NOTE 2—Values for the Address Extension Mode subfield are defined in Table 9-35.

In individually addressed mesh Data and Multihop Action frames, Address 1 and Address 2 correspond to the mesh STA receiver address (RA) and the mesh STA transmitter address (TA) for a particular mesh link. Address 3 and Address 4 correspond to the destination mesh STA and the source mesh STA of a mesh path. The Address Extension Mode subfield in the Mesh Control field indicates the presence of an optional Mesh Address Extension subfield in the Mesh Control field. When the Extension Mode subfield equals "Address5&6" (see Table 9-35), the Mesh Control field includes Address 5 and Address 6 that correspond to the end-to-end destination address (DA) and source address (SA) of STAs that communicate over the mesh path, for instance, external STAs that communicate over the mesh BSS via proxy mesh gates (see Figure 9-136).

NOTE 3—The forwarding of individually addressed mesh Data frames uses only mesh STA addresses in fields Address 1, Address 2, Address 3, and Address 4. This allows intermediate mesh STAs to forward mesh Data frames without necessarily having any knowledge of the addresses of the source and destination end stations, which might be external addresses. Thus, proxy information only needs to be maintained by proxy mesh gates and by source mesh STAs.

The term source mesh STA refers to the first mesh STA on a mesh path. A source mesh STA is either a mesh STA that is the initial source of an MSDU/MMPDU or a mesh STA that receives an MSDU/MMPDU from a mesh path or from a STA outside the mesh BSS and translates and forwards the MSDU/MMPDU on the mesh path. The address of the source mesh STA is referred to as the *Mesh SA*.

The term destination mesh STA refers to the final mesh STA on a mesh path. A destination mesh STA is either a mesh STA that is the final destination of an MSDU/MMPDU or a mesh STA that receives an MSDU/MMPDU from a mesh path and translates and forwards the MSDU/MMPDU on another mesh path or to a STA outside of the mesh BSS. The address of the destination mesh STA is referred to as the *Mesh DA*.

In group addressed mesh Data frames, Address 1 and Address 2 correspond to the group address and the mesh STA transmitter address (TA). Address 3 corresponds to the mesh source address (mesh SA) of the group addressed mesh Data frame. The Address Extension Mode indicates the presence of an optional address extension field Address 4 in the Mesh Control field that corresponds to the source address (SA) of external STAs that communicate over the mesh BSS via proxy mesh gates.

NOTE 4—The reason for not using the four-address MAC header format for group addressed traffic is to avoid interactions with existing implementations. Earlier revisions of this standard defined the four-address MAC header format without defining procedures for its use. As a result there is a large number of deployed devices that use the four-address frame format in ways that would affect and be affected by mesh traffic if four-address group addressed frames were to be used.

Figure 9-136 illustrates the addressing of a mesh Data frame that contains an MSDU transmitted and forwarded on a mesh path from a mesh STA colocated with a portal (STA 1) to a mesh STA colocated with an AP (STA 2) where the source is a STA outside of the mesh BSS (STA 33) that is reachable via the portal and the destination is an IEEE 802.11 STA associated with the AP (STA 22).

Details on how these address mappings work in forwarding processing are described in 10.37.3 and 10.37.4.

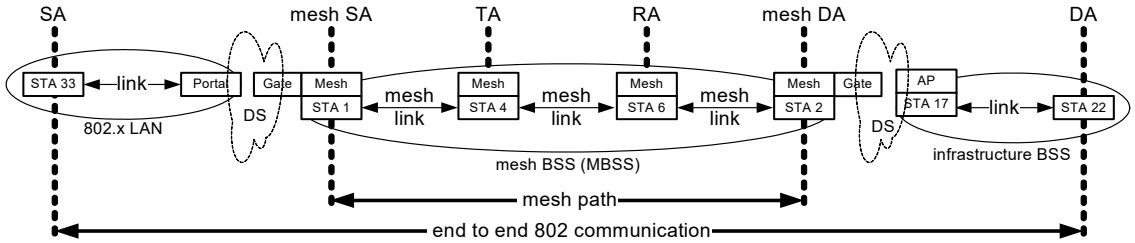

Figure 9-136—Example addressing for a mesh Data frame

9.4 Management and Extension frame body components

9.4.1 Fields that are not elements

9.4.1.1 Authentication Algorithm Number field

The Authentication Algorithm Number field indicates a single authentication algorithm. The Authentication Algorithm Number field is shown in Figure 9-137. The following values are defined for authentication algorithm number:

Authentication algorithm number = 0: Open System
Authentication algorithm number = 2: Fast BSS Transition
Authentication algorithm number = 3: Simultaneous Authentication of Equals (SAE)
Authentication algorithm number = 4: FILS Shared Key authentication without PFS
Authentication algorithm number = 5: FILS Shared Key authentication with PFS
Authentication algorithm number = 6: FILS Public Key authentication
Authentication algorithm number = 7: PASN authentication
Authentication algorithm number = 65 535: vendor specific use

NOTE—The use of this value implies that a Vendor Specific element is included with more information.

All other values of authentication algorithm number are reserved.

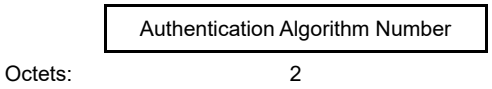

Figure 9-137—Authentication Algorithm Number field format

9.4.1.2 Authentication Transaction Sequence Number field

The Authentication Transaction Sequence Number field indicates the current state of progress through a multistep transaction. The Authentication Transaction Sequence Number field is shown in Figure 9-138.

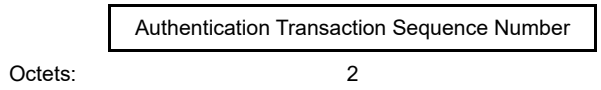

Figure 9-138—Authentication Transaction Sequence Number field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.1.3 Beacon Interval field

The Beacon Interval field represents the number of time units (TUs) between target beacon transmission times (TBTTs). The Beacon Interval field is shown in Figure 9-139.

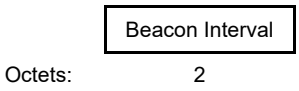

Figure 9-139—Beacon Interval field format

A 0 in the Beacon Interval field transmitted by a DMG STA indicates that the TBTT of the next BTI is unknown.

9.4.1.4 Capability Information field

The Capability Information field contains a number of subfields that are used to indicate requested or advertised optional capabilities.

The format of the Capability Information field is defined in Figure 9-140 when transmitted by a non-DMG STA and in Figure 9-141 when transmitted by a DMG STA.

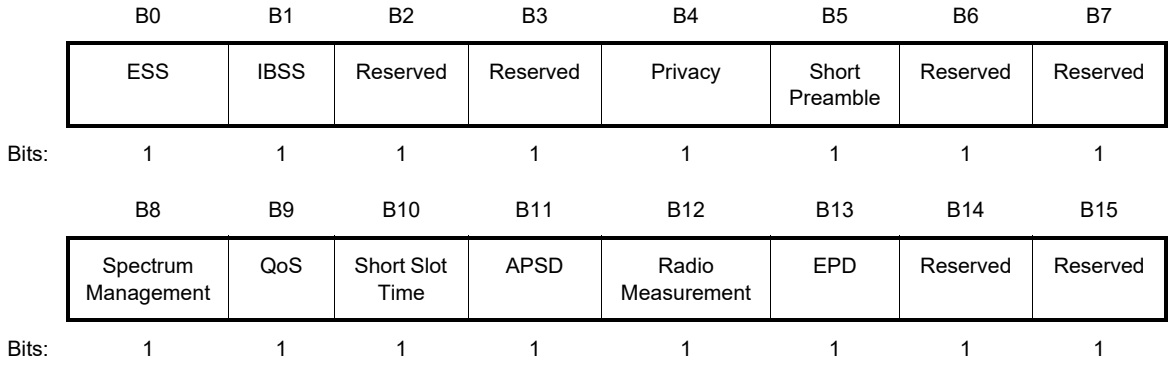

Figure 9-140—Capability Information field format (non-DMG STA)

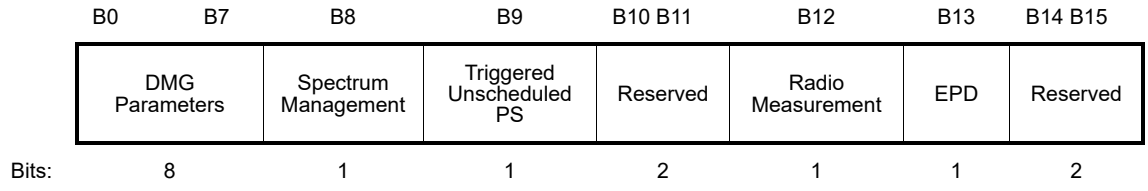

Figure 9-141—Capability Information field format (DMG STA)

A DMG STA sets the Triggered Unscheduled PS subfield to 1 within the Capability Information field when it transmits a Capability Information field in which the Reverse Direction subfield is equal to 1 and is capable of delivering a BU as an RD responder on receipt of a PPDU containing an RDG MPDU with the Power Management subfield set to 1 and sets it to 0 otherwise. An EDMG AP always sets the Triggered Unscheduled PS subfield to 1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Each Capability Information subfield is interpreted according to the management frame subtype, as defined in this subclause.

An AP sets the ESS subfield to 1 and the IBSS subfield to 0 within transmitted Beacon or Probe Response frames. An IBSS STA sets the ESS subfield to 0 and the IBSS subfield to 1 in transmitted Beacon or Probe Response frames. A mesh STA sets the ESS and IBSS subfields to 0 in transmitted Beacon or Probe Response frames. Otherwise, the ESS and IBSS subfields are reserved.

An AP sets the Privacy subfield to 1 within transmitted Beacon, Probe Response, (Re)Association Response frames if data confidentiality is required for all Data frames exchanged within the BSS. If data confidentiality is not required, the Privacy subfield is set to 0.

In an RSNA, a non-AP STA in an infrastructure BSS sets the Privacy subfield to 0 within transmitted (Re)Association Request frames. The Privacy subfield is reserved in (Re)Association Request frames.

An IBSS STA sets the Privacy subfield to 1 in transmitted Beacon or Probe Response frames if data confidentiality is required for all Data frames exchanged within the IBSS. If data confidentiality is not required, An IBSS STA sets the Privacy subfield to 0 within these Management frames.

A mesh STA sets the Privacy subfield to 1 in transmitted Beacon or Probe Response frames if data confidentiality is required for all Data frames exchanged within the MBSS. If data confidentiality is not required, a mesh STA sets the Privacy subfield to 0 within these Management frames.

A STA that includes the RSNE in Beacon and Probe Response frames sets the Privacy subfield to 1 in any frame that includes the RSNE.

An AP sets the Short Preamble subfield to 1 in transmitted Beacon, Probe Response, Association Response, and Reassociation Response frames to indicate that the use of the short preamble, as described in 16.2.2.3, is allowed within this BSS; an IBSS STA sets the Short Preamble subfield to 1 in transmitted Beacon when dot11ShortPreambleOptionImplemented is true. Otherwise an AP or an IBSS STA sets the Short Preamble subfield to 0.

A mesh STA sets the Short Preamble subfield to 1 when dot11ShortPreambleOptionImplemented is true. Otherwise, a mesh STA sets the Short Preamble subfield to 0.

An ERP STA sets dot11ShortPreambleOptionImplemented to true as all ERP STAs support both long and short preamble formats.

A STA sets the Spectrum Management subfield in the Capability Information field to 1 if dot11SpectrumManagementRequired is true; otherwise, it is set to 0.

A STA sets the QoS subfield to 1 within the Capability Information field when dot11QosOptionImplemented is true and sets it to 0 otherwise.

A non-AP STA sets the Short Slot Time subfield to 1 in transmitted Association Request, and Reassociation Request frames when dot11ShortSlotTimeOptionImplemented and dot11ShortSlotTimeOptionActivated are true. Otherwise, the STA sets the Short Slot Time subfield to 0.

An AP sets the Short Slot Time subfield to 1 in transmitted Beacon, Measurement Pilot, Probe Response, Association Response, and Reassociation Response frames to indicate the short slot time value is currently used within this BSS. Otherwise, the Short Slot Time subfield is set to 0. See 10.3.2.16 and 11.1.3.2.

See 10.3.2.16 for the operation of aSlotTime.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For IBSS and MBSS, the Short Slot Time subfield is set to 0.

An AP sets the APSD subfield to 1 within the Capability Information field when dot11APSDOptionImplemented is true and sets it to 0 otherwise. A non-AP STA always sets this subfield to 0.

A STA sets the Radio Measurement subfield in the Capability Information field to 1 when dot11RadioMeasurementActivated is true and sets it to 0 otherwise.

A STA sets the EPD subfield in the Capability Information field to 1 when dot11EPDImplemented is true and sets it to 0 otherwise.

The DMG Parameters field is defined in 9.4.1.44.

9.4.1.5 Current AP Address field

The Current AP Address field is the MAC address of the AP with which the STA is currently associated. The Current AP Address field is shown in Figure 9-142.

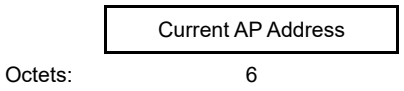

Figure 9-142—Current AP Address field format

9.4.1.6 Listen Interval field

The Listen Interval field is used to indicate to the AP how often an S1G STA with dot11NonTIMModeActivated equal to false or a non-S1G STA in power save mode wakes to listen to Beacon frames. It is also used to indicate to an AP the duration during which an S1G STA with dot11NonTIMModeActivated equal to true is required to transmit at least one frame that is addressed to the associated AP. This field is derived from the ListenInterval parameter when present as a parameter of an MLME primitive. The value is in units of beacon interval if dot11ShortBeaconInterval is false and in units of short beacon interval if dot11ShortBeaconInterval is true (see 11.1.3.10.2). The Listen Interval field is shown in Figure 9-143.

NOTE—The value 0 might be used by a STA that never enters power save mode.

Figure 9-143—Listen Interval field format carried in a non-S1G PPDU

The Listen Interval field carried in an S1G PPDU is shown in Figure 9-144.

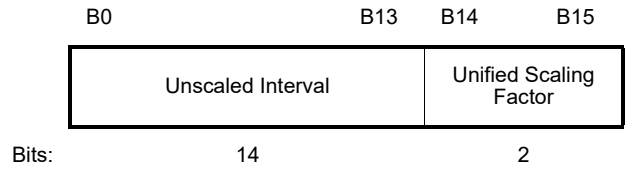

Figure 9-144—Listen Interval field format carried in an S1G PPDU

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In an S1G STA, the ListenInterval parameter used by the MLME primitives is equal to the Unscaled Interval subfield multiplied by the scaling factor that corresponds to the value indicated in the Unified Scaling Factor subfield. The Unified Scaling Factor subfield encoding is defined in Table 9-78.

Table 9-78—Unified Scaling Factor subfield encoding

Unified Scaling Factor	Scaling factor
0	1
1	10
2	1000
3	10 000

An AP uses the listen interval in determining the lifetime of frames that it buffers for a STA.

9.4.1.7 Reason Code field

This Reason Code field is used to indicate the reason that an unsolicited notification Management frame was generated. It is contained in the Mesh Channel Switch Parameters element to indicate the reason for the channel switch. It is contained in the PERR element to indicate the reason for the path error. The Reason Code field is shown in Figure 9-145.

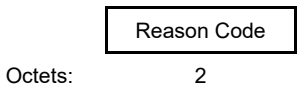

Figure 9-145—Reason Code field format

The reason codes are defined in Table 9-79.

Table 9-79—Reason codes

Reason code	Name	Meaning
0		Reserved
1	UNSPECIFIED_REASON	Unspecified reason
2	INVALID_AUTHENTICATION	Previous authentication no longer valid
3	LEAVING_NETWORK_DEAUTH	Deauthenticated because sending STA is leaving (or has left) the BSS
4	REASON_INACTIVITY	Disassociated due to inactivity
5	NO_MORE_STAS	Disassociated because AP is unable to handle all currently associated STAs
6	INVALID_CLASS2_FRAME	Class 2 frame received from nonauthenticated STA
7	INVALID_CLASS3_FRAME	Class 3 frame received from nonassociated STA

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-79—Reason codes *(continued)*

Reason code	Name	Meaning
8	LEAVING_NETWORK_DISASSOC	Disassociated because sending STA is leaving (or has left) BSS
9	NOT_AUTHENTICATED	STA requesting (re)association is not authenticated with responding STA
10	UNACCEPTABLE_POWER_CAPABILITY	Disassociated because the information in the Power Capability element is unacceptable
11	UNACCEPTABLE_SUPPORTED_CHANNELS	Disassociated because the information in the Supported Channels element is unacceptable
12	BSS_TRANSITION_DISASSOC	Disassociated due to BSS transition management
13	REASON_INVALID_ELEMENT	Invalid element, i.e., an element defined in this standard for which the content does not meet the specifications in Clause 9
14	MIC_FAILURE	Message integrity code (MIC) failure
15	4WAY_HANDSHAKE_TIMEOUT	4-way handshake timeout
16	GK_HANDSHAKE_TIMEOUT	Group key handshake timeout
17	HANDSHAKE_ELEMENT_MISMATCH	Element in 4-way handshake different from (Re)Association Request/Probe Response/Beacon frame
18	REASON_INVALID_GROUP_CIPHER	Invalid group cipher
19	REASON_INVALID_PAIRWISE_CIPHER	Invalid pairwise cipher
20	REASON_INVALID_AKMP	Invalid AKMP
21	UNSUPPORTED_RSNE_VERSION	Unsupported RSNE version
22	INVALID_RSNE_CAPABILITIES	Invalid RSNE capabilities
23	802_1_X_AUTH_FAILED	IEEE 802.1X authentication failed
24	REASON_CIPHER_OUT_OF_POLICY	Cipher suite rejected because of the security policy
25	TDLS_TEARDOWN_PEER_UNREACHABLE	TDLS direct link teardown due to TDLS peer STA unreachable via the TDLS direct link
26	TDLS_TEARDOWN_UNSPECIFIED_REASON	TDLS direct link teardown for unspecified reason
27	SSP_REQUESTED_DISASSOC	Disassociated because session terminated by SSP request
28	NO_SSP_ROAMING_AGREEMENT	Disassociated because of lack of SSP roaming agreement
29	BAD_CIPHER_OR_AKM	Requested service rejected because of SSP cipher suite or AKM requirement
30	NOT_AUTHORIZED_THIS_LOCATION	Requested service not authorized in this location

Table 9-79—Reason codes *(continued)*

Reason code	Name	Meaning
31	SERVICE_CHANGE_ PRECLUDES_TS	TS deleted because QoS AP lacks sufficient bandwidth for this QoS STA due to a change in BSS service characteristics or operational mode (e.g., an HT BSS change from 40 MHz channel to 20 MHz channel)
32	UNSPECIFIED_QOS_REASON	Disassociated for unspecified, QoS-related reason
33	NOT_ENOUGH_BANDWIDTH	Disassociated because QoS AP lacks sufficient bandwidth for this QoS STA
34	MISSING_ACKS	Disassociated because excessive number of frames need to be acknowledged, but are not acknowledged due to AP transmissions and/or poor channel conditions
35	EXCEEDED_TXOP	Disassociated because STA is transmitting outside the limits of its TXOPs
36	STA_LEAVING	Requesting STA is leaving the BSS (or resetting)
37	END_TS END_BA	Requesting STA is no longer using the stream or session
38	UNKNOWN_TS UNKNOWN_BA	Requesting STA received frames using a mechanism for which a setup has not been completed
39	TIMEOUT	Requested from peer STA due to timeout
40–45	Reserved	
46	PEER_INITIATED	Disassociated because authorized access limit reached
47	AP_INITIATED	Disassociated due to external service requirements
48	REASON_INVALID_FT_ACTIO N_FRAME_COUNT	Invalid FT Action frame count
49	REASON_INVALID_PMKID	Invalid pairwise master key identifier (PMKID)
50	REASON_INVALID_MDE	Invalid MDE
51	REASON_INVALID_FTE	Invalid FTE
52	MESH-PEERING-CANCELED	Mesh peering canceled for unknown reasons
53	MESH-MAX-PEERS	The mesh STA has reached the supported maximum number of peer mesh STAs
54	MESH-CONFIGURATION-POLICY-VIOLATION	The received information violates the mesh configuration policy configured in the mesh STA profile
55	MESH-CLOSE-RCVD	The mesh STA has received a Mesh Peering Close frame requesting to close the mesh peering
56	MESH-MAX-RETRIES	The mesh STA has resent dot11MeshMaxRetries Mesh Peering Open frames, without receiving a Mesh Peering Confirm frame
57	MESH-CONFIRM-TIMEOUT	The confirmTimer for the mesh peering instance times out.
58	MESH-INVALID-GTK	The mesh STA fails to unwrap the GTK or the values in the wrapped contents do not match
59	MESH-INCONSISTENT-PARAMETERS	The mesh STA receives inconsistent information about the mesh parameters between mesh peering Management frames

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-79—Reason codes *(continued)*

Reason code	Name	Meaning
60	MESH-INVALID-SECURITY-CAPABILITY	The mesh STA fails the authenticated mesh peering exchange because due to failure in selecting either the pairwise cipher suite or group cipher suite
61	MESH-PATH-ERROR-NO-PROXY-INFORMATION	The mesh STA does not have proxy information for this external destination
62	MESH-PATH-ERROR-NO-FORWARDING-INFORMATION	The mesh STA does not have forwarding information for this destination
63	MESH-PATH-ERROR-DESTINATION-UNREACHABLE	The mesh STA determines that the link to the next hop of an active path in its forwarding information is no longer usable.
64	MAC-ADDRESS-ALREADY-EXISTS-IN-MBSS	The Deauthentication frame was sent because the MAC address of the STA already exists in the mesh BSS. See 11.3.6
65	MESH-CHANNEL-SWITCH-REGULATORY-REQUIREMENTS	The mesh STA performs channel switch to meet regulatory requirements
66	MESH-CHANNEL-SWITCH-UNSPECIFIED	The mesh STA performs channel switching with unspecified reason
67	TRANSMISSION_LINK_ESTABLISHMENT_FAILED	Transmission link establishment in alternative channel failed.
68	ALTERNATIVE_CHANNEL_OCCUPIED	The alternative channel is occupied
69	TIME_SYNC_LOST	The STA is not able to maintain TSF
71	POOR_RSSI_CONDITIONS	Disassociated due to poor RSSI
70;72–65 535		Reserved

9.4.1.8 AID field

In infrastructure BSS operation, the AID field contains a value assigned by an AP or PCP during association. The field represents the 16-bit ID of a STA. In mesh BSS operation, the AID field is a value that represents the 16-bit ID of a neighbor peer mesh STA, assigned during mesh peering. The AID field is shown in Figure 9-146.

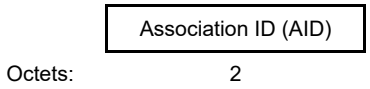

Figure 9-146—AID field format

The AID field for a non-DMG and non-S1G STA is in the range 1 to 2007. This value is placed in the 14 LSBs of the AID field, with the two MSBs of the AID field set to 1.

The AID field for an S1G STA is in the range 1 to 8191, and the 3 MSBs of the AID field are reserved.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The AID field for a DMG STA is in the range 1 to 254. The value 255 corresponds to the Broadcast AID, and the value 0 corresponds to the AP or PCP. The 8 MSBs of the AID field are reserved.

9.4.1.9 Status Code field

The Status Code field is used in a response Management frame to indicate the status of a requested operation. The Status Code field is shown in Figure 9-147. The values of the Status Code field are defined in Table 9-80.

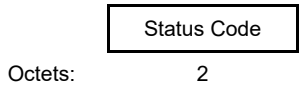

Figure 9-147—Status Code field format

Table 9-80—Status codes

Status code	Name	Meaning
0	SUCCESS	Successful.
1	REFUSED_REASON_UNSPECIFIED	Unspecified failure.
2	TDLS_REJECTED_ALTERNATIVE_PROVIDED	TDLS wakeup schedule rejected but alternative schedule provided.
3	TDLS_REJECTED	TDLS wakeup schedule rejected.
4		Reserved.
5	SECURITY_DISABLED	Security disabled.
6	UNACCEPTABLE_LIFETIME	Unacceptable lifetime.
7	NOT_IN_SAME_BSS	Not in same BSS.
8–9		Reserved.
10	REFUSED_CAPABILITIES_MISMATCH	Cannot support all requested capabilities in the Capability Information field.
11	DENIED_NO_ASSOCIATION_EXISTS	Reassociation denied due to inability to confirm that association exists.
12	DENIED_OTHER_REASON	Association denied due to reason outside the scope of this standard.
13	UNSUPPORTED_AUTH_ALGORITHM	Responding STA does not support the specified authentication algorithm.
14	TRANSACTION_SEQUENCE_ERROR	Received an Authentication frame with authentication transaction sequence number out of expected sequence.
15	CHALLENGE_FAILURE	Authentication rejected because of challenge failure.
16	REJECTED_SEQUENCE_TIMEOUT	Authentication rejected due to timeout waiting for next frame in sequence.
17	DENIED_NO_MORE_STAS	Association denied because AP is unable to handle additional associated STAs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-80—Status codes *(continued)*

Status code	Name	Meaning
18	REFUSED_BASIC_RATES_ MISMATCH	Association denied due to requesting STA not supporting all of the data rates in the BSSBasicRateSet parameter, the Basic HT-MCS Set field of the HT Operation parameter, the Basic VHT-MCS And NSS Set field in the VHT Operation parameter, or the Basic HE-MCS And NSS Set field in the HE Operation parameter.
19	DENIED_NO_SHORT_PREAMBLE_ SUPPORT	Association denied due to requesting STA not supporting the short preamble option.
20		Reserved.
21		Reserved.
22	REJECTED_SPECTRUM_MANAGE MENT_REQUIRED	Association request rejected because spectrum management capability is required.
23	REJECTED_BAD_POWER_CAPABI LITY	Association request rejected because the information in the Power Capability element is unacceptable.
24	REJECTED_BAD_SUPPORTED_CH ANNELS	Association request rejected because the information in the Supported Channels element is unacceptable.
25	DENIED_NO_SHORT_SLOT_TIME_ SUPPORT	Association denied due to requesting STA not supporting short slot time.
26		Reserved.
27	DENIED_NO_HT_SUPPORT	Association denied because the requesting STA does not support HT features.
28	R0KH_UNREACHABLE	R0KH unreachable.
29		Reserved
30	REFUSED_TEMPORARILY	Association request rejected temporarily; try again later.
31	ROBUST_MANAGEMENT_POLICY _VIOLATION	Robust management frame policy violation.
32	UNSPECIFIED_QOS_FAILURE	Unspecified, QoS-related failure.
33	DENIED_INSUFFICIENT_BANDWI DTH	Association denied because QoS AP or PCP has insufficient bandwidth to handle another QoS STA.
34	DENIED_POOR_CHANNEL_CONDI TIONS	Association denied due to excessive frame loss rates and/ or poor conditions on current operating channel.
35	DENIED_QOS_NOT_SUPPORTED	Association (with QoS BSS) denied because the requesting STA does not support the QoS facility.
36		Reserved.
37	REQUEST_DECLINED	The request has been declined.
38	INVALID_PARAMETERS	The request has not been successful as one or more parameters have invalid values.
39	REJECTED_WITH_SUGGESTED_ CHANGES	The allocation or TS has not been created because the request cannot be honored; however, a suggested TSPEC/DMG TSPEC is provided so that the initiating STA can attempt to set another allocation or TS with the suggested changes to the TSPEC/DMG TSPEC.

Table 9-80—Status codes *(continued)*

Status code	Name	Meaning
40	STATUS_INVALID_ELEMENT	Invalid element, i.e., an element defined in this standard for which the content does not meet the specifications in Clause 9.
41	STATUS_INVALID_GROUP_CIPHER	Invalid group cipher.
42	STATUS_INVALID_PAIRWISE_CIPHER	Invalid pairwise cipher.
43	STATUS_INVALID_AKMP	Invalid AKMP.
44	UNSUPPORTED_RSNE_VERSION	Unsupported RSNE version.
45	INVALID_RSNE_CAPABILITIES	Invalid RSNE capabilities.
46	STATUS_CIPHER_OUT_OF_POLICY	Cipher suite rejected because of security policy.
47	REJECTED_FOR_DELAY_PERIOD	The TS or allocation has not been created; however, the HC or PCP might be capable of creating a TS or allocation, in response to a request, after the time indicated in the TS Delay element.
48		Reserved.
49	NOT_PRESENT	The Destination STA is not present within this BSS.
50	NOT_QOS_STA	The Destination STA is not a QoS STA.
51	DENIED_LISTEN_INTERVAL_TOO_LARGE	Association denied because the listen interval is too large.
52	STATUS_INVALID_FT_ACTION_FRAME_COUNT	Invalid FT Action frame count.
53	STATUS_INVALID_PMKID	Invalid pairwise master key identifier (PMKID).
54	STATUS_INVALID_MDE	Invalid MDE.
55	STATUS_INVALID_FTE	Invalid FTE.
56	REQUESTED_TCLAS_NOT_SUPPORTED_BY_AP	Requested TCLAS processing is not supported by the AP.
57	INSUFFICIENT_TCLAS_PROCESSING_RESOURCES	The AP or PCP has insufficient TCLAS processing resources to satisfy the request.
58	TRY_ANOTHER_BSS	The TS has not been created because the request cannot be honored; however, the HC or PCP suggests that the STA transition to a different BSS to set up the TS.
59	GAS_ADVERTISEMENT_PROTOCOL_NOT_SUPPORTED	GAS advertisement protocol not supported.
60	NO_OUTSTANDING_GAS_REQUEST	No outstanding GAS request.
61	GAS_RESPONSE_NOT_RECEIVED_FROM _SERVER	GAS response not received from the advertisement server.
62	GAS_QUERY_TIMEOUT	STA timed out waiting for GAS query response.
63	GAS_QUERY_RESPONSE_TOO_ LARGE	GAS response is larger than query response length limit.

Table 9-80—Status codes *(continued)*

Status code	Name	Meaning
64	REJECTED_HOME_WITH_ SUGGESTED_CHANGES	Request refused because home network does not support request.
65	SERVER_UNREACHABLE	Advertisement server in the network is not currently reachable.
66		Reserved.
67	REJECTED_FOR_SSP_ PERMISSIONS	Request refused due to permissions received via SSPN interface.
68	REFUSED_UNAUTHENTICATED_A CCESS_NOT_SUPPORTED	Request refused because the AP or PCP does not support unauthenticated access.
69–71		Reserved.
72	INVALID_RSNE	Invalid RSNE, other than unsupported RSNE version or invalid RSNE capabilities, AKMP or pairwise cipher.
73	U_APSD_COEXISTENCE_NOT_SU PPORTED	U-APSD coexistence is not supported.
74	U_APSD_COEX_MODE_NOT_SUPP ORTED	Requested U-APSD coexistence mode is not supported.
75	BAD_INTERVAL_WITH_U_APS D_COEX	Requested interval/duration value cannot be supported with U-APSD coexistence.
76	ANTI_CLOGGING_TOKEN_REQUI RED	Authentication is rejected because an anti-clogging token is required.
77	UNSUPPORTED_FINITE_CYCLIC_ GROUP	Authentication is rejected because the offered finite cyclic group is not supported.
78	CANNOT_FIND_ALTERNATIVE_ TBTT	The TBTT adjustment request has not been successful because the STA could not find an alternative TBTT.
79	TRANSMISSION_FAILURE	Transmission failure.
80	REQUESTED_TCLAS_NOT_ SUPPORTED	Requested TCLAS not supported.
81	TCLAS_RESOURCES_EXHAUSTED	TCLAS resources exhausted.
82	REJECTED_WITH_SUGGESTED_ BSS_TRANSITION	Rejected with suggested BSS transition.
83	REJECT_WITH_SCHEDULE	Reject with recommended schedule.
84	REJECT_NO_WAKEUP_SPECIFIED	Reject because no wakeup schedule specified.
85	SUCCESS_POWER_SAVE_MODE	Success, the destination STA is in power save mode.
86	PENDING_ADMITTING_FST_SESSI ON	FST pending, in process of admitting FST session.
87	PERFORMING_FST_NOW	Performing FST now.
88	PENDING_GAP_IN_BA_WINDOW	FST pending, gap(s) in block ack window.
89	REJECT_U-PID_SETTING	Reject because of U-PID setting.
90–91		Reserved.
92	REFUSED_EXTERNAL_REASON	(Re)Association refused for some external reason.

Table 9-80—Status codes *(continued)*

Status code	Name	Meaning
93	REFUSED_AP_OUT_OF_MEMORY	(Re)Association refused because of memory limits at the AP.
94	REJECTED_EMERGENCY_ SERVICES_NOT_SUPPORTED	(Re)Association refused because emergency services are not supported at the AP.
95	QUERY_RESPONSE_ OUTSTANDING	GAS query response not yet received.
96	REJECT_DSE_BAND	Reject since the request is for transition to a frequency band subject to DSE procedures and FST Initiator is a dependent STA.
97	TCLAS_PROCESSING_ TERMINATED	Requested TCLAS processing has been terminated by the AP.
98	TS_SCHEDULE_CONFLICT	The TS schedule conflicts with an existing schedule; an alternative schedule is provided.
99	DENIED_WITH_SUGGESTED_BAN D_AND_CHANNEL	The association has been denied; however, one or more Multi-band elements are included that can be used by the receiving STA to join the BSS.
100	MCCAOP_RESERVATION_ CONFLICT	The request failed due to a reservation conflict.
101	MAF_LIMIT_EXCEEDED	The request failed due to exceeded MAF limit.
102	MCCA_TRACK_LIMIT_EXCEEDED	The request failed due to exceeded MCCA track limit.
103	DENIED_DUE_TO_SPECTRUM_MA NAGEMENT	Association denied because the information in the Spectrum Management field is unacceptable.
104	DENIED_VHT_NOT_SUPPORTED	Association denied because the requesting STA does not support VHT features.
105	ENABLEMENT DENIED	Enablement denied.
106	RESTRICTION FROM AUTHORIZED GDB	Enablement denied due to restriction from an authorized GDB.
107	AUTHORIZATION DEENABLED	Authorization deenabled.
108	ENERGY_LIMITED_OPERATION_N OT_SUPPORTED	Re(association) refused or disassociated because energy limited operation is not supported at the AP.
109	REJECTED_NDP_BLOCK_ACK_SU GGESTED	BlockAck negotiation refused because, due to buffer constraints and other unspecified reasons, the recipient prefers to generate only NDP BlockAck frames.
110	REJECTED_MAX_AWAY_DURATIO N_UNACCEPTABLE	Association denied/disassociated because the suggested value for max away duration is unacceptable.
111	FLOW_CONTROL_OPERATION_SU PPORTED	Re(association) refused or disassociated because flow control operation is not supported by the non-AP STA.
112	FILS_AUTHENTICATION_FAILURE	Authentication rejected due to FILS authentication failure.
113	UNKNOWN_AUTHENTICATION_ SERVER	Authentication rejected due to unknown Authentication Server.
114–115		Reserved.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-80—Status codes *(continued)*

Status code	Name	Meaning
116	DENIED_NOTIFICATION_PERIOD_ ALLOCATION	Request denied because the allocation of notification period is failed.
117	DENIED_CHANNEL_SPLITTING	Request denied because the request of channel splitting is failed.
118	DENIED_ALLOCATION	Request denied because the allocation request is failed.
119	CMMG_FEATURES_NOT_SUPPOR TED	Association denied because the requesting STA does not support CMMG features.
120	GAS_FRAGMENT_NOT_AVAILAB LE	The requested GAS fragment is not available.
121	SUCCESS_CAG_VERSIONS_MATC H	Success, the CAG Version provided by the requesting STA is the same as the latest CAG Version provided by the relevant server.
122	GLK_NOT_AUTHORIZED	The STA is not authorized to use GLK per local policy.
123	UNKNOWN_PASSWORD_IDENTIFI ER	Authentication rejected because the password identifier is unknown.
124	DENIED_HE_NOT_SUPPORTED	Association denied because the requesting STA does not support HE features.
125	DENIED_LOCAL_MAC_ADDRESS_ POLICY_VIOLATION	Request denied because source address of request is inconsistent with local MAC address policy.
126	SAE_HASH_TO_ELEMENT	SAE authentication uses the hash-to-element method, instead of looping, to obtain the PWE.
127		Reserved.
128	TCLAS_PROCESSING_TERMINATE D_INSUFFICIENT_QOS	Requested TCLAS processing has been terminated by the AP due to insufficient QoS capacity.
129	TCLAS_PROCESSING_TERMINATE D_POLICY_CONFLICT	Requested TCLAS processing has been terminated by the AP due to conflict with higher layer QoS policies.
130–135		Reserved
136	INVALID_PUBLIC_KEY	Public key format is invalid.
137	PASN_BASE_AKMP_FAILED	Failure from base AKMP processing during PASN.
138	OCI_MISMATCH	OCI does not match received channel information.
139–142		Reserved
143	GAS_QUERY_REQUEST_ TOO_ LARGE	GAS query request is larger than the dot11GASQueryRequestLengthLimit value.
144–65 535		Reserved.

9.4.1.10 Timestamp field

This field represents the timing synchronization function (TSF) timer (see 11.1 and 11.19) of a frame's source. The Timestamp field is shown in Figure 9-148.

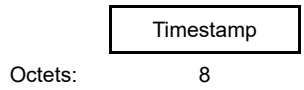

Figure 9-148—Timestamp field format

9.4.1.11 Action field

The Action field provides a mechanism for specifying extended management actions. The format of the Action field is shown in Figure 9-149.

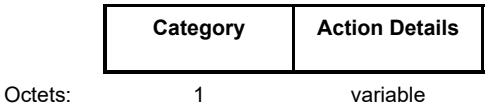

Figure 9-149—Action field format

The Category field is set to one of the nonreserved values shown in the Code column of Table 9-81. Action frames of a given category are referred to as *<category name> Action frames*. For example, frames in the QoS category are called *QoS Action frames*.

The Action Details field contains the details of the action. The details of the actions allowed in each category are described in the appropriate subclause referenced in Table 9-81. Robust Action frames are defined in 12.2.7 and group addressed privacy is defined in 11.12.

Table 9-81—Category values

Code	Meaning	See subclause	Robust	Group addressed privacy
0	Spectrum Management	9.6.2	Yes	No
1	QoS	9.6.3	Yes	No
2	Reserved			
3	Block Ack	9.6.4	Yes	No
4	Public	9.6.7	No	No
5	Radio Measurement	9.6.6	Yes	No
6	Fast BSS Transition	9.6.8	Yes	No
7	HT	9.6.11	No	No
8	SA Query	9.6.9	Yes	No
9	Protected Dual of Public Action	9.6.10	Yes	No
10	WNM	9.6.13	Yes	No

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-81—Category values *(continued)*

Code	Meaning	See subclause	Robust	Group addressed privacy
11	Unprotected WNM	9.6.14	No	No
12	TDLS	9.6.12	See NOTE	No
13	Mesh	9.6.16	Yes	Yes
14	Multihop	9.6.17	Yes	Yes
15	Self-protected	9.6.15	No	No
16	DMG	9.6.19	Yes	No
17	*Allocated to the Wi-Fi Alliance®* [a]			
18	Fast Session Transfer	9.6.20	Yes	No
19	Robust AV Streaming	9.6.18	Yes	No
20	Unprotected DMG	9.6.21	No	No
21	VHT	9.6.22	No	No
22	Unprotected S1G	9.6.24	No	No
23	S1G	9.6.25	Yes	No
24	Flow control	9.6.26	Yes	No
25	Control Response MCS Negotiation	9.6.27	Yes	No
26	FILS	9.6.23	Yes	No
27	CDMG	9.6.28	Yes	No
28	CMMG	9.6.29	Yes	No
29	GLK	9.6.30	Yes	No
30	HE	9.6.31	No	No
31	Protected HE	9.6.32	Yes	No
32	WUR	9.6.33	Yes	No
33	Reserved			
34	Protected Fine Timing	9.6.34	Yes	No
35–125	Reserved			
126	Vendor-specific Protected	9.6.5	Yes	No
127	Vendor-specific	9.6.5	No	No
128–255	Reserved			

NOTE—TDLS Action fields are always transported encapsulated within a Data frame (see 11.20.1), so there are no TDLS Action frames and in turn the question of whether these frames are robust is not applicable.

9.4.1.12 Dialog Token field

The Dialog Token field is used for matching action responses with action requests when there are multiple, concurrent action requests. The Dialog Token field is shown in Figure 9-150. See 10.28.5.

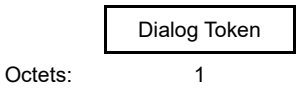

Figure 9-150—Dialog Token field format

9.4.1.13 Block Ack Parameter Set field

The Block Ack Parameter Set field is used in ADDBA Request or ADDBA Response frames to signal the parameters for setting up a block ack agreement and is used in a PBAC WinStart Update frame to identify the protected block ack agreement for which $WinStart_B$ and $WinStart_R$ at the recipient are being updated. The Block Ack Parameter Set field is shown in Figure 9-151. When carried in a PBAC WinStart Update frame all subfields except the TID subfield are reserved.

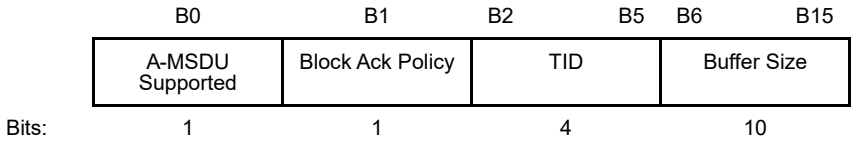

Figure 9-151—Block Ack Parameter Set field format

The A-MSDU Supported subfield is set to 1 by a STA to indicate that it supports an A-MSDU carried in a QoS Data frame sent under this block ack agreement. It is set to 0 otherwise.

The Block Ack Policy subfield is set to 1 for a non-DMG STA.

When carried in an ADDBA Request frame or an ADDBA Response frame, the TID subfield contains the TC or TS for which the BlockAck frame is being requested. When carried in a PBAC WinStart Update frame, the TID subfield is used to identify the protected block ack agreement for which $WinStart_B$ and $WinStart_R$ are being updated.

The Buffer Size subfield indicates the number of buffers available for this particular TID.[26] When the A-MSDU Supported field is equal to 0 as indicated by the STA transmitting the Block Ack Parameter Set field, each buffer is capable of holding a number of octets equal to the maximum size of an MSDU. When the A-MSDU Supported field is equal to 1 as indicated by the STA, each buffer is capable of holding a number of octets equal to the maximum size of an A-MSDU that is supported by the STA.

In an ADDBA Request frame, the Buffer Size subfield provides guidance for the frame receiver to decide its reordering buffer size. If the Buffer Size subfield is equal to 0, it implies that the block ack originator has no information to specify its value.

In an ADDBA Response frame, when the Status Code field is equal to SUCCESS, the Buffer Size subfield is set to at least 1.

[26] For buffer size, the recipient of data advertises a single scalar number that is the number of fragment buffers of the maximum MSDU or A-MSDU size (indicated by the A-MSDU Supported field) available for the block ack agreement that is being negotiated. Every buffered MPDU that is associated with this block ack agreement consumes one of these buffers regardless of whether the frame contains a whole MSDU (or a fragment thereof) or an A-MSDU. For example, ten maximum-size unfragmented MSDUs consumes the same amount of buffer space at the recipient as ten smaller fragments of a single MSDU of maximum size.

9.4.1.14 Block Ack Timeout Value field

The Block Ack Timeout Value field is used in the ADDBA Request and Response frames and the Unsolicited Block Ack Extension element to indicate the inactivity timeout for a block ack agreement. The Block Ack Timeout Value field is shown in Figure 9-152.

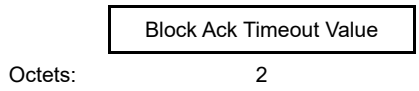

Figure 9-152—Block Ack Timeout Value field format

The Block Ack Timeout Value field contains the duration, in TUs, after which the block ack setup is terminated, if there are no frame exchange sequences (see 11.5.4) within this duration using this block ack agreement. The field is set to 0 to disable the timeout.

9.4.1.15 Originator Preferred MCS field

The Originator Preferred MCS field is used in ADDBA Response frame to signal the preferred MCS used for eliciting A-MPDUs from the data originator. The Originator Preferred MCS field is shown in Figure 9-153 (Originator Preferred MCS field format).

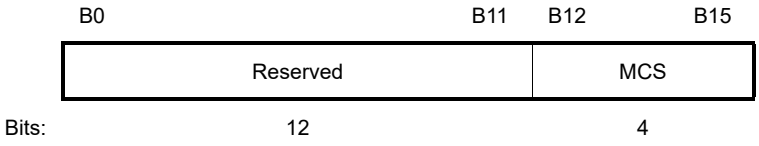

Figure 9-153—Originator Preferred MCS field format

The MCS subfield of the Originator Preferred MCS field is defined in Table 9-82.

Table 9-82—MCS subfield of the Originator Preferred MCS field

MCS subfield value	S1G-MCS Index	Description
0–10	0–10	The value represents the preferred S1G-MCS level
11–14		Reserved
15		The value represents that the asymmetric BA is not supported by either the originator or the intended recipient of the ADDBA Response that contains this value in the MCS subfield of the Originator Preferred MCS field. See 10.25.1 for asymmetric BA and 11.5.2.3 on how to set the MCS subfield of the Originator Preferred MCS field in the ADDBA Response.

9.4.1.16 DELBA Parameter Set field

The DELBA Parameter Set field is used in a DELBA frame to terminate an already set up block ack agreement. The DELBA Parameter Set field is shown in Figure 9-154.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

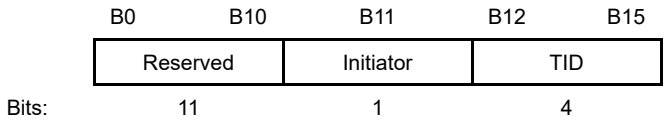

Figure 9-154—DELBA Parameter Set field format

The Initiator subfield indicates if the originator or the recipient of the data is sending this frame. It is set to 1 to indicate the originator and is set to 0 to indicate the recipient. The TID subfield indicates the TSID or the UP for which the block ack agreement has been originally set up.

9.4.1.17 QoS Info field

The QoS Info field contains capability information bits. The contents of the field are dependent on whether the STA is contained within an AP.

The format of the QoS Info field, when sent by the AP, is defined in Figure 9-155.

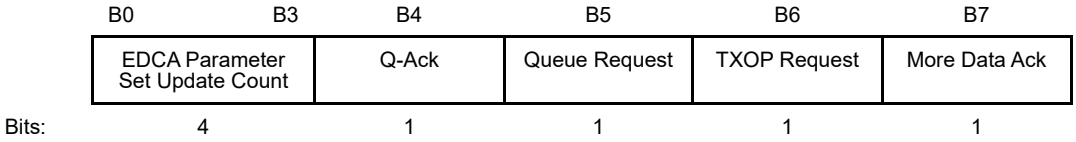

Figure 9-155—QoS Info field format when sent by an AP

The EDCA Parameter Set Update Count subfield indicates when the EDCA parameters, and for an HE BSS, the MU EDCA parameters have changed(see 10.2.3.2).

APs set the Q-Ack subfield to 1 when dot11QAckOptionImplemented is true and set it to 0 otherwise.

APs set the Queue Request subfield to 1 if they can process a nonzero Queue Size subfield in the QoS Control field in QoS Data frames and set it to 0 otherwise.

APs set the TXOP Request subfield to 1 if they can process a nonzero TXOP Duration Requested subfield in the QoS Control field in QoS Data frames and set it to 0 otherwise.

An HE AP sets the More Data Ack subfield to 1 to indicate that it can generate individually addressed Ack and BlockAck frames with the More Data bit in the Frame Control field equal to 1; otherwise, the AP sets the More Data Ack subfield to 0. For a non-HE AP, the More Data Ack subfield is reserved.

The format of the QoS Info field, when sent by the non-AP STA, is defined in Figure 9-156.

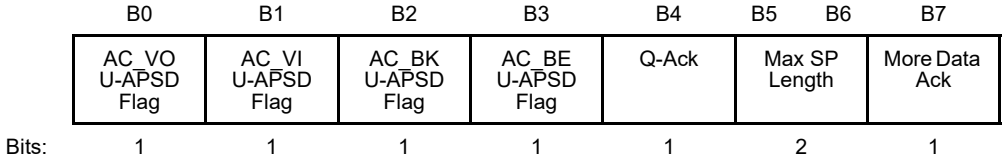

Figure 9-156—QoS Info field format when set by a non-AP STA

Each of the ACs U-APSD Flag subfields set to 1 in (Re)Association Request frames to indicate that the corresponding AC (AC_BE, AC_BK, AC_VI, or AC_VO) is both trigger-enabled and delivery-enabled. It is set to 0 in (Re)Association Request frames to indicate that the corresponding AC is neither trigger-enabled

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

nor delivery-enabled. A TSPEC as described in 11.2.3.5 is to be used to make a particular AC exclusively either trigger-enabled or delivery-enabled. These subfields are set to 0 when the APSD subfield in the Capability Information field received from the AP with which the non-AP STA is associating is equal to 0.

Non-AP STAs set the Q-Ack subfield to 1 when dot11QAckOptionImplemented is true and set it to 0 otherwise.

The Max SP Length subfield indicates the maximum number of buffered BUs the STA is prepared to receive during any SP triggered by the STA. This subfield is reserved when the APSD subfield in the Capability Information field is equal to 0. If the APSD subfield in the Capability Information field is equal to 1, the settings of the values in the Max SP Length subfield are defined in Table 9-83.

Table 9-83—Settings of the Max SP Length subfield

Bit 5	Bit 6	Usage
0	0	The STA is prepared to receive all buffered BUs.
1	0	The STA is prepared to receive a maximum of two BUs per SP.
0	1	The STA is prepared to receive a maximum of four BUs per SP.
1	1	The STA is prepared to receive a maximum of six BUs per SP.

Non-AP non-HE STAs set the More Data Ack subfield to 1 to indicate that they can process Ack frames with the More Data bit in the Frame Control field equal to 1 and remain in the awake state. Non-AP HE STAs set the More Data Ack subfield to 1 to indicate that they can process Ack and BlockAck frames with the More Data bit in the Frame Control field equal to 1 and remain in the awake state. Non-AP STAs set the More Data Ack subfield to 0 otherwise.

An HE TDLS peer STA uses the More Data Ack subfield to indicate support for both processing and generating Ack and BlockAck frames.

9.4.1.18 Measurement Pilot Interval field

The Measurement Pilot Interval field represents the number of time units (TUs) between target measurement pilot transmission times (TMPTTs). The Measurement Pilot Interval field is shown in Figure 9-157.

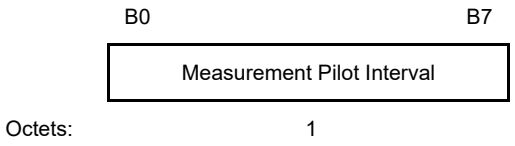

Figure 9-157—Measurement Pilot Interval field format

9.4.1.19 Max Transmit Power field

The Max Transmit Power field is a 2s complement signed integer. It provides an upper limit, in units of dBm, on the transmit power as measured at the antenna connector to be used by the transmitting STA on the current channel. The Max Transmit Power value has a tolerance of ± 5 dB. See 11.10.13. The Max Transmit Power field is shown in Figure 9-158.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Figure 9-158—Max Transmit Power field format

9.4.1.20 Transmit Power Used field

The Transmit Power Used field is a 2s complement signed integer. It is less than or equal to the Max Transmit Power and indicates the actual power used as measured at the antenna connector, in units of dBm, by a STA when transmitting the frame containing the Transmit Power Used field. The Transmit Power Used value is determined any time prior to sending the frame in which it is contained and has a tolerance of ± 5 dB. The Transmit Power Used field is shown in Figure 9-159.

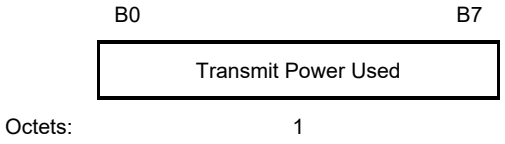

Figure 9-159—Transmit Power Used field format

9.4.1.21 Channel Width field

The Channel Width field is used in a Notify Channel Width frame (see 9.6.11.2) to indicate the channel width on which the sending STA is able to receive. The Channel Width field is shown in Figure 9-160.

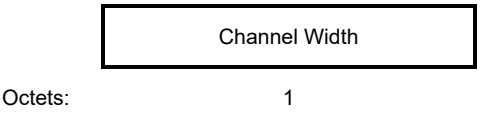

Figure 9-160—Channel Width field

If a STA transmitting or receiving this field is operating in an operating class that includes a value of PrimaryChannelLowerBehavior or PrimaryChannelUpperBehavior in the behavior limits set as specified in Annex E, then the Channel Width field is defined in Table 9-84. If a STA transmitting or receiving this field is operating in an operating class that does not include a value of PrimaryChannelLowerBehavior or PrimaryChannelUpperBehavior in the behavior limits set as specified in Annex E, then this field is reserved.

Table 9-84—Settings of the Channel Width field

Value	Meaning
0	20 MHz channel width
1	Any channel width in the STA's Supported Channel Width Set subfield
2–255	Reserved

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.1.22 Operating Class And Channel field

The Operating Class And Channel field is used in the Location Indication Channels subelement of the Location Parameters element and in the Channel Usage element. The Operating Class And Channel field indicates an operating class and channel. The format of the field is defined in Figure 9-161.

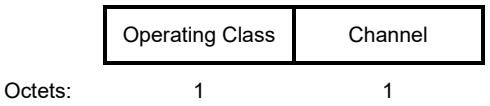

Figure 9-161—Operating Class And Channel field format

The Operating Class field indicates an operating class value as defined in Annex E. The operating class is interpreted in the context of the country specified in the Beacon frame.

The Channel field indicates a channel number, which is interpreted in the context of the indicated operating class. Channel numbers are defined in Annex E.

9.4.1.23 SM Power Control field

The SM Power Control field is used in an SM Power Save frame (see 9.6.11.3) by a STA to communicate changes in its SM power saving state. The field is shown in Figure 9-162.

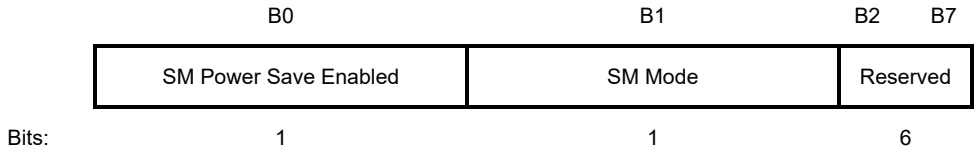

Figure 9-162—SM Power Control field format

The SM Power Save Enabled subfield indicates whether SM power saving is enabled at the STA. A 1 indicates enabled, and a 0 indicates disabled.

The SM Mode subfield indicates the mode of operation. A 1 indicates dynamic SM power save mode, a 0 indicates static SM power save mode. The modes are described in 11.2.6.

9.4.1.24 MIMO Control field

The MIMO Control field is used to manage the exchange of MIMO channel state or transmit beamforming feedback information. It is used in the CSI (see 9.6.11.4), Noncompressed Beamforming (see 9.6.11.5), and Compressed Beamforming (see 9.6.11.6) frames.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The MIMO Control field is defined in Figure 9-163.

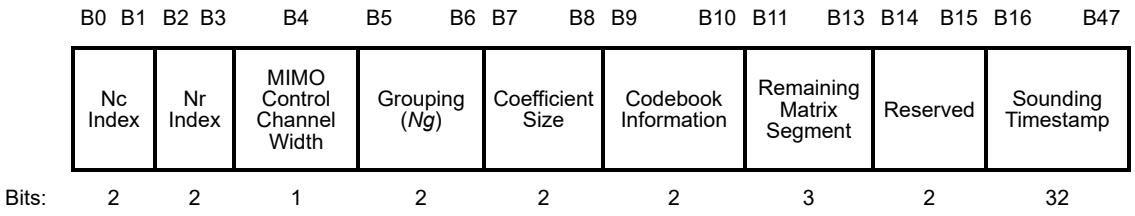

Figure 9-163—MIMO Control field format

The subfields of the MIMO Control field are defined in Table 9-85.

Table 9-85—Subfields of the MIMO Control field

Subfield	Description
Nc Index	Indicates the number of columns in the compressed beamforming feedback matrix minus one.
Nr Index	Indicates the number of rows in the compressed beamforming feedback matrix minus one. The value 0 is reserved.
MIMO Control Channel Width	Indicates the width of the channel in which a measurement was made: Set to 0 for 20 MHz Set to 1 for 40 MHz
Grouping (*Ng*)	Number of carriers grouped into one: Set to 0 for *Ng* = 1 (No grouping) Set to 1 for *Ng* = 2 Set to 2 for *Ng* = 4 The value 3 is reserved
Coefficient Size	Indicates the number of bits in the representation of the real and imaginary parts of each element in the matrix. For CSI feedback: Set to 0 for *Nb* = 4 Set to 1 for *Nb* = 5 Set to 2 for *Nb* = 6 Set to 3 for *Nb* = 8 For noncompressed beamforming feedback: Set 0 for *Nb* = 4 Set 1 for *Nb* = 2 Set 2 for *Nb* = 6 Set 3 for *Nb* = 8
Codebook Information	Indicates the size of codebook entries: Set to 0 for 1 bit for ψ, 3 bits for ϕ Set to 1 for 2 bits for ψ, 4 bits for ϕ Set to 2 for 3 bits for ψ, 5 bits for ϕ Set to 3 for 4 bits for ψ, 6 bits for ϕ

Table 9-85—Subfields of the MIMO Control field *(continued)*

Subfield	Description
Remaining Matrix Segment	Contains the remaining segment number for the associated measurement report. Set to 0 for the last segment of a segmented report or the only segment of an unsegmented report.
Sounding Timestamp	Contains the lower 4 octets of the TSF timer sampled at the instant that the MAC received the PHY-CCA.indication(IDLE) primitive that corresponds to the end of the reception of the sounding PPDU that was used to generate feedback information contained in the frame.

9.4.1.25 CSI Report field

The CSI Report field is used by the CSI frame (see 9.6.11.4) to carry explicit channel state information to a transmit HT beamformer, as described in 10.33.3.

The CSI Matrix subfields in the CSI Report field shown in Table 9-86 and Table 9-87 are matrices whose elements are taken from the CHAN_MAT parameter of RXVECTOR (see Table 19-1).

Table 9-86—CSI Report field (20 MHz)

Field	Size (bits)	Meaning
SNR in receive chain 1	8	Signal-to-noise ratio in the first receive chain of the STA sending the report.
...		
SNR in receive chain *Nr*	8	Signal-to-noise ratio in the *Nr*'th receive chain of the STA sending the report.
CSI Matrix for carrier –28	3+2× *Nb*×*Nc*×*Nr*	CSI matrix (see Figure 9-164)
...		
CSI Matrix for carrier –1	3+2× *Nb*×*Nc*×*Nr*	CSI matrix
CSI Matrix for carrier 1	3+2× *Nb*×*Nc*×*Nr*	CSI matrix
...		
CSI Matrix for carrier 28	3+2× *Nb*×*Nc*×*Nr*	CSI matrix

The structure of the field depends on the value of the MIMO Control Channel Width subfield. The CSI Report field for 20 MHz has the structure defined in Table 9-86 where

Nb is the number of bits determined by the Coefficients Size field of the MIMO Control field
Nc is the number of columns in a CSI matrix determined by the Nc Index field of the MIMO Control field
Nr is the number of rows in a CSI matrix determined by the Nr Index field of the MIMO Control field

The CSI Report field for 40 MHz has the structure defined in Table 9-87.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-87—CSI Report field (40 MHz)

Field	Size (bits)	Meaning
SNR in receive chain 1	8	Signal-to-noise ratio in the first receive chain of the STA sending the report.
...		
SNR in receive chain *Nr*	8	Signal-to-noise ratio in the *Nr*'th receive chain of the STA sending the report.
CSI Matrix for carrier –58	3+2× *Nb*×*Nc*×*Nr*	CSI matrix (see Figure 9-164)
...		
CSI Matrix for carrier –2	3+2× *Nb*×*Nc*×*Nr*	CSI matrix
CSI Matrix for carrier 2	3+2× *Nb*×*Nc*×*Nr*	CSI matrix
...		
CSI Matrix for carrier 58	3+2× *Nb*×*Nc*×*Nr*	CSI matrix

The signal-to-noise ratio (SNR) values in Table 9-86 and Table 9-87 are encoded as an 8-bit 2s complement value of 4 × (SNR_average – 22), where SNR_average is the decibel representation of linearly averaged values over the subcarriers represented. This encoding covers the SNR range from –10 dB to 53.75 dB in 0.25 dB steps.

Grouping is a method that reduces the size of the CSI Report field by reporting a single value for each group of *Ng* adjacent subcarriers. With grouping, the size of the CSI Report field is $Nr \times 8 + Ns \times (3 + 2 \times Nb \times Nc \times Nr)$ bits, where the number of subcarriers sent, *Ns*, is a function of *Ng* and whether matrices for 40 MHz or 20 MHz are sent. The value of *Ns* and the specific carriers for which matrices are sent are shown in Table 9-88. If the size of the CSI Report field is not an integer multiple of 8 bits, up to 7 0s are appended to the end of the report to make its size an integer multiple of 8 bits.

Table 9-88—Number of matrices and carrier grouping

BW	Grouping *Ng*	*Ns*	Carriers for which matrices are sent
20 MHz	1	56	All data and pilot carriers: –28, –27, …, –2, –1, 1, 2, …, 27, 28
	2	30	–28,–26,–24,–22,–20,–18,–16,–14,–12,–10,–8,–6,–4,–2,–1, 1,3,5,7,9,11,13,15,17,19,21,23,25,27,28
	4	16	–28,–24,–20,–16,–12,–8,–4,–1,1,5,9,13,17,21,25,28
40 MHz	1	114	All data and pilot carriers: –58, –57, …, –3, –2, 2, 3,…, 57, 58

The CSI matrix H_{eff} for a single carrier has the structure defined in Figure 9-164. The encoding rules for the elements of the H_{eff} matrix are given in 19.3.12.3.2.

```
For each subcarrier include
{
    Carrier Matrix Amplitude of 3 bits
    For each of Nr rows in each CSI matrix in order: (1, …, Nr)
    {
        Include Nc complex coefficients of CSI matrix Heff in order: (1, …, Nc);
        each element of Heff includes the real part of the element (Nb bits) and
        imaginary part of the element (Nb bits) in that order
    }

}
```

Figure 9-164—CSI matrix coding

When operating with a 40 MHz channel width, CSI feedback with a bandwidth of 20 MHz corresponds to the subcarriers in the primary 20 MHz channel.

9.4.1.26 Noncompressed Beamforming Report field

The Noncompressed Beamforming Report field is used by the Noncompressed Beamforming frame to carry explicit feedback in the form of noncompressed beamforming feedback matrices *V* for use by a transmit HT beamformer to determine steering matrices Q, as described in 10.33.3 and 19.3.12.3.

The structure of the field is dependent on the value of the MIMO Control Channel Width subfield. The Noncompressed Beamforming Report field for 20 MHz has the structure defined in Table 9-89 where

Nb is the number of bits determined by the Coefficients Size field of the MIMO Control field
Nc is the number of columns in a beamforming feedback matrix determined by the Nc Index field of the MIMO Control field
Nr is the number of rows in a beamforming feedback matrix determined by the Nr Index field of the MIMO Control field

The Noncompressed Beamforming Report field for 40 MHz has the structure defined in Table 9-90.

The SNR values in Table 9-89 and Table 9-90 are encoded as an 8-bit 2s complement value of 4 × (SNR_average – 22), where SNR_average is the sum of the values of SNR per subcarrier (in decibels) divided by the number of subcarriers represented. This encoding covers the SNR range from –10 dB to 53.75 dB in 0.25 dB steps. The SNR in space-time stream *i* corresponds to the SNR associated with the column *i* of the beamforming feedback matrix *V*. Each SNR corresponds to the predicted SNR at the HT beamformee when the HT beamformer applies the matrix *V*.

Grouping is a method that reduces the size of the Noncompressed Beamforming Report field by reporting a single value for each group of *Ng* adjacent subcarriers. With grouping, the size of the Noncompressed Beamforming Report field is $Nc \times 8 + Ns \times (2 \times Nb \times Nc \times Nr)$ bits. The number of subcarriers sent, *Ns*, is a function of *Ng* and whether matrices for 40 MHz or 20 MHz are sent. The value of *Ns* and the specific carriers for which matrices are sent is shown in Table 9-88. If the size of the Noncompressed Beamforming Report field is not an integer multiple of 8 bits, up to 7 0s are appended to the end of the report to make its size an integer multiple of 8 bits.

A beamforming feedback matrix *V* for a single carrier has the structure defined in Figure 9-165.

Figure 9-165—*V* matrix coding (noncompressed beamforming)

9.4.1.27 Compressed Beamforming Report field

The Compressed Beamforming Report field is used by the Compressed Beamforming frame (see 9.6.11.6) to carry explicit feedback information in the form of angles representing compressed beamforming feedback matrices *V* for use by a transmit HT beamformer to determine steering matrices Q, as described in 10.33.3 and 19.3.12.3.

The size of the Compressed Beamforming Report field depends on the values in the MIMO Control field.

The Compressed Beamforming Report field contains the channel matrix elements indexed, first, by matrix angles in the order shown in Table 9-91 and, second, by data subcarrier index from lowest frequency to highest frequency. The explanation on how these angles are generated from the beamforming feedback matrix *V* is given in 19.3.12.3.6.

Table 9-91—Order of angles in the Compressed Beamforming Report field

Size of *V* (*Nr* × *Nc*)	Number of angles (*Na*)	The order of angles in the Quantized Beamforming Feedback Matrices Information field
2×1	2	$\phi 11, \psi 21$
2×2	2	$\phi 11, \psi 21$
3×1	4	$\phi 11, \phi 21, \psi 21, \psi 31$
3×2	6	$\phi 11, \phi 21, \psi 21, \psi 31, \phi 22, \psi 32$
3×3	6	$\phi 11, \phi 21, \psi 21, \psi 31, \phi 22, \psi 32$
4×1	6	$\phi 11, \phi 21, \phi 31, \psi 21, \psi 31, \psi 41$
4×2	10	$\phi 11, \phi 21, \phi 31, \psi 21, \psi 31, \psi 41, \phi 22, \phi 32, \psi 32, \psi 42$
4×3	12	$\phi 11, \phi 21, \phi 31, \psi 21, \psi 31, \psi 41, \phi 22, \phi 32, \psi 32, \psi 42, \phi 33, \psi 43$
4×4	12	$\phi 11, \phi 21, \phi 31, \psi 21, \psi 31, \psi 41, \phi 22, \phi 32, \psi 32, \psi 42, \phi 33, \psi 43$

The angles are quantized as defined in Table 9-92.

Table 9-92—Quantization of angles

Quantized ψ	Quantized ϕ
$\psi = \frac{k\pi}{2^{b_\psi+1}} + \frac{\pi}{2^{b_\psi+2}}$ radians where $k = 0, 1, \ldots, 2^{b_\psi} - 1$ b_ψ is the number of bits used to quantize ψ (defined by the Codebook Information field of the MIMO Control field; see 9.4.1.24);	$\phi = \frac{k\pi}{2^{b_\phi-1}} + \frac{\pi}{2^{b_\phi}}$ radians where $k = 0, 1, \ldots, 2^{b_\phi} - 1$ b_ϕ is the number of bits used to quantize ϕ (defined by the Codebook Information field of the MIMO Control field; see 9.4.1.24)

The Compressed Beamforming Report field for 20 MHz has the structure defined in Table 9-93, where *Na* is the number of angles used for beamforming feedback matrix *V* (see Table 9-91).

Table 9-93—Compressed Beamforming Report field (20 MHz)

Field	Size (bits)	Meaning
SNR in space-time stream 1	8	Average signal-to-noise ratio in the STA sending the report for space-time stream 1.
...		
SNR in space-time stream *Nc*	8	Average signal-to-noise ratio in the STA sending the report for space-time stream *Nc*.
Beamforming Feedback Matrix *V* for carrier –28	$Na\times(b_\psi+b_\phi)/2$	Beamforming feedback matrix *V*.
...		
Beamforming Feedback Matrix *V* for carrier –1	$Na\times(b_\psi+b_\phi)/2$	Beamforming feedback matrix *V*.
Beamforming Feedback Matrix *V* for carrier 1	$Na\times(b_\psi+b_\phi)/2$	Beamforming feedback matrix *V*.
...		
Beamforming Feedback Matrix *V* for carrier 28	$Na\times(b_\psi+b_\phi)/2$	Beamforming feedback matrix *V*.

The Compressed Beamforming Report field for 40 MHz has the structure defined in Table 9-94, where *Na* is the number of angles used for beamforming feedback matrix *V* (see Table 9-91).

The SNR values in Table 9-93 and Table 9-94 are encoded as an 8-bit 2s complement value of 4 × (SNR_average – 22), where SNR_average is the sum of the values of SNR per subcarrier (in decibels) divided by the number of subcarriers represented. This encoding covers the SNR range from –10 dB to 53.75 dB in 0.25 dB steps. Each SNR value per subcarrier in stream *i* (before being averaged) corresponds to the SNR associated with the column *i* of the beamforming feedback matrix *V* determined at

the HT beamformee. Each SNR corresponds to the predicted SNR at the HT beamformee when the HT beamformer applies the matrix *V*.

Grouping is a method that reduces the size of the Compressed Beamforming Report field by reporting a single value for each group of *Ng* adjacent subcarriers. With grouping, the size of the Compressed Beamforming Report field is $Nc \times 8 + Ns \times (Na \times (b_\psi + b_\phi)/2)$ bits, where the number of subcarriers sent, *Ns*, is a function of *Ng* and whether matrices for 40 MHz or 20 MHz are sent. The value of *Ns* and the specific carriers for which matrices are sent is defined in Table 9-88. If the size of the Compressed Beamforming Report field is not an integer multiple of 8 bits, up to 7 0s are appended to the end of the report to make its size an integer multiple of 8 bits.

Table 9-94—Compressed Beamforming Report field (40 MHz)

Field	Size (bit)	Meaning
SNR in space-time stream 1	8	Average signal-to-noise ratio in the STA sending the report for space-time stream 1.
...		
SNR in space-time stream *Nc*	8	Average signal-to-noise ratio in the STA sending the report for space-time stream *Nc*.
Beamforming Feedback Matrix *V* for carrier –58	$Na \times (b_\psi + b_\phi)/2$	Beamforming feedback matrix *V*.
Beamforming Feedback Matrix *V* for carrier –58 + *Ng*	$Na \times (b_\psi + b_\phi)/2$	Beamforming feedback matrix *V*.
...		
Beamforming Feedback Matrix *V* for carrier –2	$Na \times (b_\psi + b_\phi)/2$	Beamforming feedback matrix *V*.
Beamforming Feedback Matrix *V* for carrier 2	$Na \times (b_\psi + b_\phi)/2$	Beamforming feedback matrix *V*.
Beamforming Feedback Matrix *V* for carrier 2 + *Ng*	$Na \times (b_\psi + b_\phi)/2$	Beamforming feedback matrix *V*.
...		
Beamforming Feedback Matrix *V* for carrier 58	$Na \times (b_\psi + b_\phi)/2$	Beamforming feedback matrix *V*.

See Figure 9-166 and Figure 9-167 for examples of this encoding.

Bits	b0..b4	b5..b7	b8..b12	b13..b15	…	b440..b444	b445..b447
Data	$\phi_{11}(-28)$	$\psi_{21}(-28)$	$\phi_{11}(-27)$	$\psi_{21}(-27)$	…	$\phi_{11}(28)$	$\psi_{21}(28)$

Conditions:
- 2 × 2 V
- $b_\psi = 3$, $b_\phi = 5$
- No grouping
- 20 MHz width
- The matrix *V* is encoded using 8 bits per subcarrier.

Conditions:
- — 4×2 V
- — $b_\psi = 2$, $b_\phi = 4$
- — 4 subcarrier grouping
- — 40 MHz width
- — The matrix V is encoded using 30 bits per subcarrier .

Figure 9-167—Second example of Compressed Beamforming Report field encoding

When operating with a 40 MHz channel width, compressed feedback with a bandwidth of 20 MHz corresponds to the subcarriers in the primary 20 MHz channel.

9.4.1.28 Antenna Selection Indices field

The Antenna Selection Indices field is used within the Antenna Selection Indices Feedback frame to carry ASEL feedback, as described in 10.34.

The Antenna Selection Indices field is shown in Figure 9-168.

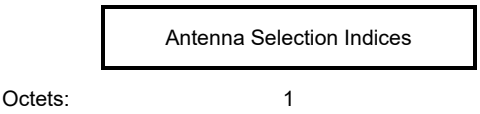

Figure 9-168—Antenna Selection Indices field format

Bits 0 to 7 in the Antenna Selection Indices field correspond to antennas with indices 0 to 7, respectively. A 1 in a bit indicates the corresponding antenna is selected, and a 0 indicates the corresponding antenna is not selected.

9.4.1.29 Organization Identifier field

The Organization Identifier field contains a public unique identifier assigned by the IEEE Registration Authority as a 24-bit OUI, a 24-bit CID, or a 36-bit OUI-36, see IEEE Registration Authority [B15] and [B16]. The order of the Organization Identifier field is described in 9.2.2.

The length of the Organization Identifier field for a 24-bit OUI or a 24-bit CID identifier is 3 octets and for a 36-bit OUI-36 identifier is 5 octets (see Figure 9-169).

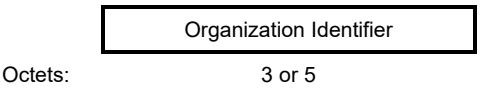

Figure 9-169—Organization Identifier field format

If the length of the IEEE-assigned identifier is not an integer number of octets, the least significant bits of the last octet are specified by the organization identified.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—For example, for the IEEE-assigned identifier 0x0050C24A4, the Organization Identifier field would contain 0x0050C24A4*y* where *y* represents the four least significant bits of the fifth octet of the field. The value of *y* is specified by the organization whose identifier is 0x0050C24A4.

9.4.1.30 Rate Identification field

The Rate Identification field contains the rate identification information for a frame that is not the current frame transmitted or received by a STA. This information allows services to exchange frame rate information prior to use of the frames that use the rate specified by the Rate Identification field. The contents of the field is defined in Figure 9-170.

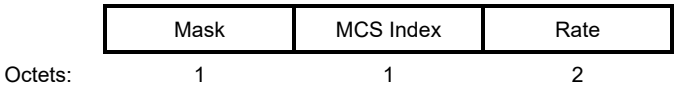

Figure 9-170—Identification field format

The Mask field specifies the other fields in the Rate Identification field that are used by a STA. The format of the Mask field is shown in Figure 9-171.

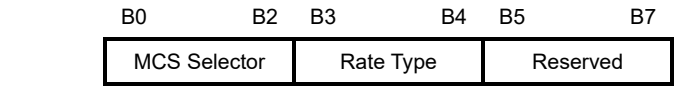

Figure 9-171—Mask field format

The MCS Selector field value 0 indicates that the MCS Index field is reserved. The MCS Selector field value 1 indicates the MCS Index field specifies an index value that is taken from Table 19-27 to Table 19-30 and Table 19-36 to Table 19-38 in 19.5.

The MCS Selector field value 2 indicates that the MCS Index field specifies:

— Values that are taken from Table 19-31 to Table 19-35 and Table 19-40 to Table 19-41 in 19.5, when carried in frames transmitted by a non-S1G STA.

— Values that are taken from Table 23-42 to Table 23-45, indicating an S1G-MCS for a 1 MHz channel width, when carried in frames transmitted by an S1G STA.

The MCS Selector field value 3 indicates that the MCS Index field specifies:

— Values that are taken from Table 21-29 to Table 21-36, indicating a VHT-MCS for a 20 MHz channel width, when carried in frames transmitted by a non-S1G STA.

— Values that are taken from Table 23-46 to Table 23-49, indicating an S1G-MCS for a 2 MHz channel width, when carried in frames transmitted by an S1G STA.

The MCS Selector field value 4 indicates that the MCS Index field specifies

— Values that are taken from Table 21-37 to Table 21-44, indicating a VHT-MCS for a 40 MHz channel width, when carried in frames transmitted by a non-TVHT and non-S1G STA.

— Values that are taken from Table 22-26 to Table 22-29, indicating a TVHT-MCS for a TVHT_W channel width, when carried in frames transmitted by a TVHT STA.

— Values that are taken from Table 23-50 to Table 23-53, indicating an S1G-MCS for a 4 MHz channel width, when carried in frames transmitted by an S1G STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The MCS Selector field value 5 indicates that the MCS Index field specifies

- Values that are taken from Table 21-45 to Table 21-52, indicating a VHT-MCS for an 80 MHz channel width, when carried in frames transmitted by a non-TVHT and non-S1G STA.
- Values that are taken from Table 22-30 to Table 22-33, indicating a TVHT-MCS for a TVHT_2W or TVHT_W+W channel width, when carried in frames transmitted by a TVHT STA.
- Values that are taken from Table 23-54 to Table 23-57, indicating an S1G-MCS for an 8 MHz channel width, when carried in frames transmitted by an S1G STA.

The MCS Selector field value 6 indicates that the MCS Index field specifies

- Values that are taken from Table 21-53 to Table 21-60, indicating a VHT-MCS for a 160 MHz or 80+80 MHz channel width, when carried in frames transmitted by a non-TVHT and non-S1G STA.
- Values that are taken from Table 22-34 to Table 22-37, indicating a TVHT-MCS for a TVHT_4W or TVHT_2W+2W channel width, when carried in frames transmitted by a TVHT STA.
- Values that are taken from Table 23-58 to Table 23-61, indicating an S1G-MCS for a 16 MHz channel width, when carried in frames transmitted by an S1G STA.

The MCS Selector field value 7 is reserved.

The Rate Type field set to 0 indicates the Rate field is reserved. The Rate Type field set to 1 indicates the Rate field specifies a data rate that is in the basic rate set. The Rate Type field set to 2 indicates the Rate field specifies a data rate that is not in the basic rate set.

If MCS Selector is 1 or 2, the MCS Index field is a 1 octet unsigned integer that specifies the row index for one of the MCS parameter tables in 19.5.

If MCS Selector field is 3, 4, 5, or 6, the MCS Index field format is as shown in Figure 9-172. In frames transmitted by an S1G STA, the MCS Index field format is also valid when MCS Selector field is 2. The NSS subfield indicates the number of spatial streams, and the VHT-MCS Index Row subfield indicates a value from the VHT-MCS Index column of Table 21-29 to Table 21-60 in 21.5 or from the MCS Index column of Table 22-26 to Table 22-37 in 22.5 that corresponds to the channel width and N_{SS} values, or from the MCS Idx column of Table 23-42 to Table 23-61 that corresponds to the channel width and NSS values.

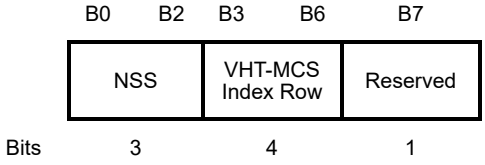

Figure 9-172—MCS Index field format when the MCS Selector field is 3, 4, 5, or 6

For non-S1G STAs, the Rate field contains an unsigned integer that specifies the PHY rate in 0.5 Mb/s units. For S1G STAs, it is reserved.

9.4.1.31 GAS Query Fragment ID field

A GAS Query Fragment ID field is used by the STA to indicate when the Query Request or Query Response field spans multiple MMPDUs. STAs responding to the GAS query request use this field to inform the requesting STA of the GAS fragment number of the transmitted frames as well as identifying the last GAS fragment of the Query Response field. Requesting STAs use this field to determine if any fragments of the GAS query request or response are missing.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The GAS Fragment ID field contains the GAS fragment number.

The More GAS Fragments field is set to 1 in GAS Comeback Request Fragment or GAS Comeback Response frames, if another GAS fragment of the current GAS query request or GAS query response to follow; otherwise, it is set to 0. The format of GAS Query Fragment ID field is shown in Figure 9-173.

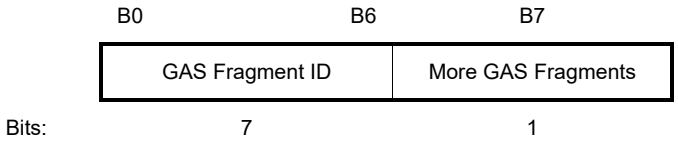

Figure 9-173—GAS Query Fragment ID field format

9.4.1.32 Venue Info field

The format of Venue Info subfield is shown in Figure 9-174.

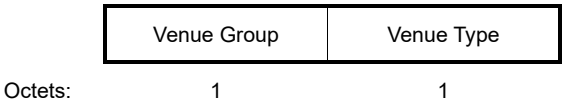

Figure 9-174—Venue Info field format

The Venue Group and Venue Type subfields are selected from Table 9-95 and Table 9-96, respectively. The entries in Table 9-95 and Table 9-96 are drawn from the *International Building Code*'s Use and Occupancy Classifications [B57].

9.4.1.33 Target Channel field

The Target Channel field specifies the channel number of the target channel. The Target Channel field is shown in Figure 9-175.

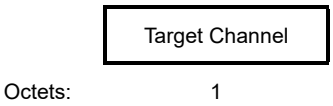

Figure 9-175—Target Channel field format

9.4.1.34 Operating Class field

The Operating Class field specifies the operating class for the channel field included in the same frame. Operating classes are defined in Annex E. The Operating Class field is shown in Figure 9-176.

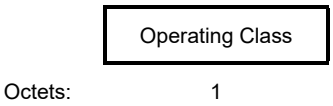

Figure 9-176—Operating Class field format

9.4.1.35 Send-Confirm field

The Send-Confirm field is used with SAE authentication as an anti-replay counter as specified in 12.4. See Figure 9-177.

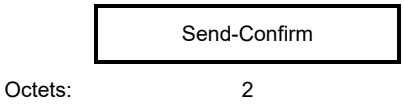

Figure 9-177—Send-Confirm field format

9.4.1.36 Anti-Clogging Token field

The Anti-Clogging Token field is used with SAE authentication for denial-of-service protection as specified in 12.4. See Figure 9-178.

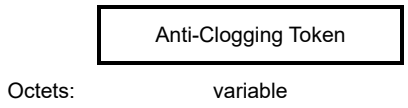

Figure 9-178—Anti-Clogging Token field format

9.4.1.37 Scalar field

The Scalar field is used with SAE authentication to communicate cryptographic material as specified in 12.4. See Figure 9-179.

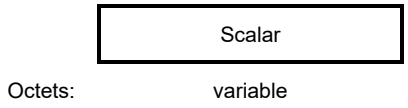

Figure 9-179—Scalar field format

9.4.1.38 FFE field

The FFE field is used with SAE authentication and FILS authentication to communicate an element in a finite field as specified in 12.4. See Figure 9-180.

Figure 9-180—FFE field format

9.4.1.39 Confirm field

The Confirm field is used with SAE authentication to authenticate and prove possession of a cryptographic key as specified in 12.4. See Figure 9-181.

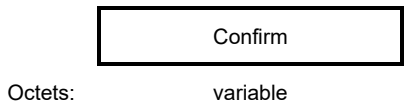

Figure 9-181—Confirm field format

9.4.1.40 Finite Cyclic Group field

The Finite Cyclic Group field is used as specified in Clause 12 to indicate an unsigned integer, from a repository maintained by IANA as “Group Description” attributes for IETF RFC 2409 (IKE) [B14][B29] that specifies the cryptographic group to use in a cryptographic exchange. See Figure 9-182.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Finite Cyclic Group field is used in SAE to indicate the cryptographic group to use in the SAE authentication as specified in 12.4. This field is also used in FILS to indicate the cryptographic group to use in FILS authentication as specified in 12.11 . See Figure 9-182.

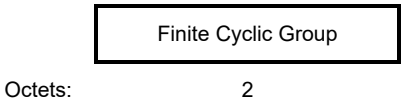

Figure 9-182—Finite Cyclic Group field format

9.4.1.41 TXOP Reservation field

The format of the TXOP Reservation field is shown in Figure 9-183.

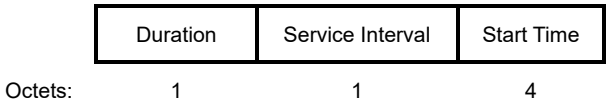

Figure 9-183—TXOP Reservation field format

The Duration subfield specifies the duration of the TXOP in units of 32 μs.

The Service Interval subfield contains an unsigned integer that specifies the service interval (SI) of the reservation in units of milliseconds.

The Start Time subfield is the offset from the next TBTT to the start of the first SP and indicates the anticipated start time, expressed in microseconds, of the first TXOP after the TBTT.

9.4.1.42 Relay Capable STA Info field

The format of the Relay Capable STA Info field is defined in Figure 9-184.

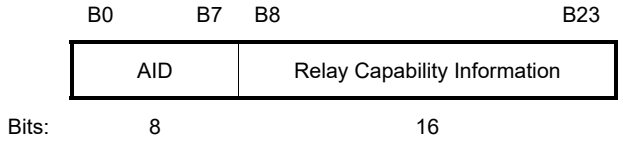

Figure 9-184—Relay Capable STA Info field format

The AID subfield contains the AID of the relay capable STA that is associated with the AP or PCP.

The Relay Capability Information subfield is defined in 9.4.2.146.

9.4.1.43 Band ID field

The Band ID field is defined in Table 9-97.

Table 9-97—Band ID field

Band ID value	Meaning
0	TV white spaces
1	Sub-1 GHz (excluding TV white spaces)
2	2.4 GHz
3	3.6 GHz
4	4.9 and 5 GHz
5	60 GHz
6	45 GHz
7	6 GHz
8–255	Reserved

9.4.1.44 DMG Parameters field

The format of the DMG Parameters field is shown in Figure 9-185.

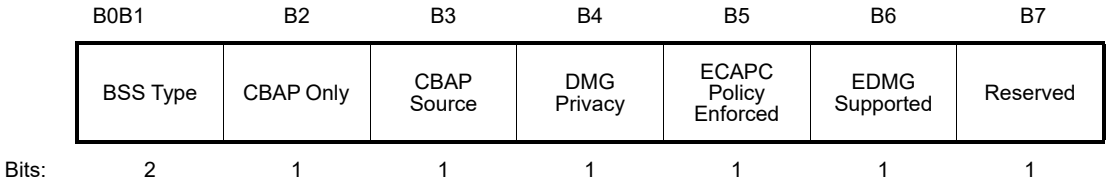

Figure 9-185—DMG Parameters field format

If the BSS Type field is transmitted as part of a DMG Beacon frame that has the Discovery Mode field within the Beacon Interval Control field (see Figure 9-131) equal to 0, then the BSS Type subfield is defined in Table 9-98 for specific types of frame cited below. An AP sets the BSS Type subfield to 3 within transmitted DMG Beacon, Probe Response, or (Re)Association Response frames. A PCP sets the BSS Type subfield to 2 within transmitted DMG Beacon, Probe Response, or (Re)Association Response frames. An IBSS STA or a STA that is not a member of a BSS sets the BSS Type subfield to 1 within transmitted DMG Beacon or Probe Response frames. The BSS Type subfield is reserved for all other types of frame.

If the BSS Type field is transmitted as part of a DMG Beacon frame that has the Discovery Mode field within the Beacon Interval Control field (see Figure 9-131) equal to 1, the BSS Type subfield is defined in Table 9-99. Depending on the role of the STA that responds to the DMG Beacon frame (identified by the Responding STA role column of Table 9-99), the behavior is different and is defined in 10.41.5.2.

The CBAP Only, CBAP Source, and ECAPC Policy Enforced subfields are valid only when transmitted within a DMG Beacon, Probe Response, or (Re)Association Response frames and are set as follows:

Table 9-98—The BSS Type subfield when the Discovery mode field is 0

Subfield value	BSS Type	Transmitted by DMG STA
3	Infrastructure BSS	AP
2	PBSS	PCP
1	IBSS	Any non-AP and non-PCP DMG STA
0	Reserved	

Table 9-99—The BSS Type subfield when the Discovery mode field is 1

Subfield value	Responding STA role	Applicable BSS types
3	AP	Infrastructure BSS
2	PCP	PBSS
1	Non-AP STA	PBSS, IBSS, OCB
0	Any	Infrastructure BSS, PBSS, IBSS, OCB
NOTE—OCB is not a BSS Type, but rather an indication of communication outside the context of a BSS.		

— The CBAP Only subfield indicates the type of link access provided by the STA sending the DMG Beacon frame in the data transfer interval (DTI) (see 10.38.2) of the beacon interval. The CBAP Only subfield is set to 1 when the entirety of the DTI portion of the beacon interval is allocated as a CBAP. The CBAP Only subfield is set to 0 when the allocation of the DTI portion of the beacon interval is provided through the Extended Schedule element.

— The CBAP Source subfield is valid only if the CBAP Only subfield is 1. The CBAP Source subfield is set to 1 to indicate that the AP or PCP has higher priority to transmit during the CBAP than non-AP and non-PCP STAs. The CBAP Source subfield is set to 0 otherwise.

— The ECAPC Policy Enforced subfield is set to 1 to indicate that medium access policies specific to the centralized AP or PCP cluster are required as defined in 10.39.3.4. The ECAPC Policy Enforced subfield is set to 0 to indicate that medium access policies specific to the centralized AP or PCP cluster are not required.

The DMG Privacy subfield is set to 1 if dot11RSNAActivated is true. Otherwise, this subfield is set to 0.

The EDMG Supported subfield is set to 1 when transmitted by an EDMG STA. Otherwise, it is set to 0.

9.4.1.45 CMMG Parameters field

The definition of the CMMG parameters field is the same as the definition of the DMG parameters field (see 9.4.1.44).

9.4.1.46 VHT MIMO Control field

The VHT MIMO Control field is included in every VHT Compressed Beamforming frame (see 9.6.22.2). The VHT MIMO Control field is defined in Figure 9-186.

B0B2	B3B5	B6B7	B8B9	B10	B11	B12B14	B15	B16B17	B18B23

Bits: 3	3	2	2	1	1	3	1	2	6

Figure 9-186—VHT MIMO Control field format

The subfields of the VHT MIMO Control field are defined in Table 9-100.

Table 9-100—Subfields of the VHT MIMO Control field

Subfield	Description
Nc Index	Indicates the number of columns, *Nc*, in the compressed beamforming feedback matrix minus 1. In an S1G PPDU, the Nc Index field does not indicate an *Nc* that is greater than 4.
Nr Index	Indicates the number of rows, *Nr*, in the compressed beamforming feedback matrix minus 1. The value 0 is reserved. In an S1G PPDU, the Nr Index field does not indicate an *Nr* that is greater than 4.
Channel Width	Indicates the width of the channel in which the measurement to create the compressed beamforming feedback matrix was made: In a non-S1G PPDU: Set to 0 for 20 MHz Set to 1 for 40 MHz Set to 2 for 80 MHz Set to 3 for 160 MHz or 80+80 MHz In an S1G PPDU: Set to 0 for 2MHz Set to 1 for 4 MHz Set to 2 for 8 MHz Set to 3 for 16 MHz
Grouping	Indicates the subcarrier grouping, *Ng*, used for the compressed beamforming feedback matrix: Set to 0 for *Ng* = 1 (No grouping) Set to 1 for *Ng* = 2 Set to 2 for *Ng* = 4 The value 3 is reserved

Table 9-100—Subfields of the VHT MIMO Control field *(continued)*

Subfield	Description
Codebook Information	Indicates the size of codebook entries: If Feedback Type is SU in a VHT PPDU: Set to 0 for 2 bits for ψ, 4 bits for ϕ Set to 1 for 4 bits for ψ, 6 bits for ϕ If Feedback Type is SU in an S1G PPDU with Nc Index field equal to 0: Set to 0 for 2 bits for ϕ, and ψ is not fed back Set to 1 for 2 bits for ψ, and 4 bits for ϕ If Feedback Type is MU in a VHT PPDU: Set to 0 for 5 bits for ψ, 7 bits for ϕ Set to 1 for 7 bits for ψ, 9 bits for ϕ If Feedback Type is MU in an S1G PPDU: Set to 0 for 5 bits for ψ, 7 bits for ϕ Set to 1 for 7 bits for ψ, 9 bits for ϕ
Feedback Type	Indicates the feedback type: Set to 0 for SU Set to 1 for MU
Remaining Feedback Segments	Indicates the number of remaining feedback segments for the associated VHT Compressed Beamforming frame: Set to 0 for the last feedback segment of a segmented report or the only feedback segment of an unsegmented report. Set to a value between 1 and 6 for a feedback segment that is neither the first nor the last of a segmented report. Set to a value between 1 and 7 for a feedback segment that is not the last feedback segment of a segmented report. In a retransmitted feedback segment, the field is set to the same value associated with the feedback segment in the original transmission.
First Feedback Segment	Set to 1 for the first feedback segment of a segmented report or the only feedback segment of an unsegmented report; set to 0 if it is not the first feedback segment or if the VHT Compressed Beamforming Report field and MU Exclusive Beamforming Report field are not present in the frame. In a retransmitted feedback segment, the field is set to the same value associated with the feedback segment in the original transmission.
Sounding Dialog Token Number	The sounding dialog token from the VHT NDP Announcement frame soliciting feedback

In a VHT Compressed Beamforming frame not carrying all or part of a VHT Compressed Beamforming report (see 10.35.5 for a description of such a case), the Nc Index, Nr Index, Channel Width, Grouping, Codebook Information, Feedback Type and Sounding Dialog Token Number subfields are reserved, the First Feedback Segment subfield is set to 0 and the Remaining Feedback Segments subfield is set to 7.

9.4.1.47 VHT Compressed Beamforming Report field

The VHT Compressed Beamforming Report field is used by the VHT compressed beamforming feedback (see 9.6.22.2) to carry explicit feedback information in the form of angles representing compressed beamforming feedback matrices V for use by a transmit beamformer to determine steering matrices Q, as described in 10.33.3 and 19.3.12.3.

The size of the VHT Compressed Beamforming Report field depends on the values in the VHT MIMO Control field. The VHT Compressed Beamforming Report field contains VHT Compressed Beamforming Report information or successive (possibly zero-length) portions thereof in the case of segmented VHT compressed beamforming feedback (see 10.35.5). VHT Compressed Beamforming Report information is always included in the VHT compressed beamforming feedback.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The VHT Compressed Beamforming Report information contains the channel matrix elements for each subcarrier from lowest frequency to highest frequency. For each subcarrier, the channel matrix element is represented by a sequence of angles. The order of the angles within each subcarrier when used in a non-S1G band is shown in Table 9-101. The order of the angles within each subcarrier when used in an S1G band for SU and MU type feedback are shown in Table 9-102 and Table 9-103, respectively. Explanation on how these angles are generated from the beamforming feedback matrix *V* is given in 19.3.12.3.6.

In Table 9-101,

Nc is the number of columns in a compressed beamforming feedback matrix determined by the Nc Index field of the VHT MIMO Control field,

Nr is the number of rows in a compressed beamforming feedback matrix determined by the Nr Index field of the VHT MIMO Control field.

Table 9-101—Order of angles in the compressed beamforming feedback matrix when used in a non-S1G band

Size of *V* (*Nr* × *Nc*)	Number of angles (*Na*)	The order of angles in the compressed beamforming feedback matrix
2×1	2	ϕ_{11}, ψ_{21}
2×2	2	ϕ_{11}, ψ_{21}
3×1	4	ϕ_{11}, ϕ_{21}, ψ_{21}, ψ_{31}

The beamforming feedback matrix *V* is formed by the beamformee as follows. The beamformer transmits an NDP with $N_{STS,NDP}$ space-time streams, where $N_{STS,NDP}$ takes a value between 2 and 8. Based on this NDP, the beamformee estimates the $N_{RX,BFEE} \times N_{STS,NDP}$ channel, and based on that channel it determines a *Nr*×*Nc* orthonormal matrix *V*, where *Nr* and *Nc* satisfy Equation (9-3).

$$Nr = N_{STS,NDP}, Nc \leq min(N_{STS,NDP}, N_{RX,BFEE}) \quad (9\text{-}3)$$

Further restrictions on *Nc* are described in 10.35.5.

The angles are quantized as defined in Table 9-104.

Table 9-104—Quantization of angles

Quantized ψ	Quantized ϕ
$\psi = \frac{k\pi}{2^{b_\psi+1}} + \frac{\pi}{2^{b_\psi+2}}$ radians where $k = 0, 1, \ldots, 2^{b_\psi} - 1$ b_ψ is the number of bits used to quantize ψ (defined by the Codebook Information field of the VHT MIMO Control field (see 9.4.1.46)	$\phi = \frac{k\pi}{2^{b_\phi-1}} + \frac{\pi}{2^{b_\phi}}$ radians where $k = 0, 1, \ldots, 2^{b_\phi} - 1$ b_ϕ is the number of bits used to quantize ϕ (defined by the Codebook Information field of the VHT MIMO Control field (see 9.4.1.46)

The VHT Compressed Beamforming Report information has the structure defined in Table 9-105, where *Na* is the number of angles used for the compressed beamforming feedback matrix (see Table 9-101, Table 9-102, and Table 9-103).

Table 9-105—VHT Compressed Beamforming Report information

Field	Size (bits)	Meaning
Average SNR of Space-Time Stream 1	8	Signal-to-noise ratio at the beamformee for space-time stream 1 averaged over all data subcarriers. See Table 9-107.
...	…	…
Average SNR of Space-Time Stream *Nc*	8	Signal-to-noise ratio at the beamformee for space-time stream *Nc* averaged over all data subcarriers. See Table 9-107.
Compressed Beamforming Feedback Matrix *V* for subcarrier $k = scidx(0)$	$Na \times (b_\psi + b_\phi)/2$	Compressed beamforming feedback matrix as defined in Table 9-101, Table 9-102, or Table 9-103

Table 9-105—VHT Compressed Beamforming Report information *(continued)*

Field	Size (bits)	Meaning
Compressed Beamforming Feedback Matrix V for subcarrier $k = scidx(1)$	$Na \times (b_\psi + b_\phi)/2$	Compressed beamforming feedback matrix as defined in Table 9-101, Table 9-102, or Table 9-103
Compressed Beamforming Feedback Matrix V for subcarrier $k = scidx(2)$	$Na \times (b_\psi + b_\phi)/2$	Compressed beamforming feedback matrix as defined in Table 9-101, Table 9-102, or Table 9-103
...	…	…
Compressed Beamforming Feedback Matrix V for subcarrier $k = scidx(Ns - 1)$	$Na \times (b_\psi + b_\phi)/2$	Compressed beamforming feedback matrix as defined in Table 9-101, Table 9-102, or Table 9-103
NOTE—*scidx()* is defined in Table 9-106.		

Ns is the number of subcarriers for which the compressed beamforming feedback matrix is sent back to the beamformer. A beamformee might choose to reduce *Ns* by using a method referred to as grouping, in which only a single Compressed Beamforming Feedback Matrix is reported for each group of *Ng* adjacent subcarriers. *Ns* is a function of the Channel Width and Grouping subfields in the VHT MIMO Control field (see 9.4.1.46). Table 9-106 lists *Ns*, the exact subcarrier indices and their order for which the compressed beamforming feedback matrix is sent back. No padding is present between angles in the VHT Compressed Beamforming Report information, even if they correspond to different subcarriers. If the size of the VHT Compressed Beamforming Report information is not an integer multiple of 8 bits, up to seven 0s are appended to the end of the field to make its size an integer multiple of 8 bits.

Table 9-106—Subcarrier indices for which a compressed beamforming feedback matrix is sent back

Channel Width	*Ng*	*Ns*	Subcarrier indices for which Compressed Beamforming Feedback Matrix subfield is sent: *scidx*(0), *scidx*(1), …, *scidx*(*Ns*-1)
20 MHz in a non-S1G band or 2 MHz in an S1G band	1	52	–28, –27, –26, –25, –24, –23, –22, –20, –19, –18, –17, –16, –15, –14, –13, –12, –11, –10, –9, –8, –6, –5, –4, –3, –2, –1, 1, 2, 3, 4, 5, 6, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 22, 23, 24, 25, 26, 27, 28 NOTE—Pilot subcarriers (± 21, ± 7) and DC subcarrier (0) are skipped
	2	30	–28, –26, –24, –22, –20, –18, –16, –14, –12, –10, –8, –6, –4, –2, –1, 1, 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24, 26, 28
	4	16	–28, –24, –20, –16, –12, –8, –4, –1, 1, 4, 8, 12, 16, 20, 24, 28

The Average SNR of Space-Time Stream *i* subfield in Table 9-105 is a 2s complement integer whose definition is shown in Table 9-107.

Table 9-107—Average SNR of Space-Time Stream *i* subfield

Average SNR of Space-Time Stream *i* subfield	$AvgSNR_i$
–128	≤ –10 dB
–127	–9.75 dB
–126	–9.5 dB
…	…
+126	53.5 dB
+127	≥ 53.75 dB

The $AvgSNR_i$ in Table 9-107 is found by computing the SNR per subcarrier in decibels for the subcarriers identified in Table 9-106, and then computing the arithmetic mean of those values. Each SNR value per subcarrier in stream *i* (before being averaged) corresponds to the SNR associated with the column *i* of the beamforming feedback matrix *V* determined at the beamformee. Each SNR corresponds to the predicted SNR at the beamformee when the beamformer applies all columns of the $Nr \times Nc$ feedback matrix *V*

A STA with a 40 MHz, 80 MHz, or 160 MHz operating channel width and sending feedback for a 20 MHz channel width includes only subcarriers corresponding to the primary 20 MHz channel in the Compressed Beamforming Feedback Matrix subfield.

A STA with an 80 MHz or 160 MHz operating channel width and sending feedback for a 40 MHz channel width includes only subcarriers corresponding to the primary 40 MHz channel in the Compressed Beamforming Feedback Matrix subfield.

A STA with a 160 MHz or 80+80 MHz operating channel width and sending feedback for an 80 MHz channel width includes only subcarriers corresponding to the primary 80 MHz channel in the Compressed Beamforming Feedback Matrix subfield.

9.4.1.48 TVHT Compressed Beamforming Report field

The format of the TVHT Compressed Beamforming Report field is the same as the VHT Compressed Beamforming Report field in 9.4.1.47 except for the following modifications.

The subcarriers for which Compressed Beamforming Feedback Matrix subfield is sent in Table 9-106 for 40 MHz are used for each basic channel unit (BCU) in TVHT_MODE_1 and TVHT_MODE_2N. See subcarrier location description in Table 22-9.

For TVHT_MODE_2C with 6 MHz and 8 MHz channelization, the subcarriers for which Compressed Beamforming Feedback Matrix subfield is sent in the Lower BCU are based on subtracting 72 from the values shown in Table 9-106 and for the Upper BCU by adding 72.

For TVHT_MODE_2C with 7 MHz channelization, the subcarriers for which Compressed Beamforming Feedback Matrix subfield is sent in the Lower BCU are based on subtracting 84 from the values shown in Table 9-106 and for the Upper BCU by adding 84.

For TVHT_MODE_4C with 6 MHz and 8 MHz channelization, the subcarriers for which Compressed Beamforming Feedback Matrix subfield is sent in the lowest, second to lowest, second to highest, and highest BCUs are based on subtracting 216, subtracting 72, adding 72, and adding 216 from the values shown in Table 9-106, respectively.

For TVHT_MODE_4C with 7 MHz channelization, the subcarriers for which Compressed Beamforming Feedback Matrix subfield is sent in the lowest, second to lowest, second to highest, and highest BCUs are based on subtracting 252, subtracting 84, adding 84, and adding 252 from the values shown in Table 9-106, respectively.

For TVHT_MODE_4N channelization, the subcarriers for which Compressed Beamforming Feedback Matrix subfield is sent in each of the two noncontiguous frequency segments are as described for TVHT_MODE_2C.

A STA with a TVHT_2W, TVHT_4W, TVHT_W+W, or TVHT_2W+2W operating channel width and sending feedback for a TVHT_W channel width includes a representation of the compressed beamforming feedback matrices of the subcarriers corresponding to the primary TVHT_W channel in the Compressed Beamforming Feedback Matrix subfield.

A STA with a TVHT_4W or TVHT_2W+2W operating channel width and sending feedback for a TVHT_2W channel width includes a representation of the compressed beamforming feedback matrices of the subcarriers corresponding to the primary TVHT_2W channel in the Compressed Beamforming Feedback Matrix subfield.

9.4.1.49 MU Exclusive Beamforming Report field

The MU Exclusive Beamforming Report field is used by the VHT compressed beamforming feedback (see 9.6.22.2) to carry explicit feedback information in the form of delta SNRs. The information in the VHT Compressed Beamforming Report field and the MU Exclusive Beamforming Report field can be used by the transmit MU beamformer to determine steering matrices Q, as described in 10.33.3, 19.3.12.3, and 21.3.11.

The size of the MU Exclusive Beamforming Report field depends on the values in the VHT MIMO Control field. The MU Exclusive Beamforming Report field contains MU Exclusive Beamforming Report information or successive (possibly zero-length) portions thereof in the case of segmented VHT compressed beamforming feedback (see 10.35.5). The MU Exclusive Beamforming Report information is included in the VHT compressed beamforming feedback if the Feedback Type subfield in the VHT MIMO Control field indicates MU (see 9.4.1.46).

The MU Exclusive Beamforming Report information consists of Delta SNR subfields for each space-time stream (1 to Nc) of a subset of the subcarriers typically spaced $2Ng$ apart, where Ng is signaled in the Grouping subfield of the VHT MIMO Control field, starting from the lowest frequency subcarrier and continuing to the highest frequency subcarrier. No padding is present between $\Delta SNR_{k,i}$ in the MU Exclusive Beamforming Report field, even if they correspond to different subcarriers. The subset of subcarriers included is determined by the values of the Channel Width and Grouping subfields of the VHT MIMO Control field as listed in Table 9-109. For each subcarrier included, the deviation in dB of the SNR of that subcarrier for each column of V relative to the average SNR of the corresponding space-time stream is computed using Equation (9-4).

$$\Delta SNR_{k,i} = min(max(\text{Round}(10\log 10\left(\frac{\left\|H_k V_{k,i}\right\|^2}{N}\right) - \overline{SNR_i}), -8), 7) \quad (9\text{-}4)$$

where

k is the subcarrier index in the range *scidx*(0), …, *scidx*(*Ns*'–1)
i is the space-time stream index in the range 1, …, *Nc*
H_k is the estimated MIMO channel for subcarrier k
$V_{k,i}$ is column i of the beamforming matrix V for subcarrier k
N is the average noise plus interference power, measured at the beamformee, that was used to calculate $\overline{SNR_i}$
$\overline{SNR_i}$ is the average SNR of space-time stream i reported in the VHT Compressed Beamforming Report information (Average SNR of Space-Time Stream i field)

Each Delta SNR subfield is a 2s complement signed integer that contains the $\Delta SNR_{k,i}$ in dB (in the range -8 to 7 dB), computed using Equation (9-4). The structure of the MU Exclusive Beamforming Report field is shown in Table 9-108.

Table 9-108—MU Exclusive Beamforming Report information

Field	Size (bits)	Meaning
Delta SNR for space-time stream 1 for subcarrier k = *scidx(0)*	4	$\Delta SNR_{scidx(0),1}$ as defined in Equation (9-4)
…	…	…
Delta SNR for space-time stream Nc for subcarrier k = *scidx(0)*	4	$\Delta SNR_{scidx(0),Nc}$ as defined in Equation (9-4)
Delta SNR for space-time stream 1 for subcarrier k = *scidx(1)*	4	$\Delta SNR_{scidx(1),1}$ as defined in Equation (9-4)
…	…	…
Delta SNR for space-time stream Nc for subcarrier k = *scidx(1)*	4	$\Delta SNR_{scidx(1),Nc}$ as defined in Equation (9-4)
…	…	…
Delta SNR for space-time stream 1 for subcarrier k = *scidx(Ns'–1)*	4	$\Delta SNR_{scidx(Ns'-1),1}$ as defined in Equation (9-4)
…	…	…
Delta SNR for space-time stream Nc for subcarrier k = *scidx(Ns'–1)*	4	$\Delta SNR_{scidx(Ns'-1),Nc}$ as defined in Equation (9-4)
NOTE—*scidx*() is defined in Table 9-109.

Table 9-109—Number of subcarriers and subcarrier mapping *(continued)*

Channel Width	*Ng*	*Ns*'	Subcarrier indices for which the Delta SNR subfield is sent: *scidx*(0), *scidx*(1), … *scidx*(*Ns*'–1)
80+80 MHz	4	64	–122(L), –114(L), –106(L), –98(L), –90(L), –82(L), –74(L), –66(L), –58(L), –50(L), -42(L), –34(L), –26(L), –18(L), –10(L), –2(L), 2(L), 10(L), 18(L), 26(L), 34(L), 42(L), 50(L), 58(L), 66(L), 74(L), 82(L), 90(L), 98(L), 106(L), 114(L), 122(L), –122(H), –114(H), –106(H), –98(H), –90(H), –82(H), –74(H), –66(H), –58(H), –50(H), –42(H), –34(H), –26(H), –18(H), –10(H), –2(H), 2(H), 10(H), 18(H), 26(H), 34(H), 42(H), 50(H), 58(H), 66(H), 74(H), 82(H), 90(H), 98(H), 106(H), 114(H), 122(H)

NOTE 1—*scidx*() is defined in Table 9-108.

NOTE 2— *x*(L) denotes subcarrier index *x* in the frequency segment lower in frequency, and *x*(H) denotes subcarrier index *x* in the frequency segment higher in frequency.

9.4.1.50 TVHT MU Exclusive Beamforming Report field

See 9.4.1.49 with the following modifications:

— For each BCU in TVHT_MODE_1 and TVHT_MODE_2N, the subcarriers used in the Delta SNR subfield are defined in Table 9-109 for 40 MHz. See the subcarrier location description in Table 22-9.

— For TVHT_MODE_2C with 6 MHz and 8 MHz channelization, the subcarriers for which Delta SNR subfield is sent in the Lower BCU are based on subtracting 72 from the values shown in Table 9-109 and for the Upper BCU by adding 72.

— For TVHT_MODE_2C with 7 MHz channelization, the subcarriers for which Delta SNR subfield is sent in the Lower BCU are based on subtracting 84 from the values shown in Table 9-109 and for the Upper BCU by adding 84.

— For TVHT_MODE_4C with 6 MHz and 8 MHz channelization, the subcarriers for which Delta SNR subfield is sent in the lowest, second to lowest, second to highest, and highest BCUs are based on subtracting 216, subtracting 72, adding 72, and adding 216 from the values shown in Table 9-109, respectively.

— For TVHT_MODE_4C with 7 MHz channelization, the subcarriers for which Delta SNR subfield is sent in the lowest, second to lowest, second to highest, and highest BCUs are based on subtracting 252, subtracting 84, adding 84, and adding 252 from the values shown in Table 9-109, respectively.

— For TVHT_MODE_4N channelization, the subcarriers for which Delta SNR subfield is sent in each of the two noncontiguous frequency segments are as described for TVHT_MODE_2C.

9.4.1.51 Operating Mode field

The Operating Mode field is present in the Operating Mode Notification frame (see 9.6.22.4) and Operating Mode Notification element (see 9.4.2.164).

The Operating Mode field for a non-S1G STA is shown in Figure 9-187.

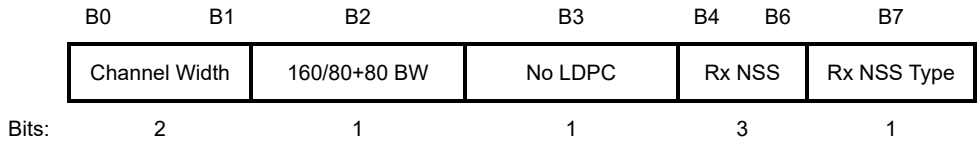

Figure 9-187—Operating Mode field format when it is carried in a non-S1G PPDU

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Operating Mode field in an S1G PPDU is shown in Figure 9-188.

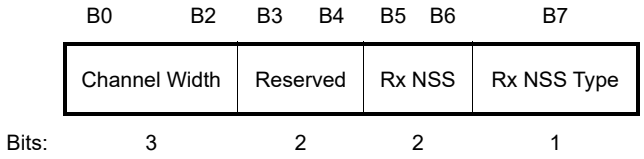

Figure 9-188—Operating Mode field format when it is carried in an S1G PPDU

The STA transmitting this field indicates its current operating channel width and the number of spatial streams it can receive using the settings defined in Table 9-110.

Table 9-110—Subfield values of the Operating Mode field

Subfield	Description
Channel Width	If the Rx NSS Type subfield is 0, indicates the supported channel width: In a VHT STA, see Table 9-111 In a TVHT STA: Set to 0 for TVHT_W Set to 1 for TVHT_2W and TVHT_W+W Set to 2 for TVHT_4W and TVHT_2W+2W The value 3 is reserved. In an S1G STA: Set to 0 for 1 MHz Set to 1 for 2 MHz Set to 2 for 4 MHz Set to 3 for 8 MHz Set to 4 for 16 MHz Reserved for values 5-7 Reserved if the Rx NSS Type subfield is 1.
160/80+80 BW	This subfield, combined with the Channel Width subfield, the Supported Channel Width Set subfield and the Supported VHT-MCS and NSS Set subfield indicates whether 80+80 MHz and 160 MHz operation is supported. In a VHT STA, see Table 9-111. In a TVHT STA, this field is reserved. In a STA with dot11VHTExtendedNSSBWCapable either equal to false or not present, this field is set to 0.
No LDPC	Set to 1 to indicate that the STA transmitting this field prefers not to receive LDPC-encoded PPDUs; set to 0 otherwise.

Table 9-110—Subfield values of the Operating Mode field *(continued)*

Subfield	Description
Rx NSS	If the STA that transmits the Operating Mode field (STA1) and the receiver of the Operating Mode field (STA2) are not both HE STAs and if the Rx NSS Type subfield is 0, then this field, combined with other information described in 9.4.2.156.3, indicates the maximum number of spatial streams that STA1 can receive. If the STA that transmits the Operating Mode field (STA1) and the receiver of the Operating Mode field (STA2) are both HE STAs and if the Rx NSS Type subfield is 0, then the following apply: — The value of this field, combined with other information described in 9.4.2.156.3, indicates the maximum number of spatial streams that the HE STA can receive in a VHT PPDU. — The value of this field, combined with other information described in 9.4.2.247.4, indicates the maximum number of spatial streams that STA1 can receive in an HE PPDU. If the Rx NSS Type subfield is 1, this field indicates the maximum number of spatial streams that the STA can receive as a beamformee in an SU PPDU using a beamforming steering matrix derived from a VHT Compressed Beamforming report with Feedback Type subfield indicating MU in the corresponding VHT Compressed Beamforming frame sent by the STA. In a non-S1G STA: Set to 0 for $N_{SS} = 1$ Set to 1 for $N_{SS} = 2$ … Set to 7 for $N_{SS} = 8$ In an S1G STA: Set to 0 for $N_{SS} = 1$ Set to 1 for $N_{SS} = 2$ Set to 2 for $N_{SS} = 3$ Set to 3 for $N_{SS} = 4$ NOTE—In a STA with dot11VHTExtendedNSSBWCapable equal to true, NSS might be further modified for VHT PPDUs per Table 9-111. In an HE STA with dot11VHTExtendedNSSBWCapable equal to true, NSS might be further modified for HE PPDUs per Equation (9-5).
Rx NSS Type	Set to 0 to indicate that the Rx NSS subfield carries the maximum number of spatial streams that the STA can receive in any PPDU. Set to 1 to indicate that the Rx NSS subfield carries the maximum number of spatial streams that the STA can receive as a beamformee in an SU PPDU using a beamforming steering matrix derived from a VHT Compressed Beamforming report with the Feedback Type subfield indicating MU in the corresponding VHT Compressed Beamforming frame sent by the STA. NOTE—An AP always sets this field to 0.

Table 9-111—Setting of the Channel Width subfield and 160/80+80 BW subfield at a VHT STA transmitting the Operating Mode field

Transmitted Operating Mode field		VHT Capabilities of STA transmitting the Operating Mode field		NSS support of STA transmitting the Operating Mode field as a function of the VHT PPDU (×Max VHT NSS) (see requirements R1 and R2)					Location of 160 MHz center frequency if BSS bandwidth is 160 MHz	Location of secondary 80 MHz center frequency if BSS bandwidth is 80+80 MHz
Channel width	160/ 80+80 BW	Supported Channel Width Set	Extended NSS BW Support	20 MHz	40 MHz	80 MHz	160 MHz	80 +80 MHz		
0	0	0-2	0-3	1						
1	0	0-2	0-3	1	1					
2	0	0-2	0-3	1	1	1				
2	1	0	1	1	1	1	1/2		CCFS2	
2	1	0	2	1	1	1	1/2	1/2	CCFS2	CCFS2
2	1	0	3	1	1	1	3/4	3/4	CCFS2	CCFS2
2	1	1	0	1	1	1	1		CCFS1	
2	1	1	1	1	1	1	1	1/2	CCFS1	CCFS2
2	1	1	2	1	1	1	1	3/4	CCFS1	CCFS2
2	1	1	3	2	2	2	2	1	CCFS1	CCFS1
2	1	2	0	1	1	1	1	1	CCFS1	CCFS1
2	1	2	3	2	2	2	1	1	CCFS1	CCFS1

R1: NSS support is rounded down to the nearest integer.
R2: The maximum NSS supported is 8.

NOTE 1—Max VHT NSS is defined per MCS in 9.4.2.156.3.

NOTE 2—1/2× or 3/4× Max VHT NSS support might end up being 0, indicating no support.

NOTE 3—Any other combination than the ones listed in this table is reserved.

NOTE 4—CCFS1 refers to the Channel Center Frequency Segment 1 field of the most recently transmitted VHT Operation element.

NOTE 5—CCFS2 refers to the Channel Center Frequency Segment 2 field of the most recently transmitted HT Operation element.

NOTE 6—CCFS1 is nonzero when the current BSS bandwidth is 160 MHz or 80+80 MHz and the NSS support is at least Max VHT NSS. CCFS2 is zero in this case.

NOTE 7—CCFS2 is nonzero when the current BSS bandwidth is 160 MHz or 80+80 MHz and the NSS support is less than Max VHT NSS. CCFS1 is zero in this case.

NOTE 8—At most one of CCFS1 and CCFS2 is nonzero.

NOTE 9—A supported multiple of Max VHT NSS applies to both transmit and receive.

Table 9-111—Setting of the Channel Width subfield and 160/80+80 BW subfield at a VHT STA transmitting the Operating Mode field *(continued)*

Transmitted Operating Mode field		VHT Capabilities of STA transmitting the Operating Mode field		NSS support of STA transmitting the Operating Mode field as a function of the VHT PPDU (×Max VHT NSS) (see requirements R1 and R2)					Location of 160 MHz center frequency if BSS bandwidth is 160 MHz	Location of secondary 80 MHz center frequency if BSS bandwidth is 80+80 MHz
Channel width	160/ 80+80 BW	Supported Channel Width Set	Extended NSS BW Support	20 MHz	40 MHz	80 MHz	160 MHz	80 +80 MHz		
NOTE 10—Some combinations of Supported Channel Width Set and Extended NSS BW support might not occur in practice.										
NOTE 11—2× Max VHT NSS support might be used for 20 MHz or 40 MHz HT PPDU.										

The maximum number of spatial streams that the STA supports in reception for a given HE-MCS as a function of the received HE PPDU bandwidth at an HE STA transmitting an Operating Mode field is defined as

$$\text{Floor}\,(Rx\text{-}NSS\text{-}from\text{-}OMF \times (Max\text{-}HE\text{-}NSS\text{-}at\text{-}BW \,/\, Max\text{-}HE\text{-}NSS\text{-}at\text{-}80)) \quad (9\text{-}5)$$

where

Rx-NSS-from-OMF is Rx NSS from the Operating Mode field transmitted by the STA

Max-HE-NSS-at-BW is the maximum NSS among all HE-MCS at *BW* MHz from the Supported HE-MCS And NSS Set field transmitted by the STA

Max-HE-NSS-at-80 is the maximum N_{SS} among all HE-MCS at 80 MHz from the Supported HE-MCS And NSS Set field transmitted by the STA

NOTE—For operating mode between two HE STAs, the Rx NSS subfield indicates the maximum number of spatial streams at channel widths less than or equal to 80 MHz.

9.4.1.52 Membership Status Array field

The Membership Status Array field is used in the Group ID Management frame (see 9.6.22.3). A Membership Status Array field (indexed by the group ID) consists of a 1-bit Membership Status subfield for each of the 64 group IDs, as shown in Figure 9-189.

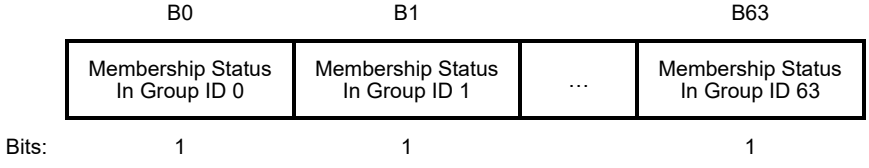

Figure 9-189—Membership Status Array field format

Within the Membership Status Array field, the 1-bit Membership Status subfield for each group ID is set as follows:

— Set to 0 if the STA is not a member of the group

— Set to 1 if STA is a member of the group

The Membership Status subfields for group ID 0 (transmissions to AP) and group ID 63 (downlink SU transmissions) are reserved.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.1.53 User Position Array field

The User Position Array field is used in the Group ID Management frame (see 9.6.22.3). A User Position Array field (indexed by the Group ID) consists of a 2-bit User Position subfield for each of the 64 group IDs, as shown in Figure 9-190.

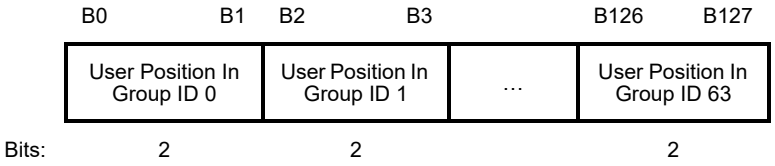

Figure 9-190—User Position Array field format

If the Membership Status subfield for a particular group ID is 1, then the corresponding User Position subfield in the User Position Array field contains the group ID's User Position.

If the Membership Status subfield for a group ID is 0 (meaning the STA is not a member of that group), then the corresponding User Position subfield in the User Position Array field is reserved.

The User Position subfields for group ID 0 (transmissions to AP) and group ID 63 (downlink SU transmissions) are reserved.

9.4.1.54 Device Location Information Body field

A Device Location Information Body field includes the location configuration information (LCI), which contains latitude, longitude, and altitude information.

The format of the Device Location Information Body field is shown in Figure 9-191.

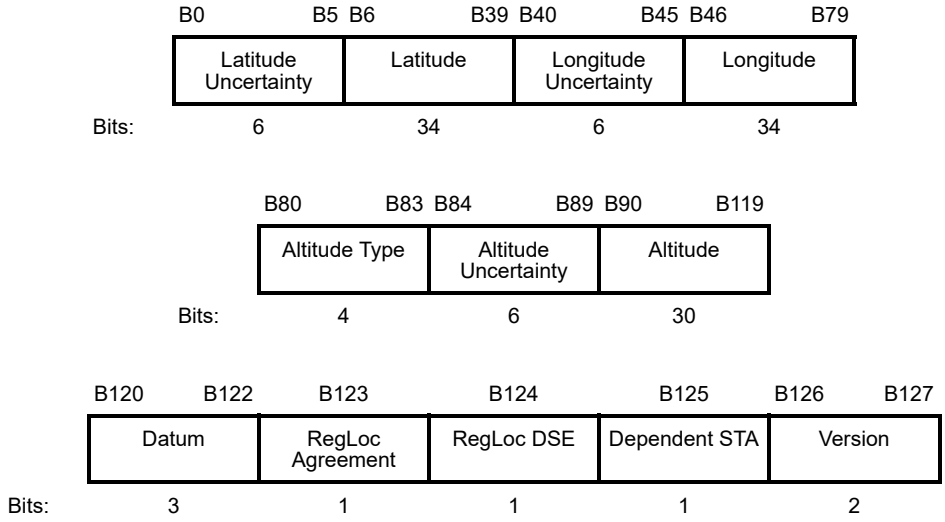

Figure 9-191—Device Location Information Body field format

The fields within the Device Location Information Body field are as defined in section 2.2 of IETF RFC 6225 except as defined in 9.4.2.50, and RegLoc Agreement and RegLoc DSE are set to 0.

9.4.1.55 WSM Type field and WSM Information field

The WSM Type field is set to a number that identifies the type of WSM information and the frequency band where the following WSM Information field is applicable. The values of WSM Types are shown in Table 9-112. The WSM Type field set to 1 indicates the WSM Information field of the WSM element contains available frequency information for operation in the TVWS. Other values are reserved.

Table 9-112—WSM Type definition

Name	WSM Type
Reserved	0
TV band WSM	1
Reserved	2–255

The WSM Information field indicates the available channel information as defined in 9.4.4.2.6.

The WSM Information field corresponding to a TV band WSM is shown in Table 9-424.

9.4.1.56 Sync Control field

The Sync Control field is present in the Sync Control frame (see 9.6.24.4). The Sync Control field is shown in Figure 9-192.

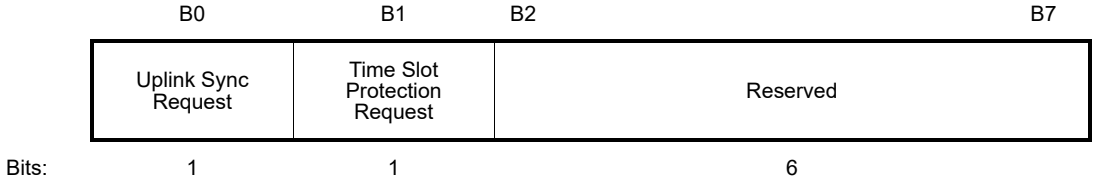

Figure 9-192—Sync Control field format

The non-AP STA transmitting this field indicates its mode of operation for the sync frame transmission. The subfields of the Sync Control field are defined in Table 9-113.

Table 9-113—Subfields of the Sync Control field

Subfield	Definition	Encoding
Uplink Sync Request	This subfield indicates request for sync frame transmission for uplink. (see 10.48)	Set to 0 if not requested. Set to 1 if requested.
Time Slot Protection Request	This subfield indicates request for a time slot protection during a time slot in a RAW (9.4.2.190) or for a duration defined in the Nominal Minimum TWT Wake Duration field for a TWT time (9.4.2.198), or for the duration of a TXOP after the expiration of wakeup timer.	Set to 0 if not requested. Set to 1 if requested.

9.4.1.57 Suspend Duration field

The format of the Suspend Duration field is shown in Figure 9-193.

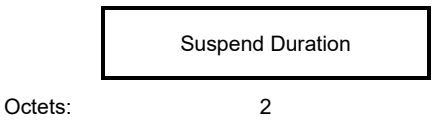

Figure 9-193—Suspend Duration field format

The Suspend Duration field contains an unsigned integer. See 10.60 for the use of this field.

9.4.1.58 TWT Information field

The TWT Information field is present in the TWT Information frame (see 9.6.24.12). The TWT Information field format is shown in Figure 9-194.

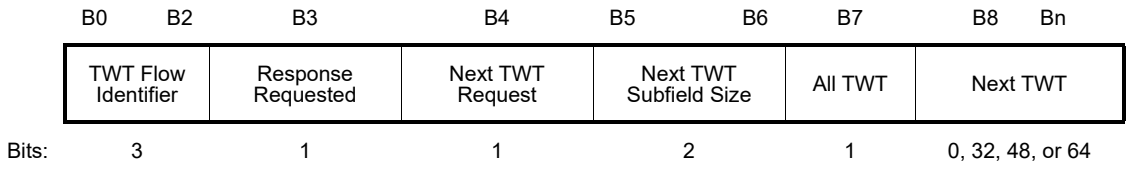

Figure 9-194—TWT Information field format

The TWT Information field size is variable and depends on the Next TWT Size field.

The TWT Flow Identifier subfield contains the TWT flow identifier for which TWT information is requested or being provided.The TWT Flow Identifier subfield is reserved if the All TWT subfield is 1.

The Response Requested subfield indicates whether the transmitter of the frame containing the TWT Information field is requesting a TWT Information frame to be transmitted in response to this frame. The Response Requested subfield is set to 0 to request the recipient to not transmit a TWT Information frame in response to the frame. The Response Requested subfield is set to 1 to request the recipient to transmit a TWT Information frame in response to the frame.

The Next TWT Request subfield is set to 1 to indicate that the TWT Information frame is a request for the delivery of a TWT Information frame containing a nonzero length Next TWT field. Otherwise, it is set to 0.

The Next TWT Subfield Size subfield describes the size of the Next TWT subfield according to Table 9-114.

The All TWT subfield is set to 1 by an HE STA to indicate that the TWT Information frame reschedules all TWTs as defined in 26.8.4. Otherwise, it is set to 0.

The Next TWT subfield is of a variable size as determined by the Next TWT Subfield Size subfield value according to Table 9-114. The value contained in the Next TWT subfield is the least significant portion of the TSF at the next TWT for the TWT specified by the TWT Flow Identifier subfield.

NOTE—The Next TWT subfield might carry only a portion of the target TSF time, and changes in the most significant octets of the corresponding target TSF time are not communicated to the receiving STA. Hence, the receiving STA must consider and account for a rollover of the corresponding most significant octets of the target TSF time that might happen at the receiving STA.

9.4.1.59 CMMG MIMO Control field

The CMMG MIMO Control field is used to manage the exchange of CMMG MIMO channel state or transmit beamforming feedback information. It is used in the CMMG Compressed Beamforming (see 9.6.29.2).

The CMMG MIMO Control field is defined in Figure 9-195.

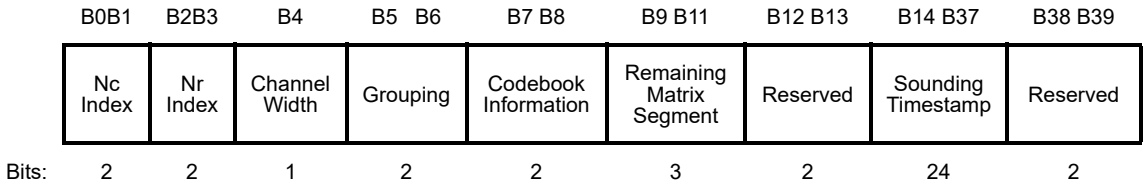

Figure 9-195—CMMG MIMO Control field format

The subfields of the CMMG MIMO Control field are defined in Table 9-115.

9.4.1.60 CMMG Compressed Beamforming Report field

The CMMG Compressed Beamforming Report field is used by the CMMG Compressed Beamforming frame (see 9.6.29.2) to carry explicit feedback information in the form of angles representing compressed beamforming feedback matrices V for use by a transmit CMMG beamformer to determine steering matrices Q, as described in 10.33.5 and 25.6.8.13.

The size of the CMMG Compressed Beamforming Report field depends on the values in the CMMG MIMO Control field.

The CMMG Compressed Beamforming Report field contains the channel matrix elements indexed, first, by matrix angles in the order shown in Table 9-116, second, by data subcarrier index from lowest frequency to highest frequency. The explanation of how these angles are generated from the beamforming feedback matrix V is given in 25.6.8.13.2.

Table 9-115—Subfields of the CMMG MIMO Control field

Subfield	Description
Nc Index	Indicates the number of columns in the compressed beamforming feedback matrix minus 1.
Nr Index	Indicates the number of rows in the compressed beamforming feedback matrix minus 1.
Channel Width	Indicates the width of the channel in which a measurement was made: Set to 0 for 540 MHz Set to 1 for 1080 MHz
Grouping	Indicates the number of subcarriers grouped into one: Set to 0 for $N_g = 1$ (No grouping) Set to 1 for $N_g = 2$ Set to 2 for $N_g = 4$ Set to 3 for $N_g = 6$
Codebook Information	Indicates the size of codebook entries: Set to 0 for 2 bits for ψ, 4 bits for ϕ Set to 1 for 3 bits for ψ, 5 bits for ϕ The value 2 and 3 are reserved.
Remaining Matrix Segments	Contains the remaining segment number for the associated measurement report. Set to 0 for the last segment of a segmented report or the only segment of an unsegmented report.
Sounding Timestamp	Contains the lower 3 octets of the TSF timer sampled at the instant that the MAC received the PHY-CCA.indication(IDLE) primitive that corresponds to the end of the reception of the sounding PPDU that was used to generate feedback information contained in the frame.

Table 9-116—Order of angles in the CMMG Compressed Beamforming Report field

Size of V ($Nr \times Nc$)	Number of angles (Na)	The order of angles in the compressed beamforming feedback matrix
2×1	2	$\varphi_{1,1}, \psi_{2,1}$
2×2	2	$\varphi_{1,1}, \psi_{2,1}$
3×1	4	$\varphi_{1,1}, \varphi_{2,1}, \psi_{2,1}, \psi_{3,1}$
3×2	6	$\varphi_{1,1}, \varphi_{2,1}, \psi_{2,1}, \psi_{3,1}, \varphi_{2,2}, \psi_{3,2}$
3×3	6	$\varphi_{1,1}, \varphi_{2,1}, \psi_{2,1}, \psi_{3,1}, \varphi_{2,2}, \psi_{3,2}$
4×1	6	$\varphi_{1,1}, \varphi_{2,1}, \varphi_{3,1}, \psi_{2,1}, \psi_{3,1}, \psi_{4,1}$
4×2	10	$\varphi_{1,1}, \varphi_{2,1}, \varphi_{3,1}, \psi_{2,1}, \psi_{3,1}, \psi_{4,1}, \varphi_{2,2}, \varphi_{3,2}, \psi_{3,2}, \psi_{4,2}$
4×3	12	$\varphi_{1,1}, \varphi_{2,1}, \varphi_{3,1}, \psi_{2,1}, \psi_{3,1}, \psi_{4,1}, \varphi_{2,2}, \varphi_{3,2}, \psi_{3,2}, \psi_{4,2}, \varphi_{3,3}, \psi_{4,3}$
4×4	12	$\varphi_{1,1}, \varphi_{2,1}, \varphi_{3,1}, \psi_{2,1}, \psi_{3,1}, \psi_{4,1}, \varphi_{2,2}, \varphi_{3,2}, \psi_{3,2}, \psi_{4,2}, \varphi_{3,3}, \psi_{4,3}$

The angles are quantized as defined in Table 9-117.

Table 9-117—Quantization of angles

Quantized ψ	Quantized φ
$\psi = \frac{k\pi}{2^{b_\psi+1}} + \frac{\pi}{2^{b_\psi+2}}$ radians where $k = 0, 1, \ldots, 2^{b_\psi} - 1$ b_ψ is the number of bits used to quantize ψ defined by the Codebook Information field of the CMMG MIMO Control field	$\varphi = \frac{k\pi}{2^{b_\varphi+1}} + \frac{\pi}{2^{b_\varphi+2}}$ radians where $k = 0, 1, \ldots, 2^{b_\varphi} - 1$ b_φ is the number of bits used to quantize φ defined by the Codebook Information field of the CMMG MIMO Control field

The CMMG Compressed Beamforming Report field has the structure defined in Table 9-118, where *Na* is the number of angles used for the CMMG compressed beamforming feedback matrix.

Table 9-118—CMMG Compressed Beamforming Report field

Field	Size (bits)	Meaning
Average SNR of Space-Time Stream 1	8	Signal-to-noise ratio at the beamformee for space-time stream 1 averaged over all data subcarriers
...	...	...
Average SNR of Space-Time Stream *Nc*	8	Signal-to-noise ratio at the beamformee for space-time stream *Nc* averaged over all data subcarriers.
Compressed Beamforming Feedback Matrix *V* for Subcarrier $k = scidx(0)$	$Na \times (b_\varphi + b_\psi)/2$	Compressed beamforming feedback matrix
Compressed Beamforming Feedback Matrix *V* for Subcarrier $k = scidx(1)$	$Na \times (b_\varphi + b_\psi)/2$	Compressed beamforming feedback matrix
Compressed Beamforming Feedback Matrix *V* for Subcarrier $k = scidx(2)$	$Na \times (b_\varphi + b_\psi)/2$	Compressed beamforming feedback matrix
...	...	...
Compressed Beamforming Feedback Matrix *V* for Subcarrier $k = scidx(Ns - 1)$	$Na \times (b_\varphi + b_\psi)/2$	Compressed beamforming feedback matrix
NOTE— *scidx()* is defined in Table 9-119.		

Ns is the number of subcarriers for which the CMMG compressed beamforming feedback matrix is sent back to the CMMG beamformer. *Ns* is a function of the Channel Width and Grouping subfields in the CMMG MIMO Control field. Table 9-119 lists *Ns*, the exact subcarrier indices and their order for which the CMMG compressed beamforming feedback matrix is sent back. No padding is present between angles in the CMMG Compressed Beamforming Report field, even if they correspond to different subcarriers. If the length of the CMMG Compressed Beamforming Report field is not an integral multiple of 8 bits, up to 7 0s are appended to the end of the field to make its size an integral multiple of 8 bits.

	6	62	–177, –176, –170, –164, –158, –152, –146, –140, –134, –128, –122, –116, –110, –104, –98, –92, –86, –80,–74,–68, –62, –56, –50, –44, –38, –32, –26, –20, –14, –8, –2, 2, 8, 14, 20, 26, 32, 38, 44, 50, 56, 62, 68, 74, 80, 86, 92, 98, 104, 110, 116, 122, 128, 134, 140, 146, 152, 158, 164, 170, 176, 177

The SNR values are encoded as an 8-bit 2s complement value of 4×(SNR_average-22), where SNR_average is the sum of the values of SNR per subcarrier (in decibels) divided by the number of subcarriers represented.

The Average SNR of Space-Time Stream *i* subfield is a 2s complement integer whose definition is shown in Table 9-120.

Table 9-120—Average SNR of Space-Time Stream *i* subfield

Average SNR of Space-Time Stream *i* subfield	$AvgSNR_i$ (dB)
–128	≤ –10
–127	–9.75
–126	–9.5

9.4.1.61 CMMG Operating Mode field

The CMMG Operating Mode field is present in the CMMG Operating Mode Notification frame (see 9.6.29.3) and CMMG Operating Mode Notification element (see 9.4.2.230).

The CMMG Operating Mode field is shown in Figure 9-196.

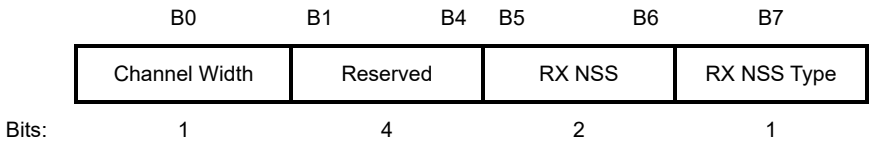

Figure 9-196—CMMG Operating Mode field format

The STA transmitting this field indicates its current operating channel width and the number of spatial streams it can receive using the settings defined in Table 9-121.

Table 9-121—Subfield values of the CMMG Operating Mode field

Subfield	Description
Channel Width	If the RX NSS Type subfield is 0, indicates the supported channel width: Set to 0 for 540 MHz Set to 1 for 1080 MHz Reserved if the Rx NSS Type subfield is 1
RX NSS	If the RX NSS Type subfield is 0, indicates the maximum number of spatial streams that the STA can receive. If the RX NSS Type subfield is 1, indicates the maximum number of spatial streams that the STA can receive as a beamformee in an SU PPDU using a beamforming steering matrix derived from a CMMG Compressed Beamforming Report field with the Feedback Type subfield indicating SU in the corresponding CMMG Compressed Beamforming frame sent by the STA. Set to 0 for NSS = 1 Set to 1 for NSS = 2 … Set to 3 for NSS = 4
RX NSS Type	Set to 0 to indicate that the RX NSS subfield carries the maximum number of spatial streams that the STA can receive. Set to 1 to indicate that the RX NSS subfield carries the maximum number of spatial streams that the STA can receive in an SU PPDU using a beamforming steering matrix derived from a CMMG Compressed Beamforming Report field with the Feedback Type subfield indicating SU in the corresponding CMMG Compressed Beamforming frame sent by the STA. NOTE—An AP always sets this field to 0.

9.4.1.62 HE MIMO Control field

The HE MIMO Control field is defined in Figure 9-197.

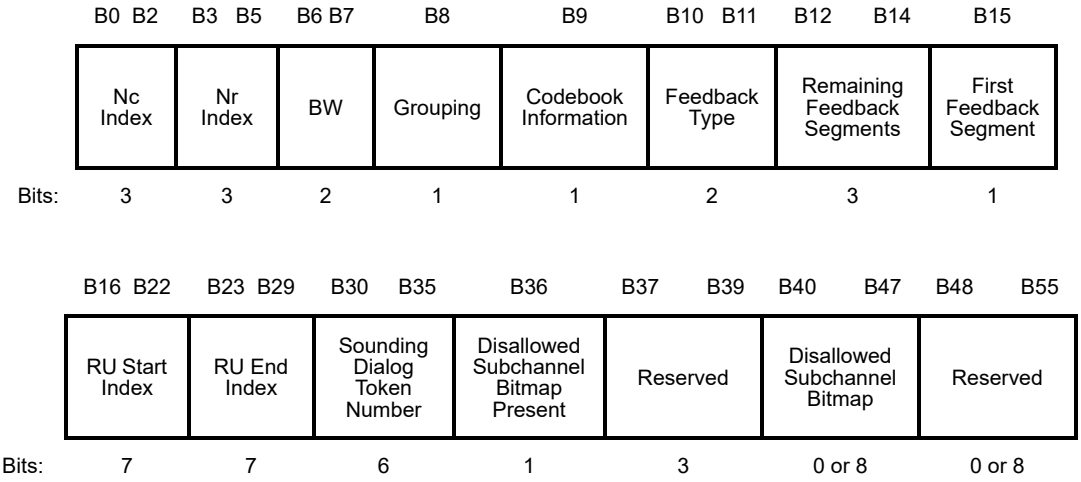

Figure 9-197—HE MIMO Control field format

The subfields of the HE MIMO Control field are defined in Table 9-122.

Table 9-122—HE MIMO Control field encoding

Subfield	Description
Nc Index	If the Feedback Type subfield indicates SU or MU, the Nc Index subfield indicates the number of columns in the compressed beamforming feedback matrix minus 1, $Nc - 1$. If the Feedback Type subfield indicates CQI, the Nc Index subfield indicates the number of space time streams in the CQI Report minus 1, $Nc - 1$.
Nr Index	If the Feedback Type subfield indicates SU or MU, then the Nr Index subfield indicates the number of rows in the compressed beamforming feedback matrix minus 1, $Nr - 1$.The value 0 is reserved. If the Feedback Type subfield indicates CQI, then the Nr Index subfield is reserved.
BW	Indicates the channel width used to determine the starting and ending subcarrier indices when interpreting the RU Start Index and RU End Index subfields. Set to 0 for 20 MHz. Set to 1 for 40 MHz. Set to 2 for 80 MHz. Set to 3 for 160 MHz and 80+80 MHz.
Grouping	If the Feedback Type subfield indicates SU or MU, then the Grouping subfield indicates the subcarrier grouping, Ng, used for the compressed beamforming feedback matrix: Set to 0 for $Ng = 4$. Set to 1 for $Ng = 16$. If the Feedback Type subfield indicates CQI, then the Grouping subfield is reserved.

Table 9-122—HE MIMO Control field encoding

Subfield	Description
Codebook Information	Indicates the size of codebook entries. If the Feedback Type subfield indicates SU: Set to 0 for 4 bits for ϕ and 2 bits for ψ. Set to 1 for 6 bits for ϕ and 4 bits for ψ. If the Feedback Type subfield indicates MU: Set to 0 for 7 bits for ϕ and 5 bits for ψ. Set to 1 for 9 bits for ϕ and 7 bits for ψ. If the Feedback Type subfield indicates CQI, then the Codebook Information subfield is reserved. NOTE—The codebook size for MU Feedback with $Ng = 16$ is limited to $(\phi, \psi) = \{9, 7\}$.
Feedback Type	Indicates the feedback type: Set to 0 for SU. Set to 1 for MU. Set to 2 for CQI. 3 is reserved.
Remaining Feedback Segments	Indicates the number of remaining feedback segments for the associated HE Compressed Beamforming/CQI frame: Set to 0 for the last feedback segment of a segmented report or the only feedback segment of an unsegmented report. Set to a value between 1 and 7 for a feedback segment that is not the last feedback segment of a segmented report. In a retransmitted feedback segment, the subfield is set to the same value associated with the feedback segment in the original transmission.
First Feedback Segment	Set to 1 for the first feedback segment of a segmented report or the only feedback segment of an unsegmented report. Set to 0 if not the first feedback segment or if the HE Compressed Beamforming Report field and HE MU Exclusive Beamforming Report field are not present in the frame. In a retransmitted feedback segment, the subfield is set to the same value associated with the feedback segment in the original transmission. NOTE—The First Feedback Segment subfield is always set to 0 if the Feedback Type subfield indicates CQI because the HE Compressed Beamforming/CQI frame is always less than 11 454 octets in length.
RU Start Index	The starting RU index indicates the first 26-tone RU for which the HE beamformer is requesting feedback.
RU End Index	The ending RU index indicates the last 26-tone RU for which the HE beamformer is requesting feedback.
Sounding Dialog Token Number	Set to the same value as the Sounding Dialog Token Number field in the corresponding HE NDP Announcement frame.

In an HE Compressed Beamforming/CQI frame that does not include the HE Sounding Feedback Segment field (see 26.7 for a description of such a case), the Nc Index, Nr Index, BW, Grouping, Codebook Information, Feedback Type and Sounding Dialog Token Number subfields are reserved, the First Feedback Segment subfield is set to 0 and the Remaining Feedback Segments subfield is set to 7.

The Disallowed Subchannel Bitmap Present subfield indicates whether a Disallowed Subchannel Bitmap subfield and a reserved field of 8 bits are present in the HE MIMO Control field. These subfields are present if the Disallowed Subchannel Bitmap Present subfield is equal to 1. These subfields are not present if the Disallowed Subchannel Bitmap Present subfield is equal to 0.

The Disallowed Subchannel Bitmap subfield is defined in 9.3.1.19.

9.4.1.63 HE Compressed Beamforming Report field

The HE Compressed Beamforming Report field carries the average SNR of each space-time stream and compressed beamforming feedback matrices V for use by a transmit beamformer to determine steering matrices Q, as described in 10.33.3 and 19.3.12.3.

The size of the HE Compressed Beamforming Report field depends on the values in the HE MIMO Control field. The HE Compressed Beamforming Report field contains HE Compressed Beamforming Report information. The HE Compressed Beamforming Report field is included in the HE Compressed Beamforming/CQI Report field (see 9.4.1.66) if the Feedback Type subfield in the HE MIMO Control field indicates SU or MU, and is not included otherwise. If the HE MIMO Control field contains a Disallowed Subchannel Bitmap subfield, then the HE Compressed Beamforming Report field does not include information for tones that are included within 242-tone RUs that are indicated as disallowed by the bitmap.

The HE Compressed Beamforming Report information contains the channel matrix elements indexed, first, by matrix angles in order shown in Table 9-101 and, second, by data and pilot subcarrier index from lowest frequency to highest frequency. An explanation of how these angles are generated from the beamforming feedback matrix V is given in 19.3.12.3.6, where Nc is the number of columns in a compressed beamforming feedback matrix determined by the Nc Index subfield of the HE MIMO Control field, and Nr is the number of rows in a compressed beamforming feedback matrix determined by the Nr Index subfield of the HE MIMO Control field.

The beamforming feedback matrix V is formed by the beamformee as follows. The beamformer transmits an HE sounding NDP with $N_{STS,NDP}$ space-time streams, where $N_{STS,NDP}$ takes a value between 2 and 8. Based on this HE sounding NDP, the beamformee estimates the $N_{RX,BFEE} \times N_{STS,NDP}$ channel, and based on that channel it determines a $Nr \times Nc$ orthogonal matrix V, where Nr and Nc satisfy Equation (9-3). $N_{RX,BFEE}$ is the number of receiver chains used to receive the HE sounding NDP at the beamformee.

Further restrictions on Nc are described in 27.2. The angles are quantized as defined in Table 9-104 with b_ψ and b_ϕ defined by the Codebook Information field of the HE MIMO Control field (see 9.4.1.62).

The HE Compressed Beamforming Report information has the structure and order defined in Table 9-123, where Na is the number of angles used for the compressed beamforming feedback matrix (see Table 9-101).

Table 9-123—HE Compressed Beamforming Report information

Field	Size (bits)	Meaning
Average SNR of Space-Time Stream 1	8	Signal-to-noise ratio at the beamformee for space-time stream 1 averaged over all data subcarriers. See Table 9-107.
…		…

Table 9-123—HE Compressed Beamforming Report information *(continued)*

Field	Size (bits)	Meaning
Average SNR of Space-Time Stream Nc	8	Signal-to-noise ratio at the beamformee for space-time stream Nc averaged over all data subcarriers. See Table 9-107.
Compressed beamforming feedback matrix V for subcarrier $k = scidx(0)$	$Na \times (b_\phi + b_\psi)/2$	Compressed beamforming feedback matrix defined in Table 9-101.
Compressed beamforming feedback matrix V for subcarrier $k = scidx(1)$	$Na \times (b_\phi + b_\psi)/2$	Compressed beamforming feedback matrix defined in Table 9-101.
Compressed beamforming feedback matrix V for subcarrier $k = scidx(2)$	$Na \times (b_\phi + b_\psi)/2$	Compressed beamforming feedback matrix defined inTable 9-101.
…		…
Compressed beamforming feedback matrix V for subcarrier $k = scidx(Ns - 1)$	$Na \times (b_\phi + b_\psi)/2$	Compressed beamforming feedback matrix defined in Table 9-101.

In Table 9-123, *Ns* is the number of subcarriers for which a compressed beamforming feedback matrix is sent back to the beamformer. A beamformer or beamformee, depending upon which of the two determines the feedback parameters, reduces *Ns* by using a method referred to as grouping, in which only a single compressed beamforming feedback matrix is reported for each group of *Ng* adjacent subcarriers. *Ns* is a function of the BW, RU Start Index, RU End Index and Grouping subfields in the HE MIMO Control field (see 9.4.1.62).

Subcarrier indices *scidx(0)* and *scidx(Ns – 1)* are identified by the RU Start Index and RU End Index subfields, respectively, together with the BW and Grouping subfields, as defined in Table 9-124 and Table 9-125.

Table 9-124—Subcarrier indices *scidx*(0) and *scidx*(*Ns* – 1) for *Ng* = 4

70							900	932	388(H)	420(H)
71							932	964	420(H)	452(H)
72							948	996	436(H)	484(H)
73							980	1012	468(H)	500(H)

NOTE 1—S denotes subcarrier index *scidx*(0), identified by the RU Start Index subfield; E denotes subcarrier index *scidx*(*Ns* – 1), identified by the RU End Index subfield.

NOTE 2—*x*(L) denotes subcarrier index *x* in the frequency segment lower in frequency, and *x*(H) denotes subcarrier index *x* in the frequency segment higher in frequency.

Subcarrier indices *scidx*(*i*), *i* = 0, …, *Ns* – 1 are the subset of the subcarrier indices identified by the BW and Grouping subfields, as defined in Table 9-126, starting with *scidx*(0) and ending with *scidx*(*Ns* – 1), in the order given.

NOTE 1—This implicitly defines *Ns*.

NOTE 2—For full-bandwidth feedback, subcarrier indices *scidx*(*i*), *i* = 0, …, *Ns* – 1 are the entire superset shown in Table 9-126, in the order given.

Table 9-126—Subcarrier indices for compressed beamforming feedback matrix

Channel width	*Ng*	Superset of subcarrier indices (*scidx*)
20 MHz	4	–122, –120, –116, …, –8, –4, –2, 2, 4, 8, …, 116, 120, 122
	16	–122, –116, –100, …, –20, –4, –2, 2, 4, 20, …, 100, 116, 122
40 MHz	4	–244, –240, …, –8, –4, 4, 8, …, 240, 244
	16	–244, –228, …, –20, –4, 4, 20, …, 228, 244
80 MHz	4	–500, –496, …, –8, –4, 4, 8, …, 496, 500
	16	–500, –484, …, –20, –4, 4, 20, …, 484, 500
160 MHz	4	–1012, –1008, …, –520, –516, –508, –504, …, –16, –12, 12, 16, …, 504, 508, 516, 520, …, 1008, 1012
	16	–1012, –996, …, –532, –516, –508, –492, …, –28, –12, 12, 28, …, 492, 508, 516, 532, …, 996, 1012

Table 9-126—Subcarrier indices for compressed beamforming feedback matrix *(continued)*

Channel width	*Ng*	Superset of subcarrier indices (*scidx*)
80+80 MHz	4	–500(L), –496(L), …, –8(L), –4(L), 4(L), 8(L), …, 496(L), 500(L), –500(H), –496(H), …, –8(H), –4(H), 4(H), 8(H), …, 496(H), 500(H)
	16	–500(L), –484(L), …, –20(L), –4(L), 4(L), 20(L), …, 484(L), 500(L), –500(H), –484(H), …, –20(H), –4(H), 4(H), 20(H), …, 484(H), 500(H)

NOTE 1—*x*(L) denotes subcarrier index *x* in the frequency segment lower in frequency, and *x*(H) denotes subcarrier index *x* in the frequency segment higher in frequency.

NOTE 2—"…" denotes an arithmetic progression in *Ng* increments.

NOTE 3—Pilot subcarriers are not skipped.

The Average SNR of Space-Time Stream *i* subfield in Table 9-123 is a 2s complement integer defined in Table 9-107.

The $AvgSNR_i$ in Table 9-107 is found by computing the SNR per subcarrier in decibels for the subcarriers identified in Table 9-124 for $Ng = 4$ and Table 9-125 for $Ng = 16$, and then computing the arithmetic mean of those values. Each SNR value per subcarrier in stream *i* (before being averaged) corresponds to the SNR associated with column *i* of the beamforming feedback matrix *V* determined at the beamformee. Each SNR corresponds to the predicted SNR at the beamformee when the beamformer applies all columns of the matrix V.

The computation of the $AvgSNR_i$ values does not include channel information from subcarriers that lie within 242-tone RUs that are indicated as punctured by the Disallowed Subchannel Bitmap subfield, if present, of the HE NDP Announcement frame that solicited the feedback.

Padding is not present between angles in the HE Compressed Beamforming Report information, even if they correspond to different subcarriers. If the size of the HE Compressed Beamforming Report information is not an integer multiple of 8 bits, up to seven 0s are appended to the end of the field to make its size an integer multiple of 8 bits.

9.4.1.64 HE MU Exclusive Beamforming Report field

The HE MU Exclusive Beamforming Report field carries explicit feedback in the form of delta SNRs. The information in the HE Compressed Beamforming Report field and the HE MU Exclusive Beamforming Report field can be used by the transmit MU beamformer to determine the steering matrices *Q*, as described in 27.3.3.1.

The size of the HE MU Exclusive Beamforming Report field depends on the values in the HE MIMO Control field. The HE MU Exclusive Beamforming Report field contains HE MU Exclusive Beamforming Report information. The HE MU Exclusive Beamforming Report field is included in the HE Compressed Beamforming/CQI Report field (see 9.4.1.66) (in addition to the HE Compressed Beamforming Report field) if the Feedback Type subfield in the HE MIMO Control field indicates MU, and is not included otherwise. If the HE MIMO Control field contains a Disallowed Subchannel Bitmap subfield, then the HE MU Exclusive Beamforming Report field does not include information for tones that are included within 242-tone RUs that are indicated as disallowed by the bitmap.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The HE MU Exclusive Beamforming Report information consists of Delta SNR subfields for each of the space-time streams, 1 to *Nc*, of a subset of subcarriers typically spaced *Ng* apart, where *Ng* is signaled in the Grouping subfield of the HE MIMO Control field. The subset of subcarriers starts from the lowest frequency subcarrier and continues to the highest frequency subcarrier. The subcarrier indices of the feedback for each Delta SNR subfield are identical to the subcarrier indices for the compressed beamforming feedback matrix *V*.

NOTE—The feedback subcarrier spacings are mostly equal to *Ng*, but there are a few exceptions, generally around the RU edge and the DC tone, where extra feedback subcarriers are added to improve the channel interpolation/extrapolation quality.

No padding is present between $\Delta SNR_{k,i}$, in the HE MU Exclusive Beamforming Report field, even if they correspond to different subcarriers. The subset of subcarriers included is determined by the values of the RU Start Index, RU End Index, and Grouping subfields of the HE MIMO Control field. For each subcarrier included, the deviation in dB of the SNR of that subcarrier for each column of *V* relative to the average SNR of the corresponding space-time stream is computed using Equation (9-4), except that *k* is the subcarrier index in the range *scidx*(0), …, *scidx*(*Ns* – 1) and $\overline{SNRi}$ is the average SNR of space-time stream *i* reported in the Average SNR of Space-Time Stream *i* field of the HE Compressed Beamforming Report information. In Equation (9-4), the average SNR value is computed only for subcarriers that are not indicated as disallowed by a Disallowed Subchannel Bitmap subfield, when it is present.

The HE MU Exclusive Beamforming Report information has the structure and order defined in Table 9-127.

Table 9-127—HE MU Exclusive Beamforming Report information

Field	Size (bits)	Meaning
Delta SNR for space-time stream 1 for subcarrier $k = scidx(0)$	4	$\Delta SNR_{scidx(0),1}$ as defined in Equation (9-2) as modified above.
…		…
Delta SNR for space-time stream *Nc* for subcarrier $k = scidx(0)$	4	$\Delta SNR_{scidx(0),Nc}$ as defined in Equation (9-2) as modified above.
Delta SNR for space-time stream 1 for subcarrier $k = scidx(1)$	4	$\Delta SNR_{scidx(1),1}$ as defined in Equation (9-2) as modified above.
…		…
Delta SNR for space-time stream *Nc* for subcarrier $k = scidx(1)$	4	$\Delta SNR_{scidx(1),Nc}$ as defined in Equation (9-2) as modified above.
…		…
Delta SNR for space-time stream 1 for subcarrier $k = scidx(Ns - 1)$	4	$\Delta SNR_{scidx(Ns-1),1}$ as defined in Equation (9-2) as modified above.
…		…
Delta SNR for space-time stream *Nc* for subcarrier $k = scidx(Ns - 1)$	4	$\Delta SNR_{scidx(Ns-1),Nc}$ as defined in Equation (9-2) as modified above.

In Table 9-127, *Ns* and *scidx()* are defined in 9.4.1.63.

9.4.1.65 HE CQI Report field

The HE CQI Report field carries the per-RU average SNRs of each space-time stream, where each per-RU average SNR is the arithmetic mean of the SNR in decibels over a 26-tone RU for which the feedback is being requested. The HE CQI Report field contains information about the quality of the link.

The size of the HE CQI Report field depends on the values in the HE MIMO Control field. The HE CQI Report field contains HE CQI Report information. HE CQI Report information is included in the HE Compressed Beamforming/CQI Report field (see 9.4.1.66) if the Feedback Type subfield in the HE MIMO Control field indicates CQI feedback, and is not included otherwise. If the HE MIMO Control field contains a Disallowed Subchannel Bitmap subfield, then the HE CQI Report field does not include information for tones that are included within 26-tone RUs that are indicated as disallowed by the bitmap.

The HE CQI Report field has the structure and order defined in Table 9-128.

Table 9-128—HE CQI Report information

Field	Size (bits)	Meaning
Average SNR for space-time stream 1 for RU index $k = ruidx(0)$	6	SNR at the beamformee for space-time stream 1 averaged over 26-tone RU. See Table 9-129.
…		…
Average SNR for space-time stream *Nc* for RU index $k = ruidx(0)$	6	SNR at the beamformee for space-time stream *Nc* averaged over 26-tone RU. See Table 9-129.
Average SNR for space-time stream 1 for RU index $k = ruidx(1)$	6	SNR at the beamformee for space-time stream 1 averaged over 26-tone RU. See Table 9-129.
…		…
Average SNR for space-time stream *Nc* for RU index $k = ruidx(1)$	6	SNR at the beamformee for space-time stream *Nc* averaged over 26-tone RU. See Table 9-129.
…		…
Average SNR for space-time stream 1 for RU index $k = ruidx(Ncqi - 1)$	6	SNR at the beamformee for space-time stream 1 averaged over 26-tone RU. See Table 9-129.
…		…
Average SNR for space-time stream *Nc* for RU index $k = ruidx(Ncqi - 1)$	6	SNR at the beamformee for space-time stream *Nc* averaged over 26-tone RU. See Table 9-129.

Ncqi is the number of RU indices for which the CQI report is sent back to the beamformer. $Ncqi = (ruidx(Ncqi - 1) - ruidx(0)) + 1 -$ Disallowed # of RU26, where $ruidx(0)$ and $ruidx(Ncqi - 1)$ are equal to the RU Start Index and RU End Index subfields, respectively. The RU index $ruidx(i) = ruidx(i - 1) + 1$, where $1 \leq i \leq Ncqi - 2$. The 26-tone RU subcarrier indices for 20 MHz, 40 MHz, and 80 MHz are defined in Table 27-8, Table 27-9, and Table 27-10, respectively.

The Average SNR of space-time stream *i* for the RU index *k* subfield in Table 9-128 is a 6-bit 2s complement integer whose definition is shown in Table 9-129.

Table 9-129—Average SNR of RU index *k* for space-time stream *i* subfield

Average SNR of RU index *k* for space-time stream *i*	$AvgSNR_{k,i}$ (dB)
–32	≤ –10
–31	–9
–30	–8
…	…
30	52
31	≥ 53

The $AvgSNR_{k,i}$ in Table 9-129 is found by computing the arithmetic mean of the SNR per subcarrier in decibels for space-time stream *i* over the subcarriers in RU index *k* for which the feedback is being requested. The SNR per subcarrier calculation is defined in 9.4.1.63.

Padding is not present between per-RU average SNRs of each space-time stream information, even if they correspond to different RUs and space-time streams. If the size of the HE CQI Report information is not an integer multiple of 8 bits, up to seven 0s are appended to the end of the field to make its size an integer multiple of 8 bits.

9.4.1.66 HE Compressed Beamforming/CQI Report field

The HE Compressed Beamforming/CQI Report field carries the HE compressed beamforming/CQI report (see 26.7) and is defined in Figure 9-198.

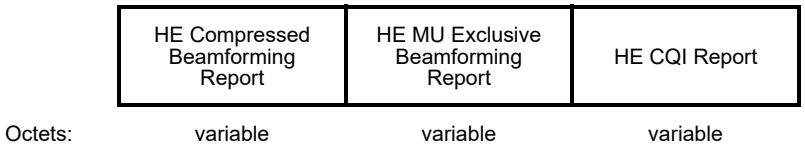

Figure 9-198—HE Compressed Beamforming/CQI Report field format

The HE Compressed Beamforming Report field is defined in 9.4.1.63.

The HE MU Exclusive Beamforming Report field is defined in 9.4.1.64.

The HE CQI Report field is defined in 9.4.1.65.

NOTE —The presence of the HE Compressed Beamforming Report field, HE MU Exclusive Beamforming Report field and HE CQI Report field are dependent on the values of the Feedback Type subfield of the HE MIMO Control field in the HE Compressed Beamforming/CQI frame.

9.4.1.67 HE Sounding Feedback Segment field

The HE Sounding Feedback Segment field is defined in Figure 9-199.

Figure 9-199—HE Sounding Feedback Segment field format

The Sounding Feedback Segment field consists of octets number *N*1 to *N*2, where the first octet is octet 1, of the HE Compressed Beamforming/CQI Report field, where *N*1 and *N*2 are determined by the HE MIMO Control field of the HE Compressed Beamforming/CQI frame containing the HE Sounding Feedback Segment field (see 26.7.4).

9.4.1.68 EBCS Content Request field

The EBCS Content Request field is included in an EBCS Content Request frame transmitted by an EBCS non-AP STA to request one or more EBCS traffic streams from its associated AP. The EBCS Content Request field is also included in an EBCS Content Request ANQP-element, transmitted by an EBCS non-AP STA to request one or more EBCS traffic streams from an unassociated AP. The format of the EBCS Content Request field is shown in Figure 9-200.

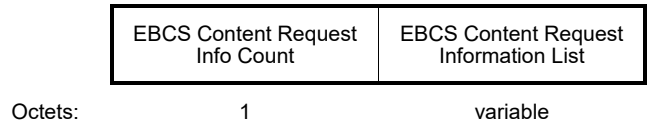

Figure 9-200—EBCS Content Request field format

The EBCS Content Request Info Count field indicates the number of EBCS Content Request Info subfields contained in the EBCS Content Request field.

The EBCS Content Request Information List field contains one or more EBCS Content Request Info subfields.

The format of the EBCS Content Request Info subfield is shown in Figure 9-201.

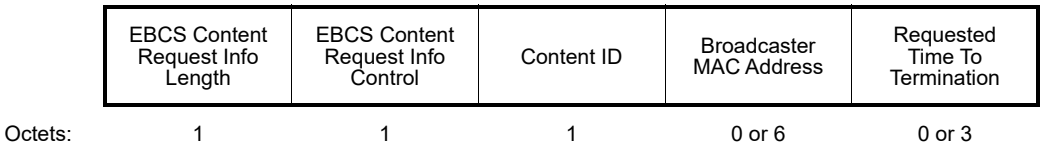

Figure 9-201—EBCS Content Request Info subfield format

The EBCS Content Request Info Length field indicates the length in octets of the EBCS Content Request Info subfield including the EBCS Content Request Info Length field.

The format of the EBCS Content Request Info Control subfield is shown in Figure 9-202.

A value of 1 in the Requested Time To Termination Present subfield indicates that a Requested Time To Termination subfield is present in the EBCS Content Request Info subfield. A value of 0 in the Requested

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

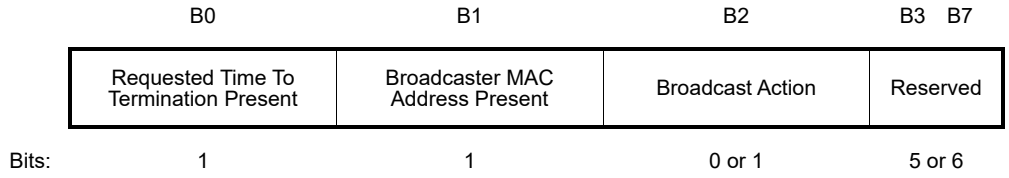

Figure 9-202—EBCS Content Request Info Control subfield format

Time To Termination Present subfield indicates that a Requested Time To Termination subfield is not present in the EBCS Content Request Info subfield.

A value of 1 in the Broadcaster MAC Address Present subfield indicates that a Broadcaster MAC Address subfield is present in the EBCS Content Request Info subfield. A value of 0 in the Broadcaster MAC Address Present subfield indicates that a Broadcaster MAC Address subfield is not present in the EBCS Content Request Info subfield.

A value of 1 in the Broadcast Action subfield indicates a request for registration to receive the EBCS traffic stream identified by the Content ID subfield included in the same EBCS Content Request Info subfield. A value of 0 in the Broadcast Action subfield indicates a request for deregistration to stop receiving the ECBS traffic stream identified by the Content ID subfield included in the same EBCS Content Request Info subfield. The Broadcast Action subfield is present when the EBCS Content Request Info subfield is carried in an EBCS Content Request ANQP-element and otherwise is not present.

The Content ID subfield indicates the ID of the EBCS traffic stream being requested.

The Broadcaster MAC Address subfield contains the MAC address of the AP from which the EBCS traffic stream is currently being received, if any.

The Requested Time To Termination subfield indicates the requested subscription period in number of TBTTs after which the EBCS traffic stream identified by the Content ID subfield is terminated. The encoding of the Requested Time To Termination subfield is the same as defined for the Time to Termination field in 9.4.1.69. An EBCS STA does not include the Requested Time To Termination subfield in the EBCS Content Request Info subfield or in the EBCS Content Request ANQP-element if it does not request a specific time to termination for the EBCS traffic stream identified by the Content ID subfield in the EBCS Content Request Info subfield or in the EBCS Content Request ANQP-element.

9.4.1.69 EBCS Content Response field

The EBCS Content Response field is included in an EBCS Content Response frame used by an EBCS AP to respond to a request for one or more EBCS traffic streams from an associated STA. The EBCS Content Request field is also included in an EBCS Content Response ANQP-element used by an EBCS AP to respond to a request for one or more EBCS traffic streams from an unassociated STA. The format of the EBCS Content Response field is shown in Figure 9-203.

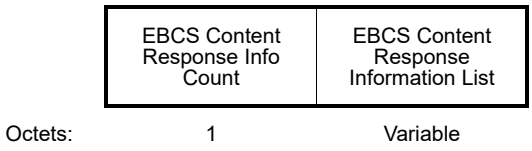

Figure 9-203—EBCS Content Response field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The EBCS Content Response Info Count field indicates the number of EBCS Content Response Info fields contained in the EBCS Content Response field.

The EBCS Content Response Information List field contains one or more EBCS Content Response Info subfields. The format of the EBCS Content Response Info subfield is shown in Figure 9-204.

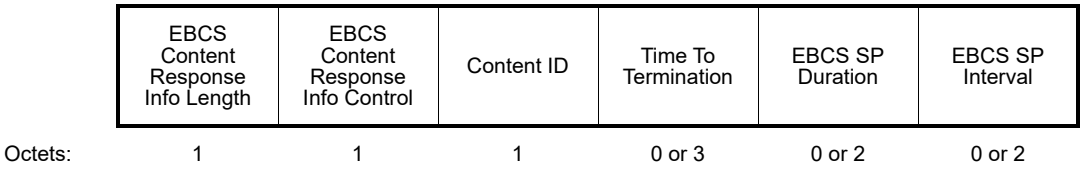

Figure 9-204—EBCS Content Response Info subfield format

The EBCS Content Response Info Length field indicates the length in octets of the EBCS Content Response field including the EBCS Content Response Info Length field.

The format of the EBCS Content Response Info Control subfield is shown in Figure 9-205.

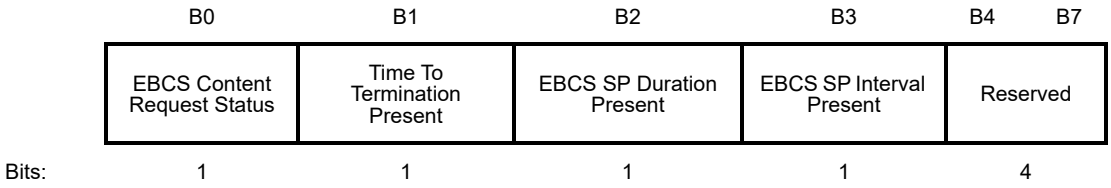

Figure 9-205—EBCS Content Response Info Control subfield format

A value of 0 in the EBCS Content Request Status subfield indicates that the request for the EBCS traffic stream identified by the Content ID subfield included in the EBCS Content Response Info subfield is successful. A value of 1 in the EBCS Content Request Status subfield indicates that the request for the EBCS traffic stream identified by the Content ID subfield included in the EBCS Content Response Info subfield is refused.

A value 1 in the Time To Termination Present subfield indicates that a Time To Termination subfield is included in the EBCS Content Response Info subfield. A value 0 indicates that the EBCS Content Response Info subfield does not contain a Time To Termination subfield.

A value 1 in the EBCS SP Duration Present subfield indicates that an EBCS SP Duration subfield is included in the EBCS Content Response Info subfield. A value 0 indicates that the EBCS Content Response Info subfield does not contain an EBCS SP Duration subfield.

A value 1 in the EBCS SP Interval Present subfield indicates that an EBCS SP Interval subfield is included in the EBCS Content Response Info subfield. A value 0 indicates that the EBCS Content Response Info subfield does not contain an EBCS SP Interval subfield.

The Content ID subfield indicates the ID of the EBCS traffic stream.

The Time To Termination subfield indicates the period in number of TBTTs after which the EBCS traffic stream identified by the Content ID subfield included in the EBCS Content Response Info subfield is terminated. The value 0 is reserved. An EBCS traffic stream identified by the Content ID subfield contained in an EBCS Content Response Info subfield has no specific termination time if the EBCS Content Response Info subfield contains no Time To Termination subfield.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The EBCS SP Duration subfield indicates the nominal duration of each EBCS service period in TUs.

The EBCS SP Interval subfield indicates the target interval between consecutive EBCS service periods for the EBCS traffic stream identified by the Content ID subfield in the EBCS Content Response Info subfield in TUs.

9.4.1.70 EBCS Info Frame Tx Countdown field

The EBCS Info Frame Tx Countdown field is shown in Figure 9-206.

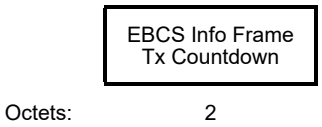

Figure 9-206—EBCS Info Frame Tx Countdown field format

The EBCS Info Frame Tx Countdown field indicates the number of TBTTs until the transmission of the next EBCS Info frame. The value 1 indicates that the frame is transmitted following the next TBTT. The value 0 is reserved.

9.4.1.71 Short SSID field

The Short SSID field is used to carry a short SSID (see 9.4.2.169.3). The Short SSID field is shown in Figure 9-207; the short SSID is transmitted commencing with the coefficient of the highest order term of the short SSID.

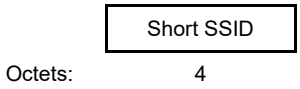

Figure 9-207—Short SSID field format

9.4.2 Elements

9.4.2.1 General

Elements have a common general format shown in Figure 9-208.

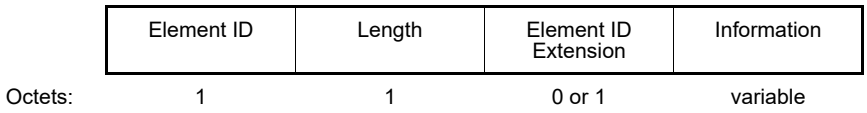

Figure 9-208—Element format

An element is identified by the Element ID field and, if present, the Element ID Extension field.

The set of valid elements is defined in Table 9-130.

If an Element ID value has an entry in Table 9-130 in the Element column of Element ID Extension present, then the Element ID Extension field is present. Otherwise, the Element ID Extension field is not present.

The Length field indicates the number of octets in the element excluding the Element ID and Length fields.

The Information field carries information specific to the element.

Table 9-130—Element IDs

Element	Element ID	Element ID Extension	Extensible	Fragmentable
SSID (see 9.4.2.2)	0	N/A	No	No

Table 9-130—Element IDs *(continued)*

Element	Element ID	Element ID Extension	Extensible	Fragmentable
Known STA Identification (see 9.4.2.297)	255	136	Yes	No
Non-AP STA Regulatory Connectivity (see 9.4.2.311)	255	137	No	Ye(s
Reserved	255	138–141		
TWT Constraint Parameters (see 9.4.2.257)	255	142	Yes	No
Tunneled PASN (see 9.4.2.315)	255	143	Yes	No
Reserved	255	144–255		
NOTE—See 10.28.6 on the parsing of elements.				

A Yes in the Extensible column of an element listed in Table 9-130 indicates that the length of the element might be extended in future revisions or amendments of this standard. See 10.28.8. When the Extensible column of an element is set to Subelements, then the element might be extended in future revisions or amendments of this standard by defining additional subelements. See 10.28.9. The element is not extensible otherwise (i.e., if marked as No). An element that is not defined as extensible will not be extended in future revisions or amendments of this standard.

A Yes in the Fragmentable column listed in Table 9-130 indicates that the element information might exceed the threshold that causes the element to be fragmented (see 10.28.11).

9.4.2.2 SSID element

The SSID element indicates the identity of an ESS or IBSS. See Figure 9-209.

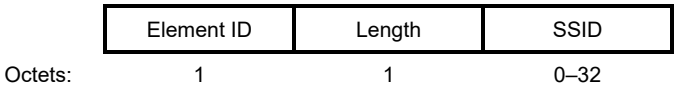

Figure 9-209—SSID element format

The Element ID and Length fields are defined in 9.4.2.1.

An SSID field of length 0 is used within Probe Request frames to indicate the wildcard SSID. The wildcard SSID is also used in Beacon and Probe Response frames transmitted by mesh STAs.

When the UTF-8 SSID subfield of the Extended Capabilities element is equal to 1 in the frame that includes the SSID element, or the Extended Capabilities element of the source of the SSID information is known to include the UTF-8 SSID capability based on a previously received Extended Capabilities element, the SSID is a sequence of UTF-8 encoded code points. Otherwise, the character encoding of the octets in this SSID element is unspecified.

NOTE—If the SSID is a sequence of UTF-8 encoded code points, a terminating null might or might not be present.

9.4.2.3 Supported Rates and BSS Membership Selectors element

The Supported Rates and BSS Membership Selectors element specifies any combination of up to eight BSS membership selectors and rates in the OperationalRateSet parameter, as described in the MLME-JOIN.request and MLME-START.request primitives.

Each octet of the Supported Rates field describes a single supported rate or BSS membership selector (see Figure 9-210).

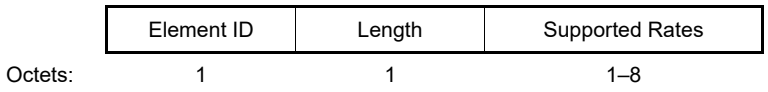

Figure 9-210—Supported Rates and BSS Membership Selectors element format

The Element ID and Length fields are defined in 9.4.2.1.

Within Beacon, Probe Response, Association Response, Reassociation Response, Mesh Peering Open, and Mesh Peering Confirm frames, each rate contained in the BSSBasicRateSet parameter is encoded as an octet with the MSB (bit 7) set to 1, and bits 6 to 0 are set to the data rate, if necessary rounded up to the next 500 kb/s, in units of 500 kb/s (e.g., a 2.25 Mb/s rate contained in the BSSBasicRateSet parameter is encoded as X'85'). Each rate in the OperationalRateSet parameter not contained in the BSSBasicRateSet parameter is encoded with the MSB set to 0, and bits 6 to 0 are set in the same way as for a rate contained in the BSSBasicRateSet parameter (e.g., a 2 Mb/s rate not contained in the BSSBasicRateSet parameter is encoded as X'04').

Within Beacon, Probe Response, Association Response, Reassociation Response, Mesh Peering Open, and Mesh Peering Confirm frames, each BSS membership selector contained in the BSSMembershipSelectorSet parameter is encoded as an octet with the MSB (bit 7) set to 1, and bits 6 to 0 are set to the encoded value for the selector as found in Table 9-131 (e.g., an HT PHY BSS membership selector contained in the BSSMembershipSelectorSet parameter is encoded as X'FF'). A BSS membership selector that has the MSB (bit 7) set to 1 in the Supported Rates and BSS Membership Selectors element is defined to be basic.

The MSB of each octet in the Supported Rates field in other management frame types is ignored by receiving STAs.

The valid values for BSS membership selectors and their associated features are shown in Table 9-131.

NOTE—Because the BSS membership selector and supported rates are carried in the same field, the BSS membership selector value cannot match the value corresponding to any valid supported rate. This allows any value to be determined as either a supported rate or a BSS membership selector.

See 11.1.4.6.

9.4.2.4 DSSS Parameter Set element

The DSSS Parameter Set element contains information to allow channel number identification for STAs. See Figure 9-211.

The Element ID and Length fields are defined in 9.4.2.1.

The Current Channel field is set to dot11CurrentChannel (see 15.4.4.3, 16.3.6.3, 17.3.8.4.2 and 19.3.15 for values).

Table 9-131—BSS membership selector value encoding

Value	Feature	Interpretation
127	HT PHY	Support for the mandatory features of Clause 19 is required in order to join the BSS that was the source of the Supported Rates and BSS Membership Selectors element or Extended Supported Rates and BSS Membership Selectors element containing this value.
126	VHT PHY	Support for the mandatory features of Clause 21 is required in order to join the BSS that was the source of the Supported Rates and BSS Membership Selectors element or Extended Supported Rates and BSS Membership Selectors element containing this value, unless the STA is a 20 MHz-only non-AP HE STA and the BSS is an HE BSS.
125	GLK	Indicates that support for the mandatory features of 11.50 is required in order to join the BSS that was the source of the Supported Rates and BSS Membership Selectors element or Extended Supported Rates and BSS Membership Selectors element containing this value.
124	EPD	Indicates that support for EPD is required in order to join the BSS that was the source of the Supported Rates and BSS Membership Selectors element or Extended Supported Rates and BSS Membership Selectors element containing this value.
123	SAE Hash to Element Only	Indicates that support for the SAE hash-to-element method is required in order to join the BSS that was the source of the Supported Rates and BSS Membership Selectors element or Extended Supported Rates and BSS Membership Selectors element containing this value.
122	HE PHY	Support for the mandatory features of Clause 27 is required in order to join the BSS that was the source of the Supported Rates and BSS Membership Selectors element or Extended Supported Rates and BSS Membership Selectors element containing this value.

	Element ID	Length	Current Channel
Octets:	1	1	1

Figure 9-211—DSSS Parameter Set element format

9.4.2.5 TIM element

9.4.2.5.1 General

The TIM element is used to signal the timing and availability of data for associated STAs. The format of this element is shown in Figure 9-212.

	Element ID	Length	DTIM Count	DTIM Period	Bitmap Control	Partial Virtual Bitmap
Octets:	1	1	1	1	0 or 1	0 –251

Figure 9-212—TIM element format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The Length field for this element is constrained as described below.

The DTIM Count field indicates how many Beacon frames (including the current frame) appear before the next DTIM beacon. A DTIM count of 0 indicates that the current beacon is a DTIM beacon. The DTIM Count field is a single octet. When a TIM element is included in a TIM frame, the DTIM Count field is reserved.

The DTIM Period field indicates the number of beacon intervals or short beacon intervals between successive DTIM beacons. If all beacons are DTIM beacons, the DTIM Period field has the value 1. The DTIM Period value 0 is reserved. The DTIM Period field is a single octet. If dot11ShortBeaconInterval is equal to true, the DTIM Period field is set to dot11ShortBeaconDTIMPeriod. If dot11ShortBeaconInterval is equal to false, the DTIM Period field is set to dot11DTIMPeriod (see 11.1.3.10.2).

The Bitmap Control field for non-S1G STAs is shown in Figure 9-213 and for S1G STAs is shown in Figure 9-214. The Traffic Indicator field contains the traffic indication virtual bitmap bit associated with AID 0.

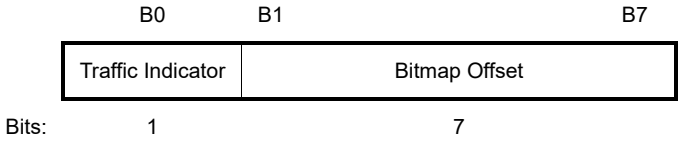

Figure 9-213—Bitmap Control field format when TIM is carried in a non-S1G PPDU

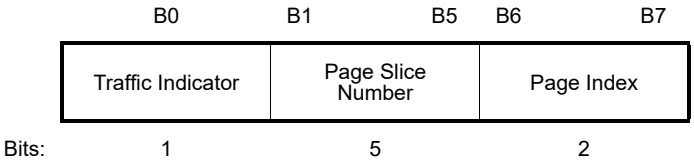

Figure 9-214—Bitmap Control field format when TIM is carried in an S1G PPDU

The Page Slice Number subfield indicates which page slice is encoded in the Partial Virtual Bitmap field (see 10.50) when the subfield is in the range 0 to 30. If the Page Slice Number subfield is 31, then the entire page indicated by the Page Index subfield value is encoded in the Partial Virtual Bitmap field of the TIM elements with the same page index.

The Page Index subfield indicates the index of the page encoded in the Partial Virtual Bitmap field.

When the TIM is carried in a non-S1G PPDU, the traffic indication virtual bitmap, maintained by the AP or the mesh STA that generates a TIM, consists of 2008 bits, and it is organized into 251 octets such that bit number N ($0 \le N \le 2007$) in the bitmap corresponds to bit number (N mod 8) in octet number $\lfloor N / 8 \rfloor$ where the low order bit of each octet is bit number 0, and the high order bit is bit number 7. When the TIM is carried in an S1G PPDU, the traffic-indication virtual bitmap has the hierarchical structure shown in Figure 9-215. Each bit in the traffic indication virtual bitmap corresponds to traffic buffered for a specific neighbor peer mesh STA within the MBSS that the mesh STA is prepared to deliver[27] or for a STA within the BSS that the AP is prepared to deliver at the time the Beacon frame is transmitted. Bit number N

[27] How the AP or mesh STA determines the traffic it is prepared to deliver is outside the scope of this standard.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

indicates the status of buffered, individually addressed MSDUs/MMPDUs for the STA whose AID is *N*, or group addressed MSDUs/MMPDUs for the STAs whose group AID is *N*. It is set as follows:

— If the STA is not using APSD, and any individually addressed MSDUs/MMPDUs for that STA are buffered and the AP or the mesh STA is prepared to deliver them, then bit number *N* in the traffic indication virtual bitmap is 1.

— If the STA is using APSD, and any individually addressed MSDUs/MMPDUs for that STA are buffered in at least one nondelivery-enabled AC (if there exists at least one nondelivery-enabled AC), then bit number *N* in the traffic indication virtual bitmap is 1.

— If the STA is using APSD, all ACs are delivery-enabled, and any individually addressed MSDUs/MMPDUs for that STA are buffered in any AC, then bit number *N* in the traffic indication virtual bitmap is 1.

— Otherwise, bit number *N* in the traffic indication virtual bitmap is 0.

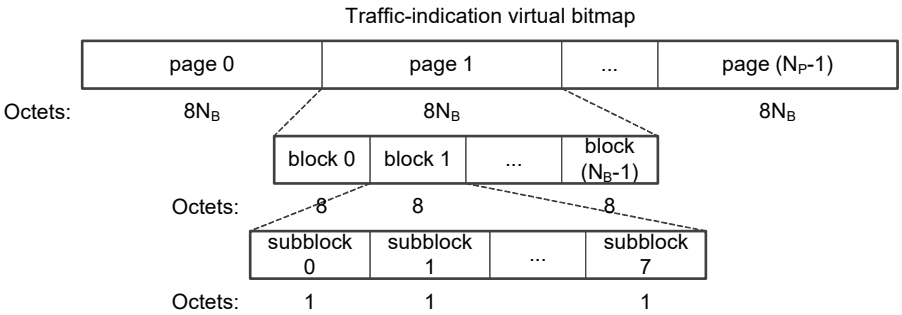

Figure 9-215—Hierarchical structure of traffic-indication virtual bitmap carried in an S1G PPDU

When dot11MultiBSSIDImplemented is false and the TIM is carried in a non-S1G PPDU, the Partial Virtual Bitmap field consists of octets numbered *N*1 to *N*2 of the traffic indication virtual bitmap, where *N*1 is the largest even number such that bits numbered 1 to $(N1 \times 8) - 1$ in the traffic indication virtual bitmap are all 0 and *N*2 is the smallest number such that bits numbered $(N2 + 1) \times 8$ to 2007 in the traffic indication virtual bitmap are all 0. In this case, the Bitmap Offset subfield value contains the number *N*1/2, and the Length field is set to $(N2 - N1) + 4$.

NOTE 1—When dot11MultiBSSIDImplemented is not true, the bit numbered 0 in the traffic indication virtual bitmap need not be included in the Partial Virtual Bitmap field even if that bit is set.

When the TIM is carried in a non-S1G PPDU, in the event that all bits other than bit 0 in the traffic indication virtual bitmap are 0, the Partial Virtual Bitmap field is encoded as a single octet equal to 0, the Bitmap Offset subfield is 0, and the Length field is 4. When the TIM is carried in an S1G PPDU, if all bits in the virtual bitmap are 0, the Partial Virtual Bitmap field is not present in the TIM element.

If all bits in the virtual bitmap are 0 and all the bits of the Bitmap Control field are 0, both the Partial Virtual Bitmap field and the Bitmap Control field are not present in the TIM element. The Bitmap Control field is present if the Partial Virtual Bitmap field is present.

When dot11MultiBSSIDImplemented is true, the Partial Virtual Bitmap field of the TIM element is constructed as follows, where the maximum possible number of BSSIDs is an integer power of 2, $n = \log2$ (maximum possible number of BSSIDs).

— The bits 1 to $(2^n - 1)$ of the bitmap are used to indicate that one or more group addressed frames are buffered for each AP corresponding to a nontransmitted BSSID. The bit position equals the value carried in the BSSID Index field of the Multiple BSSID-Index element carried in its nontransmitted BSSID profile (see 9.4.2.44). The AIDs from 1 to $(2^n - 1)$ are not allocated to a STA (in each page

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

for an S1G STA). A bit position corresponding to an inactive nontransmitted BSSID is reserved and set to 0 (in each page for an S1G STA). The remaining AIDs are shared by the BSSs corresponding to the transmitted BSSID and all nontransmitted BSSIDs.

— When the DTIM Count field carried in a Multiple BSSID-Index element is 0 for a BSS that has a nontransmitted BSSID, and one or more group addressed frames are buffered at the AP for this BSS, the corresponding bit is set to 1.

— Each bit starting from bit 2^n in the traffic indication virtual bitmap corresponds to individually addressed traffic buffered for a specific STA within any BSS corresponding to a transmitted or nontransmitted BSSID at the time the Beacon frame is transmitted. The correspondence is based on the AID of the STA.

— Based upon its knowledge of the capability of associated stations to support the multiple BSSID capability, as indicated by the corresponding field in the Extended Capabilities element and the content of the traffic indication virtual bitmap, an AP encodes the Partial Virtual Bitmap and the Bitmap Control fields of the TIM element using one of the three following methods. Specifically, a non-S1G AP uses Method B when it determines that the bit for each associated non-AP STA in the traffic indication virtual bitmap that is reconstructed by each non-AP STA from the received TIM element encoded using Method B is set correctly. Otherwise, a non-S1G AP uses Method A and an S1G AP uses Method C.

Method A, Method B and Method C are described as follows:

a) Method A: The Partial Virtual Bitmap field consists of octets numbered 0 to $N2$ of the traffic indication virtual bitmap, where $N2$ is the smallest number such that bits numbered $(N2 + 1) \times 8$ to 2007 in the traffic indication virtual bitmap are all 0. If such a value $N2$ does not exist, that is, when not all bits in the last octet of the traffic indication virtual bitmap are equal to 0, $N2 = 250$. When using this method, the Bitmap Offset subfield value always contains the number 0, and the Length field is $N2 + 4$.

b) Method B: The Partial Virtual Bitmap field consists of a concatenation of octets numbered 0 to $N0 - 1$ and octets numbered $N1$ to $N2$ of the traffic indication virtual bitmap, where $N0$ is the largest positive integer such that $N0 \times 8 - 2^n < 8$. If $N0$ is an odd number, then $N1$ is the largest odd number such that $N0 < N1$ and each of the bits $N0 \times 8$ to $(N1 \times 8 - 1)$ is equal to 0. When $N0$ is an even number, $N1$ is the largest even number such that $N0 < N1$ and each of the bits $N0 \times 8$ to $(N1 \times 8 - 1)$ is equal to 0. If such a value $N1 > N0$ does not exist, $N1 = N0$. Additionally, $N2$ is the smallest integer value for which the values for bit $(N2+1) \times 8$ to 2007 in the traffic indication virtual bitmap are all 0. If such a value $N2$ does not exist, that is, when not all bits in the last octet of the traffic indication virtual bitmap are equal to 0, $N2 = 250$. When using this method, the Bitmap Offset subfield contains $(N1 - N0)/2$, and the Length field is $N0 + N2 - N1 + 4$.

c) Method C: The Partial Virtual Bitmap field of the TIM that is carried in an S1G PPDU consists of a concatenation of Encoded Block subfields that contain BSSID indices and Encoded Block subfields that contain AIDs. When using this method, the Page Slice Number subfield is equal to 31, and the Page Index subfield is equal to the page index of the TIM to which the AIDs belong.

NOTE 2—When $N1 = N0$, Method B reduces to Method A.

For both Method A and Method B, when there are no frames buffered for any BSS corresponding to a transmitted or nontransmitted BSSID supported, the Partial Virtual Bitmap field is encoded as a single octet equal to 0, the Bitmap Offset subfield is 0, and the Length field is 4. For Method C when the Partial Virtual Bitmap field is not present in the TIM element then the Length field is 3 and when both the Partial Virtual Bitmap field and the Bitmap Control field are not present in the TIM element then the Length field is 2. For both Method A and Method B, when there are no buffered individually addressed frames for any BSS corresponding to a transmitted or nontransmitted BSSID, but there are buffered group addressed frames for one or more of the BSSs, the Partial Virtual Bitmap field consists of the octets number 0 to $N0 - 1$ where $N0$ is the largest positive integer such that $(N0 \times 8 - 2^n < 8)$. For Method C, the Partial Virtual Bitmap field

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

consists of Encoded Block subfields that contain the BSSID indices of the BSSs for which there are buffered group addressed frames. In this case for Method A and Method B, the Bitmap Offset subfield value contains the number 0, and the Length field is *N*0+3, while for Method C, the Length field is equal to 3 plus the size of the encoded blocks that carry the BSSID indices, which are present in the TIM element.

When the TIM with a nonzero Partial Virtual Bitmap field is carried in an S1G PPDU, the Partial Virtual Bitmap field is constructed with one or more Encoded Block subfields as shown in Figure 9-216. The Encoded Block subfield consists of the Block Control subfield, the Block Offset subfield, and the Encoded Block Information subfield as shown in Figure 9-217. When dot11MultiBSSIDImplemented is true, the Partial Virtual Bitmap field contains zero or more Encoded Block subfields that contain BSSID indices.

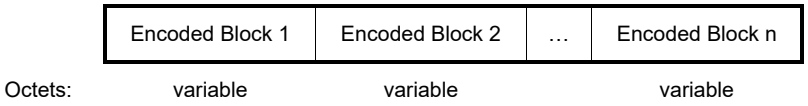

Figure 9-216—Partial Virtual Bitmap field format

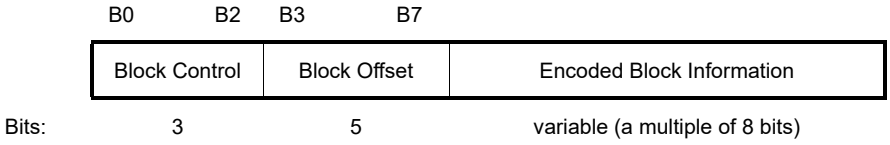

Figure 9-217—Encoded Block subfield format

The Block Control subfield indicates the encoding mode used in the Encoded Block subfield as shown in Table 9-132. The format of the Block Control subfield is as shown in Figure 9-218. The Block Control subfield consists of the Encoding Mode subfield and the Inverse Bitmap subfield.

Table 9-132—Block Control field encoding

Bit 2	Bit 1	Bit 0	Encoding mode
0	0	0	Block Bitmap
0	0	1	Single AID
0	1	0	OLB
0	1	1	ADE
1	0	0	Inverse Bitmap + Block Bitmap
1	0	1	Inverse Bitmap + Single AID
1	1	0	Inverse Bitmap + OLB
1	1	1	Inverse Bitmap + ADE

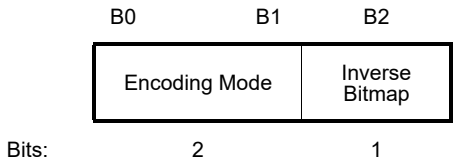

Figure 9-218—Block Control subfield format

The Inverse Bitmap subfield is set to 1, if the Encoded Block Information field is encoded based on the inverted version of the block, which inverts each bit value of the block. The Inverse Bitmap subfield is set to 0, otherwise.

The Encoding Mode subfield indicates one of the four encoding modes: the Block Bitmap mode, the Single AID mode, the offset length bitmap (OLB) mode, and the AID with differential encoding (ADE) mode. The four encoding modes are explained in the following subclauses.

The Block Offset field indicates the index of the block that is encoded in the Encoded Block subfield.

The Encoded Block Information subfield is defined depending on the Encoding Mode subfield and explained within the subclause for each of the encoding modes.

If included in an OPS frame or a FILS Discovery frame by an OPS AP for aperiodic opportunistic power save (see 26.14.3), the following apply:

- The DTIM Count field is reserved
- The DTIM Period field is reserved
- Bit *N* in the traffic indication virtual bitmap that corresponds to an OPS non-AP STA with AID *N* is determined as follows:
  - Bit *N* in the traffic indication virtual bitmap is set to 0 if the OPS AP does not intend to transmit to the OPS non-AP STA including to trigger the OPS non-AP STA for a UL MU transmission during the OPS period.
  - Otherwise, bit *N* in the traffic indication virtual bitmap for the OPS non-AP STA is set to 1.
- Bit *N* in the traffic indication virtual bitmap that corresponds to a non-OPS non-AP STA with AID *N* is determined as follows:
  - Bit *N* in the traffic indication virtual bitmap is set to 1 to indicate that AP has buffered frames for the STA and set to 0 otherwise.

If included in a TIM frame or a FILS Discovery frame by an OPS AP for periodic opportunistic power save (see 26.14.3), the following apply:

- The DTIM Count field is reserved
- The DTIM Period field is reserved
- Bit *N* in the traffic indication virtual bitmap that corresponds to an OPS non-AP STA with AID *N* is determined as follows:
  - Bit *N* in the traffic indication virtual bitmap is set to 0 if the OPS AP does not intend to transmit to the OPS non-AP STA including to trigger the OPS non-AP STA for a UL MU transmission during the TWT SP and before the next TWT SP.
  - Otherwise, bit *N* in the traffic indication virtual bitmap for the OPS non-AP STA is set to 1.
- Bit *N* in the traffic indication virtual bitmap that corresponds to a non-OPS non-AP STA with AID *N* is determined as follows:
  - Bit *N* in the traffic indication virtual bitmap is set to 1 to indicate that AP has buffered frames for the STA and set to 0 otherwise.

9.4.2.5.2 Block Bitmap mode

The Encoded Block Information field consists of the Block Bitmap subfield and n Subblock subfields, where n is the number of bits equal to 1 in the Block Bitmap subfield. The format of the Encoded Block Information subfield is shown in Figure 9-219.

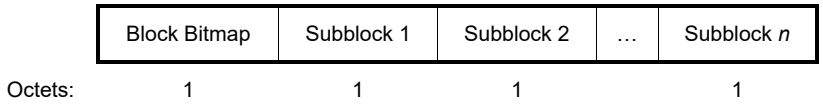

Figure 9-219—Encoded Block Information (Block Bitmap mode)

The bit in position *m* of the Block Bitmap subfield, if equal to 1, indicates that the subblock in position *m* of the Block is present in the Encoded Block Information subfield. The bit in position *m* of the Block Bitmap subfield, if equal to 0, indicates that the subblock in position *m* of the block is not present in the Encoded Block Information subfield. When *n* bits in the Block Bitmap subfield are equal to 1, *n* Subblock subfields follow the Block Bitmap field in ascending order of the subblock positions in the block.

Each Subblock subfield contains a subblock of the block, which has at least one bit position equal to 1. The bit in position *q* of the Subblock subfield, which contains the Subblock in position *m* of the block, indicates traffic buffered for the STA whose AID is *N*, where *N* is constructed by concatenating *q* (*N*[0:2]), *m* (*N*[3:5]), the Block Offset field (*N*[6:10]), and the Page Index field (*N*[11:12]) in sequence from LSB to MSB.

9.4.2.5.3 Single AID mode

The Encoded Block Information subfield consists of the Single AID subfield as shown in Figure 9-220. The Single AID subfield contains the 6 LSBs of the single AID in the block. The rest of the bits of the Encoded Block Information subfield are reserved. The value in the Single AID subfield indicates traffic buffered for the STA whose AID is *N*, where *N* is constructed by concatenating the Single AID subfield(*N*[0:5]), the Block Offset field (*N*[6:10]), and the Page Index field (*N*[11:12]) in sequence from LSB to MSB.

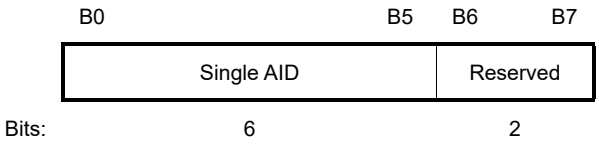

Figure 9-220—Encoded Block Information (Single AID mode)

9.4.2.5.4 OLB mode

The Encoded Block Information field consists of the Length subfield and *n* Subblock subfields. The format of the Encoded Block Information field is shown in Figure 9-221.

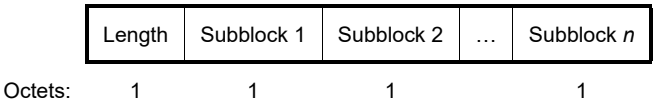

Figure 9-221—Encoded Block Information (OLB mode)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A Length subfield equal to *n* indicates that the Encoded Block Information field contains *n* contiguous subblocks in ascending order from multiple blocks starting from the first subblock of the block in position Block Offset.

Each Subblock subfield contains a subblock of the Partial Virtual Map. A subblock *m* of the Encoded Block Information field is located in block *k* where *k* is obtained as Block Offset + $\lfloor m / 8 \rfloor$. The bit in position *q* of the subblock *m*, which is located in block *k*, when set to 1, indicates that there is traffic buffered for the STA whose AID is *N*, where *N* is constructed by concatenating *q* (*N*[0:2]), the subblock offset *m* mod 8 (*N*[3: 5]), the block *k* (*N*[6:10]), and the Page Index field (*N*[11:12]), in sequence from LSB to MSB.

9.4.2.5.5 ADE mode

The Encoded Block Information field consists of the Encoding Word Length (EWL) subfield, Length subfield, *n* AID Differential Values (ΔAID) subfields and padding subfield, where *n* is the number of paged AIDs encoded in the ADE block. The format of the Encoded Block Information field is shown in Figure 9-222.

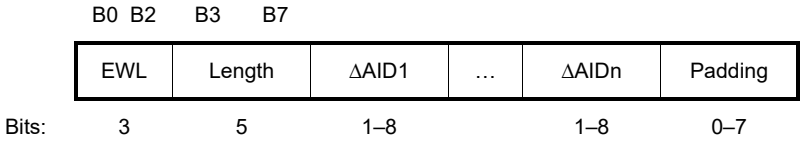

Figure 9-222—Encoded Block Information (ADE Block)

The length of each ΔAID subfields (*WL*) represents the encoded word length (the number of bits of each encoded words) of each AID. All *WL* have the same length. *WL* is indicated by EWL subfield.

The EWL subfield is 3 bits with B0 being LSB. The values of EWL subfield ranging from 0 to 7 represent *WL* being 1 to 8, respectively.

The Length subfield is 5 bits with B3 being LSB and it specifies the total length of the current ADE block in octets, excluding EWL and Length subfields.

The padding subfield contains 0–7 padding bits. The padding bits are set to 0.

To encode a list of paged AIDs, denoted as AID1, AID2 … AIDn, an AP can derive the *offset* value in the Block Offset field (9.4.2.5) for the current ADE Block by $\lfloor (\mathrm{AID}_1 \bmod 2048) / 64 \rfloor$.

The encoding procedure is as follows:

If all AIDs in the ADE blocks are paged, AP sets the Inverse Bitmap subfield to 1 and ADE block consists only EWL and Length fields, where both EWL and Length Field are set to 0s.

If all but one AIDs in the ADE blocks are paged, AP sets the Inverse Bitmap subfield to 1 and ADE block consists only one ΔAID subfield. The AP sets the EWL to 7 and the Length subfield to one. ΔAID subfield is set to (AID – (*Page Index* × 2048 + *Block Offset* × 64)).

If only one AID is paged in the ADE blocks, AP sets the Inverse Bitmap subfield to 0 and uses the Single AID mode.

For all other cases, AP sorts all AID*i*, *i* = 1, 2…*n* in an ascending order (AID1 < AID2 < … < AID*n*) and then calculates the AID differential values according to the following formulas:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$\Delta AID1 = AID1 - (Page\ Index \times 2048 + Block\ Offset \times 64)$

$\Delta AIDi = AIDi - AIDi{-}1,\ i = 2 \ldots n$

Determine *WL* as the minimum bits that can represent the largest ΔAID*i* (or mathematically $\lfloor \log 2(MAX)(\Delta AID_i) \rfloor + 1$ where $MAX(\Delta AID_i)$ denotes the largest ΔAID_i), i=1,2,…,n. The EWL subfield is set to *WL*-1. For *n* AID differential values, a total of *WL* × *n* bits are required. The number of bits is less than or equal to 248 since maximum payload in an ADE block is 31 × 8=248 (31 is the maximum value in the 5-bit Length subfield). If the total number of bits *WL* × *n* is not a multiple of an octet, [*WL*×*n*/8]×8-*WL*×*n* zero bits are padded to make the ADE block end at octet boundary.

When decoding, if the Inverse Bitmap subfield is 1, and the EWL and Length subfield are 0s, then all AIDs in the ADE blocks are paged.

If the Inverse Bitmap subfield is 1, the EWL is 7 and the Length subfield is 1, then all AIDs except one in the ADE blocks are paged. The unpaged AID is ΔAID1 + *Block Offset* × 64 + *Page Index* × 2048.

For other cases, a STA can extract *Page Index* (9.4.2.5) and *Block Offset* (9.4.2.5), EWL and Length values from the respective fields. It derives *WL* by adding 1 to the value from EWL field. The paged AIDs are then derived with following formulas:

$AID1 = \Delta AID1 + (Page\ Index \times 2048 + Block\ Offset \times 64)$

$AIDi = \Delta AIDi + AIDi - 1,\ i = 2, \ldots, n$

The decoder stops the decoding of the current ADE block when either one of following conditions is satisfied:

— The number of bits left for decoding is less than WL.
— ΔAIDi is zero and $i > 1$.

AIDs from the same or different blocks can be encoded into one ADE block. A STA can derive the number of AIDs, including both paged and unpaged AIDs, encoded in one ADE block with following method:

If an ADE block is not the last encoded block in the TIM element, the decoder can derive the number of AIDs encoded by this ADE block based on the *Block offset* values in the current and the immediate next encoded blocks. For example, the offset values in the current ADE block and the next encoded block are *Offset*1 and *Offset*2. Then the AIDs encoded by this ADE block is [*Page Index* × 2048 + *Offset*1 × 64, *Page Index* × 2048 + *Offset*2×64), *Page Index*×2048 + *Offset*1 × 64 is included and *Page Index* × 2048 + *Offset*2 × 64 is excluded.

If an ADE block is the last one in the TIM element, the number of AIDs encoded by the last ADE block can be determined based on the offset value and page length or page slice length if its TIM page is sliced.

9.4.2.6 IBSS Parameter Set element

The IBSS Parameter Set element contains the set of parameters necessary to support an IBSS. See Figure 9-223.

	Element ID	Length	ATIM Window
Octets:	1	1	2

Figure 9-223—IBSS Parameter Set element format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The ATIM Window field contains the ATIM window length in TU.

9.4.2.7 Country element

The Country element contains the information required to allow a STA to identify the regulatory domain in which the STA is located and to configure its PHY for operation in that regulatory domain. The format of this element is as shown in Figure 9-224.

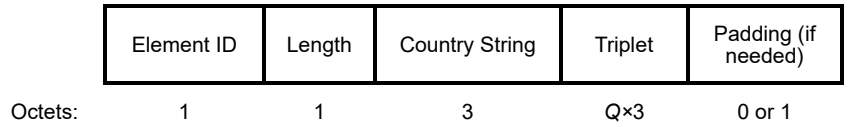

Figure 9-224—Country element format

The Element ID and Length fields are defined in 9.4.2.1.

The AP and mesh STA set the Country String field to the value contained in dot11CountryString before transmission in a Beacon or Probe Response frame. Upon reception of this element, a STA sets the dot11CountryString to the value contained in this field. The three octets of the Country String have additional structure as defined by dot11CountryString (see Annex C).

If dot11OperatingClassesRequired is false, then the Triplet field is a single Subband Triplet Sequence field, as shown in Figure 9-225, that is composed of *Q* Subband Triplet fields, where *Q* is one or more. The format of the Subband Triplet field is shown in Figure 9-226.

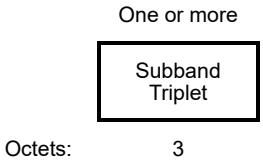

Figure 9-225—Subband Triplet Sequence format

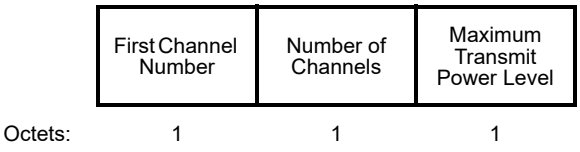

Figure 9-226—Subband Triplet field format

If dot11OperatingClassesRequired is true, then the Triplet field is composed of zero or more Subband Triplet fields followed by one or more Operating/Subband Sequence fields, as shown in Figure 9-227. If the Country element is included in a frame transmitted in the 6 GHz band, the Triplet field is composed of zero Subband Triplet fields and only has one or more Operating/Subband Sequence fields. Each Operating/ Subband Sequence field is composed of one Operating Triplet field followed by one Subband Triplet Sequence field, as shown in Figure 9-228. Each Subband Triplet Sequence field is composed of zero or more Subband Triplet fields. If dot11OperatingClassesRequired is true, the number of triplets in the Triplet

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

field is $Q = N + \sum_{m=1}^{M} (1 + P(m))$, where N is the total number of Subband Triplet fields and M is the total number of Operating/Subband Sequence fields contained in the Country element and $P(m)$ is the number of Subband Triplet fields making up Operating/Subband Sequence field m.

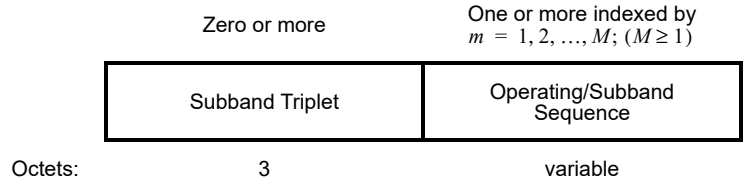

Figure 9-227—Triplet field format if dot11OperatingClassRequired is true

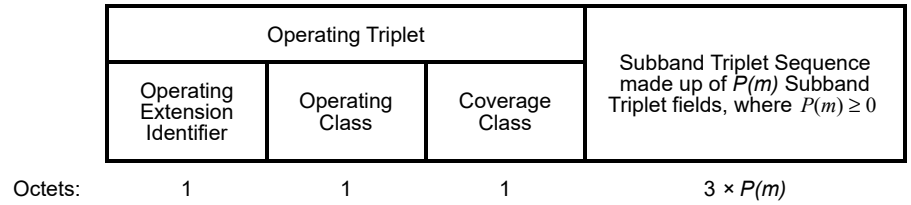

Figure 9-228—Format of *m*-th Operating/Subband Sequence field

The number Q of Subband fields or Operating triplet fields in the element is determined by the Length field.

An operating class for an 80+80 MHz channel width is expressed by two consecutive Operating/Subband Sequence fields, where the first Operating/Subband Sequence field contains an Operating Triplet field indicating an 80 MHz channel spacing with an 80+ behavior limit and the second Operating/Subband Sequence field contains an Operating Triplet field indicating an 80 MHz channel spacing without an 80+ behavior limit.

Operating/Subband Sequence fields that contain an Operating Class field for which the Channel spacing (MHz) column in the appropriate table in Annex E equals 80 or 160 contain zero Subband Triplet fields.

NOTE 1—Any Operating Triplet field indicating 80 MHz, 160 MHz, and 80+80 MHz can be omitted from the Country element (see 10.22.3).

NOTE 2—The Transmit Power Envelope element is always used for TPC for 80 MHz, 160 MHz, or 80+80 MHz operating classes instead of Subband Triplet fields (see 11.38.1).

An Operating/Subband Sequence field contains zero Subband Triplet fields if all the following conditions are true:

— The operating class table number indicated in the Country String field is Table E-4 (see dot11CountryString).
— The value in the Channel starting frequency (GHz) column in Table E-4 is greater than or equal to 5.925 and less than or equal to 7.125 for the operating class indicated in the Operating Class field.
— The value in the Channel spacing (MHz) column in Table E-4 is greater than or equal to 40 MHz for the operating class indicated in the Operating Class field.

NOTE 3—Any Operating Triplet field for an operating class for which the Channel starting frequency column in Table E-4 is greater than or equal to 5.925 and less than or equal to 7.125 can be omitted from the Country element (see 10.22.3).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 4—The Transmit Power Envelope element is always used for TPC for operating classes in the 6 GHz band instead of Subband Triplet fields (see 26.15.8).

The first octet in each Subband Triplet field or Operating Triplet field identifies the type of field. If it is less than or equal to 200, then the field is a Subband Triplet field (see Figure 9-226). Otherwise, the field is an Operating Triplet field (see left half of Figure 9-228).

The First Channel Number field indicates the lowest channel number in the Subband Triplet field. No channel is indicated by more than one pair of First Channel Number and Number of Channels fields within a Subband Triplet Sequence field. [For example, the (First Channel Number, Number of Channels) pairs (2,4) and (5,2) in 2.4 GHz each indicate channel 5, therefore are not used within the same Subband Triplet Sequence field.] The First Channel Numbers are monotonically increasing within a Subband Triplet Sequence field. The First Channel Number and the Number of Channels pairs in a Country element are used to describe channels only in the band on which the frame containing the element is transmitted.

NOTE 5—It is not possible to indicate a first channel number above 200 in the 6 GHz band (i.e., a first channel above approximately 7 GHz), since this would be interpreted as the Operating Extension Identifier field of an Operating Triplet field.

Outside the 2.4 GHz band, the channel numbers that are included in a group of channels are separated by the BSS bandwidth. For Subband Triplet fields that are not within an Operating/Subband Sequence field, the BSS bandwidth is 20 MHz. For Subband Triplet fields that are within an Operating/Subband Sequence field, the BSS bandwidth is as indicated by the operating class in the same Operating/Subband Sequence field. In the 2.4 GHz band, the channel numbers that are included in a group of channels are separated by 5 MHz (for both 20 and 40 MHz BSS bandwidth), except that channel 14 is treated as if it were 5 MHz above channel 13.

NOTE 6—For example, the channels 1 to 11 in the 2.4 GHz band can be represented using one Subband Triplet field with First Channel Number = 1 and Number of Channels = 11. The channels 36, 40, 44, and 48 with 20 MHz BSS bandwidth in the 5 GHz band can be represented using one Subband Triplet field with First Channel Number = 36 and Number of Channels = 4. The six channels 183, 184, 185, 187, 188, and 189 (but not 186) with 10 MHz BSS bandwidth can be represented using three Subband Triplet fields: one with First Channel Number = 183 and Number of Channels = 4, one with First Channel Number = 184 and Number of Channels = 1 and one with First Channel Number = 188 and Number of Channels = 1.

The Maximum Transmit Power Level field is a 2s complement signed integer. The Maximum Transmit Power Level field indicates the maximum power, in dBm, allowed to be transmitted. As the method of measurement for maximum transmit power level differs by regulatory domain, the value in this field is interpreted according to the regulations applicable for the domain identified by the Country String.

The Maximum Transmit Power Level field is reserved if it is within an Operating/Subband Sequence field with the operating class for which the Channel starting frequency column in Table E-4 is greater than or equal to 5.925 and less than or equal to 7.125.

NOTE 7—Maximum transmit power information for channels in the 6 GHz band is conveyed using the Transmit Power Envelope element (see 10.22.4).

The Operating Extension Identifier field is an arbitrary value, subject to the minimum defined above for Operating Triplet fields.

NOTE 8—The same value might be used in more than one Operating Triplet field within the Country element.

An operating class is an index into a set of values for radio equipment sets of rules.

The Operating Class field specifies the operating class to which the immediately following Subband Triplet fields, if any, within the Operating/Subband Sequence field (see Figure 9-228) pertain.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 9—The Operating/Subchannel Sequence field ends at the next Operating Class field, if any.

A coverage class is an index into a set of values for aAirPropagationTime.

The Coverage Class field is reserved in a DMG BSS. Otherwise, it specifies the aAirPropagationTime characteristic used in BSS operation, as shown in Table 9-133. The characteristic aAirPropagationTime describes variations in actual propagation time that are accounted for in a BSS and, together with maximum transmit power level, allow control of BSS diameter.

Table 9-133—Coverage Class field parameters

Coverage class value	aAirPropagationTime (μs)
0–31	$n \times 3$, where n is the value of the coverage class
32–255	Reserved

The Padding field is used to add, if needed, a single octet (with the value 0) to the Country element so that its length is evenly divisible by 2.

9.4.2.8 Request element

This element is included in a frame to request that the responding STA include the requested elements in the response frame. The format of the element is as shown in Figure 9-229.

	Element ID	Length	Requested Element IDs
Octets:	1	1	variable

Figure 9-229—Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The Requested Element IDs field is the list of elements that are requested to be included in the Probe Response or Information Response frame. The Requested Element IDs field is listed in order of increasing element ID. The Requested Element IDs field within a Request element transmitted in an Information Request frame does not include an element ID that corresponds to an element to be included in the Information Response frame even in the absence of the Request element, as shown in Table 9-572. A given element ID is included in at most once among the Requested Element IDs field.

NOTE—Some implementations might unnecessarily include in a Probe Request frame a Request element that contains the element ID of an element to be included in the Probe Response frame even in the absence of the element ID in the Request element; see the notes in Table 9-69. Some implementations might include in a Probe Request frame a Request element that contains the element ID of an element that will not be included in the Probe Response frame even in the presence of the element ID in the Request element.

The Request element does not support elements that contain an Element ID Extension field.

See 11.1.4.3.9 for additional requirements.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.9 Extended Request element

This element is included in a frame to request that the responding STA include the requested elements in the response frame. The format of the element is as shown in Figure 9-230.

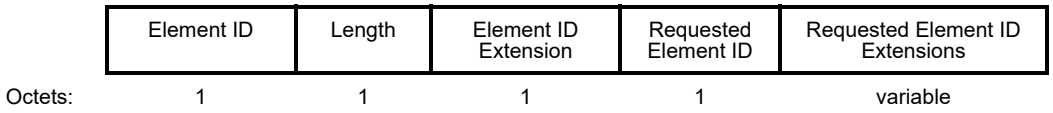

Figure 9-230—Extended Request element format

The Element ID, Element ID Extension, and Length fields are defined in 9.4.2.1.

The Requested Element ID field contains one of the element IDs used to indicate an extended element.

The Requested Element ID Extensions field contains a list of 1-octet element ID extension values that, combined with the value of the Requested Element ID field, identify elements that are requested to be included in the Probe Response or Information Response frame. The values in this field are listed in increasing order. The requested elements within an Extended Request element transmitted in a Probe Request frame do not identify elements included in the Probe Response frame even in the absence of the Request element, or excluded from the Probe Response frame even in the presence of the Extended Request element as described by the notes in Table 9-69. The requested elements within an Extended Request element transmitted in an Information Request frame do not identify elements included in the Information Response frame even in the absence of the Extended Request element, as shown in Table 9-572. A given element ID extension value is included at most once in the Requested Element ID Extensions field.

See 11.1.4.3.9 for additional requirements.

9.4.2.10 ERP element

The ERP element contains information on the presence of Clause 15 or Clause 16 STAs in the BSS that are not capable of Clause 18 (ERP-OFDM) data rates. It also contains the requirement of the ERP element sender (AP, IBSS STA, or mesh STA) as to the use of protection mechanisms to optimize BSS performance and as to the use of long or short Barker preambles. See Figure 9-231 for a definition of the frame element.

The ERP element has the form shown in Figure 9-231.

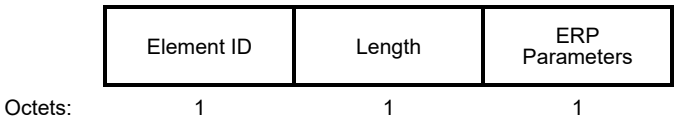

Figure 9-231—ERP element format

The Element ID and Length fields are defined in 9.4.2.1.

The ERP Parameters field is defined in Figure 9-232.

Recommended behavior for setting the Use_Protection bit is contained in 10.27.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

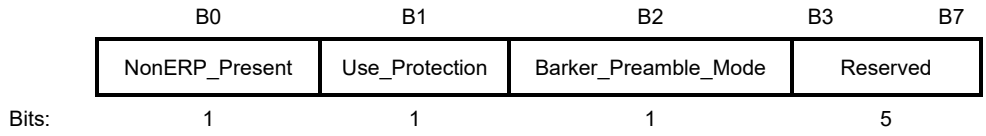

Figure 9-232—ERP Parameters field format

9.4.2.11 Extended Supported Rates and BSS Membership Selectors element

The Extended Supported Rates and BSS Membership Selectors element specifies the rates in the OperationalRateSet parameter, as described in the MLME-JOIN.request and MLME-START.request primitives, and zero or more BSS membership selectors, where these are not carried in the Supported Rates and BSS Membership Selectors element. See Figure 9-233.

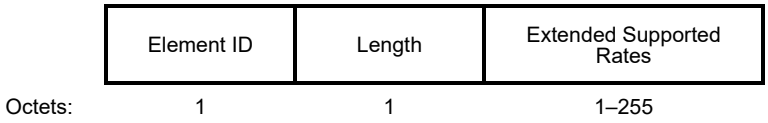

Figure 9-233—Extended Supported Rates and BSS Membership Selectors element format

The Element ID and Length fields are defined in 9.4.2.1.

The format and interpretation of each octet of the Extended Supported Rates field is the same as that of an octet in the Supported Rates field in a Supported Rates and BSS Membership Selectors element (see 9.4.2.3).

9.4.2.12 Power Constraint element

The Power Constraint element contains the information necessary to allow a STA to determine the local maximum transmit power in the current channel. The format of the Power Constraint element is shown in Figure 9-234.

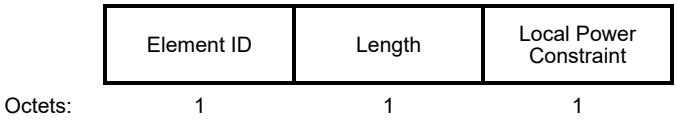

Figure 9-234—Power Constraint element format

The Element ID and Length fields are defined in 9.4.2.1.

The Local Power Constraint field is coded as an unsigned integer in units of decibels. The local maximum transmit power for a channel is thus defined as the maximum transmit power level specified for the channel in the Country element minus the local power constraint specified for the channel (from the MIB) in the Power Constraint element.

The use of Power Constraint elements is described in 11.7.5.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.13 Power Capability element

The Power Capability element specifies the minimum and maximum transmit powers with which a STA is capable of transmitting in the current channel. The format of the Power Capability element is shown in Figure 9-235.

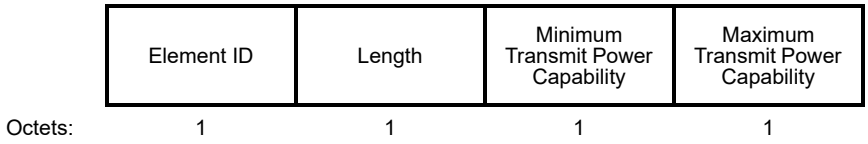

Figure 9-235—Power Capability element format

The Element ID and Length fields are defined in 9.4.2.1.

The Minimum Transmit Power Capability field is set to the nominal minimum transmit power with which the STA is capable of transmitting in the current channel, with a tolerance ± 5 dB. The field is coded as a 2s complement signed integer in units of decibels relative to 1 mW. Further interpretation of this field is defined in 11.7.4.

The Maximum Transmit Power Capability field is set to the nominal maximum transmit power with which the STA is capable of transmitting in the current channel, with a tolerance ± 5 dB. The field is coded as a 2s complement signed integer in units of decibels relative to 1 mW. Further interpretation of this field is defined in 11.7.4.

The use of Power Capability elements is described in 11.7.2.

9.4.2.14 TPC Request element

The TPC Request element contains a request for a STA to report transmit power and link margin information using a TPC Report element. The format of the TPC Request element is shown in Figure 9-236.

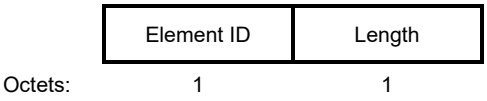

Figure 9-236—TPC Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The use of TPC Request elements and frames is described in 11.7.7.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.15 TPC Report element

The TPC Report element contains transmit power and link margin information sent in response to a TPC Request element or a Link Measurement Request frame. A TPC Report element is included in a Beacon frame or Probe Response frame without a corresponding request. The format of the TPC Report element is shown in Figure 9-237 (TPC Report element format).

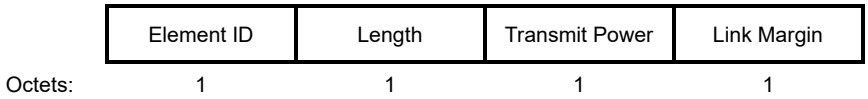

Figure 9-237—TPC Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Transmit Power field is set to the transmit power used to transmit the frame containing the TPC Report element. The field is coded as a 2s complement signed integer in units of decibels relative to 1 mW. The tolerance for the transmit power value reported in the TPC Response element is ± 5 dB. This tolerance is defined as the difference, in decibels, between the reported power value and the actual EIRP of the STA (when transmitting 1500 octet frames or maximum MPDU sized-frames, whichever is smaller).

The Link Margin field contains the link margin for the receive time and for the receive rate of the frame containing the TPC Request element or the Link Measurement Request frame. The field is coded as a 2s complement signed integer in units of decibels. The Link Margin field is reserved when a TPC Report element is included in a Beacon frame or Probe Response frame. The method used to measure the link margin is beyond the scope of this standard.

The use of TPC Report elements and frames is described in 11.7.7.

9.4.2.16 Supported Channels element

The Supported Channels element contains a list of channel subbands in which a STA is capable of operating. The format of the Supported Channels element is shown in Figure 9-238.

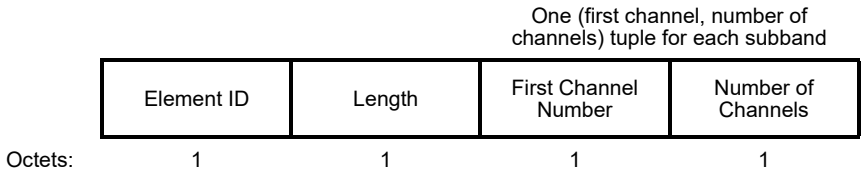

Figure 9-238—Supported Channels element format

The Element ID and Length fields are defined in 9.4.2.1.

The First Channel Number field is set to the first channel (as defined in 17.3.8.4.3) in a subband of supported channels.

The Number of Channels field is set to the number of channels in a subband of supported channels.

9.4.2.17 Channel Switch Announcement element

The Channel Switch Announcement element is used by a non-DMG AP, non-DMG IBSS STA, or mesh STA to advertise when it is changing to a new channel and the channel number of the new channel. The

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

format of the Channel Switch Announcement element is shown in Figure 9-239 (Channel Switch Announcement element format).

	Element ID	Length	Channel Switch Mode	New Channel Number	Channel Switch Count
Octets:	1	1	1	1	1

Figure 9-239—Channel Switch Announcement element format

The Element ID and Length fields are defined in 9.4.2.1.

The Channel Switch Mode field indicates any restrictions on transmission until a channel switch. A non-DMG AP or non-DMG IBSS STA sets the Channel Switch Mode field to either 0 or 1 on transmission. In an MBSS, the Channel Switch Mode field is reserved. See 11.8.9.

The New Channel Number field is set to the number of the channel to which the STA is moving (as defined in 17.3.8.4.3).

For nonmesh STAs, the Channel Switch Count field is set to the number of TBTTs until the STA sending the Channel Switch Announcement element switches to the new channel. The value 1 indicates that the switch occurs at the next TBTT (the ensuing Beacon frame is created assuming the new channel), and the value 0 indicates that the switch occurs at any time after the frame containing the element is transmitted.

For mesh STAs, the Channel Switch Count field is encoded as an octet with bits 6 to 0 set to the time, in units of 2 TU when the MSB (bit 7) is 0, or in units of 100 TU when the MSB (bit 7) is 1, until the mesh STA sending the Channel Switch Announcement element switches to the new channel. An octet with bits 6 to 0 indicates that the switch occurs at any time after the frame containing the element is transmitted. For example, a 200 TU channel switch time is encoded as X'82' and a 10 TU channel switch time is encoded as X'05'.

The use of Channel Switch Announcement elements and frames is described in 11.8.8.

9.4.2.18 Secondary Channel Offset element

The Secondary Channel Offset element is used by an AP, IBSS STA or mesh STA when changing to a new 40 MHz or wider channel. The format of the Secondary Channel Offset element is shown in Figure 9-240.

	Element ID	Length	Secondary Channel Offset
Octets:	1	1	1

Figure 9-240—Secondary Channel Offset element format

The Element ID and Length fields are defined in 9.4.2.1.

The Secondary Channel Offset field of the Secondary Channel Offset element represents the position of the secondary channel relative to the primary channel. The values of the Secondary Channel Offset field are defined in Table 9-134.

Table 9-134—Values of the Secondary Channel Offset field

Value	Name	Description
0	SCN - no secondary channel	Indicates that no secondary channel is present.
1	SCA - secondary channel above	Indicates that the secondary channel is above the primary channel.
2		Reserved.
3	SCB - secondary channel below	Indicates that the secondary channel is below the primary channel.
4–255		Reserved.

9.4.2.19 Measurement Request element

9.4.2.19.1 General

The Measurement Request element contains a request that the receiving STA undertake the specified measurement action. The Measurement Request element is included in Spectrum Measurement Request frames, as described in 9.6.2.2, or Radio Measurement Request frames, as described in 9.6.6.2. Measurement types 0, 1, and 2 are defined for spectrum management and are included only in Spectrum Measurement Request frames. The use of Measurement Request elements for spectrum management is described in 11.8.7. All other measurement types are included only in Radio Measurement Request frames. The use of Measurement Request elements for radio measurement is described in 11.10.

The format of the Measurement Request element is shown in Figure 9-241.

	Element ID	Length	Measurement Token	Measurement Request Mode	Measurement Type	Measurement Request
Octets:	1	1	1	1	1	variable

Figure 9-241—Measurement Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The Measurement Token is set to a nonzero number that is unique among the Measurement Request elements in a particular Spectrum or Radio Measurement Request frame.

The Measurement Request Mode field (shown in Figure 9-242) is a bitmap with the following bits defined:

— The Parallel subfield is used to request that more than one measurement is to be started in parallel. The Parallel subfield is set to 1 to request that the measurement is to start at the same time as the measurement described by the next Measurement Request element in the same Radio Measurement Request frame. The Parallel subfield is set to 0 if the measurements are to be performed in sequence. The Parallel subfield is reserved when the Enable subfield is 1, in the last or only Measurement Request element in the frame, or when the Measurement Type field is 0, 1, or 2 (spectrum management measurements). See 11.10.6.

— The Enable subfield is used to differentiate between a request to make a measurement and a request to control the measurement requests and triggered or autonomous reports generated by the destination STA. The Enable subfield is further described in Table 9-135.

— The Request subfield is described in Table 9-135.

— The Report subfield is described in Table 9-135.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The Duration Mandatory subfield indicates whether the measurement duration contained within the measurement request is interpreted as mandatory by the STA receiving the request. A 0 indicates that the duration requested is a maximum duration, and the requesting STA accepts measurement results taken over any shorter duration. A 1 indicates that the duration requested is a mandatory duration. The Duration Mandatory subfield is reserved when the Enable subfield is 1, or when the Measurement Type field is 0, 1, 2, 8, or 255. See 11.10.4.

— All other bits are reserved.

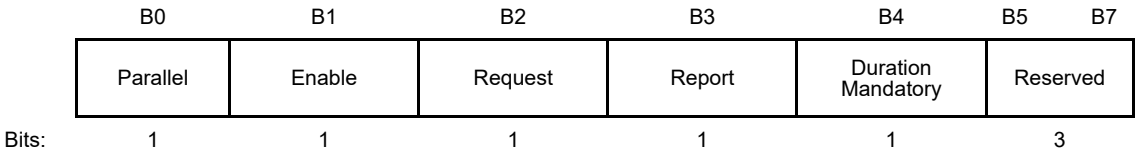

Figure 9-242—Measurement Request Mode field format

The use of the Enable, Request, and Report bits is summarized in Table 9-135. See 11.8.7 and 11.10.6 for the description of how a STA handles requests to enable or disable measurement requests and autonomous reports. See 11.10.8 for a description of the use of the Enable and Report bits in triggered reporting.

Table 9-135—Summary of use of Enable, Request, and Report subfields

Subfields			Meaning of subfields
Enable	Request	Report	
0	Reserved	Reserved	The transmitting STA is requesting that the destination STA make a measurement of type indicated in the Measurement Type field. When Enable subfield is 0, Request and Report bits are reserved.
1	0	0	The transmitting STA is requesting that the destination STA not send any measurement requests or reports of the type indicated in the Measurement Type field.
1	1	0	The transmitting STA is indicating to the destination STA that it can accept measurement requests and is requesting the destination STA not send autonomous or triggered measurement reports of the type indicated in the Measurement Type field. NOTE—This setting corresponds to the default STA behavior.
1	0	1	The transmitting STA is requesting that the destination STA not send measurement requests and indicating it accepts autonomous or triggered measurement reports of the type indicated in the Measurement Type field.
1	1	1	The transmitting STA is indicating to the destination STA that it can accept measurement requests and can accept autonomous or triggered measurement reports of the type indicated in the Measurement Type field.

The Measurement Type field is set to a number that identifies a type of measurement request or measurement report. The measurement types that have been allocated for measurement requests are shown in Table 9-136 and measurement reports are shown in Table 9-163 (in 9.4.2.20).

When the Enable subfield is 0, the Measurement Request field contains the specification of a single measurement request corresponding to the measurement type, as described in 9.4.2.19.2 to 9.4.2.19.12.

Table 9-136—Measurement type definitions for measurement requests

Name	Measurement type
Basic	0
Clear Channel Assessment (CCA)	1
Receive Power Indication (RPI) Histogram	2
Channel Load	3
Noise Histogram	4
Beacon	5
Frame	6
STA Statistics	7
LCI	8
Transmit Stream/Category Measurement	9
Multicast Diagnostics	10
Location Civic	11
Location Identifier	12
Directional Channel Quality	13
Directional Measurement	14
Directional Statistics	15
FTM Range	16
Neighboring DMG APs	17
Reserved	18–254
Measurement Pause	255

When the Enable subfield is 1, the Measurement Request field is present only when requesting a triggered measurement.

9.4.2.19.2 Basic request

The Measurement Request field corresponding to a Basic request is shown in Figure 9-243. See 11.8.7.

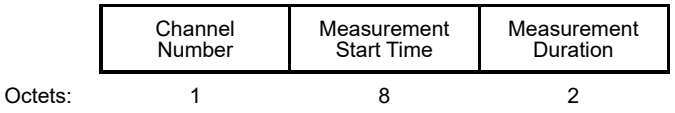

Figure 9-243—Measurement Request field format for a Basic request

The Channel Number field is set to the channel number for which the measurement request applies where the channel number is a value from the Channel set column in Table E-4, in a row having the same value in the Channel spacing (MHz) column as the width of the primary channel.

The Measurement Start Time field is set to the TSF timer at the time (± 32 μs) at which the requested Basic request measurement starts. A 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in TUs.

9.4.2.19.3 CCA request (Clear channel access request)

The Measurement Request field corresponding to a CCA request is shown in Figure 9-244.

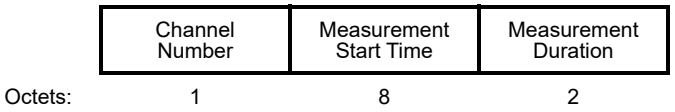

Figure 9-244—Measurement Request field format for a CCA request

The Channel Number field is set to the channel number for which the measurement request where the channel number is a value from the Channel set column in Table E-4, in a row having the same value in the Channel spacing (MHz) column as the width of the primary channel.

The Measurement Start Time field is set to the TSF at the time (± 32 μs) at which the requested CCA request measurement starts. A 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in TUs.

9.4.2.19.4 RPI histogram request (Received power indicator histogram request)

The Measurement Request field corresponding to an RPI Histogram request is shown in Figure 9-245.

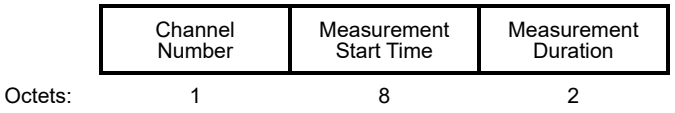

Figure 9-245—Measurement Request field format for an RPI Histogram request

The Channel Number field is set to the channel number for which the measurement request where the channel number is a value from the Channel set column in Table E-4, in a row having the same value in the Channel spacing (MHz) column as the width of the primary channel.

The Measurement Start Time field is set to the TSF at the time (± 32 μs) at which the requested RPI Histogram request measurement starts. A 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in TUs.

9.4.2.19.5 Channel Load request

The Measurement Request field corresponding to a Channel Load request is shown in Figure 9-246.

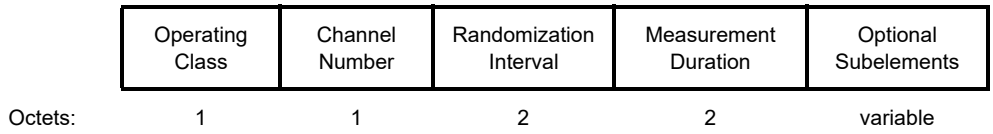

Figure 9-246—Measurement Request field format for Channel Load request

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement request applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid operating classes are listed in Annex E, excluding operating classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the channel number for which the measurement request applies. Channel number is defined within an operating class as shown in Annex E.

NOTE—Examples of operating classes that encompass a primary channel but do not identify the location of the primary channel are operating classes with 80 or 160 in the Channel spacing (MHz) column in the applicable table in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement request applies, and the Operating Class field and Channel Number field together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Randomization Interval field specifies the upper bound of the random delay to be used prior to making the measurement, in units of TUs. See 11.10.3.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, in units of TUs. See 11.10.4.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-137.

Table 9-137—Optional subelement IDs for Channel Load request

Subelement ID	Name	Extensible
0	Reserved	
1	Channel Load Reporting	Yes
2–162	Reserved	
163	Wide Bandwidth Channel Switch	Yes
164–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved

The Channel Load Reporting subelement indicates the condition for issuing a Channel Load report. The Channel Load Reporting subelement Data field format is shown in Figure 9-247. The Reporting Condition subfield is described in Table 9-138. The Channel Load Reference value is a Channel Load value as defined in 11.10.9.3 and is the reference value for the indicated reporting condition.

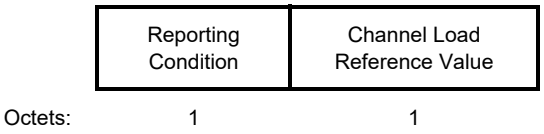

Figure 9-247—Channel Load Reporting subelement Data field format

Table 9-138—Reporting Condition subfield for Channel Load report

Condition for report to be issued	Reporting Condition
Report to be issued after each measurement (default, used when the Channel Load Reporting subelement is not included in the Channel Load request).	0
Report to be issued when the measured Channel Load is greater than or equal to the reference value.	1
Report to be issued when the measured Channel Load is less than or equal to the reference value.	2
Reserved	3–255

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.159), with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.19.6 Noise Histogram request

The Measurement Request field corresponding to a Noise Histogram request is shown in Figure 9-248.

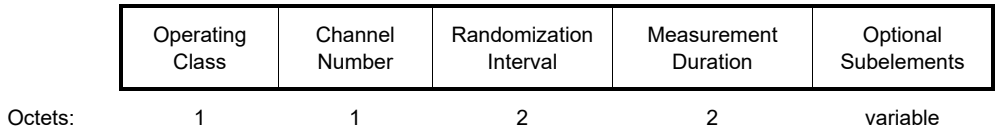

Figure 9-248—Measurement Request field format for Noise Histogram request

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement request applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid operating classes are listed in Annex E, excluding operating classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the channel number for which the measurement request applies. Channel number is defined within an operating class as shown in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement request applies, and the Operating Class and Channel Number fields together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Randomization Interval field specifies the upper bound of the random delay to be used prior to making the measurement, in units of TUs. See 11.10.3.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, in units of TUs. See 11.10.4.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-139.

Table 9-139—Optional subelement IDs for Noise Histogram request

Subelement ID	Name	Extensible
0	Reserved	
1	Noise Histogram Reporting	Yes
2–162	Reserved	
163	Wide Bandwidth Channel Switch	Yes
164–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Noise Histogram Reporting subelement indicates the condition for issuing a Noise Histogram report. The Noise Histogram Reporting subelement Data field format is shown in Figure 9-249. The Reporting Condition subfield is described in Table 9-140. The ANPI Reference Value is an ANPI value as defined in 11.10.9.4 and is the reference value for the indicated reporting condition.

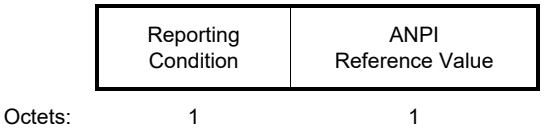

Figure 9-249—Noise Histogram Reporting subelement Data field format

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-140—Reporting Condition subfield for Noise Histogram report

Condition for report to be issued	Reporting Condition
Report to be issued after each measurement (default, used when Noise Histogram Reporting subelement is not included in a Noise Histogram request).	0
Noise Histogram report to be issued when measured ANPI is greater than or equal to the reference value.	1
Noise Histogram report to be issued when measured ANPI is less than or equal to the reference value.	2
Reserved	3–255

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.159), with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.19.7 Beacon request

The Measurement Request field corresponding to a Beacon request is shown in Figure 9-250.

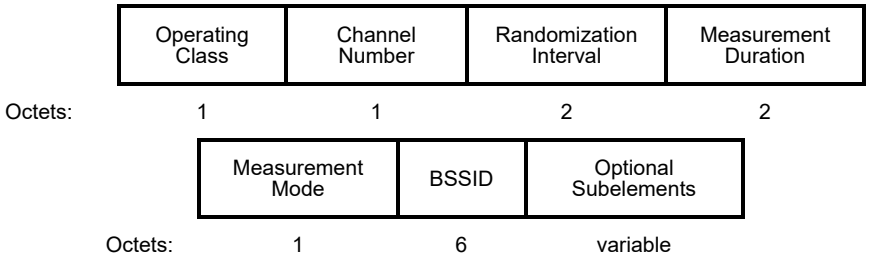

Figure 9-250—Measurement Request field format for Beacon request

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement request applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid operating classes are listed in Annex E.

For operating classes that encompass a primary channel but do not identify the location of the primary channel, the Channel Number field value is either 0 or 255; otherwise, the Channel Number field value is 0, 255, or the channel number for which the measurement request applies and is defined within an operating class as shown in Annex E.

For operating classes that identify the location of the primary channel, a Channel Number field set to 0 indicates a request to make iterative measurements for all supported channels in the operating class where the measurement is permitted on the channel and the channel is valid for the current regulatory domain.

For operating classes that encompass a primary channel but do not identify the location of the primary channel, a Channel Number field set to 0 indicates a request to make iterative measurements for all primary

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

channel positions within all requested and supported channels where the measurement is permitted on the channel and the channel is valid for the current regulatory domain.

For operating classes that identify the location of the primary channel, a Channel Number field set to 255 indicates a request to make iterative measurements for all supported channels in the current operating class listed in the latest AP Channel Report received from the serving AP.

A request frame is a request to make iterative measurements for all primary channel positions in all channels listed in the frame's AP Channel Report subelement when all of the following pertain:

— The operating class indicated by the Operating Class field in that frame encompasses a primary channel.
— The frame does not identify the location of that primary channel.
— The frame's Channel Number field is 255.
— The channel is supported.
— The measurement is permitted on the channel.
— The channel is permitted in the current regulatory domain.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement request applies, and the Operating Class and Channel Number fields together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Randomization Interval field specifies the upper bound of the random delay to be used prior to making the measurement, in units of TUs. See 11.10.3.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, in units of TUs. See 11.10.4.

The Measurement Mode field indicates the mode to be used for the measurement. The valid measurement modes are listed in Table 9-141. The procedures for each mode are described in 11.10.9.1.

Table 9-141—Measurement Mode definitions for Beacon request

Mode	Value
Passive	0
Active	1
Beacon Table	2
Reserved	3–255

The BSSID field indicates the BSSID of the BSS(s) for which a Beacon report is requested. When requesting Beacon reports for all BSSs on the channel, the BSSID field contains the wildcard BSSID; otherwise the BSSID field contains a specific BSSID for a single BSS.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Subelement ID field values for the defined subelements are shown in Table 9-142.

Table 9-142—Optional subelement IDs for Beacon request

Subelement ID	Name	Extensible
0	SSID	No
1	Beacon Reporting	Yes
2	Reporting Detail	Yes
3–9	Reserved	
10	Request	No
11	Extended Request	No
12–50	Reserved	
51	AP Channel Report	No
52–162	Reserved	
163	Wide Bandwidth Channel Switch	Yes
164	Last Beacon Report Indication Request	No
165–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The SSID subelement indicates the ESS(s) or IBSS(s) for which a Beacon report is requested. When SSID is not included in a Beacon request, the default “wildcard SSID” is used; otherwise the SSID is included in the Beacon request and contains a specific SSID for a single ESS or IBSS. The wildcard SSID is used to represent all possible SSIDs. The SSID element is described in 9.4.2.2.

The Beacon Reporting subelement indicates the condition for issuing a Beacon report. The Beacon Reporting subelement is optionally present in a Beacon request for repeated measurements; otherwise it is not present. The Beacon Reporting subelement Data field format is shown in Figure 9-251. The Reporting Condition subfield is described in Table 9-143. The Threshold/Offset Reference subfield contains either the threshold value or the offset value to be used for conditional reporting. For Reporting Condition subfield 1 and 2, the threshold value is a logarithmic function of the received signal power, as defined 9.4.2.36. For Reporting Condition subfield 3 and 4, the threshold value is a logarithmic function of the signal-to-noise ratio, as described in 9.4.2.39. For Reporting Condition subfield 5 to 10, the offset value is a 2s complement integer units of 0.5 dBm. The indicated reporting condition applies individually to each measured Beacon, Measurement Pilot, or Probe Response frame. Reporting conditions are further described in 11.10.9.1.

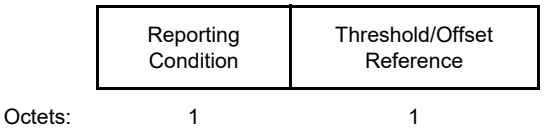

Figure 9-251—Beacon Reporting subelement Data field format

Table 9-143—Reporting Condition subfield for Beacon report

Condition for report to be issued in Repeated Measurement	Reporting Condition
Report to be issued after each measurement (default, used when the Beacon Reporting subelement is not included in a Beacon request).	0
The measured RCPI level is greater than the threshold value contained in the Threshold/Offset Reference.	1
The measured RCPI level is less than the threshold value contained in the Threshold/ Offset Reference.	2
The measured RSNI level is greater than the threshold value contained in the Threshold/Offset Reference.	3
The measured RSNI level is less than the threshold value contained in the Threshold/ Offset Reference.	4
The measured RCPI level is greater than a threshold defined by an offset from the serving AP's reference RCPI, where the offset value is contained in the Threshold/ Offset Reference.	5
The measured RCPI level is less than a threshold defined by an offset from the serving AP's reference RCPI, where the offset value is contained in the Threshold/ Offset Reference.	6
The measured RSNI level is greater than a threshold defined by an offset from the serving AP's reference RSNI, where the offset value is contained in the Threshold/ Offset Reference.	7
The measured RSNI level is less than a threshold defined by an offset from the serving AP's reference RSNI, where the offset value is contained in the Threshold/ Offset Reference.	8
The measured RCPI level is in a range bound by the serving AP's reference RCPI and an offset from the serving AP's reference RCPI, where the offset value is contained in the Threshold/Offset Reference.	9
The measured RSNI level is in a range bound by the serving AP's reference RSNI and an offset from the serving AP's reference RSNI, where the offset value is contained in the Threshold/Offset Reference.	10
Reserved	11–255

The Data field of the Reporting Detail subelement starts with a 1-octet Reporting Detail field that defines the level of detail per AP to be reported to the requesting STA. The Reporting Detail field values are defined in Table 9-144. The indicated reporting detail applies individually to each measured Beacon, Measurement Pilot, or Probe Response frame. If the Reporting Detail field equals 1, a Request element and/or one or more Extended Request elements are optionally present in the list of optional subelements (if more than one Extended Request element is present the Requested Element ID fields differ). If included, these identify elements requested to be reported in the Reported Frame Body subelement of the Beacon report.

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.159) with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Last Beacon Report Indication Request subelement has the format defined in Figure 9-1078, with a Length field set to 1. When included in a Beacon request with the Data field set to 1, it indicates that the requesting STA asks the responding STA to include an indication in the Beacon report to indicate the last frame of the sequence of frames generated as a response to a Beacon request. When included in a Beacon

Table 9-144—Reporting Detail field values

Level of detail requested	Reporting Detail
No fixed-length fields or elements	0
All fixed-length fields and any requested elements in the Request element and/or Extended Request element(s) if present	1
All fixed-length fields and elements (default, used when Reporting Detail subelement is not included in a Beacon request)	2
Reserved	3–255

request with the Data field set to other than 1, it indicates that the requesting STA asks the responding STA not to include such an indication.

The Request, Extended Request, AP Channel Report, and Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.8, 9.4.2.9, 9.4.2.34, and 9.4.2.24, respectively). Zero or more AP Channel Report subelements and zero or more Vendor Specific subelements are included in the list of optional subelements. An AP Channel Report subelement containing an operating class with an 80+ behavior limit (as defined in Annex E) is interpreted in conjunction with following AP Channel Report elements as defined in 11.10.9.1.

If one or more AP Channel Report elements are included, they indicate that iterative measurements are requested first on the channel(s) indicated by the Operating Class and Channel Number fields included in the Beacon request, and second on the channel(s) indicated by the Operating Class and Channel List fields of each AP Channel Report element included in the Beacon request. The procedures for iterative measurements on multiple channels are described in 11.10.9.1.

9.4.2.19.8 Frame request

The Measurement Request field corresponding to a Frame request is shown Figure 9-252.

	Operating Class	Channel Number	Randomization Interval	Measurement Duration	Frame Request Type	MAC Address	Optional subelements
Octets:	1	1	2	2	1	6	variable

Figure 9-252—Measurement Request field format for Frame request

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement request applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid operating classes are listed in Annex E, excluding operating classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the channel number for which the measurement request applies. Channel number is defined within an operating class as shown in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement request applies, and the Operating Class and Channel Number fields together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Randomization Interval field specifies the upper bound of the random delay to be used prior to making the measurement, in units of TUs. See 11.10.3.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, in units of TUs. See 11.10.4.

The Frame Request Type indicates the subelements requested in the Frame report. A 1 signifies that a Frame Count Report is requested. The values 0 and 2 to 255 are reserved.

The MAC Address field indicates the TA field to match against Data and Management frames in order to count toward the Frame report generated in response to this Frame request.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-145.

Table 9-145—Optional subelement IDs for Frame request

Subelement ID	Name	Extensible
0–162	Reserved	
163	Wide Bandwidth Channel Switch	Yes
164–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.159), with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.19.9 STA Statistics request

The Measurement Request field corresponding to a STA Statistics request is shown in Figure 9-253.

	Peer MAC Address	Randomization Interval	Measurement Duration	Group Identity	Optional Subelements
Octets:	6	2	2	1	variable

Figure 9-253—Measurement Request field format for STA Statistics request

The Peer MAC Address field is the RA or TA MAC address for the frame statistics of this measurement.

The Randomization Interval field specifies the upper bound of the random delay to be used prior to making the measurement, in units of TUs. See 11.10.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Measurement Duration field is set to the duration of the requested measurement in TUs except when triggered reporting is used. When triggered reporting is used, the measurement duration is 0.

The Group Identity field indicates the requested statistics group according to Table 9-146.

Table 9-146—Group Identity for a STA Statistics request

Statistics Group Name	Group Identity
STA Counters from dot11CountersTable	0
STA Counters from dot11MacStatistics group	1
QoS STA Counters for UP0 from dot11QosCountersTable	2
QoS STA Counters for UP1 from dot11QosCountersTable	3
QoS STA Counters for UP2 from dot11QosCountersTable	4
QoS STA Counters for UP3 from dot11QosCountersTable	5
QoS STA Counters for UP4 from dot11QosCountersTable	6
QoS STA Counters for UP5 from dot11QosCountersTable	7
QoS STA Counters for UP6 from dot11QosCountersTable	8

Reserved	17–255

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-147.

The Triggered Reporting subelement is used to specify trigger conditions and thresholds for triggered STA Statistics measurements. It is present when setting up triggered reporting from STA Counters, QoS STA Counters, or RSNA Counters; see 11.10.9.5.

The format of the Triggered Reporting subelement for STA Counters is shown in Figure 9-254. The fields marked as optional are only present if the appropriate bit in the STA Counter Trigger Condition field is 1.

The value in the Measurement Count field specifies the number of MSDUs or MPDUs transmitted and/or received by the STA that are to be used to determine if one or more of the trigger conditions have been met.

Table 9-147—Optional subelement IDs for STA Statistics request

Subelement ID	Name	Extensible
0	Reserved	
1	Triggered Reporting	No
2–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

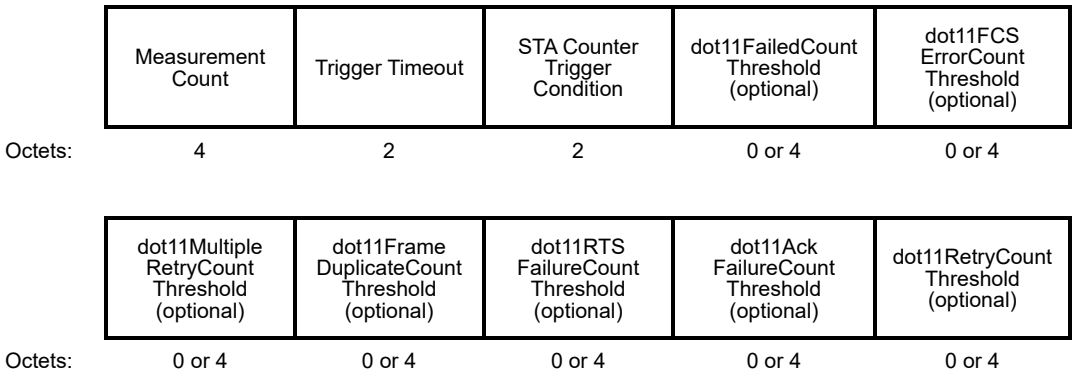

Figure 9-254—Triggered Reporting subelement format for STA Counters

The Trigger Timeout field contains a value in units of 100 TUs during which a measuring STA does not generate further triggered STA Statistics reports after a trigger condition has been met.

The STA Counter Trigger Condition field specifies trigger values used when requesting triggered STA Statistics reporting. The format of the STA Counter Trigger Condition field is shown in Figure 9-255.

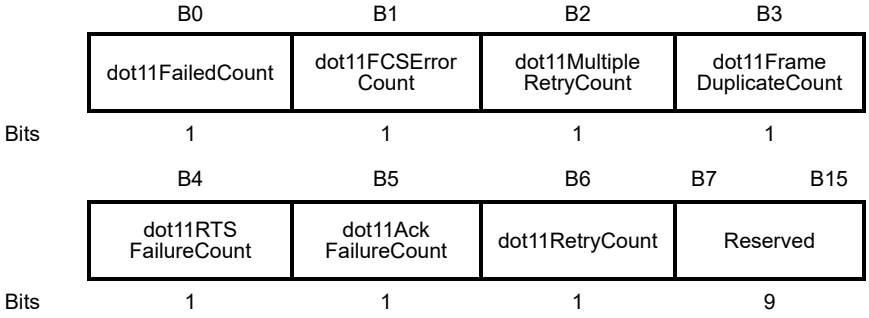

Figure 9-255—STA Counter Trigger Condition field format

For each bit in the STA Counter Trigger Condition field that is 1, a corresponding threshold value exists (defined in Figure 9-254) in the Triggered Reporting subelement for STA Counters. With this, the STA Statistics request indicates that a STA Statistics report be generated when the corresponding STA counter defined in Figure 9-304 and Figure 9-305 (in 9.4.2.20.9) exceeds the value of the specified threshold, within the total number of MSDUs or MPDUs indicated in the Measurement Count field. See 11.10.9.5. One or more trigger conditions are set with specified thresholds. In the triggered STA Statistics request, the Group Identity field is either 0 or 1. When the Group Identity field of the triggered STA Statistics

request is 0, B2–B6 in the STA Counter Trigger Condition field are set to 0. When the group identity of the triggered STA Statistics request is 1, B0 and B1 in the STA Counter Trigger Condition field are set to 0.

The format of the Triggered Reporting subelement for QoS STA Counters is shown in Figure 9-256. The fields marked as optional are only present if the appropriate bit in the QoS STA Counter Trigger Condition subfield is 1.

	Measurement Count	Trigger Timeout	QoS STA Counter Trigger Condition	dot11QoSFailed Count Threshold (optional)	dot11QoSRetry Count Threshold (optional)
Octets:	4	2	2	0 or 4	0 or 4

	dot11QoSMultiple RetryCount Threshold (optional)	dot11QoSFrame DuplicateCount Threshold (optional)	dot11QoSRTSCount Failure Threshold (optional)	dot11QoSAck FailureCount Threshold (optional)	dot11QoSDiscardedCount Threshold (optional)
Octets:	0 or 4	0 or 4	0 or 4	0 or 4	0 or 4

Figure 9-256—Triggered Reporting subelement format for QoS STA Counters

The UP of the QoS STA Counters for triggered QoS Statistics measurement is determined by the group identity of the Measurement Request field for a STA Statistics request as defined in Figure 9-146.

The value in the Measurement Count field specifies the number of MSDUs or MPDUs transmitted and/or received by the STAs that are to be used to determine if one or more of the trigger conditions have been met.

The Trigger Timeout field contains a value in units of 100 TUs during which a measuring STA does not generate further triggered STA Statistics reports after a trigger condition has been met.

The QoS STA Counter Trigger Condition field specifies reporting triggers when requesting triggered STA Statistics reporting. The format of the QoS STA Counter Trigger Condition field is shown in Figure 9-257.

	B0	B1	B2	B3
	dot11QoS FailedCount	dot11QoS RetryCount	dot11QoSMultiple RetryCount	dot11QoSFrame DuplicateCount
Bits:	1	1	1	1

	B4	B5	B6	B7-B15
	dot11QoSRTS FailureCount	dot11QoSAck FailureCount	dot11QoS DiscardedCount	Reserved
Bits:	1	1	1	9

Figure 9-257—QoS STA Counter Trigger Condition field format

For each bit in the QoS STA Counter Trigger Condition field that is 1, a corresponding threshold value exists (defined in Figure 9-256) in the Triggered Reporting subelement for QoS STA Counters. With this, the STA Statistics request indicates that a STA Statistics report be generated when the corresponding QoS STA counter defined in Figure 9-306 (in 9.4.2.20.9) exceeds the value of the specified threshold, within the

total number of MSDUs or MPDUs indicated in the Measurement Count field. See 11.10.9.5. One or more trigger conditions are set with specified thresholds.

The format of the Triggered Reporting subelement for RSNA Counters is shown in Figure 9-258. The fields marked as optional are only present if the appropriate bit in the RSNA Trigger Condition subfield is 1.

	Measurement Count	Trigger Timeout	RSNA Counter Trigger Condition	dot11RSNAStats CMACICVErrors Threshold (optional)	dot11RSNA StatsCMACReplays Threshold (optional)
Octets:	4	2	2	0 or 4	0 or 4

	dot11RSNA StatsRobustMgmt CCMPReplays Threshold (optional)	dot11RSNAStats TKIPICVErrors Threshold (optional)	dot11RSNAStats TKIPReplays Threshold (optional)	dot11RSNAStats CCMPDecryptErrors Threshold (optional)	dot11RSNAStats CCMPReplays Threshold (optional)
Octets:	0 or 4	0 or 4	0 or 4	0 or 4	0 or 4

Figure 9-258—Triggered Reporting subelement format for RSNA Counters

The value in the Measurement Count field specifies the number of MPDUs transmitted and/or received by the STA that are to be used to determine if one or more of the trigger conditions have been met.

The Trigger Timeout field contains a value in units of 100 TUs during which a measuring STA does not generate further triggered STA Statistics reports after a trigger condition has been met.

The RSNA Counter Trigger Condition field specifies reporting triggers when requesting triggered STA Statistics reporting. The format of the RSNA Trigger Condition field is shown in Figure 9-259.

	B0	B1	B2	B3
	dot11RSNAStats CMACICVErrors	dot11RSNA StatsCMACReplays	dot11RSNAStats RobustMgmt CCMPReplays	dot11RSNAStats TKIPICVErrors
Bits:	1	1	1	1

	B4	B5	B6	B7	B15
	dot11RSNAStats TKIPReplays	dot11RSNAStats CCMPDecryptErrors	dot11RSNAStats CCMPReplays	Reserved	
Bits:	1	1	1	9	

Figure 9-259—RSNA Trigger Condition field format

For each bit in the RSNA Trigger Condition field that is 1, a corresponding threshold value exists (defined in Figure 9-258) in the Triggered Reporting subelement for RSNA Counters. With this, the STA Statistics request indicates that a STA Statistics report be generated when the corresponding RSNA counter defined in Figure 9-308 (in 9.4.2.20.9) exceeds the value of the specified threshold, within the total number of MPDUs indicated in the Measurement Count field. See 11.10.9.5. One or more trigger conditions are set with specified thresholds.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.19.10 LCI request (Location configuration information request)

The Measurement Request field corresponding to an LCI request is shown in Figure 9-260.

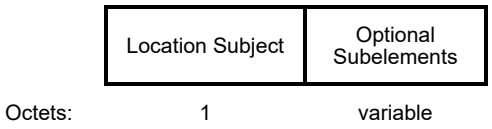

Figure 9-260—Measurement Request field format for LCI request

The Location Subject field of an LCI request is 1 octet. See Table 9-148.

Table 9-148—Location Subject field definition

Value	Location Subject
0	Location Subject Local
1	Location Subject Remote
2	Location Subject Third Party
3–255	Reserved

The term Local refers to the location of the requesting STA, and Remote refers to the location of the reporting STA.

NOTE 1—A measurement request with its Location Subject value Location Subject Local is used by a requesting STA to obtain its own location, asking “Where am I?” The Measurement Request with its Location Subject value Location Subject Remote is used by a requesting STA to obtain the location of the reporting STA, asking “Where are you?”

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-149.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-149—Optional subelement IDs for LCI request

Subelement ID	Name	Extensible
0	Reserved	
1	Azimuth Request	Yes
2	Originator Requesting STA MAC Address	No
3	Target MAC Address	No
4	Maximum Age	Yes
5–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Azimuth Request subelement is present when requesting azimuth information. The Azimuth Request subelement is as shown in Figure 9-261.

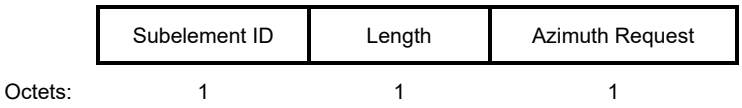

Figure 9-261—Azimuth Request subelement format

The Subelement ID field is defined in Table 9-149.

The Length field is defined in 9.4.3.

The Azimuth Request field of an Azimuth Request subelement is shown in Figure 9-262.

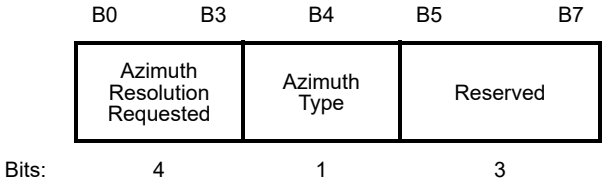

Figure 9-262—Azimuth Request field format

Azimuth Resolution Requested is the number of valid most significant bits requested for the fixed-point value of Azimuth, reported in integer degrees. Values above 9 are reserved.

Azimuth Type (bit 4) is set to 1 to request a report of the Azimuth of radio reception and is set to 0 to request a report of the Azimuth of front surface of the reporting STA.

NOTE 2—A geographic feature is an abstraction of a real-world phenomenon; it is a geographic feature if it is associated with a location relative to the Earth. The designation of a horizontal plane is relative to the Earth. The designation of the “front surface” of a station is arbitrary, but refers to an orientable surface (possessing a centerline) of the station. It is common to use a direction cosine matrix to convert from one coordinate system to another, i.e., body-centered coordinates to earth-centered coordinates.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA requesting the Location Information and it is present whenever the Location Subject field is set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 9-263.

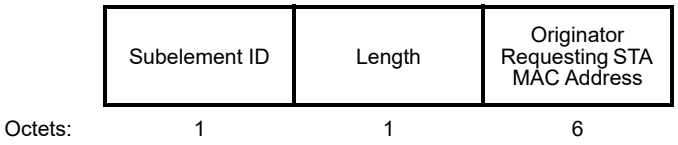

Figure 9-263—Originator Requesting STA MAC Address subelement format

The Target MAC Address subelement contains the MAC address of the STA whose Location Information is requested and it is present whenever the Location Subject field is set to 2. The format of the Target MAC Address subelement is shown in Figure 9-264.

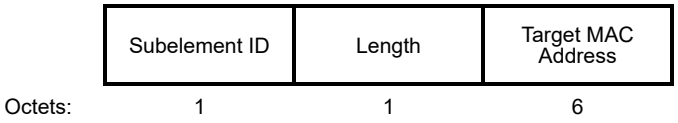

Figure 9-264—Target MAC Address subelement format

The Maximum Age subelement indicates the maximum age of the requested LCI. The format of the Maximum Age subelement is defined in Figure 9-265. The absence of a Maximum Age subelement indicates that an LCI determined at or after the LCI request is received is requested.

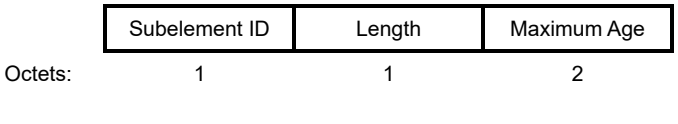

Figure 9-265—Maximum Age subelement format

The Length field is defined in 9.4.3.

The Maximum Age field of a Maximum Age subelement indicates the maximum elapsed time between when an LCI is determined and when an LCI request is received, within which the LCI satisfies the LCI request. The Maximum Age field is encoded as an unsigned integer with units of 0.1 s. The value of 0 is reserved. The value of 65 535 indicates that any LCI age is acceptable.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.19.11 Transmit Stream/Category Measurement request

The Transmit Stream/Category Measurement applies to TIDs for traffic streams associated with TSPECs and also to TIDs for traffic categories for QoS traffic without TSPECs. The Measurement Request field corresponding to a Transmit Stream/Category Measurement request is shown in Figure 9-266.

The Randomization Interval field is set to the maximum random delay in the measurement start time, in units of TUs. The use of the Randomization Interval field is described in 11.10.3. When requesting a triggered Transmit Stream/Category Measurement, the randomization interval is not used and the Randomization Interval field is reserved. See 11.10.9.8.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

	Randomization Interval	Measurement Duration	Peer STA Address	Traffic Identifier	Bin 0 Range	Optional Subelements
Octets:	2	2	6	1	1	variable

Figure 9-266—Measurement Request field format for Transmit Stream/Category Measurement Request

The Measurement Duration is set to the duration of the requested measurement, in units of TUs except when setting up a triggered QoS measurement, when it is not used and is set to 0.

The Peer STA Address contains a MAC address indicating the RA in the MSDUs to be measured.

The Traffic Identifier field contains the TID subfield as shown in Figure 9-267.

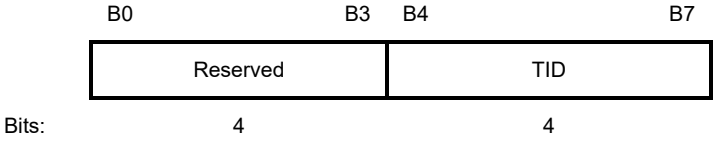

Figure 9-267—Traffic Identifier field format

The TID subfield indicates the TC or TS for which traffic is to be measured.

Bin 0 Range indicates the delay range of the first bin (Bin 0) of the Transmit Delay Histogram, in units of TUs. The Bin 0 Range value is used to calculate the delay ranges of the other 5 bins making up the histogram. The delay range for each bin increases in a binary exponential fashion as described in 9.4.2.20.11.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-150.

Table 9-150—Optional subelement IDs for Transmit Stream/Category Measurement Request

Subelement ID	Name	Extensible
0	Reserved	
1	Triggered Reporting	Yes
2–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Triggered Reporting subelement is used to specify measurement trigger thresholds. It is present only if requesting triggered transmit stream/category measurement reporting. The Triggered Reporting subelement format is shown in Figure 9-268.

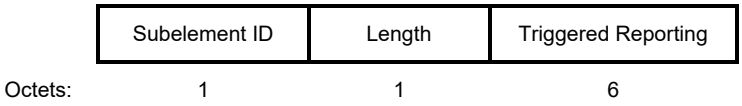

Figure 9-268—Triggered Reporting subelement format

The Subelement ID field is defined in Table 9-150.

The Length field is defined in 9.4.3.

The Triggered Reporting field is as shown in Figure 9-269.

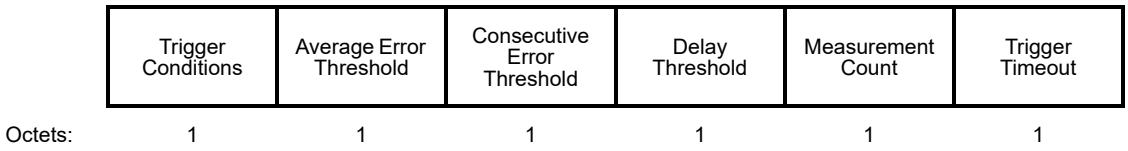

Figure 9-269—Triggered Reporting field format

Trigger Conditions is a subfield that specifies reporting triggers when requesting a triggered transmit stream/category measurement. The format of the Trigger Conditions subfield is shown in Figure 9-270.

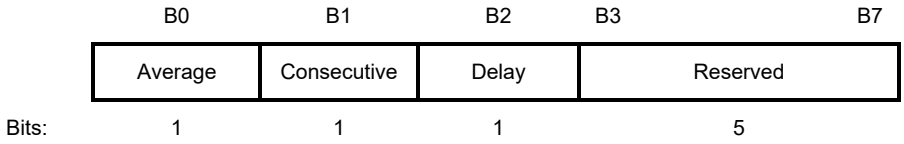

Figure 9-270—Trigger Conditions subfield format

— The Average subfield is set to 1 to request that a Transmit Stream/Category Measurement report be generated when the number of MSDUs for the TC or TS given by the TID that are discarded out of the number of preceding MSDUs specified in Measurement Count is greater than or equal to the value given in Average Error Threshold. MSDUs discarded due to the number of transmit attempts exceeding dot11ShortRetryLimit, or due to the MSDU lifetime having been reached, are counted.

— The Consecutive subfield is set to 1 to request that a Transmit Stream/Category Measurement report be generated when the number of MSDUs for the TC or TS given by the TID that are discarded in succession is greater than or equal to the value given in Consecutive Error Threshold. MSDUs discarded due to the number of transmit attempts exceeding dot11ShortRetryLimit, or due to the MSDU lifetime having been reached, are counted.

— The Delay subfield is set to 1 to request that a Transmit Stream/Category Measurement report be generated when the number of consecutive MSDUs for the TC or TS given by the TID that experience a transmit delay greater than or equal to the value specified in the Delay Threshold subfield is greater than or equal to the value given in Delayed MSDU Count. Delay is measured from the time the MSDU is passed to the MAC until the point at which the entire MSDU has been successfully transmitted, including receipt of the final Ack frame from the peer STA if the QoSAck service class is being used.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Average Error Threshold field contains a value representing the number of discarded MSDUs to be used as the threshold value for the average trigger condition. The field is reserved if the Average Error Threshold subfield of the Trigger Conditions subfield is 0.

The Consecutive Error Threshold field contains a value representing the number of discarded MSDUs to be used as the threshold value for the consecutive trigger condition. The field is reserved if the Consecutive Error Threshold subfield of the Trigger Conditions subfield is 0.

The Delay Threshold field contains two subfields as shown in Figure 9-271. The Delay Threshold field is reserved if the Delay Threshold subfield of the Trigger Conditions subfield is 0.

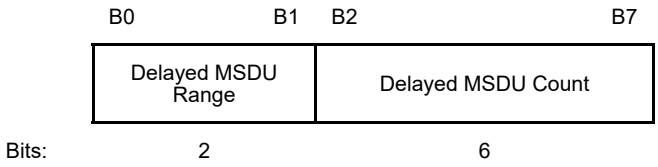

Figure 9-271—Delay Threshold subfield format

The Delayed MSDU Range field contains a value representing the MSDU transmit delay at or above which an MSDU is counted toward the Delayed MSDU Count threshold. The Delayed MSDU Range field is encoded as a value representing the lower bound of a bin in the Transmit Delay Histogram as shown in Table 9-151. The Transmit Delay Histogram is defined in 9.4.2.20.11.

Table 9-151—Delayed MSDU Range Definitions

Delayed MSDU Range	Condition
0	Transmit Delay = Lower Bound of Bin 2
1	Transmit Delay = Lower Bound of Bin 3
2	Transmit Delay = Lower Bound of Bin 4
3	Transmit Delay = Lower Bound of Bin 5

The Delayed MSDU Count field contains a value representing the number of MSDUs to be used as the threshold value for the delay trigger condition.

The Measurement Count field contains a number of MSDUs. This value is used to calculate an average discard count for the average trigger condition. It is also used in place of measurement duration in determining the scope of the reported results when a report is triggered; see 11.10.9.8.

The Trigger Timeout field contains a value, in units of 100 TU, during which a measuring STA does not generate further triggered transmit stream/category measurement reports after a trigger condition has been met. See 11.10.9.8.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.19.12 Measurement Pause request

The Measurement Request field corresponding to a Measurement Pause request is shown in Figure 9-272. The Measurement Pause request cannot be processed in parallel with any other measurement request. See 11.10.9.7.

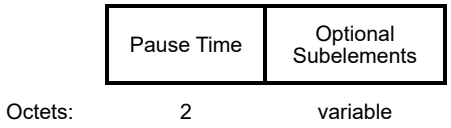

Figure 9-272—Measurement Request field format for Measurement Pause request

The Pause Time field contains a number between 1 and 65 535 representing the time period for which measurements are suspended or paused. The time unit for the Pause Time is 10 TUs. The Pause Time value 0 is reserved. Measurement Pause requests are used to provide time delays between the execution times of Measurement Request elements in a Radio Measurement Request frame.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-152.

Table 9-152—Optional subelement IDs for Measurement Pause request

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.19.13 Multicast Diagnostics request

The Measurement Request field corresponding to a Multicast Diagnostics request is shown in Figure 9-273. The response to a Multicast Diagnostics request is a Multicast Diagnostics report.

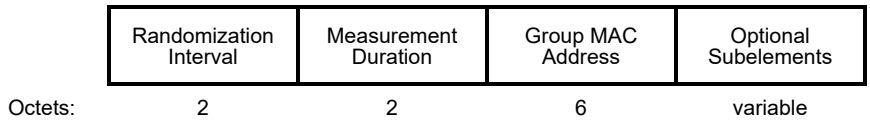

Figure 9-273—Measurement Request field format for a Multicast Diagnostics request

The Randomization Interval field is the upper limit of random delay before the measurement begins, expressed in TUs. The use of the Randomization Interval field is described in 11.11.3. When requesting a triggered multicast diagnostic report, the Randomization Interval field is reserved.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Measurement Duration field is the duration of the requested measurement, expressed in TUs. When requesting a triggered multicast diagnostic report, the Measurement Duration field is reserved.

A Group MAC Address field with bit 0 set to 1 contains the MAC address of the group addressed frames to which the measurement request relates. A Group MAC Address field with bit 0 set to 0 indicates that all group addressed frames, apart from the broadcast address, are requested.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-153.

Table 9-153—Optional subelement IDs for STA Multicast Diagnostics request

Subelement ID	Name	Extensible
0	Reserved	
1	Multicast Triggered Reporting	No
2–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Multicast Triggered Reporting subelement is used to specify trigger conditions and thresholds. It is present only when requesting triggered multicast diagnostic reporting. The format of Multicast Triggered Reporting subelement is shown in Figure 9-274.

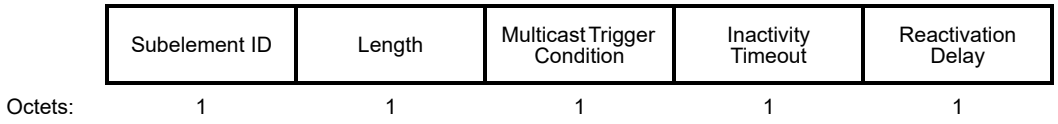

Figure 9-274—Multicast Triggered Reporting subelement format

The Multicast Trigger Condition field specifies reporting triggers for triggered management diagnostic reporting. The format of the Multicast Trigger Condition field is shown in Figure 9-275.

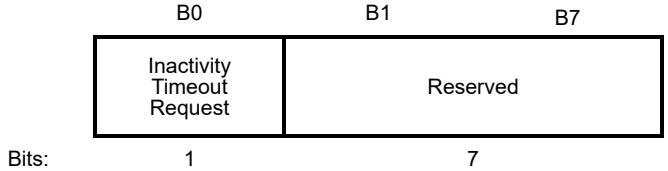

Figure 9-275—Multicast Trigger Condition field format

The Inactivity Timeout Request field is 1 to request that a multicast triggered report be generated when no group addressed frames with the monitored group address are received in a time equal to the value given in the Inactivity Timeout field. The Inactivity Timeout Request field is 0 when a multicast reception timeout is not requested.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Inactivity Timeout field contains a time value in units of 100 TUs to be used as the threshold value for the inactivity timeout trigger condition.

The Reactivation Delay field contains a value in units of 100 TUs during which a measuring STA does not generate further multicast triggered reports after a trigger condition has been met.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.24).

The use of Multicast Diagnostics request is defined in 11.10.19.

9.4.2.19.14 Location Civic request

The Measurement Request field corresponding to a Location Civic request is shown in Figure 9-276. The response to a Location Civic request is a Location Civic report.

	Location Subject	Civic Location Type	Location Service Interval Units	Location Service Interval	Optional Subelements
Octets:	1	1	1	2	variable

Figure 9-276—Location Civic Request field format

The Location Subject field is 1 octet and is defined in Table 9-148.

The Civic Location Type field contains the format of location information in the Location Civic report, as indicated in Table 9-154.

Table 9-154—Civic Location Type field values

Civic Location Type field value	Name	Description
0	IETF RFC 4776	Starting at the country code field (i.e., excluding the GEOCONF_CIVIC/ OPTION_GEOCONF_CIVIC, N/option-len and what fields); includes all subsequent RFCs that define additional civic address Types
1	Vendor Specific	
2–255	Reserved	

When the Civic Location Type value is Vendor Specific, a Vendor Specific subelement is included in the list of optional subelements that identifies the Organization Identifier corresponding to the Civic Location Type field.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Location Service Interval Units field contains the units for the Location Service Interval field, as indicated in Table 9-155.

Table 9-155—Location Service Interval Units

Location Service Interval Units value	Description
0	Seconds
1	Minutes
2	Hours
3–255	Reserved

The Location Service Interval field is the time interval, expressed in the units indicated in the Location Service Interval Units field, at which the STA requests to receive Location Civic reports. A Location Service Interval of 0 indicates that only a single Location Civic report is requested.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-156.

Table 9-156—Optional subelement IDs for Location Civic request

Subelement ID	Name	Extensible
0	Reserved	
1	Originator Requesting STA MAC Address	No
2	Target MAC Address	No
3–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA requesting for the Location Information and it is present whenever the Location Subject field is set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 9-263.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information is requested and it is present whenever the Location Subject field is set to 2. The format of the Target MAC Address subelement is shown in Figure 9-264.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.24).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.19.15 Location Identifier request

The Measurement Request field corresponding to a Location Identifier request is shown in Figure 9-277. The response to a Location Identifier request is a Location Identifier report.

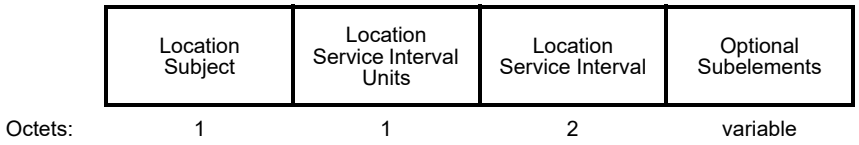

Figure 9-277—Location Identifier request field format

The Location Subject field is 1 octet and is defined in Table 9-148.

The Location Service Interval Units field is defined in Table 9-155.

The Location Service Interval field is the time interval, expressed in the units indicated in the Location Service Interval Units field, at which the STA requests to receive Location Identifier reports. A Location Service Interval of 0 indicates that only a single Location Identifier report is requested.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-157.

Table 9-157—Optional subelement IDs for Location Identifier request

Subelement ID	Name	Extensible
0	Reserved	
1	Originator Requesting STA MAC Address	No
2	Target MAC Address	No
3–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA requesting the Location Information and it is present whenever the Location Subject field is set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 9-263.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information is requested and it is present whenever the Location Subject field is set to 2. The format of the Target MAC Address subelement is shown in Figure 9-264.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.24).

9.4.2.19.16 Directional Channel Quality request

The Measurement Request field corresponding to a Directional Channel Quality request is shown in Figure 9-278. This Measurement Request is transmitted from a Requesting STA to a Requested STA to perform measurements toward a Target STA (see 11.30).

	Operating Class	Channel Number	AID	Reserved	Measurement Method
Octets:	1	1	1	1	1

	Measurement Start Time	Measurement Duration	Number of Time Blocks	Optional Subelements
Octets:	8	2	1	variable

Figure 9-278—Measurement Request field format for Directional Channel Quality request

The Operating Class field indicates the channel set for which the measurement request applies. The Operating Class and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

The Channel Number field indicates the channel number for which the measurement request applies. Channel Number is defined within an Operating Class as shown in Annex E.

The AID field contains the AID assigned to the Target STA by the AP or PCP.

The Measurement Method field indicates the method that is to be used by the Requested STA to carry out this measurement request and report back in the measurement report. If this field is set to 0, it indicates ANIPI. If this field is set to 1, it indicates RSNI. If this field is set to 2, it indicates ANIPI during the duration of the requested measurement, in units of 1 μs. If this field is set to 3, it indicates RSNI during the duration of the requested measurement, in units of 1 μs. Other values are reserved. Other values are reserved.

The Measurement Start Time field is set to the TSF timer at the time at which the requested measurement starts. A 0 indicates that the measurement starts immediately.

If the Measurement Method field is not 2 or 3, the Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, in units of TUs. See 11.10.4. If the Measurement Method field is 2 or 3, the Measurement Duration field is set to the duration of the requested measurement, in units of 1 μs (TU/1024).

The Number of Time Blocks field indicates the number of time blocks within the Measurement Duration. The ratio (Measurement Duration/Number of Time Blocks) provides the duration of an individual measurement unit.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-158.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-158—Optional subelement IDs for Directional Channel Quality request

Subelement ID	Name	Extensible
0	Reserved	
1	Directional Channel Quality Reporting	Yes
2	Measurement Configuration	Yes
3	Extended Measurement Configuration	Yes
4–220	Reserved	No
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Directional Channel Quality Reporting subelement indicates the condition for issuing a Directional Channel Quality report. The Directional Channel Quality Reporting subelement Data field format is shown in Figure 9-279. The Reporting Condition subfield is described in Table 9-159. The Directional Channel Quality Reference value is a Directional Channel Quality value and is the reference value for the indicated reporting condition.

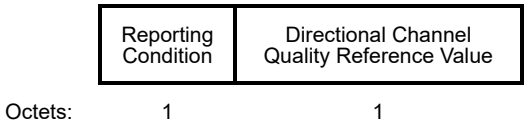

Figure 9-279—Directional Channel Quality Reporting subelement Data field format

Table 9-159—Reporting Condition subfield for Directional Channel Quality report

Condition for report to be issued	Reporting condition
Report to be issued after each measurement (default, used when Directional Channel Quality Reporting subelement is not included in Directional Channel Quality Request).	0
Report to be issued when measured ANIPI or RSNI is greater than or equal to the reference value.	1
Report to be issued when measured ANIPI or RSNI is less than or equal to the reference value.	2
Reserved	3–255

The Measurement Configuration subelement indicates measurement configuration information for which the measurement request applies and is used between a pair of EDMG STAs. The Data field of the Measurement Configuration subelement is formatted as shown in Figure 9-280.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

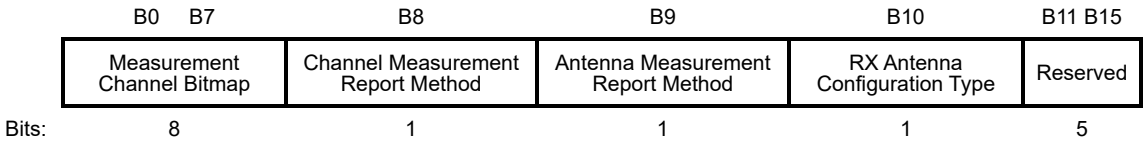

Figure 9-280—Data field format of the Measurement Configuration subelement

The Measurement Channel Bitmap subfield is a bitmap that indicates the 2.16 GHz channel(s) to which the measurement request applies and is formatted as shown in Figure 9-281. In Figure 9-281, Ch1 subfield corresponds to channel 1, Ch2 subfield corresponds to channel 2 and so on (channels are defined in Annex E). If a subfield is set to 1, the measurement request applies to the indicated channel; otherwise, if the subfield is set to 0, the measurement request does not apply to the indicated channel.

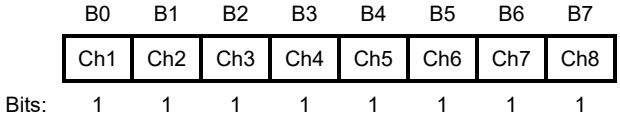

Figure 9-281—Measurement Channel Bitmap subfield format

The Channel Measurement Report Method subfield indicates the method that is to be used by the Requested STA to report the results of measurements over multiple 2.16 GHz channels in the measurement report. The Channel Measurement Report Method subfield sets to 0 to indicate the results of measurements over all the requested 2.16 GHz channels during each measurement time block are reported per 2.16 GHz channel. The Channel Measurement Report Method subfield sets to 1 to indicate the averaged results of concurrent measurements over all the requested 2.16 GHz channels during each measurement time block are reported. The Channel Measurement Report Method subfield is set to 0 when the Extended Measurement Configuration subelement is present.

The Antenna Measurement Report Method subfield indicates the method that is to be used by the Requested STA to report the results of concurrent measurements using multiple RX DMG antennas in the measurement report. The Antenna Measurement Report Method subfield is set to 0 to indicate the results of concurrent measurements over each requested 2.16 GHz channel using multiple RX DMG antennas during a measurement time block are reported per DMG antenna. The Antenna Measurement Report Method subfield is set to 1 to indicate the averaged results of concurrent measurements over each requested 2.16 GHz channel using multiple RX DMG antennas during a measurement time block are reported.

The RX Antenna Configuration Type subfield is set to 0 to request that the RX antenna configuration used for SISO reception be used for measurements, and is set to 1 to request that the RX antenna configuration used for SU-MIMO reception be used for measurements.

The Extended Measurement Configuration subelement is present if the Measurement Configuration subelement is present. The Extended Measurement Configuration subelement contains measurement timing information for the channels indicated in the Measurement Configuration subelement. If the Extended Measurement Configuration subelement is not present, the measurement timing information indicated in the Measurement Request field applies to all requested channels. If the Extended Measurement Configuration subelement is present, the measurement timing information indicated in the Measurement Request field applies to the first requested channel (i.e., the requested channel with the lowest channel number) and measurement timing information indicated in the Extended Measurement Configuration subelement applies to the remaining requested channels in ascending order in terms of channel number. The Data field of the Extended Measurement Configuration subelement is formatted as shown in Figure 9-282.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

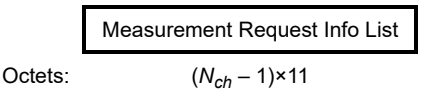

Figure 9-282—Data field format of the Extended Measurement Configuration subelement

The Measurement Request Info List field contains (N_{ch} – 1) Measurement Request Info subfields, where N_{ch} is the total number of the requested channels. Each Measurement Request Info subfield is defined in Figure 9-283.

Figure 9-283—Measurement Request Info subfield format

The measurement timing information for the i^{th} requested channel is indicated in the Measurement Start Time for i^{th} Requested Channel subfield, the Measurement Duration subfield for i^{th} Requested Channel and Number of Time Blocks for i^{th} Requested Channel subfield, where i = 2, 3, …, N_{ch}. The definition of these subfields is the same as the corresponding subfields in the Measurement Request field (Figure 9-278).

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.19.17 Directional Measurement request

The Measurement Request field corresponding to a Directional Measurement request is shown in Figure 9-284. This Measurement Request is transmitted from a Requesting STA to a Requested STA to perform directional channel measurements in all sectored receiving directions.

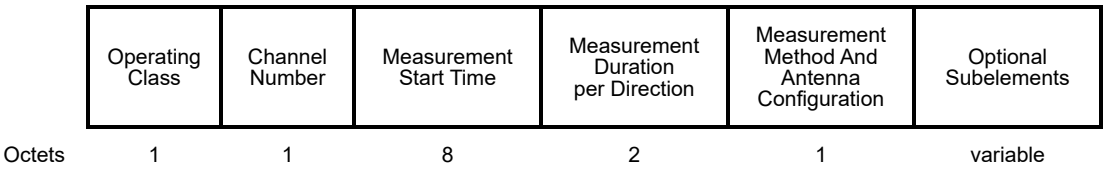

Figure 9-284—Measurement Request field format for Directional Measurement request

The Operating Class field indicates the channel set for which the measurement request applies. The Operating Class and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

The Channel Number field indicates the channel number for which the measurement request applies. Channel Number is defined within an Operating Class as shown in Annex E.

The Measurement Start Time field is set to the TSF timer at the time at which the requested measurement starts. A 0 indicates that the measurement starts immediately.

The Measurement Duration per Direction field is set to the preferred or mandatory duration of the requested measurement in each receiving direction, in units of TUs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Measurement Method And Antenna Configuration field is defined in Figure 9-285.

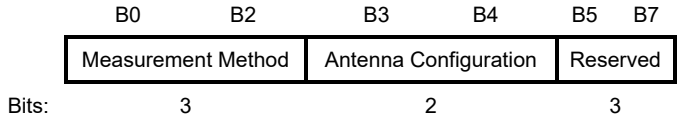

Figure 9-285—Measurement Method And Antenna Configuration field format

The Measurement Method field indicates the method that is to be used by the Requested STA to carry out this measurement request and report back in the measurement report. If this subfield is set to 0, it indicates ANIPI. If this subfield is set to 1, it indicates RCPI. If the subfield is set to 2, it indicates Channel Load. Other values are reserved.

The Antenna Configuration subfield indicates the configuration of the DMG antenna(s) used by the STA to carry out the measurement. If this subfield is set to 1, it indicates a quasi-omni antenna pattern. If this subfield is set to 2, it indicates directional antenna pattern. Other values are reserved.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-160.

Table 9-160—Optional subelement IDs for Directional Measurement request

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.19.18 Directional Statistics request

The Measurement Request field corresponding to a Directional Statistics request is shown in Figure 9-286. This Measurement Request is transmitted from a Requesting STA to a Requested STA to perform directional channel measurements in all sectored receiving directions.

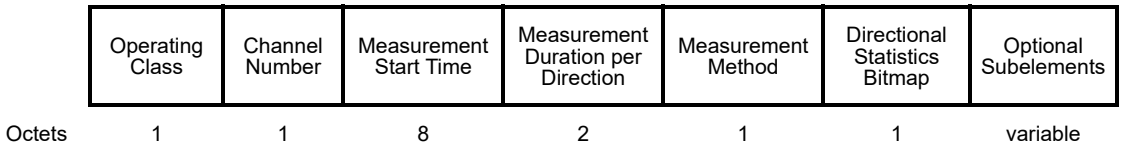

Figure 9-286—Measurement Request field format for Directional Statistics request

The Operating Class field indicates the channel set for which the measurement request applies. The Operating Class and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

The Channel Number field indicates the channel number for which the measurement request applies. Channel Number is defined within an Operating Class as shown in Annex E.

The Measurement Start Time field is set to the TSF timer at the time at which the requested measurement starts. A 0 indicates that the measurement starts immediately.

The Measurement Duration per Direction field is set to the preferred or mandatory duration of the requested measurement in each receiving direction, in units of TUs.

The Measurement Method field indicates the method that is to be used by the Requested STA to carry out this measurement request and report back in the measurement report. If this field is set to 0, it indicates ANIPI. If this field is set to 1, it indicates RCPI. If the field is set to 2, it indicates Channel Load. Other values are reserved.

The Directional Statistics Bitmap field format is shown in Figure 9-287. The Maximum field set to 1 indicates that the maximum measurement result among all directions is expected in the measurement report. The Minimum field set to 1 indicates that the minimum measurement result among all directions is expected in the measurement report. The Average field set to 1 indicates that the average measurement result among all directions is expected in the measurement report. The Variance field set to 1 indicates that the variance of measurement results among all directions is expected in the measurement report. Other bits are reserved.

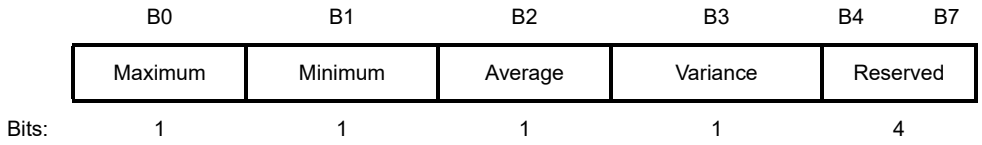

Figure 9-287—Directional Statistics Bitmap field format

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-161.

Table 9-161—Optional subelement IDs for Directional Statistics request

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.19.19 FTM Range request

The Measurement Request field corresponding to an FTM Range request is shown in Figure 9-288.

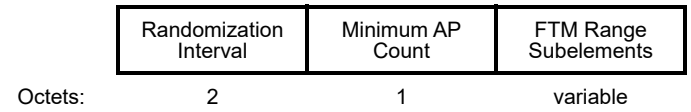

Figure 9-288—Measurement Request field format for an FTM Range request

The Randomization Interval field specifies the upper bound of the random delay to be used prior to making the measurement, in units of TUs. See 11.10.3.

The Minimum AP Count field specifies the minimum number of APs to determine the range to, among the APs identified in the Neighbor Report subelements in the FTM Range Subelements field. The value 0 and values above 15 are reserved.

The FTM Range Subelements field contains one or more subelements. The subelement format and ordering of subelements are defined in 9.4.3. The FTM Range subelements are listed in Table 9-162.

The Subelement IDs for subelements in the FTM Range Request element are defined in Table 9-162. The number of Neighbor Report subelements included in the FTM Range Subelements field is at least the value of the Minimum AP Count field. Each Neighbor Report subelement has the same format as the Neighbor Report element and contains the Wide Bandwidth Channel subelement. See Table 9-162 and 9.4.2.35. The Neighbor Report subelements specify a set of nearby APs; the requested STA is requested to perform the FTM procedure with a subset of these APs (see 11.10.9.11).

Table 9-162—FTM Range subelement IDs for FTM Range request

Subelement ID	Name	Extensible
0–3	Reserved	
4	Maximum Age	Yes
5–51	Reserved	
52	Neighbor Report	Subelements
53–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Maximum Age subelement indicates the maximum age of the requested FTM ranges. The format of the Maximum Age subelement is defined in Figure 9-265. The absence of a Maximum Age subelement indicates that FTM ranges determined at or after the FTM Range request is received are requested.

The Subelement ID field is defined in Table 9-162.

The Length field is defined in 9.4.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Maximum Age field of the Maximum Age subelement indicates the maximum elapsed time between when FTM ranges are determined and when an FTM Range request is received, within which the FTM ranges satisfy the FTM Range request. The Maximum Age field is encoded as an unsigned integer with units of 0.1 s. The value 0 is reserved. The value 65 535 indicates that FTM ranges determined at any time are acceptable.

The Vendor Specific subelement has the same format as the corresponding element (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.20 Measurement Report element

9.4.2.20.1 General

The Measurement Report element contains a measurement report. The format of the Measurement Report element is shown in Figure 9-289. The Measurement Report element is included in Measurement Report frames, as described in 9.6.2.3, or Radio Measurement Report frames, as described in 9.6.6.3. Measurement Types 0, 1, and 2 are used for spectrum management and are included only in Measurement Report frames. All other Measurement Types are included only in Radio Measurement Report frames. The use of Measurement Report elements and frames for spectrum management is described in 11.8.7. The use of Measurement Report elements and frames for radio measurement is described in 11.10.

	Element ID	Length	Measurement Token	Measurement Report Mode	Measurement Type	Measurement Report
Octets:	1	1	1	1	1	variable

Figure 9-289—Measurement Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Measurement Token field is set to the value of the Measurement Token field in the corresponding Measurement Request element. If the Measurement Report element is being sent autonomously, then the Measurement Token is set to 0. If the Measurement Report element is being sent in a Location Track Notification frame, then the Measurement Token field is set to the same value as the Location Configuration Request frame Dialog Token field that configured the STA to send the Location Track Notification frames.

The Measurement Report Mode field (shown in Figure 9-290) is used to indicate the reason for a failed or rejected measurement request. The Measurement Report Mode is a bit field with the following subfields defined:

— Late subfield indicates whether this STA is unable to carry out a measurement request because it received the request after the requested measurement time. The Late subfield is set to 1 to indicate the request was too late. The Late subfield is set to 0 to indicate the request was received in time for the measurement to be executed. The Late subfield only applies to spectrum management measurement and is set to 0 in all measurement report elements for radio measurement types (see Table 9-163).

— Incapable subfield indicates whether this STA is incapable of generating a report of the type specified in the Measurement Type field that was previously requested by the destination STA of this Measurement Report element. The Incapable subfield is set to 1 to indicate the STA is incapable. The Incapable subfield is set to 0 to indicate the STA is capable or the report is autonomous.

— Refused subfield indicates whether this STA is refusing to generate a report of the type specified in the Measurement Type field that was previously requested by the destination STA of this

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Measurement Report element. The Refused subfield is set to 1 to indicate the STA is refusing. The Refused subfield is set to 0 to indicate the STA is not refusing or the report is autonomous.

— All other bits are reserved.

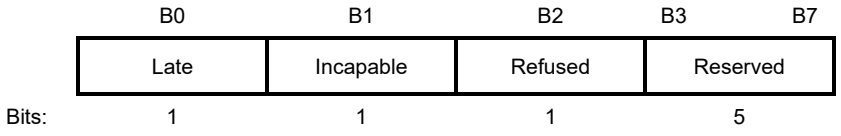

Figure 9-290—Measurement Report Mode field format

No more than one bit is set to 1 within a Measurement Report Mode field. All bits within the Measurement Mode field are set to 0 if the results of a successful measurement request or an autonomous measurement are being reported.

The Measurement Type field is set to a number that identifies the measurement report. The Measurement Types that have been allocated are shown in Table 9-163.

Table 9-163—Measurement Type field definitions for measurement reports

Name	Measurement Type
Basic	0
CCA	1
RPI Histogram	2
Channel Load	3
Noise Histogram	4
Beacon	5
Frame	6
STA Statistics	7
LCI	8
Transmit Stream/Category Measurement	9
Multicast Diagnostics	10
Location Civic	11
Location Identifier	12
Directional Channel Quality	13
Directional Measurement	14
Directional Statistics	15
FTM Range	16
Reserved	17–255

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Measurement Report field is not present when the Late subfield is equal to 1, the Incapable subfield is equal to 1, or the Refused subfield is equal to 1. Otherwise, it contains a single measurement report, as described in 9.4.2.20.2 to 9.4.2.20.11.

ANIPI is set to the average noise plus interference power value measured during the indicated Measurement Duration, using the same units and accuracy as defined for ANPI in 11.10.9.4.

RCPI is a logarithmic indication of the received channel power of the corresponding Link Measurement Request frame, as defined in 9.4.2.36.

RSNI is the ratio of the received signal power to the noise plus interference power, as defined in 9.4.2.39.

Channel Load is measured and reported as defined in 11.10.9.3.

9.4.2.20.2 Basic report

The format of the Measurement Report field corresponding to a Basic report is shown in Figure 9-291.

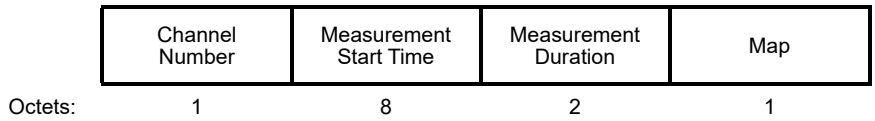

Figure 9-291—Measurement Report field format for a Basic report

The Channel Number field is set to the channel number to which the Basic report applies where the Channel Number is a value from the Channel set column in Table E-4, in a row having the same value in the Channel spacing (MHz) column as the width of the primary channel.

The Measurement Start Time field is set to the TSF at the time (± 32 μs) at which the Basic report measurement started.

The Measurement Duration field is set to the duration over which the Basic report was measured, expressed in TUs.

The Map field is coded as a bitmap, as shown in Figure 9-292, and contains the following subfields:

— BSS subfield, which is set to 1 when at least one valid MPDU was received in the channel during the measurement period from another BSS. Otherwise, the BSS subfield is set to 0.

— OFDM Preamble subfield, which is set to 1 when at least one sequence of short training symbols, as defined in 17.3.3, was detected in the channel during the measurement period without a subsequent valid SIGNAL field (see 17.3.4). This indicates the presence of an OFDM preamble, such as high-performance RLAN/2 (HIPERLAN/2). Otherwise, the OFDM Preamble subfield is set to 0.

— Unidentified Signal subfield, which is set to 1 when, in the channel during the measurement period, there is significant power detected that is not characterized as radar, an OFDM preamble, or a valid MPDU. Otherwise, the Unidentified Signal subfield is set to 0. The definition of significant power is implementation dependent.

— Radar subfield, which is set to 1 when radar was detected operating in the channel during the measurement period. The radar detection algorithm that satisfies regulatory requirements is outside the scope of this standard. Otherwise, the Radar subfield is set to 0.

— Unmeasured subfield, which is set to 1 when this channel has not been measured. Otherwise, the Unmeasured subfield is set to 0. When the Unmeasured subfield is equal to 1, all of the other subfields are set to 0.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

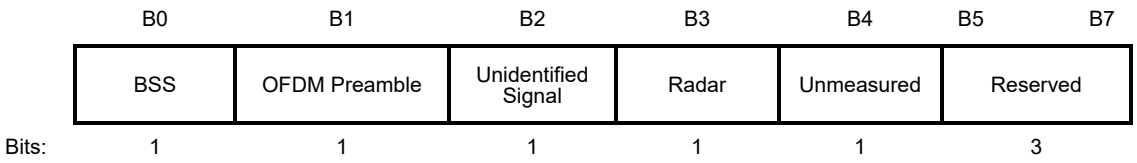

Figure 9-292—Map field format

9.4.2.20.3 CCA report

The format of the Measurement Report field corresponding to a CCA report is shown in Figure 9-293.

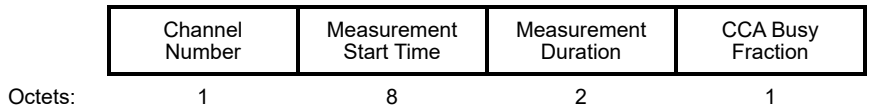

Figure 9-293—Measurement Report field format for a CCA report

The Channel Number field contains the channel number to which the CCA report applies where the Channel Number is a value from the Channel set column in Table E-4, in a row having the same value in the Channel spacing (MHz) column as the width of the primary channel.

The Measurement Start Time field is set to the TSF at the time (± 32 μs) at which the CCA report measurement started.

The Measurement Duration field is set to the duration over which the CCA report was measured, expressed in TUs.

The CCA Busy Fraction field contains the fractional duration over which CCA indicated the channel was busy during the measurement duration. The resolution of the CCA busy measurement is in microseconds. The CCA Busy Fraction value is defined as

$$\left\lceil \frac{255 \times t_{\text{busy}}}{1024 \times t_{\text{MD}}} \right\rceil$$

where

t_{busy} is the duration CCA indicated channel was busy (μs)
t_{MD} is the measurement duration (TUs)

9.4.2.20.4 RPI histogram report

The format of the Measurement Report field corresponding to an RPI histogram report is shown in Figure 9-294.

The Channel Number field is set to the channel number to which the RPI histogram report applies where the Channel Number is a value from the Channel set column in Table E-4, in a row having the same value in the Channel spacing (MHz) column as the width of the primary channel.

The Measurement Start Time field is set to the TSF at the time (± 32 μs) at which the RPI histogram report measurement started.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

	Channel Number	Measurement Start Time	Measurement Duration
Octets:	1	8	2

	RPI 0 density	RPI 1 density	RPI 2 density	RPI 3 density	RPI 4 density	RPI 5 density	RPI 6 density	RPI 7 density
Octets:	1	1	1	1	1	1	1	1

Figure 9-294—Measurement Report field format for an RPI histogram report

The Measurement Duration field is set to the duration over which the RPI histogram report was measured, expressed in TUs.

The RPI histogram report contains the RPI densities observed in the channel for the eight RPI levels defined in Table 9-164. See 11.10.12.

Table 9-164—RPI definitions for an RPI histogram report

RPI	Power observed at the antenna connector (dBm)
0	Power ≤ –87
1	–87 < Power ≤ –82
2	–82 < Power ≤ –77
3	–77 < Power ≤ –72
4	–72 < Power ≤ –67
5	–67 < Power ≤ –62
6	–62 < Power ≤ –57
7	–57 < Power

The RPI histogram report provides an additional mechanism for a STA to gather information on the state of a channel from other STAs. The STA might use this information to assist in the choice of new channel, to help avoid false radar detections, and to assess the general level of interference present on a channel.

9.4.2.20.5 Channel Load report

The format of the Measurement Report field corresponding to a Channel Load report is shown in Figure 9-295.

	Operating Class	Channel Number	Actual Measurement Start Time	Measurement Duration	Channel Load	Optional Subelements
Octets:	1	1	8	2	1	variable

Figure 9-295—Measurement Report field format for Channel Load report

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement report applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement report applies. Valid operating classes are listed in Annex E, excluding operating classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the channel number for which the measurement report applies. Channel number is defined within an operating class as shown in Annex E.

NOTE—Examples of operating classes that encompass a primary channel but do not identify the location of the primary channel are operating classes with a value of 80 or 160 in the Channel Spacing (MHz) column of the applicable table in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement report applies, and the Operating Class and Channel Number fields together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Actual Measurement Start Time field is set to the value of the measuring STA's TSF timer at the time the measurement started.

The Measurement Duration field is set to the duration over which the Channel Load report was measured, in units of TUs.

The Channel Load field contains the proportion of measurement duration for which the measuring STA determined the channel to be busy. Procedure for Channel Load measurement and definition of channel load values are found in 11.10.9.3.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-165.

Table 9-165—Optional subelement IDs for Channel Load report

Subelement ID	Name	Extensible
0–162	Reserved	
163	Wide Bandwidth Channel Switch	Yes
164–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.159), with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.20.6 Noise Histogram report

The format of the Measurement Report field of a Noise Histogram report is shown in Figure 9-296.

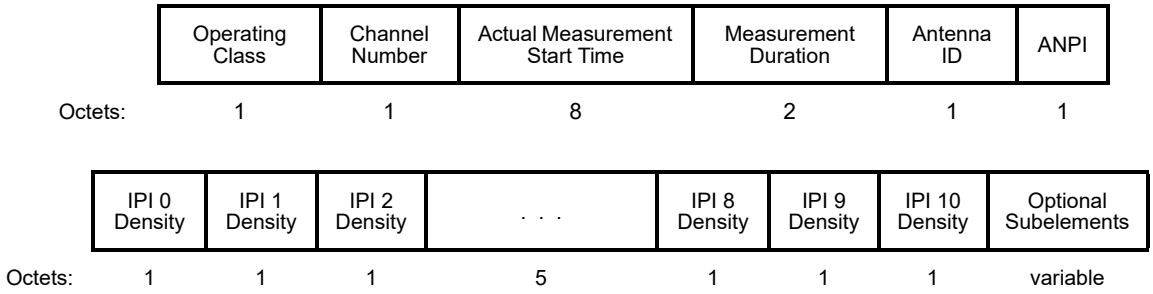

Figure 9-296—Measurement Report field format for Noise Histogram report

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement report applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement report applies. Valid operating classes are listed in Annex E, excluding operating classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the channel number for which the measurement report applies. Channel number is defined within an operating class as shown in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement report applies, and the Operating Class and Channel Number fields together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Actual Measurement Start Time field is set to the value of the measuring STA's TSF timer at the time the measurement started.

The Measurement Duration field is set to the duration over which the Noise Histogram report was measured, in units of TUs.

The Antenna ID field is set to the identifying number for the antenna(s) or DMG antenna(s) used for this measurement. The antenna ID or DMG antenna ID is defined in 9.4.2.38.

The ANPI field is set to the average noise plus interference power value measured during the indicated measurement duration while the indicated channel is idle as described in 11.10.9.4.

The Noise Histogram report contains the IPI densities, as defined in 11.10.9.4, observed in the channel for the eleven IPI levels defined in Table 9-166.

Table 9-166—IPI Definitions for a Noise Histogram report

IPI Level	IPI Measured Power (dBm)
0	IPI ≤ –92
1	–92 < IPI ≤ –89
2	–89 < IPI ≤ –86
3	–86 < IPI ≤ –83
4	–83 < IPI ≤ –80
5	–80 < IPI ≤ –75
6	–75 < IPI ≤ –70
7	–70 < IPI ≤ –65
8	–65 < IPI ≤ –60
9	–60 < IPI ≤ –55
10	–55 < IPI

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-167.

Table 9-167—Optional subelement IDs for Noise Histogram report

Subelement ID	Name	Extensible
0–162	Reserved	
163	Wide Bandwidth Channel Switch	Yes
164–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.159) with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.20.7 Beacon report

The format of the Measurement Report field corresponding to a Beacon report is shown in Figure 9-297.

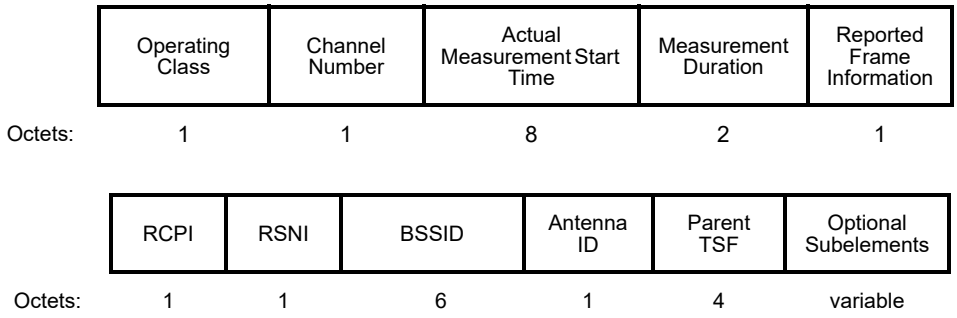

Figure 9-297—Measurement Report field format for Beacon report

The Operating Class field indicates the operating class that identifies the channel set of the received Beacon or Probe Response frame. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing of the received Beacon or Probe Response frame. Valid operating classes are listed in Annex E.

The Channel Number field indicates the channel number of the received Beacon or Probe Response frame. Channel number is defined within an operating class as shown in Annex E.

If the PPDU carrying the received frame comprises noncontiguous frequency segments, the Operating Class and Channel Number fields identify the center frequency of frequency segment 0, and a Wide Bandwidth Channel Switch subelement is included to identify the center frequency of frequency segment 1 (the other fields in the subelement indicate 80+80 bandwidth and the same center frequency of frequency segment 0 as the Operating Class and Channel Number fields); otherwise the Wide Bandwidth Channel Switch subelement is not included.

The Actual Measurement Start Time field is set to the value of the measuring STA's TSF timer at the time the measurement started.

The Measurement Duration field is set to the duration over which the Beacon report was measured, in units of TUs.

The Reported Frame Information field contains two subfields as shown in Figure 9-298.

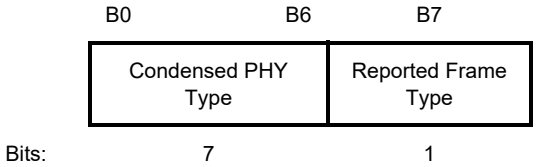

Figure 9-298—Reported Frame Information field format

The Condensed PHY Type subfield indicates the physical medium type on which the Beacon, Measurement Pilot, or Probe Response frame being reported was received. It has an integer value between 0 and 127 coded according to dot11PHYType.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Reported Frame Type subfield indicates the type of frame reported. A 0 indicates a Beacon or Probe Response frame; a 1 indicates a Measurement Pilot frame.

The RCPI field indicates the received channel power of the Beacon, Measurement Pilot, or Probe Response frame, which is a logarithmic function of the received signal power, as defined 9.4.2.36.

The RSNI field indicates the received signal-to-noise indication for the Beacon, Measurement Pilot, or Probe Response frame, as described in 9.4.2.39.

The BSSID field contains the BSSID from the Beacon, Measurement Pilot, or Probe Response frame being reported.

The Antenna ID field contains the identifying number for the antenna(s) or DMG antenna used for this measurement. The antenna ID or DMG antenna ID is defined in 9.4.2.38.

The Parent TSF field contains the value of the 4 least significant octets of the measuring STA's TSF timer at the start of reception of the first octet of the Timestamp field of the reported Beacon, Measurement Pilot, or Probe Response frame at the time the Beacon, Measurement Pilot, or Probe Response frame being reported was received.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-168.

Table 9-168—Optional subelement IDs for Beacon report

Subelement ID	Name	Extensible
0	Reserved	
1	Reported Frame Body	No
2	Reported Frame Body Fragment ID	No
3–162	Reserved	
163	Wide Bandwidth Channel Switch	Yes
164	Last Beacon Report Indication	No
165-220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Reported Frame Body subelement, if present, contains some or all of the fields and elements of the frame body of the reported Beacon, Measurement Pilot, or Probe Response frame. If the Reporting Detail field of the Reporting Detail subelement of the corresponding Beacon request equals 0, the Reported Frame Body subelement is not included in the Beacon report.

Some elements in the Reported Frame Body subelement, if present, or the Reported Frame Body subelement itself, might be large. In this case, some of the elements included in the Reported Frame Body subelement can be truncated or omitted, and the subelement itself can be truncated or fragmented over multiple Beacon reports (see 11.10.9.1.2).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE—This is not element fragmentation as defined in 10.28.11.

The Reported Frame Body Fragment ID subelement is present if a Reported Frame Body subelement is fragmented, and is not present otherwise. The format of the Data field of the Reported Frame Body Fragment ID subelement is shown in Figure 9-299.

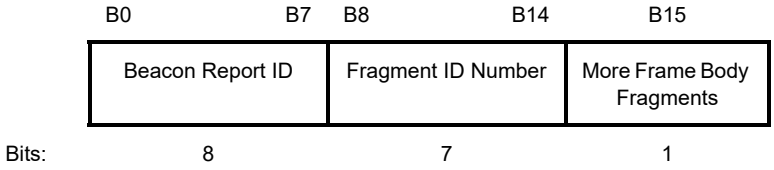

Figure 9-299—Reported Frame Body Fragment ID subelement Data field format

The Beacon Report ID field identifies the reported frame for which the Beacon reports are sent as a response to a Beacon request.

The Fragment ID Number field identifies the fragment of the fragmented Reported Frame Body subelement.

The More Frame Body Fragments field is set to 0 in the final fragment of the fragmented Reported Frame Body subelement, otherwise it is set to 1.

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.159) with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Last Beacon Report Indication subelement has the format defined in Figure 9-1078, with a Length field set to 1. When the Data field is set to 1, it indicates that this Beacon report is the last frame sent as a response to a Beacon request. A 0 indicates that there are more frames expected.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.20.8 Frame report

The format of the Measurement Report field corresponding to a Frame report is shown in Figure 9-300.

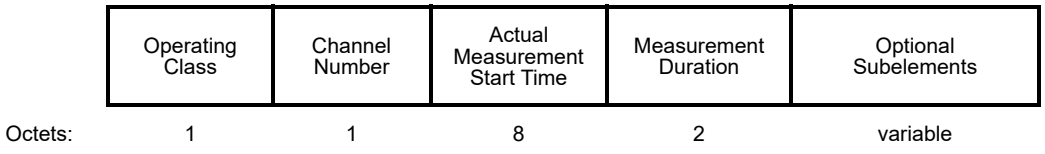

Figure 9-300—Measurement Report field format for Frame report

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement report applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement report applies. Valid operating classes are listed in Annex E, excluding operating classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the channel number for which the measurement report applies. Channel number is defined within an operating class as shown in Annex E.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement report applies, and the Operating Class and Channel Number fields together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Actual Measurement Start Time field is set to the value of the measuring STA's TSF timer at the time the measurement started.

The Measurement Duration field is set to the duration over which the Frame report was measured, in units of TUs.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-169.

Table 9-169—Optional subelement IDs for Frame report

Subelement ID	Name	Extensible
0	Reserved	
1	Frame Count Report	No
2–162	Reserved	
163	Wide Bandwidth Channel Switch	Yes
164–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Frame Count Report subelement is used to report information about frames sent by a transmitter. The Frame Count Report subelement is as shown in Figure 9-301.

	Subelement ID	Length	Frame Report Entries
Octets:	1	1	$n \times 19$

Figure 9-301—Frame Count Report subelement format

The Subelement ID field is defined in Table 9-169.

The Length field is defined in 9.4.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Frame Report Entries field contains zero or more (*n*) Frame Report Entry fields. The format of a Frame Report Entry field is shown in Figure 9-302.

	Transmitter Address	BSSID	PHY Type	Average RCPI	Last RSNI	Last RCPI	Antenna ID	Frame Count
Octets:	6	6	1	1	1	1	1	2

Figure 9-302—Frame Report Entry field format

The Transmitter Address field contains the transmitter address (TA) from the frames being reported.

The BSSID field contains the BSSID from the frames being reported.

The PHY Type field indicates the physical medium type for the frame(s) being reported. Valid entries are coded according to dot11PHYType.

The Average RCPI field indicates the average value for the received channel power of frames received and counted in this Frame Report Entry field, as described in 11.10.9.2. Average RCPI is a logarithmic function of the received signal power, as defined 9.4.2.36.

The Last RSNI field indicates the received signal-to-noise indication of the most recently measured frame counted in this Frame Report Entry field, as described in 9.4.2.39.

The Last RCPI field indicates the received channel power of the most recently measured frame counted in this Frame Report Entry field. Last RCPI is a logarithmic function of the received signal power, as defined in 9.4.2.36.

The Antenna ID field contains the identifying number for the antenna(s) or DMG antenna used to receive the most recently measured frame counted in this Frame Report Entry field. The antenna ID or DMG antenna ID is defined in 9.4.2.38.

The Frame Count field is a count of the Data and Management frames received with the indicated transmitter address and BSSID during the measurement duration. The value 65 535 indicates a count of 65 535 or more.

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.159), with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.20.9 STA Statistics report

The format of the Measurement Report field of a STA Statistics report is shown in Figure 9-303.

	Measurement Duration	Group Identity	Statistics Group Data	Optional Subelements
Octets:	2	1	variable	variable

Figure 9-303—Measurement Report field format for STA Statistics report

Copyright © 2025 IEEE. All rights reserved.

The STA Statistics report reports the change in, or current values of, the requested statistics group data measured within the measurement duration.

The Measurement Duration field is set to the duration over which the change in statistics group data was measured and reported, in units of TUs. A Measurement Duration field set to 0 indicates a report of the current values of the statistics group data.

The Group Identity field indicates the requested statistics group describing the Statistics Group Data field according to Table 9-170.

The Statistics Group Data field contains the requested statistics from the MIB in Annex C related to the interface on which the request was received according to Table 9-170. Units used for reporting a statistic or change in statistic are the units used to define the statistic in Annex C. When the Measurement Duration field is nonzero, the reported data values for statistics that are not counters are the current values of the statistics data at the end of the measurement duration. When the Measurement Duration field is zero the current values of the requested statistics group data are reported, rather than the change.

Table 9-170—Group Identity for a STA Statistics report

Group Identity Requested	Statistics Group Data field length (octets)	Statistics Returned
0	28	dot11Counters Group for the Interface on which the STA Statistics request was received (with the exception of those counters listed in Group Identity 1): dot11TransmittedFragmentCount (Counter32), dot11GroupTransmittedFrameCount (Counter32), dot11FailedCount (Counter32), dot11ReceivedFragmentCount (Counter32), dot11GroupReceivedFrameCount (Counter32), dot11FCSErrorCount (Counter32), dot11TransmittedFrameCount (Counter32)

The format of the Measurement Report field for dot11Counters Group is shown in Figure 9-304.

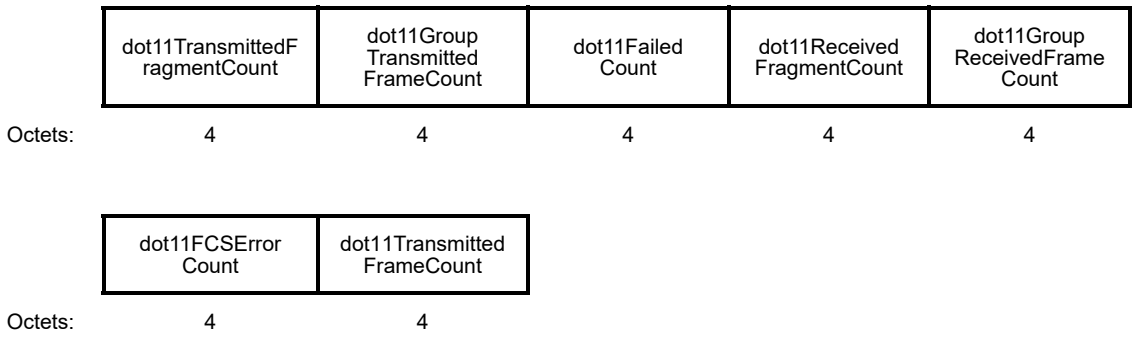

Figure 9-304—Measurement Report field format for dot11Counters Group

The format of the Measurement Report field for dot11MACStatistics is shown in Figure 9-305.

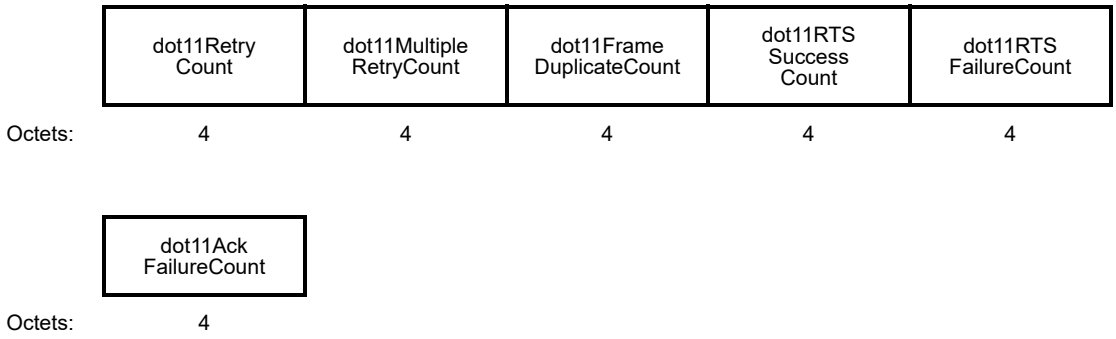

Figure 9-305—Measurement Report field format for dot11MACStatistics Group

The format of the Measurement Report field for dot11QosCounters Group for UPx is shown in Figure 9-306, where x is 0 – 7 and where the listed variables are obtained from the column of the QoS Counters Table indexed by x + 1. For example, the variables for dot11QosCounters Group for UP2 are from the third column of the dot11QosCountersTable, obtained from the dot11QosCountersEntry in which dot11QosCountersIndex is equal to 3.

The format of the Measurement Report field for dot11BSSAverageAccessDelay Group is shown in Figure 9-307. Non-QoS APs set dot11STAStatisticsAverageAccessDelayBestEffort, dot11STAStatisticsAverageAccessDelayBackGround, dot11STAStatisticsAverageAccessDelayVideo, and dot11STAStatisticsAverageAccessDelayVoice to 255 (not available).

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-171.

5	Relative Location Error	Yes
6	Usage Rules/Policy	Yes
7	Colocated BSSID List	Yes
8	Relative Compact LCI	No
9	Antenna Placement And Calibration	Yes
10–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The LCI Subelement field contains an LCI subelement. The LCI subelement is formatted as shown in Figure 9-313.

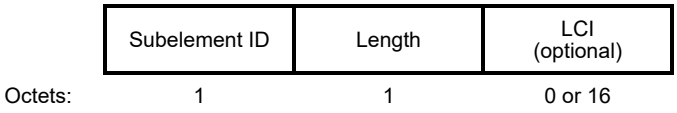

Figure 9-313—LCI subelement format

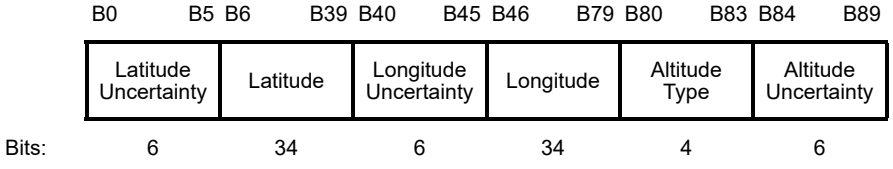
The Subelement ID field is equal to the value for LCI in Table 9-172.

The Length field is defined in 9.4.3.

The LCI field is formatted as shown in Figure 9-314.



The definitions of fields within the LCI field are as specified in section 2.2 of IETF RFC 6225 or as defined herein. This structure and information fields are based on the LCI format described in IETF RFC 6225.

NOTE 1—This example shows how to encode the coordinates of the Sydney Opera House using the encoding defined in IETF RFC 6225. The building is a polygon with the following (latitude, longitude) coordinates:

(–33.856 625°, +151.215 906°)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

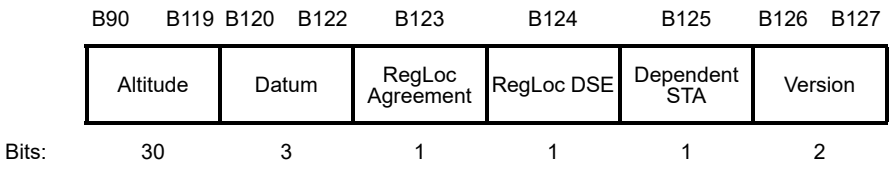


Figure 9-314—LCI field format

(–33.856 299°, +151.215 343°)
(–33.856 326°, +151.214 731°)
(–33.857 533°, +151.214 495°)
(–33.857 720°, +151.214 613°)
(–33.857 369°, +151.215 375°)

Latitude ranges from –33.857 720° to –33.856 299°; longitude ranges from +151.214 495° to +151.215 906°.

For this example, the point that is encoded is chosen by finding the middle of each range, that is (–33.857 009 5°, +151.215 200 5°), which is encoded as (11101111000100100100111011000001101,

01001011100110111000101110110000011) (2s complement, 9 bits before binary point, 25 after, MSB first).

These values can be derived as 2^{34} – Round (33.857 009 5 × 2^{25}) and Round (151.215 200 5 × 2^{25}), respectively.

The latitude uncertainty (LatUnc) is given by inserting the difference between the center value and the outer value into the formula from section 2.3.2 of IETF RFC 6225. This gives:

LatUnc = $8 - \lceil \log2(-33.8570095 - (-33.857720)) \rceil$. The result is 18, which is encoded as 010010.

Similarly, longitude uncertainty (LongUnc) is given by the formula:

LongUnc = $8 - \lceil \log2(151.2152005 - 151.214495) \rceil$. The result is also 18, which is encoded as 010010.

The top of the building is 67.4 m above sea level, and a starting altitude of 0 m above sea level is assumed. At the GPS coordinates of the Sydney Opera House, the sea level is approximately 22.5 m below the WGS84 ellipsoid. Therefore, the lowest altitude of the building is –22.5 m, while the highest altitude is (67.4 – 22.5) = 44.9 m from the WGS84 ellipsoid. The middle of the range is (44.9 – 22.5)/2 = 11.2 m, which is encoded as 00000000000000000101100110011 (22 bits before binary point, 8 after, MSB first).

Altitude uncertainty is given by the height of the building. Since the building is 67.4 m above sea level and basement is assumed to be at sea level, the uncertainty to be encoded is half of 67.4 m.

Altitude uncertainty (AltUnc) uses the formula from section 2.4.5 from IETF RFC 6225:

AltUnc = $21 - \lceil \log2(33.7 - 0) \rceil$, the result is 15, which is encoded as 001111 (MSB first).

The Altitude Type field is set to 1, indicating that the altitude is specified in meters.

The Datum field is set to 1, indicating WGS84 coordinates.

The RegLoc Agreement field is set to 0 for this example.

The RegLoc DSE field is set to 0 for this example.

The Dependent STA field is set to 0 for this example.

The Version field is set to 1, as that is the only value currently defined in IETF RFC 6225.

The LCI configuration information report for this example is encoded as (where underscores are used as field or octet delimiters):

010010_11101111000100100100111011000001101_010010_01001011100110111000101110110000011_0001_001111_00000000000000000000101100110011_001_0_0_0_01 (binary, MSB first per field)

010010_10110000011011001001001000111101111_010010_11000011011101000111011001110100 10_1000_111100_11001100110100000000000000000000_100_0_0_0_10 (binary, LSB first per field)

01001010_11000001_10110010_01001000_11110111_01001011_00001101_11010001_11011001_11010010_10001111_00110011_00110100_00000000_00000000_10000010 (binary, rearranged into octets, with LSB first per octet)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

01010010_10000011_01001101_00010010_11101111_11010010_10110000_10001011_10011011_01001011_11110001_11001100_00101100_00000000_00000000_01000001 (binary, MSB first, per octet)

52 83 4d 12 ef d2 b0 8b 9b 4b f1 cc 2c 00 00 41 (order over the PHY SAP, see 8.3.5 and 9.2.2)

The RegLoc Agreement field is set to 1 to report that the STA is operating within a national policy area or an international agreement area near a national border (see 11.11.3); otherwise, it is set to 0.

The RegLoc DSE field is set to 1 to report that the enabling STA is enabling the operation of STAs with DSE; otherwise, it is set to 0.

The Dependent STA field is set to 1 to report that the STA is operating with the enablement of the enabling STA whose LCI is being reported; otherwise, it is set to 0.

The Version field is defined in IETF RFC 6225, and its use is described in IETF RFC 6225.

The Optional Subelements field contains zero or more subelements with subelement ID greater than or equal to 1 as listed in Table 9-172. The subelement format and ordering of subelements are defined in 9.4.3.

The Azimuth Report subelement is used to report an azimuth. The Azimuth Report subelement is as shown in Figure 9-315.

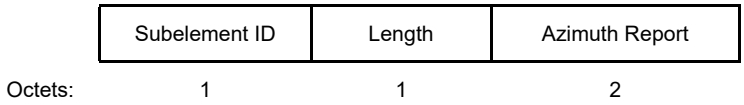

Figure 9-315—Azimuth Report subelement format

The Subelement ID field is defined in Table 9-172.

The Length field is defined in 9.4.3.

The Azimuth Report field of an Azimuth Report subelement contains three subfields as shown in Figure 9-316.

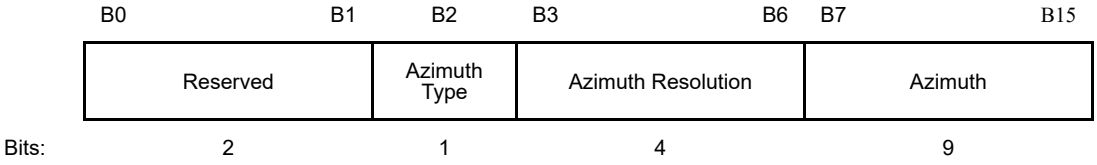

Figure 9-316—Azimuth Report subfield format

The Azimuth Type field is set to 1 to report the Azimuth of the bearing of the requester with respect to the responder and is set to 0 to report the Azimuth of front surface of the reporting STA.

The Azimuth Resolution field is 4 bits, indicating the number of valid most significant bits in the Azimuth.

The Azimuth field is a value in degrees from true north, of the type defined by the Azimuth Type field.

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA that requested the Location Information and it is present whenever the Location Subject field in the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

corresponding LCI request was set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 9-263.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information was requested and it is present whenever the Location Subject field in the corresponding LCI request was set to 2. The format of the Target MAC Address subelement is shown in Figure 9-264.

The Z subelement is used to report the floor and location of the STA with respect to the floor level. The format of the Z subelement is shown in Figure 9-317.

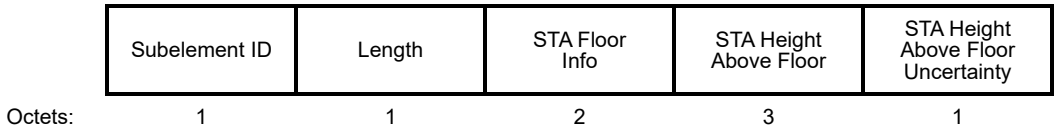

Figure 9-317—Z subelement format

The Subelement ID field is equal to the value for Z in Table 9-172.

The Length field is defined in 9.4.3.

The format of the STA Floor Info field is defined in Figure 9-317.

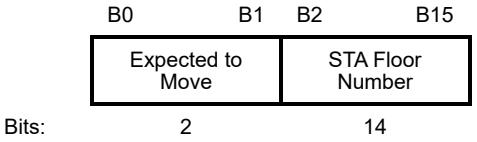

Figure 9-318—STA Floor Info field format

The Expected to Move field indicates whether the STA is expected to change its location. The value 1 indicates that the STA is expected to change its location. The value 0 indicates that the STA is not expected to change its location. The value 2 indicates that the STA's movement patterns are unknown. The value 3 is reserved.

NOTE 2—Examples of STAs that are expected to move include a) battery-powered STAs, b) STAs installed within trains/vehicles, c) STAs installed for temporary events.

The STA Floor Number field indicates the floor number of the STA. A higher value indicates a higher floor, and the integer approximates the floor number labels used at the venue (e.g., in stairwells and elevators, if present). The field is encoded as a 2s complement integer with units of $1/16^{th}$ of a floor. The value –8192 indicates an unknown floor number. The value 8191 indicates the STA's floor is 8191/16 floors or more. The value –8191 indicates the STA's floor is –8191/16 floors or less.

NOTE 3—For example, a building with floors labeled as Basement 1, Ground, Mezzanine, 1, and 2 might have the floors identified by STA Floor Number field values equal –16, 0, 8, 16 and 32 respectively.

The STA Height Above Floor field indicates the height of the STA above the floor. The field is coded as a 2s complement integer with units of 1/4096 m. The value –8 388 608 indicates an unknown STA height above floor. The value –8 388 607 indicates the height of the STA above the floor is –8 388 607/4096 m or less. The value 8 388 607 indicates the height of the STA above the floor is 8 388 607/4096 m or more.

A STA Height Above Floor Uncertainty field set to 0 indicates an unknown STA height above floor uncertainty. Values 25 or higher are reserved. A STA Height Above Floor Uncertainty field set from 1 to 24 indicates that the actual STA height above floor, *a*, is bounded according to:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$h - 2^{11-u} \le a \le h + 2^{11-u}$$

where

h is the value in units of 1/4096 m of the STA Height Above Floor field
u is the value of the STA Height Above Floor Uncertainty field

If the STA Height Above Floor field indicates an unknown STA height above floor, the STA Height Above Floor Uncertainty field is set to 0.

The Relative Location Error subelement is used to report the location error of STAs with respect to a reference STA (rather than with respect to an absolute geographic location). The format of the Relative Location Error subelement is defined in Figure 9-319.

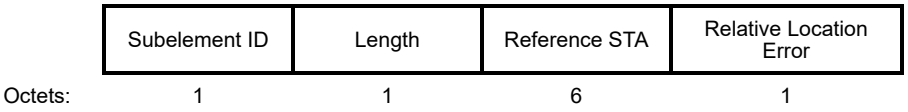

Figure 9-319—Relative Location Error subelement format

The Subelement ID field is equal to the value for Relative Location Error in Table 9-172.

The Length field is defined in 9.4.3.

The Reference STA field contains the MAC address of the reference STA.

The format of the Relative Location Error field is defined in Figure 9-320.

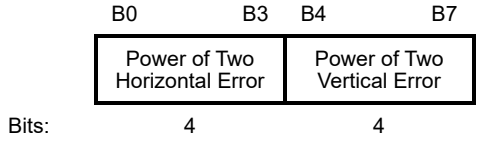

Figure 9-320—Relative Location Error field format

The Power Of Two Horizontal Error field contains an upper bound on the error between the horizontal location of the Reference STA and the Latitude and Longitude fields in the LCI subelement. The Power Of Two Horizontal Error field indicates a relative horizontal error of 2^{p-8} m, where p is the value of the Power of Two Horizontal Error field in the range 0 to 13. The value 14 indicates a relative horizontal error of greater than 32 m. The value 15 indicates an unknown relative horizontal error.

The Power Of Two Vertical Error field contains an upper bound on the error between the vertical location of the Reference STA and the Altitude field in the LCI subelement. The Power Of Two Vertical Error field indicates a relative vertical error of 2^{p-8} m, where p is the value of the Power Of Two Vertical Error field in the range 0 to 13. The value 14 indicates a relative vertical error of greater than 32 m. The value 15 indicates an unknown relative vertical error.

The Usage Rules/Policy subelement is used to report the usage rules of the reporting STA and whether additional STA or neighboring STA location information is available if the additional information can be transferred more securely. The format of the Usage Rules/Policy subelement is defined in Figure 9-321.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

	Subelement ID	Length	Usage Rules/ Policy Parameters	Retention Expires Relative (optional)
Octets:	1	1	1	0 or 2

Figure 9-321—Usage Rules/Policy subelement format

The Subelement ID field is equal to the value for Usage Rules/Policy in Table 9-172.

The Length field is defined in 9.4.3.

The Usage Rules/Policy Parameters field is defined in Figure 9-322.

	B0	B1	B2	B3	B7
	Retransmission Allowed	Retention Expires Relative Present	STA Location Policy	Reserved	
Bits:	1	1	1	5	

Figure 9-322—Usage Rules/Policy Parameters field format

The Retransmission Allowed field definition is the same as the definition for the retransmission-allowed element in IETF RFC 4119, except that the “no” and “yes” text encoding specified in IETF RFC 4119 is replaced by 0 and 1, respectively.

The Retention Expires Relative Present field indicates whether Retention Expires Relative field is present. The value 1 indicates that the Retention Expires Relative field is present; otherwise the Retention Expires Relative field is not present. If the Retention Expires Relative field is not present, it indicates that the retention duration of the LCI report field is unbounded.

The STA Location Policy field indicates whether additional STA or neighboring STA location information is available if the additional information can be transferred more securely. The security of the transfer is (from lowest to highest): unassociated, associated without RSNA established, associated with RSNA established but without management frame protection negotiated, and associated with both RSNA established and management frame protection negotiated. The additional information might be one or more of (1) the STA’s location with reduced uncertainty and (2) the location of additional neighbor APs, if the STA Location Policy field is carried within a Neighbor Report Response frame. A STA Location Policy field set to 1 indicates additional STA or neighboring STA location information is available. A STA Location Policy field set to 0 indicates no additional STA or neighboring STA location information is available.

The definition of the Retention Expires Relative field is the same as the definition for the retention-expires element in IETF RFC 4119, except that the absolute time text encoding specified in IETF RFC 4119 is replaced by a relative binary encoding: the Retention Expires Relative field is encoded as a number of hours in the future relative to the time of transmission of the Usage Rules/Policy subelement.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

The Colocated BSSID List subelement is used to report the list of BSSIDs of the BSSs sharing the same antenna connector with the reporting STA if the subelement is contained within a Fine Time Measurement frame, otherwise the BSSs that are colocated within the same physical device as the reporting STA.

The format of the Colocated BSSID List subelement is shown in Figure 9-323.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

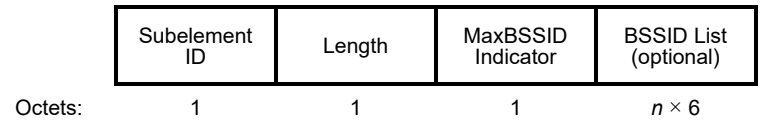

Figure 9-323—Colocated BSSID List subelement format

The Subelement ID field is equal to the value for Colocated BSSID list in Table 9-172.

The Length field is defined in 9.4.3.

The MaxBSSID Indicator field is defined in 9.4.2.44. When set to a nonzero value, it indicates the maximum possible number of BSSs, including the reference BSS, which share the same antenna connector and have the same 48 bits (BSSID[0:(47-n)]) of the BSSIDs. When the BSSIDs of the colocated BSSs are configured at the reporting STA but not represented by the MaxBSSID Indicator field, the BSSID List field is present in the Colocated BSSID List subelement to provide an explicit list of such BSSID values.

When the MaxBSSID Indicator field is equal to 0, the BSSID List field contains one or more (n) BSSID values of the BSSs sharing the same antenna connector with the reporting STA.

NOTE 4—For example, if there are 4 BSSs sharing the same antenna connector and their BSSIDs end with 16, 24, 30, and 31, and the range of MAC addresses ending with 16-31 are not assigned to other BSSs using a different antenna connector, then this list of 4 BSSIDs can be indicated with a MaxBSSID Indicator field set to 5. Otherwise, the MaxBSSID Indicator field is set to 0 and the BSSIDs are listed separately.

The Relative Compact LCI field is formatted as shown in Figure 9-324.

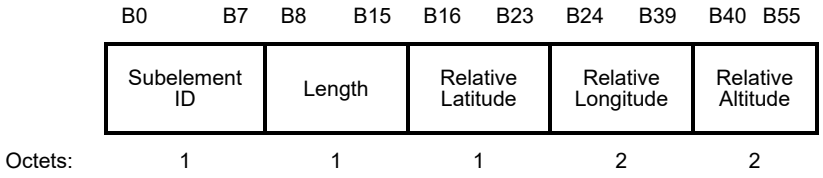

Figure 9-324—Relative Compact LCI field format

The Relative Compact LCI field is included in the Passive TB Ranging LCI Table Report element; see 9.4.2.308 that contains an RSTA LCI Report field. The reported location of the RSTA serves as the reference location for the reporting of the Relative Latitude, Longitude, and Altitude subfields in the Relative Compact LCI field.

The Relative Latitude subfield contains a signed integer in 2s complement format indicating the latitude offset of the reported location in relation to the reference location, in units of 1.8×10^{-7} deg. (Corresponds to approximately 2 cm at the equator.)

The Relative Longitude subfield contains a signed integer in 2s complement format indicating the longitude offset of the reported location in relation to the reference location, in units of 1.8×10^{-7} deg. (Corresponds to approximately 2 cm at the equator.)

The Relative Altitude subfield contains a signed integer in 2s complement format indicating the elevation offset of the reported location in relation to the reference location, in units of 2 cm.

The Antenna Placement And Calibration subelement contains the antenna placement and the delay information for each of the transmit antennas. The format of the Antenna Placement And Calibration subelement is shown in Figure 9-325.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

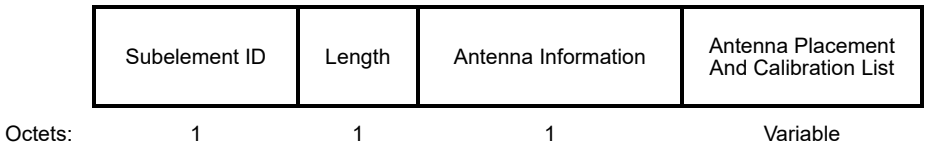

Figure 9-325—Antenna Placement And Calibration subelement format

The Subelement ID field is equal to the value for Antenna Placement And Calibration in Table 9-172.

The Length field is defined in 9.4.3.

The Antenna Information field is formatted as shown in Figure 9-326, where the Number of Selected Antennas subfield indicates the total number of the antennas selected for transmission minus one. The total number of the antennas selected for transmission is denoted as N_{Tx_sel}, as shown in Figure 9-326 and Figure 9-327.

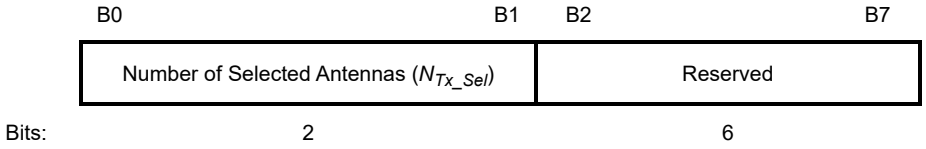

Figure 9-326—Antenna Information field format

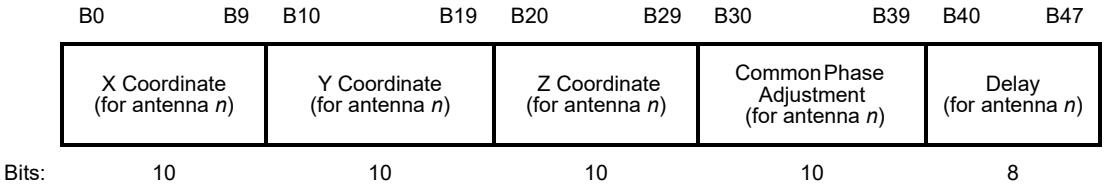
The Antenna Placement And Calibration List field is composed of N_{Tx_Sel} Antenna Placement And Calibration fields, where N_{Tx_Sel} is greater than or equal to one. The format of the Antenna Placement And Calibration field is shown in Figure 9-327. The order of the antenna ports indicated in the Antenna Placement And Calibration List field matches the order of the rows in the P matrix applied to the space time streams spatial mapped to the antenna ports.



Where "(for antenna *n*)" represents the *n*th antenna in the range 1 to N_{Tx_Sel}

Figure 9-327—Antenna Placement And Calibration field format

The X Coordinate field, Y Coordinate field, and Z Coordinate field contain the placement information of each antenna, where the origin of the axis that is defined by the Latitude, Longitude, and Altitude field values of the LCI subelement, the X axis points to the East, the Y axis points to the North, and the Z axis points up and is perpendicular to the plane formed by the X axis and the Y axis.

The values in the X, Y, and Z Coordinate field range from 0 to 1023, mapping to –512 to 511, in units of millimeters.

The value in the Common Phase Adjustment subfield indicates the additional phase rotation introduced in the RF chain that is common for all subcarriers. The value for this subfield, denoted k, ranges from 0 to 1023, and indicates a phase adjustment of $k \times \pi / 512$.

9.4.2.20.11 Transmit Stream/Category Measurement report

The Transmit Stream/Category Measurement report applies to TIDs for Traffic Streams associated with TSPECs and also to TIDs for Traffic Categories for QoS traffic without TSPECs. The format of the Measurement Report field corresponding to a Transmit Stream/Category Measurement report is shown in Figure 9-328.

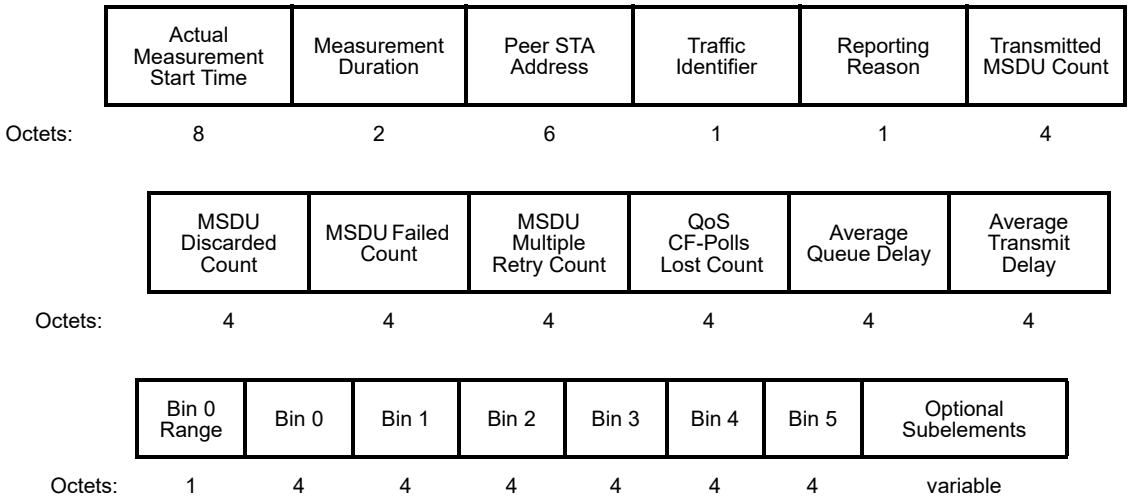

Figure 9-328—Measurement Report field format for Transmit Stream/Category Measurement report

The Actual Measurement Start Time field is set to the TSF at the time at which the measurement started, or for a triggered Transmit Stream/Category Measurement report, the TSF value at the reporting QoS STA when the trigger condition was met.

The Measurement Duration field is set to the duration over which the Transmit Stream/Category Measurement report was measured, in units of TUs. In a triggered Transmit Stream/Category Measurement report, metrics are reported over a number of transmitted MSDUs rather than a duration; hence Measurement Duration is set to 0; see 11.10.9.8.

The Peer STA Address field contains a MAC address indicating the RA for the measured frames.

The Traffic Identifier field contains the TID subfield as shown in Figure 9-266. The TID subfield indicates the TC or TS for which traffic was measured.

The Reporting Reason field is a bitmap indicating the reason that the measuring QoS STA sent the transmit stream/category measurement report. The Reporting Reason field is shown in Figure 9-329.

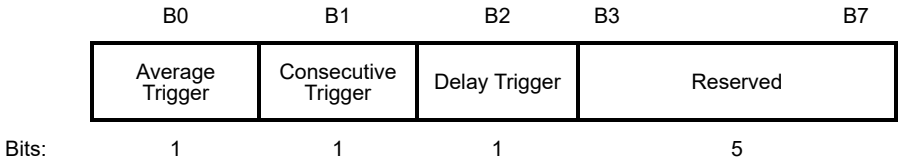

Figure 9-329—Reporting Reason field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The Average Trigger subfield set to 1 indicates that the Transmit Stream/Category Measurement report was generated as a triggered report due to the average error trigger.
— The Consecutive Trigger subfield set to 1 indicates that the Transmit Stream/Category Measurement report was generated as a triggered report due to the consecutive error trigger.
— The Delay Trigger subfield set to 1 indicates that the Transmit Stream/Category Measurement report was generated as a triggered report due to the delay exceeding the delay threshold.

When a Transmit Stream/Category Measurement report is sent as a direct response to a Transmit Stream/Category Measurement request and not as a triggered Transmit Stream/Category Measurement report, all subfields in the Reporting Reason field are set to 0. This is termed a requested Transmit Stream/Category Measurement report. Within a triggered Transmit Stream/Category Measurement report, more than one subfield in the Reporting Reason field might be set to 1 if more than one trigger condition was met.

The Transmitted MSDU Count, MSDU Failed Count, MSDU Discarded Count, MSDU Multiple Retry Count, QoS CF-Polls Lost Count, Average Queue Delay, Average Transmit Delay, and delay histogram fields relate to transmissions to the QoS STA given in the Peer STA Address field. Metrics are reported over the Measurement Duration, or for triggered transmit stream/category measurements, over the Measurement Count. Any counter that increments to a value of 2^{32}–1 terminates the measurement.

The Transmitted MSDU Count field contains the number of MSDUs for the TC or the TS specified by the TID that were successfully transmitted.

The MSDU Discarded Count field contains the number of MSDUs for the TC or the TS specified by the TID that were discarded due either to the number of transmit attempts exceeding dot11ShortRetryLimit, or due to the MSDU lifetime having been reached.

The MSDU Failed Count field contains the number of MSDUs for the TC or the TS specified by the TID that were discarded due to the number of transmit attempts exceeding dot11ShortRetryLimit.

The MSDU Multiple Retry Count field contains the number of MSDUs for the TC or the TS specified by the TID that were successfully transmitted after more than one retransmission attempt.

The QoS CF-Polls Lost Count field contains the number of QoS (+)CF-Poll frames that were transmitted where there was no response from the QoS STA. QoS CF-Polls Lost Count are returned only if the reporting QoS STA is contained within an AP and the TID is for a TS. This field is set to 0 when QoS CF-Polls Lost Count is not returned.

The Average Queue Delay field is the average queuing delay of the frames (MSDUs) that are passed to the MAC for the indicated peer STA address and the indicated traffic identifier. Queue Delay is expressed in TUs and is measured from the time the MSDU is passed to the MAC until the point at which the first or only corresponding MPDU begins transmission.

The Average Transmit Delay field is the average delay of the frames (MSDUs) that are successfully transmitted for the indicated Peer STA Address and TID. Average Transmit Delay is measured from the time the MSDU is passed to the MAC until the point at which the entire MSDU has been successfully transmitted, including receipt of the final Ack frame from the peer STA if the QoSAck service class is being used. Average Transmit delay is expressed in units of TUs.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Bin 0 Range field value indicates the delay range of the first bin (Bin 0) of the Transmit Delay Histogram, in units of TUs. It is also used to calculate the delay ranges of the other five bins making up the histogram. The delay range for each bin increases in a binary exponential fashion as follows:

Bin 0 range: $0 \le \text{Delay} < B_0$ = Bin 0 Range field value

Bin i range: $2^{i-1} \times B_0 \le \text{Delay} < 2^i \times B_0$, for $1 \le i \le 4$

Bin 5 range: $16 \times B_0 \le \text{Delay}$

For example, if the Bin 0 Range field value is 10 TUs, the bin delay ranges are as defined in Table 9-173.

Table 9-173—Delay definitions for a Transmit Stream/Category Measurement report for a Bin 0 Range field value of 10 TU

Bin	Measured MSDU Transmit Delay (TUs)
0	Delay < 10
1	10 ≤ Delay < 20
2	20 ≤ Delay < 40
3	40 ≤ Delay < 80
4	80 ≤ Delay < 160
5	160 ≤ Delay

To compute the value reported in Bin i (i.e., B_i for i = 0, 1...5 of the Transmit Delay Histogram), the STA initializes all bin values to 0. For each MSDU successfully transmitted, the measured MSDU Transmit Delay determines the bin to be incremented. If the measured delay has a duration t within Bin i, then Bin i is increased by one. MSDU Transmit Delay is measured from the time the MSDU is passed to the MAC until the point at which the entire MSDU has been successfully transmitted, including receipt of the final Ack frame from the peer STA if the QoSAck service class is being used. The sum of the values in all six bins is equal to the value reported in the Transmitted MSDU Count.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-174.

Table 9-174—Optional subelement IDs for Transmit Stream/Category Measurement report

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.20.12 Multicast Diagnostics report

The format of the Measurement Report field of a Multicast Diagnostics report is shown in Figure 9-330.

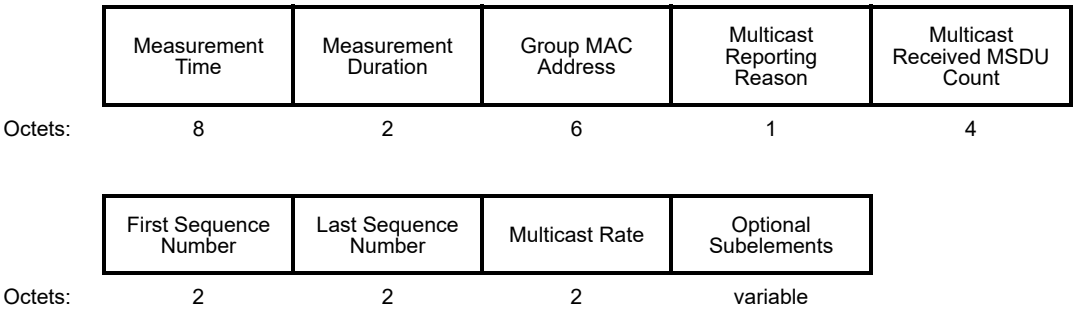

Figure 9-330—Measurement Report field format for a Multicast Diagnostics report

The Measurement Time field is the value of the STA TSF timer at the time the measurement started. In a triggered Multicast Diagnostics report, this is the TSF value at the reporting STA when the trigger condition was met. When the reason for sending the report is Performance Measurement and the Multicast Received MSDU Count is nonzero, the Measurement Time field is the value of the STA TSF timer at the time of the first group addressed MSDU received during the measurement interval.

The Measurement Duration field specifies the period over which the Multicast Diagnostic report was generated, in units of TUs.

The Group MAC Address field contains the value from the Group MAC Address field from the Multicast Diagnostics request to which the report relates.

The Multicast Reporting Reason field indicates the reason why the measuring STA sent the Multicast Diagnostics report. The Multicast Reporting Reason field is shown in Figure 9-331.

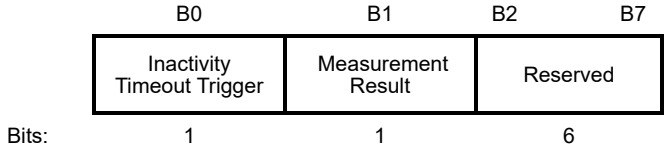

Figure 9-331—Multicast Reporting Reason field format

The subfields of the Multicast Reporting Reason field are defined as follows:

— The Inactivity Timeout Trigger field set to 1 indicates that Multicast Diagnostics report was generated as a triggered report due to the timeout of the multicast diagnostic timer.

— The Measurement Result field set to 1 indicates that the Multicast Diagnostic report contains the result of completing a Multicast Diagnostic request that did not contain a Multicast Triggered Reporting subelement.

All of the bits in the Multicast Reporting Reason field are independent.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Multicast Received MSDU Count field contains the total number of group addressed MSDUs with the indicated multicast MAC address that were received during the measurement duration. For a triggered multicast diagnostics measurement, the Multicast Received MSDU Count field contains the total number of group addressed MSDUs with the indicated multicast MAC address that were received between the acceptance of the multicast diagnostics measurement request and the occurrence of the trigger condition.

When bit 0 of the Multicast MAC address field in the Multicast Diagnostics request is 1, the twelve LSBs of the First Sequence Number field contain the sequence number of the first frame received with destination address equal to the value in the Multicast MAC address field during the measurement period. When bit 0 of the Multicast MAC address field in the Multicast Diagnostics request is 0, the twelve LSBs of the First Sequence Number field contain the sequence number of the first group addressed frame, that does not have the broadcast address as its destination, received during the measurement period. The four most significant bits of the First Sequence Number field are set to 0.

When bit 0 of the Multicast MAC address field in the Multicast Diagnostics request is 1, the twelve LSBs of the Last Sequence Number field contain the sequence number of the last frame received with destination address equal to the value in the Multicast MAC address field during the measurement period. When bit 0 of the Multicast MAC address field in the Multicast Diagnostics request is 0, the twelve LSBs of the Last Sequence Number field contain the sequence number of the last group addressed frame, that does not have the broadcast address as its destination, received during the measurement period. The four most significant bits of the Last Sequence Number field are set to 0.

The First Sequence Number field and the Last Sequence Number field are set to 0 if the Multicast Received MSDU Count is 0.

The Multicast Rate field specifies the highest data rate, in 0.5 Mb/s units, at which the STA has received a group addressed frame during the measurement period. The Multicast Rate field is encoded with the MSB set to 1 to indicate that the data rate is in the basic rate set, and set to 0 to indicate that the data rate is not in the basic rate set. The remaining 15 bit value is multiplied by 0.5 Mb/s to indicate the data rate. The Multicast Rate field is 0 by the STA to indicate that it has not received a group addressed frame during the measurement period.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-175.

Table 9-175—Optional subelement IDs for Multicast Diagnostics report

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.24).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The summary of fields used in the STA Multicast Diagnostics report is shown in Table 9-176.

Table 9-176—Summary of fields used in the STA Multicast Diagnostics report

Field	Measurement Result	Triggered Report
Measurement Time	Yes	Yes
Measurement Duration	Yes	Yes
Group MAC Address	Yes	Yes
Multicast Reporting Reason	Yes	Yes
Multicast Received MSDU Count	Yes	Yes
First Sequence Number	Yes	Yes
Last Sequence Number	Yes	Yes
Multicast Rate	Yes	Yes
Optional Subelements	Optional	Optional

The use of Multicast Diagnostics report is defined in 11.10.19.

9.4.2.20.13 Location Civic report

The Location Civic report includes the location information defined in civic format for the location subject provided in the Location Civic request, as shown in Figure 9-332.

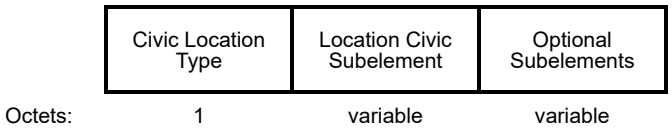

Figure 9-332—Location Civic report field format

The Civic Location Type field contains the format of location information in the Location Civic Subelement field, as indicated in Table 9-154.

The subelement IDs of the Location Civic report are defined in Table 9-177.

Table 9-177—Subelement IDs for Location Civic report

Subelement ID	Name	Extensible
0	Location Civic	No
1	Originator Requesting STA MAC Address	No
2	Target MAC Address	No
3	Location Reference	No
4	Location Shape	No

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-177—Subelement IDs for Location Civic report *(continued)*

Subelement ID	Name	Extensible
5	Map Image	No
6	Reserved	
7	Colocated BSSID List	Yes
8	Map Registration	No
9–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Location Civic Subelement field contains a Location Civic subelement. The Location Civic subelement of the Location Civic report (see Figure 9-332) is formatted according to Figure 9-333.

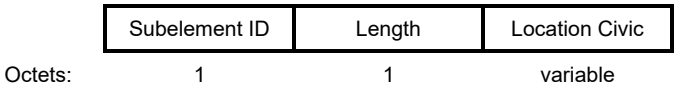

Figure 9-333—Location Civic subelement format

The Subelement ID field is equal to Location Civic as defined in Table 9-177.

The Location Civic field contains the location information in the format as indicated in the Civic Location Type field. When the Civic Location Type field is IETF RFC 4776:

— The Location Civic field is formatted according to IETF RFC 4776 starting at the country code field (i.e., excluding the GEOCONF_CIVIC/ OPTION_GEOCONF_CIVIC, N/option-len and what fields)
— An unknown civic location is indicated bya zero-length Location Civic field
— The Location Civic field follows the little-endian octet ordering

The Optional Subelements field contains zero or more subelements with subelement ID greater than or equal to 1 as listed in Table 9-177. The subelement format and ordering of subelements are defined in 9.4.2. The Optional Subelements field includes zero or one of each subelement, except that the Optional Subelements field includes zero or more Vendor Specific subelements.

If the Civic Location Type field is IETF RFC 4776 and the Optional Subelements field includes

— a Map Image subelement wherein the Map URL field does not include floor map georegistration parameters, then the Optional Subelements field also includes a Location Shape subelement
— a Location Shape subelement, then the Optional Subelements field also includes a Location Reference subelement
— both a Map Image subelement wherein the Map URL field does not include floor map georegistration parameters and a Location Reference subelement with nonzero Length field, then the Optional Subelements field also includes a Map Registration subelement
— a Location Reference subelement with Length field equal to 0, then the Optional Subelements field also includes a Map Image subelement wherein the Map URL field does not include floor map georegistration parameters and optionally includes a Map Registration subelement.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— a Map Image subelement wherein the Map URL field does include floor map georegistration parameters, then the Optional Subelements field does not include a Location Shape subelement, a Location Reference subelement nor a Map Registration subelement.

NOTE 1—In the case of a Map Image subelement wherein the Map URL field does include floor map georegistration parameters, a precise location can be conveyed separately via a Measurement Report element with the Measurement Type field set to LCI.

If the Civic Location Type field value is Vendor Specific, the Optional Subelements field includes at least one Vendor Specific subelement that identifies the Organization Identifier corresponding to the Civic Location Type field.

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA that requested the Location Information and it is present whenever the Location Subject field in the corresponding Location Civic request was set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 9-263.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information was requested and it is present whenever the Location Subject field in the corresponding Location Civic request was set to 2. The format of the Target MAC Address subelement is shown in Figure 9-264.

The format of the Location Reference subelement is shown in Figure 9-334.

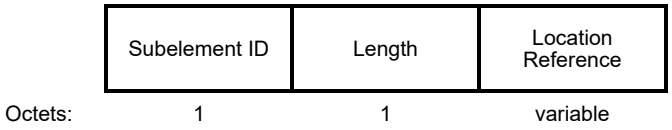

Figure 9-334—Location Reference subelement format

The Location Reference field is an ASCII string that defines the origin of the coordinate reference system and is used for the relative locations and offsets contained in the Location Shape subelement and in the Map Registration subelement. A Location Reference subelement with Length field equal to 0 indicates that the origin is the point with the same X-coordinate as the most western feature in the floor map, with the same Y-coordinate as the most northern feature in the floor map, and with the same Z-coordinate as the feature with the lowest altitude in the floor map.

NOTE 2—The floor map is identified by the Map Image subelement.

The format of the Location Shape subelement is shown in Figure 9-335.

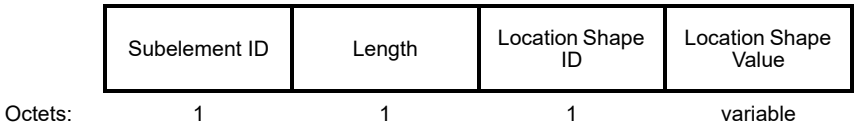

Figure 9-335—Location Shape subelement format

The Location Shape subelement defines the position in meters, including uncertainty, of the entity being located. A Shape is specified with respect to either a 2-dimensional or 3-dimensional coordinate reference system where each point in the shape defines the direction from the point indicated by the Location Reference field. Relative to the point indicated by the Location Reference field: a positive X-axis value corresponds to an easterly direction, a negative X-axis value corresponds to a westerly direction, a positive Y-axis value corresponds to a northerly direction, a negative Y-axis value corresponds to a southerly

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

direction, a positive Z-axis value corresponds to an upward direction, and a negative Z-axis value corresponds to a downward direction.

The Location Shape ID field defines the shape contained in the subelement and is one of the values defined in Table 9-178.

Table 9-178—Location Shape IDs

Location Shape ID	Name
0	Reserved
1	2-Dimension Point
2	3-Dimension Point
3	Circle
4	Sphere
5	Polygon
6	Prism
7	Ellipse
8	Ellipsoid
9	Arcband
10–255	Reserved

The Location Shape Value field contains the location shape value for each corresponding location shape ID. The formats of location shape values are described in the following text.

All shape fields that are 4-octet floating point values are in units of meters and are represented by binary32 floating point values as defined in IEEE Std 754-2008, with the least significant bit of the fraction occurring in bit 0 of the field. All shape fields that are 2-octet angles are integers (see 9.2.2) in degrees, between 0 and 359.

The format of the 2-Dimension Point Location Shape Value field is defined in Figure 9-336.

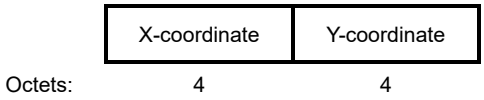

Figure 9-336—2-Dimension Point Location Shape Value format

The X-coordinate field contains the X-coordinate of the point, encoded as a floating point value.

The Y-coordinate field contains the Y-coordinate of the point, encoded as a floating point value.

The format of the 3-Dimension Point Location Shape Value field is defined in Figure 9-337.

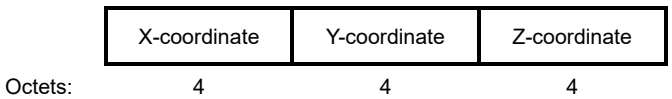

Figure 9-337—3-Dimension Point Location Shape Value format

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The X-coordinate field contains the X-coordinate of the point, encoded as a floating point value.

The Y-coordinate field contains the Y-coordinate of the point, encoded as a floating point value.

The Z-coordinate field contains the Z-coordinate of the point, encoded as a floating point value.

The format of the Circle Location Shape Value field is defined in Figure 9-338.

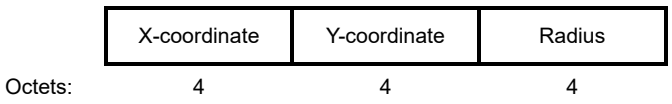

Figure 9-338—Circle Location Shape Value format

The X-coordinate field contains the X-coordinate of the center of the circle, encoded as a floating point value.

The Y-coordinate field contains the Y-coordinate of the center of the circle, encoded as a floating point value.

The Radius field contains the radius of the circle, encoded as a floating point value.

The format of the Sphere Location Shape Value field is defined in Figure 9-339.

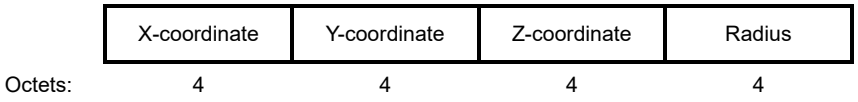

Figure 9-339—Sphere Location Shape Value format

The X-coordinate field contains the X-coordinate of the center of the sphere, encoded as a floating point value.

The Y-coordinate field contains the Y-coordinate of the center of the sphere, encoded as a floating point value.

The Z-coordinate field contains the Z-coordinate of the center of the sphere, encoded as a floating point value.

The Radius field contains the radius of the sphere, encoded as floating point value.

The format of the Polygon Location Shape Value field is defined in Figure 9-340.

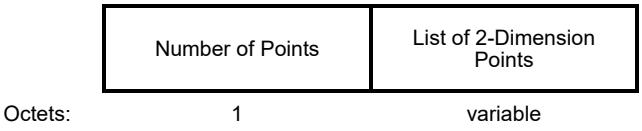

Figure 9-340—Polygon Location Shape Value format

The Number of Points field specifies the number of points defined in the polygon. The value 0 is reserved.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The List of 2-Dimension Points field is a sequence of 2-Dimension Point Location Shape Value fields that define the closed polygon.

The format of the Prism Location Shape Value field is defined in Figure 9-341.

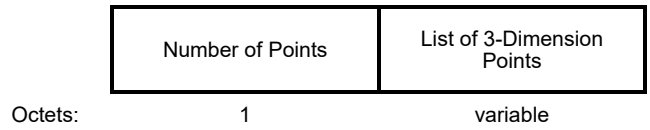

Figure 9-341—Prism Location Shape Value format

The Number of Points field specifies the number of points defined in the prism. The value 0 is reserved.

The List of 3-Dimension Points field is a sequence of 3-Dimension Point Location Shape Value fields that define the closed prism.

The format of the Ellipse Location Shape Value field is defined in Figure 9-342.

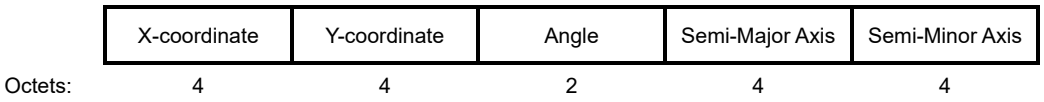

Figure 9-342—Ellipse Location Shape Value format

The X-coordinate field contains the X-coordinate of the center of the ellipse, encoded as a floating point value.

The Y-coordinate field contains the Y-coordinate of the center of the ellipse, encoded as a floating point value.

The Angle field contains the angle of the semi-major axis of the ellipse, measured clockwise from north (see IETF RFC 5491).

The Semi-Major Axis field contains the semi-major axis of the ellipse, encoded as a floating point value.

The Semi-Minor Axis field contains the semi-minor axis of the ellipse, encoded as a floating point value.

The format of the Ellipsoid Location Shape Value field is defined in Figure 9-343.

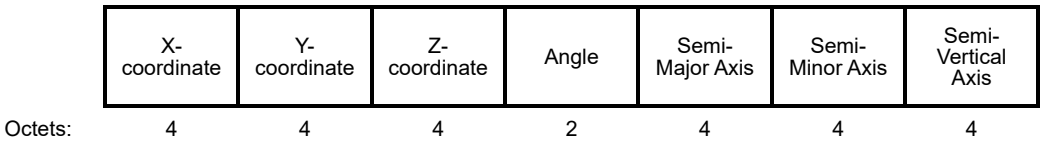

Figure 9-343—Ellipsoid Location Shape Value format

The X-coordinate field contains the X-coordinate of the center of the ellipsoid, encoded as a floating point value.

The Y-coordinate field contains the Y-coordinate of the center of the ellipsoid, encoded as a floating point value.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Z-coordinate field contains the Z-coordinate of the center of the ellipsoid, encoded as a floating point value.

The Angle field contains the angle of the semi-major axis of the ellipsoid, measured clockwise from north (see IETF RFC 5491).

NOTE 3—The semi-major axis lies in the XY-plane.

The Semi-Major Axis field contains the semi-major axis of the ellipsoid, encoded as a floating point value.

The Semi-Minor Axis field contains the semi-minor axis of the ellipsoid, encoded as a floating point value.

The Semi-Vertical Axis field contains the semi-vertical axis of the ellipsoid, encoded as a floating point value.

An arcband is defined in IETF RFC 5491.

The format of the Arcband Location Shape Value field is defined in Figure 9-344.

	X-coordinate	Y-coordinate	Inner Radius	Outer Radius	Start Angle	Opening Angle
Octets:	4	4	4	4	2	2

Figure 9-344—Arcband Location Shape Value format

The X-coordinate field contains the X-coordinate of the central point of the arcband, encoded as a floating point value.

The Y-coordinate field contains the Y-coordinate of the central point of the arcband, encoded as a floating point value.

The Inner Radius field contains the inner radius of the arcband, encoded as a floating point value.

The Outer Radius field contains the outer radius of the arcband, encoded as a floating point value.

The Start Angle field contains the start angle of the arcband, measured clockwise from north (see IETF RFC 5491).

The Opening Angle field contains the opening angle of the arcband (see IETF RFC 5491).

The Map Image subelement contains a map reference that is used in combination with the Location Reference and Location Shape subelements. The format of the Map Image subelement is shown in Figure 9-345.

	Subelement ID	Length	Map Type	Map URL
Octets:	1	1	1	variable

Figure 9-345—Map Image subelement format

The Map Type field defines the type of map referred to by the Map URL field, as defined in Table 9-179.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-179—Map types

Map Type Value	Name
0	URL Defined
1	png
2	gif
3	jpeg
4	svg
5	dxf
6	dwg
7	dwf
8	cad
9	tiff
10	gml
11	kml
12	bmp
13	pgm
14	ppm
15	xbm
16	xpm
17	ico
18–255	Reserved

The Map Type field value “URL Defined” indicates the Map URL field value has a file extension, and that the type of map referred to by the Map URL field is to be determined from this.

NOTE 4—Other Map Type field values are intended for use when the Map URL field value does not have a file extension that allows the type of map to be determined.

The Map URL field is a variable length field formatted in accordance with IETF RFC 3986 and provides the retrieval location of the floor map. The Map URL field optionally includes floor map georegistration parameters as unordered query parameters in the URL’s query string, where each of the following query parameters define string representations of numbers with arbitrary precision, with units of degrees:

— s_lat: the most southern feature in the floor map
— w_lng: the most western feature in the floor map
— n_lat: the most northern feature in the floor map
— e_lng: the most eastern feature in the floor map

NOTE 5—Seven decimal places of latitude and longitude provide sufficient resolution to achieve under 0.01 m of latitude error and longitude error throughout the globe. Considering the sizes of devices whose positions are being estimated and the use cases for the estimated positions, a map georegistration error of under 0.01 m is generally regarded as sufficient to avoid compromise of the estimated positions.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 6—Consider a floor map of the Sydney Opera House where the floor map is cropped to the minimal rectangle that encloses the building perimeter, and the building perimeter is described by a polygon with vertices having the following (latitude, longitude) coordinates:

— (-33.856 625 0°, +151.215 906 0°)
— (-33.856 299 0°, +151.215 343 0°)
— (-33.856 326 0°, +151.214 731 0°)
— (-33.857 533 0°, +151.214 495 0°)
— (-33.857 720 0°, +151.214 613 0°)
— (-33.857 369 0°, +151.215 375 0°)

Then, if the retrieval location for the floor map is http://www.example.com/floorMapImages/floorMapImage.png then the Map URL field that includes the floor map georegistration parameters could be http://www.example.com/floorMapImages/floorMapImage.png?w_lng=151.21449500&n_lat=-33.8562990&e_lng=151.2159060&s_lat=-33.8577200.

The Colocated BSSID List subelement is used to report the list of BSSIDs of the BSSs sharing the same antenna connector with the reporting STA if the subelement is contained within a Fine Time Measurement frame, otherwise the BSSs that are colocated within the same physical device as the reporting STA. The Colocated BSSID List subelement is described in 9.4.2.20.10.

The Map Registration subelement reports the registration of the floor map to the coordinate reference system.

	Subelement ID	Length	X Min	Y Min	Z Min	X Max (Optional)	Y Max (Optional)	Z Max (Optional)
Octets:	1	1	4	4	4	0 or 4	0 or 4	0 or 4

Figure 9-346—Map Registration subelement format

The Subelement ID field is equal to Map Registration as defined in Table 9-177.

The X Min, Y Min, Z Min, X Max, Y Max, and Z Max fields, when present, contain floating point values represented by binary32 floating point values as defined in IEEE Std 754-2008, with the least significant bit of the fraction occurring in bit 0 of the field. These fields have units of meters and are defined with respect to the Location Reference subelement. For a rasterized floor map, these fields indicate the outermost edge (rather than the center) of the outermost pixels in the specified X or Y direction.

The X Min field is the X-coordinate of the most western feature in the floor map.

The Y Min field is the Y-coordinate of the most southern feature in the floor map.

The Z Min field is the Z-coordinate of the lowest feature in the floor map.

The X Max field, if other than NAN, is the X-coordinate of the most eastern feature in the floor map. The X Max field is optionally present. When present and other than NAN, the X Max field, together with the X Min field, is used to scale the floor map along the X-axis. When present and set to NAN, the X Max field is a padding field.

The Y Max field is the Y-coordinate of the most northern feature in the floor map. The Y Max field is optionally present. When present, the Y Max field, together with the Y Min field, is used to scale the floor map along the Y-axis. If the Y Max field is present, then the X Max field is also present.

The Z Max field is the Z-coordinate of the highest feature in the floor map. The Z Max field is optionally present. When present, the Z Max field, together with the Z Min field, is used to scale the floor map along

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the Z-axis. If the Z Max field is present, then the X Max and Y Max fields are also present. For a 2-dimensional floor map, the Z Max field is not present or set to the Z Min field.

If the Length field of the Location Reference subelement contained in the Location Civic report is equal to 0 then the X Min and Z Min fields are equal to 0 and the Y Max field is present and equal to 0.

NOTE 7—In this case, the X Max field is present and might be set to NAN or another value.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.24).

9.4.2.20.14 Location Identifier report

The Location Identifier report includes an indirect reference to the location information for the location subject provided in the Location Identifier request, as shown in Figure 9-347.

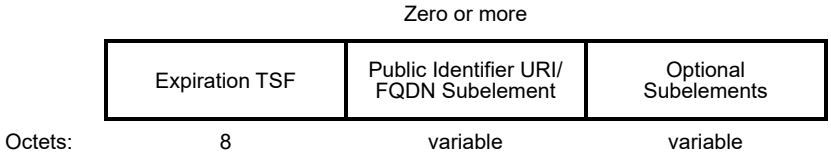

Figure 9-347—Location Identifier report field format

The Expiration TSF field is the value of the TSF when the Public Identifier URI/FQDN subelement(s) that indicate a location object are no longer valid. The Expiration TSF field set to 0 indicates the Public Identifier URI/FQDN subelement(s) that indicate a location object do not expire.

The Public Identifier URI/FQDN Subelement field contains zero or more Public Identifier URI/FQDN subelements.

The subelement IDs for the Location Identifier report are shown in Table 9-180.

Table 9-180—Subelement IDs for Location Identifier report

Subelement ID	Name	Extensible
0	Public Identifier URI/FQDN	No
1	Originator Requesting STA MAC Address	No
2	Target MAC Address	No
3–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Public Identifier URI/FQDN subelement of the Location Identifier report (see Figure 9-347) is formatted according to Figure 9-348.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

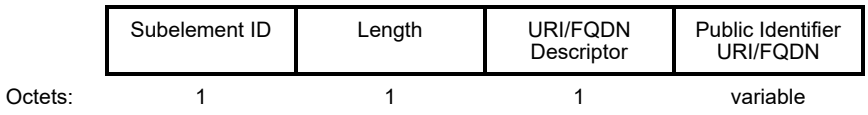

Figure 9-348—Public Identifier URI/FQDN subelement format

The Subelement ID is equal to Public Identifier URI/FQDN as defined in Table 9-180.

The URI/FQDN Descriptor field describes the Public Identifier URI/FQDN field. The URI/FQDN Descriptor field is defined in Table 9-181.

Table 9-181—URI/FQDN Descriptor field values

Value	Usage
0	Reserved
1	The uniform resource locator (URI) of the Hypertext Transfer Protocol (HTTP) enabled location delivery (HELD) location object [IETF RFC 5985]
2	Fully qualified domain name of D-SLP SUPL server (excludes port number) [OMA-TS-ULP-V2_0_1 (or higher version)]
3–255	Reserved

The Public Identifier URI/FQDN field contains a URI as a UTF-8 string, formatted in accordance with IETF RFC 3986, that points to a location object or an FQDN that identifies a location server.

A Public Identifier URI/FQDN field that points to a location object can be used to return the location value for the requesting STA. The format of the location value returned when the URI is dereferenced is dependent on the provider of the URI as indicated by the URI/FQDN Descriptor field. The Public Identifier URI field confirms the validity of the location estimate to an external agent when a STA forwards a location estimate to that agent. The protocol used to query the infrastructure for a location report based on the Public Identifier URI field is beyond the scope of this standard.

A Public Identifier URI/FQDN field that points to a location server can be used to discover the location server and establish communications with it. The protocol used with the location server is indicated by the URI/FQDN Descriptor field.

The Optional Subelements field contains zero or more subelements with subelement ID greater than or equal to 1 as listed in Table 9-180. The subelement format and ordering of subelements are defined in 9.4.3.

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA that requested the Location Information and it is present whenever the Location Subject field in the corresponding Location Identifier request was set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 9-263.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information was requested and it is present whenever the Location Subject field in the corresponding Location Identifier request was set to 2. The format of the Target MAC Address subelement is shown in Figure 9-264.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.24).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.20.15 Directional Channel Quality report

The format of the Measurement Report field of a Directional Channel Quality report is shown in Figure 9-349.

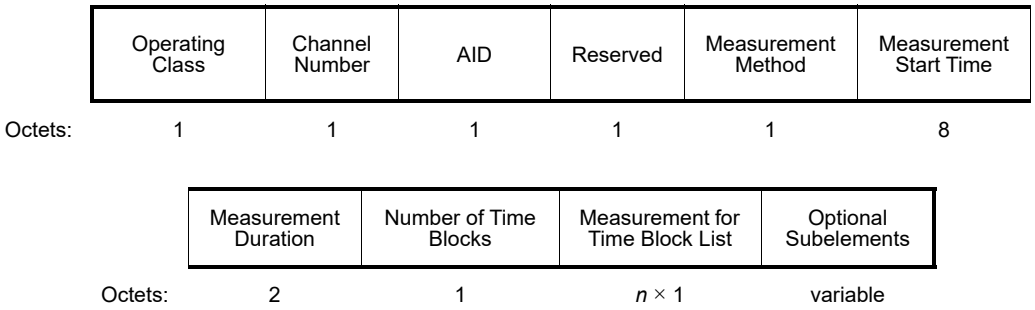

Figure 9-349—Measurement report field format for Directional Channel Quality report

The Operating Class field indicates the channel set for which the measurement report applies. The Operating Class and Channel Number fields together specify the channel frequency and spacing for which the measurement report applies. Valid values of the Operating Class field are shown in Annex E.

The Channel Number field indicates the channel number for which the measurement report applies. The channel number is defined within an Operating Class as shown in Annex E.

The AID field contains the AID assigned to the Target STA by the AP or PCP.

The Measurement Method field indicates the method used by the STA to carry out this measurement request and the format of the Measurement for Time Block field(s). If this field is set to 0, it indicates that the Measurement for Time Block fields are expressed in ANIPI. If this field is set to 1, it indicates that the Measurement for Time Block fields are expressed in RSNI. If this field is set to 2, it indicates that the Measurement for Time Block fields are expressed in ANIPI during the duration of the requested measurement, in units of 1 μs. If this field is set to 3, it indicates that the Measurement for Time Block fields are expressed in RSNI during the duration of the requested measurement, in units of 1 μs. Other values are reserved.

Measurement Start Time field is set to the value of the measuring STA's TSF timer at the time the measurement started.

If the Measurement Method field is not 2 or 3, the Measurement Duration field is set to the duration of the measurement, in units of TUs. If the Measurement Method field is 2 or 3, the Measurement Duration field is set to the duration of the requested measurement, in units of 1 μs (TU/1024).

The Number of Time Blocks field indicates the number of time blocks, *n*, within the measurement duration. The ratio (Measurement Duration/Number of Time Blocks) provides the duration of an individual measurement unit.

The Measurement for Time Block List field contains one or more (*n*) Measurement for Time Block fields.

Each Measurement for Time Block field is set to the ANIPI or RSNI value measured during each (Measurement Duration/Number of Time Blocks) measurement units. The measurement units are set in the report in increasing order of start times.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-182.

Table 9-182—Optional subelement IDs for Directional Channel Quality report

Subelement ID	Name	Extensible
0	Measurement Configuration	Yes
1	Extended Measurement Configuration	Yes
2	Extended Measurement Report	Yes
3–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Measurement Configuration subelement indicates measurement configuration information for which the measurement report applies and is used between a pair of EDMG STAs. The Data field of the Measurement Configuration subelement is formatted as shown in Figure 9-350.

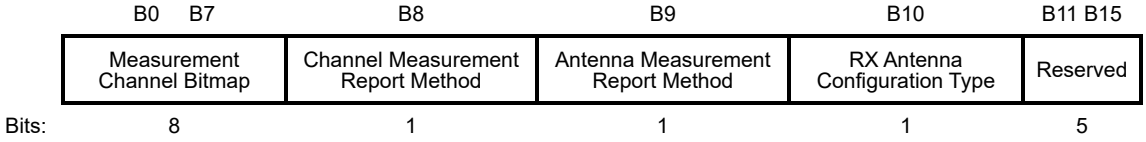

Figure 9-350—Data field format of the Measurement Configuration subelement

The Measurement Channel Bitmap subfield is a bitmap that indicates the 2.16 GHz channel(s) to which the measurement report applies and is formatted as shown in Figure 9-351. In Figure 9-351, Ch1 subfield corresponds to channel 1, Ch2 subfield corresponds to channel 2 and so on (channels are defined in Annex E). If a subfield is set to 1, the measurement report applies to the indicated channel; otherwise, if the subfield is set to 0, the measurement report does not apply to the indicated channel.

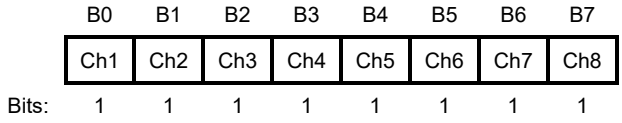

Figure 9-351—Measurement Channel Bitmap subfield format

The Channel Measurement Report Method subfield indicates the method that is to be used by the Reporting STA to report the results of measurements over multiple 2.16 GHz channels in the measurement report. The Channel Measurement Report Method subfield sets to 0 to indicate the results of measurements over all the requested 2.16 GHz channels during each measurement time block are reported per 2.16 GHz channel. The Channel Measurement Report Method subfield sets to 1 to indicate the averaged results of concurrent measurements over all the requested 2.16 GHz channels during each measurement time block are reported. The Channel Measurement Report Method subfield is set to 0 when the Extended Measurement Configuration subelement is present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Antenna Measurement Report Method subfield indicates the method that is to be used by the Reporting STA to report the results of concurrent measurements using multiple RX DMG antennas in the measurement report. The Antenna Measurement Report Method subfield is set to 0 to indicate the results of concurrent measurements over each requested 2.16 GHz channel using multiple RX DMG antennas during a measurement time block are reported per DMG antenna. The Antenna Measurement Report Method subfield is set to 1 to indicate the averaged results of concurrent measurements over each requested 2.16 GHz channel using multiple RX DMG antennas during a measurement time block are reported.

The RX Antenna Configuration Type subfield is set to 0 to indicate that the RX antenna configuration used for SISO reception is used for measurements, and is set to 1 to indicate that the RX antenna configuration used for SU-MIMO reception is used for measurements.

The Extended Measurement Configuration subelement is present if the Measurement Configuration subelement is present. The Extended Measurement Configuration subelement contains measurement timing information for the channels indicated in the Measurement Configuration subelement. If the Extended Measurement Configuration subelement is not present, the measurement timing information indicated in the Measurement Report field applies to all reported channels. If the Extended Measurement Configuration subelement is present, the measurement timing information indicated in the Measurement Report field applies to the first reported channel (i.e., the reported channel with the lowest channel number) and measurement timing information indicated in the Extended Measurement Configuration subelement applies to the remaining reported channels in ascending order in terms of channel number. The Data field of the Extended Measurement Configuration subelement is formatted as shown in Figure 9-352.

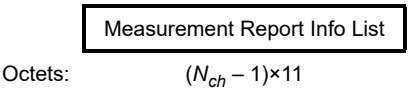

Figure 9-352—Data field of the Extended Measurement Configuration subelement format

The Measurement Report Info List field contains $(N_{ch} - 1)$ Measurement Report Info subfields, where N_{ch} is the total number of reported channels. Each Measurement Report Info subfield is defined in Figure 9-353.

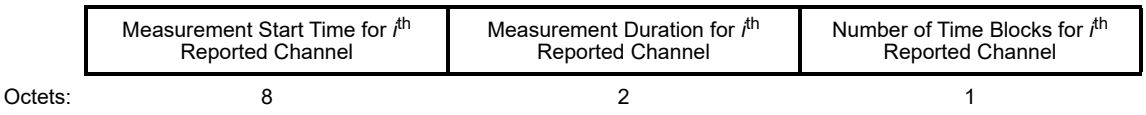

Figure 9-353—Measurement Report Info subfield format

The measurement timing information for the i^{th} reported channels is indicated in the Measurement Start Time for i^{th} Reported Channel subfield, the Measurement Duration for i^{th} Reported Channel subfield and Number of Time Blocks for i^{th} Reported Channel subfield, where $i = 2, 3, \ldots, N_{ch}$. The definition of these subfields is the same as the corresponding subfields in Measurement Report field (Figure 9-349).

The Extended Measurement Report subelement contains supplementary results of measurements performed by an EDMG STA over multiple 2.16 GHz channels using multiple RX DMG antennas. The format of the Extended Measurement Report data field depends on the values of the Channel Measurement Report Method subfield and the Antenna Measurement Report Method subfield. When both the Channel Measurement Report Method subfield and the Antenna Measurement Report Method subfield are 0, the results of measurements over the first 2.16 GHz channel using the first RX DMG antenna are carried in the Measurement for Time Blocks fields and the remaining results of measurements are carried in the Extended Measurement Report subelement. The Extended Measurement Report subelement data field format when both the Channel Measurement Report Method subfield and the Antenna Measurement Report Method

subfield are 0 is shown in Figure 9-354. The Number of RX Antennas for the j^{th} Reported Channel field (j = 1, 2, …, N_{ch}) indicates the number of RX DMG antennas used by the reporting EDMG STA to perform measurements on the j^{th} reported channel. The Measurement Results for 1st Reported Channel field consists of N1 Measurement for Time Block subfields for each of N_{RX},1 RX DMG antennas excluding the first RX DMG antenna. The Measurement Results for j^{th} Reported Channel field (j = 2, 3, …, N_{ch}) consists of Nj Measurement for Time Block subfields for each of $N_{RX,j}$ RX DMG antenna.

	Number of RX Antennas for 1st Reported Channel ($N_{RX,1}$)	Measurement Results for 1st Reported Channel	Number of RX Antennas for 2nd Reported Channel ($N_{RX,2}$)	Measurement Results for 2nd Reported channel	…	Number of RX Antennas for N_{ch}^{th} Reported Channel ($N_{RX,Nch}$)	Measurement Results for N_{ch}^{th} Reported channel
Octets:	1	$N_1 \times (N_{RX,1}-1)$	1	$N_2 \times N_{RX,2}$		1	$N_{Nch} \times N_{RX,Nch}$

Figure 9-354—Extended Measurement Report data field format when both the Channel Measurement Report Method subfield and the Antenna Measurement Report Method subfield are set to 0

When the Channel Measurement Report Method subfield is 0 and the Antenna Measurement Report Method subfield is 1, the results of measurements over the first 2.16 GHz channel using multiple RX DMG antennas are carried in the Measurement for Time Blocks fields and the remaining results of measurements are carried in the Extended Measurement Report subelement. The Extended Measurement Report subelement data field format when the Channel Measurement Report Method subfield is 0 and the Antenna Measurement Report Method subfield is 1 is shown in Figure 9-355. The Measurement Results for j^{th} Requested Channel field (j = 2, 3, …, N_{ch}) consists of Nj Measurement for Time Block subfields.

	Measurement Results for 2nd Reported Channel	Measurement Results for 3rd Reported Channel	…	Measurement Results for N_{ch}^{th} Reported Channel
Octets:	*N*2	*N*3		N_{Nch}

Figure 9-355—Extended Measurement Report data field format when the Channel Measurement Report Method subfield is set to 0 and the Antenna Measurement Report Method subfield is set to 1

When the Channel Measurement Report Method subfield is 1 and the Antenna Measurement Report Method subfield is 0, the results of measurements over multiple 2.16 GHz channels using the first RX DMG antenna are carried in the Measurement for Time Blocks fields and the remaining results of measurements are carried in the Extended Measurement Report subelement. The Extended Measurement Report subelement data field format when the Channel Measurement Report Method subfield is 1 and the Antenna Measurement Report Method subfield is 0 as shown in Figure 9-356.

	Number of Rx Antennas (NRX)	Measurement Results for 2nd RX DMG Antenna	Measurement Results for 3rd RX DMG Antenna	…	Measurement Results for NRX RX DMG Antenna
Octets:	1	*N*	*N*		*N*

Figure 9-356—Extended Measurement Report data field format when the Channel Measurement Report Method subfield is set to 1 and the Antenna Measurement Report Method subfield is set to 0

When the Channel Measurement Report Method subfield is 1 and the Antenna Measurement Report Method subfield is 1, the results of measurements over multiple 2.16 GHz channels using multiple RX DMG antennas are completely carried in the Measurement for Time Blocks fields.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.20.16 Directional Measurement report

The format of the Measurement Report field of a Directional Measurement report is shown in Figure 9-357.

	Operating Class	Channel Number	Measurement Start Time	Measurement Duration per Direction	Measurement Method And Antenna Configuration	Measurement Results	Optional Subelements
Octets	1	1	8	2	1	variable	variable

Figure 9-357—Measurement Report field format for Directional Measurement report

The Operating Class field indicates the channel set for which the measurement report applies. The Operating Class and Channel Number fields together specify the channel frequency and spacing for which the measurement report applies. Valid values of the Operating Class field are shown in Annex E.

The Channel Number field indicates the channel number for which the measurement report applies. The channel number is defined within an Operating Class as shown in Annex E.

The Measurement Start Time field is set to the value of the measuring STA's TSF timer at the time the measurement started.

The Measurement Duration per Direction field is set to the duration of the measurement in each receiving direction, in units of TUs.

The Measurement Method And Antenna Configuration field is defined in Figure 9-358.

	B0 B2	B3 B4	B5 B7
	Measurement Method	Antenna Configuration	Reserved
Bits:	3	2	3

Figure 9-358—Measurement Method And Antenna Configuration field format

Copyright © 2025 IEEE. All rights reserved.

The Measurement Method subfield indicates the method used by the STA to carry out the measurement request and the format of values in the Measurement for Direction fields. The Measurement Method subfield is defined in Table 9-183.

Table 9-183—Measurement Method subfield definition

Measurement Method subfield value	Definition
0	Values in the Measurement for Direction fields are expressed in ANIPI as defined in 9.4.2.20.15.
1	Values in the Measurement for Direction fields are expressed in RCPI as defined in 9.4.2.36.
2	Values in the Measurement for Direction fields are expressed in Channel Load as defined in 11.10.9.3.
3–7	Reserved.

The Antenna Configuration subfield indicates the configuration of the DMG antenna(s) used by the STA to carry out the measurement. If this subfield is set to 1, it indicates a quasi-omni antenna pattern. If this subfield is set to 2, it indicates a directional antenna pattern. Other values are reserved.

The format of the Measurement Results field is shown in Figure 9-359.

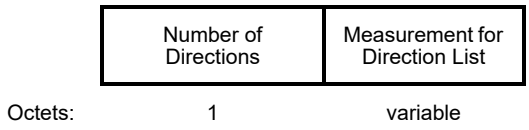

Figure 9-359—Measurement Results field format

The Number of Directions field is set to the number of measurement directions, *n*.

The Measurement for Direction List field contains one or more (*n*) Measurement for Direction fields.

Each Measurement for Direction field is set to the format of values specified in the Measurement Method subfield.

If the Antenna Configuration subfield is equal to 2, the Measurement for Direction 1 subfield contains the measurement results corresponding to the direction the reporting STA uses to receive frames from the requesting STA

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-184.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-184—Optional subelement IDs for Directional Measurement report

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

9.4.2.20.17 Directional Statistics report

The format of the Measurement Report field of a Directional Statistics report is shown in Figure 9-360.

	Operating Class	Channel Number	Measurement Start Time	Measurement Duration per Direction	Measurement Method	Directional Statistics Bitmap	Measurement Results	Optional Subelements
Octets	1	1	8	2	1	1	variable	variable

Figure 9-360—Measurement Report field format for Directional Statistics report

The Operating Class field indicates the channel set for which the measurement report applies. The Operating Class and Channel Number fields together specify the channel frequency and spacing for which the measurement report applies. Valid values of the Operating Class field are shown in Annex E.

The Channel Number field indicates the channel number for which the measurement report applies. The channel number is defined within an Operating Class as shown in Annex E.

The Measurement Start Time field is set to the value of the measuring STA's TSF timer at the time the measurement started.

The Measurement Duration per Direction field is set to the duration of the measurement in each receiving direction, in units of TUs.

The Measurement Method field indicates the method used by the STA to carry out the measurement request and the format of values in the Measurement Results field. If this field is set to 0, it indicates that the values in the Measurement Results field are expressed in ANIPI. If this field is set to 1, it indicates that the values in the Measurement Results field are expressed in RCPI. If this field is set to 2, it indicates that the values in the Measurement Results field are expressed in Channel Load. Other values are reserved.

The Directional Statistics Bitmap field format is described in 9.4.2.19.18. When the Maximum field is set, it indicates that the maximum measurement result among all directions is included in the Measurement Results field. When the Minimum field is set, it indicates that the minimum measurement result among all directions is included in the Measurement Results field. If the Average field is set, it indicates that the average measurement result among all directions is included in the Measurement Results field. If the Variance field is set, it indicates that the variance of measurement results among all directions is included in the Measurement Results field. Other bits are reserved.

The Measurement Results field is set based on the values in the Measurement Method field and the Directional Statistics Bitmap field. If two or more subfields in the Directional Statistics Bitmap are set to 1, the corresponding measurement results are included in the Measurement Results field in the same sequence as they appear in the Directional Statistics Bitmap field.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-185.

Table 9-185—Optional subelement IDs for Directional Statistics report

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.20.18 FTM Range report

The format of the Measurement Report field corresponding to an FTM Range report is shown in Figure 9-361.

	Range Entry Count	Range Entry	Error Entry Count	Error Entry	Optional Subelements
Octets:	1	*M* x 15	1	*N* x 11	variable

Figure 9-361—Measurement Report field format for an FTM Range report

The Range Entry Count field indicates the number of Range Entry fields (i.e., *M* in Figure 9-361).

The Range Entry field indicates parameters relating to a successful range measurement with a single AP and is formatted according to Figure 9-362.

	Measurement Start Time	BSSID	Range	Max Range Error Exponent	Reserved
Octets:	4	6	3	1	1

Figure 9-362—Range Entry field format

The Measurement Start Time field contains the least significant 4 octets of the TSF (synchronized with the associated AP) at the time (± 32 μs) at which the first FTM frame within the first burst (FTM_2 in Figure 11-44. FTM_1 in Figure 11-45 and FTM_1 in Figure 11-46) was transmitted where the timestamps of both the frame and response frame were successfully measured.

The BSSID field contains the BSSID of the BSS of the AP whose range is being reported.

The Range field indicates the estimated range between the requested STA and the AP using the FTM procedure, in units of 1/4096 m. A value of 2^{24}–1 indicates a range of (2^{24}–1)/4096 m or higher. See 11.10.9.11.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Max Range Error Exponent field contains an upper bound for the error in the value specified in the Range field. A Max Range Error Exponent field set to 0 indicates an unknown error. A nonzero value indicates a maximum range error of $2^{(Max\ Range\ Error\ Exponent\ -\ 13)}$ m. The Max Range Error Exponent field has a maximum value of 25. Values in the range 26–255 are reserved. A Max Range Error Exponent field set to 25 indicates a maximum range error of 4096 m or higher. For example, a Max Range Error Exponent field set to 14 indicates that the Range field has a maximum error of ± 2 m.

The Error Entry Count field indicates the number of Error Entry fields (i.e., *N* in Figure 9-361).

The Error Entry field indicates parameters relating to a failed range measurement with a single AP and is formatted according to Figure 9-363.

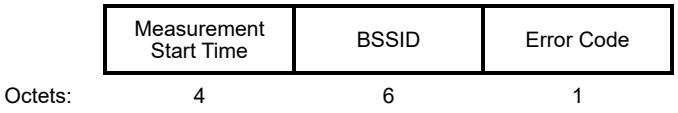

Figure 9-363—Error Entry field format

The Measurement Start Time field contains the least significant 4 octets of the TSF (synchronized with the associated AP) at the time (± 32 μs) at which the FTM failure was first detected.

The BSSID field contains the BSSID of the BSS of the AP whose range was attempted to be measured.

The Error Code field is defined in Table 9-186.

Table 9-186—Error Code field values

Error code	Meaning
0–1	Reserved
2	AP reported “Request incapable”
3	AP reported “Request failed. Do not send new request for a specified period”
4–7	Reserved
8	Unable to successfully transmit to AP
9–255	Reserved

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-187.

Table 9-187—Optional subelement IDs for FTM Range report

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.21 Quiet element

The Quiet element defines an interval during which no transmission occurs in the current channel. This interval might be used to assist in making channel measurements without interference from other STAs in the BSS. The format of the Quiet element is shown in Figure 9-364.

	Element ID	Length	Quiet Count	Quiet Period	Quiet Duration	Quiet Offset
Octets:	1	1	1	1	2	2

Figure 9-364—Quiet element format

The Element ID and Length fields are defined in 9.4.2.1.

The Quiet Count field is set to the number of TBTTs until the beacon interval during which the next quiet interval starts. The value of 0 is reserved.

The Quiet Period field is set to the number of beacon intervals between the start of regularly scheduled quiet intervals defined by this Quiet element. A Quiet Period field set to 0 indicates that no periodic quiet interval is defined.

The Quiet Duration field is set to the duration of the quiet interval, expressed in TUs.

The Quiet Offset field is set to the offset of the start of the quiet interval from the TBTT specified by the Quiet Count field, expressed in TUs. The value of the Quiet Offset field is less than one beacon interval.

The use of Quiet elements is described in 11.8.3.

9.4.2.22 IBSS DFS element

The IBSS DFS element contains information for DFS operation in an IBSS. The format of the IBSS DFS element is shown in Figure 9-365.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

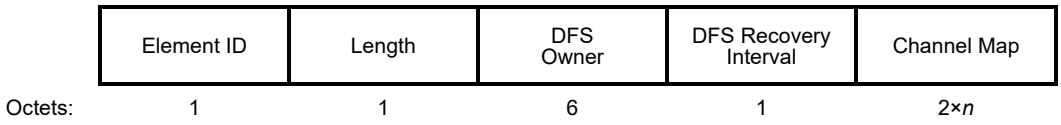

Figure 9-365—IBSS DFS element format

The Element ID and Length fields are defined in 9.4.2.1.

The DFS Owner field is set to the MAC address of the STA that is the currently known DFS Owner in the IBSS.

The DFS Recovery Interval field indicates the time interval that is used for DFS owner recovery, expressed as an integer number of beacon intervals. The DFS Recovery Interval value is static throughout the lifetime of the IBSS and is determined by the STA that starts the IBSS.

The Channel Map field shown in Figure 9-366 contains a Channel Number field and a Map field (see 9.4.2.20.2) for each channel supported by the STA transmitting the IBSS DFS element. Note that *n* in Figure 9-365 is the number of channels supported by the STA.

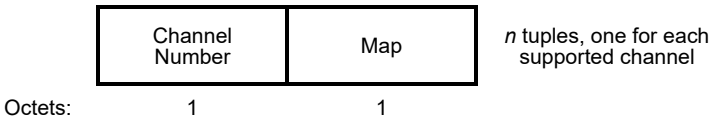

Figure 9-366—Channel Map field format

The use of IBSS DFS elements is described in 11.8.8.3.

9.4.2.23 RSNE

9.4.2.23.1 General

The RSN element (RSNE) contains the information required to establish an RSNA. The format of the RSNE is defined in Figure 9-367.

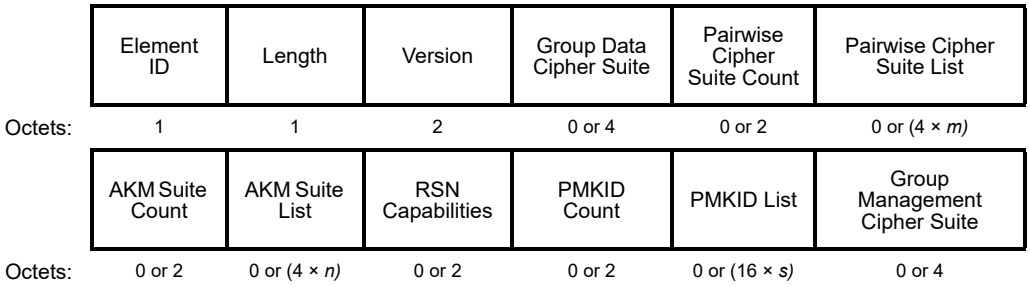

Figure 9-367—RSNE format

The Element ID and Length fields are defined in 9.4.2.1.

The size of the RSNE is limited by the size of an element, which is 255 octets. Therefore, the number of pairwise cipher suites, AKM suites, and PMKIDs is limited.

In Figure 9-367, *m* denotes the pairwise cipher suite count, *n* the AKM suite count, and *s* the PMKID count.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

All fields use the bit convention from 9.2.2. All fields after the Version field are optional. If the Group Data Cipher Suite, Pairwise Cipher Suite Count, AKM Suite Count, RSN Capabilities or PMKID Count field is absent, then all of the subsequent fields are also absent.

The Version field indicates the version number of the RSN protocol. Version 1 is defined in this standard. Other values are reserved.

NOTE 1—The following represent sample elements:

IEEE 802.1X authentication, CCMP-128 pairwise and group data cipher suites:

30, // Element ID, i.e., 48 in decimal
14, // Length in octets, i.e., 20 in decimal
01 00, // Version 1

80 00, // Management frame protection is enabled but not required
00 00, // PMKID count
00 0F AC 06 // BIP-CMAC-128 as group management cipher suite

NOTE 2—Preauthentication is deprecated.

9.4.2.23.2 Cipher suites

The Group Data Cipher Suite field contains the cipher suite selector used in the BSS to protect group addressed Data frames.

The Pairwise Cipher Suite Count field indicates the number of pairwise cipher suite selectors that are contained in the Pairwise Cipher Suite List field. The value 0 is reserved.

The Pairwise Cipher Suite List field contains a series of cipher suite selectors that indicate the pairwise cipher suite(s) that can be used to protect individually addressed Data frames and, when management frame protection is negotiated, to protect individually addressed robust Management frames. Use of BIP-CMAC-128, BIP-GMAC-128, BIP-GMAC-256, and BIP-CMAC-256 is not valid as a data cipher suite.

The Group Management Cipher Suite field contains the cipher suite selector that indicates the cipher suite used in the BSS to protect group addressed robust Management frames. Use of anything other than BIP-CMAC-128, BIP-GMAC-128, BIP-GMAC-256, and BIP-CMAC-256 is not valid as a group management cipher suite.

A suite selector has the format shown in Figure 9-368.

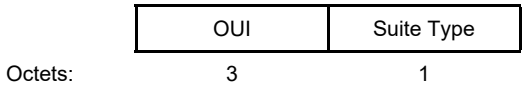

Figure 9-368—Suite selector format

The OUI field contains an OUI or CID. The order of the OUI field is described in 9.2.2.

Table 9-188 provides the cipher suite selectors defined by this standard.

In non-DMG RSNA, the cipher suite selector 00-0F-AC:4 (CCMP-128) is the default group data cipher suite when the Group Data Cipher Suite field is not included in the RSNE.

In non-DMG RSNA, the cipher suite selector 00-0F-AC:4 (CCMP-128) is the default pairwise cipher suite when the Pairwise Cipher Suite List field is not included in the RSNE.

In DMG RSNA, the cipher suite selector 00-0F-AC:8 (GCMP-128) is the default group data cipher suite when the Group Data Cipher Suite field is not included in the RSNE.

In DMG RSNA, the cipher suite selector 00-0F-AC:8 (GCMP-128) is the default pairwise cipher suite when the Pairwise Cipher Suite List field is not included in the RSNE.

Table 9-188—Cipher suite selectors

OUI	Suite type	Meaning
00-0F-AC	0	Use group data cipher suite
00-0F-AC	1	Reserved
00-0F-AC	2	TKIP
00-0F-AC	3	Reserved
00-0F-AC	4	CCMP-128
00-0F-AC	5	Reserved
00-0F-AC	6	BIP-CMAC-128
00-0F-AC	7	Group addressed traffic not allowed
00-0F-AC	8	GCMP-128
00-0F-AC	9	GCMP-256
00-0F-AC	10	CCMP-256
00-0F-AC	11	BIP-GMAC-128
00-0F-AC	12	BIP-GMAC-256
00-0F-AC	13	BIP-CMAC-256
00-0F-AC	14–255	Reserved
Other OUI or CID	Any	Vendor-specific

In an RSNA with management frame protection enabled, the cipher suite selector 00-0F-AC:6 (BIP-CMAC-128) is the default group management cipher suite when the Group Management Cipher Suite field is not included in the RSNE.

In an RSNA with WUR frame protection enabled, the cipher suite used for protecting WUR Wake-up frames is BIP-CMAC-128 and is not explicitly indicated in the RSNE.

NOTE—If the AKM Suite List field is present, the Group Data Cipher Suite field and the Pairwise Cipher Suite List field are present. If AKM 00-0F-AC:11, 00-0F-AC:12, or 00-0F-AC:13 is present in the AKM Suite List field, and the MFPC bit of the RSN Capabilities field is 1, the default group management cipher suite is not suitable.

Use of any group data cipher suite other than TKIP with TKIP as the pairwise cipher suite is not supported.

The cipher suite selector 00-0F-AC:0 (Use group data cipher suite) is valid only as the pairwise cipher suite. An AP specifies the selector 00-0F-AC:0 (Use group data cipher suite) for a pairwise cipher suite if it does not support any pairwise cipher suites. If an AP specifies 00-0F-AC:0 (Use group data cipher suite) as the pairwise cipher selection, this is the only pairwise cipher selection the AP advertises.

If an AP advertises a group data cipher suite other than TKIP, then the AP supports pairwise keys, and thus the pairwise suite selector 00-0F-AC:0 (Use group data cipher suite) is not a valid option.

Table 9-189 indicates the circumstances under which each cipher suite is used. A cipher suite selector is not used in the Group Data Cipher Suite field if No is shown in the GTK column for that cipher suite. A cipher suite selector is not used in the Pairwise Cipher Suite List field if No is shown in the PTK column for that

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

cipher suite. A cipher suite selector is not used in the Group Management Cipher Suite field if No is shown in the IGTK or BIGTK column for that cipher suite.

Table 9-189—Cipher suite usage

Cipher suite selector	GTK	PTK	IGTK or BIGTK
Use group data cipher suite	No	Yes	No
TKIP	Yes	Yes	No
CCMP-128	Yes	Yes	No
BIP-CMAC-128	No	No	Yes
GCMP-128	Yes	Yes	No
GCMP-256	Yes	Yes	No
CCMP-256	Yes	Yes	No
BIP-GMAC-128	No	No	Yes
BIP-GMAC-256	No	No	Yes
BIP-CMAC-256	No	No	Yes

9.4.2.23.3 AKM suites

The AKM Suite Count field indicates the number of AKM suite selectors that are contained in the AKM Suite List field. The value 0 is reserved.

The AKM Suite List field contains a series of AKM suite selectors. In an IBSS only a single AKMP selector is specified because IBSS STAs use the same AKM suite and because there is no mechanism to negotiate the AKMP in an IBSS (see 12.6.4).

Each AKM suite selector specifies an AKMP. Table 9-190 gives the AKM suite selectors defined by this standard. An AKM suite selector has the format shown in Figure 9-368.

AKM 00-0F-AC:1 (i.e., Authentication negotiated over IEEE Std 802.1X with RSNA key management as defined in 12.7) is the default AKMP when the AKM Suite List field is not included in the RSNE.

Table 9-190—AKM suite selectors

OUI	Suite type	Meaning			Authentication algorithm numbers (see 9.4.1.1)	Cipher suite selector restriction
		Authentication type	Key management type	Key derivation type		
00-0F-AC	0	Reserved	Reserved	Reserved	Reserved	Reserved
00-0F-AC	1	Authentication negotiated over IEEE Std 802.1X	RSNA key management as defined in 12.7	Defined in 12.7.1.2	0 (open)	None

Table 9-190—AKM suite selectors *(continued)*

OUI	Suite type	Meaning			Authentication algorithm numbers (see 9.4.1.1)	Cipher suite selector restriction
		Authentication type	Key management type	Key derivation type		
00-0F-AC	23	Authentication negotiated over IEEE Std 802.1X	RSNA key management as defined in 12.7	Defined in 12.7.1.6.2 using SHA-384	0 (open)	None
00-0F-AC	24	SAE authentication	RSNA key management as defined in 12.7, or authenticated mesh peering exchange as defined in 14.6	Defined in 12.7.1.6.2 using the hash algorithm specified in 12.4.2	3 (SAE) for SAE Authentication 0 (open) for PMKSA caching	None
00-0F-AC	25	FT authentication over SAE	FT key management defined in 12.7.1.6	Defined in 12.7.1.6.2 using the hash algorithm specified in 12.4.2	3 (SAE) for FT Initial Mobility Domain Association 2 (FT) for FT protocol reassociation as defined in 13.5 0 (open) for FT Initial Mobility Domain Association over PMKSA caching	None
00-0F-AC	26–255	Reserved	Reserved	Reserved	Reserved	Reserved
Other OUI or CID	Any	Vendor-specific	Vendor-specific	Vendor-specific	Vendor-specific	Vendor-specific

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—AKM 00-0F-AC:1 specifies only that IEEE Std 802.1X-2020 is used as the authentication transport. IEEE Std 802.1X-2020 selects the authentication mechanism.

NOTE 2—AKM 00-0F-AC:11 is deprecated.

NOTE 3—The usage of AKM suite selector values with authentication algorithms is defined in the Authentication algorithm numbers column of Table 9-190; see 9.4.1.1.

NOTE 4—AKMs 00-0F-AC:8 and 00-0F-AC:9 have the length of the PMK in bits equal to 256, the length of the PTK-KCK in bits equal to 128, and the length of the PTK-KEK in bits equal to 128 (see 12.7.1.3, and 12.7.3). AKMs 00-0F-AC:24 and 00-0F-AC:25 have the length of the PMK, the length of the SAE key confirmation key, SAE-KCK, and PTK-KCK, and the length of PTK-KEK depending on the hash algorithm specified in 12.4.2 (see 12.7.1.3 and 12.7.3).

SAE authentication (AKM 00-0F-AC:8 or 00-0F-AC:24) is used when a password is used with RSNA key management.

NOTE 5—AKMs 00-0F-AC:1 can simultaneously be enabled with AKM 00-0F-AC:8 or 00-0F-AC:24 or both by an Authenticator.

AKM 00-0F-AC:2 (PSK) is used when an alternate form of PSK is used with RSNA key management.

NOTE 6—AKMs 00-0F-AC:1 and 00-0F-AC:2 can simultaneously be enabled by an Authenticator.

NOTE 7—A PMKSA established using a given AKM selector value might be cached and used in a subsequent (re)association as defined in 12.6.8.3.

9.4.2.23.4 RSN capabilities

The RSN Capabilities field indicates requested or advertised capabilities. If the RSN Capabilities field is not present, the default value of 0 is used for all of the capability subfields.

The format of the RSN Capabilities field is as shown in Figure 9-369 and described after the figure.

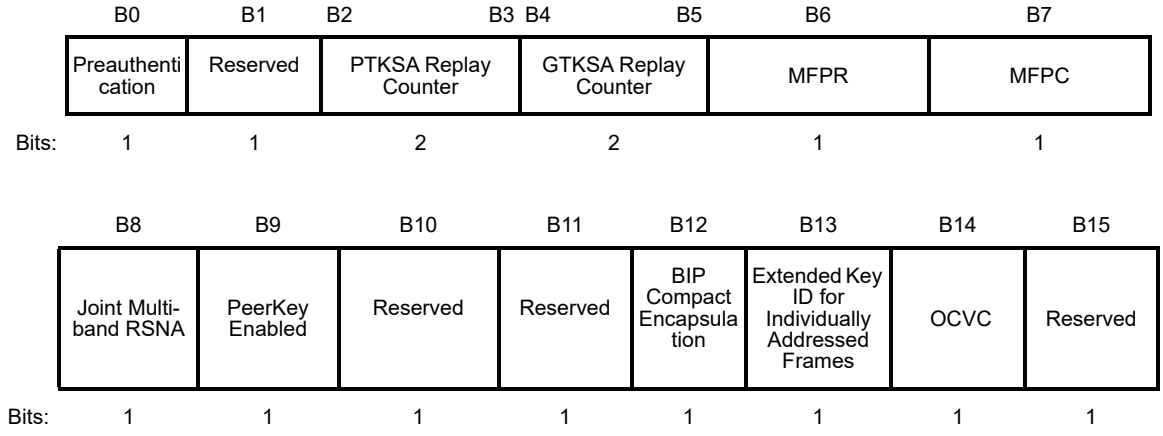

Figure 9-369—RSN Capabilities field format

— Bit 0: Preauthentication. An AP sets the Preauthentication subfield to 1 to signal it supports preauthentication (see 12.6.8.2) and sets the subfield to 0 when it does not support preauthentication. A non-AP STA sets the Preauthentication subfield to 0.

NOTE—Preauthentication is deprecated.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Bit 1: Reserved

— Bits 2–3: PTKSA Replay Counter. A STA sets the PTKSA Replay Counter subfield to the value contained in dot11RSNAConfigNumberOfPTKSAReplayCounters. See 12.3.4.6, 12.5.2.4.4, and 12.5.4.4.4. The meaning of the value in the PTKSA Replay Counter subfield is defined in Table 9-191.

Table 9-191—PTKSA/GTKSA/TPKSA replay counters usage

Replay counter value	Meaning
0	1 replay counter per PTKSA/GTKSA/TPKSA
1	2 replay counters per PTKSA/GTKSA/TPKSA
2	4 replay counters per PTKSA/GTKSA/TPKSA
3	16 replay counters per PTKSA/GTKSA/TPKSA

— Bits 4–5: GTKSA Replay Counter. A STA sets the GTKSA Replay Counter subfield to the value contained in dot11RSNAConfigNumberOfGTKSAReplayCounters. See 12.3.4.6, 12.5.2.4.4, and 12.5.4.4.4. The meaning of the value in the GTKSA Replay Counter subfield is defined in Table 9-191.

— Bit 6: MFPR. A STA sets this bit to 1 to advertise that protection of robust Management frames is mandatory; otherwise it sets this bit to 0.

— Bit 7: MFPC. A STA sets this bit to 1 to advertise that protection of robust Management frames is enabled; otherwise it sets this bit to 0.

— Bit 8: Joint Multi-band RSNA. A STA sets the Joint Multi-band RSNA subfield to 1 to indicate that it supports the Joint Multi-band RSNA (12.6.20). Otherwise, this subfield is set to 0.

— Bits 9: PeerKey Enabled. A STA sets the PeerKey Enabled subfield to 1 to signal it supports the TPK handshake (see 12.7.8). Otherwise, this subfield is set to 0.

NOTE 2—AP PeerKey support is not signaled.

— Bit 10: Reserved.

— Bit 11: Reserved.

— Bit 12: BIP Compact Encapsulation. An S1G AP sets this bit to 1 to indicate that it supports transmission of S1G Beacon frames protected using BCE and, if bit 7 (MFPC) is set to 1, that S1G Beacons will be protected using BCE. An S1G non-AP STA sets this bit to 1 to indicate that it supports reception of S1G Beacon frames protected using BCE. For non-S1G STAs, this bit is reserved.

— Bit 13: Extended Key ID for Individually Addressed Frames. This subfield is set to 1 to indicate that the STA supports key ID values in the range 0 to 1 for a PTKSA when the cipher suite is CCMP or GCMP. Bit 13 set to 0 indicates that the STA only supports key ID 0 for a PTKSA.

— Bit 14: OCVC. This subfield is set to 1 to indicate that the STA supports operating channel validation by including Operating Channel Information (OCI) in RSNA exchanges and validates the information when received from another STA that indicated this capability. Otherwise, this subfield is set to 0.

— Bits 15: Reserved.

9.4.2.23.5 PMKID

The PMKID Count field indicates the number of PMKIDs that are contained in the PMKID List field. The PMKID List field contains a series (possibly empty) of PMKIDs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When one or more PMKIDs are included in a (Re)Association Request frame or FILS Authentication frame to an AP, they identify PMKSAs that the STA believes to be valid for the destination AP. When a PMKID is included in a FILS Authentication frame to a STA, it identifies a PMKID that the AP has selected.

A PMKID in the PMKID List field can refer to

a) The PMKID of a cached PMKSA that has been obtained through preauthentication with the target AP
b) The PMKID of a cached PMKSA from an EAP, FILS, or SAE authentication
c) The PMKID of a PMKSA derived from a PSK for the target AP
d) The PMKR0Name of a PMK-R0 security association derived as part of an FT initial mobility domain association
e) The PMKR1Name of a PMK-R1 security association derived as part of an FT initial mobility domain association or as part of a fast BSS transition.

See 12.7.1.3 and 12.7.1.6.3 for the construction of the PMKID, 13.8 for the population of PMKID List for fast BSS transitions, 12.6.8.3 for the population of PMKID List when using PMKSA caching, 13.4 for the population of PMKID List for FT initial mobility domain association, 12.11.2 for the population of PMKID List with FILS authentication, and 12.7.1.6 for the construction of PMKR0Name and PMKR1Name.

NOTE—A STA need not insert a PMKID in the PMKID List field if the STA is not using that PMKSA.

9.4.2.24 Vendor Specific element

The Vendor Specific element is used to carry information not defined in this standard within a single defined format, so that reserved element IDs are not usurped for nonstandard purposes and so that interoperability is more easily achieved in the presence of nonstandard information. The element is in the format shown in Figure 9-370.

	Element ID	Length	Organization Identifier	Vendor-specific content
Octets:	1	1	3 or 5	variable

Figure 9-370—Vendor Specific element format

The Element ID and Length fields are defined in 9.4.2.1.

The Organization Identifier field contains the identity of the entity that has defined the content of the Vendor Specific element (see 9.4.1.29 for a description of the Organization Identifier field contents and length).

The Vendor-specific content field contains vendor specific content.

9.4.2.25 Extended Capabilities element

The Extended Capabilities element carries information about the capabilities of a STA that augment the capabilities specified in the Capability Information field. The format of this element is shown in Figure 9-371.

	Element ID	Length	Extended Capabilities
Octets:	1	1	variable

Figure 9-371—Extended Capabilities element format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The Extended Capabilities field is a set of 1-bit fields indicating the extended capabilities being advertised by the STA transmitting the element. If fewer bits are received in an Extended Capabilities field than shown in Table 9-192, the rest of the Extended Capabilities field bits are assumed to be zero. The Extended Capabilities field is shown in Table 9-192.

Table 9-192—Extended Capabilities field

Bit	Information	Notes
0	20/40 BSS Coexistence Management Support	The 20/40 BSS Coexistence Management Support field indicates support for the 20/40 BSS Coexistence Management frame and its use. The 20/40 BSS Coexistence Management Support field is set to 1 to indicate support for the communication of STA information through the transmission and reception of the 20/40 BSS Coexistence Management frame. The 20/40 BSS Coexistence Management Support field is set to 0 to indicate a lack of support for the communication of STA information through the transmission and reception of the 20/40 BSS Coexistence Management frame.
1	GLK	The STA sets the GLK field to 1 when dot11GLKImplemented is true and sets it to 0 otherwise.
2	Extended Channel Switching	The Extended Channel Switching field is 1 to indicate support for the communication of channel switching information through the transmission and reception of the Extended Channel Switch Announcement element and Management frame, as described in 9.6.7.7. The Extended Channel Switching field is 0 to indicate a lack of support for extended channel switching.
3	GLK-GCR	The STA sets the GLK-GCR field to 1 when dot11GLKGCRImplemented is true and sets it to 0 otherwise.
4–6	Reserved	
7	Event	The STA sets the Event field to 1 when dot11EventsActivated is true, and sets it to 0 otherwise. See 11.21.2.
8	Diagnostics	The STA sets the Diagnostics field to 1 when dot11DiagnosticsActivated is true, and sets it to 0 otherwise. See 11.21.3.
9	Multicast Diagnostics	The STA sets the Multicast Diagnostics field to 1 when dot11MulticastDiagnosticsActivated is true, and sets it to 0 otherwise. See 11.21.3.
10	Location Tracking	The STA sets the Location Tracking field to 1 when dot11LocationTrackingActivated is true, and sets it to 0 otherwise. See 11.21.4.
11	FMS	The STA sets the FMS field to 1 when dot11FMSActivated is true, and sets it to 0 otherwise. See 11.2.3.13 and 11.21.8.
12	Proxy ARP Service	The AP sets the Proxy ARP Service field to 1 when dot11ProxyARPActivated is true, and sets it to 0 otherwise. See 11.21.14. A non-AP STA sets the Proxy ARP Service field to 0.
13	Colocated Interference Reporting	The STA sets the Colocated Interference Reporting field to 1 when dot11CoLocIntfReportingActivated is true, and sets it to 0 otherwise. See 11.21.9.
14	Civic Location	The STA sets the Civic Location field to 1 when dot11RMCivicConfigured is true, and sets it to 0 otherwise. See 11.10.9.9.

Table 9-192—Extended Capabilities field *(continued)*

Bit	Information	Notes
15	Geospatial Location	The STA sets the Geospatial Location field to 1 when dot11RMLCIConfigured is true, and sets it to 0 otherwise. See 11.10.9.6.
16	TFS	The STA sets the TFS field to 1 when dot11TFSActivated is true, and sets it to 0 otherwise. See 11.21.12.
17	WNM Sleep Mode	The STA sets the WNM Sleep Mode field to 1 when dot11WNMSleepModeActivated is true, and sets it to 0 otherwise. See 11.2.3.15.
18	TIM Broadcast	The STA sets the TIM Broadcast field to 1 when dot11TIMBroadcastActivated is true, and sets it to 0 otherwise. See 11.2.3.14.
19	BSS Transition	The STA sets the BSS Transition field to 1 when dot11BSSTransitionActivated is true, and sets it to 0 otherwise. See 11.21.7.
20	QoS Traffic Capability	The STA sets the QoS Traffic Capability field to 1 when dot11QoSTrafficCapabilityActivated is true, and sets it to 0 otherwise. See 11.21.10.
21	AC Station Count	The STA sets the AC Station Count field to 1 when dot11ACStationCountActivated is true, and sets it to 0 otherwise. See 11.21.11.
22	Multiple BSSID	The STA sets the Multiple BSSID field to 1 when dot11MultiBSSIDImplemented is true, and sets it to 0 otherwise. See 11.10.14 and 11.1.3.8.
23	Timing Measurement	The STA sets the Timing Measurement field to 1 when dot11TimingMsmtActivated is true, and sets it to 0 otherwise. See 11.21.5.
24	Channel Usage	The STA sets the Channel Usage field to 1 when dot11ChannelUsageActivated is true and sets it to 0 otherwise. See 11.21.15.
25	SSID List	The STA sets the SSID List field to 1 when dot11SSIDListActivated is true, and sets it to 0 otherwise. See 11.1.4.
26	DMS	The STA sets the DMS field to 1 when dot11DMSActivated is true and sets it to 0 otherwise. See 11.21.16.
27	UTC TSF Offset	The STA sets the UTC TSF Offset field to 1 when dot11UTCTSFOffsetActivated is true and sets it to 0 otherwise. See 11.19.3.
28	TPU Buffer STA Support	The TPU Buffer STA Support subfield indicates support for the TPU buffer STA function, as defined in 11.2.3.12. When dot11TDLSPeerUAPSDBufferSTAActivated is true, and to indicate support for TPU on this link, the TPU Buffer STA Support subfield is set to 1. Otherwise, the TPU Buffer STA Support subfield is set to 0 to indicate that this capability is not supported on this link.
29	TDLS Peer PSM Support	The TDLS Peer PSM Support subfield indicates support for TDLS peer PSM, as defined in 11.2.3.11. A non-AP STA that has dot11TDLSPeerPSMActivated equal to true indicates support for TDLS peer PSM by setting the TDLS Peer PSM Support subfield to 1. Otherwise, the TDLS Peer PSM Support subfield is set to 0 to indicate that this capability is not supported. This subfield is reserved for an AP.
30	TDLS Channel Switching	A non-AP STA that has dot11TDLSChannelSwitchingActivated equal to true indicates support for TDLS channel switching as described in 11.20 by setting the TDLS Channel Switching subfield to 1. Otherwise, the TDLS Channel Switching subfield is set to 0 to indicate that this capability is not supported. This subfield is reserved for an AP.

Table 9-192—Extended Capabilities field *(continued)*

Bit	Information	Notes
31	Interworking	When dot11InterworkingServiceActivated is true, the Interworking field is set to 1 to indicate the STA supports interworking service as described in 11.22. When dot11InterworkingServiceActivated is false, the Interworking field is set to 0 to indicate the STA does not support this capability.
32	QoS Map	When dot11QosMapActivated is true, the QoS Map field is set to 1 to indicate the STA supports QoS Map service as described in 11.22.9. When dot11QosMapActivated is false, the QoS Map field is set to 0 to indicate the STA does not support this capability.
33	EBR	When dot11EBRActivated is true, the EBR field is set to 1 to indicate the STA supports EBR operation as described in 11.4. When dot11EBRActivated is false, the EBR field is set to 0 to indicate the STA does not support this capability.
34	SSPN Interface	When dot11SSPNInterfaceActivated is true, the SSPN Interface field is set to 1 to indicate the AP supports SSPN Interface service as described in 11.22.5. When dot11SSPNInterfaceActivated is false, the SSPN Interface is set to 0 to indicate the AP does not support this capability. Non-AP STAs set this field to 0.
35	Reserved	
36	MSGCF Capability	When dot11MSGCFActivated is true, the MSGCF Capability field is set to 1 to indicate the non-AP STA supports the MSGCF in 6.4. When dot11MSGCFActivated is false, the MSGCF Capability is set to 0 to indicate the non-AP STA does not support this capability. APs set this field to 0.
37	TDLS Support	The TDLS Support subfield indicates support for TDLS, as defined in 11.20. A non-AP STA that has dot11TunneledDirectLinkSetupImplemented equal to true sets this subfield to 1 to indicate support for TDLS and is set to 0 to indicate that TDLS is not supported. This subfield is reserved for an AP.
38	TDLS Prohibited	The TDLS Prohibited subfield indicates whether the use of TDLS is prohibited. An AP sets this subfield to 1 to indicate that TDLS is prohibited and to 0 to indicate that TDLS is allowed. This subfield is reserved for a non-AP STA.
39	TDLS Channel Switching Prohibited	The TDLS Channel Switching Prohibited subfield indicates whether the use of TDLS channel switching is prohibited. An AP sets this subfield to 1 to indicate that TDLS channel switching is prohibited and to 0 to indicate that TDLS channel switching is allowed. This subfield is reserved for a non-AP STA.
40	Reject Unadmitted Frame	When dot11RejectUnadmittedTraffic is true, the Reject Unadmitted Frame field is set to 1 to indicate that the STA does not transmit frames belonging to an unadmitted TS. When dot11RejectUnadmittedTraffic is false, the Reject Unadmitted Frame field is set to 0 to indicate that the STA might transmit frames belonging to an unadmitted TS. When dot11RejectUnadmittedTraffic is not present, the Reject Unadmitted Frame field is set to 0.
41-43	Reserved	
44	Identifier Location	The STA sets the Identifier Location field to 1 when dot11RMIdentifierMeasurementActivated is true, and sets it to 0 otherwise. See 11.10.9.10.
45	U-APSD Coexistence	The STA sets the U-APSD Coexistence field to 1 when dot11UAPSDCoexistenceActivated is true and sets it to 0 otherwise. See 11.2.3.5.2.

Table 9-192—Extended Capabilities field *(continued)*

Bit	Information	Notes
46	WNM Notification	The STA sets the WNM Notification field to 1 when dot11WNMNotificationActivated is true and sets it to 0 otherwise. See 11.21.17.
47	QAB Capability	Set to 1 if AP supports QAB Set to 0 otherwise
48	UTF-8 SSID	The SSID in this BSS is a sequence of UTF-8 encoded code points
49	QMFActivated	The STA sets the QMFActivated field to 1 when dot11QMFActivated is true and sets it to 0 otherwise. See 11.24.
50	QMFReconfigurationActivated	The STA sets the QMFReconfigurationActivated field to 1 when dot11QMFActivated is true and sets it to 0 otherwise. See 11.24.
51	Robust AV Streaming	The STA sets the Robust AV Streaming field to 1 when dot11RobustAVStreamingImplemented is true and sets it to 0 otherwise. See 11.25.
52	Advanced GCR	The STA sets the Advanced GCR field to 1 when dot11AdvancedGCRActivated is true and sets it to 0 otherwise. See 11.21.16.3.
53	Mesh GCR	The STA sets the mesh GCR field to 1 when dot11MeshGCRActivated is true and sets it to 0 otherwise. See 11.21.16.3.
54	SCS	The STA sets the SCS field to 1 when dot11SCSActivated is true and sets it to 0 otherwise. See 11.25.2.
55	QLoad Report	The STA sets the QLoad Report field to 1 when dot11QLoadReportActivated is true and sets it to 0 otherwise. See 11.26.2.
56	Alternate EDCA	The STA sets the Alternate EDCA field to 1 when dot11AlternateEDCAActivated is true and sets it to 0 otherwise. See 10.2.3.2.
57	Unprotected TXOP Negotiation	The STA sets the Unprotected TXOP Negotiation field to 1 when dot11PublicTXOPNegotiationActivated is true and sets it to 0 otherwise. See 11.26.3.
58	Protected TXOP Negotiation	The STA sets the Protected TXOP Negotiation field to 1 when dot11ProtectedTXOPNegotiationActivated is true and sets it to 0 otherwise. See 11.26.3.
59	Reserved	
60	Protected QLoad Report	The STA sets the Protected QLoad Report field to 1 when dot11ProtectedQLoadReportActivated is true and sets it to 0 otherwise. See 11.26.2.
61	TDLS Wider Bandwidth	The TDLS Wider Bandwidth subfield indicates whether the STA supports a wider bandwidth than the BSS bandwidth for a TDLS direct link with a primary channel equal to the base channel. The field is set to 1 to indicate that the STA supports a wider bandwidth and to 0 to indicate that the STA does not support a wider bandwidth. A 160 MHz bandwidth is defined to be identical to an 80+80 MHz bandwidth (i.e., one is not wider than the other).
62	Operating Mode Notification	If dot11OperatingModeNotificationImplemented is true, the Operating Mode Notification field is set to 1 to indicate support for reception of the Operating Mode Notification element and the Operating Mode Notification frame. If dot11OperatingModeNotificationImplemented is false or not present, the Operating Mode Notification field is set to 0 to indicate lack of support for reception of the Operating Mode Notification element and the Operating Mode Notification frame.

Table 9-192—Extended Capabilities field *(continued)*

Bit	Information	Notes
63–64	Max Number Of MSDUs In A-MSDU	Indicates the maximum number of MSDUs in an A-MSDU that the STA is able to receive from a VHT STA: Set to 0 to indicate that no limit applies. Set to 1 for 32. Set to 2 for 16. Set to 3 for 8 Reserved if A-MSDU is not supported or if the STA is not an HT STA.
65	Channel Schedule Management	The STA sets the Channel Schedule Management field to 1 when dot11ChannelScheduleManagementActivated is true and sets it to 0 otherwise. See 11.42.5.
66	Geodatabase Inband Enabling Signal	The STA sets the Geodatabase Inband Enabling Signal field to 1 when dot11GDDActivated is true and the STA permits GDD dependent STAs to operate. See 11.42.2.
67	Network Channel Control	The STA sets the Network Channel Control field to 1 when dot11NetworkChannelControlActivated is true and sets it to 0 otherwise. See 11.42.7.
68	White Space Map	The STA sets the White Space Map field to 1 when dot11WhiteSpaceMapActivated is true and sets it to 0 otherwise. See 11.42.8.
69	Channel Availability Query	The STA sets the Channel Availability Query field to 1 when dot11GDDActivated is true and sets it to 0 otherwise. See 11.42.4.
70	FTM Responder	The STA sets the FTM Responder field to 1 when dot11FineTimingMsmtRespActivated is true and sets it to 0 otherwise. See 11.21.6.
71	FTM Initiator	The STA sets the FTM Initiator field to 1 when dot11FineTimingMsmtInitActivated is true and sets it to 0 otherwise. See 11.21.6.
72	FILS Capability	The FILS Capability field is set to 1 if dot11FILSActivated is true. Otherwise, the FILS Capability field is 0.
73	Extended Spectrum Management Capable	The STA sets the Extended Spectrum Management Capable field to 1 when dot11ExtendedSpectrumManagementImplemented is true and dot11VHTOptionImplemented is false, and sets it to 0 otherwise.
74	Future Channel Guidance	The STA sets the Future Channel Guidance field to 1 when dot11FutureChannelGuidanceActivated is true and sets it to 0 otherwise. See 11.8.10.
75	PAD	Indicates support for PAD (see 11.23).
76	Reserved	
77	TWT Requester Support	A STA sets the TWT Requester Support field to 1 if dot11TWTOptionActivated is true and TWT requester functionality is supported. Otherwise, the STA sets the TWT Requester Support field to 0. See 10.46.
78	TWT Responder Support	A STA sets the TWT Responder Support field to 1 if dot11TWTOptionActivated is true and TWT responder functionality is supported. Otherwise, the STA sets the TWT Responder Support field to 0. See 10.46.
79	OBSS Narrow Bandwidth RU In OFDMA Tolerance Support	An AP STA sets the OBSS Narrow Bandwidth RU In OFDMA Tolerance Support field to 1 if dot11OBSSNarrowBWRUinOFDMATolerated is true, and sets it to 0 otherwise. A non-AP STA sets the OBSS Narrow Bandwidth RU In OFDMA Tolerance Support field to 0.

Table 9-192—Extended Capabilities field *(continued)*

Bit	Information	Notes
80	Complete List of NonTxBSSID Profiles	This field is reserved for a non-AP STA or when the AP has dot11MultiBSSIDImplemented set to false. Set to 1 to indicates that the frame carrying this element includes a complete list of nontransmitted BSSID profiles. Set to 0 by a non-HE AP if there is no indication about the completeness of the list of nontransmitted BSSID profiles in the frame. Set to 0 by an HE AP to indicate that the frame carrying this element does not include a complete list of nontransmitted BSSID profiles. Also see 11.1.3.8.
81	SAE Password Identifiers In Use	The AP sets the SAE Password Identifiers In Use field to 1 when any password in the dot11RSNAConfigPasswordValueTable has a password identifier and sets it to 0 otherwise. See 12.4.3.
82	SAE Password Identifiers Used Exclusively	The AP sets the SAE Password Identifiers Used Exclusively field to 1 when every password in the dot11RSNAConfigPasswordValueTable has a password identifier and sets it to 0 otherwise. See 12.4.3.
83	Enhanced Multi-BSSID Advertisement Support	This field is reserved for a non-AP STA or when the AP has dot11MultiBSSIDImplemented set to false. Set to 1 to indicate that the AP supports enhancements related to discovery and advertisement of nontransmitted BSSIDs. Set to 0 otherwise. Also see 11.1.3.8.
84	Beacon Protection Enabled	The AP sets the Beacon Protection Enabled field to 1 when dot11BeaconProtectionEnabled is true. Otherwise, it is set to 0. This field is reserved for a non-AP STA. See 11.52.
85	Mirrored SCS	The STA sets the Mirrored SCS field to 1 when dot11MSCSActivated is true and sets it to 0 otherwise.
86	OCT	The non-AP STA sets the OCT field to 1 when dot11OCTOptionImplemented is true and sets it to 0 otherwise. This field is reserved for an AP.
87	Local MAC Address Policy	When dot11LocalMACAddressPolicyActivated is true, the Local MAC Address Policy subfield is set to 1. When dot11LocalMACAddressPolicyActivated is false, the Local MAC Address Policy subfield is set to 0.
88		*Allocated to the Wi-Fi Alliance* [a].
89	TWT Parameters Range Support	Set to 1 to indicate support for reception of a TWT Setup frame that contains two TWT elements (see 10.46.9); otherwise, set to 0.
90	Non-TB Ranging Responder	A STA sets the Non-TB Ranging Responder field to 1 if dot11NonTriggedBasedRangingRespImplemented is true. Otherwise the STA sets the Non-TB Ranging Responder field to 0; see 11.21.6.
91	TB Ranging Responder	A STA sets the TB Ranging Responder field to 1 if dot11TriggerBasedRangingRespImplemented is true. Otherwise the STA sets the TB Ranging Responder field to 0; see 11.21.6.
92	Passive TB Ranging Responder Measurement Support	A STA sets the Passive TB Ranging Responder Measurement Support field to 1 when dot11PassiveTBRangingResponderImplemented is true. Otherwise, the STA sets Passive TB Ranging Responder Measurement Support field to 0. See 11.21.6.4.8.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-192—Extended Capabilities field *(continued)*

Bit	Information	Notes
93	Passive TB Ranging Initiator Measurement Support	A STA sets the Passive TB Ranging Initiator Measurement Support field to 1 when dot11PassiveTBRangingInitiatorImplemented is true. Otherwise, the STA sets the Passive TB Ranging Initiator Measurement Support field to 0. See 11.21.6.4.8.
94	AOA Measurements Available	A STA sets the AOA Measurement Available field to 1 when dot11AOAMeasurementImplemented is true. Otherwise, the STA sets the AOA Measurement Available field to 0.
95	Phase Shift Feedback Support	A STA sets the Phase Shift Feedback Support field to 1 or 0 as specified in 11.21.6.2. It indicates the LMR transmitted by the STA can carry Phase Shift Feedback.
96	DMG/Location Supporting APs In The Area	An AP STA sets this field to 1 to indicate that APs providing location services using DMG are in the vicinity of the AP STA. Definition of vicinity is implementation dependent. NOTE—The AP might be capable of providing information about those DMG APs.
97	I2R LMR Feedback Policy	A STA sets the I2R LMR Feedback Policy field to 1 if dot11I2RLMRFeedbackPolicy is true. Otherwise the STA sets the I2R LMR Feedback Policy field to 0. See 11.21.6.3.3. The I2R LMR Feedback Policy field indicates the policy of the STA in the role of an RSTA, and it is reserved for a STA in the role of an ISTA.
98	EBCS Support	A STA sets the EBCS Support field to 1 when dot11EBCSSupportActivated is true. Otherwise, the STA sets the EBCS Support field to 0.
99	EBCS Relaying Supported	An EBCS relaying STA that has dot11EBCSRelayingServiceImplemented equal to true sets the EBCS Relaying Supported field to 1. Otherwise, an EBCS relaying STA sets the field to 0.
100	Peer-to-peer TWT Support	Set to 1 to indicate support for reception of a Channel Usage Request frame that includes one or more TWT elements. Set to 0 otherwise.
101	Multiple BSSID Role Switch Support	A STA that has dot11MultiBSSIDImplemented equal to true sets this field to 1 to indicate support for the procedure described in 11.1.3.8.6. Otherwise, this field is set to 0.
102	Known STA Identification Enabled	Set to 1 to indicate that the AP has enabled use of Known STA Identification element. Set to 0 otherwise. This field is reserved for a non-AP STA.
103	Reserved	
104	Capability Notification Support	In an AP, set to 1 to indicate the AP supports reception of a Channel Usage Request frame that includes capabilities elements. Set to 0 otherwise. In a non-AP STA, set to 1 to indicate the STA supports transmission of a Channel Usage Request frame that includes capabilities elements. Set to 0 otherwise.
105	GAS Query Request Fragmentation	When dot11GASQueryRequestFragmentationActivated is true, the GAS Query Request Fragmentation field is set to 1 to indicate the STA supports GAS query request fragmentation as described in 11.22.3.2. When dot11GASQueryRequestFragmentationActivated is false, the GAS Query Request Fragmentation field is set to 0 to indicate the STA does not support this capability.
106–109	Reserved

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-192—Extended Capabilities field *(continued)*

Bit	Information	Notes
110	Tunneled PASN Support	Set to 1 to indicate that the AP supports the tunneled PASN feature.
101–*n*	Reserved	

[a] See http://www.wi-fi.org.

If a STA does not support any of the capabilities defined in the Extended Capabilities element, then the STA is not required to transmit the Extended Capabilities element.

NOTE—The fields of the Extended Capabilities element are not dynamic. They are determined by the parameters of the MLME-START.request or MLME-JOIN.request primitive that caused the STA to start or join its current BSS, and they remain unchanged until the next MLME-START.request or MLME-JOIN.request primitive.

9.4.2.26 BSS Load element

The BSS Load element contains information on the current STA population and traffic levels in the BSS. The element information format is defined in Figure 9-372. This element might be used by the STA for vendor-specific AP selection algorithm when performing BSS transition.

	Element ID	Length	Station Count	Channel Utilization	Available Admission Capacity
Octets:	1	1	2	1	2

Figure 9-372—BSS Load element format

The Element ID and Length fields are defined in 9.4.2.1.

The Station Count field indicates the total number of STAs currently associated with this BSS.

The Channel Utilization field is defined as the percentage of time, linearly scaled with 255 representing 100%, that the AP sensed the medium was busy, as indicated by either the physical or virtual carrier sense (CS) mechanism. When more than one channel is in use for the BSS, the Channel Utilization field value is calculated only for the primary channel. This percentage is computed using the following formula:

$$\text{Channel Utilization} = \left\lfloor \frac{\text{channel busy time}}{\text{dot11ChannelUtilizationBeaconIntervals} \times \text{dot11BeaconPeriod} \times 1024} \times 255 \right\rfloor$$

where

channel busy time is defined to be the number of microseconds during which the CS mechanism, as defined in 10.3.2.1, has indicated a channel busy indication,

dot11ChannelUtilizationBeaconIntervals represents the number of consecutive beacon intervals during which the channel busy time is measured.

The Available Admission Capacity field contains an unsigned integer that specifies the remaining amount of medium time available via explicit admission control, in units of 32 μs/s. The field is helpful for BSS transitioning STAs to select an AP that is likely to accept future admission control requests, but it does not represent an assurance that the HC admits these requests.

9.4.2.27 EDCA Parameter Set element

The EDCA Parameter Set element provides information needed by STAs for proper operation of the QoS facility. The format of the EDCA Parameter Set element is defined in Figure 9-373.

	Element ID	Length	QoS Info	Update EDCA Info	AC_BE Parameter Record	AC_BK Parameter Record	AC_VI Parameter Record	AC_VO Parameter Record
Octets:	1	1	1	1	4	4	4	4

Figure 9-373—EDCA Parameter Set element format

The Element ID and Length fields are defined in 9.4.2.1.

For an infrastructure BSS, the EDCA Parameter Set element is used by the AP to establish policy (by changing default MIB attribute values), to change policies when accepting new STAs or new traffic, or to adapt to changes in offered load. The most recent EDCA Parameter Set element received by a STA is used to update the appropriate MIB values.

The format of the QoS Info field is defined in 9.4.1.17.

NOTE 1—The QoS Info field contains the EDCA Parameter Set Update Count subfield, which indicates when the EDCA parameters and, for an HE BSS, the MU EDCA parameters have changed (see 10.2.3.2).

The Update EDCA Info field is reserved for non-S1G STAs. For S1G STAs, it is shown in Figure 9-374.

	B0	B1 B2	B3 B4	B5 B6	B7
	Override	PS-Poll ACI	RAW ACI	STA Type	Reserved
Bits:	1	2	2	2	1

Figure 9-374—Update EDCA Info field format

The Override field is used by S1G APs to indicate to S1G STAs that this element overrides previously stored EDCA parameters as described in 10.2.3.2.

The PS-Poll ACI field is used by S1G APs to inform the S1G STAs of the access category for sending a PS-Poll frame. The mapping between the PS-Poll ACI field and AC is identical to the one defined in Table 9-193.

The RAW ACI field is used by S1G APs to inform the S1G STAs of the access category for accessing the WM in the RAW as described in 10.23.5.5. The mapping between the RAW ACI field and AC is identical to the one defined in Table 9-193.

The STA Type field indicates the type of STA for which the information in the element is provided. The S1G AP sets the STA Type field to

— 0 to indicate that the information provided by this element is valid for STAs (i.e., both sensor STAs and non-sensor STAs)
— 1 to indicate that the information is valid for sensor STAs
— 2 to indicate that the information provided by this element is valid for non-sensor STAs
— 3 to indicate a reserved value

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 2—An S1G STA that transmits a (NDP) PS-Poll frame within a RAW uses the access category indicated by PS-Poll ACI subfield rather than the access category indicated by the RAW ACI subfield.

The formats of AC_BE, AC_BK, AC_VI, and AC_VO Parameter Record fields are identical and are shown in Figure 9-375.

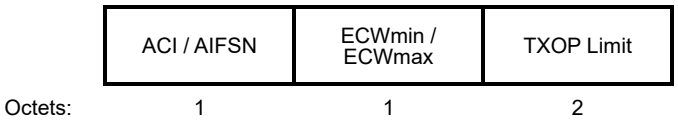

Figure 9-375—AC_BE, AC_BK, AC_VI, and AC_VO Parameter Record field format

The format of the ACI/AIFSN field is shown in Figure 9-376.

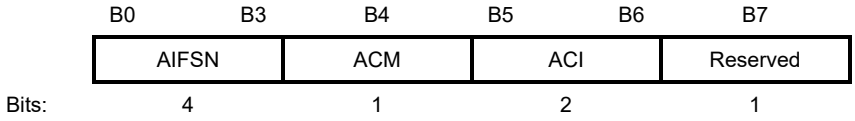

Figure 9-376—ACI/AIFSN field format

The value of the AC index (ACI) references the AC to which all parameters in this record correspond. The mapping between ACI and AC is defined in Table 9-193. The ACM (admission control mandatory) subfield indicates that admission control is required for the AC. If the ACM subfield is equal to 0, then there is no admission control for the corresponding AC. If the ACM subfield is set to 1, admission control has to be used prior to transmission using the access parameters specified for this AC. The AIFSN subfield indicates the number of slots after a SIFS a STA defers before either invoking a backoff or starting a transmission. The minimum value of the AIFSN subfield is 2.

Table 9-193—ACI-to-AC coding

ACI	AC	Description
0	AC_BE	Best effort
1	AC_BK	Background
2	AC_VI	Video
3	AC_VO	Voice

The ECWmin/ECWmax field is shown in Figure 9-377.

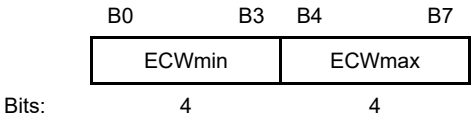

Figure 9-377—ECWmin/ECWmax field format

The ECWmin and ECWmax subfields encode the values of CWmin and CWmax, respectively, in an exponent form. The ECWmin and ECWmax values are defined so that

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$CWmin = 2^{ECWmin} - 1$

$CWmax = 2^{ECWmax} - 1$

Hence the minimum encoded value of CWmin and CWmax is 0, and the maximum value is 32 767.

The TXOP Limit field is specified as an unsigned integer, in units of 32 μs. A TXOP Limit field set to 0 has a special meaning (see 10.23.2.9).

Table 9-194 defines the default EDCA parameters used by a non-AP STA if dot11OCBActivated is false.[28]

Table 9-194—Default EDCA Parameter Set element parameters if dot11OCBActivated is false and the STA is a non-sensor STA

AC	CWmin	CWmax	AIFSN	TXOP limit				
				For PHYs defined in Clause 15 and Clause 16	For PHYs defined in Clause 17, Clause 18, Clause 19, Clause 21, and Clause 27	For PHY defined in Clause 22	Clause 23	Other PHYs
AC_BK	aCWmin	aCWmax	7	3.264 ms	2.528 ms	0	15.008 ms	0
AC_BE	aCWmin	aCWmax	3	3.264 ms	2.528 ms	0	15.008 ms	0
AC_VI	(aCWmin+1)/ 2 – 1	aCWmin	2	6.016 ms	4.096 ms	22.56 ms (BCU: 6 or 7 MHz), 16.92 ms (BCU: 8 MHz)	15.008 ms	0
AC_VO	(aCWmin+1)/ 4 – 1	(aCWmin+1)/ 2 – 1	2	3.264 ms	2.080 ms	11.28 ms (BCU: 6 or 7 MHz), 8.46 ms (BCU: 8 MHz)	15.008 ms	0

[28] The default values for TXOP limit are expressed in milliseconds and are multiples of 32 μs.

If dot11OCBActivated is true, the default EDCA parameter set for STAs transmitting QoS frames is given in Table 9-195.

Table 9-195—Default EDCA parameter set for STA operation if dot11OCBActivated is true

AC	CWmin	CWmax	AIFSN	TXOP limit
AC_BK	aCWmin	aCWmax	9	0
AC_BE	aCWmin	aCWmax	6	0
AC_VI	aCWmin	aCWmax	4	0
AC_VO	(aCWmin+1)/4–1	(aCWmin+1)/2–1	2	0

The default EDCA parameter set used by sensor STAs is given in Table 9-196.

Table 9-196—Default EDCA Parameter Set element parameters if the STA is a sensor STA

AC	CWmin	CWmax	AIFSN	TXOP limit
AC_BK	aCWmin	aCWmax	7	0
AC_BE	(aCWmin+1)/4 – 1	aCWmin	2	0
AC_VI	(aCWmin+1)/2 – 1	aCWmin	5	0
AC_VO	(aCWmin+1)/2 – 1	aCWmin	4	0

9.4.2.28 TSPEC element

The traffic specification (TSPEC) element contains the set of parameters that define the characteristics and QoS expectations of a traffic flow, in the context of a particular STA, for use by the HC or PCP and STA(s) or a mesh STA and its peer mesh STAs in support of QoS traffic transfer using the procedures defined in 11.4 and 11.21.16.3, or for use by HE STAs in support of HE AP scheduling for EDCA or MU operations (see 26.5). The element information format comprises the items as defined in this subclause, and the structure is defined in Figure 9-378.

The TSPEC element allows a set of parameters more extensive than might be needed, or might be available, for any particular instance of parameterized QoS traffic. Unless indicated otherwise, fields that follow the TS Info field are set to 0 for any unspecified parameter values. STAs set any parameters to unspecified if they have no information for setting that parameter.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

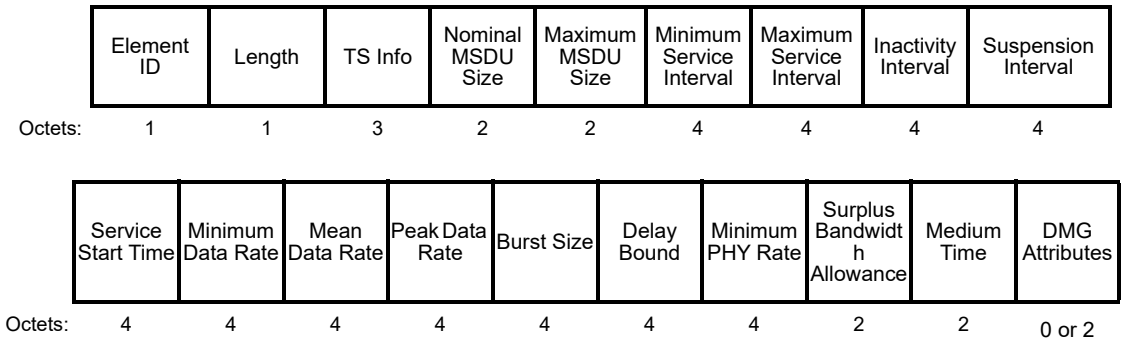

Figure 9-378—TSPEC element format

The structure of the TS Info field is defined in Figure 9-379.

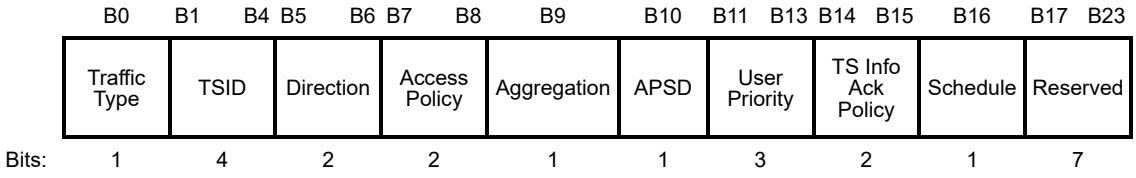

Figure 9-379—TS Info field format

The subfields of the TS Info field are defined as follows:

— The Traffic Type subfield is set to 1 for a periodic traffic pattern (e.g., isochronous TS of MSDUs or A-MSDUs, with constant or variable sizes, that are originated at fixed rate) or set to 0 for an aperiodic, or unspecified, traffic pattern (e.g., asynchronous TS of low-duty cycles).

— The TSID subfield contains a value that is a TSID. Note that the MSB (bit 4 in TS Info field) of the TSID subfield is always set to 1 when the TSPEC element is included within an ADDTS Response frame.

— The Direction subfield specifies the direction of data carried by the TS as defined in Table 9-197.

Table 9-197—Direction subfield encoding

Bit 5	Bit 6	Usage
0	0	Uplink, defined as follows: — Non-DMG BSS: MSDUs or A-MSDUs are sent from the non-AP non-HE STA to HC or from the non-AP HE STA to the HE AP. — DMG BSS: MSDUs or A-MSDUs are sent by the originator of the ADDTS Request frame.
1	0	Downlink, defined as follows: — Non-DMG BSS: MSDUs or A-MSDUs are sent from the HC to the non-AP non-HE STA or from the HE AP to the non-AP HE STA. — DMG BSS: MSDUs or A-MSDUs are sent by the recipient of the ADDTS Request frame.
0	1	Direct link (MSDUs or A-MSDUs are sent from the non-AP STA to another non-AP STA)

Table 9-197—Direction subfield encoding *(continued)*

Bit 5	Bit 6	Usage
1	1	Bidirectional link (equivalent to a downlink request plus an uplink request, each direction having the same parameters). The fields in the TSPEC element specify resources for a single direction. Double the specified resources are required to support both streams.

— The Access Policy subfield specifies the access method to be used for the TS, and is defined in Table 9-198.

Table 9-198—Access Policy subfield

Bit 7	Bit 8	Usage
0	0	Reserved
1	0	For non-HE STAs: Contention based channel access (EDCA). For HE STAs: EDCA or MU based access (see 26.5)
0	1	Controlled channel access (HCCA for non-DMG STAs and SPCA for DMG STAs)
1	1	Controlled and contention based channel access (HCCA, EDCA mixed mode (HEMM) for non-DMG STAs; SPCA, EDCA mixed mode (SEMM) for DMG STAs)

— The Aggregation subfield is valid only when the access method is HCCA or SPCA or when the access method is EDCA and the Schedule subfield is equal to 1. It is set to 1 by a non-AP STA to indicate that an aggregate schedule is required. It is set to 1 by the AP if an aggregate schedule is being provided to the STA. It is set to 0 otherwise. In all other cases, the Aggregation subfield is reserved.

— The APSD subfield is set to 1 to indicate that automatic PS delivery is to be used for the traffic associated with the TSPEC and set to 0 otherwise.

— The UP subfield indicates the actual value of the UP to be used for the transport of MSDUs or A-MSDUs belonging to this TS if relative prioritization is required. When the TCLAS element is present in the request, the UP subfield in TS Info field of the TSPEC element is reserved.

— The TS Info Ack Policy subfield indicates whether MAC acknowledgments are required for MPDUs or A-MSDUs belonging to this TSID and the form of those acknowledgments. The encoding of the TS Info Ack Policy subfield is shown in Table 9-199.

Table 9-199—TS Info Ack Policy subfield encoding

Bit 14	Bit 15	Usage
0	0	Normal Ack.(11ax) The addressed recipient returns an Ack or QoS +CF-Ack frame after a SIFS, according to the procedures defined in 10.3.2.11 and 10.23.3.5.
1	0	No Ack: The recipient(s) do not acknowledge the transmission.
0	1	Reserved
1	1	Block Ack: A separate block ack mechanism described in 10.25 is used.

— The Schedule subfield specifies the requested type of schedule. The setting of the subfield when the access policy is EDCA is shown in Table 9-200. When the Access Policy subfield is equal to any

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

value other than EDCA, the Schedule subfield is reserved. When the Schedule and APSD subfields are equal to 1, the AP sets the Aggregation subfield to 1, indicating that an aggregate schedule is being provided to the STA.

Table 9-200—Setting of Schedule subfield

APSD	Schedule	Usage
0	0	No Schedule
1	0	Unscheduled APSD
0	1	GCR-SP
1	1	Scheduled APSD

The Nominal MSDU Size field contains an unsigned integer that specifies the nominal size, in octets, of MSDUs or (where A-MSDU aggregation is employed) A-MSDUs belonging to the TS under this TSPEC element and is defined in Figure 9-380. If the Fixed subfield is equal to 1, then the size of the MSDU or A-MSDU is fixed and is indicated by the Size subfield. If the Fixed subfield is equal to 0, then the size of the MSDU or A-MSDU might not be fixed and the Size subfield indicates the nominal MSDU size. If both the Fixed and Size subfields are equal to 0, then the nominal MSDU or A-MSDU size is unspecified.

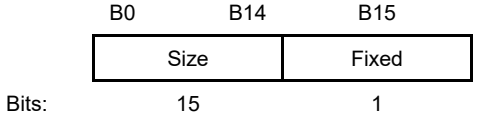

Figure 9-380—Nominal MSDU Size field format

The Maximum MSDU Size field contains an unsigned integer that specifies the maximum size, in octets, of MSDUs or A-MSDUs belonging to the TS under this TSPEC element.

The Minimum Service Interval field contains an unsigned integer that specifies the minimum interval, in microseconds, between the start of two successive SPs. If the TSPEC element is included within a GCR Request subelement that has the GCR delivery method equal to GCR-SP, a Minimum Service Interval field set to 0 indicates that SPs up to the maximum service interval are requested, including the continuous SP used by the GCR-A delivery method.

The Maximum Service Interval field contains an unsigned integer that, when the TSPEC element is for the admitting of HCCA streams, specifies the maximum interval, in microseconds, between the start of two successive SPs. If the TSPEC element is intended for EDCA Admission Control, the Maximum Service Interval field is used to indicate a latency limit, which limits the amount of aggregation (A-MSDU or A-MPDU) used, so that excessive latency does not occur (see K.4.3.1). The Maximum Service Interval field is greater than or equal to the Minimum Service Interval field. If the TSPEC element is included within a GCR Request subelement that has the GCR delivery method equal to GCR-SP, a Maximum Service Interval field set to 0 indicates that the continuous SP used by the GCR-A delivery method is requested.

K.4.3.2 provides guidance on the use of the Maximum Service Interval field to determine the limit of aggregation of nominal MSDUs.

The Inactivity Interval field contains an unsigned integer that specifies the minimum amount of time, in microseconds, that can elapse without arrival or transfer of an MPDU belonging to the TS before this TS is deleted by the MAC entity at the HC for a non-HE STA or before the information provided in this TSPEC is considered invalid at HE STAs for HE STAs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For non-HE STAs, the Suspension Interval field contains an unsigned integer that specifies the minimum amount of time, in microseconds, that can elapse without arrival or transfer of an MSDU belonging to the TS before the generation of successive QoS(+)CF-Poll is stopped for this TS. A value of 4 294 967 295 (= $2^{32} - 1$) disables the suspension interval, indicating that polling for the TS is not to be interrupted based on inactivity. The suspension interval is always less than or equal to the inactivity interval. The Suspension Interval field is reserved for HE STAs.

The Service Start Time field contains an unsigned integer that specifies the time, expressed in microseconds, when the first scheduled SP starts. The service start time indicates to the AP the time when a STA first expects to be ready to send frames and a power saving STA needs to be awake to receive frames. This might help the AP to schedule service so that the MSDUs encounter small delays in the MAC and help the power saving STAs to reduce power consumption. The field represents the four lower order octets of the TSF timer at the start of the SP. If APSD and Schedule subfields are 0, this field is also set to 0 (unspecified).

NOTE—The Service Start Time field carries only a portion of the target TSF time, and changes in the most significant octets of the corresponding target TSF time are not communicated to the receiving STA. Hence, the receiving STA must consider and account for a rollover of the corresponding most significant octets of the target TSF time that might happen at the receiving STA.

The Minimum Data Rate field indicates the lowest data rate specified at the MAC SAP, for transport of MSDUs or A-MSDUs belonging to this TS within the bounds of this TSPEC element. The field is encoded as a piecewise linear function described as follows:

$$R_{min} = \begin{cases} F_{min}, & F_{min} \le 2^{31} \\ 1024 \times (F_{min} - 2^{31}) + 2^{31}, & F_{min} > 2^{31} \end{cases}$$

where

R_{min} is the minimum data rate (in units of b/s)
F_{min} is the value of the Minimum Data Rate field

The Mean Data Rate[29] field indicates the average data rate specified at the MAC SAP, for transport of MSDUs or A-MSDUs belonging to this TS within the bounds of this TSPEC element. The field is encoded as a piecewise linear function described as follows:

$$R_{mean} = \begin{cases} F_{mean}, & F_{mean} \le 2^{31} \\ 1024 \times (F_{mean} - 2^{31}) + 2^{31}, & F_{mean} > 2^{31} \end{cases}$$

where

R_{mean} is the mean data rate (in units of b/s)
F_{mean} is the value of the Mean Data Rate field

The Peak Data Rate field indicates the maximum allowable data rate specified at the MAC SAP for transport of MSDUs or A-MSDUs belonging to this TS within the bounds of this TSPEC element. The field is encoded as a piecewise linear function described as follows:

[29] The mean data rate, the peak data rate, and the burst size are the parameters of the token bucket model, which provides standard terminology for describing the behavior of a traffic source. The token bucket model is described in IETF RFC 2212 [B26], IETF RFC 2215 [B27], and IETF RFC 3290 [B36].

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$R_{peak} = \begin{cases} F_{peak}, & F_{peak} \le 2^{31} \\ 1024 \times (F_{peak} - 2^{31}) + 2^{31}, & F_{peak} > 2^{31} \end{cases}$$

where

R_{peak} is the peak data rate (in units of b/s)
F_{peak} is the value of the Peak Data Rate field

If p is the peak rate in b/s, then the maximum amount of data, belonging to this TS, arriving in any time interval [$t1$,$t2$], where $t1 < t2$ and $t2 - t1 > 1$ TU, does not exceed $p \times (t2 - t1)$ bits.

The Minimum, Mean and Peak Data Rates do not include the MAC and PHY overheads incurred in transporting the MSDUs or A-MSDUs, with the exception of the MAC overheads specific to A-MSDUs (A-MSDU subframe header and padding). K.4.4 provides guidance on how to determine the standard deviation of the TS and how to calculate the total traffic when there are multiple TSs.

The Burst Size field contains an unsigned integer that specifies the maximum burst, in octets, of the MSDUs or A-MSDUs belonging to this TS that arrive at the MAC SAP at the peak data rate. A Burst Size field set to 0 indicates that there are no bursts.

The Delay Bound field contains an unsigned integer that specifies the maximum amount of time, in microseconds, allowed to transport an MSDU or A-MSDU belonging to the TS in this TSPEC element, measured between the time marking the arrival of the MSDU, or the first MSDU of the MSDUs constituting an A-MSDU, at the local MAC sublayer from the local MAC SAP and the time of completion of the successful transmission or retransmission of the MSDU or A-MSDU to the destination. The completion of the MSDU or A-MSDU transmission includes the relevant acknowledgment frame transmission time, if present.

The Minimum PHY Rate field indicates the minimum PHY rate for transport of MSDUs or A-MSDUs belonging to this TS within the bounds of this TSPEC element.[30] See 11.4.2 for constraints on the selection of this field. The field is encoded as a piecewise linear function described as follows:

$$R_{minphy} = \begin{cases} F_{minphy}, & F_{minphy} \le 2^{31} \\ 1024 \times (F_{minphy} - 2^{31}) + 2^{31}, & F_{minphy} > 2^{31} \end{cases}$$

where

R_{minphy} is the minimum PHY rate (in units of b/s)
F_{minphy} is the value of the Minimum PHY Rate field

The Surplus Bandwidth Allowance field specifies the excess allocation of time (and bandwidth) over and above the stated application rates required to transport an MSDU or A-MSDU belonging to the TS in this TSPEC. This field is represented as an unsigned binary number and, when specified, is greater than 0. The 13 least significant bits (LSBs) indicate the decimal part while the three MSBs indicate the integer part of the number. This field takes into account the retransmissions, as the rate information does not include retransmissions. It represents the ratio of over-the-air bandwidth (i.e., time that the scheduler allocates for

[30] This rate information is intended to confirm that the TSPEC parameter values resulting from an admission control negotiation are sufficient to provide the required throughput for the TS. In a typical implementation, a TS is admitted only if the defined traffic volume can be accommodated at the specified rate within an amount of WM occupancy time that the admissions control entity is willing to allocate to this TS.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the transmission of MSDUs or A-MSDUs at the required rates) to bandwidth of the transported MSDUs or A-MSDUs required for successful transmission (i.e., time that would be necessary at the minimum PHY rate if there were no errors on the channel) to meet throughput and delay bounds under this TSPEC, when specified. As such, it should be greater than unity. A Surplus Bandwidth Allowance field set to 1 indicates that no additional allocation of time is requested. K.4.2 provides guidance on how to calculate the value for Surplus Bandwidth Allowance element.

The Medium Time field contains the amount of time admitted to access the medium, in units of 32 μs/s. This field is reserved in the ADDTS Request frame and is set by the HC in the ADDTS Response frame. The derivation of this field is described in K.2.2. This field is not used for controlled channel access.

The UP, Minimum Data Rate, Mean Data Rate, Peak Data Rate, Burst Size, Minimum PHY Rate, and Delay Bound fields in a TSPEC element express the QoS expectations requested by a STA, if this TSPEC element was issued by that STA, or provided by the HC, if this TSPEC element was issued by the HC, when these fields are specified with nonzero values. Unspecified parameters in these fields as indicated by a value of 0 indicate that the STA does not have specific requirements for these parameters if the TSPEC element was issued by that STA or that the HC does not provide any specific values for these parameters if the TSPEC element was issued by the HC. Annex K provides guidance on the use of the TSPEC element and the settings of values of the various fields.

The DMG Attributes field is defined in Figure 9-381. The DMG Attributes field is present in a TSPEC element when the BSS to which the TSPEC element applies is a DMG BSS; otherwise absent.

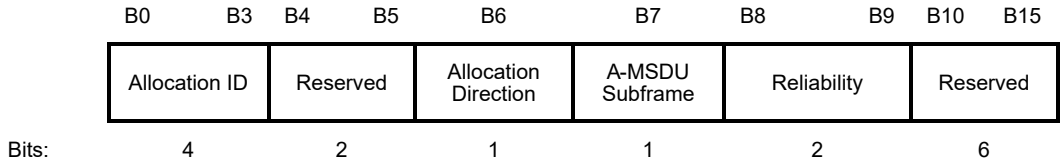

Figure 9-381—DMG Attributes field format

— Traffic streams can share an allocation through TSPEC aggregation (see Annex V). The Allocation ID subfield is used as follows:
  — When setting up a TS, the DMG STA that transmits an ADDTS Request frame containing a TSPEC or PTP TSPEC element sets the Allocation ID subfield to a nonzero value to identify the allocation it requires to carry the TS. Alternatively, the same DMG STA sets the Allocation ID subfield to 0 to indicate any CBAP allocation with the broadcast AID as Source AID.
  — When setting up a TS, the DMG STA that transmits the ADDTS Response frame containing the TSPEC or PTP TSPEC element sets the Allocation ID subfield to a nonzero value that identifies the allocation carrying the TS. Alternatively, the same DMG STA sets the Allocation ID subfield to 0 to indicate any CBAP allocation with the broadcast AID as Source AID and Destination AID.
  — When deleting a TS, the DMG STA that transmits the DELTS frame containing a TSPEC or PTP TSPEC element sets the Allocation ID subfield to a nonzero value to identify the allocation that is carrying the TS to be deleted. Alternatively, the same DMG STA sets the Allocation ID subfield to 0 to indicate no allocation exists to carry the TS to be deleted.
— The Allocation Direction subfield is equal to 1 when the originator of the ADDTS request is also the source of the allocation identified by the Allocation ID subfield and is equal to 0 otherwise. The Allocation Direction subfield is equal to 0 when the Allocation ID subfield is equal to 0.
— The A-MSDU Subframe subfield contains a value that indicates the A-MSDU subframe structure to be used for this TS. The A-MSDU Subframe subfield is set to 0 to indicate the Basic A-MSDU subframe structure and set to 1 to indicate the Short A-MSDU subframe structure.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The Reliability subfield contains an expected reliability index. The reliability index refers to the PHY PER (PSDU error rate as in 20.3.3.8). The relation between the reliability index and the PER is shown in Table 9-201.

Table 9-201—Reliability subfield values

Reliability index	PER
0	Not specified
1	10^{-2}
2	10^{-3}
3	10^{-4}

The Reliability subfield in an ADDTS Request frame that has the Direction subfield set to downlink or in an ADDTS Response frame that has the Direction field set to uplink indicates the expectation of the PER of the destination DMG STA for this TS. The Reliability subfield in an ADDTS Request frame that has the Direction subfield set to uplink or in an ADDTS Response frame that has the Direction field set to downlink is reserved. The reliability information is provided by the SME using the MLME-ADDTS.request primitive and MLME-ADDTS.response primitives. Together with the link margin (10.41.9) and other implementation specific information, this value can be used by the source DMG STA of this TS to estimate the MCS to be used for this particular TS.

9.4.2.29 TCLAS element

The traffic classification (TCLAS) element contains a set of parameters necessary to identify various kinds of PDU or incoming MSDU (from a higher layer in all STAs or from the DS in an AP) that belong to a particular TS. The TCLAS element is also used when the traffic does not belong to a TS, for example, by the FMS, DMS, and TFS services. If required, the TCLAS element is provided in ADDTS Request and ADDTS Response frames only for the downlink or bidirectional links. The TCLAS element is always included when a PTP TSPEC is transmitted to a peer STA via an AP or PCP. The structure of this element is shown in Figure 9-382.

	Element ID	Length	User Priority	Frame Classifier
Octets:	1	1	1	variable

Figure 9-382—TCLAS element format

The Element ID and Length fields are defined in 9.4.2.1.

When the UP field contains a value that is less than or equal to 7, the value specifies the UP of the associated MSDUs. When the UP field contains a value that is greater than or equal to 8 and less than or equal to 11, the value specifies the access category of the associated MPDUs. The UP field value 255 is reserved and indicates that the UP of the MSDU and the access category of the MPDU are not compared as part of the traffic filter. The encoding of the contents of the User Priority field of an TCLAS element is specified in Table 9-202.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-202—User Priority field of TCLAS element

User Priority	Meaning
0–7	The User Priority value of an MSDU.
8	The AC value of an MPDU is AC_VO.
9	The AC value of an MPDU is AC_VI.
10	The AC value of an MPDU is AC_BE.
11	The AC value of an MPDU is AC_BK.
12–254	Reserved.
255	The User Priority field is not used for comparison.

The Frame Classifier field is defined in Figure 9-383.

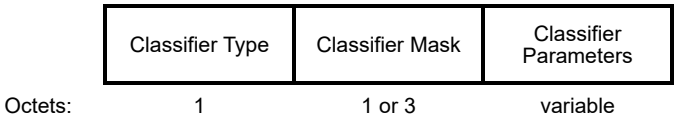

Figure 9-383—Frame Classifier field format

The Frame Classifier field comprises the following subfields: Classifier Type, Classifier Mask, and Classifier Parameters. The Classifier Type subfield specifies the type of classifier parameters in this TCLAS element as defined in Table 9-203.

Table 9-203—Frame classifier type

Classifier type	Classifier parameters
0	Ethernet parameters
1	TCP/UDP IP parameters
2	IEEE 802.1Q-2003 parameters (deprecated)
3	Filter Offset parameters
4	IP and higher layer parameters
5	IEEE 802.1Q parameters
6	IEEE 802.11 MAC header parameters
7	IEEE Std 802.11 downlink PV1 MPDU MAC header parameters (From DS field of the Frame Control field equal to 1)
8	IEEE Std 802.11 nondownlink PV1 MPDU MAC header parameters (From DS field of the Frame Control field equal to 0)
9	IEEE Std 802.11 PV1 MPDU Full Address MAC header parameters
10	IP extensions and higher layer parameters
11–255	Reserved

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When the classifier type is a value less than or equal to 5, but not equal to 3, the Classifier Mask subfield specifies a bitmap in which bits that have the value 1 identify a subset of the classifier parameters whose values need to match those of the corresponding parameters in a given MSDU for that MSDU to be classified to the TS of the affiliated TSPEC element. The bitmap is ordered from the LSB to the MSB, with each bit pointing to one of the classifier parameters of the same relative position as shown in this subclause based on classifier type. When there are more bits in the bitmap than classifier parameters that follow, the MSBs that do not point to any classifier parameters are reserved.

A Classifier Type subfield set to 6 applies only to frames with the Protocol Version subfield of the Frame Control field of the MAC header equal to 0.

A Classifier Type subfield set to 7 applies only to frames with the Protocol Version subfield of the Frame Control field of the MAC header equal to 1, the Type subfield of the Frame Control field of the MAC header equal to 0 or 1, and the From DS subfield of the Frame Control field of the MAC header equal to 1.

A Classifier Type subfield set to 8 applies only to frames with the Protocol Version subfield of the Frame Control field of the MAC header equal to 1, the Type subfield of the Frame Control field of the MAC header equal to 0 or 1, and the From DS subfield of the Frame Control field of the MAC header equal to 0.

A Classifier Type subfield set to 9 applies only to frames with the Protocol Version subfield of the Frame Control field of the MAC header equal to 1 and the Type subfield of the Frame Control field of the MAC header equal to 3.

When the Classifier Type subfield is equal to 6, 7, 8, or 9, the Classifier Mask subfield is 3 octets in length and contains a sequence of 2-bit Classifier Mask Control subfields. Each Classifier Mask Control subfield applies to a specific target field of the MAC header of an MPDU and determines whether the target field is included in the comparison and whether an additional bitmask (the target field filter mask) is present. When the target field filter mask is present, it determines the bits of the target field that are used in the comparison.

The Classifier Mask Control subfield values are interpreted as follows:

— Setting the LSB of the two bits to 1 indicates the use of the corresponding MAC header field for comparison, and setting the LSB of the two bits to 0 indicates the corresponding MAC header field is not used for comparison, and the corresponding match specification is not included in the Classifier.
— Setting the MSB of the two bits to 1 indicates the inclusion of the corresponding MAC header filter (a bitmask) in the corresponding match specification, and setting the MSB of the two bits to 0 indicates the MAC header filter is not included in the corresponding match specification and every bit of the match specification, if included in the Classifier Parameter, needs to be compared.
— If an optional MAC header field needs to be compared, the LSB of the two bits in the Classifier Mask corresponding to the optional MAC header field is set to 1, and an MPDU that does not include the optional field is not a matching MPDU.

Table 9-204, Table 9-205, Table 9-206, and Table 9-207 specify the interpretation of the Classifier Mask Control subfield for each of the Classifier Type values 6, 7, 8, and 9, respectively.

The map from the location of the Classifier Mask subfield to the target subfield is defined in Table 9-208.

Table 9-208—Map from location of Classifier Mask subfield to target subfield

Bit number	Target field
0–1	Frame Control
2–3	Duration/ID
4–5	Address 1
6–7	Address 2
8–9	Address 3
10–11	Sequence Control
12–13	Address 4
14–15	QoS Control
16–17	HT Control
18–23	Reserved

For Classifier Type 0, the classifier parameters are the following parameters contained in an Ethernet frame header: Source Address, Destination Address, and Type ("Ethernet" [B9]). The endianness of the Type field is defined in "Ethernet" [B9]. The Frame Classifier field for Classifier Type 0 is defined in Figure 9-384. It has a length of 16 octets.

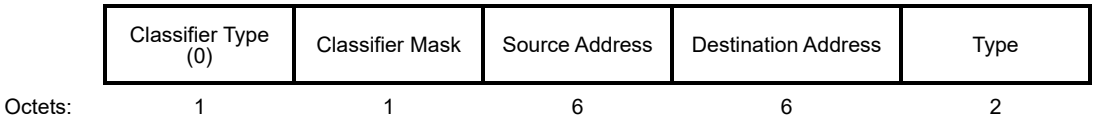

Figure 9-384—Frame Classifier field format of Classifier Type 0

For Classifier Type 1, frame classifier is defined for both IPv4 and IPv6, shown in Figure 9-385 and Figure 9-386, and distinguished by the Version field. Use of Classifier Type 1 for IPv6 is deprecated and replaced by Classifier Type 4. The subfields in the classifier parameters are represented and transmitted in the big-endian format. The classifier parameters are the following parameters:

- In the IP header: Source Address, Destination Address and Version.
- In a TCP or UDP header: Source Port and Destination Port, plus
- One of the following:
  - In an IPv4 header: Differentiated Services Code Point (DSCP) (IETF RFC 2474 [B29]) and Protocol, or
  - In an IPv6 header: Flow Label.

The DSCP field contains a value in the 6 LSBs, and the 2 MSBs are set to 0. The 2 MSBs of the DSCP field are ignored for frame classification.

The value in the Version subfield is the value specified in IETF RFC 791 or IETF RFC 8200.

Figure 9-385—Frame Classifier field format of Classifier Type 1 for traffic over IPv4

	Classifier Type (1)	Classifier Mask	Version	Source IP Address	Destination IP Address	Source Port	Destination Port	Flow Label
Octets:	1	1	1	16	16	2	2	3

Figure 9-386—Frame Classifier field format of Classifier Type 1 for traffic over IPv6

For Classifier Type 2, the Classifier Parameter is the IEEE 802.1Q-2003 VLAN Tag TCI. The endianness of the IEEE 802.1Q VLAN TCI field is defined in IEEE Std 802.1Q for the VLAN Tag TCI. The Frame Classifier field for Classifier Type 2 is defined in Figure 9-387. Classifier Type 2 is deprecated.

	Classifier Type (2)	Classifier Mask	802.1Q VLAN TCI
Octets:	1	1	2

Figure 9-387—Frame Classifier field format of Classifier Type 2

For Classifier Type 3, the classifier parameters are defined by a Filter Offset subfield, a Filter Value subfield and a Filter Mask subfield. The Frame Classifier subfield of Classifier Type 3 is defined in Figure 9-388. It has a variable length.

	Classifier Type (3)	Classifier Mask	Filter Offset	Filter Value	Filter Mask
Octets:	1	1	2	variable	variable

Figure 9-388—Frame Classifier field format of Classifier Type 3

The Classifier Mask subfield is reserved.

The Filter Offset subfield is set to the number of octets from the beginning of the MSDU or MMPDU at which the Filter Value is compared.

The length of the Filter Value and Filter Mask subfields is (*Length* – 5)/2, where *Length* is the value in the Length field of the TCLAS element.

The Filter Value subfield is an octet string that is compared to the MSDU or MMPDU content, beginning at the octet indicated by the Filter Offset.

The Filter Mask subfield is an octet string that is used to indicate the bits in the Filter Value subfield to be compared. The length of the Filter Mask subfield is equal to the length of the Filter Value subfield. A bit in the Filter Value subfield is compared only if the matching bit in the Filter Mask subfield is 1.

For Classifier Type 4, frame classifier is defined for both IPv4 and IPv6, shown in Figure 9-389 (with the Classifier Type subfield set to 4) and Figure 9-390, and distinguished by the Version subfield. The classifier parameters represent corresponding values in a received IPv4 or IPv6 frame and are defined in Table 9-209. The subfields in the classifier parameters are represented and transmitted in big-endian format.

Table 9-209—Classifier parameters for Classifier Type 4

Subfield	Included in IPv4	IPv4 field length (octets)	Included in IPv6	IPv6 field length (octets)
Version	Yes	1	Yes	1
Source IP Address	Yes	4	Yes	16
Destination IP Address	Yes	4	Yes	16
Source Port	Yes	2	Yes	2
Destination Port	Yes	2	Yes	2
DSCP	Yes	1	Yes	1
Protocol	Yes	1	No	n/a
Next Header	No	n/a	Yes	1
Flow Label	No	n/a	Yes	3

The Frame Classifier subfield of Classifier Type 4 for traffic over IPv4 is shown in Figure 9-389.

	Classifier Type (4)	Classifier Mask	Version(4)	Source IP Address	Destination IP Address
Octets:	1	1	1	4	4
	Source Port	Destination Port	DSCP	Protocol	Reserved
Octets:	2	2	1	1	1

Figure 9-389—Frame Classifier subfield format of Classifier Type 4 for traffic over IPv4

The Frame Classifier subfield of Classifier Type 4 for traffic over IPv6 is shown in Figure 9-390.

	Classifier Type (4)	Classifier Mask	Version(6)	Source IP Address	Destination IP Address
Octets:	1	1	1	16	16
	Source Port	Destination Port	DSCP	Next Header	Flow Label

NOTE 1—Frame classification when extension headers are used is supported only if the TCLAS does not classify on ports (Classifier Mask has the Source and Destination Port bits set to 0).

The value in the Version subfield is the value specified in IETF RFC 791 or IETF RFC 8200.

The DSCP subfield contains the value as described in IETF RFC 2474 [B29] in the 6 least significant bits. The 2 most significant bits are reserved. For an IPv6 packet, this corresponds to the Traffic Class subfield of the IPv6 header.

The Source IP Address and Destination IP Address subfields correspond to the identically named fields of the IPv4 and IPv6 headers.

The Source Port and Destination Port subfields correspond to the identically named fields of various protocol headers that are encapsulated within an IPv4 or IPv6 packet.

The Next Header subfield contains the next encapsulated protocol which is either the value specified in the IPv4 header's Protocol field or the value in the Next Header field of the IPv6 header. In the presence of options in the IPv6 header, the Next Header field specifies the presence of one or more extension headers as registered in "IPv6 Extension Header Types" [B58] and defined by the corresponding IETF RFCs.

The Flow Label subfield contains the value in the 20 least significant bits. The 4 most significant bits are reserved.

NOTE 2—For example, the flow label 0x12345 is represented as the octet sequence 0x01, 0x23, 0x45.

For Classifier Type 5 when used to match an IEEE 802.1Q tagged frame, the classifier parameters are: Priority Code Point, Drop Eligibility Indicator (DEI), and VLAN ID (VID).

The Frame Classifier field for Classifier Type 5 is defined in Figure 9-391.

	Classifier Type (5)	Classifier Mask	802.1Q Priority Code Point	802.1Q DEI	802.1Q VID
Octets:	1	1	1	1	2

Figure 9-391—Frame Classifier field format of Classifier Type 5

The subfields in the classifier parameters are represented and transmitted in big-endian format.

The 802.1Q Priority Code Point subfield contains the value to be matched to the appropriate type frame header in the 4 LSBs; the 4 MSBs are reserved.

The 802.1Q DEI subfield contains the value to match against an IEEE 802.1Q tagged frame header, in the LSB; the 7 MSBs are reserved.

The 802.1Q VID subfield contains the value to match against an IEEE 802.1Q tagged frame header, in the 12 LSBs; the 4 MSBs are reserved.

For Classifier Type 6, the format of the Frame Classifier field of a TCLAS element is shown in Figure 9-392.

	Classifier Type (6)	Classifier Mask	Frame Control Match Specification	Duration Match Specification	Address 1 Match Specification	Address 2 Match Specification
Octets:	1	3	0 or 2 or 4	0 or 2 or 4	0 or 6 or 12	0 or 6 or 12

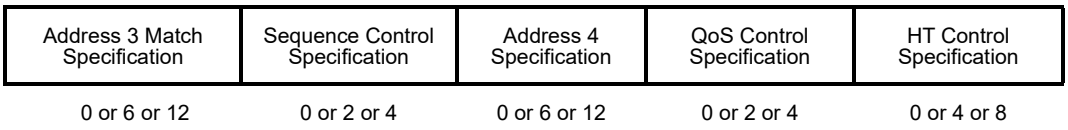

Figure 9-392—Frame Classifier field format of Classifier Type 6

For Classifier Type 6, the formats of the Frame Control Match Specification subfield, Duration/ID Match Specification subfield, Address 1 Match Specification subfield, Address 2 Match Specification subfield, Address 3 Match Specification subfield, Sequence Control Match Specification subfield, Address 4 Match Specification subfield, QoS Control Match Specification subfield and HT Control Match Specification subfield of the Frame Classifier field of a TCLAS element are shown in Figure 9-393, Figure 9-394, Figure 9-395, Figure 9-396, Figure 9-397, Figure 9-398, Figure 9-399, Figure 9-400, and Figure 9-401, respectively. The Match Specification subfield contains the match specification (i.e., the parameters) of the corresponding MAC header field with which an MPDU is compared. When the corresponding Filter Mask is not present, every bit in a match specification is compared; otherwise, only the bits with the same bit positions as the bits that are equal to 1 in the corresponding Filter Mask subfield are compared.

contains the match specification (i.e., the parameters) of the corresponding MAC header field with which an MPDU needs to be compared. When the corresponding Filter Mask subfield is not present, every bit in a Match Specification subfield needs to be compared; otherwise, only the bits with the same bit positions as the bits that are equal to 1 in the corresponding Filter Mask subfield are compared.

	Address 1 (SID) Match Specification	Address 1 Filter Mask
Octets:	2	0, or 2

Figure 9-403—Address 1 (SID) Match Specification subfield format of Classifier Type 7

For Classifier Type 8, the format of the Frame Classifier field of a TCLAS element is shown in Figure 9-404.

	Classi-fier Type (8)	Classi-fier Mask	Frame Control Match Specifica-tion	Address 1 (BSSID) Match Specifica-tion	Address 2 (SID) Match Specifica-tion	Sequence Control Match Specifica-tion	Address 3 Match Specifica-tion	Address 4 Match Specifica-tion
Octets:	1	3	0, 2, or 4	0, 6, or 12	0, 2, or 4	0, 2, or 4	0, 6, or 12	0, 6, or 12

Figure 9-404—Frame Classifier field format of Classifier Type 8

For Classifier Type 8, the formats of the Frame Control Match Specification subfield, Address 1 (BSSID) subfield, Address 2 (SID) subfield, Sequence Control subfield, and Address 3 subfield are shown in Figure 9-393, Figure 9-395, Figure 9-405, Figure 9-398, Figure 9-397, and Figure 9-399, respectively. The Match Specification subfield contains the match specification (i.e., the parameters) of the corresponding MAC header field with which an MPDU needs to be compared. When the corresponding Filter Mask subfield is not present, every bit in a Match Specification subfield needs to be compared; otherwise, only the bits with the same bit positions as the bits that are equal to 1 in the corresponding Filter Mask subfield are compared.

	Address 2(SID) Match Specification	Address 2 Filter Mask
Octets:	2	0, or 2

Figure 9-405—Address 2 (SID) Match Specification subfield format of Classifier Type 8

For Classifier Type 9, the format of the Frame Classifier field of a TCLAS element is shown in Figure 9-406.

	Classifier Type (9)	Classifier Mask	Frame Control Match Specification	Address 1 Match Specification	Address 2 Match Specification	Sequence Control Match Specification
Octets:	1	3	0, 2, or 4	0, 6, or 12	0, 6, or 12	0, 2, or 4

Figure 9-406—Frame Classifier field format of Classifier Type 9

For Classifier Type 9, the formats of the Frame Control Match Specification subfield, Address 1 subfield, Address 2 subfield, and Sequence Control subfield are shown in Figure 9-393, Figure 9-395, Figure 9-396,

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

and Figure 9-398, respectively. The Match Specification subfield contains the match specification (i.e., the parameters) of the corresponding MAC header field with which an MPDU needs to be compared. When the corresponding Filter Mask subfield is not present, every bit in a Match Specification subfield needs to be compared; otherwise, only the bits with the same bit positions as the bits that are set to 1 in the corresponding Filter Mask subfield are compared.

For Classifier Type 10, the Frame Classifier field for IP extensions and higher layer parameters is defined for packets using IPv4 and IPv6 as shown in Figure 9-407. The subfields in the classifier parameters are represented and transmitted in the big-endian format.

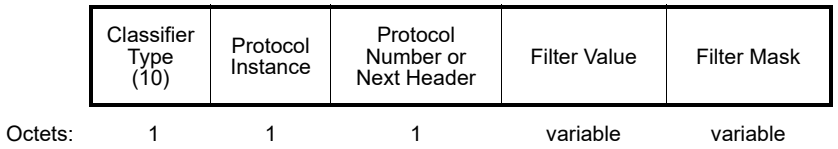

Figure 9-407—Frame Classifier field format of Classifier Type 10 for packets using IPv4 or IPv6

The Protocol Instance subfield indicates the instance number of the protocol identified by the Protocol Number or Next Header subfield. A value of 0 in this field matches the first instance of the Protocol Number or Next Header. A value of 1 matches the second instance, and so on. The only value of Protocol Number or Next Header subfield that is allowed to appear more than once within an IP packet is the Destination Options extension header of IPv6.

The Protocol Number or Next Header subfield contains an IPv4 Protocol Number or an IPv6 Next Header value, which share a common interpretation also known as an IP Protocol Number. The Protocol Number or Next Header subfield value is compared against the Protocol field value of an IPv4 header and to all Next Header field values in an IPv6 packet. This is also true for an IPv6 packet that is encapsulated within an IPv4 packet. This matching operation is not maskable.

The lengths of the Filter Value and Filter Mask subfields are the same and are each equal to (Length – 4)/2 octets, where Length is the value in the Length field of the TCLAS element.

The Filter Value subfield is an octet string that is compared to the MSDU content, beginning at the first octet of the protocol information which is identified by the Protocol Number or Next Header subfield.

The Filter Mask subfield is an octet string that is used to indicate which bits in the Filter Value subfield are compared. A bit in the Filter Value subfield is compared only if the matching bit in the Filter Mask subfield is 1.

Figure 9-408 shows an example of how the Filter Value subfield is applied to an IPv4 packet.

When the Protocol Number or Next Header subfield value of the Frame Classifier matches the value in the Protocol subfield of the IPv4 header, in this case the identifier that corresponds to protocol XYZ, then the first Filter Value octet is compared to Protocol XYZ octet 0 and so on.

Figure 9-409 shows an example of how the Filter Value subfield is applied to an IPv6 packet that contains multiple extension headers.

When the Protocol Number or Next Header subfield value of the Frame Classifier matches the value of a Next Header field of any IPv6 Header or IPv6 Extension Header, then the first Filter Value octet is compared to the first octet of the header of of the payload that is identified by the matching Protocol Number or Next Header subfield value and so on. For example, if the Protocol Number or Next Header subfield

value of a Frame Classifier of Classifier Type 10 contains the identifier for IPv6 Extension Header GHI, then this value matches the first entry of the seventh row in the figure and the Filter Value comparison begins at the first octet indicated on the ninth row of the figure. The comparison stops after the first match of a Next Header field.

If a Classifier Mask field is not reserved and is present, at least one bit in the field that is not reserved is nonzero.

9.4.2.30 TS Delay element

The TS Delay element is used in an ADDTS Response frame transmitted by an HC and indicates the time after which the ADDTS can be retried; see 11.4.6. The TS Delay element is defined in Figure 9-410.

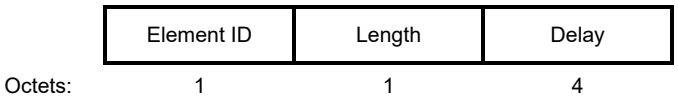

Figure 9-410—TS Delay element format

The Element ID and Length fields are defined in 9.4.2.1.

The Delay field specifies the amount of time, in TUs, a STA should wait before it reinitiates setup of a TS.

The Delay field is set to 0 when an AP does not expect to serve any TSPECs for an indeterminate time and does not know this time a priori.

9.4.2.31 TCLAS Processing element

The TCLAS Processing element, together with the TCLAS element(s), if present, indicates how a PDU or MSDU should be processed by a classifier. The TCLAS Processing element is defined in Figure 9-411.

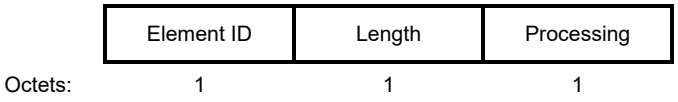

Figure 9-411—TCLAS Processing element format

The Element ID and Length fields are defined in 9.4.2.1.

The encoding of the Processing field is shown in Table 9-210.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-210—Encoding of Processing field

Processing field value	Meaning
0	PDU contents or MSDU parameters have to match to the parameters in all of the associated TCLAS elements.
1	PDU contents or MSDU parameters have to match to at least one of the associated TCLAS elements.
2	PDUs or MSDUs that do not belong to any other TS are classified to the TS for which this TCLAS Processing element is used. In this case, there are no associated TCLAS elements.
3–255	Reserved

9.4.2.32 Schedule element

The Schedule element is transmitted by the HC to a STA to announce the schedule that the HC follows for admitted streams originating from or destined to that STA, or GCR-SP streams destined to that STA, in the future. The information in this element might be used by the STA for power management, internal scheduling, or any other purpose. The element information format is shown in Figure 9-412.

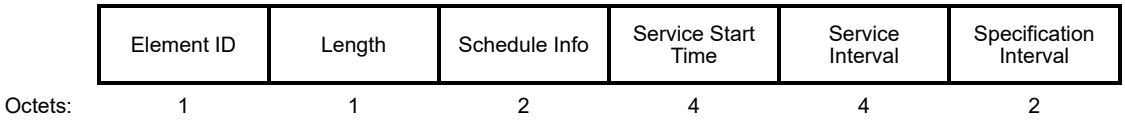

Figure 9-412—Schedule element format

The Element ID and Length fields are defined in 9.4.2.1.

The Schedule Info field is shown in Figure 9-413.

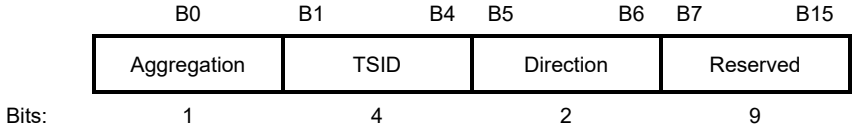

Figure 9-413—Schedule Info field format

The Aggregation subfield is set to 1 if the schedule is an aggregate schedule for all TSIDs associated with the STA to which the frame is directed. It is set to 0 otherwise. The TSID subfield contains a value allowed for a TSID, as defined in 9.2.4.5.2, and indicates the TSID for which this schedule applies. The TSID subfield is reserved when the Schedule element is included within a GCR Response subelement. The Direction subfield is defined in 9.4.2.28 and defines the direction of the TSPEC associated with the schedule. In a Schedule element sent within a GCR Response subelement, the Direction subfield is set to "Downlink." The TSID and Direction subfields are valid only when the Aggregation subfield is 0. If the Aggregation subfield is 1, the TSID and Direction subfields are reserved.

The Service Start Time field indicates the anticipated time, expressed in microseconds, when service starts and represents the lower order 4 octets of the TSF timer value at the start of the first SP. The AP uses this field to confirm or modify the service start time indicated in the TSPEC request.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Service Interval field indicates the time, expressed in microseconds, between two successive SPs and represents the measured time from the start of one SP to the start of the next SP. If the Schedule element is included within a GCR Response subelement that has the GCR delivery method equal to GCR-SP, the Service Interval field set to 0 indicates the delivery method is GCR-A.

The Specification Interval field contains an unsigned integer that specifies the time interval, in TUs, to verify schedule compliance.

The HC can set the Service Start Time field and the Service Interval field to 0 (unspecified) for nonpowersaving STAs, except when the Schedule element is included within a GCR Response subelement that has the GCR delivery method equal to GCR-SP (see 11.21.16.3.8). When the Schedule element is included within a GCR Response subelement that has the GCR delivery method equal to GCR-SP, the Service Start Time field is not set to 0 and the Service Interval field might be set to 0.

9.4.2.33 QoS Capability element

The QoS Capability element contains a number of subfields that are used to advertise optional QoS capabilities at a QoS STA. The QoS Capability element is defined in Figure 9-414.

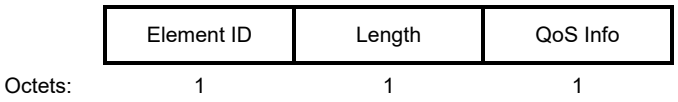

Figure 9-414—QoS Capability element format

The Element ID and Length fields are defined in 9.4.2.1.

The QoS Info field is defined in 9.4.1.17.

9.4.2.34 AP Channel Report element

The AP Channel Report element contains a list of channels where a STA is likely to find an AP. The format of the AP Channel Report element is shown in Figure 9-415. See 11.10.18 for details.

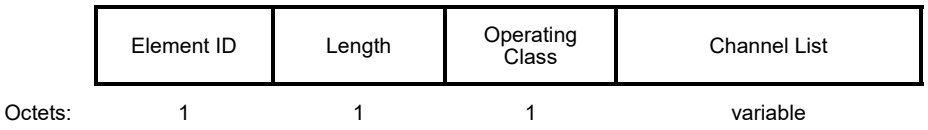

Figure 9-415—AP Channel Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Operating Class field contains an enumerated value from Annex E, specifying the operating class in which the Channel List field is valid. An AP Channel Report only reports channels for a single operating class. Multiple AP Channel Report elements are present when reporting channels in more than one operating class.

The Channel List field contains a variable number of octets, where each octet describes a single channel number. Channel numbering is dependent on Operating Class according to Annex E.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.35 Neighbor Report element

The Neighbor Report element describes an AP. The format of the Neighbor Report element is shown in Figure 9-416.

	Element ID	Length	BSSID	BSSID Information	Operating Class	Channel Number	PHY Type	Optional Subelements
Octets:	1	1	6	4	1	1	1	variable

Figure 9-416—Neighbor Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The value of the BSSID field is the BSSID of the BSS being reported. The subsequent fields in the Neighbor Report element pertain to this BSS.

The BSSID Information field can be used to help determine neighbor service set transition candidates. The format of the BSSID Information field is shown in Figure 9-417.

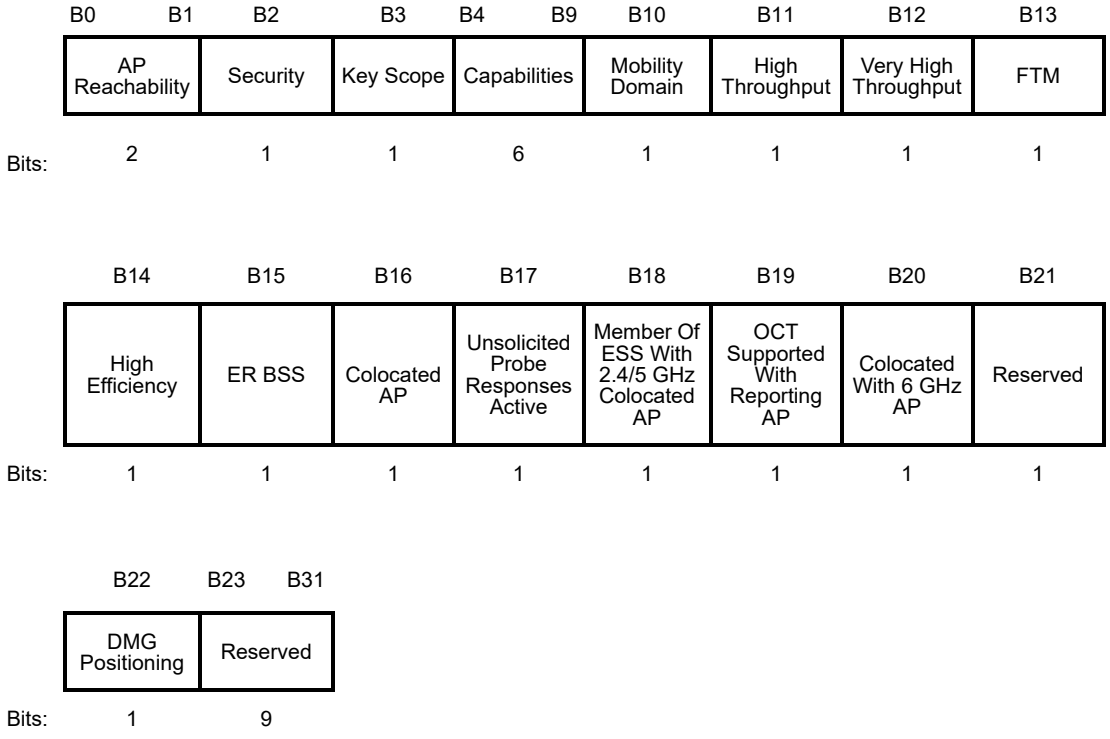

Figure 9-417—BSSID Information field format

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The AP Reachability field indicates whether the AP identified by this BSSID is reachable by the STA that requested the neighbor report. For example, the AP identified by this BSSID is reachable for the exchange of preauthentication frames as described in 12.6.8.2. The values are shown in Table 9-211.

Table 9-211—Reachability field

Value	Reachability	Usage
0	Reserved	Not used.
1	Not Reachable	A station sending a preauthentication frame to the BSSID will not receive a response even if the AP indicated by the BSSID is capable of preauthentication.
2	Unknown	The AP is unable to determine if the value Reachable or Not Reachable is to be returned.
3	Reachable	The station sending a preauthentication frame to the BSSID can receive a response from an AP that is capable of preauthentication.

The Security subfield, if 1, indicates that the AP identified by this BSSID supports the same security provisioning as used by the STA in its current association. If the bit is 0, it indicates either that the AP does not support the same security provisioning or that the security information is not available at this time.

The Key Scope subfield, when set, indicates the AP indicated by this BSSID has the same Authenticator as the AP sending the report. If this bit is 0, it indicates a distinct Authenticator or the information is not available.

The Capabilities subfield contains selected capability information for the AP indicated by this BSSID. The 1-bit subfields within this subfield have the same meaning and are set to the equivalent bits within the Capability Information field (see 9.4.1.4) being sent in the beacons by the AP being reported. The format of the Capabilities subfield is shown in Figure 9-418.

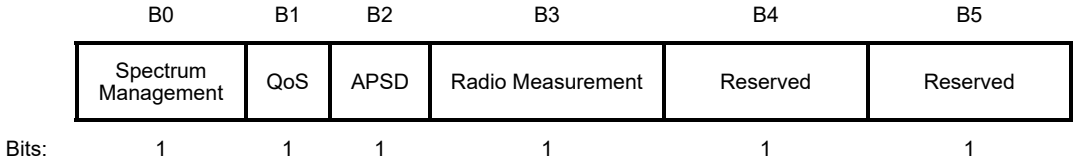

Figure 9-418—Capabilities subfield format

The Mobility Domain subfield is set to 1 to indicate that the AP represented by this BSSID is including an MDE in its Beacon frames and that the contents of that MDE are identical to the MDE advertised by the AP sending the report.

The High Throughput subfield is set to 1 to indicate that the AP represented by this BSSID is an HT AP and that the HT Capabilities element (or HT Operation element), if included as a subelement in the report, is identical in content to the HT Capabilities element (or HT Operation element) included in the neighboring AP's Beacon. Otherwise, the High Throughput subfield is set to 0.

The Very High Throughput subfield is set to 1 to indicate that the AP represented by this BSSID is a VHT AP and that the VHT Capabilities element (or VHT Operation element), if included as a subelement in the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

report, is identical in content to the VHT Capabilities element (or VHT Operation element) included in the neighboring AP's Beacon frame. Otherwise, the Very High Throughput subfield is set to 0.

The FTM field is set to 1 to indicate that the AP represented by this BSSID is an AP that has set the FTM Responder field of the Extended Capabilities element to 1. The FTM field is set to 0 to indicate either that the reporting AP has dot11FineTimingMsmtRespActivated equal to false, or the reported AP has not set the FTM Responder field of the Extended Capabilities element to 1 or that the FTM Responder field of the reported AP is not available to the reporting AP at this time.

The High Efficiency subfield is set to 1 to indicate that the AP represented by this BSSID is an HE AP and that the HE Capabilities element (or HE Operation element), if included as a subelement in the report, is identical in content to the HE Capabilities element (or HE Operation element) included in the neighboring AP's Beacon frame. Otherwise, the High Efficiency subfield is set to 0.

The ER BSS subfield is set to 1 if the BSS corresponding to the HE AP representing this BSSID is an ER BSS transmitting Beacon frames using an HE ER SU PPDU (see 26.17.6). Otherwise, the ER BSS subfield is set to 0.

The Colocated AP subfield is set to 1 to indicate that the AP reported in this Neighbor Report element is in the same colocated AP set as the AP sending the Neighbor Report element.

The Unsolicited Probe Responses Active subfield is set to 1, if the reported AP is part of an ESS where all the APs operate in the same channel as the reported AP and are on the same channel and in range of a STA receiving this frame, have dot11UnsolicitedProbeResponseOptionActivated equal to true and are transmitting unsolicited Probe Response frames every 20 TUs or less (see 26.17.2.3). It is set to 0 otherwise or if the reporting AP does not have that information.

The Member Of ESS With 2.4/5 GHz Colocated AP subfield is set to 1 if the reported AP is part of an ESS where all the APs in the ESS are operating in the same band as the reported AP (irrespective of the operating channel in that band) and are on the same channel and in the range of a STA receiving this frame have dot11MemberOfColocated6GHzESSOptionActivated equal to true and also have a corresponding AP operating in the 2.4 GHz or 5 GHz bands that is in the same colocated AP set as that AP. It is set to 0 otherwise or if the reporting AP does not have that information. It is reserved if the reported AP is operating in the 2.4 GHz or 5 GHz bands.

NOTE—This subfield indicates that the reported AP is part of an ESS that has no 6 GHz-only APs that might be detected by a STA receiving this frame. This means that all APs operating in the 6 GHz band that are part of that ESS that might be detected by a STA receiving this frame can be discovered in the 2.4 GHz and/or 5 GHz bands.

The OCT Supported With Reported AP subfield is set to 1 to indicate that OCT is supported to exchange MMPDUs with the AP reported in the Neighbor Report element (see 11.31.5), through over-the-air transmissions with the AP sending the Neighbor Report element. It is set to 0 otherwise.

The Colocated With 6 GHz AP subfield is set to 1 to indicate that the AP reported by the Neighbor Report element is in the same colocated AP set as a 6 GHz AP and that the 6 GHz AP can be discovered by receiving Management frames (as described in 26.17.2.3 and 11.53) sent by the reported AP. It is set to 0 otherwise.

The DMG Positioning field indicates that the reported AP is a DMG AP and supports FTM (see 11.21.6.4.2.2).

The Operating Class and Channel Number fields (and the Condensed Country String subelement, if present) together indicate the primary channel of the BSS being reported. Valid operating classes are listed in Annex E.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Channel Number field indicates the last known primary channel of the AP indicated by this BSSID. Channel number is defined within an operating class as shown in Annex E.

The PHY Type field indicates the PHY type of the AP indicated by this BSSID. It is an integer value coded according to the value of the dot11PHYType.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-212.

Table 9-212—Optional subelement IDs for Neighbor Report

Subelement ID	Name	Extensible
0	Reserved	
1	TSF Information	Yes
2	Condensed Country String	Yes
3	BSS Transition Candidate Preference	No
4	BSS Termination Duration	No
5	Bearing	No
6	Wide Bandwidth Channel	Yes
7–38	Reserved	
39	Measurement Report	Subelements
40–44	Reserved	
45	HT Capabilities subelement	Yes
46–60	Reserved	
61	HT Operation subelement	Yes
62	Secondary Channel Offset subelement	No
63–65	Reserved	
66	Measurement Pilot Transmission	Subelements
67–69	Reserved	
70	RM Enabled Capabilities	Yes
71	Multiple BSSID	Subelements
72–190	Reserved	
191	VHT Capabilities	Yes
192	VHT Operation	Yes
193	HE Capabilities	Yes
194	HE Operation	Yes
195	BSS Load	
196	HE BSS Load	Yes

Table 9-212—Optional subelement IDs for Neighbor Report *(continued)*

Subelement ID	Name	Extensible
197	SSID	
198	HE 6 GHz Band Capabilities	Yes
199–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The TSF subelement contains TSF Offset and Beacon Interval subfields as shown in Figure 9-419.

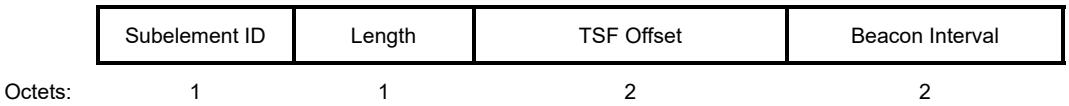

Figure 9-419—TSF subelement format

The Length field is defined in 9.4.3.

The TSF Offset subfield contains the neighbor AP's TSF timer offset. This is the time difference, in TUs, between the serving AP and a neighbor AP. This offset is given modulo the neighbor AP's Beacon Interval and rounded to the nearest TU boundary.

The Beacon Interval field is the beacon interval of the Neighbor AP indicated by this BSSID. This field is defined in 9.4.1.3 and in Figure 9-139.

The Condensed Country String subelement's Data field contains the first two octets of the value contained in dot11CountryString. This subelement is present only if the country of the neighbor AP indicated by the BSSID differs from the country of the AP that sent this neighbor report.

The Measurement Pilot Transmission subelement has the same format as the Measurement Pilot Transmission element (see 9.4.2.40). The Measurement Pilot Transmission subelement is not included if the reported AP is not transmitting Measurement Pilot frames or if the measurement pilot interval of the reported AP is unknown.

A Measurement Report subelement with the Measurement Type field equal to LCI (see Table 9-163) is optionally present. If present, the subelement has the same format as the Measurement Report element with Measurement Type field equal to LCI.The subelement indicates the LCI of the neighbor STA and further includes the Z subelement, or the subelement indicates an unknown LCI (see 11.21.6.7). The Late, Incapable and Refused subfields in the Measurement Report Mode field are set to 0. The Colocated BSSID List subelement is present in the Measurement Report subelement of the Neighbor Report element, when there is at least one other BSS that is colocated within the same physical device as the reporting BSS.

A Measurement Report subelement with the Measurement Type field equal to Location Civic (see Table 9-163) is optionally present. If present, the subelement has the same format as the Measurement Report element with Measurement Type field equal to Location Civic, and the subelement indicates the civic address of the transmitting STA or an unknown civic address (see 11.21.6.7). The Late, Incapable and Refused subfields in the Measurement Report Mode field are set to 0. The Colocated BSSID List subelement is present in the Measurement Report subelement of the Neighbor Report element, when there is at least one other BSS which is colocated within the same physical device as the reporting BSS. When a

Measurement Report subelement with Measurement Type field equal to LCI that includes a Colocated BSSID List subelement is present, the Colocated BSSID List subelement is not present in the Measurement Report subelement with Measurement Type field equal to Location Civic.

The HT Capabilities subelement has the same format as the HT Capabilities element as defined in 9.4.2.54.

The HT Operation subelement has the same format as the HT Operation element as defined in 9.4.2.55.

The Secondary Channel Offset subelement has the same format as the Secondary Channel Offset element as defined in 9.4.2.18.

The RM Enabled Capabilities subelement has the same format as the RM Enabled Capabilities element (see 9.4.2.43).

The Multiple BSSID subelement has the same format as the Multiple BSSID element (see 9.4.2.44). The reference BSSID for the Multiple BSSID subelement is the BSSID field in the Neighbor Report element. This subelement is not present if the neighbor AP is not a member of a multiple BSSID set with two or more members or its membership is unknown (see 11.10.14).

The format of the BSS Transition Candidate Preference subelement is shown in Figure 9-420.

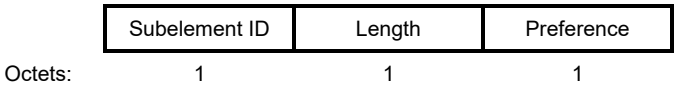

Figure 9-420—BSS Transition Candidate Preference subelement format

The Length field is defined in 9.4.3.

The Preference field indicates the network preference for BSS transition to the BSS listed in this BSS Transition Candidate List Entries field in the BSS Transition Management Request frame, BSS Transition Management Query frame, and BSS Transition Management Response frame. The Preference field value is a number ranging from 0 to 255, as defined in Table 9-213, indicating an ordering of preferences for the BSS transition candidates for this STA. Additional details describing use of the Preference field are provided in 11.21.7.

Table 9-213—Preference field values

Preference field value	Description
0	Excluded BSS; reserved when present in the BSS Transition Management Query or BSS Transition Management Response frames.
1–255	Relative values used to indicate the preferred ordering of BSSs, with 255 indicating the most preferred candidate and 1 indicating the least preferred candidate.

The BSS Termination TSF field contained in the BSS Termination Duration subelement is the TSF time of the BSS transmitting the neighbor report that corresponds to the time when termination of the neighbor BSS occurs. How the BSS determines the neighbor BSS termination time is out of scope of the standard. The format of the BSS Termination Duration subelement is shown in Figure 9-421.

The Length field is defined in 9.4.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

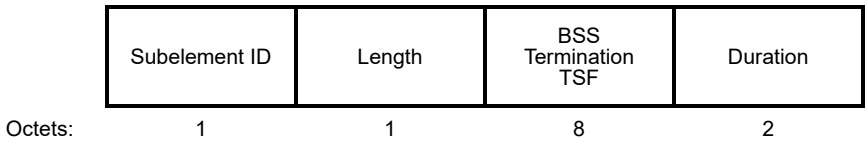

Figure 9-421—BSS Termination Duration subelement format

The BSS Termination TSF field indicates the value of the TSF timer when BSS termination will occur in the future. A BSS Termination TSF field set to 0 indicates that termination of the BSS will occur imminently. Prior to termination of the BSS, all associated STAs are disassociated by the AP.

The Duration field indicates the number of minutes for which the BSS is not present. A Duration field set to 0 is reserved. A Duration field set to 65 535 when the BSS is terminated for a period longer than or equal to 65 535 minutes.

The format of the Bearing subelement is shown in Figure 9-422.

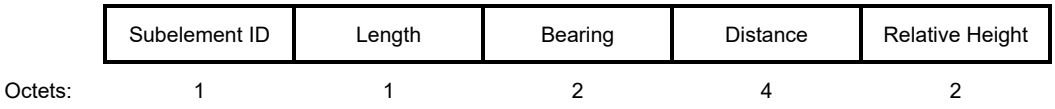

Figure 9-422—Bearing subelement format

The Length field is defined in 9.4.3.

The Bearing field specifies the direction that the neighbor, specified by the BSSID field in the Neighbor Report element, is positioned, relative to the reporting BSS and defined in relation to true north, increasing clockwise, measured in degrees from 0° to 359°. If the Bearing value is unknown, the subelement is not included.

The Distance field specifies the distance that the neighbor, specified by the BSSID field in the Neighbor Report element, is positioned relative to the reporting BSS as a floating point value, in meters.

The Relative Height field, defined by a 2s complement signed integer, specifies the relative height in meters that the neighbor is positioned, relative to the reporting BSS. If the relative height is unknown or at the same height as the reporting BSS, the field is 0.

The format of the Wide Bandwidth Channel subelement is shown in Figure 9-423.

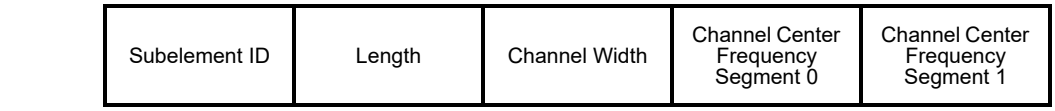

Figure 9-423—Wide Bandwidth Channel subelement format

The Length field is defined in 9.4.3.

The Channel Width, Channel Center Frequency Segment 0, and Channel Center Frequency Segment 1 subfields are defined in Table 9-214.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-214—HT/VHT Operation Information subfields

Field	Definition	Encoding
Channel Width	This field defines the BSS bandwidth (see 11.38.1).	Set to 0 for 20 MHz BSS bandwidth. Set to 1 for 40 MHz BSS bandwidth. Set to 2 for 80 MHz BSS bandwidth. Set to 3 for 160 MHz BSS bandwidth. Set to 4 for 80+80 MHz BSS bandwidth. Values in the range 5 to 255 are reserved.
Channel Center Frequency Segment 0	Defines the channel center frequency for an HT or VHT BSS or the frequency segment 0 channel center frequency for an 80+80 MHz VHT BSS. See 21.3.14.	For 20, 40, 80, or 160 MHz BSS bandwidth, indicates the channel number of the center frequency for the channel on which the HT or VHT BSS operates. For 80+80 MHz BSS bandwidth, indicates the channel number of the center frequency for the 80 MHz channel of frequency segment 0 on which the VHT BSS operates.
Channel Center Frequency Segment 1	Defines the frequency segment 1 channel center frequency for an 80+80 MHz VHT BSS. See 21.3.14.	For an 80+80 MHz BSS bandwidth, indicates the channel number of the center frequency of the 80 MHz channel of frequency segment 1 on which the VHT BSS operates. The channel number of the center frequency of segment 1 differs by more than 16 from the channel number of the center frequency of segment 0 (i.e., the channel center frequencies are more than 80 MHz apart). Reserved otherwise.

The VHT Capabilities subelement has the same format as the VHT Capabilities element as defined in 9.4.2.156.

The VHT Operation subelement has the same formatas the VHT Operation element as defined in 9.4.2.157.

The Data field of the HE Capabilities subelement has the same format as the Information field of the HE Capabilities element (see 9.4.2.247).

The Data field of the HE Operation subelement has the same format as the Information field of HE Operation element (see 9.4.2.248).

The BSS Load subelement has the same format as the BSS Load element (see 9.4.2.26).

The Data field of the HE BSS Load subelement has the same format as the Information field of the HE BSS Load element (see 9.4.2.258).

The SSID subelement has the same format as the SSID element (see 9.4.2.2).

The Data field of the HE 6 GHz Band Capabilities subelement has the same format as the Information field of the HE 6 GHz Band Capabilities element (see 9.4.2.262).

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.36 RCPI element

The RCPI element indicates the received frame power level at the receiving STA as shown in Figure 9-424.

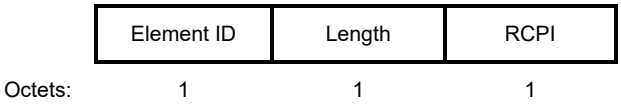

Figure 9-424—RCPI element format

The Element ID and Length fields are defined in 9.4.2.1.

The RCPI field contains an RCPI value, which is an indication of the received RF power in the selected channel for a received frame.

The value of the RCPI field is a monotonically increasing, logarithmic function of the received power level. The allowed values for the RCPI field are defined in Table 9-215, where P is the received power level in dBm.

Table 9-215—RCPI values

RCPI Value	Description
0	Represents $P < -109.5$ dBm
1–219	Power levels in the range $-109.5 \le P < 0$ are represented by $\text{RCPI} = \lfloor 2 \times (P + 110) \rfloor$
220	Represents $P \ge 0$ dBm
221–254	Reserved
255	Measurement not available

9.4.2.37 BSS Average Access Delay element

The BSS Average Access Delay element contains the AP Average Access Delay, which is a measure of load in the BSS and is available in both QoS APs and non-QoS APs. The format of the BSS Average Access Delay element is defined in Figure 9-425.

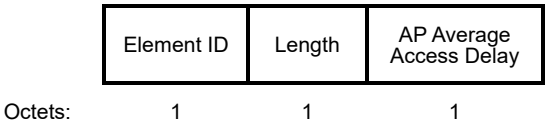

Figure 9-425—BSS Average Access Delay element format

The Element ID and Length fields are defined in 9.4.2.1.

The AP Average Access Delay is a scalar indication of the relative level of loading at an AP. A low value indicates more available capacity than a higher value. If the AP is not currently transmitting any DCF or EDCAF traffic, the AP Average Access Delay is set to 255. The values between 1 and 252 are a scaled representation of the average medium access delay for all DCF and EDCAF transmitted frames measured

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

from the time the DCF or EDCAF MPDU is ready for transmission (i.e., begins CSMA/CA access) until the actual frame transmission start time. Non-QoS APs average the access delays for all DCF transmitted frames. QoS APs average the access delays for all EDCA transmitted frames of all ACs. The AP Average Access Delay values are scaled as follows:

0:	Access Delay < 8 μs
1:	8 μs ≤ Access Delay < 16 μs
2 ≤ n ≤ 14:	n × 8 μs ≤ Access Delay < (n + 1) × 8 μs
15:	120 μs ≤ Access Delay < 128 μs
16:	128 μs ≤ Access Delay < 144 μs
17 ≤ n ≤ 106:	(n × 16) – 128 μs ≤ Access Delay < ((n + 1) × 16) – 128 μs
107:	1 584 μs ≤ Access Delay < 1 600 μs
108:	1 600 μs ≤ Access Delay < 1 632 μs
109 ≤ n ≤ 246:	(n × 32) – 1 856 μs ≤ Access Delay < ((n + 1) × 32) – 1 856 μs
247:	6 048 μs ≤ Access Delay < 6 080 μs
248:	6 080 μs ≤ Access Delay < 8 192 μs
249:	8 192 μs ≤ Access Delay < 12 288 μs
250:	12 288 μs ≤ Access Delay < 16 384 μs
251:	16 384 μs ≤ Access Delay < 20 480 μs
252:	20 480 μs ≤ Access Delay < 24 576 μs
253:	24 576 μs ≤ Access Delay
254:	Service unable to access channel
255:	Measurement not available

The values 0–253 indicate the average access delay when one or more frames were transmitted during the measurement window. The value 254 indicates that the DCF is or the EDCAFs are currently unable to access the channel due to continuous carrier sense mechanism deferral and that no frames were transmitted during the measurement window. The AP measures and averages the medium access delay for all transmit frames using the DCF or the EDCAFs over a continuous 30 s measurement window. See 11.10.16 for accuracy requirements.

9.4.2.38 Antenna element

The Antenna element contains the Antenna ID field as shown in Figure 9-426.

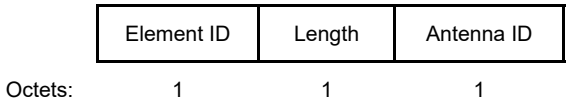

Figure 9-426—Antenna element format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The Antenna ID field contains the identifying number for the relevant antenna(s) or DMG antenna.

For a non-DMG STA, the antenna ID identifies the antenna(s) used to transmit the frame the Antenna element is contained in, or the antenna(s) used to receive an earlier frame, depending on the frame the antenna ID is contained in. A specific antenna has an antenna ID between 1 and 254. The value 0 indicates that the antenna ID is unknown. The value 255 indicates that this transmission was made with multiple antennas, i.e., antennas were switched during the transmission. If during frame reception different antennas are used to receive the preamble and body, the antenna ID identifies the antenna that receives the frame body. In these cases, the value 255 is not used. Antenna IDs are assigned to each antenna and each antenna configuration as consecutive integers starting with 1. Each antenna ID number represents a unique antenna or unique configuration of multiple antennas characterized by a fixed relative position, a fixed relative direction, and a fixed peak gain for that position and direction.

For a DMG STA, the DMG antenna ID identifies the DMG antenna used to transmit the frame the Antenna element is contained in, or the DMG antenna used to receive an earlier frame, depending on the frame the DMG antenna ID is contained in. A specific DMG antenna has a DMG antenna ID between 0 and 3. DMG antenna IDs are assigned to each DMG antenna as consecutive integers starting with 0.

9.4.2.39 RSNI element

The RSNI element contains an RSNI value, as shown in Figure 9-427.

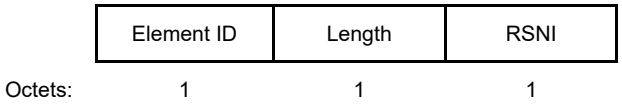

Figure 9-427—RSNI element format

The Element ID and Length fields are defined in 9.4.2.1.

The value of the RSNI field is in steps of 0.5 dB. RSNI is calculated by the ratio of the received signal power (RCPI-ANPI) to the noise plus interference power (ANPI) using the expression:

$$\text{RSNI} = (10 \times \log10((\text{RCPI}_{\text{power}} - \text{ANPI}_{\text{power}}) / \text{ANPI}_{\text{power}})+10) \times 2$$

where $\text{RCPI}_{\text{power}}$ and $\text{ANPI}_{\text{power}}$ indicate power domain values for RCPI and ANPI and not dB domain values. RSNI in dB is scaled in steps of 0.5 dB to obtain 8-bit RSNI values, which cover the range from –10 dB to +117 dB. The value 255 indicates that RSNI is not available. See 11.10.9.4 for details and procedures for measuring ANPI.

9.4.2.40 Measurement Pilot Transmission element

The Measurement Pilot Transmission element contains a Measurement Pilot Transmission field as shown in Figure 9-428.

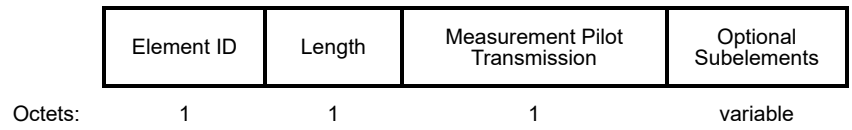

Figure 9-428—Measurement Pilot Transmission element format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The Measurement Pilot Transmission field contains the measurement pilot interval as specified in 9.4.1.18.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-216.

Table 9-216—Optional subelement IDs for Measurement Pilot Transmission

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.41 BSS Available Admission Capacity element

The BSS Available Admission Capacity element contains a list of Available Admission Capacity fields at different User Priorities and Access Categories as shown in Figure 9-429.

NOTE—The BSS Available Admission Capacity element is helpful for BSS transitioning QoS STAs to select a QoS AP that is likely to accept future admission control requests, but it does not provide an assurance that the HC will admit these requests.

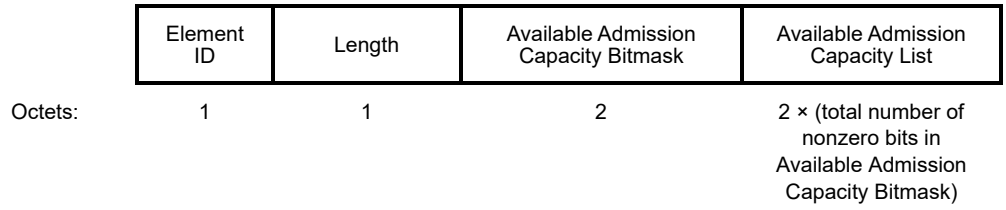

Figure 9-429—BSS Available Admission Capacity element format

The Element ID and Length fields are defined in 9.4.2.1. The Length field is set to $2 + 2N_{nz}$, where N_{nz} equals the total number of nonzero bits in Available Admission Capacity Bitmask.

The Available Admission Capacity Bitmask field indicates the UP values that have an Available Admission Capacity specified in the Available Admission Capacity List field. The format of the Available Admission Capacity Bitmask is defined in Table 9-217.

Each bit in the Available Admission Capacity Bitmask is set to 1 to indicate that the Available Admission Capacity for the corresponding traffic type is present in the Available Admission Capacity List field. The bit is set to 0 to indicate that the Available Admission Capacity for the corresponding traffic type is not present in the Available Admission Capacity List field.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-217—Available Admission Capacity Bitmask definition

Bit	Available Admission Capacity Reported
0	UP 0
1	UP 1
2	UP 2
3	UP 3
4	UP 4
5	UP 5
6	UP 6
7	UP 7
8	AC 0
9	AC 1
10	AC 2
11	AC 3
12–15	Reserved

The Available Admission Capacity List comprises a sequence of Available Admission Capacity fields corresponding respectively to the nonzero bits in the Available Admission Capacity Bitmask field.

Each Available Admission Capacity field is 2 octets long and contains an unsigned integer that specifies the amount of medium time available using explicit admission control for the corresponding UP or AC traffic, in units of 32 μs per 1 s. See 11.10.17 for furthers details.

9.4.2.42 BSS AC Access Delay element

The BSS AC Access Delay element contains an Access Category Access Delay field, as shown in Figure 9-430.

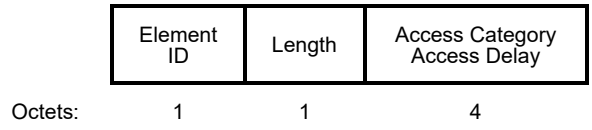

Figure 9-430—BSS AC Access Delay element format

The Element ID and Length fields are defined in 9.4.2.1.

The Access Category Access Delay field is formatted as four subfields as shown in Figure 9-431. The value of the AC Access Delay field is a scalar indication of the average access delay at a QoS AP for services for each of the indicated access categories. If the QoS AP is not currently transmitting any traffic using the indicated AC, the value of Average Access Delay field for that AC is set to 255. The values between 1 and 252 are a scaled representation of the average medium access delay for transmitted frames in the indicated AC measured from the time the EDCA MPDU is ready for transmission (i.e., begins CSMA/CA access) until the actual frame transmission start time. The AC Access Delay values are scaled as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

0:	Access Delay < 8 μs
1:	8 μs ≤ Access Delay < 16 μs
2 ≤ n ≤ 14:	n × 8 μs ≤ Access Delay < (n + 1) × 8 μs
15:	120 μs ≤ Access Delay < 128 μs
16:	128 μs ≤ Access Delay < 144 μs
17 ≤ n ≤ 106:	(n × 16) – 128 μs ≤ Access Delay < ((n + 1) × 16) – 128 μs
107:	1584 μs ≤ Access Delay < 1600 μs
108:	1600 μs ≤ Access Delay < 1632 μs
109 ≤ n ≤ 246:	(n × 32) – 1856 μs ≤ Access Delay < ((n + 1) × 32) – 1856 μs
247:	6048 μs ≤ Access Delay < 6080 μs
248:	6080 μs ≤ Access Delay < 8192 μs
249:	8192 μs ≤ Access Delay < 12 288 μs
250:	12 288 μs ≤ Access Delay < 16 384 μs
251:	16 384 μs ≤ Access Delay < 20 480 μs
252:	20 480 μs ≤ Access Delay < 24 576 μs
253:	24 576 μs ≤ Access Delay
254:	Service unable to access channel
255:	Measurement not available

The values 0–253 indicate the average access delay when one or more frames were transmitted during the measurement window. The value 254 indicates that the EDCAF is currently unable to access the channel due to continuous carrier sense mechanism deferral to higher priority AC transmissions and that no frames were transmitted during the measurement window. The QoS AP measures and averages the medium access delay for all transmit frames of the indicated AC using EDCA mechanism over a continuous 30 s measurement window. See 11.10.16 for accuracy requirements.

	Average Access Delay for Best Effort (AC_BE)	Average Access Delay for Background (AC_BK)	Average Access Delay for Video (AC_VI)	Average Access Delay for Voice (AC_VO)
Octets:	1	1	1	1

9.4.2.43 RM Enabled Capabilities element

The RM Enabled Capabilities element signals support for radio measurements in a STA. The element is shown in Figure 9-432.

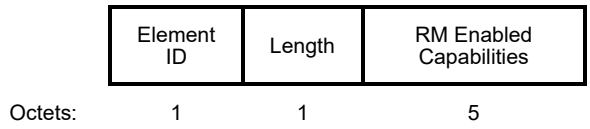

Figure 9-432—RM Enabled Capabilities element format

The Element ID and Length fields are defined in 9.4.2.1.

The RM Enabled Capabilities field is an octet string. Each subfield of this field indicates whether the corresponding capability listed in Table 9-218 is enabled.

Table 9-218—RM Enabled Capabilities definition

Bit position in the RM Enabled Capabilities field	Field name	Notes
0	Link Measurement Capability Enabled	A STA sets the Link Measurement Capability Enabled field to 1 when dot11RMLinkMeasurementActivated is true and sets it to 0 otherwise.
1	Neighbor Report Capability Enabled	A STA sets the Neighbor Report Capability Enabled field to 1 when dot11RMNeighborReportActivated is true and sets it to 0 otherwise.
2	Parallel Measurements Capability Enabled	A STA sets the Parallel Measurements Capability Enabled field to 1 when dot11RMParallelMeasurementsActivated is true and sets it to 0 otherwise.
3	Repeated Measurements Capability Enabled	A STA sets the Repeated Measurements Capability Enabled field to 1 when dot11RMRepeatedMeasurementsActivated is true and sets it to 0 otherwise.
4	Beacon Passive Measurement Capability Enabled	A STA sets the Beacon Passive Measurement Capability Enabled field to 1 when dot11RMBeaconPassiveMeasurementActivated is true and sets it to 0 otherwise.
5	Beacon Active Measurement Capability Enabled	A STA sets the Beacon Active Measurement Capability Enabled field to 1 when dot11RMBeaconActiveMeasurementActivated is true and sets it to 0 otherwise.
6	Beacon Table Measurement Capability Enabled	A STA sets the Beacon Table Measurement Capability Enabled field to 1 when dot11RMBeaconTableMeasurementActivated is true and sets it to 0 otherwise.
7	Beacon Measurement Reporting Conditions Capability Enabled	A STA sets the Beacon Measurement Reporting Conditions Capability Enabled field to 1 when dot11RMBeaconMeasurementReportingConditionsActivated is true and sets it to 0 otherwise.
8	Frame Measurement Capability Enabled	A STA sets the Frame Measurement Capability Enabled field to 1 when dot11RMFrameMeasurementActivated is true and sets it to 0 otherwise.
9	Channel Load Measurement Capability Enabled	A STA sets the Channel Load Measurement Capability Enabled field to 1 when dot11RMChannelLoadMeasurementActivated is true and sets it to 0 otherwise.

Table 9-218—RM Enabled Capabilities definition *(continued)*

Bit position in the RM Enabled Capabilities field	Field name	Notes
10	Noise Histogram Measurement Capability Enabled	A STA sets the Noise Histogram Measurement Capability Enabled field to 1 when dot11RMNoiseHistogramMeasurementActivated is true and sets it to 0 otherwise.
11	Statistics Measurement Capability Enabled	A STA sets the Statistics Measurement Capability Enabled field to 1 when dot11RMStatisticsMeasurementActivated is true and sets it to 0 otherwise.
12	LCI Measurement Capability Enabled	A STA sets the LCI Measurement Capability Enabled field to 1 when dot11RMLCIMeasurementActivated is true and sets it to 0 otherwise.
13	LCI Azimuth Capability Enabled	A STA sets the LCI Azimuth Capability Enabled field to 1 when dot11RMLCIAzimuthActivated is true and sets it to 0 otherwise.
14	Transmit Stream/ Category Measurement Capability Enabled	A STA sets the Transmit Stream/Category Measurement Capability Enabled field to 1 when dot11RMTransmitStreamCategoryMeasurementActivated is true and sets it to 0 otherwise.
15	Triggered Transmit Stream/Category Measurement Capability Enabled	A STA sets the Triggered Transmit Stream/Category Measurement Capability Enabled field to 1 when dot11RMTriggeredTransmitStreamCategoryMeasurementActivated is true and sets it to 0 otherwise.
16	AP Channel Report Capability Enabled	A STA sets the AP Channel Report Capability Enabled field to 1 when dot11RMAPChannelReportActivated is true and sets it to 0 otherwise.
17	RM MIB Capability Enabled	A STA sets the RM MIB Capability Enabled field to 1 when dot11RMMIBActivated is true and sets it to 0 otherwise.
18–20	Operating Channel Max Measurement Duration	A STA sets the Operating Channel Max Measurement Duration field to equal dot11RMMaxMeasurementDuration. See 11.10.4.
21–23	Nonoperating Channel Max Measurement Duration	A STA sets the Nonoperating Channel Max Measurement Duration field to equal dot11RMNonOperatingChannelMaxMeasurementDuration. See 11.10.4.
24–26	Measurement Pilot Capability	A STA sets the Measurement Pilot Capability field to equal dot11RMMeasurementPilotActivated. See Table 11-14 in 11.10.15.
27	Measurement Pilot Transmission Information Capability Enabled	A STA sets the Measurement Pilot Transmission Capability Enabled field to 1 when dot11RMMeasurementPilotTransmissionInformationActivated is true and sets it to 0 otherwise.
28	Neighbor Report TSF Offset Capability Enabled	A STA sets the Neighbor Report TSF Offset Capability Enabled field to 1 when dot11RMNeighborReportTSFOffsetActivated is true and sets it to 0 otherwise.
29	RCPI Measurement Capability Enabled	A STA sets the RCPI Measurement Capability Enabled field to 1 when dot11RMRCPIMeasurementActivated is true and sets it to 0 otherwise.
30	RSNI Measurement Capability Enabled	A STA sets the RSNI Measurement Capability Enabled field to 1 when dot11RMRSNIMeasurementActivated is true and sets it to 0 otherwise.

Table 9-218—RM Enabled Capabilities definition *(continued)*

Bit position in the RM Enabled Capabilities field	Field name	Notes
31	BSS Average Access Delay Capability Enabled	A STA sets the BSS Average Access Delay Capability Enabled field to 1 when dot11RMBSSAverageAccessDelayActivated is true and sets it to 0 otherwise (see NOTE).
32	BSS Available Admission Capacity Capability Enabled	A STA sets the BSS Available Admission Capacity Capability Enabled field to 1 when dot11RMBSSAvailableAdmissionCapacityActivated is true and sets it to 0 otherwise.
33	Antenna Capability Enabled	A STA sets the Antenna Capability Enabled field to 1 when dot11RMAntennaInformationActivated is true and sets it to 0 otherwise.
34	FTM Range Report Capability Enabled	A STA sets the FTM Range Report Capability Enabled field to 1 when dot11RMFineTimingMsmtRangeRepActivated is true and sets it to 0 otherwise.
35	Civic Location Measurement Capability Enabled	A STA sets the Civic Location Measurement Capability Enabled field to 1 when dot11RMCivicMeasurementActivated is true and sets it to 0 otherwise.
36–39	Reserved	
NOTE—At a QoS AP dot11RMBSSAverageAccessDelayActivated is true indicates that the AP BSS AC Access Delay capability is also enabled.		

9.4.2.44 Multiple BSSID element

The format of the Multiple BSSID element is shown in Figure 9-433.

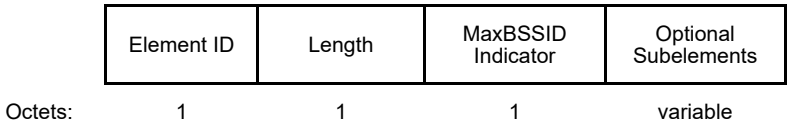

Figure 9-433—Multiple BSSID element format

The Element ID and Length fields are defined in 9.4.2.1.

The MaxBSSID Indicator field contains a value assigned to n, where 2^n is the maximum number of BSSIDs in the multiple BSSID set, including the reference BSSID (see 11.10.14). The maximum value of n is 8.

The actual number of BSSIDs in the multiple BSSID set is not explicitly signaled. BSSID(i) corresponding to the i^{th} BSSID in the multiple BSSID set is derived as follows:

A0-A1-A2-A3-A4-A5 = Reference BSSID

$B = A5 \bmod 2^n$

$A5(i) = A5 - B + ((B + i) \bmod 2^n)$

BSSID(i) = A0-A1-A2-A3-A4-A5(i)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—For example, for n = 3 and Reference BSSID = 8c-fd-0f-7f-1e-f5:

A5 = f5
B = 5
A5(5) = f2 and BSSID(5) = 8c-fd-0f-7f-1e-f2
A5(2) = f7 and BSSID(2) = 8c-fd-0f-7f-1e-f7

NOTE 2—This definition uses the hexadecimal address representation defined in IEEE Std 802.

NOTE 3—The BSSID index as defined in 9.4.2.72 cannot be larger than 255, which effectively limits n to 8.

When the Multiple BSSID element is transmitted in a Beacon, DMG Beacon, or Probe Response frame, the reference BSSID is the BSSID field of the frame. The AP or DMG STA determines the number of Multiple BSSID elements. The AP or DMG STA does not fragment a nontransmitted BSSID profile for a single BSSID across two Multiple BSSID elements, unless the contents of the nontransmitted BSSID profile are greater than the number of octets remaining in the Multiple BSSID element after taking into account the size of the mandatory fields (i.e., the MaxBSSID Indicator field, and the Subelement ID and Length fields of the Nontransmitted BSSID Profile subelement) and any preceding Nontransmitted BSSID Profile subelement(s) carried in the element (see 11.1.3.8.2). When the Multiple BSSID element is transmitted as a subelement in a Neighbor Report element, the reference BSSID is the BSSID field in the Neighbor Report element.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-219.

Table 9-219—Optional subelement IDs for Multiple BSSID

Subelement ID	Name	Extensible
0	Nontransmitted BSSID Profile	No
1–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

A nontransmitted BSSID profile (see 11.1.3.8.2) carried in one or more Nontransmitted BSSID Profile subelements across one or more multiple BSSID elements in the same frame contains a list of elements for the AP or the DMG STA that has a nontransmitted BSSID and is defined as follows:

— The Nontransmitted BSSID Capability element is the first element included followed by the SSID element and Multiple BSSID-Index element which are included as the second and third elements, respectively. This is followed by any element that is specific to the nontransmitted BSSID (see 11.1.3.8.4 for details on the inheritance operation and what qualifies as an element specific to the nontransmitted BSSID).

— The Timestamp and Beacon Interval fields, TIM, DSSS Parameter Set, IBSS Parameter Set, Country, Channel Switch Announcement, Extended Channel Switch Announcement, Wide Bandwidth Channel Switch, Transmit Power Envelope, Supported Operating Classes, IBSS DFS, ERP Information, HT Capabilities, HT Operation, VHT Capabilities, VHT Operation, S1G Beacon Compatibility, Short Beacon Interval, S1G Capabilities, S1G Operation, HE Capabilities, HE 6 GHz Band Capabilities, HE Operation, BSS Color Change Announcement, Spatial Reuse Parameter Set, Max Channel Switch Time, Quiet, Quiet Channel, and Multiple BSSID Configuration elements are not included in the Nontransmitted BSSID Profile subelement; the values of these elements for each nontransmitted BSSID are always the same as the corresponding transmitted BSSID element values.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— When included in the Nontransmitted BSSID Profile subelement for this nontransmitted BSSID, the Non-Inheritance element appears as the last element in the profile and carries a list of elements that are not inherited by this nontransmitted BSSID from the transmitted BSSID.

NOTE 5—A Reduced Neighbor Report element is not carried in the Nontransmitted BSSID Profile subelement. When present in the frame, the values of fields in the element, except the Same SSID subfield(s) apply to all the BSSs in the multiple BSSID set.

Each Nontransmitted BSSID Profile subelement contains only elements for a BSS with a nontransmitted BSSID.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

The Multiple BSSID element is included in Beacon frames (as described in 9.3.3.2), in S1G Beacon frames (as described in 9.3.4.3), in DMG Beacon frames (as described in 9.3.4.2), and Probe Response frames (as described in 9.3.3.10). The use of the Multiple BSSID element is described in 11.10.14. Nontransmitted BSSID advertisement procedures are described in 11.1.3.8.

9.4.2.45 MDE

The mobility domain element (MDE) contains the MDID (Mobility Domain Identifier) field and the FT Capability and Policy field. The AP uses the MDE to advertise that it is included in the group of APs that constitute a mobility domain, to advertise its support for FT capability, and to advertise its FT policy information. The format for this element is shown in Figure 9-434.

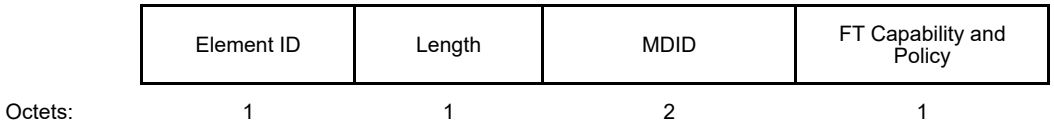

Figure 9-434—MDE format

The Element ID and Length fields are defined in 9.4.2.1.

The MDID field is an identifier that names a mobility domain.

The FT Capability and Policy field is 1 octet. The FT Capability and Policy field is defined in Figure 9-435.

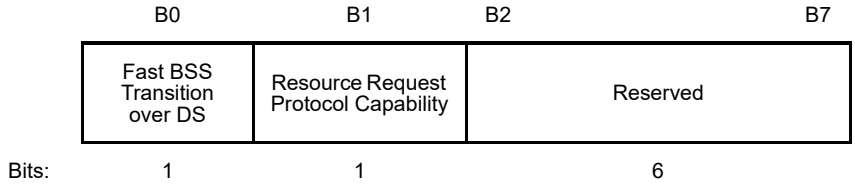

Figure 9-435—FT Capability and Policy field format

Bits 0–1 of the FT Capability and Policy field control the behavior of STAs performing fast BSS transitions (see 13.3). The STA might use information from the MDE to determine the transition methods recommended by the AP and protocols supported by the AP. The choice of executing any specific transition method is outside the scope of this standard.

If the Resource Request Protocol Capability subfield is 1, then the STA might perform the FT resource request protocol as described in 13.6.

When sent by a STA to a target AP, the FT Capability and Policy field matches the value advertised by that target AP. See 13.8.

9.4.2.46 FTE

The fast BSS transition element (FTE) includes information needed to perform the FT authentication sequence or FILS authentication during a fast BSS transition in an RSN. This element is shown in Figure 9-436.

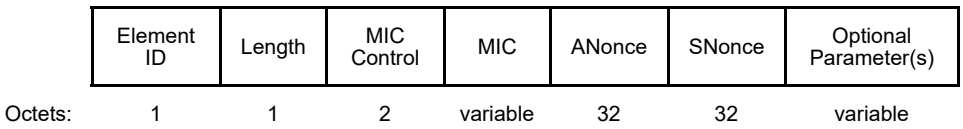

Figure 9-436—FTE format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The MIC Control field is defined in Figure 9-437.

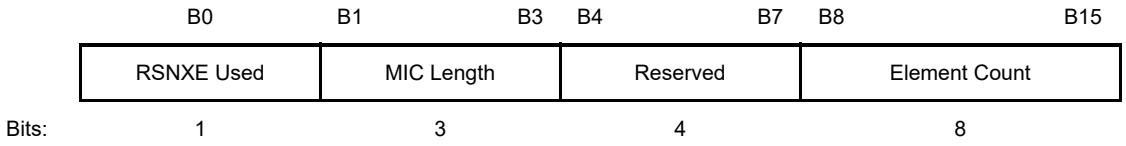

Figure 9-437—MIC Control field format

The RSNXE Used subfield of the MIC Control field is used in the third and fourth messages of the FT authentication sequence to indicate whether the STA transmitting the frame containing the FTE includes an RSNXE in other frames. This subfield is set to 0 in other frames.

When using AKM 00-0F-AC:25, the MIC Length subfield defines the length of the MIC field, as defined in Table 9-220. This subfield is reserved for other AKMs.

Table 9-220—MIC Length subfield values

Value	MIC field length in octets
0	16
1	24
2	32
3–7	Reserved

The Element Count subfield of the MIC Control field contains the number of elements that are included in the message integrity code (MIC) calculation.

When the Element Count subfield has a value greater than 0, the MIC field contains a MIC. Otherwise, the MIC field is set to 0.

The length of the MIC field depends on the negotiated AKM selector and the value of the MIC Length subfield, when not reserved, and is specified in Table 12-11.

The ANonce field contains a value chosen by the R1KH.

The SNonce field contains a value chosen by the S1KH.

The Optional Parameter(s) field contains zero or more of the triplets shown in Figure 9-438.

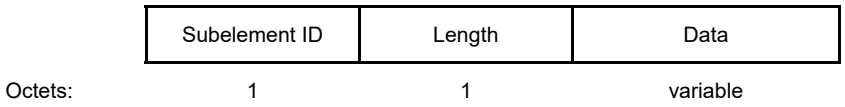

Figure 9-438—Optional Parameter(s) field format

The Subelement ID field is defined in Table 9-221:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-221—Subelement IDs

Value	Subelement Name
0	Reserved
1	R1KH-ID
2	GTK
3	R0KH-ID
4	IGTK
5	OCI
6	BIGTK
7	WIGTK
8–255	Reserved

R1KH-ID indicates the identity of the R1KH, which is used by the S0KH and the R0KH for deriving the PMK-R1s.

The GTK subelement contains the GTK, which is encrypted (see procedures in 13.8.5) and is defined in Figure 9-439.

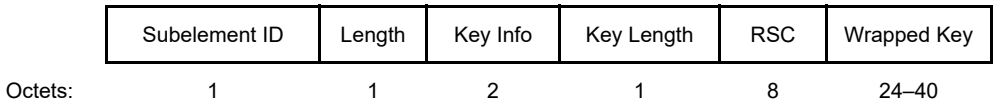

Figure 9-439—GTK subelement format

The Key Info subfield is defined in Figure 9-440.

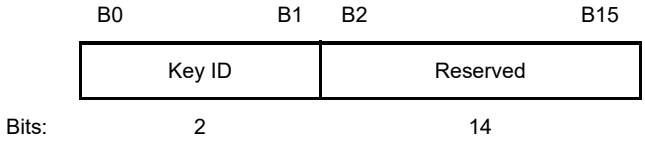

Figure 9-440—GTK subelement's Key Info subfield format

The Key ID field contains the GTK key ID.

The Key Length field is the length of the GTK in octets, not including any padding (see 13.8.5).

The RSC field contains the current receive sequence counter (RSC) for the GTK being installed. If the RSC is less than 8 octets in length, it is stored in the first octets and the remaining octets are set to 0. The least significant octet of the RSC is in the first octet of the RSC field. The RSC for TKIP is the TKIP sequence counter (TSC); for CCMP and GCMP it is the packet number (PN); see Table 12-9.

The Wrapped Key field contains the wrapped GTK being distributed.

When sent by a non-AP STA, the R0KH-ID indicates the R0KH with which the S0KH negotiated the PMK-R0 it is using for this transition. When sent by an AP, the R0KH-ID indicates the R0KH that the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

S0KH will be using to generate a PMK-R0 security association. It is encoded following the conventions from 9.2.2.

The IGTK subelement contains the IGTK, used for protecting robust Management frames. The IGTK subelement format is shown in Figure 9-441 (IGTK subelement format).

	Subelement ID	Length	Key ID	IPN	Key Length	Wrapped Key
Octets:	1	1	2	6	1	24-40

Figure 9-441—IGTK subelement format

The Key ID field contains the IGTK key ID.

The IPN field contains the current RSC for the IGTK being installed. The RSC for an IGTK is the IGTK packet number (IPN).

The Key Length field is the length of IGTK in octets, not including any padding (see 13.8.5).

The Wrapped Key field contains the wrapped IGTK being distributed.

The OCI subelement contains the operating channel information that is integrity protected (see procedures in 13.7) as defined in Figure 9-442.

	Subelement ID	Length	Operating Class	Primary Channel Number	Frequency Segment 1 Channel Number	OCT Operating Class (optional)	OCT Primary Channel Number (optional)	OCT Frequency Segment 1 Channel Number (optional)
Octets:	1	1	1	1	1	0 or 1	0 or 1	0 or 1

Figure 9-442—OCI subelement format

The definitions of the Operating Class, Primary Channel Number, Frequency Segment 1 Channel Number, OCT Operating Class, OCT Primary Channel Number and OCT Frequency Segment 1 Channel Number fields are the same as those described in 9.4.2.235.

The OCT Operating Class, OCT Primary Channel Number and OCT Frequency Segment 1 fields are present if the OCI subelement is contained in a frame sent using the OCT procedure, i.e., an MMPDU included in an MLME-OCTunnel.request or MLME-OCTunnel.response primitive (see 11.31.5); otherwise they are not present.

The BIGTK subelement contains the BIGTK, used for protecting Beacon frames. The BIGTK subelement format is shown in Figure 9-443.

	Subelement ID	Length	Key ID	BIPN	Key Length	Wrapped Key
Octets:	1	1	2	6	1	24-40

Figure 9-443—BIGTK subelement format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Key ID field contains the BIGTK key ID.

The BIPN field contains the current RSC for the BIGTK being installed. The RSC for a BIGTK is the BIGTK packet number (BIPN).

The Key Length field is the length of the BIGTK in octets, not including any padding (see 13.8.5).

The Wrapped Key field contains the wrapped BIGTK being distributed.

The WIGTK subelement contains the WIGTK, used for protecting broadcast and group addressed WUR Wake-up frames. The WIGTK subelement format is shown in Figure 9-444.

	Subelement ID	Length	Key ID	WIPN	Key Length	Wrapped Key
Octets:	1	1	2	6	1	24

Figure 9-444—WIGTK subelement format

The Key ID field contains the WIGTK key ID.

The WIPN field contains the current RSC for the WIGTK being installed. The RSC for a WIGTK is the WIGTK packet number (WIPN).

The Key Length field is the length of the WIGTK in octets, not including any padding (see 13.8.5).

The Wrapped Key field contains the wrapped WIGTK being distributed.

9.4.2.47 TIE

The timeout interval element (TIE) specifies time intervals and timeouts. Figure 9-445 shows this element.

	Element ID	Length	Timeout Interval Type	Timeout Interval Value
Octets:	1	1	1	4

Figure 9-445—TIE format

The Element ID and Length fields are defined in 9.4.2.1.

The Timeout Interval Type field is defined in Table 9-222.

The Timeout Interval Value field contains an unsigned 32-bit integer. It is encoded according to the conventions in 9.2.2.

A reassociation deadline interval set to 0 indicates no deadline exists. A key lifetime interval set to 0 is reserved.

9.4.2.48 RDE

The RIC data element (RDE) refers to a collection of elements that are used to express a resource request and to convey responses to the corresponding requests.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-222—Timeout Interval Type field value

Timeout Interval Type	Meaning	Units
0	Reserved	
1	Reassociation deadline interval	Time units (TUs)
2	Key lifetime interval	Seconds
3	Association comeback time	Time units (TUs)
4	Time-to-Start (see 11.31.3.1)	Time units (TUs)
5	Peer-to-peer TWT agreement lifetime	Time units (TUs)
6–255	Reserved	

A RIC is a sequence of one or more Resource Requests, or a sequence of one or more Resource Responses. Each Resource Request or Response consists of an RDE, followed by one or more elements that describe that resource. See 13.11 for examples and procedures.

The RDE format is shown in Figure 9-446.

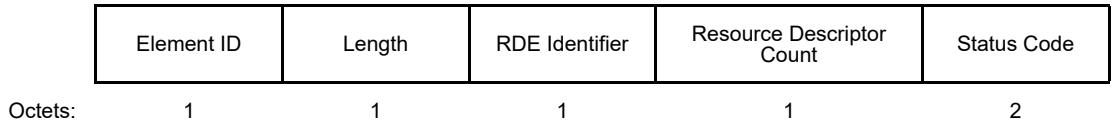

Figure 9-446—RDE format

The Element ID and Length fields are defined in 9.4.2.1.

The RDE Identifier field has an arbitrary 8-bit value, chosen by the resource requester to uniquely identify the RDE within the RIC.

The Resource Descriptor Count field indicates the number of alternative Resource Descriptors that follow this RDE.

The Status Code field is used in Resource Responses to indicate the result of the request. Valid values for the Status Code field are given in 9.4.1.9. When an RDE is included in a Resource Request, the Status Code field is reserved.

9.4.2.49 RIC Descriptor element

The RIC Descriptor element is used with an RDE during a fast BSS transition to negotiate resources that are not otherwise described by elements. See 13.11 for procedures for including this element in a RIC.

Figure 9-447 shows the format of this element.

The Element ID and Length fields are defined in 9.4.2.1.

The Resource Type field is defined in Table 9-223.

The Variable Parameters field contain any additional data based on the resource type.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

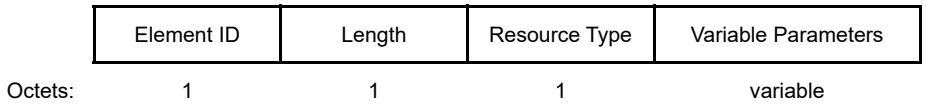

Figure 9-447—RIC Descriptor element format

Table 9-223—Resource type code in RIC Descriptor element

Resource type value	Meaning	Variable parameters
1	Block Ack	Block Ack Parameter Set field value as defined in 9.4.1.13, Block Ack Timeout Value field value as defined in 9.4.1.14, and Block Ack Starting Sequence Control subfield value as defined in 9.3.1.7.
0, 2–255	Reserved	

9.4.2.50 DSE Registered Location element

A DSE Registered Location element includes DSE location configuration information (LCI), which contains latitude, longitude, and altitude information. The DSE Registered Location element format is shown in Figure 9-448.

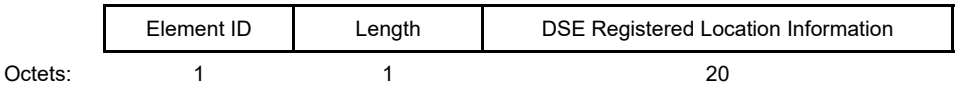

Figure 9-448—DSE Registered Location element format

The Element ID and Length fields are defined in 9.4.2.1.

The structure and information fields are based on the LCI format described in IETF RFC 6225.

The DSE Registered Location Information field is shown in Figure 9-449.

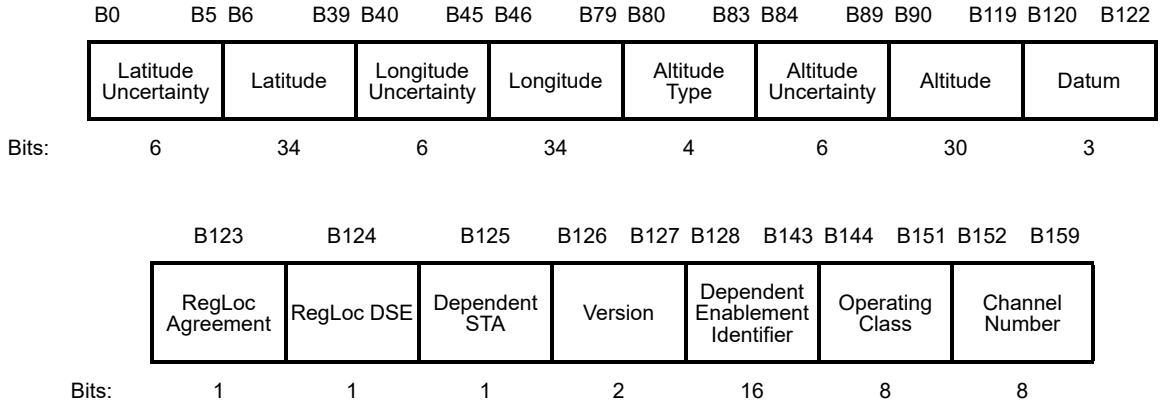

Figure 9-449—DSE Registered Location Information field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The fields within the DSE Registered Location Information field are defined in section 2.2 of IETF RFC 6225 except as defined in this standard.

With an Altitude Type field set to 3, the altitude is defined to be in meters and is formatted in 2s complement, fixed-point, 22-bit integer part with 8-bit fraction.

The Datum field is defined in IETF RFC 6225, and the codes used are as defined in IETF RFC 6225.

The RegLoc Agreement subfield is set to 1 to report that the STA is operating within a national policy area or an international agreement area near a national border (see 11.11.3); otherwise, it is set to 0.

The RegLoc DSE subfield is set to 1 to report that the enabling STA is enabling the operation of STAs with DSE; otherwise, it is set to 0.

The Dependent STA subfield is set to 1 to report that the STA is operating with the enablement of the enabling STA whose LCI is being reported; otherwise, it is set to 0.

The Version field is defined in IETF RFC 6225, and its use is described in IETF RFC 6225.

The Dependent Enablement Identifier field is a value set by the enabling STA via the DSE Enablement frame; otherwise, it is set to 0.

The Operating Class field indicates the channel set for which the enablement request, report, or announcement applies. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the report applies. Valid values for the Operating Class field are shown in Annex E.

The Channel Number field indicates the channel number for which the enablement request, report, or announcement applies. The channel number is defined within an operating class as shown in Annex E.

9.4.2.51 Extended Channel Switch Announcement element

The Extended Channel Switch Announcement element is used by an AP, PCP, IBSS STA, or mesh STA to advertise when the BSS is changing to a new channel in the same or a new operating class. The announcement includes both the operating class and the channel number of the new channel. The element is present only when an extended channel switch is pending. The format of the Extended Channel Switch Announcement element is shown in Figure 9-450.

	Element ID	Length	Channel Switch Mode	New Operating Class	New Channel Number	Channel Switch Count
Octets:	1	1	1	1	1	1

Figure 9-450—Extended Channel Switch Announcement element format

The Element ID and Length fields are defined in 9.4.2.1.

The Channel Switch Mode field indicates any restrictions on transmission until a channel switch. An AP, PCP, or an IBSS STA sets the Channel Switch Mode field to either 0 or 1 on transmission as specified in 11.8.8.2 and 11.8.8.3. The Channel Switch Mode field is reserved in an MBSS.

The New Operating Class field is set to the number of the operating class after the channel switch, as defined in Annex E.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If transmitted by a STA that is not an EDMG STA, the New Channel Number field is set to the number of the channel after the channel switch. The channel number is a channel from the STA's new operating class as defined in Annex E. If transmitted by an EDMG STA, the New Channel Number field is set to the channel number of the primary channel after the channel switch. The channel number is a channel from the STA's new operating class as defined in Annex E.

For nonmesh STAs, the Channel Switch Count field indicates the number of target beacon transmission times (TBTTs) until the STA sending the Channel Switch Count field switches to the new channel. A Channel Switch Count field set to 1 indicates that the switch occurs immediately before the next TBTT. A Channel Switch Count field set to 0 indicates that the switch occurs any time after the frame containing the Channel Switch Count field is transmitted.

For mesh STAs, the Channel Switch Count field is encoded as an octet with bits 6 to 0 set to the time, in units of 2 TU when the MSB (bit 7) is 0, or in units of 100 TU when the MSB (bit 7) is 1, until the mesh STA sending the Channel Switch Count field switches to the new channel. Bits 6 to 0 set to 0 indicates that the switch occurs at any time after the frame containing the Channel Switch Count field is transmitted. For example, a 200 TU channel switch time is encoded as X'82' and a 10 TU channel switch time is encoded as X'05'.

9.4.2.52 Supported Operating Classes element

The Supported Operating Classes element is used by a STA to advertise the operating classes within which it is currently configured to operate. The format of the Supported Operating Classes element is shown in Figure 9-451.

	Element ID	Length	Current Operating Class	Operating Classes	Current Operating Class Extension Sequence (optional)	Operating Class Duple Sequence (optional)
Octets:	1	1	1	variable	variable	variable

Figure 9-451—Supported Operating Classes element format

The Element ID and Length fields are defined in 9.4.2.1.

The Current Operating Class field, concatenated with the Current Operating Class Extension field within the Current Operating Class Extension Sequence field if present, indicates the operating class in use for transmission and reception. If the operating class in use is a single octet, the Current Operating Class Extension Sequence field is not present. If the operating class in use is more than a single octet, then the Current Operating Class Extension Sequence field is present, and the concatenation of the Current Operating Class field with the Current Operating Class Extension Sequence field comprises N (where $N \geq 0$) Operating Class octets with an 80+ behavior limit followed by one Operating Class octet without an 80+ behavior limit (as defined in Annex E). Channels using two nonadjacent frequency segments use 2-octet format to indicate the operating class (e.g., operating classes 128 and 130 are used to describe a 80+80 MHz channel).

The Operating Classes field lists, in descending order of preference, all 1-octet operating classes within which the STA is currently configured to operate. The Operating Classes field terminates immediately before a OneHundredAndThirty Delimiter (see Figure 9-452 (Current Operating Class Extension Sequence field format)), a Zero Delimiter (see Figure 9-453 (Operating Class Duple Sequence field format)), or the end of the element.

The format of the optional Current Operating Class Extension Sequence field is shown in Figure 9-452.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

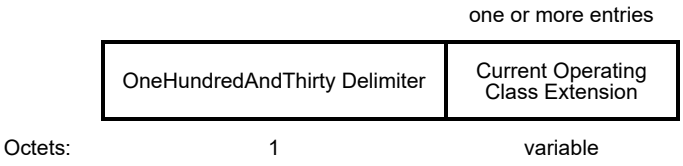

Figure 9-452—Current Operating Class Extension Sequence field format

The OneHundredAndThirty Delimiter field is set to 130.

The Current Operating Class Extension field comprises *N* (where $N \geq 0$) Operating Class octets with an 80+ behavior limit followed by one Operating Class octet without an 80+ behavior limit (as defined in Annex E).

The format of the Operating Class Duple Sequence field is shown in Figure 9-453.

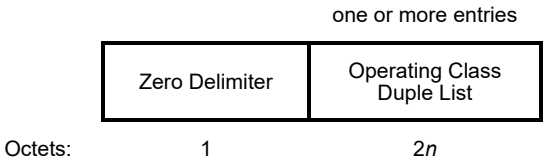

Figure 9-453—Operating Class Duple Sequence field format

The Zero Delimiter element is set to 0.

The Operating Class Duple List subfield lists all 2-octet operating classes within which the STA is currently configured to operate. Each operating class in the Operating Class Duple List subfield contains an Operating Class octet with an 80+ behavior limit followed by one Operating Class octet without an 80+ behavior limit (as defined in Annex E). Operating classes are transmitted in ascending order using the first octet in the operating class as the primary sort key and then the second octet in the operating class as the secondary sort key. If there are no 2-octet operating classes within which the STA is currently configured to operate, then the Operating Class Duple Sequence field is omitted from the Supported Operating Classes element. The Operating Class Duple List subfield terminates immediately before another zero octet or the end of the element.

The use of this element is described in 11.9.2 and 11.10.9.1.

9.4.2.53 MME

The management MIC element (MME) provides message integrity and protects group addressed robust Management frames and protected Beacon frames which are not protected with BCE from forgery and replay. Figure 9-454 (MME format) shows the MME format.

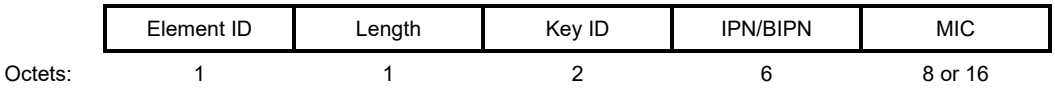

Figure 9-454—MME format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Key ID field identifies the IGTK or BIGTK used to compute the MIC. Bits 0–11 define a value in the range 0–4095. Bits 12–15 are reserved. The IGTK key ID is either 4 or 5. The BIGTK key ID is either 6 or 7. The remaining key IDs are reserved.

The IPN/BIPN field is used to detect replay of protected group addressed robust Management frames and protected Beacon frames. For protected group addressed robust Management frames, the IPN/BIPN field contains the IPN. For protected Beacon frames, the IPN/BIPN field contains the BIPN.

The MIC field contains a message integrity code calculated over the robust Management frame or protected Beacon frame as specified in 12.5.3.5 and 12.5.3.6. The length of the MIC field depends on the specific cipher negotiated and is either 8 octets (for BIP-CMAC-128) or 16 octets (for BIP-CMAC-256, BIP-GMAC-128, and BIP-GMAC-256).

9.4.2.54 HT Capabilities element

9.4.2.54.1 HT Capabilities element structure

An HT STA declares that it is an HT STA by transmitting the HT Capabilities element.

The HT Capabilities element contains a number of fields that are used to advertise optional HT capabilities of an HT STA. The HT Capabilities element is defined in Figure 9-455 (HT Capabilities element format).

	Element ID	Length	HT Capability Information	A-MPDU Parameters	Supported MCS Set	HT Extended Capabilities	Transmit Beamforming Capabilities	ASEL Capabilities
Octets:	1	1	2	1	16	2	4	1

Figure 9-455—HT Capabilities element format

The Element ID and Length fields are defined in 9.4.2.1.

9.4.2.54.2 HT Capability Information field

The HT Capability Information field of the HT Capabilities element contains capability information bits. The structure of this field is defined in Figure 9-456 (HT Capability Information field format).

	B0	B1	B2 B3	B4	B5	B6	B7	B8 B9
	LDPC Coding Capability	Supported Channel Width Set	SM Power Save	HT-Greenfield	Short GI for 20 MHz	Short GI for 40 MHz	Tx STBC	Rx STBC
Bits:	1	1	2	1	1	1	1	2

B10	B11	B12	B13	B14	B15
Reserved	Maximum A-MSDU Length	DSSS/CCK Mode in 40 MHz	Reserved	Forty MHz Intolerant	Reserved
1	1	1	1	1	1

Figure 9-456—HT Capability Information field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The subfields of the HT Capability Information field are defined in Table 9-224.

Table 9-224—Subfields of the HT Capability Information field

Subfield	Definition	Encoding
LDPC Coding Capability	Indicates support for receiving LDPC coded PPDUs	Set to 0 if not supported Set to 1 if supported
Supported Channel Width Set	Indicates the channel widths supported by the STA. See 11.15.	Set to 0 if only 20 MHz operation is supported Set to 1 if both 20 MHz and 40 MHz operation is supported This field is reserved when the transmitting or receiving STA is operating in an operating class that includes 20 in the Channel spacing (MHz) column of the appropriate table in Annex E.
SM Power Save	Indicates the spatial multiplexing power save mode that is in operation immediately after (re)association. See 11.2.6.	Set to 0 for static SM power save mode Set to 1 for dynamic SM power save mode Set to 3 for SM power save disabled or not supported The value 2 is reserved Only valid in a (Re)Association Request frame sent to an AP. Otherwise this subfield is set to 0 or 3 upon transmission and is ignored upon reception. NOTE—This subfield indicates the operational state immediately after (re)association as well as (if not set to 3) a capability.
HT-Greenfield	Indicates support for the reception of PPDUs with HT-greenfield format. See 19.1.4.	Set to 0 if not supported Set to 1 if supported
Short GI for 20 MHz	Indicates short GI support for the reception of HT PPDUs transmitted with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20 and, for a VHT STA, for the reception of VHT PPDUs transmitted with the TXVECTOR parameter CH_BANDWIDTH equal to CBW20	Set to 0 if not supported Set to 1 if supported
Short GI for 40 MHz	Indicates short GI support for the reception of HT PPDUs transmitted with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40 and, for a VHT STA, for the reception of VHT PPDUs transmitted with the TXVECTOR parameter CH_BANDWIDTH equal to CBW40	Set to 0 if not supported Set to 1 if supported

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-224—Subfields of the HT Capability Information field *(continued)*

Subfield	Definition	Encoding
Tx STBC	Indicates support for the transmission of PPDUs using STBC	Set to 0 if not supported Set to 1 if supported This field is reserved for a mesh STA.
Rx STBC	Indicates support for the reception of PPDUs using STBC	Set to 0 for no support Set to 1 for support of one spatial stream Set to 2 for support of one and two spatial streams Set to 3 for support of one, two and three spatial streams This field is reserved for a mesh STA.
Maximum A-MSDU Length	Indicates maximum A-MSDU length in an HT PPDU. See 10.11.	Set to 0 for 3839 octets Set to 1 for 7935 octets
DSSS/CCK Mode in 40 MHz	Indicates the BSS is operating in a mode that allows transmission of DSSS/CCK PPDUs, when the operating channel width is 40 MHz. See 11.15.	In Beacon and Probe Response frames: Set to 0 if the BSS is operating in a mode that does not allow transmission of DSSS/CCK PPDUs Set to 1 if the BSS is operating in a mode that allows transmission of DSSS/CCK PPDUs Otherwise: Set to 0 if the STA supports neither transmission nor reception of DSSS/CCK PPDUs when the operating channel width is 40 MHz Set to 1 if the STA supports transmission and reception of DSSS/CCK PPDUs when the operating channel width is 40 MHz See 11.15.8 for operating rules
Forty MHz Intolerant	Indicates whether APs receiving this information or reports of this information are required to prohibit 40 MHz transmissions (see 11.15.12).	Set to 1 by an HT STA to prohibit a receiving AP from operating that AP's BSS as a 20/40 MHz BSS; otherwise, set to 0.

9.4.2.54.3 A-MPDU Parameters field

The structure of the A-MPDU Parameters field of the HT Capabilities element is shown in Figure 9-457.

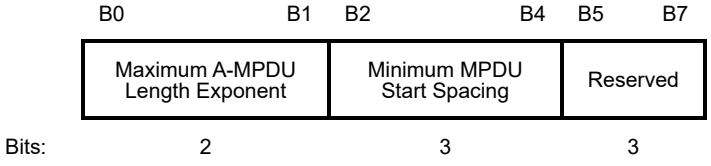

Figure 9-457—A-MPDU Parameters field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The subfields of the A-MPDU Parameters field are defined in Table 9-225.

Table 9-225—Subfields of the A-MPDU Parameters field

Subfield	Definition	Encoding
Maximum A-MPDU Length Exponent	Indicates the maximum length of A-MPDU that the STA can receive.	The length defined by this field is equal to $2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1$ octets.
Minimum MPDU Start Spacing	Determines the minimum time between the start of adjacent MPDUs within an A-MPDU that the STA can receive, measured at the PHY SAP. See 10.12.3.	Set to 0 for no restriction Set to 1 for 1/4 μs Set to 2 for 1/2 μs Set to 3 for 1 μs Set to 4 for 2 μs Set to 5 for 4 μs Set to 6 for 8 μs Set to 7 for 16 μs

9.4.2.54.4 Supported MCS Set field

The Supported MCS Set field of the HT Capabilities element indicates the HT-MCSs a STA supports.

An MCS is identified by an MCS index, which is represented by an integer in the range 0 to 76. The interpretation of the MCS index (i.e., the mapping from MCS to data rate) is PHY dependent. For the HT PHY, see 19.5.

The structure of the MCS Set field is defined in Figure 9-458.

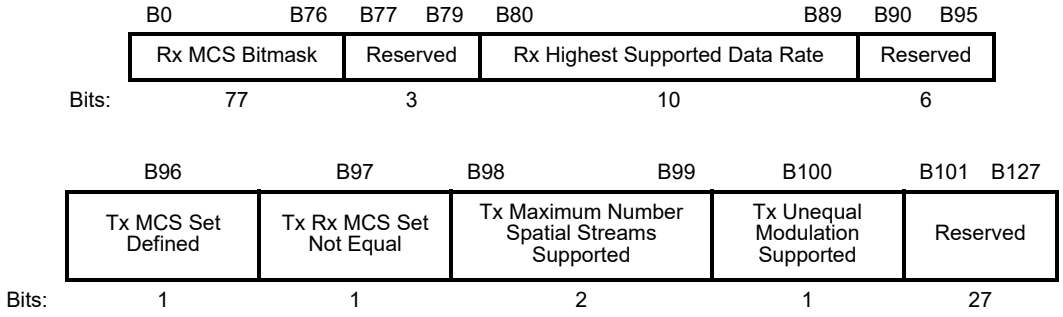

Figure 9-458—Supported MCS Set field format

The Rx MCS Bitmask subfield of the Supported MCS Set field defines a set of MCS index values, where B0 corresponds to MCS 0 and B76 corresponds to MCS 76.

NOTE—An HT STA includes the mandatory MCS values defined in 19.1 in the Rx MCS Bitmask subfield.

The Rx Highest Supported Data Rate subfield of the Supported MCS Set field defines the highest HT PPDU data rate that the STA is able to receive, in units of 1 Mb/s in the range 1 to 1023. If the maximum data rate expressed in Mb/s is not an integer, then the value is rounded down to the next integer. The value 0 indicates that this subfield does not specify the HT PPDU highest data rate that the STA is able to receive; see 10.6.6.5.3.

The Tx MCS Set Defined, Tx Rx MCS Set Not Equal, Tx Maximum Number Spatial Streams Supported, and Tx Unequal Modulation Supported subfields of the Supported MCS Set field indicate the transmit-supported MCS set, as defined in Table 9-226.

Table 9-226—Transmit MCS Set

Condition	Tx MCS Set Defined	Tx Rx MCS Set Not Equal	Tx Maximum Number Spatial Streams Supported	Tx Unequal Modulation Supported
No Tx MCS set is defined	0	0	0	0
The Tx MCS set is defined and is equal to the Rx MCS set	1	0	0	0
The Tx MCS set is defined and is not necessarily equal to the Rx MCS set	1	1	Indicates the maximum number of spatial streams supported when transmitting: Set to 0 for 1 spatial stream Set to 1 for 2 spatial streams Set to 2 for 3 spatial streams Set to 3 for 4 spatial streams	Indicates whether transmit unequal modulation (UEQM) is supported: Set to 0 for UEQM not supported Set to 1 for UEQM supported

9.4.2.54.5 HT Extended Capabilities field

The structure of the HT Extended Capabilities field of the HT Capabilities element is defined in Figure 9-459 (HT Extended Capabilities field format).

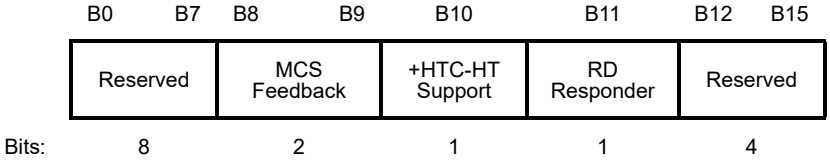

Figure 9-459—HT Extended Capabilities field format

The subfields of the HT Extended Capabilities field are defined in Table 9-227.

Table 9-227—Subfields of the HT Extended Capabilities field

Subfield	Definition	Encoding
MCS Feedback	Indicates whether the STA can provide MFB	Set to 0 (No Feedback) if the STA does not provide MFB Set to 2 (Unsolicited) if the STA provides only unsolicited MFB Set to 3 (Both) if the STA can provide MFB in response to MRQ (either Delayed or Immediate, see 10.31.1) as well as unsolicited MFB The value 1 is reserved

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-227—Subfields of the HT Extended Capabilities field

Subfield	Definition	Encoding
+HTC-HT Support	Indicates support of the HT variant HT Control field. See 10.8	Set to 0 if not supported Set to 1 if supported
RD Responder	Indicates support for acting as a reverse direction responder, i.e., the STA might use an offered RDG to transmit data to an RD initiator using the reverse direction protocol described in 10.29.	Set to 0 if not supported Set to 1 if supported

9.4.2.54.6 Transmit Beamforming Capabilities

The structure of the Transmit Beamforming Capabilities field is defined in Figure 9-460 (Transmit Beamforming Capabilities field format).

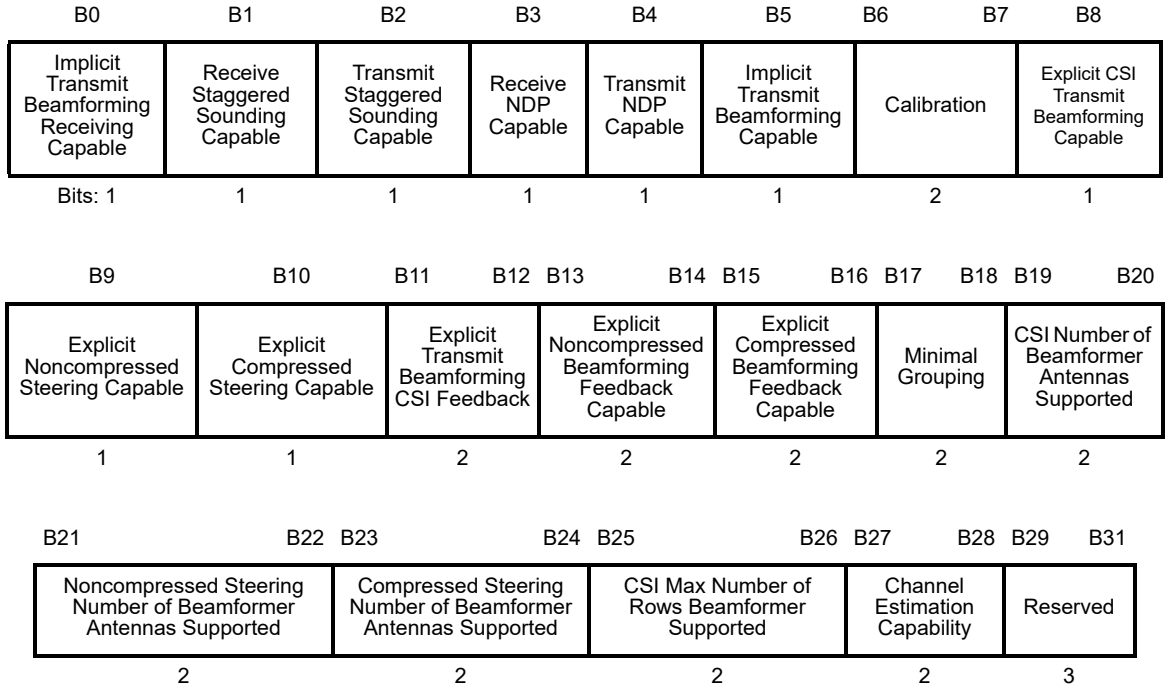

Figure 9-460—Transmit Beamforming Capabilities field format

The subfields of the Transmit Beamforming Capabilities field are defined in Table 9-228.

Table 9-228—Subfields of the Transmit Beamforming Capabilities field

Subfield	Definition	Encoding
Implicit Transmit Beamforming Receiving Capable	Indicates whether this STA can receive Transmit Beamforming steered frames using implicit feedback	Set to 0 if not supported Set to 1 if supported

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-228—Subfields of the Transmit Beamforming Capabilities field *(continued)*

Subfield	Definition	Encoding
Receive Staggered Sounding Capable	Indicates whether this STA can receive staggered sounding frames.	Set to 0 if not supported Set to 1 if supported
Transmit Staggered Sounding Capable	Indicates whether this STA can transmit staggered sounding frames.	Set to 0 if not supported Set to 1 if supported
Receive NDP Capable	Indicates whether this receiver can interpret null data PPDUs as sounding frames.	Set to 0 if not supported Set to 1 if supported
Transmit NDP Capable	Indicates whether this STA can transmit null data PPDUs as sounding frames.	Set to 0 if not supported Set to 1 if supported
Implicit Transmit Beamforming Capable	Indicates whether this STA can apply implicit transmit beamforming.	Set to 0 if not supported Set to 1 if supported
Calibration	Indicates whether the STA can participate in a calibration procedure initiated by another STA that is capable of generating an immediate response sounding PPDU and can provide a CSI report in response to a sounding PPDU.	Set to 0 if not supported Set to 1 if the STA can respond to a calibration request using the CSI report, but cannot initiate calibration The value 2 is reserved Set to 3 if the STA can both initiate and respond to a calibration request
Explicit CSI Transmit Beamforming Capable	Indicates whether this STA can apply transmit beamforming using CSI explicit feedback in its transmission	Set to 0 if not supported Set to 1 if supported
Explicit Noncompressed Steering Capable	Indicates whether this STA can apply transmit beamforming using noncompressed beamforming feedback matrix explicit feedback in its transmission	Set to 0 if not supported Set to 1 if supported
Explicit Compressed Steering Capable	Indicates whether this STA can apply transmit beamforming using compressed beamforming feedback matrix explicit feedback in its transmission	Set to 0 if not supported Set to 1 if supported
Explicit Transmit Beamforming CSI Feedback	Indicates whether this receiver can return CSI explicit feedback.	Set to 0 if not supported Set to 1 for delayed feedback Set to 2 for immediate feedback Set to 3 for delayed and immediate feedback
Explicit Noncompressed Beamforming Feedback Capable	Indicates whether this receiver can return noncompressed beamforming feedback matrix explicit feedback.	Set to 0 if not supported Set to 1 for delayed feedback Set to 2 for immediate feedback Set to 3 for delayed and immediate feedback
Explicit Compressed Beamforming Feedback Capable	Indicates whether this receiver can return compressed beamforming feedback matrix explicit feedback.	Set to 0 if not supported Set to 1 for delayed feedback Set to 2 for immediate feedback Set to 3 for delayed and immediate feedback

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-228—Subfields of the Transmit Beamforming Capabilities field *(continued)*

Subfield	Definition	Encoding
Minimal Grouping	Indicates the minimal grouping used for explicit feedback reports	Set to 0 if the STA supports groups of 1 (no grouping) Set to 1 indicates groups of 1, 2 Set to 2 indicates groups of 1, 4 Set to 3 indicates groups of 1, 2, 4
CSI Number of Beamformer Antennas Supported	Indicates the maximum number of beamformer antennas the HT beamformee can support when CSI feedback is required	Set to 0 for single Tx antenna sounding Set to 1 for 2 Tx antenna sounding Set to 2 for 3 Tx antenna sounding Set to 3 for 4 Tx antenna sounding
Noncompressed Steering Number of Beamformer Antennas Supported	Indicates the maximum number of beamformer antennas the HT beamformee can support when noncompressed beamforming feedback matrix is required	Set to 0 for single Tx antenna sounding Set to 1 for 2 Tx antenna sounding Set to 2 for 3 Tx antenna sounding Set to 3 for 4 Tx antenna sounding
Compressed Steering Number of Beamformer Antennas Supported	Indicates the maximum number of beamformer antennas the HT beamformee can support when compressed beamforming feedback matrix is required	Set to 0 for single Tx antenna sounding Set to 1 for 2 Tx antenna sounding Set to 2 for 3 Tx antenna sounding Set to 3 for 4 Tx antenna sounding
CSI Max Number of Rows Beamformer Supported	Indicates the maximum number of rows of CSI explicit feedback from the HT beamformee or calibration responder or transmit ASEL responder that an HT beamformer or calibration initiator or transmit ASEL initiator can support when CSI feedback is required.	Set to 0 for a single row of CSI Set to 1 for 2 rows of CSI Set to 2 for 3 rows of CSI Set to 3 for 4 rows of CSI
Channel Estimation Capability	Indicates the maximum number of space-time streams (columns of the MIMO channel matrix) for which channel dimensions can be simultaneously estimated when receiving an NDP sounding PPDU or the extension portion of the HT Long Training fields (HT-LTFs) in a staggered sounding PPDU. See NOTE.	Set 0 for 1 space-time stream Set 1 for 2 space-time streams Set 2 for 3 space-time streams Set 3 for 4 space-time streams

NOTE—The maximum number of space-time streams for which channel coefficients can be simultaneously estimated using the HT-LTFs corresponding to the data portion of the PPDU is limited by the Rx MCS Bitmask subfield of the Supported MCS Set field and by the Rx STBC subfield of the HT Capability Information field. Both fields are part of the HT Capabilities element.

9.4.2.54.7 ASEL Capability field

The structure of the ASEL Capability field of the HT Capabilities element is defined in Figure 9-461 (ASEL Capability field format).

	B0	B1	B2	B3	B4	B5	B6	B7
	Antenna Selection Capable	Explicit CSI Feedback Based Transmit ASEL Capable	Antenna Indices Feedback Based Transmit ASEL Capable	Explicit CSI Feed-back Capable	Antenna Indices Feedback Capable	Receive ASEL Capable	Transmit Sounding PPDUs Capable	Reserved
Bits:	1	1	1	1	1	1	1	1

Figure 9-461—ASEL Capability field format

The subfields of the ASEL Capability field are defined in Table 9-229.

Table 9-229—ASEL Capability field subfields

Subfield	Definition	Encoding
Antenna Selection Capable	Indicates whether this STA supports ASEL	Set to 0 if not supported Set to 1 if supported
Explicit CSI Feedback Based Transmit ASEL Capable	Indicates whether this STA supports transmit ASEL based on explicit CSI feedback	Set to 0 if not supported Set to 1 if supported
Antenna Indices Feedback Based Transmit ASEL Capable	Indicates whether this STA supports transmit ASEL based on antenna indices feedback	Set to 0 if not supported Set to 1 if supported
Explicit CSI Feedback Capable	Indicates whether this STA can compute CSI and provide CSI feedback in support of ASEL	Set to 0 if not supported Set to 1 if supported
Antenna Indices Feedback Capable	Indicates whether this STA can compute an antenna indices selection and return an antenna indices selection in support of ASEL	Set to 0 if not supported Set to 1 if supported
Receive ASEL Capable	Indicates whether this STA supports receive ASEL	Set to 0 if not supported Set to 1 if supported
Transmit Sounding PPDUs Capable	Indicates whether this STA can transmit sounding PPDUs for ASEL training on request	Set to 0 if not supported Set to 1 if supported

9.4.2.55 HT Operation element

The operation of HT STAs in the BSS is controlled by the HT Operation element. The structure of this element is defined in Figure 9-462 (HT Operation element format).

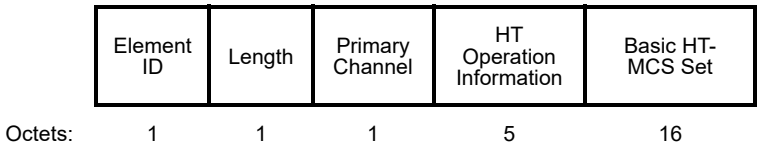

Figure 9-462—HT Operation element format

The Element ID and Length fields are defined in 9.4.2.1.

The structure of the HT Operation Information field is shown in Figure 9-463.

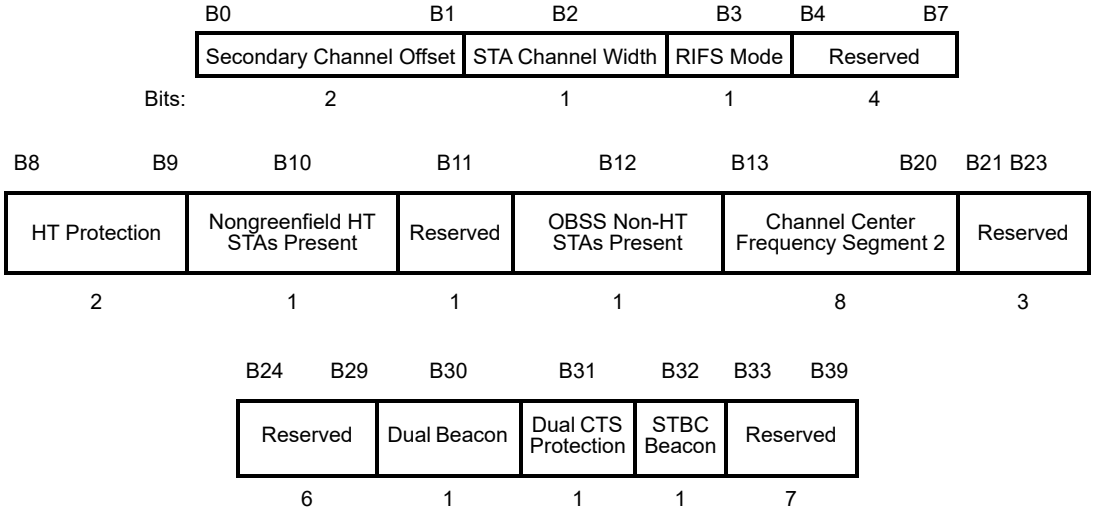

Figure 9-463—HT Operation Information field format

The Primary Channel field, subfields of the HT Operation Information field, and the Basic HT-MCS Set field are defined in Table 9-230. The Reserved in IBSS? column indicates whether each field is reserved (Y) or not reserved (N) when this element is present in a frame transmitted within an IBSS. The Reserved in MBSS? column indicates whether each field is reserved (Y) or not reserved (N) when this element is present in a frame transmitted within an MBSS.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-230—HT Operation element fields and subfields

Field	Definition	Encoding	Reserved in IBSS?	Reserved in MBSS?
Primary Channel	Indicates the channel number of the primary channel. See 11.15.2.	Channel number of the primary channel	N	N
Secondary Channel Offset	Indicates the offset of the secondary channel relative to the primary channel.	Set to 1 (SCA) if the secondary channel is above the primary channel Set to 3 (SCB) if the secondary channel is below the primary channel Set to 0 (SCN) if no secondary channel is present The value 2 is reserved	N	N
STA Channel Width	Defines the channel widths that can be used to transmit to the STA. See 11.15.12	Set to 0 for a 20 MHz channel width Set to 1 allows use of any channel width in the Supported channel width set This field is reserved when the transmitting or receiving STA is operating in an operating class that does not include a value of PrimaryChannelLowerBehavior or PrimaryChannelUpperBehavior in the behavior limits set as specified in Annex E. See NOTE 1.	N	N
RIFS Mode	Indicates whether the use of reduced interframe space is permitted within the BSS. See 10.3.2.3.2 and 10.27.3.3	Set to 0 if use of RIFS is prohibited Set to 1 if use of RIFS is permitted	Y	Y
HT Protection	Indicates protection requirements of HT transmissions. See 10.27.3.	Set to 0 for no protection mode Set to 1 for nonmember protection mode Set to 2 for 20 MHz protection mode Set to 3 for non-HT mixed mode	Y	N
Nongreenfield HT STAs Present	AP indicates if any HT STAs that are not HT-greenfield capable have associated. Mesh STA indicates if it establishes a mesh peering with an HT STA that is not HT-greenfield capable. Determines when a non-AP STA should use HT-greenfield protection. Present in Beacon and Probe Response frames transmitted by an AP or mesh STA. Otherwise reserved. See 10.27.3.1.	Set to 0 if all HT STAs that are associated are HT-greenfield capable or all HT peer mesh STAs are HT-greenfield capable Set to 1 if one or more HT STAs that are not HT-greenfield capable are associated or one or more HT peer mesh STAs are not HT-greenfield capable	Y	N

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-230—HT Operation element fields and subfields *(continued)*

Field	Definition	Encoding	Reserved in IBSS?	Reserved in MBSS?
OBSS Non-HT STAs Present	Indicates if the use of protection for non-HT STAs by overlapping BSSs is determined to be desirable. If the BSS is operating in an operating class for which the behavior limits set listed in Annex E includes the DFS_50_100_Behavior, this field indicates if there exist any non-HT OBSSs and whether HT-greenfield transmissions are allowed. Present in Beacon and Probe Response frames transmitted by an AP. Otherwise reserved. See 10.27.3.4 and 11.8.8.5.	If not operating in an operating class for which the behavior limits set listed in Annex E includes the value DFS_50_100_Behavior: Set to 1 if the use of protection for non-HT STAs by OBSSs is determined to be desirable. See NOTE 2. Set to 0 otherwise. If operating in an operating class for which the behavior limits set listed in Annex E includes the value DFS_50_100_Behavior: Set to 1 if there exists one or more non-HT OBSSs. Indicates that HT-greenfield transmissions are disallowed in the BSS. Set to 0 otherwise.	Y	Y
Channel Center Frequency Segment 2	Defines the channel center frequency for a 160 or 80+80 MHz BSS bandwidth with NSS support less than Max VHT NSS. See 21.3.14, 11.38 and 9.4.2.156.3.	For a STA with dot11VHTExtendedNSSBWCapable equal to true: See Table 9-314, otherwise this field is set to 0. NOTE—This subfield is not used in a non-VHT HT STA.	N	N
Dual Beacon	Indicates whether the AP transmits an STBC beacon. The use of the dual beacon mechanism is obsolete.	Set to 0 if no STBC beacon is transmitted Set to 1 if an STBC beacon is transmitted by the AP	Y	Y
Dual CTS Protection	Dual CTS protection is used by the AP to set a NAV at STAs that do not support STBC and at STAs that can associate solely through the STBC beacon. See 10.3.2.10. The use of the dual CTS mechanism is obsolete.	Set to 0 if dual CTS protection is not required Set to 1 if dual CTS protection is required	Y	Y
STBC Beacon	Indicates whether the beacon containing this element is a primary or an STBC beacon. The STBC beacon has half a beacon period shift relative to the primary beacon. Defined only in a Beacon frame transmitted by an AP. Otherwise reserved. See 11.1.3.2.	Set to 0 in a primary beacon Set to 1 in an STBC beacon	Y	Y

Table 9-230—HT Operation element fields and subfields *(continued)*

Field	Definition	Encoding	Reserved in IBSS?	Reserved in MBSS?
Basic HT-MCS Set	Indicates the HT-MCS values that are supported by all HT STAs in the BSS. Present in Beacon, Probe Response, Mesh Peering Open and Mesh Peering Confirm frames. Otherwise reserved.	A bitmap where a bit is set to 1 to indicate support for that MCS and 0 otherwise, where bit 0 corresponds to MCS 0. MCS values are defined in 9.4.2.54.4.	N	N

NOTE 1—Any change of STA Channel Width field does not impact the HT Protection field.
NOTE 2—Examples of when this bit might be set to 1 include, but are not limited to, the following situations:
a) One or more non-HT STAs are associated
b) A non-HT BSS is overlapping (a non-HT BSS might be detected by the reception of a Beacon or Probe Response frame that does not include an HT Capabilities element)

9.4.2.56 20/40 BSS Intolerant Channel Report element

The 20/40 BSS Intolerant Channel Report element contains a list of channels on which a STA has found conditions that disallow the use of a 20/40 MHz BSS. The format of the 20/40 BSS Intolerant Channel Report element is shown in Figure 9-464.

	Element ID	Length	Operating Class	Channel List
Octets:	1	1	1	variable

Figure 9-464—20/40 BSS Intolerant Channel Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Operating Class field of the 20/40 MHz BSS Intolerant Channel Report element contains an enumerated value from Annex E, encoded as an unsigned integer, specifying the operating class in which the Channel List field is valid. If the operating class is “unknown” as described in 11.15.12, the Operating Class field is set to 0. A 20/40 BSS Intolerant Channel Report only reports channels for a single operating class. Multiple 20/40 BSS Intolerant Channel Report elements are used to report channels in more than one operating class.

The Channel List field of the 20/40 MHz BSS Intolerant Channel Report element contains a variable number of octets, where each octet describes a single channel number. Channel numbering is dependent on operating class according to Annex E.

A 20/40 BSS Intolerant Channel Report element includes only channels that are valid for the regulatory domain in which the STA transmitting the element is operating and that are consistent with the Country element transmitted by the AP of the BSS of which it is a member.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.57 Overlapping BSS Scan Parameters element

The Overlapping BSS Scan Parameters element is used by an AP to indicate the values to be used by BSS members when performing OBSS scan operations. The format of the Overlapping BSS Scan Parameters element is shown in Figure 9-465.

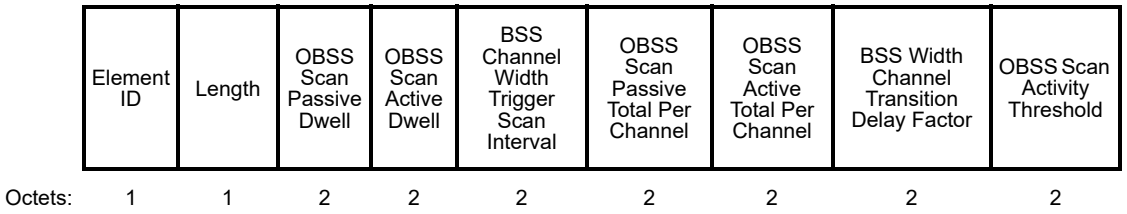

Figure 9-465—Overlapping BSS Scan Parameters element format

The Element ID and Length fields are defined in 9.4.2.1.

The OBSS Scan Passive Dwell field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanPassiveDwell as described in 11.15.5.

The OBSS Scan Active Dwell field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanActiveDwell as described in 11.15.5.

The BSS Channel Width Trigger Scan Interval field contains a value in seconds, encoded as an unsigned integer, that a receiving STA uses to set dot11BSSWidthTriggerScanInterval as described in 11.15.5.

The OBSS Scan Passive Total Per Channel field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanPassiveTotalPerChannel as described in 11.15.5.

The OBSS Scan Active Total Per Channel field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanActiveTotalPerChannel as described in 11.15.5.

The BSS Width Channel Transition Delay Factor field contains an integer value that a receiving STA uses to set dot11BSSWidthChannelTransitionDelayFactor as described in 11.15.5.

The OBSS Scan Activity Threshold field contains a value in hundredths of percent, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanActivityThreshold as described in 11.15.5.

The use of each of these parameters is described in 11.15.5.

9.4.2.58 20/40 BSS Coexistence element

The 20/40 BSS Coexistence element is used by STAs to exchange information that affects 20/40 BSS coexistence.

The 20/40 BSS Coexistence element is formatted as shown in Figure 9-466.

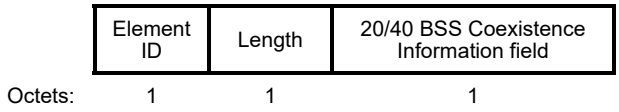

Figure 9-466—20/40 BSS Coexistence element format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The structure of the 20/40 BSS Coexistence Information field is shown in Figure 9-467.

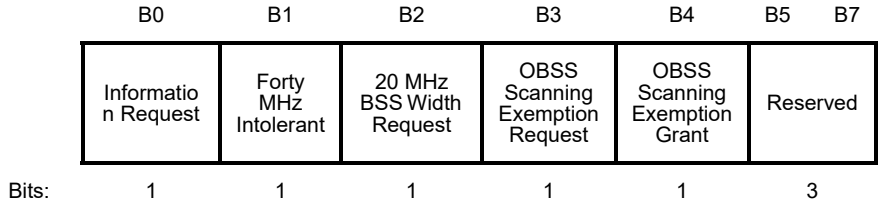

Figure 9-467—20/40 BSS Coexistence Information field format

The Information Request field is used to indicate that a transmitting STA is requesting the recipient to transmit a 20/40 BSS Coexistence Management frame with the transmitting STA as the recipient.

The Forty MHz Intolerant field is set to 1 to prohibit an AP that receives this information or reports of this information from operating a 20/40 MHz BSS. When equal to 0, it does not prohibit a receiving AP from operating a 20/40 MHz BSS. This field is used for inter-BSS communication. The definition of this field is the same as the definition of the Forty MHz Intolerant field in the HT Capabilities element (see 9.4.2.54), and its operation is described in 11.15.11.

The 20 MHz BSS Width Request field is set to 1 to prohibit a receiving AP from operating its BSS as a 20/40 MHz BSS. Otherwise, it is set to 0. This field is used for intra-BSS communication. The operation of this field is described in 11.15.12.

The OBSS Scanning Exemption Request field is set to 1 to indicate that the transmitting non-AP STA is requesting the BSS to allow the STA to be exempt from OBSS scanning. Otherwise, it is set to 0. The OBSS Scanning Exemption Request field is reserved when transmitted by an AP. The OBSS Scanning Exemption Request field is reserved when a 20/40 BSS Coexistence element is included in a group addressed frame.

The OBSS Scanning Exemption Grant field is set to 1 by an AP to indicate that the receiving STA is exempted from performing OBSS Scanning. Otherwise, it is set to 0. The OBSS Scanning Exemption Grant field is reserved when transmitted by a non-AP STA. The OBSS Scanning Exemption Grant field is reserved when a 20/40 BSS Coexistence element is included in a group addressed frame.

9.4.2.59 Time Advertisement element

The Time Advertisement element, shown in Figure 9-468, specifies fields describing the source of time corresponding to a time standard, an external clock (external time source), an estimate of the offset between that time standard and the TSF timer, and an estimate of the standard deviation of the error in the offset estimate. This information is used by a receiving STA to align its own estimate of the time standard based on that of another STA.

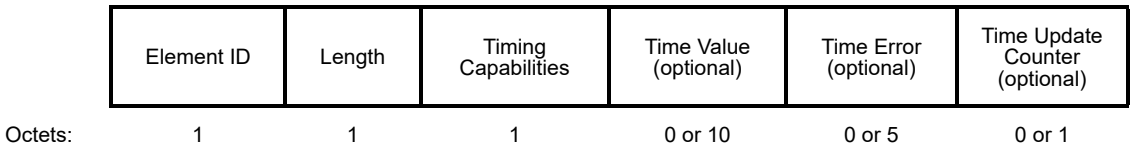

Figure 9-468—Time Advertisement element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Timing Capabilities field specifies the STA's source and encoding of the Time Value field. The encoding of the Timing Capabilities field is specified in Table 9-231.

Table 9-231—Encoding of the Timing Capabilities field

Value	Usage
0	No standardized external time source
1	Timestamp offset based on UTC (see ITU-R Recommendation TF.460-6 (2002) [B61]). The Timestamp offset value in nanoseconds is defined to be 0 at the beginning of the first nanosecond of the first day of the year 1958.
2	UTC time at which the TSF timer is 0.
3–255	Reserved

When the Timing Capabilities field is 0, only the Element ID, Length, and Timing Capabilities fields are included in the Time Advertisement element.

When the Timing Capabilities is 1, the following additional fields are included in the Time Advertisement element:

— Time Value field, a 2s complement integer in nanoseconds that, when added to the Timestamp present in the same transmitted frame, gives the receiving STA an estimate of the time standard at the time the frame was transmitted. The Timestamp is derived from the TSF Timer as defined in 11.19.

— Time Error field, which is set to an unsigned integer in nanoseconds that defines the standard deviation of the error in the Time Value estimate. The Time Error field is set to all 1s to indicate that the error is unknown.

When the Timing Capabilities field is 2, the following fields are included in the Time Advertisement element:

— The Time Value field is the UTC time at which the TSF Timer is 0, given that the TSF Timer units are 1 μs units as defined in 11.1.3. The format, including all subfields is shown in Table 9-232. For any subfield not known in the Time Value field, the subfield value is 0.

— The Time Error field is an unsigned integer in milliseconds that defines the standard deviation of the error in the Time Value estimate.

— The Time Update Counter field is a modulo 256 counter that increments each time the AP updates the Time Value UTC at which the TSF Timer is 0.

Table 9-232—Time Value field format when Timing Capabilities is 2

Octet	Description
0–1	Year (0–65 534)
2	Month (0–12)
3	Day of month (0–31)
4	Hours (0–23)
5	Minutes (0–59)
6	Seconds (0–59)
7–8	Milliseconds (0–999)
9	Reserved

9.4.2.60 Link Identifier element

The Link Identifier element contains information that identifies a TDLS direct link. The element information format is defined in Figure 9-469 (Link Identifier element format).

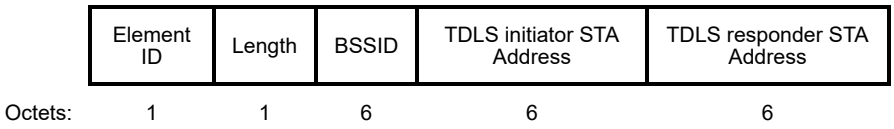

Figure 9-469—Link Identifier element format

The Element ID and Length fields are defined in 9.4.2.1.

The BSSID field is set to the BSSID of the BSS of which the TDLS initiator STA is a member.

The TDLS initiator STA Address field is set to the TDLS initiator STA's MAC address.

The TDLS responder STA Address field is set to the TDLS responder STA's MAC address.

9.4.2.61 Wakeup Schedule element

The Wakeup Schedule element contains information regarding the periodic wakeup schedule for TDLS peer PSM. The element format is defined in Figure 9-470 (Wakeup Schedule element format).

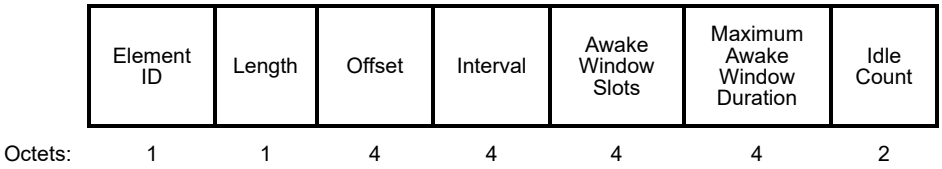

Figure 9-470—Wakeup Schedule element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Offset and Interval fields are in microseconds and define when awake windows begin. See Equation (11-1) in 11.2.3.11. The Interval field is nonzero and the Offset field is less than the Interval field.

The Awake Window Slots field is set to the duration of the awake window in units of backoff slots (see 10.23.2.4). See 11.2.3.11.

The Maximum Awake Window Duration field is set to the maximum duration of the awake window, in units of microseconds. See 11.2.3.11.

The Idle Count field is set to the number of consecutive awake windows during which no individually addressed frame is received from the TDLS peer STA before a TDLS peer STA deletes the wakeup schedule. See 11.2.3.11.

9.4.2.62 Channel Switch Timing element

The Channel Switch Timing element contains information regarding the channel switch timing. The element is defined in Figure 9-471 (Channel Switch Timing element format).

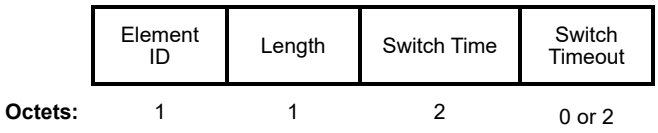

Figure 9-471—Channel Switch Timing element format

The Element ID and Length fields are defined in 9.4.2.1.

The Switch Time field is set to the time it takes for a STA sending the Channel Switch Timing element to switch channels, in units of microseconds.

The Switch Timeout field is set to a time in units of microseconds. The STA sending the Channel Switch Timing element waits for the first Data frame exchange on the off-channel for Switch Timeout microseconds before switching back to the base channel. The time is measured from the end of the PPDU[+SigExt] containing the Ack frame that is transmitted in response to a TDLS Channel Switch Response frame, as seen on the WM. If transmitted in a (Re)Association Request frame, the Switch Timeout field is not present in the Channel Switch Timing element.

9.4.2.63 PTI Control element

The PTI Control element contains information regarding the traffic buffered at the TPU buffer STA for the TPU sleep STA at the time a TDLS Peer Traffic Indication frame is transmitted by the TPU buffer STA. The element is optionally included in the TDLS Peer Traffic Indication frame. The element is defined in Figure 9-472 (PTI Control element format).

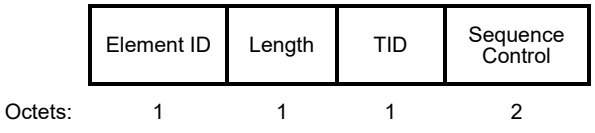

Figure 9-472—PTI Control element format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The TID field contained in the PTI Control element is set to the TID of the latest MPDU that has been transmitted over the TDLS direct link to the TPU sleep STA that is the destination of the TDLS Peer Traffic Indication frame that contains the PTI Control element. See 11.2.3.12.

The Sequence Control field is defined in 9.2.4.4. The Sequence Control field contained in the PTI Control element is set to the sequence number of the latest MPDU that has been transmitted over the TDLS direct link to the TPU sleep STA that is the destination of the TDLS Peer Traffic Indication frame that contains the PTI Control element. See 11.2.3.12.

9.4.2.64 TPU Buffer Status element

The TPU Buffer Status element contains information regarding the traffic buffered at the TPU buffer STA for the TPU sleep STA at the time a TDLS Peer Traffic Indication frame is transmitted by the TPU buffer STA. The element is included in the TDLS Peer Traffic Indication frame. The element is defined in Figure 9-473 (TPU Buffer Status element format).

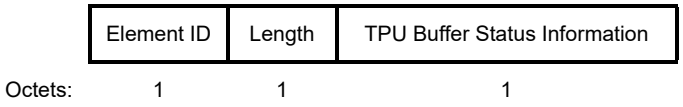

Figure 9-473—TPU Buffer Status element format

The Element ID and Length fields are defined in 9.4.2.1.

The TPU Buffer Status Information field is defined in Figure 9-474 (TPU Buffer Status Information field format)

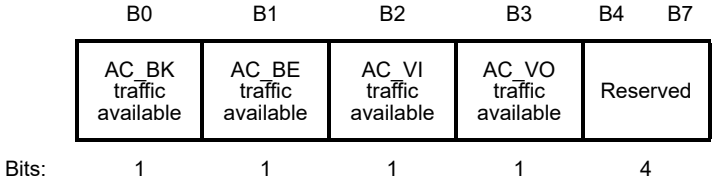

Figure 9-474—TPU Buffer Status Information field format

The AC_BK traffic available field is one bit in size and is set to 1 if AC_BK contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted and is set to 0 otherwise.

The AC_BE traffic available field is one bit in size and is set to 1 if AC_BE contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted and is set to 0 otherwise.

The AC_VI traffic available field is one bit in size and is set to 1 if AC_VI contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted and is set to 0 otherwise.

The AC_VO traffic available field is one bit in size and is set to 1 if AC_VO contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted and is set to 0 otherwise.

9.4.2.65 Event Request element

9.4.2.65.1 Event Request definition

The Event Request element contains a request to the receiving STA to perform the specified event action. The format of the Event Request element is shown in Figure 9-475.

	Element ID	Length	Event Token	Event Type	Event Response Limit	Event Request
Octets:	1	1	1	1	1	variable

Figure 9-475—Event Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The Event Token field is a nonzero number that is unique among the Event Request elements sent to each destination MAC address for which a corresponding Event Report element has not been received.

The Event Type field is a number that identifies the type of event request. The values of the Event Type field are defined in Table 9-233.

Table 9-233—Event Type field definitions for event requests and reports

Name	Event Type
Transition	0
RSNA	1
Peer-to-peer link	2
WNM log	3
BSS Color Collision	4
BSS Color In Use	5
Reserved	6–220
Vendor Specific	221
Reserved	222–255

The Event Response Limit field contains the maximum number of requested Event Reports to be included in the Event Report element. The field is set to 0 to indicate that no limit is set on the number of Event Reports to be included in the Event Report element.

The Event Request field contains the event request corresponding to the event type, as described in 9.4.2.65.2 to 9.4.2.65.4. The Event Request field is not present when requesting a WNM log report.

The Event Request element is included in an Event Request frame, as described in 9.6.13.2. The use of the Event Request element and Event Request frame is described in 11.21.2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.65.2 Transition event request

The Event Request field corresponding to the Transition event request contains zero or more Transition Event Request subelements. A transition event is a STA movement or attempted movement from one BSS (the source BSS) in one ESS to another BSS (the target BSS) within the same ESS.

The Transition Event subelements specify the conditions in which a Transition Event Report is sent by a STA. The set of valid Transition Event Request subelements is defined in Table 9-234.

Table 9-234—Transition Event Request subelement

Transition Event Request subelement	Subelement ID
Transition Target BSSID	0
Transition Source BSSID	1
Transition Time Threshold	2
Transition Result	3
Frequent Transition	4
Reserved	5–255

The Transition Target BSSID subelement is used to request that a Transition Event Report includes the transition event entry when the target BSSID is equal to the specific BSSID in the Target BSSID field. Excluding this subelement from the Event Request element indicates a request for transition events for all target BSSIDs. The format of the Transition Target BSSID subelement is shown in Figure 9-476.

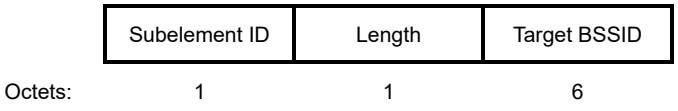

Figure 9-476—Transition Target BSSID subelement format

The Subelement ID field is equal to the Transition Target BSSID value in Table 9-234.

The Length field is defined in 9.4.3.

The Target BSSID field contains a BSSID.

The Transition Source BSSID subelement is used to request that a Transition Event Report includes the transition event entry when the source BSSID is equal to the BSSID specified in the Source BSSID field. Excluding this subelement from the Event Request element indicates a request for transition events for all source BSSIDs. The format of the Transition Source BSSID subelement is shown in Figure 9-477.

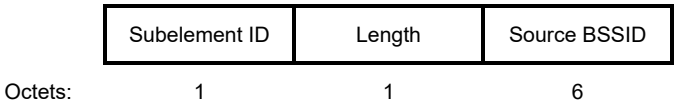

Figure 9-477—Transition Source BSSID subelement format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Subelement ID field is equal to the Transition Source BSSID value in Table 9-234.

The Length field is defined in 9.4.3.

The Source BSSID field contains a BSSID.

The Transition Time Threshold subelement is used to request that a Transition Event Report includes the transition event entry when the transition time is greater than or equal to the Transition Time Threshold value. The format of the Transition Time Threshold subelement is shown in Figure 9-478.

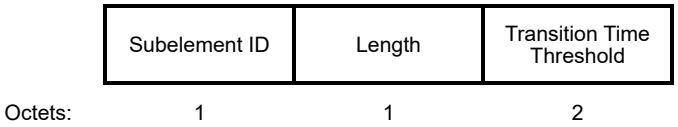

Figure 9-478—Transition Time Threshold subelement format

The Subelement ID field is equal to the Transition Time Threshold value in Table 9-234.

The Length field is defined in 9.4.3.

The Transition Time Threshold field contains a value representing the Transition Time to be used as the threshold value for the Transition Time condition in TUs. The Transition Time is defined in 11.21.2.2.

The Transition Result subelement is used to request that a Transition Event Report includes the transition event entry that matches the transition result defined by this subelement. The format of Transition Result subelement is shown in Figure 9-479.

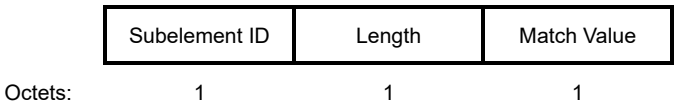

Figure 9-479—Transition Result subelement format

The Subelement ID field is equal to the Transition Result value in Table 9-234.

The Length field is defined in 9.4.3.

The Match Value field is set with each bit as defined in Figure 9-480 (Match Value field definitions) to request that the specified transition results that match the bit descriptions are included in the Transition Event report.

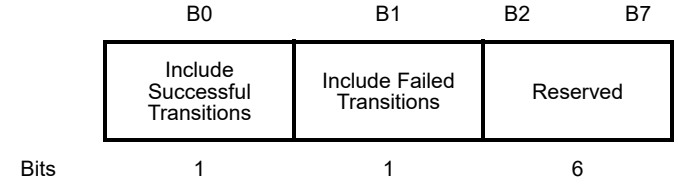

Figure 9-480—Match Value field definitions

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Frequent Transition subelement is used to request that an alerting Transition Event report be generated when the total transition count during the specified time period is greater than or equal to the value given in Frequent Transition Count Threshold field. The format of the Frequent Transition subelement is shown in Figure 9-481.

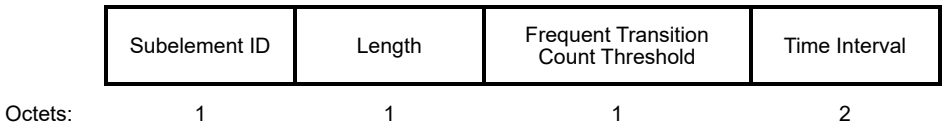

Figure 9-481—Frequent Transition subelement format

The Subelement ID field is equal to the Frequent Transition value in Table 9-234.

The Length field is defined in 9.4.3.

The Frequent Transition Count Threshold field containing the number of transitions in the measurement duration after which a Transition Event Report is generated.

The Time Interval field is the time interval in TUs during which the STA determines if the Frequent Transition Count Threshold is exceeded.

9.4.2.65.3 RSNA event request

The Event Request field corresponding to an RSNA event request contains zero or more RSNA Event Request subelements.

The subelement format and ordering of subelements are defined in 9.4.3. The set of valid RSNA Event Request subelements is defined in Table 9-235.

Table 9-235—RSNA Event Request subelement

RSNA Event Request subelement	Subelement ID
RSNA Target BSSID	0
Authentication Type	1
EAP Method	2
RSNA Result	3
Reserved	4–255

The RSNA subelements specify reporting conditions for RSNA Event Reports.

The RSNA Target BSSID subelement identifies the BSS at which an RSNA Event establishment was attempted. Excluding this subelement from the Event Request element indicates a request for transition events for all source BSSIDs. The format of the RSNA Target BSSID subelement is shown in Figure 9-482.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

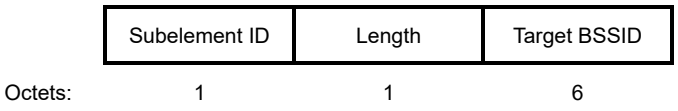

Figure 9-482—RSNA Target BSSID subelement format

The Subelement ID field is equal to the RSNA Target BSSID value in Table 9-235.

The Length field is defined in 9.4.3.

The Target BSSID field contains a BSSID.

The Authentication Type subelement is used to request that an RSNA Event Report includes the RSNA event entry when the Authentication Type is equal to the authentication type specified in the Authentication Type field. The format of the Authentication Type subelement is shown in Figure 9-483.

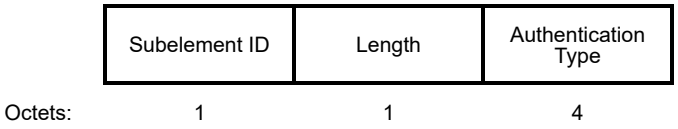

Figure 9-483—Authentication Type subelement format

The Subelement ID field is equal to the Authentication Type value in Table 9-235.

The Length field is defined in 9.4.3.

The Authentication Type field contains one of the AKM suite selectors defined in Table 9-190 in 9.4.2.23.3.

The EAP Method subelement is used to request that an RSNA Event Report includes the RSNA event entry when the EAP Method is equal to the EAP method specified in the EAP Method field. The format of the EAP Method subelement is shown in Figure 9-484.

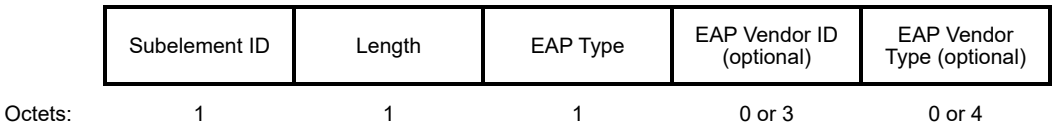

Figure 9-484—EAP Method subelement format

The Subelement ID field is equal to the EAP Method value in Table 9-235.

The Length field is defined in 9.4.3.

The EAP Type field contains a value that identifies a single EAP method and is any valid IANA assigned EAP type.

The EAP Vendor ID field contains a value that identifies the EAP Vendor. The EAP Vendor ID field is included when EAP Type field is 254 and is excluded otherwise.

The EAP Vendor Type field contains a value that identifies the EAP Type as defined by the vendor. The EAP Vendor Type field is included when EAP Type field is 254 and is excluded otherwise.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The RSNA Result subelement is used to request that an RSNA Event Report includes the RSNA event entry that matches the transition result defined by this subelement. The format of RSNA Result subelement is shown in Figure 9-485.

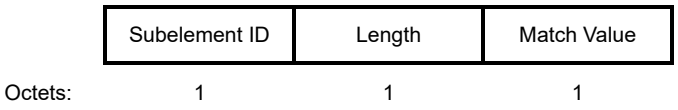

Figure 9-485—RSNA Result subelement format

The Subelement ID field is equal to the RSNA Result value in Table 9-235.

The Length field is defined in 9.4.3.

The Match Value field bits are set as defined in Figure 9-486 (Match Value field definitions) to request that the specified RSNA results that match that bit descriptions are included in the RSNA Event report.

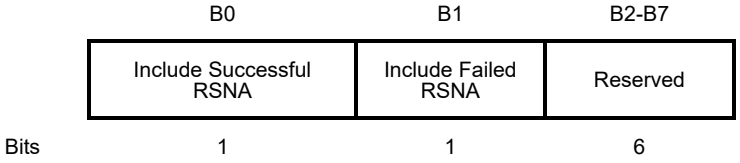

Figure 9-486—Match Value field definitions

9.4.2.65.4 Peer-to-peer link event request

The Event Request field corresponding to peer-to-peer link event request contains zero or more Peer-to-Peer Link Event Request subelements.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3. The set of valid Peer-to-Peer Link Event Request subelements is defined in Table 9-236.

Table 9-236—Peer-to-Peer Link Event Request subelement

Peer-to-Peer Link Event Request subelement	Subelement ID
Peer Address	0
Channel Number	1
Reserved	2–255

The Peer-to-Peer Link Event Request subelements specify reporting conditions for peer-to-peer link event reporting.

The Peer Address subelement identifies the peer STA, BSS, or IBSS of the peer-to-peer links to be reported. Excluding this subelement from the Event Request element indicates a request for peer-to-peer link events for any peer STA, any BSS, and any IBSS. The format of the Peer Address subelement is shown in Figure 9-487.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

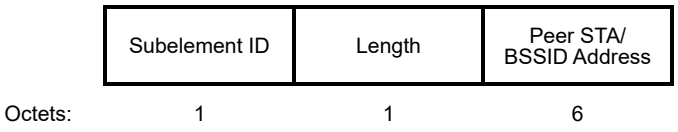

Figure 9-487—Peer Address subelement format

The Subelement ID field is equal to the Peer Address value in Table 9-236.

The Length field is defined in 9.4.3.

The Peer STA/BSSID Address field contains a MAC address of a peer STA or a BSSID for peer-to-peer links in an IBSS. If the indicated address matches the Address 1 field of the MAC header contents (see Table 9-60), then the address is a peer STA address for a TDLS peer STA or an IBSS STA. If the indicated address matches the Address 3 field of the MAC header contents, then the address is a BSSID for the TDLS direct link or for the IBSS.

The Channel Number subelement(s) identify the channel for the peer-to-peer links to be reported. Excluding this subelement from the Event Request element indicates a request for peer-to-peer link events for any channel. The format of the Channel Number subelement is shown in Figure 9-488. The identified channel is indicated by *N*+1 Channel Number subelements where the first *N* subelements contain an Operating Class octet with an 80+ behavior limit and the last subelement contains an Operating Class octet without an 80+ behavior limit (as defined in Annex E).

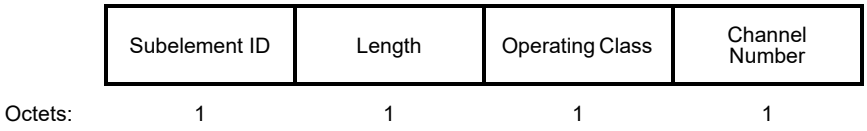

Figure 9-488—Channel Number subelement format

The Subelement ID field is equal to the Channel Number value in Table 9-236.

The Length field is defined in 9.4.3.

The Operating Class field indicates the channel set of the peer-to-peer link to be used for the peer-to-peer link event report. Operating Classes are defined in Annex E.

The Channel Number field indicates the channel number or (if the corresponding operating class in Annex E has "—" in the channel set column) the channel number of the center frequency of the frequency segment containing the primary channel of the peer-to-peer link events requested and included in the peer-to-peer link event report. A Channel Number of 0 in all *N*+1 Channel Number subelements indicates a request to report any peer-to-peer link event for any supported channel in the specified filtering Operating Class.

9.4.2.65.5 Vendor specific event request

The Event Request field corresponding to a vendor specific event request contains zero or more Vendor Specific subelements. The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.24).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.66 Event Report element

9.4.2.66.1 Event Report definition

The Event Report element is used by a STA to report an event. The format of the Event Report element is shown in Figure 9-489.

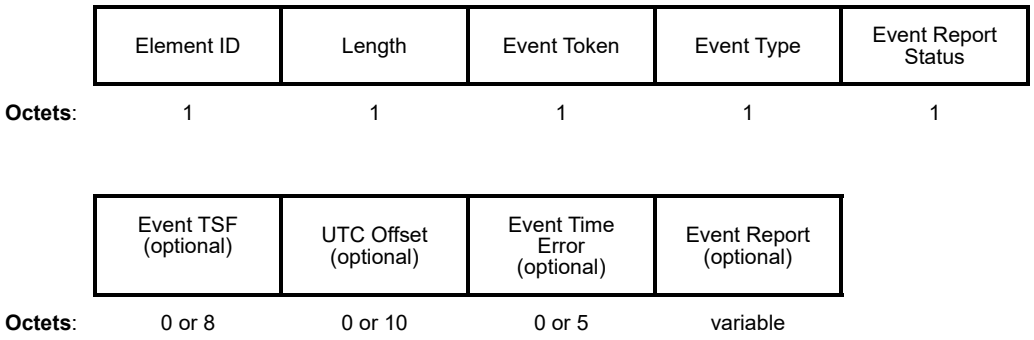

Figure 9-489—Event Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Event Token field is the Event Token in the corresponding Event Request element. If the Event Report element is being sent autonomously then the Event Token is 0.

The Event Type field is a number that identifies the type of event report. The values of the Event Type field are defined in Table 9-233.

The Event Report Status field is a value in Table 9-237, indicating the STA's response to the Event Request.

Table 9-237—Event Report Status

Event Report Status	Description
0	Successful
1	Request failed
2	Request refused
3	Request incapable
4	Detected frequent transition
5–255	Reserved

If the Event Report Status field is 0 (Successful) and the Event Type field is neither 4 (BSS Color Collision) nor 5 (BSS Color In Use), then the Event TSF, UTC Offset, Event Time Error, and Event Report fields are present. If the Event Report Status field is 0 (Successful) and the Event Type field is either 4 (BSS Color

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Collision) or 5 (BSS Color In Use), then Event TSF and Event Report fields are present. Otherwise, the Event TSF, UTC Offset, Event Time Error, and Event Report fields are not present.

The Event TSF field is TSF value when the STA logged the event.

The UTC Offset field is the UTC value that corresponds to the UTC time when the TSF timer is equal to 0. If the UTC Offset is unknown, the field is 0.

The Event Time Error field is the UTC standard deviation, as described in 9.4.2.59, that corresponds to the TSF value logged for the event. If the Event Time Error is unknown, the field is 0.

The Event Report field contains the specification of a single event report, as described in 9.4.2.66.2 to 9.4.2.66.5, 9.4.2.66.7, and 9.4.2.66.8.

The Event Report element is included in an Event Report frame, as described in 9.6.13.3. The use of the Event Report element and frame is described in 11.21.2.

9.4.2.66.2 Transition event report

The format of the Event Report field corresponding to a Transition event report is shown in Figure 9-490.

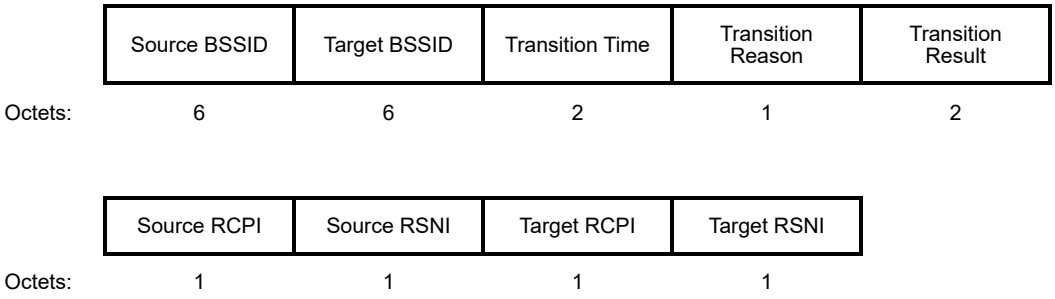

Figure 9-490—Event Report format for Transition event

The Source BSSID field contains the MAC address of the associated AP prior to the attempted transition.

The Target BSSID field contains the MAC address of the AP that is the target of the attempted transition.

The Transition Time field contains the transition time in TUs. The transition time is defined in 11.21.2.2.

The Transition Reason field indicates the reason why a transition attempt occurred and contains one of the values in Table 9-238.

The Transition Result field contains the result of the attempted transition and is one of the status codes specified in Table 9-80 in 9.4.1.9.

The Source RCPI field indicates the received channel power of the most recently measured frame from the Source BSSID before the STA reassociates with the Target BSSID. The Source RCPI is a logarithmic function of the received signal power, as defined in 9.4.2.36.

The Source RSNI field indicates the received signal-to-noise indication of the most recently measured frame from the Source BSSID before the STA reassociates with the Target BSSID. The Source RSNI is a logarithmic function of the signal-to-noise ratio, as defined in 9.4.2.39.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-238—Transition and Transition Query reasons

Transition Reason value	Description
0	Unspecified
1	Excessive frame loss rates and/or poor conditions
2	Excessive delay for current traffic streams
3	Insufficient QoS capacity for current traffic streams (TSPEC rejected)
4	First association to ESS (the association initiated by an Association Request frame instead of a Reassociation Request frame)
5	Load balancing
6	Better AP found
7	Deauthenticated or Disassociated from the previous AP
8	AP failed IEEE 802.1X EAP Authentication
9	AP failed 4-way handshake
10	Received too many replay counter failures
11	Received too many data MIC failures
12	Exceeded maximum number of retransmissions
13	Received too many broadcast disassociations
14	Received too many broadcast deauthentications
15	Previous transition failed
16	Low RSSI
17	Roam from a non-IEEE-802.11 system
18	Transition due to received BSS Transition Request frame
19	Preferred BSS transition candidate list included
20	Leaving ESS
21–255	Reserved

The Source BSSID, Source RCPI, and Source RSNI fields are set to 0 if the transition is initiated by an Association Request frame.

The Target RCPI field indicates the received channel power of the first measured frame just after the STA reassociates with the Target BSSID. If association with the Target BSSID failed, the Target RCPI field indicates the received channel power of the most recently measured frame from the Target BSSID. The Target RCPI is a logarithmic function of the received signal power, as defined in 9.4.2.36.

The Target RSNI field indicates the received signal-to-noise indication of the first measured frame just after the STA reassociates with the Target BSSID. If association with the Target BSSID failed, the Target RCPI field indicates the received signal-to-noise indication of the most recently measured frame from the Target BSSID. The Target RSNI is a logarithmic function of the signal-to-noise ratio, as defined in 9.4.2.39.

9.4.2.66.3 RSNA event report

The format of the Event Report field corresponding to an RSNA event report is shown in Figure 9-491.

	Target BSSID	Authentication Type	EAP Method	RSNA Result	RSNE
Octets:	6	4	1 or 8	2	variable

Figure 9-491—Event Report format for RSNA event

The Target BSSID field contains the MAC address of the AP accepting the authentication attempt.

The Authentication Type field identifies the AKMP in use at the time of the authentication attempt and is one of the AKM suite selectors defined in Table 9-190 in 9.4.2.23.3.

When the Authentication Type field is either 00-0F-AC:1 (Authentication negotiated over IEEE Std 802.1X or using PMKSA caching as defined in 12.6.8.3) or 00-0F-AC:3 (AKM suite selector for fast BSS transition as defined in 12.6.3), the EAP Method field contains the IANA assigned EAP type. The EAP type contains either the legacy type (1 octet) or the expanded type (1 octet type = 254, 3-octet Vendor ID, 4-octet Vendor-Type). The EAP Method field is 0 otherwise. The EAP Method field is a single octet set to 0 otherwise.

The RSNA Result field contains the result of the RSNA establishment attempt and is one of the status codes specified in Table 9-80 in 9.4.1.9.

The RSNE field contains the Information field of the RSNE in the (Re)Association Request frame that resulted in the current RSNA, truncated to the maximum length allowed for the RSNE field if necessary.

9.4.2.66.4 Peer-to-peer link event report

The format of the Event Report field corresponding to a peer-to-peer link event report is shown in Figure 9-492.

	Peer STA/ BSSID Address	Operating Class	Channel Number	STA Tx Power	Connection Time	Peer Status
Octets:	6	1	1	1	3	1

Figure 9-492—Event Report format for peer-to-peer link event

A peer-to-peer link is defined to be either a Direct Link within a QoS BSS, a TDLS, or a STA-to-STA communication in an IBSS.

The Peer STA/BSSID Address field contains a MAC address. If this event is for a peer-to-peer link in an infrastructure BSS, this field contains the MAC address of the peer STA. If this event is for a peer-to-peer link in an IBSS, this field contains the BSSID.

The Operating Class field indicates the channel set of the peer-to-peer link. Valid values of the Operating Class are shown in Annex E.

The Channel Number field indicates the peer-to-peer channel number of the peer-to-peer link. The Channel Number is defined within an Operating Class as shown in Annex E.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The STA Tx Power field indicates the target transmit power at the antenna (i.e., EIRP) in dBm with a tolerance of ± 5 dB of the lowest basic rate of the reporting STA.

The Connection Time field contains the connection time in seconds. If the Peer Status is 0, this field indicates the duration of the Direct Link. If the Peer Status field is 1, this field indicates the time difference from the time the Direct Link was established to the time at which the reporting STA generated the event report. If the Peer Status field is 2, this field indicates the duration of the IBSS membership. If the Peer Status is 3, this field indicates the time difference from the time the STA joined the IBSS to the time at which the reporting STA generated the event report. See 11.21.2.4.

The Peer Status field indicates the Peer link connection status as indicated in Table 9-239.

Table 9-239—Peer Status definitions

Peer Status	Description
0	Direct Link terminated
1	Direct Link active
2	IBSS membership terminated
3	IBSS membership active
4–255	Reserved

9.4.2.66.5 WNM log event report

The format of the Event Report field corresponding to a WNM log event report is shown in Figure 9-493.

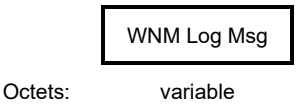

Figure 9-493—Event Report format for WNM log event

The WNM Log Msg field contains the entire syslog message, consisting of the PRI, HEADER, and MSG portion of a WNM log message as described in IETF RFC 5424. The TAG field of the MSG portion of the message is a 17-octet string containing the ASCII representation of the STA MAC address using hexadecimal notation with colons between octets. The octet containing the Individual/Group bit occurs last, and that bit is in the least significant position within that octet. See 11.21.2.5.

NOTE—For example, the TAG field for a STA with MAC address AC-DE-48-12-7B-80 is “80:7B:12:48:DE:AC” or “80:7b:12:48:de:ac”.

9.4.2.66.6 Vendor Specific event report

The Event Report field corresponding to Vendor Specific event report contains zero or more Vendor Specific subelements. The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.24).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.66.7 BSS color collision event report

The Event Report field for a BSS color collision event report is 8 octets in length with each bit representing a BSS color value. A value of 1 at a bit position indicates that the BSS color value corresponding to that position is in use by OBSS as detected by the reporting non-AP HE STA.

9.4.2.66.8 BSS color in use event report

The Event Report field for a BSS color in use event report is 1 octet in length. If a reporting non-AP HE STA communicates with a peer STA with a BSS color that is different from the BSS color used by its associated AP, the Event Report field is set to the BSS color used in the communication with the peer STA.

A non-AP HE STA sets the Event Report field to 0 to cancel a previously sent BSS color in use event report. See 11.21.2.8.

9.4.2.67 Diagnostic Request element

9.4.2.67.1 Diagnostic Request definition

The Diagnostic Request element contains a request that the receiving STA undertake the specified diagnostic action. The format of the Diagnostic Request element is shown in Figure 9-494.

	Element ID	Length	Diagnostic Token	Diagnostic Request Type	Diagnostic Timeout	Diagnostic Subelements (optional)
Octets:	1	1	1	1	2	variable

Figure 9-494—Diagnostic Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The Diagnostic Token field is a number that is unique among the Diagnostic Request elements sent to each destination MAC address for which a corresponding Diagnostic Report element has not been received.

The Diagnostic Request Type field is a number that identifies a type of diagnostic request. The values of Diagnostic Request Types are shown in Table 9-240.

The Diagnostic Timeout field contains the time, in seconds, after which no response is returned.

The Diagnostic Subelements field contains zero or more diagnostic subelements depending on the specific Diagnostic Request Type, as defined in 9.4.2.67.2 to 9.4.2.67.4.

The Cancel Diagnostic Request, Manufacturer Information STA Report, and Configuration Profile Diagnostic Request elements carry no Diagnostic subelements.

The Diagnostic Request element is included in a Diagnostic Request frame, as described in 9.6.13.4. The use of Diagnostic Request element and frames is described in 11.21.3.

9.4.2.67.2 Association Diagnostic request

The Diagnostic Subelements field corresponding to an Association Diagnostic request type is shown in Table 9-241. The corresponding Diagnostic subelements are defined in 9.4.2.67.5.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.67.4 Vendor Specific diagnostic request

The Diagnostic Subelements field corresponding to a Diagnostic Request element of type Vendor Specific diagnostic request contains zero or more Vendor Specific subelements. The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24).

9.4.2.67.5 Diagnostic subelement descriptions

The following text describes the various subelements that are optionally included in Diagnostic Subelements field of a Diagnostic Request element (9.4.2.67 (Diagnostic Request element)) or a Diagnostic Report element (9.4.2.68). The format of a Diagnostic subelement is shown in Figure 9-495.

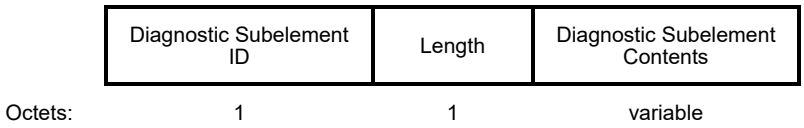

Figure 9-495—Diagnostic subelement format

The Diagnostic Subelement ID field indicates the Diagnostic subelement ID and is any allocated value in Figure 9-243 (Diagnostic subelement ID values).

Table 9-243—Diagnostic subelement ID values

Subelement ID	Subelement name
0	Credential Type

Subelement ID	Subelement name
19	Tx Power Capability
20	Certificate ID
21–220	Reserved
221	Vendor Specific
221–255	Reserved

The Length field is the length in octets of the Diagnostic Subelement Contents field.

The values of the Diagnostic Subelement Contents field are described in the following paragraphs.

The format for the Credential Type subelement is shown in Figure 9-496.

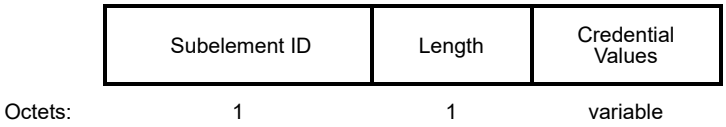

Figure 9-496—Credential Type subelement format

The Credentials Values field indicates one or more types of credential. Each value is chosen from those shown in Table 9-244.

Table 9-244—Credentials values

Value	Description
0	None
1	Preshared key
2	Username and password
3	X.509 certificate
4	Other certificate
5	One time password
6	Token
7–255	Reserved

The format for the AKM Suite subelement is shown in Figure 9-497.

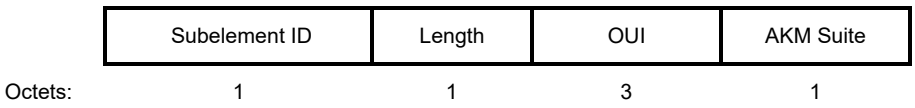

Figure 9-497—AKM Suite subelement format

The OUI and AKM Suite fields identify the authentication method, and the AKM suite selector is one of the values in Table 9-190 in 9.4.2.23.3.

The format of the AP descriptor subelement is shown in Figure 9-498.

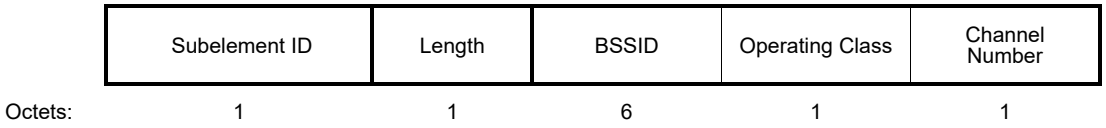

Figure 9-498—AP Descriptor subelement format

The set of current operating classes and channel widths of the AP is indicated by *N*+1 AP descriptor subelements where the first *N* subelements contain an Operating Class octet with an 80+ behavior limit and the last subelement contains an Operating Class octet without an 80+ behavior limit (as defined in Annex E).

NOTE 1—An 80+80 MHz AP sends four AP descriptor subelements for 20/40 MHz, 80 MHz, 80+ MHz (for the secondary 80 MHz frequency segment), and 80 MHz (for the primary 80 MHz frequency segment).

The BSSID field identifies the BSS indicated in the AP Descriptor subelement, as described in 9.2.4.3.4.

The Operating Class field contains an enumerated value from Annex E that identifies the mapping from Channel Number to frequency.

The Channel Number field indicates a current operating channel or (if the corresponding operating class in Annex E has "—" in the channel set column) the channel number of the center frequency of the frequency segment containing the primary channel, of the AP identified by the BSSID in the AP Descriptor subelement.

The format for the Antenna Type subelement is shown in Figure 9-499.

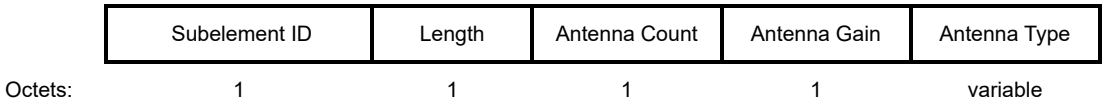

Figure 9-499—Antenna Type subelement format

The Antenna Count field contains the number of antennas of the indicated antenna type and antenna gain pair. The Antenna Count field value 0 is reserved.

The Antenna Gain field contains the peak gain, in dBi, of the antenna.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Antenna Type field contains an ASCII string (truncated to 251 octets if required) describing the manufacturer's type information (i.e., a series of letters/numbers) of the antenna(s) or DMG antenna connected to the wireless adapter.

NOTE 2—Beamforming antennas for a non-DMG STA might have several antenna IDs, depending on antenna bearing.

The format for the Cipher Suite subelement is shown in Figure 9-500.

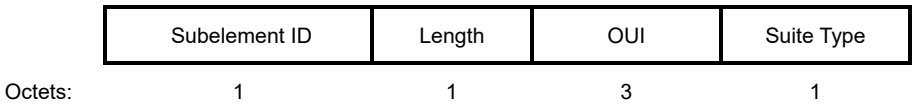

Figure 9-500—Cipher Suite subelement format

The OUI and Suite Type fields identify the cipher suite, and the cipher suite selector is one of the values in Table 9-188.

The format for the Colocated Radio Type subelement is shown in Figure 9-501.

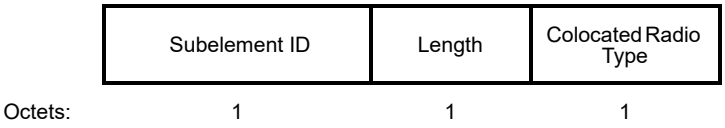

Figure 9-501—Colocated Radio Type subelement format

The Colocated Radio Type subelement indicates the type of colocated radio and is one of the values in Table 9-245. The method that a STA uses to obtain the information on the colocated radio is out of the scope of this standard.

Table 9-245—Colocated Radio Type

The format for the EAP Method subelement is shown in Figure 9-503.

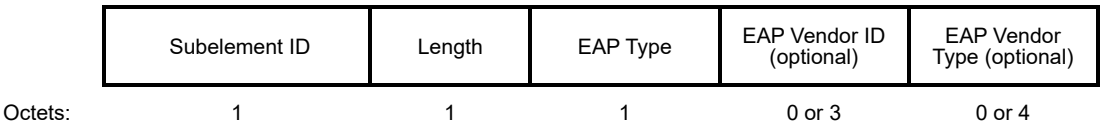

Figure 9-503—EAP Method subelement format

The EAP Type field contains a value that identifies a single EAP method and is any valid IANA assigned EAP type.

The EAP Vendor ID field contains a value that identifies the EAP Vendor. The EAP Vendor ID field is included when EAP Type field is 254 and is excluded otherwise.

The EAP Vendor Type field contains a value that identifies the EAP Type as defined by the vendor. The EAP Vendor Type field is included when EAP Type field is 254 and is excluded otherwise.

The format for the Firmware Version subelement is shown in Figure 9-504.

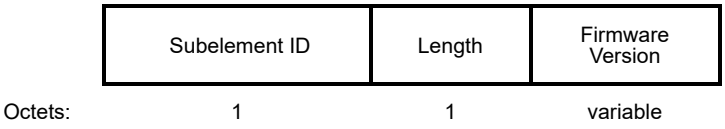

Figure 9-504—Firmware Version subelement format

This Firmware Version field contains an ASCII string identifying the version of firmware currently installed on the wireless network adaptor.

The format for the MAC Address subelement is shown in Figure 9-505.

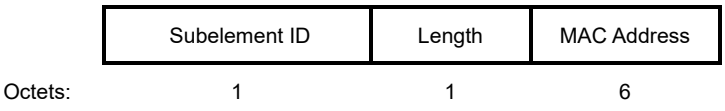

Figure 9-505—MAC Address subelement format

The MAC Address field contains the MAC address of the STA.

The format for the Manufacturer ID String subelement is shown in Figure 9-506.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

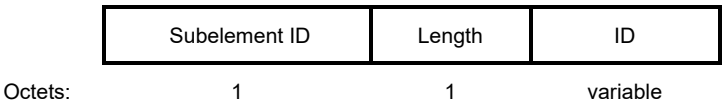

Figure 9-506—Manufacturer ID String subelement format

The ID field contains an ASCII string indicating the manufacturer identifier of the wireless network adaptor.

The format for the Manufacturer Model String subelement is shown in Figure 9-507.

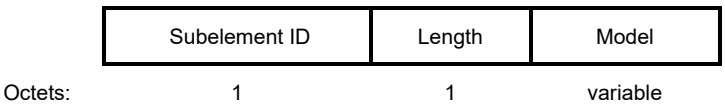

Figure 9-507—Manufacturer Model String subelement format

The Model field contains an ASCII string indicating the model of the wireless network adaptor.

The format for the Manufacturer OI subelement is shown in Figure 9-508.

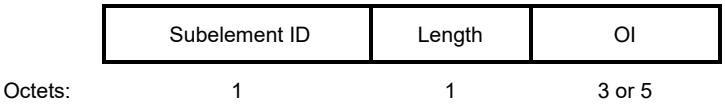

Figure 9-508—Manufacturer OI subelement format

The OI field contains an organization identifier, as defined in 9.4.1.29.

The format for the Manufacturer Serial Number String subelement is shown in Figure 9-509.

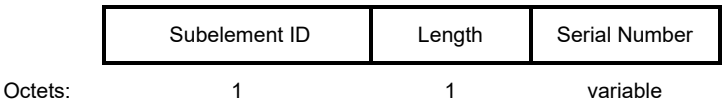

Figure 9-509—Manufacturer Serial Number String subelement format

The Serial Number field contains an ASCII string indicating the serial number of the wireless network adaptor.

The format for the Power Save Mode subelement is shown in Figure 9-510.

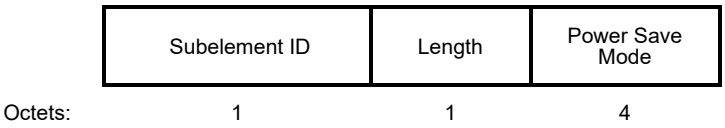

Figure 9-510—Power Save Mode subelement format

The Power Save Mode field is a bitmap field that indicates the power save mode(s) in use by the STA, as defined in Table 9-247.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

TXOP power save mode	15
Reserved	16–31

The format for the Profile ID subelement is shown in Figure 9-511.

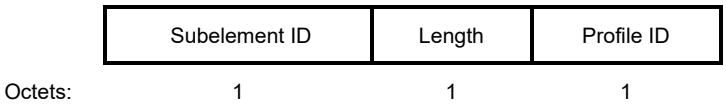

Figure 9-511—Profile ID subelement format

The Profile ID field contains a unique identifier for referencing a configuration profile available on a device. The identifier is uniquely associated to a single configuration profile on the device sending the identifier.

The format for the Supported Operating Classes subelement is shown in Figure 9-512.

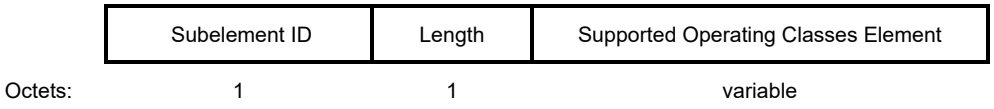

Figure 9-512—Supported Operating Classes subelement format

The Supported Operating Classes Element field contains a Supported Operating Classes element, as defined in 9.4.2.52, excluding the Element ID and Length fields.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The format for the Status Code subelement is shown in Figure 9-513.

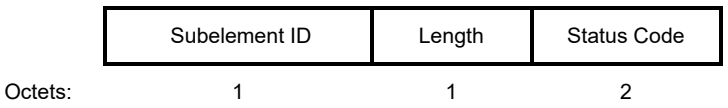

Figure 9-513—Status Code subelement format

The Status Code field contains the status code, as defined in Table 9-80 in 9.4.1.9, received at the end of the applicable operation.

The format for the SSID subelement is shown in Figure 9-514.

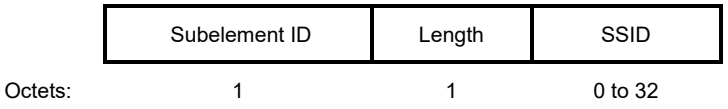

Figure 9-514—SSID subelement format

The SSID field contains a service set identifier with a maximum length of 32 octets, as defined in 9.4.2.2.

The format for the Tx Power Capability subelement is shown in Figure 9-515.

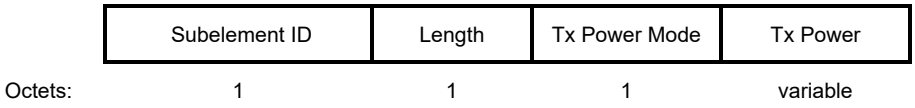

Figure 9-515—Tx Power Capability subelement format

The Tx Power Mode field identifies the transmit power mode of the non-AP STA and is one of the values in Table 9-248.

Table 9-248—Tx Power Modes

Tx Power Mode	Value
Discrete	0
Range	1
Reserved	2–255

The Tx Power field indicates the target transmit power level(s) at the antenna(s) or DMG antenna(s) (i.e., EIRP), where the actual power is within ± 5 dB to the target. Each transmit power level is encoded in a single octet as a 2s complement value in dBm, rounded to the nearest integer. If the Tx Power Mode field is 0, then the Tx Power field contains one or more transmit power levels in increasing numeric order. If the Tx Power Mode field is 1, the Tx Power field contains the STA's minimum and nonzero maximum transmit power levels, in that order.

The format for the Certificate ID subelement is shown in Figure 9-516.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

	Subelement ID	Length	Certificate ID
Octets:	1	1	variable

Figure 9-516—Certificate ID subelement format

The Certificate ID field contains a UTF-8 string indicating an identifier assigned to the STA in a manner outside the scope of the standard. The Certificate ID typically takes the form of "WFA3991" and might be used by a receiving STA to look up the certificate assigned to that ID.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24).

9.4.2.68 Diagnostic Report element

9.4.2.68.1 Diagnostic report definition

The Diagnostic Report element contains a Diagnostic report. The format of the Diagnostic Report element is shown in Figure 9-517.

	Element ID	Length	Diagnostic Token	Diagnostic Report Type	Diagnostic Status	Diagnostic Subelements
Octets:	1	1	1	1	1	variable

Figure 9-517—Diagnostic Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Diagnostic Token field is the Diagnostic Token in the corresponding Diagnostic Request element.

The Diagnostic Report Type field is a number that identifies the Diagnostic report. The Diagnostic Report Types are defined in Table 9-240.

The Diagnostic Status field is a value in Table 9-237 (see 9.4.2.66), indicating the STA's response to the diagnostic request indicated by the diagnostic token.

The Diagnostic Subelements field contains the results of the diagnostic request.

The Diagnostic Subelements field contains the diagnostic subelement values, defined in 9.4.2.67.5 corresponding to the Diagnostic Report Type field value.

The Diagnostic Report element is included in a Diagnostic Report frame, as described in 9.6.13.5. The use of Diagnostic Report element and frames is described in 11.21.3.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.68.2 Manufacturer Information STA Report

The contents of the Diagnostic Subelements field of a Diagnostic Report element of type Manufacturer Information STA Report is shown in Table 9-249. The corresponding Diagnostic subelements are defined in 9.4.2.67.5.

Table 9-249—Manufacturer Information STA report contents

Order	Subelement
1	Manufacturer OI
2	Manufacturer ID string
3	Manufacturer model string
4	Manufacturer serial number string
6	Firmware Version
7	Antenna Type
8	Colocated Radio Type
9	Device Type
10	Certificate ID

9.4.2.68.3 Configuration Profile report

The contents of the Diagnostic Subelements field of a Diagnostic Report element of type Configuration Profile is shown in Table 9-250. The corresponding Diagnostic subelements are defined in 9.4.2.67.5.

Table 9-250—Configuration Profile report contents

Order	Subelement
1	Profile ID
2	Supported Operating Classes
3	Tx Power
4	Cipher Suite
5	AKM Suite
6	EAP Method
7	Credential Type
8	SSID
9	Power Save Mode

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.68.4 Association Diagnostic report

The contents of the Diagnostic Subelements field of a Diagnostic Report element of type Association Diagnostic is shown in Table 9-251. The corresponding Diagnostic subelements are defined in 9.4.2.67.5.

Table 9-251—Association Diagnostic report contents

Order	Subelement
1	AP Descriptor
2	Status Code

9.4.2.68.5 IEEE 802.1X Authentication Diagnostic report

The contents of the Diagnostic Subelements field of a Diagnostic Report element of type IEEE 802.1X Authentication Diagnostic is shown in Table 9-252. The corresponding Diagnostic subelements are defined in 9.4.2.67.5.

Table 9-252—IEEE 802.1X Authentication Diagnostic report contents

Order	Subelement
1	AP Descriptor
2	EAP Method
3	Credential Type
4	Status Code

9.4.2.68.6 Vendor Specific diagnostic report

The contents of the Diagnostic subelements field of a Diagnostic Report element of type Vendor Specific contains zero or more Vendor Specific subelements that have the same formats as Vendor Specific elements in 9.4.2.24.

9.4.2.69 Location Parameters element

9.4.2.69.1 Location Parameters definition

The Location Parameters element is used for location services. The format of this element is shown in Figure 9-518.

	Element ID	Length	Location Subelements
Octets:	1	1	variable

Figure 9-518—Location Parameters element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Location Subelements field contains one or more Location subelements described in Table 9-253.

Table 9-253—Optional subelement IDs for Location Parameters

Subelement ID	Subelement name
1	Location Indication Parameters (see 9.4.2.69.2)
2	Location Indication Channels (see 9.4.2.69.3)
3	Location Status (see 9.4.2.69.4)
4	Radio (see 9.4.2.69.5)
5	Motion (see 9.4.2.69.6)
6	Location Indication Broadcast Data Rate (see 9.4.2.69.7)
7	Time of Departure (see 9.4.2.69.8)
8	Location Indication Options (see 9.4.2.69.9)
9–220	Reserved
221	Vendor Specific (see 9.4.2.24)
222–255	Reserved

The Location Parameters element is included in Location Configuration Request frames, as described in 9.6.13.6; Location Configuration Response frames, as described in 9.6.13.7; and Location Track Notification frames, as described in 9.6.7.18. The use of the Location Parameters element is described in 11.21.4.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.69.2 Location Indication Parameters subelement

The Location Indication Parameters subelement contains STA location reporting characteristics. The format of the Location Indication Parameters subelement is shown in Figure 9-519.

	Subelement ID	Length	Indication Multicast Address	Report Interval Units	Normal Report Interval	Normal Number of Frames per Channel
Octets:	1	1	6	1	2	1

	In-Motion Report Interval	In-Motion Number of Frames per Channel	Burst Interframe Interval	Tracking Duration	ESS Detection Interval
Octets:	2	1	1	1	1

Figure 9-519—Location Indication Parameters subelement format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Subelement ID field is defined in Table 9-253.

The Length field is defined in 9.4.3.

Except in Location Track Notification frames sent in an IBSS, the Indication Multicast Address field specifies the destination address to which the Location Track Notification frames are sent. This field is a locally administered group address formed according to the procedure defined in 11.21.4.1. The field is reserved when Location Track Notification frames are transmitted in an IBSS.

The Report Interval Units field contains the units used for the Normal Report Interval field and In-Motion Report Interval field, as indicated in Table 9-254.

Table 9-254—Report Interval Units field

Report Interval Units	Description
0	Hours
1	Minutes
2	Seconds
3	Milliseconds
4–255	Reserved

The Normal Report Interval field is the time interval, expressed in the units indicated in the Report Interval Units field, at which the reporting STA is expected to transmit one or more Location Track Notification frames if either dot11MotionDetectionActivated is false or the STA is stationary. The STA does not transmit Location Track Notification frames when the value of the Normal Report Interval field is 0.

The Normal Number of Frames per Channel field is the number of Location Track Notification frames per channel sent or expected to be sent by the STA at each Normal Report Interval.

Motion is the act or process of moving, or a particular action or movement relative to the point at which the STA is configured to send Location Track Notification frames. Motion might be detected using one of the following criteria:

— Detection of speed that is greater or equal to 0.5 m/s.
— Detection of movement or vibration, for example by a ball-in-tube sensor or accelerometer or other means.

The In-Motion Report Interval field is the time interval, expressed in the units indicated in the Report Interval Units field, at which the STA reports its location by sending a Location Track Notification frame when the reporting STA is in motion. If dot11MotionDetectionActivated is false, this field is 0.

The In-Motion Number of Frames per Channel field is the number of Location Track Notification frames per channel sent or expected to be sent by the STA at each In-Motion Report Interval. If dot11MotionDetectionActivated is false, this field is 0.

The Burst Interframe Interval field is the target time interval, expressed in milliseconds, between the transmissions of each of the Normal or In-Motion frames on the same channel. The Burst Interframe interval value is 0 to indicate that frames are transmitted with no target interframe delay.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Tracking Duration field is the amount of time, in minutes, that a STA sends the Location Track Notification frames. The duration starts as soon as the STA sends a Location Configuration Response frame with a Location Status value of Success. If the Tracking Duration value is a nonzero value the STA sends Location Track Notification frames, based on the Normal and In-Motion Report Interval field values, until the duration ends. If the Tracking Duration is 0 the STA continuously sends Location Track Notification frames as defined by Normal and In-Motion Report Interval field values until transmission is terminated based on the procedures detailed in 11.21.4.2.

The ESS Detection Interval field is the periodicity, in minutes, that a STA checks for beacons transmitted by one or more APs belonging to the same ESS that configured the STA. If no beacons from the ESS are received for this period, the STA terminates transmission of Location Track Notification frames, as described in the procedures detailed in 11.21.4.2. The ESS Detection Interval field is not used when the ESS Detection Interval field value is 0.

9.4.2.69.3 Location Indication Channels subelement

The Location Indication Channels subelement contains location reporting channel information. The format of the Location Indication Channels subelement format is shown in Figure 9-520.

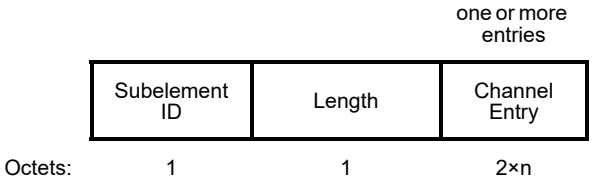

Figure 9-520—Location Indication Channels subelement format

The Subelement ID field is defined in Table 9-253.

The Length field is defined in 9.4.3.

The Channel Entry field includes one or more Operating Class And Channel fields (see Figure 9-161).

The Operating Class subfield of the Operating Class And Channel field indicates the frequency band on which a STA transmits Location Track Notification frames.

The Channel subfield of the Operating Class And Channel field indicates a channel number on which a STA sends or an ESS expects to receive Location Track Notification frames.

The Operating Class And Channel fields can be grouped together to identify a noncontiguous channel. A noncontiguous channel is indicated by a group of N+1 Operating Class And Channel fields where the first N Operating Class And Channel fields contain an Operating Class subfield with an 80+ behavior limit and the last Operating Class And Channel field in the group contains an Operating Class subfield without an 80+ behavior limit (as defined in Annex E).

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.69.4 Location Status subelement

The Location Status subelement provides the result of a Location Request or Location Configuration Request frame. The format of the Location Status subelement is shown in Figure 9-521.

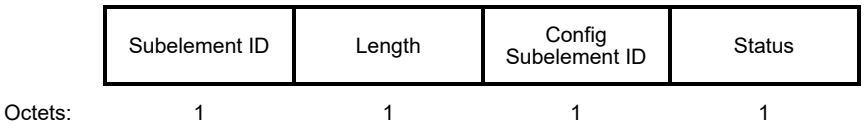

Figure 9-521—Location Status subelement format

The Subelement ID field is defined in Table 9-253.

The Length field is defined in 9.4.3.

The Config Subelement ID field is a specific Location Parameters subelement ID transmitted in a Location Configuration Request frame as defined in Table 9-253.

A Location Status subelement is included for each configuration subelement in the Location Configuration Request frame, except when all status values are the same. When all status values are the same, one Location Status subelement is included with the Config subelement ID set to 0 in the Location Configuration Response frame.

The Status field identifies the result of the Location Request frame and is one of the values in Table 9-237.

9.4.2.69.5 Radio subelement

The Radio subelement contains radio information. The format of the Radio subelement is shown in Figure 9-522.

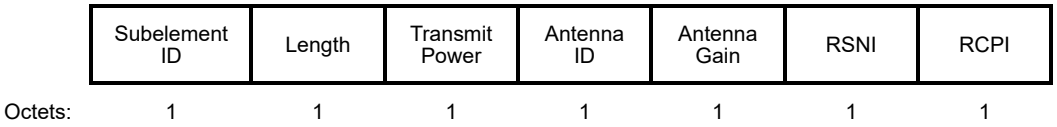

Figure 9-522—Radio subelement format

The Subelement ID field is defined in Table 9-253.

The Length field is defined in 9.4.3.

The Transmit Power field is the transmit power used to transmit the current Location Track Notification frame containing the Location Parameters element with the Radio subelement and is a 2s complement signed integer, reported as an EIRP in dBm. A Transmit Power field set to –128 indicates that the transmit power is unknown. The tolerance for the transmit power value reported in the Radio subelement is ± 5 dB. This tolerance is defined as the maximum possible difference, in decibels, between the reported power value and the total transmitted power across all antennas of the STA that were measured when transmitting Location Request frames.

The Antenna ID field is the identifying number for the antenna or DMG antenna used to transmit the Location Request frame. The antenna ID or DMG antenna ID is defined in 9.4.2.38.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Antenna Gain field is the antenna gain of the antenna (or group of antennas) over which the Location Track Notification frame is transmitted and is a 2s complement signed integer, reported in dB. An Antenna Gain field set to –128 indicates that the antenna gain is unknown.

The RSNI field contains the RSNI value measured against the most recently received Location Configuration Request frame requesting that a Radio subelement be included in the Location Track Notification frame. The RSNI value is defined in 9.4.2.39. A RSNI field set to 255 indicates that the RSNI value is unknown or is not used.

The RCPI field contains the RCPI value measured against the most recently received Location Configuration Request frame requesting that a Radio subelement be included in the Location Track Notification frame. The RCPI value is defined in 9.4.2.36. A RCPI field set to 255 indicates that the RCPI value is unknown or is not used.

9.4.2.69.6 Motion subelement

The Motion subelement contains motion information. The format of the Motion subelement is shown in Figure 9-523.

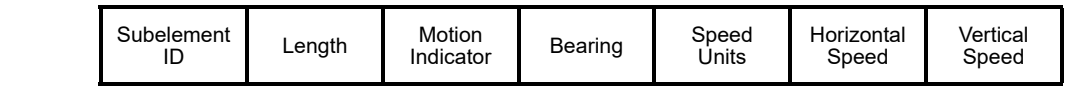

Figure 9-523—Motion subelement format

The Subelement ID field is defined in Table 9-253.

The Length field is defined in 9.4.3.

The Motion Indicator field is defined in Table 9-255. The mechanism that a STA uses to determine the value or transitions from one value to another of the Motion Indicator field is beyond the scope of the standard.

Table 9-255—Motion Indicator field

Motion Indicator value	Description
0	Stationary: the device is stationary and not in motion.
1	Start of motion: the device was stationary and is now in motion.
2	In motion: the device is and has been in motion.
3	End of motion: the device was in motion and is now stationary.
4	Unknown: information related to motion is unknown.
5–255	Reserved

The Bearing field specifies the direction that the STA is traveling with relation to true north, increasing clockwise, measured in degrees from 0° to 359°. If the Bearing value is unknown, the field is 65 535.

The Speed Units field contains the units for both Horizontal and Vertical Speed field, as defined in Table 9-256.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-256—Speed Units

Speed Units value	Description
0	cm/s
1	m/s
2–255	Reserved

The Horizontal Speed field contains the horizontal speed of the STA expressed in the units indicated in the Speed Units field. If the Horizontal Speed value is unknown, the field is 65 535.

The Vertical Speed field is a 2s complement signed integer indicating the vertical speed of the STA expressed in the units indicated in the Speed Units field. If the Vertical Speed value is unknown or greater than 32 766, the field is 32 767. If the Vertical Speed value is less than –32 767, the field is –32 768.

The Motion subelement field values are valid at the time of transmission of the Location Track Notification frame containing the subelement.

9.4.2.69.7 Location Indication Broadcast Data Rate subelement

The Location Indication Broadcast Data Rate subelement contains location reporting transmission rate information. The format of the Location Indication Broadcast Data Rate subelement format is shown in Figure 9-524.

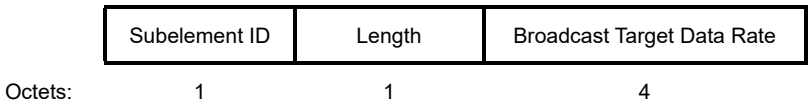

Figure 9-524—Location Indication Broadcast Data Rate subelement format

The Subelement ID field is defined in Table 9-253.

The Length field is defined in 9.4.3.

The Broadcast Target Data Rate field specifies the target data rate at which the STA transmits Location Track Notification frames. The Broadcast Target Data Rate field format is specified by the Rate Identification field defined in 9.4.1.30. A Broadcast Target Data Rate field set to 0 indicates the STA transmits Location Track Notification frames at a rate chosen by the STA transmitting the Location Track Notification frames.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.69.8 Time of Departure subelement

The Time of Departure subelement contains time of departure information for the Location Track Notification frame including the subelement. The format of the Time of Departure subelement is shown in Figure 9-525.

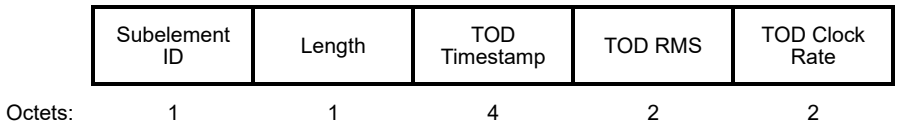

Figure 9-525—Time of Departure subelement format

The Subelement ID field is defined in Table 9-253.

The Length field is defined in 9.4.3.

The TOD Timestamp field specifies when the first frame energy is sent by the transmitting port in units equal to 1/TOD Clock Rate, where the TOD Clock Rate is specified in the TOD Clock Rate field. The reported TOD timestamp value is determined from the TIME_OF_DEPARTURE parameter within the PHY-TXSTART.confirm primitive.

The TOD RMS field specifies the RMS time of departure error in units equal to 1/TOD Clock Rate, where the TOD Clock Rate is specified in the TOD Clock Rate field, where the time of departure error equals the difference between the TOD Timestamp field and the time of departure measured by a reference entity using a clock synchronized to the start time and mean frequency of the local PHY entity's clock. The TOD RMS field is determined from aTxPHYTxStartRMS in units equal to 1/TOD Clock Rate, where the TOD Clock Rate is specified in the TOD Clock Rate field.

The TOD Clock Rate field contains the clock rate used to generate the TOD timestamp value reported in the TOD Timestamp field, and it is specified in units of MHz.

9.4.2.69.9 Location Indication Options subelement

The Location Indication Options subelement contains the options for the STA when transmitting the Location Track Notification frame. The format of the Location Indication Options subelement is shown in Figure 9-526.

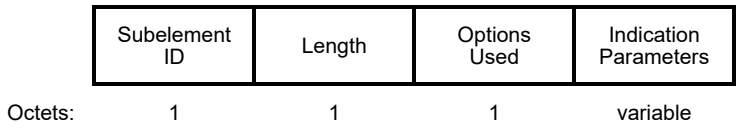

Figure 9-526—Location Indication Options subelement format

The Subelement ID field is defined in Table 9-253.

The Length field is defined in 9.4.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Options Used field specifies the Indication Parameter fields in the Location Indication Options subelement that are used. The format of the Options Used field is shown in Figure 9-527.

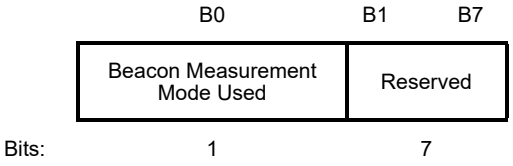

Figure 9-527—Options Used field format

The Indication Parameters field defines a sequence of optional fields that are included in the Location Indication Options subelement based on the Options Used field value. The value of the Indication Parameters field is defined in Table 9-257.

Table 9-257—Indication Parameter values

Order	Field length	Field	Description
1	1	Beacon Measurement Mode	The Beacon Measurement Mode field is the mode of beacon measurement, as defined in Table 9-141. The results of the beacon measurement are included in the Location Track Notification frame, as described in 9.6.7.18 and 11.21.4.2.
2–8		Reserved	

9.4.2.70 Nontransmitted BSSID Capability element

The format of the Nontransmitted BSSID Capability element when transmitted by a non-DMG STA is shown in Figure 9-528.

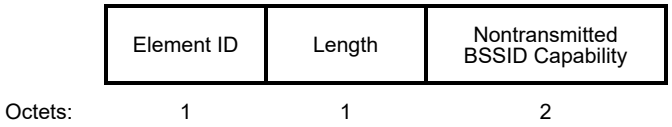

Figure 9-528—Nontransmitted BSSID Capability element format (non-DMG STA)

The format of the Nontransmitted BSSID Capability element when transmitted by a DMG STA is shown in Figure 9-529 (Nontransmitted BSSID Capability element format (DMG STA)).

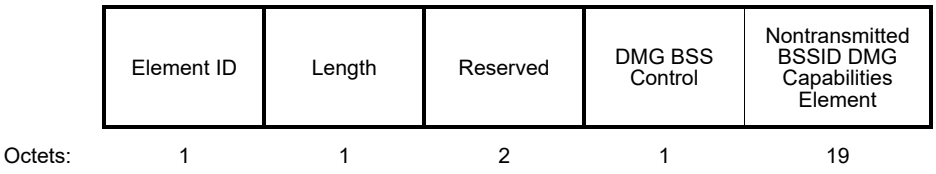

Figure 9-529—Nontransmitted BSSID Capability element format (DMG STA)

When transmitted by a DMG STA, the Nontransmitted BSSID Capability element includes the DMG BSS Control and the Nontransmitted BSSID DMG Capabilities Element fields.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The Nontransmitted BSSID Capability field has the same format as Capability Information field (defined in 9.4.1.4), and indicates the capabilities of the nontransmitted BSS.

The Nontransmitted BSSID Capability element is included in the Nontransmitted BSSID Profile subelement of the Multiple BSSID element defined in 9.4.2.44. The use of the Multiple BSSID element is described in 11.10.14 and Nontransmitted BSSID advertisement procedures are described in 11.1.3.8.

The DMG BSS Control field is defined in Figure 9-530.

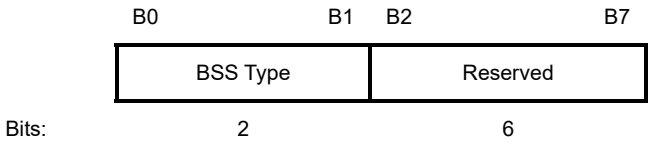

Figure 9-530—DMG BSS Control field format

The BSS Type field is defined in 9.4.1.44.

The Nontransmitted BSSID DMG Capabilities Element field contains the DMG Capabilities element of the DMG STA.

9.4.2.71 SSID List element

The format of the SSID List element is shown in Figure 9-531 (SSID List element format).

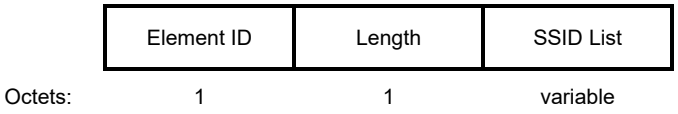

Figure 9-531—SSID List element format

The Element ID and Length fields are defined in 9.4.2.1.

The SSID List field is a list of SSID elements for which the STA is requesting information.

The SSID List element is included in Probe Request frames, as described in 9.3.3.9. The use of the SSID List element and frames is described in 11.1.4.

9.4.2.72 Multiple BSSID-Index element

The format of the Multiple BSSID-Index element is shown in Figure 9-532 (Multiple BSSID-Index element format).

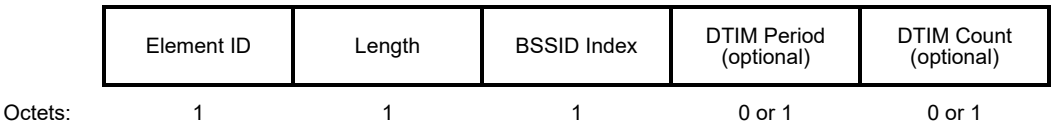

Figure 9-532—Multiple BSSID-Index element format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The BSSID Index field is a value between 1 and $2^n - 1$ that identifies the nontransmitted BSSID, where *n* is a nonzero, positive integer value.

The DTIM Period field indicates the DTIM period for the BSSID. This field is not present when the Multiple BSSID-Index element is included in the Probe Response frame.

The DTIM Count field indicates the DTIM count for the BSSID. This field is not present when the Multiple BSSID-Index element is included in the Probe Response frame.

The Multiple BSSID-Index element is included in the nontransmitted BSSID profile element, as described in 11.1.3.8. The use of the Multiple BSSID element and frames is described in 11.10.14.

9.4.2.73 FMS Descriptor element

The FMS Descriptor element defines information about group addressed BUs buffered at the AP. It is present in the Beacon frames when dot11FMSActivated is true. The format of the FMS Descriptor element is shown in Figure 9-533 (FMS Descriptor element format).

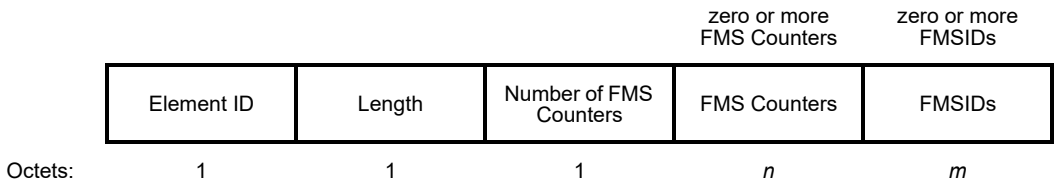

Figure 9-533—FMS Descriptor element format

The Element ID and Length fields are defined in 9.4.2.1.

The Number of FMS Counters field defines the number of FMS Counter fields that are contained in the FMS Counters field in the FMS Descriptor element.

The FMS Counters field contains zero or more FMS Counter fields. The format of the FMS Counter field is shown in Figure 9-534 (FMS Counter field format). When one or more FMS streams are accepted at the AP, at least one FMS counter is present in the FMS Descriptor element. A maximum of eight FMS counters are permitted. The FMS counters are used by the non-AP STA to identify the DTIM beacon after which group addressed BUs assigned to a particular delivery interval are transmitted. A single FMS counter is shared by all FMS streams that use the same delivery interval.

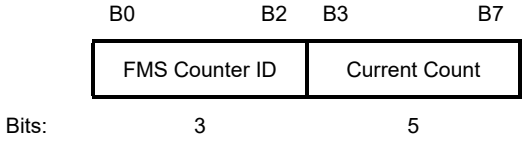

Figure 9-534—FMS Counter field format

The FMS Counter ID field represents the counter ID assigned by the AP for a particular FMS stream.

The Current Count field indicates how many DTIM beacons (including the current one) appear before the next DTIM beacon after which the group addressed BUs assigned to a particular delivery interval are scheduled to be transmitted.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The FMSIDs field contains zero or more FMSIDs. Each FMSID is a 1-octet identifier assigned by the AP.

Inclusion of an FMSID indicates the AP has buffered BUs for the corresponding group addressed stream that is scheduled for transmission immediately after the DTIM beacon.

The FMS Descriptor element is included in Beacon frames, as described in 9.3.3.2. The use of the FMS Descriptor element and frames is described in 11.2.3.13.

9.4.2.74 FMS Request element

The FMS Request element defines information about the group addressed frames being requested by the non-AP STA. The format of FMS Request element is shown in Figure 9-535 (FMS Request element format).

	Element ID	Length	FMS Token	FMS Request Subelements
Octets:	1	1	1	variable

Figure 9-535—FMS Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The FMS Token field contains a unique identifier for the FMS Stream Set that is the set of FMS subelements specified in the request. If this is a new request, then the FMS Token field is set to 0. Otherwise, the FMS Token field is set to the value assigned by the AP in the FMS Response element.

The FMS Request Subelements field contains one or more FMS Request subelements described in Table 9-258.

Table 9-258—Optional subelement IDs for FMS Request subelements

Subelement ID	Subelement name
0	Reserved
1	FMS subelement
2–220	Reserved
221	Vendor Specific subelement
222–255	Reserved

The format of the FMS subelement is shown in Figure 9-536 (FMS subelement format).

The Subelement ID field is 1 to uniquely identify this subelement as the FMS subelement.

The Length field is defined in 9.4.3.

The Delivery Interval field defines the periodicity of stream transmission in units of DTIM intervals. The value set to 0 indicates that requesting non-AP STA does not use the FMS stream identified by the TCLAS elements anymore.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

	Subelement ID	Length	Delivery Interval	Max Delivery Interval	Rate Identification	FMSID	TCLAS Elements (one or more TCLAS Elements)	TCLAS Processing Element (optional)
Octets:	1	1	1	1	4	1	variable	0 or 3

Figure 9-536—FMS subelement format

The Max Delivery Interval field defines the maximum delivery interval the non-AP STA supports for the requested stream in units of DTIM intervals. The value set to 0 indicates that the non-AP STA is willing to accept any maximum delivery interval supported by the AP.

The Rate Identification field specifies the data rate as described in 9.4.1.30, at which the STA requests to receive group addressed frames. If the STA does not request a particular multicast rate, the Rate Identification field is 0.

The FMSID field contains a unique identifier for this stream. If this is a new request, the FMSID field is reserved. Otherwise, the FMSID is set to the value assigned by the AP in the FMS Response element.

The TCLAS Elements field contains one or more TCLAS elements to specify the traffic filter as defined in 9.4.2.29. The number of TCLAS elements is limited and the total size of the FMS Request element is less than or equal to 255 octets.

The TCLAS Processing Element field is optionally present and defines how multiple TCLAS elements are processed as defined in 9.4.2.31.

The use of the FMS Request element and frames is described in 11.2.3.13.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24).

9.4.2.75 FMS Response element

The FMS Response element provides information about the delivery of group addressed frames. The format of the FMS Response element is shown in Figure 9-537 (FMS Response element format).

	Element ID	Length	FMS Token	FMS Response Subelements
Octets:	1	1	1	variable

Figure 9-537—FMS Response element format

The Element ID and Length fields are defined in 9.4.2.1.

The FMS Token field is assigned by the AP for the set of FMS streams that share the counter identified by the FMS counter ID maintained in the AP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The FMS Response Subelements field contains one or more FMS Response subelements described in Table 9-259.

Table 9-259—Optional subelement IDs for FMS Response subelements

Subelement ID	Subelement name
0	Reserved
1	FMS Status subelement
2	TCLAS Status subelement
3–220	Reserved
221	Vendor Specific subelement
222–255	Reserved

The format of the FMS Status subelement is shown in Figure 9-538 (FMS Status subelement format).

	Subelement ID	Length	Element Status	Delivery Interval	Max Delivery Interval	FMSID	FMS Counter	Rate Identification	Multicast Address
Octets:	1	1	1	1	1	1	1	4	6

Figure 9-538—FMS Status subelement format

The Subelement ID field is 1 to uniquely identify this subelement as the FMS Status subelement.

The Length field is defined in 9.4.3.

The Element Status field indicates the status of STA's requested delivery interval, as indicated in Table 9-260, provided by the AP.

Table 9-260—FMS Element Status and TFS Response Status definition

Value	Description
0	Accept
1	Deny, due to request format error or ambiguous classifier.
2	Deny, due to lack of resources on the AP.
3	Deny, due to requested classifier(s) matching 2 or more existing streams on different intervals.
4	Deny, by policy, requested stream or filter is not permitted to participate in the service.
5	Deny, reason unspecified.
6	Alternate proposed, due to existing stream with different delivery interval.
7	Alternate proposed, due to policy limits on the AP.
8	Alternate proposed, because the AP changed the delivery interval.
9	Multicast rate changes not allowed.
10	Terminate, due to an AP policy change.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-260—FMS Element Status and TFS Response Status definition *(continued)*

Value	Description
11	Terminate, due to lack of resources of the AP.
12	Terminate, due to other FMS stream with higher priority.
13	Alternate proposed, because the AP changed the maximum delivery interval.
14	Alternate proposed, because the AP is unable to provide requested TCLAS-based classifiers.
15–255	Reserved

The Delivery Interval field defines the minimum integer of DTIM periods between successive transmissions of frames for the stream corresponding to that FMSID.

The Max Delivery Interval field defines the maximum delivery interval the AP uses for the stream corresponding to FMSID. The value set to 0 indicates that the AP has no maximum delivery interval for the stream identified by FMSID.

The FMSID field is assigned by the AP and provides a unique identifier for this stream within the BSS.

The format of the FMS Counter field is shown in Figure 9-534 (FMS Counter field format). The FMS Counter ID field of the FMS Counter field is defined in 9.4.2.73. The Current Count field of the FMS Counter field is reserved in the FMS Status subelement.

The Rate Identification field specifies the data rate as described in 9.4.1.30 to be used for the multicast service. If the Rate Identification field is set to 0 then the data rate is undefined.

The Multicast MAC Address field contains the MAC address of the multicast traffic to which this FMS response relates.

The format of the TCLAS Status subelement is shown in Figure 9-539 (TCLAS Status subelement format).

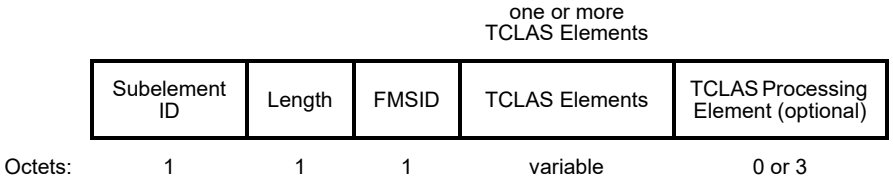

Figure 9-539—TCLAS Status subelement format

The Subelement ID field is 2 to uniquely identify this subelement as the TCLAS Status subelement.

The Length field is defined in 9.4.3.

The FMSID field is assigned by the AP and provides a unique identifier for this stream within the BSS.

The TCLAS Elements field contains one or more TCLAS elements to specify the traffic filter as defined in 9.4.2.29. The number of TCLAS elements is limited and the total size of the FMS Response element is less than or equal to 255 octets.

The TCLAS Processing Element field is optionally present and defines how multiple TCLAS elements are processed as defined in 9.4.2.31.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The use of the FMS Response element and frames is described in 11.2.3.13.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.24).

9.4.2.76 QoS Traffic Capability element

The QoS Traffic Capability element provides information about types of traffic generated by a non-AP QoS STA and is used by a QoS AP to indicate the access categories of associated non-AP QoS STAs. The format of the QoS Traffic Capability element is shown in Figure 9-540 (QoS Traffic Capability element format).

	Element ID	Length	QoS Traffic Capability Bitmask/Flags	AC STA Count List (optional)
Octets:	1	1	1	Total number of nonzero bits in Bits 0–1 of QoS Traffic Capability Bitmask/Flags field

Figure 9-540—QoS Traffic Capability element format

The Element ID and Length fields are defined in 9.4.2.1. The Length field is set to 1 + *n*, where *n* equals the total number of nonzero bits in Bits 0–1 of the QoS Traffic Capability Bitmask/Flags field.

The format of QoS Traffic Capability Bitmask/Flags field is defined in Table 9-261.

Table 9-261—Definition of the QoS Traffic Capability Bitmask/Flags field

Bit	Description
0	AC_VO
1	AC_VI
2	Reserved
3	Reserved
4	UP 4 Traffic
5	UP 5 Traffic
6	UP 6 Traffic
7	Reserved

Bits 0–1 serve as QoS traffic capability bitmask. The bitmask indicates the AC values that have the station count specified in the following AC STA Count List. An AP sets the bit to 1 to indicate that the station count for the corresponding AC is present in the AC STA Count List field. An AP sets the bit to 0 to indicate that the station count for the corresponding AC is not present in the AC STA Count List field. Bits 0–1 are reserved in a transmission to an AP.

Bits 4–6 serve as QoS traffic capability flags. Each of Bits 4–6 serves as a flag for a non-AP STA to indicate application requirements about the user priorities of the traffic it generates. A non-AP STA sets the bit to 1 to indicate the existence of an application that requires generation of traffic belonging to the corresponding user priority (UP). A non-AP STA sets the bit to 0 to indicate that such application does not exist. Bits 4–6 are reserved in a transmission from an AP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Bits 2–3 and Bit 7 are reserved.

The AC STA Count List field comprises a sequence of STA Count fields corresponding to the nonzero bits in the Bits 0–1 of the QoS Traffic Capability Bitmask/Flags field. Each STA Count field is 1 octet long and contains an unsigned integer. The STA Count field specifies the number of associated QoS STAs that have indicated QoS traffic capability of the corresponding AC. If the number of STAs is greater than 255, the STA Count field is 255. The AC STA Count List field is present only when the QoS AP transmits the QoS Traffic Capability element.

9.4.2.77 BSS Max Idle Period element

The BSS Max Idle Period element contains the time period a non-AP STA can refrain from transmitting frames to the AP before the AP disassociates the STA due to inactivity. The format of the BSS Max Idle Period element is shown in Figure 9-541 (BSS Max Idle Period element format).

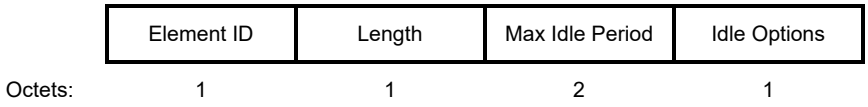

Figure 9-541—BSS Max Idle Period element format

The Element ID and Length fields are defined in 9.4.2.1.

The Max Idle Period field indicates the BSS max idle period, as described in 11.21.13. The value 0 is reserved. In a non-S1G STA, it contains the BSS max idle period in units of 1000 TUs. In an S1G STA, it has the same format as the Listen Interval field (see Figure 9-144 (Listen Interval field format carried in an S1G PPDU)), and contains the BSS max idle period as the value of the Unscaled Interval subfield, multiplied by the scaling factor that corresponds to the value indicated in the Unified Scaling Factor subfield, in units of 1000 TUs.

The Idle Options field indicates the options associated with BSS max idle period management. The Idle Options field is shown in Figure 9-542 (Idle Options field format).

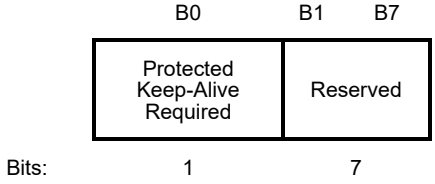

Figure 9-542—Idle Options field format

The Protected Keep-Alive Required subfield is set to 1 to indicate that only a protected frame indicates activity. The Protected Keep-Alive Required subfield is set to 0 to indicate that either an unprotected or a protected frame indicates activity.

The BSS Max Idle Period element is included in Association Request and Response frames, as described in 9.3.3.5 and 9.3.3.6, and Reassociation Request and Response frames, as described in 9.3.3.7 and 9.3.3.8. The use of the BSS Max Idle Period element and frames is described in 11.21.13.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.78 TFS Request element

The TFS Request element defines information about the traffic filters that are enabled at the AP for the requesting non-AP STA. The format of the TFS Request element is defined in Figure 9-543 (TFS Request element format).

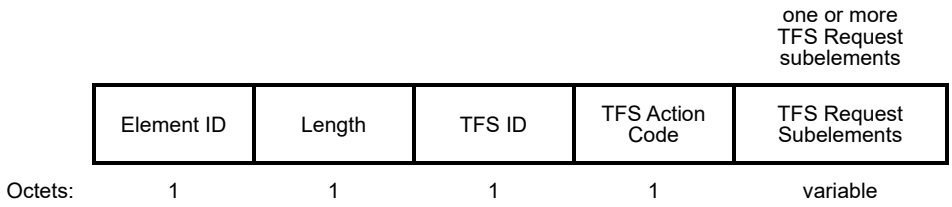

Figure 9-543—TFS Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The TFS ID field is assigned by the STA and provides a unique identifier for the traffic filter set specified by the TFS Request Subelements field.

The TFS Action Code field defines the actions taken at the AP when a frame matches a traffic filter set. The functions of the bits in this field are shown in Table 9-262.

Table 9-262—TFS Action Code field values

Bit(s)	Name	Notes
0	Delete After Match	Setting this field to 1 for any traffic filter set indicates all traffic filter sets established at the AP for the non-AP STA are deleted when a frame matches any of the traffic filter sets established for the non-AP STA. Setting this field to 0 indicates no deletion of the traffic filter set upon a match.
1	Notify	If a STA is a WUR non-AP STA: — Setting this field to 1 indicates the STA is to be sent a WUR Short Wake-up frame or a WUR Wake-up frame as described in 29.9 upon the first frame matching to the traffic filter set or the first frame match after the AP receives a Notify Response frame containing the corresponding TFS ID. Setting this field to 0 indicates the AP does not send a WUR Short Wake-up frame or a WUR Wake-up frame to the requesting STA. If a STA is not a WUR non-AP STA: — Setting this field to 1 indicates the STA requests to be sent a TFS Notify frame upon the first frame matching to the traffic filter set or the first frame match after the AP receives a Notify Response frame containing the corresponding TFS ID. Setting this field to 0 indicates the AP does not send a TFS Notify frame to the requesting STA.
2–7	Reserved	All other bits are reserved.

The TFS Request Subelements field contains one or more TFS Request subelements described in Table 9-263. The subelement format and ordering of subelements are defined in 9.4.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Subelement ID field values for the defined subelements are shown in Table 9-263. Each TFS Request subelement specifies one traffic filter. Using multiple TFS Request subelements in a TFS Request element is the equivalent to a logical AND operation on the match conditions of each TFS Request subelement.

Table 9-263—Optional subelement IDs for TFS Request parameters

Subelement ID	Subelement name
1	TFS subelement
221	Vendor Specific subelement
0, 2 to 220, 222 to 255	Reserved

In a TFS Response element, the number of the response subelements is the same as the number of the TFS Request subelements in the corresponding TFS Request element, where the TFS Response subelements appear in the same order as the corresponding TFS Request subelements in the corresponding TFS Request frame.

The format of the TFS subelement is shown in Figure 9-544 (TFS subelement format).

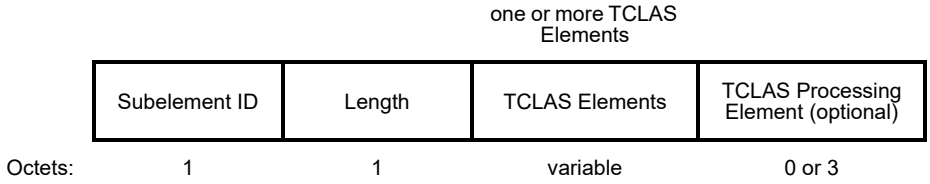

Figure 9-544—TFS subelement format

The Subelement ID field uniquely identifies this subelement to be the TFS subelement.

The Length field is defined in 9.4.3.

The TCLAS Elements field contains one or more TCLAS elements, each specifying a set of filtering parameters as defined in 9.4.2.29. The number of TCLAS elements is limited and the total size of the TFS Request element is less than 255 octets.

The TCLAS Processing Element field is optionally present and defines how multiple TCLAS elements are processed as defined in 9.4.2.31.

The format of the Vendor Specific subelement for a TFS Request element is shown in Figure 9-545 (TFS Request Vendor Specific subelement format).

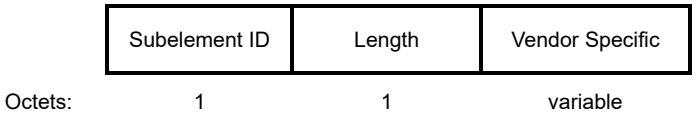

Figure 9-545—TFS Request Vendor Specific subelement format

The Subelement ID field uniquely identifies this subelement to be the TFS Request subelement.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Length field is defined in 9.4.3.

The Vendor Specific field contains the vendor specific information.

The use of the TFS Request element and frames is described in 11.21.12.

9.4.2.79 TFS Response element

The TFS Response element defines information about the status of the requested filtering parameters. The format of the TFS Response element is defined in Figure 9-546 (TFS Response element format).

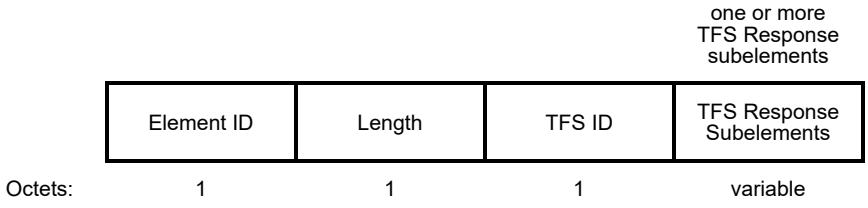

Figure 9-546—TFS Response element format

The Element ID and Length fields are defined in 9.4.2.1.

The TFS ID field indicates the unique ID for the TFS traffic filter set.

The TFS Response Subelements field contains one or more TFS Response subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-264.

In a TFS Response element, the number of the response subelements is the same as the number of the TFS Request subelements in the corresponding TFS Request element, where the TFS Response subelements appear in the same order as the corresponding TFS Request subelements in the corresponding TFS Request frame.

Table 9-264—Optional subelement IDs for TFS Response parameters

Subelement ID	Subelement name
1	TFS Status subelement
221	Vendor Specific subelement
0, 2–220, 222–255	Reserved

A TFS Status subelement contains the information as defined in Figure 9-547 (TFS Status subelement format).

The Length field is defined in 9.4.3.

The TFS Response Status field indicates the status returned by the AP responding to the STA's requested traffic filter, as indicated in Table 9-260.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

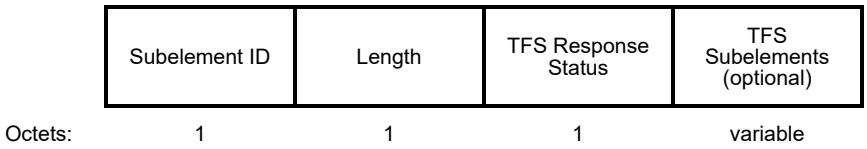

Figure 9-547—TFS Status subelement format

If present, the TFS Subelements field contains one or more TFS Request subelements containing the alternative filtering parameters preferred by the AP.

The format of the Vendor Specific subelement for a TFS Response element is shown in Figure 9-548 (TFS Response Vendor Specific subelement format).

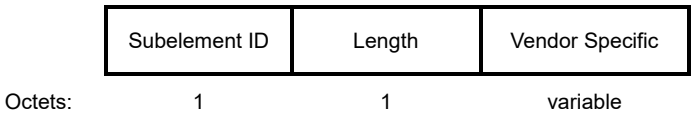

Figure 9-548—TFS Response Vendor Specific subelement format

The Subelement ID field uniquely identifies this subelement to be the TFS Response subelement.

The Length field is defined in 9.4.3.

The Vendor Specific field contains the vendor specific information.

The use of the TFS Response element and frames is described in 11.21.12.

9.4.2.80 WNM Sleep Mode element

The WNM Sleep Mode element is used to enter and exit the WNM sleep mode. The format of the WNM Sleep Mode element is shown in Figure 9-549 (WNM Sleep Mode element format).

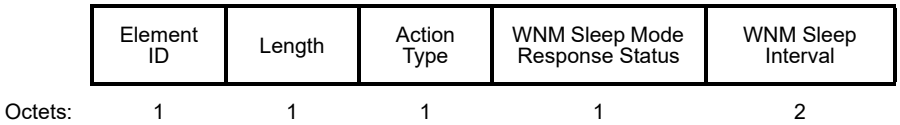

Figure 9-549—WNM Sleep Mode element format

The Element ID and Length fields are defined in 9.4.2.1.

The Action Type field is a number that identifies the type of WNM sleep mode request and response. The Action Types are shown in Table 9-265.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-265—Action Type definitions

Name	Action Type value
Enter WNM sleep mode	0
Exit WNM sleep mode	1
Reserved	2–255

The WNM Sleep Mode Response Status field indicates the status returned by the AP responding to the non-AP STA's WNM sleep mode request as defined in Table 9-266. This field is valid only in the WNM Sleep Mode element in a WNM Sleep Mode Response frame and is reserved otherwise.

Table 9-266—WNM Sleep Mode Response Status definition

Value	Description
0	Enter/Exit WNM sleep mode Accept.
1	Exit WNM sleep mode Accept, GTK/IGTK/BIGTK update required.
2	Denied. The AP is unable to perform the requested action.
3	Denied temporarily. The AP is unable to perform the requested action at the current time. The request can be submitted again at a later time.
4	Denied. Due to the pending key expiration.
5	Denied. The requested action was not granted due to other WNM services in use by the requesting STA.
6–255	Reserved

The WNM Sleep Interval field is reserved if the Action Type field is 1.

The WNM Sleep Interval field indicates to the AP how often a STA in WNM sleep mode wakes to receive Beacon frames, defined as the number of DTIM intervals. The value set to 0 indicates that the requesting non-AP STA does not transition to awake state at any specific interval. In a non-S1G STA, the WNM Sleep Interval field is an unsigned integer. In an S1G STA, the two MSBs of the WNM Sleep Interval field contain the Unified Scaling Factor subfield and the remaining 14 bits contain the Unscaled Interval subfield (see Figure 9-144 (Listen Interval field format carried in an S1G PPDU)). In an S1G STA, the WNM sleep interval is equal to the value of the Unscaled Interval subfield, multiplied by the scaling factor that corresponds to the value indicated in the Unified Scaling Factor subfield. The Unified Scaling Factor subfield encoding is defined in Table 9-78.

The use of the WNM Sleep Mode element and frames is described in 11.2.3.15.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.81 TIM Broadcast Request element

The TIM Broadcast Request element contains information about the periodic TIM broadcast being requested by the non-AP STA. The format of the TIM Broadcast Request element is shown in Figure 9-550 (TIM Broadcast Request element format).

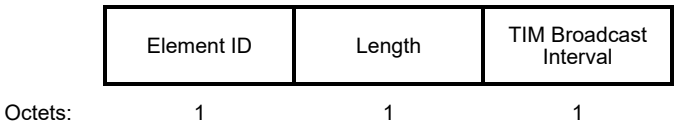

Figure 9-550—TIM Broadcast Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The TIM Broadcast Interval field is the number of beacon periods between TIM frame transmissions. A TIM Broadcast Interval field set to 0 terminates the use of TIM Broadcast for the requesting station.

The use of the TIM Broadcast Request element and frames is described in 11.2.3.14.

9.4.2.82 TIM Broadcast Response element

The TIM Broadcast Response element contains information about the periodic TIM broadcast by the AP. The format of the TIM Broadcast Response element is shown in Figure 9-551 (TIM Broadcast Response element format).

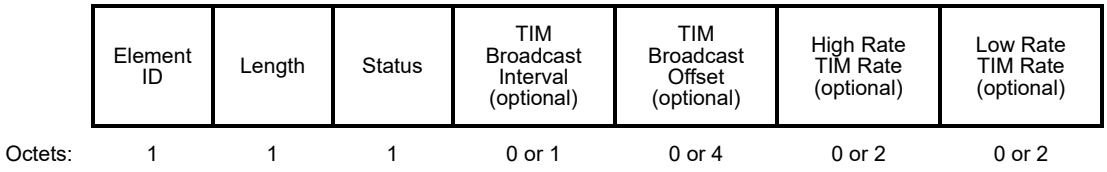

Figure 9-551—TIM Broadcast Response element format

The Element ID and Length fields are defined in 9.4.2.1.

The Status field indicates the status of the AP responding to the STA's requested delivery interval, as indicated in Table 9-267.

Table 9-267—Status field values

Field value	Description
0	Accept
1	Accept, timestamp present in TIM frames
2	Denied
3	Overridden
4	Overridden, timestamp present in TIM frames
5–255	Reserved

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When the Status field is 0, 1, 3 or 4, the TIM Broadcast Interval field, TIM Broadcast Offset field, High Rate TIM Rate field, and Low Rate TIM Rate field are included in the TIM Broadcast Response element.

The TIM Broadcast Interval field contains the number of beacon periods between scheduled TIM frame transmissions.

The TIM Broadcast Offset field contains the offset in microseconds with a tolerance of ± 4 μs relative to the TBTT for which a TIM frame is scheduled for transmission. The field contains a 2s complement signed integer.

The High Rate TIM Rate field provides an indication of the rate that is used to transmit the high data rate TIM frame, in units of 0.5 Mb/s. Setting this field to 0 indicates that the high data rate TIM frame is not transmitted.

The Low Rate TIM Rate field provides an indication of the rate that is used to transmit the low data rate TIM frame, in units of 0.5 Mb/s. The value 0 is reserved.

The use of the TIM Broadcast Response element and frames is described in 11.2.3.14.

9.4.2.83 Colocated Interference Report element

The Colocated Interference Report element contains some characteristics of the reported colocated interference. The Colocated Interference Report element is defined in Figure 9-552 (Colocated Interference Report element format).

	Element ID	Length	Report Period	Interference Level	Interference Level Accuracy/ Interference Index
Octets:	1	1	1	1	1

	Interference Interval	Interference Burst Length	Interference Start Time/Duty Cycle	Interference Center Frequency	Interference Bandwidth
Octets	4	4	4	4	2

Figure 9-552—Colocated Interference Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Report Period field contains an unsigned integer value in units of 200 TUs. If the Report Period field is a value that is greater than 0, then the reporting is periodic, and the field contains the period of sending the report. If the Report Period field is 0, then the reporting is not periodic, and a report is generated when the STA knows of a change in the colocated interference. See 11.21.9 for further details.

The Interference Level field is a 2s complement signed integer indicating the maximum level of the colocated interference power in units of dBm over all receive chains averaged over a 4 μs period during an interference period and across interference bandwidth. When the interference level is unknown, the field is +127 dBm. When the interference level is equal or greater than 126 dBm, the field is +126 dBm. If no colocated interference is present the field is –128 dBm. When the interference level is equal or lower than

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

–127 dBm, the field is –127 dBm. The interference level is referenced to the antenna connector (see "antenna connector" in 3.1) used for reception, like RCPI.

The Interference Level Accuracy/Interference Index field is shown in Figure 9-553 (Interference Level Accuracy/Interference Index field format).

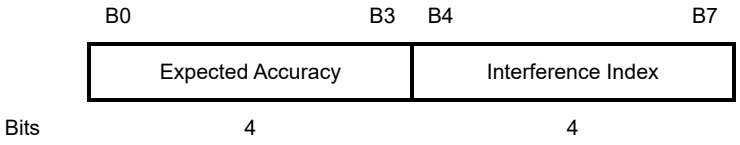

Figure 9-553—Interference Level Accuracy/Interference Index field format

The Expected Accuracy field represents an unsigned integer indicating the expected accuracy of the estimate of interference in dB with 95% confidence interval. If the Interference Level field is X (dBm) and the expected accuracy field is Y (dB), the actual interference level is in the range X – Y to X + Y with the probability of 95%. The range of expected accuracy is from 0 dB to 14 dB. If accuracy is unknown or greater than 14 dB, then the Expected Accuracy field is 15.

The Interference Index field indicates the interference index that is unique for each type of interference source. The field set to 0 indicates that no colocated interference is present. See 11.21.9 for further details.

The Interference Interval field indicates the interval between two successive periods of interference in microseconds. When the interval between two successive periods of interference is variable the field is 2^{32}–1. When the interval between two successive periods of interference is equal or greater than 2^{32}– 2, the field is 2^{32}– 2. If no colocated interference is present, the field is 0.

The Interference Burst Length field indicates the duration of each period of interference in microseconds. When the duration of each period of interference is variable the field is 2^{32}– 1. When the duration of each period of interference is equal or greater than 2^{32}– 2, the field is 2^{32}– 2. If no colocated interference is present, the field is 0.

The Interference Start Time/Duty Cycle field contains the least significant 4 octets (i.e., B0–B31) of the TSF timer at the start of the interference burst. When either the Interference Interval or the Interference Burst Length fields are set to 2^{32}– 1, this field indicates the average duty cycle. The average duty cycle value is defined as follows:

$$\text{Average duty cycle} = \left\lfloor (2^{32} - 2) \times \frac{T_B}{T_I} + 0.5 \right\rfloor$$

where

T_B is the average interference burst length
T_I is the average interference interval

When the interference is nonperiodic or no colocated interference is present, the Interference Start Time field is 0.

The Interference Center Frequency field indicates the center frequency of interference in units of 5 kHz. When center frequency is unknown, the center frequency of the STA's operating channel is reported. If no colocated interference is present the field is 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Interference Bandwidth field indicates the bandwidth in units of 5 kHz at the –3 dB roll-off point of the interference signal. When bandwidth of the interference signal is unknown, the field is 65 535. When bandwidth of the interference signal is equal or greater than 65 534 the field is 65 534. If no colocated interference is present, the field is 0.

9.4.2.84 Channel Usage element

The Channel Usage element defines channel usage information for a list of channels used in a BSS or an off-channel TDLS direct link. The format of the Channel Usage element is shown in Figure 9-554 (Channel Usage element format).

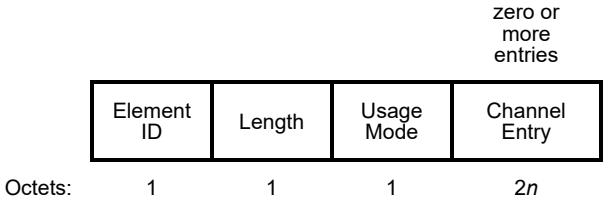

Figure 9-554—Channel Usage element format

The Element ID and Length fields are defined in 9.4.2.1.

The Usage Mode field is a number that identifies the usage of the recommended channels listed in the Operating Class/Channel Number pair fields. The Usage Mode definitions are shown in Table 9-268.

Table 9-268—Usage Mode definitions

Value	Usage Mode
0	Channel-usage-aidable BSS
1	Off-channel TDLS direct link
2	Channel-usage-aidable BSS in which none of the channel-usage-aiding BSSs that belong to the same ESS operate on the channels identified by the Channel Entry field
3	Unavailability indication
4	Channel-usage-aidable BSS channel switch request
5	Capability notification
6–254	Reserved
255	Unknown request

The Channel Entry field includes zero or more Operating Class And Channel fields. The format of the Operating Class And Channel field is defined in 9.4.1.22. Operating Class And Channel fields can be grouped together to identify a noncontiguous channel as described in 9.4.2.69.3.

The use of the Channel Usage element and frames is described in 11.21.15.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.85 Time Zone element

The Time Zone element contains the local time zone of the AP. The format of the Time Zone element is shown in Figure 9-555 (Time Zone element format).

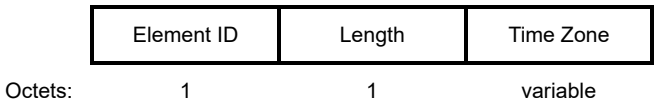

Figure 9-555—Time Zone element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Time Zone field is as specified in 8.3 of IEEE Std 1003.1-2004:

stdoffset[dst[offset][,start[/time],end[/time]]]

The length of the field is no less than 4 octets and no more than TZNAME_MAX, as defined in IEEE Std 1003.1-2004. The Time Zone field represents the time zone at the AP's location. The encoding of the field is in ASCII characters as shown in the following Example-1.

Example-1: EST5

Example-2: EST5EDT4,M3.2.0/02:00,M11.1.0/02:00

In the Example-2, the string is interpreted as a time zone that is normally five hours behind UTC, and four hours behind UTC during daylight saving time (DST), which runs from the second Sunday in March at 02:00 local time to the first Sunday in November at 02:00 local time. Normally, the time zone is abbreviated "EST" but during DST it is abbreviated "EDT."

9.4.2.86 DMS Request element

The DMS Request element defines information about the group addressed frames to be transmitted as individually addressed frames. The format of the DMS Request element is shown in Figure 9-556 (DMS Request element format).

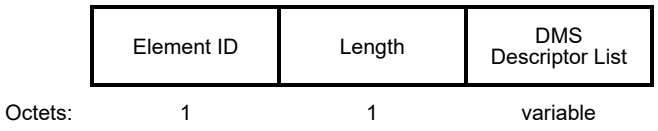

Figure 9-556—DMS Request element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The DMS Descriptor List field contains one or more DMS Descriptors. The format of the DMS Descriptor is defined in Figure 9-557 (DMS Descriptor format).

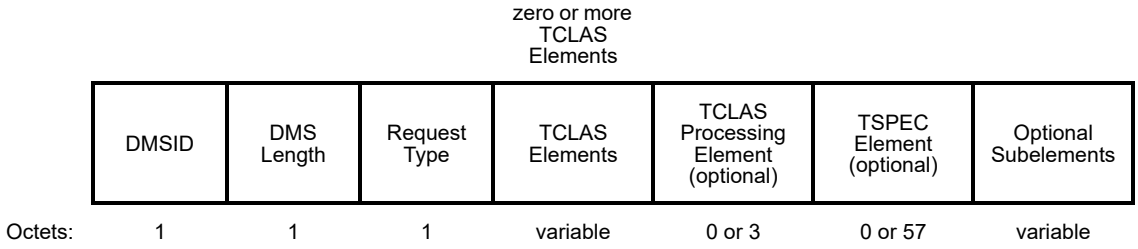

Figure 9-557—DMS Descriptor format

The DMSID field is set to 0 when the Request Type field is "Add" as defined in Table 9-269; otherwise, the DMSID field is set to the nonzero value assigned by the AP to identify the DMS traffic flow.

The DMS Length field is set to 1 + *n*, where *n* indicates the total length in octets of all of the TCLAS Elements, optional TCLAS Processing Element, optional TSPEC Element, and Optional Subelements fields contained in the DMS Descriptor field. The maximum value of the DMS Length field is 253.

The Request Type field identifies the type of DMS request. The encoding of the Request Type field is shown in Table 9-269.

Table 9-269—DMS Request Type field

Description	Request Type field value
Add	0
Remove	1
Change	2
Reserved	3–255

When the Request Type field contains "Add," the TCLAS Elements field contains one or more TCLAS elements to specify group addressed frames as defined in 9.4.2.29. When a GCR Request subelement is included in the DMS Descriptor and the Request Type field is equal to "Add," the TCLAS Elements field contains at least a TCLAS element with frame classifier type set to 0 (Ethernet parameters) to specify a destination group address as defined in 9.4.2.29. When the Request Type field contains any value other than "Add," the TCLAS Elements field contains zero TCLAS elements.

When the Request Type field contains "Add" and when there are two or more TCLAS elements present, the TCLAS Processing Element field contains one TCLAS Processing element to define how these TCLAS elements are to be processed, as defined in 9.4.2.31. Otherwise, the TCLAS Processing Element field contains zero TCLAS Processing elements.

When the Request Type field contains "Add" or "Change," the TSPEC Element field optionally contains one TSPEC element to specify the characteristics and QoS expectations of the corresponding traffic flow as defined in 9.4.2.28. When a GCR Request subelement is included in the DMS Descriptor and the Request Type field is equal to "Add" or "Change," the TSPEC Element field contains one TSPEC element. Otherwise, the TSPEC Element field contains zero TSPEC elements.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-270.

Table 9-270—Optional subelement IDs for DMS Descriptor

Subelement ID	Name	Extensible
0	Reserved	
1	GCR Request	Yes
2–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

Each DMS Descriptor contains zero or one GCR Request subelements. If present and the Request Type field is equal to “Add” or “Change,” the GCR Request subelement indicates a request by a STA to respectively add or change the GCR service for a group addressed stream identified by the TCLAS element or by the DMSID in the DMS Descriptor. The format of the GCR Request subelement is shown in Figure 9-558 (GCR Request subelement format).

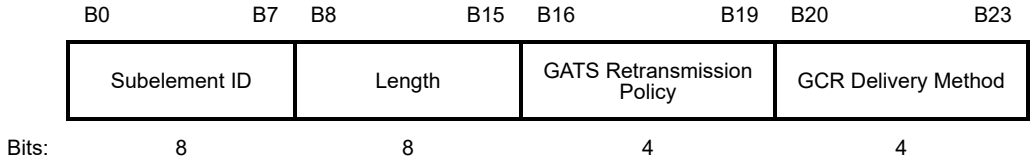

Figure 9-558—GCR Request subelement format

The Length field is defined in 9.4.3.

The GATS Retransmission Policy field is set to indicate the STA’s preferred retransmission policy for the group address for which the GCR service is requested. The values are shown in Table 9-271.

Table 9-271—GATS Retransmission Policy field values

Value	GATS retransmission policy	Notes
0	No preference	
1	DMS	See 11.21.16.2.
2	GCR unsolicited retry	See 11.21.16.3.6.
3	GCR Block Ack	See 11.21.16.3.7.
4–15	Reserved	

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The GCR Delivery Method field is set to indicate the STA's preferred delivery method for the group address for which the GCR service is requested. The values are shown in Table 9-272.

Table 9-272—GCR Delivery Method field values

Value	GCR delivery method	Notes
0	No preference	
1	Non-GCR-SP	See 11.21.16.3.1.
2	GCR-SP	See 11.21.16.3.8.
3–15	Reserved	

The DMS Request element is included in DMS Request frames, as described in 9.6.13.26, and Reassociation Request frames, as described in 9.3.3.7. The use of the DMS Request element and frames is described in 11.21.16.

9.4.2.87 DMS Response element

The DMS Response element provides the status information about the requested group addressed frames. The format of the DMS Response element is shown in Figure 9-559 (DMS Response element format).

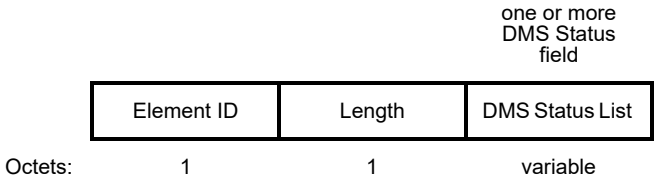

Figure 9-559—DMS Response element format

The Element ID and Length fields are defined in 9.4.2.1.

The DMS Status List field contains one or more DMS Status fields. The format of a DMS Status field is defined in Figure 9-560 (DMS Status field format).

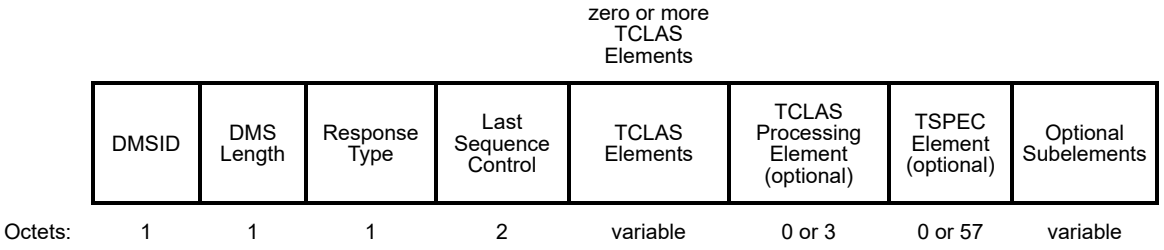

Figure 9-560—DMS Status field format

The DMSID is assigned by the AP and provides a unique identifier within the BSS for the DMS traffic flow identified by the TCLAS Elements, TCLAS Processing Element, and TSPEC Element fields. The uniqueness of the identifier is independent of the ordering of the TCLAS elements. In a mesh BSS, the DMSID is assigned by a mesh STA that responds to a GCR request and is unique among all existing DMSIDs used by the mesh STA for its current GCR agreements.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The DMS Length field is set to 3 + *n*, where *n* indicates the total length in octets of all of the TCLAS Elements, optional TCLAS Processing Element, optional TSPEC Element, and Optional Subelements fields contained in the DMS Status field. When the Response Type field is equal to "Terminate," the DMS Length field is set to 3. The maximum value of the DMS Length field is 253.

The Response Type field indicates the response type returned by the AP responding to the non-AP STA's request or by a mesh STA responding to its peer mesh STA's request or indicates the DMS status is an advertisement of an existing GCR service, as indicated in Table 9-273.

Table 9-273—Response Type field values

Field value	Description	Notes
0	Accept	STA accepts the DMS or GCR request
1	Denied	STA rejects the DMS or GCR request
2	Terminate	STA terminates DMS previously accepted DMS or GCR request
3	GCR Advertise	STA advertises a group addressed stream subject to an existing GCR agreement.
4–255	Reserved	

When the Last Sequence Control field is not supported the Last Sequence Control field is set to 65 535. When the Last Sequence Control field is supported and the Response Type field does not contain "Terminate" or "GCR Advertise," the Last Sequence Control field is reserved.

When the Response Type field is "Terminate" and the Last Sequence Control field is supported, Bit 0 to Bit 3 of the Last Sequence Control field is 0, and Bit 4 to Bit 15 of the Last Sequence Control field contains the sequence number of the last group addressed frame that the AP delivered to the non-AP STA that is the recipient of the DMS Response frame. If the Response Type field is "Terminate" and the last frame received by the non-AP STA prior to DMS termination has not also been sent using a group addressed frame, the Last Sequence Control field is set to 65 534.

When the Response Type field contains "Accept" or "Denied" and a GCR Response subelement is not included in the DMS Status field, the TCLAS Elements field contains one or more TCLAS elements to specify group addressed frames as defined in 9.4.2.29. When the Response Type field is equal to "Accept," "Denied," or "GCR Advertise" and a GCR Response subelement is included in the DMS Status field, the TCLAS Elements field contains at least one TCLAS element with frame classifier type set to 0 (Ethernet parameters) to specify a destination group address as defined in 9.4.2.29. Otherwise, the TCLAS Elements field contains zero TCLAS elements.

When the Response Type field contains "Accept" or "Denied," the TCLAS Processing Element field optionally contains one TCLAS Processing element to define how these TCLAS elements are to be processed, as defined in 9.4.2.31. When the Response Type field contains "Terminate" or when there is only one TCLAS element, the TCLAS Processing Element field contains zero TCLAS Processing elements.

When the Response Type field contains "Accept" or "Denied," the TSPEC Element field optionally contains one TSPEC element to specify the characteristics and QoS expectations of the corresponding traffic flow as defined in 9.4.2.28. When a GCR Response subelement is included in the DMS Status field and the Response Type field is equal to "Accept," "Denied," or "GCR Advertise," the TSPEC Element field contains one TSPEC element. Otherwise, the TSPEC Element field contains zero TSPEC elements.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Subelement ID field values for the defined subelements are shown in Table 9-274.

Table 9-274—Optional subelement IDs for DMS Status

Subelement ID	Name	Extensible
0	Reserved	
1	GCR Response	Subelements
2–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The GCR Response subelement contains one of the following:

— A response by an AP to a GCR request by a non-AP STA for GCR service for a group address
— A response by a mesh STA to a GCR request by a peer mesh STA for GCR service for a group address
— An unsolicited advertisement for the parameters of a group addressed stream subject to the GCR service

The format of the GCR Response subelement is shown in Figure 9-557 (DMS Descriptor format).

	Subelement ID	Length	GATS Retransmission Policy	GCR Delivery Method	GCR Concealment Address	Schedule Element
Octets:	1	1	0 or 1	0 or 1	0 or 6	0 or 14

Figure 9-561—GCR Response subelement format

The GATS Retransmission Policy, GCR Delivery Method, and GCR Concealment Address fields are present when the Response Type field is not equal to “Denied”; otherwise, they are omitted. The Schedule Element field is optionally present when the Response Type field is not equal to “Denied.”

The GATS Retransmission Policy field is set to indicate the current GCR retransmission policy for the group address for which the GCR service is requested. The values are shown in Table 9-271.

The GCR Delivery method field is set to indicate the current GCR Delivery method for the group address for which the GCR service is requested. The values are shown in Table 9-272.

The GCR Concealment Address field, when present, indicates the GCR concealment address, as described in 11.21.16.3.5.

The Schedule Element field is present if the GCR delivery method is equal to GCR-SP. It indicates the current SP schedule for the group addressed stream (see 9.4.2.32).

The DMS Response element is included in DMS Response frames, as described in 9.6.13.27, and Reassociation Response frames, as described in 9.3.3.8. The use of the DMS Response element and frames is described in 11.21.16.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.88 Destination URI element

The Destination URI element contains URI and ESS detection interval values from the requesting STA that the responding STA can use to deliver Event or Diagnostic Report frames. The format of the Destination URI element is shown in Figure 9-562 (Destination URI element format).

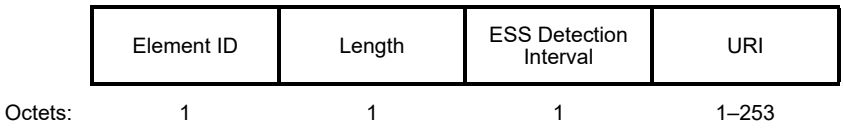

Figure 9-562—Destination URI element format

The Element ID and Length fields are defined in 9.4.2.1.

The ESS Detection Interval field is defined in 9.4.2.69.2 and its use for Event and Diagnostic requests is described in 11.21.2 and 11.21.3.

The URI field specifies the destination URI for Event and Diagnostic reports using the format defined in IETF RFC 3986. The URI field value is limited to 253 octets.

Use of the Destination URI element in an Event Request frame is described in 11.21.2.1. Use of the Destination URI element in a Diagnostic Request frame is described in 11.21.3.1.

9.4.2.89 U-APSD Coexistence element

The U-APSD Coexistence element provides the duration of requested transmission during a U-APSD service period. The format of the U-APSD Coexistence element is shown in Figure 9-563 (U-APSD Coexistence element format).

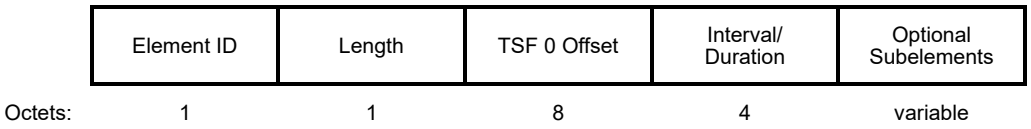

Figure 9-563—U-APSD Coexistence element format

The Element ID and Length fields are defined in 9.4.2.1.

The TSF 0 Offset field is set to the number of microseconds since TSF time 0 when the non-AP STA knew the start of interference. The AP uses the TSF 0 Offset field together with the Interval/Duration field to enqueue frames for transmission to the non-AP STA using the procedures as described in 11.2.3.5.2.

Setting the TSF 0 Offset field to 0 indicates the non-AP STA requests the AP transmit frames to the non-AP STA using the procedure described in 11.2.3.5.2 for the case where TSF 0 Offset is equal to 0.

The Interval/Duration field is defined as follows:

— When the TSF 0 Offset is 0, the Interval/Duration field is the number of microseconds during the U-APSD service period when the AP transmits frames to the non-AP STA as described in 11.2.3.5.2.
— When the TSF 0 Offset is nonzero, the Interval/Duration field is the number of microseconds between the start of consecutive interference bursts.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Interval/Duration field value of 0 is reserved.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-275.

Table 9-275—Optional subelement IDs for U-APSD coexistence

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

9.4.2.90 Interworking element

The Interworking element contains information about the interworking service capabilities of a STA as shown in Figure 9-564 (Interworking element format).

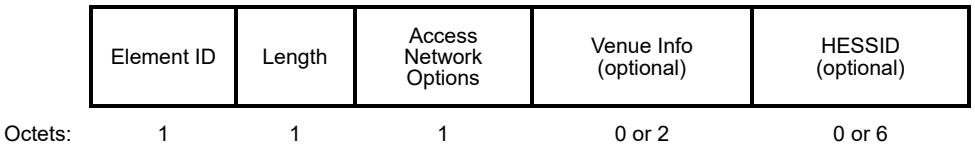

Figure 9-564—Interworking element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of Access Network Options field is shown in Figure 9-565 (Access Network Options field format).

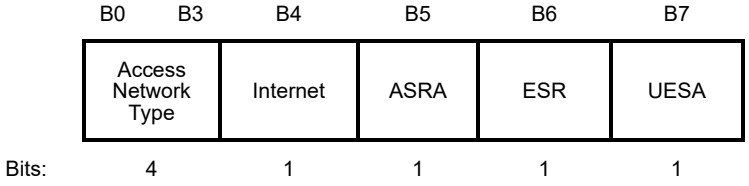

Figure 9-565—Access Network Options field format

A non-AP STA sets Internet, ASRA, ESR, and UESA fields to 0 when including the Interworking element in the Probe Request frame. A non-AP STA sets the Internet, ASRA and ESR bits to 0 when including the Interworking element in (Re)Association Request frames. A mesh STA sets the Internet bit to 0 when including the Interworking element in Mesh Peering Open frames. In (Re)Association Request frames, a non-AP STA sets the UESA bit according to the procedures in 11.3.5. The access network types are shown in Table 9-276. The Access Network Type field is set by the AP or the mesh STA to advertise its access network type to non-AP STAs. A non-AP STA uses this field to indicate the desired access network type in an active scan. See R.2 for the usage of fields contained within the Interworking element.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-276—Access network type

Access network type	Meaning	Description
0	Private network	Nonauthorized users are not permitted on this network. Examples of this access network type are home networks and enterprise networks, which might employ user accounts. Private networks do not necessarily employ encryption.
1	Private network with guest access	Private network but guest accounts are available. Example of this access network type is enterprise network offering access to guest users.
2	Chargeable public network	The network is accessible to anyone, however, access to the network requires payment. Further information on types of charges might be available through other methods (e.g., IEEE Std 802.21-2017, http/https redirect, or DNS redirection). Examples of this access network type is a hotspot in a coffee shop offering internet access on a subscription basis or a hotel offering in-room internet access service for a fee.
3	Free public network	The network is accessible to anyone and no charges apply for the network use. An example of this access network type is an airport hotspot or municipal network providing free service.
4	Personal device network	A network of personal devices. An example of this type of network is a camera attaching to a printer, thereby forming a network for the purpose of printing pictures.
5	Emergency services only network	A network dedicated and limited to accessing emergency services.
6 to 13	Reserved	Reserved
14	Test or experimental	The network is used for test or experimental purposes only.
15	Wildcard	Wildcard access network type

Bit 4 is the Internet field. The AP or mesh STA sets this field to 1 if the network provides connectivity to the Internet; otherwise it is set to 0 indicating that it is unspecified whether the network provides connectivity to the Internet.

Bit 5 is the Additional Step Required for Access (ASRA) field. It is set to 1 by the AP to indicate that the network requires a further step for access. For more information, refer to Network Authentication Type Information in 9.4.5.6. A mesh STA uses the ASRA field as an emergency indicator. If a mesh STA requires emergency services, the ASRA field is set to 1; otherwise it is set to 0. See 11.22.6.

Bit 6 is the ESR (emergency services reachable) field. It is set to 1 by the AP or mesh STA to indicate that emergency services are reachable through the AP or mesh STA; otherwise it is set to 0 indicating that it is unable to reach the emergency services. See 11.22.6.

Bit 7 is the UESA (unauthenticated emergency service accessible) field. When set to 0, this field indicates that no unauthenticated emergency services are reachable through this AP or mesh STA. When set to 1, this field indicates that higher layer unauthenticated emergency services are reachable through this AP or mesh STA. A STA uses the Interworking element with the UESA bit set to 1 to gain unauthenticated access to a BSS to access emergency services. A mesh STA uses the Interworking element with the UESA bit set to 1 to gain unauthenticated access to another mesh STA to access emergency services. See 11.3.5.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Venue Info field is defined in 9.4.1.32.

The HESSID field indicates the target HESSID when a STA is actively scanning. The HESSID field for an AP is set to dot11HESSID. This optional field is not used by mesh STAs.

9.4.2.91 Advertisement Protocol element

The Advertisement Protocol element contains information that identifies a particular advertisement protocol and its corresponding Advertisement Control. The Advertisement Protocol element format is shown in Figure 9-566 (Advertisement Protocol element format).

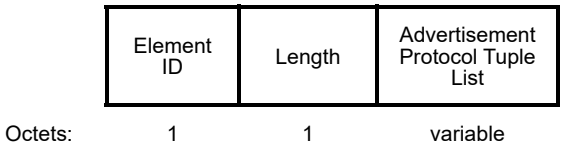

Figure 9-566—Advertisement Protocol element format

The Element ID and Length fields are defined in 9.4.2.1.

The Advertisement Protocol Tuple List field contains one or more Advertisement Protocol Tuple fields.

The format of an Advertisement Protocol Tuple field is shown in Figure 9-567 (Advertisement Protocol Tuple field format).

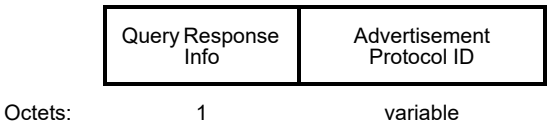

Figure 9-567—Advertisement Protocol Tuple field format

The format of Query Response Info field is shown in Figure 9-568 (Query Response Info field format).

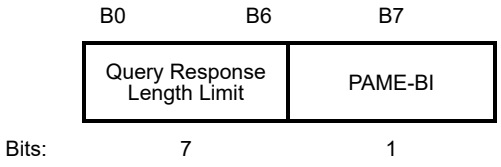

Figure 9-568—Query Response Info field format

The Query Response Info field is defined as follows:

— The Query Response Length Limit field indicates the maximum number of octets a STA will transmit in the Query Response field contained within one or more GAS Comeback Response frames. If the Query Response Length Limit field is larger than the maximum MMPDU size, the Query Response spans multiple MMPDUs. The Query Response Length Limit field is encoded as an integer number of 256 octet units. The value of 0 is reserved. The Query Response Length Limit field is set to 0x7F to indicate the maximum limit enforced is determined by the maximum allowable number of fragments in the GAS Query Response Fragment ID (see 9.4.1.31). The Query Response Length Limit field is reserved in a transmission from the requesting STA to the responding STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Bit 7, the Preassociation Message Exchange BSSID Independent (PAME-BI) bit, is used by an AP to indicate whether the advertisement server, which is the non-AP STA's peer for this advertisement protocol, returns a Query Response that is independent of the BSSID used for the GAS frame exchange. This bit is set to 1 to indicate the Query Response is independent of the BSSID; it is set to 0 to indicate that the Query Response might be dependent on the BSSID. See 11.22.3.2 for further information. Bit 7 is reserved for non-AP STAs.

The Advertisement Protocol ID field is a variable length field. When this field contains a vendor-specific advertisement protocol ID, then this field is structured per the Vendor Specific element defined in 9.4.2.24, where the Element ID of the Vendor Specific element of 9.4.2.24 is the first octet of the field and contains the vendor-specific value for advertisement protocol ID defined in Table 9-277; otherwise its length is 1 octet and its value is one of the values in Table 9-277. When one or more vendor-specific tuples are included in the Advertisement Protocol element, their total length needs to be constrained such that the total length of all of the Advertisement Protocol Tuple fields (both vendor specific and otherwise) is less than or equal to 255 octets.

— The ANQP supports information retrieval from an advertisement server. ANQP is a protocol used by a requesting STA to query another STA (i.e., the receiving STA might respond to queries with or without proxying the query to a server in an external network). See 11.22.3.3 for information on ANQP procedures.

— The MIS Information Service is a service defined in IEEE Std 802.21-2017 to support information retrieval from an information repository.

— The MIS Command and Event Services capability discovery is a mechanism defined in IEEE Std 802.21-2017 to support discovering capabilities of command service and event service entities in a STA or an external network.

— The EAS allows a network to disseminate emergency alert notifications from an external network to non-AP STAs. EAS uses the message format as defined in OASIS EDXL (see OASIS Standard EDXL-DE).

— The RLQP supports information retrieval from a RLSS. RLQP is a protocol used by a requesting STA to query another STA (i.e., the receiving STA can respond to queries with and without proxying the query to a server in an external network). 11.22 for information on RLQP procedures.

— When the Advertisement Protocol ID field is equal to 221, the format of the Advertisement Protocol ID subfield follows the format of the Vendor Specific element in 9.4.2.24.

Table 9-277—Advertisement protocol ID definitions

Name	Value
Access network query protocol (ANQP)	0
MIS Information Service	1
MIS Command and Event Services Capability Discovery	2
Emergency Alert System (EAS)	3
Registered location query protocol (RLQP)	4
Reserved	5–220
Vendor Specific	221
Reserved	222–255

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.92 Expedited Bandwidth Request element

The Expedited Bandwidth Request element is transmitted from a non-AP STA to an AP in an ADDTS Request frame containing a TSPEC element and provides usage information for the bandwidth request. The Expedited Bandwidth Request element format is shown in Figure 9-569 (Expedited Bandwidth Request element format).

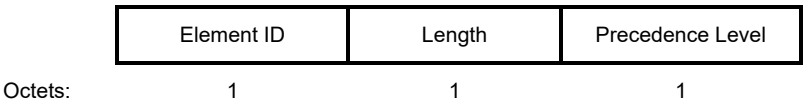

Figure 9-569—Expedited Bandwidth Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The Precedence Level field is provided in Table 9-278.

Table 9-278—Precedence Level field description

Precedence level value	Description
0–15	Reserved
16	Emergency call, defined in NENA 08-002 [B65]
17	First responder (public)
18	First responder (private)
19	MLPP Level A
20	MLPP Level B
21	MLPP Level 0
22	MLPP Level 1
23	MLPP Level 2
24	MLPP Level 3
25	MLPP Level 4
26–255	Reserved

The precedence levels are derived from the 3rd Generation Partnership Project (3GPP) document 3GPP TS 22.067 [B2].

The first responders (public) in Table 9-278 are government agencies or entities acting on behalf of the government, and the first responders (private) are private entities, such as individuals or companies.

9.4.2.93 QoS Map element

The QoS Map element is transmitted from an AP to a non-AP STA in a (Re)Association Response frame or a QoS Map Configure frame and provides the mapping of higher layer quality-of-service constructs to User Priorities defined by transmission of Data frames in this standard. This element maps the higher layer

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

priority from the DSCP field used with the Internet Protocol to User Priority as defined by this standard. The QoS Map element is shown in Figure 9-570 (QoS Map element format).

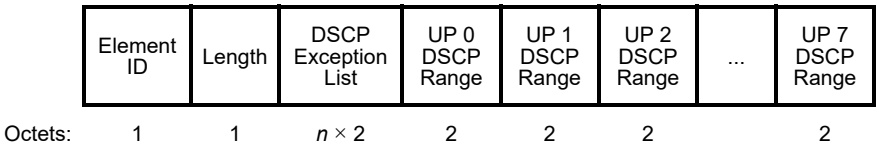

Figure 9-570—QoS Map element format

The Element ID and Length fields are defined in 9.4.2.1.

The DSCP Exception List field contains zero or more (*n*) DSCP Exception fields. The maximum value of *n* is 21. The format of each DSCP Exception field is shown in Figure 9-571 (DSCP Exception format).

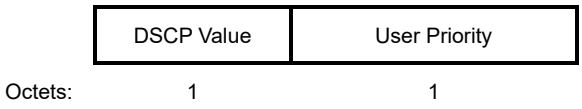

Figure 9-571—DSCP Exception format

The DSCP value in the DSCP Exception field is in the range 0 to 63, or 255; the User Priority value is in the range 0 to 7.

— When a non-AP STA begins transmission of a Data frame containing the Internet Protocol, it matches the DSCP field in the IP header to the corresponding DSCP value contained in this element. The non-AP STA first attempts to match the DSCP value to a DSCP exception field and uses the UP from the corresponding UP in the same DSCP exception field if successful; if no match is found then the non-AP STA attempts to match the DSCP field to a UP n DSCP Range field, and uses the n as the UP if successful; and otherwise uses a UP of 0.

— Each DSCP Exception field has a unique DSCP Value.

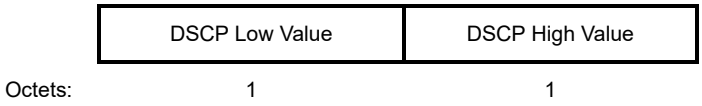

Figure 9-572—DSCP Range description

The QoS Map element has a DSCP Range field corresponding to each of the 8 user priorities. The format of the range field is shown in Figure 9-572 (DSCP Range description). The DSCP Range value is between 0 and 63, or 255.

— The DSCP range for each user priority is nonoverlapping.

— The DSCP High Value is greater than or equal to the DSCP Low Value.

— If the DSCP Range high value and low value are both equal to 255, then the corresponding UP is not used.

9.4.2.94 Roaming Consortium element

The Roaming Consortium element contains information identifying the roaming consortium and/or SSP whose security credentials can be used to authenticate with the AP transmitting this element; see 11.22.8. The element's format is shown in Figure 9-573 (Roaming Consortium element format).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

	Element ID	Length	Number of ANQP OIs	OI #1 and #2 Lengths	OI #1	OI #2 (optional)	OI #3 (optional)
Octets:	1	1	1	1	variable	variable	variable

Figure 9-573—Roaming Consortium element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Number of ANQP OIs field is an unsigned integer whose value is the number of additional roaming consortium organization identifiers (OIs) obtainable via ANQP. The Number of ANQP OIs field is set to 0 to indicate that no additional OIs are returned in response to an ANQP request for the Roaming Consortium list. The Number of ANQP OIs field is set to 255 to indicate that 255 or more additional OIs are obtainable via ANQP.

The OI #1 and #2 Lengths field format is shown in Figure 9-574 (OI #1 and #2 Lengths field format).

— The OI #1 Length subfield is set to the length in octets of the OI #1 field.
— The OI #2 Length subfield is set to the length in octets of the OI #2 field. If the OI #2 field is not present, the OI #2 Length subfield is set to 0.

	B0 B3	B4 B7
	OI #1 Length	OI #2 Length
Bits:	4	4

Figure 9-574—OI #1 and #2 Lengths field format

NOTE—When there are three OIs, the OI #3 Length is calculated by subtracting sum of 2 plus the value of the OI #1 Length subfield plus the value of the OI #2 Length subfield from the value of the Length field.

The OI field is defined in 9.4.1.29. Each OI identifies a roaming consortium (group of SSPs with inter-SSP roaming agreement) or a single SSP. The OI(s) in this table are equal to the first 3 OIs in the dot11RoamingConsortiumTable. If fewer than 3 values are defined in the dot11RoamingConsortiumTable, then only as many OIs as defined in the table are populated in this element. The values of the OIs in this element are equal to the values of the first OIs, up to 3, from the table.

9.4.2.95 Emergency Alert Identifier element

The Emergency Alert Identifier element provides a hash to identify instances of the active EAS messages that are currently available from the network. The hash allows the non-AP STA to assess whether an EAS message advertised by an AP has been previously received and therefore whether it is necessary to download from the network. The format of the Emergency Alert Identifier element is shown in Figure 9-575 (Emergency Alert Identifier element format).

	Element ID	Length	Alert Identifier Hash
Octets:	1	1	8

Figure 9-575—Emergency Alert Identifier element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Alert Identifier Hash field contains a unique value used to indicate an instance of an EAS message. This field is set to the hash produced by the HMAC-SHA-1-64 hash algorithm operating on the EAS message.

AIH =HMAC-SHA-1-64("ES_ALERT", Emergency_Alert_Message)

where

"ES_ALERT" is an ASCII string.
Emergency_Alert_Message is the EAS message itself.

9.4.2.96 Mesh Configuration element

9.4.2.96.1 General

The Mesh Configuration element shown in Figure 9-576 (Mesh Configuration element format) is used to advertise mesh services. It is contained in Beacon frames and Probe Response frames transmitted by mesh STAs and is also contained in Mesh Peering Open and Mesh Peering Confirm frames.

	Element ID	Length	Active Path Selection Protocol Identifier	Active Path Selection Metric Identifier	Congestion Control Mode Identifier	Synchronization Method Identifier	Authentication Protocol Identifier	Mesh Formation Info	Mesh Capability
Octets	1	1	1	1	1	1	1	1	1

Figure 9-576—Mesh Configuration element format

The Element ID and Length fields are defined in 9.4.2.1.

The remainder of the fields are described in the following subclauses.

9.4.2.96.2 Active Path Selection Protocol Identifier

The Active Path Selection Protocol Identifier field indicates the path selection protocol that is currently activated in the MBSS. Table 9-279 provides path selection protocol identifier values defined by this standard.

Table 9-279—Active Path Selection Protocol Identifier field values

Value	Meaning
0	Reserved
1	Hybrid wireless mesh protocol (default path selection protocol) defined in 14.11 (default path selection protocol)
2–254	Reserved
255	Vendor specific (The active path selection protocol is specified in a Vendor Specific element)

When the Active Path Selection Protocol Identifier field is 255, the active path selection protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 9.4.2.24.)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.96.3 Active Path Selection Metric Identifier

The Active Path Selection Metric Identifier field indicates the path metric that is currently used by the active path selection protocol in the MBSS. Table 9-280 provides the path selection metric identifier values defined by this standard.

Table 9-280—Active Path Selection Metric Identifier field values

Value	Meaning
0	Reserved
1	Airtime link metric defined in 14.10.2 (default path selection metric)
2	High PHY rate airtime link metric defined in 14.10.2
3–254	Reserved
255	Vendor specific (The active metric is specified in a Vendor Specific element)

When the Active Path Selection Metric Identifier field is 255, the active path metric is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 9.4.2.24.)

9.4.2.96.4 Congestion Control Mode Identifier

The Congestion Control Mode Identifier field indicates the congestion control protocol that is currently activated in the MBSS. Table 9-281 provides the congestion control mode identifier values defined by this standard.

Table 9-281—Congestion Control Mode Identifier field values

Value	Meaning
0	Congestion control is not activated (default congestion control mode)
1	Congestion control signaling protocol defined in 14.13.2
2–254	Reserved
255	Vendor specific (The active congestion control protocol is specified in a Vendor Specific element)

The Congestion Mode Identifier field set to 0 indicates the mesh STA has no active congestion control protocol and is set as the default value for the congestion control mode identifier in the MBSS.

When the Congestion Control Mode Identifier field is 255, the active congestion control protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 9.4.2.24.)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.96.5 Synchronization Method Identifier

The Synchronization Method Identifier field indicates the synchronization method that is currently activated in the MBSS. Table 9-282 provides the synchronization method identifier values defined by this standard.

Table 9-282—Synchronization Method Identifier field values

Value	Meaning
0	Reserved
1	Neighbor offset synchronization method defined in 14.14.2.2 (default synchronization method)
2–254	Reserved
255	Vendor specific (The active synchronization method is specified in a Vendor Specific element)

The neighbor offset synchronization method is defined as the default synchronization method among mesh STAs. The details of the neighbor offset synchronization method are described in 14.14.2.2.

When the Synchronization Method Identifier field is 255, the active synchronization method is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 9.4.2.24.)

9.4.2.96.6 Authentication Protocol Identifier

The Authentication Protocol Identifier field indicates the type of authentication protocol that is currently used to secure the MBSS. Table 9-283 provides the authentication protocol identifier values defined by this standard.

Table 9-283—Authentication Protocol Identifier field values

Value	Meaning
0	No authentication method is required to establish mesh peerings within the MBSS
1	SAE defined in 12.4
2	IEEE 802.1X authentication
3–254	Reserved
255	Vendor specific (The active authentication protocol is specified in a Vendor Specific element)

When the Authentication Protocol Identifier field is 255, the active authentication protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 9.4.2.24.)

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.96.7 Mesh Formation Info

The format of the Mesh Formation Info field is shown in Figure 9-577 (Mesh Formation Info field format).

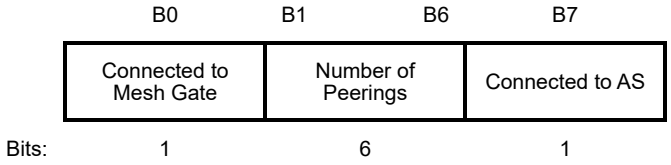

Figure 9-577—Mesh Formation Info field format

The Connected to Mesh Gate subfield is set to 1, if the mesh STA has a mesh path to a mesh gate that announces its presence using GANN elements, RANN elements, or PREQ elements, and set to 0 otherwise.

The Number of Peerings subfield contains an unsigned integer that indicates the number of mesh peerings currently maintained by the mesh STA or 63, whichever is smaller.

The Connected to AS subfield is set to 1 if the Authentication Protocol Identifier field in the Mesh Configuration element is equal to 2 (indicating IEEE 802.1X authentication) and the mesh STA has an active connection to an AS.

NOTE—When an AS is colocated with an IEEE 802.1X Authenticator an active connection is implicitly true.

9.4.2.96.8 Mesh Capability

The Mesh Capability field comprises a set of values indicating whether a mesh STA is a possible candidate for mesh peering establishment. The details of the Mesh Capability field are shown in Figure 9-578 (Mesh Capability field format).

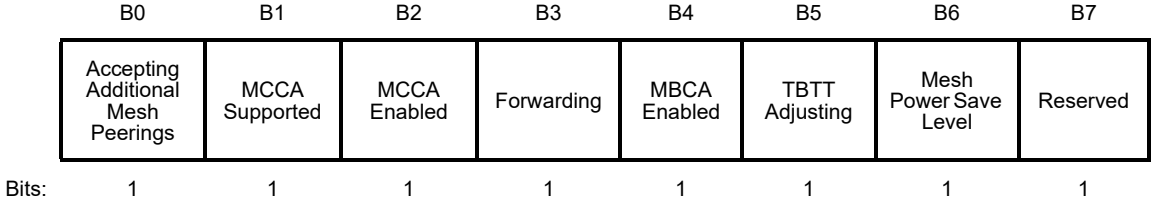

Figure 9-578—Mesh Capability field format

The Accepting Additional Mesh Peerings subfield is set to 1 if the mesh STA is willing to establish additional mesh peerings with other mesh STAs and set to 0 otherwise (i.e., the Accepting Additional Mesh Peerings subfield is set in accordance with dot11MeshAcceptingAdditionalPeerings). When the Mesh Configuration element is included in the Mesh Peering Open frame and in the Mesh Peering Confirm frame, the Accepting Additional Mesh Peerings subfield is set to 1.

The MCCA Supported subfield is set to 1 if the mesh STA implements MCCA and set to 0 otherwise (i.e., the MCCA Supported subfield is set in accordance with dot11MCCAImplemented).

The MCCA Enabled subfield is set to 1 if the mesh STA is using the MCCA and set to 0 otherwise (i.e., the MCCA Enabled subfield is set in accordance with dot11MCCAActivated).

The Forwarding subfield is set to 1 if the mesh STA forwards MSDUs and set to 0 otherwise (i.e., the Forwarding subfield is set in accordance with dot11MeshForwarding).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The MBCA Enabled subfield is set to 1 if the mesh STA is using MBCA and is set to 0 otherwise (i.e., the MBCA Enabled subfield is set in accordance with dot11MBCAActivated). (See 14.14.4.)

The TBTT Adjusting subfield is set to 1 while the TBTT adjustment procedure is ongoing and is set to 0 otherwise. (See 14.14.4.4.3.)

The Mesh Power Save Level subfield is set to 1 if at least one of the peer-specific mesh power management modes is deep sleep mode and set to 0 otherwise. The Mesh Power Save Level subfield is reserved when the Power Management subfield in the Frame Control field is set to 0. See 9.2.4.5.11.

9.4.2.97 Mesh ID element

The Mesh ID element is used to advertise the identification of an MBSS and is described in 14.3.2. The format of the Mesh ID element is shown in Figure 9-579 (Mesh ID element format). The Mesh ID element is transmitted in Mesh Peering Open frames, Mesh Peering Confirm frames, Mesh Peering Close frames, Beacon frames, and Probe Request and Response frames.

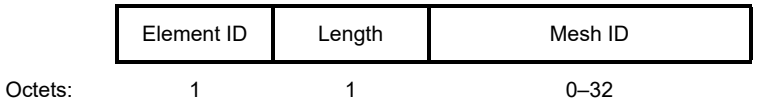

Figure 9-579—Mesh ID element format

The Element ID and Length fields are defined in 9.4.2.1.

A Mesh ID field of length 0 indicates the wildcard mesh ID, which is used within Probe Request frame.

Detailed usage of the Mesh ID element is described in 14.3.2.

9.4.2.98 Mesh Link Metric Report element

The Mesh Link Metric Report element is transmitted by a mesh STA to a neighbor peer mesh STA to indicate the quality of the link between the transmitting mesh STA and the neighbor peer mesh STA. The format of the Mesh Link Metric Report element is shown in Figure 9-580 (Mesh Link Metric Report element format).

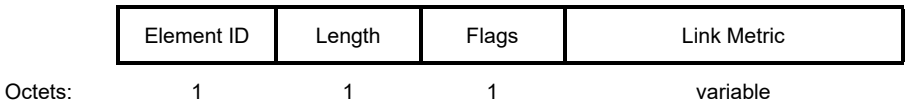

Figure 9-580—Mesh Link Metric Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Flags field is shown in Figure 9-581 (Flags field format).

The Flags field is set as follows:

— Bit 0: Request subfield (0 = not a request, 1 = link metric report request). A Request subfield equal to 1 indicates that the recipient of Mesh Link Metric Report element is requested to send a link metric report to the transmitter of the Mesh Link Metric Report element.
— Bit 1–7: Reserved.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

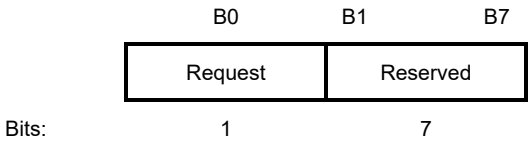

Figure 9-581—Flags field format

The Link Metric field indicates the link metric associated with the mesh link between the peer mesh STA transmitting the Mesh Link Metric Report and the neighbor mesh STA receiving the Mesh Link Metric report. The length and the data type of the Link Metric field are determined by the active path selection metric identifier (see 9.4.2.96.3). The length and the data type for the airtime link metric are given in Table 14-5 in 14.10.2. The length and the data type for the airtime link metric and the high PHY rate airtime link metric are given in Table 14-5 in 14.10.2.

9.4.2.99 Congestion Notification element

The Congestion Notification element is used to indicate the congestion status of the mesh STA per mesh destination and AC, and the duration for which the STA expects the congestion to last. The format of the Congestion Notification element is shown in Figure 9-582 (Congestion Notification element format). The Congestion Notification element is included in Congestion Control Notification frames, as described in 9.6.16.5.

	Element ID	Length	Destination Mesh STA Address	Congestion Notification Duration (AC_BK)	Congestion Notification Duration (AC_BE)	Congestion Notification Duration (AC_VI)	Congestion Notification Duration (AC_VO)
Octets:	1	1	6	2	2	2	2

Figure 9-582—Congestion Notification element format

The Element ID and Length fields are defined in 9.4.2.1.

The Destination Mesh STA Address field is set to the address of the mesh destination for which the intra-mesh congestion control is applied. It is set to the broadcast address if the intra-mesh congestion control is applied to all destinations.

The element contains four Congestion Notification Duration fields for the four EDCA access categories to indicate the estimated congestion duration per AC at the mesh STA transmitting the congestion notification. The congestion notification duration values are encoded as unsigned integers in units of 100 μs.

9.4.2.100 Mesh Peering Management element

The Mesh Peering Management element is used to manage a mesh peering with a neighbor mesh STA. The format of the Mesh Peering Management element is shown in Figure 9-583 (Mesh Peering Management element format).

The Element ID and Length fields are defined in 9.4.2.1.

The Mesh Peering Protocol Identifier field indicates the type of mesh peering protocol that is currently used to establish mesh peerings. Table 9-284 provides the mesh peering protocol identifier values defined by this standard.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

	Element ID	Length	Mesh Peering Protocol Identifier	Local Link ID	Peer Link ID (optional)	Reason Code (optional)	Chosen PMK (optional)
Octets:	1	1	2	2	0 or 2	0 or 2	0 or 16

Figure 9-583—Mesh Peering Management element format

Table 9-284—Mesh Peering Protocol Identifier field values

Value	Meaning
0	Mesh peering management protocol
1	Authenticated mesh peering exchange protocol
2–254	Reserved
255	Vendor specific (The active mesh peering protocol is specified in a Vendor Specific element)
256–65 535	Reserved

When the Mesh Peering Protocol Identifier field is 255, the active mesh peering protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 9.4.2.24.)

The Local Link ID field is the unsigned integer value generated by the local mesh STA to identify the mesh peering instance.

The conditional components of the Mesh Peering Management element are present depending on the Action field of the frame in which the Mesh Peering Management element is conveyed.

The Peer Link ID field is the unsigned integer value generated by the peer mesh STA to identify the mesh peering instance. This field is not present for the Mesh Peering Open frame, is present for the Mesh Peering Confirm frame, and is optionally present for the Mesh Peering Close frame. The presence or absence of the Peer Link ID in a Mesh Peering Close is inferred by the Length field.

The Reason Code field enumerates reasons for sending a Mesh Peering Close. It is present for the Mesh Peering Close frame and is not present for Mesh Peering Open or Mesh Peering Confirm frames. The reason code is defined in 9.4.1.7.

The Chosen PMK field is present when dot11MeshSecurityActivated is true and a PMK is shared between the transmitter and receiver of the frame containing the element. It contains the PMKID that identifies the PMK used to protect the mesh peering Management frame.

Detailed usage of the Mesh Peering Management element is described in 14.4.6, 14.4.7, 14.4.8, and 14.6.5.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.101 Mesh Channel Switch Parameters element

The Mesh Channel Switch Parameters element is used together with Channel Switch Announcement element and Extended Channel Switch Announcement element by a mesh STA to advertise to other mesh STAs when it is changing to a new operating channel and/or operating class. The format of the Mesh Channel Switch Parameters element is shown in Figure 9-584 (Mesh Channel Switch Parameters element format).

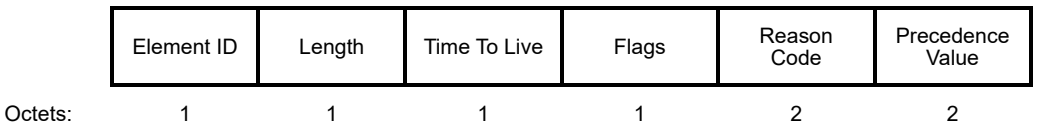

Figure 9-584—Mesh Channel Switch Parameters element format

The Element ID and Length fields are defined in 9.4.2.1.

The Time To Live field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Flags field indicates the attribute of this channel switch attempt. The format of the Flags field is shown in Figure 9-585 (Flags field format).

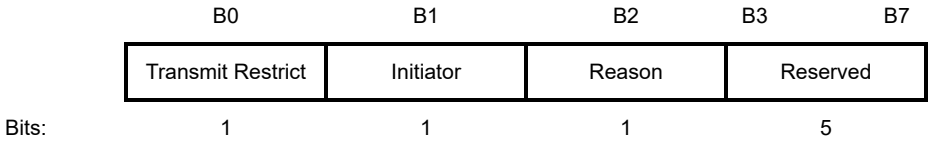

Figure 9-585—Flags field format

The Transmit Restrict subfield is set to 1 when the mesh STA asks neighboring peer mesh STAs not to transmit further frames except frames containing Mesh Channel Switch Parameters element on the current channel until the scheduled channel switch. The Transmit Restrict subfield is set to 0 otherwise.

The Initiator subfield is set to 1 when the mesh STA initiates this channel switch attempt. The Initiator subfield is set to 0 when this channel switch attempt is initiated by another mesh STA and propagated by the current mesh STA.

The Reason subfield indicates the validity of the Reason Code field. It is set to 1 if the Reason Code field is valid and is set to 0 otherwise. When the Reason subfield is 0, the content of the Reason Code field is reserved.

The Reason Code field specifies the reason for the mesh channel switch. The Reason Code is defined in 9.4.1.7. The content of the Reason Code field is valid only when Reason subfield of Flags field is set to 1 and is reserved otherwise.

The Precedence Value field is coded as unsigned integer and is set to a random value drawn from a uniform distribution in the range 0 to 65 535 determined by the initiator of this channel switch attempt.

The Mesh Channel Switch Parameters element is included in Channel Switch Announcement frames, as described in 9.6.2.6, and Extended Channel Switch Announcement frames, as described in 9.6.7.7. During MBSS channel switching, the Mesh Channel Switch Parameters element is included in Beacon frames, as

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

described in 9.3.3.2, and Probe Response frames, as described in 9.3.3.10, until the scheduled channel switch.

9.4.2.102 Mesh Awake Window element

The format of the Mesh Awake Window element is shown in Figure 9-586 (Mesh Awake Window element format).

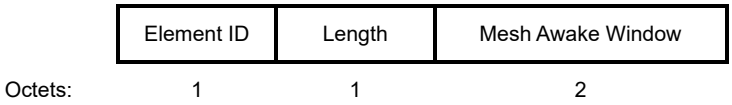

Figure 9-586—Mesh Awake Window element format

The Element ID and Length fields are defined in 9.4.2.1.

The Mesh Awake Window field contains an unsigned integer that indicates the duration of the mesh awake window in TUs.

9.4.2.103 Beacon Timing element

The Beacon Timing element is used to advertise the beacon timing information of neighbor STAs (mesh STAs, IBSS APs, or IBSS STAs). The format of the Beacon Timing element is shown in Figure 9-587 (Beacon Timing element format).

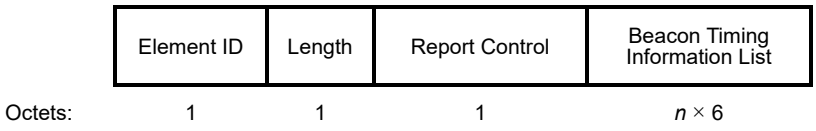

Figure 9-587—Beacon Timing element format

The Element ID and Length fields are defined in 9.4.2.1.

The Report Control field is used to signal information about the beacon timing information tuple contained in the Beacon Timing element. The structure of the Report Control field is defined in Figure 9-588 (Report Control field format).

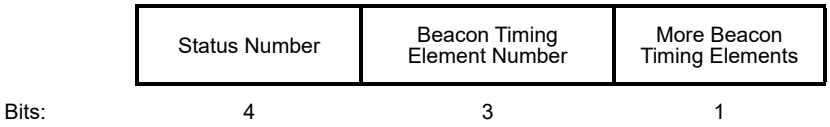

Figure 9-588—Report Control field format

The Status Number subfield is set to the status number of the beacon timing information set. The status number is managed as described in 14.14.4.2.4.

The Beacon Timing Element Number subfield is an unsigned integer that indicates the index of the beacon timing information tuple contained in this Beacon Timing element. The Beacon Timing Element Number is set to 0 in the Beacon Timing element for the first or only tuple of the beacon timing information and is

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

incremented by one for each successive tuple of the beacon timing information. The beacon timing information tuples are managed as described in 14.14.4.2.5.

The More Beacon Timing Element subfield is set to 1 if a successive tuple of beacon timing information exists, and set to 0 otherwise.

The Beacon Timing Information List field contains one or more (*n*) Beacon Timing Information fields.

Each Beacon Timing Information field contains the beacon timing information of a neighbor STA. When the mesh STA reports multiple beacon timing information, multiple Beacon Timing Information fields are included in the Beacon Timing element. The structure of the Beacon Timing Information field is defined in Figure 9-589 (Beacon Timing Information field format).

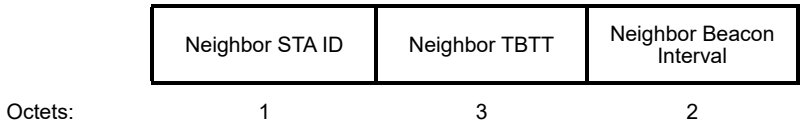

Figure 9-589—Beacon Timing Information field format

The Neighbor STA ID subfield is an unsigned integer that indicates the identification of the neighbor STA corresponding to this beacon timing information. When a mesh peering is established with this neighbor STA, the MSB of this field is set to 0, and the rest of this field is set to the last 7 digits (7 LSBs) of the AID value assigned to this neighbor mesh STA. When a mesh peering is not established with this neighbor STA, the MSB of this field is set to 1, and the rest of this field is set to MAC_ADDR[42:47] of the MAC address of this neighbor STA.

NOTE—Since the Neighbor STA ID subfield is provided in abbreviated form, it is possible that the same Neighbor STA ID value appears in multiple Beacon Timing Information fields.

The Neighbor TBTT subfield is an unsigned integer that indicates a TBTT of the corresponding neighbor STA, measured in the local TSF timer of the mesh STA. The value is indicated in multiples of 32 μs. When the active synchronization method is the neighbor offset synchronization method, the TBTT is calculated as described in 14.14.4.2.2. The B5 to the B28 (taking the B0 as the LSB) of the calculated TBTT are contained in this subfield.

The Neighbor Beacon Interval subfield is an unsigned integer that indicates the beacon interval being used by the corresponding neighbor STA. The unit of the Neighbor Beacon Interval subfield is TU.

Detailed usage of the Beacon Timing element is described in 14.14.4.2.

9.4.2.104 MCCAOP Setup Request element

9.4.2.104.1 General

The MCCAOP Setup Request element is used to make an MCCAOP reservation. This element is transmitted in individually addressed MCCA Setup Request frames or in group addressed MCCA Setup Request frames. The mesh STA transmitting the MCCA Setup Request element is the MCCAOP owner of the MCCAOPs scheduled with this reservation setup request. The receivers of the MCCAOP Setup Request frame are the MCCAOP responders. The format of the element is shown in Figure 9-590 (MCCAOP Setup Request element format).

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

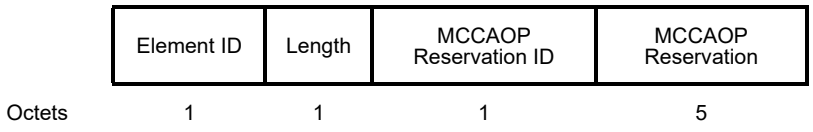

Figure 9-590—MCCAOP Setup Request element format

The MCCAOP Reservation ID field is an unsigned integer that represents the ID for the MCCAOP reservation. It is determined by the MCCAOP owner. When used in combination with the MAC address of the MCCAOP owner, the MCCAOP Reservation ID uniquely identifies the MCCAOP reservation. If this MCCAOP Setup Request element is for an individually addressed transmission, the MCCAOP Reservation ID is between 0 and 127 and the MCCAOP Setup Request element is transmitted in an individually addressed frame to the intended responder. If this MCCAOP Setup Request element is for a group addressed transmission, the MCCAOP Reservation ID is between 128 and 254 and the MCCAOP Setup Request element is transmitted in a group addressed frame. The value 255 is not used to identify a single MCCAOP reservation.

The MCCAOP Reservation field is described in 9.4.2.104.2.

9.4.2.104.2 MCCAOP Reservation field

The MCCAOP Reservation field specifies a schedule for frame transmissions called *MCCAOPs*. The MCCAOP Reservation field consists of three subfields and its format is shown in Figure 9-591 (MCCAOP Reservation field format).

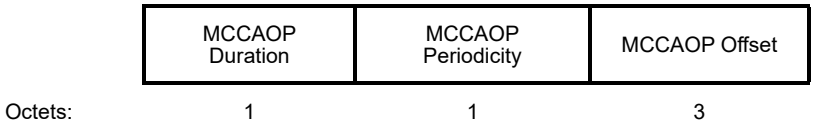

Figure 9-591—MCCAOP Reservation field format

The MCCAOP Duration subfield contains an unsigned integer. It specifies the duration of the MCCAOPs in multiples of 32 μs.

The MCCAOP Periodicity subfield contains a positive integer. It specifies the number of MCCAOPs scheduled in each DTIM interval.

The MCCAOP Offset subfield contains an unsigned integer. It specifies the beginning of the first MCCAOP in each DTIM interval. The value is specified in multiples of 32 μs. The sum of MCCAOP Offset plus MCCAOP Duration is constrained to be smaller than the duration of the DTIM interval divided by MCCAOP Periodicity.

9.4.2.105 MCCAOP Setup Reply element

The MCCAOP Setup Reply element is used to reply to an MCCAOP Setup Request. This element is transmitted in individually addressed MCCA Setup Reply frames. The mesh STA transmitting the MCCA Setup Reply element is the MCCAOP responder of the MCCAOPs scheduled in this reservation setup. The receiver of the MCCAOP Setup Reply is the MCCAOP owner. The format of the element is shown in Figure 9-592 (MCCAOP Setup Reply element format).

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

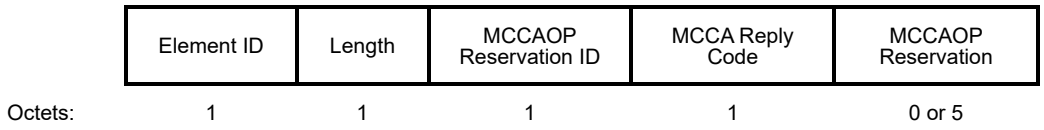

Figure 9-592—MCCAOP Setup Reply element format

The MCCAOP Reservation ID field is an unsigned integer that represents the ID for the requested series of MCCAOPs. It is determined by the MCCAOP owner and copied from the MCCAOP Setup Request element. When used in combination with the MAC address of the MCCAOP owner, the MCCAOP Reservation ID uniquely identifies the MCCAOP reservation.

The MCCA Reply Code field contains the reply code used in an MCCAOP Setup Reply element. The reply codes are defined in Table 9-285.

Table 9-285—MCCA Reply Code field values

MCCA reply code	Meaning
0	Accept
1	Reject: MCCAOP reservation conflict
2	Reject: MAF limit exceeded
3	Reject: MCCAOP reservation track limit (dot11MCCATrackStatesCapable) exceeded
4–255	Reserved

The MCCAOP Reservation field includes an alternative to the MCCAOP reservation specified in the MCCAOP Setup Request frame. Its format is described in 9.4.2.104.2. When the MCCA Reply Code is 1, the MCCAOP Reservation field might be present. When the MCCA Reply Code is set to other values, the MCCAOP Reservation field is not present.

9.4.2.106 MCCAOP Advertisement Overview element

The MCCAOP Advertisement Overview element is used by a mesh STA to advertise its MCCA Information and information about its MCCAOP Advertisement elements, representing its MCCAOP advertisement set, to its neighbors. This element is transmitted in MCCA Advertisement frames and optionally present in Beacon frames. The format of the MCCAOP Advertisement Overview element is shown in Figure 9-593 (MCCAOP Advertisement Overview element format).

Figure 9-593—MCCAOP Advertisement Overview element format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The Advertisement Set Sequence Number field is coded as an unsigned integer. It is set to the advertisement set sequence number of the current MCCAOP advertisement set. The Advertisement Set Sequence Number, together with the MAC address of the transmitter of the MCCAOP Advertisement Overview element, identifies an MCCAOP advertisement set and provides an identifier and a chronological order of different MCCAOP advertisement sets of the same mesh STA.

The format of the Flags field is shown in Figure 9-594 (Flags field format).

Figure 9-594—Flags field format

The Flags field is set as follows:

— Bit 0: Accept Reservations subfield. The Accept Reservations subfield is set to 1 if the mesh STA accepts additional reservations. It is set to 0 otherwise.

— Bit 1–7: Reserved

The MCCA Access Fraction field is an unsigned integer. The MCCA Access Fraction field is set to the current value of the MCCA access fraction at the mesh STA rounded down to the nearest multiple of (1/255) of the DTIM interval length.

The MAF Limit field is an unsigned integer. The MAF Limit field is set to the maximum MCCA access fraction allowed at the mesh STA rounded down to the nearest multiple of (1/255) of the DTIM interval length.

The Advertisement Elements Bitmap field indicates the MCCAOP Advertisement elements that are part of this MCCAOP advertisement set. The Advertisement Elements Bitmap field is a bitmap. Bit *i* in this bitmap equals 1 if the MCCAOP Advertisement element with MCCAOP Advertisement Element Index equal to *i* is part of this MCCAOP advertisement set, and it equals 0 otherwise.

9.4.2.107 MCCAOP Advertisement element

9.4.2.107.1 General

The MCCAOP Advertisement element is used by a mesh STA to advertise MCCAOP reservations to its neighbors. This element is transmitted in MCCA Advertisement frames and optionally present in Beacon frames. The format of the element is shown in Figure 9-595 (MCCAOP Advertisement element format).

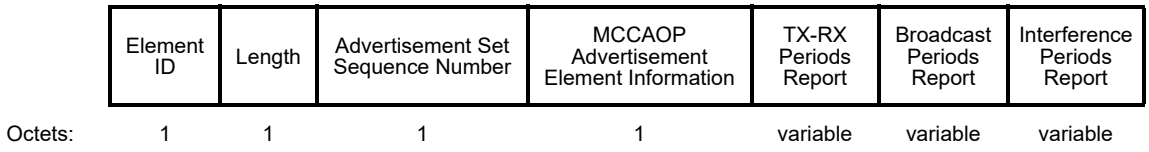

Figure 9-595—MCCAOP Advertisement element format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The Advertisement Set Sequence Number field is coded as an unsigned integer. It is set to the advertisement set sequence number of the current MCCAOP advertisement set. The Advertisement Set Sequence Number, together with the MAC address of the transmitter of the MCCAOP Advertisement element, identifies an MCCAOP advertisement set and provides an identifier and a chronological order of different MCCAOP advertisement sets of the same mesh STA.

The MCCAOP Advertisement Element Information field is described in 9.4.2.107.2.

The TX-RX Periods Report field is a variable length field that contains an MCCAOP Reservation Report field, as described in 9.4.2.107.3. This field is present when the TX-RX Report Present subfield of the MCCAOP Advertisement Element Information field is equal to 1; it is not present otherwise. The TX-RX Periods Report field is described in 10.24.3.7.2.

The Broadcast Periods Report field is a variable length field that contains an MCCAOP Reservation Report field, as described in 9.4.2.107.3. This field is present when the Broadcast Report Present subfield of the MCCAOP Advertisement Element Information field is equal to 1; it is not present otherwise. The Broadcast Periods Report field is described in 10.24.3.7.2.

The Interference Periods Report field is a variable length field that contains an MCCAOP Reservation Report field, as described in 9.4.2.107.3. This field is present when the Interference Report Present subfield of the MCCAOP Advertisement Element Information field is equal to 1; it is not present otherwise. The Interference Periods Report field is described in 10.24.3.7.2.

9.4.2.107.2 MCCAOP Advertisement Element Information field

The MCCA Information field provides information on the MCCAOP reservations. The field consists of four subfields and its format is shown in Figure 9-596 (MCCAOP Advertisement Element Information field format).

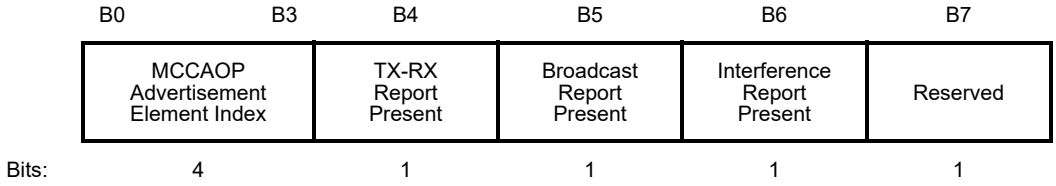

Figure 9-596—MCCAOP Advertisement Element Information field format

The MCCAOP Advertisement Element Index subfield is an unsigned integer. It identifies the MCCAOP Advertisement element.

The TX-RX Report Present subfield is set to 1 if the TX-RX Periods Report field is present in the MCCAOP Advertisement element and set to 0 if no TX-RX Periods Report field is present.

The Broadcast Report Present subfield is set to 1 if the Broadcast Periods Report field is present in the MCCAOP Advertisement element and set to 0 if no Broadcast Periods Report field is present.

The Interference Report Present subfield is set to 1 if the Interference Periods Report field is present in the MCCAOP Advertisement element and set to 0 if no Interference Periods Report field is present.

9.4.2.107.3 MCCAOP Reservation Report field

The MCCAOP Reservation Report field is of variable length and is used to report a number of MCCAOP reservations. The field consists of a variable number of subfields and its format is shown in Figure 9-597 (MCCAOP Reservation Report field format).

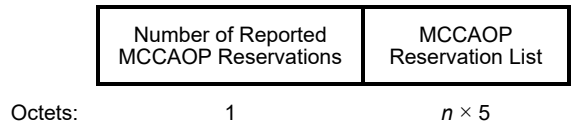

Figure 9-597—MCCAOP Reservation Report field format

The Number of Reported MCCAOP Reservations field is an unsigned integer that indicates the number, *n*, of MCCAOP Reservation fields reported in the MCCAOP Reservation List field.

The MCCAOP Reservation List field contains one or more (*n*) MCCAOP Reservation fields.

The MCCAOP Reservation fields specify the MCCAOP reservations reported. The format of each MCCAOP Reservation field is shown in Figure 9-591 (MCCAOP Reservation field format) in 9.4.2.104.2.

9.4.2.108 MCCAOP Teardown element

The MCCAOP Teardown element is used to announce the teardown of an MCCAOP reservation. The MCCAOP Teardown element is transmitted in individually addressed MCCA Teardown frames or in group addressed MCCA Teardown frames. Its format is shown in Figure 9-598 (MCCAOP Teardown element format).

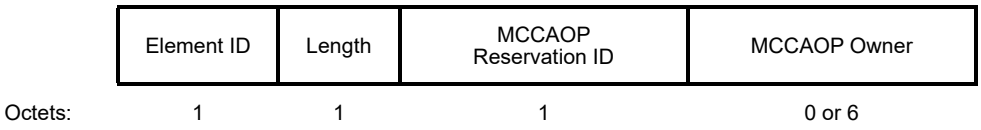

Figure 9-598—MCCAOP Teardown element format

The Element ID and Length fields are defined in 9.4.2.1.

An MCCAOP Teardown element is transmitted by either the MCCAOP owner or the MCCAOP responder of an MCCAOP reservation to tear down the MCCAOP reservation.

The MCCAOP Reservation ID field is an unsigned integer that represents the ID for the MCCAOP reservation.

The MCCAOP Owner field, if present, indicates the MAC address of the MCCAOP owner. This field is included if the element is transmitted by the MCCAOP responder; it is not included otherwise.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.109 GANN element

The GANN (gate announcement) element is used for announcing the presence of a mesh gate in the MBSS. The GANN element is transmitted in a Gate Announcement frame (see 9.6.16.4). The format of the GANN element is shown in Figure 9-599 (GANN element format).

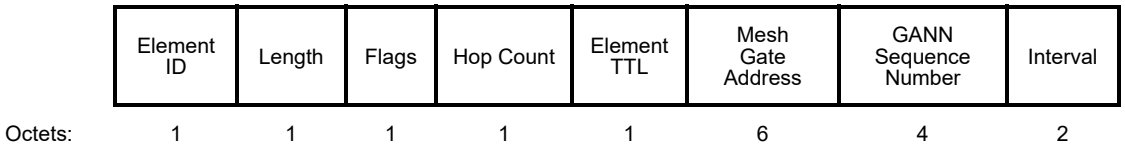

Figure 9-599—GANN element format

The Element ID and Length fields are defined in 9.4.2.1.

The Flags field is reserved.

The Hop Count field is coded as an unsigned integer and indicates the number of hops from the originating mesh gate to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Mesh Gate Address field is set to the MAC address of the mesh gate.

The GANN Sequence Number field is coded as an unsigned integer and is set to a GANN Sequence Number specific for the originating mesh gate.

The Interval field is coded as an unsigned integer and is set to the number of seconds between the periodic transmissions of Gate Announcements by the mesh gate.

Detailed usage of the GANN element is described in 14.12.2.

9.4.2.110 RANN element

The RANN (root announcement) element is used for announcing the presence of a mesh STA configured as root mesh STA with dot11MeshHWMProotMode set to rann (4). RANN elements are sent out periodically by such a root mesh STA. The RANN element is transmitted in an HWMP Mesh Path Selection frame (see 9.6.16.3). The format of the RANN element is shown in Figure 9-600 (RANN element format).

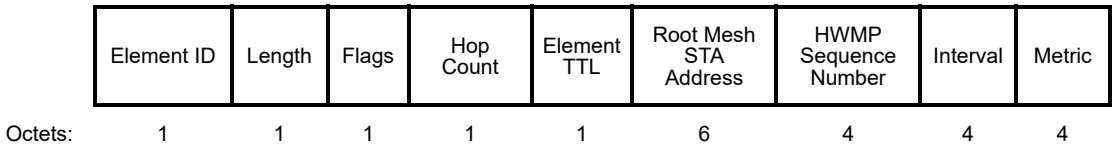

Figure 9-600—RANN element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Flags field is shown in Figure 9-601 (Flags field format).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

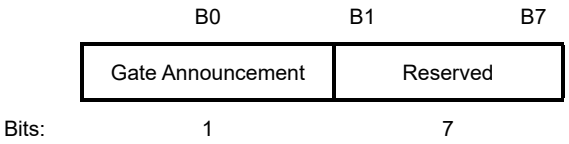

Figure 9-601—Flags field format

The Flags field is set as follows:

— Bit 0: Gate Announcement subfield (0 = gate announcement protocol not activated, 1 = gate announcement protocol activated). A Gate Announcement subfield equal to 1 indicates that the Root Mesh STA Address is a mesh gate with dot11MeshGateAnnouncements equal to true.

— Bit 1–7: Reserved.

The Hop Count field is coded as an unsigned integer and indicates the number of hops from the originating root mesh STA to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Root Mesh STA Address field is set to the MAC address of the root mesh STA.

The HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP sequence number (SN) specific to the root mesh STA.

The Interval field is coded as an unsigned integer and is set to the number of TUs between the periodic transmissions of Root Announcements.

The Metric field is set to the cumulative metric from the originating root mesh STA to the mesh STA transmitting the announcement.

Detailed usage of the RANN element is described in 14.11.12.

9.4.2.111 PREQ element

The PREQ (path request) element is used for discovering a path to one or more target mesh STAs, maintaining a path (optional), building a proactive (reverse) path selection tree to the root mesh STA, and confirming a path to a target mesh STA (optional). The PREQ element is transmitted in an HWMP Mesh Path Selection frame (see 9.6.16.3). The format of the PREQ element is shown in Figure 9-602 (PREQ element format).

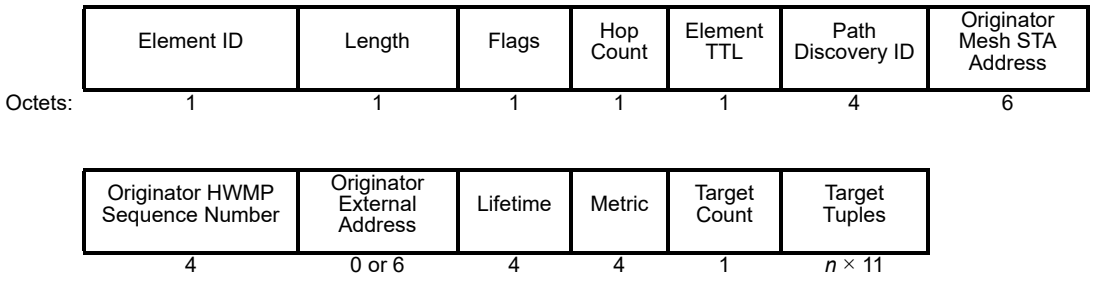

Figure 9-602—PREQ element format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Flags field is shown in Figure 9-603 (Flags field format).

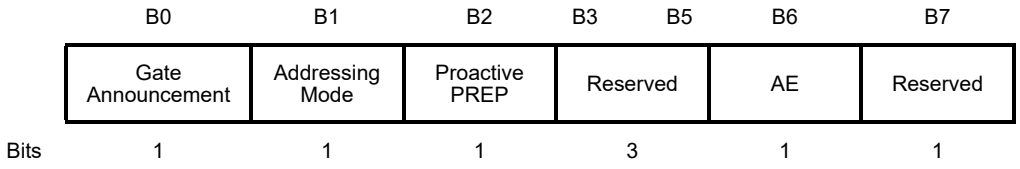

Figure 9-603—Flags field format

The Flags field is set as follows:

- Bit 0: Gate Announcement subfield (0 = gate announcement protocol not activated, 1 = gate announcement protocol activated). A Gate Announcement subfield equal to 1 indicates that the originator mesh STA address is a mesh gate with dot11MeshGateAnnouncements equal to true.
- Bit 1: Addressing Mode subfield (0 = group addressed, 1 = individually addressed). When the Addressing Mode subfield is 0, the PREQ element is sent in an HWMP Mesh Path Selection frame that is group addressed to all neighbor peer mesh STAs. When the Addressing Mode subfield is 1, the PREQ element is sent in an HWMP Mesh Path Selection frame that is individually addressed to a neighbor peer mesh STA. Detailed addressing information is provided in 14.11.7.
- Bit 2: Proactive PREP subfield (0 = off, 1 = on). The Proactive PREP subfield is of relevance only if the Target Address is the broadcast address (all 1s). If equal to 1, every recipient of a PREQ element with Target Address equal to the broadcast address replies with a PREP element. If equal to 0, a recipient replies only under certain conditions (see 14.11.4.2) and does not reply otherwise.
- Bit 3–5: Reserved.
- Bit 6: AE (Address Extension) subfield (1= external address present, 0 = otherwise). An AE subfield equal to 1 indicates that the field Originator External Address is present, and that the originator mesh STA is a proxy for this external address.
- Bit 7: Reserved.

The Hop Count field is coded as an unsigned integer and is set to the number of hops from the originator to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Path Discovery ID field is coded as an unsigned integer and is set to some unique ID for this PathDiscovery.

The Originator Mesh STA Address field is represented as a MAC address and is set to the originator MAC address.

The Originator HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP SN specific to the originator.

The Originator External Address field is the MAC address of an external STA proxied by the originator. This field is present only if the AE subfield in the Flags field is set to 1 and is set to a MAC address.

The Lifetime field is coded as an unsigned integer and is set to the time for which mesh STAs receiving the PREQ element consider the forwarding information to be valid. The lifetime is measured in TUs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Metric field is set to the cumulative metric from the originator to the mesh STA transmitting the PREQ element.

The Target Count field is an unsigned integer and gives the number of targets (*n*) contained in this PREQ element. The maximum value of *n* is 20.

The Target Tuples field contains one or more Target Tuple fields. The format of a Target Tuple field is shown in Figure 9-604 (Target Tuple field format).

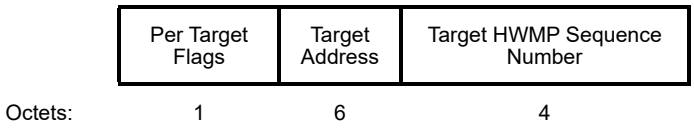

Figure 9-604—Target Tuple field format

The format of the Per Target Flags field is shown in Figure 9-605 (Per Target Flags field format).

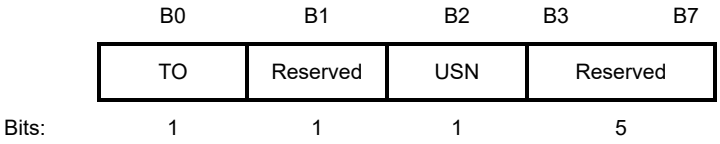

Figure 9-605—Per Target Flags field format

The Per Target Flags field is set as follows:

— Bit 0: TO (Target Only) subfield: The TO subfield defines the mesh STA to respond with a PREP element to the PREQ element containing an individual target address. If TO = 1, only the target mesh STA responds. If TO = 0, intermediate mesh STAs with active forwarding information to the target mesh STA also respond. See 14.11.10.3.

— Bit 1: Reserved.

— Bit 2: USN (Unknown Target HWMP Sequence Number) subfield: The USN subfield indicates whether the Target HWMP Sequence Number field of the corresponding target is interpreted as HWMP SN (USN = 0) or not (USN = 1), the latter meaning that a target HWMP SN is unknown at the originator mesh STA.

— Bit 3–7: Reserved.

The Target Address field is set to a MAC address.

The Target HWMP Sequence Number field is coded as an unsigned integer and is the latest known HWMP SN received in the past by the originator mesh STA for any path toward the target. If such a target HWMP SN is not known, the USN subfield is set to 1 and Target HWMP Sequence Number field is reserved.

Detailed usage of the PREQ element is described in 14.11.9.

9.4.2.112 PREP element

The PREP (path reply) element is used to establish a forward path to a target and to confirm that a target is reachable. The PREP element is issued in response to a PREQ element. The PREP element is transmitted in an HWMP Mesh Path Selection frame (see 9.6.16.3). The format of the PREP element is shown in Figure 9-606 (PREP element format).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

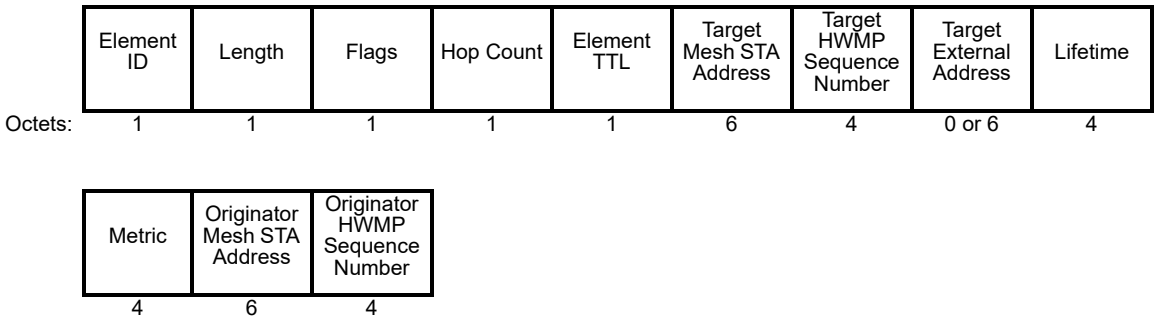

Figure 9-606—PREP element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Flags field is shown in Figure 9-607 (Flags field format).

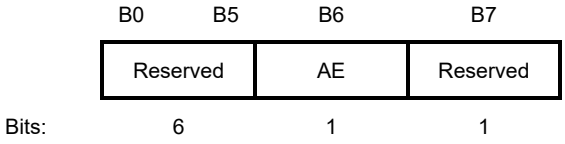

Figure 9-607—Flags field format

The Flags field is set as follows:

— Bit 0–5: Reserved.

— Bit 6: AE (Address Extension) subfield (1 = external address present, 0 = otherwise). An AE subfield equal to 1 indicates that the field Target External Address is present, and that the target mesh STA is a proxy for this external address.

— Bit 7: Reserved.

The Hop Count field is coded as an unsigned integer and is set to the number of hops from the path target to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Target Mesh STA Address is the MAC address of the target mesh STA or target proxy mesh gate and is represented as a MAC address.

The Target HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP SN of the target mesh STA (if the AE subfield in the Flags field is equal to 0) or target proxy mesh gate (if the AE subfield in the Flags field is equal to 1).

The Target External Address field is set to the external address on behalf of which the PREP element is sent. This field is present only if Bit 6 (AE subfield) in Flags field equals 1 and is represented as a MAC address.

The Lifetime field is coded as an unsigned integer and is set to the time for which mesh STAs receiving the PREP element consider the forwarding information to be valid. The lifetime is measured in TUs.

The Metric field indicates the cumulative metric from the path target to the mesh STA transmitting this element.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Originator Mesh STA Address field is represented as a MAC address and is set to the MAC address of the originator, which is contained in the PREQ element.

The Originator HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP SN of the originator mesh STA contained in the PREQ element.

The detailed usage of the PREP element is described in 14.11.10.

9.4.2.113 PERR element

The PERR (path error) element is used for announcing an unreachable destination. The PERR element is transmitted in an HWMP Mesh Path Selection frame (see 9.6.16.3). The format of the PERR element is shown in Figure 9-608 (PERR element format).

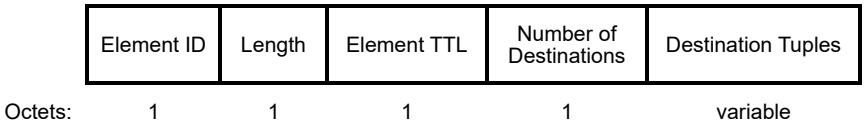

Figure 9-608—PERR element format

The Element ID and Length fields are defined in 9.4.2.1.

The Element TTL field is an unsigned integer that indicates the remaining number of hops allowed for this element.

The Number of Destinations field is an unsigned integer and indicates the number of announced destinations in PERR, *n*. The maximum value of *n* is 19.

The Destination Tuples field contains one or more Destination Tuple fields. The format of a Destination Tuple field is shown in Figure 9-609 (Destination Tuples field format).

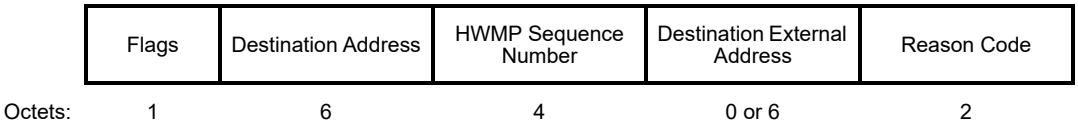

Figure 9-609—Destination Tuples field format

The format of the Flags field is shown in Figure 9-610 (Flags field format).

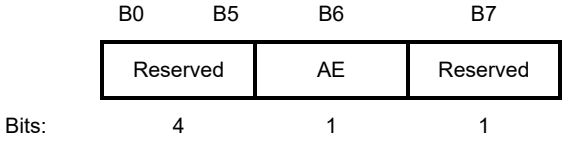

Figure 9-610—Flags field format

The Flags field is set as follows:

— Bit 0–5: Reserved.

— Bit 6: AE (Address Extension) subfield (1 = destination external address is present, 0 = otherwise).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Bit 7: Reserved.

The Destination Address field is represented as a MAC address and indicates the detected unreachable destination MAC address.

The HWMP Sequence Number field is coded as an unsigned integer and indicates the HWMP SN for the invalidated destination, if applicable. Otherwise, the HWMP Sequence Number field is reserved depending on the reason code.

The Destination External Address field is set to the external address, on behalf of which the PERR is sent. This field is present only if Bit 6 (AE subfield) in the Flags field equals 1 and is represented as a MAC address.

The Reason Code field specifies the reason for sending a PERR element. The Reason Code is defined in 9.4.1.7.

The detailed usage of the PERR element is described in 14.11.11.

9.4.2.114 PXU element

The PXU (proxy update) element is used to inform the destination mesh STA of the proxy information at the originator mesh STA. The PXU element is transmitted in a Proxy Update frame (see 9.6.17.2). The format of the PXU element is shown in Figure 9-611 (PXU element format).

	Element ID	Length	PXU ID	PXU Originator MAC Address	Number of Proxy Information	Proxy Information List
Octets:	1	1	1	6	1	variable

Figure 9-611—PXU element format

The Element ID and Length fields are defined in 9.4.2.1.

The PXU ID field is an unsigned integer and is set to the sequence number of the PXU. The source mesh STA sets the PXU ID field in the PXU element to a value from a single modulo 256 counter that is incremented by 1 for each new PXU element.

The PXU Originator MAC Address field is represented as a MAC address and is the MAC address of the mesh STA that originates this PXU element.

The Number of Proxy Information field is set to the number *n* of Proxy Information fields in the Proxy Information List field and that are reported to the destination mesh STA. The maximum value of *n* is 22.

The Proxy Information List field contains one or more (*n*) Proxy Information fields.

A Proxy Information field contains a single proxy information (see 14.12.4.2). The length of the Proxy Information field depends on the settings of the subfields in the Flags subfield and is 11, 15, 17, or 21 octets.

The format of the Proxy Information field is defined in Figure 9-612 (Proxy Information field format).

The format of the Flags subfield is shown in Figure 9-613 (Flags subfield format).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

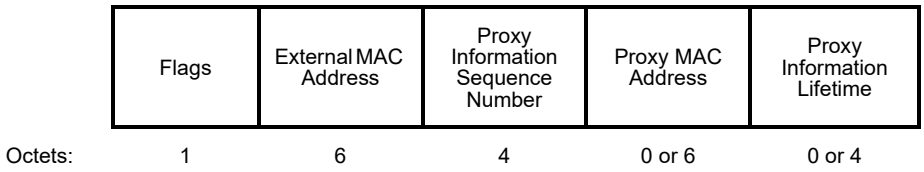

Figure 9-612—Proxy Information field format

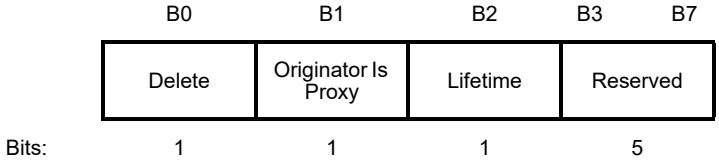

Figure 9-613—Flags subfield format

The Flags subfield is set as follows:

— Bit 0: The Delete subfield indicates whether this proxy information is to be deleted. It is set to 1 if the proxy information is to be deleted, and set to 0 otherwise.

— Bit 1: The Originator Is Proxy subfield indicates that the originator mesh STA of the PXU element is the proxy mesh gate of this proxy information when set to 1. In this case, there is no Proxy MAC Address subfield present in this Proxy Information field. When the Originator Is Proxy subfield is 0, the Proxy MAC Address subfield is present in this Proxy Information field.

— Bit 2: The Lifetime subfield indicates that the Proxy Information Lifetime subfield is present in this Proxy Information field when set to 1.

— Bit 3–7: Reserved.

The External MAC Address subfield is represented as a MAC address and is the MAC address of the external STA proxied by the proxy mesh gate.

The Proxy Information Sequence Number field is coded as an unsigned integer and is set to the sequence number of the proxy information. The sequence number of the proxy information defines a chronological order of the proxy information for the external STA at this proxy mesh gate.

The Proxy MAC Address subfield is represented as a MAC address and is set to the MAC address of the proxy mesh gate. It is present if the Originator Is Proxy subfield of the Flags subfield is 0; it is not present otherwise.

The Proxy Information Lifetime subfield is coded as an unsigned integer and is set to the time for which the mesh STA receiving this PXU considers this proxy information to be valid. The proxy information lifetime is measured in TUs. It is present if the Lifetime subfield of the Flags subfield is 1; it is not present otherwise.

9.4.2.115 PXUC element

The PXUC (proxy update confirmation) element is used to confirm the previously received PXU. The PXUC element is transmitted in a Proxy Update Confirmation frame (see 9.6.17.3). The format of PXUC element is shown in Figure 9-614 (PXUC element format).

The Element ID and Length fields are defined in 9.4.2.1.

The PXU ID field is coded as an unsigned integer and is the PXU ID of the received PXU that is being confirmed.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

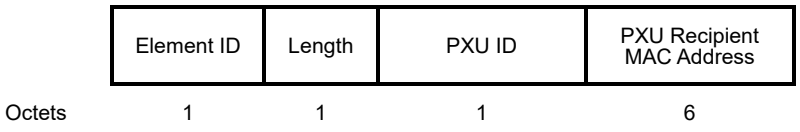

Figure 9-614—PXUC element format

The PXU Recipient MAC Address is represented as a MAC address and is set to the MAC address of the recipient of the PXU, i.e., the originator of the PXUC element.

9.4.2.116 Authenticated Mesh Peering Exchange element

The Authenticated Mesh Peering Exchange element includes information needed to perform the authentication sequence during an authenticated mesh peering exchange. This element is shown in Figure 9-615 (Authenticated Mesh Peering Exchange element format).

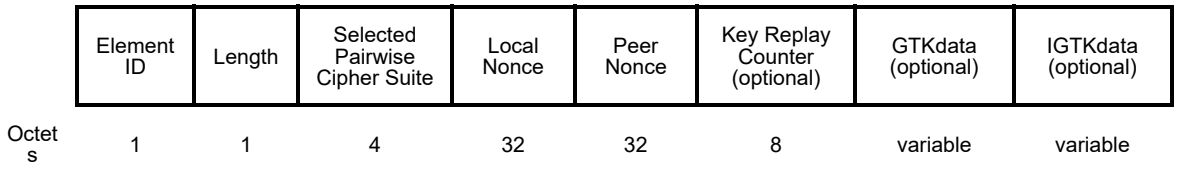

Figure 9-615—Authenticated Mesh Peering Exchange element format

The Element ID and Length fields are defined in 9.4.2.1.

The Selected Pairwise Cipher Suite field contains a pairwise cipher suite selector, as defined in 9.4.2.23.2, indicating a cipher suite to be used to secure the link.

The Local Nonce field contains a nonce value chosen by the mesh STA that is transmitting the element. It is encoded following the conventions from 9.2.2.

The Peer Nonce field contains a nonce value that was chosen by the peer mesh STA or candidate peer mesh STA to which the element is being sent. It is encoded following the conventions from 9.2.2.

The Key Replay Counter field is optional. It is used only for the Mesh Group Key Inform frame (see 14.7.3) and the Mesh Group Key Acknowledge frame (see 14.7.4). It is represented as an unsigned integer.

The GTKdata field is optional. When present, it contains the bit string of {GTK || RSC || GTKExpirationTime} as the GTK data material. When present, the GTKdata field is protected by the exchange in which it is contained (see 14.6). The RSC denotes the last TSC or PN sent using the GTK and is specified in Table 12-9 of 12.7.2. GTKExpirationTime denotes the key lifetime of the GTK in seconds and the format is specified in Figure 12-42 (Lifetime KDE format) of 12.7.2.

The IGTKdata field is optional. When present, it contains the key ID, IPN and IGTK used with BIP for management frame protection. The format of the IGTKdata field is specified in Figure 12-44 (IGTK KDE format) of 12.7.2.

Detailed usage of the Authenticated Mesh Peering Exchange element is described in 14.6.5 and in 14.7.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.117 MIC element

The MIC element provides integrity protection for Management frames. The format of the MIC element is shown in Figure 9-616 (MIC element format).

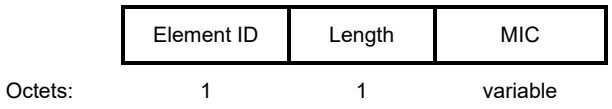

Figure 9-616—MIC element format

The Element ID and Length fields are defined in 9.4.2.1.

In the mesh peering Management frame (as specified in 14.6) and the mesh group key handshake frame (as specified in 14.7), the length of the MIC is 16 octets. In other frames, the MIC field is of variable length, depending on the context that specifies the computation of the MIC.

9.4.2.118 Quality-of-Service Management Frame Policy element

The Quality-of-Service Management Frame (QMF) Policy element defines a QMF access category mapping (QACM) of Management frames and is used to advertise and exchange QMF policy between STAs. The use of the QMF Policy element is given in 11.24. See Figure 9-617 (QMF Policy element format).

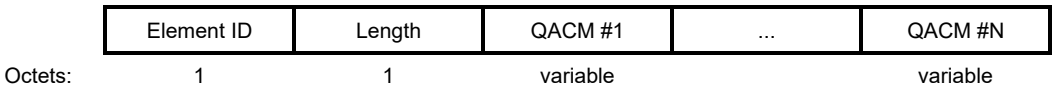

Figure 9-617—QMF Policy element format

The Element ID and Length fields are defined in 9.4.2.1.

The QACM field specifies a group of Management frames and their associated access categories. See Figure 9-618 (QACM field format) and see 11.24.3.

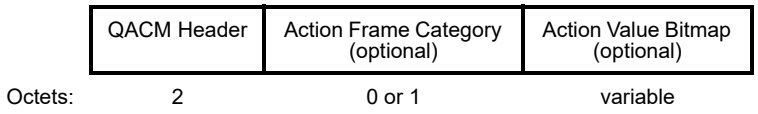

Figure 9-618—QACM field format

The format of the QACM Header subfield of the QACM field is defined in Figure 9-619 (QACM Header subfield format).

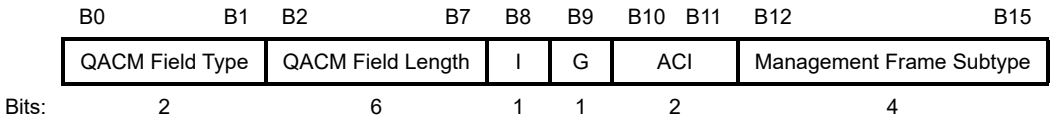

Figure 9-619—QACM Header subfield format

The QACM Field Type subfield defines the structure of the QACM field. Its value is 0. Values 1, 2, and 3 are reserved.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The QACM Field Length subfield defines the length in octets of the QACM field excluding the QACM Header subfield.

When the QACM applies to individually addressed Management frames, the Individually Addressed (I) subfield is set to 1. Otherwise, it is set to 0.

When the QACM applies to group addressed Management frames, the Group Addressed (G) subfield is set to 1. Otherwise, it is set to 0.

The combination of I = 0 and G = 0 is not allowed.

Each Management frame that is listed in the QACM Header subfield is transmitted using the access category identified by the accompanying ACI subfield.

The Management Frame Subtype subfield indicates the subtype of Management frames that are sent using the access category indicated in the ACI subfield. The valid values for this subfield are the subtypes in Table 9-1 that correspond to Management frames.

The Action Frame Category subfield indicates the category of the Action frame, as defined in 9.4.1.1, of Action frames that are sent using the access category indicated in the ACI subfield. The Action Frame Category subfield is included only when the Management Frame Subtype subfield indicates Action or Action No Ack subtype as specified in 11.24.3.

The Action Value Bitmap subfield is included when the QACM Policy is specified for a subset of Action frame types in a Action Frame Category. The Action Value Bitmap subfield is of variable length and indicates the action values, as defined in 9.5.7, for the corresponding Action frame category that are sent using the access category indicated in the ACI subfield. The Action Value Bitmap subfield is included only when the Management Frame Subtype subfield indicates Action or Action No Ack subtype and the QACM Field Length subfield is greater than or equal to 2. Each bit in the Action Value Bitmap subfield is mapped to the corresponding action value. The Action Value Bitmap subfield is zero padded to complete any incomplete octet. When included, the size in octets of the Action Value Bitmap field is found by subtracting 1 from the value of the QACM Field Length subfield.

9.4.2.119 Intra-Access Category Priority element

The Intra-Access Category Priority element provides information from a non-AP STA to an AP on the relative priorities of streams within an AC, as described in 10.2.3.2 and 11.25.2. This element is optionally present in ADDTS Request, QoS Map Configure, or SCS Request frames. The Intra-Access Category Priority element is defined in Figure 9-620 (Intra-Access Category Priority element format).

	Element ID	Length	Intra-Access Priority
Octets:	1	1	1

Figure 9-620—Intra-Access Category Priority element format

The Element ID and Length fields are defined in 9.4.2.1.

The Intra-Access Priority field is defined in Figure 9-621 (Intra-Access Priority field format).

The User Priority subfield indicates the UP of MSDUs or A-MSDUs of the stream to which this Intra-Access Category Priority element relates.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

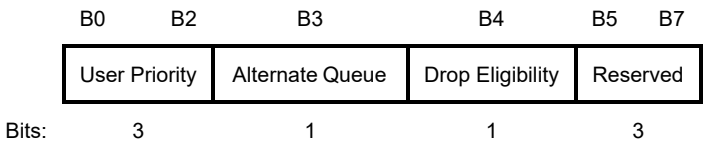

Figure 9-621—Intra-Access Priority field format

The Alternate Queue subfield indicates the intended primary or alternate EDCA queue that is used for this stream. When dot11AlternateEDCAActivated is false, this subfield is reserved. When the Alternate Queue subfield is equal to 0, the primary EDCA queue for this AC is used. When the Alternate Queue subfield is equal to 1, the Alternate EDCA queue for this AC (see 10.2.3.2) is used.

The Drop Eligibility subfield is used to indicate the suitability of this TS to be discarded if there are insufficient resources. If there are insufficient resources, a STA should discard the MSDUs or A-MSDUs of a TS with a Drop Eligibility subfield equal to 1, in preference to MSDUs or A-MSDUs of a TS whose Drop Eligibility subfield is equal to 0. See 11.24.2. The mechanisms for determining whether the resources are insufficient or when to discard MSDUs or A-MSDUs are beyond the scope of this standard.

9.4.2.120 SCS Descriptor element

The SCS Descriptor element defines information about the stream that is being classified using the procedures defined in 11.25.2. The format of the SCS Descriptor element is shown in Figure 9-622 (SCS Descriptor element format).

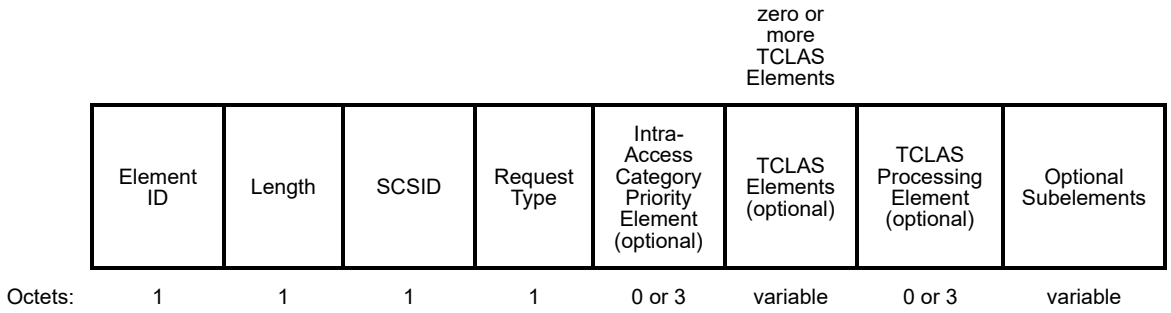

Figure 9-622—SCS Descriptor element format

The Element ID and Length fields are defined in 9.4.2.1.

The SCSID field is set to a nonzero value chosen by the non-AP STA identifying the SCS stream specified in this SCS Descriptor element.

The Request Type field is set to a number to identify the type of SCS request. The Request Types are shown in Table 9-286.

The Intra-Access Category Priority Element field is present when Request Type field is equal to “Add” or “Change” and is defined in 9.4.2.119.

The TCLAS Elements field contains zero or more TCLAS elements to specify how incoming MSDUs are classified as part of this SCS stream, as defined in 9.4.2.29. One or more TCLAS elements are present when Request Type field is equal to “Add” or “Change,” and no TCLAS elements are present when Request Type field is equal to “Remove.”

Table 9-286—SCS Request Type definitions

Name	Value
Add	0
Remove	1
Change	2
Reserved	3–255

The TCLAS Processing Element field is present when more than one TCLAS element is present in the TCLAS Elements field and contains a TCLAS Processing element that defines how the multiple TCLAS elements are to be processed, as defined in 9.4.2.31.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Optional Subelement ID field values for the defined subelements are shown in Table 9-287.

Table 9-287—Optional subelement IDs for SCS Descriptor element

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The SCS Descriptor element is included in SCS Request frames, as described in 9.6.18.2. The use of the SCS Descriptor element and SCS Request frames is described in 11.25.2.

9.4.2.121 QLoad Report element

9.4.2.121.1 QLoad Report element format

The QLoad Report element contains the set of parameters necessary to support OBSS management. The format of the QLoad Report element is shown in Figure 9-623 (QLoad Report element format).

	Element ID	Length	Potential Traffic Self	Allocated Traffic Self	Allocated Traffic Shared	EDCA Access Factor	HCCA Peak	HCCA Access Factor	Overlap	Sharing Policy	Optional Subelements
Octets:	1	1	5	5	5	1	2	1	1	1	variable

Figure 9-623—QLoad Report element format

The Element ID and Length fields are defined in 9.4.2.1.

Potential Traffic Self, Allocated Traffic Self, and Allocated Traffic Shared fields use the QLoad field format as described in 9.4.2.121.2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Potential Traffic Self field represents the peak composite QoS traffic for this BSS if all of the potential admission control and HCCA TSPECs from the non-AP STAs are active. The methods for gathering the total potential TSPEC information are described in 11.26.2.

The Allocated Traffic Self field represents the composite QoS traffic for this BSS based upon all of the admission control and HCCA TSPECs admitted within the same BSS, as described in 11.26.2.

The Allocated Traffic Shared field represents the sum of the Allocated Traffic Self field values that have been received or obtained from other APs whose beacons have been detected or obtained within the last 100 beacon periods, plus the Allocated Traffic Self field value of the AP itself. Computation of the values represented in the Allocated Traffic Shared field is described in 11.26.2.

As described in 11.26.2, the EDCA Access Factor field value is the sum of the Potential Traffic Self field values that have been received or obtained from other APs, plus the Potential Traffic Self field value of the AP itself, minus the sum of the HCCA Peak field values that have been received or obtained from overlapping APs, minus the HCCA Peak field value of the AP itself. The EDCA Access Factor field is expressed as a fraction rounded down to a multiple of 1/64. When the EDCA Access Factor field is greater than 254/64, the EDCA Access Factor field is set to 255.

The HCCA Peak field is the total peak HCCA TXOP requirement, over a period of 1 s, for the AP and BSS, for all of the HCCA TSPECs that are included in the QLoad. HCCA Peak is expressed in multiples of 32 μs over a period of 1 s. The HCCA Peak field is reserved if HCCA is not supported.

NOTE—Because the HCCA peak is calculated over 1 s periods, its value might be an underestimate of the instantaneous peak of interactive variable bit rate (VBR) flows.

The HCCA Access Factor field value is the sum of the HCCA Peak field values in the QLoad Report elements that have been received from the APs of OBSSs, plus the HCCA Peak field value of the AP itself, as described in 11.26.2. It is expressed as a fraction rounded down to a multiple of 1/64. When the HCCA Access Factor is greater than 254/64, the HCCA Access Factor field is set to 255.

The Overlap field indicates the number of other APs that are sharing the same channel and whose beacons have been detected or obtained within the last 100 beacon periods by the AP issuing this beacon.

The Sharing Policy field contains the currently active sharing policy. The values for the Sharing Policy field are described in Table 9-288.

Table 9-288—Sharing Policy definitions

Sharing Policy field value	Current sharing policy
0	Not specified
1	Static
2	Dynamic
3–220	Reserved
221	Vendor Specific
222–255	Reserved

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Subelement ID field values for the defined subelements are shown in Table 9-289.

Table 9-289—Optional subelement IDs for QLoad Report element

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

9.4.2.121.2 QLoad field format

The QLoad field format is shown in Figure 9-624 (QLoad field format).

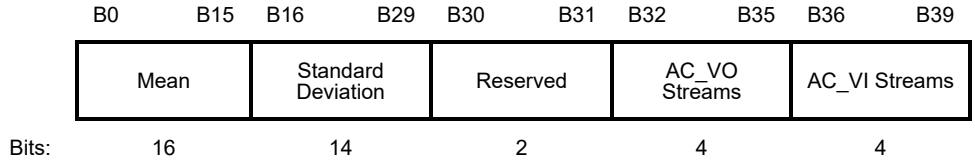

Figure 9-624—QLoad field format

The Mean subfield represents the amount of time admitted, or the amount of time scheduled traffic requires to access the medium, in units of 32 μs/s. In the case of EDCA admission control, this value is the sum of the admitted medium times, and for HCCA it is the total TXOP time required per second (see T.2.2). If the mean medium time is larger than 2 097 088 μs (65 534 × 32), the Mean subfield is set to 0xFFFE. The Mean subfield is set to 0xFFFF to indicate that the mean medium time is unknown.

The Standard Deviation subfield indicates the standard deviation from the mean medium time, in units of 32 μs/s. If the standard deviation is larger than 8128 μs (254 × 32), the Standard Deviation subfield is set to 0x3FFE. The Standard Deviation subfield is set to 0x3FFF to indicate that the standard deviation from the mean is unknown.

The AC_VO Streams subfield indicates the number of TSs using explicit admission control for AC_VO in the QoS traffic load report. Bidirectional streams are counted as two streams. If the number of admitted AC_VO streams is larger than 14, the AC_VO Streams subfield is set to 0xE. The AC_VO Streams subfield is set to 0xF to indicate that the number of TSs using explicit admission control for AC_VO is unknown.

The AC_VI Streams subfield indicates the number of TSs using explicit admission control for AC_VI in the QoS traffic load report. Bidirectional streams are counted as two streams. If the number of TSs using explicit admission control for AC_VO is larger than 14, the AC_VI Streams subfield is set to 0xE. The AC_VI Streams subfield is set to 0xF to indicate that the number of TSs using explicit admission control for AC_VI is unknown.

See 11.26.2 and Annex T.

9.4.2.122 HCCA TXOP Update Count element

The HCCA TXOP Update Count element is used by an AP to advertise its change in TXOP schedule. The format is shown in Figure 9-625 (HCCA TXOP Update Count element format).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

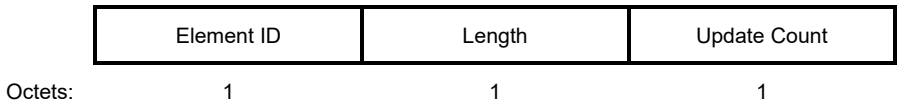

Figure 9-625—HCCA TXOP Update Count element format

The Element ID and Length fields are defined in 9.4.2.1.

The Update Count field is described in 11.26.3 and is used to indicate that a change has occurred in the number of active HCCA or HEMM TSs.

9.4.2.123 Higher Layer Stream ID element

The Higher Layer Stream ID element identifies a stream from a higher layer protocol. This element is used to bind messages that are exchanged in order to complete a procedure, e.g., messages exchanged in an AP-initiated TS setup procedure. See 11.4.4.3. The format is shown in Figure 9-626 (Higher Layer Stream ID element format).

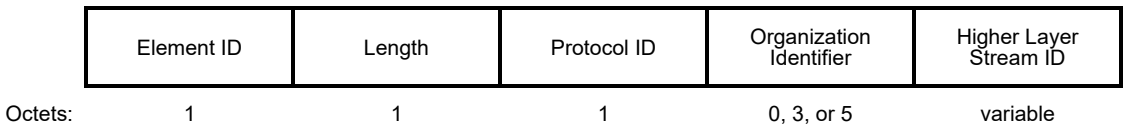

Figure 9-626—Higher Layer Stream ID element format

The Element ID and Length fields are defined in 9.4.2.1.

The Protocol ID field identifies the higher layer protocol to which the stream belongs. The values defined for the Protocol ID field are described in Table 9-290.

Table 9-290—Protocol ID definitions

Protocol ID	Protocol	Description
0	Reserved	
1	IEEE 802.1Q SRP	Protocol is IEEE 802.1Q SRP, and the corresponding Stream ID is 8 octets long.
2–220	Reserved	
221	Vendor Specific	Corresponding Organization Identifier field is included in the element.
222–255	Reserved	

The Organization Identifier field is present when the Protocol ID field is equal to 221 and contains a organization identifier assigned by IEEE. The identifier is specified in 9.4.1.29. The order of the Organization Identifier field is described in 9.2.2.

The Higher Layer Stream ID field is an octet string and is defined by the higher layer protocol specified in the Protocol ID field.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.124 GCR Group Address element

The GCR Group Address element defines information about group addressed frames to be transmitted using the GCR service. The format of the GCR Group Address element is shown in Figure 9-627 (GCR Group Address element format).

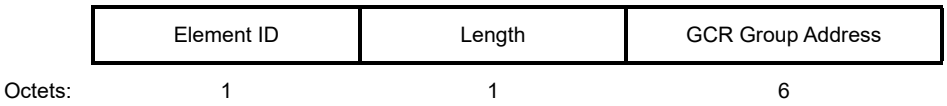

Figure 9-627—GCR Group Address element format

The Element ID and Length fields are defined in 9.4.2.1.

GCR Group Address field is the MAC address of the GCR group.

9.4.2.125 DMG BSS Parameter Change element

The DMG BSS Parameter Change element is defined in Figure 9-628 (DMG BSS Parameter Change element format).

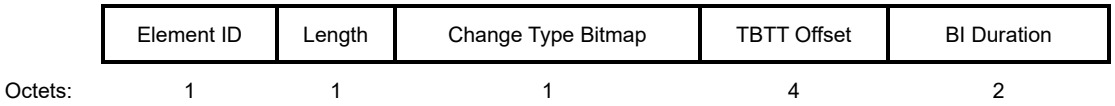

Figure 9-628—DMG BSS Parameter Change element format

The Element ID and Length fields are defined in 9.4.2.1.

The Change Type Bitmap field indicates the type of the parameter change to the BSS. This field is defined in Figure 9-629 (Change Type Bitmap field format).

Figure 9-629—Change Type Bitmap field format

If the Move subfield is set to 1, it indicates a change in the TBTT of the BSS. The TBTT is not changed if the Move field is set to 0. If the Size subfield is set to 1, it indicates a change in the beacon interval duration. The beacon interval duration is not changed if the Size subfield is set to 0.

The TBTT Offset field contains a value expressed in microseconds. In any DMG BSS Parameter Change element included in the DMG Beacon and/or Announce frame, the TBTT Offset field represents the lower order 4 octets of the AP or PCP TSF timer of the first changed TBTT.

The BI Duration field value indicates the beacon interval, expressed in TUs, following the indicated DMG BSS parameter change. The BI Duration field is reserved if the Size bit of the Change Type Bitmap field is set to 0.

9.4.2.126 DMG Capabilities element

9.4.2.126.1 General

The DMG Capabilities element contains a STA identifier and several fields that are used to advertise the support of optional DMG capabilities of a DMG STA. The DMG Capabilities element is formatted as defined in Figure 9-630 (DMG Capabilities element format).

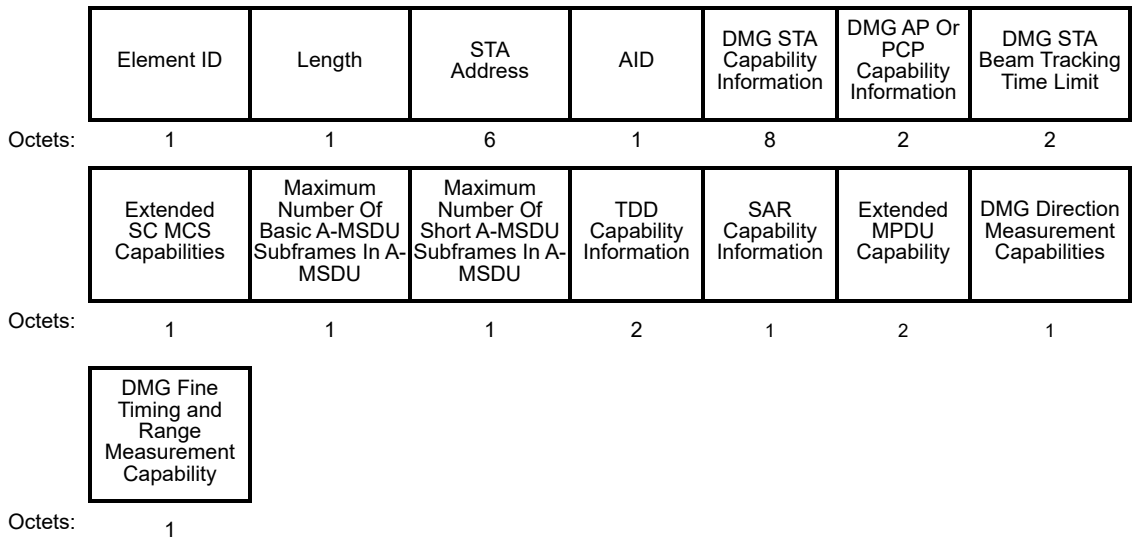

Figure 9-630—DMG Capabilities element format

The Element ID and Length fields are defined in 9.4.2.1.

The STA Address field contains the MAC address of the STA.

The AID field contains the AID assigned to the STA by the AP or PCP. The AID field is reserved in Association Request, Reassociation Request and Probe Request frames and when used in an IBSS.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.126.2 DMG STA Capability Information field

The DMG STA Capability Information field, shown in Figure 9-631 (DMG STA Capability Information field format), represents the transmitting STA capabilities irrespective of the role of the STA.

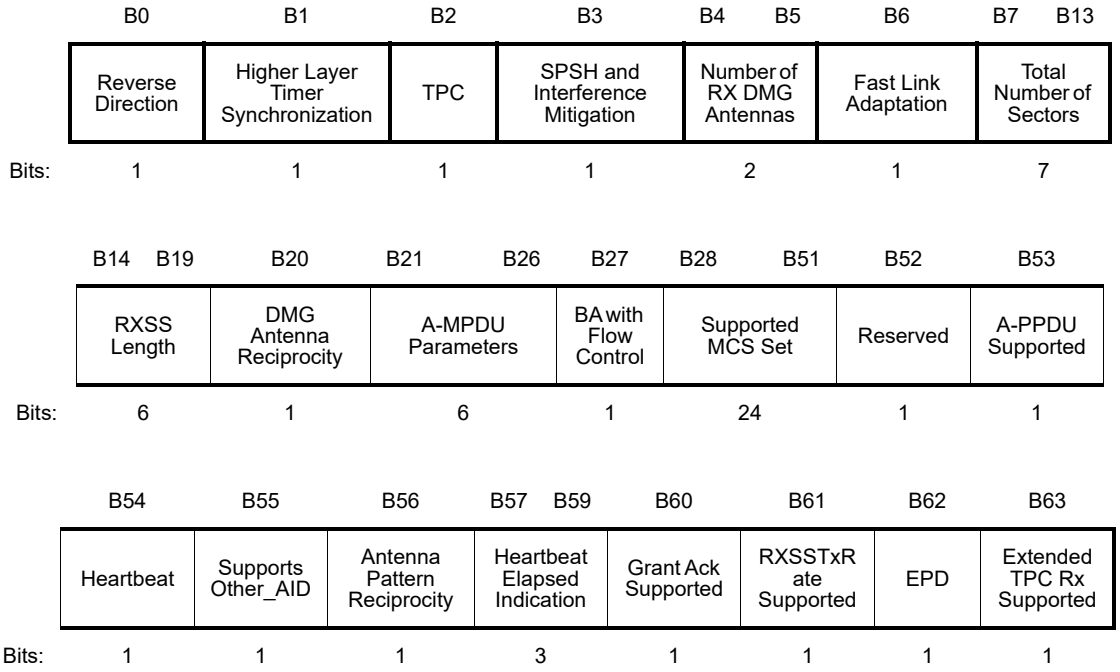

Figure 9-631—DMG STA Capability Information field format

The Reverse Direction subfield is set to 1 if the STA supports RD as defined in 10.29 and is set to 0 otherwise.

The Higher Layer Timer Synchronization subfield is set to 1 if the STA supports Higher Layer Timer Synchronization as defined in 11.6 and is set to 0 otherwise.

The TPC subfield is set to 1 if the STA supports the TPC as defined in 11.7 and is set to 0 otherwise.

The SPSH (spatial sharing) and Interference Mitigation subfield is set to 1 if the STA is capable of performing the function of SPSH and Interference Mitigation and if dot11RadioMeasurementActivated is true and is set to 0 otherwise (see 11.30).

The Number of RX DMG Antennas subfield indicates the total number of receive DMG antennas of the STA minus 1.

The Fast Link Adaptation subfield is set to 1 to indicate that the STA supports the fast link adaptation procedure described in 10.42.3. Otherwise, it is set to 0.

The Total Number of Sectors subfield indicates the total number of transmit sectors the STA uses in a transmit sector sweep combined over all DMG antennas, including any LBIFS required for DMG antenna switching (see 10.41), minus 1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The value represented by the RXSS Length subfield specifies the total number of receive sectors combined over all receive DMG antennas of the STA, including any LBIFS required for DMG antenna switching (see 10.41). This subfield is set to (RXSS Length+1)×2, which ranges from 2 to 128.

The DMG Antenna Reciprocity subfield is set to 1 to indicate that the best transmit DMG antenna of the STA is the same as the best receive DMG antenna of the STA and vice versa. Otherwise, this subfield is set to 0.

The A-MPDU Parameters subfield is shown in Figure 9-632 (A-MPDU parameters subfield format).

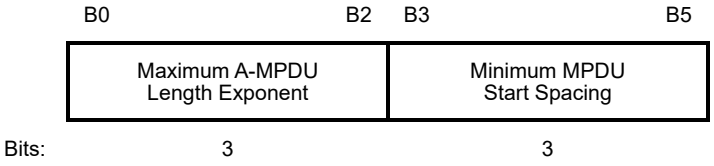

Figure 9-632—A-MPDU parameters subfield format

The subfields of the A-MPDU Parameters subfield are defined in Table 9-291.

Table 9-291—Subfields of the A-MPDU Parameters subfield

Subfield	Definition	Encoding
Maximum A-MPDU Length Exponent	Indicates the maximum length of A-MPDU that the STA can receive.	This subfield is an integer in the range 0 to 5. The length defined by this subfield is equal to $2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1$ octets.
Minimum MPDU Start Spacing	Determines the minimum time between the start of adjacent MPDUs within an A-MPDU that the STA can receive, measured at the PHY SAP.	Set to 0 for no restriction Set to 1 for 16 ns Set to 2 for 32 ns Set to 3 for 64 ns Set to 4 for 128 ns Set to 5 for 256 ns Set to 6 for 512 ns Set to 7 for 1024 ns

The BA with Flow Control subfield is set to 1 if the STA supports BA with flow control as defined in 10.41.9 and is set to 0 otherwise.

The Supported MCS Set subfield indicates the MCSs a STA supports. An MCS is identified by an MCS index, which is represented by an integer in the range 0 to 12, or an integer in the range 25 to 31 or by one of the values 9.1, 12.1, 12.2, 12.3, 12.4, 12.5 and 12.6. The interpretation of the MCS index (i.e., the mapping from MCS to data rate) is PHY dependent. For the DMG PHY, see Clause 20. The structure of the Supported MCS Set subfield is defined in Figure 9-633 (Supported MCS Set subfield format).

The Maximum SC Rx MCS subfield contains the value of the maximum MCS index the STA supports for reception of single-carrier frames. Values 0-3 of this subfield are reserved. Possible values for this subfield are shown in Table 20-15. This subfield does not indicate support for MCSs 9.1, 12.1, 12.2, 12.3, 12.4, 12.5, and 12.6. Support for these MCSs is indicated using the Extended SC MCS Capabilities field; see 9.4.2.126.5.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

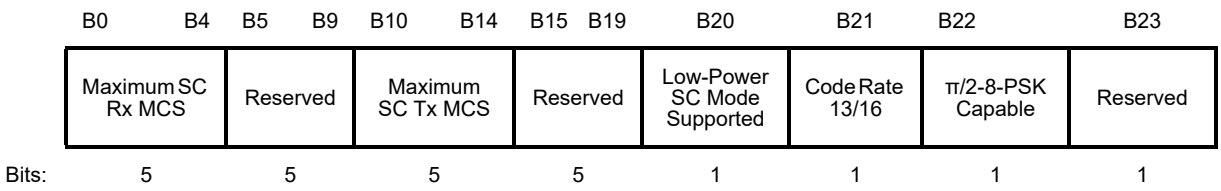

Figure 9-633—Supported MCS Set subfield format

The Maximum SC Tx MCS subfield contains the value of the maximum MCS index the STA supports for transmission of single-carrier frames. Values 0-3 of this subfield are reserved. Possible values for this subfield are shown in Table 20-15. This subfield does not indicate support for MCSs 9.1, 12.1, 12.2, 12.3, 12.4, 12.5, and 12.6. Support for these MCSs is indicated using the Extended SC MCS Capabilities field; see 9.4.2.126.5.

The Low-Power SC Mode Supported subfield is set to 1 to indicate that the STA supports the DMG low-power SC mode (20.6). Otherwise, it is set to 0. If the STA supports the low-power SC mode, it supports all low-power SC mode MCSs indicated in Table 20-21.

The Code Rate 13/16 subfield specifies whether the STA supports rate 13/16. It is set to 1 to indicate that the STA supports rate 13/16 and is set to 0 otherwise. If this subfield is 0, MCS with 13/16 code rate specified in Table 20-15 is not supported regardless of the value in Maximum SC Tx/Rx MCS subfields.

The π/2-8-PSK Capable subfield specifies whether the STA supports the use of π/2-8-PSK for MCS 10 and MCS 11. It is set to 1 to indicate the STA supports π/2-8-PSK for both transmission and reception and is set to 0 otherwise.

The A-PPDU Supported subfield is set to 1 to indicate that the STA supports A-PPDU aggregation as described in 10.14. Otherwise, it is set to 0.

The Supports Other_AID subfield is set to 1 to indicate that the STA sets its AWV configuration according to the Other_AID subfield in the BRP Request field during the BRP procedure as described in 10.41.6.4.4 and 20.9.2.2.6, if the value of the Other_AID subfield is different from zero. Otherwise, this subfield is set to 0.

The Heartbeat subfield is set to 1 to indicate that the STA expects to receive a frame from the AP or PCP during the ATI (10.38.3) and expects to receive a frame with the DMG Control modulation from a source DMG STA at the beginning of an SP (10.38.6.2) or TXOP (10.23.2). Otherwise, it is set to 0.

The Antenna Pattern Reciprocity subfield is set to 1 to indicate that the transmit antenna pattern associated with an AWV is the same as the receive antenna pattern for the same AWV. Otherwise, this subfield is set to 0.

The Heartbeat Elapsed Indication subfield is used to calculate the value of the Heartbeat Elapsed Time. The Heartbeat Elapsed Time is computed according to the following equation:

$$T_{HE} = \begin{cases} 0, & F_{HE} = 0 \\ \frac{2^{F_{HE}}}{4}, & F_{HE} > 0 \end{cases}$$

where

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

T_{HE} is the Heartbeat Elapsed Time (in milliseconds)

F_{HE} is the value of the Heartbeat Elapsed Indication subfield

The Grant Ack Supported subfield is set to 1 to indicate that the STA is capable of responding to a Grant frame with a Grant Ack frame. Otherwise, this subfield is set to 0.

The RXSSTxRate Supported subfield is set to 1 to indicate that the STA can perform an RXSS with SSW frames transmitted at MCS 1 of the DMG SC modulation class. Otherwise, it is set to 0.

A DMG STA sets the EPD subfield in the DMG STA Capability Information field to 1 when dot11EPDImplemented is true and sets it to 0 otherwise.

The Extended TPC Rx Supported subfield is set to 1 to indicate that the STA supports extended TPC Rx on the receiver side described in 10.42.6. This subfield is set to 0 otherwise.

9.4.2.126.3 DMG AP Or PCP Capability Information field

The DMG AP Or PCP Capability Information field, shown in Figure 9-634 (DMG AP Or PCP Capability Information field format), represents the capabilities when the transmitting STA performs in the role of AP or PCP and that are in addition to the capabilities in the DMG STA Capability Information field.

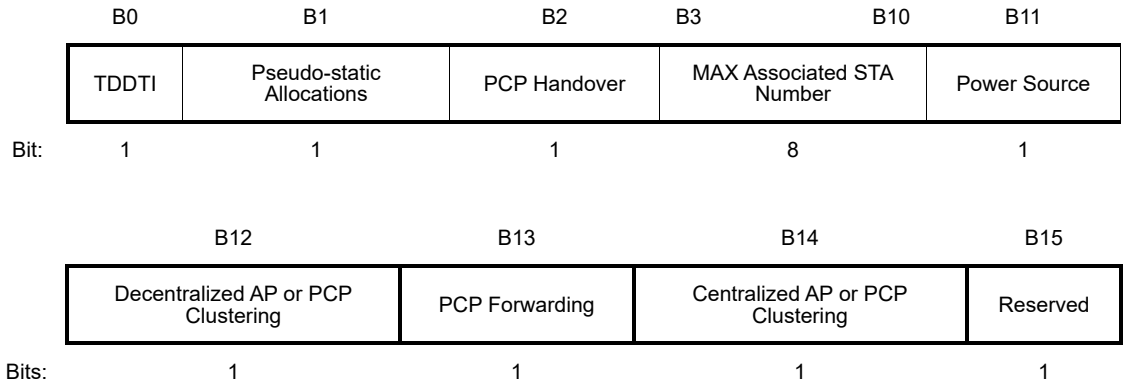

Figure 9-634—DMG AP Or PCP Capability Information field format

The TDDTI (time division data transfer interval) subfield is set to 1 if the STA, while operating as an AP or PCP, is capable of providing channel access as defined in 10.38.6 and 11.4 and is set to 0 otherwise.

The Pseudo-static Allocations subfield is set to 1 if the STA, while operating as an AP or PCP, is capable of providing pseudo-static allocations as defined in 10.38.6.4 and is set to 0 otherwise. The Pseudo-static Allocations subfield is set to 1 only if the TDDTI subfield in the DMG AP Or PCP Capability Information field is set to 1. The Pseudo-static Allocations subfield is reserved if the TDDTI subfield in the DMG AP Or PCP Capability Information field is set to 0.

The PCP Handover subfield is set to 1 if the STA, while operating as a PCP, is capable of performing a PCP Handover as defined in 11.27.2 and is set to 0 if the STA does not support PCP Handover.

The MAX Associated STA Number subfield indicates the maximum number of STAs that the STA can perform association with if operating as an AP or PCP. This subfield includes the STAs, if any, that are colocated with the AP or PCP.

The Power Source subfield is set to 0 if the STA is battery powered and is set to 1 otherwise.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Decentralized AP or PCP Clustering subfield is set to 1 if the STA, when operating as an AP or PCP, is capable of performing decentralized AP or PCP clustering and is set to 0 otherwise.

The PCP Forwarding subfield is set to 1 if the STA, while operating as a PCP, is capable of forwarding frames it receives from a non-PCP STA and destined to another non-PCP STA in the PBSS. This subfield is set to 0 otherwise.

The Centralized AP or PCP Clustering subfield is set to 1 if the STA, when operating as an AP or PCP, is capable of performing centralized AP or PCP clustering and is set to 0 otherwise. An AP or PCP that is incapable of performing centralized AP or PCP clustering is subject to requirements as described in 10.39.2.2.

9.4.2.126.4 DMG STA Beam Tracking Time Limit field

The DMG STA Beam Tracking Time Limit field contains the value of dot11BeamTrackingTimeLimit. This field indicates the maximum time between a request for beam tracking feedback and the feedback response, such that the response will be considered valid. This use of this field is discussed in 10.41.7.

9.4.2.126.5 Extended SC MCS Capabilities field

The Extended SC MCS Capabilities field (see Figure 9-635 (Extended SC MCS Capabilities field format)) advertises the support of the STA for MCSs 9.1, 12.1, 12.2, 12.3, 12.4, 12.5, and 12.6.

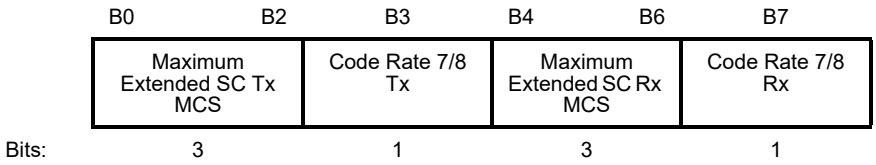

Figure 9-635—Extended SC MCS Capabilities field format

The Maximum Extended SC Tx MCS subfield indicates the maximum transmit extended SC MCS supported by the STA. The values in the subfield are ordered as shown in Table 9-292.

Table 9-292—Mapping of Extended SC MCS to Maximum Supported Rx/Tx MCS subfield values

Extended MCS name	Value in Maximum Extended SC Rx/Tx MCS subfield
None	0
MCS 9.1	1
MCS 12.1	2
MCS 12.2	3
MCS 12.3	4
MCS 12.4	5
MCS 12.5	6
MCS 12.6	7

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A STA that indicates support for transmission of an extended SC MCS by setting the value in the Maximum Extended SC Tx MCS subfield to *k* supports the subset of MCSs {9.1, 12.1, 12.2, 12.3, 12.4, 12.5 12.6} that have a data rate lower than or equal to the data rate of the MCS indicated by *k*. A STA that indicates support for MCSs with a data rate higher than the data rate of MCS 9.1 in the Maximum Extended SC Tx MCS subfield sets the Maximum SC Tx MCS subfield of the Supported MCS Set subfield to 12.

A STA that indicates support for transmission of an extended SC MCS by setting the value in the Maximum Extended SC Tx MCS subfield to *k* supports all extended SC MCSs with values lower than or equal to *k*.

The Maximum Extended SC Rx MCS subfield indicates the maximum receive extended SC MCS supported by the STA. The values in the subfield are ordered as shown in Table 9-292.

A STA indicates support for transmission of code rate 7/8 by setting the Code Rate 7/8 Tx subfield to 1. If a STA indicates that it does not support code rate 7/8, then the STA does not support MCS 9.1 or 12.2 even if the value in the Maximum Extended SC Tx MCS subfield is greater than 1 or 3 respectively. A STA that indicates support for MCSs with a data rate higher than the data rate of MCS 9.1 in the Maximum Extended SC Rx MCS subfield sets the Maximum SC Rx MCS subfield of the Supported MCS Set subfield to 12.

A STA that indicates support for reception of an extended SC MCS by setting the Maximum Extended SC Rx MCS subfield to *k* supports the subset of MCSs {9.1, 12.1, 12.2, 12.3, 12.4, 12.5 12.6} that have a data rate lower than or equal to the data rate of the MCS indicated by *k*.

A STA indicates support for reception of code rate 7/8 by setting the Code Rate 7/8 Rx subfield to 1. If a STA indicates that it does not support code rate 7/8, the STA does not support MCS 9.1 or 12.2 even if the value in the Maximum Extended SC Rx MCS field is greater than 1 or 3 respectively.

9.4.2.126.6 Maximum number of A-MSDU subframes in an A-MSDU

The Maximum Number Of Basic A-MSDU Subframes In A-MSDU subfield is defined in Table 9-293 and indicates the maximum number of Basic A-MSDU subframes in an A-MSDU that the DMG STA is able to receive from another DMG STA.

Table 9-293—Maximum Number Of Basic A-MSDU Subframes In A-MSDU subfield

Value	Meaning
0	No limit on the maximum number of Basic A-MSDU subframes supported
1	A maximum of 4 Basic A-MSDU subframes are supported
2	A maximum of 8 Basic A-MSDU subframes are supported
3	A maximum of 16 Basic A-MSDU subframes are supported
4	A maximum of 32 Basic A-MSDU subframes are supported
5	A maximum of 64 Basic A-MSDU subframes are supported
6	A maximum of 128 Basic A-MSDU subframes are supported
7	A maximum of 256 Basic A-MSDU subframes are supported
8–255	Reserved

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Maximum Number Of Short A-MSDU Subframes In A-MSDU subfield is defined in Table 9-294 and indicates the maximum number of Short A-MSDU subfields in an A-MSDU that the DMG STA is able to receive from another DMG STA.

Table 9-294—Maximum Number Of Short A-MSDU Subframes In A-MSDU subfield

Value	Meaning
0	No limit on the maximum number of Short A-MSDU subframes supported
1	A maximum of 32 Short A-MSDU subframes are supported
2	A maximum of 64 Short A-MSDU subframes are supported
3	A maximum of 128 Short A-MSDU subframes are supported
4	A maximum of 256 Short A-MSDU subframes are supported
5	A maximum of 512 Short A-MSDU subframes are supported
6	A maximum of 1024 Short A-MSDU subframes are supported
7–255	Reserved

9.4.2.126.7 TDD Capability Information field

The TDD Capability Information field, shown in Figure 9-636 (TDD Capability Information field format), indicates the transmitting STA capabilities in supporting TDD features.

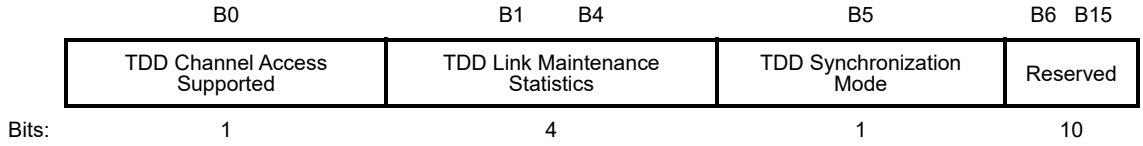

Figure 9-636—TDD Capability Information field format

The TDD Channel Access Supported subfield is set to 1 if dot11TDDOptionImplemented is true and indicates that the STA supports the TDD channel access described in 10.38.6.2.2. The subfield is set to 0 otherwise.

The TDD Link Maintenance Statistics subfield indicates the capabilities of reporting TDD rate adaptation statistics and is shown in Figure 9-637 (TDD Link Maintenance Statistics subfield format).

Figure 9-637—TDD Link Maintenance Statistics subfield format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The RX Chain Statistics Supported subfield is set to 1 to indicate the STA supports reporting the RX chain statistics in the DMG Link Margin element (see 9.4.2.141). Otherwise, this field is set to 0.

The PPDU Statistics Supported subfield is set to 1 to indicate the STA supports reporting the PPDU statistics in the DMG Link Margin element (see 9.4.2.141). Otherwise, this field is set to 0.

The LDPC Statistics Supported subfield is set to 1 to indicate the STA supports reporting the LDPC statistics in the DMG Link Margin element (see 9.4.2.141). Otherwise, this field is set to 0.

The SC/OFDM Statistics Supported subfield is set to 1 to indicate the STA supports reporting the parameters across SC blocks or OFDM symbols in the DMG Link Margin element (see 9.4.2.141). Otherwise, this field is set to 0.

The TDD Synchronization Mode subfield is set to 1 to indicate that the STA supports the TDD time synchronization described in 11.1.7. This subfield is set to 0 otherwise.

9.4.2.126.8 SAR Capability Information field

The SAR Capability Information field is defined in Figure 9-638 (SAR Capability Information field format).

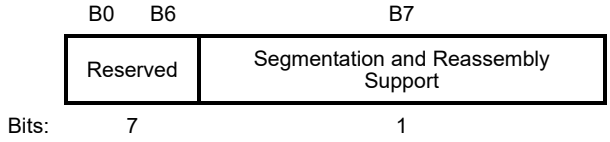

Figure 9-638—SAR Capability Information field format

The Segmentation and Reassembly Support subfield indicates whether the STA supports the segmentation and reassembly mechanism as specified in 10.69. A value of 0 indicates that segmentation and reassembly is not supported, indicated by dot11SAROptionImplemented equal to false. A value of 1 indicates that segmentation and reassembly is supported, indicated by dot11SAROptionImplemented equal to true.

9.4.2.126.9 Extended MPDU Capability field

The Extended MPDU Capability is defined in Figure 9-639 (Extended MPDU Capability field format).

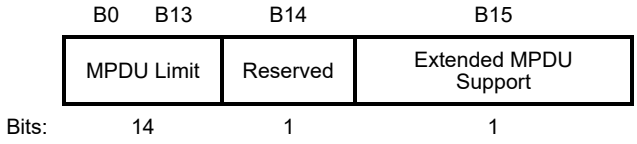

Figure 9-639—Extended MPDU Capability field format

The MPDU Limit subfield indicates the maximum MPDU size, in octets, that the STA can receive when this subfield is valid. The subfield contains an integer between 7990 and 16383.

The Extended MPDU Support subfield indicates whether the MPDU Limit subfield is valid. When dot11DMGExtendedMPDULimitValid is true, the Extended MPDU Support subfield is set to 1 to indicate that the MPDU Limit subfield is valid. When dot11DMGExtendedMPDULimitValid is false, the Extended MPDU Support subfield is set to 0 to indicate that the MPDU Limit subfield is invalid.

9.4.2.126.10 DMG Direction Measurement Capabilities field

The DMG Direction Measurement Capabilities field, shown in Figure 9-640 (DMG Direction Measurement Capabilities field format), advertises capabilities for performing direction measurement as part of DMG or EDMG exchanges.

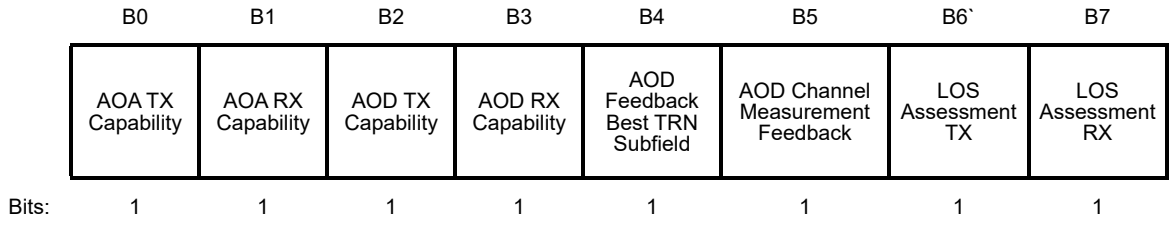

Figure 9-640—DMG Direction Measurement Capabilities field format

A DMG STA sets the AOA TX Capability subfield to 1 to indicate the ability to attach a TRN field to an FTM/Ack frame for the purpose of allowing the receiver of that frame to perform angle of arrival (AOA) estimation.

A DMG STA sets the AOA RX Capability subfield to 1 to indicate the ability to estimate the AOA based on a TRN field attached to an FTM/Ack frame.

A DMG STA sets the AOD TX Capability subfield to 1 to indicate the ability to attach a TRN field, possibly with different antenna settings to different TRN subfields, to an FTM/Ack frame, for the purpose of allowing the responder to estimate the angle of departure (AOD) of the PPDU.

A DMG STA sets the AOD RX Capability subfield to 1 to indicate the ability to estimate the AOD based on a TRN field attached to an FTM or Ack frame and send a report.

A DMG STA sets the AOD Feedback Best TRN subfield to 1 to indicate the ability to send a best TRN subfield index, based on measurement on a TRN field sent by the receiver STA, for the purpose of AOD estimation.

A DMG STA sets the AOD Channel Measurement Feedback subfield to 1 to indicate the ability to send a Channel Measurement Feedback element based on measurement on a TRN field sent by the peer RSTA, for the purpose of AOD estimation.

The LOS Assessment TX subfield is set to 1 to indicate that the STA can participate as an RSTA in a LOS Assessment exchange by transmitting a LOS Assessment FTM PPDU; see 11.21.6.4.2.5.

The LOS Assessment RX subfield is set to 1 to indicate that the STA can participate in a LOS Assessment exchange as an RSTA by switching polarization at receiving an Ack with TRN field and responding with a Channel Measurement Feedback element in the next FTM frame to the ISTA.

9.4.2.126.11 DMG Fine Timing and Range Measurement Capability Information field

The DMG Fine Timing and Range Measurement Capability Information field, shown in Figure 9-641 (DMG Fine Timing And Range Measurement Capability Information field format), advertises capabilities for performing FTMs and Range Measurements as part of DMG or EDMG exchanges.

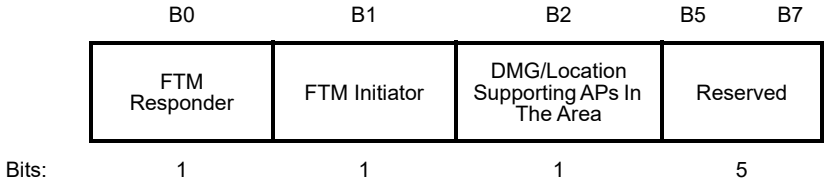

Figure 9-641—DMG Fine Timing And Range Measurement Capability Information field format

The FTM Responder field has the same meaning as the FTM Responder field in the Extended Capabilities element (see 9.4.2.25). The FTM Initiator field has the same meaning as the FTM Initiator field in the Extended Capabilities element (see 9.4.2.25).

A DMG STA in the role of AP sets the DMG/Location Supporting APs In The Area field to 1 to indicate that APs providing location services using DMG are in the vicinity of the AP STA and sets it to 0 otherwise. Definition of vicinity is implementation dependent.

NOTE—The AP might be capable of providing information about those DMG APs. The subfield is reserved if the DMG STA is not in the role of an AP.

9.4.2.127 DMG Operation element

The operational parameters of a BSS provided by the AP or PCP are determined by the DMG Operation element defined in Figure 9-642 (DMG Operation element format).

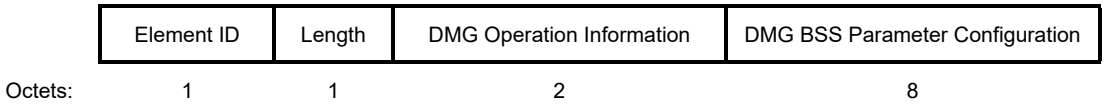

Figure 9-642—DMG Operation element format

The Element ID and Length fields are defined in 9.4.2.1.

The DMG Operation Information field is shown in Figure 9-643 (DMG Operation Information field format).

Figure 9-643—DMG Operation Information field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The TDDTI subfield is set to 1 if the AP or PCP provides time division channel access as defined in 10.38.6 and is set to 0 otherwise.

The Pseudo-static allocations subfield is set to 1 if the AP or PCP provides pseudo-static allocations as defined in 10.38.6.4 and is set to 0 otherwise. The Pseudo-static allocations subfield is set to 1 only if the TDDTI subfield in the DMG Operation Information field is 1. The Pseudo-static allocations subfield is reserved if the TDDTI subfield in the DMG Operation Information field is 0.

The PCP Handover subfield is set to 1 if the PCP provides PCP Handover as defined in 11.27.2 and is set to 0 if the PCP does not provide PCP Handover.

The DMG BSS Parameter Configuration field is defined in Figure 9-644 (DMG BSS Parameter Configuration field format).

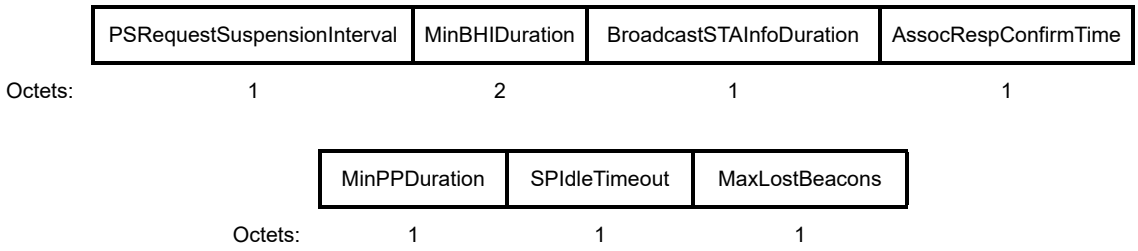

Figure 9-644—DMG BSS Parameter Configuration field format

The PSRequestSuspensionInterval subfield indicates the power save suspension interval and is specified in number of beacon intervals.

The MinBHIDuration subfield indicates the minimum duration of the BHI, which can include the BTI, A-BFT, and ATI and is specified in microseconds.

The BroadcastSTAInfoDuration subfield indicates the amount of time that the AP or PCP expects to take to transmit information about associated STAs and is specified in number of beacon intervals.

The AssocRespConfirmTime subfield indicates the amount of time that the AP or PCP expects to take to respond to association requests and is specified in units of 50 ms. A non-PCP and non-AP STA that receives a DMG Operation element can use the value of this field to set dot11AssociationResponseTimeOut.

The MinPPDuration subfield indicates the minimum duration of the PP and GP as part of the dynamic allocation of service period mechanism and is specified in microseconds.

The SPIdleTimeout subfield indicates time during which a STA expects to receive a frame from its peer STA and is specified in microseconds.

The MaxLostBeacons subfield contains the value of dot11MaxLostBeacons.

9.4.2.128 DMG Beam Refinement element

The DMG Beam Refinement element is defined as shown in Figure 9-645 (DMG Beam Refinement element format).

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

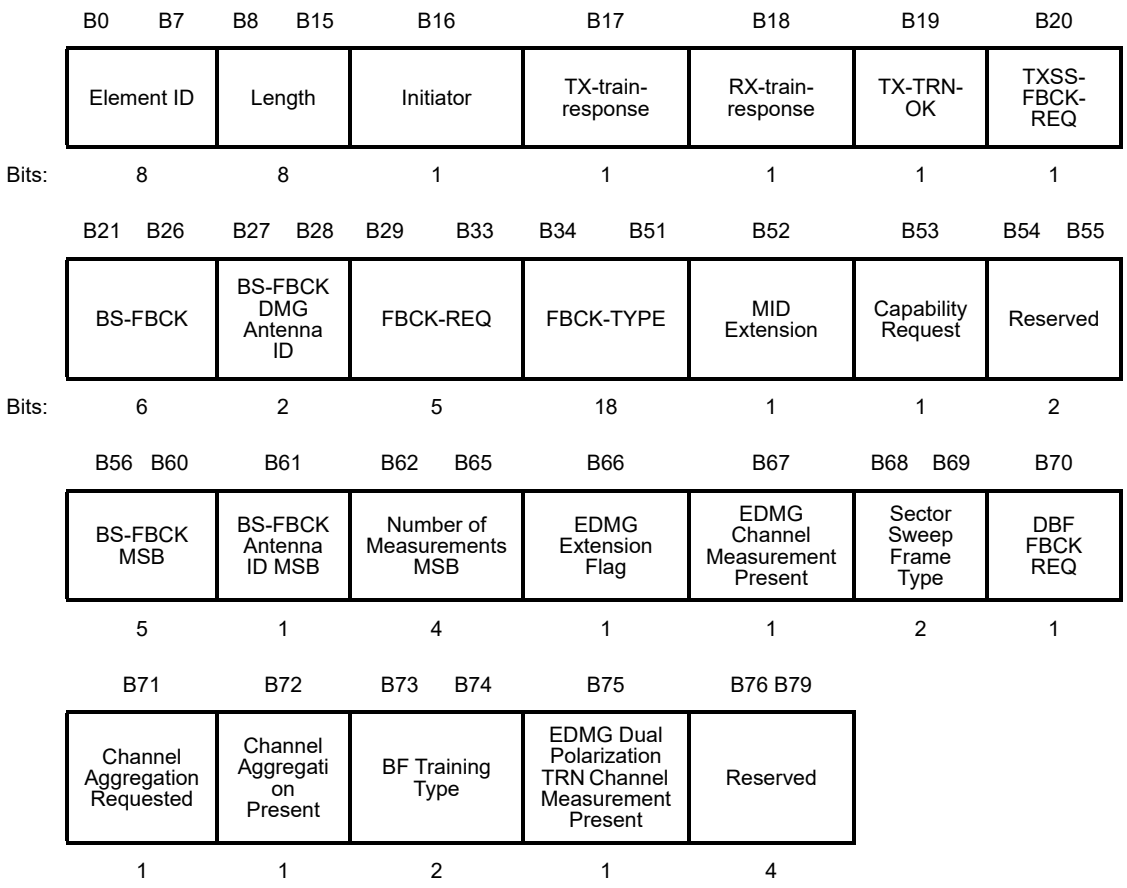

Figure 9-645—DMG Beam Refinement element format

An Initiator field set to 1 indicates that the sender is the beam refinement initiator. Otherwise, this field is set to 0.

A TX-train-response field set to 1 indicates that this element is the response to a TX training request. Otherwise, this field is set to 0.

A RX-train-response field set to 1 indicates that the element serves as an acknowledgment for a RX training request. Otherwise, this field is set to 0.

A TX-TRN-OK field set to 1 confirms a previous training request received by a STA. Otherwise, this field is set to 0.

A TXSS-FBCK-REQ field set to 1 indicates a request for transmit sector sweep feedback.

The size in bits of the BS-FBCK field depends on the value of the EDMG Extension Flag field. If the EDMG Extension Flag field is set to 1, the BS-FBCK MSB field is prepended to the BS-FBCK field to form a single BS-FBCK field of size equal to 11 bits. Otherwise, the BS-FBCK MSB field is reserved and the BS-FBCK field remains with 6 bits in length.

If the EDMG Extension Flag field is set to 0, the BS-FBCK field indicates the index of the TRN-T subfield that was received with the best quality in the last received BRP-TX PPDU, where the first TRN-T subfield in the PPDU is defined as having an index equal to 1. If the EDMG Extension Flag field is set to 1, the BS-FBCK field indicates the AWV feedback ID of the TRN subfields transmitted with the same AWV that were

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

received with the best quality in the last received EDMG BRP-TX PPDU or EDMG BRP-RX/TX PPDU as defined in 28.9.2.2. If the EDMG Extension Flag field is set to 1 and the last received EDMG BRP-TX PPDU or EDMG BRP-RX/TX PPDU was transmitted using channel aggregation, the BS-FBCK field indicates the AWV feedback ID of the TRN subfields transmitted with the same AWV that were received with the best quality in the channel that includes the primary channel. If the last received PPDU from the same STA was not a BRP-TX PPDU, an EDMG BRP-TX PPDU or an EDMG BRP-RX/TX PPDU, this field is set to 0. The determination of best quality is implementation dependent.

The size in bits of the BS-FBCK Antenna ID field depends on the value of the EDMG Extension Flag field. If the EDMG Extension Flag field is set to 1, the BS-FBCK Antenna ID MSB field is prepended to the BS-FBCK Antenna ID field to form a single BS-FBCK Antenna ID field of size equal to 3 bits. Otherwise, the BS-FBCK Antenna ID MSB field is reserved and the BS-FBCK Antenna ID field remains at 2 bits in length.

The BS-FBCK DMG Antenna ID field specifies the DMG antenna ID corresponding to the sector indicated by the BF-FBCK field.

The FBCK-REQ field is defined in Figure 9-646 (FBCK-REQ field format) and is described in Table 9-295.

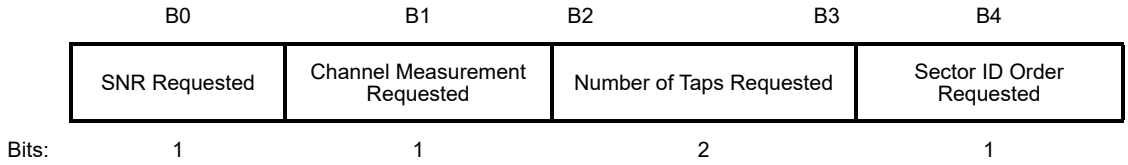

Figure 9-646—FBCK-REQ field format

Table 9-295—FBCK-REQ field description

Subfield	Meaning
SNR Requested	If set to 1, the SNR subfield is requested as part of the returned Channel Measurement element(s). Otherwise, set to 0.
Channel Measurement Requested	If set to 1, the Channel Measurement subfield is requested as part of the returned Channel Measurement element(s). Otherwise, set to 0.
Number of Taps Requested	Number of taps in each channel measurement: 0 x 0 – 1 tap 0 x 1 – $4\times N_{CB}$ + 1 taps 0 x 2 – $14\times N_{CB}$ + 1 taps 0 x 3 – $62\times N_{CB}$ + 1 taps where N_{CB} is the integer number of contiguous 2.16 GHz channels over which the measurement is requested to be taken.
Sector ID Order Requested	If this subfield is set to 1 and the EDMG Extension Flag field is set to 0, the Sector ID Order subfield is requested as part of the returned Channel Measurement element(s). If this subfield is set to 1 and the EDMG Extension Flag field is set to 1, the EDMG Sector ID Order field is requested as part of the returned EDMG Channel Measurement Feedback element(s). Otherwise, this subfield is set to 0.

The FBCK-TYPE field is defined in Figure 9-647 (FBCK-TYPE field format) and is described in Table 9-296. When both N_{meas} and N_{beam} in this field are equal to 0, the Channel Measurement Feedback element is not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

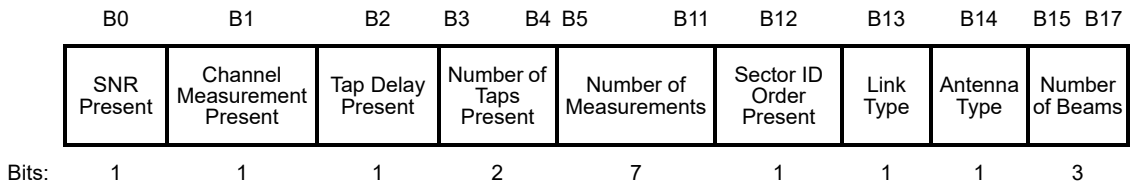

Figure 9-647—FBCK-TYPE field format

Table 9-296—FBCK-TYPE field description

Subfield	Meaning
SNR Present	Set to 1 to indicate that the SNR subfield is present as part of the channel measurement feedback. Set to 0 otherwise.
Channel Measurement Present	Set to 1 to indicate that the Channel Measurement subfield is present as part of the channel measurement feedback. Set to 0 otherwise.
Tap Delay Present	If the EDMG Extension Flag field is set to 0, this subfield is set to 1 to indicate that the Tap Delay subfield is present as part of the channel measurement feedback. If the EDMG Extension Flag field is set to 1, this subfield is set to 1 to indicate that the Tap Delay subfield is present as part of the EDMG channel measurement feedback. This subfield is set to 0 in all other cases.
Number of Taps Present	Number of taps in each channel measurement: 0 x 0 – 1 tap 0 x 1 – $4\times N_{CB}$ + 1 taps 0 x 2 – $14\times N_{CB}$ + 1 taps 0 x 3 – $62\times N_{CB}$ + 1 taps where N_{CB} is the integer number of contiguous 2.16 GHz channels over which the measurement is requested to be taken.
Number of Measurements	The size in bits of the Number of Measurements subfield depends on the value of the EDMG Extension Flag field. If the EDMG Extension Flag field is set to 1, the Number of Measurements MSB field is prepended to the Number of Measurements subfield to form a single Number of Measurements field of size 11 bits. Otherwise, the Number of Measurements MSB field is reserved. The Number of Measurements subfield indicates the number of measurements in the SNR subfield and the Channel Measurement subfield. If the EDMG Extension Flag field is set to 0, the number of measurements is equal to the number of TRN-T subfields in the BRP-TX PPDU on which the measurement is based, or the number of received sectors if TXSS result is reported by setting the TXSS-FBCK-REQ subfield to 1. If the EDMG Extension Flag field is set to 1, the number of measurements is equal to the number of TX-RX AWV configurations trained with the EDMG BRP-TX or EDMG BRP-RX/TX PPDUs on which the measurement is based (see EDMG Channel Measurement Feedback element), or is equal to the number of received sectors if a TXSS result is reported by setting the TXSS-FBCK-REQ subfield to 1.
Sector ID Order Present	Set to 1 to indicate — That the Sector ID Order subfield is present as part of the channel measurement feedback when the EDMG Extension Flag field is set to 0; or — That the EDMG Sector ID Order field is present as part of the EDMG Channel Measurement Feedback element when the EDMG Extension Flag field is set to 1. Set to 0 otherwise.
Link Type	Set to 0 for the initiator link and to 1 for the responder link
Antenna Type	Set to 0 for the transmitter antenna and to 1 for the receiver antenna
Number of Beams	Indicates the number of beams in the Sector ID Order subfield for the MIDC subphase

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A MID Extension field set to 1 indicates the intention to continue transmitting BRP-RX frames during the MID subphases. Otherwise, this field is set to 0.

A Capability Request field set to 1 indicates that the transmitter of the frame requests the intended receiver to respond with a BRP frame that includes the BRP Request field. Otherwise, this field is set to 0.

The EDMG Channel Measurement Present field is set to 1 to indicate that at least one EDMG Channel Measurement Feedback element is present in the frame. Otherwise, this field is set to 0.

The Sector Sweep Frame Type field is set to 0 to indicate that DMG Beacon frames or SSW frames are used in the last sector sweep. This field is set to 1 to indicate that Short SSW PPDUs are used in the last sector sweep. This field is set to 2 to indicate that BRP frames are used in the last sector sweep. The field is set to 3 to indicate that the BRP frame that contains this DMG Beam Refinement element carries a feedback for beam tracking.

The definition of the DBF FBCK REQ field depends on the value of the Digital BF Request field within the EDMG BRP Request element contained in the same frame. If the Digital BF Request field is 1 and the DBF FBCK REQ is set to 1, digital beamforming matrix information is requested as part of a following MIMO BF Feedback frame. If the Digital BF Request field is 1 and the DBF FBCK REQ field is set to 0, MIMO channel measurement is present as part of a following MIMO BF Feedback frame. If the Digital BF Request field is 0, the DBF FBCK REQ field is reserved.

The Channel Aggregation Requested field is set to 1 to indicate that the TRN field is transmitted over a 2.16+2.16 GHz or 4.32+4.32 GHz channel and to request the channel measurement feedback per channel in case of channel aggregation. Otherwise, it is set to 0. This field is reserved when the EDMG Extension Flag field is 0.

The Channel Aggregation Present field is set to 1 to indicate, in case of channel aggregation, that channel measurement feedback per channel is present. Otherwise, it is set to 0. This field is reserved when the EDMG Extension Flag field is 0.

The BF Training Type field is set to 0 to indicate SISO BF training, is set to 1 to indicate SU-MIMO BF training and is set to 2 to indicate MU-MIMO BF training. Other values are reserved.

The EDMG Dual Polarization TRN Channel Measurement Present field is set to 1 to indicate that the EDMG Channel Measurement Feedback element contains the Dual Polarization TRN Measurement field. If the EDMG Dual Polarization TRN Channel Measurement Present field is set to 0, the EDMG Channel Measurement Feedback element does not contain the Dual Polarization TRN Measurement field.

9.4.2.129 DMG Wakeup Schedule element

The DMG Wakeup Schedule element is defined in Figure 9-648 (DMG Wakeup Schedule element format).

	Element ID	Length	BI Start Time	Sleep Cycle	Number of Awake BIs
Octets:	1	1	4	2	2

Figure 9-648—DMG Wakeup Schedule element format

The Element ID and Length fields are defined in 9.4.2.1.

The DMG Wakeup Schedule element is used to communicate the wakeup schedule (WS) of DMG STAs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The BI Start Time field indicates the lower order 4 octets of the TSF timer at the start of the first A-BI in the WS defined by the DMG Wakeup Schedule element. A transmitted BI Start Time field points to a TBTT not more than 2^{31} μs minus aDMGDWSValidPeriod before, and not more than (2^{31} – 1) μs after the TBTT of the beacon interval during which the BI Start Time field is transmitted.

NOTE—The delay between the moment a STA receives a DMG Wakeup Schedule element over the air and the moment the STA interprets the value of the BI Start Time field in the element can be large, to the extent that the beacon interval during which the BI Start Time filed is interpreted is different from the beacon interval during which the DMG Wakeup Schedule element is received. Excluding an interval from the range of BI Start Time field values at transmission enables the receiving STA to be able to correctly interpret any received value for the BI Start Time field of the DMG Wakeup Schedule element belonging to a STA in PS mode without having to remember the beacon interval during which the DMG Wakeup Schedule element was received, as long as the beginning of the beacon interval at the time of interpretation has not advanced more than aDMGDWSValidPeriod relative to the beginning of the beacon interval at the time of reception.

The Sleep Cycle field indicates the sleep cycle duration in beacon intervals, i.e., the sum of A-BIs and D-BIs that make up the sleep cycle.

The Number of Awake BIs field indicates the number of A-BIs at the beginning of each sleep cycle. A Number of Awake BIs field set to 0 indicates that all beacon intervals in the WS are D-BIs.

9.4.2.130 Extended Schedule element

The Extended Schedule element is defined in Figure 9-649 (Extended Schedule element format). Because the length parameter supports only 255 octets of information in an element, the AP or PCP can split the Allocation fields into more than one Extended Schedule element entry in the same DMG Beacon or Announce frame. Despite this splitting, the set of Extended Schedule element entries conveyed within a DMG Beacon and Announce frame is considered to be a single schedule for the beacon interval, and in this standard referred to simply as Extended Schedule element unless otherwise noted. The Allocation fields are ordered by increasing allocation start time with allocations beginning at the same time arbitrarily ordered.

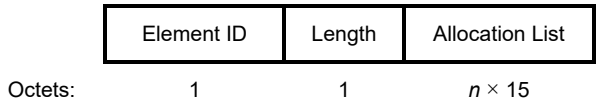

Figure 9-649—Extended Schedule element format

The Element ID and Length fields are defined in 9.4.2.1.

The Allocation List field contains one or more (*n*) Allocation fields. The Allocation fields are ordered by increasing allocation start time with allocations beginning at the same time arbitrarily ordered.

An Allocation field is formatted as shown in Figure 9-650 (Allocation field format).

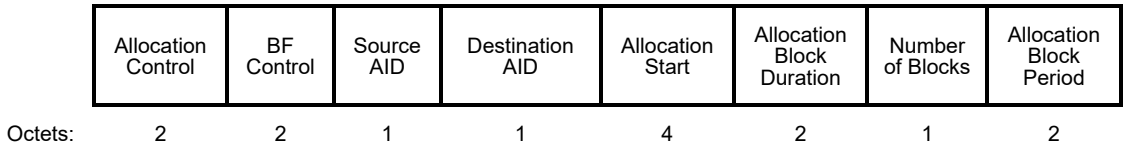

Figure 9-650—Allocation field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Allocation Control subfield is defined in Figure 9-651 (Allocation Control subfield format (DMG)) for a DMG STA and in Figure 9-652 (Allocation Control subfield format (CDMG)) for a CDMG STA.

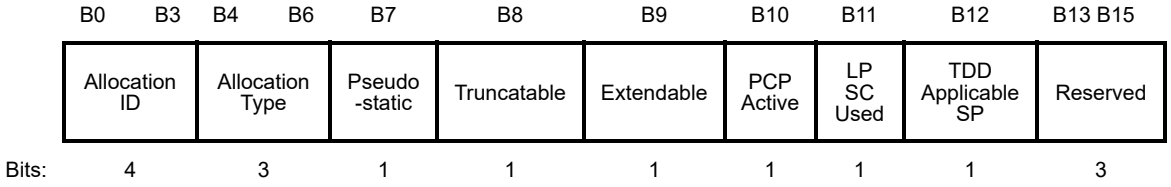

Figure 9-651—Allocation Control subfield format (DMG)

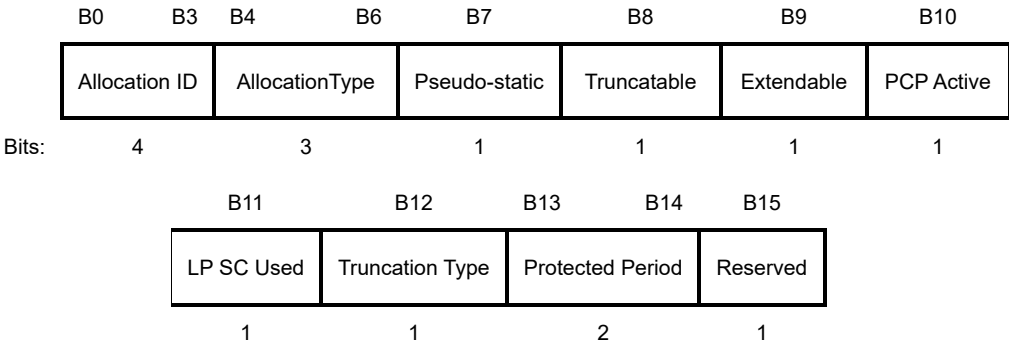

Figure 9-652—Allocation Control subfield format (CDMG)

The Allocation ID subfield, when set to a nonzero value, identifies an airtime allocation from Source AID to Destination AID. Except for CBAP allocations with broadcast Source AID and broadcast Destination AID, the tuple (Source AID, Destination AID, Allocation ID) uniquely identifies the allocation. For CBAP allocations with broadcast Source AID and broadcast Destination AID, the Allocation ID subfield is set to 0.

The AllocationType subfield defines the channel access mechanism during the allocation, with possible values listed in Table 9-297.

Table 9-297—AllocationType subfield values

Bit 4	Bit 5	Bit 6	Meaning
0	0	0	SP allocation
1	0	0	CBAP allocation
0	1	0	SP allocation on a 1.08 GHz channel
1	1	0	CBAP allocation on a 1.08 GHz channel
All other combinations			Reserved

The Pseudo-static subfield is set to 1 to indicate that this allocation is pseudo-static (10.38.6.4) and set to 0 otherwise.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

For an SP allocation, the Truncatable subfield is set to 1 to indicate that the source DMG STA and destination DMG STA can request SP truncation and set to 0 otherwise. For a CBAP allocation, the Truncatable subfield is reserved.

For an SP allocation, the Truncatable subfield is set to 1 to indicate that the source CDMG STA and destination CDMG STA can request SP truncation, and the SP truncation type is determined by the Truncation Type subfield. Otherwise, it is set to 0, and the Truncation Type subfield is reserved. For a CBAP allocation, the Truncatable subfield is reserved

For an SP allocation, the Extendable subfield is set to 1 to indicate that the source DMG STA and destination DMG STA can request SP extension and set to 0 otherwise. For a CBAP allocation, the Extendable subfield is reserved.

For a PCP in active mode (see 11.2.7), or when applied to a CBAP or SP in a PCP A-BI, a PCP Active subfield set to 1 indicates that the PCP is available to transmit or receive during the CBAP or SP, and a PCP Active subfield set to 0 indicates the PCP is unavailable to transmit or receive. For a DMG PCP, the PCP Active subfield is set to 1 at least in the following cases:

— The PCP transmitting the subfield is the source or destination of the CBAP or SP
— At least one of the Truncatable or Extendable subfields is set to 1
— The subfield is transmitted by an AP

For a CDMG PCP, the PCP Active subfield is set to 1 at least in the following cases:

— The PCP transmitting the field is the source or destination of the CBAP or SP
— The Truncatable subfield is equal to 1, and the Truncation Type subfield is equal to 0
— The Extendable subfield is equal to 1
— The subfield is transmitted by an AP

The PCP Active subfield is ignored when it applies to a CBAP or SP that resides in a PCP D- BI.

The BF Control subfield is defined in 9.5.5.

The Source AID subfield is set to the AID of the STA that initiates channel access during the SP or CBAP allocation or, in the case of a CBAP allocation, can also be set to the broadcast AID if all STAs are allowed to transmit during the CBAP allocation.

The Destination AID subfield is set to the AID of the STA that the source STA targets during the allocation, or to the broadcast AID if the source STA targets more than one STA during the allocation. If both Source AID and Destination AID subfields for an SP allocation are set to the broadcast AID, then during the SP a non-AP and non-PCP STA does not transmit unless it receives a Poll or Grant frame from the AP or PCP.

The Allocation Start subfield contains the lower 4 octets of the TSF at the time the SP or CBAP starts. The Allocation Start subfield can be specified at a future beacon interval when the pseudo-static subfield is set to 1.

The Allocation Block Duration subfield indicates the duration, in microseconds, of a time block for which the SP or CBAP allocation is made and cannot cross beacon interval boundaries. Possible values range from 1 to 32 767 for an SP allocation and 1 to 65 535 for a CBAP allocation.

The Number of Blocks subfield contains the number of time blocks making up the allocation.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Allocation Block Period subfield contains the time, in microseconds, between the start of two consecutive time blocks belonging to the same allocation. The Allocation Block Period subfield is reserved when the Number of Blocks subfield is set to 1.

The LP SC Used subfield is set to 1 to indicate that the low-power SC mode described in 20.6 is used in this SP. Otherwise, it is set to 0.

If the Truncatable subfield is equal to 0, the Truncation Type subfield is reserved. Otherwise, a CDMG AP or a CDMG PCP sets the Truncation Type subfield to 0 to indicate that the CDMG STA is to return the time left in the SP to the CDMG AP or PCP, and it sets the Truncation Type subfield to 1 to indicate that the CDMG STA allocates any portion of its SP as a CBAP.

For CDMG STAs, the Protected Period subfield is used to indicate whether the source and destination STAs of the allocated SP are required to establish a protected period and on which channels the protected period is established. The Protected Period subfield is set to 0 to indicate the source and destination STAs of the SP are allowed to create a protected period, and the STA determines whether to establish a protected period. The Protected Period subfield is set to a nonzero value to indicate the source and destination STAs of the SP are required to create a protected period on the indicated channel(s). The values of the Protected Period subfield for a CDMG STA operating on a 2.16 GHz channel or a 1.08 GHz are listed in Table 9-298 and Table 9-299, respectively. For a CBAP allocation, the Protected Period subfield is reserved.

Table 9-298—Protected Period subfield value for a CDMG STA operating on a 2.16 GHz channel

Value	Meaning
0	The STA determines whether to establish a protected period.
1	The current channel needs a protected period.
2	Both the current 2.16 GHz channel and the low frequency channel 35 or channel 37 need a protected period.
3	Both the current 2.16 GHz channel and the high frequency channel 36 or channel 38 need a protected period.

Table 9-299—Protected Period subfield value for a CDMG STA operating on a 1.08 GHz channel

Value	Meaning
0	The STA determines whether to establish a protected period.
1	The current channel needs a protected period.
2	The current 1.08 GHz channel and the overlapping 2.16 GHz channel need a protected period.
3	Reserved.

If the Allocation Type subfield indicates an SP allocation, the TDD Applicable SP subfield set to 1 indicates that the SP allocation is using TDD channel access as described in 10.38.6.2.2; otherwise, it is set to 0. For other values of the Allocation Type subfield, the TDD Applicable SP subfield is reserved.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.131 STA Availability element

The STA Availability element is used by a non-AP and non-PCP STA to inform an AP or PCP about the STA availability during the subsequent CBAPs (10.38.5) and to indicate participation in the dynamic allocation of service periods (10.38.7). The AP or PCP uses the STA Availability element to inform the non-AP and non-PCP STAs of other STAs availability during subsequent CBAPs and participation of other STAs in the Dynamic allocation of service periods.

The format of the STA Availability element is defined in Figure 9-653 (STA Availability element format).

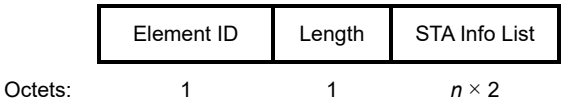

Figure 9-653—STA Availability element format

The Element ID and Length fields are defined in 9.4.2.1.

The STA Info List field contains one or more (n) STA Info fields.

The format of the STA Info field is shown in Figure 9-654 (STA Info field format).

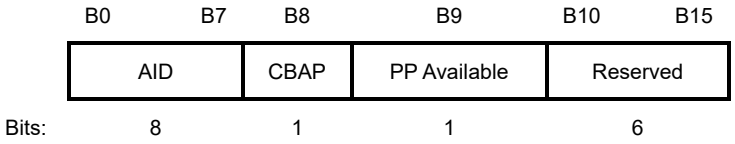

Figure 9-654—STA Info field format

The AID subfield contains the AID of the STA for which availability is indicated.

The CBAP subfield is set to 1 to indicate that the STA is available to receive transmissions during CBAPs and set to 0 otherwise.

The PP Available subfield is set to 1 to indicate that the STA is available during PPs (10.38.7) and is set to 0 otherwise.

9.4.2.132 DMG TSPEC element

The DMG TSPEC element sent by a non-AP and non-PCP DMG STA contains the set of parameters needed to create or modify an airtime allocation. The DMG TSPEC element sent by a DMG AP or PCP reflects the parameters, possibly modified, by which the allocation was created. The format of the DMG TSPEC element is shown in Figure 9-655 (DMG TSPEC element format).

The Element ID and Length fields are defined in 9.4.2.1.

The DMG Allocation Info field is formatted as shown in Figure 9-656 (DMG Allocation Info field format).

Copyright © 2025 IEEE. All rights reserved.

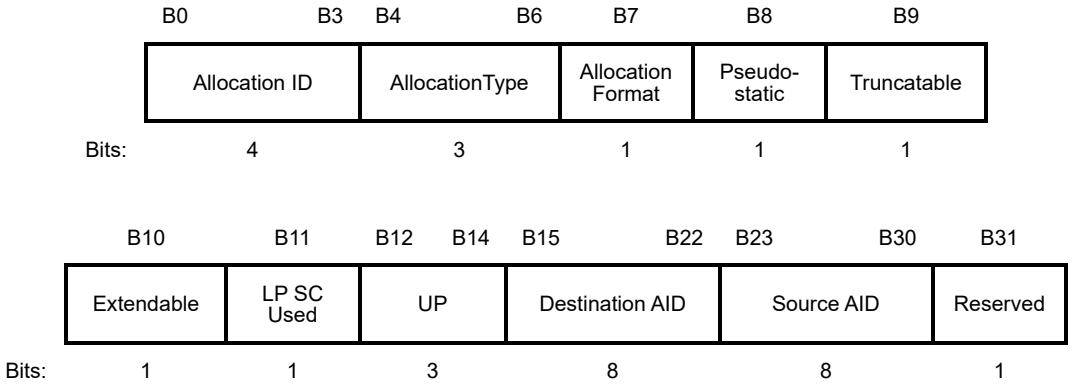

Figure 9-656—DMG Allocation Info field format

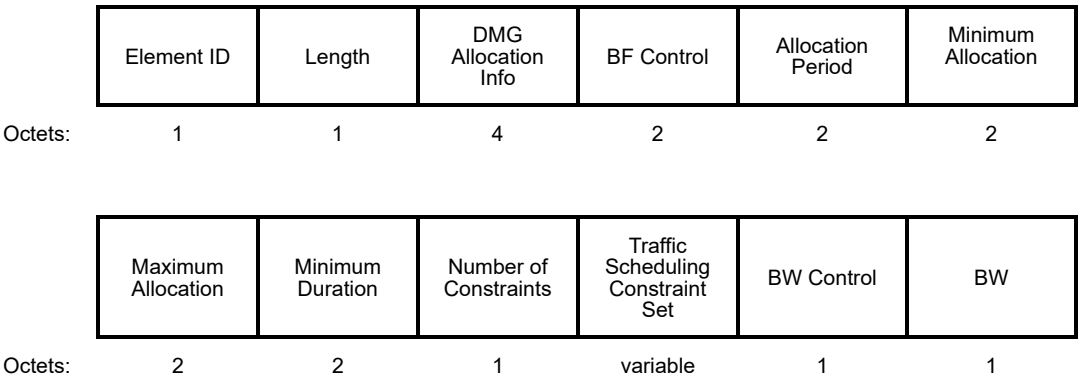

Figure 9-655—DMG TSPEC element format

The Allocation ID subfield identifies an allocation if set to a nonzero value and is used as follows:

— The STA that transmits an ADDTS Request frame containing the DMG TSPEC element sets the Allocation ID subfield to a nonzero value to create a new allocation or modify an existing allocation.

— The STA that transmits an ADDTS Response frame containing the DMG TSPEC element sets the Allocation ID subfield to a nonzero value to identify a created or modified allocation or sets it to 0 if creating or modifying the allocation failed.

The AllocationType subfield defines the channel access mechanism used during the allocation, with values listed in Table 9-297.

The Allocation Format field values are listed in Table 9-300.

Table 9-300—Allocation Format subfield values

Allocation Format subfield value	Description
1	Isochronous allocation format
0	Asynchronous allocation format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Pseudo-static subfield is set to 1 for a pseudo-static allocation and set to 0 otherwise.

For an SP allocation, the Truncatable subfield is set to 1 if the STA expects to truncate the SP, as described in 10.38.8. If the STA does not expect to truncate the SP, the Truncatable subfield is set to 0. The subfield is reserved for CBAP allocations.

For an SP allocation, the Extendable subfield is set to 1 if the STA expects to extend the SP, as described in 10.38.9. If the STA does not expect to extend the SP, the Extendable subfield is set to 0. The subfield is reserved for CBAP allocations.

The LP SC Used subfield is defined in 9.4.2.130.

The UP subfield indicates the lowest priority UP to be used for possible transport of MSDUs belonging to TCs with the same source and destination of the allocation.

The Destination AID subfield contains the AID of a STA that the requesting STA targets during the allocation.

The Source AID subfield contains the AID of the STA that initiates channel access during the allocation.

The BF Control subfield is defined in 9.5.5.

The Allocation Period is specified as a fraction or multiple of the beacon interval as defined in Table 9-301.

Table 9-301—Allocation Period field values

B0–B14	B15	Meaning
0	0	Reserved
0	1	Not periodic or periodicity unknown
1–32 767	0	The allocation period is a multiple of the beacon interval, i.e., allocation period = *n* x *bi* where *n* is the value represented by B0–B14 and *bi* is the beacon interval.
1–32 767	1	The allocation period is a fraction of the beacon interval, i.e., allocation period = *bi*/*n* where *n* is the value represented by B0–B14 and *bi* is the beacon interval.

For isochronous allocation format requests the Allocation Period, Minimum Allocation and Maximum Allocation fields are set as follows:

— The Allocation Period field indicates the period over which the allocation repeats.
— The Minimum Allocation field is set to the minimum acceptable allocation in microseconds in each allocation period.
— The Maximum Allocation field is set to the requested allocation in microseconds in each allocation period.

For asynchronous allocation format requests the Maximum Allocation field is reserved, and the Allocation Period and Minimum Allocation fields are set as follows:

— The Allocation Period field indicates the period over which the minimum allocation applies. The Allocation Period is an integer multiple of the beacon interval.
— The Minimum Allocation field specifies the minimum allocation in microseconds that the STA expects within the allocation period.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Minimum Duration field specifies the minimum acceptable duration in microseconds. Possible values range from 1 to 32 767 for an SP allocation and 1 to 65 535 for a CBAP allocation. This field is set to 0 to indicate no minimum specified.

The Number of Constraints field indicates the number of Constraint subfields contained in the element. The field ranges from 0 to 15. Other values are reserved.

The Traffic Scheduling Constraint Set field contains one or more Constraint subfields (see Figure 9-657 (Traffic Scheduling Constraint Set field format)).

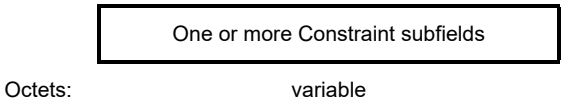

Figure 9-657—Traffic Scheduling Constraint Set field format

The Constraint subfield is defined as shown in Figure 9-658 (Constraint subfield format).

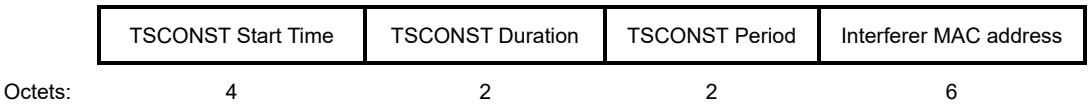

Figure 9-658—Constraint subfield format

The TSCONST Start Time subfield contains the lower 4 octets of the TSF at the time the scheduling constraint starts.

The TSCONST Duration subfield indicates the time, in microseconds, for which the scheduling constraint is specified.

The TSCONST Period subfield is specified as a fraction or multiple of the beacon interval as defined in Table 9-302. This subfield is used to indicate a periodic scheduling constraint by specifying the temporal gap between two consecutive scheduling constraints.

Table 9-302—TSCONST Period values

B0–B14	B15	Meaning
0	0	Reserved
0	1	Not periodic or periodicity unknown
1–32 767	0	The TSCONST period is a multiple of the beacon interval, i.e., TSCONST period = *n* x *bi* where *n* is the value represented by B0–B14 and *bi* is the beacon interval..
1–32 767	1	The TSCONST period is a fraction of the beacon interval, i.e., TSCONST period = *bi*/*n* where *n* is the value represented by B0–B14 and *bi* is the beacon interval..

The Interferer MAC Address subfield is set to the TA field within a frame received during the interval of time indicated by this Constraint subfield. If the value is unknown, the Interferer MAC Address subfield is set to the broadcast address.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The BW Control field is defined in Figure 9-659 (BW Control field format).

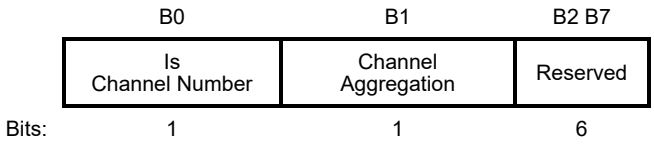

Figure 9-659—BW Control field format

The Is Channel Number subfield indicates whether the value in the BW field represents a channel width or channel number.

The Channel Aggregation subfield is defined in Table 28-12.

The BW field indicates the requested channel width or channel number of the allocation. If the Is Channel Number subfield is set to 1, the BW field uses the bitmap format of the BW field defined in Table 28-12 and, together with the Channel Aggregation subfield, are collectively used to derive a requested channel number for the allocation per the channel numbers defined in 9.4.2.264.5. If the Is Channel Number subfield is set to 0, the BW field indicates a channel width using the bitmap format of the BW field defined in Table 28-12. In this case, the channel width can be allocated on any channel number. When transmitted in an ADDTS Response frame, the BW field indicates the allocated channel for the allocation using the bitmap format of the BW field defined in Table 28-12.

9.4.2.133 CMMG TSPEC element

The definition of the CMMG TSPEC element is similar with the definition of the DMG TSPEC element except for the specific change defined by Figure 9-660 (Constraint subfield format for CMMG STAs) and Figure 9-661 (Interferer Channel Bandwidth subfield format).

The Constraint subfield is defined in Figure 9-660 (Constraint subfield format for CMMG STAs) for CMMG STAs.

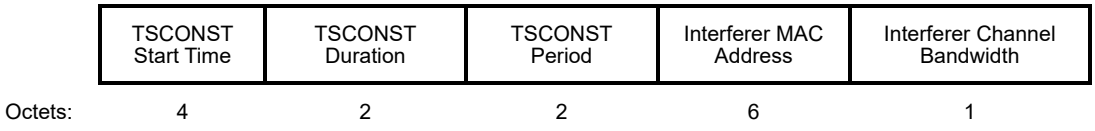

Figure 9-660—Constraint subfield format for CMMG STAs

The Interference Channel Bandwidth subfield is defined in Figure 9-661 (Interferer Channel Bandwidth subfield format).

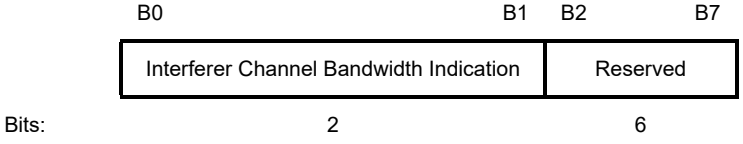

Figure 9-661—Interferer Channel Bandwidth subfield format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Interferer Channel Bandwidth Indication subfield is present only when the operating channel bandwidth of the CMMG STA is 1080 MHz. The Interferer Channel Bandwidth Indication subfield indicates the part of the operating channel with interference during the time interval indicated by the TSCONST subfields. If the Interferer Channel Bandwidth Indication subfield is 0, interference occurred in the upper 540 MHz of the 1080 MHz operating channel. If the Interferer Channel Bandwidth Indication subfield is 1, interference occurred in the lower 540 MHz of the 1080 MHz operating channel. If the Interferer Channel Bandwidth Indication subfield is 2, interference occurred in over the total operating channel. A value of 3 for the Interferer Channel Bandwidth Indication subfield is reserved.

9.4.2.134 Next DMG ATI element

The Next DMG ATI element indicates the earliest start time for the next ATI in a subsequent beacon interval. See Figure 9-662 (Next DMG ATI element format).

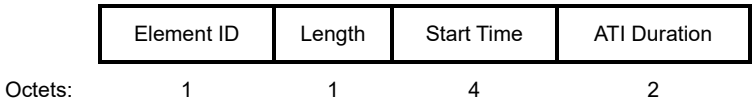

Figure 9-662—Next DMG ATI element format

The Element ID and Length fields are defined in 9.4.2.1.

The Start Time field contains the low order 4 octets of the TSF for the earliest time at which the next ATI in a subsequent beacon interval starts.

The ATI Duration field contains the duration, in microseconds, of the next ATI in a subsequent beacon interval.

9.4.2.135 Channel Measurement Feedback element

The Channel Measurement Feedback element is used to carry the channel measurement feedback in response to a request in the DMG Beam Refinement element of a BRP frame. It contains data that the STA has measured on the TRN-T subfields of the BRP PPDU that contained the BRP frame, or a list of sectors identified during a sector sweep or during beam combination (10.41.6.3). The format and size of the Channel Measurement Feedback element are defined by the parameter values specified in the accompanying DMG Beam Refinement element.

The Channel Measurement Feedback element, as shown in Table 9-303, is composed of 4 subfields: the SNR subfield, the Channel Measurement subfield, the Tap Delay subfield, and the Sector ID Order subfield.

The Element ID and Length fields are defined in 9.4.2.1.

The number of channel/SNR measurements reported, N_{meas}, is equal to the number of TRN-T subfields that were appended to the PPDU on which the measurements were performed. If the measurement reports the result of an SLS or of an MID, it is equal to the number of frames received during the sector sweep, or the number of PPDUs used during the MID subphase.

The SNR subfield levels are unsigned integers referenced to a level of –8 dB. Each step is 0.25 dB. SNR values less than or equal to –8 dB are represented as 0. SNR values greater than or equal to 55.75 dB are represented as 0xFF.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-303—Channel Measurement Feedback element format

Field	Size		Meaning
Element ID	8 bits		
Length	8 bits		
SNR	SNR_1	8 bits	SNR as measured in the first TRN-T subfield or at the first sector from which SSW frame or Short SSW PPDU is received, or at the channel indicated by the first SISO ID subset
	SNR_2	8 bits	SNR as measured in the first TRN-T subfield or at the first sector from which SSW frame or Short SSW PPDU is received, or at the channel indicated by the first SISO ID subset.
	⋮		
	$SNR_{N_{meas}}$	8 bits	SNR as measured in the N_{meas} TRN-T subfield or at sector N_{meas} from which SSW frame or Short SSW PPDU is received, or at the channel indicated by the N_{meas} SISO ID subset.
Channel Measurement	Channel Measurement 1	N_{taps}×16 bits	Channel measurement for the first TRN-T subfield or for the channel indicated by the first SISO ID subset.
	Channel Measurement 2	N_{taps}×16 bits	Channel measurement for the second TRN-T subfield or for the channel indicated by the second SISO ID subset.
	⋮		
	Channel Measurement N_{meas}	N_{taps}×16 bits	Channel measurement for the N_{meas} TRN-T subfield or for the channel indicated by the N_{meas} SISO ID subset.
Tap Delay	Relative Delay Tap #1	8 bits	The delay of Tap #1 in units of T_c relative to the path with the shortest delay detected.
	Relative Delay Tap #2	8 bits	The delay of Tap #2 in units of T_c relative to the path with the shortest delay detected.
	⋮		
	Relative Delay Tap #N_{taps}	8 bits	The delay of Tap #N_{taps} in units of T_c relative to the path with the shortest delay detected.

Table 9-303—Channel Measurement Feedback element format *(continued)*

Field	Size		Meaning
Sector ID Order	Sector ID_1	6 bits	Sector ID for SNR_1 being obtained, or sector ID of the first detected beam.
	DMG Antenna ID_1	2 bits	DMG Antenna ID corresponding to sector ID_1.
	Sector ID_2	6 bits	Sector ID for SNR_2 being obtained, or sector ID of the second detected beam.
	DMG Antenna ID_2	2 bits	DMG Antenna ID corresponding to sector ID_2.
	⋮		
	Sector ID_{Nmeas} or sector ID_{Nbeam}	6 bits	Sector ID for SNR_{Nmeas} being obtained, or sector ID of the detected beam N_{beam}.
	DMG Antenna ID_{Nmeas} or DMG Antenna ID_{Nbeam}	2 bits	DMG Antenna ID corresponding to sector ID_{Nmeas} or sector ID_{Nbeam}
Additional SNR	SNR_1	8 bits	SNR as measured in the first TRN-T field or at the channel indicated by the first SISO ID subset.
	SNR_2	8 bits	SNR as measured in the second TRN-T field or at the channel indicated by the second SISO ID subset.
	. . .		
	SNR_{Nmeas}	8 bits	SNR as measured in the N_{meas} TRN-T field or at the channel indicated by the N_{meas} SISO ID subset.
Additional Channel Measurement	Channel Measurement 1	N_{taps}×16 bits	Channel measurement for the first TRN-T field or for the channel indicated by the first SISO ID subset.
	Channel Measurement 2	N_{taps}×16 bits	Channel measurement for the second TRN-T field or for the channel indicated by the second SISO ID subset.
	. . .		
	Channel Measurement N_{meas}	N_{taps}×16 bits	Channel measurement for the N_{meas} TRN-T field or for the channel indicated by the N_{meas} SISO ID subset.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The format of each channel measurement is specified in Table 9-304.

Table 9-304—Channel measurement

Field	Size	Meaning
Relative I Component Tap #1	8 bits	The in-phase component of impulse response for Tap #1, relative to the amplitude of the strongest tap measured.
Relative Q Component Tap #1	8 bits	The quadrature component of impulse response for Tap #1, relative to the amplitude of the strongest tap measured.
Relative I Component Tap #2	8 bits	The in-phase component of impulse response for Tap #2, relative to the amplitude of the strongest tap measured.
Relative Q Component Tap #2	8 bits	The quadrature component of impulse response for Tap #2, relative to the amplitude of the strongest tap measured.
⋮		
Relative I Component Tap #N_{taps}	8 bits	The in-phase component of impulse response for Tap #N_{taps}, relative to the amplitude of the strongest tap measured.
Relative Q Component Tap #N_{taps}	8 bits	The quadrature component of impulse response for Tap #N_{taps}, relative to the amplitude of the strongest tap measured.

Each channel measurement contains N_{taps} channel impulse taps. The channel impulse response reported for all N_{meas} measurements correspond to a common set of relative tap delays. If the Tap Delay subfield is not present, then the N_{taps} channel taps is interpreted as consecutive time samples, separated by T_c. Selection of which taps are sent is implementation dependent. The delay values in the Tap Delay subfield, when present, correspond to the strongest taps and are unsigned integers, in increments of T_c, starting from 0. Each channel tap is reported as an in-phase and quadrature component pair, with each component value represented as a 2s complement number between –128 and 127. Unless all in-phase and quadrature component values are reported as zero, they are scaled such that the two most significant bits for at least one of the component values equal 01 or 10 (binary). The same scale applies to all measurements over all TRN subfields.

The Sector ID Order subfield indicates the TX sector IDs corresponding to the SNRs in the SNR subfield when the SNR Present subfield is set to 1 and Sector ID Order Present subfield is set to 1, in response to a BRP PPDU with the SNR Requested subfield set to 1. The Sector ID Order subfield indicates the TX sector IDs ranked in the decreasing order of link quality, as measured on a preceding sector sweep, MID, or BC phase, determined in an implementation dependent manner, when the SNR Present subfield is set to 0 and the Sector ID Order Present subfield is set to 1 in response to setting the SNR Requested subfield to 0 and the Sector ID Order Requested subfield to 1. The FBCK-REQ field and the FBCK TYPE field in the DMG Beam Refinement element are used by the transmitter and receiver to, respectively, request for and indicate the sector IDs and their order.

If both the Channel Aggregation Present field and the EDMG Extension Flag field in the accompanying DMG Beam Refinement element are 1 or if the Channel Aggregation Present field in the accompanying MIMO Feedback Control element is 1, the following apply:

— The SNR and Channel Measurement fields are for the channel that includes the primary channel in case of channel aggregation. Otherwise, the SNR and Channel Measurement fields are for the channel in which the measurement is taken.

— The Additional SNR and Additional Channel Measurement fields are for the channel that does not include the primary channel in case of channel aggregation. Otherwise, the Additional SNR and Additional Channel Measurement fields are not present.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If an EDMG Channel Measurement Feedback element is present in the same frame as a Channel Measurement Feedback element, the interpretation of each SNR_i, Channel $Measurement_i$, Tap $Delay_i$, Additional SNR_i and Additional Channel $Measurement_i$ fields, $1 \leq i \leq N_{meas}$, is associated to the i^{th} entry within the EDMG Sector ID Order field of the EDMG Channel Measurement Feedback element.

9.4.2.136 Awake Window element

The Awake Window element is defined as shown in Figure 9-663 (Awake Window element format).

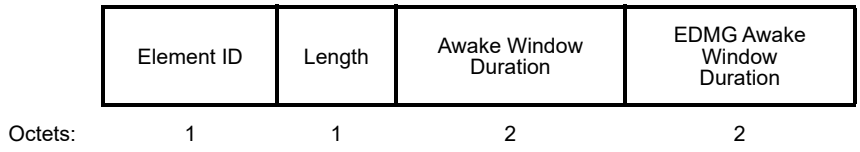

Figure 9-663—Awake Window element format

The Element ID and Length fields are defined in 9.4.2.1.

The Awake Window Duration field contains the duration of the awake windows in microseconds.

The EDMG Awake Window Duration field contains the duration, in microseconds, of the awake window for the CBAP allocations scheduled through the EDMG Extended Schedule element.

9.4.2.137 Multi-band element

The Multi-band element indicates that the STA transmitting this element (the transmitting STA) is within a multi-band device capable of operating in a frequency band or operating class or channel other than the one in which this element is transmitted. In addition, if used as part of a fast session transfer, this element indicates that the transmitting STA is able to accomplish a fast session transfer from the current channel to a channel using another STA in the same device, in the other or same band. The format of the Multi-band element is shown in Figure 9-664 (Multi-band element format).

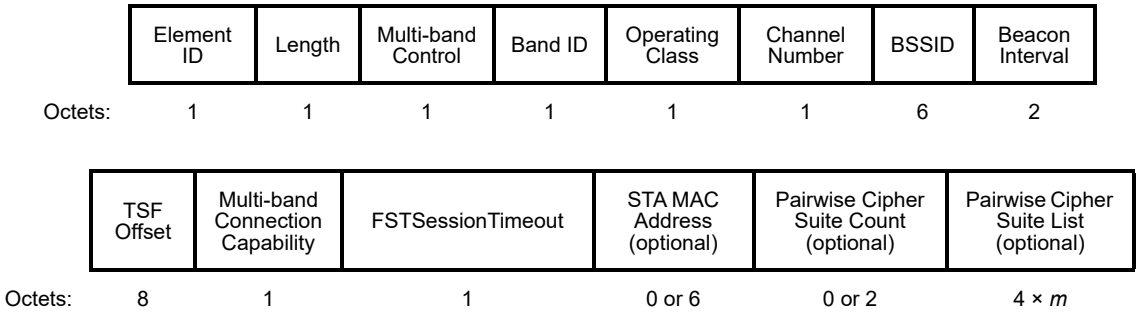

Figure 9-664—Multi-band element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Multi-band Control field is shown in Figure 9-665 (Multi-band Control field format).

The STA Role subfield specifies the role the transmitting STA plays on the channel of the operating class indicated in this element. The possible values of the STA Role subfield are indicated in Table 9-305.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

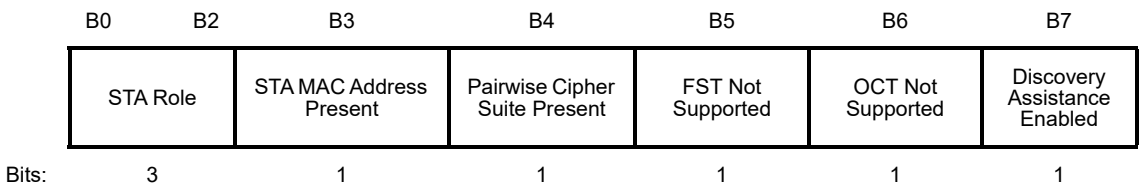

Figure 9-665—Multi-band Control field format

Table 9-305—STA Role subfield values

STA role	Value
AP	0
TDLS STA	1
IBSS STA	2
PCP	3
Non-PCP and Non-AP STA	4
Reserved	5–7

NOTE—A STA can perform in more than one role in a channel, and the STA Role subfield identifies the role that is most relevant for the STA for that channel.

The STA MAC Address Present subfield indicates whether the STA MAC Address subfield is present in the Multi-band element. If the present subfield is set to 1, the STA MAC Address subfield is present. If the STA MAC Address Present subfield is set to 0, the STA MAC Address subfield is not present.

The Pairwise Cipher Suite Present subfield indicates whether the Pairwise Cipher Suite Count field and the Pairwise Cipher Suite List field are present in the Multi-band element. If the Pairwise Cipher Suite Present subfield is set to 1, the Pairwise Cipher Suite Count field and the Pairwise Cipher Suite List field are present. If the Pairwise Cipher Suite Present subfield is set to 0, the Pairwise Cipher Suite Count field and the Pairwise Cipher Suite List field are not present.

The FST Not Supported subfield is set to 1 to indicate that FST protocol (see 11.31.3) is not supported. The FST protocol is supported otherwise.

The OCT Not Supported subfield is set to 1 to indicate that OCT (see 11.31.5) is not supported. OCT is supported otherwise.

The Discovery Assistance Enabled subfield indicates whether the STA supports the multi-band discovery assistance procedure for the BSS defined by the BSSID field on the channel defined by the Band ID field, the Operating Class field, and the Channel Number field. The Discovery Assistance Enabled subfield is set to 1 if the BSS specified in the element is a DMG BSS and if dot11DiscoveryAssistanceActivated is true. The subfield is set to 0 otherwise.

The Band ID field provides the identification of the frequency band related to the Operating Class and Channel Number fields. The Band ID field is defined in 9.4.1.43.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Operating Class field indicates the channel set for which the Multi-band element applies. The Operating Class and Channel Number fields together specify the channel frequency and spacing for which the Multi-band element applies. Valid values of the Operating Class field are shown in Annex E. This field is set to 0 to indicate all operating classes within the frequency band specified by the Band ID field.

The Channel Number field is set to the number of the channel the transmitting STA is operating on or intends to operate on. This field is set to 0 to indicate all channels within the frequency band specified by the Band ID field.

The BSSID field specifies the BSSID of the BSS operating on the channel and frequency band indicated by the Channel Number and Band ID fields. When used as part of the on-channel tunneling operation (see 11.31.5), this field can contain the wildcard BSSID.

The Beacon Interval field specifies the size of the beacon interval for the BSS operating on the channel and frequency band indicated by the Channel Number and Band ID fields. This field is set to 0 if no BSS is in operation in the indicated channel and frequency band.

If the transmitting STA is a member of a PBSS or infrastructure BSS on both the channel indicated in this element and the channel on which the element is transmitted, then the TSF Offset field contains the time offset of the TSF of the PBSS or infrastructure BSS of which the transmitting STA is member on the channel indicated in this element relative to the TSF of the PBSS or infrastructure BSS corresponding to the BSSID indicated in the Address 3 field of the MPDU in which this element is transmitted. The TSF Offset field is specified as a 2s complement integer in microsecond units. If the transmitting STA is not a member of an infrastructure BSS or PBSS on both the channel indicated in this element and the channel on which the element is transmitted, then the TSF Offset field contains the value 0.

The Multi-band Connection Capability field is defined in Figure 9-666 (Multi-band Connection Capability field format). The Multi-band Connection Capability field indicates the connection capabilities supported by the STA on the channel and band indicated in this element.

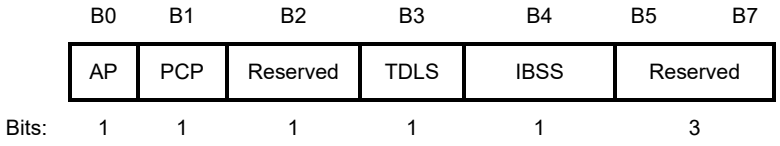

Figure 9-666—Multi-band Connection Capability field format

The AP subfield specifies whether the STA can function as an AP on the channel and band indicated in the element. It is set to 1 when the STA is capable to function as an AP, and it is set to 0 otherwise.

The PCP subfield specifies whether the STA can function as a PCP on the channel and band indicated in the element. It is set to 1 when the STA is capable to function as a PCP, and it is set to 0 otherwise.

The TDLS subfield is set to 1 to indicate that the STA can perform a TDLS on the channel and band indicated in the element. Otherwise, it is set to 0.

The IBSS subfield is set to 1 to indicate that the STA is able to support IBSS on the channel and band indicated in the element. Otherwise, it is set to 0.

The FSTSessionTimeout field is used in the FST Setup Request frame to indicate the timeout value for FST session setup protocol as defined in 11.31.1. The FSTSessionTimeout field contains the duration, in TUs, after which the FST setup is terminated. The FSTSessionTimeout field is reserved if the FST Not Supported subfield is 1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The STA MAC Address field contains the MAC address that the transmitting STA uses while operating on the channel indicated in this element. The STA MAC Address field is not present in this element if the STA MAC Address Present field is set to 0.

The Pairwise Cipher Suite Count field and the Pairwise Cipher Suite List field are defined in 9.4.2.23. These fields are not present in this element if the Pairwise Cipher Suite Present subfield is set to 0.

9.4.2.138 ADDBA Extension element

The ADDBA Extension element is shown in Figure 9-667 (ADDBA Extension element format).

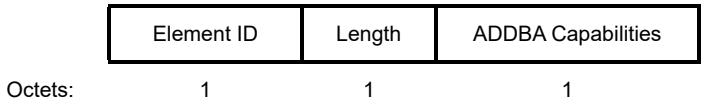

Figure 9-667—ADDBA Extension element format

The Element ID and Length fields are defined in 9.4.2.1.

The ADDBA Capabilities field is shown in Figure 9-668 (ADDBA Capabilities field format).

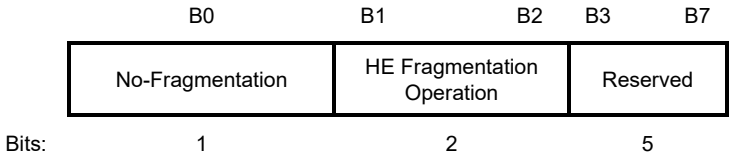

Figure 9-668—ADDBA Capabilities field format

The ADDBA Extension element can be included in the ADDBA Request and Response frames.

The No-Fragmentation subfield determines whether a fragmented MSDU can be carried in the MPDU sent under the block ack agreement. If this subfield set to 1 in the ADDBA Request frame, it indicates that the non-HE originator is not fragmenting sent MSDUs. If this subfield set to 1 in the ADDBA Response frame, it indicates that the non-HE recipient is not capable of receiving fragmented MSDUs. The No-Fragmentation subfield is reserved when transmitted by a non-DMG STA.

If transmitted by an HE STA, the HE Fragmentation Operation subfield indicates the level of dynamic fragmentation that is under negotiation for the TID indicated in the ADDBA frame as defined in Table 9-306.

Table 9-306—HE Fragmentation Operation subfield

Value	Meaning in ADDBA Request frame	Meaning in ADDBA Response frame
0	The originator does not intend to send fragmented MSDUs or A-MSDUs (if supported by the transmitter) for the TID specified in the Block Ack Parameter Set field of the ADDBA Request frame.	The recipient does not support the reception fragmented MSDUs or A-MSDUs for the TID specified in the Block Ack Parameter Set field of the ADDBA Response frame.
1	The originator intends to send fragmented MSDUs or A-MSDU (if supported by the transmitter) under fragmentation level 1 (see 26.3.2.2) for the TID specified in the Block Ack Parameter Set field of the ADDBA Request frame.	The recipient supports the reception of fragmented MSDUs or A-MSDU (if supported) under fragmentation level 1 only for the TID specified in the Block Ack Parameter Set field of the ADDBA Response frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-306—HE Fragmentation Operation subfield *(continued)*

Value	Meaning in ADDBA Request frame	Meaning in ADDBA Response frame
2	The originator intends to send fragmented MSDUs or A-MSDUs (if supported by the transmitter) under fragmentation level 2 (see 26.3.2.3) for the TID specified in the Block Ack Parameter Set field of the ADDBA Request frame.	The recipient supports the reception of receiving fragmented MSDUs or A-MSDU (if supported) under fragmentation levels 1 and 2 for the TID specified in the Block Ack Parameter Set field of the ADDBA Response frame.
3	The originator intends to send fragmented MSDUs or A-MSDUs (if supported by the transmitter) under fragmentation level 3 (see 26.3.2.4) for the TID specified in the Block Ack Parameter Set field of the ADDBA Request frame.	The recipient supports the reception of fragmented MSDUs or A-MSDU (if supported) under fragmentation levels 1, 2 and 3 for the TID specified in the Block Ack Parameter Set field of the ADDBA Response frame.

9.4.2.139 Next PCP List element

The Next PCP List element contains one or more AID of NextPCP *i* fields as shown in Figure 9-669 (Next PCP List element format).

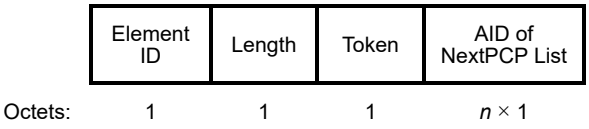

Figure 9-669—Next PCP List element format

The Element ID and Length fields are defined in 9.4.2.1.

The Token field is set to 0 when the PBSS is initialized and incremented each time the sequence of AID of NextPCP *i* fields is updated.

The AID of NextPCP List field contains one or more (*n*) AID of NextPCP fields.

Each AID of NextPCP field contains the AID value of a STA. The AID values are listed in the order described in 11.27.2.

9.4.2.140 PCP Handover element

The PCP Handover element is used to indicate the STA becoming the new PCP following an explicit or implicit handover procedure. The PCP Handover element is defined in Figure 9-670 (PCP Handover element format).

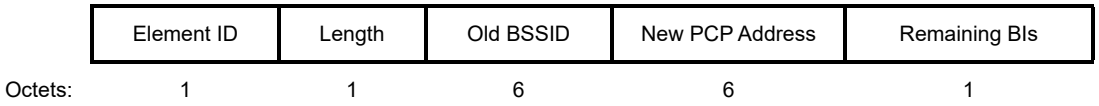

Figure 9-670—PCP Handover element format

The Element ID and Length fields are defined in 9.4.2.1.

The Old BSSID field contains the BSSID of the PBSS from which control is being handed over.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The New PCP Address field indicates the MAC address of the new PCP following a handover.

The Remaining BIs field indicates the number of beacon intervals, from the beacon interval in which this element is transmitted, remaining until the handover takes effect.

9.4.2.141 DMG Link Margin element

9.4.2.141.1 General

The format of the DMG Link Margin element is shown in Figure 9-671 (DMG Link Margin element format). The DMG Link Margin element is included in a Link Measurement Report frame.

	Element ID	Length	Activity	MCS	Link Margin	SNR	Reference Timestamp
Octets:	1	1	1	1	1	1	4

	Rate Adaptation Control/ Extended TPC	RX Chain Statistics	PPDU Statistics	LDPC Statistics	SC/OFDM Statistics	Extended TPC
Octets:	5	0 or N_{RX}	0 or $3\times N_{STS}$	0 or 8	0 or $4\times N_{STS}$	0 or $2\times N_{STS}$

Figure 9-671—DMG Link Margin element format

The Element ID and Length fields are defined in 9.4.2.1.

The Activity field is set to a preferred action that the STA sending this element recommends that the peer STA indicated in the RA field of the Link Measurement Report frame execute. The method by which the sending STA determines a suitable action for the peer STA is implementation specific. The Activity field is defined in 9.4.2.141.2.

The MCS field is set to an integer representation of the MCS that the STA sending this element recommends that the peer STA indicated in the RA field of the Link Measurement Report frame use to transmit frames to this STA. The reference PER for selection of the MCS is 10^{-2} for an MPDU length of 4096 octets. The method by which the sending STA determines a suitable MCS for the peer STA is implementation specific. Values 0–12 and values 25–31 indicate MCS 0 to MCS 12 and MCS 25 to MCS 31, respectively. Values 133, 134, 135, 136, 137, 138, and 140 indicate MCSs 12.1, 9.1, 12.3, 12.4, 12.5, 12.2, and 12.6, respectively. The MCS field is reserved when the value of the Number of Space-Time Streams Reported (NSTS) subfield within the Rate Adaptation Control/Extended TPC field is greater than 1.

The Link Margin field contains the measured link margin of Data frames received from the peer STA indicated in the RA field of the Link Measurement Report frame and is coded as a 2s complement signed integer in units of decibels. This field is set to –128 to indicate that no link margin is provided. The method used to estimate the link margin is beyond the scope of this standard. The Link Margin field is reserved when the value of the Number of Space-Time Streams Reported (NSTS) subfield within the Rate Adaptation Control/Extended TPC field is greater than 1.

The SNR field indicates the SNR measured during the reception of a PPDU. Values are from –13 dB to 50.75 dB in 0.25 dB steps. The SNR field is reserved when the value of the Number of Space-Time Streams Reported (NSTS) subfield within the Rate Adaptation Control/Extended TPC field is greater than 1.

The Reference Timestamp field contains the lower 4 octets of the TSF timer value sampled at the instant that the MAC received the PHY-CCA.indication(IDLE) primitive that corresponds to the end of the reception of

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the PPDU that was used to generate the feedback information contained in the Link Measurement Report frame.

The Rate Adaptation Control/Extended TPC field contains the number of space-time streams reported and indications of whether the element includes optional fields used for rate adaptation and TPC. The Rate Adaptation Control/Extended TPC field is defined in 9.4.2.141.3.

The RX Chain Statistics field is optionally present and is defined in 9.4.2.141.4.

The PPDU Statistics field is optionally present and is defined in 9.4.2.141.5.

The LDPC Statistics field is optionally present and is defined in 9.4.2.141.6.

The SC/OFDM Statistics field is optionally present and is defined in 9.4.2.141.7.

The Extended TPC field is optionally present and is defined in 9.4.2.141.8.

9.4.2.141.2 Activity field

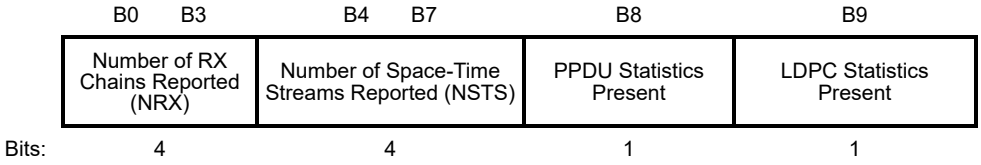
The Activity field values are defined in Table 9-307.

Table 9-307—Activity field values

Preferred Action value	Meaning
0	No change preferred
1	Change(d) MCS
2	Decrease(d) transmit power
3	Increase(d) transmit power
4	Fast session transfer (FST)
5	Power conserve mode
6	Perform SLS
7–255	Reserved

9.4.2.141.3 Rate Adaptation Control/Extended TPC field

The Rate Adaptation Control/Extended TPC field format is defined in Figure 9-672 (Rate Adaptation Control/Extended TPC field format).



Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

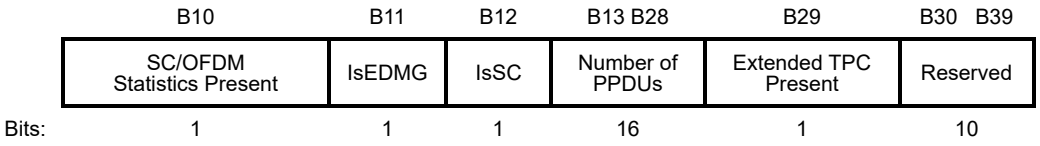


Figure 9-672—Rate Adaptation Control/Extended TPC field format

The Number of RX Chains Reported (NRX) subfield indicates the number of RX chain entries being reported. Each entry, *i*, corresponds to an RX chain *i*.

The Number of Space-Time Streams Reported (NSTS) subfield indicates the number of space-time streams being reported. Each entry, *i*, corresponds to a space-time stream. If the value of this subfield is greater than 0, the MCS, Link Margin and SNR fields in the DMG Link Margin element are reserved. For a non-EDMG STA, the value of this subfield does not exceed 1.

The PPDU Statistics Present subfield is set to 1 if the DMG Link Margin element contains the PPDU Statistics field. It is set to 0 otherwise.

The LDPC Statistics Present subfield is set to 1 if the DMG Link Margin element contains the LDPC Statistics field. It is set to 0 otherwise.

The SC/OFDM Statistics Present subfield is set to 1 if the DMG Link Margin element contains the SC/OFDM Statistics field. It is set to 0 otherwise.

The IsEDMG subfield is used to indicate whether the value in the MCS field in the DMG Link Margin element corresponds to the DMG PHY (20) or the EDMG PHY (Clause 28). It is set to 1 for the EDMG PHY and to 0 for the DMG PHY.

The IsSC subfield is used to indicate whether the value in the MCS field corresponds to SC modulation or OFDM modulation. It is set to 1 for SC and to 0 for OFDM.

The Number of PPDUs subfield contains the number of PPDUs over which the reported statistics were measured.

The Extended TPC Present subfield is set to 1 if the DMG Link Margin element contains the Extended TPC field. It is set to 0 otherwise.

9.4.2.141.4 RX Chain Statistics field

The RX Chain Statistics field is defined in Figure 9-673 (RX Chain Statistics field format). This field is present in the DMG Link Margin element when the Number of RX Chains Reported (NRX) subfield within the Rate Adaptation Control field is nonzero.

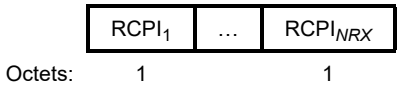

Figure 9-673—RX Chain Statistics field format

Each RCPI_i subfield, $1 \le i \le N_{RX}$, where N_{RX} is the value of the Number of RX Chains Reported subfield within the Rate Adaptation Control/Extended TPC field, contains the RCPI (see 20.3.10 and 28.3.9.2) for the i^{th} RF chain averaged across all PSDUs received within a report interval intended for the STA, and

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

where the PSDUs are transmitted using an MCS other than MCS 0 or EDMG MCS 0. The value of the subfield is found by computing the arithmetic mean of the RF power measurements in mW, converting the result to dBm, and encoding the dBm value as defined in 9.4.2.36.

9.4.2.141.5 PPDU Statistics field

The PPDU Statistics field is defined in Figure 9-674 (PPDU Statistics field format).

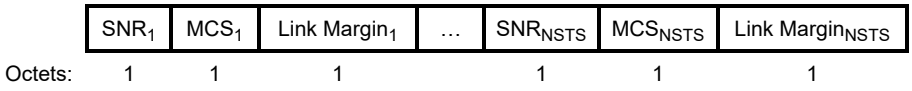

Figure 9-674—PPDU Statistics field format

Each SNR_i subfield, $1 \le i \le N_{STS}$, where N_{STS} is the value of the Number of Space-Time Streams Reported subfield within the Rate Adaptation Control/Extended TPC field, contains the SNR of space-time stream *i* averaged across all PSDUs received within a report interval intended for the STA, and where the PSDUs are transmitted using an MCS other than MCS 0 or EDMG MCS 0. The value of the subfield is found by computing the arithmetic mean of the PPDU signal-to-noise ratios with signal and noise power in mW, converting the result to dB, and encoding the dB value in the same way as the SNR field in the Channel Measurement Feedback element. If the Number of PPDUs subfield within the Rate Adaptation Control/ Extended TPC field is 0 and the PPDU Statistics field is present, the SNR_i subfield is set to 0xFF.

Each MCS*i* subfield, $1 \le i \le N_{STS}$, where N_{STS} is the value of the Number of Space-Time Streams Reported subfield within the Rate Adaptation Control/Extended TPC field, contains the MCS of space-time stream *i*. This subfield is used to indicate the MCS that was used to collect the values within the LDPC Statistics field or SC/OFDM Statistics field. If the Number of PPDUs subfield within the Rate Adaptation Control/ Extended TPC field is 0 and the PPDU Statistics field is present, the MCS_i subfield is set to 0xFF.

Each Link $Margin_i$ subfield, $1 \le i \le N_{STS}$, where N_{STS} is the value of the Number of Space-Time Streams Reported subfield within the Rate Adaptation Control/Extended TPC field, contains the link margin measured on space-time stream *i* and averaged across all PPDUs received within a report interval intended for the STA, and where all the PPDUs are transmitted using an MCS other than MCS 0 or EDMG MCS 0. The value of the subfield is found by computing the arithmetic mean of link margin values in decibels, and encoding the result as a 2s complement signed integer in units of decibels. A value of –128 indicates that no link margin is provided. The method used to estimate the link margin is beyond the scope of this standard. If the Number of PPDUs subfield within the Rate Adaptation Control/Extended TPC field is 0 and the PPDU Statistics field is present, the Link $Margin_i$ subfield is set to –128.

9.4.2.141.6 LDPC Statistics field

The LDPC Statistics field is defined in Figure 9-675 (LDPC Statistics field format).

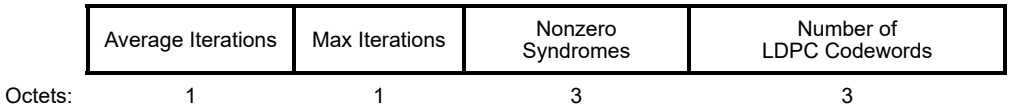

Figure 9-675—LDPC Statistics field format

The Average Iterations subfield indicates the average number of iterations used by the LDPC decoder on PSDUs received within a report interval intended for the STA, and where all PSDUs are transmitted using an MCS other than MCS 0 or EDMG MCS 0. One iteration includes processing of all rows. The value of the subfield is found by computing the arithmetic mean of number of iterations across all LDPC codewords in

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

each PSDU, and across all PSDUs in the measurement set, and encoding as an 8 bit unsigned integer with 0 to 255 representing 0.0 to +25.5 iterations in 0.1 steps.

The Max Iteration subfield indicates the maximum number of iterations used by the LDPC decoder on PSDUs received with an MCS different from MCS 0 or EDMG MCS 0. One iteration includes processing of all rows. The value of the subfield is the maximum number of iterations across all LDPC codewords in each PSDU, and across all PSDUs in the measurement set, encoded as an 8 bit unsigned integer with 0 to 255 representing 0.0 to +25.5 iterations in 0.1 steps.

NOTE—The fractional part of the Max Iteration subfield represents the ratio of processed rows to total number of rows.

The Nonzero Syndromes subfield indicates the number of LDPC codewords with nonzero syndrome, summed across all PSDUs received within a report interval intended for the STA, and where the PSDUs are transmitted using an MCS other than MCS 0 or EDMG MCS 0.

The Number of LDPC Codewords subfield indicates the number of processed LDPC codewords using an MCS different from MCS 0 and included in the Average Iterations, Max Iterations and Nonzero Syndromes subfield statistics. The value is saturated to $2^{24} - 1$ if it overflows.

9.4.2.141.7 SC/OFDM Statistics field

The SC/OFDM Statistics field is defined in Figure 9-676 (SC/OFDM Statistics field format).

	EVM_1	Number of SC Blocks/OFDM $Symbols_1$	…	EVM_{NSTS}	Number of SC Blocks/OFDM $Symbols_{NSTS}$
Octets:	1	3		1	3

Figure 9-676—SC/OFDM Statistics field format

Each EVM_i subfield, $1 \le i \le N_{STS}$, where N_{STS} is the value of the Number of Space-Time Streams Reported subfield within the Rate Adaptation Control/Extended TPC field, indicates the EVM of the SC data symbols or OFDM data subcarriers for PSDUs of space-time stream i received within a report interval intended for the STA, and where the PSDUs are transmitted using an MCS other than MCS 0 or EDMG MCS 0. The value of the subfield is found by computing the arithmetic mean of EVM values in dB, across all SC data symbols or OFDM data subcarriers in each PSDU, and across all PSDUs in the measurement set, and encoding the result as an 8 bit unsigned integer with 0 to 255 representing –5.0 dB to +46.0 dB in 0.2 dB steps.

Each Number of SC Blocks/OFDM $Symbols_i$ subfield, $1 \le i \le N_{STS}$, where N_{STS} is the value of the Number of Space-Time Streams Reported subfield within the Rate Adaptation Control/Extended TPC field, indicates the count of the SC blocks or OFDM symbols of space-time stream i included in the average EVM value. The value is saturated to $2^{24} - 1$ if it overflows.

9.4.2.141.8 Extended TPC

The Extended TPC field is defined in Figure 9-677 (Extended TPC field format).

	Extended $Activity_1$	Extended Activity $Parameter_1$	…	Extended $Activity_{NSTS}$	Extended Activity $Parameter_{NSTS}$
Octets:	1	1		1	1

Figure 9-677—Extended TPC field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Extended Activity$_i$ subfield, $1 \leq i \leq N_{STS}$, where N_{STS} is the value of the Number of Space-Time Streams Reported subfield within the Rate Adaptation Control/Extended TPC field, indicates the following:

— An action that the sending STA recommends that the peer STA performs for space-time stream *i*.
— Information about space-time stream *i* that is helpful to the peer STA when performing TPC.

The method by which the sending STA determines a suitable action for the peer STA is implementation specific.

Each Extended Activity subfield is followed by an Extended Activity Parameter subfield. The Extended Activity and Extended Activity Parameter subfields are defined in Table 9-308.

Table 9-308—Extended Activity and Extended Activity Parameter subfields definition

Extended Activity subfield value	Definition	Extended Activity Parameter subfield definition
0	No action	Reserved
1	Change MCS	Requested MCS for space-time stream *i*.
2	Increase/decrease transmit power	Change in transmit power for space-time stream *i* in units of 0.25 dB, and encoded as an 8-bit 2s complement signed integer. The encoding covers the range from –32 dB to 31.75 dB in 0.25 dB steps.
3	Link margin	Link margin for space-time stream *i* in units of dB, and encoded as 2s complement signed integer. The method used to estimate the link margin is beyond the scope of this standard.
4–255	Reserved	Reserved

The sending STA should report link margin values through the PPDU Statistics field (see 9.4.2.141.5) if the field is present, and through the Extended TPC field otherwise.

NOTE—The link margin values in the PPDU Statistics field are calculated across PPDUs in a report interval and combined as described in 9.4.2.141.5. The link margin values in the Extended TPC field are implementation dependent.

9.4.2.142 DMG Link Adaptation Acknowledgment element

The format of the DMG Link Adaptation Acknowledgment element is shown in Figure 9-678 (DMG Link Adaptation Acknowledgment element format). The DMG Link Adaptation Acknowledgment element is carried in the Optional Subelements field of the Link Measurement Report frame.

	Element ID	Length	Activity	Reference Timestamp	Extended TPC Control	Extended TPC Link Adaptation Acknowledgment
Octets:	1	1	1	4	1	$2\times N_{STS}$

Figure 9-678—DMG Link Adaptation Acknowledgment element format

The Element ID and Length fields are defined in 9.4.2.1.

The Activity field is set to the action that the STA sending this element has executed following the reception of the recommended activity in a Link Measurement Report frame. The method by which the sending STA determines the action is described in 10.41.9 and the Activity field is defined in 9.4.2.141.2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Reference Timestamp field contains the lower 4 octets of the TSF timer value sampled at the instant that the MAC received the PHY-CCA.indication(IDLE) primitive that corresponds to the end of the reception of the PPDU that was used to generate the feedback information contained in the Link Measurement Report frame.

The format of the Extended TPC Control field is shown in Figure 9-679 (Extended TPC Control field format).

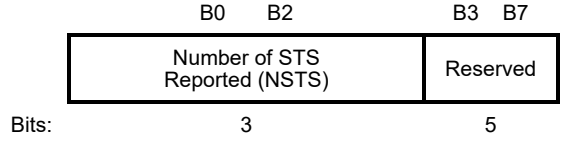

Figure 9-679—Extended TPC Control field format

The Number of STS Reported (NSTS) subfield is optionally present. If present, it indicates the number of STS being reported in the Extended TPC Link Adaptation Acknowledgment field. If the value of this field is greater than 0, the Activity field in the DMG Link Adaptation Acknowledgment element is reserved.

The Extended TPC Link Adaptation Acknowledgment field is present if the value of the Number of STS Reported (NSTS) subfield is greater than 0, and its format is shown in Figure 9-680 (Extended TPC Link Adaptation Acknowledgment field format).

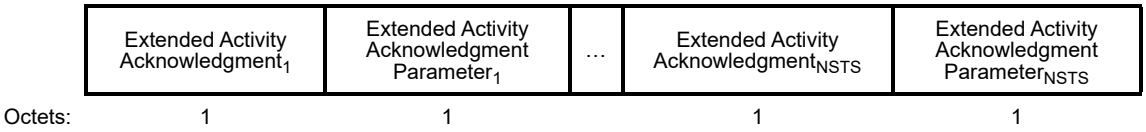

Figure 9-680—Extended TPC Link Adaptation Acknowledgment field format

Each Extended Activity Acknowledgment$_i$ subfield, $1 \le i \le N_{STS}$, is set to the action that the STA sending this element has taken for the STS i following the reception of the extended activity in a Link Measurement Report frame. The method by which the sending STA determines the action is described in 10.42.

Each Extended Activity Acknowledgment Parameter$_i$ subfield, $1 \le i \le N_{STS}$, contains the parameter associated with the Extended Activity Acknowledgment$_i$ subfield for space-time stream i. If the Extended Activity Acknowledgment$_i$ subfield is 1, the Extended Activity Acknowledgment Parameter$_i$ subfield contains the transmit power change that was done for space-time stream i, in units of 0.25 dB and encoded as an 8-bit 2s complement signed integer. The encoding covers the range from –32 dB to 31.75 dB in 0.25 dB steps. If the Extended Activity Acknowledgment$_i$ subfield is 0, no change is indicated. All other values for Extended Activity Acknowledgment$_i$ subfield are reserved.

9.4.2.143 Switching Stream element

The Switching Stream element indicates the streams that the transmitting STA requests to be switched to a new frequency band or operating class or channel. The format of the Stream Switching element is shown in Figure 9-681 (Switching Stream element format).

The Element ID and Length fields are defined in 9.4.2.1.

The Old Band ID field specifies the frequency band to which the information carried in this element is related. This field is defined in 9.4.1.43.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

	Element ID	Length	Old Band ID	New Band ID	Non-QoS Data Frames	Number of Streams Switching	Switching Parameters
Octets:	1	1	1	1	1	1	2 × Number of Streams Switching

Figure 9-681—Switching Stream element format

The New Band ID field specifies the frequency band to which the information contained in the Stream ID In New Band subfield of this element is related. This field is defined in 9.4.1.43.

The Non-QoS Data Frames field specifies whether non-QoS Data frames can be transmitted in the frequency band indicated in the New Band ID field. If the Non-QoS Data Frames field is equal to 0, non-QoS Data frames cannot be transmitted in the frequency band indicated in the New Band ID field. If the Non-QoS Data Frames field is equal to 1, non-QoS Data frames can be transmitted in the frequency band indicated in the New Band ID field.

The Number of Streams Switching field specifies the number of streams to be switched.

The format of Switching Parameters field is shown in Figure 9-682 (Switching Parameters field format).

	B0 B3	B4	B5 B8	B9	B10	B11	B12 B15
	Stream ID In Old Band		Stream ID In New Band		Stream ID In New Band Valid	LLT Type	Reserved
	TID	Direction	TID	Direction			
Bits:	4	1	4	1	1	1	4

Figure 9-682—Switching Parameters field format

The Stream ID In Old Band and Stream ID In New Band subfields are comprised of the TID and Direction subfields. The subfields within the Stream ID In New Band subfield are reserved if the Stream ID In New Band Valid subfield is set to 0.

The TID subfield specifies the stream in the corresponding band.

The Direction subfield specifies whether the STA transmitting this element is the source or destination of the corresponding TID. It is set to 0 to indicate that the STA transmitting this element is the source of the TID, and it is set to 1 otherwise.

The Stream ID In New Band Valid subfield is set to 1 if the information contained in the Stream ID In New Band subfield is valid, that is, the TID specified within the Stream ID In New Band subfield has been established in the band identified in the New Band ID field. The Stream ID In New Band Valid subfield is set to 0 otherwise.

The LLT Type subfield is set to 1 to indicate that the streambased Link Loss Countdown is used for the stream identified by the Stream ID In Old Band subfield. The LLT Type subfield is set to 0 to indicate that the STA-based Link Loss Countdown is used for the stream identified by the Stream ID In Old Band subfield. This subfield is reserved when the LLT field within the FST Setup Request or FST Setup Response frame containing this element is set to 0.

9.4.2.144 Session Transition element

The Session Transition element is defined in Figure 9-683 (Session Transition element format).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

	Element ID	Length	FSTS ID	Session Control	New Band			Old Band		
					Band ID	Setup	Operation	Band ID	Setup	Operation
Octets:	1	1	4	1	1	1	1	1	1	1

Figure 9-683—Session Transition element format

The Element ID and Length fields are defined in 9.4.2.1.

The FSTS ID (fast session transfer session identifier) field contains the identification of the FST session established between a pair of STAs as allocated by the initiator (11.31).

The Session Control field is defined in Figure 9-684 (Session Control field format).

	B0	B3	B4	B5	B7
	Session Type		Switch Intent	Reserved	
Bits:	4		1	3	

Figure 9-684—Session Control field format

The Session Type subfield is defined as shown in Table 9-309 and indicates the type of connection/session that is intended to be set up in the new band for this FST session.

Table 9-309—Session Type subfield values

Value	Session type
0	Infrastructure BSS
1	IBSS
2	Reserved
3	TDLS
4	PBSS
5–255	Reserved

When the Session Type subfield is set to IBSS and the STA Role subfield within the Multi-band element is set to IBSS STA, the BSSID field within the Multi-band element contains the BSSID. This indicates that the transmitting STA is not associated with an AP on the band and channel indicated in the Multi-band element.

The Switch Intent subfield is set to 1 to indicate that the FST initiator that transmitted the FST Setup Request frame intends to switch to the band/channel indicated within the Band ID subfield of the FST Setup Request frame and in the Multi-band element, even if the fast session transfer does not succeed. Otherwise, this subfield is set to 0. This subfield is reserved when transmitted within an FST Setup Response frame.

The New Band and Old Band subfields are used for the signaling described in 11.31.1. Both the New Band and Old Band subfields contain a Band ID subfield, a Setup subfield, and an Operation subfield.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Band ID subfield is defined in 9.4.1.43. If a Multi-band element is present in the frame containing this Session Transition element, the Band ID subfield refers to the Operating Class and Channel Number fields within the Multi-band element provided both of these fields are nonzero.

The Setup subfield is set to 1 to indicate that the STA transmitting this element has an FST session established with the STA that the frame containing this element is addressed and in the band indicated within the Band ID subfield. Otherwise, it is set to 0. Other values are reserved.

The Operation subfield is set to 1 to indicate that the STA is operating in the band indicated within the Band ID subfield. Otherwise, it is set to 0. Other values are reserved.

9.4.2.145 Cluster Report element

The format of the Cluster Report element is shown in Figure 9-685 (Cluster Report element format). The Cluster Report element is included Action frames, such as Announce and Information Response frames, transmitted to the AP or PCP of the BSS. Because the Length field supports only 255 octets of information in an element, the STA can split the content of the Extended Schedule Element field, as described in 9.4.2.130, in different Cluster Report elements.

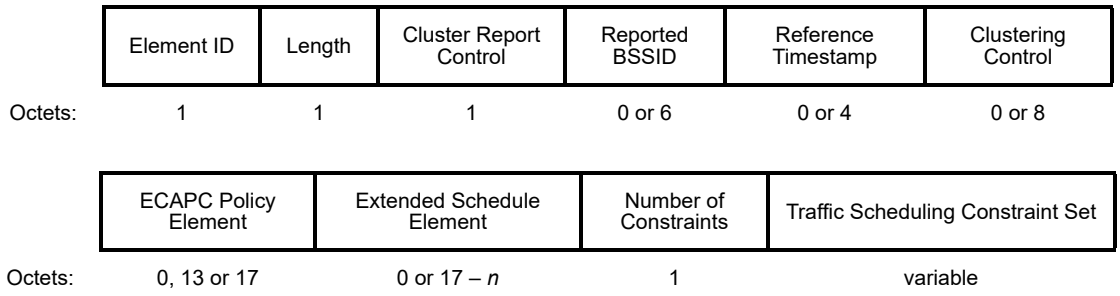

Figure 9-685—Cluster Report element format

The value of n in Figure 9-685 (Cluster Report element format) is given by the following equation:

$$n = 255 - (2 + S_{RB} + S_{RT} + S_{CC} + S_{EPE} + S_{TSCONST})$$

where

S_{RB} is the size of the Reported BSSID field in octets
S_{RT} is the size of the Reference Timestamp field in octets
S_{CC} is the size of the Clustering Control field in octets
S_{EPE} is the size of the ECAPC Policy Element field in octets
$S_{TSCONST}$ is the size of the Traffic Scheduling Constraint Set field in octets

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Cluster Report Control field is defined in Figure 9-686 (Cluster Report Control field format).

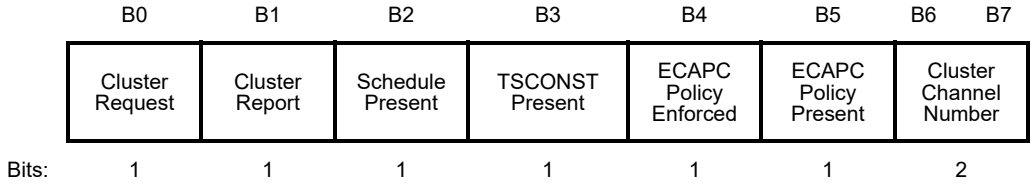

Figure 9-686—Cluster Report Control field format

The Cluster Request subfield is set to 1 to indicate that the STA is requesting the AP or PCP to start AP or PCP clustering (10.39). Otherwise, it is set to 0.

The Cluster Report subfield is set to 1 to indicate that this element contains a cluster report. If this subfield is set to 1, the Reported BSSID, Reference Timestamp and Clustering Control fields are present in this element. Otherwise, if the Cluster Report subfield is set to 0, none of the Reported BSSID, Reference Timestamp, Clustering Control, Extended Schedule Element, and Traffic Scheduling Constraint Set fields is present in this element.

The Schedule Present subfield is valid only if the Cluster Report subfield is set to 1; otherwise, it is reserved. The Schedule present subfield is set to 1 to indicate that the Extended Schedule Element field is present in this element. Otherwise, the Extended Schedule Element field is not present in this element.

The TSCONST Present subfield is valid only if the Cluster Report subfield is set to 1; otherwise, it is reserved. The TSCONST Present subfield is set to 1 to indicate that the Number of Constraints field and the Traffic Scheduling Constraint Set field are present in this element. Otherwise, these fields are not present in this element.

The ECAPC Policy Enforced subfield is valid only if the Cluster Report subfield is set to 1; otherwise, it is reserved. The ECAPC Policy Enforced subfield is defined in 9.3.4.2 and contains the ECAPC Policy Enforced subfield received in the DMG Beacon frame that generated this report.

The Cluster Channel Number subfield is set to 0 to indicate that the operating channel of the reported cluster is the common 2.16 GHz channel; it is set to 1 to indicate that the operating channel of the reported AP or PCP cluster is the low frequency 1.08 GHz channel 35 or 37 (see Annex E); it is set to 2 to indicate the operating channel of the reported AP or PCP cluster is the high frequency 1.08 GHz channel 36 or 38; and the value 3 is reserved.

The ECAPC Policy Present subfield is valid only if the Cluster Report subfield is set to 1; otherwise, it is reserved. The ECAPC Policy Present subfield is set to 1 to indicate that the ECAPC Policy Present Element field is present in this element. Otherwise, the ECAPC Policy Present Element field is not present in this element.

The Reported BSSID field contains the BSSID field of the DMG Beacon frame that triggered this report.

The Reference Timestamp field contains the lower 4 octets of the TSF timer value sampled at the instant that the STA's MAC received a DMG Beacon frame that triggered this report.

The Clustering Control field is defined in 9.3.4.2 and contains the Clustering Control received in the DMG Beacon frame that triggered this report.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The ECAPC Policy Element field is defined in 9.4.2.149 and contains the ECAPC Policy element obtained from the AP or PCP that sent the DMG Beacon frame that generated this report (see 10.39.4).

The Extended Schedule Element field is defined in 9.4.2.130 and contains a single Extended Schedule element received in the DMG Beacon frame that generated this report. If an Extended Schedule element is not present in the received DMG Beacon frame, this field is set to all 0s.

The Number of Constraints field indicates the number of Constraint subfields contained in the Traffic Scheduling Constraint Set field. This field ranges from 0 to 15. Other values are reserved.

The Traffic Scheduling Constraint Set field contains one or more Constraint subfields as defined in 9.4.2.132 and specifies periods of time with respect to the TBTT of the beacon interval of the BSS the STA participates where the STA experiences poor channel conditions, such as due to interference.

9.4.2.146 Relay Capabilities element

A STA advertises its capabilities through the Relay Capabilities element prior to participation in a relay operation (11.34). The Relay Capabilities element is defined in Figure 9-687 (Relay Capabilities element format).

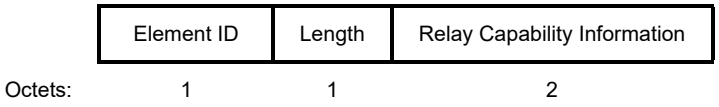

Figure 9-687—Relay Capabilities element format

The Element ID and Length fields are defined in 9.4.2.1.

The Relay Capability Information field is defined in Figure 9-688 (Relay Capability Information field format).

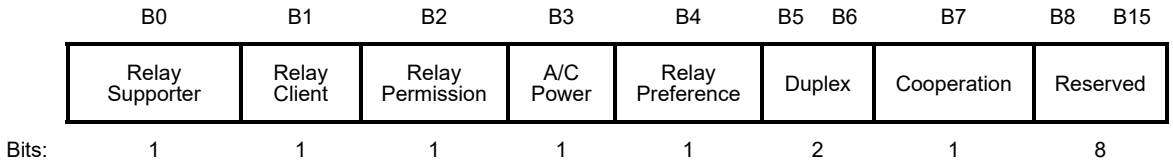

Figure 9-688—Relay Capability Information field format

The Relay Supporter subfield indicates whether the STA is capable of relaying by transmitting and receiving frames between a pair of other STAs. A STA capable of relaying is called a *relay* STA. This subfield is set to 1 if the STA supports relaying; otherwise, it is set to 0.

The Relay Client subfield indicates whether the STA is capable of using frame-relaying through a relay STA. It is set to 1 if the STA supports transmission and reception of frames through a relay STA; otherwise, it set to 0.

The Relay Permission subfield indicates whether the AP or PCP allows relay operation (11.34) to be used within the AP's or PCP's BSS. It is set to 0 if relay operation is not allowed in the BSS; otherwise, it is set to 1. This subfield is reserved when transmitted by a non-AP and non-PCP STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The A/C Power subfield indicates whether the STA is power constrained or not. It is set to 1 if the STA is not power constrained, i.e., supplied by external power, including PoE, wall plug, etc.; otherwise, it is set to 0.

The Relay Preference subfield indicates whether the STA prefers to become RDS rather than REDS. It is set to 1 if a STA prefers to be RDS; otherwise, it is set to 0.

The Duplex subfield indicates whether the STA is capable of full-duplex/amplify-and-forward (FD-AF) or half-duplex/decode-and-forward (HD-DF). It is set to 1 if the STA is not capable of HD-DF but is capable of only FD-AF. It is set to 2 if the STA is capable of HD-DF but is not capable of FD-AF. It is set to 3 if the STA is capable of both HD-DF and FD-AF. The value 0 is reserved.

The Cooperation subfield indicates whether a STA is capable of supporting link cooperation. It is set to 1 if the STA supports both link cooperation and link switching. It is set to 0 otherwise.

9.4.2.147 Relay Transfer Parameter Set element

A source REDS advertises the parameters for the relay operation with the transmission of a Relay Transfer Parameter Set element (11.34) prior to transferring frames via an RDS. The Relay Transfer Parameter Set element is defined in Figure 9-689 (Relay Transfer Parameter Set element format).

	Element ID	Length	Relay Transfer Parameter
Octets:	1	1	8

Figure 9-689—Relay Transfer Parameter Set element format

The Element ID and Length fields are defined in 9.4.2.1.

The Relay Transfer Parameter field is defined in Figure 9-690 (Relay Transfer Parameter field format).

	B0	B1	B2	B3	B7	B8	B15	B16	B23	B24	B39	B40	B55	B56	B63
	Duplex-Mode	Cooperation-Mode	Tx-Mode	Reserved		Link Change Interval		Data Sensing Time		First Period		Second Period		Reserved	
Bits:	1	1	1	5		8		8		16		16		8	

Figure 9-690—Relay Transfer Parameter field format

The Duplex-Mode subfield indicates that the source REDS set the duplex mode of the RDS involved in RLS. The Duplex-Mode subfield value is set to 0 if the RDS operates in HD-DF mode. It is set to 1 if the RDS operates in FD-AF mode.

The Cooperation-Mode subfield indicates whether the source REDS sets the link cooperation of the RDS involved in RLS. This subfield is valid only when the RDS is capable of link cooperation and Duplex-Mode subfield is set to 0. Otherwise, this subfield is reserved. The Cooperation-Mode subfield value is set to 0 if the RDS operates in link switching. It is set to 1 if the RDS operates in link cooperation.

The Tx-Mode subfield indicates that the source REDS sets the transmission mode of the RDS involved in RLS. This subfield is valid only when the RDS is capable of link switching and the Duplex-Mode subfield is set to 1. Otherwise, this subfield is reserved. The Tx-Mode subfield value is set to 0 if a group of three STAs involved in the RLS operates in Normal mode and is set to 1 if the group operates in Alternation mode.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Link Change Interval subfield indicates when the link of frame transmission between source REDS and destination REDS is changed. From the start position of one reserved continuous SP, every time instant of link change interval can have an opportunity to change the link. Within one link change interval, only one link is used for frame transfer. The unit of this subfield is microseconds. This subfield is used only when the group involved in the RLS operates in link switching.

The Data Sensing Time subfield indicates the defer time offset from the time instant of the next link change interval when the link switching occurs. By default, it is set to SIFS plus SBIFS. This subfield is used only when the STAs involved in the RLS operate in link switching with Tx-Mode that is 0.

The First Period subfield indicates the period of the source REDS-RDS link in which the source REDS and RDS exchange frames. This subfield is used only when HD-DF RDS operates in link switching.

The Second Period subfield indicates the period of the RDS-destination REDS link in which the RDS and destination REDS exchange frames and the following period of the RDS-source REDS link in which the RDS informs the source REDS of finishing one frame transfer. This subfield is used only when HD-DF RDS operates in link switching.

9.4.2.148 Quiet Period Request element

The Quiet Period Request element defines a periodic sequence of quiet intervals that the requester AP requests the responder AP to schedule. The format of the Quiet Period Request element is shown in Figure 9-691 (Quiet Period Request element format).

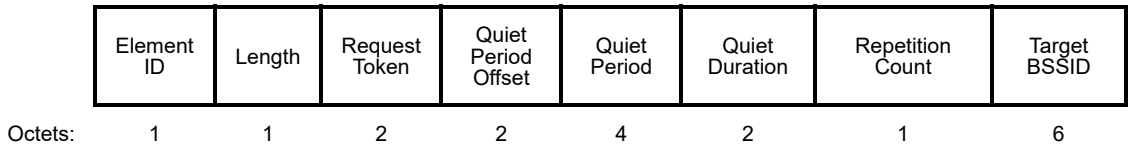

Figure 9-691—Quiet Period Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The Request Token field is set to a nonzero value chosen by the requester AP.

The Quiet Period Offset field is set to the offset of the start of the first quiet interval from the QAB Request frame that contains this element, expressed in TUs. The reference time is the start of the preamble of the PPDU that contains this element.

The Quiet Period field is set to the spacing between the start of two consecutive quiet intervals, expressed in TUs.

The Quiet Duration field is set to duration of the quiet time, expressed in TUs.

The Repetition Count field is set to the number of requested quiet intervals.

NOTE—The periodic sequence of quiet intervals ends after the start of preamble of the PPDU containing the QAB IE + Quiet Period Offset + (Repetition Count-1)×Quiet Period + Quiet Duration (in TUs).

The Target BSSID field is set to the responder AP's MAC address.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.149 Quiet Period Response element

The Quiet Period Response element defines the feedback information from the AP that received the Quiet Period Request element. The format of the Quiet Period Response element is shown in Figure 9-692 (Quiet Period Response element format).

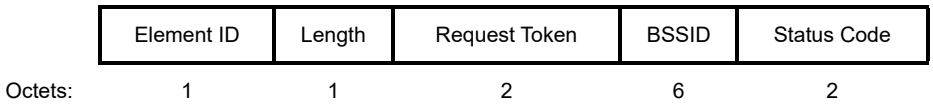

Figure 9-692—Quiet Period Response element format

The Element ID and Length fields are defined in 9.4.2.1.

The Request Token field is set to the value of the Request Token field of the corresponding received Quiet Period Request element.

The BSSID field is set to the value of the Target BSSID field of the corresponding received Quiet Period Request element.

The Status Code field is defined in 9.4.1.9.

9.4.2.150 BeamLink Maintenance element

The format of the BeamLink Maintenance element is shown in Figure 9-693 (BeamLink Maintenance element format). The BeamLink Maintenance element is included in Action frames, such as Probe, Announce and the Information Request and Response frames, transmitted between a non-AP and non-PCP DMG STA and a DMG AP or PCP. The element is included in the Probe and Information Request and Response frames transmitted between non-AP and non-PCP DMG STAs.

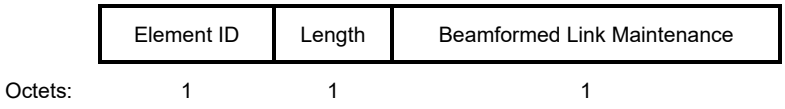

Figure 9-693—BeamLink Maintenance element format

The Element ID and Length fields are defined in 9.4.2.1.

The Beamformed Link Maintenance field is defined in 9.5.6.

9.4.2.151 MMS element

The format of the multiple MAC sublayers (MMS) element is shown in Figure 9-694 (MMS element format). The MMS element is included in Action frames, such as Probe Request, Association Request, Information Request, Announce, and Information Response frames, transmitted to the peer STA and the AP or PCP of the BSS.

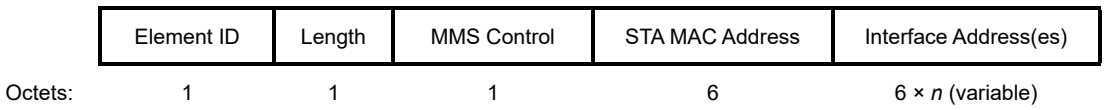

Figure 9-694—MMS element format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The MMS Control field is defined in Figure 9-695 (MMS Control field format).

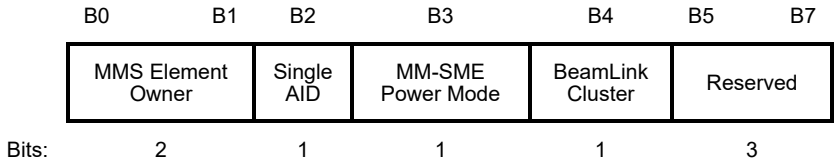

Figure 9-695—MMS Control field format

The MMS Element Owner subfield is encoded as shown in Table 9-310. If the MMS Element Owner field is set to No Owner, then the Interface address(es) field in the MMS element is reserved.

Table 9-310—MMS Element Owner subfield definition

MMS Element Owner subfield value		Meaning
B0	B1	
0	0	No Owner
1	0	Non-AP and Non-PCP MMS element
0	1	PCP MMS element
1	1	AP MMS element

The Single AID subfield is encoded as defined in Table 9-311.

The MM-SME Power Mode subfield is set to 1 to indicate that when a STA advertised in the MMS element sent by the STA coordinated by an MM-SME moves from the awake to the doze state, then all other STAs advertised in the MMS element sent by the STA move to the doze state. The STA coordinated by the MM-SME moves to the awake state only when all STAs advertised in the MMS element move to the awake state. The MM-SME Power Mode subfield is set to 0 to indicate that when a STA advertised in the MMS element sent by the STA moves from the doze to the awake state, then all other STAs advertised in the MMS element sent by the STA coordinated by the MM-SME move to the awake state. The STA coordinated by the MM-SME moves to the doze state only when all STAs advertised in the MMS element move to the doze state.

The BeamLink Cluster subfield is set to 1 if the DMG STA intends to maintain the same beamformed link for all of the links within the MMSL cluster. Otherwise, this subfield is set to 0.

The STA MAC Address field contains the MAC address of the STA.

When present in the element, the Interface Address(es) field contains one or more MAC addresses that can be used to identify the STAs in addition to the STA MAC address, coordinated by the same MM-SME (see 11.32).

Table 9-311—Single AID subfield definition

MMS element sent from	MMS element sent to	MMS Element Owner		Single AID	Meaning
		B0	B1	B2	
Non-AP and non-PCP STA	AP or PCP	1	0	1	Request to allocate single AID for MAC addresses included in the MMS element
Non-AP and non-PCP STA	AP or PCP	1	0	0	Do not allocate single AID for MAC addresses included in the MMS element
AP or PCP	Non-PCP, non-AP STA	1	0	1	Single AID is allocated for all MAC addresses in the MMS element
AP or PCP	Non-PCP, non-AP STA	1	0	0	Single AID is not allocated for all MAC addresses in the MMS element
Non-AP and non-PCP STA	Non-PCP, non-AP STA	1	0	1	Single AID is allocated for all MAC addresses in the MMS element
Non-AP and non-PCP STA	Non-PCP, non-AP STA	1	0	0	Single AID is not allocated for all MAC addresses in the MMS element
AP or PCP	Non-PCP, non-AP STA	0	1	1	Single AID is allocated for all MAC addresses in the non-AP and non-PCP STA MMS element
AP or PCP	Non-PCP, non-AP STA	0	1	0	Single AID is not allocated for all MAC addresses in the non-AP and non-PCP STA MMS element

9.4.2.152 U-PID element

The format of the upper layer protocol identification (U-PID) element is shown in Figure 9-696 (U-PID element format).

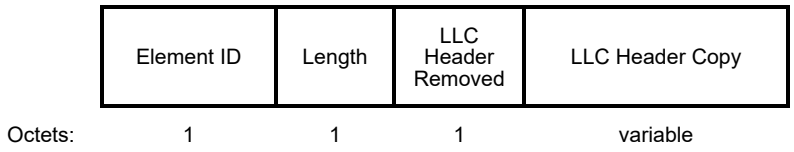

Figure 9-696—U-PID element format

The Element ID and Length fields are defined in 9.4.2.1.

The LLC Header Removed field is set to 1 to indicate that MSDUs do not contain the LLC (Logical Link Control) header over the WM. It is set to 0 otherwise.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The content and corresponding size of the LLC Header Copy field are specified in Table 9-312.

Table 9-312—LLC Header Copy field size

LLC Header Copy field contents	LLC Header Copy field size (octets)
LLC header with 8-bit control field without SNAP	3
LLC header with 8-bit control field with SNAP	8
LLC header with 16-bit control field without SNAP	4
LLC header with 16-bit content field with SNAP	9

NOTE—The structure of the LLC header is defined in ISO/IEC 8802-2:1998. The structure of the LLC with SNAP extension is defined in ISO/IEC 8802-2:1998.

9.4.2.153 ECAPC Policy element

The format of the ECAPC Policy element is shown in Figure 9-697 (ECAPC Policy element format).

	Element ID	Length	ECAPC Policy Detail	CCSR ID	Available Cluster Time Offset Bitmap	TXSS CBAP Offset (optional)	TXSS CBAP Duration (optional)	TXSS CBAP MaxMem (optional)
Octets:	1	1	1	6	4	0 or 2	0 or 1	0 or 1

Figure 9-697—ECAPC Policy element format

The Element ID and Length fields are defined in 9.4.2.1.

The ECAPC Policy Detail field is defined in Figure 9-698 (ECAPC Policy Detail field format).

	B0	B1	B2	B3 B7
	BHI Enforced	TXSS CBAP Enforced	Protected Period Enforced	Reserved
Bits:	1	1	1	5

Figure 9-698—ECAPC Policy Detail field format

The BHI Enforced subfield set to 1 indicates that an AP or PCP in a centralized AP or PCP cluster completes the BHI for the current beacon interval before TBTT + (8×Beacon SP duration), as described in 10.39.3.4. The BHI Enforced subfield set to 0 indicates that an AP or PCP within a cluster does not have to complete the BHI for the current beacon interval before TBTT + (8×Beacon SP duration).

The TXSS CBAP Enforced subfield set to 1 indicates that a STA in a centralized AP or PCP cluster performs each of its TXSSs in the DTI within one or more TXSS CBAPs, as described in 10.39.3.4. The TXSS CBAP Enforced subfield set to 0 indicates that a STA within a centralized AP or PCP cluster does not have to perform each of its TXSSs in the DTI within one or more TXSS CBAPs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Protected Period Enforced subfield indicates that every scheduled SP in the BSS is a DMG protected period as specified in 10.38.6.6. The Protected Period Enforced subfield set to 0 indicates that a scheduled SP in the BSS does not have to be a DMG protected period.

The CCSR ID field is set to the MAC address of the CCSR within the ECAPC that the AP or PCP belongs to. The AP or PCP is the transmitter of the frame containing the ECAPC Policy element except when the ECAPC Policy element is transmitted in a Cluster Report element, where the AP or PCP is the transmitter that triggered the Cluster report.

The Available Time Cluster Offset Bitmap field is a bitmap where the bit n–1, n = 1 to 32, indicates the availability of the n^{th} Beacon SP. Values of n = 1 and greater than ClusterMaxMem are reserved (i.e., bit 0 and bits ClusterMaxMem+1 to 31). Bit n–1 set to 0 indicates that $\text{ClusterTimeOffset}_{n-1}$ is determined to be already in use by a neighboring AP or PCP, excluding the recipient if sent within an individually addressed frame, in the ECAPC. Bit n–1 set to 1 indicates that $\text{ClusterTimeOffset}_{n-1}$ is not determined to be already in use by a neighboring AP or PCP, excluding the recipient if sent within an individually addressed frame, in the ECAPC.

If TXSS CBAP Enforced field is set to 0, then the TXSS CBAP Offset field, the TXSS CBAP Duration field, and the TXSS CBAP MaxMem field are not present in the element; otherwise, they are present in the element.

The TXSS CBAP Offset field is the delay of the first TXSS CBAP in a beacon interval from the TBTT, in units of 8 μs.

The TXSS CBAP Duration field indicates the duration of each TXSS CBAP, in units of 8 μs.

The TXSS CBAP MaxMem field is the number of TXSS CBAPs per beacon interval.

9.4.2.154 Cluster Time Offset element

The format of the Cluster Time Offset element is shown in Figure 9-699 (Cluster Time Offset element format).

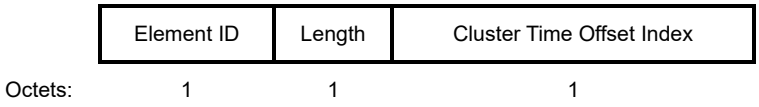

Figure 9-699—Cluster Time Offset element format

The Element ID and Length fields are defined in 9.4.2.1.

The Cluster Time Offset Index field is set to n–1 for a member AP or member PCP of a centralized AP or PCP cluster that adopted the n^{th} Beacon SP (see 10.39). Values equal to 0 and greater than ClusterMaxMem are reserved.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.155 Antenna Sector ID Pattern element

The format of the Antenna Sector ID Pattern element is shown in Figure 9-700 (Antenna Sector ID Pattern element format).

	B0 B7	B8 B15	B16 B19	B20 B25	B26 B31	B32 B39	B40 B47
	Element ID	Length	Type	Tap 1	State 1	Tap 2	State 2
Bits:	8	8	4	6	6	8	8

Figure 9-700—Antenna Sector ID Pattern element format

The Element ID and Length fields are defined in 9.4.2.1.

The Type field is set to 0 for Random Sequence Generator. Values 1 to 3 are reserved.

The Tap 1 field indicates the taps for Sequence Generator 1.

The State 1 field indicates the state for Sequence Generator 1.

The Tap 2 field indicates the taps for Sequence Generator 2.

The State 2 field indicates the state for Sequence Generator 2.

Sequence Generator 1 is shown in Figure 9-701 (Sequence Generator 1) and is defined as follows:

— Generate the sector IDs for subsequent DMG Beacons by advancing the Sequence Generator 1, which is initialized using the values of the Tap 1 and State 1 fields contained in the Antenna Sector ID Pattern element received from the AP or PCP.

— Advance the Sequence Generator 1 by one shift for each anticipated DMG Beacon frame transmission thereafter.

— After advancing the Sequence Generator 1, if the next state equals the initial state for the second time, overwrite the state with an all-zero state. The next state following the state following all zero-state uses the first 6 bits of the state of Sequence Generator 2 as the initial state.

— If the STA's total number of transmit sectors is not equal to the period of the Sequence Generator 1, ignore state(s) greater than or equal total number of transmit sectors and continue advancing Sequence Generator 1 until the state is less than the total number of transmit sectors.

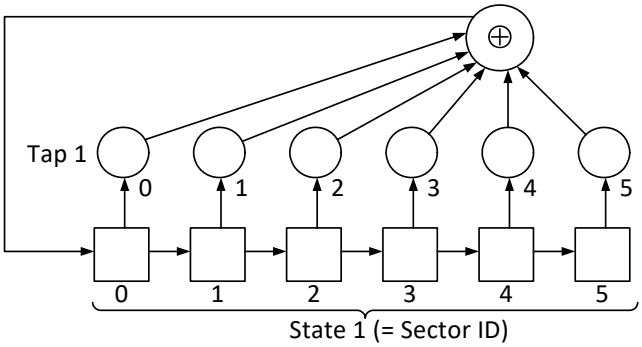

Figure 9-701—Sequence Generator 1

NOTE 1—The taps are selected from the set of sequences with maximal length property.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Sequence Generator 2 is shown in Figure 9-702 (Sequence Generator 2) and is defined as follows:

— Sequence Generator 2 is initiated with the value of the Tap 2 and State 2 fields contained in the Antenna Sector ID Pattern element received from the AP or PCP.

— Sequence Generator 2 is advanced by one shift when a new initial state is needed from Sequence Generator 1.

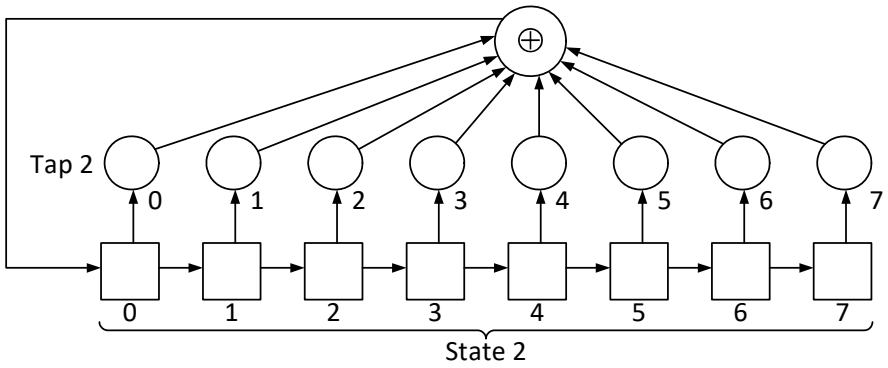

Figure 9-702—Sequence Generator 2

NOTE 2—The taps are selected from the set of the sequences with maximal length property.

9.4.2.156 VHT Capabilities element

9.4.2.156.1 VHT Capabilities element structure

A VHT STA declares that it is a VHT STA by transmitting the VHT Capabilities element.

The VHT Capabilities element contains a number of fields that are used to advertise the VHT capabilities of a VHT STA. The VHT Capabilities element is defined in Figure 9-703 (VHT Capabilities element format).

	Element ID	Length	VHT Capabilities Info	Supported VHT-MCS and NSS Set
Octets:	1	1	4	8

Figure 9-703—VHT Capabilities element format

The Element ID and Length fields are defined in 9.4.2.1.

9.4.2.156.2 VHT Capabilities Information field

The structure of the VHT Capabilities Information field is defined in Figure 9-704 (VHT Capabilities Information field format).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

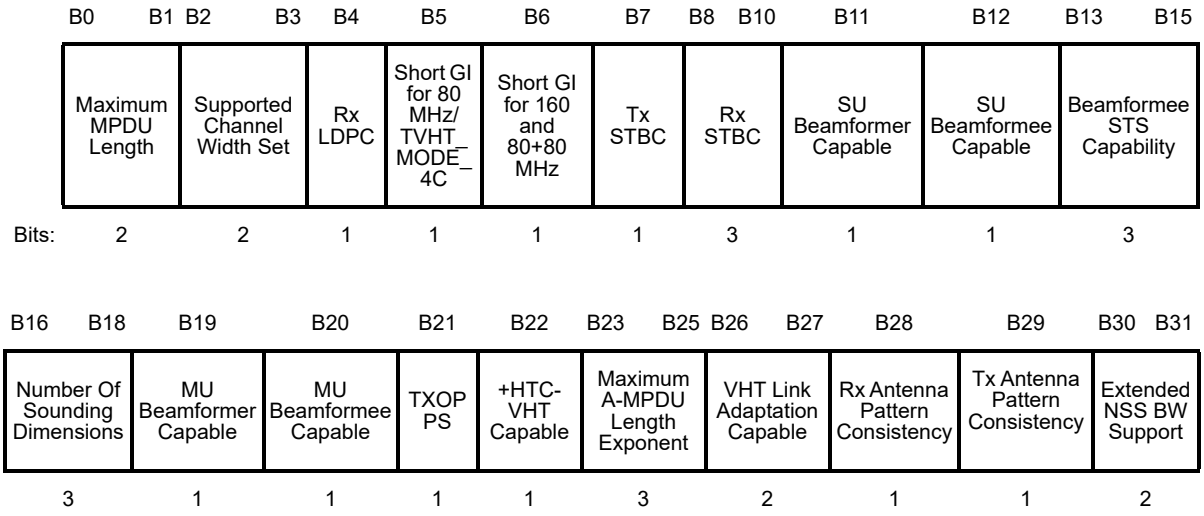

Figure 9-704—VHT Capabilities Information field format

The subfields of the VHT Capabilities Information field are defined in Table 9-313.

Table 9-313—Subfields of the VHT Capabilities Information field

Subfield	Definition	Encoding
Maximum MPDU Length	Indicates the maximum MPDU length that the STA is capable of receiving (see 10.11), excepting that a higher maximum MPDU length might be required for the frames listed in NOTE 7 in Table 9-34.	Set to 0 for 3895 octets. Set to 1 for 7991 octets. Set to 2 for 11 454 octets. The value 3 is reserved.
Supported Channel Width Set	Together with the Extended NSS BW Support subfield and Supported VHT-MCS and NSS Set field, indicates the channel widths and maximum NSS values per width supported by the STA. See 11.38.	In a non-TVHT STA, see Table 9-314. When the Channel Width subfield of the VHT Operation element is 2 or 3 (deprecated), the channel center frequency is defined in Table 11-30. In a TVHT STA, the field is structured into subfields as defined in Figure 9-705 (Supported Channel Width Set field format (TVHT)). In a TVHT STA, set the TVHT_MODE_2C Support subfield to 1 if it supports TVHT_MODE_2C; otherwise set the subfield to 0. In a TVHT STA, set the TVHT_MODE_2N Support subfield to 1 if it supports TVHT_MODE_2N; otherwise set the subfield to 0.
Rx LDPC	Indicates support for receiving LDPC encoded PPDUs.	Set to 0 if not supported. Set to 1 if supported.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-313—Subfields of the VHT Capabilities Information field *(continued)*

Subfield	Definition	Encoding
Short GI for 80 MHz/ TVHT_MODE_4C	In a non-TVHT STA, indicates short GI support for the reception of PPDUs transmitted with the TXVECTOR parameter FORMAT equal to VHT and CH_BANDWIDTH equal to CBW80. In a TVHT STA, indicates support for TVHT_MODE_4C.	In a non-TVHT STA, set to 1 if Short GI for 80 MHz is supported. In a TVHT STA, set to 1 if TVHT_MODE_4C is supported. Otherwise set to 0.
Short GI for 160 and 80+80 MHz	Indicates short GI support for the reception of PPDUs transmitted with TXVECTOR parameters FORMAT equal to VHT and CH_BANDWIDTH equal to CBW160 or CBW80+80.	Set to 0 if not supported. Set to 1 if supported. In a TVHT STA, set to 1 if it supports TVHT_MODE_4N.
Tx STBC	Indicates support for the transmission of at least 2×1 STBC.	Set to 0 if not supported. Set to 1 if supported.
Rx STBC	Indicates support for the reception of PPDUs using STBC.	Set to 0 for no support. Set to 1 for support of one spatial stream. Set to 2 for support of one and two spatial streams. Set to 3 for support of one, two, and three spatial streams. Set to 4 for support of one, two, three, and four spatial streams. The values 5, 6, 7 are reserved. See NOTE 3.
SU Beamformer Capable	Indicates support for operation as an SU beamformer (see 10.35.5).	Set to 0 if not supported. Set to 1 if supported.
SU Beamformee Capable	Indicates support for operation as an SU beamformee (see 10.35.5).	Set to 0 if not supported. Set to 1 if supported.
Beamformee STS Capability	Indicates the maximum number of space-time streams that the STA can receive in a VHT NDP, the maximum value for $N_{STS,total}$ that can be sent to the STA in a VHT MU PPDU if the STA is MU beamformee capable (subject to the Maximum NSTS, total field in the Supported VHT-MCS and NSS Set field) and the maximum value of *Nr* that the STA transmits in a VHT Compressed Beamforming frame.	If the SU Beamformee Capable field is set to 1, set to maximum number of space-time streams that the STA can receive in a VHT NDP minus 1. Otherwise, reserved.
Number of Sounding Dimensions	Beamformer's capability indicating the maximum value of the TXVECTOR parameter NUM_STS for a VHT NDP.	If the SU Beamformer Capable field is set to 1, set to the maximum supported value of the TXVECTOR parameter NUM_STS minus 1. Otherwise, reserved.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-313—Subfields of the VHT Capabilities Information field *(continued)*

Subfield	Definition	Encoding
MU Beamformer Capable	Indicates support for operation as an MU beamformer (see 10.35.5).	Set to 0 if not supported or if SU Beamformer Capable is set to 0 or if sent by a non-AP STA. Set to 1 if supported and SU Beamformer Capable is set to 1.
MU Beamformee Capable	Indicates support for operation as an MU beamformee (see 10.35.5).	Set to 0 if not supported or if SU Beamformee Capable is set to 0 or if sent by an AP. Set to 1 if supported, SU Beamformee Capable is set to 1 and not sent by an AP.
TXOP PS	Indicates whether the AP supports TXOP power save mode or whether the non-AP STA has enabled TXOP power save mode.	Set to 0 if the AP does not support TXOP power save mode. Set to 1 if the AP supports TXOP power save mode. Set to 0 if the non-AP STA does not enable TXOP power save mode. Set to 1 if the non-AP STA enables TXOP power save mode.
+HTC-VHT Capable	Indicates whether the STA supports receiving a VHT variant HT Control field.	Set to 0 if not supported. Set to 1 if supported.
Maximum A-MPDU Length Exponent	Indicates the maximum length of an A-MPDU pre-EOF padding that the STA can receive.	The length defined by this field is equal to $2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1$ octets.
VHT Link Adaptation Capable	Indicates whether the STA supports link adaptation using VHT variant HT Control field.	If +HTC-VHT Capable is 1: Set to 0 (No Feedback) if the STA does not provide VHT MFB. Set to 2 (Unsolicited) if the STA provides only unsolicited VHT MFB. Set to 3 (Both) if the STA can provide VHT MFB in response to VHT MRQ and if the STA provides unsolicited VHT MFB. The value 1 is reserved. Reserved if +HTC-VHT Capable is 0.
Rx Antenna Pattern Consistency	Indicates the possibility of a receive antenna pattern change.	Set to 0 if the receive antenna pattern might change during the lifetime of the current association. Set to 1 if the receive antenna pattern does not change during the lifetime of the current association. See 11.38.6.
Tx Antenna Pattern Consistency	Indicates the possibility of a transmit antenna pattern change.	Set to 0 if the transmit antenna pattern might change during the lifetime of the current association. Set to 1 if the transmit antenna pattern does not change during the lifetime of the current association. See 11.38.6.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-313—Subfields of the VHT Capabilities Information field *(continued)*

Subfield	Definition	Encoding
Extended NSS BW Support	Together with the Supported Channel Width Set subfield and Supported VHT-MCS and NSS Set field, indicates the channel widths and maximum NSS values per width supported by the STA (for non-TVHT VHT STAs). See 11.38.	In a non-TVHT STA, see Table 9-314. In a TVHT STA, the field is reserved. In a STA with dot11VHTExtendedNSSBWCapable equal to false or not present, this field is set to 0.

NOTE 1—An AP that sets MU Beamformer Capable to 1 can transmit a VHT MU PPDU with only one nonzero TXVECTOR parameter NUM_STS[p], for $0 \le p \le 3$. However, a STA that sets MU Beamformee Capable to 0 is not required to be able to demodulate a VHT MU PPDU with only one nonzero RXVECTOR parameter NUM_STS[p], for $0 \le p \le 3$.

NOTE 2—The Maximum MPDU Length subfield of the VHT Capabilities Information field imposes a constraint on the allowed value in the Maximum MPDU Length subfield of the HT Capabilities element carried in the same frame (see 10.11).

NOTE 3—Subject to any extended NSS BW support constraint.

In the context of Table 9-314:

— 1/2× or 3/4× Max VHT NSS support can be less than 1, indicating no support.
— A supported multiple of Max VHT NSS applies to both transmit and receive.
— 2× Max VHT NSS support can be used for 20 MHz or 40 MHz HT PPDUs.
— Any other combination than the ones listed in this table is reserved.

Table 9-314—Setting of the Supported Channel Width Set subfield and Extended NSS BW Support subfield at a STA transmitting the VHT Capabilities Information field

Transmitted VHT Capabilities Information field		NSS support of STA transmitting the VHT Capabilities Information field as a function of the VHT PPDU (×Max VHT NSS) (see requirements R1 and R2)					Location of 160 MHz channel center frequency if BSS bandwidth is 160 MHz	Location of secondary 80 MHz channel center frequency if BSS bandwidth is 80+80 MHz
Supported Channel Width Set	Extended NSS BW Support	20 MHz	40 MHz	80 MHz	160 MHz	80+80 MHz		
0	0	1	1	1				
0	1	1	1	1	1/2		CCFS2	
0	2	1	1	1	1/2	1/2	CCFS2	CCFS2
0	3	1	1	1	3/4	3/4	CCFS2	CCFS2
1	0	1	1	1	1		CCFS1	
1	1	1	1	1	1	1/2	CCFS1	CCFS2
1	2	1	1	1	1	3/4	CCFS1	CCFS2
1	3	2	2	2	2	1	CCFS1	CCFS1
2	0	1	1	1	1	1	CCFS1	CCFS1
2	3	2	2	2	1	1	CCFS1	CCFS1

Table 9-314—Setting of the Supported Channel Width Set subfield and Extended NSS BW Support subfield at a STA transmitting the VHT Capabilities Information field

Transmitted VHT Capabilities Information field		NSS support of STA transmitting the VHT Capabilities Information field as a function of the VHT PPDU (×Max VHT NSS) (see requirements R1 and R2)					Location of 160 MHz channel center frequency if BSS bandwidth is 160 MHz	Location of secondary 80 MHz channel center frequency if BSS bandwidth is 80+80 MHz
Supported Channel Width Set	Extended NSS BW Support	20 MHz	40 MHz	80 MHz	160 MHz	80+80 MHz		
R1: NSS support is rounded down to the nearest integer. R2: The maximum NSS supported is 8.								
NOTE 1—Max VHT NSS is defined per MCS in 9.4.2.156.3. NOTE 2—CCFS1 refers to the Channel Center Frequency Segment 1 field of the most recently transmitted VHT Operation element. NOTE 3—CCFS2 refers to the Channel Center Frequency Segment 2 field of the most recently transmitted HT Operation element. NOTE 4—CCFS1 is nonzero when the current BSS bandwidth is 160 MHz or 80+80 MHz and the NSS support is at least Max VHT NSS. CCFS2 is zero in this case.See NOTE 7. NOTE 5—CCFS2 is nonzero when the current BSS bandwidth is 160 MHz or 80+80 MHz and the NSS support is less than Max VHT NSS. CCFS1 is zero in this case. See NOTE 7. NOTE 6—At most one of CCFS1 and CCFS2 is nonzero when the current BSS bandwidth is 160 MHz or 80+80 MHz. See NOTE 7. NOTE 7—See Table 11-30. NOTE 8—A receiving STA in which dot11VHTExtendedNSSBWCapable is false ignores the Extended NSS BW Support subfield and effectively evaluates this table only at the entries where Extended NSS BW Support is 0. NOTE 9—See also 11.38.								

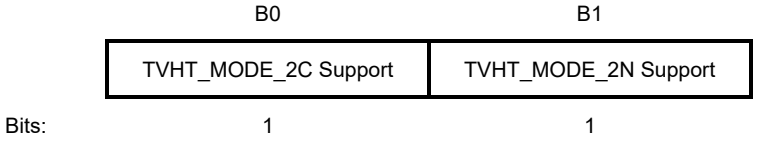

Figure 9-705—Supported Channel Width Set field format (TVHT)

Support for short GI for the reception of PPDUs with the TXVECTOR parameter CH_BANDWIDTH equal to CBW20 or CBW40 is indicated in the HT Capabilities Info field of the HT Capabilities element.

9.4.2.156.3 Supported VHT-MCS and NSS Set field

The Supported VHT-MCS and NSS Set field is used to convey the combinations of VHT-MCSs and spatial streams that a STA supports for reception and the combinations that it supports for transmission. The structure of the field is shown in Figure 9-706 (Supported VHT-MCS and NSS Set field format).

The Supported VHT-MCS and NSS Set field's subfields are defined in Table 9-315.

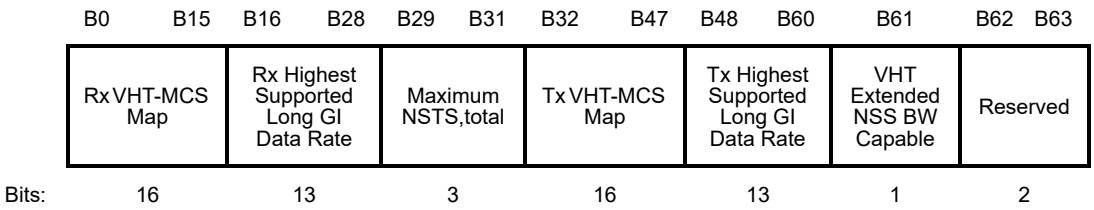

Figure 9-706—Supported VHT-MCS and NSS Set field format

Table 9-315—Supported VHT-MCS and NSS Set subfields

Subfield	Definition	Encoding
Rx VHT-MCS Map	If transmitted by a STA in which dot11VHTExtendedNSSBWCapable is not true, it indicates the maximum value of the RXVECTOR parameter MCS of a PPDU that can be received at all channel widths supported by this STA for each number of spatial streams. If transmitted by a STA in which dot11VHTExtendedNSSBWCapable is true, this field combined with the Extended NSS BW Support subfield and the 160/80+80 BW subfield of the Operating Mode field determines the maximum value of the RXVECTOR parameter MCS of a PPDU as described in 9.4.2.156.2 and 9.4.1.51.	The format and encoding of this subfield are defined in Figure 9-707 (Rx VHT-MCS Map and Tx VHT-MCS Map subfields and Basic VHT-MCS And NSS Set field format) and the associated description.
Rx Highest Supported Long GI Data Rate	Indicates the highest long GI VHT PPDU data rate that the STA is able to receive.	The largest integer value less than or equal to the highest long GI VHT PPDU data rate in Mb/s the STA is able to receive (see 10.6.13.1). The value 0 indicates that this subfield does not specify the highest long GI VHT PPDU data rate that the STA is able to receive.
Maximum NSTS,total	Indicates the maximum value for $N_{STS,total}$ that can be sent to the STA in a VHT MU PPDU.	If MU beamformee capable and different from 0, indicates the maximum value for $N_{STS,total}$ minus 1 that can be sent to the STA in a VHT MU PPDU. NOTE—This value is greater than or equal to the value in the Beamformee STS Capability subfield of the VHT Capabilities Information field. If MU beamformee capable and equal to 0, indicates that the maximum value for $N_{STS,total}$ is indicated by the Beamformee STS Capability subfield of the VHT Capabilities Information field. Otherwise reserved.

Table 9-315—Supported VHT-MCS and NSS Set subfields *(continued)*

Subfield	Definition	Encoding
Tx VHT-MCS Map	If transmitted by a STA in which dot11VHTExtendedNSSBWCapable is not true, indicates the maximum value of the TXVECTOR parameter MCS of a PPDU that can be transmitted at all channel widths supported by this STA for each number of spatial streams. If transmitted by a STA in which dot11VHTExtendedNSSBWCapable is true, this field combined with the Extended NSS BW Support subfield and the 160/80+80 BW subfield of an Operating Mode field determines the maximum value of the TXVECTOR parameter MCS of a PPDU as described in 9.4.2.156.2 and 9.4.1.51.	The format and encoding of this subfield are defined in Figure 9-707 (Rx VHT-MCS Map and Tx VHT-MCS Map subfields and Basic VHT-MCS And NSS Set field format) and the associated description.
Tx Highest Supported Long GI Data Rate	Indicates the highest long GI VHT PPDU data rate at which the STA is able to transmit.	The largest integer value less than or equal to the highest long GI VHT PPDU data rate in Mb/s that the STA is able to transmit (see 10.6.13.2). The value 0 indicates that this subfield does not specify the highest long GI VHT PPDU data rate that the STA is able to transmit.
VHT Extended NSS BW Capable	Indicates whether the STA is capable of interpreting the Extended NSS BW Support subfield of the VHT Capabilities Information field.	If dot11VHTExtendedNSSBWCapable is true, then this field is set to 1 to indicate that the STA is capable of interpreting the Extended NSS BW Support subfield of the VHT Capabilities Information field. Set to 0 otherwise.

The Rx VHT-MCS Map subfield and the Tx VHT-MCS Map subfield have the structure shown in Figure 9-707 (Rx VHT-MCS Map and Tx VHT-MCS Map subfields and Basic VHT-MCS And NSS Set field format).

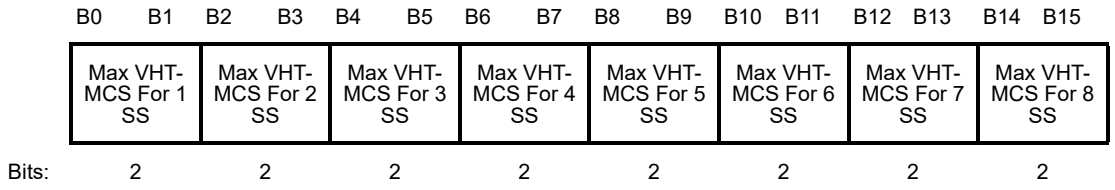

Figure 9-707—Rx VHT-MCS Map and Tx VHT-MCS Map subfields and Basic VHT-MCS And NSS Set field format

The Max VHT-MCS For *n* SS subfield (where *n* = 1, ..., 8) is encoded as follows:

— 0 indicates support for VHT-MCS 0-7 for *n* spatial streams
— 1 indicates support for VHT-MCS 0-8 for *n* spatial streams
— 2 indicates support for VHT-MCS 0-9 for *n* spatial streams
— 3 indicates that *n* spatial streams is not supported

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Max VHT NSS for a given MCS is equal to the smaller of the following:

— The maximum value of *n* for which the Max VHT-MCS for *n* SS has a value that indicates support for that VHT-MCS (0, 1 or 2 for VHT-MCS 0-7, 1 or 2 for VHT-MCS 8, 2 for VHT-MCS 9).

— The maximum supported NSS as indicated by the Rx NSS field of the Operating Mode Notification frame if the RX NSS Type is 0.

NOTE 1—A VHT-MCS indicated as supported in the VHT-MCS Map fields for a particular number of spatial streams might not be valid at all bandwidths (see 21.5), might be limited by the declaration of Tx Highest Supported Long GI Data Rates and Rx Highest Supported Long GI Data Rates, and might be affected by 10.6.13.3 and the Extended NSS BW Support field of the VHT Capabilities Information field in 9.4.2.156.2 and the 160/80+80 BW subfield of the Operating Mode field in 9.4.1.51.

The value of Max VHT NSS for a given MCS is equal to the smaller of

— The maximum value of *n* for which the Max VHT-MCS for *n* SS has a value that indicates support for that MCS or

— The maximum supported N_{SS} as indicated by the value of the Rx NSS field of the OM Control subfield (and further defined in Table 26-9).

NOTE 2—A VHT-MCS indicated as supported in the VHT-MCS Map fields for a particular number of spatial streams might not be valid at all bandwidths (see 21.5); might be limited by the declaration of Tx Highest Supported Long GI Data Rates and Rx Highest Supported Long GI Data Rates; and might be affected by additional rate selection constraints in 10.6.13.3, the value of the Extended NSS BW Support field of the VHT Capabilities Information field (see 9.4.2.156.2), and the 160/80+80 BW subfield of the Operating Mode field (see 9.4.1.51).

9.4.2.157 VHT Operation element

The operation of VHT STAs in the BSS is controlled by the HT Operation element and the VHT Operation element. The format of the VHT Operation element is defined in Figure 9-708 (VHT Operation element format).

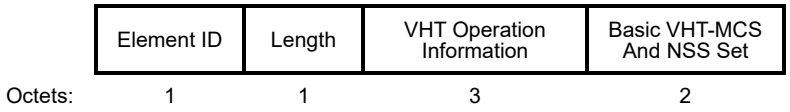

Figure 9-708—VHT Operation element format

The Element ID and Length fields are defined in 9.4.2.1.

The structure of the VHT Operation Information field is defined in Figure 9-709 (VHT Operation Information field format).

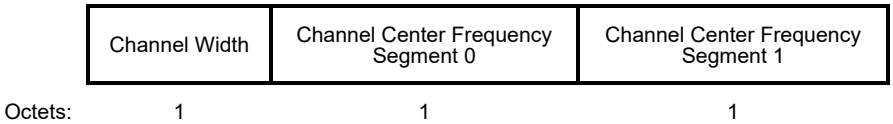

Figure 9-709—VHT Operation Information field format

The VHT STA gets the primary channel information from the HT Operation element. The subfields of the VHT Operation Information field are defined in Table 9-316.

The Basic VHT-MCS And NSS Set field indicates the VHT-MCSs for each number of spatial streams in VHT PPDUs that are supported by all VHT STAs in the BSS (including IBSS and MBSS). The Basic VHT-MCS And NSS Set field is a bitmap of size 16 bits; each 2 bits indicates the supported VHT-MCS set for

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

N_{SS} from 1 to 8. The Basic VHT-MCS And NSS Set field is defined in Figure 9-707 (Rx VHT-MCS Map and Tx VHT-MCS Map subfields and Basic VHT-MCS And NSS Set field format).

Table 9-316—VHT Operation Information subfields

Subfield	Definition	Encoding
Channel Width	This field, together with the HT Operation element STA Channel Width field, defines the BSS bandwidth (see 11.38.1).	Set to 0 for 20 MHz or 40 MHz BSS bandwidth. Set to 1 for 80 MHz, 160 MHz or 80+80 MHz BSS bandwidth. Set to 2 for 160 MHz BSS bandwidth (deprecated). Set to 3 for noncontiguous 80+80 MHz BSS bandwidth (deprecated). Values in the range 4 to 255 are reserved.
Channel Center Frequency Segment 0	Defines a channel center frequency for a 20, 40, 80, 160, or 80+80 MHz VHT BSS. See 21.3.14.	For 20, 40, or 80 MHz BSS bandwidth, indicates the channel number of the center frequency for the 20, 40, or 80 MHz channel on which the VHT BSS operates. For 160 MHz BSS bandwidth and the Channel Width subfield equal to 1, indicates the channel number of the center frequency of the 80 MHz channel segment that contains the primary channel. For 160 MHz BSS bandwidth and the Channel Width subfield equal to 2, indicates the channel number of the center frequency of the 160 MHz channel on which the VHT BSS operates. For 80+80 MHz BSS bandwidth and the Channel Width subfield equal to 1 or 3, indicates the channel number of the center frequency for the primary 80 MHz channel of the VHT BSS. Reserved otherwise.
Channel Center Frequency Segment 1	Defines a channel center frequency for a 160 or 80+80 MHz VHT BSS. See 21.3.14.	For a 20, 40, or 80 MHz BSS bandwidth, this subfield is set to 0. For a 160 MHz BSS bandwidth and the Channel Width subfield equal to 1, indicates the channel number of the center frequency of the 160 MHz channel on which the VHT BSS operates. For a 160 MHz BSS bandwidth and the Channel Width subfield equal to 2, this field is set to 0. For an 80+80 MHz BSS bandwidth and the Channel Width subfield equal to 1 or 3, indicates the channel number of the center frequency of the secondary 80 MHz channel of the VHT BSS. See Table 9-317. Reserved otherwise.

Table 9-317—BSS bandwidth when the VHT Operation Information field Channel Width subfield is 1

Channel Center Frequency Segment 1 subfield value	BSS bandwidth
CCFS1 = 0	80 MHz or less
CCFS1 > 0 and | CCFS1 – CCFS0 | = 8 (40 MHz apart)	160 MHz (CCFS0: center frequency of the 80 MHz channel segment that contains the primary channel) (CCFS1: center frequency of the 160 MHz channel)
CCFS1 > 0 and | CCFS1 – CCFS0 | > 16 (> 80 MHz apart)	80+80 MHz (CCFS0: center frequency of the primary 80 MHz channel) (CCFS1: center frequency of the secondary 80 MHz channel)
CCFS1 > 0 and | CCFS1 – CCFS0 | < 8 (< 40 MHz apart)	Reserved
CCFS1 > 0 and 8 < | CCFS1 – CCFS0 | ≤ 16 (> 40 MHz and ≤ 80 MHz apart)	Reserved
NOTE 1—CCFS0 represents the Channel Center Frequency Segment 0 subfield. NOTE 2—CCFS1 represents the Channel Center Frequency Segment 1 subfield.	

9.4.2.158 Extended BSS Load element

The Extended BSS Load element reported by the AP contains information on MIMO spatial stream underutilization and bandwidth utilization. The element format is defined in Figure 9-710 (Extended BSS Load element format). A STA receiving the element might use the information it conveys in an implementation specific AP selection algorithm.

	Element ID	Length	MU-MIMO Capable STA Count	Spatial Stream Underutilization	Observable Secondary 20 MHz Utilization	Observable Secondary 40 MHz Utilization	Observable Secondary 80 MHz Utilization
Octets:	1	1	2	1	1	1	1

Figure 9-710—Extended BSS Load element format

The Element ID and Length fields are defined in 9.4.2.1.

The MU-MIMO Capable STA Count field indicates the total number of STAs currently associated with this BSS that have a 1 in the MU Beamformee Capable field of their VHT Capabilities element.

The Spatial Stream Underutilization field is defined as the percentage of time, linearly scaled with 255 representing 100%, that the AP has underutilized spatial domain resources for given busy time of the medium. The spatial stream underutilization is calculated only for the primary channel. This percentage is computed using the formula,

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$\text{Spatial Stream Underutilization} = \left\lfloor \frac{N_{\text{max\_SS}} \times T_{\text{busy}} - T_{\text{utilized}}}{N_{\text{max\_SS}} \times T_{\text{busy}}} \times 255 \right\rfloor$$

where

$N_{\text{max\_SS}}$ is the maximum number of spatial streams supported by the AP

T_{busy} is the number of microseconds during which CCA indicated the channel was busy during the measurement duration. The resolution of the CCA busy measurement is in microseconds

T_{utilized} is $\sum_{i=1}^{N} N_{SS,i} T_i$, where T_i is the time interval, in units of microseconds, during which the primary 20 MHz channel is busy due to the transmission of one or more spatial streams by the AP to MU beamformee capable STAs; $N_{SS,i}$ is the number of spatial streams transmitted during the time interval T_i; and N is the number of busy events that occurred during the total measurement time, which is less than or equal to dot11ChannelUtilizationBeaconIntervals consecutive beacon intervals

If T_{busy} is 0, the Spatial Stream Underutilization field is reserved.

The measurement of the observable loading on each of the secondary 20 MHz channel, secondary 40 MHz channel, and secondary 80 MHz channel in conjunction with the measurement on the primary 20 MHz channel provides a STA with the loading on the 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz channels.

The Observable Secondary 20 MHz Utilization, Observable Secondary 40 MHz Utilization, and Observable Secondary 80 MHz Utilization fields are defined using Equation (9-6).

$$\text{Observable Secondary } W1 \text{ Utilization} = \left\lfloor \frac{T_{busy,W1}}{\text{dot11ChannelUtilizationBeaconIntervals} \times \text{dot11BeaconPeriod} \times 1024} \times 255 \right\rfloor \quad (9\text{-}6)$$

where

dot11ChannelUtilizationBeaconIntervals represents the number of consecutive beacon intervals during which the secondary channel busy time is measured

$T_{busy,W1}$ is computed as the sum of the times from PHY-CCA.indication(BUSY,{W2}, per20bitmap) to the next issue of a PHY-CCA.indication primitive and that overlap the measurement interval, for W1 = 20, 40, or 80.

For a VHT AP, for W1 = 20, 40, 80, W2 equals secondary, secondary40, or secondary80, respectively.

For an HE AP, for W1 = 20, W2 equals secondary or per20bitmap has the bit corresponding to the primary 20 MHz channel equal to 0 and the bit corresponding to the secondary 20 MHz channel equal to 1; for W1 = 40, W2 equals secondary40 or per20bitmap has the bits corresponding to the primary 20 MHz and secondary 20 MHz channels equal to 0, and at least one bit corresponding to any 20 MHz subchannel in the secondary 40 MHz channel equal to 1; for W1 = 80, W2 equals secondary80 or per20bitmap has the bits corresponding to the primary 20 MHz, secondary 20 MHz, and secondary 40 MHz channels equal to 0, and at least one bit corresponding to any 20 MHz subchannel in the secondary 80 MHz channel is equal to 1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the AP indicates a channel width of 20 MHz, 40 MHz, or 80 MHz in the STA Channel Width field in the HT Operation element and in the Channel Width field in the VHT Operation element, then the Observable Secondary 80 MHz Utilization field is reserved. If the AP indicates a channel width of 20 MHz or 40 MHz in the STA Channel Width field in the HT Operation element, then the Observable Secondary 40 MHz Utilization field is reserved. If the AP indicates a channel width of 20 MHz in the STA Channel Width field in the HT Operation element, then the Observable Secondary 20 MHz Utilization field is reserved.

9.4.2.159 Wide Bandwidth Channel Switch element

The Wide Bandwidth Channel Switch element is included in Channel Switch Announcement frames, as described in 9.6.2.6, Extended Channel Switch Announcement frames, as described in 9.6.7.7, and TDLS Channel Switch Request frames, as described in 9.6.12.7. The format of the Wide Bandwidth Channel Switch element is shown in Figure 9-711 (Wide Bandwidth Channel Switch element format).

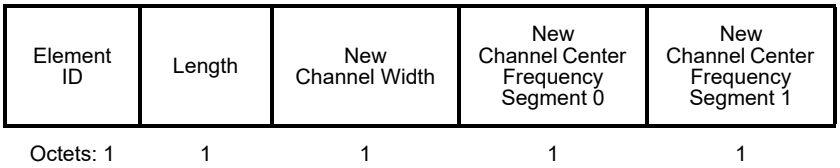

Figure 9-711—Wide Bandwidth Channel Switch element format

The Element ID and Length fields are defined in 9.4.2.1.

If the New Operating Class field in the frame that contains this element does not indicate an S1G band, the subfields New Channel Width, New Channel Center Frequency Segment 0, and New Channel Center Frequency Segment 1 have the same definition, respectively, as Channel Width, Channel Center Frequency Segment 0, and Channel Center Frequency Segment 1 in the VHT Operation Information field, described in Table 9-316. Otherwise, the subfields New Channel Width and New Channel Center Frequency Segment 0 have the same definition, respectively, as the Channel Width and the Channel Center Frequency in the S1G Operation Information field, described in Table 9-363. The New Channel Center Frequency Segment 1 subfield is reserved.

9.4.2.160 Transmit Power Envelope element

The Transmit Power Envelope element conveys the local or regulatory maximum transmit powers for various transmission bandwidths or channels within the bandwidth of the BSS. The format of the Transmit Power Envelope element is shown in Figure 9-712 (Transmit Power Envelope element format).

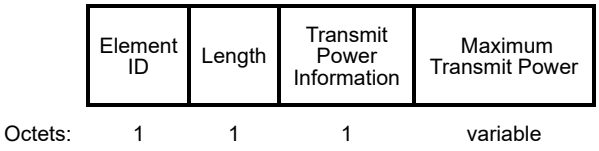

Figure 9-712—Transmit Power Envelope element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The format of the Transmit Power Information field is defined in Figure 9-713 (Transmit Power Information field format).

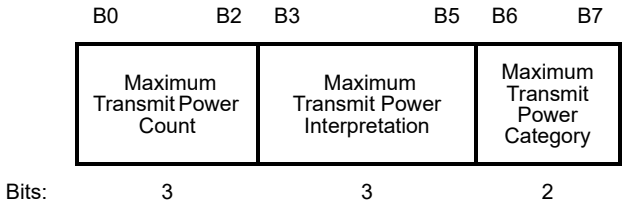

Figure 9-713—Transmit Power Information field format

The Maximum Transmit Power Interpretation subfield indicates the contents of the Maximum Transmit Power field and interpretation of the Maximum Transmit Power Count field and is defined in Table 9-318.

Table 9-318—Maximum Transmit Power Interpretation subfield encoding

Value	Interpretation of the Maximum Transmit Power field
0	Local EIRP
1	Local EIRP PSD (power spectral density)
2	Regulatory client EIRP
3	Regulatory client EIRP PSD
4	Additional regulatory client EIRP
5	Additional regulatory client EIRP PSD
6–7	Reserved
NOTE—This table is expected to be updated only if regulatory domains mandate the use of transmit power control with limits that cannot be converted into one of the currently defined interpretations.	

The Maximum Transmit Power Category subfield indicates a category for which the maximum transmit powers apply. A value of 0 indicates the default category. In the 6 GHz band, the interpretation of this subfield is defined in Table E-14 in E.2.7.

If the Maximum Transmit Power Interpretation subfield is 0, 2 or 4 (EIRP), the Maximum Transmit Power Count subfield indicates the number of Maximum Transmit Power For *X* MHz subfields (where *X* = 20, 40,

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

80, or 160/80+80) minus 1 in the Maximum Transmit Power field of the Transmit Power Envelope element, as shown in Table 9-319.

Table 9-319—Meaning of Maximum Transmit Power Count subfield if the Maximum Transmit Power Interpretation subfield is 0, 2 or 4

Value	Field(s) present
0	Maximum Transmit Power For 20 MHz.
1	Maximum Transmit Power For 20 MHz and Maximum Transmit Power For 40 MHz.
2	Maximum Transmit Power For 20 MHz, Maximum Transmit Power For 40 MHz, and Maximum Transmit Power For 80 MHz.
3	Maximum Transmit Power For 20 MHz, Maximum Transmit Power For 40 MHz, Maximum Transmit Power For 80 MHz, and Maximum Transmit Power For 160/80+80 MHz. For TVHT STAs, reserved.
4–7	Reserved

If the Maximum Transmit Power Interpretation subfield is 0, 2 or 4 (EIRP), the format of the Maximum Transmit Power field is defined in Figure 9-714 (Maximum Transmit Power field format if the Maximum Transmit Power Interpretation subfield is 0, 2 or 4).

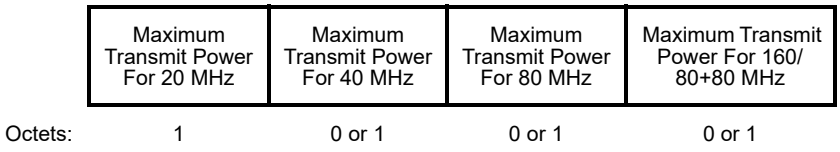

Figure 9-714—Maximum Transmit Power field format if the Maximum Transmit Power Interpretation subfield is 0, 2 or 4

Maximum Transmit Power For *X* MHz fields (where *X* = 20, 40, 80, or 160/80+80) define the local maximum transmit power limit of *X* MHz PPDUs, except for an HE TB PPDU where X MHz is the bandwidth of the pre-HE modulated fields of the HE TB PPDU transmitted by a STA. Each Maximum Transmit Power For *X* MHz field is encoded as an 8-bit 2s complement signed integer in the range –64 dBm to 63 dBm with a 0.5 dB step. Setting this field to 63.5 dBm indicates 63.5 dBm or higher (i.e., no local maximum transmit power constraint).

In frames transmitted by a TVHT STA, the Maximum Transmit Power For 20 MHz subfield indicates the local maximum transmit power for TVHT_W bandwidth; the Maximum Transmit Power For 40 MHz subfield indicates the local maximum transmit power for TVHT_2W or TVHT_W+W bandwidth; the Maximum Transmit Power For 80 MHz subfield indicates the local maximum transmit power for TVHT_4W or TVHT_2W+2W bandwidth; and the Maximum Transmit Power For 160/80+80 MHz subfield is not included in the Transmit Power Envelope element.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the Maximum Transmit Power Interpretation subfield is 1, 3 or 5 (EIRP PSD), the format of the Maximum Transmit Power field is shown in Figure 9-715 (Maximum Transmit Power field format if Maximum Transmit Power Interpretation subfield is 1, 3 or 5).

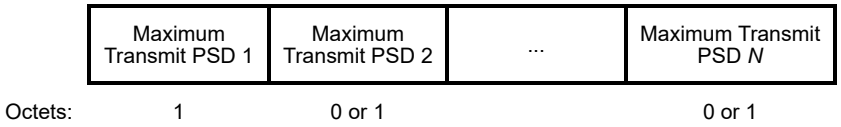

Figure 9-715—Maximum Transmit Power field format if Maximum Transmit Power Interpretation subfield is 1, 3 or 5

The Maximum Transmit Power Count subfield determines the value of an integer *N* as defined in Table 9-320 which specifies the format and interpretation of the Maximum Transmit Power field as described below.

Table 9-320—Meaning of Maximum Transmit Power Count subfield if Maximum Transmit Power Interpretation subfield is 1, 3 or 5

Value	*N*
0	0
1	1
2	2
3	4
4	8
5–7	Reserved to indicate values of *N* greater than 8

If *N* is 0, then the Maximum Transmit Power field contains one Maximum Transmit PSD subfield that represents the maximum transmit PSD for a PPDU of any bandwidth within the BSS bandwidth.

If *N* is greater than 0, then the Maximum Transmit Power field has *N* octets, with *N* representing the number of 20 MHz channels for which a maximum transmit PSD is indicated. The X^{th} octet (*X* = integer ranging from 1 to *N*) of the Maximum Transmit Power field is the Maximum Transmit PSD *X* subfield, which indicates the maximum transmit PSD for the X^{th} 20 MHz channel.

If the BSS bandwidth is 20, 40, 80, or 160 MHz, then the Maximum Transmit PSD 1-*N* subfields correspond to 20 MHz channels from lowest to highest frequency, respectively, within the indicated bandwidth. If *N* is equal to 1, 2, 4, or 8 for 20, 40, 80, or 160 MHz BSS bandwidth, respectively, the indicated bandwidth is the BSS bandwidth. If *N* is greater than 0 and less than 2, 4, or 8 for 40, 80, or 160 MHz BSS bandwidth, respectively, then the indicated bandwidth is the primary 20 MHz, primary 40 MHz, or primary 80 MHz channel for *N* equal to 1, 2, or 4, respectively. If *N* is greater than 1, 2, or 4 for 20, 40, or 80 MHz BSS bandwidth, respectively, then the indicated bandwidth is wider than the BSS bandwidth. In this case, the Maximum Transmit PSD 1-*M* subfields correspond to the 20 MHz channels from lowest to highest frequency, respectively, within the BSS bandwidth where *M* is 1, 2, or 4 for 20, 40, or 80 MHz BSS bandwidth, respectively. The Maximum Transmit PSD (*M*+1)-*N* subfields are reserved for future use (see 10.22.4).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the BSS bandwidth is 80+80 MHz, *N* is less than or equal to 8. If *N* is equal to 8 and the BSS bandwidth is 80+80 MHz, the Maximum Transmit PSD 1-4 subfields correspond to the 20 MHz channels from lowest to highest frequency, respectively, within the 80 MHz segment lower in frequency; the Maximum Transmit PSD 5-8 subfields correspond to the 20 MHz channels from lowest to highest frequency, respectively, within the 80 MHz segment higher in frequency. If *N* is greater than 0 and less than 8 for 80+80 MHz BSS bandwidth, then the bandwidth indicated by the Maximum Transmit PSD 1-*N* subfields is the primary 20 MHz, primary 40 MHz, or primary 80 MHz channel for *N* equal to 1, 2, or 4, respectively. In this case, the Maximum Transmit PSD 1-*N* subfields correspond to 20 MHz channels from lowest to highest frequency, respectively, within the indicated bandwidth.

Values of the Maximum Transmit Power Count field between 5 and 7 are reserved for future use to indicate values of *N* greater than 8. If *N* is greater than 8, the Maximum Transmit PSD 1-8 subfields correspond to the 20 MHz channels from lowest to highest frequency, respectively, within the 160 MHz channel containing the primary 20 MHz channel. See 10.22.4.

The Maximum Transmit PSD *X* subfield is encoded as an 8-bit 2s complement signed integer. The value of –128 indicates that the corresponding 20 MHz channel cannot be used for transmission. The value of +127 indicates that no maximum PSD limit is specified for the corresponding 20 MHz channel. For all other values *Y* of the subfield (i.e., –127 to +126, inclusive), the maximum transmit PSD in the corresponding 20 MHz channel is *Y*/2 dBm/MHz (i.e., ranging from –63.5 to +63 dBm/MHz). If an allowed PSD for the X^{th} 20 MHz channel is known with finer resolution than 20 MHz, the Maximum Transmit PDF *X* subfield is set to the lowest allowed PSD within the X^{th} 20 MHz channel.

9.4.2.161 Channel Switch Wrapper element

The Channel Switch Wrapper element contains subelements that indicate characteristics of the BSS after a channel switch. The format of the Channel Switch Wrapper element is defined in Figure 9-716 (Channel Switch Wrapper element format). Procedures related to the inclusion of subelements in the Channel Switch Wrapper element are defined in 11.38.4.

	Element ID	Length	New Country subelement (optional)	Wide Bandwidth Channel Switch subelement (optional)	New Transmit Power Envelope subelement (optional)
Octets:	1	1	variable	variable	variable

Figure 9-716—Channel Switch Wrapper element format

The Element ID and Length fields are defined in 9.4.2.1.

The New Country subelement is present when an AP or mesh STA performs extended channel switching to a new Country, new Operating Class Table, or a changed set of operating classes relative to the contents of the Country element sent in the Beacon; otherwise, this subelement is not present. The format of the New Country subelement is defined to be the same as the format of the Country element (see 9.4.2.7), except that no Subband Triplet fields are present in the New Country subelement. The Country String field in the New Country subelement indicates the Country and Operating Class Table of the BSS after extended channel switching, and Operating Triplet fields within the New Country subelement indicate the operating classes of the BSS after extended channel switching (see 11.38.1).

The Wide Bandwidth Channel Switch subelement is present under the following conditions:

— Channel switching to a BSS bandwidth of 40 MHz or wider
— Extended channel switching to a BSS bandwidth of 80 MHz or wider

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Wide Bandwidth Channel Switch subelement is optionally present if extended channel switching to a BSS bandwidth of 40 MHz. The Wide Bandwidth Channel Switch subelement is not present if channel switching to a 20 MHz BSS bandwidth.

The format of the Wide Bandwidth Channel Switch subelement is the same as the Wide Bandwidth Channel Switch element (see 9.4.2.159) except for the following:

— A value 0 in the New Channel Width field signifies only a 40 MHz BSS bandwidth.
— When switching to a 40 MHz BSS bandwidth, the New Channel Center Frequency Segment 0 field indicates the channel number of the center frequency for the 40 MHz channel after the channel switch.

If present, the Wide Bandwidth Channel Switch subelement indicates the BSS bandwidth after channel switching (see 11.38.1). For example, when switching to a 40 MHz BSS bandwidth on channel indices 36 and 40, the New Channel Width field is set to 0, and the New Channel Center Frequency Segment 0 field is set to 38.

Each New Transmit Power Envelope subelement that is present is defined to have the same format as the Transmit Power Envelope element (see 9.4.2.160) and includes a distinct value of the Local Maximum Transmit Power Unit Interpretation subfield. Each New Transmit Power Envelope subelement indicates the local maximum transmit powers for the BSS for the indicated bandwidths with an indicated unit interpretation after channel switching (see 11.38.1).

If transmitted by a TVHT STA, the Wide Bandwidth Channel Switch subelement is present when the STA is switching channels to a BSS bandwidth of TVHT_2W or TVHT_W+W bandwidth or wider; if switching to a TVHT_W bandwidth BSS bandwidth then this subelement is not present.

9.4.2.162 AID element

The AID element contains the AID assigned by the AP during association. The format of the AID element is shown in Figure 9-717 (AID element format).

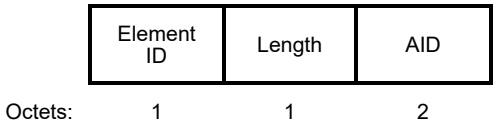

Figure 9-717—AID element format

The Element ID and Length fields are defined in 9.4.2.1.

The AID field is defined in 9.4.1.8.

9.4.2.163 Quiet Channel element

The Quiet Channel element is used to indicate that the secondary 80 MHz channel of a VHT BSS is to be quieted during a quiet interval, and, in an infrastructure BSS, to indicate if the primary 80 MHz channel of a VHT BSS can be used during the quiet interval. A quiet interval is established using either a Quiet element (see 9.4.2.21) or, in an infrastructure BSS, the Quiet Channel element if its AP Quiet Mode field is equal to 1.

The Quiet Channel element is optionally present in Beacon frames, as described in 9.3.3.2, and Probe Response frames, as described in 9.3.3.10. The use of Quiet Channel elements is described in 11.8.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The format of the Quiet Channel element is shown in Figure 9-718 (Quiet Channel element format).

	Element ID	Length	AP Quiet Mode	Quiet Count (optional)	Quiet Period (optional)	Quiet Duration (optional)	Quiet Offset (optional)
Octets:	1	1	1	0 or 1	0 or 1	0 or 2	0 or 2

Figure 9-718—Quiet Channel element format

The Element ID and Length fields are defined in 9.4.2.1.

The AP Quiet Mode field specifies STA behavior in an infrastructure BSS during the quiet intervals. When communications to the AP are allowed within the primary 80 MHz channel, then the AP Quiet Mode field is set to 1. Otherwise, the AP Quiet Mode field is set to 0.

If the AP Quiet Mode field is 1, then the Quiet Count field, Quiet Period field, Quiet Duration field, and Quiet Offset field are present in the Quiet Channel element; otherwise, these fields are not present in the Quiet Channel element.

The Quiet Count field, Quiet Period field, Quiet Duration field, and Quiet Offset field have the same definition as described in 9.4.2.21.

9.4.2.164 Operating Mode Notification element

The Operating Mode Notification element is used to notify STAs that the transmitting STA is changing one or more of its operating channel width, the maximum number of spatial streams it can receive, and its LDPC receive preference. The format of the Operating Mode Notification element is defined in Figure 9-719 (Operating Mode Notification element format).

	Element ID	Length	Operating Mode
Octets:	1	1	1

Figure 9-719—Operating Mode Notification element format

The Element ID and Length fields are defined in 9.4.2.1.

The Operating Mode field is defined in 9.4.1.51.

9.4.2.165 UPSIM element

The UPSIM element is defined as shown in Figure 9-720 (UPSIM element format).

	Element ID	Length	UPSIM Flags	Partial Unsched-uled Power Save Bitmap
Octets:	1	1	1	0-32

Figure 9-720—UPSIM element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Length field for this element is constrained as described below.

The UPSIM Flags field is defined in Figure 9-721 (UPSIM Flags field format).

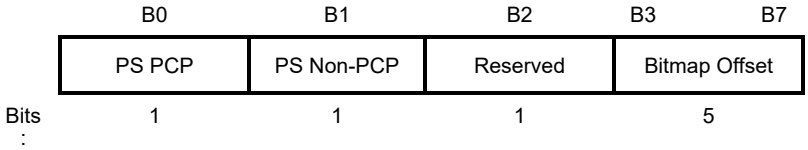

Figure 9-721—UPSIM Flags field format

The PS PCP field is set to 1 if the PCP is in unscheduled PS mode at the time of UPSIM element transmission and is set to 0 otherwise. The PS PCP field is set to 0 in infrastructure BSS. The PS Non-PCP field is set to 1 if all non-AP and non-PCP STAs are in unscheduled PS mode at the time of UPSIM element transmission and is set to 0 otherwise. The Bitmap Offset field defines the octet offset into a virtual bitmap maintained by the AP or PCP, as described below.

The AP or PCP maintains an unscheduled power save indication virtual bitmap that is 256 bits in length and is organized into 32 octets such that bit number N ($0 \le N \le 255$) in the bitmap corresponds to bit number (N mod 8) in octet number $\lfloor N / 8 \rfloor$, where the low order bit of each octet is bit number 0, and the high order bit is bit number 7. Bit N in the bitmap is set to 1 if there is an associated DMG STA with AID equal to N and the STA is in unscheduled PS mode and is set to 0 if there is no associated DMG STA with AID equal to N or the STA is not in unscheduled PS mode. Bit 0 is set to 0 in the infrastructure BSS. Bit 255 is set to 0.

The Partial Unscheduled Power Save Bitmap field is not present when bits numbered 1 to 254 of the unscheduled power save indication virtual bitmap all have the same value at the time of UPSIM element transmission. In this case, the Length field is set to 1 and the Bitmap Offset field is set to 0.

When there are two bits in the unscheduled power save indication virtual bitmap with numbers between 1 and 254 and different values, the Partial Unscheduled Power Save Bitmap field consists of octets numbered $N1$ to $N2$ of the unscheduled power save indication virtual bitmap, where $N1$ is the largest integer such that bits numbered 1 to ($N1 \times 8$) - 1 in the unscheduled power save indication virtual bitmap are all 0, and $N2$ is the smallest number such that bits numbered ($N2 + 1$) × 8 to 255 in the unscheduled power save indication virtual bitmap are all 0. In this case, the Length field is set to ($N2$ - $N1$) + 2 and the Bitmap Offset subfield is set to $N1$.

NOTE—The Partial Unscheduled Power Save Bitmap field does not need to include bit 0 of the unscheduled power save indication virtual bitmap even if that bit is set.

9.4.2.166 FTM Parameters element

The FTM Parameters element contains a number of subfields that are used to advertise the requested or allocated FTM configuration from one STA to another. The FTM Parameters element is included in the IFTMR frame, as described in 9.6.7.32, and the initial FTM frame, as described in 9.6.7.33. The use of the FTM Parameters element is described in 11.21.6.

The format of the FMT Parameters element is shown in 9-722.

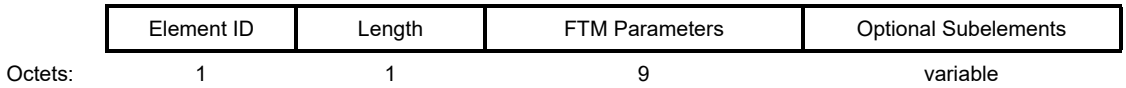

Figure 9-722—FTM Parameters element format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The format of the FTM Parameters field is shown in 9-723.

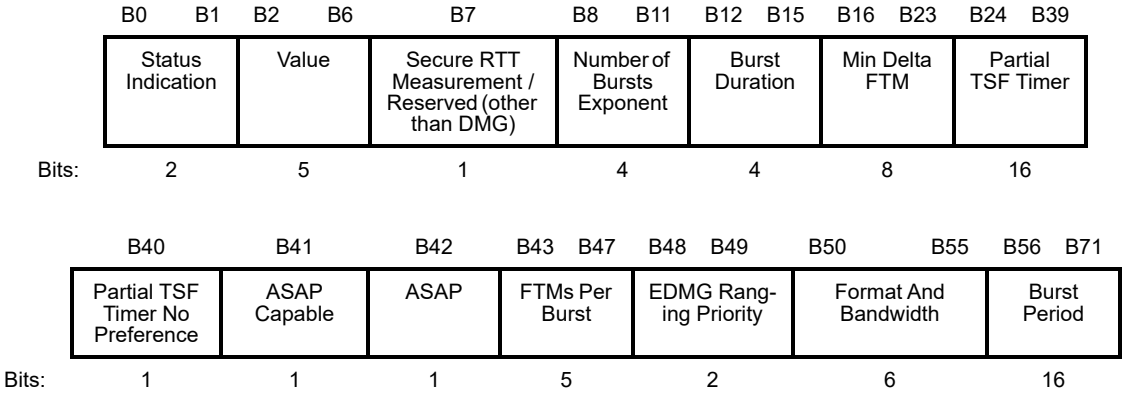

Figure 9-723—FTM Parameters field format

The Status Indication subfield indicates the responding STA's response to the IFTMR frame. The encoding of the Status Indication subfield is shown in Table 9-321.

Table 9-321—Status Indication subfield values

Value	Description
0	Reserved
1	Successful (some requested parameters might have been overridden). Measurement exchanges are about to begin.
2	Request incapable. Do not send same request again. FTM session ends.
3	Request failed. Do not send new request for Value seconds. FTM session ends.

The Status Indication subfield and Value subfield are reserved in the IFTMR frame. When the Status Indication subfield is set to 3 by the responding STA, the Value subfield contains a duration in units of seconds; otherwise the Value subfield is reserved.

For secure EDMG ranging, the Secure RTT Measurement subfield is set to 1 by an ISTA to request a secure RTT measurement exchange between an ISTA and an RSTA; see 11.21.6.3.3. The Secure RTT Measurement subfield is set to 1 by an RSTA to acknowledge a secure RTT measurement exchange, and to 0 otherwise. In cases other than secure EDMG ranging, the Secure RTT Measurement subfield is reserved.

The Number of Bursts Exponent subfield indicates how many burst instances, defined in 11.21.6.4, are requested for the FTM session if included in an IFTMR frame, or allocated for the FTM session if included in an initial FTM frame respectively, where the number of burst instances is $2^{\text{Number of Bursts Exponent}}$. The value 15 in an IFTMR frame indicates no preference by the initiating STA and is valid (indicating 2^{15} burst instances) when set by the responding STA.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Burst Duration subfield indicates the duration of a burst instance. The value 15 in the IFTMR frame indicates no preference by the initiating STA and is not used by the responding STA. Table 9-322 shows the encoding of this subfield.

Table 9-322—Burst Duration subfield encoding

Value	Represents
0-1	Reserved
2	250 μs
3	500 μs
4	1 ms
5	2 ms
6	4 ms
7	8 ms
8	16 ms
9	32 ms
10	64 ms
11	128 ms
12–14	Reserved
15	No preference

The Min Delta FTM subfield indicates the minimum time between consecutive FTM frames. It is measured from the start of an FTM frame to the start of following FTM frame, in units of 100 μs. The value 0 indicates no preference by the initiating STA and is not used by the responding STA.

The value in the Partial TSF Timer subfield is the partial value of the responding STA's TSF at the start of the first burst instance. The Partial TSF Timer subfield value is derived as follows, so as to have units of TUs: from the 64 TSF timer bits at the start of the first burst instance of an FTM session, remove the most significant 38 bits and the least significant 10 bits.

The initiating STA indicates a preferred time for the start of the first burst instance by setting the Partial TSF Timer No Preference subfield to 0 and by setting the Partial TSF Timer subfield to indicate the preferred start of the first burst instance, in the FTMR frame. Otherwise the Partial TSF Timer No Preference subfield is set to 1 and the Partial TSF Timer subfield is reserved. The Partial TSF Timer No Preference subfield is reserved when the FTM Parameters element is included in an initial FTM frame.

The value of the Partial TSF Timer subfield in an initial FTM frame is the partial value of the responding STA's TSF timer at the start of the first burst instance of an FTM session.

NOTE 1—1024 TUs out of the full range of the Partial TSF Timer subfield are not used in order to allow the recipient to resolve ambiguity arising from 1) imperfect synchronization between the initiating and responding STAs, and 2) retries of the IFTMR frame or retransmissions of the initial FTM frame.

The ASAP Capable subfield indicates that the responding STA is capable of capturing timestamps associated with an initial FTM frame and its acknowledgment and sending them in the following FTM frame. This subfield is reserved in the IFTMR frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The ASAP subfield indicates the initiating STA's request to start the first burst instance of the FTM session with the initial FTM frame and capture timestamps corresponding to the transmission of the initial FTM frame and the receipt of its acknowledgment. The responding STA sets the ASAP subfield to 1 to indicate the STA's intent to send an FTM frame as soon as possible and capture timestamps corresponding to the transmission of the initial FTM frame and the receipt of its acknowledgment.

When the ASAP subfield is set to 0 and the Partial TSF Timer No Preference subfield is set to 0 by an initiating STA, the initiating STA requests the start of the first burst instance specified by the Partial TSF Timer subfield in the IFTMR frame. When the ASAP subfield is set to 1 and the Partial TSF Timer No Preference subfield is set to 0 by an initiating STA, the Partial TSF Timer subfield in the FTMR frame indicates the requested start of the first burst instance if the ASAP subfield is set to 0 in the corresponding initial FTM frame. The Partial TSF Timer subfield in both these frames is set to a value between 0 and 62/64 of 65 535 TUs.

Figure 9-724 (Calculation of the value of the Partial TSF Timer subfield) describes how the value of the Partial TSF Timer subfield is determined based on the ASAP subfield and the Partial TSF Timer No Preference subfield at an initiating STA and on the ASAP subfield at the responding STA.

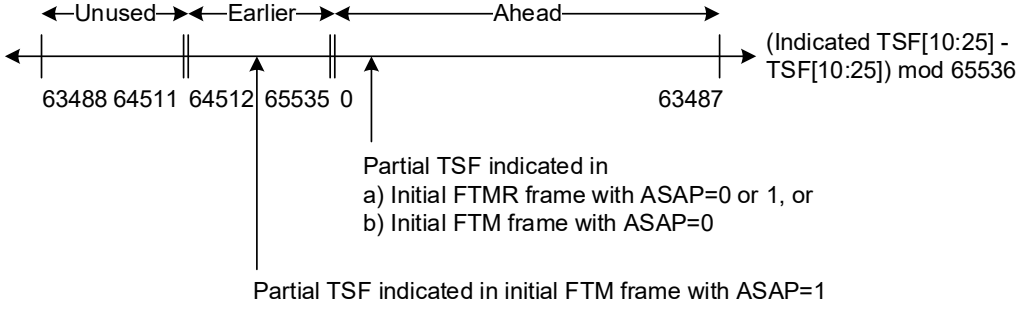

Figure 9-724—Calculation of the value of the Partial TSF Timer subfield

The ASAP subfield is also used by the responding STA to signal whether that request has been honored or not. When the ASAP subfield is set to 0 by the responding STA, the Partial TSF Timer subfield in the initial FTM frame indicates the start time of the first burst instance and the earliest time the FTMR frame (see 11.21.6.4) should be sent by the initiating STA. The Partial TSF Timer subfield in both these frames is set to a value between 0 and 62/64 of 65 535 TUs.

When the ASAP subfield is set to 1 by the responding STA, the Partial TSF Timer subfield in the initial FTM frame indicates the start time of the first burst instance and the earliest time the initial FTM frame will be sent. The value in the Partial TSF Timer subfield in this case is set to a value less than 1/64 of 65 536 TUs (≥1024 TUs) from the responding STA's TSF timer.

The FTMs Per Burst subfield indicates how many successfully transmitted FTM frames are requested per burst instance by the IFTMR frame, or allocated by the initial FTM frame, respectively. The value 0 indicates no preference by the initiating STA and is not used by the responding STA.

For EDCA based ranging where the value of the Format And Bandwidth field indicates DMG or EDMG format, see Table 9-325, the EDMG Ranging Priority subfield of the FTM Parameters field of the FTM Parameters element in the IFTMR frame contains the ISTA's ranging priority request, which indicates the time sensitivity of a ranging operation, and it is set according to Table 9-323. In cases other than EDMG ranging, EDMG Ranging Priority subfield is reserved.

For EDCA based ranging where the value of the Format And Bandwidth field indicates DMG or EDMG format, see Table 9-325, the EDMG Ranging Priority subfield of the FTM Parameters field of the FTM

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-323—Definition of the EDMG Ranging Priority subfield when included in the IFTMR frame

Ranging Priority Request Value	Description	Definition
0	No priority	The ISTA does not know the time sensitivity of the ranging operation.
1	High	The results of the ranging operation is intended for emergency services (e.g., 911 calls)
2	Medium	The completion of the ranging operation impacts user experiences.
3	Low	The completion of the ranging operation is less sensitive to application performance.

Parameters element in the IFTM frame contains the RSTA's ranging priority response, which indicates whether the RSTA accommodates the ranging priority request of the ISTA, and it is set according to Table 9-324.

Table 9-324—Definition of the EDMG Ranging Priority subfield when included in the IFTM frame

Ranging Priority Response Value	Definition
0	The RSTA will be able to prioritize ranging operations to match the ranging priority requested by the ISTA.
1	The RSTA will not be able to prioritize ranging operations to match the ranging priority requested by the ISTA
2	Reserved
3	Reserved

For EDCA based ranging where the value of the Format And Bandwidth field does not indicate DMG or EDMG format, see Table 9-325, the EDMG Ranging Priority subfield of the FTM Parameters field of the FTM Parameters element in the IFTM frame is reserved.

The Format And Bandwidth subfield indicates the requested or allocated PPDU format and bandwidth that can be used by FTM frames in an FTM session and is shown in Table 9-325. The value 0 indicates no preference by the initiating STA in the associated state and is not used by the responding STA.The value 0 is not used by the initiating STA in the unassociated state.

NOTE 2—See 21.3.17.3 regarding the usage of two separate RF LOs.

The Burst Period subfield indicates the interval between two consecutive burst instances, in units of 100 ms. The value 0 indicates no preference by the initiating STA. This subfield is reserved when the Number of Bursts Exponent subfield is set to 0.

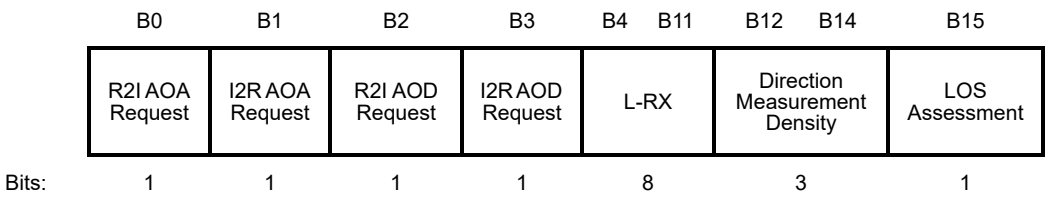

Figure 9-726—DMG Direction Measurement Parameters field format

A value of 1 in the R2I AOA Request subfield indicates a request for RSTA to ISTA angle of arrival measurement performed at the ISTA.

A value of 1 in the I2R AOA Request subfield indicates a request for ISTA to RSTA angle of arrival measurement performed at the RSTA.

A value of 1 in the R2I AOD Request subfield indicates a request for RSTA to ISTA angle of departure measurement performed at the ISTA.

A value of 1 in the I2R AOD Request subfield indicates a request for ISTA to RSTA angle of departure measurement performed at the RSTA.

The L-RX field indicates how many TRN-units are requested by the sender for angle of arrival measurements. The interpretation of this field is defined in 9.5.4. If either the initiator or the responder is a non-EDMG STA, the value of this field is limited to 32.

The Direction Measurement Density field indicates how often in a burst a direction measurement is performed. The interpretation of the values is defined in Table 9-327.

Table 9-327—Direction Measurement Density field interpretation

Value	Interpretation
0	Only the first FTM exchange in a burst is a direction measurement
1	Every measurement in a burst is a direction measurement
2	Every second measurement in a burst is a direction measurement
3	Every 4th measurement in a burst is a direction measurement
4	Every 8th measurement in a burst is a direction measurement
5–7	Reserved

The LOS Assessment field is set to 1 in a DMG Direction Measurement Parameters field sent by an ISTA in an IFTMR frame to indicate a request for LOS assessment in the FTM session (see 11.21.6.4.8).

The EDMG Specific Parameters subelement contains a number of fields that are used to advertise the requested or allocated operation configurations from one EDMG STA to another. The EDMG Specific Parameters subelement is included in the IFTMR frame, as described in 9.6.7.32, and the IFTM frame, as described in 9.6.7.33, if the Secure RTT Measurement subfield of the FTM Parameters field of these frames is equal to 1. The use of the EDMG Specific Parameters subelement is described in 11.21.6.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The format of the EDMG Specific Parameters subelement is shown in Figure 9-727 (EDMG Specific Parameters subelement format).

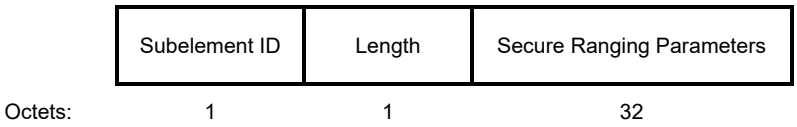

Figure 9-727—EDMG Specific Parameters subelement format

The format of the Secure Ranging Operation Parameters field is shown in Figure 9-728 (Secure Ranging Operation Parameters field format).

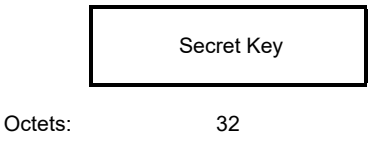

Figure 9-728—Secure Ranging Operation Parameters field format

The Secret Key subfield is used to carry the secret key, which is used along with Salt value (based on the PMKID), to generate the random sequence(s) as described in 12.2.12.

9.4.2.167 Device Location element

A Device Location element includes the location configuration information (LCI), which contains latitude, longitude, and altitude information. The Device Location element format is shown in Figure 9-729 (Device Location element format).

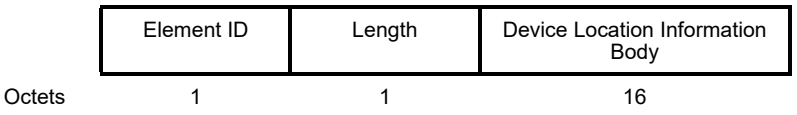

Figure 9-729—Device Location element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Device Location Information Body field is defined in 9.4.1.54.

9.4.2.168 White Space Map element

The White Space Map element includes available radio frequency information obtained from a GDB. The format of the WSM Information field is determined by the WSM Type field. The format of the White Space Map Announcement element is shown in Figure 9-730 (WSM element format).

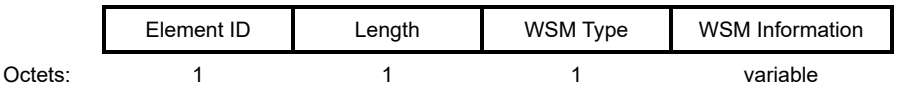

Figure 9-730—WSM element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The format and values of WSM Type and WSM Information fields are defined in 9.4.1.55.

9.4.2.169 Reduced Neighbor Report element

9.4.2.169.1 General

The Reduced Neighbor Report element contains channel and other information related to neighbor APs. The format of the Reduced Neighbor Report element is shown in Figure 9-731 (Reduced Neighbor Report element format).

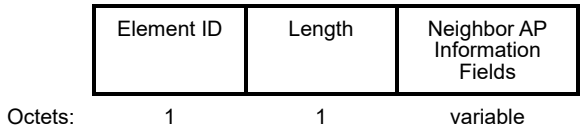

Figure 9-731—Reduced Neighbor Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Neighbor AP Information Fields field contains one or more of the Neighbor AP Information field described in 9.4.2.169.2.

9.4.2.169.2 Neighbor AP Information field

The Neighbor AP Information field specifies TBTT and other information related to a group of neighbor APs on one channel. See Figure 9-732 (Neighbor AP Information field format).

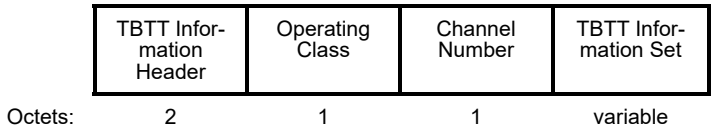

Figure 9-732—Neighbor AP Information field format

The format of TBTT Information Header subfield is defined in Figure 9-733 (TBTT Information Header subfield format).

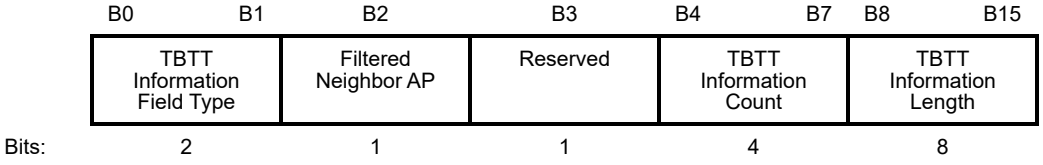

Figure 9-733—TBTT Information Header subfield format

The TBTT Information Field Type subfield identifies, together with the TBTT Information Length subfield, the format of the TBTT Information field. It is set to 0 or 1. Values 2, and 3 are reserved.

The Filtered Neighbor AP subfield is reserved except when the Reduced Neighbor Report element is carried in a Probe Response frame transmitted by a TVHT AP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

In a Probe Response frame transmitted by a TVHT AP, the Filtered Neighbor AP subfield is set to 1 if the specific SSID corresponding to every BSS of the APs in this Neighbor AP Information field matches the SSID in the corresponding Probe Request frame; otherwise it is set to 0.

The TBTT Information Count subfield contains the number of TBTT Information fields included in the TBTT Information Set field of the Neighbor AP Information field, minus one.

The TBTT Information Length subfield indicates the length of each TBTT Information field included in the TBTT Information Set field of the Neighbor AP Information field. If the TBTT Information Field Type subfield is 0, the TBTT Information Length subfield

— Contains the length in octets of each TBTT Information field that is included in the TBTT Information Set field of the Neighbor AP Information field.
— Is set to 1, 2, 5, 6, 7, 8, 9, 11, 12, or 13; other values are reserved.
— Indicates the TBTT Information field contents as shown in Table 9-328.

A TVHT AP sets the TBTT Information Length subfield to 1.

The TBTT Information Length subfield, when the TBTT Information Field Type subfield is equal to 0, is interpreted as shown in Table 9-328.

Table 9-328—TBTT Information field contents when TBTT Information Field Type Table 9-329—subfield equal to 0

TBTT Information Length subfield value	TBTT Information field contents
0	Reserved
1	The Neighbor AP TBTT Offset subfield
2	The Neighbor AP TBTT Offset subfield and the BSS Parameters subfield
3	Reserved
4	Reserved
5	The Neighbor AP TBTT Offset subfield and the Short SSID subfield
6	The Neighbor AP TBTT Offset subfield, the Short SSID subfield, and the BSS Parameters subfield
7	The Neighbor AP TBTT Offset subfield and the BSSID subfield
8	The Neighbor AP TBTT Offset subfield, the BSSID subfield, and the BSS Parameters subfield
9	The Neighbor AP TBTT Offset subfield, the BSSID subfield, the BSS Parameters subfield, and the 20 MHz PSD subfield
10	Reserved
11	The Neighbor AP TBTT Offset subfield, the BSSID subfield and the Short SSID subfield

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-328—TBTT Information field contents when TBTT Information Field Type Table 9-329—subfield equal to 0

TBTT Information Length subfield value	TBTT Information field contents
12	The Neighbor AP TBTT Offset subfield, the BSSID subfield, the Short SSID subfield, and the BSS Parameters subfield
13	The Neighbor AP TBTT Offset subfield, the BSSID subfield, the Short SSID subfield, the BSS Parameters subfield, and the 20 MHz PSD subfield
14–255	The first 13 octets of the field contain the Neighbor AP TBTT Offset subfield, the BSSID subfield, the Short SSID subfield, the BSS Parameters subfield, and the 20 MHz PSD subfield (i.e., same contents as when the length of the TBTT Information field is 13). The remaining octets are reserved.

The TBTT Information Length subfield, when the TBTT Information Field Type subfield is equal to 1, is interpreted as shown in Table 9-330.

Table 9-330—TBTT Information field contents when TBTT Information Field Type subfield equal to 1

TBTT Information Length subfield value	TBTT Information field contents
0–1	Reserved
2	The EBCS Info Frame Tx Countdown field as defined in 9.4.1.70
3–255	Reserved

The Operating Class field indicates a channel starting frequency that, together with the Channel Number field, indicates the primary channel of the BSSs of the APs in this Neighbor AP Information field.

NOTE 1—The Operating Class field and Channel Number tuple indicate the primary channel in order to assist with passive scanning.

The Channel Number field indicates the last known primary channel of the APs in this Neighbor AP Information field. Channel Number is defined within an Operating Class as shown in Table E-4.

The TBTT Information Set field contains one or more TBTT Information fields. The TBTT Information field is defined in Figure 9-734 (TBTT Information field format).

	Neighbor AP TBTT Offset	BSSID (optional)	Short SSID (optional)	BSS parameters	20 MHz PSD
Octets:	1	0 or 6	0 or 4	0 or 1	0 or 1

Figure 9-734—TBTT Information field format

The Neighbor AP TBTT Offset subfield indicates the offset in TUs, rounded down to nearest TU, to the following:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The next TBTT of the reported AP from the immediately prior TBTT of the AP that transmits this element if the reported AP is not part of a multiple BSSID set or is the transmitted BSSID of a multiple BSSID set.
— The next TBTT of the transmitted BSSID of the multiple BSSID set of the reported AP from the immediately prior TBTT of the AP that transmits this element if the reported AP is part of a multiple BSSID set and is a nontransmitted BSSID.

The value 254 indicates an offset of 254 TUs or higher. The value 255 indicates an unknown offset value.

The BSSID field is defined in 9.2.4.3.4.

The Short SSID subfield is defined in 9.4.1.71.

The format of the BSS Parameters subfield is defined in Figure 9-735 (BSS Parameters subfield format).

	B0	B1	B2	B3	B4	B5	B6	B7
	OCT Recommended	Same SSID	Multiple BSSID	Transmitted BSSID	Member Of ESS With 2.4/5 GHz Colocated AP	Unsolicited Probe Responses Active	Colocated AP	Reserved
Bits:	1	1	1	1	1	1	1	1

Figure 9-735—BSS Parameters subfield format

The OCT Recommended subfield is set to 1 to indicate that OCT is recommended to exchange MMPDUs with the AP identified in the TBTT Information field (see 11.31.5, through over-the-air transmissions with the AP sending the Reduced Neighbor Report element. It is set to 0 otherwise.

The Same SSID subfield is set to 1 to indicate that the reported AP has the same SSID as the reporting AP. It is set to 0 otherwise.

The Multiple BSSID subfield is set to 1 to indicate that the reported AP is part of a multiple BSSID set. It is set to 0 otherwise.

The Transmitted BSSID subfield is set to 1 to indicate that the reported AP is a transmitted BSSID. It is set to 0 if the reported AP is a nontransmitted BSSID. It is reserved if the Multiple BSSID subfield is set to 0.

The Member Of ESS With 2.4/5 GHz Colocated AP subfield is set to 1, if the reported AP is part of an ESS where all the APs in the ESS are operating in the same band as the reported AP (irrespective of the operating channel in that band) and are on the same channel and in range of a STA receiving this frame, have dot11MemberOfColocated6GHzESSOptionActivated equal to true and have a corresponding AP operating in the 2.4 GHz or 5 GHz bands that is in the same colocated AP set as that AP. It is set to 0 otherwise or if the reporting AP does not have that information. It is reserved if the reported AP is operating in the 2.4 GHz or 5 GHz bands.

NOTE 2—This subfield indicates that the reported AP is part of an ESS that has no 6 GHz-only APs that might be detected by a STA receiving this frame. This means that all APs operating in the 6 GHz band that are part of that ESS that might be detected by a STA receiving this frame can be discovered in the 2.4 GHz and/or 5 GHz bands.

The Unsolicited Probe Responses Active subfield is set to 1, if the reported AP is part of an ESS where all the APs are operating in the same channel as the reported AP and are on the same channel and in range of a STA receiving this frame, have dot11UnsolicitedProbeResponseOptionActivated equal to true and are transmitting unsolicited Probe Response frames every 20 TUs or less less (see 26.17.2.3). It is set to 0 otherwise or if the reporting AP does not have that information.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Colocated AP subfield is set to 1 if the AP is in the same colocated AP set as the transmitting AP. It is set to 0 otherwise.

The 20 MHz PSD subfield, if present, indicates a maximum transmit power for the Default category, with unit interpretation of PSD EIRP in dBm/MHz (see 9.4.2.160 and 11.7.5), corresponding to the primary 20 MHz channel of the reported AP. The maximum transmit power is encoded as a 2s complement signed integer. The value –128 is reserved. The value +127 indicates that no maximum transmit power is specified for the corresponding 20 MHz channel. For all other values Y of the subfield (i.e., –127 to +126), the maximum transmit power in the 20 MHz channel is $Y/2$ dBm/MHz (i.e., ranging from –63.5 to +63 dBm/MHz).

NOTE 3—For example, suppose the reported AP transmits, in Beacon and Probe Response frames, one Transmit Power Envelope element with the Maximum Transmit Power For 20 MHz subfield indicating 20 dBm (regulatory client EIRP), then the 20 MHz PSD subfield indicates the equivalent PSD limit of 7 dBm/MHz with the value 14.

9.4.2.169.3 Calculating the short SSID

A short SSID is a 32-bit value calculated over an SSID. The SSID is referred to as the calculation fields. The short SSID is calculated using the following standard generator polynomial of degree 32:

$$G(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$$

The short SSID is the 1s complement of the sum (modulo 2) of the following:

a) The remainder of $x^k \times (x^{31} + x^{30} + x^{29} + \ldots + x^2 + x + 1)$ divided (modulo 2) by $G(x)$, where k is the number of bits in the calculation fields, and

b) The remainder after multiplication of the contents (treated as a polynomial) of the calculation fields by x^{32} and then division by $G(x)$.

9.4.2.170 TVHT Operation element

The operation of TVHT STAs in the BSS is controlled by the TVHT Operation element. The format of the TVHT Operation element is defined in Figure 9-736 (TVHT Operation element format).

	Element ID	Length	TVHT Operation Information	Basic VHT-MCS And NSS Set
Octets:	1	1	4	2

Figure 9-736—TVHT Operation element format

The Element ID and Length fields are defined in 9.4.2.1.

The structure of the TVHT Operation Information field is defined in Figure 9-737 (TVHT Operation Information field format).

	Primary Channel Number	Channel Width	Channel Center Frequency Segment 0	Channel Center Frequency Segment 1
Octets:	1	1	1	1

Figure 9-737—TVHT Operation Information field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The subfields of the TVHT Operation Information field are defined in Table 9-331.

Table 9-331—TVHT Operation Information subfields

Field	Definition	Encoding
Primary Channel Number	Indicates the channel number of the primary channel (see 11.41).	Channel number of the primary channel.
Channel Width	This field defines the BSS bandwidth (see 11.41).	Set to 0 for TVHT_W BSS bandwidth. Set to 1 for TVHT_2W BSS bandwidth. Set to 2 for TVHT_W+W BSS bandwidth. Set to 3 for TVHT_4W BSS bandwidth. Set to 4 for noncontiguous TVHT_2W+2W BSS bandwidth. Values in the range 5 to 255 are reserved.
Channel Center Frequency Segment 0	Defines the channel center frequency for a TVHT_W, TVHT_2W, and TVHT_4W TVHT BSS and the segment 0 channel center frequency for a TVHT_W+W and TVHT_2W+2W TVHT BSS. See 22.3.14.	For TVHT_W or TVHT_2W or TVHT_4W BSS bandwidth, indicates the center frequency of the lowest TV channel index for the TVHT_W or TVHT_2W or TVHT_4W channel on which the TVHT BSS operates. For TVHT_W+W or TVHT_2W+2W BSS bandwidth, indicates the lowest TV channel index for the TVHT_W or TVHT_2W channel of frequency segment 0 on which the TVHT BSS operates. Reserved otherwise.
Channel Center Frequency Segment 1	Defines the segment 1 channel center frequency for a TVHT_W+W and TVHT_2W+2W TVHT BSS. See 22.3.14.	For TVHT_W+W or TVHT_2W+2W BSS bandwidth, indicates the lowest TV channel index in the segment for the TVHT_W or TVHT_2W channel of frequency segment 1 on which the TVHT BSS operates. Reserved otherwise.

The Basic VHT-MCS And NSS Set field indicates the MCSs for each spatial stream in VHT PPDU in TVWS bands that are supported by all TVHT STAs in the BSS (including IBSS). The Basic VHT-MCS And NSS Set field is a bitmap of size 16 bits; B8-B9, B10-B11, B12-B13, and B14-B15 are set to 3. For B0-B7, each 2 bits indicates the supported MCS set for N_{SS} from 1 to 4. The Basic VHT-MCS And NSS Set field is defined as B0-B7 of Rx VHT-MCS Map subfield in 9.4.2.156.3.

9.4.2.171 FTM Synchronization Information element

The format of the FTM Synchronization Information element is defined in Figure 9-738 (FTM Synchronization Information element format).

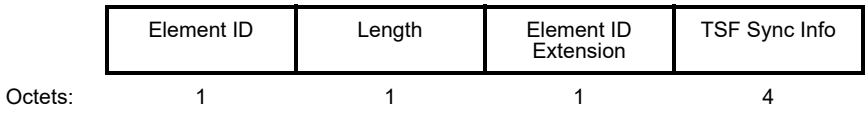

Figure 9-738—FTM Synchronization Information element format

The Element ID, Length and Element ID Extension fields are defined in 9.4.2.1.

The TSF Sync Info field is set to the 4 least significant octets of the TSF.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.172 Estimated Service Parameters Inbound element

The Estimated Service Parameters Inbound element is used by a STA to provide information to another STA that can then use the information as input to an algorithm to generate an estimate of inbound throughput between the two STAs.

The format of the Estimated Service Parameters Inbound element is shown in Figure 9-739 (Estimated Service Parameters Inbound element format).

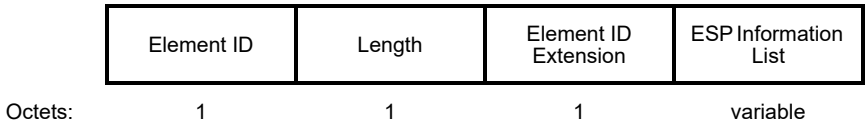

Figure 9-739—Estimated Service Parameters Inbound element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The ESP Information List field contains from 1 to 4 ESP Information fields, each corresponding to an access category for which estimated service parameters information is provided.

The format of the ESP Information field is shown in Figure 9-740 (ESP Information field format).

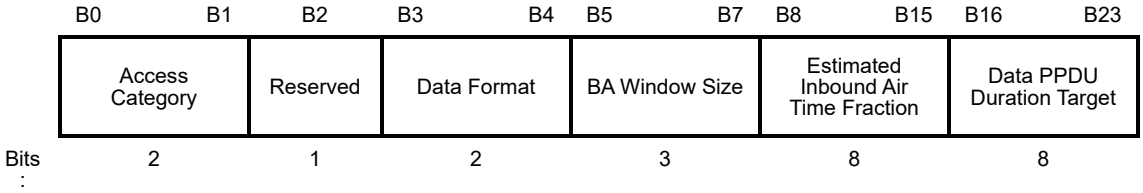

Figure 9-740—ESP Information field format

The Access Category subfield indicates the access category to which the remaining parameters of the ESP Information field apply. The encoding of the Access Category subfield is given in Table 9-332. When parameters for more than one access category are present in an Estimated Service Parameters Inbound element the ESP Information fields for the access categories appear in order of Access Category subfield value, with the ESP Information field with the lowest Access Category subfield value appearing first.

Table 9-332—Access Category subfield encoding

Value	Access Category
0	AC_BK
1	AC_BE
2	AC_VI
3	AC_VO

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Data format subfield has the meaning indicated in Table 9-333.

Table 9-333—Data Format subfield encoding

Value	Description
0	No aggregation is expected to be performed for MSDUs or MPDUs with the Type subfield equal to Data for the corresponding AC
1	A-MSDU aggregation is expected to be performed for MSDUs for the corresponding AC, but A-MPDU aggregation is not expected to be performed for MPDUs with the Type subfield equal to Data for the corresponding AC
2	A-MPDU aggregation is expected to be performed for MPDUs with the Type subfield equal to Data for the corresponding AC, but A-MSDU aggregation is not expected to be performed for MSDUs for the corresponding AC
3	A-MSDU aggregation is expected to be performed for MSDUs for the corresponding AC, and A-MPDU aggregation is expected to be performed for MPDUs with the Type subfield equal to Data for the corresponding AC

The BA Window Size subfield is indicates the size of the Block Ack window that is expected for the corresponding access category as defined in Table 9-334. When the Block Ack window size expected to be used by the transmitter of the element does not match any of the values shown in the table, the transmitter uses the next lower value in the table.

Table 9-334—BA Window Size subfield encoding

Value	Expected block ack window size
0	Block Ack not expected to be used
1	2
2	4
3	6
4	8
5	16
6	32
7	64

The Estimated Inbound Air Time Fraction subfield contains an unsigned integer that represents the predicted percentage of time, linearly scaled with 255 representing 100% and 0 representing 0%, that a new STA joining the BSS can expect to be available for the transmission of PPDUs to that STA, including overhead, where such PPDUs contain MPDUs with the Type subfield equal to Data that belong to the access category indicated in the Access Category subfield of the corresponding ESP Information field and any other MPDUs in the PPDU are considered to be overhead.

The Data PPDU Duration Target field is an unsigned integer that indicates the expected target duration of PPDUs transmitted to the STA that contain MPDUs with the Type subfield equal to Data that belong to the access category indicated in the Access Category subfield of the corresponding ESP Information field for

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the corresponding access category in units of 50 μs. This value is determined using a method that is beyond the scope of this standard.

9.4.2.173 Future Channel Guidance element

The Future Channel Guidance element is used by an AP, IBSS STA, mesh STA, or PCP to guide STAs about the likely future channel if the sending STA changes channels of operation. The format of the Future Channel Guidance element is shown in Figure 9-741 (Future Channel Guidance element format).

	Element ID	Length	Element ID Extension	New Channel Number	Secondary Channel Offset element	Mesh Channel Switch Parameters element	Wide Bandwidth Channel Switch element	New Transmit Power Envelope element
Octets:	1	1	1	4	0 or 3	0 or 8	0 or 5	variable

Figure 9-741—Future Channel Guidance element format

The Element ID, Length and Element ID Extension fields are defined in 9.4.2.1.

The New Channel Number field is set to the number of the channel to which the STA will be moving in the event of a channel switch (as defined in 17.3.8.4.3).

The Secondary Channel Offset element is defined in 9.4.2.18. This element is present when switching to a 40 MHz or wider channel. It is optionally present when switching to a 20 MHz channel (in which case the Secondary Channel Offset field is set to SCN). See 11.38.4.

The Mesh Channel Switch Parameters element is defined in 9.4.2.101. This element is present when a mesh STA performs MBSS channel switch. Otherwise, the Mesh Channel Switch Parameters element is not present.

The Wide Bandwidth Channel Switch element is defined in 9.4.2.159. This element is present when switching to a channel width wider than 40 MHz.

Each New Transmit Power Envelope element that is present is defined to have the same format as the Transmit Power Envelope element (see 9.4.2.160 and includes a distinct value of the Local Maximum Transmit Power Unit Interpretation subfield. If present, the New Transmit Power Envelope element indicates the local maximum transmit powers for the BSS for the BSS for the indicated bandwidths with an indicated unit interpretation after channel switching (see 11.38.1).

The Future Channel Guidance procedure is defined in 11.8.10.

9.4.2.174 Association Delay Info element

The Association Delay Info element is used to identify the minimum (re)association response timeout to the non-AP STA. The format of the Association Delay Info element is shown in Figure 9-742 (Association Delay Info element format).

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Association Delay Info field contains an unsigned integer indicating the minimum association response delay in number of TUs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

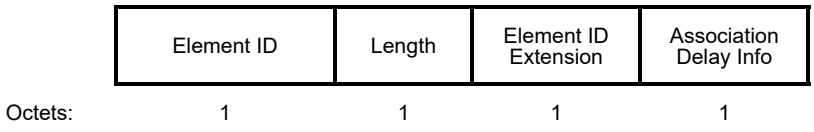

Figure 9-742—Association Delay Info element format

9.4.2.175 CAG Number element

The Common Advertisement Group (CAG) is a group of elements that are defined by the same advertisement protocol and that do not change on a rapid basis within an AP. The CAG Number element provides one or more current version numbers of the CAG (CAG Version) associated with the AP, where each version number is associated with a specific advertisement protocol and server. The CAG Number element is optionally present in the Beacon or Probe Response frame to reduce GAS frame exchanges when dot11InterworkingServiceActivated is true. The CAG Number element is optionally present in the GAS Initial Request frame to indicate the CAG Version and the associated CAG Information Type cached by the non-AP STA when dot11SolicitedPADActivated is true.

The format of the CAG Number element is shown in Figure 9-743 (CAG Number element format).

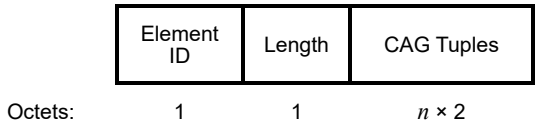

Figure 9-743—CAG Number element format

The Element ID and Length fields are defined in 9.4.2.1.

The CAG Tuples field contains one or more CAG Tuple fields. The format of a CAG Tuple field is shown in Figure 9-744 (CAG Tuple field).

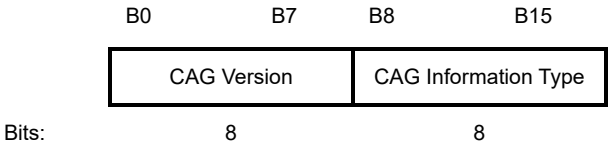

Figure 9-744—CAG Tuple field

The CAG Version subfield is an unsigned integer indicating the current version of the CAG of the associated advertisement protocol and server indicated by the CAG Information Type subfield in the same CAG Tuple field. The use of CAG Version is explained in 11.22.3.3.

The CAG Information Type subfield is indicates the type of information associated with the CAG Version in the same CAG Tuple field. The CAG Information Type is defined in Table 9-335.

9.4.2.176 FILS Request Parameters element

The contents of the FILS Request Parameters element in Probe Request frame are used in determining whether to transmit a Probe Response frame as described in 11.1.4.3.4. The FILS Request Parameters element is defined in Figure 9-745 (FILS Request Parameters element format).

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-335—CAG Information Type definitions

Name	Value
Access network query protocol (ANQP)	0
MIS Information Service	1
MIS Command and Event Services Capability Discovery	2
Emergency Alert System (EAS)	3
Registered location query protocol (RLQP)	4
Reserved	5–127
ANQP with Service Information Registry	128
Reserved	129–220
Vendor Specific	221
Reserved	222–255

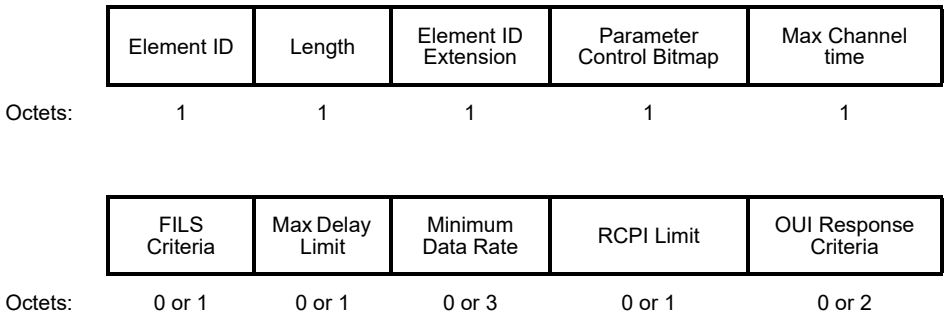

Figure 9-745—FILS Request Parameters element format

The Parameter Control Bitmap field is shown in Figure 9-746 (Parameter Control Bitmap field format).

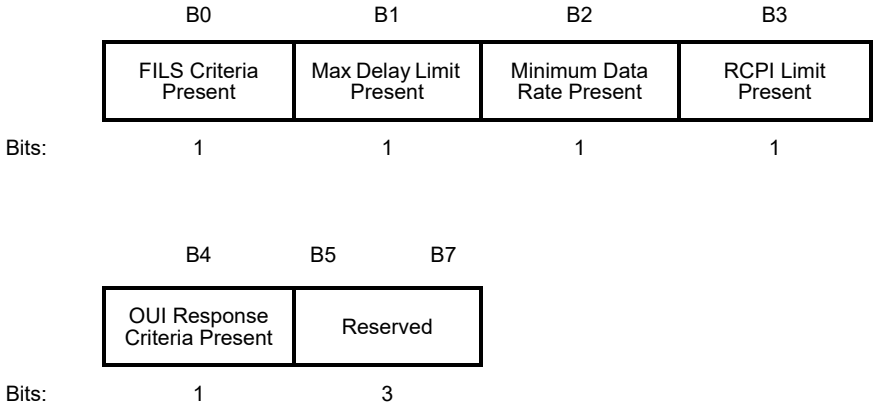

Figure 9-746—Parameter Control Bitmap field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Bits 0 to 4 of the Parameter Control Bitmap field correspond to the Parameter fields that are optionally present in the element. A 1 in a bit indicates the corresponding parameter is present, and 0 indicates the corresponding parameter is not present.

The FILS Criteria field is shown in Figure 9-747 (FILS Criteria field format).

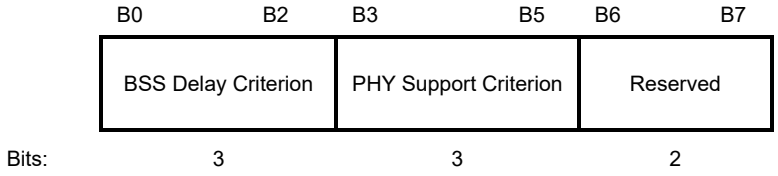

Figure 9-747—FILS Criteria field format

The BSS Delay Criterion subfield indicates the delay type that is applied in the decision to respond to the Probe Request frame as described in 11.1.4.3.4. The delay type is selected as indicated in Table 9-336.

Table 9-336—BSS Delay Criterion subfield

Value	Explanation
0	Delay criterion is not in use.
1	Access delay is indicated as Average Access Delay for Background (AC_BK) subfield of the BSS AC Access Delay element as described in 9.4.2.42.
2	Access delay is indicated as Average Access Delay for Best Effort (AC_BE) subfield of the BSS AC Access Delay element as described in 9.4.2.42.
3	Access delay is indicated as Average Access Delay for Video (AC_VI) subfield of the BSS AC Access Delay element as described in 9.4.2.42.
4	Access delay is indicated as Average Access Delay for Voice (AC_VO) subfield of the BSS AC Access Delay element as described in 9.4.2.42.
5	Access Delay is indicated as Average Access Delay as described in 9.4.2.42.
6, 7	Reserved

The PHY Support Criterion subfield indicates the required PHY type of the responding STA.

The indicated PHY type is used in the decision to respond to the Probe Request frame as described in 11.1.4.3.4. The meaning of the values for the PHY Support Criterion is shown in Table 9-337.

The Max Delay Limit field (see 11.1.4.3.4) is an unsigned integer in units of 400 μs to indicate the maximum access delay as indicated by the BSS Delay Criterion subfield of the FILS Criteria of the FILS Request Parameters element. Value 0 is reserved. The use of the maximum access delay and the delay criterion are explained in 11.1.4.3.4. Max Delay Limit is not present if FILS Criteria is not present or BSS Delay Criterion is not in use.

The Minimum Data Rate field (see 11.1.4.3.4), if present, contains an unsigned integer in units of Kb/s that specifies the lowest total data rate specified at the MAC SAP for transport of MSDUs or A-MSDUs that the STA is going to transmit. The minimum MAC SAP data rate does not include the MAC and PHY overheads incurred in transferring the MSDUs or A-MSDUs.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-337—PHY Support Criterion subfield

Value	Explanation
0	Indicates that PHY Support Criterion is not in use.
1	Indicates that a responding FILS STA is HT capable.
2	Indicates that a responding FILS STA is VHT capable.
3	Indicates that a responding FILS STA is HE capable.
4–7	Reserved

The RCPI Limit field is an unsigned integer in units of 1 dB. The use of the RCPI Limit field is explained in 11.1.4.3.4.

The OUI Response Criteria field (see 11.1.4.3.4) is a bitmap whose bits correspond to the Vendor Specific elements of the Probe Request frame in order of presence. Bit 0 corresponds to the first Vendor Specific element, bit 1 corresponds to the second, etc. A bit value of 1 in the OUI Response Criteria field indicates that the receiver identifies the Organization Identifier field of the corresponding Vendor Specific element in order to respond to the request and otherwise is 0. If the number of the Vendor Specific elements of the Probe Request frame is less than the number of bits of the OUI Response Criteria field, the remaining bits of the OUI Response Criteria field are 0. If the number of bits in the OUI Response Criteria field is less than the number of Vendor Specific elements in the Probe Request frame, the corresponding bits not present in the OUI Response Criteria field are assumed to be 0.

The Max Channel Time field (see 11.1.4.3.4) contains the value of MaxChannelTime parameter of the MLME-SCAN.request primitive represented in units of TUs, as an unsigned integer. Setting the Max Channel Time field to 255 is used to indicate any duration of more than 254 TUs, or an unspecified or unknown duration.

9.4.2.177 FILS Key Confirmation element

The FILS Key Confirmation element is used to convey a cryptographic proof of authentication between a STA and an AP. The format of the FILS Key Confirmation element is shown in Figure 9-748 (FILS Key Confirmation element format).

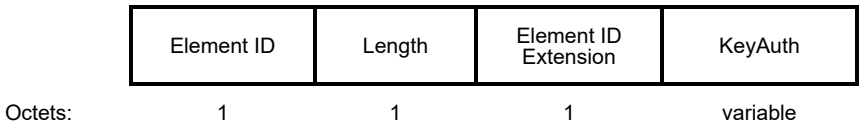

Figure 9-748—FILS Key Confirmation element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The KeyAuth field contains the cryptographic authentication information (see 12.11.2.6).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.178 FILS Session element

The FILS Session element is used to convey the (unique) identifier of an in-progress FILS authentication protocol session. The format of the FILS Session element is shown in Figure 9-749 (FILS Session element format).

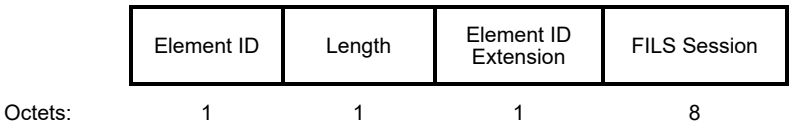

Figure 9-749—FILS Session element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The FILS Session field is chosen randomly by the non-AP STA.

9.4.2.179 FILS Public Key element

The FILS Public Key element is used to communicate the device's (certified) public key for use with the FILS authentication exchange. The format of the FILS Public Key element is shown in Figure 9-750 (FILS Public Key element format).

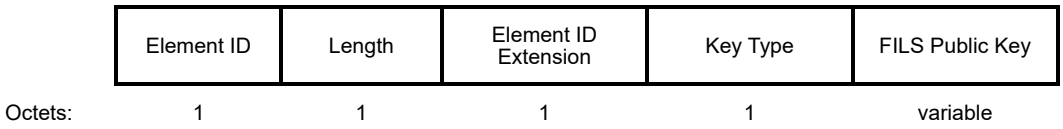

Figure 9-750—FILS Public Key element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Key Type field values are as follows:
0: Reserved.
1: FILS Public Key field contains an X.509v3 certificate encoded according to IETF RFC 5280.
2: FILS Public Key field contains an uncertified public key encoded according to IETF RFC 5480.
3: FILS Public Key field contains an uncertified public key encoded according to IETF RFC 3279.
4–255: Reserved.

9.4.2.180 AP Configuration Sequence Number (AP-CSN) element

An AP-CSN element indicates the change of system information within a BSS. The format of the AP-CSN element is shown in Figure 9-751 (AP-CSN element format).

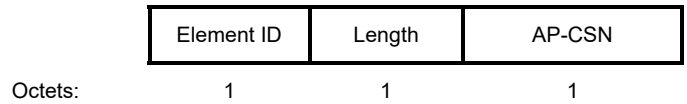

Figure 9-751—AP-CSN element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The AP-CSN contains the version number of the BSS configuration parameter set. This value increments when an update of the non-dynamic elements (all elements except dynamic elements indicated in 11.1.4.3.11) inside a Beacon frame has occurred, as described in 11.1.4.3.11.

9.4.2.181 FILS Indication element

The FILS Indication element shown in Figure 9-752 (FILS Indication element format) contains information related to FILS authentication and higher layer setup capabilities of the AP.

	Element ID	Length	FILS Information	Cache Identifier	HESSID	Realm Identifier	Public Key Identifiers
Octets:	1	1	2	0 or 2	0 or 6	variable	variable

Figure 9-752—FILS Indication element format

The Element ID and Length fields are defined in 9.4.2.1.

The FILS Information field provides information on the presence of the following optional fields in the FILS Indication element and the capability of the FILS authentication algorithms. The format of the FILS Information field is shown in Figure 9-753 (FILS Information field format).

	B0 B2	B3 B5	B6	B7	B8	B9	B10	B11	B12 B15
	Number of Public Key Identifiers	Number of Realm Identifiers	FILS IP Address Configuration	Cache Identifier Included	HESSID Included	FILS Shared Key Authentication without PFS Supported	FILS Shared Key Authentication with PFS Supported	FILS Public Key Authentication Supported	Reserved
Bits:	3	3	1	1	1	1	1	1	4

Figure 9-753—FILS Information field format

The Number of Public Key Identifiers subfield contains the number of Public Key Identifier fields that are present in the Public Key Identifiers field in the FILS Indication element. When the Number of Public Key Identifiers subfield is 0, the Public Key Identifiers field is not present in the FILS Indication element. Each Public Key Identifier field is formatted per Figure 9-755 (Public Key Identifier field format).

The Number of Realm Identifiers subfield lists the number of realm identifiers that are present in the Realm Identifier field in the FILS Indication element. When the Number of Realm Identifiers subfield is 0, the Realm Identifier field is not present in the FILS Indication element. Each realm identifier is formatted per Figure 9-754 (Realm Identifier field format).

An AP sets the FILS IP Address Configuration bit to 1 if the AP supports FILS IP address configuration and is set to 0 otherwise.

The Cache Identifier Included bit is set in the FILS Information field when PMKSA caching is supported. When the Cache Identifier Included bit is 1, a Cache Identifier field is present in the FILS Indication element. When the Cache Identifier Included bit is 0 the Cache Identifier field is not present in the FILS Indication element. The content of the Cache Identifier field is an opaque octet string that identifies the scope in which PMKSAs are cached. The assignment of the cache identifier is outside the scope of the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

standard but its value is unique per Authenticator within an ESS. On the AP, dot11CacheIdentifier contains the value of the Cache Identifier.

When the HESSID Included bit is 1, a HESSID field is present in the FILS Indication element. When the HESSID Included bit is 0, the HESSID field is not present in the FILS Indication element. The HESSID field is set to the value of dot11HESSID.

An AP sets the FILS Shared Key authentication without PFS Supported bit to 1 if the AP supports FILS Shared Key authentication without PFS and sets it to 0 otherwise. An AP sets the FILS Shared Key authentication with PFS Supported bit to 1 if the AP supports FILS Shared Key authentication with PFS and sets it to 0 otherwise. An AP sets the FILS Public Key Authentication Supported bit to 1 if the AP supports FILS Public Key authentication and sets it to 0 otherwise.

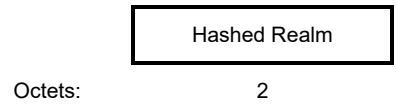

Figure 9-754—Realm Identifier field format

The Hashed Realm subfield of the Realm Identifier field entry is computed from the realm that is compliant with the preferred name syntax defined in IETF RFC 1035 (same as the domain name used in 9.4.5.15). The exact computation method for the hashed realm is given in 11.42.4.

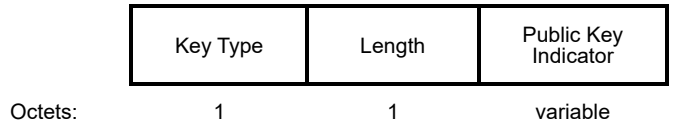

Figure 9-755—Public Key Identifier field format

The Key Type and Public Key Indicator subfields are described in Table 9-338. The Length subfield indicates the length in octets of the Public Key Indicator subfield.

Table 9-338—Key Type and Public Key Indicator subfields

Key Type subfield	Public Key Indicator subfield
0	Reserved
1	The Issuer, per IETF RFC 5280, of the AP's certificate
2	A SHA-256 hash of the AP's uncertified IETF RFC 5480 public key
3	A SHA-256 hash of the AP's uncertified IETF RFC 3279 public key
4–255	Reserved

9.4.2.182 FILS HLP Container element

The FILS HLP Container element contains higher layer protocol (HLP) packets transported during FILS association. This element is used for higher layer protocol packet encapsulation (11.45.3.2). The format of the FILS HLP Container element is shown in Figure 9-756 (FILS HLP Container element format).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

	Element ID	Length	Element ID Extension	Destination MAC Address	Source MAC Address	HLP Packet
Octets:	1	1	1	6	6	variable

Figure 9-756—FILS HLP Container element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Destination MAC Address field and the Source MAC Address field are set as described in 11.45.3.2.

The HLP Packet field contains the HLP packet.

9.4.2.183 FILS IP Address Assignment element

9.4.2.183.1 General

The FILS IP Address Assignment element is used by a STA to request or to assign an IP address using FILS IP address configuration (11.45.3.3). The format of the FILS IP Address Assignment element is shown in Figure 9-757 (FILS IP Address Assignment element format).

	Element ID	Length	Element ID Extension	IP Address Data
Octets:	1	1	1	variable

Figure 9-757—FILS IP Address Assignment element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The IP Address Data field in (Re)Association Request and FILS Container frames from a non-AP STA to an AP is described in 9.4.2.183.2. The IP Address Data field in (Re)Association Response frame and FILS Container frames from an AP to a non-AP STA is described in 9.4.2.183.3.

9.4.2.183.2 IP Address Data field for request

The format of the IP Address Data field for request is shown in Figure 9-758 (IP Address Data field format for request).

	IP Address Request Control	Requested IPv4 Address (optional)	Requested IPv6 Address (optional)
Octets:	1	0 or 4	0 or 16

Figure 9-758—IP Address Data field format for request

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The format of the IP Address Request Control subfield is shown in Figure 9-759 (IP Address Request Control subfield format).

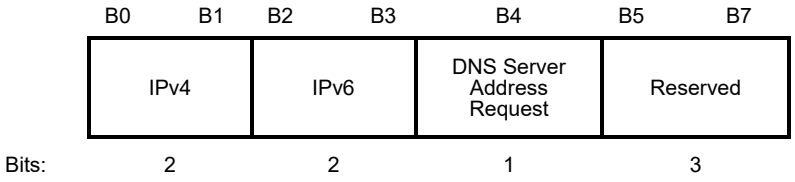

Figure 9-759—IP Address Request Control subfield format

The IPv4 subfields are set as shown in Table 9-339. The IPv6 subfields are set as shown in Table 9-340.

Table 9-339—IPv4 subfield settings

IPv4 subfield	Explanation
0	STA is not requesting an IPv4 address
1	Reserved
2	STA is requesting a new IPv4 address
3	STA is requesting the IPv4 address present in the element

Table 9-340—IPv6 subfield settings

IPv6 subfield	Explanation
0	STA is not requesting an IPv6 address
1	Reserved
2	STA is requesting a new IPv6 address
3	STA is requesting the IPv6 address present in the element

The DNS Server Address Request subfield is 1 if the STA is requesting DNS server(s) address(es). The type of DNS server requested corresponds to the type of the IP address requested. If both IPv4 and IPv6 are requested, then DNS server addresses for both types are also requested by setting this bit to 1.

The Requested IPv4 Address field (4 octets) carries the specific IPv4 address that the non-AP STA is requesting, when the IPv4 field indicates the STA is requesting a specific IPv4 address.

The Requested IPv6 Address field (16 octets) carries the specific IPv6 address that the non-AP STA is requesting, when the IPv6 field indicates the STA is requesting a specific IPv6 address.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.183.3 IP Address Data field for response

The format of the IP Address Data field for response is shown in Figure 9-760 (IP Address Data field format for response).

	IP Address Response Control	DNS Info Control	Assigned IPv4 Address (optional)	Subnet Mask (optional)	IPv4 Gateway Address (optional)
Octets:	1	1	0 or 4	0 or 4	0 or 4

	IPv4 Gateway MAC Address (optional)	Assigned IPv6 Address (optional)	IPv6 Prefix Length (optional)	IPv6 Gateway Address (optional)
Octets:	0 or 6	0 or 16	0 or 1	0 or 16

	IPv6 Gateway MAC Address (optional)	Lifetime of the Assigned IPv4 Address (optional)	Lifetime of the Assigned IPv6 Address (optional)	DNS Server IPv4 Address (optional)
Octets:	0 or 6	0 or 1	0 or 1	0 or 4

	DNS Server IPv6 Address (optional)	IPv4 DNS Server MAC Address (optional)	IPv6 DNS Server MAC Address (optional)
Octets:	0 or 16	0 or 6	0 or 6

Figure 9-760—IP Address Data field format for response

NOTE—IPv4 addressing is described in IETF RFC 791. IP Subnet and Subnet Mask is described IETF RFC 917. IPv6 addressing, IPv6 prefix and prefix-length is described in IETF RFC 4291. A default gateway in computer networking is a device that is assumed to know how to forward packets on to other networks or the Internet. IPv4 Gateway Address is the IPv4 address of the default gateway when IPv4 is used. IPv6 Gateway Address is the IPv6 address of the default gateway when IPv6 is used. The IPv6 Gateway MAC address is the MAC address of the IPv6 default gateway.

Subfields of the IP Address Response Control field are interpreted dependent on the value of B0 (IP Address pending) as defined in Table 9-341 and Table 9-342.

The format of the DNS Info Control subfield is shown in Figure 9-761 (DNS Info Control subfield format) and the DNS Info Control subfield settings are shown in Table 9-343.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-341—IP Address Response Control subfield with B0 = 0

Bit	Function of the subfield	Explanation
B0	IP address pending	Set to 0 if an IP address assignment is included in the frame. B1 to B6 are set as shown below in this table when B0 = 0.
B1	IPv4 assigned	Set to 1 if the Assigned IPv4 Address subfields are included in the element, and set to 0 otherwise.
B2	IPv4 gateway included	Set to 1 if IPv4 Gateway Address and IPv4 Gateway MAC Address subfields are included in the element and set to 0 otherwise. See NOTE.
B3	IPv6 assigned	Set to 1 if Assigned IPv6 Address and IPv6 Prefix Length subfields are included in the element and set to 0 otherwise.
B4	IPv6 gateway included	Set(to 1 if IPv6 Gateway Address and IPv6 Gateway MAC Address subfields are included in the element and set to 0 otherwise. See NOTE.
B5	Lifetime of the assigned IPv4 address included	Set to 1 if Assigned IPv4 Address subfield is present and the Lifetime of the Assigned IPv4 Address is included in the element. If this bit is 0, and if Assigned IPv4 Address subfield is present, then the assigned IPv4 address is valid during the entire time of association with the AP.
B6	Lifetime of the assigned IPv6 address included	Set to 1 if Assigned IPv6 Address subfield is present and the Lifetime of the Assigned IPv6 Address is included in the element. If this bit is 0, and if Assigned IPv6 Address subfield is present, then the assigned IPv6 address is valid during the entire time of association with the AP.
B7	Reserved	
NOTE—A STA in a purely local network environment might be assigned an IP address without requiring a gateway address.		

Table 9-342—IP Address Response Control subfield with B0 = 1

Bit	Function of the subfield	Explanation
B0	IP address pending	Set to 1 if an IP address is sent in a later transmission. An IP address is NOT present in the frame when set to 1. B1 to B6 are set as shown below in this table when B0 = 1.
B1–B6	IP address request timeout	IP address request timeout value is the maximum estimated time in the unit of seconds within which an IP address will be assigned and a DNS server address will be provided to the requesting STA. The value of 0 is reserved.
B7	Reserved	

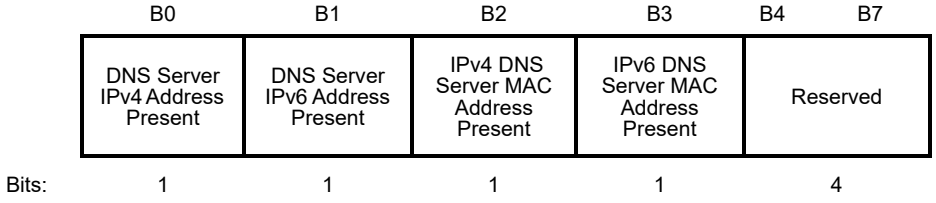

Figure 9-761—DNS Info Control subfield format

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-343—DNS Info Control subfield settings

Bit	Function of the subfield	Explanation
B0	DNS server IPv4 address included	Set to 1 if the DNS Server IPv4 Address subfield is present in the element and set to 0 otherwise. The value of the DNS Server IPv4 Address subfield is the IPv4 address of the DNS server if the DNS Server IPv4 address Present bit of the DNS Info Control subfield is 1.
B1	DNS server IPv6 address included	Set to 1 if the DNS Server IPv6 Address subfield is present in the element and set to 0 otherwise. The value of the DNS Server IPv6Address is the IPv6 address of the DNS server if the DNS Server IPv6 address Present bit of the DNS Info Control is 1.
B2	IPv4 DNS server MAC address included	Set to 1 if the MAC address to which IPv4 based DNS queries can be sent is present in the element and set to 0 otherwise. The value of the IPv4 DNS Server MAC Address subfield is the MAC address of the IPv4 DNS server if the IPv4 DNS Server MAC Address Present bit of the DNS Info Control subfield is 1.
B3	IPv6 DNS server MAC address included	Set to 1 if the MAC address to which IPv6 based DNS queries can be sent is present in the element and set to 0 otherwise. The value of the IPv6 DNS Server MAC Address subfield is the MAC address of the IPv6 DNS server if the IPv6 DNS Server MAC Address Present bit of the DNS Info Control subfield is 1.

9.4.2.184 Key Delivery element

The Key Delivery element contains the current RSC and one or more KDEs. The format of the Key Delivery element is shown in Figure 9-762 (Key Delivery element format).

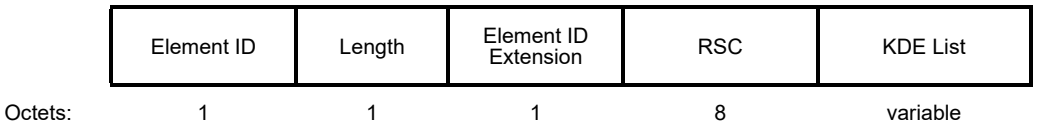

Figure 9-762—Key Delivery element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The RSC field contains the current RSC for the GTK being installed. If the RSC is less than 8 octets in length, it is stored in the first octets and the remaining octets are set to 0. The least significant octet of the RSC is in the first octet of the RSC field. The RSC for TKIP is the TKIP sequence counter (TSC); for CCMP and GCMP it is the packet number (PN); see Table 12-9.

The KDE List field contains one or more KDEs encapsulated using the format shown in Figure 12-37 (KDE format).

9.4.2.185 DILS element

The DILS element includes the conditions for a STA to determine whether it is allowed to attempt fast initial link setup for the duration specified in the element. The DILS element is optionally present in the Beacon and Probe Response frames. The DILS element is defined in Figure 9-763 (DILS element format).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

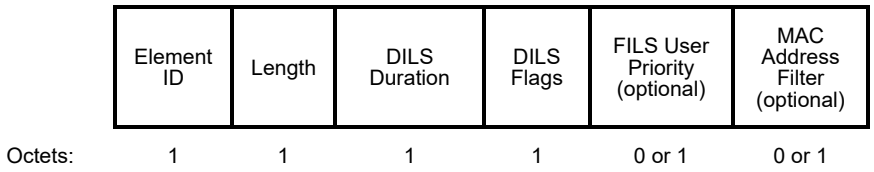

Figure 9-763—DILS element format

The Element ID and Length fields are defined in 9.4.2.1.

The DILS Duration field contains an unsigned integer that specifies the duration for the DILS restrictions (see 11.45.5.3), expressed in units of 10 ms, starting from the beginning of the frame transmission of the DILS element.

The DILS Flags field (see Figure 9-764 (DILS Flags field format)) indicates the presence of optional fields following it.

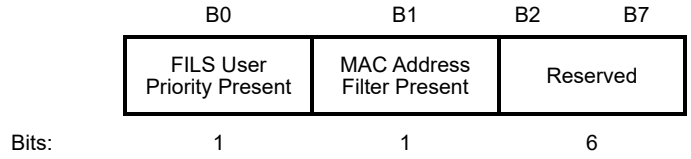

Figure 9-764—DILS Flags field format

Setting the FILS User Priority Present or MAC Address Filter Present subfields to 1 indicates that the corresponding field is present. At least one of the nonreserved bits in the DILS Flags field is set to 1.

The FILS User Priority field is defined in Figure 9-765 (FILS User Priority field format).

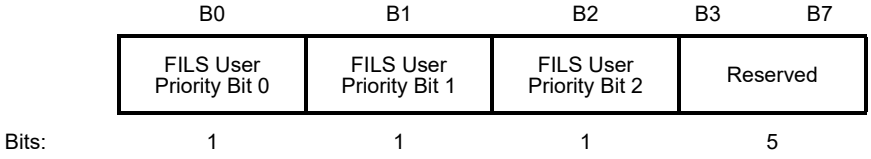

Figure 9-765—FILS User Priority field format

A value of 1 in the FILS User Priority Bit 0 subfield indicates FILS without additional delays for the STAs that have frames with User Priority 4–7 in their transmission queues, a value of 1 in the FILS User Priority Bit 1 subfield indicates high priority for the STAs that have frames with User Priority 0–3 in their transmission queues. A value of 1 in the FILS User Priority Bit 2 subfield indicates high priority for the STAs that have no frames in their transmission queues. See 11.45.5.2.

The MAC Address Filter field is defined in Figure 9-766 (MAC Address Filter field format).

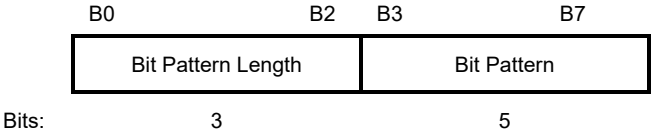

Figure 9-766—MAC Address Filter field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The usage of the Bit Pattern Length subfield and Bit Pattern subfield is defined in Table 9-344. The Bit Pattern Length subfield specifies the number of bits and the position of the bits in the Bit Pattern subfield that are used for MAC address filtering. The Bit Pattern subfield specifies the MAC addresses of the STAs that are allowed to attempt fast initial link setup. The details of MAC address filtering are described in 11.45.5.3.

Table 9-344—MAC Address Filter field

Bit Pattern Length value B0 B1 B2	Bit Pattern				
	B3	B4	B5	B6	B7
1	Reserved	Reserved	Reserved	Reserved	Used for MAC address filtering
2	Reserved	Reserved	Reserved	Used for MAC address filtering	
3	Reserved	Reserved	Used for MAC address filtering		
4	Reserved	Used for MAC address filtering			
5	Used for MAC address filtering				
0	Reserved				
6–7	Reserved				

9.4.2.186 Wrapped Data element

The Wrapped Data element is used for the STA and AP to communicate data used by the RSNA protocols. The format of the Wrapped Data element is defined in Figure 9-767 (Wrapped Data element format).

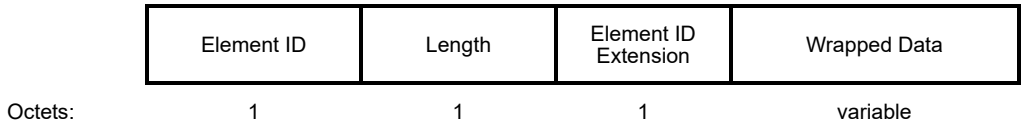

Figure 9-767— Wrapped Data element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Wrapped Data field is the data used by the FILS authentication algorithm (see 12.11) and PASN authentication algorithm (see 12.13).

9.4.2.187 Fragment element

Elements are defined to have a common general format, per 9.4.2.1. The Length field of an Element is 1 octet, and thus limited to indicate 255 octets of payload in the Information field. However, since the Element ID Extension field is optional and included in the Length count, the actual Information payload of an Element is limited to 254 octets if the Element ID Extension is present. If the information to be represented in an element is too large for this 255 or 254 octet limit, it is necessary to fragment the information as described in 10.28.11 and 10.28.12.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The format of the Fragment element is shown in Figure 9-768 (Fragment element format).

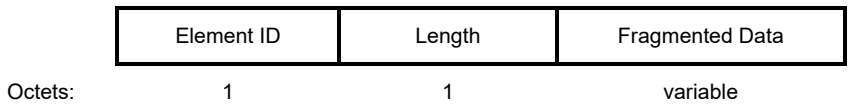

Figure 9-768—Fragment element format

The Element ID and Length fields are defined in 9.4.2.1.

The Fragmented Data field contains the data of the element that is fragmented as described in 10.28.11.

For the information being fragmented, each Fragment element contains 255 octets, except the final Fragment element that contains 1 to 255 octets.

9.4.2.188 FILS Nonce element

The FILS Nonce element is used for exchanging an additional source of randomness in the FILS authentication exchange. The format of the FILS Nonce element is shown in Figure 9-769 (FILS Nonce element format).

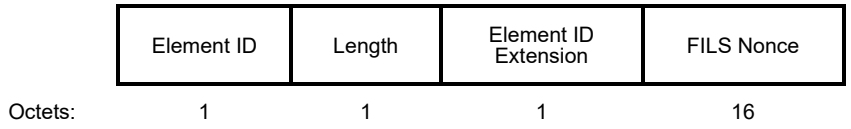

Figure 9-769—FILS Nonce element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The FILS Nonce field contains randomly generated data.

9.4.2.189 S1G Open-Loop Link Margin Index element

The S1G Open-Loop Link Margin Index element contains the link margin information. The S1G Open-Loop Link Margin Index element is optionally included in an S1G Beacon frame or a Probe Response frame without a corresponding request. The format of the S1G Open-Loop Link Margin Index element is shown in Figure 9-770 (S1G Open-Loop Link Margin Index element format).

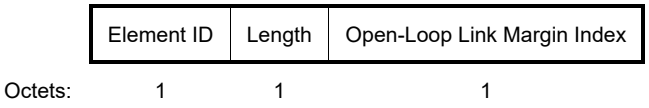

Figure 9-770—S1G Open-Loop Link Margin Index element format

The Element ID and Length fields are defined in 9.4.2.1.

The Open-Loop Link Margin Δ_{OPLM} is defined as the summation of transmit power P_{tx} and the receiver sensitivity $RX_{sensitivity}$

$$\Delta_{OPLM} = P_{tx1} + RX_{sensitivity}$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The transmit power P_{tx1} indicates the actual power used as measured at the antenna connector, in units of dBm, by a STA when transmitting the frame containing the S1G Open-Loop Link Margin Index element. The receiver sensitivity $RX_{sensitivity}$ is the minimum required receive power for reception of MCS 10 for 1 MHz channel.

The S1G Open-Loop Link Margin Δ_{OPLM} is calculated as (–128 + D × 0.5) dB, where D is called Open-Loop Link Margin Index. D is an unsigned integer value that is contained in S1G Open-Loop Link Margin Index field. For example, if the value D shown in S1G Open-Loop Link Margin Index field is 0, then it indicates the S1G Open-Loop Link Margin Δ_{OPLM} is –128 dB. If the value D shown in S1G Open-Loop Link Margin Index field is 255, then it indicates the S1G Open-Loop Link Margin Δ_{OPLM} is –0.5 dB.

The S1G Open-Loop Link Margin Index element can be used for open-loop link adaptation and open-loop transmit power control. When a STA receives the Open-loop link Margin index, it can calculate the S1G Open-Loop Link Margin Δ_{OPLM} by using (–128 + D × 0.5) dB. Then the SNR margin over the MCS 10 can be derived at the STA that receives the frame that contains S1G Open-Loop Link Margin Index based on its own transmit power P_{tx2} and the received RCPI measured for the PPDU containing the S1G Open-Loop Link Margin Index.

$$SNR_{Margin} = P_{tx2} - \Delta_{OPLM} + RCPI$$

9.4.2.190 RPS element

The RPS element contains one or more RAW Assignment subfields. Each RAW Assignment subfield contains parameters necessary to restrict medium access to one or multiple STAs within one RAW. The format of the RPS element is defined in Figure 9-771 (RPS element format).

	Element ID	Length	RAW Assignments
Octets:	1	1	variable

Figure 9-771—RPS element format

The Element ID and Length fields are defined in 9.4.2.1.

The RAW Assignments field contains one or more RAW Assignment subfields.

The format of the RAW Assignment subfield is shown in Figure 9-772 (RAW Assignment subfield format).

	RAW Control	RAW Slot Definition	RAW Start Time	RAW Group	Channel Indication	Periodic Operation Parameters
Octets:	1	2	0 or 1	0 or 3	0 or 2	0 or 3

Figure 9-772—RAW Assignment subfield format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The format of the RAW Control subfield is shown in Figure 9-773 (RAW Control subfield format).

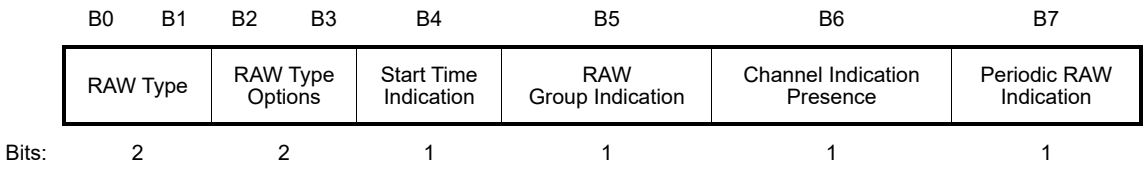

Figure 9-773—RAW Control subfield format

The value of the RAW Type field indicates the type of the RAW defined by the RAW assignment. The interpretation of the RAW Type subfields is shown in Table 9-345.

Table 9-345—Interpretation of RAW Type and RAW Type Options

RAW Type	Description	RAW Type Options subfield
0	Generic RAW	Bit 0 (Bit 2 of RAW Control subfield): Paged STA Bit 1 (Bit 3 of RAW Control subfield): RA frame
1	Sounding RAW	0: SST sounding RAW 1: SST report RAW 2: Sector sounding RAW 3: Sector report RAW
2	Simplex RAW	0: AP PM RAW 1: Non-TIM RAW 2: Omni RAW 3: Reserved
3	Triggering frame RAW	EBCS UL RAW

The different types of RAWs are interpreted as follows:

— Generic RAW: used to provide restricted medium access only to a group of STAs.

— Sounding RAW: either used for SST sounding/SST report (SST RAW) or sector sounding/sector report (Sector RAW) as indicated by the RAW Type Options subfield as follows:

  — When the sounding RAW is used as an SST sounding RAW or a sector sounding RAW, non-AP STAs do not initiate a TXOP during the RAW but elect to listen to sector sounding (described in 10.52.5.2) or SST sounding (described in 10.51). Non-AP STAs are allowed to transmit response frames during the RAW.

  — When the sounding RAW is used as an SST report RAW or a sector report RAW, as a response to the preceding SST sounding RAW or sector sounding RAW, STAs in the RAW Group can transmit a report frame to the AP during the SST report RAW as described in 10.51, or transmit sector ID feedback frame to the AP during the sector report RAW as described in 10.52.5 regardless of their corresponding TIM bits.

— Simplex RAW: the Slot Definition Format Indication, Cross Slot Boundary, and Number of Slots subfields of the Slot Definition field are set to 1, and the RAW is either used for AP Power Management (as described in 11.2.3.17), for reserving channel time for S1G STAs in non-TIM mode, or for the omni RAW, or for the EBCS UL RAW depending on the values of RAW Type Options subfield as follows:

  — When the RAW is used as the non-TIM RAW as indicated by the RAW Type Options subfield, the access is restricted to S1G STAs in non-TIM mode that have been previously scheduled within the RAW such as TWT STAs or awake/doze rescheduled STAs (as described in 10.47.2).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The RAW Assignment subfield for non-TIM RAW also conditionally contains the RAW Start Time, Channel Indication, and Periodic Operation Parameters subfields.

— When the RAW is used as the AP PM RAW as indicated by the RAW Type Options subfield, the RAW Assignment subfield for AP PM RAW also conditionally contains the RAW Start Time and Periodic Operation Parameters subfields.

— When the RAW is used as the omni RAW as indicated by the RAW Type Options subfield of the RAW Assignment subfield for omni RAW, the access is not restricted for any specific STA and this duration can be used by non-AP STAs to communicate with the AP that has scheduled the omni RAW to send the Probe Request frame or Association Request frame. The RAW assignment subfield of the omni RAW also conditionally contains the RAW Start Time, and Periodic Operation Parameters subfields.

— When the RAW is used as the EBCS UL RAW as indicated by the RAW Type Options subfield of the RAW Assignment subfield for EBCS UL RAW, the access is not restricted for any specific STA, and this duration can be used by non-AP STAs to communicate with the AP that has scheduled the EBCS UL RAW to send the EBCS UL frame. The RAW assignment subfield of the EBCS UL RAW also conditionally contains the RAW Start Time, and Periodic Operation Parameters subfields.

NOTE—An EBCS non-AP STA that does not support RAW operation (see 10.23.5) can transmit an EBCS UL frame outside the RAW window.

— Triggering Frame RAW: each paged STA belonging to the RAW group is allowed to send one specific trigger frame as described in 10.23.5.4 during its assigned RAW slot. The procedure of RAW slot assignment is described in 10.23.5.3.

The Start Time Indication subfield indicates whether the RAW Start Time subfield is present in the RAW Assignment subfield or not. If it is equal to 0, the RAW Start Time subfield is not present. If it is equal to 1, the RAW Start Time subfield is present. In the first RAW assignment, the Start Time Indication subfield equal to 0 indicates that the RAW starts immediately after the S1G Beacon, the Probe Response frame, or the PV1 Probe Response that includes the RPS element. For other RAW assignments, the Start Time Indication subfield equal to 0 indicates that the current RAW starts immediately after the end of the previous RAW.

The RAW Group Indication subfield indicates whether the RAW Group subfield is present in the RAW Assignment subfield and is interpreted as follows:

— When the RAW type is generic RAW, sounding RAW, or triggering frame RAW, the RAW Group Indication subfield indicates whether the RAW group defined in the current RAW assignment is the same RAW group as defined in the previous RAW assignment. When the RAW Group Indication subfield is equal to 0, the RAW group defined in the current RAW assignment is the same as the RAW group defined in the previous RAW assignment and the RAW Group subfield is not present in this RAW assignment. When the RAW Group Indication subfield is equal to 1, the RAW Group subfield is present in this RAW assignment. The RAW Group Indication subfield in the first RAW assignment is set to 0 to indicate the RAW group in the first RAW assignment is the same as the range of AIDs in all the TIM bitmaps in the S1G Beacon frame.

— When the RAW is a non-TIM RAW, the RAW Group Indication subfield is set to 0 and the RAW Group subfield is not present.

— When the RAW is an AP PM RAW, the RAW Group Indication subfield equal to 0 indicates that the RAW group does not include any of the non-AP STAs, and the RAW Group subfield is not present. When the RAW Group Indication subfield is equal to 1, the RAW Group subfield is present.

The Channel Indication Presence subfield indicates whether the Channel Indication subfield in the current RAW assignment is present or not. If it is equal to 0, the Channel Indication subfield is not present. If it is equal to 1, the Channel Indication subfield is present.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Periodic RAW Indication subfield indicates whether the RAW is periodic. When the Periodic RAW Indication subfield is equal to 1, the RAW is a periodic restricted access window (PRAW), and the Periodic Operation Parameters subfield is present. When the Periodic RAW Indication subfield is equal to 0, the Periodic Operation Parameters subfield is not present.

The definitions of RAW Type Options subfield are specified in Table 9-345. The RAW Type Options subfield is interpreted as follows:

— For generic RAW, Bit 0 of the RAW Type Options (Bit 2 of the RAW Control subfield) is Paged STA indication. When it is equal to 0, the RAW can be accessed by any STA (paged or unpaged) within the RAW group specified by the RAW Group subfield. When it is equal to 1, the RAW can only be accessed by paged STAs within the RAW group specified by the RAW Group subfield. Bit 1 of the RAW Type Options (Bit 3 of the RAW Control subfield) is RA Frame Indication. If it is equal to 1, the AP transmits a Resource Allocation frame, as defined in 9.8.5.4, at the beginning of the RAW defined by the RAW Assignment subfield of the RPS element.

— For sounding RAW, the RAW Type Options subfield is treated as one subfield, the interpretation of which is defined in Table 9-345. For Simplex RAW, the RAW Type Options subfield is treated as one subfield, the interpretation of which is defined in Table 9-345.

— For Triggering Frame RAW, the RAW Type Options subfield is reserved.

The format of the RAW Slot Definition subfield is shown in Figure 9-774 (RAW Slot Definition subfield format).

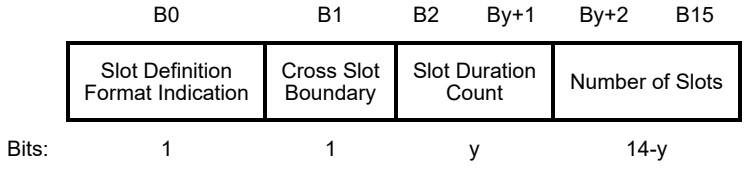

Figure 9-774—RAW Slot Definition subfield format

The Slot Definition Format Indication subfield indicates the number of bits used for the Slot Duration Count subfield, i.e., the value y in Figure 9-774 (RAW Slot Definition subfield format) of the Slot Duration Count subfield. If it is set 0, the Slot Duration Count subfield is 8 bits (y=8). If it is equal to 1, the Slot Duration Count subfield is 11 bits (y=11). When the RAW Type is sounding RAW, the Slot Duration Count subfield is 8 bits in length (y=8).

The Cross Slot Boundary subfield indicates whether STAs are allowed to transmit after the assigned RAW slot boundary. If the bit is equal to 1, crossing a RAW slot boundary is allowed. If the bit is equal to 0, crossing a RAW slot boundary is not allowed for transmissions from STAs.

The Slot Duration Count subfield is an unsigned integer and it is used to calculate the duration of a RAW slot, or the RAW slot duration. The RAW slot duration, DSLOT, has time unit of microsecond and it is calculated as:

$$D_{\mathrm{SLOT}} = 500 + C_{\mathrm{SLOT}} \times 120$$

where

C_{SLOT} is the value of the Slot Duration Count subfield

The Number of Slots subfield is an unsigned integer and indicates the number of RAW slots (N_{RAW}) in the RAW.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Slot Definition subfield is used to calculate the RAW duration. The RAW duration indicates the duration, in units of microsecond, of the restricted medium access assigned to a RAW. The RAW duration, $D_{\text{RAW,}}$ indicated by the corresponding RAW assignment can be calculated as follows:

$$D_{\text{RAW}} = D_{\text{SLOT}} \times N_{\text{RAW}}$$

where

D_{SLOT} is the RAW slot duration, in microseconds

N_{RAW} is the value of the Number of Slots subfield

When the RAW Type is generic RAW or triggering frame RAW, the RAW Slot Definition subfield also provides the N_{RAW} and slot duration information for RAW slot assignment. The procedure of RAW slot assignment is described in 10.23.5.3.

The RAW Start Time subfield indicates the duration, in units of 2 TUs, from the end of the S1G Beacon, the Probe Response, or the PV1 Probe Response frame transmission that includes the RPS element to the start time of the RAW.

The format of the RAW Group subfield is shown in Figure 9-775 (RAW Group subfield format).

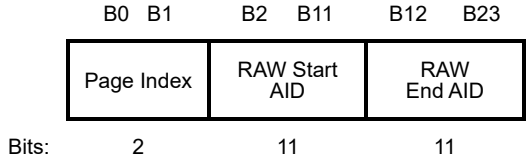

Figure 9-775—RAW Group subfield format

The RAW Group subfield indicates the STA AIDs that are allowed restricted access within the RAW period. The RAW Group subfield contains Page Index, RAW Start AID, and RAW End AID subfields according to the hierarchical addressing method of AIDs (see Figure 9-215 (Hierarchical structure of traffic-indication virtual bitmap carried in an S1G PPDU)). The Page Index subfield indicates the page index of the subset of AIDs.

The RAW Start AID field indicates the 11 LSBs of the AID of the STA with the lowest AID allocated in the RAW.

The RAW End AID field indicates the 11 LSBs of the AID of the STA with the highest AID allocated in the RAW.

The RAW Group field is set to all 0s to indicate that all STAs are allowed to access within the RAW.

The format of the Channel Indication subfield is shown in Figure 9-776 (Channel Indication subfield format). The Channel Activity Bitmap subfield shows the allowed operating channels for the STAs indicated in the RAW, as defined in 10.23.5.1. Each bit in the bitmap corresponds to one minimum width channel within the current BSS operating channels, with the least significant bit corresponding to the lowest numbered operating channel of the BSS. The Maximum Transmission Width, UL Activity, and DL Activity subfields are defined similarly as in 9.4.2.200.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

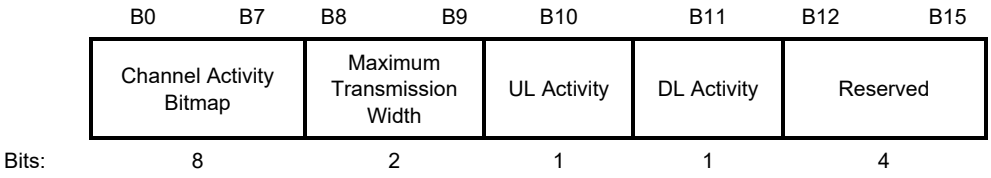

Figure 9-776—Channel Indication subfield format

The Periodic Operation Parameters subfield comprises the PRAW Periodicity, PRAW Validity, and PRAW Start Offset subfields. The format of the Periodic Operation Parameters subfield is shown in Figure 9-777 (Periodic Operation Parameters subfield format).

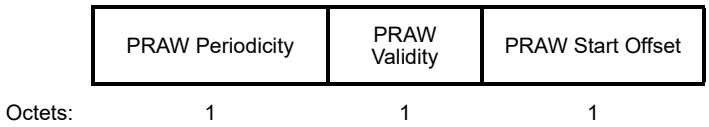

Figure 9-777—Periodic Operation Parameters subfield format

The PRAW Periodicity subfield indicates the period of current PRAW occurrence in the unit of beacon interval if dot11ShortBeaconInterval is false and in the unit of short beacon interval if dot11ShortBeaconInterval is true (see 11.1.3.10.2).

The PRAW Validity subfield indicates the number of periods that the PRAW repeats. A nonzero PRAW Validity subfield indicates the number of remaining PRAW occurrences, while a PRAW Validity subfield equal to 0 indicates that the PRAW validity is not determined.

The PRAW Start Offset subfield indicates the offset value from the end of the frame that carries the current RPS element to the S1G Beacon frame that the first window of the PRAW appears, in units of beacon interval or short beacon interval.

9.4.2.191 Page Slice element

The Page Slice element contains a subset of blocks from a single page, called a page slice. The STAs included in a page slice and indicated by the Page Slice element are served in the time intervals between Beacon frames within a page period, starting from the Beacon frame that carries the Page Slice element for the page (see 10.50). The frame format of the Page Slice element is defined in Figure 9-778 (Page Slice element format).

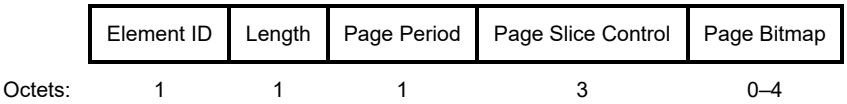

Figure 9-778—Page Slice element format

The Element ID and Length fields are defined in 9.4.2.1.

The Page Period field indicates the page period (see 10.50).

The Page Slice Control field format is shown in Figure 9-779 (Page Slice Control field format).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

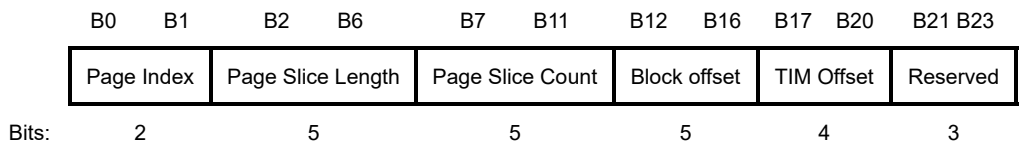

Figure 9-779—Page Slice Control field format

The Page Index subfield indicates the page whose slices are served during beacon intervals within a page period. Setting the Page Index subfield to 1 indicates the second page out of the four pages defined in the hierarchical AID addressing (see 9.4.2.5).

The Page Slice Length subfield indicates the number of blocks included in each TIM for the associated page except for the last TIM. The Page Slice Length subfield is set to number of blocks in each page slice. The value 0 for the Page Slice Length subfield is reserved. For the last TIM, the size of the last page slice, PS_{last}, is computed as

$$PS_{\text{last}} = P_{\text{length}} - (PS_{\text{count}} - 1) \times PS_{\text{length}}$$

where

P_{length} is the length (in bits) of a page indicated in the Page Bitmap field and is calculated as $P_{\text{length}} = 8 \times PB_{\text{length}}$

PB_{length} is the length of the page (in octets) indicated in the Page Bitmap field

PS_{count} is the value indicated in the Page Slice Count subfield

PS_{length} is the value indicated in the Page Slice Length subfield

For example, with a Page Bitmap field of 2 octets, a value in the Page Slice Length subfield equal to 3, and a value in the Page Slice Count subfield equal to 5, the page slice consists of 4 (=16 – 3×4) blocks for the last TIM, i.e., a value greater than the value indicated in the Page Slice Length subfield. Again, for example, with a Page Bitmap field of 2 octets, a value in the Page Slice Length subfield equal to 6, and a value in the Page Slice Count subfield equal to 3, the page slice consists of 4 (=16 – 6×2) blocks for the last TIM, i.e., a value less than the value indicated in the Page Slice Length subfield.

The number of blocks assigned to all the TIMs, except the last TIM, within a DTIM interval, P_{rem}, is computed as

$$P_{\text{rem}} = P_{\text{length}} - PS_{\text{last}}$$

where

P_{length} is the length of a page indicated in the Page Bitmap field

PS_{last} is the size of the last page slice

For every TIM, a STA computes the location of its block within a page slice, SB_{STA}, using the following equation:

$$SB_{\text{STA}} = AID[6{:}10] - BO$$

where

AID is the association identifier of the STA

BO is the value indicated in the Block Offset subfield of the Page Slice element

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If the SB_{STA} is greater than the P_{length} or less than zero, the STA is not included in the page slice for the page period, otherwise:

— If SB_{STA} is greater than P_{rem}, the page slice number for the STA indicated in the Page Slice Number field of the TIM element is equal to the value indicated in the Page Slice Count subfield of the Page Slice element

— Otherwise, the page slice number for the STA, PS_{number}, is computed as

$$PS_{number} = \lfloor SB_{STA} / PS_{length} \rfloor$$

The Page Slice Count subfield indicates the number of TIMs scheduled in one page period, except when the value is equal to 0. This field indicates a maximum of 31 TIMs that include page slices in a page period. The Page Slice Count subfield is set to 0 to indicate signaling that depends on the Page Slice Length subfield:

— If the Page Slice Length subfield is greater than 1, a 0 in the Page Slice Count field indicates that the 32nd TIM that is scheduled during this DTIM interval can contain DL BU information for non-AP STAs that do not support page slicing and for non-AP STAs whose AID is within the 32nd block of this page and do support page slicing.

— If the Page Slice Length subfield is equal to 1, a 0 in the Page Slice Count subfield indicates that all non-AP STAs for which the AP has DL BU are included in the only TIM that is scheduled within the DTIM interval.

The Block Offset subfield indicates the offset of the block in the first page slice from the first block in the page assigned within the page period. Setting the Block Offset field to 16 indicates that the first page slice starts at block 16, i.e., STAs in the second half of the page are assigned within this page period.

The TIM Offset subfield indicates the offset, in number of beacon intervals, from the DTIM beacon that carries the Page Slice element of a page to the beacon that carries the first page slice of the page indicated by the corresponding Page Slice element in the DTIM beacon.

The Page Bitmap field indicates the presence of buffered data for each of the one or more blocks in a page slice or all the assigned page slices within a page period. A bit in the Page Bitmap field indicates information of buffered data for STAs in one block of a page slice corresponding to the location of the bit in the bitmap. The first block indicated in the Page Bitmap field is the block indicated in the Block Offset subfield. Based on the number of page slices assigned to the TIMs, this field is of variable length from 0 to 4 octets. For example, setting the Page Bitmap field to 129 indicates that there is buffered data for at least one STA in the first block and at least one STA in the last block. The bit sequence also indicates that only a page slice of 8 blocks is assigned within a page period. Further, the bit sequence indicates that there is no downlink buffered data for any STA in blocks 2 to 7. Hence these STAs can enter the doze state after receiving the group addressed BUs that are delivered by the AP following the DTIM beacon as described in 11.2.3 and can avoid transitioning to awake state for the assigned TIM in the following TBTTs or TSBTTs within the DTIM interval to check for downlink buffered data.

9.4.2.192 AID Request element

The AID Request element contains information related to the characteristics of the device of the non-AP STA requesting an AID. The format of the AID Request element is shown in Figure 9-780 (AID Request element format).

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

	Element ID	Length	AID Request Mode	AID Request Interval (Optional)	Peer STA Address (Optional)	Service Characteristic (Optional)	Group Address (Optional)
Octets:	1	1	1	0 or 2	0 or 6	0 or 1	0 or 6

Figure 9-780—AID Request element format

The format of AID Request Mode field is shown in Figure 9-781 (AID Request Mode field format).

	B0	B1	B2	B3	B4	B5	B6 B7
	AID Request Interval Present	Peer STA Address Present	Service Characteristic Present	Non-TIM Mode Switch	TIM Mode Switch	Group Address Present	Reserved
Bits:	1	1	1	1	1	1	2

Figure 9-781—AID Request Mode field format

The AID Request Interval Present subfield of the AID Request Mode field is set to 1 if the AID Request Interval field is present in the AID Request element and set to 0 if no AID Request Interval field is present.

The Peer STA Address Present subfield of the AID Request Mode field is set to 1 if the Peer STA Address field is present in the AID Request element and set to 0 if no Peer STA Address field is present.

The Service Characteristic Present subfield of the AID Request Mode field is set to 1 if the Service Characteristic field is present in the AID Request element and set to 0 if no Service Characteristic field is present.

The Non-TIM Mode Switch subfield of the AID Request Mode field is set to 1 if the non-AP STA requests to switch from the TIM mode to non-TIM mode. Otherwise, it is set to 0.

The TIM Mode Switch subfield of the AID Request Mode field is set to 1 if the non-AP STA requests to switch from the non-TIM mode to TIM mode. Otherwise, it is set to 0.

The Group Address Present subfield of the AID Request Mode field is set to 1 if the Group Address field is present in the AID Request element and is set to 0 if no Group Address field is present.

The AID Request Interval field indicates to the AP:

— The listen interval, in units of beacon interval or short beacon interval as defined in 9.4.1.6, during which the S1G STA in TIM mode wakes to receive S1G Beacon frames when the Non-TIM Mode Switch field is equal to 0, TIM Mode Switch field is equal to 1, and the Group Address Present field is equal to 0.

— The listen interval, in units of beacon interval or short beacon interval as defined in 9.4.1.6, during which the S1G STA in non-TIM mode is required to transmit at least one PS-Poll or trigger frame to the AP when the Non-TIM Mode Switch field is equal to 1, TIM Mode Switch is equal to 0, and the Group Address Present field is equal to 0.

— The group listen interval, in units of beacon interval or short beacon interval (see 11.1.3.10.2), during which the non-AP STA wakes up to receive the S1G Beacon frames that signal the presence of group addressed BUs for the group address contained in the Group Address field. In this case the Group Address Present field is equal to 1 and the TIM Mode Switch field and Non-TIM Mode Switch field are equal to any value.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The AID Request Interval field contains a Unified Scaling Factor subfield (see Table 9-78) and has a format as defined in Figure 9-144 (Listen Interval field format carried in an S1G PPDU). The AID Request Interval field is calculated as the value of the Unscaled Interval subfield multiplied by the scaling factor that corresponds to the value indicated in the Unified Scaling Factor subfield.

The Peer STA Address field indicates the MAC address of the peer STA for STA-to-STA communication.

The Service Characteristic field indicates the service characteristic provided by the non-AP STA so that the AP can assign a particular AID to the STA based on the service characteristic when the STA associates or requests AID switch. The format of the Service Characteristic field is shown in Figure 9-782 (Service Characteristic field format).

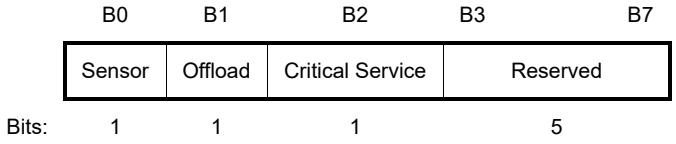

Figure 9-782—Service Characteristic field format

The Sensor subfield of the Service Characteristic field is set to 1 to indicate that the non-AP STA provides a sensor or a meter type services. Otherwise, it is set to 0. The Offload subfield of the Service Characteristic field is set to 1 to indicate that the non-AP STA provides a traffic offloading services. Otherwise, it is set to 0. The Critical Service subfield of the Service Characteristic field is set to 1 to indicate that it provides critical services such as health care, home, industrial, alarm monitoring or emergency services. Otherwise, it is set to 0.

When the Group Address field is present in the AID Request element, the AID Request element is carried in an AID Switch Request frame to request a group AID. The Group Address field indicates the group address for which a group AID is being requested.

9.4.2.193 AID Response element

The AID Response element defines information about the AID assignment. The format of AID Response element is shown in Figure 9-783 (AID Response element format).

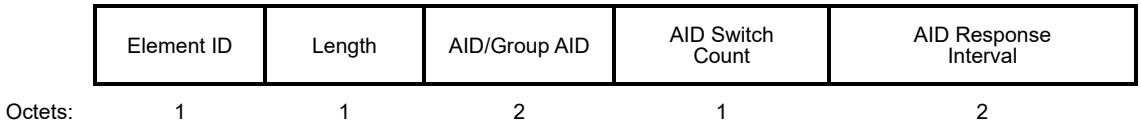

Figure 9-783—AID Response element format

The Element ID and Length fields are defined in 9.4.2.1.

The AID/Group AID field, which has the same format as the AID field described in 9.4.1.8, indicates:

— The AID that is assigned to the non-AP STA if the AID Response element is not sent as a response to an AID Switch Request frame that contained a Group Address field. If the AP does not change the AID of the STA, this field indicates the current AID assigned to the non-AP STA. If the AP changes the AID of the STA, this field indicates the changed AID assigned to the non-AP STA.

— The group AID that is assigned to a group address if the AID Response element is sent as a response to an AID Switch Request frame that contained a Group Address field carrying the group address.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The AID Switch Count field indicates a countdown value, in units of beacon interval or short beacon interval, that the AP sets for the non-AP STA to switch to the new AID or to activate the group AID. The countdown value is expressed in units of beacon interval if dot11ShortBeaconInterval is false and in units of short beacon interval if dot11ShortBeaconInterval is true (see 11.1.3.10.2). The AID Switch Count field indicates the duration after which the (group) listen interval starts and the counter that corresponds to the AID Switch Count field starts upon transmission of the AID Response element. The AID Switch Count field is set to 0 in an AID Response element that is carried in a (Re)Association Response frame.

The AID Response Interval field indicates to the non-AP STA:

— The listen interval in units of beacon interval or short beacon interval as defined in 9.4.1.6, during which the S1G STA in TIM mode wakes to receive S1G Beacon frames. The S1G Beacon frames that the S1G STA in TIM mode wakes up to listen either include a TIM element that can include their new AID or include a Page Slice element that indicates the assignment of the new AID in the corresponding page slices.

— The listen interval in units of beacon interval or short beacon interval as defined in 9.4.1.6, during which the S1G STA in non-TIM mode is required to transmit at least one PS-Poll or trigger frame to the AP.

— The group listen interval, in units of beacon interval or short beacon interval (see 11.1.3.10.2), during which the non-AP STA is required to transition to awake state for receiving the S1G Beacon frames that signal the presence of group addressed BUs for the group address contained in the Group Address field of the eliciting AID Switch Request frame. The (group) listen interval starts from the first TBTT or TSBTT that follows the expiration of the AID switch counter obtained from the AID Switch Count field of this element.

The AID Response Interval field contains a Unified Scaling Factor subfield (see Table 9-78) and has a format as defined in Figure 9-144 (Listen Interval field format carried in an S1G PPDU). The AID Response Interval field is calculated as the value of the Unscaled Interval subfield multiplied by the scaling factor that corresponds to the value indicated in the Unified Scaling Factor subfield.

9.4.2.194 S1G Sector Operation element

The S1G Sector Operation element includes the information necessary for a receiving STA to determine the type of sector operation, if it is allowed to transmit during a specified sector time interval and if it can perform sector training. The S1G Sector Operation element is optionally present in Probe Response, Beacon or Association Response frames.

The format of the S1G Sector Operation element is presented in Figure 9-784 (S1G Sector Operation element format (sectorization type is group sectorization)) and later in this subclause in Figure 9-785 (S1G Sector Operation element format (sectorization type is TXOP-based sectorization operation)).

	B0 B7	B8 B15	B16	B17B22	B23	B24B26	B27 B30			
	Element ID	Length	Sectoriza-tion Type	Period	Omni	Sector ID	Number of Groups	Group IDs	Sector Duration	Pad
Bits:	8	8	1	6	1	3	4	variable	6	1, 3, 5, or 7

Figure 9-784—S1G Sector Operation element format (sectorization type is group sectorization)

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Sectorization Type field indicates the type of sectorization. When the Sectorization Type field is equal to 0, it indicates that the format of the S1G Sector Operation element is structured for group sectorization operation.

NOTE 1—The Sectorization Type field can be set to 0 only when the Sectorized Beam-Capable field setting is either 2 or 3.

The Period field specifies the time interval, in units of 10 ms, until the next transmission of frames in the sector identified by the Sector ID field.

The Omni field indicates if the present transmission is sectorized or omnidirectional. When it is equal to 0, it indicates sectorized. When it is equal to 1, it indicates omnidirectional.

The Sector ID field identifies the ID of the active sector. It is reserved when Omni field is equal to 1.

The Number of Groups field indicates the number of Group ID subfields in the Group IDs field following this field.

Each Group ID subfield is 6 bits and identifies the group of STAs that are allowed to transmit during this sector interval.

The Sector Duration field indicates the duration of the current sector transmissions, in units of 10 ms.

The Pad field contains 1, 3, 5, or 7 bits of 0s to make the total number of bits in the S1G Sector Operation element equal to an integer number of octets.

The S1G Sector Operation element can be provided in Association Response frame when dot11S1GSectorizationActivated is true and it indicates the group ID allocated to that STA to be used during the sectorization purpose, the type of sectorization method, the value of the Period field, and the Sector Duration field if all the sector durations are equal. If the Sector Duration field is not equal for all sectors the Sector Duration field provided at the association time is 0. The values of the Sector ID and Omni fields are omitted by the STA in the Association Response frame. By default all the STAs that support group sectorization consider themselves in group ID 0 unless is specified otherwise via the Association Response frame. This way all the STAs can transmit at any time before their association. It is expected that during the association, STAs receive a nonzero group ID, which restricts their activity to a particular sector interval or during omnidirectional time interval. An AP can allow some STAs to have the group zero even after association, for instance public safety STAs or some high priority sensors.

The S1G Sector Operation element in the Beacon frame provides:

- Information related to the type of sectorization operation;
- Indication if the Beacon frame is sectorized or not;
- The sector ID of the current sector;
- The group ID that identifies the group allowed transmitting during the current sector duration; and
- The duration of this sector.

A STA that receives a Beacon frame that includes an S1G Sector Operation element determines if the received Beacon frame is sectorized or omnidirectional. If the received Beacon frame is omnidirectional the STAs are allowed to transmit in all geographical sectors provided that their group ID is group zero or it is listed in S1G Sector Operation element. If the received Beacon frame is sectorized, the STAs with group zero from any sector are allowed to transmit and the STAs that receive the sectorized Beacon frame and have the group ID listed in the S1G Sector Operation element are allowed to transmit during the current sector duration. A Beacon frame that not carries an S1G Sector Operation element does not impose any sectorization restriction on the receiving STAs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When the sectorization type is TXOP-based sectorization operation, the element is presented in Figure 9-785 (S1G Sector Operation element format (sectorization type is TXOP-based sectorization operation)).

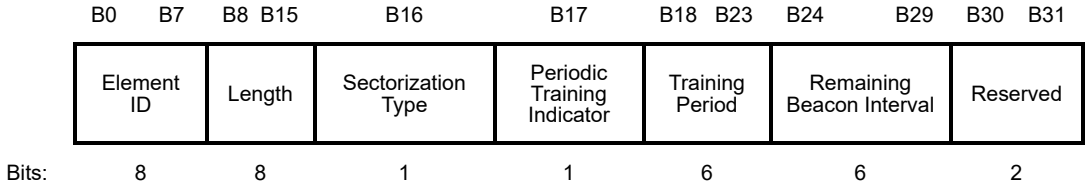

Figure 9-785—S1G Sector Operation element format (sectorization type is TXOP-based sectorization operation)

The Sectorization Type field is set to 1 to indicate that the format of the S1G Sector Operation element is structured for the TXOP-based sectorization operation.

NOTE 2—The Sectorization Type field can be set to 1 only when the Sectorized Beam-Capable field setting is 1 or 3.

The Periodic Training Indicator field is set to 1 to indicate periodic sector training is conducted by the AP and STAs can perform sector training. The Periodic Training Indicator field is set to 0 to indicate periodic sector training is not conducted by the AP.

The Training Period field is set to the number of beacon intervals in which the AP repeats the sector training.

The Remaining Beacon Interval field is set to the number of beacon intervals remaining before the next sector training commences. Setting the field to indicates the sector training is conducted in the current beacon interval.

9.4.2.195 S1G Beacon Compatibility element

The S1G Beacon Compatibility element carries the information that is shown in Figure 9-786 (S1G Beacon Compatibility element format).

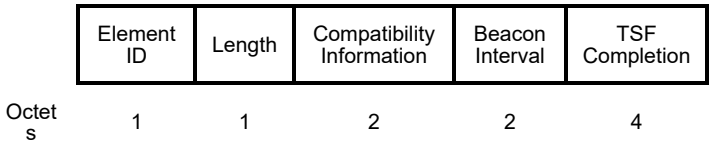

Figure 9-786—S1G Beacon Compatibility element format

The Element ID and Length fields are defined in 9.4.2.1.

The Compatibility Information field contains all the subfields defined in 9.4.1.4 except for the subfield located in B6 and B7 of the field. B6 is defined as the TSF Rollover Flag subfield. An S1G AP sets the TSF Rollover Flag subfield to the value of the most significant bit of the 4 least significant octets of the TSF timer at the time the TSF timer is read for the purpose of creating the element carrying the Compatibility Information field. B7 is defined as the BIGTK Key ID Index subfield. When the S1G Beacon frame is protected with BCE, the S1G AP sets the field to 0 when the key ID used to protect the frame is 6, and sets the field to 1 when the key ID used to protect the frame is 7, i.e. *BIGTK Key ID Index* = *key ID* + 6.

NOTE—Valid values for the BIGTK Key ID are 6 or 7 (see 6.5.14.1).

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Beacon Interval field in the element is defined in 9.4.1.3.

The TSF Completion field carries the 4 most significant octets of the TSF timer at the AP at the time of generation of the element carrying the TSF Completion field.

9.4.2.196 Short Beacon Interval element

The Short Beacon Interval element carries the short beacon interval and its format is shown in Figure 9-787 (Short Beacon Interval element format).

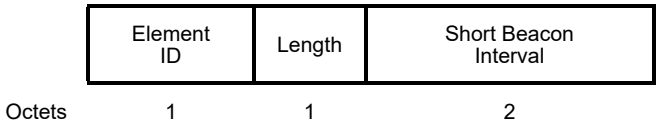

Figure 9-787—Short Beacon Interval element format

The Element ID and Length fields are defined in 9.4.2.1.

The Short Beacon Interval field represents the number of time units (TU)s between target short beacon transmission times (TSBTT)s.

9.4.2.197 Change Sequence element

The Change Sequence element indicates a change of system information within a BSS. The format of the Change Sequence element is shown in Figure 9-788 (Change Sequence element format).

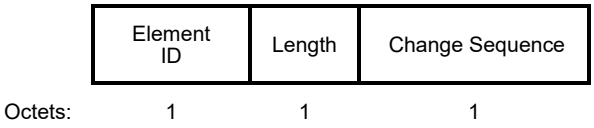

Figure 9-788—Change Sequence element format

The Element ID and Length fields are defined in 9.4.2.1.

The Change Sequence field is defined as an unsigned integer, initialized to 0, that increments when a critical update occurs to any of the elements inside an S1G Beacon frame; see 10.45.2.

9.4.2.198 TWT element

The TWT element is shown in Figure 9-789 (TWT element format).

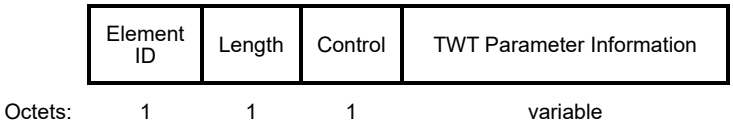

Figure 9-789—TWT element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The format of the Control field is shown in Figure 9-790 (Control field format).

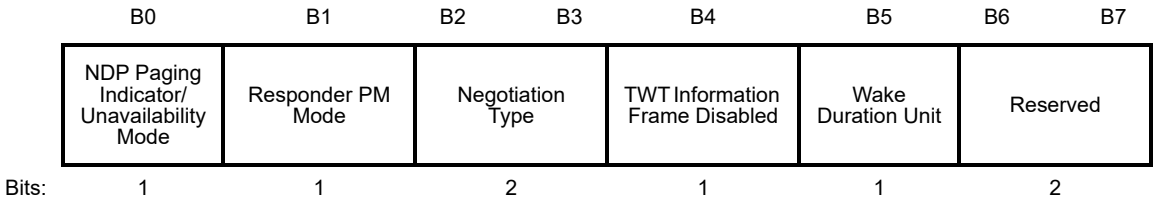

Figure 9-790—Control field format

The NDP Paging Indicator/Unavailability Mode subfield is set to 1 to indicate that the NDP Paging field is present if the STA sending the frame carrying the TWT element is an S1G STA. Otherwise, the NDP Paging field is set to 0.

The Responder PM Mode subfield indicates the power management mode as defined in 11.2.

The Negotiation Type subfield indicates whether the information included in the TWT element is for the negotiation of parameters of broadcast or individual TWT(s) or a Wake TBTT interval. The MSB of the Negotiation Type subfield is the Broadcast field.

The TWT Information Frame Disabled subfield is set to 1 to indicate that the reception of TWT Information frames is disabled by the STA; otherwise, it is set to 0.

The Wake Duration Unit subfield indicates the unit of the Nominal Minimum TWT Wake Duration field. The Wake Duration Unit subfield is set to 0 if the unit is 256 μs and is set to 1 if the unit is a TU. A non-HE STA sets the Wake Duration Unit subfield to 0.

If the Broadcast field of the Negotiation Type subfield is 1, then one or more broadcast TWT parameter sets are contained in the TWT element (see Figure 9-792 (Broadcast TWT Parameter Set field format)). If the Broadcast field of the Negotiation Type subfield is 0, then only one Individual TWT parameter set is contained in the TWT element (see Figure 9-791 (Individual TWT Parameter Set field format)). An S1G STA sets the Negotiation Type subfield to 0.

A TWT element that has the Broadcast field in the Control field set to 1 is referred to as broadcast TWT element.

The Negotiation Type subfield determines the interpretation of the Target Wake Time, TWT Wake Interval Mantissa, and TWT Wake Interval Exponent subfields of the TWT element as defined in Table 9-346.

Table 9-346—Interpretation of Negotiation Type subfield and of Target Wake Time, TWT Wake Interval Mantissa, and TWT Wake Interval Exponent subfields

Negotiation Type subfield	Target Wake Time subfield	TWT Wake Interval Mantissa and TWT Wake Interval Exponent subfields	Description
0	A future Individual TWT SP start time	Interval between individual TWT SPs	Individual TWT negotiation between TWT requesting STA and TWT responding STA or individual TWT announcement by TWT responder. See 10.46 and 26.8.2. The TWT element contains one individual TWT parameter set.
1	Next Wake TBTT time	Interval between wake TBTTs	Wake TBTT and wake interval negotiation between TWT scheduled STA and TWT scheduling AP. See 26.8.6. The TWT element contains one individual TWT parameter set.
2	A future Broadcast TWT SP start time	Interval between broadcast TWT SPs	Provide broadcast TWT schedules to TWT scheduled STAs by including the TWT element in broadcast Management frames sent by TWT scheduling AP. See 26.8.3.2. The TWT element contains one or more broadcast TWT parameter sets.
3	A future Broadcast TWT SP start time	Interval between broadcast TWT SPs	Manage memberships in broadcast TWT schedules by including the TWT element in individually addressed Management frames sent by either a TWT scheduled STA or a TWT scheduling AP. See 26.8.3. The TWT element contains one or more broadcast TWT parameter sets.

The TWT Parameter Information field contains a single Individual TWT Parameter Set field with format defined in Figure 9-791 (Individual TWT Parameter Set field format) if the Broadcast subfield in the Control field is 0 and contains one or more Broadcast TWT Parameter Set fields with format defined in Figure 9-792 (Broadcast TWT Parameter Set field format) if the Broadcast subfield of the Control field is 1. The number of Broadcast TWT Parameter Set fields present is determined by the values of the Last Broadcast Parameter Set subfields of the Request Type fields.

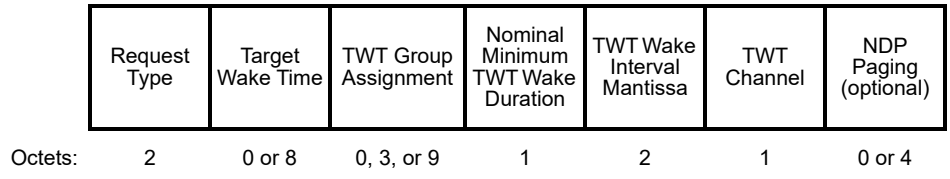

Figure 9-791—Individual TWT Parameter Set field format

The format of the Request Type field of the Individual TWT Parameter Set field is shown in Figure 9-793 (Request Type field format Individual TWT Parameter Set field) and of a Broadcast TWT Parameter Set field is shown in Figure 9-794 (Request Type field format in Broadcast TWT Parameter Set field).

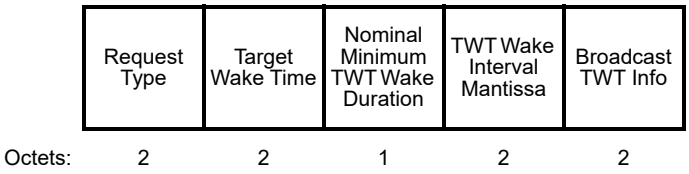

Figure 9-792—Broadcast TWT Parameter Set field format

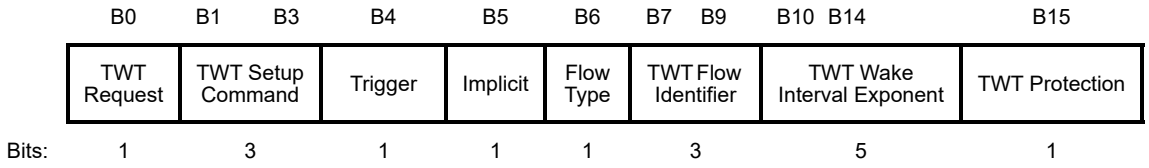

Figure 9-793—Request Type field format Individual TWT Parameter Set field

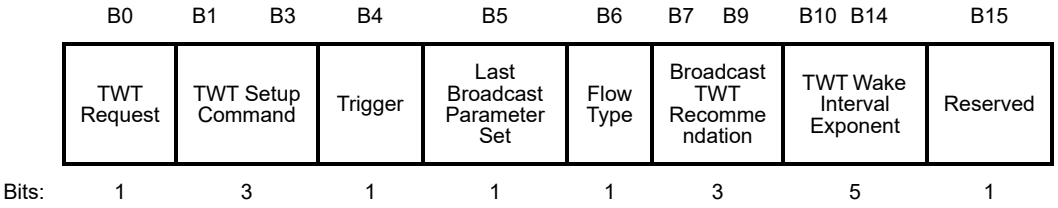

Figure 9-794—Request Type field format in Broadcast TWT Parameter Set field

A STA that transmits a TWT element with the TWT Request subfield equal to 1 is a TWT requesting STA or TWT scheduled STA. Otherwise, it is a TWT responding STA or TWT scheduling STA.

The TWT Setup Command subfield values indicate the type of TWT command. The use of the TWT Setup Command field for the negotiation of individual and broadcast TWT is described Table 9-347. The entries in the table apply to cases where the Negotiation Type subfield is not 1. For TWT Setup Command field use when the Negotiation Type subfield is 1, see 26.8.6.

Table 9-347—TWT Setup Command field values

TWT Setup Command field value	Command name	Description
0	Request TWT	A TWT requesting or TWT scheduled STA requests to join a TWT without specifying a target wake time. This command is valid if the TWT Request field is equal to 1; otherwise, the command is not applicable.
1	Suggest TWT	A TWT requesting or TWT scheduled STA requests to join a TWT and specifies a suggested set of TWT parameters with the possibility that if the requested target wake time and/or other TWT parameters cannot be accommodated, then the TWT setup might still be accepted by the TWT requesting or TWT scheduled STA. This command is valid if the TWT Request field is equal to 1; otherwise, it is not applicable.
2	Demand TWT	A TWT requesting or TWT scheduled STA requests to join a TWT and specifies a demanded set of TWT parameters. If the demanded set of TWT parameters is not accommodated by the responding STA or TWT scheduling AP, then the TWT requesting STA or TWT scheduled STA rejects the TWT setup. This command is valid if the TWT Request field is equal to 1; otherwise, it is not applicable.
3	TWT Grouping	The TWT responding STA suggests TWT group parameters that are different from the suggested or demanded TWT parameters of the TWT requesting STA This command is valid if the TWT Request field is 0 and the Negotiation Type subfield is 0 and sent by an S1G STA; otherwise, it is not applicable.
4	Accept TWT	A TWT responding STA or TWT scheduling AP accepts the TWT request with the TWT parameters (see NOTE) indicated in the TWT element transmitted by the TWT requesting STA or TWT scheduled STA. This value is also used in unsolicited TWT responses. This command is valid if the TWT Request field is 0; otherwise, it is not applicable.
5	Alternate TWT	A TWT responding STA or TWT scheduling AP suggests TWT parameters that are different from those suggested by the TWT requesting STA or TWT scheduled STA. This command is valid if the TWT Request field is 0; otherwise, it is not applicable.

Table 9-347—TWT Setup Command field values *(continued)*

TWT Setup Command field value	Command name	Description
6	Dictate TWT	A TWT responding STA or TWT scheduling AP indicates TWT parameters that are different from those suggested by the TWT requesting STA or TWT scheduled STA. This command is valid if the TWT Request field is 0; otherwise, it is not applicable.
7	Reject TWT	A TWT responding STA or TWT scheduling AP rejects setup, or a TWT scheduling AP terminates an existing broadcast TWT, or a TWT scheduled STA terminates its membership in a broadcast TWT.

NOTE—TWT Parameters are TWT, Nominal Minimum TWT Wake Duration, TWT Wake Interval, and TWT Channel subfield values indicated in the TWT element. The Trigger subfield value indicated in the TWT element is also a TWT parameter for an HE STA.

The Trigger field indicates whether or not the TWT SP indicated by the TWT element includes triggering frames as defined in 26.8. The Trigger field is set to 1 to indicate that at least one triggering frame is transmitted during the TWT SP. The Trigger field is set to 0 otherwise.

The Implicit subfield is set to 1 to indicate an implicit TWT and is set to 0 to indicate an explicit TWT.

The Last Broadcast Parameter Set subfield is set to 0 to indicate that another broadcast TWT Parameter set follows this set. The Last Broadcast Parameter Set subfield is set to 1 to indicate that this is the last broadcast TWT Parameter set in the broadcast TWT element.

The Flow Type subfield indicates the type of interaction between the TWT requesting STA or TWT scheduled STA and the TWT responding STA or TWT scheduling AP at a TWT. Setting the Flow Type subfield to 0 indicates an announced TWT in which the TWT requesting STA or TWT scheduled STA will send a PS-Poll or an APSD trigger frame (see 11.2.3.5 to signal its awake state to the TWT responding STA or TWT scheduling AP before a frame that is not a Trigger frame is sent from the TWT responding STA or TWT scheduling AP to the TWT requesting STA or TWT scheduled STA. A TWT SP that is set up under an announced TWT agreement is an announced TWT SP. Setting the Flow Type subfield to 1 indicates an unannounced TWT in which the TWT responding STA or TWT scheduling AP will send a frame to the TWT requesting STA or TWT scheduled STA at TWT without waiting to receive a PS-Poll or an APSD trigger frame from the TWT requesting STA or TWT scheduled STA. A TWT SP that is set up under an unannounced TWT agreement is an unannounced TWT SP.

NOTE—The TWT requesting STA is expected to send the PS-Poll or APSD trigger frame if the TWT is a trigger-enabled TWT.

The TWT Flow Identifier subfield contains a 3-bit value that identifies the specific information for this TWT request uniquely from other requests made between the same TWT requesting STA and TWT responding STA pair.

The Broadcast TWT Recommendation subfield contains a value that indicates recommendations on the types of frames that are transmitted by TWT scheduled STAs and scheduling AP during the broadcast TWT SP, encoded according to the Broadcast TWT Recommendation field for a broadcast TWT element as

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

defined in Table 9-348. The Broadcast TWT Recommendation is reserved if transmitted by a TWT scheduled STA.

Table 9-348—Broadcast TWT Recommendation field for a broadcast TWT element

Broadcast TWT Recommendation field value	Description when transmitted in a broadcast TWT element
0	No constraints on the frames transmitted during a broadcast TWT SP.
1	Frames transmitted during a broadcast TWT SP by a TWT scheduled STA are recommended to be limited to solicited status and solicited feedback: — PS-Poll and QoS Null frames — Feedback can be contained in the QoS Control field or in the HE variant HT Control field of the frame, if either is present (see 26.5.2, 26.9, 26.13, etc.) — Feedback in an HE TB feedback NDP, if solicited by the AP (see 26.5.7) — BQRs (see 26.5.6) — BSRs (see 26.5.5) — Frames that are sent as part of a sounding feedback exchange (see 26.7) — Management frames: Action or Action No Ack frames — Control response frames Trigger frames transmitted by the TWT scheduling AP during the broadcast TWT SP do not contain RUs for random access (see 26.8.3.2 and 26.5.4), otherwise, there are no other restrictions on the frames transmitted by the TWT scheduling AP.
2	Frames transmitted during a broadcast TWT SP by a TWT scheduled STA are recommended to be limited to solicited status and solicited feedback: — PS-Poll and QoS Null frames — Feedback can be contained in the QoS Control field or in the HE variant HT Control field of the frame, if either is present (see 26.5.2, 26.9, 26.13, etc.) — BQRs (see 26.5.6) — BSRs (see 26.5.5) — Frames that are sent as part of a sounding feedback exchange (see 26.7) — Management frames: Action, Action No Ack frames or (Re)Association Request — Control response frames Trigger frames transmitted by the TWT scheduling AP during the broadcast TWT SP contain at least one RU for random access (see 26.8.3.2 and 26.5.4); otherwise, there are no restrictions on the frames transmitted by the TWT scheduling AP.
3	No constraints on the frames transmitted during a broadcast TWT SP, except that the AP transmits a TIM frame or a FILS Discovery frame including a TIM element at the beginning of each TWT SP (see 26.14.3.2).
4–7	Reserved

In a TWT element transmitted by a TWT requesting or TWT scheduled STA, the TWT wake interval is equal to the average time that the STA expects to elapse between successive TWT SPs start times (see Table 9-346). In a TWT element transmitted by a TWT responding STA or TWT scheduling AP, the TWT wake interval is equal to the average time that the STA expects to elapse between successive TWT SPs start times. In a TWT element contained in a TWT request that is sent by the TWT scheduled STA to negotiate its wake intervals, the TWT wake interval indicates the value of the wake interval (see 26.8.6). The TWT Wake Interval Exponent subfield is set to the value of the exponent of the TWT wake interval value in microseconds, base 2. The TWT wake interval of the requesting STA is equal to (TWT Wake Interval Mantissa) $\times 2^{(\text{TWT Wake Interval Exponent})}$.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

If transmitted by a TWT requesting STA or a TWT scheduled STA and the TWT Setup Command subfield contains a value corresponding to the command “Suggest TWT” or “Demand TWT”, the Target Wake Time field contains a positive an unsigned integer corresponding to a TSF time at which the STA requests to wake. If transmitted by a TWT requesting STA or a TWT scheduled STA and the TWT Setup Command subfield contains the value corresponding to the command “Request TWT”, the Target Wake Time field contains the value 0. The Target Wake Time field is 8 octets if the Broadcast field is 0; otherwise, it is 2 octets with the lowest bit of the 2 octets corresponding to bit 10 of the relevant TSF value. If a TWT responding STA with dot11TWTGroupingSupport equal to 0 transmits a TWT element to the TWT requesting STA, the TWT element contains a value in the Target Wake Time field corresponding to a TSF time at which the TWT responding STA requests the TWT requesting STA to wake for the corresponding TWT SP and it does not contain the TWT Group Assignment field.

When a TWT responding STA with dot11TWTGroupingSupport equal to 1 transmits the TWT element to the TWT requesting STA from which it received a frame containing an S1G Capabilities element with the TWT Grouping Support subfield equal to 1, the TWT element does not contain the Target Wake Time field and it does contain the TWT Group Assignment field in order to indicate the TWT group of the requesting STA and the assigned TWT value. The presence of the TWT Group Assignment field is indicated by a TWT responding STA by using the TWT Grouping command in the TWT Setup Command subfield (see Table 9-347) within the TWT element.

The TWT Group Assignment field provides information to a requesting STA about the TWT group to which the STA is assigned. This field contains the TWT Group ID, Zero Offset of Group (optional), TWT Unit, and TWT Offset subfields. The TWT Group Assignment field and the corresponding subfields are depicted in Figure 9-795 (TWT Group Assignment field format).

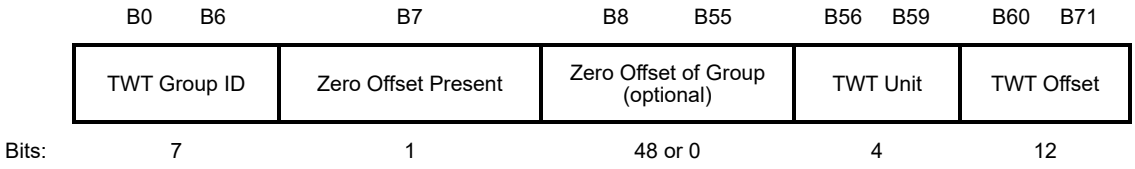

Figure 9-795—TWT Group Assignment field format

The TWT Group ID subfield is an unsigned integer and indicates the identifier of the TWT group to which the requesting STA is assigned. A TWT group is a group of STAs that have TWT values that lie within a specific interval of TSF values. The value zero in the TWT Group ID subfield is used to indicate the unique TWT group, which contains all STAs in the BSS.

The Zero Offset Present subfield indicates whether the following Zero Offset of Group subfield is included in the TWT Group Assignment field of the TWT element. Setting the Zero Offset Present subfield to 0 indicates that the Zero Offset of the Group subfield is not included in the TWT Group Assignment field.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Zero Offset of Group subfield indicates the initial TWT value for the TWT group identified by the TWT group ID. The Zero Offset of Group subfield contains the initial TWT value for the TWT group with the given TWT group ID. When the Zero Offset of Group subfield is present, it contains the value of the 6 least significant octets of the TSF timer corresponding to the TWT group offset time. The Zero Offset of Group subfield is optionally present in the TWT Group Assignment field. If a STA transmits multiple TWT requests for multiple TWT flows, the next TWT Group Assignment field transmitted in a response to a TWT request can optionally exclude the Zero Offset of the Group subfield from an included TWT Group Assignment field provided that a previous response included a Zero Offset of the Group subfield. The receipt of a TWT response with a TWT Group Assignment field with no Zero Offset of the Group subfield implies that the Zero Offset of the Group subfield value for that TWT is the same as the Zero Offset of the Group subfield value for the most recently received Zero Offset of the Group subfield for the same TWT group ID from the TWT responding STA.

The TWT Unit subfield indicates the unit of increment of the TWT values within the TWT group identified by the TWT group ID. The TWT Unit subfield encoding is shown in Table 9-349.

Table 9-349—TWT Unit subfield encoding

TWT Unit subfield value	TWT Unit time value
0	32 μs
1	256 μs
2	1024 μs
3	8.192 ms
4	32.768 ms
5	262.144 ms
6	1.048576 s
7	8.388608 s
8	33.554432 s
9	268.435456 s
10	1073.741824 s
11	8589.934592 s
12–15	Reserved

The TWT Offset subfield indicates the position within the indicated group, of the STA corresponding to the RA of the frame containing the TWT element.

A non-AP STA uses the TWT Group ID, Zero Offset of Group, TWT Unit, and TWT Offset subfield values to compute its TWT value within the TWT group. A STA's TWT value is equal to the value of the Zero Offset of Group subfield plus TWT Offset subfield times the value of TWT Unit subfield.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Nominal Minimum TWT Wake Duration field indicates the minimum amount of time, in the unit indicated by the Wake Duration Unit subfield, that the TWT requesting STA or TWT scheduled STA is expected to be awake in order to complete the frame exchange sequences for the period of TWT wake interval, where TWT wake interval is the average time that the TWT requesting STA or TWT scheduled STA expects to elapse between successive TWT SPs.

The TWT Wake Interval Mantissa subfield is set to the value of the mantissa of the TWT wake interval value in microseconds, base 2.

The Broadcast TWT Info subfield is defined in Figure 9-796 (Broadcast TWT Info subfield format).

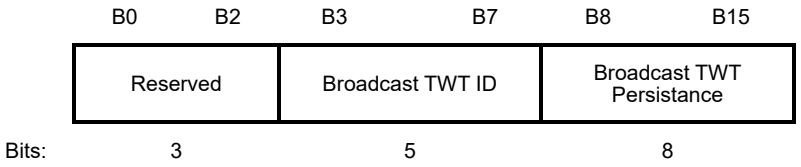

Figure 9-796—Broadcast TWT Info subfield format

Within a TWT element that includes a TWT setup command value of Request TWT, Suggest TWT, or Demand TWT, the Broadcast TWT ID, if present, indicates a specific Broadcast TWT in which the transmitting STA is requesting to participate. Within a TWT element that includes a TWT setup command value of Accept TWT, Alternate TWT, Dictate TWT, or Reject TWT, the Broadcast TWT ID, if present, indicates a specific Broadcast TWT for which the transmitting STA is providing TWT parameters. Within a TWT element that includes a TWT setup command value of TWT Grouping, the Broadcast subfield is 0 and the Broadcast TWT ID, is not present. The value 0 in the Broadcast TWT ID subfield indicates the broadcast TWT whose membership corresponds to all STAs that are members of the BSS corresponding to the BSSID of the Management frame carrying the TWT element and that is permitted to contain Trigger frames with RA-RUs for unassociated STAs.

The Broadcast TWT Persistence subfield indicates the number of TBTTs during which the Broadcast TWT SPs corresponding to this broadcast TWT Parameter set are present. The number of beacon intervals during which the Broadcast TWT SPs are present is equal to the value in the Broadcast TWT Persistence subfield plus 1, except that the value 255 indicates that the Broadcast TWT SPs are present until explicitly terminated.

The TWT Channel field includes a bitmap that provides the channel that is being negotiated by a STA as a temporary channel during a TWT SP. Each bit in the bitmap corresponds to one minimum width channel for the band in which the TWT responding STA's associated BSS is currently operating, with the least significant bit corresponding to the lowest numbered channel of the operating channels of the BSS. In an S1G BSS, the minimum width channel is equal to the SST Channel Unit field of the SST Operation element if such an element has been previously received or is equal to 1 MHz for a BSS with a BSS primary channel width of 1 MHz and 2 MHz for a BSS with a BSS primary channel width of 2 MHz if no such element has been previously received from the AP to which the SST STA is associated. In an HE BSS, the minimum width channel is equal to 20 MHz. Setting a position in the bitmap transmitted to 1 by a TWT requesting STA means that operation with that channel as the temporary channel is requested during a TWT SP. Setting a position in the bitmap transmitted to 1 by a TWT responding STA means that operation with that channel as the primary channel is allowed during the TWT SP. The TWT Channel field is used by an S1G STA as defined in 10.53 and is used by an HE STA as defined in 26.8.7. If the TWT channel field is 0 then the STA operates as define in 10.46 or 26.8.2.

A TWT requesting STA sets the TWT Protection subfield to 1 to request the TWT responding STA to provide protection of the set of TWT SPs corresponding to the requested TWT flow identifier by

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— Allocating RAW(s) that restrict access to the medium during the TWT SP(s) for the TWTs that are set up within an S1G BSS.
— Enabling NAV protection during the TWT SP(s) for the TWTs that are set up within an HE BSS.

A TWT requesting STA sets the TWT Protection subfield to 0 if TWT protection is not requested for the corresponding TWT(s).

A TWT responding STA sets the TWT Protection subfield to 1 to indicate that the TWT SP(s) corresponding to the TWT flow identifier(s) of the TWT element are protected by
— Allocating RAW(s) that restrict access to the medium during the TWT SP(s) for the TWT(s) where the TWT responding STA is an S1G STA.
— Enabling NAV protection during the TWT SP(s) for the TWTs where the TWT responding STE is an HE STA.

A TWT responding STA sets the TWT Protection subfield to 0 to indicate that the TWT SP(s) identified in the TWT element might not be protected.

The format of the NDP Paging field is defined in Figure 9-797 (NDP Paging field format).

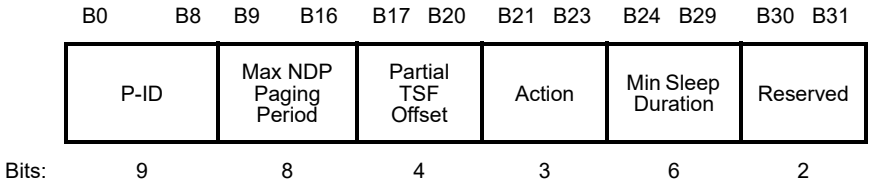

Figure 9-797—NDP Paging field format

The P-ID field is the identifier of the paged STA, as described in 10.46.6.

The Max NDP Paging Period field indicates the maximum number of TWT wake intervals between two NDP Paging frames.

The Partial TSF Offset field includes timing indications, as described in 10.46.6.

Upon reception of an NDP Paging frame with matching P-ID field as defined in 10.46.6, the TWT STA that is an NDP paging requester takes an action indicated by the Action field as described in Table 9-350.

Table 9-350—Action field

Action	Options
0	Send a PS-Poll or uplink trigger frame
1	Transition to awake state at the time indicated by the Min Sleep Duration field
2	Transition to awake state to receive the beacon
3	Transition to awake state to receive the DTIM beacon
4	Transition to awake state at the time indicated by the sum of the Min Sleep Duration field and the ASD subfield in the APDI field of the NDP Paging frame
5–7	Reserved

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Min Sleep Duration field indicates in units of SIFS the minimum duration of the STA's doze state after receiving an NDP Paging frame with a matching P-ID.

9.4.2.199 S1G Capabilities element

9.4.2.199.1 S1G Capabilities element structure

An S1G STA declares that it is an S1G STA by transmitting the S1G Capabilities element.

The S1G Capabilities element contains a number of fields that are used to advertise S1G capabilities of an S1G STA. The S1G Capabilities element is defined in Figure 9-798 (S1G Capabilities element format).

	Element ID	Length	S1G Capabilities Information	Supported S1G-MCS and NSS Set	Extended Supported S1G-MCS and NSS Set
Octets:	1	1	10	5	2

Figure 9-798—S1G Capabilities element format

The Element ID and Length fields are defined in 9.4.2.1.

The subfields of the S1G Capabilities Information field are defined in Table 9-351.

Table 9-351—Subfields of the S1G Capabilities Information field

Subfield	Definition	Encoding
S1G_LONG Support	Indicates support for the reception of S1G_LONG PPDUs. See 23.3.2.	Set to 0 if not supported. Set to 1 if supported.
Short GI for 1 MHz	Indicates short GI support for the reception of PPDUs transmitted with TXVECTOR parameters FORMAT equal to S1G and CH_BANDWIDTH equal to CBW1.	Set to 0 if not supported. Set to 1 if supported.
Short GI for 2 MHz	Indicates short GI support for the reception of PPDUs transmitted with TXVECTOR parameters FORMAT equal to S1G and CH_BANDWIDTH equal to CBW2.	Set to 0 if not supported. Set to 1 if supported.
Short GI for 4 MHz	Indicates short GI support for the reception of PPDUs transmitted with TXVECTOR parameters FORMAT equal to S1G and CH_BANDWIDTH equal to CBW4.	Set to 0 if not supported. Set to 1 if supported.
Short GI for 8 MHz	Indicates short GI support for the reception of PPDUs transmitted with TXVECTOR parameters FORMAT equal to S1G and CH_BANDWIDTH equal to CBW8.	Set to 0 if not supported. Set to 1 if supported.
Short GI for 16 MHz	Indicates short GI support for the reception of PPDUs transmitted with TXVECTOR parameters FORMAT equal to S1G and CH_BANDWIDTH equal to CBW16.	Set to 0 if not supported. Set to 1 if supported.
Supported Channel Width	Indicates the channel widths supported by the STA. See 10.45.	Set to 0 if the STA supports 1 MHz and 2 MHz operation. Set to 1 if the STA supports 1 MHz, 2 MHz, and 4 MHz operation. Set to 2 if the STA supports 1 MHz, 2 MHz, 4 MHz, and 8 MHz operation. Set to 3 if the STA supports 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz operation.
Rx LDPC	Indicates support for receiving LDPC encoded PPDUs.	Set to 0 if not supported. Set to 1 if supported.
Tx STBC	Indicates support for the transmission of at least 2×1 STBC.	Set to 0 if not supported. Set to 1 if supported.
Rx STBC	Indicates support for the reception of PPDUs using STBC.	Set to 0 if not supported. Set to 1 if supported.
SU Beamformer Capable	Indicates support for operation as an SU beamformer (see 10.35.5).	Set to 0 if not supported. Set to 1 if supported.
SU Beamformee Capable	Indicates support for operation as an SU beamformee (see 10.35.5).	Set to 0 if not supported. Set to 1 if supported.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-351—Subfields of the S1G Capabilities Information field *(continued)*

Subfield	Definition	Encoding
Beamformee STS Capability	The maximum number of space-time streams that the STA can receive in an S1G NDP, the maximum value for $N_{STS,total}$ that can be sent to the STA in an S1G MU PPDU if the STA is MU beamformee capable and the maximum value of *Nr* that the STA transmits in a VHT Compressed Beamforming frame.	If SU beamformee capable, set to maximum number of space-time streams that the STA can receive in an S1G NDP minus 1. Otherwise reserved.
Number Of Sounding Dimensions	Beamformer's capability indicating the maximum value of the TXVECTOR parameter NUM_STS for an S1G NDP.	If SU beamformer capable, set to the maximum supported value of the TXVECTOR parameter NUM_STS minus 1. Otherwise reserved.
MU Beamformer Capable	Indicates support for operation as an MU beamformer (see 10.35.5).	Set to 0 if not supported or if SU Beamformer Capable is set to 0 or if sent by a non-AP STA. Set to 1 if supported and SU Beamformer Capable is equal to 1.
MU Beamformee Capable	Indicates support for operation as an MU beamformee (see 10.35.5).	Set to 0 if not supported or if SU Beamformee Capable is set to 0 or if sent by an AP. Set to 1 if supported and SU Beamformee Capable is equal to 1.
+HTC-VHT Capable	Indicates whether or not the STA supports receiving a VHT variant HT Control field.	Set to 0 if not supported. Set to 1 if supported.
Traveling Pilot Support	Indicates support for the reception of PPDUs with a traveling pilots. See 23.3.9.10.	Set to 1 if dot11S1GTravelingPilotOptionActivated is true, and reception of traveling pilot for one space-time stream is supported but reception of traveling pilot for two space-time streams with STBC is not supported. Set to 3 if dot11S1GTravelingPilotOptionActivated is true, and reception of traveling pilot for both one space-time stream and two space-time streams with STBC is supported. Set to 0 if dot11S1GTravelingPilotOptionActivated is false. Value 2 is reserved.
RD Responder	Indicates support for acting as a reverse direction responder, i.e., the STA can use an offered RDG to transmit data to an RD initiator using the reverse direction protocol described in 10.29.	Set to 0 if not supported. Set to 1 if supported.
Maximum MPDU Length	Indicates the maximum MPDU length (see 10.11).	Set to 0 for 3895 octets. Set to 1 for 7991 octets.
Maximum A-MPDU Length Exponent	Indicates the maximum length of A-MPDU that the STA can receive. EOF padding is not included in this limit.	The length defined by this field is equal to $2^{(13+\text{Maximum A-MPDU Length Exponent})} - 1$ octets.

Table 9-351—Subfields of the S1G Capabilities Information field *(continued)*

Subfield	Definition	Encoding
Minimum MPDU Start Spacing	Determines the minimum time between the start of adjacent MPDUs within an A-MPDU that the STA can receive, measured at the PHY SAP. See 10.12.3.	Set to 0 for no restriction. Set to 1 for 1/4 μs. Set to 2 for 1/2 μs. Set to 3 for 1 μs. Set to 4 for 2 μs. Set to 5 for 4 μs. Set to 6 for 8 μs. Set to 7 for 16 μs.
Uplink Sync Capable	If sent by an AP, this subfield indicates support for sync frame transmission for uplink. If sent by a non-AP STA, this subfield indicates request for sync frame transmission for uplink. See 10.48.	If sent by an AP: Set to 0 if not supported. Set to 1 if supported. If sent by a non-AP STA: Set to 0 if not requested. Set to 1 if requested.
Dynamic AID	The STA sets the Dynamic AID field to 1 when dot11DynamicAIDActivated is true, and sets it to 0 otherwise. See 10.20.	Set to 1 if dot11DynamicAIDActivated is true. Set to 0 otherwise.
BAT Support	The BAT Support subfield indicates support for the use of the Block Acknowledgment TWT (BAT) frame in block ack agreements. When dot11BATImplemented is true, this field is set to 1 to indicate support for BAT frames as both originator and recipient.	Set to 1 if dot11BATImplemented is true. Set to 0 otherwise.
TIM ADE Support	This bit indicates support of the ADE mode of TIM bitmap encoding as described in 9.4.2.5.5.	Set to 1 if dot11TIMADEImplemented is true. Set to 0 otherwise.
Non-TIM Support	This bit indicates support of non-TIM mode.	In a non-AP STA: Set to 0: The non-AP STA does not support non-TIM mode; it needs TIM entry as in legacy PS mode. Set to 1: The non-AP STA supports non-TIM mode and does not need TIM entry when in non-TIM mode. In an AP: Set to 0: The AP does not support the STA's non-TIM mode. Set to 1: The AP supports the STA's non-TIM mode.
Group AID Support	This bit indicates support of group traffic delivery using a group AID as described in 10.54.	Set to 1 if dot11GroupAIDActivated is true. Set to 0 otherwise.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-351—Subfields of the S1G Capabilities Information field *(continued)*

Subfield	Definition	Encoding
STA Type Support	If sent by an AP, this subfield indicates the STA types that are supported by the AP. If sent by a non-AP STA, this subfield indicates the STA type of the non-AP STA.	If sent by an AP: Set to 0 if the AP supports both sensor STAs and non-sensor STAs. Set to 1 if the AP supports only sensor STAs. Set to 2 if the AP supports only non-sensor STAs. 3 is reserved. If sent by a non-AP STA: Set to 1 if the STA is a sensor STA. Set to 2 if the STA is a non-sensor STA. 0 and 3 are reserved.
Centralized Authentication Control	This field indicates support of the centralized authentication control defined in 11.3.9.2.	Set to 1 if dot11S1GCentralizedAuthenticationControlActivated is true. Set to 0 otherwise.
Distributed Authentication Control	This field indicates support of the distributed authentication control defined in 11.3.9.3.	Set to 1 if dot11S1GDistributedAuthenticationControlActivated is true. Set to 0 otherwise.
A-MSDU Supported	This bit indicates support of Aggregated MSDU.	Set to 1 if dot11AMSDUImplemented is true. Set to 0 otherwise.
A-MPDU Supported	This bit indicates support of Aggregated MPDU.	Set to 1 if dot11AMPDUImplemented is true. Set to 0 otherwise.
Asymmetric BA Supported	This bit indicates support of Asymmetric BA.	Set to 1 if dot11AsymmetricBlockAckActivated is true. Set to 0 otherwise.
Flow Control Supported	Indicates support for flow control operation.	Set to 0 if not supported Set to 1 if supported
Sectorized Beam-Capable	The Sectorized Beam-Capable subfield indicates the type of sectorization operation supported by the STA.	If sent by an AP: Set to 0 if sectorization operation is not supported, Set to 1 if only TXOP-based sectorization operation is supported, Set to 2 if only group sectorization operation is supported, Set to 3 if both group sectorization and TXOP-based sectorization operations are supported. If sent by a non-AP STA: Set to 0 if not supported, Set to 1 if supported When equal to 1, a non-AP STA supports both group sectorization and TXOP-based sectorization operation.

Table 9-351—Subfields of the S1G Capabilities Information field *(continued)*

Subfield	Definition	Encoding
OBSS Mitigation Support	The OBSS Mitigation Support subfield indicates whether the STA supports channel width reduction during a TXOP for OBSS mitigation.	Set to 1 to indicate that the STA supports channel width reduction during a TXOP for OBSS mitigation. Set to 0 otherwise.
Fragment BA Support	This bit indicates support for fragment BA.	Set to 1 if dot11FragmentBAOptionImplemented is true. Set to 0 otherwise.
NDP PS-Poll Supported	This bit indicates support for NDP PS-Poll frames.	Set to 1 if dot11NDPPSPollSupport is true. Set to 0 otherwise.
RAW Operation Support	This bit indicates support of RAW Participating as described in 10.23.5.1.	Set to 1 if dot11RAWOperationImplemented is true. Set to 0 otherwise.
Page Slicing Support	This bit indicates support of Page Slicing as described in 10.50.	Set to 1 if dot11PageSlicingImplemented is true. Set to 0 otherwise.
TXOP Sharing Implicit Ack Support	This bit indicates support of Implicit Ack in TXOP sharing.	Set to 1 if dot11TXOPSharingImplicitACKImplemented is true. Set to 0 otherwise.
VHT Link Adaptation Capable	Indicates whether or not the STA supports link adaptation using VHT variant HT Control field.	If +HTC-VHT Capable is 1: Set to 0 (No Feedback) if the STA does not provide VHT MFB. Set to 2 (Unsolicited) if the STA provides only unsolicited VHT MFB. Set to 3 (Both) if the STA can provide VHT MFB in response to VHT MRQ and if the STA provides unsolicited VHT MFB. The value 1 is reserved. Reserved if +HTC-VHT Capable is 0.
TACK Support as PS-Poll Response	This bit indicates whether the AP supports the using of TACK frame as the response to a PS-Poll frame with the Poll Type subfield equal to 1 as described in 10.47.2.	Set to 1 if dot11PollTACKResponseImplemented is true. Set to 0 otherwise.
Duplicate 1 MHz Support	This bit indicates support for transmission of S1G 1 MHz duplicate PPDUs.	Set to 1 if generation of a PPDU in duplicate 1 MHz format is supported as a response to an eliciting frame transmitted by the peer STA. Set to 0 otherwise.
MCS Negotiation Support	Indicates if the STA supports control response MCS negotiation feature.	Set to 0 if not supported. Set to 1 if supported.
1 MHz Control Response Preamble Support	Indicates if the STA supports transmitting control response frames with 1 MHz preamble as the response of ≥2 MHz PPDUs.	Set to 0 if not supported. Set to 1 if supported.
NDP Beamforming Report Poll Supported	Indicates support for reception of NDP Beamforming Report Poll frames.	Set to 0 if not supported. Set to 1 if supported.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-351—Subfields of the S1G Capabilities Information field *(continued)*

Subfield	Definition	Encoding
Unsolicited Dynamic AID	The STA sets the Unsolicited Dynamic AID field to 1 when dot11UnsolicitedDynamicAIDActivated is true, and sets it to 0 otherwise. See 10.20.	Set to 1 if dot11UnsolicitedDynamicAIDActivated is true. Set to 0 otherwise.
Sector Training Operation Supported	This bit indicates support of sector training operation described in 10.52.5.	Set to 0 if not supported. Set to 1 if supported. When equal to 1, a STA supports sector training operation.
Temporary PS Mode Switch	This bit indicates whether the STA supports the temporary PS Mode switch as described in 10.47.2 while in non-TIM mode.	Set to 1 if supported. Set to 0 otherwise.
TWT Grouping Support	This bit indicates support of TWT grouping described in 10.46.5.	Set to 0 if not supported. Set to 1 if supported.
BDT Capable	Indicates the support of bidirectional TXOP operation described in 10.49.	Set to 0 if not supported. Set to 1 if supported.
COLOR	Indicates the value that is used for the TXVECTOR parameter COLOR in frames transmitted by members of this BSS, as described in 10.21.	Set to an unsigned integer if sent by an AP. Otherwise reserved.
TWT Requester Support	This bit indicates support for the role of TWT requesting STA as described in 10.46.	Set to 1 if dot11TWTOptionActivated is true and the STA supports TWT requester STA functionality (see 10.46). Set to 0 otherwise.
TWT Responder Support	This bit indicates support for the role of TWT responding STA	Set to 1 if dot11TWTOptionActivated is true and the STA supports TWT responding STA functionality (see 10.46). Set to 0 otherwise.
PV1 Frame Support	Indicates support for PV1 MPDUs	Set to 0 if not supported. Set to 1 if supported.
Link Adaptation Without NDP CMAC PPDU Capable	Indicate whether or not link adaptation through a Control frame that is not an NDP CMAC PPDU is allowed	Set to 0 if not supported. Set to 1 if supported.

9.4.2.199.3 Supported S1G-MCS and NSS Set field

The Supported S1G-MCS and NSS Set field and the Extended Supported S1G-MCS and NSS Set field are used to convey the combinations of S1G-MCSs and spatial streams that a STA supports for reception and the combinations that it supports for transmission. The structure of the field is shown in Figure 9-800 (Supported S1G-MCS and NSS Set field format).

NOTE 1—The Extended Supported S1G-MCS and NSS Set field not being present conveys that neither S1G-MCS 11 nor S1G-MCS 12 are supported. (see 9.4.2.199.4).

The Supported S1G-MCS and NSS Set subfields are defined in Table 9-352.

Table 9-352—Supported S1G-MCS and NSS Set subfields

Subfield	Definition	Encoding
Rx S1G-MCS Map	Indicates the maximum value of the RXVECTOR parameter MCS of a PPDU that can be received at all channel widths supported by this STA for each number of spatial streams.	The format and encoding of this subfield are defined in Figure 9-801 (Rx S1G-MCS Map and Tx S1G-MCS Map subfields) and the associated description. If Rx Single Spatial Stream and S1G-MCS Map for 1 MHz subfield is greater than or equal to 1, then only the value of the Max S1G-MCS For 1 SS subfield that is indicated by the Rx Single Spatial Stream and S1G-MCS Map subfield is applicable for 1 MHz channel width.
Rx Highest Supported Long GI Data Rate	Indicates the highest long GI S1G data rate that the STA is able to receive.	The largest integer value less than or equal to the highest long GI S1G PPDU data rate in Mb/s the STA is able to receive (see 10.6.14.1). The value 0 indicates that this subfield does not specify the highest long GI S1G PPDU data rate that the STA is able to receive.
Tx S1G-MCS Map	Indicates the maximum value of the TXVECTOR parameter MCS of a PPDU that can be transmitted at all channel widths supported by this STA for each number of spatial streams.	The format and encoding of this subfield are defined in Figure 9-801 (Rx S1G-MCS Map and Tx S1G-MCS Map subfields) and the associated description. If Tx Single Spatial Stream and S1G-MCS Map for 1 MHz subfield is greater than or equal to 1, then only the value of the Max S1G-MCS For 1 SS subfield that is indicated by the Tx Single Spatial Stream and S1G-MCS Map subfield is applicable for 1 MHz channel width.
Tx Highest Supported Long GI Data Rate	Indicates the highest long GI S1G PPDU data rate at which the STA is able to transmit.	The largest integer value less than or equal to the highest long GI S1G PPDU data rate in Mb/s that the STA is able to transmit (see 10.6.14.2). The value 0 indicates that this subfield does not specify the highest long GI S1G PPDU data rate that the STA is able to transmit.
Rx Single Spatial Stream and S1G-MCS Map for 1 MHz	Indicates whether only a single spatial stream PPDU can be received at 1 MHz channel width by this STA.	0: same number of spatial streams and same Max S1G-MCS as indicated by Rx S1G-MCS Map field. 1: single spatial stream only and with Max S1G-MCS as indicated by a 0 in the S1G-MCS for 1 SS subfield. 2: single spatial stream only and with Max S1G-MCS as indicated by a 1 in the S1G-MCS for 1 SS subfield. 3: single spatial stream only and with Max S1G-MCS as indicated by a 2 in the S1G-MCS for 1 SS subfield.
Tx Single Spatial Stream and S1G-MCS Map for 1 MHz	Indicates whether only a single spatial stream PPDU can be transmitted at 1 MHz channel width by this STA.	0: same number of spatial streams and same Max S1G-MCS as indicated by Tx S1G-MCS Map field. 1: single spatial stream only and with Max S1G-MCS as indicated by a 0 in the S1G-MCS for 1 SS subfield. 2: single spatial stream only and with Max S1G-MCS as indicated by a 1 in the S1G-MCS for 1 SS subfield. 3: single spatial stream only and with Max S1G-MCS as indicated by a 2 in the S1G-MCS for 1 SS subfield.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Rx S1G-MCS Map subfield and the Tx S1G-MCS Map subfield have the structure shown in Figure 9-801 (Rx S1G-MCS Map and Tx S1G-MCS Map subfields).

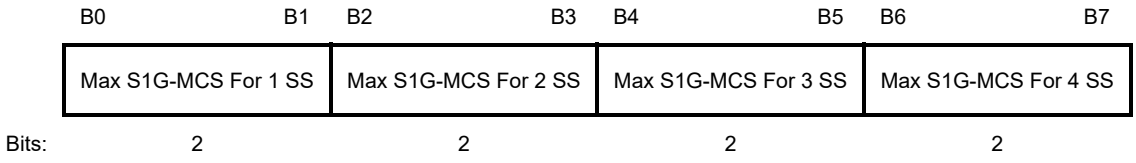

Figure 9-801—Rx S1G-MCS Map and Tx S1G-MCS Map subfields

The Max S1G-MCS for *n* SS subfield (where *n*=1,...,4) is encoded as follows:

— 0 indicates support for S1G-MCS 2 for n spatial streams
— 1 indicates support for S1G-MCS 7 for n spatial streams
— 2 indicates support for S1G-MCS 9 or more (see 9.4.2.199.4) for n spatial streams
— 3 indicates that n spatial streams is not supported

NOTE 2—An S1G-MCS indicated as supported in the S1G-MCS Map fields for a particular number of spatial streams might not be valid at all bandwidths (see 23.5) and might be limited by the declaration of Tx Highest Supported Long GI Data Rates and Rx Highest Supported Long GI Data Rates and might be affected by 10.6.14.3.

NOTE 3—For 1 MHz, MCS 10 is always supported.

9.4.2.199.4 Extended Supported S1G-MCS and NSS Set field

The Extended Supported S1G-MCS and NSS Set field is used to convey the combinations of S1G-MCSs and spatial streams that a STA supports for reception and the combinations that it supports for transmission. The structure of the field is shown in Figure 9-802 (Extended Supported S1G-MCS and NSS Set field format).

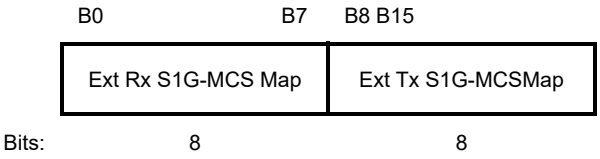

Figure 9-802—Extended Supported S1G-MCS and NSS Set field format

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Extended Supported S1G-MCS and NSS Set subfields are defined in Table 9-353.

Table 9-353—Extended Supported S1G-MCS and NSS Set subfields

Subfield	Definition	Encoding
Ext Rx S1G-MCS Map	Indicates the maximum value of the RXVECTOR parameter MCS of a PPDU that can be received at all channel widths where the MCS is valid for the channel width, supported by this STA for each number of spatial streams.	The format and encoding of this subfield are defined in Figure 9-803 (Ext Rx S1G-MCS Map and Ext Tx S1G-MCS Map subfields) and the associated description.
Ext Tx S1G-MCS Map	Indicates the maximum value of the TXVECTOR parameter MCS of a PPDU that can be transmitted at all channel widths where the MCS is valid for the channel width, supported by this STA for each number of spatial streams.	The format and encoding of this subfield are defined in Figure 9-803 (Ext Rx S1G-MCS Map and Ext Tx S1G-MCS Map subfields) and the associated description.

The Rx S1G-MCS Map subfield and the Tx S1G-MCS Map subfield have the structure shown in Figure 9-803.

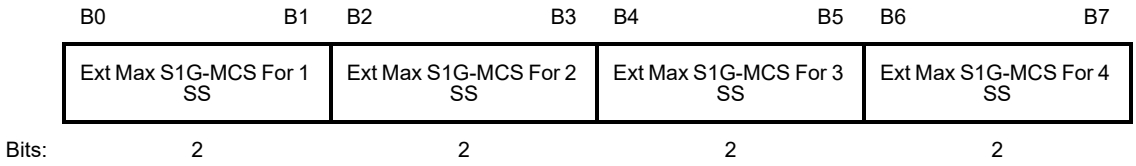

Figure 9-803—Ext Rx S1G-MCS Map and Ext Tx S1G-MCS Map subfields

The Max S1G-MCS for n SS subfield (where n=1,...,4) is encoded as follows:

— 0 indicates support for S1G-MCS 11 for n spatial streams
— 1 indicates support for S1G-MCS 12 for n spatial streams
— 2 is reserved
— 3 indicates that n spatial streams is not supported for S1G-MCS 11

9.4.2.200 SST element

The subchannel selective transmission (SST) element is shown in Figure 9-804 (SST element format).

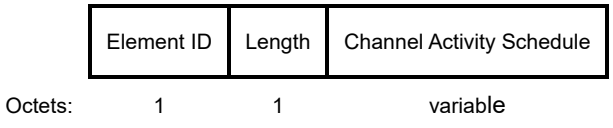

Figure 9-804—SST element format

The Element ID and Length fields are defined in 9.4.2.1.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Channel Activity Schedule subfield contains one or more channel activity schedules.

The format of the Channel Activity Schedule subfield is shown in Figure 9-805 (Channel Activity Schedule subfield format (Sounding Option = 0)) and Figure 9-806 (Channel Activity Schedule subfield format (Sounding Option = 1)).

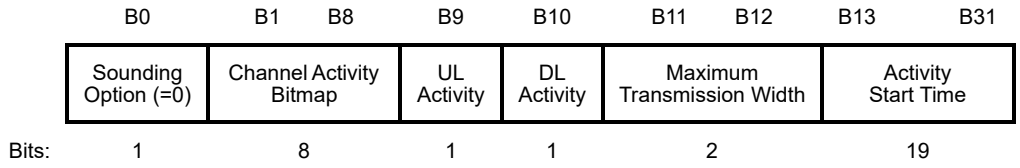

Figure 9-805—Channel Activity Schedule subfield format (Sounding Option = 0)

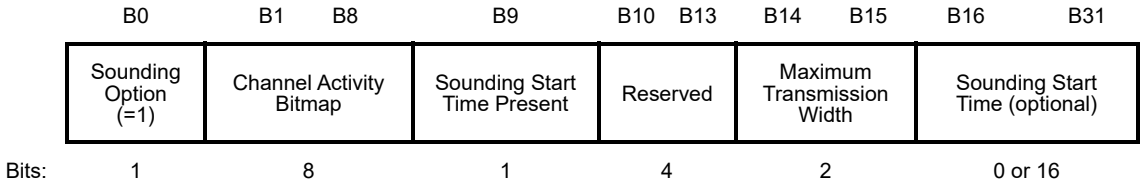

Figure 9-806—Channel Activity Schedule subfield format (Sounding Option = 1)

The Sounding Option subfield is set to 0 to indicate that the Channel Activity Schedule field is the AP Activity schedule.

When the Sounding Option subfield is equal to 0, the Channel Activity Bitmap subfield contains a bitmap indicating on which channels transmission is either expected or permitted by the AP during a given time period. Each bit in the bitmap corresponds to one minimum width channel for the band of operation with the LSB corresponding to the lowest numbered operating channel of the BSS. A 1 in a bit position in the bitmap means that the AP expects activity and/or permits transmissions with bandwidth less than or equal to the bandwidth indicated in the Maximum Transmission Width subfield and that include that channel, after the time indicated in the Activity Start Time subfield. Only one bit in the bitmap can be set to 1 within each channel activity schedule. The minimum width channel is equal to the SST Channel Unit field of the SST Operation element if such an element has been previously transmitted or is equal to 2 MHz if no such element has been previously received from the AP to which the SST STA is associated.

The UL Activity subfield is set to 1 to indicate that the SST AP (that transmits the SST element) permits the STAs associated with it to transmit frames that are not immediate response frames on the channel(s) identified by the Channel Activity Bitmap and Maximum Transmission Width subfields at the time indicated in the Activity Start Time subfield. Otherwise it is set to 0.

The DL Activity subfield is set to 1 to indicate that the AP that transmits the SST element intends to transmit frames that are not immediate response frames on the channel(s) identified by the Channel Activity Bitmap and Maximum Transmission Width subfields at the time indicated in the Activity Start Time subfield. Otherwise it is set to 0.

The Maximum Transmission Width subfield indicates the maximum PPDU bandwidth permitted by the AP for a transmission on the indicated channel and cannot exceed the BSS operating channel width specified by the AP in a transmitted S1G Operation element. In order to abide by the rules of each regulatory domain, the maximum operating channel width is limited by the BSS operating channel width even if the Maximum Transmission Width field specifies otherwise. The maximum permitted PPDU bandwidth is in MHz and is determined based on the Maximum Transmission Width subfield as shown in Table 9-354.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-354—Mapping between Maximum Transmission Width subfield and maximum permitted PPDU bandwidth

Maximum Transmission Width	Maximum permitted PPDU bandwidth (MHz)
0	channel width unit
1	4
2	8
3	16

NOTE—The channel width unit is equal to 1 MHz if the SST Channel Unit field of the most recently received SST Operation element from the SST AP is equal to 1. If no SST Operation element has been received or the SST Channel Unit field of the received SST Operation element is equal to 0 then the channel width unit is equal to 2 MHz.

The Activity Start Time subfield contains a value that defines a start time for when the AP expects frame transmissions to begin on the channel(s) indicated in the corresponding Channel Activity Bitmap field. The start time is triggered when the 19 least significant bits of the TSF timer for the BSS match the value that is indicated in the Activity Start Time subfield of the SST element. The count down to the start time is initiated at the end of the transmission of the frame containing the SST element.

The Sounding Option subfield is set to 1 in order to indicate that the Channel Activity Schedule field is the SST sounding schedule.

When the Sounding Option subfield is equal to 1, the Channel Activity Bitmap subfield contains a bitmap indicating on which channels there is an SST sounding transmission activity at a given time. Each bit in the bitmap corresponds to one minimum width channel for the band of operation with the LSB corresponding to the lowest numbered operating channel of the BSS. A 1 in a bit position in the bitmap means that the AP transmits one more PIFS-separated sounding NDPs.

The Sounding Start Time Present subfield indicates whether the Sounding Start Time subfield is present in the Channel Activity Schedule field. If the subfield is equal to 1, the Sounding Start Time subfield is present. If this subfield is equal to 0, the Sounding Start Time subfield is not present.

The Maximum Transmission Width subfield indicates the channel bandwidth of the sounding NDP and is shown in Table 9-354.

The Sounding Start Time subfield contains a value that defines a start time when the AP transmits one or more sounding NDPs on the channel(s) indicated in the corresponding Channel Activity Bitmap subfield. If the Sounding Start Time subfield is not present, the AP transmits one or more PIFS-separated sounding NDPs starting after the transmission of the Beacon frame containing the SST element. If the Sounding Start Time subfield is present, the AP transmits one or more PIFS-separated sounding NDPs starting at the time indicated in the Sounding Start Time field. The start time is triggered when the 16 least significant bits of the TSF timer for the BSS match the value that is indicated in the Sounding Start Time subfield of the SST element. The count down to the start time is initiated at the end of the transmission of the frame containing the SST element.

9.4.2.201 Authentication Control element

The notation of Authentication-Request and Authentication-Response refers to the definition in 13.1.

The Authentication Control element contains the information required to mitigate contention among Authentication-Request frames (see 11.3.9).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

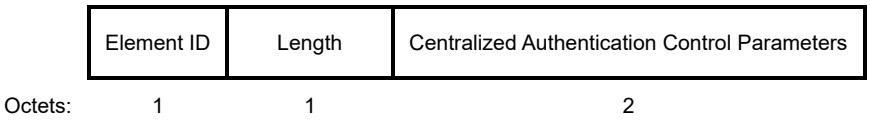

Figure 9-807—Authentication Control element format (Control subfield equal to 0)

The Element ID and Length fields are defined in 9.4.2.1.

The Information field starts with a 1-bit Control subfield.

When the Control subfield is equal to 0, the Authentication Control element format is as shown in Figure 9-807 (Authentication Control element format (Control subfield equal to 0)). The Authentication Control element indicates whether the recipient STA can transmit an Authentication-Request frame to the AP that sends the element. The remaining part of the Centralized Authentication Control Parameters field Information field following the Control subfield contains the Deferral, Reserved and the Authentication Control Threshold subfields.

The Centralized Authentication Control Parameters field format is shown in Figure 9-808 (Centralized Authentication Control Parameters format).

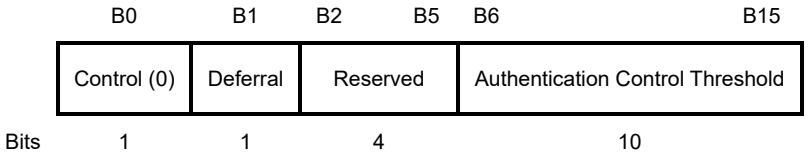

Figure 9-808—Centralized Authentication Control Parameters format

The Authentication Control Threshold subfield contains a number with a range from 0 to 1023. When the Deferral subfield is equal to 0, the value of the Authentication Control Threshold subfield is used by the recipient STA to determine whether or not the AP is allowing it to transmit an Authentication-Request frame. When the Deferral subfield is equal to 1, the Authentication Control Threshold subfield value is a time value, expressed in TUs, indicating a minimum amount of deferred time for channel access that is required before the transmission of an Authentication-Request frame and is set as described in 11.3.9.2.

When the Control subfield is equal to 1, the Authentication Control element contains the Distributed Authentication Control Parameters field as shown in Figure 9-809 (Authentication Control element format (Control subfield equal to 1)).

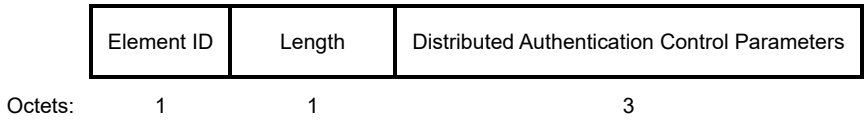

Figure 9-809—Authentication Control element format (Control subfield equal to 1)

The Distributed Authentication Control Parameters field format is shown Figure 9-810 (Distributed Authentication Control Parameters format).

The Authentication Slot Duration subfield is expressed in units of TUs and indicates the authentication slot duration.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

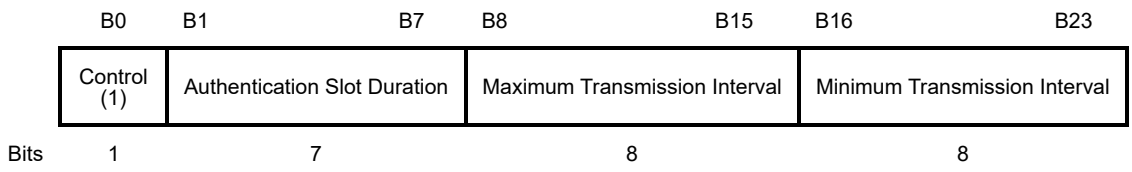

Figure 9-810—Distributed Authentication Control Parameters format

The Minimum Transmission Interval subfield is expressed in units of beacon intervals and indicates the minimum transmission interval (see 11.3.9.3).

9.4.2.202 TSF Timer Accuracy element

The TSF Timer Accuracy element, shown in Figure 9-811 (TSF Timer Accuracy element format), specifies fields describing the accuracy of TSF timer. This information is used by a receiving STA to estimate the clock accuracy of the transmitting STA and to schedule the time to transition to awake state for Beacon frame reception by taking this clock accuracy into account.

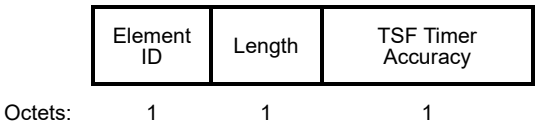

Figure 9-811—TSF Timer Accuracy element format

The Element ID and Length fields are defined in 9.4.2.1.

The TSF Timer Accuracy field specifies the accuracy of the TSF timer of transmitting STA. The unit of the TSF Timer Accuracy field is ppm. The values between 125 and 255 are reserved for future expansion.

9.4.2.203 S1G Relay element

The S1G Relay element contains parameters necessary to support the relay operation and its format is shown in Figure 9-812 (S1G Relay element format).

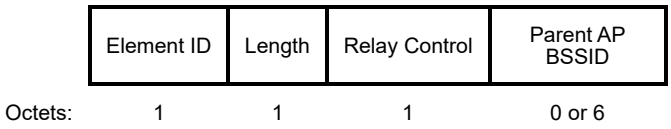

Figure 9-812—S1G Relay element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of Relay Control field is shown in Figure 9-813 (Relay Control field format).

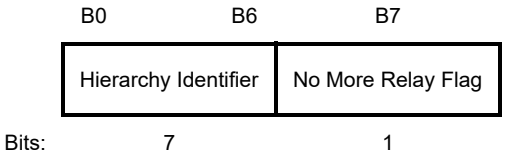

Figure 9-813—Relay Control field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Hierarchy Identifier subfield indicates whether the AP is a root AP or whether it relays an SSID, as specified in Table 9-355.

Table 9-355—Hierarchy Identifier subfield

Hierarchy Identifier	Meaning
0	Parent AP
1	S1G Relay AP that relays frames within the BSS identified by the BSSID contained in the RootAP BSSID field
2–127	Reserved

The No More Relay Flag subfield is set to 1, to indicate that the AP does not accept any more requests for operating as relays from its associated non-AP STAs. Otherwise it is set to 0.

The Parent AP BSSID field indicates the BSSID of the parent AP's BSS. The Parent AP BSSID field is present if the Hierarchy Identifier subfield is set to a nonzero value. Otherwise the Parent AP BSSID field is not present.

9.4.2.204 Reachable Address element

The format of the Reachable Address element is shown in Figure 9-814 (Reachable Address element format).

	Element ID	Length	Initiator MAC Address	Address Count	Reachable Addresses
Octets:	1	1	6	1	variable

Figure 9-814—Reachable Address element format

The Element ID and Length fields are defined in 9.4.2.1.

The Initiator MAC Address field indicates the MAC address of the relay STA that transmits the Reachable Address element.

The Address Count field is an integer representing the number of addresses in the Reachable Addresses field.

The Reachable Addresses field contains one or more Reachable Address subfields

The Reachable Address subfields indicate the MAC addresses that can be reached through the relay STA. The format of the Reachable Address subfield is shown in Figure 9-815 (Reachable Address subfield format).

The Add/Remove subfield is set to 1 if the MAC address is the address of a new STA joining the relay. Add/Remove subfield is set to 0 if the MAC address is the address of a STA leaving the relay. The Add/Remove subfield is set to 1 if the Reachable Address element is included within a (Re)Association Request frame.

The Relay Capable subfield is set to 1 if the STA is relay capable, otherwise it is set to 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

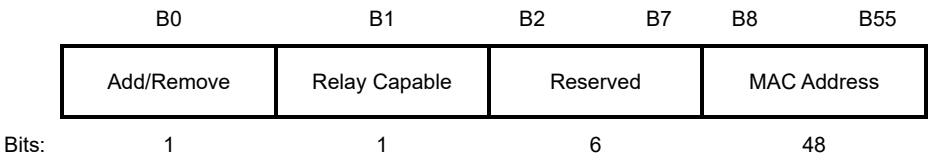

Figure 9-815—Reachable Address subfield format

The MAC Address subfield is set to the MAC address of the STA that joins or leaves the BSS.

9.4.2.205 S1G Relay Activation element

The format of the S1G Relay Activation element is shown in Figure 9-816 (S1G Relay Activation element format).

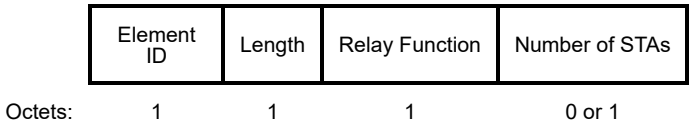

Figure 9-816—S1G Relay Activation element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Relay Function field is shown in Figure 9-817 (Relay Function field format).

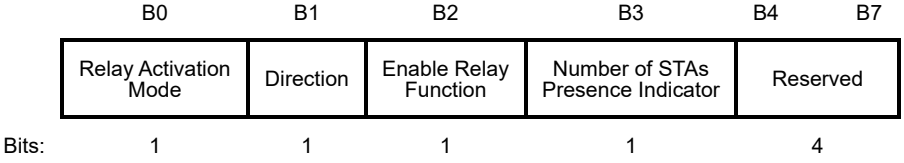

Figure 9-817—Relay Function field format

The Relay Activation Mode subfield is set to 1 to indicate that this element is a relay activation request. The Relay Activation Mode subfield is set to 0 to indicate the relay activation response.

The Direction subfield is set to 1 if the S1G Relay Activation element is sent by the AP. The Direction subfield is set to 0 if the S1G Relay Activation element is sent by the non-AP STA.

The Enable Relay Function subfield is set to a value based on the Direction and Relay Activation Mode subfield as described in Table 9-356.

When the S1G Relay Activation element is sent by an AP, the Number of STAs Presence Indicator subfield is set to 1 to indicate that a Number of STAs field is included in the S1G Relay Activation element. Otherwise, it is set to 0.

The Number of STAs field contains an unsigned integer. The Number of STAs field is used to calculate the maximum number of STAs, N_{max}, that an S1G relay AP is allowed to associate. N_{max} is determined as follows:

$$N_{max} = \text{Number of STAs} \times 32$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-356—Enable Relay Function subfield values

	Relay Activation Mode=1 (Request)	Relay Activation Mode=0 (Response)
Direction=1 (from AP)	If the Enable Relay Function subfield is set to 1, it indicates that the non-AP STA can operate as a relay and if it is set to 0 it indicates AP demands the non-AP STA to terminate the relay function.	If the Enable Relay Function subfield is set to 1, it indicates that the non-AP STA is allowed to operate as a relay and if it is set to 0, it indicates that the non-AP STA cannot operate as a relay.
Direction=0 (from non-AP STA)	If the Enable Relay Function subfield is set to 1, it indicates that the non-AP STA requests to activate its relay function and if it is set to 0, it indicates that the non-AP STA requests to terminate its relay function.	If the Enable Relay Function subfield is set to 1, it indicates that the non-AP STA activates its relay function and if it is set to 0, it indicates that the non-AP STA terminates its relay function.

9.4.2.206 S1G Relay Discovery element

The S1G Relay Discovery element is shown in Figure 9-818 (S1G Relay Discovery element format).

	Element ID	Length	Relay Discovery Control	UL/DL Data Rate (optional)	Delay Bound Requirement/ Channel Utilization (optional)	Min PHY Rate Requirement/ Relay Station Count (optional)
Octets:	1	1	1	0 to 6	0 or 1	0 or 1

Figure 9-818—S1G Relay Discovery element format

The Element ID and Length fields are defined in 9.4.2.1.

The Relay Discovery Control field contains information indicating whether some or all following fields (see Figure 9-819 (UL/DL Data Rate field format)) are included in the S1G Relay Discovery element. The structure of Relay Discovery Control field is shown later in this subclause in Figure 9-820 (Relay Discovery Control field format).

	UL Min Data Rate (optional)	UL Mean Data Rate (optional)	UL Max Data Rate (optional)	DL Min Data Rate (optional)	DL Mean Data Rate (optional)	DL Max Data Rate (optional)
Octets:	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1

Figure 9-819—UL/DL Data Rate field format

When UL Min Data Rate field is included in an S1G Relay Discovery element in a Probe Request frame, it indicates the UL minimum data rate of the direct link between the non-AP STA and AP in the unit of 100 kb/s. When UL Min Data Rate field is included in an S1G Relay Discovery element in a Probe Response or Beacon frame, it indicates the UL minimum data rate of the relay link between the relay and its associated AP in the unit of 100 kb/s.

When UL Mean Data Rate field is included in an S1G Relay Discovery element in a Probe Request frame, it indicates the UL mean data rate of the direct link between the non-AP STA and AP in the unit of 100 kb/s. When UL Mean Data Rate field is included in an S1G Relay Discovery element in a Probe Response or

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Beacon frame, it indicates the UL mean data rate of the relay link between the relay and its associated AP in the unit of 100 kb/s.

When UL Max Data Rate field is included in an S1G Relay Discovery element in a Probe Request frame, it indicates the UL maximum data rate of the direct link between the non-AP STA and AP in the unit of 100 kb/s. When UL Max Data Rate field is included in an S1G Relay Discovery element in a Probe Response or Beacon frame, it indicates the UL maximum data rate of the relay link between the relay and its associated AP in the unit of 100 kb/s.

When DL Min Data Rate field is included in an S1G Relay Discovery element in a Probe Request frame, it indicates the DL minimum data rate of the direct link between the non-AP STA and AP in the unit of 100 kb/s. When DL Min Data Rate field is included in an S1G Relay Discovery element in a Probe Response or Beacon frame, it indicates the DL minimum data rate of the relay link between the relay and its associated AP in the unit of 100 kb/s.

When DL Mean Data Rate field is included in an S1G Relay Discovery element in a Probe Request frame, it indicates the DL mean data rate of the direct link between the non-AP STA and AP in the unit of 100 kb/s. When DL Mean Data Rate field is included in an S1G Relay Discovery element in a Probe Response or Beacon frame, it indicates the DL mean data rate of the relay link between the relay and its associated AP in the unit of 100 kb/s.

When DL Max Data Rate field is included in an S1G Relay Discovery element in a Probe Request frame, it indicates the DL maximum data rate of the direct link between the non-AP STA and AP in the unit of 100 kb/s. When DL Max Data Rate field is included in an S1G Relay Discovery element in a Probe Response or Beacon frame, it indicates the DL maximum data rate of the relay link between the relay and its associated AP in the unit of 100 kb/s.

When included in the S1G Relay Discovery element of a Probe Request frame and the Delay and Rate Requirement Included field in the Relay Discovery Control field of the S1G Relay Discovery element is equal to 1, the Delay Bound Requirement/Channel Utilization field indicates the delay bound requirement of the connection through the relay. When included in the S1G Relay Discovery element that is included in a Probe Response or a Beacon frame and the Utilization and Count Included field in the Relay Discovery Control field of the S1G Relay Discovery element is equal to 1, the Delay Bound Requirement/Channel Utilization field denotes the ratio of time that relay observes the busy level on the relay link between the relay and the AP, with value 100 indicating 100% busy level and value 0 indicating idle (values from 101 to 255 are reserved).

When included in the S1G Relay Discovery element of a Probe Request frame and the Delay and Min PHY Rate Requirement Included field in the Relay Discovery Control field of the S1G Relay Discovery element is equal to 1, the Min PHY Rate Requirement/Relay Station Count field indicates the minimum PHY data rate set required by the requesting STA. When included in the S1G Relay Discovery element of a Probe Response or a Beacon frame and the Utilization and Relay Count Included field in the Relay Discovery Control field of the S1G Relay Discovery element is equal to 1, the Min PHY Rate Requirement/Relay Station Count field denotes the number of non-AP STAs currently associated with the relay.

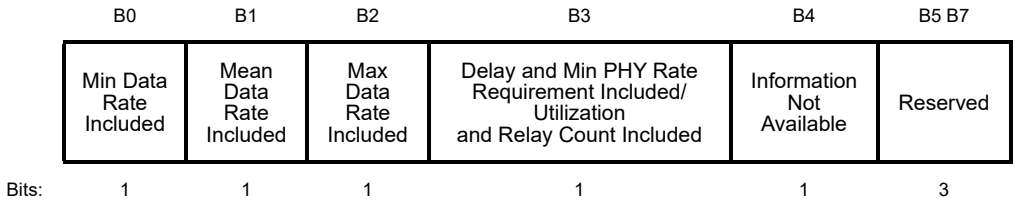

Figure 9-820—Relay Discovery Control field format

The Min Data Rate Included field is set to 1 if UL Min Data Rate field and DL Min Data Rate field are included in the S1G Relay Discovery element. Otherwise, the Min Data Rate Included field is set to 0.

The Mean Data Rate Included field is set to 1 if UL Mean Data Rate field and DL Mean Data Rate field are included in the S1G Relay Discovery element. Otherwise, the Mean Data Rate Included field is set to 0.

The Max Data Rate Included field is set to 1 if UL Max Data Rate field and DL Max Data Rate field are included in the S1G Relay Discovery element. Otherwise, the Max Data Rate Included field is set to 0.

The Delay and Rate Requirement Included/Utilization and Count Included field is set to 1 if Delay Bound Requirement/Channel Utilization field and Min PHY Rate Requirement/Relay Station Count field are included in the S1G Relay Discovery element. Otherwise, the Delay and Rate Requirement Included/ Utilization and Count Included field is set to 0.

The Information Not Available field is set to 1 if the relay does not provide the requested information. Otherwise, the Information Not Available field is set to 0.

9.4.2.207 AID Announcement element

The AID Announcement element is used to provide the mapping table between STAs' MAC addresses and AIDs. The format of the AID Announcement element is shown in Figure 9-821 (AID Announcement element format).

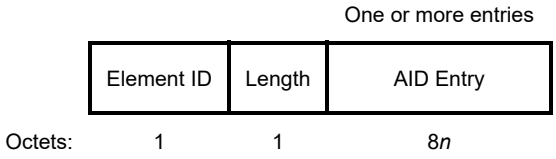

Figure 9-821—AID Announcement element format

The Element ID and Length fields are defined in 9.4.2.1.

The AID Entry field includes one or more STA MAC address and association ID pairs. The format of AID Entry field is shown in Figure 9-822 (AID Entry field format).

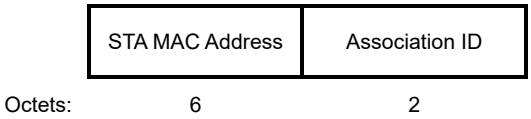

Figure 9-822—AID Entry field format

The STA MAC Address field indicates the MAC address of STA. The Association ID field, which has the same format as the AID field described in 9.4.1.8, includes the AID for the corresponding STA. If AID Announcement element is included in a frame that is transmitted by a relay STA and the Association ID field equals to 0, the STA MAC Address field indicates the BSSID of the relay AP's BSS.

9.4.2.208 PV1 Probe Response Option element

The PV1 Probe Response Option element is included in the Probe Request frame to indicate the optional information requested to be included in the PV1 Probe Response frame that is transmitted by the responding STAs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The optional information requested by the STA is indicated as bitmaps in the PV1 Probe Response Option element.

The format of the PV1 Probe Response Option element is shown in Figure 9-823 (PV1 Probe Response Option element format).

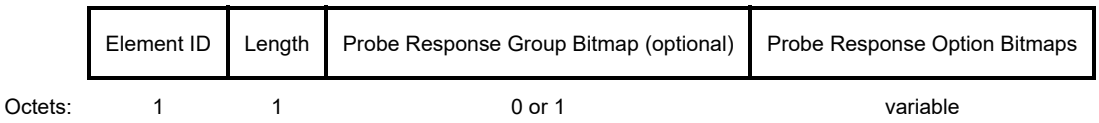

Figure 9-823—PV1 Probe Response Option element format

The Element ID and Length fields are defined in 9.4.2.1.

The Probe Response Group Bitmap field indicates the Probe Response Option Bitmap subfield(s) included in the PV1 Probe Response Option element. If Probe Response Option Bitmap subfield *i* is included in the PV1 Probe Response Option element, then *i*-th bit in the Probe Response Group Bitmap field is set to 1.

The Probe Response Option Bitmaps field contains one or more Probe Response Option Bitmap subfields.

Each Probe Response Option Bitmap subfield is 1 octet and indicates the optional information requested to be included in the PV1 Probe Response frame by the responding STAs. Setting a bit in a Probe Response Option Bitmap subfield to 1 indicates that the corresponding information is requested to be included in the PV1 Probe Response frame if the responding STA supports the indicated information.The bit is set to 0 to indicate that the information is not requested.

The optional information requested to be included in the PV1 Probe Response is categorized into 8 bitmaps (Probe Response Option bitmap 0 ~ 7).

Only Probe Response Option Bitmap subfields with at least one bit equal to 1 is included in the PV1 Probe Response Option element. For example, if only Probe Response Option Bitmap subfield 0 and 2 have bits that are equal to 1, then these two Probe Response Group Bitmap fields are included in the PV1 Probe Response Option element and the Probe Response Group Bitmap field is set to 10100000 to indicate that only the Probe Response Option Bitmap subfields 0 and 2 are included in the PV1 Probe Response Option element. When the Probe Response Group Bitmap field is included in the PV1 Probe Response Option element, at least one bit of the Probe Response Group Bitmap field is equal to 1.

Probe Response Option Bitmap subfield 0 is defined to be a default bitmap that indicates most frequently requested information. If the default bitmap is the only Probe Response Option Bitmap subfield that is included in the PV1 Probe Response Option element, then the Probe Response Group Bitmap field is omitted. In that case, only Element ID, Length, and the default bitmap (Probe Response Option Bitmap subfield 0) are included in the PV1 Probe Response Option element.

Table 9-357 to Table 9-362 define the Probe Response Option bitmap from 0 to 5, respectively.

NOTE—Probe Response Option bitmap 6 and 7 are reserved for future extension.

9.4.2.209 EL Operation element

The EL Operation element is used by a STA to inform the associated AP or TDLS peer STA about operating limitations of the STA, in terms of the maximum continuous time the STA is capable of being in the awake state, and the minimum continuous time the STA stays in doze state in between awake periods. The format of the EL Operation element is presented in Figure 9-824 (EL Operation element format).

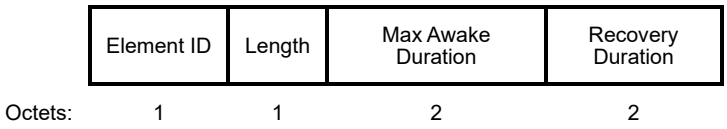

Figure 9-824—EL Operation element format

The Element ID and Length fields are defined in 9.4.2.1.

The Max Awake Duration field indicates a time in units of 40 μs, used as defined in 11.46; a value 0 indicates that no limit applies.

The Recovery Duration field indicates a time in units of 40 μs, used as defined in 11.46.

9.4.2.210 Sectorized Group ID List element

The Sectorized Group ID List element includes the information necessary for a receiving STA to determine its sectorization group membership. An example of group use is the sector operation. In sector operation, only a set of STA groups is allowed to transmit during the sector duration. The Sectorized Group ID List element can be provided in Probe Response or (Re)Association Response frame.

The format of the Sectorized Group ID List element is presented in Figure 9-825 (Sectorized Group ID List element format).

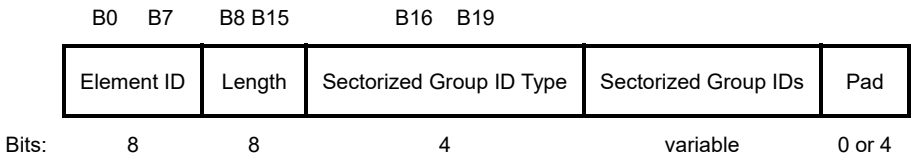

Figure 9-825—Sectorized Group ID List element format

The Element ID and Length fields are defined in 9.4.2.1.

The Sectorized Group ID Type field indicates the sectorized group IDs usage. Setting the Sectorized Group ID Type field to 0 indicates that the values in the Sectorized Group ID subfields refer to STAs in sectorization use. The values of the Sectorized Group ID Type field other than 0 are reserved for other purposes.

The Sectorized Group IDs field contains one or more Sectorized Group ID subfields.

Each Sectorized Group ID subfield is 4 bits and indicates a new sectorized group ID that is associated with the receiver STAs. A value of 15 in the Sectorized Group ID subfield is reserved for padding bits.

The Pad field contains 0 or 4 bits of 1s to make the total number of bits in the Sectorized Group ID List element equal to an integer number of octets.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.211 S1G Operation element

The operation of S1G STAs in the BSS is controlled by the S1G Operation element. The format of the S1G Operation element is defined in Figure 9-826 (S1G Operation element format).

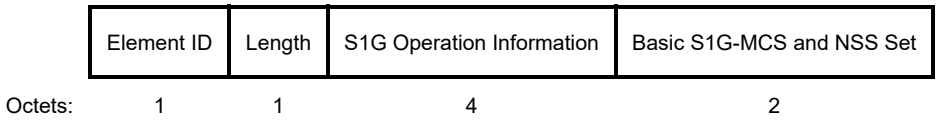

Figure 9-826—S1G Operation element format

The Element ID and Length fields are defined in 9.4.2.1.

The structure of the S1G Operation Information field is defined in Figure 9-827 (S1G Operation Information field format).

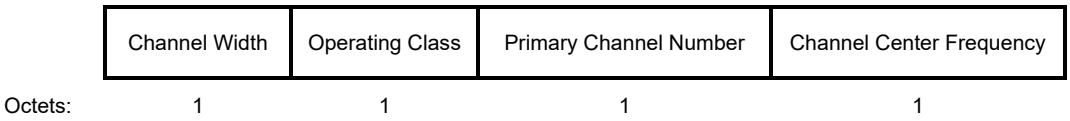

Figure 9-827—S1G Operation Information field format

The subfields of the S1G Operation Information field are defined in Table 9-363.

Table 9-363—S1G Operation Information field

Fields	Definition	Encoding
Channel Width	This field defines the BSS operating channel width (see Table 10-39 in 10.45.1 also).	Bitmap of B0–B4 indicates the primary channel width, and the operating channel widths, 1/2/4/8/16 MHz. The Primary Channel Width subfield, located in B0 of this field, and the BSS Operating Channel Width subfield, located in B1–B4 of this field, are defined in Table 10-39. B5 indicates the location of 1 MHz primary channel within the 2 MHz primary channel — B5 is set to 0 to indicate that is located at the lower side of 2 MHz primary channel. — B5 is set to 1 to indicate that is located at the upper side of 2 MHz primary channel. B6 is reserved. B7 is set to 1 to indicate that it is recommended that a STA does not use MCS 10.
Operating Class	This field defines the operating class in which the BSS is operating.	The operating class of the BSS.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-363—S1G Operation Information field

Fields	Definition	Encoding
Primary Channel Number	Primary Channel Number field indicates the channel number of 2 MHz primary channel or 1 MHz primary channel.	Channel number of the primary channel.
Channel Center Frequency	Defines the channel center frequency.	Indicates the channel index of the BSS operating channel (see 23.3.14).

The Basic S1G-MCS and NSS Set field indicates the S1G-MCSs for each number of spatial streams in S1G PPDUs that are supported by all S1G STAs in the BSS. The format of the Basic S1G-MCS and NSS Set field is shown in Figure 9-828 (Basic S1G-MCS and NSS Set field format).

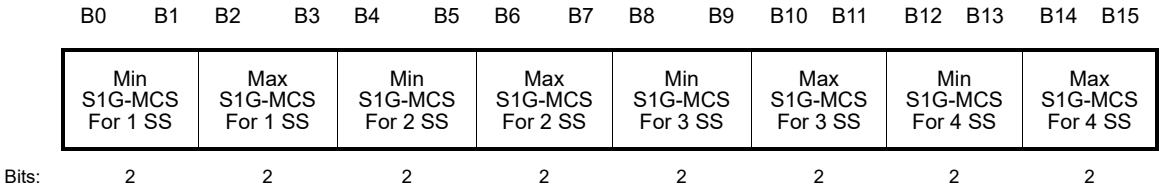

Figure 9-828—Basic S1G-MCS and NSS Set field format

Each Max S1G-MCS indicates the supported S1G-MCS set for NSS from 1 to 4 while each Min S1G-MCS indicates whether certain S1G-MCS values are not recommended for NSS from 1 to 4.

The Max S1G-MCS For *n* SS subfield (where *n* = 1,...,4) is same as the field with the same name that is defined in the S1G Capabilities element.

NOTE—Neither S1G-MCS 11 nor S1G-MCS 12 can be in the basic S1G-MCS and NSS set.

The Min S1G-MCS For *n* SS subfield (where *n* = 1,...,4) is encoded as follows:

— 0 indicates no minimum MCS restriction for n spatial streams.
— 1 indicates S1G-MCS 0 for *n* spatial streams is not recommended.
— 2 indicates S1G-MCS 0 and 1 for *n* spatial streams is not recommended.
— 3 is reserved.

9.4.2.212 Header Compression element

The Header Compression element is used by a STA to inform its intended receiver regarding frame header fields that are compressed and that it needs to store. The format of the Header Compression element is shown in Figure 9-829 (Header Compression element format).

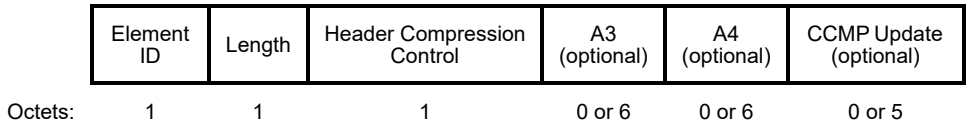

Figure 9-829—Header Compression element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Header Compression Control field is shown in Figure 9-830 (Header Compression Control field format).

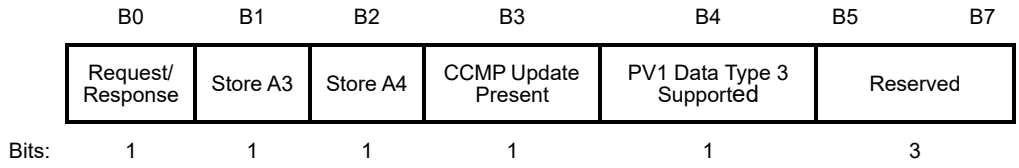

Figure 9-830—Header Compression Control field format

The Request/Response subfield is set to 0 to indicate a header compression request and set to 1 to indicate a header compression response.

The Store A3 subfield is set to 1 in the header compression request to request the intended receiver of the frame to store the A3 field and is set to 1 in the header compression response to confirm storage of the A3 field. Otherwise, it is set to 0 in the header compression request to indicate no storage request for the A3 field and is set to 0 in the header compression response to indicate unsuccessful storage or release of the stored A3 field.

The Store A4 subfield is set to 1 to request the intended receiver of the header compression request to store the A4 field and is set to 1 in the header compression response to confirm storing of the A4 field. Otherwise, it is set to 0 in the header compression request to indicate no storage request for the A4 field and is set to 0 in the header compression response to indicate unsuccessful storage or release of the stored A4 field.

The CCMP Update Present subfield is set to 1 to indicate the intended receiver of the header compression request to update the base packet number (BPN) and Key ID fields for the specified sequence number (SN) space, as identified by the PTID subfield and Management subfield in the CCMP Update field and is set to 1 in the header compression response to confirm the update of the fields or to indicate decryption error for the specified SN space. Otherwise, it is set to 0 in the header compression request to indicate no CCMP update request and is set to 0 in the header compression response to indicate no CCMP update confirmation.

NOTE—See Table 10-5 for SN space selection.

The PV1 Data Type 3 Supported subfield is set to 1 to indicate that reception of PV1 frames with Type field equal to 3 is enabled. Otherwise, it is set to 0.

The A3 field in the Header Compression element is present if the Request/Response subfield is 0 and the Store A3 subfield is 1. Otherwise, it is not present.

The A4 field in the Header Compression element is present if the Request/Response subfield is 0 and the Store A4 subfield is 1. Otherwise, it is not present.

The CCMP Update field in the Header Compression element is present if the CCMP Update Present subfield is 1. Otherwise, it is not present.

The CCMP Update field contains the BPN and key ID for the specified SN space, as shown in Figure 9-831 (CCMP Update field format).

The BPN subfield contains the BPN for the specified SN space. The BPN subfield consists of the PN2, PN3, PN4, and PN5 octets, as shown in Figure 9-832 (BPN subfield format).

The Key ID subfield contains the key ID for the specified SN space.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

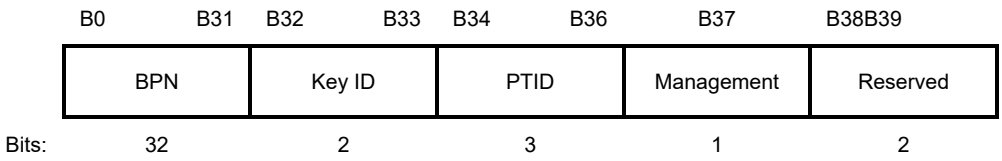

Figure 9-831—CCMP Update field format

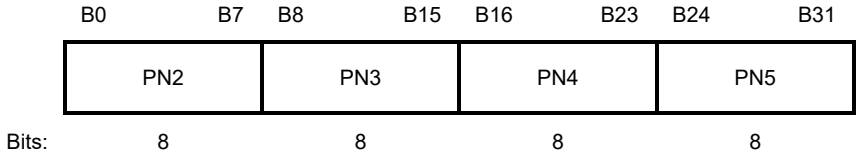

Figure 9-832—BPN subfield format

The PTID subfield contains the PTID for the specified SN space when the Management subfield value is 0, and is set to 0 otherwise.

The Management subfield is set to 1 to identify the specified SN space as SNS7, which is for individually addressed PV1 Management frames, and is set to 0 otherwise.

9.4.2.213 SST Operation element

The Subchannel Selective Transmission (SST) Operation element is shown in Figure 9-833 (SST Operation element format)

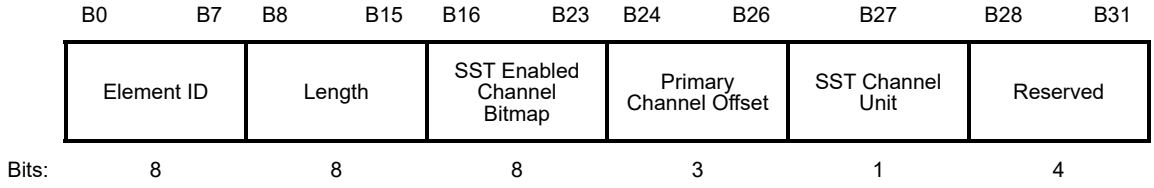

Figure 9-833—SST Operation element format

The Element ID and Length fields are defined in 9.4.2.1.

The SST Enabled Channel Bitmap field contains a bitmap indicating the channels that are enabled for SST operation. Each bit in the bitmap corresponds to one channel of width equal to the value of SST Channel Unit field, with the least significant bit corresponding to the lowest numbered subchannel in the SST Enabled Channel Bitmap field. The channel number of each of the channels in the SST Enabled Channel Bitmap field is equal to PCN minus OPC plus POS, where PCN is the value of the Primary Channel Number subfield in the most recently transmitted S1G Operation element, OPC is the offset of the primary channel relative to the lowest numbered subchannel in the bitmap as specified by the value of the Primary Channel Offset field and POS is the position of the channel in the bitmap. Setting a bit position in the bitmap to 1 indicates that the subchannel is enabled for SST operation but transmissions from SST STAs in that subchannel are allowed subject to the rules defined in 10.51. More than one bit in the bitmap can be equal to 1.

The Primary Channel Offset field indicates the relative position of the primary channel with respect to the lowest numbered channel in the SST Enabled Channel Bitmap field. For example, setting the Primary

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Channel Offset field to 2 indicates that the primary channel is the third subchannel in the SST Enabled Channel Bitmap.

The SST Channel Unit field indicates the channel width unit of each SST channel. Setting the field to 1 indicates that the channel width unit is 1 MHz and setting the field to 0 indicates that the channel width unit is 2 MHz.

9.4.2.214 MAD element

The MAD element is shown in Figure 9-834 (MAD element format).

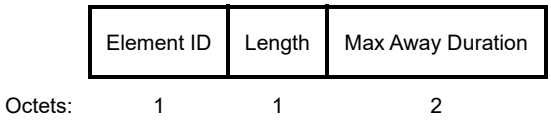

Figure 9-834—MAD element format

The Element ID and Length fields are defined in 9.4.2.1.

The Max Away Duration field indicates the maximum duration that the AP can be out of reach for the STA (operating in other channels, enter power save mode, or operating in other RAWs). The value of the Max Away Duration field is expressed in units of TU.

9.4.2.215 Password Identifier element

The Password Identifier element contains a string used to look up a password. The format of the element is defined in Figure 9-835 (Password Identifier element format).

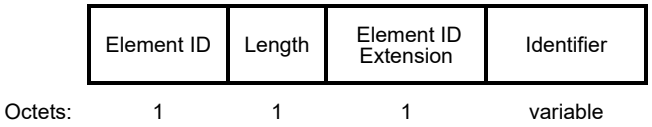

Figure 9-835—Password Identifier element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Identifier field is a variable-length string that identifies a password as specified in 12.4.

9.4.2.216 Max Channel Switch Time element

The Max Channel Switch Time element indicates the time delta between the time the last beacon is transmitted by the AP in the current channel and the expected time of the first beacon transmitted by the AP in the new channel. The format of the element is defined in Figure 9-836 (Max Channel Switch Time element format).

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Switch Time field indicates the maximum time delta between the TBTT of the last Beacon frame transmitted by the AP in the current channel and the TBTT of the first Beacon frame in the new channel, expressed in TUs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

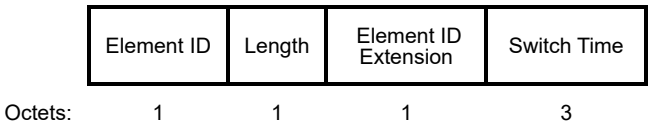

Figure 9-836—Max Channel Switch Time element format

This element is optionally present in Beacon and Probe Response frames when a Channel Switch Announcement or Extended Channel Switch Announcement element is also present.

9.4.2.217 Vendor Specific Request element

This element is placed in a Probe Request frame or Information Request frame to request that the responding STA include the requested information in the Probe Response frame or Information Response frame, respectively. It is used to make one or more requests to the responding STA using Vendor Specific Information. The format of the element is shown in Figure 9-837 (Vendor Specific Request element format).

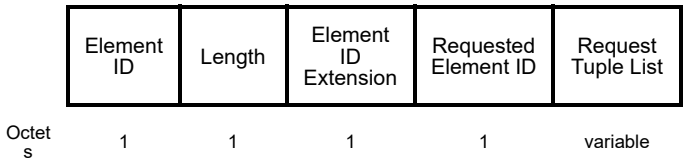

Figure 9-837—Vendor Specific Request element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Requested Element ID field is set to 221 (Vendor Specific as defined in 9.4.2.1).

The Request Tuple List field contains one or more Request Tuple fields. The format of a Request Tuple field is shown in Figure 9-838 (Request Tuple field format).

Figure 9-838—Request Tuple field format

The Length of Request field is the length of the Organization Identifier and Requested Vendor Specific Information fields. The Organization Identifier field is described in 9.4.1.29. The Requested Vendor Specific Information field is a sequence of octets that comprise individual requests.

See 11.1.4.3.9 for additional requirements.

9.4.2.218 CDMG Capabilities element

9.4.2.218.1 General

The capabilities of a CDMG STA include the capabilities indicated by both the DMG Capabilities element (9.4.2.126) and the CDMG Capabilities element (9.4.2.218). The CDMG Capabilities element contains a STA identifier and several fields to indicate the capabilities that are applicable for a CDMG STA; they are not applicable for a DMG STA. A CDMG STA uses the CDMG Capabilities element to advertise the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

support of optional CDMG capabilities. The element is present in Association Request, Association Response, Reassociation Request, Reassociation Response, Probe Request, and Probe Response frames and is optionally present in DMG Beacon, Information Request, and Information Response frames. The CDMG Capabilities element is formatted as defined in Figure 9-839 (CDMG Capabilities element format).

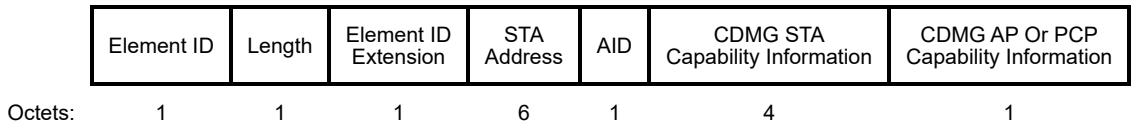

Figure 9-839—CDMG Capabilities element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The STA Address field contains the MAC address of the STA.

The AID field contains the AID assigned to the STA by the AP or PCP. The AID field is reserved in Association Request, Reassociation Request, and Probe Request frames and when used in an IBSS.

9.4.2.218.2 CDMG STA Capability Information field

The CDMG STA Capability Information field, shown in Figure 9-840 (CDMG STA Capability Information field format), represents the transmitting STA capabilities irrespective of the role of the STA.

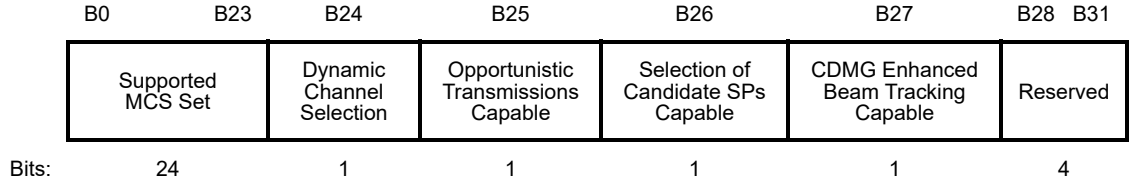

Figure 9-840—CDMG STA Capability Information field format

The Supported MCS Set subfield indicates the MCSs a CDMG STA supports. A MCS is identified by a MCS index, which is represented by an integer in the range 0 to 23. The interpretation of the MCS index (i.e., the mapping from MCS to data rate) is PHY dependent. For the CDMG PHY, see Clause 24. The structure of the Supported MCS Set subfield is defined in Figure 9-841 (Supported MCS Set subfield format).

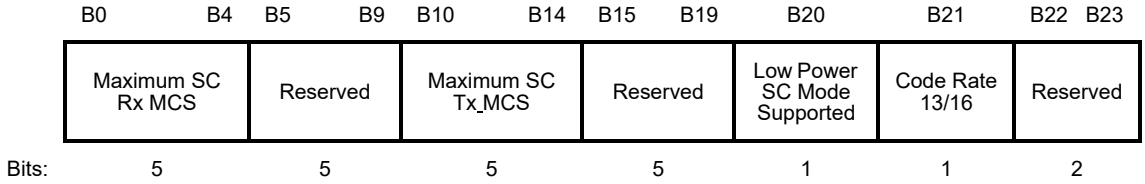

Figure 9-841—Supported MCS Set subfield format

The Maximum SC Rx MCS subfield contains the value of the maximum MCS index the CDMG STA supports for reception of single-carrier frames. Values 0-8 of this subfield are reserved. Possible values for this subfield are shown in Table 24-9.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Maximum SC Tx MCS subfield contains the value of the maximum MCS index the CDMG STA supports for transmission of single-carrier frames. Values 0-8 of this subfield are reserved. Possible values for this subfield are shown in Table 24-9.

The Low-Power SC Mode Supported subfield is set to 1 to indicate that the CDMG STA supports the low-power SC mode (24.6). Otherwise, it is set to 0. If the CDMG STA supports the low-power SC mode, it supports all low-power SC mode MCSs indicated in Table 24-11.

The Code Rate 13/16 subfield specifies whether the CDMG STA supports rate 13/16. It is set to 1 to indicate that the CDMG STA supports rate 13/16 and is set to 0 otherwise. If this subfield is 0, MCSs with 13/16 code rate specified in Table 24-9 is not supported regardless of the value in Maximum SC Tx/Rx MCSMCS subfields.

The Dynamic Channel Selection subfield is set to 1 if the STA supports DCS procedures as defined in 11.47 and is set to 0 otherwise.

The Opportunistic Transmissions Capable subfield is set to 1 if the STA supports opportunistic transmission in alternative channels for CDMG STAs as defined in 10.38.11 and is set to 0 otherwise.

The Selection of Candidate SPs Capable subfield is set to 1 if the STA supports selection of candidate SPs for spatial sharing as described in Annex W.1 and is set to 0 otherwise.

The CDMG Enhanced Beam Tracking Capable subfield is set to 1 if the STA supports CDMG enhanced beam tracking as defined in 10.41.9 and Annex W.3 and is set to 0 otherwise.

9.4.2.218.3 CDMG AP Or PCP Capability Information field

The CDMG AP Or PCP Capability Information field, defined in Figure 9-842 (CDMG AP Or PCP Capability Information field format), represents the capabilities, when the transmitting CDMG STA performs in the role of AP or PCP, that are in addition to the capabilities in the CDMG STA Capability Information field.

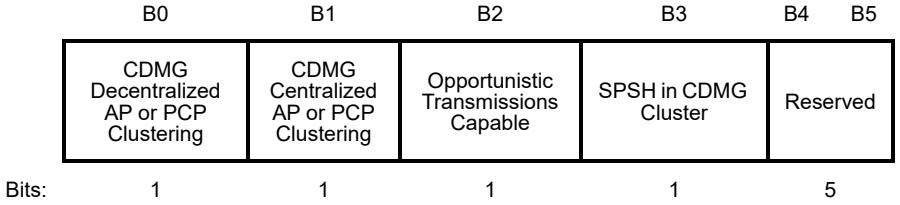

Figure 9-842—CDMG AP Or PCP Capability Information field format

The CDMG Decentralized AP or PCP Clustering subfield is set to 1 if the STA, when operating as an AP or PCP, is capable of performing decentralized AP or PCP clustering as described in 10.36 and is set to 0 otherwise.

The CDMG Centralized AP or PCP Clustering subfield is set to 1 if the STA, when operating as an AP or PCP, is capable of performing centralized AP or PCP clustering and is set to 0 otherwise. An AP or PCP that is incapable of performing centralized AP or PCP clustering is subject to requirements as described in 10.36.

The SPSH in CDMG Cluster subfield is set to 1 if the STA supports spatial sharing in a CDMG AP or PCP cluster as defined in 10.40.6 and is set to 0 otherwise. If both the CDMG Decentralized AP or PCP Clustering subfield and the CDMG Centralized AP or PCP Clustering subfield are equal to 0, the SPSH in CDMG Cluster subfield is reserved.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.219 Dynamic Bandwidth Control element

The Dynamic Bandwidth Control element defines the information from the CDMG AP or PCP to support the dynamic bandwidth control mechanism described in 10.63 and the CDMG AP or PCP clustering mechanism described in 10.63. The format of the Dynamic Bandwidth Control element is shown in Figure 9-843 (Dynamic Bandwidth Control element format).

	Element ID	Length	Element ID Extension	DBC Control	Channel Number	BI Offset	TBTT Offset	NP/BHI Duration	Adjacent NP/BHI Duration
Octets:	1	1	1	7	1	4	4	2	2

Figure 9-843—Dynamic Bandwidth Control element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The format of the DBC Control field is shown in Figure 9-844 (DBC Control field format).

	B0	B1	B2	B3	B4 B5	B6 B53	B54 B55
	Channel Splitting	DBC Option	AP or PCP Role	Adjacent Channel Occupancy	Clustering Status	Synchronizing AP or PCP MAC Address	Reserved
Bits:	1	1	1	1	2	48	2

Figure 9-844—DBC Control field format

The Channel Splitting subfield is set to 0 to indicate that an AP or PCP operates on a 2.16 GHz channel and the following subfields are reserved. Otherwise, this subfield is set to 1 to indicate that an AP or PCP operates on a 1.08 GHz channel.

The DBC Option subfield indicates the DBC option that an AP or PCP selects to operate on a 1.08 GHz channel. It is set to 0 to indicate that beacon intervals or BHIs are present on the 1.08 GHz channel and otherwise set to 1.

The AP or PCP Role subfield is set to 0 to indicate that the transmitting AP or PCP operating on a 1.08 GHz channel can provide a time reference to the AP or PCP operating on the adjacent 1.08 GHz channel. Otherwise, this subfield is set to 1 to indicate that the transmitting AP or PCP scans for DMG Beacon frames transmitted from the AP or PCP operating on the adjacent 1.08 GHz channel to maintain synchronization among them following the rules defined in 10.63.2.3.

The Adjacent Channel Occupancy subfield is set to 0 to indicate that the adjacent 1.08 GHz channel of the transmitting AP or PCP is occupied by another AP or PCP. Otherwise, this subfield is set to 1.

The Clustering Status subfield indicates the cluster status of the two 1.08 GHz channel within the same 2.16 GHz channel. The first/second bit is set to 0 to indicate that a cluster starts in the current/adjacent 1.08 GHz channel. Otherwise, the first/second bit of this field is set to 1.

The Synchronizing AP or PCP MAC Address subfield indicates the MAC address of the AP or PCP that provides the time reference for the transmitting AP or PCP. If the AP or PCP Role subfield is 0, this subfield is set to the MAC address of itself. Otherwise, this subfield is set to the MAC address of the AP or PCP operating on the adjacent 1.08 GHz channel.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Channel Number field is set to the number of the channel on which the transmitting STA is operating.

The BI Offset field contains the time offset of the TBTT of the first beacon interval that the transmitting AP or PCP starts on a 1.08 GHz channel relative to the TBTT of the beacon interval that the transmitting AP or PCP starts on the 2.16 GHz channel encompassing this 1.08 GHz channel. This field is reserved if the DBC Option subfield is 1.

The TBTT Offset field contains the time offset of the target starting time of the NP/BHI on a 2.16 GHz channel of the transmitting AP or PCP operating on one of the 1.08 GHz channels relative to that of another AP or PCP operating on the adjacent 1.08 GHz channel.

The NP/BHI Duration field is set to the length of the NP/BHI duration on a 2.16 GHz channel by the transmitting AP or PCP operating on one of the 1.08 GHz channels.

The Adjacent NP/BHI Duration field is set to the length of the NP/BHI duration on a 2.16 GHz channel by the AP or PCP operating on the adjacent 1.08 GHz channel of the transmitting AP or PCP.

9.4.2.220 CDMG Extended Schedule element

The CDMG Extended Schedule element is defined in Figure 9-845 (CDMG Extended Schedule element format). Like the Extended Schedule element (9.4.2.130), the AP or PCP can split the Allocation fields in the CDMG Extended Schedule element into more than one CDMG Extended Schedule element entry in the same DMG Beacon frame or Announce frame. Despite this splitting, the set of CDMG Extended Schedule element entries conveyed within a DMG Beacon or Announce frame is considered to be a single schedule for the beacon interval and, in this standard, is referred to simply as CDMG Extended Schedule element unless otherwise noted.

	Element ID	Length	Element ID Extension	Allocation List
Octets:	1	1	1	$n \times 19$

Figure 9-845—CDMG Extended Schedule element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Allocation List field contains one or more (n) Allocation fields. The Allocation fields are ordered by increasing allocation start time with allocations beginning at the same time arbitrarily ordered.

The Allocation field is defined in Figure 9-846 (Allocation field format).

	Allocation Control	BF Control	Source AID	Destination AID	Allocation Start
Octets:	2	2	1	1	4

	Allocation Block Duration	Number of Blocks	Allocation Block Period	Number of Alternate TX BI	Number of Suspension BI
Octets:	2	1	2	2	2

Figure 9-846—Allocation field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Allocation Control subfield format is the same as defined in 9.4.2.130, including Allocation ID, AllcationType, Pseudo-static, Truncatable, Extendable, PCP Active, and LP SC Used subfields and reserved bits.

The Allocation ID subfield is the same as defined in 9.4.2.130.

The AllocationType subfield defines the channel access mechanism during the allocation, with the possible values listed in Table 9-364 for CDMG STAs:

Table 9-364—AllocationType subfield values for CDMG STAs

Bit 4	Bit 5	Bit 6	Meaning
0	0	0	SP allocation in dedicated channel
1	0	0	CBAP allocation in dedicated channel
0	1	0	SP allocation in alternative channel
1	1	0	CBAP allocation in alternative channel
All other combinations			Reserved

The Pseudo-static, Truncatable, Extendable, PCP Active, and LP SC Used subfields are the same as defined in 9.4.2.130.

The BF Control subfield is defined in Figure 9-847 (BF Control field format when both IsInitiatorTXSS and IsResponderTXSS subfields are equal to 1 and the BF Control field is transmitted in Grant or Grant Ack frames) and Figure 9-848 (BF Control field format in all other cases).

	B0	B1	B2	B3 B9	B10 B11	B12	B13 B15
	Beamforming Training	IsInitiator TXSS	IsResponder TXSS	Total Number of Sectors	Number of RX DMG Antennas	NoPrimary Channel	Reserved
Bits:	1	1	1	7	2	1	3

Figure 9-847—BF Control field format when both IsInitiatorTXSS and IsResponderTXSS subfields are equal to 1 and the BF Control field is transmitted in Grant or Grant Ack frames

	B0	B1	B2	B3 B8	B9 B10	B11	B12 B15
	Beamforming Training	IsInitiator TXSS	IsResponder TXSS	RXSS Length	RXSSTxRate	NoPrimary Channel	Reserved
Bits:	1	1	1	6	2	1	4

Figure 9-848—BF Control field format in all other cases

The BeamformingTraining, IsInitiatorTXSS, IsResponderTXSS, Total Number of Sectors, Number of RX DMG Antennas, RXSS Length, RXSSTxRate subfields are the same as defined in 9.5.5.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The NoPrimaryChannel subfield is set to 1 to indicate that the CDMG initiator does not need to perform SLS on the primary channel. It is set to 0 to indicate that the CDMG initiator needs to perform SLS on the primary channel. This subfield is reserved when it is transmitted by an AP or PCP.

The Source AID, Destination AID, Allocation Start, Allocation Block Duration, Number of Blocks, and Allocation Block Period subfields are the same as defined in 9.4.2.130.

The Number of Alternate TX BI subfield indicates the duration of transmission phase in the alternate channel in terms of number of beacon intervals.

The Number of Suspension BI subfield indicates the duration of the suspension phase in the alternate channel in terms of the number of beacon intervals.

9.4.2.221 SSW Report element

The SSW Report element is used by a non-AP and non-PCP CDMG STA to report beamforming training information to an CDMG AP or PCP (see 11.30.1) or used by a responder STA to deliver the backup sector information to an initiator STA. The SSW Report element is defined in Figure 9-849 (SSW Report element format).

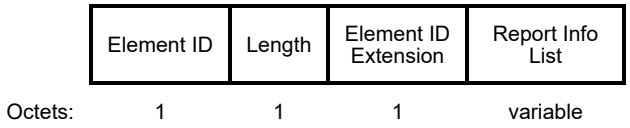

Figure 9-849—SSW Report element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Report Info List field contains one or more Report Info fields.

A Report Info field is formatted as defined in Figure 9-850 (Report Info field format when the SSW Report Control subfield is 1) when its SSW Report Control subfield is 1; otherwise, a Report Info field is formatted as defined in Figure 9-851 (Report Info field format when the SSW Report Control subfield is 0).

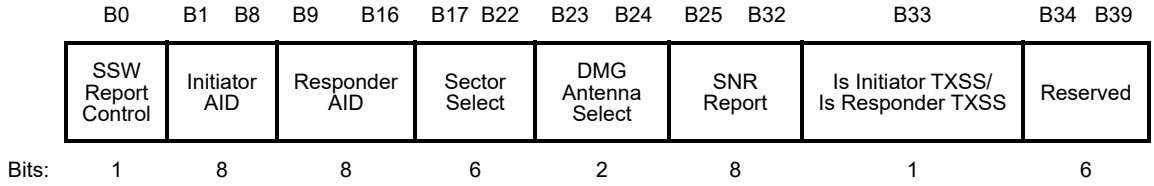

Figure 9-850—Report Info field format when the SSW Report Control subfield is 1

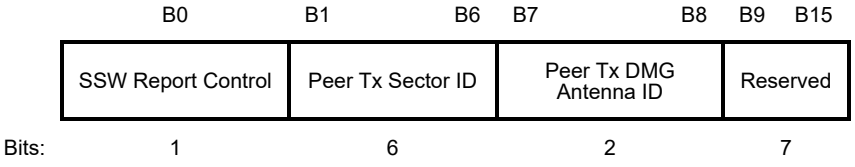

Figure 9-851—Report Info field format when the SSW Report Control subfield is 0

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The SSW Report Control subfield indicates the format of the Report Info field.

The Initiator AID subfield identifies the STA that is the initiator of the beamforming training.

The Responder AID subfield identifies the STA that is the responder of the beamforming training.

The Sector Select subfield is defined in 9.5.3.

The DMG Antenna Select subfield is defined in 9.5.3.

The SNR Report subfield is defined in 9.5.3.

The Is Initiator TXSS/Is Responder TXSS subfield is set to 1 to indicate that an initiator TXSS has been performed between the initiator and the responder. This subfield is set to 0 to indicate that a responder TXSS has been performed between the initiator and the responder.

If the SSW Report Control subfield is 0, the Peer Tx Sector IDsubfield indicates the Sector ID of the alternative Tx sector of the peer STA. The determination of the alternative Tx sector is implementation dependent. Possible values of this subfield range from 0 to 63. Otherwise, the Peer Tx Sector IDsubfield is reserved.

If the SSW Report Control subfield is 0, the Peer Tx DMG Antenna ID subfield indicates the alternative DMG antenna ID of the alternative Tx DMG antenna of the peer STA. The determination of the alternative Tx DMG antenna is implementation dependent. Otherwise, the Peer Tx DMG Antenna ID subfield is reserved.

9.4.2.222 Cluster Probe element

The Cluster Probe element is used to probe the presence of a CDMG AP or PCP cluster operating on the common 2.16 GHz channel by the CDMG AP or PCP operating on a 1.08 GHz channel. This element can be included in a DMG Beacon, Announce, or Probe Request frame. The Cluster Probe element is shown in Figure 9-852 (Cluster Probe element format).

	Element ID	Length	Element ID Extension	Request Token	SP Offset	SP Space	SP Duration	Repetition Count
Octets:	1	1	1	2	2	4	2	1

Figure 9-852—Cluster Probe element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Request Token field is set to a nonzero value chosen by the requesting AP or PCP.

The SP Offset field is set to the offset of the start of the first SP from the frame that contains this element, expressed in TUs. The reference time is the start of the preamble of the PPDU that contains this element.

The SP interval field is set to the spacing between the start of two consecutive SP intervals, expressed in TUs.

The SP Duration field is set to duration of a single SP, expressed in TUs.

The Repetition Count field is set to the number of requested SPs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.223 Extended Cluster Report element

The Extended Cluster Report element is used to report the cluster synchronization and control information to the cluster probe requesting CDMG AP or PCP by the S-AP or S-PCP of a CDMG AP or PCP cluster. The Extended Cluster Report element is also used by an S-AP to report the cluster information of the S-APs within the same CCSS for an AP or PCP. This element can be included in a DMG Beacon, Announce, or Probe Response frame transmitted by a CDMG AP or PCP. The Extended Cluster Report element is shown in Figure 9-853 (Extended Cluster Report element format).

	Element ID	Length	Element ID Extension	Extended Cluster Report Control	Request Token	Next BTI Offset	Reported Clustering Control	Reported BI Duration	Cluster Channel Number	Available Cluster Offset Bitmap
Octets:	1	1	1	1	0 or 2	4	8	0 or 2	0 or 1	0 or 4

Figure 9-853—Extended Cluster Report element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

If the Extended Cluster Report Control field is 0, this element is used in decentralized clustering mechanism, and the Reported BI Duration, Cluster Channel Number, and Available Cluster Offset Bitmap fields are not present in this element. Otherwise, this element is used in centralized clustering mechanism, and the Request Token field is not present in this element.

The Request Token field value is copied from the corresponding received Cluster Probe element.

The Next BTI Offset field contains the low order 4 octets of the TSF for the earliest time at which the next BTI in a subsequent beacon interval starts.

The Reported Clustering Control field is defined in 9.3.4.1 and contains the Clustering Control field in the last transmitted DMG Beacon frame of the S-AP or S-PCP or the reported S-AP.

The Reported BI Duration field is set to the beacon interval value of the reported S-AP, expressed in TUs.

The Cluster Channel Number field is set to the operating channel number of the reported S-AP.

The Available Cluster Time Offset Bitmap field is set to the Available Cluster Time Offset Bitmap field of the reported S-AP's ECAPC Policy element.

9.4.2.224 Cluster Switch Announcement element

A CDMG AP or PCP transmits the Cluster Switch Announcement element to its original cluster before switching from a cluster to another. One of the synchronization pair APs or PCPs also transmits the Cluster Switch Announcement element to its peer CDMG AP or PCP before joining a cluster. The Cluster Switch Announcement element can be included in the DMG Beacon frame or Announce frame transmitted by a CDMG AP or PCP and received by other member CDMG APs or member CDMG PCPs. The format of the Cluster Switch Announcement element is shown in Figure 9-854 (Cluster Switch Announcement element format).

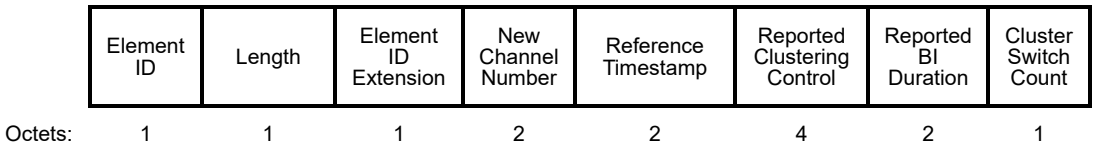

Figure 9-854—Cluster Switch Announcement element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The New Channel Number field is set to the operating channel number of the target cluster after cluster switching.

The Reference Timestamp field contains the lower 4 octets of the TSF timer value sampled at the instant that the STA's MAC received the DMG Beacon frame of the S-AP or S-PCP of the target cluster.

The Reported Clustering Control field contains the Clustering Control field included in the received DMG Beacon frame of the S-AP or S-PCP.

The Reported BI Duration field is set to the beacon interval value of the reported S-AP or S-PCP, expressed in TUs.

The Cluster Switch Count field either is set to the number of TBTTs until the AP or PCP sending the Cluster Switch Announcement element switches to the new cluster or is set to 0. This field is set to 1 to indicate that the switch occurs immediately before the next TBTT. It is set to 0 to indicate that the switch occurs at any time after the frame containing the element is transmitted.

9.4.2.225 Enhanced Beam Tracking element

The Enhanced Beam Tracking element is used to configure the alternative link of a CDMG STA, track the alternative link of the enhanced beam tracking initiator and responder, and switch to an alternative link from the current link. The element can be included in a BRP, DMG Beacon, Information Request, or Information Response frame transmitted by a CDMG STA.

The format of the Enhanced Beam Tracking element is shown in Figure 9-855 (Enhanced Beam Tracking element format).

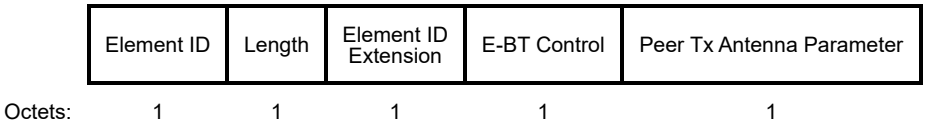

Figure 9-855—Enhanced Beam Tracking element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.224.

The E-BT Control field is defined in Figure 9-856 (E-BT Control field format).

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

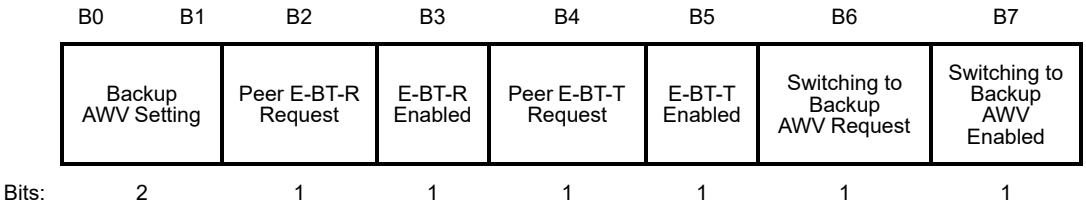

Figure 9-856—E-BT Control field format

The Backup AWV Setting subfield is used to set the alternative AWV of the peer STA. The default alternative AWV of the peer STA is set to omnidirectional. If the Backup AWV Setting subfield is 0, the peer STA does not update the alternative AWV. If the Backup AWV Setting subfield is 1, the peer STA set the alternative AWV according to the AWV specified by the Peer Tx Antenna Parameter field. If the Backup AWV Setting subfield is 2, the current received AWV of peer is used to update the alternative AWV; if the Backup AWV Setting subfield is 3, the last transmitted AWV of peer is used to update the alternative AWV.

The Peer E-BT-R Request subfield is set to 1 to indicate that the peer STA is requested to enable enhanced beam tracking to receive the e-TRN-R training sequences; otherwise, it is set to 0.

The E-BT-R Enabled subfield is set to 1 to indicate that the requested peer STA acknowledges that it has enabled enhanced receive beam tracking to receive the e-TRN-R training sequences; otherwise, it is set to 0.

The Peer E-BT-T Request subfield is set to 1 to indicate that the peer STA is requested to enable enhanced transmit beam tracking to transmit the e-TRN-T training sequences; otherwise, it is set to 0.

The E-BT-T Enabled subfield is set to 1 to indicate that the requested peer STA acknowledges that it has enabled enhanced transmit beam tracking to transmit the e-TRN-T training sequences; otherwise, it is set to 0.

The Switching to Backup AWV Request subfield is set to 1 to indicate that the peer STA is requested to switch to the alternative AWV; otherwise, it is set to 0.

The Switching to Backup AWV Enabled subfield is set to 1 to indicate that the requested STA acknowledges that its antenna setting is to be switched to the alternative AWV before the next frame and to set the AWV of the current link as the new alternative AWV; otherwise, it is set to 0.

The Peer TX Antenna Parameter field is defined in Figure 9-857 (Peer TX Antenna Parameter field format).

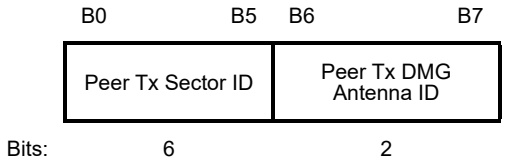

Figure 9-857—Peer TX Antenna Parameter field format

If the Backup AWV Setting subfield is 1, the Peer Tx Sector IDfield is set to the Sector ID of the alternative Tx AWV of the peer STA. Otherwise, the Peer Tx Sector IDfield is reserved.

If the Backup AWV Setting subfield is 1, the Peer Tx DMG Antenna ID field indicates the DMG antenna ID of the alternative Tx AWV of the peer STA. Otherwise, the Peer Tx DMG Antenna ID field is reserved.

9.4.2.226 SPSH Report element

The SPSH Report element is used for an AP or PCP in a cluster to report the possibility of spatial sharing and coexistence between links in other BSSs and links in its own BSS. The SPSH Report element is transmitted in the DMG Beacon frame by a CDMG AP or PCP and is defined in Figure 9-858 (SPSH Report element format). Because the length parameter supports only 255 octets of payload in an element, the AP or PCP can split the SPSH List fields into more than one SPSH Report element entry in the same DMG Beacon or Announce frame.

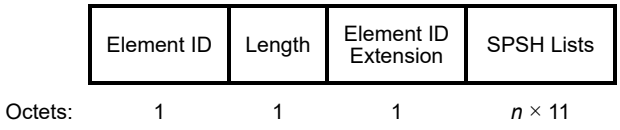

Figure 9-858—SPSH Report element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The SPSH Lists field contains one or more (*n*) SPSH List fields.

The SPSH List field contains information of non-interfering links and is defined in Figure 9-859 (SPSH List field format).

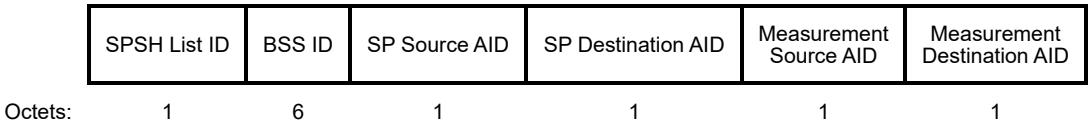

Figure 9-859—SPSH List field format

The SPSH List ID subfield indicates the identification of the SPSH List field, which is the same as the index of the corresponding field in the SPSH Report Element. It indicates that the channel measurement, between the two STAs indicated by the following Measurement Source AID subfield and the Measurement Destination AID subfield, shows no severe interference while the STA indicated by the SP Source AID subfield communicates with the STA indicated by the SP Destination AID subfield.

The BSS ID subfield indicates the identification of the measured infrastructure BSS or PBSS, which is the MAC address of the AP or PCP in the measured infrastructure BSS or PBSS.

The SP Source AID subfield indicates the AID of the transmitter STA of the link in the measured infrastructure BSS or PBSS.

The SP Destination AID subfield indicates the AID of the receiver STA of the link in the measured infrastructure BSS or PBSS. The SP Source AID and SP Destination AID subfields uniquely identify the link from the source AID STA to the destination AID STA in the BSS identified by the BSSID field.

The Measuring Source AID subfield indicates the AID of the transmitter of the link that is conducting SPSH measurement in the measured infrastructure BSS or PBSS, and the measured link does not interfere with it.

The Measuring Destination AID subfield indicates the AID of the receiver of the link that is conducting SPSH measurement in the measured infrastructure BSS or PBSS, and the measured link does not interfere with it. The Measuring Source AID and Measuring Destination AID subfields uniquely identify the link from the measuring source AID STA to the measuring destination AID STA in the BSS.

9.4.2.227 Clustering Interference Assessment element

The S-AP or S-PCP in a CDMG AP or PCP cluster uses a Clustering Interference Assessment element to enable spatial sharing in the cluster and sets channel quality measurement and control parameters of spatial sharing for their member APs or member PCPs. The Clustering Interference Assessment element can be included in the DMG Beacon frames transmitted by the CDMG S-AP or S-PCP, as shown in Figure 9-860 (Clustering Interference Assessment element format).

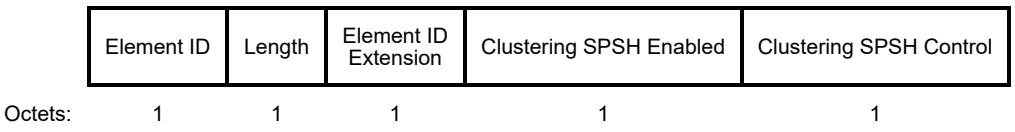

Figure 9-860—Clustering Interference Assessment element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Clustering SPSH Enabled field is set to 0 to indicate that a SPSH measurement phase starts. The Clustering SPSH Enabled field is set to 1 to indicate that the SPSH measurement phase for all member APs or member PCPs terminates and SP spatial sharing among BSSs starts. Other values are reserved. The Clustering SPSH Enabled field is set as the same as the SPSH Measurement Enabled subfield in the Clustering Control field defined in 9.3.4.2.

The Clustering SPSH Control field is defined in Figure 9-861 (Clustering SPSH Control field format).

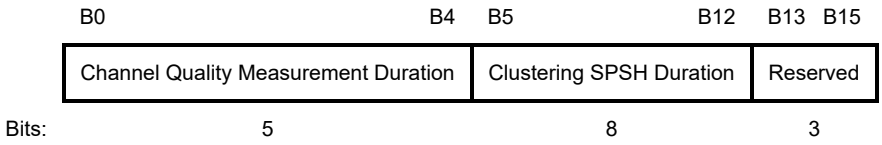

Figure 9-861—Clustering SPSH Control field format

The Channel Quality Measurement Duration subfield is set to a duration of directional channel quality measurement for all member APs or member PCPs in a CDMG AP or PCP cluster, in units of beacon intervals.

The Clustering SPSH Duration subfield is set to a duration of spatial sharing among BSSs for all member APs or member PCPs in a CDMG AP or PCP cluster, in units of beacon intervals.

9.4.2.228 CMMG Capabilities element

9.4.2.228.1 CMMG Capabilities element structure

The CMMG Capabilities element contains a number of fields that are used to advertise the CMMG capabilities of STA. The CMMG Capabilities element is defined in Figure 9-862 (CMMG Capabilities element format).

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The subfields of the CMMG Capabilities Info field are defined in Table 9-365.

Table 9-365—Subfields of the CMMG Capabilities Info field

Subfield	Definition	Encoding
Maximum MPDU Length	Indicates the maximum MPDU length (see 10.12).	Set to 0 for 3895 octets. Set to 1 for 7991 octets. Set to 2 for 11 454 octets. The value 3 is reserved.
Supported Channel Width Set	Indicates the channel widths supported by the STA. See 11.47.	Set to 0 if the STA does not support 1080 MHz. Set to 1 if the STA supports 1080 MHz.
Tx STBC	Indicates support for the transmission of at least 2x1 STBC.	Set to 0 if not supported. Set to 1 if supported.
Rx STBC	Indicates support for the reception of PPDUs using STBC.	Set to 0 for no support. Set to 1 for support of one spatial stream. Set to 2 for support of one and two spatial streams. The value 3 is reserved.
Short GI for 540 MHz	Indicates short GI support for the reception of PPDUs transmitted with the TXVECTOR parameter CH_BANDWIDTH set to CBW540.	Set to 0 if not supported. Set to 1 if supported.
Short GI for 1080 MHz	Indicates short GI support for the reception of PPDUs transmitted with the TXVECTOR parameter CH_BANDWIDTH set to CBW1080.	Set to 0 if not supported. Set to 1 if supported.
Supported MIMO	Indicates whether the STA supports MIMO.	The Supported MIMO field is set to 1 if the STA supports the SC and OFDM MIMO and is set to 0 otherwise.
Heartbeat	Indicate that whether the STA expects to receive a frame from the AP or PCP during the ATI and expects to receive a frame with the CMMG Control modulation from a source CMMG STA at the beginning of an SP or TXOP.	Set to 1 to indicate that the STA expects to receive a frame from the AP or PCP during the ATI and expects to receive a frame with the CMMG Control modulation from a source CMMG STA at the beginning of an SP or TXOP. Otherwise, this field is set to 0.
TPC	Indicates whether the STA supports TPC.	The TPC field is set to 1 if the STA supports the TPC as defined in 11.7 and is set to 0 otherwise.
Number of Sounding Dimensions	Beamformer's capability indicating the maximum value of the TXVECTOR parameter NUM_STS for a CMMG NDP.	If beamformer capable, set to the maximum supported value of the TXVECTOR parameter NUM_STS minus 1. Otherwise, reserved.
TXOP PS	Indicates whether the AP supports CMMG TXOP power save mode or whether the non-AP STA has enabled CMMG TXOP power save mode.	Set to 0 if the AP does not support TXOP power save mode. Set to 1 if the AP supports TXOP power save mode. Set to 0 if the non-AP STA does not enable TXOP power save mode. Set to 1 if the non-AP STA enables TXOP power save mode.

Table 9-365—Subfields of the CMMG Capabilities Info field *(continued)*

Subfield	Definition	Encoding
Protected Block Ack	Indicates support for protected block ack operation. See 10.25.7.	Set to 0 if not supported. Set to 1 if supported. Support indicates that the STA is able to accept an ADDBA request for protected block ack.
CMMG Link Adaptation Capable	Indicates whether the STA supports link adaptation using CMMG variant HT Control field.	Set to 0 (No Feedback) if the STA does not provide CMMG MFB. Set to 2 (Unsolicited) if the STA provides only unsolicited CMMG MFB. Set to 3 (Both) if the STA can provide CMMG MFB in response to CMMG MRQ and if the STA provides unsolicited CMMG MFB. The value 1 is reserved.
Rx Antenna Pattern Consistency	Indicates the possibility of a receive antenna pattern change.	Set to 0 if the receive antenna pattern might change during the lifetime of the current association. Set to 1 if the receive antenna pattern does not change during the lifetime of the current association. See 11.48.6.
Tx Antenna Pattern Consistency	Indicates the possibility of a transmit antenna pattern change.	Set to 0 if the transmit antenna pattern might change during the lifetime of the current association. Set to 1 if the transmit antenna pattern does not change during the lifetime of the current association. See 11.48.6.
Fast Link Adaptation	Indicates whether the STA supports fast link adaptation.	The Fast Link Adaptation field is set to 1 to indicate that the STA supports the CMMG fast link adaptation procedure described in 10.43.3. Otherwise, it is set to 0.
RXSS Length	Specifies the total number of receive sectors combined over all receive antennas of the STA.	The value represented by this field is in the range 2 to 128 and is given by (RXSS Length+1)×2. The maximum number of SSW frames transmitted during an RXSS is equal to the value of (RXSS Length+1)×2 times the total number of transmit antennas of the peer device.
Color	Indicates the value that is used for the TXVECTOR parameter COLOR in frames transmitted by members of this BSS, as described in 10.19.	Set to an unsigned integer if sent by an AP. Otherwise reserved.
SPSH and Interference Mitigation	Indicate whether the STA is capable of performing the function of SPSH and interference mitigation or not.	Set to 1 if the STA is capable of performing the function of SPSH and interference mitigation and if dot11RadioMeasurementActivated is true and is set to 0 otherwise (see 10.33).
Number of Rx Antennas	Indicates the total number of receive antennas of the STA.	Set to the number of antennas minus 1.
Supports Other_AID	Indicate that the STA sets its AWV configuration according to the Other_AID subfield in the BRP Request field.	Set to 1 if the value of the Other_AID subfield is different from zero. Otherwise, this field is set to 0.
RXSSTxRate Supported	Indicate whether the STA can perform an RXSS with the SSW frames transmitted at MCS 1 of the CMMG SC modulation class or not.	Set to 1 to indicate that the STA can perform an RXSS with the SSW frames transmitted at MCS 1 of the CMMG SC modulation class. Otherwise, it is set to 0.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-365—Subfields of the CMMG Capabilities Info field *(continued)*

Subfield	Definition	Encoding
Antenna Pattern Reciprocity	Indicate whether the transmit antenna pattern associated with an AWV is the same as the receive antenna pattern for the same AWV or not.	Set to 1 to indicate that the transmit antenna pattern associated with an AWV is the same as the receive antenna pattern for the same AWV. Otherwise, this field is set to 0.
Total Number of Sectors	Indicates the total number of transmit sectors the STA uses in a transmit sector sweep combined over all antennas.	Set to the number of transmit sectors minus 1.
Heartbeat Elapsed Indication	Used to calculate the value of the heartbeat elapsed time.	The heartbeat elapsed time is computed according to the following equation: $T_{HE} = \begin{cases} 0, F_{HE} = 0 \\ \frac{2^{F_{HE}}}{4}, F_{HE} > 0 \end{cases}$ where T_{HE} is the heartbeat elapsed time (in milliseconds); F_{HE} is the value of the Heartbeat Elapsed Indication subfield.
MCS Feedback	Indicates whether the STA can provide MFB.	Set to 0 (No Feedback) if the STA does not provide MFB. Set to 2 (Unsolicited) if the STA provides only unsolicited MFB. Set to 3 (Both) if the STA can provide MFB in response to MRQ (either Delayed or Immediate, see 10.31) as well as unsolicited MFB The value 1 is reserved.
RD Responder	Indicates support for acting as a reverse direction responder, i.e., the STA might use an offered RDG to transmit data to an RD initiator using the reverse direction protocol described in 10.27.	Set to 0 if not supported. Set to 1 if supported.
NOTE—The value for the Maximum MPDU Length subfield in the CMMG Capabilities Info field imposes a constraint on the allowed value of the Maximum MPDU Length in the CMMG Capabilities Info field of the CMMG Capabilities element carried in the same frame (see 10.11).

9.4.2.228.3 A-MPDU Parameters field

The structure of the A-MPDU Parameters field of the CMMG Capabilities element is shown in Figure 9-864 (A-MPDU Parameters field format). The definition for the subfields of the A-MPDU Parameters field is shown in Table 9-366.

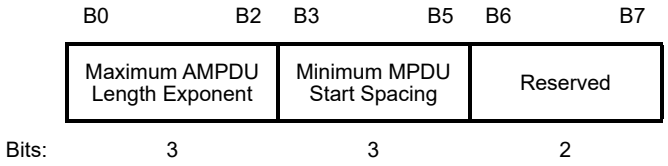

Figure 9-864—A-MPDU Parameters field format

Table 9-366—Subfields of the A-MPDU Parameters field

Subfield	Definition	Encoding
Maximum AMPDU Length Exponent	Indicates the maximum length of A-MPDU that the STA can receive. EOF padding is not included in this limit.	The length defined by this field is equal to $2^{(13 + \text{Maximum AMPDU Lenght Exponent})}$ octets.
Minimum MPDU Start Spacing	Determines the minimum time between the start of adjacent MPDUs within an A-MPDU that the STA can receive, measured at the PHY SAP. See 9.7.3.	Set to 0 for no restriction. Set to 1 for 16 ns. Set to 2 for 32 ns. Set to 3 for 64 ns. Set to 4 for 128 ns. Set to 5 for 256 ns. Set to 6 for 512 ns. Set to 7 for 1024 ns.

9.4.2.228.4 Supported CMMG-MCS and NSS Set field

The Supported CMMG-MCS and NSS Set field is used to convey the combinations of CMMG-MCSs and spatial streams that a STA supports for reception and the combinations that it supports for transmission. The structure of the field is shown in Figure 9-865 (Supported CMMG-MCS and NSS Set field format).

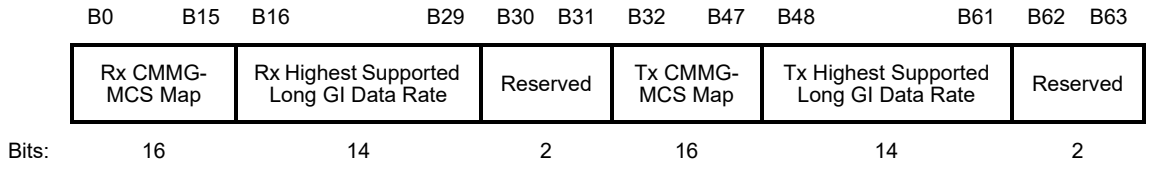

Figure 9-865—Supported CMMG-MCS and NSS Set field format

The Supported CMMG-MCS and NSS Set subfields are defined in Table 9-367.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-367—Supported CMMG-MCS and NSS Set subfields

Subfield	Definition	Encoding
Rx CMMG-MCS Map	Indicates the maximum value of the RXVECTOR parameter MCS of a PPDU that can be received at all channel widths supported by this STA for each number of spatial streams.	The format and encoding of this subfield are defined in Figure 9-866 (Rx CMMG-MCS Map and Tx CMMG-MCS Map subfields and Basic CMMG-MCS and NSS Set field format) and the associated description.
Rx Highest Supported Long GI Data Rate	Indicates the highest CMMG PPDU data rate that the STA is able to receive.	The largest integer value less than or equal to the highest CMMG PPDU data rate in Mb/s the STA is able to receive (see 10.6.15.1). The value 0 indicates that this subfield does not specify the highest CMMG PPDU data rate that the STA is able to receive.
Tx CMMG-MCS Map	Indicates the maximum value of the TXVECTOR parameter MCS of a PPDU that can be received at all channel widths supported by this STA for each number of spatial streams.	The format and encoding of this subfield are defined in Figure 9-866 (Rx CMMG-MCS Map and Tx CMMG-MCS Map subfields and Basic CMMG-MCS and NSS Set field format) and the associated description.
Tx Highest Supported Long GI Data Rate	Indicates the highest CMMG PPDU data rate at which the STA is able to transmit.	The largest integer value less than or equal to the highest CMMG PPDU data rate in Mb/s the STA is able to receive/transmit (see 10.6.15.2). The value 0 indicates that this subfield does not specify the highest CMMG PPDU data rate that the STA is able to receive transmit.

The Rx CMMG-MCS Map subfield and the Tx CMMG-MCS Map subfield have the structure shown in Figure 9-866 (Rx CMMG-MCS Map and Tx CMMG-MCS Map subfields and Basic CMMG-MCS and NSS Set field format).

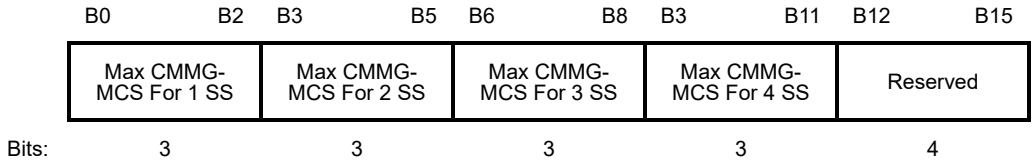

Figure 9-866—Rx CMMG-MCS Map and Tx CMMG-MCS Map subfields and Basic CMMG-MCS and NSS Set field format

The Max CMMG-MCS For *n* SS subfield (where *n* = 1, 2, 3, 4) is encoded as follows:

— 0 indicates support for SC CMMG-MCSs 1 to 5 or OFDM CMMG-MCSs 9 to 13 for *n* spatial streams
— 1 indicates support for SC CMMG-MCSs 1 to 6 or OFDM CMMG-MCSs 9 to 14 for *n* spatial streams
— 2 indicates support for SC CMMG-MCSs 1 to 7 or OFDM CMMG-MCSs 9 to 15 for *n* spatial streams
— 3 indicates support for SC CMMG-MCSs 1 to 8 or OFDM CMMG-MCSs 9 to 16 for *n* spatial streams
— 4–7 indicate that *n* spatial streams are not supported

9.4.2.228.5 Transmit Beamforming Capabilities field

The structure of the Transmit Beamforming Capabilities field is defined in Figure 9-867 (Transmit Beamforming Capabilities field format).

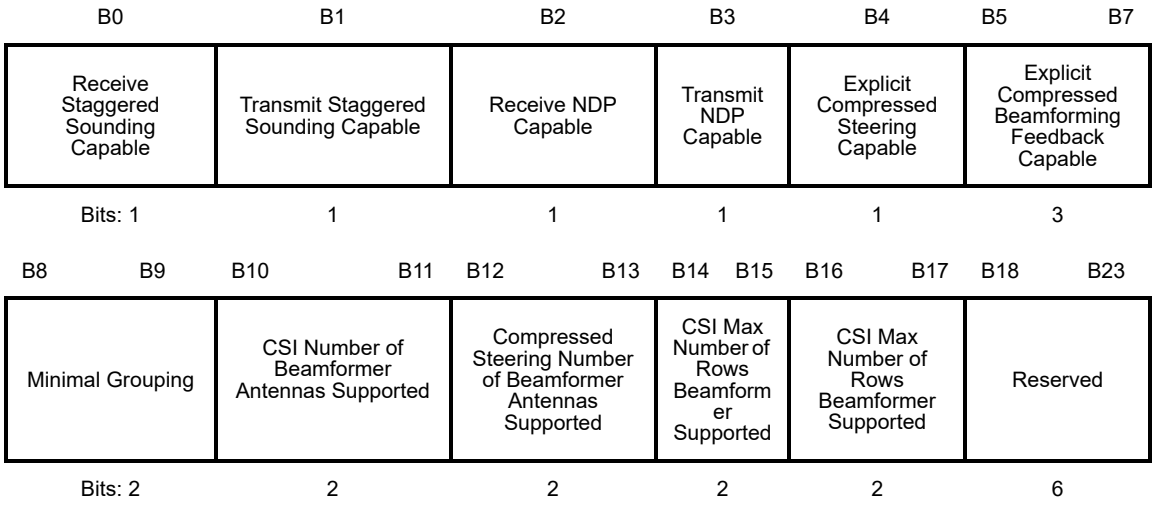

Figure 9-867—Transmit Beamforming Capabilities field format

The subfields of the Transmit Beamforming Capabilities field are defined in Table 9-368.

9.4.2.228.6 CMMG AP Or PCP Capability Information field

The CMMG AP Or PCP Capability Information field, defined in Figure 9-868 (CMMG AP Or PCP Capability Information field format), represents the capabilities, when the transmitting STA performs in the role of AP or PCP, that are in addition to the capabilities in the CMMG Capabilities Info field.

The TDDTI (time division data transfer interval) subfield is set to 1 if the STA, while operating as an AP or PCP, is capable of providing channel access as defined in 10.38.6 and 11.4 and is set to 0 otherwise.

The Pseudo-static Allocations subfield is set to 1 if the STA, while operating as an AP or PCP, is capable of providing pseudo-static allocations as defined in 10.38.6.4 and is set to 0 otherwise. The Pseudo-static Allocations subfield is set to 1 only if the TDDTI subfield in the CMMG AP Or PCP Capability Information field is equal to 1. The Pseudo-static Allocations subfield is reserved if the TDDTI subfield in the CMMG AP Or PCP Capability Information field is equal to 0.

The PCP Handover field is set to 1 if the STA, while operating as a PCP, is capable of performing a PCP handover as defined in 11.29.2 and is set to 0 if the STA does not support PCP handover.

The MAX Associated STA Number field indicates the maximum number of STAs that the STA can perform association with if operating as an AP or PCP. The value of this field includes the STAs, if any, that are colocated with the AP or PCP.

The Power Source field is set to 0 if the STA is battery powered and is set to 1 otherwise.

The Decentralized AP or PCP Clustering field is set to 1 if the STA, when operating as an AP or PCP, is capable of performing decentralized AP or PCP clustering and is set to 0 otherwise.

Table 9-368—Subfields of the Transmit Beamforming Capabilities field

Subfield	Definition	Encoding
Receive Staggered Sounding Capable	Indicates whether this STA can receive staggered sounding frames.	Set to 0 if not supported. Set to 1 if supported.
Transmit Staggered Sounding Capable	Indicates whether this STA can transmit staggered sounding frames.	Set to 0 if not supported. Set to 1 if supported.
Receive NDP Capable	Indicates whether this receiver can interpret null data PPDUs as sounding frames.	Set to 0 if not supported. Set to 1 if supported.
Transmit NDP Capable	Indicates whether this STA can transmit null data PPDUs as sounding frames.	Set to 0 if not supported. Set to 1 if supported.
Explicit Compressed Steering Capable	Indicates whether this STA can apply transmit beamforming using compressed beamforming feedback matrix explicit feedback in its transmission.	Set to 0 if not supported. Set to 1 if supported.
Explicit Compressed Beamforming Feedback Capable	Indicates whether this receiver can return compressed beamforming feedback matrix explicit feedback.	Set to 0 if not supported. Set to 1 for delayed feedback. Set to 2 for immediate feedback. Set to 3 for delayed and immediate feedback.
Minimal Grouping	Indicates the minimal grouping used for explicit feedback reports.	Set to 0 if the STA supports groups of 1 (no grouping). Set to 1 indicates groups of 1, 2. Set to 2 indicates groups of 1, 4. Set to 3 indicates groups of 1, 2, 4. Set to 4 indicates groups of 1, 6. Set to 5 indicates groups of 1, 2, 6. Set to 6 indicates groups of 1, 4, 6. Set to 7 indicates groups of 1, 2, 4, 6.
CSI Number of Beamformer Antennas Supported	Indicates the maximum number of beamformer antennas the CMMG beamformee can support when CSI feedback is required.	Set to 0 for single Tx antenna sounding. Set to 1 for 2 Tx antenna sounding. Set to 2 for 3 Tx antenna sounding. Set to 3 for 4 Tx antenna sounding.
Compressed Steering Number of Beamformer Antennas Supported	Indicates the maximum number of beamformer antennas the beamformee can support when compressed beamforming feedback matrix is required.	Set to 0 for single Tx antenna sounding. Set to 1 for 2 Tx antenna sounding. Set to 2 for 3 Tx antenna sounding. Set to 3 for 4 Tx antenna sounding.
CSI Max Number of Rows Beamformer Supported	Indicates the maximum number of rows of CSI explicit feedback from the CMMG beamformee that a CMMG beamformer can support when CSI feedback is required.	Set to 0 for a single row of CSI. Set to 1 for 2 rows of CSI. Set to 2 for 3 rows of CSI. Set to 3 for 4 rows of CSI.
Channel Estimation Capability	Indicates the maximum number of space-time streams (columns of the MIMO channel matrix) for which channel dimensions can be simultaneously estimated when receiving an NDP sounding PPDU or the extension portion of the MCTFs in a staggered sounding PPDU.	Set 0 for 1 space-time stream. Set 1 for 2 space-time streams. Set 2 for 3 space-time streams. Set 3 for 4 space-time streams.
NOTE—The maximum number of space-time streams for which channel coefficients can be simultaneously estimated using the MCTFs corresponding to the data portion of the packet is limited by the Rx MCS Bitmask subfield of the Supported MCS Set field and by the Rx STBC subfield of the CMMG Capabilities Info field. Both fields are part of the CMMG Capabilities element.

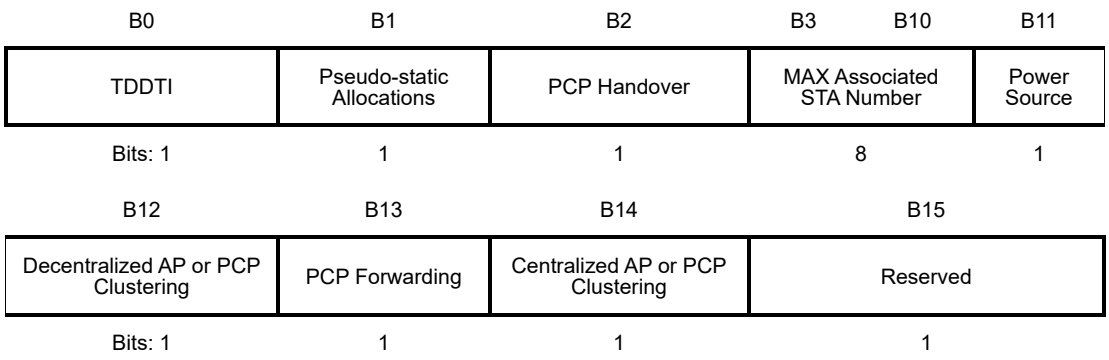

Figure 9-868—CMMG AP Or PCP Capability Information field format

The PCP Forwarding field is set to 1 if the STA, while operating as a PCP, is capable of forwarding frames it receives from a non-PCP STA and destined to another non-PCP STA in the PBSS. This field is set to 0 otherwise.

The Centralized AP or PCP Clustering field is set to 1 if the STA, when operating as an AP or PCP, is capable of performing centralized AP or PCP clustering and is set to 0 otherwise. An AP or PCP that is incapable of performing centralized AP or PCP clustering is subject to requirements as described in 10.39.2.2.

9.4.2.229 CMMG Operation element

The operation of CMMG STAs in the BSS is controlled by the CMMG Operation element. The format of the CMMG Operation element is defined in Figure 9-869 (CMMG Operation element format).

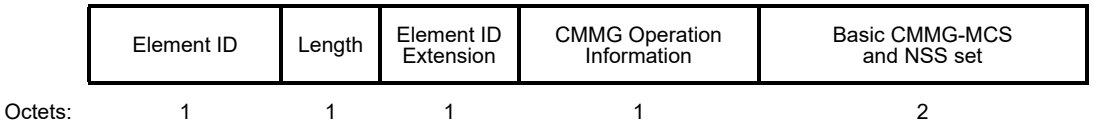

Figure 9-869—CMMG Operation element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The structure of the CMMG Operation Information field is defined in Figure 9-870 (CMMG Operation Information field format).

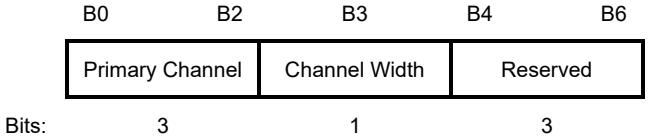

Figure 9-870—CMMG Operation Information field format

The subfields of the CMMG Operation Information field are defined in Table 9-369.

The Basic CMMG-MCS and NSS Set field indicates the CMMG-MCSs for each number of spatial streams in CMMG PPDUs that are supported by all CMMG STAs in the BSS (including IBSS and MBSS). The

Table 9-369—CMMG Operation Information field format

Subfield	Definition	Encoding
Primary Channel	Indicates the channel number of the primary channel; see 25.10.	Channel number of the primary channel.
Channel Width	This field defines the BSS operating channel width.	Set to 0 for 540 MHz operating channel width. Set to 1 for 1080 MHz operating channel width.

Basic CMMG-MCS and NSS Set field is a bitmap of size 2 bits. The Basic CMMG-MCS and NSS Set field is defined in Figure 9-866 (Rx CMMG-MCS Map and Tx CMMG-MCS Map subfields and Basic CMMG-MCS and NSS Set field format).

9.4.2.230 CMMG Operating Mode Notification element

The CMMG Operating Mode Notification element is used to notify STAs that the transmitting STA is changing its operating channel width, the maximum number of spatial streams it can receive, or both. The format of the CMMG Operating Mode Notification element is defined in Figure 9-871 (CMMG Operating Mode Notification element format).

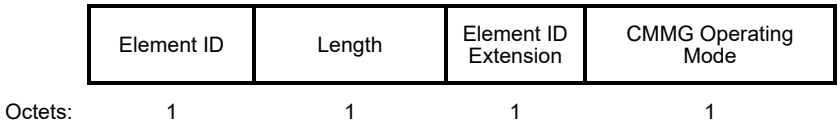

Figure 9-871—CMMG Operating Mode Notification element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The CMMG Operating Mode field is defined in 9.4.1.61.

9.4.2.231 CMMG Link Margin element

9.4.2.231.1 General

The format of the CMMG Link Margin element is shown in Figure 9-872 (CMMG Link Margin element format). The CMMG Link Margin element is included in a Link Measurement Report frame.

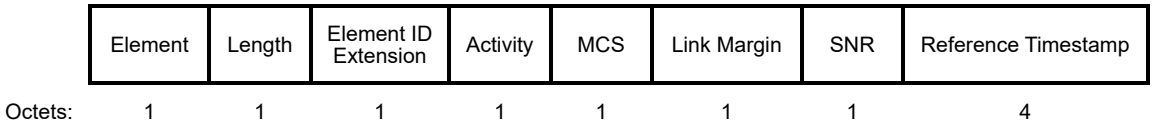

Figure 9-872—CMMG Link Margin element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Activity field is set to a preferred action that the STA sending this element recommends that the peer STA indicated in the RA field of the Link Measurement Report frame execute. The method by which the

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

sending STA determines a suitable action for the peer STA is implementation specific. The Activity field is defined in 9.4.2.231.2.

The MCS field is set to an MCS value that the STA sending this element recommends that the peer STA indicated in the RA field of the Link Measurement Report frame use to transmit frames to this STA. The reference PER for selection of the MCS is for an MPDU length of 4096 octets. The method by which the sending STA determines a suitable MCS for the peer STA is implementation specific. The Link Margin field contains the measured link margin of the Data frames received from the peer STA indicated in the RA field of the Link Measurement Report frame and is coded as a 2s complement signed integer in units of decibels. Setting the field to –128 indicates that no link margin is provided. The measurement method of link margin is beyond the scope of this standard.

The SNR field indicates the SNR measured during the reception of a PPDU. Values are from –13 dB to 50.75 dB in 0.25 dB steps.

The Reference Timestamp field contains the lower 4 octets of the TSF timer value sampled at the instant that the MAC received the PHY-CCA.indication(IDLE) primitive that corresponds to the end of the reception of the PPDU that was used to generate the feedback information contained in the Link Measurement Report frame.

9.4.2.231.2 Activity field

The Activity field values are defined in Table 9-370.

Table 9-370—Activity field values

Preferred Action value	Meaning
0	No change preferred
1	Change(d) MCS
2	Decrease(d) transmit power
3	Increase(d) transmit power
4	Fast session transfer (FST)
5	Power conserve mode
6	Perform SLS
7–255	Reserved

9.4.2.232 CMMG Link Adaptation Acknowledgment element

The format of the CMMG Link Adaptation Acknowledgment element is shown in Figure 9-873 (CMMG Link Adaptation Acknowledgment element format). The CMMG Link Adaptation Acknowledgment element is carried in the Optional Subelements field of the Link Measurement Report frame.

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Activity field is set to the action that the STA sending this element has executed following the reception of the recommended activity in a Link Measurement Report frame. The method by which the sending STA determines the action is described in 10.31, and the Activity field is defined in 9.4.2.231.2.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

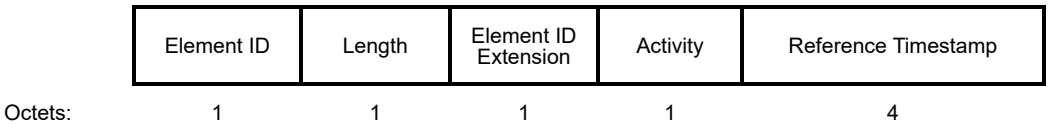

Figure 9-873—CMMG Link Adaptation Acknowledgment element format

The Reference Timestamp field contains the lower 4 octets of the TSF timer value sampled at the instant that the MAC received the PHY-CCA.indication(IDLE) primitive that corresponds to the end of the reception of the PPDU that was used to generate the feedback information contained in the Link Measurement Report frame.

9.4.2.233 GLK-GCR Parameter Set element

The GLK-GCR Parameter Set element is included in an Association Request or a Reassociation Request frame transmitted by a non-AP STA to indicate its buffering capability to support GLK-GCR. The GLK-GCR Parameter Set element is included in the corresponding Association Response or Reassociation Response frame transmitted by an AP to define the parameters that are used when the GLK AP transmits group addressed frames using GLK-GCR to the associated GLK non-AP STAs. Figure 9-874 (GLK-GCR Parameter Set element format) shows the fields that make up the GLK-GCR Parameter Set element.

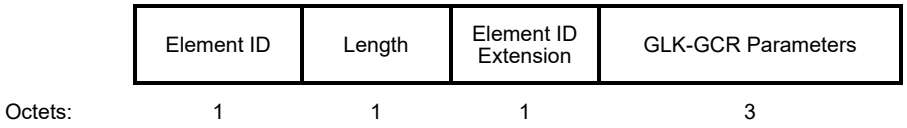

Figure 9-874—GLK-GCR Parameter Set element format

The GLK-GCR Parameters field is shown in Figure 9-875 (GLK-GCR Parameters field format).

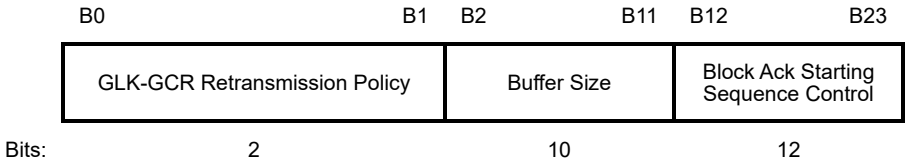

Figure 9-875—GLK-GCR Parameters field format

The GLK-GCR Retransmission Policy subfield is described in Table 9-371. This subfield is reserved when the corresponding GLK-GCR Parameters Set element is part of an Association Request or a Reassociation Request frame.

Table 9-371—GLK-GCR Retransmission Policy subfield

B0	B1	Description of the corresponding GLK-GCR mode
0	0	Reserved
0	1	GLK-GCR not operational
1	0	Operating in GLK-GCR unsolicited retry mode
1	1	Operating in GLK-GCR block ack mode

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Buffer Size subfield indicates the maximum number of buffers in the GLK-GCR block ack block. Each buffer is capable of holding a number of octets equal to the maximum size of an A-MSDU that is supported by the STA.

In an Association Request or a Reassociation Request frame, the Buffer Size subfield in a GLK-GCR Parameter Set element is intended to provide guidance for the recipient to decide its reordering buffer size. If the transmitter has no guidance for the receivers reordering buffer size it sets the Buffer Size subfield to 0.

In an Association Response or Reassociation Response frame, the Buffer Size subfield in a GLK-GCR Parameters field in the GLK-GCR Parameter Set element is set to a value greater than or equal to 1, if the GLK-GCR retransmission policy indicates GLK-GCR block ack mode. Otherwise this subfield is reserved.

The Block Ack Starting Sequence Control subfield indicates the sequence number of the first MSDU or A-MSDU for this GLK-GCR block ack agreement, and is defined in 9.3.1.8. This subfield is reserved when the corresponding GLK-GCR Parameters Set element is part of an Association Request or Reassociation Request frame.

9.4.2.234 Estimated Service Parameters Outbound element

The Estimated Service Parameters Outbound element is used by a STA to provide information to another STA that can then use the information as input to an algorithm to generate an estimate of outbound throughput between the two STAs.

The format of the Estimated Service Parameters Outbound element is shown in Figure 9-876.

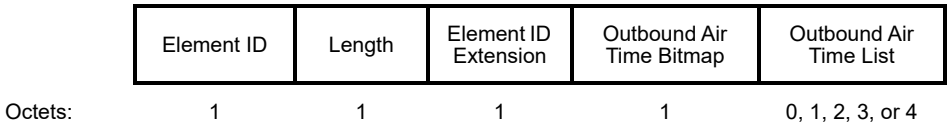

Figure 9-876—Estimated Service Parameters Outbound element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Outbound Air Time Bitmap field contains a bitmap indicating the presence or absence of an Outbound Air Time Information field for each of the four EDCA Access Categories. The format of the Outbound Air Time Bitmap field is shown in Figure 9-877.

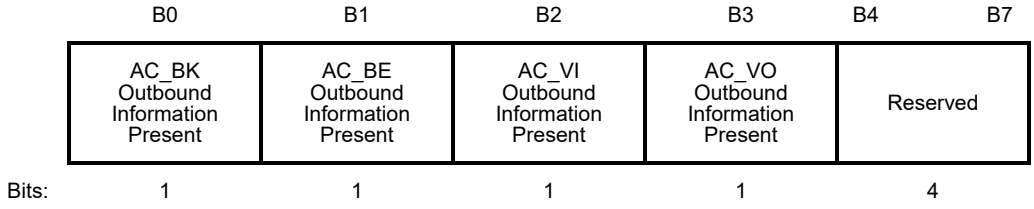

Figure 9-877—Outbound Air Time Bitmap field format

The Outbound Air Time List field contains from 0 to 4 Outbound Air Time Information fields, each corresponding to an access category for which estimated air time information for outbound traffic is provided. The Outbound Air Time Information field with the lowest numbered bits of the Outbound Air Time List field contains the outbound information corresponding to the AC of the lowest numbered bit of the Outbound Air Time Bitmap field that has a value of 1. The next Outbound Air Time Information field, if present, corresponds to the next higher numbered Outbound Air Time Bitmap field bit that has a value of 1, and so forth. If no Outbound Air Time Bitmap field bit has the value of 1, then no Outbound Air Time Information field is present. The format of the Outbound Air Time Information field is shown in Figure 9-878.

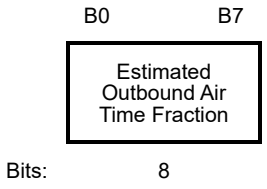

Figure 9-878—Outbound Air Time Information field format

The Estimated Outbound Air Time Fraction subfield of the Outbound Air Time Information field contains an unsigned integer that represents the predicted percentage of time, linearly scaled with 255 representing 100% and 0 representing 0%, that a new STA joining the BSS can expect to be available for the transmission of PPDUs by that STA, including overhead, where such PPDUs contain MPDUs with the Type subfield

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

equal to Data that belong to the access category corresponding to the position of the Outbound Air Time Information field in the Outbound Air Time Bitmap field and any other MPDUs in the PPDU are considered to be overhead. A new STA joining the BSS might have a different view of the medium than the STA transmitting the Estimated Outbound Air Time Fraction, e.g. due to hidden nodes. In such cases, the new STA might experience a different actual outbound airtime fraction than that advertised in the element.

9.4.2.235 OCI element

The format of the OCI element is shown in Figure 9-879.

	Element ID	Length	Element ID Extension	Operating Class	Primary Channel Number	Frequency Segment 1 Channel Number	OCT Operating Class (optional)	OCT Primary Channel Number (optional)	OCT Frequency Segment 1 Channel Number (optional)
Octets:	1	1	1	1	1	1	0 or 1	0 or 1	0 or 1

Figure 9-879—OCI element format

The Element ID and Length fields are defined in 9.4.2.1.

The Operating Class field is set to the global operating class that corresponds to the widest bandwidth currently being used by the transmitting STA. See Annex E, Table E-4 for description of the global operating classes.

The Primary Channel Number field is set to the primary channel being used currently. The Primary Channel Number field is one of the channels from the row corresponding to the operating class as defined in Annex E or the primary 20 MHz (sub)channel allowed for HT or non-HT operation for operating classes that specify only channel center frequency indices.

The Frequency Segment 1 Channel Number field is set to the channel number of the center frequency of the secondary segment (frequency segment 1) being used currently, if operating in an 80+80 MHz operating class or set to 0 otherwise. The value of the Frequency Segment 1 Channel Number field is one of the center frequency indices from the row corresponding to the operating class as defined in Annex E, or 0 if not operating in an 80+80 MHz operating class.

The OCT Operating Class, OCT Primary Channel Number and OCT Frequency Segment 1 fields are present if the OCI element is contained in a frame sent using the OCT procedure, i.e. an MMPDU included in an MLME-OCTunnel.request or MLME-OCTunnel.response primitive (see 11.31.5); otherwise they are not present. They have the same definition as the Operating Class, Primary Channel Number and Frequency Segment 1 fields, except that they pertain to the channel used by the STAs corresponding to the TR-MLMEs to transmit and receive PPDUs containing On-channel Tunnel Request frames.

9.4.2.236 Service Hint element

The Service Hint element provides a probabilistic representation of a set of services that are available to the BSS. The format of the Service Hint element is shown in Figure 9-880.

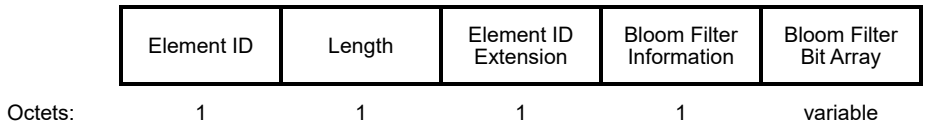

Figure 9-880—Service Hint element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Bloom Filter Information field represents the stochastic characteristics of a Bloom filter (Tarkoma et al. [B68]) that conveys the probabilistic data. The format of the Bloom Filter Information field is shown in Figure 9-881.

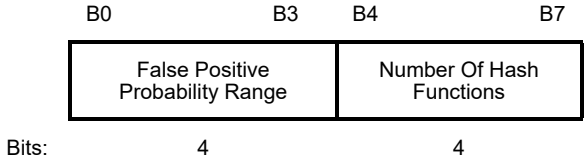

Figure 9-881—Bloom Filter Information field format

The False Positive Probability Range subfield represents the false positive probability range of the Bloom filter. The False Positive Probability Range subfield is shown in Table 9-372.

Table 9-372—False Positive Probability Range subfield values

Value	False positive probability range, p
0	$p > 25\%$
1	$20\% < p \leq 25\%$
2	$15\% < p \leq 20\%$
3	$10\% < p \leq 15\%$
4	$5\% < p \leq 10\%$
5	$1\% < p \leq 5\%$
6	$0.5\% < p \leq 1\%$
7	$0.1\% < p \leq 0.5\%$
8	$0.05\% < p \leq 0.1\%$
9	$0.01\% < p \leq 0.05\%$
10	$p \leq 0.01\%$
11–15	Reserved

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Number Of Hash Functions subfield is set to a value equal to k-1, where k is the number of hash functions used by the Bloom filter as described in 11.23.5.

The Bloom Filter Bit Array field provides an indication of the services offered by or through the AP or PCP with a target probability of false positive p. The length of the Bloom Filter Bit Array field in octets is $\lceil m/8 \rceil$ where m is the size of the Bloom filter in bits. How the size of the Bloom filter is determined is out of the scope of this standard. The maximum length of the Bloom Filter Bit Array field is 128 octets.

9.4.2.237 Service Hash element

The Service Hash element contains one or more service hashes. The format of the Service Hash element is shown in Figure 9-882 (Service Hash element format).

	Element ID	Length	Element ID Extension	Service Hashes
Octets:	1	1	1	variable

Figure 9-882—Service Hash element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Service Hashes field contains one or more 6-octet service hash values. See 11.23.4 for procedures for generating a service hash used in the Service Hash element.

9.4.2.238 GAS Extension element

The GAS Extension element is defined in 9-883. When present in the GAS Initial Request frame, the GAS Extension element indicates whether the STA is capable of:

— Transmitting and receiving group addressed GAS frames
— Retransmitting a GAS query request or GAS query response fragment
— Indicating the size of the GAS query request or GAS query response in octets
— Establishing a maximum time to wait for a response to a GAS query request.

	Element ID	Length	Element ID Extension	GAS Flags	Maximum Channel Time	Fragment ID	Number of Response Map Duples	Response Map Duples	GAS Query Size
Octets:	1	1	1	0 or 1	0 or 1	0 or 1	0 or 1	variable	0 or 2

Figure 9-883—GAS Extension element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The GAS Flags field is defined in Figure 9-884 (GAS Flags field format).

The Group Addressed GAS subfield is set to 1 to indicate that the STA is capable of receiving Group Addressed GAS Request and Group Addressed GAS Response frames and is set to 0 otherwise.

The Fragment Retransmission subfield, when present in a GAS Initial Request or GAS Initial Response frame, is set to 1 to indicate that the responding STA is capable of retransmitting a Query Request or Query Response fragment upon request and is set to 0 otherwise.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

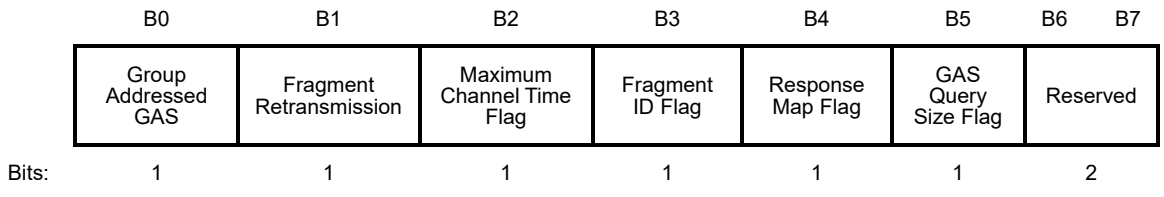

Figure 9-884—GAS Flags field format

The Maximum Channel Time Flag subfield is set to 1 to indicate that the Maximum Channel Time field is present in the element and is set to 0 otherwise.

The Fragment ID Flag subfield is set to 1 to indicate that Fragment ID field is present in the element and is set to 0 otherwise.

The Response Map Flag subfield is set to 1 to indicate that the Number of Response Map Duples field and the Response Map Duples field are present in the element and is set to 0 otherwise.

The GAS Query Size Flag subfield is set to 1 to indicate that the GAS Query Size field is present in the element and is set to 0 otherwise.

The Maximum Channel Time field indicates the maximum duration the STA will, or needs to, remain on the channel to receive a GAS Initial Response, a GAS Comeback Response, or Group Addressed GAS Response frame, expressed as a multiple of 10 TUs beginning from the end of the PPDU carrying this element. The field has a valid range of 1–255.

The Fragment ID field, when present in the GAS Comeback Request Fragment or the GAS Comeback Response frames, indicates the fragment the STA is requesting. If it is present in the GAS Initial Request frame, it indicates that the GAS query request will be transmitted using GAS Comeback Request Fragment and GAS Comeback Response frames that support GAS fragmentation. It is present only when the Fragment ID Flag subfield is set to 1 in the GAS Flags field.

The Number of Response Map Duples field indicates the number of Response Map Duple subfields contained in the Response Map Duples field. It is present only when the Response Map Flag subfield is set to 1 in the GAS Flags field. When present, the Number of Response Map Duples field is set to a nonzero value and the value of zero is reserved.

The Response Map Duples field is present only when the Number of Response Map Duples field is present and contains a nonzero value. The Response Map Duples field, when present, contains one or more Response Map Duple subfields as indicated by the Number of Response Map Duples field. The format of the Response Map Duple subfield is shown in Figure 9-885 (Response Map Duple subfield format). The Response Map Duples field is included in a Group Addressed GAS Response frame.

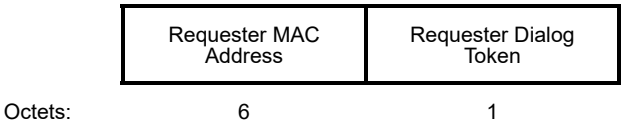

Figure 9-885—Response Map Duple subfield format

The Response Map Duple subfield contains a Requester MAC Address subfield and a Requester Dialog Token subfield. An AP or PCP includes one or more Response Map Duple subfields in a Group Addressed GAS Response frame.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The GAS Query Size subfield contains the size of the GAS query request or GAS query response in octets.

9.4.2.239 Non-Inheritance element

The Non-Inheritance element when present in the Nontransmitted BSSID Profile subelement of a Multiple BSSID element identifies one or more elements that are not inherited by the BSS corresponding to the nontransmitted BSSID profile that carried it. The identified elements are present in the Management frame of the transmitted BSSID that carried the Multiple BSSID element.

The format of the Non-Inheritance element is shown in Figure 9-886 (Non-Inheritance element format).

	Element ID	Length	Element ID extension	List Of Element IDs	List of Element ID Extensions
Octets:	1	1	1	1 or more	1 or more

Figure 9-886—Non-Inheritance element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The format of the List Of Element IDs field is shown in Figure 9-887 (List Of Element IDs field format). The Length subfield of the List of Element IDs field is set to the number of elements listed in the Element ID List subfield. If the Element ID List subfield is not present, the Length subfield is set to 0. The Element ID List subfield consists of a list of Element ID values, each one octet in length. Element ID subfield values are in increasing order and no value occurs more than once. The List Of Element IDs field does not list elements that contain an Element ID Extension field (see 9.4.2.1).

	Length	Element ID List
Octets:	1	0 or more

Figure 9-887—List Of Element IDs field format

The format of the List Of Element ID Extensions field is shown in Figure 9-888 (List Of Element ID Extensions field format). The Length subfield of the List Of Element ID Extensions field is set to the number of elements listed in the Element ID Extension List subfield. If the Element ID Extension List subfield is not present, the Length subfield is set to 0. The Element ID Extension List subfield consists of a list of Element ID Extension values, each one octet in length. Element ID Extension subfield values are in increasing order and no value occurs more than once. The List of Element ID Extensions field lists only elements that have an element ID value of 255 (see 9.4.2.1).

	Length	Element ID Extension List
Octets:	1	0 or more

Figure 9-888—List Of Element ID Extensions field format

9.4.2.240 RSNXE

The RSN extension element (RSNXE) contains additional information required to establish an RSNA. The format of the RSNXE is defined in Figure 9-889 (RSNXE format).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

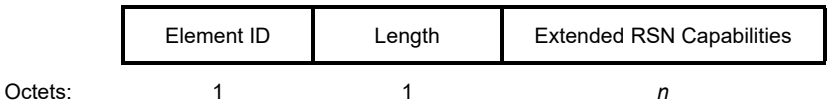

Figure 9-889—RSNXE format

The Element ID and Length fields are defined in 9.4.2.1.

The Extended RSN Capabilities field, except its first 4 bits, is a set of 1-bit fields indicating the extended RSN capabilities being advertised by the STA transmitting the element. The length of the Extended RSN Capabilities field is a variable *n*, in octets, as indicated by the first 4 bits in the field. The Extended RSN Capabilities field is shown in Table 9-373.

Table 9-373—Extended RSN Capabilities field

Bit	Information	Notes
0–3	Field length	The length of the Extended RSN Capabilities field, in octets, minus 1, i.e., $n - 1$.
4	Protected TWT Operations Support	A STA sets the Protected TWT Operations Support field to 1 when dot11ProtectedTWTOperationsImplemented is true, and sets it to 0 otherwise. See 10.46.1.
5	SAE Hash-to-element	A STA sets the SAE Hash-to-element field to 1 when it supports the hash-to-element method to obtain the PWE instead of looping, and sets it to 0 otherwise. See 12.4.4.2.3 and 12.4.4.3.3. NOTE —If SAE is not negotiated, this field is ignored by the receiver.
6		*Allocated to the Wi-Fi Alliance* [a].
7	Protected WUR Frame Support	A STA sets the Protected WUR Frame Support field to 1 when dot11RSNAWURFrameProtectionActivated is true, and sets it to 0 otherwise.
8	Secure HE-LTF Support	A STA sets the Secure HE-LTF Support field to 1 when dot11SecureLTFImplemented is true. Otherwise, the STA sets the Secure HE-LTF Support field to 0. See 11.21.6.4.5.
9	Secure RTT Support	A STA sets the Secure RTT Support field to 1 if it supports Secure RTT Measurement exchange as defined in 11.21.6.4.2.7. Otherwise, the field is set to 0.
10	URNM-MFPR-X20	A STA sets the URNM-MFPR-X20 field to 1 if dot11RSTARequiresPMFActivated is set to 1. Otherwise, it sets the field to 0. See 11.21.6.3.1 and Annex C.3.
11	Protected Announce Support	A non-EDMG STA sets the Protected Announce Support field to 1 when dot11ProtectedAnnounceImplemented is true, and sets it to 0 otherwise. See 12.6.18.
12	PBAC	A STA sets the PBAC field to indicate it can establish a protected block ack agreement and sets it to 0 otherwise.
13	Extended S1G Action Protection	A STA sets the Extended S1G Action Protection field to 1 when dot11ExtendedS1GActionProtectionOperationsImplemented is true and sets it to 0 otherwise.

Copyright © 2025 IEEE. All rights reserved.

Table 9-373—Extended RSN Capabilities field

Bit	Information	Notes
14	SPP A-MSDU Capable	A non-DMG STA sets the SPP A-MSDU Capable field to 1 if dot11SPPAMSDUCapable is true. Otherwise, this field is set to 0. See 10.11.
15	URNM-MFPR	A STA sets the URNM-MFPR field to 1 if dot11RSTARequiresPMFActivated is set to 2. Otherwise, it sets the field to 0. See 11.21.6.3.1.
21	SSID Protection	A STA sets this field to 1 to indicate support for protected exchange of the SSID during the 4-way handshake. Otherwise, it sets the field to 0.
22	QMF ACI Subfield Unmask Support	A STA sets the QMF ACI Subfield Unmask Support to 1 if the STA supports to unmask ACI subfield during AAD construction. Otherwise, this subfield is set to 0.
16–19, 20, 23–(8×*n* – 1)	Reserved	

[a] See http://www.wi-fi.org.

If a STA does not support any of the capabilities defined in the RSNXE, then the RSNXE is not present.

9.4.2.241 TCLAS Mask element

The TCLAS Mask element contains a set of parameters necessary to classify incoming MSDUs into streams based on a classifier mask. The structure of this element is shown in Figure 9-890 (TCLAS Mask element format).

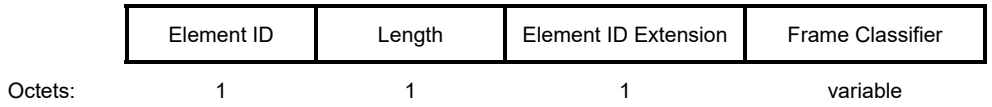

Figure 9-890—TCLAS Mask element format

The Element ID, Length and Element ID Extension fields are defined in 9.4.2.1.

The Frame Classifier field specifies the parameters that are used to classify incoming MSDUs into streams. The field is defined in 9.4.2.29 (see Figure 9-383 (Frame Classifier field format)), except that, in the Classifier Parameters subfield, all subfields other than the following (if present) are reserved:

— Filter Offset subfield
— Filter Mask subfield(s) (including MAC header filters in Match Specification subfields)
— Protocol Number or Next Header subfield

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.242 MSCS Descriptor element

The MSCS Descriptor element defines information about the parameters used to classify streams using the procedures defined in 11.25.3. The format of the MSCS Descriptor element is shown in Figure 9-891 (MSCS Descriptor element format).

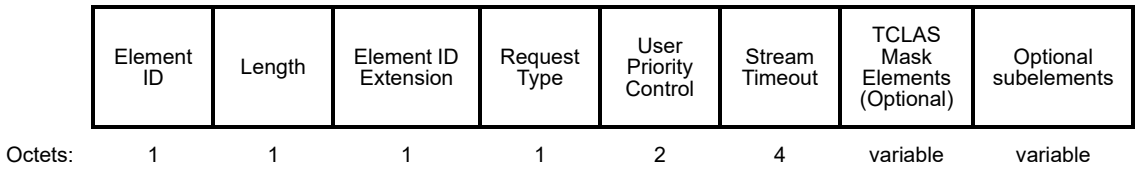

Figure 9-891—MSCS Descriptor element format

The Element ID, Length and Element ID Extension fields are defined in 9.4.2.1.

The Request Type field is defined in 9.4.2.120.

The User Priority Control field is shown in Figure 9-892 (User Priority Control field format). This field is reserved when the Request Type field is "Remove", when the element is present in a (Re)Association Response frame with a value of "SUCCESS" in the Data field of the MSCS Status subelement, or when the element is present in a (Re)Association Response frame with a value other than "SUCCESS" in the Data field of the MSCS Status subelement and a value of "Add" in the Request Type field.

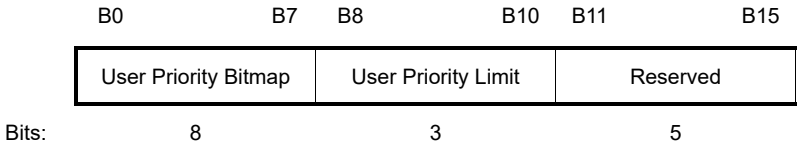

Figure 9-892—User Priority Control field format

Each bit in the User Priority Bitmap subfield corresponds to a user priority (UP), with the least significant bit corresponding to UP value of 0, and the most significant bit corresponding to UP value of 7. A value of 1 in a bit position in the bitmap indicates that the corresponding UP is used when assigning a UP to streams classified by MSCS; a value of 0 in a bit position indicates that the corresponding UP is not used for this purpose.

The User Priority Limit subfield has a value between 0 and 7; it defines the maximum limit for the UP that is assigned to incoming MSDUs in the streams classified by MSCS.

The Stream Timeout subfield indicates the minimum timeout value, in TUs, for maintaining a variable *UP{tuple}* in the MSCS list. This subfield is reserved when the Request Type field is "Remove", when the element is present in a (Re)Association Response frame with a value of "SUCCESS" in the Data field of the MSCS Status subelement, or when the element is present in a (Re)Association Response frame with a value other than "SUCCESS" in the Data field of the MSCS Status subelement and a value of "Add" in the Request Type field.

The TCLAS Mask Elements field contains zero or more TCLAS Mask elements to specify how incoming MSDUs are classified into streams in MSCS, as defined in 9.4.2.241. One or more TCLAS Mask elements are present when the Request Type field is "Add" or "Change"; no TCLAS Mask elements are present when the Request Type field is "Remove", when the element is present in a (Re)Association Response frame with a value of "SUCCESS" in the Data field of the MSCS Status subelement, or when the element is present in a

(Re)Association Response frame with a value other than "SUCCESS" in the Data field of the MSCS Status subelement and a value of "Add" in the Request Type field.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3. The subelements allowed in the MSCS Descriptor element are defined in Table 9-374.

Table 9-374—Optional subelement IDs for MSCS Descriptor element

Subelement ID	Name	Extensible
0	Reserved	
1	MSCS Status	No
2–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The MSCS Status subelement Data field has the same format as the Status Code field shown in Figure 9-147 and contains the status of the requested MSCS setup, as indicated in Table 9-80.

The use of the MSCS Descriptor element is described in 11.25.3.

9.4.2.243 Supplemental Class 2 Capabilities element

The Supplemental Class 2 Capabilities element contains a number of fields that advertise supported rates of a Class 2 ERP or Class 2 HT STA. The Supplemental Class 2 Capabilities element is defined in Figure 9-893 (Supplemental Class 2 Capabilities element format).

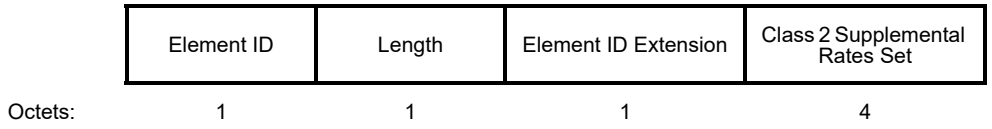

Figure 9-893—Supplemental Class 2 Capabilities element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The format of the Class 2 Supplemental Rates Set field is defined in Figure 9-894 (Class 2 Supplemental Rates Set field format).

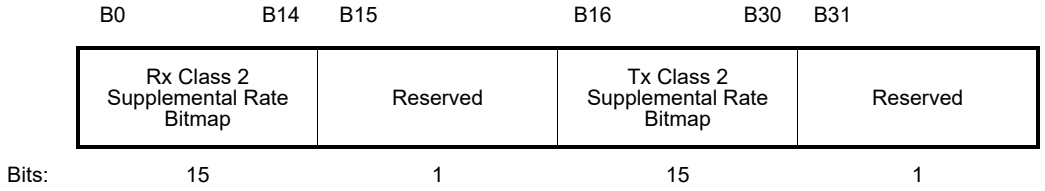

Figure 9-894—Class 2 Supplemental Rates Set field format

The Rx Class 2 Supplemental Rate Bitmap field is encoded as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

a) B0–B1 represent support for receiving 1, 2 Mb/s (DSSS), respectively;
b) B2–B3 represent support for receiving 5.5, 11 Mb/s (HR/DSSS), respectively;
c) B4–B6 represent support for receiving 6, 12, 24 Mb/s (ERP-OFDM), respectively;
d) B7–B14 represent support for receiving 6.5, 13, 19.5, 26, 39, 52, 58.5, 65 Mb/s N_{SS} = 1 (HT), respectively.

The Tx Class 2 Supplemental Rate Bitmap field is encoded as follows:

a) B16–B17 represent support for transmitting 1, 2 Mb/s (DSSS), respectively;
b) B18–B19 represent support for transmitting 5.5, 11 Mb/s (HR/DSSS), respectively;
c) B20–B22 represent support for transmitting 6, 12, 24 Mb/s (ERP-OFDM), respectively;
d) B23–B30 represent support for transmitting 6.5, 13, 19.5, 26, 39, 52, 58.5, 65 Mb/s N_{SS} = 1 (HT), respectively.

9.4.2.244 OCT Source element

The OCT Source element is used to specify the MLME that is the source of an OCT MMPDU. The format of the OCT Source element is shown in Figure 9-895 (OCT Source element format).

	Element ID	Length	Element ID Extension	Band ID	Channel Number	BSSID
Octets:	1	1	1	1	1	6

Figure 9-895—OCT Source element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Band ID field identifies the band on which the source MLME operates, as defined in Table 9-97.

The Channel Number field contains the channel number on which the source MLME operates.

The BSSID field contains the BSSID of the BSS in which the source MLME operates.

9.4.2.245 Rejected Groups element

The Rejected Groups element lists the finite cyclic groups, using the octet ordering conventions of 9.2.2, that have been rejected by a peer for use in SAE. The format of the Rejected Groups element is shown in Figure 9-896 (Rejected Groups element format).

	Element ID	Length	Element ID Extension	Rejected Groups
Octets:	1	1	1	variable

Figure 9-896—Rejected Groups element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Rejected Groups field contains one or more Finite Cyclic Group fields indicating all of the finite cyclic groups that have been rejected by a peer in a previous authentication attempt during the current SAE authentication instance.

9.4.2.246 Anti-Clogging Token Container element

The Anti-Clogging Token Container element is used to carry an Anti-Clogging Token field in contexts where an information element is needed. The format of an Anti-Clogging Token Container element is shown in Figure 9-897 (Anti-Clogging Token Container element format).

	Element ID	Length	Element ID Extension	Anti-Clogging Token
Octets:	1	1	1	variable

Figure 9-897—Anti-Clogging Token Container element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Anti-Clogging Token field is defined in 9.4.1.36.

9.4.2.247 HE Capabilities element

9.4.2.247.1 General

An HE STA declares that it is an HE STA by transmitting the HE Capabilities element.

The HE Capabilities element contains a number of fields that are used to advertise the HE capabilities of an HE STA. The HE Capabilities element is defined in Figure 9-898 (HE Capabilities element format).

	Element ID	Length	Element ID Extension	HE MAC Capabilities Information	HE PHY Capabilities Information	Supported HE-MCS And NSS Set	PPE Thresholds (optional)
Octets:	1	1	1	6	11	4, 8 or 12	variable

Figure 9-898—HE Capabilities element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The HE MAC Capabilities Information, HE PHY Capabilities Information, Supported HE-MCS And NSS Set, and PPE Thresholds fields are defined in the subclauses below.

9.4.2.247.2 HE MAC Capabilities Information field

The format of the HE MAC Capabilities Information field is defined in Figure 9-899 (HE MAC Capabilities Information field format).

	B0	B1	B2	B3 B4	B5 B7	B8 B9	B10 B11	B12 B14
	+HTC HE Support	TWT Requester Support	TWT Responder Support	Dynamic Fragmentation Support	Maximum Number Of Fragmented MSDUs/ A-MSDUs Exponent	Minimum Fragment Size	Trigger Frame MAC Padding Duration	Multi-TID Aggregation Rx Support
Bits:	1	1	1	2	3	2	2	3

The subfields of the HE MAC Capabilities Information field are defined in Table 9-375.

Table 9-375—Subfields of the HE MAC Capabilities Information field

Subfield	Definition	Encoding
+HTC-HE Support	Indicates support for the reception of a frame that carries an HE variant HT Control field.	For a non-AP STA: Set to 1 if the STA supports reception of an HE variant HT Control field based on the description in 10.8. Set to 0 otherwise. An AP sets the +HTC-HE Support subfield to 1.
TWT Requester Support	Indicates support for the role of TWT requesting STA as described in 26.8.	Set to 1 if dot11TWTOptionActivated is true and the STA supports TWT requesting STA functionality (see 26.8). Set to 0 otherwise.
TWT Responder Support	Indicates support for the role of TWT responder STA as described in 26.8.	Set to 1 if dot11TWTOptionActivated is true and the STA supports TWT responder STA functionality (see 26.8). Set to 0 otherwise. An AP sets the TWT Responder Support subfield to 1.
Dynamic Fragmentation Support	Indicates the level of dynamic fragmentation that is supported by a STA as a recipient.	Set to 0 if the STA does not support dynamic fragmentation. Set to 1 if the STA supports level 1 dynamic fragmentation (see 26.3.1). Set to 2 if the STA supports level 2 dynamic fragmentation (see 26.3.1). Set to 3 if the STA supports level 3 dynamic fragmentation (see 26.3.1).
Maximum Number Of Fragmented MSDUs/A-MSDUs Exponent	Indicates the maximum number of fragmented MSDUs and/or A-MSDUs (if supported by the recipient) that the STA is capable of receiving concurrently.	If the Dynamic Fragmentation Support subfield is greater than 0: The maximum number of fragmented MSDUs and/or A-MSDUs, N_{max}, defined by this field is $N_{max} = 2^{\text{Maximum Number Of Fragmented MSDUs/A-MSDUs Exponent}}$, except that a value 7 in the Maximum Number Of Fragmented MSDUs/A-MSDUs Exponent subfield indicates that there is no restriction. Reserved if the Dynamic Fragmentation Support subfield is 0.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-375—Subfields of the HE MAC Capabilities Information field *(continued)*

Subfield	Definition	Encoding
Minimum Fragment Size	Indicates the minimum frame body size in octets of the first fragment of an MSDU, A-MSDU (if supported), or MMPDU that is supported by the recipient STA.	If the Dynamic Fragmentation Support subfield is greater than 0: Set to 0 to indicate no minimum frame body size. Set to 1 to indicate a minimum frame body size of 128 octets. Set to 2 to indicate a minimum frame body size of 256 octets. Set to 3 to indicate a minimum frame body size of 512 octets. Reserved if the Dynamic Fragmentation Support subfield is 0.
Trigger Frame MAC Padding Duration	Indicates *MinTrigProcTime*, which is used in 26.5.2.2.3.	For a non-AP STA: Set to 0 to indicate 0. Set to 1 to indicate 8 μs. Set to 2 to indicate 16 μs. The value 3 is reserved. Reserved for an AP.
Multi-TID Aggregation Rx Support	Indicates the number of TIDs of QoS Data frames that an HE STA can receive in a multi-TID A-MPDU as described in 26.6.3.	Set to the number of TIDs minus 1 of QoS Data frames that an HE STA can receive in a multi-TID A-MPDU.
Multi-TID Aggregation Tx Support	Indicates the number of TIDs of QoS Data frames that an HE STA can transmit in a multi-TID A-MPDU as described in 26.6.3.	Set to the number of TIDs minus 1 of QoS Data frames that an HE STA can transmit in a multi-TID A-MPDU.
HE Link Adaptation Support	Indicates support for link adaptation using the HLA Control subfield.	If the +HTC-HE Support subfield is 1: Set to 0 (No Feedback) if the STA does not provide HE MFB. Set to 2 (Unsolicited) if the STA can receive and provide only unsolicited HE MFB. Set to 3 (Solicited and unsolicited) if the STA is capable of receiving and providing HE MFB in response to HE MRQ and if the STA can receive and provide unsolicited HE MFB. The value 1 is reserved. HE MFB and HE MRQ are MFB and MRQ using HLA Control subfield, respectively. Reserved if the +HTC-HE Support subfield is 0.
All Ack Support	Indicates support for the reception of a Multi-STA BlockAck frame under the all ack context (see 26.4.2)	Set to 1 if supported. Set to 0 otherwise.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-375—Subfields of the HE MAC Capabilities Information field *(continued)*

Subfield	Definition	Encoding
TRS Support	For a non-AP STA, indicates support for receiving a frame with a TRS Control subfield.	For a non-AP STA that has set the +HTC-HE Support subfield to 1: Set to 1 if the STA supports reception of the TRS Control subfield. Set to 0 otherwise. Reserved for an AP or if the +HTC-HE Support subfield is 0.
BSR Support	For an AP, indicates support for receiving a frame with a BSR Control subfield. For a non-AP STA, indicates support for generating a frame with a BSR Control subfield.	If the +HTC-HE Support subfield is 1: Set to 1 if the STA supports the BSR Control subfield functionality. Set to 0 otherwise. Reserved if the +HTC-HE Support subfield is 0.
Broadcast TWT Support	For a non-AP STA, indicates support for the role of TWT scheduled STA. For an AP indicates support for the role of TWT scheduling AP as described in 26.8.3.	Set to 1 if the STA supports broadcast TWT functionality. Set to 0 otherwise.
32-bit BA Bitmap Support	Indicates support for the reception of a Multi-STA BlockAck frame that has a Per AID Info subfield addressed to it with a 32-bit Block Ack Bitmap subfield.	Set to 1 if the STA supports reception of a Multi-STA BlockAck frame that has a Per AID Info subfield addressed to it with a 32-bit Block Ack Bitmap subfield. Set to 0 otherwise.
MU Cascading Support	Indicates support for participating in an MU cascading sequence (see 26.5.3).	For an HE AP: Set to 1 to indicate that the AP is capable of transmitting an A-MPDU that is constructed following the MU cascade sequence rules (see 26.5.3) under MU cascade operation. Set to 0 otherwise. For a non-AP HE STA: Set to 1 to indicate that the non-AP STA is capable of receiving an A-MPDU that is constructed following the MU cascade sequence rules (see 26.5.3). Set to 0 otherwise.
Ack-Enabled Aggregation Support	Indicates support by a STA to receive an A-MPDU that contains two or more frames at least one of which solicits an Ack frame or acknowledgment context in a Multi-STA BlockAck frame as described in 26.6.3 and 26.5.1.1.	Set to 1 if the STA supports reception of this A-MPDU format. Set to 0 otherwise.

Table 9-375—Subfields of the HE MAC Capabilities Information field *(continued)*

Subfield	Definition	Encoding
OM Control Support	Indicates support for receiving a frame with an OM Control subfield.	If the +HTC-HE Support subfield is 1 in a non-AP STA: Set to 1 if the non-AP STA supports reception of the OM Control subfield. Set to 0 otherwise. Reserved if the +HTC-HE Support subfield is 0 in a non-AP STA. An AP sets the OM Control Support subfield to 1.
OFDMA RA Support	For a non-AP STA, indicates support for the OFDMA random access procedure. For an AP, indicates support for sending Trigger frames that allocate RA-RUs. See 26.5.4.	Set to 1 if supported. Set to 0 otherwise.
Maximum A-MPDU Length Exponent Extension	Indicates the exponent extension for the maximum A-MPDU length supported in reception (see 26.6).	Set to the value of the maximum A-MPDU exponent extension value.
A-MSDU Fragmentation Support	Indicates support for the reception of fragmented A-MSDUs.	If the Dynamic Fragmentation Support subfield is not 0: Set to 1 to indicate support for the receipt of fragmented A-MSDUs. Set to 0 to indicate that reception of fragmented A-MSDUs is not supported. Reserved if the Dynamic Fragmentation Support subfield is 0.
Flexible TWT Schedule Support	Indicates support for the reception of TWT Information frames with flexible TWT schedules as defined in 26.8.4.4.	Set to 1 if the STA supports reception of a TWT Information frame with flexible TWT schedules. Set to 0 otherwise.
Rx Control Frame To MultiBSS	For a non-AP STA associated with a BSS corresponding to a nontransmitted BSSID, indicates support for the reception of a Control frame with TA equal to the transmitted BSSID.	For a non-AP STA: Set to 1 if supported. Set to 0 otherwise. Reserved for an AP.
BSRP BQRP A-MPDU Aggregation	For a non-AP STA, indicates whether the STA accepts a BSRP Trigger frame or BQRP Trigger frame that is aggregated with other Control, Data, and Management frames in an A-MPDU destined to the STA.	For a non-AP STA: Set to 1 if supported. Set to 0 otherwise. Reserved for an AP.
QTP Support	Indicates support for quiet time period (QTP) operation as described in 26.17.5.	Set to 1 if supported. Set to 0 otherwise.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-375—Subfields of the HE MAC Capabilities Information field *(continued)*

Subfield	Definition	Encoding
BQR Support	For an AP, indicates support for receiving a frame with a BQR Control subfield. For a non-AP STA, indicates support for generating a frame with a BQR Control subfield.	If the +HTC-HE Support subfield is 1: Set to 1 if the STA supports the BQR Control subfield functionality. Set to 0 otherwise. Reserved if the +HTC-HE Support subfield is 0.
PSR Responder	Indicates support for the role of PSR responder.	Set to 1 if the STA supports the role of PSR responder. Set to 0 otherwise.
NDP Feedback Report Support	For an AP, indicates support for the NDP feedback report procedure. For a non-AP STA, indicates support for responding to an NFRP Trigger frame.	Set to 1 if supported. Set to 0 otherwise.
OPS Support	For an AP, indicates support for encoding OPS information in the TIM element of FILS Discovery frames, TIM frames or OPS frames as described in 26.14.3.2. For a non-AP STA, indicates support for receiving the opportunistic power save encoded TIM elements.	Set to 1 if supported. Set to 0 otherwise.
A-MSDU Not Under BA In Ack-Enabled A-MPDU Support	Indicates support by a STA to receive an ack-enabled single-TID A-MPDU that carries an A-MSDU that is not under a block ack agreement.	Set to 1 if supported. Set to 0 otherwise.
HE Subchannel Selective Transmission Support	Indicates whether an HE STA supports an HE subchannel selective transmission operation described in 26.8.7.	Set to 1 if supported. Set to 0 otherwise.
UL 2×996-tone RU Support	Indicates support by a non-AP STA to receive a TRS Control subfield or a Trigger frame with a User Info field addressed to the STA with the RU Allocation subfield of the TRS Control subfield or the User Info field indicating 2×996-tone RU.	For a non-AP STA: Set to 1 if the STA supports reception of a TRS Control subfield with the RU Allocation subfield indicating a 2×996-tone RU or a Trigger frame with a User Info field addressed to the STA with the RU Allocation subfield indicating 2×996-tone RU. Set to 0 otherwise. Reserved for an AP.
OM Control UL MU Data Disable RX Support	Indicates whether an AP supports interpretation of the UL MU Data Disable subfield of the OM Control subfield as described in 26.5.2.	For an AP: Set to 1 if supported. Set to 0 otherwise. Reserved for a non-AP STA.

Table 9-375—Subfields of the HE MAC Capabilities Information field *(continued)*

Subfield	Definition	Encoding
HE Dynamic SM Power Save	Indicates support for HE dynamic SM power save. See 26.14.4.	For a non-AP STA: Set to 1 if supported. Set to 0 if not supported. Reserved for an AP.
Punctured Sounding Support	Indicates support for punctured sounding as described in 26.7.	Set to 1 if dot11HEPuncturedSoundingOptionImplemented is true (see 26.7). Set to 0 otherwise.
HT And VHT Trigger Frame Rx Support	Indicates support for receiving a Trigger frame in an HT PPDU and receiving a Trigger frame in a VHT PPDU.	For a non-AP STA: Set to 1 if supported. Set to 0 otherwise. Reserved for an AP.

9.4.2.247.3 HE PHY Capabilities Information field

The format of the HE PHY Capabilities Information field is defined in Figure 9-900 (HE PHY Capabilities Information field format).

	B0	B1 B7	B8 B11	B12	B13	B14	B15 B16	B17
	Reserved	Supported Channel Width Set	Punctured Preamble Rx	Device Class	LDPC Coding In Payload	HE SU PPDU With 1x HE-LTF And 0.8 μs GI	Midamble Tx/Rx Max NSTS	NDP With 4x HE-LTF And 3.2 μs GI
Bits:	1	7	4	1	1	1	2	1

	B18	B19	B20	B21	B22	B23	B24 B25	B26

The subfields of the HE PHY Capabilities Information field are defined in Table 9-376.

Table 9-376—Subfields of the HE PHY Capabilities Information field

Subfield	Definition	Encoding
Supported Channel Width Set	In the 2.4 GHz band: — B0 indicates support for a 40 MHz channel width. — B1, B2, and B3 are reserved. — B4 indicates support of 242-tone RUs in a 40 MHz HE MU PPDU if a non-AP STA operates with a 20 MHz channel width and the 20 MHz In 40 MHz HE PPDU In 2.4 GHz subfield is 1; otherwise, B4 is reserved. — B5 and B6 are reserved. In the 5 GHz and 6 GHz bands: — B0 is reserved. — B1 indicates support for a 40 MHz and 80 MHz channel width. — B2 indicates support for a 160 MHz channel width. — B3 indicates support for a 160/80+80 MHz channel width. — B4 is reserved. — B5 indicates support of 242-tone RUs in a — 40 MHz and 80 MHz HE MU PPDU if a non-AP STA operates with 20 MHz channel width and the 20 MHz In 160/80+80 MHz HE PPDU subfield is set to 0, or — 40 MHz, 80 MHz, 160 MHz, 80+80 MHz HE MU PPDU if a non-AP STA operates with 20 MHz channel width and the 20 MHz In 160/80+80 MHz HE PPDU subfield is set to 1; — Otherwise, B5 is reserved. — B6 is reserved.	B0 is set to 0 if not supported. B0 is set to 1 if supported. B1 is set to 0 if not supported. B1 is set to 1 if supported. B2 is set to 0 if not supported. B2 is set to 1 if supported. If B2 is 1, then B1 is set to 1. B3 is set to 0 if not supported. B3 is set to 1 if supported. If B3 is 1, then B2 is set to 1. B4 is set to 0 if not supported. B4 is set to 1 if supported. B5 is set to 0 if not supported. B5 is set to 1 if supported. NOTE 1—If a non-AP STA operates with 20 MHz channel width and the 20 MHz In 40 MHz HE PPDU In 2.4 GHz subfield is 0, then B4 is set to 0. NOTE 2—If a non-AP STA operates with 20 MHz channel width and the 20 MHz In 160/80+80 MHz HE PPDU subfield is 0, then the 242-tone RU in a 160 MHz and 80+80 MHz HE MU PPDU in the 5 GHz band or 6 GHz band is not supported.

Table 9-376—Subfields of the HE PHY Capabilities Information field *(continued)*

Subfield	Definition	Encoding
Punctured Preamble Rx	B0 indicates support for the reception of an 80 MHz preamble where the only punctured subchannel is the secondary 20 MHz channel. B1 indicates support for the reception of an 80 MHz preamble where the only punctured subchannel is one of the two 20 MHz subchannels in the secondary 40 MHz channel. B2 indicates support for the reception of a 160 MHz or 80+80 MHz preamble where the only punctured subchannels are the secondary 20 MHz channel and zero to two of the 20 MHz subchannels in the secondary 80 MHz channel. See Table 27-21 for allowed 20 MHz punctured subchannel combinations. B3 indicates support for the reception of a 160 MHz or 80+80 MHz preamble where the only punctured subchannels are zero, one or both of the 20 MHz subchannels in the secondary 40 MHz channel and zero to two of the 20 MHz subchannels in the secondary 80 MHz channel; at least one 20 MHz subchannel is punctured. See Table 27-21 for allowed 20 MHz punctured subchannel combinations.	B0 is set to 0 if not supported. B0 is set to 1 if supported. B1 is set to 0 if not supported. B1 is set to 1 if supported. B2 is set to 0 if not supported. B2 is set to 1 if supported. B3 is set to 0 if not supported. B3 is set to 1 if supported.
Device Class	For a non-AP STA, indicates whether the STA is a Class A or a Class B device.	For a non-AP STA: Set to 1 for a Class A device. Set to 0 for a Class B device. Reserved for an AP.
LDPC Coding In Payload	Indicates support for the transmission and reception of LDPC encoded PPDUs.	Set to 0 if not supported. Set to 1 if supported. NOTE—Set to 1 by a STA that supports more than 4 spatial streams, an HE PPDU bandwidth greater than 20 MHz, HE-MCS 10, or HE-MCS 11.
HE SU PPDU With 1x HE-LTF And 0.8 μs GI	Indicates support of the reception of an HE SU PPDU with 1x HE-LTF and 0.8 μs guard interval duration.	Set to 0 if not supported. Set to 1 if supported.
Midamble Tx/Rx Max NSTS	If the Doppler Rx subfield is 1, indicates the maximum number of space-time streams supported for reception when a midamble is present in the Data field. If the Doppler Tx subfield is 1, indicates the maximum number of space-time streams supported for transmission when a midamble is present in the Data field. If both Doppler Rx and Doppler Tx subfields are 1, indicates the maximum number of space-time streams supported for transmission and reception when a midamble is present in the Data field.	Set to 0 for 1 space-time stream. Set to 1 for 2 space-time streams. Set to 2 for 3 space-time streams. Set to 3 for 4 space-time streams.

Table 9-376—Subfields of the HE PHY Capabilities Information field *(continued)*

Subfield	Definition	Encoding
NDP With 4x HE-LTF And 3.2 μs GI	For a beamformee, indicates support for receiving an HE sounding NDP with 4x HE-LTF and 3.2 μs guard interval duration.	If the SU Beamformee field is 1: Set to 0 if not supported. Set to 1 if supported.
STBC Tx ≤ 80 MHz	Indicates support for the transmission of an HE TB PPDU using STBC that has a bandwidth less than or equal to 80 MHz.	For a non-AP STA: Set to 0 if not supported. Set to 1 if supported. Reserved for an AP.
STBC Rx ≤ 80 MHz	Indicates support for the reception of an HE PPDU using STBC that has a bandwidth less than or equal to 80 MHz.	Set to 0 if not supported. Set to 1 if supported.
Doppler Tx	Indicates support for transmitting HE PPDUs with midamble.	Set to 0 if not supported. Set to 1 if supported.
Doppler Rx	Indicates support for receiving HE PPDUs with midamble.	Set to 0 if not supported. Set to 1 if supported.
Full Bandwidth UL MU-MIMO	For an AP, indicates support for MU-MIMO reception of an HE TB PPDU on an RU that spans the entire PPDU bandwidth (UL MU-MIMO). For a non-AP STA, indicates support for the transmission of an HE TB PPDU on an RU that spans the entire PPDU bandwidth (UL MU-MIMO).	Set to 0 if not supported. Set to 1 if supported.
Partial Bandwidth UL MU-MIMO	For an AP, indicates support for receiving an HE TB PPDU on an RU where MU-MIMO is employed and where the RU does not span the entire PPDU bandwidth (UL MU-MIMO in OFDMA). For a non-AP STA, indicates support for transmitting an HE TB PPDU on an RU where MU-MIMO is employed and where the RU does not span the entire PPDU bandwidth (UL MU-MIMO in OFDMA). NOTE—The RU is a 106-tone or larger RU.	Set to 0 if not supported. Set to 1 if supported.
DCM Max Constellation Tx	Indicates the maximum supported constellation for DCM in the Data field of an HE TB PPDU that the STA is capable of transmitting.	For a non-AP STA: Set to 0 if DCM is not supported. Set to 1 for BPSK. Set to 2 for QPSK. Set to 3 for 16-QAM. Reserved for an AP.
DCM Max NSS Tx	Indicates the maximum number of spatial streams supported for transmission when DCM is used in the Data field of an HE TB PPDU.	For a non-AP STA, if the DCM Max Constellation Tx subfield is not 0: Set to 0 for 1 spatial stream. Set to 1 for 2 spatial streams. Reserved for an AP or if the DCM Max Constellation Tx subfield is 0.

Table 9-376—Subfields of the HE PHY Capabilities Information field *(continued)*

Subfield	Definition	Encoding
DCM Max Constellation Rx	Indicates the maximum supported constellation for DCM in both the Data field and HE-SIG-B field that the STA is capable of receiving.	Set to 0 if DCM is not supported. Set to 1 for BPSK. Set to 2 for QPSK. Set to 3 for 16-QAM.
DCM Max NSS Rx	Indicates the maximum number of spatial streams supported for reception when DCM is used in the Data field.	Set to 0 for 1 spatial stream. Set to 1 for 2 spatial streams.
Rx Partial BW SU In 20 MHz HE MU PPDU	For an AP, TDLS STA or IBSS STA, indicates support for the reception of a 20 MHz HE MU PPDU with just a 106-tone RU. NOTE—It is mandatory for a non-AP HE STA to support reception of a 20 MHz HE MU PPDU with just a 106-tone RU.	For an AP, TDLS STA or IBSS STA: Set to 0 if not supported. Set to 1 if supported. Reserved for a non-AP STA.
SU Beamformer	Indicates support for operation as an SU beamformer.	Set to 0 if not supported. Set to 1 if supported. NOTE—Set to 1 by an AP with support for 4 or more spatial streams.
SU Beamformee	Indicates support for operation as an SU beamformee.	For an AP: Set to 0 if not supported. Set to 1 if supported. Set to 1 for a non-AP STA.
MU Beamformer	Indicates support for operation as an MU beamformer.	For an AP: Set to 0 if not supported. Set to 1 if the SU Beamformer field is 1 and operation as an MU beamformer is supported. Set to 0 for a non-AP STA. NOTE—Set to 1 by an AP with support for 4 or more spatial streams.
Beamformee STS ≤ 80 MHz	For a PPDU bandwidth less than or equal to 80 MHz, indicates the maximum number of space-time streams that the STA can receive in an HE sounding NDP, which is also the maximum total number of space-time streams over all the users that can be sent in a DL MU-MIMO transmission on an RU that includes that STA, where the RU might or might not span the entire PPDU bandwidth.	If the SU Beamformee subfield is 1: Set to the maximum number of space-time streams that the STA is capable of receiving in an HE sounding NDP minus 1. The minimum value of this field is 3. Reserved if the SU Beamformee field is 0.

Table 9-376—Subfields of the HE PHY Capabilities Information field *(continued)*

Subfield	Definition	Encoding
Beamformee STS > 80 MHz	For a PPDU bandwidth greater than 80 MHz, indicates the maximum number of space-time streams that the STA can receive in an HE sounding NDP, which is also the maximum total number of space-time streams over all the users that can be sent in a DL MU-MIMO transmission on an RU that includes that STA, where the RU might or might not span the entire PPDU bandwidth.	If the SU Beamformee subfield is 1: Set to the maximum number of space-time streams that the STA is capable of receiving in an HE sounding NDP minus 1. The minimum value of this field is 3. Reserved if the SU Beamformee subfield is 0 or the Supported Channel Width Set field does not indicate support for bandwidths greater than 80 MHz.
Number Of Sounding Dimensions ≤ 80 MHz	For bandwidth less than or equal to 80 MHz, it indicates the beamformer's capability indicating the maximum value of the TXVECTOR parameter NUM_STS for an HE sounding NDP.	If the SU Beamformer subfield is 1: Set to the supported maximum TXVECTOR parameter NUM_STS value minus 1. Reserved if the SU Beamformer subfield is 0.
Number Of Sounding Dimensions > 80 MHz	For bandwidth greater than 80 MHz, indicates the beamformer's capability indicating the maximum value of the TXVECTOR parameter NUM_STS for an HE sounding NDP.	If the SU Beamformer subfield is 1: Set to the supported maximum TXVECTOR parameter NUM_STS value minus 1. Reserved if the SU Beamformer subfield is 0 or the Supported Channel Width Set field does not indicate support for bandwidths greater than 80 MHz.
Ng = 16 SU Feedback	Indicates HE beamformee support for a subcarrier grouping of 16 in the HE Compressed Beamforming Report field for SU feedback.	Set to 0 if not supported. Set to 1 if supported.
Ng = 16 MU Feedback	Indicates HE beamformee support for a subcarrier grouping of 16 in the HE Compressed Beamforming Report field for MU feedback.	Set to 0 if not supported. Set to 1 if supported.
Codebook Size (ϕ, ψ) = {4, 2} SU Feedback	Indicates HE beamformee support for a codebook size (ϕ, ψ) = {4, 2} in the HE Compressed Beamforming Report field for SU feedback.	Set to 0 if not supported. Set to 1 if supported.
Codebook Size (ϕ, ψ) = {7, 5} MU Feedback	Indicates HE beamformee support for a codebook size (ϕ, ψ) = {7, 5} in the HE Compressed Beamforming Report field for MU feedback.	Set to 0 if not supported. Set to 1 if supported.
Triggered SU Beamforming Feedback	For an AP, indicates support for the reception of partial- and full-bandwidth SU feedback in an HE TB sounding sequence. For a non-AP STA, indicates support for the transmission of partial- and full-bandwidth SU feedback in an HE TB sounding sequence.	Set to 0 if not supported. Set to 1 if supported.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-376—Subfields of the HE PHY Capabilities Information field *(continued)*

Subfield	Definition	Encoding
Triggered MU Beamforming Partial BW Feedback	For an AP, indicates support for the reception of partial-bandwidth MU feedback in an HE TB sounding sequence. For a non-AP STA, indicates support for the transmission of partial-bandwidth MU feedback in an HE TB sounding sequence.	Set to 0 if not supported. Set to 1 if supported.
Triggered CQI Feedback	For an AP, indicates support for the reception of partial- and full-bandwidth CQI feedback in an HE TB sounding sequence. For a non-AP STA, indicates support for the transmission of partial- and full-bandwidth CQI feedback in an HE TB sounding sequence.	Set to 0 if not supported. Set to 1 if supported.
Partial Bandwidth Extended Range	Indicates support for the transmission and reception of an HE ER SU PPDU in which the HE modulated fields are transmitted over the higher frequency 106-tone RU within primary 20 MHz channel.	Set to 0 if not supported. Set to 1 if supported.
Partial Bandwidth DL MU-MIMO	For a non-AP STA, indicates support for the reception of a DL MU-MIMO transmission on an RU in an HE MU PPDU where the RU does not span the entire PPDU bandwidth (DL MU-MIMO within OFDMA).	For a non-AP STA: Set to 0 if not supported. Set to 1 if supported. NOTE—A non-AP STA that sets this field to 0 supports receiving a partial-bandwidth RU allocated to a single user within an HE MU PPDU where some other RU is employing DL MU-MIMO. Reserved for an AP.
PPE Thresholds Present	Indicates whether the PPE Thresholds field is present. NOTE—This field if set to 1 overrides the Nominal Packet Padding field.	Set to 1 if PPE Thresholds field is present. Set to 0 otherwise.
PSR-based SR Support	Indicates support for PSR-based SR operation.	Set to 0 if not supported. Set to 1 if supported.
Power Boost Factor Support	Indicates that the STA supports a power boost factor for the RUs in an HE MU PPDU in the range [0.5, 2].	Set to 0 if not supported. Set to 1 if supported.
HE SU PPDU And HE MU PPDU With 4x HE-LTF And 0.8 μs GI	Indicates support for the reception of an HE SU PPDU and HE MU PPDU with 4x HE-LTF and 0.8 μs guard interval duration.	Set to 0 if not supported. Set to 1 if supported. This subfield is set to 1 if the HE ER SU PPDU With 4x HE-LTF And 0.8 μs GI subfield is 1.
Max Nc	Indicates the maximum supported *Nc* for an HE compressed beamforming/CQI report.	If the SU Beamformee subfield is 1: Set to the maximum supported *Nc* for an HE compressed beamforming/CQI report minus 1. Reserved if the SU Beamformee subfield is 0.

Table 9-376—Subfields of the HE PHY Capabilities Information field *(continued)*

Subfield	Definition	Encoding
STBC Tx > 80 MHz	Indicates support for the transmission of an HE TB PPDU using STBC that has a bandwidth greater than 80 MHz.	For a non-AP STA: Set to 0 if not supported. Set to 1 if supported. Reserved for an AP or if the Supported Channel Width Set field does not indicate support for bandwidths greater than 80 MHz.
STBC Rx > 80 MHz	Indicates support for the reception of an HE PPDU using STBC that has a bandwidth greater than 80 MHz.	Set to 0 if not supported. Set to 1 if supported. Reserved if the Supported Channel Width Set field does not indicate support for bandwidths greater than 80 MHz.
HE ER SU PPDU With 4x HE-LTF And 0.8 μs GI	Indicates support for the reception of an HE ER SU PPDU with 4x HE-LTF and 0.8 μs guard interval duration.	Set to 0 if not supported. Set to 1 if supported.
20 MHz In 40 MHz HE PPDU In 2.4 GHz Band	Indicates support for 26-, 52-, and 106-tone RU mapping for a 20 MHz operating non-AP HE STA that is the receiver of a 40 MHz HE MU PPDU in 2.4 GHz band, or the transmitter of a 40 MHz HE TB PPDU in 2.4 GHz band.	Set to 0 if not supported. Set to 1 if supported. NOTE—Set to 1 if B0 of the Supported Channel Width Set subfield is 1. Reserved for an AP.
20 MHz In 160/ 80+80 MHz HE PPDU	Indicates support for 26-, 52-, and 106-tone RU mapping for a 20 MHz operating non-AP HE STA that is the receiver of an 80+80 MHz or a 160 MHz HE MU PPDU, or the transmitter of an 80+80 MHz or 160 MHz HE TB PPDU.	Set to 0 if not supported. Set to 1 if supported. NOTE—Set to 1 if B2 of the Supported Channel Width Set subfield is 1. Reserved for an AP.
80 MHz In 160/ 80+80 MHz HE PPDU	Indicates supports of 160/80+80 MHz OFDMA for a non-AP HE STA that sets B1 of Supported Channel Width Set to 1, and sets B2 and B3 of Supported Channel Width Set each to 0, when operating with 80 MHz channel width. The capability bit is applicable while receiving an 80+80 MHz or a 160 MHz HE MU PPDU, or transmitting an 80+80 MHz or a 160 MHz HE TB PPDU.	Set to 0 if not supported. Set to 1 if supported. NOTE—Set to 1 if B2 of the Supported Channel Width Set subfield is 1. Reserved for an AP.
HE ER SU PPDU With 1x HE-LTF And 0.8 μs GI	Indicates support of the reception of an HE ER SU PPDU with 1x HE-LTF and 0.8 μs guard interval duration.	Set to 0 if not supported. Set to 1 if supported.

Table 9-376—Subfields of the HE PHY Capabilities Information field *(continued)*

Subfield	Definition	Encoding
Midamble Tx/Rx 2x And 1x HE-LTF	If the Doppler Rx subfield is 1, indicates support for receiving midambles with 2x HE-LTF, 1x HE-LTF in HE SU PPDU if the HE SU PPDU With 1x HE-LTF And 0.8 μs GI subfield is 1, and 1x HE-LTF in HE ER SU PPDU if the HE ER SU PPDU With 1x HE-LTF And 0.8 μs GI subfield is 1. If the Doppler Tx subfield is 1, indicates support for transmitting midambles with 2x HE-LTF, 1x HE-LTF in HE TB PPDU when allowed. If both the Doppler Rx and Doppler Tx subfields are 1, indicates support for receiving midambles with 2x HE-LTF, 1x HE-LTF in HE SU PPDU if the HE SU PPDU With 1x HE-LTF And 0.8 μs GI subfield is 1, and 1x HE-LTF in HE ER SU PPDU if the HE ER SU PPDU With 1x HE-LTF And 0.8 μs GI subfield is 1; and also support for transmitting midambles with 2x HE-LTF, 1x HE-LTF in HE TB PPDU when allowed.	Set to 0 if not supported. Set to 1 if supported.
DCM Max RU	If the DCM Max Constellation Tx subfield is greater than 0, then the DCM Max RU subfield indicates the maximum RU size that the STA might transmit with DCM applied. If the DCM Max Constellation Rx subfield is greater than 0, then the DCM Max RU subfield indicates the maximum RU size with DCM applied that the STA can receive. If both the DCM Max Constellation Tx subfield and DCM Max Constellation Rx subfield are 0, then this subfield is reserved.	Set to 0 for 242-tone RU Set to 1 for 484-tone RU Set to 2 for 996-tone RU Set to 3 for 2×996-tone RU
Longer Than 16 HE-SIG-B OFDM Symbols Support	For a non-AP STA, indicates support for receiving a DL HE MU PPDU where the number of OFDM symbols in the HE-SIG-B field is greater than 16.	Set to 0 if not supported. Set to 1 if supported. A 20 MHz-only non-AP HE STA sets this to 0.
Non-Triggered CQI Feedback	For an AP, indicates support for the reception of full-bandwidth non-triggered CQI feedback. For a non-AP STA, indicates support for the transmission of full-bandwidth non-triggered CQI feedback.	Set to 0 if not supported. Set to 1 if supported.
Tx 1024-QAM < 242-tone RU Support	For a non-AP STA, indicates support for the transmission of 1024-QAM on a 26-, 52-, and 106-tone RU.	For a non-AP STA: Set to 0 if not supported. Set to 1 if supported. Reserved for an AP.
Rx 1024-QAM < 242-tone RU Support	Indicates support for the reception of 1024-QAM on a 26-, 52-, and 106-tone RU.	Set to 0 if not supported. Set to 1 if supported.

Table 9-376—Subfields of the HE PHY Capabilities Information field *(continued)*

Subfield	Definition	Encoding
Rx Full BW SU Using HE MU PPDU With Compressed HE-SIG-B	Indicates support for reception of an HE MU PPDU with a single user allocated an RU spanning the entire PPDU bandwidth and a compressed HE-SIG-B field format.	Set to 0 if not supported. Set to 1 if supported.
Rx Full BW SU Using HE MU PPDU With Non-Compressed HE-SIG-B	Indicates support for reception of an HE MU PPDU with a bandwidth less than or equal to 80 MHz, a single user allocated an RU spanning the entire PPDU bandwidth and a noncompressed HE-SIG-B field format.	Set to 0 if not supported. Set to 1 if supported.
Nominal Packet Padding	Indicates the nominal packet padding to be used for all constellations, N_{SS} and RU allocations the STA supports if the PPE Thresholds Present subfield is set to 0.	Set to 0 if the nominal packet padding is 0 μs for all constellations, N_{SS} and RU allocations the STA supports. Set to 1 if the nominal packet padding is 8 μs for all constellations, N_{SS} and RU allocations the STA supports. Set to 2 if the nominal packet padding is 16 μs for all constellations, N_{SS} and RU allocations the STA supports. The value 3 is reserved. Reserved if the PPE Thresholds Present subfield is 1.
HE MU PPDU With More Than One RU Rx Max N_HE-LTF	Indicates the maximum number of HE-LTF symbols, $N_{\text{HE-LTF}}$, that the STA is capable of receiving in an HE MU PPDU with more than one RU.	For a non-AP STA: Set to 0 if the number of HE-LTF symbols, $N_{\text{HE-LTF}}$, that the STA is capable of receiving in an HE MU PPDU equals $N_{\text{HE-LTF}}$(Beamformee STS + 1), where the $N_{\text{HE-LTF}}$(Beamformee STS + 1) is the lookup function shown in Table 21-13 with $N_{STS,total}$ taken as Beamformee STS + 1. NOTE—For a PPDU bandwidth less than or equal to 80 MHz, use the value defined in the Beamformee STS ≤ 80 MHz subfield. For a PPDU bandwidth greater than 80 MHz, use the value defined in Beamformee STS > 80 MHz subfield. Set to 1 if the maximum number of HE-LTF symbols, $N_{\text{HE-LTF}}$, that the STA is capable of receiving in an HE MU PPDU is 8. Reserved for an AP.

9.4.2.247.4 Supported HE-MCS And NSS Set field

The Supported HE-MCS And NSS Set field indicates the combinations of HE-MCSs and spatial streams that a STA supports for reception and the combinations that it supports for transmission. The format of the field is shown in Figure 9-901 (Supported HE-MCS And NSS Set field format).

	Rx HE-MCS Map ≤ 80 MHz	Tx HE-MCS Map ≤ 80 MHz	Rx HE-MCS Map 160 MHz	Tx HE-MCS Map 160 MHz	Rx HE-MCS Map 80+80 MHz	Tx HE-MCS Map 80+80 MHz
Octets:	2	2	0 or 2	0 or 2	0 or 2	0 or 2

Figure 9-901—Supported HE-MCS And NSS Set field format

The subfields of the Supported HE-MCS And NSS Set field, and their presence, are defined in Table 9-377.

Table 9-377—Subfields of the Supported HE-MCS And NSS Set field

Subfield	Definition	Encoding
Rx HE-MCS Map ≤ 80 MHz	If the operating channel width of the STA is greater than 80 MHz, indicates the maximum value of the RXVECTOR parameter MCS of a PPDU that can be received by the STA for a PPDU with bandwidth less than or equal to 80 MHz for each number of spatial streams. If the operating channel width of this STA is less than or equal to 80 MHz, indicates the maximum value of the RXVECTOR parameter MCS for a PPDU that can be received by the STA for each number of spatial streams.	The format and encoding of this subfield are defined in Figure 9-901 (Supported HE-MCS And NSS Set field format) and the associated description.
Tx HE-MCS Map ≤ 80 MHz	If the operating channel width of this STA is greater than 80 MHz, indicates the maximum value of the TXVECTOR parameter MCS of a PPDU that can be transmitted by the STA for a PPDU with bandwidth less than or equal to 80 MHz for each number of spatial streams. If the operating channel width of this STA is less than or equal to 80 MHz, indicates the maximum value of the TXVECTOR parameter MCS for a PPDU that can be transmitted by the STA for each number of spatial streams.	The format and encoding of this subfield are defined in Figure 9-901 (Supported HE-MCS And NSS Set field format) and the associated description.

Table 9-377—Subfields of the Supported HE-MCS And NSS Set field *(continued)*

Subfield	Definition	Encoding
Rx HE-MCS Map 160 MHz	If the operating channel width of the STA is 160 MHz, indicates the maximum value of the RXVECTOR parameter MCS for a 160 MHz PPDU that can be received by this STA for each number of spatial streams.	The format and encoding of this subfield are defined in Figure 9-901 (Supported HE-MCS And NSS Set field format) and the associated description. The Rx HE-MCS Map 160 MHz subfield is present if B2 of the Supported Channel Width Set subfield of the HE PHY Capabilities Information field is 1; otherwise, it is not present.
Tx HE-MCS Map 160 MHz	If the operating channel width of the STA is 160 MHz, indicates the maximum value of the TXVECTOR parameter MCS for a 160 MHz PPDU that can be transmitted by this STA for each number of spatial streams.	The format and encoding of this subfield are defined in Figure 9-901 (Supported HE-MCS And NSS Set field format) and the associated description. The Tx HE-MCS Map 160 MHz subfield is present if B2 of the Supported Channel Width Set subfield of the HE PHY Capabilities Information field is 1; otherwise, it is not present.
Rx HE-MCS Map 80+80 MHz	If the operating channel width of the STA is 160 MHz, indicates the maximum value of the RXVECTOR parameter MCS for an 80+80 MHz PPDU that can be received by this STA for each number of spatial streams.	The format and encoding of this subfield are defined in Figure 9-901 (Supported HE-MCS And NSS Set field format) and the associated description. The Rx HE-MCS Map 80+80 MHz subfield is present if B3 of the Supported Channel Width Set subfield of the HE PHY Capabilities Information field is 1; otherwise, it is not present.
Tx HE-MCS Map 80+80 MHz	If the operating channel width of the STA is 160 MHz, indicates the maximum value of the TXVECTOR parameter MCS for an 80+80 MHz PPDU that can be transmitted by this STA for each number of spatial streams.	The format and encoding of this subfield are defined in Figure 9-901 (Supported HE-MCS And NSS Set field format) and the associated description. The Tx HE-MCS Map 80+80 MHz subfield is present if B3 of the Supported Channel Width Set subfield of the HE PHY Capabilities Information field is 1; otherwise, it is not present.

The Rx HE-MCS Map and Tx HE-MCS Map subfields have the format shown in Table 9-378.

	B0 B1	B2 B3	B4 B5	B6 B7	B8 B9	B10 B11	B12 B13	B14 B15
	Max HE-MCS For 1 SS	Max HE-MCS For 2 SS	Max HE-MCS For 3 SS	Max HE-MCS For 4 SS	Max HE-MCS For 5 SS	Max HE-MCS For 6 SS	Max HE-MCS For 7 SS	Max HE-MCS For 8 SS
Bits:	2	2	2	2	2	2	2	2

Table 9-378—Rx HE-MCS Map subfield, Tx HE-MCS Map subfield, and Basic HE-MCS And NSS Set field format

The Max HE-MCS For *n* SS subfield (where $n = 1, \ldots, 8$) is encoded as follows:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— 0 indicates support for HE-MCS 0–7 for *n* spatial streams.
— 1 indicates support for HE-MCS 0–9 for *n* spatial streams.
— 2 indicates support for HE-MCS 0–11 for *n* spatial streams.
— 3 indicates that *n* spatial streams is not supported for HE PPDUs.

The maximum receive N_{SS} for a given HE-MCS is equal to the smaller of

— The maximum value of *n* for which the Max HE-MCS For *n* SS has a value that indicates support for that HE-MCS or
— The maximum supported N_{SS} as indicated by the value of the Rx NSS field of the Operating Mode Notification frame if the value of Rx NSS Type is 0 or of the OM Control subfield.

NOTE 1—An HE-MCS indicated as supported in the Rx HE-MCS Map fields for a particular number of spatial streams might not be valid at all bandwidths (see 27.5) and might be affected by 26.15.4.3.

The maximum transmit N_{SS} for a given HE-MCS is equal to the smaller of

— The maximum value of *n* for which the Max HE-MCS For *n* SS has a value that indicates support for that HE-MCS (0, 1, or 2 for HE-MCS 0-7, 1 or 2 for HE-MCS 8-9, 2 for HE-MCS 10-11) or
— The maximum supported NSTS as indicated by the value of the Tx NSTS field of the OM Control subfield sent by a non-AP STA.

NOTE 2—An HE-MCS indicated as supported in the Tx HE-MCS Map fields for a particular number of space-time streams might not be valid at all bandwidths (see 27.5) and might be affected by 26.15.4.3.

9.4.2.247.5 PPE Thresholds field

The PPE Thresholds field determines the nominal packet padding value (see 26.12) for an HE PPDU of a particular RU allocation size and NSTS value. The format of the PPE Thresholds field is defined in Figure 9-902 (PPE Thresholds field format).

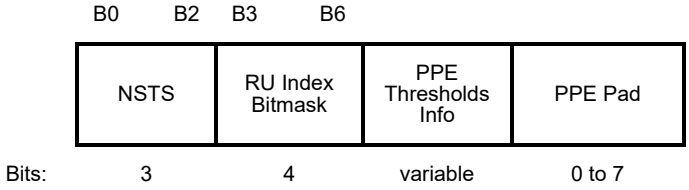

Figure 9-902—PPE Thresholds field format

The NSTS subfield contains an unsigned integer that is the number of NSTS values minus 1 for which PPE threshold values are included in the PPE Thresholds Info subfield.

The RU Index Bitmask subfield contains a bitmask that indicates whether the PPE Thresholds Info field contains PPET16 and PPET8 values for the four possible RU sizes indicated in Table 9-380. The PPET16 and PPET8 values for RU allocation index *k* is present in the PPE Thresholds Info field only if bit *k* of the RU Index Bitmask subfield (bit 3 + *k* of the PPE Thresholds field) is 1. For example, if B0 of the RU Index Bitmask subfield (B3 of the PPE Thresholds field) is 1, PPET16 and PPET8 values are present in the PPE Thresholds Info field for the RU allocation size corresponding to RU allocation index 0 (242-tone RU). If B0 of the RU Index Bitmask subfield is 0, PPET16 and PPET8 values are not present in the PPE Thresholds Info field for the RU allocation size corresponding to RU allocation index 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The PPE Thresholds Info field contains 6 × (*NSTS* + 1) bits, where *NSTS* is the value in the NSTS field, for every bit in the RU Index Bitmask subfield that is nonzero. The format of the PPE Thresholds Info field is defined in Figure 9-903 (PPE Thresholds Info field format).

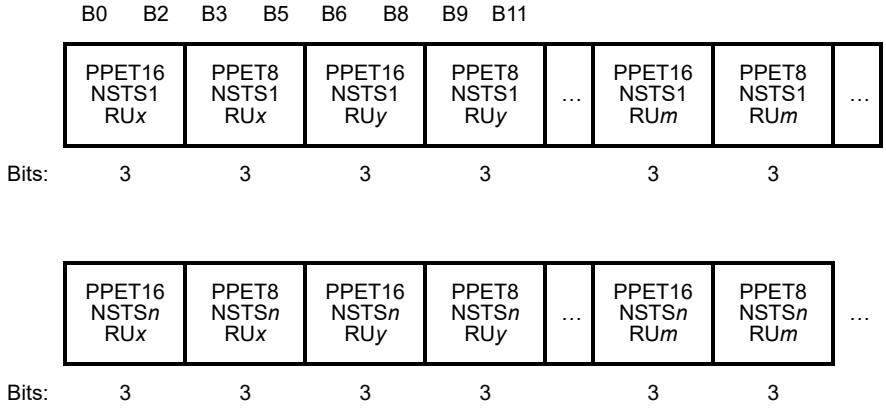

Figure 9-903—PPE Thresholds Info field format

NOTE—The figure assumes there are three or more RU sizes, fewer are possible.

The PPET16 and PPET8 subfields for various NSTS and RU values appear in increasing NSTS value and increasing RU index value order. Lower numbered PPE Thresholds Info field bits contain PPET16 and PPET8 subfields corresponding to lower numbered NSTS values. Within a set of PPET16 and PPET8 subfields corresponding to a single value of *NSTS*, lower numbered PPE Thresholds Info field bits contain PPET16 and PPET8 subfields corresponding to lower numbered RU index values. The PPET16 NSTS*n* RU*b* and PPET8 NSTS*n* RU*b* subfields are present for all values of *n* and *b* where $1 \leq n \leq (NSTS + 1)$ and where $b = [x, y, \ldots, m]$ is the set of integers equal to the ordered list of bit positions of all bits that are set to 1 in the RU Index Bitmask subfield, with *x* being the lowest value.

Each PPET8 NSTS*n* RU*b* and PPET16 NSTS*n* RU*b* subfield contains an integer as defined in Table 9-379, which is used to compute the nominal packet padding value.

Table 9-379—Constellation index

Constellation Index	Corresponding Transmission Constellation
0	BPSK
1	QPSK
2	16-QAM
3	64-QAM
4	256-QAM
5	1024-QAM
6	Reserved
7	None

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The value of the PPET8 NSTS*n* RU*b* subfield is always less than the value of the PPET16 NSTS*n* RU*b* subfield, except if the PPET8 subfield is 7.

The RU allocation index for each RU allocation size is defined in Table 9-380.

Table 9-380—RU allocation index

RU allocation index	RU allocation size
0	242
1	484
2	996
3	2×996

The PPE Pad field contains all 0s. The number of bits in the PPE Pad field is the least number of bits required to round the length of the PPE Thresholds Info field to an integer number of octets.

9.4.2.248 HE Operation element

The operation of HE STAs in an HE BSS is controlled by the following:

— The HT Operation element and the HE Operation element if operating in the 2.4 GHz band.
— The HT Operation element, VHT Operation element (if present) and the HE Operation element if operating in the 5 GHz band.
— The HE Operation element if operating in the 6 GHz band.

The format of the HE Operation element is defined in Figure 9-904 (HE Operation element format).

	Element ID	Length	Element ID Extension	HE Operation Parameters	BSS Color Information	Basic HE-MCS And NSS Set	VHT Operation Information	Max Co-Hosted BSSID Indicator	6 GHz Operation Information
Octets:	1	1	1	3	1	2	0 or 3	0 or 1	0 or 5

Figure 9-904—HE Operation element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The format of the HE Operation Parameters field is defined in Figure 9-905 (HE Operation Parameters field format).

B0 B2	B3	B4 B13	B14	B15	B16	B17	B18 B23
Default PE Duration	TWT Required	TXOP Duration RTS Threshold	VHT Operation Information Present	Co-Hosted BSS	ER SU Disable	6 GHz Operation Information Present	Reserved
Bits: 3	1	10	1	1	1	1	6

Figure 9-905—HE Operation Parameters field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Default PE Duration subfield indicates the PE field duration in units of 4 μs for an HE TB PPDU that is solicited with a TRS Control subfield and its use is defined in 26.5.2.3. Values 5–7 of the Default PE Duration subfield are reserved.

The TWT Required subfield is set to 1 to indicate that the AP requires its associated non-AP HE STAs that have declared support for TWT by setting any one of TWT Requester Support or TWT Responder Support or Broadcast TWT Support subfield in HE Capabilities element that it transmits to 1 to operate in the role of either TWT requesting STA by following the rules in 26.8.2, or TWT scheduled STA by following the rules in 26.8.3 and set to 0 otherwise.

The TXOP Duration RTS Threshold subfield enables an HE AP to manage RTS/CTS usage by non-AP HE STAs that are associated with it (see 26.2.1). The TXOP Duration RTS Threshold subfield contains the TXOP duration RTS threshold in units of 32 μs, which enables the use of RTS/CTS, except for the value 1023. The value 1023 indicates that TXOP duration-based RTS is disabled. The value of 0 is allowed in Beacon and Probe Response frames and indicates that the previously announced TXOP duration RTS threshold remains in effect. In all other frames, the value of 0 is reserved.

The VHT Operation Information Present subfield is set to 1 to indicate that the VHT Operation Information field is present in the HE Operation element and set to 0 otherwise. The VHT Operation Information Present subfield is set as defined in 26.17.

The Co-Hosted BSS subfield is set to 1 to indicate that the AP transmitting this element has dot11MultiBSSIDImplemented false or not present and shares the same operating class, channel, receive antenna connector, and transmit antenna connector with at least one other AP that is providing its BSS information by transmitting Beacon and Probe Response frames. Otherwise, the subfield is set to 0. A TDLS STA, an IBSS STA, or a mesh STA sets the subfield to 0.

NOTE—1 An AP operating in the 6 GHz band sets the Co-Hosted BSS subfield to 0 (see 26.17.2.1).

The ER SU Disable subfield indicates whether 242-tone HE ER SU PPDU reception by the AP is disabled or enabled. The ER SU Disable subfield is set to 1 to indicate that it is disabled and set to 0 to indicate that it is enabled.

The 6 GHz Operation Information Present field is set to 1 to indicate that the 6 GHz Operation Information field is present and set to 0 otherwise. The 6 GHz Operation Information Present field is set to 1 by an AP operating in the 6 GHz band.

The BSS Color Information field is defined in Figure 9-906 (BSS Color Information field format).

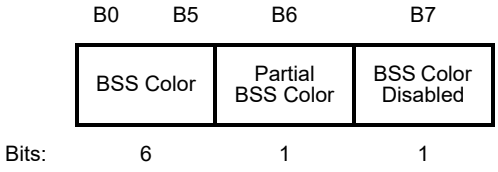

Figure 9-906—BSS Color Information field format

The BSS Color subfield is an unsigned integer whose value is the BSS Color of the BSS corresponding to the AP, IBSS STA, mesh STA or TDLS STA that transmitted this element and is set as defined in 26.17.3.

The Partial BSS Color subfield is set to 1 to indicate that an AID assignment rule based on the BSS color as defined in 26.17.4 is applied for the BSS. Otherwise, the Partial BSS Color subfield is set to 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The BSS Color Disabled subfield is set to 1 to disable the use of color for the BSS as described in 26.17.3.3; otherwise, it is set to 0.

The Basic HE-MCS And NSS Set field indicates the HE-MCSs for each number of spatial streams in HE PPDUs that are supported by all HE STAs in the BSS (including IBSS and MBSS) in transmit and receive. The Basic HE-MCS And NSS Set field is defined in Table 9-378.

The format of the VHT Operation Information field is defined in Figure 9-709 (VHT Operation Information field format) and its subfields are defined in Table 9-214. The VHT Operation Information field is present if the VHT Operation Info Present field is 1; otherwise, it is not present.

The Max Co-Hosted BSSID Indicator field contains a value assigned to n, where 2^n is the maximum number of BSSIDs in the co-hosted BSSID set as defined in 26.17.7. This field is present if the Co-Hosted BSS subfield in HE Operation Parameters field is 1 and is not present otherwise.

NOTE 2—The Max Co-Hosted BSSID Indicator field does not provide the exact number or the identity of each co-hosted BSSID.

The 6 GHz Operation Information field provides channel and bandwidth information related to 6 GHz operation (see 27.3.25.2). The format of the 6 GHz Operation Information field is defined in Figure 9-907 (6 GHz Operation Information field format).

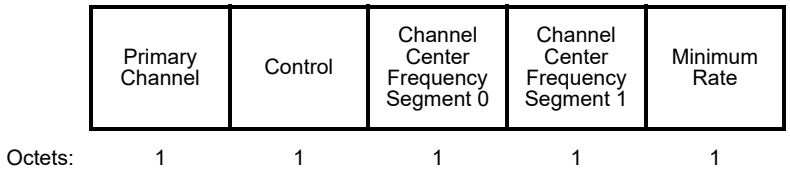

Figure 9-907—6 GHz Operation Information field format

The Primary Channel field indicates the channel number of the primary channel in the 6 GHz band.

The Control field is defined in Figure 9-908 (Control field format).

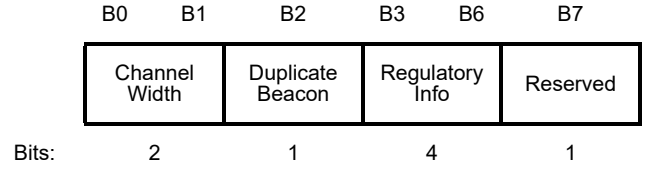

Figure 9-908—Control field format

The Channel Width field indicates the BSS channel width and is set to 0 for 20 MHz, 1 for 40 MHz, 2 for 80 MHz, and 3 for 80+80 or 160 MHz.

The Duplicate Beacon subfield is set to 1 if the AP transmits Beacon frames in non-HT duplicate PPDU with a TXVECTOR parameter CH_BANDWIDTH value that is up to the BSS bandwidth and is set to 0 otherwise.

The Regulatory Info subfield carries information related to regulatory rules specific to the country in which the BSS is operating in, which is identified by the Country String field in the Country element. The interpretation of the Regulatory Info subfield is in E.2.7.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Channel Center Frequency Segment 0 field indicates the channel number of the center frequency for the 20 MHz, 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz channel on which the BSS operates in the 6 GHz band. If the BSS channel width is 160 MHz or 80+80 MHz, then the Channel Center Frequency Segment 0 field indicates the channel number of the center frequency of the primary 80 MHz.

The Channel Center Frequency Segment 1 field indicates the channel number of the center frequency of the 160 MHz channel on which the BSS operates in the 6 GHz band. If the channel width is 80+80 MHz, then it indicates the channel number of the center frequency of the secondary 80 MHz.

The Minimum Rate field indicates the minimum rate, in units of 1 Mb/s, that the non-AP STA is allowed to use for sending PPDUs (see 26.15.4.3), where the rate is obtained with an N_{SS} that is less than or equal to 3 and an MCS that is less than or equal to 3.

9.4.2.249 UORA Parameter Set element

The metrics of the OFDMA-based random access mechanism (see 26.5.4) are signaled in the UORA Parameter Set element. The format of the UORA Parameter Set element is defined in Figure 9-909 (UORA Parameter Set element format).

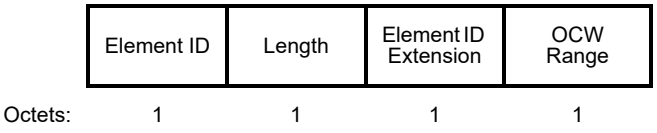

Figure 9-909—UORA Parameter Set element format

The Element ID, Length, Element ID Extension fields are defined in 9.4.2.1.

The OCW Range field indicates the minimum and maximum values of the OCW (OFDMA contention window) derived from the fields defined in Figure 9-910 (OCW Range field format).

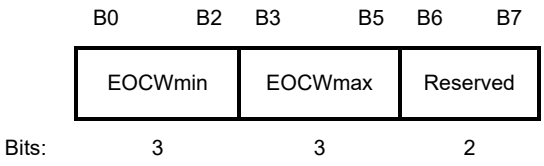

Figure 9-910—OCW Range field format

The EOCWmin subfield indicates the minimum value of OCW for the initial HE TB PPDU transmission using UORA. The *OCWmin* parameter is used by a STA either for an initial transmission or following a successful HE TB PPDU transmission and is derived as follows:

$$OCWmin = 2^{EOCWmin} - 1$$

where
EOCWmin is the value in the EOCWmin subfield

The EOCWmax subfield indicates the maximum value of OCW for UORA. The *OCWmax* parameter used by a STA for its retransmission attempts of UORA and is derived as follows:

$$OCWmax = 2^{EOCWmax} - 1$$

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

where
EOCWmax is the value in the EOCWmax subfield

9.4.2.250 MU EDCA Parameter Set element

In an infrastructure BSS, the MU EDCA Parameter Set element is used by the AP to control the use of EDCA by non-AP HE STAs following particular UL MU HE TB PPDU transmissions, as defined in 26.2.7. The most recent MU EDCA Parameter Set element received by a non-AP HE STA is used to update the appropriate MIB values.

The format of the MU EDCA Parameter Set element is defined in Figure 9-911 (MU EDCA Parameter Set element format).

	Element ID	Length	Element ID Extension	QoS Info	MU AC_BE Parameter Record	MU AC_BK Parameter Record	MU AC_VI Parameter Record	MU AC_VO Parameter Record
Octets:	1	1	1	1	3	3	3	3

Figure 9-911—MU EDCA Parameter Set element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The format of the QoS Info field is defined in 9.4.1.17 when sent by the AP.

NOTE—The QoS Info field contains the EDCA Parameter Set Update Count subfield, which indicates when the EDCA parameters and, for an HE BSS, the MU EDCA parameters have changed (see 10.2.3.2).

The format of the MU AC_BE, MU AC_BK, MU AC_VI, and MU AC_VO Parameter Record fields are identical and defined in Figure 9-912 (MU AC Parameter Record field format).

	ACI/AIFSN	ECWmin/ ECWmax	MU EDCA Timer
Octets:	1	1	1

Figure 9-912—MU AC Parameter Record field format

The format of the ACI/AIFSN field is defined in Figure 9-262 and the encoding of its subfields is defined in 9.4.2.27, except that the value 0 in the AIFSN field indicates that EDCA is disabled for the duration specified by the MUEDCATimer for the corresponding AC.

The format of the ECWmin/ECWmax field is defined in Figure 9-263, and the encoding of its subfields is defined in 9.4.2.27.

The MU EDCA Timer field indicates the duration of time, in units of 8 TUs, during which the HE STA uses the MU EDCA parameters for the corresponding AC, as defined in 26.2.7, except that the value 0 is reserved.

9.4.2.251 Spatial Reuse Parameter Set element

The Spatial Reuse Parameter Set element provides information needed by STAs when performing OBSS PD-based spatial reuse as defined in 26.10.2 and PSR-based spatial reuse as defined in 26.10.3. The format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

of the Spatial Reuse Parameter Set element is defined in Figure 9-913 (Spatial Reuse Parameter Set element format).

	Element ID	Length	Element ID Extension	SR Control	Non-SRG OBSS PD Max Offset	SRG OBSS PD Min Offset	SRG OBSS PD Max Offset	SRG BSS Color Bitmap	SRG Partial BSSID Bitmap
Octets:	1	1	1	1	0 or 1	0 or 1	0 or 1	0 or 8	0 or 8

Figure 9-913—Spatial Reuse Parameter Set element format

The Element ID, Element ID extension and Length fields are defined in 9.4.2.1.

The SR Control field is defined in Figure 9-914 (SR Control field format).

	B0	B1	B2	B3	B4	B5 B7
	PSR Disallowed	Non-SRG OBSS PD SR Disallowed	Non-SRG Offset Present	SRG Information Present	HESIGA Spatial Reuse Value15 Allowed	Reserved
Bits:	1	1	1	1	1	3

Figure 9-914—SR Control field format

The PSR Disallowed subfield in the SR Control field indicates whether PSR-based SR transmissions are allowed at non-AP STAs that are associated with the AP that transmitted this element. PSR-based SR transmissions are disallowed when the PSR Disallowed subfield is 1. PSR-based SR transmissions are allowed when the PSR Disallowed subfield is 0. The PSR Disallowed subfield also affects the value of the SPATIAL_REUSE parameter of the TXVECTOR as described in 26.11.6.

The Non-SRG OBSS PD SR Disallowed subfield in the SR Control field indicates whether non-SRG OBSS PD SR transmissions are allowed or not at non-AP STAs that are associated with the AP that transmitted this element. Non-SRG OBSS PD SR transmissions are disallowed when the Non-SRG OBSS PD SR Disallowed subfield is 1. Non-SRG OBSS PD SR transmissions are allowed when the Non-SRG OBSS PD SR Disallowed subfield is 0.

The Non-SRG Offset Present subfield in the SR Control field indicates whether the Non-SRG OBSS PD Max Offset field is present in the element. If the Non-SRG Offset Present subfield is 1, then the Non-SRG OBSS PD Max Offset field is present; otherwise, the Non-SRG OBSS PD Max Offset field is not present.

The SRG Information Present subfield in the SR Control field indicates whether the SRG OBSS PD Min Offset, SRG OBSS PD Max Offset, SRG BSS Color Bitmap, and SRG Partial BSSID Bitmap fields are present in the element. If the SRG Information Present subfield is 1, then the subfields are present; otherwise, the fields are not present.

The HESIGA Spatial Reuse Value15 Allowed subfield in the SR Control field indicates whether non-AP STAs that are associated with the AP that transmitted this element can set the TXVECTOR parameter SPATIAL_REUSE to PSR_AND_NON_SRG_OBSS_PD_PROHIBITED. The subfield is set as described in 26.11.6.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Non-SRG OBSS PD Max Offset field contains an unsigned integer that is added to –82 dBm to generate the value of the Non-SRG OBSS PD Max parameter.

The SRG OBSS PD Min Offset field contains an unsigned integer that is added to –82 dBm to generate the value of the SRG OBSS PD Min parameter.

The SRG OBSS PD Max Offset field contains an unsigned integer that is added to –82 dBm to generate the value of the SRG OBSS PD Max parameter.

The SRG BSS Color Bitmap field is a bitmap that indicates the BSS color values used by members of the SRG of which the transmitting STA is a member. Each bit of the bitmap corresponds to one of the 64 BSS colors, where the lowest numbered bit corresponds to BSS color value 0 and the highest numbered bit corresponds to BSS color value 63. A BSS color value is used by at least one BSS that is a member of the same SRG of the transmitting STA if the corresponding bit of the bitmap is 1. If a bit in the bitmap is 0, then no BSS in the same SRG of the transmitting STA uses the corresponding BSS color value. The bit in the bitmap that corresponds to the BSS color value 0 is reserved.

The SRG Partial BSSID Bitmap field is a bitmap that indicates the Partial BSSID values used by members of the SRG of which the transmitting STA is a member. Each bit of the bitmap corresponds to one of the 64 possible values of BSSID[39:44], where the lowest numbered bit corresponds to Partial BSSID value 0 and the highest numbered bit corresponds to Partial BSSID value 63. A Partial BSSID value is used by at least one BSS that is a member of the same SRG of the transmitting STA if the corresponding bit of the bitmap is 1. If a bit in the bitmap is 0, then no BSS in the same SRG of the transmitting STA uses the corresponding Partial BSSID value.

9.4.2.252 NDP Feedback Report Parameter Set element

The format of the NDP feedback report Parameter Set element is defined in Figure 9-915 (NDP Feedback Report Parameter Set element format).

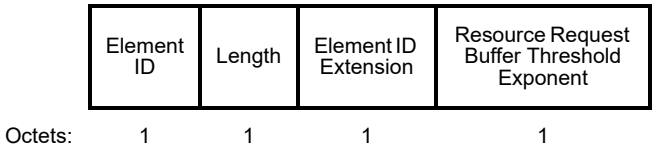

Figure 9-915—NDP Feedback Report Parameter Set element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Resource Request Buffer Threshold Exponent field is used to calculate the buffer threshold between two different resource requests as defined in 26.5.7.4. The resource request buffer threshold value is equal to $2^{(\text{Resource Request Buffer Threshold Exponent})}$ octets.

The resource request buffer threshold is equal to 256 octets if no NDP Feedback Report Parameter Set element is sent by the AP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.253 BSS Color Change Announcement element

The BSS Color Change Announcement element is used by an AP to advertise an upcoming BSS color change and the corresponding new BSS color (see 26.17.3.4). The format of the BSS Color Change Announcement element is shown in Figure 9-916 (BSS Color Change Announcement element format).

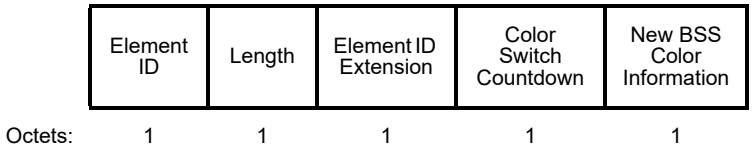

Figure 9-916—BSS Color Change Announcement element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Color Switch Countdown field is set to the number of TBTTs until the HE AP sending the BSS Color Change Announcement element switches to the new BSS color. The value 1 indicates that the switch occurs at the next TBTT (the ensuing Beacon frame advertises in the BSS Color subfield of the BSS Color Information field the new BSS color). The value 0 is reserved.

The format of the New BSS Color Information field is defined in Figure 9-917 (New BSS Color Information field format). The New BSS Color subfield is set to the new BSS color value that the HE AP intends to use starting from the TBTT at which the color switch countdown reaches 0.

Figure 9-917—New BSS Color Information field format

9.4.2.254 Quiet Time Period element

9.4.2.254.1 General

The format of the Quiet Time Period element is shown in Figure 9-918 (Quiet Time Period element format).

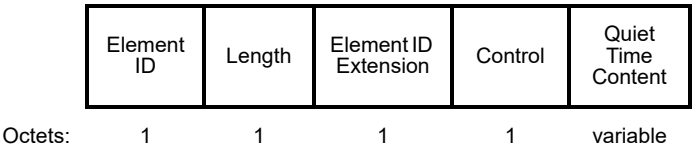

Figure 9-918—Quiet Time Period element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

A one octet Control field specifies the subtype of the Quiet Time Period element. The two LSBs define the subtype and are referred to as the Quiet Time Period Subtype field. The remaining 6 bits are reserved. Table 9-381 shows the encoding of the Quiet Time Period Subtype field.

Table 9-381—Quiet Time Period Subtype field encoding

Quiet Time Period Subtype field value	Meaning
0	Quiet Time Period Setup
1	Quiet Time Period Request
2	Quiet Time Period Response
3	Reserved

The Quiet Time Content field is a variable length field and carries information of quiet time operation indicated by the value in the Control field.

9.4.2.254.2 Quiet Time Period Setup subtype

The Quiet Time Period Setup subtype defines a period of time for QTP (see 26.17.5). The QTP can be used by an AP to mitigate interference by reducing the contention from HE STAs in a period that gives preference to HE STAs participating in the exchange of specific frames using peer-to-peer link.

The content of the Quiet Time Content subfield in the Quiet Time Period Setup subtype is shown Figure 9-919 (Quiet Time Content subfield format in Quiet Time Period Setup subtype).

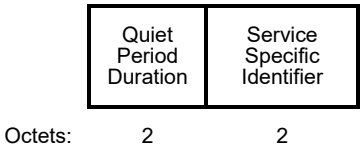

Figure 9-919—Quiet Time Content subfield format in Quiet Time Period Setup subtype

The Quiet Period Duration field is set to the duration of the QTP, in units of 32 μs, that is no larger than the value indicated in the Quiet Period Interval subtype field of the Quiet Time Period Request subtype sent by the QTP requesting STA.

The Service Specific Identifier field contains an identifier assigned by a peer-to-peer application to identify specific frame exchange sequences using peer-to-peer links during which HE STAs that have requested participation of the specified frame exchange sequences might transmit frames during the quiet time period.

9.4.2.254.3 Quiet Time Period Request subtype

The Quiet Time Period Request subtype defines a periodic sequence of QTPs that the QTP requesting STA requests the QTP AP to schedule.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The content of the Quiet Time Content subfield in the Quiet Time Period Request subtype is shown Figure 9-920 (Quiet Time Content subfield format in Quiet Time Period Request subtype).

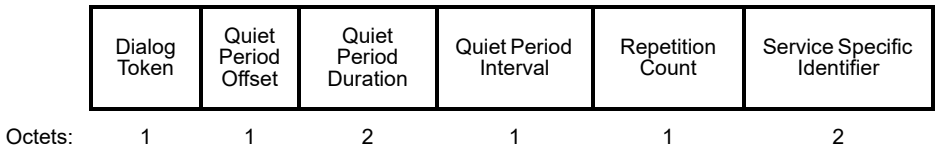

Figure 9-920—Quiet Time Content subfield format in Quiet Time Period Request subtype

The Dialog Token field identifies the Quiet Time Period Response subtype to which the Quiet Time Period Request subtype corresponds.

The Quiet Period Offset field is set to the offset of the first QTP from the TBTT expressed in TUs.

The Quiet Period Interval field is set to the requested interval between the start of two consecutive QTPs, expressed in TUs.

The Quiet Period Duration field is set to the duration of the QTP in units of 32 μs.

The Repetition Count field is set to the number of requested QTPs. A repetition count equal to 0 indicates the setup time of the QTP is for an one time operation. Repetition count equals to 0xFF indicates the setup of the QTP is canceled.

The Service Specific Identifier field contains an identifier assigned by a peer-to-peer application to identify specific frame exchange sequences using peer-to-peer links during which HE STAs that have requested the participation of the specified frame exchange sequences might transmit frames during the quiet time period.

9.4.2.254.4 Quiet Time Period Response subtype

The Quiet Time Period Response subtype defines the feedback information from the AP that received the Quiet Time Period Request element. If an AP decides not to accept the value requested by the QTP requesting STA, the AP can set different values carried in the Quiet Period Response frame.

The content of the Quiet Time Content subfield in the Quiet Time Period Response subtype is shown in Figure 9-921 (Quiet Time Content subfield format in Quiet Time Period Response subtype).

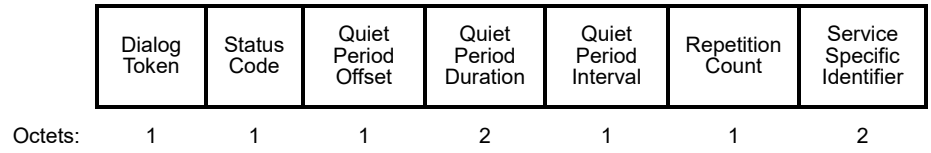

Figure 9-921—Quiet Time Content subfield format in Quiet Time Period Response subtype

The Dialog Token field identifies the Quiet Time Period Request subtype to which this Quiet Time Period Response subtype corresponds.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Status Code field indicates the status of a requested operation. The value of the status code is shown in Table 9-382.

Table 9-382—Status codes

Value	Meaning
0	Success
1	Reject
2	Counter
3–255	Reserved

The Quiet Period Offset field is set to the offset of the first QTP from the TBTT expressed in TUs.

The Quiet Period Interval field is set to the interval between the start of two consecutive quiet time periods, expressed in TUs.

The Quiet Period Duration field is a one octet field with resolution of 32 μs.

The Repetition Count field is set to the number of requested QTPs.

The Service Specific Identifier field contains an identifier assigned by a peer-to-peer application to identify specific frame exchange sequences using peer-to-peer links which HE STAs that have requested the participation of the specific frame exchange sequences might transmit frames during the quiet time period.

9.4.2.255 ESS Report element

The format of the ESS Report element is shown in Figure 9-922 (ESS Report element format).

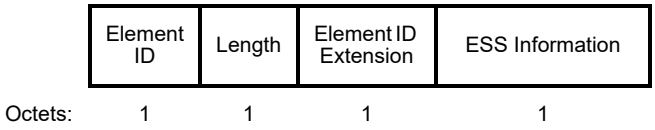

Figure 9-922—ESS Report element format

The Element ID, Length and Element ID Extension fields are defined in 9.4.2.1.

The format of the ESS Information field is defined in Figure 9-923 (ESS Information field format).

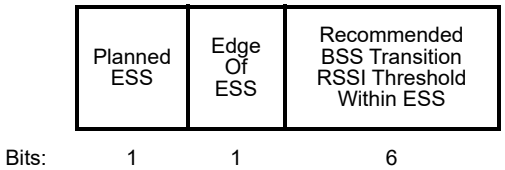

Figure 9-923—ESS Information field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Planned ESS subfield indicates whether the BSS is part of an ESS that is planned with several BSSs in an overlapping configuration. This subfield is set to 1 to indicate that the ESS is deployed to ensure blanket coverage over the extended service area. Otherwise, this subfield is set to 0 and the Edge Of ESS and Recommended BSS Transition RSSI Threshold Within ESS subfields are reserved.

The Edge Of ESS subfield indicates whether the BSS is at the edge of the ESS. This subfield is set to 1 to indicate the BSS is at the edge of the ESS. Otherwise, this subfield is set to 0.

The Recommended BSS Transition RSSI Threshold Within ESS subfield indicates the RSSI below which an associated STA is recommended to initiate BSS transition to a neighbor BSS belonging to the ESS.

The resolution for the Recommended BSS Transition RSSI Threshold Within ESS subfield is 1 dB. The encoding is defined in Table 9-383.

Table 9-383—Recommended BSS Transition RSSI Threshold Within ESS subfield encoding

Value	Description
0–62	–100 dBm to –38 dBm
63	No recommendation

The use of the ESS Report element is described in 11.21.7.5.

9.4.2.256 OPS element

The opportunistic power save (OPS) element provides information needed by STAs when operating with OPS as defined in 26.14.3. The format of the OPS element is shown in Figure 9-924 (OPS element format).

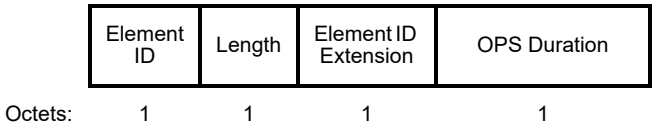

Figure 9-924—OPS element format

The Element ID, Element ID extension and Length fields are defined in 9.4.2.1.

If the OPS element is included in an OPS frame or a FILS Discovery frame, the OPS Duration field indicates the OPS period duration, during which a STA can go to doze state if it is explicitly not scheduled during that period, as defined in 26.14.3. The OPS Duration field is encoded in units of milliseconds.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.257 TWT Constraint Parameters element

The TWT Constraint Parameters element provides TWT constraint parameters that can be used during the establishment of individual TWT agreements and/or broadcast TWT schedules. The format of the TWT Constraint Parameters element is shown in Figure 9-925 (TWT Constraint Parameters element format).

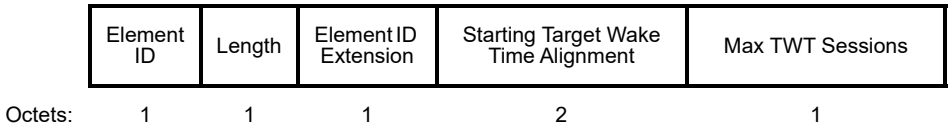

Figure 9-925—TWT Constraint Parameters element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Starting Target Wake Time Alignment field contains a positive integer *n* that indicates a recommended time for the start of the first TWT SP of a TWT agreement. A value of *n* indicates that the first start time is recommended to be an integer multiple of *n* + 1 TUs [i.e., (Target Wake Time) mod (*n* + 1) = 0].

The Max TWT Sessions field contains the maximum number of TWT sessions that a STA is capable of establishing with a peer STA.

9.4.2.258 HE BSS Load element

The HE BSS Load element reported by the AP contains information on utilization, frequency underutilization and spatial stream underutilization. The element format is defined in Figure 9-926 (HE BSS Load element format). A STA receiving the element might use the information it conveys in an implementation specific AP selection algorithm.

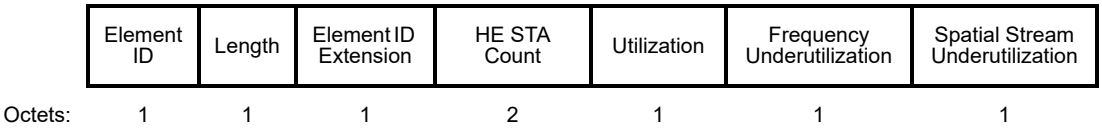

Figure 9-926—HE BSS Load element format

The Element ID, Length and Element ID extension fields are defined in 9.4.2.1.

The HE STA Count field indicates the total number of STAs currently associated with this BSS that declare that they are HE STAs by transmitting their HE Capabilities elements.

The Utilization field is defined as the fraction of time, linearly scaled with 255 representing 100%, that the AP sensed the medium was busy due to a transmission between the AP and HE STAs, as indicated by the physical carrier sense (CS) mechanism. When more than one channels are in use for the BSS, the Utilization field value is calculated only for the primary channel. This field value is computed using Equation (9-7).

$$\text{Utilization} = \left\lfloor \frac{T_{busy}}{\text{dot11ChannelUtilizationBeaconInterval} \times \text{dot11BeaconPeriod} \times 1024} \times 255 \right\rfloor \quad (9\text{-}7)$$

The Frequency Underutilization field is defined as the fraction of time, linearly scaled with 255 representing 100%, that the AP has underutilized frequency domain resources for given busy time of the medium. This field value is computed using Equation (9-8).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$\text{Frequency Underutilization} = \left\lfloor \frac{T_{busy} - \sum_{i=1} \left\{ \left(\sum_{j=1} B_{j,i} \times RU_j \right) \times T_i \right\}}{T_{busy}} \times 255 \right\rfloor \quad (9\text{-}8)$$

The Spatial Stream Underutilization field is defined as the fraction of time, linearly scaled with 255 representing 100%, that the AP has underutilized spatial domain resources for given busy time of the medium. This percentage is computed using Equation (9-9).

$$\text{Spatial Stream Underutilization} = \left\lfloor \frac{N_{maxSS} \times T_{busy} - \sum_{i=1} \left\{ \left(\sum_{j=1} N_{SS,j,i} \times RUM_j \right) \times T_i \right\}}{N_{maxSS} \times T_{busy}} \times 255 \right\rfloor \quad (9\text{-}9)$$

where

dot11ChannelUtilizationBeaconIntervals
: represents the number of consecutive beacon intervals during which the channel busy time is measured (see 9.4.2.26).

T_{busy} : is the number of microseconds during which CCA indicated the channel was busy due to a transmission between the AP and HE STAs during the measurement duration. The resolution of the CCA busy measurement is in microseconds

T_i : is the time interval, in units of microseconds, during which the primary 20 MHz channel is busy due to a transmission between the AP and HE STAs

N : is the number of busy events that occurred during the total measurement time that is less than or equal to dot11ChannelUtilizationBeaconIntervals consecutive beacon intervals

N_{RU} : is the number of RUs that are allocated within the BSS bandwidth during time interval T_i

RU_j : is a normalizing factor depending on the RU size and equals the ratio of the j^{th} RU size to the maximum RU size within the BSS bandwidth, i.e., if the j^{th} RU is a 26-tone RU and the BSS bandwidth is 20 MHz, then $RU_j = 26/242$

$B_{j,i}$: is 1 if the j^{th} RU is occupied or interfered in the busy time T_i; otherwise, it is set to 0. Any 20 MHz subchannels that are not occupied by a PPDU are regarded as interfered RUs if the bandwidth of PPDU is less than the BSS bandwidth.

N_{maxSS} : is the maximum number of spatial streams supported by the AP

N_{RUM} : is the number of RUs with a size of at least 106 tones and that are allocated within the BSS bandwidth during time interval T_i

RUM_j : is a normalizing factor depending on the RU size. RUM is applied to RUs with a size of at least 106 tones and equals the ratio of the j^{th} RU size to the maximum RUM size within the BSS bandwidth, i.e., if the j^{th} RUM is a 106-tone RU and the BSS bandwidth is 20 MHz, then $RUM_j = 106/242$.

$N_{SS,j,i}$: is the number of streams over the j^{th} RUM in the busy time T_i.

If T_{busy} is 0, the Utilization field, Frequency Underutilization field and Spatial Stream Underutilization field are reserved.

9.4.2.259 Multiple BSSID Configuration element

The Multiple BSSID Configuration element is used to provide configuration information for a multiple BSSID set (see 11.1.3.8.3) or to carry information related to the index adjustment procedure (see 11.1.3.8.6) or both.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The format of the Multiple BSSID Configuration element is shown in Figure 9-927 (Multiple BSSID Configuration element format).

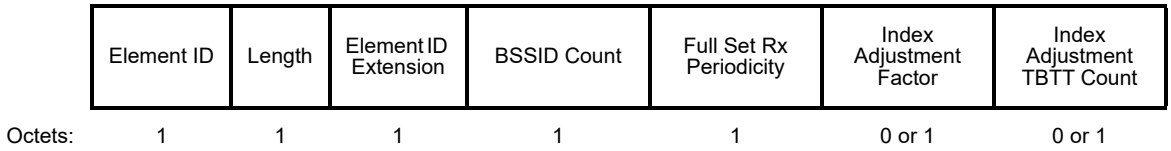

Figure 9-927—Multiple BSSID Configuration element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The BSSID Count field carries the total number of active BSSIDs in the multiple BSSID set.

The Full Set Rx Periodicity field indicates the minimum number of Beacon frames or DMG Beacon frames a non-AP STA performing scanning procedures needs to receive in order to discover all the active nontransmitted BSSIDs in the set.

NOTE—A non-AP STA is expected to know the profile periodicity of its associated AP. When its associated AP's profile is expected to be absent, the non-AP STA can choose to not process either the Beacon frame from the transmitted BSSID in the multiple BSSID set or the Multiple BSSID element within a Beacon frame from the transmitted BSSID.

The Index Adjustment Factor field if present is set to the value by which the BSSID index of each BSSID in a multiple BSSID set will be adjusted according to the procedures defined in 11.1.3.8.6. The value 0 indicates there is no adjustment.

The Index Adjustment TBTT Count field is present if the Index Adjustment Factor field is present and nonzero; otherwise it is not present. When present, the Index Adjustment Factor field is set to the number of TBTTs until a BSSID index adjustment occurs (as described in 11.1.3.8.6). A value of 1 indicates that the switch occurs at the next TBTT, and the corresponding Beacon, DMG Beacon or S1G Beacon frame is transmitted by the BSSID whose adjusted BSSID index value is 0 (i.e., the BSSID that takes on the transmitted BSSID role). The value 0 is reserved.

9.4.2.260 Known BSSID element

The Known BSSID element identifies the nontransmitted BSSIDs that a non-AP STA has discovered so far. A non-AP STA can include this element in a directed Probe Request frame to discover other nontransmitted BSSIDs not known to the requesting STA.

The format of the Known BSSID element is defined in Figure 9-928 (Known BSSID element format).

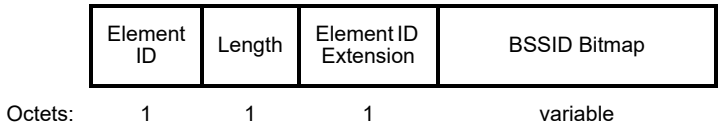

Figure 9-928—Known BSSID element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The format of the BSSID Bitmap field is as defined in Figure 9-929 (BSSID Bitmap field format).

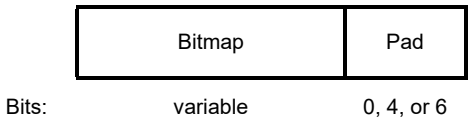

Figure 9-929—BSSID Bitmap field format

The Bitmap subfield has a length of 2^n bits where n is the value carried in the MaxBSSID Indicator field of the Multiple BSSID element advertised by the AP to which the Probe Request frame is being sent. Bit position 0 is reserved. The remainder of the bits represent one of $2^n - 1$ possible BSSID Index values (see 9.4.2.72) in the multiple BSSID set. A value of 1 at bit position k indicates that the non-AP STA has knowledge of nontransmitted BSSID with BSSID index k. Otherwise, the bit is set to 0.

The Pad subfield contains additional bits set to 0 to make the total number of bits in the BSSID Bitmap field equal to an integer number of octets.

9.4.2.261 Short SSID List element

The format of the Short SSID List Element is shown in Figure 9-930 (Short SSID List element format).

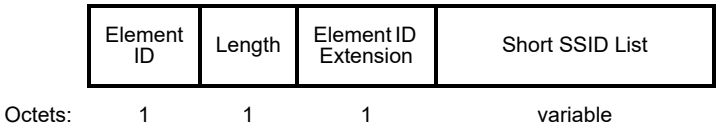

Figure 9-930—Short SSID List element format

The Element ID, Length and Element ID Extension fields are defined in 9.4.2.1.

The Short SSID List field contains the one or more Short SSID fields for which the STA is requesting information. The use of the Short SSID List element and frames is described in 11.1.4.3.2. The Short SSID field is defined in 9.4.1.71.

9.4.2.262 HE 6 GHz Band Capabilities element

An HE STA operating in the 6 GHz band declares its extended capabilities by transmitting the HE 6 GHz Band Capabilities element. The HE 6 GHz Band Capabilities element is defined in Figure 9-931 (HE 6 GHz Band Capabilities element format).

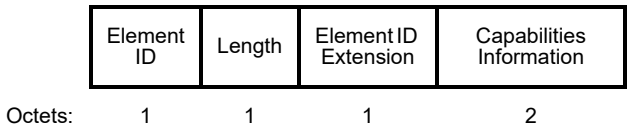

Figure 9-931—HE 6 GHz Band Capabilities element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Capabilities Information field is defined in Figure 9-932 (Capabilities Information field format).

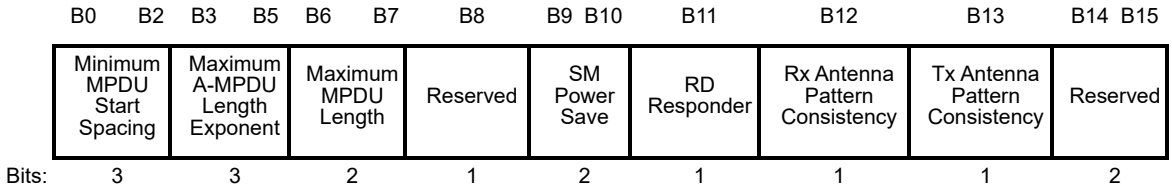

Figure 9-932—Capabilities Information field format

The Minimum MPDU Start Spacing subfield is defined in 9.4.2.55.3.

The Maximum A-MPDU Length Exponent subfield and Maximum MPDU Length subfield are defined in Table 9-313

The SM Power Save subfield is defined in defined in Table 9-224.

The RD Responder subfield is defined in defined in Table 9-227.

The Rx Antenna Pattern Consistency subfield is defined in defined in Table 9-313.

The Tx Antenna Pattern Consistency subfield is defined in defined in Table 9-313.

9.4.2.263 UL MU Power Capabilities element

The UL MU Power Capabilities element indicates the relative maximum transmit power that a STA is capable of transmitting an HE TB PPDU for each HE-MCS when using RU size greater than or equal to 242 subcarriers. The format of the UL MU Power Capabilities element is shown in Figure 9-933 (UL MU Power Capabilities element format).

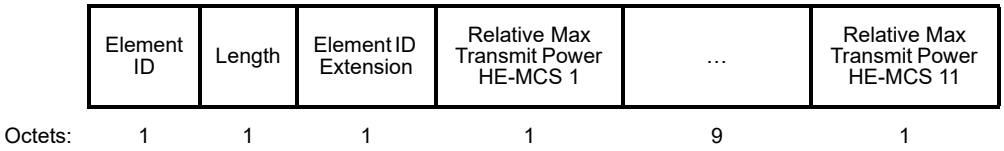

Figure 9-933—UL MU Power Capabilities element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The UL MU Power Capabilities element contains 11 Relative Max Transmit Power HE-MCS *n* fields in ascending order of HE-MCS from 1 to 11.

The Relative Max Transmit Power HE-MCS *n* field (where $n = 1, \ldots, 11$) is an unsigned integer in dB and contains the difference between the nominal maximum transmit power in dBm of an HE TB PPDU using an RU size greater than or equal to 242 subcarriers for HE-MCS 0 and that for HE-MCS *n*. The Relative Max Transmit Power HE-MCS *n* fields corresponding to HE-MCSs that are not supported by the HE STA that transmits this element are reserved.

9.4.2.264 EDMG Capabilities element

9.4.2.264.1 General

A non-AP EDMG STA or a non-PCP EDMG STA declares that it is an EDMG STA by transmitting the EDMG Capabilities element.

The format of the EDMG Capabilities element is shown in Figure 9-934 (EDMG Capabilities element format).

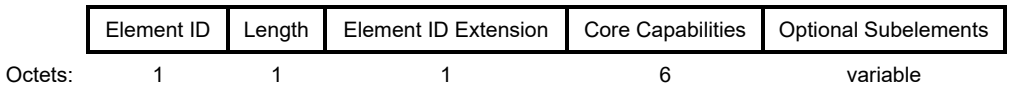

Figure 9-934—EDMG Capabilities element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Core Capabilities field is defined in Figure 9-935 (Core Capabilities field format).

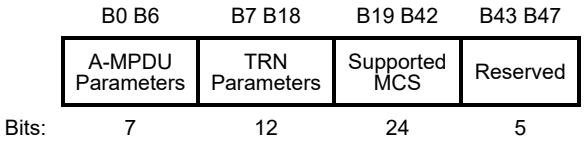

Figure 9-935—Core Capabilities field format

The A-MPDU Parameters field is defined in Figure 9-936 (A-MPDU Parameters field format). The definition of the subfields of the A-MPDU Parameters field is shown in Table 9-384.

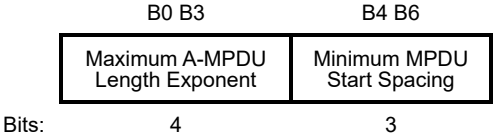

Figure 9-936—A-MPDU Parameters field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-384—A-MPDU Parameters field definition

Subfield	Definition	Encoding
Maximum A-MPDU Length Exponent	Indicates the maximum length of A-MPDU that the STA can receive.	This subfield is an integer in the range 0 to 9. The length defined by this subfield is equal to: $2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1$ octets.
Minimum MPDU Start Spacing	Determines the minimum time between the start of adjacent MPDUs within an A-MPDU that the STA can receive, measured at the PHY SAP.	Set to 0 for no restriction. Set to 1 for 8 ns. Set to 2 for 16 ns. Set to 3 for 32 ns. Set to 4 for 64 ns. Set to 5 for 128 ns. Set to 6 for 256 ns. Set to 7 for 512 ns.

The TRN Parameters field is defined in Figure 9-937 (TRN Parameters field format).

	B0	B1	B2	B3	B4	B5	B6	B7	B8	B9	B10	B11
	TP1	TP4	TN2	TN4	TN8	RP1	RP4	RN2	RN4	RN8	Short TRN	Long TRN
Bits:	1	1	1	1	1	1	1	1	1	1	1	1

Figure 9-937—TRN Parameters field format

The TP1 subfield indicates that the STA is capable of transmitting an EDMG PPDU with TXVECTOR parameter EDMG_TRN_P equal to 1.

The TP4 subfield indicates that the STA is capable of transmitting an EDMG PPDU with TXVECTOR parameter EDMG_TRN_P equal to 4.

The TN2 subfield indicates that the STA is capable of transmitting an EDMG PPDU with TXVECTOR parameter EDMG_TRN_N equal to 2.

The TN4 subfield indicates that the STA is capable of transmitting an EDMG PPDU with TXVECTOR parameter EDMG_TRN_N equal to 4.

The TN8 subfield indicates that the STA is capable of transmitting an EDMG PPDU with TXVECTOR parameter EDMG_TRN_N equal to 8.

The RP1 subfield indicates that the STA is capable of receiving an EDMG PPDU with RXVECTOR parameter EDMG_TRN_P equal to 1.

The RP4 subfield indicates that the STA is capable of receiving an EDMG PPDU with RXVECTOR parameter EDMG_TRN_P equal to 4.

The RN2 subfield indicates that the STA is capable of receiving an EDMG PPDU with RXVECTOR parameter EDMG_TRN_N equal to 2.

The RN4 subfield indicates that the STA is capable of receiving an EDMG PPDU with RXVECTOR parameter EDMG_TRN_N equal to 4.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The RN8 subfield indicates that the STA is capable of receiving an EDMG PPDU with RXVECTOR parameter EDMG_TRN_N equal to 8.

The Short TRN subfield is set to 1 to indicate that the STA is capable of receiving TRN subfields based on short Golay sequences (see 28.9.2.2.6) in SC mode or short TRN subfields (see 28.9.2.2.7) in OFDM mode; otherwise, it is set to 0.

The Long TRN subfield is set to 1 to indicate that the STA is capable of receiving TRN subfields based on long Golay sequences (see 28.9.2.2.6) in SC mode or long TRN subfields (see 28.9.2.2.7) in OFDM mode; otherwise, it is set to 0.

The Supported MCS field is defined in Figure 9-938 (Supported MCS field format).

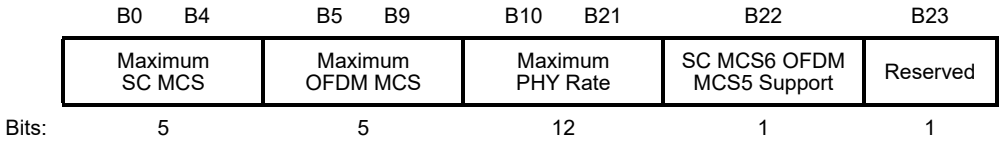

Figure 9-938—Supported MCS field format

The Maximum SC MCS subfield contains the index of the highest supported receive EDMG SC mode MCS, including with NUC if supported. The mandatory EDMG SC mode MCSs are not impacted by the value of this subfield.

The Maximum OFDM MCS subfield contains the index of the highest supported receive EDMG OFDM mode MCS. A value of zero indicates that the EDMG OFDM mode is not supported.

The Maximum PHY Rate subfield contains the maximum PHY data rate, in units of 100 Mb/s, that the STA supports in receive mode, over all supported channel bandwidths and number of spatial streams. This PHY data rate can be lower than the data rate provided by the maximum supported MCS when used with a combination of the largest supported channel bandwidth and the maximum number of supported spatial streams.

The SC MCS6 OFDM MCS5 Support subfield is set to 1 to indicate that MCS 6 of the EDMG SC mode and MCS 5 of the EDMG OFDM mode are supported in SISO. Otherwise, this subfield is set to 0.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-385. A subelement does not appear more than once in the EDMG Capabilities element. If a subelement corresponding to a Subelement ID is not present in a transmitted EDMG Capabilities element, the transmitting STA does not support any of the mechanisms defined within this subelement.

Table 9-385—Optional subelement IDs

Subelement ID	Name	Extensible
0	Beamforming Capability	Yes
1	Antenna Polarization Capability	Yes
2	PHY Capabilities	Yes
3	Supported Channels	Yes
4	MAC Capabilities	Yes
5–255	Reserved	

9.4.2.264.2 Beamforming Capability subelement

The Data field of the Beamforming Capability subelement is defined in Figure 9-939 (Data field of the Beamforming Capability subelement format).

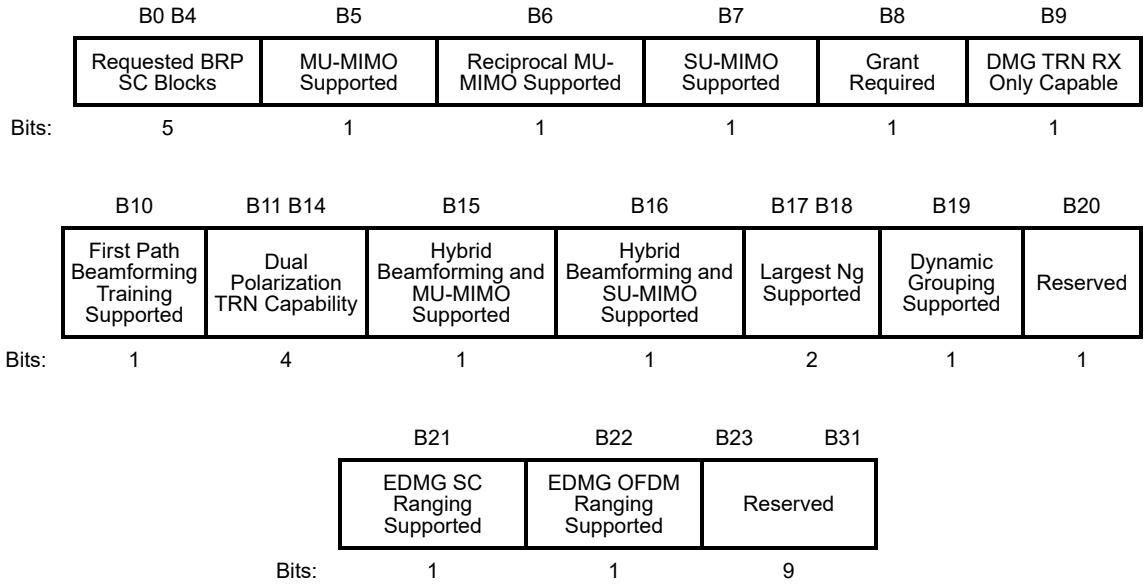

Figure 9-939—Data field of the Beamforming Capability subelement format

The Requested BRP SC Blocks subfield indicates the minimum number of data SC blocks that the STA requests be included in a PPDU carrying a TRN field and transmitted to the STA. The value of this subfield is set to dot11RequestedBRPMinDataLength. If the PPDU is an OFDM mode PPDU, the minimum number of OFDM symbols is calculated as described in 28.9.2.2.4.

The MU-MIMO Supported subfield indicates if the STA supports the DL MU-MIMO protocol including the MU-MIMO beamforming protocol described in 10.41.10.2.3. This subfield is set to 1 if dot11EDMGMIMOSupport is either muAndSuMimo (2) or reciprocalMuMimoAndSuMimo (3), and is set to 0 otherwise.

The Reciprocal MU-MIMO Supported subfield indicates if the STA supports the reciprocal MU-MIMO protocol specified in 10.41.10.2.3. This subfield is set to 1 if dot11EDMGMIMOSupport is

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

reciprocalMuMimoAndSuMimo (3), and is set to 0 otherwise. This subfield is reserved if the MU-MIMO Supported field is 0.

The SU-MIMO Supported subfield indicates if the STA supports the SU-MIMO protocol including the SU-MIMO beamforming protocol described in 10.41.10.2.2. This subfield is set to 1 if dot11EDMGMIMOSupport is suMimoOnly (1), and is set to 0 otherwise.

The Grant Required subfield indicates if the STA requires reception of a Grant frame to set up a MIMO configuration. This subfield is set to 1 if dot11EDMGBFGrantRequired is true, and is set to 0 otherwise. The Grant Required subfield is reserved if both the MU-MIMO Supported subfield and the SU-MIMO Supported subfield are set to 0.

The DMG TRN RX Only Capable subfield indicates if the STA is capable of receiving only DMG TRNs as defined in 20.9.2.2.2, even when such TRNs are appended to an EDMG PPDU (see 28.9.2.2.3). This subfield is set to 1 if dot11EDMGBFDMGTRNRXOnlyImplemented is true. Otherwise, this subfield is set to 0.

The First Path Training Supported subfield indicates if the STA supports the first path beamforming training procedure defined in 10.41.10.6. This subfield is set to 1 if dot11FirstPathTrainingImplemented is true, and is set to 0 otherwise.

The Dual Polarization TRN Capability subfield is formatted as shown in Figure 9-940 (Dual Polarization TRN Capability subfield format).

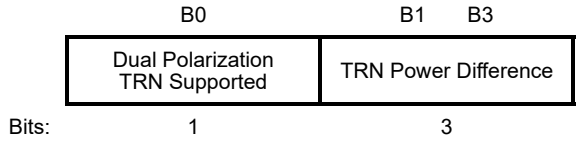

Figure 9-940—Dual Polarization TRN Capability subfield format

The Dual Polarization TRN Supported subfield is set to 1 to indicate that the repetition of the same TRN subfield with different polarizations, as specified in 10.41.10.7, is supported by the STA both for transmit and receive. Otherwise, it is set to 0.

The TRN Power Difference subfield indicates the difference, in dB, between the radiated power of consecutive TRN subfields transmitted with the same AWV but with different polarizations. The encoding of the radiated power difference is shown in Table 9-386.

Table 9-386—Encoding of TRN Power Difference subfield

TRN Power Difference subfield encoding	TRN power difference between the first TRN polarization and the second TRN polarization (dB)

7	–3
4	–4 or lower

The MU-MIMO Supported subfield and the Hybrid Beamforming and MU-MIMO Supported subfield indicates if the STA supports the hybrid beamforming protocol during MU-MIMO transmission, including the hybrid beamforming protocol described in 10.41.10.2.4. This subfield is set to 1 if dot11EDMGHybridMUMIMOImplemented is true, and is set to 0 otherwise. The Hybrid Beamforming and MU-MIMO Supported subfield is reserved if the MU-MIMO Supported subfield is 0.

The SU-MIMO Supported subfield and Hybrid Beamforming and SU-MIMO Supported subfield indicates if the STA supports hybrid beamforming protocol during SU-MIMO transmission, including the hybrid beamforming protocol described in 10.41.10.2.4. This subfield is set to 1 if dot11EDMGHybridSUMIMOImplemented is true, and is set to 0 otherwise. The Hybrid Beamforming and SU-MIMO Supported subfield is reserved if the SU-MIMO Supported subfield is 0.

The Largest Ng Supported subfield indicates largest value of N_g that the EDMG STA supports for the beamforming feedback matrix (see 9.4.2.283). This subfield is set to the value of dot11EDMGBFGrantLargestNgSupported, i.e., 0 for $N_g = 2$, set to 1 for $N_g = 4$, and set to 2 for $N_g = 8$. Value of 3 is reserved.

The Dynamic Grouping Supported subfield indicates if the EDMG STA supports dynamic grouping. The field is set to 1 if dot11EDMGBFDynamicGroupingImplemented is true, and is set to 0 otherwise.

The EDMG SC Ranging Supported subfield is set to 1 to indicate that the EDMG STA is capable of performing range measurement based on FTM using EDMG SC PPDUs. This subfield is set to 0 otherwise.

The EDMG OFDM Ranging Supported subfield is set to 1 to indicate that the EDMG STA is capable of performing range measurement based on FTM using EDMG OFDM PPDUs. This subfield is set to 0 otherwise. This field is reserved if the Maximum OFDM MCS subfield of the Supported MCS field is set to 0.

9.4.2.264.3 Antenna Polarization Capability subelement

The Data field of the Antenna Polarization Capability subelement allows a STA to share its antenna polarization characteristics with other stations. The Antenna Polarization Capability field is defined in Figure 9-941 (Data field of the Antenna Polarization Capability subelement format).

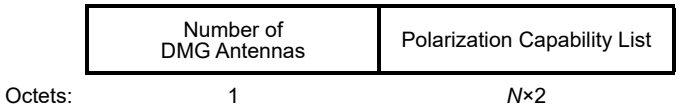

Figure 9-941—Data field of the Antenna Polarization Capability subelement format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The value of the Number of DMG Antennas subfield plus one defines the combined total number, *N*, of RX and TX antennas of an EDMG STA.

The Polarization Capability List subfield contains *N* Polarization Capability subfields. Each Polarization Capability *i* subfield, $1 \leq i \leq N$, describes the polarization characteristics of the DMG antenna that is identified by index *i*. Each Polarization Capability *i* subfield is defined in Figure 9-942 (Polarization Capability subfield format).

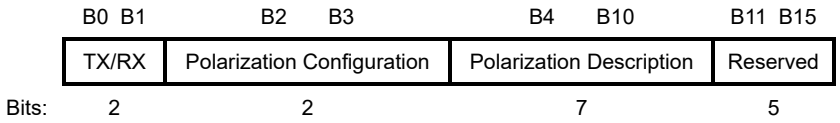

Figure 9-942—Polarization Capability subfield format

The TX/RX subfield is set to 1 to indicate that the antenna is for both transmission and reception, is set to 2 to indicate that the antenna is for transmission only, and is set to 3 to indicate that the antenna is for reception only. Value 0 is reserved.

The Polarization Configuration subfield is set to 0 to indicate single polarization, is set to 1 to indicate polarization switch, is set to 2 to indicate synthesizable polarization, and is set to 3 to indicate MIMO dual polarization.

The definition of the Polarization Description subfield depends on the setting of the Polarization Configuration subfield.

If the value of the Polarization Configuration subfield is equal to single polarization or MIMO dual polarization, the Polarization Description subfield is set to 0 to indicate linear polarization, is set to 1 to indicate circular polarization and is set to 2 for mixed polarization. Other values are reserved.

If the value of the Polarization Configuration subfield is equal to synthesizable polarization, the Polarization Description subfield is set to 0 to indicate linear polarization, is set to 1 to indicate circular polarization, is set to 2 for mixed polarization, and is set to 3 to indicate support for both linear and circular polarization. Other values are reserved.

If the value of the Polarization Configuration subfield is equal to polarization switch, the Polarization Description subfield is defined as shown in Figure 9-943 (Polarization Description subfield format).

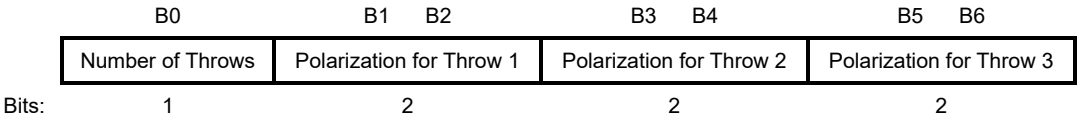

Figure 9-943—Polarization Description subfield format

The Number of Throws subfield is set to 0 to indicate 2 throws and is set to 1 to indicate 3 throws. If the Number of Throws subfield is set to indicate 2 throws, the Polarization for Throw 3 subfield is reserved.

Each of Polarization for Throw 1 subfield, Polarization for Throw 2 subfield and Polarization for Throw 3 subfield is set to set to 0 to indicate linear polarization, is set to 1 to indicate circular polarization and is set to 2 for mixed polarization. Value of 3 is reserved.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.264.4 PHY Capabilities subelement

The Data field of the PHY Capabilities subelement is defined in Figure 9-944 (Data field of the PHY Capabilities subelement format).

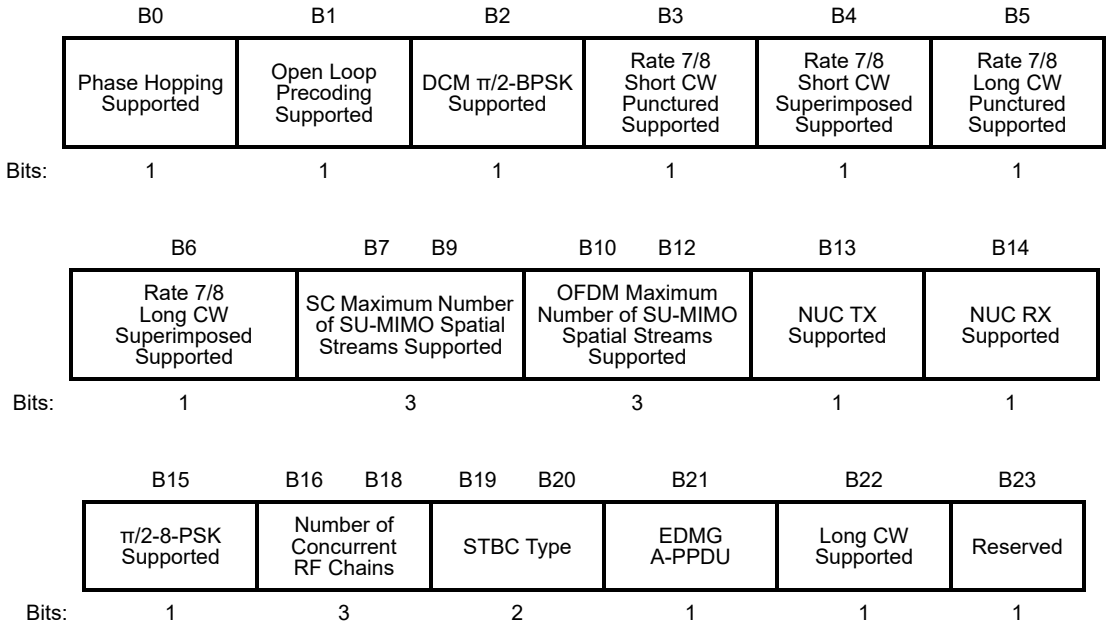

Figure 9-944—Data field of the PHY Capabilities subelement format

The Phase Hopping Supported subfield indicates if the STA supports phase hopping as specified in 28.6.9.3. The subfield is set to 1 if dot11EDMGPhaseHoppingImplemented is true, and is set to 0 otherwise.

The Open Loop Precoding Supported subfield indicates if the STA supports open loop precoding as specified in 28.6.9.3. The subfield is set to 1 if dot11EDMGOpenLoopPrecodingImplemented is true, and is set to 1 otherwise.

The DCM π/2-BPSK Supported subfield indicates if the STA supports DCM π/2-BPSK as specified in 28.5.9.5.3. The subfield is set to 1 if dot11EDMGDCMBPSKImplemented is true, and is set to 0 otherwise.

The Rate 7/8 Short CW Punctured Supported, Rate 7/8 Short CW Superimposed Supported, Rate 7/8 Long CW Punctured Supported and Rate 7/8 Long CW Superimposed Supported subfields indicate the support by an EDMG STA for LDPC code rate 7/8 with codeword length equal to 624, 672, 1248, and 1344 bits as follows:

— The Rate 7/8 Short CW Punctured Supported subfield is set to 1 if dot11EDMGShortCWPuncturedImplemented is true, and is set to 0 otherwise. The subfield indicates support for transmission and reception of LDPC code with short codeword length equal to 624 bits and code rate 7/8. The encoding procedure for short codeword length equal to 624 bits is defined in 20.5.3.2.3.3.

— The Rate 7/8 Short CW Superimposed Supported subfield is set to 1 if dot11EDMGShortCWSuperimposedImplemented is true, and is set to 0 otherwise. The subfield indicates support for transmission and reception of LDPC code with short codeword length equal to 672 bits and code rate 7/8. The encoding procedure for short codeword length equal to 672 bits is defined in 28.5.9.4, and parity check matrix is defined in 28.3.6.2. This field is reserved if the Rate 7/8 Short CW Punctured Supported subfield is 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— The Rate 7/8 Long CW Punctured Supported subfield is set to 1 if dot11EDMGLongCWPuncturedImplemented is true, and is set to 0 otherwise. The subfield indicates support for transmission and reception of LDPC code with long codeword length equal to 1248 bits and code rate 7/8. The encoding procedure for long codeword length equal to 1248 bits is defined in 28.5.9.4 (Encoding).
— The Rate 7/8 Long CW Superimposed Supported subfield is set to 1 if dot11EDMGLongCWSuperimposedImplemented is true, and is set to 0 otherwise. The subfield indicates support for transmission and reception of LDPC code with long codeword length equal to 1344 bits and code rate 7/8. The encoding procedure for long codeword length equal to 1344 bits is defined in 28.5.9.4 (Encoding). This field is reserved if the Rate 7/8 Long CW Punctured Supported subfield is 0.

The SC Maximum Number of SU-MIMO Spatial Streams Supported subfield is set to dot11EDMGSCMaxSUSpatialStreams minus 1. The value of this subfield plus 1 indicates the maximum number of SU-MIMO spatial streams for the EDMG SC modulation class that the STA can demodulate.

The OFDM Maximum Number of SU-MIMO Spatial Streams Supported subfield is set to dot11EDMGOFDMMaxSUSpatialStreams minus 1. The value of this subfield plus 1 indicates the maximum number of SU-MIMO spatial streams for the EDMG OFDM modulation class that the STA can demodulate.

The NUC TX Supported subfield is set to 1 if dot11EDMGNUCTXImplemented is true, and is set to 0 otherwise. If equal to 1, this subfield indicates that the STA supports transmission of PPDUs using nonuniform constellation.

The NUC RX Supported subfield is set to 1 if dot11EDMGNUCRXImplemented is true, and is set to 0 otherwise. If equal to 1, this subfield indicates that the STA supports reception of PPDUs using nonuniform constellation.

The π/2-8-PSK Supported subfield is set to 1 if dot11EDMG8PSKImplemented is true, and is set to 0 otherwise. If equal to 1, this subfield indicates that the STA supports SC MCS 12 and SC MCS 13 using 8-PSK modulation.

The Number of Concurrent RF Chains subfield is set to dot11EDMGNumConcurrentRFChains minus 1. The value of this subfield plus 1 indicates the maximum number of concurrent transmit or receive chains of the STA. The value of this field is less than or equal to the value of the Number of DMG Antennas subfield in the Antenna Polarization Capability field.

The STBC Type subfield is set to dot11EDMGSTBCType. If this subfield is 1, it indicates that the STA supports single stream STBC reception. If this subfield is 2, it indicates that the STA supports one or more spatial stream STBC reception; in this case, the maximum number of spatial streams that can be decoded is limited by the minimum of four and the value of the SC Maximum Number of SU-MIMO Spatial Streams Supported subfield for an EDMG SC PPDU and the value of the OFDM Maximum Number of SU-MIMO Spatial Streams Supported subfield for an EDMG OFDM PPDU. If this subfield is 0, the STA does not support STBC. Value of 3 is reserved.

The EDMG A-PPDU subfield is set to 1 if dot11EDMGAPPDUImplemented is true, and is set to 0 otherwise. If equal to 1, this subfield indicates that the STA supports EDMG A-PPDU as described in 10.14.

The Long CW Supported subfield is set to 1 if dot11EDMGLongCWImplemented is true, and is set to 0 otherwise. If equal to 1, this subfield indicates that the STA supports LDPC codeword of length 1344 on code rates 1/2, 5/8, 3/4, and 13/16. If this subfield is 0, the Rate 7/8 Long CW Punctured Supported and Rate 7/8 Long CW Superimposed Supported subfields are set to 0.

9.4.2.264.5 Supported Channels subelement

The Data field of the Supported Channels subelement is defined in Figure 9-945 (Data field of the Supported Channels subelement format), where *N* is the integer number of channels and *M* is the integer number of channel aggregation combinations that the STA supports.

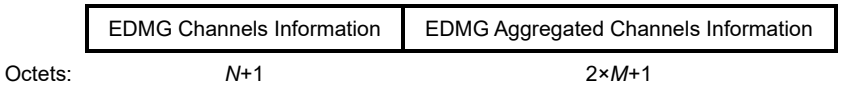

Figure 9-945—Data field of the Supported Channels subelement format

NOTE—As specified in 28.3.4 (Channelization), support for at least one 2.16 GHz channel and one 4.32 GHz channel by an EDMG STA is mandatory.

The EDMG Channels Information subfield is defined in Figure 9-946 (EDMG Channels Information subfield format).

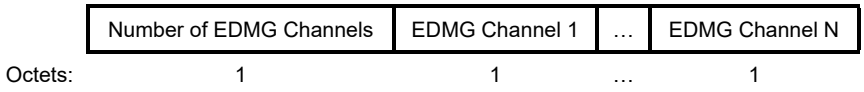

Figure 9-946—EDMG Channels Information subfield format

The Number of EDMG Channels subfield defines the value of *N*.

Each EDMG Channel *i* subfield ($1 \le i \le N$) includes the channel number of a channel that is supported by the STA, as defined in Annex E.

The EDMG Aggregated Channels Information subfield is defined in Figure 9-947 (EDMG Aggregated Channels Information subfield format).

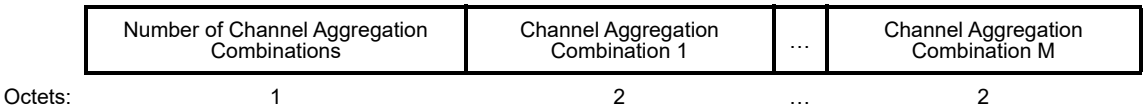

Figure 9-947—EDMG Aggregated Channels Information subfield format

The Number of Channel Aggregation Combinations subfield defines the value of *M*.

Each Channel Aggregation Combination *i* subfield ($1 \le i \le M$) is defined in Figure 9-948 (Channel Aggregation Combination subfield format). The channel numbers, as defined in Annex E, of the channels that are aggregated for each channel aggregation combination are included in the Aggregated Channel 1 and Aggregated Channel 2 subfields.

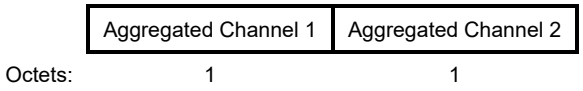

Figure 9-948—Channel Aggregation Combination subfield format

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.264.6 MAC Capabilities subelement

The Data field of the MAC Capabilities subelement is defined in Figure 9-949 (Data field of the MAC Capabilities subelement format).

	B0 B3	B4	B5 B6	B7	B8 B15
	EDMG Multi-TID Aggregation Support	EDMG All Ack Support	SM Power Save	Scheduled RD Supported	Reserved
Bits:	4	1	2	1	8

Figure 9-949—Data field of the MAC Capabilities subelement format

The EDMG Multi-TID Aggregation Support field contains the number of TIDs minus one of QoS Data frames that the STA is able to receive or aggregate in a multi-TID A-MPDU as described in 10.70. A value of zero indicates that the STA does not support EDMG multi-TID aggregation.

The EDMG All Ack Support field is set to 1 to indicate support for the reception of an EDMG Multi-TID BlockAck frame under the all ack context when the Ack Type subfield value is 2 (see 10.70.2). The EDMG All Ack Support field is set to 0 otherwise.

The SM Power Save field indicates the support for spatial multiplexing power save for an EDMG STA (see 11.2.6). It also indicates the spatial multiplexing power save mode that is in operation immediately after (re)association. This field is set to 0 for static SM power save mode, 1 for dynamic SM power save mode, and 3 for SM power save disabled or not supported (see 11.2.6). The value of 2 is reserved. This field is valid in a (Re)Association Request frame sent to an AP or a PCP. Otherwise, this field is set to 0 or 3 upon transmission and it ignored upon reception.

NOTE—This field indicates the operational state immediately after (re)association as well as (if not set to 3) a capability.

The Scheduled RD Supported field indicates if the EDMG STA supports the scheduling procedure of the RD protocol described in 10.29.3 and 10.29.4. This field is set to 1 if dot11EDMGScheduledRDImplemented is true. Otherwise, this field is set to 0. When dot11EDMGMIMOSupport is either muAndSuMimo (2) or reciprocalMuMimoAndSuMimo (3), dot11EDMGScheduledRDImplemented is always true.

9.4.2.265 EDMG Operation element

The operational parameters of an EDMG BSS provided by an EDMG AP or EDMG PCP are determined by the EDMG Operation element.

The format of the EDMG Operation element is shown in Figure 9-950 (EDMG Operation element format).

	Element ID	Length	Element ID Extension	Primary Channel	BSS AID	A-BFT Parameters	BSS Operating Channels	Operating Channel Width
Octets:	1	1	1	1	1	1	1	1

Figure 9-950—EDMG Operation element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Primary Channel field indicates a 2.16 GHz channel number, as defined in Annex E, of the primary channel of the BSS.

The BSS AID field contains a value in the range 1 to 254 assigned by an AP or PCP to identify the BSS. Other values are reserved.

The A-BFT Parameters field is defined in Figure 9-951 (A-BFT Parameters field format).

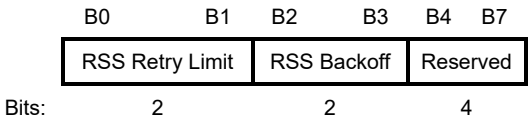

Figure 9-951—A-BFT Parameters field format

The RSS Retry Limit subfield defines the value of the retry limit that a STA attempting to access the A-BFT of the BSS uses. If the RSS Retry Limit subfield is set to 0 it indicates 2 retries, if set to 1 it indicates 4 retries, if set to 2 it indicates 6 retries and if set to 3 it indicates 8 retries.

The RSS Backoff subfield defines the value of the backoff that a STA uses when the consecutive number of failed attempts to access the A-BFT of the BSS exceeds the retry limit specified by the RSS Retry Limit subfield. If the RSS Backoff subfield is set to 0 it indicates a backoff of 8, if set to 1 it indicates a backoff of 16, if set to 2 it indicates a backoff of 24 and if set to 4 it indicates a backoff of 32.

The BSS Operating Channels field is a bitmap that indicates the 2.16 GHz channel(s) that are allowed to be used for transmissions in the BSS and is formatted as shown in Figure 9-952 (BSS Operating Channels field format). In Figure 9-952 (BSS Operating Channels field format), Ch1 subfield corresponds to channel 1, Ch2 subfield corresponds to channel 2 and so on (channels are defined in Annex E). If a subfield is set to 1, transmission on the indicated channel is allowed; otherwise, if the subfield is set to 0, transmission on the indicated channel is not allowed. The subfield corresponding to the primary channel is always set to 1 and the total number of subfields set to 1 does not exceed four.

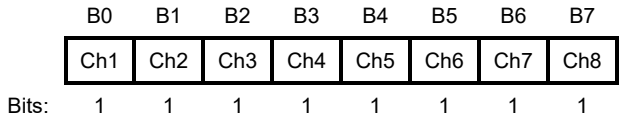

Figure 9-952—BSS Operating Channels field format

The Operating Channel Width field is defined in Figure 9-953 (Operating Channel Width field format) and indicates each possible bandwidth that a PPDU transmitted in the BSS can occupy.

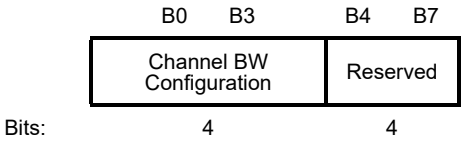

Figure 9-953—Operating Channel Width field format

The Channel BW Configuration subfield encodes the allowed channel bandwidth configurations and is defined in Table 9-387.

Table 9-387—Channel BW Configuration subfield definition

Channel BW Configuration subfield value		PPDU masks that are allowed to be transmitted in the BSS per rules defined in 10.23.2.14 and 10.38.12					
		2.16 GHz	4.32 GHz	6.48 GHz	8.64 GHz	2.16+2.16 GHz	4.32+4.32 GHz
Reserved	0–3						
Operating on 2.16 GHz, 4.32 GHz, 6.48 GHz, and 8.64 GHz only	4	1	0	0	0	0	0
	5	1	1	0	0	0	0
	6	1	1	1	0	0	0
	7	1	1	1	1	0	0
Operating on 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, and 2.16+2.16 GHz only	8	1	0	0	0	1	0
	9	1	1	0	0	1	0
	10	1	1	1	0	1	0
	11	1	1	1	1	1	0
Operating on 2.16 GHz, 4.32 GHz, 6.48 GHz, 8.64 GHz, 2.16+2.16 GHz, and 4.32+4.32 GHz only	12	1	0	0	0	1	1
	13	1	1	0	0	1	1
	14	1	1	1	0	1	1
	15	1	1	1	1	1	1
NOTE—"1" denotes an allowed PPDU mask; "0" denotes a disallowed PPDU mask.							

9.4.2.266 EDMG Extended Schedule element

The EDMG Extended Schedule element defines the channel scheduling for an EDMG BSS, including an indication of which channels an allocation is scheduled on.

The format of the EDMG Extended Schedule element is shown in Figure 9-954 (EDMG Extended Schedule element format).

	Element ID	Length	Element ID Extension	EDMG Allocation Control	Number of Allocations	Channel Allocation 1	…	Channel Allocation N
Octets:	1	1	1	1	1	5 or 20		5 or 20

Figure 9-954—EDMG Extended Schedule element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The EDMG Allocation Control field is defined in Figure 9-955 (EDMG Allocation Control field format).

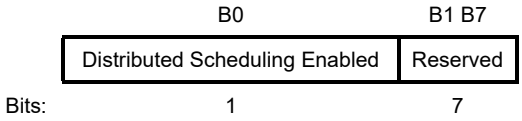

Figure 9-955—EDMG Allocation Control field format

The Distributed Scheduling Enabled subfield is set to 1 to indicate that the distributed scheduling mechanism (see 10.68) is enabled. Otherwise, this subfield is set to 0.

The Number of Allocations field indicates the number, *N*, of Channel Allocation fields following it.

Each Channel Allocation *i* subfield ($1 \leq i \leq N$) starts with a Scheduling Type subfield, which defines the format of the remainder of the Channel Allocation field.

If the Scheduling Type subfield is 0, the Channel Allocation field contains supplemental allocation information (e.g., bandwidth that the allocation occupies) to the Allocation field in the Extended Schedule element for the same allocation. In this case, the Channel Allocation field is defined in Figure 9-956 (Channel Allocation field format when Scheduling Type is 0).

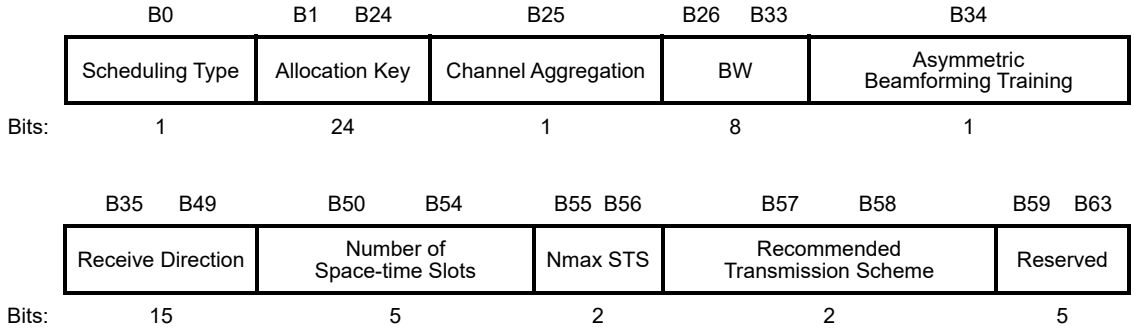

Figure 9-956—Channel Allocation field format when Scheduling Type is 0

The contents of the Allocation Key subfield are used to identify the allocation. This is done by matching the contents of this subfield with the information obtained from the Extended Schedule element transmitted in the same frame containing the EDMG Extended Schedule element. The Allocation Key subfield is formatted as shown in Figure 9-957 (Allocation Key field format).

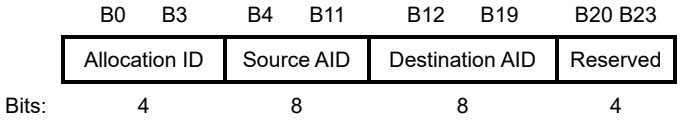

Figure 9-957—Allocation Key field format

The Allocation ID, Source AID, and Destination AID subfields are collectively used to identify the allocation included as part of the Extended Schedule element.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Channel Aggregation and BW subfields are defined in Table 28-12. These fields specify the channel(s) on which the allocation is scheduled.

If the Scheduling Type subfield is 1, the Channel Allocation field contains the complete allocation scheduling information. In this case, the Channel Allocation field is defined in Figure 9-958 (Channel Allocation field format when Scheduling Type is 1).

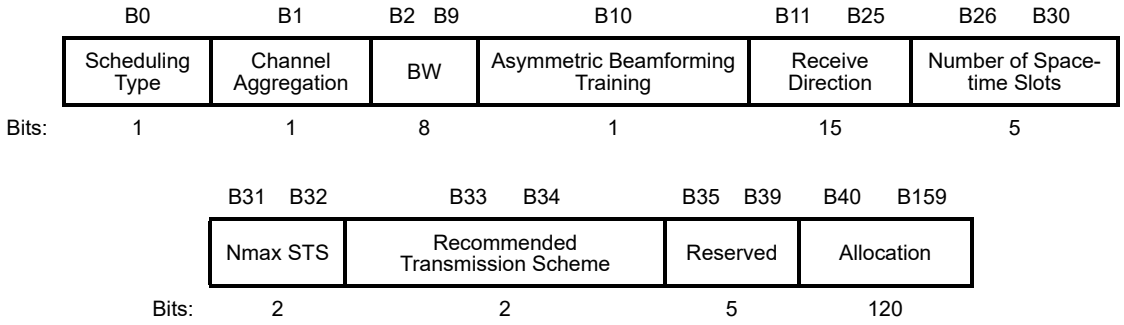

Figure 9-958—Channel Allocation field format when Scheduling Type is 1

The Channel Aggregation and BW subfields are defined in Table 28-12. These fields specify the channel(s) on which the allocation is scheduled. The Channel Aggregation and BW subfields are reserved when the Asymmetric Beamforming Training subfield is set to 1.

The Asymmetric Beamforming Training subfield is set to 1 to indicate that this allocation is dedicated to performing the procedure specified in 10.41.10.3. Otherwise, this subfield is set to 0.

The Receive Direction subfield indicates the receive antenna configuration that the PCP or AP uses during the allocation and is formatted as shown in Figure 9-959 (Receive Direction subfield format). The Receive Direction subfield is reserved if the Asymmetric Beamforming Training subfield is 1.

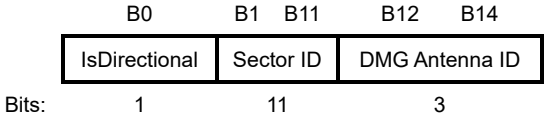

Figure 9-959—Receive Direction subfield format

The IsDirectional subfield is set to 1 to indicate that the PCP or AP uses a directional, non quasi-omni antenna pattern to receive frames during the allocation, and is set to 0 otherwise.

The Sector ID subfield is reserved if the IsDirectional subfield is 0. Otherwise, the Sector ID subfield indicates the sector that the AP or PCP uses to receive frames during this allocation.

The DMG Antenna ID subfield is reserved if the IsDirectional subfield is 0. Otherwise, the DMG Antenna ID subfield indicates the DMG antenna that the AP or PCP uses to receive frames during this allocation.

The value of the Number of Space-time Slots subfield indicates the number of space-time slots allocated by the AP or PCP for asymmetric beamforming training. The Number of Space-time Slots subfield is reserved if the Asymmetric Beamforming Training subfield is 0. A space-time slot is a time slot in an asymmetric beamforming training allocation in which the AP or PCP listens on the combination of sector and DMG antenna as defined in 10.41.10.3.3.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The value 2^{STS}, where STS is the value of the Nmax STS subfield, indicates the maximum number of consecutive space-time slots a responder can occupy within a listen period of asymmetric beamforming training. The Nmax STS subfield is reserved if the Asymmetric Beamforming Training subfield is 0. The value 2^{STS} is no more than the value of the Number of Space-time Slots subfield.

The Recommended Transmission Scheme subfield is set to 0 to indicate no transmission scheme for the allocation is recommended by the AP or the PCP. The subfield is set to 1 to indicate SISO transmission is recommended by the AP or the PCP for the allocation. The subfield is set to 2 to indicate SU-MIMO transmission is recommended by the AP or the PCP for the allocation. Value of 3 is reserved.

The Allocation subfield is defined in Figure 9-846 (Allocation field format). Other subfields are defined in the paragraphs above.

9.4.2.267 EDMG Channel Measurement Feedback element

The EDMG Channel Measurement Feedback element is used to carry channel measurement feedback data that an EDMG STA has measured on DMG Beacon frames, SSW frames, Short SSW PPDUs or TRN fields of EDMG BRP PPDUs. This channel measurement feedback data is provided in addition to what is provided in the Channel Measurement Feedback element. The EDMG Channel Measurement Feedback element provides a list of sectors per transmit DMG antenna identified during sector sweep or during beam combination, or a list of TX sector combinations identified during SU-MIMO or MU-MIMO beamforming training and that can be used to establish a beamformed SISO, SU-MIMO, or MU-MIMO link, as well as AWV information obtained during beam tracking.

The format and size of the EDMG Channel Measurement Feedback element are defined by the parameter values specified in the accompanying DMG Beam Refinement element or MIMO Feedback Control element. The EDMG Channel Measurement Feedback element is shown in Table 9-388.

If the RXVECTOR parameter DUAL_POL_TRAINING of the PPDU over which the measurements were performed was 1 and the RXVECTOR parameter FIRST_PATH_TRAINING was 0, the Dual Polarization TRN Measurement field contains the measurements for all measured taps. If the RXVECTOR parameter DUAL_POL_TRAINING of the PPDU over which the measurements were performed was 1 and the RXVECTOR parameter FIRST_PATH_TRAINING was also 1, only the measurements corresponding to the tap #1 (shortest delay) are added to the Dual Polarization TRN Measurement field. The Relative I/Q Component Tap #N, polarization #1 or #2, represent the measured signal strength for the I or Q component for the tap #N and polarization #1 or #2, respectively.

Table 9-388—EDMG Channel Measurement Feedback element format

Field	Size (bits)	Meaning

Relative Q Component Tap #N Polarization #2	8	The quadrature component of impulse response for tap #N, and polarization #2 in the dual polarization TRN
Padding	0–7	Zero padding to make the EDMG Channel Measurement Feedback element length a multiple of 8 bits

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

When the EDMG Channel Measurement Feedback element is included in a BRP frame, the EDMG Sector ID Order field indicates the TX sector IDs, TX antenna IDs and RX antenna IDs corresponding to the SNRs in the SNR field when the SNR Present subfield of the FBCK-TYPE field is equal to 1 and the Sector Sweep Frame Type field is equal to 0 (i.e., DMG Beacon frame or SSW frame) in the DMG Beam Refinement element contained in the frame. The EDMG Sector ID Order field indicates the CDOWN values and RX antenna IDs corresponding to the SNRs in the SNR field when the SNR Present subfield of the FBCK-TYPE field is equal to 1 and the Sector Sweep Frame Type field is equal to 1 (i.e., Short SSW PPDU) in the DMG Beam Refinement element contained in the frame. The TX Antenna ID subfields of the EDMG Sector ID Order field are reserved when the Sector Sweep Frame Type field is equal to 1 in the DMG Beam Refinement element contained in the frame.

When the EDMG Channel Measurement Feedback element is included in a MIMO BF Feedback frame or when the EDMG Channel Measurement Feedback element is included in a BRP frame with the Sector Sweep Frame Type field of the DMG Beam Refinement element contained in the frame equal to 2, the EDMG Sector ID Order field indicates AWV feedback IDs, TX antenna IDs and RX antenna IDs. The RX Antenna ID subfields of the EDMG Sector ID Order field are reserved when the EDMG Channel Measurement Feedback element is included in the MIMO BF Feedback frame. The BRP CDOWN field indicates BRP CDOWN values. The EDMG Sector ID Order field and the BRP CDOWN field can be divided into N_{meas} SISO ID subsets. Specifically, the i SISO ID subset (i = 1, 2, …, N_{meas}) comprises the values of the AWV Feedback IDi, TX Antenna IDi, RX Antenna IDi and BRP CDOWNi subfields, where the AWV Feedback IDi subfield indicates the AWV for a TX DMG antenna having its TX antenna ID equal to the TX Antenna IDi subfield value, which is used to transmit an EDMG BRP-RX/TX PPDU or EDMG BRP-TX PPDU with the BRP CDOWN field set to the BRP CDOWNi subfield value.

Table 9-389 summarizes how the sector and DMG antenna are interpreted on the basis of the value of the Sector Sweep Frame Type field value.

Table 9-389—Sector and DMG antenna interpretation based on the Sector Sweep Frame Type field value

Sector Sweep Frame Type field value	Basis for sector sweep result	TX sector ID interpretation	TX antenna ID interpretation
0	DMG Beacon or SSW frame	Sector ID field value in frame	DMG/CMMGAntenna ID subfield value in frame
1	Short SSW PPDU	CDOWN field value in PPDU	RF Chain ID field in PPDU
2	BRP frame	AWV Feedback ID field value in frame	TX Antenna Mask field in EDMG BRP Request element
3	TRN field as part of beam tracking	AWV Feedback ID field value in frame	N/A

When the EDMG Channel Measurement Feedback element is carried within a MIMO BF Feedback frame, the number of measurements, N_{meas}, is equal to $N_{tsc} \times N_{TX} \times N_{RX}$, where N_{tsc} is given by the Number of TX Sector Combinations Present field in the MIMO Feedback Control element within the MIMO BF Feedback frame, N_{TX} refers to the value indicated by the Number of TX Antennas subfield in the MIMO Feedback Control element within the MIMO BF Feedback frame, and N_{RX} refers to the value indicated by the Number of RX Antennas subfield in the MIMO Feedback Control element within the MIMO BF Feedback frame.

When the EDMG Channel Measurement Feedback element is carried within a MIMO BF Feedback frame, every $N_{TX} \times N_{RX}$ consecutive SISO ID subsets constitute a set that corresponds to a specific TX sector combination (or equivalently a specific TX-RX AWV configuration). Each TX sector combination comprises a single TX sector for each of N_{TX} TX DMG antennas. N_{tsc} TX sector combinations are ranked in the decreasing order of an implementation dependent metric. Specifically, the j set ($j = 1, 2, \ldots, N_{tsc}$), which corresponds to the j TX-RX AWV configuration, comprises the $((j-1) \times N_{TX} \times N_{RX} + 1)$ SISO ID subset to the $(j \times N_{TX} \times N_{RX})$ SISO ID subset. Assume that the MIMO channel corresponding to the j TX-RX AWV configuration is defined by the following equation:

$$H_j = \begin{bmatrix} h_{1,1}^{(j)} & \cdots & h_{1,N_{RX}}^{(j)} \\ \vdots & \ddots & \vdots \\ h_{N_{TX},1}^{(j)} & \cdots & h_{N_{TX},N_{RX}}^{(j)} \end{bmatrix}$$

Here, $h_{m,n}^{(j)}$ ($m = 1, 2, \ldots, N_{TX}$ and $n = 1, 2, \ldots, N_{RX}$) represents the channel between the m TX DMG antenna and the n RX DMG antenna and is indicated by the $((j-1) \times N_{TX} \times N_{RX} + (m-1) \times N_{RX} + n)$ SISO ID subset. In particular, for the j TX sector combination ($j = 1, 2, \ldots, N_{tsc}$), the AWV used by the m TX antenna ($m = 1, 2, \ldots, N_{TX}$) is indicated by the values of the AWV feedback ID_l and BRP $CDOWN_l$ subfields, where $l = ((j-1) \times N_{TX} \times N_{RX} + (m-1) \times N_{RX} + n$ and n is any integer between 1 and N_{RX}.

NOTE—Since a DMG Beacon frame, SSW frame or Short SSW PPDU transmitted through a TX sector, or a TRN subfield of an EDMG BRP-TX PPDU or an EDMG BRP-RX/TX PPDU transmitted using a TX AWV, can be received by several RX DMG antennas, reception of each DMG Beacon frame, SSW frame, Short SSW PPDU or TRN subfield of an EDMG BRP-TX PPDU or an EDMG BRP-RX/TX PPDU through an RX DMG antenna has an entry in the SNR field, the EDMG Sector ID Order field, the Additional SNR field (if present) and the Additional EDMG Sector ID Order field (if present).

If both the Channel Aggregation Present field and the EDMG Extension Flag field in the accompanying DMG Beam Refinement element are 1 or if the Channel Aggregation Present subfield of the MIMO FBCK-TYPE field in the accompanying MIMO Feedback Control element is 1, the following apply:

— The EDMG Sector ID Order, BRP CDOWN and Tap Delay fields are for the channel that includes the primary channel in case of channel aggregation. Otherwise, the EDMG Sector ID Order, BRP CDOWN and Tap Delay fields are for the channel in which the measurement is taken.

— The Additional EDMG Sector ID Order, Additional BRP CDOWN and Additional Tap Delay fields are for the channel that does not include the primary channel in case of channel aggregation. Otherwise, the Additional EDMG Sector ID Order, Additional BRP CDOWN and Additional Tap Delay fields are not present.

9.4.2.268 EDMG Group ID Set element

The EDMG Group ID Set element allows an AP or PCP to define groups of MU capable EDMG STAs to perform DL MU-MIMO beamforming training and transmissions.

The format of the EDMG Group ID Set element is shown in Figure 9-960 (EDMG Group ID Set element format).

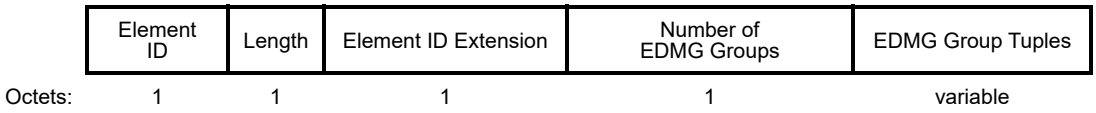

Figure 9-960—EDMG Group ID Set element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Number of EDMG Groups field indicates the number of EDMG Group fields.

The EDMG Group Tuples field contains one or more EDMG Group Tuple subfields. Each EDMG Group Tuple subfield has the structure shown in Figure 9-961 (EDMG Group Tuple subfield format).

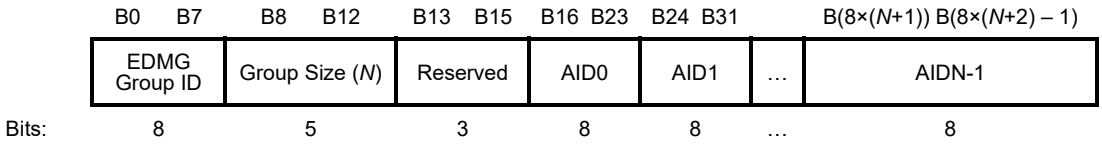

Figure 9-961—EDMG Group Tuple subfield format

The EDMG Group ID subfield is a unique, nonzero value that identifies the group.

The Group Size subfield indicates the number of EDMG STAs that belong to the group, i.e., the number of AID subfields following this subfield minus one.

Each AID subfield contains the AID of an EDMG STA that belongs to the group.

9.4.2.269 EDMG BRP Request element

The EDMG BRP Request element provides BRP configuration in addition to the BRP configuration provided in the BRP Request field. The EDMG BRP Request element is defined in Figure 9-962 (EDMG BRP Request element format).

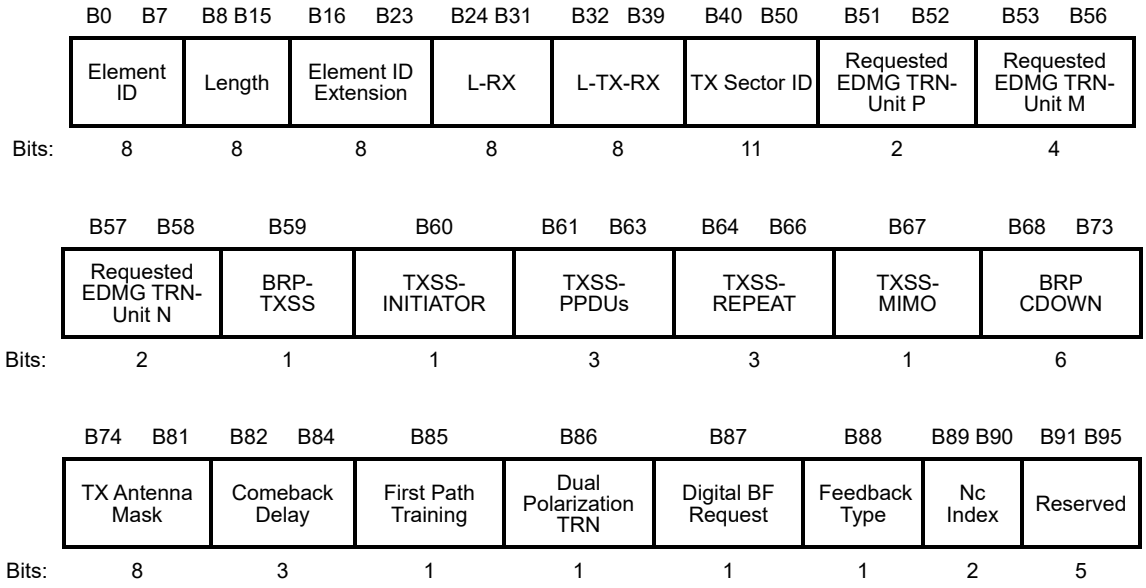

Figure 9-962—EDMG BRP Request element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The L-RX field indicates the number of TRN-Units requested by the transmitting STA as part of receive beam refinement. When the EDMG BRP Request element is present in a frame, the value of this field overrides the value of the subfield with the same name carried in the BRP Request field.

The L-TX-RX field indicates the requested number of consecutive TRN-Units for which the transmit AWV remains with the same AWV configuration as part of simultaneous receive and transmit beam refinement.

The TX Sector ID field indicates the sector ID that is used when transmitting the frame. If the frame is transmitted using a pattern that is not a sector that has been used in the sector sweep, the value of this field is set to 2047. When the EDMG BRP Request element is present in a frame, the value of this field overrides the value of the subfield with the same name carried in the BRP Request field.

The Requested EDMG TRN-Unit P field indicates the requested number of TRN subfields at the start of a TRN-Unit that use the same AWV, which is the same AWV used in the transmission of the preamble and Data fields of the PPDU, except for the case when the DMG antenna used in the transmission of the PPDU changes at the beginning of the TRN field (see 28.9.2.2.5). A svalue of zero indicates zero requested TRN subfields, a value of one indicates one requested TRN subfield, a value of two indicates two requested TRN subfields and a value of three indicates four requested TRN subfields.

The value of the Requested EDMG TRN-Unit M field plus one indicates the requested number of TRN subfields within a TRN-Unit that can be used for transmit training, as defined in 28.9.2.2. The value of this field plus one is an integer multiple of the value indicated in the Requested EDMG TRN-Unit N field.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Requested EDMG TRN-Unit N field indicates the requested number of consecutive TRN subfields within EDMG TRN-Unit M that are transmitted using the same AWV. A value of zero indicates one requested TRN subfield, a value of one indicates two requested TRN subfields, a value of two indicates three requested TRN subfields if the Requested EDMG TRN-Unit M field is equal to 2, 5, 8, 11, or 14, a value of two indicates eight requested TRN subfields if the Requested EDMG TRN-Unit M field is equal to 7 or 15, and a value of three indicates four requested TRN subfields.

The BRP-TXSS field is set to 1 to indicate either a request to perform BRP TXSS or to acknowledge a request to perform BRP TXSS, as defined in 10.41.10.5. Otherwise, this field is set to 0.

If the BRP-TXSS field is equal to 1, the TXSS-INITIATOR field set to 1 indicates that the transmitter of the BRP frame is the initiator of a BRP TXSS and the TXSS-INITIATOR field set to 0 indicates that the transmitter of the BRP frame is the responder of a BRP TXSS. If the BRP-TXSS field is equal to 0, the TXSS-INITIATOR field is reserved.

If the BRP-TXSS field and the TXSS-INITIATOR are both equal to 1, the value in the TXSS-PPDUs field plus one indicates the number of EDMG BRP-TX PPDUs necessary for the initiator to perform transmit training. If the BRP-TXSS field is equal to 1 and the TXSS-INITIATOR field is equal to 0, the value in the TXSS-PPDUs field plus one indicates the number of EDMG BRP-TX PPDUs necessary for the responder to perform transmit training if the procedure includes a Responder BRP TXSS (see 10.41.10.5). If the BRP-TXSS field is equal to 0, the TXSS-PPDUs field is reserved.

If the BRP-TXSS field and the TXSS-INITIATOR field are both equal to 1, the TXSS-REPEAT field plus one indicates the number of times that the EDMG BRP-TX PPDUs transmitted in the Responder BRP TXSS is repeated if the BRP TXSS includes a Responder BRP TXSS. If the BRP-TXSS field is equal to 1 and the TXSS-INITIATOR field is equal to 0, the TXSS-REPEAT field plus one indicates the number of times that the EDMG BRP-TX PPDUs transmitted in the Initiator BRP TXSS is repeated. If the BRP-TXSS field is equal to 0, the TXSS-REPEAT field is reserved.

If the BRP-TXSS field and the TXSS-INITIATOR field are both equal to 1, the TXSS-MIMO field set to 1 indicates that the requested BRP TXSS is a MIMO BRP TXSS (see 10.41.10.5), and the TXSS-MIMO field set to 0 indicates that the requested BRP TXSS is a SISO BRP TXSS (see 10.41.10.5). If the BRP-TXSS field and the TXSS-INITIATOR field are not both equal to 1, the TXSS-MIMO field is reserved.

The BRP CDOWN field is a down counter indicating the number of remaining EDMG BRP PPDU transmissions to the end of the BF training.

The TX Antenna Mask field is a bitmap that indicates whether each of eight TX DMG antennas is used in the transmission of the EDMG BRP PPDU. The first bit (i.e., the least significant bit) corresponds to the first TX DMG antenna, the second bit corresponds to the second TX DMG antenna, and so on. A bit is set to 1 to indicate the associated TX DMG antenna is used in the transmission of the EDMG BRP PPDU; otherwise, the bit is set to 0.

The Comeback Delay field indicates that the STA might not be ready with the feedback within BRPIFS. The value in the Comeback Delay field indicates when the device is ready with feedback. The interpretation of this field is defined according to Table 9-390.

The First Path training field set to 1 indicates that the BRP procedure is designated as a first path training procedure as specified in 10.41.10.6. This field is set to 0 otherwise.

The Dual Polarization TRN field is set to 1 to request a BRP initiator to send TRN subfields with different polarizations for the same AWV as specified in 10.41.10.7. It is set to 0 otherwise.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-390—Interpretation of the Comeback Delay field

Value	Meaning
0	Feedback is ready within this frame.
1	64 μs
2	128 μs
3	256 μs
4	512 μs
5	768 μs
6	1024 μs
7	2048 μs

The Digital BF Request field set to 1 indicates a request for performing digital beamforming. Otherwise, this field is set to 0.

The Feedback Type field indicates the type of feedback requested. Set to 0 for SU and set to 1 for MU.

If the Feedback Type field indicates MU, then the *Nc* Index field indicates the number of columns, *Nc*, in the compressed beamforming feedback matrix minus 1 for hybrid beamforming feedback in the EDMG OFDM mode. The interpretation of this field is defined according to Table 9-391.

Table 9-391—Encoding of Nc Index field

Value	Meaning
0	$Nc = 1$.
1	$Nc = 2$.
2	Reserved.
3	Reserved.

9.4.2.270 EDMG Training Field Schedule element

The EDMG Training Field Schedule element allows an EDMG STA to announce BTIs in which TRN-R subfields are present in PPDUs containing DMG Beacon frames transmitted during the BTI.

The format of the EDMG Training Field Schedule element is shown in Figure 9-963 (EDMG Training Field Schedule element format).

	Element ID	Length	Element ID Extension	Next BTI With TRN	TRN Schedule Interval
Octets:	1	1	1	1	1

Figure 9-963—EDMG Training Field Schedule element format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Next BTI With TRN field indicates the number of beacon intervals in which TRN-R subfields are not present in any PPDU transmitted in a BTI. The value of this field is this field is decreased by one at the start of every beacon interval until it reaches zero and is subsequently reset. If the Next BTI With TRN field is 0, TRN-R fields are present in the BTI.

The TRN Schedule Interval field indicates the periodic interval, in number of beacon intervals, at which TRN-R subfields are present in the BTI of one or more consecutive beacon intervals. If the value of this field is 0, there is no periodicity and the presence of TRN-R fields in a BTI is determined solely by the value of the Next BTI With TRN field.

9.4.2.271 EDMG Partial Sector Level Sweep element

The EDMG Partial Sector Level Sweep element is used to exchange the length of a sector level sweep to be performed when the link is lost before the STA's resort to a complete sector level sweep. The format of the element is shown in Figure 9-964 (EDMG Partial Sector Level Sweep element format).

	Element ID	Length	Element ID Extension	Partial SLS Configuration
Octets:	1	1	1	4

Figure 9-964—EDMG Partial Sector Level Sweep element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Partial SLS Configuration field is defined in Figure 9-965 (Partial SLS Configuration field format).

	B0 B5	B6 B16	B17 B19	B20 B22	B23 B26	B27	B28	B29 B31
	Partial Number of Sectors	Total Number of Sectors	Partial Number of Rx Antennas	Total Number of Rx Antennas	Time to Switch to Full Sector Sweep	Agree to Change Initiator/ Responder Roles	Agree to Partial Sector Sweep	Reserved
Bits:	6	11	3	3	4	1	1	3

Figure 9-965—Partial SLS Configuration field format

The Partial Number of Sector field indicates the number of sectors the sender intends to transmit per each of the peer STA's receive antennas as part of the partial sector level sweep.

The Total Number of Sector field indicates the number of sectors the sender intends to use as a transmitter per each of the peer STA's receive antennas as part of the complete sector level sweep.

The Partial Number of Rx antennas field indicates the number of RX antennas the sender intends to use when receiving the partial sector sweep.

The Total Number of Rx antennas field indicates the number of RX antennas the sender intends to use when receiving the complete sector level sweep.

When sent by the initiator of the partial sector level sweep exchange, the Time to Switch to Full Sector Sweep field is the time, in units of one millisecond, after the expiration of the beamformed link maintenance timer (see 11.27.1.1) that the initiator of the exchange proposes to switch to a complete sector level sweep. This field is reserved when sent by the responder of this exchange.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When sent by the initiator of the partial sector level sweep exchange and set to 1, the Agree to Change Initiator/Responder Roles field indicates that the initiator requests to change the roles of initiator/responder in the sector level sweep starting with the expiration of the beamformed link maintenance timer. This field is reserved otherwise.

When sent by the initiator of the partial sector level sweep exchange, the Agree to Partial Sector Sweep field is set to 1. When sent by the responder of the partial sector level sweep exchange, the Agree to Partial Sector Sweep field is set to 1 to indicate agreement to the partial sector level sweep and is set to 0 to indicate disagreement to the partial sector level sweep.

9.4.2.272 MIMO Setup Control element

The MIMO Setup Control element, defined in Table 9-392, is used to carry configuration information required for the SU-MIMO BF training and feedback subphases or the MU-MIMO BF training and feedback subphases.

Table 9-392—MIMO Setup Control element format

Field	Size (bits)	Meaning
Element ID	8	
Length	8	
Element ID Extension	8	
SU/MU	1	This field is set to 0 to indicate SU-MIMO beamforming and is set to 1 to indicate MU-MIMO beamforming.
Nonreciprocal/Reciprocal MIMO Phase	1	This field is set to 0 to indicate the nonreciprocal MIMO phase and is set to 1 to indicate the reciprocal MIMO phase.
EDMG Group ID	8	Indicates the EDMG Group ID of target MU group. This field is reserved when the SU/MU field is set to 0.
Group User Mask	32	
L-TX-RX	8	Indicates the requested number of consecutive TRN-Units in which the same AWV is used in the transmission of the last *M* TRN subfields of each TRN-Unit. This field is reserved when the SU/MU field is set to 1 or when the SU/MU field is set to 0, the Nonreciprocal/Reciprocal MIMO phase field is set to 1 and the Initiator field is set to 1. NOTE—*M* is equal to the value of the Requested EDMG TRN-Unit M field plus 1.
Requested EDMG TRN-Unit M	4	The value of this field plus one indicates the requested number of TRN subfields in a TRN-Unit that can be used for transmit training, as defined in 28.9.2.2 (EDMG BRP PPDU). This field is reserved when the SU/MU field is set to 1 or when the SU/MU field is set to 0, the Nonreciprocal/ Reciprocal MIMO phase field is set to 1 and the Initiator field is set to 1.
Initiator	1	This field is set to 1 to indicate the sender is the initiator and is set to 0 otherwise. This field is set to 1 when the SU/MU field is set to 1.
MIMO FBCK-REQ	10	Indicates requested channel measurement feedback.
Reserved	7	

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Group User Mask field is a bitmap that indicates whether an EDMG STA in the target MU group is requested to engage in the subsequent MU-MIMO BF training. The order of EDMG STAs in the Group User Mask field follows the order in which they appear in the corresponding EDMG Group field of the EDMG Group ID Set element defining the target MU group. The first bit (i.e., the least significant bit) of the Group User Mask field corresponds to the first EDMG STA in the MU group, the second bit corresponds to the second EDMG STA, and so on. A bit is set to 1 to indicate that the corresponding EDMG STA is requested to engage in the subsequent MU-MIMO BF training; otherwise, the bit is set to 0. This Group User Mask field is reserved when the SU/MU field is set to 0. If the number of EDMG STAs in the target MU group is smaller than 32, the corresponding bits in the Group User Mask field are set to 0.

The MIMO FBCK-REQ field is defined in Figure 9-966 (MIMO FBCK-REQ field format).

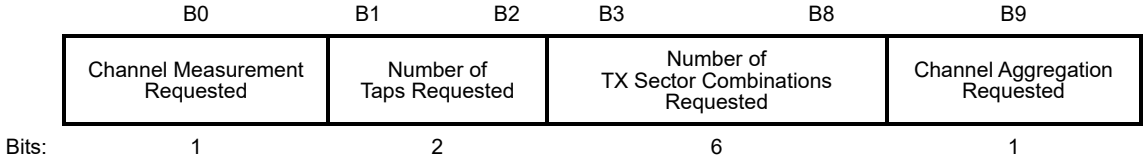

Figure 9-966—MIMO FBCK-REQ field format

If the Channel Measurement Requested subfield is set to 1, the Channel Measurement subfield is requested as part of MIMO BF feedback. Otherwise, set to 0.

The Number of Taps Requested subfield indicates the number of taps requested in each channel measurement. The encoding for this subfield is specified in Table 9-296.

The value of the Number of TX Sector Combinations Requested subfield plus one indicates the number of TX sector combinations requested as part of MIMO BF feedback.

The Channel Aggregation Requested subfield is set to 1 to indicate that the TRN field is transmitted over a 2.16+2.16 GHz or 4.32+4.32 GHz channel and to request the channel measurement feedback per channel, in case channel aggregation is used as part of MIMO BF feedback. Otherwise, this subfield is set to 0.

9.4.2.273 MIMO Poll Control element

The MIMO Poll Control element is defined in Table 9-393.

Table 9-393—MIMO Poll Control element format

Field	Size (bits)	Meaning
Element ID	8	
Length	8	
Element ID Extension	8	
SU/MU	1	This field is set to 0 to indicate SU-MIMO beamforming and is set to 1 to indicate MU-MIMO beamforming.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-393—MIMO Poll Control element format

Field	Size (bits)	Meaning
Poll Type	1	This field is set to 1 to indicate training PPDU poll used in the reciprocal MU-MIMO beamforming or the MU-MIMO hybrid beamforming feedback phase. It is set to 0 to indicate MIMO BF feedback poll used in the SU-MIMO beamforming or the nonreciprocal MU-MIMO beamforming.
L-TX-RX	8	Indicates the requested number of consecutive TRN-Units in which the same AWV is used in the transmission of the last *M* TRN subfields of each TRN-Unit. This field is reserved when the Poll Type field is set to 0.
Requested EDMG TRN-Unit M	4	The value of this field plus one indicates the requested number of TRN subfields in a TRN-Unit can be used for transmit training, as defined in 28.9.2.2. This field is reserved when the Poll Type field is set to 0.
Requested EDMG TRN-Unit P	2	Indicates the requested number of TRN subfields at the start of a TRN-Unit that use the same AWV. A value of zero indicates zero requested TRN subfields, a value of one indicates one requested TRN subfield, a value of two indicates two requested TRN subfields and a value of three indicates four requested TRN subfields. This field is reserved when the Poll Type field is set to 0.
Training Duration	14	Indicates the maximum duration, in microseconds, that can be used by the polled responder to transmit EDMG BRP-RX/TX PPDUs and starts following the reception of the MIMO BF Poll frame containing this element. Possible values range from 1 to 16383. This field is reserved when the Poll Type field is set to 0.
Reserved	2	

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

9.4.2.274 MIMO Feedback Control element

The MIMO Feedback Control element, as shown in Table 9-394, is used to carry configuration information for accompanying Channel Measurement Feedback element, EDMG Channel Measurement Feedback element and/or Digital BF Feedback element.

Table 9-394—MIMO Feedback Control element format

Field	Size (bits)	Meaning
Element ID	8	
Length	8	
Element ID Extension	8	
SU/MU	1	This field is set to 0 to indicate SU-MIMO beamforming and is set to 1 to indicate MU-MIMO beamforming.
Link Type	1	This field is set to 0 to indicate initiator link and is set to 1 otherwise. This field is set to 0 when the SU/MU field is set to 1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-394—MIMO Feedback Control element format

Field	Size (bits)	Meaning
Comeback Delay	3	This field indicates whether MIMO BF feedback is included in the MIMO BF Feedback frame containing the MIMO Feedback Control element or when the EDMG STA transmitting the MIMO Feedback Control element is ready with MIMO BF feedback. The encoding of this field is defined in Table 9-390.
MIMO FBCK-TYPE	18	
Digital Fbck Control	30	Defines the requirements for the digital feedback type.
Reserved	3	

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The MIMO FBCK-TYPE field is defined in Figure 9-967 (MIMO FBCK-TYPE field format). This field is reserved when the Comeback Delay field is set to a nonzero value.

	B0	B1	B2 B3	B4 B9	B10	B11	B12 B14	B15 B17
	Channel Measurement Present	Tap Delay Present	Number of Taps Present	Number of TX Sector Combinations Present	Precoder Information Present	Channel Aggregation Present	Number of TX Antennas	Number of RX Antennas
Bits:	1	1	2	6	1	1	3	3

Figure 9-967—MIMO FBCK-TYPE field format

If the Channel Measurement Present subfield is set to 1, the Channel Measurement subfield is present as part of the MIMO BF feedback. Otherwise, set to 0.

If the Tap Delay Present subfield is set to 1, the Tap Delay subfield is present as part of the MIMO BF feedback. Otherwise, set to 0.

The Number of Taps Present subfield indicates the number of taps present in each channel measurement. This subfield has the same encoding as the Number of Taps Requested subfield specified in Table 9-296.

The value of the Number of TX Sector Combinations Present subfield plus one indicates the number of TX sector combinations, N_{tsc}, for the MIMO BF feedback. The number of measurements, N_{meas}, is $N_{TX} \times N_{RX}$ multiples of the number of TX sector combinations, N_{tsc} (see 9.4.2.267).

The Precoder Information Present subfield is set to 1 to indicate that precoding information is present as part of the MIMO BF feedback. Otherwise, it is set to 0.

The Channel Aggregation Present subfield is set to 1 to indicate that, in case of channel aggregation, channel measurement feedback per channel is present. Otherwise, it is set to 0.

The Number of TX Antennas and the Number of RX Antennas subfields describe the N_{TX} and N_{RX} used in each of the N_{tsc} sector combinations.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Digital Fbck Control field defines the parameters of the accompanying digital BF feedback. The field is defined in Figure 9-968 (Digital Fbck Control field format), and its subfields are described in Table 9-395.

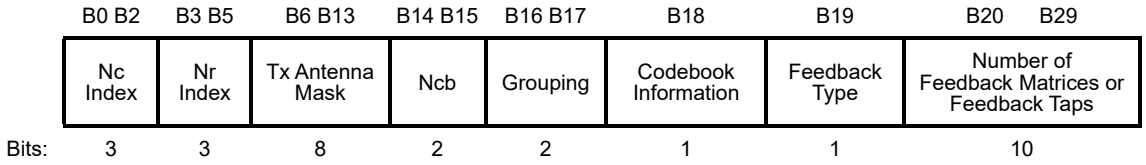

Figure 9-968—Digital Fbck Control field format

Table 9-395—Definition of subfields within Digital Fbck Control field

Subfield	Meaning
Nc Index	Indicates the number of columns, *Nc*, in the beamforming feedback matrix minus one: Set to 0 for *Nc* = 1. Set to 1 for *Nc* = 2. Set to 2 for *Nc* = 3. Set to 3 for *Nc* = 4. Set to 4 for *Nc* = 5. Set to 5 for *Nc* = 6. Set to 6 for *Nc* = 7. Set to 7 for *Nc* = 8.
Nr Index	Indicates the number of rows, Nr, in a beamforming feedback matrix minus one: Set to 0 for Nr = 1. Set to 1 for Nr = 2. Set to 2 for Nr = 3. Set to 3 for Nr = 4. Set to 4 for Nr = 5. Set to 5 for Nr = 6. Set to 6 for Nr = 7. Set to 7 for Nr = 8.
Tx Antenna Mask	Indicates the Tx Antennas reported in the accompanying Digital BF Feedback element. If the CSI for the i^{th} Tx Antenna is included in the accompanying Digital BF Feedback element, the i^{th} bit in Tx Antenna Mask is set to 1. Otherwise, the i^{th} bit in Tx Antenna Mask is set to 0.
Ncb	Indicates the number of contiguous 2.16 GHz channels the measurement was made for minus one: Set to 0 for 2.16 GHz. Set to 1 for 4.32 GHz. Set to 2 for 6.48 GHz. Set to 3 for 8.64 GHz.
Grouping	Indicates the subcarrier grouping, Ng, used for beamforming feedback matrix Set to 0 for $N_g = 2$. Set to 1 for $N_g = 4$. Set to 2 for $N_g = 8$. Set to 3 for dynamic grouping; reserved if dynamic grouping is not supported. If the Feedback Type subfield is 0, the Grouping subfield is reserved.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-395—Definition of subfields within Digital Fbck Control field *(continued)*

Subfield	Meaning
Codebook Information	Indicates the size of codebook entries. If the SU/MU field in the MIMO Feedback Control element is 1: Set to 0 for 6 bits for Ψ, 4 bits for ϕ. Value 1 is reserved. If the SU/MU field in the MIMO Feedback Control element is 0: Set to 0 for 9 bits for Ψ , 7 bits for ϕ. Value 1 is reserved.
Feedback Type	Indicates which type of feedback is provided. Set to 0 for uncompressed beamforming feedback in time domain (EDMG SC mode) and set to 1 for compressed using Givens-Rotation in frequency domain (EDMG OFDM mode).
Number of Feedback Matrices or Feedback Taps	This field is set to the value of the variable *Nsc*. The value 0 is reserved. If the Feedback Type subfield is 0, *Nsc* is the number of feedback taps per element of the SC feedback matrix. If the Feedback Type subfield is 1 and the Grouping subfield is less than 3, *Nsc* is determined by Table 9-403. If the Feedback Type subfield is 1 and the Grouping subfield is 3, *Nsc* specifies the number of subcarriers present in the Digital Beamforming Feedback Information field of the Digital BF Feedback element.

9.4.2.275 MIMO Selection Control element

The MIMO Selection Control element is defined in Table 9-396.

Table 9-396—MIMO Selection Control element format

Field	Size (bits)	Meaning
Element ID	8	
Length	8	
Element ID Extension	8	
EDMG Group ID	8	Indicates the EDMG group ID of target MU group.
Number of MU-MIMO Transmission Configurations	3	Indicates the number of MU-MIMO transmission configurations, N_{conf}.
MU-MIMO Transmission Configuration Type	1	This field is set to 0 to indicate the MU-MIMO transmission configurations obtained from the nonreciprocal MU-MIMO BF training. This field is set to 1 to indicate the MU-MIMO transmission configurations obtained from the reciprocal MU-MIMO BF training.
Number of TX Antennas	3	Indicates the N_{TX} used in each MU-MIMO transmission configuration.
Nonreciprocal MU-MIMO BF Training Based Transmission Configuration

Table 9-396—MIMO Selection Control element format *(continued)*

Field	Size (bits)	Meaning
Configuration 1 Group User Mask for Antenna 1	32	Indicates the STA(s) in the target MU group associated with the first TX DMG antenna in the first MU-MIMO transmission configuration.
Configuration 1 User 1 SISO ID Subset Index/RX Antenna ID for Antenna 1	12	Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the first STA associated with the first TX DMG antenna in the first MU-MIMO transmission configuration.
...		
Configuration 1 User $N_{1,1}^{(u)}$ SISO ID Subset Index/RX Antenna ID for Antenna 1	12	Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the $N_{1,1}^{(u)}$ STA associated with the first TX DMG antenna in the first MU-MIMO transmission configuration.
...		
Configuration 1 Group User Mask for Antenna N_{TX}	32	Indicates the STA(s) in the target MU group associated with the N_{TX} TX DMG antenna in the first MU-MIMO transmission configuration.
Configuration 1 User 1 SISO ID Subset Index/RX Antenna ID for Antenna N_{TX}	12	Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the first STA associated with the N_{TX} TX DMG antenna in the first MU-MIMO transmission configuration.
...		
Configuration 1 User $N_{1,N_{TX}}^{(u)}$ SISO ID Subset Index/RX Antenna ID for Antenna N_{TX}	12	Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the $N_{1,N_{TX}}^{(u)}$ STA associated with the N_{TX} TX DMG antenna in the first MU-MIMO transmission configuration.
...		
Configuration N_{conf} Group User Mask for Antenna 1	32	Indicates the STA(s) in the target MU group associated with the first TX DMG antenna in the N_{conf} MU-MIMO transmission configuration.
Configuration N_{conf} User 1 SISO ID Subset Index/RX Antenna ID for Antenna 1	12	Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the first STA associated with the first TX DMG antenna in the N_{conf} MU-MIMO transmission configuration.
...		
Configuration N_{conf} User $N_{N_{conf},1}^{(u)}$ SISO ID Subset Index/RX Antenna ID for Antenna N_{TX}	12	Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the $N_{N_{conf},1}^{(u)}$ STA associated with the first TX DMG antenna in the N_{conf} MU-MIMO transmission configuration.
...		
Configuration N_{conf} Group User Mask for Antenna N_{TX}	32	Indicates the STA(s) in the target MU group associated with the N_{TX} TX DMG antenna in the N_{conf} MU-MIMO transmission configuration.
Configuration N_{conf} User 1 SISO ID Subset Index/RX Antenna ID for Antenna N_{TX}	12	Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the first STA associated with the N_{TX} TX DMG antenna in the N_{conf} MU-MIMO transmission configuration.
...

Table 9-396—MIMO Selection Control element format *(continued)*

Field	Size (bits)	Meaning
Configuration N_{conf} User $N^{(u)}_{N_{conf},N_{TX}}$ SISO ID Subset Index/RX Antenna ID for Antenna N_{TX}	12	Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the $N^{(u)}_{N_{conf},N_{TX}}$ STA associated with the N_{TX} TX DMG antenna in the N_{conf} MU-MIMO transmission configuration.
Reciprocal MU-MIMO BF Training Based Transmission Configuration		
Configuration 1 Group User Mask for Antenna 1	32	Indicates the STA(s) in the target MU group associated with the first TX DMG antenna in the first MU-MIMO transmission configuration.
Configuration 1 User 1 AWV feedback ID for Antenna 1	11	Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the first STA associated with the first TX DMG antenna in the first MU-MIMO transmission configuration.
Configuration 1 User 1 BRP CDOWN for Antenna 1	6	
Configuration 1 User 1 RX Antenna ID for Antenna 1	3	
...		
Configuration 1 User $N^{(u)}_{1,1}$ AWV feedback ID for Antenna 1	11	Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the $N^{(u)}_{1,1}$ STA associated with the first TX DMG antenna in the first MU-MIMO transmission configuration.
Configuration 1 User $N^{(u)}_{1,1}$ BRP CDOWN for Antenna 1	6	
Configuration 1 User $N^{(u)}_{1,1}$ RX Antenna ID for Antenna 1	3	
...		
Configuration 1 Group User Mask for Antenna N_{TX}	32	Indicates the STA(s) in the target MU group associated with the N_{TX} TX DMG antenna in the first MU-MIMO transmission configuration.
Configuration 1 User 1 AWV feedback ID for Antenna N_{TX}	11	Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the first STA associated with the N_{TX} TX DMG antenna in the first MU-MIMO transmission configuration.
Configuration 1 User 1 BRP CDOWN for Antenna N_{TX}	6	
Configuration 1 User 1 RX Antenna ID for Antenna N_{TX}	3	
...		
Configuration 1 User $N^{(u)}_{1,N_{TX}}$ AWV feedback ID for Antenna N_{TX}	11	Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the $N^{(u)}_{1,N_{TX}}$ STA associated with the N_{TX} TX DMG antenna in the first MU-MIMO transmission configuration.
Configuration 1 User $N^{(u)}_{1,N_{TX}}$ BRP CDOWN for Antenna N_{TX}	6	
Configuration 1 User $N^{(u)}_{1,N_{TX}}$ RX Antenna ID for Antenna N_{TX}	3

Table 9-396—MIMO Selection Control element format *(continued)*

Field	Size (bits)	Meaning
Configuration N_{conf} User $N^{(u)}_{N_{conf},N_{TX}}$ AWV feedback ID for Antenna N_{TX}	11	Indicates the RX AWV, from a receiver's perspective, or RX DMG antenna of the $N^{(u)}_{N_{conf},N_{TX}}$ STA associated with the N_{TX} TX DMG antenna in the N_{conf} MU-MIMO transmission configuration.
Configuration N_{conf} User $N^{(u)}_{N_{conf},N_{TX}}$ BRP CDOWN for Antenna N_{TX}	6	
Configuration N_{conf} User $N^{(u)}_{N_{conf},N_{TX}}$ RX Antenna ID for Antenna N_{TX}	3	
Padding	0–7	Zero padding to make the MIMO Selection Control element length a multiple of 8 bits

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Configuration *i* Group User Mask for Antenna *j* field (i = 1, 2, …, N_{conf} and j = 1, 2, …, N_{TX}) is a bitmap that indicates whether each of EDMG STAs in the target MU group is associated with the j^{th} TX DMG antenna in the i^{th} MU-MIMO transmission configuration. An MU-MIMO transmission configuration defines a specific subset of STAs in the target MU group and their respective RX AWVs to be used for receiving DL MU-MIMO data transmission. The order of EDMG STAs in the Configuration *i* Group User Mask for Antenna *j* field follows the order in which they appear in the corresponding EDMG Group field of the EDMG Group ID Set element containing the target MU group. The first bit (i.e., the least significant bit) corresponds to the first EDMG STA, and the second bit corresponds to the second EDMG STA, and so on. A bit is set to 1 to indicate the corresponding STA is associated with the j^{th} TX DMG antenna in the i^{th} MU-MIMO transmission configuration; otherwise, the bit is set to 0. If the number of EDMG STAs in the target MU group is smaller than 32, the corresponding bits in the Configuration *i* Group User Mask for Antenna *j* field (i = 1, 2, …, N_{conf} and j = 1, 2, …, N_{TX}) is set to 0.

The Nonreciprocal MU-MIMO BF Training Based Transmission Configuration field is not present in the MIMO BF Selection frame when the MU-MIMO Transmission Configuration Type field is set to 1. The Reciprocal MU-MIMO BF Training Based Transmission Configuration field is not present in the MIMO BF Selection frame when the MU-MIMO Transmission Configuration Type field is set to 0.

9.4.2.276 EDMG Flow Control Extension Configuration element

The EDMG Flow Control Extension Configuration element is defined in Figure 9-969 (EDMG Flow Control Extension Configuration element format).

	Element ID	Length	Element ID Extension	RBUFCAP	Flow Control Status	Advanced Recipient Memory Length Exponent	Recipient Memory Capabilities	Optional Subelements
Octets:	1	1	1	1	1	1	1	variable

Figure 9-969—EDMG Flow Control Extension Configuration element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

When sent in an ADDBA Response frame, the RBUFCAP field is as defined in 9.3.1.8.7. This field is reserved when sent in an ADDBA Request frame.

When sent in an ADDBA Response frame, the Flow Control Status field is defined in Figure 9-970 (Flow Control Status field format). This field is reserved when sent in an ADDBA Request frame.

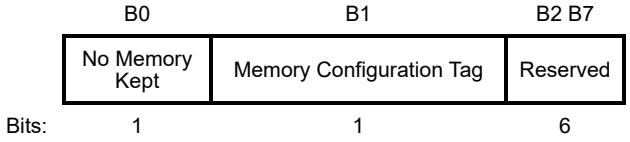

Figure 9-970—Flow Control Status field format

The No Memory Kept and Memory Configuration Tag subfields are defined in 9.3.1.8.1.

When sent in an ADDBA Response frame, the Advanced Recipient Memory Length Exponent field indicates the amount of free space at the recipient's memory at the start of a TXOP or SP. This field is an integer in the range 0 to 9. The length defined by this subfield is equal to $2^{(13 + \text{Advanced Recipient Memory Length Exponent})} - 1$ octets. The value $2^{(13 + \text{Advanced Recipient Memory Length Exponent})}$ is smaller than or equal to the value $2^{(13 + \text{Maximum A-MPDU Length Exponent})}$ as advertised by the STA's EDMG Capabilities element. Only one value for the Advanced Recipient Memory Length Exponent field can be present in all Block Ack agreements. This field applies to all successfully established Block Ack agreements identified by the same pair of Address 1 and Address 2 fields. This field is reserved when sent in an ADDBA Request frame.

The Recipient Memory Capabilities field is defined in Figure 9-971 (Recipient Memory Capabilities field format).

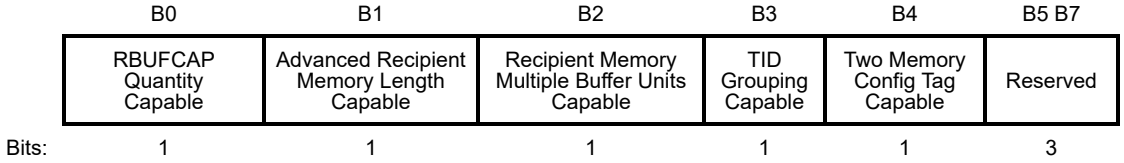

Figure 9-971—Recipient Memory Capabilities field format

The RBUFCAP Quantity Capable subfield is set to 1 to indicate support of RBUFCAP values in the range 1 through 254 and is set to 0 otherwise (Table 9-41).

The Advanced Recipient Memory Length Capable subfield is set to 1 by the recipient to indicate its request to be supported with the Advanced Recipient Memory Length Exponent (Figure 9-969 (EDMG Flow Control Extension Configuration element format)) and is set to 0 otherwise.

The Recipient Memory Multiple Buffer Units Capable subfield is set to 1 to indicate support of Memory Unit Size, Maximum MPDU per Memory Unit, and MPDU Split in Buffer values (Figure 9-972 (Recipient Memory Configuration subelement format)) and is set to 0 otherwise.

The TID Grouping Capable subfield is set to 1 to indicate support of TID Grouping values (Figure 9-972 (Recipient Memory Configuration subelement format)) and set to 0 otherwise.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Two Memory Config Tag Capable subfield is set to 1 to indicate the capability to support two Memory Configuration Tag values per TID or TID group (Figure 9-972 (Recipient Memory Configuration subelement format)) and is set to 0 otherwise.

The Optional Subelements field is defined in Table 9-397. An EDMG Flow Control Extension Configuration element contains no more than two Recipient Memory Configuration subelements.

Table 9-397—Optional subelement IDs for the EDMG Flow Control Extension Configuration element

Subelement ID	Name	Extensible
0	Recipient Memory Configuration	Yes
1–220	Reserved	
221	Vendor specific	Vendor defined
222–225	Reserved	

The Recipient Memory Configuration subelement is defined in Figure 9-972 (Recipient Memory Configuration subelement format).

	Subelement ID	Length	Memory Configuration Tag	Buffer Unit Size	Recipient Memory Multiple Buffer Units Parameters			TID Grouping
					Memory Unit Size	Maximum MPDU per Memory Unit	MPDU Split in Buffer	
Octets:	1	1	1	2	2	1	1	2

Figure 9-972—Recipient Memory Configuration subelement format

The Subelement ID field is defined in Table 9-397.

The Length field is defined in 9.4.2.1.

The Memory Configuration Tag subfield indicates one of two recipient memory configurations indicated in ADDBA Response frame within which the EDMG Flow Control Extension Configuration element is included. Allowed values are 0 and 1.

The Buffer Unit Size subfield indicates the size, in octets, of the RBUFCAP to deliver information of the recipient's available memory space to the originator for MPDU delivery. This subfield is set to a value greater than 0 if the RBUFCAP Quantity Capable subfield is 1 and is set to 0 otherwise. The recipient's available memory space, in octets, is equal to RBUFCAP × Buffer Unit Size.

The subfields within the Recipient Memory Multiple Buffer Units Parameters indicate a recipient memory structure constructed from fixed size memory buffers used to store incoming MPDUs.

The Memory Unit Size subfield indicates the size, in octets, of each buffer unit in the recipient's memory.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Maximum MPDU per Memory Unit subfield indicates the maximum number of MPDUs that can be held in a single buffer. Valid values are 1 through 255, where value 255 indicates that there is no limitation on the number of MPDUs that can be held in a single buffer.

The MPDU Split in Buffer subfield is set to 1 to indicate that an MPDU can be split between memory buffer units in the recipient's memory and is set to 0 otherwise.

The TID Grouping subfield is a bitmap where each bit corresponds to a TID (Figure 9-973 (TID Grouping subfield format)). By setting a bit to one in the TID Grouping subfield, it indicates the TID that correspond to a TID of an ADDBA Response frame within which the Recipient Memory Configuration subelement(s) is transmitted. The recipient memory configuration becomes applicable to all TIDs/TSIDs that have their bit in the TID Grouping subfield set to 1. The RBUFCAP field, No Memory Kept and Memory Configuration Tag subfields delivered in an EDMG Flow Control Extension Configuration element within an ADDBA Response frame and in a BlockAck frame are applicable to all TIDs/TSIDs that correspond to the TIDs/TSIDs of the ADDBA Response frame that contained the TID Grouping subfield. The Advanced Recipient Memory Length Exponent field delivered in an EDMG Flow Control Extension Configuration element of an ADDBA Response frame is applicable to all TIDs/TSIDs that correspond to the TIDs/TSIDs of the ADDBA Response frame that contained the TID Grouping subfield.

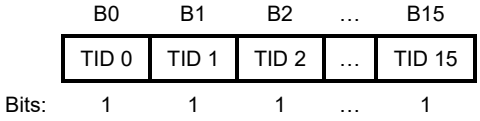

Figure 9-973—TID Grouping subfield format

9.4.2.277 QoS-TU element

The QoS triggered unscheduled (QoS-TU) element is used to communicate the QoS triggered unscheduled parameters between a non-AP and non-PCP EDMG STA and an EDMG AP or EDMG PCP.

The QoS triggered unscheduled (QoS-TU) element is defined in Figure 9-974 (QoS Triggered Unscheduled element format).

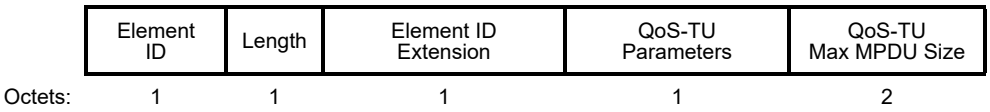

Figure 9-974—QoS Triggered Unscheduled element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The QoS-TU Parameters field contains the QoS-TU AC and the QoS-TU Max A-MPDU Length Exponent subfields as shown in Figure 9-975 (QoS-TU Parameters field format).

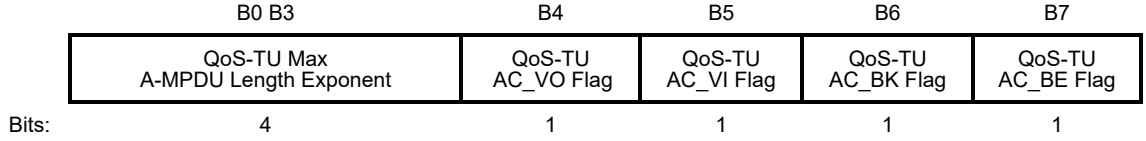

Figure 9-975—QoS-TU Parameters field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Each of the QoS-TU ACs Flag subfields is set to 1 to indicate that the corresponding AC (AC_BE, AC_BK, AC_VI, or AC_VO) is QoS triggered unscheduled enabled as described in 11.2.7.2.2; otherwise, it is set to 0.

When sent by a non-PCP and non-AP EDMG STA, the QoS-TU Max A-MPDU Length Exponent subfield is set according to the Maximum A-MPDU Length Exponent subfield described in Table 9-384. This subfield indicates the maximum A-MPDU size of buffered BUs the STA is prepared to receive during a QoS triggered unscheduled data transmission. When sent by an EDMG PCP or EDMG AP, this field is reserved.

When sent by a non-PCP and non-AP EDMG STA, the QoS-TU Max MPDU Size field indicates the maximum number of buffered BUs (MPDUs) that the STA is prepared to receive during a QoS triggered unscheduled data transmission. When sent by an EDMG PCP or EDMG AP, this field is reserved.

9.4.2.278 Unsolicited Block Ack Extension element

The Unsolicited Block Ack Extension element includes information necessary to set up an unsolicited block ack extension agreement between a non-AP and non-PCP STA and an AP or PCP at the association establishment, or between a pair of non-AP and non-PCP STAs using an Information Request and Information Response frame exchange. The format of the element is shown in Figure 9-976 (Unsolicited Block Ack Extension element format).

	Element ID	Length	Element ID Extension	Unsolicited Block Ack Extension Parameters	Block Ack Timeout Value
Octets:	1	1	1	2	2

Figure 9-976—Unsolicited Block Ack Extension element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Unsolicited Block Ack Extension Parameters field is defined in Figure 9-977 (Unsolicited Block Ack Extension Parameters field format).

	B0 B7	B8	B9 B15	B16 B26	B27	B28 B31
	Reserved	A-MSDU Supported	Reserved	Buffer Size	Multi-TID Supported	Reserved
Bits:	8	1	7	11	1	4

Figure 9-977—Unsolicited Block Ack Extension Parameters field format

The A-MSDU Supported subfield is set to 1 to indicate that the STA supports an A-MSDU carried in a QoS Data frame sent under the unsolicited block ack extension. It is set to 0 otherwise.

The Buffer Size subfield is an integer ranging from 1 to 1024 that indicates the number of buffers available for each unsolicited block ack extension agreement.

The Multi-TID Supported subfield is set to 1 to indicate that the STA supports multiple TIDs in unsolicited block ack agreements. An EDMG STA that supports multi-TID in unsolicited block ack agreements also sets the EDMG Multi-TID Aggregation Support field defined in 9.4.2.264.6 to a nonzero value. An EDMG STA that does not support multi-TID as indicated by the EDMG Multi-TID Aggregation Support field defined in 9.4.2.264.6, sets the Multi-TID Supported subfield to 0.

The Block Ack Timeout Value field is defined in 9.4.1.14.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.279 SAR Configuration element

The Segmentation and Reassembly (SAR) Configuration element is formatted as shown in Figure 9-978 (SAR Configuration element format). The SAR Configuration element can be included in the ADDBA Request and Response frames in case the ADDBA originator requests the recipient to use segmentation and reassembly for a corresponding TID. The SAR Configuration element indicates the specific segmentation parameters for the TID.

	Element ID	Length	Element ID Extension	SAR Parameters	MSDU Buffer Size	MPDU Buffer Size	Maximum Segmented MSDU Exponent
Octets:	1	1	1	1	2	2	1

Figure 9-978—SAR Configuration element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The SAR Parameters field is defined in Figure 9-979 (SAR Parameters field format).

	B0	B1 B3	B4 B7
	SAR Enabled	MSDU Modulo	MPDU Modulo
Bits:	1	3	4

Figure 9-979—SAR Parameters field format

The SAR Enabled subfield set to 1 indicates that segmentation and reassembly is to be used with the parameters indicated in this element for the corresponding TID.

The MSDU Modulo subfield indicates the number of bits to be allocated to the length of the MSDU Sequence Number subfield within the Sequence Control field. The MPDU Modulo subfield indicates the number of bits to be allocated to the length of the MPDU Sequence Number subfield within the Sequence Control field. The sum of the values of the MSDU Modulo subfield and the MPDU Modulo subfield is equal to 14.

The MSDU Buffer Size field indicates the number of buffers available for this particular TID. Each buffer is capable of holding the number of octets equal to the value defined by the Maximum Segmented MSDU Exponent subfield.

The MPDU Buffer Size field indicates the number of buffers available for this particular TID. Each buffer is capable of holding a number of octets equal to the maximum MPDU size as indicated in Table 9-34 for a DMG PPDU, or to the value of the last Maximum MSDU Size field of the TSPEC element agreed between the peers via an ADDTS Request and Response frame exchange for this TID, plus any security encapsulation overhead, MAC header and FCS.

The Maximum Segmented MSDU Exponent subfield specifies the maximum size of the segmented MSDU belonging to the TID under the BA agreement. This subfield is an integer in the range 0 to 9, occupying bit positions 0 through 3 in the Maximum Segmented MSDU Exponent subfield; other bit positions in the subfield are reserved. The maximum segmented MSDU size that is defined by this subfield is equal to $2^{(13 + \text{Maximum Segmented MSDU Exponent})} - 1$ octets.

9.4.2.280 TDD Slot Structure element

The TDD Slot Structure element defines the structure of a TDD SP described in 10.38.6.2.2. The format of the TDD Slot Structure element is shown in Figure 9-980 (TDD Slot Structure element format).

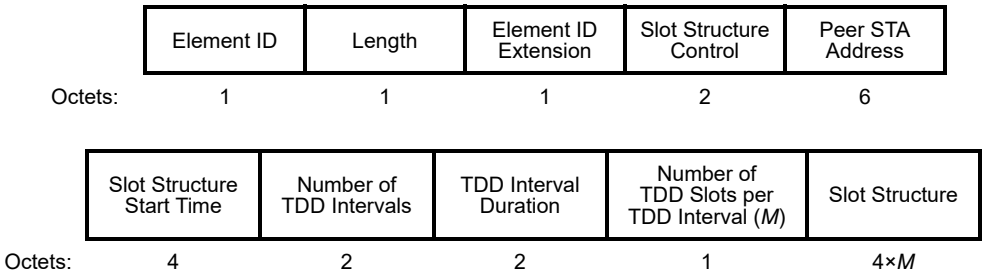

Figure 9-980—TDD Slot Structure element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Slot Structure Control field is defined in Figure 9-981 (Slot Structure Control field format).

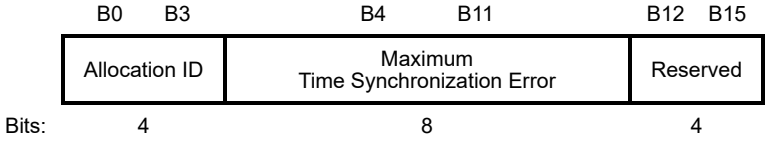

Figure 9-981—Slot Structure Control field format

The Allocation ID subfield is set to the same value of the Allocation ID subfield in the Allocation Control field of the Extended Schedule element describing the TDD SP allocation.

The Maximum Time Synchronization Error subfield indicates the maximum time synchronization error, in microseconds, between a transmitter and receiver in either uplink or downlink direction.

The Peer STA Address field is any valid individual or broadcast address that specifies the MAC address of the STA that is the intended recipient of the TDD Slot Structure element. The broadcast address indicates that the TDD Slot Structure element is common for the entire BSS.

The Slot Structure Start Time field indicates the lower 4 octets of the TSF timer at the start of the first TDD interval in which the slot structure takes effect.

The Number of TDD Intervals field indicates the time duration the slot structure holds, in units of TDD intervals.

The TDD Interval Duration field indicates the TDD interval duration in microseconds.

The Number of TDD Slots per TDD Interval field indicates the number of TDD slots in each TDD interval.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Slot Structure field is defined in Figure 9-982 (Slot Structure field format). The size of this field is $4\times M$ octets, where M is equal to the value of the Number of TDD Slots per TDD Interval field.

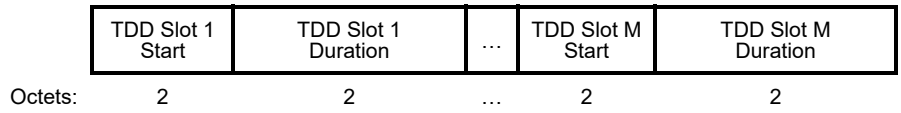

Figure 9-982—Slot Structure field format

The TDD Slot i Start subfield, $1 \le i \le M$, indicates the start time, in microseconds, of the i^{th} TDD slot relative to the beginning of each TDD interval.

The TDD Slot i Duration subfield, $1 \le i \le M$, indicates the duration, in microseconds, of the i^{th} TDD slot in each TDD interval.

9.4.2.281 TDD Slot Schedule element

The TDD Slot Schedule element defines the access assignment of DMG STAs to TDD slots within a TDD SP (see 10.38.6.2.2 (SP with TDD channel access)). The format of the TDD Slot Schedule element is shown in Figure 9-983 (TDD Slot Schedule element format).

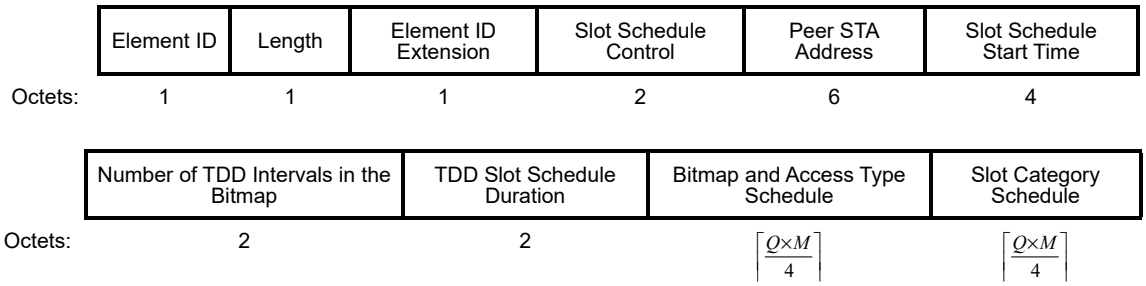

Figure 9-983—TDD Slot Schedule element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Slot Schedule Control field is defined in Figure 9-984 (Slot Schedule Control field format).

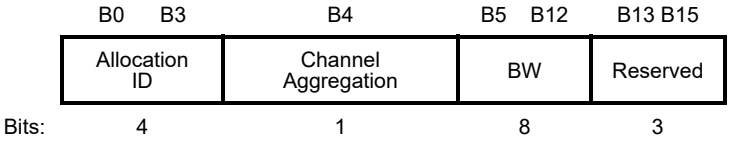

Figure 9-984—Slot Schedule Control field format

The Allocation ID subfield is set to the same value of the Allocation ID subfield in Allocation Control field of the Extended Schedule element describing the SP allocation.

The Channel Aggregation and BW subfields are defined in Table 28-12.

The Peer STA Address field specifies the MAC address of the STA that is the intended recipient of the TDD Slot Structure element.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Slot Schedule Start Time field indicates the lower 4 octets of the TSF timer at the start of the first TDD interval in which the schedule takes effect.

The Number of TDD Intervals in the Bitmap field indicates the number of TDD intervals described in the Bitmap and Access Type Schedule field following the time indicated by the Slot Schedule Start Time field.

The TDD Slot Schedule Duration field indicates the duration, in microseconds, from the start of the first TDD interval to the end of the last TDD interval in which the schedule takes effect.

The Bitmap and Access Type Schedule field defines the type of a TDD slot and the access permission of a DMG STA to the TDD slots covered by this bitmap. Each pair of consecutive 2 bits indicates the type and access permission of the TDD slot as specified in Table 9-398 (see 10.38.6.2.2 and 11.2.7). The size of the Bitmap and Access Type Schedule field is a function of the value of the Number of TDD Slots per TDD Interval field in the TDD Slot Structure element, *M*, and the value of the Number of TDD Intervals in the Bitmap field, *Q*. If padding is required to make the size of this field an integer number, a TDD slot of type unassigned is used. The TDD slots defined by the Bitmap and Access Type Schedule field are repeated for the duration indicated by the TDD Slot Schedule Duration field value.

Table 9-398—Bitmap and Access Type Schedule field encoding

Encoding	Behavior of STA that transmits the TDD Slot Schedule element	Behavior of STA that receives the TDD Slot Schedule element
0	TDD slot unassigned	
1	Simplex TX	Simplex RX
2	Simplex RX	Simplex TX
3	Unavailable	

The Slot Category Schedule field defines the TDD slot category. Each pair of consecutive 2 bits indicates the frame type(s) that are allowed to be transmitted in the corresponding TDD slot defined by the Bitmap and Access Type Schedule field. A value of 0 indicates Basic TDD slot, a value of 1 indicates Data TDD slot and a value of 2 indicates a BF TDD slot. Value of 3 is reserved. The size of the Slot Category Schedule field is a function of the value of the Number of TDD Slots per TDD Interval field in the TDD Slot Structure element, *M*, and the value of the Number of TDD Intervals in the Bitmap field, *Q*. If padding is required to make the size of this field an integer number, a reserved TDD slot category is used.

9.4.2.282 TDD Route element

The TDD Route element is used to communicate TDD beamforming results and sector switch configuration as described in 10.41.11 and 11.36. The format of the TDD Route element is shown in Figure 9-985 (TDD Route element format).

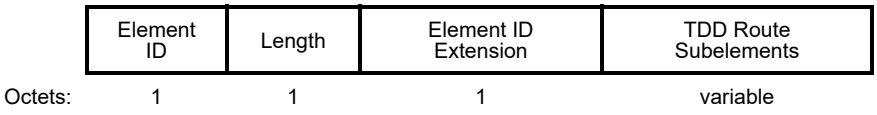

Figure 9-985—TDD Route element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The TDD Route Subelements field is defined in Table 9-399. The TDD Route element contains one or more of the subelements indicated in Table 9-399.

Table 9-399—TDD Route Subelements field format

Subelement ID	Name	Length
0	TDD Sector Feedback	Variable
1	TDD Sector Setting	25
2	TDD Sector Config	Variable
3–220	Reserved	
221	Vendor specific	Vendor defined
222–225	Reserved	

The TDD Sector Feedback subelement is used to communicate all the initiator TX Sector IDs as received by the responder during a TDD beamforming training procedure described in 10.41.11 (TDD beamforming). The format of the TDD Sector Feedback element is shown in Figure 9-986 (TDD Sector Feedback subelement format).

	Subelement ID	Length	Number of Tx Beams	Tx Beam Feedback$_1$	…	Tx Beam Feedback$_N$
Octets:	1	1	2	variable		variable

Figure 9-986—TDD Sector Feedback subelement format

The Subelement ID subfield is defined in Table 9-399.

The Length subfield is defined in 9.4.2.1.

The Number of Tx Beams subfield indicates the number of Tx Beam Feedback subfields, *N*, included in the subelement.

Each Tx Beam Feedback subfield has a variable size and is defined in Figure 9-987 (Tx Beam Feedback subfield format).

	B0 B8	B9 B11	B12 B19	B20 B23	B24 B55		
	TX Sector ID	TX Antenna ID	Number of Decoded RX Sectors	Reserved	Decoded RX Sector Information$_1$	…	Decoded RX Sector Information$_M$
Bits:	9	3	8	4	32		32

Figure 9-987—Tx Beam Feedback subfield format

The TX Sector ID subfield contains the value of the TX Sector ID subfield in the TDD SSW frame to which the Tx Beam Feedback subfield applies.

The TX Antenna ID subfield contains the value of the TX Antenna ID subfield in the TDD SSW frame to which the Tx Beam Feedback subfield applies.

The Number of Decoded RX Sectors subfield indicates the number of Decoded RX Sector Information subfields, *M*, included in this subfield.

The Decoded RX Sectors Information subfield is defined in Figure 9-988 (Decoded RX Sectors Information subfield format).

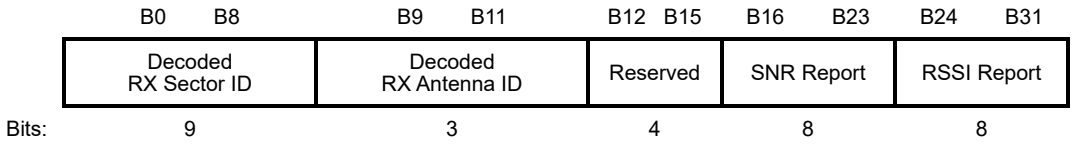

Figure 9-988—Decoded RX Sectors Information subfield format

The Decoded RX Sector ID subfield indicates the receive sector index used by the responder when it decoded a TDD SSW frame with TX Sector ID and TX Antenna ID subfields matching the corresponding subfields in the Tx Beam Feedback subfield.

The Decoded RX Antenna ID subfield indicates the receive DMG antenna index used by the responder when it decoded a TDD SSW frame with TX Sector ID and TX Antenna ID subfields matching the corresponding subfields in the Tx Beam Feedback subfield.

The SNR Report subfield is set to the value of the SNR achieved while decoding TDD SSW frame(s) with TX Sector ID and TX Antenna ID subfields matching the corresponding subfields in the Tx Beam Feedback subfield. The SNR Report subfield is an unsigned integer referenced to a level of –8 dB. Each step is 0.25 dB. SNR values less than or equal to –8 dB are represented as 0. SNR values greater than or equal to 55.75 dB are represented as 0xFF.

The RSSI Report subfield is set to the value of the received power while receiving the L-STF field of TDD SSW frame(s) with TX Sector ID and TX Antenna ID subfields matching the corresponding subfields in the Tx Beam Feedback subfield. The RSSI Report is a signed integer in the range –128 dBm to 127 dBm and is measured by the PHY as the power observed at the input of the antenna plus the antenna gain, or the equivalent antenna gain for phased array antennas, used to receive the TDD SSW frame(s).

NOTE—When multiple TDD SSW frames are received for the same combination of transmit and receive DMG antennas, and transmit and receive sectors, the SNR and RSSI values reported in the SNR Report and RSSI Report subfields can be a combination of measurements taken over any subset of the received TDD SSW frames.

The TDD Sector Setting subelement is used to request the peer to configure its antenna to a specific receive and transmit sector combination as described in 11.36. The format of the TDD Sector Setting subelement is shown in Figure 9-989 (TDD Sector Setting subelement format).

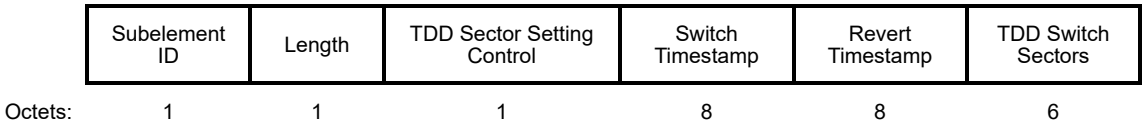

Figure 9-989—TDD Sector Setting subelement format

The Subelement ID subfield is defined in Table 9-399.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Length subfield is defined in 9.4.2.1.

The TDD Sector Setting Control subfield is defined in Figure 9-990 (TDD Sector Setting Control field format).

Figure 9-990—TDD Sector Setting Control field format

The Set Sector Request subfield is set to 1 by the initiator to request the responder to change its receiver sector setting according to the Responder RX Sector ID subfield and its transmitter sector setting according to Responder TX Sector ID subfield, with both subfields indicated in the TDD Switch Sectors subfield.

The Set Sector Response subfield is set to 1 by the responder to indicate the reception of a successful TDD Sector Setting subelement with the Set Sector Request subfield equal to 1.

The Set Sector Acknowledge subfield is set to 1 by the initiator to acknowledge the reception of a successful TDD Sector Setting subelement with the Set Sector Response subfield equal to 1.

The Switch Timestamp subfield indicates a future TSF timer value in which the new sector configuration setting is to take effect.

The Revert Timestamp subfield indicates a future TSF timer value in which the previous sector configuration is restored in case sector switching fails.

The TDD Switch Sectors subfield is defined in Figure 9-991 (TDD Switch Sectors field format).

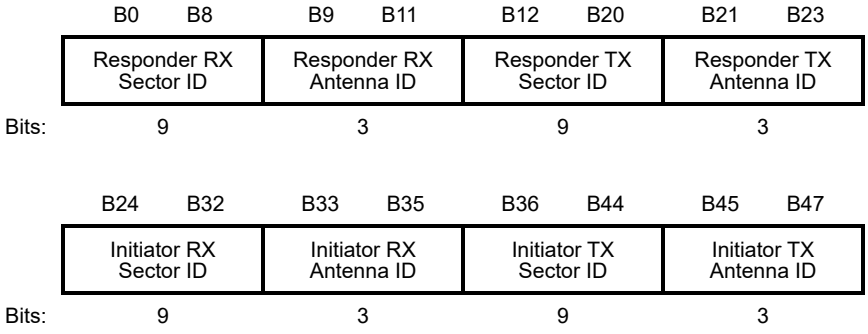

Figure 9-991—TDD Switch Sectors field format

The Responder RX Sector ID subfield contains the value of the sector ID the responder uses to set its receive sector.

The Responder RX Antenna ID subfield contains the antenna ID the responder uses to set its receive DMG antenna.

The Responder TX Sector ID subfield contains the value of the sector ID the responder uses to set its transmit sector.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Responder TX Antenna ID subfield contains the antenna ID the responder uses to set its transmit DMG antenna.

The Initiator RX Sector ID subfield contains the value of the sector index the initiator uses to set its receive sector.

The Initiator RX Antenna ID subfield contains the antenna ID the initiator uses to set its receive DMG antenna.

The Initiator TX Sector ID subfield contains the value of the sector index the initiator uses to set its transmit sector.

The Initiator TX Antenna ID subfield contains the antenna ID the initiator uses to set its transmit DMG antenna.

The TDD Sector Config subelement is used to communicate the RX Sector IDs and RX Antenna ID to be used by the responder during the next beam measurement procedure as described in 10.41.11. The format of the TDD Sector Config subelement is shown in Figure 9-992 (TDD Sector Config subelement format).

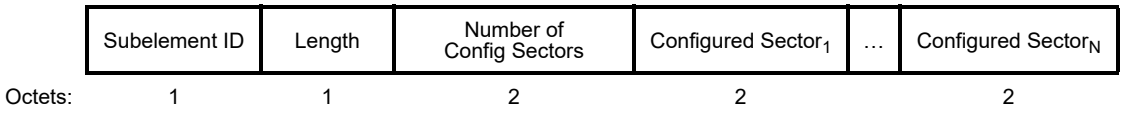

Figure 9-992—TDD Sector Config subelement format

The Subelement ID subfield is defined in Table 9-399.

The Length subfield is defined in 9.4.2.1.

The Number of Config Sectors subfield indicates the number of Configured Sector subfields, *N*, included in the subelement.

Each Configured Sector subfield is defined as indicated in Figure 9-993 (Configured Sector subfield format).

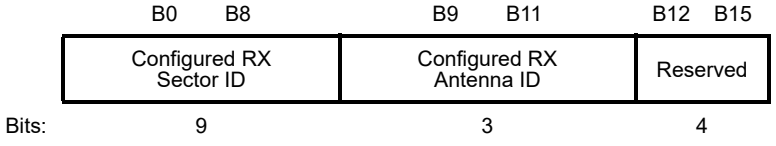

Figure 9-993—Configured Sector subfield format

The Configured RX Sector ID subfield indicates the receive sector index to be used by the responder in the upcoming beam measurement procedure.

The Configured RX Antenna ID subfield indicates the receive DMG antenna index to be used by the responder in the upcoming beam measurement procedure.

9.4.2.283 Digital BF Feedback element

The Digital BF Feedback element is transmitted in the MIMO BF Feedback frame and carries feedback information in the form of beamforming feedback matrices and differential SNRs. The feedback information

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

is used by a transmit beamformer to determine digital beamforming steering matrices, Q. This process is described in 10.41.10.2.4. When the Digital BF Feedback element is transmitted in the MIMO BF Feedback frame, the SNR fields within the Channel Measurement Feedback element are interpreted as average SNR per stream, as defined in Table 9-264 (see 9.4.2.135).

As specified in this subclause, the size and configuration of the Digital BF Feedback element depends on the field values in the MIMO Feedback Control element transmitted in the same frame that carries the Digital BF Feedback element. Therefore, all references to fields present in the MIMO Feedback Control element refer to the element transmitted in the same frame that carries the Digital BF Feedback element.

When the Feedback Type subfield within the Digital Fbck Control field is 0, the Digital Beamforming Feedback Information field in the Digital BF Feedback element contains N_{SC} digital beamforming matrices. When $N_{SC} > 1$, a Tap Delay field indicating the tap to which each digital beamforming matrix corresponds to is additionally present. The digital beamforming information in time domain can be represented as a matrix function V given by the following:

$$V\left(n\frac{T_c}{N_{CB}}\right)=\sum_{k=1}^{N_{SC}}\tilde{V}_k\delta\left(\frac{T_c}{N_{CB}}\left[n-n_k\right]\right)$$

where

n_k is the delay of the k^{th} tap and $n_k = 0$ for $k = 1$

T_c/N_{CB} is defined in Table 28-47

$\tilde{V}_k$ is the digital beamforming matrix per tap

$$\delta(n)=\begin{cases}1 & n=0\\ 0 & n\neq 0\end{cases}$$

The components of the digital beamforming matrix per tap $\tilde{V}_k$ are contained in the Digital Beamforming Feedback Matrix k subfield, in uncompressed form, indexed such that the $(i, j)^{\text{th}}$ element of $\tilde{V}_k$ is the $(j - 1) \times Nr + (i - 1)^{\text{th}}$ entry of the k^{th} Digital Beamforming Feedback Matrix field, shown in Table 9-994, and $i = 1 \ldots Nr$, $j = 1 \ldots Nc$, where Nr and Nc are defined by the Nr Index and Nc Index subfields, respectively, in the Digital Fbck Control field. Each digital feedback component is represented as an 8 bit real part, followed by an 8 bit imaginary part. The taps $n_k > 0$ for which each of the beamforming feedback matrices are computed are indicated in the Tap Delay field.

Figure 9-994—Description of the Digital Beamforming Feedback Matrix *k* subfield in SC mode

Subfield		Size (bits)	Meaning
Digital Beamforming Feedback Matrix *k*	Digital Feedback Component 1	16	Digital beamforming coefficient(s) for stream 1 to TX transmit chain 1
	Digital Feedback Component 2	16	Digital beamforming coefficient(s) for stream 1 to TX transmit chain 2
	…	…	…
	Digital Feedback Component *Nr* × *Nc*	16	Digital beamforming coefficient for stream *Nr* to TX transmit chain *Nc*.

When the Feedback Type within the Digital Fbck Control field is 1, the Digital Beamforming Feedback Information field contains the digital beamforming feedback matrices in compressed form with elements indexed, first, by matrix angles in the order shown in Table 9-103 and, second, by data subcarrier index from lowest frequency to highest frequency. The explanation on how these angles are generated from the beamforming feedback matrix *V* is given in 19.3.12.3.6. For channel aggregation where the total number of spatial streams is evenly divided between the primary and secondary channels (see 28.3.3.3.2.3), the number of rows and columns in beamforming feedback matrix is an even number. The number of rows in each aggregated channel's beamforming feedback matrix is *Nr*/2 and the number of columns in each aggregated channel's beamforming feedback matrix is *Nc*/2, where *Nr* and *Nc* are the values, respectively, indicated by the Nr Index and Nc Index subfields within the Digital Fbck Control field.

The Digital BF Feedback element has the structure and order defined in Table 9-400, where the value of n_{bit} is defined in Table 9-401 as a function of the value of the Feedback Type subfield within the Digital Fbck Control field. For channel aggregation, the value of n_{bit} is composed of feedback bits for each aggregated channel.

Table 9-400—Digital BF Feedback element format

Field	Size (bits)	Meaning
Element ID	8	
Length	8	
Element ID Extension	8	
Digital Beamforming Feedback Information		
Digital Beamforming Feedback Matrix 1	n_{bit}	If the Feedback Type subfield is 0, represents the beamforming matrix in time domain for the 1st tap as described above. If Feedback Type subfield is 1, represents the beamforming matrix for the 1st subcarrier, indexed by matrix angles in the order shown in Table 9-103.
…	…	
Digital Beamforming Feedback Matrix N_{SC}	n_{bit}	If the Feedback Type subfield is 0, represents the beamforming matrix in time domain for the N_{SC}th tap as described above. If Feedback Type subfield is 1, represents the beamforming matrix for the N_{SC}th subcarrier, indexed by matrix angles in the order shown in Table 9-103.

Table 9-400—Digital BF Feedback element format *(continued)*

Field	Size (bits)	Meaning
Differential Subcarrier Index		
Differential subcarrier index *scidx*(0) – *scidx*(1)	3	When the Grouping subfield is 3, this field represents the number of subcarriers between *scidx*(0) and *scidx*(1). Otherwise, it is not present. It is set to *j* to indicate the distance between the *scidx*(0) and *scidx*(1) is 2^j. Set to 0 to indicate 1. Set to 1 to indicate 2. Set to 2 to indicate 4. Set to 3 to indicate 8. Set to 4 to indicate 16. Set to 5 to indicate 32. Values 6 and 7 are reserved.
…	…	
Differential subcarrier index *scidx*(N_{SC} – 2) – *scidx*(N_{SC} – 1)	3	When the Grouping subfield is 3, this field represents the number of subcarriers between *scidx*(N_{SC} – 2) and *scidx*(N_{SC} – 1). Otherwise, it is not present. It is set to *j* to indicate the distance between the *scidx*(N_{SC} – 2) and *scidx*(N_{SC} – 1) is 2^j.
Tap Delay		
Relative Tap Delay 2	12	When the Feedback Type subfield is 0 and $N_{SC} > 1$, this field represents the delay of tap #2 in units of T_c/N_{CB} relative to Tap 1. Otherwise, it is not present.
…	...	…
Relative Tap Delay N_{SC}	12	When the Feedback Type subfield is 0 and $N_{SC} > 1$, this field represents the delay of tap #N_{SC} in units of T_c/N_{CB} relative to Tap 1. Otherwise, it is not present.
MU Exclusive Beamforming Report		
Differential SNR for space-time stream 1 for subcarrier *k* = *scidx*(0)	8	$D\_SNR_{scidx(0),1}$ as defined in Equation (9-11)
…	…	…
Differential SNR for space-time stream *Nc* for subcarrier *k* = *scidx*(0)	8	$D\_SNR_{scidx(0),Nc}$ as defined in Equation (9-11)
Differential SNR for space-time stream 1 for subcarrier *k* = *scidx*(1)	4	$D\_SNR_{scidx(1),1}$ as defined in Equation (9-10)
…	…	…
Differential SNR for space-time stream *Nc* for subcarrier *k* = *scidx*(1)	4	$D\_SNR_{scidx(1),Nc}$ as defined in Equation (9-10)
…	…	…
Differential SNR for space-time stream 1 for subcarrier *k* = *scidx*(N_{SC} – 1)	4	$D\_SNR_{scidx(Nsc-1),1}$ as defined in Equation (9-10)

Table 9-400—Digital BF Feedback element format *(continued)*

Field	Size (bits)	Meaning
…	…	…
Differential SNR for space-time stream *Nc* for subcarrier $k = scidx(N_{SC} - 1)$	4	$D\_SNR_{scidx(Nsc-1),Nc}$ as defined in Equation (9-10)
Padding	0–7	Zero padding to make the Digital BF Feedback element length a multiple of 8 bits

Table 9-401—Definition of n_{bit}

Feedback Type subfield value	n_{bit} size (bits)		
	2.16 GHz, 4.32 GHz, 6.48 GHz, or 8.64 GHz channel	2.16+2.16 GHz or 4.32+4.32 GHz channel	
0	$2\times8\times N_c\times N_r$	$2\times8\times(N_c/2)\times(N_r/2)$	2.16 GHz or 4.32 GHz channel containing the primary channel
		$2\times8\times(N_c/2)\times(N_r/2)$	2.16 GHz or 4.32 GHz channel not containing the primary channel
1	$N_a\times(b_\psi+b_\varphi)/2$, with $N_\varphi=\left(N_r\times\frac{N_r+1}{2}-N_r\right)$ and $N_\psi=\left(N_r\times\frac{N_r-1}{2}\right)$, $N_a=N_\psi+N_\phi$	$N_a\times(b_\psi+b_\varphi)/2$, with $N_\varphi=\left((N_r/2)\times\frac{(N_r/2)+1}{2}-(N_r/2)\right)$ and $N_\psi=\left((N_r/2)\times\frac{(N_r/2)-1}{2}\right)$, $N_a=N_\psi+N_\phi$	2.16 GHz or 4.32 GHz channel containing the primary channel
		$N_a\times(b_\psi+b_\varphi)/2$	2.16 GHz or 4.32 GHz channel not containing the primary channel

When the Grouping subfield within the Digital Fbck Control field is less than or equal to 2, the subcarrier indices for which the beamforming matrices are computed are defined in Table 9-403. When the Grouping subfield within the Digital Fbck Control field is 3, the Digital BF Feedback element includes the Differential Subcarrier Index field marking the number of subcarriers between each two adjacent subcarriers within the feedback report. The subcarrier index set is constructed such that it is a subset of the subcarrier index set defined for *Ng*=2 and the corresponding N_{CB} in Table 9-403, such that the edge subcarriers and the subcarriers with indices –2 and 2 are present within the feedback report and the distance between subcarriers within the feedback report is one of the values in {1, 2, 4, 8, 16, 32}.

In Table 9-103, *Nc* is the number of columns in a compressed beamforming feedback matrix determined by the Nc Index subfield within the Digital Fbck Control field, and *Nr* is the number of rows in a compressed beamforming feedback matrix determined by the Nr Index subfield within the Digital Fbck Control field.

The angles are quantized as defined in Table 9-402.

Table 9-402—Quantization of angles

Quantized Ψ	Quantized ϕ
$\psi = \frac{k\pi}{2^{b_\psi+1}} + \frac{\pi}{2^{b_\psi+2}}$ radians where $k = 0, 1, 2, \ldots, 2^{b_\psi} - 1$ b_ψ is the number of bits used to quantize ψ (defined by the Codebook Information field of the MIMO Feedback Control element)	$\phi = \frac{k\pi}{2^{b_\phi-1}} + \frac{\pi}{2^{b_\phi}}$ radians where $k = 0, 1, 2, \ldots, 2^{b_\phi} - 1$ b_ϕ is the number of bits used to quantize ϕ (defined by the Codebook Information field of the MIMO Feedback Control element)

Table 9-403—Subcarriers for which a compressed beamforming feedback matrix is sent back

N_{CB}	Ng	N_{SC}	Subcarriers for which compressed feedback beamforming matrix is sent: *scidx*(0), *scidx*(1), …, *scidx*(N_{SC} − 1) (Note that DC subcarriers (0, ±1) are skipped.)

The MU Exclusive Beamforming Report field carries explicit feedback information in the form of differential SNRs contained in the Differential SNR subfields. The MU Exclusive Beamforming Report field is included in the Digital BF Feedback element if the SU/MU field in MIMO Feedback Control element is 1 (MU transmission) and the Feedback Type subfield of the Digital Fbck Control field is 1 (EDMG OFDM mode).

The MU Exclusive Beamforming Report field consists of Differential SNR subfields for each space-time stream (1 to *Nc*) of a subset of the subcarriers spaced *Ng* apart, where *Ng* is the value of the Grouping subfield of the Digital Fbck Control field in the MIMO Feedback Control element, starting from the lowest frequency subcarrier and continuing to the highest frequency subcarrier. No padding is present between $D\_SNR_{k,i}$ in the MU Exclusive Beamforming Report field, even if they correspond to different subcarriers. The subset of subcarriers included is determined by the values of Table 9-403. For each subcarrier included, the deviation in dB of the SNR of that subcarrier for each column of *V* relative to the adjacent subcarrier spaced *Ng* apart of the corresponding space-time stream is computed using Equation (9-10).

$$D\_SNR_{k,j} = min\left(max\left(round\left(10\log10\left(\frac{\left\|H_k V_{k,i}\right\|^2}{N}\right) - 10\log10\left(\frac{\left\|H_{\tilde{k}} V_{\tilde{k},i}\right\|^2}{N}\right)\right), -8\right), -7\right) \quad (9\text{-}10)$$

where

k is the subcarrier index in the range $scidx(1)$, …, $scidx(N_{SC} - 1)$

$\tilde{k}$ is the subcarrier index in the range $scidx(0)$, …, $scidx(N_{SC} - 2)$

i is the space-time stream index in the range 1, …, Nc

H_k is the estimated MIMO channel for subcarrier k

$V_{k,i}$ is column i of the beamforming matrix V for subcarrier k

N is the average noise plus interference power, measured at the responder

Each Differential SNR subfield contains the $D\_SNR_{k,i}$ computed using Equation (9-10) and quantized to 4 bits in the range –8 dB to 7 dB with 1 dB granularity, except for $k = scidx(0)$. $D\_SNR_{scidx(0),i}$ is computed using Equation (9-11) and quantized to 8 bits in the range –8 dB to 55.75 dB with 0.25 dB granularity.

$$D\_SNR_{scidx(0),i} = 10\log10\left(\frac{\left\|H_{scidx(0)} V_{scidx(0),i}\right\|^2}{N}\right) \quad (9\text{-}11)$$

9.4.2.284 TDD Bandwidth Request element

The TDD Bandwidth Request element contains the information needed for bandwidth reservation request during TDD SPs. The format of the TDD Bandwidth Request element is shown in Figure 9-995 (TDD Bandwidth Request element format).

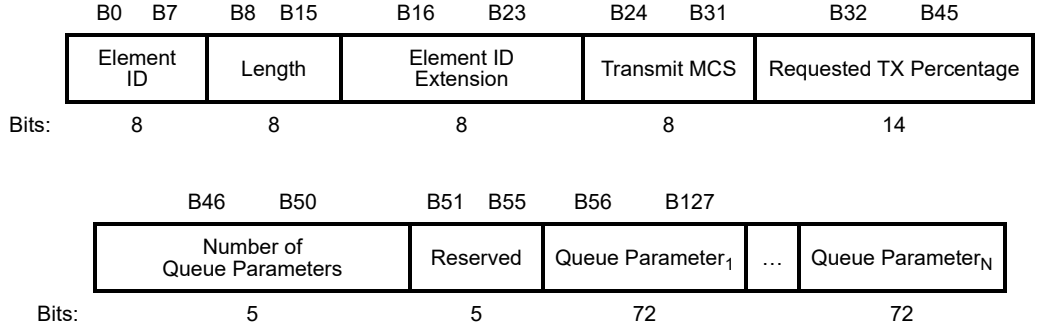

Figure 9-995—TDD Bandwidth Request element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Transmit MCS field indicates the recommended MCS value to be used for the upcoming non-AP and non-PCP STA to AP or PCP transmission(s).

The Requested TX Percentage field indicates the requested transmit percentage of airtime from the non-AP and non-PCP STA to the AP or PCP in relation to the airtime occupied by the bidirectional traffic between the STA and the AP or PCP. The value is in units of 0.01 percent.

The Number of Queue Parameters field defines the integer number, *N*, of subsequent Queue Parameter fields.

Each Queue Parameter field is defined as shown in Figure 9-996 (Queue Parameter field format).

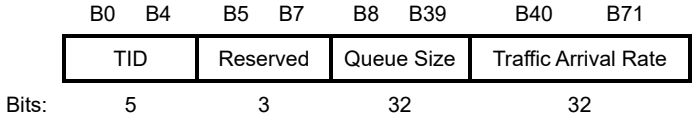

Figure 9-996—Queue Parameter field format

For values from 0 to 15, the TID subfield indicates the TID corresponding to the queue. A value of 31 indicates that this field is not applicable. Other values are reserved.

The Queue Size subfield indicates the amount of queued traffic at the transmitter, in unit of octets, corresponding to the TID indicated by the TID subfield.

The Traffic Arrival Rate subfield indicates the arrival rate of the traffic since the last reporting event, in units of 1 kb/s. The method for computing the arrival rate is implementation dependent.

9.4.2.285 TDD Synchronization element

The TDD Synchronization element contains the information needed for clock synchronization during TDD SPs. The format of the element is shown in Figure 9-997 (TDD Synchronization element format).

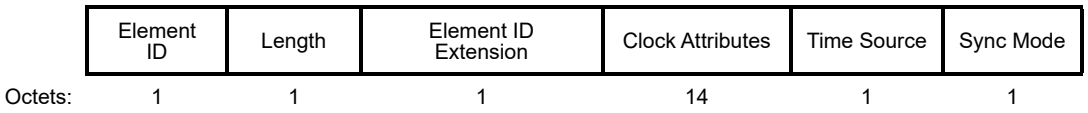

Figure 9-997—TDD Synchronization element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Clock Attributes field format is shown in Figure 9-998 (Clock Attributes field format).

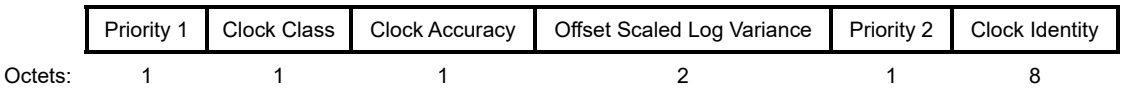

Figure 9-998—Clock Attributes field format

The Priority 1, Clock Class, Clock Accuracy, Offset Scaled Log Variance, Priority 2 and Clock Identity subfields indicate attributes of the source of timing locally available to the STA that transmits the element, and are defined the same as priority1, clockClass, clockAccuracy, offsetSceledLogVariance, priority2, and clockIdentity attributes defined in 8.6.2 in IEEE Std 802.1AS-Rev/D8.0.

The Time Source field indicates the type of clock available to the STA transmitting the element. It is defined the same as the timeSource attribute defined in 8.6.2 in IEEE Std 802.1AS-Rev/D8.0.

NOTE 1—The Clock Attributes field is defined similar to the IEEE 802.1AS systemIdentity attribute, as a metric to compare the local clock available to a STA and the clock available to the peer STA that transmits the TDD Clock

Attributes element. While the comparison metric and logic are defined the same as IEEE 802.1AS for flexibility, using the IEEE 802.1AS protocol for TDD time synchronization is not required and is beyond the scope of this standard.

NOTE 2—DMG STAs that support TDD channel access can use external timing sources such as GNSS for accurate clock attributes. For example, for a STA with access to a clock that is synchronized to a primary reference time source such as GNSS (i.e., clockClass of 0x06), and has a precision of ±500 ps (i.e., clockAccuracy of 0x23) and a clock variance of 1.497e-22 s^2 (i.e., offsetScaledLogVariance 0x3780), the Clock Class, Clock Accuracy and Offset Scaled Log Variance fields are respectively set to 0x06, 0x23 and 0x3780. Refer to IEEE Std 802.1AS for details.

The Sync Mode field indicates access to a local source of timing (e.g., GNSS). The Sync Mode field is set to 1 to indicate that the STA does not have access to a local source of timing at the time of transmitting the element. The Sync Mode field is set to 0 to indicate that the local clock is used by the STA at the time of transmitting the element.

9.4.2.286 EDMG Wide Bandwidth Channel Switch element

The EDMG Wide Bandwidth Channel Switch element is included in DMG Beacon frames, Announce frames, or Information Response frames, as defined in 11.8.8.7. The format of the EDMG Wide Bandwidth Channel Switch element is shown in Figure 9-999 (EDMG Wide Bandwidth Channel Switch element format).

	Element ID	Length	Element ID Extension	EDMG New Operating Channel
Octets:	1	1	1	2

Figure 9-999—EDMG Wide Bandwidth Channel Switch element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The EDMG New Operating Channel field is defined in Figure 9-1000 (EDMG New Operating Channel field format).

	BSS Operating Channels	Operating Channel Width
Octets:	1	1

Figure 9-1000—EDMG New Operating Channel field format

The BSS Operating Channels subfield and the Operating Channel Width subfield are defined in 9.4.2.265.

9.4.2.287 DMG Discovery Assistance element

The DMG Discovery Assistance element indicates parameters and attributes of the discovery assistance. This element is optionally present in FST Setup Request and FST Setup Response frames. The format of the DMG Discovery Assistance element is shown in Figure 9-1001 (EDMG Discovery Assistance element format).

	Element ID	Length	Element ID Extension	Discovery Assistance Control	Discovery Assistance Request Status Code
Octets:	1	1	1	1	2

	Discovery Assistance Window Length	Sector Sweep Start Time (Optional)	Temporary AID (Optional)	Dwelling Time (Optional)
Octets:	3	4	1	2

Figure 9-1001—EDMG Discovery Assistance element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The format of the Discovery Assistance Control field is shown in Figure 9-1002 (Discovery Assistance Control field format). This field is reserved when the element is contained in an FST Setup Request frame.

	B0	B1	B2 B7
	Discovery Assistance Type	Dwelling Time Present	Reserved
Bits:	1	1	6

Figure 9-1002—Discovery Assistance Control field format

The Discovery Assistance Type subfield is set to 0 to indicate that the Sector Sweep Start Time field is present in this element. When this field is set to 1, the schedule to perform discovery assistance is indicated in the Extended Schedule element and the Temporary AID field is present in this element. This field is reserved when the Discovery Assistance Request Status Code field is not equal to SUCCESS.

The Dwelling Time Present subfield is set to 1 to indicate that the Dwelling Time field is present in the element and is set to 0 otherwise.

The Discovery Assistance Request Status Code field contains the result of the discovery assistance request and is one of the status codes specified in Table 9-80 in 9.4.1.9. This field is reserved when the element is contained in an FST Setup Request frame.

The Discovery Assistance Window Length field indicates the discovery assistance window length value, in microseconds, as confirmed by the STA transmitting this element. This field is reserved when the element is contained in an FST Setup Request frame.

The Sector Sweep Start Time field indicates the lower 4 octets of the TSF of the DMG BSS at the time the sector sweep transmission starts. This field is present if the Discovery Assistance Type subfield is 0. This field is reserved when the element is contained in an FST Setup Request frame.

The Temporary AID field indicates a temporary AID assigned by an AP or PCP to the STA receiving this element. The temporary AID is used for scheduling discovery assistance. This field is present if the Discovery Assistance Type subfield is 1.

The Dwelling Time field indicates the recommended time, in microseconds, to sweep the receive sectors to scan for beamforming or discovery signals. This field is present if the Dwelling Time Present subfield is 1.

9.4.2.288 Extended Link Measurement element

9.4.2.288.1 General

The Extended Link Measurement element contains information used to solicit link measurement report and is optionally included in Link Measurement Request and Link Measurement Report frames. The format of

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Extended Link Measurement element is shown in Figure 9-1003 (Extended Link Measurement element format).

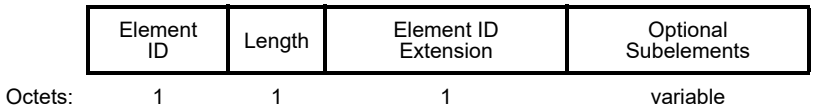

Figure 9-1003—Extended Link Measurement element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-404. A subelement does not appear more than once in the Extended Link Measurement element.

Table 9-404—Optional subelement IDs

Subelement ID	Name	Extensible
0	Periodic Report Request	Yes
1	Extended TPC Configuration	Yes
2	EDMG Transmit Power	Yes
3	Periodic Report	Yes
4–255	Reserved	

9.4.2.288.2 Periodic Report Request subelement

The Periodic Report Request subelement contains information to solicit periodic link measurement report and is optionally included in Link Measurement Request frame. The format of the Data field of the Periodic Report Request subelement is shown in Figure 9-1004 (Data field of the Periodic Report Request subelement format).

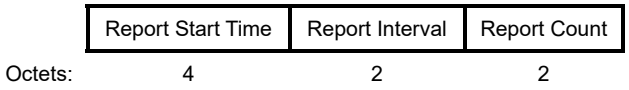

Figure 9-1004—Data field of the Periodic Report Request subelement format

The Report Start Time subfield indicates the lower 4 octets of the TSF timer at the start of the first report interval.

The Report Interval subfield indicates the interval of time, in microseconds, at which the responding STA needs to take measurements and send an unsolicited Link Measurement Report frame to the requesting STA. Value zero is reserved.

The Report Count subfield indicates the number of report intervals. A responding STA sends an unsolicited Link Measurement Report frame to the requesting STA for every report interval. Value zero is reserved.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.288.3 Extended TPC Configuration subelement

The Extended TPC Configuration subelement contains information for EDMG transmit power control configuration and is optionally included in a Link Measurement Request frame. The format of the Data field of the Extended TPC Configuration subelement is shown in Figure 9-1005 (Data field of the Extended TPC Configuration subelement format).

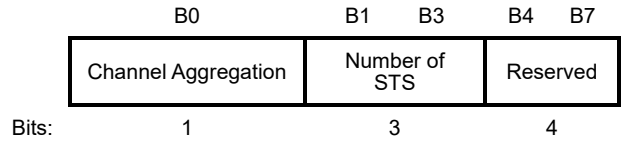

Figure 9-1005—Data field of the Extended TPC Configuration subelement format

The Channel Aggregation field is set to 1 to indicate that the PPDU containing the Link Measurement Request frame is transmitted over a 2.16+2.16 GHz or a 4.32+4.32 GHz channel, and is set to 0 otherwise.

The Number of STS field indicates the number of STS used in the transmission of the PPDU containing the Link Measurement Request frame. If the Channel Aggregation field is 1, the Number of STS subfield is an even number.

9.4.2.288.4 EDMG Transmit Power subelement

The EDMG Transmit Power subelement contains information for transmit power in link measurement and is optionally included in a Link Measurement Request frame. The format of the Data field of the EDMG Transmit Power subelement is shown in Figure 9-1006 (Data field of the EDMG Transmit Power subelement format).

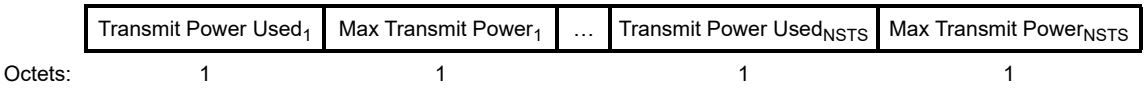

Figure 9-1006—Data field of the EDMG Transmit Power subelement format

Each Transmit Power Used$_i$ field, $1 \le i \le N_{STS}$, indicates the transmit power used in the STS i to transmit the PPDU containing the Link Measurement Request frame, as described in 9.4.1.20. N_{STS} represents the number of STS.

Each Max Transmit Power$_i$ field, $1 \le i \le N_{STS}$, indicates the upper limit on the transmit power of the STS i measured at the output of the antenna connector to be used by the transmitting STA on its operating channel. This field is described in 9.4.1.19. The value of each Max Transmit Power$_i$ field is equal to the minimum of the maximum powers at which the STA is permitted to transmit in the operating channel by device capability, policy, and regulatory authority.

9.4.2.288.5 Periodic Report subelement

The Periodic Report subelement contains information in response to a periodic link measurement request and is optionally included in a Link Measurement Report frame. The format of the Data field of the Periodic Report subelement is shown in Figure 9-1007 (Data field of the Periodic Report subelement format).

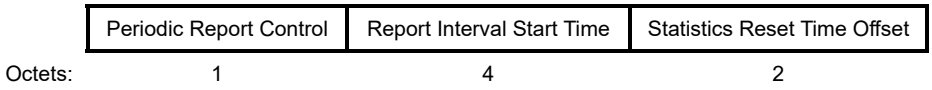

Figure 9-1007—Data field of the Periodic Report subelement format

The Periodic Report Control field contains indications of whether the responding STA accepts or rejects the periodic link measurement request, and whether the Link Measurement Report frame includes optional fields used for periodic link measurement reports. The field is shown in Figure 9-1008 (Period Report Control field format).

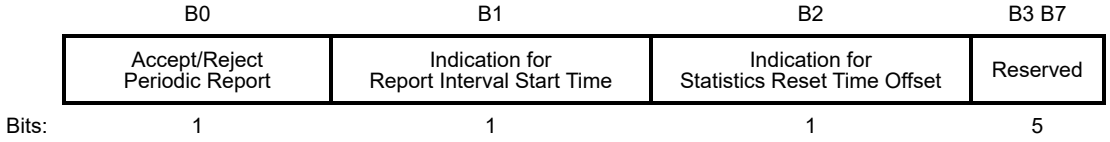

Figure 9-1008—Period Report Control field format

The Accept/Reject Periodic Report subfield is set to 1 if the responding STA accepts periodic report, and is set to 0 if the responding STA rejects periodic report.

The Indication for Report Interval Start Time subfield is set to 1 if the Link Measurement Report frame contains the Report Interval Start Time field. It is set to 0 otherwise.

The Indication for Statistics Reset Time Offset subfield is set to 1 if the Link Measurement Report frame contains the Statistics Reset Time Offset field. It is set to 0 otherwise.

The Report Interval Start Time field is optionally present. If present, it indicates the lower 4 octets of the TSF timer at the start of the report interval of the corresponding Link Measurement Report frame.

The Statistics Reset Time Offset field is optionally present. If present, it indicates the relative time offset, in microseconds, of the last event when the reset condition (see 9.4.2.141.6) is met since the start of the corresponding report interval.

9.4.2.289 DMG STA Directional Transmit Activity Report element

The format of DMG STA Directional Transmit Activity Report element is shown in Figure 9-1009 (DMG STA Directional Transmit Activity Report element format).

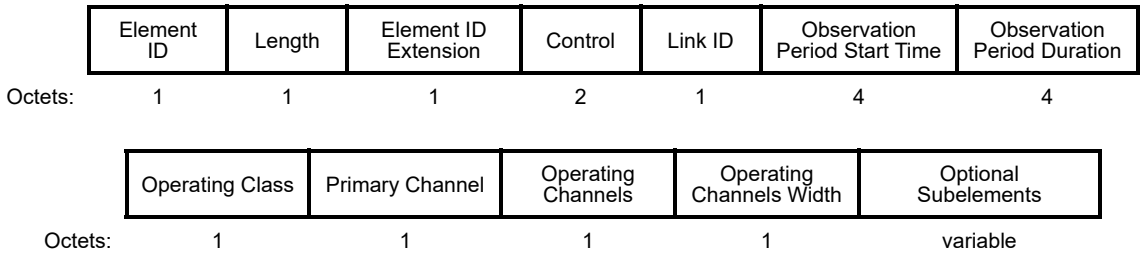

Figure 9-1009—DMG STA Directional Transmit Activity Report element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Control field is defined in Figure 9-1010 (Control field format).

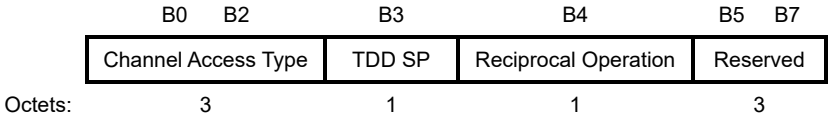

Figure 9-1010—Control field format

The Channel Access Type subfield identifies the most used channel access mechanism during the observation period, i.e., the channel access mechanism used by one or more allocations with the largest total airtime inside the observation period. It has the same encoding as the Allocation Type subfield in the Extended Schedule element.

When the Channel Access Type subfield indicates SP channel access (0 or 2), the TDD SP field is set to 1 if majority of the airtime used by SP allocations during the observation period belongs to SPs with TDD Applicable SP subfield set to 1, and set to zero otherwise. The TDD SP subfield is reserved when the Channel Access Type subfield does not indicate SP channel access.

The Reciprocal Operation subfield is set to 1 to indicate that the transmitting STA is using or intends to use the same antenna pattern that it is using for transmission to also receive from other STAs, and is set to 0 otherwise.

The Link ID subfield is a locally unique identifier for data transmit activities targeting a given receiver, or a group of receivers, that are always transmitted data to through a common transmit antenna pattern and transmit power.

NOTE 1—Link ID helps a receiving STA correlate multiple DMG STA Directional Transmit Activity Report elements received through different frames. Specifically, elements with the same Link ID identify a unique transmit activity towards one or more intended receivers that are always using a common (not necessarily fixed) transmit antenna pattern. Link ID is independent of the specific antenna pattern used for transmission, i.e., changing the antenna pattern used to transmit data to the given receiver(s) does not change the Link ID associated with the DMG STA Directional Transmit Activity Report elements that are sent to report the corresponding transmit activity.

The Observation Period Start Time field is set to the lower 4 octets of the measuring STA's TSF timer at the beginning of the observation period.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Observation Period Duration field is set to the duration of the observation period that all reported metrics apply to, in μs.

The Operating Class field indicates an operating class value as defined in Annex E. The operating class is interpreted in the context of the country specified in the Country element included in the frame.

The Primary Channel field indicates the 2.16 GHz primary channel of the BSS to which the transmitting STA belongs.

The Operating Channels field indicates all 2.16 GHz channels occupied by PPDUs transmitted during the observation period, using the same DMG antenna and antenna pattern as the frame containing the element. The Operating Channels field has the same format as the BSS Operating Channels field in the EDMG Operation element.

The Operating Channels Width field indicates all bandwidths occupied by PPDUs transmitted during the observation period, using the same DMG antenna and antenna pattern as the frame containing the element. The Operating Channels Width field has the same format as the Operating Channels Width field in the EDMG Operation element.

The Optional Subelements field contains two or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are listed in Table 9-405.

Table 9-405—Optional subelement IDs

Subelement ID	Name	Extensible
0	Directional Transmit Activity	Yes
1	Transceiver Parameters	Yes
2–255	Reserved	

The Directional Transmit Activity subelement Data field format is shown in Figure 9-1011 (Directional Transmit Activity subelement Data field format).

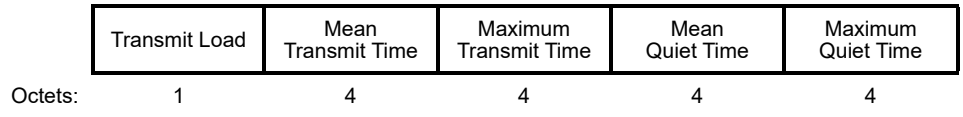

Figure 9-1011—Directional Transmit Activity subelement Data field format

In the following, each 2.16 GHz channel that the frame containing the DMG STA Directional Transmit Activity Report element is transmitted on is referred to as a reported channel.

The Transmit Load subfield contains the percentage of time during the observation period that the local DMG PHY entity was in transmit state and was using the reported channel and Link ID. The subfield is encoded as an 8-bit unsigned integer, linearly scaled, with values of 0 and 255 representing 0% and 100%, respectively.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Mean Transmit Time and Maximum Transmit Time subfields respectively contain the arithmetic mean and maximum of all continuous transmission periods during the observation period, in μs. For the purpose of calculating these metrics, a continuous transmission period is a period during which the local DMG PHY entity was in transmit state using the reported channel and Link ID, except for short intervals not longer than SIFS.

The Mean Quiet Time and Maximum Quiet Time subfields contain, respectively, the arithmetic mean and maximum of all continuous quiet periods during the observation period, in μs. For the purpose of calculating these metrics, a continuous quiet period is a period longer than SIFS during which the local DMG PHY entity was not in transmit state using the reported channel and Link ID. In the absence of continuous quiet periods during the observation period both subfields are set to 0.

Figure 9-1012 (Examples of Maximum Transmit Time and Maximum Quiet Time: (a) operation during a TDD SP, (b) operation during other DMG allocations) illustrates two examples of Maximum Transmit Time and Maximum Quiet Time calculation.

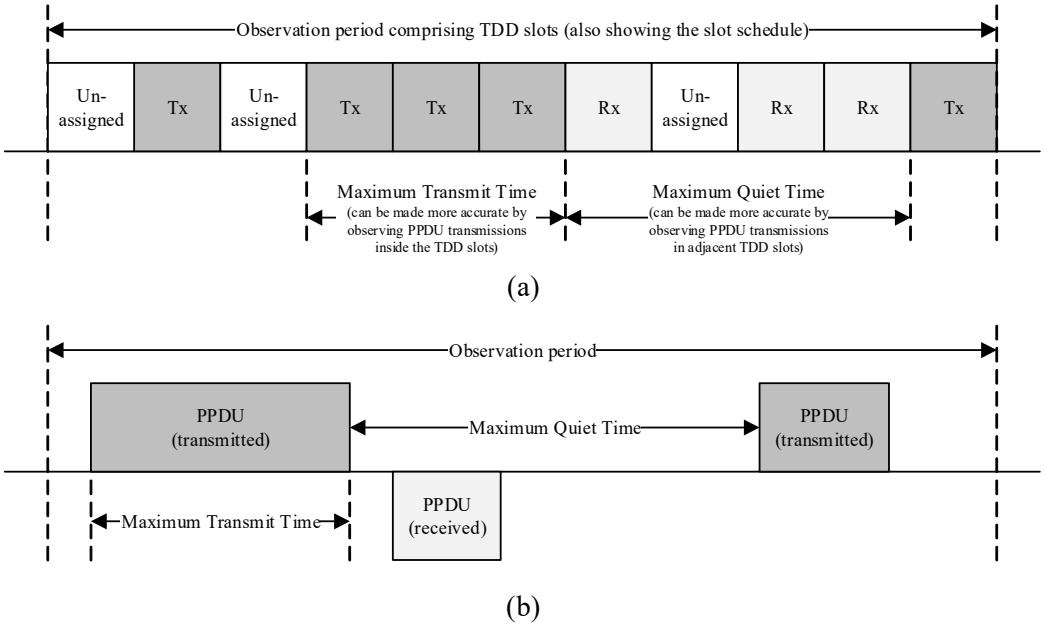

Figure 9-1012—Examples of Maximum Transmit Time and Maximum Quiet Time: (a) operation during a TDD SP, (b) operation during other DMG allocations

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Transceiver Parameters subelement Data field format is shown in Figure 9-1013 (Transceiver Parameters subelement Data field format).

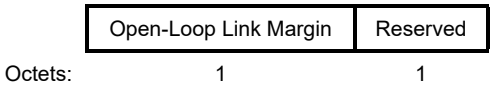

Figure 9-1013—Transceiver Parameters subelement Data field format

The Open-Loop Link Margin field is calculated as follows:

$$OPLM = TRP + P_{sensitivity}$$

where

TRP is the total radiated power, in dBm, used to transmit the PPDU that contains the element

$P_{sensitivity}$ is the actual receiver sensitivity for MCS 0, in dBm, and measured as defined in 20.3.3.8

The Open-Loop Link Margin field is encoded as an 8-bit unsigned integer with values 0 through 255, representing –48 to 15.75 dBm in 0.25 dBm steps.

NOTE 2—A STA that receives a frame that contains the DMG STA Directional Transmit Activity Report element (activity report frame, for short) can use the TRP and Additional Sensitivity subfields in the frame to reduce the interference they cause to the frame transmitter. To illustrate, consider STA1 receiving an activity report frame transmitted by STA2, and assume the following definitions:

$G_{RX}^{STA1}(\phi)$ STA1 receive antenna gain in the direction ϕ towards STA2 when it received the activity report frame; if needed, STA1 can estimate ϕ using the TRN fields of the PPDU that contains the activity report frame.

$G_{TX}^{STA1}(\phi)$ STA1 transmit antenna gain in the direction ϕ towards STA2 for a given transmission, possibly using a different DMG antenna configuration from what STA1 was using when it received the activity report frame

$G_{RX}^{STA2}(\theta)$ STA2 receive antenna gain in the direction θ towards STA1, when STA2 uses the same DMG antenna configuration it was using when it transmitted the activity report frame

$G_{TX}^{STA2}(\theta)$ STA2 transmit antenna gain in the direction θ towards STA1

TRP^{STA1} STA1 total radiated power

TRP^{STA2} STA2 total radiated power, as indicated by the value of the TRP field

$P_{sensitivity}^{STA2}$ STA2 actual receiver sensitivity

$Loss$ Path loss between STA1 and STA2

The antenna gains are not necessarily the peak gains that STA1 and STA2 can achieve along ϕ and θ directions towards each other. The receive power at STA1 is $P_{RX}^{STA1} = TRP^{STA2} + G_{TX}^{STA2}(\theta) - Loss + G_{RX}^{STA1}(\phi)$. The receive power at STA2, if using the same DMG antenna configuration STA2 used to transmit the activity report frame, is $P_{RX}^{STA2} = TRP^{STA1} + G_{TX}^{STA1}(\phi) - Loss + G_{RX}^{STA2}(\theta)$. Assuming DMG antenna pattern reciprocity for STA2, and substituting $G_{RX}^{STA2}(\theta) - Loss = G_{TX}^{STA2}(\theta) - Loss = P_{RX}^{STA1} - TRP^{STA2} - G_{RX}^{STA1}(\phi)$, it is easy to see that STA1 can keep the receive power at STA2 below STA2 receiver sensitivity by limiting its total radiated power as $TRP^{STA1} \le (TRP^{STA2} + P_{sensitivity}^{STA2}) - (G_{TX}^{STA1}(\phi) - G_{RX}^{STA1}(\phi)) - P_{RX}^{STA1}$, where all parameters on the right-hand side of the inequality are known to STA1.

9.4.2.290 WUR Capabilities element

A WUR STA declares that it is a WUR STA by transmitting the WUR Capabilities element. The WUR Capabilities element contains a number of fields that are used to advertise WUR capabilities of a WUR STA. The WUR Capabilities element is defined in Figure 9-1014 (WUR Capabilities element format).

	Element ID	Length	Element ID Extension	Supported Bands	WUR Capabilities Information
Octets:	1	1	1	1	2

Figure 9-1014—WUR Capabilities element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

When the WUR Capabilities element is transmitted by a WUR AP, the Supported Bands field of the WUR capabilities element is reserved.

When the WUR Capabilities element is transmitted by a WUR non-AP STA, the Supported Bands field of the WUR capabilities element indicates the supported bands for the WUR operation. The format of the Supported Bands field is shown in Figure 9-1015.

	B0	B1	B2 B7
	2.4 GHz	5 GHz	Reserved
Bits:	1	1	6

Figure 9-1015— Supported Bands field format

The 2.4 GHz subfield of the Supported Bands field is set to 1 to indicate the support of the 2.4 GHz band for the WUR operation. Otherwise, the 2.4 GHz subfield of the Supported Bands field is set to 0. The 5 GHz subfield of the Supported Bands field is set to 1 to indicate the support of the 5 GHz band for the WUR operation. Otherwise, the 5 GHz subfield of the Supported Bands field is set to 0.

The format of the WUR Capabilities Information field is defined in Figure 9-1016.

	B0 B7	B8	B9 B10	B11	B12	B13	B14	B15
	Transition Delay	VL WUR Frame Support	WUR Group IDs Support	Reserved	20 MHz WUR Basic PPDU with HDR Support	WUR FDMA Support	WUR Short Wake-up Frame Support	Reserved
Bits:	8	1	2	1	1	1	1	1

Figure 9-1016—WUR Capabilities Information field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The subfields of the WUR Capabilities Information field are defined in Table 9-406.

Table 9-406—Subfields of the WUR Capabilities Information field

Subfield	Definition	Encoding
Transition Delay	Indicates the maximum time that the non-AP STA requires to transition from the doze state to the awake state. (see 11.2.1)	Set to (the indicated value minus 1)/256. Reserved for a WUR AP.
VL WUR Frame Support	Indicates support for VL WUR frames.	For a WUR non-AP STA: Set to 1 to indicate support for the reception of VL WUR frames. Set to 0 otherwise. For a WUR AP: Set to 1 to indicate support for the transmission of VL WUR frames. Set to 0 otherwise.
WUR Group IDs Support	Indicates WUR Group IDs support.	For a WUR non-AP STA: — Set to 0 to indicate no support for WUR group IDs if the VL WUR Frame Support subfield is 0 and to indicate support for a single WUR group ID when the VL WUR Frame Support subfield is 1. — Set to 1 to indicate support for 1 to 16 WUR group IDs. — Set to 2 to indicate support for 1 to 32 WUR group IDs. — Set to 3 to indicate support for 1 to 64 WUR group IDs. NOTE—If the WUR Group IDs Support subfield is equal to a non-zero value, then it implies support of group addressed fixed-length (FL) WUR Wake-up frame. For a WUR AP: — Set to 0 to indicate no support for WUR group IDs if the variable-length (VL) WUR Frame Support subfield is 0 and to indicate support for single WUR group ID when the VL WUR Frame Support subfield is 1. — Set to 1 to indicate support for WUR group IDs. NOTE—If WUR Group IDs Support subfield is equal to 1, it also implies support of group addressed FL WUR Wake-up frame.
20 MHz WUR Basic PPDU with HDR Support	Indicate support for the reception of 20 MHz WUR Basic PPDU with HDR.	Set to 1 to indicate support for the reception of 20 MHz WUR Basic PPDUs with HDR. Set to 0 otherwise. Reserved for a WUR AP.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-406—Subfields of the WUR Capabilities Information field *(continued)*

Subfield	Definition	Encoding
WUR FDMA Support	Indicates whether the WUR FDMA is supported or not (see 29.11).	For a WUR non-AP STA: Set to 1 if the WUR FDMA channel switching capability is supported. Set to 0 otherwise. For a WUR AP: Set to 1 if the transmission of WUR FDMA PPDU is supported. Set to 0 otherwise. Set to 0 otherwise.
WUR Short Wake-up Frame Support	Indicates support for the WUR Short Wake-up frame.	For a WUR non-AP STA: Set to 1 to indicate support for the reception of WUR Short Wake-up frames. Set to 0 otherwise. For a WUR AP: Set to 1 to indicate support for the transmission of WUR Short Wake-up frames. Set to 0 otherwise.

9.4.2.291 WUR Operation element

The WUR Operation element contains the set of parameters necessary to support the WUR operation. The format of the WUR Operation element is defined in Figure 9-1017.

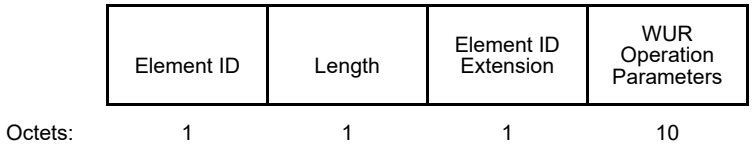

Figure 9-1017—WUR Operation element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The format of the WUR Operation Parameters field is defined in Figure 9-1018.

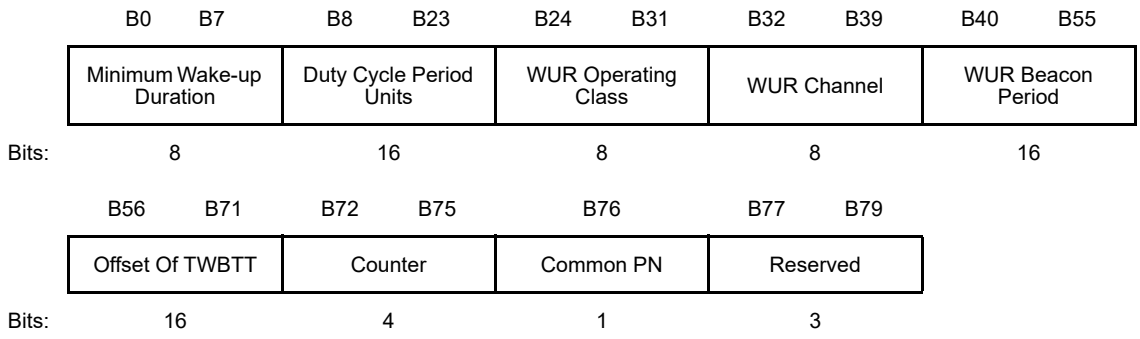

Figure 9-1018—WUR Operation Parameters field format

The Minimum Wake-up Duration subfield indicates the minimum WUR duty cycle service period of the WUR duty cycle operation (see 29.7) in units of 256 μs.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Duty Cycle Period Units subfield indicates the basic unit of the period of the WUR duty cycle operation (see 29.7) in the unit of 4 μs.The WUR Operating Class subfield indicates the operating class values of the WUR primary channel as defined in Annex E in use for transmission of WUR Beacon frames from the WUR AP to the WUR non-AP STA. The operating class is interpreted in the context of the country specified in the Beacon frame (see 29.2). The encoding is the same as the definition of Operating Class field in 9.4.1.22.

The WUR Channel subfield indicates a channel number of the WUR primary channel, which is interpreted in the context of the indicated operating class as defined in Annex E in use for transmission of WUR Beacon frames from the WUR AP to the WUR non-AP STA (see 29.2). The encoding is the same as the definition of Channel field in 9.4.1.22.

The WUR Beacon Period subfield represents the number of time units (TUs) between consecutive target WUR beacon transmission times (see 29.6.2).

The Offset Of TWBTT subfield indicates the time difference between the target WUR beacon transmission time with the smallest TSF time in units of TU and TSF 0 (see 29.6.2).

The Counter subfield indicates the current Counter subfield included in the broadcast WUR Wake-up frames (see 29.5.3) that are transmitted by the same AP.

The Common PN subfield indicates if a common PN is used for all protected WUR frames generated within the BSS. The Common PN subfield is set to 1 to indicate that a common PN is used for all protected WUR frames and is set to 0 to indicate that independent PNs are used for protected WUR frames addressed to different receivers (see 29.10.4).

9.4.2.292 WUR Mode element

The WUR Mode element is used to negotiate the parameters related to WUR operation. The format of the WUR Mode element is shown in Figure 9-1019.

	Element ID	Length	Element ID Extension	Action Type	WUR Mode Response Status	WUR Parameters Control	WUR Parameters
Octets:	1	1	1	1	1	1	variable

Figure 9-1019—WUR Mode element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Action Type field contains a number that identifies the type of WUR mode operation. The Action Type values are shown in Table 9-407.

Table 9-407—Action Type definitions

Action Type value	Meaning
0	Enter WUR Mode Request
1	Enter WUR Mode Response

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-407—Action Type definitions

Action Type value	Meaning
2	Enter WUR Mode Suspend Request
3	Enter WUR Mode Suspend Response
4	Enter WUR Mode Suspend
5	Enter WUR Mode
6–255	Reserved

The WUR Mode Response Status field indicates the status returned by the WUR AP responding to the WUR non-AP STA's WUR mode request operation, and its values are defined in Table 9-408. This field is valid when the Action Type field is equal to "Enter WUR Mode Response" or "Enter WUR Mode Suspend Response" and is reserved otherwise.

Table 9-408— WUR Mode Response Status Definition

Value	Meaning
0	Accept.
1	Denied. Due to unspecified reason.
2	Denied. The preferred duty cycle period is too large.
3	Denied. Cannot satisfy the request of generating keep-alive WUR frames every WUR duty cycle service period.
4–255	Reserved

NOTE 1—The threshold and duration of duty cycle period and detail operation of the WUR AP when the WUR mode Response Status field is equal to 2 are implementation dependent.

The WUR Parameters Control field indicates the configuration of the following WUR Parameters field. The format of the WUR Parameters Control field when the Action Type field is equal to "Enter WUR Mode Response" or "Enter WUR Mode Suspend Response" and the WUR Mode Response Status field is equal to "Accept" or when sent by a WUR non-AP STA is shown in Figure 9-1020. Otherwise, the field is reserved.

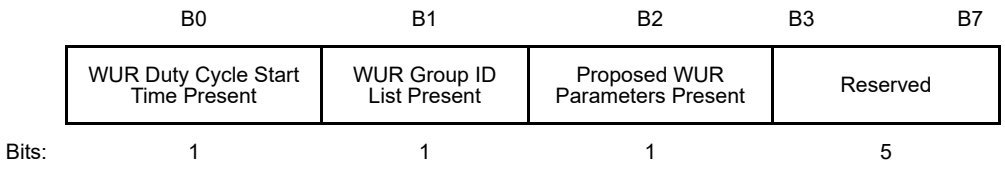

Figure 9-1020—WUR Parameters Control field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The WUR Duty Cycle Start Time Present subfield is set to 1 if the WUR Duty Cycle Start Time subfield is present in the following WUR Parameters field and is set to 0 otherwise.

NOTE 2—WUR non-AP STA always sets the WUR Duty Cycle Start Time Present subfield to 0 (see 29.7).

The WUR Group ID List Present subfield is set to 1 if the WUR Group ID List subfield is present in the following WUR Parameters field and is set to 0 otherwise. The WUR Group ID List Present subfield is reserved when the WUR Mode element is transmitted by a WUR non-AP STA.

The Proposed WUR Parameters Present subfield is set to 1 if the Proposed WUR Parameters subfield is present in the following WUR Parameters field and is set to 0 otherwise. The Proposed WUR Parameters Present subfield is reserved when the WUR Mode element is transmitted by a WUR AP.

The subfields of the WUR Parameters field sent from a WUR AP when the Action Type field is equal to "Enter WUR Mode Response" or "Enter WUR Mode Suspend Response" and the WUR Mode Response Status field is equal to "Accept" are defined in Figure 9-1021 and Table 9-409. Otherwise, the WUR Parameters field sent from a WUR AP is reserved.

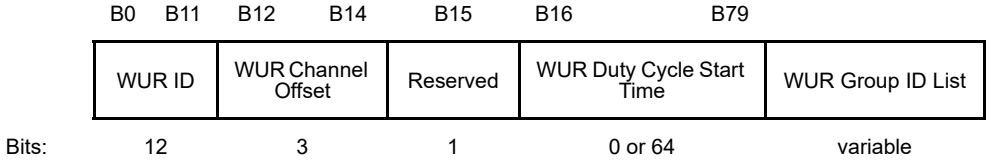

Figure 9-1021—WUR Parameters field format if sent by a WUR AP

Table 9-409—Subfields of WUR Parameters field from WUR AP

Subfield	Definition	Encoding
WUR ID	A WUR identifier that uniquely identifies the WUR non-AP STA within the BSS of the AP	The size of the subfield is 12 bits.
WUR Channel Offset	Indicates the offset of the WUR channel on which WUR Short Wake-up frames or WUR Wake-up frames or WUR Vendor Specific frames are transmitted relative to the WUR primary channel (see 29.11).	The size of the subfield is 3 bits. The encoding is described in Table 9-410.
Reserved	Reserved field	The size of the subfield is 1 bit.
WUR Duty Cycle Start Time	TSF time of the start point of the WUR duty cycle	The size of the subfield is 8 octets in units of μs.
WUR Group ID List	Indicates one or more WUR group IDs assigned to the WUR non-AP STA	The format is shown in Figure 9-1022. This subfield is present if the WUR Group ID List Present subfield of the WUR Parameters Control field is equal to 1. Otherwise this subfield is not present. When this subfield is present, the size of this subfield in octets is 2, 4, 6 or 10 respectively when the WUR Group ID Bitmap Size field is 0, 1, 2 or 3.

Table 9-410—WUR Channel Offset subfield encoding

WUR Channel Offset subfield	Meaning
0	The WUR Short Wake-up frames or the WUR Wake-up frames or the WUR Vendor Specific frames are to be transmitted in the WUR primary channel, which is indicated in the WUR Operation Class and the WUR Channel subfields in the WUR Operation element.
1	The WUR Short Wake-up frames or the WUR Wake-up frames or the WUR Vendor Specific frames are to be transmitted in first higher frequency 20 MHz channel relative to the WUR primary channel.
2	The WUR Short Wake-up frames or the WUR Wake-up frames or the WUR Vendor Specific frames are to be transmitted in first lower frequency 20 MHz channel relative to the WUR primary channel.
3	The WUR Short Wake-up frames or the WUR Wake-up frames or the WUR Vendor Specific frames are to be transmitted in second higher frequency 20 MHz channel relative to the WUR primary channel.
4	The WUR Short Wake-up frames or the WUR Wake-up frames or the WUR Vendor Specific frames are to be transmitted in second lower frequency 20 MHz channel relative to the WUR primary channel.
5	The WUR Short Wake-up frames or the WUR Wake-up frames or the WUR Vendor Specific frames are to be transmitted in third higher frequency 20 MHz channel relative to the WUR primary channel.
6	The WUR Short Wake-up frames or the WUR Wake-up frames or the WUR Vendor Specific frames are to be transmitted in third lower frequency 20 MHz channel relative to the WUR primary channel.
7	Reserved

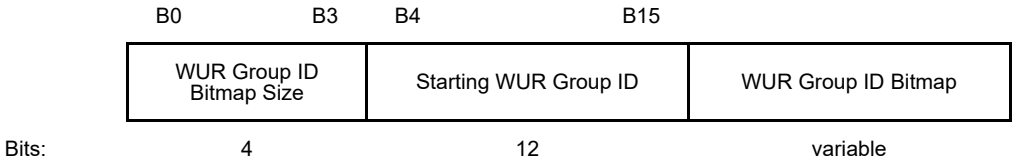

Figure 9-1022—WUR Group ID List subfield format

A WUR AP indicates the start time of a WUR duty cycle service period in the WUR Duty Cycle Start Time subfield of the WUR Parameters field in the WUR Mode element (see 29.7).

The WUR Group ID Bitmap Size field is set to 0 to indicate that the WUR Group ID Bitmap field is not present. The WUR Group ID Bitmap Size field is set to 1 to indicate that the WUR Group ID Bitmap field contains a 16-bit bitmap. The WUR Group ID Bitmap Size field is set to 2 to indicate that the WUR Group ID Bitmap field contains a 32-bit bitmap.The WUR Group ID Bitmap Size field is set to 3 to indicate that the WUR Group ID Bitmap field contains a 64-bit bitmap. The values of 4 to 15 are reserved.

The Starting WUR Group ID field contains the starting WUR group ID of the WUR Group ID Bitmap field if the WUR Group ID Bitmap Size field is equal to a nonzero value. The Starting WUR Group ID field contains a single WUR group ID assigned by the WUR AP to the WUR non-AP STA if the WUR Group ID Bitmap Size field is equal to 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The WUR Group ID Bitmap field, if present, together with the Starting WUR Group ID field, indicates the WUR group IDs assigned by the WUR AP to the WUR non-AP STA. The first bit of the WUR Group ID Bitmap field corresponds to bit position 0. Bit position n of the WUR Group ID Bitmap field, if equal to 1, indicates the WUR group ID with a value equal to (the starting WUR group ID+ n) mod 4096 is assigned to the WUR non-AP STA. Bit position n of the WUR Group ID Bitmap field, if equal to 0, indicates the WUR group ID with a value equal to (the starting WUR group ID+ n) mod 4096 is not assigned to the WUR non-AP STA.

The subfields of the WUR Parameters field sent from a WUR non-AP STA when the Action Type field is equal to "Enter WUR Mode Request" or "Enter WUR Mode Suspend Request" are defined in Figure 9-1023 and Table 9-411. Otherwise, the WUR Parameters field sent from a WUR non-AP STA is reserved.

Table 9-411—Subfields of the WUR Parameters field if sent by a WUR non-AP STA

Subfield	Definition	Encoding
WUR Duty Cycle Service Period	Indicates the preferred WUR duty cycle service period that the WUR power state of the WUR non-AP STA is in the WUR awake state for each WUR duty cycle period (see 29.7).	The size of the field is 4 octets. The unit of the field is 4 μs.
Duty Cycle Period	Indicates the preferred elapsed time between the start times of two successive WUR duty cycle service periods (see 29.7).	The size of the field is 2 octets. The unit of the field is indicated by the Duty Cycle Period Units field in the most recently received WUR Operation element from the associated WUR AP.
Proposed WUR Parameters	Indicates one or more proposed WUR Parameters	The format is shown in Figure 9-1024.

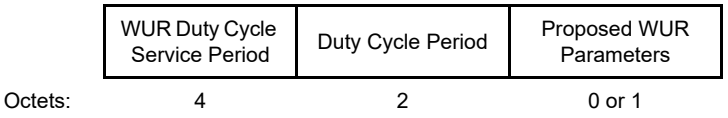

Figure 9-1023—WUR Parameters field format if sent by a WUR non-AP STA

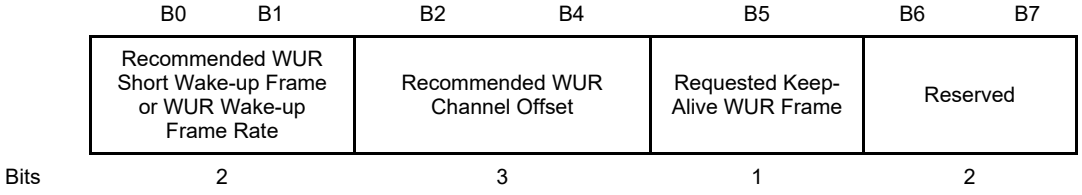

Figure 9-1024—Proposed WUR Parameters subfield format

The format of the Proposed WUR Parameters subfield is shown in Figure 9-1024. This field is present if the Proposed WUR Parameters Present subfield of the WUR Parameter Control field is equal to 1. Otherwise this field is not present.

The Recommended WUR Short Wake-up Frame or WUR Wake-up Frame Rate field is set to 0 to indicate that the WUR non-AP STA has no recommendation on the data rate to be used for WUR Short Wake-up frames or WUR Wake-up frames. The Recommended WUR Short Wake-up Frame or WUR Wake-up

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Frame Rate field is set to 1 to indicate that LDR is recommended to be used for WUR Short Wake-up frames or individually or group addressed WUR Wake-up frames transmitted to the WUR non-AP STA. The Recommended WUR Short Wake-up Frame or WUR Wake-up Frame Rate field is set to 2 to indicate that HDR is recommended to be used for WUR Short Wake-up frames or individually or group addressed WUR Wake-up frames transmitted to the WUR non-AP STA. 3 is reserved.

The Recommended WUR Channel Offset field is used by a WUR non-AP STA to indicate a recommended value for the WUR Channel Offset field, with the same encoding as described in Table 9-410, except that the value 7 indicates that the WUR non-AP STA has no recommendation regarding the WUR channel assigned to the WUR non-AP STA.

The Requested Keep-Alive WUR Frame field is set to 1 if the WUR non-AP STA requests the WUR AP to transmit a keep-alive WUR frame during the WUR duty cycle service periods that are negotiated with the WUR non-AP STA. Otherwise, it is set to 0.

9.4.2.293 WUR Discovery element

The WUR Discovery element is used to advertise the WUR discovery channels on which WUR APs transmit WUR Discovery frames. The format of the WUR Discovery element is shown in Figure 9-1025.

	Element ID	Length	Element ID Extension	WUR AP Information List
Octets:	1	1	1	variable

Figure 9-1025—WUR Discovery element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The WUR AP Information List field contains one or more WUR AP Information subfields. Each WUR AP Information subfield identifies the WUR APs that transmit WUR Discovery frames on a particular WUR Discovery channel. The format of the WUR AP Information subfield is shown in Figure 9-1026.

	WUR Discovery Operating Class	WUR Discovery Channel	WUR AP Count	WUR AP Parameters List
Octets:	1	1	1	variable

Figure 9-1026—WUR AP Information subfield format

The WUR Discovery Operating Class field indicates the operating class in use for transmission of WUR Discovery frames by WUR APs listed in this subfield. The encoding is the same as the definition of Operating Class field in 9.4.1.22.

The WUR Discovery Channel field indicates the channel in use for transmission of WUR Discovery frames by WUR APs listed in this subfield. The encoding is the same as the definition of Channel field in 9.4.1.22.

The WUR AP Count field specifies the number of WUR AP Parameters subfields that are included in the WUR AP Parameters List field, minus one. 0 indicates that one WUR AP Parameters subfield is present.

The WUR AP Parameters List field contains one or more WUR AP Parameters subfields. Each WUR AP Parameters subfield identifies one WUR AP, which might be the WUR AP transmitting this WUR

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Discovery element itself or might be a neighboring WUR AP. The format of the WUR AP Parameters subfield is shown in Figure 9-1027.

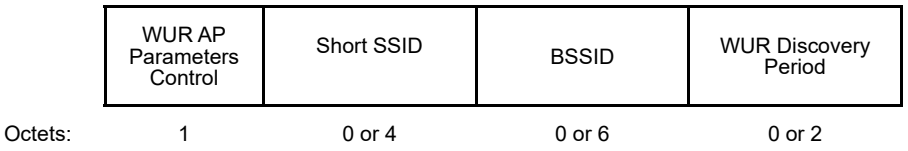

Figure 9-1027—WUR AP Parameters subfield format

The WUR AP Parameters Control field indicates the presence of the Short SSID field, the BSSID field, and the WUR Discovery Period field. The format of the WUR AP Parameters Control is shown in Figure 9-1028.

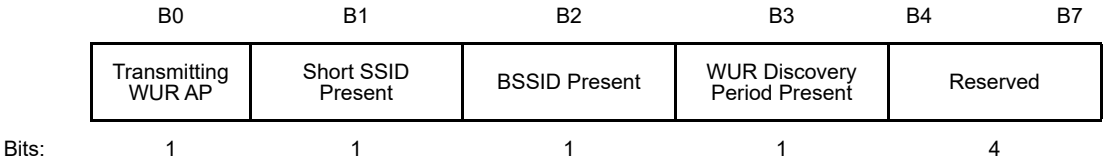

Figure 9-1028—WUR AP Parameters Control field format

The Transmitting WUR AP subfield is set to 1 if the WUR AP Information subfield identifies the WUR AP's own WUR discovery channel and is set to 0, otherwise.

The Short SSID Present subfield is set to 1 if the Short SSID field is present in the WUR AP Parameters subfield and is set to 0, otherwise.

The BSSID Present subfield is set to 1 if the BSSID field is present in the WUR AP Parameters subfield and is set to 0, otherwise.

The WUR Discovery Period Present subfield is set to 1 if the WUR Discovery Period is present in the WUR AP Parameters subfield. Otherwise, the WUR Discovery Period Present subfield is set to 0.

The Short SSID field is defined in 9.4.1.71 and contains the short SSID of the WUR AP identified by the WUR AP Parameters subfield.

The BSSID field contains the BSSID of the WUR AP identified by the WUR AP Parameters subfield as defined in 9.2.4.3.4.

The WUR Discovery Period field contains the number of time units (TUs) between consecutive WUR Discovery frames transmitted by the WUR AP identified by the WUR AP Parameters subfield. 0 is reserved.

9.4.2.294 WUR PN Update element

The WUR PN Update element is used to update the PN maintained by a WUR non-AP STA. The format of the WUR PN Update element is shown in Figure 9-1029.

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The format of the Key Info field is shown in Figure Figure 9-1030.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

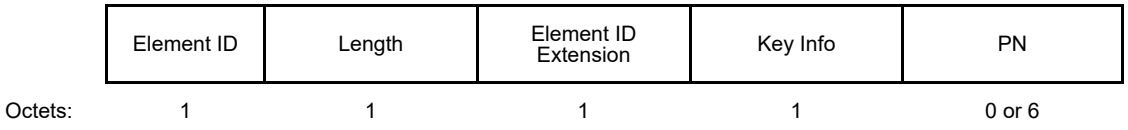

Figure 9-1029—WUR PN Update element format

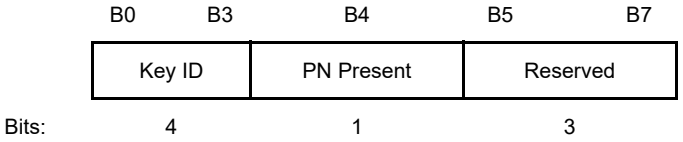

Figure 9-1030—Key Info field format

The Key ID subfield contains the key ID corresponding to the WTK or WIGTK.

The PN Present subfield is set to 1 if the PN field is present in the WUR PN Update element and is set to 0 otherwise.

The format of the PN field is shown in Figure 9-1031.

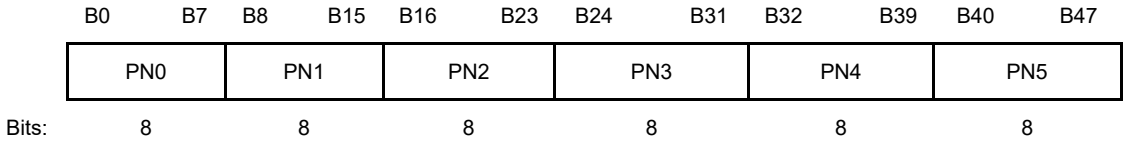

Figure 9-1031—PN field format

The PN field contains the PN corresponding to the integrity key indicated by the Key ID subfield in the Key Info field.

9.4.2.295 AKM Suite Selector element

The AKM Suite Selector element is used to indicate the intended AKM in SAE.

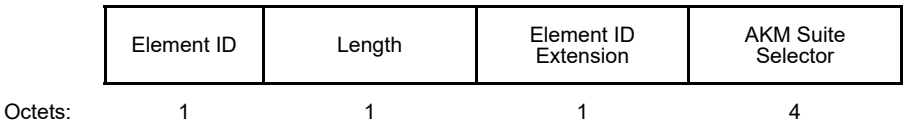

Figure 9-1032—AKM Suite Selector element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The AKM Suite Selector field has the format shown in Figure 9-368, where the suite type is defined in Table 9-190.

9.4.2.296 Originator Preferred MCS element

The Originator Preferred MCS element is used to signal the preferred MCS used for eliciting A-MPDUs from the data originator. The format of the Originator Preferred MCS element is shown in Figure 9-1033.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

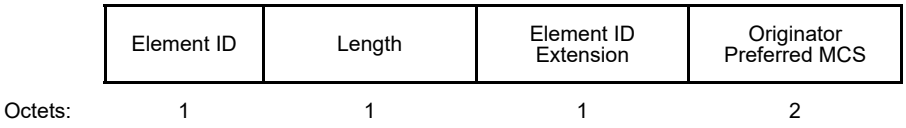

Figure 9-1033—Originator Preferred MCSelement format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Originator Preferred MCS field is defined in 9.4.1.15.

9.4.2.297 Known STA Identification element

The Known STA Identification element is used to demonstrate possession of a recently used PTK-KCK to allow a (re)associating STA to be identified in an RSN. The format of the Known STA Identification element is shown in Figure 9-1034.

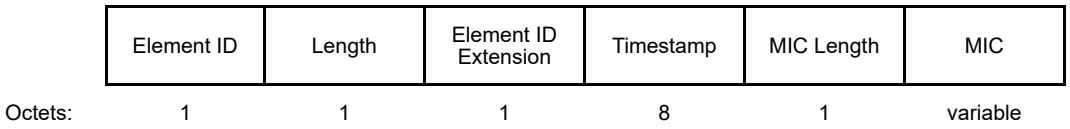

Figure 9-1034—Known STA Identification element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Timestamp field contains the value of the most recently received Timestamp field from the AP to which the Known STA Identification element is being sent.

The MIC Length field contains the length of the MIC field in octets.

The MIC field contains a MIC calculated as specified in 11.13.

9.4.2.298 ISTA Availability Window element

The format of the ISTA Availability Window element is shown in Figure 9-1035.

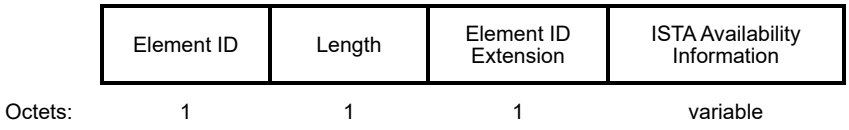

Figure 9-1035—ISTA Availability Window element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The ISTA Availability Information field format is shown in Figure 9-1036.

The Count subfield in the ISTA Availability Information field indicates the size in bits of the Availability Bitmap subfield. The value of this subfield is denoted as “count”.

Each Availability Bit in the Availability Bitmap subfield indicates the ISTA’s availability for TB ranging with the recipient RSTA. The value indicated by each bit in the Availability Bitmap subfield is in units of 10 TUs. Bit B_k (where $0 \le k \le \text{count} - 1$) represents the ISTA’s periodic availability for TB ranging with the RSTA in the interval $[t_{start,k}, t_{end,k}]$ repeated every N TUs; see Equation (9-12):

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

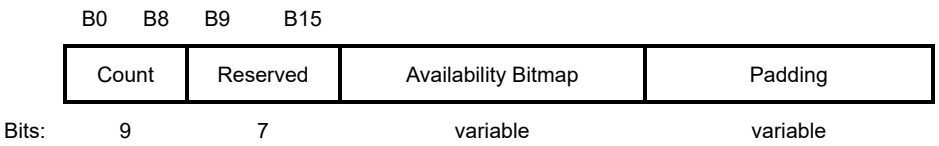

Figure 9-1036—ISTA Availability Information field format

$$t_{start,k} = t_{start,0} + 10k \text{ TU}$$
$$t_{end,k} = t_{start,0} + 10(k+1) \text{ TU} \quad (9\text{-}12)$$
$$t_{start,0} = \text{time 0 per RSTA's TSF}$$
$$N = 10 \times \text{count}$$

A value of 1 in an Availability Bit indicates the ISTA's availability at time $t_{start,k}$ for a duration of 10 TUs, while a value of 0 indicates the ISTA's unavailability at time $t_{start,k}$ for a duration of 10 TUs.

The Padding subfield is optionally present to render the length of the Availability Bitmap subfield to be a multiple of eight. The value of the bits in the Padding field is reserved.

9.4.2.299 RSTA Availability Window element

The format of the RSTA Availability Window element is shown in Figure 9-1037.

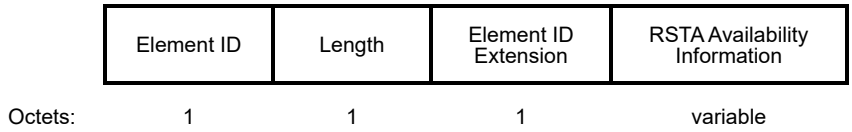

Figure 9-1037—RSTA Availability Window element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The RSTA Availability Information field format is shown in Figure 9-1038.

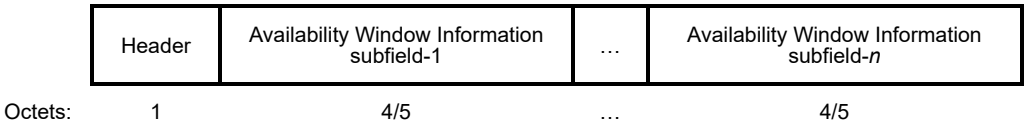

Figure 9-1038—RSTA Availability Information field format

The Header subfield format in the RSTA Availability Information field is shown in Figure 9-1039.

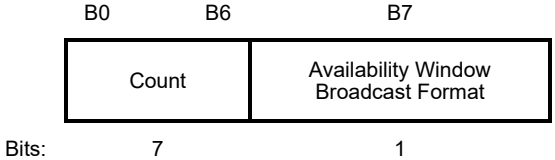

Figure 9-1039—Header subfield format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Count subfield in the Header subfield indicates the number of Availability Window Information subfields included in the RSTA Availability information field.

The Availability Window Broadcast Format subfield indicates the format of the Availability Window Information subfields.

When the Availability Window Broadcast Format subfield is set to 0, the format of each Availability Window Information subfield is shown in Figure 9-1040.

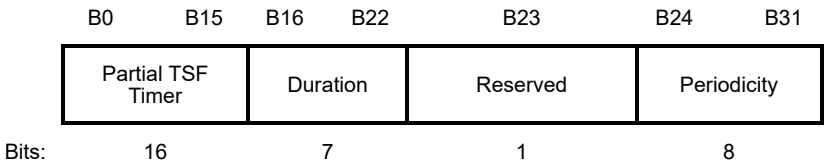

Figure 9-1040—Availability Window Information field format when the Availability Window Broadcast Format subfield is set to 0

The Partial TSF Timer subfield is derived as described in 9.4.2.166 and indicates the TSF timer of the RSTA at the start of first availability window.

The Duration subfield in the Availability Window Information field indicates the duration of the corresponding availability window in units of 100 μs (giving it a value from 0 to ~12.7 ms). The value 0 is Reserved.

The Periodicity subfield in an Availability Window Information subfield indicates the periodicity of that availability window in units of 100 TU (Giving it a value from 0 to ~26.1 s).

When the Availability Window Broadcast Format subfield is set to one, the format of each Availability Window Information subfield is shown in Figure 9-1041.

Figure 9-1041—Availability Window Information field format when the Availability Window Broadcast Format subfield is set to 1

The format of the Partial TSF Timer, Duration, and Periodicity subfields when the Availability Window Broadcast Format subfield is set to 1 are the same as the formats of the subfields when the Availability Window Broadcast Format subfield is set to 0. The Passive TB Ranging Parameters subfield format is shown in Figure 9-1042.

The Format And Bandwidth subfield is defined in Table 9-412, and indicates the requested or allocated PPDU format and nominal bandwidth used to transmit the I2R/R2I NDP exchange as part of the passive TB ranging measurement exchange in the passive TB ranging availability window. Depending on the medium availability, the bandwidth used for the exchanged frames is equal to or smaller than the nominal bandwidth.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

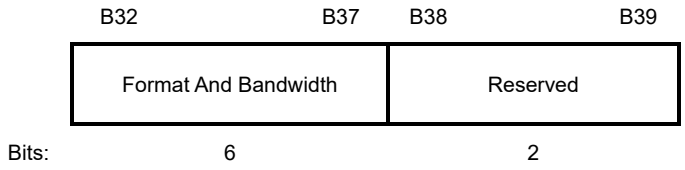

Figure 9-1042—Passive TB Ranging Parameters subfield format

9.4.2.300 Ranging Parameters element

The Ranging Parameters element is optionally included in the IFTMR frame, as described in 9.6.7.32, and the IFTM frame, as described in 9.6.7.33. The use of the Ranging Parameters element is described in 11.21.6.

The format of the Ranging Parameters element is shown in Figure 9-1043.

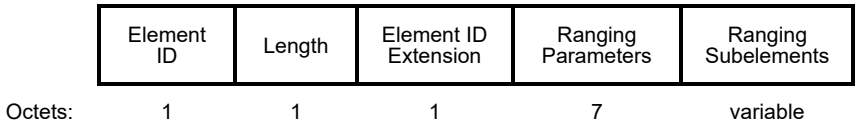

Figure 9-1043—Ranging Parameters element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The format of the Ranging Parameters field is shown in Figure 9-1044.

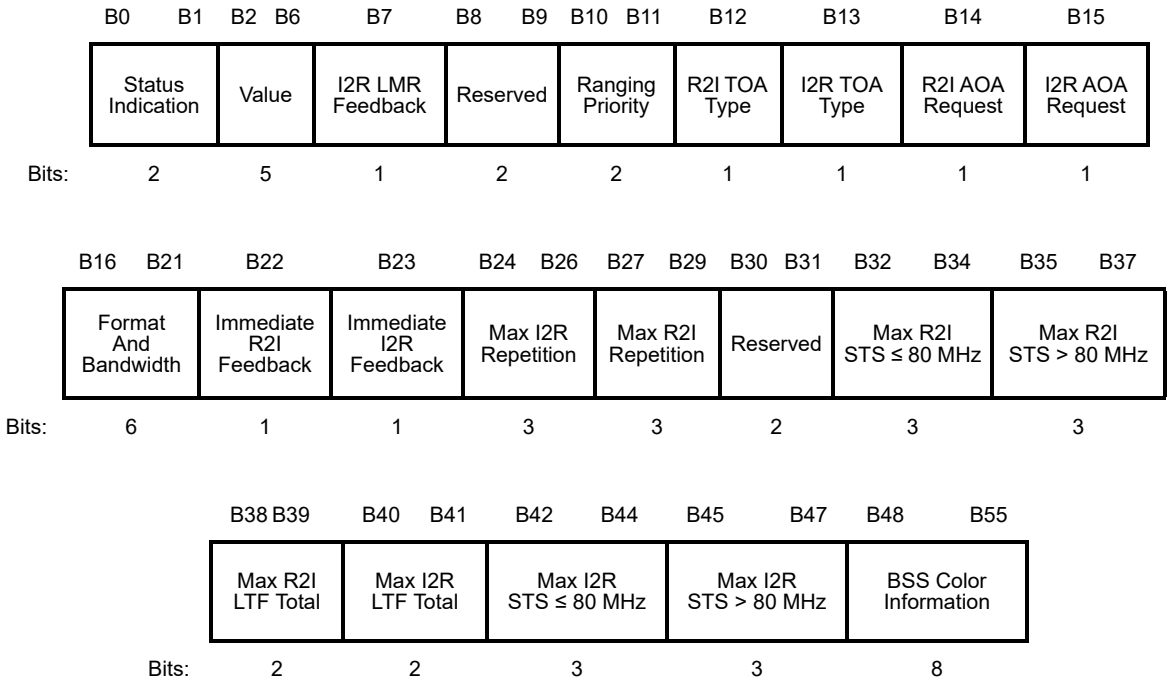

Figure 9-1044—Ranging Parameters field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Status Indication subfield indicates the RSTA's response to the Fine Timing Request. The encoding of the Status Indication subfield is shown in Table 9-321.

The Status Indication subfield and Value subfield are reserved in the IFTMR frame. When the Status Indication subfield is set to 3 by the RSTA, the Value subfield contains a duration in units of seconds; otherwise the Value subfield is reserved.

The I2R LMR Feedback subfield in the Ranging Parameters element in the IFTMR frame is set to indicate whether it transmits I2R LMR feedback to the RSTA, if requested by the RSTA; (see 11.21.6.3.3).

The RSTA sets the I2R LMR Feedback subfield in the Ranging Parameters element in the IFTM frame to 1 to indicate it requests the ISTA to transmit I2R LMR feedback to the RSTA and sets it to 0 otherwise (see 11.21.6.3.3, 11.21.6.4.3.4, and 11.21.6.4.4.3).

The R2I TOA Type subfield is set to 1 in the IFTMR frame by the ISTA to indicate that it requests phase shift TOA feedback in the R2I LMR and is set to 0 otherwise. The R2I TOA Type subfield is set to 1 in the IFTM frame by the RSTA to indicate that it reports phase shift TOA feedback in the R2I LMR and is set to 0 otherwise; see 11.21.6.3.3.

The I2R TOA Type subfield is set to 1 in the IFTMR frame by the ISTA to indicate that it supports phase shift TOA feedback in the I2R LMR and is set to 0 otherwise. The I2R TOA type subfield is set to 1 in the IFTM frame by the RSTA to assign phase shift TOA feedback in the I2R LMR and is set to 0 otherwise; see 11.21.6.3.3.

The R2I AOA Requested subfield is set to 1 in the IFTMR frame by the ISTA when it requests the RSTA to include AOA measurements in the AOA Feedback field of the R2I LMR. The R2I AOA Requested subfield is set to 1 in the IFTM frame to indicate that the RSTA includes the AOA measurements in the R2I LMR.

The I2R AOA Requested subfield in the IFTMR frame is set to 1 to indicate that the ISTA supports AOA measurement feedback in the I2R LMR. The I2R AOA Requested subfield in the IFTM frame is set to 1 to request the ISTA to include the AOA measurement feedback in the I2R LMR and is set to 0 otherwise.

The Format And Bandwidth subfield indicates the requested or allocated PPDU format and bandwidth used to transmit the I2R/R2I NDP exchange as part of the non-TB ranging, or TB ranging measurement exchange; see 11.21.6.4.3 and 11.21.6.4.4. The encoding of this subfield is given in Table 9-412.

Table 9-412—Format And Bandwidth subfield

Field value	Format	Bandwidth
0	HE	20
1	HE	40
2	HE	80
3	HE	80+80
4	HE (two separate RF LOs)	160
5	HE (single RF LO)	160
6	NGV	10
7	NGV	20
8–63	Reserved	Reserved
NOTE—Values 6 and 7 are supported only when dot11NGVOptionImplemented is true.		

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The values of 3, 4, and 5 indicate STA support for 160 MHz operation as either 80+80, 160 two-LO, or 160 single-LO, respectively in addition to supporting 80 MHz, 40 MHz, and 20 MHz bandwidths (e.g., a field value of 5 does not mean the device supports all 160 MHz options but rather 160 MHz single LO).

The Max I2R Repetition subfield indicates the maximum number of HE-LTF repetitions that the ISTA uses in the preamble of the I2R NDP and is set to the number of HE-LTF repetitions minus 1.

The Max R2I Repetition subfield indicates the maximum number of HE-LTF repetitions that the RSTA uses in the preamble of the R2I NDP and is set to the number of HE-LTF repetitions minus 1.

NOTE—The values of 0 to 7 contained in the Max I2R Repetition and Max R2I Repetition subfields are mapped to the values 1 to 8 for the number of HE-LTF repetitions, respectively.

The Ranging Priority subfield of the Ranging Parameters field of the Ranging Parameters element in the IFTMR frame contains the ISTA's ranging priority request, which indicates the time sensitivity of a ranging operation, and it is set according to Table 9-323.

For TB ranging, the Ranging Priority subfield of the Ranging Parameters field of the Ranging Parameters element in the IFTM frame contains the RSTA's ranging priority response, which indicates whether the RSTA accommodates the ranging priority request of the ISTA, and it is set according to Table 9-324 in 9.4.2.166.

For non-TB ranging, the Ranging Priority subfield of the Ranging Parameters field of the Ranging Parameters element in the IFTM frame is reserved.

The Immediate R2I Feedback and Immediate I2R Feedback subfields indicate if the measurement results from the current measurement exchange are reported immediately by setting it to 1 (from the current measurement) or delayed by setting it to 0 (from the previous measurement) in the R2I and I2R LMR frame respectively.

The Immediate R2I Feedback subfield is reserved in the IFTMR frame. In the IFTM frame the Immediate R2I Feedback field is set to 1 to indicate that the R2I LMR will be immediate feedback and to 0 to indicate delayed feedback.

The Immediate I2R Feedback field in the IFTMR frame is set to 1 to indicate immediate feedback in the I2R LMR and is set to 0 to indicate delayed feedback. In the IFTM frame the Immediate I2R Feedback field is set to the same value as in the IFTMR frame.

The Max R2I STS ≤ 80 MHz subfield indicates for bandwidths less than or equal to 80 MHz the maximum number of space-time streams to be used in the R2I NDP in the session.

The Max R2I STS > 80 MHz subfield indicates for bandwidths greater than 80 MHz the maximum number of space-time streams to be used in the R2I NDP in the session.

The BSS Color Information subfield has the same format as in the BSS Color Information field in the HE Operation element. Each subfield of the BSS Color Information field is set to the same value, as in the HE Operation element transmitted by an RSTA. The BSS Color Information subfield is reserved in the IFTMR frame.

The Max R2I LTF Total and Max I2R LTF Total subfields indicate the maximum number of HE-LTFs to be destined to an ISTA in the R2I NDP and an RSTA in an I2R NDP, respectively, the encoding is given in Table 9-413. The maximum number of HE-LTFs limits the allowed combinations of number of space-time streams and HE-LTF repetitions.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-413—Max R2I/I2R LTF Total subfields

Field value	Max number of HE-LTFs
0	4
1	8
2	16
3	64

The Max I2R STS ≤ 80 MHz subfield indicates for bandwidths less than or equal to 80 MHz the maximum number of space-time streams to be used in the I2R NDP in the session.

The Max I2R STS > 80 MHz subfield indicates for bandwidths greater than 80 MHz the maximum number of space-time streams to be used in the I2R NDP in the session.

The Ranging Subelements field contains one or more subelements. The format and ordering of the subelements are defined in 9.4.3. The Subelement ID field values for the defined subelements are shown in Table 9-414.

Table 9-414—Ranging Subelement IDs for Ranging Parameters

Subelement ID field	Name	Extensible
0	Non-TB Specific subelement	Yes
1	TB-specific subelement	Yes
2	Secure HE-LTF subelement	Yes
3–220	Reserved	
221	Vendor Specific	
222–255	Reserved	

If the initiator and the responder successfully negotiate an FTM session, and the negotiated ranging protocol is non-TB, then the Non-TB Specific subelement is included in both the IFTMR frame, to describe the requested set of parameters that the initiator proposes to use, and in the IFTM frame.

The format of the Non-TB Specific subelement is as shown in Figure 9-1045.

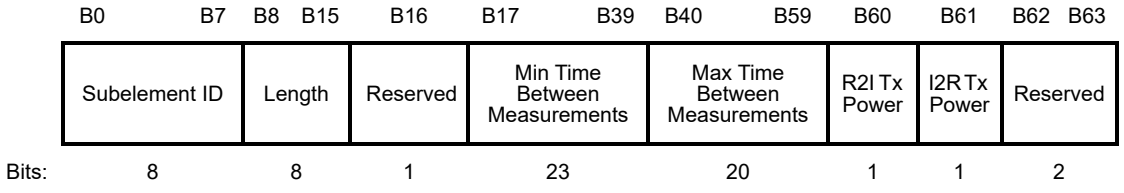

Figure 9-1045—Non-TB Specific subelement format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Subelement ID and Length fields are defined in 9.4.3.

The R2I Tx Power field in the IFTMR frame is set to 1 to indicate that the ISTA requests the RSTA to report the TX power of the R2I NDPs in the R2I NDP Tx Power field in the following LMR, and 0 otherwise. In the IFTM frame, the R2I Tx Power field is set to 1 by the RSTA to indicate that it will report the TX power of the R2I NDPs in the R2I NDP Tx Power field of the following LMR, and 0 otherwise.

The I2R Tx Power field in the IFTMR frame is set to 1 to indicate that the ISTA supports announcing the TX power of the I2R NDPs in the STA Info field with the AID11 subfield set to 2045 of the preceding NDP Announcement frame, and 0 otherwise. In the IFTM frame, the I2R Tx Power field is set to 1 by the RSTA to request the ISTA to announce the TX power of the I2R NDPs in the STA Info field with the AID11 subfield set to 2045 of the preceding NDP Announcement frame, and 0 otherwise.

The Min Time Between Measurements field is requested by the ISTA in the IFTMR frame and assigned by RSTA in the IFTM frame, and indicates the minimum time between two consecutive range measurements initiated by an ISTA, in units of 100 μs.

The Max Time Between Measurements field is requested by the ISTA in the IFTMR frame and assigned by RSTA in the IFTM frame, and indicates the latest time by which the ISTA needs to complete the next round of measurements, in units of 10 ms.

If the initiator and the responder successfully negotiate an FTM session where the negotiated ranging protocol is TB, then the TB Specific subelement is included in both the IFTMR frame, to describe the requested set of parameters that the initiator proposes to use, and in the IFTM frame.

The format of the TB Specific subelement is as shown in Figure 9-1046.

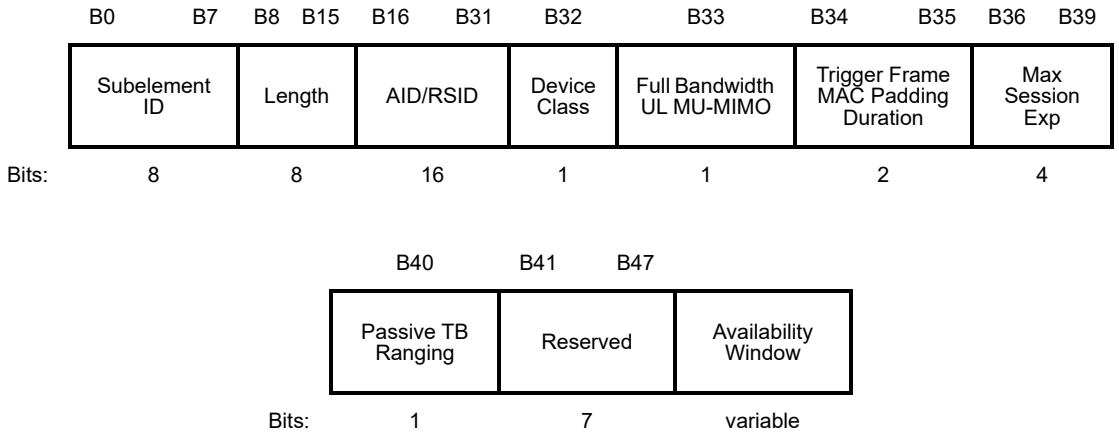

Figure 9-1046—TB Specific subelement format

The Subelement ID and Length fields are defined in 9.4.3.

The AID/RSID field is reserved in the IFTMR frame. In the IFTM frame it contains an identifier for the ISTA for the duration of the FTM session. If the ISTA is associated with the RSTA, the value is set to the ISTA's AID. If the ISTA is not associated with the RSTA, the AID/RSID field is set to the RSID, which is assigned by the responder to identify the unassociated ISTA, and has the same length as the AID.

The Device Class and Full Bandwidth UL MU-MIMO fields correspond to the Device Class and Full Bandwidth UL MU-MIMO fields defined in Table 9-376. For associated STAs, the values of the Device

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Class and Full Bandwidth UL MU-MIMO subfields are equal to the values of the Device Class and Full Bandwidth UL MU-MIMO fields, respectively, that are exchanged during association.

The Trigger Frame MAC Padding Duration field correspond to the Trigger Frame MAC Padding Duration field defined in Table 9-375. For associated STAs, the value of the Trigger Frame MAC Padding Duration field is equal to the value that was exchanged during association.

The Max Session Exp field indicates the time before which a new measurement exchange between the ISTA and RSTA should be initiated and completed. This value is computed as $2^{(\text{Max Session Exp} + 8)}$ ms. The Max Session Exp field is reserved in an IFTMR frame.

The Passive TB Ranging field is set to 1 by the initiator to request passive TB ranging operation, otherwise it is set to 0. The Passive TB Ranging field is set to 1 by the Responder to grant passive TB ranging operation, otherwise it is set to 0.

The Availability Window field contains either an ISTA Availability Window element, see Figure 9-1035, when the containing Ranging Parameters element is in an IFTMR frame; or an RSTA Availability Window element, see Figure 9-1037, when the containing Ranging Parameters element is in an FTM frame.

Figure 9-1047 (Example of a bitmap with 200 TU periodicity signaled in the ISTA Availability Window element), Figure 9-1048, and Figure 9-1049 (Example of how an RSTA assigns an Availability Window to an ISTA) together show an example of how an RSTA assigns an availability window from the received Availability Window element of the ISTA. Figure 9-1047 (Example of a bitmap with 200 TU periodicity signaled in the ISTA Availability Window element) shows the bitmap in the ISTA Availability Information field of the ISTA Availability Window element included with an IFTMR frame. The bitmap has periodicity of 200 TUs and the RSTA Beacon Interval is 100 TUs. Figure 9-1048 shows how the RSTA calculates ISTA's periodic availability from this bitmap relative to RSTA TSF. Finally, Figure 9-1049 shows how the RSTA constructs an availability window with periodicity of 200 TUs requested by the ISTA and with a window duration of 10 TUs. The shaded region indicates the location of the assigned availability windows.

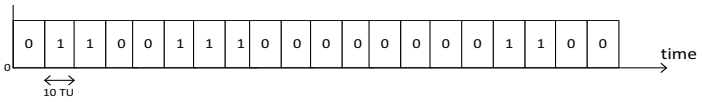

Figure 9-1047—Example of a bitmap with 200 TU periodicity signaled in the ISTA Availability Window element

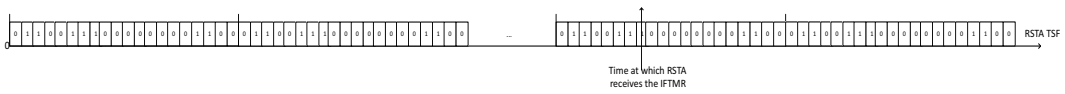

Figure 9-1048—Example of mapping of ISTA's availability bitmap to RSTA's TSF

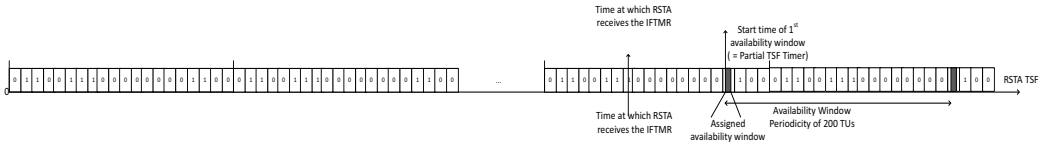

Figure 9-1049—Example of how an RSTA assigns an Availability Window to an ISTA

The Ranging Parameters element in the IFTMR frame includes a Non-TB Specific subelement and/or a TB specific subelement; and the Ranging Parameters element in the corresponding IFTM frame includes either a Non-TB Specific subelement or a TB specific subelement, if the Status Indication subfield in the Ranging Parameters field is set to Success to indicate the range measurement protocol selected by the responder for the negotiated FTM session.

The Secure HE-LTF subelement is included in the IFTMR frame to indicate that the initiator supports use of secure HE-LTF and the associated parameters; it is included in the IFTM, if the initiator and the responder successfully negotiate an FTM session where secure HE-LTF is used.

The format of the Secure HE-LTF subelement is as shown in Figure 9-1050.

B0 – B7	B8 – B15	B16 – B18	B19	B20	B21	B22 – B23
Subelement ID	Length	Protocol Version	Secure HE-LTF Req.	R2I Tx Window	I2R Tx Window	Reserved
Bits: 8	8	3	1	1	1	2

Figure 9-1050—Secure HE-LTF subelement format

The Subelement ID and Length fields are defined in Figure 9.4.3 (Subelements).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Protocol Version field in the IFTMR frame is set to the value 0 by the ISTA, with values 1 to 7 reserved for future use; see Table 9-415. In the IFTM frame the Version field is set to the value 0 by the RSTA, with values 1 to 7 reserved for future use. The interpretation of the version field in the IFTMR frame and IFTM frame, and the possible resulting actions, are described in 11.21.6.3.4.

The Secure HE-LTF Required field is set to 1 by the ISTA to indicate it requires secure HE-LTF to be enabled and is set to 1 by the RSTA to enable a secure HE-LTF measurement exchange between an ISTA and an RSTA. Otherwise the Secure HE-LTF Required field is set to 0.

The R2I Tx Window field in the IFTMR frame is set to 1 to indicate the ISTA requests use of the optional frequency domain Tx Window in the R2I NDPs, and 0 to indicate the default frequency domain Tx window. In the IFTM frame, the R2I Tx Window field is set to 1 to indicate the RSTA will use the optional frequency domain Tx window in the R2I NDPs, and 0 to indicate the default frequency domain Tx window; see Table 9-415.

The I2R Tx Window field in the IFTMR frame is set to 1 to indicate that the ISTA supports use of the optional frequency domain Tx window in the I2R NDPs, and 0 to indicate the default frequency domain Tx window. In the IFTM frame, the I2R Tx Window field is set to 1 by the RSTA to request that the ISTA use the optional frequency domain Tx window in the I2R NDPs, and 0 to indicate the default frequency domain Tx window; see Table 9-415.

Table 9-415—Secure HE-LTF protocol section identifier

Protocol Version	Secure HE-LTF PHY sections
0	27.3.19
1–7	Reserved

9.4.2.301 Secure HE-LTF Parameters element

The Secure HE-LTF Parameters element is optionally included in the IFTM frame, as described in 9.6.7.33, and the LMR frame, as described in 9.6.7.49 for a secure HE-LTF measurement exchange mode of the non-TB ranging and TB ranging measurement exchange (see 11.21.6.4.5). The use of the Secure HE-LTF Parameters element is described in 11.21.6.

The format of the Secure HE-LTF Parameters element is shown in Figure 9-1051.

	Element ID	Length	Element ID Extension	Secure LTF Counter	Validation SAC	Measurement SAC	Measurement Result LTF Offset
Octets:	1	1	1	6	2	2	1

Figure 9-1051—Secure HE-LTF Parameters element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Secure LTF Counter field is used to determine the randomized LTF sequence of an I2R NDP and R2I NDP in one of the following secure HE-LTF measurement exchange sequences:

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

— An I2R NDP and an R2I NDP immediately following a Ranging NDP Announcement frame, in a non-TB ranging measurement exchange (11.21.6.4.4).
— A sequence of an I2R NDP, a Ranging NDP Announcement frame, an R2I NDP, in a TB ranging measurement exchange (11.21.6.4.3).

The Secure LTF Counter field is used in the IFTM frame and the R2I LMR frame when part of a secure HE-LTF measurement exchange; it is reserved otherwise.

The Validation SAC field is a nonzero value associated with the secure LTF counter carried in the same Secure HE-LTF Parameters element and validates the randomized LTF sequence; see 11.21.6.3.4. This field is used in the initial protected FTM frame, the R2I protected LMR frame and is reserved otherwise.

The Measurement SAC field is used to verify that range measurement results contained in the LMR frame are calculated using the same LTF sequence between ISTA and RSTA. The Measurement SAC field is the same value as the SAC subfield in the STA Info field with AID equal to 2043 in the Ranging NDP Announcement frame that solicited the I2R NDP and the R2I NDP in the non-TB ranging measurement exchange or the SAC subfield in the Trigger Dependent User Info of the Secure Sounding Ranging Trigger frame in the TB ranging measurement exchange; see 11.21.6.4.5. This field is reserved in the IFTM frame.

The Measurement Results LTF Offset field is used in TB ranging to verify that the measurement results contained in the LMR frame are calculated using the same LTF Offset for the R2I NDP between RSTA and ISTA. The Measurement Result LTF Offset field has the same value as the LTF Offset subfield in the corresponding STA Info field of the Ranging NDP Announcement frame preceding the R2I NDP, which was used for estimating the measurement results contained in the LMR frame. The Measurement Result LTF Offset field is structured as shown in Figure 9-1052. This field is not used in the IFTM frame nor in the LMR frames in non-TB ranging.

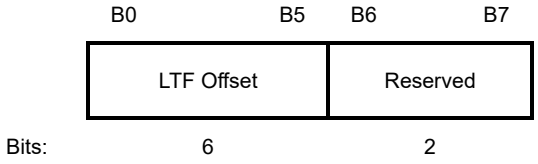

Figure 9-1052—Measurement Result LTF Offset field format

9.4.2.302 Direction Measurement Results element

The Direction Measurement Results element is used to send angle of arrival (AOA) and angle of departure (AOD) measurement results and is defined in Figure 9-1053.

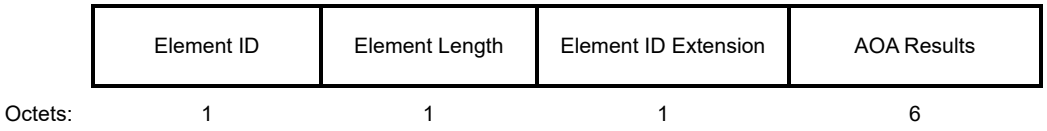

Figure 9-1053—Direction Measurement Results element

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The AOA Results field is as shown in Figure 9-1054.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

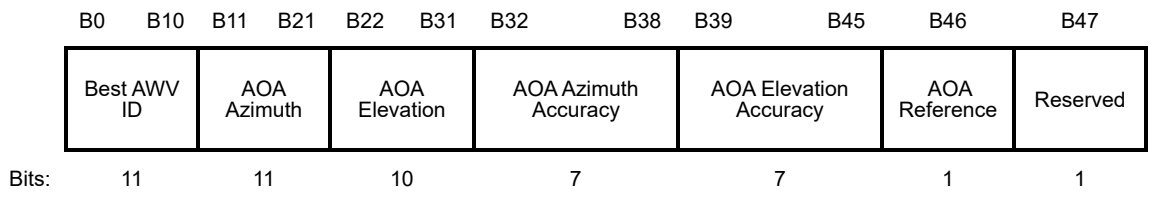

Figure 9-1054—AOA Results field format

The AOA Azimuth subfield contains the AOA azimuth result in 360º/2048 resolution. This subfield is an unsigned 2s complement number taking values between 0 and 2047. When the AOA Reference subfield is set to 1, the AOA Azimuth subfield is in earth coordinates (i.e., direction 0 is north). When the AOA Reference subfield is set to 0, the AOA Azimuth subfield is in coordinates relative to the orientation of the STA measuring the AOA azimuth.

The AOA Elevation subfield contains the AOA elevation result in 180º/1024 resolution. This subfield is a signed 2s complement number taking values between –512 and 511.

The AOA Azimuth Accuracy subfield contains the AOA azimuth result's estimated accuracy in 360º/2048 resolution. An accuracy larger than 125 × 360º/2048 is represented by the value of 125. A value of 126 indicates no azimuth measurement. A value of 127 indicates no ability to estimate azimuth accuracy.

The AOA Elevation Accuracy subfield contains the AOA elevation result's estimated accuracy in 360º/2048 resolution. An accuracy larger than 125 × 360º/2048 is represented by the value 125. A value of 126 indicates no elevation measurement. A value of 127 indicates no ability to estimate elevation accuracy.

When the AOA Reference subfield is set to 1, the AOA Elevation subfield is in earth coordinates (i.e., elevation 0 is the horizon). When the AOA Reference subfield is set to 0, the AOA elevation is in coordinates relative to the orientation of the STA measuring the AOA elevation.

If the STA sending the frame containing the element is a DMG STA, and the frame containing the Direction Measurement Result element follows an ISTA PPDU that enabled AOD by containing TRN-T subfields, the Best AWV ID subfield contains the index of the TRN-T subfield that was received with the highest SNR. If the ISTA PPDU that enabled AOD contained EDMG TRN-T subfields, then the AWV ID field contains the AWV ID (see 28.9.2.2.5) of the TRN subfields that were received with the highest SNR. If the STA sending the frame containing the element is a non-DMG STA, the Best AWV ID subfield is reserved.

9.4.2.303 Multiple Best AWV ID element

The Multiple Best AWV ID element is used to send multiple TRN subfields indices/AWV IDs from an ISTA to an RSTA and is defined in Figure 9-1055. The Multiple Best AWV ID element is carried in an FTM frame.

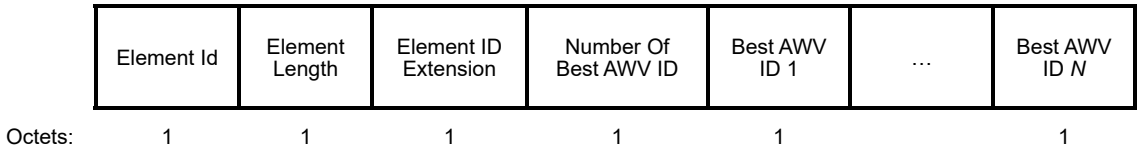

Figure 9-1055—Multiple Best AWV ID element

The Number Of Best AWV ID field indicates the number of attached Best AWV ID fields. Each Best AWV ID field is 16 bits long. Bits B0–B4 are reserved. It indicates the index of either the TRN subfield index or

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

the AWV ID of the TRN subfield(s) received with highest SNR. The choice of whether TRN subfield index or AWV ID is used depends on whether the PPDU over which the TRN subfield(s) were selected contained a DMG TRN field or an EDMG TRN field.

9.4.2.304 Multiple AOD Feedback element

The Multiple AOD Feedback element is used to send multiple angle of departure (AOD) results from an RSTA to an ISTA and is defined in Figure 9-1056. The Multiple AOD Feedback element is carried in an FTM frame.

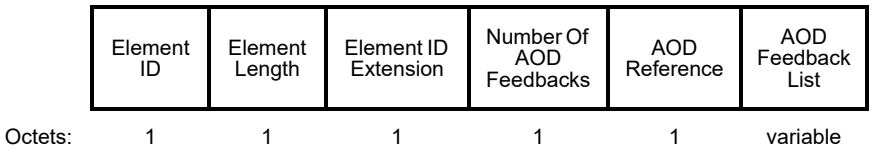

Figure 9-1056—Multiple AOD Feedback element

The value contained in the Number Of AOD Feedbacks field indicates the number of AOD Feedback fields present in the AOD Feedback List field, and is set to the Number Of Best AWV ID fields present in the last received Multiple Best AWV ID element from the ISTA.

When the AOD Reference field is set to 1, the AOD Elevation subfield is in earth coordinates (i.e., elevation 0 is horizon). When the AOD Reference field is set to 0, the AOD Elevation subfield is in coordinates relative to the orientation of the STA transmitting the measurement signal. When the AOD Reference field is set to 1, the AOD Azimuth subfield is in earth coordinates (i.e., direction 0 is north). When the AOD Reference field is set to 0, the AOD Azimuth subfield is in coordinates relative to the orientation of the STA transmitting the measurement signal.

The AOD Feedback List field is composed of a set of AOD Feedback fields. Each AOD Feedback field has the structure in Figure 9-1057.

Figure 9-1057—AOD Feedback field format

The AOD Azimuth subfield contains the angle of departure (AOD) azimuth result in 360º/2048 resolution. This subfield is an unsigned 2s complement number taking values between 0 and 2047.

The AOD Azimuth Accuracy subfield contains the AOD azimuth result's estimated accuracy in 360º/2048 resolution. An accuracy larger than 125 × 360º/2048 is represented by the value of 125. A value of 126 indicates no azimuth measurement. A value of 127 indicates no ability to estimate azimuth accuracy.

The AOD Elevation subfield contains the AOD elevation result in 180º/1024 resolution. This subfield is a signed 2s complement number taking values between –512 and 511.

The AOD Elevation Accuracy subfield contains the AOD elevation result's estimated accuracy in 360º/2048 resolution. An accuracy larger than 125 × 360º/2048 is represented by the value of 125. A value of 126 indicates no elevation measurement. A value of 127 indicates no ability to estimate elevation accuracy.

9.4.2.305 PASN Parameters element

The Control field, see Figure 9-1059, indicates the presence or absence of other fields in the PASN Parameters element; see Figure 9-1058.

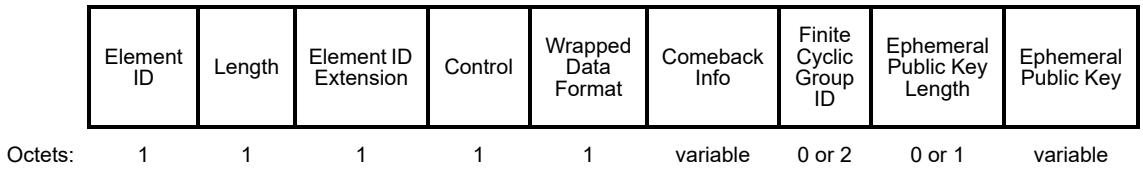

Figure 9-1058—PASN Parameters element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

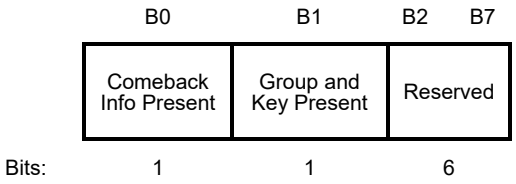

Figure 9-1059—PASN Parameters element Control Info field format

The Comeback Info Present subfield indicates if the Comeback Info field is included in the PASN Parameters element. The Group and Key Present subfield indicates if the PASN Parameters element includes the Finite Cyclic Group ID, the Ephemeral Public Key Length, and the Ephemeral Public Key fields.

The Wrapped Data Format field indicates the format of data in the Wrapped Data element included along with the PASN Parameters element. The values defined for this format are:

— 0: No wrapped data
— 1: Fast BSS Transition Wrapped Data; see 12.13.6
— 2: FILS Shared Key authentication without PFS Wrapped Data; see 12.13.4
— 3: SAE Wrapped Data; see 12.13.5
— 4–255: Reserved

The Comeback Info field, present only when the corresponding Comeback Info Present subfield in the Control field is set to 1, is of variable length and is formatted as shown in Figure 9-1060.

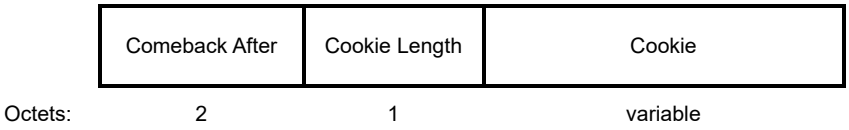

Figure 9-1060—Comeback Info field format

The Comeback After subfield value is the time in TUs after which the non-AP STA is requested to retry the PASN authentication. The Comeback After subfield is set to 0 to indicate that the operation can be retried

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

with a cookie of nonzero length in the Cookie subfield. The Comeback After subfield is reserved in PASN Authentication frames from a non-AP STA.

The Cookie Length subfield contains the length in octets of the Cookie subfield. If the Cookie Length subfield is 0, it indicates that there is no Cookie subfield.

The Cookie subfield contains a cookie, which is an opaque sequence of octets generated by an AP STA in an implementation dependent manner; see 12.13.10.

The Finite Cyclic Group ID, Ephemeral Public Key Length, and Ephemeral Public Key fields are present if the Group and Key Present subfield in the Control field is set to 1.

The Finite Cyclic Group ID field indicates the group used in PASN authentication. It has the same semantics as the field Finite Cyclic Group field (9.4.1.40).

The Ephemeral Public Key Length field is set to the length in octets of the Ephemeral Public Key field.

The Ephemeral Public Key field contains the public key encoded using IETF RFC 5480 conventions, in either compressed or uncompressed form.

9.4.2.306 ISTA Passive TB Ranging Measurement Report element

The ISTA Passive TB Ranging Measurement Report element, defined in Figure 9-1061, is used to convey measurement results and associated parameters from an ISTA to the RSTA in a passive TB ranging exchange.

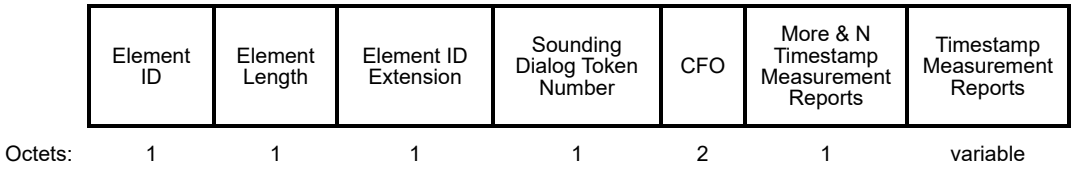

Figure 9-1061—ISTA Passive TB Ranging Measurement Report element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The value of the Sounding Dialog Token Number field is the value of the Sounding Dialog Token Number subfield in the Ranging NDP Announcement frame of the corresponding measurement sounding phase in which the reported ISTA's timestamps were measured; see 11.21.6.4.3 and 11.21.6.4.8.

The CFO field indicates the reporting ISTA's carrier frequency offset with respect to the RSTA, as a signed integer in 2s complement format in units of 0.01 ppm.

The More & N Timestamp Measurement Reports field is defined as depicted in Figure 9-1062.

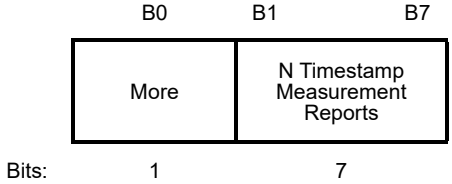

Figure 9-1062—More & N Timestamp Measurement Reports field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The More subfield is used to indicate that the ISTA has more timestamps ready to report but is not able to fit them in its allocated resources as given by the RSTA.

The N Timestamp Measurement Reports subfield is an unsigned integer indicating the number of Timestamp Measurement Report subfields present in the Timestamp Measurement Reports field. The value 0 of the N Timestamp Measurement Reports field is reserved.

The Timestamp Measurement Reports field contains one or more Timestamp Measurement Report subfields defined as in Figure 9-1063.

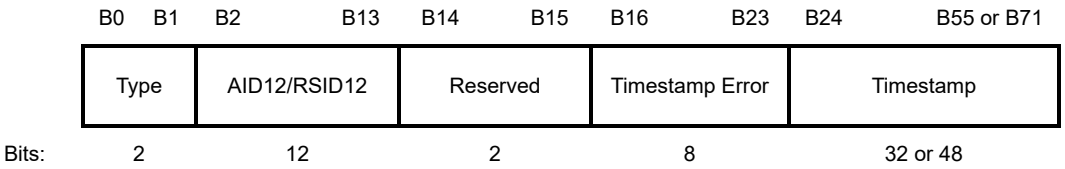

Figure 9-1063—Timestamp Measurement Report subfield format

The Type subfield is set according to Table 9-416.

Table 9-416—Type subfield

Field value	Timestamp type	Description
00	TOD	Time of departure timestamp
01	TOA	Time of arrival timestamp
10	PSTOA	Phase shift TOA
11	Reserved	Reserved

The AID12/RSID12 subfield contains the 12 LSBs of the AID, for an associated ISTA, or the 12 LSBs of the RSID, for an unassociated ISTA, of the STA that transmitted the NDP that the timestamp is reported for. When the STA that transmitted the NDP is the RSTA the value zero is reported in the AID12/RSID12 subfield.

The Timestamp Error field is structured as shown in Figure 9-1064.

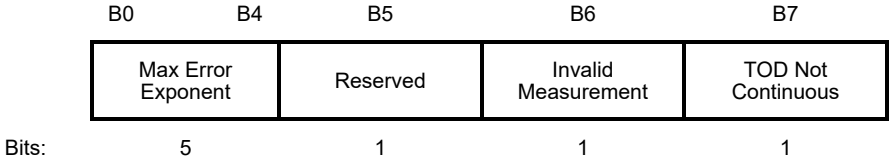

Figure 9-1064—Timestamp Error subfield format

The maximum errors in the timestamp values are represented using the function defined in Equation (9-13).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

$$E_{max} = \begin{cases} \text{unknown}, & F = 0 \\ 2^{F-1}, & 1 \le F \le 30 \\ \ge 2^{30}, & F = 31 \end{cases} \quad (9\text{-}13)$$

where

F is the Max Error Exponent

E_{max} is the maximum timestamp error, respectively, in units of picoseconds

The Max Error Exponent subfield contains the Max Error Exponent, F, in Equation (9-13) for the value specified in the Timestamp subfield.

The Invalid Measurement field is set to 1 to indicate that the timestamp is invalid and set to 0 to indicate that the timestamp is valid.

For a timestamp of type TOD, the TOD Not Continuous subfield indicates that the TOD value is with respect to a different underlying time base than the last transmitted TOD value. It is set to 1 when a discontinuity is present. Otherwise, it is set to 0. For other timestamp types, this field is reserved.

The Timestamp subfield contains a TOD, TOA, or a PSTOA timestamp. The TOD timestamps are represented with 48 bits in units of 1 ps. The TOA and PSTOA timestamps are represented with 32 bits in units of 16 ps.

The TOD timestamp represents the time, with respect to the ISTA's time base, at which the start of the preamble of the NDP in question appeared at the transmit antenna connector.

The TOA timestamp represents the time, with respect to the ISTA's time base, at which the start of preamble of the NDP in question arrived at the receive antenna connector.

The PSTOA timestamp represents the time, with respect to the ISTA's time base, at which the start of preamble of the NDP in question arrived at the receive antenna connector, calculated based on the average linear phase shift between two adjacent tones normalized by the tone spacing. An example of calculation of the phase shift is shown in Annex AD.

9.4.2.307 RSTA Passive TB Ranging Measurement Report element

The RSTA Passive TB Ranging Measurement Report element, defined in Figure 9-1065, is used to broadcast measurement results and associated parameters from an RSTA to STAs that want to use this information.

	Element ID	Length	Element ID Extension	Sounding Dialog Token Number	N Timestamp Measurement Reports	Timestamp Measurement Reports
Octets:	1	1	1	1	1	variable

Figure 9-1065—RSTA Passive TB Ranging Measurement Report element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The value of the Sounding Dialog Token Number field is the value of the Sounding Dialog Token Number subfield in the Ranging NDP Announcement frame corresponding to the measurement sounding phase in which the reported RSTA timestamps were measured; see 11.21.6.4.3 and 11.21.6.4.8.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The N Timestamp Measurement Reports field is an unsigned integer indicating the number of Timestamp Measurement Reports. The value 0 of the N Timestamp Measurement Reports field is reserved.

The Timestamp Measurement Reports field contains one or more Timestamp Measurement Report fields defined as in Figure 9-1063 (Timestamp Measurement Report subfield format) with definitions as detailed in 9.4.2.308.

9.4.2.308 Passive TB Ranging LCI Table element

The Passive TB Ranging LCI Table Report element, defined in Figure 9-1066, is used by an RSTA to broadcast LCI data for the ISTAs participating in its passive TB ranging exchanges.

	Element ID	Length	Element ID Extension	Number of ISTA LCI Report Entries	ISTA LCI Reports Entries	RSTA LCI Report (optional)	RSTA Location Civic Report (optional)
Octets:	1	1	1	1	variable	variable	variable

Figure 9-1066—Passive TB Ranging LCI Table Report element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The number of ISTA LCI Reports contained in the ISTA LCI Reports field is indicated by the Number of ISTA LCI Reports ISTA LCI Report field. The format of the ISTA LCI Report field is defined in Figure 9-1067.

The RSTA LCI Report field is present if the RSTA has never transmitted it before or its content has changed, and it is periodically present otherwise. If present, it contains a Measurement Report element with Measurement Type field equal to LCI, see Table 9-163, which either indicates the LCI of the RSTA and can include the Z subelement, Usage Rules/Policy subelement, and Antenna Placement And Calibration subelement, or indicates an unknown LCI; see 11.21.6.7.

The RSTA Location Civic Report field is optionally present. If present, it contains a Measurement Report element with Measurement Type field equal to Location Civic, see Table 9-163, which either indicates the Civic address of the ISTA or an unknown Civic address; see 11.21.6.7.

	ISTA RSID/AID	ISTA MAC ADDRESS	ISTA LCI Report (optional)	ISTA Location Civic Report (optional)
Octets:	2	6	variable	variable

Figure 9-1067—ISTA LCI Report Entry field format

The ISTA RSID/AID subfield contains the ranging ID of the ISTA reported on.

The ISTA MAC ADDRESS subfield contains the MAC address of the ISTA reported on.

The ISTA LCI Report subfield is present if the RSTA has never transmitted it before or its content has changed and it is periodically present otherwise. If present, it contains a Measurement Report element with Measurement Type field equal to LCI (see Table 9-163), which either indicates the LCI of the ISTA and can include the Z subelement, Usage Rules/Policy subelement, and Antenna Placement And Calibration subelement, or indicates an unknown LCI; see 11.21.6.7.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The ISTA Location Civic Report field is optionally present. If present, it contains a Measurement Report element with Measurement Type field equal to Location Civic (see Table 9-163), which either indicates the Civic address of the ISTA or an unknown Civic address; see 11.21.6.7.

An ISTA LCI Report Entry includes at least one of ISTA LCI Report or ISTA Location Civic Report.

NOTE—To shorten the LCI reporting, the 'Relative Compact LCI' Measurement Type can be used in the ISTA's LCI reporting. In this case the ISTA's location is reported in relation to the location reported for the RSTA in the Passive TB Ranging LCI Table Report within which the ISTA's LCI report is contained. See 9.4.2.20.10.

9.4.2.309 LOS Likelihood element

The LOS Likelihood field contains the estimated log likelihood that measurements contained in the Direction Measurement Results element or in the TOD field of the same FTM frame, are line of sight (LOS) measurements. The method to estimate the likelihood is implementation dependent. The format of the LOS Likelihood element is shown in Figure 9-1068.

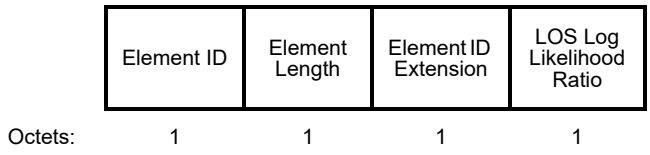

Figure 9-1068—LOS Likelihood element format

The LOS Log Likelihood Ratio field is a signed 2s complement 8-bit number containing $40 \times \log_{10}$ of the estimated ratio between the probability that measurement is on a LOS path and the probability is on a non-LOS path. This covers the range –31.75 dB to +31.75 dB. If this field has a value equal to 255, it indicates that the LOS Log Likelihood Ratio is not available.

9.4.2.310 DMG OCB element

The format of the DMG OCB element is shown in Figure 9-1069.

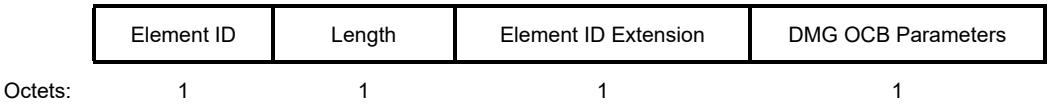

Figure 9-1069—DMG OCB element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The DMG OCB Parameters field is defined in Figure 9-1070.

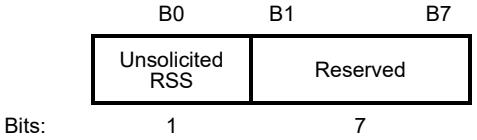

Figure 9-1070—DMG OCB Parameters field format

The Unsolicited RSS subfield is defined in 9.5.5.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.311 Non-AP STA Regulatory Connectivity element

The format of the Non-AP STA Regulatory Connectivity element is defined in Figure 9-1071.

	Element ID	Length	Element ID Extension	Regulatory Connectivity
Octets:	1	1	1	variable

Figure 9-1071—Non-AP STA Regulatory Connectivity element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Regulatory Connectivity field indicates certain regulatory capabilities of the non-AP STA transmitting the element. The Regulatory Connectivity field is defined in Table 9-417.

NOTE—The length of the Regulatory Connectivity field is variable and is liable to increase as additional connectivity capabilities are defined.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-417—Regulatory Connectivity field

Subfield bit or bits	Subfield name	Interpretation
0	Connectivity With Indoor AP Valid	Indicates whether the Connectivity With Indoor AP subfield is reserved or not: Set to 0 if the Connectivity With Indoor AP subfield is reserved. Set to 1 if the Connectivity With Indoor AP subfield is valid.
1	Connectivity With Indoor AP	Indicates whether operating under the control of an indoor AP and an indoor standard power AP is implemented (see E.2.7). For a non-SP STA: Set to 0 if not implemented. Set to 1 if implemented. Reserved for a non-AP STA that is incapable of operating as a STA 6G in the current regulatory domain and for an AP. Reserved if the Connectivity With Indoor AP Valid subfield is set to 0. See NOTE.
2	Connectivity With SP AP Valid	Indicates whether the Connectivity With SP AP subfield is reserved or not: Set to 0 if the Connectivity With SP AP subfield is reserved. Set to 1 if the Connectivity With SP AP subfield is valid.
3	Connectivity With SP AP	Indicates whether at least one of the following is implemented: operating under the control of an SP AP and an indoor standard power AP and operating as a fixed client device (see E.2.7). For a non-AP STA: Set to 0 if not implemented. Set to 1 if implemented. Reserved for a non-AP STA that is incapable of operating as a STA 6G in the current regulatory domain and for an AP. Reserved if the Connectivity With SP AP Valid subfield is set to 0. See NOTE.
4 to 8 × (Length – 1) – 1	Pad	Reserved
NOTE—This field is informative (e.g., for troubleshooting), has no regulatory purpose, and does not imply a need for any action by a peer STA.

9.4.2.312 Diffie-Hellman Parameter element

The Diffie-Hellman Parameter element contains a Diffe-Hellman public value and an indicator of the finite cyclic group from which it was obtained. See Figure 9-1072.

	Element ID	Length	Element ID Extension	Group	Public Key
Octets:	1	1	1	2	variable

Figure 9-1072—Diffie-Hellman Parameter element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Group field is a 16-bit unsigned integer that maps an identifying number from the “Group Description” registry maintained by IANA for IETF RFC 2409 (IKE) to a complete domain parameter set.

The Public Key field is a Diffie-Hellman public key, an element in the group described by the domain parameter set indicated by the value in the Group field.

9.4.2.313 EBCS Parameters element

An EBCS AP advertises its EBCS operational parameters in the EBCS Parameters element.

The format of the EBCS Parameters element is shown in Figure 9-1073.

	Element ID	Length	Element ID Extension	EBCS Parameters Control	EBCS Info Frame TX Countdown	Compressed Certificate Group ID (optional)	EBCS AP Group ID (optional)
Octets:	1	1	1	1	0 or 2	0 or 4	0 or 2

Figure 9-1073—EBCS Parameters element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The format of the EBCS Parameters Control field is shown in Figure 9-1074.

	B0	B1	B2	B3 B7
	EBCS Info Frame Tx Countdown Present	Compressed Certificate Group ID Present	EBCS AP Group ID Present	Reserved
Bits:	1	1	1	5

Figure 9-1074—EBCS Parameters Control field format

The EBCS Info Frame Tx Countdown Present subfield is set to 1 if the EBCS Info Frame Tx Countdown subfield is present and is set to 0 otherwise.

The Compressed Certificate Group ID Present subfield is set to 1 if the Compressed Certificate Group ID field is present and is set to 0 otherwise.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The EBCS AP Group ID Present subfield is set to 1 if the EBCS AP Group ID field is present and is set to 0 otherwise.

The EBCS Info Frame Tx Countdown field is defined in 9.4.1.70.

The Compressed Certificate Group ID field indicates a 32-bit CRC calculated over the certificate of the AP.

The EBCS AP Group ID field contains the EBCS AP Group ID of the AP.

9.4.2.314 EBCS TIM element

The EBCS TIM element is used to signal the availability of EBCS traffic stream frames. The format of this element is shown in Figure 9-1075.

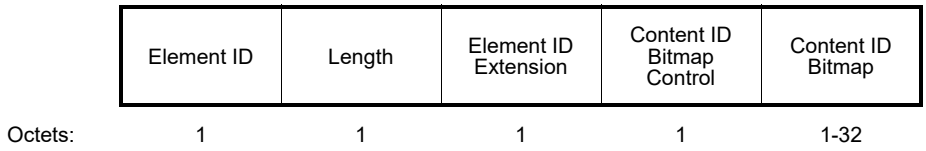

Figure 9-1075—EBCS TIM element format

The Element ID, Length and Element ID Extension fields are defined in 9.4.2.1.

The format of the Content ID Bitmap Control field is shown in Figure 9-1076.

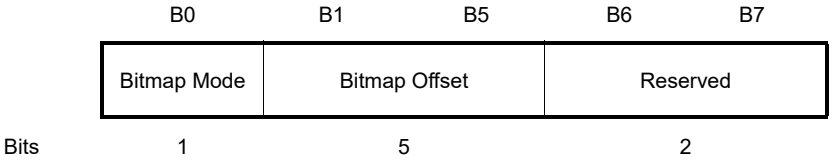

Figure 9-1076—Content ID Bitmap Control field format

The EBCS traffic indication virtual bitmap, maintained by the EBCS AP that generates an EBCS TIM, consists of 256 bits and is organized into 32 octets such that bit number N ($0 \le N \le 255$) in the bitmap corresponds to bit number N mod 8 in octet number, $\lfloor N/8 \rfloor$, where the low order bit of each octet is bit number 0, and the high order bit is bit number 7. A bit value 1 means the corresponding EBCS traffic stream is buffered at the AP.

The format of the Content ID Bitmap field is identified by the Bitmap Mode subfield.

If the Bitmap Mode subfield is 0, the Content ID Bitmap field consists of octets numbered N_1 to N_2 of the EBCS traffic indication virtual bitmap, where N_1 is the largest integer such that each of the bits 0 to $(N_1 \times 8) - 1)$ is equal to 0. If such a value does not exist, $N_1 = 0$. Additionally, N_2 is the smallest integer such that each of the bits $(N_2 + 1) \times 8$ to 255 is equal to 0. If such a value does not exist, that is, when not all bits in the last octet of the EBCS traffic indication virtual bitmap are equal to 0, $N_2 = 31$. The Bitmap Offset subfield contains N_1, and the Length field is set to $(N_2 - N_1) + 4$.

If the Bitmap Mode subfield is 1, the Bitmap Offset subfield is set to 0 and the Content ID Bitmap field contains a set of octets indicating the content IDs of EBCS traffic streams buffered at the AP.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.2.315 Tunneled PASN element

The Tunneled PASN element is present in tunneled PASN frames (12.13.7). The format of the Tunneled PASN element is shown in Figure 9-1077.

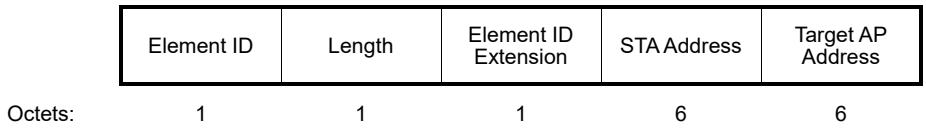

Figure 9-1077—Tunneled PASN element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The STA address is the address that the STA intends to use with the target AP. The Target AP Address field is the BSSID of the BSS of the AP with which the STA performs tunneled PASN.

9.4.3 Subelements

Subelements have a common general format shown in Figure 9-1078. Each subelement is assigned a subelement ID that is unique within the containing element or subelement. The Length field specifies the number of octets in the Data field.

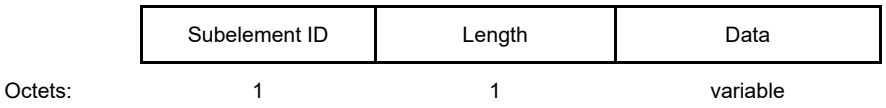

Figure 9-1078—Subelement format

At the location in this standard that a subelement is defined, the definition might indicate if the subelement is extensible, typically using a table column called Extensible in the table in which subelement IDs are defined. A subelement that is indicated as extensible (typically with Yes in the Extensible column) might be extended in future revisions or amendments of this standard. A subelement that is indicated as extensible through subelements (typically with Subelements in the Extensible column) might be extended in future revisions or amendments of this standard by defining (additional) subelements within the subelement.

If the definition of a subelement does not indicate whether it is extensible (e.g., there is no Extensible column in a table defining it) that subelement is not extensible.

A subelement that is not defined as extensible will not be extended in future revisions or amendments of this standard.

Subelements within an element and subelements in a field outside of an element are in each case ordered by nondecreasing Subelement ID. See 10.28.9.

Unless stated otherwise, no more than one subelement with the same Subelement ID, apart from Vendor Specific subelements, is present within an element.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.4 TLV encodings

9.4.4.1 General

The following TLV encodings are used to convey parameters within Management frames (9.3.3, 9.4, and 9.5.7). TLV tuples with type values that are unknown, not specified in this subclause, or specified as "reserved" are discarded upon receipt. The form of TLVs is shown in Table 9-418.

Table 9-418—General TLV format

Name	Type	Length (octets)	Value	Scope/ Country code
The name of the TLV	1	variable	Single Octet, Single Value, or Compound TLV tuples.	

NOTE—This standard is complete regarding the endianness of multi-octet fields as they are covered by 9.2.2. Be aware that most protocols above the MAC operate in the opposite endianness.

The Name field is the name of the TLV tuple.

The '*m.n*' syntax in the Type field means that the TLV has type *n*, an unsigned 1-octet integer, and is embedded in the Value field of a TLV of type *m*. The length of the Type field is 1 octet.

The format of the Length field is an unsigned number of size 1 octet, and the value in the Length field specifies the number of octets in the Value field.

A single octet TLV has a Value field that is 1 octet, a single value TLV has a Value field larger than 1 octet, and a compound TLV has a Value field that represents more than 1-octet fields.

When a Scope field entry contains two characters, it identifies the country or other entity to which the STA's operation is bound. If the two-character value stands for a country or other entity, then the value matches a code defined in ISO 3166-1. When a Scope field entry contains more than two characters, it identifies a scope for the TLV tuple.

9.4.4.2 Common TLVs

9.4.4.2.1 General

The general form of common TLVs is shown in Table 9-418 and is used in 9.4.4.2.2 to 9.4.4.2.6.

9.4.4.2.2 Device Class

This parameter contains the intended class of device for operation in TVWS band after it receives the available channel list at its location. The Device Class field format is shown in Table 9-419.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-419—Device Class field definition

Name	Type	Length (octets)	Value	Scope/ Country code
Device Class	2	1	The Device Class field contains an integer that indicates the device's TVWS band mode of operation as follows: 0: GDD non-AP STA 1: GDD geolocated non-AP STA 2: GDD AP 3: GDD fixed STA 4–255: Reserved	CAQ, GDDENABLEMENT, WSM

9.4.4.2.3 Device Identification Information

This parameter contains the identification information of the device initiating the channel availability query. The Device Identification Information field format is shown in Table 9-420 and related Device Identification Information Value fields tables in E.2 for specific regulatory domains.

Table 9-420—Device Identification Information field definition

Name	Type	Length (octets)	Value	Scope/ Country code
Device Identification Information	3	variable	One or more TLV fields as defined in Table E-9 for a specific regulatory domain.	CAQ, GDDENABLEMENT, CSM

9.4.4.2.4 Device Location Information

This parameter contains the location information of the device initiating the channel availability query. The Device Location Information field format is shown in Table 9-421.

Table 9-421—Device Location Information field definition

Name	Type	Length (octets)	Value	Scope/ Country code
Device Location Information	10	16	The Device Location Information field contains the latitude, longitude, and altitude information of the device in the format specified by the Device Location Information Body fields in Figure 9-191 (Device Location Information Body field format). When the Device Type subfield (see Table 9-419) is not GDD fixed STA, the altitude information (Altitude Type, Altitude Uncertainty, and Altitude subfields) of the Device Location Information field remain unused.	CAQ

9.4.4.2.5 Channel Schedule Descriptor

This parameter contains the channel number associated with channel schedule information used for channel schedule management. The Channel Schedule Descriptor Tuple attribute format is shown in Table 9-422 and Table 9-423. Channel Schedule Descriptor field is constructed with either Channel Availability Starting Time field or Channel Availability Starting Timestamp field present or neither of these two fields present.

Table 9-422—Channel Schedule Descriptor Tuple attribute definition

Name	Type	Length (octets)	Value	Scope/ Country code
Channel Schedule Descriptor	11	variable	Compound TLVs in Table 9-423.	CSM

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-423—Channel Schedule Descriptor Value fields

Name	Subtype	Length (octets)	Value	Scope/ Country code
Operating Class	1	1	The Operating Class field is the number of the operating class of the channel, which is defined in E.1.	CSM
Channel Number	2	1	The Channel Number field is the number of the channel, which is the subject of the value of Channel Schedule Management Mode field. If the Channel Schedule Management Mode field indicates the schedule information is based on WLAN channels, the Channel Number is a channel from the operating class of the STA as defined in E.1; otherwise, the Operating Class compound TLV is not present, and the Channel Number is a positive integer value as defined in D.1 to indicate the available TV channel for WLAN operation.	CSM
Channel Availability Starting Time	3	8	The Channel Availability Starting Time field indicates the starting time in Coordinated Universal Time (UTC) from when the channel indicated in the Channel Number field is available for operation. When neither this field nor a Channel Availability Starting Timestamp is present, the STA takes the time that the response element is received as the starting time of the channel availability. NOTE—The Channel Availability Starting Time field follows the UTC time definition of the Time Value field of the Time Advertisement element in 9.4.2.59, and the first 6 octets are used to indicate the UTC time until minutes. The left 2 octets are reserved.	CSM
Channel Availability Starting Timestamp	4	8	The Channel Availability Starting Timestamp field indicates the starting timestamp from when the channel indicated in the Channel Number field is available for operation. When neither this field nor a Channel Availability Starting Time field is present, the STA takes the time that the response element is received as the starting time of the channel availability.	CSM
Channel Availability Offset Time	5	2	The Channel Availability Offset Time field indicates the offset of channel availability time with respect to the time that the Channel Schedule Descriptor is received. This field is present when the Channel Availability Starting Time field is not present in the response TLV and the channel is not available at the moment the TLV is received.	CSM
Channel Availability Duration	6	2	The Channel Availability Duration field indicates the duration in minutes of the availability of the channel that indicated in the Channel Number field.	CSM

9.4.4.2.6 WSM information values

The format of the WSM information values is shown in Table 9-424. If the WSM Type field of the White Space Map element (9.4.1.55) is set to 1, the WSM Information field specifies available channel information for TVWS, which is country-specific.

Table 9-424—WSM information values

Name	Type	Length (octets)	Value	Scope/ Country code
WSM Information	12	variable	Single value TLV comprising fields in related table in E.2 for a specific regulatory domain.	WSM

The format of the WSM Information Value fields is shown in Table 9-425.

Table 9-425—WSM Information Value fields

Name	Length (octets)	Value	Scope/ Country code
Device Class	1	Single octet TLV comprising fields in Table 9-419.	WSM
Map ID	1	Bit 0: Type bit indicates whether the following channel list is a full channel list or a partial channel list. If the Type bit is 1, the following channel list is a full channel list; and if the Type bit is 0, the following channel list is a partial channel list. Bits 1–7: Map version identifies the version of the WSM.	WSM
Channel Number	1	Channel Number field in related WSM Information Value fields table in E.2.	WSM
Maximum Power Level	1	Maximum Power Level field in related WSM Information Value fields table in E.2.	WSM
Validity	1	The Validity field indicates the duration in minutes for which the Channel Number is available with the allowed maximum power level, where the Validity field is provided for each available Channel Number.	WSM, UK
Maximum Channel Bandwidth	2	Limits on the maximum contiguous and maximum noncontiguous instantaneous bandwidths of STA specified as $n \times 0.1$ MHz, where $n > 0$.	WSM, UK

The Device Class field is defined in 9.4.4.2.2 and identifies the device class used by the WSM. It determines the length of the channel availability tuple consisting of the Channel Number, Maximum Power Level, and Validity fields, which is repeated as indicated by the Length field of the WSM element. If the Device Class field is 0, the Validity field in WSM Information Value field is not present. Otherwise, the Validity field exists in the WSM Information Value field.

9.4.5 Access network query protocol (ANQP)-elements

9.4.5.1 General

ANQP-elements have a common format shown in Figure 9-1079. Each element is assigned a unique Info ID as defined in this standard. See R.2 for the ANQP usage.

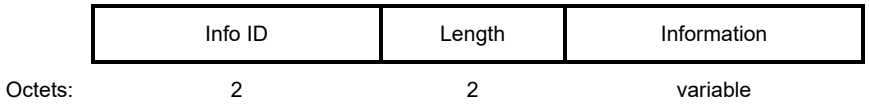

Figure 9-1079—ANQP-element format

Each ANQP-element in 9.4.5 is assigned a unique 2-octet Info ID. The set of valid Info IDs are defined in Table 9-426.

Table 9-426—ANQP-element definitions

ANQP-element name	Info ID	ANQP-element (subclause)
Reserved	0–255	—
Query List	256	9.4.5.2
Capability List	257	9.4.5.3
Venue Name	258	9.4.5.4
Emergency Call Number	259	9.4.5.5
Network Authentication Type	260	9.4.5.6
Roaming Consortium	261	9.4.5.7
IP Address Type Availability	262	9.4.5.9
NAI Realm	263	9.4.5.10
3GPP Cellular Network	264	9.4.5.11
AP Geospatial Location	265	9.4.5.12
AP Civic Location	266	9.4.5.13
AP Location Public Identifier URI/ FQDN	267	9.4.5.14
Domain Name	268	9.4.5.15
Emergency Alert Identifier URI	269	9.4.5.16
TDLS Capability	270	9.4.5.18
Emergency NAI	271	9.4.5.17
Neighbor Report	272	9.4.5.19
Query AP List	273	9.4.5.24
AP List Response	274	9.4.5.25
Reserved	275	—

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-426—ANQP-element definitions *(continued)*

ANQP-element name	Info ID	ANQP-element (subclause)
CAG	276	9.4.5.26
Venue URL	277	9.4.5.20
Advice of Charge	278	9.4.5.21
Local Content	279	9.4.5.22
Network Authentication Type with Timestamp	280	9.4.5.23
Service Information Request	281	9.4.5.27
Service Information Response	282	9.4.5.28
Local MAC Address Policy	283	9.4.5.29
EBCS Content Request	284	9.4.5.31
EBCS Content Response	285	9.4.5.32
EBCS	286	9.4.5.30
Credential Types	287	9.4.5.33
Service Level Agreement	288	9.4.5.34
Excluded NAI Realm	289	9.4.5.35
Reserved	290 –56 796	—
Vendor Specific	56 797	9.4.5.8
Reserved	56 798–65 535	—

The Length field specifies the number of octets in the Information field.

The ANQP-elements with type S in Table 11-20 can be configured. If information is not configured for a particular ANQP-element with type S, then that ANQP-element is not included in the response.

NOTE—Some STAs might return a queried ANQP-element for which information is not configured with all optional fields not present.

9.4.5.2 Query List ANQP-element

The Query List ANQP-element provides a list of identifiers of ANQP-elements for which the requesting STA is querying; see 11.22.3.3.2.

The format of the Query List ANQP-element is shown in Figure 9-1080.

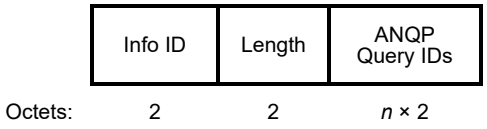

Figure 9-1080—Query List ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The ANQP Query IDs field contains one or more 2-octet ANQP Query ID subfields.

Each ANQP Query ID subfield value is an Info ID drawn from Table 9-426. Including an Info ID in the Query List ANQP-element declares that the STA performing the ANQP request is requesting the ANQP-element corresponding to that Info ID be returned in the ANQP response. The Info IDs included in the Query List ANQP-element are ordered by monotonically increasing Info ID value. The ANQP response is defined in 11.22.3.3.1.

9.4.5.3 Capability List ANQP-element

The Capability List ANQP-element provides a list of information/capabilities that has been configured on a STA. The Capability List ANQP-element is returned in response to a Query List ANQP-element containing the Info ID of the Capability List ANQP-element.

The format of the Capability List ANQP-element is shown in Figure 9-1081.

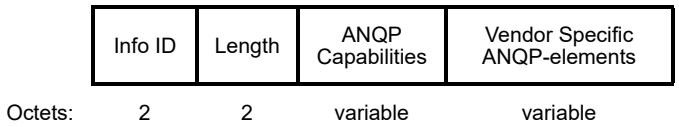

Figure 9-1081—Capability List ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The ANQP Capabilities field contains one or more 2-octet ANQP Capability subfields.

Each ANQP Capability subfield value is an Info ID drawn from Table 9-426. If included in the Capability List ANQP-element, it declares that a Query List ANQP-element including that Info ID will return the requested ANQP-element. The Info ID for Capability List ANQP-element is always included in the Capability List ANQP-element returned in a GAS query response. The list does not include any duplicate Info IDs, except possibly the Info ID for each Vendor Specific ANQP-element. The Info IDs returned in the Capability List ANQP-element are ordered by nondecreasing Info ID value.

The Vendor Specific ANQP-elements field contains one or more variable length Vendor Specific ANQP-elements.

The Vendor Specific ANQP-element is defined in 9.4.5.8. The Vendor Specific ANQP-element is structured such that the first 2 octets of the Vendor Specific ANQP-element is the Info ID whose value corresponds to the Vendor Specific ANQP-element (see Table 9-426). When a Vendor Specific ANQP-element is present in the Capability List ANQP-element, the Vendor Specific ANQP-element contains the capabilities of that vendor-specific query protocol.

9.4.5.4 Venue Name ANQP-element

The Venue Name ANQP-element provides zero or more venue names associated with the BSS. The format of the Venue Name ANQP-element is shown in Figure 9-1082. The Venue Name ANQP-element might be used to provide additional metadata on the BSS. For example, the information might be used to assist a user in selecting the appropriate BSS of which to become a member.

The Info ID and Length fields are defined in 9.4.5.1.

The Venue Info field is defined in 9.4.1.32.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

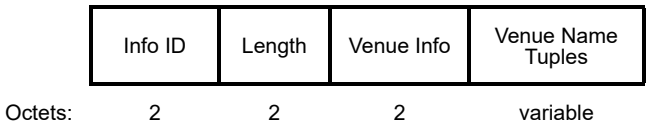

Figure 9-1082—Venue Name ANQP-element format

The Venue Name Tuples field contains zero or more variable length Venue Name Tuple subfields.

The format of the Venue Name Tuple subfield is shown in Figure 9-1083.

— The Length field is equal to 3 plus the number of octets in the Venue Name field.

— The Language Code field contains an ASCII-encoded language code selected from ISO 639, and defines the language used in the Venue Name field. A two character language code has 0 (ASCII NUL) appended.

— The Venue Name field is a UTF-8 string containing the venue's name. The maximum length of this field is 252 octets.

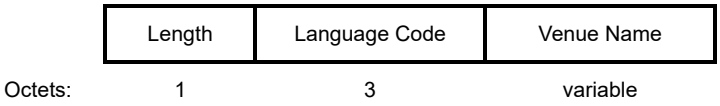

Figure 9-1083—Venue Name Tuple subfield

A URL associated with the Venue Name field can be specified by the Venue URL ANQP-element defined in 9.4.5.20.

9.4.5.5 Emergency Call Number ANQP-element

The Emergency Call Number ANQP-element provides a list of emergency phone numbers to an emergency responder, such as directed by a public safety answering point (PSAP), that is used in the geographic location of the STA. The format of the Emergency Call Number ANQP-element is shown in Figure 9-1084.

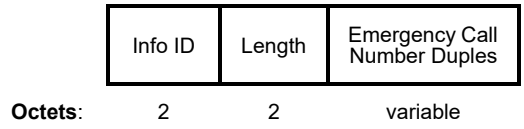

Figure 9-1084—Emergency Call Number ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Emergency Call Number Duples field contains zero or more variable length Emergency Call Number Duple subfields.

Each Emergency Call Number Duple subfield has the structure shown in Figure 9-1085.

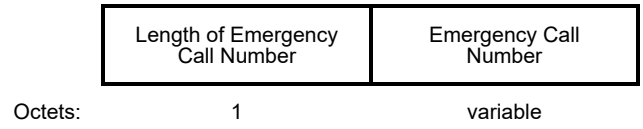

Figure 9-1085—Emergency Call Number Duple subfield format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Length of Emergency Call Number field contains the length in octets of the Emergency Call Number field.

The Emergency Call Number field is a UTF-8 string containing information, used to reach emergency services, from the network [e.g., dialed digits, emergency service URN label (IETF RFC 5031 [B46])]. When this field is transmitted by an AP, with the intention of the field being received by a STA in a 3GPP capable device, the recommended format and content of this field is defined in Annex I of 3GPP TS 24.302.

9.4.5.6 Network Authentication Type ANQP-element

The Network Authentication Type ANQP-element provides a list of authentication types when ASRA is set to 1. The format of the Network Authentication Type ANQP-element is shown in Figure 9-1086.

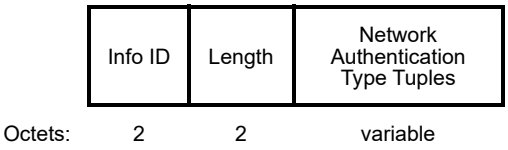

Figure 9-1086—Network Authentication Type ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Network Authentication Type Tuples field contains zero or more variable length Network Authentication Type Tuple subfields.

Each Network Authentication Type Tuple subfield has the structure shown in Figure 9-1087.

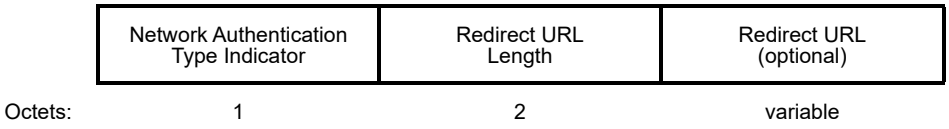

Figure 9-1087—Network Authentication Type Tuple subfield format

The Network Authentication Type Indicator field is set to one of the values shown in Table 9-427.

Table 9-427—Network Authentication Type Indicator definitions

Value	Meaning
0	Acceptance of terms and conditions
1	On-line enrollment supported
2	http/https redirection
3	DNS redirection
4–255	Reserved

Each Network Authentication Type Indicator field defines additional information that can be communicated.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Redirect URL Length field contains the length in octets of the Redirect URL field. The Redirect URL Length field is set to 0 whenever the Redirect URL field is not present.

The Redirect URL field is a variable length field that is optionally included if the Network Authentication Type Indicator field is either 0 or 2; otherwise, it is not included. The URL is formatted in accordance with IETF RFC 3986.

If the Network Authentication Type Indicator field is 0, the network requires the user to accept terms and conditions. The Redirect URL field can be used by the non-AP STA to obtain the terms and conditions.

If the Network Authentication Type Indicator field is 1, the network supports on-line enrollment. Higher layer protocols on the non-AP STA might indicate to the user that accounts might be created. When the Network Authentication Type Indicator is 1, the Redirect URL field is not present.

If the Network Authentication Type Indicator field is 2, the network infrastructure performs http/https redirect. The Redirect URL field is used by the non-AP STA to perform additional steps required for network access.

If the Network Authentication Type Indicator field is 3, the network supports DNS redirection. Higher layer software on the non-AP STA exchanges credentials with the network, the Redirect URL field is not present.

9.4.5.7 Roaming Consortium ANQP-element

The Roaming Consortium ANQP-element provides a list of information about the Roaming Consortium and/or SSPs whose networks are accessible via this AP. This list can be returned in response to a GAS query request using procedures in 11.22.3.3.3. The format of the Roaming Consortium ANQP-element is shown in Figure 9-1088.

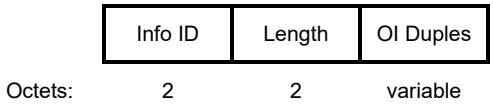

Figure 9-1088—Roaming Consortium ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

OIs contained within the Roaming Consortium element (see 9.4.2.94) are also included in this ANQP-element. The value of the OI subfield(s) in this ANQP-element are equal to the values of the OI(s) in the dot11RoamingConsortiumTable.

The OI Duples field contains zero or more variable length OI Duple subfields.

The format of the OI Duple subfield is shown in Figure 9-1089.

— The OI Length field is set to the number of octets in the OI field.
— The OI field is defined in 9.4.1.29. Each OI identifies a roaming consortium (group of SSPs with inter-SSP roaming agreement) or a single SSP.

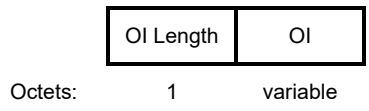

Figure 9-1089—OI Duple subfield format

9.4.5.8 Vendor Specific ANQP-element

The Vendor Specific ANQP-element is used to query for information not defined in this standard within a single defined format, so that reserved Info IDs are not usurped for nonstandard purposes and interoperability is more easily achieved in the presence of nonstandard information. The ANQP-element is in the format shown in Figure 9-1090.

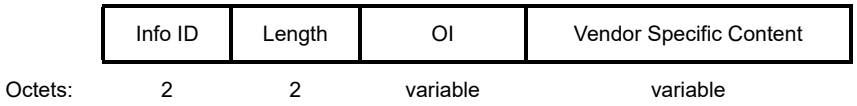

Figure 9-1090—Vendor Specific ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The OI field is defined in 9.4.1.29.

The Vendor Specific Content field is a variable length field whose content is defined by the entity identified in the OI field.

9.4.5.9 IP Address Type Availability ANQP-element

The IP Address Type Availability ANQP-element provides STA with the information about the availability of IP address version and type that could be allocated to the STA after successful association. The format of the IP Address Type Availability ANQP-element is shown in Figure 9-1091.

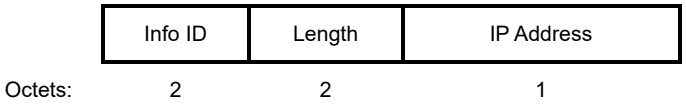

Figure 9-1091—IP Address Type Availability ANQP-element

The Info ID and Length fields are defined in 9.4.5.1.

The format of the IP Address field shown in Figure 9-1092.

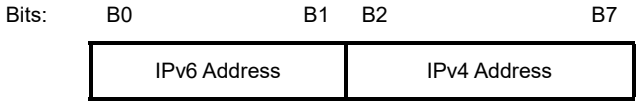

Figure 9-1092—IP Address field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The IPv6 Address field values are shown in Table 9-428.

Table 9-428—IPv6 Address field values

Address value	Meaning
0	Address type not available
1	Address type available
2	Availability of the address type not known
3	Reserved

The IPv4 Address field values are shown in Table 9-429.

Table 9-429—IPv4 Address field values

Address value	Meaning
0	Address type not available
1	Public IPv4 address available
2	Port-restricted IPv4 address available
3	Single NATed private IPv4 address available
4	Double NATed private IPv4 address available
5	Port-restricted IPv4 address and single NATed IPv4 address available
6	Port-restricted IPv4 address and double NATed IPv4 address available
7	Availability of the address type is not known
8–63	Reserved

9.4.5.10 NAI Realm ANQP-element

The NAI Realm ANQP-element provides a list of network access identifier (NAI) realms corresponding to SSPs or other entities whose networks or services are accessible via this AP; optionally included for each NAI realm is a list of one or more EAP Method subfields, which that NAI realm uses for authentication. The format of the NAI Realm ANQP-element is shown in Figure 9-1093.

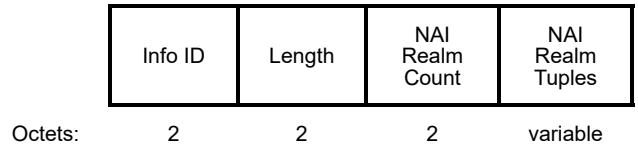

Figure 9-1093—NAI Realm ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The NAI Realm Count field specifies the number of NAI Realm Tuple subfields included in the NAI Realm ANQP-element.

The NAI Realm Tuples field contains zero or more variable length NAI Realm Tuple subfields.

The format of the NAI Realm Tuple subfield is shown in Figure 9-1094.

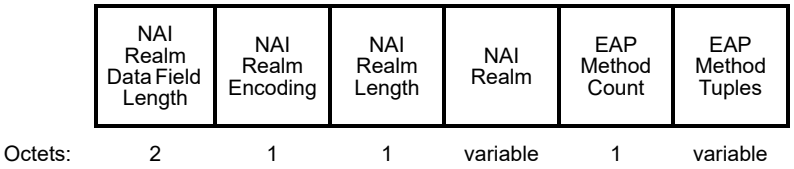

Figure 9-1094—NAI Realm Tuple subfield format

The NAI Realm Data Field Length subfield is equal to 3 plus the length in octets of the NAI Realm subfield plus the length in octets of the EAP Method Tuples subfield.

The NAI Realm Encoding subfield is shown in Figure 9-1095.

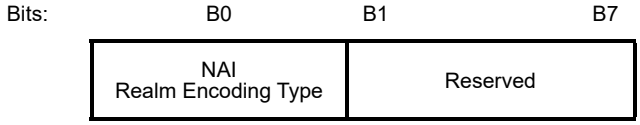

Figure 9-1095—NAI Realm Encoding subfield format

The NAI Realm Encoding Type subfield is set to 0 to indicate that each NAI realm in the NAI Realm subfield is formatted in accordance with IETF RFC 4282. It is set to 1 to indicate that each NAI realm is a UTF-8 string that might not be formatted in accordance with IETF RFC 4282.

NOTE—This encoding is to facilitate roaming consortium or other entities that use nonstandard NAI realm formats.

The NAI Realm Length subfield is the length in octets of the NAI Realm subfield.

The NAI Realm subfield is one or more NAI realms formatted as defined in the NAI Realm Encoding Type subfield of the NAI Realm Encoding subfield. If there is more than one NAI realm in this subfield, the NAI realms are delimited by a semicolon character (i.e., ";", which is encoded in UTF-8 as 0x3B). All of the realms included in the NAI Realm subfield support all of the EAP methods identified by the EAP Method subfields, if present. The maximum length of this subfield is 255 octets.

The EAP Method Count subfield specifies the number of EAP methods subfields for the NAI realm. If the count is 0, there is no EAP method information provided for the NAI realm.

The EAP Method Tuples field contains zero or more variable length EAP Method Tuple subfields.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The format of the optional EAP Method Tuple subfield is shown in Figure 9-1096. Each EAP Method subfield contains a set of Authentication Parameters associated with the EAP-Method.

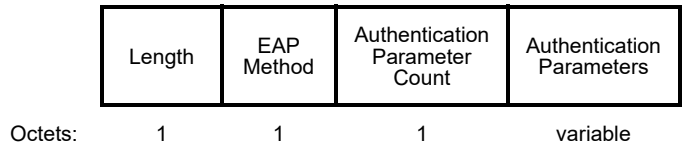

Figure 9-1096—EAP Method Tuple subfield format

The Length subfield is 2 plus the length in octets of the Authentication Parameters subfield.

The EAP method subfield is set to the EAP Type value as given in IANA EAP Method Type Numbers.

The Authentication Parameter Count indicates how many additional Authentication Parameter subfields are specified for the supported EAP Method. If the Authentication Parameters Count subfield is 0, there are no Authentication Parameters subfields present, meaning no additional Authentication Parameters are specified for the EAP Method.

The Authentication Parameters field contains zero or more variable length Authentication Parameter subfields.

The format of the Authentication Parameter subfield is shown in Figure 9-1097.

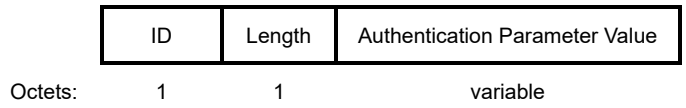

Figure 9-1097—Authentication Parameter subfield format

The ID subfield indicates the type of authentication information provided.

The Length subfield indicates the length in octets of the Authentication Parameter Value subfield.

The Authentication Parameter Value subfield is a variable length subfield containing the value of the parameter indicated by the ID.

The ID and its associated formats are specified in Table 9-430. Each ID indicates a different type of information. Use of multiple Authentication Parameter subfields allows all of the required authentication parameter requirements to be provided.

If the EAP Method type is an Expanded EAP type (the EAP Method value is 254), the Authentication Parameter is used to specify additional information on the EAP method. Table 9-431 describes the Authentication Parameter format for the Expanded EAP method; values for the Vendor ID and Vendor Type are specified in IETF RFC 3748. The Vendor ID and Vendor Type fields are expressed in big endian octet order.

The Non-EAP Inner Authentication Type is specified as a single enumerated value given in Table 9-430. This Authentication Information type is used for non-EAP Inner Authentication methods. The possible values are PAP (as specified in IETF RFC 1334 [B23]), CHAP (as specified in IETF RFC 1994 [B24]), MSCHAP (as specified in IETF RFC 2433 [B28]), and MSCHAPv2 (as specified in IETF RFC 2759 [B32]).

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-430—Authentication Parameter types

Authentication information	ID	Description	Length (octets)
Reserved	0		
Expanded EAP Method	1	Expanded EAP Method Subfield	7
Non-EAP Inner Authentication Type	2	Enum (0 - Reserved, 1 - PAP, 2 - CHAP, 3 - MSCHAP, 4 - MSCHAPV2)	1
Inner Authentication EAP Method Type	3	Value drawn from IANA EAP Method Type Numbers	1
Expanded Inner EAP Method	4	Expanded EAP Method Subfield	7
Credential Type	5	Enum (1 - SIM, 2 - USIM, 3 - NFC Secure Element, 4 - Hardware Token, 5 - Softoken, 6 - Certificate, 7 - username/password, 8 - none (see NOTE), 9 - Reserved, 10 - Vendor Specific)	1
Tunneled EAP Method Credential Type	6	Enum (1 - SIM, 2 - USIM, 3 - NFC Secure Element, 4 - Hardware Token, 5 - Softoken, 6 - Certificate, 7 - username/password, 8 - Reserved, 9 - Anonymous, 10 - Vendor Specific)	1
Reserved	7–220		
Vendor Specific	221	Variable	variable
Reserved	222–255		
NOTE—None means server-side authentication only.			

Table 9-431—Authentication Parameter format for the Expanded EAP method

Parameters	Length (octets)
ID	1
Length	1
Vendor ID	3
Vendor Type	4

The Inner Authentication EAP Method Type is specified as the EAP number as defined in IANA EAP Method Type Numbers. This Authentication Information type is used when the Inner Authentication method is an EAP method. If the Inner Authentication EAP Method Type is equal to 254 indicating an Expanded EAP Type, then the Expanded EAP Method Authentication Parameter is included.

A Credential Type is specified as a single enumerated value as shown in Table 9-430. If the value is equal to the “Vendor Specific” value, then a Vendor-Specific Authentication Parameter is included.

Vendor-Specific Authentication Parameters are specified as shown in Table 9-432.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-432—Vendor Specific Authentication Parameters

Parameters	Length (octets)
ID	1
Length	1
OI	variable
Authentication Parameter Value	variable

9.4.5.11 3GPP Cellular Network ANQP-element

The 3GPP Cellular Network ANQP-element contains cellular information such as network advertisement information e.g., network codes and country codes to assist a non-AP STA in selecting an AP to access 3GPP networks. The format of the 3GPP Cellular Network ANQP-element is shown in Figure 9-1098.

Figure 9-1098—3GPP Cellular Network ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Payload field is a variable length field and is a generic container. An example of the format and content is defined in Annex H of 3GPP TS 24.302.

9.4.5.12 AP Geospatial Location ANQP-element

The AP Geospatial Location ANQP-element provides the AP's location in LCI format; see 9.4.2.20.10. This information is taken from dot11APLCITable.

The format of the AP Geospatial Location ANQP-element is shown in Figure 9-1099.

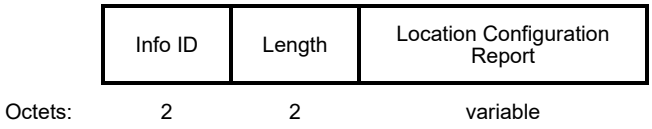

Figure 9-1099—AP Geospatial Location ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Location Configuration Report field is of variable length and defined in 9.4.2.20.10. The Z and Usage Rules/Policy subelements are optionally present in the Location Configuration Report field, when it is used in the AP Geospatial Location ANQP element. The Colocated BSSID List subelement is present when there is at least one other BSS that is colocated within the same physical device as the reporting BSS.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.5.13 AP Civic Location ANQP-element

The AP Civic Location ANQP-element provides the AP's location in civic format. The format of the AP Civic Location ANQP-element is shown in Figure 9-1100.

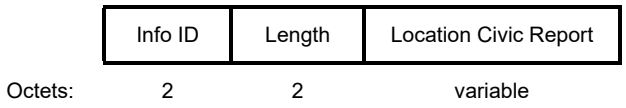

Figure 9-1100—AP Civic Location ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Location Civic Report field is a variable length field and the format is provided in 9.4.2.20.13. This information is taken from dot11APCivicLocationTable. The Colocated BSSID List subelement is present when there is at least one other BSS that is colocated within the same physical device as the reporting BSS and the Colocated BSSID List subelement is not present in the AP Geospatial Location ANQP-element; this subelement is not present otherwise.

9.4.5.14 AP Location Public Identifier URI/FQDN ANQP-element

The AP Location Public Identifier URI/FQDN ANQP-element provides an indirect reference to the location information for the AP. This list element can be returned in response to a GAS query request using the procedures in 11.22.3.3. The format of the AP Location Public Identifier URI/FQDN ANQP-element is shown in Figure 9-1101.

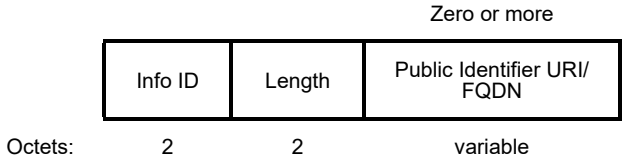

Figure 9-1101—AP Location Public Identifier URI/FQDN ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Public Identifier URI/FQDN field is a variable length field containing zero or more Public Identifier URI/FQDN subelements, as defined in 9.4.2.20.14.

9.4.5.15 Domain Name ANQP-element

The Domain Name ANQP-element provides a list of one or more domain names of the entity operating the IEEE 802.11 access network. Domain Names in this ANQP-element are taken from dot11DomainNameTable. The format of the Domain Name ANQP-element is shown in Figure 9-1102.

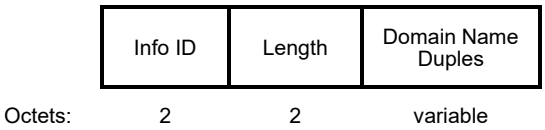

Figure 9-1102—Domain Name ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Domain Name Duples field contains zero or more variable length Domain Name Duple subfields.

The format of the Domain Name Duple subfield is shown in Figure 9-1103.

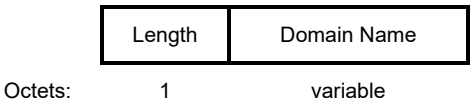

Figure 9-1103—Domain Name Duple subfield format

The Length subfield indicates the length in octets of the Domain Name subfield.

The Domain Name subfield is of variable length and contains a domain name compliant with the "Preferred Name Syntax" as defined in IETF RFC 1035. The maximum length of this field is 255 octets.

9.4.5.16 Emergency Alert URI ANQP-element

The Emergency Alert URI ANQP-element provides a URI for EAS message retrieval.

The format of the Emergency Alert URI ANQP-element is shown in Figure 9-1104.

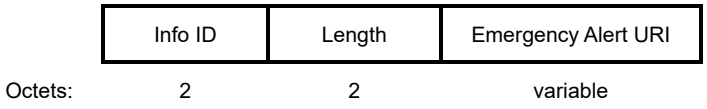

Figure 9-1104—Emergency Alert URI ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Emergency Alert URI field is a variable length field used to indicate the URI at which an EAS message can be retrieved as described in 11.22.7. The Emergency Alert URI field is formatted in accordance with IETF RFC 3986.

9.4.5.17 Emergency NAI ANQP-element

The Emergency NAI ANQP-element contains an emergency string that is available for use by a STA as its identity to indicate emergency access request. The format of the Emergency NAI ANQP-element is shown in Figure 9-1105.

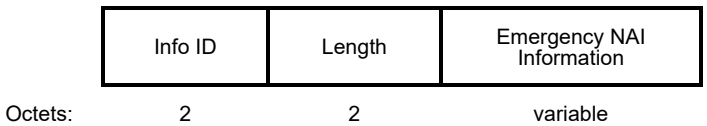

Figure 9-1105—Emergency NAI ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Emergency NAI Information field is a UTF-8 string formatted in accordance with IETF RFC 4282.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.5.18 TDLS Capability ANQP-element

The TDLS Capability ANQP-element is used by a STA to discover the TDLS capabilities of a peer STA. The format of the TDLS Capability ANQP-element is shown in Figure 9-1106.

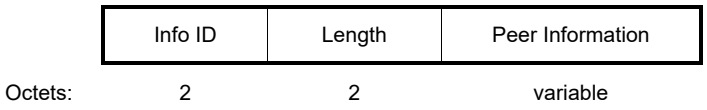

Figure 9-1106—TDLS Capability ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Peer Information field is a variable length field containing information that a STA can use to establish a TDLS direct link and is defined as an XML schema (see R.6). An example of the peer information is described in 11.22.3.3.10.

9.4.5.19 Neighbor Report ANQP-element

The Neighbor Report ANQP-element provides zero or more neighbor reports about neighboring APs. This is of benefit to a STA in a preassociated state. The format of the Neighbor Report ANQP-element is defined in Figure 9-1107.

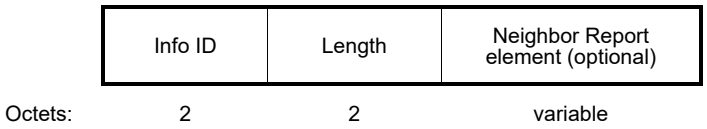

Figure 9-1107—Neighbor Report ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The format of the Neighbor Report element is shown in Figure 9-416 defined in 9.4.2.35. The Colocated BSSID List subelement is present in the Measurement Report subelement when there is at least one other BSS that is colocated within the same physical device as the reporting BSS.

9.4.5.20 Venue URL ANQP-element

The Venue URL ANQP-element provides a list of one or more URLs that can be used for web page advertising services or providing information, particular to a venue's BSS, to a STA. The format of the Venue URL ANQP-element is defined in Figure 9-1108.

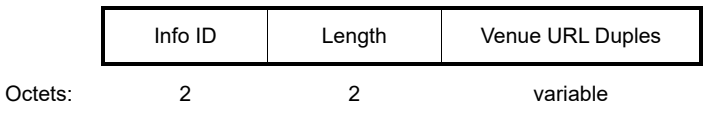

Figure 9-1108—Venue URL ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Venue URL Duples field contains one or more Venue URL Duple fields as shown in Figure 9-1109.

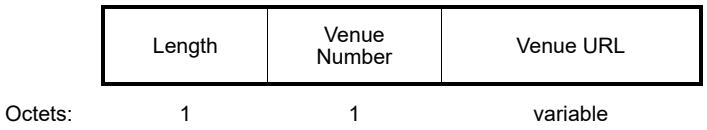

Figure 9-1109—Venue URL Duple field

The Length field is set to 1 plus the number of octets in the Venue URL field.

The Venue Number field identifies the position (1 = 1st, 2 = 2nd, and so on) of the corresponding Venue Name Tuple subfield in the Venue Name ANQP-element from the same STA, as defined in 9.4.5.4. If that same STA does not advertise a Venue Name ANQP-element, or does not advertise any Venue Name Tuple subfields in the Venue Name ANQP-element, then the Venue Number field is set to 0.

The Venue URL field is a variable length field that indicates the URL at which information relevant to the corresponding Venue Name Tuple subfield, indicated by the Venue Number, might be retrieved. This is further described in 11.22.3.3.11. If no Venue URL is provided this field is left empty. The Venue URL field is formatted in accordance with IETF RFC 3986.

9.4.5.21 Advice of Charge ANQP-element

The Advice of Charge ANQP-element provides a list of one or more financial advice of charges related to access to a BSS. The format of the Advice of Charge ANQP-element is defined in Figure 9-1110.

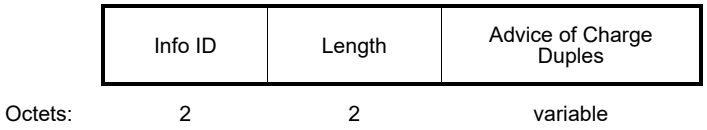

Figure 9-1110—Advice of Charge ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Advice of Charge Duples field contains one or more Advice of Charge Duple fields as shown in Figure 9-1111.

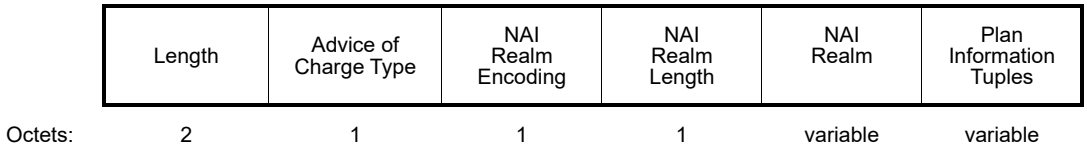

Figure 9-1111—Advice of Charge Duple field

The Length field is set to 3 plus the number of octets in the NAI Realm and Plan Information Tuples fields.

The Advice of Charge Type field is set to one of the values defined in Table 9-433.

The NAI Realm Encoding and NAI Realm Length are defined in 9.4.5.10. The NAI Realm subfield is one or more NAI realms formatted as defined in 9.4.5.10.

The format of the Plan Information Tuples field is defined in Figure 9-1112.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-433—Advice of Charge Type field values

Advice of Charge Type Value	Description
0	Time-based
1	Data-volume-based
2	Time-and-data-volume-based
3	Unlimited
4–255	Reserved

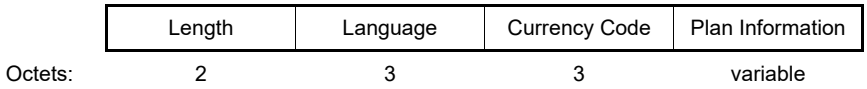

Figure 9-1112—Plan Information Tuple field format

The Length field is set to the number of octets in the Language, Currency Code, and Plan Information fields.

The Language Code field contains an ASCII-encoded language code selected from ISO 639, and defines the language used in the Cost Information field. A two character language code has 0 (ASCII NUL) appended.

The Currency Code field is an ASCII string representing an ISO 4217 currency alphabetic or numeric code (e.g., “USD”).

The Plan Information field is a UTF-8 string that carries an XML description of an advice of charge plan. The schema and semantics of this description are outside the scope of this standard.

9.4.5.22 Local Content ANQP-element

The Local Content ANQP-element provides a list of one or more URLs that can be used to display local content related to the BSS. The format of the Local Content ANQP-element is defined in Figure 9-1113.

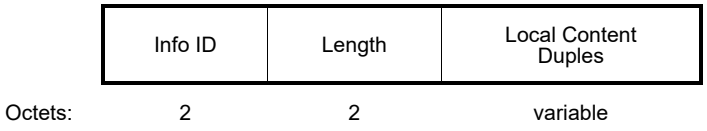

Figure 9-1113—Local Content ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Local Content Duples field contains one or more Local Content Duple fields as shown in Figure 9-1114.

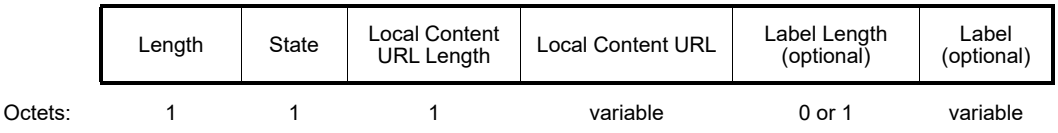

Figure 9-1114—Local Content Duple field format

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Length field is set to 2 plus the number of octets in the Local Content URL, Label Length and Label fields.

The State field is defined in Table 9-434.

Table 9-434—Local Content State values

State	Name
0	Not authenticated
1	Authenticated
2	Failure during authentication
3	Incorrect credentials
4	Credentials expired
5–255	Reserved

The Local Content URL Length field contains the length of the Local Content URL field in octets.

The Local Content URL field is a variable length field containing a URL that is used for directing the device to local content. The Local Content URL field is formatted in accordance with IETF RFC 3986.

The Label Length field contains the value of the length of the Label field in octets. If the Label field is not present, this field is not present.

The Label field is a UTF-8 string containing a text description of the URL suitable for display on a user interface. It provides the type and potential usage of the URL.

9.4.5.23 Network Authentication Type with Timestamp ANQP-element

The Network Authentication Type with Timestamp ANQP-element provides similar information to that of the Network Authentication Type as defined in 9.4.5.6. In addition, a timestamp field is optionally provided to indicate to the requesting STA a timestamp corresponding to the time at which the received terms and conditions were most recently modified. With this timestamp, the requesting STA can determine if previously received information is stale.

The format of the Network Authentication Type with Time ANQP-element is shown in Figure 9-1115.

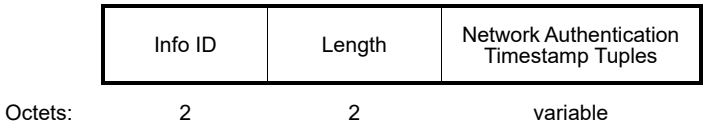

Figure 9-1115—Network Authentication Type with Timestamp ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Network Authentication Timestamp Tuples field contains zero or more variable length Network Authentication Timestamp Tuple subfields.

Each Network Authentication Timestamp Tuple subfield has the structure shown in Figure 9-1116.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

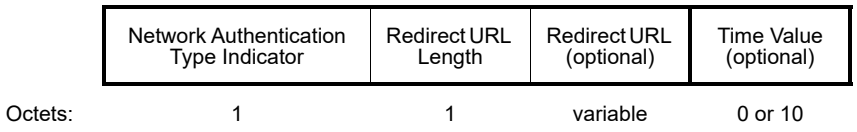

Figure 9-1116—Network Authentication Timestamp Tuple subfield format

The Network Authentication Type Indicator field is defined in 9.4.5.6

The Redirect URL Length field and the Redirect URL field are defined in 9.4.5.6.

The Time Value field is defined in Table 9-232 using the Timing Capability equal to 2 encoding. This field is used by the responding STA to set a time of the ANQP response.

9.4.5.24 Query AP List ANQP-element

The Query AP List ANQP-element provides a list of APs and a list of Info IDs of ANQP-elements that the requesting STA is requesting from each AP in the list. The Query AP List ANQP-element declares that the STA performing the ANQP request is requesting that the ANQP-element corresponding to each Info ID be returned in the AP List Response ANQP-element. This element allows an optimization of the single ANQP request procedure (see 9.4.5.2) by having multiple ANQP requests in a single ANQP-element thus reducing the time necessary for network discovery and selection. See 11.22.3.3.14 for information on the Query AP list procedure.

The format of the Query AP List ANQP-element is shown in Figure 9-1117.

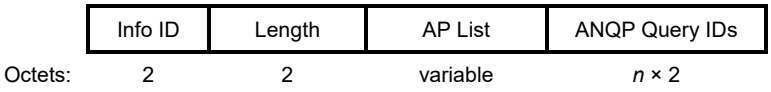

Figure 9-1117—Query AP List ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The AP List field is a variable length field defined in Figure 9-1118 that contains the list of BSSIDs for requested information.

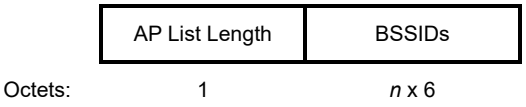

Figure 9-1118—AP List field format

The AP List Length field indicates the length in octets of the BSSIDs field.

The BSSIDs field contains one or more BSSID fields. Each BSSID field indicates the BSSID of the BSS of an AP that the requesting STA wants to query.

The ANQP Query IDs field contains one or more ANQP Query ID fields that are ordered by increasing info ID value. Each ANQP Query ID field is an unsigned integer of length two octets.

The ANQP Query ID field value is drawn from Table 9-426.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

9.4.5.25 AP List Response ANQP-element

The AP List Response ANQP-element provides the response to the Query AP List ANQP-element request. The ANQP response is defined in 11.22.3.3. The format of the AP List Response ANQP-element is defined in Figure 9-1119.

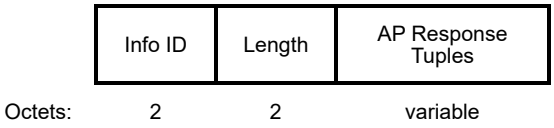

Figure 9-1119—AP List Response ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The AP Response Tuples field contains zero or more AP Response Tuple fields.

The format of the AP Response Tuple field is defined in Figure 9-1120.

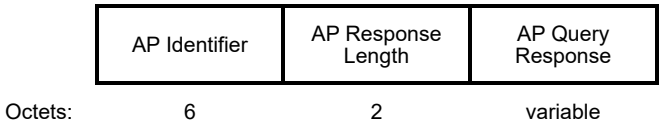

Figure 9-1120—AP Response Tuple field format

The AP Identifier field indicates the BSSID of the BSS of the AP that the requesting STA queries.

The AP Response Length field indicates the number of octets in the following AP Query Response field.

The AP Query Response field contains an ANQP response corresponding to the ANQP Query ID in the received Query AP List ANQP-element as specified in 9.4.5.24. Each ANQP response comprises one or more ANQP-elements (Table 9-426).

9.4.5.26 CAG ANQP-element

The CAG ANQP-element provides the info IDs for the ANQP-elements contained within a CAG associated with ANQP, or ANQP with Service Information Registry, and the current value of the ANQP CAG version, indicating the version of information within the CAG associated with ANQP, or ANQP with Service Information Registry. The format of the CAG ANQP-element is defined in Figure 9-1121. The selection of the specific number of info IDs and the specific values of info IDs in a CAG associated with ANQP is left to the implementation and is beyond the scope of this standard.

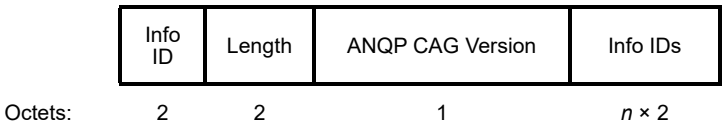

Figure 9-1121—CAG ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The ANQP CAG Version field indicates the current version of the CAG associated with ANQP, or ANQP with Service Information Registry.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Info IDs field contains zero or more Info ID fields. The Info ID field contains the info ID of an ANQP-element Info ID specified in Table 9-343.

9.4.5.27 Service Information Request ANQP-element

The Service Information Request ANQP-element contains a generic request for service information associated with the service hash(es) provided.

The format of the Service Information Request ANQP-element is shown in Figure 9-1122.

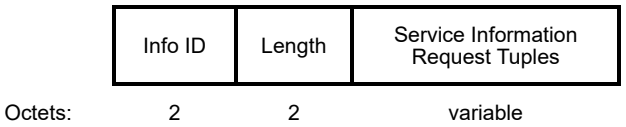

Figure 9-1122—Service Information Request ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Service Information Request Tuples field contains one or more Service Information Request Tuple subfields. The format of the Service Information Request Tuple subfield is shown in Figure 9-1123.

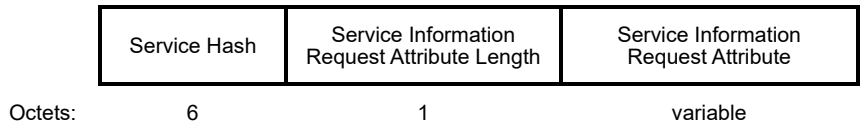

Figure 9-1123—Service Information Request Tuple subfield format

The Service Hash field contains a service hash value. See 11.23.4 for procedures for generating a service hash.

The Service Information Request Attribute Length subfield indicates the length in octets of the Service Information Request Attribute subfield.

The Service Information Request Attribute subfield contains a service-specific query. The value of this subfield is out of the scope of this standard.

9.4.5.28 Service Information Response ANQP-element

The Service Information Response ANQP-element contains the detailed service information in response to a Service Information Request ANQP-element.

The format of the Service Information Response ANQP-element is shown in Figure 9-1124.

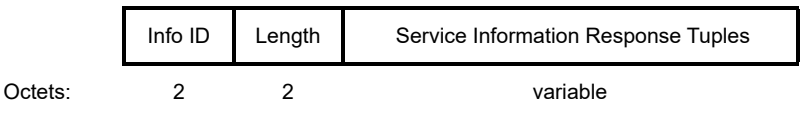

Figure 9-1124—Service Information Response ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The Service Information Response Tuples field contains zero or more Service Information Response Tuple subfields.

The format of the Service Information Response Tuple subfield is shown in Figure 9-1125.

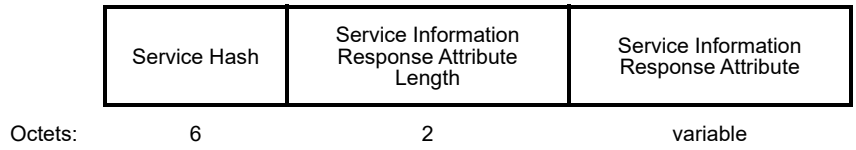

Figure 9-1125—Service Information Response Tuple subfield format

The Service Hash field contains a service hash value. See 11.23.4 for procedures for generating a service hash.

The Service Information Response Attribute Length subfield indicates the length in octets of the Service Information Response Attribute subfield.

The content of the Service Information Response Attribute subfield is service specific based on the corresponding Service Information Request Attribute subfield in the Service Information Request Tuples of the Service Information Request ANQP-element as described in 9.4.5.27.

9.4.5.29 Local MAC Address Policy ANQP-element

The Local MAC Address Policy ANQP-element provides an indication of the local MAC address policy of the ESS.

The format of the Local MAC Address Policy ANQP-element is specified in Figure 9-1126.

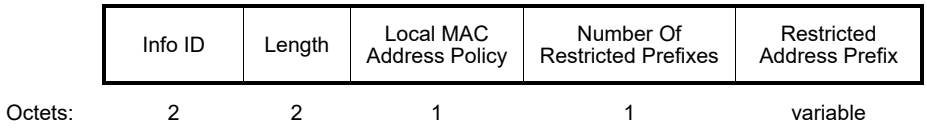

Figure 9-1126—Local MAC Address Policy ANQP-element format

The Info ID and Length fields are specified in 9.4.5.1.

The Local MAC Address Policy field is a bitmap advertising policies supported by the ESS regarding its support for local MAC address. The values of the bits are specified in Table 9-435.

The bitmap values provided in Table 9-435 indicate, to the receiving STA, aspects of the local MAC address policy of the ESS. The bits are independent and not mutually exclusive. They make reference to the Structured Local Address Plan (SLAP) introduced into IEEE Std 802 via the amendment IEEE Std 802c-2017. The bit value indications are as follows:

— Bit 0 is reserved.
— Bit 1, when set to 1, indicates the support of an address chosen by the STA randomly, in SLAP Quadrant 00 (i.e., the SLAP AAI quadrant, with 0100 as the M, X, Y, and Z bits, respectively) but avoiding addresses beginning with any prefix specified in the Restricted Address Prefix field. Bit 1, when set to 0, indicates that the ESS provides no rules on MAC address use within SLAP Quadrant 00.

Table 9-435—Local MAC Address Policy field bits

Bitmap value	Description
Bit 0 (MSB)	Reserved
Bit 1	Randomization subject to Restricted Address Prefixes supported in SLAP Quadrant 00
Bit 2	Randomization subject to Restricted Address Prefixes supported in SLAP Quadrant 01
Bit 3	Randomization subject to Restricted Address Prefixes supported in SLAP Quadrant 10
Bit 4	Randomization subject to Restricted Address Prefixes supported in SLAP Quadrant 11
Bit 5	Reserved
Bit 6	Reserved
Bit 7	Reserved

— Bit 2, when set to 1, represents the support of an address chosen by the STA randomly, in SLAP Quadrant 01 (i.e., the SLAP ELI quadrant, with 0101 as the M, X, Y, and Z bits, respectively) but avoiding addresses beginning with any prefix specified in the Restricted Address Prefix field. Bit 2, when set to 0, indicates that the ESS provides no rules on MAC address use within SLAP Quadrant 01.

— Bit 3, when set to 1, represents the support of an address chosen by the STA randomly, in SLAP Quadrant 10 (i.e., the SLAP Reserved quadrant, with 0110 as the M, X, Y, and Z bits, respectively) but avoiding addresses beginning with any prefix specified in the Restricted Address Prefix field. Bit 3, when set to 0, indicates that the ESS provides no rules on MAC address use within SLAP Quadrant 10.

— Bit 4, when set to 1, represents the support of an address chosen by the STA randomly, in SLAP Quadrant 11 (i.e., the SLAP SAI quadrant, with 0111 as the M, X, Y, and Z bits, respectively) but avoiding addresses beginning with any prefix specified in the Restricted Address Prefix field. Bit 4, when set to 0, indicates that the ESS provides no rules on MAC address use within SLAP Quadrant 11.

The Number Of Restricted Prefixes field specifies the number of Restricted Address Prefix subfields in the Restricted Address Prefix field.

NOTE 1—If Local MAC Address Policy field bits 1-4 are set to 1 and Number Of Restricted Prefixes to 0, the Local MAC Address Policy ANQP-element indicates that the ESS supports randomized address throughout local address range. In this case, the AP STA sets the Local MAC Address Policy field in the Extended Capabilities field to 0, indicating that local MAC addresses are not restricted, and consequently the Local MAC Address Policy ANQP-element is redundant.

The Restricted Address Prefix field contains zero or more Restricted Address Prefix subfields, each specifying the prefix of local MAC addresses supported in the ESS. Each such prefix indicates support for MAC addresses assigned as extensions of the indicated prefix, provided that the assignment is made according to the procedures specified for the use of that prefix, or, in the case that a MAC address is an extension of multiple indicated prefixes, the longest of those prefixes.

Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

NOTE 2—The detailed specification of the use of local MAC addresses is provided in IEEE Std 802. Per its amendment IEEE Std 802c-2017, an SAI is assigned by a protocol specified in an IEEE 802 standard, and specification of the use of ELI addresses is provided by the assignee of a CID duly assigned by the IEEE Registration Authority.

The format of the Restricted Address Prefix subfield is described in Figure 9-1127.

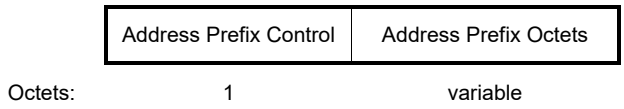

Figure 9-1127—Restricted Address Prefix subfield format

The format of the Address Prefix Control subfield is described in Figure 9-1128.

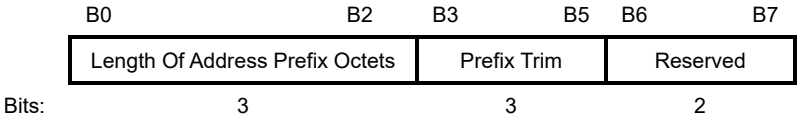

Figure 9-1128—Address Prefix Control subfield format

The Length Of Address Prefix Octets subfield indicates the length (in octets) of the Address Prefix Octets field. Values 0 and 7 are reserved.

The Prefix Trim subfield indicates the number of bits to be truncated from the end of the value of the Address Prefix Octets subfield in order to obtain the MAC address prefix. In other words, the MAC address prefix is the value of the Address Prefix Octets subfield after truncation of some of the most significant bits of the last octet, with the number of truncated bits equal to the value of the Prefix Trim subfield. If the Length of Address Prefix Octets subfield is set to 1, then the value of the Prefix Trim subfield is not be set to 7; this provides that the length of the MAC address prefix is at least two bits. The bit and octet ordering of the MAC address prefix is per Figure 9-1.

9.4.5.30 EBCS ANQP-element

The EBCS ANQP-element provides a list of zero or more enhanced broadcast services that are available from the STA transmitting this element. The format of the EBCS ANQP-element is defined in Figure 9-1129.

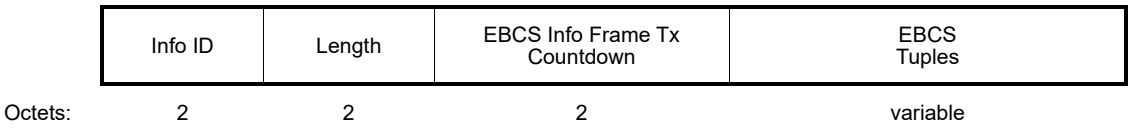

Figure 9-1129—EBCS ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The EBCS Info Frame Tx Countdown field is defined in 9.4.1.70.

If present, the EBCS Tuples field contains one or more EBCS Tuple fields as defined in Figure 9-1130..

The Control field defines which of the optional fields are present in the EBCS Tuple field and is defined in Figure 9-1131.

	Control	Content ID	Negotiation Method	Content Authentication Algorithm	Content Address Type	Content Address Length	Content Address
Octets:	1	1	1	1	1	1	variable

	Title Length	Title	PHY Type (optional)	Tx Rate (optional)	Next Tx Schedule (optional)	Time To Termination (optional)
Octets:	1	variable	0 or 1	variable	0 or 2	0 or 2

Figure 9-1130—EBCS Tuple field format

	B0	B1	B2	B3	B4 B7
	Tx Rate Present	Next Tx Schedule Present	Time To Termination Present	Association Required	Reserved
Bits:	1	1	1	1	4

Figure 9-1131—Control field format

The Tx Rate Present subfield is set to 1 if the PHY Type subfield and the Tx Rate subfield are present and is set to 0 otherwise.

The Next Tx Schedule Present subfield is set to 1 by a STA to indicate that the EBCS Tuple field contains a Next Tx Schedule field. This subfield is set to 0 to indicate that there is no Next Tx Schedule field.

The Time To Termination Present subfield is set to 1 by a STA to indicate that the EBCS Tuple field contains a Time To Termination field. This subfield is set to 0 to indicate that there is no Time To Termination field.

A value of 1 in the Association Required subfield indicates that association is required to consume the EBCS traffic stream identified by the content ID contained in the Content ID subfield. A value of 0 indicates that association is not required to consume the EBCS traffic stream identified by the content ID contained in the Content ID subfield.

The Content ID subfield indicates the identifier of the content.

The format of the Negotiation Method subfield is shown in Figure 9-1132.

The EBCS Content Request Frame subfield is set to 1 if the EBCS traffic stream identified by the Content ID subfield included in the same EBCS Tuple field can be requested using EBCS Content Request frames, otherwise it is set to 0.

The EBCS Content Request ANQP Element subfield is set to 1 if the EBCS traffic stream identified by the Content ID subfield included in the same EBCS Tuple field can be requested using the EBCS Content Request ANQP-element, otherwise it is set to 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

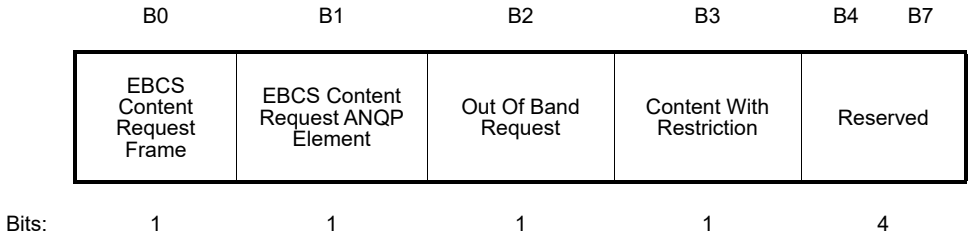

Figure 9-1132—Negotiation Method subfield format

The Out Of Band Request subfield is set to 1 if the EBCS traffic stream, identified by the Content ID subfield included in the same EBCS Tuple field, can be requested using an out of band method, otherwise it is set to 0. The URL to be used for the out of band negotiation method is contained in the EBCS Info frame.

If the Association Required bit in the Control field included in the same EBCS Tuple field is equal to 1, the only allowed request method is through EBCS Content Request/Response frames, therefore the EBCS Content Request Frame bit is set to 1 and EBCS Content Request ANQP Element bit is set to 0.

The Content With Restriction subfield is set to 1 if the content requires offline registration to be consumed and is set to 0 otherwise. The registration process is outside of the scope of this standard. The URL used for offline registration is contained in the Service URL subfield in the EBCS Info frame.

When the EBCS Content Request Frame subfield, the EBCS Content Request ANQP Element subfield, and the Out Of Band Request subfield are all set to 0, the EBCS traffic stream will be transmitted without any STA requesting it.

The Content Authentication Algorithm field indicates the authentication algorithm used for this EBCS traffic stream.

The Content Authentication Algorithm subfield is defined in Table 9-436.

Table 9-436—Content Authentication Algorithms

Value	Content Authentication Algorithms
0	HLSA (see 12.15.4)
1	PKFA (see 12.15.2)
2	HCFA without instant authentication (see 12.15.3)
3	HCFA with instant authentication (see 12.15.3)
4–255	Reserved

The Content Address Type subfield is defined in Table 9-437.

The Content Address Length subfield contains the length of the Content Address subfield in octets.

The Content Address subfield contains the addresses and the port to select the content, encoded as follows.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

Table 9-437—Content Address Type subfield

Value	Address Type
0	UDP/IPv4
1	UDP/IPv6
2	MAC address
3–255	Reserved

If the Content Address Type subfield indicates UDP/IPv4, the format of the Content Address subfield is shown in Figure 9-1133.

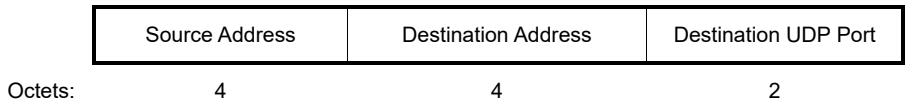

Figure 9-1133—Content Address subfield format for UDP/IPv4

The Source Address subfield contains the source IPv4 address of the content. If the value of the Source Address subfield is 0, the source address of the content is not specified.

The Destination Address subfield indicates the IPv4 address used as the destination address (typically a multicast IPv4 address) in the broadcast frames for the EBCS traffic stream identified by the Content ID field. The Destination Port subfield indicates the UDP port associated with the IPv4 address indicated in the Destination Address subfield.

NOTE—The UDP port is encoded per the conventions defined in 9.2.2. IPv4 addresses correspond to the identically named fields of the IPv4 header.

If the Content Address Type subfield indicates UDP/IPv6, the format of the Content Address subfield is shown in Figure 9-1134.

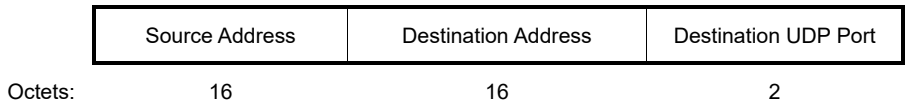

Figure 9-1134—Content Address subfield format for UDP/IPv6

The Source Address subfield contains the source IPv6 address of the content. If the value of the Source Address subfield is 0, the source address of the content is not specified.

The Destination Address subfield indicates the IPv6 address used as the destination address (typically a multicast IPv6 address) in the broadcast frames for the EBCS traffic stream identified by the Content ID field. The Destination Port subfield indicates the UDP port associated with the IPv6 address indicated in the Destination Address subfield.

NOTE—The UDP port is encoded per the conventions defined in 9.2.2. IPv6 addresses correspond to the identically named fields of the IPv6 header.

If the Content Address Type subfield indicates MAC address, the format of the Content Address subfield is shown in Figure 9-1135. The Content Address subfields contain MAC addresses.

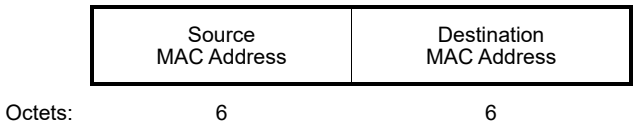

Figure 9-1135—Content Address subfield format for MAC Address

The Source MAC Address subfield contains the source MAC address of the content. If the value of the Source MAC Address subfield is 0, the source MAC address of the content is not specified.

The Destination MAC Address subfield contains the destination MAC address of the content that is a group address.

The Title Length field indicates the length of the Title field in octets.

The Title field is a human readable title of the content as a UTF-8 string.

The PHY Type subfield indicates the PHY type of the EBCS Data frames of the EBCS traffic stream. The PHY type is encoded as defined in Table 9-438.

Table 9-438—PHY Type subfield

Value	Operating band			
	Sub 1 GHz	2.4 GHz	5 GHz	6 GHz
0	S1G	DSSS / HR/DSSS / OFDM / ERP	OFDM	Reserved
1	Reserved	HT	HT	Reserved
2	Reserved	Reserved	VHT	Reserved
3	Reserved	HE	HE	HE
4–255	Reserved	Reserved	Reserved	Reserved

The PHY Type subfield value depends on the operating band of the EBCS AP. If the PHY Type subfield is not present, the PHY type and the transmission rate of the EBCS Data frames of the EBCS traffic stream is same as the PHY type and the transmission rate of the EBCS Info frame (dot11EBCSInfoTxRate).

The Tx Rate subfield indicates the transmission rate of the EBCS Data frames of the EBCS traffic stream.

The format of the TX Rate subfield for DSSS, HR/DSSS, OFDM, or ERP is shown in Figure 9-1136. The Data Rate subfield indicates the transmission rate multiplied by 2 in units of megabits per second.

The format of the TX Rate subfield for HT is defined in Figure 9-1137.

The MCS subfield indicates the HT MCS index. The format of the Flags subfield is shown in Figure 9-1138.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

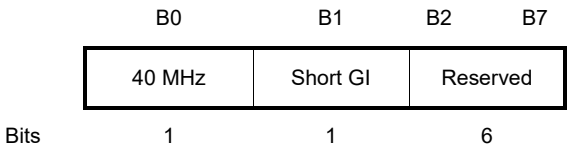

Figure 9-1138—Flags subfield format

The 40 MHz subfield is set to 1 when the channel bandwidth is 40 MHz. Otherwise, the subfield is set to 0. The Short GI subfield is set to 1 when a short GI is used. Otherwise the subfield is set to 0.

The format of the TX Rate subfield for VHT is defined in Figure 9-1139.

Figure 9-1139—VHT TX Rate subfield format

The format of the VHT MCS subfield is defined in Figure 9-1140.

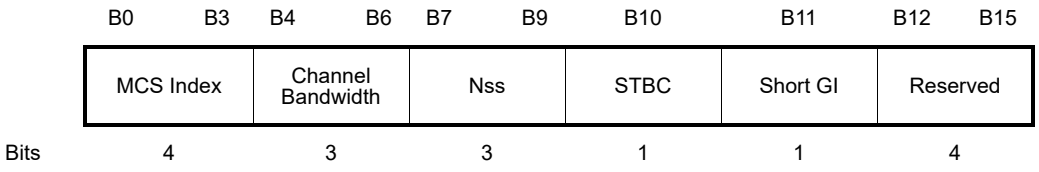

Figure 9-1140—VHT MCS subfield format

The MCS Index subfield indicates the VHT MCS index.

The Channel Bandwidth subfield value is encoded as defined in Table 9-439.

The Nss subfield value indicates the N_{ss} minus 1.

The STBC subfield is set to 1 when STBC is used. Otherwise, the subfield is set to 0.

The Short GI subfield is set to 1 when a short GI is used. Otherwise, the subfield is set to 0.

Table 9-439—VHT Channel Bandwidth subfield

Value	Channel bandwidth
0	20 MHz
1	40 MHz
2	80 MHz
3	160 MHz
4	80+80 MHz
5–7	Reserved

The format of the TX Rate subfield for TVHT is shown in Figure 9-1141.

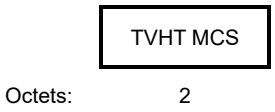

Figure 9-1141—TVHT TX Rate subfield format

The format of the TVHT MCS subfield is shown in Figure 9-1142.

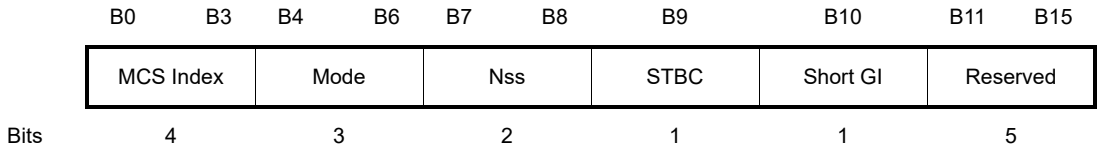

Figure 9-1142—TVHT MCS Subfield format

The MCS Index subfield indicates the TVHT MCS index.

The Mode subfield value is encoded as defined in Table 9-440.The Nss subfield value indicates the N_{ss} minus 1.

The STBC subfield is set to 1 when STBC is used. Otherwise, the subfield is set to 0.

The Short GI subfield is set to 1 when a short GI is used. Otherwise, the subfield is set to 0.

The format of the TX Rate subfield for S1G is shown in Figure 9-1143.

The format of the S1G MCS subfield is shown in Figure 9-1144.

The MCS Index subfield indicates the S1G MCS index.

The Channel Bandwidth subfield value is encoded as defined in Table 9-441.

The Nss subfield value indicates the N_{ss} minus 1.

The Traveling Pilots subfield is set to 1 when traveling pilots are used. Otherwise, the subfield is set to 0.

The format of the TX Rate subfield for CMMG is defined in Figure 9-1145.

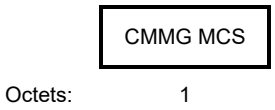

Figure 9-1145—CMMG TX Rate subfield format

The format of the CMMG MCS subfield is shown in Figure 9-1146.

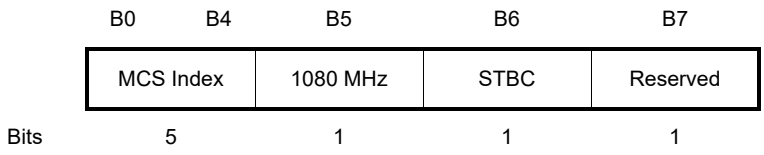

Figure 9-1146—CMMG MCS subfield format

The MCS Index subfield indicates the CMMG MCS index.

The 1080 MHz subfield is set to 1 when the channel bandwidth is 1080 MHz. Otherwise, the subfield is set to 0.

The STBC subfield is set to 1 when STBC is enabled. Otherwise, the subfield is set to 0.

The format of the HE TX Rate subfield is defined in Figure 9-1147.

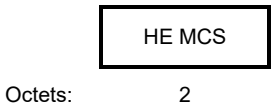

Figure 9-1147—HE TX Rate subfield format

The format of the HE MCS subfield is defined in Figure 9-1148.

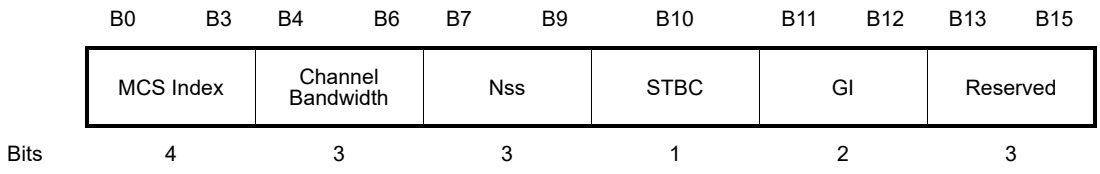

Figure 9-1148—HE MCS Subfield format

The MCS Index subfield indicates the HE MCS index.

The Channel Bandwidth subfield value is encoded as shown in Table 9-439.

The Nss subfield value indicates the N_{ss} minus 1.

The STBC subfield is set to 1 when STBC is used. Otherwise, the subfield is set to 0.

Copyright © 2025 IEEE. All rights reserved.
Authorized licensed use limited to: zq lv. Downloaded on September 14,2025 at 06:04:32 UTC from IEEE Xplore. Restrictions apply.

The GI subfield value is encoded as defined in Table 9-442.

Table 9-442—HE GI subfield values

Value	Guard interval
0	0.8 μs
1	1.6 μs
2	3.2 μs
3	Reserved

The Channel Configuration subfield indicates the channel configuration number.

The Time To Termination subfield is defined in 9.4.1.69.

The Next Tx Schedule subfield indicates the number of TBTTs until the beacon interval in which the next frame belonging to the EBCS traffic stream, identified by the Content ID subfield, is transmitted. A value of 0 indicates that this transmission occurs in the beacon interval that starts at the next TBTT. A value of 1 indicates that it occurs in the beacon interval that follows that beacon interval. A value of 65 535 indicates that there is no specific transmission starting time.

9.4.5.31 EBCS Content Request ANQP-element

The EBCS Content Request ANQP-element transmits a register (or unregister) request from a STA to a peer STA to receive (or stop receiving) enhanced broadcast services that are available from the peer STA. The format of the EBCS Content Request ANQP-element is defined in Figure 9-1149.

	Info ID	Length	EBCS Content Request Info subfield
Octets:	2	2	variable

Figure 9-1149—EBCS Content Request ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The EBCS Content Request Info subfield is defined in 9.4.1.68.

9.4.5.32 EBCS Content Response ANQP-element

The EBCS Content Response ANQP-element provides a list of zero or more enhanced broadcast services that are available from a peer STA. The format of the EBCS Content Response ANQP-element is defined in Figure 9-1150.

The Info ID and Length fields are defined in 9.4.5.1.

The EBCS Content Response field is defined in 9.4.1.69.

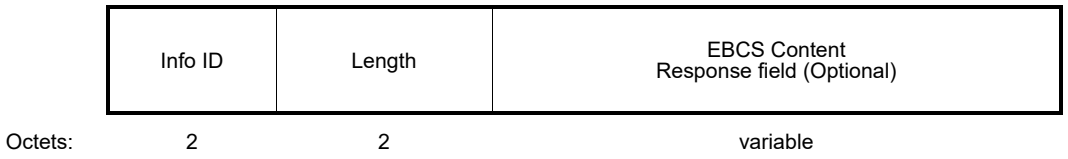

Figure 9-1150—EBCS Content Response ANQP-element format

9.4.5.33 Credential Types ANQP-element

The Credential Types ANQP-element provides a STA with information about the types of credentials accepted via that AP. The format of the Credential Types ANQP-element is shown in Figure 9-1151.

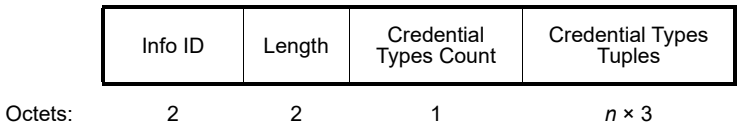

Figure 9-1151—Credential Types ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Credential Types Count field specifies the number *n* of Credential Types Tuple subfields.

The Credential Types Tuples subfield contains zero or more Credential Types Tuple subfields.

The format of the Credential Types Tuple subfield is shown in Figure 9-1152.

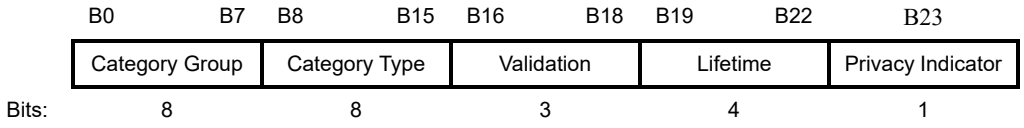

Figure 9-1152—Credential Types Tuple subfield format

The Category Group and Category Type subfields specify the credential issuer(s) accepted via the AP, mapped to the Venue group code and the Venue type code in Table 9-96, respectively.

The Validation subfield indicates the minimum type of credential validation for the credentials to be deemed valid. The values of the subfield are defined in Table 9-443.

Table 9-443—Validation subfield values

Value	Validation method	Notes
0	No verification	Credentials do not need to be verified
1	Any method allowed	
2	Email verification	
3	SMS verification	
4	Government ID	e.g., account obtained by showing a government ID

Copyright © 2025 IEEE. All rights reserved.

Table 9-443—Validation subfield values

Value	Validation method	Notes
5	Government issued credentials	e.g., a certificate issued by a government
6–7	Reserved	

The Lifetime subfield indicates the minimum age required for the credentials to be acceptable, in units of year quarters.

The Privacy Indicator subfield is set to 1 if this AP requires the user to expose a contactable identity to the AP (usually for legal purposes). It is set to 0 if this AP accepts anonymous roaming.

9.4.5.34 Service Level Agreement ANQP-element
