield is equal to 1 and the status code is SUCCESS, and not present otherwise.
10	RSNE	The RSNE is present if security is required on the TDLS direct link (see 12.7.8.1) and the status code is SUCCESS, and not present otherwise. The RSNE is defined in 9.4.2.23.
11	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero and the status code is SUCCESS, and not present otherwise. The Extended Capabilities element is defined in 9.4.2.25.
12	QoS Capability	The QoS Capability element is present when dot11QosOptionImplemented is true and the status code is SUCCESS and not present otherwise. The QoS Capability element is defined in 9.4.2.33.
13	FTE	The FTE is present if security is required on the TDLS direct link (see 12.7.8.1) and the status code is SUCCESS, and not present otherwise. The FTE is defined in 9.4.2.46.
14	Timeout Interval (TPK key lifetime)	The TIE, containing the TPK key lifetime, is present if security is required on the TDLS direct link (see 12.7.8.1) and the status code is SUCCESS, and not present otherwise. The TIE is defined in 9.4.2.47.

Table 9-526—Information for TDLS Setup Response Action field *(continued)*

Order	Information	Notes
15	Supported Operating Classes	The Supported Operating Classes element is present if the TDLS Channel Switching subfield is equal to 1 and the status code is SUCCESS and not present otherwise.
16	HT Capabilities	The HT Capabilities element is present if dot11HighThroughputOptionImplemented is true and the status code is SUCCESS and is not present otherwise. The HT Capabilities element is defined in 9.4.2.54.
17	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present if the status code is SUCCESS and not present otherwise. The 20/40 BSS Coexistence element is defined in 9.4.2.58.
18	Link Identifier	The Link Identifier element is present if the status code is SUCCESS and not present otherwise. The Link Identifier is specified in 9.4.2.60.
19	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true and the status code is SUCCESS and not present otherwise.
20	AID	The AID element containing the AID of the STA sending the frame is present if dot11VHTOptionImplemented, dot11HEOptionImplemented, or dot11S1GOptionImplemented is true and the status code is SUCCESS and not present otherwise.
21	VHT Capabilities	The VHT Capabilities element is present in the 5 GHz band if dot11VHTOptionImplemented is true and the status code is SUCCESS and not present otherwise.
22	Operating Mode Notification	The Operating Mode Notification element is optionally present if the TDLS Setup Request frame contained an Extended Capabilities element with the Operating Mode Notification field is equal to 1.
23	S1G Capabilities	S1G Capabilities element is optionally present if dot11S1GOptionImplemented is true.
24	EL Operation	EL Operation element is present if dot11S1GELOperationActivated is true.
25	HE Capabilities	The HE Capabilities element is present if dot11HEOptionImplemented is true and the status code is SUCCESS; otherwise, it is not present. The HE Capabilities element is defined in 9.4.2.247.
26	TWT	The TWT element is present if dot11TWTOptionActivated is true and the TWT element is present in the TDLS Setup Request frame that elicited this TDLS Setup Response frame. The TWT element is optionally present if dot11TWTOptionActivated is true and the TWT Requester Support field or the TWT Responder Support field is equal to 1 in the HE Capabilities in the TDLS Setup Request frame that elicited this TDLS Setup Response frame. Otherwise, the TWT element is not present. The Trigger subfield and the Negotiation Type subfield of the TWT element are set to 0.
27	HE 6 GHz Band Capabilities	The HE 6 GHz Band Capabilities element is present if dot11HEOptionImplemented and dot11HE6GOptionImplemented are true; otherwise, it is not present.

Table 9-527—Information for TDLS Setup Confirm Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Status Code	The Status Code is defined in 9.4.1.9.
4	Dialog Token	The dialog token is copied from the corresponding TDLS Setup Response. The dialog token is specified in 9.4.1.12.
5	RSNE	The RSNE is present if security is required on the TDLS direct link (see 12.7.8.1) and the status code is SUCCESS, and not present otherwise. The RSNE is defined in 9.4.2.23.
6	EDCA Parameter Set	The EDCA parameter set is present if QoS is supported on the TLDS direct link (see 12.7.8.1) . The EDCA Parameter Set element is specified in 9.4.2.27. It is present for Status Code SUCCESS.
7	FTE	The FTE is defined in 9.4.2.46. The FTE is present if security is required on the TDLS direct link (see 12.7.8.1) and the status code is SUCCESS, and not present otherwise.
8	Timeout Interval (TPK key lifetime)	The TIE is defined in 9.4.2.47. The TIE, containing the TPK key lifetime, is present if security is required on the TDLS direct link and the status code is SUCCESS, and not present otherwise.
9	HT Operation	The HT Operation element is present if dot11HighThroughputOptionImplemented is true, the TDLS Setup Response frame contained an HT Capabilities element, the status code is SUCCESS. The HT Operation element is defined in 9.4.2.55.
10	Link Identifier	The Link Identifier is specified in 9.4.2.60. It is present if the status code is SUCCESS.
11	VHT Operation	VHT Operation element (optional). The VHT Operation element is present if dot11VHTOptionImplemented is true, the TDLS Setup Response frame contained a VHT Capabilities element, the status code is SUCCESS, and the TDLS direct link is not established in the 2.4 GHz band. The VHT Operation element is defined in 9.4.2.157.
12	Operating Mode Notification	The Operating Mode Notification element is optionally present if the TDLS Setup Request frame contained an Extended Capabilities element with the Operating Mode Notification field is equal to 1.
13	S1G Operation	The S1G Operation element is present if dot11S1GOptionImplemented is true and the status code is 0 (Successful). The S1G Operation element is defined in 9.4.2.211.
14	HE Operation	The HE Operation element is present when dot11HEOptionImplemented is true, the TDLS Setup Response frame contains an HE Capabilities element, and the status code is SUCCESS; otherwise, it is not present. The HE Operation element is defined in 9.4.2.248.

9.6.12.5 TDLS Teardown Action field format

The Action field of a TDLS Teardown Action field contains the information shown in Table 9-528.

Table 9-528—Information for TDLS Teardown Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Reason Code	The Reason Code is defined in 9.4.1.7.
4	FTE	The FTE is present if a TPK handshake was successful for this session. The FTE is defined in 9.4.2.46.
5	Link Identifier	The Link Identifier is specified in 9.4.2.60.

The TDLS Teardown Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA directly or through the AP to tear down a TDLS direct link. See 11.20.

9.6.12.6 TDLS Peer Traffic Indication Action field format

The Action field of a TDLS Peer Traffic Indication Action field contains the information shown in Table 9-529.

Table 9-529—Information for TDLS Peer Traffic Indication Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Dialog Token	The dialog token is specified in 9.4.1.12.
4	Link Identifier	The Link Identifier is specified in 9.4.2.60.
5	PTI Control	The PTI Control element is optionally present. It is defined in 9.4.2.63.
6	TPU Buffer Status	The TPU Buffer Status element is defined in 9.4.2.64.

The TDLS Peer Traffic Indication Action field indicates the state of the power save buffer at the STA supporting TPU that is buffering data for a TDLS peer STA in power save mode.

The TPU Buffer Status element indicates the status of the AC buffers at the TPU buffer STA.

The PTI Control element is optionally included in the TDLS Peer Traffic Indication Action field (see 11.2.3.12) to identify the latest MPDU transmitted to the TPU sleep STA that is the destination of the TDLS Peer Traffic Indication Action field.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The TDLS Peer Traffic Indication Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA through the AP. See 11.2.3.12.

9.6.12.7 TDLS Channel Switch Request Action field format

The Action field of the TDLS Channel Switch Request Action field contains the information shown in Table 9-530.

Table 9-530—Information for TDLS Channel Switch Request Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Target Channel	1-octet field that specifies the channel number of the target channel. See 9.4.1.33.
4	Operating Class	1-octet field that specifies the operating class for the target channel. The Operating Channel field is defined in 9.4.1.34.
5	Secondary Channel Offset	The secondary channel offset is present if a switch to a 40 MHz TDLS direct link is indicated and is absent otherwise. See 9.4.2.18.
6	Link Identifier	The Link Identifier element is specified in 9.4.2.60.
7	Channel Switch Timing	The Channel Switch Timing element is specified in 9.4.2.62.
8	Wide Bandwidth Channel Switch	Wide Bandwidth Channel Switch element (optional). The Wide Bandwidth Channel Switch element is included when a switch to an 80 MHz, 160 MHz, or 80+80 MHz TDLS direct link is indicated. See 9.4.2.159.
9	Country	Country element (optional). The Country element is included to change operating classes when a switch to a TDLS direct link is indicated. The Country element indicates the same country as the BSS and includes zero Subband Triplet fields.
10	Transmit Power Envelope	Transmit Power Envelope element (zero or more). Each Transmit Power Envelope element that is present includes a distinct value of the Local Maximum Transmit Power Unit Interpretation subfield. If present, the New Transmit Power Envelope element indicates the maximum transmit powers for the TDLS direct link for the indicated bandwidths with an indicated unit interpretation after a switch to a TDLS direct link (see 11.20.6.5.1).

The TDLS Channel Switch Request Action field is encapsulated in a Data frame and transmitted directly to the TDLS peer STA to request for the TDLS direct link to be switched to another channel. See 11.20.

9.6.12.8 TDLS Channel Switch Response Action field format

The Action field of the TDLS Channel Switch Response Action field contains the information shown in Table 9-531.

The TDLS Channel Switch Response Action field is encapsulated in a Data frame and transmitted directly to the TDLS peer STA in response to a TDLS Channel Switch Request Action field. See 11.20.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-531—Information for TDLS Channel Switch Response Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Status Code	The Status Code is defined in 9.4.1.9.
5	Link Identifier	The Link Identifier element is specified in 9.4.2.60. It is present if the status code is SUCCESS.
6	Channel Switch Timing	The Channel Switch Timing element is specified in 9.4.2.62.

9.6.12.9 TDLS Peer PSM Request Action field format

The TDLS Peer PSM Request Action field contains the information shown in Table 9-532.

Table 9-532—Information for TDLS Peer PSM Request Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Dialog Token	The Dialog Token field contains a value that is unique among TDLS Peer PSM Request Action fields for which a corresponding TDLS Peer PSM Response Action field has not been received. The dialog token is specified in 9.4.1.12.
4	Link Identifier	The Link Identifier element is specified in 9.4.2.60.
5	Wakeup Schedule	The Wakeup Schedule element is specified in 9.4.2.61.

The TDLS Peer PSM Request Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA, directly or through the AP, to set up or change a periodic wakeup schedule on the TDLS direct link. See 11.2.3.11.

9.6.12.10 TDLS Peer PSM Response Action field format

The TDLS Peer PSM Response Action field contains the information shown in Table 9-533.

The TDLS Peer PSM Response Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA directly in response to a TDLS Peer PSM Request Action field. See 11.2.3.11.

9.6.12.11 TDLS Peer Traffic Response Action field format

The Action field of a TDLS Peer Traffic Response Action field contains the information shown in Table 9-534.

The TDLS Peer Traffic Response Action field indicates the receipt of the corresponding TDLS Peer Traffic Indication Action field.

Table 9-533—Information for TDLS Peer PSM Response Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Dialog Token	The dialog token is set to the value contained in the corresponding TDLS Peer PSM Request Action field. The dialog token is specified in 9.4.1.12.
4	Status Code	The Status Code is specified in 9.4.1.9.
5	Link Identifier	The Link Identifier element is specified in 9.4.2.60. It is present if the status code is SUCCESS.
6	Wakeup Schedule	The Wakeup Schedule element is present is present if the status code is set to TDLS_REJECTED_ALTERNATIVE_PROVIDED and is not present otherwise. The Wakeup Schedule element is specified in 9.4.2.61.

Table 9-534—Information for TDLS Peer Traffic Response Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Dialog Token	The dialog token is specified in 9.4.1.12.
4	Link Identifier	The Link Identifier element is specified in 9.4.2.60.

The Dialog Token field is defined in 9.4.1.12. It is set to the nonzero value of the corresponding TDLS Peer Traffic Indication Action field.

The Link Identifier field is set to identify the TDLS direct link in relation to which the TDLS Peer Traffic Response Action field is transmitted.

The TDLS Peer Traffic Response Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA directly. See 11.2.3.12.

9.6.12.12 TDLS Discovery Request Action field format

The TDLS Discovery Request Action field contains the information shown in Table 9-535.

The TDLS Discovery Request Action field is encapsulated in a Data frame and transmitted to a TDLS peer STA through the AP, to request TDLS STAs in the same BSS to respond with a TDLS Discovery Response frame. See 11.20.

Table 9-535—Information for TDLS Discovery Request Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Dialog Token	The Dialog Token field can be used to match TDLS Discovery Response frames to the corresponding TDLS Discovery Request frame. The dialog token is specified in 9.4.1.12.
4	Link Identifier	The Link Identifier element is specified in 9.4.2.60.
5	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.

9.6.13 WNM Action frame details

9.6.13.1 WNM Action field

Several Action frame formats are defined for wireless network management (WNM) purposes. A WNM Action field, in the field immediately after the Category field, differentiates the formats. The WNM Action field values associated with each frame format are defined in Table 9-536.

Table 9-536—WNM Action field values

WNM Action field value	Description
0	Event Request
1	Event Report
2	Diagnostic Request
3	Diagnostic Report
4	Location Configuration Request
5	Location Configuration Response
6	BSS Transition Management Query
7	BSS Transition Management Request
8	BSS Transition Management Response
9	FMS Request
10	FMS Response
11	Colocated Interference Request
12	Colocated Interference Report
13	TFS Request
14	TFS Response
15	TFS Notify
16	WNM Sleep Mode Request

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-536—WNM Action field values *(continued)*

WNM Action field value	Description
17	WNM Sleep Mode Response
18	TIM Broadcast Request
19	TIM Broadcast Response
20	QoS Traffic Capability Update
21	Channel Usage Request
22	Channel Usage Response
23	DMS Request
24	DMS Response
25	Timing Measurement Request
26	WNM Notification Request
27	WNM Notification Response
28–255	Reserved

9.6.13.2 Event Request frame format

The Event Request frame is transmitted to request another STA to report one or more events. The format of the Event Request frame Action field is shown in Figure 9-1268.

	Category	WNM Action	Dialog Token	Event Request Elements	Destination URI Element (optional)
Octets:	1	1	1	variable	variable

Figure 9-1268—Event Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is a nonzero value chosen by the STA sending the event request to identify the request/report transaction.

The Event Request Elements field contains one or more of the Event Request elements described in 9.4.2.65.

The Destination URI element field contains zero or one Destination URI elements described in 9.4.2.88.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.13.3 Event Report frame format

The Event Report frame is transmitted in response to an Event Request frame, or autonomously. The format of the Event Report frame Action field is shown in Figure 9-1269.

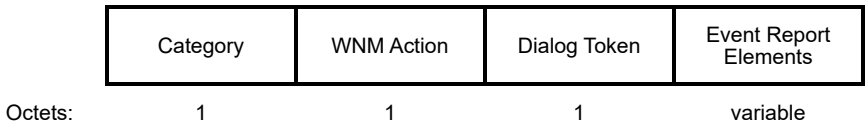

Figure 9-1269—Event Report frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is the nonzero value of the corresponding Event Request frame. If the Event Report frame is being transmitted other than in response to an Event Request frame, then the dialog token is 0.

The Event Report Elements field contains one or more of the Event Report elements described in 9.4.2.66.

9.6.13.4 Diagnostic Request frame format

The Diagnostic Request frame is transmitted requesting the receiving STA to execute a diagnostic test. The format of the Diagnostic Request frame Action field is shown in Figure 9-1270.

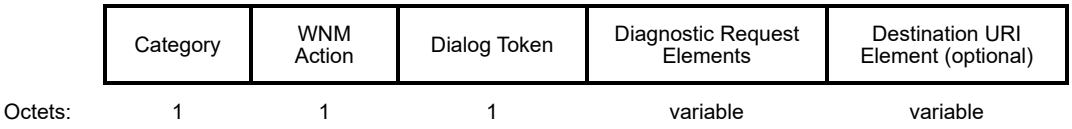

Figure 9-1270—Diagnostic Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is a nonzero value chosen by the STA sending the Diagnostic Request frame to identify the request/report transaction.

The Diagnostic Request Elements field contains one or more of the Diagnostic Request elements described in 9.4.2.67. The number and length of the Diagnostic Request elements in a Diagnostic Request frame is limited by the maximum MMPDU size (see 9.3.3.1).

The Destination URI element field contains zero or one Destination URI elements described in 9.4.2.88.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.13.5 Diagnostic Report frame format

The Diagnostic Report frame is transmitted by a STA in response to a Diagnostic Request frame. The format of the Diagnostic Report frame Action field is shown in Figure 9-1271.

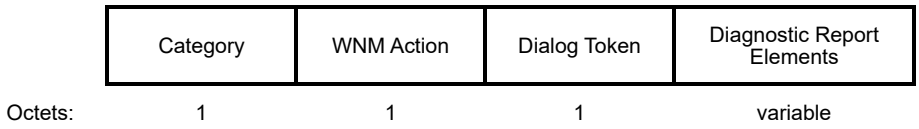

Figure 9-1271—Diagnostic Report frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is the nonzero value in any corresponding Diagnostic Request frame.

The Diagnostic Report Elements field contains one or more of the Diagnostic Report elements described in 9.4.2.68. The number and length of the Diagnostic Report elements in a Diagnostic Report frame is limited by the maximum MMPDU size (see 9.3.3.1).

9.6.13.6 Location Configuration Request frame format

The Location Configuration Request frame is transmitted to configure another STA to send a Location Track Notification frame on a set of channels periodically for the purposes of determining location of the STA. The format of the Location Configuration Request frame Action field is shown in Figure 9-1272.

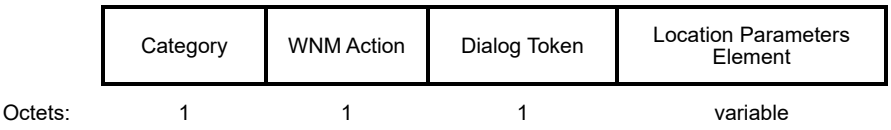

Figure 9-1272—Location Configuration Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is a nonzero value that is unique among the Location Configuration Request frames sent to each destination MAC address for which a corresponding Location Configuration Response frame has not been received.

The Location Parameters Element field contains the location parameters subelements, described in 9.4.2.69. Table 9-537 defines the allowed Location Parameters subelements for a Location Parameters element that is included in the Location Configuration Request frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-537—Location Parameters Element field for Location Configuration Request frame

Allowed subelements	Subelement ID	Notes
Location Indication Parameters	1	The Location Indication Parameters subelement is included in the Location Configuration Request frame.
Location Indication Channels	2	The Location Indication Channels subelement is included in the Location Configuration Request frame.
Location Indication Broadcast Data Rate	6	The Location Indication Broadcast Data Rate subelement is included in the Location Configuration Request frame.
Location Indication Options	8	The Location Indication Options subelement is optionally included in the Location Configuration Request frame.
Vendor Specific Information	221	Zero or more Vendor Specific subelements are included in the Location Configuration Request frame.

9.6.13.7 Location Configuration Response frame format

The Location Configuration Response frame is transmitted in response to a Location Configuration Request frame. The format of the Location Configuration Response frame Action field is shown in Figure 9-1273.

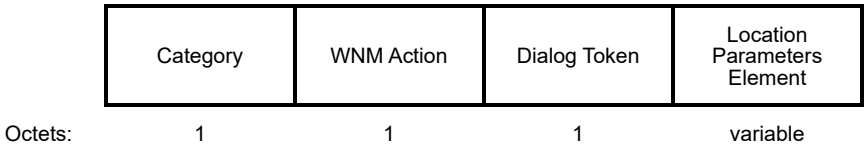

Figure 9-1273—Location Configuration Response frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is the nonzero value received in the Location Configuration Request frame to identify the request/response transaction.

The Location Parameters Element field contains the location parameters subelements, described in 9.4.2.69. Table 9-538 defines the allowed Location Parameters subelements for a Location Parameters element that is included in the Location Configuration Response frame.

9.6.13.8 BSS Transition Management Query frame format

The BSS Transition Management Query frame is transmitted to request or provide information on BSS transition candidate APs. The format of the BSS Transition Management Query frame Action field is shown in Figure 9-1274.

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is a nonzero value chosen by the STA sending the BSS Transition Management Query frame to identify the query/request/response transaction.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-538—Location Parameters Element field for Location Configuration Response frame

Allowed subelements	Subelement ID	Notes
Location Indication Parameters	1	The Location Indication Parameters subelement is optionally included in the Location Configuration Response frame.
Location Indication Channels	2	The Location Indication Channels subelement is optionally included in the Location Configuration Response frame.
Location Indication Broadcast Data Rate	6	The Location Indication Broadcast Data Rate subelement is optionally included in the Location Configuration Response frame.
Location Indication Options	8	The Location Indication Options subelement is optionally included in the Location Configuration Response frame.
Location Status	3	The Location Status subelement is included in the Location Configuration Response frame. If all configuration of the subelements contained in a Location Configuration Request frame was successful, then a single Location Status subelement is included in the Location Configuration Response frame. For each subelement contained in the Location Configuration Request frame that is not successful a Location Status subelement is included in the Location Configuration Response frame that indicates the subelement ID and the unsuccessful status code for that subelement ID.
Vendor Specific Information	221	Zero or more Vendor Specific subelements are included in the Location Configuration Response frame.

Figure 9-1274—BSS Transition Management Query frame Action field format

The BSS Transition Query Reason field contains the reason code for a BSS transition management query as defined in Table 9-238.

The BSS Transition Candidate List Entries field contains zero or more Neighbor Report elements, as described in 9.4.2.35. The Neighbor Report elements are collected by the STA as part of its scanning procedures and provided to the AP as described in 11.21.7.2. The length of the BSS Transition Candidate List Entries field in a BSS Transition Management Query frame is limited by the maximum MMPDU size (see 9.3.3.1).

9.6.13.9 BSS Transition Management Request frame format

The BSS Transition Management Request frame is transmitted by an AP in response to a BSS Transition Management Query frame, or autonomously. The format of the BSS Transition Management Request frame Action field is shown in Figure 9-1275.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

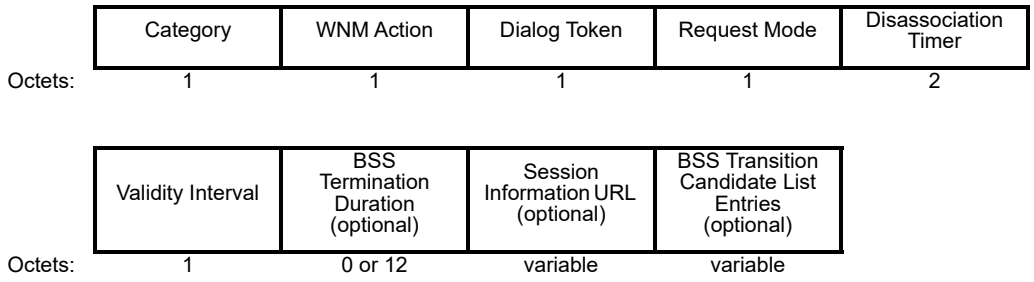

Figure 9-1275—BSS Transition Management Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is the nonzero value received in the BSS Transition Management Query frame if the BSS Transition Management Request frame is being transmitted in response to a BSS Transition Management Query frame. If the BSS Transition Management Request frame is being transmitted other than in response to a BSS Transition Management Query frame, then the Dialog Token field is a nonzero value chosen by the AP sending the BSS Transition Management Request frame to identify the request/response transaction.

The Request Mode field is defined in Figure 9-1276.

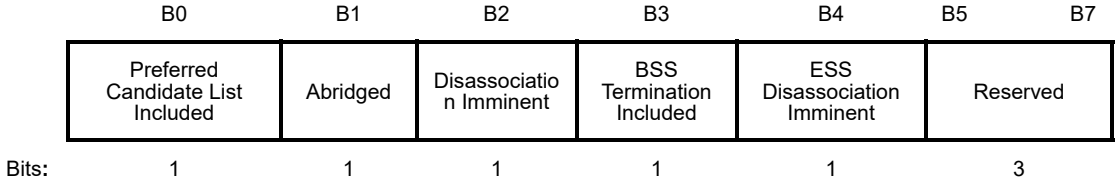

Figure 9-1276—Request Mode field format

— The Preferred Candidate List Included (bit 0) field indicates whether the BSS transition candidate list included in this frame is a preferred candidate list or a list of known BSS transition candidates. The Preferred Candidate List Included bit set to 0 indicates that the receiving STA can ignore the BSS Transition Candidate List Entries field (see 11.21.7.3). The Preferred Candidate List Included bit set to 1 indicates that the sender expects the receiving STA to process this frame.

— The Abridged (bit 1) field indicates to the recipient of the frame the intended treatment of all BSSIDs not listed in the BSS Transition Candidate List Entries field. The AP sets the Abridged bit in the Request Mode field to 1 when a preference value of 0 is assigned to all BSSIDs that do NOT appear in the BSS Transition Candidate List. The AP sets the Abridged bit in the Request Mode field to 0 when the AP has no recommendation for or against any BSSID not present in the BSS Transition Candidate List Entries field.

— The Disassociation Imminent (bit 2) field indicates whether the STA will be disassociated from the current AP. The value 1 in the Disassociation Imminent bit in the Request Mode field indicates that the STA is to be disassociated from the current AP, while the value 0 indicates that disassociation from the AP is not imminent.

— The BSS Termination Included (bit 3) field indicates that the BSS Termination Duration field is included, the BSS is shutting down and the STA will be disassociated. The AP sets the BSS Termination Included bit in the Request Mode field to 1 to indicate that the BSS is shutting down.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The BSS Termination Included bit is 0 if no BSS Termination Duration information is included in the BSS Transition Management Request frame.

— The ESS Disassociation Imminent (bit 4) field indicates that the Session Information URL field is included, and that the STA will be disassociated from the ESS. The value 1 in the ESS Disassociation Imminent bit in the Request Mode field indicates that the STA is to be disassociated from the ESS, while the value 0 indicates that disassociation from the ESS is not imminent. When the ESS Disassociation Imminent bit value is 1, a Session Information URL field is included in the BSS Transition Management Request frame.

The Disassociation Timer indicates the time after which the AP issues a Disassociation frame to this STA. The Disassociation Timer field contains the number of target beacon transmission times (TBTTs) until the AP sends a Disassociation frame to this STA. Setting the field to 0 indicates that the AP has not determined when it will send a Disassociation frame to this STA. If the Disassociation Imminent field is 0, the Disassociation Timer field is reserved. The format of the Disassociation Timer field is shown in Figure 9-1277.

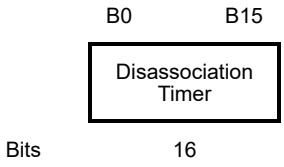

Figure 9-1277—Disassociation Timer field format

The Validity Interval field is the number of target beacon transmission times (TBTTs) until the BSS transition candidate list is no longer valid. A value of 0 is reserved.

The BSS Termination Duration field contains the BSS Termination Duration subelement (see 9.4.2.35) for the current BSS and is present only when the BSS Termination Included field is 1 in the Request Mode field.

The format of the optional Session Information URL field is shown in Figure 9-1278. This field is present when the ESS Disassociation Imminent field is 1.

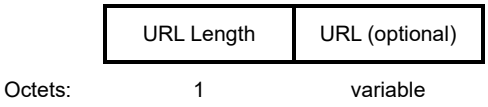

Figure 9-1278—Session Information URL field format

The URL Length field is the length in octets of the URL field. The URL Length field is 0 when the URL field is not present.

The URL field is a variable length field formatted in accordance with IETF RFC 3986.

The BSS Transition Candidate List Entries field contains zero or more Neighbor Report elements described in 9.4.2.35. If the STA has no information in response to the BSS Transition Management Query frame or in an unsolicited BSS Transition Management Request frame, the Neighbor Report elements are omitted and the Preferred Candidate List Included bit is 0. The length of the BSS Transition Candidate List Entries in a BSS Transition Management Request frame is limited by the maximum MMPDU size (see 9.3.3.1).

9.6.13.10 BSS Transition Management Response frame format

The BSS Transition Management Response frame is optionally transmitted by a STA in response to a BSS Transition Management Request frame. The format of the BSS Transition Management Response frame Action field is shown in Figure 9-1279.

	Category	WNM Action	Dialog Token	BTM Status Code	BSS Termination Delay	Target BSSID (Optional)	BSS Transition Candidate List Entries (Optional)
Octets:	1	1	1	1	1	0 or 6	variable

Figure 9-1279—BSS Transition Management Response frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is the value in the corresponding BSS Transition Management Request frame. The BSS Transition Management Response frame is transmitted in response to a BSS Transition Management Request frame.

The BTM Status Code field contains the status code in response to a BSS Transition Management Request frame as defined in Table 9-539. If the STA will transition to another BSS, then the status code is 0 (i.e., Accept). If the STA intends to retain the association with the current BSS, the status code is one of the "Reject" status codes.

Table 9-539—BTM status code definitions

Status code	Status code description
0	Accept
1	Reject—Unspecified reject reason.
2	Reject—Insufficient Beacon or Probe Response frames received from all candidates.
3	Reject—Insufficient available capacity from all candidates.
4	Reject—BSS termination undesired.
5	Reject—BSS termination delay requested.
6	Reject—STA BSS Transition Candidate List provided.
7	Reject—No suitable BSS transition candidates.
8	Reject—Leaving ESS.
9–255	Reserved

The BSS Termination Delay field is the number of minutes that the responding STA requests the BSS to delay termination. This field is reserved if the BTM Status Code field is not 5.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Target BSSID field is the BSSID of the BSS that the non-AP STA transitions to. This field is present if the BTM Status Code field is 0, and not present otherwise.

The BSS Transition Candidate List Entries field contains zero or more Neighbor Report elements described in 9.4.2.35. The Neighbor Report elements are collected by the STA as part of its scanning procedures and provided to the AP as described in 11.21.7.4. The length of the BSS Transition Candidate List Entries field in a BSS Transition Management Response frame is limited by the maximum MMPDU size (see 9.3.3.1).

9.6.13.11 FMS Request frame format

The FMS Request frame is sent by a non-AP STA to the AP to request the specified FMS and to propose delivery intervals for a set of group addressed streams. The FMS Request frame is also sent by a non-AP STA to request a modification to an existing FMS. The format of the Action field of the FMS Request frame is shown in Figure 9-1280.

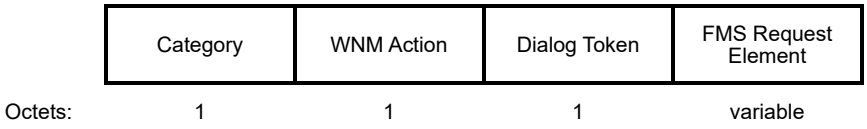

Figure 9-1280—FMS Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is a nonzero value that is unique among the FMS Request frame sent to each destination MAC address for which a corresponding FMS Report frame has not been received.

The FMS Request Element field indicates the group addressed traffic streams that are requested by the non-AP STA. The FMS Request Element field contains one FMS Request element described in 9.4.2.74.

9.6.13.12 FMS Response frame format

The FMS Response frame is sent by an AP in response to an FMS Request frame, or sent by the AP to the STA to instruct the non-AP STA to change the delivery interval or data rate. The format of the Action field of the FMS Response frame is shown in Figure 9-1281.

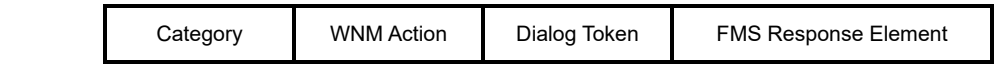

Figure 9-1281—FMS Response frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is the nonzero value received in the FMS Request frame to identify the request/response transaction. If an FMS Response frame is being transmitted other than in response to an FMS Request frame, then the Dialog Token field is 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The FMS Response Element indicates the group addressed traffic streams that the AP supports and the corresponding delivery intervals. The FMS Response Element field contains one FMS Response elements, described in 9.4.2.75.

9.6.13.13 Colocated Interference Request frame format

The Colocated Interference Request frame is transmitted to request colocated interference reports, sent using Colocated Interference Report frames. The format of the Colocated Interference Request frame Action field is shown in Figure 9-1282.

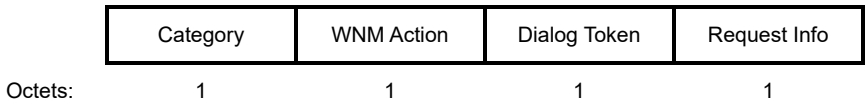

Figure 9-1282—Colocated Interference Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is any nonzero value to identify the request/response transaction.

The Request Info field is shown in Figure 9-1283.

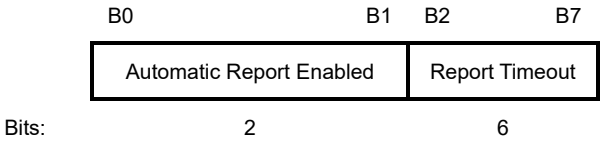

Figure 9-1283—Request Info field format

The Automatic Report Enabled subfield contains an unsigned integer value.

The Automatic Report Enabled subfield set to 0 indicates that the requesting STA cancels the previous requests so that the receiving STA stops sending colocated interference reports.

The Automatic Report Enabled subfield set to 1 indicates that the requesting STA requests the receiving STA to send a colocated interference report when the STA knows of a change in the colocated interference, subject to meeting the Report Timeout requirement.

The Automatic Report Enabled subfield set to 2 indicates that the requesting STA requests the receiving STA to send a colocated interference report periodically using the period included in the Report Period field in the Colocated Interference Report element; see 9.4.2.83.

The Automatic Report Enabled subfield set to 3 indicates that the requesting STA requests the receiving STA to send colocated interference reports periodically using the period included in the Report Period field in the Colocated Interference Report element; see 9.4.2.83, or send a colocated interference report when the STA knows of a change in the colocated interference, subject to meeting the Report Timeout requirement.

The Report Timeout field contains a value in units of 200 TUs and indicates the minimum duration between two consecutive Colocated Interference Report frames from the reporting STA. When the Automatic Report Enabled subfield is 0, the Report Timeout field is reserved.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.13.14 Colocated Interference Report frame format

The Colocated Interference Report frame is transmitted in response to a Colocated Interference Request frame. The format of the Colocated Interference Report frame Action field is shown in Figure 9-1284.

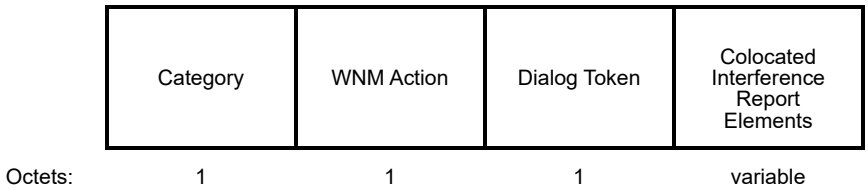

Figure 9-1284—Colocated Interference Report frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is the nonzero value received in the corresponding Colocated Interference Request frame to identify the request/response transaction.

The Colocated Interference Report Elements field contains one or more Colocated Interference Report elements to indicate the characteristics of the reported colocated interferences, as defined in 9.4.2.83.

9.6.13.15 TFS Request frame format

The TFS Request frame is sent by a non-AP STA to the AP to request the specified traffic filtering. The format of the TFS Request frame Action field is defined in Figure 9-1285.

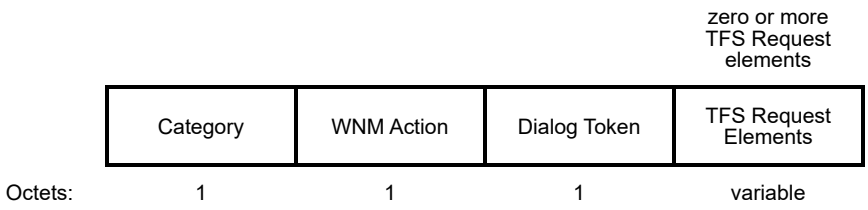

Figure 9-1285—TFS Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is a value chosen by the STA sending the TFS Request frame to identify the request/response transaction.

The TFS Request Elements field contains one or more TFS Request elements to specify one or more traffic filter sets that are requested by the non-AP STA, as defined in 9.4.2.78, or zero TFS Request elements to cancel all of the existing traffic filter sets (see 11.21.12.2).

9.6.13.16 TFS Response frame format

The TFS Response frame is sent by an AP in response to a TFS Request frame. The format of the TFS Response frame Action field is defined in Figure 9-1286.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

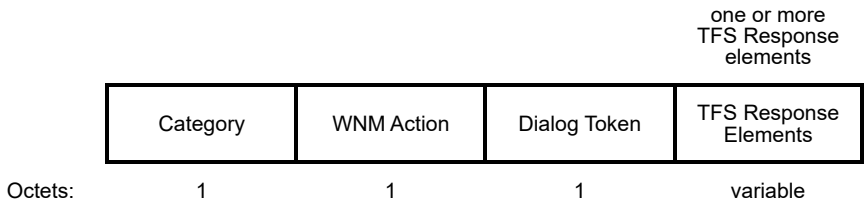

Figure 9-1286—TFS Response frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is the value in the corresponding TFS Request frame.

The TFS Response Elements field contains one or more TFS Response elements to indicate the status of the filtering parameters that the AP is requested to support, as defined in 9.4.2.79. The number of TFS Response elements in a TFS Response frame is the same as the number of the TFS Request elements in the TFS Request frame with the same dialog token, where the TFS Response elements appear in the same order as the corresponding TFS Request elements in the TFS Request frame with the same dialog token.

9.6.13.17 TFS Notify frame format

The TFS Notify frame is sent by an AP to a STA when a frame matching a traffic filter is encountered. The format of the TFS Notify frame Action field is defined in Figure 9-1287.

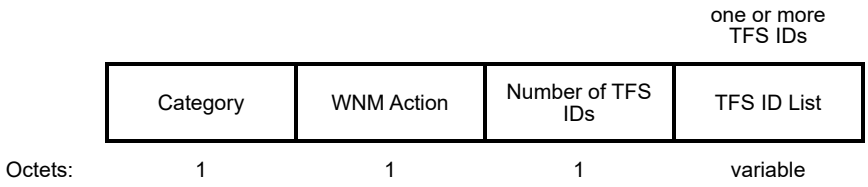

Figure 9-1287—TFS Notify frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Number of TFS IDs field indicates the number of 1-octet TFS IDs present in the TFS ID List field.

The TFS ID field indicates the traffic filter set containing the matched TCLAS element.

9.6.13.18 TFS Notify Response frame format

A TFS Notify Response frame is transmitted by a non-AP STA to an AP to request the AP to resume generation of the TFS Notify frame when a frame matches any traffic filter set identified by the TFS ID(s) included in the TFS Notify Response frame. The format of the TFS Notify Response frame Action field is shown in Figure 9-1288.

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

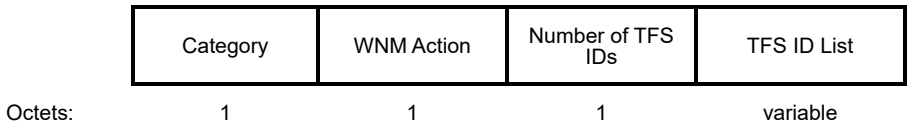

Figure 9-1288—TFS Notify Response frame Action field format

The Number of TFS IDs field indicates the number of 1-octet TFS IDs present in the TFS ID List field.

The TFS ID List field indicates the identifiers of the traffic filter sets.

9.6.13.19 WNM Sleep Mode Request frame format

The WNM Sleep Mode Request frame is sent by a non-AP STA to the AP to enter the WNM sleep mode. The format of the WNM Sleep Mode Request frame Action field is defined in Figure 9-1289.

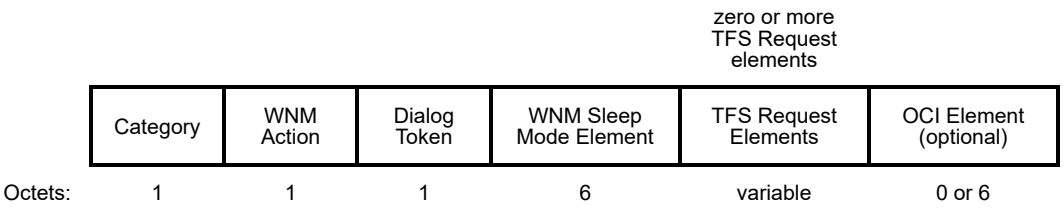

Figure 9-1289—WNM Sleep Mode Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is a nonzero value chosen by the non-AP STA sending the WNM Sleep Mode Request frame to identify the request/response transaction.

The WNM Sleep Mode Element field contains a WNM Sleep Mode element that is requested by a non-AP STA, as described in 9.4.2.80.

The TFS Request Elements field contains zero or more TFS Request elements to specify the traffic filters that are requested by a non-AP STA, as defined in 9.4.2.78.

The OCI Element field is optionally present, and contains an OCI element as defined in 9.4.2.235.

9.6.13.20 WNM Sleep Mode Response frame format

The WNM Sleep Mode Response frame is sent by an AP in response to a WNM Sleep Mode Request frame or is sent without solicitation by an AP to a non-AP STA upon the AP's deletion of all traffic filter sets established according to the traffic filtering agreement between the AP and the non-AP STA. The format of the WNM Sleep Mode Response frame Action field is defined in Figure 9-1290.

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. When the WNM Sleep Mode Response frame is transmitted as a response to a WNM Sleep Mode Request frame, the Dialog Token field is the value in the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

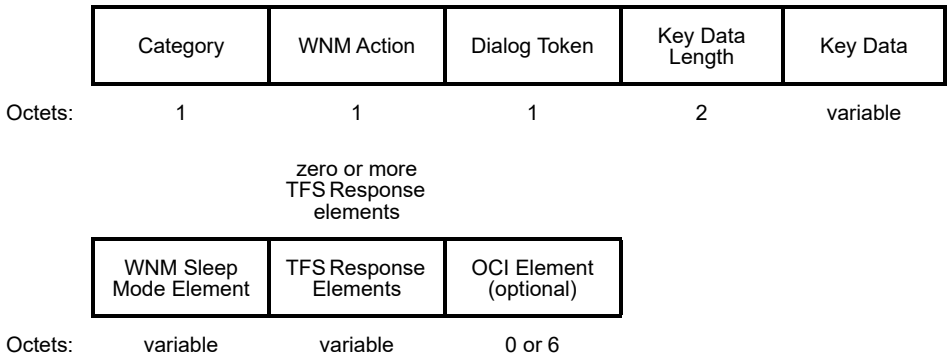

Figure 9-1290—WNM Sleep Mode Response frame Action field format

corresponding WNM Sleep Mode Request frame. When the WNM Sleep Mode Response frame is transmitted as an unsolicited response, the Dialog Token field is set to 0.

The Key Data Length field is the length in octets of the Key Data field. If management frame protection was not negotiated for the current association, this field is 0.

The Key Data field contains zero or more subelements that provide the current GTK, IGTK and BIGTK to the STA. The format of these subelements is shown in Figure 9-1291, Figure 9-1292, and Figure 9-1293. The subelement IDs for these subelements are defined in Table 9-540. When management frame protection was not negotiated for the current association, the Key Data field is not present.

Table 9-540—Optional subelement IDs for WNM Sleep Mode parameters

Value	Contents of subelement
0	GTK
1	IGTK
2	BIGTK
3–255	Reserved

The GTK subelement contains the GTK as shown in Figure 9-1291.

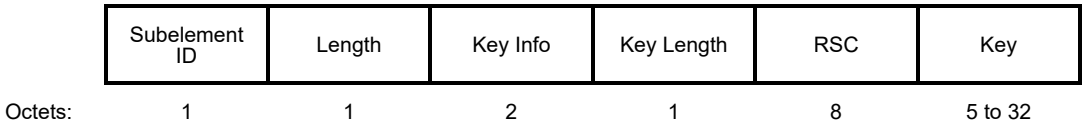

Figure 9-1291—WNM Sleep Mode GTK subelement format

The Length field is defined in 9.4.3.

The Key Info field is defined in Figure 9-440.

The Key Length field is the length of the Key field in octets.

The RSC field contains the current RSC for the GTK being installed. If the RSC is less than 8 octets in length, it is stored in the first octets and the remaining octets are set to 0. The least significant octet of the RSC is in the first octet of the RSC field. The RSC for TKIP is the TKIP sequence counter (TSC); for CCMP and GCMP it is the packet number (PN); see Table 12-9.

The Key field is the GTK being distributed.

The IGTK subelement contains the IGTK as shown in Figure 9-1292.

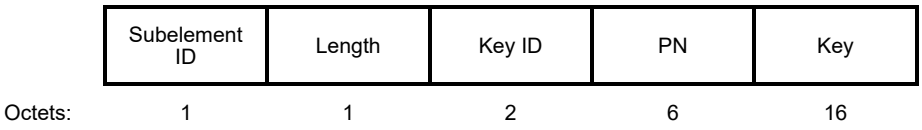

Figure 9-1292—WNM Sleep Mode IGTK subelement format

The Length field is defined in 9.4.3.

The Key ID field contains the IGTK key ID.

The PN field contains the current RSC for the IGTK being installed. The RSC for an IGTK is the IGTK packet number (IPN).

The Key field is the IGTK being distributed.

The BIGTK subelement contains the BIGTK as shown in Figure 9-1293.

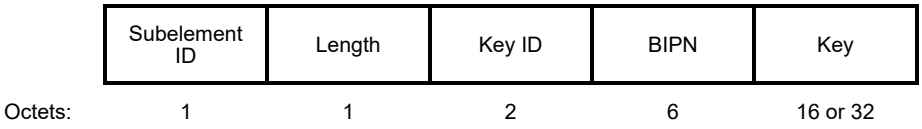

Figure 9-1293—WNM Sleep Mode BIGTK subelement format

The Subelement ID field is defined in 9.6.13.20.

The Length field is defined in 9.4.3.

The Key ID field contains the BIGTK key ID.

The BIPN field contains the current RSC for the BIGTK being installed. The RSC for a BIGTK is the BIGTK packet number (BIPN).

The Key field is the BIGTK being distributed.

NOTE 1—There might be multiple GTK, multiple IGTK, and multiple BIGTK subelements if GTK rekeying is in progress when the non-AP STA wakes up from WNM sleep mode.

NOTE 2—Management frame protection is used to provide confidentiality, replay, and integrity protection for GTK/IGTK/BIGTK update in WNM Sleep Mode Response frames.

The WNM Sleep Mode Element field contains a WNM Sleep Mode element, as described in 9.4.2.80.

The TFS Response Elements field contains zero or more TFS Response elements to specify the traffic filters, as defined in 9.4.2.79.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The OCI Element field is optionally present, and contains an OCI element as defined in 9.4.2.235.

9.6.13.21 TIM Broadcast Request frame format

The format of the TIM Broadcast Request frame Action field is shown in Figure 9-1294.

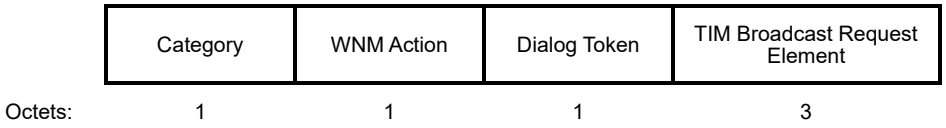

Figure 9-1294—TIM Broadcast Request frame Action fieldformat

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is a nonzero value chosen by the STA sending the TIM Broadcast Request frame to identify the request/response transaction.

The TIM Broadcast Request Element field contains a TIM Broadcast Request Element as specified in 9.4.2.81.

9.6.13.22 TIM Broadcast Response frame format

The format of the TIM Broadcast Response frame Action field is shown in Figure 9-1295.

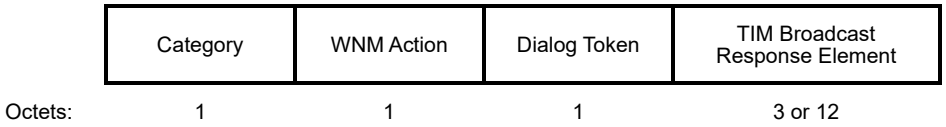

Figure 9-1295—TIM Broadcast Response frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is the nonzero value of the corresponding TIM Broadcast Request frame. If the TIM Broadcast Response frame is being transmitted other than in response to a TIM Broadcast Request frame, then the dialog token is 0.

The TIM Broadcast Response Element field contains a TIM Broadcast Response Element as specified in 9.4.2.82.

9.6.13.23 QoS Traffic Capability Update frame format

The QoS Traffic Capability Update frame is sent by a non-AP STA to the AP to update QoS Traffic Capability information. The format of the Action field of the QoS Traffic Capability Update frame is shown in Figure 9-1296.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

	Category	WNM Action	QoS Traffic Capability Flags
Octets:	1	1	1

Figure 9-1296—QoS Traffic Capability Update frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The QoS Traffic Capability Flags field is defined in Table 9-541. The QoS Traffic Capability Flags field comprises 1 octet, with the bits 4–6 serving as QoS traffic capability flags. Each of the bits 4–6 serves as a flag for one of the three user priorities, UP 4–6. The field is 1 to indicate the expectation of generating traffic belonging to the corresponding user priority (UP). The field is 0 to indicate that such expectation does not exist. The use of the QoS Traffic Capability Update frame is described in 11.21.10.

Table 9-541—Definition of the QoS Traffic Capability Flags field

Bit	Description
0–3	Reserved
4	UP 4 Traffic
5	UP 5 Traffic
6	UP 6 Traffic
7	Reserved

9.6.13.24 Channel Usage Request frame format

The Channel Usage Request frame is sent by a non-AP STA to the AP to request the specified channel usage information. The format of the Channel Usage Request frame Action field is defined in Figure 9-1297.

	Category	WNM Action	Dialog Token	Channel Usage Elements	Supported Operating Classes Element	TWT Elements (optional)	Timeout Interval Element (optional)
Octets:	1	1	1	variable	variable	variable	0 or 7

	HT Capabilities Element (optional)	VHT Capabilities Element (optional)	HE Capabilities Element (optional)	HE 6 GHz Band Capabilities Element (optional)
Octets:	variable	variable	variable	variable

Figure 9-1297—Channel Usage Request frame Action field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is a nonzero value chosen by the non-AP STA sending the Channel Usage Request frame to identify the request/response transaction.

The Channel Usage Elements field includes one or more Channel Usage elements described in 9.4.2.84 to identify the request channel usage. If the Usage Mode field in a Channel Usage element indicates Channel-usage-aidable BSS channel switch request or Capability notification, no other Channel Usage element is included in the Channel Usage Request frame.

The Supported Operating Classes Element field contains a Supported Operating Classes element to indicate the supported operating classes for the requested network type, consistent with the Country element advertised by the AP. The Supported Operating Classes is described in 9.4.2.52. This field is not present if the Usage Mode field in the Channel Usage element is Capability notification.

The TWT Elements field includes zero or more TWT elements each containing only one individual TWT parameter set (see Figure 9-791). When included in a Channel Usage Request frame, the TWT Elements field contains only one TWT element, except if used for the establishment of a peer-to-peer TWT agreement with a range of TWT parameter values (see 10.46.9). In this case, an additional TWT element is present. The subfields of the Individual TWT Parameter Set field are set as described in 11.21.15.

The Timeout Interval Element field is present when the TWT Elements field contains at least one TWT element; if present it contains a TIE. Otherwise, the Timeout Interval Element field is not present in this frame. The subfields of the TIE are set as described in 11.21.15.

The HT Capabilities Element field, if present, contains an HT Capabilities element. It specifies the HT capabilities of the STA in the operating class and channel specified in the Channel Entry field of the Channel Usage element. It is optionally present when the Usage Mode field in the Channel Usage element indicates Channel-usage-aidable BSS channel switch request or Capability notification; not present otherwise.

The VHT Capabilities Element field, if present, contains a VHT Capabilities element. It specifies the VHT capabilities of the STA for the operating class and channel specified in the Channel Entry field of the Channel Usage element. It is optionally present when the Usage Mode field in the Channel Usage element indicates Channel-usage-aidable BSS channel switch request or Capability notification; not present otherwise.

The HE Capabilities Element field, if present, contains an HE Capabilities element. It specifies the HE capabilities of the STA for the operating class and channel specified in the Channel Entry field of the Channel Usage element. It is optionally present when the Usage Mode field in the Channel Usage element indicates Channel-usage-aidable BSS channel switch request or Capability notification; not present otherwise.

The HE 6 GHz Band Capabilities Element field, if present, contains an HE 6 GHz Band Capabilities element. It specifies the HE capabilities of the STA for the operating class and channel in the 6 GHz band that is specified in the Channel Entry field of the Channel Usage element. It is optionally present when the Usage Mode field in the Channel Usage element indicates Channel-usage-aidable BSS channel switch request or Capability notification; not present otherwise.

9.6.13.25 Channel Usage Response frame format

The Channel Usage Response frame is sent by an AP in response to a Channel Usage Request frame, or autonomously. The format of the Channel Usage Response frame Action field is shown in Figure 9-1298.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

	Category	WNM Action	Dialog Token	Channel Usage Elements	Country String	Power Constraint Element (optional)	EDCA Parameter Set Element (optional)	Transmit Power Envelope Element (optional)	TWT Elements (optional)	Timeout Interval Element (optional)
Octets:	1	1	1	variable	3	0 or 3	0 or 20	variable	variable	0 or 7

Figure 9-1298—Channel Usage Response frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is the nonzero value received in the Channel Usage Request frame if the Channel Usage Response frame is being transmitted in response to a Channel Usage Request frame. The Dialog Token field is 0 if the Channel Usage Response frame is being transmitted other than in response to a Channel Usage Request frame.

The Channel Usage Element field includes zero or more Channel Usage elements described in 9.4.2.84.

The Country String field is the value contained in the dot11CountryString attribute.

The Power Constraint Element field includes zero or one Power Constraint elements described in 9.4.2.12. The use of the Power Constraint element included in the Power Constraint Element field is described in 11.21.15.

The EDCA Parameter Set Element field includes zero or one EDCA Parameter Set elements described in 9.4.2.27. The use of the EDCA Parameter Set element included in the EDCA Parameter Set Element field is described in 11.21.15.

The Transmit Power Envelope Element field includes zero or one Transmit Power Envelope element described in 9.4.2.160. The use of the Transmit Power Envelope element included in the Transmit Power Envelope Element field is described in 11.21.15.

The TWT Elements field includes zero or more TWT elements each containing only one individual TWT parameter set (see Figure 9-791). When included in a Channel Usage Request frame, the TWT Elements field contains only one TWT element, except if used for the establishment of a peer-to-peer TWT agreement with a range of TWT parameter values (see 10.46.9). In this case, an additional TWT element is present. The subfields of the Individual TWT Parameter Set field are set as described in 11.21.15.

The Timeout Interval Element field is present when the TWT Elements field contains at least one TWT element; if present it contains a TIE. Otherwise, the Timeout Interval Element field is not present in this frame. The subfields of the TIE are set as described in 11.21.15.

9.6.13.26 DMS Request frame format

The DMS Request frame is sent by a non-AP STA to the AP to define information about a DMS request to the AP. The format of the DMS Request frame Action field is defined in Figure 9-1299.

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

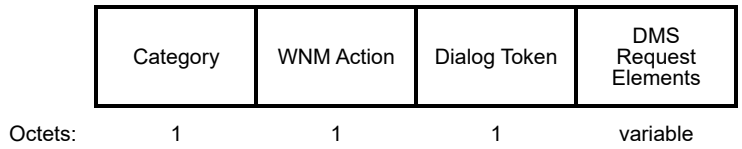

Figure 9-1299—DMS Request frame Action field format

The Dialog Token field is defined in 9.4.1.12. It is a nonzero value chosen by the non-AP STA sending the DMS Request frame to identify the request/response transaction.

The DMS Request Elements field contains one or more DMS Request elements as specified in 9.4.2.86.

9.6.13.27 DMS Response frame format

The DMS Response frame is sent by an AP or a mesh STA in response to a DMS Request frame, or autonomously to terminate a requested DMS stream, or to advertise the current parameters for one or more GCR streams. The format of the DMS Response frame Action field is shown in Figure 9-1300.

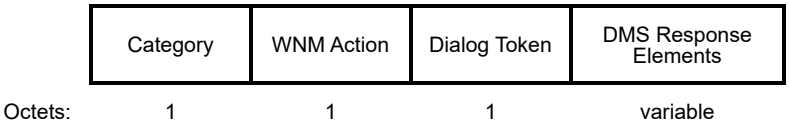

Figure 9-1300—DMS Response frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is the nonzero value received in the DMS Request frame if the DMS Response frame is being transmitted in response to a DMS Request frame. The Dialog Token field is 0 if the DMS Response frame is being transmitted autonomously, and not in response to a DMS Request frame.

The DMS Response Elements field contains one or more DMS Response elements as specified in 9.4.2.87.

9.6.13.28 Timing Measurement Request frame format

The format of the Timing Measurement Request frame Action field is shown in Figure 9-1301.

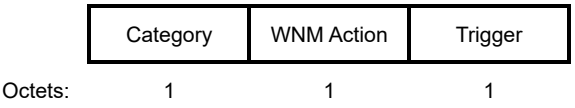

Figure 9-1301—Timing Measurement Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Trigger field set to the value 1 indicates that the sending STA requests a timing measurement procedure at the receiving STA as defined in 11.21.5. The Trigger field set to the value 0 indicates that the sending

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

STA requests that the receiving STA stop sending Timing Measurement frames. Trigger field values 2–255 are reserved.

9.6.13.29 WNM Notification Request frame format

The format of the WNM Notification Request frame Action field is shown in Figure 9-1302.

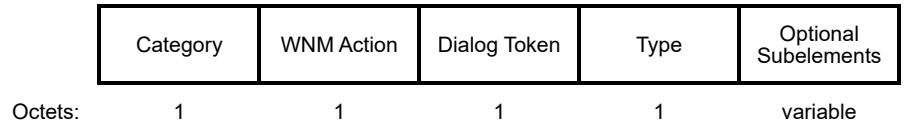

Figure 9-1302—WNM Notification Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is set to a nonzero value chosen by the STA sending the WNM notification request to identify the request/response transaction.

The Type field indicates the type of WNM notification, as defined in Table 9-542.

Table 9-542—WNM notification type

Value	Description
0	Firmware Update Notification
1	Reserved
2	Beacon Protection Failure
3–220	Reserved
221	Vendor Specific
222–255	Reserved

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-543.

When the Type field is 0, the AP Descriptor, Firmware Version—Current, and Firmware Version—New optional subelements are included in the WNM Notification Request frame. The AP descriptor field format is defined in Figure 9-498. The Firmware Version—Current subelement contains the current firmware version, in the Firmware Version subelement format defined in Figure 9-504. The Firmware Version—New subelement contains the new firmware version, in the Firmware Version subelement format defined in Figure 9-504 (Firmware Version subelement format).

When the Type field is 2, the AP Descriptor, Firmware Version—Current, and Firmware Version—New optional subelements are not included in the WNM Notification Request frame.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-543—Optional subelement IDs for WNM Notification Request

Subelement ID	Name	Extensible
0	AP Descriptor	No
1	Firmware Version—Current	No
2	Firmware Version—New	No
3–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

9.6.13.30 WNM Notification Response frame format

The format of the WNM Notification Response frame Action field is shown in Figure 9-1303.

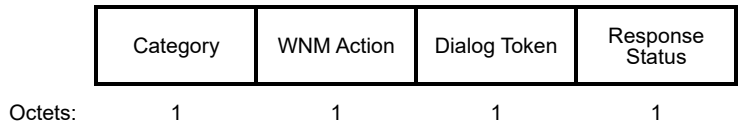

Figure 9-1303—WNM Notification Response frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is defined in 9.4.1.12. It is set to the nonzero value of the corresponding WNM Notification Request frame.

The Response Status field indicates the Response Status value, as defined in Table 9-544.

Table 9-544—WNM Notification Response Status

Value	Description
0	Notification Acknowledged
1–255	Reserved

9.6.14 Unprotected WNM Action frame details

9.6.14.1 Unprotected WNM Action field

Unprotected WNM Action frames are not encapsulated using mechanisms defined for robust Management frames. An Unprotected WNM Action field, in the field immediately after the Category field, differentiates the formats. The Unprotected WNM Action field values associated with each frame format is defined in Table 9-545.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-545—Unprotected WNM Action field values

Action field value	Description
0	TIM
1	Timing Measurement
2–255	Reserved

9.6.14.2 TIM frame format

The format of the TIM frame Action field is shown in Figure 9-1304.

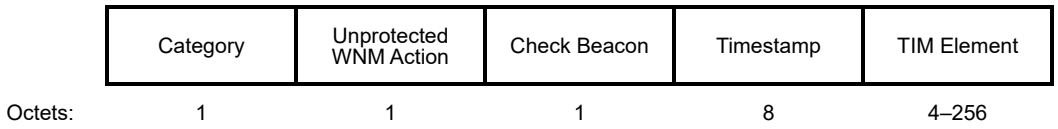

Figure 9-1304—TIM frame Action field format

The Category field is defined in 9.4.1.11.

The Unprotected WNM Action field is defined in 9.6.14.1.

The Check Beacon field is defined as an unsigned integer initialized to 0, that increments when a critical update to the Beacon frame has occurred; see 11.2.3.14.

The Timestamp field is defined in 9.4.1.10. The field contains a TSF timestamp when the TIM Broadcast Response frame contained a Status field set to “Accept, timestamp present in TIM frames” or “Overridden, timestamp present in TIM frames.” The field is reserved otherwise.

The TIM Element field contains a TIM element as specified in 9.4.2.5. The bit corresponding to buffered group addressed frames is reserved for all BSSIDs.

9.6.14.3 Timing Measurement frame format

The Timing Measurement frame is used to support the timing measurement procedure described in 11.21.5. The format of the Timing Measurement frame Action field is shown in Figure 9-1305.

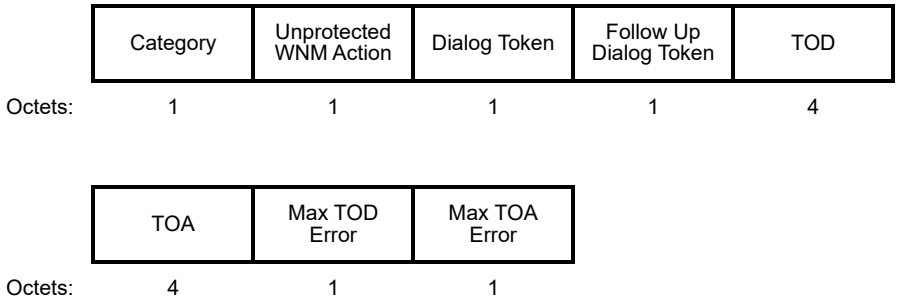

Figure 9-1305—Timing Measurement frame Action field format

The Category field is defined in 9.4.1.11.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Unprotected WNM Action field is defined in 9.6.14.1.

The Dialog Token field is defined in 9.4.1.12. It is a nonzero value chosen by the sending STA to identify the Timing Measurement frame as the first of a pair, with the second or followup Timing Measurement frame to be sent later. The Dialog Token field is set to 0 to indicate that the Timing Measurement frame will not be followed by a subsequent followup Timing Measurement frame.

The Follow Up Dialog Token field is the nonzero value of the Dialog Token field of the previously transmitted Timing Measurement frame to indicate that it is the follow up Timing Measurement frame and that the TOD, TOA, Max TOD Error and Max TOA Error fields contain the values of the timestamps captured with the first Timing Measurement frame of the pair. The Follow Up Dialog Token field is 0 to indicate that the Timing Measurement frame is not a follow up to a previously transmitted Timing Measurement frame. The value 0 in this field also indicates that the TOD, TOA, Max TOD Error, and Max TOA Error fields are reserved. See 11.21.5.

The TOD, TOA, Max TOD Error, and Max TOA Error fields are expressed in units of 10 ns.

The TOD field contains a timestamp that represents the time at which the start of the preamble of the previously transmitted Timing Measurement frame appeared at the transmit antenna connector.

The TOA field contains a timestamp that represents the time at which the start of the preamble of the Ack frame to the previously transmitted Timing Measurement frame arrived at the receive antenna connector.

NOTE—The values specified in the TOD and TOA fields are described in MLME-TIMINGMSMT.request MLME-TIMINGMSMT.confirm and MLME-TIMINGMSMT.indication primitives.

The Max TOD Error field contains an upper bound for the error in the value specified in the TOD field. For instance, a 2 in the Max TOD Error field indicates that the TOD field has a maximum error of ± 20 ns.

The Max TOA Error field contains an upper bound for the error in the value specified in the TOA field. For instance, a 2 in the Max TOA Error field indicates that the TOA field has a maximum error of ± 20 ns.

Setting the Max TOD Error or the Max TOA Error field to 0 indicates that the upper bound on the error in the corresponding TOD or TOA value is unknown. Setting either field to 255 indicates that the upper bound on the error is greater than or equal to 2.55 μs.

9.6.15 Self-protected Action frame details

9.6.15.1 Self-protected Action field

The Self-protected Action frame is defined to allow robust STA-STA communications of the Action frames that are not robust (see 9.4.1.11). The protocols that use these Action frames are responsible for deciding whether to protect these frames and supporting protection mechanisms for these frames as needed.

Self-protected Action frames have a different nature than Public Action frames and robust Action frames. Robust Action frames assume the existence of a completely established security association. Self-protected Action frames typically exist to manage the creation and deletion of security associations, regardless of whether they are completely established.

Public Action frames are defined as public for all STAs, including those that are not in the BSS and MBSS. Self-protected Action frames, however, are used for relationship creation and maintenance between two specific STAs. Their public nature is incidental.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Mesh Peering Open frame, the Mesh Peering Confirm frame, and the Mesh Peering Close frame are referred to as *mesh peering Management frames*.

A Self-protected Action field, in the field immediately after the Category field, differentiates the formats. The defined Self-protected Action frames are listed in Table 9-546.

Table 9-546—Self-protected Action field values

Self-protected Action field value	Description
0	Reserved
1	Mesh Peering Open
2	Mesh Peering Confirm
3	Mesh Peering Close
4	Mesh Group Key Inform
5	Mesh Group Key Acknowledge
6–255	Reserved

NOTE—A Self-protected Action frame is not necessarily protected. When it is, the MIC element and the Authenticated Mesh Peering Exchange element are present after the Action field (see 9.3.3.13).

9.6.15.2 Mesh Peering Open frame format

9.6.15.2.1 Mesh Peering Open frame self protection

Protection of this frame is provided when authenticated mesh peering exchange (AMPE) is enabled. AMPE provides integrity protection of Mesh Peering Open frames.

When the Mesh Peering Open frame is used by the mesh peering management (MPM) protocol, integrity protection on the frame is not enabled.

9.6.15.2.2 Mesh Peering Open frame details

The Mesh Peering Open frame is used to open a mesh peering using the procedures defined in 14.4.6 and in 14.6.5. It is also used for HCCA TXOP negotiation between APs (see 11.26.3). The format of the Mesh Peering Open frame Action field is shown in Table 9-547.

9.6.15.3 Mesh Peering Confirm frame format

9.6.15.3.1 Mesh Peering Confirm frame self protection

Protection of this frame is provided when authenticated mesh peering exchange (AMPE) is enabled. AMPE provides integrity protection of Mesh Peering Confirm frames.

When the Mesh Peering Confirm frame is used by the mesh peering management (MPM) protocol, integrity protection on the frame is not enabled.

Table 9-547—Mesh Peering Open frame Action field format

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	Self-protected Action	The Self-protected Action field is defined in 9.6.15.1.
3	Capability	The Capability field is defined in 9.4.1.4.
4	Supported Rates and BSS Membership Selectors	The Supported Rates and BSS Membership Selectors element is defined in 9.4.2.3.
5	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if the number of supported rates and BSS membership selectors together exceed eight; it is optional otherwise.
6	Power Capability	The Power Capability element is present if dot11SpectrumManagementRequired is true.
7	Supported Channels	The Supported Channels element is present if dot11SpectrumManagementRequired is true and dot11ExtendedChannelSwitchActivated is false. The Supported Channels element is optionally present, otherwise.
8	RSN	The RSNE is present if dot11MeshSecurityActivated, dot11ProtectedQLoadReportActivated, or dot11ProtectedTXOPNegotiationActivated is true; otherwise not present.
9	Mesh ID	The Mesh ID element is defined in 9.4.2.97 and is present when dot11MeshActivated is true; otherwise it is not present.
10	Mesh Configuration	The Mesh Configuration element is defined in 9.4.2.96 and is present when dot11MeshActivated is true; otherwise it is not present.
11	Mesh Peering Management	The Mesh Peering Management element is defined in 9.4.2.100.
12	ERP Information	The ERP element is present if ERP mesh STA detects non-ERP STAs in its vicinity and is optionally present otherwise.
13	Supported Operating Classes	The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated is true, or for a mesh STA if dot11OperatingClassesImplemented is true and the STA is capable of operation in more than one operating class.
14	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-547—Mesh Peering Open frame Action field format *(continued)*

Order	Information	Notes
15	HT Operation	The HT Operation element is included when dot11HighThroughputOptionImplemented is true.
16	20/40 BSS Coexistence element	The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true.
17	Extended Capabilities element	The Extended Capabilities element is present if any of the fields in this element are nonzero.
18	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true.
19	VHT Capabilities	The VHT Capabilities element is present in the 5 GHz band if dot11VHTOptionImplemented is true.
20	VHT Operation	The VHT Operation element is present when dot11VHTOptionImplemented is true.
21	Operating Mode Notification	The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true.
22	HE Capabilities	The HE Capabilities element is present when dot11HEOptionImplemented is true; otherwise, it is not present.
23	HE Operation	The HE Operation element is present when dot11HEOptionImplemented is true; otherwise, it is not present.
24	OCI	The OCI element is present when dot11RSNAOperatingChannelValidationActivated is true; otherwise, it is not present.

9.6.15.3.2 Mesh Peering Confirm frame details

The Mesh Peering Confirm frame is used to confirm a mesh peering using the procedures defined in 14.4.7 and 14.6.5. It is also used for HCCA TXOP negotiation between APs (see 11.26.3). The format of the Mesh Peering Confirm frame Action field is shown in Table 9-548.

9.6.15.4 Mesh Peering Close frame format

9.6.15.4.1 Mesh Peering Close frame self protection

Protection of this frame is provided when authenticated mesh peering exchange (AMPE) is enabled. AMPE provides integrity protection of Mesh Peering Close frames.

When the Mesh Peering Close frame is used by the mesh peering management (MPM) protocol, integrity protection on the frame is not enabled.

9.6.15.4.2 Mesh Peering Close frame details

The Mesh Peering Close frame is used to close a mesh peering using the procedures defined in 14.4.8 and in 14.6.5. It is also used for HCCA TXOP negotiation between APs (see 11.26.3). The format of the Mesh Peering Close frame Action field is shown in Table 9-549.

1	Category	The Category field is defined in 9.4.1.11.
2	Self-protected Action	The Self-protected Action field is defined in 9.6.15.1.
3	Capability	The Capability field is defined in 9.4.1.4.
4	AID	The AID field is defined in 9.4.1.8.
5	Supported Rates and BSS Membership Selectors	The Supported Rates and BSS Membership Selectors element is defined in 9.4.2.3.
6	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if the number of supported rates and BSS membership selectors together exceed eight; it is optional otherwise.
7	RSN	The RSNE is present when dot11MeshSecurityActivated, dot11ProtectedQLoadReportActivated, or dot11ProtectedTXOPNegotiationActivated is true; otherwise not present.
8	Mesh ID	The Mesh ID element is defined in 9.4.2.97 and is present when dot11MeshActivated is true; otherwise it is not present.
9	Mesh Configuration	The Mesh Configuration element is defined in 9.4.2.96 and is present when dot11MeshActivated is true; otherwise it is not present.
10	Mesh Peering Management	The Mesh Peering Management element is defined in 9.4.2.100.
11	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true.
12	HT Operation	The HT Operation element is included when dot11HighThroughputOptionImplemented is true.
13	20/40 BSS Coexistence element	The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true.
14	Extended Capabilities element	The Extended Capabilities element is present if any of the fields in this element are nonzero.
15	VHT Capabilities	The VHT Capabilities element is present in the 5 GHz band if dot11VHTOptionImplemented is true.
16	VHT Operation	The VHT Operation element is present when dot11VHTOptionImplemented is true.
17	Operating Mode Notification	The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true.
18	HE Capabilities	The HE Capabilities element is present when dot11HEOptionImplemented is true; otherwise, it is not present.
19	HE Operation	The HE Operation element is present when dot11HEOptionImplemented is true; otherwise, it is not present.
20	OCI	The OCI element is present when dot11RSNAOperatingChannelValidationActivated is true; otherwise, it is not present.

Table 9-549—Mesh Peering Close frame Action field format

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	Self-protected Action	The Self-protected Action field is defined in 9.6.15.1.
3	Mesh ID	The Mesh ID element is defined in 9.4.2.97 and is present when dot11MeshActivated is true; otherwise it is not present.
4	Mesh Peering Management	The Mesh Peering Management element is defined in 9.4.2.100.

9.6.15.5 Mesh Group Key Inform frame format

9.6.15.5.1 Mesh Group Key Inform frame self protection

The protection of the frames is provided by the mesh group key handshake protocol (see 14.7) that uses Mesh Group Key Inform frames.

9.6.15.5.2 Mesh Group Key Inform frame details

The Mesh Group Key Inform frame is used to update a mesh GTK (MGTK) with a peer (see 14.7.2). The format of the Mesh Group Key Inform frame Action field is shown in Table 9-550.

Table 9-550—Mesh Group Key Inform frame Action field format

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	Self-protected Action	The Self-protected Action field is defined in 9.6.15.1.

9.6.15.6 Mesh Group Key Acknowledge frame format

9.6.15.6.1 Mesh Group Key Acknowledge frame self protection

The protection of the frames is provided by the mesh group key handshake protocol (see 14.7) that uses Mesh Group Key Acknowledge frames.

9.6.15.6.2 Mesh Group Key Acknowledge frame details

The Mesh Group Key Acknowledge frame is used to acknowledge receipt and processing of a Mesh Group Key Inform frame (see 14.7.2). The format of the Mesh Group Key Acknowledge frame Action field is shown in Table 9-551.

9.6.16 Mesh Action frame details

9.6.16.1 Mesh Action field

Several Mesh Action frame formats are defined for mesh BSS operation. A Mesh Action field, in the field immediately after the Category field, differentiates the formats. The Mesh Action field values associated with each frame format are defined in Table 9-552.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-551—Mesh Group Key Acknowledge frame Action field format

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	Self-protected Action	The Self-protected Action field is defined in 9.6.15.1.

Table 9-552—Mesh Action field values

Mesh Action field value	Description
0	Mesh Link Metric Report
1	HWMP Mesh Path Selection
2	Gate Announcement
3	Congestion Control Notification
4	MCCA Setup Request
5	MCCA Setup Reply
6	MCCA Advertisement Request
7	MCCA Advertisement
8	MCCA Teardown
9	TBTT Adjustment Request
10	TBTT Adjustment Response
11–255	Reserved

9.6.16.2 Mesh Link Metric Report frame format

The Mesh Link Metric Report frame is transmitted by a mesh STA to a neighbor peer mesh STA to report metric information on the link between the two mesh STAs. It is also transmitted by a mesh STA to a neighbor peer mesh STA to request metric information on the link between the two mesh STAs from the recipient. This frame is transmitted using an individually addressed frame. The format of the Mesh Link Metric Report frame Action field is shown in Table 9-553.

Table 9-553—Mesh Link Metric Report frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	Mesh Link Metric Report element	

The Category field is defined in 9.4.1.11.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Mesh Action field is defined in 9.6.16.1.

The Mesh Link Metric Report element is set as described in 9.4.2.98.

9.6.16.3 HWMP Mesh Path Selection frame format

The HWMP Mesh Path Selection frame is transmitted by a mesh STA to establish, update or delete paths to other mesh STAs using the HWMP defined in 14.11. This frame is transmitted in an individually or group addressed frame depending on the contained elements and as defined in 14.11.7. The format of the HWMP Mesh Path Selection frame Action field is shown in Table 9-554.

The HWMP Mesh Path Selection frame contains one or more of the elements indicated in Table 9-554. Usage of the HWMP Mesh Path Selection frame is described in 14.11.7.

Table 9-554—HWMP Mesh Path Selection frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	PREQ element	A PREQ element is optionally present
4	PREP element	A PREP element is optionally present
5	PERR element	A PERR element is optionally present
6	RANN element	A RANN element is optionally present

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

The PREQ element is set as described in 9.4.2.111. It is present in an HWMP Mesh Path Selection frame as described in 14.11.9.

The PREP element is set as described in 9.4.2.112.

The PERR element is set as described in 9.4.2.113.

The RANN element is set as described in 9.4.2.110.

9.6.16.4 Gate Announcement frame format

The Gate Announcement frame is transmitted by a mesh gate to announce its presence in the MBSS. This frame is transmitted using group addresses. The format of the Gate Announcement frame Action field is shown in Table 9-555.

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

The GANN element is set as described in 9.4.2.109.

3	GANN element	

9.6.16.5 Congestion Control Notification frame format

A mesh STA uses the Congestion Control Notification frame to indicate its congestion status to its neighbor peer mesh STA(s). This frame is transmitted using individual addresses or group addresses. The format of the Congestion Control Notification frame Action field is shown in Table 9-556.

Table 9-556—Congestion Control Notification frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	Congestion Notification element	One or more Congestion Notification elements (9.4.2.99) are present. Repeated *N* times (*N* is the number of Congestion Notification elements contained in the frame).

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

The Congestion Notification element is set as described in 9.4.2.99.

9.6.16.6 MCCA Setup Request frame format

The MCCA Setup Request frame is used to set up an MCCAOP reservation. A mesh STA (with dot11MCCAActivated equal to true) transmits the MCCA Setup Request frame to one or more neighbor mesh STAs (with dot11MCCAActivated equal to true too). This frame is transmitted using individual addresses or group addresses. The format of the MCCA Setup Request frame Action field is shown in Table 9-557.

Table 9-557—MCCA Setup Request frame Action field format

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

The MCCAOP Setup Request element is described in 9.4.2.104.

9.6.16.7 MCCA Setup Reply frame format

The MCCA Setup Reply frame is used to reply to an MCCA Setup Request frame. It is transmitted by a mesh STA with dot11MCCAActivated equal to true to a neighbor peer mesh STA with dot11MCCAActivated equal to true. This frame is transmitted using individual addresses. The format of the MCCA Setup Reply frame Action field is shown in Table 9-558.

Table 9-558—MCCA Setup Reply frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	MCCAOP Setup Reply element	

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

The MCCAOP Setup Reply element is described in 9.4.2.105.

9.6.16.8 MCCA Advertisement Request frame format

The MCCA Advertisement Request frame is transmitted by a mesh STA with dot11MCCAActivated equal to true to a neighbor peer mesh STA with dot11MCCAActivated equal to true in order to request MCCAOP advertisements from the neighbor peer mesh STA. This frame is transmitted using individual addresses. The format of the MCCA Advertisement Request frame Action field is shown in Table 9-559.

Table 9-559—MCCA Advertisement Request frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	MCCAOP Advertisement Overview element	An MCCAOP Advertisement Overview element is optionally present.

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The MCCAOP Advertisement Overview element is described in 9.4.2.106.

9.6.16.9 MCCA Advertisement frame format

The MCCA Advertisement frame is transmitted by a mesh STA with dot11MCCAActivated equal to true to one or more neighbor peer mesh STAs with dot11MCCAActivated equal to true. This frame is transmitted using group addresses or individual addresses. The format of the MCCA Advertisement frame Action field is shown in Table 9-560.

Table 9-560—MCCA Advertisement frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	MCCAOP Advertisement Overview element	An MCCAOP Advertisement Overview element is optionally present.
4	MCCAOP Advertisement elements	If an MCCAOP Advertisement Overview element is present, zero or more MCCAOP Advertisement elements are present. If an MCCAOP Advertisement Overview element is not present, one or more MCCAOP Advertisement elements are present.

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

The MCCAOP Advertisement Overview element is described in 9.4.2.106.

The MCCAOP Advertisement element is described in 9.4.2.107.

9.6.16.10 MCCA Teardown frame format

The MCCA Teardown frame is transmitted by a mesh STA with dot11MCCAActivated equal to true to one or more neighbor peer mesh STAs with dot11MCCAActivated equal to true. This frame is transmitted using group addresses or individual addresses. The format of the MCCA Teardown frame Action field is shown in Table 9-561.

Table 9-561—MCCA Teardown frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	MCCAOP Teardown element	

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The MCCAOP Teardown element is described in 9.4.2.108.

9.6.16.11 TBTT Adjustment Request frame format

The TBTT Adjustment Request frame is used to request a particular neighbor peer mesh STA to adjust its TBTT. This frame is transmitted using individual addresses. The format of the TBTT Adjustment Request frame Action field is shown in Table 9-562.

Table 9-562—TBTT Adjustment Request frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	Beacon Timing element	Repeated *N_Info* times (*N_Info* is a number of beacon timing information tuples as described in 14.14.4.2.5).

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

The Beacon Timing element is set as described in 9.4.2.103. When not all beacon timing information is included in a Beacon Timing element due to the maximum element size limit, multiple Beacon Timing elements are present. The elements are present in the order of Beacon Timing Element Number field value in the Report Control field of the Beacon Timing element.

9.6.16.12 TBTT Adjustment Response frame format

The TBTT Adjustment Response frame is used to respond to a TBTT adjustment request. This frame is transmitted using individual addresses. The format of the TBTT Adjustment Response frame Action field is shown in Table 9-563.

Table 9-563—TBTT Adjustment Response frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	Status Code	
4	Beacon Timing element (optional)	Repeated *N_Info* times (*N_Info* is a number of beacon timing information tuples as described in 14.14.4.2.5).

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

The Status Code field is set as described in 14.14.4.4.2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Beacon Timing element is set as defined in 9.4.2.103. It is present only if the status code is set to CANNOT_FIND_ALTERNATIVE_TBTT (i.e., when the request is not successful due to the neighbor constraint). When not all beacon timing information is included in a Beacon Timing element due to the maximum element size limit, multiple Beacon Timing elements are present. The elements are present in the order of Beacon Timing Element Number field value in the Report Control field of the Beacon Timing element.

9.6.17 Multihop Action frame details

9.6.17.1 Multihop Action field

Several Multihop Action frame formats are defined for mesh BSS operation. A Multihop Action field, in the field immediately after the Category field, differentiates the formats. The Multihop Action field values associated with each frame format are defined in Table 9-564. The Mesh Control field is present immediately after the Multihop Action field in all Multihop Action frames.

Table 9-564—Multihop Action field values

Multihop Action field value	Description
0	Proxy Update
1	Proxy Update Confirmation
2–255	Reserved

9.6.17.2 Proxy Update frame format

The Proxy Update frame is used to inform the recipient about new, updated, or deleted proxy information. This frame is transmitted using individual addresses. The format of the Proxy Update frame Action field is shown in Table 9-565.

Table 9-565—Proxy Update frame Action field format

Order	Information	Notes
1	Category	
2	Multihop Action	
3	Mesh Control	
4	PXU element	Repeated *N* times (*N* is the number of PXU elements contained in the frame).

The Category field is defined in 9.4.1.11.

The Multihop Action field is defined in 9.6.17.1.

The Mesh Control field is set as defined in 9.2.4.8.3.

The PXU element is described in 9.4.2.114. The Proxy Update frame allows the inclusion of multiple PXU elements.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.17.3 Proxy Update Confirmation frame format

The Proxy Update Confirmation frame is transmitted by a mesh STA in response to a Proxy Update frame. This frame is used to inform that the corresponding PXU element has been properly received and is transmitted using individual addresses. The format of the Proxy Update Confirmation frame Action field is shown in Table 9-566.

Table 9-566—Proxy Update Confirmation frame Action field format

Order	Information	Notes
1	Category	
2	Multihop Action	
3	Mesh Control	
4	PXUC element	Repeated *N* times (*N* is the number of PXUC elements contained in the frame).

The Category field is defined in 9.4.1.11.

The Multihop Action field is defined in 9.6.17.1.

The Mesh Control field is set as defined in 9.2.4.8.3.

The PXUC element is described in 9.4.2.115. The Proxy Update Confirmation frame allows the inclusion of one or more PXUC elements.

9.6.18 Robust AV Streaming Action frame details

9.6.18.1 Robust AV Streaming Action field

Several Action frame formats are defined to support robust AV streaming. The Robust Action field values associated with each frame format within the robust AV streaming category are defined in Table 9-567. The frame formats are defined in 9.6.18.2 to 9.6.18.7.

Table 9-567—Robust AV streaming Robust Action field values

Robust Action field value	Meaning
0	SCS Request
1	SCS Response
2	Group Membership Request
3	Group Membership Response
4	MSCS Request
5	MSCS Response
6–255	Reserved

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.18.2 SCS Request frame format

SCS Request frames are used to request the creation, modification, or deletion of a stream classification using the procedures defined in 11.25.2.

The Action field of the SCS Request frame contains the information shown in Figure 9-1306.

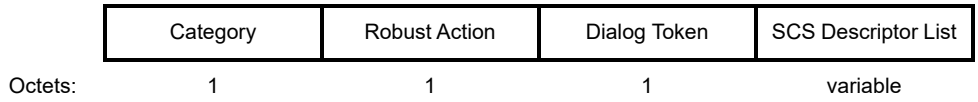

Figure 9-1306—SCS Request frame Action field format

The Category field is defined in 9.4.1.11.

The Robust Action field is defined in 9.6.18.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA to a nonzero value that is used for matching action responses with action requests. See 10.28.5.

The SCS Descriptor List field contains one or more SCS Descriptor elements, as defined in 9.4.2.120.

9.6.18.3 SCS Response frame format

The SCS Response frame is sent in response to an SCS Request frame using the procedures defined in 11.25.2. The Action field of an SCS Response frame contains the information shown in Figure 9-1307.

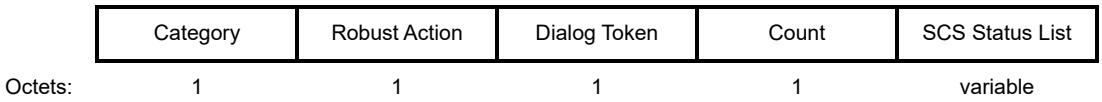

Figure 9-1307—SCS Response frame Action field format

The Category field is defined in 9.4.1.11.

The Robust Action field is defined in 9.6.18.1.

The Dialog Token field is defined in 9.4.1.12. It is set to the nonzero value of the corresponding SCS Request frame. If the SCS Report frame is being transmitted for a reason other than in response to an SCS Request frame, then the Dialog Token field is set to 0.

The Count field is set to the value of the number of SCS Status duples in the SCS Status List field.

The SCS Status List field contains one or more SCS Status duples. The format of the SCS Status duple is defined in Figure 9-1308.

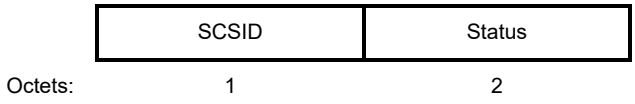

Figure 9-1308—SCS Status duple format

The SCSID field identifies an SCS stream.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Status field indicates the status of the SCS stream, as defined in Table 9-80.

9.6.18.4 Group Membership Request frame format

The Group Membership Request frame is sent to a STA to request the contents of its dot11GroupAddressesTable. The Action field of a Group Membership Request frame contains the information shown in Figure 9-1309.

	Category	Robust Action	Dialog Token
Octets:	1	1	1

Figure 9-1309—Group Membership Request frame Action field format

The Category field is defined in 9.4.1.11.

The Robust Action field is defined in 9.6.18.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA to a nonzero value that is used for matching action responses with action requests. See 10.28.5.

Usage of the Group Membership Request frame is described in 11.21.16.3.2.

9.6.18.5 Group Membership Response frame format

The Group Membership Response frame is sent in response to a Group Membership Request frame or upon a change in the dot11GroupAddressesTable object, using the procedures defined in 11.21.16.3.2. The Action field of a Group Membership Response frame contains the information shown in Figure 9-1310.

	Category	Robust Action	Dialog Token	Address Count	Group Address List
Octets:	1	1	1	1	$n \times 6$

Figure 9-1310—Group Membership Response frame Action field format

The Category field is defined in 9.4.1.11.

The Robust Action field is defined in 9.6.18.1.

The Dialog Token field is defined in 9.4.1.12. It is set to the nonzero value of the corresponding Group Membership Request frame. If the Group Membership Report frame is being transmitted for a reason other than in response to a Group Membership Request frame, the Dialog Token field is set to 0.

The Address Count field specifies the number of MAC addresses that are in the Group Address List field.

The Group Address List field contains zero or more MAC addresses to indicate the set of group addresses for which the STA receives frames.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.18.6 MSCS Request frame format

MSCS Request frames are used to request the creation, modification, or deletion of mirrored stream classification using the procedures defined in 11.25.3.

The Action field of the MSCS Request frame contains the information shown in Figure 9-1311.

	Category	Robust Action	Dialog Token	MSCS Descriptor element
Octets:	1	1	1	variable

Figure 9-1311—MSCS Request frame Action field format

The Category field is defined in 9.4.1.11.

The Robust Action field is defined in 9.6.18.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA to a nonzero value that is used for matching action responses with action requests. See 10.28.5.

The MSCS Descriptor element is defined in 9.4.2.242.

9.6.18.7 MSCS Response frame format

The MSCS Response frame is sent in response to an MSCS Request frame using the procedures defined in 11.25.3. The Action field of an MSCS Response frame contains the information shown in Figure 9-1312.

	Category	Robust Action	Dialog Token	Status	MSCS Descriptor element (optional)
Octets:	1	1	1	2	variable

Figure 9-1312—MSCS Response frame Action field format

The Category field is defined in 9.4.1.11.

The Robust Action field is defined in 9.6.18.1

The Dialog Token field is defined in 9.4.1.12. It is set to the nonzero value of the corresponding MSCS Request frame. If the MSCS Report frame is being transmitted for a reason other than in response to an MSCS Request frame, then the Dialog Token field is set to 0.

The Status field indicates the status of the request, as defined in Table 9-80.

The MSCS Descriptor element is defined in 9.4.2.242. When the Status field is SUCCESS the element is not present; otherwise it is optionally present as described in 11.25.3.

9.6.19 DMG Action frame details

9.6.19.1 DMG Action field

Several Action frame formats are defined to support DMG features. A DMG Action field, in the octet immediately after the Category field, differentiates the DMG Action frame formats. The DMG Action field values associated with each frame format within the DMG category are defined in Table 9-568.

Table 9-568—DMG Action field values

DMG Action field value	Meaning
0	Power Save Configuration Request
1	Power Save Configuration Response
2	Information Request
3	Information Response
4	Handover Request
5	Handover Response
6	Reserved
7	Reserved
8	Relay Search Request
9	Relay Search Response
10	Multi-Relay Channel Measurement Request
11	Multi-Relay Channel Measurement Report
12	RLS Request
13	RLS Response
14	RLS Announcement
15	RLS Teardown
16	Relay Ack Request
17	Relay Ack Response
18	TPA Request
19	TPA Response
20	TPA Report
21	ROC Request
22	ROC Response
23	Protected Announce

9.6.19.2 Power Save Configuration Request frame format

The format of the Power Save Configuration Request (PSC-REQ) frame Action field is shown in Table 9-569.

Table 9-569—Power Save Configuration Request frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	DMG Power Management
5	DMG Wakeup Schedule element (optional)
6	QoS Triggered Unscheduled element (optional)

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is defined in 9.4.1.12. It is set to a value chosen by the STA sending the frame to uniquely identify the transaction.

The length of the DMG Power Management (DPM) field is 1 octet. Setting the DPM field to 0 indicates a transition from power save mode to active mode. Setting the DPM field to 1 indicates a transition from active mode to power save mode. All other values are reserved.

The DMG Wakeup Schedule element is defined in 9.4.2.129 (11.2.7.2).

The QoS Triggered Unscheduled element is defined in 9.4.2.277.

9.6.19.3 Power Save Configuration Response frame format

The format of the Power Save Configuration Response (PSC-RSP) frame Action field is shown in Table 9-570.

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is defined in 9.4.1.12. It is set to the value of the Dialog Token field in the corresponding PSC-REQ frame.

The Status Code field is defined in 9.4.1.9.

The DMG Wakeup Schedule element is defined in 9.4.2.129.

The Antenna Sector ID Pattern element is defined in 9.4.2.155.

Table 9-570—Power Save Configuration Response frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	Status Code
5	DMG Wakeup Schedule element (optional)
6	Antenna Sector ID Pattern element (optional)
7	QoS Triggered Unscheduled element (optional)

The QoS Triggered Unscheduled element is defined in 9.4.2.277.

9.6.19.4 Information Request frame format

The format of an Information Request frame Action field is shown in Table 9-571.

Table 9-571—Information Request frame Action field format

Order	Information
1	Category
2	DMG Action
3	Subject Address
4	Request element
5	Zero or more DMG Capabilities elements
6	Zero or more provided elements
7	Zero or more Extended Request elements
8	Zero or more Vendor Specific Request elements

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Subject Address field contains the MAC address of the STA whose information is being requested. If this frame is sent to the PCP and the Subject Address field is the broadcast address, then the STA is requesting information regarding all associated STAs.

The Request element field is described in 9.4.2.8.

The DMG Capabilities element carries information about the transmitter STA and other STAs known to the transmitter STA. The format of this element is defined in 9.4.2.126.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Each provided element is an element as specified in 9.4.2, that the transmitter of this frame is providing to the destination of the frame.

The Extended Request element is described in 9.4.2.9.

The Vendor Specific Request element is described in 9.4.2.217.

9.6.19.5 Information Response frame format

The format of an Information Response frame Action field is shown in Table 9-572.

This frame is individually addressed to a STA in response to an Information Request frame or it is sent unsolicited and individually addressed to a STA or broadcast to all STAs in the PBSS/infrastructure BSS. If this frame is sent as a broadcast, then this frame is an Action No Ack frame.

Table 9-572—Information Response frame Action field format

Order	Information
1	Category
2	DMG Action
3	Subject Address
4	One or more DMG Capabilities elements
5	Zero or more requested elements
6	Zero or more provided elements

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Subject Address field contains the MAC address of the STA whose information is being provided. If this field is set to the broadcast address, then the STA is providing information regarding all associated STAs.

The DMG Capabilities element carries information about the transmitter STA and other STAs known to the transmitter STA. The DMG Capabilities element is described in 9.4.2.126.

The requested elements are those returned in response to an Information Request frame, as described in 11.28.1.

The provided elements are elements, as described in 9.4.2, that the transmitter of this frame provides to the destination of the frame, either in addition to the requested elements, or in an unsolicited Information Response frame.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.19.6 Handover Request frame format

The format of the Handover Request frame Action field is shown in Table 9-573.

Table 9-573—Handover Request frame Action field format

Order	Information
1	Category
2	DMG Action
3	Handover Reason
4	Handover Remaining BI

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Handover Reason field is 1 octet in length and indicates the reason that the current PCP intends to do the PCP handover. The Handover Reason field is set to 0 to indicate the PCP is leaving the PBSS, it is set to 1 to indicate low power in the PCP, is set to 2 to indicate that a more qualified PCP handover capable STA is available, and is set to 3 to indicate that the PCP handover capable STA wishes to become a PCP. The other values are reserved.

The Handover Remaining BI field is 1 octet in length and indicates the number of beacon intervals, excluding the beacon interval in which this frame is transmitted, remaining until the handover takes effect.

9.6.19.7 Handover Response frame format

The format of the Handover Response frame Action field is shown in Table 9-574.

Table 9-574—Handover Response frame Action field format

Order	Information
1	Category
2	DMG Action
3	Handover Result
4	Handover Reject Reason

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Handover Result field is 1 octet in length and indicates whether the STA accepted the handover request. Setting this field to 0 indicates that the STA accepts the handover request. Setting this field to 1 indicates that the STA does not accept the handover request.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the Handover Result field is set to 0, the Handover Reject Reason field is reserved and set to 0. If the Handover Result field is set to 1, the Handover Reject Reason field indicates the reason the STA rejected the handover request and can be one of the following: 0 for low power, 1 for handover in progress with another STA, 2 for invalid value for Handover Remaining BI field, and 3 for unspecified reason. The length of Handover Reject Reason field is 1 octet.

9.6.19.8 Relay Search Request frame format

The Relay Search Request frame is transmitted by a non-AP and non-PCP STA to the AP or PCP to request a list of RDSs in the BSS. The format of the Relay Search Request frame Action field is shown in Table 9-575.

Table 9-575—Relay Search Request frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	Destination REDS AID

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is defined in 9.4.1.12. It is set to a nonzero value chosen by the STA sending the Relay Search Request frame to identify the request/response transaction.

The Destination REDS AID field is set to the AID of the target destination REDS. The structure of the field is defined in 9.4.1.8.

9.6.19.9 Relay Search Response frame format

The Relay Search Response frame is sent by an AP or PCP in response to a Relay Search Request frame. The format of a Relay Search Response frame Action field is shown in Table 9-576.

Table 9-576—Relay Search Response frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	Status Code
5	Number of Relay Capable STAs
6	Zero or more Relay Capable STA Info fields

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is defined in 9.4.1.12. It is set to the value in the corresponding Relay Search Request frame that generated this response.

The Status Code field is defined in 9.4.1.9.

The Number of Relay Capable STAs field is 1 octet in length and indicates the number of STAs in the BSS that are relay capable. This field is set to 0 if the status code does not indicate success.

The Relay Capable STA Info field is defined in 9.4.1.42. This information is included only if the status code indicates successful. The number of Relay Capable STA Info fields that appear in the frame is indicated by the value of the Number of Relay Capable STAs field.

9.6.19.10 Multi-relay Channel Measurement Request frame format

The Multi-Relay Channel Measurement Request frame is transmitted by a STA initiating relay operation to the recipient STA in order to obtain Channel Measurements between the recipient STA and the other STA participating in the relay operation. The format of the Multi-Relay Channel Measurement Request frame Action field is shown in Table 9-577.

Table 9-577—Multi-relay Channel Measurement Request frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is defined in 9.4.1.12. It is set to a nonzero value chosen by the STA sending the Multi-Relay Channel Measurement Request frame to identify the request/report transaction.

9.6.19.11 Multi-relay Channel Measurement Report frame format

The Multi-Relay Channel Measurement Report frame is sent in response to a Multi-Relay Channel Measurement Request. The format of the Multi-Relay Channel Measurement Report frame Action field is shown in Table 9-578.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-578—Multi-relay Channel Measurement Report frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	Number of Channel Measurement Info
5	One or more Channel Measurement Info fields

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is defined in 9.4.1.12. It is set to the value in any corresponding Multi-Relay Channel Measurement Request frame. If the Multi-Relay Channel Measurement Report frame is not being transmitted in response to a Multi-Relay Channel Measurement Request frame, then the dialog token is set to 0.

The Number of Channel Measurement Info field is 1 octet in length and indicates the number of Channel Measurements Info fields included in the frame.

The format of the Channel Measurement Info field is defined in Figure 9-1313. The number of Channel Measurement Info fields included in the frame is indicated by the Number of Channel Measurement Info field. More than one Multiple Channel Measurement Info field is included if the reporting STA measures the channel for multiple RDSs.

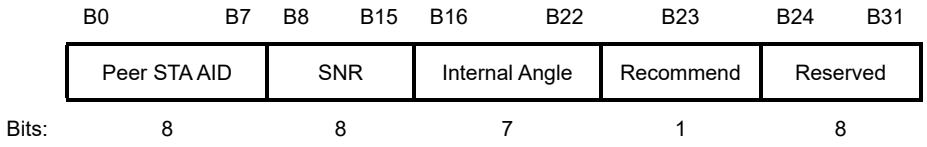

Figure 9-1313—Channel Measurement Info field format

The Peer STA AID subfield contains the AID of the STA toward which the reporting STA measures link.

The SNR subfield indicates the SNR measured in the link toward the STA corresponding to Peer STA AID. This subfield is encoded as 8-bit 2s complement value of 4x(SNR-19), where SNR is measured in dB. This covers from –13 dB to 50.75 dB in 0.25 dB steps.

The Internal Angle subfield indicates the angle between directions toward the other STAs involved in the relay operation. This covers from 0° to 180° in 2° steps. This subfield uses the degree of the direction from the sector that the feedbacks indicates has highest quality during TXSS if SLS phase of BF is performed and RXSS is not included.

The Recommend subfield indicates whether the responding STA recommends relay operation based on the channel measurement with the Peer STA. This subfield is set to 1 when the relay operation is recommended and otherwise is set to 0.

9.6.19.12 RLS Request frame format

The RLS Request frame is used to set up a relay link. The format of the RLS Request frame Action field is shown in Table 9-579.

Table 9-579—RLS Request frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	Destination AID
5	Relay AID
6	Source AID
7	Destination Capability Information
8	Relay Capability Information
9	Source Capability Information
10	Relay Transfer Parameter Set

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is defined in 9.4.1.12. It is set to a nonzero value chosen by the STA sending the RLS Request frame to identify the request/response transaction.

The Destination AID field value is the AID of the target destination formatted per 9.4.1.8.

The Relay AID field value is the AID of the selected RDS formatted per 9.4.1.8.

The Source AID field value is the AID of the initiating STA formatted per 9.4.1.8.

The Destination Capability Information field indicates the Relay Capability Information field within the Relay Capabilities element of the target destination REDS as defined in 9.4.2.146.

The Relay Capability Information field indicates the Relay Capability Information field within the Relay Capabilities element of the selected RDS as defined in 9.4.2.146.

The Source Capability Information field indicates the Relay Capability Information field within the Relay Capabilities element of the originator of the request as defined in 9.4.2.146.

The Relay Transfer Parameter Set element is defined in 9.4.2.147.

9.6.19.13 RLS Response frame format

The RLS Response frame is sent in response to an RLS Request frame. The format of an RLS Response frame Action field is shown in Table 9-580.

Table 9-580—RLS Response frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	Destination Status Code
5	Relay Status Code (optional)

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is defined in 9.4.1.12. It is set to the value in any corresponding RLS Request frame.

The Destination Status Code field is included when the destination REDS transmits an RLS Response frame as a result of RLS Request. It is defined in 9.4.1.9.

The Relay Status Code field is included when the relay REDS transmits an RLS Response frame as a result of RLS Request. It is defined in 9.4.1.9.

9.6.19.14 RLS Announcement frame format

The RLS Announcement frame is sent to announce the successful RLS. The format of an RLS Announcement frame Action field is shown in Table 9-581.

Table 9-581—RLS Announcement frame Action field format

Order	Information
1	Category
2	DMG Action
3	Status Code
4	Destination AID
5	Relay AID
6	Source AID

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Status Code field is defined in 9.4.1.9.

The Destination AID field value is the AID of the target destination formatted per 9.4.1.8.

The Relay AID field value is the AID of the RDS formatted per 9.4.1.8.

The Source AID field value is the AID of the initiating STA formatted per 9.4.1.8.

9.6.19.15 RLS Teardown frame format

The RLS Teardown frame is sent to terminate a relay operation. The format of the RLS Teardown frame Action field is shown in Table 9-582.

Table 9-582—RLS Teardown frame Action field format

Order	Information
1	Category
2	DMG Action
3	Destination AID
4	Relay AID
5	Source AID
6	Reason Code

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Destination AID field value is the AID of the destination REDS formatted per 9.4.1.8.

The Relay AID field value is the AID of the RDS formatted per 9.4.1.8.

The Source AID field value is the AID of the source REDS formatted per 9.4.1.8.

The Reason Code field is defined in 9.4.1.7.

9.6.19.16 Relay Ack Request frame format

The Relay Ack Request frame is sent by a source REDS to an RDS participating in a relay operation in order to determine whether all frames forwarded through the RDS were received by the destination REDS also participating in the relay operation. This frame is used only when the RDS is operated in HD-DF mode and relay operation is link switching. The format of the Relay Ack Request frame Action field is shown in Table 9-583.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-583—Relay Ack Request frame Action field format

2	DMG Action
3	BAR Control
4	Block Ack Starting Sequence Control

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The BAR Control and Block Ack Starting Sequence Control fields are defined in 9.3.1.7.

9.6.19.17 Relay Ack Response frame format

The Relay Ack Response frame is sent by an RDS to a source REDS participating in a relay operation in order to report the frames received by the destination REDS also participating in the relay operation. This frame is used only when the RDS is operated in HD-DF mode and relay operation is link switching. The format of the Relay Ack Response frame Action field is shown in Table 9-584.

Table 9-584—Relay Ack Response frame Action field format

Order	Information
1	Category
2	DMG Action
3	BA Control
4	Block Ack Starting Sequence Control
5	BlockAck Bitmap

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The BA Control, Block Ack Starting Sequence Control, and BlockAck Bitmap fields are defined in 9.3.1.8.

The BlockAck Bitmap field is defined in 9.3.1.8.

9.6.19.18 TPA Request frame format

The TPA Request frame is sent by a destination REDS participating in operation based on link cooperation to both the RDS and source REDS that belong to the same group as the destination REDS in order for them to send back their own TPA Response frames at the separately predefined times. Also, a source REDS sends a TPA Request frame to the RDS that is selected by the source REDS in order for the RDS to feedback its own TPA Response frame at the predefined time.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The format of the TPA Request frame Action field is shown in Table 9-585.

Table 9-585—TPA Request frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	Timing Offset
5	Sampling Frequency Offset

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is defined in 9.4.1.12. It is set to a nonzero value chosen by the STA sending the TPA Request frame to identify the request/response transaction.

The Timing Offset field is 2 octets in length and indicates the amount of time, in nanoseconds, that the STA identified in the RA of the frame is required to change the timing offset of its transmissions so that they arrive at the expected time at the transmitting STA.

The Sampling Frequency Offset field is 2 octets in length and indicates the amount by which to change the sampling frequency offset of the burst transmission so that bursts arrive at the destination DMG STA with no sampling frequency offset. The unit is 0.01 ppm.

9.6.19.19 TPA Response frame format

The TPA Response frame is sent by an RDS or a source REDS participating in relay operation in response to a TPA Request frame from a destination REDS or a source REDS. The RDS or the source REDS that receives a TPA Request frame responds to the destination REDS or the source REDS, as appropriate, with a TPA Response frame at a predetermined time from the end of the TPA Request frame (see 11.34). The format of the TPA Response frame Action field is shown in Table 9-586.

Table 9-586—TPA Response frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token

Copyright © 2025 IEEE. All rights reserved.

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is defined in 9.4.1.12. It is set to the value of the Dialog Token field of the TPA Request frame that generated this response.

9.6.19.20 TPA Report frame format

The TPA Report frame is sent to announce whether a TPA procedure is successful. The format of the TPA Report frame Action field is shown in Table 9-587.

Table 9-587—TPA Report frame Action field format

Order	Information
1	Category
2	DMG Action
3	Status Code

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Status Code field indicates the result of the current TPA procedure and is defined in 9.4.1.9.

9.6.19.21 ROC Request frame format

The ROC Request frame is sent by the source REDS participating in a relay operation in order to request a change in the current relay operation type. The format of the ROC Request frame Action field is shown in Table 9-588.

Table 9-588—ROC Request frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	Relay Operation Type

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is defined in 9.4.1.12. It is set to a nonzero value chosen by the STA sending the ROC Request frame to identify the request/response transaction.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The format of the Relay Operation Type field is defined in Figure 9-1314.

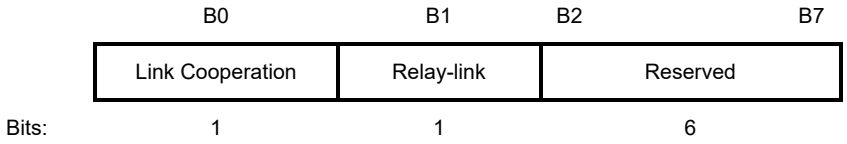

Figure 9-1314—Relay Operation Type field format

The Link Cooperation subfield is set to 0 to request the operation to be changed to link switching and is set to 1 to request the operation to be changed to link cooperation.

The Relay-link subfield is set to 0 to indicate that the link switching operation starts at the direct link between the source REDS and destination REDS and set to 1 to indicate that the link switching operation starts with the RDS. If the Link Cooperation subfield is set to 1, the Relay-link subfield is reserved.

9.6.19.22 ROC Response frame format

The ROC Response frame is sent by the RDS or the destination DMG STA participating in a relay operation in response to a ROC Request frame from the source DMG STA. The format of the ROC Response frame Action field is shown in Table 9-589.

Table 9-589—ROC Response frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	Status Code

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is defined in 9.4.1.12. It is set to the value received in the corresponding ROC Request frame that generated this response.

The Status Code field is defined in 9.4.1.9.

9.6.19.23 Protected Announce frame format

The Protected Announce frame allows robust STA-STA communications of the same information that is conveyed in the nonrobust Announce frame (see 9.6.21.2).

The format of the robust Protected Announce and nonrobust Announce frame is the same and defined in 9.6.21.2. The Category field value differentiates whether the frame is robust or not.

9.6.20 FST Action frame details

9.6.20.1 FST Action field

The FST Action field values are defined in Table 9-590.

Table 9-590—FST Action field values

FST Action field value	Meaning
0	FST Setup Request
1	FST Setup Response
2	FST Teardown
3	FST Ack Request
4	FST Ack Response
5	On-channel Tunnel Request

9.6.20.2 FST Setup Request frame format

The FST Setup Request frame allows an initiating STA to announce to a peer STA whether the initiating STA intends to enable FST for the session between the initiating STA and the peer STA (11.31). The format of the FST Setup Request frame Action field is shown in Table 9-591.

Table 9-591—FST Setup Request frame Action field format

Order	Information
1	Category
2	FST Action
3	Dialog Token
4	LLT
5	Session Transition
6	Multi-band (optional)
7	DMG Wakeup Schedule (optional)
8	Awake Window (optional)
9	Switching Stream (optional)
10	Zero or more additional elements are present, as defined in 11.31.1. Each of these elements is not present more than once in the frame.

The Category field is defined in 9.4.1.11.

The FST Action field is defined in 9.6.20.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Dialog Token field is defined in 9.4.1.12. It is set to a nonzero value chosen by the STA.

The Link loss timeout (LLT) field is 32 bits and indicates the compressed maximum duration counted from the last time an MPDU was received by the initiating STA from the peer STA until the initiating STA decides to initiate FST. The use of this field is described in 11.31.

The Session Transition field contains the Session Transition element as defined in 9.4.2.144.

The Multi-band field contains the Multi-Band element as defined in 9.4.2.137. The regulatory information contained in the Multi-band element is applicable to all of the fields and elements contained in the frame.

The DMG Wakeup Schedule element is defined in 9.4.2.129.

The Awake Window element is defined in 9.4.2.136.

The Switching Stream element is defined in 9.4.2.143.

9.6.20.3 FST Setup Response frame format

The FST Setup Response frame is transmitted in response to an FST Setup Request frame. The format of the frame Action field is shown in Table 9-592.

Table 9-592—FST Setup Response frame Action field format

Order	Information
1	Category
2	FST Action
3	Dialog Token
4	Status Code
5	Session Transition
6	Multi-band (optional)
7	DMG Wakeup Schedule (optional)
8	Awake Window (optional)
9	Switching Stream (optional)
10	TIE (optional)
11	Zero or more additional elements are present, as defined in 11.31.1. Each of these elements is not present more than once in the frame.

The Category field is defined in 9.4.1.11.

The FST Action field is defined in 9.6.20.1.

The Dialog Token field value is copied from the corresponding received FST Setup Request frame.

The Status Code field is defined in 9.4.1.9.

The Session Transition field contains the Session Transition element as defined in 9.4.2.144.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Multi-band element is defined in 9.4.2.137.

The DMG Wakeup Schedule element is defined in 9.4.2.129.

The Awake Window element is defined in 9.4.2.136

The Switching Stream element is defined in 9.4.2.143.

The TIE is defined in 9.4.2.47.

9.6.20.4 FST Teardown frame format

The FST Teardown frame is transmitted to delete an established FST session between STAs. The format of the frame Action field is shown in Table 9-593.

Table 9-593—FST Teardown frame Action field format

Order	Information
1	Category
2	FST Action
3	FSTS ID

The Category field is defined in 9.4.1.11.

The FST Action field is defined in 9.6.20.1.

The FSTS ID field contains the identification of the FST session established between the STAs identified by the TA and RA fields of this frame. The format of the FSTS ID field is as specified 9.4.2.144.

9.6.20.5 FST Ack Request frame format

The FST Ack Request frame is transmitted in the frequency band an FST session is transferred to and confirms the FST. The format of the frame Action field is shown in Table 9-594.

Table 9-594—FST Ack Request frame Action field format

Order	Information
1	Category
2	FST Action
3	Dialog Token
4	FSTS ID

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The FST Action field is defined in 9.6.20.1.

The Dialog Token field is defined in 9.4.1.12. It is set to a nonzero value chosen by the STA sending the FST Ack request to identify the request/report transaction.

The FSTS ID field contains the identification of the FST session established between the STAs identified by the TA and RA fields of this frame. The format of the FSTS ID field is as specified in 9.4.2.144.

9.6.20.6 FST Ack Response frame format

The FST Ack Response frame is transmitted in response to an FST Ack Request frame. The format of the frame Action field is shown in Table 9-595.

Table 9-595—FST Ack Response frame Action field format

Order	Information
1	Category
2	FST Action
3	Dialog Token
4	FSTS ID

The Category field is defined in 9.4.1.11.

The FST Action field is defined in 9.6.20.1.

The Dialog Token field is defined in 9.4.1.12. It is set to the value in any corresponding FST Ack Request frame. If the FST Ack Response frame is not being transmitted in response to an FST Ack Request frame, then the dialog token is set to 0.

The FSTS ID field contains the identification of the FST session established between the STAs identified in the TA and RA fields of this frame. The format of the FSTS ID field is as specified in 9.4.2.144.

9.6.20.7 On-channel Tunnel Request frame format

The On-channel Tunnel Request frame allows a STA of a multi-band device to encapsulate an MMPDU for transmission to an MLME of a peer STA within the same multi-band device (11.31), which can be used to perform multi-band association and multi-band authentication.

The format of the On-channel Tunnel Request frame Action field is shown in Table 9-596.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

1	Category
2	FST Action
3	OCT MMPDU Descriptor
4	Multi-band
5	OCT Source

The Category field is defined in 9.4.1.11.

The FST Action field is defined in 9.6.20.1.

The OCT MMPDU Descriptor field is defined in Figure 9-1315.

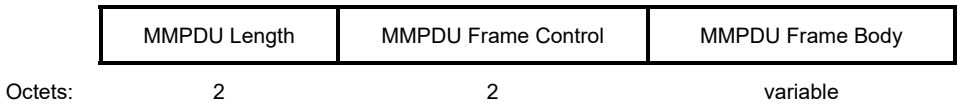

Figure 9-1315—Definition of the OCT MMPDU Descriptor field

The MMPDU Length subfield contains the length in octets of the MMPDU Frame Body subfield.

The MMPDU Frame Control subfield carries the content of the Frame Control field of an MMPDU that would be constructed if the MMPDU for the corresponding management frame type were transmitted over the air.

The MMPDU Frame Body subfield carries the content of the Frame Body field of an MPDU carrying the MMPDU that would be constructed if the MMPDU for the corresponding management frame type were transmitted unencrypted over the air (i.e., all of the octets after the MAC header and up to, but not including, the FCS).

The Multi-band field contains the Multi-band element (see 9.4.2.137) of the peer MLME to which the OCT MMPDU is destined to. The values of the Band ID, Channel Number and BSSID fields contained in this element are used to deliver the OCT MMPDU to the correct MLME within the peer STA.

The OCT Source field contains an OCT Source element that identifies the MLME that is the source of an OCT MMPDU.

9.6.21 Unprotected DMG Action frame details

9.6.21.1 Unprotected DMG Action field

Unprotected DMG Action frames are not encapsulated using mechanisms defined for robust Management frames. An Unprotected DMG Action field, in the field immediately after the Category field, differentiates the formats. The Action field values associated with each frame format are defined in Table 9-597.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-597—Unprotected DMG Action field values

Unprotected DMG Action field value	Meaning
0	Announce
1	BRP
2	MIMO BF Setup
3	MIMO BF Poll
4	MIMO BF Feedback
5	MIMO BF Selection

9.6.21.2 Announce frame format

The Announce frame is an Action or an Action No Ack frame of category Unprotected DMG. The format of an Announce frame Action field is shown in Table 9-598.

Announce frames can be transmitted during the ATI of a beacon interval and can perform functions including of a DMG Beacon frame, but since this frame does not have to be transmitted as a sector sweep to a STA, it can provide much more spectrally efficient access than using a DMG Beacon frame.

9.6.21.3 BRP frame format

The BRP frame is an Action No Ack frame. The BRP frame Action field format is one of two variants depending upon the value of the EDMG-SHORT-BRP subfield within the BRP Request field. If the value of the EDMG-SHORT-BRP subfield is 1, the format of the BRP frame Action field is shown in Table 9-600. In all other cases, the format of a BRP frame Action field is shown in Table 9-599.

The Category field is defined in 9.4.1.11.

The Unprotected DMG Action field is defined in 9.6.21.1.

The Dialog Token field is defined in 9.4.1.12. It is set to a value chosen by the STA sending the frame to uniquely identify the transaction.

The BRP Request field is defined in 9.5.4.

The DMG Beam Refinement element is defined in 9.4.2.128.

The Channel Measurement Feedback element is defined in 9.4.2.135.

The BRP frame contains more than one Channel Measurement Feedback element if the measurement information exceeds 255 octets. The content of each Channel Measurement Feedback element that follows the first one in a single BRP frame is a continuation of the content in the previous element. The Channel Measurement, Tap Delay, and Sector ID Order subfields can be split between several elements. Each Channel Measurement Feedback element that is not the last Channel Measurement Feedback element in the frame is 257 octets long. Channel measurement information for a single channel measurement is always contained within a single BRP frame.

NOTE—The length of a BRP frame can limit the choice of channel measurement parameters such as the number of measurements and the number of taps.

Table 9-598—Announce frame Action field format

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	Unprotected DMG Action or DMG Action	The Unprotected DMG Action field is defined in 9.6.21.1 and is sent when the Announce frame is transmitted unprotected. The DMG Action field is defined in 9.6.19.1 and is sent when the Announce frame is transmitted protected.
3	Timestamp	The Timestamp field is defined in 9.4.1.10.
4	Beacon Interval	The Beacon Interval field is defined in 9.4.1.3 and specifies the duration of the beacon interval of the BSS.
5	SSID	The SSID element is defined in 9.4.2.2. The SSID element is optionally present. If present, the SSID element specifies the SSID of the BSS.
6	Extended Schedule	The Extended Schedule element is defined in 9.4.2.130. The Extended Schedule element is optionally present. If present, the Extended Schedule element specifies the schedule of the BSS.
7	DMG Capabilities	The DMG Capabilities element is defined in 9.4.2.126. The DMG Capabilities element is optionally present. If present, the DMG Capabilities element specifies capabilities of the transmitting STA.
8	RSN	The RSNE is defined in 9.4.2.23. The RSNE is optionally present. If present, the RSNE indicates that security is required in the BSS.
9	Multiple BSSID	One or more Multiple BSSID elements are present if the AP is a member of a multiple BSSID set (see 11.10.14) with two or more members and any of the following conditions are true: • dot11MultiBSSIDImplemented is true • dot11MultiBSSIDImplemented is false and dot11RMMeasurementPilotActivated is between 2 and 7 • dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID exists Otherwise not present.
10	DMG Operation	The DMG Operation element is defined in 9.4.2.126.7. The DMG Operation element is optionally present. If present, the DMG Operation element specifies the operational parameters of the BSS.
11	Next DMG ATI	The Next DMG ATI element is defined in 9.4.2.134. The Next DMG ATI element is optionally present. If present, the Next DMG ATI element specifies the start time of the next ATI at a subsequent beacon interval.
12	Multi-band	The Multi-band element is defined in 9.4.2.137. The Multi-band element is optionally present.
13	Awake Window	The Awake Window element is defined in 9.4.2.136. The Awake Window element is optionally present.
14	DMG BSS Parameter Change	The DMG BSS Parameter Change element is defined in 9.4.2.125. The DMG BSS Parameter Change element is optionally present.
15	BeamLink Maintenance	The BeamLink Maintenance element is defined in 9.4.2.150. The BeamLink Maintenance element is optionally present.

Table 9-598—Announce frame Action field format *(continued)*

Order	Information	Notes
16	Multiple MAC Sublayers	The Multiple MAC Sublayers element is defined in 9.4.2.151. The Multiple MAC Sublayers element is optionally present.
17	ECAPC Policy	The ECAPC Policy element is defined in 9.4.2.153. The ECAPC Policy element is optionally present.
18	Cluster Report	The Cluster Report element is defined in 9.4.2.145. The Cluster Report element is optionally present.
19	Next PCP List	The Next PCP List element is defined in 9.4.2.139. The Next PCP List element is optionally present.
20	PCP Handover	The PCP Handover element is defined in 9.4.2.140. The PCP Handover element is optionally present.
21	STA Availability	The STA Availability element is defined in 9.8. The STA Availability element is optionally present.
22	UPSIM	The UPSIM element is defined in 9.4.2.165. The UPSIM element is optionally present.
23	Extended Channel Switch Announcement	The Extended Channel Switch Announcement element is defined in 9.4.2.51. The Extended Channel Switch Announcement element is optionally present if dot11ExtendedChannelSwitchActivated is true.
24	Cluster Probe	The Cluster Probe element is defined in 9.4.2.222. The Cluster Probe element is optionally present.
25	Extended Cluster Report	The Extended Cluster Report element is defined in 9.4.2.223. The Extended Cluster Report element is optionally present.
26	Cluster Switch Announcement	The Cluster Switch Announcement element is defined in 9.4.2.224. The Cluster Switch Announcement element is optionally present.
27	CDMG Extended Schedule	The Extended Schedule element is optionally present if dot11OpportunisticTransmissionsImplemented is true; otherwise not present.
28	Service Hash	The Service Hash element is optionally present if dot11UnsolicitedPADActivated is true; otherwise not present.
29	Service Hint	The Service Hint element is optionally present if dot11UnsolicitedPADActivated is true; otherwise not present.
30	TDD Slot Structure	This element is optionally present if dot11TDDOptionImplemented is true; otherwise, not present. If present, the element specifies the TDD slot timing.
31	TDD Slot Schedule	This element is optionally present if dot11TDDOptionImplemented is true; otherwise, not present. If present, the element specifies the type of the TDD slot and the access permission.
32	TDD Route	This element is optionally present if dot11TDDOptionImplemented is true; otherwise, not present. If present, the element specifies the TDD beamforming results and sector switch configuration.

Table 9-598—Announce frame Action field format *(continued)*

Order	Information	Notes
33	DMG Link Margin	This element is optionally present. If present, the element specifies the parameters needed for link maintenance.
34	TDD Bandwidth Request	This element is optionally present if dot11TDDOptionImplemented is true; otherwise, not present. If present, the element specifies the parameters needed for bandwidth reservation during TDD SPs.
35	TDD Synchronization	This element is optionally present if dot11TDDOptionImplemented is true; otherwise, not present. If present, the element specifies the information needed for clock synchronization during TDD SPs.
36	EDMG Capabilities	This element is optionally present if dot11EDMGOptionImplemented is true.
37	EDMG Operation	This element is optionally present if dot11EDMGOptionImplemented is true.
38	EDMG Extended Schedule	This element is optionally present if dot11EDMGOptionImplemented is true.
39	EDMG Group ID Set	This element is optionally present if dot11EDMGOptionImplemented is true.
40	EDMG Training Field Schedule	This element is optionally present if dot11EDMGOptionImplemented is true.
41	Time Advertisement	Optionally present if dot11UTCTSFOffsetActivated is true
42	BSS Load	The BSS Load element is present if dot11QBSSLoadImplemented is true.

Table 9-599—BRP frame Action field format

Order	Information
1	Category
2	Unprotected DMG Action
3	Dialog Token
4	BRP Request field
5	DMG Beam Refinement element
6	Zero or more Channel Measurement Feedback elements
7	Enhanced Beam Tracking element
8	SSW Report element
9	EDMG Partial Sector Level Sweep element (optional)
10	EDMG BRP Request element (optional)
11	Zero or more EDMG Channel Measurement Feedback elements

Table 9-600—BRP frame Action field format when the EDMG-SHORT-BRP subfield is 1

Order	Information
1	Category
2	Unprotected DMG Action
3	Dialog Token
4	BRP Request field
5	EDMG BRP field
6	Short BRP Feedback field (optional)

The EDMG Partial Sector Level Sweep element is defined in 9.4.2.271.

The EDMG BRP Request element is defined in 9.4.2.269. If this element is present in the frame, the value of a field within this element overrides the value of the field with the same name in the BRP Request field contained in the frame.

The EDMG Channel Measurement Feedback element is defined in 9.4.2.267. If an EDMG Channel Measurement Feedback element appears in the frame, then at least one Channel Measurement Feedback element is also included in the frame.

The EDMG BRP field is defined in 9.5.7.

The Short BRP Feedback field is defined in 9.5.8.

The Enhanced Beam Tracking element is defined in 9.4.2.225.

The SSW Report element is defined in 9.4.2.221.

9.6.21.4 MIMO BF Setup frame format

The MIMO BF Setup frame is an Action No Ack frame. The format of a MIMO BF Setup frame Action field is shown in Table 9-601.

Table 9-601—MIMO BF Setup frame Action field format

Order	Information
1	Category
2	Unprotected DMG Action
3	Dialog Token
4	MIMO Setup Control element

The Category field is defined in 9.4.1.11.

The Unprotected DMG Action field is defined in 9.6.21.1.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Dialog Token field is set to a value chosen by the STA sending the frame to uniquely identify the transaction.

The MIMO Setup Control element is defined in 9.4.2.272.

9.6.21.5 MIMO BF Poll frame format

The MIMO BF Poll frame is an Action No Ack frame. The format of a MIMO BF Poll frame Action field is shown in Table 9-602.

Table 9-602—MIMO BF Poll frame Action field format

Order	Information
1	Category
2	Unprotected DMG Action
3	Dialog Token
4	MIMO Poll Control element

The Category field is defined in 9.4.1.11.

The Unprotected DMG Action field is defined in 9.6.21.1.

The Dialog Token field is set to a value chosen by the STA sending the frame to uniquely identify the transaction.

The MIMO Poll Control element is defined in 9.4.2.273.

9.6.21.6 MIMO BF Feedback frame format

The MIMO BF Feedback frame is an Action No Ack frame. The format of a MIMO BF Feedback frame Action field is shown in Table 9-603.

Table 9-603—MIMO BF Feedback frame Action field format

Order	Information
1	Category
2	Unprotected DMG Action
3	Dialog Token
4	MIMO Feedback Control element
5	Zero or more Channel Measurement Feedback elements
6	Zero or more EDMG Channel Measurement Feedback elements
7	Zero or more Digital BF Feedback elements

The Category field is defined in 9.4.1.11.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Unprotected DMG Action field is defined in 9.6.21.1.

The Dialog Token field is set to a value chosen by the STA sending the frame to uniquely identify the transaction.

The MIMO Feedback Control element is defined in 9.4.2.274.

The Channel Measurement Feedback element is defined in 9.4.2.135.

The EDMG Channel Measurement Feedback element is defined in 9.4.2.267.

The Digital BF Feedback element is defined in 9.4.2.283.

The MIMO BF Feedback frame contains more than one Channel Measurement Feedback element if the measurement information exceeds 255 octets. The content of each Channel Measurement Feedback element that follows the first one in a single MIMO BF Feedback frame is a continuation of the content in the previous element. The SNR, Channel Measurement, Additional SNR and Additional Channel Measurement subfields can be split between several elements. Each Channel Measurement Feedback element that is not the last Channel Measurement Feedback element in the frame is 257 octets long. Channel measurement information for a single channel measurement is always contained within a single MIMO BF Feedback frame.

The MIMO BF Feedback frame contains more than one EDMG Channel Measurement Feedback element if the measurement information exceeds 254 octets. The content of each EDMG Channel Measurement Feedback element that follows the first one in a single MIMO BF Feedback frame is a continuation of the content in the previous element. The EDMG Sector ID Order, BRP CDOWN, Tap Delay, Additional EDMG Sector ID Order, Additional BRP CDOWN and Additional Tap Delay fields can be split between several elements. Each EDMG Channel Measurement Feedback element that is not the last EDMG Channel Measurement Feedback element in the frame is 257 octets long. Channel measurement information for a single channel measurement is always contained within a single MIMO BF Feedback frame.

NOTE—The length of a MIMO BF Feedback frame can limit the choice of channel measurement parameters such as the number of measurements and the number of taps.

9.6.21.7 MIMO BF Selection frame format

The MIMO BF Selection frame is an Action No Ack frame. The format of a MIMO BF Selection frame Action field is shown in Table 9-604.

Table 9-604—MIMO BF Selection frame Action field format

Order	Information
1	Category
2	Unprotected DMG Action
3	Dialog Token
4	MIMO Selection Control element
5	EDMG Group ID Set element (optional)

The Category field is defined in 9.4.1.11.

The Unprotected DMG Action field is defined in 9.6.21.1.

The Dialog Token field is set to a value chosen by the STA sending the frame to uniquely identify the transaction.

The MIMO Selection Control element is defined in 9.4.2.275.

The EDMG Group ID Set element is defined in 9.4.2.268. The element contains the updated list of MU groups following completion of the MU MIMO beamforming training.

9.6.22 VHT Action frame details

9.6.22.1 VHT Action field

Several Action frame formats are defined to support VHT functionality and S1G functionality. A VHT Action field, in the octet immediately after the Category field, differentiates the VHT Action frame formats. The VHT Action field values associated with each frame format within the VHT category are defined in Table 9-605.

Table 9-605—VHT Action field values

Value	Meaning	Time priority
0	VHT Compressed Beamforming	Yes
1	Group ID Management	No
2	Operating Mode Notification	No
3–255	Reserved	

9.6.22.2 VHT Compressed Beamforming frame format

The VHT Compressed Beamforming frame is an Action No Ack frame of category VHT. The Action field of a VHT Compressed Beamforming frame contains the information shown in Table 9-606.

Table 9-606—VHT Compressed Beamforming frame Action field format

Order	Information
1	Category
2	VHT Action
3	VHT MIMO Control (see 9.4.1.46)
4	VHT Compressed Beamforming Report (see 9.4.1.47)
5	MU Exclusive Beamforming Report (see 9.4.1.49)

The Category field is defined in 9.4.1.11.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The VHT Action field is defined in 9.6.22.1.

The VHT MIMO Control field is always present in the frame. The presence and contents of the VHT Compressed Beamforming Report field and the MU Exclusive Beamforming Report field are dependent on the values of the Feedback Type, Remaining Feedback Segments, and First Feedback Segment subfields of the VHT MIMO Control field (see 9.4.1.46, 9.4.1.47, 9.4.1.49, and 10.35.5).

No Vendor Specific elements are present in a VHT Compressed Beamforming frame.

When carried in an S1G PPDU, a VHT Compressed Beamforming frame is referred to as an S1G Compressed Beamforming frame, and a VHT MIMO Control field is referred to as an S1G MIMO Control field.

When carried in an S1G PPDU, a VHT NDP Announcement frame is referred to as an S1G NDP Announcement frame.

9.6.22.3 Group ID Management frame format

The Group ID Management frame is transmitted by the AP to assign or change the user position of a STA for one or more group IDs. The Action field of a Group ID Management frame contains the information shown in Table 9-607.

Table 9-607—Group ID Management frame Action field format

Order	Information
1	Category
2	VHT Action
3	Membership Status Array (see 9.4.1.52)
4	User Position Array (see 9.4.1.53)

The Category field is defined in 9.4.1.11.

The VHT Action field is defined in 9.6.22.1.

9.6.22.4 Operating Mode Notification frame format

The Operating Mode Notification frame is used to notify STAs that the transmitting STA is changing one or more of its operating channel width, the maximum number of spatial streams it can receive, and its LDPC receive preference.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Action field of the Operating Mode Notification frame contains the information shown in Table 9-608.

Table 9-608—Operating Mode Notification frame Action field format

Order	Information
1	Category
2	VHT Action
3	Operating Mode (see 9.4.1.51)

The Category field is defined in 9.4.1.11.

The VHT Action field is defined in 9.6.22.1.

9.6.23 FILS Action frame details

9.6.23.1 FILS Action field

The FILS Action frame is used for FILS operation after the non-AP STA has associated with the AP. The defined FILS Action frames are listed in Table 9-609.

Table 9-609—FILS Action field values

Action field value	Description
0	FILS Container
1–255	Reserved

9.6.23.2 FILS Container frame

The FILS Container frame is used to exchange FILS IP Address Assignment elements (see 9.4.2.183). The format of the Action field of the FILS Container frame is shown in Figure 9-1316.

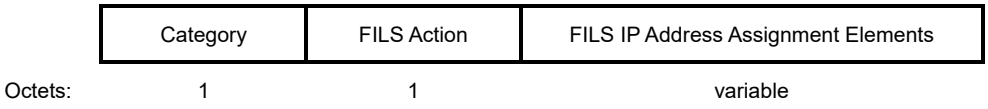

Figure 9-1316—FILS Container frame Action field format

The Category field is set to the value for FILS defined in Table 9-81.

The FILS Action field is defined in 9.6.23.1.

The FILS IP Address Assignment Elements field contains one or more FILS IP Address Assignment elements as defined in 9.4.2.183.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.24 Unprotected S1G Action frame details

9.6.24.1 Unprotected S1G Action field

An Unprotected S1G Action field, in the octet immediately after the Category field, differentiates the Unprotected S1G Action frame formats. The Unprotected S1G Action field values associated with each frame format within the Unprotected S1G category are defined in Table 9-610.

Table 9-610—Unprotected S1G Action field values

Value	Meaning
0	AID Switch Request
1	AID Switch Response
2	Sync Control
3	STA Information Announcement
4	EDCA Parameter Set
5	EL Operation
6	TWT Setup
7	TWT Teardown
8	Sectorized Group ID List
9	Sector ID Feedback
10	Reserved
11	TWT Information
12–255	Reserved

9.6.24.2 AID Switch Request frame format

A STA that is changing its device characteristic as defined in 9.4.2.192 uses the AID Switch Request frame to request the frame's recipient to change its AID or to request a group AID from an AP. The Action field of the AID Switch Request frame contains the information shown in Table 9-611.

Table 9-611—AID Switch Request frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	Dialog Token
4	AID Request (see 9.4.2.192)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

The Dialog Token field is defined in 9.4.1.12. It is a value chosen by the non-AP STA sending the AID Switch Request frame to identify the request/response transaction.

The AID Request field contains an AID Request element as specified in 9.4.2.192.

9.6.24.3 AID Switch Response frame format

The AID Switch Response frame is sent by an AP in response to an AID Switch Request frame, or sent by an AP to a non-AP STA to instruct the STA to change its AID or wakeup interval and it is sent by an AP to assign a group AID to a requesting STA. The Action field of the AID Switch Response frame contains the information shown in Table 9-612.

Table 9-612—AID Switch Response frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	Dialog Token
4	AID Response (see 9.4.2.193)

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

The Dialog Token field is defined in 9.4.1.12. It is the value in the corresponding AID Switch Request frame. If the AID Switch Response frame is not being transmitted in response to an AID Switch Request frame, then the Dialog token is set to 0.

The AID Response field contains an AID Response element as specified in 9.4.2.193.

9.6.24.4 Sync Control frame format

The Sync Control frame is transmitted by a non-AP STA to a UL-Sync capable AP to enable or disable sync frame transmission for uplink traffic (see 10.48). The Action field of a Sync Control frame contains the information shown in Table 9-613.

Table 9-613—Sync Control frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	Sync Control (see 9.4.1.56)

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

The Sync Control field is defined in 9.4.1.56.

9.6.24.5 STA Information Announcement frame format

The STA Information Announcement frame is either used by a non-AP STA to inform the peer STAs of the updated AID when a STA's AID is changed or used by a relay STA to inform the AP of a newly associated STA's AID or the updated AID when a STA's AID is changed. The Action field of the STA Information Announcement frame contains the information shown in Table 9-614.

Table 9-614—STA Information Announcement frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	AID Announcement (9.4.2.207)

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

The AID Announcement field contains an AID Announcement element as specified in 9.4.2.207.

9.6.24.6 EDCA Parameter Set frame format

The EDCA Parameter Set frame is used to update the EDCA Parameter Set at the recipient STA, as defined in 10.2.3.2). The Action field of the EDCA Parameter Set frame contains the information shown in Table 9-615.

Table 9-615—EDCA Parameter Set frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	EDCA Parameter Set (9.4.2.27)

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

The EDCA Parameter Set field contains an EDCA Parameter Set element as specified in 9.4.2.27.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.24.7 EL Operation frame format

The EL Operation frame is used to carry the EL Operation element (9.4.2.209). The Action field of the EL Operation frame contains the information shown in Table 9-616

Table 9-616—EL Operation Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	EL Operation (9.4.2.209)

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

The EL Operation field contains an EL Operation element as specified in 9.4.2.209.

9.6.24.8 TWT Setup frame format

The TWT Setup frame is sent by a STA to request the setup of a TWT SP and it is sent by a responding STA to indicate the status of a requested TWT SP. The Action field of the TWT Setup frame contains the information shown in Table 9-617.

Table 9-617—TWT Setup frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	Dialog Token
4	One or two TWT (9.4.2.198)

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

The Dialog Token field is defined in 9.4.1.12. In a TWT Setup frame with a TWT Request field that is set to 1, the Dialog Token field is set to a nonzero value chosen by the transmitting STA to identify the request/response transaction. In a TWT Setup frame with a TWT Request field set to 0 that is sent in response to a TWT Setup frame with a TWT Request field that is equal to 1, the Dialog Token field is set to the value copied from the corresponding received TWT Setup frame with a TWT Request field equal to 1. In a TWT Setup frame with a TWT Request field set to 0 that is not sent in response to a TWT Setup frame with a TWT Request field equal to 1, the Dialog Token field is set to 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A TWT Setup frame contains only one TWT element, except if used for the establishment of a TWT agreement with a range of TWT parameter values (see 10.47.9 (TWT parameter ranges)). In this case, an additional TWT element is present.

9.6.24.9 TWT Teardown frame format

The TWT Teardown frame is sent by a STA to request the teardown of a TWT agreement and is transmitted by either STA of an existing TWT agreement. The Action field of the TWT Teardown frame contains the information shown in Table 9-618.

Table 9-618—TWT Teardown frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	TWT Flow

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

The format of the TWT Flow field if the Negotiation Type subfield is 0 or 1 is defined in Figure 9-1317. The format of the TWT Flow field if the Negotiation Type field is 2 is defined in Figure 9-1318. The format of the TWT Flow field if the Negotiation Type subfield is 3 is defined in Figure 9-1319.

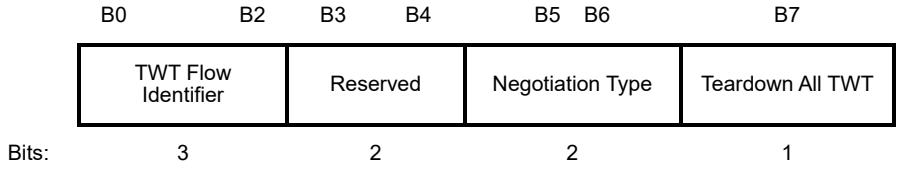

Figure 9-1317—TWT Flow field format if the Negotiation Type subfield is 0 or 1

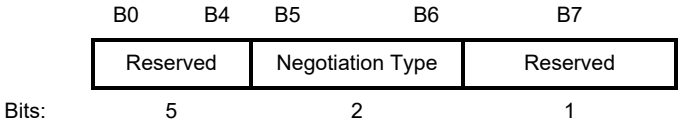

Figure 9-1318—TWT Flow field format if the Negotiation Type subfield is 2

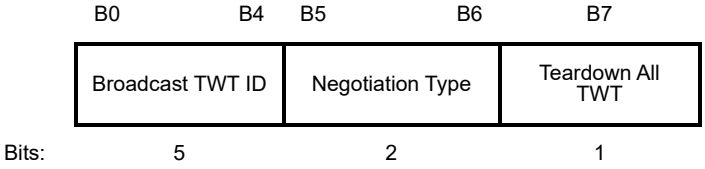

Figure 9-1319—TWT Flow field format if the Negotiation Type subfield is 3

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The TWT Flow Identifier/Broadcast TWT ID field contains the TWT Flow Identifier when the Negotiation Type subfield is 0 or 1 and contains the Broadcast TWT ID field when the Negotiation Type subfield is 3. The TWT Flow Identifier field and the Broadcast TWT ID field are ~~is~~ defined in 9.4.2.198 and are reserved if the Teardown All TWT field is 1.

The TWT Flow Identifier field in a TWT Teardown frame is set to the value of the TWT Flow Identifier field of the TWT element in the frame that successfully concluded the setup of the TWT that is the subject of the teardown request. The Broadcast TWT ID field of a TWT Teardown frame is set to the value of the Broadcast TWT identifier of the broadcast TWT schedule that is subject of the teardown request.

The Negotiation Type subfield indicates the type of negotiation that is subject to the teardown request and is set as defined in Table 9-346. An S1G STA sets the Negotiation Type subfield to 0. The Negotiation Type subfield is reserved if the Teardown All TWT field is 1.

The Teardown All TWT field is set to 1 by an HE STA to indicate that the TWT Teardown frame tears down all TWTs as defined in 26.8. Otherwise, it is set to 0.

9.6.24.10 Sectorized Group ID List frame format

The Sectorized Group ID List frame is an Action or Action No Ack frame of category Unprotected S1G Action. The frame is used to allocate/change sectorized group IDs to a STA. The format of its Action field is defined in Table 9-619.

Table 9-619—Sectorized Group ID List frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	Sectorized Group ID List (9.4.2.210)

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

The Sectorized Group ID List field contains a Sectorized Group ID List as specified in 9.4.2.210.

9.6.24.11 Sector ID Feedback frame format

The Sector ID Feedback frame is an Action or Action No Ack frame of category Unprotected S1G. The format of its Action field is defined in Table 9-620.

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-620—Sector ID Feedback frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	Sector ID Index

The Sector ID index field is shown in Figure 9-1320.

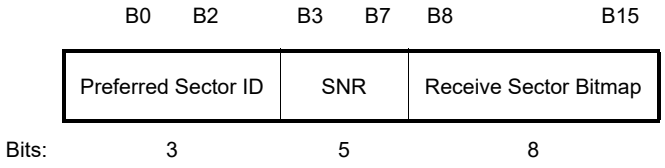

Figure 9-1320—Sector ID Index format

The Preferred Sector ID field indicates the sector selected by the STA. The method in which a STA selects the Sector ID is out of the scope of this standard.

The SNR field indicates the received SNR at the preferred Sector, 0 to 30 represents SNR values from –3 to 27 dB, respectively. If the SNR value is less than –3 dB, set to 0. If the SNR value is greater than 27 dB, set to 30. 31 indicates no feedback.

The Receive Sector Bitmap field indicates a bit map. A bit position equal to 0 within the bit map indicates that the STA does not receive the AP signal in the corresponding Sector ID. A bit position equal to 1 within the bit map indicates that the STA does receive the AP signal in the corresponding Sector ID. The position of the bit map (0 to 7) corresponding to the sector ID (see Figure 9-1321).

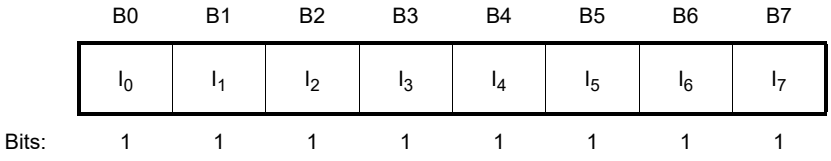

Figure 9-1321—Receive Sector Bitmap format

9.6.24.12 TWT Information frame format

The TWT Information frame is sent by a STA to request or deliver information about a TWT and is transmitted by either STA of an existing TWT agreement or is transmitted by a STA to a peer STA that has indicated support of its reception. The Action field of the TWT Information frame contains the information shown in Table 9-621.

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-621—TWT Information frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	TWT Information (9.4.1.58)

9.6.25 S1G Action frame details

9.6.25.1 S1G Action field

The S1G Action field values are specified in Table 9-622.

Table 9-622—S1G Action field values

S1G Action field value	Description
0	Reachable Address Update
1	Relay Activation Request
2	Relay Activation Response
3	Header Compression
4	Protected TWT Setup
5	Protected TWT Teardown
6	Protected TWT Information
7	Protected AID Switch Request
8	Protected AID Switch Response
9	Protected Sync Control
10	Protected STA Information Announcement
11	Protected EDCA Parameter Set
12	Protected EL Operation
13	Protected Sectorized Group ID List
14	Protected Sector ID Feedback
15–255	Reserved

9.6.25.2 Reachable Address Update frame format

The Reachable Address Update frame is used to update the addresses that can be reached through a relay STA. The format of the Reachable Address Update frame Action field is shown in Table 9-623.

The Category field is defined in 9.4.1.11.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Order	Information
1	Category
2	S1G Action
3	Reachable Address

The S1G Action field is defined in 9.6.25.1.

The Reachable Address element (as specified by 9.4.2.204) contains the addresses whose reachability through the S1G relay STA is being updated.

9.6.25.3 Relay Activation Request frame format

The Relay Activation Request frame is used by the STA or AP to Request start or terminate a relay function. The format of the Relay Activation Request frame Action field is shown in Table 9-624.

Table 9-624—Relay Activation Request frame Action field format

Order	Information
1	Category
2	S1G Action
3	Relay Activation

The Category field is defined in 9.4.1.11.

The S1G Action field is defined in 9.6.25.1.

The Relay Activation Mode subfield of the S1G Relay Activation element (as specified by 9.4.2.205) included in the Relay Activation Request frame is set to 1.

9.6.25.4 Relay Activation Response frame format

The Relay Activation Response frame is used by the STA or AP to confirm or reject the start or the termination of the relay function. The format of the Relay Activation Response frame Action field is shown in Table 9-625.

Table 9-625—Relay Activation Response frame Action field format

The Category field is defined in 9.4.1.11.

The S1G Action field is defined in 9.6.25.1.

The Relay Activation Mode subfield of the S1G Relay Activation element (as specified by 9.4.2.205) included in the Relay Activation Response frame is set to 0.

9.6.25.5 Header Compression frame format

The Header Compression frame is used to update information at the recipient STA, as defined in 10.57. The Header Compression frame Action field contains the information shown in Table 9-626.

Table 9-626—Header Compression frame Action field format

Order	Information
1	Category
2	S1G Action
3	Dialog Token
4	Header Compression (see 9.4.2.212)

The Category field is defined in 9.4.1.11.

The S1G Action field is defined in 9.6.25.1.

The Dialog Token field is defined in 9.4.1.12. It is is a value chosen by the STA sending the Header Compression frame to identify the request/response transaction.

The Header Compression field contains a Header Compression element as specified in 9.4.2.212.

9.6.25.6 Protected TWT Setup frame format

The Protected TWT Setup frame allows robust STA-STA communication of the same information that is conveyed in the TWT Setup frame that is not robust (see 9.6.24.1).

The Action field of the Protected TWT Setup frame has the same format as the Action field of the unprotected TWT Setup frame (see 9.6.24.8), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1, instead of the Unprotected S1G Action field.

9.6.25.7 Protected TWT Teardown frame format

The Protected TWT Teardown frame allows robust STA-STA communication of the same information that is conveyed in the TWT Teardown frame that is not robust (see 9.6.24.1).

The Action field of the Protected TWT Teardown frame has the same format as the Action field of the unprotected TWT Teardown frame (see 9.6.24.9), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1, instead of the Unprotected S1G Action field.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.25.8 Protected TWT Information frame format

The Protected TWT Information frame allows robust STA-STA communication of the same information that is conveyed in the TWT Information frame that is not robust (see 9.6.24.1).

The Action field of the Protected TWT Information frame has the same format as the Action field of the unprotected TWT Information frame (see 9.6.24.12), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1, instead of the Unprotected S1G Action field.

9.6.25.9 Protected AID Switch Request frame format

The Protected AID Switch Request frame allows robust STA-STA communication of the same information that is conveyed in the AID Switch Request frame that is not robust (see 9.6.24.1).

The Action field of the Protected AID Switch Request frame has the same format as the Action field of the unprotected AID Switch Request frame (see 9.6.24.2), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1, instead of the Unprotected S1G Action field.

9.6.25.10 Protected AID Switch Response frame format

The Protected AID Switch Response frame is an Action frame of category S1G and is defined to allow robust STA-STA communication of the same information that is conveyed in the AID Switch Response frame that is not robust (see 9.6.24.1).

The Action field of the Protected AID Switch Response frame has the same format as the Action field of the unprotected AID Switch Response frame (see 9.6.24.3), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1, instead of the Unprotected S1G Action field.

9.6.25.11 Protected Sync Control frame format

The Protected Sync Control frame is an Action frame of category S1G and is defined to allow robust STA-STA communication of the same information that is conveyed in the Sync Control frame that is not robust (see 9.6.24.1).

The Action field of the Protected Sync Control frame has the same format as the Action field of the unprotected Sync Control frame (see 9.6.24.4), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1, instead of the Unprotected S1G Action field.

9.6.25.12 Protected STA Information Announcement frame format

The Protected STA Information Announcement frame is an Action frame of category S1G and is defined to allow robust STA-STA communication of the same information that is conveyed in the STA Information Announcement frame that is not robust (see 9.6.24.1).

The Action field of the Protected STA Information Announcement frame has the same format as the Action field of the unprotected STA Information Announcement frame (see 9.6.24.5), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1, instead of the Unprotected S1G Action field.

9.6.25.13 Protected EDCA Parameter Set frame format

The Protected EDCA Parameter Set frame is an Action frame of category S1G and is defined to allow robust STA-STA communication of the same information that is conveyed in the EDCA Parameter Set frame that is not robust (see 9.6.24.1).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Action field of the Protected EDCA Parameter Set frame has the same format as the Action field of the unprotected EDCA Parameter Set frame (see 9.6.24.6), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1, instead of the Unprotected S1G Action field.

9.6.25.14 Protected EL Operation frame format

The Protected EL Operation frame is an Action frame of category S1G and is defined to allow robust STA-STA communication of the same information that is conveyed in the EL Operation frame that is not robust (see 9.6.24.1).

The Action field of the Protected EL Operation frame has the same format as the Action field of the unprotected EL Operation frame (see 9.6.24.7), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1, instead of the Unprotected S1G Action field.

9.6.25.15 Protected Sectorized Group ID List frame format

The Protected Sectorized Group ID List frame is an Action frame of category S1G and is defined to allow robust STA-STA communication of the same information that is conveyed in the Sectorized Group ID List frame that is not robust (see 9.6.24.1).

The Action field of the Protected Sectorized Group ID List frame has the same format as the Action field of the unprotected Sectorized Group ID List frame (see 9.6.24.10), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1, instead of the Unprotected S1G Action field.

9.6.25.16 Protected Sector ID Feedback frame format

The Protected Sector ID Feedback frame is an Action frame of category S1G and is defined to allow robust STA-STA communication of the same information that is conveyed in the Sector ID Feedback frame that is not robust (see 9.6.24.1 (Unprotected S1G Action field)).

The Action field of the Protected Sector ID Feedback frame has the same format as the Action field of the unprotected Sector ID Feedback frame (see 9.6.24.11), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1 (S1G Action field), instead of the Unprotected S1G Action field.

9.6.26 Flow Control Action frame details

9.6.26.1 Flow Control Action field

The Flow Control Action field values are specified in Table 9-627.

Table 9-627—Flow Control Action field format

Flow Control Action field value	Description	Time priority
0	Flow suspension	Yes when transmitted as an Action no Ack frame
1	Flow resumption	Yes when transmitted as an Action no Ack frame
2–255	Reserved

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.26.2 Flow Suspension frame format

The Flow Suspension frame is an Action or an Action No Ack frame of category Flow Control Action used by a STA to suspend incoming transmissions for an amount of time indicated in the Suspend Duration field. The format of the Flow Suspension frame Action field is shown in Table 9-628.

Table 9-628—Flow Suspension frame Action field format

Order	Information
1	Category
2	Flow Control Action
3	Suspend Duration

The Category field is defined in 9.4.1.11.

The Flow Control Action field is defined in 9.6.26.1.

The Suspend Duration field is 2 octets and denotes the amount of time, in microseconds, during which the intended recipient STAs are not allowed to transmit Data frames to the STA identified by the TA field of the Flow Suspension frame.

9.6.26.3 Flow Resumption frame format

The Flow Resumption frame is an Action or an Action No Ack frame of category Flow Control Action used by the STA identified by the TA field of the frame to cancel any outstanding flow suspension time the STA had previously invoked through the transmission of a Flow Suspension, BAT, TACK, STACK, or NDP Ack frame as described in 10.60. The format of the Flow Resumption frame Action field is shown in Table 9-629.

Table 9-629—Flow Resumption frame Action field format

Order	Information
1	Category
2	Flow Control Action

The Category field is defined in 9.4.1.11.

The Flow Control Action field is defined in 9.6.26.1.

9.6.27 Control Response MCS Negotiation Action frame details

9.6.27.1 Control Response MCS Negotiation Action field

The Control Response MCS Negotiation Action field values are specified in Table 9-630.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-630—Control Response MCS Negotiation Action field values

MCS Negotiation Action field value	Description
0	Control Response MCS Negotiation Request
1	Control Response MCS Negotiation Response
2–255	Reserved

9.6.27.2 Control Response MCS Negotiation Request frame format

The Control Response MCS Negotiation Request frame is used by a STA to negotiate with its peer STA the requested MCS for transmitting control response frame as defined in 10.6.6.5.3. The format of the Action field of the Control Response MCS Negotiation Request frame is shown Table 9-631.

Table 9-631—Control Response Negotiation Request frame Action field format

Order	Information
1	Category
2	Control Response MCS Negotiation Action
3	MCS Difference

The Category field is defined in 9.4.1.11.

The Control Response MCS Negotiation Action field is defined in 9.6.27.1.

The MCS Difference field is 1 octet and is set to an unsigned value that represents the MCS difference between the index of the primary MCS and the index of the MCS that is preferred for use by the STA to transmit control response frame as described in 10.6.6.5.6.

9.6.27.3 Control Response MCS Negotiation Response frame format

The Control Response MCS Negotiation Response frame is used to indicate a response to a Control Response MCS Negotiation Request frame, which is either Accept or Reject, and the MCS Difference proposed by the Requesting STA. The format of the Action field of the Control Response MCS Negotiation Response frame is shown in Table 9-632.

Table 9-632—Control Response MCS Negotiation Response frame Action field format

Order	Information
1	Category
2	Control Response MCS Negotiation Action
3	Command

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The Control Response MCS Negotiation Action field is defined in 9.6.27.1.

The Command field is 1 octet and is set to a value from the Table 9-633 to represent accepting or rejecting the proposed MCS Difference by the Control Response MCS Negotiation Request frame as described in 10.6.6.5.6.

Table 9-633—Command values

Values	Description
0	Reject
1	Accept
2–255	Reserved

9.6.28 CDMG Action frame details

9.6.28.1 CDMG Action field

Several Action frame formats are defined to support CDMG features. A CDMG Action field, in the octet immediately after the Category field, differentiates the CDMG Action frame formats. The CDMG Action field values associated with each frame format within the CDMG category are defined in Table 9-634.

Table 9-634—CDMG Action field values

CDMG Action field value	Meaning
0	Notification Period Request frame
1	Notification Period Response frame
2	Channel Splitting Request frame
3	Channel Splitting Response frame
4	CDMG Allocation Request frame
5	CDMG Allocation Response frame

9.6.28.2 Notification Period Request frame format

The format of the Notification Period Request frame Action field is shown in Figure 9-1322.

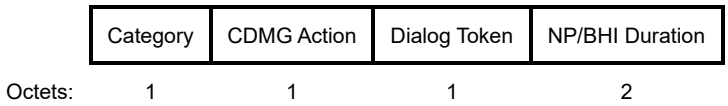

Figure 9-1322—Notification Period Request frame Action field format

The Category field is defined in 9.4.1.11.

The CDMG Action field is defined in 9.6.28.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Dialog Token field is defined in 9.4.1.12. It is defined in 9.4.1.12 and set by the requesting STA.

The NP/BHI Duration field is set to the length of the NP/BHI duration requested by the STA intending to establish its BSS on a free 1.08 GHz channel to the peer STA operating on the adjacent 1.08 GHz channel.

9.6.28.3 Notification Period Response frame format

The format of the Notification Period Response frame Action field is shown in Table 9-635.

Table 9-635—Notification Period Response frame Action field format

Order	Information
0	Category
1	CDMG Action
2	Dialog Token
3	Status Code
4	Dynamic Bandwidth Control

The Category field is defined in 9.4.1.11.

The CDMG Action field is defined in 9.6.28.1.

The Dialog Token field is defined in 9.4.1.12. It is copied from the corresponding Notification Period Request frame.

The Status Code field indicates the result of the notification period allocation request and is defined in 9.4.1.9.

The Dynamic Bandwidth Control element is defined in 9.4.2.219. This element is present if the Status Code field indicates successful; otherwise, it is not present.

9.6.28.4 Channel Splitting Request frame format

The format of the Channel Splitting Request frame Action field is shown in Figure 9-1323.

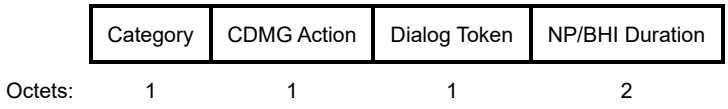

Figure 9-1323—Channel Splitting Request frame Action field format

The Category field is defined in 9.4.1.11.

The CDMG Action field is defined in 9.6.28.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA.

The NP/BHI Duration field is set to the length of the NP/BHI duration requested by the STA intending to establish its BSS on a free 1.08 GHz channel to the peer STA operating on the adjacent 1.08 GHz channel.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.28.5 Channel Splitting Response frame format

The format of the Channel Splitting Response frame Action field is shown in Table 9-636.

Table 9-636—Channel Splitting Response frame Action field format

Order	Information
0	Category
1	CDMG Action
2	Dialog Token
3	Status Code
4	Channel Switch Announcement
5	Beacon Interval
6	Dynamic Bandwidth Control

The Category field is defined in 9.4.1.11.

The CDMG Action field is defined in 9.6.28.1.

The Dialog Token field is defined in 9.4.1.12. It is copied from the corresponding Channel Splitting Request frame.

The Status Code field indicates the result of the channel splitting request and is defined in 9.4.1.11.

The Channel Switch Announcement element is defined in 9.4.2.17. This element is present if the Status Code field indicates successful; otherwise, it is not present.

The Beacon Interval field specifies the beacon interval length on a 2.16 GHz channel set by the STA operating on one of the 1.08 GHz channel after channel splitting and is defined in 9.4.1.3. This element is present if the Status Code field indicates successful; otherwise, it is not present.

The Dynamic Bandwidth Control element specifies the information of the STA operating on a 1.08 GHz channel after channel splitting and is defined in 9.4.2.219. This element is present if the Status Code field indicates successful; otherwise, it is not present.

9.6.28.6 CDMG Allocation Request frame format

The format of the CDMG Allocation Request frame Action field is shown in Figure 9-1324.

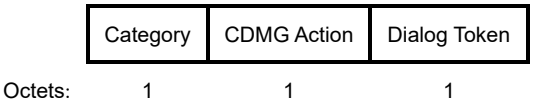

Figure 9-1324—CDMG Allocation Request frame Action field format

The Category field is defined in 9.4.1.11.

The CDMG Action field is defined in 9.6.28.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA.

9.6.28.7 CDMG Allocation Response frame format

The format of the CDMG Allocation Response frame Action field is shown in Table 9-637.

Table 9-637—CDMG Allocation Response frame Action field format

Order	Information
0	Category
1	CDMG Action
2	Dialog Token
3	Status Code
4	Extended Schedule

The Category field is defined in 9.4.1.11.

The CDMG Action field is defined in 9.6.29.1.

The Dialog Token field is defined in 9.4.1.12. It is copied from the corresponding CDMG Allocation Request frame.

The Status Code field indicates the result of the Allocation request and is defined in 9.4.1.9.

The Extended Schedule element indicates all the available time that can be allocated to the DMG STAs on a 2.16 GHz channel by the STA operating on the adjacent 1.08 GHz channel of the STA sending this response and is defined in 9.4.2.130. This element is present if the Status Code field indicates successful; otherwise, it is not present.

9.6.29 CMMG Action frame details

9.6.29.1 CMMG Action field

Several Action frame formats are defined to support CMMG functionality. A CMMG Action field, in the octet immediately after the Category field, differentiates the CMMG Action frame formats. The CMMG Action field values associated with each frame format within the CMMG category are defined in Table 9-638.

Table 9-638—CMMG Action field values

Value	Meaning	Time priority
0	CMMG CSI	Yes
1	CMMG Compressed Beamforming	Yes
2	CMMG Operating Mode Notification	Yes
3–255	Reserved	

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.29.2 CMMG Compressed Beamforming frame format

The CMMG Compressed Beamforming frame is an Action or an Action No Ack frame of category CMMG. The format of its Action field is defined in Table 9-639.

Table 9-639—CMMG Compressed Beamforming frame Action field format

Order	Information
1	Category
2	CMMG Action
3	CMMG MIMO Control (see 9.4.1.59)
4	CMMG Compressed Beamforming Report (see 9.4.1.60)

The Category field is defined in 9.4.1.11.

The CMMG Action field is defined in 9.6.29.1.

The CMMG MIMO Control field (see 9.4.1.59) are used as described in Table 9-115.

The CMMG Compressed Beamforming Report field is defined in 9.4.1.60.

9.6.29.3 CMMG Operating Mode Notification frame format

The CMMG Operating Mode Notification frame is used to notify STAs that the transmitting STA is changing its operating channel width, the maximum number of spatial streams it can receive, or both.

In the context of CMMG STAs, references to an Operating Mode Notification frame or element should be understood as referring to a CMMG Operating Mode Notification frame or element, respectively.

The Action field of the CMMG Operating Mode Notification frame contains the information shown in Table 9-640.

Table 9-640—CMMG Operating Mode Notification frame Action field format

Order	Information
1	Category
2	CMMG Action
3	CMMG Operating Mode (see 9.4.1.61)

The Category field is defined in 9.4.1.11.

The CMMG Action field is defined in 9.6.29.1.

The CMMG Operating Mode field is defined in 9.4.1.61.

9.6.30 GLK Action frame details

9.6.30.1 GLK Action field

A GLK Action field, in the octet immediately after the Category field, differentiates the GLK Action frame formats. The GLK Action field values associated with each frame format within the GLK category are defined in Table 9-641.

Table 9-641—GLK Action field values

Value	Meaning
0	GLK Groupcast Mode Change Notification
1–255	Reserved

9.6.30.2 GLK Groupcast Mode Change Notification

The GLK Groupcast Mode Change Notification frame is used to indicate a change to the GLK groupcast transmission policy. See Table 9-642.

Table 9-642—GLK Groupcast Mode Change Notification frame format

Order	Information
1	Category
2	GLK Action
3	GLK-GCR Parameter Set

The Category field is defined in 9.4.1.11. The GLK Action field is defined in 9.6.30.1. The GLK-GCR Parameter Set element is defined in 9.4.2.233.

9.6.31 HE Action frame details

9.6.31.1 HE Action field

An HE Action field, in the octet immediately after the Category field, differentiates the HE Action frame formats. The HE Action field values associated with each frame format within the HE category are defined in Table 9-643.

Table 9-643—HE Action field values

Value	Meaning	Time priority
0	HE Compressed Beamforming/CQI	Yes
1	Quiet Time Period	No
2	OPS	No
3–255	Reserved	

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.31.2 HE Compressed Beamforming/CQI frame format

The HE Compressed Beamforming/CQI frame is an Action No Ack frame of category HE. The Action field of an HE Compressed Beamforming/CQI frame contains the information shown in Table 9-644.

Table 9-644—HE Compressed Beamforming/CQI frame Action field format

Order	Information	Notes
1	Category	
2	HE Action	
3	HE MIMO Control (see 9.4.1.62)	
4	HE Sounding Feedback Segment (see 9.4.1.67)	Optional

The Category field is defined in Table 9-81.

The HE Action field is defined in 9.6.31.1.

A Vendor Specific element is not present in the HE Compressed Beamforming/CQI frame.

9.6.31.3 Quiet Time Period action frame format

The Quiet Time Period action frame is an Action No Ack frame of category HE. The Action field of a Quiet Time Period contains the information shown in Table 9-645.

Table 9-645—Quiet Time Period frame body

Order	Information
1	Category
2	HE Action
3	Quiet Time Period element (see 9.4.2.254)

The Category field is defined in Table 9-81.

The HE Action field is defined in 9.6.31.1.

The Quiet Time Period element is defined in 9.4.2.254.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.31.4 OPS frame format

The OPS frame is an Action No Ack frame of category HE. The Action field of an OPS frame contains the information shown in Table 9-646.

Table 9-646—OPS frame Action field format

Order	Information
1	Category
2	HE Action
3	TIM element (see 9.4.2.5)
4	OPS element (see 9.4.2.256)

The Category field is defined in Table 9-81.

The HE Action field is defined in 9.6.31.1.

9.6.32 Protected HE Action frame details

9.6.32.1 Protected HE Action field

A Protected HE Action field, in the octet immediately after the Category field, differentiates the Protected HE Action frame formats. The Protected HE Action field values associated with each frame format within the Protected HE category are defined in Table 9-647.

Table 9-647—Protected HE Action field values

Value	Meaning
0	HE BSS Color Change Announcement
1	MU EDCA Reset
2–255	Reserved

9.6.32.2 HE BSS Color Change Announcement frame format

The HE BSS Color Change Announcement frame is an Action or Action No Ack frame of category Protected HE. The Action field of an HE BSS Color Change Announcement frame contains the information shown in Table 9-648.

Table 9-648—HE BSS Color Change Announcement frame Action field format

Order	Information
1	Category
2	Protected HE Action
3	BSS Color Change Announcement element (see 9.4.2.253)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—An HE AP might send an HE BSS Color Change Announcement frame as an Action frame to a STA that appears to have missed a color change announcement and is transmitting with the old color.

The Category field is defined in Table 9-81.

The Protected HE Action field is defined in 9.6.32.1.

9.6.32.3 MU EDCA Reset frame format

The MU EDCA Reset frame is an Action frame of category Protected HE. The Action field of an MU EDCA Reset frame contains the information shown in Table 9-649.

Table 9-649—MU EDCA Reset frame Action field format

Order	Information
1	Category
2	Protected HE Action
3	MU EDCA Control

The Category field is defined in Table 9-81.

The Protected HE Action field is defined in 9.6.32.1.

The MU EDCA Control field is defined in Figure 9-1325.

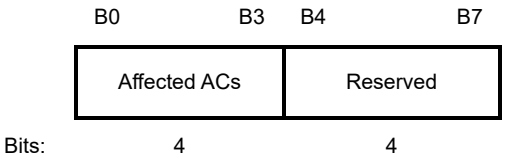

Figure 9-1325—MU EDCA Control field format

The Affected ACs subfield contains a bitmap that indicates the ACs for which the MUEDCATimer[AC] as defined in 26.2.7 are reset to 0 upon receipt of the MU EDCA Reset frame for affected STAs. Each bit in the bitmap corresponds to one AC with B0 mapped to AC_BK, B1 mapped to AC_BE, B2 mapped to AC_VI and B3 mapped to AC_VO. A value of 1 in the bit position corresponding to a given AC indicates that the MUEDCATimer[AC] for that AC is reset to 0; otherwise, the value of the bit is 0.

9.6.33 WUR Action frame details

9.6.33.1 WUR Action field

Several Action frame formats are defined to support WUR functionalities. A WUR Action field, in the octet field immediately after the Category field, differentiates the formats. The WUR Action field values associated with each frame format are defined in Table 9-650.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-650—WUR Action field values

Value	Meaning
0	WUR Mode Setup
1	WUR Mode Teardown
2	WUR Wake-up Indication
3–255	Reserved

9.6.33.2 WUR Mode Setup frame format

The WUR Mode Setup frame is an Action frame of category WUR. The Action field of a WUR Mode Setup frame contains the information shown in Table 9-651.

Table 9-651—WUR Mode Setup frame Action field format

Order	Information
1	Category
2	WUR Action
3	Dialog Token
4	WUR Mode element (see 9.4.2.292)
5	WUR Operation element (optional) (see 9.4.2.291)
6	WUR PN Update (optional) (see 9.4.2.294)

In a WUR Mode Setup frame with the Action Type field of the WUR Mode element equal to “Enter WUR Mode Suspend Request” or “Enter WUR Mode Request”, the Dialog Token field is set to a nonzero value chosen by the transmitting STA to identify the request/response transaction.

In a WUR Mode Setup frame with the Action Type field of the WUR Mode element equal to “Enter WUR Mode Suspend Response” or “Enter WUR Mode Response”, the Dialog Token field is set to the value copied from the corresponding received WUR Mode Setup frame with the Action Type field of the carrying WUR Mode element equal to “Enter WUR Mode Suspend Request” or “Enter WUR Mode Request”

In a WUR Mode Setup frame with the Action Type field of the WUR Mode element equal to “Enter WUR Mode Suspend” or “Enter WUR Mode”, the Dialog Token field is set to 0.

The WUR Mode element field contains a WUR Mode element as defined in 9.4.2.292.

The WUR Operation element field contains a WUR Operation element as defined in 9.4.2.291.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The WUR PN Update field contains one or more WUR PN Update elements as defined in 9.4.2.294.

9.6.33.3 WUR Mode Teardown frame format

The WUR Mode Teardown frame is an Action frame of category WUR. The Action field of a WUR Mode Teardown frame contains the information shown in Table 9-652.

Table 9-652—WUR Mode Teardown frame Action field format

Order	Information
1	Category
2	WUR Action

The Category field is defined in Table 9-81.

The WUR Action field is defined in 9.6.33.1.

9.6.33.4 WUR Wake-up Indication frame format

The WUR Wake-up Indication frame is an Action frame of category WUR. The Action field of a WUR Wake-up Indication frame contains the information shown in Table 9-653.

Table 9-653—WUR Wake-up Indication frame Action field format

Order	Information
1	Category
2	WUR Action
3	WUR Wake-up Indication

The Category field is defined in Table 9-81.

The WUR Action field is defined in 9.6.33.1.

The WUR Wake-up Indication field is 8 bits in size and contains an unsigned integer.

The WUR Wake-up Indication field is defined in Table 9-654.

Table 9-654—WUR Wake-up Indication field values

Value	Description
0	UNSOLICITED_WAKEUP
1–255	Reserved

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.6.34 Protected Fine Timing Action frame details

9.6.34.1 Protected Fine Timing Action field

The Protected Fine Timing Action field, in the octet immediately after the Category field, differentiates between various Protected Fine Timing frames as shown in the Table 9-655.

Table 9-655—Protected Fine Timing Action field values

Value	Meaning
0	Reserved.
1	Protected FTMR frame. The format of frame after the Action field is identical to the format of the FTM Request frame; see 9.6.7.32. It is carried in an Action frame.
2	Protected FTM frame. The format of the frame after the Action field is identical to the format of the FTM frame; see 9.6.7.33. It is carried in an Action frame.
3	Protected LMR frame. The format of the frame after the Action field is identical to the format of the LMR frame; see 9.6.7.49. It is carried in an Action No Ack frame.
4–255	Reserved.

9.6.35 EBCS Action frame details

9.6.35.1 EBCS Action field

Two Action frame formats are defined to support EBCS functionalities. The EBCS Action field, in the octet field immediately after the Category field, differentiates the formats. The EBCS Action field values associated with each frame format are defined in Table 9-656.

Table 9-656—EBCS Action field values

Value	Meaning
0	EBCS content request
1	EBCS content response
2–255	Reserved

9.6.35.2 EBCS Content Request frame format

The EBCS Content Request frame is an Action frame of category EBCS. The EBCS Content Request frame is transmitted by a STA to its associated EBCS AP to request one or more EBCS traffic streams. The Action field of an EBCS Content Request frame contains the information shown in Table 9-657.

The Category field is defined in Table 9-81.

The EBCS Action field is set to 0 to indicate an EBCS content request as defined in Table 9-656.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-657—EBCS Content Request frame Action field format

Order	Information
1	Category
2	EBCS Action
3	Dialog Token
4	EBCS Content Request

The Dialog Token field is defined in 9.4.1.12.

In an EBCS Content Request frame, the Dialog Token field is set to a nonzero value chosen by the transmitting STA to identify the request/response transaction.

The EBCS Content Request field is defined in 9.4.1.68.

9.6.35.3 EBCS Content Response frame format

The EBCS Content Response frame is an Action frame of category EBCS. The EBCS Content Response frame is transmitted by an EBCS AP to an associated EBCS non-AP STA in response to an EBCS Content Request frame received from the EBCS STA. The Action field of an EBCS Content Response frame contains the information shown in Table 9-658.

The Category field is defined in Table 9-81.

The EBCS Action field is set to 1 to indicate an EBCS content response as defined in Table 9-656.

The Dialog Token field is defined in 9.4.1.12. The Dialog Token field is set to the value contained in the Dialog Token field in the corresponding received EBCS Content Request frame.

The EBCS Content Response field is defined in 9.4.1.69.

Table 9-658—EBCS Content Response frame Action field format

Field	Information
1	Category
2	EBCS Action
3	Dialog Token
4	EBCS Content Response

9.7 Aggregate MPDU (A-MPDU)

9.7.1 A-MPDU format

An A-MPDU consists of a sequence of one or more A-MPDU subframes and a variable amount of EOF padding as shown in Figure 9-1326 (A-MPDU format).

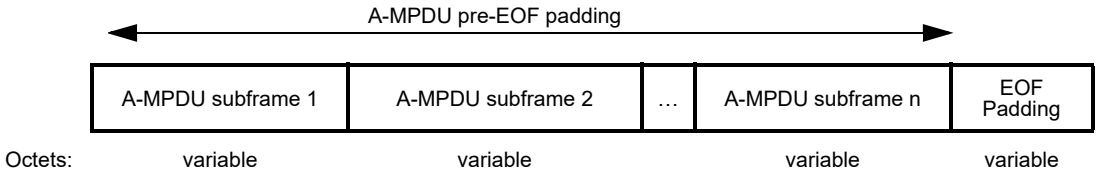

Figure 9-1326—A-MPDU format

The structure of the A-MPDU subframe is shown in Figure 9-1328. Each A-MPDU subframe consists of an MPDU delimiter optionally followed by an MPDU. Each nonfinal A-MPDU subframe in an A-MPDU has padding octets appended to make the subframe a multiple of 4 octets in length. The content of these octets is unspecified.

In an HT, DMG or NGV PPDU, the final A-MPDU subframe is not padded. In a VHT, EDMG, or S1G PPDU, padding is added as described below.

The EOF Padding field is shown in Figure 9-1327. This is present only in a VHT, EDMG, S1G, or HE PPDU.

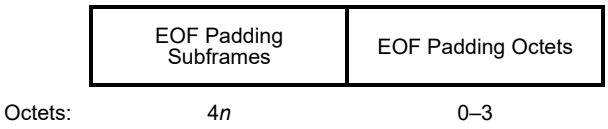

Figure 9-1327—EOF Padding field format

The EOF Padding Subframes subfield contains zero or more EOF padding subframes. An EOF padding subframe is an A-MPDU subframe with 0 in the MPDU Length field and 1 in the EOF/Tag field.

In a VHT, EDMG, S1G, or HE PPDU, the following padding is present, as determined by the rules in 10.12.6:

— 0–3 octets in the Padding subfield of the final A-MPDU subframe (see Figure 9-1328 (A-MPDU subframe format)) before any EOF padding subframes. The content of these octets is unspecified.
— Zero or more EOF padding subframes in the EOF Padding Subframes subfield.
— 0–3 octets in the EOF Padding Octets subfield. The content of these octets is unspecified.

An A-MPDU pre-EOF padding refers to the contents of the A-MPDU up to, but not including, the EOF Padding field.

NOTE 1—A-MPDU pre-EOF padding includes any A-MPDU subframes with 0 in the MPDU Length field and 0 in the EOF/Tag field inserted in order to meet the minimum MPDU start spacing requirement.

The maximum length of an A-MPDU in an HT PPDU is 65 535 octets. The maximum length of an A-MPDU in a DMG PPDU is 262 143 octets. The maximum length of an A-MPDU pre-EOF padding in a VHT PPDU is 1 048 575 octets. The maximum length of an A-MPDU pre-EOF padding in an HE PPDU is 6 500 631 octets. The maximum length of an A-MPDU in an EDMG PPDU is 4 194 303 octets. The length of an A-MPDU addressed to a particular STA can be further constrained as described in 10.12.2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

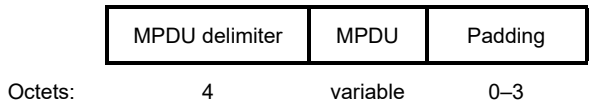

Figure 9-1328—A-MPDU subframe format

The structure of the MPDU delimiter is defined in Figure 9-1329.

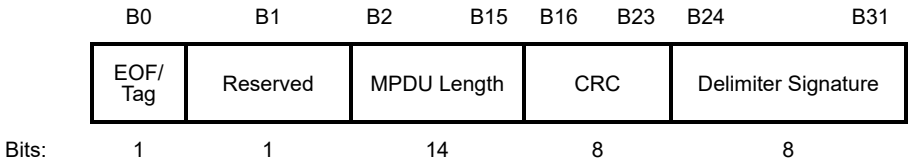

Figure 9-1329—MPDU delimiter

The fields of the MPDU delimiter are defined in Table 9-659.

Table 9-659—MPDU delimiter fields

Field	Size (bits)	Description
EOF/Tag	1	End of frame indication if the MPDU Length field is 0. Set to 1 in an A-MPDU subframe that has 0 in the MPDU Length field and that is used to pad the A-MPDU in a VHT or HE PPDU as described in 10.12.6. Set to 1 in the MPDU delimiter of an S-MPDU as described in 10.12.7. Tagged/untagged indication if the MPDU Length field is nonzero. Set to 1 in an MPDU delimiter preceding a QoS Data frame or Management frame soliciting an Ack frame or Per AID TID Info field with the Ack Type field set to 1 in a Multi-STA BlockAck frame in a response that is contained in an ack-enabled multi-TID A-MPDU as described in 26.6.3.4and ack-enabled single-TID A-MPDU as described in 26.6.3.2. Set to 0 otherwise. In a DMG PPDU, this field is reserved. In an EDMG PPDU, it is set to 1 in EOF padding subframes and set to 0 otherwise (see 10.12.7).
Reserved	1	
MPDU Length	14	Length of the MPDU in octets. Set to 0 if no MPDU is present. An A-MPDU subframe with 0 in the MPDU Length field is used as defined in 10.12.3 to meet the minimum MPDU start spacing requirement and also to pad the A-MPDU to fill the available octets in a VHT or HE PPDU as defined in 10.12.6.
CRC	8	8-bit CRC of the preceding 16 bits.
Delimiter Signature	8	Pattern that can be used to detect an MPDU delimiter when scanning for an MPDU delimiter. The unique pattern is 0x4E, which is the ASCII value of the character “N”.

The format of the MPDU Length field when transmitted by a non-DMG STA is shown in Figure 9-1330. The MPDU Length Low subfield contains the 12 low order bits of the MPDU length. In a VHT or HE PPDU, the MPDU Length High subfield contains the two high order bits of the MPDU length. In an HT PPDU, the MPDU Length High subfield is reserved.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

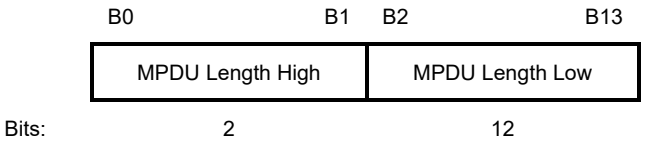

Figure 9-1330—MPDU Length field format (non-DMG)

The format of the MPDU Length field when transmitted by a DMG STA is shown in Figure 9-1331. The MPDU Length Low subfield contains the 13 low order bits of the MPDU length. The MPDU Length High subfield contains one high order bit of the MPDU length.

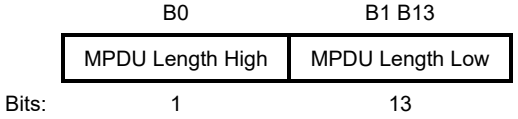

Figure 9-1331—MPDU Length field format (DMG)

The MPDU length value is derived from the MPDU Length field subfields as follows:

$$L_{MPDU} = \begin{cases} L_{low} + L_{high} \times 4096, & \text{for a VHT and HE PPDU} \\ L_{low}, & \text{for an HT PPDU} \\ L_{low} + L_{high} \times 8192, & \text{for a DMG and EDMG PPDU} \end{cases} \quad (9\text{-}16)$$

where

L_{low} is the value of the MPDU Length Low subfield
L_{high} is the value of the MPDU Length High subfield
L is the value of the MPDU Length field

NOTE 2—The format of the MPDU Length field maintains a common encoding structure for HE, VHT, and HT PPDUs. For HT PPDUs, only the MPDU Length Low subfield is used, while for VHT and HE PPDUs, both subfields are used.

9.7.2 MPDU delimiter CRC field

The purpose of the MPDU delimiter is to locate the MPDUs within the A-MPDU so that the structure of the A-MPDU can usually be recovered when one or more MPDU delimiters are received with errors. See O.2 for a description of a deaggregation algorithm.

The MPDU delimiter CRC field is a CRC value used as a check sequence to protect the fields that precede it in the MPDU delimiter. The CRC field is the 1s complement of the remainder generated by the modulo 2 division of the protected bits by the polynomial $x^8 + x^2 + x^1 + 1$, where the shift-register state is preset to all 1s.

NOTE—The order of transmission of bits within the CRC field is defined in 9.2.2.

Figure 9-1332 illustrates the CRC calculation for the MPDU delimiter.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

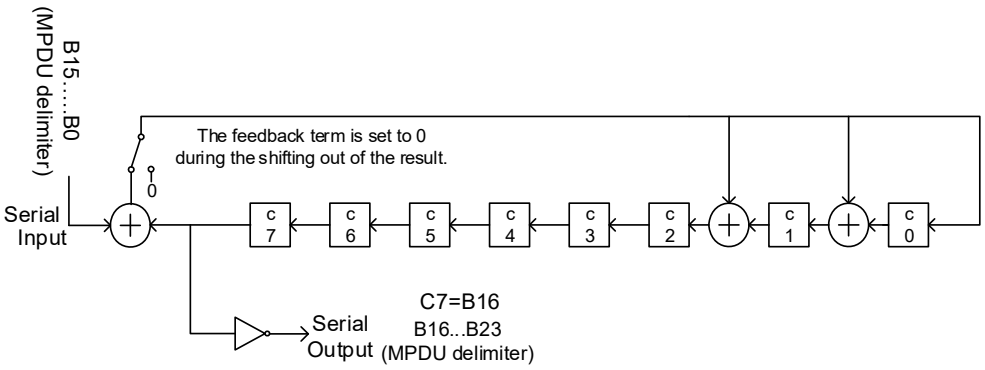

Figure 9-1332—MPDU delimiter CRC calculation

9.7.3 A-MPDU contents

In a non-DMG PPDU, an A-MPDU is a sequence of A-MPDU subframes carried in a single PPDU with one of the following combinations of RXVECTOR or TXVECTOR parameter values:

- The FORMAT parameter set to VHT
- The FORMAT parameter set to HT_MF or HT_GF and the AGGREGATION parameter set to 1
- The FORMAT parameter set to S1G, S1G_DUP_1M, or S1G_DUP_2M and the AGGREGATION parameter set to 1.
- The FORMAT parameter set to HE_SU, HE_MU, HE_TB, or HE_ER_SU.
- The FORMAT parameter set to NGV.

An A-MPDU carried in an HE SU PPDU, HE ER SU PPDU, HE TB PPDU, or HE MU PPDU can include MPDUs with different values of the TID field as described in 26.6.3.

In a DMG PPDU, an A-MPDU is a sequence of A-MPDU subframes carried in a single PPDU with the TXVECTOR/RXVECTOR AGGREGATION parameter set to 1.

All of the MPDUs within an A-MPDU are addressed to the same RA. All of the MPDUs within an A-MPDU have the same TA. All QoS Data frames within an A-MPDU that have a TID for which an HT-immediate block ack agreement exists have the same value for the Ack Policy Indicator subfield of the QoS Control field.

All protected MPDUs within an A-MPDU have the same key ID.

The Duration/ID fields in the MAC headers of all MPDUs in an A-MPDU carry the same value. The Duration/ID fields in the MAC headers of the MPDUs in the A-MPDUs carried in a VHT MU PPDU and an HE MU PPDU carry the same value.

NOTE 1—The reference point for the Duration/ID field is the end of the PPDU carrying the MPDU. Setting the Duration/ID field to the same value in the case of A-MPDU aggregation means that each MPDU consistently specifies the same NAV setting.

An A-MPDU is transmitted in one of the contexts specified in Table 9-660 as defined by the description in the Definition of context column.The content of an A-MPDU depends on the context in which it is transmitted as defined in the tables below. Ordering of MPDUs within an A-MPDU is not constrained, except where noted in these tables. See 10.12.1.

NOTE 2—If the number qualifier for a frame subtype does not exist, zero or more frames of the frame subtype can be aggregated in the A-MPDU.

A VHT MU PPDU, S1G MU PPDU, and HE MU PPDU do not carry more than one A-MPDU that contains one or more MPDUs soliciting an immediate response if the immediate response is carried in a PPDU that is not an HE TB PPDU. An HE MU PPDU can carry more than one A-MPDU each of which contains one or more MPDUs soliciting an immediate response if the immediate response is carried in an HE TB PPDU.

NOTE 3—The TIDs present in a data enabled A-MPDU context are also constrained by the channel access rules (for a TXOP holder; see 10.23.2 and 10.23.3), the TXOP responder rules (see 26.6, and 26.5.2) and the RD response rules (for an RD responder, see 10.29.4). This is not shown in these tables.

NOTE 4—If a STA supports A-MSDUs of 7935 octets (indicated by the Maximum A-MSDU Length field in the HT Capabilities element), A-MSDUs transmitted by that TA within an A-MPDU carried in a PPDU with FORMAT HT_MF or HT_GF or within an MPDU carried in a non-HT PPDU are constrained so that the length of the QoS Data frame carrying the A-MSDU is no more than 4095 octets. The 4095-octet MPDU length limit does not apply to A-MPDUs carried in VHT or DMG PPDUs. The use of A-MSDU within A-MPDU might be further constrained as described in 9.4.1.13 through the operation of the A-MSDU Supported field.

NOTE 5—If a STA transmits an A-MPDU in a TDD slot, the contents of the A-MPDU follows the TDD slot category as defined in 10.38.6.2.2.

NOTE 6—Limits on using BRP frames in A-MPDU are defined in 10.41.6.4.1.

An A-MPDU carried in an EDMG PPDU can include MPDUs with different values for the TID field as described in 10.70.

Table 9-660—A-MPDU contexts

Name of Context	Definition of Context	Table defining permitted contents
Non-HE Data Enabled Immediate Response	The A-MPDU is transmitted by a TXOP holder or an RD responder including potential immediate responses.	Table 9-661
Data Enabled No Immediate Response	The A-MPDU is transmitted by a TXOP holder, TXOP responder when transmitted by an HE STA to another HE STA, and the A-MPDU does not include or solicit an immediate response. See NOTE.	Table 9-662
Control Response	The A-MPDU is transmitted by a STA that is neither a TXOP holder nor an RD responder, or the A-MPDU is transmitted by an HE AP in response to an HE TB PPDU, and the transmitter also needs to transmit one of the following immediate response frames: — Ack frame — BlockAck frame with a TID for which an HT-immediate block ack agreement exists — Multi-STA BlockAck frame for acknowledging multi-TID A-MPDU	Table 9-663
S-MPDU context	The A-MPDU is transmitted within a VHT PPDU or an HE PPDU and contains an S-MPDU.	Table 9-664
HE Non-Ack-Enabled Single-TID Immediate Response	The A-MPDU is transmitted by a TXOP holder or TXOP responder in an HE PPDU and solicits block acknowledgment for a single TID.	Table 9-665

Table 9-661—A-MPDU contents in the non-HE data enabled immediate response context

MPDU Description	Conditions	
Ack	If the preceding PPDU contains an MPDU that requires an Ack frame response, a single Ack frame at the start of the A-MPDU.	Of these, in a non-DMG STA: at most one MPDU is present. Of these, in a non-EDMG STA: at most one Ack frame is present, and zero or more HT-immediate BlockAck frames are present. Of these, in an EDMG STA: at most one Ack frame is present. Zero or more HT-immediate BlockAck frames or zero or more EDMG Multi-TID BlockAck frames are present, but not both block ack variants are present in the same A-MPDU.
HT-immediate BlockAck	In a non-DMG STA: if the preceding PPDU contains an implicit or explicit block ack request for a TID for which an HT-immediate block ack agreement exists, at most one BlockAck frame for this TID, in which case it occurs at the start of the A-MPDU. In a DMG STA: if the preceding PPDU contains an implicit or explicit block ack request for a TID for which an HT-immediate block ack agreement or an unsolicited block ack extension agreement exists, one or more copies of the same BlockAck for this TID.	
EDMG Multi-TID BlockAck	In an EDMG STA: if the preceding PPDU that carried a multi-TID A-MPDU contains implicit or explicit block ack requests for multiple TIDs for which an HT-immediate block ack agreement exists, one or more copies of the same EDMG Multi-TID BlockAck frame.	
Action No Ack	Action No Ack frames.	
Data frames sent under an HT-immediate block ack agreement	QoS Data frames with the same TID, which corresponds to an HT-immediate block ack agreement. See NOTE 1. QoS Data frames with different TIDs, which corresponds to multiple HT-immediate block ack agreements. See NOTE 2	Of these, at most one of the following is present in a non-DMG BSS: — One or more QoS Data frames with Implicit BAR ack policy — A BlockAckReq frame Of these, at most one of the following is present in a DMG BSS: — One or more QoS Data frames with Implicit BAR ack policy — QoS Null frame with the No Ack ack policy — A BlockAckReq frame with an optional QoS Null frame with No Ack ack policy Of these, any of the following is present in an EDMG BSS: — One or more QoS Data frames with different TIDs and at the most one Action frame. — One or more QoS Null frames with No Ack ack policy. — One of BlockAckReq or Multi-TID BlockAckReq frame, but not both in the same A-MPDU.
QoS Null frames with the No Ack ack policy	In a DMG BSS, QoS Null frames with the No Ack ack policy.	
Immediate BlockAckReq	At most one BlockAckReq frame with a TID that corresponds to an HT-immediate block ack agreement or an unsolicited block ack extension agreement. It is not present if any QoS Data frames for that TID are present. Multi-TID BlockAckReq frame with TIDs that correspond to an HT-immediate block ack agreement. It is not present if any QoS Data frames for those TIDs are present. This is the last MPDU in the A-MPDU.	
Management frame requires Ack or Action Ack frames	At most one Action Ack in case of an EDMG STA supporting EDMG Multi-TID BlockAck.

Table 9-661—A-MPDU contents in the non-HE data enabled immediate response context *(continued)*

MPDU Description	Conditions
Block Ack Schedule	In an EDMG BSS, one or more copies of the Block Ack Schedule frame is present when transmitted within an EDMG MU PPDU.
Data without a block ack agreement	QoS Data frames with a TID that does not have an established block ack agreement. These one per TID MPDUs with the Ack Policy field equal to Scheduled Ack are conveyed in an EDMG MU-MIMO PPDU.
NOTE 1—These MPDUs all have the same ack policy, which is Implicit BAR, Block Ack, or Scheduled Ack. NOTE 2—The agreement can be established using an ADDBA exchange or under an unsolicited block ack extension.	

Table 9-662—A-MPDU contents in the data enabled no immediate response context

MPDU Description	Conditions
Data without a block ack agreement	QoS Data frames with a TID that does not correspond to a block ack agreement. These have No Ack ack policy and the A-MSDU Present subfield equal to 0.
Action No Ack	Action No Ack frames.
Trigger	If sent by an HE AP, Trigger frames where the Trigger Type field indicates Basic Trigger frame, BSRP Trigger frame, or BQRP Trigger frame. The Trigger frames are the first MPDUs of the A-MPDU, unless the A-MPDU also carries an Ack or BlockAck frame in which case the Trigger frames are included immediately after the Ack or BlockAck frame. See NOTE 1 and NOTE 2.
QoS Null frame with No Ack ack policy	If sent to an HE STA, QoS Null frames with No Ack ack policy.
NOTE 1—Only an HE AP is allowed to include a Trigger frame in the A-MPDU. The presence of more than one copy of a Trigger frame in an A-MPDU might increase the probability of the successful reception of the Trigger frame. The content of all Trigger frames in the A-MPDU is the same. NOTE 2—The BSRP and BQRP Trigger frames can be aggregated with other MPDUs in the A-MPDU if the receiver has indicated the support of receiving these trigger types in the BSRP BQRP A-MPDU Aggregation field in the HE Capabilities element.

Table 9-665—A-MPDU contents in the HE non-ack-enabled single-TID immediate response context

MPDU	Conditions	
Data frames sent under an HT-immediate block ack agreement	One or more QoS Data frames with the same TID, which corresponds to an HT-immediate block ack agreement See NOTE 1.	One of the following is present: — One or more untagged MPDUs, each of which is a QoS Data frame with Implicit BAR, HETP Ack, or Block Ack ack policy and belonging to a block ack agreement, zero or more untagged MPDUs, each of which is a Basic Trigger, BSRP Trigger, or BQRP Trigger frame. — One untagged MPDU that is BlockAckReq frame, zero or more untagged MPDUs each of which is a QoS Null frame with No Ack ack policy. — One or more untagged MPDUs each of which is a Basic Trigger, MU-BAR Trigger, BQRP Trigger, or BSRP Trigger frame. The MU-BAR Trigger frame solicits block acknowledgment for one TID.
Compressed BlockAckReq	At most one BlockAckReq frame with a TID that corresponds to an HT-immediate block ack agreement. This frame is the last MPDU in the A-MPDU. BlockAckReq is not present if any QoS Data frames are present.	
Trigger	Trigger frames where the Trigger Type field is Basic Trigger, MU-BAR Trigger, BQRP Trigger or BSRP Trigger. MU BAR Trigger frame is not present if any QoS Data frames are present. The Trigger frames are the first MPDUs of the A-MPDU, unless the A-MPDU also carries an Ack or BlockAck frame in which case the Trigger frames are included immediately after the Ack or BlockAck frame. See NOTE 2 and NOTE 3.	

NOTE 1—MPDUs from the same TID all have the same ack policy, which is Implicit BAR, HETP Ack or Block Ack.

NOTE 2—Only an HE AP is allowed to include a Trigger frame in the A-MPDU. The presence of more than one copy of a Trigger frame in an A-MPDU might increase the probability of the reception of the Trigger frame. The content of all Trigger frames in the A-MPDU is the same.

NOTE 3–The BSRP and BQRP Trigger frames can be aggregated with other MPDUs in the A-MPDU if the receiver has indicated the support of receiving these trigger types in the BSRP BQRP A-MPDU Aggregation field in the HE Capabilities element.

9.8 MAC frame format for PV1 frames

9.8.1 Basic components

Each PV1 frame consists of the following basic components:

a) A PV1 MAC header, which comprises frame control, address, optional sequence control information;

b) A variable-length frame body, which contains information specific to the frame type;

c) An FCS, which contains a 32-bit CRC based on ITU-T Recommendation V.42 [B63] (see 9.2.4.9).

Table 9-666—A-MPDU contents in the HE ack-enabled single-TID immediate response context

MPDU	Conditions	
Ack	If the preceding PPDU contains an MPDU that requires an Ack frame response, a single Ack frame at the start of the A MPDU.	At most one untagged MPDU that is an Ack, Compressed BlockAck, or Multi-STA BlockAck frame is present
HT-immediate BlockAck	If the preceding PPDU contains an implicit or explicit block ack request for a TID for which an HT-immediate block ack agreement exists, at most one Compressed BlockAck frame for this TID at the start of the A-MPDU. If the preceding PPDU contains explicit block ack requests for multiple TIDs or a multi-TID A-MPDU, at most one Multi-STA BlockAck frame at the start of the A-MPDU.	
Action No Ack	Untagged MPDUs that are Action No Ack frames.	
Data frames not sent under an HT-immediate block ack agreement	At most one Data frame with a TID that does not correspond to an HT-immediate block ack agreement and Normal Ack or HETP Ack ack policy.	One of the following: — A tagged MPDU that is a QoS Data frame with Normal Ack or HETP Ack ack policy — A tagged MPDU that is a Management frame that solicits an immediate response And at least one untagged MPDU that is a QoS Null frame with No Ack ack policy, Basic Trigger frame, BSRP Trigger frame, or BQRP Trigger frame.
Data frames sent under an HT-immediate block ack agreement	At most one QoS Data frame with a TID that corresponds to an HT-immediate block ack agreement	
QoS Null frame with No Ack ack policy	QoS Null frames with No Ack ack policy.	
Management frame	At most one Management frame that solicits an acknowledgment.	
Trigger	Basic Trigger, BQRP Trigger or BSRP Trigger frames. The Trigger frames are the first MPDUs of the A-MPDU, unless the A-MPDU also carries an Ack or BlockAck frame in which case the Trigger frames are included immediately after the Ack or BlockAck frame. See NOTE 1 and NOTE 2.	

NOTE 1—Only an HE AP is allowed to include a Trigger frame in the A-MPDU. The presence of more than one copy of a Trigger frame in an A-MPDU might increase the probability of the reception of the Trigger frame. The content of all Trigger frames in the A-MPDU is the same.

NOTE 2—The BSRP Trigger and BQRP Trigger frames can be aggregated with other MPDUs in the A-MPDU if the receiver has indicated the support of receiving these Trigger frame types in the BSRP BQRP A-MPDU Aggregation field in the HE Capabilities element.

NOTE 3—The single Management frame that solicits the acknowledgment in ack-enabled single-TID A-MPDU is treated as single-TID frame, e.g., soliciting Ack of TID 15 in multi-STA BlockAck frame.

Table 9-667—A-MPDU contents in the HE non-ack-enabled multi-TID immediate response context

MPDU	Conditions	
Ack	If the preceding PPDU contains an MPDU that requires an Ack frame response, a single Ack frame at the start of the A MPDU.	At most one untagged MPDU that is an Ack, Compressed BlockAck, or Multi-STA BlockAck frame is present
HT-immediate BlockAck	If the preceding PPDU contains an implicit or explicit block ack request for a TID for which an HT-immediate block ack agreement exists, at most one Compressed BlockAck frame for this TID at the start of the A-MPDU. If the preceding PPDU contains explicit block ack requests for multiple TIDs or a multi-TID A-MPDU, at most one Multi-STA BlockAck frame at the start of the A-MPDU.	
Action No Ack	Untagged MPDUs that are Action No Ack frames.	
QoS Null frame with No Ack ack policy	Untagged MPDUs that are QoS Null frames with No Ack ack policy.	
Data frames sent under an HT-immediate block ack agreement	QoS Data frames with different TIDs each of which corresponds to an HT-immediate block ack agreement. See NOTE 1.	One of the following is present: — Two or more untagged MPDUs that are QoS Data frames that belong to two or more block ack agreements and with Implicit BAR, HETP Ack, or Block Ack ack policy, zero or more untagged MPDUs each of which is a Trigger frame. The Trigger frame is a Basic Trigger, BSRP Trigger, or BQRP Trigger frame — One untagged MPDU that is a Multi-TID BlockAckReq frame. — One or more untagged MPDUs each of which is an MU-BAR Trigger frame that solicits block acknowledgment for more than one TID.
Immediate BlockAckReq	At most one multi-TID BlockAckReq frame with TIDs that correspond to HT-immediate block ack agreements This frame is the last MPDU in the A-MPDU. Multi-TID BlockAckReq frame is not present if any QoS Data frames are present.	
Trigger	Basic Trigger, MU-BAR Trigger, BQRP Trigger or BSRP Trigger frames. MU-BAR Trigger frame is not present if any QoS Data frames are present. The Trigger frames are the first MPDUs of the A-MPDU, unless the A-MPDU also carries an Ack or BlockAck frame in which case the Trigger frames are included immediately after the Ack or BlockAck frame. See NOTE 2 and NOTE 3.	

NOTE 1—MPDUs from the same TID all have the same ack policy, which is Implicit BAR, HETP Ack or Block Ack.

NOTE 2—Only an HE AP is allowed to include a Trigger frame in the A-MPDU. Multiple Trigger frames in one A-MPDU increases the robustness. The content of all Trigger frames in the A-MPDU is the same.

NOTE 3—The BSRP Trigger and BQRP Trigger frames can be aggregated with other MPDUs in the A-MPDU if the receiver has indicated the support of receiving these trigger types in the BSRP BQRP A-MPDU Aggregation field in the HE Capabilities element.

Table 9-668—A-MPDU contents in the HE ack-enabled multi-TID immediate response context

MPDU	Conditions	
Ack	If the preceding PPDU contains an MPDU that requires an Ack frame response, a single Ack frame at the start of the A MPDU.	At most one untagged MPDU that is an Ack, Compressed BlockAck, or Multi-STA BlockAck frame is present
HT-immediate BlockAck	If the preceding PPDU contains an implicit or explicit block ack request for a TID for which an HT-immediate block ack agreement exists, at most one Compressed BlockAck frame for this TID at the start of the A-MPDU. If the preceding PPDU contains explicit block ack requests for multiple TIDs or a multi-TID A-MPDU, at most one Multi-STA BlockAck frame at the start of the A-MPDU.	
Action No Ack	Untagged MPDUs that are Action No Ack frames.	
QoS Null frame with No Ack ack policy	Untagged MPDUs that are QoS Null frames with No Ack ack policy.	
Data frames without an HT-immediate block ack agreement	One or more QoS Data frames with each with different TIDs where none of the TID have HT-immediate block ack agreement See NOTE 1.	One of the following is present: — Tagged MPDUs each of which is a QoS Data frame with Normal Ack or HETP Ack ack policy and where the TIDs of the QoS Data frames differ if there is more than one, zero or more untagged MPDUs each of which is a Basic Trigger, BSRP Trigger, or BQRP Trigger frame. — Zero or more untagged MPDUs each of which is a QoS Data frame with Implicit BAR, HETP Ack, or Block Ack ack policy and belonging to a block ack agreement, one or more tagged MPDUs each of which is a QoS Data frame with Normal Ack or HETP Ack ack policy and where the TIDs of the QoS Data frames differ if there is more than one, a tagged MPDU that is a Management frame, zero or more untagged MPDUs each of which is a Basic Trigger, BSRP Trigger, or BQRP Trigger frame. — Zero or more untagged MPDUs each of which is a QoS Data frame with Implicit BAR, HETP Ack, or Block Ack ack policy and belonging to a block ack agreement, and two or more tagged MPDUs each of which is a QoS Data frame with Normal Ack or HETP Ack ack policy and where the TIDs of the QoS Data frames differ if there is more than one, zero or more untagged MPDUs each of which is a Basic Trigger, BSRP Trigger, or BQRP Trigger frame.
Data frames sent under an HT-immediate block ack agreement	One of the following: — One or more QoS Data frames with a TID that corresponding to an HT-immediate block ack agreement. — QoS Data frames with TIDs that correspond to two or more HT-immediate block ack agreements. See NOTE 1.	
Management	At most one Management frame that solicits an acknowledgment	
Trigger	One or more Basic Trigger, BQRP Trigger or BSRP Trigger frames. The Trigger frames are the first MPDUs of the A-MPDU, unless the A-MPDU also carries an Ack or BlockAck frame in which case the Trigger frames are included immediately after the Ack or BlockAck frame. See NOTE 2 and NOTE 3.

Table 9-668—A-MPDU contents in the HE ack-enabled multi-TID immediate response context *(continued)*

MPDU	Conditions
NOTE 1—MPDUs with the same TID all have the same ack policy, which is Implicit BAR, HETP Ack or Block Ack. NOTE 2—Only an HE AP is allowed to include a Trigger frame in the A-MPDU. Multiple Trigger frames in one A-MPDU increases the robustness. The content of all Trigger frames in the A-MPDU is the same. NOTE 3—The BSRP Trigger and BQRP Trigger frames can be aggregated with other MPDUs in the A-MPDU if the receiver has indicated the support of receiving these trigger types in the BSRP BQRP A-MPDU Aggregation field in the HE Capabilities element.	

9.8.2 General PV1 frame format

Figure 9-1333 depicts the general PV1 MAC frame format. The first three fields (Frame Control, A1 and A2) and the last field FCS are always present in PV1 frames. The Sequence Control, A3, A4 and Frame body fields are optionally present. Each field is defined in 9.8.3.

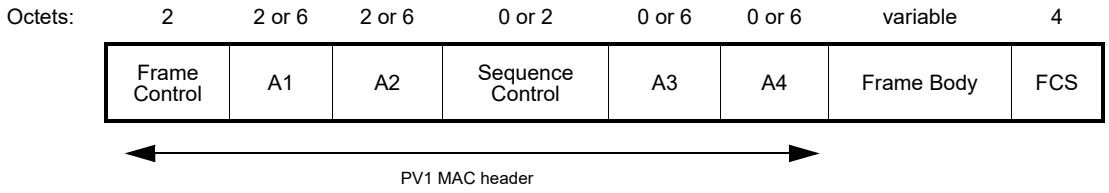

Figure 9-1333—PV1 frame format

NOTE—In Figure 9-1333, the total number of octets in the A1 and A2 fields is either 8 or 12.

The Frame Body field is of variable size, constrained as defined in 9.2.4.8.1.

9.8.3 PV1 frame fields

9.8.3.1 Frame Control field

The Frame Control field of the PV1 MAC header for PV1 frames except the PV1 Probe Response frame, PV1 Resource Allocation frame, and PV1 Control frames, is defined in Figure 9-1334.

The Frame Control field of the PV1 MAC header for the PV1 Probe Response frame, PV1 Resource Allocation frame and PV1 Control frames is defined in 9.8.5.3, 9.8.5.4, and 9.8.4, respectively.

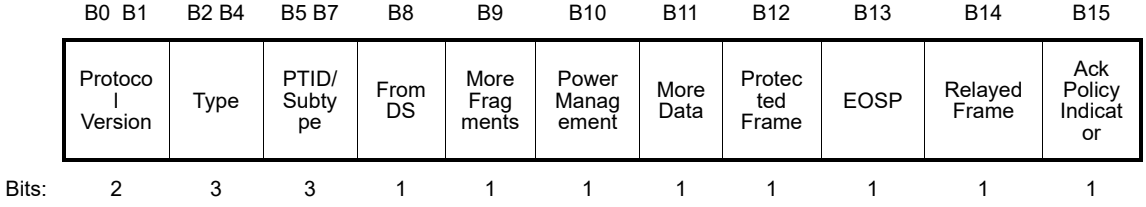

Figure 9-1334—Frame Control field format for some PV1 frames

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Protocol Version subfield is defined in 9.2.4.1.2. For PV1 frames the Protocol Version subfield is 1.

The Type subfield identifies the type of the frame, as defined in Table 9-669.

Table 9-669—PV1 frame types

Type Value	Type	Description
0	QoS Data	Either the A1 field or the A2 field is a SID (defined in 9.8.3.2), as determined by the From DS subfield in the Frame Control field (see Table 9-670), and the other field contains a MAC address.
1	Management	For PV1 Probe Response frames: both A1 and A2 fields contain MAC addresses. Otherwise: either the A1 field or the A2 field is a SID (defined in 9.8.3.2), as determined by the From DS subfield in the Frame Control field (see Table 9-670), and the other field contains a MAC address.
2	Control	The A1 field is a SID and the A2 field is either a SID or contains a MAC address, depending on the PV1 Control frame subtype (see 9.8.4).
3	QoS Data	Both A1 and A2 fields contain MAC addresses.
4–6	Reserved	
7	Reserved for extension	

The PTID/Subtype subfield, depending on the type of the PV1 frame, indicates:

— The 3 LSBs of the TID as defined in 9.2.4.5.2 for PV1 QoS Data frames (Type subfield equal to 0 and 3) transmitted by a QoS STA.

— The subtype for PV1 Control frames (Type subfield equal to 2) as described in 9.8.4.

— The subtype for PV1 Management frames (Type subfield equal to 1) as described in 9.8.5.

The From DS subfield defines the addressing of PV1 frames with values of the Type field less than 2, as defined in Table 9-670.

Table 9-670—From DS subfield values in type 0 or 1 PV1 frames

From DS subfield	Meaning	Use
0	A1 contains the MAC address of the receiver A2 is a SID, which contains the AID of the transmitter — A2 contains the MAC address of the transmitter for PV1 QoS Data frames with Type subfield equal to 3 A3 (if present) contains the MAC address of the destination A4 (if present) contains the MAC address of the source	For frames transmitted by a non-AP STA to an AP For frames transmitted from a non-AP STA to non-AP STA (direct link)
1	A1 is a SID, which contains the AID of the receiver — A1 contains the MAC address of the receiver for PV1 QoS Data frames with Type subfield equal to 3 A2 is the MAC address of the transmitter A3 (if present) contains the MAC address of the destination A4 (if present) contains the MAC address of the source	AP to non-AP STA

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The More Fragments subfield is described in 9.2.4.1.5.

The Power Management subfield is described in 9.2.4.1.7.

The EOSP subfield is described in 9.2.4.5.3.

The Protected Frame subfield is described in 9.2.4.1.9.

The More Data subfield is described in 9.2.4.1.8.

The Relayed Frame subfield indicates that the current TXOP is shared with the relay STA using the TXOP sharing procedures for relays described in 10.53.5.

The Ack Policy Indicator subfield identifies the ack policy that is followed upon the delivery of the MPDU, as defined in Table 9-671.

Table 9-671—Ack Policy Indicator subfield in the Frame Control field for PV1 frames

Ack policy	Ack Policy Indicator subfield	Other conditions	Meaning
Normal Ack	0	MPDU is a non-A-MPDU frame	Where the frame contains a fragment and both the originator and the addressed recipient support fragment BA: The addressed recipient returns an NDP BlockAck or BAT frame after a SIFS, according to the procedures defined in 10.3.2.12 and 10.46.2. Otherwise: The addressed recipient returns an Ack, TACK or STACK frame after a short interframe space (SIFS), according to the procedures defined in 10.3.2.11 and 10.46.2.
Implicit BAR	0	MPDU is not a non-A-MPDU frame	The addressed recipient returns a BlockAck or BAT frame, either individually or as part of an A-MPDU starting a SIFS after the PPDU carrying the frame, according to the procedures defined in 10.3.2.11 and 10.46.2.
No Ack	1	MPDU is a non-A-MPDU frame	The addressed recipient takes no action upon receipt of the frame. More details are provided in 10.26. This ack policy is used in all individually addressed frames in which the sender does not require acknowledgment. It is also used in all group addressed frames. It is not used for PV1 Data frames with a TID for which a block ack agreement exists.
Block Ack	1	MPDU is not a non-A-MPDU frame	The addressed recipient takes no action upon the receipt of the frame except for recording the state. The recipient can expect a BlockAckReq frame in the future to which it responds using the procedure described in 10.25.

9.8.3.2 Address fields

There are up to four address fields in the PV1 MAC frame format. These fields are used to indicate the recipient of the frame (A1), the transmitter of the frame (A2), and optionally the MAC address of the source and/or the MAC address of the destination of the frame (A3 and/or A4).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The recipient of the frame (A1) or the transmitter of the frame (A2) can be identified by the AID subfield located in the Short ID (SID) field depending on the value of the From DS subfield of the Frame Control field as described in 9.8.3.1. A group of receiving non-AP STAs of the frame can be identified by the AID subfield with a group AID value, as described in 10.54, located in the Short ID (SID) field. The length of the SID field is shown in Figure 9-1335.

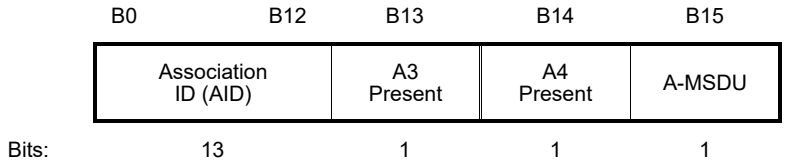

Figure 9-1335—SID field format

The AID subfield contains an AID as specified in Table 9-670 in PV1 frames of Type 0, 1, and 2.

The A3 Present subfield is 1 if the A3 is present in the PV1 MAC header, otherwise it is 0.

The A4 Present subfield is 1 if the A4 is present in the PV1 MAC header, otherwise it is 0.

The A-MSDU subfield is 1 if the MPDU contains a Dynamic A-MSDU as described in 9.3.2.2.5.

NOTE—PV1 frames without a SID field do not contain A3 and A4 fields and do not carry A-MSDUs.

The A3 field is present if A3 is not equal to the address identified by A1 and an A3 is not stored at the receiver, or when A3 is not equal to an A3 stored at the receiver (as described in 10.57). When the A3 field is not present, A3 is either stored at the recipient of the frame or, if an A3 is not stored at the recipient of the frame then A3 is equal to the address identified by A1.

The A4 field is present if A4 is not equal to the address identified by A2 and an A4 is not stored at the receiver, or when A4 is not equal to an A4 stored at the receiver (as described in 10.57). When the A4 field is not present, A4 is either stored at the recipient of the frame or, if an A4 is not stored at the recipient of the frame then A4 is equal to the address identified by A2.

9.8.3.3 Sequence Control field

The Sequence Control field is present in all PV1 Data frames and PV1 Management frames other than PV1 Probe Response frames, and is described in 9.2.4.4.

9.8.3.4 Frame Body field

The Frame Body field is a variable-length field and is described in 9.2.4.7.

9.8.3.5 Overhead for encryption

The overhead for encryption is described in Clause 12.

9.8.3.6 FCS field

The FCS field is described in 9.2.4.9.

9.8.4 PV1 Control frames

9.8.4.1 General

The subfields within the Frame Control field of PV1 Control frames are set as shown in Figure 9-1336.

	B0 B1	B2 B4	B5 B7	B8 B10	B11	B12	B13	B14	B15
	Protocol Version	Type (Control)	PTID/ Subtype	Bandwidth Indication	Dynamic Indication	Power Management	More Data	Flow Control	Next TWT Info Present
Bits:	2	3	3	3	1	1	1	1	1

Figure 9-1336—Frame Control field subfield values within PV1 Control frames

Table 9-672 defines the different PV1 Control frame subtypes.

Table 9-672—PV1 Control frame subtypes

PTID/Subtype value b2 b1 b0	Subtype description
000	STACK
001	BAT
010–111	Reserved

The Bandwidth Indication subfield and the Dynamic Indication subfield are described in 9.2.4.1.11.

The Next TWT Info Present subfield is set to 1 if the Next TWT Info field is present in PV1 Control frames. Otherwise, it is set to 0.

The More Data subfield is described in 9.2.4.1.8.

The Flow Control subfield is used for flow suspension signaling as described in 10.60.

9.8.4.2 STACK frame format

The frame format of the short TWT acknowledgment (STACK) frame is defined in Figure 9-1337. The A1 field is a SID field that contains the AID of the intended recipient of the frame in the AID subfield when the intended recipient is not an AP and the value 0 when the intended recipient is an AP. A3 Present, A4 Present, and A-MSDU subfields (B13, B14, and B15) of the SID field are reserved.

The A2 field is a SID field that contains the bit sequence Scrambler Initialization[0:6] || FCS[23:31] obtained from the scrambler initialization value in the SERVICE field (as defined in 23.3.9.2), prior to descrambling, and the FCS field of the PSDU that carries the soliciting frame. The scrambler initialization value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

Copyright © 2025 IEEE. All rights reserved.

	Frame Control	A1	A2	Tetrapartial Timestamp/ Next TWT Info/ Suspend Duration	FCS
Octets:	2	2	2	4	4

Figure 9-1337—STACK frame format

If the Next TWT Info Present subfield in the Frame Control field is equal to 0, the Tetrapartial Timestamp/Next TWT Info/Suspend Duration field contains the value of the 4 least significant octets of the STA's TSF timer at the time that the start of the data symbol containing the first bit of the Tetrapartial Timestamp field appears at the transmit antenna connector.

If the Next TWT Info Present subfield in the Frame Control field is equal to 1 and the Flow Control subfield of the Frame Control field is equal to 0, then the Tetrapartial Timestamp/Next TWT Info/Suspend Duration field contains the value of the 4 least significant octets of the TSF timer for the next TWT logically ANDed with the value 0xFFFFFFF8 and then added to the value of the TWT flow identifier that corresponds to that next TWT value.

NOTE—The Next TWT Info/Suspension Duration field carries only a portion of the target TSF time, and changes in the most significant octets of the corresponding target TSF time are not communicated to the receiving STA. Hence, the receiving STA must consider and account for a rollover of the corresponding most significant octets of the target TSF time that might happen at the receiving STA.

If the Next TWT Info Present subfield in the Frame Control field is equal to 1 and the Flow Control subfield of the Frame Control field is equal to 0 and the 29 MSBs of the Next TWT Info subfield is equal to all 0s, the transmitter does not currently have a next TWT value available for transmission for the TWT indicated by the TWT flow identifier corresponding to the value of the 3 LSBs of the Next TWT Info field.

If the Next TWT Info Present subfield in the Frame Control field is equal to 1 and the Flow Control subfield of the Frame Control field is equal to 1, then the Tetrapartial Timestamp/Next TWT Info/Suspend Duration field contains a flow suspension duration, in microseconds, during which the intended recipient TWT STAs are not allowed to transmit Data frames to the STA identified by the RA field of the frame that elicited the STACK frame.

9.8.4.3 BAT frame format

The frame format of the Block Acknowledgment TWT (BAT) frame is defined in Figure 9-1338:

	Frame Control	A1	A2	Beacon Sequence	Pentapartial Timestamp	Next TWT Info /Suspend Duration	Starting Sequence Control	BAT Bitmap	FCS
Octets:	2	2	6	1	5	6	2	4	4

Figure 9-1338—BAT frame format

The A1 field is a SID that contains the AID of the intended recipient of the frame in the AID subfield when the intended recipient is not an AP and the value 0 when the intended recipient is an AP. A3 Present, A4 Present, and A-MSDU subfields (B13, B14, and B15) of the SID field are reserved.

The A2 field contains the MAC address of the transmitter sending the frame.

The Beacon Sequence field contains the value of the Change Sequence field from the most recently transmitted Beacon frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Pentapartial Timestamp field contains the value of the 5 least significant octets of the STA's TSF timer at the time that the start of the data symbol containing the first bit of the Pentapartial Timestamp field appears at the transmit antenna connector.

If the Next TWT Info Present subfield in the Frame Control field is equal to 1 and the Flow Control subfield of the Frame Control field is equal to 0, then the Next TWT Info/Suspend Duration field contains a next TWT value for the intended recipient of the frame corresponding to the value of the 6 least significant octets of the TSF timer for the next TWT logically ANDed with the value 0xFFFFFFFFFFF8 and then added to the value of the TWT flow identifier that corresponds to that next TWT value.

If the Next TWT Info Present subfield in the Frame Control field is equal to 1 and the Flow Control subfield of the Frame Control field is equal to 0 and the 45 MSBs of the Next TWT Info/Suspend Duration subfield is equal to all 0s, the transmitter does not currently have a next TWT value available for transmission for the TWT indicated by the TWT flow identifier corresponding to the value of the 3 LSBs of the Next TWT Info/Suspend Duration field.

If the Next TWT Info Present subfield in the Frame Control field is equal to 1 and the Flow Control subfield of the Frame Control field is equal to 1, then the Next TWT Info/Suspend Duration field contains a flow suspension duration, in microseconds, during which the intended recipient TWT STAs are not allowed to transmit Data frames to the STA identified by the A2 field of the BAT frame.

If the Next TWT Info Present subfield in the Frame Control field is equal to 0, then the Next TWT Info/Suspend Duration field is reserved.

The Starting Sequence Control field contains the sequence number of the first MSDU and the TID for which this BAT frame is sent and is defined in Figure 9-1339:

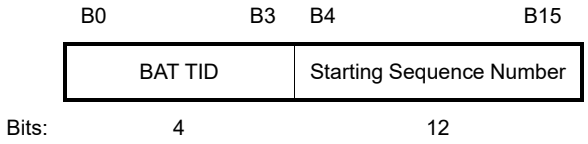

Figure 9-1339—Starting Sequence Control field format

The BAT Bitmap field is used to indicate the received status of up to 32 MSDUs and A-MSDUs. Each bit that is equal to 1 in the BAT Bitmap field acknowledges the reception of a single MSDU or A-MSDU in sequentially increasing sequence number order, with the first bit of the BAT Bitmap field corresponding to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Number subfield of the BAT frame.

9.8.5 PV1 Management frames

9.8.5.1 Format of PV1 Management frames

The format of a PV1 Management frame is defined in Figure 9-1340.

The Frame Control, A1, and A2 fields are present in all PV1 Management frame subtypes.

The address fields A1 and A2 contain the receiver and transmitter addresses either of which can be a SID field as described in 9.8.3.2.

The Sequence Control field is described in 9.2.4.4 and is present in PV1 Management frames of subtype Action and Action No Ack.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

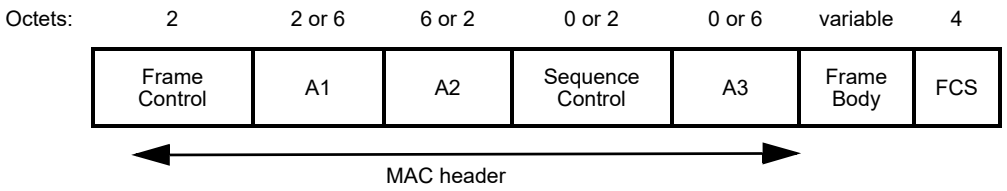

Figure 9-1340—PV1 Management frame format

The address field A3 (if present, as described in 9.8.3.2) is set to the BSSID.

The frame body consists of the fields followed by the elements defined for each PV1 Management frame subtype. All fields and elements are mandatory unless stated otherwise and appear in the specified, relative order. STAs that encounter an element ID they do not recognize in the frame body of a received PV1 Management frame ignore that element and continue to parse the remainder of the PV1 Management frame body (if any) for additional elements with recognizable element IDs. See 10.28.7.

Table 9-673 defines the different PV1 Management frame subtypes.

Table 9-673—PV1 Management frame subtypes

PTID/Subtype value b2 b1 b0	Subtype description
000	Action
001	Action No Ack
010	PV1 Probe Response
011	Resource Allocation
100–111	Reserved

PV1 Management frames are Management frames.

9.8.5.2 Action and Action No Ack frames

The frame body of a PV1 Management frame of subtype Action is described in 9.3.3.13 and the format of the Action field formats allowed is described in 9.6.

The frame body of a PV1 Management frame of subtype Action No Ack is described in 9.3.3.14 and the format of the Action field formats allowed is described in 9.6.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.8.5.3 PV1 Probe Response frame format

The format of the PV1 Probe Response frame is shown in Figure 9-1341.

	Frame Control	A1	A2	Timestamp	Change Sequence	Next TBTT (optional)	Short SSID (optional)	Access Network Options (optional)	Optional Elements	FCS
Octets:	2	6	6	4	1	0 or 3	0 or 4	0 or 1	variable	4

Figure 9-1341—PV1 Probe Response frame format

The A1 field contains the MAC address of the intended recipient of the frame.

The A2 field contains the MAC address of the transmitter sending the frame.

The Timestamp field contains the value of the 4 least significant octets of the STA's TSF timer at the time that the start of the data symbol containing the first bit of the Timestamp field appears at the transmit antenna connector.

The Change Sequence field is defined as an unsigned integer, initialized to 0, that increments when a critical update to the Beacon frame has occurred (see 10.45.2).

The Next TBTT field is present if the Next TBTT Present subfield in the Frame Control field is 1 and indicates the most significant 3 octets of the 4 least significant octets of the next TBTT. Otherwise, it is not present.

Either a Short SSID field or an SSID element is included in the PV1 Probe Response frame.

A Short SSID field is present if the Full SSID Present subfield in the Frame Control field is 0 and it contains a 32-bit CRC calculated over the SSID contained in the Probe Response or S1G Beacon frame (calculation is performed as defined in 9.2.4.9 where the SSID is the calculation fields). An SSID element is not present if the Full SSID Present subfield in the Frame Control field is 0.

An SSID element as defined in 9.4.2.2 is present in the Optional Elements field of the PV1 Probe Response frame if the Full SSID Present subfield in the Frame Control field is 1. A Short SSID field is not present if the Full SSID Present subfield in the Frame Control field is 1.

The Access Network Options field is present if the ANO Present subfield in the Frame Control field is 1 and is defined in 9.4.2.90. Otherwise, it is not present.

The Optional Elements field contains optional elements requested to be included in the PV1 Probe Response frame such as S1G Beacon Compatibility element. If the S1G Beacon Compatibility element is requested to be included, the PV1 Probe Response frame includes it as the first optional element.

The Frame Control field of the PV1 Probe Response frame is shown in Figure 9-1342.

The Next TBTT present subfield is set to 1 if the Next TBTT field is included in the PV1 Probe Response frame and otherwise set to 0.

The Full SSID Present field indicates whether an SSID or a short SSID is included in the PV1 Probe Response frame. Setting the field to 1 indicates that an SSID element is included and a Short SSID field is

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

not included in the PV1 Probe Response frame. Setting the field to 0 indicates that a Short SSID field is included and an SSID element is not included in the PV1 Probe Response frame.

	B0 B1	B2 B4	B5 B7	B8	B9	B10	B11 B13	B14	B15
	Protocol Version	Type	PTID/ Subtype	Next TBTT Present	Full SSID Present	ANO Present	BSS BW	Security	1 MHz Primary Channel Location
Bits:	2	3	3	1	1	1	3	1	1

Figure 9-1342—Frame Control field of PV1 Probe Response frame format

The ANO Present subfield equals 1 if the Access Network Options field is present; otherwise, it equals 0.

The BSS BW subfield indicates the minimum and the maximum operating bandwidths of the BSS and is defined in Table 9-8.

The Security subfield equals 1 if the transmitting STA is an RSNA STA.

The 1 MHz Primary Channel Location subfield indicates the location of the 1 MHz primary channel. If it is equal to 0, it indicates that the 1 MHz primary channel is located at lower side of 2 MHz primary channel. If it is equal to 1, it indicates that the 1 MHz primary channel is located at upper side of 2 MHz primary channel.

9.8.5.4 Resource Allocation frame format

The Resource Allocation (RA) frame is broadcasted to all non-AP STAs that belong to the RAW group identified by the RAW Group field of a previously transmitted RPS element with the RAW Type subfield indicating a generic RAW and the RAW Type Options subfield indicating an RA frame (see 9.4.2.190). The RA frame signals the presence of downlink buffered data for paged STAs and their assigned RAW slots for both uplink and downlink service periods. The Resource Allocation frame has two kinds of format depending on the slot assignment mode indicated in the Frame Control field. The Resource Allocation frame formats are shown in Figure 9-1343 and Figure 9-1344.

	Frame Control	A1	BSSID	RAW Group	RAW Duration	Slot Assignment 1	...	Slot Assignment N	FCS
Octets:	2	2	6	3	2	3 or 4		3 or 4	4

Figure 9-1343—Resource Allocation frame format when Slot Assignment Mode field is 0

	Frame Control	A1	BSSID	RAW Group	RAW Duration	Slot Assignment Indication	FCS
Octets:	2	2	6	3	2	variable	4

Figure 9-1344—Resource Allocation frame format when Slot Assignment Mode field is 1

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Slot Assignment Indication field formats are shown in Figure 9-1345, Figure 9-1346, and Figure 9-1347.

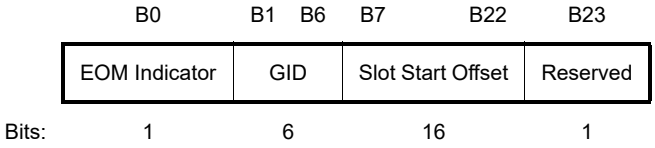

Figure 9-1345—Slot Assignment Indication field for MU group when Slot Assignment Mode field is 0 and the Group Indicator field is 1

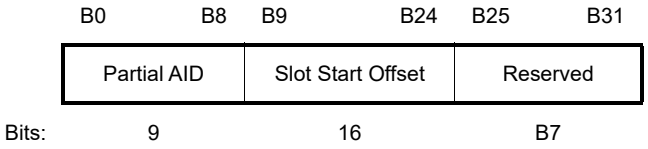

Figure 9-1346—Slot Assignment Indication field for a STA when Slot Assignment Mode is 0 and the Group Indicator field is 0

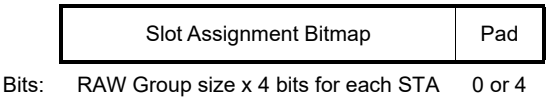

Figure 9-1347—Slot Assignment Indication field when Slot Assignment Mode field is 1

The Frame Control field of the Resource Allocation frame is shown in Figure 9-1348.

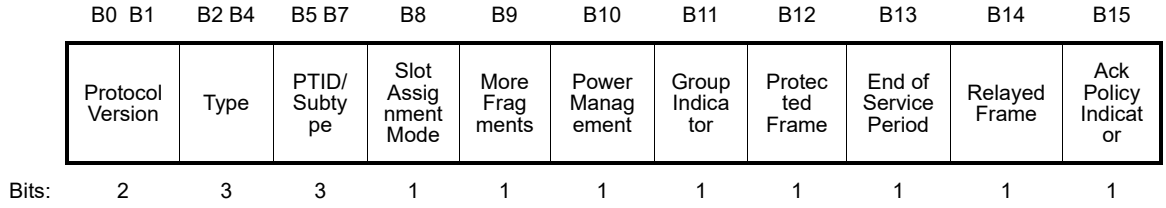

Figure 9-1348—Frame Control field format for Resource Allocation frame

The subfields of the Frame Control field, except for the Slot Assignment Mode and the Group Indicator subfields, are defined in 9.8.3.1. The Slot Assignment Mode and the Group Indicator subfields are defined as follows:

— The Slot Assignment Mode subfield indicates the format of the Resource Allocation frame:
  — If the Slot Assignment Mode subfield is equal to 0, the Resource Allocation frame format is as shown in Figure 9-1343.
  — If the Slot Assignment Mode subfield is equal to 1, the Resource Allocation frame format is as shown in Figure 9-1344.

— The Group Indicator subfield indicates whether any subfield of MU group is included or no subfield of MU group exists in the Slot Assignment field if Slot Assignment mode field is equal to 0. Otherwise, it is reserved.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The A1 field is a SID that contains the value 0 in the AID subfield. A3 Present, A4 Present, and A-MSDU subfields (B13, B14, and B15) of the SID field are reserved.

The BSSID field indicates the address of the AP transmitting the Resource Allocation frame.

The RAW Group field indicates the STA AIDs that are assigned the RAW as defined in 9.4.2.190. The AIDs in this RAW Group are identical to the AIDs in the RAW Group subfield with the value in the RAW Type subfield set to 0 and the value in the RAW Type Options subfield set to 1 in the RAW Control subfield within the RPS element.

The RAW Duration field is an unsigned integer expressed in TUs that indicates the duration of the current RAW where the Resource Allocation frame is broadcasted. The field is either set to the value of the RAW duration deduced from the value in the RAW Slot Definition subfield (9.4.2.190) or is modified from the value indicated in the RAW Slot Definition subfield of the RPS element (9.4.2.190).

The Slot Assignment field indicates a partial AID for a STA or a GID for STAs in the corresponding MU Group and their corresponding slot(s) of medium access within the current RAW. Since MU MIMO is used for DL traffic, the first bit, as called end of multi-user (EOM) Indicator, for the MU group block indicates whether the following subfields are used for the last MU group when this bit is 1 or more MU groups exist after subfields for this MU group when the bit is 0. This field is of length 3 octets for each MU Group and 4 octets for each STA and the length is determined based on the value in the EOM subfield.

If Slot Assignment Mode field is 0 and the Group Indicator field is 1, the Slot Assignment field is used for either MU group of STAs or an assigned STA as shown in Figure 9-1345 and Figure 9-1346. If Slot Assignment Mode field is 0 and the Group Indicator field is 0, the Slot Assignment field is not used for MU group of STAs. The Slot Assignment field for MU group of STAs is located first at the beginning of the Slot Assignment fields, if exists.

The Partial AID subfield indicates a partial AID for an assigned STA.

The Slot Start Offset subfield indicates the start time of a RAW slot, in TU, for a STA's or MU MIMO group of STAs' medium access, relative to the RAW Start Time field as defined in 9.4.2.190 and is of length 2 octets.

The RA frame contains Slot Assignment Indication field to indicate to each of the STAs in the RAW group the number of UL/DL slot allocations within the current RAW.

The Slot Assignment Bitmap subfield indicates the number of RAW slots allocated for all STAs in the RAW group in ascending order with each 4 bits corresponding to one STA. The decimal number represented by the 4 bits indicates the number of allocation units for a STA. For example, setting this subfield to 0 indicates no allocation for a STA. Setting this subfield to 1 indicates one RAW slot for a STA. All RAW slots have equal duration, in TUs, which is calculated by dividing the value of the RAW Duration field with the number of RAW slots allocated to all STAs in the RAW group. The first RAW slot starts at the end of the Resource Allocation frame while the start times of the remaining RAW slots are equal to the end times of their immediately preceding RAW slots as indicated in the Slot Assignment Bitmap subfield.

The Slot Assignment Bitmap subfield has a length in bits, SAB_{length}, which is determined as:

$$SAB_{\text{length}} = (\text{RAW End AID} - \text{RAW Start AID} + 1) \times 4$$

where

RAW End AID and RAW Start AID for the RAW group are defined in 9.4.2.190

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Pad subfield contains 0 or 4 bits of 0s to make the total number of bits in the Slot Assignment Indication field equal to an integer number of octets.

9.9 MAC frame format for WUR frames

9.9.1 Basic components

Each WUR frame except the WUR Short Wake-up frame consists of the following basic components:

— A *MAC header*, which comprises Frame Control, ID, and Type Dependent Control fields;
— A variable-length *frame body*, which, if present, contains information specific to the frame *type*;
— An *FCS*, which, depending on the Protected subfield in the Frame Control field, contains either a 16-bit CRC or a 16-bit MIC.

The format of a WUR Short Wake-up frame is defined in 9.9.3.5.

9.9.2 General WUR frame format

9.9.2.1 General

Figure 9-1349 depicts the general MAC frame format for WUR frames.

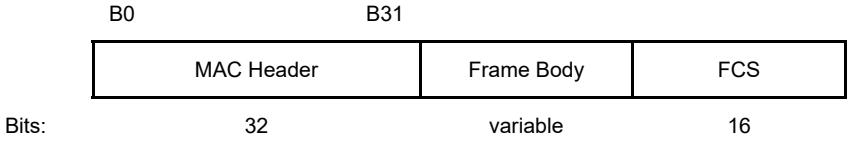

Figure 9-1349—WUR frame format

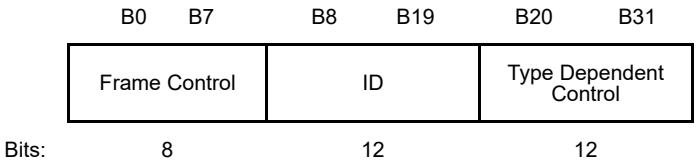

Figure 9-1350—MAC header field format of the WUR frame

The MAC header of the WUR frame consists of the Frame Control, ID, and Type Dependent Control fields, and is defined in 9.9.2.2.

The Frame Body field is optionally present in certain WUR frame types and is defined in 9.9.2.3.

A WUR frame (except WUR Short Wake-up frame) that does not have a Frame Body field is referred to as a FL WUR frame. A WUR frame that has a Frame Body field is referred to as a VL WUR frame.

The FCS field is defined in 9.9.2.4.

9.9.2.2 MAC header

9.9.2.2.1 Frame Control field

The format of the Frame Control field is illustrated in Figure 9-1351.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

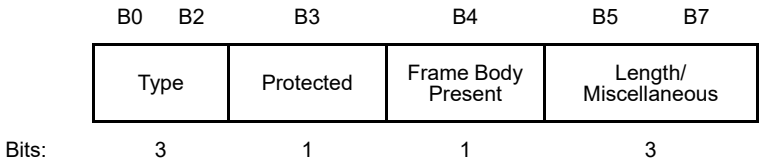

Figure 9-1351—Frame Control field format of WUR frame

The Type subfield indicates the type of the WUR frame, as defined in Table 9-674.

Table 9-674—WUR frame types

Type	Type description
0	WUR Beacon
1	WUR Wake-up
2	WUR Vendor Specific
3	WUR Discovery
4	WUR Short Wake-up
5–7	Reserved

The Protected subfield indicates whether the information carried in the WUR frame has been processed by a message integrity check (MIC) algorithm. The Protected subfield is set to 1 if the WUR frame is protected utilizing the MIC algorithm as defined in 29.10; otherwise it is set to 0 to indicate that the WUR frame contains the 16-bit CRC as defined in 9.9.2.4.2.

The Frame Body Present subfield indicates whether the Frame Body field is present or not.

The Length/Miscellaneous subfield contains the Length subfield when the Frame Body Present subfield is equal to 1; otherwise it contains the Miscellaneous subfield.

The Length subfield indicates the length in octets of the Frame Body field as defined in 9.9.2.3.

The Miscellaneous subfield is reserved in all FL WUR frames except for broadcast and group addressed WUR Wake-up frames as defined in 9.9.3.2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.9.2.2.2 ID field

The ID field contains an identifier (or, in the case of WUR Vendor ID, a portion of an identifier) for the WUR frame. The nature of the identifier for various cases is shown in Table 9-675 and depends on the type of WUR frame (see 9.9.3).

Table 9-675—Identifiers of WUR frames

ID field	Identifier description
Transmitter ID	Identifier of the transmitting AP (see 29.5.3)
ID	Identifier of the nontransmitted BSSID (see 29.5.6)
WUR Group ID	Identifier of a group of receiving WUR non-AP STAs (see 29.5.4)
WUR ID	Identifier of an individual receiving WUR non-AP STA (see 29.5.5)
12 LSB of WUR Vendor ID	The identifier is a public unique identifier assigned by the IEEE Registration Authority as a 24-bit OUI or a 24-bit CID (see [B15] and [B16]). The 12 LSBs of the identifier are carried in the ID field and the 12 MSBs are carried in the Type Dependent Control field

9.9.2.2.3 Type Dependent Control field

The Type Dependent Control field contains control information that depends on the WUR frame type (see 9.9.3).

9.9.2.3 Frame Body field

The Frame Body field is a variable-length field that contains information specific to individual WUR frame types (see 9.9.3). The Frame Body field is not present when the Frame Body Present subfield of the Frame Control field is 0 (i.e., within FL WUR frames) and is present when the Frame Body Present subfield of the Frame Control field is 1 (i.e., within VL WUR frames).

If present, the length of the Frame Body field is $2 \times (L + 1)$ octets, where L is equal to value contained in the Length/Miscellaneous subfield in the Frame Control field.

NOTE—If present, the Frame Body field is between 2 and 16 octets in length.

9.9.2.4 Frame Check Sequence (FCS) field

9.9.2.4.1 General

The FCS field contains a 16-bit CRC when the Protected subfield in the Frame Control field is 0 and contains a 16-bit MIC when the Protected subfield in the Frame Control field is 1 except for the WUR Vendor Specific frame (see 9.9.3.4). The 16-bit CRC is calculated as defined in 9.9.2.4.2, and the MIC is calculated as defined in 29.10.

9.9.2.4.2 Cyclic Redundancy Check (CRC) for WUR frames

The CRC is calculated over the *calculation fields*, which are all the fields present in the WUR frame except the CRC field and the Embedded BSSID field (if present in the *calculation fields*).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—The Embedded BSSID field, if present, is part of the *calculation fields* but is not part of the fields of the WUR frame transmitted over the *WM*.

NOTE 2—The Frame Body field is present in the *calculation fields* when the WUR frame is a VL WUR frame (see 9.9.2.3); otherwise, the Frame Body field is not present.

The Embedded BSSID field, if present, is the last field of the *calculation fields*. The Embedded BSSID field contains the 16 MSBs of the compressed BSSID, which is defined in 29.5.2.

The Embedded BSSID field is present in the *calculation fields* of a WUR Beacon frame and of a WUR (Short) Wake-up frame. The Embedded BSSID field is not present in the *calculation fields* of a WUR Discovery frame. Whether the Embedded BSSID field is present or not in the *calculation fields* of a WUR Vendor Specific frame is vendor specific.

The CRC is the 1s complement of the remainder generated by the modulo 2 division of the *calculation fields* by the polynomial $x^{16}+x^{12}+x^5+1$, where the shift register state is preset to all 1s.

NOTE 3—The order of transmission of bits within the FCS field is defined in 9.2.2.

The *calculation fields* are processed in the order they would have been transmitted.

A schematic of the CRC processing is shown in Figure 9-1352, where the SERIAL DATA INPUT consists of the *calculation fields* (B_L, B_{L-1}..., B_1, B_0), with B_L being the most significant bit of the *calculation fields*. The CRC computation and transmission is the same as the one depicted in Figure 15-2.

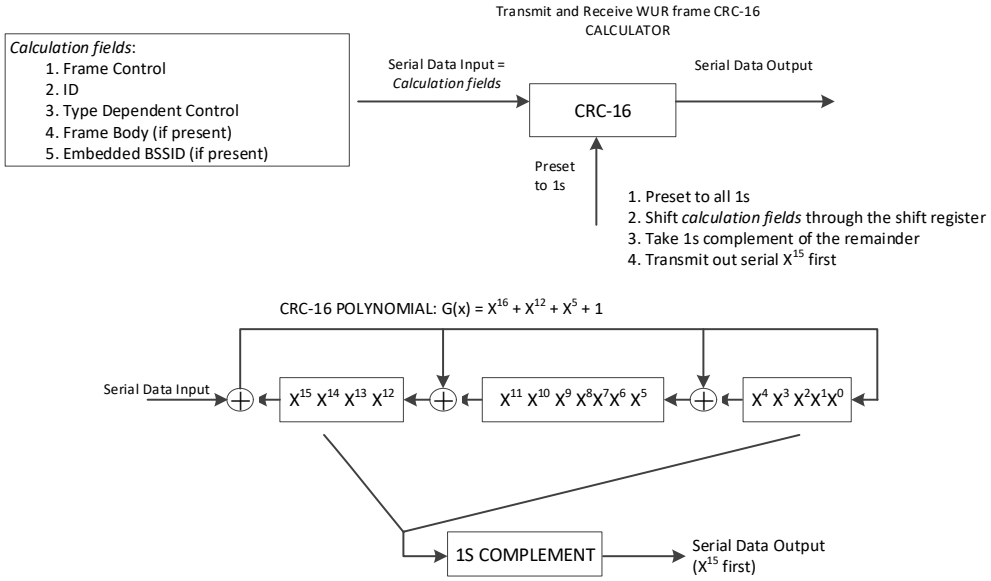

Figure 9-1352—CRC-16 implementation for WUR frames

9.9.3 Format of individual WUR frame types

9.9.3.1 WUR Beacon frame format

The frame format of the WUR Beacon frame is defined in Figure 9-1349.

The Frame Control field is defined in 9.9.2.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Protected subfield of the Frame Control field is set to 0.

The Frame Body Present subfield of the Frame Control field is set to 0.

The Length/Miscellaneous subfield of the Frame Control field is reserved.

The ID field of the WUR Beacon frame is set to the transmitter ID.

The Type Dependent Control field contains the partial TSF that is generated as defined in 29.6.1.

The Frame Body field is not present in the WUR Beacon frame.

The FCS field contains the CRC as defined in 9.9.2.4.2.

9.9.3.2 WUR Wake-up frame format

The frame format of the WUR Wake-up frame is defined in Figure 9-1349.

The Frame Control field is defined in 9.9.2.2.1.

The ID field of the FL WUR Wake-up frame contains one of the following:

— The WUR ID when the frame is individually addressed to a WUR non-AP STA (see 29.5.5).
— The WUR group ID when the frame is group addressed to all WUR non-AP STAs belonging to the group identified by the WUR group ID (see 29.5.4).
— The transmitter ID when the frame is a broadcast frame transmitted by the WUR AP identified by the transmitter ID (see 29.5.3).
— The ID when the frame is a broadcast frame transmitted by the WUR AP identified by the nontransmitted ID when dot11MultiBSSIDImplemented is true (see 29.5.6).

The ID field of the VL WUR Wake-up frame contains a WUR group ID, and the frame is group addressed to one or more WUR non-AP STAs that are identified by the WUR IDs included in the Frame Body field and belong to the group identified by the WUR group ID (see 29.5.4).

The Type Dependent Control field of a WUR Wake-up frame contains the Sequence Number subfield and the Counter subfield as defined in Figure 9-1353.

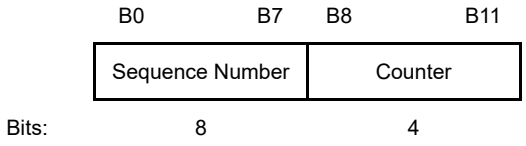

Figure 9-1353—Type Dependent Control field format

The Sequence Number subfield:

— Contains the TSF timer [9: 16] if the Protected subfield in the Frame Control field is 1 and the most recently sent WUR Operation element has the Common PN subfield equal to 1 (see 29.10.4.1), or
— Contains PN0 (see 29.10) if Protected subfield in the Frame Control field is 1, and the most recently sent WUR Operation element has the Common PN subfield equal to 0, or
— Is reserved otherwise.

The Counter subfield:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Contains the BSS Update Counter field if the WUR Wake-up frame is broadcast. The BSS Update Counter field is defined as an unsigned integer initialized to 0 that increments when a critical update to the BSS parameters has occurred (see 29.9.3), or

— Contains PN1[0:3] (see 29.10) if the WUR Wake-up frame is not broadcast, the Protected subfield in the Frame Control field is 1, and the most recently sent WUR Operation element has the Common PN subfield equal to 0, or

— Is reserved otherwise.

The Miscellaneous subfield is present if the Frame Body Present subfield is equal to 0. The format of Miscellaneous subfield is shown in Figure 9-1354 if the frame is broadcast or group addressed FL WUR Wake-up frame. The Miscellaneous subfield is reserved in FL WUR Wake-up frames that are neither broadcast nor group addressed.

NOTE—A broadcast WUR Wake-up frame is always a FL WUR Wake-up frame.

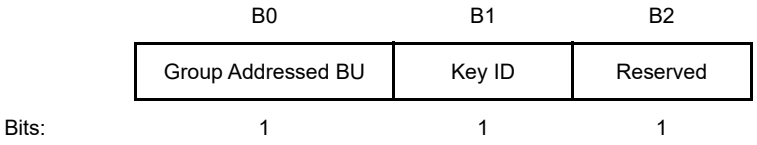

Figure 9-1354—Miscellaneous subfield format

The Group Addressed BU subfield is set to 1 to indicate that one or more group addressed frames are buffered at the AP corresponding to the BSSID that is identified in the ID field. Otherwise, the Group Addressed BU subfield is set to 0. The Group Addressed BU subfield is reserved in a group addressed FL WUR Wake-up frame.

If the FL WUR Wake-up frame is broadcast or group addressed, and the Protected subfield of the Frame Control field is equal to 1, the Key ID subfield is set to 0 to indicate that the WIGTK key ID of the WIGTK used to compute the MIC is 8. If the Protected subfield of the Frame Control field is equal to 1, the Key ID subfield is set to 1 to indicate that the WIGTK key ID of the WIGTK used to compute the MIC is 9. Otherwise, the Key ID subfield is reserved.

The Frame Body field is present in a VL WUR Wake-up frame and contains one or more STA Info fields. The Frame Body field is not present otherwise. The format of the STA Info field is defined in Figure 9-1355.

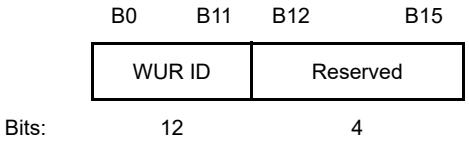

Figure 9-1355—STA Info field format

The WUR ID field is defined in 29.5.

The FCS field contains a CRC when the Protected field is equal to 0 and a MIC when the Protected field is equal to 1 (see 9.9.2.4).

9.9.3.3 WUR Discovery frame format

The frame format of the WUR Discovery frame is defined in Figure Figure 9-1349.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Frame Control field is defined in 9.9.2.2.1.

The Protected subfield in the Frame Control field is set to 0.

The Frame Body Present subfield in the Frame Control field is set to 1. The Length/Miscellaneous subfield is set to indicate that the Frame Body field is 4 octets in length.

The ID field is set to the transmitter ID.

The Type Dependent Control field is set to 12 MSBs of the compressed BSSID (see 29.5.2).

The format of the Frame Body field is defined in Figure 9-1356.

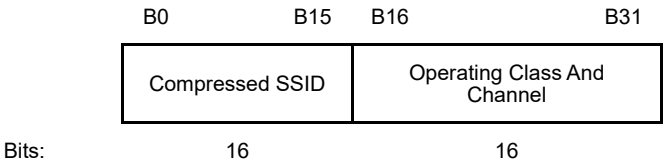

Figure 9-1356— Frame Body field format of WUR Discovery frame

The Compressed SSID field contains the 16 LSBs of the short SSID as defined in 9.4.2.169.3.

NOTE—This is encoded per 9.2.2. For example, if the short SSID has the coefficient of the highest order term set, and the coefficient of the next-to-lowest order term set, and all other coefficients clear, then the Compressed SSID field contains 0x02 followed by 0x00.

The Operating Class And Channel field defined in 9.4.1.22 indicates the location of the primary channel of the BSS being advertised by the WUR Discovery frame.

The FCS field contains the 16-bit CRC as defined in 9.9.2.4.2.

9.9.3.4 WUR Vendor Specific frame format

The frame format of the WUR Vendor Specific frame is defined in Figure 9-1349.

The Frame Control field is defined in 9.9.2.2.1.

If the Frame Body Present subfield in the Frame Control field is set to 0, then the Length/Miscellaneous subfield contains vendor specific information that is outside the scope of the standard.

The ID field is set to the 12 LSBs of the OUI or CID (see Table 9-675).

The Type Dependent Control field is set to the 12 MSBs of the OUI or CID (see Table 9-675).

The Frame Body field, if present, contains vendor specific information that is out of scope of the standard.

The FCS field contains the CRC as defined in 9.9.2.4.2 when the Protected field is equal to 0 and a MIC when the Protected field is equal to 1, wherein the MIC contains vendor specific control information that is out of scope of the standard.

9.9.3.5 WUR Short Wake-up frame format

The frame format of the WUR Short Wake-up frame is defined in Figure 9-1357.

10. MAC sublayer functional description

10.1 Introduction

The MAC functional description is presented in this clause. The architecture of the MAC sublayer, including the distributed coordination function (DCF), the hybrid coordination function (HCF), the mesh coordination function (MCF), the triggered UL access (TUA), and their coexistence in an IEEE 802.11 LAN are introduced in 10.2. These functions are expanded on in 10.3, 10.23, 10.24, and 26.2. Fragmentation and defragmentation are defined in 10.4 and 10.5. Multirate support is addressed in 10.6. A number of additional restrictions to limit the cases in which MSDUs are reordered or discarded are described in 10.7. Operation across regulatory domains is defined in 10.22. The block ack mechanism is described in 10.25. The No Ack mechanism is described in 10.26. The protection mechanism is described in 10.27. Rules for processing MAC frames are described in 10.28.

10.2 MAC architecture

10.2.1 General

The MAC architecture is shown in Figure 10-1, Figure 10-2, and Figure 10-3.

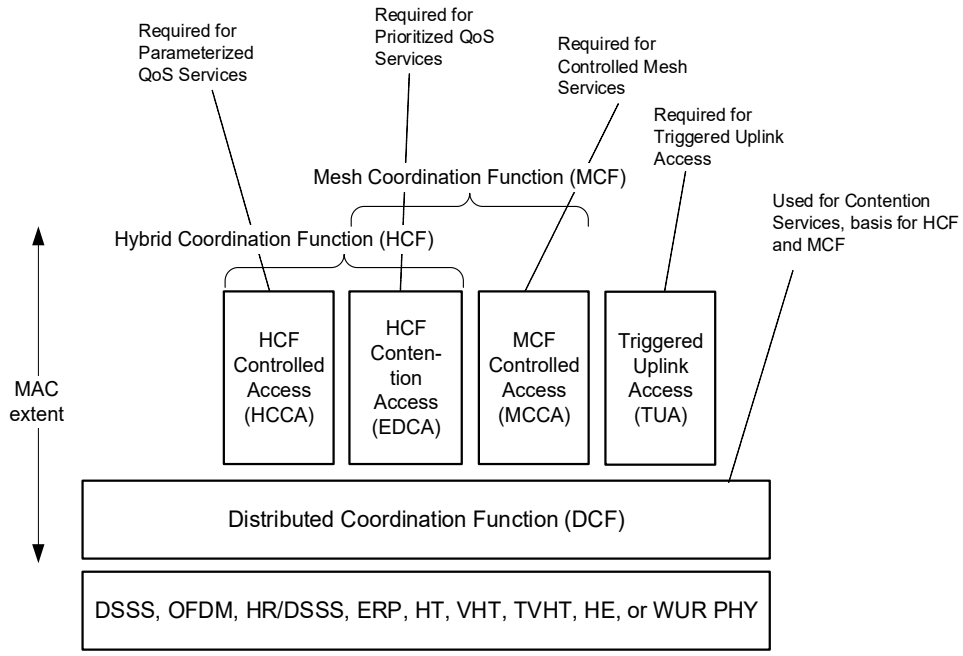

Figure 10-1—STA MAC architecture (non-DMG non-CMMG non-S1G)

In a STA that is not a DMG STA, nor a CMMG STA, nor an S1G STA:

— The MAC provides the HCF, MCF, and TUA service using the services of the DCF. The MAC also provides direct access to the DCF service.

— The HCF is present in QoS STAs and absent otherwise.

— The MCF is present in mesh STAs and absent otherwise.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

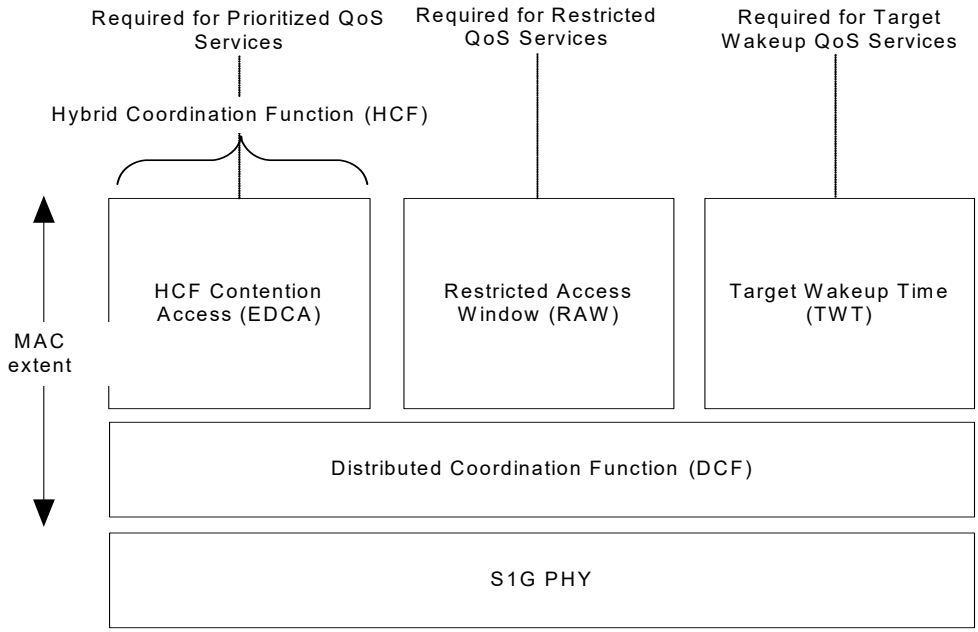

Figure 10-2—S1G STA MAC architecture

— The TUA is present in non-AP HE STAs and absent otherwise.

In an S1G STA:

— The MAC provides EDCA service using the services of the DCF.
— The RAW is optionally present.
— The TWT is optionally present.

In a DMG STA:

— The MAC provides services using the DMG channel access mechanisms.
— PBSS STAs (whether associated with the PCP or not) can receive group addressed frames from the PCP.
— PBSS STAs (whether PCP or non-PCP STA) can receive group addressed frames from a non-PCP STA in the BSS.

In a CMMG STA:

— The MAC provides services using the CMMG channel access mechanisms.

In either a DMG or CMMG STA:

— Specific rules apply for access during scheduled periods, which include the association beamforming training (A-BFT) period, announcement transmission interval (ATI), contention based access period (CBAP), and service period (SP).
— The DCF is used during contention based access periods.
— Dynamic allocation (10.38.7) is built on service period and contention based access period.

The MAC maintains information in local variables called *MAC variables*. MAC variables that hold state information are also called *state variables*.

NOTE—The MMPDU occupies a position in the management plane similar to that of the MAC service data unit (MSDU) in the data plane. An MSDU, A-MSDU, or MMPDU is transmitted in one or more MAC protocol data units (MPDUs) (with the Type field set to Data or Management, respectively). An A-MSDU is transmitted in one MPDU. An MSDU, A-MSDU, or MMPDU can be carried (in an MPDU) in an aggregate MAC protocol data unit (A-MPDU).

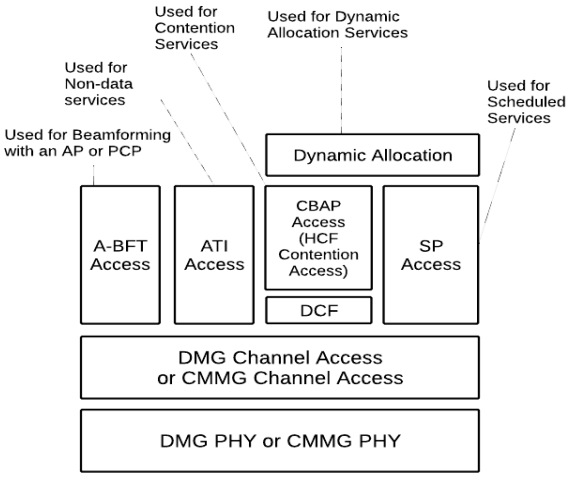

Figure 10-3—DMG STA and CMMG STA architecture

10.2.2 DCF

The fundamental access method of the MAC used by non-DMG STAs is a DCF known as *carrier sense multiple access with collision avoidance* (CSMA/CA). The DCF shall be implemented in all STAs.

For a STA to transmit, it shall sense the medium to determine if another STA is transmitting. If the medium is not determined to be busy (see 10.3.2.1), the transmission may proceed. The CSMA/CA distributed algorithm mandates that a gap of a minimum specified duration exists between frame exchange sequences. A transmitting STA shall verify that the medium is idle for this required duration before attempting to transmit. If the medium is determined to be busy, a non-DMG STA shall defer until the end of the current transmission, and a DMG STA may defer until the end of the current transmission. After deferral, or prior to attempting to transmit again immediately after a successful transmission, the STA shall initialize a backoff counter to a random backoff count (see Equation (10-1)) and shall decrement the backoff counter once per interval of aSlotTime (a backoff slot) while the medium is idle. A refinement of the method may be used under various circumstances to further minimize collisions—here the transmitting and receiving STA exchange short Control frames (RTS and CTS frames for non-DMG STAs, and RTS and DMG CTS frames for DMG STAs) after determining that the medium is idle and after any deferrals or backoffs, prior to data transmission. The details of CSMA/CA, deferrals, and backoffs are described in 10.3. RTS/CTS and RTS/DMG CTS exchanges are also presented in 10.3.

10.2.3 Hybrid coordination function (HCF)

10.2.3.1 General

The QoS facility includes an additional coordination function called *HCF* that is usable only in QoS network configurations. The HCF shall be implemented in all QoS STAs except mesh STAs. Instead, mesh STAs implement the MCF. The HCF combines functions from the DCF with some enhanced, QoS-specific mechanisms and frame subtypes to allow a uniform set of frame exchange sequences to be used for QoS data

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

transfers . The HCF uses both a contention based channel access method, called the *enhanced distributed channel access (EDCA)* mechanism for contention based transfer and a controlled channel access, referred to as the *HCF controlled channel access (HCCA)* mechanism, for contention free transfer.

A STA may obtain a TXOP using one or both of the channel access mechanisms specified in 10.23. If a TXOP is obtained using the contention based channel access, it is defined as *EDCA TXOP*. If a TXOP is obtained using the controlled channel access, it is defined as *HCCA TXOP*. If an HCCA TXOP is obtained due to a QoS (+)CF-Poll frame from the HC, the TXOP is defined as a *polled TXOP*.

Time priority Management frames are defined to be those that appear in a table that has a Time priority column and that have a value of Yes in that Time priority column. No other frames are time priority Management frames.

10.2.3.2 HCF contention based channel access (EDCA)

The EDCA mechanism provides differentiated, distributed access to the WM for STAs using eight different UPs. The EDCA mechanism defines four access categories (ACs) that provide support for the delivery of traffic with UPs at the STAs. Six transmit queues are defined when dot11AlternateEDCAActivated is true, and four transmit queues otherwise. The transmit queue and AC are derived from the UPs as shown in Table 10-1.

Table 10-1—UP-to-AC mappings

Priority	UP	AC	Transmit queue (dot11Alternate-EDCAActivated false or not present)	Transmit queue (dot11Alternate EDCAActivated true)	Designation
Lowest	1	AC_BK	BK	BK	Background
	2	AC_BK	BK	BK	Background
	0	AC_BE	BE	BE	Best Effort
	3	AC_BE	BE	BE	Best Effort
	4	AC_VI	VI	A_VI	Video (alternate)
	5	AC_VI	VI	VI	Video (primary)
	6	AC_VO	VO	VO	Voice (primary)
Highest	7	AC_VO	VO	A_VO	Voice (alternate)
NOTE—The Designation column is an indication of general usage and guidance. Actual uses of each UP are implementation specific.					

NOTE 1—A DMG or S1G STA that implements a single AC (see 10.23.2.1) has all of its UP values in Table 10-1 mapped to AC_BE.

For each AC an enhanced variant of the DCF, called an *enhanced distributed channel access function (EDCAF)*, contends for TXOPs using a set of EDCA parameters. When communicating Data frames outside the context of a BSS (dot11OCBActivated is true), the EDCA parameters are the corresponding default values or are as set by the SME in dot11EDCATable (except for TXOP limits, when the TXOP limits are set to 0 for each AC as specified in 10.23.2.9). For a STA operating OCB the STA's transmit queue for an AC may be cleared by the invocation of the MLME-CANCELTX.request primitive (see 6.5.26). For a non-AP STA communicating within a non-mesh QoS BSS, the EDCA parameters used are from the EDCA Parameter Set

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

element or (for a non-AP STA prior to associating with an AP of an infrastructure BSS, a mesh STA, or a STA that operates OCB) from the default values for the parameters. The parameters used by the EDCAF to control its operation are defined by dot11QAPEDCATable at the AP and by dot11EDCATable at the non-AP STA.

The following rules apply for HCF contention based channel access:

a) The minimum specified idle duration is not the constant value (DIFS) defined for DCF, but is a distinct value. This value is specified in table dot11QAPEDCATableAIFSN for an AP and in table dot11EDCATableAIFSN for a non-AP STA; see 10.23.2. The minimum idle duration is assigned either by a management entity or by an AP.

b) The contention window limits aCWmin and aCWmax, from which the random backoff is computed, are not fixed per PHY, as with DCF, but are variable (contained in tables dot11QAPEDCATableCWmin and dot11QAPEDCATableCWmax for an AP and in tables dot11EDCATableCWmin and dot11EDCATableCWmax for a non-AP STA) and assigned by a management entity or by an AP.

c) Collisions between contending EDCAFs in a STA are resolved within the STA, so that the Data frames from the higher priority AC receive the TXOP and the Data frames from the lower priority colliding AC(s) behave as if there were an external collision on the WM except that the Retry subfield in the MAC headers of MPDUs at the head of the lower priority ACs is not affected.

d) During an EDCA TXOP won by an EDCAF a STA may initiate multiple frame exchange sequences to transmit MMPDUs and/or MSDUs within the same AC. The duration of this EDCA TXOP is bounded, for an AC, by the value dot11QAPEDCATableTXOPLimit for an AP and by dot11EDCATableTXOPLimit for a non-AP STA. A value of 0 for this duration means that the EDCA TXOP is limited as defined by the rule for TXOP limit of 0 found in 10.23.2.9.

The QoS AP shall announce the EDCA parameters in selected Beacon frames and in all Probe Response and (Re)Association Response frames by the inclusion of the EDCA Parameter Set element using the information from the MIB entries in dot11EDCATable. If no such element has been received (e.g., prior to association in an infrastructure BSS), a non-AP QoS STA shall use the default values for the parameters. The EDCA Parameter Set element shall be included in all Beacon frames occurring within two delivery traffic indication map (DTIM) periods following a change in announced EDCA parameters, which provides all STAs an opportunity to receive the updated EDCA parameters; it may optionally be included in more Beacon frames. If any associated STAs are in WNM sleep mode or using FMS, these fields should be included by the AP for as many DTIM periods as needed to exceed the longest interval any STA is expected to not receive Beacon frames.

An HE AP can additionally provide MU EDCA parameters for non-AP HE STAs as defined in 26.2.7.

A non-AP non-S1G QoS STA, on receiving an updated EDCA Parameter Set element, should update the dot11EDCATable as soon as practical in the implementation and shall update the dot11EDCATable within an interval of time equal to one beacon interval. The STA shall update the dot11EDCATable and store the EDCA Parameter Set Update Count subfield in the QoS Info field. A non-AP S1G STA shall update its dot11EDCATable if its STA type is indicated by the STA Type subfield contained in the received EDCA Parameter Set element (see 10.60). An AP may change the EDCA access parameters by changing the EDCA Parameter Set element in the Beacon frame, Probe Response frame, and (Re)Association Response frame. However, the AP should change them only rarely. A non-AP QoS STA shall use the EDCA Parameter Set Update Count subfield in the QoS Capability element of Beacon frames, when present, to determine whether the STA is using the current EDCA parameters. If the EDCA Parameter Set Update Count subfield in the QoS Capability element is different from the value that has been stored, it shall query the updated EDCA parameters by sending a Probe Request frame to the AP.

The S1G AP shall set the STA Type subfield of EDCA Parameter Set elements it transmits as follows:

— 1 if it indicates support for sensor STAs but no support for non-sensor STAs

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— 2 if it indicates support for non-sensor STAs but no support for sensor STAs

The S1G AP may set the STA Type subfield of EDCA Parameter Set elements to any value that is less than 3 if it indicates support for both sensor STAs and non-sensor STAs as described in 10.60.

When an S1G AP assigns EDCA Parameters, if management frame protection is negotiated and both STAs set the Extended S1G Action Protection field in the RSNXE that they transmit to 1, the STAs shall:

— use individually addressed Protected EDCA Parameter Set frames instead EDCA Parameter Set frames and
— discard any individually addressed EDCA Parameter Set frame received from the peer STA, with which management frame protection is negotiated.

STAs that exchange individually addressed Protected EDCA Parameter Set frames shall follow the rules defined in 12.6.17.

When management frame protection is not negotiated or the Extended S1G Action Protection field in the RSNXE transmitted by either STA is set to 0, the STAs shall not use the Protected EDCA Parameter Set frame.

An S1G AP may assign to an S1G STA EDCA parameters different from the ones in dot11EDCATable, by sending to the STA an EDCA Parameter Set frame with an EDCA Parameter Set element with the Override field equal to 1. An S1G STA receiving an EDCA Parameter Set element with the Override field equal to 1 shall update its MIB values of the EDCA parameters based on the values indicated by the EDCA Parameter Set element.

An S1G STA that receives an EDCA Parameter Set frame with an EDCA Parameter Set element with the Override field equal to 1 shall disregard any EDCA Parameter Set elements with the Override field equal to 0 received afterward during the current association until it receives the EDCA Parameter Set element with the Override field equal to 1 carried in an EDCA Parameter Set frame.

In the Beacon frame the EDCA Parameter Set Update Count subfield is incremented every time any of the announced EDCA parameters change.

An AP or PCP may use a different set of EDCA parameters than it advertises to the STAs in its BSS.

A non-QoS STA shall use frames with the QoS subfield of the Subtype subfield set to 0 for data transmissions to other STAs. A STA shall use frames with the QoS subfield of the Subtype subfield set to 0 for group addressed Data frames that are not GCR frames unless the transmitting STA knows that all STAs in the BSS have QoS capability, in which case the STA shall use QoS Data frames. A STA shall use frames with the QoS subfield of the Subtype subfield set to 0 for nonbroadcast group addressed Data frames that are not GCR frames unless it is known to the transmitter that all STAs in the BSS that are members of the multicast group have QoS capability, in which case STAs shall use QoS Data frames. An AP with dot11RobustAVStreamingImplemented equal to true or a mesh STA with dot11MeshGCRImplemented equal to true uses frames with the QoS subfield of the Subtype subfield set to 1 for GCR frames, as described in 11.21.16.3.5.

A QoS STA shall not transmit to another QoS STA an individually addressed frame with the Type subfield indicating Data and the QoS subfield of the Subtype subfield set to 0, except if the Subtype subfield indicates Null. A QoS STA should not transmit to another QoS STA an individually addressed frame with the Type subfield indicating Data and the Subtype subfield indicating Null.

A QoS STA that transmits a group addressed frame with the Type subfield indicating Data shall transmit it with the QoS subfield of the Subtype subfield set to 0 if non-QoS STAs are among the intended receivers,

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

should transmit it with the QoS subfield set to 0 if non-QoS STAs might be among the intended receivers, and should transmit it with the QoS subfield set to 1 if no non-QoS STAs are among the intended receivers.

A QoS STA that transmits a Management frame determines access category used for medium access in transmission of the Management frame as follows:

- If dot11QMFActivated is false or not present and
  - If the Management frame is individually addressed to a non-QoS STA, category AC_BE should be selected.

    NOTE 2—AC_VO might be selected prior to completion of the (re)association procedure, to assist timely discovery of and joining a BSS.
  - If category AC_BE was not selected by the previous step, category AC_VO shall be selected.

    NOTE 3—Selection of AC_VO above is independent of whether the STA is associated with a BSS, or whether there is a QoS facility in the BSS.
- If dot11QMFActivated is true, the STA determines the access category as described in 11.24.

BlockAckReq and BlockAck frames shall be sent using the same access category for medium access as the corresponding QoS Data frames. When a BlockAckReq, Multi-TID BlockAckReq, or Multi-STA BlockAck frame is transmitted by an HE STA, its operation is defined in 26.4.

A non-S1G STA shall send PS-Poll frames using the access category AC_BE. This reduces the likelihood of collisions following a Beacon frame.

If an S1G STA receives an EDCA Parameter Set element from its associated AP and its STA type is indicated in the STA Type subfield in the received EDCA Parameter Set element, an S1G STA shall transmit PS-Poll frames, PS-Poll+BDT frames and NDP PS-Poll frames using the access category indicated in the PS-Poll ACI subfield. Otherwise, an S1G STA shall transmit PS-Poll frames, PS-Poll+BDT frames and NDP PS-Poll frames either using access category AC_VO when the S1G STA is a non-sensor STA or using access category AC_BE when the S1G STA is a sensor STA (see 10.60).

When the first frame in a frame exchange sequence intended to carry a QoS Data, QoS Null or Management frame is an RTS or CTS frame, the RTS or CTS frame shall be transmitted using the access category of the corresponding QoS Data or QoS Null frame or the access category used for medium access of the Management frame.

Control Wrapper frames shall be sent using the access category that would apply to the carried Control frame.

A beamformer may send an HE or VHT NDP Announcement frame or Beamforming Report Poll frame using any access category and without being restricted by admission control procedures.

PS-Poll frames and Management frames are exempted from any and all restrictions on transmissions arising from admission control procedures.

The operation rules of HCF contention based channel access are defined in 10.23.2.

The alternate video (A_VI) and alternate voice (A_VO) transmit queues share the same EDCAF as VI and VO transmit queues, respectively, as shown in Figure 10-28. When dot11AlternateEDCAActivated is true, a scheduling function above the VO EDCAF selects from the primary or alternate EDCA transmit queue an MSDU, an A-MSDU, an MMPDU, or set of MSDUs to be the next to be passed to the VO EDCAF (as shown in Figure 10-28) so that the MSDU(s), A-MSDU(s), or MMPDU(s) from the queue with the higher UP are selected with a higher probability than from the queue with the lower UP. When dot11AlternateEDCAActivated is true, a scheduling function above the VI EDCAF selects from the primary or alternate EDCA transmit queue an MSDU, an A-MSDU, an MMPDU, or set of MSDUs to be the next to

be passed to the VI EDCAF so that the MSDU(s), A-MSDU(s), or MMPDU(s) from the queue with the higher UP are selected with a higher probability than from the queue with the lower UP. The default algorithm to select an MSDU, A-MSDU, or MMPDU from either the A_VI or VI queue and to select an MSDU, A-MSDU, or MMPDU from either the A_VO or VO queue is as follows:

— For each EDCAF, an MSDU, A-MSDU, or MMPDU is selected for transmission using the transmission selection procedures defined in 8.6.8 of IEEE Std 802.1Q using two queues, the primary and alternate.
— For a given AC, the order in which frames are selected for transmission shall maintain the requirements specified in 10.7 of this standard.

Alternative prioritization algorithms that meet the requirements of 10.7 may be used.

10.2.3.3 HCF controlled channel access (HCCA)

HCCA is deprecated.

The HCCA mechanism uses a QoS-aware centralized coordinator, called a *hybrid coordinator (HC)*. The HC is colocated with the AP of the BSS and uses the HC's higher priority of access to the WM to initiate frame exchange sequences and to allocate TXOPs to itself and other STAs in order to provide limited-duration CAPs for contention free transfer of QoS data.

The HC traffic delivery and TXOP allocation may be scheduled to meet the QoS requirements of a particular TC or TS. TXOP allocations and contention free transfers of QoS traffic might be based on the HC's BSS-wide knowledge of the amounts of pending traffic belonging to different TS and/or TCs and are subject to BSS-specific QoS policies.

Implementers are cautioned that QoS STAs are not required to interpret data subtypes that include QoS +CF-Ack in frames not addressed to themselves unless they set the Q-Ack subfield in the QoS Capability element to 1.

The HCF protects the transmissions during each CAP using the virtual CS mechanism.

A STA may initiate multiple frame exchange sequences during a polled TXOP of sufficient duration to perform more than one such sequence.

The operation rules of the HCCA are defined in 10.23.3.

10.2.4 Mesh coordination function (MCF)

The mesh facility includes an additional coordination function called *MCF* that is usable only in an MBSS. A mesh STA shall implement the MCF only. MCF has both a contention based channel access and contention free channel access mechanism. The contention based mechanism is EDCA and the contention free mechanism is called the *MCF controlled channel access (MCCA)*. MCF uses the default values for the PTKSA, and GTKSA Replay Counters. The operation rules of the EDCA are defined in 10.23.2. The operation rules of the MCCA are defined in 10.24.3.

10.2.5 Triggered uplink access (TUA)

A non-AP HE STA supports trigger-based UL access methods. Triggered UL access (TUA) is used when an HE AP triggers one or more non-AP HE STAs to transmit HE TB PPDUs simultaneously. The optional UL OFDMA-based random access (UORA) additionally allows a non-AP HE STA to access one of a number of resource units (RUs) designated for random access by the HE AP. See 26.5.2 and 26.5.4).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

10.2.6 Combined use of DCF, HCF and TUA

The DCF, HCF, and TUA are defined so they may operate within the same BSS. The HCF access methods (controlled and contention based) operate sequentially. Sequential operation allows the polled and contention based access methods to alternate, within intervals as short as the time to transmit a frame exchange sequence, under rules defined in 10.23. The TUA access methods (see 26.5.2 and 26.5.4) allow triggered uplink periods to be interspersed with polled and contention based access methods. In addition, triggered uplink periods support contention based random access.

10.2.7 Fragmentation/defragmentation overview

The process of partitioning an MSDU, A-MSDU, or an MMPDU into smaller MAC-level frames, MPDUs, is called *fragmentation*. Fragmentation creates MPDUs smaller than the original MSDU, A-MSDU, or MMPDU length to increase reliability, by increasing the probability of successful transmission as defined in 10.2.2 of the MSDU, A-MSDU, or MMPDU when channel characteristics limit reception reliability for longer frames. A STA may use fragmentation to use the medium efficiently in consideration of the duration available in granted TXOPs, as long as the rules in 10.4 and 10.11 are followed. Fragmentation is accomplished at each immediate transmitter. The process of recombining MPDUs into a single MSDU, A-MSDU, or MMPDU is defined as *defragmentation*. Defragmentation is accomplished at each immediate recipient.

An MSDU transmitted under an HT-immediate block ack agreement shall not be fragmented even if its length exceeds dot11FragmentationThreshold. An MSDU or MMPDU transmitted within an A-MPDU that does not contain an S-MPDU (see 10.12.8) shall not be fragmented even if its length exceeds dot11FragmentationThreshold. A group addressed MPDU shall not carry a fragment of an MSDU or MMPDU even if the MPDU length exceeds dot11FragmentationThreshold.

NOTE 1—A fragmented MSDU or MMPDU transmitted by an HT STA to another HT STA can be acknowledged only using immediate acknowledgment (i.e., transmission of an Ack frame after a SIFS).

NOTE 2—As specified in 10.4 and 10.11, only dynamic fragmentation is supported for A-MSDUs.

NOTE 3—A fragmented MSDU or MMPDU transmitted by an S1G STA can be acknowledged either using immediate acknowledgment (i.e., transmission of an (NDP) Ack frame after a SIFS) or using fragment BA described in 10.3.2.12.

Except as described below, when an individually addressed MSDU is received from the LLC or an individually addressed MMPDU is received from the MLME that would result in an MPDU of length greater than dot11FragmentationThreshold, the MSDU or MMPDU shall be fragmented. An MSDU or MMPDU may be fragmented even if this is not the case. An exception applies when an MSDU is transmitted using an HT-immediate block ack agreement or when the MSDU or MMPDU is carried in an A-MPDU that does not contain an S-MPDU, in which case the MSDU or MMPDU is transmitted without fragmentation. Each fragment is a frame no longer than dot11FragmentationThreshold, if security encapsulation is not invoked for the MPDU. If security encapsulation is active for the MPDU, then the fragments shall be expanded by the encapsulation overhead and this may result in a fragment larger than dot11FragmentationThreshold. An illustration of fragmentation is shown in Figure 10-4.

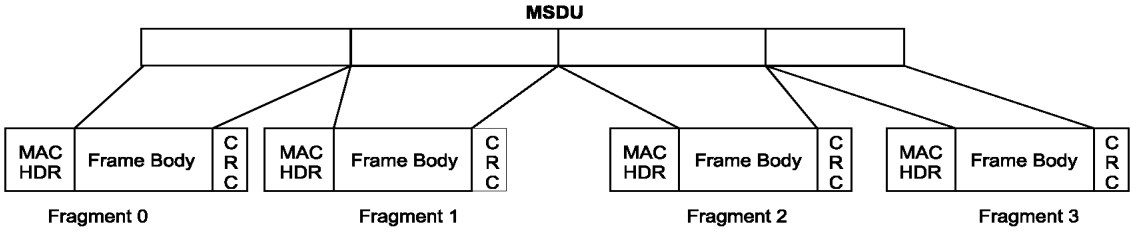

Figure 10-4—Fragmentation

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The MPDUs resulting from the fragmentation of an MSDU or MMPDU are sent as independent transmissions, each of which is separately acknowledged. This permits transmission retries to occur per fragment, rather than per MSDU or MMPDU. The fragments of a single MSDU or MMPDU are either

— Sent as individual frames using the DCF, or
— Sent as a burst in an EDCA or HCCA TXOP, subject to TXOP limits and medium occupancy limits for the attached PHY.

A QoS Data frame with a TID matching a block ack agreement may be transmitted in a non-A-MPDU with Normal Ack ack policy.

Transmission of fragmented MPDUs by a DMG STA outside of an A-MPDU depends on setting of the No-Fragmentation field in the ADDBA Extension element within the ADDBA Response frame transmitted during the block ack agreement handshake. The MSDU shall not be fragmented if the No-Fragmentation field in the ADDBA Extension element within the ADDBA Response frame transmitted during the block ack agreement handshake is 1. If the No-Fragmentation field in the ADDBA Extension element within the ADDBA Response frame is 0, the originator may fragment an MSDU sent under the block ack agreement, with Normal Ack ack policy for the corresponding MPDUs.

10.2.8 MAC data service

The MAC data service provides the transport of MSDUs between MAC peer entities as characterized in 5.1.1.

The transmission process is started by the MAC's receipt of one or more MA-UNITDATA.request primitives, each containing an MSDU and its associated parameters. This might cause one or more Data frames, containing the MSDU(s), to be transmitted.

The reception process is started by the MAC's receipt of one or more Data frames containing one or more MSDUs. This might cause one or more MA-UNITDATA.indication primitives, each containing an MSDU and its associated parameters, to be issued.

When dot11SSPNInterfaceActivated is true, an AP shall distribute the group addressed message into the BSS only if dot11NonAPStationAuthSourceMulticast in the dot11InterworkingEntry identified by the source MAC address in the received message is true. When dot11SSPNInterfaceActivated is false, an AP shall distribute the group addressed message into the BSS, except when dot11RelayAPOperationActivated is true and the group addressed message is received from a STA. In that case, the group addressed message shall not be distributed into the BSS, and it shall be forwarded to the S1G relay STA in the same relay. The S1G relay STA shall send the group addressed message to the associated AP as an individually addressed frame using either a four address frame format (PV0 or PV1) or an A-MSDU format as specified in 10.53.4.

Unless the MPDU is delivered via DMS, the STA originating the message receives the message as a group addressed message (prior to any filtering). Therefore, a STA shall filter out group addressed messages that contain their address as the source address; the point at which such filtering occurs in the processing of received frames is an implementation choice. When dot11SSPNInterfaceActivated is false, group addressed MSDUs shall be propagated throughout the ESS. When dot11SSPNInterfaceActivated is true, group addressed MSDUs shall be propagated throughout the ESS only if dot11NonAPStationAuthSourceMulticast in the dot11InterworkingEntry identified by the source MAC address in the received message is true.

A STA transmitting on a general link also uses the addressing rules described in 10.64.

A MAC not contained within an S1G relay shall perform address filtering on the Address 1 field in each MPDU contained in a PPDU and, for non-GLK non-AP STAs, on the DA of each MSDU within an A-MSDU. In the case of a non-GLK STA receiver, when the Address 1 field or DA field contains a group address, address filtering is performed by comparing the value in the Address 1 field or DA field to all values in

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the dot11GroupAddressesTable and the broadcast address value. The STA also validates the BSSID to verify that it either corresponds to the BSS of which the receiving STA is a member, or if dot11OCBActivated is true, that it contains the wildcard BSSID, indicating a Data frame sent outside the context of a BSS. Address 1 filtering is as specified in 10.64 when Address 1 is a SYNRA. A GLK AP does not perform any DA filtering for MPDUs received over a non-general link; all MSDUs so received are passed to the DS for further processing. A GLK STA does not perform DA filtering for MPDUs received over a general link; all MSDUs so received are passed to the GLK convergence function and from there to the bridge for further processing.

A mesh STA also uses the address matching rules described in 10.37.3, when it receives an individually addressed frame. When a mesh STA receives a frame with the Address 1 field equal to a group address, the mesh STA also checks the TA to determine whether the group addressed frame originated from one of its peer mesh STAs; if there is no match, the STA shall discard the frame. A mesh STA also uses the address matching rules described in 10.37.4.

If the Address 1 field of an MPDU carrying an A-MSDU does not match any address at a receiving STA, then the entire A-MSDU is discarded.

In a QoS STA, the TID parameter of the MA-UNITDATA.request primitive results in a TID being specified for the transmitted MSDU. This TID associates the MSDU with the AC or TS queue for the indicated traffic.

10.3 DCF

10.3.1 General

The basic medium access protocol is a DCF that allows for automatic medium sharing between compatible PHYs through the use of CSMA/CA and a random backoff count following a busy medium condition. In addition, all individually addressed traffic uses immediate positive acknowledgment (Ack frame), in which retransmission is scheduled by the sender if no Ack frame is received.

The CSMA/CA protocol is designed to reduce the collision probability between multiple STAs accessing a medium, at the point where collisions would most likely occur. Just after the medium becomes idle following a busy medium (as indicated by the CS function) is when the highest probability of a collision exists. This is because multiple STAs could have been waiting for the medium to become available again. This is the situation that necessitates a random backoff procedure to resolve medium contention conflicts.

The DCF is modified for use by DMG STAs to allow sharing of the medium between compatible DMG PHYs (see 10.3.4). A DMG STA has no direct knowledge of when it might interfere (collide with the transmission of) another STA.

The CS function of a DMG STA might not indicate the medium busy condition due to the predominant nature of directional transmissions and receptions. The transmission of a STA might interfere (collide) with the transmission of another STA even though the CS function at the first STA does not indicate medium busy. The interference (collision) is identified when the expected response frame is not received. SPSH is achieved by the proper combination of the STA antenna configuration during the media access and data transfer phases.

CS shall be performed both through physical and virtual mechanisms.

The virtual CS mechanism is achieved by distributing reservation information announcing the impending use of the medium. The exchange of RTS and CTS frames prior to the actual Data frame is one means of distribution of this medium reservation information. The RTS and CTS frames contain a Duration field that defines the period of time that the medium is to be reserved to transmit the actual Data frame and the returning Ack frame. A STA receiving either the RTS frame (sent by the originating STA) or the CTS frame (sent by the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

destination STA) shall process the medium reservation. Thus, a STA might be unable to receive from the originating STA and yet still know about the impending use of the medium to transmit a Data frame. The exchange of an MU-RTS Trigger frame and simultaneous CTS frame transmissions by HE STAs prior to the actual Data frames is another means of distribution of this medium reservation information.

Another means of distributing the medium reservation information is the Duration/ID field in individually addressed frames. This field gives the time that the medium is reserved, either to the end of the immediately following Ack frame, or in the case of a fragment sequence, to the end of the Ack frame following the next fragment.

The RTS/CTS exchange also performs both a type of fast collision inference and a transmission path check. If the return CTS frame is not detected by the STA originating the RTS, the originating STA may repeat the process (after observing the other medium-use rules) more quickly than if the long Data frame had been transmitted and a return Ack frame had not been detected. An RTS/CTS exchange by VHT STAs also performs fast collision inference on the secondary 20 MHz channel, secondary 40 MHz channel, and secondary 80 MHz channel and helps the VHT STA transmitting the RTS to determine the available bandwidth at the responder. Similarly, an RTS/DMG CTS exchange by EDMG STAs performs fast collision inference on the secondary channel, secondary1 channel, and secondary2 channel and helps the EDMG STA transmitting the RTS to determine the available bandwidth at the responder.

Another advantage of the RTS/CTS mechanism occurs where multiple BSSs utilizing the same channel overlap. The medium reservation mechanism works across the BSS boundaries. The RTS/CTS mechanism might also improve operation in a typical situation in which all STAs are able to receive from the AP, but might not be able to receive from all other STAs in the BSA.

Except for MPDUs transmitted via the GCR service, the RTS/CTS mechanism cannot be used for MPDUs with a group addressed immediate destination because there are multiple recipients for the RTS frame, and thus potentially multiple concurrent senders of the CTS frame in response. For MPDUs transmitted via the GCR service, an RTS frame may be used if it is directed to a STA within the GCR group (see 10.23.2.12.2 and 10.25.8). The RTS/CTS mechanism is not used for every Data frame transmission. Because the additional RTS and CTS frames add overhead inefficiency, the mechanism is not always justified, especially for short Data frames.

The use of the RTS/CTS mechanism under control of dot11RTSThreshold if dot11TXOPDurationRTSThreshold is 1023 or is not present is described in 10.3.5.

The use of the RTS/CTS mechanism is under the control of dot11TXOPDurationRTSThreshold if dot11TXOPDurationRTSThreshold is present and is not 1023. If this mechanism is enabled, a non-AP HE STA shall initiate a TXOP that is used for individually addressed frames with an RTS/CTS exchange as defined in 26.2.1.

All non-DMG STAs that are members of a BSS are able to receive and transmit at all of the data rates in the BSSBasicRateSet parameter of the MLME-START.request primitive or BSSBasicRateSet parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive; see 6.5.4.2.4 and 6.5.11.2.4.

NOTE—The operational rate or MCS set that a STA advertises does not necessarily contain all the mandatory rates or MCSs, respectively. The basic rate or MCS set that a STA starting a BSS advertises does not necessarily contain all the mandatory rates or MCSs, respectively. However, a STA has to be capable of receiving using a mandatory rate or MCS (when required by the rules in 10.6) even if it is not present in the operational rate or MCS set, respectively, that the STA advertises, and similarly has to be capable of transmitting using a mandatory rate or MCS (when required by the rules in 10.6) even if it is not present in the basic rate or MCS set, respectively. In this context, “mandatory” describes rates or MCSs that are so described, or described using “shall support”, in reference to the STA type, in the PHY clause applicable to the STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

All HT STAs that are members of a BSS are able to receive and transmit using all of the MCSs in the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive; see 6.5.4.2.4 and 6.5.11.2.4.

All VHT STAs that are members of a BSS are able to receive and transmit using all of the <VHT-MCS, NSS> tuples in the basic VHT-MCS and NSS set (see 11.38.7) except as constrained by the rules of 10.6.13.

All DMG STAs that are members of a BSS are able to receive and transmit using all of the MCSs in the OperationalRateSet parameter of the MLME-START.request primitive or OperationalRateSet parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive; see 6.5.4.2.4 and 6.5.11.2.4.

To support the proper operation of the RTS/CTS by non-DMG STAs, RTS/DMG CTS by DMG STAs, and the virtual CS mechanism, a non-DMG STA shall interpret Control frames with the Subtype subfield equal to RTS or CTS, and a DMG STA shall interpret Control frames with the Subtype subfield equal to RTS or DMG CTS.

A Data frame sent under the DCF shall have the Type subfield set to Data and the Subtype subfield set to Data or Null. A STA receiving a frame with the Type subfield equal to Data shall not indicate the frame to the LLC when the Subtype subfield is equal to Null, but shall indicate the frame to the LLC when the Subtype subfield is equal to Data, even if the frame body contains zero octets.

While in the awake state and operating under DCF but not transmitting, a DMG STA can configure its receive antenna to a quasi-omni pattern in order to receive frames transmitted by any STA that is covered by this antenna pattern.

10.3.2 Procedures common to the DCF and EDCAF

10.3.2.1 CS mechanism

Physical and virtual CS functions are used to determine the state of the medium. When either function indicates a busy medium, the medium shall be considered busy; otherwise, it shall be considered idle.

A physical CS mechanism shall be provided by the PHY. See Clause 8 for how this information is conveyed to the MAC. The details of physical CS are provided in the individual PHY specifications.

A virtual CS mechanism, referred to as the NAV, shall be provided by all MACs. An additional virtual CS mechanism, referred to as response indication deferral (RID), shall be provided by S1G MACs.

The NAV maintains a prediction of future traffic on the medium based on duration information that is announced in RTS/CTS frames by non-DMG STAs, in MU-RTS Trigger/CTS frames by HE STAs as defined in 26.2.6, and in RTS/DMG CTS frames by DMG STAs prior to the actual exchange of data. The duration information is also available in the MAC headers of all frames other than PV1 MAC frames and PS-Poll frames, and during the BTI, the A-BFT, the ATI, the CBAP, and the SP. The duration information in a frame transmitted by an S1G STA is also available in PS-Poll+BDT frames, in NDP CTS frames, in NDP Ack frames whose Idle Indication field value is 0, and in NDP_2M PS-Poll-Ack frames whose Idle Indication field is 0. The duration information might also be available in the RXVECTOR parameter TXOP_DURATION when an HE PPDU is received (see 26.11.5).

The mechanism for setting the NAV using RTS/CTS or RTS/DMG CTS in the DCF is described in 10.3.2.4, and use of the NAV in HCF is described in 10.23.2.2 and 10.23.3.4. Additional details regarding NAV use appear in 10.3.2.6, 10.3.2.15, 10.38.10, and 10.27.

The mechanism for setting the RID is described in 10.3.2.5.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The CS mechanism combines the NAV state, and in S1G STAs also the RID state, and the STA's transmitter status with physical CS to determine the busy/idle state of the medium. The NAV and RID might be thought of as counters that count down to 0 at a uniform rate. In non-S1G STAs, when the NAV counter is 0, the virtual CS indication is that the medium is idle; when the counter is nonzero, the indication is busy. In S1G STAs, when both NAV and RID counters are 0, the virtual CS indication is that the medium is idle; when either the NAV counter or the RID counter is nonzero the indication is that the medium is busy. The virtual CS indication of medium for HE STAs with two NAVs is described in 26.2.4. If a DMG STA supports multiple NAVs as defined in 10.38.10 and all counters are 0, the virtual CS indication is that the medium is idle; when at least one of the counters is nonzero, the indication is busy. The medium shall be determined to be busy when the STA is transmitting.

Immediately after aRxTxTurnaroundTime + aAirPropagationTime + 10% × (aSlotTime – aAirPropagationTime) after each MAC slot boundary as defined in 10.3.7 and 10.23.2.4, the MAC shall issue a PHY-CCARESET.request primitive to the PHY, where aAirPropagationTime determined as described in 10.22.5.

10.3.2.2 MAC-level acknowledgments

The reception of some frames, as described in 10.3.2.11, requires the receiving STA to respond with an acknowledgment if the FCS of the received frame is correct. This technique is known as positive acknowledgment.

Lack of reception of an expected frame containing an acknowledgment indicates to the STA initiating the frame exchange sequence that an error has occurred. Note, however, that the destination STA may have received the frame correctly, and that the error may have occurred in the transfer or reception of the frame containing an acknowledgment. When a frame containing an acknowledgment is lost, the MAC that initiated the frame exchange sequence does not receive a protocol indication of whether the initial frame was correctly received.

A correctly received frame is one for which the PHY-RXEND.indication primitive does not indicate an error and the FCS indicates the frame is error free.

10.3.2.3 IFS

10.3.2.3.1 General

The time interval between certain adjacent PPDU[+SigExt]s is called the *IFS*. A STA shall determine that the medium is idle through the use of the CS function for the interval specified. Ten different IFSs are defined to provide priority levels for access to the wireless medium. Figure 10-5 shows some of these relationships. All timings are referenced from occurrence of the PHY interface primitives PHY-TXEND.confirm, PHY-TXSTART.confirm, PHY-RXSTART.indication, and PHY-RXEND.indication.

The IFSs are as follows:

a) RIFS reduced interframe space
b) SIFS short interframe space
c) PIFS priority interframe space
d) DIFS DCF interframe space
e) AIFS[AC] AIFS arbitration interframe space (for the AC used by the QoS facility)
f) EIFS extended interframe space
g) SBIFS short beamforming interframe space
h) BRPIFS beam refinement protocol interframe space

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

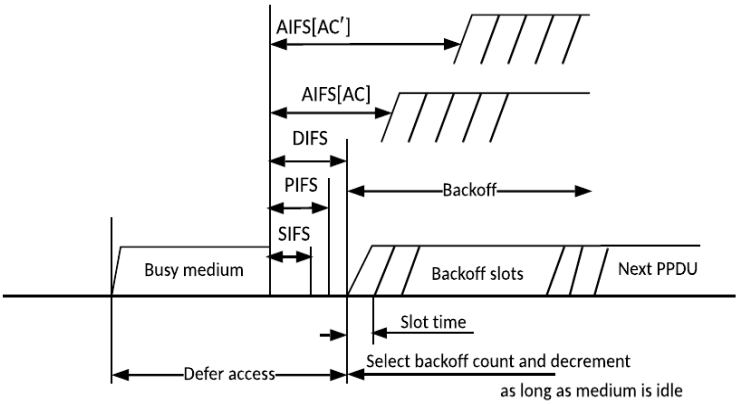

Figure 10-5—Some IFS relationships

i) MBIFS medium beamforming interframe space

j) LBIFS long beamforming interframe space

The different IFSs shall be independent of the STA bit rate. The IFS timings are defined as the nominal time gaps between primitives at the MAC after accounting for defined delays (see 10.3.7). The timing of primitives in turn depend on time gaps between PPDU[+SigExt]s on the medium. The IFS timings except AIFS are fixed for each PHY (even in multirate-capable PHYs). The IFSs are determined from attributes specified by the PHY.

NOTE—The “frame” in “interframe” is due to historical use of “frame” to signify “PHY frame”, as a synonym for “PPDU”.

10.3.2.3.2 RIFS

The use of RIFS for a non-DMG STA is obsolete, and support for such use might be subject to removal in a future revision of the standard. A VHT or S1G STA shall not transmit frames separated by a RIFS.

RIFS is a means of reducing overhead and thereby increasing network efficiency.

RIFS may be used in place of SIFS to separate multiple transmissions from a single transmitter, when no SIFS-separated response transmission is expected and either of the following is true:

— The transmitter is not a DMG STA.

— The transmitter is a DMG STA, and each transmission occurs with the same transmit antenna configuration.

RIFS shall not be used between frames with different RA field. The duration of RIFS is defined by the aRIFS PHY characteristic (see Table 19-25 and Table 20-30). The RIFS is the time from the end of the previous PPDU to the beginning of the preamble of the subsequent PPDU as seen on the WM. A STA shall not allow the space between PPDUs that are defined to be separated by a RIFS, as measured on the medium, to vary from the nominal RIFS (aRIFSTime) by more than ± 10% of aRIFSTime. Two PPDUs separated by a RIFS shall both be HT PPDUs or shall both be DMG PPDUs.

An HT STA shall not transmit PPDUs separated by a RIFS unless the beacon or probe response most recently received from the BSS’s AP contains an HT Operation element with RIFS Mode field equal to 1.

There are additional restrictions regarding when RIFS may be employed as defined in 10.29. See also 10.27.3.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

10.3.2.3.3 SIFS

The SIFS is the time from the end of the previous PPDU[+SigExt] to the beginning of the preamble of the subsequent PPDU as seen on the WM at the STA transmitting the subsequent PPDU.

NOTE—The time between these PPDUs as seen on the WM at any other STA in the BSS, including the STA transmitting the previous PPDU, might be anything from SIFS to SIFS + aAirPropagationTime. Because aSlotTime includes aAirPropagationTime, even in the worst case the beginning of the preamble of the subsequent PPDU will arrive before PIFS at any STA in the BSS.

SIFS is the shortest of the IFSs between transmissions from different non-DMG STAs. SIFS shall be used when STAs have seized the medium and need to keep it for the duration of the frame exchange sequence to be performed. Using the smallest gap between transmissions within the frame exchange sequence prevents other STAs, which are required to wait for the medium to be idle for a longer gap, from attempting to use the medium, thus giving priority to completion of the frame exchange sequence in progress.

The SIFS shall be used prior to transmission of each of the following frames:

- An (NDP) Ack frame, a TACK frame, a STACK frame, NDP PS-Poll-Ack frame, a (NDP) CTS frame;
- A PPDU containing a BlockAck frame, NDP BlockAck frame, or BAT frame that is an immediate response to either a BlockAckReq frame or an A-MPDU;
- A DMG CTS frame, a DMG DTS frame, a Grant Ack frame;
- A response frame transmitted in the ATI, and the second or subsequent MPDU of a fragment burst;
- A frame within a series of NDP sector training frames transmitted by an S1G AP after a sector training announcement;
- An RTS frame that is sent as an immediate response to a PS-Poll(+BDT) frame.

The SIFS may also be used, and by an S1G STA for an (NDP) PS-Poll frame or uplink trigger frame that is a response to an NDP Paging frame (see 10.46.6).

A non-DMG STA shall not allow the space between PPDU[+SigExt]s that are defined to be separated by a SIFS, as measured on the medium at the STA, to vary from the nominal SIFS by more than ± 10% × (aSlotTime – aAirPropagationTime) for the PHY in use. A DMG STA shall not allow the space between PPDUs that are defined to be separated by a SIFS, as measured on the medium at the STA, to vary from the nominal SIFS by more than –0% or +10% × (aSlotTime – aAirPropagationTime).

When transmitting a response frame immediately following a SIFS, a DMG STA, or CMMG STA shall set the TXVECTOR parameter LAST_RSSI of the response frame to the power that was measured on the received PPDU, as reported in the RCPI field of the frame that elicited the response frame. The encoding of the value is as follows:

- Power values less than or equal to –68 dBm are represented as the value of 1.
- Power values between –68 dBm and –42 dBm are represented as $\left\lfloor \frac{p - (-71) + 0.5}{2} \right\rfloor$, where p is the power in dBm.
- Power values greater than or equal to –42 dBm are represented as the value 15.
- For all other cases, the STA shall set the TXVECTOR parameter LAST_RSSI of the transmitted frame to 0.

A DMG STA that transmits a PPDU containing at least one individually addressed MPDU shall set the TXVECTOR parameter TURNAROUND to 1 if the STA is required to listen for an incoming PPDU immediately following the transmission of the PPDU; otherwise, the STA shall set the TXVECTOR parameter TURNAROUND to 0. The STA shall set the TXVECTOR parameter TURNAROUND to 0 when it transmits an RTS frame.

An HE STA that transmits an HE TB PPDU a SIFS after the end of a received PPDU follows the procedure in 26.5.2.3.

10.3.2.3.4 PIFS

The PIFS is used to gain priority access to the medium.

The PIFS may be used as described in the following list and shall not be used otherwise:

- A STA transmitting a Channel Switch Announcement frame, as described in 11.8 or transmitting an Extended Channel Switch Announcement frame, as described in 11.9
- A STA transmitting a TIM frame, as described in 11.2.3.14
- A STA transmitting a Beacon, DMG Beacon or S1G Beacon frame
- An HC starting an HCCA TXOP, as described in 10.23.3.2.2
- A non-AP QoS STA that is a polled TXOP holder recovering from the absence of an expected reception in a CAP, as described in 10.23.3.2.3
- An HT STA using dual CTS protection before transmission of the CTS2, as described in 10.3.2.10
- A TXOP holder continuing to transmit after a transmission failure, as described in 10.23.2.8
- A TXOP holder transmitting an RTS with a bandwidth signaling TA within multiple frame exchange sequences, as specified in 10.23.2.8
- An RD initiator continuing to transmit using error recovery, as described in 10.29.3
- An HT STA performing clear channel assessment (CCA) in the secondary channel before transmitting a 40 MHz mask PPDU using EDCA channel access, as described in 11.15.9
- An AP continuing to transmit in a GCR block ack TXOP after the failure to receive a BlockAck frame, as described in 10.25.8
- A VHT STA performing CCA in the secondary 20 MHz, 40 MHz, and 80 MHz channels before transmitting a 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz mask PPDU using EDCA channel access, as described in 10.23.3
- An AP or PCP continuing to transmit in the ATI after a transmission failure during the ATI (10.38.3)
- A source DMG STA of an SP continuing to transmit after a transmission failure, as described in 10.38.6.2
- A DMG STA performing EDCA access during an allocated CBAP, as described in 10.38.5
- A TVHT STA performing CCA in the secondary TVHT_W and TVHT_2W channels before transmitting a TVHT_2W or TVHT_W+W mask PPDU and TVHT_4W or TVHT_2W+2W mask PPDU, respectively, using EDCA channel access, as defined in 10.23.3
- An S1G STA performing clear channel assessment (CCA) in the secondary 2 MHz, 4 MHz, and 8 MHz channels before transmitting a 4 MHz, 8 MHz, or 16 MHz mask PPDU using EDCA channel access, as described in 10.23.2.6
- An S1G AP transmitting sounding NDP(s) within an SST sounding RAW
- An EDMG STA performing CCA in the secondary, secondary1, and secondary2 channels before transmitting a 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, or 4.32+4.32 GHz mask PPDU using EDCA channel access, as described in 10.23.2.

With the exception of performing CCA in the secondary channel (where the timing is defined in 11.15.9 for an HT STA and defined in10.38.12.2 for an EDMG STA), a STA using PIFS starts its transmission after its CS mechanism (see 10.3.2.1) determines that the medium is idle at the TxPIFS slot boundary, as defined in 10.3.7 and 10.23.2.4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

10.3.2.3.5 DIFS

The DIFS shall be used by STAs operating under the DCF to transmit Data frames (MPDUs) and Management frames (MMPDUs). A STA using the DCF may transmit if both:

— After it has correctly received a frame, its CS mechanism (see 10.3.2.1) determines that the medium is idle at the TxDIFS slot boundary as defined in 10.3.7.

— The STA's backoff counter has a value of zero.

10.3.2.3.6 AIFS

The AIFS shall be used by QoS STAs that access the medium using the EDCAF to transmit: all Data frames (MPDUs) except during the ATI or an SP, all Management frames (MMPDUs) except during the ATI or an SP, all Extension frames except for the DMG Beacon frame, and the following Control frames:

— PS-Poll(+BDT)

— SSW (if first transmission by an initiator in a CBAP)

— Poll (if first transmission and when in a CBAP)

— Grant (if first transmission and when in a CBAP and not transmitted in response to an SPR frame)

— SPR (when in a CBAP and not transmitted as a response to a Poll)

— RTS (when not transmitted as a response to a PS-Poll(+BDT) frame by an S1G STA)

— CTS (when not transmitted as a response to an RTS frame)

— DMG CTS (when not transmitted as a response to an RTS frame)

— BlockAckReq

— BlockAck (when not transmitted as a response to a BlockAckReq frame)

— NDP PS-Poll

A STA using the EDCAF shall obtain a TXOP for an AC if the STA's CS mechanism (see 10.3.2.1) determines that the medium is idle at the AIFS[AC] slot boundary (see 10.23.2.4), after a correctly received frame, and the backoff counter for that AC has a value of zero.

A non-AP and non-PCP QoS STA computes the time periods for each AIFS[AC] from dot11EDCATableAIFSN. In an infrastructure BSS, QoS STAs update their dot11EDCATableAIFSN values using information in the most recent EDCA Parameter Set element of Beacon frames received from the AP of the BSS (see 9.4.2.27) if the STA is a non-DMG STA or the most recent EDCA Parameter Set element of DMG Beacon and Announce frames received from the AP or PCP of the BSS if the STA is a DMG STA. A QoS AP or PCP computes the time periods for each AIFS[AC] from dot11QAPEDCATableAIFSN.

10.3.2.3.7 EIFS

A DCF shall use EIFS before transmission, when it determines that the medium is idle immediately following reception of a PPDU[+SigExt] for which the PHY-RXEND.indication primitive contained an error or a frame for which the FCS value was not correct. Similarly, a STA's EDCA mechanism under HCF shall use the EIFS–DIFS+AIFS[AC] interval. The duration of an EIFS is defined in 10.3.7. The EIFS or EIFS–DIFS+AIFS[AC] interval shall begin following indication by the PHY that the medium is idle after detection of the erroneous PPDU or frame, without regard to the virtual CS mechanism. The STA shall not begin a transmission until the expiration of the later of the NAV and EIFS or EIFS–DIFS+AIFS[AC]. The EIFS and EIFS–DIFS+AIFS[AC] are defined to provide enough time for another STA to acknowledge what was, to this STA, an incorrectly received PPDU or frame before this STA commences transmission. Reception of an error-free frame or reception of an HE PPDU with the RXVECTOR parameter TXOP_DURATION that is not set to UNSPECIFIED during the EIFS or EIFS-DIFS+AIFS[AC] resynchronizes the STA to the actual busy/idle state of the medium, so the EIFS or EIFS-DIFS+AIFS[AC] is terminated and medium access (using

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

DIFS or AIFS as appropriate and, if necessary, backoff) continues following reception of the PPDU[+SigExt] containing error-free frame or following an expected end of the received HE PPDU. At the expiration or termination of the EIFS or EIFS-DIFS+AIFS[AC], the STA reverts to the NAV and physical CS to control access to the medium.

EIFS shall not be invoked for an A-MPDU if one or more of its frames are received correctly. EIFS shall not be invoked if the RXVECTOR parameter TXOP_DURATION of a received HE PPDU is not set to UNSPECIFIED.

10.3.2.3.8 SBIFS

The SBIFS shall separate PPDU transmissions in each of the following cases:

a) Back-to-back PPDU transmissions from a single transmitter during a receive sector sweep or TDD beamforming, or
b) Back-to-back PPDU transmissions when each PPDU transmission occurs with a different transmit antenna configuration and no SIFS-separated response transmission is expected, or
c) Back-to-back PPDU transmissions from a single transmitter when each PPDU transmission occurs with a different transmit RF chain and no SIFS-separated response transmission is expected.

The duration of SBIFS is determined by the aSBIFSTime PHY characteristic. The SBIFS is the time from the end of the previous PPDU to the beginning of the preamble of the subsequent PPDU as seen on the WM. A STA shall not allow the space between PPDUs that are defined to be separated by a SBIFS, as measured at the DMG antenna, to be less than aSBIFSTime or to be more than aSBIFSTime + aSBIFSAccuracy. Two PPDUs separated by a SBIFS shall both be either DMG PPDUs or EDMG PPDUs.

10.3.2.3.9 BRPIFS

The BRPIFS shall be used by STAs between transmissions of BRP frames. The BRPIFS is the maximum time from the end of the previous PPDU, or training field if present in the PPDU, to the beginning of the preamble of the subsequent PPDU as seen on the WM. The corresponding minimum time is SIFS. BRPIFS is defined to be equal to aBRPIFS+10%.

10.3.2.3.10 MBIFS

The MBIFS shall be used between the BTI and the A-BFT and between the ISS, RSS, SSW-Feedback, and SSW-Ack. In a BRP TXSS, MBIFS shall be used in between the first three transmitted BRP PPDUs (see 10.41.10.5). MBIFS is equal to 3×aSIFSTime. A DMG STA shall not allow the space between PPDUs containing frames that are defined to be separated by an MBIFS, as measured on the medium, to vary from the nominal MBIFS by more than –0% or +10% × (aSlotTime – aAirPropagationTime).

10.3.2.3.11 LBIFS

The LBIFS shall be used between two consecutive transmissions that use different DMG antennas but with common RF chain, and when the recipient STA is expected to switch DMG antennas. LBIFS is equal to TXTIME(SSW) + 2×SBIFS, except when used as part of an ISS or an RSS employing Short SSW PPDUs, in which case LBIFS is equal to 2×TXTIME(Short SSW) + 3×SBIFS. A DMG STA shall not allow the space between PPDUs containing frames that are defined to be separated by an LBIFS, as measured on the medium, to vary from the nominal LBIFS by more than –0% or +10% × (aSlotTime – aAirPropagationTime).

10.3.2.4 Setting and resetting the NAV

This subclause describes the setting and resetting of the NAV for non-DMG STAs and DMG STAs that support a single NAV. DMG STAs that support multiple NAVs shall update their NAVs according to the procedures described in 10.38.10. HE STAs with two NAV timers shall update their NAV timers according to the procedures described in 26.2.4.

The duration information is indicated by a frame as follows:

— If there is a Duration field in the frame, then the duration information is indicated by the Duration field.

— If the frame is a PS-Poll, then the duration information is equal to the time, in microseconds, required to transmit one Ack frame plus one SIFS under the data rate selection rules. If the calculated duration information includes a fractional microsecond, that duration information is rounded up to the next higher integer.

A STA that receives at least one frame in a PSDU can update its NAV with the information from any valid Duration field in the PSDU. When the received frame's RA is equal to the STA's own MAC address, the STA shall not update its NAV. Further, when the received frame is a DMG CTS frame and its TA is equal to the STA's own MAC address, the STA shall not update its NAV. For all other received frames the STA shall update its NAV when the received Duration is greater than the STA's current NAV value. Upon receipt of a PS-Poll frame, a STA, except for an S1G STA for which the RXVECTOR parameter RESPONSE_INDICATION of the received PS-Poll frame is NDP Response, shall update its NAV settings as appropriate under the data rate selection rules using a duration value equal to the time, in microseconds, required to transmit one Ack frame plus one SIFS, but only when the new NAV value is greater than the current NAV value. If the value calculated for the Duration/ID field is not an integer, the value inserted in the Duration/ID field is rounded up to the next higher integer. When the NAV is reset, a PHY-CCARESET.request primitive shall be issued. This NAV update operation is performed when the PHY-RXEND.indication primitive is received, except when the PHY-RXEND.indication primitive is received before the end of the PPDU. In this exception, the NAV update is performed at the expected end of the PPDU.

NOTE 1—An S1G STA that receives a frame that does not include a valid Duration field does not update its NAV. However, it updates its RID as described in 10.3.2.5.

An S1G STA that receives a PS-Poll frame with the RXVECTOR parameter RESPONSE_INDICATION equal to NDP Response shall update its NAV using a duration value equal to NDPTxTime (10.3.2.5.2) plus one SIFS, but only when the new NAV value is greater than the current NAV value. The NDPTxTime is calculated according to additional RXVECTOR parameters as described in 10.3.2.5.2.

In addition to the NAV update rules described in this subclause, an S1G STA shall also update its NAV to a new NAV value if it receives information that the NAV is greater than the STA's current NAV value. This information shall be received in the Duration field of the following frames: NDP CTS, NDP Ack, NDP_2M PS-Poll-Ack, and S1G Beacon, except when the received frame is one of the following:

— NDP CTS frame that is either addressed to the S1G STA as a response to an RTS frame, or that is an NDP CTS frame whose value of the Duration field can be disregarded as defined in 10.3.2.9.

— NDP Ack frame that is either addressed to the S1G STA, or that has the Idle Indication field equal to 1 (see 10.3.2.11).

— NDP_2M PS-Poll-Ack frame that is either addressed to that S1G STA, or that has the Idle Indication field equal to 1 (see 10.3.2.11).

— S1G Beacon frame that includes at least one TIM element in which there is an indication of available BUs for the receiving STA in at least one of the TIM elements.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— S1G Beacon frame that includes at least one TIM element and at least one RPS element that indicate both of the following:
  — There is no indication of available BUs for the receiving STA in any of the TIM elements.
  — The receiving S1G STA is allowed to access the first RAW immediately following the S1G Beacon frame as specified in at least one of the RPS elements.

An HE AP that is not a TXOP holder shall update the NAV with the duration information indicated by the RXVECTOR parameter TXOP_DURATION for an HE PPDU if all of the following conditions are met and shall not update the NAV with the duration information indicated by the RXVECTOR parameter TXOP_DURATION if one or more of the following conditions are not met:

— The RXVECTOR parameter TXOP_DURATION is not UNSPECIFIED.
— The HE AP does not receive a frame with a Duration field in the PPDU.
— The duration indicated by the RXVECTOR parameter TXOP_DURATION is greater than the current NAV value of the HE AP.

An HE AP that is a TXOP holder shall update the NAV with the duration information indicated by the RXVECTOR parameter TXOP_DURATION for an HE PPDU if all of the following conditions are met and shall not update the NAV with the duration information indicated by the RXVECTOR parameter TXOP_DURATION if one or more of the following conditions are not met:

— The RXVECTOR parameter TXOP_DURATION is not UNSPECIFIED.
— The HE AP does not receive a frame with a Duration field in the PPDU.
— The duration indicated by the RXVECTOR parameter TXOP_DURATION is greater than the current NAV value of the HE AP.
— The RXVECTOR parameter BSS_COLOR is not equal to the BSS color of the HE AP.

NOTE 2—A non-AP HE STA maintains two NAVs, but an HE AP might maintain only one NAV (see 26.2.4).

NOTE 3—If a STA receives an HE PPDU with the duration information indicated by both a frame with a Duration field and the RXVECTOR parameter TXOP_DURATION, then the duration information indicated by the RXVECTOR parameter TXOP_DURATION is ignored.

Figure 10-6 indicates the NAV for STAs that might receive the RTS frame, while other STAs might receive only the CTS frame, resulting in the lower NAV bar as shown (with the exception of the STA to which the RTS frame was addressed).

A STA that used information from an RTS frame or MU-RTS Trigger frame as the most recent basis to update its NAV setting is permitted to reset its NAV if no PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive is received from the PHY during a NAVTimeout period starting when the MAC receives a PHY-RXEND.indication primitive corresponding to the detection of the RTS frame or MU-RTS Trigger frame.

In a non-DMG BSS, NAVTimeout period is equal to (2 × aSIFSTime) + (CTS_Time) + aRxPHYStartDelay + (2 × aSlotTime). In a non-S1G STA, if an RTS frame is used for the most recent NAV update, CTS_Time shall be calculated using the length of the CTS frame and the data rate at which the RTS frame used for the most recent NAV update was received. If an MU-RTS Trigger frame was used for the most recent NAV update, CTS_Time shall be calculated using the length of the CTS frame and the 6 Mb/s data rate (see 26.2.6). In an S1G STA, CTS_Time shall be calculated using the time required to transmit an NDP CTS frame that is equal to NDPTxTime, which is specified in 10.3.2.5.2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

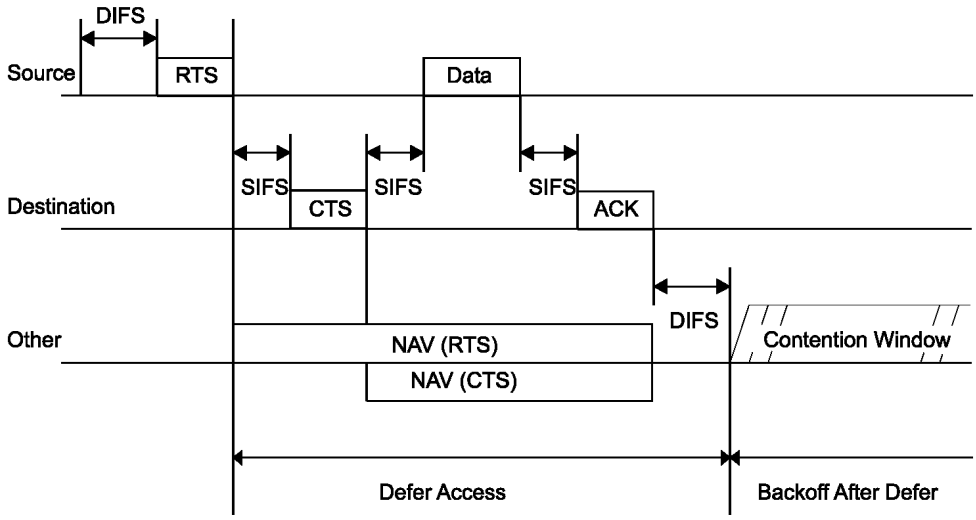

Figure 10-6—RTS/CTS/data/Ack and NAV setting

In DMG BSS, NAVTimeout period is equal to (2 × aSIFSTime) + $T_{DMG\text{-}CTS}$ + StartDelayCompensation + (2 × aSlotTime), where $T_{DMG\text{-}CTS}$ is the duration of a DMG CTS frame calculated using the TXVECTOR TRN_LEN parameter equal to the RXVECTOR TRN_LEN parameter of the received RTS frame and StartDelayCompensation is equal to aSlotTime.

NOTE 4—This value of StartDelayCompensation is a compromise over the possible values of aRxPHYStartDelay, which are dependent on both the implementation and the DMG PHY mode.

10.3.2.5 Setting and resetting the RID

10.3.2.5.1 General

This subclause describes the setting and resetting of the RID for S1G STAs.

An S1G STA that receives a frame that is not an NDP CMAC PPDU shall update its RID counter based on the values of the received frame's RXVECTOR parameters FORMAT, PREAMBLE_TYPE, RESPONSE_INDICATION, AGGREGATION, MCS, PARTIAL_AID, COLOR, UPLINK_INDICATION, and CH_BANDWITH, as described in this subclause. An S1G STA that receives an NDP CMAC PPDU shall update its RID counter based on the values of the RXVECTOR parameter FORMAT, PREAMBLE_TYPE and the RESPONSE_INDICATION value, which is defined per type of NDP CMAC PPDU in Table 10-2.

A member PPDU is a PPDU transmitted by a STA that is a member of the same BSS of the receiving STA. A PPDU that is not a member PPDU is a nonmember PPDU.

An S1G STA that receives a member PPDU shall reset and update its RID counter, as defined in 10.3.2.5.2, when the PHY-RXSTART.indication primitive corresponding to that PPDU is received. An S1G STA that receives a nonmember PPDU shall not reset the RID counter and shall update the RID counter, i.e., set it to a new value (as defined in 10.3.2.5.2) that is not less than the value that the RID counter will have at the instant of time that corresponds to the end of the received PPDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 10-2—RESPONSE_INDICATION value for NDP CMAC PPDUs

NDP CMAC PPDU type	RESPONSE_INDICATION value
NDP Ack or NDP PS-Poll-Ack (NDP (PS-Poll-)Ack)	No Response if either Idle Indication field value is 0 or the Duration field value is not 0 Long Response if Idle Indication field value is 1 and Duration field value is 0
NDP Block Ack	No Response
NDP CTS	No Response
NDP PS-Poll	NDP Response
NDP Beamforming Report Poll	Long Response
NDP Paging	No Response
NDP Probe Request	No Response
NDP CF-End	No Response

The S1G STA shall classify a received PPDU as a member PPDU if it is an NDP CMAC PPDU, or an S1G_1M PPDU. The S1G STA shall classify a received PPDU as a member PPDU if its PREAMBLE_TYPE is either S1G_LONG_PREAMBLE or S1G_SHORT_PREAMBLE and either of the conditions below is satisfied:

— UPLINK_INDICATION is 1 and the PARTIAL_AID indicates that the PPDU is addressed to the AP with which the non-AP STA is associated.

— UPLINK_INDICATION is 0 and the COLOR indicates that the PPDU is generated by the AP with which the STA is associated.

Because the PARTIAL_AID and COLOR values obtained from received PPDUs are not globally unique, an S1G STA that has classified a PPDU as a member PPDU based on PARTIAL_AID and/or COLOR may additionally use the information contained in a valid MAC header (i.e., neither A1 nor A2 field contain a MAC address that corresponds to a STA that is a member of the same BSS as known at the STA) from an MPDU carried in the received PPDU to change the classification of the PPDU to a nonmember PPDU. If the classification of a PPDU is changed from member to nonmember PPDU, then the STA shall:

— Reload the RID counter to the value that the RID counter had at the time of the receipt of the PHY-RXSTART.indication primitive corresponding to this PPDU minus the difference between the current time and that time; and

— Update the RID counter according to the rules for a nonmember PPDU.

NOTE 1—If the PHY-RXEND.indication primitive for the received S1G PPDU contains an ERROR or FormatViolation then the S1G STA sets the EIFS as described in 10.3.7.

If the RID counter is updated then it shall start counting down the RID counter at the end of the received S1G PPDU, except when the PPDU either contains a valid nonzero Duration field that is used for setting the NAV, as described in 10.3.2.4, or it is intended to the S1G STA. In both of these cases the RID shall be reset.

The received PPDU has an expected duration, in microseconds, of PSDU_RXTIME, starting from the moment the PHY-RXSTART.indication primitive is received. If the PPDU is an NDP CMAC PPDU, the PSDU_RXTIME is equal to 0. If the PPDU is not an NDP CMAC PPDU, the PSDU_RXTIME is calculated based on multiple RXVECTOR parameters and is equal to

— The RXTIME defined in Equation (23-69) for S1G_SHORT/S1G_1M formats.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The RXTIME defined in Equation (23-69) if the PPDU has S1G_LONG format and is an SU PPDU.
— The RXTIME defined in Equation (23-70) minus ($T_{DSTF} + N_{LTF}\, D_{DLTF} + T_{SIG\text{-}B}$) if the PPDU has S1G_LONG format and is an MU PPDU.

NOTE 2—T_{DSTF}, T_{DLTF}, and $T_{SIG\text{-}B}$ are defined in Table 23-5 while N_{LTF} is defined in Table 23-11.

Figure 10-7 indicates the RID for STAs that receive the PHY header of the Data frame whose MAC portion does not contain a valid Duration field that updates the NAV. The RID for STAs that receive the PHY header of the Ack frame but not that of the Data frame is 0 (i.e., no response is expected to the Ack frame in this example). The RID is reset for the STA to which the Data was addressed.

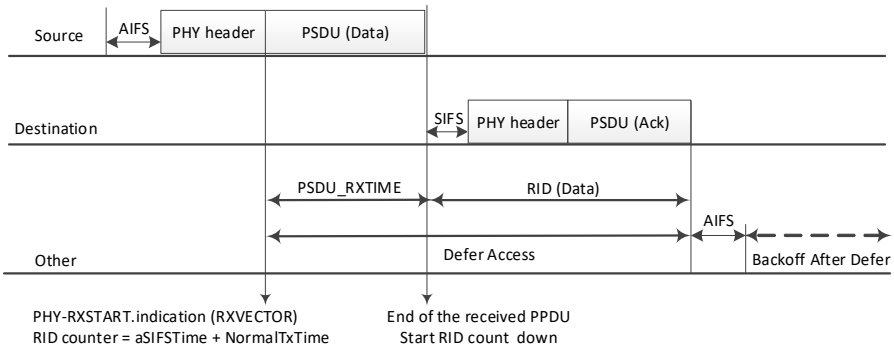

Figure 10-7—Data/Ack with RID setting

10.3.2.5.2 RID update

An S1G STA updates the value of the RID counter by setting it as described below.

If the value of the RESPONSE_INDICATION parameter is Long Response, the RID counter shall be set to LongTxTime + aSIFSTime, where LongTxTime is obtained as follows:

— If FORMAT is S1G and CH_BANDWIDTH is CBW1 or FORMAT is S1G_DUP_1M, then LongTxTime is equal to the S1G PPDU duration as defined in Table 9-34.
— If FORMAT is S1G and PREAMBLE_TYPE is S1G_SHORT_PREAMBLE or S1G_LONG_PREAMBLE, then LongTxTime is equal to the largest value in the dot11EDCATableTXOPLimit.
— If FORMAT is S1G_DUP_2M then LongTxTime is equal to the largest value in the dot11EDCATableTXOPLimt

If the value of the RESPONSE_INDICATION parameter is Normal Response, the RID counter shall be set to NormalTxTime + aSIFSTime. NormalTxTime is calculated based on the RXVECTOR parameters PREAMBLE_TYPE, AGGREGATION, MCS and CH_BANDWIDTH following the rules listed in Table 10-3.

If the value of RESPONSE_INDICATION parameter is NDP Response, the RID counter shall be set to NDPTxTime + aSIFSTime. NDPTxTime is calculated based on the RXVECTOR parameter PREAMBLE_TYPE and is equal to the time, in microseconds, required to transmit either an NDP_1M CMAC PPDU if the PPDU format is S1G_1M or an NDP_2M CMAC PPDU if the PPDU format is either S1G_SHORT or S1G_LONG (see 23.1.4).

If the value of the RESPONSE_INDICATION parameter is No Response, the RID counter shall be set to 0.

Table 10-3—NormalTXTime duration based on RXVECTOR parameters

PPDU format (see 23.1.4)	AGGREGATION	Expected Response Length (Type)	NormalTxTime
S1G_1M	0	14-octet MPDU (Ack)	The time, in microseconds, required to transmit one Ack frame, where the duration of the frame is calculated according to the rate selection rules described in 10.6.6.5 using its BSSBasicMCSSet parameter and with CH_BANDWIDTH RXVECTOR value equal to CBW1.
	1	32-octet MPDU (BlockAck)	The time, in microseconds, required to transmit one BlockAck frame, where the duration of the frame is calculated according to the rate selection rules described in 10.6.6.5 using its BSSBasicMCSSet parameter and with CH_BANDWIDTH RXVECTOR value equal to CBW1
S1G_SHORT or S1G LONG PREAMBLE	0	14-octet MPDU (Ack)	The time, in microseconds, required to transmit one Ack frame, where the duration of the frame is calculated according to the rate selection rules described in 10.6.6.5 using its BSSBasicMCSSet parameter and channel width selection rules for Control frames described in 10.6.6.6.
	1	32-octet MPDU (BlockAck)	The time, in microseconds, required to transmit one BlockAck frame, where the duration of the frame is calculated according to the rate selection rules described in 10.6.6.5 using its BSSBasicMCSSet parameter and channel width selection rules for Control frames described in 10.6.6.6.

10.3.2.6 RTS/CTS with fragmentation

The following is a description of using RTS/CTS for a fragmented MSDU or MMPDU. The RTS/CTS frames define the duration of the following frame and acknowledgment. The Duration/ID field in the Data and Ack frames specifies the total duration of the next fragment and acknowledgment. This is illustrated in Figure 10-8.

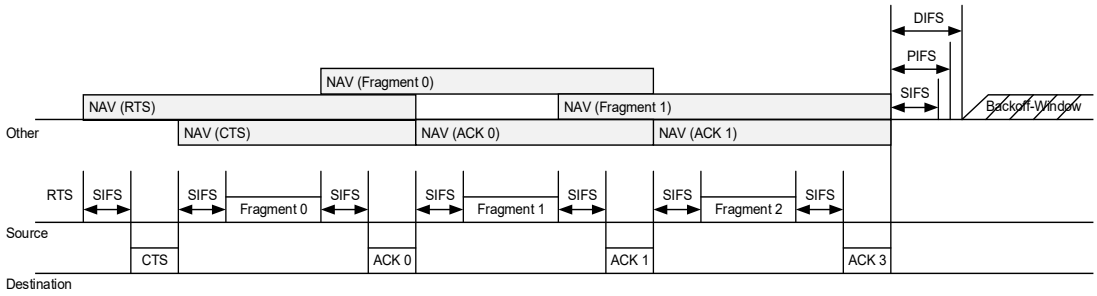

Figure 10-8—RTS/CTS with fragmented MSDU

Each frame contains information that defines the duration of the next transmission. The duration information from RTS frames shall be used to update the NAV to indicate busy until the end of Ack frame 0. The duration information from the CTS frame shall also be used to update the NAV to indicate busy until the end of Ack frame 0. Both Fragment 0 and Ack frame 0 shall contain duration information to update the NAV to indicate busy until the end of Ack frame 1. This shall be done by using the Duration/ID field in the Data and Ack frames. This shall continue until the last fragment, which shall have a duration of one Ack time plus one SIFS, and its Ack frame, which shall have its Duration/ID field set to 0. Each fragment and Ack frame acts as a

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

virtual RTS frame and CTS frame; therefore no further RTS/CTS frames need to be generated after the RTS/CTS that began the frame exchange sequence.

In the case where an acknowledgment is sent but not received by the source STA, STAs that heard the fragment, or Ack frame, mark the channel busy for the next frame exchange sequence due to the NAV having been updated from these frames. This is the worst-case situation, and it is shown in Figure 10-9. If an acknowledgment is not sent by the destination STA, STAs that can only hear the destination STA do not update their NAV and may attempt to access the channel when their NAV updated from the previously received frame reaches 0. All STAs that hear the source are free to access the channel after their NAV updated from the transmitted fragment has expired.

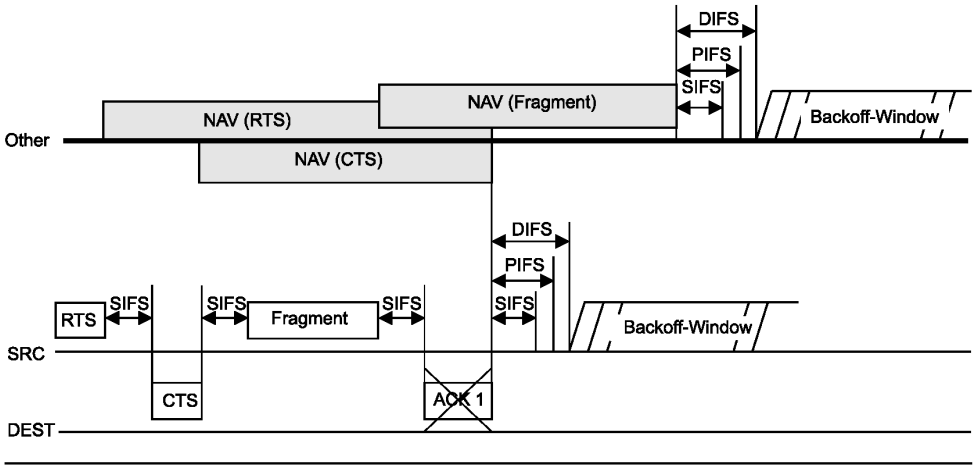

Figure 10-9—RTS/CTS with transmitter priority and missed acknowledgment

10.3.2.7 VHT and S1G RTS procedure

A VHT STA transmitting an RTS frame carried in non-HT or non-HT duplicate format and addressed to a VHT STA shall set the TA field to a bandwidth signaling TA and shall set the TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and CH_BANDWIDTH to the same value. If the STA sending the RTS frame is capable of dynamic bandwidth operation as the RTS originator (see 10.3.2.9), the STA shall set the TXVECTOR parameter DYN_BANDWIDTH_IN_NON_HT to Dynamic. Otherwise, the STA shall set the TXVECTOR parameter DYN_BANDWIDTH_IN_NON_HT to Static.

A VHT STA that initiates a TXOP by transmitting an RTS frame with the TA field set to a bandwidth signaling TA shall not send an RTS frame to a non-VHT STA for the duration of the TXOP.

NOTE—A non-VHT STA considers the bandwidth signaling TA as the address of the TXOP holder. If an RTS frame is sent to a non-VHT STA during a TXOP that is initiated by an RTS frame with a bandwidth signaling TA, the non-VHT STA does not recognize the RTS sender as the TXOP holder.

An S1G STA using dynamic bandwidth operation (see 10.3.2.9) that transmits an RTS carried in a greater than 2 MHz PPDU with the TXVECTOR parameter FORMAT set to S1G_DUP_2M shall set the Dynamic Indication field in the Frame Control field of the RTS frame to 1. Otherwise, the S1G STA shall set the Dynamic Indication field in the Frame Control field of the RTS carried in any other PPDU to 0 to indicate that it shall not use dynamic bandwidth operation (see 10.3.2.9).

An S1G STA that transmits an RTS frame to another STA shall set the TXVECTOR parameter RESPONSE_INDICATION to NDP_RESPONSE unless the Link Adaptation Without NDP CMAC PPDU Capable field of the S1G Capabilities element received from that STA contained a value of 1 in which case the S1G STA may set the RESPONSE_INDICATION to NORMAL_RESPONSE as described in 10.31.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An S1G STA that initiates a TXOP with a PV1 frame or an NDP CMAC PPDU shall not send an RTS frame for the duration of the TXOP.

10.3.2.8 CMMG RTS procedure

A CMMG STA shall transmit an RTS frame carried in CMMG or CMMG duplicate format (see 25.3.10). If the STA sending the RTS frame is capable of dynamic bandwidth operation as the RTS originator (see 10.3.2.9), the CMMG STA shall set the TXVECTOR parameter DYN_BANDWIDTH to Dynamic. Otherwise, the STA shall set the TXVECTOR parameter DYN_BANDWIDTH to Static.

10.3.2.9 CTS and DMG CTS procedure

A STA that receives an RTS frame addressed to it considers the NAV in determining whether to respond with CTS, unless the NAV was set by a frame originating from the STA sending the RTS frame (see 10.23.2.4). In this subclause for a non-S1G STA, “NAV indicates idle” means that the NAV count is 0 or that the NAV count is nonzero but the nonbandwidth signaling TA obtained from the TA field of the RTS frame matches the saved TXOP holder address. In an S1G STA, “NAV indicates idle” means that both NAV and RID counters are 0 or that either NAV or RID counter is nonzero but the TA field of the RTS frame matches the saved TXOP holder address.

A VHT STA that is addressed by an RTS frame in a non-HT or non-HT duplicate PPDU that has a bandwidth signaling TA and that has the RXVECTOR parameter DYN_BANDWIDTH_IN_NON_HT equal to Static behaves as follows:

— If the NAV indicates idle and CCA has been idle for all secondary channels (secondary 20 MHz channel, secondary 40 MHz channel, and secondary 80 MHz channel) in the channel width indicated by the RTS frame’s RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT for a PIFS prior to the start of the RTS frame, then the STA shall respond with a CTS frame carried in a non-HT or non-HT duplicate PPDU after a SIFS. The CTS frame’s TXVECTOR parameters CH_BANDWIDTH and CH_BANDWIDTH_IN_NON_HT shall be set to the same value as the RTS frame’s RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT.
— Otherwise, the STA shall not respond with a CTS frame.

NOTE 1—A VHT STA that receives a CTS frame in response to an RTS frame the STA has transmitted with the TXVECTOR parameter DYN_BANDWIDTH_IN_NON_HT set to Static might ignore the RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT as it will be the same as the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT in the RTS frame.

A VHT STA that is addressed by an RTS frame in a non-HT or non-HT duplicate PPDU that has a bandwidth signaling TA and that has the RXVECTOR parameter DYN_BANDWIDTH_IN_NON_HT equal to Dynamic behaves as follows:

— If the NAV indicates idle, then the STA shall respond with a CTS frame in a non-HT or non-HT duplicate PPDU after a SIFS. The CTS frame’s TXVECTOR parameters CH_BANDWIDTH and CH_BANDWIDTH_IN_NON_HT shall be set to any channel width for which CCA on all secondary channels has been idle for a PIFS prior to the start of the RTS frame and that is less than or equal to the channel width indicated in the RTS frame’s RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT.
— Otherwise, the STA shall not respond with a CTS frame.

An S1G STA that is addressed by an RTS frame that has the Dynamic Indication field in the Frame Control field equal to 0 (Static) behaves as follows:

— If the NAV indicates idle and the CCA has been idle for all secondary channels within the channel width indicated in the Bandwidth Indication field of the Frame Control field of the RTS frame for a PIFS prior to the start of the RTS frame, then the STA shall respond with an (NDP) CTS frame after

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

a SIFS. The STA shall set the TXVECTOR parameter CH_BANDWIDTH to a value that is equivalent to the value of the Bandwidth Indication field of the Frame Control field in the received RTS frame. The (NDP_2M) CTS frame shall have the Bandwidth Indication field set to the value of the Bandwidth Indication field of the received RTS frame.

— Otherwise the STA shall not respond with an (NDP) CTS frame.

An S1G STA that is addressed by an RTS carried in a 2 MHz duplicate frame that has the Dynamic Indication field in the Frame Control field equal to 1 (Dynamic) behaves as follows:

— If the NAV indicates idle, then the STA shall respond with an (NDP_2M) CTS frame after a SIFS. The (NDP) CTS frame's TXVECTOR parameter CH_BANDWIDTH may be set to any channel width for which the CCA on all secondary channels has been idle for a PIFS prior to the start of the RTS frame and that is equal to or less than the channel width indicated in the Bandwidth Indication field of the Frame Control field of the RTS frame. The (NDP_2M) CTS frame shall have the Bandwidth Indication field set to a value that is equivalent to the value of the TXVECTOR parameter's CH_BANDWIDTH.

— Otherwise the STA shall not respond with an (NDP) CTS frame.

NOTE 2—The NDP_1M CTS frame is not used for dynamic bandwidth indication.

A non-VHT and non-S1G STA that is addressed by an RTS frame or a VHT STA that is addressed by an RTS frame carried in a non-HT or non-HT duplicate PPDU that has a nonbandwidth signaling TA or a VHT STA that is addressed by an RTS frame in a format other than non-HT or non-HT duplicate behaves as follows:

— If the NAV indicates idle, the STA shall respond with a CTS frame after a SIFS.

— Otherwise, the STA shall not respond with a CTS frame.

The RA field of the CTS frame shall be set to the nonbandwidth signaling TA obtained from the TA field of the RTS frame to which this CTS frame is a response. The Duration field in the CTS frame shall be the duration field from the received RTS frame, adjusted by subtraction of aSIFSTime and the number of microseconds required to transmit the CTS frame at a data rate determined by the rules in 10.6.

After transmitting an RTS frame, the STA shall wait for a CTSTimeout interval with a value of aSIFSTime + aSlotTime + aRxPHYStartDelay. This interval begins when the MAC receives a PHY-TXEND.confirm primitive. If a PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive does not occur during the CTSTimeout interval, the STA shall conclude that the transmission of the RTS frame has failed, and this STA shall invoke its backoff procedure upon expiration of the CTSTimeout interval. If a PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive does occur during the CTSTimeout interval, the STA shall wait for the corresponding PHY-RXEND.indication primitive to determine whether the RTS frame transmission was successful. The reception of a CTS frame addressed to the STA, corresponding to this PHY-RXEND.indication primitive, shall be interpreted as successful response, permitting the frame exchange sequence to continue. Anything else, including the reception of any other frame, shall be interpreted as failure of the RTS frame transmission. In this instance, the STA shall invoke its backoff procedure at the PHY-RXEND.indication primitive and may process the received frame.

A DMG STA follows the procedure defined in this subclause, except that it uses a DMG CTS frame instead of a CTS frame. A non-DMG STA does not transmit DMG CTS frames.

An S1G STA shall transmit NDP CTS frames instead of CTS frames with the following exception: transmission of an CTS frame is required if the link adaptation procedure is negotiated as described in 10.31.

The RA/Partial BSSID field of the NDP CTS shall be generated as described in 23.3.12.2.1. The Duration field in the NDP CTS frame shall be set to the same value as the Duration field from the received RTS

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

frame, adjusted by subtracting the value of aSIFSTime and the NDPTxTime required to transmit the NDP CTS frame, where NDPTxTime is calculated according to 10.3.2.5.2.

An S1G STA that receives an NDP CTS frame should disregard the value of the Duration field of the NDP CTS frame if any of the following conditions are satisfied:

— The Address Indicator field is equal to 1, and the Early Sector Indicator field is equal to 0, and the RA/PBSSID field is equal to the PBSSID of the BSS of which the non-AP STA is a member (see 10.52.4).
— The Address Indicator field is equal to 0, and the RA/PBSSID indicates that the STA is the intended receiver of this frame, and the frame is received during the intervals of time negotiated with the UL-Sync capable AP (see 10.48).

A CMMG STA that receives an RTS frame in a CMMG or CMMG duplicate PPDU that has the RXVECTOR parameter DYN_BANDWIDTH equal to Static behaves as follows:

— If the NAV indicates idle and CCA has been idle for the secondary channel (secondary 540 MHz channel) in the channel width indicated by the RTS frame's RXVECTOR parameter CH_BANDWIDTH for a PIFS prior to the start of the RTS frame, then the STA shall respond with a CTS frame carried in a CMMG or CMMG duplicate PPDU after a SIFS. The CTS frame's TXVECTOR parameters CH_BANDWIDTH shall be set to the same value as the RTS frame's RXVECTOR parameter CH_BANDWIDTH.
— Otherwise, the STA shall not respond with a CTS frame.

A CMMG STA that is addressed by an RTS frame in a CMMG or CMMG duplicate PPDU that has the RXVECTOR parameter DYN_BANDWIDTH equal to Dynamic behaves as follows:

— If the NAV indicates idle, then the STA shall respond with a CTS frame in a CMMG or CMMG duplicate PPDU after a SIFS. The CTS frame's TXVECTOR parameters CH_BANDWIDTH may be set to any channel width for which CCA has been idle for a PIFS prior to the start of the RTS frame and that is equal to or less than the channel width indicated in the RTS frame's RXVECTOR parameter indicated in the RTS frame's RXVECTOR parameter CH_BANDWIDTH.
— Otherwise, the STA shall not respond with a CTS frame.

An EDMG STA that is addressed by an RTS frame sent in non-EDMG duplicate PPDU format to establish a TXOP shall behave as follows:

If the NAV in the primary channel indicates idle, then

— The STA shall respond with a DMG CTS frame transmitted in non-EDMG or non-EDMG duplicate PPDU format after a SIFS.
— In case the DMG CTS frame is sent in a non-EDMG duplicate PPDU format in response to an RTS sent to establish a TXOP for the transmission of a SISO or an MU PPDU, the TXVECTOR shall be configured as follows:
  — The SCRAMBLER_INIT_SETTING parameter shall be set to indicate Channel_BW if the channel combinations are covered in Table 28-6; otherwise, it shall be set to indicate CONTROL_TRAILER and the parameter CT_TYPE shall be set to CTS_DTS.
  — If the CCA of all the channels that were indicated in the RTS's RXVECTOR parameter CH_BANDWIDTH_SIGNALING were idle for a duration of PIFS prior to the start of the RTS frame, the CH_BANDWIDTH parameter shall be exactly the same as that were indicated in the RTS's RXVECTOR parameter CH_BANDWIDTH_SIGNALING. Otherwise, the CH_BANDWIDTH parameter shall be set to a subset of the channels that were indicated in the RTS's RXVECTOR parameter CH_BANDWIDTH_SIGNALING encoded as defined in Table 28-6 or in the control trailer and where the CCA of such channels were idle for a duration of PIFS prior to the start of the RTS frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

- The CH_BANDWIDTH_SIGNALING parameter shall be set to the encoded value of the set of channels indicated by the CH_BANDWIDTH parameter as defined in Table 28-6 or in the control trailer.

- In case the DMG CTS is sent in a non-EDMG duplicate PPDU format in response to an RTS sent to establish a TXOP for the transmission of an SU MIMO PPDU, the TXVECTOR shall be configured as follows:
  - The SCRAMBLER_INIT_SETTING parameter shall be set to indicate CONTROL_TRAILER and the parameter CT_TYPE shall be set to CTS_DTS.
  - If the CCA of all the channels that were indicated in the RTS's RXVECTOR parameter CH_BANDWIDTH_SIGNALING were idle for a duration of PIFS prior to the start of the RTS frame, the CH_BANDWIDTH parameter shall be exactly the same as that were indicated in the RTS's RXVECTOR parameter CH_BANDWIDTH_SIGNALING. Otherwise, the CH_BANDWIDTH parameter shall be set to a subset of the channels that were indicated by the RTS's RXVECTOR parameter CH_BANDWIDTH and for which the CCA of such channels were idle for a duration of PIFS prior to the start of the RTS frame.

Otherwise,

- The STA shall not respond with a DMG CTS frame.
- Except in the case of an RTS frame used for MU-MIMO channel access (see 10.38.12.4.4), the STA may respond with a DMG DTS frame in a non-EDMG or non-EDMG duplicate PPDU after a SIFS. In case the DMG DTS frame is sent in a non-EDMG duplicate PPDU format, the STA shall set the Duration, NAV-SA and NAV-DA fields of the DMG DTS frame to zero and shall set the TXVECTOR parameters as follows:
  - The SCRAMBLER_INIT_SETTING parameter shall be set to indicate Channel_BW.
  - The CH_BANDWIDTH parameter shall be set to the channels that were indicated in the RTS's RXVECTOR parameter CH_BANDWIDTH_SIGNALING encoded as defined in Table 28-6.
  - The CH_BANDWIDTH_SIGNALING parameter shall be set to the encoded value of the set of channels indicated by the CH_BANDWIDTH parameter as defined in Table 28-6.

An EDMG STA that is addressed by an RTS frame sent to establish TXOP for transmission of at least one MIMO PPDU shall follow the procedure defined in 10.38.12.4.

10.3.2.10 Dual CTS protection

10.3.2.10.1 Dual CTS protection procedure

The dual CTS mechanism is obsolete. Support for this mechanism might be removed in a later revision of the standard.

A VHT STA shall not transmit VHT PPDUs in a TXOP protected by dual CTS protection.

A VHT AP shall not transmit an HT Operation element with the Dual CTS Protection field set to 1.

If the Dual CTS Protection field of the HT Operation element has value 1 in the Beacon frames transmitted by its AP, a non-AP HT STA shall start every TXOP with an RTS frame addressed to the AP. The RTS frame shall be an STBC frame if the STBC transmit and receive capabilities of the non-AP HT STA allow it to receive and transmit STBC frames using a single spatial stream; otherwise, the RTS frame shall be a non-STBC frame. The AP shall respond with a dual CTS (CTS1 followed by CTS2) separated by PIFS or SIFS. Table 10-4 describes the sequence of CTS frame transmissions and the required timing.

The dual CTS response applies only to the AP; a non-AP STA shall respond to an RTS frame with a single CTS frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 10-4—Dual CTS rules

Type of RTS	CTS description	Timing
RTS (non-STBC frame)	CTS1: Same rate or MCS as the RTS frame (non-STBC frame) CTS2: Basic STBC MCS (STBC frame)	A PIFS shall be used as the interval between CTS1 and CTS2. If the CS mechanism (see 10.3.2.1) indicates that the medium is busy at the TxPIFS slot boundary (see Figure 10-29) following CTS1, CTS2 shall not be transmitted as part of this frame exchange.
RTS (STBC frame)	CTS1: Basic STBC MCS (STBC frame) CTS2: Lowest basic rate (non-STBC frame)	A SIFS shall be used as the interval between CTS1 and CTS2. The STA resumes transmission a SIFS+CTS2+SIFS after receiving CTS1, instead of after a SIFS.

If dual CTS Protection is enabled, the AP shall begin each EDCA TXOP with a CTS frame. This CTS frame uses STBC when the immediately following frame uses non-STBC and vice versa. The RA of this CTS frame shall be identical to the RA of the immediately following frame. The AP may continue a PIFS after the CTS frame, only if the CS mechanism (see 10.3.2.1) indicates that the medium is IDLE at the TxPIFS slot boundary (see Figure 10-29) following the transmission of the CTS frame.

To avoid the resetting of NAV by STAs that have set their NAV due to the reception of a non-STBC RTS frame that is part of a dual CTS exchange, but then do not hear the CTS2, a non-AP HT STA may create a NAV that is not resettable according to the RTS NAV reset rule defined in 10.3.2.4 at the receiving STAs by initiating the TXOP with a non-STBC CTS addressed to the AP (known as *CTS-to-AP*).

NOTE 1—Sending a CTS-to-AP allows NAV protection to be established without causing the AP to update its NAV, as opposed to, for example, the sending of a CTS-to-self frame, which would potentially have caused the AP NAV to become set and then prevented it from responding to the subsequent RTS frame. The AP does not set a NAV in the CTS-to-AP case and is able to respond to the following RTS frame. The NAV at receiving STAs is not updated by the RTS frame because its duration does not exceed the duration of the preceding CTS frame, and subsequently, the NAV cannot be reset during CTS2.

An STBC CTS addressed to the AP may be transmitted prior to an STBC RTS frame to set a NAV that is not resettable according to the RTS NAV reset rule defined in 10.3.2.4 at receiving STAs.

NOTE 2—When an HT STA sends an RTS frame to the AP that is a non-STBC frame, the AP returns a CTS frame that is a non-STBC frame to the STA and then immediately transmits a CTS frame that is an STBC frame. The original non-AP STA is now free to transmit. But a non-HT STA that has set its NAV based on the original RTS frame might reset its NAV and then decrement its backoff counter, given that a SIFS + the duration of CTS2 is longer than a DIFS (i.e., the STA does not detect a PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive within the period specified in 10.3.2.4). Thus, without sending a CTS-to-AP, the NAV reservation might not always work.

If dual CTS protection is enabled and a STA obtains a TXOP and does not have any frames to transmit before the expiration of the TXOP duration, the STA may indicate truncation of the TXOP provided that the remaining duration of the TXOP after the transmission of the last frame can accommodate the CF-End frame, a CF-End frame that is an STBC frame duration at the basic STBC MCS, a CF-End frame that is a non-STBC frame at the lowest basic rate, and three SIFSs. The STA indicates truncation of the TXOP by transmitting a CF-End frame with TXVECTOR parameter restrictions as specified in 10.6.6.3.

On receiving a CF-End frame from a STA with a matching BSSID, an AP whose last transmitted HT Operation element contained the Dual CTS Protection field equal to 1 shall respond with dual CF-End frames, one CF-End frame that is an STBC frame at the basic STBC MCS and one CF-End frame that is a non-STBC frame at the lowest basic rate, after a SIFS. Dual CF-End frames eliminate unfairness toward STAs that are not of the same mode as the one that owns the TXOP being truncated.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the TXOP is owned by the AP and dual CTS protection is enabled in the system, the AP may send dual CF-End frames if it runs out of frames to transmit, provided that the remaining TXOP duration after the transmission of the last frame can accommodate an STBC CF-End frame duration at the lowest STBC basic rate, a CF-End frame that is a non-STBC frame at the lowest basic rate, and two SIFSs.

The spacing between the dual CF-End frames sent by the AP shall be SIFS. The first CF-End frame shall use the same encoding (STBC frame versus non-STBC frame) used for transmissions in the TXOP being truncated, and the second CF-End frame shall use the other encoding.

An STBC-capable STA shall choose between control frame operation using either STBC frames or non-STBC frames. In the non-STBC frame case, it discards Control frames that are STBC frames it receives. In the STBC frame case, it discards Control frames that are non-STBC frames received from its own BSS. This choice is a matter of policy local at the STA.

An S1G STA shall not support the Dual CTS Protection procedure defined in 10.3.2.10.

10.3.2.10.2 Dual CTS protection examples

Figure 10-10 shows an example of the operation of the dual CTS protection mechanism. In this example, the initiating STA is an STBC non-AP STA.

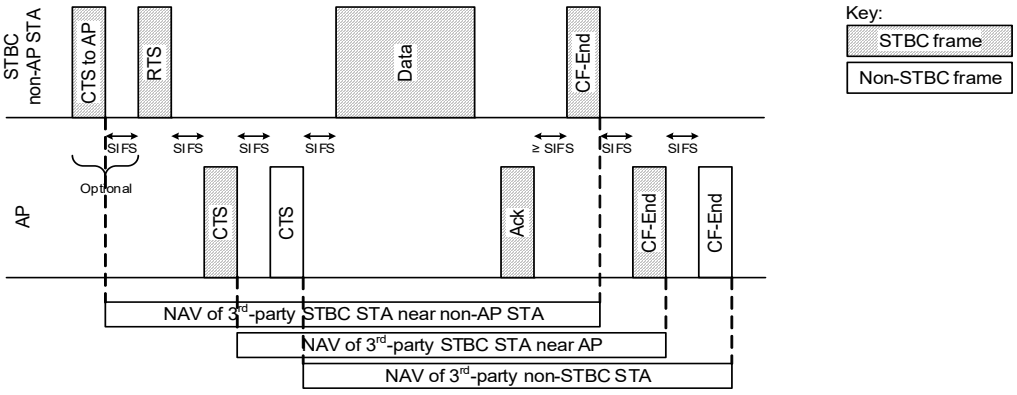

Figure 10-10—Example of dual CTS mechanism (STBC initiator)

Figure 10-11 shows an example of the operation of the dual CTS protection mechanism. In this example, the initiating STA is a non-STBC non-AP HT STA.

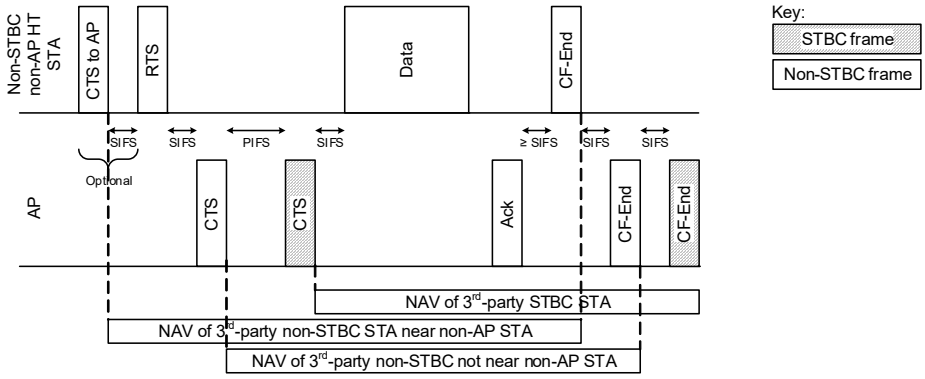

Figure 10-11—Example of dual CTS mechanism (non-STBC initiator)

10.3.2.11 Acknowledgment procedure

The following frames require immediate acknowledgment:

— Individually addressed Management frames other than Action No Ack frames
— Individually addressed non-QoS Data frames
— Individually addressed QoS Data frames with Normal Ack or Implicit BAR ack policy
— BlockAck frames not sent in immediate response to A-MPDU
— BlockAckReq frames
— PS-Poll frames, which can be acknowledged by generating a Data frame

During a TWT SP, either the STACK frame or TACK frame can be used in place of the (NDP) Ack frame according to the procedure described in 10.46 and otherwise shall not be used.

A STA shall not transmit an Ack frame in response to a Management frame of subtype Action No Ack. A STA shall not transmit an Ack or BlockAck frame in response to a group addressed frame. An MPDU that does not require immediate acknowledgment is implicitly considered acknowledged, as if an explicit acknowledgment had been sent.

NOTE 1—Group addressed MSDUs are sent to an AP in individually addressed frames.

Otherwise, upon reception of a frame that requires immediate acknowledgment and, for an AP, with the To DS subfield equal to 1, a STA shall transmit an Ack or BlockAck frame after a SIFS, without regard to the busy/idle state of the medium. (See Figure 10-12.)

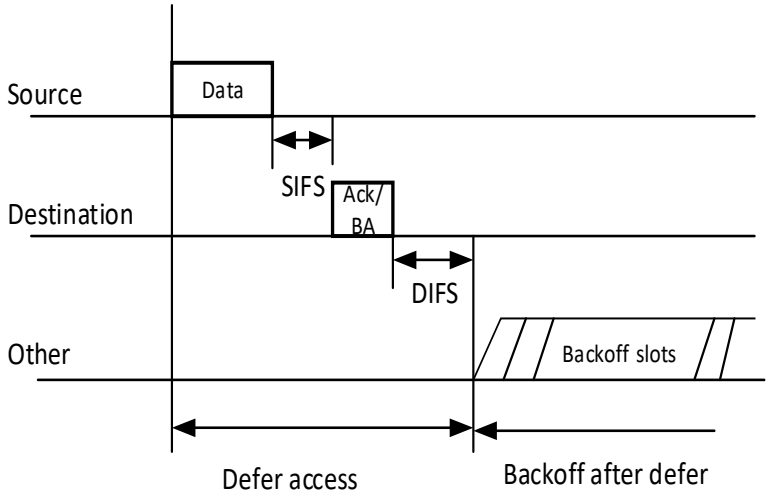

Figure 10-12—Individually addressed data/Ack/BlockAck frame

A STA operating in an SP with TDD channel access (see 10.38.6.2.2), upon reception of a frame that requires acknowledgment shall transmit an Ack or BlockAck frame at the start of the earliest occurring TDD slot the STA is assigned to, with the Bitmap and Access Type Schedule field of the TDD slot set to TX, and with slot category of the TDD slot set to Basic TDD slot, as indicated in the TDD Slot Schedule element (see 9.4.2.281).

After transmitting an MPDU that requires an Ack or BlockAck frame as a response, the STA shall wait for an AckTimeout interval, with a value of aSIFSTime + aSlotTime + aRxPHYStartDelay, starting at the PHY-TXEND.confirm primitive. If a PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive does

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

not occur during the AckTimeout interval, the STA concludes that the transmission of the MPDU has failed, and this STA shall invoke its backoff procedure upon expiration of the AckTimeout interval.

If a PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive does occur during the AckTimeout interval, the STA shall wait for the corresponding PHY-RXEND.indication primitive to determine whether the MPDU transmission was successful. If the STA receives an Ack frame addressed to the STA and corresponding to this PHY-RXEND.indication primitive, this shall be interpreted as successful acknowledgment.

A STA operating in an SP with TDD channel access (see 10.38.6.2.2) has AckTimeout interval value equal to the duration from the PHY-TXEND.confirm primitive of the current frame to the end of the earliest occurring TDD slot the addressed recipient of the MPDU is assigned to, with the Bitmap and Access Type Schedule field of the TDD slot set to RX, and with slot category of the TDD slot set to Basic TDD slot, as indicated in the TDD Slot Schedule element (see 9.4.2.281).

When a STA operating in an SP with TDD channel access transmits, in a TDD slot, an MPDU that has an Ack Policy of Normal Ack, the STA shall not transmit another MPDU that has an Ack Policy of Normal Ack to the same receiver until the corresponding Ack frame is received or the end of the AckTimeout interval, whichever comes first.

If the STA does not receive an Ack frame addressed to the STA, this condition shall be interpreted as failure of its MPDU transmission, except as defined below. In this instance, the STA shall invoke its backoff procedure at the PHY-RXEND.indication primitive and may process the received frame. If the STA has transmitted a PS-Poll frame, then the STA's receipt of a Data or Management frame transmitted by the recipient of the PS-Poll frame and addressed to the STA shall also be accepted as successful acknowledgment of the PS-Poll frame.

NOTE 2—The backoff procedure in the specific case of reception of a corrupted Ack or BlockAck frame results in EIFS rather than DIFS or AIFS being used after the AckTimeout interval and subsequent reception of the corrupted Ack or BlockAck frame (see 10.3.4.3 and 10.23.2.4 respectively).

NOTE 3—The receiver STA performs the acknowledgment procedure on all received frames requiring immediate acknowledgment, even if an MSDU or A-MSDU is carried partly or wholly within the frame and is subsequently discarded due to drop eligibility (see DEI subfield in 9.2.4.6.2).

NOTE 4—The rules that specify the contents of BlockAck frames are defined in 10.25.

Additional exceptions exist for S1G STAs for accepting a frame as successful acknowledgment as described in the following three paragraphs:

1) A STA that has enabled the implicit Ack procedure (see 10.53.5.3) shall consider a received S1G_SHORT/S1G_LONG PPDU as successful acknowledgment of a previously transmitted MPDU that was carried in an S1G_SHORT/S1G_LONG PPDU only in the following two cases:
   a) The STA is a non-AP STA associated to an S1G relay AP and all the conditions below are satisfied:
      — A PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive that corresponds to the received PPDU is detected within the AckTimeout interval that started as a result of the previously transmitted MPDU.
      — The RXVECTOR parameter PARTIAL_AID is equal to the PARTIAL_AID that corresponds to the BSSID of the parent AP's BSS, or the RXVECTOR parameter PARTIAL_AID is equal to 0 and the PPDU contains an RTS frame with RA equal to the BSSID of the parent AP's BSS.
      — The RXVECTOR parameter UPLINK_INDICATION is equal to 1.
   b) The STA is an AP that has an S1G relay STA associated to it and all the conditions below are satisfied:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— A PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive that corresponds to the received PPDU is detected within the AckTimeout interval that started as a result of the previously transmitted MPDU.
— The RXVECTOR parameter PARTIAL_AID is equal to the 6 LSBs of the PARTIAL_AID that corresponds to the DA of the non-AP STA or the RXVECTOR parameter PARTIAL_AID is equal to 0 and the received PPDU contains an RTS frame with RA equal to the DA of the non-AP STA.
— The RXVECTOR parameter UPLINK_INDICATION is equal to 0 and the RXVECTOR parameter COLOR is equal to the COLOR value of the S1G relay AP.

2) Under BDT operation as described in 10.49: If a Data frame is sent as an immediate response to an MPDU requiring immediate acknowledgment, the reception of the Data frame shall be accepted as successful acknowledgment of the eliciting MPDU.
3) The reception of an S1G RTS frame sent by the recipient of a PS-Poll frame or of a PS-Poll+BDT frame shall be accepted as successful acknowledgment of the PS-Poll or of the PS-Poll+BDT frame.

An S1G STA shall transmit NDP Ack frames for acknowledgment with the following exceptions:

1) Transmission of an Ack frame is required if link adaptation procedure is negotiated as described in 10.31.
2) Transmission of a TACK frame or a STACK frame is required if target wake time is negotiated as described in 10.46.
3) Transmission of a TACK frame is required as a response to a PS-Poll frame with the Poll Type subfield equal to 1 as described in 10.47.2.
4) Transmission of an NDP PS-Poll-Ack frame is required as a response to an NDP PS-Poll frame.

An S1G STA that satisfies any of the first three exceptions above shall transmit an Ack frame, TACK frame, or STACK frame instead of an NDP Ack frame as a response to an eliciting PPDU for which the RXVECTOR parameter RESPONSE_INDICATION is equal to Normal Response. The control response frame shall have a duration that is equal to NormalTXTime value for a 32-octet MPDU (see Table 10-3) if the eliciting PPDU contains an S-MPDU.

A non-S1G STA shall not transmit NDP Ack and NDP PS-Poll-Ack frames.

An S1G STA that transmits or receives an NDP Ack or NDP PS-Poll-Ack frame shall follow the same rules described above for Ack frames with the following exceptions that apply only to NDP Ack and NDP PS-Poll-Ack frames:

1) An S1G STA that transmits an NDP Ack frame for acknowledgment shall generate the Ack ID field of the NDP Ack frame as described in 23.3.12.2.4.
2) An S1G AP that transmits an NDP PS-Poll-Ack frame for acknowledgment of an NDP PS-Poll frame shall generate the Ack ID field of the NDP PS-Poll-Ack frame as described in 23.3.12.2.5. In addition, if the eliciting NDP PS-Poll is an NDP_1M PS-Poll frame the Duration field of the NDP_1M PS-Poll-Ack is set as follows:
    a) If the eliciting NDP_1M PS-Poll frame has a value of the Preferred MCS field equal to “No Preference” the Duration field should indicate an idle period (i.e., the Idle Indication field should be set to 1 as described in 23.3.12.2.5).
    b) Otherwise, the Duration field should indicate an Ack ID extension (i.e., the Idle Indication field should be set to 0 as described in 23.3.12.2.5).
3) An S1G STA that expects an NDP Ack frame as a response shall consider a received NDP Ack frame as a successful response if the Ack ID field of the NDP Ack frame equals the bit sequence generated from the scrambler initialization value and the FCS field of its immediately previously transmitted PSDU as described in 23.3.12.2.4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

4) An S1G STA that expects an NDP PS-Poll-Ack frame as a response to an NDP PS-Poll shall consider a received NDP PS-Poll-Ack frame as a successful response if the Ack ID field, together with the extension of the Ack ID if present in the Duration field, of the frame equals the bit sequence generated from the RA, TA and CRC fields of its immediately previously transmitted NDP PS-Poll frame as described in 23.3.12.2.5.

Upon reception of a PV1 frame that requires acknowledgment with the From DS subfield equal to 1, an S1G STA shall generate an acknowledgment frame in response if the AID subfield of A1 field is equal to the AID of the S1G STA and the A2 field is equal to the MAC address of its associated AP. Upon reception of a PV1 frame that requires acknowledgment with the From DS subfield equal to 0, an S1G STA shall generate an acknowledgment frame in response if A1 field is equal to the MAC address of the S1G STA.

In an S1G BSS, the AckTimeout interval depends on the TXVECTOR parameter PREAMBLE_TYPE. When the TXVECTOR parameter PREAMBLE_TYPE is equal to S1G_SHORT_PREAMBLE or S1G_LONG PREAMBLE, the AckTimeout interval is calculated with aRxPHYStartDelay value for ≥ 2 MHz short/long preamble except when the receiving STA has indicated use of 1 MHz control responses as described in 10.6.6.6 in which case the AckTimeout interval is calculated with aRxPHYStartDelay value for S1G_1M preamble. When the TXVECTOR parameter PREAMBLE_TYPE is equal to S1G_1M preamble, the AckTimeout interval is calculated with aRxPHYStartDelay value for S1G_1M preamble.

During a TWT SP, the BAT frame can be used in place of the (NDP) BlockAck frame, as described in 10.25 and otherwise, is not used.

10.3.2.12 Fragment BA procedure

An S1G STA can partition an MSDU or an MMPDU into multiple fragments as described in 10.4 and send the frames containing the fragments of the MSDU or of the MMPDU as independent transmissions.

An S1G STA indicates support for fragment BA using the Fragment BA Support subfield of the S1G Capabilities Information field in the S1G Capabilities element. An S1G STA shall set the Fragment BA Support subfield to 1 in S1G Capabilities element if dot11FragmentBAOptionImplemented is true. Otherwise, the S1G STA shall set the Fragment BA Support subfield to 0. An S1G STA (known as the originator STA) with dot11FragmentBAOptionImplemented equal to true sending an MSDU or MMPDU (whether fragmented or not) to another S1G STA shall use the fragment BA procedure as described in this subclause if it has received from the STA (known as the recipient STA) a frame that included an S1G Capabilities element with the Fragment BA Support subfield equal to 1. Otherwise an S1G STA shall not use the fragment BA procedure. Non-S1G STAs shall not use the fragment BA procedure.

An originator STA may send fragments with Block Ack ack policy.

The receiving STA that is the intended receiver of either a fragment with Implicit BAR ack policy or a BlockAckReq frame shall send an NDP BlockAck frame after a SIFS, without regard of the idle/busy state of the medium, that is:

— An NDP_1M BlockAck frame if the eliciting fragment is either carried in an S1G_1M PPDU or the receiving STA has indicated use of 1 MHz control response frames as described in 10.6.6.6.

— An NDP_2M BlockAck frame if the eliciting fragment is carried in an S1G_SHORT/S1G_LONG PPDU and the receiving STA has not indicated use of 1 MHz control response frames as described in 10.6.6.6.

The receiving STA shall generate the BlockAck ID and the Starting Sequence Control field of the NDP BlockAck as described in 23.3.12.2.6.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The receiving STA shall include the receipt status of a set of the fragments in the BlockAck Bitmap field of the NDP BlockAck frame as follows:

1) If the originator STA elicits an NDP_1M BlockAck frame as a response, the BlockAck Bitmap field of the NDP BlockAck frame indicates the receipt status of a set of fragments which depends on the value of the Fragment Number subfield in the Sequence Control field of the fragment that elicited the response:
   a) If the Fragment Number subfield is not greater than 7 then the BlockAck Bitmap field shall indicate the receipt status of fragments with fragment numbers from 0 to 7.
   b) If the Fragment Number subfield is greater than 7 then the BlockAck Bitmap field shall indicate the receipt status of fragments with fragment numbers from 8 to 15.
2) If the originator STA elicits an NDP_2M BlockAck frame as a response, the BlockAck Bitmap field of the NDP BlockAck frame shall indicate the receipt status of the fragments with fragment numbers from 0 to 15.

NOTE 1—An NDP_1M BlockAck frame can acknowledge only a limited number of consecutive fragments because its BlockAck Bitmap field size is 8. Instead, an NDP_2M BlockAck frame can acknowledge up to the maximum number of fragments because its BlockAck Bitmap field size is 16.

The bitmap of the NDP BlockAck frame is protected using the encoding procedure described in 10.56.

An originator STA that elicits an NDP_1M BlockAck frame as a response shall not transmit a fragment that has a Fragment Number subfield greater than 7 if it has not previously received an NDP_1M BlockAck frame that indicates reception of all fragments with fragment numbers from 0 to 7.

The originator STA shall consider an NDP_1M BlockAck frame (or an NDP_2M BlockAck frame) as received if the BlockAck ID field value equals the 2 LSBs (or 6 LSBs) of the scrambler initialization value in the SERVICE field and the Starting Sequence Control field value equals the Sequence Number of the fragment that elicited the response.

NOTE 2—The scrambler initialization value is obtained from the PHY-TXEND.confirm parameter SCRAMBLER_OR_CRC. The values of the BlockAck ID and Starting Sequence Number fields are obtained after decoding the NDP BlockAck frame as described in 10.56.

If the originator STA does not receive an NDP BlockAck frame as an immediate response, it may retransmit the last transmitted fragment to resolicit an immediate NDP BlockAck response.

10.3.2.13 MU acknowledgment procedure

10.3.2.13.1 Acknowledgment procedure for DL MU PPDU in SU PPDU

The acknowledgment procedure performed by a STA that receives MPDUs that were transmitted within a VHT MU PPDU or an HE MU PPDU is the same as the acknowledgment procedure for MPDUs that were not transmitted within a VHT MU PPDU or an HE MU PPDU sent by an AP, except if the STA is an HE STA that follows the rules defined in 26.3 and in 26.4.

NOTE 1—All MPDUs transmitted within a VHT MU PPDU or an HE MU PPDU are contained within A-MPDUs, and the rules specified in 9.7.3 prevent an immediate response carried in an SU PPDU to more than one of the A-MPDUs.

Responses to A-MPDUs within a VHT MU PPDU or an HE MU PPDU for DL transmission that are not immediate responses to the VHT MU PPDU or the HE MU PPDU are transmitted in response to explicit

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

BlockAckReq frames by the AP. Examples of VHT MU PPDU frame exchange sequences are shown in Figure 10-13 and Figure 10-14.

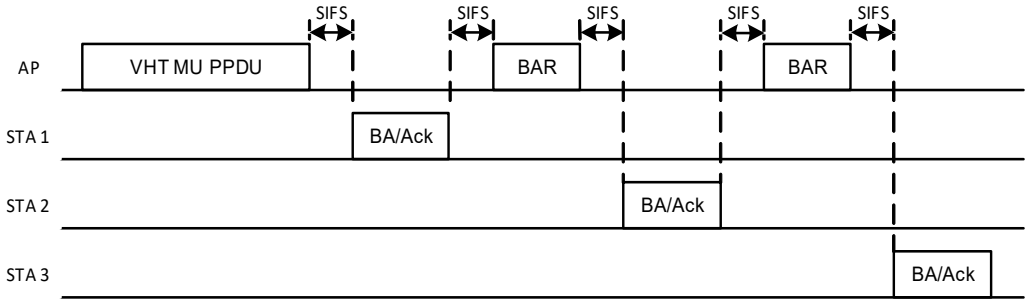

Figure 10-13—Example of TXOP containing VHT MU PPDU transmission with immediate acknowledgment to VHT MU PPDU

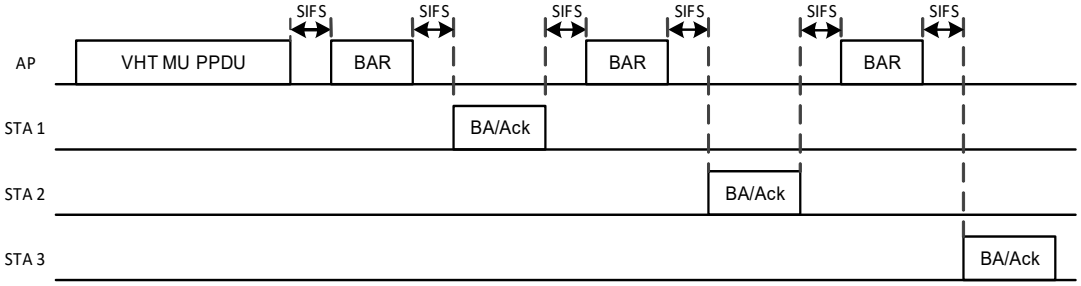

Figure 10-14—Example of TXOP containing VHT MU PPDU transmission with no immediate acknowledgment to VHT MU PPDU

Recovery within the TXOP that contains a VHT MU PPDU or an HE MU PPDU can be performed according to the rules of 10.23.2.8. BlockAckReq frames related to A-MPDUs within a VHT MU PPDU or an HE MU PPDU can be transmitted in a TXOP separate from the one that contained the VHT MU PPDU or the HE MU PPDU.

An EDMG STA indicates that it is DL MU-MIMO capable by setting the MU-MIMO Supported subfield in the STA's EDMG Capabilities element to 1. An EDMG MU-MIMO initiator shall not transmit an EDMG MU-MIMO PPDU to an EDMG STA that does not have the MU-MIMO Supported subfield equal to 1.

An EDMG STA that is DL MU-MIMO capable shall support the EDMG Multi-TID BlockAck frame. An MU-MIMO initiator may transmit an MPDU with TID for which a block ack agreement does not exist. In this case, the MU-MIMO responder shall respond to the MPDU with an EDMG Multi-TID BlockAck frame following the rules defined in 10.70.2.

An EDMG STA that is DL MU-MIMO capable and that has the EDMG Multi-TID Aggregation Support subfield of its EDMG Capabilities element set to a nonzero value

— May set the EDMG All Ack Support subfield in the STA's EDMG Capabilities element to 1 and
— Shall follow rules defined in 10.70.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The acknowledgment procedure performed by EDMG STAs that receive an MPDU within an EDMG MU PPDU from an MU-MIMO initiator shall follow the schedule defined by the MU-MIMO initiator.

An MU-MIMO initiator shall set the ack policy of MPDUs contained in each A-MPDU transmitted within an EDMG MU PPDU to Scheduled Ack and shall include at least one Block Ack Schedule frame in each A-MPDU transmitted within an EDMG MU PPDU. Each Block Ack Schedule frame shall contain the scheduling information for the EDMG STA that is an intended receiver of the A-MPDU. An MU-MIMO initiator shall set the value of the Response Duration subfield of the Block Ack Schedule frame equal to the duration of the expected BlockAck frame or EDMG Multi-TID BlockAck frame (see 10.25.5) transmission from a STA addressed by an A-MPDU within a transmitted MU PPDU. The value of the expected transmission should be calculated using MCS 0. The values of all subfields of the Block Ack Schedule frame shall not change if transmitted multiple times in the same A-MPDU. An MU-MIMO initiator shall set the value of the Response Offset subfield of the Block Ack Schedule frame to SIFS in an A-MPDU transmitted to a STA that is expected to be the first responder.

An EDMG STA shall transmit a BlockAck frame or EDMG Multi-TID BlockAck frame in response to a received EDMG MU PPDU immediately after a period of time equal to the value of the Response Offset subfield from the end of EDMG MU PPDU. The Response Offset subfield is contained in the Block Ack Schedule frame within the MU PPDU.

If an MU-MIMO initiator does not intend to elicit a BlockAck frame or EDMG Multi-TID BlockAck frame from a STA addressed by an A-MPDU within a transmitted MU PPDU, it shall set the Ack Policy field equal to No Ack or Block Ack as defined in Table 9-13 and shall set the values of the Response Offset field and Response Duration field within the frame to 0.

If an expected BlockAck frame or EDMG Multi-TID BlockAck frame from a STA was not received by an MU-MIMO initiator, the initiator may transmit a BlockAckReq frame or Multi-TID BlockAckReq frame (see 10.25.5) to that STA immediately after a period of time equal to the value of the Next PPDU Start Offset subfield starting from the end of EDMG MU PPDU. The Next PPDU Start Offset subfield is contained in the Block Ack Schedule frame within the MU PPDU.

The entire MU sequence shall not exceed the established TXOP duration.

An example of an A-MPDU transmitted in an EDMG MU PPDU is shown in Figure 10-15. In this example, an A-MPDU contains three Block Ack Schedule frames: one at the beginning and two at the end of the A-MPDU.

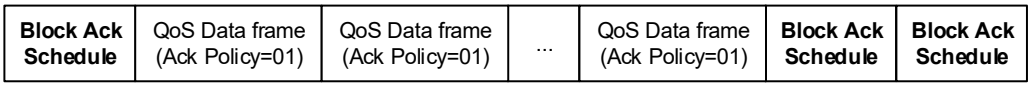

Figure 10-15—Example of A-MPDU transmitted in EDMG MU PPDU

An example of the EDMG MU PPDU frame acknowledgment procedure for three EDMG STAs with the illustration of scheduling information delivered to them is shown in Figure 10-16. In this example, the value of the Next PPDU Start Offset field is the same for all STAs.

NOTE 2—A BlockAck frame is sent in immediate response to the BlockAckReq frame for HT-immediate block ack. An Ack frame might be sent in immediate response carried in an SU PPDU to an S-MPDU in the VHT MU PPDU or the HE MU PPDU. Responses to S-MPDUs for more than one STA contained in an HE MU PPDU are transmitted as specified in 10.3.2.13.2. A Multi-STA BlockAck frame is sent in immediate response to a Multi-TID BlockAckReq frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

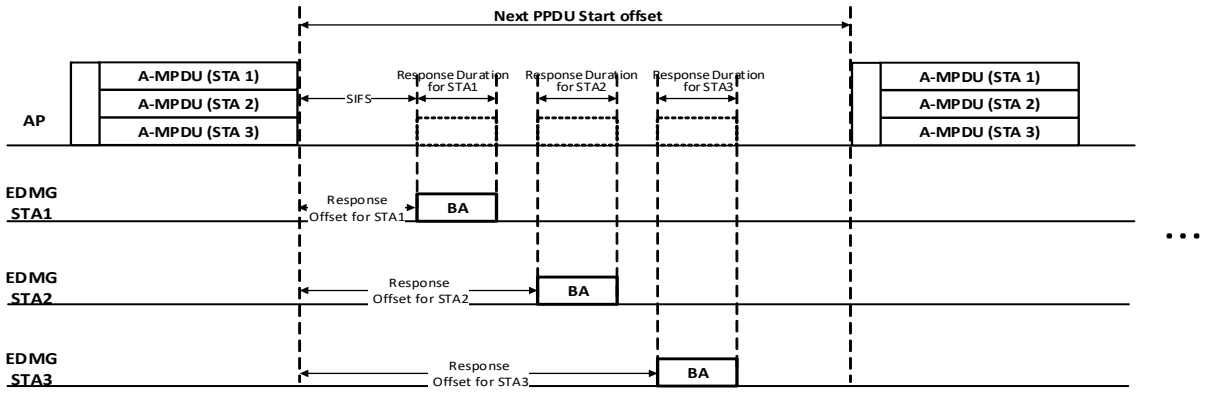

Figure 10-16—Example of TXOP containing EDMG MU PPDU transmission

NOTE 3—A BlockAckRequest frame would typically not be sent to a STA in the case where the A-MPDU to the STA contained no MPDUs requiring immediate acknowledgment. It could be sent if MPDUs in a previous A-MPDU remain unacknowledged.

10.3.2.13.2 Acknowledgment procedure for DL MU PPDU in MU format

A non-AP STA shall not set the ack policy to HETP Ack.

A non-AP STA that is the recipient, within an HE MU PPDU, of a QoS Data frame or QoS Null frame with HETP Ack ack policy, of an MU-BAR Trigger frame or a GCR MU-BAR Trigger frame, or of a Management frame that solicits acknowledgment, shall send the immediate response according to the scheduling information that is carried either in the Trigger frame(s) or TRS Control subfield. If a Basic Trigger frame (see 9.3.1.22) or frame carrying a TRS Control subfield (see 9.2.4.7.1) is not received, then the STA shall not respond.

An example of UL OFDMA acknowledgment to an HE MU PPDU is shown in Figure 10-17.

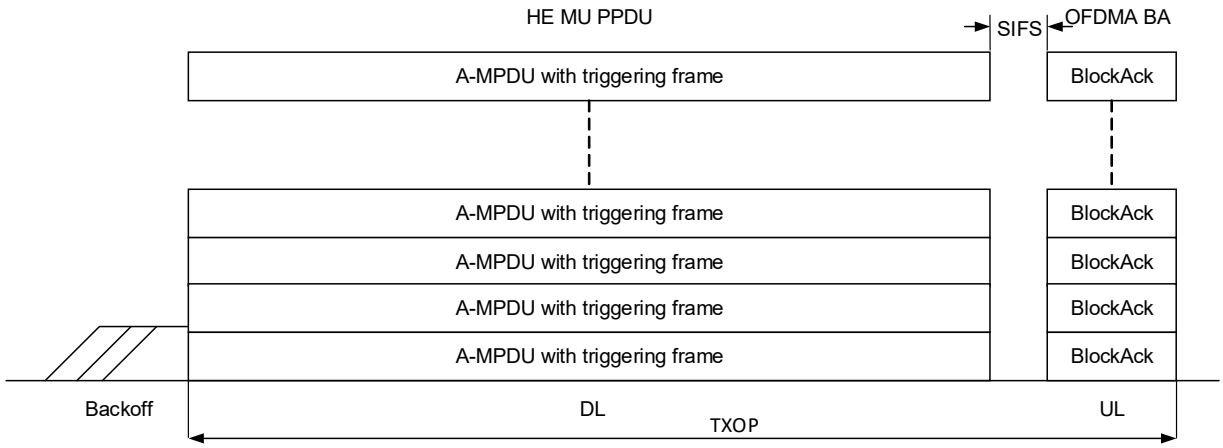

Figure 10-17—Example of HE MU PPDU transmission with immediate UL OFDMA acknowledgment

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An AP may use an MU-BAR Trigger frame or a GCR MU-BAR Trigger frame to solicit acknowledgment frames from multiple HE STAs to which the AP has sent QoS Data frames with Block Ack ack policy or from which the AP has not received immediate acknowledgment frames after sending QoS Data frames with HETP Ack ack policy in an HE MU PPDU.

10.3.2.13.3 Acknowledgment procedure for UL MU transmission

An AP that receives frames from more than one STA that are part of a UL MU transmission (see 9.42.2) and that require an immediate acknowledgment (i.e., a QoS Data frame with Normal Ack or Implicit BAR ack policy or a Management frame other than an Action No Ack frame), shall send an immediate acknowledgment in either an SU PPDU (see 26.4.4.5) or an HE MU PPDU (see 26.4.4.6). The Multi-STA BlockAck frame may be transmitted in a non-HT PPDU, non-HT duplicate PPDU, HT PPDU, VHT PPDU, HE SU PPDU, HE ER SU PPDU, or HE MU PPDU. After the reception of a UL frame requiring acknowledgment, transmission of the DL acknowledgment shall commence after a SIFS, without regard to the busy/idle state of the medium. When an AP transmits an immediate acknowledgment in an HE MU PPDU in response to an A-MPDU sent in an HE TB PPDU, the AP should send it within the 20 MHz channel(s) where the pre-HE modulated fields of the HE TB PPDU sent by the STA are located. The immediate acknowledgment is an Ack frame, Compressed BlockAck frame, or Multi-STA BlockAck frame.

An example of multiple BlockAck frames sent in DL MU is shown in Figure 10-18.

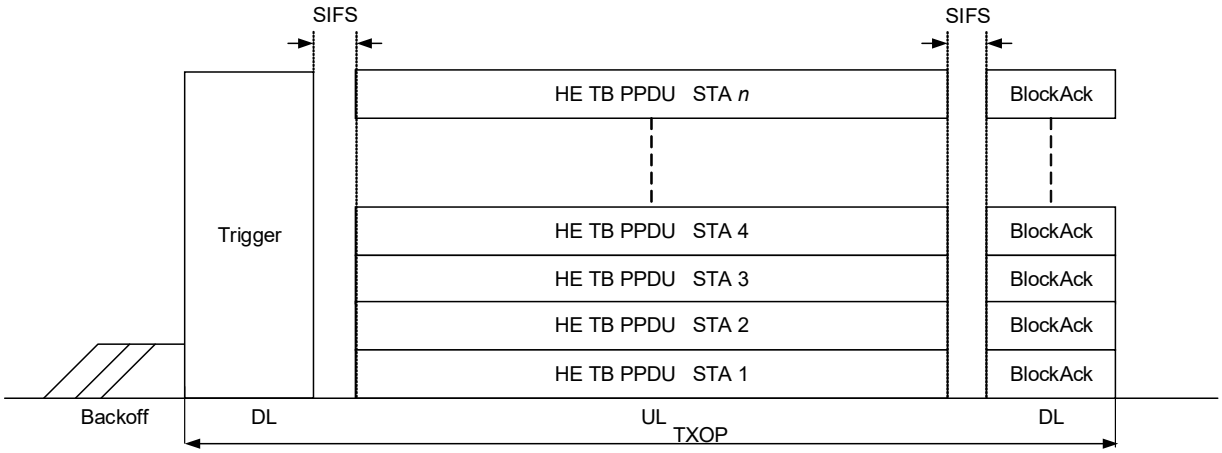

Figure 10-18—Example of UL MU transmission with immediate DL MU transmission containing individually addressed BlockAck frames acknowledging frames received from respective STAs

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An example of a Multi-STA BlockAck frame acknowledgment in a non-HT PPDU, HT PPDU, VHT PPDU, HE SU PPDU, or HE ER SU PPDU is given in Figure 10-19.

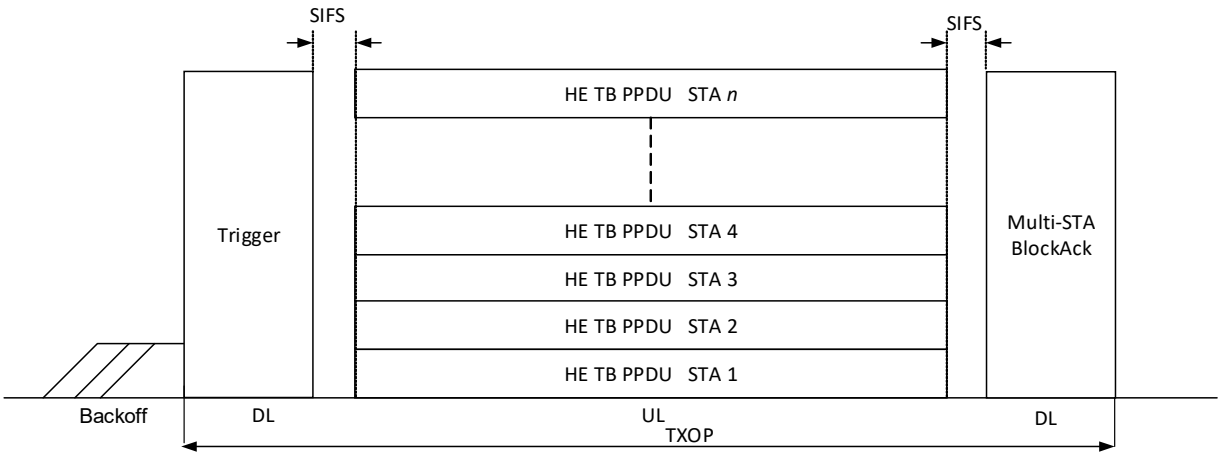

Figure 10-19—Example of UL MU transmissions with immediate Multi-STA BlockAck frame acknowledging MPDUs

An example of a Multi-STA BlockAck frame acknowledgment in a non-HT duplicate PPDU is given in Figure 10-20.

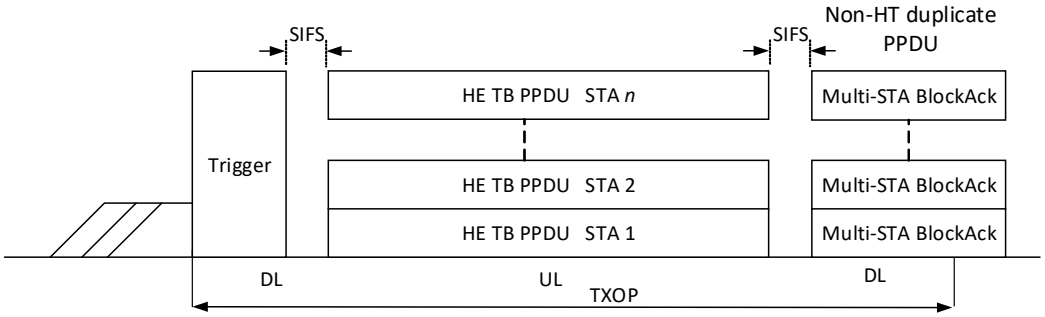

Figure 10-20—Example of UL MU transmissions with immediate DL non-HT duplicate PPDU containing Multi-STA BlockAck frame

The Ack Policy Indicator subfield of a QoS Data frame sent in an HE TB PPDU shall not be set to Block Ack.

A STA may send a BlockAckReq frame or Multi-TID BlockAckReq frame to solicit the acknowledgment frame(s) from an AP.

10.3.2.14 Duplicate detection and recovery

10.3.2.14.1 General

Because MAC-level acknowledgments and retransmissions are incorporated into the protocol, there is the possibility that a frame may be received more than once. The procedures defined in this subclause attempt to

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

filter out these duplicates. Additional duplicate filtering is performed during Receive Buffer Operation for frames that are part of a block ack agreement as described in 10.25.6.

Duplicate frame filtering is facilitated through the inclusion of a Sequence Control field (consisting of a sequence number and fragment number) within Data, Management, and Extension frames, a TID subfield in the QoS Control field within QoS Data frames, and an ACI subfield in the Sequence Number field within QMFs, and a PTID/Subtype subfield in the Frame Control field within PV1 Data frames.

NOTE—In 10.3.2.14, Data frames with a value of 1 in the QoS subfield of the Subtype subfield are collectively referred to as *QoS Data frames*.

10.3.2.14.2 Transmitter requirements

A STA maintains one or more sequence number spaces that are used when transmitting a frame to determine the sequence number for the frame. When multiple sequence number spaces are supported, the appropriate sequence number space is determined by information from the MAC control fields of the frame to be transmitted. Except as noted below, each sequence number space is represented by a modulo 4096 counter, starting at 0 and incrementing by 1, for each MSDU (if not in an A-MSDU), A-MSDU or MMPDU transmitted using that sequence number space. If dot11MACPrivacyActivated is true, the counter in each sequence number space shall be set to a random number modulo 4096 when the STA's MAC address is changed.

NOTE 1—Under a block ack agreement using segmentation and reassembly (see 10.69), the MPDU sequence number is represented by a $2^{\text{MPDU Modulo}}$ counter and the MSDU sequence number is represented by $2^{\text{MSDU Modulo}}$ counter (see 9.2.4.4.2), where MPDU Modulo and MSDU Modulo are as defined in the SAR Configuration element (see 9.4.2.279).

NOTE 2—Group addressed retransmissions of BUs use the same sequence number as the initial group addressed transmission of the BU. Individually addressed retransmissions of a group addressed BU delivered via DMS use the same sequence number as the initial individually addressed transmission of the BU. When a BU is delivered both using group addressing and individual addressing (e.g., when DMS is active but there are other associated STAs not using DMS), the sequence number might differ between the group addressed and individually addressed transmissions of the same BU.

MPDUs that are part of the same MSDU or A-MSDU shall have the same sequence number. Different MSDUs (if not in an A-MSDU), A-MSDUs or MMPDUs have (with a high probability) a different sequence number.

A transmitting STA shall support the applicable sequence number spaces defined in Table 10-5. Applicability is defined by the Applies to column. The Status column indicates the level of support that is required if the Applies to column matches the transmission. The Multiplicity column indicates whether the sequence number space contains a single counter, or multiple counters and in the latter case identifies any indices. The Transmitter requirements column identifies requirements for the operation of this sequence number space. The referenced requirements are defined at the end of the table.

10.3.2.14.3 Receiver requirements

A STA maintains one or more duplicate detection caches. Table 10-6 defines the conditions under which a duplication detection cache is supported and the rules followed by the receiver for the cache. When a Data, Management or Extension frame is received, a record of that frame is inserted in an appropriate cache. That record is identified by a sequence number and possibly other information from the MAC control fields of the frame. When a Data, Management or Extension frame is received in which the Retry subfield of the Frame Control field is equal to 1, the appropriate cache, if any, is searched for a matching frame. In DMG, when a group addressed frame is received the appropriate cache is searched for a matching frame. When a PV1 Data frame or PV1 Management frame is received, the appropriate cache, if any, is searched for a matching frame, despite the absence of a Retry subfield in the Frame Control field. If the search is successful, the frame is considered to be a duplicate. Duplicate frames are discarded.

Table 10-5—Transmitter sequence number spaces

Sequence number space identifier	Sequence number space	Applies to	Status	Multiplicity	Transmitter requirements
SNS1	Baseline	A STA transmitting a frame that is not covered by any of the other sequence number spaces.	Mandatory	Single Instance	TR1
SNS2	Individually addressed QoS Data	A STA transmitting an individually addressed QoS Data frame, excluding SNS5	Mandatory	Indexed by <Address 1, TID>	
SNS3	Time Priority Management	A QoS STA transmitting a Time Priority Management frame	Optional	Indexed by <Address 1, TID>	
SNS4	QMF	A QMF STA transmitting a QMF that is neither a Protected Fine Timing frame nor a Public Action LMR	Mandatory	Indexed by <Address 1, AC>	TR2
SNS5	QoS (+)Null	A STA transmitting a QoS (+)Null frame	Mandatory	None	TR3
SNS6	Individually addressed PV1 Data frame	A STA operating as an S1G STA transmitting a PV1 Data frame	Mandatory	Indexed by <STA MAC Address identified by Address 1, PTID>	TR4
SNS7	Individually addressed PV1 Management frame	A STA operating as an S1G STA transmitting a PV1 Management frame	Mandatory	Indexed by <STA MAC Address identified by Address 1>	
SNS8	Protected Fine Timing frame and Public Action LMR frame	A STA transmitting Protected Fine Timing frames or Public Action LMR frames	Mandatory	Single Instance	

TR1: A transmitting STA should cache the last used sequence number per RA for frames that are assigned sequence numbers from this sequence number space. The STA should check that the successively assigned sequence numbers for frames transmitted to a single RA do not have the same value as is found in the cache for that RA. If the check fails the STA should increment the counter by 2, rather than 1.

TR2: The STA shall assign the sequence number from one modulo 1024 counter per <Address 1, AC> tuple starting at 0 and incrementing by 1 for each MMPDU carried in one or more QMFs with Address 1 and ACI fields matching the <Address 1, AC> tuple values corresponding to that counter.

TR3: Sequence numbers for transmitted QoS (+)Null frames may be set to any value.

TR4: The same modulo 4096 counter per <STA MAC Address identified by Address 1, PTID> tuple shall be used for both PV1 Type 0 (QoS Data) and Type 3 (QoS Data) frames.

NOTE—The receiver STA performs the Ack and (for an AP) PS procedures on all received frames requiring immediate acknowledgment, even if the frame is discarded due to duplicate filtering.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

There is a small possibility that a frame may be improperly rejected due to such a match; however, this occurrence is rare and simply results in a lost frame (similar to an FCS error in other LAN protocols).

A receiving STA shall implement the applicable receiver requirements defined in Table 10-6 with Status indicated as Mandatory. A receiving STA should implement the applicable receiver requirements defined in Table 10-6 with Status indicated as Recommended. A receiving STA may implement the applicable receiver requirements defined in Table 10-6 with Status indicated as Optional. Applicability is defined by the Applies to column. The Status column indicates the level of support that is required if the Applies to column matches the received frame. The Multiplicity/Cache size column indicates the indices that identify a cache entry and the number of entries that shall be supported. The Receiver requirements column identifies requirements for the operation of this cache. The referenced requirements are defined at the end of the table. The requirements relate to caching information that identifies a cache entry and discarding duplicate MPDUs.

Table 10-6—Receiver caches

Receiver cache identifier	Cache name	Applies to	Status	Multiplicity/Cache size	Receiver requirements
RC1	Not QoS Data	A STA receiving frames (individually or group addressed) that are not QoS Data, excluding if applicable: RC4 RC5 RC6 RC7 RC8 RC10	Mandatory	Indexed by: <Address 2, sequence number, fragment number>. At least the most recent cache entry per <Address 2>.	RR1 RR2 RR5
RC2	QoS Data	A STA receiving an (individually or group addressed) QoS Data frame, excluding RC3, and if applicable: RC7, RC8, RC9, and RC10	Mandatory	Indexed by: <Address 2, TID, sequence number, fragment number>. At least the most recent cache entry per <Address 2, TID> pair in this cache.	RR1 RR5
RC3	QoS (+)Null	A QoS STA receiving a QoS (+)Null frame	Mandatory	None	RR4
RC4	Non-time priority Management	A STA receiving an individually addressed non-time priority Management frame, excluding RC6 if RC6 is applicable	Recommended	Indexed by: <Address 2, sequence number, fragment number> At least the most recent cache entry per <Address 2> value.	RR1 RR2 RR5

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 10-6—Receiver caches *(continued)*

Receiver cache identifier	Cache name	Applies to	Status	Multiplicity/Cache size	Receiver requirements
RC5	Time priority Management	A STA receiving an individually addressed time priority Management frame	Recommended	Indexed by: <Address 2, sequence number, fragment number>. At least the most recent cache entry per <Address 2> value.	RR5
RC6	QMFs	A STA receiving an individually addressed QMF that is neither a Protected Fine Timing frame nor a Public Action LMR	Mandatory	Indexed by: <Address 2, AC, sequence number, fragment number> The most recent cache entry per <Address 2, AC, sequence-number, fragment-number>.	RR2 RR3 RR5
RC7	Nonmesh GCR	A nonmesh STA receiving a group addressed frame subject to a GCR agreement.	Mandatory	Indexed by: <DA, sequence number> One cache entry per <DA, sequence-number> tuple for each group address subject to a GCR agreement.	RR5
RC8	Mesh GCR	A mesh STA receiving a group addressed frame subject to a GCR agreement.	Mandatory	Indexed by: <DA, Address 2, sequence number>. One cache entry per <DA, Address 2, sequence-number> tuple for each group address subject to a GCR agreement.	RR5
RC9	QoS Data under BA	A non-DMG QoS STA receiving a QoS Data frame sent under a block ack agreement	Mandatory	None	RR4
RC10	DMG Group Addressed	A DMG STA receiving a group addressed frame.	Mandatory	Indexed by: <Address 1, Address 2, sequence number, fragment number> The most recent cache entry per <Address 1, Address 2, sequence-number>.	RR6

Table 10-6—Receiver caches *(continued)*

Receiver cache identifier	Cache name	Applies to	Status	Multiplicity/Cache size	Receiver requirements
RC11	Individually addressed PV1 Data frame	An S1G STA receiving an individually addressed PV1 Data frame	Mandatory	Indexed by <STA MAC Address identified by Address 2, PTID, sequence number, fragment number>. At least the most recent cache entry per <STA MAC Address identified by Address 2, PTID> pair in this cache.	RR1 RR6
RC12	Individually addressed PV1 Management frame	An S1G STA receiving an individually addressed PV1 Management frame	Mandatory	Indexed by <STA MAC Address identified by Address 2, sequence number, fragment number>. At least the most recent cache entry per <STA MAC Address identified by Address 2> pair in this cache.	RR1 RR2 RR6
RC13	Protected Fine Timing frame and Public Action LMR frame	A STA receiving Protected Fine Timing frames or Public Action LMR frames	Mandatory	Indexed by: <Address 2, sequence number, fragment number>. At least the most recent cache entry per <Address 2>.	RR1 RR2 RR5

RR1: A receiving non-DMG STA with dot11QMFActivated false or not present and with dot11RobustAVStreamingImplemented false or not present should omit tuples obtained from group addressed frames from this cache.

RR2: A receiving STA should omit tuples obtained from ATIM frames from this cache.

RR3: A receiving QMF STA that is a non-DMG STA with dot11RobustAVStreamingImplemented false or not present shall omit from the cache all tuples obtained from group addressed Data frames.

RR4: For the purposes of duplicate detection using receiver caches, QoS (+)Null frames and, in a non-DMG BSS, QoS Data frames under a block ack agreement, shall be ignored.

RR5: The STA shall discard the frame if the Retry subfield of the Frame Control field is 1 and it matches an entry in the cache.

RR6: The STA shall discard the frame if it matches an entry in the cache.

10.3.2.15 NAV distribution

When a node needs to distribute NAV information, for instance, to reserve the medium for a transmission of a nonbasic rate frame (that might not be heard by other nodes in the BSS), the node may first transmit a CTS frame with the RA field equal to its own MAC address (CTS-to-self) if the node is a non-DMG STA, or it may transmit a DMG CTS frame with the RA field equal to its own MAC address and the TA field equal to the MAC address of the peer STA for which the forthcoming transmission of the node is intended (DMG CTS-to-

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

self) if the node is a DMG STA. A duration value in the frame protects the pending transmission, plus possibly an Ack frame.

The CTS-to-self and DMG CTS-to-self NAV distribution mechanisms are lower in network overhead cost than are the RTS/CTS and RTS/DMG CTS NAV distribution mechanisms, respectively, but CTS-to-self and DMG CTS-to-self are less robust against hidden nodes and collisions than RTS/CTS and RTS/DMG CTS-to-self, respectively. STAs employing a NAV distribution mechanism should choose a mechanism that is appropriate for the given network conditions. If errors occur when employing the CTS-to-self or DMG CTS-to-self mechanism, STAs should switch to a more robust mechanism.

When the NDP CTS frame is a CTS-to-self, the value in the Duration field of the NDP CTS frame shall protect the pending transmission, plus any expected (NDP) Ack frame in response.

10.3.2.16 Operation of aSlotTime

An AP with the MAC variable aSlotTime equal to the long slot time shall set the Short Slot Time subfield in transmitted Beacon, Probe Response, Association Response, and Reassociation Response frames to 0. An AP with the MAC variable aSlotTime equal to the short slot time shall set the Short Slot Time subfield in transmitted Beacon, Probe Response, Association Response, and Reassociation Response frames to 1.

A non-AP STA in which dot11ShortSlotTimeOptionImplemented and dot11ShortSlotTimeOptionActivated are true shall set the MAC variable aSlotTime to the short slot time upon reception of Beacon, Measurement Pilot, Probe Response, Association Response, and Reassociation Response frames with the Short Slot Time subfield value equal to 1 from the AP that the STA is associated or associating to. A non-AP STA in which dot11ShortSlotTimeOptionImplemented and dot11ShortSlotTimeOptionActivated are true shall set the MAC variable aSlotTime to the long slot time upon reception of Beacon, Measurement Pilot, Probe Response, Association Response, and Reassociation Response frames with the Short Slot Time subfield value equal to 0 from the AP that the STA is associated or associating to. See also 11.1.3.2.

A STA in which either dot11ShortSlotTimeOptionImplemented or dot11ShortSlotTimeOptionActivated is false shall set the MAC variable aSlotTime to the long slot time at all times. A STA in which dot11ShortSlotTimeOptionImplemented is not present, or whose PHY supports only a single slot time value shall set the MAC variable aSlotTime to the PHY characteristic aSlotTime.

NOTE—The MAC variable aSlotTime is distinct from the PHY characteristic aSlotTime. Outside this subclause, the MAC uses the MAC variable aSlotTime whenever the value of aSlotTime is required.

10.3.2.17 Response Indication procedure

An S1G STA distributes RID information in order to protect the response frame expected SIFS after the frame that elicits that response. The TXVECTOR parameter RESPONSE_INDICATION for S1G non-NDPs shall be set based on the expected response type, as described in Table 10-7. The TXVECTOR parameter RESPONSE_INDICATION for S1G NDPs other than NDP CMAC PPDUs is set as described in 10.35.7.

NOTE—The TXVECTOR parameter RESPONSE_INDICATION is not present for NDP CMAC PPDUs.

An S1G STA shall not cause its intended receiver to generate a control response frame that is not an NDP CMAC PPDU except as specified below:

a) If the intended receiver has indicated that it supports generating +HTC Control frames then the S1G STA can solicit +HTC Control frames of the types described in 10.31.
b) If the intended receiver has negotiated with the S1G STA the generation of TACK frame or STACK frames then the S1G STA can solicit TACK frames or STACK frames as described in 10.46.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 10-7—Setting the TXVECTOR parameter RESPONSE_INDICATION

RESPONSE_INDICATION	Solicited Immediate Response
0 (No Response)	No immediate response. None of the MPDUs in the PPDU solicit an immediate acknowledgment (e.g., a QoS Data frame whose ack policy is neither Normal Ack nor Implicit BAR (see 9.2.4.5.4 and 9.8.3.1), Action No Ack frame).
1 (NDP Response)	The addressed recipient returns an individual NDP CMAC PPDU: — NDP Ack frame, as described in 10.3.2.11, — NDP CTS frame, as described in 10.3.2.9, — NDP BlockAck frame, as described in 10.25.6 and 10.3.2.12. At least one of the MPDUs in the PPDU solicits an immediate acknowledgment, (e.g., a QoS Data frame whose ack policy is either Normal Ack or Implicit BAR, Action frame).
2 (Normal Response)	The addressed recipient returns an individual control response frame: — Ack frame, as described in 10.3.2.11, — CTS frame, as described in 10.3.2.9, — BlockAck frame or BAT frame, as described in 10.3.2.11 and 10.46, — TACK frame or STACK frame as described in 10.46. At least one of the MPDUs in the PPDU solicits an immediate acknowledgment (e.g., a QoS Data frame whose ack policy is Normal Ack or Implicit BAR; or an Action frame).
3 (Long Response)	The addressed recipient may return a response frame, which is not an individual control response frame. More details are provided in 10.49, 10.29, 10.33.3, and 10.53.5.2.

c) If the intended receiver has indicated that it supports generating TACK frames then the S1G STA can solicit a TACK frame as described in 10.47.2.

d) If the intended receiver has negotiated with the S1G STA the use of either BlockAck or BAT frames then the S1G STA can solicit either BlockAck or BAT frames as described in 10.25.5.

e) If the intended receiver has negotiated with the S1G STA the generation of control response frames with different MCSs than the primary MCS as described in 10.6.6.5.6.

An S1G STA transmitting a PPDU that expects an NDP Response shall calculate the Duration/ID field of the transmitted PPDU as described in 9.2.5.2 where the estimated duration of "CTS frame," "Ack frame," or "BlockAck frame" is equal to NDPTxTime. NDPTxTime depends on the TXVECTOR parameter PREAMBLE_TYPE and is equal to the time in microseconds, required to transmit:

— An NDP_1M MAC frame if PREAMBLE_TYPE is an S1G_1M preamble or the intended receiver has indicated the use of 1 MHz control response frames (see 10.6.6.6).

— An NDP_2M MAC frame if PREAMBLE_TYPE is a ≥ 2 MHz short/long preamble and the intended receiver has not indicated the use of 1 MHz control response frames.

An S1G STA that expects a Normal Response that is a BAT frame or TACK frame shall calculate the Duration/ID field of the PPDU as described in 9.2.5.2 using the same estimated duration of a BlockAck frame. An S1G STA that expects a Normal Response that is a STACK frame shall use the estimated duration of an Ack frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An S1G STA that expects a Long Response shall calculate the Duration/ID field of the PPDU as described in 9.2.5.2 for multiple protection settings.

An S1G STA transmitting an eliciting frame for which it expects a response that is a BAT frame or BlockAck frame as described in 10.25.6 or a TACK frame as described in 10.46 and 10.47.2 shall carry the eliciting frame in an A-MPDU or in an S-MPDU (i.e., sets the TXVECTOR parameter AGGREGATION to 1). The intended recipient selects the type of control response frame based on the type of the eliciting frame and other information available in the PSDU such as Ack Policy Indicator field, EOF/Tag field, etc.

An S1G STA transmitting an eliciting frame for which it expects a response that is an Ack frame as described in 10.31 or a STACK frame as described in 10.46 shall carry the eliciting frame in an MPDU (i.e., sets the TXVECTOR parameter AGGREGATION to 0) except when the intended receiver has set the A-MPDU Supported field in the most recently transmitted S1G Capabilities element to 1, in which case the S1G STA may transmit the eliciting frame as an S-MPDU.

An S1G STA transmitting a CF-End frame shall set the TXVECTOR parameter RESPONSE_INDICATION to No Response.

An S1G AP sending an NDP Ack frame with the More Data field equal to 1 as a response to an eliciting PS-Poll frame may set the Duration field of the NDP Ack frame to the estimated duration of the BU frame that the S1G AP has buffered for the polling STA, plus SIFS, plus the duration of the response from the non-AP S1G STA, if required.

An S1G AP that sends an NDP_2M PS-Poll-Ack frame with the Idle Indication field equal to 0 and the More Data field equal to 1 as a response to an eliciting NDP PS-Poll frame may set the Duration field of the NDP_2M PS-Poll-Ack frame to the estimated duration of the BU frame that the S1G AP has buffered for the polling STA, plus SIFS, plus the duration of the response from the non-AP S1G STA, if required. An S1G AP that sends an NDP_2M PS-Poll-Ack frame with the Idle Indication field equal to 0 and the More Data field equal to 0 as a response to an eliciting NDP PS-Poll frame shall set the Duration field of the NDP_2M PS-Poll-Ack frame to 0.

An S1G STA should protect the sequence of two or more SIFS-separated PV1 frames for which it does not follow the BDT rules defined in 10.49 with a protective mechanism that uses multiple protection as described in 9.2.5.2.

10.3.2.18 EDMG RTS procedure

In order to establish a TXOP with a peer EDMG STA, an EDMG STA shall transmit an RTS frame. For channel combinations covered in Table 28-6, the TXVECTOR parameter CH BANDWIDTH shall be set according to rules specified in 10.23.2.14. For those combinations that are not covered in Table 28-6, the TXVECTOR parameter SCRAMBLER_INIT_SETTING shall be set to CONTROL_TRAILER.

If a TXOP is established to send at least one SU MIMO or MU MIMO PPDU, and the number of bits set to 1 in the TXVECTOR parameter CH_BANDWIDTH is greater than 1, the RTS frame shall be sent in non-EDMG duplicate PPDU format, the TXVECTOR parameter SCRAMBLER_INIT_SETTING shall be set to indicate CONTROL_TRAILER and the parameter CT_TYPE shall be set to GRANT_RTS_CTS2Self.

If a TXOP is established to send at least one SU MIMO or MU MIMO PPDU, and the number of bits set to 1 in the TXVECTOR parameter CH_BANDWIDTH is equal to 1, the RTS frame shall be sent in non-EDMG PPDU format, the TXVECTOR parameter SCRAMBLER_INIT_SETTING shall be set to indicate CONTROL_TRAILER and the parameter CT_TYPE shall be set to GRANT_RTS_CTS2Self.

If a TXOP is established to send PPDUs using a single transmit chain and the number of bits set to 1 in the CH_BANDWIDTH parameter is greater than 1:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The RTS frame shall be sent in non-EDMG duplicate PPDU format.
— The TXVECTOR parameter SCRAMBLER_INIT_SETTING shall be set to Channel_BW for channel combinations covered in Table 28-6; otherwise, for those combinations that are not covered in Table 28-6 the TXVECTOR parameter SCRAMBLER_INIT_SETTING shall be set to CONTROL_TRAILER.
— The TXVECTOR parameter CH_BANDWIDTH_SIGNALING shall be set to the encoded value of the set of channels indicated by the CH_BANDWIDTH parameter as defined in Table 28-6.

If the number of bits set to 1 in the CH_BANDWIDTH parameter is equal to 1, STA may perform one of the following:

— Follow the procedure defined in the paragraph above, or
— Transmit the RTS in non-EDMG format and follow the procedure defined in 10.3.2.4.

A CF-End frame sent to truncate a TXOP initiated by RTS frame carried in a non-EDMG duplicate PPDU format shall be sent using a non-EDMG duplicate PPDU format. The TXVECTOR parameters CHANNEL_AGGREGATION and CH_BANDWIDTH_SIGNALING of the CF-End frame shall be set to the same values as indicated by the RXVECTOR parameters of the DMG CTS frame, if received, or to the same values as indicated by the TXVECTOR parameters of the RTS frame otherwise.

An EDMG STA transmitting an RTS frame to establish a TXOP for the transmission of at least one MIMO PPDU or a SISO PPDU using multiple transmit chains with hybrid beamforming follows the procedure defined in 10.38.12.4.

10.3.3 Random backoff procedure

A STA desiring to initiate transfer of Data frames and/or Management frames using the DCF shall invoke the CS mechanism (see 10.3.2.1) to determine the busy/idle state of the medium. If the medium is busy, the STA shall defer until the medium is determined to be idle without interruption for a period of time equal to EIFS when the last transition to idle medium was a result of a frame detected on the medium that was not received correctly, or equal to DIFS otherwise. After this DIFS or EIFS medium idle time, the STA shall then generate a random backoff count [defined by Equation (10-1)] for an additional deferral time before transmitting, unless the backoff counter already contains a nonzero value, in which case the selection of a random number is not needed and not performed. This process minimizes collisions during contention between multiple STAs that have been deferring to the same event.

$$\text{Backoff Count} = \text{Random}() \tag{10-1}$$

where

Random() = Pseudorandom integer drawn from a uniform distribution over the interval [0,CW], where CW is an integer within the range of values of the PHY characteristics aCWmin and aCWmax, aCWmin ≤ CW ≤ aCWmax.

NOTE 1—It is important that designers recognize the need for statistical independence of the random number streams between STAs.

The contention window (CW) parameter shall take an initial value of aCWmin. Every STA shall maintain a STA short retry count (SSRC) as well as a STA long retry count (SLRC), both of which shall take an initial value of 0. The SSRC shall be incremented when any short retry count (SRC) associated with any MPDU with the Type subfield equal to Data or Management is incremented. The SLRC shall be incremented when any long retry count (LRC) associated with any MPDU with the Type subfield equal to Data or Management is incremented. The CW shall take the next value in the series every time an unsuccessful attempt to transmit an MPDU causes either STA retry count to increment, until the CW reaches the value of aCWmax. Once it

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

reaches aCWmax, the CW shall remain at the value of aCWmax until the CW is reset. This improves the stability of the access protocol under high-load conditions. See Figure 10-21.

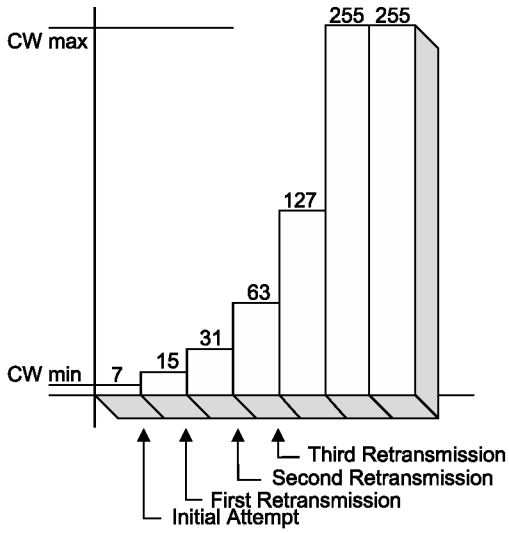

Figure 10-21—Example of exponential increase of CW

The CW shall be reset to aCWmin after every successful attempt to transmit a Data or Management frame, or when SSRC reaches dot11ShortRetryLimit.

The SSRC shall be reset to 0 when a CTS frame is received in response to an RTS frame, when a BlockAck frame is received in response to a BlockAckReq frame, when an Ack frame is received in response to the transmission of a frame containing all or part of an MSDU or MMPDU that is contained in a PSDU of length less than or equal to dot11RTSThreshold, or when a frame with a group address in the Address 1 field is transmitted.

The SLRC shall be reset to 0 when an Ack frame is received in response to transmission of a frame containing all or part of an MSDU or MMPDU that is contained in a PSDU of length greater than dot11RTSThreshold, or when a frame with a group address in the Address 1 field is transmitted.

NOTE 2—For non-HE STAs that use DCF for channel access, dot11TXOPDurationRTSThreshold is not present and the use of the RTS/CTS mechanism is under the control of dot11RTSThreshold.

The set of CW values shall be sequentially ascending integer powers of 2, minus 1, beginning with a PHY-specific aCWmin value, and continuing up to a PHY-specific aCWmax value.

10.3.4 DCF access procedure

10.3.4.1 Introduction

The CSMA/CA access method is the foundation of the DCF.

10.3.4.2 Basic access

Basic access refers to the core mechanism a STA uses to determine whether it may transmit using the DCF.

A STA may transmit an MPDU when it is operating under the DCF access method, when the STA determines that the medium is idle when a frame is queued for transmission, and remains idle for a period of

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

a DIFS, or an EIFS (10.3.2.3.7) from the end of the immediately preceding medium-busy event, whichever is the greater, and the backoff counter has a value of zero. Otherwise the random backoff procedure described in 10.3.4.3 shall be followed.

A DMG STA operating under the DCF access method should transmit frames with its transmit antenna pattern directed toward the intended receiver.

A DMG STA operating under the DCF access method that does not operate in a TXOP exchange may configure its receiving antenna array to a quasi-omni antenna pattern to be ready to receive frames from any DMG STA.

NOTE—The steady state of the antenna configuration might depend on the actual applications in which a DMG STA is involved. For example, a DMG STA that expects transactions with several STAs during a CBAP configures the receiving antenna to a quasi-omni pattern to be ready to receive transmission from any of the STAs. A DMG STA that expects transactions with a single STA (e.g., AP or PCP) might keep its receiving antenna directed to the peer STA.

A DMG STA operating under the DCF access method that is participating in a TXOP exchange should configure its receiving antenna array to be directed toward the other transmitter involved in the TXOP.

The basic access mechanism is illustrated in Figure 10-22.

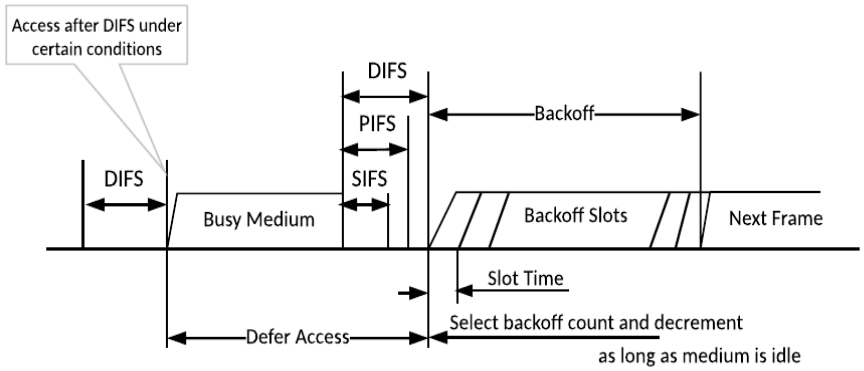

Figure 10-22—Basic access method

10.3.4.3 Backoff procedure for DCF

This subclause describes backoff procedure that is to be invoked when DCF is used. For the backoff procedure when EDCA is used, see 10.23.2.2.

A STA shall invoke the backoff procedure to transfer a frame when finding the medium busy as indicated by either the physical or virtual CS mechanism (see Figure 10-23). A transmitting STA shall invoke the backoff procedure when the STA infers a failed transmission as defined in 10.3.2.9 or 10.3.2.11.

To begin the backoff procedure, the STA shall set its backoff counter to a random value using the equation in 10.3.3. All backoff slots occur following a DIFS or EIFS as appropriate (see 10.3.3 and 10.3.2.3.7) except that no backoff slots for DCF occur during the BTI, the A-BFT, the ATI, and non-CBAP portions of the DTI.

A STA performing the backoff procedure shall use the CS mechanism (see 10.3.2.1) to determine whether there is activity during each backoff slot. If no medium activity is indicated for the duration of a particular backoff slot, then the backoff procedure shall decrement its backoff counter.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

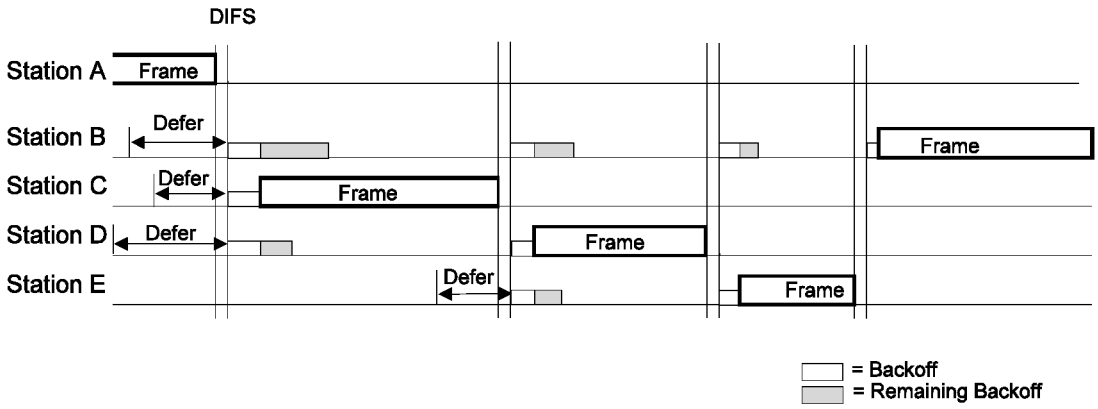

Figure 10-23—Backoff procedure

If the medium is determined to be busy at any time during a backoff slot, then the backoff counter shall not be decremented for that slot. The backoff counter is next decremented after the medium has been determined to be idle for the duration of a DIFS or EIFS, as appropriate (see 10.3.3 and 10.3.2.3.7), plus aSlotTime.

Transmission shall commence when the backoff counter equals 0.

A backoff procedure shall be performed immediately after the end of every transmission with the More Fragments bit equal to 0 of an MPDU with the Type subfield equal to Data, Management, or Control with subtype PS-Poll, even if no additional transmissions are currently queued. In the case of successful acknowledged transmissions, this backoff procedure shall begin at the end of the received Ack frame. In the case of unsuccessful transmissions requiring an immediate response, this backoff procedure shall begin at the end of the AckTimeout interval (as defined in 10.3.2.11) or CTSTimeout interval (as defined in 10.3.2.9). An unsuccessful transmission is one where a control response frame is not received from the STA addressed by the RA field of the transmitted frame and the value of the RA field is an individual address. If the transmission is successful, the CW value reverts to aCWmin before the random backoff count is chosen, and the SSRC and/or SLRC are updated as described in 10.3.3. The result of this procedure is that transmitted frames from a STA are always separated by at least DIFS.

The effect of this procedure is that when multiple STAs are deferring and go into random backoff, then the STA selecting the smallest backoff count using the random function wins the contention (assuming all of the contending STAs detect the same instances of WM activity at their respective receivers, a situation that is not always true, due to hidden node effects and interference events). The number of DMG STAs that are able to detect each WM transmission is reduced even further due to SPSH.

In an IBSS the backoff counter for a pending non-Beacon or non-ATIM transmission shall not decrement in the period from the TBTT until the expiration of the ATIM window, and the backoff counter for a pending ATIM frame shall decrement only within the ATIM window. (See Clause 11.) Within an IBSS a separate backoff count shall be generated to precede the transmission of a Beacon frame, as described in 11.1.3.5.

At the start of an awake window, a DMG STA shall suspend decrementing its backoff counter(s) for any transmission of non-ATIM frames for the duration of the awake window as indicated in the most recently received Awake Window element. At the end of the awake window, the DMG STA shall resume decrementing the backoff counter(s) for non-ATIM frames. A DMG STA shall not decrement the backoff counter for a pending ATIM frame outside the awake window.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

DMG STAs may use different receiving antenna pattern for CCA. Hence, NAV setting behavior might be different depending on the receiving antenna pattern of the STA, even though they are in the same neighborhood. An example of the backoff procedure is described in V.2.

10.3.4.4 Recovery procedures and retransmit limits

Under DCF, error recovery is always the responsibility of the STA that initiates a frame exchange sequence. Many circumstances might cause an error to occur that requires recovery. For example, the CTS frame might not be returned after an RTS frame is transmitted. This may happen due to a collision with another transmission, due to interference in the channel during the RTS or CTS frame, or because the STA receiving the RTS frame has an active virtual CS condition (indicating a busy medium time period).

Error recovery shall be attempted by retrying transmissions for frame exchange sequences that the initiating STA infers have failed. Retries shall continue, for each failing frame exchange sequence, until the transmission is successful, or until the relevant retry limit or lifetime is reached, whichever occurs first. A STA shall maintain an SRC and an LRC for each MSDU or MMPDU awaiting transmission. These counts are incremented and reset independently of each other.

After an RTS frame is transmitted, the STA shall perform the CTS procedure, as defined in 10.3.2.9. If the RTS frame transmission fails, the SRC for the MSDU or MMPDU and the SSRC are incremented. This process shall continue until the number of attempts to transmit that MSDU or MMPDU reaches dot11ShortRetryLimit.

After transmitting a frame that requires immediate acknowledgment, the STA shall perform the acknowledgment procedure, as defined in 10.3.2.11. The SRC for an MPDU with the Type subfield equal to Data or Management and of length less than or equal to dot11RTSThreshold and the SSRC shall be incremented every time transmission of that MPDU fails. This SRC and the SSRC shall be reset when transmission of that MPDU succeeds. The LRC for an MPDU with the Type subfield equal to Data or Management and of length greater than dot11RTSThreshold and the SLRC shall be incremented every time transmission of that MPDU fails. This LRC and the SLRC shall be reset when transmission of that MPDU succeeds. All retransmission attempts for an MPDU with the Type subfield equal to Data or Management that has failed the acknowledgment procedure one or more times shall be made with the Retry subfield set to 1.

NOTE 1—These rules do not apply for frames sent under EDCAF by a non-DMG STA under a block ack agreement (see 10.23.2.12.1).

NOTE 2—For non-HE STAs that use DCF for channel access, dot11TXOPDurationRTSThreshold is not present, and the use of the RTS/CTS mechanism is under the control of dot11RTSThreshold.

Retries for failed transmission attempts shall continue until the SRC for the MPDU with the Type subfield equal to Data or Management is equal to dot11ShortRetryLimit or until the transmit MSDU timer for the MSDU or any undelivered fragments of that MSDU exceeds dot11MaxTransmitMSDULifetime (see 10.4). When any of these limits is reached, retry attempts shall cease, and the MPDU with the Type subfield Data (and any MSDU of which it is a part) or Management shall be discarded. A DMG STA, in addition to using random access within a CBAP, may transmit retries in available scheduled SPs.

A STA in PS mode, in an infrastructure BSS, initiates a frame exchange sequence by transmitting a PS-Poll frame to request data from an AP. If no Ack, Data, or Management frame is received from the AP in response to a PS-Poll frame, then the STA shall retry the sequence, by transmitting another PS-Poll frame.

If the AP sends a Data or Management frame in response to a PS-Poll frame, but fails to receive the Ack frame acknowledging this Data or Management frame, the next PS-Poll frame from the same STA might cause a retransmission of the last MSDU.

NOTE 3—This duplicate MSDU is filtered at the receiving STA using the duplicate frame filtering mechanism.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the AP responds to a PS-Poll frame by transmitting an Ack frame, then responsibility for the Data or Management frame delivery error recovery shifts to the AP because the data are transferred in a subsequent frame exchange sequence, which is initiated by the AP. The AP shall attempt to deliver one buffered BU to the STA that transmitted the PS-Poll frame, using any frame exchange sequence valid for an individually addressed BU. If the PS STA that transmitted the PS-Poll frame returns to doze state after transmitting the Ack frame in response to receipt of this BU, but the AP fails to receive this Ack frame, then the AP retries transmission of this BU until the relevant retry limit is reached. See 11.2.3.7 for details on filtering of extra PS-Poll frames.

An AP that fails to receive an acknowledgment after the AP transmits a frame with the More Data subfield set to 0 to a non-AP VHT STA that is in TXOP power save mode retransmits the frame within the current TXOP under certain conditions as described in 11.2.3.16.

A CMMG AP that fails to receive an acknowledgment after the AP transmits a frame with the More Data field set to 0 to a non-AP CMMG STA in CMMG TXOP power save mode may retransmit the frame within the current TXOP under certain conditions as described in 11.2.3.18.

10.3.4.5 Control of the channel

The SIFS is used to provide an efficient MSDU delivery mechanism. Once the STA has contended for the channel, that STA shall continue to send fragments until either all fragments of a single MSDU or MMPDU have been sent or an acknowledgment is not received. Should the sending of the fragments be interrupted due to one of these reasons, when the next opportunity for transmission occurs the STA shall resume transmission. The algorithm by which the STA decides which of the outstanding MSDUs shall next be attempted after an unsuccessful transmission (as defined in 10.3.4.3) attempt is beyond the scope of this standard, but any such algorithm shall comply with the restrictions listed in 10.7.

Figure 10-24 illustrates the transmission of a fragmented MSDU using the SIFS.

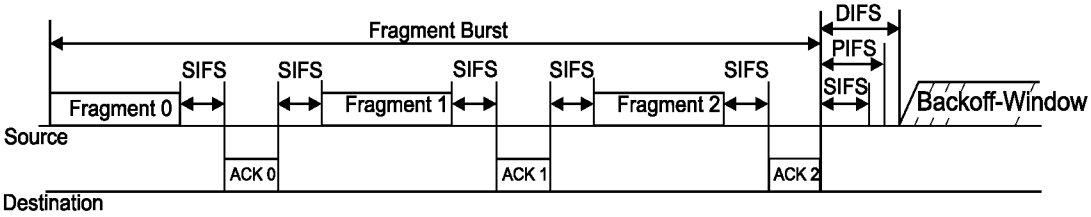

Figure 10-24—Transmission of a fragmented MSDU using SIFS

When the source STA transmits a fragment, it shall release the channel, then immediately monitor the channel for an acknowledgment as described in 10.3.2.11.

When the destination STA has finished sending the acknowledgment, the SIFS following the acknowledgment shall be reserved for the source STA to continue (if necessary) with another fragment. The STA sending the acknowledgment shall not transmit on the channel immediately following the acknowledgment.

The process of sending multiple fragments after contending for the channel is defined as a fragment burst.

If the source STA does not receive an acknowledgment frame, it shall attempt to retransmit the failed MPDU or another eligible MPDU, as defined in 10.7, after performing the backoff procedure and the contention process.

After a STA contends for the channel to retransmit a fragment of an MSDU, it shall start with the last fragment that was not acknowledged. The destination STA shall receive the fragments in order (because the source sends

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

them in order and they are individually acknowledged). It is possible, however, that the destination STA may receive duplicate fragments. It shall be the responsibility of the receiving STA to detect and discard duplicate fragments.

A STA shall transmit after the SIFS only under the following conditions during a fragment burst:

— The STA has just received a fragment that requires immediate acknowledgment.
— The source STA has received an acknowledgment for a previous fragment and has more fragment(s) for the same MSDU to transmit.

The following rules shall also apply:

— When a STA has transmitted a frame other than an initial or intermediate fragment, that STA shall not transmit on the channel following the acknowledgment for that frame, without performing the backoff procedure.
— When an MSDU has been successfully delivered or all retransmission attempts have been exhausted, and the STA has a subsequent MSDU to transmit, then that STA shall perform a backoff procedure.

10.3.5 Individually addressed MPDU transfer procedure

If dot11TXOPDurationRTSThreshold is 1023 or not present, a STA shall use an RTS/CTS preceding a frame exchange including an individually addressed Data or Management frame when the length of the PSDU is greater than the length threshold indicated by dot11RTSThreshold. If dot11TXOPDurationRTSThreshold is present and is not 1023, a non-AP HE STA using EDCA shall use an RTS/CTS exchange as defined in 26.2.1. A STA may also use an RTS/CTS exchange to protect the transmission of individually addressed frames when it is necessary to distribute the NAV, or when it is necessary to establish protection (see 10.27), or for other purposes.

NOTE 1—If dot11RTSThreshold is 0, an RTS/CTS exchange precedes all frame exchange sequences including an individually addressed Data or Management frame, except for a non-AP STA with dot11TXOPDurationRTSThreshold present and not equal to 1023. In this exception, use of an RTS/CTS exchange is controlled by dot11TXOPDurationRTSThreshold (see 26.2.1).

NOTE 2—A non-AP STA that transmits an HE TB PPDU outside the context of an RDG is exempt from requirements related to dot11RTSThreshold and dot11TXOPDurationRTSThreshold because the STA is not the TXOP holder.

If an RTS/CTS exchange is used, the PPDU containing the PSDU shall be transmitted starting one SIFS after the end of the CTS frame.

NOTE 3—No regard is given to the busy or idle status of the medium when transmitting this PSDU.

If an RTS/CTS exchange is not used, the PSDU shall be transmitted following the success of the basic access procedure. With or without the use of the RTS/CTS exchange procedure, the STA that is the destination of a Data frame shall follow the acknowledgment procedure.

10.3.6 Group addressed MPDU transfer procedure

When a STA transmits group addressed MPDUs in which the To DS subfield is 0, the STA shall use the basic access procedure, unless these MPDUs are delivered using the group addressed transmission service (GATS). When GATS is not used to deliver group addressed MPDUs, the STA shall not use an RTS/(NDP) CTS or RTS/DMG CTS exchange, regardless of the length of the frame. In addition, no recipient of the frame shall transmit an Ack frame. A STA that transmits a group addressed MPDU in which the To DS subfield is 1 shall, in addition to complying with the basic access procedure of CSMA/CA, obey the rules for RTS/CTS exchange and the acknowledgment procedure because the MPDU is directed to the AP. For DMG STAs, the MPDU transmission shall also comply with the access procedures defined in 10.38.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

There is no MAC-level recovery on group addressed frames, except for the following:

— Frames in which the To DS subfield is 1
— Group addressed frames transmitted via the GATS

As a result, the reliability of this traffic is reduced, relative to the reliability of individually addressed traffic, due to the increased probability of lost frames from interference, collisions, or time-varying channel properties.

A DMG STA may transmit a copy of the same group addressed MPDU using different antenna configurations. This might be needed to provide a quasi-omni coverage or to enable transmission by an MCS that is higher than MCS 0. A DMG STA with dot11DMGOCBActivated equal to true may transmit copies of the same group addressed MPDU using different antenna configurations to provide sufficient coverage to communicate with peer STAs with which the DMG STA is maintaining beam links and may omit transmissions that use an antenna configuration over which a beamformed link is not maintained. If multiple copies of a group addressed MPDU with a To DS subfield equal to 0 are transmitted, the STA shall not transmit a different frame before the completion of the transmission of all copies of the group addressed MPDU.

NOTE—The following paragraph addresses the Dual CTS protection mechanism. The use of the Dual CTS protection mechanism is obsolete.

An STBC-capable STA shall discard either all received group addressed Data frames that are STBC frames or all received group addressed Data frames that are non-STBC frames. How it makes this decision is outside the scope of this standard.

A STA that is not an S1G relay STA shall discard an MPDU with a group address in the Address 1 field unless one of the following cases applies: (1) the value in the Address 1 field matches any value in the dot11GroupAddressesTable or is the broadcast address, or (2) the STA is a GLK STA and the address in the Address 1 field is a SYNRA. A GLK STA shall process an MPDU with a SYNRA in the Address 1 field as described in 10.65. If an MPDU originates from an S1G relay STA’s associated AP and if the MPDU has any group address in its Address 1 field, then the STA shall forward that MPDU to the S1G relay AP.

10.3.7 DCF timing relations

The IFSs are periods of time on the medium. The attributes of the IFSs are determined by the specific PHY (see Figure 10-25). The IFSs apply to transmission under EDCA, too (see Figure 10-29).

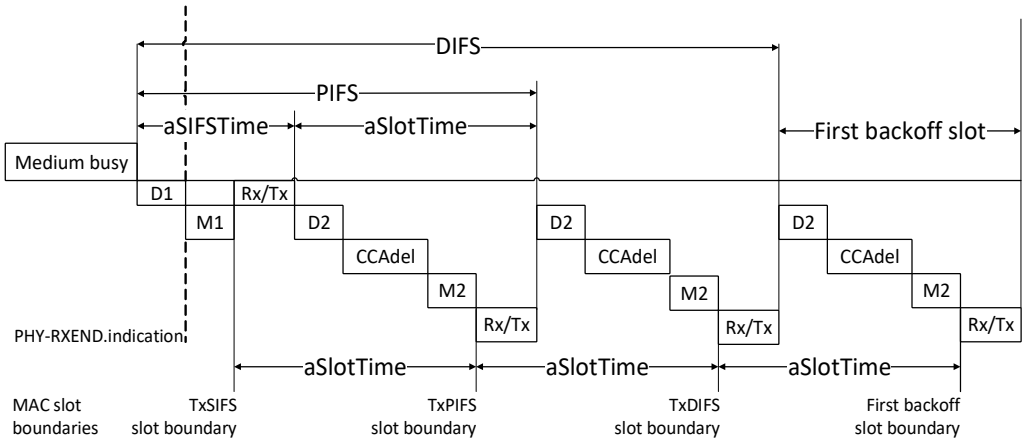
All medium timings that are referenced from the end of the transmission are referenced from the end of the PPDU[+SigExt]. The beginning of transmission refers to the start of the preamble of the next PPDU. All MAC timings are referenced from the PHY-TXEND.confirm, PHY-TXSTART.confirm, PHY-RXSTART.indication, and PHY-RXEND.indication primitives.

aSIFSTime and aSlotTime are determined per PHY, aSIFSTime is fixed, and aSlotTime can change dynamically as aAirPropagationTime changes (see 10.22.5).

The STA may employ any non-negative value for each of the parameters:

— aRxPHYDelay
— aMACProcessingDelay
— aTxPHYDelay
— aTxRampOnTime
— aCCATime
— aRxTxSwitchTime

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.



D1 = aRxPHYDelay (referenced from the end of the last PPDU[+SigExt] on the medium)
D2 = aAirPropagationTime
Rx/Tx = aRxTxTurnaroundTime (begins with a PHY-TXSTART.request)
M1 = M2 = aMACProcessingDelay
CCAdel = aCCATime

Figure 10-25—DCF timing relationships

provided that the constraints in Equation (10-2), Equation (10-3), and Equation (10-4) are met, and provided that the CCA sensitivity specification for the attached PHY is met (see 15.4.6.5, 16.3.8.5, 17.3.10.6, 18.4.6, 19.3.19.6, 20.4.4.2.2, 20.5.4.2.2, 21.3.18.5, and 22.3.18.6).

$$\text{aSIFSTime} = \text{aRxPHYDelay} + \text{aMACProcessingDelay} + \text{aRxTxTurnaroundTime} \quad (10\text{-}2)$$

$$\text{aSlotTime} = \text{aCCATime} + \text{aMACProcessingDelay} + \text{aRxTxTurnaroundTime} + \text{aAirPropagationTime} \quad (10\text{-}3)$$

$$\text{aRxTxTurnaroundTime} = \text{aTxPHYDelay} + \text{aRxTxSwitchTime} + \text{aTxRampOnTime} \quad (10\text{-}4)$$

where

aAirPropagationTime is determined as described in 10.22.5

aSlotTime, aSIFSTime, and aRxTxTurnaroundTime are the values indicated in the PLME-CHARACTERISTICS.confirm primitive

the other attribute values are the values implemented

The PIFS and DIFS are derived by the Equation (10-5) and Equation (10-6), as illustrated in Figure 10-25.

$$\text{PIFS} = \text{aSIFSTime} + \text{aSlotTime} \quad (10\text{-}5)$$

$$\text{DIFS} = \text{aSIFSTime} + 2 \times \text{aSlotTime} \quad (10\text{-}6)$$

In a non-S1G STA, when dot11DynamicEIFSActivated is false or not defined, the EIFS is derived from the SIFS and the DIFS and the length of time it takes to transmit an Ack frame at the lowest PHY mandatory rate or MCS by Equation (10-7).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$EIFS = aSIFSTime + AckTxTime + DIFS \quad (10\text{-}7)$$

where AckTxTime is the time expressed in microseconds required to transmit an Ack frame, including preamble, PHY header and any additional PHY dependent information, at the lowest PHY mandatory rate or MCS.

In an S1G STA, the EIFS is equal to DIFS if the PPDU that causes the EIFS does not generate a PHY-RXEND.indication(FormatViolation) primitive. Otherwise, the EIFS for the S1G STA is derived by Equation (10-7), where ACKTxTime is equal to NDPTxTime as defined in 10.3.2.5.2.

When dot11DynamicEIFSActivated is true, EIFS is based on an estimated duration of the PPDU that is the possible response to the PPDU that causes the EIFS. The estimation is based on properties of the PHY header of the PPDU that causes the EIFS, such as modulation, rate/MCS, or length.

NOTE 1—If the L-SIG field is used, as it does not have CRC protection, this information might not always be correct.

In a non-DMG and non-S1G STA, when dot11DynamicEIFSActivated is true, if the PPDU that causes the EIFS does not contain a single MPDU with a length equal to 14 or 32 octets, and the modulation of the PPDU that causes the EIFS is included in Table 10-8, then EIFS is determined as shown in Equation (10-8).

$$EIFS = aSIFSTime + EstimatedAckTxTime + DIFS \quad (10\text{-}8)$$

where EstimatedAckTxTime is based on an estimated duration of the PPDU that is the possible response to the PPDU that causes the EIFS, as specified in Table 10-8.

Table 10-8—Determination of the EstimatedAckTxTime based on properties of the PPDU causing the EIFS

Modulation of PPDU causing EIFS	Rate/MCS of PPDU causing EIFS	Other properties of PPDU causing EIFS	Presumed response	Presumed response rate	EstimatedAckTxTime (μs)
(HR-)DSSS	1 Mb/s		Ack	1 Mb/s	304
(HR-)DSSS	≥ 2 Mb/s (long preamble)		Ack	2 Mb/s	248
(HR-)DSSS	≥ 2 Mb/s (short preamble)		Ack	2 Mb/s	152
(ERP-)OFDM	BPSK		Ack	6 Mb/s	44
(ERP-)OFDM	QPSK		Ack	12 Mb/s	32
(ERP-)OFDM	≥16-QAM		Ack	24 Mb/s	28
HT	BPSK	Aggregation = 0	Ack	6 Mb/s	44
HT	QPSK	Aggregation = 0	Ack	12 Mb/s	32
HT	≥16-QAM	Aggregation = 0	Ack	24 Mb/s	28
HT	BPSK	Aggregation = 1	BlockAck	6 Mb/s	68
HT	QPSK	Aggregation = 1	BlockAck	12 Mb/s	44
HT	≥16-QAM	Aggregation = 1	BlockAck	24 Mb/s	32
VHT	BPSK		BlockAck		68
VHT	QPSK		BlockAck		44
VHT	≥16-QAM		BlockAck		32

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 2—This also applies to an HE STA with dot11DynamicEIFSActivated set to true that receives an HE PPDU with the RXVECTOR parameter TXOP_DURATION set to UNSPECIFIED that causes the EIFS.

When dot11DynamicEIFSActivated is true and the PPDU that causes the EIFS contains a single MPDU with a length equal to 14 or 32 octets, EIFS is equal to DIFS. This reflects the fact that a 14-octet or 32-octet MPDU is very likely an Ack or a BlockAck frame, which does not cause a response PPDU to be transmitted.

When dot11DynamicEIFSActivated is true and the modulation of the PPDU that causes the EIFS does not occur in Table 10-8, then EIFS is determined as shown in Equation (10-7).

Figure 10-25 illustrates the relation between the SIFS, PIFS, and DIFS as they are measured on the medium and the different MAC slot boundaries TxSIFS, TxPIFS, and TxDIFS. These slot boundaries define when the transmitter shall be turned on by the MAC to meet the different IFS timings on the medium, after subsequent detection of the CCA result of the previous slot time.

Equation (10-9), Equation (10-10), and Equation (10-11) define the MAC slot boundaries using attributes provided by the PHY, which are such that they compensate for implementation timing variations. The starting reference of these slot boundaries is again the end of the previous PPDU[+SigExt].

$$\text{TxSIFS} = \text{SIFS} - \text{aRxTxTurnaroundTime} \tag{10-9}$$

$$\text{TxPIFS} = \text{TxSIFS} + \text{aSlotTime} \tag{10-10}$$

$$\text{TxDIFS} = \text{TxSIFS} + 2 \times \text{aSlotTime} \tag{10-11}$$

NOTE 3—The tolerance for SIFS is defined in 10.3.2.3.3.

10.3.8 Signal extension

Transmissions of PSDUs with the TXVECTOR parameter FORMAT of type NON_HT with NON_HT_MODULATION values of ERP-OFDM and NON_HT_DUP_OFDM and transmissions of frames with the TXVECTOR parameter FORMAT with values of HT_MF, HT_GF, HE_SU, HE_MU, HE_ER_SU, or HE_TB are immediately followed by a period of no transmission of duration aSignalExtension, except for RIFS transmissions. The purpose of this signal extension is to enable the NAV value of Clause 16 STAs to be set correctly.

When an HT STA transmits a PPDU using a RIFS and with the TXVECTOR parameter FORMAT equal to NON_HT with the NON_HT_MODULATION parameter equal to one of ERP-OFDM and NON_HT_DUP_OFDM or a PPDU using a RIFS and with the TXVECTOR parameter FORMAT equal to HT_MF or HT_GF, it shall set the TXVECTOR parameter NO_SIG_EXTN to true. Otherwise, it shall set the TXVECTOR parameter NO_SIG_EXTN to false.

10.3.9 Determination of PLME aCWmin characteristics

In the case of the Clause 18 ERP, the aCWmin value is dependent on the requester's characteristic rate set. The characteristic rate set is equal to the IBSS's basic rate set when the STA is an IBSS STA. It is equal to the AP's operational rate set when the STA is associated with an AP. At all other times, it is equal to the STA's mandatory rate set.

If the PHY characteristic aCWmin is a vector, then the MAC variable aCWmin is set to the PHY characteristic aCWmin(0) if the characteristic rate set includes only rates in the set 1, 2, 5.5, 11 and to aCWmin(1) otherwise. If the PHY characteristic aCWmin is a scalar, then the MAC variable aCWmin is set to the PHY characteristic aCWmin.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—The MAC variable aCWmin is distinct from the PHY characteristic aCWmin. Outside this subclause, the MAC uses the MAC variable aCWmin whenever the value of aCWmin is required.

10.4 MSDU, A-MSDU, and MMPDU fragmentation

The MAC may fragment and reassemble MSDUs or MMPDUs that are carried in individually addressed MPDUs. The fragmentation and defragmentation mechanisms allow for fragment retransmission.

Dynamic fragmentation allows A-MSDUs to be fragmented. An HE STA may use dynamic fragmentation as defined in 26.3.2 if the conditions in 26.3.2.1 are met. Transmission and retransmission of A-MSDU fragments shall follow the procedures defined in this subclause except where superseded by 26.3.

The length of each fragment shall be an equal number of octets for all fragments except the last, which may be smaller. The length of each fragment shall be an even number of octets, except for the last fragment of an MSDU or MMPDU, which may be either an even or an odd number of octets. The length of a fragment shall never be larger than dot11FragmentationThreshold unless security encapsulation is invoked for the MPDU. If security encapsulation is active for the MPDU, then the MPDU shall be expanded by the encapsulation overhead and this may result in a fragment larger than dot11FragmentationThreshold.

A fragment is an MPDU, the Frame Body field of which carries only a portion of an MSDU, A-MSDU, or MMPDU. When data are to be transmitted, the number of octets in the fragment (before processing by the security mechanism) shall be limited by dot11FragmentationThreshold and the number of octets in the MPDU that have yet to be assigned to a fragment at the instant the fragment is constructed for the first time. Once a fragment is transmitted for the first time, its frame body content and length shall be fixed until it is successfully delivered to the immediate receiving STA.

NOTE 1—Packet numbers for consecutive fragments of an MSDU, A-MSDU or MMPDU in an RSNA are required to increment in steps of 1 (see 12.5.2.3.2 and 12.5.4.3.2).

A STA shall support receiving MPDUs, containing all or part of an MSDU, of arbitrary length that is less than or equal to the maximum MSDU size as specified in 9-34, plus any security encapsulation overhead, plus MAC header and FCS.

A STA shall support receiving MPDUs, containing all or part of an MMPDU, of arbitrary length that is less than or equal to the minimum of

- The maximum MMPDU size as defined in 9.3.3.1, plus any security encapsulation overhead, plus MAC header and FCS
- Any maximum MPDU length advertised by the STA

If a fragment requires retransmission, its frame body content and length shall remain fixed for the lifetime of the MSDU or MMPDU at that STA. Each fragment contains a Sequence Control field, which comprises a sequence number and fragment number. When a STA is transmitting a fragmented MSDU or MMPDU or dynamically fragmented A-MSDU, the sequence number shall remain the same for all fragments of that MSDU, A-MSDU, or MMPDU. The fragments shall be sent in order of lowest fragment number to highest fragment number, where the fragment number value starts at 0, and increases by 1 for each successive fragment. The Frame Control field also contains a bit, the More Fragments bit, that is equal to 0 to indicate the last fragment of the MSDU, A-MSDU, or MMPDU (or that the MSDU, A-MSDU or MMPDU was not fragmented, if the Fragment Number subfield is also equal to 0).

The source STA shall maintain a transmit MSDU/MMPDU timer for each MSDU/MMPDU being transmitted. The attribute dot11MaxTransmitMSDULifetime specifies the maximum amount of time allowed to transmit an MSDU/MMPDU. The timer starts on the initial attempt to transmit the MSDU/MMPDU, or first fragment of the MSDU/MMPDU if the MSDU/MMPDU is fragmented. If the timer exceeds

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

dot11MaxTransmitMSDULifetime, then any remaining fragments are discarded by the source STA and no attempt is made to complete transmission of the MSDU/MMPDU.

NOTE 2—A STA might interleave fragments of MSDUs with different TIDs sent to the same receiver, subject to any constraint caused by the number of replay counters.

10.5 MSDU, A-MSDU, and MMPDU defragmentation

Reception and reassembly of A-MSDU fragments shall follow the procedures defined in this subclause except where superseded by 26.3.

The header of each fragment contains the following information that is used by the destination STA to reassemble the MSDU, A-MSDU, or MMPDU:

— Frame type
— Address of the sender, obtained from the Address 2 field
— Destination address
— *Sequence Control field:* This field allows the destination STA to check that all incoming fragments belong to the same MSDU, A-MSDU, or MMPDU, and the sequence in which the fragments should be reassembled. The sequence number within the Sequence Control field remains the same for all fragments of an MSDU, A-MSDU, or MMPDU, while the fragment number within the Sequence Control field increments for each fragment.
— Traffic identifier, for frames with a QoS Control field.
— *More Fragments indicator:* Indicates to the destination STA that this is not the last fragment of a fragmented MSDU, A-MSDU, or MMPDU. Only the last fragment of a fragmented MSDU, A-MSDU, or MMPDU shall have this bit set to 0. All other fragments of a fragmented MSDU, A-MSDU, or MMPDU shall have this bit set to 1.

The destination STA shall reconstruct the MSDU or MMPDU by combining the fragments in order of fragment number subfield of the Sequence Control field. If security encapsulation has been applied to the fragment, it shall be deencapsulated and decrypted before the fragment is used for defragmentation of the MSDU, A-MSDU, or MMPDU. If the fragment with the More Fragments bit equal to 0 has not yet been received, then the destination STA knows that the MSDU, A-MSDU, or MMPDU is not yet complete. As soon as the STA receives the fragment with the More Fragments bit equal to 0, the STA knows that no more fragments will be received for the MSDU, A-MSDU, or MMPDU.

An MSDU or MMPDU shall not be reassembled from fragments that were encrypted with different keys, or from a mixture of encrypted and unencrypted fragments.

NOTE 1—Packet numbers for consecutive fragments of an MSDU, A-MSDU or MMPDU in an RSNA are required to increment in steps of 1 (see 12.5.2.4.4 and 12.5.4.4.4 under d)).

NOTE 2—All the fragments of an MSDU or A-MSDU are required to have the same indication of whether they are fragments of an MSDU or of an A-MSDU (see 26.3.3.1).

A STA shall support the concurrent reception of fragments of at least three MSDUs or MMPDUs. A STA should support the concurrent reception of fragments of at least one MSDU per access category. An AP should support the concurrent reception of at least one MSDU per access category per associated STA. Note that a STA receiving more than three fragmented MSDUs or MMPDUs concurrently might experience a significant increase in the number of frames discarded.

NOTE 3—The three MSDUs or MMPDUs might be from different peers (e.g., in an IBSS or MBSS).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The destination STA shall maintain a Receive Timer for each MSDU or MMPDU being received, for a minimum of three MSDUs or MMPDUs. The STA may implement additional timers to be able to receive additional concurrent MSDUs or MMPDUs. The receiving STA shall discard all fragments that are part of an MSDU or MMPDU for which a timer is not maintained. There is also dot11MaxReceiveLifetime, that specifies the maximum amount of time allowed to receive an MSDU. The receive timer starts on the reception of the first fragment of a fragmented MSDU or MMPDU. If the receive timer exceeds dot11MaxReceiveLifetime, then all received fragments of this MSDU or MMPDU shall be discarded by the destination STA. If additional fragments of this MSDU or MMPDU are subsequently received, those fragments shall be acknowledged and discarded.

To properly reassemble MPDUs into an MSDU, A-MSDU, or MMPDU, a destination STA shall discard any duplicated fragments received. A STA shall discard duplicate fragments as described in 10.3.2.14. However, a duplicate fragment of an individually addressed MSDU, A-MSDU, or MMPDU shall be acknowledged.

10.6 Multirate support

10.6.1 Overview

Some PHYs have multiple data transfer rate capabilities that allow implementations to perform dynamic rate switching with the objective of improving performance. The algorithm for performing rate switching is beyond the scope of this standard, but in order to provide coexistence and interoperability on multirate-capable PHYs, this standard defines a set of rules to be followed by all STAs.

Only the data transfer rates of the mandatory rate set of the attached PHY are guaranteed to be supported when a STA for which dot11OCBActivated is true transmits a Management or Data frame. A higher layer protocol entity within a STA in which dot11OCBActivated is true might negotiate a rate outside the mandatory rate set.

A STA that transmits a frame shall select a rate defined by the rules for determining the rates of transmission of protection frames in 10.27 when the following conditions apply:

— The STA’s protection mechanism for non-ERP receivers is enabled.
— The frame is a protection mechanism frame.
— The frame initiates an exchange.

Otherwise, a non-DMG and non-CMMGSTA shall transmit the frame using a rate that is in accordance with rules defined in 10.6.5 and 10.6.6. A DMG STA shall transmit the frame using a rate that is in accordance with rules defined in 10.6.7. A CMMG STA shall transmit the frame using a rate that is in accordance with rules defined in 10.6.8.

For specific PHYs, the value of the Duration/ID field is determined using the PLME-TXTIME.request primitive and the PLME-TXTIME.confirm primitive. These specific PHYs are defined in:

— Clause 16 for HR/DSSS
— Clause 17 for OFDM
— Clause 18 for ERP
— Clause 19 for HT
— Clause 20 for DMG
— Clause 21 for VHT
— Clause 22 for TVHT
— Clause 24 for CDMG
— Clause 25 for CMMG
— Clause 27 for HE

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The two PLME-TXTIME primitives are defined in the respective PHY specifications:

- 16.3.4 for HR TXTIME calculation
- 17.4.3 for OFDM TXTIME calculation
- 18.5.3.2 for ERP-OFDM TXTIME calculation
- 19.4.3 for HT TXTIME calculation
- 20.11.3 for DMG PLME TXTIME calculation
- 21.4.3 for VHT PLME TXTIME calculation
- 22.4.3 for TVHT PLME TXTIME calculation
- 25.14.3 for CMMG PLME TXTIME calculation
- 27.4.3 for HE PLME TXTIME calculation

The Duration/ID field in a frame transmitted by a QoS STA may cover multiple frames and might involve using the PLME-TXTIME.request primitive several times.

10.6.2 Basic HT-MCS Set field

An AP that transmits a frame containing an HT Operation element with either the Dual Beacon field or the Dual CTS Protection field equal to 1 shall include at least one MCS that has only one spatial stream in the Basic HT-MCS Set field of the HT Operation element of that frame.

10.6.3 Basic STBC MCS

The basic STBC MCS has the value null when any of the following conditions is true:

- The Dual Beacon field in the HT Operation element is equal to 0, and the Dual CTS Protection field in the HT Operation element is equal to 0.
- No HT Operation element is present in the Association Response frame received from the current AP.
- The Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive is empty or does not exist.
- The lowest MCS of the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive has NSS value greater than 1 (the mapping of MCS to NSS is PHY dependent, for the HT PHY see 19.5).

If none of the above conditions is true, then the basic STBC MCS is the lowest MCS index of the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive.

When an MCS from the basic STBC MCS is required in 10.6.5 and 10.6.6 but the basic STBC MCS has the value null, the STA shall select a mandatory MCS of the attached PHY.

10.6.4 Basic rate set, basic HT-MCS set, and basic VHT-MCS and NSS set for mesh STA

A mesh STA shall not establish a mesh peering with a mesh STA using a different BSSBasicRateSet (see 14.3.7 and 14.3.8).

The SME of a Mesh STA should use the mandatory PHY rates as the default BSSBasicRateSet in the MLME-START.request primitive to reduce the risk that a candidate peer mesh STA utilizes a different

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

BSSBasicRateSet. If the mesh STA is also an HT STA, it should adopt the mandatory HT-MCSs as the default basic HT-MCS set. If the mesh STA is also a VHT STA, it should adopt <VHT-MCS, NSS> tuples formed from the mandatory VHT-MCSs and NSS = 1 as the default basic VHT-MCS and NSS set (see 11.38.7).

10.6.5 Rate selection for Data and Management frames

10.6.5.1 Rate selection for non-STBC Beacon frames

In an S1G STA, non-STBC S1G Beacon frames shall be transmitted in an S1G 1 MHz PPDU, an S1G 2 MHz PPDU with short preamble, an S1G 1 MHz duplicate PPDU, or an S1G 2 MHz duplicate PPDU with short preamble using one of the mandatory PHY rates.

If the BSSBasicRateSet parameter is not empty, a non-STBC Beacon frame that is not an ER beacon or HE beacon shall be transmitted in a non-HT PPDU using one of the rates included in the BSSBasicRateSet parameter. An ER beacon is transmitted as defined in 26.15.5, and an HE beacon is transmitted as defined in 26.15.6.

If the BSSBasicRateSet parameter is empty, the frame shall be transmitted in a non-HT PPDU using one of the mandatory PHY rates.

10.6.5.2 Rate selection for STBC group addressed Data and Management frames

When a STA has dot11TxSTBCOptionActivated true, it shall use the basic STBC MCS when it transmits an STBC Beacon frame or when it transmits a group addressed Data or Management frame that is an STBC frame.

10.6.5.3 Rate selection for EBCS Info, EBCS UL, and EBCS Data frames

The transmission rate for EBCS Info frames and EBCS UL frames is determined from dot11EBCSInfoPHYType and dot11EBCSInfoTxRate. When dot11EBCSInfoPHYType is equal to 255, the AP may select a transmission rate following the rules specified in 10.6.5.4.

The transmission rate for EBCS Data frames is determined from dot11EBCSTrafficStreamPHYType and dot11EBCSTrafficStreamTxRate. When dot11EBCSTrafficStreamPHYType is equal to 255, the AP may select a transmission rate following the rules specified in 10.6.5.4.

10.6.5.4 Rate selection for other group addressed Data and Management frames

This subclause describes the rate selection rules for group addressed Data and Management frames, excluding the following:

— Non-STBC Beacon frames
— ER beacon and HE beacon
— STBC group addressed Data and Management frames
— Data frames located in an FMS stream (see 11.21.8)
— Group addressed frames transmitted to the GCR concealment address (see 11.21.16.3.5)
— Group addressed Data and Management frames transmitted in an HE ER SU PPDU (see 26.15.5)
— Group addressed Data and Management frames transmitted in an HE SU PPDU (see 26.15.6)
— Group addressed Data and Management frames transmitted in an HE MU PPDU (see 26.15.7)
— EBCS Info frames, EBCS UL frames and EBCS Data frames

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the BSSBasicRateSet parameter is not empty, a Data or Management frame (excluding the frames listed above) with a group address in the Address 1 field shall be transmitted in a non-HT PPDU using one of the rates included in the BSSBasicRateSet parameter or the rate chosen by the AP, described in 11.21.8, if the Data frames are part of an FMS stream.

If the BSSBasicRateSet parameter is empty and the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive is not empty, the frame shall be transmitted in an HT PPDU using one of the MCSs included in the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive.

If the BSSBasicRateSet parameter is empty and the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive is empty and the basic VHT-MCS and NSS set is not empty, the frame shall be transmitted in a VHT PPDU using one of the <VHT-MCS. NSS> tuples included in the basic VHT-MCS and NSS set.

In a non-S1G STA, if the BSSBasicRateSet parameter, the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive, and the basic VHT-MCS and NSS set are empty (e.g., a scanning STA that is not yet associated with a BSS), the frame shall be transmitted in a non-HT PPDU using one of the mandatory PHY rates.

In an S1G STA, if the BSSBasicS1GMCS_NSSSet parameter is empty (e.g., a scanning STA that is not yet associated with a BSS), the frame shall be transmitted in an S1G PPDU using one of the mandatory PHY rates.

If the BSSBasicS1GMCS_NSSSet is not empty, the frame shall be transmitted in an S1G PPDU using an MCS and NSS from one of the <S1G-MCS, NSS> tuples included in the BSSBasicS1GMCS_NSSSet parameter.

10.6.5.5 Rate selection for polling frames

A Data frame of a subtype that includes CF-Poll that does not also include CF-Ack shall be transmitted at a rate selected as follows:

a) If an initial exchange has already established protection and the Duration/ID field in the frame establishing protection covers the entire TXOP, the rate or MCS is selected according to the rules in 10.6.5.8.
b) Otherwise, the Data frame shall be transmitted at a rate or MCS as defined in 10.6.5.4, treating the frame as though it has a group address in the Address 1 field, solely for the purpose of determining the appropriate rate or MCS.

10.6.5.6 Rate selection for +CF-Ack frames

For a frame of type Data +CF-Ack, Data +CF-Poll+CF-Ack, or CF-Poll +CF-Ack, the rate or MCS and TXVECTOR parameter CH_BANDWIDTH used to transmit the frame shall be chosen from among those supported by both the addressed recipient STA and the STA to which the Ack frame is intended.

10.6.5.7 Rate selection for Data frames sent within an FMS stream

Data frames sent within an FMS stream are sent at a rate negotiated during the establishment of the FMS stream. See 11.21.8.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

10.6.5.8 Rate selection for other individually addressed Data and Management frames

A Data or Management frame not identified in 10.6.5.1 to 10.6.5.7 shall be sent using any data rate, MCS, <VHT-MCS, NSS> tuple, or <S1G-MCS, NSS> tuple subject to the following constraints:

- A STA shall not transmit a frame using a rate or MCS that is not supported by the receiver STA, as reported in any Supported Rates and BSS Membership Selectors element, Extended Supported Rates and BSS Membership Selectors element, or Supported MCS Set field in Management frames transmitted by the receiver STA.
- A STA shall not transmit a frame using a <VHT-MCS, NSS> tuple that is not supported by the receiver STA, as reported in any Supported VHT-MCS and NSS Set field in Management frames transmitted by the receiver STA.
- A STA shall not transmit a frame using a <S1G-MCS, NSS> tuple that is not supported by the receiver STA, as reported in any Supported S1G-MCS and NSS Set field in Management frames transmitted by the receiver STA.
- If at least one Operating Mode field with the Rx NSS Type subfield equal to 0 was received from the receiver STA:
  - A STA shall not transmit a frame with the number of spatial streams greater than that indicated in the Rx NSS subfield in the most recently received Operating Mode field with the Rx NSS Type subfield equal to 0 from the receiver STA.
- If at least one Operating Mode field with the Rx NSS Type subfield equal to 1 was received from the receiver STA:
  - A STA shall not transmit an SU PPDU frame using a beamforming steering matrix with the number of spatial streams greater than that indicated in the Rx NSS subfield in the most recently received Operating Mode field with the Rx NSS Type subfield equal to 1 from the receiver STA if the beamforming steering matrix was derived from a VHT Compressed Beamforming report with Feedback Type subfield indicating MU in the VHT Compressed Beamforming frame(s).
- A STA shall not transmit a frame using a value for the CH_BANDWIDTH parameter of the TXVECTOR that is not supported by the receiver STA, as reported in any HT Capabilities element, VHT Capabilities element, or S1G Capabilities element received from the intended receiver.
- An HT STA that is a member of a BSS and that is not a VHT STA shall not transmit a frame using a value for the CH_BANDWIDTH parameter of the TXVECTOR that is not permitted for use in the BSS, as reported in the most recently received HT Operation element, with the exception of transmissions on an off-channel TDLS direct link, which follow the rules described in 11.20.6.2 and 11.20.6.3.
- A VHT STA that is a member of a BSS shall not transmit a frame using a value for the CH_BANDWIDTH parameter of the TXVECTOR that is not permitted for use in the BSS, as reported in the most recently received VHT Operation element with the following exceptions:
  - Transmissions on an off-channel TDLS direct link follow the rules described in 11.20.6.2 and 11.20.6.3.
  - Transmissions by a VHT STA on a TDLS direct link follow the rules described in 11.20.1 and 11.20.6.5.
- An S1G STA that is a member of a BSS shall not transmit a frame using a value for the CH_BANDWIDTH parameter of the TXVECTOR that is not permitted for use in the BSS, as reported in the most recently received S1G Operation element with the following exceptions:
  - Transmissions on a TDLS off-channel link follow the rules described in 11.20.6.2 and 11.20.6.3.
  - Transmissions by an S1G STA on a TDLS direct link follow the rules described in 11.20.1 and 11.20.6.5.

  Additionally, the value of the CH_BANDWIDTH parameter for a transmission by an S1G STA that is operating as an SST STA is limited by the Maximum permitted PPDU bandwidth as indicated in

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the Maximum Transmission Width field of the most recently received SST element or RPS element (see 10.51 and 10.23.5).

— If at least one Operating Mode field with the Rx NSS Type subfield equal to 0 was received from the receiver STA:
  — A STA shall not transmit a frame using a value for the TXVECTOR parameter CH_BANDWIDTH that is not supported by the receiver STA as reported in the most recently received Operating Mode field with the Rx NSS Type subfield equal to 0 from the receiver STA.

When the operational rate set of the receiving STA or STAs is not known, the transmitting STA shall transmit using a rate in the BSSBasicRateSet parameter, or an MCS in the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive, or a <VHT-MCS, NSS> tuple in the basic VHT-MCS and NSS set, or an <S1G-MCS, NSS> tuple in the BSSBasicS1GMCS_NSSSet parameter, or a rate from the mandatory rate set of the attached PHY if the BSSBasicRateSet, the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive, and the basic VHT-MCS and NSS set, and the BSSBasicS1GMCS_NSSSet are empty.

The rules in this subclause also apply to A-MPDUs that aggregate MPDUs with the Type subfield equal to Data or Management with any other types of MPDU.

10.6.6 Rate selection for Control frames

10.6.6.1 General rules for rate selection for Control frames

Control frames carried in an A-MPDU that does not contain an S-MPDU shall be sent at a rate selected from the rules defined in 10.6.5.8.

NOTE—The rules defined in 10.6.6.2 to 10.6.6.5 apply only to Control frames not carried in an A-MPDU that does not contain an S-MPDU.

A Control frame shall be carried in an S1G PPDU with NSS equal to 1 without using long preamble, short GI, LDPC coding, STBC format, and traveling pilots when the Control frame is transmitted by an S1G STA.

The following rules determine whether a Control frame is carried in a non-HT, HT or VHT PPDU:

a) A control response frame shall be carried in an HT PPDU when the Control frame is a response to a frame that meets any of the following conditions:
   1) The frame eliciting the response included an HT variant HT Control field with the TRQ field equal to 1 and the HT NDP Announcement subfield equal to 0, and this responder set the Implicit Transmit Beamforming Receiving Capable field to 1 in its last transmitted HT Capabilities element; or
   2) The frame eliciting the response was an RTS frame carried in an HT PPDU; or
   3) The frame eliciting the response was an STBC frame, and the Dual CTS Protection field was equal to 1 in the last HT Operation element received from its AP or transmitted by the STA (see 10.3.2.10).
b) A Control frame may be carried in an HT PPDU when the Control frame meets any of the following conditions:
   1) The Control frame contains an HT variant HT Control field with the MRQ subfield equal to 1, or
   2) The Control frame contains an HT variant HT Control field with the TRQ field equal to 1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

c) A Control frame may be carried in a VHT PPDU when the Control frame contains an HT Control field.

d) A Control frame shall be carried in an HT PPDU or a VHT PPDU when the Control frame is sent using an STBC frame.

e) A control response frame shall be carried in a VHT PPDU if the eliciting frame was an RTS frame carried in a VHT PPDU that contains an HT Control field with MRQ subfield equal to 1.

f) A control response frame may be carried in a VHT PPDU or HT PPDU if the eliciting frame was an FTM frame carried in a VHT PPDU or HT PPDU, respectively.

Otherwise, the Control frame shall be carried in a non-HT PPDU. The requirements specified in 10.30, 10.31.2, and 10.33 further constrain the choice of non-HT, HT, or VHT PPDU.

If an Operating Mode field has been received from the intended receiver STA, the following constraints also apply:

- If at least one Operating Mode field with the Rx NSS Type subfield equal to 0 was received from the receiver STA:
  - A STA shall not transmit a frame with the number of spatial streams greater than that indicated in the Rx NSS subfield in the most recently received Operating Mode field with the Rx NSS Type subfield equal to 0 from the receiver STA.
- If at least one Operating Mode field with the Rx NSS Type subfield equal to 1 was received from the receiver STA:
  - A STA shall not transmit an SU PPDU frame using a beamforming steering matrix with the number of spatial streams greater than that indicated in the Rx NSS subfield in the most recently received Operating Mode field with the Rx NSS Type subfield equal to 1 from the receiver STA if the beamforming steering matrix was derived from a VHT Compressed Beamforming report with Feedback Type subfield indicating MU in the VHT Compressed Beamforming frame(s).

Selection of channel width is defined in 10.6.6.6.

A control response frame is a Control frame that is transmitted as a response to the reception of a frame a SIFS after the PPDU containing the frame that elicited the response, e.g., a CTS frame in response to an RTS frame reception, an Ack frame in response to a Data frame reception, a BlockAck frame in response to a BlockAckReq frame reception. In some situations, the transmission of a Control frame is not a control response transmission, such as when a CTS frame is used to initiate a TXOP.

An HE STA that transmits a Trigger frame, Multi-STA BlockAck frame, or HE/VHT NDP Announcement frame addressed to more than one STA shall use a rate, HT-MCS, <VHT-MCS, NSS> tuple, or <HE-MCS, NSS> tuple that is supported by all recipient STAs.

10.6.6.2 Rate selection for Control frames that initiate a TXOP

This subclause describes the rate selection rules for Control frames that initiate a TXOP and that are either an S-MPDU or not carried in an A-MPDU.

If a Control frame is carried in a non-HT PPDU, the transmitting STA shall transmit the frame using one of the rates in the BSSBasicRateSet parameter or a rate from the mandatory rate set of the attached PHY if the BSSBasicRateSet is empty.

NOTE—Because of their utility in resolving contention and in establishing a NAV, most control subtype frames that initiate a frame exchange sequence are subject to explicit limitations regarding the choice of transmission rate with the intent of ensuring maximum possible coverage and receivability of the frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An HT STA shall select an MCS from the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive when protection is required (as defined in 10.27) and shall select an MCS from the SupportedMCSSet parameter of the intended receiver when protection is not required.

When transmitting a VHT PPDU, a STA shall select a <VHT-MCS, NSS> tuple from the basic VHT-MCS and NSS set when protection is required (as defined in 10.27) and shall select a <VHT-MCS, NSS> tuple from the operational VHT-MCS and NSS set parameter of the intended receiver when protection is not required.

10.6.6.3 Rate selection for CF-End frames

A STA that transmits a CF-End frame that is not at the end of a TXOP that was obtained through the use of the dual CTS mechanism shall transmit the frame using a rate in BSSBasicRateSet or from the mandatory rate set of the attached PHY if the BSSBasicRateSet is empty.

A STA that transmits a CF-End frame at the end of a TXOP that was obtained by a non-AP STA through the use of the dual CTS mechanism shall transmit the CF-End frame with the same value for the TXVECTOR parameter STBC, TXVECTOR parameter MCS (if present), and TXVECTOR parameter RATE as was used for the transmission of the matching Control frame at the beginning of the TXOP. The matching Control frame is defined as follows:

— For the first CF-End frame transmitted in the TXOP, the matching Control frame is the first RTS frame transmitted in the TXOP.
— For the second CF-End frame transmitted in the TXOP, the matching Control frame is the first CTS frame that follows the first RTS frame transmitted in the TXOP.
— For the third CF-End frame transmitted in the TXOP, the matching Control frame is the second CTS frame that follows the first RTS frame transmitted in the TXOP.

A STA that transmits a CF-End frame at the end of a TXOP that was obtained by an AP through the use of the dual CTS mechanism shall transmit the CF-End frame with the same value for the TXVECTOR parameter STBC, TXVECTOR parameter MCS (if present), and TXVECTOR parameter RATE as was used for the transmission of the matching Control frame at the beginning of the TXOP. The matching Control frame is defined as follows:

— For the first CF-End frame transmitted in the TXOP, the matching Control frame is the first CTS-to-self frame transmitted in the TXOP.
— For the second CF-End frame transmitted in the TXOP, the matching Control frame is the first RTS transmitted in the TXOP.

10.6.6.4 Rate selection for Control frames that are not control response frames

This subclause describes the rate selection rules for Control frames that are not control response frames, are not the frame that initiates a TXOP, are not the frame that terminates a TXOP, and are either an S-MPDU or not carried in an A-MPDU.

A frame other than a BlockAckReq or BlockAck that is carried in a non-HT PPDU shall be transmitted by the STA using a rate no higher than the highest rate in the BSSBasicRateSet parameter that is less than or equal to the rate or non-HT reference rate (see 10.6.11) of the previously transmitted frame that was directed to the same receiving STA. If no rate in the BSSBasicRateSet parameter meets these conditions, the Control frame shall be transmitted at a rate no higher than the highest mandatory rate of the attached PHY that is less than or equal to the rate or non-HT reference rate (see 10.6.11) of the previously transmitted frame that was directed to the same receiving STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A BlockAckReq or BlockAck frame that is carried in a non-HT PPDU shall be transmitted by the STA using a rate supported by the receiver STA, as reported in the Supported Rates and BSS Membership Selectors element and/or Extended Supported Rates and BSS Membership Selectors element in frames transmitted by that STA. When the operational rate set of the receiving STA or STAs is not known, the transmitting STA shall transmit using a rate from the BSSBasicRateSet parameter or from the mandatory rate set of the attached PHY if the BSSBasicRateSet is empty.

A frame that is carried in an HT PPDU shall be transmitted by the STA using an MCS supported by the receiver STA, as reported in the Supported MCS Set field in the HT Capabilities element received from that STA. When the supported MCS set of the receiving STA or STAs is not known, the transmitting STA shall transmit using an MCS in the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive.

A frame that is carried in a VHT PPDU shall be transmitted by the STA using a <VHT-MCS, NSS> tuple supported by the receiver STA. A <VHT-MCS, NSS> tuple is supported if reported as such in the Supported VHT-MCS and NSS Set field in the VHT Capabilities element received from that STA. When the Supported VHT-MCS and NSS set of the receiving STA or STAs is not known, the transmitting STA shall transmit using a <VHT-MCS, NSS> tuple in the basic VHT-MCS and NSS set.

A frame that is carried in an S1G PPDU shall be transmitted by the STA using a <S1G-MCS, NSS> tuple supported by the receiver STA, as reported in the Supported S1G-MCS and NSS Set field in the S1G Capabilities element received from that STA. When the Supported S1G-MCS for NSS set of the receiving STA or STAs is not known, the transmitting STA shall transmit using a <S1G-MCS, NSS> tuple in the BSSBasicS1GMCS_NSSSet parameter.

10.6.6.5 Rate selection for control response frames

10.6.6.5.1 Introduction

Subclauses 10.6.6.5.2 to 10.6.6.5.7 describe the rate selection rules for control response frames that are either an S-MPDU or not carried in an A-MPDU.

10.6.6.5.2 Selection of a rate or MCS

To allow the transmitting STA to calculate the contents of the Duration/ID field, a STA responding to a received frame transmits its control response frame at a primary rate, or at an alternate rate, or at an MCS, as specified by the following rules:

— If a CTS or Ack frame is carried in a non-HT PPDU, the primary rate is defined to be the highest rate in the BSSBasicRateSet parameter that is less than or equal to the rate (or non-HT reference rate; see 10.6.11) of the previous frame. If no rate in the BSSBasicRateSet parameter meets these conditions, the primary rate is defined to be the highest mandatory rate of the attached PHY that is less than or equal to the rate (or non-HT reference rate; see 10.6.11) of the previous frame. The STA may select an alternate rate according to the rules in 10.6.6.5.4. The STA shall transmit the non-HT PPDU CTS or Ack frame at either the primary rate or the alternate rate, if one exists.

— If a BlockAck frame is sent as an immediate response to either an Implicit BAR request or to a BlockAckReq frame that was carried in an HT or VHT PPDU and the BlockAck frame is carried in a non-HT PPDU, the primary rate is defined to be the highest rate in the BSSBasicRateSet parameter that is less than or equal to the rate (or non-HT reference rate; see 10.6.11) of the previous frame. If no rate in the BSSBasicRateSet parameter meets these conditions, the primary rate is defined to be the highest mandatory rate of the attached PHY that is less than or equal to the rate (or non-HT reference rate; see 10.6.11) of the previous frame. The STA may select an alternate rate according to

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the rules in 10.6.6.5.4. The STA shall transmit the non-HT PPDU BlockAck frame at either the primary rate or the alternate rate, if one exists.

— If a BlockAck frame is sent as an immediate response to either an Implicit BAR request or to a BlockAckReq frame that was carried in an S1G PPDU, the primary rate is defined to be the highest rate in the BSSBasicS1GMCS_NSSSet parameter that is less than or equal to the rate of the previous frame. If no rate in the BSSBasicS1GMCS_NSSSet parameter meets these conditions, the primary rate is defined to be the highest mandatory rate of the attached PHY that is less than or equal to the rate of the previous frame. The STA may select an alternate rate according to the rules in 10.6.6.5.4. The STA shall transmit the BlockAck control response frame at either the primary rate or the alternate rate, if one exists.

— When in asymmetric BA operation, the S1G STA shall transmit the BlockAck frame at the MCS according to the rules in 10.6.6.5.5.

— When the S1G STA is not following asymmetric BA operation, then

  — If the STA receives an Accept in the Control Response MCS Negotiation Response frame from a responding STA, then it shall transmit the BlockAck frame to the responding STA with the rate described in 10.6.6.5.3.

  — Otherwise, the STA shall transmit the BlockAck frame at either the primary rate or the alternate rate (according to the rules in 10.6.6.5.4), if one exists.

— If a Basic BlockAck frame is sent as an immediate response to a BlockAckReq frame that was carried in a non-HT PPDU and the Basic BlockAck frame is carried in a non-HT PPDU, the primary rate is defined to be the same rate and modulation class as the BlockAckReq frame, and the STA shall transmit the Basic BlockAck frame at the primary rate.

— If a Compressed BlockAck frame is sent as an immediate response to a BlockAckReq frame that was carried in a non-HT PPDU and the Compressed BlockAck frame is carried in a non-HT PPDU, the primary rate is defined to be the highest rate in the BSSBasicRateSet parameter that is less than or equal to the rate (or non-HT reference rate; see 10.6.11) of the previous frame. If no rate in the BSSBasicRateSet parameter meets these conditions, the primary rate is defined to be the highest mandatory rate of the attached PHY that is less than or equal to the rate (or non-HT reference rate; see 10.6.11) of the previous frame. The STA may select an alternate rate according to the rules in 10.6.6.5.4. The STA shall transmit the non-HT PPDU Compressed BlockAck frame at either the primary rate or the alternate rate, if one exists.

— If the control response frame is carried in an HT or VHT PPDU, then it is transmitted using an MCS or <VHT-MCS, NSS> tuple as determined by the procedure defined in 10.6.6.5.3.

— If the control response frame is carried in an S1G PPDU, then it is transmitted using an <S1G-MCS, NSS> tuple as determined by the procedure defined in 10.6.6.5.3.

The modulation class of the PSDU containing the control response frame shall be selected according to the following rules:

— If the PSDU containing the received frame is of a modulation class other than HT, VHT, or S1G and the control response frame is carried in a non-HT PPDU, the control response frame shall be transmitted in a PSDU using the same modulation class as the PSDU containing the received frame. In addition, the control response frame shall be sent using the same value for the TXVECTOR parameter PREAMBLE_TYPE as the received frame.

— If the PSDU containing the received frame is of the modulation class HT or VHT and the control response frame is carried in a non-HT PPDU, the control response frame shall be transmitted in a PSDU using one of the ERP-OFDM or OFDM modulation classes.

— If the control response frame is carried in an HT PPDU, the modulation class shall be HT.

— If the control response frame is carried in a VHT PPDU, the modulation class shall be VHT.

— If the control response frame is carried in an S1G PPDU, the modulation class shall be S1G.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The selection of the value for the channel width (CH_BANDWIDTH parameter of the TXVECTOR) of the response transmission is defined in 10.6.6.6.

10.6.6.5.3 Control response frame MCS computation

If a control response frame is to be transmitted within an HT or VHT PPDU, the channel width (CH_BANDWIDTH parameter of the TXVECTOR) shall be selected first according to 10.6.6.6, and then the MCS or <VHT-MCS, NSS> tuple shall be selected from a set of MCSs and <VHT-MCS, NSS> tuples called the *CandidateMCSSet* as described in this subclause.

If a control response frame is to be transmitted within an S1G PPDU, the channel width (CH_BANDWIDTH parameter of the TXVECTOR) shall be selected first according to 10.6.6.6, and then the <S1G-MCS, NSS> tuple shall be selected from a set of <S1G-MCS, NSS> tuples called the *CandidateMCSSet* as described in this subclause.

If the frame eliciting the response was transmitted by an HT STA that is not a VHT STA, the Rx Supported MCS Set is determined from the Supported MCS Set field in the HT Capabilities element received from the STA as follows:

— If a bit in the Rx MCS Bitmask subfield is equal to 0, the corresponding MCS is not supported.

— If a bit in the Rx MCS Bitmask subfield is equal to 1 and the integer part of the data rate (expressed in Mb/s) of the corresponding MCS is less than or equal to the rate represented by the Rx Highest Supported Data Rate subfield, then the MCS is supported by the STA on receive. If the Rx Highest Supported Data Rate subfield is equal to 0 and a bit in the Rx MCS Bitmask is equal to 1, then the corresponding MCS is supported by the STA on receive.

If the frame eliciting the response was transmitted by a VHT STA, the Rx Supported MCS Set is determined for VHT PPDUs as described in 10.6.13 and for HT PPDUs from the Supported MCS Set field in the HT Capabilities element received from the STA as follows:

— If a bit in the Rx MCS Bitmask subfield is equal to 0, the corresponding MCS is not supported.

— If a bit in the Rx MCS Bitmask subfield is equal to 1 and the integer part of the data rate (expressed in Mb/s) of the corresponding MCS is less than or equal to the rate represented by the Rx Highest Supported Data Rate subfield, then the MCS is supported by the STA on receive. If the Rx Highest Supported Data Rate subfield is equal to 0 and a bit in the Rx MCS Bitmask is equal to 1, then the corresponding MCS is supported by the STA on receive.

The Rx Supported MCS Set is determined for S1G PPDUs as described in 10.6.14.

The CandidateMCSSet is determined using the following rules:

— If the frame eliciting the response was an STBC frame and the Dual CTS Protection bit is equal to 1, the CandidateMCSSet shall contain only the basic STBC MCS.

— For S1G STAs, if none of the above conditions is true, the CandidateMCSSet is the BSSBasicS1GMCS_NSSSet parameters. If the frame eliciting the response was an RTS frame, then the CandidateMCSSet may additionally include the <S1G-MCS, NSS> tuple with the same MCS and number of spatial streams as the S1G PPDU. If the combined BSSBasicMCSSet parameter is empty, the CandidateMCSSet shall consist of the set of mandatory <S1G-MCS, NSS> tuples corresponding to the mandatory S1G PHY MCSs with NSS = 1.

— For non-S1G STAs, if none of the above conditions is true, the CandidateMCSSet is the union of the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive and the basic VHT-MCS and NSS set. If the frame eliciting the response was an RTS frame carried in a VHT PPDU, then the CandidateMCSSet may additionally include the <VHT-MCS, NSS> tuple with the same MCS and number of spatial streams as the VHT

PPDU. If the combined Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive is empty, the CandidateMCSSet shall consist of

— The set of mandatory HT PHY MCSs if the STA eliciting the response is an HT STA that is not a VHT STA
— The set of mandatory HT-MCSs plus the set of <VHT-MCS, NSS> tuples corresponding to the mandatory VHT PHY MCSs with NSS = 1 if the STA eliciting the response is a VHT STA

MCS values from the CandidateMCSSet that cannot be transmitted with the selected CH_BANDWIDTH parameter value shall be eliminated from the CandidateMCSSet.

The choice of a response MCS is made as follows:

a) If the frame eliciting the response is within a non-HT PPDU,
   1) Eliminate from the CandidateMCSSet all <VHT-MCS, NSS> tuples. Eliminate all MCSs that have a data rate greater than the data rate of the received PPDU (the mapping of MCS to data rate is defined in 19.5).
   2) Find the highest indexed MCS from the CandidateMCSSet. The index of this MCS is the index of the MCS that is the primary MCS for the response transmission.
   3) If the CandidateMCSSet is empty, the primary MCS is the lowest indexed MCS of the mandatory MCSs.
b) If the frame eliciting the response is within an HT PPDU,
   1) Eliminate from the CandidateMCSSet all <VHT-MCS, NSS> tuples. Eliminate all MCSs that have an index that is higher than the index of the MCS of the received frame. Also eliminate all MCSs that have a number of spatial streams greater than that indicated in the Rx NSS subfield in the most recent Operating Mode field with the Rx NSS Type subfield equal to 0 from the intended receiver STA, if at least one Operating Mode field with the Rx NSS Type subfield equal to 0 was received from the intended receiver STA.
   2) Determine the highest number of spatial streams (N_{SS}) value of the MCSs in the CandidateMCSSet that is less than or equal to the N_{SS} value of the MCS of the received frame. Eliminate all MCSs from the CandidateMCSSet that have an N_{SS} value that is not equal to this N_{SS} value. The mapping from MCS to N_{SS} is dependent on the attached PHY. For the HT PHY, see 19.5.
   3) Find the highest indexed MCS of the CandidateMCSSet for which the modulation value of each stream is less than or equal to the modulation value of each stream of the MCS of the received frame and for which the coding rate is less than or equal to the coding rate of the MCS from the received frame. This MCS is the primary MCS for the response transmission. The mapping from MCS to modulation and coding rate is dependent on the attached PHY. For the HT PHY, see 19.5. For the purpose of comparing modulation values, the following sequence shows increasing modulation values: BPSK, QPSK, 16-QAM, 64-QAM.
   4) If no MCS meets the condition in step 3), remove each MCS from the CandidateMCSSet that has the highest value of N_{SS} in the CandidateMCSSet. If the resulting CandidateMCSSet is empty, then set the CandidateMCSSet to the HT PHY mandatory MCSs. Repeat step 3) using the modified CandidateMCSSet.
c) If the frame eliciting the response is within a VHT PPDU,
   1) Eliminate from the CandidateMCSSet all MCSs and all <VHT-MCS, NSS> tuples that meet any of the following conditions:
      i) Have a data rate that is higher than the data rate of the <VHT-MCS, NSS> tuple of the received frame using the largest possible value of CH_BANDWIDTH that is no larger than the value of CH_BANDWIDTH of the received frame

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

ii) Have a number of spatial streams greater than that indicated in the Rx NSS subfield in the most recent Operating Mode field with the Rx NSS Type subfield equal to 0 from the intended receiver STA, if at least one Operating Mode field with the Rx NSS Type subfield equal to 0 was received from the intended receiver STA

iii) Have a number of spatial streams greater than that indicated in the Rx NSS subfield in the most recent Operating Mode field with the Rx NSS Type subfield equal to 1 from the intended receiver STA if at least one Operating Mode field with the Rx NSS Type subfield equal to 1 was received from the receiver STA and the control response frame is an SU PPDU frame with a beamforming steering matrix and the beamforming steering matrix was derived from a VHT Compressed Beamforming report with Feedback Type subfield indicating MU in the VHT Compressed Beamforming frame(s)

2) Determine the highest number of spatial streams (N_{SS}) value of the MCSs and <VHT-MCS, NSS> tuples in the CandidateMCSSet that is less than or equal to the N_{SS} value of the received frame. Eliminate all MCSs from the CandidateMCSSet that have an N_{SS} value that is not equal to this N_{SS} value. The mapping from MCS to N_{SS} is dependent on the attached PHY. For the HT PHY, see 19.5.

3) Find the highest rate MCS or <VHT-MCS, NSS> tuple of the CandidateMCSSet for which the modulation value of each stream is less than or equal to the modulation value of each stream of the MCS of the received frame and for which the coding rate is less than or equal to the coding rate of the MCS from the received frame. This MCS or <VHT-MCS, NSS> tuple is the primary MCS for the response transmission. The mapping from MCS or <VHT-MCS, NSS> tuple to modulation and coding rate is dependent on the attached PHY. For the HT PHY, see 19.5; for the VHT PHY, see 21.5. For the purpose of comparing modulation values, the following sequence shows increasing modulation values: BPSK, QPSK, 16-QAM, 64-QAM, 256-QAM.

4) If no MCS meets the condition in step 3), remove each MCS or <VHT-MCS, NSS> tuple from the CandidateMCSSet that has the highest value of N_{SS} in the CandidateMCSSet. If the resulting CandidateMCSSet is empty, then set the CandidateMCSSet to the VHT PHY mandatory MCSs. Repeat step 3) using the modified CandidateMCSSet.

d) If the frame eliciting the response is within an S1G PPDU,

1) Eliminate from the CandidateMCSSet all MCSs and all <S1G-MCS, NSS> tuples that meet any of the following conditions:

i) Have a data rate that is higher than the data rate of the <S1G-MCS, NSS> tuple of the received frame using the largest possible value of CH_BANDWIDTH that is no larger than the value of CH_BANDWIDTH of the received frame

ii) Have a number of spatial streams greater than one

2) Find the highest rate MCS or <S1G-MCS, NSS> tuple of the CandidateMCSSet for which the modulation value of each stream is less than or equal to the modulation value of each stream of the MCS of the received frame and for which the coding rate is less than or equal to the coding rate of the MCS from the received frame. This MCS or <S1G-MCS, NSS> tuple is the primary MCS for the response transmission. The mapping from MCS or <S1G-MCS, NSS> tuple to modulation and coding rate is dependent on the attached PHY; see 23.5. For the purpose of comparing modulation values, the following sequence shows increasing modulation values: BPSK, QPSK, 16-QAM, 64-QAM, 256-QAM, 1024-QAM.

3) If no MCS meets the condition in step 2), then set the CandidateMCSSet to the S1G PHY mandatory MCSs. Repeat step 2) using the modified CandidateMCSSet.

Once the primary MCS, <VHT-MCS, NSS> tuple, or <S1G-MCS, NSS> tuple has been selected, the STA may select an alternate MCS according to 10.6.6.5.4. If the STA has not negotiated the control response MCS negotiation as described in 10.6.6.5.6 or has received a Reject indication in the Control Response MCS Negotiation Response frame, then it shall transmit the control response frame using either the primary MCS or the alternate MCS, if one exists. If the STA has received an Accept indication in the Control Response

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

MCS Negotiation Response frame from a responding STA, then it shall transmit the control response frame to the responding STA using the negotiated MCS or alternative MCS provided that the duration of the frame at the alternate MCS is the same as the duration of the frame at the negotiated MCS, if one exists. Negotiated MCS is computed as the highest MCS less than or equal to the MCS that is MCSDifference lower than the primary MCS if one exists, or the MCS 10 otherwise.

10.6.6.5.4 Selection of an alternate rate or MCS for a control response frame

An alternate rate may be selected provided that all of the following conditions are met:

- The duration of frame at the alternate rate is the same as the duration of the frame at the primary rate determined by 10.6.6.5.2.
- The alternate rate is in either the BSSBasicRateSet parameter or is a mandatory rate of the attached PHY.
- The modulation class of the frame at the alternate rate is the same class as that of the primary rate selected by 10.6.6.5.2.

An alternate MCS may be selected provided that both of the following conditions are met:

- The duration of the frame at the alternate MCS is the same as the duration of the frame at the primary MCS.
- The alternate MCS is in the CandidateMCSSet that was generated according to the procedure of 10.6.6.5.3.

10.6.6.5.5 MCS for asymmetric BA operation

The primary MCS for asymmetric BA operation is defined as the MCS that is MCSDifference (see 10.25.2) lower than that of the eliciting A-MPDU. An alternate MCS may be selected provided that the duration of the frame at the alternate MCS is the same as the duration of the frame at the primary MCS.

10.6.6.5.6 Control response MCS negotiation

Control response MCS negotiation allows two STAs with power imbalance to send the control responses with different MCSs than the primary MCS as defined by the rules in 10.6.6.5.3. A STA may initiate the Control Response Negotiation by sending a Control Response MCS Request frame. After reception of a Control Response MCS Response frame that indicates Accept, the STA sends the control response frames with the Negotiated MCS as defined in 10.6.6.5.3.

An S1G STA with dot11MCSNegotiation equal to true shall set the MCS Negotiation Support field of the S1G Capabilities element to 1. An S1G STA with dot11MCSNegotiation equal to false shall set the MCS Negotiation Support field of the S1G Capabilities element to 0.

An S1G STA shall not transmit a Control Response MCS Negotiation Request frame to another S1G STA unless the MCS Negotiation Support field of the S1G Capabilities element received from that STA contained a value of 1 and dot11MCSNegotiation is true.

An S1G STA shall transmit the Control Response MCS Negotiation Response frame to a STA from which it has received a Control Response MCS Negotiation Request frame. The STA shall include a value that indicates either Accept or Reject in the Command field of the Response frame as defined in Table 9-633.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

10.6.6.5.7 Control response frame TXVECTOR parameter restrictions

A STA shall not transmit a control response frame with the TXVECTOR parameter GI_TYPE set to SHORT_GI unless it is in response to a frame with the RXVECTOR parameter GI_TYPE equal to SHORT_GI.

A STA shall not transmit a control response frame with the TXVECTOR parameter FEC_CODING set to LDPC_CODING unless it is in response to a frame with the RXVECTOR parameter FEC_CODING equal to LDPC_CODING.

A STA shall not transmit a control response frame with the TXVECTOR parameter FORMAT set to HT_GF.

10.6.6.6 Channel Width selection for Control frames

The rules in this subclause, combined with the rules in 10.6.6.1, determine the format of control response frames.

If a VHT or HE STA transmits to another VHT or HE STA a Control frame that is not an RTS frame or a CF-End frame, if that Control frame is an HE NDP Announcement frame or elicits a control response frame, a VHT Compressed Beamforming frame, or an HE Compressed Beamforming/CQI frame, and

— If the Control frame is transmitted in a non-HT duplicate PPDU (channel width 40 MHz or wider), the transmitting VHT or HE STA shall set the TA field to a bandwidth signaling TA.

— If the Control frame is transmitted in a non-HT PPDU (channel width 20 MHz), the transmitting VHT or HE STA may set the TA field to a bandwidth signaling TA.

If the TA is a bandwidth signaling TA, the transmitting VHT STA shall set the TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and CH_BANDWIDTH to the same value.

NOTE 1—Such Control frames are BlockAckReq frames, PS-Poll frames, VHT NDP Announcement frames, and Beamforming Report Poll frames.

NOTE 2—Control Wrapper frames follow the rules pertaining to the carried Control frame (see 10.9).

Channel width selection rules for RTS frames are described in 10.3.2.7.

A VHT STA that transmits a CF-End frame in a non-HT duplicate PPDU (channel width 40 MHz or wider) addressed to a VHT AP shall set the Individual/Group bit in the BSSID(TA) field to 1.

A VHT STA that transmits a CF-End frame in a non-HT PPDU (channel width 20 MHz) addressed to a VHT AP may set the Individual/Group bit in the BSSID(TA) field to 1.

If the Individual/Group bit in the BSSID(TA) field of the CF-End frame is 1, the transmitting VHT STA shall set the TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and CH_BANDWIDTH to the same value.

A STA that sends a Control frame in response to a frame carried in an HT PPDU or a VHT PPDU shall set the TXVECTOR parameter CH_BANDWIDTH to indicate a channel width that is the same as the channel width indicated by the RXVECTOR parameter CH_BANDWIDTH of the frame eliciting the response.

A STA that sends a Control frame in response to a frame carried in a non-HT or non-HT duplicate PPDU with a nonbandwidth signaling TA

— Should set the TXVECTOR parameter CH_BANDWIDTH to the same value as the RXVECTOR parameter CH_BANDWIDTH for the frame eliciting the response.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Shall not set the TXVECTOR parameter CH_BANDWIDTH to a value greater than the RXVECTOR parameter CH_BANDWIDTH for the frame eliciting the response.

NOTE 3—According to this rule, a STA can respond with a 20 MHz PPDU if it receives a non-HT duplicate frame but is not able to detect the channel width occupied by the frame (whether by design or because the frame was received over a channel that is narrower than the channel on which it was transmitted).

A VHT STA that sends a Control frame that is in response to a non-HT or non-HT duplicate format frame with a bandwidth signaling TA and that is not a CTS shall set the channel width indicated by the TXVECTOR parameter CH_BANDWIDTH to the same value as the channel width indicated by the RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT for the frame eliciting the response. The RA field of a Control frame that is not a CF-End frame and that is sent in response to a Control frame with a bandwidth signaling TA shall be set to a nonbandwidth signaling TA obtained from the TA field of the immediately previous Control frame. For the channel width selection rules for CTS sent in response to an RTS with a bandwidth signaling TA, see 10.3.2.9.

A frame that is intended to provide protection is transmitted using a channel width selected by the rules defined in 10.27.

An HT STA that uses a non-HT duplicate frame to establish protection of its TXOP shall send any CF-End frame using a non-HT duplicate frame.

The TXOP holder should set the TXVECTOR parameter CH_BANDWIDTH of a CF-End frame to the maximum bandwidth allowed by the rules in 10.23.2.8.

NOTE 4—A CF-End frame transmitted by an AP a SIFS duration after receiving a CF-End frame is considered a control response frame.

An S1G STA that has set the 1 MHz Control Response Preamble Support field to 1 in the S1G Capabilities element transmitted to its peer STA shall use S1G_1M preamble transmission as the response of S1G_SHORT_PREAMBLE or S1G_LONG_PREAMBLE as follows:

— An S1G STA that sends a Control frame in response to a frame carried in an S1G PPDU shall set the TXVECTOR parameter CH_BANDWIDTH to indicate a channel width that is the same or lower as the channel width indicated by the RXVECTOR parameter CH_BANDWIDTH of the frame eliciting the response.
— In a TXOP, a STA shall not set the TXVECTOR parameter CH_BANDWIDTH to a value greater than the RXVECTOR parameter CH_BANDWIDTH for the next frame exchange sequence.

Otherwise, in S1G BSS, S1G_1M preamble transmission as the response of S1G_SHORT_PREAMBLE or S1G_LONG_PREAMBLE is not allowed and the S1G STA behaves as follows:

— An S1G STA that sends a Control frame in response to a frame carried in an S1G PPDU shall set the TXVECTOR parameter CH_BANDWIDTH to indicate a channel width that is the same as the channel width indicated by the RXVECTOR parameter CH_BANDWIDTH of the frame eliciting the response, except when the frame eliciting the response is an S1G RTS frame with the Dynamic Indication field in the Frame Control field equal to 1.

When both transmitting STA and receiving STA indicate OBSS mitigation support in the OBSS Mitigation Support subfield of the S1G Capabilities element, the receiving STA operating in a 2/4/8/16 MHz BSS that sends a (duplicate) NDP_2M Ack frame or NDP_2M BlockAck frame in response to a frame carried in an S1G PPDU may set the TXVECTOR parameter CH_BANDWIDTH to indicate a channel width that is less than or equal to the channel width indicated by the RXVECTOR parameter CH_BANDWIDTH of the frame eliciting the response.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An S1G STA transmitting a Control frame or an NDP CMAC PPDU shall set the TXVECTOR parameter FORMAT depending on the value of the TXVECTOR parameter CH_BANDWIDTH:

- If CH_BANDWIDTH is equal to CBW1 then the FORMAT shall be S1G
- If CH_BANDWIDTH is equal to CBW2 then the FORMAT shall be:
  - S1G_DUP_1M if the RXVECTOR parameter CH_BANDWIDTH of the eliciting Control frame is equal to CBW1 and the Bandwidth Indication field in the Frame Control field is 1.
  - S1G_DUP_1M if the S1G STA intends to transmit a duplicate 1 MHz Control frame to an S1G STA that supports duplicate 1 MHz frames as indicated in the duplicate 1 MHz Support field of the S1G Capabilities element received from that S1G STA.
  - S1G otherwise.
- Otherwise, the FORMAT shall be S1G DUP_2M.

10.6.6.7 Control frame TXVECTOR parameter restrictions

A STA shall not transmit a Control frame that initiates a TXOP with the TXVECTOR parameter GI_TYPE set to a value of SHORT_GI.

A STA shall not transmit a Control frame that initiates a TXOP with the TXVECTOR parameter FEC_CODING set to a value of LDPC_CODING.

10.6.7 Multirate support for DMG STAs

10.6.7.1 Usage of DMG Control modulation class

The DMG Control modulation class has only one MCS, which is DMG MCS 0 defined in Clause 20. The DMG Beacon, SSW-Feedback, SSW-Ack, RTS, DMG CTS, DMG CTS-to-self, DMG DTS, CF-End, Grant, SPR, Poll, Sector Ack, TDD Beamforming frames (i.e., TDD SSW, TDD SSW Feedback and TDD SSW Ack), and first BRP PPDU in beam refinement shall be transmitted using the DMG Control modulation class. In the case of an RXSS that was specified through the Beamforming Control field with the value of the RXSSTxRate subfield equal to 1 and the RXSSTxRate Supported field in the DMG Capabilities element of the STA performing the RXSS is 1, the first SSW frame of the RXSS shall be transmitted using the DMG Control modulation class, and the remaining frames of the RXSS shall be transmitted using MCS 1 of the DMG SC modulation class. In all other cases, the SSW frames shall be transmitted using the DMG Control modulation class. Other DMG beamforming training frames may be transmitted using the DMG Control modulation class or the DMG SC modulation class.

10.6.7.2 Rate selection rules for Control frames transmitted by DMG STAs

This subclause describes the rate selection rules for Control frames transmitted by DMG STAs. The rate selection rules apply only for MCSs defined in Clause 20 and in Clause 28.

A Control frame that does not have an MCS defined in 10.6.7.1 and that is not a control response frame shall be transmitted using an MCS from the mandatory MCS set of the DMG SC modulation class or DMG Control modulation class.

A STA transmitting an Ack or a BlockAck frame that is a response to a frame sent using the DMG low-power SC modulation class shall use an MCS from the DMG low-power SC Supported MCS set of the STA that transmitted the frame that elicited the response as long as (a) the selected MCS has a Data Rate that does not exceed the Data Rate of the frame that elicited the response, and (b) no other MCS satisfying condition (a) results in a shorter frame transmission time.

A STA transmitting a Grant Ack frame shall use the DMG Control modulation class or any MCS from the mandatory MCS set of the DMG SC modulation class.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A STA transmitting an Ack or a BlockAck frame that is a response to a frame sent using the DMG Control modulation class shall use the DMG Control modulation class.

A STA transmitting an Ack frame or a BlockAck frame in response to a frame sent using the DMG SC modulation class shall use an MCS from the mandatory MCS set of the DMG SC modulation class as long as (a) the selected MCS has a Data Rate that does not exceed the Data Rate of the last frame that elicited the response, and (b) no other MCS satisfying condition (a) results in a shorter frame transmission time.

An EDMG STA transmitting an Ack frame or a BlockAck frame in response to a frame sent using the EDMG SC modulation class or EDMG OFDM modulation class shall

- Use the rules applicable to an DMG STA rules when the number of bits set to 1 in the CH_BANDWIDTH parameter in the RXVECTOR of the received EDMG PPDU is equal to 1 (i.e., a single 2.16 GHz channel).
- Use MCS1 when the Ack or BlockAck frame is sent within a non-EDMG duplicate PPDU and the number of bits set to 1 in the CH_BANDWIDTH parameter is greater than 1.
- Use one of MCS 1 through MCS 4 from the mandatory MCS set of the EDMG SC modulation class when the ACK or BlockAck frame is sent within an EDMG PPDU as long as (a) the selected MCS has a Data Rate that does not exceed the Data Rate of the frame that elicited the response, and (b) no other MCS satisfying condition (a) results in a shorter frame transmission time.
- In case the PPDU containing the Ack frame or a BlockAck frame carries a control trailer that provides spatial stream feedback, it shall be transmitted using MCS 0 and shall follow the rules defined in 10.42.4.

The rules in this subclause and in 10.6.7.7 do not apply to Block Ack Schedule frames carried within an A-MPDU. The rate selection rules that apply to a Block Ack Schedule frame are those applying to Data frames (see 10.6.7.4).

Rules for channel width selection of Control frames for an EDMG STA are specified in 10.6.7.6.

NOTE—A control response frame is a Control frame that is transmitted within an MPDU as a response to a reception SIFS after the PPDU containing the frame that elicits the response, e.g., a DMG CTS frame in response to an RTS frame reception, an Ack frame in response to a Data frame reception, a BlockAck frame in response to a BlockAckReq frame reception. In some situations, the transmission of some of these Control frames is not a control response transmission, such as when a DMG CTS frame is used to initiate a TXOP.

Except in an A-MPDU consisting of one of the combinations listed below, the rules in this subclause do not apply to Control frames that are contained in A-MPDUs that also include at least one MPDU with the Type subfield equal to Data or Management. In the following cases, the rate selection rules are the same as those for a standalone Ack or BlockAck frame:

- An Ack frame and a QoS Null frame
- A BlockAck frame and a QoS Null frame
- A BlockAckReq frame and a QoS Null frame
- A BlockAck frame, a BlockAckReq frame, and a QoS Null frame

10.6.7.3 Rate selection for group addressed Data and Management frames transmitted by DMG STAs

This subclause describes the rate selection rules for group addressed Data and Management frames transmitted by DMG STAs. The rate selection rules apply only for MCSs defined in Clause 20 and in Clause 28.

If the transmit antenna pattern of a single transmission of a group addressed frame covers more than one receiver, then the sender shall employ an MCS that is supported by all of the receivers. Furthermore, the sender

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

shall not employ π/2-8-PSK modulation unless all receivers support π/2-8-PSK modulation. If the capability of any receiver is not known, the frame shall be transmitted using an MCS from the mandatory MCS set of the DMG control or SC mode.

If the transmit antenna pattern of a single transmission of a group addressed frame covers only one receiver, the frame shall be transmitted following the rate selection rules of individually addressed frames as described in 10.6.7.4.

Group addressed DMG STA Directional Transmit Activity Report frames shall be transmitted using DMG MCS 0.

10.6.7.4 Rate selection for individually addressed Data and Management frames transmitted by DMG STAs

This subclause describes the rate selection rules for individually addressed Data and Management frames as transmitted by DMG STAs. The rate selection rules apply only for MCSs defined in Clause 20 and in Clause 28.

An individually addressed Data or Management frame transmitted to a non-EDMG STA shall be sent using an MCS supported by the receiver STA, as reported in the maximum receive MCS subfields in the Supported MCS Set field of the DMG STA Capability Information field and in the Extended SC MCS Capabilities field of the DMG Capabilities element carried in Management frames transmitted by the receiver STA.

An individually addressed Data, Management, and Block Ack Schedule frame transmitted to an EDMG STA shall be sent using a combination of MCSs, number of spatial streams and bandwidth supported by the STA, as reported in the

- Maximum receive MCS subfields in the Supported MCS Set subfield within the DMG STA Capability Information field and within the Extended SC MCS Capabilities field of the STA's last transmitted DMG Capabilities element.
- Maximum receive MCS subfields within the Supported MCS field of the STA's last transmitted EDMG Capabilities element.
- Maximum PHY Rate subfield within the Supported MCS field of the STA's last transmitted EDMG Capabilities element.
- If present in the STA's last transmitted EDMG Capabilities element, the maximum number of spatial streams and LDPC codeword supported subfields.

When the Supported MCS set of the receiving STA is not known, the transmitting STA shall transmit using an MCS from the mandatory MCS set of the DMG control or SC mode.

When the capabilities of the receiving STA are not known, the transmitting STA shall transmit using an MCS from the mandatory MCS set of the DMG control or SC mode. In addition for an EDMG STA, the TXVECTOR parameter LDPC_CW_TYPE shall be set to SHORT.

A DMG STA shall transmit a TPA Request frame and a TPA Response frame using MCS 1.

An individually addressed Data or Management frame with MCS 10 or MCS 11 shall only employ π/2-8-PSK modulation if the receiving STA supports π/2-8-PSK. The receiving STA indicates support by setting the π/2-8-PSK Capable subfield to 1 in the Supported MCS Set subfield of the DMG STA Capability Information field of the DMG Capabilities element all DMG Capabilities fields that are included in transmitted Management frames.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The rules in this subclause also apply to A-MPDUs that contain at least one MPDU with Type subfield equal to Control and at least one MPDU with Type subfield equal to Data or Management.

10.6.7.5 Rate selection for BRP PPDUs

The first BRP PPDU transmitted from the initiator to the responder after the SLS phase shall use MCS 0.

The first BRP PPDU transmitted from the responder to the initiator after the SLS phase shall use MCS 0.

A BRP PPDU transmitted during beam refinement at the start of an SP (as defined in 10.38.6.2) should use MCS 0, otherwise a BRP PPDU transmitted during beam refinement should use MCS 1. A BRP PPDU transmitted during beam refinement shall not use any MCS greater than MCS 12.

BRP PPDUs transmitted during the BRP setup subphase, the MID subphase, and the BC subphase shall use MCS 0.

BRP PPDUs transmitted during a BC subphase, as part of a BC subphase only training, may use MCS 0 to MCS 12.

BRP PPDUs transmitted during beam tracking may use any MCS.

If an EDMG BRP PPDU is sent during a BRP transaction to perform beamforming training over a 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz or 4.32+4.32 GHz channel, the EDMG BRP PPDU should be transmitted with MCS 0.

10.6.7.6 Channel Width selection for Control frames transmitted by EDMG STAs

The rules in this subclause, combined with the rules in 10.6.7.2, determine the format of Control frames that are not RTS, DMG CTS, DMG DTS or CF-End frames.

Channel width selection rules for DMG CTS and DMG DTS frames are specified in 10.3.2.9.

Channel width selection rules for RTS and CF-End frames are specified in 10.3.2.18.

An EDMG STA that sends a Control frame in response to a frame carried in an EDMG PPDU shall set the TXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION to the value indicated by the RXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION of the frame eliciting the response.

An EDMG STA that sends a Control frame in response to a frame carried in a non-EDMG duplicate PPDU shall set the TXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION as follows:

— If the frame that elicited the response includes the channel bandwidth information in the RXVECTOR parameter CH_BANDWIDTH_SIGNALING or BW_IN_CT, CH_BANDWIDTH and CHANNEL_AGGREGATION shall be set to a value that represents the equivalent channels indicated by the CH_BANDWIDTH_SIGNALING or BW_IN_CT parameter, respectively.
— Otherwise, if the STA received at least one EDMG PPDU as part of the current frame exchange sequence, CH_BANDWIDTH and CHANNEL_AGGREGATION shall be set to respectively, the value of the RXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION of the last received EDMG PPDU in the current frame exchange sequence.
— Otherwise, if the STA transmitted at least one EDMG PPDU or non-EDMG duplicate PPDU as part of the current frame exchange sequence, CH_BANDWIDTH and CHANNEL_AGGREGATION shall be set to, respectively, the value of the TXVECTOR parameters CH_BANDWIDTH and

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

CHANNEL_AGGREGATION of the last EDMG PPDU or non-EDMG duplicate PPDU, whichever came later, transmitted by the STA in the current frame exchange sequence.

— Otherwise, CH_BANDWIDTH and CHANNEL_AGGREGATION shall be set to, respectively, the estimated value of the RXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION of the frame that elicited the response.

10.6.7.7 Control frame TXVECTOR parameter restrictions

A STA shall not transmit a Control frame with the TXVECTOR parameter GI_TYPE set to a value that is not equal to NORMAL.

A STA shall not transmit a Control frame with the TXVECTOR parameter EDMG_MODULATION set to EDMG_OFDM_MODE.

A STA shall not transmit a Control frame with the TXVECTOR parameter NUM_STS set to a value greater than one.

A STA shall not transmit a Control frame with the TXVECTOR parameter NUM_USERS set to a value greater than one.

A STA shall not transmit a Control frame with the TXVECTOR parameter LDPC_CW_TYPE set to LONG.

10.6.7.8 Channel Width selection for individually addressed Data and Management frames transmitted by EDMG STAs

A TXOP holder that transmits a Data or Management frame during a TXOP that was established using the bandwidth negotiation procedures specified in 10.3.2.9 and 10.3.2.18 shall set the TXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION according to the following rules:

— The CH_BANDWIDTH and CHANNEL_AGGREGATION parameters shall be set to channels that were indicated in the RXVECTOR parameter CH_BANDWIDTH_SIGNALING, if a control trailer is not present, or parameter BW_IN_CT, if a control trailer is present, of the DMG CTS frame transmitted in a non-EDMG duplicate or non-EDMG PPDU that established the TXOP.

— The CH_BANDWIDTH and CHANNEL_AGGREGATION parameters may indicate a subset of the channels that were indicated as used in an immediately preceding received PPDU in the TXOP, if any, provided the transmitted PPDU is an EDMG PPDU.

— The CH_BANDWIDTH and CHANNEL_AGGREGATION parameters shall not indicate channels that were not used by all previous PPDUs sent in same TXOP.

A TXOP responder that transmits a PPDU as a result of a reverse direction grant shall set the TXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION of the PPDU to the value of the RXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION of the received EDMG PPDU addressed to the TXOP responder and that granted the reverse direction.

10.6.8 Multirate support for CMMG STAs

10.6.8.1 Usage of CMMG Control modulation class

The CMMG Control modulation class has only one MCS, which is CMMG-MCS 0 defined in 25.6.8.14 with the spreading factor set to 13. The DMG Beacon, SSW-Feedback, SSW-Ack, RTS, CTS, and first BRP PPDU in beam refinement shall be transmitted using the CMMG Control modulation class. In the case of an RXSS that was specified through the Beamforming Control field in which the RXSSTxRate subfield is 1 and the RXSSTxRate Supported field in the CMMG Capabilities element of the STA performing the RXSS is 1, the first SSW frame of the RXSS shall be transmitted using the CMMG Control modulation class, and the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

remaining frames of the RXSS shall be transmitted using MCS 0 of the CMMG SC modulation class. In all other cases, the SSW frames shall be transmitted using the CMMG Control modulation class. Other CMMG beamforming training frames may be transmitted using the CMMG Control modulation class or the CMMG SC modulation class.

10.6.8.2 Rate selection rules for Control frames transmitted by CMMG STAs

This subclause describes the rate selection rules for Control frames transmitted by CMMG STAs. The rate selection rules apply only for MCSs defined in Clause 25.

A Control frame that does not have an MCS defined in 10.6.8.1 and that is not a control response frame shall be transmitted using an MCS from the mandatory MCS set of the CMMG SC modulation class or CMMG Control modulation class.

A STA transmitting a Grant Ack frame shall use the CMMG Control modulation class or any MCS from the mandatory MCS set of the CMMG SC modulation class.

A STA transmitting an Ack or a BlockAck frame that is a response to a frame sent using the CMMG Control modulation class shall use the CMMG Control modulation class.

A STA transmitting an Ack frame or a BlockAck frame in response to a frame sent using the CMMG SC modulation class or CMMG OFDM modulation class shall use an MCS from the mandatory MCS set of the CMMG SC modulation class as long as

a) The selected MCS has a data rate that does not exceed the data rate of the frame that elicited the response, and
b) No other MCS satisfying condition a) results in a shorter frame transmission time.

NOTE—A control response frame is a Control frame that is transmitted within an MPDU as a response to a reception SIFS after the PPDU containing the frame that elicits the response, e.g., a CTS frame in response to an RTS frame reception, an Ack frame in response to a Data frame reception, a BlockAck frame in response to a BlockAckReq frame reception. In some situations, the transmission of some of these Control frames is not a control response transmission, such as when a DMG CTS frame is used to initiate a TXOP.

Except in an A-MPDU consisting of one of the combinations listed below, the rules in this subclause do not apply to Control frames that are contained in A-MPDUs that also include at least one MPDU with the Type subfield equal to Data or Management. In the following cases, the rate selection rules are the same as those for a standalone Ack or BlockAck frame:

— An Ack frame and a QoS Null frame
— A BlockAck frame and a QoS Null frame
— A BlockAckReq frame and a QoS Null frame
— A BlockAck frame, a BlockAckReq frame, and a QoS Null frame

10.6.8.3 Rate selection for group addressed Data and Management frames transmitted by CMMG STAs

This subclause describes the rate selection rules for group addressed Data and Management frames transmitted by CMMG STAs. The rate selection rules apply only for MCSs defined in Clause 25.

If the transmit antenna pattern of a single transmission of a group addressed frame covers more than one receiver and the supported set of each of the receivers is known to the sender, then the MCS used for the transmission shall be an MCS common to the supported MCS sets of all of the receivers. If such an MCS is not known, the frame shall be transmitted using an MCS from the mandatory MCS set of the CMMG control or SC mode.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the transmit antenna pattern of a single transmission of a group addressed frame covers only one receiver, the frame shall be transmitted following the rate selection rules of individually addressed frames as described in 10.6.8.4.

For SC and OFDM MIMO transmission, if the BSSBasicRateSet parameter is empty, the BSSBasicMCSSet parameter is empty, and the BSS basic CMMG-MCS and NSS set is not empty, then the frame shall be transmitted in a CMMG PPDU using one of the <CMMG-MCS, NSS> tuples included in the BSS basic CMMG-MCS and NSS set.

10.6.8.4 Rate selection for individually addressed Data and Management frames transmitted by CMMG STAs

This subclause describes the rate selection rules for individually addressed Data and Management frames as transmitted by CMMG STAs. The rate selection rules apply only for MCSs defined in Clause 25.

An individually addressed Data or Management frame shall be sent using an MCS supported by the receiver STA, as reported in the maximum receive MCS subfields in the Supported MCS Set field in Management frames transmitted by the receiver STA.

When the supported MCS set of the receiving STA is not known, the transmitting STA shall transmit using an MCS from the mandatory MCS set of the CMMG control or SC mode.

The rules in this subclause also apply to A-MPDUs that contain at least one MPDU with Type subfield equal to Control and at least one MPDU with Type subfield equal to Data or Management.

A Data frame or Management frame for SC and OFDM MIMO transmission shall be sent using any data rate, MCS, or <CMMG-MCS, NSS> tuple subject to the following constraints:

- A STA shall not transmit a frame using a rate or MCS that is not supported by the receiver STA, as reported in any Supported Rates and BSS Membership Selectors element, Extended Supported Rates and BSS Membership Selectors element, or Supported MCS Set field in the Management frames transmitted by the receiver STA.
- A STA shall not transmit a frame using a <CMMG-MCS, NSS> tuple that is not supported by the receiver STA, as reported in any Supported CMMG-MCS and NSS Set field in the Management frames transmitted by the receiver STA.
- If at least one CMMG Operating Mode field with the Rx NSS Type subfield equal to 0 was received from the receiver STA:
  - A STA shall not transmit a frame with the number of spatial streams greater than that indicated in the Rx NSS subfield in the most recently received CMMG Operating Mode field with the Rx NSS Type subfield equal to 0 from the receiver STA.
- A STA shall not transmit a frame using a value for the CH_BANDWIDTH parameter of the TXVECTOR that is not supported by the receiver STA, as reported in any CMMG Capabilities element received from the intended receiver.
- A STA that is a member of a BSS shall not transmit a frame using a value for the CH_BANDWIDTH parameter of the TXVECTOR that is not permitted for use in the BSS, as reported in the most recently received CMMG Operation element with the following exceptions:
  - Transmissions on a TDLS off-channel link follow the rules described in 11.20.
  - Transmissions by a CMMG STA on a TDLS direct link follow the rules described in 11.20.
- If at least one CMMG Operating Mode field with the Rx NSS Type subfield equal to 0 was received from the receiver STA:
  - A STA shall not transmit a frame using a value for the TXVECTOR parameter CH_BANDWIDTH that is not supported by the receiver STA as reported in the most recently

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

received CMMG Operating Mode field with the Rx NSS Type subfield equal to 0 from the receiver STA.

When the supported rate set of the receiving STA or STAs is not known, the transmitting STA shall transmit using a rate in the BSSBasicRateSet parameter, or an MCS in the BSSBasicMCSSet parameter, or a <CMMG-MCS, NSS> tuple in the BSS basic CMMG-MCS and NSS set, or a rate from the mandatory rate set of the attached PHY if the BSSBasicRateSet, the BSSBasicMCSSet, and the BSS basic CMMG-MCS and NSS set are empty.

The rules in this subclause also apply to A-MPDUs that aggregate MPDUs of type Data or Management with any other types of MPDU.

10.6.8.5 Rate selection for BRP PPDUs for CMMG STAs

The first BRP PPDU transmitted from the initiator to the responder after the SLS phase shall use MCS 0.

The first BRP PPDU transmitted from the responder to the initiator after the SLS phase shall use MCS 0.

BRP PPDUs transmitted during beam refinement should use MCS 0 and shall not use any MCS greater than MCS 8. BRP PPDUs transmitted during beam refinement should use MCS 0 if the BRP PPDU is sent at start of an SP as defined in 10.38.6.2.

BRP PPDUs transmitted during the BRP setup subphase, the MID subphase, and the BC subphase shall use MCS 0.

BRP PPDUs transmitted during a BC subphase, as part of a BC subphase only training, may use MCS 0 to MCS 8. BRP PPDUs transmitted during beam tracking may use any MCS.

10.6.9 Multiple BSSID rate selection

If the multiple BSSID capability is supported, Beacon frames shall be transmitted using any basic rate valid for all of the BSSs supported. If no such rate exists, then Beacon frames shall be transmitted using any mandatory PHY rate for any PHY type that all BSSs have in common.

10.6.10 Modulation classes

Table 10-9 defines modulation classes for the rules for response frames in 10.6.

Table 10-9—Modulation classes

Description of modulation	Condition that selects this modulation class			
	Clause 15 to Clause 18 PHYs or Clause 20 PHY, or Clause 24 PHY, Clause 25 PHY, or Clause 28 PHY	**Clause 19 PHY**	**Clause 21 PHY**	**Clause 27 PHY**
DSSS and HR/ DSSS	Clause 15 or Clause 16 transmission	FORMAT is NON_HT. NON_HT_MODULATION is ERP-DSSS or ERP-CCK.	N/A	FORMAT is NON_HT. NON_HT_MODULATION is ERP-DSSS or ERP-CCK.

Table 10-9—Modulation classes *(continued)*

Description of modulation	Condition that selects this modulation class			
	Clause 15 to Clause 18 PHYs or Clause 20 PHY, or Clause 24 PHY, Clause 25 PHY, or Clause 28 PHY	**Clause 19 PHY**	**Clause 21 PHY**	**Clause 27 PHY**
CMMG OFDM	Clause 25 transmission and $9 \leq MCS \leq 16$	N/A	N/A	N/A
HE	N/A	N/A	N/A	FORMAT is HE_SU, HE_ER_SU, HE_MU, or HE_TB.
EDMG Control	Clause 28 transmission FORMAT is EDMG and EDMG_MODULATION is EDMG_C_MODE	N/A	N/A	N/A
EDMG SC	Clause 28 transmission FORMAT is EDMG, EDMG_MODULATION is EDMG_SC_MODE	N/A	N/A	N/A
EDMG OFDM	Clause 28 transmission FORMAT is EDMG, EDMG_MODULATION is EDMG_OFDM_MODE	N/A	N/A	N/A

10.6.11 Non-HT basic rate calculation

This subclause defines how to convert an HT-MCS, a VHT-MCS, or an HE-MCS to a non-HT basic rate for the purpose of determining the rate of the response frame. It consists of two steps as follows:

a) Use the modulation and coding rate determined from the HT-MCS (defined in 19.5), VHT-MCS (defined in 21.5), or HE-MCS (defined in 27.5) to locate a non-HT reference rate by lookup into Table 10-10.[31] In the case of an MCS with UEQM, the modulation of stream 1 is used.

b) The non-HT basic rate is the highest rate in the BSSBasicRateSet that is less than or equal to this non-HT reference rate.

NOTE 1—The selection of a non-HT basic rate for the frame sent in response to an HE PPDU is not influenced by DCM encoding in the HE PPDU.

[31] For example, if an HT PPDU transmission uses 64-QAM and coding rate of 3/4, the related non-HT reference rate is 54 Mb/s.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 10-10—Non-HT reference rate

Modulation	Coding rate (R)	Non-HT reference rate (Mb/s)
BPSK	1/2	6
BPSK	3/4	9
QPSK	1/2	12
QPSK	3/4	18
16-QAM	1/2	24
16-QAM	3/4	36
64-QAM	1/2	48
64-QAM	2/3	48
64-QAM	3/4	54
64-QAM	5/6	54
256-QAM	3/4	54
256-QAM	5/6	54
1024-QAM	3/4	54
1024-QAM	5/6	54

NOTE 2—In a TVWS band, the non-HT reference rate is scaled as described in 22.2.4.

10.6.12 Channel Width in non-HT and non-HT duplicate PPDUs

A non-VHT STA shall include neither the CH_BANDWIDTH_IN_NON_HT parameter nor the DYN_BANDWIDTH_IN_NON_HT parameter in either of the TXVECTOR or RXVECTOR for NON_HT PPDUs. A non-VHT STA shall not set the TA field to a bandwidth signaling TA. A VHT STA shall include neither the CH_BANDWIDTH_IN_NON_HT parameter nor the DYN_BANDWIDTH_IN_NON_HT parameter in the TXVECTOR of a non-HT PPDU containing frames addressed to a non-VHT STA. A VHT STA shall not set the TA field to a bandwidth signaling TA in a frame addressed to a non-VHT STA. The TA field shall not be set to a bandwidth signaling TA in a frame carried in a DSSS/CCK PPDU. A VHT STA that includes the DYN_BANDWIDTH_IN_NON_HT parameter in the TXVECTOR shall also include the CH_BANDWIDTH_IN_NON_HT parameter in the TXVECTOR. A VHT STA shall not include the DYN_BANDWIDTH_IN_NON_HT parameter in the TXVECTOR for transmitted frames other than RTS frames with bandwidth signaling TA and that are sent in a non-HT PPDU. A STA that transmits an RTS frame with a bandwidth signaling TA shall include the DYN_BANDWIDTH_IN_NON_HT parameter in the TXVECTOR. A VHT STA shall include both the CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT parameters in the RXVECTOR if the PPDU format is NON_HT.

A bandwidth signaling TA may be included in non-HT and non-HT duplicate PPDUs and shall not be included in other PPDUs. If the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT is present and a Control frame other than a CTS is being transmitted, then the TA field shall be set to a bandwidth signaling TA; otherwise, the TA field shall be set to an individual address.

NOTE—A CTS frame, even though it does not have a TA field, can also be transmitted with the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An S1G STA transmitting a Control frame that is not a control response frame shall set the Bandwidth Indication field in the Frame Control field of the frame to a value that is equivalent to the TXVECTOR parameter CH_BANDWIDTH.

An S1G STA shall not transmit a Control frame or an NDP CMAC PPDU with the TXVECTOR parameter S1G_DUP_1M to another S1G STA, unless the Duplicate 1 MHz Support field of the S1G Capabilities element received from that STA contained a value of 1.

An S1G STA transmitting a Control frame that is sent as a response to a Control frame shall set the Bandwidth Indication field in the Frame Control field of the frame to the value of the Bandwidth Indication field in the Frame Control field of the eliciting frame, except for an S1G STA that has indicated the use of 1 MHz control response frames (see 10.6.6.6) in which case the Bandwidth Indication field in the Frame Control field of the solicited Control frame shall be set to 0.

An S1G STA shall set the Dynamic Indication field in the Frame Control field of Control frames, other than RTS frame, to 0.

The TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT shall not be present in PPDUs carrying Management or Data frames.

10.6.13 Rate selection constraints for VHT STAs

10.6.13.1 Rx Supported VHT-MCS and NSS Set

The Rx Supported VHT-MCS and NSS Set of a first VHT STA is determined by a second VHT STA for each <VHT-MCS, NSS> tuple NSS = 1, …, 8 and bandwidth (20 MHz, 40 MHz, 80 MHz, and 160 MHz or 80+80 MHz) from the Supported VHT-MCS and NSS Set field received from the first STA as follows:

- If support for the VHT-MCS for NSS spatial streams at that bandwidth is mandatory (see 21.5), then the <VHT-MCS, NSS> tuple at that bandwidth is supported by the first STA on receive.
- Otherwise, if the Max VHT-MCS For *n* SS subfield (*n* = NSS) in the Rx VHT-MCS Map subfield indicates support and the Rx Highest Supported Long GI Data Rate subfield is equal to 0, then
  - the <VHT-MCS, NSS> tuple at that bandwidth is supported by the first STA on receive, except that if dot11VHTExtendedNSSBWCapable of the second STA is true, the supported bandwidth values and NSS values of each <VHT-MCS, NSS> tuple are updated according to Table 9-314 if no Operating Mode Notification frame has been received from the first STA, otherwise, according to Table 9-111, wherein the VHT Capabilities Information field and the Operating Mode field have been transmitted by the first STA.
- Otherwise, if the Max VHT-MCS For *n* SS subfield (*n* = NSS) in the Rx VHT-MCS Map subfield indicates support and the data rate for long GI of the MCS for NSS spatial streams at that bandwidth (expressed as the largest integer in Mb/s that is less than or equal to the data rate) is less than or equal to the rate represented by the Rx Highest Supported Long GI Data Rate subfield, then
  - the <VHT-MCS, NSS> tuple at that bandwidth is supported by the first STA on receive, except that if dot11VHTExtendedNSSBWCapable of the second STA is true, the supported bandwidth values and NSS values of each <VHT-MCS, NSS> tuple are updated according to Table 9-314 if no Operating Mode Notification frame has been received from the first STA, otherwise, according to Table 9-111, wherein the VHT Capabilities Information field and the Operating Mode field have been transmitted by the first STA.
- Otherwise, the <VHT-MCS, NSS> tuple at that bandwidth is not supported by the first STA on receive.

The <VHT-MCS, NSS> tuples excluded by 10.6.13.3 are also eliminated from the Rx Supported VHT-MCS and NSS Set.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A VHT STA shall not, unless explicitly stated otherwise, transmit a VHT PPDU unless the <VHT-MCS, NSS> tuple and bandwidth used are in the Rx Supported VHT-MCS and NSS Set of the receiving STA(s).

NOTE 1—Support for a <VHT-MCS, NSS> tuple at a given bandwidth implies support for both long GI and short GI on receive, if short GI is supported at that bandwidth.

NOTE 2—A STA can determine the expected interpretation of its Supported Channel Width Set and Channel Width and 160/80+80 BW and Extended NSS BW Support fields at a recipient by examining the VHT Extended NSS BW Capable field value in the Supported VHT-MCS and NSS Set field of the recipient.

10.6.13.2 Tx Supported VHT-MCS and NSS Set

The Tx Supported VHT-MCS and NSS Set of a first VHT STA is determined by a second STA for each <VHT-MCS, NSS> tuple NSS = 1, …, 8 and bandwidth (20 MHz, 40 MHz, 80 MHz, and 160 MHz or 80+80 MHz) from the Supported VHT-MCS and NSS Set field received from the first STA as follows:

- If support for the <VHT-MCS, NSS> tuple at that bandwidth is mandatory (see 21.5), then the <VHT-MCS, NSS> tuple at that bandwidth is supported by the first STA on transmit.
- Otherwise, if the Max VHT-MCS for *n* SS subfield (*n* = NSS) in the Tx VHT-MCS Map subfield indicates support and the Tx Highest Supported Long GI Data Rate subfield is equal to 0, then
  - The <VHT-MCS, NSS> tuple at that bandwidth is supported by the first STA on transmit, except that if dot11VHTExtendedNSSBWCapable of the second STA is true, the supported bandwidth values and NSS values of each <VHT-MCS, NSS> tuple are updated according to Table 9-314 if no Operating Mode Notification frame has been received from the first STA, otherwise, according to Table 9-111, wherein the VHT Capabilities Information field and the Operating Mode field have been transmitted by the first STA.
- Otherwise, if the Max VHT-MCS for *n* SS subfield (*n* = NSS) in the Tx VHT-MCS Map subfield indicates support and the data rate for long GI of the <VHT-MCS, NSS> tuple at that bandwidth (expressed as the largest integer in Mb/s that is less than or equal to the data rate) is less than or equal to the rate represented by the Tx Highest Supported Long GI Data Rate subfield, then
  - The <VHT-MCS, NSS> tuple at that bandwidth is supported by the first STA on transmit, except that if dot11VHTExtendedNSSBWCapable of the second STA is true, the supported bandwidth values and NSS values of each <VHT-MCS, NSS> tuple are updated according to Table 9-314 if no Operating Mode Notification frame has been received from the first STA, otherwise, according to Table 9-111, wherein the VHT Capabilities Information field and the Operating Mode field have been transmitted by the first STA.
- Otherwise, the <VHT-MCS, NSS> tuple at that bandwidth is not supported by the first STA on transmit.

NOTE 1—In contrast to reception, support for short GI transmissions by a STA cannot be determined by other STAs.

NOTE 2—A STA can determine the expected interpretation of its Supported Channel Width Set and Channel Width and 160/80+80 BW and Extended NSS BW Support fields at a recipient by examining the VHT Extended NSS BW Capable field value in the Supported VHT-MCS and NSS Set field of the recipient.

10.6.13.3 Additional rate selection constraints for VHT PPDUs

A STA should not transmit a 20 MHz or 40 MHz VHT PPDU with a <VHT-MCS, NSS> tuple that has VHT-MCS 0, 1, 2, or 3 and NSS less than or equal to 4 to a receiver STA that has marked as unsupported the HT-MCS with value VHT-MCS + 8 × (NSS – 1) in the Rx MCS Bitmask subfield in the Supported MCS Set field in the HT Capabilities element it transmits. The transmission of a 20 MHz or 40 MHz VHT PPDU with VHT-MCS greater than 3 is not subject to this constraint.

A STA should not transmit an 80 MHz, 160 MHz, or 80+80 MHz VHT PPDU with a <VHT-MCS, NSS> tuple that has VHT-MCS 0 or 1 and NSS less than or equal to 4 to a receiver STA that has marked as

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

unsupported the HT-MCS values of both 2 × VHT-MCS + 8 × (NSS – 1) and 2 × VHT-MCS + 1 + 8 × (NSS – 1) in the Rx MCS Bitmask subfield in the Supported MCS Set field in the HT Capabilities element it transmits. The transmission of an 80 MHz, 160 MHz, or 80+80 MHz VHT PPDU with VHT-MCS greater than 1 is not subject to this constraint.

An example tabulation of this behavior is given in Table 10-11.

Table 10-11—Example of rate selection for VHT PPDUs

HT-MCSs that are marked as unsupported	<VHT-MCS, NSS> tuples that are not used for CBW20 and CBW40	<VHT-MCS, NSS> tuples that are not used for CBW80, CBW160, and CBW80+80
0, 8, 16	<0, 1>, <0, 2>, <0, 3>	—
1, 9	<1, 1>, <1, 2>	—
10	<2, 2>	—
3	<3, 1>	—
0, 1	<0, 1>, <1, 1>	<0, 1>
2, 3	<2, 1>, <3, 1>	<1, 1>
0, 1, 8, 9	<0, 1>, <1, 1>, <0, 2>, <1, 2>	<0, 1>, <0, 2>

10.6.14 Rate selection constraints for S1G STAs

10.6.14.1 RX Supported S1G-MCS and NSS Set

The Rx Supported S1G-MCS and NSS Set of an S1G STA is determined for each <S1G-MCS, NSS> tuple NSS = 1, …, 4 and bandwidth (1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz) from its Supported S1G-MCS and NSS Set field and Extended Supported S1G-MCS and NSS Set field as follows:

- If the Extended Supported S1G-MCS and NSS Set field is present then if the Ext Max S1G-MCS For n SS subfield (n = NSS) in the Ext Rx S1G-MCS Map field indicates support then the <S1G-MCS, NSS> tuple at that bandwidth is supported by the STA on receive.
- Otherwise, if support for the S1G-MCS for NSS spatial streams at that bandwidth is mandatory (see 23.5), then the <S1G-MCS, NSS> tuple at that bandwidth is supported by the STA on receive.
- Otherwise, if the Max S1G-MCS For n SS subfield (n = NSS) in the Rx S1G-MCS Map field indicates support and the Rx Highest Supported Long GI Data Rate subfield is equal to 0, then the <S1G-MCS, NSS> tuple at that bandwidth is supported by the STA on receive.
- Otherwise, if the Max S1G-MCS For n SS subfield (n = NSS) in the Rx S1G-MCS Map subfield indicates support and the data rate (expressed in Mb/s) for long GI of the MCS for NSS spatial streams at that bandwidth (if the data rate is not an integer, the data rate value is rounded down to the next integer) is less than or equal to the rate represented by the Rx Highest Supported Long GI Data Rate subfield, then the <S1G-MCS, NSS> tuple at that bandwidth is supported by the STA on receive.
- Otherwise the <S1G-MCS, NSS> tuple at that bandwidth is not supported by the STA on receive.

An S1G STA shall not, unless explicitly stated otherwise, transmit an S1G PPDU unless the <S1G-MCS, NSS> tuple and bandwidth used are in the Rx Supported S1G-MCS and NSS Set of the receiving STA(s) or the Extended Supported S1G-MCS and NSS Set.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—Support for a <S1G-MCS, NSS> tuple at a given bandwidth implies support for long GI.

10.6.14.2 TX Supported S1G-MCS and NSS Set

The Tx Supported S1G-MCS and NSS Set of an S1G STA is determined for each <S1G-MCS, NSS> tuple NSS = 1, …, 4 and bandwidth (1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz) from its Supported S1G-MCS and NSS Set field and Extended Supported S1G-MCS and NSS Set field as follows:

— If the Extended Supported S1G-MCS and NSS Set field is present then if the Ext Max S1G-MCS for n SS subfield (n = NSS) in the Ext Tx S1G-MCS Map subfield indicates support then the <S1G-MCS, NSS> tuple at that bandwidth is supported by the STA on transmit.

— Otherwise, if support for the <S1G-MCS, NSS> tuple at that bandwidth is mandatory (see 23.5), then the <S1G-MCS, NSS> tuple at that bandwidth is supported by the STA on transmit.

— Otherwise if the Max S1G-MCS for n SS subfield (n = NSS) in the Tx S1G-MCS Map subfield indicates support and the Tx Highest Supported Long GI Data Rate subfield is equal to 0, then the <S1G-MCS, NSS> tuple at that bandwidth is supported by the STA on transmit.

— Otherwise if the Max S1G-MCS for n SS subfield (n = NSS) in the Tx S1G-MCS Map subfield indicates support and the data rate (expressed in Mb/s) for long GI of the <S1G-MCS, NSS> tuple at that bandwidth (if the data rate is not an integer, the data rate value is rounded down to the next integer) is less than or equal to the rate represented by the Tx Highest Supported Long GI Data Rate subfield, then the <S1G-MCS, NSS> tuple at that bandwidth is supported by the STA on transmit.

— Otherwise the <S1G-MCS, NSS> tuple at that bandwidth is not supported by the STA on transmit.

10.6.14.3 Additional rate selection constraints for S1G PPDUs

The following apply for a STA that transmits an S1G PPDU:

— If the channel width of the PPDU is equal to CBW1, CBW2, CBW4, CBW8 or CBW16, then the STA should not use a <S1G-MCS, NSS> tuple if the S1G-MCS is equal to 0 and the Min S1G-MCS For n SS subfield in the Basic S1G-MCS and NSS Set field of the S1G Operation element of the receiver STA is equal to 1.

— If the channel width of the PPDU is equal to CBW1, CBW2, CBW4, CBW8 or CBW16, then the STA should not use a <S1G-MCS, NSS> tuple if the S1G-MCS is equal to 0 or 1 and the Min S1G-MCS For n SS subfield in the Basic S1G-MCS and NSS Set field of the S1G Operation element of the receiver STA is equal to 2.

If the channel width of the PPDU is equal to CBW1, then the STA should not use a <S1G-MCS, NSS> tuple if the S1G-MCS is equal to 10 and the B7 of the Channel Width subfield in the S1G Operation Information field of the S1G Operation element of the receiver STA is equal to 0.

10.6.15 Rate selection constraints for CMMG STAs

10.6.15.1 Rx supported CMMG-MCS and NSS set

The Rx supported CMMG-MCS and NSS set of a CMMG STA is determined for each <CMMG-MCS, NSS> tuple NSS = 1,…, 4 and bandwidth (540 MHz and 1080 MHz) from its Supported CMMG-MCS and NSS Set field as follows:

— If support for the CMMG-MCS for NSS spatial streams at that bandwidth is mandatory (see 25.15), then the <CMMG-MCS, NSS> tuple at that bandwidth is supported by the STA on receive.

— Otherwise, the <CMMG-MCS, NSS> tuple at that bandwidth is not supported by the STA on receive.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A CMMG STA shall not, unless explicitly stated otherwise, transmit a CMMG PPDU unless the <CMMG-MCS, NSS> tuple and bandwidth used are in the Rx Supported CMMG-MCS and NSS Set of the receiving STA(s).

10.6.15.2 Tx supported CMMG-MCS and NSS set

The Tx supported CMMG-MCS and NSS set of a CMMG STA is determined for each <CMMG-MCS, NSS> tuple NSS = 1,…, 4 and bandwidth (540 MHz and 1080 MHz) from its Supported CMMG-MCS and NSS Set field as follows:

— If support for the <CMMG-MCS, NSS> tuple at that bandwidth is mandatory (see 25.15), then the <CMMG-MCS, NSS> tuple at that bandwidth is supported by the STA on transmit.

— Otherwise, the <CMMG-MCS, NSS> tuple at that bandwidth is not supported by the STA on transmit.

10.7 MSDU transmission restrictions

To avoid reordering MSDUs between pairs of LLC entities and/or unnecessarily discarding MSDUs, the following restrictions shall be observed by any STA that is able to concurrently process multiple outstanding MSDUs for transmission. The term *outstanding* refers to an MPDU containing all or part of an MSDU or MMPDU for which transmission has been started, and for which delivery of the MSDU or MMPDU has not yet been completed (i.e., an acknowledgment of the final fragment or only corresponding MPDU has not been received and the MSDU or MMPDU has not been discarded due to retries, lifetime, or for some other reason). A STA may have any number (greater than or equal to one) of eligible MSDUs outstanding concurrently, subject to the restrictions below.

A non-QoS STA shall have outstanding at any time:

— No more than one MSDU from any particular SA, and

— No more than one MMPDU

transmitted in one or more MPDUs with a particular individual RA.

NOTE 1—A simpler, more restrictive alternative to the rule in the above paragraph that might be used is that no more than one MSDU transmitted in one or more MPDUs with a particular individual RA be outstanding at any time.

For frames that are not sent within the context of a block ack agreement, a QoS STA shall have outstanding at any time:

— No more than one MSDU or A-MSDU for each TID from any particular SA, and

— No more than one MMPDU

transmitted in one or more MPDUs with a particular individual RA.

NOTE 2—A simpler, more restrictive alternative to the rule in the above paragraph that might be used is that no more than one MSDU or A-MSDU with any particular TID transmitted in one or more MPDUs with a particular individual RA be outstanding at any time.

A STA should select a value of dot11MaxTransmitMSDULifetime that is sufficiently large that the STA does not discard MSDUs or MMPDUs due to the transmit MSDU/MMPDU timer being exceeded, under normal operating conditions.

An A-MSDU shall contain only MSDUs of a single service class and inherits that service class for the purpose of the following rules. For MSDUs or A-MSDUs belonging to the service class of QoSAck when the receiver is a QoS STA, the QoS Data frames that are used to send these MSDUs or A-MSDUs shall have Normal Ack, Implicit BAR, or Block Ack ack policy. For MSDUs or A-MSDUs belonging to the service class of

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

QoSNoAck when the receiver is a QoS STA, the QoS Data frames that are used to send these MSDUs or A-MSDUs shall have No Ack ack policy.

10.8 HT Control field operation

If dot11HTControlFieldSupported is true, a STA shall set the +HTC-HT Support subfield of the HT Extended Capabilities field of the HT Capabilities element to 1 in HT Capabilities elements that it transmits. If dot11VHTControlFieldOptionImplemented is true, a STA shall set the +HTC-VHT Support subfield of the VHT Capabilities Information field of the VHT Capabilities element to 1 in VHT Capabilities elements that it transmits. If dot11HEControlFieldOptionImplemented is true, a STA shall set the +HTC-HE Support subfield in the HE MAC Capabilities Information field to 1 in the HE Capabilities elements that it transmits.

A STA in which at least one of dot11RDResponderOptionImplemented, dot11MCSFeedbackOptionImplemented, and dot11AlternateEDCAActivated is equal to true shall set dot11HTControlFieldSupported or dot11VHTControlFieldOptionImplemented or both equal to true. A STA that has at least one of dot11TRSOptionImplemented, dot11OMIOptionImplemented, dot11HEBSRControlImplemented, dot11HEBQRControlImplemented, dot11RDResponderOptionImplemented, and dot11SRResponderOptionImplemented equal to true or has dot11HEMCSFeedbackOptionImplemented greater than zero shall set dot11HEControlFieldOptionImplemented to true. An HE AP shall set dot11HEControlFieldOptionImplemented to true.

An HT variant HT Control field shall not be present in a frame addressed to a STA unless that STA declares support for +HTC-HT in the HT Extended Capabilities field of its HT Capabilities element (see 9.4.2.54).

A VHT variant HT Control field shall not be present in a frame addressed to a STA unless that STA declares support for +HTC-VHT in the VHT Capabilities Information field of its VHT Capabilities element or in the S1G Capabilities Information field of S1G Capabilities elements that it transmits.

NOTE—An HT STA that does not support +HTC (HT, VHT or HE variant) that receives a +HTC frame addressed to another STA still performs the CRC on the actual length of the MPDU and uses the Duration/ID field to update the NAV, as described in 10.3.2.4.

An HE variant HT Control field shall not be present in a frame addressed to a STA, unless that STA declares support for +HTC-HE in the HE MAC Capabilities Information field in the HE Capabilities element. The HE

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

variant HT Control field carried in the frame may contain one or more Control subfields under the conditions listed in Table 10-12.

Table 10-12—Conditions for including Control subfield variants

Control subfield variant	Condition
TRS	The transmitting AP expects an HE TB PPDU that follows the TRS information as described in 26.5.2.2 and the recipient non-AP STA has set the TRS Support subfield in the HE MAC Capabilities Information field in the HE Capabilities elements it transmits to 1.
OM	The transmitting STA changes its operating mode, as described in 26.9 and the recipient STA has set the OM Control Support subfield in the HE MAC Capabilities Information field in the HE Capabilities elements it transmits to 1.
HLA	The transmitting STA follows the HE link adaptation procedure, as described in 26.13 and the recipient STA has set the HE Link Adaptation Support subfield in the HE MAC Capabilities Information field in the HE Capabilities elements it transmits to a nonzero value.
BSR	The transmitting non-AP STA follows the corresponding buffer status report procedure, as described in 26.5.5 and the recipient AP has set the BSR Support subfield in the HE MAC Capabilities Information field in the HE Capabilities elements it transmits to 1.
UPH	The transmitting non-AP STA follows the UL MU operation procedure, as described in 26.5.2.3.
BQR	The transmitting non-AP STA follows the bandwidth query report procedure, as described in 26.5.2 and the recipient AP has set the BQR Support subfield in the HE MAC Capabilities Information field in the HE Capabilities elements it transmits to 1.
CAS	The transmitting STA follows either: — The reverse direction protocol procedure described in 10.29 and the recipient STA has set the RD Responder in the HT Extended Capabilities field in the HT Capabilities elements it transmits to 1, or — The PSR procedure described in 26.10.3 and the recipient STA has set the PSR Responder subfield of the HE MAC Capabilities Information field in the HE Capabilities elements it transmits to 1.
ONES	The transmitting STA may include a ONES Control subfield in an MPDU that is not carried in an HE TB PPDU (see 26.5.2.4).

If the HT Control field is present in an MPDU aggregated in an A-MPDU, then all MPDUs of the same frame type (i.e., having the same value for the Type subfield of the Frame Control field) aggregated in the same A-MPDU shall contain the same HT Control field. If MSDU(s) received in an MPDU are delivered via an MA-UNITDATA.indication, the drop eligible parameter of the MA-UNITDATA.indication is set to true if the MPDU contains an HT variant HT Control field and the DEI subfield is equal to 1 and set to false otherwise.

An HE STA that transmits a frame containing an A-Control subfield shall include at least one Control subfield in the A-Control subfield, and the included Control subfields shall be those that are supported by the receiving STAs, unless the Control ID subfield is 15.

An HE STA that receives a Control subfield in an A-Control subfield with a Control ID subfield value that is not recognized or not supported by the HE STA shall ignore the Control subfield and the remainder of the A-Control subfield. If more than one Control subfield is present in an A-Control subfield, the Control subfields shall not have the same Control ID value.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An HE STA that receives a ONES Control subfield shall ignore the remainder of the A-Control subfield.

If the HT variant HT Control field is present in an MPDU, the DEI subfield provides information on the drop eligibility of the contents of the received MPDU. With the information from the DEI subfield, a STA may selectively discard frames with the DEI subfield set to 1 in preference to frames with the DEI subfield set to 0, if resources are insufficient. Note that this might not help in the recovery in all conditions, and the STA might still have to fall back to an arbitrary discard strategy. The mechanisms for determining whether resources are insufficient or when to discard MSDUs or A-MSDUs are beyond the scope of this standard.

If the value of dot11S1GControlFieldOptionImplemented is true, an S1G STA shall set the +HTC-VHT Capable subfield of the S1G Capabilities Information field of the S1G Capabilities element that it transmits to 1.

An S1G shall not use an HT Control field other than a VHT variant HT Control field. An S1G STA shall not use a VHT variant HT Control field for any purpose other than link adaptation (see 10.31.3).

10.9 Control Wrapper operation

A STA supporting the HT Control field that receives a Control Wrapper frame shall process it as though it received a frame of the subtype of the wrapped frame. An HE STA shall not send a Control Wrapper frame to another HE STA.

10.10 MSDU processing

A STA can use the U-PID element transmitted in ADDTS Request, DMG ADDTS Request, ADDTS Response and DMG ADDTS Response frames to indicate the upper layer protocol responsible for handling MSDUs corresponding to the TID indicated within the frame carrying the U-PID element (see 11.4.4.4).

A STA that participates in a successful ADDTS exchange that included a U-PID element in the ADDTS Response or DMG ADDTS Response frame with the LLC Header Removed field equal to 1 shall strip the number of octets in the LLC Header Copy field of the U-PID element from the start of an MSDU (received in an MA-UNITDATA.request.primitive) corresponding to the TID indicated in the ADDTS exchange before transmission of the MSDU to the peer STA.

NOTE 1—The MSDU in the MA-UNITDATA.request.primitive must start with the octets specified in the LLC Header Copy field.

NOTE 2—The STA does not verify that the MSDU does indeed start with the octets specified in the LLC Header Copy field.

A STA that participates in a successful ADDTS exchange that included a U-PID element in the ADDTS Response or DMG ADDTS Response frame with the LLC Header Removed field equal to 1 and that receives from the peer STA an MSDU corresponding to the TID indicated in the ADDTS exchange shall insert the octets in the LLC Header Copy field of the U-PID element at the start of the MSDU before delivery of the MSDU (in an MA-UNITDATA.indication.primitive).

NOTE 3—If the LLC Header Removed field is equal to 0, the LLC Header Copy field in the U-PID element is ignored, except for possible implementation-dependent local optimizations.

10.11 A-MSDU operation

An A-MSDU contains only MSDUs whose DA parameter values map to a single RA field value and whose SA parameter values map to a single TA (see 9.3.2.2).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Specifically, for a frame containing an A-MSDU, if the frame is a three-address frame, or a four-address frame in a context defined by this standard:

NOTE 1—This standard defines use of four-address frames in the content of transmissions by a mesh STA (see 10.37), an S1G relay STA or AP (see 10.53) or a GLK STA (see 10.64).

— The RA may be a group address if all of the following conditions are met:
  — the frame is from an AP or PCP, or between IBSS, PBSS or mesh STAs
  — the DAs in all A-MSDU subframe headers are group addresses, or the frame is transmitted under GLK and the RA is a SYNRA

  Otherwise, the RA shall be an individual address.

  NOTE 2—STAs conformant with a previous revision of this standard might not accept a group addressed frame containing an A-MSDU, outside the context of a GCR concealment address or a GLK SYNRA, where supported.

— Each DA shall be the RA or, except if the A-MSDU is transmitted on a TDLS direct link, a group address, if none of the following conditions is met:
  — the frame is to an AP or associated PCP
  — the frame is transmitted under DMG relay or S1G relay operation
  — the frame is from a GLK STA
  — the frame is from a mesh STA

  Otherwise, there is no restriction on each DA, except that the first six octets of the first A-MSDU subframe header (the mesh DA, if the frame is from a mesh STA, or the DA in a Basic A-MSDU not from a mesh STA) shall not be AA-AA-03-00-00-00.

  NOTE 3—The address AA-AA-03-00-00-00 is that which results from an attack in which an encrypted QoS Data frame not containing an A-MSDU (whose unencrypted frame body therefore starts with an LLC header followed by a SNAP header constructed per IETF RFC 1042) has the A-MSDU Present subfield changed to 1 by an attacker to cause it to appear to be a payload protected A-MSDU (PP A-MSDU) with multiple MSDUs (each preceded by an A-MSDU subframe header, which starts with the DA or mesh DA).

— Each SA shall be the nonbandwidth signaling TA if none of the following conditions is met:
  — the frame is from an AP or PCP
  — the frame is transmitted under DMG relay or S1G relay operation
  — the frame is from a GLK STA
  — the frame is from a mesh STA

  Otherwise, each SA shall be an individual address.

  NOTE 4—The DA and SA are contained in the DA and SA subfields, respectively, where present, in A-MSDU subframes that are not transmitted in mesh Data frames (Basic A-MSDU subframes transmitted in mesh Data frames contain the mesh DA and mesh SA).

  NOTE 5—Frames not to an AP or associated PCP and frames not from an AP or PCP include frames transmitted between TDLS peer STAs or between IBSS, non-PCP PBSS or mesh STAs.

— In an MBSS,
  — each mesh STA, including the mesh SA in the Address 3 or Address 4 field if present (see Table 9-77), shall be the same individual address
  — in an individually addressed frame, each mesh DA that is an individual address, including the mesh DA in the Address 3 field (see Table 9-77), shall be the same individual address

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— in a group addressed frame, each mesh DA, and the DA in the Address 1 field (see Table 9-77), shall be the same group address.

A STA that receives a frame containing an A-MSDU that violates these rules should discard it[32].

For the Short A-MSDU case, an A-MSDU contains only MSDUs whose SAs are all the same, and whose DAs are all the same. The Short A-MSDU subframe structure is used only between a pair of STAs that communicate directly (see 9.3.2.1). The Short A-MSDU subframe structure cannot be used for frame forwarding. The constituent MSDUs of an A-MSDU shall all have the same priority parameter value from the corresponding MA-UNITDATA.request primitive.

If the recipient STA has omitted the HE Capabilities element or the recipient STA has transmitted an HE Capabilities element with the A-MSDU Fragmentation Support subfield in the MAC Capabilities Information field set to 0, then an A-MSDU shall be carried, without fragmentation, within a single QoS Data frame. If the recipient STA has transmitted an HE Capabilities element with the A-MSDU Fragmentation Support subfield set to 1, then an A-MSDU may be fragmented, and each fragment is sent to the recipient in a QoS Data frame.

The channel access rules for a QoS Data frame carrying an A-MSDU (or fragment thereof) are the same as a Data frame carrying an MSDU (or fragment thereof) of the same TID.

The expiration of the A-MSDU lifetime timer occurs only when the lifetime timer of all of the constituent MSDUs of the A-MSDU have expired.

NOTE 6—This rule implicitly allows an MSDU that is a constituent of an A-MSDU to potentially be transmitted after the expiration of its lifetime.

NOTE 7—Selecting any other value for the timeout would result in loss of MSDUs. Selecting the maximum value avoids this loss of MSDUs at the cost of transmitting MSDUs that have exceeded their lifetime.

The following rules in this paragraph apply to the transmission of an A-MSDU:

— A non-DMG and non-S1G STA that has a value of false for dot11HighthroughputOptionImplemented shall not transmit an A-MSDU.
— A non-DMG and non-S1G STA shall not transmit an A-MSDU to a STA from which it has not received a frame containing an HT Capabilities element.

An S1G STA shall not transmit an A-MSDU to an S1G STA from which it received a frame containing an S1G Capabilities element with the A-MSDU Supported subfield equal to 0.

An S1G STA transmitting an A-MSDU shall use only the Dynamic A-MSDU subframe format (see 9.3.2.2.5). The DA Present and SA Present subfields in the Subframe Control field of each Dynamic A-MSDU subframe shall be set to 1 unless the frame carrying the A-MSDU is a PV1 frame (see 9.8).

An A-MSDU carried in a PV1 frame shall include the DA field in a Dynamic A-MSDU subframe if the value of this field

— Is not equal to the value of the A3 stored at the recipient.
— Is not equal to the value of the A3 field of the frame when an A3 is not stored at the recipient.

[32]The check on the DA in the first A-MSDU subframe header is important to defend against attacks from malicious outsiders when signaling and payload protected A-MSDUs (SPP A-MSDUs) are not being used. The other checks on the DAs and the checks on the SAs are important to defend against impersonation attacks from malicious insiders (which means there is no protection against malicious APs or PCPs, DMG or S1G relays, GLK STAs, and mesh STAs). The lack of checks on the SA and DA in the case of mesh and relay operation presents an attack surface that is outside the scope of remediation in this standard. In the case of GLK, use of a SYNRA for an individually addressed MSDU with multiple links indicated in the station vector parameter also presents such an attack surface, which can be avoided by transmitting multiple individually addressed MPDUs instead (see 10.64).

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Is not equal to the value of the address identified by the A1 field when an A3 field is not present in the frame and an A3 is not stored at the recipient.

Otherwise, the DA field shall not be included in the Dynamic A-MSDU subframe.

An A-MSDU carried in a PV1 frame shall include the SA field in a Dynamic A-MSDU subframe if the value of this field

— Is not equal to the value of the A4 stored at the recipient.
— Is not equal to the value of the A4 field of the frame when an A4 is not stored at the recipient.
— Is not equal to the value of the address identified by the A2 field when an A4 field is not present in the frame and an A4 is not stored at the recipient.

Otherwise, the SA field shall not be included in the Dynamic A-MSDU subframe.

A non-S1G STA transmitting an A-MSDU shall not use the Dynamic A-MSDU format. A non-DMG STA transmitting an A-MSDU shall not use the Short A-MSDU format.

The length of an A-MSDU transmitted in an S1G PPDU is limited by the maximum MPDU size supported by the recipient STA (see 10.12.5).

A STA shall support the reception of an A-MSDU, where the A-MSDU is carried in a QoS Data frame with Normal Ack ack policy in the following cases:

— By an HT STA if the A-MSDU is not aggregated within an A-MPDU
— By a VHT or HE STA if the A-MSDU is sent as an S-MPDU
— For a CMMG STA if the A-MSDU is not aggregated within an A-MPDU

The use of an A-MSDU carried in a QoS Data frame under a block ack agreement is determined for each block ack agreement. A STA shall not transmit an A-MSDU within a QoS Data frame under a block ack agreement unless the recipient indicates support for A-MSDU by setting the A-MSDU Supported field to 1 in the Block Ack Parameter Set field of the ADDBA Response frame.

An HE STA shall not transmit an A-MSDU that is carried in a QoS Data frame for which no block ack agreement exists and that is part of an ack-enabled single-TID A-MPDU, unless the recipient has set the A-MSDU Not Under BA In Ack-Enabled A-MPDU Support subfield in the HE MAC Capabilities Information field in the HE Capabilities element to 1.

A STA shall not transmit an A-MSDU in an HT PPDU if the A-MSDU length exceeds the value indicated by the Maximum A-MSDU Length field of the HT Capabilities element received from the recipient STA.

A VHT STA that sets the value of the Maximum MPDU Length subfield in the VHT Capabilities Information field of the VHT Capabilities element to indicate 3895 octets shall set the Maximum A-MSDU Length in the HT Capabilities element to indicate 3839 octets. A VHT STA that sets the Maximum MPDU Length in the VHT Capabilities element to indicate 7991 octets or 11 454 octets shall set the Maximum A-MSDU Length in the HT Capabilities element to indicate 7935 octets.

The length of an A-MSDU transmitted in a VHT PPDU is limited by the maximum MPDU size supported by the recipient STA (see 10.12.5).

The length of an A-MSDU transmitted in an HE PPDU is limited by the maximum MPDU length capability supported by the recipient STA (see 10.12.5, 26.17.1, and 26.17.2.1).

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 8—An A-MSDU that meets the A-MSDU length limit for transmission in a VHT PPDU or HE PPDU might exceed the A-MSDU length limit for an HT PPDU, in which case it cannot be retransmitted in an HT PPDU.

NOTE 9—Support for A-MSDU aggregation does not affect the maximum size of MSDU transported by the MA-UNITDATA primitives.

A VHT STA shall not transmit an A-MSDU that includes a number of MSDUs greater than the value indicated by the Max Number Of MSDUs In A-MSDU field in any Extended Capabilities element sent by the recipient STA. An HT STA that is not a VHT STA should not transmit an A-MSDU that includes a number of MSDUs greater than the value indicated by the Max Number Of MSDUs In A-MSDU field in any Extended Capabilities element sent by the recipient STA. A STA shall not transmit an A-MSDU in a CMMG PPDU to a STA if the A-MSDU length exceeds the value indicated by the Maximum A-MSDU Length field of the CMMG Capabilities element received from the recipient STA.

A DMG STA shall not transmit an A-MSDU that includes a number of Basic A-MSDU subframes greater than the value indicated by the Maximum Number Of Basic A-MSDU Subframes In A-MSDU subfield in any DMG Capabilities element sent by the recipient STA. A DMG STA shall not transmit an A-MSDU that includes a number of Short A-MSDU subframes greater than the value indicated by the Maximum Number Of Short A-MSDU Subframes In A-MSDU subfield in any DMG Capabilities element sent by the recipient STA. A DMG STA that sets the A-MSDU Subframe subfield to 1 in a DMG Attributes field of TSPEC element (9.4.2.28), which indicates Short A-MSDU subframe support, shall support receiving at least 32 Short A-MSDU subframes in A-MSDU. A CMMG STA that sets the Maximum MPDU Length subfield in the CMMG Capabilities element to indicate 3895 octets shall set the maximum A-MSDU length in the CMMG Capabilities element to indicate 3839 octets. A CMMG STA that sets the Maximum MPDU Length subfield in the CMMG Capabilities element to indicate 7991 octets or 11 454 octets shall set the maximum A-MSDU length in the CMMG Capabilities element to indicate 7935 octets.

The transmitter of frames for a TID established using a PTP TSPEC shall use an A-MSDU subframe format that is the result of the PTP TSPEC negotiation for that TID. The A-MSDU subframe format is negotiated using the PTP TSPEC (9.4.2.28): the Short A-MSDU subframe format shall not be used for frames of the corresponding TID if the A-MSDU subframe field of the PTP TSPEC element is 0 either in the ADDTS Request frame or in the ADDTS Response frame used to set up the TID. Prior to PTP TSPEC negotiation, a STA shall use the Basic A-MSDU subframe format if the STA employs MSDU aggregation.

A non-PCP DMG STA in a PBSS may use the PCP of the PBSS to forward MSDUs to another non-PCP STA in the PBSS if the value of the PCP Forwarding field within the PCP's DMG Capabilities element is 1. A non-PCP DMG STA in a PBSS shall not use the PCP to forward MSDUs if the value of the PCP Forwarding field within the PCP's DMG Capabilities element is 0. To forward an MSDU via the PCP, a non-PCP STA shall encapsulate the MSDU within an A-MSDU in an individually addressed MPDU sent to the PCP. The DA field of the A-MSDU shall be set to the destination's individual or group address.

The length of an A-MSDU transmitted in a CMMG PPDU is limited by the maximum MPDU size supported by the recipient STA (see 10.12.5).

A CMMG STA shall not transmit to a recipient CMMG STA an A-MSDU that includes a number of MSDUs greater than the value indicated by the Max Number of MSDUs in A-MSDU field in the Extended Capabilities element received from the recipient STA.

A non-DMG STA indicates support for payload protected A-MSDUs (PP A-MSDUs) or signaling and payload protected A-MSDUs (SPP A-MSDUs), when dot11RSNAActivated is true, in its RSNXE. A non-DMG STA and its peer STA both determine and maintain a record of whether an encrypted A-MSDU sent to its peer is to be a PP A-MSDU or an SPP A-MSDU based on the SPP A-MSDU Capable subfield of the Extended RSN Capabilities field of the RSNXE (see 9.4.2.240). If a STA and its peer STA are DMG STAs or both have their

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

SPP A-MSDU Capable subfields equal to 1, A-MSDUs shall be transmitted as SPP A-MSDUs and shall not be transmitted in PV1 MPDUs. Otherwise, A-MSDUs shall be transmitted as PP A-MSDUs.

NOTE 10—A PV1 MPDU cannot contain an SPP A-MSDU because the signaling of whether an A-MSDU is being carried is not part of the AAD (see Figure 12-19) and so is not protected.

Reception and transmission of A-MSDUs using a non-RSNA is unaffected by the value of the SPP A-MSDU Capable subfield.

An AP may transmit an SPP A-MSDU for a GCR group address if it has negotiated RSNAs with all associated STAs that have an active GCR agreement for this group address.

10.12 A-MPDU operation

10.12.1 A-MPDU contents

According to its context (defined in Table 9-660), an A-MPDU shall be constrained so that it contains only MPDUs as specified in the relevant table referenced from Table 9-660.

The values of the Protocol Version field in the Frame Control field of the MPDUs contained in an A-MPDU shall be the same, except for a Control frame with the Protocol Version field equal to 0 in which case the Control frame can be aggregated with PV1 frame.

If an A-MPDU contains multiple QoS Control fields, then bit 4 of all the QoS Control fields shall have the same value, and bits 8–15 of the QoS Control fields that have the same value in bits 0–3 shall have the same value.

When an A-MPDU contains multiple MPDUs whose Protocol Version field value is 1, the values of EOSP and Relayed Frame fields in the Frame Control field, and A3 Present, A4 Present subfields in the SID field shall be identical across MPDUs within the A-MPDU.

A DMG STA that transmits an A-MPDU shall do so only in the Data Enabled Immediate Response context or the Control Response context, with contents as specified in Table 9-661 and Table 9-663, respectively.

10.12.2 A-MPDU length limit rules

A STA indicates in the Maximum A-MPDU Length Exponent field in its HT Capabilities element the maximum A-MPDU length that it can receive in an HT PPDU. A STA indicates in the Maximum A-MPDU Length Exponent field in its VHT Capabilities element the maximum length of the A-MPDU pre-EOF padding that it can receive in a VHT PPDU. A STA indicates in the Maximum A-MPDU Length Exponent field in its S1G Capabilities element the maximum length of the A-MPDU pre-EOF padding that it can receive in an S1G PPDU. A STA indicates in the Maximum A-MPDU Length Exponent field in its DMG Capabilities element the maximum A-MPDU length that it can receive in a DMG PPDU. A STA indicates the maximum length of the A-MPDU pre-EOF padding that it can receive in an HE PPDU in the Maximum A-MPDU Length Exponent field in its HT Capabilities, VHT Capabilities, and HE 6 GHz Band Capabilities elements (if present) and in the Maximum A-MPDU Length Exponent Extension field in its HE Capabilities element. A STA indicates in the Maximum A-MPDU Length Exponent field in its EDMG Capabilities element the maximum length of the A-MPDU that it can receive in an EDMG PPDU.

A VHT STA that sets the Maximum A-MPDU Length Exponent field in its VHT Capabilities element to a value in the range 0 to 3 shall set the Maximum A-MPDU Length Exponent in its HT Capabilities to the same value. A VHT STA that sets the Maximum A-MPDU Length Exponent field in the VHT Capabilities element to a value larger than 3 shall set the Maximum A-MPDU Length Exponent in its HT Capabilities element to 3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Using the Maximum A-MPDU Length Exponent fields in the HT Capabilities, VHT Capabilities, HE Capabilities, and HE 6 GHz Band Capabilities elements (if present), the STA establishes at association the maximum length of an A-MPDU pre-EOF padding that can be sent to it. An HT STA shall support receiving A-MPDUs of length up to the value indicated by the Maximum A-MPDU Length Exponent field in its HT Capabilities element. A VHT STA shall support receiving A-MPDUs where the A-MPDU pre-EOF padding length is up to the value indicated by the Maximum A-MPDU Length Exponent field in its VHT Capabilities element. An S1G STA that sets the A-MPDU Supported subfield in the S1G Capabilities element to 1 shall support receiving A-MPDUs where the A-MPDU pre-EOF padding length is up to the value indicated by the Maximum A-MPDU Length Exponent field in its S1G Capabilities element.

An HE STA shall support receiving A-MPDUs where the A-MPDU pre-EOF padding length is up to the value indicated by the Maximum A-MPDU Length Exponent field in its HT Capabilities and VHT Capabilities elements and the Maximum A-MPDU Length Exponent Extension field in its HE Capabilities element in the 2.4 GHz or 5 GHz bands. An HE STA shall support receiving A-MPDUs where the A-MPDU pre-EOF padding length is up to the value indicated by the Maximum A-MPDU Length Exponent Extension field in the HE Capabilities element and the Maximum A-MPDU Length Exponent field in HE 6 GHz Band Capabilities element in the 6 GHz band.

A STA shall not transmit an A-MPDU in an HT PPDU that is longer than the value indicated by the Maximum A-MPDU Length Exponent field in the HT Capabilities element received from the intended receiver. MPDUs in an A-MPDU carried in an HT PPDU shall be limited to a maximum length of 4095 octets. A STA shall not transmit an A-MPDU in a VHT PPDU where the A-MPDU pre-EOF padding length is longer than the value indicated by the Maximum A-MPDU Length Exponent field in the VHT Capabilities element received from the intended receiver. An S1G STA shall not transmit an A-MPDU in an S1G PPDU where the A-MPDU pre-EOF padding length field is longer than the value indicated by the Maximum A-MPDU Length Exponent field in the S1G Capabilities element received from the intended receiver. A STA shall not transmit an A-MPDU in a DMG PPDU that is longer than the value indicated by the Maximum A-MPDU Length Exponent field in the DMG Capabilities element received from the intended receiver. A STA shall not transmit an A-MPDU in an EDMG PPDU that is longer than the value indicated by the Maximum A-MPDU Length Exponent field in the EDMG Capabilities element received from the intended receiver.

A STA shall not transmit an A-MPDU in an HE PPDU where the A-MPDU pre-EOF padding length is greater than the value indicated by the Maximum A-MPDU Length Exponent field in the HT Capabilities and VHT Capabilities elements and the Maximum A-MPDU Length Exponent Extension field in its HE Capabilities elements received from the intended receiver in the 2.4 GHz or 5 GHz bands. A STA shall not transmit an A-MPDU in an HE PPDU where the A-MPDU pre-EOF padding length is greater than the value indicated by the Maximum A-MPDU Length Exponent Extension field in the HE Capabilities element and the Maximum A-MPDU Length Exponent field in the HE 6 GHz Band Capabilities element received from the intended receiver in the 6 GHz band.

An S1G STA shall not transmit an A-MPDU, except for an S-MPDU, to an S1G STA from which it received a frame containing an S1G Capability element with the A-MPDU Supported subfield equal to 0.

An NGV STA may transmit an A-MPDU without capability exchange as specified in 31.2.3. An NGV STA shall support reception of an A-MPDU as specified in 31.2.3.

NOTE—An NGV STA does not use the HT Capabilities element or the VHT Capabilities element to establish the maximum length of an A-MPDU, as an NGV STA only operates OCB and need not exchange these elements.

10.12.3 Minimum MPDU start spacing rules

If the intended receiver is a non-HE STA, a STA shall not start the transmission of more than one MPDU within the time limit described in the Minimum MPDU Start Spacing field declared by the intended receiver. If the intended receiver is an HE STA, an HE STA shall not start the transmission of more than one QoS Data

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

frame, QoS Null frame, or Management frame within the time limit described in the Minimum MPDU Start Spacing field declared by the intended receiver. To satisfy this requirement, the number of octets between the start of two consecutive MPDUs in an A-MPDU, *N*, measured at the PHY SAP, shall meet the condition defined by Equation (10-12).

$$N \geq \begin{cases} t_{MMSS} \times r/8, \text{ if the A-MPDU is not carried in an HE TB PPDU} \\ t_{MMSS} \times 2^{MMSF} \times r/8, \text{ if the A-MPDU is carried in an HE TB PPDU} \end{cases} \quad (10\text{-}12)$$

where

t_{MMSS} is the time (in microseconds) defined in the Encoding column of Table 9-225 for an HT STA, of Table 9-351 for an S1G STA for the value of the Minimum MPDU Start Spacing field, and of Table 9-291 for a DMG STA for the value of the Minimum MPDU Start Spacing field

MMSF is the value of the MPDU MU Spacing Factor subfield of the User Info field addressed to the HE STA in the Trigger frame soliciting the HE TB PPDU (see 9.3.1.22)

r is the value of the PHY Data Rate (in Mb/s) defined in 19.5 for HT PPDUs, in 21.5 for VHT PPDUs, in 23.5 for S1G PPDUs, and in Clause 20 for a DMG STA

If necessary, in order to satisfy this requirement, a STA shall add padding between MPDUs in an A-MPDU. Any such padding shall be in the form of one or more MPDU delimiters with the MPDU Length field set to 0.

QoS Null frames transmitted by DMG STAs are not subject to this spacing, i.e., no MPDU delimiters with zero length need to be inserted after the MPDU immediately preceding the QoS Null frame in an A-MPDU.

For FTM procedure measurement exchange with an unassociated STA, the transmitting STA shall use one of the values specified in 9-225, for the t_{MMSS}.

10.12.4 A-MPDU aggregation of group addressed Data frames

A STA that is not one of an AP, a mesh STA, or an NGV STA shall not transmit an A-MPDU containing an MPDU with an RA that is a group address.

NOTE 1—An HT AP and an HT mesh STA can transmit an A-MPDU containing MPDUs with an RA that is a group address.

NOTE 2—As a VHT STA and an HE STA are HT STAs, NOTE 1 also applies to VHT APs, VHT mesh STAs, HE APs, and HE mesh STAs.

NOTE 3—An AP providing GCR service can transmit an A-MPDU containing MPDUs with an RA that is a group address.

NOTE 4—An S1G AP can transmit an A-MPDU containing MPDUs with an RA that is a group address.

A STA that is an AP or a mesh STA shall not transmit an A-MPDU containing group addressed MPDUs if the HT Protection field is equal to non-HT mixed mode.

A DMG STA may transmit an A-MPDU containing MPDUs with an RA that is a group address.

When a STA transmits a PPDU containing at least one A-MPDU that contains MPDUs with an RA that is a group address, the following shall apply:

— If the PPDU is an HT PPDU, the maximum A-MPDU length exponent value is the minimum value in the Maximum A-MPDU Length Exponent subfield of the A-MPDU Parameters field of the HT Capabilities element across all HT STAs associated with the transmitting AP or across all peer HT mesh STAs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— If the PPDU is a VHT PPDU, the maximum A-MPDU length exponent value is the minimum value in the Maximum A-MPDU Length Exponent subfields of the VHT Capabilities elements across all VHT STAs associated with the transmitting AP or across all peer VHT mesh STAs.
— If the PPDU is an HE PPDU sent in the 2.4 GHz or 5 GHz band, the maximum A-MPDU length exponent value is the minimum value in the Maximum A-MPDU Length Exponent subfield of the VHT Capabilities elements across all HE STAs associated with the transmitting AP or across all peer HE mesh STAs.
— If the PPDU is an HE PPDU sent in the 6 GHz band, the maximum A-MPDU length exponent value is the minimum value in the Maximum A-MPDU Length Exponent subfield of the HE 6 GHz Band Capabilities elements across all HE STAs associated with the transmitting AP or across all peer HE mesh STAs.
— If the PPDU is a VHT PPDU, the minimum MPDU start spacing value is the maximum value in the Minimum MPDU Start Spacing subfields of the A-MPDU Parameters field of the HT Capabilities elements across all VHT STAs associated with the transmitting AP or across all peer VHT mesh STAs.
— If the PPDU is an HT PPDU transmitted by an AP, the minimum MPDU start spacing value is the maximum value in the Minimum MPDU Start Spacing subfield of the A-MPDU Parameters field of the HT Capabilities elements across all HT STAs associated with the transmitting AP or across all peer HT mesh STAs.
— If the PPDU is an HE PPDU sent in the 2.4 GHz or 5 GHz band, the minimum MPDU start spacing value is the maximum value in the Minimum MPDU Start Spacing subfield of the A-MPDU Parameters field of the HT Capabilities elements across all HE STAs associated with the transmitting AP or across all peer HE mesh STAs.
— If the PPDU is an HE PPDU sent in the 6 GHz band, the minimum MPDU start spacing value is the maximum value in the Minimum MPDU Start Spacing subfield of the HE 6 GHz Band Capabilities elements across all HE STAs associated with the transmitting AP or across all peer HE mesh STAs.
— If the PPDU is a DMG PPDU, the maximum A-MPDU length exponent value is the minimum value in the Maximum A-MPDU Length Exponent subfield of the A-MPDU Parameters field of the DMG Capabilities element of all DMG STAs associated with the AP or PCP.
— If the PPDU is a DMG PPDU, the minimum MPDU start spacing value is the maximum value in the Minimum MPDU Start Spacing subfield of the A-MPDU Parameters field of the DMG Capabilities element of all DMG STAs associated with the AP or PCP.
— If the PPDU is an S1G PPDU, the maximum A-MPDU length exponent value is the minimum value in the Maximum A-MPDU Length Exponent subfields of the S1G Capabilities Information field of the S1G Capabilities elements across all S1G STAs associated with the transmitting AP.
— If the PPDU is an S1G PPDU, the minimum MPDU start spacing value is the maximum value in the Minimum MPDU Start Spacing subfields of the S1G Capabilities Information field of the S1G Capabilities elements across all S1G STAs associated with the transmitting AP.
— If the PPDU is an EDMG PPDU, the maximum A-MPDU length exponent value that applies is the minimum value in the Maximum A-MPDU Length Exponent subfield of the A-MPDU Parameters field of the EDMG Capabilities element of all EDMG STAs associated with the AP or PCP.
— If the PPDU is an EDMG PPDU, the minimum MPDU start spacing value that applies is the maximum value in the Minimum MPDU Start Spacing subfield of the A-MPDU Parameters field of the EDMG Capabilities element of all EDMG STAs associated with the AP or PCP.

10.12.5 Transport of A-MPDU by the PHY data service

An A-MPDU shall be transmitted in a PSDU associated with a PHY-TXSTART.request primitive with the TXVECTOR parameter AGGREGATION set to 1 or the TXVECTOR parameter FORMAT set to VHT. A received PSDU is determined to be an A-MPDU when the associated PHY-RXSTART.indication primitive

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

RXVECTOR parameter AGGREGATION is equal to 1 or the RXVECTOR parameter FORMAT is equal to VHT.

A STA shall not transmit an MPDU in an S1G PPDU that exceeds the maximum MPDU length capability indicated in the S1G Capabilities element received from the recipient STA.

An S1G STA shall set the TXVECTOR parameter AGGREGATION to 1 when the length of the PSDU to be carried in the S1G PPDU is greater than aPSDUMaxLengthWithNoAggregation.

10.12.6 A-MPDU padding for VHT, HE or S1G PPDU

A VHT STA that transmits a VHT PPDU or an S1G STA that transmits an S1G PPDU that contains one or more PSDUs, each of which contains an A-MPDU, shall construct the A-MPDU(s) as described in this subclause.

An A-MPDU pre-EOF padding (see 10.12.2) is constructed for each user from any of the following:

- A-MPDU subframes constructed from the MPDUs available for transmission that have a TID value that maps to the primary AC
- A-MPDU subframes with 0 in the MPDU Length field and 0 in the EOF/Tag field

provided that each added subframe and the A-MPDU pre-EOF padding meet all of the following:

- A-MPDU content constraints (see 10.12.1) for the intended recipient
- Format and length limit constraints (see 9.7.1 and 10.12.2) for the intended recipient
- Minimum MPDU start spacing constraints (see 10.12.3) for the intended recipient
- TXOP duration limits (see 10.23.2.9) for the primary AC

The A-MPDU_Length[*n*] for user *n* is initialized as the length of the resulting A-MPDU pre-EOF padding.

This initial value of A-MPDU_Length[*n*] for user *n* is used as the APEP_LENGTH[*n*] parameter value for the PLME-TXTIME.request primitive (see 6.7.5). The PLME-TXTIME.request primitive is then invoked once for the VHT PPDU or the S1G PPDU. The PLME-TXTIME.confirm primitive (see 6.7.6) provides the TXTIME parameter and PSDU_LENGTH[] parameters for all of the users for the transmission.

Subsequently, for each user *n*, as permitted by the rules for EDCA TXOP Sharing (see 10.23.2.7), a VHT STA or S1G STA may add A-MPDU subframes to the A-MPDU for that user that meets either of the following conditions:

- Have a TID that maps to an AC that is not the primary AC
- Have 0 in the MPDU Length field and 0 in the EOF/Tag field

provided that each added subframe and the resulting A-MPDU meet all of the following:

- A-MPDU content constraints (see 10.12.1) for the intended recipient
- Length limit constraints (see 9.7.1 and 10.12.2) for the intended recipient
- MPDU start spacing constraints (see 10.12.3) for the intended recipient

and provided that, after incrementing the A-MPDU_Length[*n*] with the length of each such added A-MPDU subframe, the relationship A-MPDU_Length[*n*] ≤ PSDU_LENGTH[*n*] is true.

Subsequently, for each user n, a VHT STA or S1G STA may add A-MPDU subframes to the A-MPDU for that user that meet the following condition:

- Have 0 in the MPDU Length field

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

provided that each added subframe and the resulting A-MPDU meet the following condition:

— Length limit constraints (see 9.7.1 and 10.12.2) for the intended recipient

and provided that, after incrementing the A-MPDU_Length[n] with the length of each such added A-MPDU subframe, the relationship A-MPDU_Length[*n*] ≤ PSDU_LENGTH[*n*] is true.

An implementation may reduce the A-MPDU_Length[*n*] by the amount of padding for user *n* that was added subsequent to the addition of a subframe for user *n* that contains 1 in the EOF/Tag field.

The final value of A-MPDU_Length[] shall be used as APEP_LENGTH[] in the PHY-TXSTART.request primitive for the VHT PPDU or S1G PPDU.

Padding is then added for each user such that the resulting A-MPDU contains exactly PSDU_LENGTH octets for that user as follows:

— First, while A-MPDU_Length[*n*] < PSDU_LENGTH[*n*] and A-MPDU_Length[*n*] mod 4 ≠ 0, add an octet to the final A-MPDU subframe's Padding subfield and increment A-MPDU_Length[*n*] by 1.
— Then, while A-MPDU_Length[*n*] + 4 ≤ PSDU_LENGTH[*n*], add an EOF padding subframe to the EOF Padding Subframes field and increment A-MPDU_Length[*n*] by 4.
— Finally, while A-MPDU_Length[*n*] < PSDU_LENGTH[*n*], add an octet to the EOF Padding Octets subfield and increment A-MPDU_Length[*n*] by 1.

An A-MPDU subframe with EOF set to 0 shall not be added after any A-MPDU subframe with EOF set to 1, except if the A-MPDU subframe is in an ack-enabled single-TID A-MPDU or ack-enabled multi-TID A-MPDU (see 9.7.3).

An A-MPDU subframe with EOF set to 1 and with MPDU Length field set to 0 shall not be added before an A-MPDU subframe that contains an S-MPDU (see 10.12.7).

10.12.7 Setting the EOF/Tag field of the MPDU delimiter

The EOF/Tag field may be set to 1 in an A-MPDU subframe carried in a VHT PPDU, HE PPDU, or S1G PPDU if the subframe's MPDU Length field is nonzero and the subframe is the only subframe that has a nonzero MPDU Length field. The EOF/Tag field of each A-MPDU subframe with an MPDU Length field with a nonzero value that is not the only A-MPDU subframe with MPDU Length field with a nonzero value in the A-MPDU carried in a VHT PPDU or S1G PPDU shall be set to 0. The EOF/Tag field shall be set to 0 in all A-MPDU subframes that are carried in an HT PPDU.

An MPDU that is the only MPDU in an A-MPDU and that is carried in an A-MPDU subframe with 1 in the EOF/Tag field is called an S-MPDU.

In an EDMG PPDU, the EOF padding can be used to indicate that no more MPDUs are present at end of the A-MPDU in the case the PSDU length exceeds the accumulated size of A-MPDU subframes plus the number of octets used for MPDU start spacing.

In the sequence of A-MPDU subframes transmitted in an EDMG PPDU, the EOF/Tag field is set as follows:

— Shall be set to 0 in all A-MPDU subframes if the subframe's MPDU Length field is nonzero.
— May be set to 1 in all A-MPDU subframes if the subframe's MPDU Length field is 0 and no A-MPDU subframe with nonzero value in the subframe's MPDU Length field is set for transmission in the A-MPDU subframes sequence after the subframe with MPDU Length field equal to 0 is transmitted.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An MPDU that is carried in an A-MPDU subframe with the EOF/Tag field in the MPDU delimiter set to 1 is called a *tagged* MPDU. An S-MPDU is a tagged MPDU, but a tagged MPDU is not necessarily an S-MPDU.

An MPDU that is carried in an A-MPDU subframe with the EOF/Tag field in the MPDU delimiter set to 0 is called an untagged MPDU.

10.12.8 Transport of S-MPDUs

The rules for S-MPDU operation are the same as the rules for non-A-MPDU frame operation with other types of non-A-MPDU.

NOTE—This affects the following behavior:

a) The frame could carry a fragment of an MSDU or MMPDU (see 10.2.7).
b) Rate selection of control responses (see 10.6).
c) A QoS Data frame cannot have Implicit BAR ack policy, and does not generate a BlockAck frame response (see 9.2.4.5.4).
d) A QoS Data frame could have Normal Ack ack policy, which solicits an Ack frame immediate response. No block ack agreement is needed in this case (see 9.2.4.5.4).
e) The frame could be a Management frame that solicits an Ack frame response (see 9.7.3).

10.13 PPDU duration constraint

A STA shall not transmit an HT PPDU that has a duration (as determined by the PLME-TXTIME.confirm primitive defined in 6.7.6) that is greater than aPPDUMaxTime defined in Table 19-25.

A STA shall not transmit a DMG PPDU that has a duration (as determined by the PLME-TXTIME.confirm primitive defined in 6.7.6) that is greater than aPPDUMaxTime defined in Table 20-30.

A CMMG STA shall not transmit a PPDU that has a duration (as determined by the PLME-TXTIME.confirm primitive defined in 6.7.6) that is greater than aPPDUMaxTime.

A STA shall not transmit a VHT PPDU that has a duration (as determined by the PLME-TXTIME.confirm primitive defined in 6.7.6) that is greater than aPPDUMaxTime defined in Table 21-28.

A STA shall not transmit a VHT MU PPDU with the TXVECTOR parameter APEP_LENGTH for any of the users greater than aAPEPMaxLengthVHTMU20, aAPEPMaxLengthVHTMU40 or aAPEPMaxLengthVHTMU80orMore when TXVECTOR parameter CH_BANDWIDTH is CBW20, CBW40, or other values, respectively.

NOTE—In the case of using aPEPMaxLengthVHTMU80orMore, the constraint from Maximum A-MPDU Length Exponent of 7 is smaller and becomes the actual limiting factor (see 10.12.2).

A STA shall not transmit a VHT PPDU in TVWS bands that has a duration (as determined by the PLME-TXTIME.confirm primitive defined in 6.7.6) that is greater than aPPDUMaxTime defined in Table 22-25.

A STA shall not transmit an S1G PPDU that has a duration (as determined by the PLME-TXTIME.confirm primitive defined in 6.7.6) that is greater than aPPDUMaxTime defined in Table 23-41.

An HE STA shall not transmit an HE PPDU that has a duration (as determined by the PLME-TXTIME.confirm primitive defined in 6.7.6) that is greater than *aPPDUMaxTime* defined in Table 27-61.

A STA shall not transmit an EDMG PPDU that has a duration (as determined by the PLME-TXTIME.confirm primitive defined in 6.7.6) that is greater than aPPDUMaxTime defined in Table 20-30.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A STA shall not transmit an NGV PPDU that has a duration (as determined by the PLME-TXTIME.confirm primitive defined in 6.7.6) that is greater than aPPDUMaxTime defined in Table 32-20.

10.14 DMG A-PPDU and EDMG A-PPDU operation

A DMG STA is a QoS STA and shall set dot11QosOptionImplemented to true.

A DMG STA is DMG aggregate PPDU (A-PPDU) capable if the A-PPDU supported field within the STA's DMG Capabilities element is 1. Otherwise, the STA is not DMG A-PPDU capable.

An EDMG STA is EDMG A-PPDU capable if the EDMG A-PPDU subfield within the STA's EDMG Capabilities element is 1. Otherwise, the STA is not EDMG A-PPDU capable.

A DMG STA shall not transmit a DMG A-PPDU to a STA that is not DMG A-PPDU capable.

An EDMG STA shall not transmit an EDMG A-PPDU to a STA that is not EDMG A-PPDU capable.

All PPDUs within a DMG A-PPDU shall have the ADD-PPDU parameter of the TXVECTOR set to ADD-PPDU, except for the last PPDU in the DMG A-PPDU that shall have this parameter set to NO-ADD-PPDU. An EDMG PPDU shall have the ADD-PPDU parameter of the TXVECTOR set to NO-ADD-PPDU. All PPDUs within an EDMG A-PPDU shall have the EDMG_ADD_PPDU parameter of the TXVECTOR set to ADD-PPDU, except for the last PPDU in the EDMG A-PPDU that shall have this parameter set to NO-ADD-PPDU. A DMG PPDU and an EDMG PPDU shall not be included in the same A-PPDU.

The value of a TXVECTOR parameter of a PPDU belonging to a DMG A-PPDU or an EDMG A-PPDU might differ from the value of the same TXVECTOR parameter of another PPDU in the same A-PPDU, including the MCS parameter.

A PPDU within an A-PPDU shall contain an A-MPDU. All MPDUs within A-MPDUs within an A-PPDU shall have the same values for the TA and RA fields. All QoS Data frames within A-MPDUs within an A-PPDU shall have the same ack policy. If a frame that requires an immediate response is present within an A-PPDU, it shall be transmitted in the last A-MPDU of the A-PPDU.

The transmission duration of an A-PPDU shall be no greater than aPPDUMaxTime (see Table 20-30).

10.15 Low-density parity check code (LDPC) operation

An HT STA shall not transmit a frame in a PSDU with the TXVECTOR parameter FORMAT set to HT_MF or HT_GF and TXVECTOR parameter FEC_CODING set to LDPC_CODING unless the RA of the frame corresponds to an HT STA for which the LDPC Coding Capability subfield of the HT Capabilities element received from that STA contained a value of 1 and dot11LDPCCodingOptionActivated is true (if there is more than one intended receiver, then this requirement applies for each intended receiver).

A VHT STA shall not transmit a frame in a PSDU with the TXVECTOR parameter FORMAT set to VHT and TXVECTOR parameter FEC_CODING set to LDPC_CODING unless the RA of the frame corresponds to a VHT STA for which the Rx LDPC subfield of the VHT Capabilities element received from that STA contained a value of 1 and dot11VHTLDPCCodingOptionActivated is true (if there is more than one intended receiver, then this requirement applies for each intended receiver).

An S1G STA shall not transmit a frame in a PSDU with the TXVECTOR parameter FEC_CODING set to LDPC_CODING unless the RA of the frame corresponds to a STA for which the Rx LDPC subfield of the S1G Capabilities element from that STA contained a value of 1 and

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

dot11S1GLDPCCodingOptionActivated is true (if there is more than one intended receiver, then this requirement applies for each intended receiver).

A STA should not transmit a frame in a PSDU with the TXVECTOR parameter FORMAT set to HT_MF, HT_GF or VHT and TXVECTOR parameter FEC_CODING set to LDPC_CODING if the RA of the frame corresponds to a STA from which it has received a frame containing an Operating Mode field and the most recent Operating Mode field it has received from that STA had the No LDPC subfield equal to 1 (if there is more than one intended receiver, then this requirement applies for each intended receiver).

Further restrictions on TXVECTOR parameter values may apply due to rules found in 10.27 and 10.6.

An HE STA shall not transmit a frame in an HE PPDU with the TXVECTOR parameter FEC_CODING set to LDPC_CODING, unless the frame is addressed to an HE STA for which the LDPC Coding In Payload subfield in the HE Capabilities element received from that STA contained a value of 1 and dot11HELDPCCodingInPayloadImplemented is true.

10.16 STBC operation

A STA that has not set the Tx STBC subfield to 1 in the HT Capabilities element shall not transmit HT PPDUs with a TXVECTOR parameter STBC set to a nonzero value. A STA that has not set the Tx STBC subfield to 1 in the VHT Capabilities element shall not transmit VHT SU PPDUs with a TXVECTOR parameter STBC set to a nonzero value. A STA that has not set the Tx STBC subfield to 1 in the S1G Capabilities element shall not transmit S1G SU PPDUs with the TXVECTOR parameter STBC set to a nonzero value.

A STA shall not send an HT PPDU with the TXVECTOR parameter STBC set to a nonzero value to a recipient STA unless the recipient STA has indicated in the Rx STBC field of its HT Capabilities element that it supports the reception of PPDUs using STBC with a number of spatial streams greater than or equal to the number of spatial streams in the HT PPDU (if there is more than one intended receiver, then this requirement applies for each intended receiver). A STA shall not send a VHT PPDU with the TXVECTOR parameter STBC set to a nonzero value to a recipient STA unless the recipient STA has indicated in the Rx STBC field of its VHT Capabilities element that it supports the reception of PPDUs using STBC with a number of spatial streams greater than or equal to the number of spatial streams in the VHT PPDU (if there is more than one intended receiver, then this requirement applies for each intended receiver). A STA shall not send an S1G PPDU with the TXVECTOR parameter STBC set to a nonzero value to a recipient STA unless the recipient STA has indicated in the Rx STBC field of its S1G Capabilities element that it supports the reception of PPDUs using STBC with a number of spatial streams greater than or equal to the number of spatial streams in the S1G PPDU (if there is more than one intended receiver, then this requirement applies for each intended receiver).

A STA that has not set the Tx STBC subfield to 1 in the CMMG Capabilities element shall not transmit CMMG PPDUs with a TXVECTOR parameter STBC set to a nonzero value.

A STA shall not send a CMMG PPDU with the TXVECTOR parameter STBC set to a nonzero value to a recipient STA unless the recipient STA has indicated in the Rx STBC field of its CMMG Capabilities element that it supports the reception of PPDUs using STBC with a number of spatial streams equal to or greater than the number of spatial streams in the CMMG PPDU (if there is more than one intended receiver, then this requirement applies for each intended receiver).

10.17 Short GI operation

A STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to HT_CBW20 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The STA is an HT STA.
— The TXVECTOR parameter FORMAT is equal to HT_MF or HT_GF.
— The RA of the frame corresponds to a STA for which the Short GI for 20 MHz subfield of the HT Capabilities element contained a value of 1.
— dot11ShortGIOptionInTwentyActivated is present and is true.

A STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to CBW20 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

— The STA is a VHT STA.
— The TXVECTOR parameter FORMAT is equal to VHT.
— The RA of the frame corresponds to a STA for which the Short GI for 20 MHz subfield of the HT Capabilities element contained a value of 1.
— dot11ShortGIOptionInTwentyActivated is present and is true.

A STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to HT_CBW40 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

— The STA is an HT STA.
— The TXVECTOR parameter FORMAT is equal to HT_MF or HT_GF.
— The RA of the frame corresponds to a STA for which the Short GI for 40 MHz subfield of the HT Capabilities element contained a value of 1.
— dot11ShortGIOptionInFortyActivated is present and is true.

A STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to CBW40 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

— The STA is a VHT STA.
— The TXVECTOR parameter FORMAT is equal to VHT.
— The RA of the frame corresponds to a STA for which the Short GI for 40 MHz subfield of the HT Capabilities element contained a value of 1.
— dot11ShortGIOptionInFortyActivated is present and is true.

A STA shall not transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to CBW80 and GI_TYPE set to SHORT_GI unless all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

— The STA is a VHT STA.
— The TXVECTOR parameter FORMAT is equal to VHT.
— The RA of the frame corresponds to a STA for which the Short GI for 80 MHz/TVHT_MODE_4C subfield of the VHT Capabilities element contained a value of 1.
— dot11VHTShortGIOptionIn80Activated is present and is true.

A STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to CBW160 or CBW80+80 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

— The STA is a VHT STA.
— The TXVECTOR parameter FORMAT is equal to VHT.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The RA of the frame corresponds to a STA for which the Short GI for 160 and 80+80 MHz subfield of the VHT Capabilities element contained a value of 1.

— dot11VHTShortGIOptionIn160and80p80Activated is present and is true.

A STA may transmit a frame in a PSDU with TXVECTOR parameters FORMAT set to VHT, NUM_USERS set to greater than 1, and GI_TYPE set to SHORT_GI only if all of the following conditions are met:

— The STA is a VHT STA.

— The TXVECTOR parameter FORMAT is equal to VHT.

— The RAs of all MPDUs in the VHT MU PPDU correspond to STAs for which the Short GI subfield of the following conditions are satisfied:

  — If the TXVECTOR parameter CH_BANDWIDTH is CBW20, the Short GI for 20 MHz subfields of the HT Capabilities element contained a value of 1, and dot11ShortGIOptionInTwentyActivated is present and is true.

  — If the TXVECTOR parameter CH_BANDWIDTH is CBW40, the Short GI for 40 MHz subfields of the HT Capabilities element contained a value of 1, and dot11ShortGIOptionInFortyActivated is present and is true.

  — If the TXVECTOR parameter CH_BANDWIDTH is CBW80, the Short GI for 80 MHz/ TVHT_MODE_4C subfields of the VHT Capabilities element contained a value of 1, and dot11VHTShortGIOptionIn80Activated is present and is true.

  — If the TXVECTOR parameter CH_BANDWIDTH is CBW160 or CBW80+80, the Short GI for 160 MHz and 80+80 MHz subfields of the VHT Capabilities element contained a value of 1, and dot11VHTShortGIOptionIn160and80p80Activated is present and is true.

An S1G STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to CBW1 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

— The RA of the frame corresponds to a STA for which the Short GI for 1 MHz subfield of the S1G Capabilities element is 1.

— dot11ShortGIOptionIn1MActivated is present and is true.

An S1G STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to CBW2 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

— The RA of the frame corresponds to a STA for which the Short GI for 2 MHz subfield of the S1G Capabilities element is 1.

— dot11ShortGIOptionIn2MActivated is present and is true.

An S1G STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to CBW4 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

— The RA of the frame corresponds to a STA for which the Short GI for 4 MHz subfield of the S1G Capabilities element is 1.

— dot11ShortGIOptionIn4MActivated is present and is true.

An S1G STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to CBW8 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

— The RA of the frame corresponds to a STA for which the Short GI for 8 MHz subfield of the S1G Capabilities element is 1.

— dot11ShortGIOptionIn8MActivated is present and is true.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An S1G STA may transmit a frame in a PSDU with TXVECTOR parameters CH_BANDWIDTH set to CBW16 and GI_TYPE set to SHORT_GI only if all of the following conditions are met (if there is more than one intended receiver, then this requirement applies for each intended receiver):

— The RA of the frame corresponds to a STA for which the Short GI for 16 MHz subfield of the S1G Capabilities element is 1.

— dot11ShortGIOptionIn16MActivated is present and is true.

An S1G STA may transmit a frame in a PSDU with TXVECTOR parameters NUM_USERS set to greater than 1, and GI_TYPE set to SHORT_GI only if all of the following conditions are met:

— The RAs of all MPDUs in the S1G MU PPDU correspond to STAs for which the Short GI subfield of the following conditions are satisfied:
  — If the TXVECTOR parameter CH_BANDWIDTH is equal to CBW2, the Short GI for 2 MHz subfield of the S1G Capabilities element is equal to 1, and dot11ShortGIOptionIn2MActivated is present and is true.
  — If the TXVECTOR parameter CH_BANDWIDTH is equal to CBW4, the Short GI for 4 MHz subfield of the S1G Capabilities element is equal to 1, and dot11ShortGIOptionIn4MActivated is present and is true.
  — If the TXVECTOR parameter CH_BANDWIDTH is equal to CBW8, the Short GI for 8 MHz subfield of the S1G Capabilities element is equal to 1, and dot11ShortGIOptionIn8MActivated is present and is true.
  — If the TXVECTOR parameter CH_BANDWIDTH is equal to CBW16, the Short GI for 16 MHz subfield of the S1G Capabilities element is equal to 1, and dot11ShortGIOptionIn16MActivated is present and is true.

An HT STA shall not transmit a frame with TXVECTOR parameter FORMAT set to HT_GF and the GI_TYPE parameter set to SHORT_GI when the MCS parameter indicates a single spatial stream.

Further restrictions on TXVECTOR parameter values may apply due to rules found in 10.27 and 10.6.

10.18 Greenfield operation

An HT STA shall not transmit a frame in a PSDU with the TXVECTOR parameter FORMAT set to HT_GF unless the RA of the frame corresponds to a STA for which the HT-Greenfield subfield of the HT Capabilities element contained a value of 1 and dot11HTGreenfieldOptionActivated is true (if there is more than one intended receiver, then this requirement applies for each intended receiver). Further restrictions may apply due to rules found in 10.27, 10.6, and 11.8.8.5.

10.19 Group ID and partial AID in VHT and CMMG PPDUs

The partial AID is a nonunique STA identifier defined in Table 10-13 and Table 10-14. The partial AID is carried in the TXVECTOR parameter PARTIAL_AID of a VHT SU PPDU or a CMMG PPDU and is limited to 9 bits.

A STA transmitting a VHT SU PPDU carrying one or more group addressed MPDUs or transmitting a VHT NDP intended for multiple recipients shall set the TXVECTOR parameters GROUP_ID to 63 and PARTIAL_AID to 0. The intended recipient of a VHT NDP is defined in 10.35.6.

A STA transmitting a CMMG PPDU carrying one or more group addressed MPDUs shall set the TXVECTOR parameters PARTIAL_AID to 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A STA transmitting a VHT SU PPDU carrying one or more individually addressed MPDUs or a VHT NDP intended for a single recipient shall set the TXVECTOR parameters GROUP_ID and PARTIAL_AID as shown in Table 10-13.

Table 10-13—Settings for the TXVECTOR parameters GROUP_ID and PARTIAL_AID for VHT STAs

Condition	GROUP_ID	PARTIAL_AID
Addressed to AP	0	*int(*BSSID[39:47])
Addressed to Mesh STA	0	*int(*RA[39:47])
Sent by an AP and addressed to a STA associated with that AP or sent by a TDLS STA in a direct path to a TDLS peer STA	63	STA_Partial_AID_VHT (see Equation (10-13))
Otherwise (see NOTE)	63	0
NOTE—The last row covers the following cases: a) A PPDU sent to an IBSS STA b) A PPDU sent by an AP to a non associated STA c) Any other condition not explicitly listed elsewhere in the table		

A STA transmitting a CMMG PPDU carrying one or more individually addressed MPDUs shall set the TXVECTOR parameter PARTIAL_AID as shown in Table 10-14.

Table 10-14—Settings for the TXVECTOR parameter PARTIAL_AID for CMMG STAs

Condition	PARTIAL_AID
A frame that is not a Control frame that is addressed to an AP.	$(dec(\text{BSSID}[39:47]) \bmod (2^9 - 1)) + 1$
A frame that is not a Control frame that is addressed to an AP.	$(dec(\text{RA}[39:47]) \bmod (2^9 - 1)) + 1$
A frame that is not a Control frame that is sent by an AP and addressed to a STA associated with that AP or sent by a TDLS STA in a direct path to a TDLS peer STA.	STA_Partial_AID_CMMG (see Equation (10-14))
Otherwise (see NOTE)	0
NOTE—The last row covers the following cases: a) A PPDU sent to an IBSS STA b) A PPDU sent by an AP to a non associated STA c) Any other condition not explicitly listed elsewhere in the table	

A STA shall include the values computed in Table 10-13 in the PHYCONFIG_VECTOR parameters PARTIAL_AID_LIST_GID00 and PARTIAL_AID_LIST_GID63.

A STA that transmits a VHT or CMMG PPDU to a TDLS peer STA obtains the AID for the peer STA from the TDLS Setup Request or TDLS Setup Response frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An AP should not assign to a STA an AID that results in a 0 value STA_Partial_AID_VHT as computed using Equation (10-13):

$$\text{STA\_Partial\_AID\_VHT} = (\text{AID}[0:8] + int(\text{BSSID}[44:47] \oplus \text{BSSID}[40:43]) \times 2^5) \bmod 2^9 \quad (10\text{-}13)$$

A CMMG AP should not assign to a CMMG STA an AID that results in the STA_Partial_AID_CMMG as computed using Equation (10-14):

$$\text{STA\_Partial\_AID\_CMMG} = (dec(\text{AID}[0:8]) + dec(\text{BSSID}[44:47] \oplus \text{BSSID}[40:43]) \times 2^5) \bmod 2^6 \quad (10\text{-}14)$$

being equal to one of the following:

$$0 \text{ or } (dec(\text{BSSID}[39:47]) \bmod (2^9 - 1)) + 1 \text{ or } (dec(\text{OBSSID}[39:47]) \bmod (2^9 - 1)) + 1$$

where OBSSID is the BSSID of a BSS that is not the BSS of which the AP is a member and for which the AP might be heard by the STA being assigned the AID.

A STA transmitting a VHT MU PPDU sets the TXVECTOR parameter GROUP_ID as described in 21.3.11.4.

As an example of the GROUP_ID and PARTIAL_AID setting, consider the case of a BSS with BSSID 00-21-6A-AC-53-52 that has as a member a non-AP STA assigned AID 5.[33] In VHT PPDUs sent to an AP, the GROUP_ID is set to 0 and the PARTIAL_AID is set to 164. In VHT PPDUs sent by the AP to the non-AP STA associated with that AP, the GROUP_ID is set to 63 and PARTIAL_AID is set to 229.

As an example of the PARTIAL_AID setting, consider the case of a BSS with BSSID 00-21-6A-AC-53-52 that has as a member a non-AP CMMG STA assigned AID 5. In CMMG PPDUs sent to an AP, the PARTIAL_AID is set to 165. In CMMG PPDUs sent by the AP to the non-AP STA associated with that AP, the PARTIAL_AID is set to 37.

A STA transmitting a CMMG PPDU that is addressed to an AP shall set the TXVECTOR parameter UPLINK_INDICATION to 1. The UPLINK_INDICATION parameter shall be set to 0 for all other cases.

The TXVECTOR parameter COLOR is used to assist a receiving STA in identifying the BSS from which a reception originates so that the receiving STA might increase spatial reuse and reduce power consumption by terminating the reception process in the case when the reception is not from the BSS of which the STA is a member. A STA transmitting a CMMG PPDU that is addressed to an AP need not include the TXVECTOR parameter COLOR in the TXVECTOR. A STA transmitting a CMMG PPDU that is not an NDP and that is sent by a TDLS STA in a direct path to a TDLS peer STA shall set the TXVECTOR parameter COLOR to the value of the COLOR parameter, if present, from the RXVECTOR of the most recently received frame from its associated AP or from the DO of the IBSS of which it is a member that contained a COLOR parameter. An AP transmitting a CMMG PPDU shall set the TXVECTOR parameter COLOR to a value of its choosing and shall maintain that value for the duration of the existence of the BSS. The AP which is a member of a Multiple BSSID Set shall set the TXVECTOR parameter COLOR for each different BSSID(*i*) to a same value.

An AP shall include the value that it is using for the TXVECTOR parameter COLOR in the COLOR field of the CMMG Capabilities Info field of the CMMG Capabilities element in all frames that contain that element. The COLOR field of the CMMG Capabilities Info field of the CMMG Capabilities element in all frames transmitted from a non-AP STA is reserved.

[33] As described in IEEE Std 802, the use of hyphens for the BSSID indicates hexadecimal representation rather than bit-reversed representation.

10.20 S1G dynamic AID assignment operation

An S1G STA may support dynamic AID assignment. A STA with dot11DynamicAIDActivated equal to true is defined as a D-AID STA. A D-AID STA shall set the Dynamic AID field of the S1G Capabilities Information field in the S1G Capabilities element to 1. Otherwise it shall set the Dynamic AID field to 0.

When performing the S1G dynamic AID operations described in this subclause, if management frame protection is negotiated and both STAs set the Extended S1G Action Protection field in the RSNXE that they transmit to 1, the STAs shall:

— use individually addressed Protected AID Switch Request, Protected AID Switch Response and Protected Information Announcement frames instead of AID Switch Request, AID Switch Response and STA Information Announcement frames, respectively and

— discard any individually addressed AID Switch Request, AID Switch Response or STA Information Announcement frame received from the peer STA, with which management frame protection is negotiated.

STAs that exchange individually addressed Protected AID Switch Request, Protected AID Switch Response or Protected STA Information Announcement frames shall follow the rules defined in 12.6.17.

When management frame protection is not negotiated or the Extended S1G Action Protection field in the RSNXE transmitted by either STA is set to 0, the STAs shall not use the Protected AID Switch Request, Protected AID Switch Response nor the Protected STA Information Announcement frame.

A D-AID STA may transmit AID Switch Request or AID Switch Response frames to a D-AID STA. A STA shall not transmit an AID Switch Request frame or AID Switch Response frame to a STA from which it has received an S1G Capabilities element with the Dynamic AID field equal to 0.

When the traffic pattern or the service characteristic or the remaining battery life of a D-AID STA is changed, the D-AID STA may change its listen interval. If the listen interval of the STA is changed, the AID of the STA should be updated so that the STA belong to the STA group consisting of the STAs having the same listen interval. A D-AID STA requesting a new listen interval may transmit an AID Switch Request frame containing an AID Request element with the AID Request Interval Present subfield of an AID Request Mode field equal to 1 and the AID Request Interval field equal to the requested new listen interval to the AP. The Service Characteristic field may be included in the AID Request element with the Service Characteristic Present subfield of the AID Request Mode field equal to 1 to inform the AP of the service characteristic of the STA if it has been changed. After receiving the AID Switch Request frame, the AP with dot11DynamicAIDActivated equal to true shall respond with an AID Switch Response frame containing an AID Response element with the AID/Group AID field equal to a new AID and the AID Response Interval field equal to a new listen interval. The AP may assign a particular AID to the D-AID STA taking into account the received service characteristic information from the STA if it is included in the AID Switch Request frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An illustration of the dynamic AID assignment is shown in Figure 10-26.

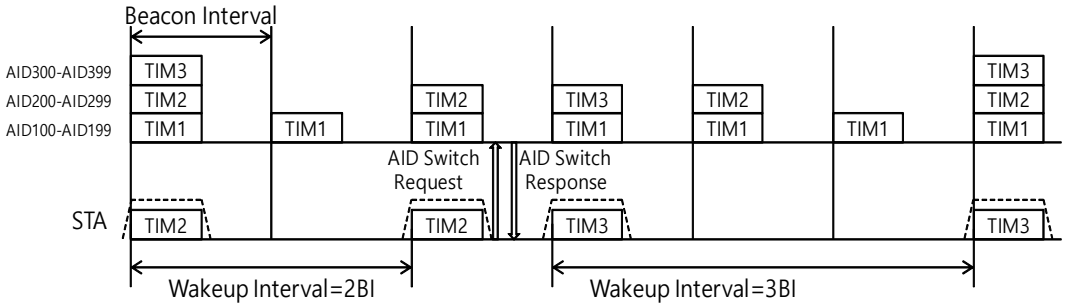

Figure 10-26—Illustration of dynamic AID assignment

A D-AID STA may switch between TIM mode and non-TIM mode during operation.

The mode switching is initiated by a non-AP D-AID STA. When the D-AID STA switches from TIM mode to non-TIM mode, the STA should inform the AP of its switching through the AID Switch Request frame with the Non-TIM Mode Switch subfield of the AID Request element set to 1 and the TIM Mode Switch subfield set to 0, the STA otherwise should inform the AP of its switching through the AID Switch Request frame with the TIM Mode Switch subfield of AID Request element equal to 1 and Non-TIM Mode Switch subfield set to 0 when the STA switches from non-TIM mode to TIM mode. A D-AID STA that switches between TIM mode and non-TIM mode, which also wants to update its listen interval may request a listen interval change by including a listen interval value in the AID Request Interval field in the AID Request element. The Service Characteristic field may be included in the AID Request element if the service characteristic has been changed.

Upon receiving AID Switch Request frame with the Non-TIM Mode Switch subfield or TIM Mode Switch subfield of AID Request element equal to 1, the AP may reassign a new AID to the STA. The new AID is transmitted to the D-AID STA by including it in the AID Response element of the AID Switch Response frame. The AP may reassign a new value for the listen interval and include it in the AID Response Interval field of the AID Response element. The STA shall update its listen interval to the value indicated in the AID Response.

If the AID included in the AID Response element of the AID Switch Response frame is not the same as the STA's current AID, the STA shall use the AID included in the AID Response element as its new AID. The non-AP STA shall switch to the new AID after the duration specified by the AID Switch Count field in the received AID Response element.

An AP can change the group of a STA for load/traffic distribution of each group. An AP with dot11UnsolicitedDynamicAIDActivated equal to true may transmit an unsolicited AID Switch Response frame containing an AID Response element with the AID/Group AID field equal to a new AID and an the AID Response Interval field equal to a new listen interval to the STA that has the Unsolicited Dynamic AID bit equal to 1 in its S1G Capabilities element. The STA for which dot11UnsolicitedDynamicAIDActivated is true shall set the Unsolicited Dynamic AID field of the S1G Capabilities Information field in the S1G Capabilities element to 1.

When a D-AID STA has buffered frames for a peer non-AP STA, it may request to belong to the group of AIDs having the same listen interval with a the peer non-AP STA. A D-AID STA requesting the same listen interval with a the peer non-AP STA may transmit an AID Switch Request frame containing an AID Request element with the Peer STA Address Present subfield of an AID Request Mode field equal to 1 and a the Peer STA Address field equal to the MAC address of the peer non-AP STA to an the AP. After receiving the AID Switch Request frame, the AP with dot11DynamicAIDActivated equal to true shall respond with an

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

AID Switch Response frame containing an AID Response element with an the AID/Group AID field equal to a new AID and the AID Response Interval field equal to the same listen interval with the peer non-AP STA.

When the AID of a non-AP D-AID STA has changed and that STA has direct connections with other peer STAs (e.g., TDLS), the AP shall transmit a STA Information Announcement frame (see 9.6.24.5) that contains the updated AID of the non-AP STA to each peer STA. A D-AID STA with direct connections with non-AP D-AID STAs that receives a STA Information Announcement frame shall update the AIDs of these STAs with the information contained in the received frame.

If a non-AP STA with direct connections receives a STA Information Announcement frame including an AID Announcement element from a peer STA, the non-AP STA updates the peer STA's AID to the received AID and sends the Ack frame after a SIFS.

An S1G STA may indicate to the AP its service characteristic information by including the Service Characteristic field in the AID Request element in (Re)Association Request frames as described in 11.3.5.11 in which case the AID Request Interval field of the element is equal to the value of the Listen Interval field of the (Re)Association Request frame. Otherwise the AID Request element is not present in the (Re)Association Request frame.

10.21 Group ID, partial AID, Uplink Indication, and COLOR in S1G PPDUs

The S1G partial AID is a nonunique identifier of an S1G STA as defined in Table 10-15 and Table 10-16. The partial AID is carried in the TXVECTOR parameter PARTIAL_AID of an S1G SU PPDU with the TXVECTOR parameter CH_BANDWIDTH set to CBW2, CBW4, CBW8, or CBW16 and is limited to 9 bits.

A STA transmitting an S1G PPDU carrying one or more group addressed MPDUs that share a single, common group AID value shall set the TXVECTOR parameter PARTIAL_AID according to Table 10-16. A STA transmitting an S1G PPDU carrying one or more group addressed MPDUs that do not share a common group AID and a common BSSID or that is transmitting an S1G NDP intended for multiple recipients shall set the TXVECTOR parameter PARTIAL_AID to 0. The intended recipient of an S1G NDP is defined in 10.35.7.

A STA transmitting an S1G SU PPDU carrying one or more individually addressed MPDUs or an S1G NDP intended for a single recipient shall select any one of the AIDs assigned to the recipient and then set the TXVECTOR parameter PARTIAL_AID as shown in Table 10-15 and Table 10-16.

Table 10-15—Settings for the TXVECTOR parameter PARTIAL_AID for an NDP

Condition	PARTIAL_AID
An NDP that is intended for an AP or sent by an AP and intended for all STAs associated with that AP.	(*int*(BSSID[39:47])) mod (2^9 – 1) + 1
An NDP that is sent by an AP and intended for a STA associated with that AP or for a group of non-AP STAs with a common group AID and a common BSSID, or sent by a TDLS STA and intended for a TDLS peer STA.	STA_Partial_AID_NDP (see Equation (10-15))
Otherwise	0

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 10-16—Settings for the TXVECTOR parameter PARTIAL_AID for non-1 MHz PPDUs and non-NDPs

Condition	PARTIAL_AID
A PPDU containing one or more frames addressed to an AP; except for a PPDU that just contains a single frame, and that frame is a Control frame.	*int*(BSSID[39:47]) mod (2^9–1)) + 1
A PPDU containing one or more frames sent by an AP and addressed to a STA associated with that AP or to a group of STAs with a common group AID and a common BSSID, or sent by a TDLS STA in a direct path to a TDLS peer STA; except for a PPDU that just contains a single frame, and that frame is a Control frame.	STA_Partial_AID (see Equation (10-16))
Otherwise	0

NOTE—In Table 10-15 and Table 10-16, the last row includes the cases of a PPDU carrying MPDUs:
a) Sent by an IBSS STA to one or more IBSS STAs
b) Sent by an AP to a non associated STA
c) Any other condition not explicitly listed elsewhere in the table.

An S1G STA shall include the values computed in Table 10-15 in the PHYCONFIG_VECTOR parameter PARTIAL_AID_LIST_GID00 and PARTIAL_AID_LIST_GID63.

An S1G STA that transmits an S1G PPDU to a TDLS peer STA obtains the AID for the peer STA from TDLS Setup Request, or TDLS Setup Response frame.

An S1G AP should not assign an AID that results in the STA_Partial_AID_NDP value as computed using Equation (10-15):

$$\text{STA\_Partial\_AID\_NDP} = (\text{AID}[0{:}8] + int(\text{BSSID}[44{:}47] \oplus \text{BSSID}[40{:}43]) \times 2^5) \bmod 2^9 \quad (10\text{-}15)$$

being equal to one of the following:

$$0 \quad \text{or} \quad (int(\text{BSSID}[39{:}47]) \bmod (2^9 - 1)) + 1 \quad \text{or} \quad (int(\text{OBSSID}[39{:}47]) \bmod (2^9 - 1) + 1$$

where OBSSID is the BSSID of a BSS that is not the BSS of which the AP is a member and for which the AP might be heard by the STA being assigned the AID.

An SIG AP should not assign an AID that results in the STA_Partial_AID value as computed using Equation (10-16):

$$\text{STA\_Partial\_AID} = (\text{AID}[0{:}8] + int(\text{BSSID}[44{:}47] \oplus \text{BSSID}[40{:}43]) \times 2^5) \bmod 2^6 \quad (10\text{-}16)$$

being equal to one of the following:

$$0 \quad \text{or} \quad (int(\text{BSSID}[39{:}47]) \bmod (2^9 - 1)) + 1 \quad \text{or} \quad (int(\text{OBSSID}[39{:}47]) \bmod (2^9 - 1) + 1$$

where OBSSID is the BSSID of a BSS that is not the BSS of which the AP is a member and for which the AP might be heard by the STA being assigned the AID.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An S1G STA transmitting an S1G MU PPDU sets the TXVECTOR parameter GROUP_ID as described in 23.3.10.4.

As an example of the PARTIAL_AID setting, consider the case of a BSS with BSSID 00-21-6A-AC-53-52 that has as a member a non-AP S1G STA assigned AID 5. In an NDP sent by the non-AP S1G STA to the AP, the PARTIAL_AID is equal to 165. In an NDP sent by the S1G AP to the non-AP STA, the PARTIAL_AID is equal to 229. In a non-1 MHz S1G PPDU that is not an NDP, that does not contain a Control frame and that is sent by the non-AP S1G STA to the AP, the PARTIAL_AID is set to 165. In a non-1 MHz S1G PPDU that is not an NDP, that does not contain a Control frame and that is sent by the S1G AP to the non-AP STA, the PARTIAL_AID is set to 37.

A STA transmitting a non-1 MHz S1G PPDU that is not an NDP and that is addressed to an AP shall set the TXVECTOR parameter UPLINK_INDICATION to 1. The UPLINK_INDICATION parameter shall be set to 0 for all other cases. The TXVECTOR parameter UPLINK_INDICATION is not present for 1 MHz PPDUs or NDPs.

The TXVECTOR parameter COLOR is used to assist a receiving STA in identifying the BSS from which a received PPDU originates so that the receiving STA reduces intra-BSS collisions by reporting a busy medium regardless of the received power when COLOR indicates that the current PPDU might be intra-BSS and might reduce power consumption by terminating the reception process when the received PPDU could not be from the BSS of which the STA is a member. A STA transmitting a non-1 MHz S1G PPDU that is not an NDP and that is addressed to an AP need not include the TXVECTOR parameter COLOR in the TXVECTOR. A STA transmitting a non-1 MHz S1G PPDU that is not an NDP and that is sent by a TDLS STA in a direct path to a TDLS peer STA shall set the TXVECTOR parameter COLOR to the value of the COLOR parameter, if present, from the RXVECTOR of the most recently received frame from its associated AP or from the STA transmitting a beacon of the IBSS of which it is a member that contained a COLOR parameter. An AP transmitting a non-1 MHz S1G PPDU that is not an NDP shall set the TXVECTOR parameter COLOR to a value of its choosing and shall maintain that value for the duration of the existence of the BSS. The AP which is a member of a Multiple BSSID Set shall set the TXVECTOR parameter COLOR for each different BSSID(i) to a same value.

When an S1G AP transmits a non-1 MHz S1G PPDU that is not an NDP, the AP shall set the TXVECTOR parameter COLOR to the value of the COLOR field of the S1G Capabilities Information field of the S1G Capabilities element transmitted by the AP. The COLOR field of the S1G Capabilities Information field of the S1G Capabilities element in all frames transmitted from a non-AP STA is reserved.

The partial BSSID is defined to be the PARTIAL_AID of the address of the STA contained in the AP and is equal to

$$(int(\text{BSSID}[39:47]) \bmod (2^9 - 1)) + 1$$

10.22 Operation across regulatory domains

10.22.1 General

The PHY of a WLAN is subject to regulations that might vary significantly from one regulatory domain to another. This subclause provides the framework for operation across regulatory domains and describes the mechanism that supports cross-domain mobility and operation in multiple regulatory domains. When this mechanism is active, dot11MultiDomainCapabilityActivated attribute be true.

NOTE—This subclause does not eliminate the need to obtain type acceptance, regulatory approval, equipment authorization, or equipment certification in each of the regulatory domains in which the equipment operates. The mechanisms described in this subclause provide the information to the STA to identify the regulatory domain in which it

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

is located and to cease operation while in those domains for which it does not have type approval. It is incumbent upon the implementer to provide proof of compliance to the requirements of individual regulatory agencies.

The method for configuring individual STAs is outside the scope of this standard. A STA needs to be properly configured for operation in a particular regulatory domain prior to beginning normal operation. Particular care needs to be taken when operating in an IBSS configuration.

10.22.2 Operation upon entering a regulatory domain

A STA that is enabled for operation across regulatory domains uses passive scanning when it has lost connectivity with its ESS. Passive scanning is performed using only the receive capabilities of the STA and is, thus, compatible with regulatory requirements. The timeout for determining the loss of connectivity is system dependent and beyond the scope of this standard.

When a STA with dot11MultiDomainCapabilityActivated true enters a regulatory domain, before transmitting, it shall passively scan to learn at least one valid channel, i.e., a channel upon which it detects IEEE 802.11 frames. The Beacon frame transmitted by non-DMG STAs and the DMG Beacon or Announce frame transmitted by DMG STAs contains information on the country code, the maximum allowable transmit power, and the channels that may be used for the regulatory domain. Optionally, these frames may also include in the Country element, on a periodic basis, the regulatory information that would be returned in a Probe Response frame. When DSE dependent STA operation is required in a regulatory domain, a dependent STA may be required to receive a Beacon, DMG Beacon, or an Announce frame signaling dependent enablement (11.11.5), and until one of these frames is received, the STA may continue passive scanning to receive one such frame directly from an enabling STA. Once the STA has acquired the information so that it is able to meet the transmit requirements of the regulatory domain, it shall transmit a Probe Request frame to an AP or PCP to gain the additional necessary regulatory domain information contained in the Probe Response frame, unless the information was previously received in a Beacon, DMG Beacon, or Announce frame. The STA then has sufficient information available to configure its PHY for operation in the regulatory domain.

10.22.3 Operation with operating classes

The following, and only the following, are extended spectrum management capable: a VHT STA, an HE STA, and a STA that has dot11ExtendedSpectrumManagementImplemented true. A non-VHT STA that has dot11ExtendedSpectrumManagementImplemented true shall indicate that it is extended spectrum management capable using the Extended Spectrum Management Capable field of the Extended Capabilities element.

When communicating with a STA that supports global operating classes, all requests and Action and Action No Ack frames that convey elements containing operating classes shall use global operating class values.

When dot11OperatingClassesImplemented is true, the following statements apply:

- When dot11OperatingClassesRequired is false, or where operating classes domain information is not present in a STA, that STA is not required to change its operation in response to an element that contains an operating class.
- When dot11OperatingClassesRequired is true, or where operating classes domain information is present in a STA, the STA shall indicate current operating class information in the Country element and Supported Operating Classes element, except for the following cases:
  - A VHT STA may omit from the Country element any Operating Triplet field for an Operating Class for which the Channel spacing (MHz) column indicates 80 MHz or wider and for which the Behavior limits set column in the applicable table in Annex E contains only a blank entry or either or both of “80+” and “UseEirpForVHTTxPowEnv.”
  - An HE STA may omit from the Country element any Operating Triplet field for an Operating Class for which the Channel starting frequency column in Table E-4 is greater than or equal to 5.925 and less than or equal to 7.125.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— When dot11OperatingClassesRequired and dot11ExtendedChannelSwitchActivated are true and a STA is capable of operating as specified in more than one operating class, the STA shall include the Supported Operating Classes element in (Re)Association Request and Response frames.
— When dot11OperatingClassesRequired is true, or where operating classes domain information is present and the STA parsing a Country element finds an invalid First Channel Number field or Operating Class field with a value that is reserved, the STA shall ignore the remainder of the Country element and shall parse any remaining management frame body for additional elements.
— When dot11OperatingClassesRequired is true and the STA supports one or more global operating classes, or where global operating classes domain information is present in a STA, the STA shall indicate current operating class information in the Country element and Supported Operating Classes element using the country string for the global operating classes, except for the following cases:
  — A VHT STA may omit from the Country element any Operating Triplet field for an Operating Class for which the Channel spacing (MHz) column indicates 80 MHz or wider and for which the Behavior limits set column in the applicable table in Annex E contains only a blank entry or either or both of "80+" and "UseEirpForVHTTxPowEnv."
  — An HE STA may omit from the Country element any Operating Triplet field for an Operating Class for which the Channel starting frequency column in Table E-4 is greater than or equal to 5.925 and less than or equal to 7.125.

10.22.4 Operation with the Transmit Power Envelope element

A STA that is not operating in the 6 GHz band, is extended spectrum management capable, and has dot11SpectrumManagementRequired or dot11RadioMeasurementActivated equal to true shall determine a local maximum transmit power from a Transmit Power Envelope element for which the Maximum Transmit Power Interpretation subfield indicates EIRP.

A STA that is operating in the 6 GHz band shall determine local and regulatory client maximum transmit powers from Transmit Power Envelope element(s) and other sources known to the STA, according to local regulations known at the STA (see 11.7.5 and E.2.7). A STA shall ignore Transmit Power Envelope element(s) indicating transmit power category values that the STA is unable to interpret for the current country.

NOTE 1—The Default category value (0) is applicable to, and so can be interpreted for, all countries (see 11.7.5). An AP in the 6 GHz band has dot11SpectrumManagementRequired equal to true and therefore transmits a Country element in Beacon and Probe Response frames.

A STA that sends two or more Transmit Power Envelope elements in a frame shall order the elements by increasing values of their Maximum Transmit Power Interpretation subfields.

A STA that is operating in the 6 GHz band that sends two or more Transmit Power Envelope elements in a frame with the same value in the Maximum Transmit Power Interpretation subfield shall order the elements by increasing values of their Maximum Transmit Power Category subfields.

NOTE 2—The Maximum Transmit Power Category subfield is reserved, except in the 6 GHz band.

If a STA that is extended spectrum management capable finds an unknown value in the Maximum Transmit Power Interpretation subfield in a Transmit Power Envelope element, then the STA shall ignore that and subsequent Transmit Power Envelope elements.

A STA that receives two or more Transmit Power Envelope elements in the same frame with known values in their Maximum Transmit Power Interpretation subfields shall process all of the elements according to the local regulations known at the STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 3—If a STA receives two Transmit Power Envelope elements, each with a known value in the Maximum Transmit Power Interpretation subfield, then the expected possibilities are as follows:

a) The STA complies with either element (shared spectrum),
b) The STA complies with both elements (tightened regulations), or
c) The STA complies with the second element (changed regulations).

If a STA receives a Transmit Power Envelope element with the Maximum Transmit Power Interpretation subfield equal to 1 or 3 (EIRP PSD) and the Maximum Transmit Power Count subfield indicating a value of *N* greater than 1, 2, 4, or 8 from an AP that the STA identifies to have BSS bandwidth of 20, 40, 80, or 160/80+80 MHz, respectively, then the STA shall use the Maximum Transmit PSD 1–*M* subfields (*M* equal to 1, 2, 4, or 8 for BSS bandwidth of 20, 40, 80, or 160/80+80 MHz, respectively) to determine the maximum transmit PSD for each 20 MHz channel within the BSS bandwidth. The STA shall ignore the Maximum Transmit PSD *X* subfields with $X > M$.

NOTE 4—This might occur when the AP supports PHY mode(s) unknown to the STA and the actual BSS bandwidth is wider than the BSS bandwidth recognized by the STA.

10.22.5 Operation with coverage classes

The attribute aSlotTime and other MAC timings are based on the PHY timing parameters, as specified in 10.3.2.3, 10.3.7, and 10.23.2.5, and in particular on aAirPropagationTime. If dot11OperatingClassesRequired is true, it is possible to manage the MAC timings of STAs to increase fairness in contending for the medium. Radio waves propagate at ~300 m/μs in free space, and, for example, 3 μs would be the maximum round-trip delay for a BSS with maximum coverage distance of ~450 m (~900 m round trip). The Coverage Class field of the Country element indicates a value of aAirPropagationTime (see Table 9-133), and the MAC can use the value to calculate aSlotTime (as specified in the relevant PHY clause) and other timings.

If dot11OperatingClassesRequired is true and a Country element containing a Coverage Class field has been received from the AP of the BSS of which a STA is a member, from the DO of the IBSS of which a STA is a member, or from another mesh STA in the same MBSS, an associated STA, dependent STA, IBSS STA, or member of an MBSS shall, if the relevant PHY clause specifies that aAirPropagationTime is indicated by the coverage class, use MAC timings that correspond to the value of aAirPropagationTime indicated (as specified in the relevant PHY clause).

NOTE 1—Some PHYs do not specify a dependency of aSlotTime on aAirPropagationTime.

NOTE 2—Operation over larger BSS diameters is facilitated by relaxing some PHY timing parameters, while maintaining compatibility with existing implementations in small BSS diameters.

NOTE 3—An AP using coverage classes that determines that an associating or associated STA does not support coverage classes may deny association to or disassociate that STA. The mechanism by which the AP makes that determination is outside the scope of the standard.

aAirPropagationTime is 0 μs if

— The relevant PHY clause specifies that aAirPropagationTime is indicated by the coverage class, and
— At least one of the following applies:
  — dot11OperatingClassesRequired is false.
  — No Country element containing a Coverage Class field has been received from the AP of the BSS of which a STA is a member, from the DO of the IBSS of which a STA is a member, or from another mesh STA in the same MBSS.

10.23 HCF

10.23.1 General

Under HCF, the basic unit of allocation of the right to transmit onto the WM is the TXOP. Each TXOP is defined by a starting time and a defined maximum length. In a non-DMG BSS, the TXOP may be obtained by a STA winning an instance of EDCA contention (see 10.23.2) or by a STA receiving a QoS (+)CF-Poll frame (see 10.23.3). The former is called *EDCA TXOP*, while the latter is called *HCCA TXOP* or *polled TXOP*.

In a DMG BSS, the EDCAF operates only during CBAPs. Operation of the EDCAF is suspended at the end of a CBAP and is resumed at the beginning of the following CBAP. See 10.38.5 and 10.38.5 for additional rules regarding contention based access in DMG BSSs.

HCCA is not used by DMG, S1G, and HE STAs.

10.23.2 HCF contention based channel access (EDCA)

10.23.2.1 Reference model

The EDCA channel access protocol is derived from the DCF procedures described in 10.3 by adding four independent enhanced distributed channel access functions (EDCAFs) to provide differentiated priorities to transmitted traffic, through the use of four different access categories (ACs).

For the case in which dot11AlternateEDCAActivated is false or not present, a model of the reference implementation is shown in Figure 10-27 and for the case in which dot11AlternateEDCAActivated is true, a model is shown in Figure 10-28. These figures illustrate a mapping from frame type or UP to the transmit queues and the four independent EDCAFs. The mapping of UP to the transmit queue and the mapping to AC are described in 10.2.3.2 and Table 10-1. The mapping of frame types to ACs is also described in 10.2.3.2.

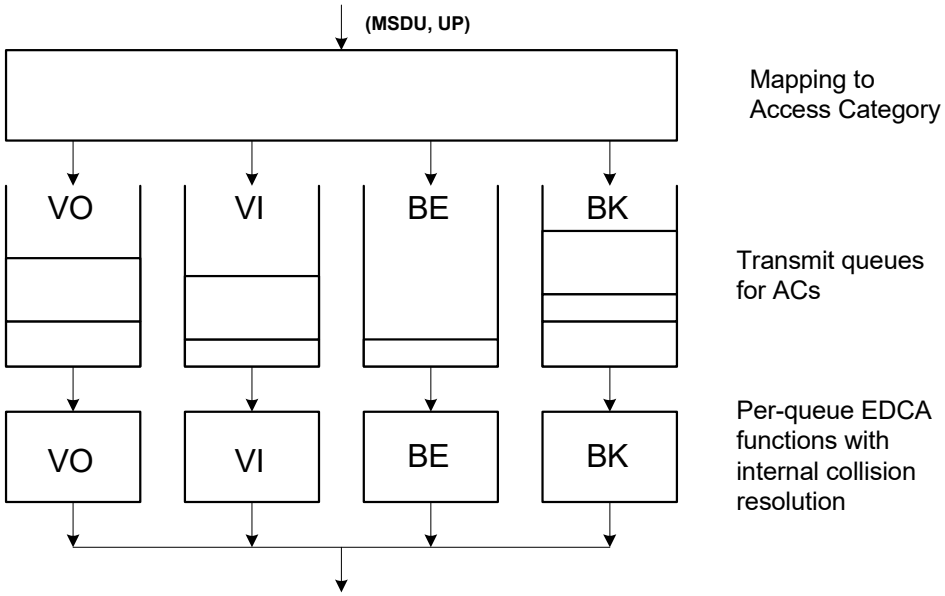

Figure 10-27—Reference implementation model when dot11AlternateEDCAActivated is false or not present

An S1G STA shall be a QoS STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

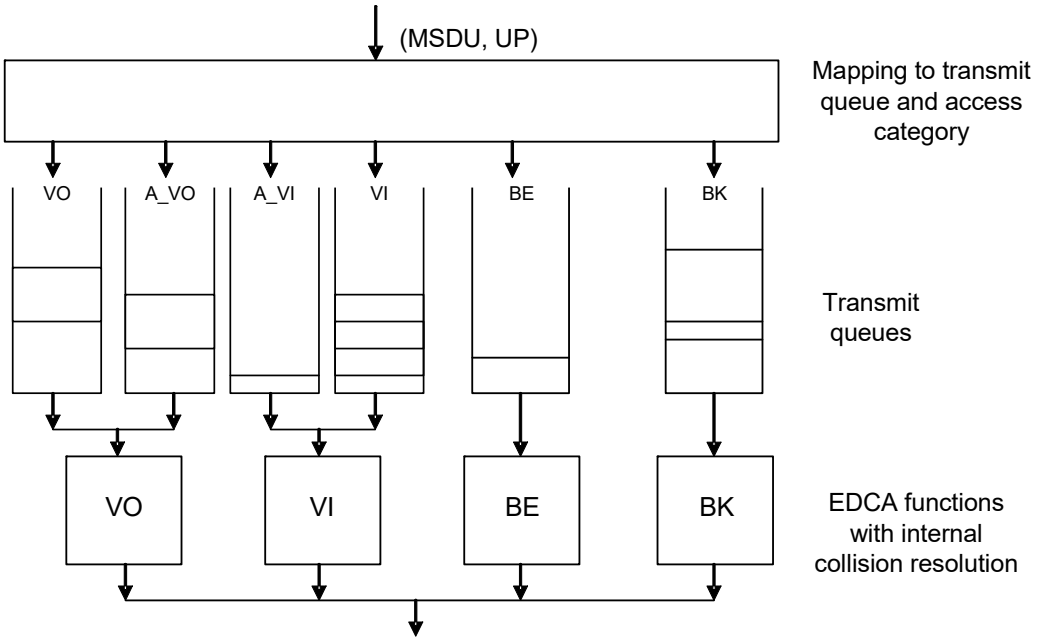

Figure 10-28—Reference implementation model when dot11AlternateEDCAActivated is true

A DMG STA or an S1G STA that is a sensor STA may implement a single AC. If the DMG or S1G STA implements a single AC, all UP and frame types shall be mapped to AC_BE.

NOTE—A DMG or S1G STA that implements a single AC has only one queue in Figure 10-27.

10.23.2.2 EDCA backoff procedure

Each EDCAF shall maintain a MAC variable CW[AC], which shall be initialized to the value of the parameter CWmin[AC], for that EDCAF's AC.

For the purposes of this subclause, transmission success or failure of an MPDU is defined as follows:

- After transmitting an MPDU (even if it is carried in an A-MPDU, as part of a VHT or S1G MU PPDU, or as part of an HE MU PPDU that is sent using TXVECTOR parameter NUM_USERS > 1) that requires an immediate response:
  - The STA shall wait for a timeout interval of duration aSIFSTime + aSlotTime + aRxPHYStartDelay, starting when the MAC receives a PHY-TXEND.confirm primitive. If a PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive does not occur during the timeout interval, the transmission of the MPDU has failed.
  - If a PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive does occur during the timeout interval, the STA shall wait for the corresponding PHY-RXEND.indication primitive to receive a response MPDU that either does not have a TA field or is sent by the recipient of the MPDU requiring a response. Anything else, including the reception of any other frame, is defined to be a failure.
- The nonfinal (re)transmission of an MPDU that is delivered using the GCR unsolicited retry retransmission policy (10.23.2.12.2) is defined to be a failure.
- In all other cases, the transmission of the MPDU is considered to be a successful transmission.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The TXNAV timer is a single timer, shared by the EDCAFs within a STA, that is initialized with the duration from the Duration/ID field in the frame most recently successfully transmitted by the TXOP holder, except for PS-Poll frames. The TXNAV timer begins counting down from the end of the transmission of the PPDU containing that frame. The Reservation Allocation Vector (RAV) timer for a mesh STA that has dot11MCCAActivated true is initialized with the MCCAOP Duration in the MCCAOP Reservation field at the start of an MCCAOP reservation. The RAV timer begins counting down from the start of an MCCAOP reservation (see 10.24.3.9.2).

The backoff procedure shall be invoked by an EDCAF if any of the following events occurs:

a) An MA-UNITDATA.request primitive is received that causes an MPDU corresponding to the EDCAF's AC to be queued for transmission such that all of the following are true:
   1) One of the transmit queues associated with that AC has now become nonempty
   2) Any other transmit queues associated with that AC are empty
   3) The backoff counter has a value of 0 for that AC
   4) The medium is busy on the primary channel as indicated by any of the following:
      — Physical CS
      — Virtual CS
      — A nonzero TXNAV timer value
      — For a mesh STA that has dot11MCCAActivated true, a nonzero RAV timer value

b) For the EDCAF that is the TXOP holder, the transmission of the final PPDU transmitted by the TXOP holder during the TXOP has completed, the final PPDU does not solicit an HE TB PPDU, and the TXNAV timer has expired.

c) For the EDCAF that is the TXOP holder, the transmission of an MPDU in the initial PPDU of a TXOP fails, as defined in this subclause, and the initial PPDU does not solicit an HE TB PPDU.

d) A transmission attempt by the EDCAF collides internally with another EDCAF of an AC that has higher priority, that is, two or more EDCAFs in the same STA are granted a TXOP at the same time.

e) The transmission of at least one MPDU in the final PPDU transmitted by the TXOP holder during the TXOP for that AC has completed, the PPDU contains an MPDU that solicits an HE TB PPDU and the TXNAV timer has expired.

f) The transmission of all MPDUs in the initial PPDU of a TXOP fails, as defined in this subclause, and the PPDU contains an MPDU that solicits an HE TB PPDU.

g) If explicitly indicated, such as in 26.17.2.3.3.

h) The EDCAF is permitted to initiate a TXOP (see 10.23.2.4) but chooses not to.

In addition, the backoff procedure may be invoked by an EDCAF if:

i) For the EDCAF that is the TXOP holder, the transmission by the TXOP holder of an MPDU in a non-initial PPDU of a TXOP fails, as defined in this subclause and an MPDU in the non-initial PPDU does not solicit an HE TB PPDU.

j) For the EDCAF that is the TXOP holder, the transmission by the TXOP holder of all MPDUs in a non-initial PPDU of a TXOP fails, as defined in this subclause, and the PPDU contains an MPDU that solicits an HE TB PPDU.

NOTE 1—If the transmission by the TXOP holder of an MPDU in a non-initial PPDU of a TXOP failed, the STA can perform either a PIFS recovery, as described in 10.23.2.8, perform a backoff as described in item i) above, or wait for the TXNAV timer to expire and invoke the backoff procedure per item b) above. How it chooses among these options is implementation dependent.

A STA that performs a backoff within its existing TXOP per item i) above shall not extend the TXNAV timer value (see 10.23.2.8).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 2—In other words, the backoff is a continuation of the TXOP, not the start of a new TXOP.

If the backoff procedure is invoked for reason a), g) or h) above, CW[AC] and QSRC[AC] shall be left unchanged.

If the backoff procedure is invoked for reason b) or e) above, CW[AC] shall be set to CWmin[AC], and QSRC[AC] shall be set to 0.

If the backoff procedure is invoked for reason c), d), f), i), or j) above, CW[AC] and QSRC[AC] shall be updated as follows:

- If QSRC[AC] is less than dot11ShortRetryLimit,
  - QSRC[AC] shall be incremented by 1.
  - CW[AC] shall be set to the lesser of CWmax[AC] and $2^{QSRC[AC]} \times (CWmin[AC] + 1) - 1$.
- Else
  - QSRC[AC] shall be set to 0.
  - CW[AC] shall be set to CWmin[AC].

NOTE 3—An HE STA updates its local MIB variables related to CWmin and CWmax as defined in 26.2.7 (EDCA operation using MU EDCA parameters).

After transmission of an MPDU in an HE TB PPDU, an HE STA resumes the EDCA backoff procedure without modifying CW or the backoff counter for the associated EDCAF regardless of whether the STA has received the corresponding acknowledgment frame in response to the MPDU sent in the HE TB PPDU.

10.23.2.3 EDCA TXOPs

There are three modes of EDCA TXOP defined: initiation of an EDCA TXOP, sharing an EDCA TXOP, and multiple frame exchange sequence(s) within an EDCA TXOP. Initiation of the TXOP occurs when the EDCA rules permit access to the medium. Sharing of the EDCA TXOP occurs when an EDCAF within an AP that supports DL MU-MIMO has obtained access to the medium, making the corresponding AC the primary AC, and includes traffic from queues associated with other ACs, in MU PPDUs transmitted during the TXOP. In addition, sharing of the EDCA TXOP also occurs when an EDCAF within an HE STA that intends to transmit a Multi-TID A-MPDU has obtained access to the medium following rules defined in 26.6.3. Multiple frame exchange sequence(s) within the TXOP occurs when an EDCAF retains the right to access the medium.

10.23.2.4 Obtaining an EDCA TXOP

Each EDCAF shall maintain a backoff counter, which has a value measured in backoff slots as described below.

When the backoff procedure is invoked, the backoff counter is set to an integer value chosen randomly with a uniform distribution taking values in the range 0 to CW[AC].

The duration AIFS[AC] is a duration derived from the value AIFSN[AC] by the relation

$$AIFS[AC] = AIFSN[AC] \times aSlotTime + aSIFSTime.$$

In an infrastructure BSS, AIFSN[AC] is advertised by an EDCA AP in the EDCA Parameter Set element in Beacon and Probe Response frames transmitted by the AP. The value of AIFSN[AC] shall be greater than or equal to 2 for non-AP STAs. The value of AIFSN[AC] shall be greater than or equal to 1 for APs. An EDCA TXOP is granted to an EDCAF when the EDCAF determines that it shall initiate a frame exchange sequence according to the following rules:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

EDCAF operations shall be performed at slot boundaries, defined as follows on the primary channel, for each EDCAF:

a) Following AIFSN[AC] × aSlotTime – aRxTxTurnaroundTime of idle medium after a SIFS (not necessarily idle medium during the SIFS) after the last busy medium on the antenna that was the result of a reception of a frame with a correct FCS or of an S1G frame. Note that upon reception of an S1G frame, an S1G STA updates its RID counter based on information obtained from the RXVECTOR as described in 10.3.2.5 and this update does not depend on the outcome of the FCS check.

b) Following EIFS – DIFS + AIFSN[AC] × aSlotTime + aSIFSTime – aRxTxTurnaroundTime of idle medium after the last indicated busy medium as determined by the physical CS mechanism that was the result of a non-S1G frame reception that has resulted in FCS error, or of a frame reception that has resulted in PHY-RXEND.indication (RXERROR) primitive where the value of RXERROR is not NoError.

c) When any other EDCAF at this STA transmitted a frame requiring immediate acknowledgment, the earlier of

   1) The end of the AckTimeout interval timed from the PHY-TXEND.confirm primitive, followed by AIFSN[AC] × aSlotTime + aSIFSTime – aRxTxTurnaroundTime of idle medium, and

   2) The end of the first AIFSN[AC] × aSlotTime – aRxTxTurnaroundTime of idle medium after a SIFS (not necessarily medium idle during the SIFS, the start of the SIFS implied by the length in the PHY header of the previous frame) when a PHY-RXEND.indication primitive occurs as specified in 10.3.2.11.

d) Following AIFSN[AC] × aSlotTime – aRxTxTurnaroundTime of idle medium after a SIFS (not necessarily medium idle during the SIFS) after the last busy medium on the antenna that was the result of a transmission of a frame for any EDCAF and which did not require an acknowledgment and after the expiration of the TXNAV timer if nonzero, and, if dot11MCCAActivated is true, the expiration of the RAV timer if nonzero.

e) Following AIFSN[AC] × aSlotTime + aSIFSTime – aRxTxTurnaroundTime of idle medium after the last indicated busy medium as indicated by the CS mechanism that is not covered by condition a) to condition d).

f) Following aSlotTime of idle medium, which occurs immediately after any of these conditions, a) to f), is met for the EDCAF.

On these specific slot boundaries, each EDCAF shall make a determination to perform one and only one of the following functions:

— Decrement the backoff counter.
— Initiate a TXOP.
— Invoke the backoff procedure due to choosing not to transmit.
— Invoke the backoff procedure due to an internal collision.
— Do nothing.

At each of the above-described specific slot boundaries, each EDCAF shall decrement the backoff counter if the backoff counter for that EDCAF has a nonzero value.

At each of the above-described specific slot boundaries, if

— There is a frame available for transmission at an EDCAF, and
— The backoff counter for that EDCAF has a value of 0, and
— Initiation of a transmission sequence is not allowed to commence at this time for an EDCAF of higher UP, that EDCAF shall either choose not to transmit (which results in invocation of the backoff procedure as specified in 10.23.2.2) or initiate a TXOP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—An EDCAF might choose not to transmit if the available bandwidth (based on the state of the secondary channel(s)) is insufficient for its purposes, or for other reasons.

At each of the above-described specific slot boundaries, each EDCAF shall report an internal collision (which results in invocation of the backoff procedure as specified in 10.23.2.2 (see item d)) if

— There is a frame available for transmission at that EDCAF, and
— The backoff counter for that EDCAF has a value of 0, and
— Initiation of a frame exchange sequence is allowed to commence at this time for an EDCAF of higher UP.

At each of the above-described specific slot boundaries, each EDCAF shall do nothing if

— There is no frame available for transmission at that EDCAF, and
— The backoff counter for that EDCAF has a value of 0.

NOTE 2—An EDCAF does nothing at each of the above-described specific slot boundaries if there is not a frame available for transmission at that EDCAF and the backoff counter for that EDCAF has a value of 0.

NOTE 3—If an EDCAF gains access to the channel and transmits MSDUs, A-MSDUs, or MMPDUs from a secondary AC, the EDCAF of the secondary AC is not affected by this operation. If the EDCAF of a secondary AC experiences an internal collision with the EDCAF that gained access to the channel, it performs the backoff procedure regardless of the transmission of any of its MSDUs, A-MSDUs, or MMPDUs (see 10.23.2.7).

An example showing the relationship between AIFS, AIFSN, DIFS, and slot times immediately following a medium busy condition (and assuming that medium busy condition was not caused by a frame in error) is shown in Figure 10-29. In this case, with AIFSN = 2, the EDCAF may decrement the backoff counter for the first time at 2 × aSlotTime following the TxSIFS (where TxSIFS is the time at which the MAC responds to the end of the medium busy condition if it is going to respond “after a SIFS”). If, in this example, the backoff counter contained a value of 1 at the time the medium became idle, transmission would start as a result of an EDCA TXOP on-air at a time

aSIFSTime + 3 × aSlotTime

following the end of the medium busy condition.

A STA shall save the TXOP holder address for the BSS in which it is associated. The TXOP holder address is the MAC address from the Address 2 field of the frame that initiated a frame exchange sequence except if this is a CTS frame, in which case the TXOP holder address is the Address 1 field. If the TXOP holder address is obtained from a Control frame, a VHT STA or HE STA shall save the nonbandwidth signaling TA obtained from the Address 2 field. If a non-VHT non-HE STA receives an RTS frame with the RA matching the MAC address of the STA and the MAC address in the TA field in the RTS frame matches the saved TXOP holder address, then the STA shall send the CTS frame after a SIFS, without regard for, and without resetting, its NAV. If a VHT STA or HE STA receives an RTS frame with the RA matching the MAC address of the STA and the nonbandwidth signaling TA obtained from the Address 2 field in the RTS frame matches the saved TXOP holder address, then the STA shall send the CTS frame after a SIFS, without regard for, and without resetting, its NAV. If a CMMG STA receives an RTS frame with the RA matching the MAC address of the STA and the TA value obtained from the Address 2 field in the RTS frame matches the saved TXOP holder address, then the STA shall send the CTS frame after a SIFS, without regarding for, and without resetting its NAV. When a STA receives a frame addressed to it that requires an immediate response, except for RTS and Trigger frames (see 26.5.2.5), it shall transmit the response independent of its NAV. The saved TXOP holder address shall be cleared when the NAV is reset or when the NAV counts down to 0.

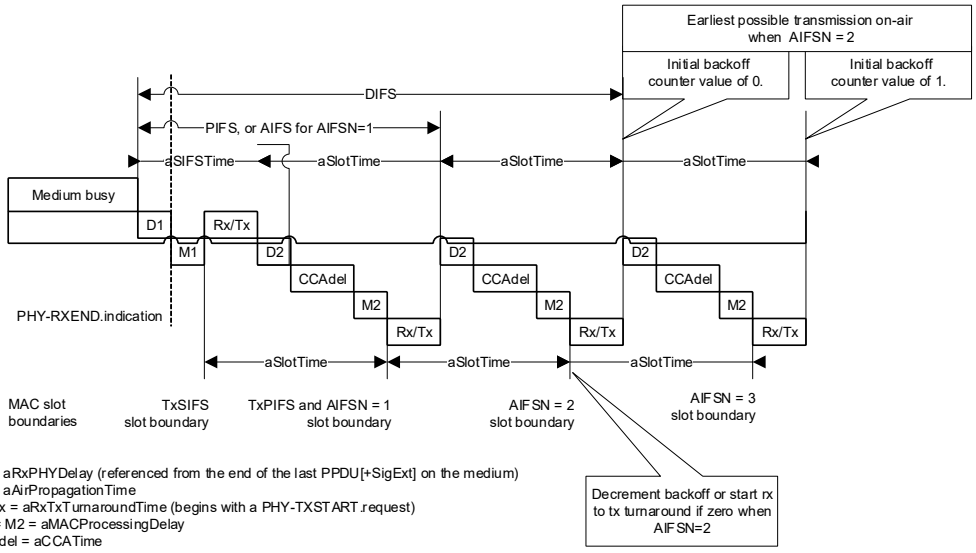

Figure 10-29—EDCA mechanism timing relationships

During an EDCA TXOP, the Address 2 field excluding the Individual/Group bit of all Control frames sent by an HE STA that is a TXOP holder and carried in a PPDU that is not an HE MU PPDU shall be set to the same address value.

10.23.2.5 EDCA channel access in a VHT or TVHT BSS

If the MAC receives a PHY-CCA.indication primitive with the channel-list parameter present, the channels considered idle are defined in Table 10-17.

Table 10-17—Channels indicated idle by the channel-list parameter for VHT or TVHT BSSs

PHY-CCA.indication primitive channel-list parameter entry	Idle channels
primary	None
secondary	Primary 20 MHz channel
secondary40	Primary 20 MHz channel and secondary 20 MHz channel
secondary80	Primary 20 MHz channel, secondary 20 MHz channel, and secondary 40 MHz channel

If the MAC receives a PHY-CCA.indication primitive with the per20bitmap parameter present, the parameter indicates the busy/idle status of each of the 20 MHz subchannels that comprise the operating channel width.

When a STA and the BSS, of which the STA is a member, both support multiple channel widths, an EDCA TXOP is obtained based solely on activity of the primary channel (see 10.23.2.4). “Idle medium” in this subclause means “idle primary channel.” Likewise “busy medium” means “busy primary channel.” Once an EDCA TXOP has been obtained according to this subclause, further constraints defined in 11.15.9 and 10.23.3

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

might limit the width of transmission during the TXOP or deny the channel access, based on the state of CCA on secondary channel, secondary 40 MHz channel, or secondary 80 MHz channel.

In the following description, the CCA is sampled according to the timing relationships defined in 10.3.7. Slot boundaries are determined solely by activity on the primary channel. “Channel idle for an interval of PIFS” means that the STATE parameter of the most recent PHY-CCA.indication primitive was IDLE, and no PHY-CCA.indication(BUSY) occurred during the period of PIFS that ends at the start of transmission, the CCA for that channel was determined to be idle.

If one of a STA’s EDCAFs is permitted to initiate a TXOP (as specified in 10.23.2.4), the STA shall perform exactly one of the following actions:

a) Transmit a 160 MHz or 80+80 MHz mask PPDU if the secondary channel, the secondary 40 MHz channel, and the secondary 80 MHz channel were idle during an interval of PIFS immediately preceding the start of the TXOP.

b) Transmit an 80 MHz mask PPDU on the primary 80 MHz channel if both the secondary channel and the secondary 40 MHz channel were idle during an interval of PIFS immediately preceding the start of the TXOP.

c) Transmit a 40 MHz mask PPDU on the primary 40 MHz channel if the secondary channel was idle during an interval of duration 1) DIFS if the PPDU is transmitted in the 2.4 GHz band or 2) PIFS otherwise, immediately preceding the start of the TXOP.

d) Transmit a 20 MHz mask PPDU on the primary 20 MHz channel.

e) Transmit nothing and invoke the backoff procedure for the EDCAF as specified in 10.23.2.2.

f) Transmit a TVHT_4W or TVHT_2W+2W mask PPDU if the secondary TVHT_W channel and the secondary TVHT_2W channel were idle during an interval of PIFS immediately preceding the start of the TXOP.

g) Transmit a TVHT_2W or TVHT_W+W mask PPDU if the secondary TVHT_W channel was idle during an interval of PIFS immediately preceding the start of the TXOP.

h) Transmit a TVHT_W mask PPDU on the primary TVHT_W channel.

i) Transmit an 80 MHz HE MU PPDU where in the preamble the only punctured subchannel is the secondary 20 MHz channel, if all of the 20 MHz subchannels (other than the primary 20 MHz channel) that are not punctured were idle during an interval of PIFS immediately preceding the start of the TXOP.

j) Transmit an 80 MHz HE MU PPDU where in the preamble the only punctured subchannel is one of the two 20 MHz subchannels in the secondary 40 MHz channel, if all of the 20 MHz subchannels that are not punctured were idle during an interval of PIFS immediately preceding the start of the TXOP.

k) Transmit a 160 MHz or 80+80 MHz HE MU PPDU where in the preamble the only punctured subchannels are the secondary 20 MHz channel and zero to two of the 20 MHz subchannels in the secondary 80 MHz channel, if all of the 20 MHz subchannels that are not punctured were idle during an interval of PIFS immediately preceding the start of the TXOP. If two of the 20 MHz subchannels in the secondary 80 MHz channel are punctured, these are either the lower two or the higher two. No more than two adjacent 20 MHz subchannels are punctured across the preamble, for a 160 MHz preamble.

l) Transmit a 160 MHz or 80+80 MHz HE MU PPDU where in the preamble the only punctured subchannels are zero, one, or both of the 20 MHz subchannels in the secondary 40 MHz channel and zero to two of the 20 MHz subchannels in the secondary 80 MHz channel, if all of the 20 MHz subchannels that are not punctured were idle during an interval of PIFS immediately preceding the start of the TXOP. At least one 20 MHz subchannel is punctured. If two of the 20 MHz subchannels in the secondary 80 MHz channel are punctured, these are either the lower two or the higher two. No more than two adjacent 20 MHz subchannels are punctured across the preamble, for a 160 MHz preamble.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—An EDCAF that initiates a TXOP has a frame available for transmission (see 10.23.2.4). There might be another EDCAF of lower priority that invokes the backoff procedure due to an internal collision (see 10.23.2.4.

NOTE 2—In the case of rule e), the STA selects a new random number using the current value of CW[AC], and the retry count is not updated [as described in 10.23.2.2; backoff procedure invoked for event a)].

NOTE 3—An HT, VHT, or HE STA obtains an EDCA TXOP based on activity on the primary channel (see 10.23.2.4). The width of transmission is determined by the CCA status of the nonprimary channels during an interval of duration 1) DIFS if transmitting in the 2.4 GHz band or 2) PIFS otherwise, before transmission (see in 10.3.2).

NOTE 4—In the case of rule j), there was only one idle 20 MHz subchannel in the secondary 40 MHz channel, and the other 20 MHz subchannel in the secondary 40 MHz channel is preamble punctured.

10.23.2.6 EDCA channel access in an S1G BSS

If the MAC receives a PHY-CCA.indication primitive with the channel-list parameter present, the channels considered idle are defined in Table 10-18.

Table 10-18—Channels indicated idle by the channel-list parameter for S1G BSSs

PHY-CCA.indication primitive channel-list parameter entry	Idle channels
primary1	None
primary2	primary 1 MHz channel
secondary2	primary 1 MHz channel, primary 2 MHz channel
secondary4	primary 1 MHz channel, primary 2 MHz channel and secondary 2 MHz channel
secondary8	primary 1 MHz channel, primary 2 MHz channel, secondary 2 MHz channel and secondary 4 MHz channel

When a STA and the BSS, of which the STA is a member, both support multiple channel widths, an EDCA TXOP is obtained based solely on activity of the primary channel (see 10.23.2.4). “Idle medium” in this subclause means “idle primary channel.” Likewise “busy medium” means “busy primary channel.”

In the following description, the CCA is sampled according to the timing relationships defined in 10.3.7. Slot boundaries are determined solely by activity on the primary channel. “Channel idle for an interval of PIFS” means that whenever CCA is sampled during the period of PIFS that ends at the start of transmission, the CCA for that channel was determined to be idle.

a) If an S1G STA invokes a backoff procedure at the primary 2 MHz channel for ≥ 2 MHz mask PPDU transmission using the CCA conditions defined in 23.3.18.5.3 and one of the STA’s EDCAFs is permitted to initiate a TXOP (as specified in 10.23.2.4), the STA shall perform exactly one of the following actions:
   1) Transmit a 16 MHz mask PPDU if the secondary 2 MHz channel, the secondary 4 MHz channel and the secondary 8 MHz channel were idle during an interval of PIFS immediately preceding the start of the TXOP.
   2) Transmit an 8 MHz mask PPDU on the primary 8 MHz channel if both the secondary 2 MHz channel and the secondary 4 MHz channel were idle during an interval of PIFS immediately preceding the start of the TXOP.
   3) Transmit a 4 MHz mask PPDU on the primary 4 MHz channel if the secondary 2 MHz channel was idle during an interval of PIFS immediately preceding the start of the TXOP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

4) Transmit a 2 MHz mask PPDU on the primary 2 MHz channel.
5) Transmit nothing and invoke the backoff procedure for the EDCAF as specified in 10.23.2.3.

b) Prior to transmitting an 8 or 16 MHz PPDU, an S1G STA may also invoke a backoff procedure at the primary 2 MHz channel using the CCA conditions defined in 23.3.18.5.3.2, if one of the STA's EDCAFs is permitted to initiate a TXOP (as in 10.23.2.4). In this case the S1G STA shall perform exactly one of the following actions:
1) Transmit a 16 MHz PPDU if the secondary 2 MHz channel, the secondary 4 MHz channel and the secondary 8 MHz channel were idle during an interval of PIFS immediately preceding the start of the TXOP.
2) Transmit an 8 MHz PPDU on the primary 8 MHz channel if both the secondary 2 MHz channel and the secondary 4 MHz channel were idle during an interval of PIFS immediately preceding the start of the TXOP.
3) Transmit nothing and invoke the backoff procedure for the EDCAF as specified in 10.23.2.2.

c) If an S1G STA invokes a backoff procedure at the primary 1 MHz channel for 1 MHz PPDU transmission and one of the STA's EDCAFs is permitted to initiate a TXOP (as specified in 10.23.2.4), the S1G STA shall transmit a 1 MHz mask PPDU on the primary 1 MHz channel.

NOTE —An EDCAF that initiates a TXOP has a frame available for transmission (see 10.23.2.4). There might be another EDCAF of lower priority that invokes the backoff procedure due to an internal collision (see 10.23.2.4).

10.23.2.7 Sharing an EDCA TXOP

The AC associated with the EDCAF that gains an EDCA TXOP is referred to as the primary AC. Frames from ACs other than the primary AC shall not be included in the TXOP, with the following exceptions (TXOP sharing):

— For a multi-TID A-MPDU in an HE MU PPDU transmitted by an AP, frames from any AC may be included as defined in 26.6.3. Otherwise, frames from a higher priority AC may be included when at least one frame from the primary AC has been transmitted and all frames from the primary AC have been transmitted.

NOTE 1—The frames from a higher priority AC might be included in successive PPDUs in the TXOP and/or in one or more MU PPDUs.

— When VHT AP, EDMG AP, or PCP supports DL MU-MIMO, frames from a lower priority AC may be included in VHT or EDMG MU PPDU with the TXVECTOR parameter NUM_USERS > 1 when these frames do not increase the duration of the VHT or EDMG MU PPDU beyond that required for the transmissions of the frames of the primary AC and any frames from a high priority AC. For a given user, any frames from the primary AC shall be transmitted first and then any frames from a higher priority AC immediately next.

— When an HE AP transmits an HE MU PPDU, frames from higher or lower priority AC may be included in the HE MU PPDU when these frames do not increase the duration of the HE MU PPDU beyond that required for the transmissions of the frames of the primary AC and any frames from a high priority AC. For a given user, any frames from the primary AC shall be transmitted first, and then any frames from a higher priority AC immediately next.

NOTE 1—TXOP sharing is an operation performed by a single EDCAF, using frames belonging to another EDCAF's queues.

The EDCAF remains bound by the TXOP limit for its AC (i.e., the primary AC), irrespective of the AC(s) of the frames transmitted during the TXOP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

With respect to admission control (see 10.23.4.2), all frames transmitted under TXOP sharing shall be treated as if they were from the primary AC.

NOTE 2—An AP or PCP can protect an immediate response by preceding the DL MU-MIMO PPDU (which might have TXVECTOR parameter NUM_USERS > 1) with an RTS/CTS, MU-RTS Trigger/CTS frame exchange sequence or a CTS-to-self transmission.

An illustration of TXOP sharing is shown in Figure 10-30 and Figure 10-31. The AP has frames in queues of three of its ACs. The TXOP was obtained by AC_VI or AC_BE, as shown, and is shared by the other two ACs. The frames target three STAs, STA-1 to STA-3.

10.23.2.8 Multiple frame exchange sequences in an EDCA TXOP

Frame exchange sequences of the primary AC may be transmitted in an EDCA TXOP that was acquired following the rules in 10.23.2.4. Frames that are pending in other ACs shall not be transmitted in this EDCA TXOP except when permitted by the rules in 10.23.2.7. If a TXOP holder has in its transmit queue an additional frame exchange sequence of the primary AC (or, where permitted, a secondary AC) and the duration of that frame exchange sequence is less than the remaining TXNAV timer value and, if dot11MCCAActivated is true, the remaining RAV timer value, then the TXOP holder may initiate that frame exchange sequence a SIFS (or RIFS, if the conditions defined in 10.3.2.3.2 are met, or PIFS, if the frame contains a bandwidth signaling TA) after the completion of the immediately preceding frame exchange sequence, subject to the TXOP limit restriction as described in 10.23.2.9. A STA shall not commence the transmission of an RTS with a bandwidth signaling TA until at least a PIFS after the immediately preceding frame exchange sequence. A CMMG STA shall not commence the transmission of an RTS frame until at least PIFS time after the immediately preceding frame exchange sequence. An HT STA that is a TXOP holder may transmit multiple MPDUs of the same AC within an A-MPDU as long as the duration of transmission of the A-MPDU plus any expected BlockAck frame response is less than the remaining TXNAV timer value and, if dot11MCCAActivated is true, the remaining RAV timer value. An S1G STA that is a TXOP holder may transmit multiple MPDUs of the same AC within an A-MPDU as long as the duration of transmission of the A-MPDU plus any expected (NDP) BlockAck frame response is less than the remaining TXNAV timer value.

NOTE 1—PIFS is used by a VHT STA to perform CCA in the secondary 20 MHz, 40 MHz, and 80 MHz channels before receiving RTS (see 10.3.2).

NOTE 2—An RD responder can transmit multiple MPDUs as described in 10.29.4.

NOTE 3—PIFS is used by an EDMG STA to perform CCA in the secondary, secondary1, and secondary2 channels before receiving RTS (see 10.3.2).

NOTE 4—Within a BDT, STAs can transmit multiple MPDUs as described in 10.49.

NOTE 5—A PIFS is required to be present preceding an RTS transmission by a CMMG STA in order to allow a recipient of the RTS to perform CCA in the secondary 540 MHz channels to determine the appropriate response to the RTS.

After a valid response to the initial frame of a TXOP, if the Duration/ID field is set for multiple frame exchange sequences and there is a subsequent transmission failure, the corresponding channel access function may transmit after the CS mechanism (see 10.3.2.1) indicates that the medium is idle at the TxPIFS slot boundary (see Figure 10-29) provided that the duration of that transmission plus the duration of any expected acknowledgment and applicable IFS is less than the remaining TXNAV timer value and, if dot11MCCAActivated is true, the RAV timer. At the expiration of the TXNAV timer and if dot11MCCAActivated is true, the RAV timer, if the channel access function has not regained access to the medium, then the EDCAF shall invoke the backoff procedure that is described in 10.23.2.4. Transmission failure is defined in 10.23.2.12.

All other channel access functions at the STA shall treat the medium as busy until the expiration of the TXNAV timer.

NOTE 6—Frame exchange sequence(s) are granted to an EDCAF, not to a STA, so that multiple frame exchange sequences are permitted only for the transmission of frames of the same AC as the frame that was granted the EDCA TXOP, except as specified in 10.23.2.7.

If a TXOP is protected by an RTS or CTS frame carried in a non-HT or a non-HT duplicate PPDU, the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of a PPDU as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— To be the same or narrower than the RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT of the last received CTS frame in the same TXOP, if the RTS frame with a bandwidth signaling TA and TXVECTOR parameter DYN_BANDWIDTH_IN_NON_HT set to Dynamic has been sent by the TXOP holder in the last RTS/CTS exchange.
— Otherwise, to be the same or narrower than the TXVECTOR parameter CH_BANDWIDTH of the RTS frame that has been sent by the TXOP holder in the last RTS/CTS exchange in the same TXOP.

If a TXOP is protected by an MU-RTS Trigger frame or CTS frame carried in a non-HT or a non-HT duplicate PPDU, the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of a PPDU as follows:

— To be the same or narrower than the TXVECTOR parameter CH_BANDWIDTH of the MU-RTS Trigger frame that has been sent by the TXOP holder in the last MU-RTS Trigger/CTS frame exchange sequence in the same TXOP, if the RU Allocation subfields of the MU-RTS Trigger frame for all intended receivers are equal to a value that corresponds to the channel bandwidth that is indicated in the UL BW subfield in the Common Info field of the MU-RTS Trigger frame.
— Otherwise, to be the same or narrower than the TXVECTOR parameter CH_BANDWIDTH of the preceding PPDU that it has transmitted in the same TXOP.

If there is no RTS/CTS or MU-RTS Trigger/CTS frame exchange sequence in non-HT duplicate format in a TXOP, and the TXOP includes at least one non-HT duplicate frame that does not include a PS-Poll, then the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of a PPDU sent after the first non-HT duplicate frame that is not a PS-Poll to be the same or narrower than the TXVECTOR parameter CH_BANDWIDTH of the initial frame in the first non-HT duplicate frame in the same TXOP.

If there is no non-HT duplicate frame in a TXOP, the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of a non-initial PPDU to be the same or narrower than the TXVECTOR parameter CH_BANDWIDTH of the preceding PPDU that it has transmitted in the same TXOP, subject to the following constraints:

— If the preceding PPDU is a DL HE MU PPDU with preamble puncture, the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of the non-initial PPDU to a value whose corresponding 20 MHz channels are within a set of 20 MHz channels where pre-HE modulated fields of the preceding PPDU are located.
— If the non-initial PPDU is a DL HE MU PPDU with preamble puncture, the TXOP holder shall set the TXVECTOR parameter RU_ALLOCATION of the non-initial PPDU to a value whose corresponding RU is within a set of 20 MHz channels where pre-HE modulated fields of the preceding PPDU are located.

If a TXOP is protected by a CTS-to-self frame carried in a non-HT or non-HT duplicate PPDU, the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of a PPDU to be the same or narrower than the TXVECTOR parameter CH_BANDWIDTH of the CTS-to-self frame in the same TXOP.

Note that multiple frame exchange sequences in a TXOP that use acknowledgment mechanisms other than immediate acknowledgment should use a protective mechanism (such as RTS/CTS or the protection mechanism described in 10.27). A QoS AP or a mesh STA may send group addressed frames without using any protection mechanism. In a QoS IBSS, group addressed frames shall be sent one at a time, and backoff shall be performed after the transmission of each of the group addressed frames. In an MBSS, a mesh STA may send multiple group addressed frames in a TXOP, bounded by the TXOP limit, without performing backoff after the TXOP is obtained.

In the course of transmitting transmit an 8 MHz or 16 MHz PPDU invoking a backoff procedure in the primary 2 MHz channel using the channel busy conditions defined in 23.3.18.5.3.2 an S1G STA shall not set

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the Dynamic Indication field to 1 in any RTS frame that is scheduled for transmission at the expiration of this backoff.

10.23.2.9 TXOP limits

The duration of a TXOP is the time a STA obtaining a TXOP (the TXOP holder) maintains uninterrupted control of the medium, and it includes the time required to transmit frames sent as an immediate response to TXOP holder transmissions. The TXOP holder shall, subject to the exceptions below, ensure that the duration of a TXOP does not exceed the TXOP limit, when nonzero.

The TXOP limits are advertised by the AP in the EDCA Parameter Set element in Beacon and Probe Response frames transmitted by the AP.

A TXOP limit of 0 indicates that the TXOP holder may transmit or cause to be transmitted (as responses) the following within the current TXOP:

a) One of the following at any rate, subject to the rules in 10.6
   1) One or more SU PPDUs carrying fragments of a single MSDU or MMPDU
   2) An SU or MU PPDU, where the PPDU carries a single MSDU, single MMPDU, single A-MSDU, or single A-MPDU
   3) An MU PPDU carrying A-MPDUs to different users (a single A-MPDU to each user)
   4) A QoS Null frame or PS-Poll frame that is not an PS-Poll+BDT frame
   5) A Basic Trigger frame, BSRP Trigger frame, or BQRP Trigger frame
   6) An HE TB PPDU carrying A-MPDUs from different users (a single A-MPDU from each user)
b) Any required acknowledgments
c) Any frames required for protection, including one of the following:
   1) An RTS/CTS or MU-RTS Trigger/CTS frame exchange
   2) CTS-to-self
   3) Dual CTS as specified in 10.3.2.10
d) Any frames required for beamforming as specified in 10.30, 10.35.5, 26.7, and 10.41
e) Any frames required for link adaptation as specified in 10.31 and 26.13
f) Any number of BlockAckReq, MU-BAR Trigger, Multi-TID BlockAckReq, or GCR MU-BAR Trigger frames

NOTE 1—This is a rule for the TXOP holder. A TXOP responder need not be aware of the TXOP limit nor of when the TXOP was started.

NOTE 2—This rule prevents the use of RD, BDT, and TXOP sharing when the TXOP limit is 0.

When dot11OCBActivated is true, dot11NGVOptionImplemented is false or not present, and dot11DMGOCBActivated is false or not present, the TXOP limit shall be 0 for each AC.

The TXOP holder may exceed the TXOP limit only if it does not transmit more than one Data or Management frame in the TXOP, only if it does not transmit a DL MU-MIMO PPDU in the TXOP, and only for the following situations:

— Retransmission of an MPDU, not in an A-MPDU consisting of more than one MPDU, where the size of the retransmitted MPDU is the same as the initially transmitted MPDU.
— Transmission of an MSDU or MMPDU less than 600 octets by an S1G non-sensor STA.
— Transmission of a fragment of an MSDU or MMPDU, the fragment being less than 256 octets, by an S1G non-sensor STA.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

- Initial transmission of an MSDU under a block ack agreement, where the MSDU is not in an A-MPDU consisting of more than one MPDU and the MSDU is not in an A-MSDU.
- Transmission of a Control frame or a QoS Null frame , not in an A-MPDU consisting of more than one MPDU.
- Initial transmission of a nondynamic fragment of an MSDU or MMPDU (see 10.4), if a previous fragment of that MSDU or MMPDU was retransmitted.
- Transmission of a nondynamic fragment of an MSDU or MMPDU fragmented into 16 fragments.
- Transmission of the 16th dynamic fragment of an MSDU or MMPDU.
- Initial transmission of the first dynamic fragment of an MSDU or MMPDU, where the size of the first fragment is equal to the minimum fragment size specified by the receiver STA and the MSDU or MMPDU is not in an A-MPDU consisting of more than one MPDU.
- Transmission of an A-MPDU consisting of the initial transmission of a single MPDU not containing an MSDU and that is not an individually addressed Management frame.
- Transmission of a group addressed MPDU, not in an A-MPDU consisting of more than one MPDU.
- Transmission of a null data PPDU (NDP).
- Transmission of a VHT NDP Announcement frame and NDP or transmission of a Beamforming Report Poll frame, where these fit within the TXOP limit and only the response and the immediately preceding SIFS cause the TXOP limit to be exceeded.
- Transmission of one of the following sequences, provided that the sequence fits within the TXOP limit and only the response and the immediately preceding SIFS cause the TXOP limit to be exceeded:
  - An HE NDP Announcement frame and HE sounding NDP
  - An HE NDP Announcement frame and HE sounding NDP and BFRP Trigger frame
  - A BFRP Trigger frame

Except as described above, a STA shall fragment an individually addressed MSDU or MMPDU so that the initial transmission of the first fragment does not cause the TXOP limit to be exceeded.

NOTE 3—The TXOP limit is not exceeded for the following situations:

a) Initial transmission of an MPDU containing an unfragmented though fragmentable (see 10.2.7 and 26.3) MSDU/MMPDU.
b) Initial transmission of the first fragment of a fragmented MSDU/MMPDU, except if the MSDU/MMPDU is fragmented into 16 fragments.
c) Initial transmission of an A-MSDU.
d) Initial transmission of a nondynamic fragment of a fragmented MSDU/MMPDU, if no previous fragment of that MSDU/MMPDU was retransmitted, except if the MSDU/MMPDU is fragmented into 16 fragments.
e) Initial transmission of a dynamic fragment of a fragmented MSDU/MMPDU, except for either the first dynamic fragment of a fragmented MSDU/MMPDU using the minimum fragment size specified by the receiver STA, or the 16th dynamic fragment of a fragmented MSDU/MMPDU.
f) Transmission of an A-MPDU consisting of a single MPDU containing an A MSDU or individually addressed Management frame, unless this is a retransmission of that MPDU.
g) Transmission of an A-MPDU consisting of more than one MPDU, even if some or all of the MPDUs are retransmissions.
h) Transmission of a Trigger frame, other than a BFRP Trigger frame, where either the Trigger frame or its response does not fit within the TXOP limit.

If the TXOP holder exceeds the TXOP limit, it should use as high a PHY rate as possible to minimize the duration of the TXOP.

The duration of a TXOP for a mesh STA that has dot11MCCAActivated true shall not exceed the time between the start of the TXOP and the end of the current MCCAOP reservation.

NOTE 4—The rules in this subclause also apply to priority-downgraded MSDUs and A-MSDUs (see 10.23.4.2).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the Duration field in a frame carried in an HE TB PPDU is set to 0, the HE TB PPDU shall not include any frames that solicit a control response frame from the AP.

10.23.2.10 Truncation of TXOP

When a STA gains access to the channel using EDCA and empties its transmission queue, it may transmit a CF-End frame provided that the remaining duration is long enough to transmit this frame. By transmitting the CF-End frame, the STA is explicitly indicating the completion of its TXOP. In a DMG BSS, the STA shall not send a CF-End frame with a nonzero value in the Duration/ID field if the remaining duration is shorter than $2\times T_{CF\text{-}End}$ + 2×SIFS, where $T_{CF\text{-}End}$ is the duration of a CF-End frame. A STA that is an S1G AP may transmit an NDP CF-End frame instead of a CF-End frame. A non-S1G STA shall not transmit an NDP CF-End frame.

An S1G STA that both

— Transmits either a PPDU with its TXVECTOR parameter RESPONSE_INDICATION value Long Response or an NDP (PS-Poll-)Ack frame with its Idle Indication field value 1 and Duration field value 0 and

— Does not receive (after a SIFS) a response with its RXVECTOR parameter RESPONSE_INDICATION value NDP Response or Normal Response

may, after a PIFS, transmit an NDP CF-End frame to truncate any active RID or NAV.

A TXOP holder that transmits a CF-End frame shall not initiate any further frame exchange sequences within the current TXOP.

An S1G STA that transmits an NDP CF-End frame shall set the frame's Duration field to 0 and shall initiate no other frame exchange sequences in the current TXOP.

A non-AP STA that is not the TXOP holder shall not transmit a CF-End frame.

In a non-DMG BSS, a non-S1G non-HE STA shall interpret the reception of a CF-End frame as a NAV reset, i.e., it resets its NAV to 0 at the end of the PPDU containing this frame. After receiving a CF-End frame with a matching BSSID(TA) without comparing Individual/Group bit, an AP may respond by transmitting a CF-End frame after a SIFS. An HE STA interprets the reception of a CF-End frame as defined in 26.2.5.

NOTE 1—The transmission of a single CF-End frame by the TXOP holder resets the NAV of STAs hearing the TXOP holder. There may be STAs that could hear the TXOP responder that had set their NAV that do not hear this NAV reset. Those STAs are prevented from contending for the medium until the original NAV reservation expires.

NOTE 2—A CF-End sent by a non-AP VHT STA that is a member of a VHT BSS can include the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT as defined in 10.6.6.6 in case it elicits a CF-End response.

In a DMG BSS, a STA that is not in the listening mode (10.38.6.6) shall interpret the reception of a CF-End frame as a NAV reset, i.e., it resets its NAV to 0 at the end of the time interval indicated in the value of the Duration/ID field of the received frame. The interval starts at PHY-RXEND.indication primitive of the frame reception. The STA shall not transmit during the interval if the RA field of the frame is not equal to the STA MAC address. The STA may transmit a CF-End frame if the RA field of the received frame is equal to the STA MAC address and the value of the Duration/ID field in the received frame is not equal to 0.

Figure 10-32 shows an example of TXOP truncation. In this example, the STA accesses the medium using EDCA channel access and then transmits a nav-set sequence (e.g., RTS/CTS for non-DMG STAs or RTS/DMG CTS for DMG STAs). After a SIFS, it then transmits an initiator-sequence, which may involve the exchange of multiple PPDUs between the TXOP holder and TXOP responders. At the end of the second sequence, the TXOP holder has no more data that it can send that fits within the TXOP limit; therefore, it truncates the TXOP by transmitting a CF-End frame.

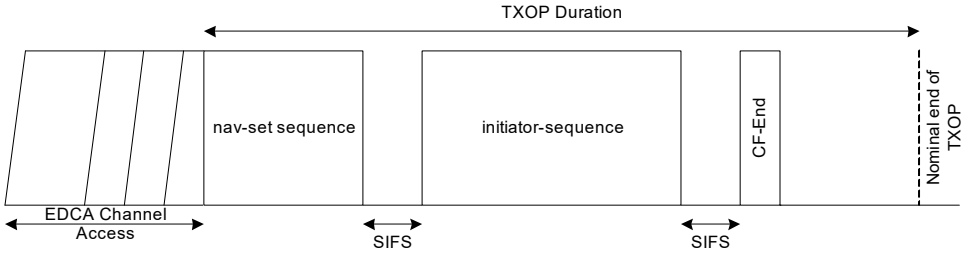

Figure 10-32—Example of TXOP truncation

Non-DMG non-S1G non-HE STAs that receive a CF-End frame reset their NAV and can start contending for the medium without further delay. An HE STA that receives a CF-End frame may start contending for the medium without further delay as defined in 26.2.5. A DMG STA that receives a CF-End frame can start contending for the medium at the end of the time interval equal to the value in the Duration/ID field of the frame if none of its NAVs has a nonzero value (10.38.10).

An S1G STA that receives an NDP CF-End frame should reset its NAV and may start contending for the medium without further delay.

An S1G STA may transmit a CF-End frame containing a value greater or equal to 0 in the Duration/ID field.

An S1G STA shall interpret the reception of a CF-End frame with the Duration/ID field equal to 0 as a NAV reset, i.e., it resets its NAV timer to 0 at the end of the PPDU containing this frame. After receiving a CF-End frame with the Duration/ID field equal to 0 and a matching BSSID, an AP may respond by transmitting a CF-End frame with the Duration/ID field equal to 0 after a SIFS.

When an S1G STA receives a CF-End frame with the Duration/ID field not equal to 0 that falls in the range [NAV value – 8, NAV value + 8] (microseconds) at the time of the reception of the PHY-RXEND.indication, it shall reset the NAV and may start contending for the medium without further delay. If the received duration value does not fall in the range [NAV value – 8, NAV value + 8] microseconds at the time of the reception of the PHY-RXEND.indication, the STA shall discard the CF-End frame.

NOTE 3—A NAV value that varies within ±8 μs boundaries accommodates almost all inaccuracies (e.g., due to clock drifting) to the NAV counter at the receiving STA.

After receiving a CF-End frame with a matching BSSID, an S1G AP may respond by transmitting a CF-End frame after a SIFS in which the value of the Duration field is equal to the value obtained from the Duration field of the received CF-End frame adjusted by subtracting the value of aSIFSTime and the time required to transmit the CF-End frame, in units of microseconds. If the adjusted value is a negative value, the Duration field of the CF-End frame is set to 0.

10.23.2.11 Termination of TXOP

A TXOP holder that transmits a PPDU using one of the modulation classes in Table 10-19 should transmit a short Control frame as the final transmission in a TXOP, under the conditions specified in Table 10-20.

The final transmission can be a CF-End, or a CTS-to-self when no NAV needs to be truncated.

NOTE—The final transmission at the lowest data rate within the modulation class is needed because a final transmission at a higher rate can cause spurious EIFSs to occur, because the PHY header of such frames travels farther than the MPDU.

Other eligible modulation classes, except 6 Mb/s OFDM	6 Mb/s OFDM

10.23.2.12 Retransmit procedures

10.23.2.12.1 General

A QoS STA shall maintain a frame retry count for each MSDU, A-MSDU, or MMPDU that requires acknowledgment. The initial value for the frame retry count shall be 0.

QoS STAs shall also maintain a QoS STA retry count for each AC, QSRC[AC]. The initial value for the QSRC[AC] counters shall be 0.

When dot11RobustAVStreamingImplemented is true, a QoS STA shall maintain a drop-eligible frame retry count for each QoS Data frame with an HT variant HT Control field with the DEI field equal to 1. The initial value for the drop-eligible frame retry count shall be 0.

APs with dot11RobustAVStreamingImplemented equal to true and mesh STAs with dot11MeshGCRImplemented equal to true, shall maintain an unsolicited frame retry count. The initial value for the unsolicited frame retry count shall be 0.

After transmitting a frame that requires an immediate acknowledgment, the STA shall perform either of the acknowledgment procedures, as appropriate, that are defined in 10.3.2.11. The frame retry count for an MSDU or A-MSDU that is not part of a block ack agreement or for an MMPDU shall be incremented every time transmission fails for that MSDU, A-MSDU, or MMPDU, including of an associated RTS.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For APs with dot11RobustAVStreamingImplemented equal to true and mesh STAs with dot11MeshGCRImplemented equal to true, the unsolicited frame retry count shall be incremented after the transmission of every A-MSDU that is transmitted using the GCR unsolicited retry retransmission policy.

All retransmission attempts by a non-DMG STA for an MPDU with the Type subfield equal to Data or Management that is not sent under a block ack agreement and that has failed the acknowledgment procedure one or more times shall be made with the Retry subfield set to 1.

All retransmission attempts by a DMG STA for an MPDU with the Type subfield equal to Data or Management that has failed the acknowledgment procedure one or more times shall be made with the Retry subfield set to 1.

A QoS STA shall maintain a transmit MSDU/MMPDU timer for each MSDU passed to the MAC and for each MMPDU. For a non-AP STA, dot11EDCATableMSDULifetime specifies the maximum amount of time allowed to transmit an MSDU/MMPDU for a given AC. For an AP, dot11QAPEDCATableMSDULifetime specifies the maximum amount of time allowed to transmit an MSDU/MMPDU for a given AC. The transmit MSDU/MMPDU timer shall be started when the MSDU/MMPDU is passed to the MAC.

NOTE—The timer is started at different times for DCF and EDCA.

When A-MSDU aggregation is used, the HT STA maintains a single timer for the whole A-MSDU. The timer is restarted each time an MSDU is added to the A-MSDU. The result of this procedure is that no MSDU in the A-MSDU is discarded before a period of dot11EDCATableMSDULifetime for a non-AP STA or dot11QAPEDCATableMSDULifetime for an AP has elapsed.

Retries for failed transmission attempts shall continue until one or more of the following conditions occur:

- The frame retry count for the MSDU, A-MSDU, or MMPDU is equal to dot11ShortRetryLimit.
- The drop-eligible frame retry count for the MSDU, A-MSDU, or MMPDU is equal to dot11ShortDEIRetryLimit.
- The unsolicited frame retry count for the A-MSDU is equal to dot11UnsolicitedRetryLimit.
- The transmit MSDU/MMPDU timer for the MSDU/MMPDU or any undelivered fragments of that MSDU/MMPDU exceeds dot11EDCATableMSDULifetime for a non-AP STA or dot11QAPEDCATableMSDULifetime for an AP.

When any of these limits is reached, retry attempts shall cease, and the associated MSDU, A-MSDU, or MMPDU shall be discarded.

For internal collisions, the frame retry counts associated with the MSDUs, A-MSDUs, or MMPDUs involved in the internal collision shall be incremented.

With the exception of a frame belonging to a TID for which block ack agreement is set up, a QoS STA shall not initiate the transmission of any Management or Data frame to a specific RA while the transmission of another Management or Data frame with the same RA and having been assigned its sequence number from the same sequence number space has not yet completed to the point of success, retry fail, or other MAC discard (e.g., lifetime expiration).

If an HE STA transmits an HE TB PPDU, the QSRC[AC] for the associated EDCAF is not changed.

10.23.2.12.2 Unsolicited retry procedure

When using the GCR unsolicited retry retransmission policy for a group address, an AP or mesh STA may retransmit an MPDU to increase the probability of correct reception at the STAs that are listening to this group address (i.e., the group address is in their dot11GroupAddressesTable). The set of MPDUs that may

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

be retransmitted is dependent upon whether block ack agreements are active with the STAs that are listening to this group address and is defined in 11.21.16.3.6. How an AP or a mesh STA chooses which MPDUs to retransmit is an implementation decision and beyond the scope of this standard.

A protective mechanism (such as a mechanism described in 10.27) should be used to reduce the probability of other STAs transmitting during the GCR TXOP. When using a protection mechanism that requires a response from another STA, the AP should select a STA that is a member of the GCR group.

The TXOP initiation rules defined in 10.23.2.2 and 10.23.2.3 shall be used for initiating a GCR TXOP. The duration of a GCR TXOP shall be subject to the TXOP limits defined in 10.23.2.9.

When transmitting MPDUs using the GCR service with retransmission policy equal to GCR unsolicited retry, the following rules apply:

— Following a MAC protection exchange that includes a response frame, in all GCR unsolicited retry retransmissions, the STA shall either transmit the frames within a GCR TXOP separated by SIFS or invoke its backoff procedure as defined in 10.23.2.2. The STA shall not transmit an MPDU and a retransmission of the same MPDU within the same GCR TXOP. The final frame transmitted within a GCR TXOP shall follow the backoff procedure defined in 10.23.2.2.
— Without MAC protection or with MAC protection that lacks a response frame, in all transmissions, the STA shall invoke the backoff procedure defined in 10.23.2.2, using a value of CWmin[AC] for CW, at the PHY-TXEND.confirm primitive that follows the transmission of each unsolicited retry GCR MPDU.
— All retransmissions of an MPDU shall have the Retry subfield in their Frame Control fields set to 1.
— During a GCR TXOP, frames may be transmitted within the GCR TXOP that do not use the GCR unsolicited retry retransmission policy.

10.23.2.13 EDCA channel access in a CMMG BSS

If the MAC receives a PHY-CCA.indication primitive with the channel-list parameter present, the channels considered idle are defined in Table 10-21.

Table 10-21—Channels indicated idle by the channel-list parameter for CMMG BSSs

PHY-CCA.indication primitive channel-list parameter entry	Idle channel
primary	None
secondary	Primary 540 MHz

In the following description, the CCA is sampled according to the timing relationships defined in 10.3.7. Slot boundaries are determined solely by activity on the primary channel. “Channel idle for an interval of PIFS” means that whenever CCA is sampled during the period of PIFS that ends at the start of transmission, the CCA for that channel was determined to be idle.

If one of a STA’s EDCAFs is permitted to initiate a TXOP (as specified in 10.23.2.4), the STA shall perform exactly one of the following actions:

a) Transmit a 1080 MHz mask PPDU if the secondary 540 MHz channel is idle during an interval of PIFS immediately preceding the start of the TXOP.
b) Transmit a 540 MHz mask PPDU on the primary 540 MHz channel.
c) Transmit nothing and invoke the backoff procedure for the EDCAF as specified in 10.23.2.2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—In the case of rule c), the STA selects a new random number using the current value of CW[AC], and the retry counts are not updated [as described in 10.23.2.2; backoff procedure invoked for event a)].

NOTE 2—For CMMG STAs, an EDCA TXOP is obtained based on activity on the primary channel (see 10.23.2.4). The width of transmission is determined by the CCA status of the nonprimary channels during the PIFS before transmission (see 10.23.2.4).

NOTE 3—An EDCAF that initiates a TXOP has a frame available for transmission (see 10.23.2.4). There might be another EDCAF of lower priority that invokes the backoff procedure due to an internal collision (see 10.23.2.4).

10.23.2.14 EDCA channel access in an EDMG BSS

If the MAC receives a PHY-CCA.indication primitive with the channel-list parameter present, the channels considered busy are defined in Table 10-22. Channels not indicated as busy are considered idle.

When a STA and the BSS, of which the STA is a member, both support multiple channel widths, an EDCA TXOP is obtained based solely on activity of the primary channel (see 10.23.2.4). “Idle medium” in this subclause means “idle primary channel.” Likewise “busy medium” means “busy primary channel.”

Once an EDCA TXOP has been obtained according to this subclause, further constraints defined in 10.38.12.2 and 10.23.2 might limit the width of transmission during the TXOP or deny the channel access, based on the state of CCA on secondary channels.

Table 10-22—Channels indicated busy by the channel-list parameter

PHY-CCA.indication primitive channel-list parameter	Busy channels
Primary	Primary
secondary	First secondary channel
secondary1	Second secondary channel
secondary2	Third secondary channel

In the following description, the CCA is sampled according to the timing relationships defined in 10.3.7. Slot boundaries are determined solely by activity on the primary channel. “Channel idle for an interval of PIFS” means that the STATE parameter of the most recent PHY-CCA.indication primitive was IDLE, and no PHY-CCA.indication(BUSY) occurred during an interval of PIFS that ends at the start of transmission, the CCA for that channel was determined to be idle.

If one of a STA’s EDCAFs is permitted to initiate a TXOP (as specified in 10.23.2.4), the STA shall perform exactly one of the following actions on the primary, secondary, seconday1, and secondary2 channels defined in Table 8-6, which is based on the BSS Operating Channels field and Primary Channel field within the EDMG Operation element transmitted by an EDMG AP or an EDMG PCP:

a) Transmit an 8.64 GHz mask PPDU if the secondary, secondary1 and secondary2 channels are contiguous and secondary, secondary1 and secondary2 were idle during an interval of PIFS immediately preceding the start of the TXOP.

b) Transmit a 4.32+4.32 GHz mask PPDU if the primary and secondary channels are contiguous, secondary1 and secondary2 channels are contiguous and secondary, secondary1 and secondary2 channels were idle during an interval of PIFS immediately preceding the start of the TXOP.

c) Transmit a 6.48 GHz mask PPDU if the primary, secondary and secondary1 channels are contiguous and the secondary and secondary1 channels were idle during an interval of PIFS immediately

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

preceding the start of the TXOP or if the primary, secondary1 and secondary2 channels are contiguous and secondary1 and secondary2 channels were idle during an interval of PIFS immediately preceding the start of the TXOP.

d) Transmit a 4.32 GHz mask PPDU if the primary and secondary channels are contiguous and the secondary channel was idle during an interval of PIFS immediately preceding the start of the TXOP or if the primary and secondary1 channels are contiguous and the secondary1 channel was idle during an interval of PIFS immediately preceding the start of the TXOP.

e) Transmit a 2.16+2.16 GHz mask PPDU if the secondary, secondary1 or secondary2 channels were idle during an interval of PIFS immediately preceding the start of the TXOP.

f) Transmit a 2.16 GHz mask PPDU on the primary channel.

g) Transmit nothing and invoke the backoff procedure for the EDCAF as specified in 10.23.2.2.

NOTE 1–In the case of rule g), the STA selects a new random number using the current value of CW[AC], and the retry counters are not updated [as described in 10.23.2.2; backoff procedure invoked for event a)].

NOTE 2–For an EDMG STA, an EDCA TXOP is obtained based on activity on the primary channel (see 10.23.2.4). The width of transmission is determined by the CCA status of the nonprimary channels during an interval of PIFS before transmission (see EDMG description in 10.3.2).

NOTE 3—An EDCAF that initiates a TXOP has a frame available for transmission (see 10.23.2.4). There might be another EDCAF of lower priority that invokes the backoff procedure due to an internal collision (see 10.23.2.4).

An EDMG STA that initiates a PPDU transmission to peer EDMG STA shall set the TXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION of the PPDU to a subset of the channels in which the CCA were idle according to Table 8-6, and shall set the TXVECTOR parameter SCRAMBLER_INIT_SETTING to a value that provides bandwidth information to the peer STA.

10.23.3 HCF controlled channel access (HCCA)

10.23.3.1 General

The HCCA mechanism manages access to the WM using an HC that has higher medium access priority than non-AP STAs. This allows it to transfer MSDUs to STAs and to allocate TXOPs to STAs.

The HC grants a STA a polled TXOP with duration specified in a QoS (+)CF-Poll frame. A STA may transmit multiple frame exchange sequences within given polled TXOPs, subject to the limit on TXOP duration.

All STAs inherently obey the NAV rules of the HCF because each frame transmitted under HCF contains a duration value chosen to cause STAs in the BSS to set their NAVs to protect the expected subsequent frames.

A non-AP QoS STA that is a non-S1G STA shall respond to QoS (+)CF-Poll frames received from an HC with the Address 1 field matching their own addresses.

The HC shall perform delivery of buffered non-GCR-SP group addressed MSDUs/MMPDUs following DTIM beacons.

An HC may perform a backoff following an interruption of a frame exchange sequence due to lack of an expected response under the rules described in 10.23.3.2.3, using the parameters dot11HCCWmin, dot11HCCWmax, and dot11HCCAIFSN and the backoff rules in 10.2 and 10.23.2.2. The decision to perform a backoff by the HC is dependent on conditions such as interference from an overlapping BSS. The mechanism to detect the interference from an overlapping BSS and the decision to perform a backoff, DFS (such as in 11.6), or other techniques (such as inter-BSS scheduling) is beyond the scope of this standard.

10.23.3.2 HCCA procedure

10.23.3.2.1 General

To start an HCCA TXOP, the HC gains control of the WM by waiting a shorter time before initiating the first transmission of the TXOP than STAs using the EDCA procedures. The duration values used in QoS frame exchange sequences reserve the medium to permit completion of the current sequence.

10.23.3.2.2 CAP generation

When the HC needs access to the WM to start a CAP, the HC shall sense the WM. When the WM is determined to be idle at the TxPIFS slot boundary as defined in 10.3.7, the HC shall transmit either a QoS (+)CF-Poll with the duration value set to cover the polled TXOP, or the first frame of any permitted frame exchange sequence with the duration value set to cover the HCCA TXOP. A CAP shall not extend across a TBTT. The occurrence of a TBTT implies the end of the CAP, after which the regular channel access procedure (EDCA or HCCA) is resumed. It is possible that no Data frame was transmitted during an HCCA TXOP. The shortened termination of the HCCA TXOP does not imply an error condition. CAPs are illustrated in Figure 10-33.

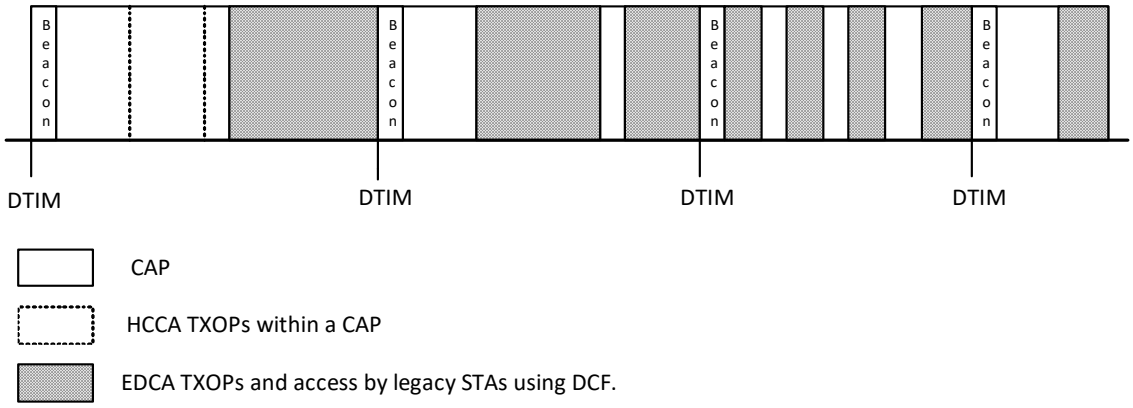

Figure 10-33—CAP periods

After the last frame of all other nonfinal frame exchange sequences (e.g., sequences that convey individually addressed QoS Data or Management frames) during an HCCA TXOP, the holder of the current HCCA TXOP shall wait for one SIFS before transmitting the first frame of the next frame exchange sequence. The HC may sense the channel and reclaim the channel if the WM is determined to be idle at the TxPIFS slot boundary after the HCCA TXOP (see Figure 10-29). A CAP ends when the HC does not reclaim the channel at the TxPIFS slot boundary after the end of an HCCA TXOP.

10.23.3.2.3 Recovery from the absence of an expected reception

This subclause describes recovery from the absence of an expected reception in a CAP. Note that the recovery rules from the absence of an expected reception are different from EDCA because in this case the NAVs of all of the STAs in the BSS have already been set up by the transmissions by the HC. The recovery rules for the multiple frame exchange sequences in an EDCA TXOP are different because a STA may always be hidden and may have not set its NAV due to the transmission by another STA. Finally, since an HC is colocated with the AP, the AP may recover using the rules described in this subclause even if the recovery is from the absence of an expected reception.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The beginning of reception of an expected response is detected by the occurrence of PHY-CCA.indication(BUSY,channel-list) primitive at the STA that is expecting the response where the channel-list parameter is absent or, if present, includes "primary."

If the beginning of such reception does not occur during the first slot time following a SIFS, then:[34]

— If the transmitting STA is the HC, it may initiate recovery by transmitting at the TxPIFS slot boundary after the end of the HC's last transmission only if the PHY-CCA state indicates IDLE during the CCAdel period preceding the TxPIFS slot boundary as shown in 10-25.

— If the transmitting STA is a non-AP QoS STA, and there is an MPDU for transmission, it shall initiate recovery by transmitting at a PIFS after the end of the last transmission if the PHY-CCA state indicates IDLE during the CCAdel period preceding the TxPIFS slot boundary, the polled TXOP limit is nonzero and at least one frame (re)transmissions can be completed within the remaining duration of a nonzero polled TXOP limit.

If the transmitted frame is not of type QoS (+)CF-Poll and the expected response frame is not received correctly, regardless of the occurrence of the PHY-RXSTART.indication primitive, the QoS STA may initiate recovery following the occurrence of PHY-CCA.indication(IDLE) primitive so that a SIFS occurs between the last energy on the WM and the transmission of the recovery frame.

When there is a transmission failure within a polled TXOP, the short retry count (as described in 10.23.2.12) corresponding to the failed MSDU or MMPDU shall be incremented.

An MPDU belonging to a TC is subject to the respective retry limit as well as the dot11EDCATableMSDULifetime for a non-AP STA or dot11QAPEDCATableMSDULifetime for an AP and is discarded when either of them is exceeded.

An MPDU belonging to a TS with a specified delay bound is subject to delay bound and is discarded if the MPDU could not be transmitted successfully since it has been delivered to the MAC. An MPDU belonging to a TS with an unspecified delay is subject to dot11MaxTransmitMSDULifetime and is discarded when it is exceeded.

Non-AP STAs that receive a QoS (+)CF-Poll frame shall respond within a SIFS, regardless of the NAV setting. If a response is not received but a PHY-CCA.indication(BUSY) primitive occurs during the slot following a SIFS and is followed by a PHY-RXSTART.indication or PHY-RXEND.indication primitive prior to a PHY-CCA.indication(IDLE) primitive, then the HC assumes that the transmitted QoS (+)CF-Poll frame was received by the polled STA. In the cases of QoS Data +CF-Poll, QoS Data +CF-Ack +CF-Poll, or QoS CF-Ack +CF-Poll, the PHY-CCA.indication(BUSY) primitive is used only to determine whether the transfer of control of the channel has been successful. The PHY-CCA.indication(BUSY) primitive is not used for determining the success or failure of the transmission. If the CF-Poll is piggybacked onto a QoS Data frame, the HC may have to retransmit that QoS Data frame subsequently.

If an HC receives a frame from a STA with a duration/ID covering only the response frame, the HC shall assume that the STA is terminating its TXOP, and the HC may initiate other transmissions, or send a CF-End frame (see 10.23.3.4).

If a polled QoS STA has no queued traffic to send or if the MPDUs available to send are too long to be transmitted within the specified TXOP limit, the QoS STA shall send a QoS (+)Null frame. In the case of no queued traffic, this QoS (+)Null frame shall have a QoS Control field that reports a queue size of 0 for any TID with the duration/ID set to the time required for the transmission of one Ack frame, plus one SIFS. In the case of insufficient TXOP size, such as when the maximum MSDU size is not specified, this QoS (+)Null frame

[34] This restriction is intended to avoid collisions due to inconsistent CCA reports in different STAs, not to optimize the bandwidth usage efficiency.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

shall have a QoS Control field that contains the TID and TXOP duration or a nonzero queue size needed to send the MPDU that is ready for transmission. When a queue size is transmitted, the HC shall combine the queue size information with the rate of the received QoS (+)Null frame to determine the required size of the requested TXOP.

Within a polled TXOP, the unused portion of TXOPs shall not be used by the STA and may be reallocated by the HC as follows:

a) The recipient of the final frame, with Normal Ack ack policy, shall be the HC if there will be time remaining in the TXOP after the transmission of the final frame and its expected Ack frame. If there are no frames to be sent to the HC, then the QoS STA shall send to the HC a QoS Null with the Queue Size subfield in the QoS Control field set to 0.
    1) If a PHY-CCA.indication(BUSY) primitive occurs at the STA that is expecting the Ack frame during the first slot following a SIFS after the end of the transmission of the final frame, it shall be interpreted as indicating that the channel control has been successfully transferred and no further frames shall be transmitted by the STA in the TXOP, even though the Ack frame from HC may be incorrectly received.[35]
    2) If the beginning of the reception of an expected Ack frame to the final frame does not occur, detected as the nonoccurrence of the PHY-CCA.indication(BUSY) primitive at the QoS STA that is expecting the response during the first slot time following a SIFS, the QoS STA shall retransmit the frame or transmit a QoS Null frame, with Normal Ack ack policy and the Queue Size subfield set to 0, after a PIFS from the end of last transmission, until such time that it receives an acknowledgment or when there is not enough time remaining in the TXOP for sending such a frame.[36]
b) If there is not enough time within the unused portion of the TXOP to transmit either the QoS Null frame or the frame with the Duration/ID field covering only the response frame, then the STA shall cease control of the channel.[37]

10.23.3.3 HCCA TXOP structure and timing

Any QoS Data frame of a subtype that includes CF-Poll contains a TXOP limit in its QoS Control field. The ensuing polled TXOP is protected by the NAV set by the Duration field of the frame that contained the QoS (+)CF-Poll function, as shown in Figure 10-34. Within a polled TXOP, a STA may initiate the transmission of one or more frame exchange sequences, with all such sequences nominally separated by a SIFS. The STA shall not initiate transmission of a frame unless the transmission and any acknowledgment or other immediate response expected from the peer MAC entity are able to complete within the polled TXOP, and the HC shall account for these when setting the TXOP limit. If the TXOP Limit subfield in the QoS Control field of the QoS Data frame that includes CF-Poll is equal to 0, then the STA to which the frame is directed to shall respond with either one MPDU or one QoS Null frame.

A TXOP or transmission within a TXOP shall not extend across TBTT, or dot11CAPLimit. The HC shall verify that the full duration of any granted TXOP meets these requirements so that a STA may use the time prior to the TXOP limit of a polled TXOP without checking for these constraints. Subject to these limitations, all decisions regarding what MSDUs, A-MSDUs, and/or MMPDUs are transmitted during any given TXOP are made by the STA that holds the TXOP.[38,39]

[35] Note that while the PHY-CCA.indication(BUSY) primitive is used in this instance to determine the control of the channel, it is not used for determining the success or failure of the transmission.

[36] This is to avoid the situation where the HC might not receive the frame and might result in an inefficient use of the channel.

[37] In this case the channel is not accessed until the NAVs expire at all of the STAs.

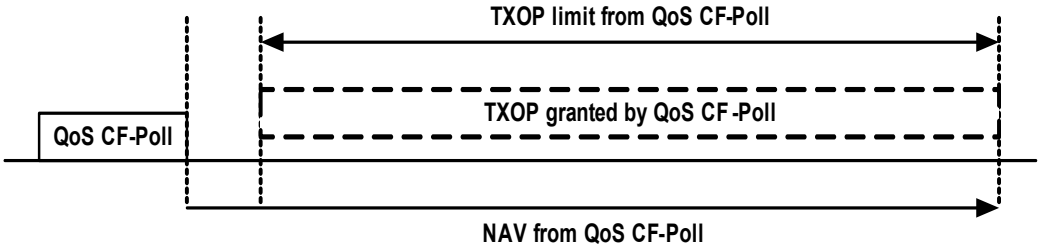

Figure 10-34—Polled TXOP

10.23.3.4 NAV operation of a TXOP under HCCA

An HC shall set its own NAV to prevent it from transmitting during a TXOP that it has granted to a STA through an HCCA poll. However, the HC may reclaim the TXOP if a STA is not using it or ends the TXOP early (see 10.23.3.2.3).

If the HC has no more STAs to poll and it has no more Data, Management, BlockAckReq, or BlockAck frames to send, it may reset the NAVs of all QoS STAs in the BSS by sending a QoS CF-Poll frame with the RA matching its MAC address and with the Duration/ID field set to 0.

A STA that receives a QoS (+)CF-Poll frame with a MAC address in the Address 1 field that matches the HC's MAC address and the Duration/ID field value equal to 0 shall reset the NAV value to 0.

When a STA receives a QoS (+)CF-Poll frame containing the BSSID of the BSS of which the STA is a member, that STA shall update the NAV if necessary and shall save the TXOP holder address for that BSS, which is the MAC address from the Address 1 field of the frame containing the QoS (+)CF-Poll. If an RTS frame is received with the RA matching the MAC address of the STA and the MAC address in the TA field in the RTS frame matches the saved TXOP holder address, then the STA shall send the CTS frame after a SIFS, without regard for, and without resetting, its NAV. The saved TXOP holder address shall be cleared when the NAV is reset or when the NAV counts down to 0.

When a STA receives a frame addressed to it and requires an acknowledgment, it shall respond with an Ack or QoS +CF-Ack frame independent of its NAV. A non-AP STA shall accept a polled TXOP by initiating a frame exchange sequence independent of its NAV.

10.23.3.5 HCCA transfer rules

10.23.3.5.1 General

A TXOP obtained by receiving a QoS (+)CF-Poll frame uses the specified TXOP limit consisting of one or more frame exchange sequences with the sole time-related restriction being that the final sequence shall end not later than the TXOP limit. In QoS CF-Poll and QoS CF-Ack +CF-Poll frames, the TID subfield in the QoS

[38] In certain regulatory domains, channel sensing needs to be done at periodic intervals (for example, in Japan, this period is 4 ms). This means that the duration of a TXOP in these regulatory domains might not be more than this periodic interval. In order to extend the TXOP beyond the limit implied by this periodic interval, the TXOP holder needs to sense the channel at least once in the limit imposed in the regulatory domain, by waiting for at least for the duration of one PIFS during which it senses the channel. If it does not detect any energy, it may continue by sending the next frame. In other words, the total TXOP size assigned should include an extra time allocated (i.e., $n \times$ aSlotTime, where n is the number of times the STA needs to sense the channel) and is given by $\lfloor$TXOP limit/limit imposed in the regulatory domain$\rfloor$.

[39] The TID value in the QoS Control field of a QoS Data +CF-Poll frame pertains only to the MSDU or fragment thereof in the Frame Body field of that frame. This TID value does not pertain to the TXOP limit value and does not place any constraints on what frame(s) the addressed STA may send in the granted TXOP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Control field indicates the TS for which the poll is intended. The requirement to respond to that TID is nonbinding, and a STA may respond with any frame. Upon receiving a QoS (+)CF-Poll frame, a STA may send any frames, i.e., QoS Data frames belonging to any TID as well as Management frames in the obtained TXOP. MSDUs may be fragmented in order to fit within TXOPs.

The QoS CF-Poll frames shall be sent only by an HC. Non-AP STAs are not allowed to send QoS (+)CF-Poll frames. A STA shall not send QoS (+)Data frames in response to any Data frame other than the QoS (+)CF-Poll frames.

The TXOP limit is inclusive of the PHY and IFS overhead, and an AP should account for the overhead when granting TXOPs.

If a STA has set up at least one TS for which the Aggregation subfield in the associated TSPEC is equal to 0, the AP shall use only QoS CF-Poll or QoS CF-Ack +CF-Poll frames to poll the STA and shall never use QoS (+)Data +CF-Poll to poll the STA. Note that although QoS (+)CF-Poll is a Data frame, it should be transmitted at one of the rates in the BSSBasicRateSet parameter in order to set the NAV of all STAs that are not being polled (see 10.6). If a CF-Poll is piggybacked with a QoS Data frame, then the frame containing all or part of an MSDU or A-MSDU may be transmitted at a rate that is below the negotiated minimum PHY rate in the TSPEC related to that data.

A QoS STA shall use QoS Data frames for all MSDU transfers to another QoS STA. The TID in the QoS Control fields of these frames shall indicate the TC or TS to which the MPDU belongs. Furthermore, either the Queue Size subfield shall indicate the amount of queued traffic present in the output queue that the STA uses for traffic belonging to this TC or TS, or the TXOP Duration Requested subfield shall indicate the duration that the STA requests for use in the next TXOP for traffic belonging to this TC or TS. The queue size value reflects the amount on the appropriate queue not including the present MPDU. The queue size value may remain constant in all QoS Data frames that carry fragments of the same MSDU even if the amount of queued traffic changes as successive fragments are transmitted. In order to inform the HC of queue status, a STA may use the QoS Null frame indicating the TID and the queue size or TXOP duration request (also see 10.23.3.5.2).

A QoS STA shall support receiving QoS +CF-Ack frames. The HC may use QoS Data +CF-Ack frames to send frames to the same STA a SIFS after receiving the final transmission of the previous TXOP. The HC may also use QoS Data +CF-Ack frames to send frames to any other STA a SIFS after receiving the final transmission of the previous TXOP, if the STA that sent the final transmission of the previous TXOP has set the Q-Ack subfield in the QoS Capability element in the (Re)Association Request frame to 1. A STA shall respond to QoS Data frames having Normal Ack ack policy with an Ack frame, unless the acknowledgment is piggybacked in which case it shall use a QoS +CF-Ack frame. Piggybacked frames are allowed only within TXOPs initiated by the HC. The HC shall not send a QoS Data frame containing a +CF-Ack with an Address 1 that does not correspond to the address of the STA for which the +CF-Ack is intended, unless the STA to which the +CF-Ack is intended, sets the Q-Ack subfield in the QoS Capability element in the (Re)Association Request frame. STAs are not required to be able to transmit QoS Data frames with subtypes that include +CF-Ack.

An AP that has dot11QAckOptionImplemented true may allow associations with STAs advertising support for the Q-Ack option. Such associations do not require the AP to employ piggyback acknowledgments directed toward that associated STA in frames that are not directed to that associated STA. A QoS STA shall process received QoS Data frames with subtypes that include +CF-Ack when the STA to which the acknowledgment is directed is the same as the STA addressed by the Address 1 field of that Data frame. A STA that does not set the Q-Ack subfield to 1 in the QoS Capability element in the (Re)Association Request frame is not required to handle the received QoS (+)Data +CF-Ack frames that are addressed to other STAs. The net effect of these restrictions on the use of QoS +CF-Ack frames is that the principal QoS +CF-Ack subtype that is useful is the QoS Data +CF-Ack frame, which can be sent by a STA as the first frame in a polled TXOP when that TXOP was conveyed in a QoS Data +CF-Poll (+CF-Ack) frame and the outgoing frame is directed to the HC's STA address. QoS (Data +)CF-Poll +CF-Ack frames are useful to allow the HC to grant another TXOP to the same

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

STA a SIFS after receiving the final transmission of that STA's previous TXOP. QoS (Data+)CF-Poll +CF-Ack frames are also useful to allow the HC to grant another TXOP to a different STA a SIFS after receiving the final transmission of a STA's previous TXOP, if the STA that sent the final transmission of the previous TXOP has set the Q-Ack subfield in the QoS Capability element in the (Re)Association Request frame to 1.

HCF contention based channel access shall not be used to transmit MSDUs belonging to an established TS (with the HC's acceptance of the associated TSPEC), unless the granted TSPEC indicates it is permitted to do so when the Access Policy subfield of the TS Info field is equal to "HCCA, EDCA mixed mode" (HEMM), the polled STA utilized the full TXOP provided by the HC, and it has more MPDUs to send. When this STA sends frames belonging to a TS using contention based channel access, it shall encode the TID subfield in the QoS Data frame with the TID associated with the TS. When the AP grants a TSPEC with the Access Policy subfield equal to HEMM and if the corresponding AC needs admission control, the AP shall include the medium time that specifies the granted time for EDCA access in the ADDTS Response frame.

10.23.3.5.2 TXOP requests

STAs may send TXOP requests during polled TXOPs or EDCA TXOPs using the QoS Control field in a QoS Data frame or a QoS Null frame directed to the HC, with the TXOP Duration Requested or Queue Size subfield value and TID subfield value indicated to the HC. APs indicate whether they process TXOP request or queue size in the QoS Info field in the Beacon, Probe Response, and (Re)Association Response frames. An AP shall process requests in at least one format. The AP may reallocate TXOPs if the request belongs to TS or update the EDCA parameter set if the above request belongs to TC. A STA shall use only the request format that the AP indicates it can process.

TXOP Duration Requested subfield values are not cumulative. A TXOP duration requested for a particular TID supersedes any prior TXOP duration requested for that TID. A value of 0 in the TXOP Duration Requested subfield may be used to cancel a pending unsatisfied TXOP request when its MSDU is no longer queued for transmission. The TXOP duration requested is inclusive of the PHY and IFS overhead, and a STA should account for this when attempting to determine whether a given transmission fits within a specified TXOP duration.

The AP may choose to assign a TXOP duration shorter than that requested in the TXOP Duration Requested subfield.

Even if the value of TXOP Duration Requested subfield or Queue Size subfield in a QoS Data frame is 0, the HC shall continue to poll according to the negotiated schedule.

10.23.3.5.3 Use of RTS/CTS

In order to provide improved NAV protection, a STA may send an RTS frame as the first frame of any frame exchange sequence without regard for dot11RTSThreshold or dot11TXOPDurationRTSThreshold.

If a QoS STA sends an RTS frame and does not receive an expected CTS frame, then the recovery rules are as specified in 10.23.3.2.3.

In order to provide NAV protection for a transmission to the AP in response to a QoS Data frame with a subtype that includes CF-Poll, the polled STA may send a CTS frame with the RA containing its own MAC.

NOTE 1—The CTS frame is shorter than a QoS Data frame and has a higher probability that it will be received by other STAs.

NOTE 2—The transmission of the CTS sets the NAV in its own vicinity without the extra time required to send an RTS frame.[40]

10.23.3.5.4 HCCA transfer rules for a VHT STA

A VHT STA that is a member of a BSS that supports multiple channel widths is granted a TXOP for a specified duration and for a channel width that is equal to the channel width of the frame containing the QoS CF-Poll.

10.23.4 Admission control at the HC

10.23.4.1 General

An IEEE 802.11 network may use admission control to administer policy or regulate the available bandwidth resources. Admission control is used to attempt to provide a guarantee of the amount of time that a STA has available to access the channel. The HC, which is in the AP, is used to administer admission control in the network. As the QoS facility supports two access mechanisms, there are two distinct admission control mechanisms: one for contention based access and another for controlled access.

Admission control, in general, depends on vendors' implementation of the scheduler, available channel capacity, link conditions, retransmission limits, and the scheduling requirements of a given stream. All of these criteria affect the admissibility of a given stream. If the HC has admitted no streams that require polling, it might not find it necessary to perform the scheduler or related HC functions.

10.23.4.2 Contention based admission control procedures

10.23.4.2.1 General

An AP shall support admission control procedures, at least to the minimal extent of advertising that admission is not mandatory on its ACs. The AP uses the ACM (admission control mandatory) subfields advertised in the EDCA Parameter Set element to indicate whether admission control is required for each of the ACs. All ACs with priority higher than that of an AC for which the ACM subfield is set to 1 should have the ACM subfield set to 1. While the CWmin, CWmax, AIFS, and TXOP limit parameters may be adjusted over time by the AP, the ACM subfield shall be static for the duration of the lifetime of the BSS.

A non-AP STA may send frames in an AC where admission control is not mandated.

A non-AP STA may support the admission control procedure in 10.23.4.2.3 to send frames in an AC where admission control is mandated. If it does not support that procedure or admission was denied, and both of the following apply:

— dot11RejectUnadmittedTraffic is false or not present
— there is a lower priority AC (see Table 10-1) that does not require admission control

then it may send such frames using the EDCA parameters of that lower priority AC for channel access; the contents of the frames are unaffected. Otherwise, it shall not send such frames.

A STA shall transmit an ADDTS Request frame to the HC in order to request admission of traffic in any direction (i.e., uplink, downlink, direct, or bidirectional) employing an AC that requires admission control. The ADDTS Request frame shall contain the UP associated with the traffic and shall indicate EDCA as the access policy. The AP shall associate the received UP of the ADDTS Request frame with the appropriate AC per the UP-to-AC mappings described in 10.2.3.2.

The HC contained within an AP when dot11SSPNInterfaceActivated is true shall admit a non-AP STA's request based on dot11NonAPStationAuthAccessCategories stored in that non-AP STA's

[40] This is unnecessary because the NAVs in the vicinity of the QoS AP were set by the QoS (+)CF-Poll frame.

dot11InterworkingEntry, which is part of the dot11InterworkingTable. The dot11InterworkingEntry specifies the EDCA access classes and throughput limitations on each access class for which a non-AP STA is permitted to transmit.

10.23.4.2.2 Procedures at the AP

Regardless of the AC's ACM setting, the AP shall respond to an ADDTS Request frame with an ADDTS Response frame that may be to accept or deny the request. On receipt of an ADDTS Request frame from a non-AP STA, the AP shall make a determination about whether to

a) Accept the request, or
b) Deny the request.

The algorithm used by the AP to make this determination is implementation dependent. An AP when dot11SSPNInterfaceActivated is true shall use the policies delivered by the SSPN that are stored in the dot11InterworkingEntry, which is part of the dot11InterworkingTable. If the AP decides to accept the request, the AP shall also derive the medium time from the information conveyed in the TSPEC element in the ADDTS Request frame. The AP may use any algorithm in deriving the medium time, but K.2.2 provides a procedure that may be used. Having made such a determination, the AP shall transmit a TSPEC element to the requesting non-AP STA contained in an ADDTS Response frame. If the AP is accepting the request, the Medium Time field shall be specified. If the AP is accepting a request for a downlink TS, the Medium Time field shall be set to 0. If the AP is accepting a request corresponding to an AC for which ACM is 0 (e.g., the TSPEC is to change APSD behavior), the Medium Time field shall be set to 0.

10.23.4.2.3 Procedure at non-AP STAs

Each EDCAF shall maintain two MAC variables: admitted_time and used_time.

The admitted_time and used_time shall be set to 0 at the time of (re)association. The STA may subsequently decide to explicitly request medium time for the AC that is associated with the specified priority.

In order to make such a request, the STA shall transmit a TSPEC element contained in an ADDTS Request frame with the following fields specified (i.e., nonzero): Nominal MSDU Size, Mean Data Rate, Minimum PHY Rate, Inactivity Interval, and Surplus Bandwidth Allowance. The Medium Time field is not used in the request frame and shall be set to 0.

On receipt of a TSPEC element contained in an ADDTS Response frame indicating that the request has been accepted, the STA shall recompute the admitted_time for the specified EDCAF as follows:

admitted_time = admitted_time + dot11EDCAAveragingPeriod × medium time of TSPEC.

The STA may choose to tear down the explicit request at any time. For the teardown of an explicit admission, the STA shall transmit a DELTS frame containing the TSID and direction that specify the TSPEC to the AP.

If the STA sends or receives a DELTS frame, it shall recompute the admitted_time for the specified EDCAF as follows:

admitted_time = admitted_time – dot11EDCAAveragingPeriod × medium time of TSPEC.

The MAC variable used_time is the amount of time used, in units of 32 μs, by the STA in dot11EDCAAveragingPeriod. The MAC variable admitted_time is the medium time allowed by the AP, in units of 32 μs, in dot11EDCAAveragingPeriod. The STA shall update the value of used_time:

a) At dot11EDCAAveragingPeriod second intervals

used_time = max((used_time – admitted_time), 0)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

b) After each successful or unsuccessful frame exchange sequence,

used_time = used_time + MPDUExchangeTime

The MPDUExchangeTime is the duration of the frame exchange sequence. For the case of an MPDU transmitted with Normal Ack ack policy and without RTS/CTS protection, this equals the time required to transmit the MPDU plus the time required to transmit the expected response frame plus one SIFS. Frame exchange sequences that do not include any Data frames are excluded from the used_time update. Any RD transmission granted by the AP is excluded from the used_time update. If the used_time value reaches or exceeds the admitted_time value, the corresponding EDCAF shall no longer transmit QoS Data frames or QoS Null frames using the EDCA parameters for that AC as specified in the QoS Parameter Set element. However, a STA may choose to temporarily replace the EDCA parameters for that EDCAF with those specified for an AC of lower priority, if no admission control is required for those ACs.

NOTE—When a frame is transmitted using temporary EDCA parameters, the TID field of that frame is not modified.

If, for example, a STA has made and had accepted an explicit admission for a TS and the channel conditions subsequently worsen, possibly including a change in PHY data rate so that it requires more time to send the same data, the STA may make a request for more admitted_time to the AP and at the same time downgrade the EDCA parameters for that AC for short intervals in order to send some of the traffic at the admitted priority and some at the unadmitted priority, while waiting for a response to the admission request.

10.23.4.3 Controlled-access admission control

This subclause describes the schedule management of the admitted HCCA streams by the HC. When the HC provides controlled channel access to STAs, it is responsible for granting or denying polling service to a TS based on the parameters in the associated TSPEC. If the TS is admitted, the HC is responsible for scheduling channel access to this TS based on the negotiated TSPEC fields. The HC should not initiate a modification of TSPEC fields of an admitted TS unless requested by the STA. The HC should not tear down a TS unless explicitly requested by the STA or at the expiration of the inactivity timer. The polling service based on admitted TS provides a “guaranteed channel access” from the scheduler in order to have its QoS requirements met. This is an achievable goal when the WM operates free of external interference (such as operation within the channel by other technologies and co-channel overlapping BSS interference). The nature of wireless communications may preclude absolute guarantees to satisfy QoS requirements.

The following are rules for the operation of the scheduler:

— The scheduler shall be implemented so that, under controlled operating conditions, all STAs with admitted TS are offered TXOPs that satisfy the service schedule.

— Specifically, if a TS is admitted by the HC, then the scheduler shall service the STA during an SP. An SP is a period of time during which a set of one or more downlink individually addressed frames and/or one or more polled TXOPs are granted to the STA. An SP starts at fixed intervals of time specified in Service Interval field. The first SP starts when the lower order 4 octets of the TSF timer equals the value specified in Service Start Time field.[41] Additionally, the minimum TXOP duration shall be at least the time to transmit one maximum MSDU size successfully at the minimum PHY rate specified in the TSPEC. If maximum MSDU size is not specified in the TSPEC, then the minimum TXOP duration shall be at least the time to transmit one nominal MSDU size successfully at the minimum PHY rate. The vendors are free to implement any optimized algorithms, such as reducing the polling overheads, increasing the TXOP duration, etc., within the parameters of the transmitted schedule.

[41] The lower order 4 octets of the TSF timer cover a span of around 71 min. Due to TSF timer wrapover and due to the possibility of receiving the schedule frame after the indicated start time timer, ambiguity may occur. This ambiguity is resolved by using the nearest absolute TSF timer value in past or future when the lower order 4 octets match the Start Time field in the Schedule element.

— The HC shall admit its request based on Infrastructure Authorization Information in dot11InterworkingEntry, which is part of the dot11InterworkingTable. The dot11InterworkingEntry specifies whether a non-AP STA is permitted to use HCCA, its throughput limitation and its minimum delay bound.

When the HC aggregates the admitted TS, it shall set the Aggregation field in the granted TSPEC to 1. An AP shall schedule the transmissions in HCCA TXOPs and communicate the service schedule to the STA. The HC shall provide an aggregate service schedule if the STA sets the Aggregation field in its TSPEC request. If the AP establishes an aggregate service schedule for a STA, it shall aggregate all HCCA streams for the STA. The service schedule is communicated to the STA in a Schedule element contained in an ADDTS Response frame. In the ADDTS Response frame, the modified service start time shall not exceed the requested service start time, if specified in ADDTS Request frame, by more than one maximum service interval (SI). The HC uses the maximum SI for the initial scheduling only as there might be situations that HC is not be able to service the TS at the scheduled timing, due to an EDCA or DCF transmission or other interferences interrupting the schedule. The Service Interval field value in the Schedule element shall be greater than the minimum SI. The service schedule could be subsequently updated by an AP as long as it meets TSPEC requirements.

The HC may update the service schedule at any time by sending a Schedule element in a Schedule frame. The updated schedule is in effect when the HC receives the Ack frame for the Schedule frame. The service start time in the Schedule element in the Schedule frame shall not exceed the beginning of the immediately previous SP by more than the maximum SI. The service start time shall not precede the beginning of the immediately previous SP by more than the minimum SI.

A STA may affect the service schedule by modifying or deleting its existing TS as specified in 11.4.

K.3.1 provides guidelines for deriving an aggregate service schedule for a single STA from the STA's admitted TS. The schedule shall meet the QoS requirements specified in the TSPEC.

During any time interval [$t1$, $t2$] including the interval that is greater than the specification interval, the cumulative TXOP duration shall be greater than the time required to transmit all MSDUs (of nominal MSDU size) arriving at the mean data rate for the stream, over the period [$t1$, $t2 - D$]. The parameter D is set to the specified maximum SI in the TSPEC. If maximum SI is not specified, then D is set to the delay bound in the TSPEC.

The HC shall use the minimum PHY rate in calculating TXOPs if the minimum PHY rate is present in the TSPEC field in the ADDTS response. Otherwise, the HC may use an observed PHY rate in calculating TXOPs. A STA may have an operational rate lower than the minimum PHY rate due to varying conditions on the channel for a short time and still may be able to sustain the TS without changing the minimum PHY rate in the TSPEC.

A minimum set of TSPEC fields shall be specified during the TSPEC negotiation. The specification of a minimum set of parameters is required so that the scheduler can determine a schedule for the stream that is to be admitted. These parameters are Mean Data Rate, Nominal MSDU Size, Minimum PHY Rate, Surplus Bandwidth Allowance, and at least one of Maximum Service Interval and Delay Bound in the ADDTS Request frame. In the ADDTS Response frame, these parameters are Mean Data Rate, Nominal MSDU Size, Minimum PHY Rate, Surplus Bandwidth Allowance, and Maximum Service Interval and shall be nonzero when a stream is admitted.

If any of the elements in the minimum set of parameters does not have the required nonzero value, as specified above in this subclause, in the ADDTS Request frame, the HC may replace the unspecified parameters with nonzero values and admit the stream, or it may reject the stream. If the HC admits the stream with the alternative set of TSPEC fields, these parameters are indicated to the STA through the ADDTS Response frame. If both maximum SI and delay bound are specified, the HC may use only the maximum SI. If any other parameter is specified in the TSPEC element, the scheduler may use it when calculating the schedule for the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2029 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

stream. The HC may also use the UP value in the TS Info field for admission control or scheduling purposes; however, this decision is outside the scope of this standard. The mandatory set of parameters might be set by any higher layer entity or may be generated autonomously by the MAC.

If a STA specifies a nonzero minimum SI and if the TS is admitted, the HC shall generate a schedule that conforms to the specified minimum SI.

A reference design for a sample scheduler and admission control unit is provided in Annex K. A sample use of the TSPEC for admission control is also described in Annex K.

10.23.5 Restricted access window (RAW) operation

10.23.5.1 General

Restricting uplink channel access to a small number of STAs and spreading their uplink access attempts over a period of time might improve the medium utilization's efficiency by reducing collisions. When dot11RAWOperationActivated is true, an AP may allocate a medium access interval, called a restricted access window (RAW), for a group of STAs within a (short) beacon interval and broadcast this information using S1G Beacon frame.

An S1G STA with dot11RAWOperationImplemented equal to true shall set the RAW Operation Support field in the S1G Capabilities element it transmits to 1. An S1G STA with dot11RAWOperationImplemented equal to false shall set the RAW Operation Support field in the S1G Capabilities element it transmits to 0.

A non-AP STA with dot11RAWOperationImplemented equal to true shall follow the RAW procedure, as described in this subclause.

An AP shall not include a non-AP STA in any RAW Group from which it has received an S1G Capabilities element whose RAW Operation Support field value is 0.

An S1G STA in TIM mode with dot11RAWOperationImplemented equal to false that receives an RPS element from the AP it is associated shall not access the WM for the RAW duration indicated in the RPS element.

An S1G STA in TIM mode is in the RAW group indicated by the RAW Group subfield in the RAW Assignment subfield of the RPS element if the AID of the S1G STA in TIM mode (n) is greater than or equal to the lowest AID of the STA allocated in the RAW (N_1) and the AID of the STA is less than or equal to the highest AID of the S1G STA in TIM mode (N_2) allocated in the RAW (i.e., $N_1 \leq n \leq N_2$), where N_1 is constructed by concatenating the Page Index subfield and the RAW Start AID subfield in the RAW Group subfield of the RPS element and N_2 is constructed by concatenating the Page Index subfield and the RAW End AID subfield in the RAW Group subfield of the RPS element.

An S1G STA in TIM mode that receives an RPS element in an S1G Beacon frame transmitted by the AP with which it is associated determines the RAW timing as the RAW duration specified by RAW Slot Definition subfield in the RAW Assignment subfield of the received RPS element and the start time of the RAW specified by the RAW Start Time subfield in the RAW Assignment subfield of the received RPS element.

The RAW is divided into one or more RAW slots. The Slot Duration Count subfield of the RAW Slot Definition subfield in the RAW Assignment subfield of the RPS element defines the duration of a RAW slot in the RAW.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the S1G STA in TIM mode belongs to the RAW group, it is allowed to contend for medium access at the start of its assigned RAW slot (see 10.23.5.3) and shall not contend for medium access within a RAW slot not assigned to it during that RAW.

An AP may allocate more than one RAW by including more than one RAW Assignment subfield in the RPS element within a (short) beacon interval with different RAW parameters. The AP may also assign periodic RAWs to a group of S1G STAs in TIM mode where the periodicity information is indicated in the RPS element (see 9.4.2.190).

An AP may assign to each S1G STA in TIM mode or a group of S1G STAs in TIM mode a RAW slot inside the RAW at which the STA(s) is (are) allowed to contend for medium access. After determining its channel access RAW slot assigned by the AP, the S1G STA in TIM mode starts to access the channel not earlier than its assigned RAW slot based on the S1G variant of EDCA (10.23.2.6). An S1G STA in TIM mode that is not a member of the RAW group indicated by the RAW Group subfield in the RAW Assignment subfield of the RPS element or is not allowed to access the RAW implicitly indicated by the values of RAW Type and RAW Type Options subfield for which the RAW Group subfield is not present, shall not access the WM in the indicated channels of the RPS element or in the BSS operating channel if there are no indicated channels for duration of the RAW, except for a non-AP STA that is allowed not to check the Beacon frame (e.g., S1G STA in non-TIM mode). Upon receipt of any frame (e.g., PS-Poll frame or trigger frame) for the RAW duration from an S1G STA in TIM mode not within the RAW group indicated by the RAW Group subfield in the RAW Assignment subfield of the RPS element, the AP shall respond with a Control frame (e.g., NDP PS-Poll ACK frame).

An AP may further indicate on which channel(s) the SST STA(s) that are granted access to the RAW are allowed to transmit for the RAW duration, through the Channel Indication subfield in the RAW Assignment subfield of the RPS element (see 9.4.2.190). An SST STA is an S1G STA that is associated with an AP and that chooses a subset of the allowed operating channels for the SST on which to operate when SST operation is activated by the AP as indicated in the SST element in the Beacon frame. A value of 1 in a bit position in the Channel Activity Bitmap in the Channel Indication subfield of the RPS element indicates that operation is allowed on the BSS operating channel for the RAW duration, with any allowed operating bandwidth that includes that channel, subject to the limitations described in 10.51. Access to the channel shall be performed according to the signaling of the procedure described in 10.51 followed by the Channel Indication signaling in RPS element, assuming the primary channel is a channel identified by a value of 1 in one of the Channel Activity bits in the Channel Indication subfield in the RAW Assignment subfield of the RPS element. The channels that are allowed for SST operation in the RPS element can be different from the channels allowed for SST operation in the SST element. An AP shall not include an S1G STA in TIM mode that is not supporting the SST Operation in the RAW Group of an RPS element that has a Channel Indication that does not include the primary BSS operating channel.

An S1G AP may protect the access of sensor STAs in some S1G Beacon frames by allocating the PRAW (10.23.5.8). During the allocated PRAW, only sensor STAs can access the wireless medium. An S1G AP may determine the duration of the PRAW based on the number of sensor STAs in its network, their expected uplink data amount and data rate and any other factors that the S1G AP chooses.

AP may designate a RAW for S1G STAs in non-TIM mode by setting the RAW Type to Simplex RAW and setting the RAW Type Options to Non-TIM RAW in the RPS element. In a non-TIM RAW, only S1G STAs in non-TIM mode that have been previously scheduled within the RAW such as TWT STAs or awake/doze rescheduled STAs (as described in 10.47.2) are allowed to access the medium.

10.23.5.2 RAW structure and timing

An illustration of the RAW structure and timing diagram is shown in Figure 10-35.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An AP indicates the RAW allocation and RAW slot assignment within the RAW by including the RPS element and the TIM element in an S1G Beacon frame.

An AP allows or prohibits transmission at the end of the assigned RAW slot by using the Cross Slot Boundary subfield in the RAW Slot Definition subfield within the RAW Assignment subfield of the RPS element (9.4.2.190).

If the Cross Slot Boundary subfield in the RAW Slot Definition subfield within the RAW Assignment subfield of the RPS element is set to 1, a STA is allowed to cross its assigned RAW slot boundary to complete the ongoing frame exchange sequence.

If the Cross Slot Boundary subfield in the RAW Slot Definition subfield within the RAW Assignment subfield of the RPS element is 0, a STA shall not transmit or cause to be transmitted a frame exchange sequence that would exceed boundary of its allocated RAW slot.

As shown in Figure 10-35, if the Cross Slot Boundary subfield in RAW Assignment subfield of the RPS element is equal to 0, a STA may initiate frame transmission only if the remaining time to the end of the assigned RAW slot duration is greater than or equal to the transmission time and reception of any immediate response expected from the peer MAC entity prior to the end of the allocated RAW slot boundary. Otherwise, it shall not initiate transmission of a frame even though the remaining RAW slot duration is nonzero.

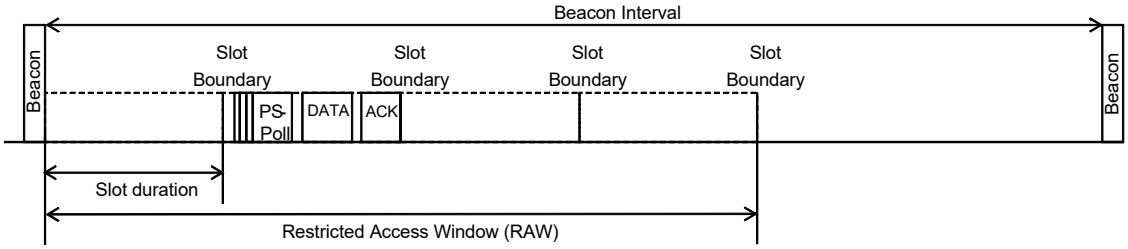

Figure 10-35—Restricted Access Window (RAW)

10.23.5.3 Slot assignment procedure in RAW

This subclause defines a RAW slot assignment procedure for STAs that are allowed to access the medium within a RAW based on the RPS element and the TIM element in a Beacon frame. Further restrictions apply to a RAW for which the RA Frame Indication field in the RPS element is 1 as described in 10.23.5.7.

A STA shall obtain the number of RAW slots in the RAW (N_{RAW}) from the Number of Slots subfield in the RAW Slot Definition subfield of RAW Assignment subfield of the RPS element. The RAW slots in the RAW are indexed from 0 to ($N_{RAW} - 1$) as shown in Figure 10-36.

The STA shall determine the index of the RAW slot, i_{slot}, in which the STA is allowed to start contending for the medium based on the following mapping function:

$$i_{slot} = (x + N_{offset}) \bmod N_{RAW}$$

where

x	is the position index of the AID of the STA or the AID of the STA
N_{offset}	represents the offset value in the mapping function
N_{RAW}	is the value of the Number of Slots subfield

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The value x is the position index of the AID of the STA if the RAW is restricted to STAs whose AID bits in the TIM element are equal to 1 (the RAW Type field is equal to 0 and the Bit 0 of the RAW Type Options field is equal to 1 or the RAW Type field is equal to 3), and AIDs are arranged in ascending order and each AID is assigned with a position index, which starts from 0 (see Figure 10-37). Otherwise, if the RAW is not restricted to STAs whose AID bits in the TIM element are equal to 1 (the RAW Type field is equal to 0 and the Bit 0 of the Raw Type Options field is equal to 0), x is the AID of the STA (see Figure 10-36); N_{offset} represents the offset value in the mapping function, which improves the fairness among the STAs in the RAW, and the STA shall use the 2 least significant octets of the FCS field of the S1G Beacon frame for the N_{offset}.

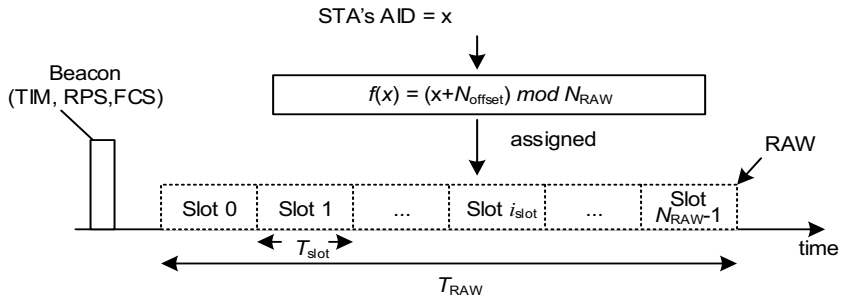

Figure 10-36—Illustration of the RAW slot assignment procedure (RAW not restricted to STAs whose AID bits in the TIM element are equal to 1)

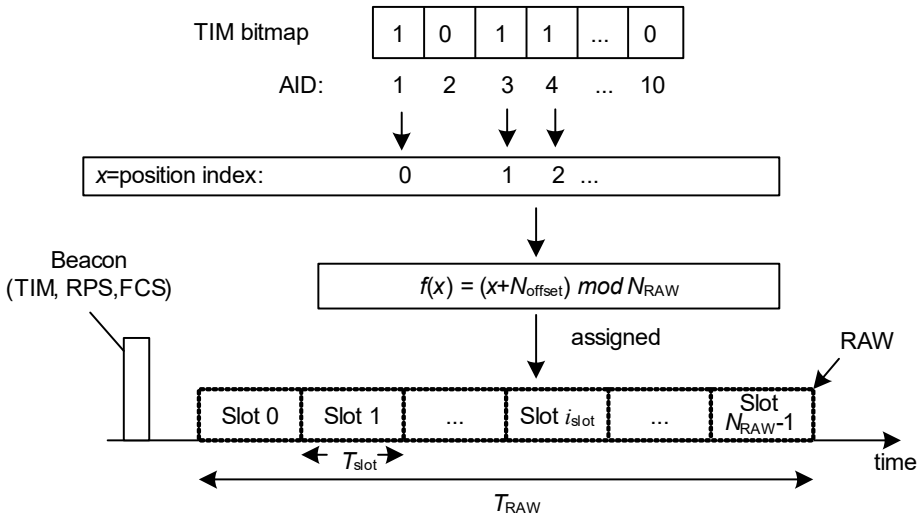

Figure 10-37—Illustration of the RAW slot assignment procedure (RAW restricted to STAs whose AID bits in the TIM element are equal to 1)

10.23.5.4 Slotted channel access procedure in RAW

When the RAW is not restricted to STAs with DL BU indication in the TIM element (the RAW is a generic RAW and the Paged STA indication is equal to 0), all STAs that belong to a RAW group are allowed to access the medium in the RAW of the RAW group, an AP assigns a RAW slot for each STA that belongs to the RAW group (10.23.5.3). Each STA that belongs to the RAW group shall start to contend for the WM not earlier than the start of the assigned RAW slot. The channel access is based on EDCA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When the RAW is restricted to STAs with DL BU indication in the TIM element (the RAW is a generic RAW and the Paged STA indication is equal to 1 or the RAW is a triggering frame RAW), paged STAs only are allowed to access the medium in the RAW, after receiving a TIM element, the paged STA starts to contend for the WM not earlier than the allocated RAW slot within the RAW defined as the function of STA position in the TIM element and the RAW group information in the RPS element (10.23.5.3), and non-paged STAs are not allowed to access the RAW.

An AP may designate a RAW for trigger frames by setting the RAW type to Triggering Frame RAW. When the RAW type is Triggering Frame RAW, each STA in the RAW Group is only allowed to send up to one trigger frame during its assigned RAW slot as described in 10.23.5.3. In the Triggering Frame RAW, a trigger frame is limited to a QoS Null contained in a non-A-MPDU frame or a (NDP) PS-Poll frame. In the Triggering Frame RAW, the STA transmits a trigger frame to the AP not earlier than the start of its assigned RAW slot. The duration of the trigger frame exchange sequence shall not exceed a RAW slot duration calculated by the RAW Slot Definition subfield in the RAW Assignment subfield of the RPS element. And, in the Triggering Frame RAW, crossing RAW slot boundary is not allowed.

After receiving the trigger frame from the paged STA in the Triggering Frame RAW, the AP shall not respond with the downlink buffered BU during the Triggered Frame RAW and may deliver the downlink buffered BU for the corresponding paged STAs after the end of the current Triggering Frame RAW.

An AP may protect transmissions of PS-Poll or trigger frames by setting the NAV for the RAW immediately following the S1G Beacon frame as specified in at least one of the RPS elements (see 10.3.2.4). A STA with dot11RAWOperationImplemented equal to true that is allowed to access the medium during this RAW shall ignore the NAV set by the S1G Beacon frame as described in 10.3.2.4.

10.23.5.5 EDCA backoff procedure in generic RAW or triggering frame RAW

An illustration of EDCA backoff procedure in RAW is shown in Figure 10-38.

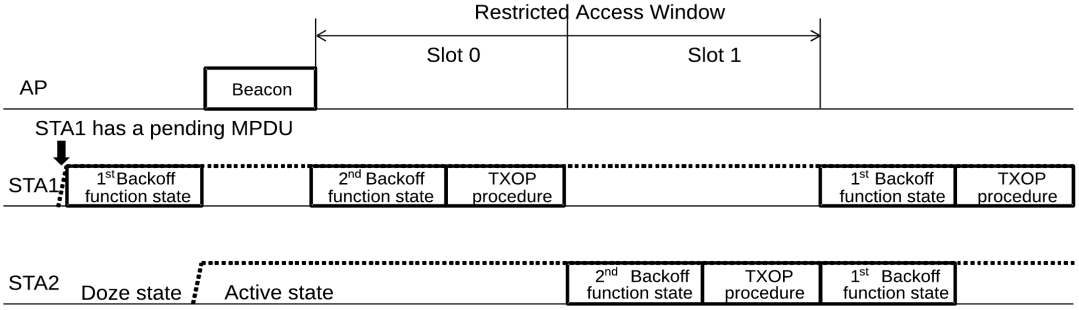

Figure 10-38—Backoff procedure for restricted channel access control

For supporting the restricted channel access control based on EDCA, a STA maintains two backoff function states. First backoff function state is used outside RAW and second backoff function state is used inside RAW.

Each STA performing EDCA access suspends an operation of its EDCAF at the start of each RAW and stores the value of the backoff counter, CW[AC], and QSRC[AC] as the first backoff state. At the end of the RAW, the stored first backoff function state is restored and an operation of the EDCAF is resumed. If the previously stored first backoff function state is empty, the EDCAF of a STA shall invoke a backoff procedure, even if no additional transmissions are currently queued.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the STA is participating in the RAW and has a pending MPDU, the EDCAF of the STA shall invoke a new backoff procedure for accessing the WM in the RAW using the access category indicated by the RAW ACI subfield in an EDCA Parameter Set element. At the beginning of the allocated RAW slot, the STA sets the CW[AC] of the secondary backoff procedure to CWmin[AC]. The values of the backoff and CW[AC] used in the RAW is called the second backoff function state.

If the Cross Slot Boundary subfield in RAW Assignment subfield of the RPS element is 0, the STA shall count down backoff only in its assigned RAW slots within the RAW. If the Cross Slot Boundary subfield in RAW Assignment subfield of the RPS element is 1, the STA shall continue to count down backoff after its assigned RAW slots within the RAW.

After the end of the RAW, STAs with the second backoff counter shall reset and disregard the second backoff function state.

10.23.5.6 EDCA backoff procedure in RAWs other than generic or triggering frame RAW

When the S1G STA is performing EDCA in any RAW other than generic or triggering frame RAW, it shall follow the rules defined in 10.23.2.

An S1G STA performing EDCA outside a RAW shall suspend an operation of its EDCA at the start of the RAW and may resume it at the end of the RAW if the STA is not included in that RAW.

An S1G STA performing EDCA outside a RAW shall continue its EDCA operation at the start of the RAW if it is included in that RAW.

10.23.5.7 RAW Operation with Resource Allocation frame

An AP transmits a Resource Allocation (RA) frame if Bit 1 of the RAW Type Options subfield is equal to 1 in the RAW Control subfield of the RAW Assignment subfield of the RPS element.

The AP transmits the RA frame to non-AP STAs belonging to the RAW group allocated to access the RAW as specified in the previously transmitted RPS element. A non-AP STA that does not belong to the RAW group may discard the RA frame.

An AP shall schedule the Resource Allocation frame as the first frame to be transmitted at the beginning of the RAW following the channel access rules. The beginning of the RAW is further defined in the RAW start time subfield of the RAW assignment subfield of the RPS element.

AP shall defer the transmission of the RA frame till the channel is free but since the preallocated RAW duration information in the RPS frame may be shortened by the delay of the transmission of the RA frame, the AP and STA shall check the transmission time of the allocated RAW slot against the end of RAW period. If the transmission of the RA frame is later than the end of RAW period, the AP and STA shall discard the information indicated in the RPS element and follow the channel access rules defined outside the RAW (10.23.5).

The AP assigns a RAW slot to either an individual STA indicated by the Partial AID subfield or a group of STAs indicated by the Group ID subfield within the Slot Assignment field of the RA frame when Slot Assignment Mode subfield in the Frame Control field of the RA frame is equal to 0. The AP assigns a RAW slot to an individual STA indicated by the Slot Assignment Indication field of the RA frame when Slot Assignment Mode subfield in the Frame Control field of the RA frame is equal to 1.

An intended STA identified by the RPS element should transition to awake state before the RAW start time indicated in the RAW start time subfield of the RAW assignment subfield of the RPS element to receive the RA frame. The STA shall not access the medium during its assigned RAW with the RA indication if it fails

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

to receive the RA frame. The STA can resume medium access according to the channel access rule after the RAW.

An intended STA identified by the RPS element of a RAW learns its assigned RAW slots for both uplink and downlink service periods according to the Slot Assignment subfield or the Slot Assignment Bitmap subfield in Slot Assignment Indication field of the RA frame. The STA should be awake before the start of the RAW slot time assigned to it. The AP shall start the delivery of BUs addressed to the STA using the EDCA procedure at the beginning of the RAW slot assignment if the TIM bit for the STA in the TIM element is equal to 1 after receiving an (NDP) PS-Poll or trigger frame from the STA. The STA may transmit uplink data as listed below:

— When the AP explicitly signals permission for the non-AP STA to begin UL transmission using the explicit signaling provided by BDT (10.49) or RD protocol (10.29).
— Using EDCA procedure when the AP transmits a frame to the STA with more data bit equal to 0.
— Using EDCA procedure at the beginning of its RAW slot assignment if the TIM bit for this STA is 0 and this STA has not negotiated with the AP to use the UL-Sync procedure (10.48).
— After receiving a frame sequence that contains a sync frame if the STA has negotiated with the AP to use the UL-Sync procedure.

10.23.5.8 Periodic RAW (PRAW) operation

An AP may schedule a RAW in periodic manner by setting Periodic RAW Indication subfield to 1 for the RAW Assignment subfield of an RPS element, and this RAW is called a PRAW.

PRAW allocation may be indicated by an RPS element included in S1G Beacon frames and/or Probe Response frames. Once a PRAW is allocated, the allocation indication is broadcasted by the AP such that every S1G STA in TIM mode can identify the allocation of PRAW. However, it is not necessary for an AP to indicate the PRAW allocation in every S1G Beacon frame transmitted in the beacon interval or short beacon interval, for which PRAW is allocated. The parameters in the RAW Assignment subfield for PRAW shall not be changed until updated PRAW information is broadcasted. A non-AP STA updates the PRAW information and accesses the channel according to the parameters in the RAW Assignment subfield of the PRAW indicated by the Periodic Operation Parameters subfield of the most recently received RPS element.

If an AP allocates more than one PRAW assignments, all active PRAW assignments shall be included in one or more RPS elements in the same S1G Beacon frame.

The S1G Beacon frame after which the first window of the PRAW appears is indicated by the PRAW Start Offset subfield of Periodic Operation Parameters of RPS element, and the starting time of the first window of the PRAW with respect to the S1G Beacon frame is equal to the RAW start time indicated by the same RAW Assignment subfield.

The periodicity of RAW assignment for a group of STAs indicated in the RAW Group subfield of the RAW Assignment subfield of RPS element is valid for a fixed number of periods indicated in the PRAW Validity subfield of the Periodic Operation Parameters subfield in the RAW Assignment subfield of RPS element. An AP may extend current PRAW assignment by indicating the PRAW assignment with the PRAW Validity subfield value extended before it expires.

At each RPS element with one or more PRAW assignments included, an AP indicates next scheduled PRAW indication time at which the AP will send another RPS element with PRAW assignments. The next scheduled PRAW indication time is the closest DTIM beacon before any of PRAW Validity subfield value of PRAW assignments included in current RPS element expires.

An AP may send another RPS element with PRAW assignments before next scheduled PRAW indication time. However, an AP shall not modify currently active PRAW assignment until next scheduled PRAW

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

indication time. If an AP intends to add a new PRAW assignment, the new PRAW assignment shall be indicated from the next scheduled PRAW indication time.

10.24 Mesh coordination function (MCF)

10.24.1 General

Under MCF, the basic unit of allocation of the right to transmit onto the WM is the TXOP. Each TXOP is defined by a starting time and a defined maximum length.

There are two types of TXOP in MCF: EDCA TXOPs and MCCA TXOPs. The EDCA TXOP is obtained by a mesh STA winning an instance of EDCA contention (see 10.23.2). The MCCA TXOP is obtained by a mesh STA gaining control of the WM during an MCCAOP. The MCCAOP is an interval of time for frame transmissions that has been reserved by means of the exchange of MCCA frames (see 10.24.3).

EDCA TXOPs of a mesh STA that has dot11MCCAActivated true shall not overlap with the time periods of any of its tracked MCCAOP reservations.

The process of tracking MCCAOP reservations involves the recording of the MCCAOP reservations and the data that structure the MCCAOP advertisements of these reservations, namely the advertisement set sequence number, advertisement elements bitmap, and the advertisement element indices, in a local database, and the updating of this database on the basis of received advertisements as described in 10.24.3.7.5.

10.24.2 MCF contention based channel access

MCF implements the same EDCA (see 10.23.2) as does HCF.

10.24.3 MCF controlled channel access (MCCA)

10.24.3.1 General

MCF controlled channel access (MCCA) is an optional access method that allows mesh STAs to access the WM at selected times with lower contention than would otherwise be possible. This standard does not require all mesh STAs to use MCCA. MCCA might be used by a subset of mesh STAs in an MBSS. However, MCCAOP reservations may be set up among mesh STAs that have dot11MCCAActivated true and that operate on the same channel; MCCAOP reservations shall not be set up otherwise. The performance of MCCA might be impacted by STAs that do not respect MCCAOP reservations.

MCCA enabled mesh STAs use Management frames to make reservations for transmissions. The mesh STA transmitting an MCCA Setup Request frame to initiate a reservation becomes the MCCAOP owner of the MCCAOP reservation. The receivers of the MCCA Setup Request frame are the MCCAOP responders. The MCCAOP owner and the MCCAOP responders advertise this MCCAOP reservation to their neighbors via an MCCAOP advertisement. An MCCA enabled neighbor mesh STA shall not transmit during these reserved MCCAOP time periods. During its MCCAOP, the MCCAOP owner obtains a TXOP by winning an instance of EDCA contention. Because of its reservation, the MCCAOP owner experiences no competition from other MCCA enabled neighbor mesh STAs. At the start of an MCCAOP, the EDCAF of the MCCAOP owner replaces the AIFSN, CWmin, and CWmax value of its dot11EDCATable with MCCA access parameters.

In order to use MCCA, a mesh STA maintains synchronization with its neighboring mesh STAs. Mesh STAs that use MCCA shall use a DTIM interval with a duration of $2^n \times 100$ TU with n being a non-negative

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

integer less than or equal to 17. Additionally, a mesh STA shall track the reservations of its neighboring mesh STAs.

NOTE 1—The DTIM interval of this form was chosen so that the starting times of the reservations do not change relative to each other between consecutive DTIM intervals. The restriction that *n* be less than or equal to 17 was chosen for compatibility with the maximum DTIM interval as well as the compatibility of the reservation's MCCAOP offset range (see 9.4.2.104.2) with the maximal DTIM interval length.

NOTE 2—It is allowed that a different value for the DTIM interval is used for mesh STAs that use MCCA in an MBSS that is centrally controlled and the central authority provides a coordination of the DTIM interval of the mesh STAs that use MCCA in the MBSS.

10.24.3.2 MCCA activation

When it receives an MLME-ACTIVATEMCCA.request primitive from its SME, a mesh STA shall set the MCCA Enabled subfield of the Mesh Capability field in the Mesh Configuration element to 1 in Beacon and Probe Response frames it transmits. It shall not initiate or accept MCCA Setup Request frames for dot11MCCAScanDuration TUs after the receipt of the MLME-ACTIVATEMCCA.request primitive.

During the dot11MCCAScanDuration waiting period, the mesh STA learns its neighborhood MCCAOP periods by receiving Beacon, Probe Response, or MCCA Advertisement frames from neighboring mesh STAs.

After this period, the mesh STA may initiate and accept MCCA Setup Request frames as per 10.24.3.6.

10.24.3.3 MCCAOP reservations

An MCCAOP reservation specifies a schedule for frame transmissions. The time periods scheduled for frame transmissions in the reservation are called *MCCAOPs*. The schedule is set up between an MCCAOP owner and one (for individually addressed frames) or more (for group addressed frames) MCCAOP responders. MCCAOPs are set up by means of the procedure defined in 10.24.3.6. Once an MCCAOP reservation is set:

— Access to the channel by MCCA enabled mesh STAs is governed by the procedures in 10.24.3.9.
— The MCCAOP reservation is advertised according to the procedures in 10.24.3.7.

The schedule is defined by means of the MCCAOP Reservation field defined in 9.4.2.104.2. An MCCAOP reservation schedules a series of MCCAOPs with a common duration given in the MCCAOP Duration subfield of the MCCAOP Reservation field. This series is started after the first DTIM beacon following the successful completion of the MCCAOP setup procedure and terminated when the MCCAOP reservation is torn down.

The reservation defines a regular schedule of MCCAOPs in the DTIM interval of the MCCAOP owner. The number of MCCAOPs in the DTIM interval is given by the value of the MCCAOP Periodicity subfield of the MCCAOP Reservation field. The MCCAOP Offset subfield specifies the offset of the first scheduled MCCAOP of the transmission schedule relative to the beginning of the DTIM interval of the MCCAOP owner. The following MCCAOPs are separated by a time interval with a duration equal to the length of the DTIM period divided by the value in the MCCAOP Periodicity subfield.

An example of an MCCAOP reservation schedule is shown in Figure 10-39. In this example, the MCCAOP Periodicity equals two, so that there are two MCCAOPs in each DTIM interval. As further illustrated in the figure, the MCCAOP Offset value indicates the beginning of the first MCCAOP in each DTIM interval.

If a mesh STA adjusts its TBTT, e.g., in response to a TBTT adjustment request, it shall adjust the MCCAOP reservations by modifying the MCCAOP Offset of each MCCAOP reservation.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

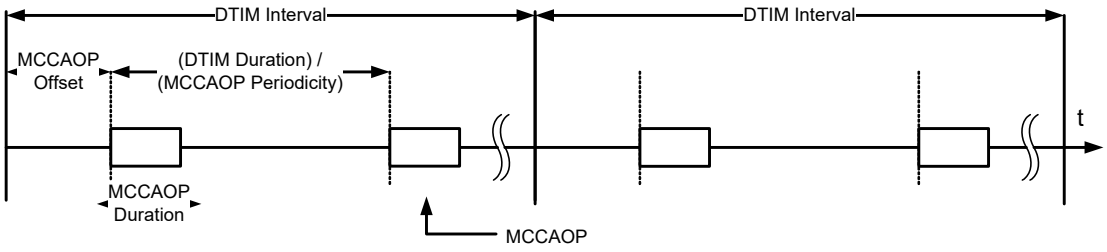

Figure 10-39—Example MCCAOP reservation with MCCAOP Periodicity equal to 2

An MCCAOP reservation is identified by an MCCAOP reservation ID. The MCCAOP owner shall select an MCCAOP reservation ID that is unique among all of its MCCAOP reservations. The MCCAOP reservation ID and MAC address of the MCCAOP owner uniquely identify the MCCAOP reservation in the mesh BSS. The MCCAOP reservation ID is an 8-bit unsigned integer and included in the MCCAOP Reservation ID field of an MCCAOP Setup Request element. If this MCCAOP setup request is for an individually addressed transmission, the MCCAOP Reservation ID is between 0 and 127. If this MCCAOP setup request is for a group addressed transmission, the MCCAOP Reservation ID is between 128 and 254. The value 255 is not used to identify a specific MCCAOP reservation but is reserved for usage in the MCCAOP teardown procedure as described in 10.24.3.8.

A mesh STA with dot11MCCAActivated equal to true shall support tracking of dot11MCCATrackStatesCapable MCCAOP reservations, including its own reservations. A mesh STA shall record the number of MCCAOP reservations that the mesh STA is currently tracking as dot11MCCATrackStatesActive.

If dot11MCCATrackStatesActive is less than dot11MCCATrackStatesCapable, the mesh STA shall support tracking, setting up, and accepting additional MCCAOP reservations. In this case, the mesh STA shall set the Accept Reservations subfield in the Flags field to 1 in the MCCAOP Advertisement Overview elements it transmits.

If dot11MCCATrackStatesActive is equal to dot11MCCATrackStatesCapable, the mesh STA shall not track, set up, or accept additional reservations. In this case, the mesh STA shall set the Accept Reservations subfield in the Flags field to 0 in the MCCAOP Advertisement Overview elements it transmits. Moreover, it shall reply to MCCA Setup Request frames with an MCCA Setup Reply frame with the MCCA Reply Code field in the MCCAOP Setup Reply element equal to 3: Reject: MCCAOP track limit exceeded.

The tracked MCCAOP reservations are advertised as described in 10.24.3.7. How to access the medium during the tracked MCCAOP reservations is specified in 10.24.3.9.

10.24.3.4 Neighborhood MCCAOP periods at a mesh STA

The set of MCCAOP reservations in which a mesh STA is involved as an MCCAOP owner or an MCCAOP responder and that are used for individually addressed transmissions are referred to as the *TX-RX periods of this mesh STA*.

The set of MCCAOP reservations in which a mesh STA is involved as an MCCAOP owner or an MCCAOP responder and that are used for group addressed transmissions are referred to as the *broadcast periods of this mesh STA*. Optionally, the broadcast periods of a mesh STA includes known target beacon transmission times of Beacon frames for which this mesh STA is either the transmitter or the receiver, and transmission or reception periods of a STA that is colocated with the reporting mesh STA, for example, beacon or HCCA times of a colocated AP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The interference periods of a mesh STA comprise the TX-RX periods and the broadcast periods of its neighbor mesh STAs in which the mesh STA is not involved as the owner or as a responder. The TX-RX periods, the broadcast periods, and the interference periods of a mesh STA shall not be used for a new MCCAOP reservation with the mesh STA as transmissions in these periods might experience interference from the transmissions in the new MCCAOPs or might cause interference to them.

The interference periods are directly derived from the TX-RX Periods Report field and Broadcast Periods Report field of the MCCAOP Advertisement elements transmitted by the neighbor mesh STAs. The Interference Periods Report field reflects the latest TX-RX Periods Report and Broadcast Periods Report fields received from the neighbor mesh STAs.

The MCCAOP reservations of a mesh STA and its neighbors define a set of MCCAOPs that are already reserved for frame transmissions in the mesh neighborhood of a mesh STA. This set of MCCAOPs is referred to as the *neighborhood MCCAOP periods for the mesh STA*. Thus, neighborhood MCCAOP periods at a mesh STA include all MCCAOPs for which the mesh STA or one of its neighbors, including neighbors from other MBSSs, is either transmitter or receiver.

10.24.3.5 MCCA access fraction (MAF)

The MCCA access fraction at a mesh STA is the ratio of the time reserved for MCCAOPs in the DTIM interval of this mesh STA to the duration of the DTIM interval. This parameter is reported in the MCCA Access Fraction field of the MCCAOP Advertisement Overview elements. The maximum value for the MAF that is allowed at a mesh STA is specified by dot11MAFlimit. The dot11MAFlimit is copied into the MAF Limit field of the MCCAOP Advertisement Overview element as described in 9.4.2.106.

The MAF and the MAF Limit may be used to limit the use of MCCA in the mesh neighborhood of a mesh STA, as specified in 10.24.3.6. Before attempting to set up an MCCAOP reservation with a neighbor peer mesh STA, a mesh STA shall verify that the new MCCAOP reservation does not cause its MAF to exceed its MAF Limit and that the new MCCAOP reservation does not cause the MAF of any of its neighbor peer mesh STAs to exceed their MAF Limit. An MCCAOP setup request shall be refused by the intended MCCAOP responder if the MAF limit of one of its neighbors is exceeded due to the new setup.

10.24.3.6 MCCAOP setup procedure

The setup of an MCCAOP reservation is initiated by the MCCAOP owner and is accepted or rejected by the MCCAOP responder. The setup procedure for an MCCAOP reservation is as follows:

a) The MCCAOP owner shall build a map of the neighborhood MCCAOP periods in the DTIM interval after hearing advertisements from all of its neighbor mesh STAs with the MCCA Enabled subfield of the Mesh Capability field in the Mesh Configuration element equal to 1. It shall request an MCCAOP advertisement, as described in 10.24.3.7.8, from each neighbor mesh STA from which no advertisement was heard in the last dot11MCCAAdvertPeriodMax DTIM intervals.

b) The MCCAOP owner shall determine the MCCAOP reservation. The MCCAOP parameters shall be chosen in such a way that they satisfy the following conditions:

   1) The reservation shall not overlap with the neighborhood MCCAOP periods of the MCCAOP owner.

   2) The reservation shall not overlap with the interference periods of the intended MCCAOP responder or responders.

   3) The reservation shall not cause the MAF limit to be exceeded for either itself or its neighbor mesh STAs.

   4) The Accept Reservations subfield of the Flags field equals 1 in the most recent MCCAOP Advertisement Overview element received from all intended MCCAOP responders.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

c) If the conditions in item b) are satisfied, the MCCAOP owner shall transmit an MCCAOP Setup Request element to the intended MCCAOP responder with the chosen MCCAOP parameters.

d) The MCCAOP responder shall verify the following conditions:
   1) The reservation does not overlap with its neighborhood MCCAOP periods.
   2) The reservation does not cause the MAF limit to be exceeded for itself or its neighbor mesh STAs.
   3) The reservation does not cause dot11MCCATrackStatesActive to exceed dot11MCCATrackStatesCapable.

e) If the conditions in item d) are satisfied, the responder shall send an MCCA Setup Reply frame to the MCCAOP owner with the MCCA Reply Code field in the MCCAOP Setup Reply element equal to 0: Accept, as defined in Table 9-285.

f) If the conditions in item d) are satisfied and the MCCAOP request has been intended for group addressed transmissions, the responder shall include the reservation in its MCCAOP advertisement only after the MCCAOP advertisement from the MCCAOP owner is received.

g) If not all of the conditions in item d) are satisfied and the MCCAOP request is intended for individually addressed transmissions, the responder shall transmit to the MCCAOP owner an MCCA Setup Reply frame that is constructed as follows:
   1) If the condition in item d)1) is not satisfied and both conditions in item d)2) and item d)3) are satisfied, the responder may calculate an alternative MCCAOP reservation and include it in the MCCAOP Reservation field of the MCCAOP Setup Reply element. It shall set the MCCA Reply Code field of the MCCAOP Setup Reply element to 1: Reject: MCCAOP reservation conflict, as defined in Table 9-285.
   2) If the condition in item d)2) is not satisfied, it shall set the MCCA Reply Code field of the MCCAOP Setup Reply element to 2: Reject: MAF limit exceeded, as defined in Table 9-285.
   3) If the condition in item d)2) is satisfied and the condition in item d)3) is not satisfied, it shall set the MCCA Reply Code field of the MCCAOP Setup Reply element to 3: Reject: MCCAOP track limit exceeded, as defined in Table 9-285.

h) If not all of the conditions in item d) are satisfied and the MCCAOP request is intended for group addressed transmissions, the responder shall send an MCCA Setup Reply frame to the MCCAOP owner with the MCCA Reply Code field in the MCCAOP Setup Reply element equal to 1: Reject: MCCAOP reservation conflict.

i) If the MCCAOP owner receives an MCCA Setup Reply frame with MCCA Reply Code equal to Accept, the MCCAOP reservation is established. Otherwise, the mesh STA may repeat the MCCAOP setup procedure using a modified MCCAOP Setup Request. If an alternative MCCAOP reservation is included in the MCCAOP Setup Reply element, the mesh STA may consider this alternative in its modified MCCAOP Setup Request.

10.24.3.7 MCCAOP advertisement

10.24.3.7.1 General

A mesh STA with dot11MCCAActivated equal to true tracks MCCAOP reservations. The tracked MCCAOP reservations contain the neighborhood MCCAOP periods and optionally other periodic transmission of itself or of neighboring STAs.

The MCCAOP advertisement set contains all MCCAOP reservations tracked by the mesh STA. The MCCAOP advertisement set is represented by an MCCAOP Advertisement Overview element and zero (if the MCCAOP advertisement set is empty) or more (if the MCCAOP advertisement set is nonempty) MCCAOP Advertisement elements. An MCCAOP Advertisement element contains one or more tracked MCCAOP reservations.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The mesh STA advertises its MCCAOP advertisement set to its neighbor mesh STAs.

This subclause describes how the mesh STA constructs the MCCAOP Advertisement Overview element and the MCCAOP Advertisement elements. Further, this subclause describes the procedure to advertise an MCCAOP advertisement set, the procedure to request an MCCAOP advertisement from a neighboring mesh STA, and the procedure to process a received MCCAOP advertisement.

10.24.3.7.2 Construction of an MCCAOP advertisement set

The following terminology is used in this subclause:

- TX-RX report: an MCCAOP Reservation field contained in the TX-RX Periods Report field of an MCCAOP Advertisement element
- Broadcast report: an MCCAOP Reservation field contained in the Broadcast Periods Report field of an MCCAOP Advertisement element
- Interference report: an MCCAOP Reservation field contained in the Interference Periods Report field of an MCCAOP Advertisement element

Each MCCAOP reservation tracked by a mesh STA is one of the following types:

- TX-RX period:
  - An MCCAOP reservation for individually addressed frames for which the mesh STA is the MCCAOP owner or the MCCAOP responder.
- Broadcast period:
  - An MCCAOP reservation for group addressed frames for which the mesh STA is the MCCAOP owner or the MCCAOP responder.
  - Optionally, known target beacon transmission times of Beacon frames for which the mesh STA is either the transmitter or the receiver.
  - Optionally, a transmission or reception period of a STA that is colocated with the mesh STA, for example, beacon or HCCA times of a colocated AP.
- Interference period:
  - A TX-RX or a broadcast period reported by a neighbor peer mesh STAs of the mesh STA excluding those periods for which this mesh STA is either the MCCAOP owner or the MCCAOP responder.
  - Optionally, a TX-RX or a broadcast period reported by neighbor nonpeer mesh STAs of the mesh STA.

The MCCAOP reservations are grouped into the following sets:

- MCCAOP TX-RX advertisement set, which includes all TX-RX periods
- MCCAOP broadcast advertisement set, which includes all broadcast periods
- MCCAOP interference advertisement set, which includes all interference periods

These three sets constitute the MCCAOP advertisement set. The mesh STA uses the MCCAOP Overview element and MCCAOP Advertisement elements to advertise its MCCAOP advertisement set to its neighbor mesh STAs.

The mesh STA acts as follows to construct the MCCAOP Overview elements and the MCCAOP Advertisement elements:

a) If the MCCAOP advertisement set is nonempty, the mesh STA constructs one or more MCCAOP reports according to the format described in 9.4.2.107.3 as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

1) If the MCCAOP TX-RX advertisement set is nonempty, the mesh STA constructs one or more TX-RX reports according to the format described in 9.4.2.107.3 such that each reservation in the MCCAOP TX-RX advertisement set occurs exactly in one TX-RX report.
2) If the MCCAOP broadcast advertisement set is nonempty, the mesh STA constructs one or more broadcast reports according to the format described in 9.4.2.107.3 such that each reservation in the MCCAOP broadcast advertisement set occurs exactly in one broadcast report.
3) If the MCCAOP interference advertisement set is nonempty, the mesh STA constructs one or more interference reports according to the format described in 9.4.2.107.3 such that each reservation in the MCCAOP interference advertisement set occurs exactly in one interference report.

b) If the MCCAOP advertisement set is nonempty, the mesh STA constructs one or more MCCAOP Advertisement elements as follows:
1) The MCCAOP Advertisement Set Sequence Number field is set to the MCCAOP advertisement set sequence number as explained in 10.24.3.7.3.
2) The MCCAOP Advertisement Element Index subfield is set to an identifier that uniquely identifies the MCCAOP Advertisement element in the MCCAOP advertisement set.
3) Each MCCAOP Advertisement element includes at least one of the TX-RX reports, broadcast reports, or interference reports. Moreover, it includes at most one of the TX-RX reports, at most one of the broadcast reports, and at most one of the interference reports. In case the MCCAOP Advertisement element contains a TX-RX report, the TX-RX Report Present subfield of the MCCAOP Advertisement Element Information field is set to 1; otherwise this subfield is set to 0. In case the MCCAOP Advertisement element contains a broadcast report, the Broadcast Report Present subfield of the MCCAOP Advertisement Element Information field is set to 1; otherwise this subfield is set to 0. In case the MCCAOP Advertisement element contains an interference report, the Interference Report Present subfield of the MCCAOP Advertisement Element Information field is set to 1; otherwise, this subfield is set to 0.
4) Each report as constructed in step a) is present in exactly one MCCAOP Advertisement element.

c) The mesh STA constructs one MCCAOP Advertisement Overview element such that
1) The MCCAOP Advertisement Set Sequence Number field is set to the advertisement set sequence number as explained in 10.24.3.7.3.
2) The Medium Access Fraction field is set to the medium access fraction.
3) The MAF limit field is set to dot11MAFlimit.
4) The Accept Reservations field is set to 1 if dot11MCCATrackStatesActive is less than dot11MCCATrackStatesCapable, and set to 0 otherwise.
5) Bit *i* of the Advertisement Elements Bitmap field is set to 1 if an MCCAOP Advertisement element with the MCCAOP Advertisement Element Index subfield equal to *i* is part of the representation of this MCCAOP advertisement set, and set to 0 otherwise.

10.24.3.7.3 Setting the MCCAOP advertisement set sequence number

The MCCAOP advertisement set sequence number identifies an MCCAOP advertisement set. Mesh STAs with dot11MCCAActivated equal to true assign MCCAOP advertisement set sequence numbers from a single modulo 256 counter. The MCCAOP advertisement set sequence number is initialized to 0. The MCCAOP advertisement set sequence number shall be incremented by 1 if one of the following conditions holds:

a) The mesh STA sets the bit for an MCCAOP Advertisement element in the Advertisement Elements Bitmap from 0 to 1 and this bit has been set to 1 under the same MCCAOP Advertisement Sequence Number before.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

b) The bit of the Advertisement Elements Bitmap corresponding to an MCCAOP Advertisement element is equal to 1 and the content of this MCCAOP Advertisement element changes.

However, the MCCAOP advertisement set sequence number may remain unchanged if

— The mesh STA changes a bit in the Advertisement Element Bitmap from 0 to 1 and this bit has not been set to 1 under the same MCCAOP Advertisement Sequence Number before, or

— The mesh STA changes a bit in the Advertisement Elements Bitmap from 1 to 0.

NOTE—The Advertisement Set Sequence Number identifies the current distribution of the MCCAOP advertisement set over the MCCAOP Advertisement elements. Using a new MCCAOP advertisement set sequence number signals a new, (possibly) completely different distribution of the MCCAOP advertisement set over the MCCAOP Advertisement elements, and requires an advertisement of all reservations of the MCCAOP advertisement set. Leaving the MCCAOP advertisement set sequence number unchanged as in the previous MCCAOP Advertisement Overview element indicates MCCAOP Advertisement elements that have previously been advertised are not changed and remain current. This enables a limited advertisement procedure in which only new MCCAOP Advertisement elements are advertised. Additionally, this enables mesh STAs that operate in light or deep sleep mode to request a limited update of the MCCAOP advertisement set of a neighboring mesh STA in which only new MCCAOP Advertisement elements are included.

10.24.3.7.4 Advertisement procedure

To advertise its MCCAOP advertisement set, the mesh STA constructs a representation of the MCCAOP advertisement set as described in 10.24.3.7.2. The MCCAOP advertisement set is advertised by transmitting an MCCAOP Advertisement Overview element and zero or more MCCAOP Advertisement elements (see 10.24.3.7.2) to neighbor peer mesh STAs. The MCCAOP Advertisement Overview element and the MCCAOP Advertisement elements are transmitted in Beacon frames, Probe Response frames, or MCCA Advertisement frames.

The mesh STA shall advertise its MCCAOP advertisement set according to the following rules:

a) The mesh STA shall advertise at least one MCCAOP Advertisement Overview element in every dot11MCCAAdvertPeriodMax DTIM intervals.

b) The mesh STA shall advertise its MCCAOP Advertisement Overview element and any new MCCAOP Advertisement elements at the latest with the transmission of its next Beacon frame after its MCCAOP advertisement set has changed.

c) The mesh STA shall advertise the requested MCCAOP Advertisement elements as described in 10.24.3.7.8 if the mesh STA receives an MCCA Advertisement Request frame.

10.24.3.7.5 Receipt of an MCCAOP advertisement

Upon receipt of an MCCAOP advertisement a mesh STA with dot11MCCAActivated shall compare the Advertisement Set Sequence Number contained in the MCCAOP Advertisement Overview element of the received MCCAOP advertisement with the last advertisement set sequence number that this mesh STA tracked for the sender of the received MCCAOP advertisement.

If the tracked advertisement set sequence number does not equal the Advertisement Set Sequence Number of the received MCCAOP advertisement, the mesh STA shall perform the procedure described in 10.24.3.7.6.

If the tracked advertisement set sequence number equals the Advertisement Set Sequence Number of the received MCCAOP advertisement, the mesh STA shall compare the Advertisement Elements Bitmap contained in the received MCCAOP Advertisement Overview element with the last Advertisement Elements Bitmap that this mesh STA tracked for the sender of the received MCCAOP advertisement. If the tracked Advertisement Elements Bitmap does not equal the Advertisement Elements Bitmap of the received MCCAOP advertisement, the mesh STA shall perform the procedure described in 10.24.3.7.7.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—If both the tracked advertisement set sequence number equals the Advertisement Set Sequence Number of the received MCCAOP advertisement and the tracked Advertisement Elements Bitmap equals the Advertisement Elements Bitmap of the received MCCAOP advertisement, the MCCAOP advertisement set of the sender of the MCCAOP advertisement tracked by the mesh STA is current, and no update of the MCCAOP advertisement set is needed.

10.24.3.7.6 Complete update of the tracked MCCAOP reservations of a neighbor mesh STA

The mesh STA performed the steps in 10.24.3.7.5 and detected that the MCCAOP advertisement set sequence number has been updated. Consequently, the mesh STA shall operate as follows.

The mesh STA shall discard all MCCAOP reservations that it tracked for the sender of the received MCCAOP advertisement. The mesh STA shall record the Advertisement Set Sequence Number and the source address (SA) of the received MCCAOP advertisement. The mesh STA shall record all reservations in the MCCAOP Advertisement elements of the received MCCAOP advertisement.

If the mesh STA does not receive all MCCAOP Advertisement elements of the sender of the MCCAOP advertisement before a frame exchange sequence on the wireless medium causes the mesh STA to set its NAV, the mesh STA shall perform the MCCAOP advertisement request procedure as described in 10.24.3.7.8.

10.24.3.7.7 Partial update of the tracked MCCAOP reservations of a neighbor mesh STA

The mesh STA performed the steps in 10.24.3.7.5 and detected that part of the MCCAOP advertisement set of the sender of the MCCAOP advertisement has been updated. Consequently, the mesh STA shall operate as follows for each bit in the Advertisement Elements Bitmap contained in the MCCAOP Advertisement Overview element of the received MCCAOP advertisement.

If the bit in position n of the Advertisement Elements Bitmap in the received MCCAOP Advertisement is equal to 0 and if the bit in position n of the Advertisement Elements Bitmap tracked for the sender of the received MCCAOP advertisement is equal to 1, the mesh STA shall delete the reservations with the same Advertisement Sequence Number and the same MCCAOP Advertisement Element Index received from the same sender from its tracked reservations.

If the bit in position n of the Advertisement Elements Bitmap in the received MCCAOP Advertisement is equal to 1 and if the bit in position n of the Advertisement Elements Bitmap tracked for the sender of the received MCCAOP advertisement is equal to 0, the mesh STA shall add the reservations of the received MCCAOP Advertisement element with the MCCAOP Advertisement Element Index set to n to its tracked reservations. If the mesh STA does not receive this MCCAOP Advertisement element of the sender of the MCCAOP Advertisement before a frame exchange sequence on the wireless medium causes the mesh STA to set its NAV, the mesh STA shall perform the MCCAOP Advertisement request procedure as described in 10.24.3.7.8.

NOTE—If the bit in position n of the received Advertisement Elements Bitmap contained in the received MCCAOP Advertisement is equal to the bit in position n of the Advertisement Elements Bitmap tracked for the sender of the received MCCAOP advertisement, then the Advertisement element with the MCCAOP Advertisement Element Index equal to n is current, and no update of this Advertisement element is needed.

10.24.3.7.8 MCCAOP advertisement request procedure

To request all MCCAOP Advertisement elements from a neighbor peer mesh STA, the mesh STA transmits an MCCA Advertisement Request frame without an MCCAOP Advertisement Overview element.

To request a subset of the MCCAOP Advertisement elements of a neighbor peer mesh STA, the mesh STA transmits an MCCA Advertisement Request frame including an MCCAOP Advertisement Overview

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

element. The mesh STA shall set the contents of the MCCAOP Advertisement Overview element as follows. The mesh STA sets

a) The Advertisement Set Sequence Number field to the Advertisement Sequence Number that it tracks for the recipient of this frame
b) In the Advertisement Element Bitmap, the bit to 1 for each MCCAOP Advertisement element that the mesh STA requests from the recipient of this frame
c) The Flags field, the MCCA Access Fraction field, and the MAF Limit field to 0

The mesh STA shall discard the MCCA Advertisement Request frame from its frame queue if it receives all of the MCCAOP Advertisement elements that it requests in the MCCAOP Advertisement Request.

10.24.3.8 MCCAOP teardown

10.24.3.8.1 Conditions that trigger an MCCAOP teardown

The MCCAOP owner and the MCCAOP responder may initiate a teardown of an MCCAOP reservation, e.g., when the reservation is no longer needed. A mesh STA shall act as follows to resolve conflicts between MCCAOP reservations in its neighborhood MCCAOP periods. If the conflict is caused by overlapping reservations from its TX-RX periods and broadcast periods, it shall select one of these reservations and initiate a teardown for it. If the conflict is caused by an overlap between a reservation from its TX-RX periods or broadcast periods, and another reservation from its interference periods, it shall act as follows. It creates a first unsigned integer by inverting the bit order of its MAC address and a second unsigned integer by inverting the bit order of the lowest of the known MAC addresses of the owner and responder(s) of the reservation in the interference periods. If the first unsigned integer is smaller than the second unsigned integer, it shall initiate a teardown of the reservation in its TX-RX or broadcast periods. Otherwise, it may initiate a teardown of the reservation in its TX-RX or broadcast periods.

There are also other conditions that trigger the MCCAOP owner and responder to delete a reservation, without an explicit tear down. An MCCAOP owner shall delete a reservation for an individually addressed transmission when it has not received an acknowledgment for any frame transmission in the MCCAOPs corresponding to the reservation for greater than dot11MCCAOPtimeout time. An MCCAOP responder shall delete a reservation for individually addressed transmission or group addressed transmissions when it has not received a frame transmission in any of the MCCAOPs corresponding to the reservation for greater than dot11MCCAOPtimeout time.

10.24.3.8.2 MCCAOP teardown procedure

The teardown is initiated by transmitting an MCCA Teardown frame. The MCCAOP Reservation ID field in the MCCAOP Teardown element is set to the MCCAOP Reservation ID of the reservation that is to be torn down. In case the tear down is initiated by an MCCAOP responder, the MCCAOP Owner field of the MCCAOP Teardown element is set to the MAC address of the MCCAOP owner.

The transmitter of the MCCA Teardown frame deletes the reservation after the MCCA Teardown frame has been successfully transmitted. The receiver of the MCCA Teardown frame acts as follows. In case the MCCAOP Reservation ID field corresponds to a reservation for individually addressed transmissions, it deletes the reservation. If the reservation is for group addressed transmissions for which it is the MCCAOP owner, it deletes the reservation if there are no other MCCAOP responders for this reservation.

The MCCAOP owner acts as follows when deleting a reservation:

— It stops executing the access procedure described in 10.24.3.9.1 at the start of the MCCAOPs corresponding to the reservation that was deleted.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— In case the reservation was for individually addressed frames, it stops advertising the MCCAOP reservation in its TX-RX Periods Report field.
— In case the reservation was for group addressed frames, it stops advertising the MCCAOP reservation in its Broadcast Periods Report field.

The MCCAOP responder acts as follows when deleting a reservation:

— It stops executing the procedure described in 10.24.3.9.2 during the MCCAOPs corresponding to the reservation that was deleted.
— In case the reservation was for individually addressed frames, it stops advertising the MCCAOP reservation in its TX-RX Periods Report field.
— In case the reservation was for group addressed frames, it stops advertising the MCCAOP reservation in its Broadcast Periods Report field.

10.24.3.9 Access during MCCAOPs

10.24.3.9.1 Access by MCCAOP owners

At the start of the MCCAOP, the EDCAF of the MCCAOP owner shall set AIFSN[AC] equal to dot11MCCAAIFSN, CWmax[AC] equal to dot11MCCACWmax, CW[AC] equal to dot11MCCACWmin, and QSRC[AC] to 0 for all ACs. The TXOP limit shall specify a duration value no larger than the MCCAOP Duration.

During the MCCAOP, the EDCAFs of the ACs operates as specified in 10.23.2, with the following modifications.

— During the MCCAOP, the EDCAF of each AC shall consider only those frame whose RA matches the MAC address of the MCCAOP responder.
— When the access to the medium is delayed, the TXOP limit shall specify a duration to end no later than the MCCAOP start time plus the MCCAOP Duration.
— As specified in 10.24.3.9.2, a neighboring STA shall not access the WM during an MCCAOP, until it receives a frame from either the MCCAOP owner or the MCCAOP responder. With the exception of truncation of an MCCA TXOP by means of a CF-End, standard EDCA TXOP rules apply for the remainder of the MCCAOP. For HT mesh STAs, these include the reverse direction protocol as specified in 10.29.
— At the end of the MCCAOP, the parameters used by the EDCAF of the MCCAOP owner shall be set to dot11EDCATable, and QSRC[AC] shall be set to 0 for all ACs.

The MCCAOP owner may adjust the duration of an MCCAOP by setting the Duration/ID field in the frames it transmits. In particular, if an MCCAOP owner has no data to transmit in an MCCAOP corresponding to an MCCAOP reservation that is intended for individually addressed frames, it may transmit an individually addressed QoS Null frame during the MCCAOP to end the MCCAOP.

NOTE—An MCCAOP owner ought to send a QoS Null frame to end the MCCAOP although there might be situations in which the transmission of a QoS Null is not needed or undesirable.

If an MCCAOP owner has no data to transmit in an MCCAOP reservation that is intended for group addressed frames, it may transmit a group addressed QoS Null frame during the MCCAOP to end the MCCAOP.

10.24.3.9.2 Access during an MCCAOP by mesh STAs that are not the MCCAOP owner

The MAC of a mesh STA with dot11MCCAActivated is true shall provide a Reservation Allocation Vector (RAV) mechanism to indicate a busy medium from the start of an MCCAOP corresponding to a reservation

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

in its interference periods until the receipt of a frame transmitted by either the MCCAOP owner or the MCCAOP responder. The RAV mechanism is provided in addition to the PHY and virtual CS mechanisms described in 10.3.2.1. It is different from the virtual CS mechanism in two aspects. Firstly, a mesh STA might be neighbor to multiple ongoing MCCAOPs corresponding to different reservations and the regular NAV setting and updating rules do not suffice to prevent interference during these reservations. Secondly, the virtual CS mechanism is set immediately upon receipt of a frame, whereas the RAV mechanism is based on reservation frames received at some earlier time instant. When either the CS function provided by the PHY, the virtual CS function provided by the MAC via the NAV, or the RAV mechanism indicate a busy medium during an MCCAOP for which the mesh STA is neither the MCCAOP owner nor the MCCAOP responder, the medium shall be considered busy; otherwise, it shall be considered idle.

The RAV mechanism maintains an index of future MCCAOPs based on the reservation information that is available in the interference periods of a mesh STA. At the start of each MCCAOP corresponding to a reservation in the interference periods, a RAV is set to indicate a busy medium for the duration of the MCCAOP given in the MCCAOP Duration subfield of the MCCAOP reservation. At the start of each MCCAOP corresponding to a reservation in the TX-RX or broadcast periods for which the mesh STA is an MCCAOP responder, a RAV is set to indicate a busy medium for the duration of the MCCAOP given in the MCCAOP Duration subfield of the MCCAOP reservation. The RAV may be thought of as a counter, corresponding to an MCCAOP corresponding to a reservation in the interference periods. The RAV counts down to zero at a uniform rate. When the counter is zero, the RAV indication is that the medium is idle; when nonzero, the indication is busy.

The mesh STA clears the RAV timer, i.e., sets it to 0, upon receipt of a frame from either the MCCAOP owner or responder. If a mesh STA receives an RTS frame during an MCCAOP for which it is an MCCAOP responder, with the RA matching its MAC address and with the MAC address in the TA field in the RTS frame matching the MAC address of the MCCAOP owner, then the STA shall send the CTS frame after a SIFS, without regard for the NAV and the RAV, and without resetting its NAV. The RAV for an MCCAOP is not cleared upon receipt of a frame originating from stations that are not the MCCAOP owner or responder. Since the NAV is set upon receipt of frames with a Duration/ID field, the MCCAOP owner and responder adjust the reservation period of an MCCAOP to their actual traffic needs by the Duration/ID field in the transmitted frame and obtain protection of the frame transmission via the NAV setting.

The RAV mechanism might be represented by a number of counters, where each counter corresponds to one MCCAOP. The number of counters needed at any instant is equal to the number of MCCAOPs at this instant corresponding to reservations in the interference periods of the mesh STA.

10.24.3.10 Interaction with time synchronization

If a mesh STA adjusts its TBTT, e.g., in response to a TBTT Adjustment Request, it shall adjust the reservations by modifying the MCCAOP Offset of each of the tracked MCCAOP reservations. If a mesh STA adjusts its timing offset value with respect to a neighbor mesh STA, as specified in 14.14.2.2, it shall adjust the reservations by modifying the MCCAOP Offset of each of the tracked MCCAOP reservations for which this neighbor mesh STA is the owner. In either case, an MCCAOP advertisement of a mesh STA shall always contain the most recent MCCAOP Offsets.

10.25 Block acknowledgment (block ack)

10.25.1 Introduction

The block ack mechanism improves channel efficiency by aggregating several acknowledgments into one frame. In this subclause, the STA with data to send using the block ack mechanism is referred to as the *originator*, and the receiver of that data as the *recipient*.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The block ack mechanism is initialized by an exchange of ADDBA Request/Response frames except for GLK-GCR block ack and block ack between two NGV STAs, or by using the unsolicited block ack extension mechanism. After initialization, blocks of QoS Data frames may be transmitted from the originator to the recipient. A block may be started within a polled TXOP, within an SP, or by winning EDCA contention. The number of frames in the block is limited, and the amount of state that is to be kept by the recipient is bounded. The MPDUs within the block of frames are acknowledged by a BlockAck frame, which is requested by a BlockAckReq frame.

For GLK-GCR block ack, the block ack mechanism is initialized when the GLK STA associates with the GLK AP. The MPDUs within a block of SYNRA addressed Data frames are acknowledged by a BlockAck frame, which is requested by a BlockAckReq frame.

The block ack mechanism does not require the setting up of a TS; however, QoS STAs using the TS facility may choose to signal their intention to use block ack mechanism for the scheduler's consideration in assigning TXOPs. The block ack mechanism is also used by the GCR service. Acknowledgments of frames belonging to the same TID, but transmitted during multiple TXOPs/SPs, may also be combined into a single BlockAck frame. This mechanism allows the originator to have flexibility regarding the transmission of Data frames. The originator may split the block of frames across TXOPs/SPs, separate the data transfer and the block ack exchange, and interleave blocks of MPDUs carrying all or part of MSDUs or A-MSDUs for different TIDs or RAs.

A non-AP S1G STA may negotiate an asymmetric BA with an S1G AP as described in 10.25.2. A non-S1G STA shall not transmit NDP BlockAck frames and shall not initiate an asymmetric BA. An S1G AP with dot11AsymmetricBlockAckActivated equal to false shall not support asymmetric BA. Under asymmetric BA operation, the responding S1G STA may use a lower MCS for transmitting the immediate BlockAck frame as described in 10.6.6.5.2. The intended recipient STA maintains a measure of the degree of asymmetry between the AP and the STA and implicitly indicates the value to the originator AP during the block ack setup phase. This degree of asymmetry is represented as the difference in MCS values between AP and STA, and referred to as MCSDifference (see 10.25.2). After an asymmetric BA agreement is established, the originator AP uses the MCSDifference to calculate the Duration field of PV0 frames carried in the A-MPDU that elicits the BlockAck frame.

An S1G STA that sets the STA Type Support subfield in a transmitted S1G Capabilities element to 0 or 2, as described in 10.62, shall support the HT-immediate block ack extension. An S1G STA that sets the A-MPDU Supported field in the S1G Capabilities element to 1 shall support the HT-immediate block ack extension.

All arithmetic and equations (including inequalities) in 10.25 are to be understood as being modulo the size of the relevant counter space (typically 4096).

Under a block ack agreement using segmentation and reassembly, operations on MSDU Sequence Number and MPDU Sequence Number are performed modulo $2^{\text{MSDU Modulo}}$ and modulo $2^{\text{MPDU Modulo}}$ respectively (see 10.69), where MSDU Modulo and MPDU Modulo correspond to the values of the MSDU Modulo and MPDU Modulo subfields, respectively, defined in the SAR Configuration element. Comparisons between MPDU sequence number and MSDU sequence number are circular modulo $2^{\text{MPDU Modulo}}$ and $2^{\text{MSDU Modulo}}$, respectively, i.e., the sequence number space is considered divided into two parts, one of which is "old" and one of which is "new," by means of a boundary created by adding half the sequence number range to the current start of receive window (modulo $2^{\text{MPDU Modulo}}$ and $2^{\text{MSDU Modulo}}$, respectively). The Block Ack Starting Sequence Control subfield within the BlockAckReq frame represents the MPDU starting sequence number.

The EDMG flow control is an amendment to the block ack mechanism to prevent overloading of the recipient's memory space, which may happen in case the link speed is higher than STA's capability to

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

process or consume incoming data. The EDMG flow control adjusts to the recipient's capabilities to optimize network utilization.

10.25.2 Setup and modification of the block ack parameters

Where the generic terms ADDBA Request frame, ADDBA Response frame, and DELBA frame are used throughout 10.25 in reference to a block ack agreement between S1G STAs, the appropriate variant according to this subclause (e.g., NDP ADDBA Request, BAT ADDBA Request, and ADDBA Request) is referenced by the generic term.

To establish a block ack agreement, an originator sends an ADDBA Request frame indicating the TID for which the block ack agreement is being established. The Buffer Size and Block Ack Timeout Value fields in the ADDBA Request frame are advisory. A block ack agreement shall not be established between a non-HT non-DMG non-S1G STA and another STA.

If the intended S1G recipient is capable of participating in an HT-immediate block ack agreement, the S1G originator shall send an NDP ADDBA Request to indicate that it expects only NDP BlockAck frames during the block ack agreement with the following exceptions:

a) If the S1G originator has the dot11BATImplemented equal to true and the BAT Support subfield in the S1G Capabilities element received from the S1G recipient is 1 and a TWT has been established with the S1G recipient as described in 10.46, then the S1G originator shall send a BAT ADDBA Request to indicate that it expects only BAT frames during the block ack agreement.
b) When any of the conditions below is satisfied then the S1G originator may send an ADDBA Request to indicate that it expects only BlockAck frames during the block ack agreement:
    1) The value of the Buffer Size field in the ADDBA Request, carried in an S1G_LONG or S1G_SHORT PPDU, is greater than 16.
    2) The value of the Buffer Size field of the ADDBA Request, carried in an S1G_1M PPDU, is greater than 8.
    3) The dot11AsymmetricBlockAckActivated is true and Asymmetric BA Supported field in the S1G Capabilities element received from the S1G recipient is 1.

The recipient STA shall respond by an ADDBA Response frame. The recipient STA has the option of accepting or rejecting the request. When the recipient STA accepts, then a block ack agreement exists between the originator and recipient.

When the S1G recipient STA rejects the request it may indicate a status code of 109 (REJECTED_NDP_BLOCK_ACK_SUGGESTED) to indicate to the S1G originator that it prefers to generate only NDP BlockAck frames.

When the recipient STA accepts, it indicates the type of block ack agreement, the type of BlockAck frames, and the number of buffers that it shall allocate for the support of this block ack agreement within the ADDBA Response frame and the block ack agreement inactivity timeout that is used. Each block ack agreement that is established by a STA may have a different buffer allocation. If the intended recipient STA rejects the request, then the originator shall not use the block ack mechanism.

An S1G recipient STA that accepts an HT-immediate block ack agreement shall respond with the following:

— An NDP ADDBA Response if the value of the Buffer Size field of the NDP ADDBA Response is not greater than the value of the maximum number of MSDUs and A-MSDUs that can be acknowledged with the selected NDP BlockAck frame and no TWT has already been established with the S1G originator as described in 10.46.
    — This value is 8 for NDP_1M BlockAck frames and 16 for NDP_2M BlockAck frames as described in 23.3.12.2.6. The NDP ADDBA Response frame shall be carried in an S1G_1M

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

PPDU to indicate the use of NDP_1M BlockAck frames and shall be carried in an S1G_SHORT or S1G_LONG PPDU to indicate the use of NDP_2M BlockAck frames.

— Otherwise, a BAT ADDBA Response as a response to a BAT ADDBA Request if a TWT has already been established with the S1G originator as described in 10.46.
  — The value of the Buffer Size field in the BAT ADDBA Response shall not be greater than 32.
— Otherwise, a ADDBA Response to indicate the use of BlockAck frames.

The MCS subfield in the Originator Preferred MCS field shall be set to 15 unless the dot11AsymmetricBlockAckActivated is true and the Asymmetric BA Supported field in the S1G Capabilities element received from the S1G originator is 1 in which case the MCS subfield may indicate the value of the preferred MCS if asymmetric BA operation is used. The preferred MCS implicitly indicates the MCSDifference value, which is the difference between the preferred MCS and the MCS at which the ADDBA Response is sent.

When the Block Ack Policy subfield value is 1 in an ADDBA Request frame, the responding HT STA shall set the Block Ack Policy subfield to 1 in the ADDBA Response frame accepting the ADDBA Request frame.

For each accepted block ack agreement, the originator shall set the sequence number of the first frame transmitted under the agreement to the value of the Block Ack Starting Sequence Control field of the ADDBA Request frame of the accepted block ack agreement.

When a block ack agreement is established between two HT STAs, two DMG STAs, or two S1G STAs, the originator may change the size of its transmission window:

— The transmission window is not greater than the value in the Buffer Size field of the ADDBA Response frame.
— The transmission window is not greater than 64 if the sender or receiver of the ADDBA Response frame is a non-HE STA.
— The transmission window is not greater than 256 if the sender and receiver of the ADDBA Response frame are HE STAs.

If the value in the Buffer Size field of the ADDBA Response frame is smaller than the value in the ADDBA Request frame, the originator shall change the size of its transmission window ($WinSize_O$) so that it meets the following conditions:

— Is not greater than the value in the Buffer Size field of the ADDBA Response frame.
— Is not greater than 64 if the sender or receiver of the ADDBA Response frame is a non-HE STA or if the STAs that establish the block ack agreement are HT STAs or DMG STAs that are not EDMG STAs.
— Is not greater than 256 if the sender and receiver of the ADDBA Response frame are HE STAs.
— Is not greater than 1024 if the STAs that establish the block ack agreement are EDMG STAs.

When a block ack agreement is established between two EDMG STAs, the size of the Block Ack bitmap the recipient shall use depends on the established size of the transmission window ($WinSize_O$). The size of the Block Ack bitmap for an EDMG STA shall be one of 64, 128, 256, 512, or 1024 bits. The size of the Block Ack bitmap shall be the smallest size that is greater than $WinSize_O$ for the established block ack agreement.

NOTE 1—A block ack associated with a GCR group address does not use an inactivity timer because the GCR originator might switch between the DMS delivery method, the GCR unsolicited retry retransmission policy, and the GCR block ack retransmission policy during the lifetime of a GCR agreement.

NOTE 2—A GLK-GCR block ack is established at the time the general link is established and might be used by the general link originator whenever the GCR block ack retransmission policy is active. Therefore, an explicit block ack

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

setup or modification procedure is not defined for GLK-GCR block ack. The GLK-GCR block ack is deleted when the corresponding general link gets reassociated or disassociated.

The A-MSDU Supported field indicates whether an A-MSDU may be sent under the particular block ack agreement. The originator sets this field to 1 to indicate that it might transmit A-MSDUs with this TID. The recipient sets this field to 1 to indicate that it is capable of receiving an A-MSDU with this TID.

NOTE 3—The recipient is free to respond with any setting of the A-MSDU Supported field, irrespective of the originator's setting of the A-MSDU Supported field. If the value in the ADDBA Response frame is not acceptable to the originator, it can delete the block ack agreement and transmit data using normal acknowledgment.

If the block ack mechanism is being established for a TS, bandwidth negotiation (using ADDTS Request and Response frames) should precede the establishment of the block ack mechanism. If the block ack mechanism is being established for the GCR service, then the following steps apply:

— One or more GCR request/response frame exchanges precede the establishment of the block ack mechanism.
— The ADDBA Request and Response frames exchanged to establish the block ack agreement shall include the GCR Group Address element indicating the group address of the GCR service.

Once the block ack agreement has been established, QoS Data frames are transferred in A-MPDUs and acknowledged using the procedure described in 10.25.3.

An originator may include the SAR Configuration element in the ADDBA Request frame if the recipient supports segmentation and reassembly as indicated by the Segmentation and Reassembly Support subfield within the recipient's DMG Capabilities element. If the SAR Enabled field is 1 in a SAR Configuration element transmitted within an ADDBA Request frame, the value of the MPDU Modulo subfield shall be more than or equal to 7 and less than or equal to 12, and the sum of the MPDU Modulo and MSDU Modulo subfields shall be equal to 14. If the recipient accepts the SAR configuration within a received ADDBA Request frame, the recipient shall transmit an ADDBA Response frame that includes the SAR Configuration element with the SAR Enabled subfield set to 1, and the MSDU Modulo and MPDU Modulo subfields set to the same value of the MSDU Modulo and MPDU Modulo subfields received in the ADDBA Request frame. A recipient may reject the SAR configuration by setting the SAR Enabled field within the SAR Configuration element in the ADDBA Response to zero or by not including the SAR Configuration element in the ADDBA Response frame. The size of the originator's transmission window shall not be greater than value in the Buffer Size subfield of the Block Ack Parameter Set field of the ADDBA Response frame in the case that the recipient rejects the SAR configuration, but responds with a status code of SUCCESS in the ADDBA Response frame. The originator shall set the Sequence Number field to zero in the first MPDU it transmits under an established block ack agreement in case the recipient rejects the SAR configuration, but responds with a status code of SUCCESS in the ADDBA Response frame.

When a block ack agreement with segmentation and reassembly is established, a DMG originator may change the size of its transmission window if the value in the MPDU Buffer Size or MSDU Buffer Size fields within the SAR Configuration element contained in an ADDBA Response frame are larger than the corresponding field values transmitted in the ADDBA Request frame. If the value in the MSDU Buffer Size or the MPDU Buffer Size fields in the ADDBA Response frame is smaller than the corresponding value in the ADDBA Request frame, the originator shall change the size of its transmission window ($WinSize_O$ or $WinSize_{OJ}$) so that it is not larger than the value of the field in the ADDBA Response frame and not larger than 1024. In addition, the MPDU Buffer Size subfield shall not exceed the value of $2^{(\text{MPDU Modulo-2})}$ and shall be equal or larger than the value of the resulting maximum segmented MSDU size as indicated by the Maximum Segmented MSDU Exponent subfield in the recipient's SAR Configuration element divided by the maximum MPDU size as defined in 9.4.2.279. The originator may set the MSDU Buffer Size subfield to a value greater than $2^{\text{MSDU Modulo} - 2}$ if the MPDU Modulo subfield is greater than 9; in this case, the recipient may receive multiple MSDUs or A-MSDUs with identical SNs that are not detected.

An EDMG originator STA may insert an EDMG Flow Control Extension Configuration element in an ADDBA Request frame. In this case, no subelements shall be present in the EDMG Flow Control Extension Configuration element.

An EDMG recipient STA that responds to an ADDBA Request frame that contains an EDMG Flow Control Extension Configuration element should insert an EDMG Flow Control Extension Configuration element in the ADDBA Response frame sent as response. A Recipient Memory Configuration subelement shall be included in the EDMG Flow Control Extension Configuration element sent by the recipient if at least one subfield, except for the Advanced Recipient Memory Length Capable subfield, in the Recipient Memory Capabilities field of the EDMG Flow Control Extension Configuration element is nonzero.

EDMG STAs that established a block ack agreement with or without exchange of an EDMG Flow Control Extension Configuration element shall follow the flow control operation rules defined in 10.25.6.5, 10.25.6.6, and 10.25.6.7.

The following negotiation rules apply to EDMG STAs (EDMG originator and EDMG recipient) that exchange ADDBA Request and ADDBA Response frames.

An EDMG originator or EDMG recipient support those recipient memory capabilities for which the corresponding subfields in the Recipient Memory Capabilities field of the EDMG originator or EDMG recipient, respectively, are set to 1 in ADDBA Request and ADDBA Response frames of the block ack agreement established between the EDMG originator and EDMG recipient, and do not support otherwise.

An EDMG recipient shall not respond with Status Code = SUCCESS in an ADDBA Response frame if the EDMG recipient sets to one at least one of the subfields within the recipient's Recipient Memory Capabilities field and:

— The same subfield is set to 0 in the Recipient Memory Capabilities field in the corresponding ADDBA Request frame received from EDMG originator; or

— No EDMG Flow Control Extension Configuration element is present in the corresponding ADDBA Request frame.

NOTE 4—Status Code values REFUSED_REASON_UNSPECIFIED, REQUEST_DECLINED, or INVALID_PARAMETERS can be used in the aforementioned case.

The recipient memory multiple buffer units capability is supported in a successfully established block ack agreement if both the originator and recipient set the RBUFCAP Quantity Capable and Recipient Memory Multiple Buffer Units Capable subfields to 1 in their respective EDMG Flow Control Extension Configuration elements transmitted in the ADDBA Request and ADDBA Response frames. Otherwise, the recipient memory multiple buffer units capability is not supported.

The memory config tag capability is supported in a successfully established block ack agreements if both the originator and recipient set the RBUFCAP Quantity Capable and Two Memory Config Tag Capable subfields to 1 in their respective EDMG Flow Control Extension Configuration elements transmitted in the ADDBA Request and ADDBA Response frames. Otherwise, the memory config tag capability is not supported.

The advanced recipient memory length capability is supported in a successfully established block ack agreement if the recipient set the Advanced Recipient Memory Length Capable subfield to 1 in its EDMG Flow Control Extension Configuration element transmitted in the ADDBA Response. Otherwise, the advanced recipient memory length capability is not supported.

The TID grouping capability is supported in a successfully established block ack agreements if both the originator and recipient set the TID Grouping Capable and the RBUFCAP Quantity Capable subfields to 1 in their respective EDMG Flow Control Extension Configuration elements transmitted in the ADDBA

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Request and ADDBA Response frames. The Recipient Memory Capabilities field and fields within the Recipient Memory Configuration subelement for TIDs that were set to 1 in the TID Grouping subfield shall be identical in the ADDBA Response frame.

An EDMG STA that has negotiated a block ack agreement shall obey the following rules as a recipient in addition to the rules specified in 10.25.6. The recipient may transmit an unsolicited ADDBA Response frame that is not a response to an ADDBA Request frame to update the RBUFCAP subfield and Advanced Recipient Memory Length field values. The unsolicited ADDBA Response frame is sent by the recipient that is a TXOP holder or source of an SP. The Dialog Token field of an unsolicited ADDBA Response frame shall be set to 0 and the Status Code field shall be set to SUCCESS. An EDMG Flow Control Extension Configuration element shall be included in the ADDBA Response frame, and the element shall not contain a Recipient Memory Configuration subelement. The RBUFCAP subfield and Advanced Recipient Memory Length Exponent field values shall comply, respectively, with the RBUFCAP quantity and advanced recipient memory length capabilities that established the block ack agreement. After transmitting an unsolicited ADDBA Response frame, the recipient may

— Transmit a Grant frame to the TXOP responder or SP destination (see 10.38.7.3) to relinquish the remainder of the TXOP or SP, respectively; or
— Grant a reverse direction (see 10.29) to the TXOP responder or SP destination.

An EDMG STA that has negotiated a block ack agreement shall obey the following rules as an originator in addition to rules specified in 10.25.6. The originator that receives an ADDBA Response frame with the Dialog Token field equal to 0 shall ignore the Block Ack Parameter Set and Block Ack Timeout Value fields of the frame. In addition, the originator shall update the local values of the RBUFCAP and Advanced Recipient Memory Length Exponent field values to the values received in the ADDBA Response frame, provided it is in compliance with RBUFCAP quantity and advanced recipient memory length capabilities.

Support for the unsolicited block ack extension is a capability of a recipient. Support for the unsolicited block ack extension by the recipient is advertised by insertion of the Unsolicited Block Ack Extension element in all transmitted Probe Request, Probe Response, Association Request, Association Response, Reassociation Request, Reassociation Response, Information Request and Information Response frames. An originator shall not use the unsolicited block ack extension mechanism with a recipient that does not support the mechanism.

An unsolicited block ack extension agreement is established per <TA, RA, TID> tuple. The unsolicited block ack extension agreement is established if the following conditions apply:

— The recipient transmits and the originator receives a BlockAck frame in response to an MPDU with the Ack Policy field set to Implicit Block Ack Request sent by the originator; and
— Prior to the reception of the BlockAck frame, the originator does not receive an ADDBA Response frame with Status Code equal to SUCCESS with the same <TA, RA, TID> tuple as the BlockAck frame <TA, RA, TID> tuple.

Parameters of the established unsolicited block ack extension agreement are equal to those advertised by the recipient in the recipient's Unsolicited Block Ack Extension element.

A pair of EDMG STAs that have an established unsolicited block ack agreement shall follow the RBUFCAP operation rules defined in 10.25.6.5 and 10.25.6.7.

An unsolicited block ack extension agreement may be torn down by transmitting a DELBA frame as defined in 10.25.3.

A block ack agreement may be modified by the originator by sending an ADDBA Request frame (see 11.5.2, except that MLME-ADDBA primitives are not used by the originator). All parameters of the agreement may be modified except for the TID. If the request is not successful, the existing agreement is not

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

modified. If the request is successful, the behavior is as if a DELBA frame for the block ack agreement had been transmitted by the originator and received by the recipient immediately prior to the ADDBA Request frame.

An NGV STA does not initialize the block ack mechanism as defined in this subclause; a block ack agreement with parameters defined in 31.2.3 is always in place.

10.25.3 Data and acknowledgment transfer using immediate block ack policy

After establishing an immediate block ack agreement following the procedure in 10.25.2, and having gained access to the medium and established protection, if necessary, the originator may transmit an A-MPDU. The RA field of the frames that are not delivered using the GCR block ack retransmission policy shall be the recipient's individual address. The RA field in GCR frames delivered using the GCR block ack retransmission policy shall be set to the GCR concealment address. The RA field in Data frames delivered using the GLK-GCR block ack retransmission policy shall be set to a SYNRA. The originator requests acknowledgment of outstanding QoS Data frames by sending a BlockAckReq frame.

10.25.4 Teardown of the block ack agreement

When the originator has no data to send and the final block ack exchange has completed, it shall signal the end of its use of the block ack mechanism by sending the DELBA frame to its recipient. The DELBA frame sent by the S1G originator shall be a BAT DELBA if a BAT ADDBA Request was sent during block ack establishment or NDP DELBA if an NDP ADDBA Request was sent during block ack establishment or DELBA if ADDBA Request was sent during block ack setup. The recipient does not generate a Management frame in response to the DELBA frame.[42] The recipient of the DELBA frame shall release all resources allocated for the block ack transfer.

The block ack agreement shall be torn down if there are no BlockAck, BlockAckReq, or Data frames received from the peer under the block ack agreement, for the block ack agreement's TID, within the block ack agreement inactivity timeout (see 11.5.4).

The DELBA frame transmitted to release the block ack establishment of a GCR service shall include the GCR Group Address element to indicate the group address of the GCR service. For general links using a GLK-GCR block ack retransmission policy, there is no explicit teardown of the block ack agreement. The GLK-GCR block ack agreement terminates when the general link is reassociated/disassociated.

10.25.5 Selection of BlockAck and BlockAckReq variants

For non-HE STAs, the Multi-TID BlockAckReq variant shall not be used. The Multi-TID BlockAckReq variant can be used between HE STAs to solicit a Multi-STA BlockAck frame for Multi-TID A-MPDUs.

In a DMG BSS, if the Compressed BlockAckReq variant is used related to an HT-immediate agreement, then all of the following BlockAck and BlockAckReq frames transmitted as part of the HT-immediate agreement shall use the Compressed BlockAck and Compressed BlockAckReq variants.

In a DMG BSS, if the Extended Compressed BlockAckReq variant is used related to an HT-immediate agreement, then all of the following BlockAck and BlockAckReq frames transmitted as part of the HT-immediate agreement shall use the Extended Compressed BlockAck and Extended Compressed BlockAckReq variants.

[42] Normal Ack rules apply.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In a DMG BSS, when transmitted between EDMG STAs as part of the HT-immediate agreement, BlockAck frames shall be of EDMG Compressed BlockAck frame variant or of EDMG Multi-TID BlockAck variant, and BlockAckReq frames shall be of Compressed BlockAckReq variant or of Multi-TID BlockAckReq variant.

Where the terms BlockAck and BlockAckReq are used in 10.25.6, the appropriate variant according to this subclause (e.g., Compressed, Multi-TID) is referenced by the generic term. The term BlockAck as used in 10.25.6 includes the additional NDP_1M BlockAck, NDP_2M BlockAck, BAT, and BlockAck frame variants.

GCR BlockAck and GCR BlockAckReq variants shall be used in a GCR block ack agreement. GLK-GCR BlockAck and GLK-GCR BlockAckReq variants shall be used in a GLK-GCR block ack agreement.

The S1G recipient of an accepted block ack agreement that was negotiated with NDP ADDBA shall use NDP BlockAck frames instead of BlockAck frames to acknowledge MPDUs within A-MPDUs during an HT-immediate block ack agreement.

The S1G recipient of an accepted block ack agreement that was negotiated with BAT ADDBA shall use BAT frames instead of BlockAck frames to acknowledge MPDUs within A-MPDUs during an HT-immediate block ack agreement. Otherwise, the S1G recipient of an accepted block ack agreement shall not use BAT frames.

The S1G recipient of an accepted block ack agreement that was negotiated with ADDBA shall use BlockAck frames to acknowledge MPDUs within A-MPDUs during an HT-immediate block ack agreement.

The S1G recipient of an accepted block ack agreement that was negotiated with either ADDBA Request/ NDP ADDBA Response or NDP ADDBA Request/ADDBA Response shall use either NDP BlockAck or BlockAck frames depending on the type of response frame elicited by the S1G originator. The type of response shall be:

- An NDP BlockAck frame if the RXVECTOR parameter RESPONSE_INDICATION of the eliciting PPDU that contains a BlockAckReq or an A-MPDU is equal to NDP Response
- A BlockAck frame if the RXVECTOR parameter RESPONSE_INDICATION of the eliciting PPDU that contains a BlockAckReq or an A-MPDU is equal to Normal Response
- A PPDU that contains a BlockAck frame if the RXVECTOR parameter RESPONSE_INDICATION of the eliciting PPDU is equal to Long Response

An EDMG STA that has a value of 0 in the EDMG Multi-TID Aggregation Support subfield of the STA's EDMG Capabilities element shall not initiate transmission of Multi-TID BlockAckReq variant frames.

An EDMG STA shall not transmit a Multi-TID BlockAckReq variant frame to a peer STA that has a value of 0 in the EDMG Multi-TID Aggregation Support subfield within the peer STA's EDMG Capabilities element.

An EDMG STA that indicates a nonzero value in the EDMG Multi-TID Aggregation Support subfield of the STA's EDMG Capabilities element shall respond with an EDMG Multi-TID BlockAck variant frame to a received Multi-TID BlockAckReq variant frame.

An EDMG STA that indicates a nonzero value in the EDMG Multi-TID Aggregation Support subfield of the STA's EDMG Capabilities element shall respond with an EDMG Multi-TID BlockAck variant frame to an A-MPDU that contains MPDUs of different TIDs and Ack policy equal to Normal Ack or Scheduled Ack. The STA shall set to 1 the Management Ack subfield in the BA Control field of the EDMG Multi-TID BlockAck variant frame to acknowledge an Action Ack or Management frame received within the multi-TID A-MPDU.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An EDMG Multi-TID BlockAck frame shall not include more than one BA Information field for a specific TID.

An EDMG STA shall respond with an EDMG Multi-TID BlockAck frame to an A-MPDU conveyed in an EDMG MU-MIMO PPDU that contains an MPDU with a TID without a block ack agreement.

10.25.6 HT-immediate block ack extensions

10.25.6.1 Introduction to HT-immediate block ack extensions

An HT extension to the block ack feature (defined in 10.25.1 to 10.25.4), called *HT-immediate block ack,* is defined in 10.25.6.2 to 10.25.6.9.

The HT-immediate extensions simplify immediate block ack use with A-MPDUs and reduce recipient resource requirements.

An HT STA shall support HT-immediate block ack in the role of recipient.

A DMG STA shall support HT-immediate block ack.

If the B0 of Fragment Number subfield of a Compressed BlockAck frame or Multi-STA BlockAck frame is equal to 0, then *BitmapLength* represents the maximum length, in bits, of the Block Ack Bitmap subfield in the Compressed BlockAck frame and Multi-STA BlockAck frame for a particular TID; otherwise, *BitmapLength* is derived by dividing by 4 the length represented in the Block Ack Bitmap subfield in the Compressed BlockAck frame and Multi-STA BlockAck frame for a particular TID. For a non-HE STA, *BitmapLength* is 64. For an HE STA, *BitmapLength* is negotiated when the block ack agreement is established as defined in 26.4.3.

An EDMG STA shall support HT-immediate block ack with EDMG flow control extension.

An HT-immediate block ack agreement in which the SAR Configuration element was included in the both the ADDBA Request and ADDBA Response frames and that had the SAR Enabled subfield set to 1 in both frames is considered as a block ack agreement with segmentation and reassembly.

After setting up an immediate block ack establishment following the procedure in 10.25.2, and having gained access to the medium and established protection, if necessary, an originator that is a DMG STA may transmit a block of QoS Data frames separated by SIFS as follows:

— The total number of frames shall not exceed the Buffer Size subfield value in the associated ADDBA Response frame and subject to any additional duration limitations based on the channel access mechanism; and

— If the block ack agreement is between a pair of EDMG STAs, the memory occupied by the frames shall not exceed the values computed in Table 10-24 and in Table 10-25. The actual RBUFCAP value is delivered by the EDMG Compressed BlockAck, EDMG Multi-TID BlockAck, EDMG Flow Control Extension Configuration element in the ADDBA Response frame or the RBUFCAP update of other TIDs as indicated in TID Grouping field of the Recipient Memory Configuration subelement, whichever comes later. If the ADDBA Response frame does not contain an EDMG Flow Control Extension Configuration element, the relevant originator parameters shall be considered as receiving an RBUFCAP with value Receiver Buffer Empty (9.3.1.8.7).

Each of the frames shall have the Ack Policy Indicator subfield in the QoS Control field set to Block Ack. The RA field of the frames shall be the recipient's individual address. The originator requests acknowledgment of outstanding QoS Data frames by sending a BlockAckReq frame. The recipient shall

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

maintain a block ack record for the block. An EDMG recipient shall maintain free memory space for the established block ack agreement(s) (10.25.6.5).

An EDMG recipient that is TXOP holder or source of an SP may transmit ADDBA Response frames to the originator as defined in 10.25.2.

10.25.6.2 HT-immediate block ack architecture

The HT-immediate block acknowledgment rules are explained in terms of the architecture shown in Figure 10-40 and in Figure 10-41 for non-EDMG and EDMG STAs, respectively.

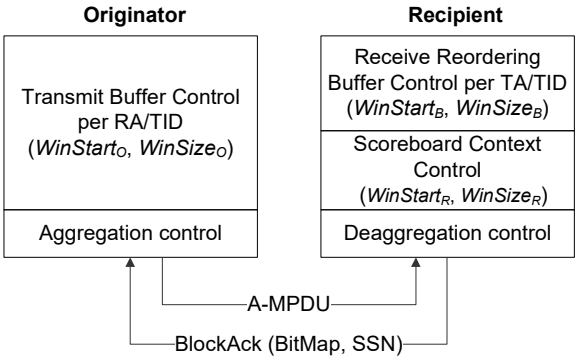

Figure 10-40—HT-immediate block ack architecture

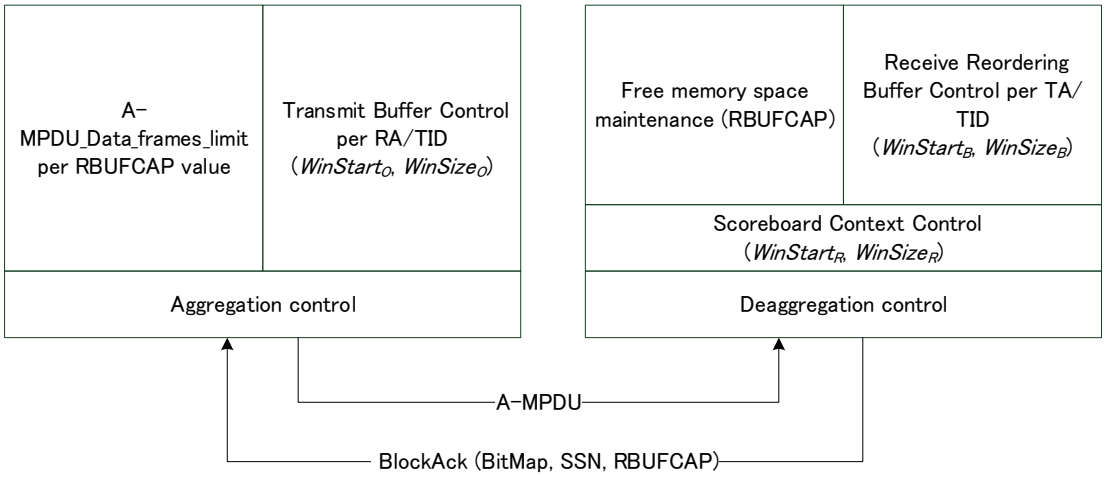

Figure 10-41—HT-immediate block ack architecture with EDMG flow control

The originator contains a transmit buffer control that uses $WinStart_O$ and $WinSize_O$ to submit MPDUs for transmission and releases transmit buffers upon receiving BlockAck frames from the recipient.

$WinStart_O$ is the starting sequence number of the transmit window, and $WinSize_O$ is the number of buffers negotiated in the block ack agreement.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In a block ack agreement with segmentation and reassembly, the originator maintains a transmit buffer control that uses $WinStart_{OJ}$ and $WinSize_{OJ}$ to submit MPDUs for transmission and releases transmit buffers upon reception of BlockAck frames from the recipient. $WinStart_{OJ}$ is the starting sequence number of the transmit window and $WinSize_{OJ}$ is the value of the MSDU Buffer Size field in the recipient's SAR Configuration element that established the block ack agreement.

An EDMG originator uses RBUFCAP to limit the number of transmitted MPDUs to not exceed the available free memory space at an EDMG recipient.

The Aggregation control creates A-MPDUs. It may adjust the ack policy of transmitted QoS Data frames according to the rules defined in 10.25.6.7 in order to solicit BlockAck frame responses.

The recipient contains a receive reordering buffer control per TA/TID, which contains a related control state. The receive reordering buffer is responsible for reordering MSDUs or A-MSDUs so that MSDUs or A-MSDUs are eventually passed up to the next MAC process in order of received sequence number. It is also responsible for identifying and discarding duplicate frames (i.e., frames that have the same sequence number as a currently buffered frame) that are part of this block ack agreement. It maintains its own state independent of the scoreboard context control to perform this reordering as specified in 10.25.6.6.

For each HT-immediate block ack agreement, the recipient chooses either full-state or partial-state operation (this choice is known only to the recipient). A STA may simultaneously use full-state operation for some agreements and partial-state operation for other agreements. The scoreboard context control stores an acknowledgment bitmap containing the current reception status of MSDUs or A-MSDUs for HT-immediate block ack agreements. Under a block ack agreement with segmentation and reassembly, the scoreboard context control stores an acknowledgment bitmap containing the current reception status of MPDUs. Under full-state operation, status is maintained in statically assigned memory. Under partial-state operation, status is maintained in a cache memory; therefore, the status information is subject to cache replacement. This entity provides the bitmap and the value for the Starting Sequence Number subfield to be sent in BlockAck frame responses to the originator.

An EDMG recipient contains a free memory space maintenance entity. This entity is responsible to compute the RBUFCAP value. This entity provides the RBUFCAP value subfield to be sent in BlockAck and in ADDBA Response frames to an EDMG originator.

The deaggregation control entity separates frames contained in an A-MPDU.

Each received MPDU is analyzed by the scoreboard context control as well as by the receive reordering buffer control.

Each HT-immediate block ack agreement is uniquely identified by a tuple of Address 1, Address 2, and TID from the ADDBA Response frame that successfully established the HT-immediate block ack agreement. The STA that corresponds to Address 1 of the ADDBA Response frame is the originator. The STA that corresponds to Address 2 of the ADDBA Response frame is the recipient. Data frames that contain the same values for Address 1, Address 2, and TID as a successful ADDBA Response frame are related to the HT-immediate block ack agreement that was established by the receipt of that ADDBA Response frame provided that the HT-immediate block ack agreement is still active.

10.25.6.3 Scoreboard context control during full-state operation

For each HT-immediate block ack agreement that uses full-state operation, a recipient shall maintain a block acknowledgment record. This record includes a bitmap, indexed by sequence number; a 12-bit unsigned integer starting sequence number, $WinStart_R$, representing the lowest sequence number position in the bitmap; $WinEnd_R$, representing the highest sequence number in the current transmission window; and the maximum transmission window size, $WinSize_R$, which is set to the smaller of *BitmapLength* and the value of the Buffer

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Size field of the associated ADDBA Response frame that established the block ack agreement. A STA implementing full-state operation for an HT-immediate block ack agreement shall maintain the block acknowledgment record for that agreement according to the following rules:

a) At HT-immediate block ack agreement establishment:
   1) $WinStart_R$ = Starting Sequence Number subfield in the ADDBA Request frame that elicited the ADDBA Response frame that established the HT-immediate block ack agreement or from an MPDU that synchronized an unsolicited block ack agreement.
   2) $WinEnd_R = WinStart_R + WinSize_R - 1$.

b) For each received Data frame that is related to a specific full-state operation HT-immediate block ack agreement, the block acknowledgment record for that agreement is modified as follows, where *SN* is the value of the Sequence Number subfield of the received Data frame:
   1) If $WinStart_R \le SN \le WinEnd_R$, set to 1 the bit in position *SN* within the bitmap.
   2) If $WinEnd_R < SN < WinStart_R + 2^{11}$,
      i) Set to 0 the bits corresponding to MPDUs with Sequence Number subfield values from $WinEnd_R + 1$ to $SN - 1$.
      ii) Set $WinStart_R = SN - WinSize_R + 1$.
      iii) Set $WinEnd_R = SN$.
      iv) Set to 1 the bit at position *SN* in the bitmap.
   3) If $WinStart_R + 2^{11} \le SN < WinStart_R$, make no changes to the record.

      NOTE —A later-arriving Data frame might validly contain a sequence number that is lower than an earlier-arriving one. This might happen because the transmitter may choose to send Data frames in a nonsequential sequence number order or because a previous Data frame transmission with lower sequence number is not successful and is being retransmitted.

c) For each received BlockAckReq frame that is related to a specific full-state operation HT-immediate block ack agreement that is not a protected block ack agreement, the block acknowledgment record for that agreement is modified as follows, where *SSN* is the Starting Sequence Number subfield of the received BlockAckReq frame:
   1) If $WinStart_R < SSN \le WinEnd_R$,
      i) Set $WinStart_R = SSN$.
      ii) Set to 0 the bits corresponding to MPDUs with Sequence Number subfield values from $WinEnd_R + 1$ to $WinStart_R + WinSize_R - 1$.
      iii) Set $WinEnd_R = WinStart_R + WinSize_R - 1$.
   2) If $WinEnd_R < SSN < WinStart_R + 2^{11}$,
      i) Set $WinStart_R = SSN$.
      ii) Set $WinEnd_R = WinStart_R + WinSize_R - 1$.
      iii) Set to 0 bits the corresponding to MPDU with Sequence Number subfield values from $WinStart_R$ to $WinEnd_R$.
   3) If $WinStart_R + 2^{11} \le SSN \le WinStart_R$, make no changes to the record.

10.25.6.4 Scoreboard context control during partial-state operation

In an HT-immediate block ack agreement that uses partial-state operation, a recipient shall maintain a temporary block acknowledgment record. This temporary record includes a bitmap, indexed by sequence number; a 12-bit unsigned integer $WinStart_R$ (the lowest sequence number represented in the bitmap); a 12-bit unsigned integer $WinEnd_R$ (the highest sequence number in the bitmap); the originator address; TID; and the maximum transmission window size, $WinSize_R$, which is set to the smaller of 64 and the value of the Buffer Size field of the associated ADDBA Response frame that established the block ack agreement.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

During partial-state operation of scoreboard context control, the recipient retains the current record for an HT-immediate block ack agreement at least as long as it receives data from the same originator. If a frame for an HT-immediate block ack agreement from a different originator is received, the temporary record may be discarded if the resources it uses are needed to store the temporary record corresponding to the newly arriving frame.

A STA implementing partial-state operation for an HT-immediate block ack agreement shall maintain the temporary block acknowledgment record for that agreement according to the following rules:

a) During partial-state operation, $WinStart_R$ is determined by the Sequence Number subfield value of received Data frames and by the Starting Sequence Number subfield value of received BlockAckReq frames as described below.

b) For each received Data frame that is related to a specific partial-state operation HT-immediate block ack agreement, when no temporary record for the agreement related to the received Data frame exists at the time of receipt of the Data frame, a temporary block acknowledgment record is created as follows, where *SN* is the value of the Sequence Number subfield of the received Data frame if segmentation and reassembly is not used and is the value of the MPDU Sequence Number subfield of the received Data frame when segmentation and reassembly is used:

   1) $WinEnd_R = SN$.
   2) $WinStart_R = WinEnd_R - WinSize_R + 1$.
   3) Create a bitmap of size $WinSize_R$, with the first bit corresponding to sequence number $WinStart_R$ and the last bit corresponding to sequence number $WinEnd_R$, and set all bits in the bitmap to 0.
   4) Set to 1 the bit in the position in the bitmap that corresponds to *SN*.

c) For each received Data frame that is related to a specific partial-state operation HT-immediate block ack agreement, when a temporary record for the agreement related to the received Data frame exists at the time of receipt of the Data frame, the temporary block acknowledgment record for that agreement is modified in the same manner as the acknowledgment record for a full-state agreement described in 10.25.6.3.

d) For each received BlockAckReq frame that is related to a specific partial-state operation HT-immediate block ack agreement that is not a protected block ack agreement, when no temporary record for the agreement related to the received frame exists at the time of receipt of the frame, a temporary block acknowledgment record is created as follows, where *SSN* is the Starting Sequence Number subfield of the received BlockAckReq frame:

   1) $WinStart_R = SSN$.
   2) $WinEnd_R = WinStart_R + WinSize_R - 1$.
   3) Create a bitmap of size $WinSize_R$, and set all bits in the bitmap to 0.

e) For each received BlockAckReq frame that is related to a specific partial-state operation HT-immediate block ack agreement that is not a protected block ack agreement, when a temporary record for the agreement related to the received frame exists at the time of receipt of the frame, the temporary block acknowledgment record for that agreement is modified in the same manner as the acknowledgment record for a full-state agreement described in 10.25.6.3.

10.25.6.5 Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA

A STA that receives a PPDU that contains a BlockAckReq frame in which the Address 1 field matches its MAC address during either full-state operation or partial-state operation shall transmit a PPDU containing a BlockAck frame that is separated on the WM by a SIFS from the PPDU that elicited the BlockAck frame as a response. A STA that receives an A-MPDU that contains one or more QoS Data frames with Implicit BAR ack policy during either full-state operation or partial-state operation shall transmit a PPDU containing a BlockAck frame that is separated on the WM by a SIFS from the PPDU that elicited the BlockAck frame as a response.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A STA operating in an SP with TDD channel access (see 10.38.6.2.2) that receives a PPDU that contains a BlockAckReq frame in which the Address 1 field matches its MAC address during either full-state or partial-state operation shall transmit a PPDU containing a BlockAck frame starting at the earliest occurring TDD slot the STA is assigned to, with the Bitmap and Access Type Schedule field of the TDD slot set to TX, and with slot category of the TDD slot set to Basic TDD slot, as indicated in the TDD Slot Schedule element.

A STA operating in an SP with TDD channel access (see 10.38.6.2.2) that receives an A-MPDU that contains one or more MPDUs in which the Address 1 field matches its MAC address with the Ack Policy field equal to Normal Ack (i.e., implicit block ack request) during either full-state operation or partial-state operation shall transmit a PPDU containing a BlockAck frame starting at the earliest occurring TDD slot the STA is assigned to, with the Bitmap and Access Type Schedule field of the TDD slot set to TX, and with slot category of the TDD slot set to Basic TDD slot, as indicated in the TDD Slot Schedule element.

When responding with a BlockAck frame to either a received BlockAckReq frame or a received QoS Data frame with Implicit BAR ack policy during either full-state operation or partial-state operation, any adjustment to the value of $WinStart_R$ according to the procedures defined within 10.25.6.3 and 10.25.6.4 shall be performed before the generation and transmission of the response BlockAck frame. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield of the BlockAck frame shall be set to any value in the range ($WinEnd_R - BitmapLength + 1$)) to $WinStart_R$. The Starting Sequence Number subfield stored in the Starting Sequence Control field of NDP BlockAck and BAT frames shall be set to $WinStart_R$. The values in the recipient's record of status of MPDUs beginning with the MPDU for which the Sequence Number subfield value is equal to $WinStart_R$ and ending with the MPDU for which the Sequence Number subfield value is equal to $WinEnd_R$ shall be included in the bitmap of the BlockAck frame. The bitmap of the NDP BlockAck frame is protected using the encoding procedure described in 10.56.

When responding with a BlockAck frame to either a received BlockAckReq frame or a received QoS Data frame with Implicit BAR ack policy during either full-state or partial-state operation, if the adjusted value of $WinStart_R$ is greater than the value of the starting sequence number of the BlockAck frame, within the bitmap of the BlockAck frame, the status of MPDUs with sequence numbers that are less than the adjusted value of $WinStart_R$ may be set to any value.

When responding with a BlockAck frame to either a received BlockAckReq frame or a received QoS Data frame with Implicit BAR ack policy during either full-state or partial-state operation, if the adjusted value of $WinEnd_R$ is less than the value of the starting sequence number of the BlockAck frame plus $BitmapLength - 1$, within the bitmap of the BlockAck frame, the status of MPDUs with sequence numbers that are greater than the adjusted value of $WinEnd_R$ shall be reported as not received (i.e., the corresponding bit in the bitmap shall be set to 0).

If a BlockAckReq frame is received and no matching partial state is available, the recipient shall send a null BlockAck frame in which the bitmap is set to all 0s.

If an EDMG STA transmits a BlockAck frame in response to a BlockAckReq frame or an A-MPDU with Ack Policy equal to Normal Ack (i.e., implicit block ack request) during either full-state or partial-state operation, the EDMG STA shall calculate the free memory space value at the generation and transmission of the BlockAck frame. The RBUFCAP subfield value in the transmitted BlockAck frame shall be computed as defined in Table 10-23. The free memory space is an estimation of the amount of free memory available at the recipient to collect MPDUs at the time of and during reception of a forthcoming A-MPDU.

Within an unsolicited block ack agreement, the RBUFCAP value used by an EDMG STA for the RBUFCAP calculation in Table 10-23 shall assume that the RBUFCAP Quantity Capable subfield value is "Not Supported" and shall not use a value between 1 and 254, inclusive.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 10-23—RBUFCAP value calculation

Free memory space comparison	RBUFCAP Quantity Capable subfield value (10.25.2)	RBUFCAP subfield value
Free memory space ≥ $(2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1)$	Supported	Receiver Buffer Empty
Free memory space ≥ $(2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1)$	Not supported	Receiver Buffer Empty
Free memory space < $(2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1)$	Supported	Int [Free memory space/ Buffer Unit Size]
Free memory space < $(2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1)$	Not supported	Receiver Buffer Full

10.25.6.6 Receive reordering buffer control operation

10.25.6.6.1 General

The behavior described in this subclause, 10.25.6.6.2, and 10.25.6.6.3 applies to a STA that uses either partial-state operation or full-state operation for an HT-immediate block ack agreement.

For each HT-immediate block ack agreement that does not use segmentation and reassembly, a receive reordering buffer shall be maintained for each HT-immediate block ack agreement. Each receive reordering buffer includes a record comprising the following:

— Buffered MSDUs or A-MSDUs that have been received, but not yet passed up to the next MAC process

— A $WinStart_B$ parameter, indicating the value of the Sequence Number subfield of the first (in order of ascending sequence number) MSDU or A-MSDU that has not yet been received

— A $WinEnd_B$ parameter, indicating the highest sequence number expected to be received in the current reception window

— A $WinSize_B$ parameter, indicating the size of the reception window

For each HT-immediate block ack agreement that does not use segmentation and reassembly and is not part of an unsolicited block ack agreement, the variables shall be initialized as follows:

— $WinStart_B$ is initialized to the Starting Sequence Number subfield value of the ADDBA Request frame that elicited the ADDBA Response frame that established the HT-immediate block ack agreement.

— $WinEnd_B$ is initialized to $WinStart_B + WinSize_B - 1$, where $WinSize_B$ is set to the smaller of*BitmapLength* and the value of the Buffer Size field of the ADDBA Response frame that established the block ack agreement.

For each HT-immediate block ack agreement that does not use segmentation and reassembly, the recipient shall always pass MSDUs or A-MSDUs up to the next MAC process in order of increasing Sequence Number subfield value.

For each HT-immediate block ack agreement that uses segmentation and reassembly, a receive reordering buffer shall be maintained. Each receive reordering buffer includes a record comprising the following:

— Buffered MPDUs belonging to MSDUs or A-MSDUs that have been received, but not yet passed up to the next MAC process.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— A $WinStart_B$ parameter, indicating the value of the MPDU Sequence Number subfield of the first (in order of ascending sequence number) MPDU that has not yet been received.
— A $WinEnd_B$ parameter, indicating the highest MPDU sequence number expected to be received in the current reception window.
— A $WinSize_B$ parameter, indicating the size of the reception window.

For each HT-immediate block ack agreement that uses segmentation and reassembly, $WinStart_B$ and $WinEnd_B$ variables shall be initialized as follows:

— $WinStart_B$ is initialized to the Starting Sequence Number subfield value of the ADDBA Request frame that elicited the ADDBA Response frame that established the block ack agreement.
— $WinEnd_B$ is initialized to $WinStart_B + WinSize_B - 1$, where $WinSize_B$ is set to the smaller of 1024 and the value of the MPDU Buffer Size field of the ADDBA Response frame that established the block ack agreement.

For each HT-immediate block ack agreement that uses segmentation and reassembly, the recipient shall always pass MSDUs or A-MSDUs up to the next MAC process in order of increasing MSDU Sequence Number subfield value.

Any MSDU or A-MSDU that has been passed up to the next MAC process shall be deleted from the receive reordering buffer.

10.25.6.6.2 Operation for each received Data frame

10.25.6.6.2.1 Block ack agreements not using segmentation and reassembly

For each received Data frame that is related to a specific HT-immediate block ack agreement that does not use segmentation and reassembly, the receive reordering buffer record shall be modified as follows, where *SN* is the value of the Sequence Number subfield of the received MPDU:

a) If $WinStart_B \le SN \le WinEnd_B$,
   1) Store the received MPDU in the buffer, if no MSDU or A-MSDU with the same sequence number is already present; otherwise discard the MPDU.
   2) Pass MSDUs or A-MSDUs up to the next MAC process if they are stored in the buffer in order of increasing value of the Sequence Number subfield starting with the MSDU or A-MSDU that has $SN=WinStart_B$ or if $SN>WinStart_B$, the STA is a non-EDMG STA, and one of the following conditions is met:
      i) The MPDU is received as non-first frame in the A-MPDU; the bit at position $SN=WinStart_R - 1$ is set to 1; and all delimiters between the received MPDU and the preceding MPDU ($SN=WinStart_R - 1$) are valid.
      ii) The MPDU is received as first frame in the A-MPDU; the A-MPDU is received in SIFS or RIFS after an A-MPDU or in SIFS after transmission of a BlockAck frame; the bit at position $SN=WinStart_R - 1$ is set to 1; and all delimiters after the MPDU ($SN=WinStart_R - 1$) in the preceding A-MPDU are valid.
      iii) The MPDU is received in SIFS or RIFS after an A-MPDU or in SIFS after transmission of a BlockAck frame; the bit at position $SN=WinStart_R - 1$ is set to 1; and all delimiters after the MPDU ($SN=WinStart_R - 1$) in the preceding A-MPDU are valid.
      iv) The MPDU is received as first frame in the A-MPDU; the A-MPDU is received in SIFS or RIFS after an MPDU or in SIFS after transmission of an Ack frame; and the bit at position $SN=WinStart_R - 1$ is set to 1.
      v) The MPDU is received in SIFS or RIFS after the preceding MPDU or in SIFS after transmission of an Ack frame; and the bit at position $SN=WinStart_R - 1$ is set to 1.

This process is continued sequentially until there is no buffered MSDU or A-MSDU for the next sequential value of the Sequence Number subfield.

3) Set $WinStart_B$ to the value of the Sequence Number subfield of the last MSDU or A-MSDU that was passed up to the next MAC process plus one.

4) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.

b) If $WinEnd_B < SN < WinStart_B + 2^{11}$,

1) Store the received MPDU in the buffer, if no MSDU or A-MSDU with the same sequence number is already present; otherwise discard the MPDU.

2) Set $WinEnd_B = SN$.

3) Set $WinStart_B = WinEnd_B - WinSize_B + 1$.

4) Pass any complete MSDUs or A-MSDUs stored in the buffer with Sequence Number subfield values that are lower than the new value of $WinStart_B$ up to the next MAC process in order of increasing Sequence Number subfield value. Gaps may exist in the Sequence Number subfield values of the MSDUs or A-MSDUs that are passed up to the next MAC process.

5) In a non-DMG STA, pass MSDUs or A-MSDUs stored in the buffer up to the next MAC process in order of increasing value of the Sequence Number subfield starting with $WinStart_B$ and proceeding sequentially until there is no buffered MSDU or A-MSDU for the next sequential Sequence Number subfield value. For a DMG STA, follow rules defined in item a)2) above.

6) Set $WinStart_B$ to the Sequence Number subfield value of the last MSDU or A-MSDU that was passed up to the next MAC process plus one.

7) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.

c) If $WinStart_B + 2^{11} \leq SN < WinStart_B$, discard the MPDU (do not store the MPDU in the buffer, and do not pass the MSDU or A-MSDU up to the next MAC process).

10.25.6.6.2.2 Block ack agreements using segmentation and reassembly

For each received data MPDU that is related to a specific block ack agreement using segmentation and reassembly, the receive reordering buffer record shall be modified as follows, where MPDU_SN is the value of the Sequence Number subfield of the received MPDU:

a) If $WinStart_B \leq MPDU\_SN \leq WinEnd_B$,

1) Store the received MPDU in the buffer if no MPDU with the same sequence number is already present; otherwise, discard the MPDU.

2) Pass to the next MAC process any complete MSDUs or A-MSDUs in the buffer, which includes all MPDUs with the same value of *MSDU_SN* in increasing order of MPDU_SN, from the *MPDU_SN* with Start of MSDU subfield equal to 1 until the MPDU with End of MSDU subfield equal to 1 and which their MPDU_SN starts with $MPDU\_SN = WinStart_B$ and proceeds sequentially until there is no buffered MPDUs for the next *MPDU_SN*. An MSDU or A-MSDU is complete if all MPDUs identified with the same MSDU_SN from the *MPDU_SN* with Start of MSDU subfield equal to 1 until the MPDU with End of MSDU subfield equal to 1 are present in the receive reordering buffer.

3) Set $WinStart_B$ to the value of the MPDU_SN subfield of the last MPDU of the MSDU or A-MSDU that was passed up to the next MAC process plus one.

4) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.

b) If $WinEnd_B < MPDU\_SN < WinStart_B + 2^{\text{MPDU Modulo-1}}$,

1) Store the received MPDU in the buffer if no MPDU with the same sequence number is already present; otherwise, discard the MPDU.

2) Set $WinEnd_B = MPDU\_SN$.

3) Set $WinStart_B = WinEnd_B - WinSize_B + 1$.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

4) Pass to the next MAC process any complete MSDUs or A-MSDUs in the buffer, which include all MPDUs with the same value of *MSDU_SN* in increasing order of *MPDU_SN*, from the *MPDU_SN* with Start of MSDU subfield equal to 1 until the MPDU with End of MSDU subfield equal to 1 and which their *MPDU_SN* is lower than $WinStart_B$. Gaps may exist in the MPDU_SN subfield, in this case the recipient shall discard the MSDUs or A-MSDUs with missing *MPDU_SN* and may inform the next MAC process of the incomplete or missing *MSDU_SN*.
5) Set $WinStart_B$ to the value of the *MPDU_SN* of the last MSDU or A-MSDU that was passed up to the next MAC process plus one.
6) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.

c) If $WinStart_B + 2^{\text{MPDU Modulo-1}} \leq MPDU\_SN < WinStart_B$, discard the MPDU.

An originator shall not transmit a segmented MSDU if the size of the segmented MSDU is greater than the value defined by the Maximum Segmented MSDU Exponent subfield of the recipient's SAR Configuration element.

10.25.6.6.3 Operation for each received BlockAckReq

10.25.6.6.3.1 Block ack agreements not using segmentation and reassembly

For each received BlockAckReq frame that is related to a specific HT-immediate block ack agreement that does not use segmentation and reassembly, the receive reordering buffer record is modified as follows, where *SSN* is the Starting Sequence Number subfield value of the received BlockAckReq frame:

a) If $WinStart_B < SSN < WinStart_B + 2^{11}$,
1) In a block ack agreement that is not a protected block ack agreement, set $WinStart_B = SSN$. See 10.25.7 for a protected block ack agreement.
2) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.
3) Pass any complete MSDUs or A-MSDUs stored in the buffer with Sequence Number subfield values that are lower than the new value of $WinStart_B$ up to the next MAC process in order of increasing Sequence Number subfield value. Gaps may exist in the Sequence Number subfield values of the MSDUs or A-MSDUs that are passed up to the next MAC process.
4) Pass MSDUs or A-MSDUs stored in the buffer up to the next MAC process in order of increasing Sequence Number subfield value starting with $SN=WinStart_B$ and proceeding sequentially until there is no buffered MSDU or A-MSDU for the next sequential Sequence Number subfield value.
5) Set $WinStart_B$ to the Sequence Number subfield value of the last MSDU or A-MSDU that was passed up to the next MAC process plus one.
6) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.

b) If $WinStart_B + 2^{11} \leq SSN \leq WinStart_B$, do not make any changes to the receive reordering buffer record.

10.25.6.6.3.2 Block ack agreements using segmentation and reassembly

For each received BlockAckReq frame that is related to a specific block ack agreement that uses segmentation and reassembly, the receive reordering buffer record is modified as follows, where *MPDU_SSN* is the Starting Sequence Number subfield value of the received BlockAckReq frame:

a) If $WinStart_B < MPDU\_SSN < WinStart_B + 2^{\text{MPDU Modulo-1}}$,
1) In a block ack agreement that is not a protected block ack agreement, set $WinStart_B = MPDU\_SSN$. See 10.25.7 for a protected block ack agreement.
2) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

3) Pass to the next MAC process any complete MSDUs or A-MSDUs in the buffer, which include all MPDUs with the same value of *MSDU_SN* in increasing order of MPDU_SN, from the *MPDU_SN* with Start of MSDU subfield equal to 1 until the MPDU with End of MSDU subfield equal to 1 and which their *MPDU_SN* is lower than $WinStart_B$. Gaps may exist in the MPDU_SN subfield, in this case the recipient shall discard the MSDUs or A-MSDUs with missing *MPDU_SN* and may inform the next MAC process of the incomplete or missing MSDUs or A-MSDUs.

4) Pass to the next MAC process any complete MSDUs or A-MSDUs in the buffer, which include all MPDUs with the same value of *MSDU_SN* in increasing order of *MPDU_SN*, from the *MPDU_SN* set with the Start of MSDU subfield equal to 1 until the MPDU with End of MSDU subfield equal to 1 and which their MPDU_SN starts with $MPDU\_SN = WinStart_B$ and proceeds sequentially until there is no buffered MPDUs for the next *MPDU_SN*.

5) Set $WinStart_B$ to the *MPDU_SN* value of the last MSDU or A-MSDU that was passed up to the next MAC process plus one.

6) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.

b) If $WinStart_B + 2^{\text{MPDU Modulo-1}} \leq MPDU\_SSN < WinStart_B$, do not make any changes to the receive reordering buffer record.

10.25.6.7 Originator's behavior

10.25.6.7.1 General

A STA may send a block of data in a single A-MPDU where each QoS Data frame has Normal Ack ack policy. The originator expects to receive a BlockAck frame response immediately following the A-MPDU if at least one Data frame is received without error.

A DMG STA originator operating in an SP with TDD channel access (see 10.38.6.2.2) expects to receive a BlockAck frame response in the earliest occurring TDD slot with slot category of the TDD slot set to Basic TDD slot as defined in 10.25.6.5 if at least one Data frame is received without error.

A DMG STA originator operating in an SP with TDD channel access (see 10.38.6.2.2) shall not transmit to a peer STA more than one MPDU or A-MPDU that has an Ack Policy of Normal Ack per each occurrence of a TDD slot the peer STA is assigned to, with the Bitmap and Access Type Schedule field of the TDD slot set to TX, and with slot category of the TDD slot set to Basic TDD slot or Data TDD slot, as indicated in the TDD Slot Schedule element.

If the received BlockAck response is of an expected NDP_1M BlockAck frame (or an NDP_2M BlockAck frame), the S1G originator shall accept it as correctly received if the value obtained from the BlockAck ID field equals the 2 LSBs (or the 6 LSBs) of the scrambler initialization value of the immediately previously transmitted A-MPDU that is not an S-MPDU, or BlockAckReq frame, and the Starting Sequence Number obtained from the Starting Sequence Control field equals $WinStart_O$. The S1G originator shall otherwise consider the NDP BlockAck frame to be lost.

NOTE—The scrambler initialization value is obtained from the PHY-TXEND.confirm parameter SCRAMBLER_OR_CRC. The values of the BlockAck ID and Starting Sequence Number fields are obtained after decoding the NDP BlockAck frame as described in 10.56.

Alternatively, the originator may send an A-MPDU where each QoS Data frame has Block Ack ack policy under an HT-immediate block ack agreement if it does not require a BlockAck frame response immediately following the A-MPDU.

If the BlockAck frame is lost, the originator may transmit a BlockAckReq frame to solicit an immediate BlockAck frame or it may retransmit the Data frames.

During an accepted HT-immediate block ack agreement, the S1G originator shall set the TXVECTOR parameter RESPONSE_INDICATION of a PPDU transmitted to the S1G recipient that elicits a block acknowledgment frame to

— NDP Response if the block ack agreement was negotiated with NDP ADDBA Request/NDP ADDBA Response exchange

— Normal Response if the block ack agreement was negotiated with either BAT ADDBA Request/ BAT ADDBA Response or ADDBA Request/ADDBA Response exchange

During an accepted HT-immediate block ack agreement, the S1G originator is allowed to elicit an NDP BlockAck or a BlockAck frame on a per-PPDU basis only if the block ack agreement was negotiated with either ADDBA Request/NDP ADDBA Response or NDP ADDBA Request/ADDBA Response exchanges. In this case the S1G originator may set the TXVECTOR parameter RESPONSE_INDICATION of a PPDU transmitted to the S1G recipient that elicits a block acknowledgment frame to either NDP Response or Normal Response.

The S1G originator shall not set the TXVECTOR parameter RESPONSE_INDICATION to Long Response for a PPDU transmitted to the S1G recipient that elicits a block acknowledgment frame, if neither BlockAck frame nor BAT frames have been negotiated with the S1G recipient. The S1G originator may set the TXVECTOR parameter RESPONSE_INDICATION to Long Response if either BlockAck frame or BAT frames have been negotiated with the S1G recipient.

The originator may transmit QoS Data frames with a TID matching a block ack agreement in any order provided that their sequence numbers lie within the current transmission window. The originator may transmit an MPDU with a sequence number that is beyond the current transmission window ($SN > WinStart_O + WinSize_O - 1$), in which case the originator's transmission window (and the recipient's window) is moved forward. The originator should not transmit an MPDU with a sequence number that is before the current transmission window (i.e., $SN < WinStart_O$). Under a block ack agreement with segmentation and reassembly, the originator may transmit QoS Data frames with a TID matching an established block ack agreement in any order provided that their *MPDU_SN* and MSDU_SN are within the current transmission window. The originator may transmit an MPDU with an *MSDU_SN* that is beyond the current transmission window ($MSDU\_SN > WinStart_{OJ} + WinSize_{OJ} - 1$), in which case the originator's transmission window (and the recipient's window) is moved forward. The originator shall not transmit MSDUs or A-MSDUs that are lower than the current transmission window (i.e., $SN < WinStart_{OJ}$) in case the MSDU Modulo subfield was set to a value smaller than 5.

The originator shall not retransmit an MPDU after that MPDU's appropriate lifetime limit.

When a QoS Data frame that was previously transmitted within an A-MPDU that had Normal Ack ack policy is discarded due to exhausted MSDU lifetime, the originator may send a BlockAckReq frame for a block ack agreement that is not a protected block ack agreement or a PBAC WinStart Update frame for a protected block ack agreement to shift the recipient's $WinStart_B$ and $WinStart_R$ past the hole in the sequence number space that is created by the discarded Data frame and thereby to allow the earliest possible passing of buffered frames up to the next MAC process. Under a block ack agreement with segmentation and reassembly, the BlockAckReq and PBAC WinStart Update frames shall have a Starting Sequence Number field that corresponds to an MPDU that has the Start of MSDU subfield equal to 1.

An originator that is a DMG STA shall transmit MPDUs sent under a block ack agreement such that:

— If the originator or the recipient are a non-EDMG STA,

  — MPDUs that need to be retransmitted are transmitted first, in sequential order of sequence number, starting from the oldest MPDU that needs to be retransmitted

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— MPDUs that are being transmitted for the first time are sent after any MPDUs that need to be retransmitted, in sequential order of sequence number, starting from the oldest MPDU that has not been transmitted

— QoS Data MPDUs are transmitted with Block Ack ack policy if the A-MPDU that contains them is followed after a SIFS or RIFS by another A-MPDU

An originator that is a DMG STA shall not start a new TXOP or SP with a PPDU containing a QoS Data MPDU that has an ack policy other than Normal Ack or Implicit BAR if at least one frame transmitted by the originator to the recipient in the last PPDU did not require an immediate response.

At the start of a data transfer sequence that has an established Block Ack agreement, an originator that is an EDMG STA shall not transmit a frame with a PSDU size greater than *FlowControlByteCountLimit*, where *FlowControlByteCountLimit* is defined per the configuration obtained during the Block Ack agreement establishment for the respective TID or group of TIDs described in Table 10-24 and per the computation described in 10.25.6.7.2.

Table 10-24—FlowControlByteCountLimit computation at the start of a data transfer sequence

According to Block Ack agreement		As received via BlockAck or ADDBA Response frame		FlowControlByteCount Limit
Advanced recipient memory length capable	Recipient buffer quantity capable	Updated RBUFCAP	No Memory Kept	
0	N/A	Receiver Buffer Full	N/A	Zero (see NOTE)
N/A	N/A	Receiver Buffer Empty	0	$2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1$
1	N/A	N/A	1	$2^{(13 + \text{Advanced Recipient Memory Length Exponent})} - 1$
0	N/A	Receiver Buffer Empty or Receiver Buffer Available	1	Zero (see NOTE)
N/A	1	Receiver Buffer Available	0	Receiver Buffer Available × Buffer Unit Size

NOTE—An originator can poll a responder's RBUFCAP value.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

During a data transfer sequence that has an established Block Ack agreement, an originator that is an EDMG STA shall not transmit a frame with a PSDU size greater than *FlowControlByteCountLimit*, where *FlowControlByteCountLimit* is defined per the configuration obtained during the Block Ack agreement establishment for the respective TID or group of TIDs described in Table 10-25 and per the computation described in 10.25.6.7.2.

Table 10-25—FlowControlByteCountLimit computation during a data transfer sequence

According to Block Ack agreement	**As received via BlockAck or ADDBA Response frame**	**FlowControlByteCountLimit**
Recipient buffer quantity capable	**Updated RBUFCAP**	
N/A	Receiver Buffer Full	Zero (see NOTE)
N/A	Receiver Buffer Empty	$2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1$)
1	Receiver Buffer Available	Receiver Buffer Available × Buffer Unit Size
NOTE—An originator can poll a responder's RBUFCAP value.		

10.25.6.7.2 Number of MPDUs per FlowControlByteCountLimit computation

Figure 10-42 specifies the algorithm used to compute the number of MPDUs satisfying a given *FlowControlByteCountLimit* based on Table 10-24 and Table 10-25. In this algorithm, the following apply:

— *numOfMpdusForTx* indicates the number of pending MPDUs in the transmit queue that are within the transmission window.

— If the recipient memory multiple buffer units capability is not supported, then the parameters *maxMpduInMem* and *mpduSplitInBuffer* are assigned with values 255 and 1, respectively.

— Parameters *unitBufferSize*, *rbufcap*, *memoryUnitSize*, *maxMpduInMem*, and *mpduSplitInBuffer* correspond to the last EDMG flow control parameters as received from a TID within a group of TIDs and with the respective memory configuration tag.

— *mpduForTx[k]* contains the size of the MPDU at location *k* in the transmit queue with the padding for minimum A-MPDU spacing and A-MPDU delimiter alignment, if required.

— For a multi-TID A-MPDU containing TIDs not included in a TID group, the algorithm computes the number of MPDUs for each TID using the *FlowControlByteCountLimit* of that TID. For a multi-TID A-MPDU containing TIDs included in a TID group, the algorithm computes the number of MPDUs for all the TIDs using the recent calculated *FlowControlByteCountLimit* for any TID within the TID group.

10.25.6.8 Maintaining block ack state at the originator

If an originator receives a BlockAck frame, the originator updates the status of MPDUs in its transmit buffer that have the same TID as the BlockAck frame, RA equal to the TA of the BlockAck frame and TA equal to the RA of the BlockAck frame. Status update is performed as follows:

— The originator shall not update the status of MPDUs with Sequence Number subfield values between $WinStart_O$ and $SSN - 1$ of the received BlockAck frame, where *SSN* is the Starting Sequence Number subfield in the received BlockAck frame.

```

Figure 10-36b—Algorithm for computation of FlowControlByteCountLimit
(continued from previous page)

NOTE 1—It is possible for *SSN* to be greater than $WinStart_O$ because of the lack of reception of a nonzero number of MPDUs beginning with the MPDU with Sequence Number subfield value equal to $WinStart_O$ at a recipient that is using partial-state operation.

— For each MPDU for which the status is not acknowledged, and for which the corresponding bit of the received bitmap contains a value of 1, and for which the Sequence Number subfield value is between *SSN* and $WinStart_O + WinSize_O - 1$, the originator shall change its status to acknowledged.

NOTE 2—This second rule means that if an originator successfully delivered an MPDU and received the BlockAck frame in one TXOP and then receives a BlockAck frame in a later TXOP in which the MPDU is not indicated as received (i.e., the corresponding bit of the received bitmap is 0 because the partial state has been reset), the originator knows not to retry the MPDU.

Under a block ack agreement with segmentation and reassembly, the originator shall update $WinStart_{OJ}$ and $WinEnd_{OJ}$ at the arrival of a BlockAck frame. At each subsequent MPDU sent with End of MSDU subfield set to 1 in the Sequence Control field, $WinStart_{OJ}$ shall be set to *MSDU_SN*+1 and $WinEnd_{OJ}$ shall be set to $WinStart_{OJ} + WinSize_{OJ} - 1$ if following conditions are met:

— The MPDU is indicated as acknowledged in the Block Ack bitmap.

All preceding MPDUs starting from MPDU_SN with Start of MSDU subfield set to 1 in the Sequence Control field are indicated as successfully delivered.

10.25.6.9 Originator's support of recipient's partial state

A recipient may choose to employ either full-state operation or partial-state operation for each individual block ack agreement. An originator is unaware of the recipient's choice of full-state or partial-state operation.

NOTE—The originator might solicit a BlockAck frame as the last activity associated with that block ack agreement in the current TXOP to reduce the probability that data are unnecessarily retransmitted due to loss of partial state.

10.25.7 Protected block ack agreement

A STA indicates support for protected block ack by setting the MFPC subfield in the RSN Capabilities field to 1 (see 9.4.2.23.4) and the PBAC subfield in the Extended RSN Capabilities field to 1 (see 9.4.2.240). Such a STA is a PBAC STA; otherwise, the STA is a non-PBAC STA. A block ack agreement that is negotiated between two PBAC STAs is a protected block ack agreement. A block ack agreement that is negotiated between two STAs when either or both of the STAs is not a PBAC STA is a block ack agreement that is not a protected block ack agreement.

A PBAC STA may choose to negotiate a block ack agreement with a non-PBAC STA if dot11RSNAPBACRequired is false; otherwise, it shall negotiate a block ack agreement only with other PBAC

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

STAs. If a PBAC STA is communicating with a non-PBAC STA, it shall follow the rules for a nonprotected block ack agreement.

A STA that has negotiated a protected block ack agreement shall obey the following rule as a block ack originator in addition to rules specified in 10.25.6.7 and 10.25.6.8:

— To update $WinStart_B$ and $WinStart_R$ at the receiver, the STA shall use a PBAC WinStart Update frame.

A STA that has successfully negotiated a protected block ack agreement shall obey the following rules for that agreement as a block ack recipient in addition to rules specified from 10.25.6.3 to 10.25.6.6:

— The STA shall not use the Starting Sequence Number subfield of the Block Ack Starting Sequence Control field in a BlockAckReq, MU-BAR Trigger or GCR-MU BAR Trigger frame to update $WinStart_B$ and $WinStart_R$. If the Starting Sequence Number subfield is greater than $WinEnd_B$ or less than $WinStart_B$, dot11PBACErrors shall be incremented by 1.

— Upon receipt of a PBAC WinStart Update frame whose TID and transmitter address are the same as those of the protected block ack agreement, the STA shall update its $WinStart_R$ and $WinStart_B$ values based on the starting sequence number in the PBAC WinStart Update frame according to the procedures outlined for reception of BlockAckReq frames in 10.25.6.3, 10.25.6.4, 10.25.6.6.1, and 10.25.6.6.3, while treating the starting sequence number as though it were the Starting Sequence Number field of a received BlockAckReq frame.

10.25.8 GCR and GLK-GCR block ack

10.25.8.1 General

Subclause 10.25.8 extends the block ack mechanism to group addressed frames that are transmitted using the GCR block ack and GLK-GCR retransmission policies. Other than the exceptions noted in 10.25.8.2 to 10.25.8.4, the operation of GCR block ack is the same as is described in 10.25.6.

An HE AP shall not send a GCR MU-BAR Trigger frame to a non-AP HE STA if the most recently received Extended Capabilities element from the STA does not indicate support for Robust AV Streaming or Advanced GCR.

10.25.8.2 Scoreboard context control during GCR block ack

For each GCR block ack agreement, each recipient shall maintain a block acknowledgment record. This record includes the following information:

— A bitmap, indexed by sequence number
— A 12-bit unsigned integer starting sequence number
— $WinStart_R$, representing the lowest sequence number position in the bitmap
— $WinEnd_R$, representing the highest sequence number in the current transmission window
— The maximum transmission window size, $WinSize_R$

$WinSize_R$ is set to the smaller of 64 and the value of the Buffer Size field of the associated ADDBA Response frame that established the block ack agreement. $WinEnd_R$ is defined as the highest sequence number in the current transmission window. A STA implementing a GCR block ack agreement shall maintain the block acknowledgment record for that agreement according to the following rules:

a) At GCR block ack agreement establishment:
   1) $WinStart_R$ = the Starting Sequence Number subfield value in the ADDBA Request frame that elicited the ADDBA Response frame that established the GCR block ack agreement.
   2) $WinEnd_R = WinStart_R + WinSize_R - 1$.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

b) For each received Data frame that is related to a specific GCR block ack agreement, the block acknowledgment record for that agreement is modified as follows, where *SN* is the value of the Sequence Number subfield of the received Data frame:
   1) If $WinStart_R \leq SN \leq WinEnd_R$, set to 1 the bit in position *SN* within the bitmap.
   2) If $WinEnd_R < SN < WinStart_R + 2^{11}$,
      i) Set to 0 the bits corresponding to MPDUs with Sequence Number subfield values from $WinEnd_R + 1$ to $SN - 1$.
      ii) Set $WinStart_R = SN - WinSize_R + 1$.
      iii) Set $WinEnd_R = SN$.
      iv) Set to 1 the bit at position *SN* in the bitmap.
   3) If $WinStart_R + 2^{11} \leq SN \leq WinStart_R$, make no changes to the record.
c) For each received BlockAckReq frame that is related to a specific GCR block ack agreement, the block acknowledgment record for that agreement is modified as follows, where *SSN* is the value from the Starting Sequence Number subfield of the received BlockAckReq frame:
   1) If $WinStart_R < SSN \leq WinEnd_R$,
      i) Set $WinStart_R = SSN$.
      ii) Set to 0 the bits corresponding to MPDUs with Sequence Number subfield values from $WinEnd_R + 1$ to $WinStart_R + WinSize_R - 1$.
      iii) Set $WinEnd_R = WinStart_R + WinSize_R - 1$.
   2) If $WinEnd_R < SSN < WinStart_R + 2^{11}$,
      i) Set $WinStart_R = SSN$.
      ii) Set $WinEnd_R = WinStart_R + WinSize_R - 1$.
      iii) Set to 0 bits the corresponding to MPDU with Sequence Number subfield values from $WinStart_R$ to $WinEnd_R$.
   3) If $WinStart_R + 2^{11} \leq SSN \leq WinStart_R$, make no changes to the record.

10.25.8.3 Scoreboard context control during GLK-GCR block ack

GLK-GCR scoreboarding accounts for all GLK-GCR frames received under the GLK-GCR block ack agreement. The received frame may be discarded after SYNRA filtering (see 10.64) but still accounted for in the scoreboarding.

A GLK AP may establish a GLK-GCR block ack agreement with each GLK STA that has indicated support for GLK-GCR in the Association/Reassociation Request frame when the GLK STA associated/reassociated with the GLK AP. Each of those GLK STAs with GLK-GCR block ack agreement shall maintain a block acknowledgment record for full state operation as defined in 10.25.3. This record includes the following information:

— A bitmap, indexed by sequence number
— A 12-bit unsigned integer starting sequence number
— $WinStart_R$, representing the lowest sequence number position in the bitmap
— $WinEnd_R$, representing the highest sequence number in the current transmission window
— The maximum transmission window size, $WinSize_R$

$WinSize_R$ is set to the smaller of 64 and the value of the Buffer Size subfield in the GLK-GCR Parameter Set element in the most recently received Association Response or the Reassociation Response frame that established the GLK-GCR block ack agreement, or the GLK Groupcast Mode Change Notification frame. $WinEnd_R$ is defined as the highest sequence number in the current transmission window. A STA

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

implementing a GLK-GCR block ack agreement shall maintain the block acknowledgment record for that agreement according to the following rules:

a) At GCR block ack agreement establishment (either during general link establishment or when GLK-GCR groupcast mode changes):
   1) $WinStart_R$ = the Starting Sequence Number subfield value in the GLK-GCR Parameter Set element included in the Association Response frame, Reassociation Response frame or in the GLK-GCR Groupcast Mode Change Notification frame.
   2) $WinEnd_R = WinStart_R + WinSize_R - 1$.
b) For each Data frame that is received under the GLK-GCR block ack agreement, the block acknowledgment record for that agreement is modified as follows, where SN is the value of the Sequence Number subfield in the received Data frame:
   1) If $WinStart_R \leq SN \leq WinEnd_R$, set to 1 the bit in position SN within the bitmap.
   2) If $WinEnd_R < SN < WinStart_R + 2^{11}$,
      i) Set to 0 the bits corresponding to MPDUs with Sequence Number subfield values from $WinEnd_R + 1$ to SN – 1.
      ii) Set $WinStart_R = SN - WinSize_R + 1$.
      iii) Set $WinEnd_R = SN$.
      iv) Set to 1 the bit at position SN in the bitmap.
   3) If $WinStart_R + 2^{11} \leq SN \leq WinStart_R$, make no changes to the record.
c) For each BlockAckReq frame received under the GLK-GCR block ack agreement, the block acknowledgment record for that agreement is modified as follows, where SSN is the value from the Starting Sequence Number subfield in the received BlockAckReq frame:
   1) If $WinStart_R < SSN \leq WinEnd_R$,
      i) Set $WinStart_R = SSN$.
      ii) Set to 0 the bits corresponding to MPDUs with Sequence Number subfield values from $WinEnd_R + 1$ to $WinStart_R + WinSize_R - 1$.
      iii) Set $WinEnd_R = WinStart_R + WinSize_R - 1$.
   2) If $WinEnd_R < SSN < WinStart_R + 2^{11}$,
      i) Set $WinStart_R = SSN$.
      ii) Set $WinEnd_R = WinStart_R + WinSize_R - 1$.
      iii) Set to 0 bits the corresponding to MPDU with Sequence Number subfield values from $WinStart_R$ to $WinEnd_R$.
   3) If $WinStart_R + 2^{11} \leq SSN \leq WinStart_R$, make no changes to the record.

10.25.8.4 GCR block ack BlockAckReq and BlockAck frame exchange sequences

A protective mechanism (such as transmitting an HCCA CAP, MCCA, or RTS/CTS; setting the Duration field in the first frame and response frames to update the NAVs of STAs in the BSS and OBSS(s); or using another mechanism described in 10.27 and 10.3.2.10) should be used to reduce the probability of other STAs transmitting during the GCR TXOP.

If the retransmission policy for a group address is GCR Block Ack, an originator shall not transmit more than the GCR buffer size number of A-MSDUs with the RA field set to the GCR concealment address and the DA field of the A-MSDU subframe set to the GCR group address before sending a BlockAckReq frame to one of the STAs that has a GCR block ack agreement for this group address. The RA field of the BlockAckReq frame shall be set to the MAC address of the destination STA. Upon reception of the BlockAck frame, an originator may send a BlockAckReq frame to another STA that has a block ack agreement for this group address, and this process may be repeated multiple times. If the originator has a

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

GCR block ack agreement with one or more of the HE STAs for this group address, the originator may send a GCR MU-BAR Trigger frame to one or more of the HE STAs that are in the awake state. Upon reception of the BlockAck frame from one or more HE STAs, the originator may send a GCR MU-BAR Trigger frame to one or more other HE STAs that have a GCR block ack agreement, and this process may be repeated multiple times.

NOTE 1—If the originator sends a BlockAckReq frame to a STA with a MAC address that matches the SA in any of the A-MSDUs transmitted during the GCR TXOP, the Block Ack Bitmap subfield does not indicate the MSDUs sourced from this STA. This is because the STA will have discarded all group addressed MPDUs transmitted by the AP that have the source address equal to their MAC address (see 10.3.6).

If a recipient receives a BlockAckReq frame with the GCR Group Address subfield equal to a GCR group address, the recipient shall transmit a BlockAck frame at a delay of SIFS after the BlockAckReq frame. The BlockAck frame acknowledges the STA's reception status of the block of group addressed frames requested by the BlockAckReq frame. If an HE STA receives a GCR MU-BAR Trigger frame with the AID12 subfield set to the 12 LSBs of the AID of the HE STA, the HE STA shall include the BlockAck frame in the HE TB PPDU sent in response to the Trigger frame. The BlockAck frame acknowledges the HE STA's reception status of the block of group addressed frames requested by the GCR MU-BAR Trigger frame.

Figure 10-43 shows an example of a frame exchange sequence when the GCR block ack retransmission policy is used. The AP sends several A-MSDUs using the GCR block ack retransmission policy. The AP then sends a BlockAckReq frame to group member 1 of the GCR group, waits for the BlockAck frame, and then sends a BlockAckReq frame to group member 2. After receiving the BlockAck frame from GCR group member 2, the AP determines whether any A-MSDUs need to be retransmitted and sends additional A-MSDUs (some of which might be retransmissions of previous A-MSDUs) using the GCR block ack retransmission policy.

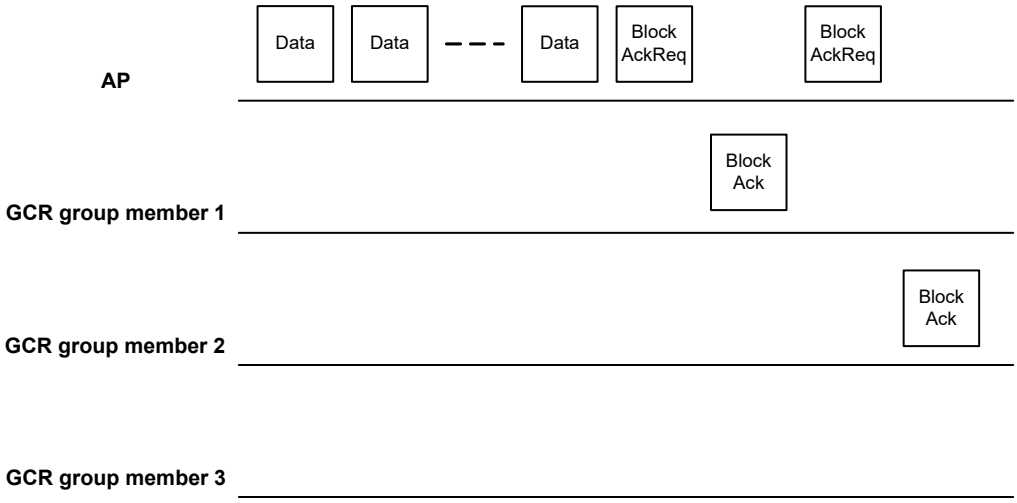

Figure 10-43—Example of frame exchange sequence with GCR block ack retransmission

Figure 10-43 shows another example of a frame exchange sequence when the GCR block ack retransmission policy is used. The HE AP sends several A-MSDUs using the GCR block ack retransmission policy. The HE AP then sends a GCR MU-BAR Trigger frame to group members 1 and 2 of the GCR group, waits for the BlockAck frames, then sends a GCR MU-BAR Trigger frame to group members 3 and 4, and waits for the BlockAck frames. The HE AP then sends a BlockAckReq frame to group member 5, which is a non-HE STA, and waits for the BlockAck frame. After receiving the BlockAck frames, the HE AP determines whether any A-MSDUs need to be retransmitted and sends additional A-MSDUs (some of which might be retransmissions of previous A-MSDUs) using the GCR block ack retransmission policy.

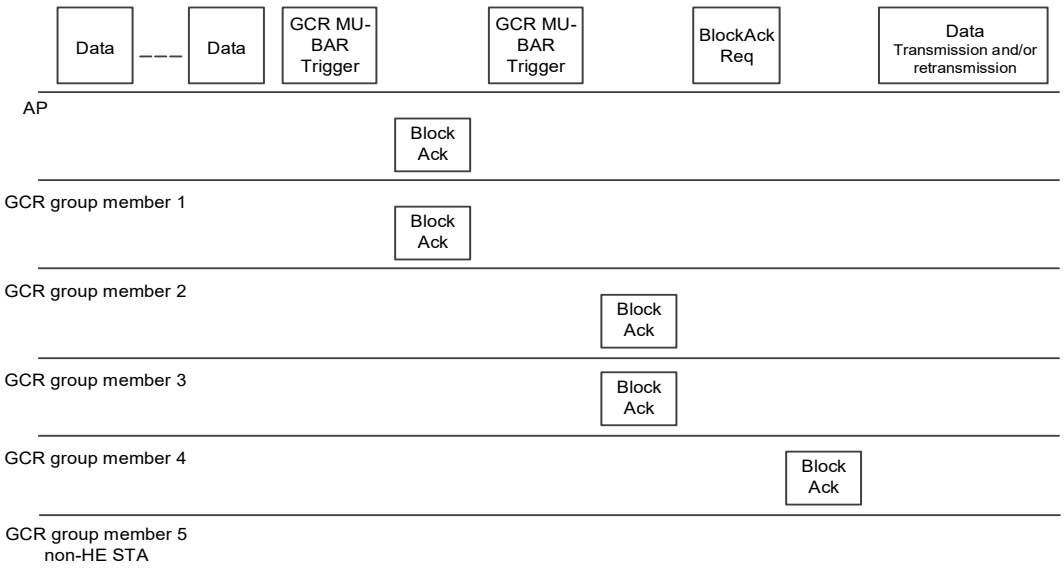

Figure 10-44—Example of a frame exchange sequence with GCR MU-BAR Trigger

After completing the BlockAckReq or GCR MU-BAR Trigger frame and BlockAck frame exchange sequences, the originator determines, from the information provided in the BlockAck bitmap and from the missing BlockAck frame, the A-MSDUs, if any, that need to be retransmitted.

An originator adopting the GCR block ack retransmission policy for a GCR group address chooses a lifetime limit for the group address. The originator may vary the lifetime limit for the group address at any time and may use different lifetime limits for different GCR group addresses. The originator transmits and retries each A-MSDU until the appropriate lifetime limit is reached or until each one has been received by all group members to which a BlockAckReq frame or a GCR MU-BAR Trigger frame has been sent, whichever occurs first.

For GCR streams with retransmission policy equal to GCR Block Ack, an originator may regularly send a BlockAckReq frame with the GCR Group Address subfield in the BAR Information field set to the GCR group address and the Block Ack Starting Sequence Control subfield set to the Sequence Number field in the MPDU containing the earliest A-MSDU that has not been acknowledged by all group members and has not expired due to lifetime limits, in order to minimize buffering latency at receivers in the GCR group. An originator may also send a GCR MU-BAR Trigger frame with the AID12 fields set to the 12 LSBs of the AIDs of HE STAs that transmit the BlockAck frames and the Block Ack Starting Sequence Control subfield set to the Sequence Number field of the earliest A-MSDU of the GCR stream that has not been acknowledged by all group members and has not expired due to lifetime limits, in order to minimize buffering latency at receivers in the GCR group.

NOTE 2—This is because an originator might transmit Management frames, QoS Data frames with a group address in the Address 1 field (including different GCR streams), and non-QoS Data frames intermingled. Since these are transmitted using a single sequence number space, missing frames or frames sent to group addresses absent from a receiving STA's dot11GroupAddresses table complicate receiver processing for GCR streams with a GCR block ack retransmission policy since the cause of a hole in a receiver's block ack bitmap is ambiguous: it is due either to an MPDU being lost from the GCR stream or to transmissions of MPDUs not related to the GCR service using the same sequence number counter.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For GLK-GCR transmissions with retransmission policy equal to GLK-GCR block ack, an originator may send a BlockAckReq frame with the Block Ack Starting Sequence Control subfield set to the Sequence Number field in the MPDU containing the earliest MSDU that has not been acknowledged and has not expired due to lifetime limits, in order to minimize buffering latency at the receivers of the GLK-GCR transmission.

If an originator accepts two or more GCR agreements with multiple STAs where the GCR agreements have the same Ethernet classifiers, but different additional classifiers, then each STA receives multiple GCR flows from the originator and sends them to upper layers where the MSDUs irrelevant to the STA are discarded, in the same manner that non-GCR MSDUs irrelevant to the STA are discarded. In the Block Ack Bitmap field sent to the originator, each STA sets bits corresponding to MPDUs received from any of the multiple GCR streams. The originator should not retry MPDUs to the STA for the bit positions that are irrelevant to that STA.

The beginning of reception of an expected response to a BlockAckReq frame is detected by the occurrence of a PHY-CCA.indication(BUSY, channel-list) primitive at the STA that is expecting the response where the channel-list parameter is absent or, if present, includes “primary.”

If the beginning of such reception does not occur during the first slot time following a SIFS, then the originator may perform error recovery by retransmitting a BlockAckReq frame or a GCR MU-BAR Trigger frame PIFS after the previous BlockAckReq frame or GCR MU-BAR Trigger frame if both of the following conditions are met:

— The carrier sense mechanism (see 10.3.2.1) indicates that the medium is idle at the TxPIFS slot boundary (see Figure 10-29) after the expected start of a BlockAck frame, and
— The remaining duration of the GCR TXOP is longer than the total time required to retransmit the GCR BlockAckReq frame or GCR MU-BAR Trigger frame plus one slot time.

NOTE 3—If an originator fails to receive a BlockAck frame in response to a BlockAckReq frame and there is insufficient time to transmit a recovery frame, the AP retransmits the BlockAckReq frame in a new TXOP.

10.25.9 DMG block ack with flow control

10.25.9.1 General

A DMG STA indicates that it is capable of supporting DMG block ack with flow control by establishing the block ack with Flow Control field to 1 within the STA’s DMG Capabilities element. A DMG block ack agreement with flow control can be established only when both originator and recipient support this capability.

10.25.9.2 DMG block ack architecture with flow control

The DMG block acknowledgment rules are explained in terms of the architecture shown in Figure 10-45 and explained in this subclause.

The originator contains a transmit buffer control that uses $WinStart_O$, $BufSize_O$, and $WinLimit_O$ to submit MPDUs for transmission, and releases transmit buffers upon receiving BlockAck frames from the recipient or when it advances the transmit control buffer window.

$WinStart_O$ is the starting sequence number of the transmit range, $WinLimit_O$ is the last sequence number expected to exhaust the receiver buffer capacity, and $BufSize_O$ is the number of buffers negotiated in the block ack agreement.

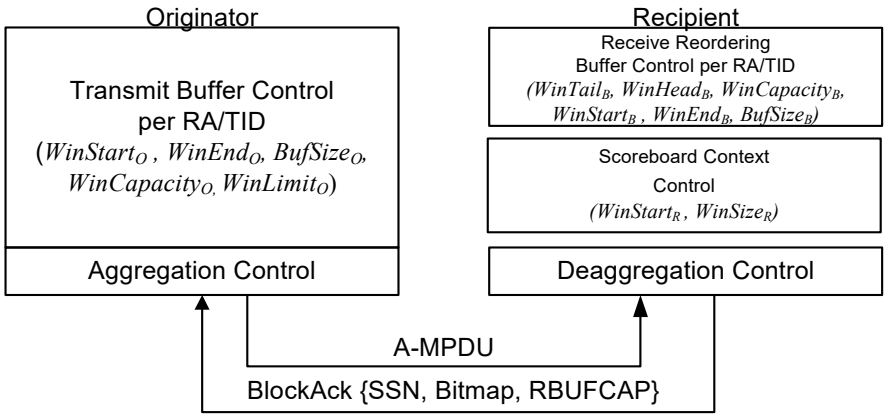

Figure 10-45—DMG block ack architecture

Figure 10-46 shows the DMG block ack with flow control and its associated parameters from the originator perspective.

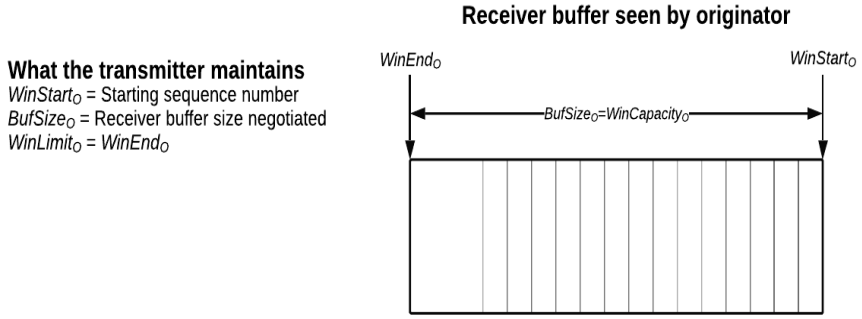

Figure 10-46—Flow control and its associated parameters as a function of receiver buffer size

The Aggregation control creates A-MPDUs. It can adjust the ack policy of transmitted QoS Data frames according to the rules defined in 10.25.6.7 in order to solicit block ack responses.

The recipient contains a Receive Reordering Buffer Control per TA/TID, which contains related control state.

The receive reordering buffer is responsible for reordering MSDUs or A-MSDUs so that MSDUs or A-MSDUs are eventually passed up to the next MAC process in order of received sequence number (SN). It maintains its own state independent of the scoreboard context control to perform this reordering as specified in 10.25.6.6. The delivery of in order MSDUs or A-MSDUs to the next MAC process is implementation dependent. In some cases, the receiver reordering buffer might be forced to hold on to MSDUs ready for in order delivery due to deferred reception at the next MAC process. This behavior can impose additional buffering requirements on the receiver, causing the actual available buffer capacity to vary dynamically. The reordering buffer is required to manage its lowest and highest (in order) SN, which are marked as $WinTail_B$ and $WinHead_B$, respectively.

The scoreboard context control provides the $WinCapacity_B$, actually controlled by the Reordering buffer in addition to the bitmap field and the Starting Sequence Number field value to be sent in BlockAck frame responses to the originator.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

10.25.9.3 Scoreboard context control with flow control

The scoreboard context control with flow control is defined in 10.25.6.3 and 10.25.6.4.

10.25.9.4 Receive Reordering Buffer with flow control operation

10.25.9.4.1 General

A recipient shall maintain a receive reordering buffer for each DMG block ack agreement. Each receive reordering buffer includes a record comprising the following:

— Buffered MSDUs or A-MSDUs that have been received, but not yet passed up to the next MAC process
— A $WinStart_B$ parameter, indicating the value of the Sequence Number field (SN) of the first (in order of ascending sequence number) MSDU or A-MSDU that has not yet been received
— A $WinEnd_B$ parameter, indicating the highest SN expected to be received in the current reception range
— A $BufSize_B$ parameter, indicating the size of the reception window
— A $WinTail_B$ parameter, indicating the value of the Sequence Number field (SN) of the first (in order of ascending sequence number) MSDU or A-MSDU that has not yet been delivered to the next MAC process
— A $WinHead_B$ parameter, indicating the highest SN received in the current reception range

$WinStart_B$ is initialized to the Starting Sequence Number field value of the ADDBA Request frame that elicited the ADDBA Response frame that established the DMG block ack agreement.

$WinEnd_B$ is initialized to $WinStart_B + BufSize_B - 1$, where $BufSize_B$ is set to the value of the Buffer Size field of the ADDBA Response frame that established the block ack agreement. Both $WinTail_B$ and $WinHead_B$ are initialized to the preceding Starting Sequence Number field value, to indicate no MPDU was received, within the current reception window.

Any MSDU or A-MSDU that has been passed up to the next MAC process shall be deleted from the receive reordering buffer, advancing the $WinTail_B$.

The recipient shall pass MSDUs or A-MSDUs up to the next MAC process in order of increasing Sequence Number field value.

10.25.9.4.2 Operation for DMG block ack agreement initialization

At DMG block ack agreement establishment:

a) $WinStart_B = SSN$, where SSN is the Starting Sequence Number field in the ADDBA Request frame that elicited the ADDBA Response frame that established the DMG block ack agreement
b) $WinEnd_B = WinStart_B + BufSize_B - 1$
c) $WinCapacity_B = BufSize_B$
d) $WinHead_B = SSN - 1$, where SSN is taken from the ADDBA Request, similar to $WinStart_B$
e) $WinTail_B = SSN - 1$

10.25.9.4.3 Operation for each received Data frame

For each received Data frame that is related to a specific DMG block ack agreement, the receive reordering buffer record is modified as follows, where SN is the value of the Sequence Number field of the received MPDU:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

a) If $WinStart_B \le SN \le WinEnd_B$
   1) Store the received MPDU in the buffer.
      i) If $SN > WinHead_B$, Set $WinHead_B = SN$.
      ii) If $SN > (WinTail_B + BufSize_B)$,
         1) All MSDUs and A-MSDUs buffered with sequence numbers from $WinTail_B$ to $SN - BufSize_B$ that were received correctly are passed to the next MAC process.
         2) Set $WinTail_B = SN - BufSize_B$.
      iii) Set $WinCapacity_B = WinTail_B + BufSize_B - WinHead_B$.
   2) Set $WinStart_B$ to the value of the Sequence Number field of the first MSDU or A-MSDU that is missing to allow in-order delivery to the next MAC process.
   3) Set $WinEnd_B = WinStart_B + BufSize_B - 1$.

b) If $WinEnd_B < SN < WinStart_B + 2^{11}$
   1) Store the received MPDU in the buffer.
   2) Set $WinEnd_B = SN$.
   3) Set $WinStart_B = WinEnd_B - BufSize_B + 1$.
   4) All MSDUs and A-MSDUs buffered with sequence numbers from $WinTail_B$ to $SN - BufSize_B$ that were received correctly are passed to the next MAC process.
   5) Set $WinTail_B = SN - BufSize_B$.
   6) Set $WinHead_B = SN$.
   7) Set $WinCapacity_B = WinTail_B + BufSize_B - WinHead_B$.

c) If $WinStart_B + 2^{11} \le SN < WinStart_B$, discard the MPDU (do not store the MPDU in the buffer, do not pass the MSDU or A-MSDU up to the next MAC process).

d) For each received BlockAckReq frame the block acknowledgment record for that agreement is modified as follows, where SSN is the value from the Starting Sequence Number field of the received BlockAckReq frame:
   1) If $WinStart_B < SSN \le WinEnd_B$
      i) Set $WinStart_B = SSN$.
      ii) Set $WinEnd_B = WinStart_B + BufSize_B - 1$.
      iii) If $SSN > WinHead_B$, set $WinHead_B = SSN - 1$.
      iv) If $SSN > (WinTail_B + BufSize_B)$,
         1) All MSDUs and A-MSDUs buffered with sequence numbers from $WinTail_B$ to $SSN - BufSize_B$, are discarded from the buffer.
         2) Set $WinTail_B = SSN - BufSize_B$.
      v) Set $WinCapacity_B = WinTail_B + BufSize_B - WinHead_B$.
   2) If $WinEnd_B < SSN < WinStart_B + 2^{11}$
      i) Set $WinStart_B = SSN$.
      ii) Set $WinEnd_B = WinStart_B + BufSize_B - 1$.
      iii) Set $WinHead_B = SSN - 1$.
      iv) If $SSN > (WinTail_B + BufSize_B)$,
         1) All MSDUs and A-MSDUs buffered with sequence numbers from $WinTail_B$ to $SSN - BufSize_B$, are discarded from the buffer.
         2) Set $WinTail_B = SSN - BufSize_B$.
      v) Set $WinCapacity_B = WinTail_B + BufSize_B - WinHead_B$.
   3) If $WinStart_B + 2^{11} \le SSN \le WinStart_B$, make no changes to the record.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

10.25.9.4.4 Operation for ongoing release of received MPDUs

The reordering buffer shall continue to pass MSDUs or A-MSDUs up to the next MAC process that are stored in the buffer in order of increasing value of the Sequence Number field, starting with the MSDU or A-MSDU that has $SN = WinTail_B$ and proceeding sequentially until there is no ready in-order MSDU or A-MSDU buffered for the next sequential value of the Sequence Number field.

a) Set $WinTail_B$ to the value of the Sequence Number field of the last MSDU or A-MSDU that was passed up to the next MAC process plus one.

10.25.9.5 Generation and transmission of BlockAck frame by a STA with flow control

In addition to the behavior specified in 10.25.6.5 when responding with a BlockAck frame, the RBUFCAP field shall be updated with the value of $WinCapacity_B$.

10.25.9.6 Originator's behavior with flow control support

If the BA with Flow Control field within a recipient's DMG Capabilities element is equal to 1, the originator shall not transmit an MPDU with a SN that is beyond the current recipient's buffer capacity ($WinLimit_O$).

The BlockAck frame indicates the number of free buffer slots available at the recipient for reception of additional MPDUs.

The originator shall update $WinLimit_O$ upon reception of a valid BlockAck:

— Set $WinCapacity_O$ to the received value of the RBUFCAP field in the BlockAck frame.
— Set *MostSuccSN* to the highest *SN* of positively acknowledged MPDUs
— Set $WinLimit_O = MostSuccSN + WinCapacity_O$

NOTE—Updating $WinLimit_O$ limits the transmission of the following MPDUs.

Originator's support of recipient's partial state is defined in 10.25.6.9.

10.25.10 Unsolicited block ack extension

10.25.10.1 Introduction

The unsolicited block ack is an extension to the HT-Immediate block ack mechanism that allows transmission of A-MPDUs without the need for a prior exchange of ADDBA Request and ADDBA Response frames to establish the agreement. The unsolicited block ack extension also enables optimizing the buffering requirements needed at the recipient side with the ability to share the recipient resources among all originators.

A recipient that supports the unsolicited block ack extension is ready to use this mechanism with an originator following the exchange of frames as specified in 10.25.2.

10.25.10.2 Unsolicited block ack extension agreement architecture

The unsolicited block ack extension to the HT-immediate block ack architecture is identical to the HT-immediate block ack extension architecture described in 10.25.6.2 with the following rules:

— $WinSize_O$ is the value of the Buffer Size field advertised in the recipient's Unsolicited Block Ack Extension element.
— $WinStart_O$ is equal to the sequence number of the first MPDU inside the first A-MPDU sent with a specific tuple <TA, RA, TID>.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The recipient shall only use full-state operation of the scoreboard context control.

10.25.10.3 Scoreboard context control during full-state operation

The scoreboard context control for the unsolicited block ack extension mechanism shall follow the rules of full-state operation defined in 10.25.6.3 with the following additional rule. When the recipient flushes buffers in the reordering buffer control, the bits in the bitmap position in the block acknowledgment record for the SNs that are higher than the lowest SN of all unsuccessful MPDUs and lower than the highest SN of all successful MPDUs are set to 0. $WinStart_R$, $WinSize_R$, and $WinEnd_R$ remain unchanged.

10.25.10.4 Generation and transmission of BlockAck frames

The recipient shall follow the same rules defined in 10.25.6.5.

10.25.10.5 Receive reordering buffer control operation

The receive reordering buffer control behaves the same as in the HT-Immediate block ack agreement defined in 10.25.6.6, with the ability of the recipient to flush the buffers when it starts receiving from a different originator or TID.

Under the unsolicited block ack extension mechanism, the parameters are initialized as follows:

— $WinSize_B$ is set to the value of the Buffer Size field advertised in the Unsolicited Block Ack Extension element.

— When the unsolicited block ack extension agreement is established, $WinEnd_B$ is initialized to the sequence number of the first MPDU inside the first A-MPDU sent with a specific tuple <TA, RA, TID>, and $WinStart_B$ is set to $WinEnd_B - WinSize_B + 1$.

— The buffered MSDUs in the receive reordering buffer control may be flushed when the STA starts receiving from a different <TA, TID> pair.

The recipient shall pass MSDUs and A-MSDUs up to the next MAC process in order of increasing sequence number.

10.25.10.6 Originator behavior and block ack state maintenance

In addition to the rules defined for the HT-immediate block ack extension specified in 10.25.6.7 and 10.25.6.8, an originator that utilizes the unsolicited block ack extension mechanism:

— Shall not transmit an A-MPDU corresponding to a tuple <TA, RA, TID> before synchronizing at the recipient the *SSN*, $WinStart_R$, and $WinStart_B$ parameters for the specific tuple. The originator may transmit either an MPDU or a BlockAckReq frame to initiate the synchronization. Synchronization is confirmed by reception of an Ack frame from the recipient when an MPDU was used, or by a BlockAck frame when a BlockAckReq was used.

— Shall not release transmitted buffers (MPDUs) with *SN* equal or higher than the first unsuccessful MPDU.

— At the end of a TXOP or SP, shall set to 0 the acknowledgment status of MPDUs with *SN* equal or higher than the first unsuccessful MPDU even if such MPDUs have been already positively acknowledged.

— At the start of the next TXOP or SP, may transmit all the MPDUs with *SN* equal or higher than the first unsuccessful MPDU, or may send a BlockAckReq frame with the Starting Sequence Number field equal to the *SN* of the first unsuccessful MPDU to determine the state of the buffers at the recipient and retransmit MPDUs that are not received or flushed by the recipient.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The originator shall not use the multi-TID variant with a recipient if the recipient has not set the Multi-TID Supported subfield in the recipient's Unsolicited Block Ack Extension element to 1.

10.26 No Acknowledgment (No Ack)

When a QoS Data frame is transmitted with No Ack ack policy, there is no MAC-level recovery, and the reliability of this traffic is reduced, relative to the reliability of traffic with other ack policy, due to the increased probability of lost frames from interference, collisions, or time-varying channel parameters. A protective mechanism (such as transmitting using HCCA, RTS/CTS, or the mechanism described in 10.27) should be used to reduce the probability of other STAs transmitting during the TXOP.

10.27 Protection mechanisms

10.27.1 Introduction

These protection mechanisms cause a STA that is a potential interferer to defer any transmission for a known period of time. When these mechanisms are used, non-ERP STAs do not interfere with frame exchange sequences using ERP PPDUs between ERP STAs and non-HT STAs do not interfere with frame exchanges using HT PPDUs between HT STAs.

10.27.2 Protection mechanism for non-ERP receivers

The intent of a protection mechanism is to cause a STA not to transmit an MPDU with the Type subfield equal to Data or an MMPDU with an ERP-OFDM preamble and header unless it has attempted to update the NAV of receiving non-ERP STAs. The updated NAV period shall be longer than or equal to the total time required to send the Data and any required response frames. An ERP STA shall use protection mechanisms (such as RTS/CTS or CTS-to-self) for ERP-OFDM MPDUs with the Type subfield equal to Data or an MMPDU when the Use_Protection field of the ERP element is equal to 1 (see the requirements of 10.6). Protection mechanisms frames shall be sent using one of the mandatory Clause 15 or Clause 16 rates and using one of the mandatory Clause 15 or Clause 16 waveforms, so all STAs in the BSA are able to learn the duration of the exchange even if they cannot detect the ERP-OFDM signals using their CCA function.

In the case of a BSS composed of only ERP STAs, but with knowledge of a neighboring co-channel BSS having non-ERP traffic, the AP might need protection mechanisms to protect the BSS's traffic from interference. This provides propagation of NAV to all attached STAs and all STAs in a neighboring co-channel BSS within range by messages sent using rates contained in the BSSBasicRateSet parameter. The frames that propagate the NAV throughout the BSS include RTS/CTS/Ack frames, all Data frames with the More Fragments field equal to 1, all Data or Management frames sent in response to a PS-Poll frame that are not preceded in the frame exchange sequence by a Data frame with the More Fragments field equal to 1, and CF-End frames.

When RTS/CTS is used as the protection mechanism, cases exist such as NAV resetting (discretionary, as indicated in 10.3.2.4), where a hidden STA may reset its NAV and this might cause a collision. The likelihood of occurrence is low, and it is not considered to represent a significant impairment to overall system operation. A mechanism to address this possible situation would be to use alternative protection mechanisms or to revert to alternative modulation methods.

The rules for calculating RTS/CTS NAV fields are unchanged when using RTS/CTS as a protection mechanism.

Additionally, if any of the rates in the BSSBasicRateSet parameter of the protection mechanism frame transmitting STA's BSS are Clause 15 or Clause 16 rates, then the protection mechanism frames shall be sent at one of those Clause 15 or Clause 16 basic rates.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The NonERP_Present bit shall be set to 1 when a non-ERP STA is associated with the BSS. In an IBSS if an IBSS STA detects one or more non-ERP STAs that are members of the same IBSS the NonERP_Present bit should be set to 1. Examples of when the NonERP_Present bit may additionally be set to 1 include, but are not limited to, when:

a) A non-ERP infrastructure BSS or non-ERP IBSS is overlapping (a non-ERP BSS may be detected by the reception of a Beacon frame where the supported rates contain only Clause 15 or Clause 16 rates).
b) In an IBSS if a Beacon frame is received from one of the IBSS participants where the operational rate set contains no Clause 18 rates and no BSS membership selectors.
c) A Management frame (excluding a Probe Request) is received where the operational rate set contains no Clause 18 rates and no BSS membership selectors.

A non-ERP mesh STA shall set the NonERP_Present and Use_Protection bits to 1, when establishing a mesh peering with a mesh STA.

When a mesh STA establishes a mesh peering with a non-ERP mesh STA, the mesh STA shall set the NonERP_Present bit to 1 and the mesh STA should set the Use_Protection bit to 1. In addition, a mesh STA should set the NonERP_Present bit and the Use_Protection bit to 1 when

— A mesh STA detects the overlapped presence of either a non-ERP BSS, a non-ERP IBSS, or a non-ERP MBSS, or
— A Beacon frame is received from a neighbor STA where the operational rate set contains no Clause 18 rates and no BSS membership selectors, or
— A Management frame (excluding Probe Request) is received where the operational rate set contains no Clause 18 rates and no BSS membership selectors.

A mesh STA may set the NonERP_Present and the Use_Protection bits to 1 based on its internal policies, which is beyond the scope of the standard.

The Use_Protection bit may be set to 1 when the NonERP_Present bit is 1.

If one or more non-ERP STAs are associated in the BSS, the Use_Protection bit shall be set to 1 in transmitted ERP elements.

In an IBSS the setting of the Use_Protection bit is left to the STA. In an IBSS there is no uniform concept of association; therefore, a typical algorithm for setting the Use_Protection bit takes into account the traffic pattern and history on the network. If an IBSS STA detects one or more non-ERP STAs that are members of the same IBSS or receives a Beacon from a member of the same IBSS with the Use_Protection bit equal to 1, then the Use_Protection bit should be set to 1 in the ERP element of transmitted Beacon and Probe Response frames.

An ERP STA shall invoke the use of a protection mechanism after transmission or reception of the Use_Protection bit with a value of 1 in an MMPDU to or from the BSS that the ERP STA has joined or started. An ERP STA may additionally invoke protection mechanism use at other times. An ERP STA may disable protection mechanism use after transmission or reception of the Use_Protection bit with a value of 0 in an MMPDU to or from the BSS that the ERP STA has joined or started.

An ERP mesh STA shall invoke the use of a protection mechanism after the transmission of the Use_Protection bit with a value of 1 in an MMPDU. In addition, an ERP mesh STA may invoke protection mechanism at other times. An ERP mesh STA may disable protection mechanism use after transmission of the Use_Protection bit with a value of 0 in an MMPDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When there are no non-ERP STAs associated with the BSS and the ERP element sender's dot11ShortPreambleOptionImplemented is true, then the Barker_Preamble_Mode bit may be set to 0. The Barker_Preamble_Mode bit shall be set to 1 by the ERP element sender if one or more associated non-ERP STAs are not short preamble capable as indicated in their Capability Information field, or if the ERP element senders dot11ShortPreambleOptionImplemented is false.

When dot11ShortPreambleOptionImplemented is true and all peer mesh STAs support the short preamble, the mesh STA may set the Barker_Preamble_Mode bit to 0. When dot11ShortPreambleOptionImplemented is false or any of its peer mesh STAs do not support the short preamble, the mesh STA shall set the Barker_Preamble_Mode field to 1.

If an IBSS STA detects one or more nonshort-preamble-capable STAs that are members of the same IBSS, then the Barker_Preamble_Mode bit should be set to 1 in the transmitted ERP element.

An ERP STA shall use long preambles when transmitting Clause 15, Clause 16, and Clause 18 frames after transmission or reception of an ERP element with a Barker_Preamble_Mode value of 1 in an MMPDU to or from the BSS that the ERP STA has joined or started, regardless of the value of the Short Preamble subfield in the Capability Information field from the same received or transmitted MMPDU that contained the ERP element. An ERP STA may additionally use long preambles when transmitting Clause 15, Clause 16, and Clause 18 frames at other times. An ERP STA may use short preambles when transmitting Clause 15, Clause 16, and Clause 18 frames after transmission or reception of an ERP element with a Barker_Preamble_Mode value of 0 in an MMPDU to or from the BSS that the ERP STA has joined or started, regardless of the value of the Short Preamble subfield in the Capability Information field from the same received or transmitted MMPDU. A non-ERP STA may also follow the rules given in this paragraph.

An ERP mesh STA shall use long preambles when transmitting Clause 15, Clause 16, and Clause 18 frames after transmission or reception of an ERP element with a Barker_Preamble_Mode value of 1 in an MMPDU to or from the MBSS to which the ERP mesh STA belongs. A Mesh STA may use long preambles when transmitting Clause 15, Clause 16, and Clause 18 frames at other times.

10.27.3 Protection mechanisms for transmissions of HT PPDUs

10.27.3.1 General

Transmissions of HT PPDUs, referred to as *HT transmissions*, are protected if there are other STAs present that cannot interpret HT transmissions correctly. The HT Protection and Nongreenfield HT STAs Present fields in the HT Operation element within Beacon and Probe Response frames are used to indicate the protection requirements for HT transmissions.

The HT Protection field may be set to no protection mode only if the following are true:

- All STAs detected (by any means) in the primary or the secondary channel are HT STAs, and
- All STAs that are known by the transmitting STA to be a member of this BSS are either
  - 20/40 MHz HT STAs in a 20/40 MHz BSS, or
  - 20 MHz HT STAs in a 20 MHz BSS.

The HT Protection field may be set to nonmember protection mode only if the following are true:

- A non-HT STA is detected (by any means) in either the primary or the secondary channel or in both the primary and secondary channels, that is not known by the transmitting STA to be a member of this BSS, and
- All STAs that are known by the transmitting STA to be a member of this BSS are HT STAs.

The HT Protection field may be set to 20 MHz protection mode only if the following are true:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— All STAs detected (by any means) in the primary channel and all STAs detected (by any means) in the secondary channel are HT STAs and all STAs that are members of this BSS are HT STAs, and
— This BSS is a 20/40 MHz BSS, and
— There is at least one 20 MHz HT STA associated with this BSS.

The HT Protection field is set to non-HT mixed mode otherwise.

NOTE 1—The rules stated above allow an HT AP to select non-HT mixed mode at any time.

In an IBSS, the HT Protection field is reserved, but an HT STA shall protect HT transmissions as though the HT Protection field were equal to non-HT mixed mode. An IBSS STA shall protect HT-greenfield format PPDUs and RIFS sequences, adhering to the same requirements as described in the line of Table 10-26 labeled "Use_Protection = 0 or ERP element is not present (HT Protection field equal to non-HT mixed mode)."

Table 10-26—Protection requirements for HT Protection field values nonmember protection mode and non-HT mixed mode

Condition	Requirements
Use_Protection = 0 or ERP element is not present (HT Protection field equal to non-HT mixed mode)	The protection requirements for HT transmissions using HT-greenfield format are specified in 10.27.3.1. The protection requirements for HT transmissions using RIFS within the HT transmission burst are specified in 10.27.3.3. The protection mechanism for other transmissions not already described above is based on one of the sequences defined in Table 10-27.
Use_Protection = 1 (HT Protection field equal to nonmember protection mode or non-HT mixed mode)	All HT transmissions shall be protected using mechanisms as described in 10.27.2.

In an MBSS, the HT Protection field and the Nongreenfield HT STAs Present field are determined as described in 10.27.3.5.

In an IBSS and an MBSS, the RIFS Mode field of the HT Operation element is reserved, but an HT STA shall operate as though this field were equal to 1.

When the HT Protection field is equal to no protection mode or 20 MHz protection mode and the Nongreenfield HT STAs Present field is equal to 0, no protection is required since all HT STAs in the BSS are capable of decoding HT-mixed format and HT-greenfield format transmissions.

When the HT Protection field is equal to no protection mode or 20 MHz protection mode and the Nongreenfield HT STAs Present field is equal to 1, HT transmissions that use the HT-greenfield format shall be protected. This protection may be established by transmitting a PPDU with the TXVECTOR FORMAT parameter set to HT_MF or any of the methods described in Table 10-27.

When the HT Protection field is equal to nonmember protection mode and the Use_Protection field in the ERP element is equal to 0, HT transmissions should be protected. When the HT Protection field is equal to nonmember protection mode, the Use_Protection field in the ERP element is equal to 0, and the Nongreenfield HT STAs Present field is equal to 1, HT transmissions using HT-greenfield format shall be protected. When the HT Protection field is equal to nonmember protection mode and the Use_Protection field in the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 10-27—Applicable HT protection mechanisms

HT protection mechanism
Control frames such as RTS/CTS or CTS-to-self prior to the HT transmissions: — 20 MHz transmissions use the rates defined in Clause 17 or Clause 18 — 40 MHz transmissions use non-HT duplicate frames defined in Clause 19
As the first PPDU in the TXOP, send one of: — A non-HT PPDU containing a frame that requires an immediate response — An HT-mixed format PPDU containing a frame that requires an immediate response in a non-HT PPDU PPDUs after the first PPDU exchange may be HT-greenfield format PPDUs and/or be separated by RIFS.

ERP element is equal to 1, HT transmissions shall be protected according to the requirements described in Table 10-26.

When the HT Protection field is equal to non-HT mixed mode, HT transmissions shall be protected. The type of protection required depends on the type of transmission as well as the type of the non-HT STAs that are present in the BSS. Protection requirements that apply when the HT Protection field is equal to non-HT mixed mode are described in Table 10-26.

NOTE 2—Rules for rate selection for the HT protection mechanisms listed in Table 10-27 are described in 10.6.

If the HT Protection field is equal to no protection mode and the Secondary Channel Offset field is equal to SCA or SCB, a STA may transmit a 40 MHz HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to HT_CBW40) to initiate a TXOP provided that the restrictions specified in 10.6 are obeyed. When the HT Protection field is not equal to no protection mode or the Secondary Channel Offset field is equal to SCN, a STA shall not transmit a 40 MHz HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to HT_CBW40) to initiate a TXOP.

10.27.3.2 Protection rules for HT STA operating a direct link

An HT STA operating a direct link with another HT STA in a non-HT BSS shall operate according to the rules found in 10.27 as though the following fields have the settings indicated:

a) The RIFS Mode field of the HT Operation element equal to 1
b) The HT Protection field equal to non-HT mixed mode
c) The Nongreenfield HT STAs Present field equal to 1
d) The OBSS Non-HT STAs Present field equal to 1
e) The Basic HT-MCS Set field equal to all 0s

10.27.3.3 RIFS protection

If the HT Protection field is equal to nonmember protection mode or non-HT mixed mode, the AP may set the RIFS Mode field to 0 according to implementation specific criteria (i.e., such as to protect overlapping non-HT BSSs in the primary or secondary channels).

If the HT Protection field is not equal to nonmember protection mode and it is not equal to non-HT mixed mode, the RIFS Mode field shall be set to 1.

If the RIFS Mode field of an AP's HT Operation element is equal to 1:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

a) A STA that is associated with the AP may protect RIFS sequences when the HT Protection field of the HT Operation element transmitted by the AP is equal to nonmember protection mode.
b) A STA that is associated with the AP shall protect RIFS sequences when the HT Protection field of the HT Operation element transmitted by the AP is equal to non-HT mixed mode.

10.27.3.4 Use of OBSS Non-HT STAs Present field

The OBSS Non-HT STAs Present field allows HT APs to report the presence of non-HT STAs that are not members of its BSS in the primary channel, the secondary channel, or in both primary and secondary channels.

A second HT AP that detects a first HT AP's Beacon frame with the OBSS Non-HT STAs Present field equal to 1 may cause HT-greenfield format and RIFS sequence transmissions of the second AP's BSS to be protected by setting the HT Protection field of its HT Operation element to non-HT mixed mode. If the NonERP_Present field is equal to 1 in the first AP's Beacon frame, the Use_Protection field may also be set to 1 by the second AP.

An HT STA may also scan for the presence of non-HT devices either autonomously or, for example, after the STA's AP transmits an HT Operation element with the HT Protection field equal to nonmember protection mode. Non-HT devices can be detected as follows:

— Reception of a Management frame that does not carry an HT Capabilities element and the frame is required to carry this element when transmitted by an HT STA, or
— Reception of a Beacon frame containing an HT Operation element with the OBSS Non-HT STAs Present field equal to 1.

When non-HT devices are detected, the STA may enable protection of its HT-greenfield format and RIFS sequence transmissions.

NOTE—If a non-HT device is detected and the STA determines that its HT-greenfield format or RIFS sequence transmissions are affecting the operation of the non-HT device, then the STA might enable protection of its HT-greenfield format and RIFS sequence transmissions.

See also 11.8.8.5, which defines rules for the OBSS Non-HT STAs Present field related to HT-greenfield transmissions in certain operating classes.

10.27.3.5 Protection rules for an HT mesh STA

A mesh STA determines the HT Protection and Nongreenfield HT STAs Present fields in the HT Operation element in the transmitting frame as follows:

The HT Protection field in a mesh STA may be set to no protection mode only if

— All STAs detected in the primary or the secondary channel are HT STAs, and
— All mesh STA members of this MBSS that are one-hop neighbors of the transmitting mesh STA are either:
  — 20/40 MHz HT mesh STAs in a 20/40 MHz MBSS, or
  — 20 MHz HT mesh STAs in a 20 MHz MBSS.

The HT Protection field in a mesh STA may be set to nonmember protection mode only if

— A non-HT STA is detected in either the primary or the secondary channel or in both the primary and secondary channels, that is not known by the transmitting mesh STA to be a member of this MBSS, and
— All mesh STA members of this MBSS that are one-hop neighbors of the transmitting mesh STA are HT mesh STAs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The HT Protection field in a mesh STA may be set to 20 MHz protection mode only if

— All STAs detected in the primary and all STAs detected in the secondary channel are HT STAs, and
— All mesh STA members of this MBSS that are one-hop neighbors of the transmitting mesh STA are HT mesh STAs, and
— The MBSS is a 20/40 MHz MBSS, and
— There is at least one 20 MHz HT mesh STA that is one-hop neighbor of the transmitting mesh STA.

The HT Protection field in a mesh STA is set to non-HT mixed mode otherwise.

If two peer HT mesh STAs report the same protection mode in HT Protection field, the protection mechanisms of the related mode shall be used to protect the transmission between the peer HT mesh STAs.

If an HT mesh STA and its peer HT mesh STA report different protection modes in HT Protection field, the following rules shall be used:

a) If an HT mesh STA or its peer HT mesh STA reports non-HT mixed mode, the protection mechanisms of non-HT mixed mode shall be used to protect the transmission between the peer HT mesh STAs.
b) If an HT mesh STA or its peer HT mesh STA reports nonmember protection mode and non-HT mixed mode is not reported by any of these HT mesh STAs, the protection mechanisms of nonmember protection mode shall be used to protect the transmission between the peer HT mesh STAs.
c) If an HT mesh STA or its peer HT mesh STA reports 20 MHz protection mode and neither non-HT mixed mode nor nonmember protection mode is reported by any of these HT mesh STAs, the protection mechanisms of 20 MHz protection mode shall be used to protect the transmission between the peer HT mesh STA.

If at least one HT peer mesh STA in its mesh neighborhood indicates the Nongreenfield HT STAs Present equal to 1, the protection rules related to Nongreenfield HT STAs Present should also be applied to the communication between HT peer mesh STAs.

10.27.4 L_LENGTH and L_DATARATE parameter values for HT-mixed format PPDUs

L_LENGTH and L_DATARATE determine the duration that non-HT STAs do not transmit, equal to the remaining duration of the HT PPDU, following the non-HT portion of the preamble of the HT-mixed format PPDU.

The L_DATARATE parameter of the TXVECTOR shall be set to the value 6 Mb/s.

A STA that is transmitting a PPDU with the FORMAT parameter of the TXVECTOR equal to HT_MF shall set the value of the L_LENGTH parameter to the value (in octets) given by Equation (10-17):

$$\text{L\_LENGTH} = \left\lceil \frac{((\text{TXTIME} - \text{Signal Extension}) - \text{NonHTLength})}{\text{aSymbolLength}} \right\rceil \times N_{OPS} - \left\lceil \frac{\text{PHYServiceLength} + \text{PHYConvolutionalTailLength}}{8} \right\rceil \quad (10\text{-}17)$$

where

TXTIME	is the duration (in microseconds) of the HT PPDU defined in 6.7.5
Signal Extension	is 0 μs when TXVECTOR parameter NO_SIG_EXTN is true and is aSignalExtension as defined in Table 19-25 of 19.4.4 when TXVECTOR parameter NO_SIG_EXTN is false
aSymbolLength	is the duration of a symbol (in microseconds), defined in 6.7.4

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NonHTLength is 20 μs, the duration of the non-HT PHY preamble and L-SIG

N_{OPS} is the number of octets transmitted during a period of aSymbolLength at the rate specified by L_DATARATE

PHYServiceLength is 16 bits, the number of bits in the PHY SERVICE field

PHYConvolutionalTailLength is 6 bits, the number of bits in the convolutional code tail bit sequence

NOTE 1—The last term of the L_LENGTH definition corrects for the fact that non-HT STAs add the length of the SERVICE field and tail bits (assuming a single convolutional encoder) to the value communicated by the L_LENGTH field.

Equation (10-17) can be simplified to Equation (10-18)

$$\text{L\_LENGTH} = \left\lceil \frac{((\text{TXTIME} - \text{Signal Extension}) - 20)}{4} \right\rceil \times 3 - 3 \quad (10\text{-}18)$$

A STA shall not transmit a PPDU with the FORMAT parameter set to HT_MF in TXVECTOR if the corresponding L_LENGTH value calculated with Equation (10-17) exceeds 4095 octets.

NOTE 2—The transmission of frames with L_LENGTH above 2332 octets (i.e., a Data frame containing an unencrypted 2304-octet MSDU) might be accompanied by a protection mechanism (e.g., RTS/CTS or CTS-to-self protection) if it is determined that the use of L_LENGTH fails to effectively suppress non-HT transmissions. How this is determined is outside the scope of this standard.

10.27.5 Protection rules for VHT STAs

A VHT STA is subject to all of the rules for HT STAs that apply to its operating band, except that a PPDU with the TXVECTOR FORMAT parameter set to VHT may be substituted for a PPDU with the TXVECTOR FORMAT parameter set to HT_MF and that the applicable HT protection mechanisms are extended to include 80, 160 and 80+80 MHz transmissions using non-HT duplicate frames defined in Clause 21.

10.27.6 Protection rules for HE STAs

An HE STA operating in the 2.4 GHz band is subject to all of the rules for HT STAs that apply to that band, except that a PPDU with the TXVECTOR parameter FORMAT set to HE_SU, HE_ER_SU, HE_MU, or HE_TB may be substituted for a PPDU with the TXVECTOR parameter FORMAT set to HT_MF.

An HE STA operating in the 5 GHz band is subject to all of the rules for VHT STAs that apply to that band, except that a PPDU with the TXVECTOR parameter FORMAT set to HE_SU, HE_ER_SU, HE_MU, or HE_TB may be substituted for a PPDU with the TXVECTOR parameter FORMAT set to VHT.

Additionally, an HE STA can use the MU-RTS/CTS frame exchange sequence procedure.

10.27.7 Protection mechanisms for transmissions of EDMG PPDUs

The intent of the protection mechanism is to cause an EDMG STA not to transmit an EDMG PPDU unless it has attempted to update the NAV of receiving non-EDMG STAs. The updated NAV period shall be longer than or equal to the total time required to send the Data and any required response frames. An EDMG STA shall use protection if a TXOP is obtained using the contention based channel access and may use protection at service period access. The protection mechanism does not need to be used if all PPDUs in the obtained TXOP are transmitted by MCS 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Frames used to support the protection mechanism shall be transmitted using MCS 0 as defined in Clause 20 or non-EDMG duplicate control mode MCS 0 as defined in Clause 28, so STAs in the BSA that receive such frames are able to learn the duration of the exchange even if they cannot detect the EDMG signals using their CCA function.

RTS, DMG CTS, DMG CTS-to-self, DMG DTS and CF-End frames are used as the protection mechanism according to the procedures defined in 10.3.2.4, 10.3.2.9, and 10.3.2.18. The rules for calculating the Duration field value of RTS/DMG CTS frames are unchanged when using RTS/DMG CTS frames as a protection mechanism.

Control frames that are not RTS, DMG CTS, DMG CTS-to-self, DMG DTS and CF-End frames are sent according to the rules defined in Figure 10.6.7.2 and 10.6.7.6.

10.28 MAC frame processing

10.28.1 Introduction

Subclauses 10.28.2 to 10.28.9 describe MAC frame and element processing requirements to provide frame, element, and subelement extensibility.

10.28.2 Revision level field processing

A MAC entity that receives a frame with a higher revision level than it supports shall discard the frame without indication to the sending STA or to LLC.

10.28.3 Duration/ID field processing

When the contents of a received Duration/ID field, treated as an unsigned integer and without regard for address, type, and subtype (even when type or subtype contain reserved values), are less than 32 768, the duration value is used to update the network allocation vector (NAV) according to the procedures defined in 10.3.2.4, 10.23.3.4, or 10.38.10, as appropriate.

When the contents of a received Duration/ID field, treated as an unsigned integer, are greater than 32 768, the contents are interpreted as appropriate for the frame type and subtype or ignored if the receiving MAC entity does not have a defined interpretation for that type and subtype.

10.28.4 Response to an invalid Action or Action No Ack frame

If a STA receives an individually addressed Action or Action No Ack frame with an unrecognized Category field or some other syntactic error and the MSB of the Category field equal to 0, then the STA shall discard the frame.

10.28.5 Operation of the Dialog Token field

A dialog token is an integer value that assists a STA in grouping Management frames sent or received at different times as part of the same dialog. The algorithm by which the integer value for the dialog is selected is implementation specific, but should be selected in a manner that minimizes the probability of a frame associated with one dialog being incorrectly associated with another dialog.

10.28.6 Element parsing

A STA that encounters an element with an unknown or reserved element ID value, or an element with an element ID extension whose element ID extension value is unknown or reserved, in a Management frame

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

received without error, shall ignore that element and shall parse any remaining management frame body for additional elements with recognizable element ID (and, if present, element ID extension) values.

10.28.7 Vendor specific element parsing

A STA receiving a Vendor Specific element that it does not support shall ignore the Vendor Specific element.

10.28.8 Extensible element parsing

Table 9-130 indicates which elements are considered extensible in future revisions of the standard, by placing a Yes in the Extensible column. Each element that has a Yes in the Extensible column has an Information field with a known length that can be determined from the definition of the Information field in this standard; i.e., the Information field has a fixed structure or has a variable structure whose length is determined by fields within the Information field. A STA that receives an extensible element in which the Length field exceeds the known length of the Information field of that element shall discard any part of the Information field beyond the known length and shall otherwise process the element as though this truncated element had been received.

10.28.9 Extensible subelement parsing

A subelement has the structure defined in 9.4.3 and is contained within an element or subelement.

A STA that encounters an unknown, unsupported, or reserved subelement ID value contained in an element or subelement shall ignore the subelement with that subelement ID value and shall continue to parse any remaining element or subelement body for additional subelements with recognizable subelement ID values.

A STA that receives an element or subelement for which a vendor-specific subelement is defined and that contains a vendor-specific subelement that it does not support shall ignore this vendor-specific subelement and shall continue to parse any remaining element or subelement body for additional subelements with recognizable subelement ID values.

Subelements are defined locally in each subclause that defines a structure containing subelements. Subelement ID numbering is private to that structure. A STA that receives an extensible subelement that is not extensible using subelements and in which the Length field exceeds the length of the structure of the subelement defined in this standard shall discard any part of the subelement beyond that length and shall otherwise process the subelement as though this truncated subelement had been received.

10.28.10 Extensible TLV parsing

A TVHT STA that receives a frame containing a TLV tuple with an unknown Type value shall discard the tuple and continue processing the next tuple.

10.28.11 Element fragmentation

The general format of elements limits the size of the information to 255 octets in an element without Element ID Extension field (Figure 10-47) or 254 octets in an element with Element ID Extension field (Figure 10-48). A STA may transmit information that is too large to fit in a single element by fragmenting the element into a series of elements consisting of the element that the information does not fit, immediately followed by one or more Fragment elements as illustrated in Figure 10-47. Information that fits in a single element shall not be fragmented. The rules related to element fragmentation for the case where a fragmentable element is carried as a subelement within an element that is not fragmentable are described in 10.28.13. All the information for a fragmented element shall be in the same MMPDU.

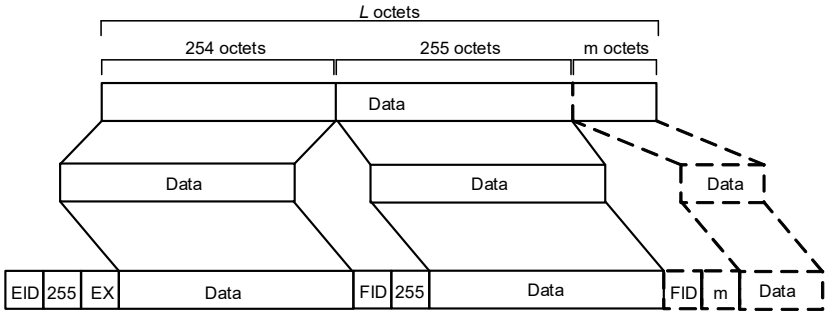
EID: The element ID of the fragmented element
FID: The Fragment element ID
m: *L* mod 255

Figure 10-47—Example of the element fragmentation without Element ID Extension



EID: The element ID of the fragmented element
EX: the element ID extension of the fragmented element
FID: The Fragment element ID
m: (*L*–254) mod 255 (The dashed Fragment element is present when (*L*–254) mod 255 is not equal to 0)

Figure 10-48—Example of the element fragmentation with Element ID Extension

The information to be fragmented is divided into $M + N$ portions, where the following define each variable:

For an element without an Element ID Extension field:

— L is the size of the information in octets.
— M is $\lfloor L/255 \rfloor$.
— N is equal to 1 if L mod 255 > 0 and equal to 0 otherwise.

For an element with an Element ID Extension field:

— L is the size of the information in octets.
— M is $\lfloor (L+1)/255 \rfloor$.
— N is equal to 1 if (L–254) mod 255 > 0 and equal to 0 otherwise.

The element into which the information does not fit is filled with the first portion of information and is termed the leading element. The leading element contains 255 octets of information for the element without Element

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

ID Extension or 254 octets of information for the element with Element ID Extension. This element is immediately followed by $M - 1$ Fragment elements, each containing the next portion of 255 octets of information. If $N = 1$ these elements are immediately followed by the last portion of information.

NOTE—A Fragment element never follows an element with fewer than 255 octets of information without Element ID Extension, and an element with fewer than 254 octets of information with Element ID Extension. A Fragment element is never fragmented.

10.28.12 Element defragmentation

Elements that have had their information fragmented shall be followed by one or more Fragment elements. To reconstruct the original information, the portion of information from the leading element shall be concatenated, in order, with the portions of information from the series of Fragment elements that follow it. The rules related to element defragmentation for the case where a fragmentable element is carried as a subelement within an element that is not fragmentable are described in 10.28.14. The defragmentation procedure shall complete when any element other than a Fragment element is encountered, or the end of the MMPDU is reached.

10.28.13 Element fragmentation within a subelement of a nonfragmentable element

If a nonfragmentable element (i.e., has a No in the Fragmentable column in Table 9-130) includes a fragmentable element, as a subelement, then the maximum octets of the fragmentable element that can be carried within the subelement are limited by the remaining length in the subelement. In such a case, if the remaining length of the subelement is less than the length of the Information field of the fragmentable element, then the element is fragmented by following procedures described in 10.28.11 where the length considerations are based on the pending octets in the subelement(s) that carries it. In addition, the nonfragmentable element is followed by at least one element having the same value in the Element ID field and Element ID Extension field (if applicable) as the nonfragmentable element (e.g., see Figure 11-5). Each subsequent nonfragmentable element includes, as a first subelement, the same subelement (that carried the fragmented element) and carries a Fragment element (see 9.4.2.187) containing the remainder of the contents of the fragmented element. The maximum length of the Fragment element is based on the pending octets in the subelement. The fragmentable element may be fragmented across subelements carried across multiple elements. An example of a fragmentable element carried in a Nontransmitted BSSID Profile subelement of a Multiple BSSID element is shown in Figure 10-49.

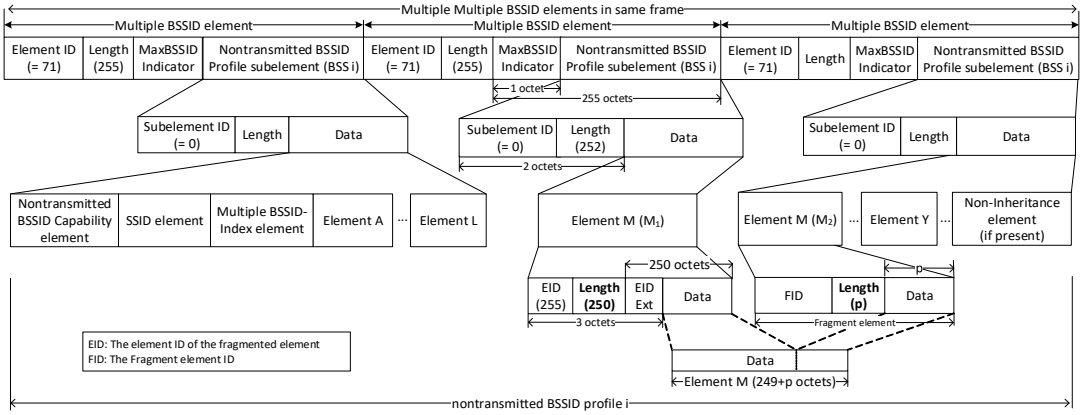


Figure 10-49—Example of a fragmentable element in a nontransmitted BSSID profile carried across Multiple BSSID elements

10.28.14 Element defragmentation within a subelement of a nonfragmentable element

When an element that is fragmentable is carried as a subelement within an element that is not fragmentable, the procedure for defragmentation shall be the same as that described in 10.28.12 with the additional consideration

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

that the fragments of the element are carried across subelements contained in multiple nonfragmentable elements.

10.29 Reverse direction protocol

10.29.1 General

The RD protocol may be supported by an HT STA, by an S1G STA, and by a DMG STA that is not an EDMG STA. The RD protocol shall be supported by an EDMG STA if dot11DMGChannelAccessScheme is either dmgChannelAccessOnly or dmgAndTddMixedChannelAccess. A STA receiving an RDG is never required to use the grant.

An HT STA indicates support of the RD feature as an RD responder using the RD Responder subfield of the HT Extended Capabilities field of the HT Capabilities element or the RD Responder subfield of the HE 6 GHz Band Capabilities element. A STA shall set the RD Responder subfield to 1 in frames that it transmits containing the HT Capabilities element in the 2.4 GHz or 5 GHz band and sets the RD Responder subfield to 1 in frames that it transmits containing the HE 6 GHz Band Capabilities element in the 6 GHz band if dot11RDResponderOptionImplemented is true. Otherwise, the STA shall set the RD Responder subfield to 0. In a non-HE HT STA, the RDG/More PPDU subfield and the AC Constraint subfield are present in the HTC field. In an HE STA, the RDG/More PPDU subfield and the AC Constraint subfield are present in the CAS Control subfield.

A DMG STA indicates support of the RD feature using the Reverse Direction subfield of the DMG STA Capability Information field of the DMG Capabilities element. A STA shall set the Reverse Direction subfield to 1 in frames that it transmits containing the DMG Capabilities element if dot11RDResponderOptionImplemented is true. Otherwise, the STA shall set the Reverse Direction subfield to 0. In a DMG STA, the RDG/More PPDU subfield and the AC Constraint subfield are present in the QoS Control field.

An S1G STA indicates support of the RD feature as an RD responder using the RD Responder subfield of the S1G Capabilities element. A STA shall set the RD Responder subfield to 1 in frames that it transmits containing the S1G Capabilities element if dot11RDResponderOptionImplemented is true. Otherwise, the STA shall set the RD Responder subfield to 0. For an EDMG STA, dot11RDResponderOptionImplemented shall always be set to true if dot11DMGChannelAccessScheme is either dmgChannelAccessOnly or dmgAndTddMixedChannelAccess. For an S1G STA, the RDG/More PPDU subfield and the AC Constraint subfield are present in the HTC field.

10.29.2 Reverse direction (RD) frame exchange sequence

An RD frame exchange sequence comprises the following:

a) The transmission of a PPDU by a TXOP holder or SP source containing an RD grant (the *RDG PPDU*), which is indicated by the PPDU containing one or more +HTC or DMG MPDUs in which the RDG/More PPDU subfield is equal to 1. The STA that transmits this PPDU is known as the *RD initiator*. The rules for an RD initiator apply only during a single RD frame exchange sequence, i.e., after the transmission of an RDG PPDU and up to the end of the last PPDU in the RD frame exchange sequence.

b) The transmission of one or more PPDUs (the *RD response burst*) by the STA addressed in the MPDUs of the RDG PPDU. The first (or only) PPDU of the RD response burst contains at most one immediate BlockAck or Ack frame. The last (or only) PPDU of the RD response burst contains any MPDUs requiring a response that is an immediate BlockAck or Ack frame. The STA that transmits the RD response burst is known as the *RD responder*. The rules for an RD responder apply only during a single RD frame exchange sequence, i.e., following the reception of an RDG PPDU and up

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

to the transmission of a PPDU by the RD responder in which the RDG/More PPDU subfield is equal to 0.

c) The transmission of a PPDU by the RD initiator containing an immediate BlockAck frame or Ack frame (the *RD initiator final PPDU*), if so required by the last PPDU of the RD response burst.

NOTE 1—An RD initiator might include multiple RD frame exchange sequences within a single TXOP or SP. Each RD frame exchange sequence within a single TXOP or SP might be addressed to a different recipient, and any single recipient might be given more than one RDG within a single TXOP or SP.

NOTE 2—If the RD responder is a VHT AP, the RD response burst can contain VHT MU PPDUs that might have TXVECTOR parameter NUM_USERS > 1. If the RD responder is an HE AP, the RD response burst can contain HE MU PPDUs that might have TXVECTOR parameter NUM_USERS > 1.

NOTE 3—If the RD responder is an S1G AP, the RD response burst can contain S1G MU PPDUs that might have TXVECTOR parameter NUM_USERS > 1.

If the RD initiator is an HE STA and the RD responder is an HE AP, the RD response burst may contain one or more Basic Trigger frames. The Basic Trigger frames shall trigger the RD initiator and at least one other STA in a full-bandwidth UL MU-MIMO transmission.

An example of an RD frame exchange sequence is given in O.3.

10.29.3 Rules for RD initiator

An RDG shall not be present unless the MPDU carrying the grant, or every MPDU carrying the grant in an A-MPDU, matches one of the following conditions:

— For a STA that is not an EDMG STA, a QoS Data frame with an ack policy other than No explicit acknowledgment or Scheduled Ack (i.e., including Implicit BAR), or

— For an EDMG STA, a QoS Data frame with the Ack Policy field equal to any value except No explicit acknowledgment, or

— For a non-DMG STA, a BlockAckReq frame related to an HT-immediate block ack agreement, or

— For a non-DMG STA, an MPDU not needing an immediate response (e.g., block ack under an HT-immediate block ack agreement, or Action No Ack).

NOTE 1—These rules together with the rules in 9.7.3 cause an RDG to be delivered in a PPDU that either requires no immediate response or requires an immediate response that is a BlockAck or Ack frame.

NOTE 2—An RD initiator is not required to examine the RD Responder field of a potential responder before deciding whether to send a PPDU to that STA in which the RDG/More PPDU subfield is set to 1.

NOTE 3—An RD initiator is required according to 10.8 to examine the +HTC-HT Support field of a potential responder before deciding whether to send a PPDU to that STA in which the RDG/More PPDU subfield is set to 1.

Transmission of a +HTC or DMG frame by an RD initiator with the RDG/More PPDU subfield equal to 1 (either transmitted as a non-A-MPDU frame,, or within an A-MPDU) indicates that the duration indicated by the Duration/ID field is available for the RD response burst and RD initiator final PPDU (if present).Transmission of an MPDU by an HE RD initiator that contains a CAS Control subfield with the RDG/More PPDU subfield equal to 1 indicates that the duration indicated by the Duration/ID field is available for the RD response burst and RD initiator final PPDU (if present).

An RD initiator that sets the RDG/More PPDU field to 1 in a +HTC or DMG frame transmitted during a TXOP shall set the AC Constraint subfield to 1 in that frame if the TXOP was gained through the EDCA channel access mechanism and shall otherwise set it to 0. An RD initiator that sets the RDG/More PPDU field to 1 in a DMG frame transmitted during an SP can set the AC Constraint subfield to 1 to limit the Data frames transmitted by the RD responder.An HE STA RD initiator that sets the RDG/More PPDU field to 1 in a CAS

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Control subfield in a frame transmitted during a TXOP may set the AC Constraint subfield in the CAS Control subfield to 1.

If an RD initiator and an RD responder are EDMG STAs with the Scheduled RD Supported field in their EDMG Capabilities element equal to 1, then the RD initiator may set the ack policy of MPDUs contained in A-MPDU transmitted within an RDG PPDU to Scheduled Ack. In this case, the RD initiator shall include at least one Block Ack Schedule frame with Response Offset and Response Duration fields set to nonzero values in an A-MPDU transmitted within the RDG PPDU. If an A-MPDU is transmitted not as a part of an EDMG MU PPDU, the RD initiator shall set the value of the Response Offset field in the Block Ack Schedule frame equal to SIFS.

An RD initiator shall not transmit a +HTC or DMG frame with the RDG/More PPDU subfield set to 1 that requires a response MPDU that is not one of the following frames:

— Ack
— Compressed BlockAck
— Extended Compressed BlockAck
— Multi-STA BlockAck
— EDMG Compressed BlockAck
— EDMG Multi-TID BlockAck

Subject to TXOP or SP constraints, after transmitting an RDG PPDU, an RD initiator may transmit its next PPDU as follows:

a) *Normal continuation:* The RD initiator may transmit its next PPDU a minimum of a SIFS after receiving a response PPDU that meets one of the following conditions:
    1) Contains one or more received +HTC or DMG frames with the RDG/More PPDU subfield equal to 0
    2) In an HT STA or an S1G STA, contains one or more received frames that are capable of carrying the HT Control field but did not contain an HT Control field
    3) Contains a received frame that requires an immediate response
    4) In a DMG STA, none of the correctly received frames in the PPDU carry the QoS Control field
b) *Error recovery:* For TXOPs and non-DMG SPs, the RD initiator may transmit its next PPDU if the CS mechanism (see 10.3.2.1) indicates that the medium is idle at the TxPIFS slot boundary (see Figure 10-29). For DMG SPs, the RD initiator shall not transmit its next PPDU earlier than PIFS following its last PPDU transmission. Transmission is a continuation of the current TXOP or SP.

NOTE 4—Error recovery of the RDG mechanism is the responsibility of the RD initiator.

NOTE 5—Control response frames generated by HE STAs do not carry the HT Control field.

A STA that transmits a QoS +CF-Ack Data frame according to the rules in 10.23.3.5 may also include an RDG in that frame provided that

— It is a non-A-MPDU frame, and
— The target of the +CF-Ack is equal to the Address 1 field of the frame.

NOTE 6—In a non-DMG BSS, the RD initiator can transmit a CF-End frame according to the rules for TXOP truncation in 10.23.2.10 following an RD transmit sequence. An RD responder never transmits a CF-End.

NOTE 7—In a DMG network, the RD initiator can transmit a CF-End frame according to the rules for TXOP truncation in 10.23.2.10 or SP truncation in 10.38.8, as appropriate, following an RD transmit sequence. An RD responder never transmits a CF-End.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The value in the TID Aggregation Limit subfield in a transmitted Block Ack Schedule frame shall be less than or equal to *MT* + 1, where *MT* is the value indicated in the EDMG Multi-TID Aggregation Support subfield within the EDMG Capabilities element transmitted by the EDMG AP or EDMG PCP of the BSS.

10.29.4 Rules for RD responder

If an RDG was granted by an MPDU contained in an A-MPDU with the ack policy different from Scheduled Ack, an RD responder shall transmit the initial PPDU of the RD response burst a SIFS after the reception of the RDG PPDU. PPDUs in a response burst are separated by SIFS or RIFS. The RIFS rules in the RD are the same as in the forward direction; the use of RIFS is constrained as defined in 10.3.2.3.2 and 10.27.3.3.

If an RDG was granted by an MPDU contained in an A-MPDU with the ack policy equal to Scheduled Ack, an RD responder shall transmit the initial PPDU of the RD response burst at a time equal to *T_Offset* from the end of RDG PPDU, where *T_Offset* is the value of Response Offset subfield of the Block Ack Schedule frame in the A-MPDU that has the MPDU that granted the RDG. The duration of the RD response burst shall not exceed the value of the Response Duration subfield of the Block Ack Schedule frame in the A-MPDU that has the MPDU that granted the RDG.

NOTE 1—The transmission of a response by the RD responder does not constitute a new channel access but a continuation of the RD initiator's TXOP or SP. An RD responder ignores the NAV when responding to an RDG.

The recipient of an RDG may decline the RDG by

- Not transmitting any frames following the RDG PPDU if no response is otherwise required, or
- For a non-DMG STA, transmitting a control response frame with the RDG/More PPDU subfield set to 0, or
- For a non-DMG STA, transmitting a control response frame that contains no HT Control field, or
- Transmitting a control response frame aggregated with other MPDUs with the RDG/More PPDU subfield set to 0.

An RD responder that is a non-DMG STA may transmit a +CF-Ack non-A-MPDU frame in response to a QoS Data +HTC non-A-MPDU frame that has the Normal Ack ack policy and the RDG/More PPDU subfield equal to 1.

The RD responder shall ensure that its PPDU transmission(s) and any expected responses fit entirely within the remaining TXOP or SP duration, as indicated in the Duration/ID field of MPDUs within the RDG PPDU.

An RD responder shall not transmit an MPDU (either individually or aggregated within an A-MPDU) that is not one of the following frames:

- Ack
- Compressed BlockAck
- Compressed BlockAckReq
- Extended Compressed BlockAck
- Extended Compressed BlockAckReq
- Multi-STA BlockAck
- QoS Data
- QoS Null
- Management
- Basic Trigger

For an EDMG Multi-TID A-MPDU or an EDMG MU PPDU, if the AC Constraint subfield is equal to 1, the RD responder shall transmit Data frames following the rules specified in this subclause and in 10.70.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Otherwise, if the AC Constraint subfield is equal to 1, the RD responder shall transmit Data frames of only the same AC as the last frame received from the RD initiator. If the AC Constraint subfield is equal to 1 in the last frame received from an RD initiator,

— A non-HE RD responder shall transmit Data frames of only the same AC as the last frame received from the RD initiator.
— An HE RD responder may transmit an A-MPDU or multi-TID A-MPDU with MPDUs from one or more ACs that have a priority that is equal to or higher than the lowest priority AC of the MPDU(s) carried in the last PPDU received from the RD initiator (see 10.12) and if the RD initiator is an HE STA subject to the additional rules defined in 26.6.3.

For a BlockAckReq or BlockAck frame, the AC is determined by examining the TID field. For a Management frame, the AC is AC_VO. The RD initiator shall not transmit a +HTC or DMG MPDU with the RDG/More PPDU subfield set to 1 from which the AC cannot be determined. If the AC Constraint subfield is equal to 0, the RD responder may transmit Data frames of any TID.

NOTE 2—If the RD initiator's last PPDU contained an A-MPDU, the last frame is the last Data frame in the A-MPDU.

During an RD response burst any PPDU transmitted by an RD responder shall contain at least one MPDU with an Address 1 field that matches the MAC address of the RD initiator or at least one Trigger frame that addresses the RD initiator, and the inclusion of traffic to STAs other than the RD initiator in a VHT MU PPDU, S1G MU PPDU, or HE MU PPDU shall not increase the duration of the PPDU beyond that required to transport the traffic to the RD initiator. The RD responder shall not transmit a frame that is not a Basic Trigger frame and that causes a response after a SIFS with an Address 1 field that does not match the MAC address of the RD initiator. The RD responder shall not transmit any PPDUs with a CH_BANDWIDTH that is wider than the CH_BANDWIDTH of the PPDU containing the frame(s) that delivered the RD grant.

An RD responder that transmits a Basic Trigger frame shall set the CS Required subfield to 1 and shall allocate a number of streams for the RD initiator that is not smaller than the number of streams of the RD initiator's last PPDU.

If an RD initiator sets the RDG/More PPDU field to 1 in a +HTC frame transmitted during a TXOP and sets the AC Constraint subfield to 1 in that frame, the RD responder shall set the Preferred AC subfield of the Trigger Dependent User Info field in the Trigger frame to the same AC as the last frame received from the RD initiator.

If an RDG PPDU also requires an immediate block ack response, the BlockAck frame shall be included in the first PPDU of the response.

When a PPDU is not the final PPDU of a response burst, an HT Control field carrying the RDG/More PPDU subfield set to 1 shall be present in every MPDU within the PPDU capable of carrying the HT Control field, or if the PPDU is transmitted in a DMG BSS, the RDG/More PPDU subfield within the QoS Control field shall be set to 1 in every MPDU within the PPDU. The last PPDU of a response burst shall have the RDG/More PPDU subfield set to 0 in all +HTC or DMG MPDUs contained in that PPDU.

The RD responder shall not set the RDG/More PPDU subfield to 1 in any MPDU in a PPDU that contains an MPDU that requires an immediate response.

NOTE 3—If the RD responder transmits a PPDU that expects a transmission by the RD initiator after a SIFS and no such transmission is detected, the RD responder does not retry the exchange before either another RDG or its own TXOP or SP.

After transmitting a PPDU containing one or more +HTC or DMG MPDUs in which the RDG/More PPDU subfield is equal to 0, the RD responder shall not transmit any more PPDUs within the current response burst.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 4—If an RD-capable STA that is not the TXOP holder or SP source receives a PPDU that does not indicate an RDG, there is no difference in its response compared to a STA that is not RD-capable.

As part of an RDG, an RD responder that is a DMG STA shall not transmit a PPDU following a BlockAck frame unless the BlockAck frame is transmitted as part of an A-MPDU that includes an MPDU (e.g., QoS Null) that has the RDG/More PPDU subfield set to 1.

The following provides additional rules for an RD responder that constructs a multi-TID A-MPDU in response to an MU PPDU.

A non-AP and non-PCP EDMG STA with dot11EDMGAMPDUwithMultipleTIDOptionImplemented set to true shall not send a multi-TID A-MPDU to an EDMG AP or EDMG PCP unless all the following conditions are met:

— The EDMG Multi-TID Aggregation Support subfield in the AP's or PCP's EDMG Capabilities element is greater than 0.
— The RDG/More PPDU subfield is set to 1 in the QoS Control field of all MPDU(s) in the EDMG MU PPDU transmitted by the AP or PCP.
— The TID Aggregation Limit field in the Block Ack Schedule frame sent to the STA within the EDMG MU PPDU is nonzero.

The number of different TID values for QoS Data frames in the multi-TID A-MPDU shall not exceed the value in the TID Aggregation Limit subfield in the Block Ack Schedule frame the EDMG STA received in the MU PPDU. The multi-TID A-MPDU may contain no more than one Management frame, with exception of Action no Ack frames that can occur more than once. Any number of QoS Null frames with the Ack Policy field set to No Ack may be aggregated in the A-MPDU, irrespective of the value of the TID Aggregation Limit subfield and the value of the Preferred AC subfield in the Block Ack Schedule frame.

An EDMG Multi-TID BlockAck frame is used to acknowledge the MPDUs in a multi-TID A-MPDU. The rules for EDMG Multi-TID BlockAck are defined in 10.70.

When a multi-TID A-MPDU is sent in an SP in response to an MPDU with the RD Grant field set to 1 and the AC Constraint field set to 0 as specified in 10.29.3, an EDMG STA may aggregate MPDUs from any TID in the multi-TID A-MPDU for transmission in the SP as long as the transmission of the multi-TID A-MPDU does not cause the STA to exceed the current SP duration.

An EDMG STA operating as an RD responder that constructs a multi-TID A-MPDU in response to an MU PPDU shall aggregate MPDUs in the A-MPDU in the following order:

— MPDUs with TIDs originating from the same or higher AC as indicated in the Preferred AC subfield of the received Block Ack schedule frame.
— MPDUs with TIDs originating from any other AC in the A-MPDU carried in the MU PPDU, if the responding EDMG STA has no buffered MPDU for TIDs belonging to the same or higher priority AC indicated in the Preferred AC subfield.
— MPDUs with TIDs originating from other ACs within the remaining time of the Response Duration subfield value indicated in the Block Ack Schedule Information field of the received Block Ack Schedule frame.

10.29.5 Reverse direction for EDMG DL MU-MIMO

An EDMG STA with dot11EDMGScheduledRDImplemented equal to true shall support the reverse direction for EDMG DL MU-MIMO mechanism described in this subclause.

To start a DL MU PPDU transmission with reverse direction, an AP or PCP shall set the RDG/More PPDU subfield to 1 and the Ack Policy Indicator subfield to Scheduled Ack in the QoS Control field of an MPDU

contained in the PPDU and addressed to the intended RD responder. The AP or PCP shall also include at least one Block Ack Schedule frame with nonzero Response Offset, Response Duration and Next PPDU Start Offset fields in an A-MPDU addressed to the intended RD responder.

Upon receiving an RD grant as part of a DL MU-MIMO transmission, an RD responder shall respond according to the rules that are defined in 10.29.4. The duration of the RD response burst shall be equal to the value of the Response Duration subfield of the last Block Ack Schedule frame received from the RD initiator.

An RD responder that intends to elicit a BlockAck frame from the RD initiator shall set the Ack Policy Indicator subfield of MPDUs addressed to RD initiator to Scheduled Ack.

Upon receiving an RD response burst with the ack policy of MPDUs contained in A-MPDU equal to Scheduled Ack, the RD initiator that granted an RD as part of a DL MU-MIMO transmission shall respond to the RD responder by aggregating a BlockAck frame into the next PPDU transmitted to the RD responder.

Figure 10-50 illustrates an example of the RD sequence during DL MU-MIMO transmissions. The RD initiator (e.g., an AP) transmits an MU PPDU to STA 1 and STA 2. The RD initiator requests a BlockAck frame and grants an RD to STA 1 by setting RDG/More PPDU to 1, Ack Policy Indicator subfield set to Scheduled Ack and including a Block Ack Schedule frame with the schedule for the RD response burst. The A-MPDU sent to STA 2 has RDG/More PPDU set to 0, Ack Policy set to Scheduled Ack and includes a Block Ack Schedule frame with the schedule for a BlockAck frame transmission.

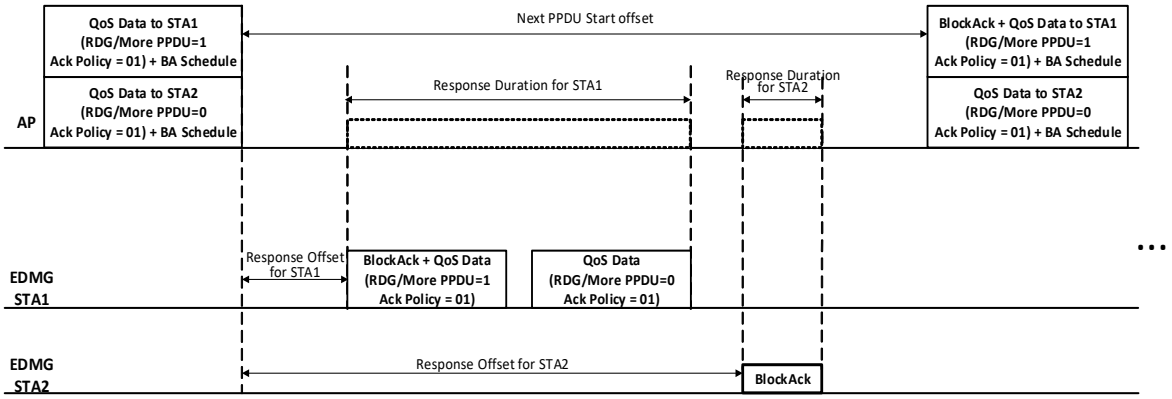

Figure 10-50—Example of reverse direction for DL MU-MIMO

Following the reception of the RD grant, STA 1 transmits its RD response burst in multiple PPDUs during the scheduled time slot defined by Response Offset and Response Duration subfields of the received Block Ack Schedule frame. The first PPDU is an A-MPDU, which includes the BlockAck to the RD initiator and QoS Data frames with RDG/More PPDU equal to 1. A PPDU in the RD response burst contains QoS DATA with RDG/More PPDU equal to 1 if it is not the last PPDU, and it contains QoS Data with RDG/More PPDU equal to 0 if it is the last PPDU of the RD response burst. STA 1 requests the acknowledgment for the RD response burst by setting the Ack Policy Indicator subfield to Scheduled Ack. STA 2 did not receive an RD grant, and so it uses the scheduled time slot for the transmission of only a BlockAck frame. After a period of time equal to the value of the Next PPDU Start Offset subfield starting from the end of the EDMG MU PPDU, the AP transmits another MU PPDU to both STA 1 and STA 2. In addition to QoS Data and Block Ack Schedule frames, the A-MPDU sent to STA 1 also includes a BlockAck to the RD response burst.

10.30 Sounding PPDUs

The behavior described in this subclause is specific to the use of the HT variant HT Control field and CMMG variant HT Control field.

A sounding PPDU is a PPDU for which the SOUNDING parameter of the corresponding RXVECTOR or TXVECTOR has the value SOUNDING. Sounding PPDUs are transmitted by STAs to enable the receiving STAs to estimate the channel between the transmitting STA and the receiving STA.

A STA transmits sounding PPDUs when it operates in the following roles:

- MFB requester (see 10.31.2 and 10.31.4)
- HT beamformee responding to a training request, calibration initiator, or responder involved in implicit transmit beamforming (see 10.33.2.2, 10.33.2.3, and 10.33.2.4)
- HT beamformer involved in explicit transmit beamforming (see 10.33.3)
- ASEL transmitter and ASEL sounding-capable transmitter involved in ASEL (see 10.34.2)
- CMMG beamformer involved in explicit transmit beamforming (see 10.33.5)

A STA receives sounding PPDUs when it operates in the following roles:

- MFB responder (see 10.31.2 and 10.31.4)
- HT beamformer sending a training request, calibration initiator, or responder involved in implicit transmit beamforming (see 10.33.2.2, 10.33.2.3, and 10.33.2.4)
- HT beamformee involved in explicit transmit beamforming (see 10.33.3)
- Transmit ASEL responder and ASEL receiver involved in ASEL (see 10.34.2)
- CMMG beamformee involved in explicit transmit beamforming (see 10.33.5)

When transmitting a sounding PPDU, the transmitting STA follows the rules stated below to determine the maximum number of space-time streams for which channel coefficients can be simultaneously estimated:

- When transmitting a sounding PPDU that
  - Contains a +HTC frame with the MRQ subfield equal to 1, or
  - Is sent as a response to a +HTC frame with the TRQ field equal to 1, or
  - Is sent during a calibration sounding exchange, or
  - Is sent by an HT beamformer involved in explicit transmit beamforming, or
  - Is sent in transmit or receive ASEL exchanges,
  - Is sent by a CMMG beamformer involved in explicit transmit beamforming
- Then:
  - If the sounding PPDU is not an NDP sounding PPDU, the NUM_EXTEN_SS parameter in the TXVECTOR shall not be set to a value greater than the limit indicated by the Channel Estimation Capability subfield in the Transmit Beamforming Capabilities field transmitted by the STA that is the intended receiver of the sounding PPDU.

    NOTE—The maximum number of space-time streams for which channel coefficients can be simultaneously estimated using the HT-LTFs corresponding to the data portion of the PPDU is limited by the Rx MCS Bitmask subfield of the Supported MCS Set field and by the Rx STBC subfield of the HT Capability Information field. Both fields are part of the HT Capabilities element.

  - If the sounding PPDU is an NDP, the number of spatial streams corresponding to the MCS parameter of the TXVECTOR shall not exceed the limit indicated by the Channel Estimation Capability subfield in the Transmit Beamforming Capabilities field transmitted from the STA that is the intended receiver of the NDP (see 10.35.2 for details on setting the MCS parameter).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If a STA sets the Receive Staggered Sounding Capable subfield in the Transmit Beamforming Capabilities field to 1, the STA shall set the Channel Estimation Capability subfield in the Transmit Beamforming Capabilities field to indicate a dimension that is greater than or equal to the dimension indicated by the Supported MCS Set field of the HT Capabilities element.

10.31 Link adaptation

10.31.1 Introduction

To fully exploit MIMO channel variations and transmit beamforming on a MIMO link, a STA can request that another STA provide MIMO channel sounding and MFB.

Link adaptation may be supported by immediate response or delayed response as described below. Unsolicited MFB is also possible.

— *Immediate.* An immediate response occurs when the MFB responder transmits the response in the TXOP obtained by the TXOP holder. This approach allows the MFB requester to obtain the benefit of link adaptation within the same TXOP.

— *Delayed.* A delayed response occurs when the MFB responder transmits the response in the role of a TXOP holder in response to an MRQ in a previous TXOP obtained by the MFB requester.

— *Unsolicited.* An unsolicited response occurs when a STA sends MFB independent of any preceding MRQ.

For an S1G STA, the same link adaptation procedure specified in 10.31.3 is applied with the following qualifications:

— "VHT" is replaced by "S1G" when referring to characteristics of an S1G STA or when referring to the contents of an S1G PPDU. More specifically:
  — "VHT Capabilities Info field in the VHT Capabilities element" is replaced by "S1G Capabilities Information field in the S1G Capabilities element"
  — "VHT NDP Announcement frame" is replaced by "VHT NDP Announcement frame carried in an S1G PPDU"
  — "VHT MU PPDU" is replaced by "S1G MU PPDU"

10.31.2 Link adaptation using the HT variant HT Control field

The behavior described in this subclause is specific to the HT variant HT Control field.

A STA that supports link adaptation using the HT Control field shall set the MCS Feedback field of the HT Extended Capabilities field to Unsolicited or Both, depending on its specific MFB capability, in HT Capabilities elements that it transmits. A STA shall not send an MRQ to a STA that has not set the MCS Feedback subfield to Both in the HT Extended Capabilities field of the HT Capabilities element. A STA whose MCS Feedback field of the HT Extended capabilities field of the HT Capabilities element is equal to Unsolicited or Both may transmit unsolicited MFB in any frame that contains a +HTC field.

The MFB requester may set the MRQ subfield to 1 in the MAI subfield of the HT Control field of a +HTC frame to request a STA to provide MFB. In each MRQ, the MFB requester shall set the MSI subfield in the MAI subfield to a value in the range 0 to 6. How the MFB requester chooses the MSI value is implementation dependent.

The appearance of more than one instance of an HT Control field with the MRQ subfield equal to 1 within a single PPDU shall be interpreted by the receiver as a single request for MFB.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An MFB requester shall transmit +HTC frames with the MRQ subfield equal to 1 in one of the following ways:

— Within a sounding PPDU, or
— With the HT NDP Announcement subfield in the +HTC frame set to 1 and following the +HTC frame by an NDP transmission.

The number of HT-LTFs sent in the sounding PPDU or in the NDP is determined by the total number of spatial dimensions to be sounded, including any extra spatial dimensions beyond those used by the data portion of the frame.

An MFB-capable STA (identified by the MCS Feedback field in the Extended HT Capability Information field equal to 3) shall support the following:

— MFB estimate computation and feedback on the receipt of MRQ (MRQ=1 in +HTC) in a sounding PPDU for which the RXVECTOR NUM_EXTEN_SS parameter contains 0 in the PHY-RXSTART.indication primitive.
— MFB estimate computation and feedback on the receipt of MRQ (MRQ=1 in +HTC) in a staggered sounding PPDU if this STA declares support for receive staggered sounding by setting the Receive Staggered Sounding Capable subfield of the Transmit Beamforming Capabilities field to 1.
— MFB estimate computation and feedback on the receipt of NDP (see 10.35) if this STA declares support for receiving NDP sounding by setting the Receive NDP Capable subfield of the Transmit Beamforming Capabilities field to 1. The MFB requester shall set the MRQ subfield to 1 in the frame where the HT NDP Announcement subfield is equal to 1.

On receipt of a +HTC frame with the MRQ subfield equal to 1, an MFB responder initiates computation of the MCS estimate based on the associated sounding PPDU and labels the result of this computation with the MSI value. The MFB responder includes the received MSI value in the MFSI field of the corresponding response frame. In the case of a delayed response, this use of MSI and MFSI fields allows the MFB requester to correlate the MFB with the related MRQ.

The responder may send a response frame with any of the following combinations of MFB and MFSI:

— MFB = 127, MFSI = 7: no information is provided for the immediately preceding request or for any other pending request. This combination is used when the responder is required to include an HT Control field due to other protocols that use this field (i.e., the reverse direction protocol) and when no MFB is available. It has no effect on the status of any pending MRQ.
— MFB = 127, MFSI in the range 0 to 6: the responder is not providing feedback for the request with he MSI value that matches the MFSI value.
— MFB in the range 0 to 126, MFSI in the range 0 to 6: the responder is providing feedback for the request that had the MSI value that matches the MFSI value.
— MFB in the range 0 to 126, MFSI = 7: the responder is providing unsolicited feedback.

Hardware and buffer capability may limit the number of MCS estimate computations that an MFB responder is capable of computing simultaneously. When a new MRQ is received either from a different MFB requester or from the same MFB requester with a different MSI value, and the MFB responder is not able to complete the computation for MRQ, the MFB responder may either discard the new request or may abandon an existing request and initiate an MCS estimate computation for the new MRQ.

An MFB responder that discards or abandons the computation for an MRQ should indicate this action to the MFB requester by setting the MFB to the value 127 in the next transmission of a frame addressed to the MFB requester that includes the HT Control field. The value of the MFSI is set to the MSI value of the sounding frame for which the computation was abandoned.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When computing the MCS estimate for an MFB requester whose Tx MCS Set Defined field is equal to 1, the number of spatial streams corresponding to the recommended MCS shall not exceed the limit indicated by the Tx Maximum Number Spatial Streams Supported field. The MFB responder shall not recommend an MCS corresponding to UEQM unless the MFB requester supports such modulation, as indicated by the Tx Unequal Modulation Supported bit in the Supported MCS Set field.

If the MFB is in the same PPDU as a Noncompressed Beamforming frame or a Compressed Beamforming frame, the MFB responder should estimate the recommended MCS under the assumption that the MFB requester uses the steering matrices contained therein.

After the MCS estimate computation is completed, the MFB responder should include the MFB in the MFB field in the next transmission of a frame addressed to the MFB requester that includes an HT Control field. When the MFB requester sets the MRQ subfield to 1 and sets the MSI subfield to a value that matches the MSI subfield value of a previous request for which the responder has not yet provided feedback, the responder shall discard or abandon the computation for the MRQ that corresponds to the previous use of that MSI subfield value.

A STA may respond immediately to a current request for MFB with a frame containing an MFSI field value and MFB field value that correspond to a request that precedes the current request.

Bidirectional request/responses are supported. A STA may act as both the MFB requester for one direction of a duplex link and the MFB responder for the other direction and include both MRQ and MFB in the same HT Data frame.

If an HT beamformer transmits a PPDU with the TXVECTOR EXPANSION_MAT_TYPE set to either COMPRESSED_SV or NON_COMPRESSED_SV, it should use the recommended MCS associated with those matrices reported in a Noncompressed Beamforming frame or a Compressed Beamforming frame.

10.31.3 Link adaptation using the VHT variant HT Control field

This subclause applies to frame exchange sequences that include PPDUs containing an HT variant HT Control field. The VHT variant HT Control field may be used by VHT STAs and S1G STAs.

A STA that supports VHT link adaptation using the VHT variant HT Control field shall set the VHT Link Adaptation Capable subfield in the VHT Capabilities Information field in the VHT Capabilities element to Unsolicited or Both, depending on its specific link adaptation feedback capability. A STA shall not send an MRQ to a STA that has not set the VHT Link Adaptation Capable subfield to Both in the VHT Capabilities Information field of the VHT Capabilities element. A STA whose VHT Link Adaptation Capable subfield of the VHT Capabilities Information field of the VHT Capabilities element is either set to Unsolicited or Both may transmit unsolicited MFB in any frame that contains a VHT variant HT Control field.

The MFB requester or MFB responder that is an S1G STA shall set the S1G subfield in the VHT variant HT Control field to 1. Otherwise the S1G field shall be reserved.

An S1G STA shall not transmit a +HTC Control frame to another S1G STA that does not support VHT link adaptation.

An S1G STA that sets the +HTC VHT Capable to 1 and supports sending control response frames that are not NDP CMAC PPDUs for link adaptation shall set Link Adaptation Without NDP CMAC PPDU Capable subfield in the S1G Capabilities element to 1. Otherwise it shall set it to 0. An S1G STA shall not elicit a Control frame that is not an NDP CMAC PPDU for link adaptation from another S1G STA when the received Link Adaptation Without NDP CMAC PPDU Capable subfield in the received S1G Capabilities element from the STA is 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An S1G STA that is an MFB requester shall set the TXVECTOR parameter RESPONSE_INDICATION to NORMAL_RESPONSE if it intends to elicit link adaptation feedback in the immediate control response frame. Otherwise, it shall not set the TXVECTOR parameter RESPONSE_INDICATION to Normal Response, unless it is permitted to do so as described in 10.25, 10.3.2.11, and 10.46.

An S1G STA that is an MFB responder may transmit a +HTC Control frame as an immediate response to an eliciting frame for which the RXVECTOR parameter RESPONSE_INDICATION is equal to NORMAL_RESPONSE. The +HTC control response frame shall be one of the following:

— +HTC Ack frame if the eliciting frame requires an Ack frame as a response (see 10.3.2.11)
— +HTC BlockAck frame or +HTC BAT frame if the eliciting frame requires a BlockAck frame or BAT frame as a response (see 10.25)
— +HTC TACK frame or +HTC STACK frame if the eliciting frame requires a TACK frame or STACK frame as a response (see 10.46.2)
— +HTC CTS frame in the eliciting frame requires an CTS frame as a response (see 10.3.2.9)

Otherwise, the S1G STA shall not transmit a +HTC control response frame.

The MFB requester may set the MRQ field to 1 in the VHT variant HT Control field of a frame to request a STA to provide link adaptation feedback. In each request the MFB requester shall set the MSI/STBC field to a value in the ranges 0 to 6, 0 to 2, or 0 to 3, depending on the settings in the Unsolicited MFB and STBC fields (see 9.2.4.6.3). The choice of MSI value is implementation dependent.

The appearance of more than one instance of a VHT variant HT Control field with the MRQ field equal to 1 within a single PPDU shall be interpreted by the receiver as a single request for link adaptation feedback.

An MFB responder that has set the VHT Link Adaptation Capable subfield to Both in the VHT Capabilities Information field of the VHT Capabilities element shall support both of the following:

— Computation and feedback of the MFB estimate on the receipt of an MFB request (MRQ equal to 1 in the VHT variant HT Control field) in a PPDU that is not a VHT NDP Announcement frame.
— Computation and feedback of the MFB estimate on the receipt of an MFB request (MRQ equal to 1 in VHT variant HT Control field) in a VHT NDP Announcement frame and the receipt of VHT NDPs (see 10.35) if this STA set the SU Beamformee Capable subfield of the VHT Capabilities Information field of the VHT Capabilities element to 1.

On receipt of a VHT variant HT Control field with the MRQ field equal to 1, an MFB responder computes the VHT-MCS, NUM_STS, and SNR estimates based on the PPDU carrying the MRQ or, in the case of a VHT NDP Announcement frame carrying the MRQ, based on the subsequent VHT NDP. The MFB responder labels the result of this computation with the MSI value from the VHT variant HT Control field in the received frame carrying the MRQ. The MFB responder may include the received MSI value in the MFSI field of the corresponding response frame. In the case of a delayed response, this allows the MFB requester to associate the MFB with the soliciting MRQ.

An MFB responder that sends a solicited MFB shall set the Unsolicited MFB subfield in VHT variant HT Control field to 0.
The MFB responder may send a solicited response frame with any of the following combinations of VHT-MCS, NUM_STS, and MFSI:

— VHT-MCS = 15, NUM_STS = 7 in the MFB subfield, MFSI = 7 in a VHT PPDU; and VHT-MCS = 15, NUM_STS = 3, and MFSI = 7 in an S1G PPDU: no information is provided for the immediately preceding request or for any other pending request. This combination is used when the responder is required to include a VHT variant HT Control field due to other protocols that use this field (e.g., the Reverse Direction Protocol) and when no MFB is available. It has no effect on the status of any pending MRQ.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— VHT-MCS = 15, NUM_STS = 7 in the MFB subfield, MFSI in the range 0 to 6 in a VHT PPDU; and VHT-MCS = 15, NUM_STS = 3, and MFSI in the range 0 to 6 in an S1G PPDU: the responder is not providing feedback for the request with the MSI value that matches the MFSI value.
— VHT-MCS = valid value, NUM_STS = valid value in the MFB subfield, MFSI in the range 0 to 6: the responder is providing feedback for the request that had the MSI value that matches the MFSI value.

An MFB responder that discards or abandons the MFB estimates computed in response to an MRQ may indicate that it has done so by setting the VHT-MCS to 15 and NUM_STS to 7 in the MFB subfield in the next VHT PPDU frame if the frame is carried in a VHT PPDU or by setting the VHT-MCS to 15 and NUM_STS to 3 if the frame is carried in an S1G PPDU containing frames addressed to the MFB requester that includes the VHT variant HT Control field. The value of the MFSI is set to the value of the MSI/STBC subfield of the frame that contains an MRQ for which the computation was abandoned, regardless of whether the MSI/STBC subfield contains an MSI or a Compressed MSI and STBC Indication subfields.

The STA receiving MFB may use the received MFB to compute the appropriate VHT-MCS, SNR, and NUM_STS.

A STA sending unsolicited MFB using the VHT variant HT Control field shall set the Unsolicited MFB subfield to 1.

Unsolicited VHT-MCS, NUM_STS, BW, and SNR estimates reported in the MFB subfield of a VHT variant HT Control field sent by a STA are computed based on the most recent PPDU received by the STA that matches the description indicated by the GID-L, GID-H, Coding Type, STBC Indication, and FB Tx Type fields in the same VHT variant HT Control field.

In an unsolicited MFB response the GID-L, GID-H, Coding Type, STBC Indication, FB Tx Type, and BW fields are set according to the RXVECTOR parameters of the received PPDU from which the VHT-MCS, SNR, BW, and NUM_STS are estimated, as follows:

— If the VHT-MCS, SNR, BW, and NUM_STS are estimated from a VHT MU PPDU, then the GID-L field is set to the 3 least significant bits and the GID-H field to the 3 most significant bits of the parameter GROUP_ID.
— If the VHT-MCS, SNR, BW, and NUM_STS are estimated from an SU PPDU, then the GID-L field and GID-H field are set to all 1s.
— The Coding Type field is set to 0 if the parameter FEC_CODING is equal to BCC_CODING and set to 1 if equal to LDPC_CODING.
— The STBC Indication field is set to 1 if the parameter STBC is equal to 1 and set to 0 if the STBC parameter is equal to 0.
— The FB TX Type field is set to 1 if the parameter BEAMFORMED is equal to 1 and set to 0 if equal to 0.
— The BW field shall indicate a bandwidth less than or equal to the bandwidth indicated by the parameter CH_BANDWIDTH.

In an MFB response solicited by an MRQ that was not carried in a VHT NDP Announcement frame, the MFB is computed based on RXVECTOR parameters CH_BANDWIDTH, GROUP_ID, NUM_STS, FEC_CODING, BEAMFORMED, and STBC of the received PPDU that carried the MRQ and might additionally be based on other factors that are not part of the RXVECTOR. The NUM_STS subfield of the MFB subfield of VHT variant HT Control field shall be set to an equal or smaller value than the RXVECTOR parameter NUM_STS of the received PPDU that triggered the MRQ.

If the MFB is in the same MPDU as a VHT Compressed Beamforming frame, the MFB responder shall estimate the recommended MFB under the assumption that the beamformer will use the steering matrices

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

contained therein for performing an SU beamformed transmission. In this case the value of the NUM_STS field in the MFB subfield of the VHT variant HT Control field shall be the same as the value of the Nc Index field in the VHT MIMO Control field of the VHT Compressed Beamforming frame and, if the MFB is unsolicited, the Coding Type shall be set to BCC and the FB Tx Type shall be set to 0. Additionally, MFB estimate shall be based on the bandwidth indicated by the Channel Width subfield of the VHT MIMO Control field of the VHT Compressed Beamforming frame. In this case the SNR and BW subfields are reserved and set to 0.

If an unsolicited MFB is not in the same MPDU as a VHT Compressed Beamforming frame, the NUM_STS subfield of the MFB subfield of the VHT variant HT Control field shall be set to an equal or smaller value than the RXVECTOR parameter NUM_STS of the received PPDU from which the MFB parameters are estimated.

If the MFB requester sends the MRQ in a VHT NDP Announcement frame, then the MFB responder shall include the corresponding MFB in (all of) the VHT Compressed Beamforming frame(s) sent in response to the same VHT NDP Announcement frame and NDP sequence.

If the value of the NUM_STS subfield of the MFB field (solicited or unsolicited) is a smaller value than the RXVECTOR parameter NUM_STS of the received PPDU on which the MFB is based, the MFB responder shall estimate the recommended VHT-MCS under the assumption that the MFB requester will transmit the first N_{STS} space-time streams in the corresponding PPDU carrying MRQ. If the MFB is based on an SU PPDU the first N_{STS} space-time streams correspond to columns 1, ..., N_{STS} of the spatial mapping matrix Q. If the MFB is based on a VHT MU PPDU, then for the user u the first N_{STS} space-time streams correspond to columns M_u+1, ..., M_u+$N_{STS,u}$ of the spatial mapping matrix Q (M_u is defined in 21.3.10.11.1 and in 23.3.9.11). The VHT-MCS recommendation shall be a value from the peer's Tx Supported VHT-MCS and NSS Set (see 10.6.13.2).

A VHT NDP Announcement frame that contains multiple STA Info fields and that contains a VHT format of HT Control field with the MRQ subfield equal to 1 solicits an MFB response from all of the STAs listed in the STA Info fields.

When the MFB requester sets the MRQ subfield to 1 and sets the MSI/STBC subfield to a value that matches the MSI/STBC subfield value of a previous request for which the responder has not yet provided feedback, the responder shall discard or abandon the computation for the MRQ that corresponds to the previous use of that MSI/STBC subfield value and start a new computation based on the new request.

A STA may respond immediately to a current request for MFB with a frame containing an MFSI field value and an MFB field value that correspond to a request that precedes the current request.

Bidirectional request/responses are supported. A STA may act as both the MFB requester for one direction of a duplex link and the MFB responder for the other direction and include both an MRQ and an MFB in the same VHT variant HT Control field.

10.31.4 Link adaptation using the CMMG variant HT Control field

The behavior described in this subclause is specific to the CMMG variant HT Control field.

A STA that supports link adaptation using the CMMG variant HT Control field shall set the CMMG Link Adaptation Capable subfield in the CMMG Capabilities Info field of the CMMG Capabilities element to Unsolicited or Both, depending on its specific link adaptation feedback capability. A STA shall not send an MRQ to STAs that have not set the CMMG Link Adaptation Capable subfield to Both in the CMMG Capabilities Info field of the CMMG Capabilities element. A STA whose most recently transmitted MCS Feedback field of the CMMG Extended capabilities field of the CMMG Capabilities element is equal to Unsolicited or Both may transmit unsolicited MFB in any frame that contains a CMMG variant HT Control field.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The MFB requester may set the MRQ field to 1 in the CMMG variant HT Control field of a frame to request a STA to provide link adaptation feedback. In each request the MFB requester shall set the MSI/STBC field to a value in the ranges 0 to 6, 0 to 2, or 0 to 3, depending on the settings in the Unsolicited MFB and STBC fields (see 9.2.4.6.4). The choice of MSI value is implementation dependent.

NOTE 1—The MFB requester might use the MSI subfield as an MRQ sequence number, or it might implement any other encoding of the field.

The appearance of more than one instance of a CMMG variant HT Control field with the MRQ field equal to 1 within a single PPDU shall be interpreted by the receiver as a single request for link adaptation feedback.

In OFDM transmission the number of MCTFs sent in the sounding PPDU or in the NDP is determined by the total number of spatial dimensions to be sounded, including any extra spatial dimensions beyond those used by the data portion of the frame.

On receipt of a CMMG variant HT Control field with the MRQ subfield equal to 1, an MFB responder computes the CMMG-MCS, NUM_STS, and SNR estimates based on the PPDU carrying the MRQ or, in the case of a CMMG with the NDP Announcement subfield set to 1 carrying the MRQ, based on the subsequent CMMG NDP. The MFB responder labels the result of this computation with the MSI value from the CMMG variant HT Control field in the received frame carrying the MRQ. The MFB responder may include the received MSI value in the MFSI field of the corresponding response frame. In the case of a delayed response, this allows the MFB requester to associate the MFB with the soliciting MRQ.

An MFB responder that sends a solicited MFB shall set the Unsolicited MFB subfield in CMMG variant HT Control field to 0.

The MFB responder may send a solicited response frame with any of the following combinations of CMMG-MCS, NUM_STS, and MFSI:

— CMMG-MCS = 31, NUM_STS = 3 in the MFB subfield, MFSI = 7: no information is provided for the immediately preceding request or for any other pending request. This combination is used when the responder is required to include a CMMG variant HT Control field due to other protocols that use this field (e.g., the reverse direction protocol) and when no MFB is available. It has no effect on the status of any pending MRQ.
— CMMG-MCS = 31, NUM_STS = 3 in the MFB subfield, MFSI in the range 0 to 6: the responder is not providing feedback for the request with the MSI value that matches the MFSI value.
— CMMG-MCS = valid value, NUM_STS = valid value in the MFB subfield, MFSI in the range 0 to 6: the responder is providing feedback for the request that had the MSI value that matches the MFSI value.

An MFB responder that discards or abandons the MFB estimates computed in response to an MRQ may indicate that it has done so by setting the CMMG-MCS to 31 and NUM_STS to 3 in the MFB subfield in the next frame addressed to the MFB requester that includes the CMMG variant HT Control field. The value of the MFSI is set to the value of the MSI/STBC subfield of the frame that contains an MRQ for which the computation was abandoned, regardless of whether the MSI/STBC subfield contains an MSI or a Compressed MSI and STBC Indication subfields.

The STA receiving MFB may use the received MFB to compute the appropriate CMMG-MCS, SNR, BW, and NUM_STS.

When computing the MCS estimate for an MFB requester whose Tx MCS Set Defined field is equal to 1, the number of spatial streams corresponding to the recommended MCS shall not exceed the limit indicated by the Tx Maximum Number Spatial Streams Supported field.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Hardware and buffer capability may limit the number of MCS estimate computations that a MFB responder is capable of computing simultaneously. When a new MRQ is received either from a different MFB requester or from the same MFB requester with a different MSI value and when the MFB responder is not able to complete the computation for MRQ, then the MFB responder may either discard the new request or abandon an existing request in order to initiate computation for the new MRQ.

A STA sending unsolicited MFB feedback using the CMMG variant HT Control field shall set the Unsolicited MFB subfield to 1.

Unsolicited CMMG-MCS, NUM_STS, BW, and SNR estimates reported in the MFB subfield of a CMMG variant HT Control field sent by a STA are computed based on the most recent PPDU received by the STA that matches the description indicated by the STBC Indication and FB Tx Type fields in the same CMMG variant HT Control field.

In an unsolicited MFB response the STBC Indication, FB Tx Type, and BW fields are set according to the RXVECTOR parameters of the received PPDU from which the CMMG-MCS, SNR, BW, and NUM_STS are estimated, as follows:

— The STBC Indication field is set to 1 if the parameter STBC is equal to 1 and set to 0 if the parameter STBC is equal to 0.
— The FB TX Type field is set to 1 if the parameter BEAMFORMED is equal to 1 and set to 0 if the parameter BEAMFORMED is equal to 0.
— The BW field shall indicate a bandwidth equal to or less than the bandwidth indicated by the parameter CH_BANDWIDTH.

In an MFB response solicited by an MRQ that was not carried in a CMMG NDP announcement, the MFB is computed based on RXVECTOR parameters CH_BANDWIDTH, NUM_STS, BEAMFORMED, and STBC of the received PPDU that carried the MRQ and might additionally be based on other factors that are not part of the RXVECTOR. The NUM_STS subfield of the MFB subfield of the CMMG variant HT Control field shall be set to an equal or smaller value than the RXVECTOR parameter NUM_STS of the received PPDU that triggered the MRQ.

If the MFB is in the same PPDU as a CMMG Compressed Beamforming frame, the MFB responder should estimate the recommended MFB under the assumption that the MFB requester uses the steering matrices contained therein.

If the MFB is in the same MPDU as a CMMG Compressed Beamforming frame, the MFB responder shall estimate the recommended MFB under the assumption that the beamformer uses the steering matrices contained therein. In this case the value of the NUM_STS field in the MFB subfield of the CMMG variant HT Control field shall be the same as the value of the Nc Index field in the CMMG MIMO Control field of the CMMG Compressed Beamforming frame; and, if the MFB is unsolicited, the FB Tx Type shall be set to 0. Additionally, MFB estimate shall be based on the bandwidth indicated by the Channel Width subfield of the CMMG MIMO Control field of the CMMG Compressed Beamforming frame. In this case the SNR and BW subfields are reserved and set to 0.

If an unsolicited MFB is not in the same MPDU as a CMMG Compressed Beamforming frame, the NUM_STS subfield of the MFB subfield of the CMMG variant HT Control field shall be set to an equal or smaller value than the RXVECTOR parameter NUM_STS of the received PPDU from which the MFB parameters are estimated.

After the MFB estimate computation is completed, the MFB responder should include the MFB in the MFB field in the next transmission of a frame addressed to the MFB requester that includes a CMMG variant HT Control field. When the MFB requester sets the MRQ subfield to 1 and sets the MSI subfield to a value that matches the MSI subfield value of a previous request for which the responder has not yet provided feedback,

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the responder shall discard or abandon the computation for the MRQ that corresponds to the previous use of that MSI subfield value.

A STA may respond immediately to a current request for MFB with a frame containing an MFSI field value and MFB field value that correspond to a request that precedes the current request.

NOTE 2—If a CMMG STA includes the CMMG variant HT Control field in the initial frame of an immediate response exchange and the responding CMMG STA includes the CMMG variant HT Control field in the immediate response frame, the immediate response exchange effectively permits the exchange of the CMMG variant HT Control field elements.

NOTE 3—If an MRQ is included in the last PPDU in a TXOP and there is not enough time for a response, the recipient might transmit the response MFB in a subsequent TXOP.

NOTE 4—Bidirectional request/responses are supported. In this case, a STA acts as the MFB requester for one direction of a duplex link and a MFB responder for the other direction and transmits both MRQ and MFB in the same CMMG Data frames.

10.32 CMMG beamforming

A CMMG STA may use beamforming transmission to achieve diversity gain with directional beamforming or the spatial multiplex gain with transmit beamforming.

— Directional beamforming (BF) that does not use an omnidirectional antenna pattern or quasi-omni antenna pattern is a mechanism that is used by a pair of STAs to achieve the necessary link budget for subsequent communication. Directional BF training is a bidirectional sequence of BF frame transmissions that uses sector sweep and provides the necessary signaling to allow each STA to determine appropriate antenna system settings for both transmission and reception. CMMG STAs shall follow the same beamforming training rules defined in 10.41. BF frame transmitted by a CMMG STA is contained in CMMG PPDU.

— Transmit beamforming (see 10.33) that uses an omnidirectional antenna pattern or quasi-omni antenna pattern.

10.33 Transmit beamforming

10.33.1 HT steering matrix calculations

In order for an HT beamformer to calculate an appropriate steering matrix for transmit spatial processing when transmitting to a specific HT beamformee, the HT beamformer needs to have an accurate estimate of the channel over which it is transmitting. Two methods of calculation are defined as follows:

— *Implicit feedback*: When using implicit feedback, the beamformer receives long training symbols transmitted by the HT beamformee, which allow the MIMO channel between the HT beamformee and HT beamformer to be estimated. If the channel is reciprocal, the HT beamformer can use the training symbols that it receives from the HT beamformee to make a channel estimate suitable for computing the transmit steering matrix. Generally, calibrated radios in MIMO systems can improve reciprocity. See 10.33.2.

— *Explicit feedback*: When using explicit feedback, the HT beamformee makes a direct estimate of the channel from training symbols sent to the HT beamformee by the HT beamformer. The HT beamformee may prepare CSI or steering feedback based on an observation of these training symbols. The HT beamformee quantizes the feedback and sends it to the HT beamformer. The HT beamformer can use the feedback as the basis for determining transmit steering vectors. See 10.33.3.

An HT STA shall not transmit a PPDU with the TXVECTOR EXPANSION_MAT parameter present if dot11BeamFormingOptionActivated is false.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In order for a CMMG beamformer to calculate an appropriate steering matrix for transmit spatial processing when transmitting to a specific CMMG beamformee, the CMMG beamformer needs to have an accurate estimate of the channel over which it is transmitting. The method of calculation for CMMG beamformer based on explicit feedback is defined as follows:

— When using explicit feedback, the CMMG beamformee makes a direct estimate of the channel from training symbols sent to the CMMG beamformee by the CMMG beamformer. The CMMG beamformee may prepare CSI or steering feedback based on an observation of these training symbols. The CMMG beamformee quantizes the feedback and sends it to the CMMG beamformer. The CMMG beamformer can use the feedback as the basis for determining transmit steering vectors. See 10.33.5.

A CMMG STA shall not transmit a PPDU with the TXVECTOR EXPANSION_MAT parameter present if dot11BeamFormingOptionActivated is false.

10.33.2 HT transmit beamforming with implicit feedback

10.33.2.1 General

The procedures for HT transmit beamforming with implicit feedback use only HT and non-HT PPDUs, and the HT Control field, when present, is the HT variant HT Control field.

Transmit beamforming with implicit feedback can operate in a unidirectional or bidirectional manner. In unidirectional implicit transmit beamforming, only the HT beamformer sends beamformed transmissions. In bidirectional implicit transmit beamforming, both STAs send beamformed transmissions, i.e., a STA may act as both HT beamformer and HT beamformee.

Calibration of receive/transmit chains should be done to improve performance of transmit beamforming using implicit feedback. Over-the-air calibration is described in 10.33.2.4. For implicit transmit beamforming, only the HT beamformer, which is sending the beamformed transmissions, needs to be calibrated.

A STA that advertises itself as being capable of being an HT beamformer and/or HT beamformee using implicit feedback shall support the requirements in Table 10-28.

A STA that performs one of the roles related to transmit beamforming with implicit feedback shall support the associated capabilities shown in Table 10-29.

When an HT beamformee transmits a sounding PPDU, the SOUNDING parameter in the TXVECTOR in the PHY-TXSTART.request primitive shall be set to SOUNDING. If the HT beamformee is capable of implicit transmit beamforming and the HT beamformer is capable of receiving implicit transmit beamforming, the sounding PPDU from the HT beamformee may be steered.

A PPDU containing one or more +HTC MPDUs in which the TRQ field is equal to 1 shall not be sent to a STA that sets the Implicit Transmit Beamforming Receiving Capable subfield of the Transmit Beamforming field of the HT Capabilities element to 0.

If a PPDU containing one or more +HTC MPDUs in which the TRQ field is equal to 1 requires an immediate response, either the response from the HT beamformee shall be included in a sounding PPDU, or the HT NDP Announcement subfield of the HT Control field shall be set to 1 and the PPDU shall be followed by an NDP. If the PPDU in which the TRQ field is equal to 1 does not require an immediate response, either the HT beamformee shall transmit a sounding PPDU in the next TXOP obtained by the HT beamformee, or the HT beamformee shall transmit a PPDU in the next TXOP obtained by the HT beamformee in which the HT NDP Announcement subfield of the HT Control field is set to 1 and that PPDU shall be followed by an NDP. The use of NDP as a sounding PPDU is described in 10.35.

Table 10-28—STA type requirements for transmit beamforming with implicit feedback

STA capability	Required support
Beamformer	Shall set the Implicit Transmit Beamforming Capable subfield to 1 of the Transmit Beamforming Capability field of the HT Capabilities element in HT Capabilities elements that it transmits. Shall set the Implicit Transmit Beamforming Receiving Capable subfield to 1 of the Transmit Beamforming Capability field of the HT Capabilities element. Shall support receiving a sounding PPDU for which the SOUNDING parameter is SOUNDING and the NUM_EXTEN_SS is equal to 0 in the RXVECTOR in the PHY-RXSTART.indication primitive, independently of the values of the Receive Staggered Sounding Capable and Receive NDP Capable subfields. Shall set the Calibration subfield to 3 of the Transmit Beamforming Capability field of the HT Capabilities element to advertise full calibration support.
Beamformee	Shall set the Implicit Transmit Beamforming Receiving Capable subfield to 1 of the Transmit Beamforming Capability field of the HT Capabilities element in HT Capabilities elements that it transmits. Shall support setting the SOUNDING parameter to SOUNDING and the NUM_EXTEN_SS to 0 in the TXVECTOR in the PHY-TXSTART.request primitive when transmitting a sounding PPDU, as a response to TRQ=1, independently of the values of the Transmit Staggered Sounding Capable and Transmit NDP Capable subfields.

Table 10-29—Transmit beamforming support required with implicit feedback

Role	Required support
HT beamformee: A receiver of transmit beamformed PPDUs	Shall transmit sounding PPDUs as a response to TRQ=1.
Beamformer: A transmitter of beamformed PPDUs	Can receive sounding PPDUs. Can compute steering matrices from MIMO channel estimates obtained from long training symbols in sounding PPDUs received from the HT beamformee.
A responder in a calibration exchange	Can receive and transmit sounding PPDUs. Can respond with a CSI frame that contains channel measurement information obtained during reception of a sounding PPDU.
An initiator in a calibration exchange	Can receive and transmit sounding PPDUs. Can receive a CSI frame sent by a calibration responder.

NOTE—A STA that acts as an HT beamformer using implicit feedback expects to receive a sounding PPDU in response to a training request. The STA can compute steering matrices from the channel estimates obtained from the received sounding PPDU.

At the end of the TXOP the final PPDU from the HT beamformer shall not have the TRQ field set to 1 in a frame that requests an immediate response if there is not enough time left in the TXOP for the HT beamformee to transmit the longest valid sounding PPDU with its response.

10.33.2.2 Unidirectional implicit transmit beamforming

Figure 10-51 shows an example of a PPDU exchange used in unidirectional implicit transmit beamforming using the Clause 19 PHY. In this example, sounding PPDUs are used that carry MPDUs (i.e., an example of implicit beamforming using NDPs is not shown here.) STA A is the beamformer that initiates the PPDU exchange, and STA B is the beamformee.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

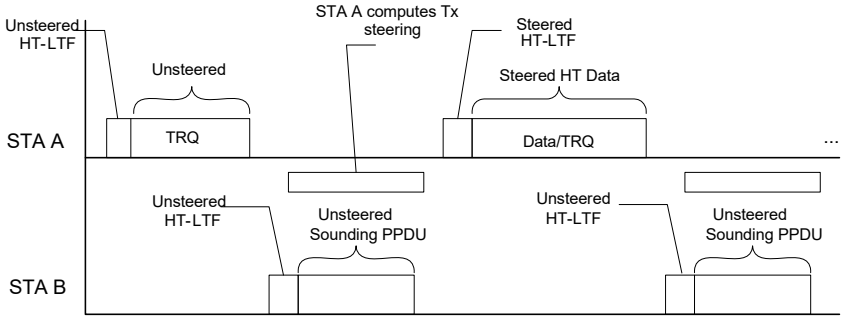

Figure 10-51—Example PPDU exchange for unidirectional implicit transmit beamforming

The PPDU exchange can be summarized as follows:

a) STA A initiates the frame exchange sequence by sending an unsteered PPDU to STA B. The PPDU includes a training request (TRQ= 1) in a +HTC MPDU.

b) STA B sends a sounding PPDU in response to the training request from STA A.

c) On receiving the sounding PPDU, STA A uses the resulting channel estimate to compute steering matrices and uses these matrices to send a steered PPDU back to STA B.

d) The steered PPDU transmitted in step c) and subsequent steered PPDUs transmitted by STA A may include training requests (TRQ=1) in a +HTC MPDU. In response to each training request, STA B returns a sounding PPDU to STA A, which enables STA A to update its steering vectors. If the steering vectors resulting from step c) or subsequent sounding PPDUs are deemed stale due to delay, the sequence may be restarted by returning to step a).

Step d) in the above PPDU exchange represents steady-state unidirectional transmit beamforming operation.

During the PPDU exchange neither the receiving nor the transmitting STA should switch antennas.

10.33.2.3 Bidirectional implicit transmit beamforming

Figure 10-52 shows an example of a PPDU exchange used in bidirectional implicit transmit beamforming, using the Clause 19 PHY. In this example, sounding PPDUs are used that carry MPDUs. STA A initiates the frame exchange sequence, and STA A and STA B alternate in the roles of HT beamformer and HT beamformee.

The PPDU exchange can be summarized as follows:

a) STA A initiates the frame exchange sequence by sending an unsteered PPDU to STA B. The PPDU includes a training request (TRQ= 1) in a +HTC MPDU.

b) STA B sends a sounding PPDU in response to the training request. In addition, this PPDU includes a training request in a +HTC MPDU to enable implicit transmit beamforming in the RD.

c) On receiving the sounding PPDU, STA A uses the resulting channel estimate to compute steering matrices and uses these matrices to send a steered PPDU back to STA B. This steered PPDU is also a sounding PPDU in response to the training request from STA B.

NOTE 1—Steering matrices with nonorthonormal columns should not be used in transmitting sounding PPDUs for implicit feedback. In general, bidirectional implicit beamforming does not function as described here when the steering matrices have nonorthonormal columns. See 19.3.12.2.

d) On receiving the sounding PPDU, STA B uses the resulting channel estimate to compute steering matrices and uses these matrices to send a steered PPDU back to STA A. The steered PPDU transmitted in step c) and subsequent steered PPDUs transmitted by STA A may include training

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

requests in HTC. In response to each training request, STA B returns a sounding PPDU to STA A, which enables STA A to update its steering vectors. If the steering vectors resulting from step c) or subsequent sounding PPDUs are deemed stale due to delay, the sequence may be restarted by returning to step a).

e) The steered PPDU transmitted in step d) and subsequent steered PPDUs transmitted by STA B may include training requests in HTC. In response to each training request, STA A returns a sounding PPDU to STA B, which enables STA B to update its steering vectors. If the steering vectors resulting from step d) or subsequent sounding PPDUs are deemed stale due to delay, the sequence may be restarted by returning to step a).

Steps d) and e) in the above PPDU exchange represent steady-state bidirectional transmit beamforming operation.

During the PPDU exchange neither the receiving nor the transmitting STA should switch antennas.

NOTE 2—The TRQ protocol used with the beamforming training process is not sufficient to permit STA B to transmit Data frames in the RD. In the example shown in Figure 10-52, STA A would additionally have to follow the rules of the reverse direction protocol (see 10.29).

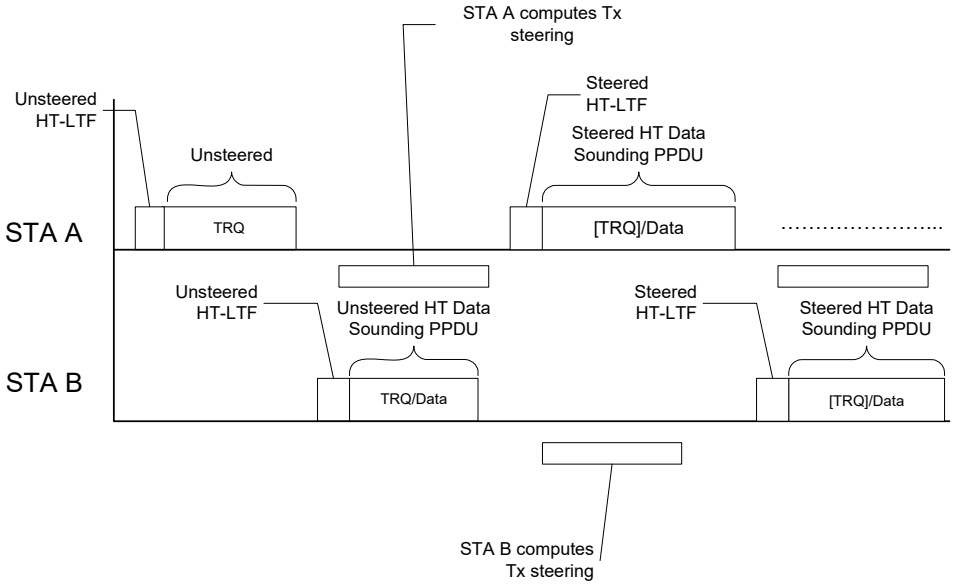

Figure 10-52—Example PPDU exchange for bidirectional implicit transmit beamforming

10.33.2.4 Calibration

10.33.2.4.1 Introduction

Differences between transmit and receive chains in a STA degrade the inherent reciprocity of the over-the-air time division duplex channel and cause degradation of the performance of implicit beamforming. Calibration acts to remove or reduce differences between transmit and receive chains and enforce reciprocity in the observed baseband-to-baseband channels between two STAs.

A STA acting as an HT beamformer should be calibrated to maximize performance. A STA acting only as an HT beamformee does not need to be calibrated. In order to perform calibration, the STA follows the procedure described below.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The calibration procedure involves the computation of correction matrices that cause the observed channel matrices in the two directions of the link to be transposes of each other and thus renders the resultant channel reciprocal. See 19.3.12.2 for a more detailed description. If it is able to do so, a STA should calibrate upon association.

NOTE—STAs with two or more transmit chains should be calibrated in order to engage in implicit transmit beamforming. STAs with any number of RF chains, including those with a single RF chain, can participate in a calibration exchange as a calibration responder.

10.33.2.4.2 Calibration capabilities

A STA that sets the Implicit Transmit Beamforming Capable subfield of the Transmit Beamforming Capabilities field to 1 shall support calibration and shall set the Calibration subfield of the Transmit Beamforming Capabilities field to 3 (indicating full support of calibration) in HT Capabilities elements that it transmits. A STA that does not set the Implicit Transmit Beamforming Capable subfield of the Transmit Beamforming Capabilities field to 1 may support calibration and shall set the Calibration subfield of the Transmit Beamforming Capabilities field to the value that indicates its calibration capability in the Transmit Beamforming Capabilities field in HT Capabilities elements that it transmits (see Table 9-228), when the Transmit Beamforming Capabilities field exists.

A STA that is capable of initiating calibration (the Calibration subfield of the Transmit Beamforming Capabilities field is equal to 3) shall set the CSI Max Number of Rows Beamformer Supported subfield to an appropriate value, even if the STA sets the Explicit Transmit Beamforming CSI Feedback subfield to the value 0.

In order to support calibration, a STA that advertises that it is capable of responding to a calibration request shall support transmitting a CSI frame in which the value of the Grouping subfield of the MIMO Control field is 0 (no grouping) and the Coefficients Size subfield of the MIMO Control field is 3 (Nb = 8 bits) in response to a CSI feedback request indicated by the CSI/Steering subfield of the HT Control field equal to 1 and the Calibration Position subfield of the HT Control field equal to 3, independently of the advertised values of the Explicit Transmit Beamforming CSI Feedback subfield in the Transmit Beamforming Capabilities field in the HT Capabilities element. A STA that advertises that it is capable of initiating a calibration request shall support receiving a CSI frame in which the value of the Grouping subfield of the MIMO Control field is equal to 0 (no grouping) and the Coefficients Size subfield of the MIMO Control field is equal to 3 (Nb = 8 bits) as a response to CSI feedback request indicated by the CSI/Steering subfield of the HT Control field equal to 1 with the Calibration Position subfield equal to 3, independently of the advertised values of the Explicit CSI Transmit Beamforming Capable subfield in the Transmit Beamforming Capabilities field in the HT Capabilities element.

A STA may initiate a calibration training frame exchange sequence with another STA if that STA supports calibration. A STA shall not initiate a calibration training frame exchange sequence with another STA if that STA does not support calibration.

If the Receive NDP Capable subfield is equal to 1, the value of the Calibration subfield is equal to 1 or 3, and the device supports transmitting sounding PPDUs for which two or more channel dimensions can be estimated (two or more columns of the MIMO channel matrix), then transmission of NDPs shall be supported (and the Transmit NDP Capable subfield shall be set to 1).

10.33.2.4.3 Sounding exchange for calibration

Figure 10-53 illustrates the calibration PPDU exchange using sounding PPDUs that contain an MPDU.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

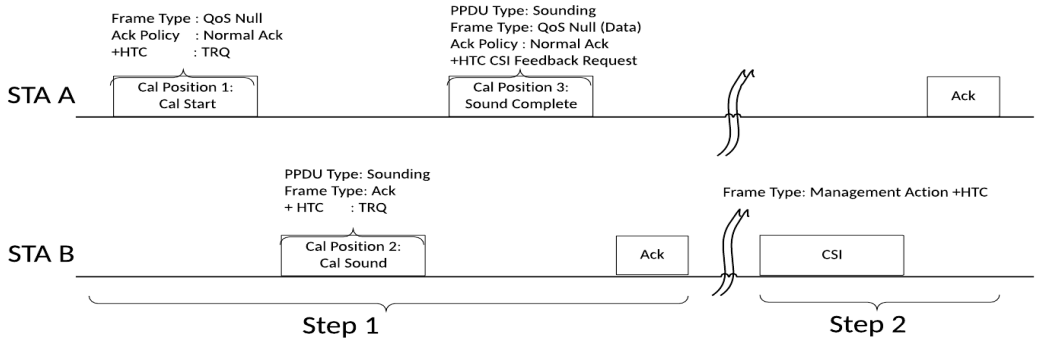

Figure 10-53—Calibration procedure with sounding PPDU containing an MPDU

The calibration procedure begins with a calibration sounding frame exchange sequence shown as Step 1 in Figure 10-53. The Calibration Sequence subfield in the HT Control field shall be incremented each time a new calibration procedure is started.

STA A (the calibration initiator) shall transmit a Calibration Start frame (Calibration Position subfield set to 1) with the TRQ field in the HT Control field set to 1. This frame initiates a calibration procedure. It shall be a QoS Null frame with Normal Ack ack policy.

In response, STA B (the calibration responder) shall transmit a Calibration Sounding Response frame (Calibration Position subfield set to 2), a SIFS after the end of the Calibration Start frame, using a sounding PPDU. This step allows STA A to estimate the MIMO channel from STA B to STA A. In the Calibration Sounding Response frame, the Calibration Sequence subfield in HT Control field shall be set to the same value that is indicated in the Calibration Start frame. The Calibration Sounding Response frame shall have a frame type of Ack+HTC, and the TRQ field in the HT Control field in this frame shall be set to 1.

In response, STA A shall transmit a Calibration Sounding Complete frame (Calibration Position subfield set to 3) that contains the CSI/Steering subfield of the HT Control field set to 1, a SIFS after the end of the Calibration Sounding Response frame, using a sounding PPDU. This step allows STA B to estimate the MIMO channel from STA A to STA B. In this Calibration Sounding Complete frame, the Calibration Sequence subfield in the HT Control field shall be set to the same value that is indicated in the Calibration Sounding Response frame. The Calibration Sounding Complete frame shall be a QoS Null+HTC with Normal Ack ack policy.

A frame in which the Calibration Position subfield is equal to 2 or 3 shall be transmitted in a sounding PPDU (a PPDU for which the SOUNDING parameter is set to SOUNDING). The number of Long Training fields (LTFs) used to obtain MIMO channel estimation that are sent in the sounding PPDU shall be determined by the number of transmit chains (N_{TX}) used in sending these LTFs at the STA transmitting the sounding PPDU. The transmit chains used at the calibration initiator are those for which calibration is required.

The calibration responder may train up to maximum available transmit chains to maximize the quality of the resulting calibration, although the number of space-time streams for data symbols shall be determined by the rule described in 10.6.

When transmitting a sounding PPDU during Step 1 of a calibration procedure, if the Receive Staggered Capability subfield in the Transmit Beamforming Capability field of the HT Capabilities element transmitted by the intended receiver is 0, then,

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— If the sounding PPDU is not an NDP, the number of antennas used by the sender shall be less than or equal to the maximum number of space-time streams indicated by the Rx MCS Bitmask subfield of the Supported MCS Set field and the Rx STBC subfield of the HT Capabilities element transmitted by the intended receiver.
— If the sounding PPDU is an NDP, the number of antennas used by the sender shall be less than or equal to the number indicated by the Channel Estimation Capability subfield in the Transmit Beamforming Capability field of the HT Capabilities element transmitted by the intended receiver.

Sounding PPDUs in which the Calibration Position subfield is equal to 2 or 3 shall use the spatial mapping matrices defined in 19.3.12.3. The calibration responder shall not remove the spatial mapping from the CSI to be fed back to the initiator of the frame exchange sequence.

NOTE 1—The calibration initiator of this frame exchange sequence is responsible for accounting for the spatial mapping in both its local channel estimate as well as in the quantized CSI fed back to it.

The row order in the CSI feedback matrix transmitted from STA B shall correspond to the association of the rows of the spatial mapping matrix (see Equation (19-75)) to its transmit antennas. For example, the receive antenna at STA B associated with row *i* in the CSI feedback matrix in each subcarrier is the same as its transmit antenna associated with row *i* in the spatial mapping matrix used for transmitting the sounding response with Calibration Position equal to 2.

Figure 10-54 and Figure 10-55 illustrate the calibration PPDU exchange using NDPs.

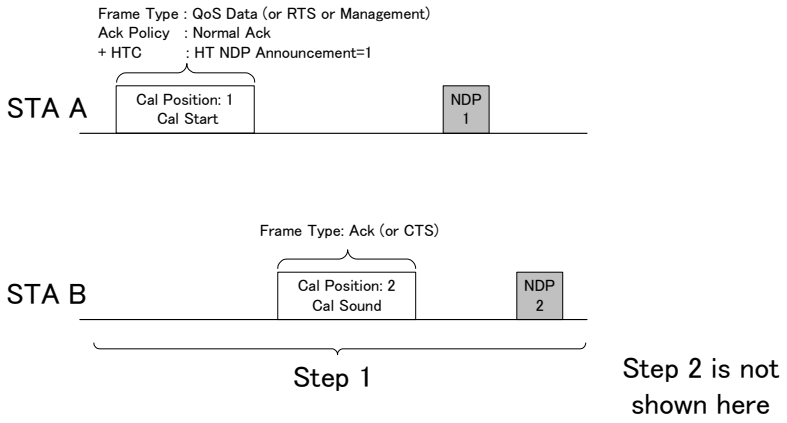

Figure 10-54—Calibration procedure with NDP

The calibration procedure begins with a calibration sounding frame exchange sequence, shown as Step 1 in Figure 10-54 and Figure 10-55, when STA B supports transmitting sounding PPDUs for which only one channel dimension can be estimated (i.e., a single column of the MIMO channel matrix). The Calibration Sequence subfield in the HT Control field shall be incremented each time a new calibration procedure is started.

NDP transmission within a calibration procedure follows the rules defined in 10.35.1. STA A transmits a Calibration Start frame (i.e., with the Calibration Position subfield set to 1) with the HT NDP Announcement subfield set to 1 and CSI/Steering subfield of the HT Control field set to 1. Only the current TXOP holder may set both the Calibration Position and HT NDP Announcement subfields to 1. This frame initiates a calibration procedure.

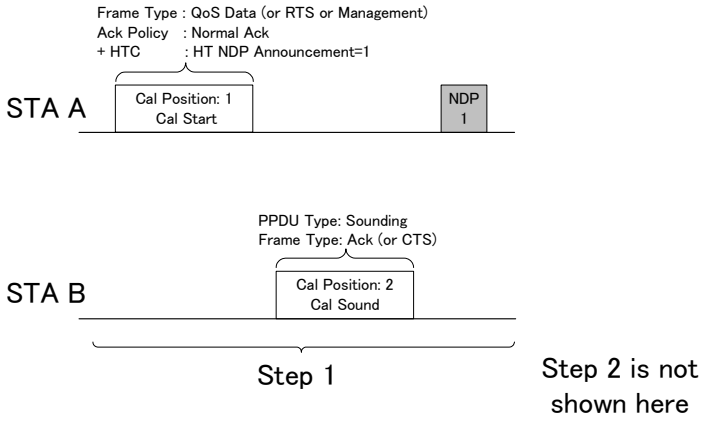

Figure 10-55—Calibration procedure with NDP when STA B supports transmitting sounding PPDUs for which only one channel dimension can be estimated (i.e., a single column of the MIMO channel matrix)

STA B shall transmit a Calibration Sounding Response frame (i.e., with the Calibration Position subfield set to 2) after a SIFS after the received Calibration Start frame. If STA B supports transmitting sounding PPDUs for which only one channel dimension can be estimated (i.e., a single column of the MIMO channel matrix), this Calibration Sounding Response frame is sent with the SOUNDING parameter of the TXVECTOR set to SOUNDING (see Figure 10-55).

As determined by NDP rules a) or b) in 10.35.1, STA A sends the first NDP as a sounding PPDU a SIFS after receiving the Calibration Sounding Response frame. This step allows STA B to estimate the MIMO channel from STA A to STA B. In the Calibration Sounding Response frame, the Calibration Sequence subfield in HT Control field shall be set to the same value that is contained in the Calibration Start frame. The Calibration Sounding Response frame shall contain an HT Control field, and the type and subtype of the frame are determined by the Calibration Start frame.

As determined by NDP rule d), STA B might transmit a second NDP as a sounding PPDU a SIFS after receiving the first NDP. This second NDP allows STA A to estimate the channel from STA B to STA A.

NOTE 2—STA B does not transmit an NDP when it supports transmitting sounding PPDUs for which only one channel dimension can be estimated (see Figure 10-55).

Otherwise [i.e., if STA B supports transmitting sounding PPDUs for which only one channel dimension can be estimated (single column of the MIMO channel matrix)], the transmission of the sounding PPDU in Calibration Position 2 allows STA A to estimate the channel from STA B to STA A.

NDP sounding PPDUs shall use the spatial mapping matrices defined in 19.3.13.3. The calibration responder shall not remove the spatial mapping from the CSI to be fed back to the initiator of the frame exchange sequence.

NOTE 3—The calibration initiator of this frame exchange sequence is responsible for accounting for the spatial mapping in both its local channel estimate as well as in the quantized CSI fed back to it.

10.33.2.4.4 CSI reporting for calibration

The remaining message exchange in the calibration procedure is not time critical.

The calibration initiator should not transmit any frames that are part of the calibration sequence shown in Step 1 in Figure 10-53 if either of the response frames from the calibration responder (the frames shown as

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Calibration Position 2 and Ack in Step 1) is not received correctly within an AckTimeout interval (as defined in 10.3.2.11) after the PHY-TXEND.confirm primitive. If the calibration initiator aborts the calibration sequence, it may restart the calibration sequence with a value of the Calibration Sequence subfield in the Calibration Control subfield of the HT Control field that is different (i.e., incremented) from the value used in the aborted sequence. Within a non-NDP calibration sequence, the calibration responder should not transmit any further frames that are part of the calibration sequence shown in Step 1 if the frame having Calibration Position 3 is not received correctly within an AckTimeout interval (as defined in 10.3.2.11) after the PHY-TXEND.confirm primitive.

When the MIMO channel measurements become available at STA B, STA B shall send one or more CSI frames that contain the CSI report (Step 2 in Figure 10-53). This CSI report shall have full precision, i.e, *Ng*=1 (no grouping) and *Nb*=3 (8 bits). In these CSI frames, the Calibration Sequence subfields in HT Control fields shall be set to the same value that is indicated in the Calibration Sounding Complete frame. These CSI frames shall have a frame type of Management Action +HTC.

STA B should finish transmission of the first CSI frame within aMaxCSIMatricesReportDelay (in milliseconds) after the reception of the frame containing the CSI feedback request or HT NDP announcement.

NOTE—If necessary, the CSI Report field can be split into up to 8 segments as specified in Table 9-85.

A STA that has started but not completed the calibration procedure and that receives some other request that requires the buffering of CSI (such as another calibration initiation frame, MFB request, CSI feedback request for link adaptation, or feedback request for explicit Transmit Beamforming) may ignore the other request.

From the beginning of Step 1 of the calibration procedure and continuing through the end of Step 2 of the calibration procedure, neither the receiving nor the transmitting STA should switch antennas.

10.33.3 Explicit feedback beamforming

The procedures in this subclause apply only to HT and non-HT PPDUs for which the HT Control field, if present, is the HT variant HT Control field.

In this subclause, the terms *HT beamformer* and *HT beamformee* refer to STAs that are involved in explicit feedback beamforming.

An HT beamformer uses the feedback response that it receives from the HT beamformee to calculate a beamforming feedback matrix for transmit beamforming. This feedback response may have one of three formats:

— *CSI*: The HT beamformee sends the MIMO channel coefficients to the HT beamformer.
— *Noncompressed beamforming*: The HT beamformee sends calculated beamforming feedback matrices to the HT beamformer.
— *Compressed beamforming*: The HT beamformee sends compressed beamforming feedback matrices to the HT beamformer.

The supported formats shall be advertised in the HT beamformee's HT Capabilities element.

NOTE 1—An HT beamformer might discard the feedback response if the TSF time when the PHY-CCA.indication(IDLE) primitive corresponding to the feedback response frame's arrival minus the value from the Sounding Timestamp field in the feedback response frame is greater than the coherence time interval of the propagation channel.

An HT beamformee's responding capabilities shall be advertised in HT Capabilities elements that are transmitted by the HT beamformee. Devices that are capable of acting as an HT beamformee shall advertise

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

one of the following response capabilities in the Explicit Transmit Beamforming CSI Feedback subfield of the Transmit Beamforming Capability field:

— *Immediate*: The HT beamformee is capable of sending a feedback response a SIFS after receiving a sounding PPDU and/or is capable of sending a feedback response aggregated in a PPDU that contains a MAC response within the HT beamformer's TXOP.

— *Delayed*: The HT beamformee is not capable of sending the feedback response within the HT beamformer's TXOP, but it is capable of sending the feedback response in a TXOP that it obtains.

— *Immediate and Delayed*: The HT beamformee is capable of sending a feedback response a SIFS after receiving a sounding PPDU, sending a feedback response aggregated in a PPDU that contains a MAC response within the HT beamformer's TXOP, or sending the feedback response in a TXOP that it obtains.

The sounding frame types supported by the HT beamformee, staggered and/or NDP, are advertised in the HT Capabilities element in frames that are transmitted by the HT beamformee.

A STA that sets any of the Explicit Transmit Beamforming CSI Feedback Capable, Explicit Noncompressed Beamforming Feedback Capable, or Explicit Compressed Beamforming Feedback Capable fields to 1 shall transmit explicit feedback based on the receipt of a +HTC sounding PPDU in which the CSI/Steering subfield has a nonzero value and that does not contain Extension HT-LTFs (HT-ELTFs). This requirement is independent of the values of the Receive Staggered Sounding Capable and the Receive NDP Capable fields.

An HT beamformer shall set the SOUNDING parameter of the TXVECTOR to SOUNDING in the PHY-TXSTART.request primitive corresponding to each PPDU that is used for sounding.

An HT beamformer shall set the response type format indicated in the CSI/Steering subfield of the HT Control field of any sounding frame excluding the NDP and of any PPDU with the HT NDP Announcement field equal to 1 to one of the nonzero values (CSI, Compressed Beamforming, or Noncompressed Beamforming) that corresponds to a type that is supported by the HT beamformee.

The receipt of a PHY-RXSTART.indication primitive with the RXVECTOR SOUNDING parameter value equal to SOUNDING indicates a sounding PPDU. A non-NDP request for feedback is a sounding PPDU with a +HTC MPDU that contains a nonzero value of the CSI/Steering subfield and that has the HT NDP Announcement subfield equal to 0.

An NDP request for feedback is the combination of a +HTC MPDU that contains a nonzero value of the CSI/Steering subfield and that has the HT NDP Announcement subfield equal to 1 and the NDP that follows.

An HT beamformee that transmits a feedback frame in response to a sounding PPDU sent by an HT beamformer shall transmit a frame of the type (CSI, Compressed Beamforming, or Noncompressed Beamforming) indicated in the CSI/Steering subfield of the HT Control field transmitted by the HT beamformer.

The HT beamformee decides on any subcarrier grouping to be used in the explicit Beamforming feedback. The value selected shall be a value supported by the HT beamformer as indicated in the Minimal Grouping subfield of the HT beamformer's HT Capabilities element.

An HT beamformee that sets the Explicit Transmit Beamforming CSI Feedback field of its HT Capabilities element to either 2 or 3 shall transmit Explicit CSI feedback after a SIFS or later in the HT beamformer's TXOP as a response to a non-NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-30. An HT beamformee that sets the Explicit Noncompressed Beamforming Feedback Capable field of its HT Capabilities element to either 2 or 3 shall transmit Explicit Noncompressed Beamforming feedback after a SIFS or later in the HT beamformer's TXOP as a response to a

non-NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-30.

Table 10-30—Rules for HT beamformee immediate feedback transmission responding to non-NDP sounding

Type of response	Rule
CTS response	If the transmission of a CTS is required in response to the non-NDP request for feedback, the transmission of the feedback response frame shall be delayed until the HT beamformee's next transmission within the TXOP. This feedback response frame may be aggregated in an A-MPDU with an Ack or BlockAck frame.
Acknowledgment response	If the transmission of an Ack or BlockAck frame is required in response to the non-NDP request for feedback, both the feedback response frame and the control response frame may be aggregated in an A-MPDU.
No control response	If the transmission of a control response frame is not required in response to the non-NDP request for feedback, the feedback response frame shall be sent a SIFS after the reception of the sounding PPDU containing the request for feedback.
Later aggregation of feedback and acknowledgment	If the immediate-feedback-capable HT beamformee cannot transmit an aggregated or immediate CSI/Steering response in a SIFS after the end of the received sounding PPDU and the HT beamformee is subsequently required to transmit an Ack or BlockAck frame in the same TXOP, it may transmit the feedback response in an A-MPDU with the Ack or BlockAck frame.

An HT beamformee that sets the Explicit Compressed Beamforming Feedback Capable field of its HT Capabilities element to either 2 or 3 shall transmit Explicit Compressed Beamforming feedback after a SIFS or later in the HT beamformer's TXOP as a response to a non-NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-30.

An HT beamformee that sets the Explicit Transmit Beamforming CSI Feedback field of its HT Capabilities element to either 2 or 3 shall transmit the Explicit CSI feedback after a SIFS or later in the HT beamformer's TXOP as a response to an NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-31.

Table 10-31—Rules for HT beamformee immediate feedback transmission responding to NDP sounding

Type of response	Rule
Control response	If the transmission of a control response frame is required in response to the NDP request for feedback, the control response frame is transmitted a SIFS after reception of the PPDU that elicited the control response, and the feedback response frame may be transmitted a SIFS after the reception of the NDP. — If the feedback response frame is not transmitted a SIFS after the reception of the NDP and the HT beamformee is subsequently required to transmit an Ack or BlockAck frame in the same TXOP, then the feedback response may be aggregated with the Ack or BlockAck frame. — If the feedback response frame is not transmitted a SIFS after the reception of the NDP and is not transmitted with an aggregated Ack or BlockAck frame in the same TXOP, then the feedback response frame is delayed until the HT beamformee's next transmission within the TXOP.

Table 10-31—Rules for HT beamformee immediate feedback transmission responding to NDP sounding *(continued)*

Type of response	Rule
No control response	If the transmission of a control response frame is not required in response to the NDP request for feedback, the feedback response frame may be sent a SIFS after the reception of the NDP. — If the feedback response frame is not transmitted a SIFS after the reception of the NDP and the HT beamformee is subsequently required to transmit an Ack or BlockAck frame in the same TXOP, then the feedback response may be aggregated with the Ack or BlockAck frame. — If the feedback response frame is not transmitted a SIFS after the reception of the NDP and is not transmitted with an aggregated Ack or BlockAck frame in the same TXOP, then the feedback response frame is delayed until the HT beamformee's next transmission within the TXOP.

An HT beamformee that sets the Explicit Noncompressed Beamforming Feedback Capable field of its HT Capabilities element to either 2 or 3 shall transmit the Explicit Noncompressed Beamforming feedback after a SIFS or later in the HT beamformer's TXOP as a response to an NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-31.

An HT beamformee that sets the Explicit Compressed Beamforming Feedback Capable field of its HT Capabilities element to either 2 or 3 shall transmit the Explicit Compressed Beamforming feedback after a SIFS or later in the HT beamformer's TXOP as a response to an NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-31.

When the HT beamformee sets the Explicit Transmit Beamforming CSI Feedback field of its HT Capabilities element to either 2 or 3 and the HT beamformer has transmitted an NDP or a non-NDP Explicit Beamforming CSI feedback request in a frame that does not require immediate control response, the HT beamformer shall not transmit the next PPDU to the HT beamformee until PIFS after transmitting the sounding request.

When the HT beamformee sets the Explicit Noncompressed Beamforming Feedback Capable field of its HT Capabilities element to either 2 or 3 and the HT beamformer has transmitted an NDP or a non-NDP Explicit Noncompressed Beamforming feedback request in a frame that does not require immediate control response, the HT beamformer shall not transmit the next PPDU to the HT beamformee until PIFS after the sounding request.

When the HT beamformee sets the Explicit Compressed Beamforming Feedback Capable field of its HT Capabilities element to either 2 or 3 and the HT beamformer has transmitted an NDP or a non-NDP Explicit Compressed Beamforming feedback request in a frame that does not require immediate control response, the HT beamformer shall not transmit the next PPDU to the HT beamformee until PIFS after transmitting the sounding request.

An HT beamformee shall not transmit a CSI, Compressed Beamforming, or Noncompressed Beamforming frame except in response to a request for feedback.

NOTE 2—Error recovery in a TXOP is not affected by sounding. An HT beamformer that is a TXOP holder and that fails to receive an expected response to a sounding PPDU can continue transmission as specified in 10.23.2.8.

An HT beamformee transmitting a feedback response after a SIFS or later in the HT beamformer's TXOP shall use an Action No Ack frame or an Action No Ack +HTC frame (defined in 9.3.3.14).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An HT beamformee transmitting delayed feedback response shall use an Action frame or an Action +HTC frame to send this information within a separate TXOP.

If necessary, the CSI Report field, Noncompressed Beamforming Report field, or Compressed Beamforming Report field may be split into up to 8 frames. The length of each segment shall be equal number of octets for all segments except the last, which may be smaller.

NOTE 3—A STA that has been granted an RDG can act as an HT beamformer during the RDG time period, provided that the RD rules are obeyed.

An HT beamformee that advertises itself as delayed-feedback-capable shall not transmit an immediate feedback response unless it also advertises itself as immediate-feedback-capable.

An HT beamformer may use worst-case parameters to estimate the duration of the expected frame that contains the feedback response, e.g. the lowest rate/MCS in the basic rate/MCS set, HT-mixed format if an HT PPDU is expected, and no grouping.

An Explicit Feedback Request may be combined with an MRQ. If the response contains a beamforming feedback matrix, the returned MCS shall be derived from the same information that was used to generate this particular beamforming feedback matrix. If the response contains channel coefficients, the returned MCS shall be derived from an analysis of the sounding frame that was used to generate the channel coefficients. The MFB field set to 127 (meaning no feedback) may be used when the HT beamformee is unable to generate the MCS in time for inclusion in the response transmission frame. A CSI-capable STA may be incapable of generating MFB.

Explicit feedback shall be calculated only from a sounding PPDU.

An HT beamformee that transmits a feedback frame of type Compressed Beamforming in response to a sounding PPDU sent by an HT beamformer shall set the *Nr* Index subfield in the MIMO Control field of the feedback frame to indicate the same value as the number of streams in the sounding PPDU.

10.33.4 VHT MU beamforming

An MU beamformer may transmit a VHT MU PPDU with a single nonzero TXVECTOR parameter NUM_STS[p], where $0 \le p \le 3$.

An MU beamformer shall not transmit a VHT MU PPDU with a nonzero TXVECTOR parameter NUM_STS[p], where $0 \le p \le 3$, to a STA whose MU Beamformee Capable field is equal to 0.

When transmitting a VHT MU PPDU, an MU beamformer shall order the per-user arrays of TXVECTOR parameters so that the per-user USER_POSITION array is in ascending order.

10.33.5 Explicit feedback beamforming for CMMG STAs

In this subclause, the terms *CMMG beamformer* and *CMMG beamformee* refer to STAs that are involved in explicit feedback beamforming.

A CMMG beamformer uses the feedback response that it receives from the CMMG beamformee to calculate a beamforming feedback matrix for transmit beamforming. This feedback response has the following format:

— *Compressed beamforming*: The CMMG beamformee sends compressed beamforming feedback matrices to the CMMG beamformer.

The supported formats shall be advertised in the beamformee's CMMG Capabilities element.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—An HT and CMMG beamformer might discard the feedback response if the TSF time when the PHY-CCA.indication(IDLE) primitive corresponding to the feedback response frame's arrival minus the value from the Sounding Timestamp field in the feedback response frame is greater than the coherence time interval of the propagation channel.

A CMMG beamformee's responding capabilities shall be advertised in CMMG Capabilities elements contained in DMG Beacon, Probe Request, Probe Response, Association Request, Association Response, Action, and Action No Ack frames that are transmitted by the CMMG beamformee. Devices that are capable of acting as a CMMG beamformee shall advertise one of the following response capabilities in the Explicit Compressed Beamforming Feedback Capable subfield of the Transmit Beamforming Capability field:

— *Immediate:* The CMMG beamformee is capable of sending a feedback response a SIFS after receiving a sounding PPDU and/or is capable of sending a feedback response aggregated in a PPDU that contains a MAC response within the CMMG beamformer's TXOP.

— *Delayed:* The CMMG beamformee is not capable of sending the feedback response within the CMMG beamformer's TXOP, but it is capable of sending the feedback response in a TXOP that it obtains.

— *Immediate and Delayed:* The CMMG beamformee is capable of sending a feedback response a SIFS after receiving a sounding PPDU, sending a feedback response aggregated in a PPDU that contains a MAC response within the CMMG beamformer's TXOP, or sending the feedback response in a TXOP that it obtains.

The sounding frame types supported by the CMMG beamformee, staggered and/or NDP, are advertised in the CMMG Capabilities element in frames that are transmitted by the CMMG beamformee.

A STA that sets Explicit Compressed Beamforming Feedback Capable fields to 1 shall transmit explicit feedback based on the receipt of a sounding PPDU in which the CSI/Steering subfield has a nonzero value. This requirement is independent of the values of the Receive Staggered Sounding Capable and the Receive NDP Capable fields.

A CMMG beamformer shall set the SOUNDING parameter of the TXVECTOR to SOUNDING in the PHY-TXSTART.request primitive corresponding to each PPDU that is used for sounding.

A CMMG beamformer shall set the response type format indicated in the CSI/Steering subfield of the CMMG variant HT Control field of any sounding frame excluding the NDP and of any PPDU with the CMMG NDP Sounding Announcement field equal to 1 to the value of the type Compressed Beamforming.

The receipt of a PHY-RXSTART.indication primitive with the RXVECTOR SOUNDING parameter value equal to SOUNDING indicates a sounding PPDU. A non-NDP request for feedback is a sounding PPDU that contains a nonzero value of the CSI/Steering subfield and that has the NDP Announcement subfield equal to 0.

An NDP request for feedback is the combination of a CMMG MPDU that contains a nonzero value of the CSI/Steering subfield and that has the NDP Announcement subfield equal to 1 and the NDP that follows.

A CMMG beamformee that transmits a feedback frame in response to a sounding PPDU sent by a beamformer shall transmit a Compressed Beamforming frame.

The CMMG beamformee decides on any subcarrier grouping to be used in the explicit beamforming feedback. The value selected shall be a value supported by the CMMG beamformer as indicated in the Minimal Grouping subfield of the CMMG beamformer's CMMG Capabilities element.

A CMMG beamformee that sets the Explicit Compressed Feedback Capable field of its CMMG Capabilities element to either 2 or 3 shall transmit explicit compressed beamforming feedback after a SIFS or later in the beamformer's TXOP as a response to a non-NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-32.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 10-32—Rules for CMMG beamformee immediate feedback transmission responding to non-NDP sounding

Type of response	Rule
CTS response	If the transmission of a CTS is required in response to the non-NDP request for feedback, the transmission of the feedback response frame shall be delayed until the CMMG beamformee's next transmission within the TXOP. This feedback response frame may be aggregated in an A-MPDU with an Ack or BlockAck frame.
Acknowledgment response	If the transmission of an Ack or BlockAck frame is required in response to the non-NDP request for feedback, both the feedback response frame and the control response frame may be aggregated in an A-MPDU.
No control response	If the transmission of a control response frame is not required in response to the non-NDP request for feedback, the feedback response frame shall be sent a SIFS after the reception of the sounding PPDU containing the request for feedback.
Later aggregation of feedback and acknowledgment	If the immediate-feedback-capable CMMG beamformee cannot transmit an aggregated or immediate CSI/Steering response in a SIFS after the end of the received sounding PPDU and the CMMG beamformee is subsequently required to transmit an Ack or BlockAck frame in the same TXOP, it may transmit the feedback response in an A-MPDU with the Ack or BlockAck frame.

A CMMG beamformee that sets the Explicit Compressed Beamforming Feedback Capable field of its CMMG Capabilities element to either 2 or 3 shall transmit the explicit compressed beamforming feedback after a SIFS or later in the CMMG beamformer's TXOP as a response to an NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-33.

Table 10-33—Rules for CMMG beamformee immediate feedback transmission responding to NDP sounding

Type of response	Rule
Control response	If the transmission of a control response frame is required in response to the NDP request for feedback, the control response frame is transmitted a SIFS after reception of the PPDU that elicited the control response, and the feedback response frame may be transmitted a SIFS after the reception of the NDP. — If the feedback response frame is not transmitted a SIFS after the reception of the NDP and the CMMG beamformee is subsequently required to transmit anAck or BlockAck frame in the same TXOP, then the feedback response may be aggregated with the Ack or BlockAck frame. — If the feedback response frame is not transmitted a SIFS after the reception of the NDP and is not transmitted with an aggregated Ack or BlockAck frame in the same TXOP, then the feedback response frame is delayed until the CMMG beamformee's next transmission within the TXOP.
No control response	If the transmission of a control response frame is not required in response to the NDP request for feedback, the feedback response frame may be sent a SIFS after the reception of the NDP. — If the feedback response frame is not transmitted a SIFS after the reception of the NDP and the CMMG beamformee is subsequently required to transmit an Ack or BlockAck frame in the same TXOP, then the feedback response may be aggregated with the Ack or BlockAck frame. — If the feedback response frame is not transmitted a SIFS after the reception of the NDP and is not transmitted with an aggregated Ack or BlockAck frame in the same TXOP, then the feedback response frame is delayed until the CMMG beamformee's next transmission within the TXOP.

When the CMMG beamformee sets the Explicit Compressed Beamforming Feedback Capable field of its CMMG Capabilities element to either 2 or 3 and the CMMG beamformer has transmitted an NDP or a non-NDP explicit compressed beamforming feedback request in a frame that does not require immediate control response, the CMMG beamformer shall not transmit the next PPDU to the beamformee until PIFS after transmitting the sounding request.

A CMMG beamformee shall not transmit Compressed Beamforming frame except in response to a request for feedback.

NOTE 2—Error recovery in a TXOP is not affected by sounding. A beamformer that is a TXOP holder and that fails to receive an expected response to a sounding PPDU can continue transmission as specified in 10.23.2.4.

A CMMG beamformee transmitting a feedback response after a SIFS or later in the beamformer's TXOP shall use an Action No Ack frame defined in 9.3.3.14.

A CMMG beamformee transmitting delayed feedback response shall use an Action frame to send this information within a separate TXOP.

If necessary, the Compressed Beamforming Report field may be split into up to 8 frames. The length of each segment shall be equal number of octets for all segments except the last, which may be smaller.

NOTE 3—A STA that has been granted an RDG can act as a CMMG beamformer during the RDG time period, provided that the RD rules are obeyed.

A CMMG beamformee that advertises itself as delayed-feedback-capable shall not transmit an immediate feedback response unless it also advertises itself as immediate-feedback-capable.

An explicit feedback request may be combined with an MRQ. If the response contains a beamforming feedback matrix, the returned MCS shall be derived from the same information that was used to generate this particular beamforming feedback matrix. If the response contains channel coefficients, the returned MCS shall be derived from an analysis of the sounding frame that was used to generate the channel coefficients. The MFB field set to 127 (meaning no feedback) may be used when the CMMG beamformee is unable to generate the MCS in time for inclusion in the response transmission frame. A CSI-capable STA may be incapable of generating MFB.

Explicit feedback shall be calculated only from a sounding PPDU.

A CMMG beamformee that transmits a feedback frame of type Compressed Beamforming in response to a sounding PPDU sent by a CMMG beamformer shall set the *Nr* Index subfield in the MIMO Control field of the feedback frame to indicate the same value as the number of streams in the sounding PPDU.

A CMMG beamformer shall set the Number of Sounding Dimensions subfield in the CMMG Capabilities element to a value greater than or equal to 1 (2 STS).

10.34 Antenna selection (ASEL)

10.34.1 Introduction

The procedures in this subclause apply only to HT and non-HT PPDUs for which the HT Control field, if present, is the HT variant HT Control field.

ASEL is a time-variant mapping of the signals at the RF chains onto a set of antenna elements when the number of RF chains is smaller than the number of antenna elements. The mapping might be chosen based on instantaneous or averaged CSI. ASEL requires the training of the full size channel associated with all antenna

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

elements, which is obtained by transmitting or receiving sounding PPDUs over all antennas. These sounding PPDUs should be sent within a single TXOP. To avoid channel distortions, these sounding PPDUs shall be transmitted consecutively. The training information is exchanged using the HT Control field. When both transmitter and receiver have ASEL capabilities, training of transmit and receive antennas might be done one after another. ASEL supports up to eight antennas and up to four RF chains.

10.34.2 ASEL frame exchange procedure

A STA shall not initiate an ASEL training frame exchange with another STA unless that STA supports ASEL, as determined by the ASEL Capability field (see 9.4.2.54.7).

A STA that is capable of supporting ASEL should set each subfield of the ASEL Capability field of the HT Capabilities element to 1 depending on its capabilities in HT Capabilities elements that it transmits (see 9.4.2.54.7).

A STA that sets the Explicit CSI Feedback Based Tx ASEL Capable subfield of the ASEL Capability field (see 9.4.2.54.7) to 1 shall set the CSI Max Number of Rows Beamformer Supported subfield of the Transmit Beamforming Capabilities field to an appropriate value, even if the STA sets the Explicit Transmit Beamforming CSI Feedback subfield to the value 0.

The frame exchange for transmit ASEL is shown in Figure 10-56, where the term *ASEL transmitter* identifies the STA that is conducting transmit ASEL, and the term *transmit ASEL responder* identifies the STA that provides ASEL feedback. The frame exchange comprises the following steps:

a) (Optional) A transmit ASEL responder may initiate the transmit ASEL training by sending a +HTC frame with the ASEL Command subfield set to Transmit Antenna Selection Sounding Request (TXASSR).

b) The ASEL transmitter sends out consecutive sounding PPDUs separated by SIFS in a TXOP of which it is the TXOP holder with no acknowledgment over different antenna sets, each PPDU containing a +HTC frame with the ASEL Command subfield set to Transmit Antenna Selection Sounding Indication (TXASSI or TXASSI-CSI). Each sounding PPDU is transmitted over one antenna set.

   If the ASEL transmitter allows antenna indices feedback (by setting the ASEL Command subfield to TXASSI), the antenna sets from which the sounding PPDUs are transmitted shall be disjoint. If the ASEL transmitter uses NDP sounding PPDUs for the ASEL sounding, the spatial mapping matrix Q_k shall be the identity matrix starting with the first NDP. If the ASEL transmitter uses non-NDP sounding PPDUs for the ASEL sounding, the spatial mapping matrix Q_k shall be an FFT matrix. An FFT matrix of size N is defined as a square matrix of dimension NxN with entries w_{im}, i=0, ..., N–1, m=0, ..., N–1 where $w_{im} = \frac{1}{\sqrt{N}} \times \exp\left(-j2\pi\frac{im}{N}\right)$.

   The ASEL transmitter shall not include TXASSI-CSI in the command field of the sounding frame if the last received value of the Explicit CSI Feedback Capable subfield of the ASEL Capability field (see 9.4.2.54.7) from the receiver was 0.

   NOTE 1—For example, in the case of sounding over all disjointed antenna sets, the number of consecutive sounding PPDUs equals the smallest integer that is greater than or equal to the number of antennas divided by the number of RF chains. These sounding PPDUs need to be sent within a single TXOP in order to minimize the change in the channel during this procedure.

c) The transmit ASEL responder estimates the subchannel corresponding to each sounding PPDU.

d) If the ASEL Command subfield in the sounding frames is equal to TXASSI-CSI, after receiving all of the sounding PPDUs, the transmit ASEL responder shall respond with the full size CSI in a subsequent TXOP. If the ASEL Command subfield in the sounding frames is equal to TXASSI, after

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

receiving all of the sounding PPDUs, the transmit ASEL responder may either respond with the full size CSI in a subsequent TXOP, or conduct ASEL computation and provide the selected antenna indices in a subsequent TXOP.

1) CSI is transported using the MIMO CSI Matrices frame defined in 9.6.11.4 contained within either an Action No Ack or Action frame. Multiple CSI frames may be required to provide the complete feedback, in which case the value of the Sounding Timestamp field within each of these CSI frames shall correspond to the arrival time of the sounding frame that was used to generate the feedback information contained in the frame.
2) Antenna indices feedback is carried in the Antenna Selection Indices Feedback frame, defined in 9.6.11.7. One octet of the Antenna Selection Indices field is used to carry the selected antenna indices feedback.

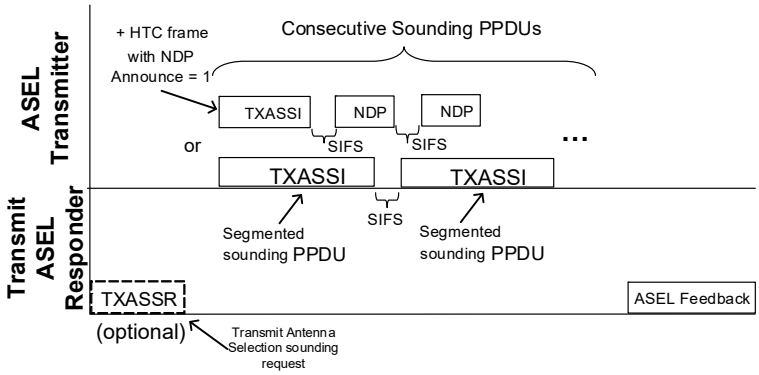

Figure 10-56—Transmit ASEL

If the transmit ASEL responder does not correctly receive all of the sounding PPDUs but has correctly received at least one of the preceding sounding PPDUs, it shall send a +HTC frame with the MAI subfield set to the value ASELI (see Table 9-18), the ASEL Command subfield set to No Feedback Due to ASEL Training Failure or Stale Feedback to indicate the failure of the ASEL training process, and the ASEL Data subfield set to either of the following:

— The integer value corresponding to the number in sequence of the first sounding PPDU that was not properly received, where 0 corresponds to the first sounding PPDU in the ASEL training sequence or
— The value 0

A transmit ASEL responder that determines that the ASEL feedback is stale shall notify the ASEL transmitter by transmitting a +HTC MPDU with the MAI subfield set to ASELI, the ASEL Command subfield set to No Feedback Due to ASEL Training Failure or Stale Feedback, and the ASEL Data subfield set to 0.

If, in response to the transmission of a sequence of sounding PPDUs, the ASEL transmitter receives a +HTC MPDU with the MAI subfield equal to ASELI, the ASEL Command subfield equal to No Feedback Due to ASEL Training Failure or Stale Feedback, and the ASEL Data subfield not equal to 0 to indicate a failed ASEL training frame exchange, the ASEL transmitter may perform any of the following actions:

— Do nothing.
— Restart the failed ASEL training frame exchange from the point of failure by transmitting a +HTC MPDU with the MAI subfield set to ASELI, the ASEL Command subfield set to TXASSR, and the ASEL Data subfield set to a nonzero value to correspond to the command Transmit Antenna Selection Sounding Resumption (a Resumption MPDU), where the ASEL Data subfield value is the order number (from the original training frame sequence) of the first sounding PPDU transmitted in

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the restarted ASEL training frame sequence and where 0 corresponds to the first sounding PPDU in the original ASEL training sequence.

— Execute a new ASEL training frame sequence by transmitting a +HTC MPDU with the MAI subfield set to ASELI, the ASEL Command subfield set to TXASSI or TXASSI-CSI, and the ASEL Data subfield set to a nonzero value.

If a transmit ASEL responder receives a +HTC MPDU with the MAI subfield equal to ASELI, the ASEL Command subfield equal to TXASSR, and the ASEL Data subfield not equal to 0 to correspond to the command Transmit Antenna Selection Sounding Resumption (a Resumption MPDU), the transmit ASEL responder shall respond to the training sequence according to the original command value (i.e., TXASSI or TXASSI-CSI) and shall assume a total number of sounding PPDUs that corresponds to the number of sounding PPDUs from the original command frame. The number of sounding frames that follow the Resumption MPDU is equal to the number of sounding PPDUs from the original command frame minus the order number transmitted in the ASEL Data subfield of the Resumption MPDU.

The frame exchange for receive ASEL is shown in Figure 10-57, where the term *ASEL receiver* identifies the STA that is conducting receive ASEL, and the term *ASEL sounding-capable transmitter* identifies the STA sending the consecutive sounding PPDUs used for receive ASEL calculations. The frame exchange comprises the following steps:

— The ASEL receiver transmits a +HTC frame with the MAI subfield set to ASELI, the ASEL Command subfield set to Receive Antenna Selection Sounding Request (RXASSR), and the ASEL Data subfield set to the number of sounding PPDUs required.

NOTE 2—For example, in the case of sounding over all disjointed antenna sets, the number of total consecutive sounding PPDUs or NDPs equals the smallest integer that is greater than or equal to the number of antennas divided by the number of RF chains.

— The ASEL sounding-capable transmitter responds with the corresponding number of sounding PPDUs in its subsequent TXOP. These PPDUs are separated by SIFS. When using non-NDP sounding, each PPDU contains a +HTC frame in which the MAI subfield is set to ASELI, the ASEL Command subfield is set to Receive Antenna Selection Sounding Indication (RXASSI), and the ASEL Data subfield is set to the remaining number of sounding PPDUs to be transmitted. When using NDP sounding, the PPDU that precedes the first NDP contains a +HTC frame in which the NDP Announce field is set to 1, the MAI subfield is set to ASELI, the ASEL Command subfield is set to RXASSI, and the ASEL Data subfield is set to the remaining number of sounding PPDUs to be transmitted.

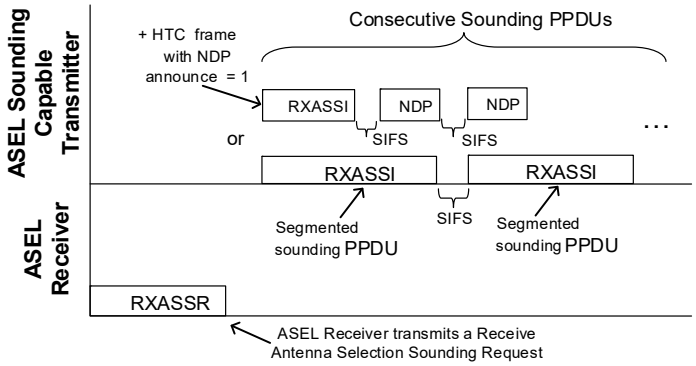

Figure 10-57—Receive ASEL

The ASEL receiver uses different antenna sets to receive these sounding PPDUs, estimates CSI after receiving all these sounding PPDUs, and conducts the ASEL.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When transmitting the consecutive sounding PPDUs in transmit and receive ASEL exchanges (illustrated in Figure 10-56 and Figure 10-57), the transmitter shall not change the TXPWR_LEVEL_INDEX parameter of the TXVECTOR.

When transmitting a sounding PPDU sent in transmit and receive ASEL exchanges (illustrated in Figure 10-56 and Figure 10-57), if the Receive Staggered Capability subfield of the Transmit Beamforming Capability field of the HT Capabilities element transmitted by the intended receiver is 0, then,

— If the sounding PPDU is not an NDP, the number of antennas used by the sender, as indicated by the ANTENNA_SET parameter in the TXVECTOR, shall be less than or equal to the maximum number of space-time streams indicated by the Rx MCS Bitmask subfield of the Supported MCS Set field and the Rx STBC subfield of the HT Capabilities element transmitted by the intended receiver.
— If the sounding PPDU is an NDP, the number of antennas used by the sender, as indicated by the ANTENNA_SET parameter in the TXVECTOR, shall be less than or equal to the number indicated by the Channel Estimation Capability subfield of the Transmit Beamforming Capability field of the HT Capabilities element transmitted by the intended receiver.

When both transmitter and receiver have ASEL capabilities, the following constraints apply:

— During a transmit ASEL frame exchange, the transmit ASEL responder shall use a subset of antennas that does not change during the reception of all of the sounding PPDUs of the ASEL sounding sequence.
— During a receive ASEL frame exchange, the ASEL sounding-capable transmitter shall use a subset of antennas that does not change during the transmission of all of the sounding PPDUs of the ASEL sounding sequence.

NOTE 3—When a receiver (either a transmit ASEL responder or an ASEL receiver) conducts ASEL computations (for either transmit or receive ASEL), if there is no transmit beamforming conducted at the same time, to achieve the best performance of ASEL, the receiver assumes that the first N_{STS} columns of the same spatial mapping matrix Q_k used for transmitting ASEL sounding PPDUs, where N_{STS} is the number of space-time streams, are applied for the spatial mapping at the ASEL transmitter after the ASEL exchange as in Figure 10-56 and Figure 10-57. To achieve the best performance of ASEL, the ASEL transmitter applies the first N_{STS} columns of the same Q_k for spatial mapping after the ASEL exchange as in Figure 10-56 and Figure 10-57.

10.35 Null data PPDU (NDP) sounding

10.35.1 HT NDP sounding protocol

Sounding may be accomplished using either staggered sounding PPDU or HT NDP, as described in 19.3.13. The MAC rules associated with sounding using HT NDP are described in 10.35.1 to 10.35.4.

An HT STA that has set the Receive NDP Capable field of its HT Capabilities element to 1 during association processes an HT NDP as a sounding PPDU if the destination of the sounding PPDU is determined to match itself as described in 10.35.3 and if the source of the sounding PPDU can be ascertained as described in 10.35.4.

An RXVECTOR LENGTH parameter equal to 0 indicates that an HT PPDU is an HT NDP.

A STA that is a TXOP holder or an RD responder shall not set both the HT NDP Announcement and RDG/More PPDU subfields to 1 simultaneously. The Calibration Position subfield shall not be set to any value except 0 and 1 in any +HTC frame in a PPDU that is also an HT NDP announcement. The Calibration Position subfield shall be set to 0 in any +HTC frame in a PPDU that is an HT NDP announcement that also contains any +HTC frame with the MAI subfield equal to ASELI. The Calibration Position subfield shall be set to 0 in all +HTC frames in a PPDU that is an HT NDP announcement and that contains any +HTC frame with the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

MRQ subfield equal to 1. The TRQ field shall be set to 0 in all +HTC frames in a PPDU that is an HT NDP announcement.

An NDP sequence contains at least one HT NDP and at least one PPDU that is not an NDP. Only one PPDU in the NDP sequence may contain an HT NDP announcement. An NDP sequence begins with an HT NDP announcement. The NDP sequence ends at the end of the transmission of the last HT NDP that is announced by the HT NDP announcement. A STA that transmits the first PPDU of an NDP sequence is the NDP sequence owner. In the NDP sequence, only PPDUs that are HT NDPs and PPDUs each carrying a Control frame as an S-MPDU may follow the NDP sequence's starting PPDU.

A STA shall transmit only one HT NDP per HT NDP announcement, unless the HT NDP announcement includes a value in the ASEL Data subfield of the ASEL Command subfield of the HTC Control field that is greater than one. Each PPDU in an NDP sequence shall start a SIFS after end of the previous PPDU.

A STA shall not transmit a VHT NDP in an NDP sequence that contains an HT NDP announcement.

A CTS frame that is a +HTC frame shall not contain the HT NDP Announcement subfield set to 1.

NOTE 1—A CTS frame cannot be used for HT NDP announcement: if the CTS frame is a response to an RTS frame, the optional NAV reset timeout that starts at the end of the RTS frame does not include the additional HT NDP and SIFS (see 10.3.2.4). Also, if the CTS were the first frame of an NDP sequence, it would not be possible to determine the destination address of the HT NDP.

A STA shall transmit an HT NDP as follows:

a) A SIFS after sending a PPDU that is an HT NDP announcement and that does not contain an MPDU that requires an immediate response.

b) A SIFS after receiving a correctly formed and addressed immediate response to a PPDU that is an HT NDP announcement and that contains an MPDU that requires an immediate response.

c) A SIFS after transmitting an HT NDP if the HT NDP announcement contains an ASEL Command subfield equal to TXASSI, TXASSI-CSI, or RXASSI and the ASEL Data subfield is equal to a value greater than 0 and if the number of HT NDPs sent before this one is less than the value in the ASEL Data subfield + 1.

   NOTE 2—The total number of sent HT NDPs is equal to the value of in the ASEL Data subfield + 1.

d) A SIFS after receiving an HT NDP from a STA whose HT NDP announcement contained one or more +HTC frames with the Calibration Position subfield equal to 1, when the receiving STA supports transmitting sounding PPDUs for which more than one channel dimension can be estimated (i.e., more than one column of the MIMO channel matrix).

This rule enables the NDP receiver to know that it will receive an HT NDP and can determine the source and destination of the HT NDP. It enables the receiver and transmitter to know when the immediate response and HT NDP will be transmitted relative to the frame containing the HT NDP announcement indication.

A STA that has transmitted an HT NDP announcement in a frame that requires an immediate response and that does not receive the expected response shall terminate the NDP sequence at that point (i.e., the STA does not transmit an HT NDP in the current NDP sequence).

A STA that has received an HT NDP announcement in a +HTC with the Calibration Position equal to 1 or 2, and that does not receive the expected HT NDP shall terminate the NDP sequence at that point (i.e., does not transmit an HT NDP in the current NDP sequence) and not transmit any further frames that are a part of this calibration sequence shown in Step 1 of Figure 10-54.

Feedback information generated from the reception of an HT NDP is transmitted using any of the feedback rules and signaling as appropriate, e.g., immediate or delayed.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

10.35.2 Transmission of an HT NDP

A STA that transmits an HT NDP shall set the LENGTH, SOUNDING, STBC, MCS, and NUM_EXTEN_SS parameters of the TXVECTOR as specified in this subclause.

— LENGTH shall be set to 0.
— SOUNDING shall be set to SOUNDING.
— STBC shall be set to 0.
— MCS shall indicate two or more spatial streams.

The number of spatial streams sounded is indicated by the MCS parameter of the TXVECTOR and shall not exceed the limit indicated by the Channel Estimation Capability field in the Transmit Beamforming Capabilities field transmitted by the STA that is the intended receiver of the HT NDP. The MCS parameter may be set to any value, subject to the constraint of the previous sentence, regardless of the value of the Supported MCS Set field of the HT Capabilities field at either the transmitter or recipient of the HT NDP. A STA shall set the NUM_EXTEN_SS parameter of the TXVECTOR to 0 in the PHY-TXSTART.request primitive corresponding to an HT NDP transmission.

A STA shall not transmit an HT NDP announcement with an RA corresponding to another STA unless it has received an HT Capabilities element from the destination STA in which the Receive NDP Capable field is equal to 1.

10.35.3 Determination of HT NDP destination

The destination of an HT NDP is determined at the NDP receiver by examining the HT NDP announcement as follows:

— The destination of the first HT NDP in the NDP sequence is equal to the RA of any MPDU within HT NDP announcement.
— If Calibration Position subfield is equal to 1 in the HT NDP announcement at the NDP receiver, the destination of the second HT NDP is equal to the TA of that frame. Otherwise, the destination of the second and any subsequent HT NDPs is equal to the destination of the previous HT NDP.

See O.4 for an illustration of these rules.

10.35.4 Determination of HT NDP source

The source of an HT NDP is determined at the NDP receiver by examining the NDP sequences's starting PPDU as follows:

— If any MPDU within the HT NDP announcement contains two or more addresses, the source of the first HT NDP is equal to the TA of that frame.
— Otherwise (i.e., the HT NDP announcement contains one address), the source of the first HT NDP is equal to the RA of the MPDU to which the HT NDP announcement is a response.
— If the Calibration Position subfield is equal to 1 in an MPDU in the HT NDP announcement, the source of the second HT NDP is equal to the RA of that MPDU. Otherwise, the source of the second and any subsequent HT NDPs is equal to the source of the previous NDP.

See O.4 for an illustration of these rules.

10.35.5 VHT sounding protocol

10.35.5.1 General

Transmit beamforming and DL MU-MIMO require knowledge of the channel state to compute a steering matrix that is applied to the transmitted signal to optimize reception at one or more receivers. The STA transmitting using the steering matrix is called the *VHT beamformer*, and a STA for which reception is optimized is called a *VHT beamformee*. An explicit feedback mechanism is used where the VHT beamformee directly measures the channel from the training symbols transmitted by the VHT beamformer and sends back a transformed estimate of the channel state to the VHT beamformer. The VHT beamformer then uses this estimate, perhaps combining estimates from multiple VHT beamformees, to derive the steering matrix.

If dot11VHTSUBeamformerOptionImplemented is true, a STA shall set the SU Beamformer Capable field in the VHT Capabilities element to 1. If dot11VHTSUBeamformeeOptionImplemented is true, a STA shall set the SU Beamformee Capable field in the VHT Capabilities element to 1.

If dot11VHTMUBeamformerOptionImplemented is true, a STA shall set the MU Beamformer Capable field in the VHT Capabilities element to 1. If dot11VHTMUBeamformeeOptionImplemented is true, a STA shall set the MU Beamformee Capable field in the VHT Capabilities element to 1.

If dot11VHTMUBeamformerOptionImplemented is true, a STA shall set dot11VHTSUBeamformerOptionImplemented to true. If dot11VHTMUBeamformeeOptionImplemented is true, a STA shall set dot11VHTSUBeamformeeOptionImplemented to true.

A STA is a VHT SU-only beamformer if it sets the SU Beamformer Capable field to 1 but sets the MU Beamformer Capable field to 0 in transmitted VHT Capabilities elements. A STA is an SU-only beamformee if it sets the SU Beamformee Capable field to 1 but sets the MU Beamformee Capable field to 0 in transmitted VHT Capabilities elements.

If dot11VHTSUBeamformerOptionImplemented is false, a STA shall not act in the role of a VHT beamformer. If dot11VHTSUBeamformeeOptionImplemented is false, a STA shall not act in the role of a VHT beamformee.

For an S1G STA, the S1G sounding protocol is specified in 10.35.5 with “VHT” replaced by “S1G”, except in this sentence.

A VHT beamformer shall set the Number Of Sounding Dimensions subfield in the VHT Capabilities element to a value greater than or equal to 1 (2 STS). A VHT beamformee shall set the Beamformee STS Capability subfield in the VHT Capabilities element to a value greater than or equal to 1 (2 STS).

VHT compressed beamforming feedback comprises the VHT Compressed Beamforming Report information (see Table 9-105) and the MU Exclusive Beamforming Report information (see Table 9-108). Subclause 9.6.22.2 specifies how VHT compressed beamforming feedback is converted into a VHT Compressed Beamforming frame, and it also specifies the rules for the presence or absence of the two fields listed here.

10.35.5.2 Rules for VHT sounding protocol sequences

A VHT beamformer shall initiate a sounding feedback sequence by transmitting a VHT NDP Announcement frame followed by a VHT NDP after a SIFS. The VHT beamformer shall include in the VHT NDP Announcement frame one STA Info field for each VHT beamformee that is expected to prepare VHT compressed beamforming feedback and shall identify the VHT beamformee by including the VHT beamformee’s AID in the AID12 subfield of the STA Info field. The VHT NDP Announcement frame shall include at least one STA Info field.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—A STA that transmits a VHT NDP Announcement frame to a TDLS peer STA obtains the AID for the peer STA from the TDLS Setup Request or TDLS Setup Response frame.

A VHT beamformer shall not transmit either a VHT NDP Announcement+HTC frame or a Beamforming Report Poll+HTC frame that contains an HT variant HT Control field.

A VHT NDP shall be transmitted only following a SIFS after a VHT NDP Announcement frame. A VHT NDP Announcement frame shall be followed by a VHT NDP after a SIFS.

A VHT beamformer that has not received a VHT Capabilities element from a STA or where the last VHT Capabilities element received from a STA has the SU Beamformee Capable field set to 0 shall not transmit either of the following:

— A VHT NDP Announcement frame addressed to the STA or that includes the STA's AID in one of the STA Info fields
— A Beamforming Report Poll frame addressed to the STA

A VHT beamformer that transmits a VHT NDP Announcement frame to a VHT SU-only beamformee shall include only one STA Info field in the VHT NDP Announcement frame and set the Feedback Type subfield of the STA Info field to SU.

An S1G beamformee with dot11NDPBeamformingReportPollImplemented equal to true shall set the NDP Beamforming Report Poll Supported field in the S1G Capabilities element to 1. Otherwise it shall set the NDP Beamforming Report Poll Supported field in the S1G Capabilities element to 0.

An S1G beamformer may transmit NDP Beamforming Report Poll frames instead of VHT Beamforming Report Poll frames to an S1G beamformee from which it has received a frame containing an S1G Capabilities element with the NDP Beamforming Report Poll Supported field equal to true; otherwise, the S1G beamformer shall not transmit NDP Beamforming Report Poll frames to the S1G beamformee. A non-S1G beamformer or an S1G beamformer working on 1 MHz channel shall not transmit NDP Beamforming Report Poll frames. A non-AP S1G beamformer shall not transmit NDP Beamforming Report Poll frames to a non-AP beamformee.

If the VHT NDP Announcement frame includes more than one STA Info field, the RA of the VHT NDP Announcement frame shall be set to the broadcast address. If the VHT NDP Announcement frame includes a single STA Info field, the RA of the VHT NDP Announcement frame shall be set to the MAC address of the VHT beamformee.

A VHT NDP Announcement frame shall not include two or more STA Info fields with same value in the AID12 subfield.

A VHT beamformer that transmits a VHT NDP Announcement frame to a VHT beamformee that is an AP, mesh STA or IBSS STA, shall include a single STA Info field in the VHT NDP Announcement frame and shall set the AID12 subfield in the STA Info field to 0.

A VHT NDP Announcement frame with more than one STA Info field shall not carry a VHT variant HT Control field, unless all of the STAs listed in the AID12 subfield of the STA Info fields have set +HTC-VHT Capable to 1 in the VHT Capabilities Information field.

A VHT beamformer that transmits a VHT NDP Announcement frame with more than one STA Info field should transmit any Beamforming Report Poll frames used to retrieve VHT compressed beamforming feedback from the intended VHT beamformees in the same TXOP. If the duration of the TXOP that contained the VHT NDP Announcement frame has insufficient duration to accommodate the transmission of all of the feedback reports, the VHT beamformer may poll for the remaining VHT compressed beamforming feedback in subsequent TXOPs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A VHT beamformer may use worst-case parameters to estimate the duration of the expected frame(s) that contain(s) the feedback response(s), e.g. the lowest rate/MCS in the basic rate/MCS set, no grouping, and the highest-precision codebook.

NOTE 2—The transmission of the VHT NDP Announcement, VHT NDP, VHT Compressed Beamforming, and Beamforming Report Poll frames is subject to the rules in 10.23.2.8.

A VHT beamformer that sets the Feedback Type subfield of a STA Info field to MU shall set the Nc Index subfield of the same STA Info field to a value less than or equal to the minimum of both of the following:

— The maximum number of supported spatial streams for receive operation according to the combination of the corresponding VHT beamformee's Rx VHT-MCS Map subfield in the Supported VHT-MCS and NSS Set field and VHT Capabilities Information field
— The maximum number of supported spatial streams according to the Rx NSS subfield value and, when the value of the VHT Extended NSS BW Capable subfield received from the VHT beamformee is 1 and dot11ExtendedNSSSupported is equal to true, the 160/80+80 BW subfield value in the Operating Mode field of the most recently received Operating Mode Notification frame or Operating Mode Notification element with the Rx NSS Type subfield equal to 0 from the corresponding VHT beamformee, as computed according to 10.6.13.1

A non-AP VHT beamformee that receives a VHT NDP Announcement frame from a VHT beamformer with which it is associated or has an established TDLS session and that contains the VHT beamformee's AID in the AID12 subfield of the first (or only) STA Info field and also receives a VHT NDP a SIFS after the VHT NDP Announcement frame shall transmit the PPDU containing its VHT compressed beamforming feedback a SIFS after the VHT NDP. A VHT beamformee that is an AP, mesh STA, or IBSS STA, that receives a VHT NDP Announcement frame with the RA matching its MAC address and the AID12 subfield of the only STA Info field set to 0, and that also receives a VHT NDP a SIFS after the VHT NDP Announcement frame shall transmit the PPDU containing its VHT compressed beamforming feedback a SIFS after the VHT NDP. The TXVECTOR parameter CH_BANDWIDTH of the PPDU containing the VHT compressed beamforming feedback shall be set to indicate a bandwidth not wider than that indicated in the RXVECTOR parameter CH_BANDWIDTH of the received VHT NDP. A STA shall discard received VHT NDP Announcement, VHT NDP, and Beamforming Report Poll frames if dot11VHTSUBeamformeeOptionImplemented is false.

A VHT beamformee shall indicate the maximum number of space-time streams it can receive in a VHT NDP in the Beamformee STS Capability subfield of the VHT Capabilities Information field of the VHT Capabilities element. If the beamformee is a non-AP STA, this shall be less than or equal to the maximum total number of space-time streams that the STA can receive in a VHT MU PPDU.

An example of the VHT sounding protocol with a single VHT beamformee is shown in Figure 10-58.

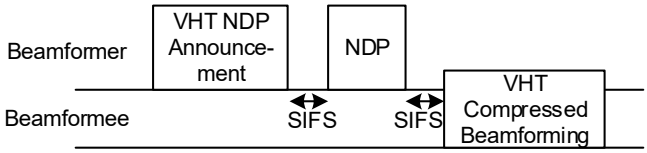

Figure 10-58—Example of the sounding protocol with a single VHT beamformee

A non-AP VHT beamformee that receives a VHT NDP Announcement frame from a VHT beamformer with which it is associated or has an established TDLS session and that contains the VHT beamformee's AID in the AID12 subfield of a STA Info field that is not the first STA Info field shall transmit its VHT compressed beamforming feedback a SIFS after receiving a Beamforming Report Poll with RA matching its MAC address and a nonbandwidth signaling TA obtained from the TA field matching the MAC address of the VHT beamformer. If the RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT of the received Beamforming

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Report Poll frame is valid, the TXVECTOR parameter CH_BANDWIDTH of the PPDU containing the VHT compressed beamforming feedback shall be set to indicate a bandwidth not wider than that indicated by the RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT of the Beamforming Report Poll frame; otherwise, the TXVECTOR parameter CH_BANDWIDTH of the PPDU containing VHT compressed beamforming feedback shall be set to indicate a bandwidth not wider than that indicated by the RXVECTOR parameter CH_BANDWIDTH of the Beamforming Report Poll frame.

An example of the VHT sounding protocol with more than one VHT beamformee is shown in Figure 10-59.

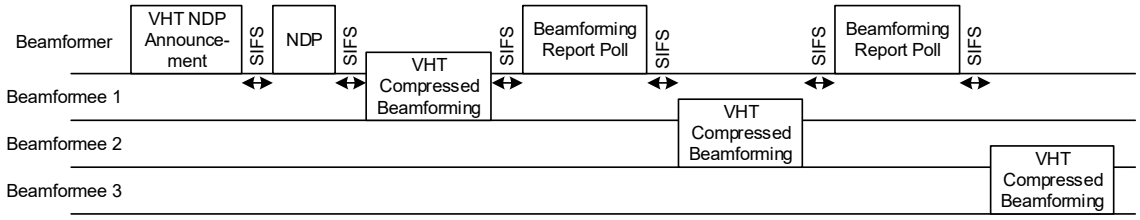

Figure 10-59—Example of the sounding protocol with more than one VHT beamformee

The RA field of the VHT Compressed Beamforming frame(s) of the VHT compressed beamforming feedback shall be set to a nonbandwidth signaling TA obtained from the TA field of the VHT NDP Announcement frame or the Beamforming Report Poll frame to which this VHT compressed beamforming feedback is a response.

If the VHT Beamformee is transmitting VHT Compressed Beamforming frame(s) a SIFS after the VHT NDP, then the VHT Compressed Beamforming frame(s) shall include the VHT Compressed Beamforming Report information and, for the case of MU feedback, the MU Exclusive Beamforming Report information.

A VHT beamformee that transmits a VHT Compressed Beamforming frame shall set the Feedback Type field in the VHT MIMO Control field to the same value as the Feedback Type field in the corresponding STA Info field in the VHT NDP Announcement frame. If the Feedback Type field indicates MU, the STA shall send a VHT Compressed Beamforming frame with the Nc Index field value in the VHT MIMO Control field equal to the minimum of all of the following:

— The Nc Index field value in the corresponding STA Info field in the VHT NDP Announcement Frame
— The maximum number of supported spatial streams for receive operation according to the combination of its Rx VHT-MCS Map subfield in the Supported VHT-MCS and NSS Set field, VHT Capabilities Information field and Operating Mode field (see 10.6.13.1)
— The maximum number of supported spatial streams according to the Rx NSS subfield value and, when the value of the most recently transmitted VHT Extended NSS BW Capable subfield is 1, the 160/80+80 BW subfield value in the Operating Mode field of the most recently transmitted Operating Mode Notification frame or Operating Mode Notification element, as computed according to 10.6.13.1

If the Feedback Type indicates SU, the Nc Index field value in the VHT MIMO Control field is determined by the VHT beamformee.

The Nr Index field in the VHT MIMO Control field shall be set to the same value as the RXVECTOR parameter NUM_STS of the corresponding VHT NDP. The Nc Index field shall not be set to a value larger than the Nr Index value in the VHT MIMO Control field. A VHT beamformee shall set the value of the Channel Width subfield in the VHT MIMO Control field of a VHT Compressed Beamforming frame to the same value as the RXVECTOR parameter CH_BANDWIDTH of the corresponding VHT NDP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A VHT beamformee shall not include MU Exclusive Beamforming Report information in VHT compressed beamforming feedback if the Feedback Type subfield in the MIMO Control field of the VHT Compressed Beamforming frame(s) indicates SU. A VHT beamformee shall include both VHT Compressed Beamforming Report information and MU Exclusive Beamforming Report information in VHT compressed beamforming feedback if the Feedback Type subfield in the MIMO Control field of the VHT Compressed Beamforming frame(s) indicates MU.

A VHT beamformee that transmits VHT compressed beamforming feedback shall include neither the VHT Compressed Beamforming Report information nor the MU Exclusive Beamforming Report information, if the transmission duration of the PPDU carrying the VHT Compressed Beamforming Report information and any MU Exclusive Beamforming Report information would exceed the maximum PPDU duration.

The value of the Sounding Dialog Token Number subfield in the VHT MIMO Control field shall be set to the same value as the Sounding Dialog Token Number subfield in the Sounding Dialog Token field in the corresponding VHT NDP Announcement frame.

NOTE 3—The VHT beamformer can use the sounding dialog token in the VHT Compressed Beamforming frame(s) of the VHT compressed beamforming feedback to associate the feedback with a prior VHT NDP Announcement frame and thus compute the delay between sounding and receiving the feedback. The VHT beamformer can use this delay time when making a decision regarding the applicability of the feedback for the link.

NOTE 4—Recovery in the case of a missing response to a VHT NDP Announcement or Beamforming Report Poll frame follows the rules for multiple frame exchange sequence in an EDCA TXOP (see 10.23.2.8).

In a frame transmitted by a TVHT STA, the TVHT Compressed Beamforming Report field replaces the VHT Compressed Beamforming Report field.

In a frame transmitted by a TVHT STA, the TVHT MU Exclusive Beamforming Report field replaces the MU Exclusive Beamforming Report field.

10.35.5.3 Rules for fragmented feedback in VHT sounding protocol sequences

VHT compressed beamforming feedback shall be transmitted in a single VHT Compressed Beamforming frame unless the result would be a VHT Compressed Beamforming frame that exceeds the VHT beamformer’s maximum MPDU length capability.

NOTE 1—The requirement that the VHT compressed beamforming feedback is transmitted in a single VHT Compressed Beamforming frame implies that the VHT beamformee might have to transmit an MPDU that is bigger than its receive capability.

If VHT compressed beamforming feedback would result in a VHT Compressed Beamforming frame that exceeds the VHT beamformer’s maximum MPDU length capability, the VHT compressed beamforming feedback shall be split into up to 8 feedback segments, with each feedback segment sent in a different VHT Compressed Beamforming frame and containing successive portions of the VHT compressed beamforming feedback consisting of the VHT Compressed Beamforming Report information followed by any MU Exclusive Beamforming Report information. Each of the feedback segments except the last shall be transmitted in a frame that contains the maximum number of octets allowed by the VHT beamformer’s maximum MPDU length capability. The last feedback segment may be transmitted in a smaller frame. Each feedback segment is identified by the value of the Remaining Feedback Segments subfield and the First Feedback Segment subfield in the VHT MIMO Control field as defined in 9.4.1.46; the other nonreserved subfields of the VHT MIMO Control field shall be the same for all feedback segments. All feedback segments shall be sent in a single A-MPDU and shall be included in the A-MPDU in the descending order of the Remaining Feedback Segments subfield values.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 2—The feedback segment of VHT compressed beamforming feedback are not MSDU/MMPDU fragments, rather each feedback segment, together with the other fields in the Frame Body field of the VHT Compressed Beamforming frame (see Figure 9-128 and 9.6.22.2), constitutes a single unfragmented MMPDU.

A VHT beamformer, in its first attempt to retrieve VHT compressed beamforming feedback from a VHT beamformee that is not the one indicated by the first STA Info field, shall transmit a Beamforming Report Poll frame to poll all possible feedback segments of the VHT compressed beamforming feedback from the VHT beamformee, by setting all of the bits in the Feedback Segment Retransmission Bitmap field of the Beamforming Report Poll frame to 1.

If a VHT beamformer fails to receive some or all feedback segments of VHT compressed beamforming feedback, the VHT beamformer may, subject to the condition on VHT SU-only beamformees described at the end of this subclause, request a selective retransmission of missing feedback segments by transmitting a Beamforming Report Poll frame with the Feedback Segment Retransmission Bitmap field set as described in 9.3.1.20 to indicate the feedback segments requested for retransmission. If the VHT beamformer fails to receive the feedback segment with the First Feedback Segment field set to 1, the VHT beamformer may request a selective retransmission of missing feedback segments assuming the VHT compressed beamforming feedback is split into 8 feedback segments. The VHT beamformer may also request the retransmission of all feedback segments by setting all of the bits in the Feedback Segment Retransmission Bitmap field of the Beamforming Report Poll frame to 1.

A VHT beamformee that transmits VHT compressed beamforming feedback including the VHT Compressed Beamforming Report information and any MU Exclusive Beamforming Report information in response to a Beamforming Report Poll frame shall either transmit only the feedback segments indicated in the Feedback Segment Retransmission Bitmap field in the Beamforming Report Poll frame excluding the indicated feedback segments that do not exist at the VHT beamformee or transmit all of the feedback segments that exist at the VHT beamformee disregarding the Feedback Segment Retransmission Bitmap field in the Beamforming Report Poll frame.

A VHT beamformer shall not transmit a Beamforming Report Poll frame to a VHT SU-only beamformee unless the VHT beamformer has received at least one feedback segment of the VHT compressed beamforming feedback from the VHT beamformee in the current frame exchange sequence.

In a frame transmitted by a TVHT STA, the TVHT Compressed Beamforming Report field replaces the VHT Compressed Beamforming Report field.

In a frame transmitted by a TVHT STA, the TVHT MU Exclusive Beamforming Report field replaces the MU Exclusive Beamforming Report field.

10.35.6 Transmission of a VHT NDP

A VHT NDP shall use the SU PPDU format as described in 21.1.4. A STA shall transmit a VHT NDP using the following TXVECTOR parameters:

- APEP_LENGTH set to 0
- NUM_USERS set to 1
- NUM_STS indicates two or more space-time streams
- CH_BANDWIDTH set to the same value as the TXVECTOR parameter CH_BANDWIDTH in the preceding VHT NDP Announcement frame
- GROUP_ID and PARTIAL_AID are set as described in 10.19

The number of space-time streams sounded and as indicated by the NUM_STS parameter shall not exceed the value indicated in the Beamformee STS Capability field in the VHT Capabilities element of any intended recipient of the VHT NDP. The NUM_STS parameter may be set to any value, subject to the constraint of the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

previous sentence, regardless of the value of the Supported VHT-MCS and NSS Set field of the VHT Capabilities element at either the transmitter or recipient of the NDP.

If an HE STA transmits a VHT NDP where at least one of the intended recipients of the VHT NDP is an HE STA, then the following conditions apply:

— If the bandwidth of an VHT NDP is less than or equal to 80 MHz, the number of space-time streams sounded as indicated by the TXVECTOR parameter NUM_STS shall not exceed the value indicated in the Beamformee STS ≤ 80 MHz subfield in the HE Capabilities element of any intended HE STA recipient of the VHT NDP.

— If the bandwidth of an VHT NDP is greater than 80 MHz, the number of space-time streams sounded as indicated by the TXVECTOR parameter NUM_STS shall not exceed the value indicated in the Beamformee STS > 80 MHz subfield in the HE Capabilities element of any intended HE STA recipient of the VHT NDP.

The intended receiver of a VHT NDP is identified by the RA of the immediately preceding VHT NDP Announcement frame.

The transmitter of a VHT NDP is identified by the TA of the immediately preceding VHT NDP Announcement frame.

10.35.7 Transmission of an S1G NDP

An S1G NDP shall use the 2 MHz short format as described in 23.1.4. An S1G STA transmitting an S1G NDP shall use the following TXVECTOR parameters:

— APEP_LENGTH set to 0 if AGGREGATION is equal to AGGREGATED
— PSDU_LENGTH set to 0 if AGGREGATION is equal to NOT_AGGREGATED
— NUM_USERS set to 1
— CH_BANDWIDTH set to the same value as the TXVECTOR parameter CH_BANDWIDTH in the preceding VHT NDP Announcement frame carried in an S1G PPDU
— NUM_STS indicates two or more space-time streams
— PARTIAL_AID set as described in 10.21
— NDP_INDICATION set to 0
— RESPONSE_INDICATION set to Long Response

The number of space-time streams sounded as indicated by the NUM_STS parameter shall not exceed the value indicated in the Beamformee STS Capability field in the S1G Capabilities element of any intended recipient of the S1G NDP. The NUM_STS parameter may be set to any value, subject to the constraint of the previous sentence, regardless of the value of the Supported S1G-MCS and NSS Set field of the S1G Capabilities element transmitted by either the transmitter or recipient of the S1G NDP.

The intended receiver of an S1G NDP is identified by the RA of the immediately preceding VHT NDP Announcement frame carried in an S1G PPDU.

The transmitter of an S1G NDP is identified by the TA of the immediately preceding VHT NDP Announcement frame carried in an S1G PPDU.

10.36 Null data PPDU (NDP) sounding for CMMG STAs

10.36.1 NDP rules

Sounding may be accomplished using a CMMG NDP, as described in 25.6.8.14. The MAC rules associated with sounding using a CMMG NDP are described in 10.36.1 and 10.36.2.

A CMMG STA that has set the Receive NDP Capable field of its CMMG Capabilities element to 1 during association processes a CMMG NDP as a sounding PPDU if the destination of the sounding PPDU is determined to match itself and if the source of the sounding PPDU can be ascertained.

An RXVECTOR LENGTH parameter equal to 0 indicates that the PPDU is a CMMG NDP.

A STA that is a TXOP holder or an RD responder shall not set both the CMMG NDP Announcement and RDG/More PPDU subfields to 1 in the same frame.

An NDP sequence contains at least one CMMG NDP and at least one PPDU that is not an NDP. Only one PPDU in the NDP sequence may contain a CMMG NDP announcement. A *CMMG NDP announcement* is a PPDU containing a +HTC frame with the CMMG NDP Announcement subfield set to 1. An NDP sequence begins with a CMMG NDP announcement. The NDP sequence ends at the end of the transmission of the last CMMG NDP that is announced by the CMMG NDP announcement. A STA that transmits the first PPDU of an NDP sequence is the NDP sequence owner. In the NDP sequence, only PPDUs that are CMMG NDPs and PPDUs each carrying a Control frame as an S-MPDU may follow the NDP sequence's starting PPDU.

A STA shall transmit only one CMMG NDP per NDP announcement. Each PPDU in an NDP sequence shall start a SIFS after end of the previous PPDU.

NOTE—A CTS frame cannot be used for CMMG NDP announcement even if it is in a Control Wrapper frame; if the CTS frame is a response to an RTS frame, the optional NAV reset timeout that starts at the end of the RTS frame does not include the additional CMMG NDP and SIFS. Also, if the CTS frame were the first frame of an NDP sequence, it would not be possible to determine the destination address of the CMMG NDP.

A STA shall transmit a CMMG NDP as follows:

a) A SIFS after sending a CMMG NDP announcement and that does not contain an MPDU that requires an immediate response.
b) A SIFS after receiving a correctly formed and addressed immediate response to a CMMG NDP announcement and that contains an MPDU that requires an immediate response.

This rule enables the NDP receiver to know that it receives a CMMG NDP and can determine the source and destination of the CMMG NDP. It enables the receiver and transmitter to know when the immediate response and CMMG NDP are transmitted relative to the frame containing the CMMG NDP announcement indication.

A STA that has transmitted a CMMG NDP announcement indication in a frame that requires an immediate response and that does not receive the expected response shall terminate the NDP sequence at that point (i.e., the STA does not transmit a CMMG NDP in the current NDP sequence).

Feedback information generated from the reception of a CMMG NDP is transmitted using any of the feedback rules and signaling as appropriate, e.g., immediate or delayed.

10.36.2 Transmission of a CMMG NDP

A STA that transmits a CMMG NDP shall set the LENGTH, SOUNDING, NSS, and STBC parameters of the TXVECTOR as specified in this subclause.

— LENGTH shall be set to 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— SOUNDING shall be set to SOUNDING.
— STBC shall be set to 0.
— NSS indicates two or more spatial streams.

The number of spatial streams sounded is indicated by the NSS parameter of the TXVECTOR and shall not exceed the limit indicated by the Channel Estimation Capability field in the Transmit Beamforming Capabilities field transmitted by the STA that is the intended receiver of the CMMG NDP.

10.36.3 Determination of CMMG NDP destination

The destination of a CMMG NDP is determined at the NDP receiver by examining the CMMG NDP announcement as follows:

— The destination of the first CMMG NDP in the NDP sequence is equal to the RA of any MPDU within the CMMG NDP announcement.
— If the Calibration Position subfield is equal to 1 in the frame containing the CMMG NDP announcement indication, the destination of the second CMMG NDP is equal to the TA of that frame. Otherwise, the destination of the second and any subsequent CMMG NDPs is equal to the destination of the previous CMMG NDP.

10.36.4 Determination of CMMG NDP source

The source of a CMMG NDP is determined at the NDP receiver by examining the NDP sequences's starting PPDU as follows:

— If any MPDU within the CMMG NDP announcement contains two or more addresses, the source of the first CMMG NDP is equal to the TA of that frame.
— Otherwise (i.e., the CMMG NDP announcement contains one address), the source of the first CMMG NDP is equal to the RA of the MPDU to which the CMMG NDP announcement is a response.

If the Calibration Position subfield is equal to 1 in an MPDU in the CMMG NDP announcement, the source of the second CMMG NDP is equal to the RA of that MPDU. Otherwise, the source of the second and any subsequent CMMG NDPs is equal to the source of the previous NDP.

10.37 Mesh forwarding framework

10.37.1 General

The term *mesh forwarding* refers to forwarding of MSDUs and MMPDUs on paths determined by the mesh path selection between mesh STAs at the link layer. The mesh paths are contained in the forwarding information. The forwarding information, for instance, the lifetime of a mesh path, may be updated as a consequence of mesh forwarding.

The forwarding of MSDUs and MMPDUs within an MBSS is described in 10.37.3, 10.37.4, 10.37.5, and 10.37.8. The forwarding of MSDUs and MMPDUs between the MBSS and the DS at proxy mesh gates is described in 14.12.3.

10.37.2 Forwarding information

Forwarding information is created by the active mesh path selection protocol and is utilized for MSDU/MMPDU forwarding as described in 10.37.3 and 10.37.5.2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The basic forwarding information to a destination mesh STA consists of the destination mesh STA address, the next-hop address, the precursor list, and the lifetime of this forwarding information.

An entry in the precursor list contains the precursor mesh STA address and the lifetime of this entry. If an existing entry in a precursor list is updated, the lifetime is the maximum of the current and the updated value. If the lifetime of a precursor expires, it will be deleted from the precursor list. Precursors are used to identify legitimate transmitters of individually addressed frames (see 10.37.3.2) and for the notification of link failures (in case of HWMP, see 14.11.11).

The forwarding information shall be considered as valid when the active mesh path selection protocol validates it. When a STA performs MSDU/MMPDU forwarding, it shall use valid forwarding information only.

If a STA finds its forwarding information to a particular destination mesh STA is not validated, it shall consider the corresponding next-hop address as unknown and may take necessary actions to forward any MSDU/MMPDU appropriately. See 10.37.8 and 14.11.9.3 for the HWMP case.

The forwarding information shall be considered as invalid if its lifetime has expired. Also, forwarding information is marked as invalid when certain conditions are met in the processing of mesh path selection elements, e.g., path error processing in HWMP (14.11.11.4).

The active path selection protocol may define additional parameters in the forwarding information. Details on the additional parameters of the forwarding information constructed by the hybrid wireless mesh protocol (HWMP) are described in 14.11.8.4.

10.37.3 Addressing and forwarding of individually addressed mesh Data frames

10.37.3.1 At source mesh STAs (individually addressed)

MSDUs sent by a mesh STA (as a consequence of an MA-UNITDATA.request primitive with an individual destination address) and destined to another mesh STA in the MBSS shall be transmitted using a frame with the four-address MAC header format (with the Address Extension Mode subfield in the Mesh Control field set to “None” (see Table 9-35)), where the four address fields are set as follows (see row “Mesh Data (individually addressed)” in Table 9-77):

— Address 1: The address of the next-hop mesh STA (toward the destination mesh STA according to the forwarding information; see 10.37.2).
— Address 2: The address of the transmitter mesh STA.
— Address 3: The address of the destination mesh STA.
— Address 4: The address of the source mesh STA.

MSDUs that are sent by a mesh STA as a consequence of an MA-UNITDATA.request primitive with an individual destination address and are destined to an address that is different from the mesh STA at the end of a mesh path shall be transmitted using a frame with the four-address MAC header format [with the Address Extension Mode subfield in the Mesh Control field set to “Address5&6” (see Table 9-35)], where the Mesh Address Extension subfield in the Mesh Control field carries the addresses of the end stations, as specified in row “Mesh Data (proxied, individually addressed)” of Table 9-77. The additional addresses 5 and 6 are defined as follows:

— Address 5: The address of the destination end mesh STA (may be the same as Address 3 if the destination is the mesh STA at the end of the mesh path).
— Address 6: The address of the source end mesh STA (may be the same as Address 4 if the source is the mesh STA at the beginning of the mesh path).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—The destination address is distinct from the mesh STA at the end of the mesh path in two cases: 1) when the destination is an external address and 2) when the destination is a mesh STA distinct from the destination mesh STA at the end of the mesh path. The former case is described in 14.12.3. The latter case might occur if a source mesh STA sends the MSDU to another intermediate mesh STA that sends the MSDU on a different mesh path to the destination mesh STA in the MBSS.

The Mesh TTL subfield in the Mesh Control field shall be set to dot11MeshTTL.The MSDUs are forwarded multiple hops, limited by the Mesh TTL value.

The source mesh STA shall set the Mesh Sequence Number subfield in the Mesh Control field to a value from a modulo 2^{32} counter that is incremented by 1 for each new MSDU (not in an A-MSDU) or A-MSDU transmitted with a Mesh Control field and for each new MMPDU transmitted using a Multihop Action frame.

10.37.3.2 At intermediate and destination mesh STAs (individually addressed)

On receipt of an individually addressed mesh Data frame, a mesh STA shall perform the following:

a) The mesh STA shall decipher the frame and check it for authenticity. If it is not from a peer mesh STA, the frame shall be silently discarded.
b) The mesh STA shall check to see whether the MAC address in the Address 3 field is a known destination address; if it is an unknown destination address, the mesh STA may perform any of the following three actions:
    1) Silently discard the frame.
    2) Trigger a path discovery procedure depending on the path selection protocol that is currently active in the mesh BSS. For HWMP, see 14.11.9.3 Case A.
    3) Inform the mesh STA in Address 2 that the destination is unreachable depending on the path selection protocol that is currently active in the mesh BSS. For HWMP, see 14.11.11.3 Case B.
c) If Address 2 is not one of the precursors for this destination mesh STA (see 10.37.2), the frame shall be discarded.

If the frame is not discarded and one or more MSDUs are collected from the frame, the mesh STA may detect duplicate MSDUs according to 10.37.6 and discard them.

If Address 3 does not match the mesh STA's own address, but is a known individual destination MAC address in the forwarding information then the following actions are taken:

— The lifetime of the forwarding information to the destination (Address 3) is set to its initial value.
— The lifetime of the forwarding information to the source (Address 4) is set to its initial value.
— The lifetime of the precursor list entry for the precursor to the destination (Address 2) is set to the maximum of the initial value and the current value.
— The lifetime of the precursor list entry for the precursor to the source (next hop to the destination) is set to the maximum of the initial value and the current value.
— The Mesh TTL in the corresponding Mesh Control field of the collected MSDU is decremented by 1. If zero has been reached, the MSDU shall be discarded.
— If the MSDU has not been discarded, the mesh STA shall forward the MSDU via a frame with the Address 1 field set to the MAC address of the next-hop mesh STA as determined from the forwarding information (see 10.37.2) and the Address 2 field set to its own MAC address and queue the frame for transmission.

If Address 3 matches the mesh STA's own MAC address, the following actions are taken:

— The lifetime of the forwarding information to the source (Address 4) is set to its initial value.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The lifetime of the precursor list entry for the precursor to the destination (Address 2) is set to the maximum of the initial value and the current value.
— If the Address Extension Mode subfield in the Mesh Control field is "None" (see Table 9-35), the MA-UNITDATA.indication primitive is passed from the MAC sublayer entity to the LLC sublayer entity or entities.
— If the Address Extension Mode subfield in the Mesh Control field is "Address5&6" (see Table 9-35) and Address 5 is equal to Address 3, the mesh STA is the final destination of the MSDU, and the MA-UNITDATA.indication primitive is passed from the MAC sublayer entity to the LLC sublayer entity or entities.
— If the Address Extension Mode subfield in the Mesh Control field is "Address5&6" (see Table 9-35) and Address 5 is a known destination MAC address in the forwarding information (mesh STA), the mesh STA shall forward the MSDU via a frame as described in 10.37.3.1 with the Address 3 field set to the MAC Address of the Address 5 field.
— If the Address Extension Mode subfield in the Mesh Control field is "Address5&6" (see Table 9-35), the MSDU is forwarded according to 14.12.3.2 in all other cases.

If Address 3 matches the group address, the mesh STA shall perform the procedures as given in 10.37.4.2.

Note that during the forwarding process at intermediate mesh STAs, the content of the MSDU is not changed.

10.37.4 Addressing and forwarding of group addressed mesh Data frames

10.37.4.1 At source mesh STAs (group addressed)

MSDUs sent by a mesh STA (as a consequence of an MA-UNITDATA.request primitive with a group destination address) shall be transmitted using a group addressed mesh Data frame (with the Address Extension Mode subfield in the Mesh Control field set to "None" (see Table 9-35)) (see row "Mesh Data (group addressed)" in Table 9-77). An implementation may circumvent the unreliability of group addressed transmissions by using multiple individually addressed mesh Data frames, which are individually acknowledged. In such case, the frame may be converted to individually addressed frames and transmitted as individually addressed mesh Data frames to each peer mesh STA as described in 10.37.3.1 with the Address 3 field set to the group address. The circumstances for choosing this method are outside the scope of the standard.

In group addressed mesh Data frames, the address fields are set as follows:

— Address 1: The group address
— Address 2: The address of the transmitter mesh STA
— Address 3: The address of the source mesh STA

The source mesh STA shall set the Mesh TTL subfield in the Mesh Control field to dot11MeshTTL in order to control the hop count. The MSDUs are forwarded multiple hops, limited by the Mesh TTL value. For example, if the Mesh TTL subfield is 1, MSDUs are delivered only to immediate neighbors.

The source mesh STA shall set the Mesh Sequence Number subfield in the Mesh Control field to a value from a modulo 2^{32} counter that is incremented by 1 for each new MSDU (not in an A-MSDU) or A-MSDU transmitted with a Mesh Control field and for each new MMPDU transmitted using a Multihop Action frame.

Procedures that enhance the reliability or efficiency of group addressed transmissions are outside the scope of this standard.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

10.37.4.2 At recipient mesh STAs (group addressed)

On receipt of a group addressed mesh Data frame with Address 1 (DA) equal to the group address, or on receipt of an individually addressed mesh Data frame with Address 3 (Mesh DA) equal to the group address, a mesh STA shall perform the following:

a) The mesh STA shall decipher the frame and check it for authenticity. If it is not from a peer mesh STA, the frame shall be silently discarded.

b) If the frame is not discarded and one or more MSDUs are collected from the frame, the mesh STA may detect duplicate MSDUs according to 10.37.6 and discard them.

c) The mesh STA decrements the Mesh TTL in the Mesh Control field. If the Mesh TTL value has reached zero, the corresponding MSDU shall not be forwarded to other mesh STAs.

d) If the Mesh TTL value has not reached zero and if dot11MeshForwarding is true, the mesh STA shall forward the MSDU via a group address mesh Data frame with the Address 2 field set to its own MAC address.

e) If the Address Extension Mode is “Address4” (see Table 9-35) and the recipient mesh STA is a proxy mesh gate and if the Mesh TTL value has not reached zero and if dot11MeshForwarding is true, the MSDU is forwarded according to 14.12.3.2.

When the SA and the Mesh SA are not identical (the source address is therefore an external address), the MSDU shall be forwarded by using a frame with the three-address MAC header format [with the Address Extension Mode subfield in the Mesh Control field set to “Address4” (see Table 9-35)] as specified in row “Mesh Data (proxied, group addressed)” of Table 9-77. Otherwise, the MSDU shall be forwarded by using a frame with the three-address MAC header format (with the Address Extension Mode subfield in the Mesh Control field set to “None” (see Table 9-35)] as specified in row “Mesh Data (group addressed)” of Table 9-77.

An implementation may circumvent the unreliability of group addressed transmissions by using multiple individually addressed mesh Data frames, which are individually acknowledged. In such case, the frame may be converted to individually addressed frames and transmitted as an individually addressed mesh Data frame to each peer mesh STAs as described in 10.37.3.2 with the Address 3 field set to the group address. If the Address Extension Mode subfield in the Mesh Control field in the group addressed mesh Data frame is equal to “Address4” (see Table 9-35), the Address Extension Mode subfield in the Mesh Control field in the individually addressed mesh Data frames is set to “Address5&6” (see Table 9-35), the Address 5 field is set to the group address, and the Address 6 field set to the Source Address contained in the Address 4 field of the group addressed mesh Data frame. The circumstances for choosing this method and the ability to determine all of the addresses of the neighbor peer mesh STAs are beyond the scope of the standard.

If one or more MSDUs collected from the frame have not been discarded, the MA-UNITDATA.indication primitive is passed from the MAC sublayer entity to the LLC sublayer entity or entities.

10.37.5 Addressing of Management frames and MMPDU forwarding

10.37.5.1 General

All MMPDUs except MMPDUs transmitted using Multihop Action frames are transmitted over only one hop to peer mesh STAs.

NOTE—In several cases, the reception and processing of an Action frame leads to the transmission of a new Action frame of the same type that might include an identical or a modified version of the contents from the elements of the received Action frame. This is called *propagation* in contrast to forwarding.

A mesh STA may convert a group addressed Management frame to individually addressed Management frames and transmit them as individually addressed frames to each peer mesh STA, if the frame is intended

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

to be delivered only to its peer mesh STAs. The circumstances for choosing this method are outside the scope of the standard.

10.37.5.2 MMPDU forwarding using individually addressed Multihop Action frames

MMPDUs sent by a mesh STA and destined to another mesh STA in the MBSS using individually addressed Multihop Action frames (see 9.6.17) shall be transmitted using a Management frame with the three-address MAC header format [with the Address Extension Mode subfield in the Mesh Control field set to "Address4" (see Table 9-35)], where the four address fields are set as follows [see row "Multihop Action (individually addressed)" in Table 9-77)]:

— Address 1: The address of the next-hop mesh STA (toward the destination mesh STA according to the forwarding information; see 10.37.2.
— Address 2: The address of the transmitter mesh STA.
— Address 3: The address of the destination mesh STA.
— Address 4: The address of the source mesh STA.

The source mesh STA shall set the Mesh TTL subfield in the Mesh Control field to dot11MeshTTL, and set the Mesh Sequence Number subfield in the Mesh Control field to a value from a modulo 2^{32} counter that is incremented by 1 for each new MSDU (not in an A-MSDU) or A-MSDU transmitted with a Mesh Control field and for each new MMPDU transmitted using a Multihop Action frame.

At intermediate and destination mesh STAs, on receipt of an individually addressed Multihop Action frame, the address matching, the reception procedures, the forwarding information update, and the Mesh TTL decrement are performed as described in 10.37.3.2, and the MMPDU is forwarded according to the forwarding information and the procedures in 10.37.3.2.

At intermediate mesh STAs, frame fields following the Mesh Control field are not required to be examined.

If the Address 3 in the received Multihop Action frame matches the mesh STA's own MAC address or the group address, the mesh STA (destination mesh STA) shall process the content of the MMPDU.

10.37.5.3 MMPDU forwarding using group addressed Multihop Action frames

MMPDUs sent by a mesh STA and destined to all other mesh STAs in the MBSS using group addressed Multihop Action frames (see 9.6.17) shall be transmitted using a Management frame with the three-address MAC header format [with the Address Extension Mode subfield in the Mesh Control field set to "None" (see Table 9-35)], where the three address fields are set as follows [see row "Multihop Action (group addressed)" in Table 9-77]:

— Address 1: The group address
— Address 2: The address of the transmitter mesh STA
— Address 3: The address of the source mesh STA

An implementation may circumvent the unreliability of group addressed transmissions by using multiple individually addressed Multihop Action frames, which are individually acknowledged. In such case, the frame may be converted to individually addressed frames and transmitted as individually addressed Multihop Action frames to each peer mesh STA as described in 10.37.5.2 with the Address 3 field set to the group address. The circumstances for choosing this method are outside the scope of the standard.

The source mesh STA shall set the Mesh TTL subfield in the Mesh Control field to dot11MeshTTL, and set the Mesh Sequence Number subfield in the Mesh Control field to a value from a modulo 2^{32} counter that is incremented by 1 for each new MSDU (not in an A-MSDU) or A-MSDU transmitted with a Mesh Control field and for each new MMPDU transmitted using a Multihop Action frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

At recipient mesh STAs, on receipt of Multihop Action frame, the address matching, the reception procedures, the forwarding information update, and the Mesh TTL decrement are performed as described in 10.37.4.2, and the MMPDU is forwarded according to the forwarding information and the procedures in 10.37.4.2.

If the Address 1 in the received Multihop Action frame matches the group address, the mesh STA shall process the content of the MMPDU.

Procedures that enhance the reliability or efficiency of group addressed transmissions are outside the scope of this standard.

10.37.6 Detection of duplicate MSDUs/MMPDUs

A mesh STA may receive multiple copies of the same MSDU or MMPDU from different neighbor peer mesh STAs.

The filtering of such duplicates is facilitated through the inclusion of a Mesh Sequence Number subfield in the Mesh Control field in mesh Data frames and Multihop Action frames as specified in 9.2.4.8.3.

The receiving mesh STA shall keep a cache of recently received <Mesh SA, Mesh Sequence Number> tuples. The Mesh Source Address (Mesh SA) is contained in Address 4 for individually addressed mesh Data frames and Multihop Action frames. The Mesh Source Address (Mesh SA) is contained in Address 3 for group addressed mesh Data frames.

A mesh STA shall reject an MSDU, A-MSDU or MMPDU with a Mesh Control field as a duplicate if it matches a <Mesh SA, Mesh Sequence Number> tuple of an entry in the cache.

The rules in 10.3.2.14 also apply to the filtering of duplicates sent by the same neighbor peer mesh STA.

10.37.7 Mesh STAs that do not forward

A mesh STA that has dot11MeshForwarding equal to false does not forward either MSDUs, or Multihop Action frames. The circumstances in which a mesh STA may be allowed to become a non- forwarding entity and the authority to set dot11MeshForwarding to false are beyond the scope of this standard.

A mesh STA that does not forward is a special case of a mesh STA. Such mechanism depends on whether the path selection protocol provides a mechanism to allow mesh STAs not to participate in forwarding. The HWMP path selection protocol provides such a mechanism; see 14.11.

10.37.8 MSDU forwarding and unknown destination

A source mesh STA in the MBSS might not able to forward an MSDU that it has received as a consequence of an MA-UNITDATA.request primitive with an individual destination address. This is the case if the destination of the MSDU is unknown to the mesh STA. The destination is unknown to a mesh STA if the mesh STA has no valid forwarding information for this destination or if the destination is not in its proxy information as an external STA (see 14.12.4.2). Note that the procedure to determine that an address is unknown depends on the active path selection protocol. It might require an attempt to establish a path to the destination (see 14.9).

If the source mesh STA is not able to forward the MSDU because its destination is unknown, the mesh STA shall assume that the destination is outside the MBSS and shall forward the MSDU to known mesh gates in the MBSS as one or more individually addressed frames according to the procedures for frame addressing and data forwarding of individually addressed frames at source mesh STAs in an MBSS (10.37.3.1). These frame(s) shall be transmitted using the four-address MAC header format [with the Address Extension Mode

subfield in the Mesh Control field set to "Address5&6" (see Table 9-35)], where the Mesh Address Extension subfield in the Mesh Control field carries the address of the destination end station, as specified in row "Mesh Data (proxied, individually addressed)" of Table 9-77. The address fields are set as follows:

— Address 1: The address of the next-hop mesh STA (toward the known mesh gate in the MBSS according to the forwarding information; see 10.37.2).
— Address 2: The address of the source mesh STA.
— Address 3: The address of the known mesh STA in the MBSS.
— Address 4: The address of the source mesh STA.
— Address 5: The address of the destination end mesh STA, which is the unknown destination address of the MSDU.
— Address 6: The address of the source mesh STA, which is the same as Address 4.

If there is no mesh gate available, the mesh STA shall silently discard the MSDU.

Discovery of mesh gates by mesh STAs is performed using propagated elements, such as a GANN (14.12.2). Other methods specific to the HWMP path selection protocol are also available, such as the proactive PREQ mechanism (14.11.4.2) or the proactive RANN mechanism (14.11.4.3), when the Gate Announcement subfield in the Flags field in these HWMP elements is set to 1.

10.38 DMG and CMMG channel access

10.38.1 General

Channel access by a DMG STA is related to beacon interval timing and is coordinated using a schedule. A DMG STA operating as an AP or PCP generates the schedule and communicates it to STAs using DMG Beacon and Announce frames. A non-PCP STA that is a non-AP STA and that receives scheduling information accesses the medium during the scheduled periods using the access rules specific to that period. Medium access rules to establish a BSS are defined in 10.39 and 11.1.4. CMMG STAs follow the same rules of DMG channel access except the specific modification for CMMG STAs as described in 10.38.

10.38.2 Access periods within a beacon interval

Medium time within a DMG or CMMG BSS is divided into beacon intervals. Subdivisions within the beacon interval are called *access periods*. Different access periods within a beacon interval have different access rules. The access periods are described in a schedule that is communicated by the AP or PCP to the non-PCP and non-AP STAs within the BSS. The schedule communicated by the AP or PCP can include the following access periods:

— *BTI:* For DMG STAs, it is an access period during which one or more DMG Beacon frames is transmitted. Not all DMG Beacon frames are detectable by all non-PCP and non-AP STAs (see 10.41.4). Not all beacon intervals contain a BTI. For CMMG STAs, it is an access period during which one or more DMG Beacon frames are transmitted at least in the primary 540 MHz channel. Not all DMG Beacon frames are detectable by all non-PCP and non-AP STAs. A non-PCP STA that is a non-AP STA shall not transmit during the BTI of the BSS of which it is a member.

— *A-BFT:* An access period during which beamforming training is performed with the STA that transmitted a DMG Beacon frame during the preceding BTI (see 10.41.5). The presence of the A-BFT is optional and signaled in DMG Beacon frames.

— *ATI:* A request-response based management access period between the AP or PCP and non-AP and non-PCP STAs (see 10.38.3). The presence of the ATI is optional and signaled in DMG Beacon frames.

— *CBAP:* An access period during which frame exchange sequences between STAs that use the channel access rules described in 10.38.5.

— *SP:* An access period during which frame exchange sequences between STAs use the channel access rules described in 10.38.6.2.

The BHI comprises the BTI, A-BFT and ATI. The DTI, in turn, comprises contention based access periods (CBAPs) and scheduled service periods (SPs). There is a single BHI and a single DTI per beacon interval.

Figure 10-60 (Example of access periods within a beacon interval) illustrates an example of access periods within a beacon interval comprising a BTI, an A-BFT, an ATI, and two CBAPs and SPs within the DTI. Any combination in the number and order of SPs and CBAPs can be present in the DTI.

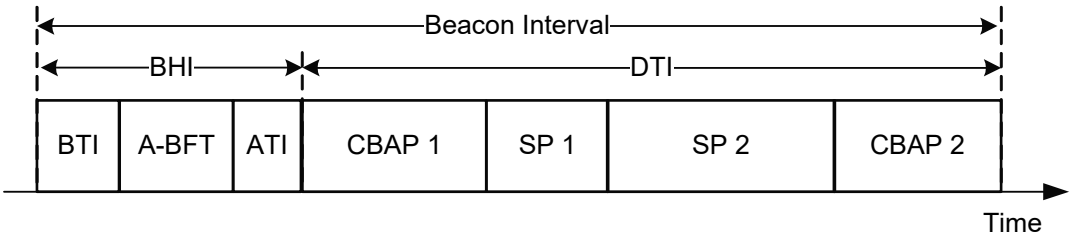

Figure 10-60—Example of access periods within a beacon interval

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In an EDMG BSS, the following apply:

— Frames sent during the BTI and ATI shall be transmitted on only the primary channel of the BSS.
— The A-BFT shall be present on the primary channel of the BSS and can also be present on the secondary or secondary1 channel of the BSS (see 10.41.5.1 (Allocation of A-BFT)).
— Transmissions within a CBAP or an SP may span the primary channel and the secondary channel(s).
— The channel width of the primary channel is 2.16 GHz.

For a 1080 MHz CMMG BSS, the DTI can comprise contention-based access periods (CBAPs) and scheduled service periods (SPs), and the bandwidth of the allocation in the DTI can be 540 MHz and 1080 MHz.

Figure 10-61 (Example of access periods within a beacon interval for CMMG STAs) illustrates an example of access periods within a beacon interval for a 1080 MHz CMMG BSS, comprising a BHI, that may contain BTI, A-BFT, and ATI, and two 540 MHz CBAPs and SPs within the DTI and one 1080 MHz CBAPs and SPs within the DTI. Any combination in the number and order of SPs and CBAPs can be present in the DTI. For a CMMG BSS, the BHI shall be sent on the primary 540 MHz channel and can be sent on the 1080 MHz channel with duplicate format.

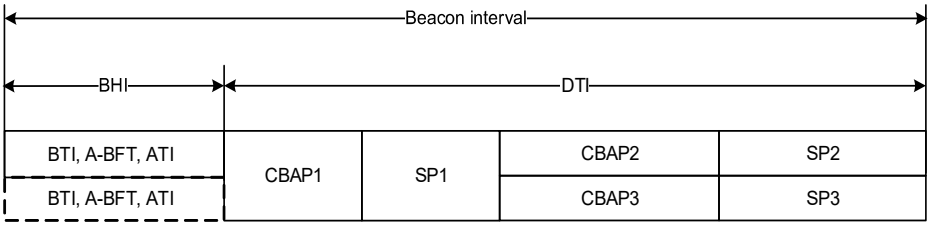

Figure 10-61—Example of access periods within a beacon interval for CMMG STAs

The details of the access protocol within each of the access periods are described in the remaining subclauses of 10.38 and within 10.41.

In the ATI, a non-AP and non-PCP STA shall be ready to receive a transmission from the AP or PCP at least RxAdvanceTime before the expected transmission of a request frame. The destination STA of an SP shall be ready to receive a transmission from the source STA of the SP at least RxAdvanceTime before the start of the SP. A STA that participates in a CBAP shall be ready to receive a transmission within the CBAP at least RxAdvanceTime before the start of the CBAP plus DIFS. In the A-BFT, the AP or PCP should be ready to receive a transmission from a non-AP and non-PCP STA at least RxAdvanceTime before the start of an SSW slot. In all of the preceding rules, RxAdvanceTime is defined as follows:

$$\text{RxAdvanceTime} = \text{Ceil}\left(\left(\frac{C \times T_{DI}}{10^6} + T_P\right),\ T_{TR}\right)$$

where

C is aDMGTSFAccuracy, in ppm
T_{DI} is the time elapsed since a synchronizing reference event, in μs. The synchronizing event is the reception of the Timestamp field from the AP or PCP
T_P is aAirPropagationTime, in μs
T_{TR} is aTSFResolution, in μs

10.38.3 ATI transmission rules

The presence of an ATI in the current beacon interval is signaled by the ATI Present field set to 1 in the current DMG Beacon frame (9.3.4.2). The Next DMG ATI element (9.4.2.134) transmitted in the Announce frame or in the DMG Beacon frame indicates the earliest start time for the next ATI in a subsequent beacon interval and ATI duration.

An example of an ATI is shown in Figure 10-62.

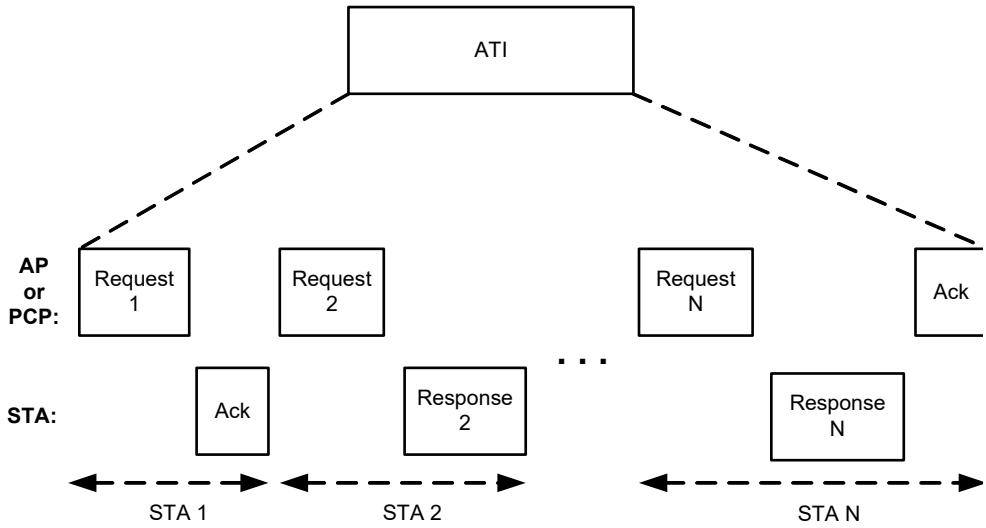

Figure 10-62—Example of frame exchanges during the ATI

During an ATI, request and response frames are exchanged between the AP or PCP and any subset of STAs. The AP or PCP initiates all frame exchange sequences that occur during the ATI. The ATI shall not start sooner than Max(guard time, MBIFS), where guard time is defined in 10.38.6.5, following the end of the previous A-BFT when an A-BFT is present in the beacon interval or following the end of the previous BTI when an A-BFT is not present but a BTI is present in the beacon interval. The ATI shall not start before TBTT if the ATI is the first period in the beacon interval. Once the ATI starts, the AP or PCP may start transmission of a request frame immediately or it may delay the transmission of the request frame if the medium is determined by the CCA mechanism to be busy.

For DMG STAs, during each ATI the AP or PCP shall schedule transmissions to a non-AP and non-PCP STA if the non-AP and non-PCP STA Heartbeat field in the STA's DMG Capabilities element within the Association Request frame of the last successful association attempt is 1. If the non-AP and non-PCP STA does not respond to the frame transmitted by the AP or PCP, the AP or PCP shall use the DMG Control modulation class (10.6.7.1) at its next transmission attempt to the non-AP and non-PCP STA. The AP or PCP shall use the DMG Control modulation class for all subsequent transmissions to the non-AP and non-PCP STA until it receives a frame from the non-AP and non-PCP STA.

For CMMG STAs, during each ATI the AP or PCP shall schedule transmissions to a non-AP and non-PCP STA if the non-AP and non-PCP STA Heartbeat field in the STA's CMMG Capabilities element within the Association Request frame of the last successful association attempt is 1 and the non-AP and non-PCP STA is in the awake state. If the non-AP and non-PCP STA does not respond to the frame transmitted by the AP or PCP, the AP or PCP shall use the CMMG Control modulation class ((10.6.8.1) at its next transmission attempt to the non-AP and non-PCP STA. The AP or PCP shall use the CMMG Control modulation class for all subsequent transmissions to the non-AP and non-PCP STA until it receives a frame from the non-AP and non-PCP STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A non-AP and non-PCP STA shall not transmit during the ATI except in response to an individually addressed frame whose TA field contains the AP's or PCP's MAC address and whose RA field contains the STA's MAC address.

During the ATI a STA shall not transmit frames that are not request or response frames. Request and response frames transmitted during the ATI shall be one of the following:

— A Management frame
— An Ack frame
— A Grant, Poll, RTS or DMG CTS frame when transmitted as a request frame
— An SPR or DMG CTS frame when transmitted as a response frame
— A frame with the Type subfield equal to Data only as part of an authentication exchange to reach an RSNA security association

NOTE 1—The Announce frame is designed to be used primarily during the ATI and can perform functions of a DMG Beacon frame.

The transmission of Poll frames during the ATI follows the rules described in 10.38.7. The Response Offset field within a Poll frame transmitted during the ATI shall be set to 0.

The transmission of Grant frame during the ATI follows the rules described in 10.38.7.3.

Individually addressed request frames transmitted during the ATI shall not be sent using Action No Ack frames.

During the ATI, after an AP or PCP transmits an individually addressed request frame (such as an Announce frame) to a non-AP and non-PCP STA, and the STA receives that frame, the STA shall transmit a response frame addressed to the AP or PCP. The transmission of the response frame shall commence one SIFS after the reception of the request frame. The AP or PCP shall interpret the receipt of the response frame as an acknowledgment of the request frame. Response frames transmitted by non-AP and non-PCP STAs during the ATI shall be individually addressed to the AP or PCP.

NOTE 2—STAs do not transmit a response frame to the AP or PCP when they receive a request frame from the AP or PCP with the RA equal to a group address (see 10.3.6).

The Duration field of a request frame transmitted during the ATI shall be set to cover the remaining duration of the ATI at the end of the request frame transmission. The Duration field of a response frame transmitted during the ATI shall be set to the value of the Duration field within the previously received request frame minus SIFS and minus the duration of the response frame transmission.

When a transmission by a STA is expected by an AP or PCP and a SIFS elapses without its receipt, the AP or PCP may either repeat its individually addressed transmission to that STA or, as early as one PIFS after the end of its previous transmission, transmit a frame to any other STA.

NOTE 3—If acknowledgment is required, the AP or PCP transmits an Ack frame to acknowledge the reception of a response frame during the ATI (see Figure 10-62 (Example of frame exchanges during the ATI)).

Multiple request and response frame exchange sequences between the AP or PCP and a STA might occur during a single ATI.

For CMMG STAs, the bandwidth of a response frame transmitted during the ATI shall be set to the same as previously received request frame.

10.38.4 DTI transmission rules

During the DTI, a STA may initiate a frame exchange sequence (following the DMG channel access rules for DMG STAs and following the CMMG channel access rules for CMMG STAs) if any of the following conditions are met:

a) During a CBAP for which the STA is identified or included as source or destination (10.38.6.3, 10.38.7, and 10.38.8)
b) During an SP for which the STA is identified as source or destination (10.38.6.2 and 10.38.7)

and shall not initiate a frame exchange sequence if none of these conditions are met. A STA initiating data transfer shall check that the transaction, including acknowledgments, completes before the end of the CBAP or SP in which it was initiated. Also, a CMMG STA initiating data transfer shall use a bandwidth no larger than the allocated channel bandwidth of the CBAP or SP in which it was initiated.

When the entire DTI is allocated to CBAP (that is, the CBAP Only field is 1 in the DMG Parameters field for DMG STAs, or the CBAP Only field is 1 in the CMMG Parameters field for CMMG STAs), for DMG STAs, the ATI Present field within the DMG Beacon frame containing the DMG Parameters field shall be set to 0, and for CMMG STAs the ATI Present field within the DMG Beacon frame containing the CMMG Parameters field shall be set to 0.

A DMG or CMMG STA shall support processing Grant frames. An EDMG STA shall support processing Grant Ack frames and shall set the Grant Ack Supported field to 1 in the STA's DMG Capabilities element. A non-AP and non-PCP DMG or CMMG STA shall support processing Poll frames and the Extended Schedule element. An AP or PCP shall support processing SPR frames transmitted by a non-AP and non-PCP STA and responding to an SPR frame with a Grant frame.

The DMG low-power SC mode (20.6) may be used only within SPs that have the LP SC Used subfield within the Extended Schedule element equal to 1 and shall not be used otherwise. A STA supports the DMG low-power SC mode if the Low-Power SC Mode Supported subfield within its DMG Capabilities element is 1. A STA that supports the DMG low-power SC mode shall not initiate a frame exchange sequence using the DMG low-power SC mode unless the STAs identified in the RA field of all MPDUs contained within the PPDU support the DMG low-power SC mode. A STA can use the procedure described in 11.28.1 to discover the capabilities of another STA.

A STA that receives a Grant frame and that has the Grant Ack Supported field equal to 1 in the STA's DMG Capabilities element shall respond with a Grant Ack frame SIFS after reception of the Grant frame. In the transmitted Grant Ack frame, the STA shall copy the Source AID, Destination AID, and Beamforming Training fields from the Grant frame that the Grant Ack frame is being sent in response to. A STA that receives a group addressed Grant frame shall not respond with Grant Ack frame. A STA that receives a Grant frame and that does not have the Grant Ack Supported field equal to 1 in the STA's DMG Capabilities element shall not respond with a Grant Ack frame.

A STA shall support receiving MPDUs of arbitrary length that is less than or equal to the MPDU size advertised by the STA (see Table 9-25).

10.38.5 Contention based access period (CBAP) transmission rules

The definition of contention based transmission rules used within a CBAP is provided in 10.3 and in 10.23. This subclause specifies additional rules applicable to the CBAP.

A STA shall not initiate a frame exchange sequence within a CBAP unless at least one of the following conditions is met:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The value of the CBAP Only field is equal to 1 and the value of the CBAP Source field is equal to 0 within the DMG Parameters field of the DMG Beacon frame that allocates the CBAP
— The STA is an AP or PCP and the value of the CBAP Only field is equal to 1 and the value of the CBAP Source field is equal to 1 within the DMG Parameters field of the DMG Beacon frame that allocates the CBAP
— The value of the Source AID field of the CBAP is equal to the broadcast AID
— The STA's AID is equal to the value of the Source AID field of the CBAP
— The STA's AID is equal to the value of the Destination AID field of the CBAP

If a STA's AID is equal to the value of the Source AID field of a CBAP allocation or if a STA performs in the role of AP or PCP and both the CBAP Only and CBAP Source fields are equal to 1 in the DMG Beacon frame that allocates a CBAP, the STA may initiate a frame transmission within the CBAP immediately after the medium is determined to be idle for one PIFS.

A BF initiator (10.41) should not initiate an SLS phase within a CBAP if there is not enough time within the CBAP to complete the SLS phase.

A STA shall not extend a frame exchange sequence that started during a CBAP beyond the end of that CBAP. A STA that initiates a sequence shall check that the frame exchange sequence, including any control frame responses, completes before the end of the CBAP.

Operation of the EDCAF is suspended at the end of a CBAP and is resumed at the beginning of the following CBAP. When the EDCAF is being suspended, the values of the backoff and NAVs shall remain unchanged until the start of the following CBAP. A TXOP may be obtained by a DMG STA winning an instance of EDCA contention (see 10.23.2).

At the beginning of a TXOP with a TXOP responder that has the Heartbeat field in the TXOP responder's DMG Capabilities element equal to 1 for DMG STAs or has the Heartbeat field in the TXOP responder's CMMG Capabilities element equal to 1 for CMMG STAs, the following rules apply:

— For DMG STAs, the TXOP holder shall transmit a frame to the TXOP responder using the DMG Control modulation class before it uses any other modulation class for transmission if the time elapsed since the last frame received from the TXOP responder is larger than or equal to the Heartbeat Elapsed Time value computed using the Heartbeat Elapsed Indication field within the TXOP responder's DMG Capabilities element.
— For DMG STAs, the TXOP holder may transmit a frame using a modulation class other than the DMG Control modulation class at the start of the TXOP if the time elapsed since the last frame received from the TXOP responder is shorter than the Heartbeat Elapsed Time value computed using the Heartbeat Elapsed Indication field within the TXOP responder's DMG Capabilities element.
— For CMMG STAs, the TXOP holder shall transmit a frame to the TXOP responder using the CMMG Control modulation class before it uses any other modulation class for transmission if the time elapsed since the last frame received from the TXOP responder is larger than or equal to the Heartbeat Elapsed Time value computed using the Heartbeat Elapsed Indication field within the TXOP responder's CMMG Capabilities element.
— For CMMG STAs, the TXOP holder may transmit a frame using a modulation class other than the CMMG Control modulation class at the start of the TXOP if the time elapsed since the last frame received from the TXOP responder is shorter than the Heartbeat Elapsed Time value computed using the Heartbeat Elapsed Indication field within the TXOP responder's CMMG Capabilities element.

The frame sent by the STA at the beginning of the TXOP may be an RTS frame or a DMG CTS-to-self frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Within a CBAP a STA with multiple DMG antennas should use only one DMG antenna in its frame transmission, CCA and frame reception, except if it is the initiator or responder in an SLS (10.41). The algorithm to select a DMG antenna and switch the active DMG antenna is implementation dependent. Within CBAPs a STA that changed to a different DMG antenna in order to transmit should perform CCA on that DMG antenna until a frame is detected by which it can set its NAV, or until a period of time equal to the dot11DMGNavSync has transpired, whichever is earlier.

10.38.6 Channel access in scheduled DTI

10.38.6.1 General

An AP or PCP schedules each allocation with a specified start time from the TSF and with a fixed duration. An allocation can be an SP, where ownership of channel time is granted to a single STA, or a CBAP, where STAs can compete for channel access. The start time of each allocation is based on the TSF of the AP or PCP.

The AP or PCP may schedule SPs or CBAPs only during the DTI of a beacon interval, following the end of an allocated BTI, A-BFT, and ATI when any of these periods are present in the beacon interval.

The schedule of the DTI of a beacon interval shall be communicated through the Extended Schedule element and, in an EDMG BSS, also through the EDMG Extended Schedule element. The AP or PCP transmits the Extended Schedule element in either or both an Announce frame or a DMG Beacon frame. If the Extended Schedule element includes at least one TDD SP, it shall be transmitted in a DMG Beacon frame. The Extended Schedule element shall contain the scheduling information of all allocations in the DTI, except if transmitted in an EDMG BSS where the Extended Schedule element may exclude one or more allocations that are included in EDMG Extended Schedule element transmitted through at least one sector. The same Allocation field shall not appear more than once in the Extended Schedule element transmitted in a beacon interval. The content of the Extended Schedule element and the EDMG Extended Schedule element communicated in a beacon interval shall not change if transmitted more than once in the beacon interval, except as follows;

— If the STA transmitting the Extended Schedule element or the EDMG Extended Schedule element is a PCP with multiple DMG antennas, then the value of the PCP Active field of CBAP allocations within the Extended Schedule element or the EDMG Extended Schedule element might change when these elements are transmitted through different DMG antennas.

— For the EDMG Extended Schedule element, fields that are related to directional allocation (10.38.12.3 (Directional allocation)) or beamforming training allocation (10.41.10.3.3 (Beamforming training allocation in DTI)) may change during the beacon interval when transmitted through different sectors.

The AP or PCP should schedule SPs for a STA such that the scheduled SPs do not overlap in time with the traffic scheduling constraints indicated by this STA in the Traffic Scheduling Constraint Set field of the associated DMG TSPEC element.

When scheduling a nonpseudo-static allocation or changing the start time of an existing pseudo-static allocation that has a non-AP and non-PCP STA as a source DMG STA or as a destination DMG STA of the allocation, an AP or PCP shall set the start time of the allocation to no less than aMinAllocationDeliveryTime after the last Extended Schedule element containing this allocation is transmitted by the AP or PCP.

NOTE—This rule does not apply to the case when an AP or PCP schedules a new pseudo-static allocation.

When receiving an Extended Schedule element containing a new pseudo-static allocation in which it is expected to participate, a non-AP and non-PCP STA ignores the allocation if the value of the TSF at the time

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the frame containing the Extended Schedule element is received is greater than the value of the TSF at the start of the pseudo-static allocation; this allocation is called an *obsolete allocation*. The value of the TSF at the start of the pseudo-static allocation is constructed using the value of the Allocation Start Time field within the Allocation field for the pseudo-static allocation.

An SP or CBAP allocation within an Extended Schedule element may comprise one or more individual allocations. The start time of each individual allocation of an SP or CBAP is given by

$$(A_{start} + (i - 1) \times A_{period})$$

where

A_{start} is the value of the Allocation Start field for the SP or CBAP

A_{period} is the value of the Allocation Block Period field for the SP or CBAP

i is an integer greater than 0 and less than or equal to the value of the Number of Blocks field for the SP or CBAP

The end of the i^{th} individual SP or CBAP allocation is computed by adding the start time of the i^{th} individual allocation to the value of the Allocation Block Duration field for the corresponding SP or CBAP allocation.

For CMMG STAs, an SP or CBAP allocation within an Extended Schedule element may be a 540 MHz allocation or a 1080 MHz allocation; the channel and bandwidth of the SP or CBAP allocation are indicated in the Extended Schedule element.

If the PCP Active subfield in the Allocation field for an allocation within an Extended Schedule element is 1, the PCP shall be in the receive state for the duration of that allocation, except when transmitting during that allocation. The AP shall set the PCP Active field to 1 for every allocation within an Extended Schedule element transmitted by the AP.

10.38.6.2 Service period (SP) allocation

10.38.6.2.1 General

The AP or PCP shall set the AllocationType subfield to 0 in an Allocation field within an Extended Schedule element to indicate an SP allocation.

If an SP has the TDD Applicable SP subfield in an Allocation field within an Extended Schedule element equal to 1, it is an SP with TDD channel access (i.e., TDD SP) and the rules specified in 10.38.6.2.2 (SP with TDD channel access) for TDD channel access during the SP shall apply. Otherwise, the TDD channel access rules shall not apply and the SP does not use the TDD channel access rules.

A DMG STA may transmit in a TDD SP only if the TDD Channel Access Supported subfield in the STA's DMG Capabilities element is 1. Otherwise, the DMG STA shall not transmit in the TDD SP.

A TDD SP comprises a sequence of TDD intervals that, in turn, comprise a sequence of TDD slots (see 10.38.6.2.2 (SP with TDD channel access)). TDD intervals and TDD slots exist only in a TDD SP. Unless otherwise specified, the rules applicable to an SP shall also be applicable to TDD slots within a TDD SP.

An SP allocation that is not an obsolete allocation is assigned to the source DMG STA identified in the Source AID subfield in an Allocation field within the Extended Schedule element. The source DMG STA shall initiate the frame exchange sequence that takes place during the SP at the start of the SP, except when the source DMG STA intends to establish a DMG protected period in which case the rules described in 10.38.6.6 shall be followed before the source DMG STA initiates the frame exchange sequence in the SP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The SP allocation identifies the TC or TS for which the allocation is made; however, the type of traffic transmitted is not restricted to the specified TC or TS (11.4.1).

An SP that is not a TDD SP is assigned to the source CMMG STA identified in the Source AID subfield in an Allocation field that is not an obsolete allocation within the Extended Schedule element. The source CMMG STA shall initiate the frame exchange sequence that takes place during the SP at the start of the SP, except when the source CMMG STA intends to establish a CMMG protected period in which case the rules described in 10.38.6.6 shall be followed before the source CMMG STA initiates the frame exchange sequence in the SP. The SP allocation identifies the TC or TS for which the allocation is made; however, the type of traffic transmitted is not restricted to the specified TC or TS (11.4.1).

Except when transmitting a frame as part of the SP recovery procedure (10.38.6.7) or transmitting a response to the source DMG STA or transmitting a PPDU as part of an RD response burst (10.29) or in a TDD slot, the STA identified by the Destination AID field in the Extended Schedule element should be in the receive state for the duration of the SP in order to receive transmissions from the source DMG STA. If the Destination AID field of the scheduled SP is equal to the broadcast AID and if the Source AID field of the scheduled SP is not equal to the broadcast AID, then all STAs on the PBSS/infrastructure BSS should be in the receive state in order to receive transmissions from the source DMG STA for the duration of the SP. Subclause 10.38.7 describes the rules for when the scheduled SP has both the Source and Destination AID fields equal to the broadcast AID.

Only a STA identified as the source DMG STA or destination DMG STA of an SP may transmit during the SP, except when the rules in 10.38.7, 10.38.8, or 10.38.9 are used.

At the beginning of an SP (except when the source DMG STA intends to establish a DMG protected period, see 10.38.6.6) before the source DMG STA initiates the frame exchange sequence in the SP, a source DMG STA shall transmit a frame to the destination DMG STA using the DMG Control modulation class before it uses any other modulation class for transmission if the Heartbeat field in the destination DMG STA's DMG Capabilities element is 1. The frame sent by the source STA may be an RTS frame or a DMG CTS-to-self frame. The frame sent by the source STA may be an SSW frame or a BRP PPDU if the source STA is performing beamforming (10.6.7.5).

At the beginning of an SP in a CMMG band, except when the source CMMG STA intends to establish a CMMG protected period (see 10.38.6.6) before the source CMMG STA initiates the frame exchange sequence in the SP, a source CMMG STA shall transmit a frame to the destination CMMG STA using the CMMG Control modulation class before it uses any other modulation class for transmission if the Heartbeat field in the destination CMMG STA's CMMG Capabilities element is 1. The frame sent by the source STA may be an RTS frame or a DMG CTS-to-self frame. The frame sent by the source STA may be an SSW frame or a BRP PPDU if the source STA is performing beamforming (10.6.8.5).

The first frame transmitted by a destination DMG STA to the source DMG STA in an SP shall use the DMG Control modulation class if the Heartbeat field in the source DMG STA's DMG Capabilities element is 1. Subject to the rules specified in 10.6, subsequent frames transmitted by the destination DMG STA within the SP may use a different modulation class.

At the beginning of an SP, a destination CMMG STA shall transmit a frame to the source CMMG STA using the CMMG Control modulation class before it uses any other modulation for transmission if the Heartbeat field in the source CMMG STA's CMMG Capabilities element is 1 and the frame sent by the destination CMMG STA is the unsolicited DMG DTS as first frame in the SP of the STA performing CMMG protected period.

Any MAC entity coordinated by an MM-SME that belongs to an MMSL cluster identified by the Source AID and Destination AID that are equal to, respectively, the Source AID and Destination AID of the Allocation field that is not an obsolete allocation in the Extended Schedule element that allocates the SP may

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

transmit during the SP, if the STA sent an MMS element to the peer STA and the BeamLink Cluster field within the MMS element is 1.

The AP or PCP may create SPs in its beacon interval with the source and destination AID subfields within an Allocation field set to 255 to prevent transmissions during specific periods in the beacon interval.

The AP or PCP shall set the Beamforming Training subfield to 1 in the Allocation field for an SP within an Extended Schedule element to indicate that the source DMG STA of this SP initiates beamforming training with the destination DMG STA at the start of that SP. The source DMG STA and destination DMG STA of the SP shall perform beamforming training as described in 10.41.

If the PCP Active subfield is 0 in the Allocation field for an SP within an Extended Schedule element, neither the destination DMG STA of the SP nor the source DMG STA of the SP shall transmit to the PCP during the SP if none of the STAs are the PCP.

Except for an SP using TDD channel access and under the conditions specified in 10.38.6.2.2 (SP with TDD channel access), in no case shall the source or destination DMG STA extend a frame exchange sequence that started during an SP beyond the end of that SP. A STA that initiates a sequence shall check that the frame exchange sequence, including any control frame responses, completes before the end of the SP.

When scheduling two adjacent SPs where at least one of the SPs has the TDD Applicable SP subfield set to 0, the AP or PCP should allocate the SPs separated by at least aDMGPPMinListeningTime if one or more of the source or destination DMG STAs participate in both SPs. Otherwise, there is no separation between the SPs (see 10.38.6.2.2 (SP with TDD channel access)).

Except for frames used for beamforming as described in 10.41, the source of an SP may retransmit a frame PIFS after the end of the frame transmission in case a response frame is expected from the destination DMG STA and a SIFS elapses without receipt of the expected transmission.

The source DMG STA can relinquish the remainder of an SP to the destination DMG STA by sending a Grant frame to the destination DMG STA (10.38.7.3).

10.38.6.2.2 SP with TDD channel access

A DMG AP or DMG PCP shall set the AllocationType subfield to 0 and the TDD Applicable SP subfield to 1 in an Allocation field within an Extended Schedule element to indicate a TDD SP allocation.

When allocating a TDD SP, the AP or PCP shall set both of the Source AID and Destination AID subfields in the corresponding Allocation field to 0.

If an Extended Schedule element includes at least one TDD SP, a DMG PCP or DMG AP shall include the Extended Schedule element in each transmitted DMG Beacon frame.

The structure of TDD SP is shown in Figure 10-63 (Example of TDD SP). A TDD SP consists of one or more consecutive and adjacent TDD intervals specified by the TDD Slot Structure element. A TDD interval comprises one or more TDD slots.

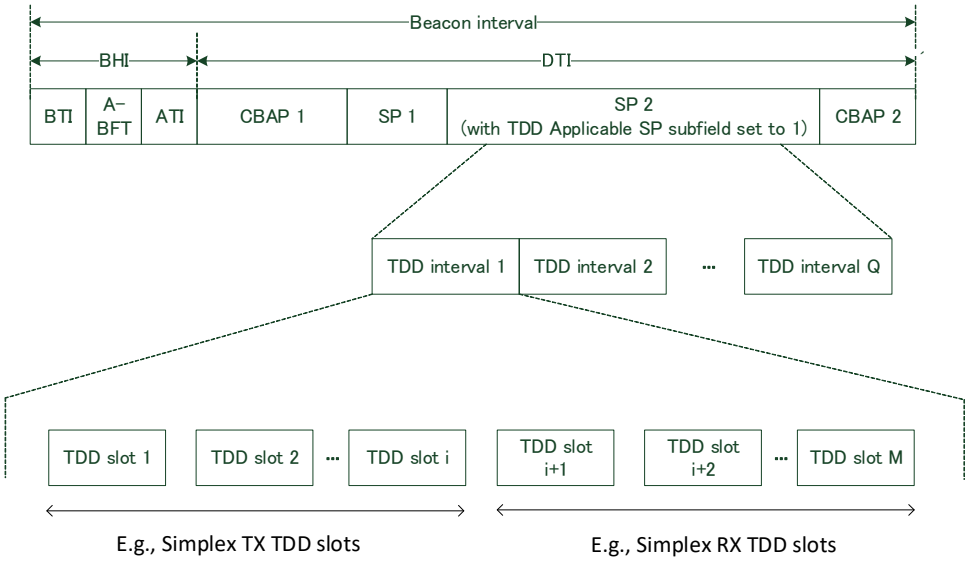

Figure 10-63—Example of TDD SP

The parameters of the TDD structure within a TDD SP are defined by the TDD Slot Structure element. A non-AP and non-PCP STA shall not transmit a TDD Slot Structure element. A DMG AP or DMG PCP shall transmit a TDD Slot Structure element to each non-AP and non-PCP DMG STA that is expected to transmit or receive during a TDD SP. TDD Slot Structure elements may be included in DMG Beacon or Announce frames transmitted by the DMG AP or DMG PCP. Upon reception of a TDD Slot Structure element corresponding to allocations identified by the Allocation ID subfield value within the element, a DMG STA shall adopt the TDD slot structure within the element for all the TDD SPs identified by the same Allocation ID subfield value at the time indicated by the value of the Slot Structure Start Time field in the element. From the time the DMG STA receives an updated TDD Slot Structure element until the TDD structure is adopted, the current TDD structure shall remain in effect.

The assignment of the TDD slots within a TDD SP is done through the TDD Slot Schedule element. Except for the transmission of a TDD Beamforming frame prior to association, a DMG STA shall not transmit during a TDD SP unless it receives a TDD Slot Schedule element that indicates it is assigned, by the DMG AP or DMG PCP, to at least one TDD slot within the TDD SP that has the Bitmap and Access Type Schedule field for the STA equal to TX. Within a TDD SP, a STA shall not transmit outside the boundaries of a TDD slot it is assigned to with the Bitmap and Access Type Schedule field equal to TX, except between two adjacent TDD slots of the same category and with same destination STA. The DMG AP or DMG PCP shall transmit the TDD Slot Schedule element to each DMG STA that is assigned to access the TDD SP; this transmission shall be done using an Announce frame and Association Response frame before the time indicated by the value of the Slot Schedule Start Time field within the element. Upon reception of a TDD Slot Schedule element corresponding to allocations identified by the Allocation ID subfield value within the element, a DMG STA shall adopt the schedule within the element at the time indicated by the value of the Slot Schedule Start Time field within the element.

Figure 10-64 (Example of TDD Slot Structure and TDD Slot Schedule elements relationship) depicts an example of the TDD slot timing and access permissions provided by the TDD Slot Structure element and the TDD Slot Schedule element. Starting from the value indicated in the Slot Structure Start Time field, the TDD slot structure repeats each beacon interval. The Slot Structure Start Time field is equal to TBTT2 in

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

this example. In each beacon interval, the TDD intervals indicated by the Number of TDD intervals field, *n*, occupies the entire beacon interval. Each TDD interval has a duration equal to value of the TDD Interval Duration field, *k*, so that $k \times n$ equals the beacon interval duration. Each TDD interval contains *M* TDD slots indicated in the Number of TDD Slots per TDD Interval field (*M* is equal to 3 in this example). Each TDD slot in a TDD Interval is defined by a pair of TDD slot start and TDD slot duration in the Slot Structure field. In the example, starting from value T as indicated in the Slot Schedule Start Time field, a new slot schedule becomes active. The Bitmap and Access Type Schedule field and the Slot Category Schedule field in the TDD Slot Schedule element indicates access type and slot category for each of the $M \times Q$ TDD slots, where *Q* is the value of the Number of TDD Intervals in the Bitmap field (*Q* is equal to 2 in this example). The bitmap that indicates the access type and the slot category for the $M \times Q$ TDD slots is repeated during the time indicated by the value of the TDD Slot Schedule Duration field.

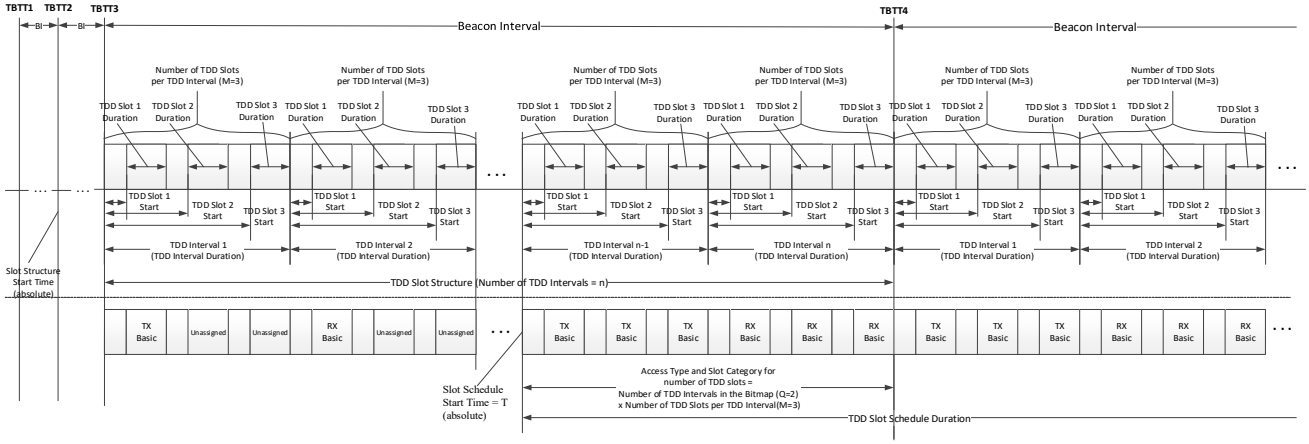

Figure 10-64—Example of TDD Slot Structure and TDD Slot Schedule elements relationship

A non-AP and non-PCP DMG STA may transmit a TDD Slot Schedule element in an Announce frame or (Re)Association Request frame to a DMG AP or DMG PCP. In this case, the Bitmap and Access Type Schedule field in the element indicates the availability of the STA, which can be used as input to the AP or PCP scheduling.

TDD slots shall not overlap in time. A TDD slot can be a simplex TDD slot, an unavailable TDD slot, or an unassigned TDD slot. A STA shall not transmit in an unassigned TDD slot or an unavailable TDD slot. RX and TX operations during a simplex TDD slot depend on the STA behavior indicated in the Bitmap and Access Type Schedule field defined in Table 9-398 as follows:

— A STA shall not transmit in a simplex TDD slot if the Bitmap and Access Type Schedule field indicates a value different from TX for the STA for the TDD slot.

— In a simplex TDD slot that has the Bitmap and Access Type Schedule field for the STA equal to TX, the STA can transmit to the peer STA assigned to the TDD slot.

— In a simplex TDD slot that has the Bitmap and Access Type Schedule field for the STA equal to RX, the STA shall be beamformed towards the peer STA assigned to the TDD slot, shall be ready to receive at least *RxTDDSlotAdvanceTime* before the start of the TDD Slot and shall remain in the receive state for the duration of the TDD slot in order to receive transmissions from the peer STA. *RxTDDSlotAdvanceTime* is computed as follows:

$$RxTDDSlotAdvanceTime = Ceil\,(T_{ME} + T_P, T_{TR})$$

where

T_{ME} is the value of the Maximum Time Synchronization Error subfield in the TDD Slot Structure element describing the TDD SP, in μs

T_P is aTDDAirPropagationTime, in μs

T_{TR} is aTSFResolution, in μs

Provided the STA behavior is the same in adjacent TDD slots, transmissions and receptions in adjacent TDD slots that are assigned to the same pair of STAs may continue in between the adjacent TDD slots.

When an AP or PCP receives a TDD Slot Schedule element from a STA that indicates a TDD slot is an unavailable TDD slot for that STA, the AP or PCP shall not schedule any transmission or reception in this TDD slot for that STA.

Each TDD slot is of one of the following categories: Basic, Data and BF. Table 10-34 lists the frames that are allowed to be transmitted during each slot category, together with the transmit order of those frames within the TDD slot.

The reverse direction protocol (see 10.29 (Reverse direction protocol)) shall not be used in a TDD SP.

A DMG STA that has TDD Channel Access Supported subfield in the STA's DMG Capabilities element equal to 1 shall set to 1 at least one of the following subfields in a transmitted DMG Link Margin element: PPDU Statistics Present subfield, LDPC Statistics Present subfield or SC/OFDM Statistics Present subfield.

The Duration field in frames sent in an SP with TDD channel access shall be set as follows: bits 0–13 set to 0, and bits 14–15 set to 1.

10.38.6.3 Contention based access period (CBAP) allocation

The AP or PCP shall set the AllocationType subfield to 1, the Source AID subfield to the broadcast AID or to the AID of the source of the CBAP, and the Destination AID subfield to the broadcast AID or to the AID of the destination of the CBAP in an Allocation field within an Extended Schedule element to indicate a CBAP allocation.

All CBAPs are allocated by the AP or PCP, except when allocated by a non-AP and non-PCP STA with the transmission of a Grant frame following an SP truncation (10.38.8). Multiple CBAPs may be present in a beacon interval, with the location and duration of each determined by the AP or PCP and announced in the Extended Schedule element. When only one CBAP is present and no other allocations exist for the DTI, then

Table 10-34—Allowed frames and transmit order for each TDD slot category

TDD slot category	Allowed frames	MPDU transmit order	Conditions	
Basic	Control: Ack, BlockAck, DMG CTS-to-self, BlockAckReq Extension Management Data	— Ack (as standalone PPDU, or as part of an A-MPDU; see NOTE 1). — BlockAck (as standalone PPDU, or as part of an A-MPDU; see NOTE 1). — As many Extension and Management frames as available, or fitting in the TDD slot. — Zero or more Data frames, optionally followed by a BlockAckReq frame. Optionally, repeat the steps until the end of the TDD slot. See NOTE 3.	— If present, Ack shall be the first frame in the slot. — If present, BlockAck shall be the first frame in the slot, unless preceded by an Ack frame. — Management and Data frames may be aggregated following the rules in 9.7.3, as long as all buffered Management frames are present in the A-MPDU.	— The following frames may appear only once during the TDD slot: Ack, BlockAck, and BlockAckReq. — PPDUs containing Data or Management frames may be preceded and/or followed by DMG CTS-to-self frames.
Data		— As many Data frames as available, or fitting in the TDD slot, optionally followed by a BlockAckReq frame. — Ack (as standalone PPDU, or as part of an A-MPDU; see NOTE 1 and NOTE 2). — BlockAck (as standalone PPDU, or as part of an A-MPDU; see NOTE 1 and NOTE 2). — Zero or more Extension and Management frames. Optionally, repeat the steps until the end of the TDD slot. See NOTE 4.	— Data and Management frames can be aggregated following the rules in 9.7.3, as long as all buffered Data frames are present in the A-MPDU.

Table 10-34—Allowed frames and transmit order for each TDD slot category *(continued)*

TDD slot category	Allowed frames	MPDU transmit order	Conditions	
BF	TDD Beamforming	— TDD SSW — TDD SSW Feedback — TDD SSW Ack		

NOTE 1—Action No Ack frames can also be aggregated with Ack or BlockAck frames and sent as part of an A-MPDU in control response context, as defined in 9.7.3. Action No Ack frames sent in this fashion are allowed to not follow the MPDU transmit order defined for the slot category.

NOTE 2—Opportunistic transmission of Ack and BlockAck frames in Data TDD slots does not change the timeout rules defined in 10.3.2.11 (Acknowledgment procedure).

NOTE 3—Repeating these steps during the TDD slot means that once STA has transmitted all buffered Management frames, it can transmit zero or more Data frames (optionally followed by a BlockAckReq frame) before it checks for new Management frames to transmit.

NOTE 4—Repeating these steps during the TDD slot means that once STA has transmitted all buffered Data frames, it can transmit Ack, BlockAck, and zero or more Management frames before it checks for new Data frames to transmit.

the AP or PCP shall announce the presence of the CBAP by setting the CBAP Only field to 1 in the DMG Parameters field of the DMG Beacon. If at least one non-CBAP allocation is present, or more than one CBAP is present, or no allocations are present within a DTI, then the AP or PCP shall set the CBAP Only field to 0 in the DMG Parameters field in the DMG Beacon frame transmitted during the BTI. The AP or PCP shall set the CBAP Only field to 0 in the DMG Parameters field within a transmitted DMG Beacon frame if the DMG Beacon frame contains at least one Extended Schedule element.

When the entire DTI is allocated to CBAP through the CBAP Only field in the DMG Parameters field, then that CBAP is pseudo-static and exists for dot11MaxLostBeacons beacon intervals following the most recently transmitted DMG Beacon frame that contained the indication, except if the CBAP is canceled by the transmission by the AP or PCP of a DMG Beacon frame with the CBAP Only field of the DMG Parameters field equal to 0 or an Announce frame with an Extended Schedule element. A guard time (10.38.6.5) precedes a CBAP that is allocated through the CBAP Only field equal to 1.

Channel access during a CBAP shall follow the rules described in 10.38.5.

10.38.6.4 Pseudo-static allocations

An SP or CBAP allocation is pseudo-static if the Pseudo-static field in the Allocation control field for the SP or CBAP is 1, or when the Extended Schedule element is not used and the CBAP Only field within the DMG Parameters field of the DMG Beacon frame is 1 (10.38.5). A pseudo-static SP or CBAP recurs at the same relative offset to TBTT and with the same duration in up to dot11MaxLostBeacons beacon intervals following the last received Extended Schedule element containing the pseudo-static allocation or DMG Beacon frame with the CBAP Only field equal to 1.

A STA might fail to receive up to (dot11MaxLostBeacons–1) Extended Schedule elements or DMG Beacon frame with the CBAP Only field equal to 1 in consecutive beacon intervals and still may access the channel during the pseudo-static SP or CBAP. The STA shall cease transmission during a pseudo-static allocation if it fails to receive an Extended Schedule element or DMG Beacon frame with the CBAP Only field equal to 1 for dot11MaxLostBeacons consecutive beacon intervals.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The AP or PCP may change the offset relative to TBTT or the duration of a pseudo-static allocation by transmitting a modified Allocation field in an Extended Schedule element before dot11MaxLostBeacons beacon intervals from the last transmitted Extended Schedule element. The AP or PCP may delete a pseudo-static allocation by transmitting an Extended Schedule element that does not include an allocation field containing that allocation's TID, source AID, and destination AID before the completion of dot11MaxLostBeacons beacon intervals from the last transmitted Extended Schedule element. In either case, the AP or PCP should not schedule a new allocation that overlaps with the previous pseudo-static allocation for a minimum of dot11MaxLostBeacons beacon intervals unless both the new and previous allocation are for a CBAP or the new allocation identifies the same source DMG STA as the original pseudo-static allocation.

If the destination DMG STA of a pseudo-static allocation receives an Extended Schedule element with an Allocation field that indicates a change in the schedule of the pseudo-static allocation, the STA should enter receive state during the new pseudo-static allocation and may enter receive state during the previous allocation to account for the time it can take the source DMG STA of the allocation to receive the updated schedule.

10.38.6.5 Guard time

Guard time is the time between the end of one allocation and the start of the following allocation, provided these allocations are not under spatial sharing (11.30). For the purpose of guard time insertion, an allocation is defined as an SP, a CBAP, and a BTI or A-BFT or ATI that is immediately followed by a CBAP allocated through the CBAP Only field (10.38.6.3). Guard times are used to keep transmissions in adjacent allocations from colliding. Figure 10-65 (The guard time) shows an example of the insertion of the guard time such that the allocations are separated by at least the guard time, in case the STAs participating in the adjacent allocations drift toward each other's allocation.

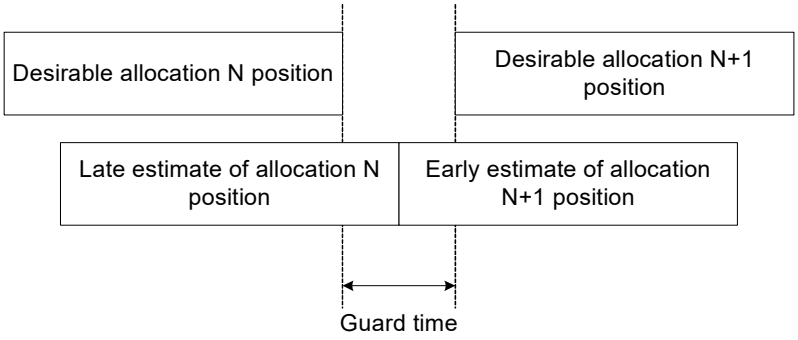

Figure 10-65—The guard time

The AP or PCP shall insert a sufficient guard time between adjacent allocations so that transmissions in adjacent allocations do not overlap in time. For each of the adjacent allocations, guard times are calculated based on the worst case drift and the maximum allowed number of lost DMG Beacons. The AP or PCP shall insert a guard time (T_{guard}) between adjacent allocations that is not shorter than

$$T_{guard} = \text{Ceil}\left(\frac{((A_i + 1) \times C \times D_i) + ((A_{i+1} + 1) \times C \times D_{i+1})}{10^6} + SIFS + T_P, T_{TR}\right)$$

where

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A_i is the value of MLB allocation i, and the value of A_i for each allocation depends on whether the allocation is pseudo-static. A_i is 0 for a nonpseudo-static allocation and is equal to dot11MaxLostBeacons if the allocation is pseudo-static
C is aDMGTSFAccuracy, in ppm
D_i is the time elapsed since a synchronizing reference event, in μs. The synchronizing event is the reception of the Timestamp field from the AP or PCP. For a pseudo-static allocation, D_i is equal to the beacon interval
$SIFS$ in aSIFSTime, in μs
T_P is aAirPropagationTime, in μs, which accounts for the propagation delay between the STAs participating in the adjacent allocations
T_{TR} is aTSFResolution, in μs

10.38.6.6 DMG and CMMG protected period

10.38.6.6.1 Introduction

Communicating STA pairs of neighboring PBSS/infrastructure BSS might be granted SPs that potentially create interference for neighbor PBSS/infrastructure BSS STA pairs. SPs within a PBSS/infrastructure BSS can also experience such interference when spatial diversity conditions change. The intent of DMG protected period is to minimize such interference by allowing any pair of STAs to protect their SP and thereby limit the transmission of frames during the DMG protected period to not more than one pair of potentially interfering pairs of communicating stations.

In the CMMG protected period that has 540 MHz or 1080 MHz bandwidth, the STA can use dynamic bandwidth operation to negotiate a bandwidth that can be used in this SP.

A DMG protected period can be created by the source DMG STA during an SP, and shall be created by the source DMG STA if at least one of the following conditions is met:

— The source DMG STA is the AP or PCP of the BSS, the ECAPC Policy Enforced subfield within the DMG Parameters field of the last DMG Beacon frame transmitted by the source DMG STA is equal to 1, and the Protected Period Enforced field within the ECAPC Policy Detail field of the last ECAPC Policy element transmitted by the source DMG STA is equal to 1.
— The source DMG STA is not the AP or PCP of the BSS, the ECAPC Policy Enforced subfield within the DMG Parameters field of the last DMG Beacon frame received by the source DMG STA from the AP or PCP of the BSS is equal to 1, and the Protected Period Enforced field within the ECAPC Policy Detail field of the last ECAPC Policy element received by the source DMG STA from the AP or PCP of the BSS is equal to 1.

Both the source DMG STA and destination DMG STA of an SP are owners of the DMG protected period. During any DMG protected period, both stations can receive frames from the other participant.

A CMMG protected period can use the dynamic bandwidth operation during an SP if the bandwidth of the SP that indicated in the Extended Schedule element is 1080 MHz.

A DMG STA that creates a DMG protected period during an SP in which it is a source DMG STA or a destination DMG STA moves to and stays in listening mode during time interval that starts before the start of the SP and remains in the listening mode until it is allowed to use the SP. The actual duration of the time the STA stays in the listening mode is limited by the aDMGPPMinListeningTime parameter. The intent of the listening mode is that the STA listens to other STAs that may have an SP that overlaps with the SP where the STA is a source DMG STA or a destination DMG STA. The NAV mechanism is used to indicate the time occupancy and if the STA is in the listening mode, it updates its NAVs. If the NAVs are not equal to 0, the STA does not use the time of the SP in which it is a source DMG STA or a destination DMG STA. If

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

none of the NAVs has a nonzero value at the start of the SP, the STA is allowed to leave the listening mode and use the SP. If at least one of the NAVs has a nonzero value at the start of the SP, the STA is allowed to leave the listening mode and to use the time remaining in the SP after all NAVs become or already have value zero.

A CMMG STA that creates a CMMG protected period during an SP in which it is a source CMMG STA or a destination CMMG STA moves to and stays in listening mode during time interval that starts before the start of the SP and remains in the listening mode until it is allowed to use the SP. The actual duration of the time the STA stays in the listening mode is limited by the aCMMGPPMinListeningTime parameter. The intent of the listening mode is that the CMMG STA listens to other CMMG STAs that may have an SP that overlaps with the SP where the CMMG STA is a source CMMG STA or a destination CMMG STA. The NAV mechanism is used to indicate the time and frequency occupancy, and the CMMG STA in the listening mode updates NAV timers. If the NAV timers are not equal to 0 for the corresponding channel bandwidth, the CMMG STA does not use the time and the band of the SP in which it is a source CMMG TA or a destination CMMG STA. If none of the NAV timers has a nonzero value at the start of the SP, the DMG STA is allowed to leave the listening mode and use the SP. If at least one of the NAV timers has a nonzero value at the start of the SP, the DMG STA is allowed to leave the listening mode and to use the time remaining in the SP after all NAV timers become or already have value zero.

Listening mode is a mode of operation during which a DMG STA is in receiving state and meets at least one of the following conditions:

a) Its receiving antenna are in the quasi-omni mode.
b) Its receiving antenna are directed to the peer STA for which this DMG STA is either the destination or source DMG STA.

A DMG protected period is established through an RTS/DMG CTS handshake. The DMG CTS can be sent in a CMMG PHY format and can be sent in 540 MHz or 540 MHz duplicated mode. To create a DMG protected period, the source DMG STA of an SP sends an RTS, and the recipient STA responds with a DMG CTS. If the recipient STA responds with a DMG CTS, then a DMG protected period is established; otherwise, no DMG protected period has been established. In all cases of DMG protected period establishment, the same antenna configurations that are used by the STAs that establish the DMG protected period are used for the exchange of frames during the DMG protected period.

10.38.6.6.2 DMG and CMMG protected period establishment and maintenance

A DMG STA that attempts to create a DMG protected period during an SP shall transition to listening mode not less than aDMGPPMinListeningTime before the attempt and shall remain in listening mode for at least aDMGPPMinListeningTime before making the attempt.

A CMMG STA that attempts to create a CMMG protected period shall transition to listening mode on a channel that the bandwidth is indicated in the Extended Schedule element for this SP.

A DMG STA shall not issue an RTS frame to establish a DMG protected period if any of its NAVs is not equal to 0.

A CMMG STA shall not issue an RTS frame to establish a CMMG protected period on a channel if any of its NAV timers corresponding to this channel are not equal to 0. A CMMG STA may issue an RTS frame to establish a CMMG protected period on a channel if the bandwidth of the channel is less than the SP allocated channel bandwidth and all of its NAV timers that correspond to this channel are 0.

A DMG STA that transmits an RTS frame to establish a DMG protected period during an SP in which it is a source DMG STA shall not transmit the RTS frame outside of the SP and the value of the Duration field of

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the RTS frame shall not exceed the duration of the portion of the SP that remains following the RTS frame transmission.

A CMMG STA that transmits an RTS frame to establish a CMMG protected period during an SP in which it is a source CMMG STA shall not transmit the RTS frame outside of the SP, and the value of the Duration field of the RTS frame shall not exceed the duration of the portion of the SP that remains following the RTS transmission. And a CMMG STA that transmits an RTS frame to establish a CMMG protected period during an SP in which it is a source CMMG STA shall not transmit an RTS frame that has a bandwidth that is larger than the allocated bandwidth.

In order to maintain STAs that are not aware of the establishment of the DMG protected period because they have begun listening to the medium after the establishment of a DMG protected period, a STA that established a DMG protected period should transmit additional RTSs. An additional RTS frame should be sent at the end of every (aDMGPPMinListeningTime – aRTSTimeoutTime) interval during the DMG protected period if the duration of the RTS/DMG CTS exchange is less than the time remaining in the SP.

A DMG STA that transmitted an RTS frame that established a DMG protected period shall use the same antenna configuration as was used for the transmission of the RTS frame during transmission of Data frame(s) during the DMG protected period.

A DMG STA should transition to listening mode not less than aDMGPPMinListeningTime before the start of an SP in which it is the destination DMG STA.

During an SP in which it is the destination DMG STA, a DMG STA that receives a valid RTS frame with the RA equal to the recipient DMG STA MAC address and the TA corresponding to the source DMG STA of the SP shall respond with a DMG CTS frame if the recipient DMG STA has been in listening mode for aDMGPPMinListeningTime at the start of the reception of the RTS frame and none of its NAVs has a nonzero value.

During an SP in which it is the destination CMMG STA, a CMMG STA that receives a valid RTS frame addressed to it and the TA corresponding to the source CMMG STA of the SP shall not respond with a DMG CTS frame on the channel if at the start of the reception of the RTS frame the recipient CMMG STA has a nonzero value in at least one of its NAV timers corresponding to this channel.

During an SP in which it is the destination DMG STA, a DMG STA that receives a valid RTS frame with the RA equal to the recipient DMG STA MAC address and the TA corresponding to the source DMG STA of the SP shall not respond with a DMG CTS frame if at the start of the reception of the RTS frame the recipient DMG STA has a nonzero value in at least one of its NAVs or the recipient DMG STA has not been in listening mode for at least aDMGPPMinListeningTime.

During an SP in which it is the destination DMG STA, a DMG STA that receives a valid RTS frame with the RA equal to the recipient DMG STA MAC address and the TA corresponding to the source DMG STA of the SP may respond with a DMG DTS frame if at the start of the reception of the RTS frame the recipient DMG STA has a nonzero value in at least one of its NAVs.

A DMG STA may transmit a DMG DTS frame after the expiration of the aRTSTimeoutTime time following the start of an SP in which it is the destination DMG STA, if any of its NAVs has a nonzero value at that time and no RTS has been received from the source DMG STA of the SP and the STA has been in listening mode for aDMGPPMinListeningTime immediately preceding the start of transmission of the DMG DTS frame. The destination DMG STA shall not transmit a DMG DTS frame if any portion of the DMG DTS frame would be transmitted outside of the SP.

The value in the Duration field of a DMG DTS frame shall be calculated by subtracting the DMG DTS frame transmission time from the NAV in the destination DMG STA that has the largest value at the time of

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the start of the transmission of the DMG DTS frame. The NAV-DA and NAV-SA fields shall be set to the MAC addresses that identify the NAV in the destination DMG STA that was used to determine the Duration field value of the DMG DTS frame.

During an SP in which it is the destination DMG STA, a DMG STA that receives a valid RTS frame with the RA equal to the recipient DMG STA MAC address and the TA corresponding to the source DMG STA of the SP may respond with a DMG DTS frame if at the start of the reception of the RTS frame the recipient DMG STA has not been in listening mode for at least aDMGPPMinListeningTime. The value of the Duration field of the DMG DTS frame sent by the recipient DMG STA shall include the difference of aDMGPPMinListeningTime and the elapsed time since the recipient DMG STA has been in listening mode, and the NAV-SA and the NAV-DA fields of the DMG DTS frame shall contain the recipient DMG STA MAC address.

A destination DMG STA that responds to an RTS frame with a DMG CTS or DMG DTS frame shall transmit the response frame a SIFS after the end of the received RTS frame. A destination DMG STA that transmits either a DMG CTS or a DMG DTS frame shall use the same antenna configuration for the subsequent transmission of Ack frames and Data frames within the SP as is used for the transmission of the DMG CTS or DMG DTS frame.

The source DMG STA of an SP can send a CF-End frame to the destination DMG STA of the SP to truncate a DMG protected period. Regardless of whether this CF-End frame is sent, a CF-End frame is also sent to the AP or PCP (see 10.38.8).

10.38.6.6.3 CDMG protected period establishment and maintenance

In addition to establishing a DMG protected period on its current operating channel, a CDMG STA might create another DMG protected period on an overlapping channel to avoid the potential interference from the overlapping channel. This subclause describes rules for establishing and maintaining a CDMG protected period for a pair of CDMG STAs.

A CDMG AP or PCP shall set the Protected Period subfield within the Extended Schedule element sent to the source and destination STAs to indicate whether the protected period is to be created and on which channels the protected period should be created for an SP allocation. The CDMG AP or PCP should determine the time and frequency overlapping status of an SP scheduled by itself with other SPs or CBAPs scheduled by other APs or PCPs according to the schedule information of the neighboring APs or PCPs and itself. The CDMG AP or PCP can obtain the schedule information of the neighboring APs or PCPs by receiving DMG Beacon frames directly if it is within an AP or PCP cluster, or by receiving interference reports included in the Cluster Report elements or DMG TSPEC elements transmitted by STAs within the BSS.

If a CDMG AP or PCP determines that there exists at least one SP or CBAP scheduled by a neighboring AP or PCP that is overlapping in both time and frequency with an SP allocated by the CDMG AP or PCP and cannot determine that the neighboring SP or CBAP does not interfere with its allocated SP based on the received interference report (10.38.6.6.6) from STAs, the CDMG AP or PCP shall set the Protected Period subfield to a nonzero value for the allocated SP to indicate that the source and destination CDMG STAs are required to establish a protected period for the SP. Otherwise, the CDMG AP or PCP shall set the Protected Period subfield to 0 to indicate that the source and destination CDMG STAs do not have to establish a protected period for the SP.

If a potentially interfering SP or CBAP is allocated on the current operating channel, the AP or PCP shall set the Protected Period subfield within the Allocation Control field to 1. The source and destination CDMG STAs shall follow the rules defined in 10.38.6.6.1 to establish a DMG protected period on its current operating channel.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the source CDMG STA and destination CDMG STA are operating on a 1.08 GHz channel and a potentially interfering SP or CBAP is allocated on the overlapping 2.16 GHz channel, the CDMG AP or PCP shall set the Protected Period subfield to 2. The source CDMG STA and destination CDMG STA shall create a CDMG protected period on both the current operating 1.08 GHz channel and the overlapping 2.16 GHz channel.

If the source CDMG STA and destination CDMG STA are operating on a 2.16 GHz channel and a potentially interfering SP or CBAP is allocated on the overlapped low frequency 1.08 GHz channel, the CDMG AP or PCP shall set the Protected Period subfield to 2 to indicate that the source CDMG STA and destination CDMG STA create a DMG protected period on both the current operating 2.16 GHz channel and the low frequency 1.08 GHz channel.

If the source CDMG STA and destination CDMG STA are operating on a 2.16 GHz channel and a potentially interfering SP or CBAP is allocated on the overlapped high frequency 1.08 GHz channel, the CDMG AP or PCP shall set the Protected Period subfield to 3 to indicate that the source CDMG STA and destination CDMG STA create a DMG protected period on both the current operating 2.16 GHz channel and the high frequency 1.08 GHz channel.

If creating a CDMG protected period on two channels is required, the source and destination STAs shall listen to the current channel first and transition to and stay in listening mode following the rules specified in 10.38.6.6.1. If both the results of the PHY layer carrier sensing (CS) and the virtual carrier sensing show that the current channel is idle, the source STA and destination STA shall perform a RTS/DMG CTS handshake on the current channel. Once the first RTS/DMG CTS handshake is completed, the source STA and destination STA shall perform another RTS/DMG CTS handshake on the second channel after a SIFS. After the second RTS/DMG CTS handshake is done, the source STA and destination STA shall switch back to their operating channel and transmit data following a SIFS. An example of creating a CDMG protected period through two RTS/DMG CTS handshakes for CDMG STAs operating on a 1.08 GHz channel is shown in Figure 10-66 (An example of creating a CDMG protected period on two channels for CDMG STAs).

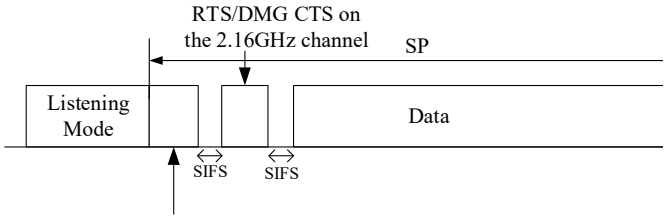

Figure 10-66—An example of creating a CDMG protected period on two channels for CDMG STAs

If an RTS/DMG CTS frame exchange sequence on the 1.08 GHz channel failed, the CDMG STA shall not transmit the subsequent RTS frame on the 2.16 GHz channel after a SIFS from the end of the expected CTS frame on the 1.08 GHz channel as shown in Figure 10-66 (An example of creating a CDMG protected period on two channels for CDMG STAs).

In order to maintain protection from STAs that are not aware of the establishment of the CDMG protected period because they have begun listening to the medium after the establishment of a CDMG protected period, a CDMG STA that established a CDMG protected period should transmit additional RTS frames on the channels that are the same as the channels used when establishing the CDMG protected period. The source STA should initiate an additional two RTS/DMG CTS handshakes on the two channels at the end of every (aDMGPPMinListeningTime – aRTSTimeoutTime) interval during the CDMG protected period if the duration of the two RTS/DMG CTS handshakes exchange is less than the time remaining in the SP.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A CDMG AP or PCP can merge the time interval of listening mode when creating a CDMG protected period and the channel measurement time during SPSH (see 11.30) by using the Protected Period subfield and the Directional Channel Quality Request element. If the AP or PCP determines two SPs allocated for two pairs of CDMG STAs within the BSS should both be created with protected period, the AP or PCP may transmit a Directional Channel Quality Request element to the two pairs of STAs based on allocation positions of the SPs for the two pairs of STAs. The directional channel measurement time interval indicated by the Directional Channel Quality Request element of one pair of STAs should cover the listening mode that begins at the start of the SP of this pair of STAs. Thus, the two pairs of STAs can direct their received antennae to their peer STAs involved in the same SP to perform channel monitoring required for establishing the protected period and perform the directional channel quality measurement required by the SPSH mechanism simultaneously. The AP or PCP may use the received Directional Channel Quality Report elements after the listening mode for subsequent SPSH with time overlapping SPs for the two pairs of STAs after the beginning of the next beacon interval.

10.38.6.6.4 Dynamic and static bandwidth operation during CMMG protected period

If the CMMG STA that sending the RTS frame to establish a CMMG protected period during an SP in which it is a source CMMG STA is capable of dynamic bandwidth operation (see 10.3.2.8), the STA shall set the TXVECTOR parameter DYN_BANDWIDTH to Dynamic. Otherwise, the STA shall set the TXVECTOR parameter DYN_BANDWIDTH to Static.

During an SP, a CMMG STA that is the destination CMMG STA in the SP and that is addressed by an RTS frame in a CMMG PPDU that has the RXVECTOR parameter DYN_BANDWIDTH equal to Static behaves as follows:

— If the NAV indicates idle and CCA has been idle for all the channel width indicated by the RTS frame's RXVECTOR parameter CH_BANDWIDTH, then the STA shall respond with a DMG CTS frame carried in a CMMG PPDU after a SIFS. The DMG CTS frame's TXVECTOR parameter CH_BANDWIDTH shall be set to the same value as the RTS frame's RXVECTOR parameter CH_BANDWIDTH.
— Otherwise, the STA shall not respond with a CTS frame.

During an SP, a CMMG STA that is the destination CMMG STA of the SP and that is addressed by an RTS frame in a CMMG PPDU that has the RXVECTOR parameter DYN_BANDWIDTH equal to Dynamic behaves as follows:

— If the NAV indicates idle in the primary 540 MHz channel, then the STA shall respond with a DMG CTS frame carried in a CMMG PPDU after a SIFS. The DMG CTS frame's TXVECTOR parameter CH_BANDWIDTH shall be set to 540 MHz if the CCA on the secondary 540 MHz channel is detected as busy and shall be set to 1080 MHz if the CCA on the secondary 540 MHz channel is detected as idle and the channel width indicated in the RTS frame's RXVECTOR parameter CH_BANDWIDTH is 1080 MHz.
— Otherwise, the STA shall not respond with a CTS frame.

10.38.6.6.5 NAV update in DMG and CMMG protected period

STAs in the listening mode shall update their NAVs according to the procedures described in 10.38.10.

NOTE—Support of multiple NAVs as defined in 10.38.10 is not limited to be used in the listening mode only and is also used in any case a NAV update is performed.

When an SP terminates, either through time allocation expiration or truncation, then the source DMG STA of that SP may reset any NAV to 0 that has an associated MAC variable NAV_DTSCANCELABLE with a value of true.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

10.38.6.6.6 Interference report

A STA that receives an RTS and/or DMG CTS frame that updates the NAV and that overlaps in time with an SP where the STA is destination or source may report the overlap to the AP or PCP by sending a DMG ADDTS Request frame variant (9.6.3.3.2) and including in the DMG TSPEC element (9.4.2.132) the indication of interference in the Traffic Scheduling Constraint Set field (Figure 9-657 (Traffic Scheduling Constraint Set field format)). Transmission of the DMG ADDTS Request frame variant shall follow the rules defined in 11.4, with the following exceptions.

The Allocation ID subfield of the DMG TSPEC element shall identify the allocation during which the interference was detected. One ADDTS Request frame is generated and transmitted for each allocation during which interference is detected.

The Traffic Scheduling Constraint Set field of the DMG TSPEC element may contain one or more Constraint subfields. Each Constraint subfield provides information separately for each overlapping NAV event. The following NAV events should be reported:

a) Nonzero NAV at start of SP
b) Extension of NAV during the SP, including extension of an initial nonzero NAV and transitioning of the NAV from zero to nonzero value during the SP
c) Truncation of the NAV during the SP

The TSCONST Start Time field is set to the TSF value at which the NAV event is detected. For event a) above, the TSCONST Start Time field shall be set to the start of the SP. For event b) above, the TSCONST Start Time field shall be set to the time the NAV was updated or initialized to the value reported in the TSCONST Duration field. For event c) above, the TSCONST Start Time field shall be set to the time the NAV was reset.

The TSCONST Duration field shall be set to the NAV value at the TSCONST Start Time, which is the value zero for event c).

The TSCONST Period shall be set to 0 indicating that the field is not applicable.

The Interferer MAC Address shall be set to the NAVDST of the NAV from which the TSCONST Start Time was derived (10.38.10).

CMMG STAs shall also include the Interferer Channel Bandwidth subfield in the report, and the Interferer Channel Bandwidth subfield shall be set to the CH_BANDWIDTH of the NAV timer.

All values conveyed in the Traffic Scheduling Constraint Set field shall refer to the allocation identified by the value of the Allocation ID subfield of the TSPEC.

The value of other fields within the DMG TSPEC element shall comply with the rules specified in 11.4.

Use of the information conveyed in the Traffic Scheduling Constraint Set field is outside the scope of this standard.

10.38.6.7 Service period recovery

When a non-AP and non-PCP STA fails to receive the Extended Schedule element for a beacon interval, the non-AP and non-PCP STA has no knowledge of the nonpseudo-static SPs allocated during the beacon interval that indicate it is the source DMG STA; therefore, it fails to transmit during those SPs. If the destination of the nonpseudo-static SP is an AP or PCP and it does not receive any frames from the source non-AP and non-PCP STA for the dot11SPIdleTimeout interval from the start of the SP, the AP or PCP may

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

truncate the SP and use the mechanism described in 10.38.7 to reallocate the remaining duration of the SP to the source DMG STA of the SP or other STAs provided that it was a truncatable SP. If the SP is not a truncatable SP, the PCP may stay in awake state or may switch to doze state. If the non-AP and non-PCP STA failed to receive the Extended Schedule element from the AP or PCP for that beacon interval, it may switch to doze state or may direct its receive antenna toward the AP or PCP to receive a grant during nonpseudo-static SPs or CBAPs in the current beacon interval.

An AP or PCP may reclaim the entire time allocated in an SP between two non-AP and non-PCP STAs if the following two conditions are met:

— The SP is announced within an Extended Schedule element transmitted during the ATI.
— The AP or PCP does not receive a response frame from at least one of the source and destination non-AP and non-PCP STAs of that SP as part of the ATI exchange (10.38.3).

In either case described in this subclause, the AP or PCP may reallocate the reclaimed SP time as a CBAP, SP, or take no further action. Otherwise, if none of these conditions apply, no time may be reclaimed.

10.38.7 Dynamic allocation of service period

10.38.7.1 General

Dynamic allocation of service period is employed to allocate channel time during scheduled SPs and CBAPs. The procedure includes an optional Polling Period (PP) phase and a Grant Period (GP) phase. Service periods allocated using this mechanism do not persist beyond a beacon interval. Persistent allocations are created using the allocation mechanisms described in 11.4.

The PP Available field in the STA Availability element (9.8) indicates whether a STA participates in the PP phase of the dynamic allocation of service period mechanism. A STA that participates in PP phase of the dynamic allocation of service periods responds to Poll frames during the PP. A STA that participates in dynamic allocation of service periods uses the time allocated through Grant frames during the GP to transmit frames. A STA may set the PP Available field in a transmitted STA Availability element to 0 to indicate that the STA does not respond to Poll frames during the PP and the GP.

NOTE—A STA can receive a Grant frame in periods of the beacon interval other than the GP, in which case the STA uses the time allocated through the Grant frame.

The AP or PCP shall not transmit Poll frames to a STA whose PP Available field in the STA Availability element is 0. The AP or PCP shall not dynamically allocate a service period to a STA that is in a D-BI (11.2.7). An AP or PCP may transmit Poll frames to a STA from which the AP or PCP has not received a STA Availability element with the PP Available field from the STA equal to 0.

An AP or PCP may dynamically allocate Service Periods during a scheduled SP for which both the source and destination AID fields are set to the broadcast AID by setting the Truncatable subfield to 1 within the Allocation field corresponding to the scheduled SP.

If a non-AP and non-PCP STA is neither source nor an individually addressed destination during a truncatable SP and the non-AP and non-PCP STA participates in dynamic allocation of service periods and the non-AP and non-PCP STA is in an A-BI, then the non-AP and non-PCP STA should be in the awake state for the duration of the truncatable SP.

A non-AP and non-PCP STA that participates in dynamic allocation of service periods shall be in the awake state for dot11MinPPDuration from the start of each truncatable SP for which both the source and the destination AID fields are set to the broadcast AID and that occurs within each A-BI of that STA. Following

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the expiration of dot11MinPPDuration, the non-AP and non-PCP STA should remain in the awake state until the end of the truncatable SP.

A STA shall be in the awake state for dot11MinPPDuration from the start of each scheduled CBAP that occurs within each A-BI of that STA. A STA that enters the doze state at any time during a CBAP and then returns to the awake state later during that same CBAP shall perform CCA until a frame is detected by which it can set its NAV, or until a period of time equal to the NAVSyncDelay has expired before it initiates a transmission.

As described in 10.38.8, a STA that participates in dynamic allocation of service periods and that is neither source nor destination during a truncatable SP can be in the receive state with its receive antennas configured in a quasi-omni antenna pattern for the duration of the truncatable SP.

A STA that receives a Grant frame with an SP allocation for which it is either source or destination shall not transmit longer than the time granted to it.

Any STA coordinated by an MM-SME that belongs to an MMSL cluster identified by the Source AID and Destination AID that are equal to, respectively, the Source AID and Destination AID of the Dynamic Allocation Info field in the Grant frame may transmit during the allocation, if the STA sent an MMS element to the peer STA and the BeamLink Cluster field within the MMS element is 1.

An example of dynamic allocation of service period is shown in Figure 10-67 (Example of dynamic allocation of service period mechanism).

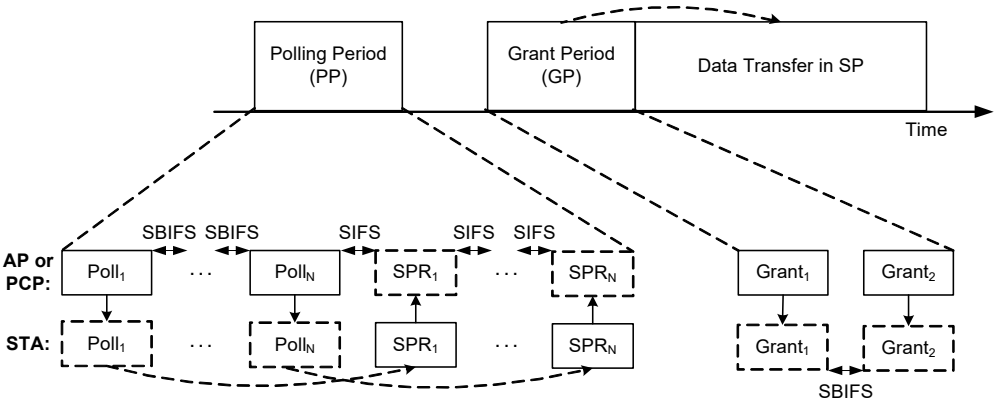

Figure 10-67—Example of dynamic allocation of service period mechanism

10.38.7.2 Polling period (PP)

An AP or PCP that uses a PP to dynamically allocate an SP within the DTI shall commence the PP at a time instant indicated by at least one of the following:

— Any time during a scheduled SP for which the source AID and destination AID are equal to the broadcast AID, excluding any time that has been allocated dynamically

— Any time during a TXOP within a scheduled CBAP for which the destination AID is equal to the broadcast AID, excluding any time that has been allocated dynamically

— Any time during the relinquished channel time following an SP truncation, excluding any time that has been allocated dynamically

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The AP or PCP shall not transmit a frame during a PP if any portion of that frame would extend beyond the end of the originally scheduled SP or CBAP.

During the PP, the AP or PCP may transmit individually addressed Poll frames to STAs to solicit SPR frames from those STAs. The Duration field within each Poll frame i out of a total of n ($0 < i \leq n$) transmitted Poll frames in the PP shall be calculated as defined by Equation (10-19).

$$D_i = D_{i,n} + O_m + \text{Ceil}(\text{TXTIME}(\text{SPR}_m), T_{TR}) \quad (10\text{-}19)$$

where

$D_{i,n}$ is the duration of the remaining poll transmissions, in μs, given by

$$D_{i,n} = \text{Ceil}\left(\sum_{k=i+1}^{n} \text{TXTIME}(\text{Poll}_k) + SBIFS + A_k + S, T_{TR}\right)$$

O_m is the offset of SPR transmission m, in μs

SPR_m is SPR transmission m

T_{TR} is aTSFResolution, in μs

The AP or PCP expects an SPR frame in response to each transmitted Poll frame (i.e., m=n). The position of each SPR frame in the sequence of SPR frames is indicated as j. Thus, j=1 refers to the first SPR frame transmission in the sequence of SPR frames, and j=m refers to the last SPR frame transmission in the sequence of SPR frames. Based on this, the Response Offset field within each Poll frame i transmitted in the PP shall be calculated as follows:

$$\textit{Response Offset}_i = D_{i,n} + O_j$$

where

$D_{i,n}$ is the duration of the remaining poll transmissions, defined in Equation (10-19).

Poll_k is poll transmission k

$SBIFS$ is aSBIFSTime, in μs

A_k is the antenna switching time, in μs, which is 0 if the AP or PCP uses the same antenna to transmit frame k and frame k+1 and is equal to dot11AntennaSwitchingTime otherwise

S is aSBIFSAccuracy, in μs

T_{TR} is aTSFResolution, in μs

O_j is the offset of SPR transmission j, given by

$$O_j = \begin{cases} SIFS, & j = 1 \\ O_{j-1} + \text{Ceil}(\text{TXTIME}(\text{SPR}_j) + SIFS, T_{TR}), & 2 < j \leq m \end{cases}$$

$SIFS$ is aSIFSTime, in μs, the time interval between the end of the last Poll frame transmitted by the AP or PCP and the expected start time of the first SPR frame by the non-AP and non-PCP STA

SPR_j is an SPR transmission j

NOTE—The calculation of O_j guarantees that no less than SIFS or SIFS+dot11AntennaSwitchingTime is provided for the AP or PCP to switch antennas when receiving an SPR from different STAs.

A STA that receives an individually addressed Poll frame shall respond to the AP or PCP with a single directional and individually addressed SPR frame at the time offset from the end of the Poll frame indicated in the Response Offset field within the received Poll frame. The Duration field within the SPR frame shall be set to the value of the Duration field contained in the received Poll frame, minus the value of the Response Offset field contained in the received Poll frame, minus the time taken to transmit the SPR frame. If the AP or PCP is an EDMG STA and the AllocationType field within the SPR is equal to SP, the STA

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

may set the TXVECTOR parameter SCRAMBLER_INIT_SETTING to CONTROL_TRAILER and CT_TYPE to SPR to request the PCP or AP to grant the SP allocation on a specific channel or over a specified channel bandwidth.

The PP ends at a time equal to the end of the last Poll frame transmission plus the value of the Response Offset field in that Poll frame plus the expected duration of the SPR transmission that is expected in response to that Poll frame plus SIFS.

10.38.7.3 Grant period (GP)

In order to dynamically allocate an SP within the DTI, an AP or PCP shall commence a GP at a time instant indicated by at least one of the following:

— SIFS following the end of a PP if the PP is present
— Any time during a scheduled SP for which the source AID and destination AID are equal to the broadcast AID if a PP does not precede the GP, excluding any time that has been allocated dynamically
— Any time during a TXOP within a scheduled CBAP for which the destination AID is equal to the broadcast AID, excluding any time that has been allocated dynamically
— Any time during the relinquished channel time following an SP truncation if a PP does not precede the GP, excluding any time that has been allocated dynamically

The AP or PCP shall not transmit a frame during a GP if any portion of that frame would extend beyond the end of the originally scheduled SP or CBAP, or beyond the end of an immediately following SP if that SP has the broadcast AID as both source and destination AID, whichever is later.

A non-AP and non-PCP STA may switch to doze state if it does not receive a Grant frame from the AP or PCP within dot11MinPPDuration from the start of the scheduled SP for which the source AID and destination AID are set to the broadcast AID.

To commence the GP, the AP or PCP shall transmit Grant frames to notify the source DMG STA and destination DMG STA about a dynamically allocated service period, or the AP or PCP shall transmit Grant frames to notify the source CMMG STA and destination CMMG STA about a dynamically allocated service period. The AP or PCP should transmit the last Grant frame within a GP to the source of the dynamically allocated SP if the source of the dynamically allocated SP is not the AP or PCP. In each transmitted Grant frame, the AP or PCP shall set the Duration field within the Grant frame to a time that covers the duration of all remaining Grant frame and Grant Ack frame transmissions, if any, plus all appropriate IFSs (10.3.2.3). In addition, the source AID and destination AID fields shall be set to the source and destination, respectively, of the dynamically allocated SP, the AllocationType field set to indicate the channel access mechanism during the allocation, and the Allocation Duration field set to a value that if added to the value of the Duration field does not overlap in time with another SP that has either the source AID or destination AID different from the broadcast AID. An allocation that is indicated in this manner begins at the time that is equal to the PHY-TXEND.indication primitive of the Grant frame plus the value from the Duration field of the Grant frame.

If the source DMG STA, destination DMG STA and the STA transmitting the Grant frame are all EDMG STAs, a granted dynamic allocation should meet the bandwidth requirements specified in the received SPR frame.

The Dynamic Allocation Info field within Grant frames transmitted as part of the same GP shall be the same.

NOTE—This means the AP or PCP can create only one allocation per GP.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

During an SP between a source DMG STA and a destination DMG STA, the source DMG STA may transmit a Grant frame to the destination DMG STA to relinquish the remainder of the SP to the destination DMG STA. In the Allocation Info field of the transmitted Grant frame, the source DMG STA shall set source AID field to the AID of the destination DMG STA, the destination AID field to the AID of the source DMG STA, the AllocationType field set to indicate SP, and the Allocation Duration field set to a value of 32 768 as defined in 9.5.2. The Duration field in the Grant frame shall be set to the time remaining in the SP minus TXTIME (Grant frame) minus aSIFSTime. The Beamforming Training subfield within the Beamforming Control field of the Grant frame shall be set to 0. For the remainder of the SP the roles of source DMG STA and destination DMG STA are swapped between the STAs. If both the source STA and destination STA are EDMG STAs, and if any bit in the CH_BANDWIDTH parameter in the RXVECTOR of the received Grant frame was 0, the destination STA shall not transmit frames with the corresponding bit in the TXVECTOR parameter CH_BANDWIDTH set to 1, and shall be subject to the channel access rules in 10.38.12.2.1 (Channel access rules).

During an SP between a source CMMG STA and a destination CMMG STA, the source CMMG STA may transmit a Grant frame to the destination CMMG STA to relinquish the remainder of the SP to the destination CMMG STA. In the Allocation Info field of the transmitted Grant frame, the source CMMG STA shall set the Source AID field to the AID of the destination CMMG STA, the Destination AID field to the AID of the source CMMG STA, the AllocationType subfield to indicate SP, the Allocation Duration field to the time remaining in the SP minus the time taken to transmit the Grant frame, and the Allocation Channel Band field to the same channel and bandwidth as the original SP. The Duration field in the Grant frame shall be set to the value of the Allocation Duration field. Upon transmission of the Grant frame, for the remainder of the SP, the roles of source CMMG STA and destination CMMG STA are swapped between the STAs.

During a TXOP between a TXOP holder and a TXOP responder, the TXOP holder may transmit a Grant frame to the TXOP responder to relinquish the remainder of the TXOP to the TXOP responder. In the transmitted Grant frame, the TXOP holder shall set source AID field to the AID of the TXOP responder, the destination AID field to the AID of the TXOP holder, the AllocationType field set to indicate CBAP, and the Allocation Duration field set to a value of 32 768 as defined in 9.5.2. For CMMG STAs, the Channel Band field shall be set to the same channel and bandwidth as the original TXOP. The Duration field in the Grant frame shall be set to the time remaining in the TXOP minus TXTIME (Grant frame) minus aSIFSTime. The Beamforming Training subfield within the Beamforming Control field of the Grant frame shall be set to 0. For the remainder the TXOP the roles of TXOP holder and TXOP responder are swapped between the STAs. If both the TXOP holder and TXOP responder are EDMG STAs, and if any bit in the CH_BANDWIDTH parameter in the RXVECTOR of the received Grant frame was 0, the TXOP responder shall not transmit frames with the corresponding bit in the TXVECTOR parameter CH_BANDWIDTH set to 1, and shall be subject to the channel access rules in 10.38.12.2.1 (Channel access rules).

A STA that receives a Grant frame shall not update its NAV if the value of either the source AID or destination AID fields in the Grant frame are equal to the STA’s AID.

The AP or PCP may grant a dynamic allocation of service period to a STA that does not transmit an SPR frame during the PP.

10.38.8 Dynamic truncation of service period

10.38.8.1 DMG dynamic truncation of service period

A STA truncates an SP to release the remaining time in the SP. The STA can use the CF-End frame to truncate the SP at the peer STA, to reset NAV in third party STAs and to return to the AP or PCP the time left in the SP, thus allowing the AP or PCP to grant any portion of the released time as part of an SP to any other STA or to allocate any portion of it as a CBAP. The STA can use the Grant frame to release any part of the time left in the SP as a CBAP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A STA that is neither source nor destination during a truncatable SP may participate in dynamic allocation of service period by being in the receive state with its receive antenna configured in a quasi-omni antenna pattern for the duration of the truncatable SP. If both the source and destination AID fields of a truncatable SP are set to the broadcast AID, a non-AP and non-PCP STA may direct its receive antenna to its AP or PCP for the duration of the truncatable SP if the non-AP and non-PCP STA does not participate in a frame exchange sequence and the truncatable SP is not dynamically allocated to the non-AP and non-PCP STA.

Only the source DMG STA of an SP may truncate the SP, except that the destination DMG STA may truncate the SP if it does not receive an expected transmission from the source DMG STA at the start of the SP as defined in 10.38.6.7.

Only the source CMMG STA of an SP may truncate the SP, except that the destination CMMG STA may truncate the SP if it does not receive an expected transmission from the source CMMG STA at the start of the SP as defined in 10.38.6.7.

In order to advertise the availability of truncatable SP time for reuse through AP or PCP dynamic allocation, a non-AP and non-PCP STA shall transmit a CF-End frame to the AP or PCP. A STA is not required to truncate an SP if a portion of the SP is unused.

In order to enable CBAP access during the time released through SP truncation, the STA shall broadcast a Grant frame with the Source AID and Destination AID set to broadcast AID, the AllocationType field set to indicate CBAP and the Duration field set to the time needed to transmit the Grant frame(s) (the Duration field in a Grant frame does not include duration of that frame) plus SIFS and plus the time needed to transmit the following CF-End frame and the response CF-End frame, if required and appropriate IFS (10.3.2.3) values. The Allocation Duration field shall be set to a value that is not greater than the result of the subtraction of the value in the Duration field from the time remaining in the SP. The CBAP that is indicated in this manner begins at the time that is equal to the PHY-TXEND.indication primitive of the Grant frame plus the value from the Duration field of the Grant frame and continues for the time indicated in the Allocation Duration field of the Grant frame.

The STA shall not transmit the Grant frame and shall not transmit the CF-End frame to the AP or PCP if the SP is not indicated as truncatable.

After transmission of the CF-End frame to the AP or PCP or after broadcasting a Grant frame, the STA shall transmit a CF-End frame to the peer STA of the SP. The CF-End frame releases any time remaining in the SP at the recipient and resets the NAV in third party STAs. The NAV is reset only if the RA and TA of the CF-End frame match the addresses of the frame that established the NAV (see 10.38.10). The recipient STA may transmit a CF-End frame SIFS after the reception if the Duration field of the received frame is not equal to 0 and the transmission does not extend beyond the end of the originally scheduled SP.

A STA shall not initiate SP truncation if there is not enough time left in the SP to complete the frame exchange sequence required for truncation of the SP.

After the truncation is completed, the AP or PCP may dynamically allocate any portion of the relinquished channel time that has not been allocated to a CBAP through a transmitted Grant frame (10.38.7).

10.38.8.2 CDMG dynamic truncation of service period

A CDMG STA truncates an SP to release the remaining time in the SP. The dynamic truncation of SP includes two types of truncation. The first type of truncation is that the STA can return to the AP or PCP the time left in the SP, thus allowing the AP or PCP to grant any portion of the released time as part of an SP to any other STA or to allocate any portion of it as a CBAP. The second type of truncation is that the STA can use the Grant frame to release any part of the time left in the SP as a CBAP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A CDMG STA supports the DMG dynamic truncation of SP as described in 10.38.8.1. Unlike the DMG dynamic truncation of SP, the SP truncation type shall be determined by the CDMG AP or PCP when allocating an SP.

A CDMG AP or PCP shall determine whether an SP is truncatable and which truncation type is adopted by setting the Truncatable subfield and the Truncation Type subfield within the Allocation Control field when allocating an SP for the source CDMG STA and destination CDMG STA. If the Truncatable subfield of the Extended Schedule element is equal to 1, the CDMG STA may truncate the SP to release any part of the time left in the SP in accordance with the truncation type indicated by the received Truncation Type subfield.

A CDMG AP or PCP should determine the Truncatable subfield and the Truncation Type subfield according to the allocation type requirements of the STAs in its BSS, in order to satisfy the channel access requirements of the STAs using the potential released time of SPs. If the remaining time in the SP released as a CBAP might cause interference to other STAs during SPSH, the CDMG AP or PCP shall set the Truncatable subfield to 1 and the Truncation Type subfield to 0 for the SPs that are under SPSH state to indicate that the CDMG STA returns the time left in the SP to the AP or PCP; otherwise, the CDMG AP or PCP may set the Truncatable subfield to 1 and the Truncation Type subfield to 1. The CDMG AP or PCP may also set the Truncation Type subfield to 0 for an SP in order to mitigate interference to other STAs of a adjacent BSS based on the schedule information of the adjacent BSS.

A CDMG PCP may transition to doze state if it is in a truncatable SP that has time left in this SP that is released as a CBAP by the CDMG STA by setting the Truncation Type subfield to 1 and the PCP Active field to 0. If both the Truncatable subfield and the Extendable subfield are set to 0, or if the Truncatable subfield is equal to 1 and the Truncation Type subfield is equal to 1, the CDMG PCP can set the PCP Active subfield to 0.

10.38.9 Dynamic extension of service period

A non-AP and non-PCP STA uses dynamic extension of SP to extend the allocated time in the current SP. The additional time can be used to support variable bit rate traffic, for retransmissions or for other purposes. The SPR frame is sent by a non-AP and non-PCP STA to the AP or PCP to request additional SP time in the current beacon interval.

Except in response to a Poll frame from the AP or PCP, a non-AP and non-PCP STA shall not transmit an SPR frame within an SP if the current SP is not extendable (see 9.4.2.130).

Only the source DMG STA and destination DMG STA of an SP can transmit an SPR frame during that SP.

If the AP or PCP is not the source of an extendable SP, it should be in the receive state and with its receive antennas configured in a quasi-omni antenna pattern for the duration of the extendable SP.

To request an extension of the current SP, a non-AP and non-PCP STA shall transmit an SPR frame to the AP or PCP. The non-AP and non-PCP STA shall not request extension of the current SP if there is not enough time left in the SP to complete the frame exchange sequence required for the SP extension. In the transmitted SPR frame, the STA shall set the RA field to the address of the AP or PCP, the Duration field to the time left in the SP (not including the SPR transmission time), and the Allocation Duration field to the additional amount of time requested by the STA following the end of the current SP.

The AP or PCP may grant the request for an extension of an SP only if the following SP has the broadcast AID as both source and destination AID, and the duration of the following SP is larger than the value of the Allocation Duration field in the received SPR frame. To grant an extension request, the AP or PCP shall transmit a Grant frame with the RA field set to the value of the TA in the received SPR frame, the Duration field set to the value of the Duration field received in the SPR frame minus SIFS and minus the duration of this Grant frame transmission, and the Allocation Duration field set to the amount of additional time granted

by the AP or PCP. If a Grant Ack frame is transmitted following reception of the Grant frame, the frame shall be configured as specified in 10.38.4.

To decline a request for an extension of an SP, the AP or PCP shall transmit a Grant frame with the RA field set to the value of the TA in the received SPR frame, the Duration field set to the value of the Duration field received in the SPR frame minus SIFS and minus the duration of this Grant frame transmission, and the Allocation Duration field set to 0.

The extension request is successful if the non-AP and non-PCP STA receives from the AP or PCP a Grant frame with a nonzero value of the Allocation Duration field SIFS after the SPR. SIFS after the reception of a Grant frame from the AP or PCP with a nonzero value of the Allocation Duration field, the non-AP and non-PCP STA shall transmit a Grant frame to the partner STA of the SP with the Duration field set to the value of the Duration field of the Grant frame received from the AP or PCP minus the duration of this Grant frame transmission minus SIFS, and the Allocation Duration field set to the value of the Allocation Duration field of the Grant frame received from the AP or PCP.

An AP or PCP may extend an SP for which it is the source DMG STA by transmitting a Grant frame to the destination DMG STA of the SP. The Grant frame indicates extension of the SP. The Duration field in the transmitted Grant frame shall be set to the remaining time in the SP. The Allocation Duration field of the Grant frame shall be set to the additional channel time allocated by the AP or PCP following the end of the SP. If a Grant Ack frame is transmitted following reception of the Grant frame the frame shall be configured as specified in 10.38.4.

10.38.10 Updating multiple NAVs

If a DMG STA supports multiple NAVs, the number of available NAVs within the STA shall be not less than aMinNAVTimersNumber. Each NAV is identified by a pair of MAC addresses, NAVSRC and NAVDST, and has associated MAC variables NAV_RTSCANCELABLE, NAV_DTSCANCELABLE and NAV_CHANNEL the last of which is used only by CMMG STAs. The MAC variable NAV_CHANNEL indicates the channel on which the Duration field is received, and it is a channel index that contains channel bandwidth information. Each STA also maintains a MAC variable UPDATE_OPTIONAL. When a STA is enabled for operation, all NAVs shall have NULL values for their NAVSRC and NAVDST identifiers, the value of NAV_RTSCANCELABLE shall be false, the value of NAV_DTSCANCELABLE shall be false, the value of NAV_CHANNEL shall be NULL only for CMMG STAs, and each NAV shall have the value 0. NAV address pairs correspond to the NAV-SA and NAV-DA fields in DMG DTS frames and correspond to the RA and TA fields of all other received frames that are used to update the NAV. Receipt of any frame can cause an update to the NAV whose identifying address pair corresponds to the specified address fields of the received frame according to the rules in this subclause.

DMG STAs receiving any frame shall perform the following NAV update operation expressed using the following pseudocode:

```
NAV_TIMER_UPDATE(received_frame):

        UPDATE_OPTIONAL ← false

        If (received_frame = DMG DTS) {
                UPDATE_OPTIONAL ← true
        }

        If (received_frame(RA) ≠ This STA MAC address || UPDATE_OPTIONAL = true) {
                If (received_frame = DMG DTS) {
                        R_DST ← received_frame(NAV-DA)
                        R_SRC ← received_frame(NAV-SA)
```

```
} else if (received_frame = Ack) {
        R_DST ← received_frame(RA)
        R_SRC ← 0
} else {
        R_DST ← received_frame(RA)
        R_SRC ← received_frame(TA)
}

R_DUR ← received_frame(DUR)

N_TIMER ← -1

// Searching for a matching NAV
For (x ← 0; x < aMinNAVTimersNumber; x++) {
        If (received_frame = Ack || NAVSRC(x)=R_DST) {
                If(NAVDST(x) = R_DST) {
                        N_TIMER ← x
                        Break
                }
        } else if (NAVSRC(x) = R_SRC && (NAVDST(x) = R_DST
                                || NAVDST(x) = 0) ||
                (NAVSRC(x)=0 && NAVDST(x) = R_DST) ||
                (NAVDST(x)=R_SRC && NAVSRC(x)=R_DST)) {
                N_TIMER ← x
                Break
        }
}

// No NAV has been found that matches the addresses
If (N_TIMER < 0) {
        For (x ← 0; x < aMinNAVTimersNumber; x++) {
                If (NAVSRC(x) = NULL && NAVDST(x) = NULL
                        || NAV(x) = 0) {
                        NAVSRC(x) ← R_SRC
                        NAVDST(x) ← R_DST
                        N_TIMER ← x
                        Break
                }
        }
}

// Existing NAV found
If (N_TIMER ≥ 0) {
        If (UPDATE_OPTIONAL = false
                && R_DUR > NAV(N_TIMER) ) {
                NAV(N_TIMER) ← R_DUR
                If (received_frame = RTS) {
                        NAV_RTSCANCELABLE(N_TIMER) ← true
                } else {
                        NAV_RTSCANCELABLE(N_TIMER) ← false
```

```
                        }
                    } else if (UPDATE_OPTIONAL = true && R_DUR > NAV(N_TIMER)) {
                        If ((implementation decision to update = true) ||
                        (received_frame(RA) = This STA MAC address &&
                        This STA MAC address = source DMG STA MAC address for current SP))
                        ) {
                            NAV_DTSCANCELABLE(N_TIMER) ← true
                            NAV(N_TIMER) ← R_DUR
                        }
                    }
                }

        } else {
                No change to NAV
        }

END OF NAV_TIMER_UPDATE
```

CMMG STAs receiving any frame shall perform the following NAV update operation expressed using the following pseudocode:

```
NAV_TIMER_UPDATE(received_frame):

        UPDATE_OPTIONAL ← false

        If (received_frame = DMG DTS) {
                UPDATE_OPTIONAL ← true

        }
        If (received_frame(RA) ≠ This STA MAC address || UPDATE_OPTIONAL = true) {
                If (received_frame = DMG DTS) {
                        R_DST ← received_frame(NAV-DA)
                        R_SRC ← received_frame(NAV-SA)
                        R_CHANNEL ← received_frame(CHANNEL BANDWIDTH)
                } else if (received_frame = Ack) {
                        R_DST ← received_frame(RA)
                        R_SRC ← 0
                        NAV_CHANNEL ← received_frame(CHANNEL BANDWIDTH)
        } else {
                R_DST ← received_frame(RA)

                                }
                        }
                }
        } else {
                No change to NAV timers
        }
END OF NAV_TIMER_UPDATE
```

A STA that has updated a NAV as a result of the reception of an RTS may reset its NAV(s) as follows. After the NAV update for a duration of NAVTimeout period (10.3.2.4), the STA shall monitor the channel to determine if a PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive is received from the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

PHY. If such an event has not occurred during this time period, then the STA may reset to 0 any NAV whose NAV_RTSCANCELABLE value is true.

After each NAV is updated, it counts down until it reaches 0 or is reset to 0.

If a STA receives a valid CF-End frame response with RA and TA fields that match the NAVSRC and NAVDST values, in any order, for any NAV, then the STA shall set the associated NAV to the value of the Duration field in the received CF-End frame. If one of NAVSRC or NAVDST of a NAV is 0 and the corresponding NAVDST or NAVSRC, respectively, of the NAV matches the RA or the TA field of the received CF-End frame, then the STA shall set the associated NAV to the value of the Duration field in the received CF-End frame.

If one of NAVSRC or NAVDST of a NAV is 0 and the nonzero NAVDST or NAVSRC of the NAV match either the RA or the TA field of a received frame, the NAVSRC or NAVDST that is 0 shall be set to the RA or TA that does not match the nonzero NAVSRC or NAVDST.

10.38.11 Opportunistic transmission in alternative channel for CDMG STAs

When dot11OpportunisticTransmissionsImplemented is true, an AP or PCP is capable of supporting the scheduling of opportunistic data transmission between two or more non-AP and non-PCP CDMG STAs that support such opportunistic transmission in a channel that is not the BSS's operating channel. The channel for such opportunistic transmission is termed the alternative channel while the BSS's operating channel is termed the dedicated channel as a contrast in this subclause. The spectrum access in the alternative channel is divided into three phases: monitor phase, transmission phase, and suspension phase. Scheduled transmission in the alternative channel shall start with the monitor phase, and then the three phases rotate cyclically until all the scheduled transmissions in the alternative channel are completed as illustrated in Figure 10-68 (Opportunistic transmission in alternative channels for CDMG STAs).

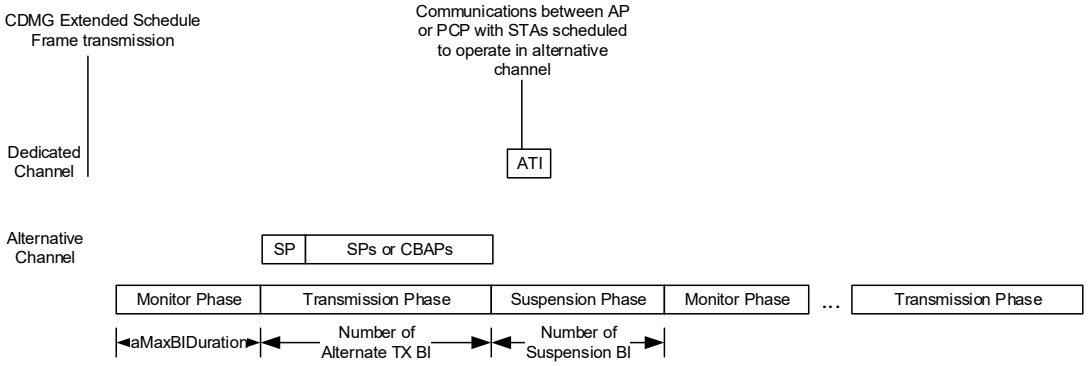

Figure 10-68—Opportunistic transmission in alternative channels for CDMG STAs

The monitor phase shall last for at least aMaxBIDuration. During the monitor phase, a CDMG STA that is scheduled to operate in the alternative channel shall listen for the transmission of DMG Beacon frames in the alternative channel. If a CDMG STA receives one or more valid DMG Beacon frames with a BSSID different from its own, it shall abandon transmission during the transmission phase.

During the transmission phase, a CDMG STA may transmit frames according to the DTI transmission rules (10.38.4). A CDMG STA may continue to listen for the transmission of DMG Beacon frames in the alternative channel during the transmission phase when the CDMG STA is not transmitting. If a CDMG STA is not the source or destination STA in an access period, it may switch to the dedicated channel to receive the DMG Beacon frame or Announce frame send out by the AP or PCP to maintain synchronization with the AP or PCP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

During the suspension phase, a CDMG STA that is scheduled to operate in the alternative channel shall switch to the dedicated channel and be ready to receive transmission from the AP or PCP in the dedicated channel. The CDMG STA may receive the DMG Beacon frame or Announce frame transmitted by the AP or PCP to maintain synchronization with the AP or PCP during the suspension phase. If a CDMG STA receives a DELTS frame from the AP or PCP during the suspension phase, the CDMG STA should cease opportunistic transmission in the alternative channel.

The schedule of the transmission in the alternative channel is communicated through the CDMG Extended Schedule element (9.4.2.220). The AP or PCP shall transmit the CDMG Extended Schedule element in the Announce frame and/or DMG Beacon frame. The CDMG Extended Schedule element shall contain the scheduling information of all allocations in the alternative channel. The Number of Alternate TX BI field in the CDMG Extended Schedule element indicates the number of beacon intervals that makes up the transmission phase. The Number of Suspension BI field in the CDMG Extended Schedule element indicates the number of beacon intervals that makes up the suspension phase.

The access periods in the alternative channel may be scheduled to be either CBAPs or SPs but the first access period shall be an SP. The CBAPs in the alternative channel may be used by the AP or PCP to send more CDMG STAs to operate in the alternative channel after the initial setup. The source CDMG STA of the first SP in the alternative channel shall transmit a DMG Beacon frame at the start of the first transmission phase in the alternative channel and after every aMaxBIDuration within the transmission phase if the duration of the transmission phase exceeds aMaxBIDuration.

The AP or PCP should send a DMG CTS-to-self frame in the ATIs (10.38.3) during the suspension phase to each of the CDMG STAs scheduled to operate in the alternative channel. If a CDMG STA receives one or more DMG Beacon frames with a BSSID different from its own during the monitor phase, the CDMG STA shall respond with a DELTS frame to the AP or PCP with the Reason Code field set to the value defined in 9.4.1.7 that indicates the alternative channel is occupied upon reception of a DMG CTS-to-self frame from the AP or PCP during the ATI. If a transmission link in the alternative channel cannot be established during the transmission phase, the CDMG STA shall respond with a DELTS frame to the AP or PCP with the Reason Code field set to 67 to indicate that the transmission link establishment in alternative channel is failed. If the AP or PCP received a DELTS frame with the Reason Code field (9.4.1.7) set to 68 in an ATI, the AP or PCP shall transmit a DELTS frame to each of the CDMG STAs scheduled to operate in the alternative channel in the same ATI.

A CDMG AP or PCP may allocate a pair of STAs to perform SLS on an alternative channel. A CDMG STA may reuse the transmit sector indicated by the Sector Select field obtained from the operating channel, which is the primary channel on an alternative channel with the same channel width, and vice versa. If an SPR frame with the Beamforming Training subfield equal to 1 is received from a CDMG initiator STA, the CDMG AP or PCP may configure a channel for the initiator and the responder designated by the initiator to perform BF training according to the AllocationType subfield in the SPR frame. The SPR frame contains channel allocation request in the AllocationType subfield and BF Control field for the initiator and responder that form a BF pair. If the NoPrimaryChannel subfield in the BF Control field is equal to 1 and the Beamforming Training subfield is equal to 1 in the SPR frame, the CDMG AP or PCP can allocate SPs on an alternative channel using the CDMG Extended Schedule element included in a DMG Beacon frame or an Announce frame for the initiator and the responder; otherwise, the CDMG AP or PCP should allocate SPs on the current operating channel. If the CDMG AP or PCP receives SPR frames from multiple pairs of initiators and responders, the CDMG AP or PCP may allocate time overlapping SPs on designated channels with different channel numbers for different pairs of STAs to perform an SLS.

10.38.12 EDMG channel access

10.38.12.1 General

This subclause specifies channel access rules that are applicable to an EDMG STA. These rules are in addition to the rules specified in 10.3 (DCF), 10.23 (HCF), and 10.29 (Reverse direction protocol), which are applicable to DMG STAs.

An EDMG STA shall set dot11EDMGOptionImplemented to true.

An EDMG STA shall set the EDMG Supported subfield in the DMG Parameters field to 1 in transmitted frames.

10.38.12.2 Channel access over multiple channels

10.38.12.2.1 Channel access rules

The following apply to transmissions performed in an EDMG BSS:

— Transmissions shall not occupy a bandwidth that exceeds the equivalent of four 2.16 GHz channels.

— Transmissions shall be confined to the channel number indicated by the primary channel, the channels indicated in the EDMG Operation element, and the channels indicated in the EDMG Capabilities element.

An EDMG STA shall not transmit an EDMG PPDU to a peer EDMG STA over a channel that is not supported by the peer STA as indicated in the Supported Channels subelement in the peer STA's EDMG Capabilities element.

An EDMG STA may transmit a Grant frame to a peer EDMG STA to indicate intent to transmit an EDMG PPDU to the peer STA over a 4.32 GHz, 2.16+2.16 GHz, 6.48 GHz, 4.32+4.32 GHz, or 8.64 GHz channel at the time indicated by the sum of the Allocation Duration field and the Duration field within the Grant frame following the end of the Grant frame transmission as described in 9.5.2. When a peer EDMG STA receives the Grant frame, it may

— Limit its receiver bandwidth to 2.16 GHz until the time indicated by the sum of the Allocation Duration field and the Duration field; or

— Configure its receive DMG antenna(s) to a directional antenna pattern only at the time indicated by the sum of the Allocation Duration field and the Duration field, allowing it to employ a quasi-omni antenna pattern beforehand. This would allow the peer EDMG STA to receive from a wider coverage area.

To do this, in the TXVECTOR of the transmitted Grant frame the EDMG STA shall set the TXVECTOR parameter SCRAMBLER_INIT_SETTING to CONTROL_TRAILER, the parameter CT_TYPE to GRANT_RTS_CTS2Self, the parameter IS_CHANNEL_NUMBER to ChannelWidth and the parameter BW_IN_CT to indicate the bandwidth with which the EDMG PPDU is going to be transmitted.

An EDMG AP or EDMG PCP may use the EDMG Extended Schedule element to allocate an SP or a CBAP over channels with different bandwidths. For partially or fully overlapping allocations, both the source AID and the destination AID of each allocation shall be different from both the source AID and destination AID of every other overlapping allocation. Channels used for such allocations shall be included in the EDMG Operation element transmitted by the AP or PCP. An allocation and channel access within the allocation follow the following rules:

— If the allocation is an SP, then

  — The allocation does not have to include the primary channel.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

  - If the allocation does not include the primary channel, the allocation shall not span more than one 2.16 GHz channel.
- If the allocation is a scheduled CBAP, then channel access during the allocation shall include the primary channel.
- Any transmissions within the allocation shall not exceed the corresponding bandwidth for this allocation.

If the CBAP Only field in a transmitted DMG Beacon frame is 1, then channel access within the CBAP of the DTI specified by the DMG Beacon frame shall include the primary channel.

If an EDMG Extended Schedule element that has at least one Channel Allocation field with the Scheduling Type subfield equal to 0 is present in a transmitted frame, an Extended Schedule element shall also be present in the same frame. The Allocation Key subfield of a Channel Allocation field with the Scheduling Type subfield equal to 0 shall have its contents matched to the tuple <Source AID, Destination AID, Allocation ID> of an Allocation field in the Extended Schedule element for the same allocation. A Channel Allocation field with the Scheduling Type subfield equal to 0 included in the EDMG Extended Schedule element shall be ignored if the contents of its Allocation Key subfield do not match to the tuple <Source AID, Destination AID, Allocation ID> of any Allocation field in the Extended Schedule element.

For an allocation that does not include the primary channel, the allocation information shall be present in the EDMG Extended Schedule element only. This shall be indicated by setting the value of the Scheduling Type subfield for the allocation to 1.

10.38.12.2.2 CCA in secondary channels

An EDMG STA shall maintain physical and virtual CS on a primary channel as specified in 10.3.2 (Procedures common to the DCF and EDCAF).

To perform the procedure specified in 10.23.2.14 (EDCA channel access in an EDMG BSS), an EDMG STA shall support performing energy detection on each of its supported channels that are also supported by the AP or PCP, as indicated in the AP's or PCP's EDMG Operation element.

At the specific slot boundaries (see Figure V-4) determined by the STA based on the primary channel CCA, when the transmission begins a TXOP using EDCA (as described in 10.23.2.4 (Obtaining an EDCA TXOP)), the STA may transmit on secondary channels only if the respective secondary channel has also been idle during the times the primary channel CCA is performed (defined in 10.23.2.4) for an interval of PIFS immediately preceding the expiration of the backoff counter.

10.38.12.3 Directional allocation

A directional allocation is an allocation during which an EDMG AP or EDMG PCP uses a directional, non quasi-omni DMG antenna pattern to receive frames. Directional allocation can facilitate the frame exchange between an EDMG AP or EDMG PCP and an EDMG STA through the use of a directional link, particularly for those STAs that have asymmetric links (see 10.41.10.3).

To schedule a directional allocation, an EDMG AP or EDMG PCP shall set the IsDirectional subfield in the Receive Direction subfield within the corresponding Channel Allocation field of the EDMG Extended Schedule element to one. The decision to schedule a directional allocation is implementation dependent, but may be as a result of performing the procedure specified in 10.41.10 (EDMG beamforming).

Within the Channel Allocation field in the EDMG Extended Schedule element that specifies a directional allocation, the Sector ID and DMG Antenna ID subfields of a directional allocation shall be set to the sector and DMG antenna, respectively, that the PCP or AP uses to receive frames during the entire allocation. A

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

non-PCP and non-AP EDMG STA receiving such allocation shall stay awake during the allocation if the value of the Sector ID and DMG Antenna ID subfields identified in the allocation correspond to a sector and DMG antenna reported by the STA to the PCP or AP in the last beamforming feedback to the PCP or AP, respectively. If the value of the Sector ID and DMG Antenna ID subfields identified in the allocation do not correspond to a sector and DMG antenna reported by the STA to the PCP or AP in the last beamforming feedback, the non-PCP and non-AP EDMG STA shall not access the directional allocation.

Channel access during a directional allocation shall follow the same rules that are applicable to a CBAP (see 10.38.6.3 (Contention based access period (CBAP) allocation)) if the directional allocation is of type CBAP and shall follow the same rules that are applicable to an SP (see 10.38.6.2 (Service period (SP) allocation)) if the directional allocation is of type SP.

10.38.12.4 MIMO channel access

10.38.12.4.1 General

This subclause describes the MIMO channel access mechanisms that are applicable to EDMG STAs. General MIMO channel access rules are defined in 10.38.12.4.2 (MIMO channel access rules). The SU-MIMO channel access procedure and the MU-MIMO channel access procedure are specified in 10.38.12.4.3 (SU-MIMO channel access procedure) and 10.38.12.4.4 (MU-MIMO channel access procedure), respectively, and EDMG STAs using these procedures shall also follow the MIMO channel access rules specified in 10.38.12.4.2 (MIMO channel access rules).

In this subclause, the EDMG STA that obtains a TXOP or is the source STA of an allocated SP and that initiates the MIMO channel access procedure is referred to as the initiator, and the EDMG STA(s) that are addressed by the MIMO channel access is referred to as the responder(s).

10.38.12.4.2 MIMO channel access rules

An EDMG STA that has either the MU-MIMO Supported subfield set to 1 or the SU-MIMO Supported subfield set to 1 in the Beamforming Capability subelement of its EDMG Capabilities element shall maintain physical and virtual CS and backoff procedure as specified in 10.23.2 (HCF contention based channel access (EDCA)). This allows the STA to be able to transmit and receive a single space time-stream PPDU (i.e., using SISO transmission) for the establishment of a TXOP when a subsequent transmission of a PPDU with multiple space-time streams is to take place.

When an EDMG STA that has either the MU-MIMO Supported set to 1 or the SU-MIMO Supported set to 1 in the Beamforming Capability subelement of its EDMG Capabilities element attempts to obtain a TXOP for MIMO transmission, CCA shall be maintained such that at least all the MIMO RX DMG antennas corresponding to the MIMO TX DMG antennas intended to be used in the TXOP, which have been determined by applying the beamforming protocols defined in 10.41.10.2.2 (SU-MIMO beamforming) or in 10.41.10.2.3 (MU-MIMO beamforming), are observed. The STATE parameter of PHY-CCA.indication can be one of two values: BUSY or IDLE. The parameter value is BUSY if the assessment of the channel by the PHY determines that the channel on at least one of the MIMO TX antennas intended to be used in the TXOP is not idle. The parameter value is IDLE if the assessment by the PHY of the channel on all of the MIMO TX antennas intended to be used in the TXOP determines that the channel is idle.

In the following, “MIMO channel was idle for an interval of PIFS” means that the STATE parameter of the most recent PHY-CCA.indication primitive that sensed at least all the MIMO TX antennas intended to be used in the TXOP was IDLE for an interval of PIFS that ends at the start of the transmission. “MIMO channel was busy” means that the STATE parameter of the most recent PHY-CCA.indication primitive that sensed at least one of the MIMO TX antennas intended to be used in the TXOP was BUSY.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The initiator uses the procedures in 10.3 (DCF) and 10.23.2 (HCF contention based channel access (EDCA)) to obtain a TXOP, or use the procedures in 11.4.12 (DMG allocation formats) to obtain an SP allocation prior to initiating MIMO channel access.

When the channel is clear for SISO transmission (physical and virtual CS are clear) for the corresponding DMG antenna that is used for SISO transmission to establish a TXOP and the backoff timer reaches 0, a STA is permitted to obtain the TXOP. If the initiator has at least one MSDU pending for transmission during the permitted TXOP, the initiator shall perform exactly one of the following actions:

— Transmit a MIMO PPDU or initiate the hybrid beamforming protocol if the MIMO channel was idle for an interval of PIFS immediately preceding the start of the TXOP.
— Transmit a PPDU using a single transmit chain with the same DMG antenna that was used to obtain the TXOP or cancel the hybrid beamforming protocol if any DMG antenna connected to an active receive chain indicates busy during an interval of PIFS immediately preceding the start of the TXOP.
— Restart the channel access attempt by invoking the backoff procedure as specified in 10.23.2 (HCF contention based channel access (EDCA)) as though the medium is busy as indicated by either physical or virtual CS and the backoff timer has a value of 0.

In the case of an SP, if the initiator has at least one MSDU pending for transmission during the SP, the initiator transmits a MIMO PPDU or initiates the hybrid beamforming protocol at the start of the SP.

If the Grant Required field within a responder's EDMG Capabilities element is 1, the initiator shall transmit a Grant frame with a control trailer in a CBAP to this responder before initiating MIMO channel access or the hybrid beamforming protocol, to indicate the intent to transmit a MIMO PPDU to the responder or announce the start of the hybrid beamforming protocol respectively. Otherwise, if the Grant Required field within a responder's EDMG Capabilities is 0, the initiator may optionally transmit a Grant frame to the responder.

In the transmitted Grant frame, the value of the Allocation Duration field plus the Duration field of the Grant frame indicates the estimated time offset from the PHY-TXEND.indication primitive of the Grant frame transmission when the initiator intends to initiate access to the channel to transmit to or start the hybrid beamforming protocol with the responder. For the transmitted Grant frame, the TXVECTOR parameter SCRAMBLER_INIT_SETTING shall be set to CONTROL_TRAILER, the parameter CT_TYPE shall be set to GRANT_RTS_CTS2Self, and the NEXT_TX_SISO parameter shall be set to NextTxMultiAntenna. For hybrid beamforming training, the HBF_TRAINING parameter shall be set NextHBF to indicate that the following transmission from this STA is hybrid beamforming training. The MU_MIMO_NEXT parameter shall be set to NextNotMUMIMO to indicate that the following transmission (see 10.41.10.2.2 (SU-MIMO beamforming)) or hybrid beamforming training (see 10.41.10.2.4 (Hybrid beamforming for SU-MIMO and MU-MIMO)) is performed in SU-MIMO or shall be set to NextMUMIMO to indicate that the following transmission (see 10.41.10.2.3 (MU-MIMO beamforming)) or hybrid beamforming training is performed in MU-MIMO. The control trailer shall also indicate the corresponding DMG antenna configuration for the upcoming MIMO transmission or hybrid beamforming training through the TXVECTOR parameters TX_SECTOR_CONFIG_INDEX, MU_MIMO_TX_CONFIG_TYPE and MU_MIMO_TX_CONFIG_INDEX.

If an EDMG STA receives a Grant frame with a control trailer indicating an SU-MIMO or MU-MIMO transmission, or hybrid beamforming training and is able to receive the SU-MIMO or MU-MIMO transmission or perform hybrid beamforming training at the target time indicated by the Grant frame, the EDMG STA shall

— Transmit a Grant Ack frame in response to the received Grant frame.
— In the case when the STA received a Grant frame with a control trailer indicating SU-MIMO transmission or the start of the hybrid beamforming training protocol, for this transmitted Grant Ack frame, the TXVECTOR parameter SCRAMBLER_INIT_SETTING shall be set to

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

CONTROL_TRAILER and the parameter CT_TYPE shall be set to GRANT_RTS_CTS2Self. If it uses SU-MIMO for the transmission in the opposite direction, i.e., from the responder to the initiator, or desires to announce the hybrid beamforming protocol in the opposite direction, the TXVECTOR parameter NEXT_TX_SISO of the Grant Ack shall be set to NextTxMultiAntenna. For hybrid beamforming training, the HBF_TRAINING parameter shall be set NextHBF to indicate that the following transmission from this STA is hybrid beamforming training. The control trailer shall also indicate the corresponding DMG antenna configuration for the upcoming SU-MIMO transmission or hybrid beamforming training in the opposite direction using the TXVECTOR parameter TX_SECTOR_CONFIG_INDEX. If the responder STA intends to use SISO for the transmission in the opposite direction, the TXVECTOR parameter NEXT_TX_SISO of the Grant Ack shall be set to NextTxSingleAntenna.

— Configure its DMG antennas according to the settings included in the control trailer of the received Grant frame within a time period determined by the value of the Allocation Duration field plus the value of the Duration field of the received Grant frame starting from the PHY-TXEND.indication primitive of the Grant frame transmission.

10.38.12.4.3 SU-MIMO channel access procedure

An EDMG STA is SU-MIMO capable if the SU-MIMO Supported field in the STA's EDMG Capabilities element is equal to 1. The SU-MIMO channel access procedure describes how an SU-MIMO capable initiator and an SU-MIMO capable responder shall access the channel to start exchanging one or more EDMG SU PPDUs using SU-MIMO, and also describes how an SU-MIMO capable initiator and responder that are also hybrid beamforming capable start an hybrid beamforming protocol.

Prior to initiating the SU-MIMO channel access with a responder, an initiator shall perform SU-MIMO beamforming with the responder (see 10.41.10.2.2 (SU-MIMO beamforming)).

An EDMG STA, the SU-MIMO initiator, initiates SU-MIMO channel access by transmitting an RTS frame or a DMG CTS-to-self frame to the intended SU-MIMO responder. The SU-MIMO initiator shall transmit the RTS or DMG CTS-to-self frame with a control trailer to the SU-MIMO responder. The RTS or DMG CTS-to-self frame shall be transmitted using the same set of DMG antennas and antenna configuration planned to be used during the SU-MIMO transmission or hybrid beamforming training, and with a CSD between the transmissions in different antennas as defined in 28.4.7.2 and 28.4.7.3.3. For the transmitted RTS or DMG CTS-to-self frame, the TXVECTOR parameter SCRAMBLER_INIT_SETTING shall be set to CONTROL_TRAILER, the parameter CT_TYPE shall be set to GRANT_RTS_CTS2Self, the NEXT_TX_SISO parameter shall be set to NextTxMultiAntenna and the MU_MIMO_NEXT parameter shall be set to NextNotMUMIMO to indicate that the following transmission or hybrid beamforming training is performed in SU-MIMO. For hybrid beamforming training, the HBF_TRAINING parameter shall be set NextHBF to indicate that the following transmission from this STA is hybrid beamforming training. The control trailer shall also indicate the corresponding DMG antenna configuration for the upcoming SU-MIMO transmission or hybrid beamforming training through the TXVECTOR parameter TX_SECTOR_CONFIG_INDEX.

If an SU-MIMO initiator transmits to a responder a DMG CTS-to-self frame that contains a control trailer indicating an SU-MIMO transmission, all the PPDUs transmitted by the initiator to the responder within this TXOP shall use the antenna setting indicated in the TXVECTOR parameter TX_SECTOR_CONFIG_INDEX. For transmissions in the opposite direction, the initiator should configure its receive DMG antennas according to the settings included in the control trailer of the last Grant Ack frame received from the responder and the responder should use the antenna setting indicated in this same transmitted Grant Ack frame. If there was no prior Grant/Grant Ack frame exchange sequence between the initiator and the responder, the SISO antenna setting should be used instead.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If an SU-MIMO initiator uses a DMG CTS-to-self frame to switch to SU-MIMO transmission in a TDD slot, the initiator and responder shall communicate using SU-MIMO transmissions until one of the following occurs:

— The initiator transmits to the responder a DMG CTS-to-self frame with TXVECTOR parameters CT_TYPE set to GRANT_RTS_CTS-2self and NEXT_TX_SISO set to NextTxSingleAntenna; or

— Beamforming training between the initiator and responder.

If a responder receives an RTS frame with a control trailer indicating an SU-MIMO transmission or a hybrid beamforming announcement addressed to itself and is able to perform the SU-MIMO reception or hybrid beamforming training, the responder shall

— Configure its DMG antennas according to the settings indicated in the RXVECTOR parameter TX_SECTOR_CONFIG_INDEX of the received RTS frame.

— Transmit a DMG CTS frame with a control trailer in response of the received RTS frame. For this transmitted DMG CTS frame, the TXVECTOR parameter SCRAMBLER_INIT_SETTING shall be set to CONTROL_TRAILER and the parameter CT_TYPE shall be set to CTS_DTS.

— If the responder uses SU-MIMO for the transmission in the opposite direction (i.e., from the EDMG STA receiving the RTS frame to the EDMG STA transmitting the RTS frame) or desires to announce the hybrid beamforming protocol in the opposite direction, the TXVECTOR parameter NEXT_TX_SISO of the DMG CTS frame shall be set to NextTxMultiAntenna and the MU_MIMO_NEXT parameter shall be set to NextNotMUMIMO. For hybrid beamforming training, the HBF_TRAINING parameter shall be set NextHBF to indicate that the following transmission from this STA is hybrid beamforming training. The control trailer shall also indicate the corresponding DMG antenna configuration for the upcoming SU-MIMO transmission or hybrid beamforming training in the opposite direction using the TXVECTOR parameter TX_SECTOR_CONFIG_INDEX. The DMG CTS frame shall be transmitted using the same set of DMG antennas and antenna configuration planned to be used during the SU-MIMO transmission or hybrid beamforming training, and with a CSD between the transmissions in different antennas as defined in 28.4.7.2 (Non-EDMG PPDU transmission) and 28.4.7.3.3 (EDMG duplicate preamble and Data field transmission over a 4.32 GHz, 6.48 GHz, 8.64 GHz, and 4.32+4.32 GHz channel).

— If the responder uses SISO for the transmission in the opposite direction, the TXVECTOR parameter NEXT_TX_SISO of the DMG CTS frame shall be set to NextTxSingleAntenna and the DMG CTS frame shall be sent using the SISO antenna setting.

Alternatively, if the responder is not able to perform the SU-MIMO reception or hybrid beamforming training, it may transmit a DMG DTS frame with a control trailer to the initiator to provide further information. The DMG DTS frame shall be sent using the SISO antenna setting.

A responder that receives a DMG CTS-to-self frame with a control trailer indicating a SU-MIMO transmission or hybrid beamforming training addressed to itself and is able to perform the SU-MIMO reception or hybrid beamforming training shall

— Configure its DMG antennas according to the settings included in the RXVECTOR parameter TX_SECTOR_CONFIG_INDEX of the received CTS-to-self frame; and

— Begin the SU-MIMO reception or hybrid beamforming training SIFS following the end of the DMG CTS-to-self frame transmission by the initiator.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Figure 10-69 (SU-MIMO channel access procedure when RTS/DMG CTS is used) and Figure 10-70 (SU-MIMO channel access procedure when DMG CTS-to-self is used) illustrate examples of frame exchange sequences using the SU-MIMO channel access procedure.

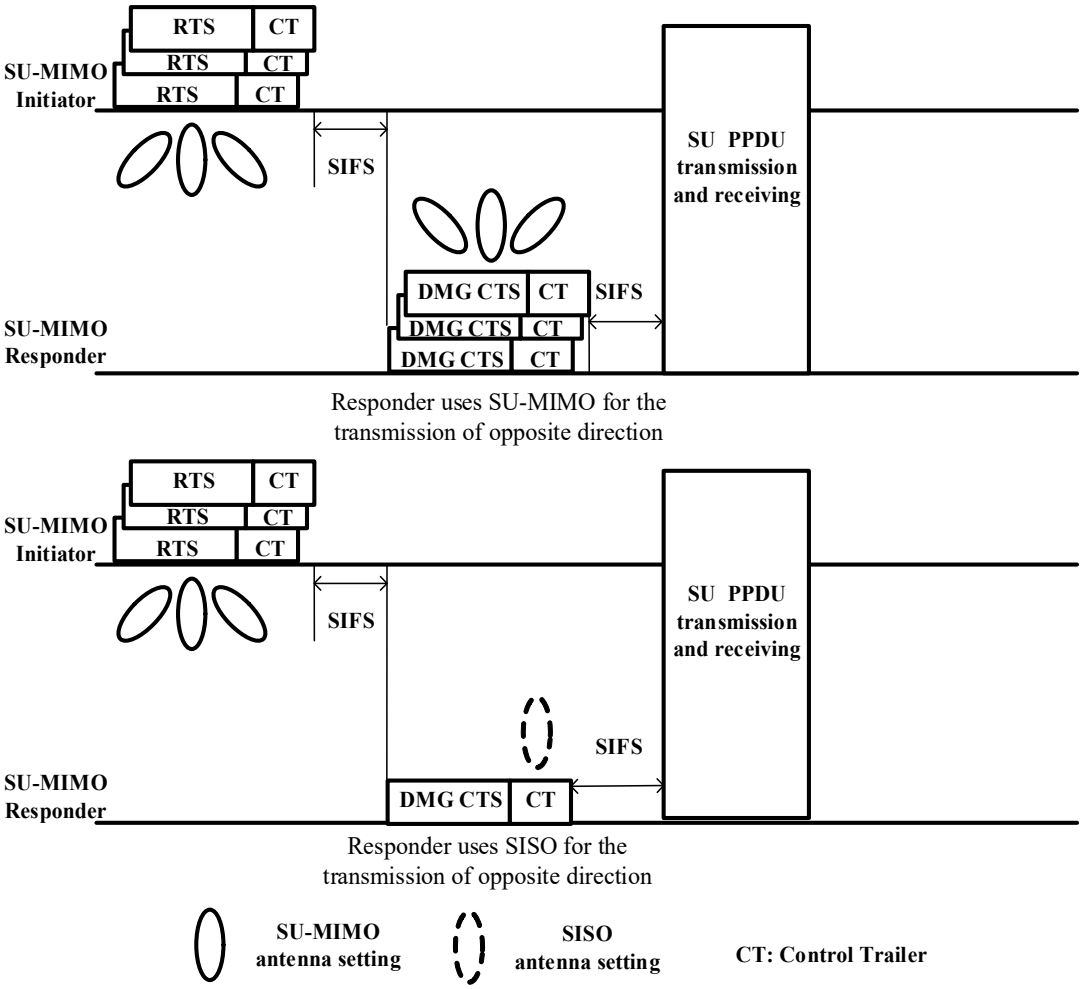

Figure 10-69—SU-MIMO channel access procedure when RTS/DMG CTS is used

An SU-MIMO initiator may send a CF-End frame to reset the NAV and release the remaining time of the TXOP. If the CF-End is transmitted, it shall be sent using the same set of DMG antennas and antenna configuration during the SU-MIMO transmission or hybrid beamforming training and a CSD between the transmissions in different antennas as defined in 28.4.7.2 (Non-EDMG PPDU transmission).

10.38.12.4.4 MU-MIMO channel access procedure

An EDMG STA is MU-MIMO capable if the MU-MIMO Supported subfield of the Beamforming Capability subelement in the STA's EDMG Capabilities element is 1. The MU-MIMO channel access procedure describes how an MU-MIMO capable initiator and multiple MU-MIMO capable responders shall access the channel to start exchanging one or more EDMG MU PPDUs, and also describes how an MU-MIMO capable initiator and multiple MU-MIMO capable responders that are also hybrid beamforming capable (see 10.41.10.2.4 (Hybrid beamforming for SU-MIMO and MU-MIMO)) start the hybrid beamforming protocol.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

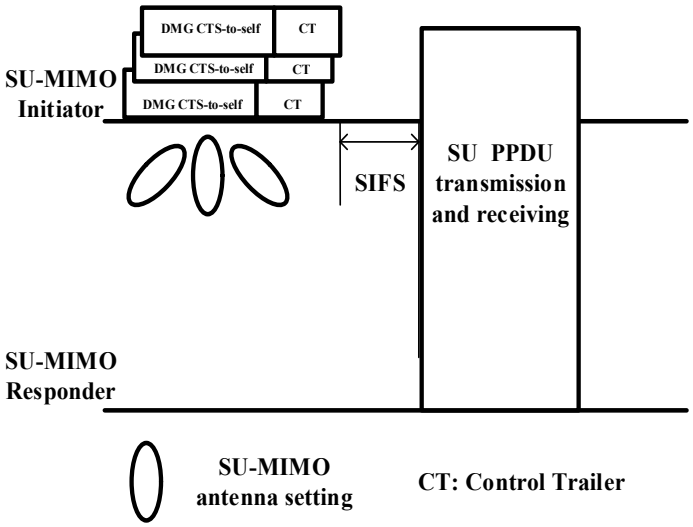

Figure 10-70—SU-MIMO channel access procedure when DMG CTS-to-self is used

Prior to initiating the MU-MIMO channel access with a set of responder STAs within an MU group, the initiator shall

— Include the MU group within the EDMG Group ID Set element and communicate the resulting element to the STAs in the BSS (see 10.41.10.2.3 (MU-MIMO beamforming)).

— Perform MU-MIMO beamforming with the responders of the MU group (see 10.41.10.2.3 (MU-MIMO beamforming)).

An EDMG STA initiates MU-MIMO channel access by transmitting an RTS frame or a DMG CTS-to-self frame to the intended MU-MIMO group of responders. The EDMG STA shall transmit the RTS frame or DMG CTS-to-self frame with a control trailer to the group of responders. The RTS or DMG CTS-to-self frame shall be transmitted using the same set of DMG antennas and antenna configuration planned to be used during the MU-MIMO transmission or hybrid beamforming training, and a CSD between the transmissions in different antennas as defined in 28.4.7.2 (Non-EDMG PPDU transmission). The TA field of the transmitted DMG CTS-to-self frame shall be set to the broadcast address.

For the transmitted RTS or DMG CTS-to-self frame, the TXVECTOR parameter SCRAMBLER_INIT_SETTING shall be set to CONTROL_TRAILER, the parameter CT_TYPE shall be set to GRANT_RTS_CTS2self, the parameter NEXT_TX_SISO shall be set to NextTxMultiAntenna, and the parameter MU_MIMO_NEXT shall be set to NextMUMIMO to indicate that the following PPDU transmitted by the initiator is an EDMG MU PPDU. In addition to the previous settings, for hybrid beamforming training the HBF_TRAINING parameter shall be set NextHBF to indicate that the following transmission from this STA is hybrid beamforming training. The TXVECTOR parameter EDMG_GROUP_ID shall be set to the value that identifies the corresponding group of responders that are the intended destinations of the EDMG MU PPDU to be transmitted or the intended recipients of the hybrid beamforming training. The TXVECTOR parameters MU_MIMO_TX_CONFIG_TYPE and MU_MIMO_TX_CONFIG_INDEX indicate the corresponding DMG antenna configuration for the upcoming MU-MIMO transmission or hybrid beamforming training. The RA field of the RTS shall be set to the broadcast address. After transmitting the RTS frame, the initiator should configure its receive antenna to a quasi-omni receive pattern to receive the DMG CTS.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An initiator that transmits an RTS frame or a DMG CTS-to-self frame addressed to an MU group shall set the TXVECTOR parameter IS_CHANNEL_NUMBER to ChannelWidth and shall set the BW_IN_CT to indicate the bandwidth to be used for all EDMG MU PPDU transmissions within the TXOP or SP allocation.

When a responder receives an RTS frame addressed to an MU group and belongs to the corresponding MU-MIMO transmission configuration indicated in the control trailer, if the responder is able to perform the MU-MIMO reception then it shall

— Transmit a DMG CTS frame back to the initiator employing the most recent SISO antenna configuration used between the responder and the initiator. The TA field of the DMG CTS frame shall be set to the broadcast address.

Following the transmission of the DMG CTS frame, the responder shall then configure its antennas according to the settings indicated in the RXVECTOR parameters MU_MIMO_TX_CONFIG_TYPE and MU_MIMO_TX_CONFIG_INDEX of the received RTS frame.

For the successful reception of the DMG CTS frame, the difference in time between all the DMG CTS transmissions as measured at the receiving STA should be no more than $T_{GI\ normal}$ (see 28.5.2.2 (Timing-related parameters)). A STA that transmits the DMG CTS should precompensate for carrier frequency offset error to mitigate the frequency error in the transmitted signal.

The MU-MIMO transmission or hybrid beamforming training shall begin between a SIFS and a SIFS + 10% × (aSlotTime – aAirPropagationTime) following the reception or expected reception of the DMG CTS frame by the initiator. This is shown in Figure 10-71 (MU-MIMO channel access flow when RTS/DMG CTS is used).

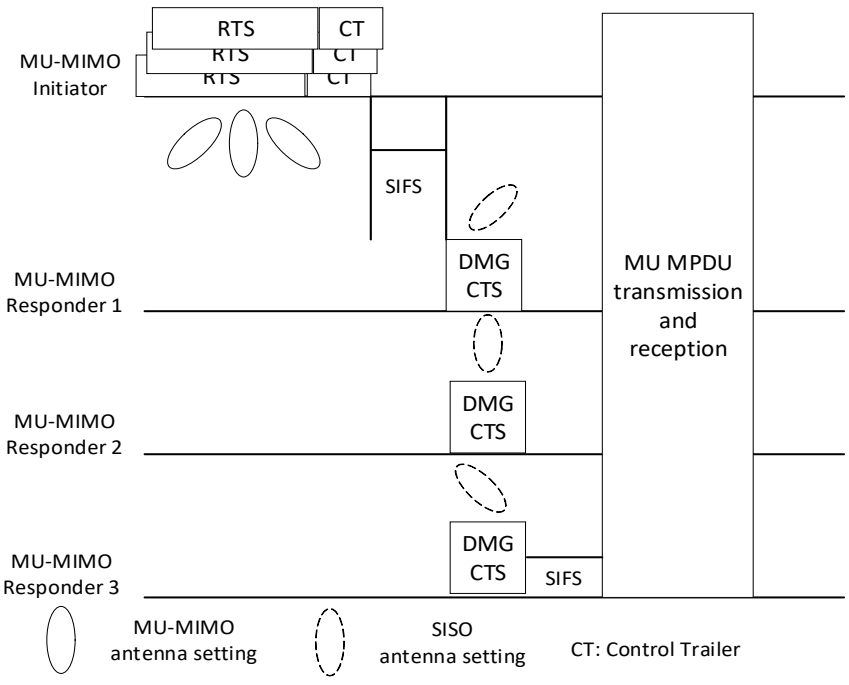

Figure 10-71—MU-MIMO channel access flow when RTS/DMG CTS is used

NOTE—If an RTS/DMG CTS frame exchange sequence is used to obtain MU-MIMO channel access, the successful reception of the DMG CTS frame at the initiator is not required to proceed with the MU-MIMO channel access.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When a responder receives a DMG CTS-to-self frame addressed to an MU group and belongs to the corresponding MU-MIMO transmission configuration indicated in the control trailer, if the responder is able to perform the MU-MIMO reception then it shall configure its antennas according to the settings indicated in the RXVECTOR parameters MU_MIMO_TX_CONFIG_TYPE and MU_MIMO_TX_CONFIG_INDEX of the received CTS-to-self frame. The MU-MIMO transmission or hybrid beamforming shall begin a SIFS following the end of the DMG CTS-to-self frame transmission by the initiator. This is shown in Figure 10-72 (MU-MIMO channel access flow when DMG CTS-to-self is used).

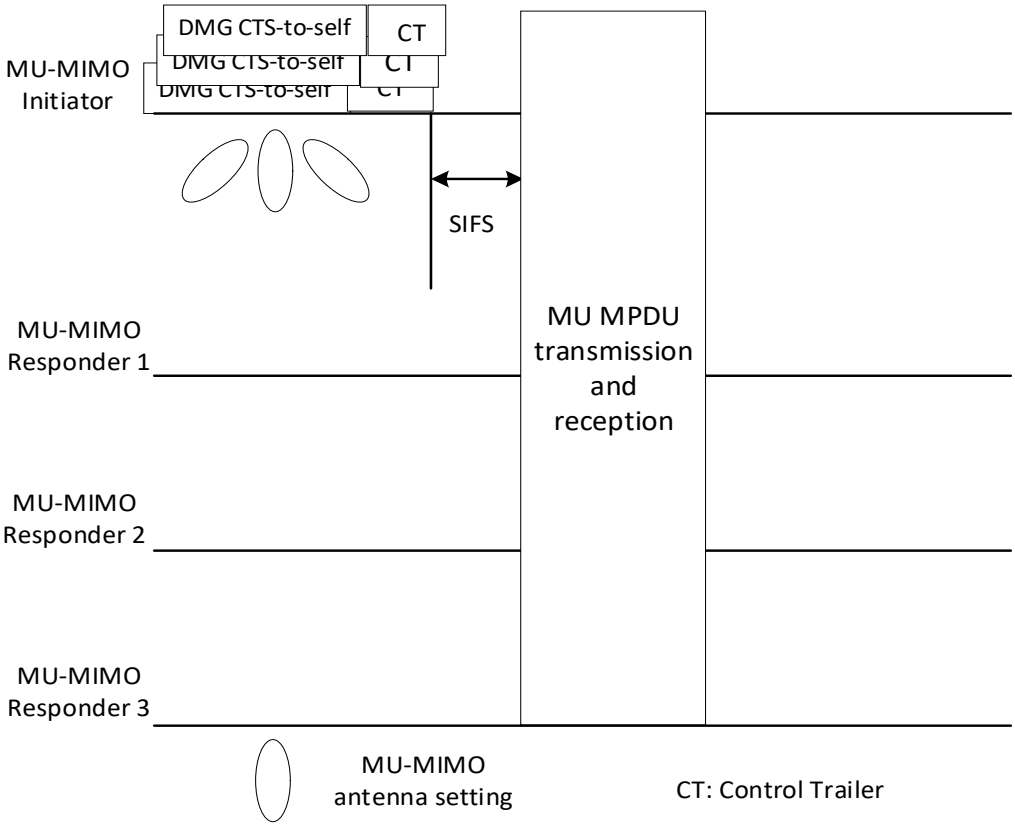

Figure 10-72—MU-MIMO channel access flow when DMG CTS-to-self is used

Subclause 10.3.2.13 (MU acknowledgment procedure) describes the MU PPDU acknowledgment procedure.

The initiator may send a CF-End frame to one or more responders in an MU-MIMO TXOP to truncate the TXOP.

10.38.12.5 Control trailer

To provide additional control signaling, a control trailer may be inserted in a control mode PPDU transmitted to an EDMG STA. An EDMG STA shall set the TXVECTOR parameter SCRAMBLER_INIT_SETTING to CONTROL_TRAILER to indicate the presence of the control trailer in a control mode PPDU and shall set the TXVECTOR parameter CT_TYPE to indicate the type of control trailer to be included in the PPDU. The control trailer is defined in 28.3.7 (Control trailer).

10.38.12.6 “Near-Far” self classification

A non-PCP and non-AP EDMG STA may estimate whether its signal can be successfully received by an EDMG PCP or EDMG AP that is listening in quasi-omni mode, i.e., to classify itself as a “Near” or a “Far” STA to the PCP or AP. This allows the EDMG STA to decide whether to access the A-BFT (if it is classified as “Near”) or to use asymmetric beamforming (if it classified as “Far”) as defined in 10.41.10.3 (Beamforming for asymmetric links). To enable this, the PCP or AP informs EDMG STAs about its link budget parameters combined in one value, the PCP/AP Coverage Parameter subfield, which is transmitted in the SSW field of the DMG Beacon frame.

An EDMG STA may classify itself as a “Near” STA if the following inequality is true:

$$P_{APrx} = (EIRP_{STA} - G_{STArx}) + RSSI - C > P_{min\_sensitivity}$$

where

P_{APrx}	is an estimation by the STA of the expected power that the STA’s transmission is received by the PCP/AP
$EIRP_{STA}$	is set to $P_{STA} + G_{STAtx}$, where P_{STA} and G_{STAtx} are the transmit power and antenna gain for the expected STA transmission
G_{STArx}	is the STA’s receive antenna gain during DMG Beacon reception
$RSSI$	is the power that was measured by the STA during DMG Beacon reception
C	is the value of the PCP/AP Coverage Parameter subfield contained in the SSW field within the received DMG Beacon frame
$P_{min\_sensitivity}$	is the receiver sensitivity for MCS 0 defined in Table 20-3

Otherwise if the above inequality is false, the EDMG STA may classify itself as a “Far” STA.

Figure 10-73 (Example behavior for “Near-Far” self classification) illustrates an example behavior used by an EDMG STA to classify itself as “Near” or “Far”. After reception of a DMG Beacon frame from an EDMG PCP or EDMG AP that has a valid PCP/AP Coverage Parameter subfield in the SSW field, the EDMG STA checks inequality specified above. In case the inequality is true, EDMG STA classifies itself as a “Near” EDMG STA for this PCP/AP and decides to access the A-BFT or the DTI. In case the inequality is false, the EDMG STA classifies itself as a “Far” EDMG STA for this PCP or AP, and therefore it decides to skip the A-BFT and use asymmetric beamforming, if scheduled by the PCP or AP, to establish communication with the PCP or AP.

10.39 DMG and CMMG AP or PCP clustering

10.39.1 General

An AP or PCP may use the AP or PCP clustering mechanism to improve spatial sharing and interference mitigation with other co-channel DMG BSSs. An AP or PCP may use the AP or PCP clustering mechanism to improve spatial sharing and interference mitigation with other co-channel CMMG BSSs. There are two types of clustering:

— Decentralized AP or PCP clustering that involves a single S-AP or S-PCP in the BSA of the S-AP or S-PCP

— Centralized AP or PCP clustering where there can be multiple S-APs in the BSA of any one S-AP, and all S-APs are coordinated via a single centralized coordination service set

AP or PCP clustering allows an AP or PCP that is a member of a cluster to schedule transmissions in nonoverlapping time periods with respect to other members of the same cluster since the AP or PCP can receive DMG Beacon and Announce frames containing the Extended Schedule element of other APs and

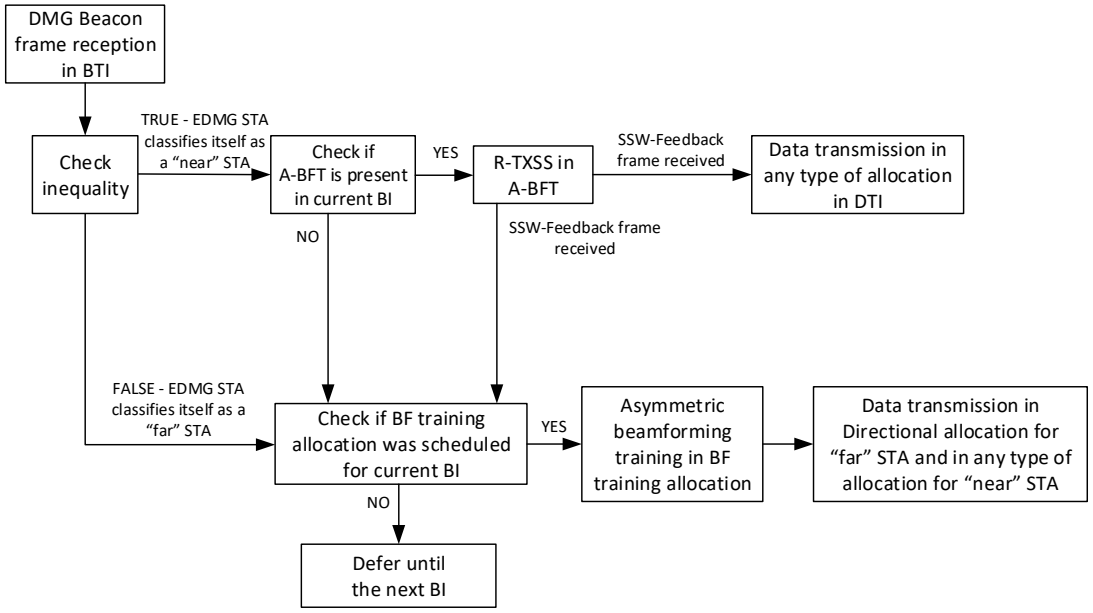

Figure 10-73—Example behavior for "Near-Far" self classification

PCPs that are members of the cluster and can also receive the Extended Schedule element from another BSS through associated non-AP and non-PCP STAs (10.39.4).

A STA is decentralized AP or PCP clustering capable if it sets the Decentralized AP or PCP Clustering field to 1 within the DMG AP Or PCP Capability Information field in the DMG Capabilities element. A STA is decentralized AP or PCP clustering capable if it sets the Decentralized AP or PCP Clustering field to 1 within the CMMG AP Or PCP Capability Information field in the CMMG Capabilities element. A STA is centralized AP or PCP clustering capable if it sets the Centralized AP or PCP Clustering field to 1 within the DMG AP Or PCP Capability Information field in the DMG Capabilities element. A STA is centralized AP or PCP clustering capable if it sets the Centralized AP or PCP Clustering field to 1 within the CMMG AP Or PCP Capability Information field in the CMMG Capabilities element. The AP or PCP employs the Clustering Control field and ECAPC Policy Enforced field defined in 9.3.4.2 to configure the use of AP or PCP Clustering. A decentralized AP or PCP clustering capable or centralized AP or PCP clustering capable AP or PCP that transmits the Clustering Control field is decentralized clustering enabled or centralized clustering enabled, respectively.

An AP or PCP cluster includes one S-AP or S-PCP and zero or more member APs and PCPs. Decentralized clustering enabled APs and PCPs operating on the same channel may form a decentralized AP or PCP cluster. The Cluster ID of the decentralized AP or PCP cluster shall be set to the MAC address of the S-AP or S-PCP. Centralized clustering enabled APs and PCPs operating on the same channel as a S-AP form a centralized AP or PCP cluster as described in 10.39.2.2. The Cluster ID of the centralized AP or PCP cluster shall be set to the MAC address of the S-AP.

A clustering enabled AP or PCP that is not a member of any cluster shall set the Cluster Member Role subfield to 0 in transmitted frames that contain the Clustering Control field.

Each AP or PCP that is a member of an AP or PCP cluster shall include the Clustering Control field in each DMG Beacon frame it transmits.

For each cluster, there exists a set of ClusterMaxMem Beacon SPs. The n^{th} Beacon SP, Beacon SP_n, begins at $ClusterTimeOffset_{n-1}$ μs following the TBTT of the S-AP or S-PCP, where

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$ClusterTimeOffset_{n-1} = 1024 \times (dot11BeaconPeriod/ClusterMaxMem) \times (n–1)$

and n=2, 3,…, *ClusterMaxMem*

The $ClusterTimeOffset_{n-1}$ and Beacon SP_n where n equals one is reserved for the S-AP or S-PCP.

An AP or PCP that is a member of an AP or PCP cluster shall transmit its DMG Beacon frame during one of the Beacon SPs as specified in 10.39.2.

The maximum size of the Beacon SP Duration field transmitted by a S-AP or S-PCP shall be the beacon interval of the S-AP or S-PCP divided by ClusterMaxMem.

10.39.2 Cluster formation

10.39.2.1 Decentralized AP or PCP cluster formation

A clustering enabled AP or PCP starts a decentralized AP or PCP cluster by becoming an S-AP or S-PCP, subject to the absence of existing clusters as described below and in 10.39.2.2. A decentralized clustering enabled AP or PCP becomes an S-AP or S-PCP of a decentralized AP or PCP cluster by transmitting a DMG Beacon frame at least once every aMinBTIPeriod beacon intervals that has the ECAPC Policy Enforced subfield in the DMG Parameters field set to 0 and that includes a Clustering Control field with the Beacon SP Duration subfield set to dot11BeaconSPDuration, the Cluster ID subfield set to the S-AP or S-PCP MAC address, and the Cluster Member Role subfield set to the value for an S-AP or S-PCP. The value of ClusterMaxMem subfield shall be chosen to keep the result of (beacon interval length/ClusterMaxMem) as an integer number of microseconds.

A decentralized clustering enabled AP or PCP that receives a DMG Beacon frame with the ECAPC Policy Enforced subfield in the DMG Parameters field set to 0 from an S-AP or S-PCP on the channel the AP or PCP selects to establish a BSS shall monitor the channel for DMG Beacon frame transmissions during each Beacon SP for an interval of length at least aMinChannelTime. A Beacon SP is empty if no DMG Beacon frame is received during the Beacon SP over an interval of length aMinChannelTime. The AP or PCP shall not become a member of the cluster if no Beacon SP is determined to be empty during aMinChannelTime, in which case, subject to the requirements described in 10.39.2.2, the AP or PCP may become the S-AP or S-PCP of a new cluster, or may cease its activity on this channel and may attempt operation on a different channel.

A decentralized clustering enabled AP or PCP that operates its BSS on a channel on which it discovered an S-AP or S-PCP within a decentralized AP or PCP cluster and at least one empty Beacon SP shall transmit its DMG Beacon frame during an empty Beacon SP. By transmitting its DMG Beacon frame during an empty Beacon SP and by setting the clustering control field appropriately as described in 9.3.4.2, the AP or PCP becomes a member AP or member PCP.

The member AP or member PCP shall select a beacon interval length that is equal to the beacon interval length of its S-AP or S-PCP.

The member AP or member PCP shall transmit its DMG Beacon frame with the ECAPC Policy Enforced field set to 0, the Beacon SP Duration subfield set to the value of the Beacon SP Duration subfield contained in the S-AP or S-PCP DMG Beacon frame, the Cluster ID subfield set to the MAC address of the S-AP or S-PCP, the Cluster Member Role subfield set to the member AP or member PCP value, and the ClusterMaxMem subfield set to the value of the ClusterMaxMem field contained in the S-AP or S-PCP DMG Beacon frame.

An AP or PCP with a value of Cluster Member Role that is not zero shall schedule a Beacon SP that is allocated for DMG Beacon frame transmission of other cluster member APs and PCPs within the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

decentralized AP or PCP cluster at each of $\text{ClusterTimeOffset}_n$, at any time the AP or PCP transmits its own DMG Beacon frame. The minimum size of the Beacon SP should be equal to the value of the Beacon SP Duration subfield within the S-AP or S-PCP DMG Beacon.

An S-AP or S-PCP and a member AP or member PCP of a decentralized AP or PCP cluster should not transmit or schedule transmissions during a Beacon SP that is not its own Beacon SP.

Figure 10-74 (Decentralized AP or PCP clustering for 3 APs and PCPs) illustrates, for three APs and PCPs, the Beacon SPs of the S-AP or S-PCP and member APs and PCPs of a decentralized AP or PCP cluster.

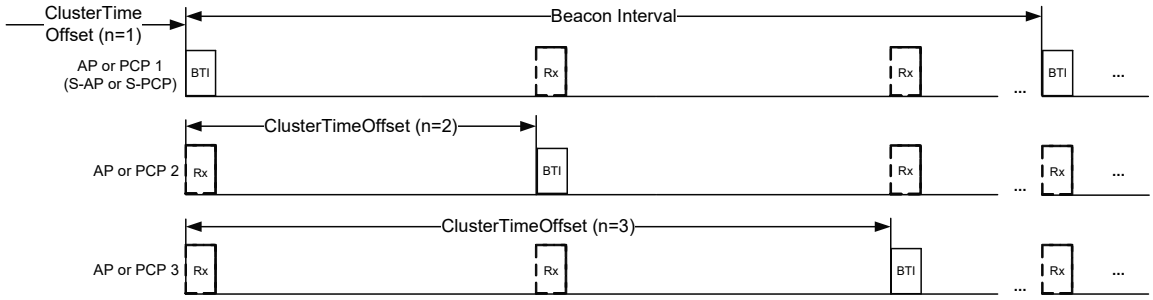

Figure 10-74—Decentralized AP or PCP clustering for 3 APs and PCPs

10.39.2.2 Centralized AP or PCP cluster formation

In order to become an S-AP, a centralized clustering enabled STA that is stationary with respect to its local environment shall successfully perform both the following steps in order:

- Configuration step
- Verification step

Once these steps have been performed successfully, the STA has become an S-AP.

- *Configuration step*: The configuration step is defined to be successful if the following occur:
  - The STA obtains the MAC address of the CCSR; and
  - The STA obtains an ECAPC Policy Detail field, beacon interval, ClusterMaxMem, Beacon SP Duration, TXSS CBAP Offset, TXSS CBAP Duration, TXSS CBAP MaxMem, TSF synchronization parameters, Cluster Time Offset availability information, and a nonempty list of excluded channels for the intended operating class of the STA from the CCSR; and
  - Either channel 2 is an allowed channel in the current regulatory domain and the list of excluded channels includes channel 2, or channel 2 is not an allowed channel in the current regulatory domain; and
  - The beacon interval/ClusterMaxMem is an integer number of microseconds; and
  - At least one of beacon interval/TXSS CBAP MaxMem or TXSS CBAP MaxMem/beacon interval is an integer.

  Otherwise, the configuration step is defined to be unsuccessful. If the configuration step is unsuccessful, then the STA can attempt to resolve the problem or quit attempting to start a centralized AP or PCP cluster. The method by which the STA obtains the configuration information from the CCSR is not defined in this standard.
- *Verification step*: The verification step is defined to be the following procedure:
  - The centralized clustering enabled STA monitors the channel for DMG Beacon frames over an interval of at least aMinChannelTime.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— During this monitoring period, for each distinct Cluster ID received in a DMG Beacon frame that has the ECAPC Policy Enforced field set to 1 in the DMG Parameters field and Cluster Member Role set to 1 (S-AP or S-PCP of the cluster) or 2 (a member AP or member PCP of the cluster), the centralized clustering enabled STA determines if an S-AP with a MAC address equal to the Cluster ID belongs to the same CCSS as the centralized clustering enabled STA, via i) attempting to receive an Announce frame from the S-AP that transmitted the DMG Beacon frame according to the channel access rules described in 10.38 in order to solicit an ECAPC Policy element or ii) any other means. Any such DMG Beacon frame whose transmitter cannot be determined in this way to belong to the same CCSS as the centralized clustering enabled STA is defined to be from another ECAPC.

The verification step is defined to be unsuccessful if, at the end of the monitoring period, there are one or more received DMG Beacon frames that are from another ECAPC. Otherwise, the verification step is defined to be successful.

If a centralized clustering enabled STA receives at least one DMG Beacon frame that has the ECAPC Policy Enforced field set to 1 and from a member AP, S-AP, or member PCP of another ECAPC during the monitoring period and the STA is not an ECAPC policy blind AP or PCP, the STA

— Shall cease its activity on this channel and may attempt operation on a different channel, or
— If one of the received DMG Beacon frames was sent by an S-AP, may elect to unenroll from its current CCSS and join the cluster of the S-AP as a member AP or member PCP.

If a centralized clustering enabled STA receives at least one DMG Beacon frame that has the ECAPC Policy Enforced field set to 1 from an S-AP from the same CCSS during the monitoring period and the STA is not an ECAPC policy blind AP or PCP, the STA may elect either to unenroll from its current CCSS and join the cluster of the S-AP as a member AP or member PCP or to continue and become an S-AP in the CCSS.

In order to become an S-AP in a centralized AP or PCP cluster, a centralized clustering enabled STA shall take the following actions:

— Set dot11ChannelUsageImplemented to true
— Start a BSS as an AP
  — On a channel that is not listed as excluded by the CCSR, and
  — At the start time and with the beacon interval configured by the CCSR
— Include in transmitted DMG Beacon frames
  — The ECAPC Policy Enforced field set to 1 in the DMG Parameters field, and
  — A Clustering Control field with the ClusterMaxMem subfield set to the values configured by the CCSR, the Beacon SP Duration subfield set to the value most recently configured by the CCSR, the Cluster ID subfield set to the S-AP MAC address, and the Cluster Member Role subfield set to 1 (S-AP or S-PCP of the cluster).

An S-AP in a centralized AP or PCP cluster shall set the ECAPC Policy Enforced subfield in the DMG Parameters field to 1 for the lifetime of the BSS.

An S-AP within a centralized AP or PCP cluster shall include the ECAPC Policy element in (Re)Association Response, Announce, and Information Response frames with the ECAPC Policy Detail, TXSS CBAP Offset, and TXSS CBAP Duration fields set to the respective values most recently configured by the CCSR for the S-AP, the TXSS CBAP MaxMem subfield set to the policy configured by the CCSR, the CCSR ID subfield set to the MAC address of the CCSR, and bits in the Available Cluster Time Offset Bitmap subfield set to 0 to indicate the Cluster Time Offsets that are determined to be already in use, excluding the recipient if sent within an individually addressed frame. The means by which a Cluster Time Offset is determined to be in use are unspecified. Bits in the Available Cluster Time Offset Bitmap subfield for other Cluster Time Offsets shall be set to 1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An AP or PCP that

- receives a DMG Beacon frame that has the ECAPC Policy Enforced subfield in the DMG Parameters field set to 1 from an S-AP on a channel and
- does not receive at least one DMG Beacon frame that has the ECAPC Policy Enforced subfield in the DMG Parameters field set to 1 from S-AP on every channel supported by the AP or PCP in the Operating Class within the next aMinChannelTime and
- is not an ECAPC policy blind AP or PCP

shall either join the cluster of the S-AP as a member AP or member PCP if centralized clustering enabled or cease its activity on this channel and may attempt operation on a different channel. S-APs within a CCSS report the channels unused by the ECAPC via the channel usage procedures (see 11.21.15).

An AP or PCP within a decentralized AP or PCP cluster that

- receives a DMG Beacon frame that has the ECAPC Policy Enforced subfield in the DMG Parameters field set to 1 from an S-AP and
- does not receive at least one DMG Beacon frame that has the ECAPC Policy Enforced subfield in the DMG Parameters field set to 1 from an S-AP on every channel supported by the AP or PCP in the Operating Class within the next aMinChannelTime (i.e., does not become a ECAPC policy blind AP) and
- is not already an ECAPC policy blind AP or PCP

shall quit the decentralized AP or PCP cluster before the next TBTT + beacon interval length, then the AP or PCP shall either join the cluster of the S-AP as a member AP or member PCP if centralized AP or PCP clustering enabled or cease its activity on this channel and may attempt operation on a different channel.

An AP or PCP that receives at least one DMG Beacon frame that has the ECAPC Policy Enforced subfield in the DMG Parameters field set to 1 sent by an S-AP on every channel supported by the AP or PCP in the Operating Class within the most recent aMinChannelTime ignores the ECAPC Policy Enforced subfield (i.e., treats this subfield as though equal to 0) in DMG Beacon frames received from S-APs for 300 × aMinChannelTime. During this period, the AP or PCP is called an *ECAPC policy blind AP or PCP*.

NOTE—An AP or PCP within a decentralized AP or PCP cluster does not cease DMG Beacon frame transmission when quitting a decentralized AP or PCP cluster. Hence, data communication is unaffected while performing these procedures.

A centralized clustering enabled AP or PCP that attempts to join the centralized AP or PCP cluster of an S-AP as a member AP or member PCP shall be a STA coordinated by an MM-SME that also coordinates a second non-AP and non-PCP STA, and shall successfully perform the following steps in order:

- The AP or PCP shall monitor the channel for DMG Beacon frames during each Beacon SP over an interval of length at least aMinChannelTime. A Beacon SP_n is empty if no DMG Beacon frame is received during the Beacon SP_n over an interval of length aMinChannelTime.
- The second non-AP and non-PCP STA shall attempt to associate with the S-AP and thereby receive an Announce frame from the S-AP. The contents of the Announce frame are passed to the AP or PCP.
- Upon receiving an Announce frame that includes the ECAPC Policy element, the AP or PCP shall select a Cluster Time Offset index from the intersection of a) the Cluster Time Offset indices of the empty Beacon SPs with b) the indices indicated by the Available Cluster Offset Bitmap field in the ECAPC Policy element. If the intersection is empty, the AP or PCP shall select a Cluster Time Offset index of an empty Beacon SP. The selected Cluster Time Offset index is passed to the second non-AP and non-PCP STA.
- The second non-AP and non-PCP STA shall respond to the Announce frame with an Information Response frame that includes the Cluster Time Offset element containing the Cluster Time Offset Index set to the selected index.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The AP or PCP shall operate its BSS at the selected Cluster Time Offset on the channel of the S-AP and include the AP or PCP clustering control field in transmitted DMG Beacon frames.

The AP or PCP shall not become a member of the centralized AP or PCP cluster if no Beacon SP is determined to be empty during aMinChannelTime or if the second non-AP and non-PCP STA did not associate to the S-AP, in which case the AP or PCP may attempt to join the cluster of another S-AP or cease its activity on this channel and may attempt operation on a different channel.

A member AP or member PCP within a centralized AP or PCP cluster shall select a beacon interval that is equal to the beacon interval of the S-AP of the cluster.

The member AP or member PCP within a centralized AP or PCP cluster shall transmit its DMG Beacon frames with the ECAPC Policy Enforced subfield in the DMG Parameters field set to 1, the Beacon SP Duration subfield in the Clustering Control field set to the value of the Beacon SP Duration subfield contained in the most recently received S-AP DMG Beacon frame, the Cluster ID subfield set to the MAC address of the S-AP, the Cluster Member Role subfield set to 2 (a member AP or member PCP of the cluster), and the ClusterMaxMem subfields set to the value of the ClusterMaxMem field contained in the S-AP DMG Beacon.

A member AP or member PCP within a centralized AP or PCP cluster shall include the ECAPC Policy element in (Re)Association Response, Announce, and Information Response frames with the ECAPC Policy Detail, TXSS CBAP Offset, and TXSS CBAP Duration fields set to the most recently received respective field from the S-AP of the cluster, the TXSS CBAP MaxMem field set to the value of the TXSS CBAP MaxMem field received from the S-AP of the cluster, with the CCSR ID set to the MAC address of the CCSR field received from the S-AP of the cluster, and with the Available Cluster Time Offset Bitmap field reserved.

At any time an AP or PCP within a centralized AP or PCP cluster transmits a DMG Beacon frame, the AP or PCP shall schedule a Beacon SP that reserves time for BHI transmission by other APs and PCPs within the centralized AP or PCP cluster at each in use $\text{ClusterTimeOffset}_{n-1}$ as indicated by the most recently transmitted (if S-AP) or received (if member AP or member PCP) Available Cluster Time Offset Bitmap. The minimum size of the Beacon SP shall be equal to the value of the Beacon SP Duration subfield within the DMG Beacon frame of the S-AP of the centralized AP or PCP cluster. A member AP, S-AP, or member PCP of a centralized AP or PCP cluster shall not transmit or schedule transmissions during a Beacon SP of another member AP, S-AP, or member PCP.

10.39.3 Cluster maintenance

10.39.3.1 General cluster maintenance

The TBTT of the S-AP or S-PCP provides a timing reference for the Beacon SPs of the member APs and PCPs. Timing synchronization among the member APs and PCPs facilitates equitable sharing of the common medium among the member APs and PCPs. As long as a member AP or member PCP periodically receives DMG Beacons from the S-AP or S-PCP, the member AP or member PCP is able to maintain synchronization with the S-AP or S-PCP and hence the other member APs and PCPs.

10.39.3.2 Decentralized AP or PCP cluster maintenance

In the case when the S-AP or S-PCP of a decentralized AP or PCP cluster is lost, or appears to a member AP or member PCP to have been lost, another AP or PCP needs to become the S-AP or S-PCP of the decentralized AP or PCP cluster in order to allow the remaining member APs and PCPs to maintain synchronization with the cluster. The creation of a new S-AP or S-PCP is called *S-AP or S-PCP handover*. After an S-AP or S-PCP handover, the cluster might continue to function as before, except with altered membership, or the cluster might no longer exist, or there might be one or more new clusters.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A member AP or member PCP of the decentralized AP or PCP cluster shall start an S-AP or S-PCP handover if, within a time period of 4×aMinBTIPeriod beacon intervals, it does not receive a DMG Beacon frame with the ECAPC Policy Enforced field set to 0, with the value of the Cluster ID field equal to the Cluster ID of the cluster of which the AP or PCP is a member and with the Cluster Member Role field set to the S-AP or S-PCP value. This is the first cluster monitoring period. During the next step in the S-AP or S-PCP handover, the member AP or member PCP performs another cluster monitoring period. A cluster monitoring period is a time period of 4×aMinBTIPeriod beacon intervals during which the AP or PCP listens for DMG Beacons while continuing to transmit DMG Beacons using its current Beacon SP_n.

NOTE 1—A decentralized clustering enabled AP or PCP does not cease DMG Beacon frame transmission during Cluster Monitoring and S-AP or S-PCP handover. Hence, data communication is unaffected while performing these procedures.

If, during a cluster monitoring period, the member AP or member PCP receives a DMG Beacon frame with the value of Cluster Member Role set to the S-AP or S-PCP value, the member AP or member PCP shall follow the rules in 10.39.2 to become a member AP or member PCP of the cluster corresponding to the detected S-AP or S-PCP or cease operation on the channel; in either case, the cluster monitoring period is terminated.

If, during a cluster monitoring period, the AP or PCP receives no DMG Beacons with the value of Cluster Member Role set to the S-AP or S-PCP value and one or more DMG Beacons with the ECAPC Policy Enforced field set to 0 and with Cluster ID equal to the Cluster ID of its last S-AP or S-PCP, then at the end of the cluster monitoring period the AP or PCP compares the MAC addresses of all such received DMG Beacons with its own MAC address. If its MAC address is the lowest, the AP or PCP shall become an S-AP or S-PCP according to the rules in 10.39.2. If its MAC address is not the lowest, the AP or PCP shall perform a new cluster monitoring period. If the number of cluster monitoring periods performed by the AP or PCP exceeds dot11MaxNumberOfClusteringMonitoringPeriods, the AP or PCP may cease cluster maintenance and initiate cluster formation as described in 10.39.2.

If, during a cluster monitoring period, the AP or PCP does not receive a DMG Beacon frame that contains the value of S-AP or S-PCP in the Cluster Member Role field and does not receive a DMG Beacon frame with the ECAPC Policy Enforced field set to 0 and with Cluster ID equal to the Cluster ID of the cluster of which it is currently a member, then at the end of the cluster monitoring period the AP or PCP may become an S-AP or S-PCP according to the rules of 10.39.2, or it may cease its activity on this channel and may attempt operation on a different channel.

NOTE 2—An assumption to allow the establishment of an S-AP or S-PCP in this case is that the APs and PCPs cannot hear each other's DMG Beacons. How a STA decides to switch the channel or to establish an S-AP or S-PCP is implementation dependent.

If, during a cluster monitoring period, the member AP or member PCP of a decentralized AP or PCP cluster receives no DMG Beacons from clustering enabled STAs, then the AP or PCP shall establish itself as an S-AP or S-PCP according to the rules in 10.39.2.

If an S-AP or S-PCP of a decentralized AP or PCP cluster detects the presence of a S-AP or S-PCP of another decentralized AP or PCP cluster on the same channel, it should schedule a Beacon SP for the DMG Beacon frame transmission of the other S-AP or S-PCP if the MAC address of the other S-AP or S-PCP is lower than the MAC address of this S-AP or S-PCP. The S-AP or S-PCP with higher MAC address should become a member AP or member PCP of the cluster corresponding to the S-AP or S-PCP with the lower MAC address according to the rules in 10.39.2.

10.39.3.3 Centralized AP or PCP cluster maintenance

A STA, while operating as an S-AP, remains stationary with respect to its local environment.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

An S-AP within a centralized AP or PCP cluster, upon a change of the Beacon SP Duration field or the ECAPC Policy element configured by the CCSR, shall update the Clustering Control field sent in subsequent frames and shall send individually addressed Announce or Information Response frames to other STAs within the BSS in order notify them of the changes.

When a member AP or member PCP is coordinated by an MM-SME and the member AP or member PCP elects to change its S-AP within a centralized AP or PCP cluster, then a second non-AP and non-PCP STA coordinated by the MM-SME of the member AP or member PCP should disassociate from the previous S-AP, and the member AP or member PCP shall perform the steps described in 10.39.2.2 that allow a clustering enabled AP or PCP to join the centralized AP or PCP cluster of an S-AP as a member AP or member PCP.

When a member AP or member PCP is coordinated by an MM-SME and the member AP or member PCP elects to change its Cluster Time Offset within a centralized AP or PCP cluster, then the member AP or member PCP shall pass the updated Cluster Time Offset to a second non-AP and non-PCP STA coordinated by the MM-SME of the member AP or member PCP, and the second non-AP and non-PCP STA shall send an Information Response frame that includes a Cluster Time Offset element containing the Cluster Time Offset Index set to the updated index to the S-AP of the centralized AP or PCP cluster.

A member AP or member PCP within a centralized AP or PCP cluster, upon a change of the Clustering Control field received from its S-AP, shall update the Clustering Control field sent in subsequent frames. Upon a change of the ECAPC Policy Detail field received from its S-AP, a member AP or member PCP within a centralized AP or PCP cluster shall update the ECAPC Policy element sent in subsequent frames and send individually addressed Announce or Information Response frames to other STAs within the BSS in order to notify them of the changes. The member AP or member PCP within the centralized AP or PCP cluster shall attempt to receive a DMG Beacon frame from its S-AP at least once every dot11DMGEcssPolicyDetailUpdateDurationMax TUs.

In the case when a member AP or member PCP of a cluster has not received DMG Beacon frames from its S-AP for a duration exceeding 4×aMinBTIPeriod beacon intervals, and the member AP or member PCP intends to continue to operate a BSS on the channel, the AP or PCP shall either

a) Stop the current BSS then become an S-AP within the CCSS as described in 10.39.2.2; or
b) Monitor the channel for DMG Beacon frames for an interval of length at least aMinChannelTime. During this period
    1) If one or more DMG Beacon frames are received with the ECAPC Policy Enforced field set to 1 in the DMG Parameters field and the Cluster Member Role set to 1 (S-AP or S-PCP of cluster) from one or more S-APs and the AP or PCP is not an ECAPC policy blind AP or PCP, then the AP or PCP shall join a selected S-AP as a cluster member as described in 10.39.2.2;
    2) Otherwise, if the AP or PCP is an ECAPC policy blind PCP or AP, then it may join a selected S-AP as a cluster member;
    3) Otherwise, if, after the period elapses, no DMG Beacon frames are received with the ECAPC Policy Enforced field in the DMG Parameters field set to 1 and the Cluster Member Role set to 1 (S-AP or S-PCP of cluster) and if the AP or PCP is decentralized AP or PCP clustering capable, then the AP or PCP shall attempt to join a decentralized AP or PCP cluster if present as described in 10.39.2.1. If the AP or PCP is not decentralized AP or PCP clustering capable or a decentralized AP or PCP cluster is not present, then the AP or PCP shall set its Cluster Member Role to 0 (not currently participating in a cluster).
c) In all three cases, the AP or PCP
    1) Shall set the ECAPC Policy Enforced bit to 0 and shall not include the ECAPC Policy element in (Re)Association Response, Announce, or Information Response frames and
    2) Should send individually addressed Announce or Information Response frames to other STAs within the BSS to notify them of the changes.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

10.39.3.4 Centralized AP or PCP cluster MAC requirements

If the most recent ECAPC Policy element transmitted by a member AP, S-AP, or member PCP includes the BHI Enforced field set to 1, the member AP, S-AP, or member PCP shall complete the BTI, A-BFT, and ATI for each subsequent beacon interval before TBTT + (8×Beacon SP duration). The most recently transmitted (if an S-AP) or received (if a member AP, member PCP, or non-AP and non-PCP STA) value of Beacon SP Duration is used.

If the most recent ECAPC Policy element transmitted by a member AP, S-AP, or member PCP has the TXSS CBAP Enforced field set to 1, the member AP, S-AP, or member PCP shall complete each of its TXSSs in the DTI within one or more TXSS CBAPs.

If the most recent ECAPC Policy element, received by a non-AP and non-PCP STA in a BSS from the member AP, S-AP, or member PCP of the BSS, has the TXSS CBAP Enforced field set to 1, then the non-AP and non-PCP STA shall perform each of its TXSSs in the DTI within one or more TXSS CBAPs. If the non-AP and non-PCP STA is the source DMG STA of an SP and if the non-AP and non-PCP determines that it needs to perform a TXSS before continuing to transmit to the destination DMG STA of the SP, then the non-AP and non-PCP STA should truncate the SP (see 10.38.8). If the non-AP and non-PCP STA is the source CMMG STA of an SP and if the non-AP and non-PCP STA determines that it needs to perform a TXSS before continuing to transmit to the destination CMMG STA of the SP, then the non-AP and non-PCP STA should truncate the SP.

A TXSS CBAP shall last from T_{Start} to T_{End}, as defined below, excluding any time that overlaps a BHI or an SP that has source and destination DMG AIDs set to 255 (such as for a Beacon SP). A TXSS CBAP shall last from TStart to TEnd, as defined below, excluding any time that overlaps a BHI or an SP that has source and destination CMMG AIDs set to 255 (such as for a Beacon SP).

$$T_{Start} = T_{TBTT} + 8 \times T_o + \frac{(n-1) \times 1024 \times T_{BI}}{N}, 1 \le n \le N$$

$$T_{End} = T_{TBTT} + 8 \times T_o + \frac{(n-1) \times 1024 \times T_{BI}}{N} + 8 \times T_d, 1 \le n \le N$$

where

T_{TBTT} is the TBTT
T_o is the TXSS CBAP Offset, in microseconds
T_d is the TXSS CBAP Duration, in microseconds
T_{BI} is the beacon interval, in TU
N is TXSS CBAP MaxMem

The most recently transmitted (if an S-AP) or received (if a member AP, member PCP, or non-AP and non-PCP STA) value of TXSS CBAP Offset and TXSS CBAP Duration fields are used.

The TXSS CBAP is available to all STAs in an ECAPC. A STA may also use the TXSS CBAP for sending frames not related to transmit sector sweeping. Transmission rules during a TXSS CBAP are defined in 10.38.5.

NOTE—Frames, such as Data frames, sent in a TXSS CBAP when the TXSS CBAP Enforced field is set to 1 might experience erratically higher interference than frames sent at other times due to the TXSSs of other nearby STAs.

Additional centralized AP or PCP cluster requirements are defined in 10.38.6.6 and 11.1.3.3.

10.39.4 Cluster report and rescheduling

A clustering enabled AP or PCP that receives an Extended Schedule element from another clustering enabled AP or PCP may reschedule SPs and CBAPs in its beacon interval, or move the BTI (11.1.3.3), in an attempt to mitigate any interference with the transmissions indicated in the received Extended Schedule element. The AP or PCP can create SPs in its beacon interval with the source and destination AID set to 255 to prevent transmissions during specific periods in the beacon interval (10.38.6.2).

A non-AP and non-PCP STA that is a member of a BSS and that receives a DMG Beacon frame should send a Cluster Report element to its AP or PCP if the received DMG Beacon frame meets all of the following conditions:

- The DMG Beacon frame is not from the STA's AP or PCP.
- The DMG Beacon frame contains the Clustering Control field.
- Either
  - The value of the Cluster ID field within the Clustering Control field is different from the MAC address of the STA's AP or PCP; or
  - The value of the Cluster ID field within the Clustering Control field is the same as the MAC address of the STA's AP or PCP, the TBTTs of the two BSSs are less than dot11BeaconPeriod/(2×ClusterMemMax) apart in time, and the ECAPC Policy Enforced field in the DMG Beacon frame received most recently from the STA's AP or PCP is equal to 1.

The non-AP and non-PCP STA shall not send a Cluster Report element to its AP or PCP if the received DMG Beacon frame does not meet the preceding conditions.

A Cluster Report element meeting the conditions above shall be transmitted in an Announce or Information Response frame sent to the STA's AP or PCP. Within the transmitted Cluster Report element, the STA shall set the Cluster report subfield to 1. The STA shall set the Clustering Control field within a transmitted Cluster Report element to the corresponding field values within the Clustering Control of the received DMG Beacon frame, shall set the Reported BSSID field to the BSSID field of the received DMG Beacon frame, and shall set the Reference Timestamp field to indicate the DMG Beacon frame reception time. The STA shall set the Schedule present subfield to 1 if the Extended Schedule field is present in the transmitted Cluster Report element; otherwise, it shall set Schedule present subfield to 0. The STA shall set the TSCONST present subfield to 1 if the Traffic Scheduling Constraint Set field is present in the transmitted Cluster Report element; otherwise, it shall set TSCONST present subfield to 0.

The STA shall set the ECAPC Policy Enforced field in the Cluster Report Control field to the value of the ECAPC Policy Enforced field in the received DMG Beacon frame. The STA should attempt to receive an Announce frame from the AP or PCP that transmitted the DMG Beacon frame according to the channel access rules described in 10.38 in order to solicit an ECAPC Policy element. If the STA obtains an ECAPC Policy element from the AP or PCP that transmitted the DMG Beacon frame, the STA shall set the ECAPC Policy Present subfield to 1 and include the ECAPC Policy element in the transmitted Cluster Report element; otherwise, the STA shall set ECAPC Policy Present subfield to 0 and not include the ECAPC Policy element in the transmitted Cluster Report element. If present, the Extended Schedule Element field within the Cluster Report element shall be set to the corresponding field values within the Extended Schedule element of the received DMG Beacon frame. If present, the Traffic Scheduling Constraint Set field shall be set to indicate periods of time with respect to the TBTT of the beacon interval of the BSS the STA participates where the transmitting STA experiences poor channel conditions, such as due to interference.

If the received DMG Beacon frame contains more than one Extended Schedule element entry, the STA shall repeat the aforementioned procedure and transmit a Cluster Report element corresponding to each Extended Schedule element entry.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Upon receiving a Cluster Report element from a non-AP and non-PCP STA with the Cluster report field set to 1, a clustering enabled AP or PCP may reschedule SPs and CBAPs in its beacon interval, move the BTI if the clustering enabled AP or PCP is an S-AP or S-PCP in a decentralized AP or PCP cluster, or change the Cluster Time Offset if the clustering enabled AP or PCP is a member AP or member PCP, or perform other actions, in an attempt to mitigate any interference with the transmissions indicated in the received Cluster Report element. The clustering enabled AP or PCP may also create SPs in its beacon interval with the source and destination AID set to 255 to prevent transmissions during specific periods in the beacon interval.

A member AP or member PCP within a centralized AP or PCP cluster should report new interference information and may report all interference information to the S-AP of the cluster

- When the member AP or member PCP receives one or more of the following:
  - A DMG Beacon frame from another AP or PCP in another centralized AP or PCP cluster within the same CCSS or another CCSS
  - A Cluster Report element with the Cluster Report field set to 1 from a non-AP and non-PCP STA within the same BSS characterizing an AP or PCP in another centralized AP or PCP cluster within the same CCSS or another CCSS; and
- If at least dot11DMGEcssClusterReportDurationMin TUs have elapsed since the last report.

The report should aggregate the information received from all sources and minimize duplication. The member AP or member PCP passes the report to a second non-AP and non-PCP STA coordinated by the MM-SME of the member AP or member PCP, and the second non-AP and non-PCP STA sends the report in an Information Response frame that includes one or more Cluster Report elements to the S-AP of its centralized AP or PCP cluster. If the member AP or member PCP does not elect to change its Cluster Time Offset at this time, the second non-AP and non-PCP STA includes a Cluster Time Offset element with an unchanged Cluster Time Offset Index field.

Via unspecified means, the S-AP might aggregate received DMG Beacon frames and Cluster Report elements and send the aggregate to the CCSR. Upon receiving this information, the CCSR might reconfigure the TSF offsets of an S-AP, reconfigure the ECAPC Policy Detail of an S-AP, update the Cluster Time Offset availability information provided in an individually addressed frame by an S-AP to a member AP or member PCP, or perform other actions.

10.39.5 Decentralized AP or PCP cluster request

A non-AP and non-PCP STA that is a member of a BSS may transmit a Cluster Report element to its AP or PCP to request that decentralized AP or PCP clustering be enabled in the BSS. The non-AP and non-PCP STA can make this request if, for example, the device containing the non-AP and non-PCP STA intends to initialize another co-channel BSS (11.1) in which it performs the role of AP or PCP and, when performing this role, it wishes to become a member AP or member PCP of the decentralized AP or PCP cluster formed by its current AP or PCP.

To request AP or PCP clustering to be enabled in the BSS, the STA shall transmit a Cluster Report element with the Cluster request subfield set to 1 to its AP or PCP. Upon receiving a Cluster Report element with the Cluster request subfield set to 1, the AP or PCP should form and maintain decentralized AP or PCP clustering in the BSS according to the procedures described in 10.39.2 and 10.39.3. In doing that, the AP or PCP should set the minimum duration of the Beacon SP to be equal to the Beacon SP duration.

If the non-AP and non-PCP STA does not receive a DMG Beacon frame from its AP or PCP with decentralized AP or PCP clustering enabled after dot11ClusterEnableTime following the transmission to its AP or PCP of a Cluster Report element with the Cluster request subfield set to 1, the non-AP and non-PCP STA may transmit an Announce frame including the last Extended Schedule element transmitted by the AP or PCP. If the Announce frame is transmitted, it shall use MCS 0, and the TA field shall be set to the broadcast address. If a DMG STA receives an Announce frame with the TA field set to the broadcast

address and with the BSSID field different from the BSSID of its BSS, the STA may send a Cluster Report element containing the Extended Schedule element within the received Announce frame to its AP or PCP, which might be used by the AP or PCP to reschedule SPs in portions of the beacon interval that are nonoverlapping in time with the SPs contained in the Extended Schedule element reported by the STA. if a CMMG STA receives an Announce frame with the TA field set to the broadcast address and with the BSSID field different from the BSSID of its BSS, the STA may send a Cluster Report element containing the Extended Schedule element within the received Announce frame to its AP or PCP, which might be used by the AP or PCP to reschedule SPs in portions of the beacon interval that are nonoverlapping in time with the SPs contained in the Extended Schedule element reported by the STA.

If a non-AP and non-PCP STA becomes a member AP or member PCP of the clustering enabled by its current AP or PCP, the non-AP and non-PCP STA can synchronize scheduled CBAP allocations, if any, between the BSS in which it performs the role of AP or PCP and the BSS of its current AP or PCP. The non-AP and non-PCP STA can disallow STAs in the BSS in which it plays the role of AP or PCP from transmitting during the Beacon SPs of the cluster it is a part of, and this can be done by allocating an SP time-overlapping with each Beacon SP such that each allocated SP has both the source AID and destination AID fields within the Extended Schedule element set to the AID of the non-AP and non-PCP STA.

10.40 CDMG AP or PCP clustering

10.40.1 General

A CDMG AP or PCP may use the CDMG AP or PCP clustering mechanism to improve spatial sharing and interference mitigation with other co-channel DMG or CDMG BSSs.

A clustering enabled AP or PCP that is operating on a 2.16 GHz or 1.08 GHz channel and transmitting DMG Beacon frames with the DBC Option subfield of the Dynamic Bandwidth Control element set to 1 (10.63.2.2) is able to start a decentralized AP or PCP cluster or a centralized AP or PCP cluster on a 2.16 GHz channel following the rules as described in 10.39.

A clustering enabled AP or PCP that is operating on a 1.08 GHz channel and transmitting DMG Beacon frames with the DBC Option subfield of the Dynamic Bandwidth Control element set to 0 (10.63.2.2) is able to start an AP or PCP cluster on a 1.08 GHz channel. Starting an AP or PCP cluster on a 1.08 GHz channel shall follow the rules defined in 10.39 and in this subclause.

If an AP or PCP cluster starts on a 1.08 GHz channel, the S-AP or S-PCP shall not only transmit its DMG Beacon frame during the first Beacon SP (10.39.1) on this 1.08 GHz channel but also transmit the DMG Beacon frame during the notification period (NP) of each allocated quiet period (QP) on the corresponding 2.16 GHz common channel as described in 10.63. Moreover, according to the rules in 10.63, the S-AP or S-PCP shall set its beacon interval on the 2.16 GHz common channel as an integer multiple of the beacon interval on the 1.08 GHz channel in terms of TUs, and the maximum length of beacon interval on the 1.08 GHz channel can be given as the same length of the beacon interval on the 2.16 GHz channel.

The member AP or member PCP of a cluster starting on a 1.08 GHz channel shall not allocate QP on the 2.16 GHz common channel to transmit its DMG Beacon frame if there is no legacy non-AP and non-PCP DMG STA within its BSS or it does not involve in a synchronization pair with another AP or PCP operating in the adjacent 1.08 GHz channel. Otherwise, the member AP or member PCP shall transmit its DMG Beacon frame during its NP of the allocated QP on the 2.16 GHz common channel, similar to the S-AP or S-PCP.

10.40.2 Cluster formation

10.40.2.1 Decentralized CDMG AP or PCP cluster formation

A decentralized clustering enabled AP or PCP starts a decentralized AP or PCP cluster on a 1.08 GHz channel by becoming an S-AP or S-PCP, subject to the absence of existing clusters on this 1.08 GHz channel as described below and in 10.39.2.1.

The S-AP or S-PCP of an AP or PCP cluster starting on a 1.08 GHz channel shall set the DMG Parameters field and the Clustering Control field following the rules defined in 10.39.2.1 and also set the first bit of the Clustering Status subfield contained in the Dynamic Bandwidth Control element to 1.

A decentralized clustering enabled AP or PCP that receives a DMG Beacon frame from an S-AP or S-PCP on either a 2.16 GHz channel or a 1.08 GHz channel shall know the exact channel on which this S-AP or S-PCP selects to start a cluster through the Channel Splitting subfield, Clustering Status subfield, and the Channel Number field contained in the Dynamic Bandwidth Control element.

If an existing AP or PCP cluster is operating on a 2.16 GHz channel, the decentralized clustering enabled AP or PCP shall monitor the corresponding 2.16 GHz channel and then follow the procedures defined in 10.39.2.1 to become a member AP or member PCP of this cluster.

If the decentralized clustering enabled AP or PCP receives a DMG Beacon frame containing the Clustering Control field from an S-AP or S-PCP on a 1.08 GHz channel, the AP or PCP shall monitor the corresponding 1.08 GHz channel during each Beacon SP according to the received cluster synchronization and control information to listen whether the Beacon SPs are occupied by other member APs or member PCPs. If an empty Beacon SP is discovered, the AP or PCP shall follow the same procedures defined in 10.39.2.1 to become a member AP or member PCP of this cluster.

A decentralized clustering enabled AP or PCP shall not become a member of a cluster starting on a 1.08 GHz channel if no Beacon SP is determined to be empty during aMinChannelTime, in which case, subject to the requirements described in 10.39.2.1, the AP or PCP may become the S-AP or S-PCP of a new cluster, or may cease its activity on this 1.08 GHz channel, or may request to operate on the unoccupied adjacent 1.08 GHz channel within the 2.16 GHz common channel (10.63.2.3), and, if desired, attempt operation on a different 2.16 GHz or 1.08 GHz channel.

The AP or PCP of a decentralized AP or PCP cluster shall not transmit or schedule transmissions during a Beacon SP that is not its own Beacon SP and a QP duration that is not its own QP.

Figure 10-75 (Example of a decentralized AP or PCP cluster on a 1.08 GHz channel) illustrates an example of a decentralized AP or PCP cluster starting on the 1.08 GHz channel 35 while the adjacent 1.08 GHz channel 36 is unoccupied. The S-AP or S-PCP and member AP 3 or member PCP 3 with a BSS in which there is at least one DMG STA transmit DMG Beacon frames during the NPs of the allocated QPs on the 2.16 GHz channel 2 and their own Beacon SPs on channel 35, respectively. Other member APs or member PCPs transmit DMG Beacon frames only during their own Beacon SPs on channel 35.

Figure 10-76 (Example of decentralized clusters for two APs or PCPs of a synchronization pair) illustrates an example of two decentralized AP or PCP clusters starting on the two adjacent 1.08 GHz channel 35 and channel 36, respectively. Two S-APs or S-PCPs form a synchronization pair under the first mode of DBC mechanism(10.43) and transmit DMG Beacon frames during their own NPs of the allocated QPs on the 2.16 GHz channel 2 and the Beacon SPs on the 1.08 GHz channel 35 and channel 36. Other member APs or member PCPs APs transmit DMG Beacon frames only during their own Beacon SPs on the corresponding 1.08 GHz channels.

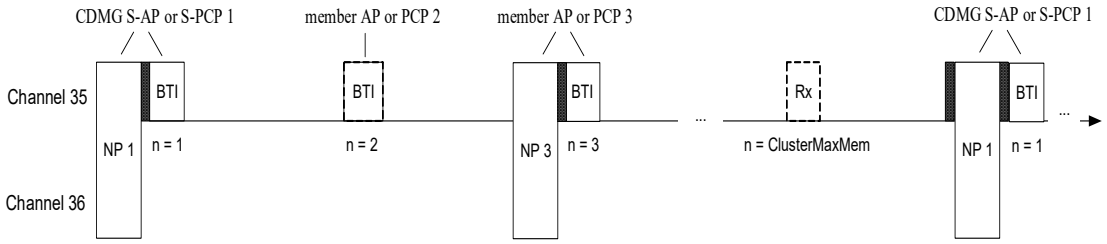

Figure 10-75—Example of a decentralized AP or PCP cluster on a 1.08 GHz channel

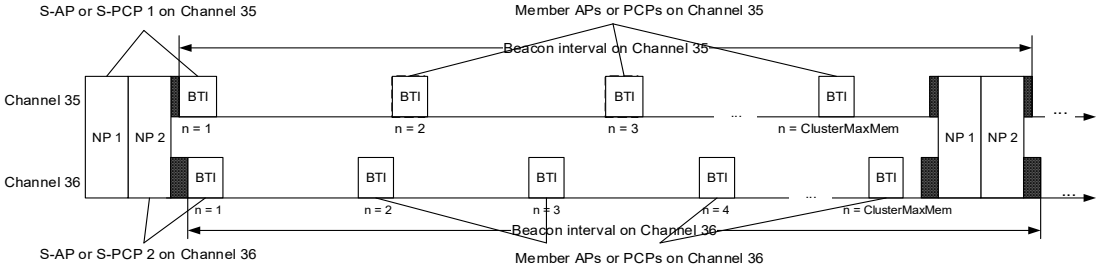

Figure 10-76—Example of decentralized clusters for two APs or PCPs of a synchronization pair

The member AP or member PCP operating on a 1.08 GHz channel shall select a beacon interval length on the 1.08 GHz channel that is equal to the beacon interval length of its S-AP or S-PCP on the same channel.

The AP or PCP operating on the 1.08 GHz channel should determine its beacon interval on the 2.16 GHz channel to be equal to the beacon interval of the S-AP or S-PCP on the 2.16 GHz channel according to the cluster synchronization and control information of the S-AP or S-PCP. The AP or PCP operating on the 1.08 GHz channel should continue transmitting the DMG Beacon frames on the 2.16 GHz channel during the beacon SP according to the beacon interval on the 2.16 GHz channel. The AP or PCP operating on the 1.08 GHz channel shall switch back to the 1.08 GHz channel to transmit DMG Beacon frames during the BTI on the 1.08 GHz channel according to the beacon interval on the 2.16 GHz channel.

If a member AP or member PCP does not involve in a synchronization pair with another AP or PCP (10.63.2.3), it shall set the beacon interval length on the 2.16 GHz channel as an integer multiple of its beacon interval length on the 1.08 GHz channel. Otherwise, if the member AP or member PCP is involved in a synchronization pair with another AP or PCP operating in the adjacent 1.08 GHz channel, it shall adjust its beacon interval length on the 2.16 GHz channel as an integer multiple of its beacon interval length on the 1.08 GHz channels and also notify the neighboring AP or PCP that is involved in the synchronization pair to adjust the beacon interval on the 2.16 GHz channel to the same value through a DMG BSS Parameter Change element within the DMG Beacon frame transmitted in its NP of the allocated QP on the 2.16 GHz common channel following the rules in 11.31.4 In this case, subject to the requirement described in 10.63, the neighboring AP or PCP may further adjust its beacon interval on the 1.08 GHz channel as an integer factor of the new beacon interval length on the 2.16 GHz channel in units of TUs. The procedures of the adjusting beacon interval and CDMG SBBI for AP or PCP 1 and AP or PCP 2 that is involved in a synchronization pair should be as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

a) If the AP or PCP 1 detected an empty Beacon SP on the 1.08 GHz channel, AP or PCP 1 shall change the current beacon interval length beacon interval 1 to beacon interval 2 on the 2.16 GHz channel to align the beginning of the first BTI on the 1.08 GHz channel after beacon interval 2 duration with the beginning of the empty Beacon SP.

b) Determine whether the ratio of beacon interval 2 divided by CDMG SBBI of the S-AP or S-PCP is an integer. If the ratio of beacon interval 2 divided by CDMG SBBI of the S-AP or S-PCP is an integer, the AP or PCP 1 shall adjust CDMG SBBI 1 to equal the CDMG SBBI of the S-AP or S-PCP. Otherwise, the AP or PCP 1 shall change its beacon interval length beacon interval 2 to beacon interval 3 on 2.16 GHz channel during its next NP 1 and set its CDMG SBBI 1 to the CDMG SBBI of S-AP or S-PCP during the BTI to make the ratio of beacon interval 3 divided by CDMG SBBI of the S-AP or S-PCP an integer. For both cases, the AP or PCP 1 shall notify the AP or PCP 2 of the new beacon interval 2 or beacon interval 3 during the first QP at the end of beacon interval 2 or beacon interval 3, where the QP comprises the NP and a guard interval (GI) used for channel switching, and the AP or PCP 2 should also adjust its SBBI 2 to make the ratio of beacon interval 2 or beacon interval 3 divided by CDMG SBBI 2 an integer.

c) The AP or PCP 1 transmits the DMG Beacon frame including the Clustering Control field during the empty Beacon SP on the 1.08 GHz channel to join the intended 1.08 GHz cluster as a member AP or member PCP.

An example of adjusting beacon interval and CDMG SBBI for step a) and b) is illustrated in Figure 10-77 (Example of joining the CDMG AP or PCP cluster for a CDMG AP or PCP involved in a synchronization pair with another AP or PCP). For step a) and step b), changing beacon interval on the 2.16 GHz channel or changing SBBI on the 1.08 GHz channel is completed by AP or PCP 1 by negotiation with AP or PCP 2 in a notification period (NP) that comprises NP1 and NP2. AP or PCP 1 transmits the DMG Beacon frame to AP or PCP 2 in NP1, and AP or PCP 2 transmits the DMG Beacon frame to AP or PCP 1 in NP2.

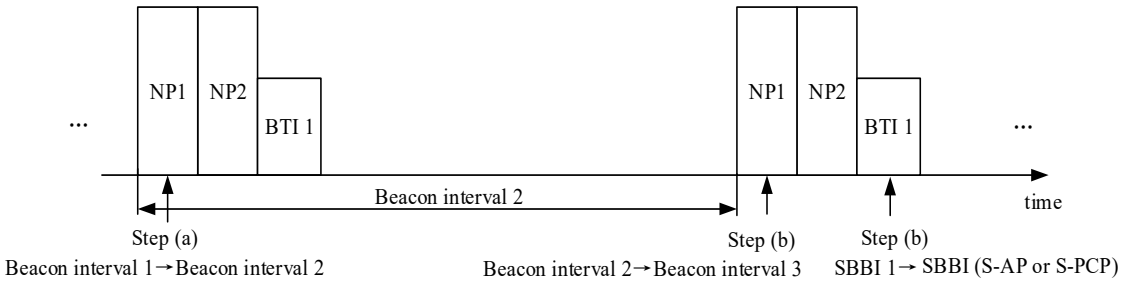

Figure 10-77—Example of joining the CDMG AP or PCP cluster for a CDMG AP or PCP involved in a synchronization pair with another AP or PCP

A synchronized AP or PCP is a CDMG AP or PCP that is operating on a 1.08 GHz channel but still transmitting its DMG Beacon frames on the relevant 2.16 GHz channel with the AP or PCP Role subfield of the Dynamic Bandwidth Control element (9.4.2.219) set to 1 and synchronizing with the synchronizing AP or PCP on the relevant 2.16 GHz channel.

A synchronizing AP or PCP is a CDMG AP or PCP that is operating on a 1.08 GHz channel but still transmitting its DMG Beacon frames on the relevant 2.16 GHz channel with the AP or PCP Role subfield of the Dynamic Bandwidth Control element (9.4.2.219) set to 0 and providing synchronization service to a synchronized AP or PCP on the relevant 2.16 GHz channel.

If an AP or PCP involved in a synchronization pair is a synchronized AP or PCP and intends to join to a co-channel AP or PCP cluster, it shall set the AP or PCP Role subfield within the Dynamic Bandwidth Control element to 0 to exchange the role with the synchronizing AP or PCP before joining the co-channel cluster.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When the AP or PCP Role subfield is changed, the synchronized AP or PCP shall include the Cluster Switch Announcement element in the DMG Beacon frame to indicate the time that the AP or PCP role exchange occurs.

If an AP or PCP that is involved in a synchronization pair intends to join a discovered cluster or intends to start a cluster on the 2.16 GHz common channel, it should send a Cluster Switch Announcement element included in the DMG Beacon frame during its NP to notify the peer AP or PCP involved in the synchronization pair to monitor the common 2.16 GHz channel and join the cluster on 2.16 GHz channel if an empty Beacon SP can be found. After the Cluster Switch Announcement element is transmitted, the AP or PCP should cease transmission during its NP.

When a decentralized clustering enabled AP or PCP operating on 1.08 GHz channel receives a DMG Beacon frame that contains the Clustering Control field in the Cluster Switch Announcement element from its neighboring AP or PCP of a synchronization pair to indicate the presence of a cluster on the 2.16 GHz common channel, it may monitor this 2.16 GHz channel to become a member AP or member PCP following the procedures described in 10.39.2.1.

When a decentralized clustering enabled AP or PCP operating on a 1.08 GHz channel still experiences poor channel conditions after performing all the actions in an attempt to mitigate any interference, it may broadcast one or more Cluster Probe elements using the DMG Beacon frame or Probe Request frame to detect the presence of a cluster actively on the 2.16 GHz common channel during its NPs, SPs, or CBAPs. In addition to transmitting Cluster Probe elements included in DMG Beacon frames on the 2.16 GHz common channel during NPs, the AP or PCP operating on a 1.08 GHz channel may reserve multiple SPs during DTI and switch to the 2.16 GHz channel during each of the SPs to transmit Cluster Probe elements included in Probe Request frames on the 2.16 GHz common channel.

For an AP or PCP that is operating on a 1.08 GHz channel and is involved in a synchronization pair, the AP or PCP may transmit Cluster Probe elements on the common 2.16 GHz channel, using Probe Request frames during its reserved SPs or using DMG Beacon frames during its NPs. The SPs for receiving a Probe Response frame from S-PCP or S-AP can be scheduled in the NP of the next beacon interval on the 2.16 GHz channel or in a DTI. The peer AP or PCP that is involved in the synchronization pair shall also reserve the same SPs with destination AIDs set to 255 to listen for a Probe Response frame and to avoid interferences to the SPs used for cluster probe.

The S-AP or S-PCP that is operating on the 2.16 GHz common channel and receives a Cluster Probe element shall respond with one or more Probe Response frames including an Extended Cluster Report element in each SP scheduled according to the Cluster Probe element to indicate its presence by including the cluster synchronization and control information of the S-AP or S-PCP in the Extended Cluster Report element. The Cluster Probe element contains timing information for the CDMG S-AP or S-PCP operating on the 2.16 GHz channel to transmit the Probe Response frame for the Cluster Probe element. This element defines a sequence of SPs that are scheduled in a DTI or the next NP by both the cluster probe requesting AP or PCP and responder AP or PCP for receiving and transmitting the response frames. The multiple SPs are reserved corresponding to the SPs during which the Cluster Probe elements are transmitted.

After receiving a Probe Response frame from an S-AP or S-PCP operating on the 2.16 GHz common channel, during at least one of the reserved SPs in a DTI, the decentralized clustering enabled AP or PCP operating on 1.08 GHz channel may switch to the 2.16 GHz common channel, by using the cluster synchronization and control information in the Extended Cluster Report element in the Probe Response frame of the S-AP or S-PCP operating on the 2.16 GHz channel, and attempt to discover an empty Beacon SP. If an empty Beacon SP exists, then the AP or PCP may transmit DMG Beacon frames during the empty Beacon SP to become a member AP or member PCP of this cluster following the procedures described in 10.39.2.1.

If two APs or PCPs involved in a synchronization pair both receive an Extended Cluster Report element and discover an empty Beacon SP during their reserved SPs at the same time, the AP or PCP that first transmits a

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Cluster Switch Announcement element during NP should join the empty Beacon SP with priority, and the peer AP or PCP should monitor the 2.16 GHz channel for another aMinChannelTime to find another empty Beacon SP.

If the decentralized clustering enabled AP or PCP on the 1.08 GHz channel does not receive any Probe Response frame from an S-AP or S-PCP during the reserved SPs on the 2.16 GHz channel in the whole DTI, it may reschedule multiple SPs whose positions are adjusted stochastically in the following DTI.

10.40.2.2 Centralized CDMG AP or PCP cluster formation

In order to become an S-AP, a centralized clustering enabled CDMG STA that is operating on a 2.16 GHz channel or a 1.08 GHz channel and is stationary with respect to its local environment shall successfully perform both the configuration step and verification step in order and take the actions following the rules as described in 10.39.2.2.

If at least one DMG Beacon frame that has the ECAPC Policy Enforced field set to 1 and is sent by an S-AP or member AP or member PCP from another ECAPC is received during the monitoring period, the centralized clustering enabled CDMG STA shall follow the rules as described in 10.39.2.2.

The remaining available channels for a centralized CDMG AP or PCP cluster are channels 3, 37, and 38. Channels 2, 35, and 36 are the channels upon which the S-AP is excluded from operating. The channels 3, 37, and 38 that interfere with each other form a channel set. The channel set available for a centralized CDMG AP or PCP cluster is channel {3, 37, 38}.

The functions of a CDMG CCSR shall cover the channel set. The CDMG CCSR shall provide coordination services for all the S-APs operating on the channels of the channel set {3, 37, 38} within the CCSS to mitigate interference. The CDMG CCSR should provide an S-AP with the cluster information of other S-APs. Thus, each S-AP operating on a channel within the channel set can obtain the same cluster information from the CDMG CCSR.

After receiving a DMG Beacon frame including cluster information transmitted by an S-AP, in order to become a member AP or member PCP, a centralized clustering enabled AP or PCP shall successfully perform the following steps in order:

a) The AP or PCP shall monitor the channel for DMG Beacon frames during each Beacon SP over an interval of length at least aMinChannelTime to find an empty Beacon SP and measure the status of each Beacon SP and the signal quality (RCPI and RSNI) of the received DMG Beacon frames based on the received cluster information of the S-AP. The AP or PCP can determine the timing start point of each Beacon SP over a beacon interval of the S-AP based on the Next BTI Offset field, the Reported BI Duration field, and the Reported Clustering Control field. Thus, the AP or PCP can measure each Beacon SP over a beacon interval of the S-AP based on the timing start point of each Beacon SP over a beacon interval and obtain the status of each Beacon SP and signal quality over a beacon interval.

b) If an empty Beacon SP is discovered, the second non-AP and non-PCP STA shall attempt to associate with the S-AP and thereby receive an Announce frame from the S-AP. The contents of the Announce frame are passed to the AP or PCP. All the centralized cluster information of the S-AP(s) operating on the channels in the same channel set except the current S-AP shall be included in the Announce frame. The cluster information of the other S-AP(s) can be conveyed in the Extended Cluster Report elements.

c) The CDMG AP or PCP should determine whether to join the current S-AP's cluster or other S-AP(s)'s cluster based on the signal quality, the states of Beacon SPs during a beacon interval indicated by the Available Cluster Offset Bitmap field in the ECAPC Policy element of the S-AP or the member APs or member PCPs of the current S-AP's cluster, and other S-AP(s)'s cluster information. If the AP or PCP elects to join the current cluster, it proceeds to step d); otherwise, the

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

AP or PCP monitors the channels for DMG Beacon frames during each Beacon SP of all the centralized clusters over an interval of length at least aMinChannelTime using the cluster information from the current S-AP. The CDMG AP or PCP may identify a new intended cluster based on the signal quality of the DMG Beacon frames or the Available Cluster Offset Bitmap field in the ECAPC Policy element of the other clusters, if the intersection of 1) the Cluster Time Offset indices of the empty Beacon SPs with 2) the indices indicated by the Available Cluster Offset Bitmap field shows more common nonempty Beacon SPs. The second non-AP and non-PCP STA shall disassociate from the current S-AP and associate with the S-AP of the intended cluster, receive the Announce frame from the S-AP, and pass the contents of the Announce frame to the AP or PCP.

d) Upon receiving an Announce frame that includes the ECAPC Policy element, the AP or PCP shall select a cluster time offset index from the intersection of the cluster time offset indices of the empty Beacon SPs with the indices indicated by the Available Cluster Offset Bitmap field in the ECAPC Policy element. If the intersection is empty, the AP or PCP shall select a cluster time offset index of an empty Beacon SP. The selected cluster time offset index is passed to the second non-AP and non-PCP STA.

e) The second non-AP and non-PCP STA shall respond to the Announce frame with an Information Response frame that includes the Cluster Time Offset element containing the Cluster Time Offset Index field set to the selected index.

f) The AP or PCP shall join the cluster of S-AP at the selected cluster time offset on the channel of the S-AP and transmit DMG Beacon frames with the AP or PCP Clustering Control field.

After joining the centralized AP or PCP cluster, the CDMG member AP or member PCP shall transmit its DMG Beacon frames and include the ECAPC Policy element in (Re)Association Response, Announce, and Information Response frames following the rules as described in 10.39.2.2.

10.40.3 Cluster maintenance

10.40.3.1 General cluster maintenance

Regardless of whether a cluster starts on a 2.16 GHz channel or a 1.08 GHz channel, the member AP or member PCP is able to maintain synchronization with the S-AP or S-PCP and other member APs or member PCPs through receiving DMG Beacon frames from the S-AP or S-PCP on this channel.

If an AP or PCP cluster starts on a 1.08 GHz channel and the AP or PCP of this cluster involves in a synchronization pair with another AP or PCP operating in the adjacent 1.08 GHz channel at the same time, this pair of APs or PCPs shall also maintain synchronization according to the rules described in 10.63 unless one of them ceases its BSS.

10.40.3.2 Decentralized CDMG AP or PCP cluster maintenance

In the case when the S-AP or S-PCP of a decentralized AP or PCP cluster on a 1.08 GHz channel is lost, or appears to a member AP or member PCP to have been lost, the S-AP or S-PCP handover procedures shall follow the rules in 10.39.3.2. In addition, the new S-AP or S-PCP shall also transmit the DMG Beacon frame during its NP of the allocated QP on the 2.16 GHz common channel as described in 10.63.5, even if there is no legacy non-AP and non-PCP DMG STA within its BSS or it does not involve in a synchronization pair with another AP or PCP operating in the adjacent 1.08 GHz channel.

If the S-AP or S-PCP of a decentralized AP or PCP cluster detects the presence of the S-AP or S-PCP of another decentralized AP or PCP cluster through receiving a DMG Beacon frame on either a 2.16 GHz channel or a 1.08 GHz channel or receiving a Probe Response frame including the Extended Cluster Report element on a 2.16 GHz channel with the DBC Present field set to 1 and the Channel Splitting subfield set to 1, it should become a member AP or member PCP of the other cluster on the corresponding channel according to the procedures described in 10.40.2 if the values of its Adjacent Channel Occupancy subfield, Clustering Status

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

subfield, and the Synchronizing AP or PCP MAC Address subfield in the Dynamic Bandwidth Control element are higher than those of the other S-AP or S-PCP.

If the S-AP or S-PCP of a decentralized AP or PCP cluster detects the presence of the S-AP or S-PCP of another decentralized AP or PCP cluster through receiving a DMG Beacon frame on either a 2.16 GHz channel or a 1.08 GHz channel or receiving a Probe Response frame including the Extended Cluster Report element on a 2.16 GHz channel with the DBC Present field set to 1 and the Channel Splitting subfield set to 0, it should become a member AP or member PCP of the other cluster on the corresponding channel according to the procedures described in 10.40.2 if its Channel Splitting subfield is 1 or its Channel Splitting subfield is 0, but the MAC Address is higher than that of the other S-AP or S-PCP.

If the S-AP or S-PCP of a decentralized AP or PCP cluster detects the presence of the DMG S-AP or S-PCP of another decentralized AP or PCP cluster through receiving a DMG Beacon frame on a 2.16 GHz channel with the DBC Present field set to 0, it should become a member AP or member PCP of the other cluster on this 2.16 GHz channel according to the procedures described in 10.39.2 if its MAC address is higher than that of the other DMG S-AP or S-PCP.

If the S-AP or S-PCP operating on a 1.08 GHz channel detects the presence of the S-AP or S-PCP of another decentralized AP or PCP cluster starting on the 2.16 GHz common channel and intends to become a member AP or member PCP of the other cluster, it may transmit a DMG Beacon frame containing the Cluster Switch Announcement element to its member APs or member PCPs before it switches to the 2.16 GHz common channel. After that, the S-AP or S-PCP may continue transmitting DMG Beacon frames on the 1.08 GHz channel within a time period of (aMinBTIPeriod × BI + aMinChannelTime) to maintain the time reference for the cluster, where BI is the Reported BI Duration field in the Cluster Switch Announcement element. Then it shall monitor the 1.08 GHz channel for DMG Beacon frames within the next time interval of (aMinChannelTime + CDMG SBBI), where CDMG SBBI is its beacon interval on the 1.08 GHz channel.

If no DMG Beacon frames are received over the monitoring period, the S-AP or S-PCP shall cease operation on the 1.08 GHz channel. Otherwise, it may use the cluster coordination mechanism described in 10.40.3.3 to mitigate interference between the cluster operating on the 1.08 GHz channel and the cluster operating on the 2.16 GHz common channel.

Upon receiving a DMG Beacon frame including a Cluster Switch Announcement element on a 1.08 GHz channel, a member AP or member PCP should switch to the corresponding 2.16 GHz common channel to become a member AP or member PCP of the cluster operating on this 2.16 GHz channel following the procedure described in 10.39.2.1. If the AP or PCP cannot detect the presence of the S-AP or S-PCP of another decentralized AP or PCP cluster operating on the 2.16 GHz channel or cannot discover an empty Beacon SP, it should switch back to the former 1.08 GHz channel. After that, the decentralized clustering enabled AP or PCP may monitor this 1.08 GHz channel and follow the same procedures defined in 10.39.2.1 to become a member AP or member PCP of the cluster corresponding to the former S-AP or S-PCP or start an S-AP or S-PCP handover process according to 10.39.3.2.

10.40.3.3 Cluster coordination

The cluster coordination mechanism allows a CDMG S-AP or S-PCP of a decentralized cluster operating on the 1.08 GHz channel to be a member AP (or member PCP) or S-AP (or S-PCP) of a decentralized cluster operating on the 2.16 GHz channel simultaneously by transmitting and receiving DMG Beacon frames within both clusters. By this means, cluster synchronization and control information can be exchanged to mitigate interference and improve spatial sharing.

In the case when a decentralized clustering enabled CDMG AP or PCP using cluster coordination mechanism, it shall maintain schedule information for both clusters (i.e., beacon intervals, Beacon SPs or SPs) to switch alternatively between the 1.08 GHz channel and 2.16 GHz channel. For example, it should switch to

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the 2.16 GHz channel prior to a Beacon SP allocated on the 2.16 GHz channel and transmit or receive the DMG Beacon frames.

The decentralized clustering enabled CDMG AP or PCP using cluster coordination mechanism should schedule at least one SP within the cluster operating on the 2.16 GHz channel that has the source and destination DMG AIDs set to 255 and the AllocationType subfield set to 2 indicating the Beacon SP of the synchronization CDMG AP or PCP of the cluster operating on the 1.08 GHz channel. In addition, it may schedule more SPs indicating other nonempty Beacon SPs of the cluster operating on the 1.08 GHz channel.

As being an S-AP or S-PCP of the cluster operating on the 1.08 GHz channel, the AP or PCP using coordination mechanism shall adjust its TBTT to avoid overlapping with any Beacon SP of the cluster operating on the 2.16 GHz channel. In addition, it should schedule multiple SPs within the cluster operating on the 1.08 GHz channel that has the source and destination DMG AIDs set to 255 and the AllocationType subfield set to 0 indicating the schedule information of a nonempty Beacon SP_n of the cluster operating on the 2.16 GHz channel.

If a member AP or member PCP of a cluster operating on the 1.08 GHz channel receives an Extended Schedule element from an S-AP or S-PCP with the same cluster ID that includes at least one Allocation field with the AllocationType subfield set to 0 and the source and destination AIDs set to 255, it may switch to the 2.16 GHz channel according to the schedule information in an attempt to receive a DMG Beacon frame.

10.40.3.4 Centralized CDMG AP or PCP cluster maintenance

In the case when the S-AP or S-PCP of a centralized AP or PCP cluster on a 1.08 GHz channel is lost, or appears to a member AP or member PCP to have been lost, the S-AP handover procedures shall follow the rules in 10.39.3.3. In addition, the new S-AP or S-PCP shall also transmit a DMG Beacon frame during its NP of the allocated QP on the 2.16 GHz common channel as described in 10.63.5, even if there is no legacy non-AP and non-PCP DMG STA within its BSS or it does not involve in a synchronization pair with another AP or PCP operating on the adjacent 1.08 GHz channel.

If a CDMG CCSR detects that a new S-AP that is joining the CCSS is a DMG AP or a CDMG AP operating on the 2.16 GHz channel and there is at least one S-AP operating on a 1.08 GHz channel in its CCSS, the CDMG CCSR shall announce the cluster information (including the cluster ID, cluster synchronization and control information, and the channel number of the new S-AP operating on the 2.16 GHz common channel) to each S-AP operating on 1.08 GHz channel to facilitate the detection of the presence of the new S-AP for the S-APs operating on 1.08 GHz channel.

If a CDMG S-AP operating on a 1.08 GHz channel receives the cluster information of the new S-AP operating on 2.16 GHz channel from the CCSR, it should measure the state and the signal quality of each Beacon SP and determine whether to join the centralized cluster of the new S-AP based on the state or signal quality of each Beacon SP.

The S-AP shall broadcast the cluster information of the new S-AP to all the member APs or member PCPs in its centralized cluster using the Extended Cluster Report element indicated in the DMG Beacon frame. The member APs or member PCPs on the 1.08 GHz channels should determine whether to join the centralized cluster of the new S-AP based on the cluster information and the monitoring results of the new S-AP operating on the 2.16 GHz channel.

If an S-AP or a member AP or member PCP operating on a 1.08 GHz channel decides to join the centralized cluster of the new S-AP operating on a 2.16 GHz channel, the S-AP or member AP or member PCP shall transmit a Cluster Switch Announcement element to all its cluster members using the DMG Beacon frame to broadcast the cluster information and its cluster switching determination to all the member APs or member PCPs in the centralized cluster. The remaining member APs or member PCPs can update the Available Cluster

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Offset Bitmap field by using the Cluster Switch Announcement element transmitted by a member AP or member PCP.

10.40.3.5 Centralized CDMG AP or PCP cluster MAC requirements

Centralized CDMG AP or PCP cluster MAC requirements shall follow the rules described in 10.39.3.4.

10.40.4 Cluster report and rescheduling

Regardless of whether an AP or PCP cluster starts on a 2.16 GHz channel or a 1.08 GHz channel, a CDMG STA shall follow the rules defined in 10.39.4 for the cluster report and rescheduling.

When an AP or PCP operating on a 1.08 GHz channel still experiences poor channel conditions after performing all the actions in an attempt to mitigate any interference, it may send an Information Request frame to one of the non-AP and non-PCP STAs within its BSS to monitor the corresponding 2.16 GHz common channel for a cluster monitoring period defined in 10.39.3.2. The non-AP and non-PCP STA operating on a 1.08 GHz channel that receives a DMG Beacon frame on the 2.16 GHz common channel shall report the monitoring results through sending a Cluster Report element contained in an Announce frame or Information Response frame to the AP or PCP if the received DMG Beacon frame meets the conditions given in 10.39.4.

Upon receiving a Cluster Report element included in the Announce frame from a non-AP and non-PCP STA operating on the 1.08 GHz channel with the Cluster Report field equal to 1 and the Cluster Channel Number field equal to 0, a decentralized cluster enabled AP or PCP operating on a 1.08 GHz channel may reserve multiple SPs on the 1.08 GHz channel to identify whether there is an empty Beacon SP. The AP or PCP may reschedule SPs and CBAPs in its beacon interval, or move the BTI if the clustering enabled AP or PCP is an S-AP or S-PCP in a decentralized AP or PCP cluster, or change the cluster time offset if the clustering enabled AP or PCP is a member AP or member PCP, or perform other actions, in an attempt to mitigate any interference from the transmissions as indicated in the received Cluster Report element. The AP or PCP may also create SPs in its beacon interval with the source and destination AIDs set to 255 to eliminate transmissions during specific periods in the beacon interval. In addition, the AP or PCP operating on a 1.08 GHz channel can reserve multiple SPs in a DTI based on the clustering synchronization and control information included in the Cluster Report element, monitoring the Beacon SPs on the 2.16 GHz channel, to identify whether there is an empty Beacon SP of the decentralized cluster operating on the channel indicated by the Cluster Channel Number field.

Upon receiving a Cluster Report element from a non-AP and non-PCP STA with the Cluster Report field set to 1 and the Cluster Channel Number field set to 0, a clustering enabled AP or PCP that is an S-AP or S-PCP or a member AP or member PCP may switch to the corresponding 2.16 GHz common channel and discover an empty Beacon SP to become a member AP or member PCP of this cluster following the procedures described in 10.40.3.2. The AP or PCP should also broadcast a DMG Beacon frame containing the Cluster Switch Announcement element to other APs or PCPs of the same cluster before it switches to the 2.16 GHz common channel.

10.40.5 Decentralized AP or PCP cluster request

Regardless of whether a BSS starts on a 2.16 GHz channel or a 1.08 GHz channel, a CDMG STA shall follow the rules defined in 10.39.4 for the cluster request.

To request AP or PCP clustering to be enabled in the BSS, the STA shall transmit a Cluster Report element with the Cluster Request subfield set to 1 to its AP or PCP. Upon receiving a Cluster Report element with the Cluster Request subfield set to 1, the AP or PCP should form and maintain decentralized AP or PCP clustering in the BSS according to the procedures described in 10.39.2, 10.39.3, 10.40.2, and 10.40.3.

10.40.6 Spatial sharing in a CDMG AP or PCP cluster

This subclause describes mechanisms to enable spatial sharing and interference mitigation among CDMG infrastructure BSSs or PBSSs in a coordinated OBSS environment, i.e., in a CDMG AP or PCP clustering environment. By utilizing the schedule information of SP allocation in other BSSs in an AP or PCP cluster, an AP or PCP acquires and shares channel measurement results of STAs within its BSS by requesting STAs in its BSS to perform directional channel measurement during SPs of other BSSs. Therefore, APs or PCPs in different BSSs can allocate SPs in overlapping time periods in the same channel and achieve spatial sharing among BSSs.

If the SPSH in CDMG Cluster subfield in the CDMG Capabilities element of a CDMG AP or PCP is 1 and one of the Decentralized Cluster field and the Centralized Cluster field is 1, then the CDMG AP or PCP supports spatial sharing mechanism among BSSs in the AP or PCP cluster.

A CDMG STA that supports spatial sharing, as indicated by the SPSH in CDMG Cluster subfield set to 1 in the STA's CDMG Capabilities element, shall support the directional channel quality measurements described in 9.4.2.20.15 and 9.4.2.20.16.

The SP spatial sharing among BSSs in an AP or PCP cluster contains two phases: SPSH measurement phase and SP spatial sharing phase. The goal of setting an SPSH measurement phase is to allow APs or PCPs to find pairs of links in different BSSs that can coexist. Spatial reuse is not allowed in SPSH measurement phase. Only one pair of STAs participate directional channel quality measurement.

A CDMG S-AP or S-PCP that supports SPSH among BSSs should indicate whether all the member APs or member PCPs in a cluster are in the SPSH measurement phase or in the SP spatial sharing phase by setting the SPSH Measurement Enabled subfield in the Clustering Control field of the DMG Beacon frame to 1 or by setting the Clustering SPSH Enabled field within the Clustering Interference Assessment element to 1. The SPSH Measurement field is set to 1 to indicate that SPSH measurement phase starts. Each member AP or member PCP that supports SPSH among BSSs should request STAs in its BSS to perform directional channel quality measurement during SPs of other BSSs in the same cluster, as described in 11.11. The CDMG AP or PCP should send directional channel quality request to STAs in the same BSS and receive directional channel quality report from the STAs. The period of the directional channel quality measurement is indicated by the Channel Quality Measurement Duration subfield within the Clustering Interference Assessment element. The AP or PCP can obtain the interference information that indicates link(s) in its BSS experience interference from at least one link of other BSS within the AP or PCP cluster through channel measurement of STAs. The AP or PCP can determine the channel quality across STAs within multiple BSSs and implement spatial sharing based on the results of the measurements performed by the STAs associated with the AP or PCP. The S-AP or S-PCP should periodically set the SPSH Measurement Enabled subfield, generating and sending the indicated information of interference measurement.

In the SPSH measurement phase, each member AP or member PCP that supports SPSH among BSSs in an AP or PCP cluster shall schedule SPs in nonoverlapping period according to the clustering mechanism, as described in 10.39 and 10.40. If one link in a BSS is transmitting data, link(s) in other BSSs keeps in directional channel measurement state. The determination of the interference from the measured link (existing SP) to the candidate SP is implementation dependent and beyond the scope of this standard.

Each member AP or member PCP in a cluster may record the information that links in other BSSs do not interfere with the link(s) in its BSS through channel measurement of STAs, and include the information in SPSH Report elements that are sent to other AP(s) or PCP(s) through DMG Beacon frames. Each member AP or member PCP can obtain interference information that indicates interference experienced by at least one link of other BSS(s) from link(s) of its BSS, after receiving the SPSH Report element from other APs or PCPs in the same cluster. Each AP or PCP is able to obtain a database of links that may perform SPSH, but the definition of the database is beyond the scope of this standard.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

After SPSH measurement, the S-AP or S-PCP shall set the SPSH Measurement Enabled subfield in the Clustering Control field of the DMG Beacon frame to 0, indicating that BSSs in the cluster are allowed to conduct spatial sharing in overlapping SPs in SP spatial sharing phase.

In the SP spatial sharing phase, each AP or PCP in the cluster should schedule SPs to achieve spatial sharing according to the received SP allocation information that indicates scheduled SP allocation for link(s) of other BSS(s) in the same AP or PCP cluster and according to the interference information from link(s) of other BSS(s) to its BSS and the interference information from link(s) of its BSS to link(s) of other BSS(s) obtained in SPSH measurement phase. The SP allocation information is obtained by receiving the Extended Schedule element in the DMG Beacon frame of other AP(s) or PCP(s) in the AP or PCP cluster. The scheduled link(s) of the AP's or PCP's BSS and link(s) of other BSS(s) should not interfere with each other during the same SP.

If an AP or PCP discovers that a link in its BSS and a link in another BSS in the same cluster do not interfere with each other, then the AP or PCP can schedule overlapping SPs for the two links.

Through sending and receiving the SPSH Report element, an AP or PCP should schedule an overlapping candidate SP only after sharing the spatial reuse information including noninterfering links corresponding to the scheduled SPs and candidate SPs with a neighbor AP or PCP. If an AP or PCP cannot know the interference information between links in neighboring BSSs and its BSS, it should not conduct SP spatial sharing.

Figure 10-78 (Example of spatial sharing with interference mitigation among multiple BSSs) illustrates an example of the resulting SP schedule for the spatial sharing among three BSSs in a cluster.

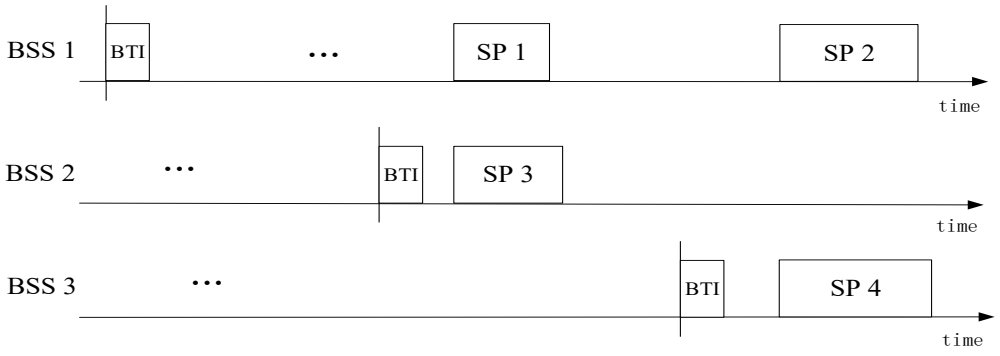

Figure 10-78—Example of spatial sharing with interference mitigation among multiple BSSs

10.41 DMG beamforming

10.41.1 General

Beamforming (BF) is a mechanism that is used by a pair of STAs to achieve the necessary DMG link budget for subsequent communication. BF training is a bidirectional sequence of BF frame or Short SSW PPDU transmissions that uses sector sweep and provides the necessary signaling to allow each STA to determine appropriate antenna system settings for both transmission and reception. After the successful completion of BF training, BF is said to be established. A BF frame is an SSW frame, a DMG Beacon frame, an SSW-Feedback frame, an SSW-Ack frame or a BRP frame. Figure 10-79 (An example of beamforming training) gives an example of the beamforming training procedure.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

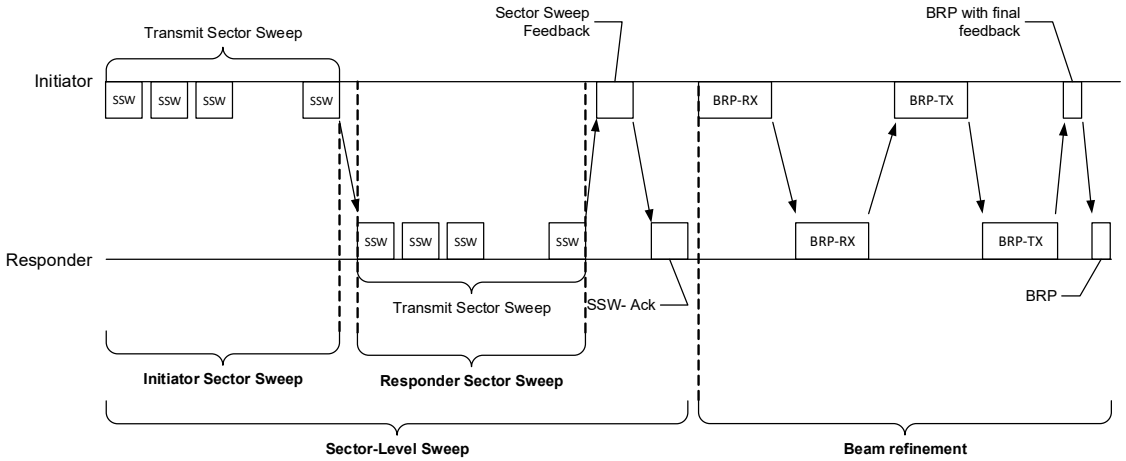

Figure 10-79—An example of beamforming training

Short SSW PPDUs are used between EDMG STAs. Unless otherwise specified, the rules applicable to transmission of SSW frames specified in this subclause are also applicable to transmission of Short SSW PPDUs.

In this subclause, the STA that initiates BF training through the transmission of a BF frame is referred to as the *initiator*, and the recipient STA of the BF frame that participates in BF training with the initiator is referred to as the *responder*. For BF training that occurs within the A-BFT allocation, the AP or PCP is the initiator and a non-AP and non-PCP STA becomes the responder. For BF training that occurs during an SP allocation, the source DMG STA of the SP is the initiator and the destination DMG STA of the SP becomes the responder. For BF training during a CBAP allocation, the TXOP holder is the initiator and the TXOP responder is the responder and the value of the Duration field in the transmitted BF frames does not limit the duration of the BF training procedure. The duration of the BF training procedure is specified in 10.41.6.2 and 10.41.6.4.

The link from the initiator to the responder is referred to as the *initiator link*, and the link from the responder to the initiator is referred to as the *responder link*.

BF training starts with a SLS from the initiator. A beam refinement protocol (BRP) may follow, if requested by either the initiator or the responder. The purpose of the SLS phase is to enable communications between the two participating STAs at the DMG control mode rate or higher MCS. Normally, the SLS phase provides only transmit BF training. The purpose of the BRP phase is to enable receive training and enable iterative refinement of the AWV of both transmitter and receiver at both participating STAs. If one of the participating STAs chooses to use only one transmit antenna pattern, receive training may be performed as part of the SLS.

Any BF information obtained by an initiator or a responder during a BF training attempt shall be considered invalid if either or both of the following conditions are satisfied:

a) The SLS phase was not completed within dot11MaxBFTime beacon intervals from the start of the SLS phase.
b) The BRP phase, if initiated, was not completed within dot11MaxBFTime beacon intervals from the start of the BRP phase.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A STA shall abort an SLS if the SLS is not completed within dot11MaxBFTime beacon intervals from the start of the SLS, and shall abort a BRP if the BRP is not completed within dot11MaxBFTime beacon intervals from the start of the BRP.

A STA can have one or more DMG antennas. A DMG antenna can be used to create sectors through which a STA can transmit or receive frames. The number of sectors per DMG antenna shall not be greater than 64. The total number of sectors across all DMG antennas in a STA shall not be greater than 128.

Table 10-35 shows the mandatory and optional procedures in the beamforming mechanism described in this subclause.

Table 10-35—Mandatory and optional procedures in the Beamforming mechanism

Beamforming item		Support mandatory	Notes
SLS phase (10.41.2, 10.41.6.2)		Yes	A DMG STA is capable to participate in an SLS with any other STA as described in 10.41.2 and 10.41.6.2.
Beamforming in BTI (10.41.4)		Yes	When operating as an AP or PCP, a DMG STA is capable to perform beamforming in the BTI as described in 10.41.4.
Beamforming in A-BFT (10.41.5)		Yes	When operating as an AP or PCP, a DMG STA is capable to perform beamforming in the A-BFT as described in 10.41.5.
BRP setup subphase (10.41.3.2)		Yes	A DMG STA is capable to negotiate BRP settings with any other STA as described in 10.41.3.2.
MIDC subphase (10.41.6.3)	MID subphase	No	A DMG STA does not have to be capable to perform MID as described in 10.41.6.3.
	BC subphase	No	A DMG STA does not have to be capable to perform BC as described in 10.41.6.3.
BRP phase (10.41.3, 10.41.6.4)	Feedback = BS-FBCK	Yes	A DMG STA is capable to perform the BRP with any other STA as described in 10.41.3 and 10.41.6.4 and is capable to return the BS-FBCK.
	Feedback = Channel measurement	No	A DMG STA is capable to perform the BRP with any other STA as described in 10.41.3 and 10.41.6.4, but does not have to be capable to return channel measurements.
Beam tracking (10.41.7)	Feedback = BS-FBCK	Yes	A DMG STA is capable of responding to a receive beam tracking request. A DMG STA is capable of responding to a transmit beam tracking request with the BS-FBCK.
	Feedback = Channel measurement	No	A DMG STA is capable of responding to a receive beam tracking request. A DMG STA does not have to be capable of responding to a transmit beam tracking request with channel measurements.

An SLS between an initiator and a responder is successful for the initiator if, after the completion of the SLS, the initiator receives a response to a frame transmitted to the responder using the sector and antenna selected during the SLS. The SLS is successful for the responder if, after the completion of the SLS, the responder receives a response to a frame transmitted to the initiator using the sector and antenna selected during the SLS.

In this subclause, the last negotiated Total Number of Sectors field, Number of RX DMG Antennas field, and RXSS Length field held by the initiator with respect to the responder refer to the last value of the corresponding field received by the initiator from the responder and that the SLS between the initiator and responder using this value was successful for the initiator. Similarly, the last negotiated Total Number of Sectors field, Number of RX DMG Antennas field, and RXSS Length field held by the responder with respect to the initiator refer to the last value of the corresponding field received by the responder from the initiator and that the SLS between the responder and initiator using this value was successful for the responder.

Until an SLS is successful between an initiator and a responder, the last negotiated Total Number of Sectors field, Number of RX DMG Antennas field, and RXSS Length field used by the initiator with respect to the responder refer to the value of these fields in the responder's DMG Capabilities element, and the last negotiated Total Number of Sectors field, Number of RX DMG Antennas field, and RXSS Length field used by the responder with respect to the initiator refer to the value of these fields in the initiator's DMG Capabilities element.

If an MMSL cluster capable STA has successfully transmitted to a peer STA an MMS element with the BeamLink Cluster field set to 1, then all MAC entities coordinated by the same MM-SME as the MMSL cluster capable STA shall use a single beamformed link for the MMSL cluster. Also, the MAC address used by the MMSL cluster capable STA to initiate the beamforming procedure shall remain the same until the completion of the beamforming procedure.

A CMMG STA shall follow the DMG beamforming rules as described in 10.41 where a BF frame transmitted by a CMMG STA is contained in a CMMG PPDU.

A CDMG STA shall follow the DMG beamforming rules as described in 10.41, including the rules of CDMG enhanced beam tracking as described in 10.41.9.

A non-AP and non-PCP initiator or a non-AP and non-PCP unsolicited RSS responder may send an SPR frame to request a dynamic allocation of a service period to the AP or PCP to perform beamforming training. If either the initiator or the responder is an AP or a PCP and both initiator and responder are EDMG STAs that have an established control mode link between them, then the AP or PCP shall send a Grant frame to the responder (or the initiator of an unsolicited RSS). The non-AP and non-PCP STA shall respond with a Grant Ack frame to the AP or PCP, as appropriate, to update the last negotiated Total Number of Sectors field and Number of RX DMG Antennas field with respect to each other before starting an SLS procedure in the same CBAP or SP.

If both the initiator and the responder are non-AP and non-PCP EDMG STAs, the initiator (or the responder of an unsolicited RSS) may send an SPR frame in a PPDU with the NUM_SECTORS and NUM_ANT parameters of TXVECTOR set to, respectively, the number of sectors of the I-TXSS (or R-TXSS if an unsolicited RSS) and the requested number of repetitions of the R-TXSS in the SLS to be performed. If the AP or PCP did not receive an SPR frame in a PPDU with a control trailer from the initiator (or the responder of an unsolicited RSS) immediately prior to a GP, the AP or PCP shall set the Number of RX DMG Antennas field to 1 and set the Total Number of Sectors field to the value indicated in the Total Number of Sectors field in the last DMG Capabilities element received from the initiator (or the responder of an unsolicited RSS) in a Grant frame transmitted to the responder (or the initiator of an unsolicited RSS) during the GP.

10.41.2 Sector-level sweep (SLS) phase

10.41.2.1 General

The SLS phase can include as many as four components: an initiator sector sweep (ISS) to train the initiator link as described in 10.41.2.2, a responder sector sweep (RSS) to train the responder link as described

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

in 10.41.2.3, an SSW feedback procedure as described in 10.41.2.4, and an SSW ack procedure as described in 10.41.2.5.

An initiator shall begin the SLS phase by transmitting the frames of the ISS.

A responder shall not begin transmitting the frames of an RSS before the ISS is successfully completed (as defined in 10.41.1), except when the ISS occurs in the BTI (10.41.5).

An initiator shall not begin an SSW feedback procedure before the RSS phase is successfully completed (as defined in 10.41.1), except when the RSS occurs in the A-BFT.

A responder shall not begin an SSW ack procedure with an initiator in the A-BFT. A responder shall begin an SSW ack procedure with an initiator immediately following the successful completion (as defined in 10.41.1) of the SSW feedback procedure with the initiator.

During the SLS phase the only BF frames an initiator may transmit are the DMG Beacon frame, the SSW frame, and the SSW-Feedback frame. During the SLS phase the only BF frames a responder may transmit are the SSW frame and the SSW-Ack frame.

If an initiator uses SSW frames to perform the ISS, the responder shall use SSW frames to perform the RSS. If an initiator uses Short SSW PPDUs to perform the ISS, the responder shall use Short SSW PPDUs to perform the RSS.

A STA shall not transmit a Short SSW PPDU to another STA that is not an EDMG STA. A STA performing an ISS or an RSS using Short SSW PPDUs shall increase the value of the CDOWN field within the Short SSW PPDU by two for each LBIFS contained as part of a sector sweep.

An EDMG STA that supports reception of Short SSW PPDUs from unassociated STAs during CBAP allocations shall set the RX Unassociated Short SSW subfield in the SSW field to 1 within transmitted DMG Beacon frames.

If during the SLS the initiator and responder each execute a TXSS, then at the end of the SLS phase both the initiator and the responder possess their own transmit sector. If either the ISS or the RSS employs a receive sector sweep, then the responder or the initiator, respectively, possesses its own receive sector.

The following rule applies to all channel access in DMG BSSs. A STA shall not transmit a frame as part of a sector sweep comprising at least two sectors if a response is expected within SIFS from the STA identified in the RA field of the transmitted frame.

A STA shall not change its transmit power during a sector sweep.

Except when used to implement radar functionality as described in Annex AB, the following rules apply to a PPDU transmitted as part of a sector sweep:

— The PPDU transmitted by a non-EDMG STA as part of a sector sweep does not include a TRN field. A non-EDMG STA shall set the TRN-LEN parameter of the TXVECTOR to 0 for a frame transmitted as part of a sector sweep.
— The PPDU transmitted by an EDMG STA as part of a sector sweep and that does not include a DMG Beacon does not also include a TRN field. An EDMG STA shall set the TRN-LEN parameter of the TXVECTOR to 0 for a frame transmitted as part of a sector sweep and that is not a DMG Beacon.

Two examples of the SLS phases are shown in Figure 10-80 (An example of SLS where receive sector sweep is used in the response sector sweep) and Figure 10-81 (An example of SLS where transmit sector sweep is used in the response sector sweep).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In Figure 10-80 (An example of SLS where receive sector sweep is used in the response sector sweep) the initiator has many sectors, the responder has only one transmit sector, and receive sector sweep is used in the responder sector sweep (the responder is transmitting all responder SSW frames through the same transmit sector, and the initiator is switching receive antennas at the same time).

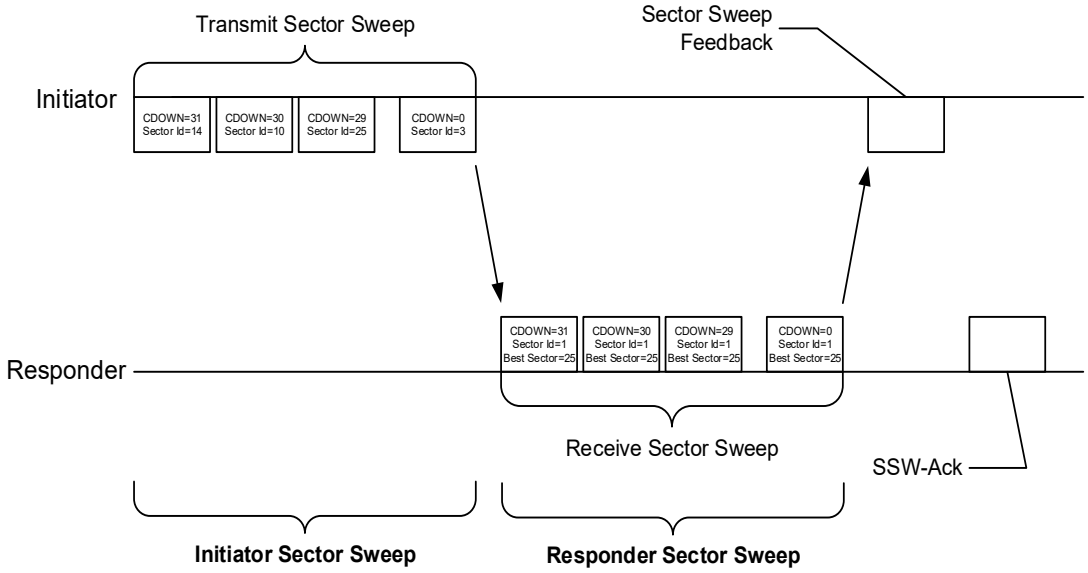

Figure 10-80—An example of SLS where receive sector sweep is used in the response sector sweep

In Figure 10-81 (An example of SLS where transmit sector sweep is used in the response sector sweep) the initiator has many transmit sectors, and the responder has one transmit sector. In this case, receive training for the initiator is performed in the BRP phase.

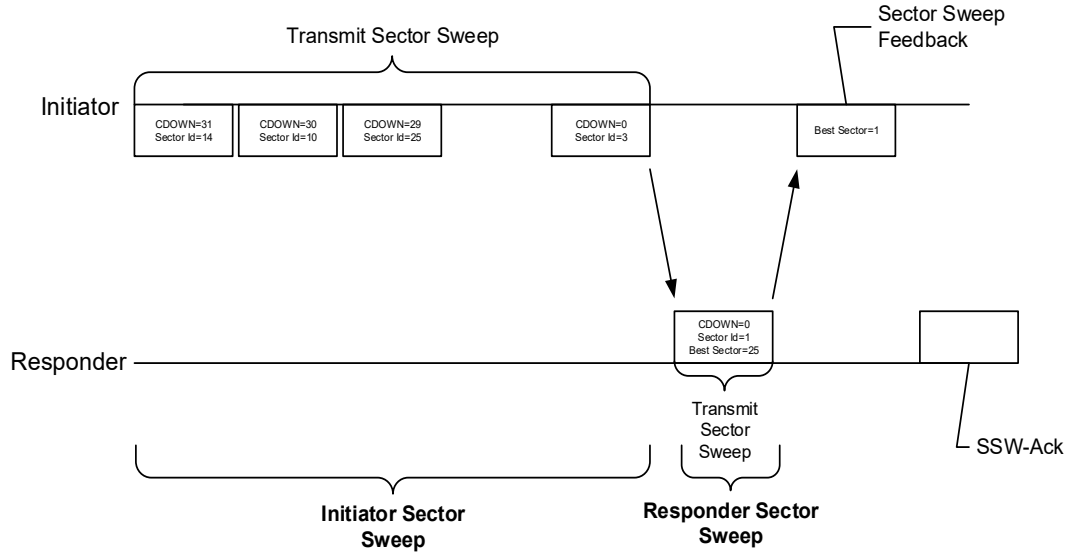

Figure 10-81—An example of SLS where transmit sector sweep is used in the response sector sweep

10.41.2.2 Initiator sector sweep (ISS)

10.41.2.2.1 General

An ISS comprises either an initiator TXSS or an initiator RXSS.

An initiator RXSS may be performed in an ISS when the initiator chooses to use only one transmit antenna pattern across each of its DMG antennas.

An initiator may employ either DMG Beacon frames or SSW frames in the ISS. If the initiator begins an ISS with the transmission of a DMG Beacon frame, it shall use the DMG Beacon frame for all subsequent transmissions during the ISS. Conversely, if the initiator begins an ISS with the transmission of an SSW frame, it shall use the SSW frame for all subsequent transmissions during the ISS. A responder never begins an ISS.

An initiator may employ DMG Beacon frames, SSW frames, or Short SSW PPDUs in the ISS. If the initiator begins an ISS with the transmission of a DMG Beacon frame, it shall use the DMG Beacon frame for all subsequent transmissions during the ISS. If the initiator begins an ISS with the transmission of an SSW frame, it shall use the SSW frame for all subsequent transmissions during the ISS. If the initiator begins an ISS with the transmission of a Short SSW PPDU, it shall use the Short SSW PPDU for all subsequent transmissions during the ISS. A responder never begins an ISS.

The initiator shall set the Direction subfield in the SSW field to 0 within each DMG Beacon and SSW frame transmitted during an ISS. The initiator shall set the TXVECTOR parameter SSSW_DIR to Initiator within each Short SSW PPDU transmitted during an ISS.

During a CBAP, an EDMG STA may obtain a TXOP with an unsolicited RSS by transmitting a Grant frame at the beginning of the TXOP or use an existing TXOP for an unsolicited RSS (see 10.41.6.2 (SLS phase execution)). If a TXOP is obtained through the transmission of a Grant frame and the TXOP holder intends to continue the TXOP with an unsolicited RSS, the TXOP holder shall set the Unsolicited RSS subfield in the Grant frame to 1 to indicate the SLS begins with an unsolicited RSS and is performed without an ISS.

If an SP is allocated with the Unsolicited RSS subfield in the BF Control field set to 1, the source STA shall set the Direction subfield in the SSW frame(s) to 1 to indicate the SLS begins with an unsolicited RSS and is performed without an ISS.

The initiator shall set the Total Sectors in ISS subfield within the SSW Feedback field to the total number of sectors that it is using in the ISS. The total is computed as the sum of all sectors employed on all antennas in the ISS multiplied by the number of the responder's receive DMG antennas. For example, if 4 sectors are used on antenna 0, 3 sectors on antenna 1, 5 sectors on antenna 2, and the responder has two receive DMG antennas, then the Total Sectors in ISS subfield is set to 24.

10.41.2.2.2 Initiator TXSS

When the IsInitiatorTXSS field for a specific SP is 1 in a received Extended Schedule element (see 9.4.2.130) or Grant frame (see 9.3.1.12) and the Beamforming Training field of the BF Control field for that SP in the same Extended Schedule element or Grant frame is 1, then the SP contains an initiator TXSS, and the initiator shall start an initiator TXSS at the start of the next SP as indicated by the received Extended Schedule element or Grant frame.

During the BTI, the initiator shall start an initiator TXSS (see also 10.41.4).

During a CBAP, an initiator may obtain a TXOP with an initiator TXSS or use an existing TXOP for the initiator TXSS. If transmission of a Grant frame to the responder is used to initiate the TXSS, the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Beamforming Training and IsInitiatorTXSS fields of the BF Control field is set to 1. If a Grant Ack frame is transmitted by the responder, it shall comply with 10.38.4. In the Grant Ack frame, the responder shall set the Beamforming Training field to 1. The initiator starts the initiator TXSS SIFS after transmission of the Grant frame or after the reception of the Grant Ack frame if the Grant Ack Supported field in the responder's DMG Capabilities element is 1 or PIFS interval after the transmission the Grant frame otherwise.

During an initiator TXSS, the Sector ID field in each BF frame shall be set to a value that uniquely identifies the transmit antenna sector employed when the BF frame is transmitted. The CDOWN field in each transmitted frame shall contain the total number of transmissions remaining until the end of the initiator TXSS, including any LBIFS if required, such that the last BF frame transmission of the initiator TXSS has the CDOWN field set to 0. Each transmitted BF frame shall be separated by a time interval equal to SBIFS, unless the allocation ends as described in 10.41.6. This is indicated in Figure 10-82 (Initiator TXSS or initiator RXSS).

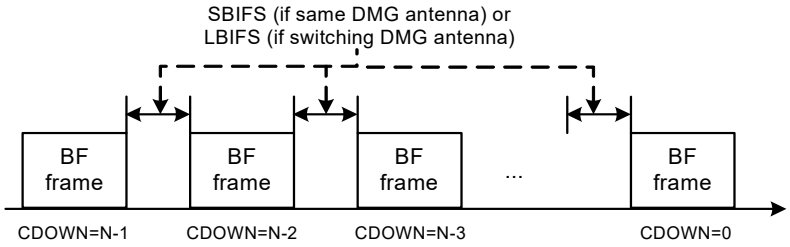

Figure 10-82—Initiator TXSS or initiator RXSS

An initiator that is not associated to the responder may transmit Short SSW PPDUs during the initiator TXSS if it has received a DMG Beacon frame from the responder with the RX Unassociated Short SSW subfield in the SSW field set to 1. In this case, in the Short SSW PPDU the initiator shall set the TXVECTOR parameter SSSW_ADD_MODE to IndividualAddr, SSSW_SOURCE_AID, and SSSW_DESTINATION_AID parameters to random values between $[0, 255]$ and the SSSW_UNASSOCIATED parameter to 1. The values of the SSSW_SOURCE_AID and SSSW_DESTINATION_AID parameters shall not change between Short SSW PPDUs transmitted within the same initiator TXSS.

If the initiator has more than one DMG antenna, the initiator transmits the BF frame through a number of sectors equal to the value of the last negotiated Total Number of Sectors field that was transmitted by the initiator to the responder. In each transmitted BF frame, the initiator shall set the Sector ID and DMG Antenna ID fields to uniquely identify the sector and the DMG antenna ID, respectively, the initiator is using for the frame transmission and shall set the CDOWN field to the total number of transmissions remaining from all of the initiator's DMG antennas.

If an ISS is outside the BTI and if the responder has more than one DMG antenna, the initiator repeats its initiator sector sweep for the number of DMG antennas indicated by the responder in the last negotiated Number of RX DMG Antennas field that was transmitted by the responder. Repetitions of the initiator sector sweep are separated by an interval equal to LBIFS. In this case CDOWN indicates the number of sectors until the end of transmission from all initiator's DMG antennas to all responder's DMG antennas. At the start of an initiator TXSS, the responder should have its first receive DMG antenna configured to a quasi-omni pattern and should not change its receive antenna configuration for a time corresponding to the value of the last negotiated Total Number of Sectors field transmitted by the initiator multiplied by the time to transmit a single SSW frame, plus appropriate IFSs (10.3.2.3). After this time, the responder may switch to a quasi-omni pattern in another DMG antenna.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The initiator TXSS ends at the end time of the BF frame from the initiator with the CDOWN field set to 0. If the responder is unable to receive this frame, the responder shall assume that the initiator TXSS has completed at the expected end time of this frame.

10.41.2.2.3 Initiator RXSS

An initiator RXSS may be requested only when an initiator is aware of the capabilities of a responder, which includes the RXSS Length field. An initiator can obtain the capabilities of a responder using the Information Request and Response procedure as described in 11.28.1.

When the IsInitiatorTXSS field for a specific SP in a received Extended Schedule element or Grant frame is 0 and the Beamforming Training field of the BF Control field for that SP in the same Extended Schedule element or Grant frame is 1, then the SP shall contain an initiator RXSS, and the initiator shall start an initiator RXSS at the start of the next SP described by the received Extended Schedule element or Grant frame.

The initiator never performs an initiator RXSS during the BTI.

During a CBAP, an initiator shall not obtain a TXOP with an initiator RXSS. When transmission of a Grant frame to the responder is used to initiate the RXSS the Beamforming Training field set to 1 and the IsInitiatorTXSS field set to 0. If a Grant Ack frame is transmitted by the responder it shall comply with 10.38.4. In the Grant Ack frame, the responder shall set the Beamforming Training field to 1. The initiator starts the initiator RXSS SIFS after transmission of the Grant frame or after the reception of the Grant Ack frame if the Grant Ack Supported field in the responder's DMG Capabilities element is 1 or PIFS after the transmission the Grant frame otherwise.

If the initiator uses more than one transmit sector or more than one transmit DMG antenna to perform beamforming with the responder, the initiator shall perform an initiator TXSS with the responder before participating in an initiator RXSS with the responder.

During the initiator RXSS the initiator shall transmit from the DMG antenna and sector that were selected during the preceding TXSS with the responder the number of BF frames indicated by the responder in the last negotiated RXSS Length field transmitted by the responder. Each transmitted BF frame shall be transmitted with the same fixed antenna sector or pattern. The initiator shall set the Sector ID and DMG Antenna ID fields in each transmitted BF frame to a value that uniquely identifies the single sector through which the BF frame is transmitted. The initiator shall set the CDOWN field in each transmitted BF frame to contain the total number of transmissions remaining to the end of the initiator RXSS, such that the last BF frame transmission of the initiator RXSS has the CDOWN field set to 0. Each transmitted BF frame shall be separated by a time interval equal to SBIFS, except if the allocation ends as described in 10.41.6. This is indicated in Figure 10-82 (Initiator TXSS or initiator RXSS).

During an initiator RXSS, the responder should have its receive antenna array configured to sweep RXSS Length sectors, including any LBIFS if required, while attempting to receive SSW frames from the initiator.

The initiator RXSS ends at the end time of the SSW frame from the initiator with the CDOWN field set to 0. If the responder is unable to receive this frame, the responder shall assume that the initiator RXSS has completed at the expected end time of this frame.

10.41.2.3 Responder sector sweep (RSS)

10.41.2.3.1 General

An RSS comprises either a responder TXSS or a responder RXSS.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A responder RXSS may be performed in an RSS when the responder chooses to use only one transmit antenna pattern across each of its DMG antennas.

The responder initiates an RSS with the transmission of an SSW frame if the preceding ISS was performed with at least one SSW frame. The responder initiates an RSS with the transmission of a Short SSW PPDU if the preceding ISS was performed with at least one Short SSW PPDU. If the ISS was performed in the BTI, the responder behavior in the A-BFT is described in 10.41.5.2 (Operation during the A-BFT).

The responder shall set the Direction subfield in the SSW field to 1 within each SSW frame transmitted during an RSS. The responder shall set the TXVECTOR parameter SSSW_DIR to Responder within each Short SSW PPDU transmitted during an RSS.

10.41.2.3.2 Responder TXSS

If the DMG Beacon frame immediately preceding an A-BFT contained a value of one in the IsResponderTXSS subfield of the Beacon Interval Control field, then the A-BFT is a responder TXSS A-BFT.

When the IsResponderTXSS field for a specific SP in a received Extended Schedule element or Grant frame is 1 and the Beamforming Training field of the BF Control field for that SP in the same Extended Schedule element or Grant frame is 1, then the SP contains a responder TXSS, and the responder shall initiate a TXSS following the completion of the ISS in the SP described by the received Extended Schedule element or Grant frame.

When the RXSS Length field within an SSW frame used to obtain a TXOP during a CBAP is 0, the responder shall initiate a TXSS following the completion of the ISS in the TXOP described by the received SSW frame.

A responder that has transmitted a DMG Beacon frame with the RX Unassociated Short SSW subfield in the SSW field set to 1 and that receives a Short SSW PPDU as part of an ISS with the Direction field set to 0 and the Unassociated field set to 1 during the CBAP, shall initiate a responder TXSS using Short SSW PPDUs following the completion of the ISS. In this case, the responder shall set the Source AID field and Destination AID field in transmitted Short SSW PPDUs to the values of the Source AID field and Destination AID field, respectively, in the received Short SSW PPDUs during the ISS.

During a responder TXSS, the responder shall set the Sector ID and the DMG Antenna ID fields in each transmitted SSW frame to a value that uniquely identifies the sector through which the SSW frame is transmitted. The initial value of CDOWN is set to the total number of sectors in the responder (covering all DMG antennas) multiplied by the number of DMG antennas at the initiator minus one. The responder shall set the CDOWN field in each transmitted SSW frame to contain the total number of transmissions remaining to the end of the responder TXSS, including any LBIFS if required, such that the last SSW frame transmission of the responder TXSS has the CDOWN field set to 0. The responder shall transmit from its DMG antennas in increasing order of DMG antenna ID. Each transmitted SSW frame shall be separated by an interval of time equal to SBIFS. Transmissions are not separated by SBIFS if the allocation ends as described in 10.41.4 and 10.41.6 or if the end of an SSW slot is reached as described in 10.41.5 or when the responder completed a full sweep of all its transmit sectors and is ready to transmit to another DMG antenna of the initiator. In the latter case, the next transmission is separated from the previous transmission by LBIFS. This is indicated in Figure 10-83 (Responder TXSS or responder RXSS).

A responder that has more than one DMG antenna and has set the value of the DMG Antenna Reciprocity field in its DMG Capabilities element to 0 transmits sequentially through all of the sectors of all of its DMG antennas. A responder that has more than one DMG antenna and has set the value of the DMG Antenna Reciprocity field in the responder's DMG Capabilities element to 1 transmits through the DMG antenna

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

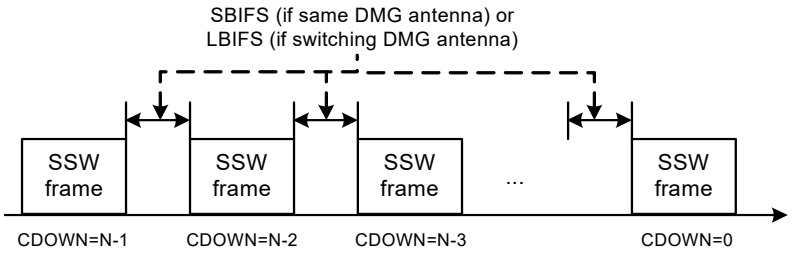

Figure 10-83—Responder TXSS or responder RXSS

from which it had the best reception in the initiator sector sweep. The length of the sector sweep to each of the initiator's DMG antennas is not dependent on the value of the DMG Antenna Reciprocity field.

A responder that has only one DMG antenna should transmits through all its sectors, regardless of the setting of the DMG Antenna Reciprocity field.

The responder shall set the Sector Select field and the DMG Antenna Select field in each transmitted SSW frame to the value of the Sector ID field and DMG Antenna ID field, respectively, of the frame received with the best quality during the ISS. The responder shall set the Short SSW Feedback field in each transmitted Short SSW PPDU to the value of the CDOWN field of the Short SSW PPDU that was received with the best quality during the preceding initiator TXSS. The determination of which frame is received with best quality is implementation dependent and beyond the scope of this standard. The responder shall set the SNR Report field in transmitted SSW frames to the SNR measured for the frame indicated by the Sector Select field and DMG Antenna Select field.

If the initiator has more than one DMG antenna, the responder repeats its responder sector sweep for the number of DMG antennas indicated by the initiator in the last negotiated Number of RX DMG Antennas field transmitted by the initiator. At the start of a responder TXSS, the initiator should have its receive antenna array configured to a quasi-omni antenna pattern in one of its DMG antennas for a time corresponding to the value of the last negotiated Total Number of Sectors field transmitted by the responder multiplied by the time to transmit a single SSW frame, plus any appropriate IFSs (10.3.2.3). After this time, the initiator may switch to a quasi-omni pattern in another DMG antenna.

If the initiator transmitted Short SSW PPDUs with the Unassociated field set to 1 during the ISS, it shall match the transmitted Source AID field and Destination AID field values with the received Source AID field and Destination AID field values, respectively, in the received Short SSW PPDUs during the RSS to determine if it is the intended recipient of the RSS.

The responder TXSS ends at the end time of the SSW frame from the responder with the CDOWN field set to 0. If the initiator is unable to receive this frame, the initiator shall assume that the responder TXSS has completed at the expected end time of this frame.

10.41.2.3.3 Responder RXSS

If the DMG Beacon frame immediately preceding an A-BFT contained a value of zero in the IsResponderTXSS subfield of the Beacon Interval Control field within the DMG Beacon frame, then the A-BFT is a responder RXSS A-BFT.

When the IsResponderTXSS field for a specific SP in a received Extended Schedule element or Grant frame is 0 and the Beamforming Training field of the BF Control field for that SP in the same Extended Schedule element or Grant frame is 1, then the SP contains a responder RXSS, and the responder shall initiate an

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

RXSS following the completion of the ISS in the SP described by the received Extended Schedule element or Grant frame.

When the RXSS Length field within an SSW frame used to obtain a TXOP during a CBAP is nonzero, the responder shall initiate an RXSS following the completion of the ISS in the TXOP described by the received SSW frame.

If the responder chooses to use more than one transmit sector or more than one transmit DMG antenna to perform beamforming with the initiator, the responder shall perform a responder TXSS with the initiator before participating in a responder RXSS with the initiator.

During the responder RXSS, the responder shall transmit the number of SSW frames indicated by the initiator in the initiator's most recently transmitted RXSS Length field (non-A-BFT) or FSS field (A-BFT) from the DMG antenna and sector that were selected during the preceding TXSS with the initiator. The responder shall set the Sector ID and DMG Antenna ID fields in each transmitted frame to a value that uniquely identifies the sector and DMG antenna, respectively, through which the BF frame is transmitted. The responder shall set the CDOWN field in each transmitted SSW frame to contain the total number of transmissions remaining until the end of the responder RXSS, such that the last SSW frame transmission of the responder RXSS has the CDOWN field equal to 0. Each transmitted SSW frame shall be separated by an interval of time equal to SBIFS, except if the allocation ends as described in 10.41.6 or if the end of an SSW slot is reached as described in 10.41.5. This is indicated in Figure 10-83 (Responder TXSS or responder RXSS).

The responder shall set the Sector Select field and the DMG Antenna Select field in each transmitted SSW frame to the value of the Sector ID field and the DMG Antenna ID field, respectively, of the frame received with the best quality during the ISS. The determination of which frame is received with best quality is implementation dependent and beyond the scope of this standard.

At the start of a responder RXSS, the initiator should have its receive antenna array configured to sweep over RXSS Length sectors, including any LBIFS if required, when it attempts to receive frames from the responder until the completion of the responder RXSS.

The responder RXSS ends at the end time of the SSW frame from the responder with the CDOWN field set to 0. If the initiator is unable to receive this frame, the initiator shall assume that the responder RXSS has completed at the expected end time of this frame.

10.41.2.4 Sector sweep (SSW) feedback

An SSW feedback procedure occurs following each RSS.

During an SSW feedback procedure, the initiator shall transmit an SSW-Feedback frame to the responder.

During an SSW feedback procedure, the responder should have its receive antenna array configured to a quasi-omni antenna pattern in the DMG antenna through which it received with the highest quality during the ISS, or to the best antenna configuration it has found during RXSS if RXSS has been performed during the ISS, and should not change its receive antenna configuration when it communicates with the initiator until the expected end of the SSW feedback procedure.

When a responder TXSS comprising SSW frames was performed during the preceding RSS, the initiator shall set the Sector Select field and the DMG Antenna Select field in the SSW-Feedback frame it transmits to the value of the Sector ID field and DMG Antenna ID field, respectively, of the frame received with the best quality during the responder TXSS. The determination of which frame is received with the best quality is implementation dependent and beyond the scope of this standard. In addition, the initiator shall set the SNR Report field to the SNR measured for the frame received by the sector and DMG antenna indicated by

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the Sector Select field and DMG Antenna Select field. The SSW-Feedback frame shall be transmitted through the sector identified by the value of the Sector Select field and DMG Antenna Select field received from the responder during the preceding responder TXSS.

When a responder TXSS comprising Short SSW PPDUs was performed during the preceding RSS, the initiator shall transmit an SSW-Feedback frame through the sector identified by the value of the Short SSW Feedback field received from the responder during the responder TXSS. In the SSW-Feedback frame, the initiator shall set the EDMG Extension Flag subfield to 1, the Sector Select and Sector Select MSB subfields to represent the value of the CDOWN field within the Short SSW PPDU that was received with the best quality during the responder TXSS, and shall set the DMG Antenna Select and DMG Antenna Select MSB subfields to the value of the RF Chain ID field within the same Short SSW PPDU. The determination of which PPDU is received with the best quality is implementation dependent and beyond the scope of this standard, but should be based on the reception quality measured over the DMG antenna used to transmit the current SSW-Feedback frame. In addition, the initiator shall set the SNR Report field to the SNR measured for the PPDU received by the sector and DMG antenna indicated by the Sector Select, Sector Select MSB, DMG Antenna Select and DMG Antenna Select MSB subfields.

When responder RXSS was performed during the preceding RSS, the Sector Select field and the DMG Antenna select field in the transmitted SSW-Feedback frame are reserved. The initiator shall set the SNR Report field to the SNR measured on the frame on the receive sector designated by the RSS. The SSW-Feedback frame shall be transmitted through the sector identified by the value of the Sector Select field received from the responder during its most recently completed RSS with the initiator.

The initiator may include transmit training as part of the beam refinement phase by setting the TX-TRN-REQ field to 1 in the SSW Feedback frame and setting the L-RX field to indicate the length of the training sequence it requests the responder to use in the beam refinement phase. The initiator may carry out the MIDC subphase as part of the beam refinement by setting the BC-REQ field to 1 (to request a BC subphase) and setting the MID-REQ field to 1 (to request an MID subphase); in this case, the L-RX field shall be set to indicate the number of receive AWVs the initiator uses during the MID subphase.

If the responder receives an SSW-Feedback frame from the initiator before it completes the RSS with the initiator such as described in 10.41.5, the responder may cease the RSS.

10.41.2.5 SSW ack

When present, the SSW ack procedure occurs following an SSW feedback procedure.

When a responder TXSS is performed during an RSS, the responder shall transmit an SSW-Ack frame to the initiator to perform an SSW ack procedure. The SSW-Ack frame shall be transmitted through the sector identified by the value of the Sector Select field and the DMG Antenna Select field received from the initiator in the last SSW-Feedback frame if the RSS comprises SSW frames, and by the value of the Sector Select subfield, Sector Select MSB subfield, DMG Antenna Select subfield, and DMG Antenna Select MSB subfield received from the initiator in the last SSW-Feedback frame if the RSS comprises Short SSW PPDUs. If the RSS comprises Short SSW PPDUs, the Sector Select field and the Sector Select MSB field in the SSW-Ack frame shall be set to values corresponding to a sector from the same initiator DMG antenna that was used to transmit the preceding SSW-Feedback frame. The values should be based on the reception quality measured over the same DMG antenna used to transmit the current SSW-Ack frame and may correspond to a sector different from the sector indicated by the Short SSW Feedback field in Short SSW PPDUs transmitted during the RSS.

When an initiator TXSS comprising of Short SSW PPDUs with the Unassociated field set to 1 is performed during the ISS, the Sector Select subfield, Sector Select MSB subfield, DMG Antenna Select subfield and DMG Antenna Select MSB subfield in the SSW-Ack frame are ignored.

When an RXSS was performed during an RSS, an SSW-Ack frame shall be sent by the responder to the initiator. The SSW-Ack frame should be sent using the DMG antenna indicated in the DMG Antenna Select field in the last SSW-Feedback frame.

The responder may include transmit training as part of the beam refinement phase by setting the TX-TRN-REQ field to 1 in the SSW-Ack frame and setting the L-RX field to indicate the length of the training sequence it requests the initiator to use in the beam refinement phase, as described in 9.5.4. The responder may carry out a MID subphase by setting the MID-REQ bit to 1 in the BRP Request field of the SSW frame. In this case, it shall also set the L-RX field to indicate the number of receive AWVs it uses during the MID subphase. The responder may carry out a BC subphase by setting the BC-REQ bit to 1. If the initiator has set either the MID-REQ or the BC-REQ fields to 1 in the SSW-Feedback frame, the responder may set the MID-Grant or the BC-Grant fields to 1, or both, to grant the requests.

If the RSS comprises SSW frames, at the start of an SSW ack procedure, the initiator should have its receive antenna array configured to a quasi-omni antenna pattern using the DMG antenna through which it received with the highest quality during the RSS, or the best receive sector if an RXSS has been performed during the RSS, and should not change its receive antenna configuration while it attempts to receive from the responder until the expected end of the SSW ack procedure. If the RSS comprises Short SSW PPDUs, at the start of an SSW ack procedure, the initiator should have its receive antenna array configured to a quasi-omni antenna pattern using the DMG antenna used to transmit the preceding SSW-Feedback frame.

10.41.3 Beam Refinement Protocol (BRP) phase

10.41.3.1 General

BRP is a process in which a STA trains its RX and TX antenna array(s) and improves its TX antenna configuration and RX antenna configuration using an iterative procedure. BRP may be used regardless of the antenna configuration a STA supports.

The BRP phase is composed of a BRP setup subphase, a Multiple sector ID Detection (MID) subphase, a Beam Combining (BC) subphase, a subset of the previous subphases, and one or more beam refinement transactions. BRP setup allows STAs to exchange beam refinement capability information and to request the execution of the other BRP subphases. MID and BC (collectively, the MIDC subphase) are optionally used to find better initial AWVs for iterative beam refinement than might have been found by SLS due to imperfect quasi-omni receive antenna patterns. In MID, a quasi-omni transmit pattern is tested against a number of receive AWVs; this reverses the scanning roles from the transmit sector sweep. In BC, a small set of transmit and receive AWVs are tested in pairwise combinations, thus avoiding the use of quasi-omni patterns. Finally, given the starting point from SLS or MIDC, STAs can explore a broader set of transmit and receive AWVs using a request/response frame exchange referred to as a *beam refinement transaction*.

The BRP setup subphase may be skipped if the BRP phase does not include a MID or BC subphase. MID and BC subphases can be skipped if either STA indicates that the subphase is not needed by setting the MID-REQ and BC-REQ fields to 0 or by setting the MID-Grant and BC-Grant fields to 0. The beam refinement transaction can be skipped if both sides indicate that the transaction is not needed by setting the L-RX and TX-TRN-REQ fields to 0.

The BRP setup subphase is defined in 10.41.3.2.

The MID subphase is composed of either an R-MID subphase or an I-MID subphase or both, which are composed of one or more transmissions of BRP-RX PPDUs (20.9.2.2), followed by feedback contained in the next BRP frames from the initiator and responder.

The BC subphase is composed of either an R-BC subphase or an I-BC subphase or both, which are composed of transmission of BRP-RX PPDUs to select a beam, followed by feedback.

A beam refinement transaction is a set of BRP frames consisting of beam refinement requests and responses. A beam refinement request can be either a transmit beam refinement request or a receive beam refinement request or both.

A transmit beam refinement request (TX-TRN-REQ field within the BRP Request field set to 1) indicates the need for transmit antenna array training by the transmitting STA. The BRP PPDU that has the TX-TRN-REQ set to 1 (or the next BRP PPDU from this STA) shall include transmit training (TRN-T) subfields appended to it. The STA responding to the BRP PPDU shall include feedback based on measurements it performed during the reception of the BRP PPDU. The feedback type is dictated by the FBCK-TYPE field within the DMG Beam Refinement element contained in the BRP PPDU.

A receive beam refinement request (L-RX field within the BRP Request field greater than zero) indicates the need of the receive antenna array training for the transmitting STA. The responding STA shall respond with a BRP PPDU with receive training (TRN-R) subfields appended to it.

An EDMG STA may enable training of both TX and RX on the same PPDU by setting the TXVECTOR parameter EDMG_TRN_LEN to a value greater than 0 and the parameter RX_TRN_PER_TX_TRN to a value greater than one.

Prior to transmitting an EDMG PPDU on a 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, or 4.32+4.32 GHz channel, an EDMG STA may use the BRP phase described in this subclause or the BRP TXSS protocol defined in 10.41.10.5 (BRP transmit sector sweep (BRP TXSS)) to perform beamforming training over the channel.

Requests and responses can be combined in the same frame. As an example, the same frame can be both a transmit beam refinement request and a receive beam refinement request. The same frame can also be used as receive beam refinement response and a receive beam refinement request. See the example in Figure 10-84 (Example of beam refinement transaction outside of TDD SP allocation).

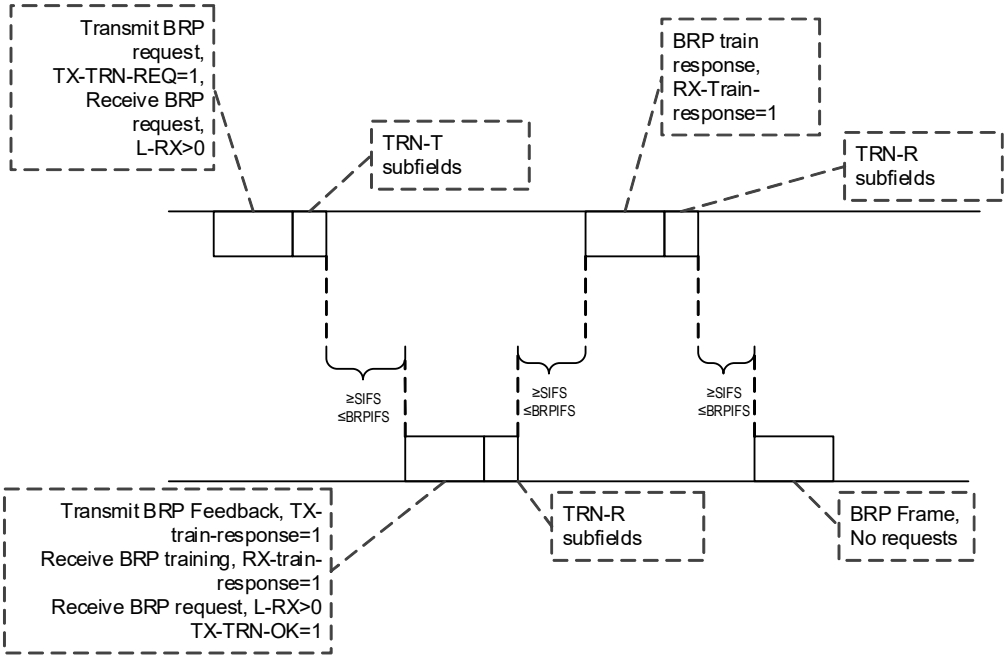

Figure 10-84—Example of beam refinement transaction outside of TDD SP allocation

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A beam refinement response is separated from a preceding beam refinement request by at least a SIFS and at most a BRPIFS provided sufficient time is available for the complete transmission of those frames within the SP allocation that is not a TDD SP or TXOP. Similarly, a beam refinement request, if any, is separated from a preceding beam refinement response by at least a SIFS and at most a BRPIFS provided sufficient time is available for the complete transmission of the beam refinement request within the SP allocation is not a TDD SP or TXOP.

An EDMG STA may send a beam refinement request to a peer EDMG STA with the EDMG-SHORT-BRP subfield within the BRP Request field set to 1. The peer EDMG STA shall send the response to this request separated by at least SIFS and at most MBIFS from the reception of the request. In this case, the response shall also have the EDMG-SHORT-BRP subfield within the BRP Request field set to 1.

In a TDD SP, a non-AP and non-PCP STA transmits a beam refinement response to a preceding beam refinement request from an AP or PCP in the earliest occurring TDD slot the non-AP and non-PCP STA is assigned to, with access permission of the TDD slot set to simplex RX TDD slot, and with slot category of the TDD slot set to Basic TDD slot, as indicated in the TDD Slot Schedule element (see 9.4.2.281).

In a TDD SP, an AP or PCP transmits a beam refinement response to a preceding beam refinement request from a non-AP and non-PCP STA in the earliest occurring TDD slot the non-AP and non-PCP STA is assigned to, with access permission of the TDD slot set to simplex TX TDD slot, and with slot category of the TDD slot set to Basic TDD slot, as indicated in the TDD Slot Schedule element (see 9.4.2.281).

When performing BRP outside a TDD SP allocation, if a responding STA requires longer than SIFS to transmit a BRP frame as a response for beam refinement training request from a requesting STA, the responding STA should keep the IFS not longer than SIFS by transmitting one or more PPDUs to the requesting STA.

When the beam refinement occurs within the same allocation as the SLS, the SLS initiator is the beam refinement initiator. If the beam refinement occurs in a separate allocation, the STA that transmits the first beam refinement request is the beam refinement initiator. The other STA is the beam refinement responder.

A beam refinement transaction is complete when one of the following conditions is met:

a) The initiator determines that it does not need further training and it has received a BRP frame with no training requests from the beam refinement responder.
b) When performing BRP outside of a TDD SP allocation, a duration equal to BRPIFS plus aSlotTime has elapsed since the last transmission from the beam refinement initiator to the refinement responder without a response from the beam refinement responder.
c) When performing BRP in a TDD SP allocation, a response from the beam refinement responder is not received in the earliest occurring TDD slot that allows for its transmission.

In Figure 10-84 (Example of beam refinement transaction outside of TDD SP allocation), the first PPDU (from the initiator) has TX-TRN-REQ=1, the L-RX field has a value greater than zero and TRN-T subfields are appended to the PPDU. The second PPDU (from the responder) has a value greater than zero in the L-RX field, the TX-train-response field set to 1, the RX-train-response field set to 1, and TRN-R subfields are appended to the PPDU. The last PPDU (from the initiator) has RX-train-response set to 1 and TRN-R subfields are appended to the PPDU.

10.41.3.2 BRP setup subphase

The BRP setup subphase is used to exchange the intent and capabilities to conduct some or all of the subphases and beam refinement transactions in a subsequent BRP phase. The BRP setup subphase is used to set up the MIDC subphase, but can also be used to set up beam refinement transactions.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The BRP setup subphase shall be used in the following cases:

— When the RSS part of the SLS phase occurred in an A-BFT, in which case the SSW-Ack frame was not part of the SLS.
— When the initiator set the MID-REQ or BC-REQ fields in the SSW-Feedback frame to 1 or the responder set the MID-REQ or BC-REQ fields in the SSW-Ack frame to 1.
— When the initiator intends to include MID or BC or both subphases, independent of a preceding SLS phase.

The BRP setup subphase starts with the initiator sending a BRP PPDU with the Capability Request subfield set to 1 and with the remaining subfields within the BRP Request field set according to the initiator's need for an MID subphase, a BC subphase, and a beam refinement subphase. The BRP setup subphase can also start when the responder grants a MID-REQ or BC-REQ through the SSW-Ack frame or when the responder requests MID or BC in the SSW-Ack frame. Upon receiving a BRP PPDU with the Capability Request subfield set to 1, the responder shall respond with a BRP PPDU with the subfields within the BRP Request field set to indicate the presence of an MID subphase, a BC subphase and a beam refinement subphase. This process is repeated until the responder transmits to the initiator a BRP PPDU with the Capability Request subfield set to 0 and the initiator sends as a response a BRP PPDU with the Capability Request subfield also set to 0. The BRP PPDU from the initiator that initiates the termination of the BRP setup subphase can be the first BRP PPDU of the BRP phase, either as part of beam refinement or as part of a MID or BC subphase.

A DMG STA (either initiator or responder) requests MID and BC subphases (see 10.41.6.3.2) by setting both the MID-REQ and BC-REQ subfields to 1 in the BRP Request field of an SSW-Feedback, SSW-Ack or BRP frame. It shall also set the L-RX subfield in the BRP Request field to the number of RX AWV settings it needs in each BRP-RX PPDU during the MID subphase. The peer STA grants the request by setting the MID-Grant and BC-Grant subfields to 1 in the BRP Request field within the next SSW-Ack or BRP frame transmitted to the requesting DMG STA. If either the MID or BC were not granted by the peer STA, the MID and BC subphases shall not occur.

A DMG STA (either initiator or responder) requests an MID only subphase (see 10.41.6.3.3) by setting the MID-REQ subfield to 1 in the BRP Request field of an SSW-Feedback, SSW-Ack or BRP frame. The STA shall also set the L-RX subfield in the BRP Request field to the number of RX AWV settings it needs in each BRP-RX PPDU during the MID-subphase. The peer STA grants the request by setting the MID-Grant subfield to 1 in the BRP Request field within the next SSW-Ack or BRP frame transmitted to the requesting DMG STA. The Capability Request subfield and request subfields (TX-TRN-REQ, L-RX, MID-REQ, BC-REQ) within the granting frame shall be set to 0.

If the MID-REQ was granted, the requesting STA shall transmit a BRP frame with the SNR Present and Sector ID Order Present subfields set to 1 and with the Number of Measurements field in the FBCK-TYPE field indicating the number of SNR measurements from the last SLS phase. In the Channel Measurement Feedback element, the requesting STA sets the SNR subfields to the SNRs corresponding to the TX sectors received during the SLS phase. In the Sector ID Order subfield, the requesting STA lists the sector IDs of the received sectors. The Capability Request field within the BRP frame shall be set to 0. The MID subphase starts with the transmission of a BRP PPDU from the peer STA after the reception of the list of sectors. A STA that has granted a MID only request shall not request MID or BC in the response PPDU. The STA may request MID or BC in the last PPDU it transmits to the requesting STA as part of the MID. The MID only subphase shall not occur if it was not granted by the peer STA.

A DMG STA (either initiator or responder) requests a BC only subphase (see 10.41.6.3.4) by setting the BC-REQ subfield to 1 in the BRP Request field of an SSW-Feedback, SSW-Ack, or BRP frame. The peer STA (either a responder or initiator) grants the request by setting the BC-Grant subfield to 1 in the BRP Request field within the next SSW-Ack or BRP frame transmitted to the requesting STA. The BC subphase shall not occur if the peer STA does not grant the request.

A DMG STA indicates that beam refinement transactions (10.41.6.4.2) occur by setting the L-RX field to a value greater than 0 to indicate the need for receive beam refinement or by setting the value of the TX-TRN-REQ field to 1 to indicate the need for transmit beam refinement or by setting both. The beam refinement transactions shall occur if at least one of these conditions is met.

If the initiator has requested an MID subphase by setting the MID-REQ subfield or the BC-REQ subfield to 1 and the responder rejected by setting in the response the MID-Grant subfield or the BC-Grant subfield to 0, respectively, the initiator should send a BRP frame with the MID-REQ field set to 0 and the L-RX field set to indicate the number of TRN-R subfields the initiator requests for use in the BRP transaction.

If the responder has requested an MID subphase by setting the MID-REQ subfield or the BC-REQ subfield to 1 and the initiator rejected by setting in the response the MID-Grant or the BC-Grant subfields to 0, the initiator should send a BRP frame with the Capability Request subfield set to 1. The responder shall respond with a BRP frame with the MID-REQ field set to 0 and the L-RX field set to indicate the number of TRN-R subfields the responder requests for use in the BRP transaction.

Beam refinement transactions shall occur following a MIDC subphase when one or both of the following conditions are met at the last BRP frame transmitted by either the initiator or responder as part of the MID or BC subphases:

a) Either the initiator or the responder set the L-RX field to a value greater than 0.
b) Either the initiator or responder has set the value of the TX-TRN-REQ field to 1.

If within the appropriate IFS the initiator does not receive a response from the responder to a PPDU transmitted to the responder, the initiator may retransmit the PPDU.

After the BRP setup subphase, beamforming training shall immediately continue to the next phase (i.e., either MIDC subphase or the beam refinement transactions). Examples of BRP setup subphase procedures are illustrated in Figure 10-85 (Example of BRP setup subphase procedure (SLS in BTI and A-BFT)) and Figure 10-86 (Example of skipping the BRP setup subphase (SLS in DTI)) as well as in Figure 10-94 (Example of time allocation for the MIDC subphase with the MID subphase only), Figure 10-95 (Example of using BRP setup subphase to set up subsequent MIDC subphase in A-BFT and DTI), and Figure 10-101 (Example of using BRP setup subphase to set up subsequent R-MID subphase).

10.41.4 Beamforming in BTI

In the BTI, the AP or PCP performs an initiator TXSS as the first part of the SLS with the transmission of at least one DMG Beacon frame. The AP or PCP does not transmit SSW frames in the BTI (10.41.2.2.1).

The AP or PCP may fragment the initiator TXSS over multiple consecutive BTIs by not transmitting a DMG Beacon frame through all sectors available to the AP or PCP in a single BTI. In a BTI with a fragmented initiator TXSS, the AP or PCP shall transmit DMG Beacon frames with the Fragmented TXSS field set to 1. Otherwise, the AP or PCP shall set the Fragmented TXSS field to 0. The AP or PCP shall not change the duration of the next BTI if at least one of the DMG Beacon frames transmitted in the current BTI have the Fragmented TXSS field set to 1. The CDOWN field shall be set to the total number of transmissions remaining to the end of the initiator TXSS, such that the last DMG Beacon frame transmission of the initiator TXSS has the CDOWN field set to 0 (i.e., in a fragmented TXSS, the value of the CDOWN field covers the total number of transmissions remaining in the fragmented TXSS). The TXSS Span field shall be set to the total number of beacon intervals it takes the AP or PCP to complete the entire TXSS phase.

The Duration field within each transmitted DMG Beacon frame shall be set to the time remaining until the end of the current BTI, except in an EDMG BSS if the value of the Next A-BFT subfield is equal to 0 and the value of the A-BFT Multiplier subfield is greater than 0 in the transmitted DMG Beacon frame. In this

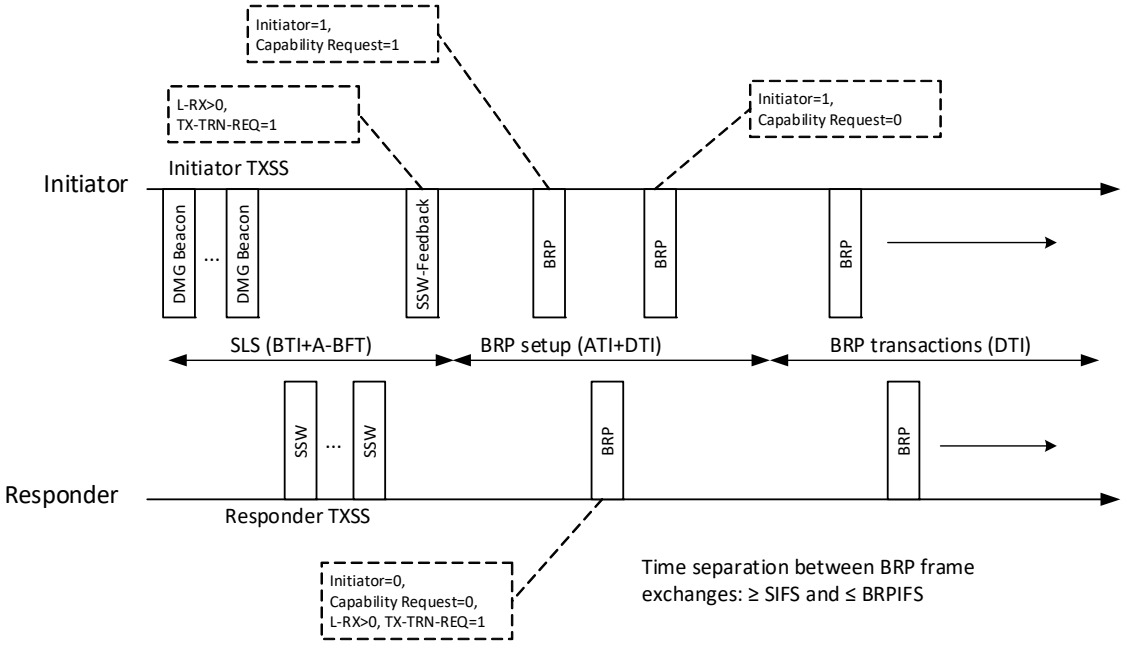

Figure 10-85—Example of BRP setup subphase procedure (SLS in BTI and A-BFT)

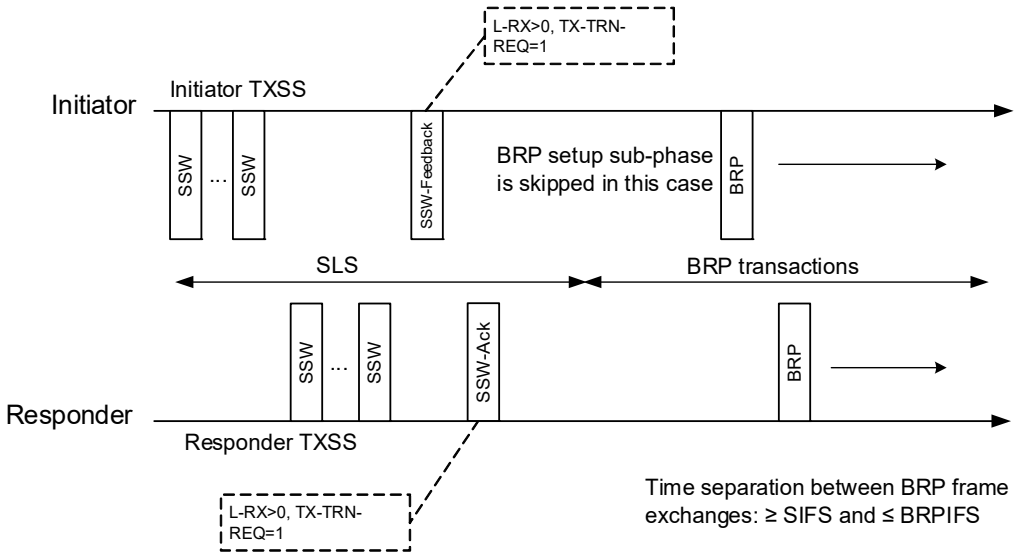

Figure 10-86—Example of skipping the BRP setup subphase (SLS in DTI)

case, the value of the Duration field shall be set to the time remaining until the end of the transmission of the last DMG Beacon frame in the BTI plus MBIFS plus the duration equivalent to the multiplication of the value of the A-BFT Length subfield and the value of the A-BFT Multiplier subfield. In the latter case, the duration of the BTI covers DMG Beacon transmissions and the additional SSW slots that are present in the A-BFT (see 10.41.5 (Beamforming in A-BFT)).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When an AP or PCP has more than one DMG antenna, the TXSS shall cover all of the sectors in all DMG antennas. The TXSS Span field indicates the total number of beacon intervals it takes the AP or PCP to cover all sectors in all DMG antennas. The value of the TXSS Span field shall be lower than dot11MaximalSectorScan.

A non-EDMG AP or non-EDMG PCP, or an EDMG AP or EDMG PCP with a single RF chain, shall not change DMG antennas within a BTI. For an EDMG AP or EDMG PCP having multiple RF chains, the EDMG AP or EDMG PCP may switch from one RF chain to another RF chain within a BTI. The set of DMG antennas that are used for DMG Beacon transmission in a BTI form a DMG antenna group. The EDMG AP or EDMG PCP shall not change DMG antennas for the RF chains used within a BTI. Figure 10-87 (Example of use of multiple DMG antennas during BTI and A-BFT) shows an example of an EDMG AP or EDMG PCP using a DMG antenna group consisting of DMG antenna 0 and 1 in the BTI and the A-BFT of a first beacon interval, and using another DMG antenna group consisting of DMG antenna 2 and 3 in the BTI and the A-BFT of the following beacon interval.

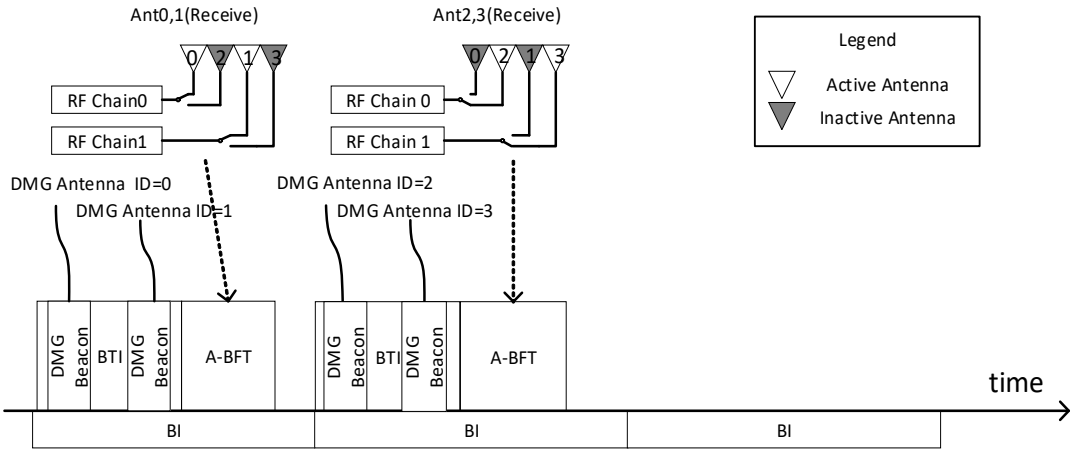

Figure 10-87—Example of use of multiple DMG antennas during BTI and A-BFT

The AP or PCP has a regular schedule of transmitting through each DMG antenna (see 10.41.5.4).

NOTE—If an unassociated responder receives a DMG Beacon frame in the BTI with a fragmented initiator TXSS, the responder may start a responder TXSS in the following A-BFT or can perform beamforming training for asymmetric links in a subsequent allocation (see 10.41.10.3 (Beamforming for asymmetric links)). Alternatively, the responder may scan for the number of beacon intervals indicated in a received TXSS Span field in order to cover a complete initiator TXSS and find a suitable TX sector from the AP or PCP to start a responder TXSS or beamforming training for asymmetric links.

Each subfield in the Beacon Interval Control field and DMG Parameters field of each DMG Beacon frame transmitted by the AP or PCP shall retain the same value from start to completion of a TXSS phase.

A PPDU containing a DMG Beacon frame transmitted by an EDMG STA may include TRN-R subfields within the TRN field of the PPDU to enable receive training by an EDMG STA receiving the DMG Beacon. Figure 10-88 (Receive beamforming training during the BTI through the use of TRN-R fields)depicts an example of how an EDMG STA receiving such a DMG Beacon may use the TRN field appended to a DMG Beacon frame to perform receive beamforming. Although inclusion of TRN-R subfields within a PPDU does not require prior scheduling, the EDMG STA transmitting the DMG Beacon may announce the presence of TRN-R subfields in a subsequent BTI by transmitting an EDMG Training Field Schedule element in DMG Beacon, Announce, Probe Response or Association Response frames.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

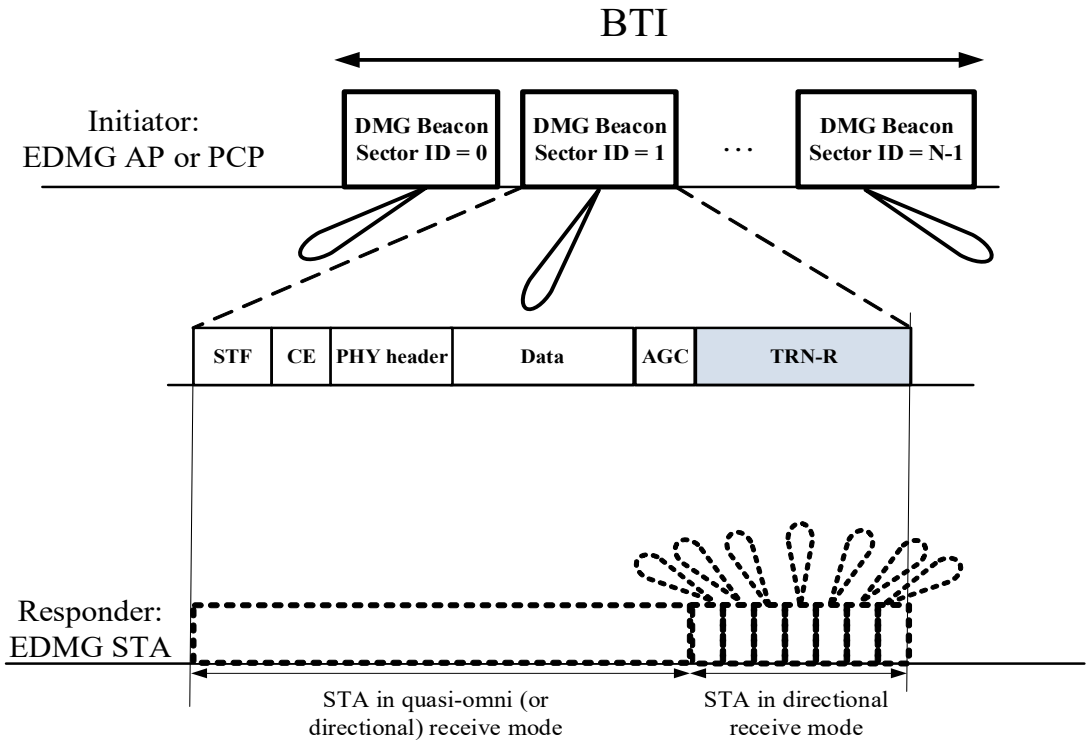

Figure 10-88—Receive beamforming training during the BTI through the use of TRN-R fields

An EDMG STA may set the TRN-LEN parameter of the TXVECTOR of a PPDU containing a DMG Beacon frame to a value greater than or equal to 0 if the PPDU_TYPE parameter of the TXVECTOR is set to TRN-R. The PPDU_TYPE parameter of the TXVECTOR of a PPDU containing a DMG Beacon frame shall not be set to TRN-T.

If a DMG Beacon frame is transmitted by an EDMG STA using a quasi-omni antenna pattern, the Quasi-omni TX subfield in the SSW field in the frame shall be set to 1. An EDMG STA may append receive training (TRN-R) subfields to DMG Beacon frames transmitted with the Quasi-omni TX subfield in the SSW field set to 1 to enable receive training and, subsequently, selection of a transmit sector by a receiving STA that supports antenna reciprocity or antenna pattern reciprocity. Antenna reciprocity and antenna pattern reciprocity are indicated by setting the DMG Antenna Reciprocity field and Antenna Pattern Reciprocity field in the DMG Capabilities element to 1, respectively.

10.41.5 Beamforming in A-BFT

10.41.5.1 Allocation of A-BFT

The AP or PCP shall allocate an A-BFT period MBIFS following the end of a BTI that included a DMG Beacon frame transmission with Next A-BFT equal to 0.

Following the end of a BTI, the AP or PCP shall decrement the value of the Next A-BFT field by 1 provided it is not equal to 0 and shall announce this value in the next BTI. The AP or PCP may increase the Next A-BFT field value following a BTI in which the Next A-BFT field was equal to 0. A STA shall consider that a

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

BTI is completed at the expiration of the value within the Duration field of the last DMG Beacon frame received in that BTI.

All DMG Beacon frames transmitted within the number of beacon intervals specified within the most recently updated TXSS Span field have the same value for each subfield within the Beacon Interval Control field (11.1.3.3).

When allocating an A-BFT over the primary channel, an EDMG PCP or EDMG AP may also allocate an A-BFT over a secondary channel. This is indicated by the A-BFT in Secondary Channel subfield in the Beacon Interval Control field of a DMG Beacon frame. The A-BFT allocated over the secondary channel has the same start time, length and SSW slot configuration as the A-BFT allocated on the primary channel and signaled through the Beacon Interval Control field of the DMG Beacon frame. An EDMG STA may access the A-BFT allocated over a secondary channel and, in this case, shall use the same access rules specified in this subclause.

An EDMG AP or EDMG PCP that transmits a DMG Beacon frame with the value of the A-BFT in Secondary Channel subfield set to a nonzero value shall support simultaneously receiving SSW frames transmitted by EDMG STAs during the corresponding A-BFT on the primary and adjacent secondary channels and, in response, shall support simultaneously transmitting SSW-Feedback frames on the primary and adjacent secondary channels using the same sector of the same DMG antenna as indicated in the SSW frame(s) received within the same SSW slot.

To accommodate a larger number of STAs attempting access during the A-BFT, the number of SSW slots available to EDMG STAs in an A-BFT can be increased compared to what is available to non-EDMG STAs. The presence of additional SSW slots is indicated through the A-BFT Multiplier subfield in the Beacon Interval Control field in a DMG Beacon frame. When the A-BFT Multiplier field is nonzero and the Next A-BFT field is 0, an EDMG STA subtracts (A-BFT Multiplier × A-BFT Length) from the value of the Duration field of the received DMG Beacon frame to determine the start time of the additional SSW slots available to the EDMG STA. These additional SSW slots are then immediately followed by the SSW slots available to both EDMG and non-EDMG STAs, which is indicated by the value of the A-BFT Length field. Thus, from an EDMG STA's perspective, the A-BFT contains A-BFT Length × (1 + A-BFT Multiplier) SSW slots.

10.41.5.2 Operation during the A-BFT

Beamforming training in the A-BFT consists of the RSS and SSW feedback procedures of the SLS between the AP or PCP and a STA.

In the A-BFT, the AP or PCP is the initiator and the STA is the responder in the RSS part of the SLS (10.41.2.3). The BRP phase shall not be performed within the A-BFT. A STA shall not transmit in the A-BFT of a beacon interval if it does not receive at least one DMG Beacon frame during the BTI of that beacon interval.

In all cases, a DMG STA may use SSW frames to perform an RSS during the A-BFT. If the BSS is an EDMG BSS and if the STA is associated with the BSS, an EDMG STA may use Short SSW PPDUs (see 28.9.1 (Short SSW PPDU)) instead of SSW frames to perform an RSS during the A-BFT. When using Short SSW PPDUs, an EDMG STA can transmit more Short SSW PPDUs within an SSW slot compared to when SSW frames are used.

A DMG STA that receives a DMG Beacon frame with the Discovery Mode field equal to 1 may transmit in the A-BFT following the BTI where the DMG Beacon frame is received if at least one of the following conditions is met:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The CC Present field within the received DMG Beacon frame is equal to 1 and the STA's MAC address is equal to the value of the A-BFT Responder Address subfield within the received DMG Beacon frame.
— The CC Present field within the received DMG Beacon frame is equal to 1, the value of the A-BFT Responder Address subfield within the received DMG Beacon frame is a group address of a group to which the STA belongs, and the responding STA's role matches the role identified by the value of the BSS Type subfield within the received DMG Beacon frame and the Responding STA role column of Table 9-99.
— The CC Present field within the received DMG Beacon frame is equal to 0.

If none of these conditions is met following the reception of a DMG Beacon frame with the Discovery Mode field equal to 1, the STA shall not transmit in the A-BFT.

The A-BFT is slotted and the length of the A-BFT is an integer multiple of the sector sweep slot time. The structure of the A-BFT when SSW frames are used is shown in Figure 10-89 (A-BFT structure when SSW frames are used). The structure of the A-BFT when Short SSW PPDUs are used is shown in Figure 10-89 (A-BFT structure when SSW frames are used). A non-EDMG AP or non-EDMG PCP shall announce the size of the A-BFT in the A-BFT Length subfield of the Beacon Interval Control field (9.3.4.2), while an EDMG AP or EDMG PCP shall also use the A-BFT Multiplier subfield of the Beacon Interval Control field. The first SSW slot begins at the start of the A-BFT, and the following SSW slots are adjacent and nonoverlapping. An SSW slot (Figure 10-91 (SSW slot (aSSSlotTime) definition)) is a period of time within the A-BFT that can be used by a responder to transmit at least one SSW frame. An SSW slot has a duration of aSSSlotTime. aSSSlotTime is defined to be

aSSSlotTime = aAirPropagationTime + aSSDuration + MBIFS + aSSFBDuration + MBIFS

where

aAirPropagationTime	accounts for the propagation delay between the initiator and the responder
aSSDuration	provides, if the STA transmits SSW frames in the A-BFT, time for a responder to transmit up to the number of SSW frames announced in the FSS subfield of the Beacon Interval Control field in the DMG Beacon (see 11.37 (DMG MAC sublayer attributes)); otherwise, if the STA transmits Short SSW PPDUs in the A-BFT, the number of Short SSW PPDUs the STA may transmit is a function of the value of the FSS subfield of the Beacon Interval Control field in the DMG Beacon as indicated by Table 10-36
aSSFBDuration	provides time for the initiator to perform an SSW feedback procedure (see 11.37)

Table 10-36—Number of Short SSW PPDUs as a function of the FSS subfield value

Value of the FSS subfield	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Number of Short SSW PPDUs	1	3	4	6	8	9	11	12	14	16	17	19	21	22	24	25

The initiator shall set the FSS subfield of the Beacon Interval Control field in the DMG Beacon frame to a value that is no less than aSSFramesPerSlot. See Figure 10-89 (A-BFT structure when SSW frames are used).

Example of A-BFT with length 8 and with each SSW slot accommodating 8 SSW frames. A possible contention between 3 STAs is shown in the figure below: STAs A, B and C are competing for access. All STAs choose a random value between [0,7]. STA A chooses value = 2, while STAs B and C choose value = 5, which might result in a collision.

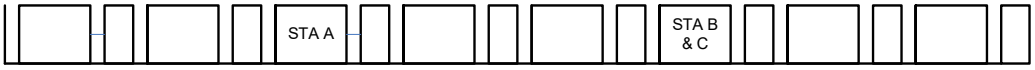

Figure 10-89—A-BFT structure when SSW frames are used

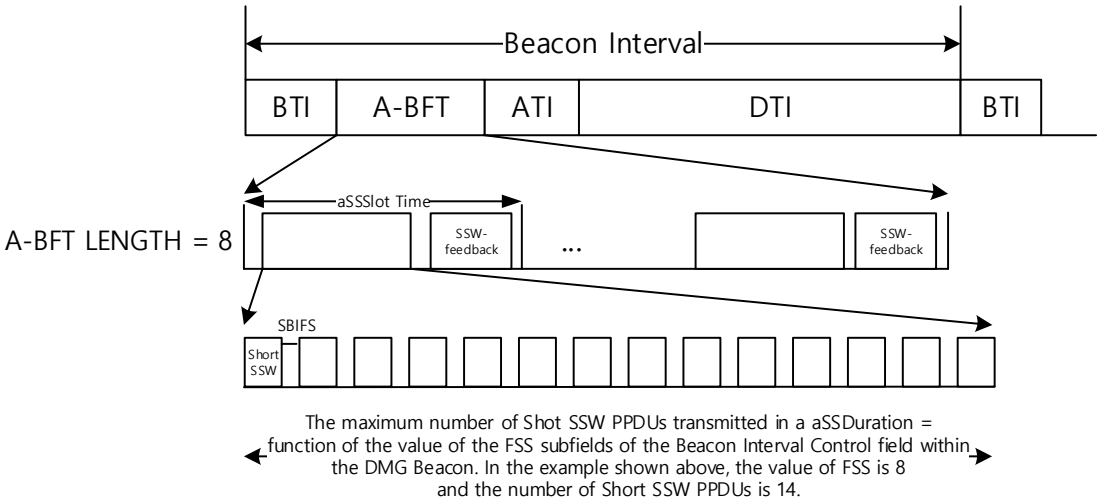

Figure 10-90—A-BFT structure when Short SSW PPDUs are used

If the IsResponderTXSS subfield of the Beacon Interval Control field is equal to 1, the A-BFT shall be used to perform a responder TXSS. Otherwise, the A-BFT shall be used to perform a responder RXSS. In the case of a responder RXSS, the same slotted structure described above is used and the responder shall transmit the

number of SSW frames announced in the FSS field in the DMG Beacon. If the AP or PCP allocates the A-BFT as a responder RXSS, it should set the value of the FSS field within the Beacon Interval Control to the number of receive sectors supported by the AP or PCP. The AP or PCP shall allocate the A-BFT as a responder TXSS at least once every dot11ABFTRTXSSSwitch beacon intervals in which an A-BFT is present.

At the start of each A-BFT, the responder(s) shall invoke a random backoff procedure to initiate or resume an RSS as follows. If either the initiator or the responder is a non-EDMG STA, the random backoff procedure begins at the start of the A-BFT with the responder selecting a backoff count as a random integer drawn from a uniform distribution [0, A-BFT Length), i.e., 0 to A-BFT Length – 1, where A-BFT Length is the value of the A-BFT Length field in the last received DMG Beacon. If both the initiator and the responder are EDMG STAs, the random backoff procedure begins at the start of the A-BFT with the responder:

— Selecting a single 2.16 GHz channel where the A-BFT is present based on the value of the A-BFT in Secondary Channel subfield in the last received DMG Beacon. Any frame transmission between the initiatior and responder during the A-BFT shall be performed using the selected channel.

— Selecting a backoff count as a random integer drawn from a uniform distribution [0, A-BFT Length + A-BFT Length × A-BFT Multiplier), i.e., 0 to A-BFT Length + A-BFT Length × A-BFT Multiplier – 1, where A-BFT Length and A-BFT Multiplier are the values of the A-BFT Length and A-BFT Multiplier fields, respectively, in the last received DMG Beacon.

The responder shall decrement the backoff count by one at the end of each SSW slot, even if the CS function at the responder indicates the medium busy condition for that SSW slot. The responder may initiate the RSS only at the start of the SSW slot for which the backoff count is 0 at the beginning of the SSW slot. See Figure 10-91 (SSW slot (aSSSlotTime) definition).

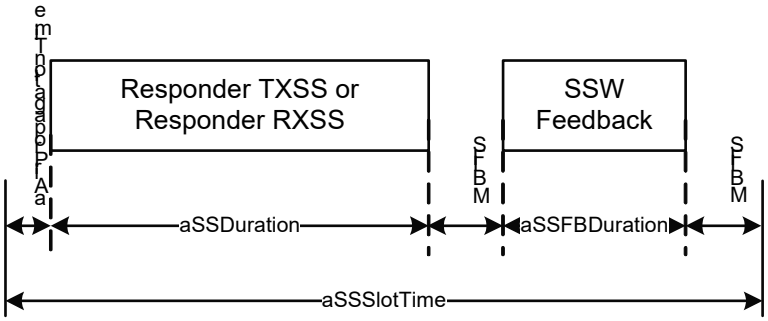

Figure 10-91—SSW slot (aSSSlotTime) definition

The responder shall transmit no more SSW frames within an SSW slot than indicated in the value of the FSS subfield in the DMG Beacon. If the responder has more SSW frames to transmit as part of the RSS, but is not allowed to send any more SSW frames in the current SSW slot, then the responder may resume the RSS at the start of the following SSW slot provided that the A-BFT has not ended. If the responder cannot complete the RSS before the end of the A-BFT, it may use the same backoff procedure described above to resume the RSS at the next A-BFT for which the value of the IsResponderTXSS field is the same as the current A-BFT.

For a non-EDMG AP or a non-EDMG PCP or if the A-BFT in Secondary Channel subfield is 0, the initiator shall initiate an SSW feedback procedure to a responder (10.41.2.4) at a time such that the beginning of the first symbol of the SSW-Feedback frame on the WM occurs at aSSFBDuration + MBIFS before the end of the SSW slot. If the A-BFT in Secondary Channel subfield is a nonzero value and an EDMG AP or EDMG PCP received SSW frames transmitted from different EDMG STAs on the primary channel and/or adjacent secondary channel(s) with the same Sector ID and the DMG Antenna ID subfield values, the initiator shall initiate an SSW feedback procedure to the responder(s) on the corresponding primary channel and/or adjacent channel(s) at a time such that the beginning of the first symbol of the SSW-Feedback frame(s) on the WM occurs at aSSFBDuration + MBIFS before the end of the SSW slot. If the A-BFT in Secondary Channel subfield is set to a nonzero value and an EDMG AP or EDMG PCP received SSW frame(s) transmitted from different EDMG STAs on the primary channel and/or adjacent secondary channel(s) with different Sector ID or DMG Antenna ID subfield values, the initiator shall initiate an SSW feedback procedure to the responder on the primary channel at a time such that the beginning of the first symbol of the SSW- Feedback frame on the WM occurs at aSSFBDuration + MBIFS before the end of the SSW slot, and/ or should initiate the SSW feedback procedure to the responder(s) on the adjacent secondary channel(s) at a time such that the beginning of the first symbol of the SSW-Feedback frame on the WM occurs at aSSFBDuration + MBIFS before the end of the next available SSW slot (s).

A responder that transmitted at least one SSW frame or Short SSW PPDU within an SSW slot shall be in quasi-omni receive mode for a period of aSSFBDuration ending MBIFS before the end of the SSW slot. The initiator may initiate an SSW feedback procedure to the responder at an SSW slot even if the responder did not complete RSS within that SSW slot. If the initiator transmits an SSW-Feedback under this circumstance, it can transmit an Announce frame to the responder in an ATI. Following the reception of the Announce frame, the responder can respond with an SPR frame requesting time for the responder to continue with the RSS. Alternatively, the responder can transmit an SPR frame to the AP or PCP in accordance with the channel access rules.

The information contained in an SSW-Feedback frame is based on the SSW frames received during the SSW slot in which the SSW-Feedback frame was transmitted. To communicate with each other following an SLS, an initiator and responder should use the information contained within the SSW-Feedback frame that had the highest value in its SNR Report field and was transmitted or received, respectively, as part of the most recent SLS between the initiator and responder.

A responder that receives an SSW-Feedback frame from the initiator during an A-BFT that was allocated with a DMG Beacon frame with Discovery Mode equal to 1 should not attempt to access the following aMaxABFTAccessPeriod A-BFT allocations to redo beamforming with the initiator, unless in the BTI preceding the A-BFT the responder receives a DMG Beacon frame that has the Discovery Mode field equal to 1, the CC Present field equal to 1 and the value of the A-BFT Responder Address subfield equal to the responder’s MAC address. This allows other STAs the opportunity to successfully contend for A-BFT access and perform beamforming with the initiator.

The responder may attempt to restart the RSS within the same A-BFT if it does not receive an SSW-Feedback frame from the initiator by the end of the SSW slot in which it completes the RSS. To do this, the responder shall invoke the random backoff procedure beginning at the start of the SSW slot following the completion of the RSS. If either the initiator or the responder is a non-EDMG STA, the responder shall select a backoff count as a random integer drawn from a uniform distribution [0, A-BFT Length), i.e., 0 to A-BFT Length – 1, where A-BFT Length is the value of the A-BFT Length field in the last received DMG Beacon. If both the initiator and the responder are EDMG STAs, the random backoff procedure begins at the start of the A-BFT with the responder:

— Selecting a single 2.16 GHz channel where the A-BFT is present based on the value of the A-BFT in Secondary Channel subfield in the last received DMG Beacon. Any frame exchange between the initiator and responder during the A-BFT shall be performed using the selected channel.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Selecting a backoff count as a random integer drawn from a uniform distribution [0, A-BFT Length + A-BFT Length × A-BFT Multiplier), i.e., 0 to A-BFT Length + A-BFT Length × A-BFT Multiplier – 1, where A-BFT Length and A-BFT Multiplier are the values of the A-BFT Length and A-BFT Multiplier fields, respectively, in the last received DMG Beacon.

The responder shall decrement the backoff count by one at the end of each SSW slot, even if the CS function at the responder indicates the medium busy condition for that SSW slot. The responder may restart the RSS at the start of the SSW slot for which the backoff count is 0 at the beginning of the SSW slot provided the A-BFT still has SSW slots available.

At the end of an A-BFT the responder shall cancel a backoff procedure that was started during the A-BFT, but has not been completed at the end of the A-BFT. As described above, the responder invokes a random backoff procedure at the start of each A-BFT.

Each STA maintains a counter, FailedRSSAttempts, of the consecutive number of times the STA initiates RSS during A-BFTs but does not receive an SSW-Feedback frame as a response. If FailedRSSAttempts exceeds RSSRetryLimit, the STA shall select a backoff count as a random integer drawn from a uniform distribution [0, RSSBackoff), i.e., 0 to RSSBackoff – 1. For a non-EDMG STA the value of RSSRetryLimit is equal to dot11RSSRetryLimit and the value of RSSBackoff is equal to dot11RSSBackoff, and for an EDMG STA the value of RSSRetryLimit is equal to the value of the RSS Retry Limit subfield in the last received EDMG Operation element and the value of RSSBackoff is equal to the value the RSS Backoff subfield in the last received EDMG Operation element. The responder shall decrement the backoff count by one at the end of each A-BFT period in the following beacon intervals. The responder may reinitiate RSS only during an A-BFT when the backoff count becomes zero. The STA shall set FailedRSSAttempts to 0 upon receiving an SSW-Feedback frame during the A-BFT.

In an A-BFT, the responder shall not initiate an SSW ack procedure (10.41.2.5) in response to an SSW-Feedback frame from the initiator. The SSW ack procedure occurs within the DTI of a beacon interval (10.41.6.2); it does not occur otherwise.

If the AP or PCP receives an SSW frame from the responder during the RSS with the Poll Required field within the SSW frame equal to 1 and the TDDTI field within the AP's or PCP's DMG Capabilities element is 1, the AP or PCP shall allocate time for the responder and the AP or PCP to communicate during the ATI or within an SP of the DTI of at least one of the following aMinBTIPeriod beacon intervals beginning with the beacon interval in which the SSW frame was received. This can be done through the Extended Schedule element or the transmission of a Poll or Grant frame addressed to the responder, and the allocated time can be used for at least one of association, authentication, and service period request.

After transmitting an SSW-Feedback frame to the responder, the initiator shall send a BRP frame with the Capability Request subfield within the BRP Request field set to 1 and addressed to the responder. The BRP frame shall be sent in one of the following aMinBTIPeriod beacon intervals beginning with the beacon interval in which the RSS phase with the responder was last completed. The BRP frame shall be transmitted at MCS 0 using the sector identified by the Sector Select field received from the responder during the RSS.

In an ATI after the completion of the SSW feedback procedure, a responder should have its receive antenna configured to a quasi-omni antenna pattern in the DMG antenna in which it received the best sector from the initiator during the preceding ISS in order to receive an Announce, Grant, or BRP frame (with the Capability Request subfield within the BRP Request field set to 1) from the initiator, while the initiator should configure its transmit DMG antenna to the value of the Sector Select and the DMG Antenna Select fields received from the responder during the preceding RSS. If the responder does not receive an Announce or Grant frame from the initiator with the RA equal to the responder's MAC address until aMinBTIPeriod beacon intervals after the beacon interval in which the SLS phase with the initiator was last attempted, it may retry BF with the initiator in the A-BFT.

NOTE—Due to the multiple access nature of RSS in the A-BFT, the AP or PCP might not receive the best sector for communication with the STA. The AP or PCP might schedule an SP to perform BF again with the STA to find the best sector for communication with the STA.

10.41.5.3 STA Beamforming after A-BFT

The initiator shall either initiate BRP execution with the responder in the next CBAP or shall schedule time in the DTI for BRP execution with the responder if the initiator needs BRP training or the responder indicated a need for training (by setting any of the L-RX, TX-TRN-REQ, MID-REQ, or BC-REQ fields to a nonzero value) as a response to an SSW-Feedback or BRP frame with Capability Request subfield within the BRP Request field set to 1.

The responder may initiate BRP in a CBAP by sending a BRP frame with any of the training request fields (i.e., L-RX, TX-TRN-REQ, MID-REQ, BC-REQ) set to 1.

To schedule time in the DTI for BRP execution with a responder, the initiator may use any of the following methods:

1) Allocate an SP with the Beamforming Training subfield set to 1 in the Allocation field within an Extended Schedule element. The source of the SP shall be the initiator and the destination of the SP shall be the responder. The Extended Schedule element is carried in DMG Beacon or Announce frames, as defined in 10.38.4. The source AID of the allocation shall be set to the AID of the initiator. The destination AID of the allocation shall be set to the AID of the responder or the broadcast AID.
2) Allocate a CBAP in which the initiator or responder may start beamforming training with each other. The CBAP allocation is announced in an Extended Schedule element carried in a DMG Beacon or an Announce frame, as defined in 10.38.4. The source AID of the CBAP shall be set to the AID of the initiator or to the broadcast AID. The destination AID of the CBAP may be set to the AID of the responder or to the broadcast AID.
3) Use a Grant frame to allocate either a CBAP or an SP in which the initiator or responder may start beamforming with each other. In the Grant frame, the initiator shall set the RA field to the MAC address of the responder and the TA field to the MAC address of the initiator. In the Dynamic Allocation Info field of the Grant frame, the AllocationType field shall be set to indicate CBAP or SP, the source AID field shall be set to the AID of the initiator, the destination AID field shall be set to the AID of the responder or the broadcast AID, and the Allocation Duration field shall be set to the expected duration of the BRP phase.
4) Allocate a DTI as CBAP only as defined in 10.38.4.

At least one of the above allocations shall occur during one of the following aMinBTIPeriod beacon intervals beginning with the beacon interval in which the SLS phase with the responder was last completed.

The duration of the allocation, as specified in the Allocation Block Duration (see 9.4.2.130), shall cover at least the expected duration of the BRP phase.

If the initiator receives at least one SSW frame from a responder within an A-BFT but did not transmit an SSW-Feedback frame to the responder within that A-BFT, the initiator may schedule time in the DTI to perform the ISS and RSS. To do that, the initiator may use one of the methods above. The Allocation Block Duration field shall be set to cover at least the ISS and RSS.

The initiator may transmit an Announce frame to the responder during the ATI to announce a CBAP allocation in the beacon interval. If the responder receives the Announce frame with a CBAP allocation, the responder may contend for a TXOP during a CBAP to perform the BRP execution with the initiator or continue the RSS with the initiator.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Any Announce or Grant frame the initiator sends to a responder after initiating beamforming with the responder in the A-BFT but before beamforming with the responder is completed shall be transmitted at MCS 0 using the sector identified by the Sector Select field received from the responder in the RSS.

The execution of the beamforming procedure in an allocation in the DTI is described in 10.41.6.

10.41.5.4 Beamforming in A-BFT with multiple DMG antennas

A non-EDMG AP or non-EDMG PCP, or an EDMG AP or EDMG PCP that used one RF chain in the last BTI, shall receive through a quasi-omni antenna pattern from a single DMG antenna throughout an A-BFT unless RXSS is used in the A-BFT, in which case it switches through antenna patterns as described in 10.41.5.2. An EDMG AP or EDMG PCP that used multiple RF chains to transmit DMG Beacon frames in the last BTI shall simultaneously receive throughout the A-BFT with a quasi-omni antenna pattern from each DMG antenna used in the last BTI.

An AP or PCP shall have an A-BFT every *k* beacon intervals, where *k* is the value indicated by the N BIs A-BFT subfield in the Beacon Interval Control field. In an A-BFT, the non-EDMG AP or non-EDMG PCP, or an EDMG AP or EDMG PCP with one or multiple DMG antennas but that used one RF chain in the last BTI, shall receive in a quasi-omni antenna pattern using the DMG antenna indicated by the value of the DMG Antenna ID subfield within the SSW field transmitted in the DMG Beacon. A non-EDMG AP or non-EDMG PCP, or an EDMG AP or EDMG PCP having a single RF chain, with multiple DMG antennas has a regular schedule of receiving through each DMG antenna corresponding to the DMG antenna in which a DMG Beacon frame is transmitted through. The AP or PCP shall switch RX DMG antenna every *l* allocations, where *l* is the value of the N A-BFT in Ant subfield within the Beacon Interval Control field.

In an A-BFT, an EDMG AP or EDMG PCP that used multiple RF chains and the same number of DMG antennas within one DMG antenna group in the last BTI shall receive in a quasi-omni antenna pattern through each DMG antenna indicated by the values of the DMG Antenna ID subfields within the SSW fields transmitted in one or multiple DMG Beacon frames during the last BTI. DMG Beacon frames transmitted from different DMG antennas have different values in their DMG Antenna ID subfields. An EDMG AP or EDMG PCP having multiple RF chains and multiple DMG antenna groups has a regular schedule of receiving through each DMG antenna group corresponding to the DMG antennas in which a DMG Beacon frame is transmitted through. The EDMG AP or EDMG PCP with multiple RF chains shall switch RX DMG antenna group every *l* allocations, where *l* is the value of the N A-BFT in Ant subfield within the Beacon Interval Control field.

In each DMG Beacon frame, the A-BFT Count subfield in the Beacon Interval Control field indicates the number of A-BFTs that have passed since the AP or PCP last switched RX DMG antennas.

10.41.6 Beamforming in DTI

10.41.6.1 General

An initiator and responder may perform BF training within an SP or CBAP.

An initiator shall determine the capabilities of the responder prior to initiating BF training with the responder if the responder is associated. A STA may obtain the capabilities of other STAs through the Information Request and Information Response frames (11.28.1) or following a STA's association with the PBSS/infrastructure BSS. The initiator should use its own capabilities and the capabilities of the responder to compute the required allocation size and TXOP duration to perform BF training and BF training related timeouts.

An initiator may request the AP or PCP to schedule an SP to perform BF training with a responder by setting the Beamforming Training subfield in the BF Control field of the DMG TSPEC element or SPR frame to 1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The AP or PCP shall set the Beamforming Training subfield to 1 in the Allocation field of the Extended Schedule element if the Beamforming Training subfield in the BF Control field of the DMG TSPEC element or SPR frame that generated this Allocation field is equal to 1. The AP or PCP should set the Beamforming Training subfield in an Allocation field of the Extended Schedule element to 0 if this subfield was equal to 1 when the allocation was last transmitted by the AP or PCP in an Extended Schedule element and if, since that last transmission, the AP or PCP did not receive a DMG TSPEC element for this allocation with the Beamforming Training subfield equal to 1.

10.41.6.2 SLS phase execution

For BF training in the DTI, both the initiator and responder shall use the SSW frame for the ISS and RSS.

The initiator shall begin an ISS (10.41.2.2) at the start of an SP allocation or TXOP with an initiator TXSS, except in the case of an SP allocation that has the IsInitiatorTXSS field for this SP is equal to 0 in which case the initiator shall begin an ISS with an initiator RXSS.

If the responder has more than one DMG antenna, the initiator shall repeat its ISS k+1 times, where k is the value indicated by the responder in the last negotiated Number of RX DMG Antennas field transmitted by the responder. Repetitions of the ISS are separated by an interval equal to LBIFS. The value of the CDOWN field within SSW frames transmitted in the ISS indicates the number of sectors until the end of transmissions from all of the initiator's DMG antennas to all of the responder's DMG antennas. The ISS phase shall not be fragmented across multiple allocations.

The RSS comprises a responder TXSS unless the allocation is an SP and the IsResponderTXSS field for this SP is equal to 0 or the allocation is a CBAP and the RXSS Length field within the SSW frame received by the responder during the ISS is nonzero. The responder shall begin an RSS (10.41.2.3) MBIFS following the completion of an ISS, provided the responder received an SSW frame from the initiator during the ISS and there is sufficient time in the allocation for the responder to transmit all SSW frames necessary to complete the RSS phase. The responder shall not begin or continue the RSS phase in a different allocation from the allocation that contained the ISS phase.

NOTE 1—The responder can begin an RSS if there is not sufficient time in the allocation to complete the RSS phase. The RSS phase does not continue in a subsequent allocation in this case.

The initiator shall begin an SSW feedback procedure (10.41.2.4) MBIFS following the completion of an RSS, provided the initiator received an SSW frame from the responder during the RSS and there is sufficient time left in the allocation to complete the SSW feedback procedure followed by an SSW ack procedure (10.41.2.5) from the responder in an MBIFS. If there is not sufficient time left in the allocation for the completion of the SSW feedback and SSW ack procedures, the initiator may begin the SSW feedback procedure in the following allocation between the initiator and the responder.

The responder shall begin an SSW ack procedure (10.41.2.5) to the initiator an MBIFS following the reception of an SSW-Feedback frame from the initiator.

The initiator may restart the SSW feedback procedure up to dot11BFRetryLimit times if it does not receive an SSW-Ack frame from the responder an MBIFS following the completion of the SSW feedback procedure. The initiator shall restart the SSW feedback procedure PIFS following the expected end of the SSW-Ack frame by the responder, provided there is sufficient time left in the allocation for the initiator to begin the SSW feedback procedure followed by an SSW ack procedure from the responder in an MBIFS. If there is not sufficient time left in the allocation for the completion of the SSW feedback and SSW ack procedures, the initiator may restart the SSW feedback procedure in the following allocation between the initiator and the responder.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Once started, the initiator and responder shall complete the SLS phase before any additional frame exchange sequence takes place between these STAs.

An EDMG STA that is a TXOP holder or is an SP source may transmit SSW frame(s) with the Direction subfield set to 1 and the RA field set to the TA field of an SSW frame that the STA received with the Unsolicited RSS Enabled field set to 1.

NOTE 2—If a TXOP holder or source STA of an SP transmits SSW frames with the Direction field set to 1 at the beginning of a TXOP or SP, respectively, the STA is considered as the responder for an ISS or RSS that occurred in an earlier BTI, TXOP or SP. The EDMG STA performing the ISS or RSS in the earlier BTI, TXOP or SP is considered as the initiator for the subsequent unsolicited RSS.

If an EDMG STA receives a DMG Beacon or SSW frame from an EDMG STA with the Unsolicited RSS Enabled subfield equal to 1, the STA may process the received DMG Beacon or SSW frames as a responder even if the A-BFT is not present for the case of a received DMG Beacon frame, or even if the STA's MAC address does not match the RA field for the case of a received SSW frame. The STA may then perform an RSS with the initiator in response to the received SSW frames in a subsequent TXOP or SP. This is known as an unsolicited RSS.

If an EDMG STA receives a DMG Beacon or SSW frame with the Unsolicited RSS Enabled subfield equal to 1 and if, as a result, an unsolicited RSS is performed, the EDMG STA shall complete the unsolicited RSS within the same beacon interval in which the DMG Beacon or SSW frame was received.

An EDMG STA shall not perform an unsolicited RSS in response to a DMG Beacon or SSW frame with the Unsolicited RSS Enabled subfield equal to 0.

An unsolicited RSS takes place when all of the following conditions are met:

a) A first EDMG STA transmits a DMG Beacon or SSW frame with the Unsolicited RSS Enabled subfield set to 1; and
b) Following the transmission of a DMG Beacon or SSW frame with the Unsolicited RSS Enabled subfield set to 1, the first EDMG STA receives an SSW frame from a second EDMG STA that is not a response to an immediately preceding ISS or RSS and that has the Direction field equal to 1 and the RA field equal to the first STA's MAC address; and
c) In the case the first STA transmitted an SSW frame in condition a), the second STA that transmitted the SSW frame identified in condition b) is different from the STA addressed by the SSW frame transmitted by the first STA in condition a).

An EDMG STA that receives an unsolicited RSS shall perform an SSW Feedback as specified in 10.41.2.4 (Sector sweep (SSW) feedback).

An EDMG STA that transmitted an unsolicited RSS shall wait for MBIFSTimeout interval, which has a value of MBIFS + aSlotTime + aRxPHYStartDelay, starting at the PHY-TXEND.confirm primitive of the last SSW frame transmitted as part of the unsolicited RSS. If a PHY-RXEARLYSIG.indication or PHY-RXSTART.indication primitive does not occur during the MBIFSTimeout interval, the STA concludes that the unsolicited RSS failed and may initiate an ISS to the STA to which the unsolicited RSS was transmitted.

Figure 10-92 (Example of unsolicited RSS) shows an example of an unsolicited RSS. STA A that performs an ISS or RSS with STA C sets the Unsolicited RSS Enabled subfield to 1 to indicate it is operating as an initiator corresponding to a potential unsolicited RSS in a subsequent TXOP or SP. STA B (TXOP holder or source STA of the SP) transmitting SSW frames with the Direction subfield set to 1 at the beginning of a TXOP or SP (e.g., TXOP2 or SP2) is considered as the responder of STA A for the ISS or RSS in the earlier BTI, TXOP or SP (e.g., TXOP1 or SP1). In the TXOP2 or SP2, if an SSW frame with the Direction subfield set to 1 is received, STA A operates as the initiator and responds with an SSW-Feedback frame without performing an ISS.

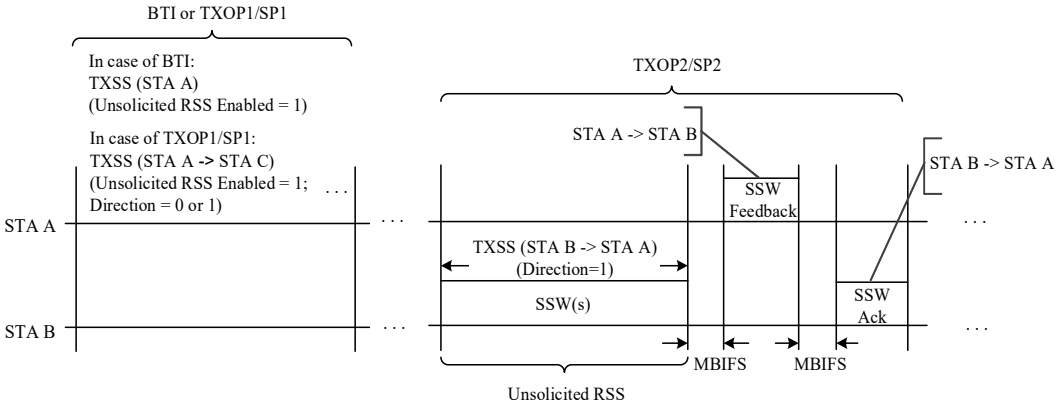

Figure 10-92—Example of unsolicited RSS

10.41.6.3 Multiple sector ID capture (MIDC) subphase

10.41.6.3.1 General

In practice, the quasi-omni RX antenna patterns used in the SLS phase might exhibit imperfections that lead to an incorrect choice of the best TX sector and consequently a sub-optimal starting point for beam refinement in the BRP phase. To remedy this, a multiple sector ID capture (MIDC) subphase may be used. Instead of selecting the starting point for the beam refinement transactions (i.e., the best TX sector) based on information obtained with quasi-omni RX antenna patterns from the SLS phase, the MIDC subphase enables the use of additional information based on the trial of multiple transmit and receive sectors.

The MIDC subphase can be implemented in two ways. The first option is to conduct a trial between a small set of transmit and receive AWV settings with wide (e.g., quasi-omni) antenna patterns. The second option is to carry out a trial between a small set of TX sectors and a set of RX AWV settings, chosen by the receiver in an implementation dependent manner, that maximizes the probability of determining the RX AWVs that best match the chosen set of TX sectors. Note that this may involve using a set of RX AWVs that correspond to the "full set" of RX sectors (from the SLS phase). The set of TX sectors are chosen from a TX sector sweep with a quasi-omni RX antenna pattern. With either option, the end result from the MIDC subphase can be the better starting point transmit and receive sector pair for further beam refinement.

For the first option above, the MIDC subphase consists of a MID subphase and a BC subphase. This is further elaborated upon in 10.41.6.3.2, and a sample time allocation is illustrated in Figure 10-93 (Example of time allocation for the MIDC subphase with MID and BC subphases). For the second option, the MIDC subphase consists only of a MID subphase. This is further elaborated upon in 10.41.6.3.3, and a sample time allocation is illustrated in Figure 10-94 (Example of time allocation for the MIDC subphase with the MID subphase only).

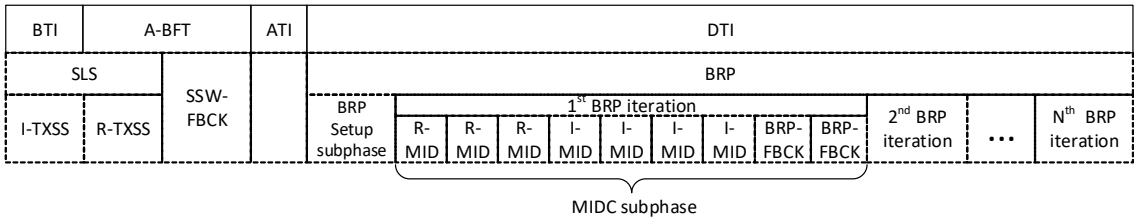

Figure 10-94—Example of time allocation for the MIDC subphase with the MID subphase only

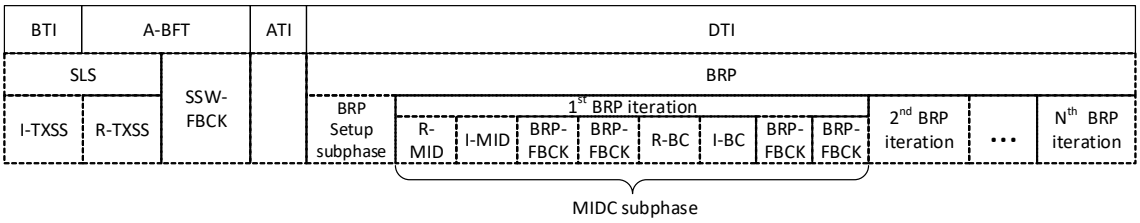

Figure 10-93—Example of time allocation for the MIDC subphase with MID and BC subphases

Prior to the beginning of the MIDC subphase, a BRP setup subphase is carried out as specified in 10.41.3.2. This subphase enables the two DMG STAs involved to negotiate whether and how the MIDC subphase is carried out.

In 10.41.6.3 the following terminology is used:

— Nbeam: the value of the Number of Beams subfield of the FBCK-TYPE field.

— Nbeam(Link Type,Antenna Type): represents a combination of Nbeam, Link Type (I for Initiator, R for Responder), and Antenna Type (TX for Transmitter, RX for Receiver).

— Number of Measurements: the value of the Number of Measurements subfield of the FBCK-TYPE field.

Examples of how the MIDC subphase is set up, depending on whether beamforming is initiated in the BTI and A-BFT or in the DTI, are illustrated in Figure 10-95 (Example of using BRP setup subphase to set up subsequent MIDC subphase in A-BFT and DTI) and Figure 10-96 (Example of using BRP setup subphase to set up subsequent MIDC subphase in DTI), respectively. Note that the MIDC subphase is applicable only when both the initiator and the responder have the ability to switch among their sectors.

10.41.6.3.2 MIDC subphase with MID and BC subphases

The MIDC subphase can be implemented such that small subsets of TX sector IDs and RX AWVs are first chosen, followed by trials between these subsets to determine the optimal starting TX sector ID and RX AWV pair. The set of TX sectors is chosen from an a priori TX sector sweep with a quasi-omni RX antenna pattern (in the SLS phase). To enable the selection of the RX sectors, and the subsequent trial between the transmit and receive sectors, the MIDC subphase consists of an MID subphase and a BC (or beam combining) subphase. In the MID subphase, a wide TX beam (e.g., quasi-omni) is used while the receiver sweeps through its choice of AWV settings to determine the set of RX AWVs with the highest link quality. This is followed by the BC subphase, which involves testing the multiple RX AWVs together with multiple TX AWVs.

This is conceptually illustrated in Figure 10-97 (Conceptual flow of sample MIDC subphase execution with MID and BC subphases for initiator link). Note that the consecutive numbering of TX sector IDs (e.g., TX sector ID1, TX sector ID2, …) or RX AWVs is just used for representation purposes. It is used to indicate the subset of TX sector IDs without placing any restrictions on how these sector IDs are selected (i.e., consecutive numbering of TX sector IDs does not mean that the selected TX sector IDs should be those that are consecutively numbered).

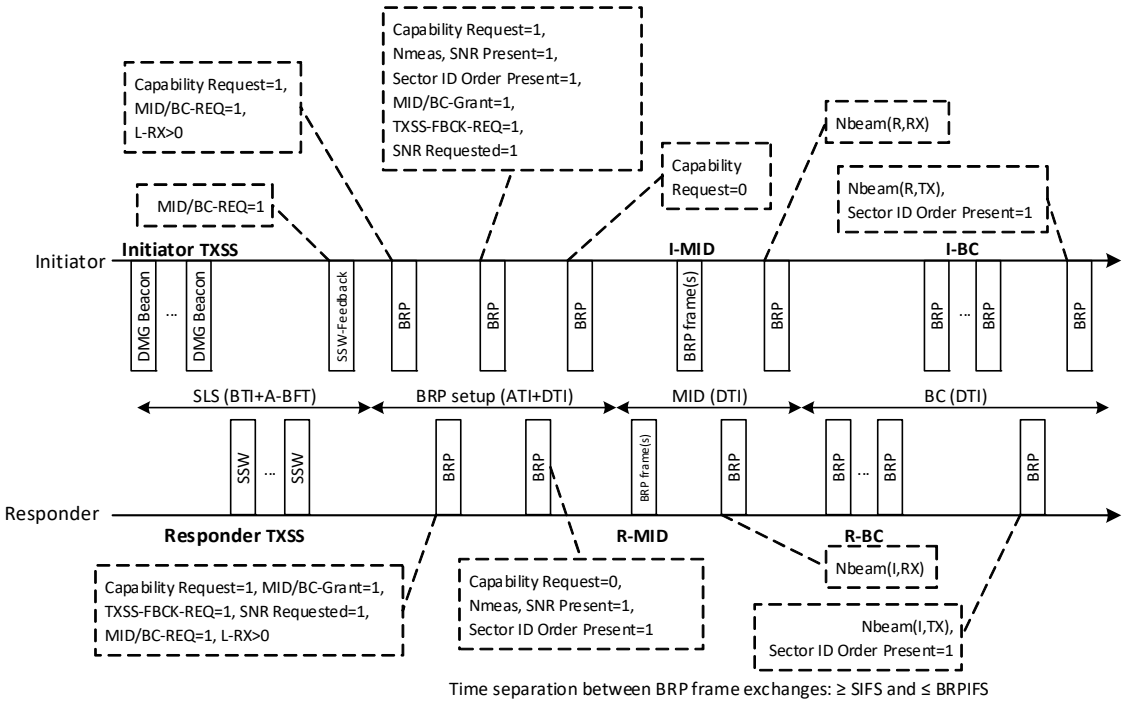

Figure 10-95—Example of using BRP setup subphase to set up subsequent MIDC subphase in A-BFT and DTI

a) *Setting up the MID and BC subphases*: To request a MIDC subphase with the MID and the BC subphases, the initiator shall transmit an SSW-Feedback or BRP frame with the MID-REQ and the BC-REQ fields set to 1 in the BRP Request field. The responder may grant this request by setting the MID-Grant and the BC-Grant fields to 1 in the BRP Request field within the next SSW-Ack or BRP frame transmitted to the initiator. The R-MID and R-BC subphases are performed if the request is granted and are not performed otherwise.

The responder shall transmit an SSW-Ack or BRP frame to request a MIDC subphase, with the I-MID and I-BC subphases. It shall do so by setting the MID-REQ and the BC-REQ fields to 1 in the BRP Request field within the transmitted frame. The initiator may grant this request by setting the MID-Grant and the BC-Grant fields to 1 in the BRP Request field within the next BRP frame transmitted to the responder. The I-MID and I-BC subphases are performed if the request is granted and are not performed otherwise.

If all of R-MID, R-BC, I-MID, and I-BC subphases are performed, the MID subphases are performed before the BC subphases. Within the MID subphase, R-MID is performed before I-MID. Within the BC subphase, R-BC is performed before I-BC (see Figure 10-93 (Example of time allocation for the MIDC subphase with MID and BC subphases) and Figure 10-94 (Example of time allocation for the MIDC subphase with the MID subphase only)).

In addition to the MID-REQ, BC-REQ, MID-Grant and BC-Grant fields, the responder (and/or initiator) needs to obtain the number of RX AWV settings to be appended to BRP-RX PPDUs in the R/I-MID subphase. To do this, the initiator (and/or responder) should use the L-RX field in the BRP Request field to convey this information. Similarly, the responder (and/or initiator) needs to obtain the IDs and SNRs of the TX sectors received during the SLS phase for use in the R-BC and I-BC subphases. To do this, the responder (and/or initiator) shall send a BRP PPDU with the TXSS-FBCK-REQ subfield and SNR Requested subfield set to 1 in the FBCK-REQ field of the DMG Beam Refinement element. In response, the initiator (and/or responder) should send a BRP frame with both the SNR Present subfield and the Sector ID Order Present subfield set to 1. The Number of

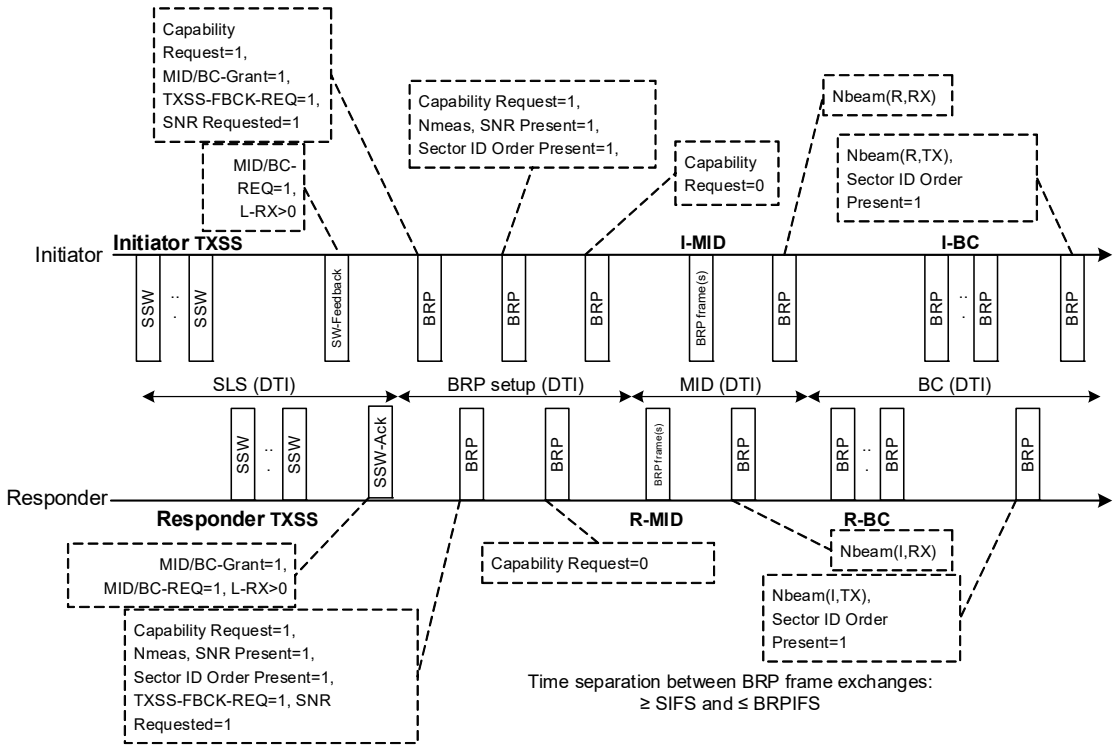

Figure 10-96—Example of using BRP setup subphase to set up subsequent MIDC subphase in DTI

Measurements subfield in the FBCK-TYPE field is set to indicate the number of sectors received during the last SLS for which an SNR measurement is included. In the Channel Measurement field, the initiator (or responder) should set the SNR subfield to the SNRs corresponding to the TX sectors trialled during the SLS phase. In the Sector ID subfield, it should list the sector IDs of the received sectors. The responder (and/or initiator) should then use the SNR information, and any additional information such as angular separation between sectors, to determine the TX sectors for use in the BC subphase. The responder (or initiator) shall inform the initiator (or responder) of the number of TX sectors using the Number of Beams subfield in the FBCK-TYPE field during the BRP setup subphase. After the R/I-MID subphases, the same field is used to exchange information about the number of RX AWVs to be trialled during the BC subphase.

b) *Executing the MID subphase*: If R-MID was requested and granted during the SLS and/or subsequent BRP setup subphase, then after the BRP setup subphase, the R-MID shall be initiated by the responder sending a BRP frame with TRN-R subfields (as requested in the BRP setup subphase). This PPDU may be transmitted using a wide pattern, approaching an omni transmit pattern, or using a sector antenna pattern. The receiver may use the TRN-R subfields for receive training.

   If the MID Extension field in the PPDU is equal to 1, the responder shall transmit another BRP-RX PPDU, which may be transmitted using another transmit pattern. It may continue transmitting BRP-RX PPDUs as long as the MID Extension field in all of them is equal to 1. The last BRP-RX PPDU transmitted by the responder shall have the MID Extension field set to 0.

   If the initiator does not receive a BRP-RX PPDU within BRPIFS after transmitting the last PPDU of the BRP setup subphase, it may retransmit the last PPDU of the BRP setup subphase.

   After the initiator receives a BRP-RX PPDU with the MID Extension field set to 0, it shall respond with a BRP frame with the appropriate feedback. This BRP frame should be sent using the best TX sector as determined in the SLS phase, while the responder should use a quasi-omni pattern to

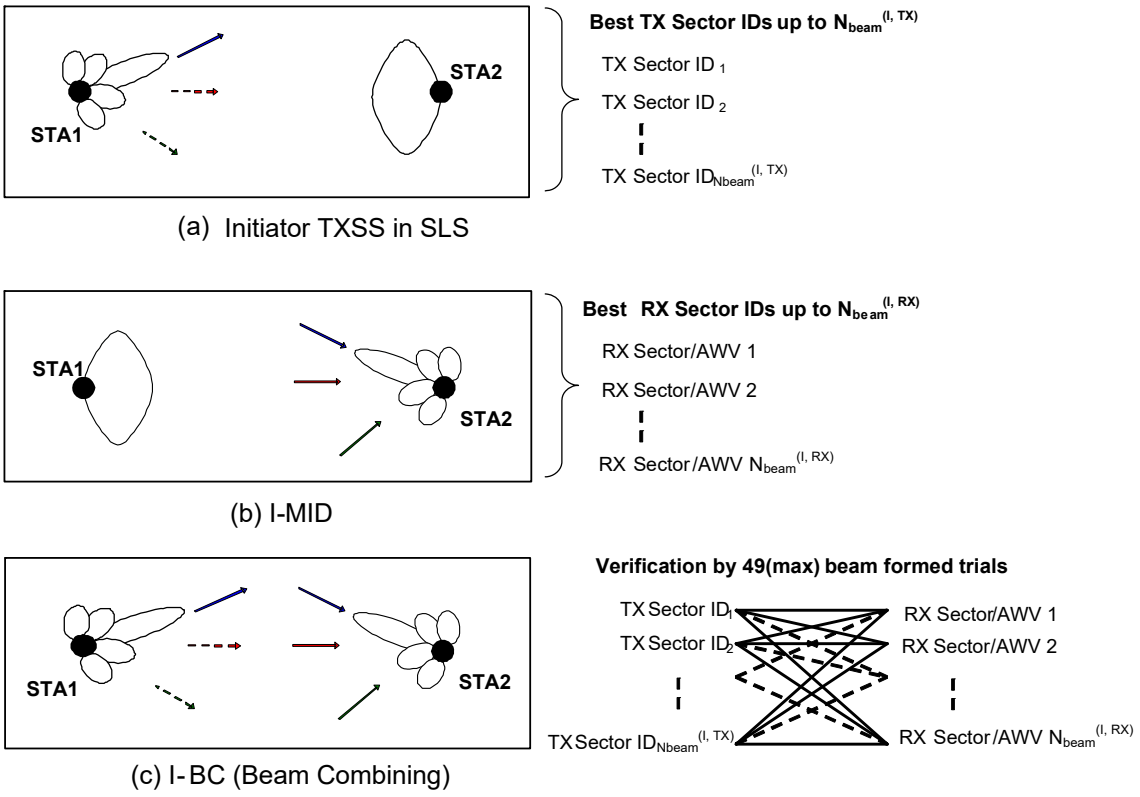

Figure 10-97—Conceptual flow of sample MIDC subphase execution with MID and BC subphases for initiator link

receive this frame. The feedback included in this BRP frame is the number of RX AWVs to be tested in the subsequent R-BC subphase using the Number of Beams subfield in the FBCK-TYPE field.

If I-MID was granted in addition to R-MID, the initiator shall send a BRP frame with TRN-R subfields (as requested in the BRP setup subphase). The initiator shall continue to send BRP PPDUs if the MID Extension was set to 1 as in the R-MID.

After the responder receives a BRP-RX PPDU with the MID Extension set to 0, it shall respond by sending a BRP frame with feedback. This BRP frame should be sent using the best TX sector as determined in the SLS phase, while the initiator should use a quasi-omni pattern to receive this frame. The feedback included in this BRP frame is the number of RX AWVs to be tested in the subsequent I-BC subphase using the Number of Beams subfield in the FBCK-TYPE field. The initiator shall respond with a BRP frame with the TX-TRN-OK field set to 1 as an acknowledgment. The R-BC subphase then follows.

If I-MID does not follow R-MID, the BC subphase follows immediately.

c) *Executing the BC subphase*: The execution of an I-BC subphase is used as an example. In an I-BC subphase, the initiator shall transmit Nbeam(I,TX) BRP-RX frames using the number of TX sectors specified during the BRP setup subphase. Each BRP-RX frame shall be appended with Nbeam(I,RX) TRN-R subfields, and shall include the Sector ID subfield of the TX sector used. While receiving these TRN-R subfields, the responder shall switch through the RX AWVs selected during the prior I-MID subphase. To conclude the I-BC subphase, the responder shall feed back to the initiator a BRP frame with (a) the BS-FBCK field set to the TX sector ID of the BRP-RX PPDU received with the highest link quality, and (b) the ordered list of transmit sectors (based on received link quality during the I-BC) using the Sector ID Order subfield in the Channel Measurement

Feedback element. This BRP frame should be sent using the best TX sector as determined in the SLS phase, while the initiator should use a quasi-omni pattern to receive this frame. Figure 10-98 (Beam combining) depicts the beam combining subphase. The complete procedure is illustrated in Figure 10-99 (Examples of using MID Extension field during execution of MID subphase).

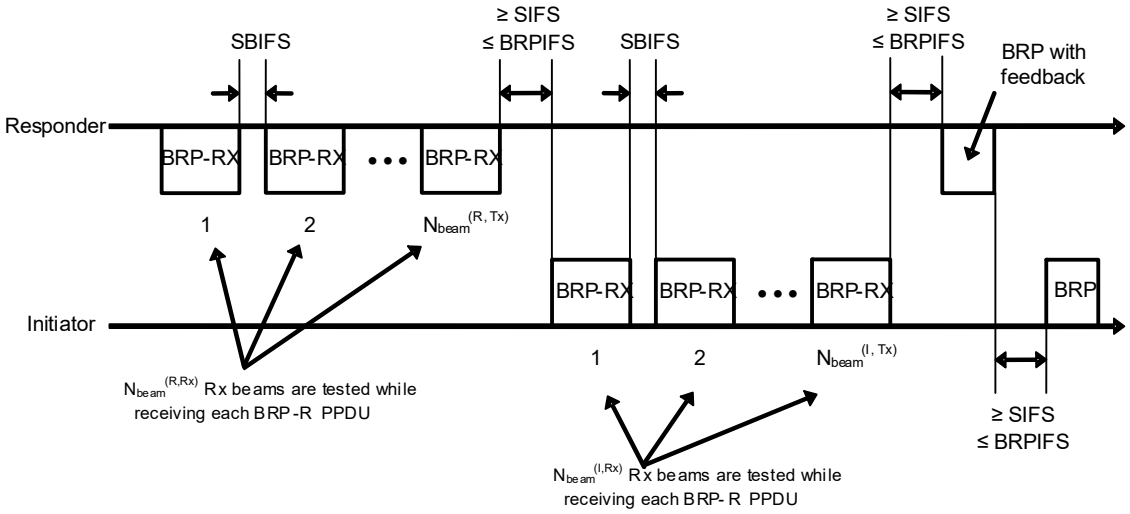

Figure 10-98—Beam combining

10.41.6.3.3 MIDC subphase with MID subphase only

The MIDC subphase may also be implemented such that multiple TX sectors, obtained from the TXSS in the SLS phase, are used instead of wide TX beams. Here, the receiver employs multiple RX AWVs for each TX sector chosen by the transmitter. Based on this joint trial of transmit and receive AWVs, the optimal starting transmit and receive AWV pair is chosen for further refinement in the BRP phase. In this case, the MIDC subphase consists only of the MID subphase. This is conceptually illustrated in Figure 10-100 (Conceptual flow of sample MIDC subphase execution with only MID subphase for initiator link).

a) *Setting up the MID subphase*: The procedure of setting up the MID-subphase is described in 10.41.3.2.

   In the example of Figure 10-101 (Example of using BRP setup subphase to set up subsequent R-MID subphase), the initiator transmits an SSW-Feedback frame with the MID-REQ subfield set to 1 and the BC-REQ subfield set to 0 in the BRP Request field, thus requesting an MIDC with only the R-MID subphase. The responder grants the MID-REQ by setting the MID-Grant subfield to 1 in the SSW-Ack frame. The initiator then sends a frame with the SNR Present and Sector ID Order Present subfields both set to 1, the Number of Measurement subfield in the FBCK-TYPE field indicating the number of SNR measurements from the last SLS phase, and the SNR and Sector ID subfields with the SNRs measured during the SLS phase and the list of received sectors, respectively. The L-RX

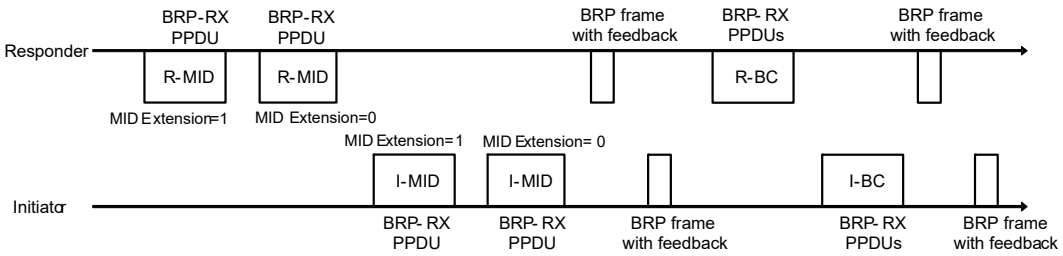
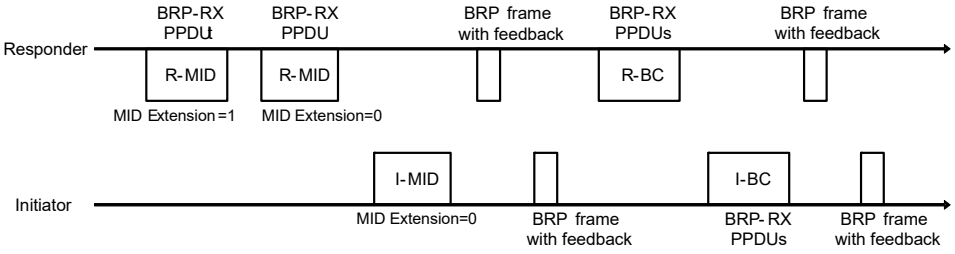
(a) Normal process: one MID and BC for each initiator and responder link
(the initiator and responder use a quasi-omni TX pattern)



(b) The MID for both the initiator and responder are repeated twice:
each TX beam is wider than a TX sector, but narrower than a quasi-omni pattern and covers a different direction



(c) The MID for the initiator is repeated twice:
each TX beam is wider than a TX sector, but narrower than a quasi-omni pattern and covers a different direction

Figure 10-99—Examples of using MID Extension field during execution of MID subphase

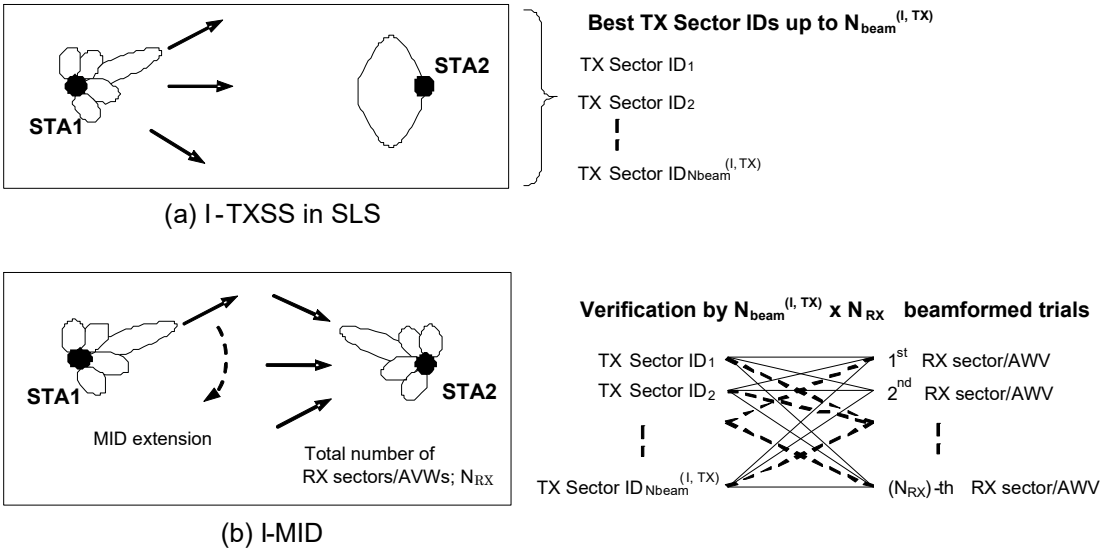

Figure 10-100—Conceptual flow of sample MIDC subphase execution with only MID subphase for initiator link

subfield is set according to the number of training fields the initiator needs in each PPDU as part of the R-MID. The responder then starts the R-MID process by transmitting BRP-RX PPDUs.

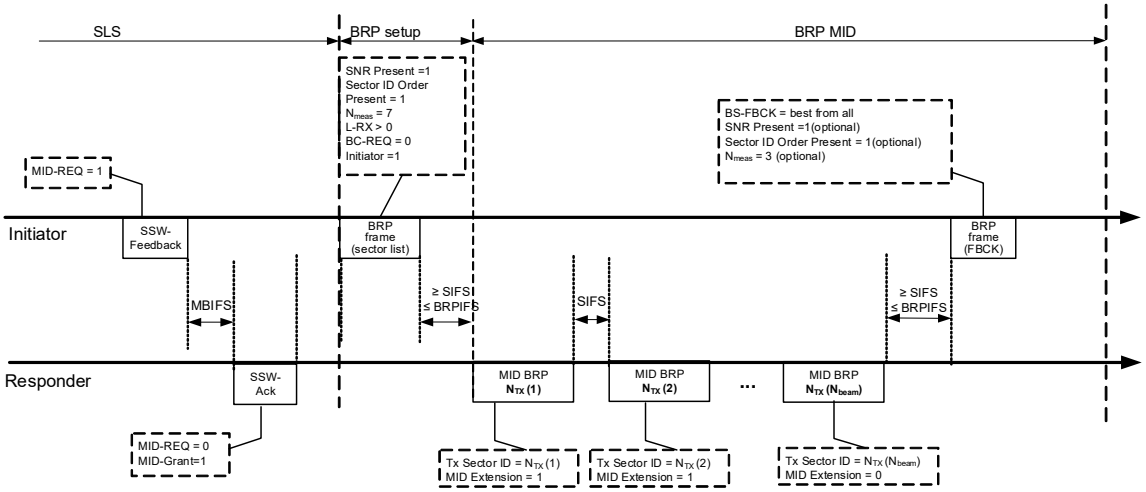

Figure 10-101—Example of using BRP setup subphase to set up subsequent R-MID subphase

b) *Executing the MID subphase*: The execution of the MID subphase for the responder link (i.e., R-MID) is used as an example. Execution of the MID subphase for the initiator link (i.e., I-MID) is similar, except for a change in the direction of the corresponding frames. In an R-MID subphase, the responder shall transmit one BRP-RX PPDU each from one of the chosen TX sectors. In each PPDU, it shall indicate the sector ID of the TX sector used using the Sector ID field in the BRP Request field. Each transmitted BRP-RX PPDU should be appended with multiple TRN-R subfields such that the initiator can train its receiver antenna during the R-MID subphase. The initiator shall train its receiver antenna by cycling through its choice of RX AWVs while receiving the TRN-R subfields. The initiator shall indicate to the responder the number of TRN-R subfields to be

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

appended using the *L-RX* field in the BRP Request field during the SLS phase or the BRP setup subphase. For all BRP-RX PPDUs except the last one, the responder shall also set the MID Extension field to 1. An EDMG responder, responding to an EDMG initiator, may choose to use a single PPDU for training during the MID phase by setting the TXVECTOR parameter EDMG_TRN_LEN to a value greater than 0 and the parameter RX_TRN_PER_TX_TRN to a value equal to the value of the L-RX subfield transmitted during the last SLS phase or last BRP setup subphase, whichever is later. The EDMG responder shall then transmit through a list of chosen sectors during the TRN field of the transmitted PPDU. For each of the responder's TX sector, the initiator shall perform RX AWV training. In the feedback, the initiator shall set the BS-FBCK and BS-FBCK MSB fields to the AWV ID rather than the sector ID, where the first TX sector has AWV ID equal to 0.

In the R-MID subphase, the initiator shall send a BRP frame with feedback. This BRP frame should be sent using the best TX sector as determined in the SLS phase, while the responder should use a quasi-omni pattern to receive this frame. The feedback included in this BRP frame should be (a) the BS-FBCK field set to the TX sector ID or the AWV ID (if an EDMG BRP-TX or EDMG BRP-RX/TX PPDU was used) of the sector or AWV received with the best quality, and (b) the ordered list of transmit sectors (based on received link quality during the R-MID) using the Sector ID Order subfield. An EDMG STA returns the ordered list in the EDMG Sector ID Order field.

10.41.6.3.4 MIDC subphase with BC subphase only

An MIDC subphase with only the BC subphase is carried out when the MID and BC subphases have been carried out earlier. In this case, the initiator and responder keep track of the transmit and receive sectors, for use in the BC subphase, from earlier iterations. Since the best transmit and receive sectors (in terms of link quality) are kept track of, this information can be used to deal with link blockage events. STAs can utilize only the chosen set of TX sectors in the SLS phase to reduce beamforming training time, and jump to the BC subphase directly without executing the MID subphase. In this manner, fast recovery is possible when some of the backup links are available after partial blockage around the STA.

To carry out the MIDC subphase with the BC subphase only, the MID-REQ field is set to 0 and the BC-REQ field is set to 1 in SSW-Feedback or SSW-Ack or BRP frames, and the BC-Grant field is set to 1 in the following SSW-Ack or BRP frame. The BC subphase can include an I-BC and/or an R-BC (10.41.6.3.2).

10.41.6.4 BRP phase execution

10.41.6.4.1 General

Beam refinement is a request/response based process. A STA requests receive beam refinement training by sending a BRP frame with a nonzero value in the L-RX field. The STA that receives the BRP frame shall respond with a BRP PPDU (20.9.2.2) including as many TRN-R subfields as indicated in the value of the L-RX field within the received BRP frame and with the RX-train-response field in the DMG Beam Refinement element set to 1.

A STA requests transmit beam refinement training by sending a BRP frame as follows. In the BRP Request field, the TX-TRN-REQ field is set to 1, and the FBCK-REQ field indicates the feedback type. The Sector ID Order Requested subfield in the FBCK-REQ field shall be set to 0. In the TXVECTOR, the PPDU_TYPE parameter is set to TRN-T-PACKET, and the TRN_LEN parameter indicates the number of AGC and TRN-T subfields appended to the PPDU.

A STA shall reply to a transmit beam refinement training request with a BRP frame containing a DMG Beam Refinement element with the TX-TRN-OK field and TX-train-response field both set to 1 and the BS-FBCK field set to indicate the TRN-T subfield on which the responding STA received the best signal (the determination of best signal is implementation dependent). The FBCK-TYPE field shall be set to according

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

to the format of the Channel Measurement Feedback element, if one is included in the frame. If the SNR Present and Channel Measurement Present subfields of this FBCK-TYPE field are set to 0, the Channel Measurement Feedback element shall not be included. The number of taps indicated in the FBCK-TYPE field shall be less than or equal to the number of taps indicated in the FBCK-REQ field of the request frame.

An EDMG STA responding to a transmit beam refinement training request in which the EDMG-SHORT-BRP subfield was 0 may respond within MBIFS with a BRP frame in which the Comeback Delay field in the EDMG BRP Request element is set to a nonzero value. This indicates that the STA is not ready with the feedback within BRPIFS from the request. The value in the Comeback Delay field indicates when the responding STA is ready. The requesting STA may send a BRP frame with a feedback request that contains no training requests and that has the same dialog token as the frame that originally solicited the response after the comeback delay has elapsed; in this case, the responding STA shall respond with feedback within MBIFS. If the TXOP or SP ended before the comeback delay elapsed, the responder may send the feedback in a BRP frame as part of another TXOP or SP. The dialog token within the feedback frame shall be the same as in the BRP frame soliciting the response.

An EDMG STA responding to a transmit beam refinement training request in which the EDMG-SHORT-BRP subfield was 1 shall respond within MBIFS with a BRP frame that has the EDMG-SHORT-BRP subfield set to 1 and the EDMG-SHORT-FBCK subfield set to 1. The number of valid AWV feedback IDs (N_{AID}) in the Short BRP Feedback field shall comply with the following equation:

$$N_{AID} = \begin{cases} 16 & P \geq 16 \\ P & P < 16 \end{cases}$$

where

$$P = \sum_{k=1}^{K} L_k \times \frac{M_k}{N_k} \times T_k$$

L_K, M_K, N_K, and T_k are the values of the EDMG_TRN_LEN, EDMG_TRN_M, EDMG_TRN_N and NUM_TX_CHAINS parameters, respectively, in the RXVECTOR of the k^{th} EDMG BRP PPDU of the TXSS

K is the total number of EDMG BRP PPDU received in the BRP TXSS or BRP-TX

If $N_{AID} < 16$, the $(16 - N_{AID})$ Sector Measurement subfields of the Short BRP Feedback field shall be denoted as invalid by setting the SNR subfield to 0xFF as defined in 9.5.8.

If a STA requests transmit beam refinement training, but does not send TRN-T subfields, the responding STA shall reply with a BRP frame containing a DMG Beam Refinement element with the TX-TRN-OK field set to 1. In this case (i.e., when the TX-train-response field is equal to 0), the responding STA shall set L-RX field to 0. The requesting STA shall then transmit a BRP PPDU with TRN-T subfields. The responding STA shall then respond with a BRP frame with the TX-train-response field set to 1 and the BS-FBCK and Channel Measurement Feedback element as above.

Beam refinement can be performed following SLS (10.41.6.4.3). If the responder receives an SSW-Feedback frame from the AP or PCP in an A-BFT, the AP or PCP allocates an SP for the beam refinement if required (see 10.41.5.3). A STA may transmit a BRP PPDU to another STA whenever the STA transmits a frame to that STA, provided that the transmitting STA knows that the recipient STA's receive antennas are directed to it or are in a quasi-omni antenna pattern.

A STA shall set the Initiator field to 1 within a DMG Beam Refinement element if the previous received frame was not a BRP frame, or the last PPDU the STA transmitted was a BRP frame with the Initiator field set to 1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A STA that has transmitted a BRP frame with the Initiator field set to 1 and has not received a response BRPIFS after the transmission may retransmit the frame.

In a beam refinement transaction outside of a TDD SP allocation, a STA that has transmitted a BRP frame with the Initiator field set to 1 and has not received a response BRPIFS after the transmission may retransmit the frame.

In a beam refinement transaction in a TDD SP allocation, a STA that has transmitted a BRP frame with the Initiator field set to 1 and has not received a response in the earliest occurring TDD slot the STA is assigned to, with access permission of the TDD slot set to simplex TX TDD slot, and with slot category of the TDD slot set to Basic TDD slot as indicated in the TDD Slot Schedule element, after the transmission may retransmit the frame, according to the TDD channel access rules (see 10.38.6.2.2 (SP with TDD channel access)).

A STA may request a TXSS sector list feedback by sending a BRP frame with the TXSS-FBCK-REQ field set to 1, the SNR Requested subfield within the FBCK-REQ field set to 1 and the remaining subfields within the FBCK-REQ field set to 0. The responding STA shall respond with a BRP frame with the SNR Present subfield within the FBCK-TYPE field set to 1 and Sector ID Order Present subfield set to 1, with a list of sector IDs indicating the sector IDs of the received SSW frames or DMG Beacon frames, and with the SNR values with which those frames were received in the last TXSS. The Number of Measurements subfield in the FBCK-TYPE field is set to indicate the number of sectors received during the last SLS for which an SNR measurement is included.

An EDMG STA may request a TXSS sector list feedback from a peer EDMG STA by sending a BRP frame with the BF Training Type field set to 0, the TXSS-FBCK-REQ field set to 1, the SNR Requested subfield within the FBCK-REQ field set to 1 and the remaining subfields within the FBCK-REQ field set to 0. The responding EDMG STA shall respond with a BRP frame with the BF Training Type field set to 0, the SNR Present and Sector ID Order subfields within the FBCK-TYPE field set to 1, the EDMG Extension Flag field set to 1 and the EDMG Channel Measurement Present field set to 1. In the EDMG Sector ID Order field, the SISO IDs indicate the sector IDs/CDOWN/AWV IDs, TX antennas and RX antennas of sectors that were used for reception in the last TXSS. The SNRs subfield in the Channel Measurement Feedback field indicates the SNRs on the sectors used for reception. The last TXSS may have been performed using DMG Beacon frames, SSW frames, Short SSW PPDUs or BRP-TX PPDUs. If the last TXSS was performed using BRP-TX PPDUs:

— The BRP-CDOWNs associated with each SISO ID indicate the BRP-CDOWN of the received BRP-TX PPDU.

— The Number of Measurements subfield of the FBCK-TYPE field is at least the minimum of $\{16, P\}$, where $P = \sum_{k=1}^{K} L_k \times \frac{M_k}{N_k} \times T_k$, and L_k, M_k, N_k, and T_k are the values of the EDMG_TRN_LEN, EDMG_TRN_M, EDMG_TRN_N, and NUM_TX_CHAINS parameters, respectively, in the RXVECTOR of the received BRP-TX PPDUs and k is the total number of BRP-TX PPDUs received in the TXSS.

An EDMG STA responding to a TXSS sector list feedback request with the EDMG-SHORT-BRP subfield equal to 0 may respond within MBFIS with a BRP frame with the Comeback Delay field in the EDMG BRP Request element set to a nonzero value. This indicates that the STA is not ready with the feedback within BRPIFS from the request. The value in the Comeback Delay field indicates when the responding STA is ready. The requesting STA may send a BRP frame with a feedback request that contains no training requests and that has the same dialog token as the frame that originally solicited the response after the comeback delay has elapsed; in this case, the responding STA shall respond with feedback within MBIFS. If the TXOP or SP ended before the comeback delay elapsed, the responder may send the feedback in a BRP frame as

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

part of another TXOP or SP. The dialog token within the feedback frame shall be the same as in the BRP frame soliciting the response.

An EDMG STA may request a TXSS sector list feedback from a peer EDMG STA by sending a BRP frame with the EDMG-SHORT-BRP subfield, TXSS-FBCK-REQ subfield and the SNR Requested subfield within the FBCK-REQ set to 1. The responding EDMG STA shall send a BRP frame with the EDMG-SHORT-BRP subfield and the EDMG-SHORT-FBCK subfield set to 1 within MBIFS from the reception of the request.

A STA shall not set the TXSS-FBCK-REQ and the TX-TRN-REQ fields to 1 in the same BRP frame.

Two or more BRP frames shall not be aggregated in the same A-MPDU. A BRP frame that contains a beam refinement request may be aggregated with another frame in the same A-MPDU only if the other frame is a single Ack, BA or QoS Null frame. A BRP frame that does not contain a beam refinement request may be aggregated with another frame in the same A-MPDU if the other frame is a single Data, Management (except BRP), Ack, Block Ack or QoS Null frame.

The Duration field within each BRP frame is set to the time remaining until the end of the current allocation, when transmitted within an SP. Otherwise it is set to the time remaining until the end of the TXOP.

An initiator EDMG STA may include an EDMG Partial Sector Level Sweep element within a BRP frame transmitted as part of a BRP transaction. The responder EDMG STA shall respond with a BRP frame with an EDMG Partial Sector Level Sweep element representing its preferences for a sector sweep that takes place following the expiration of the beamformed link maintenance timer. If the initiator sets the Agree to Change Initiator/Responder Roles field to 1 and the responder agrees to change beamforming initiator/responder roles when the beamformed link maintenance timer expires, the responder shall set the Agree to Change Initiator/Responder Roles field to 1. If the initiator sets the Agree to Change Initiator/Responder Roles field to 0, this field is ignored. If the responder sets the Agree to Partial Sector Level Sweep to 1, the exchange is considered successful; otherwise, it is considered as failed.

An EDMG STA that supports 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz or 4.32+4.32 GHz PPDU transmission shall not set the DMG TRN RX Only Capable subfield in the STA's EDMG Capabilities element to one. Otherwise, the STA may set the DMG TRN RX Only Capable subfield to one.

A 4.32 GHz EDMG PPDU transmission that includes a TRN field shall have the DMG_TRN parameter of the TXVECTOR set to 0.

A 2.16 GHz EDMG PPDU transmitted using a single space-time stream that includes the TRN field and is addressed to a STA that has the DMG TRN RX Only Capable subfield set to 1 in the STA's EDMG Capabilities element shall have the DMG_TRN parameter of the TXVECTOR set to 1 and the EDMG_TRN_LEN parameter of the TXVECTOR set to a value greater than 0 and less than 32. Otherwise, the DMG_TRN parameter of the TXVECTOR shall be set to 0. If the EDMG_TRN_LEN parameter of the TXVECTOR of a PPDU sent to a STA that has set the DMG TRN RX Only Capable subfield equal to 1 is greater than 0, the CH_BANDWIDTH parameter shall be set to a value having only 1 bit set to 1.

A EDMG STA that receives an EDMG BRP frame with RXVECTOR parameter DMG_TRN equal to 1, with the Channel Measurement Requested subfield of the FBCK-REQ field in the DMG Beam Refinement element within the frame equal to 1 and that has set the Chan-FBCK-CAP subfield to 1 in the last BRP Request field sent to the transmitter of the EDMG BRP frame, shall use the Channel Measurement Feedback element in its response to the received EDMG BRP frame.

10.41.6.4.2 Beam refinement transaction

A beam refinement transaction is a set of BRP frames composed of request and responses.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A beam refinement transaction starts with the beamforming initiator STA sending a BRP frame with the Initiator field set to 1.

A beam refinement responder is a STA that receives a BRP frame with the Initiator field set to 1.

A beam refinement transaction participant shall respond to a BRP frame with a BRP frame.

If the beam refinement transaction initiator received a BRP frame from the responder with no training requests, the initiator may terminate the transaction by not transmitting any further BRP PPDUs.

Figure 10-102 (Example beam refinement transaction (receive training)), Figure 10-103 (Example beam refinement transaction (transmit training)), and Figure 10-104 (Example beam refinement transaction (combination of receive and transmit training)) show examples of beam refinement transactions.

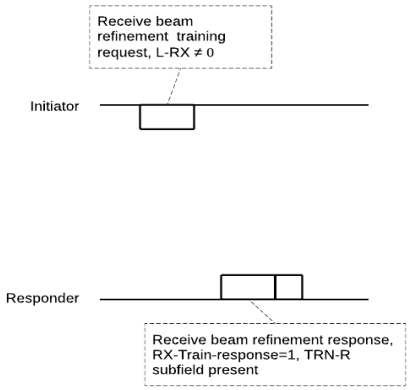

Figure 10-102—Example beam refinement transaction (receive training)

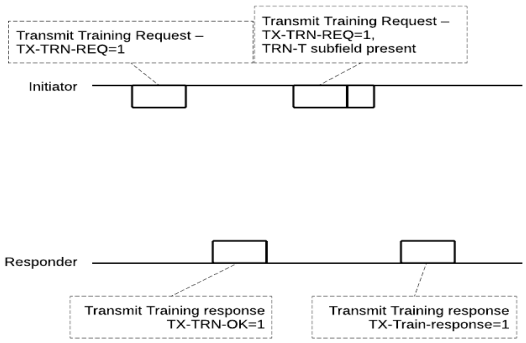

Figure 10-103—Example beam refinement transaction (transmit training)

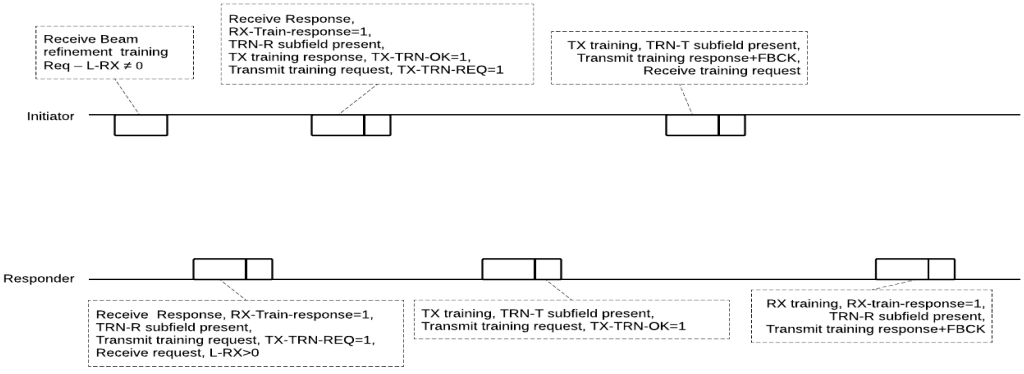

Figure 10-104—Example beam refinement transaction (combination of receive and transmit training)

All PPDUs in a BRP transaction are transmitted with the same bandwidth and with the same channel aggregation setting. In a BRP transaction, except for the first PPDU of the BRP transaction, an EDMG initiator shall set the values of the TXVECTOR parameters CH_BANDWIDTH and CHANNEL_AGGREGATION of a PPDU to the same corresponding values used in the preceding PPDU transmitted by the initiator in the BRP transaction. In a BRP transaction, an EDMG responder shall transmit a PPDU with TXVECTOR parameter CH_BANDWIDTH equal to the value of the RXVECTOR parameter CH_BANWDITH of the PPDU that elicited the response, and with TXVECTOR parameter CHANNEL_AGGREGATION equal to the value of the RXVECTOR parameter CHANNEL_AGGREGATION of the PPDU that elicited the response.

10.41.6.4.3 Beam refinement transaction after SLS

If either L-RX or TX-TRN-REQ is nonzero within the BRP Request field in the SSW-Ack frame of the most recent SLS phase execution, no MID or BC was granted during the BRP setup subphase, and no beam refinement transaction has been done since the most recent SLS phase execution, then the initiator shall initiate the beam refinement transaction with the responder by sending a BRP frame to the responder. If the value of the L-RX field is greater than 0 in the SSW-Ack frame, the first BRP frame the initiator transmits to the responder is a BRP-RX frame. If the value of the L-RX field is 0 and the value of the TX-TRN-REQ field is 1, the first BRP frame the initiator transmits to the responder shall have either the TX-TRN-OK field set to 1 or the L-RX field greater than 0.

10.41.6.4.4 Antenna configuration setting during a beam refinement transaction

A STA that has requested beam refinement receive training shall, except when receiving TRN-R subfields, set its receive antenna configuration to the best known receive antenna configuration based on previous beam refinement receive training or RXSS. If the STA has not received a BRP frame since the last SLS and the SLS did not include an RXSS, the STA should set its receive antenna configuration to a quasi-omni antenna pattern in the DMG antenna through which the STA received the best sector during the SLS.

A STA that receives a beam refinement transmit training request shall send the response frame and then set its antenna configuration to the best known receive antenna configuration based on previous beam refinement receive training or RXSS, except if both the initiator STA and responder STA support the Other_AID subfield as indicated through the Supports Other_AID field set to 1 within the STA's DMG Capabilities element and the value of the Other_AID subfield within the BRP Request field is different from 0, in which case the STA sets its antenna configuration to the best known receive antenna configuration for receiving from the STA with AID equal to the value of the Other_AID subfield within the BRP Request field. If the STA has not received a BRP frame since the last SLS and the SLS did not include an RXSS, the STA should set its antennas to a quasi-omni antenna pattern.

In a BRP-RX PPDU, all TRN-R subfields shall be transmitted using the same TX AWV configuration as the preamble and data fields of the PPDU, except if both the transmitting and receiving STAs support the Other_AID subfield as indicated through the Supports Other_AID field set to 1 within the STA's DMG Capabilities element and the value of the Other_AID subfield within the BRP Request field is different from 0, in which case the TRN-R subfields shall be transmitted using the best known TX AWV configuration for transmitting to the STA with AID equal to the value of the Other_AID subfield within the BRP Request field.

A STA that sets to 1 the Antenna Pattern Reciprocity subfield in the DMG STA Capability Information field in the DMG Capabilities element it transmits and that receives a BRP-RX PPDU from a peer STA that also sets to 1 the Antenna Pattern Reciprocity subfield in the DMG STA Capability Information field of the peer's DMG Capabilities element it transmits shall use the same AWV that was configured with the BRP-RX PPDU in subsequent transmissions and receptions with the peer STA during the DTI. This allows STAs that use reciprocity to shorten the beamforming training time.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A STA that sets to 1 the Antenna Pattern Reciprocity subfield in the CMMG Capabilities Info field in the CMMG Capabilities element it transmits and that receives a BRP-RX PPDU from a peer STA that also sets to 1 the Antenna Pattern Reciprocity subfield in the CMMG Capabilities Info field in the CMMG Capabilities element it transmits shall use the same AWV that was configured with the BRP-RX PPDU in subsequent transmissions and receptions with the peer STA during the DTI. This allows STAs that use reciprocity to shorten the beamforming training time.

10.41.7 Beam tracking

Beam tracking enables an initiator or responder to track changes in the AWVs of its DMG antennas and/or the spatial mapping matrix Q (defined in Clause 28) without the need to perform a complete BRP procedure. Analog beam tracking allows DMG STAs to track changes in the AWVs of its DMG antennas. Baseband beam tracking allows EDMG STAs to track changes in the spatial mapping matrix Q for SU and MU MIMO transmissions that use digital beamforming (see Clause 28).

Beam tracking may be one of the following:

— Initiator receive beam tracking
— Initiator transmit beam tracking
— Responder receive beam tracking

A STA (beam tracking initiator) may request a peer STA (beam tracking responder) to provide receive beam tracking training signals to the initiator on the next PPDU transmitted by the responder. The initiator does this by setting, in a transmitted PPDU, the TXVECTOR parameter BEAM_TRACKING_REQUEST to BEAM-TRACKING-REQUESTED, TRN_LEN to the number of requested TRN subfields as described in 20.9.2.2.3 and PPDU_TYPE to TRN-R. Otherwise, the BEAM_TRACKING_REQUEST parameter shall be set to BEAM-TRACKING-NOT-REQUESTED.

An EDMG STA (beam tracking initiator) may request a peer EDMG STA (beam tracking responder) to perform receive beam tracking by setting, in a transmitted PPDU, the TXVECTOR parameter EDMG_BEAM_TRACKING_REQUEST to BEAM-TRACKING-REQUESTED, EDMG_BEAM_TRACKING_TYPE to Analog Beam Tracking or Baseband Beam Tracking, BEAM_TRACKING_REQUEST to BEAM-TRACKING-NOT-REQUESTED, EDMG_TRN_LEN to the number of requested TRN units as described in 28.9.2.2 (EDMG BRP PPDU), and EDMG_PPDU_TYPE to EDMG-TRN-R. Otherwise, the EDMG_BEAM_TRACKING_REQUEST parameter shall be set to BEAM-TRACKING-NOT-REQUESTED.

A beam tracking responder that receives a PPDU requesting receive beam tracking with the BEAM_TRACKING_REQUEST or EDMG_BEAM_TRACKING_REQUEST parameter in the RXVECTOR set to BEAM-TRACKING-REQUESTED and the PPDU_TYPE parameter in the RXVECTOR set to TRN-R shall

— If BEAM_TRACKING_REQUEST parameter in the RXVECTOR is BEAM-TRACKING-REQUESTED, follow the rules described in 20.9.2.2 and shall include a beam refinement AGC field and TRN-R subfields appended to the next PPDU that is transmitted to the initiator in the same allocation and that employs an MCS index greater than 0. The value of the TRN_LEN parameter in the TXVECTOR of that PPDU shall be equal to the value of the TRN_LEN parameter in the RXVECTOR of the PPDU from the initiator.
— If BEAM_TRACKING_REQUEST parameter in the RXVECTOR is BEAM-TRACKING-NOT-REQUESTED, EDMG_BEAM_TRACKING_REQUEST parameter in the RXVECTOR is BEAM-TRACKING-REQUESTED, EDMG_BEAM_TRACKING_TYPE parameter in the RXVECTOR is Baseband Beam Tracking, and EDMG_PPDU_TYPE parameter in the RXVECTOR is EDMG-TRN-R, follow the rules described in 28.9.2.2 (EDMG BRP PPDU) and shall include TRN-R subfields to the following PPDU transmitted to the initiator in the same allocation, with an MCS index greater than 0. The following PPDU from the responder to the initiator shall have the value of

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the TXVECTOR parameter EDMG_PPDU_TYPE equal to EDMG-TRN-R and the value of the TXVECTOR parameter EDMG_TRN_LEN equal to the value of the EDMG_TRN_LEN parameter in the RXVECTOR of the PPDU from the initiator.

— If BEAM_TRACKING_REQUEST parameter in the RXVECTOR is BEAM-TRACKING-NOT-REQUESTED, EDMG_BEAM_TRACKING_REQUEST parameter in the RXVECTOR is BEAM-TRACKING-REQUESTED, EDMG_BEAM_TRACKING_TYPE parameter in the RXVECTOR is Analog Beam Tracking, and EDMG_PPDU_TYPE parameter in the RXVECTOR is EDMG-TRN-R, follow the rules described in 28.9.2.2 (EDMG BRP PPDU) and the beam tracking responder shall respond with either an EDMG BRP-RX PPDU or an EDMG BRP-RX/TX PPDU to the initiator in the same allocation, with an MCS index greater than 0. If the responder sends an EDMG BRP-RX PPDU, the value of TXVECTOR parameter EDMG_TRN_LEN in the following PPDU from the responder to the initiator shall be equal to the value of the EDMG_TRN_LEN parameter in the RXVECTOR of the PPDU from the initiator. If the responder sends EDMG BRP-RX/TX PPDU, the value of TXVECTOR parameter RX_TRN_PER_TX_TRN in the following PPDU from the responder to the initiator shall be equal to the value of the EDMG_TRN_LEN parameter in the RXVECTOR of the PPDU from the initiator.

If a beam tracking responder sends an EDMG BRP-RX/TX PPDU in response to an analog receive beam tracking request, the beam tracking initiator may aggregate in an A-MPDU a BRP frame that contains an EDMG Channel Measurement Feedback element with the feedback (see 10.41.6.4.1 (General)). The feedback type shall be the same as the feedback type in the last BRP frame that was transmitted from the responder to the initiator with TX-TRN-REQ equal to 1. If the initiator has never received a BRP frame from the responder with TX-TRN-REQ equal to 1, the initiator shall respond with all subfields of the FBCK-TYPE field equal to 0 and set the BS-FBCK field to the AWV feedback ID corresponding to the TRN subfields received with the best quality.

If the EDMG_BEAM_TRACKING_TYPE parameter in the RXVECTOR is not equal to Baseband Beam Tracking or the received PPDU is not EDMG, a responder may ignore a request for beam tracking within an allocation if it transmits no PPDUs other than PPDUs using MCS 0 (control mode PPDUs) to the initiator within the allocation.

NOTE 1—If the EDMG_BEAM_TRACKING_TYPE parameter in the RXVECTOR is Baseband Beam Tracking, the digital beamformers at the initiator can be set to a predetermined orthogonal matrix (e.g., the identity matrix) during the transmission of the appended TRN-R subfields only and the measurement at the initiator is based on the appended TRN-R subfields.

A beam tracking initiator requesting transmit beam tracking shall either

— set the BEAM_TRACKING_REQUEST parameter in the TXVECTOR to BEAM-TRACKING-REQUESTED, PPDU_TYPE to TRN-T, TRN_LEN to the number of TRN Units as described in 20.9.2.2.3, and append an AGC field and TRN-T subfields to the PPDU; or,

— Set the EDMG_BEAM_TRACKING_REQUEST parameter in the TXVECTOR to BEAM-TRACKING-REQUESTED, EDMG_BEAM_TRACKING_TYPE to Analog Beam Tracking or Baseband Beam Tracking, BEAM_TRACKING_REQUEST to BEAM-TRACKING-NOT-REQUESTED, EDMG_PPDU_TYPE to EDMG-TRN-T, and EDMG_TRN_LEN, EDMG_TRN_P, EDMG_TRN_M, and EDMG_TRN_N as described in 28.9.2.2 (EDMG BRP PPDU), and append TRN-T subfields to the PPDU.

NOTE 2—If the EDMG_BEAM_TRACKING_TYPE parameter in the TXVECTOR is Baseband Beam Tracking, then EDMG_TRN_LEN TRN units are appended to the PPDU (each with EDMG_TRN_P TRN subfields) and are transmitted using the same AWV as the preamble and Data fields of the PPDU. The digital beamformer for the responder can be set to a predetermined orthogonal matrix (e.g., the identity matrix) during the transmission of the appended TRN-T subfields only and the measurement is based on the appended TRN-T subfields.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A beam tracking initiator shall not initiate transmit beam tracking if the beam tracking responder has indicated lack of support by setting the DMG STA Beam Tracking Time Limit field to zero.

The beam tracking responder may aggregate in an A-MPDU a BRP frame that contains a Channel Measurement Feedback element with the feedback (see 10.41.6.4.1 (General)). The initiator may allocate time for the feedback through a reverse direction grant, provided the reverse direction protocol is supported by both the initiator and responder. The feedback type shall be the same as the feedback type in the last BRP frame that was transmitted from the initiator to the responder with TX-TRN-REQ equal to 1. If the NUM_TX_CHAINS parameter in the RXVECTOR of the frame that elicits the feedback is greater than 1, the responder may send the feedback in a MIMO BF Feedback frame. If the responder has never received a BRP frame from the initiator with TX-TRN-REQ equal to 1,

— If the BEAM_TRACKING_REQUEST parameter in the RXVECTOR of the PPDU sent by the initiator requesting beam tracking is BEAM-TRACKING-REQUESTED, the responder shall respond with all subfields of the FBCK-TYPE field equal to 0 and set the BS-FBCK field to the index of the TRN-T subfield that was received with the best quality.
— If, in the PPDU sent by the initiator requesting beam tracking, BEAM_TRACKING_REQUEST parameter in the RXVECTOR is BEAM-TRACKING-NOT-REQUESTED, EDMG_BEAM_TRACKING_REQUEST parameter in the RXVECTOR is BEAM-TRACKING-REQUESTED and EDMG_BEAM_TRACKING_TYPE in the RXVECTOR is Baseband Beam Tracking, the initiator shall include a FBCK-REQ in a DMG Beam Refinement element to request the needed feedback. The responder shall respond with the requested feedback in a MIMO BF Feedback frame.
— If, in the PPDU sent by the initiator requesting beam tracking, BEAM_TRACKING_REQUEST parameter in the RXVECTOR is BEAM-TRACKING-NOT-REQUESTED, EDMG_BEAM_TRACKING_REQUEST parameter in the RXVECTOR is BEAM-TRACKING-REQUESTED, EDMG_BEAM_TRACKING_TYPE in the RXVECTOR is Analog Beam Tracking, and EDMG_PPDU_TYPE is equal to EDMG-TRN-T, the responder shall respond with all subfields of the FBCK-TYPE field equal to 0 and set the BS-FBCK field to the AWV feedback ID corresponding to the TRN subfields received with the best quality.

A beam tracking initiator may also request a beam tracking responder to perform receive beam tracking by setting the TXVECTOR parameter BEAM_TRACKING_REQUEST to BEAM-TRACKING-NOT-REQUESTED, the TRN_LEN parameter to a nonzero value, the PPDU_TYPE parameter to TRN-R, and append an AGC field and TRN-R subfields to the transmitted PPDU.

A beam tracking responder that receives a PPDU with the BEAM_TRACKING_REQUEST parameter in the RXVECTOR equal to BEAM-TRACKING-NOT-REQUESTED, the TRN_LEN parameter in RXVECTOR having a nonzero value and the PPDU_TYPE parameter in the RXVECTOR equal to TRN-R, shall follow the rules described in 20.9.2.2 and may use the beam refinement AGC field and TRN-R subfields appended to the received PPDU to perform receive beam training.

A beam tracking initiator may request that a beam tracking responder performs receive beam tracking by setting the TXVECTOR parameter EDMG_BEAM_TRACKING_REQUEST to BEAM-TRACKING-NOT-REQUESTED, EDMG_BEAM_TRACKING_TYPE to Analog Beam Tracking, BEAM_TRACKING_REQUEST to BEAM-TRACKING-NOT-REQUESTED, EDMG_PPDU_TYPE to EDMG-TRN-R, EDMG_TRN_LEN to a nonzero value, and appending TRN-R subfields to the PPDU.

A beam tracking responder that receives a PPDU with RXVECTOR parameter BEAM_TRACKING_REQUEST equal to BEAM-TRACKING-NOT-REQUESTED, EDMG_BEAM_TRACKING_REQUEST equal to BEAM-TRACKING-NOT-REQUESTED, EDMG_BEAM_TRACKING_TYPE to Analog Beam Tracking, EDMG_PPDU_TYPE equal to EDMG-TRN-R, and EDMG_TRN_LEN to a nonzero value shall follow the rules described in 28.9.2.2 (EDMG BRP PPDU) and may use the TRN-R subfields appended to the received PPDU to perform receive beam

training. A beam tracking initiator may use the procedures specified above to request a beam tracking responder to perform both transmit and receive beam tracking on the same PPDU. This is done by, on top of the corresponding TXVECTOR parameter configuration specified above, setting the TXVECTOR parameter RX_TRN_PER_TX_TRN to a value greater than 0 and EDMG_PPDU_TYPE to EDMG-TRN-T. In this case, the beam tracking initiator and beam tracking responder shall use the rules described in 28.9.2.2 (EDMG BRP PPDU) to perform both transmit and receive training over the TRN subfields appended to the transmitted PPDU.

A beam tracking initiator requesting simultaneous receive and transmit beam tracking shall set the EDMG_BEAM_TRACKING_REQUEST parameter in the TXVECTOR to BEAM-TRACKING-REQUESTED, EDMG_BEAM_TRACKING_TYPE to Analog Beam Tracking, BEAM_TRACKING_REQUEST to BEAM-TRACKING-NOT-REQUESTED, EDMG_PPDU_TYPE to EDMG-TRN-T, the TXVECTOR parameter RX_TRN_PER_TX_TRN to a value greater than 0, and the parameters EDMG_TRN_LEN, EDMG_TRN_P, EDMG_TRN_M, and EDMG_TRN_N as described in 28.9.2.2 (EDMG BRP PPDU), and append a TRN field to the PPDU. The feedback sent by the beam tracking responder shall follow the same specification defined for the transmit beam tracking procedure.

Figure 10-105 (Example of beam tracking procedure with initiator requesting TRN-R) illustrates a beam tracking frame exchange sequence when the beam tracking initiator requests TRN-R subfields, while Figure 10-106 (Example of beam tracking procedure with initiator requesting TRN-T) illustrates a beam tracking frame exchange sequence when the beam tracking initiator requests TRN-T subfields.

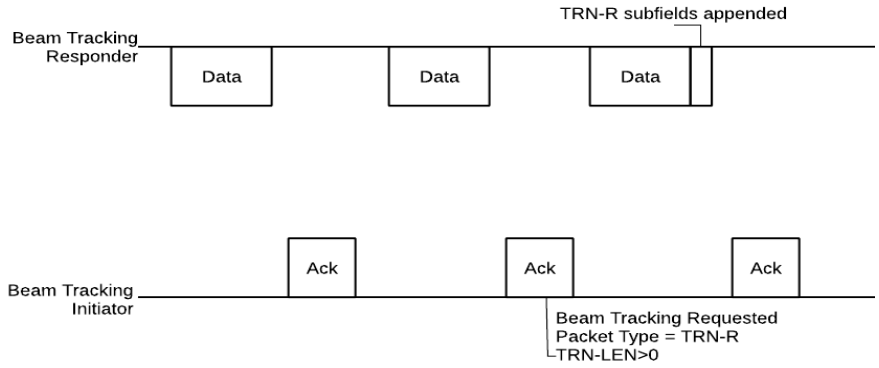

Figure 10-105—Example of beam tracking procedure with initiator requesting TRN-R

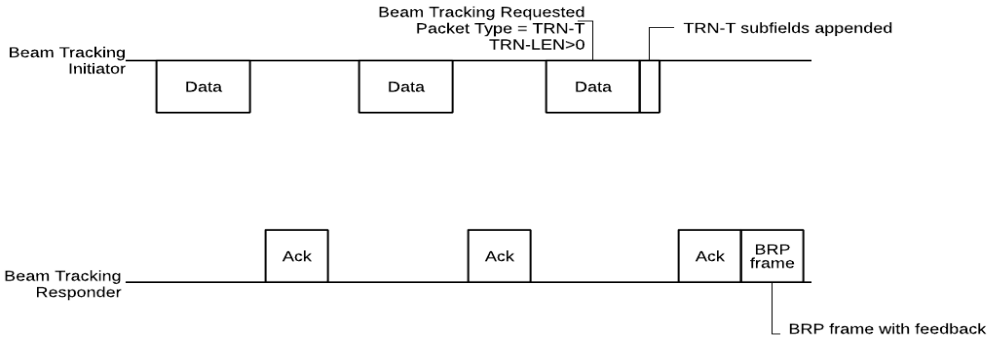

Figure 10-106—Example of beam tracking procedure with initiator requesting TRN-T

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A beam tracking initiator may transmit to the beam tracking responder a PPDU requesting transmit beam tracking if at least one of the following conditions is met:

— The time since the last PPDU it transmitted to the beam tracking responder that requested transmit beam tracking is greater than the beam tracking time limit plus BRPIFS.

— A BRP frame with the channel measurement feedback from the beam tracking responder has been received.

In addition, a beam tracking initiator or beam tracking responder may request baseband beam tracking if at least one of the following conditions is met:

— The performance of the system is degraded in a hybrid beamforming transmission and the initiator would like to reestimate the spatial mapping matrix Q as part of the link adaptation procedure.

— The initiator did not determine the spatial mapping matrix Q as part of the hybrid beamforming setup procedure, i.e., based on channel measurements reported as feedback to the MIMO training procedure or hybrid beamforming feedback during a hybrid beamforming training procedure as described in item b) in 10.41.10.2.4 (Hybrid beamforming for SU-MIMO and MU-MIMO). In this case, the AWVs of the DMG antennas at the transmitter and receiver have been identified, but a procedure to determine the spatial mapping matrix Q is still needed.

If the beam tracking initiator does not receive the expected feedback from the beam tracking responder within a time period that is less than the beam tracking time limit plus BRPIFS of the last request, the beam tracking request has failed.

If the initiator receives the expected feedback from the responder within a time period that is greater than or equal to the beam tracking time limit plus BRPIFS of the last request, the initiator should ignore it.

The time of arrival of the beam tracking responder's feedback is indicated by the PHY-RXEND.indication primitive of PPDU that contains the BRP MMPDU.

The time of transmit completion of the beam tracking initiator's PPDU is indicated by the PHY-TXEND.confirm primitive.

The beam tracking responder shall not transmit a BRP frame with feedback to the beam tracking initiator if the time period between PHY-RXEND.indication primitive of the PPDU that contains the beam tracking request and of PHY-TXEND.confirm primitive of the response BRP frame is longer than the beam tracking time limit.

The beam tracking time limit is based on the values of the DMG STA Beam Tracking Time Limit field received from the peer STA in the DMG Capabilities element and the dot11BeamTrackingTimeLimit. The beam tracking time limit is determined according to Table 10-37.

Table 10-37—Beam tracking time limit determination

DMG STA Beam Tracking Time Limit field from peer STA - denoted A	dot11BeamTrackingTime Limit - denoted B	A vs. B	Beam tracking time limit
0	0	N/A	Transmit beam tracking is not supported
>0	0	N/A	
0	>0	N/A	
>0 and < 65 535	>0 and < 65 535	A ≥ B	A

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 10-37—Beam tracking time limit determination

DMG STA Beam Tracking Time Limit field from peer STA - denoted A	dot11BeamTrackingTime Limit - denoted B	A vs. B	Beam tracking time limit
>0 and < 65 535	>0 and < 65 535	A < B	B
65 535	>0 and < 65 535	NA	B
>0 and < 65 535	65 535	NA	A
65 535	65 535	NA	Default dot11BeamTrackingTimeLimit value

NOTE 1—If the beam tracking responder has not included the DMG STA Beam Tracking Time Limit field in the DMG Capabilities element, the beam tracking initiator cannot tell whether the procedure failed. Retransmission is therefore implementation dependent.

NOTE 2—The signaling that beam tracking is not supported by setting the DMG STA Beam Tracking Time Limit field to zero is deprecated.

If the beam tracking procedure includes the transmission of BRP-TX or EDMG BRP-TX PPDUs, both STAs (initiator and responder) shall not change their antenna settings, except during the transmission of the TRN field in PPDUs used to perform beam tracking, during the procedure. If the beam tracking procedure includes the transmission of EDMG BRP-RX/TX PPDUs, both STAs (initiator and responder) shall not change their antenna settings, except during the transmission and reception of the TRN field in PPDUs used to perform beam tracking, during the procedure. The STAs shall use the beam tracking procedure feedback and then update their antenna settings before their next TXOP or SP.

10.41.8 State machines

Figure 10-107 (SLS phase state machine (initiator)) depicts an example state machine of the SLS phase for the initiator, and Figure 10-108 (SLS phase state machine (responder)) illustrates an example state machine of the SLS phase for the responder. These state machines describe the behavior of the initiator and responder during BF and are applicable for any period of the beacon interval where BF is performed.

10.41.9 CDMG enhanced beam tracking

In addition to the beam tracking mechanism in 10.41.7, the CDMG enhanced beam tracking mechanism enables CDMG communicating STA pairs to measure and switch to an alternative link to reduce the link outage probability induced by an unexpected blockage or a rapid antenna rotation. The alternative link is a

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

suboptimal link configured by a pair of CDMG STAs during the SLS phase or the BRP phase. The enhanced beam tracking mechanism extends the capabilities on the basis of the beam tracking mechanism in 10.41.7. A pair of CDMG STAs may perform beam tracking (see 10.41.7) and enhanced beam tracking described in this subclause simultaneously.

The Enhanced Beam Tracking Supported subfield in the CDMG STA Capability Information field of a CDMG STA's CDMG Capabilities element is set to 1 to indicate that the CDMG STA supports enhanced beam tracking.

The initial alternative link of the peer STA under enhanced beam tracking is configured in the BRP phase. Specifically, in the first BRP phase after the SLS, the initiator STA returns the sector and DMG antenna IDs of the alternative link to the responder STA, via transmitting the SSW Report element or the Enhanced Beam Tracking element in the BRP frame(s). The responder STA shall specify the alternative TX AWV according to the received Report Info field in the SSW Report element or the Peer TX Antenna Parameter field in the Enhanced Beam Tracking element. For the BRP phase, the index of the TRN-T subfield that was received with the second best quality in the last received BRP-TX PPDU is included in the Enhanced Beam Tracking element to specify the alternative TX AWV. The alternative link is not used for the current data transmission.

During the enhanced beam tracking phase, if a pair of STAs is operating on the link that is selected with best quality after SLS or BRP phase, switching to alternative link may be required if the signal quality of the current link deteriorates significantly based on the measurement results of e-TRN-R/T. If switching to alternative link is required, the initiator shall set the Switching to Backup AWV Request subfield of the Enhanced Beam Tracking element of the transmitted BRP frame to 1. If the initiator receives an Enhanced Beam Tracking element with the Switching to Backup AWV Enabled subfield set to 1 in the following BRP frame from the responder, the initiator and responder shall switch to the alternative link before transmitting the next frame. After switching to the alternative link, the initiator and responder shall set the last link as the new alternative link.

A CDMG STA (beam tracking initiator) may request a peer CDMG STA (beam tracking responder) to perform enhanced receive beam tracking by setting, in a transmitted PPDU, the TXVECTOR parameter ENHANCED_BEAM_TRACKING_REQUEST to ENHANCED-BEAM-TRACKING-REQUESTED, the TRN_LEN parameter to the number of requested TRN Units as described in 24.9.2.2.3, and PPDU_TYPE to TRN-R. Otherwise, the ENHANCED_BEAM_TRACKING_REQUEST parameter shall be set to ENHANCED-BEAM-TRACKING-NOT-REQUESTED.

An enhanced beam tracking responder that receives a PPDU with ENHANCED_BEAM_TRACKING_REQUEST parameter in the RXVECTOR equal to ENHANCED-BEAM-TRACKING-REQUESTED and the PPDU_TYPE parameter in the RXVECTOR equal to TRN-R) shall follow the rules described in 24.9.2.2 and shall include a beam refinement AGC field, TRN-R subfields, STF, and CE field appended to the next PPDU transmitted to the initiator. The value of the TRN_LEN parameter in the TXVECTOR of that PPDU shall be set to the value of the TRN_LEN parameter in the RXVECTOR of the PPDU from the initiator.

An enhanced beam tracking initiator requesting enhanced transmit beam tracking shall set the ENHANCED_BEAM_TRACKING_REQUEST parameter in the TXVECTOR to ENHANCED-BEAM-TRACKING-REQUESTED, the PPDU_TYPE to TRN-T, and the TRN_LEN parameter to the number of TRN Units as described in 24.9.2.2.3 and append an AGC field, TRN-R subfields, an STF, and a CE field to the PPDU. The enhanced beam tracking responder may aggregate the feedback inside an A-MPDU in a frame sent from the responder to the initiator according to the rules specified in 10.41.6.4.1. The initiator may allocate time for the feedback through a reverse direction grant, provided the reverse direction protocol is supported by both the initiator and responder. The Feedback Type field shall be set to the value of the Feedback Type field in the last BRP frame that was transmitted from the initiator to the responder with the TX-TRN-REQ subfield set to 1. If the responder has never received a BRP frame from the initiator with the TX-TRN-REQ subfield is equal to 1, the responder shall respond with all subfields of the FBCK-TYPE field set to 0 and set the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

BS-FBCK field to the best sector. If switching to the alternative link is required, the initiator shall set the Switching to Backup AWV Request subfield to 1 within the Enhanced Beam Tracking element within the transmitted BRP frame. The responder should respond with an Enhanced Beam Tracking element with the Switching to Backup AWV Enabled subfield set to 1 in the following BRP frame. If the Enhanced Beam Tracking element with the Switching to Backup AWV Enabled subfield set to 1 is transmitted or received, the initiator and responder shall switch to the alternative link before the next frame. After switching to the alternative link, the initiator and responder shall both set the last link as the new alternative link.

An enhanced beam tracking initiator may also request a beam tracking responder to perform receive beam tracking by setting, in a transmitted PPDU, the ENHANCED_BEAM_TRACKING_REQUEST parameter in the TXVECTOR to ENHANCED-BEAM-TRACKING-REQUESTED, the TRN_LEN parameter to a nonzero value, and the PPDU_TYPE parameter to 0 and appending an AGC field, TRN-R subfields, an STF, and a CE field to the transmitted PPDU.

A beam tracking responder that receives a PPDU with the ENHANCED_BEAM_TRACKING_REQUEST parameter in the RXVECTOR equal to ENHANCED-BEAM-TRACKING-REQUESTED, the TRN_LEN parameter not equal to 0, and the PPDU_TYPE parameter equal to 0 shall follow the rules described in 24.9.2.2 and may use the beam refinement AGC field, TRN-R subfields, STF, and CE field appended to the received PPDU to perform receive beam tracking. If the switching to the alternative link is required, the responder shall set the Switching to Backup AWV Request subfield within the Enhanced Beam Tracking element within the transmitted BRP frame to 1. The initiator should respond with an Enhanced Beam Tracking element with the Switching to Backup AWV Enabled subfield set to 1 in the following BRP frame. If the Enhanced Beam Tracking element with the Switching to Backup AWV Enabled subfield set to 1 is transmitted or received, the initiator and responder shall switch to the alternative link before the next frame. After switching to the alternative link, the initiator and responder shall both set the last link as the new alternative link.

The CDMG STAs that switched to the alternative link that is a suboptimal link after SLS or BRP phase should measure the quality of the original optimal beam link (the new alternative link) during the subsequent frames exchange. The initiator should transmit a beam tracking request to the responder to switch to the new alternative link if the new alternative link has a better link quality. The decision process of switching to the alternative link is implementation dependent and beyond the scope of this standard.

BRP frames transmitted during enhanced beam tracking may be aggregated within A-MPDUs. Figure 10-109 (Example of an enhanced beam tracking procedure with the initiator requesting TRN-R) illustrates a beam tracking frame exchange sequence when the beam tracking initiator requests TRN-R subfields, while Figure 10-110 (Example of an enhanced beam tracking procedure with the initiator requesting TRN-T) illustrates a beam tracking frame exchange sequence when the beam tracking initiator requests TRN-T subfields.

An example of beam tracking and switching for enhanced beam tracking is shown in Annex W.3.

10.41.10 EDMG beamforming

10.41.10.1 General

This subclause specifies beamforming mechanisms that are applicable to an EDMG STA. These mechanisms are in addition to the mechanisms specified in the remainder of 10.41 (DMG beamforming), which are applicable to DMG STAs.

If an EDMG STA transmits a BRP frame with the TXVECTOR parameter EDMG_TRN_LEN > 0, the EDMG_PPDU_TYPE parameter equal to either EDMG-TRN-T or EDMG-TRN-R/T, the Channel Measurement Requested subfield in the FBCK-REQ field of the DMG Beam Refinement element equal to 1 and the TX-TRN-REQ subfield in the BRP Request field equal to 1, the TXVECTOR parameter EDMG_TRN_P shall not be set to 0.

If an EDMG STA transmits a BRP frame and all the addressed receivers' EDMG Capabilities elements include the Beamforming Capability subelement, the TXVECTOR parameter EDMG_BRP_MIN_SC_BLOCKS shall be set to the largest value of the Requested BRP SC Blocks subfield of all receiver STAs.

If an EDMG STA transmits a BRP frame and at least one of the addressed receivers' EDMG Capabilities element does not include the Beamforming Capability subelement, the TXVECTOR parameter EDMG_BRP_MIN_SC_BLOCKS shall be set to aBRPminSCBlocks that is specified in 20.11.4 (DMG PHY).

A STA can utilize the information from a peer STA's antenna polarization in order to enhance the beamformed link quality with the peer STA. Antenna polarization capability is contained in the Antenna Polarization Capability field in a STA's EDMG Capabilities element. For example, if a STA is synthesizable polarization capable and a peer STA is linear polarization capable, the STA can employ circularly polarized antenna to do initial beamforming training with the peer STA to avoid polarization alignment loss. Once initial beamforming training is completed, the STA can further perform beam refinement by switching to a linear polarized antenna and performing polarization alignment using BRP.

10.41.10.2 MIMO beamforming

10.41.10.2.1 General

This subclause describes the procedures used to perform SU-MIMO and MU-MIMO beamforming training and enable MIMO communication between an initiator and one or more responders. The procedures described in this subclause are performed in the DTI of a beacon interval and shall not be initiated unless the initiator and the intended responder(s) have an established control mode link between them.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Sector ID Order and Tap Delay fields shall not be present in the Channel Measurement Feedback element included in any MIMO BF Feedback frame transmitted during SU-MIMO or MU-MIMO BF training.

The SNR field shall be present in the Channel Measurement Feedback element included in any MIMO BF Feedback frame transmitted during SU-MIMO or MU-MIMO BF training. The EDMG Sector ID Order field (containing AWV feedback IDs and TX antenna IDs) and the BRP CDOWN field shall be present in the EDMG Channel Measurement Feedback element included in any MIMO BF Feedback frame transmitted during SU-MIMO or MU-MIMO BF training.

10.41.10.2.2 SU-MIMO beamforming

10.41.10.2.2.1 General

An EDMG STA is SU-MIMO capable if the SU-MIMO Supported subfield of the Beamforming Capability subelement in the STA's EDMG Capabilities element is 1. An SU-MIMO capable STA supports both SU-MIMO transmission and reception and the SU-MIMO beamforming protocol described in this subclause.

The SU-MIMO beamforming protocol supports beamforming training for subsequent transmission and reception of multiple spatial streams between an SU-MIMO capable initiator and an SU-MIMO capable responder. The SU-MIMO beamforming protocol enables the determination of transmit antenna settings and the corresponding receive antenna settings for simultaneous transmission of multiple spatial streams from the initiator to the responder or vice versa.

The SU-MIMO beamforming protocol can also be used to enable transmit beamforming and receive beamforming operation between the initiator and the responder in which a single spatial stream is transmitted through multiple DMG antennas using the determined transmit antenna settings and received through multiple DMG antennas using the determined corresponding receive antenna settings.

The SU-MIMO beamforming protocol comprises the following consecutive phases:

— SISO phase
— MIMO phase

10.41.10.2.2.2 SISO phase

This subclause describes the SISO phase performed outside of a TDD SP. When the SISO phase is performed in a TDD SP, the SISO phase comprises TDD BF procedure (see 10.41.11 (TDD beamforming)).

The objective of the SISO phase is to enable the initiator to collect feedback of the last initiator TXSS from the responder and also enables the responder to collect feedback of the last responder TXSS from the initiator.

The SISO phase comprises either a MIMO BRP TXSS procedure (see 10.41.10.5 (BRP transmit sector sweep (BRP TXSS))) or a SISO feedback procedure. When the SISO phase comprises a MIMO BRP TXSS procedure, it includes a setup phase, an Initiator BRP TXSS, a Responder BRP TXSS, and a feedback phase as defined in 10.41.10.5 (BRP transmit sector sweep (BRP TXSS)). In particular, the BRP frame sent by the initiator during the setup phase to start the SISO phase shall have the BRP-TXSS, TXSS-INITIATOR and TXSS-MIMO fields within the EDMG BRP Request element all set to 1.

In the BRP frame sent by the initiator during the feedback phase, the EDMG Sector ID Order field in the EDMG Channel Measurement Feedback element indicates AWV feedback IDs, TX antennas and RX antennas of all or a subset of sectors that were received in the Responder BRP TXSS. The BRP CDOWN field in the EDMG Channel Measurement Feedback element indicates BRP CDOWNs of the PPDUs in

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

which these sectors were received. The SNR field in the Channel Measurement Feedback element indicates the SNRs with which these sectors were received. If the number of sectors for a pair of TX and RX DMG antennas that were received in the responder BRP TXSS is larger than aMinTXSSSectorFBCnt, the BRP frame shall contain feedback for at least aMinTXSSSectorFBCnt received sectors for the pair of TX and RX DMG antennas. Otherwise, the BRP frame shall contain feedback for all the received sectors for the pair of TX and RX DMG antennas.

In the BRP frame sent by the responder during the feedback phase, the EDMG Sector ID Order field in the EDMG Channel Measurement Feedback element indicates AWV feedback IDs, TX antennas and RX antennas of all or a subset of sectors that were received in the Initiator BRP TXSS. The BRP CDOWN field in the EDMG Channel Measurement Feedback element indicates BRP CDOWNs of the BRP PPDUs in which these sectors were received. The SNR field in the Channel Measurement Feedback element indicates the SNRs with which these sectors were received. If the number of sectors for a pair of TX and RX DMG antennas that were received in the initiator BRP TXSS is larger than aMinTXSSSectorFBCnt, the BRP frame shall contain feedback for at least aMinTXSSSectorFBCnt received sectors for the pair of TX and RX DMG antennas. Otherwise, the BRP frame shall contain feedback for all the received sectors for the pair of TX and RX DMG antennas.

When the SISO phase comprises a SISO feedback procedure, the initiator shall send a BRP frame to the responder. The DMG Beam Refinement element included in the BRP frame shall have the BF Training Type, TXSS-FBCK-REQ, EDMG Extension Flag and EDMG Channel Measurement Present fields set to 1, the SNR Requested and Sector ID Order Requested subfields within the FBCK-REQ field set to 1, the remaining subfields within the FBCK-REQ field set to 0, and the SNR Present, Sector ID Order Present, Channel Measurement Present, Tap Delay Present and Link Type subfields within the FBCK-TYPE field set to 1, 1, 0, 0, and 1, respectively.

The last responder TXSS may have been performed using SSW frames, Short SSW PPDUs or EDMG BRP-TX PPDUs.

— If the Sector Sweep Frame Type field in the DMG Beam Refinement element is 0, the EDMG Sector ID Order field in the EDMG Channel Measurement Feedback element indicates the sector IDs, TX antennas and RX antennas of all or a subset of sectors that were received in the last responder TXSS.
— If the Sector Sweep Frame Type field in the DMG Beam Refinement element is 1, the EDMG Sector ID Order field in the EDMG Channel Measurement Feedback element indicates the CDOWNs and RX antennas of all or a subset of sectors that were received in the last responder TXSS.
— If the Sector Sweep Frame Type field in the DMG Beam Refinement element is 2, the EDMG Sector ID Order field in the EDMG Channel Measurement Feedback element indicate AWV feedback IDs, TX antennas and RX antennas of all or a subset of sectors that were received in the last responder TXSS.

The BRP CDOWN field in the EDMG Channel Measurement Feedback element indicates the BRP CODWNs of the BRP PPDUs in which these sectors were received. The SNR field in the Channel Measurement Feedback element indicates the SNRs with which these sectors were received. If the number of sectors for a pair of TX and RX DMG antennas that were received in the last responder TXSS is larger than aMinTXSSSectorFBCnt, the BRP frame shall contain feedback for at least aMinTXSSSectorFBCnt received sectors for the pair of TX and RX DMG antennas. Otherwise, the BRP frame shall contain feedback for all the received sectors for the pair of TX and RX DMG antennas.

The responder shall send a BRP frame to the initiator within an MBIFS following the reception of the BRP frame from the initiator. The DMG Beam Refinement element included in the BRP frame shall have the BF Training Type, EDMG Extension Flag and EDMG Channel Measurement Present fields set to 1, all the subfields within the FBCK-REQ field set to 0, and the SNR Present, Sector ID Order Present, Channel Measurement Present, Tap Delay Present and Link Type subfields within the FBCK-TYPE field set to 1, 1, 0, 0, and 0, respectively.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The last initiator TXSS may have been performed using DMG Beacon frames, SSW frames, Short SSW PPDUs or EDMG BRP-TX PPDUs.

— If the Sector Sweep Frame Type field in the DMG Beam Refinement element is 0, the EDMG Sector ID Order field in the EDMG Channel Measurement Feedback element indicates the sector IDs, TX antennas and RX antennas of all or a subset of sectors that were received in the last initiator TXSS.

— If the Sector Sweep Frame Type field in the DMG Beam Refinement element is 1, the EDMG Sector ID Order field in the EDMG Channel Measurement Feedback element indicates the CDOWNs and RX antennas of all or a subset of sectors that were received in the last initiator TXSS.

— If the Sector Sweep Frame Type field in the DMG Beam Refinement element is 2, the EDMG Sector ID Order field in the EDMG Channel Measurement Feedback element indicates AWV feedback IDs, TX antennas and RX antennas of all or a subset of sectors that were received in the last initiator TXSS.

The BRP CDOWN field in the EDMG Channel Measurement Feedback element indicates the BRP CODWNs of the BRP PPDUs in which these sectors were received. The SNR field in the Channel Measurement Feedback element indicates the SNRs with which these sectors were received. If the number of sectors for a pair of TX and RX DMG antennas that were received in the last initiator TXSS is larger than aMinTXSSSectorFBCnt, the BRP frame shall contain feedback for at least aMinTXSSSectorFBCnt received sectors for the pair of TX and RX DMG antennas. Otherwise, the BRP frame shall contain feedback for all the received sectors for the pair of TX and RX DMG antennas.

During the SISO feedback procedure, all transmissions should use the DMG control mode.

10.41.10.2.2.3 MIMO phase—general

The MIMO phase enables the training of transmit and receive sectors and DMG antennas to determine best combinations of transmit and receive sectors and DMG antennas for SU-MIMO operation.

When the MIMO phase is performed outside of a TDD SP, the initiator starts the MIMO phase an MBIFS following the end of the SISO phase. When the MIMO phase is performed in a TDD SP, after the end of TDD beamforming, each subphase should start within the earliest occurring TDD slot the initiator is assigned to and with slot category of the TDD slot set to Basic TDD slot, as indicated in the TDD Slot Schedule element.

The MIMO phase consists of a nonreciprocal MIMO phase or a reciprocal MIMO phase (see 10.41.10.2.2 (SU-MIMO beamforming)).

The nonreciprocal MIMO phase shall be supported by all EDMG STAs that are SU-MIMO capable. The reciprocal MIMO phase shall be supported by all EDMG STAs that are SU-MIMO capable and have the Antenna Pattern Reciprocity subfield in the DMG Capabilities element equal to 1.

The MIMO BF Setup frame, MIMO BF Poll frame and MIMO BF Feedback frame sent in the MIMO phase of an SU-MIMO beamforming shall be transmitted by applying spatial expansion and mapping a single space-time stream to all N_{TX} transmit chains to be trained in the procedure. The MIMO BF Setup frame, MIMO BF Poll frame and MIMO BF Feedback frame should be sent using the EDMG control mode.

BRP frames sent in the MIMO phase of an SU-MIMO beamforming shall be transmitted using EDMG PPDUs by applying spatial expansion and mapping a single space-time stream to all N_{TX} transmit chains to be trained in the procedure. The TRN field of each EDMG BRP-RX/TX PPDU used in SU-MIMO beamforming shall consist of N_{TX} orthogonal waveforms as defined in 28.9.2 (Beam refinement).

At the beginning of the MIMO phase of an SU-MIMO beamforming, if an implementation has not yet determined AWVs to use in some of its transmit chains (for example, if a STA has been using a single

Copyright © 2025 IEEE. All rights reserved.

transmit chain before the MIMO phase), the AWVs used by such chains should be selected in an implementation dependent manner.

The AWVs used in the transmission of a MIMO BF Feedback frame, MIMO BF Poll frame and all fields except for the TRN field of each EDMG BRP-RX/TX PPDU shall be the same as those used in the transmission of MIMO BF Setup frame. Similarly, the AWVs used in the reception of a MIMO BF Feedback frame, MIMO BF Poll frame and all fields except for the TRN field of each EDMG BRP-RX/TX PPDU shall be the same as those used in the reception of MIMO BF Setup frame.

10.41.10.2.2.4 MIMO phase–nonreciprocal

The nonreciprocal MIMO phase is shown in Figure 10-111 (Nonreciprocal MIMO phase of SU-MIMO beamforming) and consists of four subphases: an SU-MIMO BF setup subphase, an initiator SU-MIMO BF training (SMBT) subphase, a responder SMBT subphase, and an SU-MIMO BF feedback subphase.

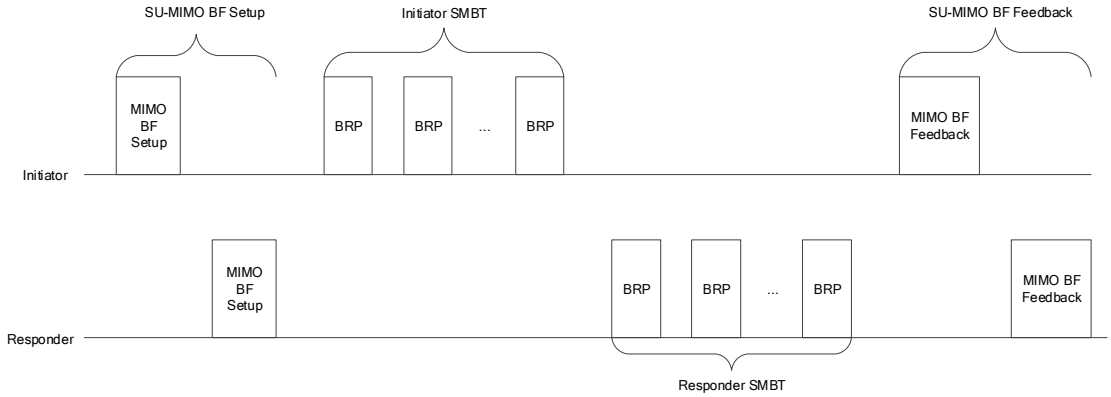

Figure 10-111—Nonreciprocal MIMO phase of SU-MIMO beamforming

It is mandatory to perform the SU-MIMO BF setup subphase.

In the SU-MIMO BF setup subphase, the initiator shall send a MIMO BF Setup frame with the TA field and the RA field set to the MAC addresses of the initiator and the responder, respectively. The MIMO BF Setup frame shall indicate a unique dialog token in the Dialog Token field for identifying SU-MIMO BF training. In the MIMO Setup Control element of the MIMO BF Setup frame, the SU/MU and Nonreciprocal/ Reciprocal MIMO Phase fields shall be set to 0 and the Initiator field shall be set to 1. The L-TX-RX field and the Requested EDMG TRN-Unit M field shall indicate the number of TRN subfields requested for receive AWV training in the following responder SMBT subphase. The number of transmit sector combinations requested for the initiator link ($N_{tsc}^{(I)}$) shall be indicated in the Number of TX Sector Combinations Requested subfield of the MIMO FBCK-REQ field. Whether time domain channel response is requested as part of SU-MIMO BF feedback shall be indicated in the Channel Measurement Requested subfield of the MIMO FBCK-REQ field. If the time domain channel response is requested as part of SU-MIMO BF feedback, the Channel Measurement Requested subfield of the MIMO FBCK-REQ field shall be set to 1 and the Number of Taps Requested subfield of the MIMO FBCK-REQ field shall indicate the number of channel taps requested in time domain channel response. For channel aggregation, the Channel Aggregation Requested subfield of the MIMO FBCK-REQ field should be set to 1. Additionally, based on the SNRs of the transmit sectors collected from the responder in the SISO phase, the initiator may select a subset of candidate transmit sectors per DMG antenna to reduce the initiator SMBT training time. Each DMG antenna should have the similar number of candidate transmit sectors in order to avoid biasing a DMG antenna. The L-TX-RX subfield and the Requested EDMG TRN-Unit M subfield of the MIMO BF Setup frame shall indicate the number of TRN subfields requested for receive AWV training in the following responder SMBT subphase.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—If the initiator has antenna pattern reciprocity, the subset of candidate transmit sectors per DMG antenna selected by the initiator for the initiator SMBT subphase can also be used to reduce the number of TRN subfields required for receive AWV training in the following responder SMBT subphase.

In the MIMO phase outside of a TDD SP, the responder shall send a MIMO BF Setup frame a SIFS following the reception of the MIMO BF Setup frame from the initiator. In the MIMO phase in a TDD SP, upon reception of the MIMO BF Setup frame from the initiator, the responder shall send a MIMO BF Setup frame within the earliest occurring TDD slot the responder is assigned to and with slot category of the TDD slot set to Basic TDD slot as indicated in the TDD Slot Schedule element.

The TA field and the RA field of the MIMO BF Setup frame shall be set to the MAC address of the responder and the initiator, respectively. The MIMO BF Setup frame shall indicate the same dialog token value in the Dialog Token field as in the MIMO BF Setup frame received from the initiator. In the MIMO Setup Control element of the MIMO BF Setup frame, the SU/MU, Nonreciprocal/Reciprocal MIMO Phase and Initiator fields shall be set to 0. The L-TX-RX field and the Requested EDMG TRN-Unit M field shall indicate the number of TRN subfields requested for receive AWV training in the following initiator SMBT subphase. The number of transmit sector combinations requested for the responder link ($N_{tsc}^{(R)}$) shall be indicated in the Number of TX Sector Combinations Requested subfield of the MIMO FBCK-REQ field. Whether time domain channel response is requested as part of SU-MIMO BF feedback shall be indicated in the Channel Measurement Requested subfield of the MIMO FBCK-REQ field. If the time domain channel response is requested as part of SU-MIMO BF feedback, the Channel Measurement Requested subfield of the MIMO FBCK-REQ field shall be set to 1 and the Number of Taps Requested subfield of the MIMO FBCK-REQ field shall indicate the number of channel taps requested in time domain channel response. The Channel Aggregation Requested subfield of the MIMO FBCK-REQ field shall be set to the same value as its counterpart in the MIMO BF Setup frame received from the initiator. Additionally, based on the SNRs of the transmit sectors collected from the initiator in the SISO phase, the responder may select a subset of candidate transmit sectors per DMG antenna to reduce the responder SMBT training time. Each DMG antenna should have the similar number of candidate transmit sectors in order to avoid biasing a DMG antenna. The L-TX-RX subfield and the Requested EDMG TRN-Unit M subfield of the MIMO BF Setup frame shall indicate the number of TRN subfields requested for receive AWV training in the following initiator SMBT subphase.

NOTE 2—If the responder has antenna pattern reciprocity, the subset of candidate transmit sectors per DMG antenna selected by the responder for the responder SMBT subphase can also be used to reduce the number of TRN subfields required for receive AWV training in the following initiator SMBT subphase.

When the MIMO phase is performed outside of a TDD SP, the initiator shall initiate the initiator SMBT subphase an MBIFS following the reception of the MIMO BF Setup frame from the responder. When the MIMO phase is performed in a TDD SP, upon reception of the MIMO BF Setup frame from the responder, the initiator shall initiate the initiator SMBT subphase within the earliest occurring TDD slot the initiator is assigned to and with slot category of the TDD slot set to Basic TDD slot as indicated in the TDD Slot Schedule element.

In the initiator SMBT subphase, the initiator shall transmit EDMG BRP-RX/TX PPDUs to the responder. Each EDMG BRP-RX/TX PPDU shall be separated by SIFS. When performed within a TDD SP and there is not enough time within a TDD slot to transmit all EDMG BRP-RX/TX PPDUs, the remaining EDMG BRP-RX/TX PPDUs are transmitted within the earliest occurring TDD slot the initiator is assigned to and with slot category of the TDD slot set to Basic TDD slot as indicated in the TDD Slot Schedule element. Each transmitted EDMG BRP-RX/TX PPDU is used to train one or more transmit sectors and, for each transmit sector, a number of receive AWVs. In each EDMG BRP-RX/TX PPDU, the initiator shall include, for each selected transmit sector, TRN subfields in the TRN field of the PPDU for the responder to perform receive AWV training. For each EDMG BRP-RX/TX PPDU, the TXVECTOR parameter EDMG_TRN_LEN shall be set to a value greater than 0, and the parameters RX_TRN_PER_TX_TRN and EDMG_TRN_M shall be set to the values of the L-TX-RX and Requested EDMG TRN-Unit M fields in the MIMO BF Setup frame received from the responder, respectively. The TX Antenna Mask field of each

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

EDMG BRP-RX/TX PPDU shall indicate the TX DMG antenna(s) that is being used by the initiator to transmit the EDMG BRP-RX/TX PPDU. The BRP CDOWN field of each EDMG BRP-RX/TX PPDU shall indicate the number of remaining EDMG BRP-RX/TX PPDUs to be transmitted by the initiator in the initiator SMBT subphase.

In the MIMO phase performed outside of a TDD SP, the responder shall initiate the responder SMBT subphase an MBIFS following the reception of an EDMG BRP-RX/TX PPDU with the BRP CDOWN field set to 0 from the initiator. In the MIMO phase performed in a TDD SP, upon reception of an EDMG BRP-RX/TX PPDU with the BRP CDOWN field set to 0 from the initiator, the responder shall initiate the responder SMBT subphase within the earliest occurring TDD slot the responder is assigned to and with slot category of the TDD slot set to Basic TDD slot as indicated in the TDD Slot Schedule element.

In the responder SMBT subphase, the responder shall transmit EDMG BRP-RX/TX PPDUs to the initiator. Each EDMG BRP-RX/TX PPDU shall be separated by SIFS. When performed within a TDD SP and there is not enough time within a TDD slot to transmit all EDMG BRP-RX/TX PPDUs, the remaining EDMG BRP-RX/TX PPDUs are transmitted within the earliest occurring TDD slot the responder is assigned to and with slot category of the TDD slot set to Basic TDD slot as indicated in the TDD Slot Schedule element. For each EDMG BRP-RX/TX PPDU, the TXVECTOR parameter EDMG_TRN_LEN shall be set to a value greater than 0, and the parameters RX_TRN_PER_TX_TRN and EDMG_TRN_M shall be set to the values of the L-TX-RX and Requested EDMG TRN-Unit M fields in the MIMO BF Setup frame received from the initiator, respectively. The TX Antenna Mask field of each EDMG BRP-RX/TX PPDU shall indicate the TX DMG antenna(s) that is being used by the responder to transmit the EDMG BRP-RX/TX PPDU. The BRP CDOWN field of each EDMG BRP-RX/TX PPDU shall indicate the number of remaining EDMG BRP-RX/TX PPDUs to be transmitted by the responder in the responder SMBT subphase.

When the MIMO phase is performed outside of a TDD SP, the initiator shall initiate the SU-MIMO BF feedback subphase an MBIFS following the reception of an EDMG BRP-RX/TX PPDU with the BRP CDOWN field set to 0 from the responder. When the MIMO phase is performed in a TDD SP, upon reception of an EDMG BRP-RX/TX PPDU with the BRP CDOWN field set to 0 from the responder, the initiator shall initiate the SU-MIMO BF feedback subphase within the earliest occurring TDD slot the initiator is assigned to and with slot category of the TDD slot set to Basic TDD slot as indicated in the TDD Slot Schedule element.

In the SU-MIMO BF feedback subphase, the initiator shall send to the responder a MIMO BF Feedback frame with the TA field set to the MAC address of the initiator and the RA field set to the MAC address of the responder. The MIMO BF Feedback frame shall carry the dialog token in the Dialog Token field that identifies the SU-MIMO BF training. In the MIMO Feedback Control element of the MIMO BF Feedback frame, the SU/MU field shall be set to 0 and the Link Type field shall be set to 1. If the MIMO BF Feedback frame contains SU-MIMO BF feedback for responder link, the ComeBack Delay field shall be set to 0. Otherwise, the ComeBack Delay field shall be set to a nonzero value that indicates when the initiator is ready with SU-MIMO BF feedback for responder link. If the ComeBack Delay field is 0 and for a 2.16+2.16 GHz or 4.32+4.32 GHz channel, the Channel Aggregation Present subfield of the MIMO FBCK-TYPE field should be set to 1. If the ComeBack Delay field is a nonzero value, the Channel Aggregation Present subfield of the MIMO FBCK-TYPE field shall be set to 0. The Number of TX Sector Combinations Present subfield of the MIMO FBCK-TYPE field shall indicate the number of best transmit sector combinations, $N_{tsc}^{(R)}$, recommended by the initiator for responder link.

The EDMG Channel Measurement Feedback element in the MIMO BF Feedback frame shall indicate $N_{tsc}^{(R)}$ best transmit sector combinations in the EDMG Sector ID Order field and the BRP CDOWN field, which are determined based on channel measurement data captured from the responder SMBT subphase. The Channel Measurement Feedback element in the MIMO BF Feedback frame shall contain SNRs corresponding to the $N_{tsc}^{(R)}$ transmit sector combinations in the SNR field. If the Channel Measurement Requested subfield of the MIMO FBCK-REQ field in the MIMO BF Setup frame received from the responder in the preceding SU-MIMO BF setup subphase is 1, the Channel Measurement Present subfield of

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the MIMO FBCK-TYPE field in the MIMO Feedback Control element shall be set to 1 and the Channel Measurement Feedback element shall contain channel measurements corresponding to the $N_{tsc}^{(R)}$ transmit sector combinations in the Channel Measurement field. If the Tap Delay Requested subfield of the MIMO FBCK-REQ field in the MIMO BF Setup frame received from the responder in the preceding SU-MIMO BF setup subphase is 1, the Tap Delay Present subfield of the MIMO FBCK-TYPE field in the MIMO Feedback Control element shall be set to 1 and the EDMG Channel Measurement Feedback element shall contain relative tap delays for the measurements in the Tap Delay field.

In the MIMO phase outside of a TDD SP, the responder shall send a MIMO BF Feedback frame to the initiator a SIFS following reception of a MIMO BF Feedback frame from the initiator. In the MIMO phase in a TDD SP, upon reception of a MIMO BF Feedback frame from the initiator, the responder shall send a MIMO BF Feedback frame to the initiator within the earliest occurring TDD slot the responder is assigned to and with slot category of the TDD slot set to Basic TDD slot as indicated in the TDD Slot Schedule element.

The TA field of the MIMO BF Feedback shall be set to the MAC address of the responder and the RA field shall be set to the MAC address of the initiator. The MIMO BF Feedback frame shall carry the dialog token in the Dialog Token field that identifies the SU-MIMO BF training. In the MIMO Feedback Control element of the MIMO BF Feedback frame, the SU/MU and Link Type fields shall be set to 0. If the MIMO BF Feedback frame contains SU-MIMO BF feedback for initiator link, the ComeBack Delay field shall be set to 0. Otherwise, the ComeBack Delay field shall be set to a nonzero value that indicates when the responder is ready with SU-MIMO BF feedback for initiator link. If the ComeBack Delay field is 0 and for 2.16+2.16 or 4.32+4.32 GHz channels, the Channel Aggregation Present subfield of the MIMO FBCK-TYPE field should be set to 1. If the ComeBack Delay field is a nonzero value, the Channel Aggregation Present subfield of the MIMO FBCK-TYPE field shall be set to 0. The Number of TX Sector Combinations Present subfield of the MIMO FBCK-TYPE field shall indicate the number of best transmit sector combinations, $N_{tsc}^{(I)}$, recommended by the responder for initiator link.

If the ComeBack Delay field of the MIMO BF Feedback frame received from the initiator is nonzero, the responder shall send a MIMO BF Poll frame with the SU/MU and Poll Type fields set to 0 to the initiator after the initiator's comeback delay has elapsed subject to the DMG channel access rules in a DTI. The initiator shall send a MIMO BF Feedback frame that contains the SU-MIMO BF feedback for the responder link a SIFS following the reception of the MIMO BF Poll frame. If the ComeBack Delay field of the MIMO BF Feedback frame received from the responder is nonzero, the initiator shall send a MIMO BF Poll frame to the responder with the SU/MU and Poll Type fields set to 0 after the responder's comeback delay has elapsed subject to the DMG channel access rules in a DTI. The responder shall respond with a MIMO BF Feedback frame that contains the SU-MIMO BF feedback for the initiator link a SIFS following the reception of the MIMO BF Poll frame.

The EDMG Channel Measurement Feedback element in the MIMO BF Feedback frame shall indicate $N_{tsc}^{(I)}$ best transmit sector combinations in the EDMG Sector ID Order field and the BRP CDOWN field, which are determined based on channel measurement data captured from the initiator SMBT subphase. The Channel Measurement Feedback element in the MIMO BF Feedback frame shall contain SNRs corresponding to the $N_{tsc}^{(I)}$ transmit sector combinations in the SNR field. If the Channel Measurement Requested subfield of the MIMO FBCK-REQ field in the MIMO BF Setup frame received from the initiator in the preceding SU-MIMO BF setup subphase is 1, the Channel Measurement Present subfield of the MIMO FBCK-TYPE field in the MIMO Feedback Control element shall be set to 1 and the Channel Measurement Feedback element shall contain channel measurements corresponding to the $N_{tsc}^{(I)}$ transmit sector combinations in the Channel Measurement field. If the Tap Delay Requested subfield of the MIMO FBCK-REQ field in the MIMO BF Setup frame received from the initiator in the preceding SU-MIMO BF setup subphase is 1, the Tap Delay Present subfield of the MIMO FBCK-TYPE field in the MIMO Feedback Control element shall be set to 1 and the EDMG Channel Measurement Feedback element shall contain tap delays corresponding to the $N_{tsc}^{(I)}$ transmit sector combinations in the Tap Delay field.

The $N_{tsc}^{(I)}$ best transmit sector combinations (or equivalently $N_{tsc}^{(I)}$ best TX-RX AWV configurations) for the initiator link and the $N_{tsc}^{(R)}$ best transmit sector combinations (or equivalently $N_{tsc}^{(R)}$ best TX-RX AWV configurations) for the responder link shall be determined in such a way that no transmit or receive AWV come from the same DMG antenna (i.e., a transmit sector combination indicated by a specific SISO ID subset in the EDMG Channel Measurement Feedback element comprises a single transmit sector for each of N_{TX} TX DMG antennas and the corresponding receive sector combination comprises a single receive sector for each of N_{RX} RX DMG antennas). The algorithms for determining the $N_{tsc}^{(I)}$ best transmit sector combinations for the initiator link and for determining the $N_{tsc}^{(R)}$ best transmit sector combinations for the responder link are implementation dependent. The transmit sector combinations to be used for the initiator link and the responder link are indicated using either RTS/DMG CTS frames with a control trailer or a DMG CTS-to-self frame with a control trailer at the beginning of a SU-MIMO channel access procedure (see 10.38.12.4.3 (SU-MIMO channel access procedure)).

10.41.10.2.2.5 MIMO phase–reciprocal

The reciprocal MIMO phase might shorten the SU-MIMO BF training time. The initiator may initiate a reciprocal MIMO phase if the following conditions are met:

— The SU-MIMO Supported field in initiator's and responder's EDMG Capabilities element equals one; and

— The Antenna Pattern Reciprocity field in initiator's and responder's DMG Capabilities element equals one

The reciprocal MIMO phase is shown in Figure 10-112 (Reciprocal MIMO phase of SU-MIMO beamforming) and consists of three subphases: an SU-MIMO BF setup subphase, an initiator SMBT subphase and an SU-MIMO BF feedback subphase.

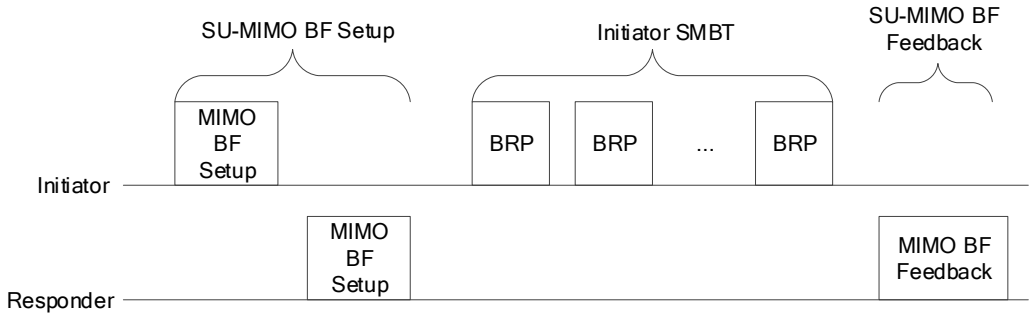

Figure 10-112—Reciprocal MIMO phase of SU-MIMO beamforming

It is mandatory to perform the SU-MIMO BF setup subphase.

In the SU-MIMO BF setup subphase, the initiator shall send a MIMO BF Setup frame with the TA field and the RA field of the MIMO BF Setup frame set to the MAC addresses of the initiator and the responder, respectively. The MIMO BF Setup frame shall indicate a unique dialog token in the Dialog Token field for identifying SU-MIMO BF training. In the MIMO Setup Control element of the MIMO BF Setup frame, the SU/MU field shall be set to 0, and both the Nonreciprocal/Reciprocal MIMO Phase and Initiator field shall be set to 1. The number of transmit sector combinations requested for the initiator link ($N_{tsc}^{(I)}$) shall be indicated in the Number of TX Sector Combinations Requested subfield of the MIMO FBCK-REQ field. Whether time domain channel response is requested as part of SU-MIMO BF feedback shall be indicated in the Channel Measurement Requested subfield of the MIMO FBCK-REQ field. If the time domain channel response is requested as part of SU-MIMO BF feedback, the Channel Measurement Requested subfield of the MIMO FBCK-REQ field shall be set to 1 and the Number of Taps Requested subfield of the MIMO FBCK-REQ field shall indicate the number of channel taps requested in time domain channel response. For

channel aggregation, the Channel Aggregation Requested subfield of the MIMO FBCK-REQ field should be set to 1. Additionally, based on the SNRs of the transmit sectors collected from the responder in the SISO phase, the initiator may select a subset of candidate transmit sectors per DMG antenna to reduce the initiator SMBT training time. Each DMG antenna should have the similar number of candidate transmit sectors in order to avoid biasing a DMG antenna.

In the MIMO phase performed outside of a TDD SP, the responder shall send a MIMO BF Setup frame a SIFS following the reception of the MIMO BF Setup frame from the initiator. In the MIMO phase performed in a TDD SP, upon reception of the MIMO BF Setup frame from the initiator, the responder shall send a MIMO BF Setup frame within the earliest occurring TDD slot the responder is assigned to and with slot category of the TDD slot set to Basic TDD slot as indicated in the TDD Slot Schedule element.

The TA field and the RA field of the MIMO BF Setup frame shall be set to the MAC address of the responder and the initiator, respectively. The MIMO BF Setup frame shall indicate the same dialog token value in the Dialog Token field as in the MIMO BF Setup frame received from the initiator. In the MIMO Setup Control element of the MIMO BF Setup frame, the SU/MU and Initiator fields shall be set to 0, and the Nonreciprocal/Reciprocal MIMO Phase field shall be set to 1. The L-TX-RX field and the Requested EDMG TRN-Unit M field shall indicate the number of TRN subfields requested for receive AWV training in the following initiator SMBT subphase. Based on the SNRs of the transmit sectors collected from the initiator in the SISO phase, the responder may select a subset of candidate receive sectors per DMG antenna to reduce the initiator SMBT training time. Each DMG antenna should have the similar number of candidate receive sectors in order to avoid biasing a DMG antenna.

When the MIMO phase is performed outside of a TDD SP, the initiator shall initiate the initiator SMBT subphase an MBIFS following the reception of the MIMO BF Setup frame from the responder. When the MIMO phase is performed in a TDD SP, upon reception of the MIMO BF Setup frame from the responder, the initiator shall initiate the initiator SMBT subphase within the earliest occurring TDD slot the initiator is assigned to and with slot category of the TDD slot set to Basic TDD slot as indicated in the TDD Slot Schedule element.

In the initiator SMBT subphase, the initiator shall transmit EDMG BRP-RX/TX PPDUs to the responder. Each EDMG BRP-RX/TX PPDU shall be separated by SIFS. When performed within a TDD SP and there is not enough time within a TDD slot to transmit all EDMG BRP-RX/TX PPDUs, the remaining EDMG BRP-RX/TX PPDUs are transmitted within the earliest occurring TDD slot the initiator is assigned to and with slot category of the TDD slot set to Basic TDD slot as indicated in the TDD Slot Schedule element. Each transmitted EDMG BRP-RX/TX PPDU is used to train one or more transmit sectors and, for each transmit sector, a number of receive AWVs. In each EDMG BRP-RX/TX PPDU, the initiator shall include, for each selected transmit sector, TRN subfields in the TRN field of the PPDU for the responder to perform receive AWV training. For each EDMG BRP-RX/TX PPDU, the TXVECTOR parameter EDMG_TRN_LEN shall be set to a value greater than 0, and the parameters RX_TRN_PER_TX_TRN and EDMG_TRN_M shall be set to the values of the L-TX-RX and Requested EDMG TRN-Unit M fields in the MIMO BF Setup frame received from the responder, respectively. The TX Antenna Mask field of each EDMG BRP-RX/TX PPDU shall indicate the TX DMG antenna(s) that is being used by the initiator to transmit the EDMG BRP-RX/TX PPDU. The BRP CDOWN field of each EDMG BRP-RX/TX PPDU shall indicate the number of remaining EDMG BRP-RX/TX PPDUs to be transmitted by the initiator in the initiator SMBT subphase.

When the MIMO phase is performed outside of a TDD SP, the responder shall initiate the SU-MIMO BF feedback subphase an MBIFS following the reception of an EDMG BRP-RX/TX PPDU with the BRP CDOWN field set to 0 from the initiator. When the MIMO phase is performed in a TDD SP, upon reception of an EDMG BRP-RX/TX PPDU with the BRP CDOWN field set to 0 from the initiator, the responder shall initiate the SU-MIMO BF feedback subphase within the earliest occurring TDD slot the responder is assigned to and with slot category of the TDD slot set to Basic TDD slot as indicated in the TDD Slot Schedule element.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In the SU-MIMO BF feedback subphase, the responder shall send a MIMO BF Feedback frame to the initiator with the TA field set to the MAC address of the responder and the RA field set to the MAC address of the initiator. The MIMO BF Feedback frame shall carry the dialog token in the Dialog Token field that identifies the SU-MIMO BF training. In the MIMO Feedback Control element of the MIMO BF Feedback frame, the SU/MU and Link Type field shall be set to 0. If the MIMO BF Feedback frame contains SU-MIMO BF feedback for the initiator link, the ComeBack Delay field shall be set to 0. Otherwise, the ComeBack Delay field shall be set to a nonzero value that indicates when the responder is ready with SU-MIMO BF feedback for initiator link. If the ComeBack Delay field is 0 and for 2.16+2.16 GHz or 4.32+4.32 GHz channels, the Channel Aggregation Present subfield of the MIMO FBCK-TYPE field should be set to 1. If the ComeBack Delay field is a nonzero value, the Channel Aggregation Present subfield of the MIMO FBCK-TYPE field shall be set to 0. The Number of TX Sector Combinations Present subfield of the MIMO FBCK-TYPE field shall indicate the number of best transmit sector combinations, $N_{tsc}^{(I)}$, recommended by the responder for initiator link.

If the ComeBack Delay field of the MIMO BF Feedback frame received from the responder is nonzero, the initiator shall send a MIMO BF Poll frame with the SU/MU and Poll Type fields set to 0 to the responder immediately after the responder's comeback delay has elapsed subject to the DMG channel access rules in a DTI. In this case, the responder shall respond with a MIMO BF Feedback frame that contains SU-MIMO BF feedback for the initiator link a SIFS following the reception of the MIMO BF Poll frame.

The EDMG Channel Measurement Feedback element in the MIMO BF Feedback frame shall indicate $N_{tsc}^{(I)}$ best transmit sector combinations in the EDMG Sector ID Order field and the BRP CDOWN field, which are determined based on channel measurement data captured from the initiator SMBT subphase. The Channel Measurement Feedback element in the MIMO BF Feedback frame shall contain SNRs corresponding to the $N_{tsc}^{(I)}$ transmit sector combinations in the SNR field. If the Channel Measurement Requested subfield of the MIMO FBCK-REQ field in the MIMO BF Setup frame received from the initiator in the preceding SU-MIMO BF setup subphase is 1, the Channel Measurement Present subfield of the MIMO FBCK-TYPE field in the MIMO Feedback Control element shall be set to 1 and the Channel Measurement Feedback element shall contain channel measurements corresponding to the $N_{tsc}^{(I)}$ transmit sector combinations in the Channel Measurement field. If the Tap Delay Requested subfield of the MIMO FBCK-REQ field in the MIMO BF Setup frame received from the initiator in the preceding SU-MIMO BF setup subphase is 1, the Tap Delay Present subfield of the MIMO FBCK-TYPE field in the MIMO Feedback Control element shall be set to 1 and the EDMG Channel Measurement Feedback element shall contain tap delays corresponding to the $N_{tsc}^{(I)}$ transmit sector combinations in the Tap Delay field.

The $N_{tsc}^{(I)}$ best transmit sector combinations (or equivalently $N_{tsc}^{(I)}$ best TX-RX AWV configurations) for the initiator link shall be determined in such a way that no transmit or receive AWV come from the same DMG antenna (i.e., a transmit sector combination indicated by a specific SISO ID subset in the EDMG Channel Measurement Feedback element comprises a single transmit sector for each of N_{TX} TX DMG antennas and the corresponding receive sector combination comprises a single receive sector for each of N_{RX} RX DMG antennas). The determined $N_{tsc}^{(I)}$ best transmit and receive sector combinations for the initiator link shall be treated as the $N_{tsc}^{(R)}$ best receive and transmit sector combinations for the responder link, respectively, where $N_{tsc}^{(I)} = N_{tsc}^{(R)}$. The algorithm for determining the $N_{tsc}^{(I)}$ best transmit sector combinations for the initiator link is implementation dependent. The transmit sector combinations to be used for the initiator link and the responder link are indicated using either RTS/DMG CTS frames with a control trailer or a DMG CTS-to-self frame with a control trailer at the beginning of a SU-MIMO channel access procedure (see 10.38.12.4.3 (SU-MIMO channel access procedure)).

10.41.10.2.3 MU-MIMO beamforming

10.41.10.2.3.1 General

An EDMG STA is MU-MIMO capable if the MU-MIMO Supported subfield of the Beamforming Capability subelement in the STA's EDMG Capabilities element is 1. The MU-MIMO beamforming

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

protocol enables an MU-MIMO capable initiator and one or more MU-MIMO capable responders in an MU group to establish an antenna configuration that allows the initiator to transmit an EDMG MU PPDU to the responders in the MU group, such that the mutual interference among the streams transmitted in the MU PPDU is minimized. In this context, the method of minimizing interference is implementation dependent.

MU-MIMO beamforming shall not be performed within a TDD SP.

The MU-MIMO beamforming protocol is started and controlled by the initiator, and comprises the following consecutive phases:

— SISO phase
— MIMO phase

The MU-MIMO beamforming protocol uses the EDMG Group ID Set element transmitted by the AP or PCP of the BSS. The AP or PCP shall transmit an EDMG Group ID Set element prior to performing MU-MIMO beamforming protocol. The EDMG Group ID Set element shall include all existing groups in a BSS. An MU-MIMO capable EDMG STA shall store the groups in the last received EDMG Group ID Set element transmitted by the AP or PCP. If an AP or PCP needs to change the STAs in an MU group associated with an existing EDMG group ID, it shall send an individually addressed Announce frame including the updated EDMG Group ID Set element to each of the STAs that are affected by the change to notify of the update.

MIMO BF Setup frames, MIMO BF Poll frames and MIMO BF Selection frames sent by the initiator in the MIMO phase of an MU-MIMO beamforming shall be transmitted by applying spatial expansion and mapping a single space-time stream to all N_{TX} transmit chains to be trained in the procedure. The AWVs used by such chains in the transmission of MIMO BF Setup frames and MIMO BF Selection frames should be selected in an implementation dependent manner. If an implementation has not yet determined AWVs to use in some of its transmit chains for the transmission of MIMO BF Poll frame, the AWVs used by such chains should be selected in an implementation dependent manner. MIMO BF Setup frames, MIMO BF Poll frames and MIMO BF Selection frames should be sent using the EDMG control mode.

In the nonreciprocal MU-MIMO BF feedback subphase, MIMO BF Feedback frame sent by each responder shall be transmitted by applying spatial expansion and mapping a single space-time stream to all N_{TX} transmit chains. If an implementation has not yet determined AWVs to use in some of its transmit chains for the transmission of MIMO BF Feedback frame, the AWVs used by such chains should be selected in an implementation dependent manner. MIMO BF Feedback frame should be sent using the EDMG control mode.

BRP frames sent in the MIMO phase of an MU-MIMO beamforming shall be transmitted using EDMG PPDUs by applying spatial expansion and mapping a single space-time stream to all N_{TX} transmit chains to be trained in the procedure. The TRN field of each EDMG BRP-RX/TX PPDU used in MU-MIMO beamforming shall consist of N_{TX} orthogonal waveforms, as defined in 28.9.2 (Beam refinement). In the nonreciprocal MU-MIMO BF training subphase, the AWVs used by such chains in the transmission of all fields except for the TRN field of each EDMG BRP-RX/TX PPDU should be selected in an implementation dependent manner.

In the reciprocal MU-MIMO BF training subphase, if an implementation has not yet determined AWVs to use in some of its transmit chains for the transmission of all fields except for the TRN field of each EDMG BRP-RX/TX PPDU, the AWVs used by such chains should be selected in an implementation dependent manner.

10.41.10.2.3.2 SISO phase

The goal of the SISO phase is to collect feedback on one or more suitable initiator's TX and responder's RX DMG antennas and sectors between the initiator and each responder in the MU group. This information is

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

then used to perform the following MIMO phase. All transmissions during the SISO phase should use the DMG control mode.

Figure 10-113 (SISO phase of MU-MIMO beamforming) depicts the SISO phase, which consists of two subphases, namely, an Initiator TXSS subphase and a SISO Feedback subphase. The initiator may perform the Initiator TXSS subphase. The Initiator TXSS subphase enables the initiator to obtain feedback from the responders in the MU group on one or more sectors for each of the initiator's TX DMG antenna.

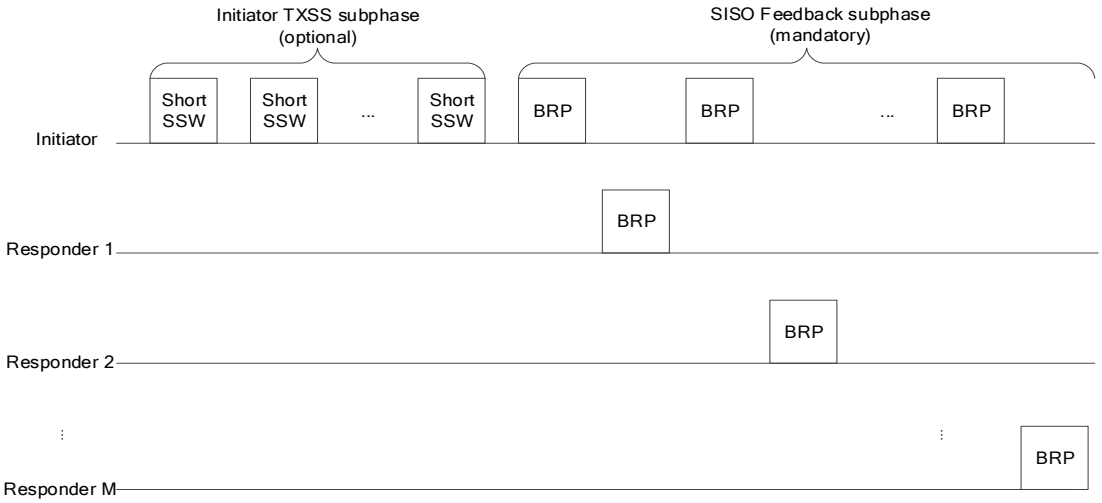

Figure 10-113—SISO phase of MU-MIMO beamforming

The initiator performs the Initiator TXSS subphase through the use of the Short SSW PPDU (see 28.9.1 (Short SSW PPDU)). In each Short SSW PPDU transmitted as part of the Initiator TXSS, the initiator shall set the TXVECTOR parameter SSSW_DIR to indicate Initiator, shall set the TXVECTOR parameter SSSW_ADD_MODE to indicate GroupAddr and shall set the TXVECTOR parameter SSSW_DESTINATION_AID to contain a group ID announced by the PCP or AP in the last transmitted EDMG Group ID Set element. In addition, the TXVECTOR parameter SSSW_CDOWN shall be set to the number of Short SSW PPDUs remaining until the end of the Initiator TXSS subphase and the TXVECTOR parameter SSSW_SISO_FEEDBACK_DURATION shall be set to the duration of the following SISO Feedback subphase.

An MU-MIMO capable EDMG STA that receives a Short SSW PPDU indicating MU-MIMO transmission determines that it is an intended recipient of the PPDU by matching the value of the RXVECTOR parameter SSSW_DESTINATION_AID in the PPDU with a value of the EDMG Group ID subfield contained in the last received EDMG Group ID Set element. In case a match is found, the EDMG STA is an intended recipient of the PPDU if its AID is included in the EDMG Group ID subfield of the corresponding group. Otherwise, the EDMG STA is not an intended recipient of the PPDU and can ignore the remainder of the Initiator TXSS and SISO Feedback subphase, which can be done through the use of the value of the RXVECTOR parameters SSSW_CDOWN and SSSW_SISO_FEEDBACK_DURATION of the received Short SSW PPDU.

The initiator shall perform the SISO Feedback subphase. If the Initiator TXSS is present, the SISO Feedback subphase shall start MBIFS following the end of the Initiator TXSS subphase. During the SISO Feedback subphase, the initiator transmits a BRP frame to poll each responder in the MU group. The DMG Beam Refinement element of the BRP frame shall have the BF Training Type field set to 2, the TXSS-FBCK-REQ field set to 1, the SNR Requested subfield within the FBCK-REQ field set to 1, the Sector ID Order Requested field within the FBCK-REQ field set to 1, the Channel Measurement Requested subfield within the FBCK-REQ field set to 0, all the subfields within the FBCK-TYPE field set to 0 and the EDMG Channel

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Measurement Present field set to 0. A responder shall respond with a BRP frame within an MBIFS following the reception of the corresponding BRP frame. The DMG Beam Refinement element of the BRP frame shall have the BF Training Type field set to 2, all the subfields within the FBCK-REQ field set to 0, the SNR Present subfield within the FBCK-TYPE field set to 1, the Sector ID Order Present subfield within the FBCK-TYPE field set to 1, the Channel Measurement Present subfield within the FBCK-TYPE field set to 0, the Tap Delay Present subfield within the FBCK-TYPE field set to 0, the Link Type subfield within the FBCK-TYPE field set to 0, the EDMG Extension Flag field set to 1 and the EDMG Channel Measurement Present field set to 1. The BRP frame shall include an EDMG BRP Request element, in which the L-TX-RX and Requested EDMG TRN-Unit M fields indicate the number of TRN subfields requested for receive AWV training in the following nonreciprocal MU-MIMO BF training.

The last initiator TXSS may have been performed using DMG Beacon frames, SSW frames, Short SSW PPDUs or EDMG BRP-TX PPDUs.

— If the Sector Sweep Frame Type field in the DMG Beam Refinement element is 0, the EDMG Sector ID Order field in the EDMG Channel Measurement Feedback element indicates the sector IDs, TX antennas and RX antennas of all or a subset of sectors that were received in the last initiator TXSS.
— If the Sector Sweep Frame Type field in the DMG Beam Refinement element is 1, the EDMG Sector ID Order field in the EDMG Channel Measurement Feedback element indicates the CDOWNs and RX antennas of all or a subset of sectors that were received in the last initiator TXSS.
— If the Sector Sweep Frame Type field in the DMG Beam Refinement element is 2, the EDMG Sector ID Order field in the EDMG Channel Measurement Feedback element indicates AWV feedback IDs, TX antennas and RX antennas of all or a subset of sectors that were received in the last Initiator TXSS.

The BRP CDOWN field in the EDMG Channel Measurement Feedback element indicates the BRP CDOWNs of the PPDUs in which these sectors were received. The SNR field in the Channel Measurement Feedback element indicates the SNRs with which these sectors were received. If the number of sectors for a pair of TX and RX DMG antennas that were received in the last initiator TXSS is larger than aMinTXSSSectorFBCnt, the BRP frame shall contain feedback for at least aMinTXSSSectorFBCnt received sectors for the pair of TX and RX DMG antennas. Otherwise, the BRP frame shall contain feedback for all the received sectors for the pair of TX and RX DMG antennas.

10.41.10.2.3.3 MIMO phase—general

The MIMO phase consists of a nonreciprocal MIMO phase or a reciprocal MIMO phase (see 10.41.10.2.3 (MU-MIMO beamforming)).

The nonreciprocal MIMO phase shall be supported by all EDMG STAs that are MU-MIMO capable. The reciprocal MIMO phase may be supported by EDMG STAs that are MU-MIMO capable.

10.41.10.2.3.4 MIMO phase–nonreciprocal

The initiator shall start the MIMO phase MBIFS following the end of the SISO phase. The nonreciprocal MIMO phase is shown in Figure 10-114 (Nonreciprocal MIMO phase of MU-MIMO beamforming) and consists of four subphases, namely, an MU-MIMO BF setup subphase, an MU-MIMO BF training subphase, an MU-MIMO BF feedback subphase, and an MU-MIMO BF selection subphase. Each subphase shall be separated by MBIFS.

Based on the feedback from the SISO phase, in the MU-MIMO BF setup subphase the initiator may exclude some responders from the following MU-MIMO BF training subphase and MU-MIMO BF feedback subphase if the multiuser interference the responders are expected to suffer due to MU-MIMO transmission is negligible. If all of the responders are excluded from the following MU-MIMO BF training subphase and MU-MIMO BF feedback subphase, these two subphases are not present in the MIMO phase.

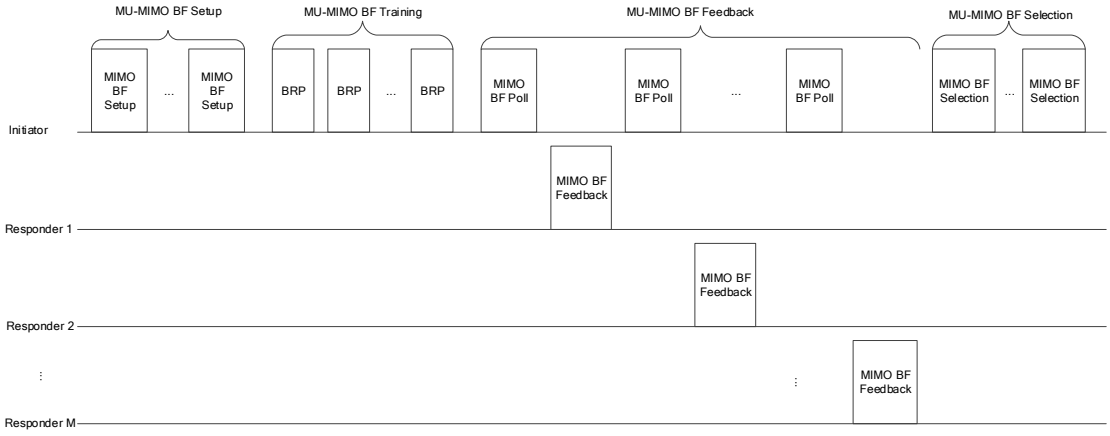

Figure 10-114—Nonreciprocal MIMO phase of MU-MIMO beamforming

In the MU-MIMO BF setup subphase, the initiator shall transmit one or more MIMO BF Setup frame to each responder in the MU group. The initiator should transmit the minimum number of MIMO BF Setup frames to reach all responders in the MU group. The TA field of each MIMO BF Setup frame shall be set to the BSSID of the initiator and the RA field shall be set to the broadcast address. Each MIMO BF Setup frame shall indicate a unique dialog token in the Dialog Token field for identifying MU-MIMO BF training. In the MIMO Setup Control element of each MIMO BF Setup frame, the SU/MU field shall be set to 1, the Nonreciprocal/Reciprocal MIMO Phase field shall be set to 0, and the Initiator field shall be set to 1. The EDMG group ID of the MU group shall be indicated in the EDMG Group ID field and each remaining responder shall be indicated in the Group User Mask field. Whether time domain channel response is requested as part of MU-MIMO BF feedback shall be indicated in the Channel Measurement Requested subfield of the MIMO FBCK-REQ field. If the time domain channel response is requested as part of MU-MIMO BF feedback, the Channel Measurement Requested subfield of the MIMO FBCK-REQ field shall be set to 1 and the Number of Taps Requested subfield of the MIMO FBCK-REQ field shall indicate the number of channel taps requested in time domain channel response. For channel aggregation, the Channel Aggregation Requested subfield of the MIMO FBCK-REQ field should be set to 1. To reduce the MU-MIMO BF training time, the initiator may select a subset of TX sectors for each DMG antenna. The number of TRN subfields required for receive AWV training is based on the L-TX-RX field and the Requested EDMG TRN-Unit M field of the EDMG BRP Request element included in the BRP frame received from each responder during the SISO feedback subphase. A responder whose corresponding bit in the Group User Mask field of the MIMO Setup Control element included in the received MIMO BF Setup frame is equal to 0 can discard frames transmitted in the following MU-MIMO BF training subphase and MU-MIMO BF feedback subphase.

The initiator shall initiate the MU-MIMO BF training subphase an MBIFS following the transmission of the MIMO BF Setup frame. In the MU-MIMO BF training subphase, the initiator shall transmit one or more EDMG BRP-RX/TX PPDUs to the remaining responders in the MU group. Each EDMG BRP-RX/TX PPDU shall be separated by SIFS. Both the TA and RA fields of each transmitted EDMG BRP-RX/TX PPDU shall be set to the MAC address of the initiator. If a responder whose corresponding bit in the Group User Mask field within the last received MIMO BF Setup frame from the initiator was equal to 1 receives an EDMG BRP-RX/TX PPDU with both the TA and RA fields equal to the MAC address of the initiator, the responder should perform receive AWV training. For each EDMG BRP-RX/TX PPDU, the TXVECTOR parameter EDMG_TRN_LEN shall be set to a value greater than 0. The parameters RX_TRN_PER_TX_TRN and EDMG_TRN_M shall be set in such a manner that the number of TRN subfields included in the TRN field used for receive AWV training is the maximum number of receive sectors across all the remaining responders based on the L-TX-RX subfields and the Requested EDMG TRN-Unit M subfields in the feedback from all the remaining responders in the SISO phase. The TX

Antenna Mask field of each EDMG BRP-RX/TX PPDU shall indicate the TX DMG antenna(s) that is being used by the initiator to transmit the EDMG BRP-RX/TX PPDU. The BRP CDOWN field of each EDMG BRP-RX/TX PPDU shall indicate the number of remaining EDMG BRP-RX/TX PPDUs to be transmitted by the initiator in the MU-MIMO BF training subphase.
